The profound European concern with the economic future rests on many specific points. First and foremost is worry as to lack of future markets. This is heightened by fear that American industrial technology may have so far outstripped the European that European products will not be able fully to compete in world markets. Closely allied to this is concern lest bars on trade with the Soviet bloc will strangle the full economic development of highly industrialized nations, particularly Britain, Germany, and Japan. These points all join to raise the specter of possible overproduction and disastrous international competition. Worsening terms of trade against manufactured goods are worrisome too, and so is possible inability to obtain needed raw materials in the face of economic nationalism in producer countries and the rapidly expanding demands of United States production. Lack of adequate resources for investment and improvement in standards of living is heightened by the demands for rearmament.

These are some of the specifics, but their summation is what matters. Together they have tended to breed apathy or resignation with regard to the economic future, not so much among those European leaders who courageously wish to face the problems, but among the warp and woof of the political and economic fabric—the moneyed class, the entrepreneurs, labor and labor union leaders, professional classes, and the bureaucracy. The problems themselves pose no insuperable difficulties, but their solution demands vision, vigor, and a new and broader approach, which have

not yet been inspired. Private enterprise is weakened and confused, and governmental action reflects the apathy of the body politic.

UNDERDEVELOPED POTENTIALITIES

Yet, in the latent aspirations of the millions who inhabit underdeveloped lands lie markets of unimaginable potentialities and an answer to the economic problems of the industrialized West. Enlightened development of these lands can provide the greatly increased mineral and agricultural production which would slowly bring these markets to life. But the problems to be solved in realizing these potentials are far more than economic. They present the moral and political challenges to western civilization—and to the rest of the free world—which are implicit in the struggle for lasting peace, security, and freedom. They are not yet being met with the essential degree of public comprehension and energy within the Atlantic community. The West needs to recognize that the development of a spirit of common purpose within the whole free world is the surest way to the solution of its economic—and consequently to many of its political, moral, and military—problems. So far, its leaders have been unable to clarify this issue. The whole campaign of Communist divisive propaganda has been aimed at beclouding it.

DISTRUST OF THE WEST

The United States is as involved as the rest of the West in the basic problem. By the very fact of concentrating so much effort in aiding Europe and by becoming a leading partner in NATO, we have heightened suspicions and doubts among some of the peoples of underdeveloped areas. In our efforts to activate the concept of an expanding world economy for our own as well as others' well-being, we are accused of economic exploitation and materialistic

disregard for higher, ethical, values. Communist propaganda has increasingly been focused on proving an alleged "imperialist" design, and tries to show some sinister connection between our support of the so-called "ex-colonial" powers of Europe and our efforts to help develop political advancement in, and the economic resources of, less-developed lands. Perhaps the greatest paradox in our foreign policy today is that in helping to strengthen the West, we seem to be prejudicing our ability to help create cohesion within the whole free world.

One of the most profoundly disturbing factors in the situation today is the increasing suspicion with which the peoples of some of the underdeveloped areas look upon the West. Their inchoate but nonetheless positive feelings regarding what Toynbee calls the "aggressive" history of western civilization are intensifying a schism that the free world cannot afford. The rapid advance of the world-wide politico-sociological revolution through these lands; the crumbling of local versions of feudalistic society; the heightening awareness and ambitions of the common man; the impact of western materialism on age-old cultures and philosophies which sought other values and rewards than those involving some satisfaction of men's material wants; the breakdown of the colonial systems and the rise of fervent nationalism—all these and many other causes are creating political stresses and through them a fundamental economic instability which would be dangerous enough to the well-being of the world in any circumstances, and is all the more so in the shadow of the Communist threat. It is important to realize, however, that the causes of stress in the underdeveloped areas lie far less in economic origins than in the realm of principles and conviction, and that they derive, in part, from the continued failure of the western countries to act abroad

in a unified exemplification of the basic moral and spiritual values of our civilization.

The troubled, dissatisfied, and sometimes oversensitive countries in underdeveloped areas need rapidly to find or to be shown a course of common purpose in the entire free world that will enlist their real co-operation, will permit mutually beneficial development, will offer hope for the timely satisfaction of reasonable aspirations and at the same time will allay their fears of exploitation—either in the economic sense or in the sense of unwilling involvement in action against the Soviets. It is right here that the West confuses rather than helps. Each western country, in outmoded reaction to the economic pressures of today, has been attempting to relate itself independently with the rest of the world and has failed to face the need for community of purpose and action. So far, the West has not met today's challenge adequately. Last autumn the Communists reiterated the price of failure.

A SEARCH FOR THE ANSWER

There is nothing new in what I have said. Others have stressed, far better than I, how necessary it is for NATO to look outside itself if it is to be a great force for peace. Only in the recent past, however, has it become evident that these broad problems are being placed together in the fullest context by the policy-makers of NATO governments and are beginning to stir the search for realistic answers. This is the most heartening development, and is the next step forward to expand on Point Four, the Colombo plan, and the United Nations' first moves towards development. President Eisenhower and Messrs. Anthony Eden and René Mayer have made recent comments on this theme. Field Marshal Montgomery was very specific only a short time ago. We may hope

that the governments of many nations outside the NATO grouping are also giving it greater thought.

SOME CONCLUSIONS

There are certain broad conclusions which may be drawn from the discussion so far. The first of these is that the nations of the West need, as a community, to act with greater recognition of the realities of interdependence within the free world. To achieve necessary economic expansion, on which depend political stability and the ability to build and maintain needed military strength—in a word, to achieve peace—there must be demonstrated a convincing intent to work with the underdeveloped countries for mutual benefit.

From this we can conclude that a present anomaly in NATO can no longer be ignored—the fact that while, in NATO, there is a real, if as yet only minor, pooling of sovereignty in terms of national defense, there has been little retreat from economic nationalism, particularly in its overseas manifestations. Not to be confused with this point are the steps like the formation of Benelux or the Schuman plan, which, excellent in themselves, are internal to Europe and unlikely as yet greatly to affect its external economic relationships.

We can further conclude that the search for basic economic strength for the West, which means the development of vastly greater markets and of greater availability of raw materials, cannot be pursued within the Atlantic community alone. No matter how much trade is increased between North America and free Europe, it can never fully solve the dollar gap, let alone the basic developmental problems. The world economic imbalance of too little food and raw material production as against industrial production cannot be corrected just within the NATO area.

But the most important conclusion is

that there is a basic dichotomy involved in promoting the full potential of the free world. From the western point of view, economic development is the vital emphasis. From the point of view of the underdeveloped areas, it is a social, philosophical, and spiritual community of ideas within which all free nations can accommodate themselves which most needs creation and which must precede full economic development. These different concepts are not antithetic, but they point clearly to the dangers of any one-sided approach to a solution.

The job, then, is first of all political, in the broadest meaning of the word. But it really transcends the political, and is more a test of the true intelligence and adaptability of the West. Not for centuries has western civilization found itself in jeopardy from external forces. So far as the traditions of modern western statesmanship are concerned, there is no precedent for the present crises. There must be developed new concepts of self-interest and national interest to cope with them, based on the inspiration of common purpose.

REGIONS FOR ACTION

We come back now to our original question—how can NATO develop its fullest potential to meet and resolve the Communist menace? The answer lies in developing the potential of the whole free world. There are three regions for action. The first of these is within NATO itself. The second is between NATO and the underdeveloped areas. The third is within the underdeveloped countries.

In the first area, the goal is a unity in the West. This does not mean a unity in continental Europe, with the United States, the United Kingdom, and Canada standing apart. It does not mean a unity of western Europe including the United Kingdom, but with

the United States and Canada apart. It means unity among all these countries. It means, in reality, an expansion of the idea of NATO beyond the lines envisaged in Article 2 of the North Atlantic Treaty, which covers other than military aspects of the treaty. This unity need not, at this time, be precisely defined in terms of political or economic arrangements. What is meant by unity is a concept of conscious awareness by each NATO nation of the importance of the group as a whole, transcendent over narrow national interests, and the courage and vision to act from this concept to strengthen the entire free world. This is not proposed in blithe disregard for "political realities." One of the inexorable political realities of today is the growing awareness of the interdependence of economic affairs and thus of national existences.

In the second region—between NATO and the underdeveloped areas—it may be argued that the action required becomes even more unlikely, because unity in NATO is a prerequisite, but does not yet really exist. But that is not quite correct. Any deepening schism between the West and the underdeveloped areas would be even more dangerous to the NATO countries than to the others. It would mark a triumph for the Communist strategy of division and imperil the economic viability of the West. Hence, there are powerful political forces impelling the West concurrently to action towards both ends—unity in NATO and the creation of a universal community of ideals and purpose throughout the free world within which full economic and political development can move slowly but surely forward.

The last region for action—that within the underdeveloped countries themselves—presents the greatest challenge. Today there is little incentive for the governments in many such countries to act co-operatively towards the West or to

make even the first moves to permit the West to help them and their peoples to the mutual benefit of both parties. It must be made clear by the West that co-operation will not mean exploitation. Centuries-old suspicions and fears must be allayed. Opposing philosophies and customs must be reconciled. The spirit of public duty must be strengthened. Communist distortions and threats must be overcome. This will take long years. But the first step is the most important. It is for the West, through private enterprise as well as governmental actions, to show a genuine intent to find greater strength and vigor for itself and the whole free world by giving greater strength and vigor to the underdeveloped areas.

EFFECT OF THE SOVIET MOVES

In conclusion, there is this to be said. The recent seemingly conciliatory moves by the Kremlin are being viewed with

mixed concern by many persons in the West. Some fear that these deliberate moves to lessen tensions, for whatever reasons they are being made, will weaken the impelling force which has been binding NATO together and will aggravate the divisive tendencies within the West. If this should happen, it could be disastrous. But it need not happen. The growing recognition by governments and peoples of the interdependence of their economic affairs, and thus of their military strength, can best be translated into positive and collective action during even a momentary lull in the Soviet threat. If the West is to prove its best values, this is what will be done. But if slow and sure movement to build a common purpose in the free world falters, and economic nationalism in the West and in the underdeveloped areas persists unchanged, then peace and security will come under double jeopardy.

Colonel Charles H. Bonesteel, III, U.S.A., Washington, D. C., served in numerous areas during the Second World War; also in the General Staff of the Army in Washington working with the Department of State on matters concerning the Council of Foreign Ministers, the United Nations, and others. He has recently returned from four years in Europe—two years with Mr. Averell Harriman in Paris, and two years in London as the executive director of the European Coordinating Committee of the Mutual Defense Assistance Program.

NATO and the Captive Countries

By ZYGMUNT NAGORSKI, JR.

THE signing of the North Atlantic Pact four years ago was a spectacular international event. It was also in a way a unique one. The main participant of the pact was and still is the United States of America.

RECEPTION OF NATO

Yet when the weary Congressmen left Capitol Hill for the Easter recess in 1949 and went to their electorates they discovered to their great amazement that few people cared to ask them questions about the pact. They also noticed that the local press followed the popular lead and relegated news about the pact to its most insignificant items.

Yet the North Atlantic Pact opened a new chapter in postwar history: it closed the previous one, which could be called containment with hope for a permanent peace. Shortly, however, it became containment without very much hope, containment with a possibility of war in mind. Who likes to be reminded of his past mistakes? Who likes to be brought to the realities of life? Therefore, the American people went about their affairs trying not to notice the big change. That change meant for them assuming the actual leadership of the free world. This leadership meant also responsibilities.

The signing of the North Atlantic Pact met with an entirely different reception in western Europe. There it was a ray of hope and an injection of courage. The majority of the politically conscious population realized that the signing had more psychological than military significance, but was grateful for even that. Western Europeans had been living in fear of a Russian invasion,

which was felt to be a constant threat. Now the situation had changed almost overnight. The Americans had committed themselves to come to the assistance of western Europe should it or any part thereof be invaded. The Soviets were given a clear-cut warning.

Still another reception awaited the news about the birth of the North Atlantic Treaty Organization, in the captive countries of eastern Europe. There were no misgivings or apathy there. NATO was greeted with blessings and with widespread belief that the war of liberation was around the corner. After all, it was argued in Warsaw, Bucharest, and Sofia, this was the first concrete step taken by the free world as a follow-up to the Truman Doctrine.

The makers of the pact thus faced a situation without parallel to anything in the history of postwar developments. The people on whose behalf the pact was signed were partly apathetic and partly relieved. But the real enthusiasm, the real backing, was observed among the people of the captive countries of eastern Europe. The occupied countries, just as they appeared during the German war, proved to be most eagerly interested in the defense preparations of the West. Their interest must be passive right now, but it is a well-known fact that the captive countries may become the most valuable allies of the West in the future. Their stand and their real role will depend on the plans and possibilities set up by the West. Should the West fail to see the Soviet danger, should it wither away under the pressure of peace offers and similar gestures, should it be blind to the threat the Soviet Union represents to the world,

the apathy in the American constituencies and in western Europe after the signing of the North Atlantic Pact might well spread to America's most faithful allies, the captive peoples.

The role NATO is going to play, the role NATO is meant to play, will to a great extent determine their stand. As far back as March 12, 1951 General Eisenhower stated, "The satellite countries, instead of bringing their contribution, will become progressively one of the main sources of weakness for the U.S.S.R." To make these words come true, several conditions must be met.

POLICY OF LIBERATION NEEDED

The first and most vital one which must be stressed is a united policy toward the Soviet Union by all the signatories of the Atlantic Pact. Such a policy naturally must include plans for the captive countries. The policy of liberation is what is needed there. Such a policy means in practical terms the compelling of the Soviet Union to withdraw to her prewar frontiers. It would also mean far greater security for the western European countries. Such a policy would also reverse the present trend in the foreign policies of many western European countries, a trend which may be described as eagerly awaiting signs of good will coming from the Kremlin. It is important to realize that right now we are the targets of a new Soviet psychological offensive, and that so far we are meekly falling into line.

In NATO the captive peoples see an instrument of strength which makes effective negotiations with the Russians possible. They want and expect more than expediency, and they know that this cannot be achieved without such strength and without a firm western foreign policy embracing certain basic principles. Their reasoning is simple: Is not what we are going through right

now enough evidence of Soviet intentions? Is not what we see with our own eyes enough to warn the West what kind of fate is in store for its own future?

SOVIET PREPARATIONS IN CAPTIVE COUNTRIES

The captive peoples are also comparing and appraising the military strength in their respective countries with that of the West. The figures are fairly well known, so it is unnecessary to cite them again. But in addition to the general building up of the armed forces, a great deal of other preparation is in process. There is a unified system of training in the satellite armies, weapons and equipment have been standardized, and there has been a steady increase of the contingents with intensified training of reserves. These moves have been buttressed by various economic steps. There are the regional economic plans which the Soviet Union has set up in precise detail. For some time, now, the production of all nonessential goods has been curtailed. The captive countries have been carefully surveyed and each assigned a special role in producing and storing supplies, raw materials, industrial products, and foodstuffs. In the field of communications there has been a steady transformation of the railroad system to conform to the basic directions, east-west and north-south. This is to be accomplished through standardization of the lines, construction of bridges, and increase of the carrying capacity.

The captive peoples are observing these preparations from within. They can see changes being made from the narrow-gauge railway lines to the Soviet broad-gauge; they see new harbors and ports being hastily constructed; underground storage facilities and fuel tanks are mushrooming.

From all these preparations one conclusion is drawn by these passive ob-

servers: The Soviet Union is steadily and systematically preparing herself for a showdown with the West, and will start the ball rolling when she herself decides that the time is ripe.

In NATO, through its unified strategy, the captive peoples see the hope of a solid front opposing aggression. However, they attribute to this front a different purpose from that which is envisaged on this side of the Iron Curtain. To the West, NATO is an instrument of defense; they see in it the road to liberation.

POLICY LACKING

That liberation, it is widely realized behind the Iron Curtain, depends on two principal conditions. First, a policy must be agreed upon; and second, a military build-up must be completed to back up such a policy. In the North Atlantic Treaty Organization the captive peoples see such a force. What is still lacking is the policy.

When during the last Presidential campaign Republican spokesmen proclaimed liberation as their goal, a wave of enthusiasm swamped the captive countries. These two necessary conditions for liberation became suddenly part of practical politics. The great majority of the people behind the Iron Curtain today cling to the idea that it is now time for the West to present demands; that this is the time to use firm methods of persuasion; that now, and not a year from now or five years from now, there is a good chance to avoid a third world war and achieve liberation at the same time.

The Soviet Union today seems to be unsettled and uneasy. This period closely resembles the lack of internal stability following Lenin's death, with the difference that at that time the Union of Soviet Socialist Republics was not one of the two major world powers. Communism then did not overflow the

Soviet borders, nor did it overpower close to a hundred million non-Communists in Europe. Today it will take Malenkov much less time to consolidate his power. But he still needs time, and he is trying to secure it right now.

The organization which I head in New York, the Foreign News Service, has been conducting a survey of opinion among recent refugees escaping from Soviet-dominated areas. The purpose of that survey is to establish the effectiveness of western radio programs beamed to those countries. But there are also additional questions being asked by our reporters. Some questions are political, such as, "What do you think is the American policy towards Russia? How about the policies of Great Britain, France, and other member countries of the Atlantic community?"

Last year we interviewed close to three hundred persons from every Iron Curtain country, a cross section of all age brackets, ranging from a 13-year-old boy to a 68-year-old woman, and representing all social strata. Their answers, therefore, may be treated as typical of opinions held by their countrymen.

WHAT THE CAPTIVE PEOPLE THINK

Of those commenting on these questions, 12.5 per cent declared themselves for an outright war against the U.S.S.R., seeing in it the only possibility of salvation both for their countries and eventually for the West. Their arguments run to the effect that the Soviet Union wants world conquest, and nothing short of the total destruction of the Communist regime can stop this objective. This, they reason, can be achieved only from the outside and not from within.

But the largest group of the people interviewed, as many as 30.2 per cent, want to see Communism destroyed and their countries liberated without a war. How? Through an impressive show of western strength. Here is where NATO

comes in. It is frequently said that NATO is an instrument born out of the growing threat posed by the Soviet Union. Is this instrument going to be used only halfway? A 20-year-old Armenian girl who escaped from Rumania last September and now lives in Turkey expressed her thoughts on that subject vividly:

America is conducting a determined fight against Communism. The Atlantic Pact, the Marshall plan are best proofs of it. Are the other partners backing up the United States strongly enough in that fight? Are all of them realizing that the very future of their own countries is interlinked with what progress Russia is making today in the satellite countries? Are they going to stop her now and make her withdraw? Tomorrow it may be too late.

FREE AND CAPTIVE COUNTRIES LINKED

It may be appropriate to recall at this point a bit of history behind NATO. I should like to remind you of one chapter of it concerning Norway. In March 1949 that small but strategically vital Scandinavian country decided to abandon its traditional policy of neutrality and commit itself to stand with the West against the Soviet Union. The vote in the Norwegian Storting was 118 against 11 for joining in preliminary talks on the pact. The eleven opposing votes were all cast by Communists. At the same time Norway turned down a Soviet offer to enter into a nonaggression pact.

There is evidence that both these decisions were made because of certain events which occurred in some Communist-threatened countries. The most important of these events was the Communist coup in Czechoslovakia. Another was the Soviet demand from Finland to enter into a mutual assistance and nonaggression pact.

The shock produced by the former and to a minor extent by the latter was

followed by Soviet efforts to establish military bases on Svalbard (Spitsbergen). Such bases were set up during the war, but the U.S.S.R. tried in 1946 to conclude a further agreement and to have the use of that part of Norwegian territory. The Soviet Union finally dropped her request, but the ill feeling created by it backfired against the Soviets when the Czechoslovak coup occurred. The Norwegians were ready to abandon their traditional neutrality to be in a position to defend themselves, convinced that the U.S.S.R. was a threat to their independence.

The case of Norway is an excellent illustration of how the fate of the captive countries is linked with the fate of free countries, and how the defense system built around NATO has been influenced by events which took place behind the Iron Curtain.

From this statement another logical thought must follow: There is a similar interrelation between current Soviet policies and military preparations and the security and future fate of all other free countries of the West. If we accept the theory that the Soviet Union has never abandoned her ambitions and that she still follows the dogma that Communism is to conquer all non-Communist countries of the world (and I for one strongly subscribe to that theory), then we must move fast. The time for pressure and for a western political offensive is now. The time for bold statesmanship is now. The time for demands backed by a show of strength is now. This is the only way to avoid a costly, bloody atomic war in the future.

THE QUESTION OF STRENGTH

There is, naturally, an immediate question arising in anyone's mind. Is the North Atlantic Treaty Organization a sufficient force to back up political de-

mands? Is it solid enough and strong enough? Are the six American divisions, the four British, the five French only partly equipped, and three divisions from the Benelux countries enough to stop the onslaught of Soviet troops should they decide to roll? The enemy could attack through the Danube Valley into southern Germany and through the Fulda Gap into the northern part of Germany. It could cut across Yugoslavia through the Ljubljana Gap into Italy, where four partly equipped divisions are all it would meet. Turkey with its twelve divisions and Greece with ten are to be kept in reserve for a possible threat to the Mediterranean area from the east.

There are no answers to these questions. It may be that we are not ready for the Soviet threat, but we probably will never be unless the U.S.S.R. stages another Pearl Harbor. Consequently, having constructed a unified western defense system and having set up the Council of Europe, we cannot stop at these two purely defensive measures. NATO as a defensive force alone will not be able to fulfill its task. I am not advocating a preventive war. I am only suggesting that the West must take into consideration the necessity of formulating a decisive, firm policy toward the Soviet Union.

Within the framework of such a policy there is room for a vigorous force, for a European Army under NATO command. There should also be room for national units composed of exiled soldiers from the captive countries. Such units would inspire their countrymen to desert their Soviet-commanded regiments. Their very appearance, combined with the western proclamation of political aims, may easily fire the imagination of the captive peoples. They are willing and ready to fight and die if necessary for their own freedom and that of others, but they will not fight for the freedom

of others alone. The lesson of the last war is still too vivid in their memories.

NATO AS AN INSTRUMENT OF POLICY

Once again at this point, policy is the key to everything else. What should such a policy be? What lines should it follow? How can NATO be instrumental in making such policy a working proposition?

A declaration should be formulated by members of the Atlantic community to the effect that the liberation of the enslaved nations is one of the objectives of their joint foreign policy. Such a statement might be combined with another declaration to the effect that the major powers—the United States, Great Britain, and France—would oppose supremacy over Europe by any single nation. This point is very important in view of widespread fears, existing particularly in France and in Poland, regarding the possibility of a revival of German imperialism. In addition, it should be stated that the major powers, members of the Atlantic community, would encourage the creation of a regional federal organization within a United Europe to be formed by the nations liberated from Soviet domination.

NATO can help to a great extent in making people see the necessity of such a bold policy. It is a working international organization. It stands side by side with other similar defense pacts in the Far East and in other areas of the world, such as the Rio pact, the South Pacific pact, the Japanese pact, and the Philippine pact. It has already achieved considerable success in improving morale in western Europe, as manifested by a sharp drop in Communist voting strength and in the decreasing number of Communists elected to parliaments. Now only 1.5 per cent of the population of the European NATO countries are members of the Communist party.

ENSNARED BY FEAR

NATO has already eliminated a considerable amount of fear among the people, and it can and should do so among the policy makers of western Europe. The element of fear is the worst enemy we are facing today. It plagued and paralyzed Britain and France during the period of the Munich appeasement. It is paralyzing them—and others—today. The Soviet Union, waving the white flag of truce one moment and making aggressive actions the very next, has been successful in exploiting this fear in international politics, in keeping the West off balance and holding onto its own initiative.

I cannot resist the temptation of quoting the famous sentence of Goethe, "None are more hopelessly enslaved than those who falsely believe they are free." We are in that position today. The freedom of the countries on this side of the Iron Curtain depends on organizations of the type of NATO.

A NATO or a Pacific pact created solely for containment purposes would be sufficient if the other party, in this case the Soviet Union, were willing to pursue a similar policy. But from all evidence observable during the past decades, it is clear that the Soviet Union is not thus willing. Instead, it is set on destroying our free institutions and our way of life.

The North Atlantic Treaty Organization hinders the Soviet Union from accomplishing its purpose. But while defending certain territories, NATO must also defend and stand for certain intangibles; otherwise its ideological significance would be lost entirely. Such intangibles, among many others, are freedom and democracy in the whole world. While defending them in western Europe, NATO should foster their rebirth also in other parts of the globe, including China and the captive Euro-

pean countries. This is at present the most direct link NATO could have with the captive peoples.

We are not free from fear today, and therefore we must not commit the error of believing that we are. We are afraid of war; and because we fear war we are eager to pay a considerably high price for peace, or for what we now believe would be prolonged peace. This price, in the thoughts of many, includes the abandonment of captive peoples. The relationship between nations, between geographical areas, the similarities of mutual purposes, are easily forgotten. The ultimate aims of the Communists, stated plainly in their books, either are not read or are purposely overlooked. Again, at this time, a rosy era of wishful thinking is swiftly descending upon the free world. There are people who feel that if for the sake of one billion free people, one hundred million must be abandoned and sacrificed, we should accept this as an inevitable verdict of history.

COMPROMISE MEANS FAILURE

There is, of course, nothing more dangerous than this kind of reasoning. The whole machine of international communism, every component part of that machine, is geared toward the destruction of free, liberal, democratic society. When Czechoslovakia fell, Norway felt insecure. When China was conquered, Korea was next on the list. Never in modern history was freedom more indivisible than it is now. For every Polish youth sentenced to live under communism, an American boy was sent to Korea five years later. For every Balt deported to Siberia, an Englishman had to fight in Malaya. For every Hungarian deported from Budapest, a Frenchman must fight a bloody war in Indochina.

We are approaching an inescapable conclusion. NATO and its counterparts

in other parts of the world are instruments of a policy forced upon the free world by the Soviet Union. This policy has been so far a defensive one—a policy willing to reconcile itself to the status quo in Europe, a policy which has accepted the 38th parallel, the Iron Curtain in Europe, and the dividing line running through the city of Berlin. That policy has also envisaged the possibility of a federated Europe, but a Europe crippled by Russia. Winston Churchill, the initiator and promoter of that idea, set up the Council of Europe. Like NATO, this organization tells only one part of the whole story. Many millions of Europeans who should be represented there, are not. As long as they remain absent, nothing will come out of the desire for a united, peaceful European continent.

RECAPITULATION

In conclusion, it seems to me that a recapitulation of my main points is necessary.

First, it is my belief that the North Atlantic Treaty Organization is closely linked with the fate of the captive countries. It is linked militarily in terms of future reserves should a full-scale war break out: the number of deserters from the Communist armies will be great, their eagerness to fight on our side still greater. It is linked politically because events leading to its creation included the faked elections in Poland, the coup in Czechoslovakia, the Berlin blockade, and scores of others which took place behind the Iron Curtain.

According to the best of my knowledge, based on evidence gathered, this belief of mine is shared by the vast majority of the people living in captivity. They greeted the creation of NATO with enthusiasm, seeing in it much more than it was actually meant to be at that time.

A further link can be made by including national units of exiled nationals of the captive countries within the NATO forces. Such an inclusion would have, besides its other advantages, a tremendous psychological effect on the people behind the Iron Curtain. It can be made only after a clear declaration of policy is made by the western allies.

My second point is that the North Atlantic Treaty Organization cannot be effective if it is limited to defense. It would be so if the U.S.S.R. were willing to confine herself to her present sphere of influence. She does not do so, and does not even hide her intentions for further expansion. If we accept the principle of negotiating through strength, NATO is our strength for such negotiations. This strength can, however, be fully developed only if physical and mechanical force is combined with ideological principles. This in turn can be achieved only by returning to certain fundamentals, such as the principle of self-determination of nations. From that stems the idea of a policy of liberation for any country which may be ruled by a foreign power directly or indirectly, for any country where a minority imposes its power upon the majority by sheer force.

My third and final point is that the North Atlantic Treaty Organization and the Schuman plan, the Council of Europe, and similar bodies are to be the nuclei of a future federated Europe. NATO may very well serve as the core of a European Army which would be under a unified command similar to the one in Korea set up by the United Nations. Within that future army, regional federated units could maintain their separate identities in the form of regional corps. Thus NATO, after fulfilling its initial task of defending western Europe, progressing toward becoming a striking force behind the diplomatic moves of the West, could put the

crown on its activities by becoming the nucleus of a unified European Army. I realize that I may be accused of dreaming. I am convinced, however, that with a little imagination and a lot of courage, this dream may yet come true.

It is my firm belief that we can still avoid another war if a forceful global policy is adopted by this country together with its European and Far Eastern allies. Such a policy must be based on principles and not on expediency. It may mean a temporary strain on our

nerves, but it will pay its dividends in the long run. The North Atlantic Treaty Organization was in itself a bold move, a move opposed by many, criticized by many. It was put through, and as a result, together with the Marshall plan, it stopped the Communist march on Europe. It is high time that we proceed further in trying to frustrate Soviet plans for world conquest. We can do this by bringing the lands lost to democracy as a result of World War II back to the family of free nations.

Zygmunt Nagorski, Jr., LL.D., New York City, is a writer and journalist. He is editor in chief of Foreign News Service, and is a permanent representative of the International Federation of Free Journalists to the United Nations. During World War II he was chief of the Lecture Division of the Polish Ministry of Information in London, and he has served as editor of the Polish Press Agency in Edinburgh. He contributes to American and European newspapers, and was a war correspondent in Germany.

Which Way to Liberation?

By JAMES P. WARBURG

IN April 1948 I delivered an address entitled "Halt! About Face!"

Then, as now, we had come to the end of one phase of postwar foreign policy and the beginning of another. We had come to the end of that rather brief period during which we had cherished the hope of achieving peace through friendly co-operation with the Soviet Union. For about a year we had been wrestling with the unpleasant problem of learning to deal with an openly hostile Soviet dictatorship. The mood of the country was one of puzzled frustration and mounting anger.

My address was a warning against the policy of global military containment which had then recently sprung from the indomitable spirit of Winston Churchill, the geopolitical brain of George Kennan, and the petulant disillusionment of President Harry S. Truman. This policy had been adumbrated at Fulton, Missouri, in March 1946, somewhat vaguely enunciated by President Truman in March 1947, and sharply defined on March 17, 1948. It seemed to me a very foolish and very dangerous policy.

Now, five years later, we are again at a turning point. The containment policy has failed. We have had a political overturn. A new Republican administration has embarked upon a course of action which is supposedly based on the recognition of past error. Yet, as I view the beginnings of this new departure I am filled with forebodings as to the new "policy of liberation," very similar to those which prompted me to speak out in 1948 against the then new policy of containment. Indeed, so much does the new policy seem to me the child

of the old that I am tempted once more to use the title, "Halt! About Face!"

FALLACY OF CONTAINMENT POLICY

Five years ago I attempted to show that the containment policy originated from an oversimplified and only partially correct analysis of what the world crisis was about; from a sort of devil theory promulgated by President Truman—a theory which maintained that there would actually be no crisis in world affairs if only the Russians had behaved like Anglo-Saxon gentlemen. Without minimizing the effects of Soviet intransigence or excusing any part of Soviet behavior, I ventured to express the opinion that this beautifully simple explanation overlooked such basic phenomena of non-Soviet origin as the decline of west European power, the elimination of Germany and Japan as barriers to Soviet expansion, the polarization of power and the breakdown of the balance-of-power mechanism, the end of colonialism, and the existence of a world-wide technological and social revolution. I pointed out that none of these basic factors in the world crisis had been created by the Kremlin, even though the Kremlin had without doubt ruthlessly exploited the resulting strains and tensions. It seemed to me correct to say that Russian behavior had sharpened the crisis and made a solution infinitely more difficult. However, to say that there would have been no crisis if the Union of Soviet Socialist Republics had not created it, seemed to me like cursing the chair against which one has stubbed a toe in the dark.

I endeavored to point out that the adoption of an easy devil theory to ex-

plain a highly complicated phenomenon would be extremely dangerous; that it would blind us to the existence of many aspects of the world problem and lead to the adoption of a purely negative policy. Not only would this devil theory cause us to see the enemy as so utterly evil that nothing less than his extirpation could ever bring about peace, but it would cause us to see ourselves as being so wholly right as to be unable to recognize our own mistakes. To illustrate this point, I called attention to President Truman's statement of March 17, 1948, in which he had told Congress that the agreements we had made—meaning the Yalta and Potsdam Agreements—"could have furnished the basis for a just peace, if they had been kept," but that they had been ignored and violated by Russia. I expressed the opinion, which I have certainly had no reason to change since then, that the Yalta and Potsdam Agreements could not possibly have furnished the basis for a just peace, even if they had been carried out to the letter; and that not to recognize the mistakes made in these agreements would be the most dangerous kind of self-deception.

CONTAINMENT VERSUS MARSHALL PLAN

At the time of this earlier discussion, we actually had two foreign policies: we had the purely negative, stop-Russia, or stop-Communism, policy of containment; but we also had the Marshall plan, which was, in its author's own words, "not directed against any country or doctrine, but against hunger, poverty, desperation and chaos." I ventured to suggest that we could not for long expect to ride two horses galloping off in opposite directions. I argued in favor of broadening and strengthening the Marshall plan approach to the world crisis, and against the policy of military containment.

Admitting that the creation of military strength as a deterrent to Soviet aggression was imperative, I contended that rearmament, while necessary, did not in itself constitute a foreign policy; and that if rearmament were to be combined with a policy of global military containment, it would not only fail to provide a deterrent but would result in a costly and extremely dangerous arms race.

ARGUMENTS AGAINST CONTAINMENT POLICY

Five arguments were adduced against the containment policy:

1. It would fail, because it was physically impossible to muster the force to stand effective guard at every point along the vast Soviet periphery.
2. It would fail, because a threat of primarily political nature could not be contained by military means.
3. It was unwise, because a negative policy, by definition, would surrender the initiative to the enemy.
4. It was self-defeating, because the negative effort would pre-empt the resources and energies which we might otherwise devote to the achievement of creative purposes of our own.
5. It was dangerous, because it would lead to unhealthy alliances and provocative expedients based solely on military considerations.

In calling for a halt and an about-face, I ventured to suggest, as I have many times since then, that the way to stop Soviet-Communist expansion was not to pursue this aim as an end in itself, but to achieve it as the automatic by-product of an affirmative, creative policy of our own. The way to stop the U.S.S.R., I said, was to stop letting the U.S.S.R. make our foreign policy.

To a very large extent, this is what President Eisenhower and Secretary Dulles have been saying in recent months. Our new leadership has em-

phasized again and again that the policy of containment has failed, chiefly because it was negative; that the wartime agreements did not, as President Truman claimed, lay the foundations for a just peace; that a new approach is called for and that we shall henceforth pursue an affirmative policy.

Why, then, do I view the present prospect with such alarm?

Partly because the recognition of past error has come so late, and partly because, as I see it, only a very small part of past error has been recognized.

RESULTS OF CONTAINMENT

Five years of containment have left us considerably worse off than we were when the experiment started. The only positive success we have to show for our efforts is the saving of western Europe from collapse and probable subversion. This was accomplished not by the containment policy, but by the Marshall plan; and even this limited success has since been undermined by converting the Marshall plan into a rearmament effort for the sake of military containment.

Since 1948 our military expenditures have risen from ten billion to almost fifty billion dollars a year, while our creative economic aid to other countries has been reduced to a mere trickle.

We have sacrificed on the altar of military strength not only our material resources but the moral integrity of our cause. For the sake of military expediency we have made an alliance with fascist Portugal, we have frantically sought an alliance with fascist Spain, and we have proposed the rearming of Germany and Japan.

And what does this policy of military containment show in the way of results? Let us look around the world.

China has been engulfed in the Soviet orbit. Not only that, but we are at

war with China, a nation of 450,000,000 inhabitants. I am not one who thinks that we could have saved China, even if we had pursued a wiser policy, nor one who doubts that aggression had to be met in Korea. But I doubt very much whether it was wise or necessary to drive Mao Tse-tung into the arms of Stalin or to invite Chinese intervention in Korea by marching up to the Yalu River.

In Malaya and Indochina our European friends are hanging on by their toenails to their last footholds of colonial empire. Indian allegiance has not been won. We have no firm allies on the whole Asian Continent except Syngman Rhee and Chiang Kai-shek.

In the whole Near East, the tiny state of Israel is our one firm ally. Africa is seething with revolt.

Our own so-called hemisphere solidarity is an illusion.

THE EUROPEAN SITUATION

Ah, you may say, but look at Europe! Look at the great and growing North Atlantic Treaty Organization! I assure you, I have been looking at it—looking at it very hard for the past three years—and what I see is this:

The arc from Norway down to Turkey is the one part of the world where we have really tried, at great effort and sacrifice, to build a containing wall against Soviet aggression. Norway and Denmark, each with tiny defense establishments, are signed up as allies in the event of war. They want help if they are attacked, but they are not willing in time of peace to permit other than their own air or naval forces to use their bases. Britain, our one really firm ally in western Europe, has welcomed American air groups and is doing what it can to help us bolster the defense of the Continent.

In the south, a fairly strong though

small Italian army guards the Italian plain. Farther east, Greece and Turkey have been helped to build up defense forces of considerable strength, and we may before long solidify the Mediterranean line by reaching an agreement with a sturdily armed Yugoslavia. Beyond Turkey to the east, it is better not to look.

But what about the center of this defensive arc? What about the military forces which are to hold a Russian invader from erupting across the plains of Germany and over the Rhine to the English Channel? Here we see a thing called the European Defense Community, which is supposed to create a European Army, consisting of French, Dutch, Belgian, Luxembourgian, Italian, and German contingents. Since the Italian forces will be required in Italy and the contingents of the Low Countries are negligible, this European Army will, to all intents and purposes, be a Franco-German army, bolstered by American, British, and Canadian forces operating independently but under the same NATO command. The British will help to defend western Europe, but want no part of the Defense Community. Neither do the Norwegians or the Danes. That leaves France and Germany more or less alone together, and neither of them likes it. The French do not like it because they fear that, with Britain absent, even a truncated West Germany will dominate the European Army. The Germans do not like it because the whole plan rests upon the continued partition of Germany, and because Germany's contribution is held down to a level below that of France. Since France can at most contribute some fourteen divisions, as long as her strength is drained off into Indochina, Germany's contingent will be limited to twelve divisions. Even with six American and four British divisions to help

out, the Germans know that this plan will not produce an army capable of more than a delaying action fought across their country to the Rhine. What happens after the Russians reach the Rhine is of little interest to the Germans.

It is now two and a half years since we demanded that the West Germans be rearmed and permitted to contribute to the containment policy. The Germans are still haggling over the terms of their participation. The French are still more afraid of a rearmed and resurgent Germany than they are of the U.S.S.R. In spite of all the effort and sacrifice, there is in existence nothing like a force capable of holding off a Russian invasion. That was the stated opinion of General Alphonse Pierre Juin, the NATO ground commander, only a short time ago.

The containment policy has failed—and was bound to fail—because its fulfillment lay beyond our power. It has failed—and was bound to fail—because it sought to contain a windstorm with bayonets. It failed to muster even the bayonets, because it never became a coalition policy. It could not become a coalition policy because it offered no affirmative attraction. Hence, containment has remained essentially an American policy, rejected altogether by Asia and the Arab world, and accepted with halfhearted reluctance by a Europe dependent upon American aid. Finally, containment failed because the whole military policy was never properly conceived by Washington as a deterrent. It began as a deterrent but was allowed to become more and more a policy of preparing to win a war tacitly assumed to be inevitable. These two things do not mix. When the attempt is made to mix them, the deterrent tends to become a provocation. Worse yet, the chances of victory in war are diminished

by premature commitment to a strategy of static defense.

DOUBTFUL BASIS OF NEW POLICY

What alarms me about the ostensibly new policy of the Eisenhower administration is this. To be sure, it substitutes "push back Russia" for "stop Russia," and in that sense it is affirmative rather than negative. But (I profoundly hope that I am wrong about this) the new policy appears to rest on the same oversimplified analysis of the world crisis as that promulgated by President Truman, and to rely on the same predominantly military means for a solution. The new policy seems to ignore the probability that if stopping Russia by physical means lay beyond our power, pushing Russia back by these same means will prove an even more difficult undertaking. It seems to assume that, although we have been unable to unite a strong coalition by summoning it to arms in defense of freedom, we shall succeed in uniting that coalition by calling upon it to liberate the peoples which have fallen under Soviet tyranny.

What alarms me, in other words, is that the new policy is still nothing more than an anti-Soviet policy, offering no affirmative power of attraction, and merely substituting offensive for defensive tactics. If this is a correct appraisal, then the new policy merely multiplies the risk without adding to the probability of success.

There would be no useful purpose served by voicing these perhaps premature forebodings if the course upon which we now appear to be embarking were the only course open to us. I am convinced that such is not the case—that there is still time to adopt a saner and more promising alternative. Moreover, I believe that the Eisenhower administration is flexible enough and, I

hope, wise enough never to become as stubbornly committed to any policy as its predecessor.

The problem, as I see it, is, first, one of redefining the ultimate aim of our global policy, and, second, of choosing the means by which to work toward its attainment. In redefining the aim of our policy, the Eisenhower administration has already moved in the right direction; but in choosing the means by which the new aim is to be accomplished, the administration is, in my judgment, courting disaster.

A CHANGE IN AIM

The new administration is entirely right in rejecting the policy of containment. It is right in declaring that our objective cannot be merely to prevent the further encroachment of totalitarian tyranny. In the long run, the world cannot be expected to exist half slave and half free.

As a matter of fact, this was recognized by the Truman administration. It would not be correct to say that Mr. Truman sought only to preserve the status quo as between the two power orbits. Mr. Truman, too, sought to alter that status, but by a procedure which, in my judgment, could not possibly have succeeded in altering it for the better. The officially proclaimed Truman policy was to hold the line and, while holding it, to build up "situations of strength" from which eventually to negotiate. The trouble was that Mr. Truman also took the flat position that negotiation with the Kremlin was impossible and that any agreement which the Kremlin might sign would not be worth the paper on which it was written. Thus, Mr. Truman inadvertently made it clear that his policy was aimed not at creating a position of strength from which to negotiate, but at creating a position of preponderant power from

which eventually to deliver an ultimatum.

It is obvious that this policy rested on an utterly absurd assumption, namely, that the Communist dictators, who were presumed to understand no language other than that of force, would quietly wait while we built up a sufficient quantity of force to enable us to lay down the terms of their unconditional surrender.

The policy of the Eisenhower administration appears to depart from this assumption. The Eisenhower policy seems to be to hold the line and, while holding it, to undertake certain operations designed to weaken the Communist dictatorships. This policy does not apparently envisage the eventual laying down of an ultimatum backed by preponderant force; it envisages the eventual retreat of a gradually weakened adversary.

Up to this point, it seems to me that the Eisenhower policy is a marked improvement over that of the Truman administration.

The crucial question, however, is: *By what means are the Communist dictatorships to be weakened and forced into eventual retreat?*

DUBIOUS METHODS

This is where I find the present prospects most disturbing. The Eisenhower administration apparently contemplates various methods of political, psychological, and economic warfare. It intends to seize the initiative by fostering discontent among the captive peoples, dissension within the ruling groups, and disaffection on the part of the satellite governments. On the basis of my own direct experience in this sort of subversive warfare against the Germans during World War II, I question whether these methods can be successfully employed by a democracy against a police

state, except perhaps in the last stages of an actual war of liberation. Secrecy and surprise are the essential elements in such operations. In a democracy such as ours there is no such thing as secrecy, except in time of war. Without secret planning and secretly conducted operations, it is hard to see how any appreciable damage can be inflicted upon a police state.

Moreover, this type of subversive activity requires the most thoroughgoing system of espionage behind the enemy lines; for unless the effort to subvert is based upon accurate and detailed knowledge of existing causes of dissatisfaction, it cannot possibly succeed. Wholesale espionage involves an ever increasing risk of full-scale war.

And that is not all. Assuming that espionage and secret intelligence supply the necessary target information, how is this information to be utilized? The mere broadcasting of overt and covert propaganda is certainly not enough. Leaflets and clandestine newspapers must be printed and either be dropped from the air or smuggled into enemy territory by secret agents. This means inevitably that a certain number of planes will be shot down, crews captured, and secret agents apprehended. How much of this can be expected to happen without provoking war? Imagine the state of mind in this country if Soviet planes or pilotless carriers were to begin dropping leaflets at night on a few of our major cities! Would the panic in Moscow be any less?

With all due respect, it seems to me that this whole notion of cloak-and-dagger subversion is nothing more than a romantic outlet for impatience and frustration. This is emphatically not the way to conduct a policy of liberation. It is the way to increase tensions, to frighten our allies, and to tickle the tiger with a straw.

We are engaged in a grim and deadly serious business. This is no time for a glorified game of cops and robbers.

ATTRACT WIDE SUPPORT

What is the alternative? What are the means which might usefully be employed to achieve the affirmative aim of liberation?

Let me begin by stating a point of departure which may in itself be debatable. I start from the assumption that the United States alone, no matter how great and powerful it may be, cannot either stop Russia or break up the Soviet empire, except perhaps through the dubious adventure of atomic war. It follows that the United States must so set and define its aim as to attract the allegiance and the willing co-operation not only of its allies but of at least some of the uncommitted peoples of Asia, Africa, the Near East, and Latin America. The same consideration must govern the choice of means by which the aim is to be pursued.

In thus recognizing the need for shaping our policy so that it will command widespread support, I do not mean to imply that we should attempt to develop a policy concerning which we shall then expect all the world's people to take an unequivocal stand, for or against. If anything, I mean just the opposite. I mean that we should endeavor to develop a policy within which there is room for wide diversity of opinion, for this is the only kind of policy which will express and articulate the essence of that free world which we wish to preserve and expand. The attitude that "if you are not with us, you are against us" is antithetical to the free society; it is the attitude characteristic of the totalitarian society which we intend to fight and ultimately to destroy.

OUR AIM SHOULD BE—

Looking at the problem from the point of view of developing not a new United States policy but a new coalition policy, I come to this conclusion:

Our aim should *not* be to bring about through direct action the overthrow or the breakup of the Soviet empire. This would again be a negative purpose, even though expressed in terms of affirmative action.

Our aim should be create those conditions in which the breakup and eventual overthrow of the Soviet empire will come about as the result of the inability of tyranny to survive in the same world with societies which are truly permeated by justice and in which all men are truly free. Our aim, in other words, should be to bring about the end of totalitarian tyranny, not by direct intervention in the affairs of the dark world behind the Iron Curtain, but by creating conditions of justice and satisfaction *on our side of the Iron Curtain* with which Communist tyranny will find itself unable to compete.

The Achilles' heel of the Stalinist dictatorship lies in its doctrine. As long as the rulers in the Kremlin can successfully propagate the belief that man's long pilgrimage toward freedom has reached a dead end—that our form of society is on its way out—they will be able to assert with some degree of persuasiveness that Communism is the "wave of the future." The way to turn the tables on the Communist offensive is to turn the tables on this doctrine—to assert and to prove that it is tyranny that cannot survive in competition with freedom.

Our aim, then, should be the liberation of that part of mankind which dwells on our side of the Iron Curtain. Our aim should be to develop a policy which will, first of all, make what we

call the free world truly free—free from hunger, from grinding poverty, from disease, from ignorance, and from oppression. The implications of such a policy, as far as the United States is concerned, are many and far-reaching. We shall have to learn to think not just as Americans, but as members of the human race—as peculiarly and uniquely fortunate members of the human race, endowed with an enormous potential for creative action. We shall have to learn to think not in terms of charity or in terms of enlightened self-defense, but in terms of pioneers opening up new horizons, clearing new fields of progress and conquering the desert areas. We shall have to shake off the corroding fear of losing what we possess, and recapture the spirit of adventure, along with the affinity for all men everywhere seeking change for the better, which once made our nation a symbol of hope throughout the world.

This is the sort of leadership which will unite a coalition of the free. This is the sort of leadership which will attract the suffering masses of mankind who wish to be free. This is the sort of action which, though taken entirely on our side of the Iron Curtain, will undermine tyranny in the farthest and darkest recesses of the totalitarian orbit. Once we of the "free world" buckle down to the task of our own liberation, the conviction will travel around the world that the future belongs not to the tyrant or to the slave society, but to the free.

That is the first element in the alternative policy which I should like to submit for your consideration.

USE OF DIPLOMACY

The second element would be a sustained diplomatic effort to force a contraction of the Soviet orbit of power, to break away the satellites, and to lay the foundations for universal disarmament.

When I say "to break away the satellites," I do not mean by any form of overt or covert intervention behind the Iron Curtain. I mean to use the art of diplomacy to discover, expose, and exploit the cleavages of interest which exist as between the exploitative power center at Moscow and the subservient dictatorships.

Red China furnishes the best and also the most important example. The Peiping regime is not, strictly speaking, a satellite of Moscow. For the time being, it is a firm ally of the Soviet regime, but with an independent power potential at least as great as that of the Soviet Union. Chinese and Russian interests are by no means identical. What binds the two regimes together at the present time is chiefly a common hostility to the United States and to the colonial powers of western Europe, and a common fear of the re-emergence of Japan as a military power in the Far East. If, in a new Dulles-Eisenhower "policy of liberation," we declare our aim to be the overthrow of the Mao regime, we shall in all probability cement the Sino-Soviet alliance for the foreseeable future. If, on the other hand, we direct our policy toward peace in Korea and a political settlement which recognizes the Peiping government, even though it be openly hostile for the time being, we shall open the way for a diplomatic effort, not necessarily to win China as an ally, but to break it loose from its alliance with Moscow.

The premature rearming of Japan and the reliance upon a rearmed Japan as a defense bastion of the anti-Soviet coalition would constitute a mistake very similar to that which we have committed with respect to Germany. On the other hand, once direct relations were established with China, the threat of rearming Japan might create a bargaining po-

sition closely analogous to that which we have created and failed to exploit vis-à-vis the U.S.S.R. in our search for a European settlement.

EXAMPLE OF GERMANY

This brings me to the other and perhaps even more important aspect of the diplomatic task, namely, the effort to force a gradual contraction of the Soviet orbit. Let me illustrate this by taking Germany as an example. The dispute over Germany is the key log in the political log jam which prevents a European peace settlement. Because of a long series of tragic errors, the German nation is partitioned, with one-third locked in the Soviet orbit and two-thirds precariously attached to the western defense community. If an agreement could be reached by which the two Germanys could be reunited on terms guaranteeing that the new Germany would become neither a pawn nor a partner in an East-West power struggle, then 18,000,000 Germans would be liberated from Soviet slavery. With East Germany liberated and a satisfactory All-German settlement reached, the prospects for an Austrian peace treaty would be vastly improved. Were an Austrian peace treaty concluded, the Russians would no longer have an excuse to maintain line-of-communication troops in Hungary and Rumania.

Although an All-German settlement would mean the beginning of a retreat of the Russian army from central Europe, the Russians have several times indicated that they would rather make such a settlement than see a rearmed West Germany enter the NATO alliance. Our European friends have wanted very much to explore the possibilities of negotiating such a settlement. In fact, our friends have said very frankly that they do not wish to ratify the NATO treaties with Germany unless they are convinced that

no All-German settlement is possible. Most Germans feel the same way. We have, so far, stubbornly refused. We have insisted upon going ahead with the unpopular NATO plan without finding out whether or not there is an alternative. We have done this because we have lost sight of the woods for the trees—because we have let our plan for defense in the event of war become more important than taking the first great step toward reaching a European peace settlement.

Last December, before the Eisenhower administration took office, I ventured to submit to it a concrete plan for an All-German settlement.¹ Had the western powers made such a proposal, and had the Russians accepted it, we should now be on our way toward liberating a substantial and important part of central Europe. Had we made a proposal which seemed just and desirable to the peoples of Europe, and had Russia rejected it, Russian influence in Europe would have suffered a serious diminution. Stalin's death and recent developments in Soviet policy indicate a renewed opportunity to put matters to the test both in Germany and in the Far East.

Clearly, the time has come to seize the initiative and put forward a continuous series of diplomatic proposals for the settlement of specific disputes, which, if accepted, will result in the contraction of the Soviet orbit, or, if rejected, in a diminution of Soviet influence.

MILITARY POWER

Finally, let me say a word as to the maintenance of military power. Since the two elements of policy just discussed will keep the Kremlin under increasing pressure, it is necessary to see to it that military adventure remains

¹ *France, Germany & NATO*, New York: Current Affairs Press, 1953.

unattractive as an escape. This means continuing the policy of building deterrent military power, but it should mean as well a re-examination of just what kind of military power really constitutes a deterrent. The point may best be illustrated by taking certain aspects of NATO as an example.

The fact that Turkey is now well armed and apparently quite ready to defend her mountainous frontier is a deterrent, much as the Russians may wish to lay hands on the Dardanelles. But this is only a local deterrent, which would not necessarily prevent the Soviet Union from attacking elsewhere, let us say in Iran. It is manifestly impossible to create a series of local deterrents all the way around the vast Soviet frontier. Yet that, in a way, is precisely what we have been trying to do. We have been trying to do this because we have been thinking less in terms of preventing war than in terms of what we desire at all costs to hold onto if war comes. Thus, we wish to hold the Ruhr; that means that we must fight in central Germany. But if central Germany is to be defended, why should not the Germans help to defend it? so we arm the Germans. But is this creating a deterrent? Or is it creating both a provocation to war and a commitment to fight the war, if it comes, according to a preannounced, defensive strategy?

My point is this: the stronger the anti-Soviet coalition and the less committed its military power to any theater of action or to any defensive strategy, the more unpredictable and the more hazardous will be the outcome of any Soviet military adventure. If the Russians see our forces stretched out in a thin line all over the surface of the globe, they cannot help visualizing any number of possibilities of initial victory; if they are deterred at all, it will not be by fear of initial repulse but by fear of

ultimate defeat in spite of initial victories. If, on the other hand, the coalition forces are uncommitted and so disposed that, in the event of war, they could strike offensively in a number of unpredictable directions, the Kremlin may be expected to hesitate to commit its own forces to an attack upon even the most invitingly undefended frontier. Our only effective answer to the Soviet Union's vast military power operating on interior lines of communication is mobility and surprise. We sacrifice both, whenever we commit ourselves to positions of more or less static defense.

SUMMARY OF ALTERNATIVE

To summarize the four-point alternative which I submit for your consideration and criticism:

1. Seize the political offensive, *not* by any attempted intervention behind the Iron Curtain, but by creating on our side of the Iron Curtain conditions of justice and satisfaction in the face of which totalitarian tyranny will eventually be unable to survive.

2. Pursue a course of making a continuous series of diplomatic proposals for the settlement of specific disputes, which, if accepted, will result in the gradual contraction of the Soviet orbit, or, if rejected, will tend to isolate the Soviet regime, diminish its prestige, and alienate its satellites.

3. Apply this same technique to the making of a continuous series of proposals for the limitation and control of national armaments and for the strengthening of the United Nations to the point where it shall become capable of enforcing disarmament and the peaceable settlement of all disputes.

4. Pending the adoption of effective and enforceable control of national armaments, create and maintain sufficient military power, *uncommitted to any preannounced strategy of defense*, to make Soviet military adventure un-

attractive. Such a military policy would promise no nation immunity from invasion in the event of war. It would promise all nations the maximum assurance that there would be no war.

This program will not satisfy those who demand quick and spectacular solu-

tions. It is not a dramatic program. It is a prescription for long, hard, unremitting, backbreaking labor. And that, as I see it, is precisely the price we shall have to pay for survival and for the ultimate achievement of lasting peace.

James P. Warburg, New York City, is an economist and author on international affairs. He was formerly a banker, and was financial adviser to the United States Delegation to the World Economic Conference in 1933. He was Deputy Director of the Overseas Branch of the Office of War Information during World War II. He has written numerous books, among the latest of which are Last Call for Common Sense (1949); Faith, Purpose and Power (1950); Victory Without War (1951); and How to Co-exist (1952).

The Liberation Policy and International Order

By CHARLES J. KERSTEN

THE classic counsel of Lenin bequeathed to the leaders of the Soviet state which he founded, to use every stratagem, deceit, and subterfuge to accomplish its purpose of world subversion, was never more heeded and acted upon by the leaders of the Soviet Union than at the present time. If the free world should be so naïve as to be deceived by the current "peace offensive" of the Soviet Union after the experiences of recent years, it would indeed be amazing.

AGGRESSION IN THE NAME OF PEACE

The Communist *Daily Worker* has been headlining this peace offensive as the great and ever present purpose of the Communists to bring their kind of peace to the world. The *Daily Worker*, like other Communist publications throughout the world, is expressing its fears that the free world will not accept the great and peaceful purposes of the Kremlin.

Every Communist aggression since the end of World War II has been perpetrated in the name of "peace," and the victims of the Reds in these aggressions have always been declared to be "the enemies of the peace."

The Stockholm Peace Petition was engineered to prevent the strengthening of western Europe against Communism.

The appeal of the Soviet Union's Malik for truce talks for a peace in Korea had, as is now very clear, the sole purpose of lulling the United Nations into complacency and giving the Reds in Korea a chance to build up their badly battered forces.

The ominous directive given by Stalin last August in Moscow to the People's Democracies of eastern Europe and of

Asia to be the shock brigades to prepare for the liberation of the nations enslaved by the capitalist world was a directive given under the avowed purpose of a "fight for the peace."

Under the slogan "For a People's Peace and Democracy," G. M. Malenkov said at Warsaw in September of 1947 when he founded the Cominform, "The foreign policy of the Soviet Union and of the 'democratic countries' is directed to the undermining of imperialism." The purpose of the Cominform is to carry on the world-wide conspiracy of Communist aggression from the base of an enslaved eastern Europe.

In the Communist dictionary the word "peace" means only one kind of peace, that is, a Communist peace, which in the inner circles of the Communist hierarchy means that there will be real peace only when Communism extends throughout the earth, and all peoples have been liberated from the imperialist slavery of capitalist society, and the proletariat of the world are living in happy people's democracies.

"The dictatorship of the proletariat," says Lenin, "is a persistent struggle, bloody and bloodless, violent and peaceful, military and economic, educational and administrative, against the forces and traditions of the old society."¹

The current peace offensive is a part of the persistent struggle prescribed by Lenin. The sudden Soviet shift to words of peace from words of violence, from scorn to applause by Vyshinsky in the United Nations, the new good manners in Berlin, and the Communist talk of Korean peace are all part of a major stratagem with a very important objec-

¹ *Lenin's Selected Works*, Vol. 10, p. 84.

tive for the Communists. What is that important objective?

The obvious objective of the current Communist peace offensive is to cause the free world to want to enter into a bargain whereby the Communists will be given a breathing space and opportunity to consolidate and digest their conquests in eastern Europe and in China. The great need of the Communists at this time is to be undisturbed and to have a free hand in those areas. For if they should have a major setback in eastern Europe or in China, a setback that might start the process of ultimate liberation of the captive peoples from the police state, it would seriously endanger their plans for world conquest. It might even commence a chain of events that could end in the downfall of the Communist terror in the Soviet Union itself.

On the other hand, the Communists can afford to make almost any concession or bargain that leaves them free to forge the enslaved millions of eastern Europe and Asia into a weapon for further world aggression.

POSSIBLE DANGERS FOR COMMUNISTS

While we must not be too optimistic, because of the iron hold of the Communists upon their domain, recent events do indicate the awakening of long dormant dangers for the Communists behind the Iron Curtain. The fall of Ana Pauker in Rumania, the trials of Slánský and Clementis and the suspicious circumstances of the death of Gottwald in Czechoslovakia, the stepped-up persecution of Christianity and Judaism, Malenkov's speech in Moscow last fall lashing at the dissident elements in the Soviet Union—all of these and other events adumbrate what might be the beginning of serious internal dangers for the Communist leaders in the Soviet world.

The words of President Eisenhower

in his State of the Union Message to Congress that we would never acquiesce in the enslavement of any peoples, and the President's order withdrawing the 7th fleet that had been protecting the Chinese Reds from attack from Formosa, have also had their effect. The words of President Eisenhower pointed up the basic weakness of Communist power: the gigantic potential of unrest and resistance among the Kremlin's 800 million slaves.

The passage by Congress in 1951 of the so-called Kersten Amendment to the Mutual Security Act, which provides, among other things, for the setting up of national military units from escapees from the captive nations, such units to be attached to the North Atlantic Treaty Organization, has caused the Communist leaders certain hysterical anguish because of the potential of such units for becoming magnets of defection from the Communist armed forces. Twice the Reds have leveled charges in the United Nations against the United States on the basis of this amendment, claiming that it was an "interference in the internal affairs of the People's Democracies," not bothering to advert to the fact that the Communists themselves had grossly interfered with and committed aggression upon the internal affairs of these very nations.

The magnitude and intensity of the current Communist peace offensive are in direct proportion to the Communist need to be let alone in eastern Europe and on the Chinese mainland. It is vital to the interests of the Communists to stop, in these areas, the beginnings of any movement toward freedom; for the members of the Politburo realize far more keenly than we, that they are sitting on a volcano.

The sincerity of the Communist peace offensive might easily be tested by the reaction of the Communists to the free world's insistence that they stand by

their obligation under the Atlantic Charter and the postwar agreements, to all of which they are signatories, and withdraw their armed forces *and agents* from eastern Europe and from China and permit the conduct in those areas of free elections under U.N. supervision. But the Communists cannot relinquish their hold upon these criminally conquered nations; to do so would mean the fall of Communist power. And retaining these countries means that the Communists are still on the road to world conquest.

COMMUNIST METHODS

I am not an expert on foreign policy. Therefore I am not speaking as an authority, but as a witness—a witness to a crisis which, through its dimensions, complexity, and novelty, challenges even the most eminent students of foreign affairs.

I came in close touch with international problems along an unusual road, apparently divergent and unrelated, which for this very reason is significant. As a member of Congress I worked for a certain period on an investigation of the infiltration of Communists in labor unions. I was chairman of the subcommittee which examined, among others, the activities of the United Electrical, Radio and Machine Workers of America. The subcommittee established that the real bosses of the U.E. were two Communists—James Matles, chief organizer, and Julius Emspak, secretary-treasurer—who succeeded in filling a majority of the U.E.'s official positions with Stalinist party-liners.

The role of these U.E. officials was twofold: to implement Moscow's policies and propaganda through strikes, slowdowns, and every other kind of sabotage, and to use their positions to further the policies of the Soviet Union, for which they had admirable opportunities. There is by now not the slightest doubt that certain officers of the union had op-

portunities to furnish the Soviet Union with blueprints of secret work done in the plants where their authority reached under cover of union activities.

During the war Major George Racey Jordan was stationed at a Montana air base where Soviet officials frequently stopped between Washington and Moscow. He declared the Russians took with them hundreds of suitcases filled with documents, and accidentally by a spot check he discovered one containing a complete set of blueprints of two important United States plants for secret weapons.

Thus the subcommittee's work opened to me a wide perspective of the real nature of the problem which assails us under so many guises. It familiarized me with both Communist doctrine and Communist tactics. I saw Communism in action, and following its ideological and political threads I was brought to the realization of one of the most characteristic features of our epoch, namely, the inexorable interdependence of national and international order. The Communists were penetrating our labor unions not only as members of a political party but as agents of a foreign power. Consequently I was compelled to be aware of and to analyze the activities of a foreign state and its camouflaged organizations, without entering officially the realm of classic international relations.

Thus I was approaching the problem not focusing my attention as it were toward the exterior but, on the contrary, toward the interior. And, as is well known, the essence of the international crisis, that is to say the Communist menace, is to be found in various fields of our national life.

CHANGE IN POLITICAL IDEAS

A radical change has obviously occurred in the conditions under which the community of nations is evolving,

a change which requires a new vision and new methods of dealing with the problem which confronts us. What has happened to bring about this change?

Between the Congress of Vienna in 1815 and the First World War in 1914, the world knew a period of relative calm and normalcy. This was due in a measure to a certain homogeneity of political ideas. The respect for treaties—the principle of *pacta sunt servanda*—still had some prestige, and under the circumstances the technique of the balance of power contributed to prevention of major catastrophes. The concept of war had generally acknowledged limits. War was waged for limited objectives; the idea of total war was as yet unpracticed. Frontiers still had a strong political significance. Conflicts were aimed at obtaining from the enemy specific material advantages, and not at his absolute political, social, and national destruction. The frontiers, mutilated or not, remained as guardians of inviolable state entities.

At that moment we had to deal generally with what Guglielmo Ferrero called "war of conflict"; that is to say, a dispute on certain precise claims, which was settled in the actual framework of those claims. In our time, on the contrary, we are faced with what the same author called "war of aggression," by which is understood the will to achieve total destruction and subjugation of the adversary.

With the advent of totalitarian concepts and techniques, the whole picture has consequently changed, and all the paraphernalia of international relations—peace, war, frontiers, balance of power, treaties, and others—are accordingly metamorphosed.

Is the frontier of France really on the Rhine, and is our frontier at the limit of the territorial waters of our eastern seaboard? Are we fighting our enemies on these old lines of political boundaries,

or are we forced by the nature of the new attack of our adversaries to struggle on new frontiers less clearly delineated and stable? Is not the new frontier which is imposed on us by our enemy a movable one, a frontier which can be today in the Berlin cold war and tomorrow in the Pacific coast strikes, a frontier against aggression in Korea or a frontier against subversion in our own institutions?

Of course, our intellectual formation and habits of mind render us rather reluctant to establish a clear connection between such apparently disparate facts; but the deeper we penetrate into the subject, the more inescapable this connection appears. There is rigorous co-ordination of the various moves of Communist agents all over the world. This reality was forced upon many of us again and again throughout our experiences during these years and during the further research which we thereupon determined to undertake.

CORRELATION OF LIBERATION AND INTERNATIONAL ORDER

"Liberation and international order" must, I think, strike a strange note in many solid and well-intentioned minds. What does international order—this respectable notion—have to do with such a poor relation as "liberation," which has, besides, the ill-omened connotation of a risky and provocative venture? Is not international order a global, world-embracing concept, whereas liberation is limited to a comparatively insignificant geographical area? Why should we care about such remote lands as the captive nations and their seemingly irrelevant problems?

We must—so they say—be "realists," discarding every "legalistic" and "ethical" prejudice, if we want to achieve peace and security for ourselves. We do not need liberation in order to have international order and peace, which

are, according to adepts in *Realpolitik*, the product of the "balance of power." On the other hand, they say, liberation means war; so why should we even for a moment seriously contemplate such a risk?

I acknowledge that my task is not an easy one in an atmosphere still charged with the "containment" superstitions and the Soviet smoke screens of "co-existence," "peace," and "liberation means war" slogans. But let us nevertheless proceed with a dispassionate analysis of the terms of my thesis: "Liberation and international order." I contend that liberation is an indispensable element of international order.

Now, what is the meaning of these two concepts?

INTERNATIONAL ORDER VERSUS TOTALITARIANISM

International order is a situation in which the states are agreed and bound to regulate their relationships under the law in a way similar to that in which the citizens of a civilized nation are subjected to a system of legal norms. This means that the states recognize as binding the basic concepts of international law. I do not mean to cover by this definition the whole substance of the concept. In addition to this juridical aspect, the international order presupposes a political and economic foundation. Experience has shown us that no international order is possible between democracies and totalitarianism, or between free economies and economic dictatorship. A despotism or a tyranny is not willing to abide by the law of nations. A collectivist economy cannot offer the co-operation necessary to an international integration.

These corollaries of the juridical concept of an international order are quite obvious. Indeed, the establishment of such an order requires a certain diminu-

tion of state power; whereas the totalitarian system means an increase, approaching the absolute, in the power of the state. Similarly, whereas a free economy promotes economic co-operation between nations, collectivism and its autocratic developments constitute an obstacle to international collaboration, and finally a disruptive factor.

In fact, the Soviet totalitarian state raises to their maximum potentiality the very causes of war: the will to dominate and conquer, militarism, chauvinism and xenophobia, a necessity for diverting the attention of the masses from the internal shortcomings to external imaginary menaces, and so forth. Besides, it is by now common knowledge that there cannot be real peace between the democratic world and the totalitarian regimes, in spite of Munichs, Yaltas, or Potsdams. The totalitarian systems cannot, indeed, sustain themselves out of the fruits of peace. As a matter of fact, they live in a state of permanent siege; and for the enslaved masses, war does not appear as a scourge, but in a certain measure as a deliverance.

* It is equally common knowledge that these collectivist despotisms do not accept the procedure of arbitration, neither do they submit to the authority of an international court, and even less are they willing to abide by international law, whereby an orderly international community could be established. It is therefore, for me, sufficiently clear that international order and Communist totalitarianism are two contradictory concepts.

I suppose that in the strictest sense there could be no disagreement on this point. Nevertheless, at this juncture we are faced with a debate of the greatest importance, touching, as it does, the most vital problems for the future of our civilization. We must stop a moment and weigh the merits of that debate.

POLITICAL "REALISM"

The main contention runs as follows: We are not concerned with the establishment of an ideal international order or any other such utopia; what we should work for, they say, is an arrangement which would ensure "peace in our time"—as Chamberlain declared in 1938. We must be "realists" and "pragmatical"; we must aim at a "compromise," a "modus vivendi," a "co-existence" with tyranny, and leave to the dreamers the illusory idea of a world based on justice, ethics, and law. We must abandon, so they say, the "legalistic" and "moralistic" criteria, because international politics are ruled by completely different elements: power politics, reasons of state, geopolitics—in short, everything that is covered by the concept of *Realpolitik*.

After all, as the London *Economist* put it a few months ago, Europe can very well live divided between slaves and free men; this holds good, of course, as long as England is not in the enslaved half. Were not we ourselves practicing a similar *Realpolitik* until a tall, angular dreamer called Abraham Lincoln put an end to it by raising his voice against slavery and proclaiming that the nation could not live half slave and half free?

We have, in consequence, to confine our efforts within the framework of this "realism", so strongly recommended by the career diplomats, the technicians of international conferences, and other serious and respectable officials. I am far from challenging the good faith of any of these apologists of the so-called realism, but I do challenge as to whether they are really realists. Let us scratch the surface of this mental attitude.

Is not the so-called political realism another face of Machiavellianism, that is to say a hand-to-mouth policy, a short-term patchwork, dealing in dubi-

ous secret pacts, unenforceable treaties, and unworkable international organizations? It is true that these awkward Machiavellians assure us that this is the only way to avoid major catastrophes. It seems to be all right with them to have minor catastrophes, such as the enslavement of eastern Europe, communization of China, the cold and lukewarm war in Europe, and the rather hot war in Korea and southeastern Asia. As long as we pay only in installments the price demanded by our foes, our "realist" experts are satisfied.

THE BALANCE OF POWER

Another big gun of the "realists" is the "balance of power" theory. The balance of power is presented as a universal panacea for all the troubles besetting the world.

It is true that the balance of power is a highly valuable technique in helping to deter or limit the consequences of aggression, but we must not transform this balance of power into a myth and expect it to achieve what we ourselves are not prepared to do. As an opponent of mine in a debate said, the intrinsic virtues and miraculous influence of the balance of power would automatically disintegrate the Communist empire, the fragments of which would fall into our laps like overripe fruit. It seems to me that this is a most unbalanced interpretation of the "balance of power."

The balance of power is not a recipe for stopping wars. Experts and diplomats have been rather busy with balancing, and yet wars have gone on uninterruptedly, maliciously ignoring their efforts. The "balance" is not a magic formula; it is but one of the means aimed at discouraging war. Balance of power of itself is not enough, as patriotism is not enough.

International order and peace can be achieved only through combined efforts, diplomatic, political, economic, moral,

and spiritual. Yet what is the actual physiognomy of the balance of power?

FREEDOM MISUSED TO DESTROY
FREEDOM

Soviet Communist power is built up not only on the accepted elements, such as military and industrial potential, but to a great extent on new and not easily recognized factors, such as Communist parties; subversion in labor unions, education, and other fields of national life; camouflaged organizations; and various other fifth columns.

This multiform Trojan horse is an immense power wielded within our own gates, and there is no hope of checking it by a merely defensive policy. These enemy barricades inside our own boundaries are raised through the exploitation of our institutions and national virtues. It is sufficient to note the ostentatious veneration and overzealous devotion for the Fifth Amendment of our Constitution in these last years, in order to realize what their technique is. Fighting against the principles of our Constitution and working for its destruction, they are using it to protect and immunize themselves.

This is not an unknown procedure. The collectivists tried to use it during the second half of the nineteenth century, and the famous French Catholic pamphleteer, Louis Veuillot, denounced them in the following acid tones: "When you believers in democracy are in power (say the collectivists) we demand liberty in the name of *your* principles; when we collectivists are in power we refuse you liberty in the name of our principles."

So liberty nurses at her breast these vipers, her mortal enemies. Our sacred Constitution, which was created to protect those who were faithful to the ideal of freedom, is now being used as a tool for the agents of tyranny.

How are we going to respond to this

insidious assault? In other words, how are we going to *balance* this new kind of power?

LIBERATION AS POLITICAL WARFARE

The problem of liberation has of course its sources in our moral conscience and our ideal of justice, but equally in the natural reaction of a sound organism to such an assault.

Why are the Soviets so disturbed and worried over this idea of liberation? Why do they take pains to engineer every six months or so in the United Nations a farcical attack on our so-called "interference" behind the Iron Curtain? Why are they so anxious to extract from us denials of the alleged interference?

As you may know, the subjugated peoples behind the Iron Curtain constitute a vast, uncertain factor of the Soviet empire. These enslaved people, who have been sacrificed through the force of circumstances, have not lost their faith or their hope. They are our *natural allies* in this new kind of warfare behind the frontiers. *Shall we scorn them because they expect from us help and encouragement in order to wage within the boundaries of tyranny the kind of fight tyranny is waging against us within our own boundaries?*

Thus we are brought inevitably into contact with the problem of liberation, by the mere analysis of the new conditions in which the balance of power is obliged to function. Indeed, a true balance of power in our time can no longer ignore the field of political warfare. We can understand why the Soviets, who until now have had an almost unchallenged monopoly on political warfare, are very anxious to preserve that monopoly and are doing everything possible in order to prevent us from entering this field of incalculable possibilities.

In a certain way we also are beginning to realize the importance of po-

litical warfare, as is demonstrated by the numerous boards and committees which are supposed to furnish us with psychological formulas. What these formulas are worth is another question.

APATHY TOWARD LIBERATION

Let us for the moment look more closely into the problem of liberation. What does liberation really mean?

Liberation means that the peoples who have been subjugated by Soviet aggression regain their freedom.

Theoretically there seems to be agreement on the desirability of liberation. Everybody wishes that Communist despotism would be crushed, but few will take a concrete step toward that end. One leaves the task to history, waiting for the nowadays much emphasized law of the self-disintegration of tyranny to accomplish the job for us.

Until recently, one cherished the idea that the death of Stalin would bring about this disintegration. I remember that Mr. Churchill entertained such a significant illusion, hoping that the disappearance of the Great Khan would bring about the dismemberment of the Empire.

I grant that in the epoch of the Great Khans such an expectancy was plausible; but today, with the Soviet totalitarian organization, the khan theory is more than problematical. As a matter of fact, now that the khan is dead, this historical analogy seems to have lost much of its charm. Now other theories are in vogue, much more daring and imaginative, as, for instance, the Titoist theory.

Before dissecting this new *deus ex machina* of our psychological warriors, I wish to add something further on the liberation concept.

For most people, liberation presents itself as a wish and not as a necessity; although I am sure that the majority of Americans, from the moral and legal

point of view, will be obliged to acknowledge the compelling necessity for liberation. Our origins and our traditions as a people are against slavery and inexorably tied to the idea of freedom. On the other hand, we have undertaken international obligations, both of a general and a specific nature, whereby we pledged ourselves to ensure the independence, the human rights and fundamental freedoms, of the nations now enslaved by our former ally, the Soviet Union. Morally and juridically we are consequently committed to a policy of liberation. But in reality, no serious action has been taken in regard to these obligations.

What can one do against a fait accompli? say the exponents of the defensive-passive school of thought. To attempt any constructive action in the direction of liberation would mean war, they contend.

DOES LIBERATION MEAN WAR?

This "liberation means war" slogan was launched by the *Daily Worker* and echoed shrilly by all its auxiliaries, from the Fifth Amendment fans to the containment-policy sages. There is no doubt whatsoever that Soviet propaganda has a major interest in implanting this bogey in our peace-loving minds. The Soviets would have us publicly deny any serious intention of contributing to the liberation of the enslaved. They badly need such denials in order to crush the hopes of the Iron Curtain victims and their die-hard faith in our moral and political standards. Conscious of the immense dangers for Communist domination, inherent in the liberation potentialities, the Soviets are making every effort to discredit and kill the idea in its budding stage.

They are doing this not because liberation means war, but because *it means a heavy blow dealt to the Soviet war potential.*

It is not difficult to understand that if we nourish the hope of liberation by liberation-inspired activities, helped by the free world, from the most conspicuous act of individual resistance to the underground organization of resistance groups, the Soviet Union will be a great deal weaker than if we renounce any liberation initiative and completely abandon the subjugated nations to her dominion.

Remember this: Liberation does not mean war, but a diminution of the Soviet war potential. If we realize this truth, we shall at the same time grasp one of the facets of the urgent necessity for such a policy.

Do not forget also that the wars and trouble spots which are plaguing us just now are the inevitable products of the appeasement and containment policy. Our present-day troubles and the menaces that hang over us stem from the so-called realistic bargaining and awkward Machiavellian experiments, rather than from any "legalistic," "moralistic," idealistic, or simply honest and courageous political behavior.

INCREASED ATTENTION TO LIBERATION

In view of all this, I think the idea of liberation is imposing itself on our attention more and more, whether we think in terms of long-range balance of power, or of the urgent necessity to weaken and obstruct the enemy's aggressive potential.

Now if we look at the ultimate objective of our foreign policy, which is peace and international order, we are bound to recognize that liberation is one of the most indispensable instruments in working toward its achievement. As already pointed out, lasting peace cannot be assured in a medium where Communist tyranny dominates one-third of the earth. The long-range policies of those who desire to establish peace in the

world are thus unavoidably bound to aim at the very things which the liberation policy would pursue in its development; namely, limitation, weakening, and final disintegration of the Communist dictatorship. There is no other road to international order.

It is therefore heartening that our present administration has shown a real interest in the idea of liberation. Study groups and prominent experts are engaged in investigating ways and means of implementing such a policy. We certainly hope for constructive planning from these studies. But it is a grave misfortune that nothing has been done through the past few critical years. The so-called Kersten Amendment to the Mutual Security Act of 1951, which has so far been the only concrete step in the implementation of a liberation political warfare, has been, since its enactment in 1951, for the most part a dead letter.

I understand that after a long period of inaction and defensive, passive strategy, it is not a little difficult to start being dynamic and positive; but there is a certain danger that the past proclivity for inaction may subsist in the minds of some under different guises, and that under a dynamic, offensive, verbal policy the same old passivity or an ersatz thereof may persist too long.

THE TITOIST THEORY

I am mentioning all this because there is a definite perfume of Titoism in the psychological warfare breezes. There is indeed an increasing amount of talk lately about the miraculous virtues of Titoism, which, if adroitly stimulated, would dismember the Soviet empire. It is said that some of our psychological warriors are looking hopefully in that direction. They are visualizing a world of greater and lesser Titos, who would be willing to accept our loans and visit the British Queen.

There is nothing wrong with this phantasmagory except the fact of its utter improbability.

I do not propose to discuss here at length the case of Titoism. I herewith wish to recall to you that the very special circumstances which produced the successful break of Tito from the Soviet orbit are almost unique and not likely to be repeated or artificially created. Knowing the Soviet grip on the Communist parties of the enslaved countries and the severe anti-Titoist measures taken since 1948, it is hard to find an objective reason for advocating such a sanguine formula. The reason seems to lie on quite another ground: it lies, I believe, in the pernicious reluctance to act positively in the field of political warfare. There persists a strange and comfortable feeling that things will arrange themselves. I grant it is a certainty that they will arrange themselves, but quite possibly very badly for us.

SENTIMENTAL AND SCIENTIFIC PROPOSALS

This tendency toward a do-nothing policy in this respect takes sometimes a rather sentimental turn. We do not want to do anything to engage the enslaved in a liberation drive, out of human sympathy for them—these sentimentalists assert. Indeed, it is said, liberation activities will only entail massacre and liquidation for the enslaved people themselves.

I cannot help stressing the hypocrisy of such unexpected concern for the welfare of those people. It would seem to me that people whom we abandoned eight years ago to Soviet terror, people who have been subjected to the most cruel persecutions, people thrown into the salt mines for their belief in and friendship for America, people crushed out of all human semblance in forced labor camps, people decimated by de-

portations and every other kind of genocide, the unfortunate masses harassed by police terror and exhausted by piecework labor exploitation and also those who being excluded from the so-called field of labor are condemned to slow but sure human degradation and starvation—it would seem to me, I say, that all these people do not deserve the insult of such a late, hollow, and smug interest on our part. This kind of false charity for those sacrificed brothers of ours leaves one with the impression that if they are further abandoned to the Communist executioners, their death through famine and prison will be more humane and therefore more bearable for our sensitivity than would be their death in the struggle for liberty.

The inaction ideal takes at other times a rather scientific turn. If we leave things as they are for a long enough period, for instance a mere fifty years—as one of the prominent inactivists suggested—situations will mature to our advantage and finally offer themselves to us as ripe fruit for the picking. This gratis-ripe-fruit policy is but another face of a childish desire to avoid the things we should do, but have them happen just the same—a heroism without risk and an efficiency without mental effort.

This is what Titoism and similar psychological concoctions amount to.

THE CORE OF THE MATTER

For me, a layman from Wisconsin, it is a subject of great and permanent wonder, how so many men of learning and responsibility expect to do something out of nothing, to have liberation without liberty and reaping without plowing. Because if we really want to follow a policy of liberation for our own benefit and for that of mankind, we cannot present ourselves to the enslaved peoples with empty hands. We must

give something of our own substance, and not only of the material but something of our hearts and souls as well.

Let us not forget for one moment that this is first and foremost a battle of the spirit against matter, a battle for freedom against tyranny, a battle for the dignity of human beings and for the sanctity of the soul of man. Such a battle cannot be won without understanding, without generosity, or without faith. We have in front of us the most decisive test of history, the weight of which destiny has placed on our shoulders. It depends on how we respond to the test, as to whether our civilization is going to advance the cause of humanity or leave a vacuum for a dark age of terror and despotism to enter in.

Arnold Toynbee tells us in his latest message that the course of history can be decided by the proper response to its periodical challenges. I believe that the challenge with which we are now faced is directed at the capacity of Christianity and freedom to respond to the needs and aspirations of a suffering humanity.

If we have the perspective and the courage to see things in this true light, then the problem of so-called foreign affairs will become rather a problem of human affairs. If we realize, as some have realized, that the fight is waged everywhere, on all fronts, behind and beyond frontiers, we are going to grasp the ultimate meaning of the present struggle and become conscious, each of us, of our call as free human beings. We shall have thus reached, underneath so many superstructures, the heart of the matter, the fight of man for his free existence as a spiritual being.

LET US STAND ON PRINCIPLE

We should be conscious of the tremendous forces latent in human beings reduced to physical slavery and moral oppression. I cannot conceive of a

more powerful force than that of cruelly humiliated human beings who strive against colossal odds to regain their lost dignity.

Do we want that force on our side? This is the problem.

If the answer is Yes, we must come in simplicity and honesty and say to them, We are together in this fight. We are going to help you when the time is opportune to put an end to Soviet Communist interference, to regain your national independence, your human rights and fundamental freedoms. Our Atlantic Charters, our United Nations Charters, and all the other international pledges we undertook for freedom and justice, were not mere empty words, but things in which we believe and on the principles of which we are determined to stand.

In this way we shall be able to reach the vast spiritual forces which can be of inestimable help in the creation of a new world of peace and international order. It is the greatest fallacy to believe that we can use those forces by our moral abdication, lack of courage, and clever ruses of smug psychologists.

We have on our side the noblest and most inspiring cause, one that requires neither refined sophistry nor dubious Machiavellianism. Why do we not remain on the sure ground of principles, of justice and truth? This is the manner in which our own country was built and in which everything great and lasting was created.

PRACTICAL SUGGESTIONS

But perhaps my opponents would say, This is not a question of principle, this is a question of practical recipe. Give us the blueprint, with the patent for no risk, and we will think it over.

I do not contend that I am the possessor of the desired blueprint. But I believe this country does not suffer particularly from a shortage of blueprints.

But I came almost two years ago with a modest practical suggestion which was adopted by the Congress of the United States. I proposed, and the Congress agreed to, the formation of exiles' military units to be attached to the NATO forces, and also the investigation of ways to help our friends behind the Iron Curtain.

The purpose of the exiles' military units is, in my view, twofold: first, to furnish the NATO forces with an initial nucleus of determined anticommunist fighters, which could eventually reduce the drain on American manpower; second, to weaken morally and disintegrate the military potential of the satellite armies. It is obvious that such units would have a tremendous psychological effect on their compatriots. As one official in the Pentagon remarked, a battalion "of eastern European nationals is worth a division of American, British or French troops in opposing Soviet satellite armies."

A CLEAR-CUT ISSUE

Many other Americans are ready to come with other practical suggestions. I am convinced, nonetheless, that practical formulas are not the main need. We are a practical and imaginative people, and if we really set our minds on something, we shall find the proper methods to achieve it. The vital problem with us is to make a clear-cut de-

cision; once that is taken, all methods implementing that decision will fall into a clear, purposeful pattern.

I consequently hold, in divergence from my opponents, that the core of the liberation problem is still a question of principle, a question as to whether or not we make an honest decision—a decision based, if you please, on the principles of our own Declaration of Independence. This appears to me with the utmost clarity when I see all the pragmatic fumbling, with empty radio propaganda not backed by any policy—all these fruits of indecision and confusion.

For myself, as a grass-roots American, I believe that it is high time to put order into our ideas. It is high time to understand that no peace and no international order can be achieved in the modern world without the ultimate liberation of the enslaved. And there is no other way to achieve this goal than to act on principle, with courage and with faith in the triumphant force of human freedom.

Let us not forget what we owe to ourselves, to humanity, and to God. Let us remember that there is no "reaping where thou hast not sown and gathering where thou hast not strawed" and that we must give ourselves, "for unto everyone that hath shall be given . . . but from him that hath not shall be taken away even that which he hath."²

² Matthew 25: 24, 29.

Charles J. Kersten, Washington, D. C., is a member of the Congress of the United States from the Fifth Congressional District of Wisconsin. He is a lawyer, and has traveled extensively in Europe and in the Near East. He has taken an active part in legislation having to do with foreign affairs.

The Contribution of Yugoslavia to Peace

By LEO MATES

SPEAKING of the contribution of my country to the peace in Europe, I am aware of the fact that the present state of international relations cannot be properly described as peace, as this word is generally understood. We in Yugoslavia, however, agree with those who believe that the prevention of a new war is the first step on the road to peace.

It is indeed the only realistic point of departure for a policy of peaceful international co-operation, and it was in the mind of the statesmen who in San Francisco drafted the Charter of the United Nations. In the opening sentence of the Charter, the United Nations expresses the determination "to save succeeding generations from the scourge of war, which twice in our lifetime has brought untold sorrow to mankind. . . ."

I quote these words not only because of their general significance, but also because they have a particular meaning and force in my country. Yugoslavia lost in the Second World War more than one-tenth of her population, not to speak of the great number of disabled, or the plight of orphans and the tremendous loss in property. Sacrifices and losses in one part of Yugoslavia, in Serbia, in the course of the First World War were even heavier than that.

I departed, perhaps, somewhat from my theme in making this introduction, but I feel that it had to be said because these memories and scars of the past play an important role in the framing of minds in my country.

RELATIONS WITH THE SOVIET UNION

Immediately after the end of the Second World War Yugoslavia hoped

that all existing differences in international relations would be solved through peaceful negotiations and through discussions in the United Nations. We particularly hoped that our future relations with the Soviet Union would develop in an atmosphere of increased friendship. Furthermore, we hoped that this development would tend to enhance better relations in general.

That was the period in which the new, postwar, international stage was being set. Throughout that period it became more and more apparent that the setting of the stage tended to develop into a scene of new conflicts rather than harmonious co-operation between free nations. We finally had to realize that in the world at large the threat to peace had developed into a real danger, and we had to face a specific threat to our own independence, an attempt to transform Yugoslavia into a satellite of the Soviet Union.

Three years after the liberation of our country from the enemies of the United Nations we had to defy another attempt upon our independence.

This new attempt did not come in the form of an open military aggression; it assumed the peculiar form of hostile activities and pressures of a full-fledged cold war, including a constant threat of open aggression. Yugoslavia thereby became one of the hot spots in an already fully developed general cold war.

Leaving aside the internal problems and consequences of this situation, I shall concentrate on foreign relations and first of all on a definition of the situation as it arose and our attitude toward the world problem of which we became so important a part.

ELEMENTS IN MOSCOW OFFENSIVE

The unparalleled violence which the Soviet Union displayed in the course of the hostile campaign against Yugoslavia, which began in 1948, requires some preliminary comment. It is not merely a new instance of the hate campaign directed against other nations, or a component of a plan to bring under Russian domination an important area in a wider strategical plan.

Without neglecting the elements I have just mentioned, it is my conviction that the most important element is the impact of the total defeat of the general offensive launched by Moscow in 1948 with the aim to subjugate Yugoslavia without an open military aggression, followed by a gradual realization of the fact that the unsuccessful offensive of the cold war could not be transformed into a full-scale military operation without risking a general war.

In spite of all facilities for obtaining a true picture of the internal situation of Yugoslavia, the Government of the Soviet Union was unable to foresee what the reaction of the people would be, to an attempt to destroy the achievements of their struggle during the war. Moscow staged its onslaught in the form of a cold war blitzkrieg. The plan was to create fear, consternation, and a general feeling of helplessness in the face of an overwhelmingly stronger hostile power, assisted by four other countries situated along more than three-quarters of Yugoslavia's land boundaries, and three other satellites in Europe.

The anticipated result was the internal disintegration of Yugoslavia under the combined effect of political, economic, and military pressure. The consequences should have been either the surrender of the government followed up by extensive purges, or its overthrow and replacement by docile stooges.

THE YUGOSLAV RESPONSE

The Yugoslav Government did not hesitate to accept the challenge, and brought the blitzkrieg offensive to its dramatic culmination by releasing to the press all the charges and attacks, including the open appeal to the people to overthrow its government, as they were issued by Moscow through the medium of the Cominform, together with the Yugoslav answer.

Thus the issue was brought directly to the sixteen million citizens of Yugoslavia, and the offensive completely broke down in its opening phase. The whole structure of the Soviet empire received a hard blow. The expansionist aims and ruthless methods of domination were conspicuously exposed to the world. What is more, however, the people of the satellites have been shown that it is possible to defy the "almighty" rulers in Moscow and win.

In this first battle in the cold war launched by the Soviet Union, Yugoslavia stood alone. It was won only by the unbreakable spirit and determination of the citizens of Yugoslavia, who almost unanimously ranged themselves behind their leaders.

This was not only because of the rather cold relations at that time with the countries of the West as they developed through the first postwar years in the confusion of the development and intensification of the general cold war. It was not only because hardly anybody in the West could understand the significance of the events in and around Yugoslavia. But I believe it could not have happened differently, because the people of Yugoslavia had to fight out this battle alone; it could not have been won for them by anybody else. From the point of view of international relations, it was a battle in the cold war; but internally, it was above all a his-

toric decision of a sovereign people, and this decision had to be made by the people themselves and nobody else.

INTERNATIONAL EFFECTS OF
YUGOSLAV BREAK

But again, I do not intend to examine the internal significance of the events of 1948 and after, which have opened a new chapter in our national history. I shall rather remain in the sphere of international relations.

Yugoslavia prevented the extension of the Soviet empire to the shores of the Mediterranean, with its strategic consequences, which of itself is of the utmost importance. But more important, I think, was the political significance of this event. The Soviet Union failed to achieve a local gain in Europe which would have considerably increased tensions. The march of Soviet expansion in Europe was halted.

The cold war, of course, had not thereby come to an end. Actually, a new sector had been opened; but this new sector proved to be a source of considerable trouble for the Soviet Government. In spite of all efforts to describe the attitude of Yugoslavia as a step in the alleged preparations for an attack on the Soviet Union and the satellites, I have reason to believe that the majority of the population in the satellites followed with admiration the resistance of Yugoslavia to pressures from Moscow.

These efforts to misrepresent the nature and the aims of Moscow's cold war against Yugoslavia in fact appear to have made the defeat more conspicuous, and its consequences and impact upon the people under Russian domination even stronger. The best proof thereof is the undiminished and desperate effort to keep the psychological war against Yugoslavia on an unprecedented level of intensity throughout the Soviet

empire, and, through the media of fifth columns, in other countries.

INTERNAL AND EXTERNAL
CONSOLIDATION

The next stage, after the defeat of the first onslaught, was the consolidation of the internal and external situation of Yugoslavia. Without going into details, I shall only mention that a wide range of measures have been undertaken and are being undertaken in Yugoslavia to strengthen the country through the improvement of general conditions of life in all its aspects, combined with the building of a military establishment sufficiently strong to deter possible aggression by armed forces. This is regarded as the only real danger to the independence of the country since the failure of the attempts to destroy it through pressure and subversion.

This program proved to be extremely arduous in view of the still strongly felt consequences of dislocations and damages caused during the war and the heavy burden of defense expenditures. Even Nature was unkind; catastrophic droughts were visited upon the country in 1950 and 1952.

In international relations Yugoslavia had to fulfill the double task of consolidating her relations with friendly nations and strengthening her position in the first line of defense against a possible aggression in Europe.

This could be achieved through co-operation in the economic field and through active co-operation in the general task of building up an effective system of collective security. In both fields, very important results have been achieved through the United Nations and through bilateral negotiations with friendly nations. I think that they have been made possible primarily because of the sincere recognition on both sides

that the strengthening of the position of Yugoslavia is not only a national concern of her people, but also an important component part of the general effort to prevent aggression in Europe. The basis for this recognition is the demonstration by Yugoslavia that she is able and determined to defend herself and her independence, to play her role in the community of nations as an independent country ready to co-operate in all efforts to establish international security. On the other side, there has been a readiness of other countries to co-operate with her on this basis.

CO-OPERATION UNIVERSAL AND REGIONAL

The development of the cold war and the experience of two world wars have sufficiently proved that neither war nor peace is divisible, and the same is obviously true for the present general cold war, too. International co-operation, therefore, cannot be limited to a certain area in the world; it must be universal, or at least as close to universality as possible, if it is to be effective.

The expansion of international co-operation over remote areas of the world has to face the existence of diversity, which does not necessarily mean controversy. Therefore, co-operation for the strengthening of international security cannot be exhausted by world-wide efforts in the field of collective measures against aggression, in the United Nations. Nor can such specific problems of collective action as require a very close co-operation between nations in the event of aggression be solved through a central world organization without the risk that the solution will remain in general terms or tend to impose a degree of uniformity incompatible with the existent diversity in the world—the individuality of nations.

Preparations for collective self-defense must therefore rest on a basis wide enough to produce an amount of strength sufficient to deter aggression, or, in the case of an aggression, to enable an effective collective defense action, without being extended over such large areas as to impair its efficiency or the individuality of its participants.

FRIENDSHIP WITH GREECE AND TURKEY

I believe that this general consideration, as well as the necessity to increase stability along the Iron Curtain in the Balkans, caused Yugoslavia to initiate negotiations which have led to the conclusion of the Treaty of Friendship and Cooperation with Greece and Turkey.

The conclusion of this treaty was preceded by a steady development of friendly relations between Yugoslavia and the two other contracting parties. Numerous visits have been exchanged of representatives of all aspects of public life, including parliamentarians, journalists, artists, businessmen, sportsmen, and others. An honest attempt has been made to solve all existing differences, and the result has proved that differences can be solved if there is a sincere desire to co-operate. Relations between the armed forces have become more and more friendly, and mutual visits of generals and high-ranking officers have brought about a better understanding between them.

I have mentioned particularly visits of persons in public life because some of the visitors came in direct contact with the people of the other countries and experienced the feeling of friendship which developed increasingly on both sides. I think I should perhaps particularly mention the friendly visits of journalists and parliamentarians, which have immensely contributed to the mutual understanding between our people and those of Greece and Turkey.

I believe that this friendship, which is much more than a diplomatic formula, is based on strong and durable foundations. I am convinced that it will outlast the present situation in the world, because there is every reason why it should, and I can see no reason which should disturb it in the future. Its so strong and visible expression at present, however, cannot be dissociated from the danger to the independence of the three countries, from the north. This danger has found repeated expression in the recent past, but its deeper sources can be traced back to past centuries.

RUSSIA'S DRIVE TO THE MEDITERRANEAN

The foreign policy of the Russia of today, in all aspects, follows essentially in the footsteps of the ambitions and directions of expansion of the rulers of Russia throughout the last two or three centuries. It is enough to remember the attempts to expand the dominion of the Czars in Asia—in the Far East as well as in central Asia—or the partitions of Poland and the incursions into central and northern Europe.

The Balkans have perhaps been one of the most obstinately pursued objects of Russian expansion. The reason was always the attempt to reach the shores of the Mediterranean. The main direction of this thrust in the past was the Straits connecting the Black Sea with the Mediterranean. Russia, in fact, waged several wars without achieving the desired goal.

In the situation after the Second World War, the Soviet Union could undertake no open action to invade Turkey and extend its rule over the Straits. Its hostility toward Turkey was, however, kept alive by various means, including certain territorial claims.

Another possible approach to the Mediterranean was through Bulgaria and Greece to the shores of Thrace. There, only a few miles divide Soviet-dominated Bulgaria from the waters of the Mediterranean.

The third possibility of achieving this goal was the subjugation of Yugoslavia, with her long Adriatic coastline. The conquest of Yugoslavia combined with the domination over Albania, which commands the gates to the Adriatic, would assure the Russians the entry into the Mediterranean.

Even if we leave aside the particular hostility of the Soviet Union toward Yugoslavia, and other strategic considerations, it is easy to understand that in the case of an attempt to transform the cold war into a shooting war, one of the objectives of the Russian command would be to push toward this outlet on the northern shores of the Mediterranean.

THE BALKAN TREATY

The natural consequence is, therefore, the endeavor of Yugoslavia, Greece, and Turkey to combine their efforts in the defense of their national security and independence against a threat to any one of them. This is the way not only to repel an aggression, should it occur, but also to prevent it. In this respect the Balkan Treaty contributes essentially to the general efforts in the field of collective security.

The text of the treaty provides for regular annual conferences of the Ministers of Foreign Affairs of the three countries, and extraordinary conferences if found necessary, and for general consultation between the three governments on all problems of common interest.

More specifically, the treaty provides for the continuation of "common efforts for the safeguarding of peace and security in their regions" and "the examina-

tion of their security problems, including collective measures of defense, the necessity for which might arise in the event of unprovoked aggression against them."

Then comes the following provision: "The General Staffs of the contracting Parties will pursue their co-operation in order to submit recommendations to their Governments concerning questions of defense, mutually agreed upon, with a view to adopting co-ordinated decisions."

I have selected these particular provisions not only because they are the core of the treaty, but also because they illustrate the spirit of the treaty. This treaty does not pretend to be the last word in the settling of the issue; it is of the type of modern treaties which take into consideration the necessity to keep pace with future developments and requirements of situations which may subsequently arise.

The strength of the treaty is not in legal obligations; it does not provide for automatic action in the case of aggression. Its strength lies rather in the establishment of a machinery for the development of specific agreements, and establishment of a workable co-operation, in the political and military fields, as well as in the economic, technical, and cultural fields. Past experiences have sufficiently proved that legal obligations may be insufficient to preserve peace; strength, organized in a flexible and efficacious manner, is much more impressive (to the potential aggressor) and reliable (from the point of view of the defenders of peace).

Moreover, the treaty provides for the accession of other countries willing to become parties to the treaty and willing to co-operate under its terms. No specific country is mentioned, but it is transparent that besides Italy—whose accession is likely to occur in the

future—the makers of the treaty had in mind the possibility of accession of any satellite of the Soviet Union adjacent to the three signatories, which might be able to regain its independence.

LINKED WITH THE WIDER EFFORT

While I am still speaking of the Balkan Treaty, I should like to mention one question which came up in the course of the negotiations, and which found its expression in a separate article in the treaty. It was the question of the effect on this treaty of the membership of Greece and Turkey in the North Atlantic Treaty Organization. The question was whether either of the two treaties precluded the other. The answer was No. The two treaties are fully compatible. Actually, the Balkan Treaty is a contribution to the strengthening of peace which is the aim of the North Atlantic Treaty. Article VIII of the Balkan Treaty deals with this question in the following terms: "This Treaty does not affect and should not be construed as affecting in any way rights and obligations of Greece and Turkey deriving from the NAT of April 4, 1949."

This is, however, not the only link with a wider and more general effort of collective security measures.

I have pointed out that specific questions which require very close co-operation can best be dealt with in the framework of regional agreements. I should like now to put forward the counterpart of that thesis, namely, the fact that much wider co-operation is essential to the effective operation of any regional arrangement, both in its role of preventing aggression, and in the event of actual aggression. Furthermore, a world-wide threat can be met only through world-wide co-operation in defense. Also, the resources of one region

could hardly be sufficient for the requirements of an emergency.

This was recognized while the present Balkan Treaty was still a plan for the future. Without being a member of NATO, Yugoslavia has concluded agreements with the United States, the United Kingdom, and France, under which economic and military assistance is granted to Yugoslavia. This assistance has not only partially offset the effects of the two droughts, but has considerably contributed to the strengthening of her defense.

Besides, friendly contacts have been established and are being maintained between the General Staff of Yugoslavia and the General Staffs of three great powers with a view to facilitating co-operation in questions of mutual interest.

TRIESTE AND AUSTRIA

The only question which has so far defied all efforts on our part is the outstanding territorial dispute with Italy concerning Trieste and a small stretch of land around that city. This is the only dispute which Yugoslavia has with any country in the world outside the Soviet empire. If it were not for various causes beyond the control of Yugoslavia, this dispute might have been settled. I do, however, hope that before long this question will be settled through an agreement between the two countries. And may I add, this will be an important additional contribution to the strengthening of peace in that area, despite the fact that this dispute has never assumed the character of a conflict which might endanger peace.

This question is not important as a possible source of an acute conflict, but as an impediment to the friendly co-operation required by the general situation in Europe and permanently needed

by both countries. This is why Yugoslavia has on several occasions expressed her readiness to co-operate in a friendly spirit with Italy on all urgent questions of mutual interest even while the Trieste issue still awaits its solution.

This short survey of the effects of Yugoslavia to improve the situation and to contribute to stabilization in her region would not be complete without mentioning Austria.

Our relations with Austria would in all probability have developed to the same extent as our relations with Greece if it were not for the occupation of the former country and the consequent limitations on the authority of her government in some vital internal and external functions.

EFFECTS OF BALKAN TREATY

The Balkans have constantly been honored with the epithet, "the powder keg of Europe." In reality the Balkans were a trouble spot not so much because of internal developments as because of outside interference. It appears, therefore, that the present efforts of the three Balkan countries, in which Yugoslavia plays its full share, tend to bring a greater stability to this area. It may be hoped that the effort of those countries to stand together and to preserve peace in their neighborhood will avert the recurrence of an invasion of the Balkans.

How much this may contribute to the final elimination of the tensions which still prevail there, as a result of Soviet policies of expansion, cannot be foreseen. Neither can we foresee how much the concerted action for peace of the three Balkan countries will contribute to the prevention of a war in Europe in general. It can, however, be accepted that the conclusion of the Balkan Treaty is one step further to-

wards the development of a much wider system of collective security against aggression, which could serve as an example for a more flexible pattern of international co-operation in this field in other parts of Europe and elsewhere.

If this should be one of the effects of the Balkan Treaty, its importance would be still greater, since it would promote active and organized co-operation in the efforts to prevent a new world war by countries which may have well-founded reasons for abstaining from participation in existing defense agreements.

PAST, PRESENT, AND FUTURE

The contribution of Yugoslavia to peace has its past, its present, and, naturally, its probable effect upon the future.

The essence of her contribution in the past has been her tenacious resistance to every aggression, without herself participating in any aggressive enterprise whatsoever. The essence of her contribution to peace has been her effort to assert herself, and her success in defying aggression and the threat of aggression. Her contribution in the present is mainly her active participation in the stabilization of the Balkans and her initiative in the development of a form of co-operation in the organization of collective defense against aggression which could contribute to the strengthening of security in Europe and in the rest of the world.

I do not intend to pursue this idea any further. I mentioned it only because I believe that the appraisal of an effort of a country cannot be reduced to its mere ponderable effect at a given moment. There should also be consideration of much less ponderable effects and achievements which may prove to be of even greater value in the long run.

DIFFERENCE WITHOUT CONFLICT

Having said this, I cannot but refer briefly to another question which cannot and should not be left out in this context.

Yugoslavia has joined forces with two other countries, and established friendly relations and co-operation with others, including the United States, regardless of the differences in the internal social, economic, and political structure of these countries. I believe that this is one more proof that such differences, as well as any other ideological or religious differences, do not prevent international co-operation. I think, even, that it is dangerous to overestimate the ideological background of a conflict which in reality is based on the desire to expand the dominion of one person or group of persons over the rest of the world. Such desires, in whatever ideological garb they are clothed, remain what they really are; and in our epoch they are one and the same whether their protagonist be a Kaiser, a Führer, or a Russian dictator.

The reading of ideological tenets into the expansionist policies of an imperialism is, in my opinion, dangerous because it tends to make us believe that a general conflagration is inevitable, and may therefore lead to the slackening of our efforts to prevent aggression.

I wish to emphasize this particularly as we in Yugoslavia do not believe that the differences between Yugoslavia and the Soviet Union must necessarily lead to an open conflict, notwithstanding the profound ideological conflict which developed openly in the years following the break in 1948. Inasmuch as we believe that the application of the theories of the Russian leaders cannot but bring slavery to the peoples of the Soviet Union, we hold firmly to the belief that it is the task of those peoples themselves

to improve this unfortunate situation. We believe our task is to develop our own national institutions independently and to co-operate with other nations in the prevention of aggression; and this, I am confident, Yugoslavia will continue to do with undiminished efforts, whatever the strain and stress may prove to be.

IMPORTANCE OF KOREA

On the other hand, I think that I should not conclude without saying that Yugoslavia follows with great attention and interest recent developments which

give us a reasonable basis to hope that the shooting war in Korea may soon come to an end with the conclusion of an armistice agreement.

There is no doubt that this would cause a substantial diminution of international tensions. The whole purport and consequences of these developments cannot yet be fully appraised. I am, however, certain that Yugoslavia will, as she has done in the past, contribute her share to the development of peaceful relations in the world, without neglecting the task to safeguard her security and that of her region.

Leo Mates, New York City, is Permanent Representative of the Federal People's Republic of Yugoslavia to the United Nations. He participated in the War of Liberation, and entered the diplomatic service of his country in 1945. He was Director of the United Nations Department in the Ministry of Foreign Affairs in Belgrade, and since 1948 has been Assistant Foreign Minister. He has represented his country at various sessions of the General Assembly of the United Nations and at other conferences.

NATO and Coalition Diplomacy

By WILLIAM T. R. FOX

THE experience of our western state system with coalition warmaking is a great deal more extensive than the experience with coalition peacemaking. If we ask what is new and different about the North Atlantic Treaty Organization, one answer is that a group of states, including several major states, have banded together for closely concerted action against a jointly recognized peril before rather than after a general war has broken out.

FAMILIAR ELEMENTS IN NATO

NATO may be compared to a variety of previous experiences in co-operative international action. The North Atlantic Pact of 1949 is a defensive military alliance, and there have been many of these in the last three centuries.

The subsequent conversations between the staff officers of the various signatory nations involved an exchange of information and a joint formulation of war plans, which also has precedents—in the years immediately preceding the First World War, for example.

The conception that the states of Europe, and in our own century of the whole Atlantic community, should unite into a grand alliance once an aggressor has clearly revealed himself is also a familiar one, as Louis XIV, Napoleon, Kaiser Wilhelm, and Hitler have all had reason to know. The North Atlantic Treaty is such a grand alliance.

The Locarno Pacts provide still another parallel, guaranteeing, as does the North Atlantic Treaty, security against aggression from across one part of the prospective aggressor's frontiers without providing equally firm guarantees all the

way around. In the Locarno case it was the states along Germany's western frontiers that were guaranteed; equally specific guarantees were denied Germany's eastern neighbors. In the present case the automatic guarantees of the North Atlantic Treaty do not run east of Turkey.

Finally, the North Atlantic Pact and the Organization erected upon it may be compared to the Rio Pact, which explicitly was based on Article 51 of the Charter of the United Nations.

Thus we see in NATO elements of traditional military alliance, of military planning among allies in anticipation of a specific war, of grand alliance against an expanding aspirant for universal hegemony, and of regional security guarantee to buttress a commitment already made through membership in a general international organization.

HINDERING AND FACILITATING FACTORS

If there are familiar elements in NATO, there are also some novel elements in the world situation in which NATO was created. With the number of powers of the first rank reduced to two, the task of organizing against the one which seems unambiguously to have embarked on a program of unlimited expansion is a more formidable one than has ever before faced western foreign policy-makers in peacetime. Furthermore, Europe without the United States seems now so out of balance that it takes the full participation of the United States just barely to preserve the existing order. Western Europe has no hope of saving itself in the event of aggression from the East without American

participation in its defense from the first day of hostilities and even before that.

This participation must come early, for the steadily lengthening time required for industrial mobilization and effective military training means that a military alliance is by itself nearly meaningless. It has to be implemented by carefully prepared plans for joint action on the basis of semimobilization undertaken years before the crisis of general war.

Finally, a grand strategy of liberation after Soviet forces had first rolled westward to the English Channel, even though it might be technically feasible, would command no measure of support on the Continent, since there is widespread apprehension that the liberating Anglo-Americans would find the whole leadership of their continental allies wiped out when they returned.

All these have made the task of the statesman and the military planner more difficult than in an earlier era.

On the other side of the ledger, we have to point to several factors which have made it easier for the statesmen of our own day to forge a more impressive instrument of coalition diplomacy than their predecessors. In contrast to the situation prevailing during most of the past eighty to one hundred years, when Germany and Russia were often simultaneously seeming to threaten the stability of the European order, this time there has seemed no ambiguity about the identity of the chief disturber. The contingency that Germany may again become a military threat cannot be ignored, and is a natural preoccupation of our French ally; but there is no difference among the Atlantic community partners as to which is the major source of disturbance at the present moment.

A second factor which has favored the growth of NATO is the existence of a

pool of able and devoted military officers and civilians who have for more than a decade in war and in peace been engaged in detailed planning for the joint security of the western countries. This statement of course applies particularly to British and United States soldiers, statesmen, and civil servants.

Still a third factor which may have made the task easier is the widespread acceptance of the notion that war among the states of western Europe themselves has become an anachronism and that it is no longer each other against whom military preparations have to be made.

Finally, United States leadership in the atomic arms race provided, even if only temporarily, an effective deterrent against Soviet counter-action. This has permitted the NATO countries to move from a situation of military helplessness towards one which one can only hope will give the Soviet leadership pause, even though it too has atomic weapons.

NOVEL COMMITMENTS

We can now perhaps begin to describe the unique characteristics of NATO in terms of the unique problems which the world situation of the years since 1948 have posed for western statesmanship.

Certainty about the identity of the prospective aggressor, recognition of the anachronism of war with each other, incapacity to make any significant defense except in union and with United States aid, and the necessity for having military mobilization fairly far advanced before the outbreak of actual war, have all contributed to make the NATO allies willing to form a grand alliance relatively much earlier than was possible in the time of Louis XIV or Napoleon or Bismarck or Kaiser Wilhelm or Hitler.

These factors have further brought the North Atlantic allies to a general

acceptance of the necessity for making military commitments to each other in the most precise fashion possible, and to acceptance of the principle of a collective balanced force. France, for example, no longer needs a huge fleet of submarines to take care of the contingency that she might some day be at war with a great sea power. Recognition of this necessity for a balanced force is based on the shared belief that there is really only one all-out war to prepare for, and that therefore there is only one balance of collective forces which has to be envisioned.

Not only was the grand alliance formed earlier, but the participation of the United States was secured earlier. The United States has never yet failed to participate in any general European war, but until our own day it has never committed itself in advance to participate. The recognition here and abroad that Europe will no longer stay in balance while the United States stands aside, and recognition in the United States that a Europe under a single aggressor would be a threat to the United States, have made this possible.

NOVEL METHODS

So much for the novelty of the commitments. There is an even greater novelty in the way in which these commitments have so far been met. The pre-1939 Europe has sometimes been described as a suborganized system in which there was a more or less spontaneous coalescence of the powers whenever a great aggressor revealed himself. The new North Atlantic community has by no means yet reached the level of organization which could be described as a confederation or a federation, but its organization is somewhere between that and the suborganized system of the former period; for the North Atlantic

community has developed some rudimentary executive organs.

Old-style military alliances were subject to reinterpretation from day to day in each of the national capitals of the participants. The new organization under the North Atlantic Pact has equipped itself with a central secretariat (now called the Permanent Organization) and a continuously operating group of Permanent Representatives under the direction of NATO's Secretary-General, Lord Ismay, and a central apparatus of military planning and command now heading up under General Ridgway.

Lord Ismay has referred to the skeptics of this vastly elaborate organization who have described NATO as "too much harness and not enough horse," but he has also given eloquent testimony to the international loyalties, transcending their prior national loyalties, of the soldiers and civilians who have served in the various NATO bodies. The result is that the NATO consensus has been able to broaden and deepen through the activities of a central organization, and not exclusively through the cumbersome processes of multilateral diplomacy.

The activities of NATO have also been calculated to make a dramatic appeal to the public opinions of the various signatory countries. Here is another distinction from the old-time diplomacy. The fanfare attending its operations is in sharp contrast to the carefully muted and discreet activities of traditional diplomacy, though it is much less than that which characterizes the public and sometimes clamorous activities of the United Nations General Assembly.

Since the Organization is designed to deter, there is no reason to conceal its activities from the power which needs to be deterred. Nor do these activities need to be concealed from the public

opinion which supports them, in a day when free peoples are asked to submit themselves to regimes of austerity and high taxation before a military crisis has actually occurred. The activities of NATO have to be designed to make the publics of the various countries feel that their sacrifice makes a difference. Joint maneuvers would have been unthinkable before 1939. Today they have not only a substantive but a propaganda value.

In all the speculation as to the meaning of the olive branches held out from Moscow, beginning about ten days after Stalin's death, there has been very little public attention to the possibility that NATO may actually be having the deterring effect which its original supporters hoped for it—that its novel elements are having a novel deterrent effect.

DIPLOMATIC TASKS

Whatever the degree of success which NATO has so far enjoyed, the tasks of coalition diplomacy have not been simple. The North Atlantic coalition has had to arrive at many difficult decisions, for example: (1) how much each country shall sacrifice, the so-called "fair shares problem"; (2) whose equipment shall be taken as standard for all the rest, the standardization problem; (3) how influence shall be distributed as between the one who is making the major financial contribution (the United States), the two who have the greatest experience in detailed and protracted joint action (the United States and the United Kingdom), the three who are represented in the Standing Group of NATO (the United States, the United Kingdom, and France), and the fourteen signatories; (4) the German rearmament problem, which, according to one writer, can be solved only when weapons are invented that are only capable of firing eastward; (5) the dis-

tribution of top command positions among the various nationalities; and (6) the problem of expanding the membership and the guaranteed security area. All these have provided a full agenda for coalition diplomacy, and all of them may be regarded as continuing problems.

Perhaps, however, the hardest task of the NATO diplomatic coalition is just now being met. It was one thing to develop a concerted plan of action on the assumption that the Soviet Union was *the* menace and that it could be counted on to make menacing gestures often enough to ensure continued public support for a high level of peacetime mobilization. It may be quite another thing for this same group of powers to develop a policy in concert when a changing world situation and an abrupt shift in Soviet diplomatic tactics call for a reappraisal of Soviet intentions and capabilities. Since one has to assume that the prime objective of Soviet diplomacy in these coming months and years is to divide the opposing coalition, the North Atlantic Treaty countries have to be prepared to modify continuously their common conceptions of the nature and the intensity of the Soviet menace or see their present imposing structure of cooperation dissolve.

Similarly, it is one thing to develop a common policy on the assumption that for the foreseeable future Germany will remain prostrate and divided and that the West Germans will welcome the opportunity to participate in western defense. It may be quite another thing to develop common policies if German recovery proceeds to the point where German unification is loudly demanded by Germans and vociferously supported as part of the Soviet peace offensive.

In conclusion, NATO seems to have performed the tasks of coalition diplomacy with admirable efficiency in the

world crisis of the last four years. Whether our unique North Atlantic coalition can perform the even more difficult task of adapting its complicated program to the changing initiatives of Soviet diplomacy, or can even go beyond that and seize the diplomatic initiative for itself, we do not yet know.

William T. R. Fox, Ph.D., New York City, is professor of international relations at Columbia University, and director of its Institute of War and Peace Studies. He is also managing editor of World Politics. He has taught at Temple, Princeton, and Yale universities. He is author of The Super-Powers and of articles in scholarly journals and symposium volumes on inter-great-power relations.

NATO and U.N.

By R. G. MACKAY *

THE title of this article has the merit of being short, but my reason for choosing it is, rather, its significance to the great number of citizens in North Atlantic countries who are still puzzled, or have difficulty in reconciling their feelings, as to what undoubtedly appears to many of them as a conflict between two rival forms of international organization.

For the problem of harmonizing the conception of the North Atlantic Treaty Organization with that of the United Nations is, I believe, a very real one, perhaps more particularly in the United States. I think it is probably true that the original idea of the United Nations was taken up in this country with an enthusiasm which was all the greater for the fact of its not having been preceded, as in the case of many other North Atlantic countries, by direct experience of the frustrations connected with the League of Nations.

Added to the important contribution made by the American Association for the United Nations, the mobilization of much of your great educational system in support of the United Nations did, I feel sure, instill a confidence in the outcome of postwar international relations, which has led to a great deal of disappointment and disillusionment.

On the other hand, the process of disillusionment, though progressive, has been rather slow, because of the plain man's reluctance to believe that anyone, Russian or otherwise, could still be

stupid enough to desire world domination. Governments, however, responsible for the security of their countries, could not afford such a complacent attitude, and, in the face of mounting Russian aggressiveness, have been obliged to take measures for which in some cases the man in the street was not yet fully prepared.

WHY EUROPE HAS PRIORITY

In turn the Anglo-French treaty of Dunkirk in 1947, the five-power Brussels treaty of 1948, and the North Atlantic Treaty of 1949 showed steadily increasing appreciation of the peril to which the free world was exposed by the weakness of European defenses, and the necessity for building them up with the shortest possible delay. But, one may ask, why was Europe rather than, say, Asia held to be the area of greatest danger?

Power in the modern age still depends to some extent upon numbers of men, but to a much greater extent on industrial potential. The three main industrial blocs in the world to-day are those of North America, Europe, and the Soviet group. European industrial capacity can be looked upon as a balance weight. Swung toward the West, it reinforces the strength of the North American bloc and establishes decisive superiority over the Soviet bloc. Swung toward the East, the combination with the Soviet bloc would immediately place the North American bloc in serious jeopardy.

Here lies the reason for the priority given to Europe over Asia in its call upon the defense resources of the free world. For, even though Asia has the

* I wish to make it clear at the outset that I have retired from the service of the British Government, and that any opinions that I express are entirely personal and without any official standing.

manpower, with the exception of Japan it has not, and cannot possibly have for generations, the industrial capacity which would call for reconsideration of the priority now afforded to Europe.

So the fourteen North Atlantic powers are, rightly, prepared to place a large proportion of their forces at the disposal of a joint command for joint defense of the North Atlantic region, but are not prepared to undertake, simultaneously, commitments under a universal system, whose calls they could not afford to meet without weakening the defense of the key region, which is vital to the maintenance of the principles of freedom in the world. I assume of course that the United States on the one hand and the Soviet Union on the other are immune to anything but mutual long-range aerial bombardment, while Europe is exposed to the danger of being physically overrun by enemy land forces.

ACHIEVEMENT OF NATO

And here in passing may I say just one word about the achievements of the North Atlantic Treaty Organization up to date. NATO has just enjoyed, if that is the right expression, its fourth birthday; and, to judge from much of the popular press, the infant would appear to have been suffering since birth not only from rickets, consumption, and pernicious anemia, but from sleeping sickness in the bargain. Well, all I can say is that, in my humble opinion, the progress achieved in the four years has been little short of phenomenal.

At what other period in history can one point to the formation of a defensive military alliance in time of peace, or at least of cold war, with a supreme commander, or rather two supreme commanders, already appointed, and staffs, troops, ships, and aircraft already under their orders, ready to move at the first sign of enemy action. Contrast this

with the earlier history of defensive alliances; political engagements followed by so-called staff talks, hedged around with every political and legal restriction. Not a man, not a ship, not a gun moved to the points of danger till after the act of aggression had been committed and the local defenders were already nearly overwhelmed.

But is not this almost an exact statement of what occurred in the case of Korea? All the years of discussion in the United Nations did not provide for one man, ready or near at hand, for the emergency which arose in Korea. No, that is not quite fair. There was a United Nations political commission already in Korea when the blow was struck, able to perform one vital task, namely, to convince the Security Council, sitting in the fortunate absence of its Russian member, as to which side had committed the act of aggression, and on which side the moral force of world opinion should at once be thrown.

This was enough to enable the only forces available in the area, apart from the local defenders, to come to the rescue as the spearhead of the United Nations, and not as the representatives of a new imperialism, which is of course how the enemy was bound to try to describe them, with all the force of the gigantic propaganda weapons at his command. Such propaganda has already done much harm among Asiatic peoples, but just think for a moment how much more dangerous would have been the enemy's psychological warfare had there been no overwhelming vote in the world forum of the United Nations to give moral backing to the action of the West in checking military aggression!

I shall return to this point later, but I should first like to take up the question as to why all the discussions in the United Nations, in four years of work, achieved no progress whatever in the

organization of world collective security. To this end I hope you will bear with me if I retrace briefly the story of collective security up to the Korean incident.

HISTORY OF COLLECTIVE SECURITY

Although dreams of collective security as an antidote to war certainly date back to the early nineteenth century, it was in the Covenant of the League of Nations, in 1919, that the first serious attempt was made to deal with the question. The Covenant imposed upon the League Council, among many other responsibilities, the obligation of recommending what forces member states should contribute to the assistance of any state which might become the victim of aggression. But there was no mention of any military organization to meet the requirement of taking collective action against an aggressor, and the whole effect was weakened by the then widespread belief that aggression could be held in check by the force of world opinion, supported in the last resort by economic sanctions. In brief, it was felt that, although provision was made in the Covenant for collective military action, such action would never really be required in an enlightened world, acutely conscious of the disastrous effects, upon both victor and vanquished, of a conflagration such as World War I.

In due course, the Council of the League, having been inactive in the face of several minor acts of aggression, mustered up courage in 1935 to impose economic sanctions on Italy in consequence of her aggression upon Abyssinia, but balked at the imposition of the two key sanctions which would have brought Italian operations to a standstill, namely, embargoes on oil and on the use of the Suez Canal. Mussolini having threatened war if such restrictions were imposed, the League Council gave way to this form of international black-

mail, and so established the fact that real sanctions, sanctions which would hurt, mean war. Such action, or rather inaction, on the part of League members gave the green light to aggressors in general, and certainly smoothed their path on the way towards World War II.

Profiting by the experience of the League, the authors of the Charter of the United Nations made clear their acceptance of the view that a need for military action on the part of the world organization might arise, at least in the formative phases of the new body, and Chapter VII of the Charter was drawn up accordingly, to provide the "teeth" which the Covenant of the League had been thought to lack.

The teeth consisted of a more tightly drawn obligation upon members of the organization to take military action if necessary, under the orders of the Security Council, which was to be assisted for this purpose by the elements of a military organization, to be known as the Military Staff Committee. This body, consisting of the Chiefs of Staff of the five permanent members of the Security Council or their representatives, was to organize a United Nations Armed Force, to be furnished in the first instance from the forces of these five powers, and was to advise upon the employment of the force should need arise.

The work of the Military Staff Committee, started off with high hopes early in 1946, gradually ground to a standstill in the summer of 1948, by which time the attitude of the Soviet Union had deadlocked the Committee on practically every subject discussed. The disagreements were referred to the Security Council for decision, but the Russian attitude in the upper body maintained the deadlock in the lower, and although these questions have remained on the agenda of the Council, they have never been discussed at either

level since 1948. The Military Staff Committee, as an organ of the United Nations, is still in existence and meets, according to protocol, once a fortnight, the ranks and numbers of the military representatives of the five powers being steadily reduced as the years pass by. One has only to cite the fact that the Military Staff Committee was not even called upon to meet when the Korean crisis arose in 1950, to realize to what a pass the Charter conception of collective security had been reduced.

It is pertinent to inquire why the Russians saw fit to bring the work of the Military Staff Committee to a standstill. In view of the Soviet philosophy which teaches the inevitability of ultimate war with the capitalist powers, it must, I think, be assumed that they were afraid of allowing any international force to be formed, the non-Soviet contingents of which might be used against them. The actual technicalities over which deadlocks arose are of little consequence. If the western members of the Committee had been authorized to accept the Soviet view on such questions, there seems little doubt that other grounds for disagreement would have been brought up, under the procedure so familiar at Panmunjom.

Incidentally, it is somewhat ironic to reflect that, like the Nazis in Germany, the leaders of the Soviet Union themselves seem to have chosen the very lines of action most likely to lead to the formation of what they hoped to avoid—a coalition of powers dedicated to checking their expansionist designs.

But again, why did this NATO coalition have to be formed outside the United Nations, even though its authors were careful to point out that such a regional organization was expressly provided for in Article 51 of the Charter, which authorizes the right of individual or collective self-defense? Here we go to the root of the whole question of col-

lective defense, either on a universal or on a regional basis.

QUESTION OF GREAT-POWER AGGRESSION

Collective security under the Charter was based on one fundamental premise, which happened to be false; namely, that the system would never have to be brought into action against one of the permanent members of the Security Council. Since, therefore, no great power would be concerned in hostilities, there would be no need, it was thought, for military organization at the operational level. What was envisaged was in the nature of police action only, since acts of aggression, if any, would be on the part of small powers, for whose disciplining in case of need an *ad hoc* military organization could be set up at the last moment. As an example of the sort of thing in mind, one might cite the formation, under the auspices of the League of Nations, of the international force to supervise the Saar plebiscite in 1935.

Once, however, it comes to be accepted that there is even a possibility of aggression on the part of a great power, the entire military picture changes completely. With the frightening speed at which military aggression can be developed in modern times, to halt such an act requires not only forces already in position, but also the existence of a fully developed command organization with operational, intelligence, and logistic planning in an advanced state of preparedness.

The truth of this statement has now been pretty well demonstrated in the case of Korea. Although there were no U.N. forces in existence at the time, not only was there a South Korean army in existence behind its frontier, but there were United States occupation troops available in Japan, together with the necessary transport to move them, and a fully developed command organization

in existence under General MacArthur, who was ready and able to take the decisions which became immediately necessary. And, despite the fact that the postulated conditions were largely fulfilled, it was still a question of touch and go whether the aggressor could be held before achieving his objective of overrunning the whole country.

The collective security for which men yearn is nowadays no paper exercise against a purely theoretical aggressor. Under present world conditions it means protection against the forces of Communist imperialism directed from Moscow by one of the permanent members of the Security Council, and this threat is likely to last as long as the current regime in Russia endures. Therefore, as long as the Soviet Union remains a member of the United Nations, it will be impossible for any military organization at the headquarters of the United Nations, such as the Military Staff Committee, to take any effective action of any sort. One cannot make defensive plans in the presence of the representative of the potential aggressor, against whom the plans are directed.

It is clear, therefore, that the first requirement of a workable collective security system is the separation of the defensive planning organization from U.N. headquarters. Furthermore, the planning process can never be truly collective in the universal sense, for the simple reason that at least the potential aggressor and his associates must necessarily be excluded from consideration.

From this argument it follows that, in these troublous times, no military organization can be a United Nations organ, and that most of Chapter VII of the Charter is now dead and cannot be revived. But this does not prevent the United Nations from giving political direction to any collective forces which may be engaged in resistance to aggression. Clearly, the General Assembly,

assuming the Security Council to be veto-bound, must be able to debate publicly the issues involved, and to decide whether or not to give its moral backing to any group of powers which may claim that an act of aggression has been committed against them. Equally clearly, the politico-strategic direction of military operations cannot be debated in public. On the contrary, full discussion must be limited to the minimum possible number of governments, both on grounds of military security and also because of the necessity for taking rapid decisions, the time for which is likely to increase in proportion to the square of the number of authorities involved!

DISPOSITION OF FORCES

Another vital factor in the problem is the extent to which sovereign states are prepared to commit their forces to the control of an international organization. Once national security is seriously threatened, as is that of the western powers at the present moment, governments are obliged to limit the use of the forces for which they are able to provide the necessary economic support to the defense of the areas which seem to them of paramount importance.

As I remarked earlier, this is the main reason for the priority given by the western powers to the defense of Europe, and why the European powers have shown themselves so unwilling to transfer any further forces from the European to the Asiatic theater. In addition, it accounts for the reluctance shown by the members of the United Nations Collective Measures Committee to recommend world-wide security commitments, for which adequate forces simply do not exist and perhaps could not even be supported economically. International politics is no exercise in ethics, but a pretty grim business in which military, industrial, and moral power all play their parts, but in which

right does not necessarily prevail unless supported by adequate might.

REGIONAL ORGANIZATION DESIRABLE

Taking into account the present position reached in the development of collective security, and the requirements for a workable system which we have just discussed, it is difficult to escape the conclusion that only a decentralized, or regional, organization can in future fill the bill. It will certainly be so as long as the Soviet Union pursues her present course, and it might be found that the decentralized solution would still be preferable, in this imperfect world, even if a liberalized regime ever achieved power in that country.

Furthermore, acceptance of decentralization would be swimming with, rather than against, the current of world affairs, for it is an undeniable fact that the number of regional security organizations is steadily, if slowly, growing. And to those who fear that such a system falls short of the ideals set forth in the Covenant of the League and in the Charter of the United Nations, I would suggest that, in addition to holding out hopes of practical efficiency, it also presents certain moral advantages.

In the first place, such regional organizations, of which NATO is of course by far the most important, are, as I remarked earlier, directly provided for in Article 51 of the Charter, which authorizes both individual and collective self-defense.

Second, if an act of aggression is committed against a regional group, the group can lawfully, under the Charter, take the immediate military action required by the conditions of modern warfare, thus giving time to the United Nations to decide upon the identity of the aggressor and to mobilize the moral force of world opinion behind the victim or victims.

Third (and this seems to me of the first importance), the United Nations can appoint the directing powers of the group of nations attacked to be what is called an Executive Military Authority on behalf of the United Nations, thus fitting the regional organization, for example NATO, into the world organization at the only level at which such a junction can effectively be made. At the moment, for example, it would be true to say that the Government of the United States is acting as Executive Military Authority for the Korean incident.

I should perhaps add a word of explanation here of the term Executive Military Authority, which may not be altogether familiar to some. When the General Assembly of the United Nations in 1950 passed the resolution known as "Uniting for Peace," for the purpose of strengthening the Assembly's hand should the Security Council be deadlocked by veto, a body known as the Collective Measures Committee was set up to study means of furthering collective security under the United Nations. For reasons, some of which I have indicated, the Committee ruled that the setting-up of a U.N. military command organization in peacetime was impracticable; but it recommended that in any future emergency the General Assembly or the Security Council should delegate responsibility for the conduct of military operations to a state or group of states, to be known as the United Nations Executive Military Authority.

The delegation of responsibility for the conduct of military operations to a fully organized group of powers, capable of dealing with the military situation in a way for which the world organization is simply not designed, should enable the United Nations, while deciding upon the political objectives to be achieved, to remain a little more above the battle than in the case of Korea, the

organization for which had not been thought out beforehand. Thus, instead of playing the embarrassing role of judge and plaintiff in the same case, the United Nations, no longer tied to the actual conduct of hostilities, should be that much freer to pursue the twin paths of negotiation and conciliation, with a view to the rapid restoration of peace.

SUMMARY

To sum up these thoughts, it is my conviction that to remove the preparation for and conduct of military operations as far as possible from U.N. headquarters and to confine the activities of the Security Council and the General Assembly in this respect to the pacific settlement of disputes—or at worst to establishing the identity of the aggressor and making recommendations for the political settlement to end hostilities—holds out the best hopes of establishing collective security. At the same time, the world organization should, I believe, do all in its power to foster the extension of regional defense organizations, with a view to their eventually covering the entire world.

Such a system has the merit of flexibility. It leaves to each individual nation its own assessment of the risks which threaten it, and the degree to which it feels able to commit its forces to the support of one or more regional organizations. And finally, it gives promise, by the gradual strengthening of the free world, of reaching the point at which the risk to the potential aggressor may become such as to lead him, in his own interests, to keep the peace.

As I have said, of the regional defense

system which alone corresponds to the current needs of world collective security, NATO is by far the most important element, including as it does most of the strength of the free world, the world whose long-term ideals are those of the Charter of the United Nations. As such, it forms the principal buttress of the United Nations, and ensures the freedom of thought and of speech which is the lifeblood of that organization. Of itself, U.N. is unable to organize its own security, largely on account of the practical military difficulties which I have tried to explain.

Unfortunately, as I believe, plain speaking on such lines is apparently politically impossible, even for the representatives of the powers which have banded themselves together under the flag of NATO to ensure their own security and indirectly that of the entire free world. But can we not be honest with ourselves and with the public, and admit that U.N. cannot do the work that NATO and other regional organizations can do, in providing effective military security? Equally well, can we not admit that NATO, if forced into defensive action against aggression, needs the moral support and backing of world opinion, which U.N. alone is in a position to mobilize? Each needs the other, and neither can successfully ensure collective security on its own. Together, the moral force and the fighting power in reserve may yet bring us safely through our present dangers to a brighter future, in which war as a means of settling political disputes may have become no more than an unhappy memory.

Captain R. G. Mackay, Royal Navy Retired, is at present with the Foster-Wheeler Corporation in New York City. He has had a long naval service and has represented the United Kingdom as Naval Representative on the Military Staff Committee of the United Nations. He retired from the Navy and from his appointment with the United Nations in 1952.

NATO: Myth or Reality

By ALFRED J. HOTZ

IT is not the poetic justice of charters or resolutions, but the prosaic business of living and working co-operatively together, that will ultimately forge a stable world order. In the present anarchical world situation, two major alternative roads to world order are struggling for acceptance and consummation—the Soviet concept of a monistic, highly centralized, coercive Universal Union of Soviet Republics, and the western concept of a pluralistic, decentralized, co-operative international union.

During the past three centuries, the western concept has failed to develop sufficient stability beyond the separate interests of national states which have engaged in an unceasing struggle for power. Inability of the West to establish a harmony among divergent national interests and to institutionalize the balance of power has resulted in recurrent wars. The severe test of Axis aggression was met by a coalition of national states whose immediate strategic-security interests were endangered, but whose long-term political and economic interests remained irreconcilable. The postwar world order, the United Nations, was conceived as a multilateral alliance dedicated to the proposition that "peaceful coexistence" of multiple political and ethical systems was possible. Within the context of great-power unanimity, the U.N. was purposefully not designed to be utilized militarily against one of the great powers.

WHAT NATO IS

Soviet incapacity or unwillingness to countenance the peaceful coexistence of multiple states within a pluralistic de-

centralized world order, and Soviet strategy and tactics, including dualistic concepts of indirect and direct aggression, forced the western states to organize into a coalition to defend their separate national interests. The North Atlantic Treaty Organization was the calculated response to this Soviet challenge. NATO's short-term objective was to deter the Soviets from aggression; its intermediate objective was to develop western total power to the point where serious negotiation might be possible, from "situations of strength"; its long-term objective was the integration of western Europe. NATO's major problem has been to establish a reasonable harmony among dissimilar national interests and to institutionalize a viable balance of power vis-à-vis the Soviet Union.

Three types of international order, each to a variant degree, are discernible within NATO: first, the traditional military alliance; second, a functional coalition; third, an integrated collectivity. These three types are distinguished by their quantitative and qualitative measurements. With a fourteen-nation membership and a broad scope of activities promoted through concerted action, NATO is, quantitatively, the most unique military alliance yet devised, maintaining a strategic frontier in a gigantic arc four thousand miles in length from the northern tip of Norway to the Caucasus frontier of Turkey. Yet, it was irrevocably clear that if NATO remained merely a military alliance, it would fail in its objectives. It is to the eternal credit of its founders that NATO was conceived of also as a functional coalition and ultimately as an integrated collectivity.

Qualitatively, the traditional military alliance evolves into a functional coalition and finally into an integrated collectivity depending upon (a) its density—the amount and depth of political, economic, and psychological actions that buttress the military-strategic concept; (b) its diversity—the degree to which these nonmilitary actions are co-ordinated beyond the strictly military requirements; (c) its continuity—the institutionalization of these military and related activities through centralized planning and co-ordinated action. Whether NATO is a myth or a reality may be determined by the direct application of the above theoretical constructs to the concrete development of the western alliance. Yet, a more immediate test may also be utilized—whether or not NATO achieves the avowed objectives of its member states. To analyze adequately the respective national interests and resultant national objectives of all the NATO states is beyond the purview of this article. Therefore, focus will be directed toward American national interests and objectives as elucidated through NATO.

NATIONAL INTEREST PROMOTED IN ALLIANCE

General Eisenhower, in his First Annual Report as Supreme Allied Commander in Europe, clearly stated the issue:

The unity of NATO must rest ultimately on one thing—the enlightened self-interest of each participating nation. . . . If the free nations are to remain secure, our peoples must march together, agreed on common goals, and win that co-operative unity possible only in a free society.¹

Soviet imperialist pressure provided the crucible to forge mutual security interests from previously separate na-

¹"First Annual Report to NATO," *New York Times*, April 2, 1952.

tional security interests. General Bradley, testifying before the Senate Committee on Foreign Relations, confirmed this merger when he stated: "I can assure you that our frontiers of collective defense lie in common with theirs [our allies] in the heart of Europe."²

Thus, Article 5 of the North Atlantic Treaty, which declared that "an armed attack against one . . . shall be considered an attack against them all," enunciated the first basic principle and, therefore, criterion for an alliance organization. Two other criteria, namely, the legal and moral obligations to sustain the basic principle, and proviso for the concrete implementation of these obligations, are even more crucial. Any careful analysis of the genesis of Article 5,³ the heart of the treaty, suggests that the only legal obligation undertaken was to "take action." But the kind of action (political, economic, and/or military) and the timing and extent of this action were left to the judgment of each individual state, based on the moral obligation to its own national interest. In the words of Senator Vandenberg:

But you are undertaking at all times to leave the Government of the United States in complete and unquestioned control of its own decisions in this aspect, without any sort of mortgage or commitment to its right to make those decisions.⁴

National sovereignty was preserved, and freedom of execution of decision was maintained.

²*North Atlantic Treaty Hearings*, 81st Cong., 1st sess., 1949, p. 287. General Collins declared even more bluntly that the reason we are in Europe is "primarily to protect the good old U.S.A." See the *Mutual Security Program Hearings*, 82d Cong., 1st sess., 1951, p. 568.

³The evolution of Article 5 from the original Brussels Pact commitment to "take military and other action forthwith," through the State Department revision to "take military or other action forthwith," modified drastically by the Vandenberg-Connally proposal merely "to take action forthwith," is indeed instructive.

⁴*North Atlantic Treaty Hearings*, p. 244-46.

IMPLEMENTATION

Yet, it is in the implementation of these obligations that the distinguishing characteristics of the Atlantic alliance are to be found. Article 3 declares that "the Parties, separately and jointly, by means of continuous and effective self-help and mutual aid, will maintain and develop their individual and collective capacity to resist armed attack." Machinery for such implementation is provided for in Article 9, which establishes a "council" and requires this organ to "set up such subsidiary bodies as may be necessary" to achieve collective defense.

Both the interpretation of Article 3 and its implementation were, according to Senator Vandenberg, "entirely contingent upon events."⁵ Within the context of the 1949 international situation, the American implementation was primarily in the form of economic aid to the amount of \$1,130,000,000, of which \$320,000,000 was allocated to Greece and Turkey, then nonmembers of NATO. This nominal implementation was symptomatic of the basic assumption that time was on the side of the West.⁶

However, events transpired to force, if not a review of Allied objectives, at least a drastic reassessment of the power capabilities prerequisite to collective defense. Advent of a successful Soviet A-bomb and outbreak of the Korean war brought qualitative implementation and institutionalization in NATO unsurpassed in history since the British-American collaboration through the Combined Chiefs of Staff and ancillary boards during World War II. At the New York meeting of the Atlantic Coun-

⁵ *North Atlantic Treaty Hearings*, p. 124.

⁶ European recovery through the Economic Cooperation Administration was to have "complete priority," according to Secretary Acheson. *Ibid.*, p. 33.

cil, in September 1950, four vital decisions were taken: (1) that Germany was "to contribute" to the military power of the alliance; (2) that an integrated force under centralized command was to be established, with the Supreme Commander having "sufficient delegated authority" for training the NATO armed forces; (3) that the Standing Group, composed of high military representatives of Great Britain, France, and the United States, was to have the power of "strategic direction" of the integrated force; and (4) that the Defense Committee should simplify the military structure and the chain of command. Thus, from a military standpoint, greater density, diversity, and continuity were achieved, both procedurally and substantively, in NATO.

It had become irrevocably clear by late 1950 that a mere American declaration of intention to come to the assistance of our allies was insufficient to deter the Soviets. A theoretical balance of power awaiting the outbreak of aggression lent credence to the inconclusiveness of the western pluralistic world order. Since the primary objective of politico-military action is not to destroy nations but to influence their attitudes and consequent behavior, NATO had to be concretized.

CONCRETE ACTION

Three practical actions were immediately forthcoming as the traditional military alliance merged into a true functional coalition. First, the United States assigned additional combat divisions to duty in the European area,⁷ which signified a sharp warning to the Soviets that the United States would be automatically at war. Second, a vigorous

⁷ *Report of the Committee on Foreign Relations and the Committee on Armed Services on S. Res. 99 and S. Con. Res. 18*, 82d Cong., 1st sess., 1951.

rearmament program was undertaken by the Allies. Third, greater co-ordination of political and economic decisions was effectuated. In Lord Ismay's words:

From the year 1949-50 up to the current year, defense expenditure in the European countries has increased 120 per cent. The first year after the signing of the North Atlantic Treaty, these countries devoted 20 per cent more to defense. Defense expenditure figures for 1951-52 jumped more than 47 per cent over 1950-51. And the current year shows a further increase amounting to 24 per cent.⁸

American defense expenditures increased over this same period by almost 360 per cent.

While there is considerable validity to the assumption that Allied superiority in quality of arms and of military training may compensate for Soviet superiority in quantity of manpower and equipment, it would be specious to attempt to draw definitive conclusions as to the present military balance. Near-achievement of the Lisbon goals of 50 active divisions has been negated by the "stretch-out" decisions of the Paris Meetings, December 1952. Yet, the 18 NATO divisions in West Germany,⁹ half of them armored, the 5,000 planes of all types, of which 1,800 are jet aircraft, plus the nearly 25 Greek and Turkish divisions, constitute a sufficient force to have robbed the Soviets of the opportunity for a surprise sweep to the English Channel. Significantly enough, General Gruenther is reliably reported to have stated that progress was greater than he and General Eisenhower had

⁸ Address by Lord Ismay, Secretary-General of the North Atlantic Treaty Organization, at the National Press Club, Washington, March 12, 1953. In addition, there was a net increase in total European men under arms from 2,450,000 to nearly 3,300,000.

⁹ Presumably, these include 6 American divisions, 5 French, 4 British, 2 Belgian, and elements of Canadian and Dutch troops.

estimated would be possible by the end of two years.

Recent NATO land maneuvers based on the British strategic concept of both static and mobile forces, and the successful naval maneuvers in both the North and Mediterranean seas, have demonstrated that centralized strategic planning and unified command have progressed considerably beyond the original 1949 concepts. A sounder logistic base for effective mobility has been established through "infrastructure." Still unresolved, however, are the military problems related to the build-up of reserve divisions and the co-operative utilization of atomic power, both of tactical atomic weapons and of strategic air force carrying A-bombs.

Perhaps the gravest military-political problem revolves about the proposed 12 German divisions to be added to the western balance of power by incorporation through the European Defense Community. Since the bastion of the defense frontier lies in the central part of Europe, between the Rhine and Elbe rivers, this dilemma is one of the crucial tests still to be met by NATC and the American policy-makers, especially in the view of the Soviet peace maneuvers designed to arrest German rearmament and integration into the E.D.C.

STRUCTURAL FEATURES

Having added conviction to mere intention through the concrete build-up of military power, the functional coalition has continued its development in density, diversity, and continuity since the outbreak of the Korean war.¹⁰ At

¹⁰ It is not without considerable significance that the U.N. members assisting in the Korean war are primarily the NATO states along with those Pacific nations (Australia, New Zealand, and the Philippines) allied to the United States through military agreements.

the Ottawa Conference, the Temporary Council Committee, composed of the Three Wise Men,¹¹ was established to study the "political economic capabilities of the member states with a view to buttressing the increased military demands. So thorough and objective was the report that the TCC was institutionalized in the form of the International Secretariat under Lord Ismay.

In effect, the NATO Secretariat is the civilian counterpart to the military structure which includes the Standing Group and the Supreme Headquarters Allied Powers in Europe (SHAPE). Its main functions are (a) the reconciliation of military and production programs with the politico-economic capabilities of member states; (b) the examination of military plans to avoid overlapping; and (c) the preparation of the annual program for approval by the Atlantic Council. By virtue of the institutionalization of the International Secretariat, NATO verges upon an integrated collectivity, and its authority and effectiveness will "grow out of the process of collaboration between the Permanent Representatives with their national points of view, and the NATO secretariat with their independent and collective point of view."¹²

While the hierarchy of national interests continued to grant first place to military considerations, there was increasing recognition that NATO functions must develop in the correlative political, economic, and social fields. Under the prodding of Canada, the NATO Council as early as May 1950 declared:

Only a free society can guarantee to the individual the benefits of the economic progress and prosperity of the peoples of

their countries, and promote the economic and social development of other peoples of the free world through close co-operation with each other and with other nations.

ECONOMIC AND POLITICAL DEVELOPMENT

In the economic field, two vital agencies, the Financial and Economic Board and the Defense Production Board, have been institutionalized by their incorporation within the Secretariat, under the supervision of an Assistant Secretary General for Economics and Finance and an Assistant Secretary for Production and Logistics. Most of the activities of these agencies are directed toward promoting the production, delivery, and financing of military hardware; yet the studies and recommendations undertaken affect the over-all economic relationships of the respective member states. Off-Shore Procurement and the letting of select contracts to develop certain key industries in Europe, notably the machine-tool industries, have assisted in the general economic viability of the Continent. An intensified production-assistance drive administered by the Mutual Security Agency centers about the positive concept of "productivity." A greater mutuality of national interests is being achieved by certain collateral co-operation with the Organization for European Economic Cooperation. To be sure, very little progress has been made toward general economic planning for expanding productivity, or with regard to raw materials development and adequate new investment.

In the political field, the replacement of the Deputies Council by the Council of Permanent Representatives,¹³ residing

¹² This multilateral group implements Article 4 of the treaty, which states that "the Parties will consult together whenever . . . the territorial integrity, political independence or security of any of the Parties is threatened."

in Paris, has answered, in part, the warning expressed in the Pearson Report, November 28, 1951, to the effect that "the enduring nature of the North Atlantic Community must rest on something broader and deeper than military co-operation alone." Since the Lisbon determination, the full Council of Ministers (Foreign Affairs, Defense, and Finance) meets three times a year. However, the Council of Permanent Representatives engages in continuous weekly meetings. With effective powers of decision, upon instructions from their respective national governments, the Permanent Representatives constitute a significant advance toward an integrated collectivity, and simultaneously reaffirm Clemenceau's famous dictum that war is too grave a matter to be left solely to the military.

The politicalization and socialization process inherent within Council deliberations, whereby unanimity is reached without formal voting on issues, is indeed a unique achievement.¹⁴ This centralized NATO machinery, involving discussion, consideration, and recommendation on matters of mutual concern, does not invade the sacred prerogatives of national sovereignty.¹⁵ However, the NATO political process does require that the right to determine national interests and to execute national actions without prior consultation with the Allies be restricted, at least insofar as these decisions may affect the security and the prosperity of the North Atlantic area. What has been limited is not sovereignty itself, but merely the "exercise of sovereignty."

¹⁴ "The effort to achieve unanimity between independent Allies by these steps of discussion is the essence of what may be called the 'NATO method.'" *Atlantic Alliance*, p. 126.

¹⁵ The Royal Institute of International Affairs Report stated that "it is in combining unity of effort with full respect for national independence that NATO achieves its distinctive though limited character" (p. 43).

On the assumption that military security, political stability, and economic viability are mutually inseparable, it is not unreasonable to suggest that, if NATO expects to achieve its avowed objectives, it will have to merge into an integrated collectivity. It is significant that such an open appeal was made, November 22, 1951, by General Marshall and three former Under Secretaries of State, namely, Will Clayton, Joseph Grew, and William Phillips. They proposed (1) a single NATO authority for political decisions, (2) a single NATO agency for executing foreign policy, and (3) an agency for the co-ordination of economic policies of the Atlantic community.

THE REALITY OF NATO

The reality of NATO is clearly demonstrable, for its short-term objective to deter the Soviets from imposing their concept of world order upon the West has been realized. Its intermediate objective to forge an effective power balance for serious negotiation¹⁶ with the Kremlin may be realizable. Yet, the ultimate objective must continue to be the development of a pluralistic co-operative world order evolving through the pragmatic functionalism and empiricism of NATO. In the words of General Eisenhower:

The logic of larger groups and associations [of nations] is becoming increasingly impelling. In the NATO nations, especially, the resultant task is to reconcile the demands for association into larger groupings with the deep and spiritual ties to nationhood and sovereignty.¹⁷

¹⁶ Secretary Acheson declared in 1951 that the West must "reach a point [in the power balance] where they [vital issues] can be discussed and settled by negotiation. But I believe that that cannot be done as long as there is a great disparity in power which makes negotiation seem unnecessary to one side." *Mutual Security Hearings*, 1951, pp. 61-62.

¹⁷ *First Annual Report*.

¹¹ Mr. Harriman, Mr. Monnet, and Mr. Plowden.

¹² Royal Institute of International Affairs Study Group, *Atlantic Alliance: NATO's Role in the Free World*, 1952, p. 43.

Perhaps the best test whether NATO is myth or reality is the reaction of the Soviet Union. NATO has been vigorously attacked since its inception by Soviet leaders and propagandists. The developing unity of the West has been characterized as the "aggressive Atlantic coalition, headed by American and British imperialism, [which] is endeavoring to step up the preparations for wars and to involve the western European countries more deeply in them."¹⁸ With reference to German participation within the NATO framework, the Soviets have warned against the involvement of "Western Germany in the self-styled 'European Community,' which is to become part of the Atlantic war bloc." Soviet charges that NATO is "preparing the outbreak of another war in Europe" are combined with accusations that the West German army, "led by fascist-Hitlerite generals, in the so-called 'European Army,' and consequently in the Atlantic Alliance army, brings out even more saliently the aggressive nature of the Atlantic grouping as a whole."¹⁹

It is elementary logic that the Soviet Union should be deeply disturbed over the co-ordinated and effective balance of power that is gradually emerging through NATO. However, to achieve the "preponderance of power"²⁰ that Warren Austin hypothesized would require that the present functional coalition merge into a more integrated collectivity. There is a strong probability that the present Soviet "peace offensive" is due to the reality, not the myth, of NATO. Soviet objectives have consistently been (a) to weaken and divide the western world by political and economic means, and even by military pressure; (b) to prevent western European integration

under American leadership; (c) to maintain dominant Soviet power in Europe, with a view to securing the withdrawal of American forces; and (d) to win Germany to at least a neutral-independent position.

BASIC SOVIET POLICY UNCHANGED

The vast progress made by NATO may have caused the new Soviet leadership to re-examine its position and re-assess its power capabilities. Any tactical change in Soviet policy would be designed to weaken the collective strength of the West and to exploit the divisive forces within us. However, as Secretary Dulles stated, "Nothing that has happened, or which seems to me likely to happen, has changed the basic situation of danger in which we stand."²¹ Soviet expanded military power and directed hostility to the West remain. The steady increase in Soviet armaments,²² the reorganization of the satellite armed forces,²³ and the acceleration of Soviet economic development provide the Soviet Union with the power capabilities that would constitute a continuing source of danger to the West even should a series of concrete "accommodations" be effectuated. George Kennan declared:

The central emphasis of their [Soviet] policy, therefore, lies not in the prospect of a head-on confrontation but in the hope of weakening and dissipating the strength of the free world through promoting disunity

¹⁸ Comment at news conference, *New York Times*, April 4, 1953.

¹⁹ The Soviets are reported to have in East Germany about 22 divisions (10 armored, 8 mechanized, 4 rifle) with 5,000 tanks and 5,000 aircraft; Soviet troops in Byelorussia and Ukraine alone constitute 60 divisions.

²⁰ The East German *Bereitschaften* will have, by June 1953, about 3 divisions, one of them armored; the Polish Army has at least 16 divisions, and there has been vast improvement in the Czech, Bulgarian, Hungarian, and Rumanian armies.

within its ranks. I reiterate: the basis of their attack on us is the development and exploitation of divisions among us. Correspondingly, the first element of our defense should logically be the cultivation of unity within our own ranks.²⁴

Seriously to negotiate from strength will require the emergence of NATO from a functional coalition into an integrated collectivity; and the key challenge that must be met is whether or not NATO can forge not only a united military policy, but a collective political policy as well. The appeal of General Marshall resounds again—to establish a single authority for political decisions vis-à-vis the Soviet Union and a combined agency for the execution of these decisions. To determine our objectives through mutual consultation and collective decision, to assess our power capabilities through common procedures, and

²⁴ Address before the Pennsylvania State Bar Association, Scranton, Pennsylvania, January 16, 1953.

to implement our policies through an integrated collectivity is the goal that must be reached.

THE TASK BEFORE US

Much has been accomplished through NATO, but still more is required before the western pluralistic co-operative concept of a world order shall have proved capable of a positive and constructive answer to the challenge of the Soviet monistic, centralized, coercive order. The West can no longer afford the luxury of disunion and disorder. In the words of Arnold Toynbee, "If we decide to build a united house, NATO is already there to serve as the foundation."²⁵ Thus, it is not the poetic justice of charters or resolutions, but the prosaic business of living and working co-operatively together, that will ultimately establish some semblance of peace.

What Should Follow from NATO?

By OWEN J. ROBERTS

AFTER the United Nations Charter was adopted, the United States attempted to do what I think was more than its full duty—made the most generous contributions for the restoration of the free world, which had been nearly destroyed by war.

It was decided that the devastated nations of Europe which had fought with us could not recover of their own force and strength, and the British loan and the Marshall plan were intended to restore to some extent their economic potential. Even the Union of Soviet Socialist Republics was offered an opportunity to share in the benefits of rehabilitation through the Marshall plan. She refused.

Shortly afterward, the attitude of the U.S.S.R. in the United Nations and in international affairs convinced the people of the United States that the U.S.S.R. was not willing to play the role that had been assigned to members of the United Nations. The incident that constrained President Truman to announce his Turkish and Greek policy emphasized that fact.

The conduct of the Soviet Union, characterized as cold war, so frightened and discouraged our allies in Europe that they felt that even with the aid of economic rehabilitation, they would be but food for the Soviet war machine sooner or later. A new instrument, it was felt, must be devised for their protection. It was understood that England and western Europe together had not the potential to stand off aggression from the great Soviet empire, and that the United States must join in any movement for that purpose.

PURPOSE AND NATURE OF THE TREATY

This was the genesis of the North Atlantic Treaty which was intended to bind together the free nations of western Europe and of the North American Continent to resist aggression and to make aggression unlikely, or, we hoped, impossible, on the part of an ideological group that had divided the world into two camps—the camp of the slave and the camp of the free; the camp of the Marxist and the camp of free competition and individual liberty.

And so, the North Atlantic Treaty was adopted. I stress at the outset that it was a treaty. Each of the signatories reserves its full and complete sovereignty and independence of action. Each member of the North Atlantic Treaty Organization has the perfect right to agree or not to agree to any action proposed under the treaty. All actions taken by the parties to this treaty must be unanimous.

IMPLEMENTATION OF THE TREATY

In order to implement the treaty, the members set up a Council, consisting of the ministers of foreign affairs and the ministers of defense of the member nations. That Council, after due deliberation, made one great decision; it decided that the military forces of the member countries should be placed under one unified command, and General Eisenhower was chosen as the commander of this unified force.

Nothing like that had ever occurred in peacetime before. Under the stress of World War II, Great Britain and the United States had made a similar

arrangement; but in the absence of actual warfare, no nations had ever gone so far. It was a great step forward.

The members of this body, of course, were bound to support this unified military force, commanded by the choice of all the member nations; but the foreign ministers of twelve nations could not meet more than once in three or four months, and therefore decisions were made very slowly. To obviate that difficulty, they set up a Permanent Council in London, where each foreign minister named a deputy to represent his country; but even after the deputies had unanimously agreed, their decisions had to be referred back to twelve chancelleries in twelve member nations, and decisions were inordinately delayed.

General Eisenhower, having a thorough grasp of what was necessary to organize a unified army, went ahead so fast that the military preparations completely outran the political and economic implementations that must support them. Then the North Atlantic Treaty Organization created a number of *ad hoc* committees on resources, defense, and so on, and these committees debated for many months. When the NATO powers met at Ottawa, they were completely discouraged by the fact that there had been no sort of arrangement to support what the Supreme Command in France was attempting to do.

They therefore appointed the Temporary Council Committee, consisting of one Frenchman, one Englishman, and one American. Mr. Harriman, of our own country, was the chairman. After months of study, that committee reported to a meeting of NATO at Lisbon with recommendations that were indeed grandiose, about what each of the nations was to contribute, economically and in the matter of resources, to support the great unified military effort which Eisenhower envisioned.

The NATO abolished all *ad hoc* committees. It brought the Permanent Council from London to Paris. It created a Secretariat of which it made Lord Ismay the incumbent in Paris, who should act under the Permanent Council. It was planned that the Permanent Council, in place of the many scattered committees, should study all pertinent questions, and, after clearing its findings with Lord Ismay, should go to the powers with full recommendations.

The result has been totally disappointing. None of the great powers, except our own perhaps, has been willing to live up to the program for the support of the unified military effort of NATO that was set forth at Lisbon. The departure from that plan is so great that in an article in a recent number of *Foreign Affairs* it is stated that NATO has changed its direction, or has slowed down or has abandoned a great deal of what it intended to do militarily.

NONMILITARY ASPECTS

But of course, there is far more that concerns the free nations that are bound together in NATO than the mere supply of a military force, important as that is.

In a recent study prepared by a committee of Chatham House in Great Britain, under the title of "Atlantic Alliance," this is said—this, you will note, by the British committee: "The cold war has made the grand strategy of the free world dependent as much on political and economic as on military and geographic factors."

The North Atlantic Pact recognizes that fact. At the insistence of Canada, this was inserted in the pact: "They [the member nations] will seek to eliminate conflict in their international economic policies and will encourage

economic collaboration between any or all of them."

At Ottawa a committee was appointed, headed by Mr. Pearson, the Secretary of Foreign Affairs of Canada, to study and report to NATO what was meant by the "Atlantic Community." This was at Canada's insistence that the "Atlantic Community" must get on with its business—the other business than the mere military job. It must proceed with the economic job and the political job. That committee, after long consideration, suggested that it would be a long time before this objective of economic and political co-operation could be brought about. They said it must come as a result of needs and events—whatever that means—and they warned that the member nations of NATO must formulate a common foreign policy if their organization were to survive and to serve the purposes intended.

NATO's NEEDS

But the needs that they spoke of are here, now. I can do no better than to cite a great Englishman on this subject. Lord Montgomery, in a speech before the Press Club in Washington last March, listed six of NATO's needs. Without quoting him exactly, the six needs are as follows:

1. Political unity and agreement on our problems and how to solve them.
2. A central organization to direct this agreed political policy.
3. An agreed master plan to handle the present cold war and a future hot war, if one ever bursts upon us.
4. The closest possible link-up of interests—political, military, economic—between the national communities in a geographic area.
5. A complete overhauling of the present North Atlantic Treaty Organization.

6. A pooling of resources of all the Allied Nations.

And Lord Montgomery insisted that none of these six needs had been met.

WEAKNESS OF NATO

Now, let me summarize the situation. NATO has resulted in a single military command; but it leaves the provision, the equipment, and the financial support of all forces for that command to the discretion of each individual nation. It leaves all the economic means affecting the function of the Organization to the separate national controls. We can build as high tariffs as we please in an effort to starve the industries of Europe. We can build as high walls against immigration as we please. We can adopt any fiscal policies we please, no matter how injurious to any of our allies in NATO, and not one of them has a right to say a word against them.

The military establishment can never persist or succeed without two things: a political entity which sets the policy to be implemented by the military arm, and an economy which ensures the resources to support the army in its assigned task. No one can say how we are going to attain these two requirements under NATO.

We must realize that NATO is now at the point of stalemate. Many of the member nations are now deficient in their contributions toward the army that General Eisenhower and his staff have set up. They give various reasons for this situation, and I do not criticize their reasons. Some say that their economies are debilitated by our tariff system, and that it is a pretty situation when we weaken their economies by our tariffs and then ask them to pay us what they cannot pay. Britain and France both say they have commitments of one sort or another—France, a military commitment, and Britain, certain other com-

mitments—that make it impossible for them to reach the goal set by NATO to make a military force in Europe that is respectable.

There is no way to force anyone to contribute. What are we to do? They are saying to us, We want trade, not aid. We are at the point where not only the United Nations, but NATO, faces a tremendous crisis, and nobody knows what the future is to be.

LIMITATIONS ON TREATY POWERS

I come, then, to the last matter that I wish to discuss, and I think this brief statement of our experience under NATO has been necessary to what I shall say.

Shall we grant more powers to this international organization, this Council of NATO, thus surrendering to the Council many sovereign powers of our own? Bear in mind, as I said at the start, NATO is a treaty organization. Can the Senate of the United States, by ratifying a treaty, give to a central body in Paris the power to levy taxes in the United States on you and me? Can Congress, by ratifying a treaty, give to this central power the right to make appropriations of your money, your taxes? Or does that power, under our Constitution, rest in Congress? Can the treaty be amended to give the central body the power to conscript men and women in the United States for the unified army?

To ask these questions is to answer them. The Constitution of the United States confers on the Congress the power to levy taxes; it confers on the Congress, your delegates, the power to make appropriations of the moneys raised by those taxes; it confers on your Congress the power to declare war and to do the things necessary to make war effective, among others, conscription. It is therefore perfectly obvious that by no supplemental treaties, and certainly not

by the North Atlantic Treaty as it stands, can the United States ever agree to surrender to a central power these functions which, under the Constitution, belong in Congress and nowhere else. Only by an amendment of our Constitution, which would completely subvert the theory of our government, could we do this by treaty.

The same difficulty, of course, arises with respect to every other member nation. Great Britain might, by an Act of Parliament, and by treaty, agree to a certain assessment on Britain for the expenses of NATO, or a certain draft for men; but the government might change to a Labor government next year, and that government might completely reverse the action of the earlier Parliament, and there would be nothing short of war that could compel Britain to live up to the supplemental treaty that dealt with these things.

THE SITUATION UNDER NATO

What, then, can we do under NATO? How can we go farther with this enterprise? How can we integrate our economies? How can we get a political direction for our army, and how can we raise and support that army, if any nation, or any two or three nations, simply fail in their moral obligations, or fail to agree that these are their obligations, unless all the nations are going to change completely their domestic economy and their whole theory of government and surrender sovereign powers that under our theory belong to the people, not to their government?

The government has no right to surrender any of the powers that vest in the people. The people have given some of those powers to Congress under an agency arrangement. Congress cannot exceed its agency, and nobody can do it but you and me; and I think it is true, in essence, of the British people

and the French people. We seem to be stopped at that point.

Now, what other contingency is there in the offing? There are a great many good but misguided people in Europe who think that NATO is nothing but a step toward a new Roman Empire, we playing the part of the Caesars in the picture. That is, of course, foolish. The whole history of the American people indicates that we are never going to become the masters of the world, in the sense that Rome was.

There is one other possibility. There is the possibility that we stand where we are, on the terms of the treaty, and unless some new invention is found to cure the situation in which we find ourselves, we shall gradually revert to the old, complete, independent nationalism; that is, the treaty will become, in effect, a dead letter, and then the United States, France, Britain, and the other nations will each have to look after its own troubles.

"DIVIDED WE FALL"

Of course, in the present posture of the world, that is national suicide. None of us can do it. The western nations need us bitterly in the present crisis; but, make no mistake, we need them just as much as they need us. We need their manpower; we need their population; we need their production; we need their traditions; we need to save liberty somewhere else besides on this continent; we need them, and they need us, and some way must be found to unite us.

Some way must be found by which there will be one armed force that belongs to all of us, but represents you, individually, just as your army does, and represents a British man, a Frenchman, just as his army today represents him. That is a people's force.

There needs to be one foreign policy. We cannot go on having one member

of the NATO community recognizing a government and others refusing to recognize it. We cannot have one member of NATO supporting a military arrangement in the Near East or the Far East, and another denying its validity. This will not work.

We must find some way to pool our economies, as Field Marshal Montgomery has said, so that the joint economy will not only support the joint effort, but will advance the welfare of all the people who live under that single economy, in the mass and as a whole.

THE CASE FOR INTEGRATION

Now, I make no concealment of my position. I have been, for years, an Atlantic Unionist. I have for years believed that the advanced people of the world, the free people of the world, could be persuaded, if there were intelligent and vital leadership, to pool their interests in a limited way, so that one agency would represent them in military affairs, in fiscal affairs, and in their international relations. We should have then, for them all, one foreign policy, decided as we decide our foreign policy, after debate by our elected representatives; one military policy, decided as we decide it in this country, by debate and a vote of our electors.

I do not care whether you call it federation (a word the British do not like) or whether you call it something else, but it has to be some kind of integration. It has to be something else than twelve sovereign nations sitting down and agreeing as long as they can agree, and breaking up the party when anyone refuses to agree to any measure. That is not representative democracy.

I think the salvation of the forward-looking people of the world lies in integration. I think the time has come when all the free people of western Europe and Canada and ourselves can find some instrumentality that will rep-

resent them all in this way. I believe they will be willing to take from their respective legislatures certain limited powers and, in the interest of all, give them to some central agency.

Now, this is not my particular quack notion. These free people all want only one thing—to be let alone, to work out their destinies, to pursue their own local policies in their own way. They are entitled to security, to protection, to live according to their consciences, under a free system of laws enacted by their representatives. And if anybody can suggest a way to accomplish this, God bless him; I will be for it.

NEW COALITION NEEDED

But when you ask me where NATO is going from here, I say, with all conviction, NATO is either going to a dictatorship of the United States, which is unthinkable; or it is going, like every other treaty arrangement that we have known in the world's history, ultimately to disintegrate through disagreement and failure on the part of one or another nation to live up to what the other nations

think is its obligations; or we are going to find some other method of carrying on this progression which started with the League of Nations, went on to the United Nations, and has now come to NATO.

The League of Nations failed; the United Nations is a failure as a means of guaranteeing peace in the world; and NATO, as Lord Montgomery says, must be overhauled or it is going to die. But how can it be overhauled? God bless anybody that can suggest a way by which, under a treaty, twelve sovereign nations can have any assurance that they will live in unity and in unison of action for any long period of time.

So I say, either NATO is going to dissolve and we shall go back to the old idea of every fellow for himself, or NATO must be supplemented or supplanted by some other common agency with power conferred by all the people who are in the group—not governments, but people. Such an agency will represent all those people in their common vital interests that they need to protect against the Soviet threat.

Owen J. Roberts, Philadelphia, Pennsylvania, is president of the Atlantic Union Committee and of the American Philosophical Society, and is a member of numerous boards of directors. He served as an associate justice of the Supreme Court of the United States from 1930 to 1945, after which he was for several years dean of the Law School of the University of Pennsylvania.

Politics in the Union of South Africa

By AUSTIN F. MACDONALD

RACE conflict is the essence of South African politics. The whites are arrayed against the blacks, and even against one another. Most serious is the conflict of white versus black. The Europeans—that is, those with European blood in their veins—comprise only a small part of the population; yet they virtually monopolize the public service, the professions, large-scale industry and commerce, and even the skilled trades. They are a favored class; the country is run for their benefit; and they are determined to retain their advantageous position at all costs. So far they have been able to maintain their complete supremacy, but the difficulty of keeping millions of nonwhites in a subordinate position is likely to increase with the passing of the years.

THE NATIVE POPULATION

South Africa has a population of a little more than eleven million, and nearly eight million, or just under 70 per cent, are blacks. Commonly they are called natives, but many times they are referred to as the Bantu, because their numerous languages have a common Bantu origin. So different are the various dialects, however, that natives from different parts of the Union cannot understand one another unless they know Zulu—the principal Bantu tongue—or unless they have learned the white man's language. For that matter, most of the natives make no attempt to understand one another. Millions of them continue to live in the reserves that have been set aside for them, obeying tribal law and regulating their affairs in much the same manner as they did before the coming of the Europeans. Old customs

and old superstitions still persist. Every year many persons are put to death in an attempt to propitiate pagan deities. These "ritual murders" are against the law, of course, and some persons have been executed or sentenced to long prison terms for participating in them. But they still persist, and sometimes they are directed by chiefs or headmen.¹

Little by little, however, the old order is changing. Increasing numbers of natives are leaving their reserves and drifting into the cities, where they become familiar with the white man's civilization. Today more than half of the natives are officially listed as detribalized. Some of these detribalized natives work in the mines or in industry; some are engaged in domestic service. Many of them have gone to the cities to earn a specific sum of money—enough to buy a wife, perhaps—and plan to return as soon as they have accomplished this purpose. But many others have become a permanent part of the white man's labor force. Their wages are almost unbelievably low, averaging not much more than one-eighth of the wages of white workers, even in mining operations where the jobs are not too dissimilar.

The educational policies of the South African Union for whites are very different from those for nonwhites. For European children education is compulsory, and most of the schools are good. For natives there is no compulsory education. Schools are maintained largely by missionary and other private bodies, though the state does make contributions for this purpose. Most of the natives receive little or no education, of course, and most of those

¹ *Round Table*, March 1950, pp. 182–86.

who attend the elementary grades never progress beyond that point.

When a system of social security was introduced in South Africa, it applied solely to Europeans. Now the natives are included, but the benefits that they may collect are on a much smaller scale.

POLITICAL STATUS OF NATIVES

The several provinces of the Union have not agreed as to the desirability of permitting the natives to vote. In the Cape Province every person was originally permitted to vote, provided he possessed the necessary qualifications of property and literacy. Few natives did in fact possess these qualifications, but there were some who could and did vote at every election. Elsewhere, the natives were disfranchised.

In 1936 the Union Parliament passed the Representation of Natives Act, which grouped all the Cape natives who were entitled to vote into three electoral areas, and authorized them to elect one representative—a European—from each area. This new arrangement was said to be beneficial for the natives, since it gave them three members of the Assembly who would be devoted exclusively to their interests. In practice, this advantage proved to be largely illusory, since the representatives of the natives exerted almost no influence. And of course the natives, whose names had formerly been found on the election rolls in many districts of the Cape, lost their opportunity to influence the elections in these districts.

In 1936 an attempt was made to "satisfy" native opinion by establishing a Native Representative Council, consisting in part of white public officials but mostly of natives chosen by a system of indirect election. The chief objection to this council as an effective instrument of policy was that it had only advisory powers. In practice, the gov-

ernment paid almost no attention to it.

The vast majority of the natives are politically inarticulate. They have no clear understanding of the organization of government, and no interest in its problems. This indifference is natural enough, in view of the wide spread of native illiteracy and the general denial of political rights to black men. But it imposes a serious barrier between the ignorant masses and the few highly educated natives who strive to improve the standard of Bantu life. These native leaders have established a number of organizations—among them, the All-African Convention and the African National Congress. Yet neither these organizations nor any others can fairly claim to speak for the African masses.²

VIEWS REGARDING TREATMENT OF NATIVES

Among the whites of South Africa there are three schools of thought as to the proper treatment of the natives. The humanitarians believe that all men should be treated alike, without regard to race or color, and that economic and social opportunities for natives should be limited only by their capacity. The prospect of the loss of white supremacy and the ultimate development of a coffee-colored race holds no terrors for those who accept this line of reasoning. But the number of such persons among the whites of South Africa is negligible. For the most part they are religious workers or university professors or other intellectuals. They have no appreciable influence on public opinion.

The overwhelming majority of the Europeans in South Africa agree on the fundamental proposition that white supremacy should continue for all time.

² See Z. K. Matthews, "The African Response to Racial Laws," *Foreign Affairs*, March 1951, pp. 91–102. The author is a member of the National Executive of the African National Congress.

But there is sharp disagreement as to the exact manner in which that supremacy should be maintained. Some contend that the natives should be given greater economic opportunities and a larger measure of political representation, though always within clearly defined limits. Such a liberal policy, it is said, would keep the native population better satisfied, and yet would do no real harm to white interests, since the whites would always determine how much to give and how much to withhold.

Many persons, however, view with genuine alarm the proposal to increase native rights, either political or economic. They declare that nothing will satisfy the Bantu, in the long run, short of absolute equality, and that any liberal concessions will merely hasten the day when the numerically superior blacks will try to take over complete control of the country. The only possible solution, according to this school of thought, is to keep the native "in his place"—in other words, to deny him the opportunity to take any part in public affairs or to compete with the white man on even approximately equal terms.

Here, then, is one of the most fundamental issues of South African politics.

THE COLORED AND THE ASIATICS

The same issue arises in connection with the *colored* population—that is, the people of mixed blood. The coloreds are the product of the blending of the original European settlers with the Hottentots, the Bushmen, and slaves from other parts of Africa and from the East Indies. Nearly nine-tenths of the colored people are in the Cape Province; they constitute 40 per cent of the population of Cape Town. Throughout the entire Union, however, their total number is not over one million. In the Cape Province they have traditionally

fared somewhat better than the natives. They have been permitted to vote, to enter the skilled trades, and to obtain higher wages than the native laborers. Yet most of them live in extreme squalor. They have never been able to approximate the economic conditions of the Europeans.

Whether the coloreds should be encouraged to aspire to equality with the whites, or instead should be forced down to the level of the natives, is a question that has long agitated South Africa. The late General James B. M. Hertzog, who presided over the destinies of the South African Union for fifteen years, expressed the moderate view when he said:

If we want to do justice to the colored person, we shall have to include him among the whites, industrially, economically, and politically. . . . It was one of the most foolish attitudes the whites could adopt to drive the colored people to the enemies of the European—and that will happen if we repel him—to allow him to come to rest eventually in the arms of the native.³

But a large section of white public opinion strenuously opposes the idea that the colored man should be treated like a European. After all, he is *non-white*. That automatically puts him in the same class as all the other non-whites.

Among the nonwhites, also, must be listed the Asiatics—the Indians and the Malays whose ancestors were originally brought as indentured servants to work on the sugar plantations of Natal, on the east coast. Today there are about 300,000 Asiatics, mostly in Natal. Government policy has discriminated against them in many ways, yet they have managed to acquire a higher standard of living than the natives. Some of them have even entered the professions. They are a proud people, nurtured in the tra-

³ Quoted in *Round Table*, March 1951, p. 137.

dition of an ancient civilization, and they do not accept discrimination so passively as the other non-European groups. Their treatment in South Africa has even been challenged by India and Pakistan before the Assembly of the United Nations, though without much success.

AFRIKANERS AND BRITISH

The problem of maintaining white supremacy in South Africa is complicated by the deep cleavage between the Afrikaners and the whites of British descent. The Afrikaners are mostly the descendants of the Dutch settlers (the Boers, or farmers) who trekked into the interior more than a century ago to escape British control, and founded the two republics—the Transvaal and the Orange Free State—that are now the northern provinces of the South African Union. Among the Afrikaners there is also some French and German blood.

Approximately 60 per cent of the white population is Afrikaner; the remainder is almost exclusively British. The Afrikaners have their greatest strength in the Orange Free State, in the Transvaal outside of Johannesburg, and in the western part of the Cape Province. Predominantly they are a rural people, though large numbers of them have found their way into the cities in recent years.

The Boer War (1899–1902) cost the Boers their independence, and though they received honorable terms from the British, many of them cherished a strong resentment against their conquerors. Great Britain attempted to dispel that resentment by pursuing an enlightened policy. It encouraged the people of South Africa to merge the four provinces and to prepare a constitution for this new Union. The constitution was completed early in 1909 and passed by the British Parliament as the South Africa Act later in the year. In 1910 the Un-

ion of South Africa was officially proclaimed.

Every Prime Minister of the Union from its inception until 1948 was a Boer general who had once fought against the British. Yet these men were willing to co-operate with Great Britain, and with their own English-speaking neighbors, in the development of South Africa. General Louis Botha, who served as Prime Minister from 1910 until 1919, kept South Africa on the side of Britain during the First World War. General Jan Christiaan Smuts followed a similar policy during World War II. Even General Hertzog, who was frequently accused of anti-British sentiments, seems to have been inspired by love of South Africa rather than hatred of England. "I believe in the British Empire," he once declared, "to the extent that it benefits South Africa. But when its interests are at variance with those of South Africa, I am opposed to it."⁴

Certainly Hertzog did his best to transform his country into an independent republic. He was chiefly responsible for a series of measures that weakened British authority in South Africa. These measures asserted that South Africa was an independent state, that its governor general, though nominally representing the British Crown, could act only upon the advice of South African ministers, and that laws passed by the British Parliament would be inapplicable to South Africa unless repassed by the South African Parliament. To Hertzog these laws meant that South Africa could remain neutral in a war involving Britain, and that it could even secede from the British Commonwealth if it so desired.

Smuts interpreted these statutes somewhat differently. But for a number of

⁴ For a brief discussion of Hertzog's view, see Henry Gibbs, *Twilight in South Africa* (New York: Philosophical Library, 1950), pp. 173–75.

years these two statesmen worked side by side, agreeing to subordinate their differences to the need for co-operative effort in the development of the nation.

Many English-speaking South Africans served under Hertzog and also under Smuts. Every effort was made by responsible South African leaders to assure equal treatment of both language groups. Both English and Afrikaans—the South African version of Dutch—were made official languages, and every candidate for a position in the public service was required to demonstrate reasonable proficiency in the two tongues. "God Save the King" and "Die Stem van Suid Afrika" ("The Voice of South Africa") were placed on an equal footing. So were the Union Jack and South Africa's orange, white, and blue tricolor.

AFRIKAANS LANGUAGE DIGNIFIED

The widespread use of the Afrikaans language, especially in literary form, has been fairly recent. Afrikaans developed in spoken form during the seventeenth and eighteenth centuries, but not until after 1900 did it receive serious attention from educated people. The two languages recognized as official by the South Africa Act of 1909 were Dutch and English.

But the South Africans of Dutch descent were proud of their distinctive culture and traditions. They wished to emphasize their independence—both literary and political—of any other nation. This upsurge of nationalism found ready expression in the Afrikaans language. So Afrikaners deliberately developed the crude idiom and transformed it into a literary language. Afrikaans acquired its novelists and poets. It became a medium of instruction in many schools throughout the Union. In 1916 it was generally accepted by the Dutch Reformed Church, and in 1925 it was officially adopted by the Union

Parliament as one of the languages of South Africa. Today it has almost completely replaced Dutch throughout the Union. Every large city has newspapers published in Afrikaans.

EARLY POLITICS OF THE UNION

When General Botha became the first Prime Minister of the Union of South Africa, in 1910, he governed in the name of the South African National party. Most of its principal figures had been leaders in the former Boer republics, and they still smarted under the memory of their military defeat by Great Britain. The rank and file of the party's members were Afrikaners, not only from the Transvaal and the Orange Free State, but also from the Cape, and even from Natal. The opposition was represented chiefly by the Unionist party, which consisted almost exclusively of persons of British extraction. Unionist strength centered in Natal, in Cape Town and the eastern Cape, and in the great mining area around Johannesburg. This mining area also fostered a small Labor party.

If the Nationalists had been united, they could easily have dominated South African politics. They possessed a clear majority in Parliament and throughout the country. Before long, however, they quarreled violently over a major issue: the proper relationship between the Afrikaans- and English-speaking sections of the population. Botha believed that the two groups should forget their differences and gradually merge into one united people. But another Nationalist leader—General James Hertzog—declared that fusion should be deliberately opposed, lest it lead to a uniform *British* culture at the expense of the Afrikaners.

Eventually Hertzog led most of the Afrikaners out of the party, and Botha governed the nation with a coalition of moderate Afrikaners and persons of

British descent. After Botha's death in 1919, General Smuts carried on essentially the same policies.

Finally, in 1924, the Nationalists managed to gain power. Their victory was due in no small part, however, to the support of Labor. This alliance was unstable and, in a sense, unnatural. It combined the ardent Nationalists, who were pledged to combat British supremacy, with the mine workers, who were mostly British. It became possible only because Labor had not been able to win sufficient support from other English-speaking groups for its program of social security. The Nationalists endorsed social and industrial legislation, and at the same time agreed to abandon their plans for secession from the British Commonwealth.

PARTY REALIGNMENT

By 1933 South Africa was feeling the full effect of the Great Depression. Hertzog's government had lost much of its support, and no longer seemed able to command the allegiance of the South African people. Under such circumstances a realignment of political groups seemed necessary. Hertzog and Smuts finally decided to combine their forces in a new political organization to be known as the United party. Hertzog remained as Prime Minister, and Smuts accepted the position of Deputy Prime Minister. Thus Boers and Britons were reconciled. Together they agreed to work for the common welfare.

Not all Afrikaners accepted this compromise, however. Some of them quarreled with Hertzog and formed a Purified Nationalist party. The leader of this schism was a former clergyman, Dr. Daniel F. Malan, who had been in Parliament since 1919 and had served in Hertzog's Cabinet. Some of the English-speaking people, also, were unwilling to accept the Hertzog-Smuts compromise. They formed a Dominion

party—later known as the South African party—under the leadership of Colonel C. F. Stallard, an English-born Transvaal lawyer. But the United party easily dominated the field. Moderates of both racial groups were happy that a reasonable compromise had been reached.

DURING AND FOLLOWING WORLD WAR II

A new crisis arose, however, at the outbreak of the Second World War. Prime Minister Hertzog believed that the South African Union should demonstrate its right of independent action by remaining neutral, and five members of the Cabinet supported him. Six other Cabinet ministers, however, agreed with General Smuts that South Africa's interests demanded the strongest possible support of Great Britain. The Assembly—the lower and dominant house of South Africa's Parliament—voted to declare war on Germany, and Hertzog resigned as Prime Minister, taking his place beside Malan on the opposition benches. For the next nine years General Smuts governed the country with the support of all political groups except the Nationalists. An election in 1943 demonstrated the general popularity of this coalition.⁵

In 1948, as the time drew near for another general election, the political picture was somewhat confused. The two major groups, of course, were the United party under Smuts and the Reunited National or People's party under Malan. (Hertzog was dead.) But there were a number of "splinter" parties, and no one knew how much they might influence the election. Labor was divided into two factions—a South African Labor party and a United Labor party.

⁵ For a more detailed history of political parties to 1946, see Alexander Brady's *Democracy in the Dominions* (New York: Oxford University Press, 1947), pp. 327–55.

Colonel Stallard's South African party threatened to split the pro-British vote. And, on the other hand, a group calling itself the Afrikaner party offered a menace to Nationalist unity. The Afrikaner party was headed by Nicolas C. Havenga, a former Minister of Finance who had followed Hertzog in the schism of 1939. Havenga's views were not essentially different from those of Malan, yet the two party organizations remained separate.

CAMPAIGN STRATEGY—1948

The opening of the 1948 campaign witnessed aggressive activity by Malan's Nationalists. Their program had only one major plank—to put the black man in his place. Many moderates thought that the black man was already "in his place"—that is, in such a position that he could not possibly offer effective opposition to white supremacy. But the Nationalists professed to see danger in the few minor concessions that had been granted. They expressed the fear that white supremacy might eventually be lost unless drastic steps were taken. And they proposed a drastic program. The name they selected for their proposed course of action was *apartheid*—separateness.

Now practically every white person in South Africa believed that whites and blacks should be kept separate, at least to the extent that such separation was economically feasible. So *apartheid* had a very strong emotional appeal. But of course there were many who wished to know more specifically what the Nationalists had in mind. A committee of party leaders finally succeeded in preparing a vague statement that seemed to meet the requirements of an election campaign. This statement declared that the National party

accepts the Christian guardianship of the European race as the basic principle of its policy with regard to the non-European

racess, and desires to furnish them with the opportunity to develop themselves in their own areas in accordance with their natural genius and capacity, and to assure for them fair and just treatment in the administration of the country. It is definitely opposed to any miscegenation between the European and non-European races, and favors the territorial, political, residential, and, as far as possible, industrial separation of European and non-European.⁶

Concerning relations with the British Commonwealth, the National party adopted a conciliatory attitude. It promised not to cut the nation loose from its ties with the British Crown unless it received the specific authorization of the voters. At the same time, however, it expressed its belief that South Africa should be an independent republic. It promised equal language and cultural rights for both sections of the European population.

There can be no doubt that the Nationalists seized the initiative with their program of *apartheid*. The United party could not offer a similar native policy without being accused of imitation, and it could not submit a radically different native policy without the virtual certainty of losing the election. United party strategists tried to solve this dilemma by offering a seven-point program that almost completely ignored the native question. Emphasis was placed instead on the economic problems of the white population—adequate housing for all, maintenance of trade union rights, conservation of natural resources.

NATIONALIST VICTORY

As election day approached, the Nationalists agreed with the Afrikaner party to leave a number of seats uncontested in Afrikaner strongholds, in exchange for Afrikaner support in other constituencies. The United party made a similar deal with the main body of

⁶ *Statement of National Party Principles, 1948.*

Labor. When all the votes had been counted, it was found that the Nationalists and their allies had won a majority of the seats in the Assembly, though actually polling fewer votes than the United-Labor coalition. Nationalist strength was greatest in the rural districts, which have always had a disproportionate share of parliamentary representation. Colonel Stallard's South African party failed to win a single seat.

Dr. Malan promptly took over as Prime Minister, and appointed Nicolas Havenga Minister of Finance. This appointment was dictated by motives of high strategy, for Havenga's Afrikaner party held the balance of power in the Assembly, and could overthrow the government whenever it desired to do so. For the first time since the creation of the South African Union, the Cabinet was composed solely of Afrikaans-speaking members. Boers were arrayed against Britons as never before since the period of actual hostilities, half a century earlier.

APPLICATION OF *Apartheid*

At last the time had come for a concrete application of *apartheid*. But the Nationalists could not readily make sweeping changes in the relations of whites and blacks. Detribalized natives already lived in their own districts of the cities, and engaged only in occupations that white men did not want. Natives in the reserves were as completely separated from white civilization as anyone could desire.

During the campaign Nationalist orators had frequently given the impression that their plan was to send all the natives back to the reserves, permitting them to come to the white man's cities only as migrant workers, and only as such labor might be required.⁷ But such a plan was utterly impractical. Perhaps it was never really contemplated.

⁷ *Cape Times*, March 8, 11, 17, 1948.

For the gold and diamond mines depended largely on native labor, and they produced most of the nation's wealth. Moreover, native domestic servants were regarded as virtually indispensable. So the talk of returning the urbanized natives to the already overcrowded reserves died away soon after election day.

During the campaign Dr. Malan frequently referred to *apartheid* as a two-sided coin. Its negative side was to be the withdrawal of certain privileges from the natives, especially the privilege of voting; but its positive side was to be the creation of new opportunities for black men, particularly in the areas set aside for their exclusive use. In practice, however, the *apartheid* coin seems to have had only one side. Nothing of any consequence has been done to improve the lot of the natives. The Nationalists have concentrated on the task of making life more difficult for all nonwhites.

This goal has been achieved in a number of ways. Laws forbidding native construction workers to carry on their trades in white areas have been enforced more strictly than ever before, despite the acute shortage of housing in all parts of the Union. The well-established policy of residential segregation of the races has been implemented by a new law, which threatens to force native homeowners out of areas long devoted to their use. New discriminations against the blacks have appeared in the administration of the pension laws. And there have been dozens of minor annoyances, such as the erection of "For Europeans only" signs in places where custom had already prevented any intermingling of the races.

POLICY TOWARD THE COLORED

The chief victims of *apartheid*, however, were the colored people. Traditionally they had been treated more like

whites than natives, but the Malan government deliberately reversed this policy. It enacted a law prohibiting the marriage of whites with nonwhites, though the number of such marriages was already less than one hundred a year, and was steadily decreasing.

Finally, the government turned its attention to the colored franchise. The traditionally liberal Cape Province had long permitted colored persons to vote on the same terms as Europeans, and this arrangement was retained in the constitution of 1910 (the South Africa Act), which further specified that no change in the colored franchise might be made except by a two-thirds vote at a joint meeting of the two houses of Parliament.⁸

Very few colored persons actually voted, however. Their number was limited by qualifications of literacy and property. Moreover, colored women were denied the franchise, whereas white women were not. Yet the colored vote was sometimes sufficient to determine the result of elections in certain districts. And, since colored voters almost invariably cast their ballots for candidates of the United party, the Nationalists had a definite interest in changing the existing arrangement.

⁸ Article 35 of the South Africa Act reads as follows:

"Parliament may by law prescribe the qualifications which shall be necessary to entitle persons to vote at the election of members of the House of Assembly, but no such law shall disqualify any person in the Province of the Cape of Good Hope who, under the laws existing in the Colony of the Cape of Good Hope at the establishment of the Union, is or may become capable of being registered as a voter from being so registered in the Province of the Cape of Good Hope by reason of his race or color only, unless the bill be passed by both Houses of Parliament sitting together, and at the third reading be agreed to by not less than two thirds of the total number of members of both houses. A bill so passed at such joint sitting shall be taken to have been duly passed by both Houses of Parliament."

VIOLATION OF SOUTH AFRICA ACT

Nationalist leaders finally evolved the plan of removing the names of colored persons from the general list of voters and permitting them to vote separately for their own white representatives in the Assembly. In this way their influence on elections could be reduced to a minimum. Spokesmen for the United party immediately raised strenuous objections. Without mentioning the obvious fact that such a change would weaken their own position, they stressed the plain words of the South Africa Act.

But the Nationalists, who obviously could not obtain the two-thirds majority necessary to pass the law over United party objections, declared that the restrictive clauses of the South Africa Act were no longer effective. In 1931 the British Parliament had enacted the Statute of Westminster, which in effect placed the dominions on a par with the United Kingdom. And one of the effects of the Statute of Westminster, according to the Nationalists, was to eliminate the need for more than a simple majority for any act of the Union Parliament.

Leaders of the United party refused to accept this interpretation. They said that the original provisions of the South Africa Act were still legally binding, and that, in any case, they constituted a moral obligation.

Dr. Malan was not very much disturbed by the objections of the United party. But he soon discovered, to his annoyance, that the leader of the Afrikaner party, Nicolas Havenga, also had scruples about the removal of the colored voters from the general roll without a two-thirds vote. The Afrikaner party's balance of power in the Assembly enabled it to block any legislation of which it disapproved. Therefore the colored people seemed certain to retain their voting rights unless a new Parlia-

ment should be elected or Havenga should change his mind.

SOUTH-WEST AFRICA ENTERS

At this point, however, a new development threatened to upset the existing balance of power. South-West Africa, a vast but sparsely settled territory adjoining South Africa, indicated its desire for incorporation into the Union. At one time it had been a German colony, but had been turned over to South Africa as a mandate by the League of Nations shortly after the First World War.

When Malan and his Nationalists came into power in 1948, they soon enacted a law bringing South-West Africa into the Union. The terms of admission were extremely generous: South-West Africa was given a substantial measure of fiscal autonomy, and a much larger representation in the Union Assembly than it might reasonably have expected on the basis of its population. The election for these new members of the Assembly was held in 1950, and the Nationalists succeeded in winning all six seats. Only white persons voted, of course; the natives of South-West Africa were not represented or even consulted in any way.

Subsequently some of the native chiefs appealed to the United Nations, which had assumed the responsibility for supervising the old League of Nations mandates. United Nations protests against South African racial policies, and against the Union's failure to submit trusteeship reports, were dismissed by Malan's government without serious consideration. The Nationalists regarded the annexation of South-West Africa as a *fait accompli*.

One of the important results of the Nationalists' 1950 triumph in the South-West Africa election was to free them from the necessity of working with

Havenga's Afrikaner party. After the election, the Nationalists had a clear majority in the Assembly. And almost immediately afterward, Mr. Havenga changed his mind concerning the necessity of securing a two-thirds vote in Parliament before taking the colored voters off the general roll. He signed with Dr. Malan a joint statement in which they expressed the belief that the proposed change would "in no way constitute a reduction of the existing political rights of the colored people" and that it would not "conflict with the provisions of . . . the South Africa Act."⁹ So at last the stage was set for a major change in Union policy concerning colored voters. The act was passed by an ordinary majority, over the strenuous protests of the United party, and its constitutionality was immediately challenged in the courts.

CONFLICT WITH THE COURTS

In March 1952 the Appellate Division of South Africa's Supreme Court handed down a decision invalidating the Nationalist policy of discrimination against colored voters. All five judges agreed that the government must leave the colored franchise unchanged unless it could secure a two-thirds majority for its proposed amendments, as required by the plain words of the South Africa Act. The Court brushed aside the government's contention that any restriction on the authority of Parliament would be a limitation on the sovereignty of the South African nation. "To say that the Union of S. A. is not a sovereign state simply because Parliament hasn't the power to amend the constitution is to state a manifest absurdity," declared the Court. "It would be surprising to be told that the great and powerful country, the United States, is not sovereign and independent because its Con-

⁹ *Round Table*, March 1951, pp. 135-42.

gress cannot pass any law it pleases."¹⁰

The verdict of South Africa's highest court evidently came as a bitter disappointment to Prime Minister Malan, who had appointed a majority of the judges and seemed to believe that he could count on their political reliability. But neither Malan nor his advisers had any intention of abiding by the Supreme Court's decision. Instead, they speedily introduced a bill to establish a High Court of Parliament, which would have power to override the Supreme Court of the Union on constitutional issues. The so-called High Court of Parliament was to consist of nothing more than the two houses of Parliament in joint session, and its decision could be made by a simple majority. In other words, Parliament would be the final arbiter of the validity of its own acts.

The introduction of the High Court of Parliament bill occasioned angry protests from all parts of South Africa. Strauss and other leaders of the United party demanded the government's resignation. Mass meetings of protest were held in all the principal cities. Some hotheads in Natal even talked of the secession of that province from the Union. But more responsible leaders carefully avoided such threats. Meanwhile, the High Court of Parliament bill was enacted into law by a straight party vote. The High Court of Parliament then met in formal session and solemnly overrode the Supreme Court's decision concerning colored voters. Opposition members of Parliament boycotted these proceedings.

In August 1952 a lower court invalidated the High Court of Parliament Act, thus reasserting judicial authority to pass upon the constitutionality of legislation. Three months later this judgment was upheld by the Appellate

¹⁰ Harris v. Dönges. The judgment of the Court appears in *The Times Law Reports*, May 23, 1952.

Division of the Supreme Court. Prime Minister Malan thereupon announced that he would accept the Court's decision, but that he would appeal the issue to the voters at the election scheduled for the following April.

THE NATIONALISTS GAIN STRENGTH

As the time of the election approached, Malan and his Nationalists once again seized the initiative by declaring themselves the only true champions of white supremacy in South Africa. In strident speeches they pointed to the Mau Mau terrorism in faraway Kenya, and declared that only a Nationalist policy of strict repression could prevent similar atrocities in the South African Union. Thus the Nationalists put the United party on the defensive, as usual. United party orators went to great lengths to emphasize the obvious fact that they too believed in white supremacy, that they too accepted the principle of racial segregation, and that they had no intention of changing the established pattern of racial relations.

Not all South Africans, however, accepted the status quo with such equanimity. The major trade unions went on record as favoring the principle of equal pay for equal work, regardless of race or color. And the Supreme Court of the Union handed down another decision in which it ruled that the railways must provide "substantially equal" facilities for blacks and whites. These developments doubtless strengthened the position of the Nationalists. Many wavering voters apparently decided at almost the last minute that the United party could not be trusted to discipline labor and the Supreme Court in a manner that would assure the preservation of white supremacy.

The 1953 election was a great triumph for the Nationalists. They won a large majority of the seats in Parliament. As in 1948, they failed to receive a ma-

jority of the popular vote, but they concentrated their strength in the overrepresented rural districts. When all the votes had been counted, it was found that the Nationalists had gained almost—but not quite—a two-thirds majority in Parliament. Thus they still lacked, by a very scant margin, the votes necessary to change the South Africa Act. As of the moment, therefore, the Nationalist victory is indecisive. Malan and his followers must still try to find some way to violate the constitution and outwit the courts.

AFRIKANER SUPREMACY

The Nationalist government frequently stresses its desire to assure equal treatment for all persons of European stock, but its policies often have the effect of strengthening Afrikaner supremacy. The 1949 citizenship law is a case in point. Until that year newcomers from Britain automatically became citizens of South Africa after two years of residence, and were thereupon entitled to vote. Since most of them voted for the United party, the Nationalists decided to change this arrangement. They enacted a statute which put Britons on a par with "other foreigners" by requiring them to reside five years in the South African Union before making application for citizenship. The clause permitting automatic citizenship was eliminated.

In 1948, when Dr. Malan was in the midst of a heated political campaign, he sought to win the support of some English-speaking voters by promising not to press his earlier demands for a republic. In 1953 he repeated the essence of that pledge, and to date he has kept his word. But he is now seventy-nine years old, and in poor health. His physical ability to retain the office of Prime Minister is uncertain. And if he should be succeeded by Johannes Strydom, the lawyer from the Transvaal

who seems to have first claim on the post, Nationalist policies might be very different. Strydom is fanatically devoted to the cause of Afrikaner supremacy. He loses no opportunity to aver his belief in a South African republic entirely separate from the British Commonwealth. There are many Afrikaners who share his views. Most of the members of the present Cabinet belong to the *Broederbond*, a secret society dedicated to the triumph of Afrikaner culture and politics.

Afrikaner resentment against Great Britain has recently been strengthened by British policy concerning the territories of Basutoland, Swaziland, and the Bechuanaland Protectorate. These territories, which have been set aside as native reserves, are not legally a part of the Union of South Africa, though they lie within or adjacent to it. Today they are still governed from London, with some advice from native councils.

The British Government long ago half promised that these territories would eventually be turned over to South Africa, and Malan's Nationalists contend that this step should now be taken. Their proud spirits can scarcely bear the thought of great areas that are within the physical limits of the Union, yet not subject to Union control.

Britain, for its part, would be glad to rid itself of the territories. They are a continual, though extremely small, drain on the British treasury, and they give virtually nothing in return. Yet British public opinion cannot conscientiously abandon the native residents of the territories to a South African government based frankly on *apartheid*.

THE UNFINISHED STORY

The rapid march of events has virtually forced the merger of major political groups holding essentially the same views. Havenga's Afrikaner party has united with the Nationalists, and the

principal labor group has thrown in its lot with the United party. Thus two political parties now claim the allegiance of the vast majority of South African voters. The United party is headed by Jacobus G. N. Strauss, the middle-aged lawyer who took over at the death of General Smuts in 1949.

Today the Nationalists seem to be strongly entrenched. Their policy of strident patriotism makes a strong appeal to the dominant Boer element in the population. Their antinative, anti-colored, anti-Indian program has attracted vast numbers of voters. So, too, has their anticommunist policy, manifested chiefly in a Suppression of Communism Act which permits the Minister of the Interior to brand any government or trade union official as a Communist and thereupon bar him from office, without recourse to the courts.

Many groups, however, have manifested strong opposition to Nationalist ideas. The Torch Commando, organized by veterans of the Second World War but now open to all South Africans, has led demonstrations of protest in Cape Town, Johannesburg, and other cities. Natives and colored persons

have conducted protest strikes and have joined with the Indians of Natal in a passive resistance movement. But these activities seem to have been largely ineffective. The nonwhites are not sufficiently united or sufficiently powerful to offer any real opposition, and most of the whites are unwilling to endorse any program that even approximates black-white equality.

The sober truth is that white South Africa faces a tragic dilemma. It can scarcely hope to maintain for all time its political, social, and economic supremacy over the numerically superior nonwhites. Nor, on the other hand, can it permit its nonwhite races to achieve gradual equality without abandoning its own privileged position—and perhaps abandoning South Africa. In the long run, the course of history seems to be against South Africa's white population; but the whites are determined to keep the upper hand as long as possible. Meanwhile, the National and United parties continue to quarrel about the best way of achieving that result.¹¹

Macdonald, Ph.D., Berkeley, California, has been professor of political science at the University of California since 1930, and was formerly assistant professor of political science at the University of Pennsylvania. He has recently returned from the Union of South Africa, where he spent a sabbatical leave. He is author of numerous works in his field, of which the latest are American State Government and Administration (1934, 1940, 1945), Government of the Argentine Republic (1942), and Latin American Politics and Government (1949). He is editor of two volumes of THE ANNALS: The Far East (November 1925) and Planning for City Traffic (September 1927).

LETTER TO THE EDITOR

The editors are glad to publish the following letter from Dr. Feliks Gross.

Dear Sir:

In my article, "Political Emigration from Iron Curtain Countries," which appeared in the September 1950 issue of *THE ANNALS*, an unfortunate error occurred. I wrote on page 183, "There are also a number of fascist groupings of other eastern European nationalities, including Croat and Serb fascists . . . 'Ustachis,' and 'Srbska Narodna Obrana.'" I intended to mention a Serbian extremist organization. By an error, due to my lack of knowledge of Serbo-Croat and difficulty in obtaining the precise names of organizations in the Balkans during the Second World War under Nazi occupation, I used the name "Srbska Narodna Obrana." It certainly was not my intention to refer to the Serbian National Defense Council of America who also call themselves "Srpska Narodna Odbrana" as I discovered later.

As an old friend of the Serbian people and as a defender of General Mihailovich, I was of course aware that the Serbian National Defense Council of America is a patriotic organization of Americans of Serbian descent, created in 1941 for the purpose of helping the Serbian people in their struggle against the Nazi and fascist invaders. After the United States entered

the war, this organization also helped the American war effort.

From the very beginning, the Serbian National Defense Council of America gave its fullest support to the actions of General Drazha Mihailovich, in whom they saw rightly an outstanding fighter not only for Yugoslav independence but for the ideal of freedom and democracy in the whole world.

I regret this misunderstanding particularly because from the beginning of the Yugoslav resistance, which was initiated and carried out under Drazha Mihailovich, I had a great admiration for this struggle which I have often expressed publicly. At the time that official allied support to him was withdrawn, I was one of those who stood publicly for his struggle and idea of freedom. We felt that his fate was one of the greatest tragedies of this war and was responsible for incalculable damage to the prestige of the democracies and the cause of freedom and democracy.

I am writing this letter in the spirit of understanding and sincerity, and I hope that the officials and members of the Serbian National Defense Council will accept my words in the same spirit.

Very sincerely yours,
FELIKS GROSS

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

BURNHAM, JAMES. *Containment or Liberation? An Inquiry into the Aims of United States Foreign Policy*. Pp. 256. New York: John Day Company, 1953. \$3.50.

Books can be divided into four categories: good books, bad books, bad good books, and good bad books. We need not concern ourselves here with the first two, since good books descend so seldom from the rare heights of thought that the average reviewer hardly ever risks being struck by one. The less said about bad books, the better. The influence of bad good books is as wide as it is insidious. Under this category fall those beautifully written and skillfully promoted tomes which lead the reader across cleverly illuminated, albeit familiar, ground and convey a sense of high intellectual adventure—only to leave him stranded, semantically, metaphysically, or merely practically. Any intelligent reader exposed to the current tide of studies of histories and projects for world government will be able to recognize the type. Throughout the ages, it is the good bad books which have exercised the most thought-provoking and, hence, the most healthy influence. Although they do not attain the heights of scholarly and logical excellence—or, perhaps, because of their very shortcomings—they challenge the reader's imagination and critical faculties. They are

controversial; they are seminal. James Burnham's last book falls into this category. *Containment or Liberation* appears to have been written in great haste, is marred by annoying factual inaccuracies, and indulges in blatantly partisan sniping at a variety of targets, some of which have been riddled by better marksmen. Yet it is also a contentious and vigorous critique of our recent foreign policies. The author's brilliant insight flashes fitfully across the pages of our confused history from Yalta to Panmunjom.

When Mr. Burnham hits upon the real issue, the sparks do fly. *Containment or Liberation* is a biting and uninhibited attack upon the many ambiguities and preconceptions which found shelter under what appears to have been the official foreign policy, 1947–1952, for “containing” the Soviets. Mr. Burnham speaks his mind with unprofessional clarity and, not infrequently, with wit. He steps smartly on the toes of not a few of our most privileged professionals, academic and diplomatic, who speak with neither. This book has thus far been noted perfunctorily by the press, receiving considerably less attention than that bestowed upon, let us say, a routine novel-with-a-message on society and sex in the Deep South.

Ever since the outbreak of the Korean War the plausibility of the policy of containment has been diminishing. Mr. Burnham gives the theory, which underlies it

and owes so much to George F. Kennan, the coup de grace. Strictly speaking, it never was policy but rather a compromise between appeasement and what Mr. Burnham calls Liberation—that is, a positive, an offensive policy designed to cut down the Soviet Union to its pre-1939 size. This compromise, I submit in disagreement with Mr. Burnham, was necessary, given the military weakness of the United States after demobilization, the confusion of public opinion due to the incredible obfuscations perpetrated in order to sell us the Soviet Union as a loyal ally and the United Nations as an all-weather shelter, and the debilitated state of postwar Europe. He argues quite rightly that the “containment” policy was perpetuated long after it became clear that the returns of containment were inadequate and that the United States could afford a better policy.

The idea that the Soviet Union can be contained indefinitely, or until something inside it gives, is absurd. It is absurd geographically, for the strategic potentials of Eurasia must weigh increasingly upon the Eurasian rimlands. It is absurd psychologically, because it suggests a posture which American society and all other democratic societies cannot maintain without themselves lapsing into one or the other totalitarian neurosis. It is absurd from the point of view of elementary national security, for it is a policy which would have to be abandoned instantly in case of war and would leave the nation politically, militarily, and psychologically unprepared to fight such a war confidently and aggressively. Moreover, the clear and present danger is not that the Soviet Union will burst through any or all of the many holes perforating the containment dike, but that it stays where it now is and consolidates the immense resources of its Russian base, the satellite states, and China. If the Soviet Union is left for two or three decades undisturbed in its possessions, then the defeat of the West is a statistical certainty, demographically and economically.

Mr. Burnham argues that the United States has no other choice but to seek to pry loose the hold which the Communists have won on Eastern Europe and China and on the Russian people themselves.

This, he argues, can be done by vigorous political warfare, and, in particular, by such individual measures as the establishment of East European governments-in-exile, the incorporation of emigré contingents in NATO, overt and covert operations well inside the Iron Curtain, and, above all else, the kindling in the enslaved peoples under the red star the hope, nay the certainty, of liberation. Since one cannot pursue two contrary policies at the same time—containment for Western home consumption and liberation for propaganda inside the Soviet orbit—we must come down on the side of one policy—that is, liberation. Once our allies know that we mean business, they will rouse themselves and forsake the weak and ambiguous policies—neutralism, Bevanism, Third Forcism—which, though quite understandable in view of our own inconsistencies, hamper the growth of real Western power and drain our own not-so-unlimited economic resources.

Mr. Burnham has a good and wholesome time flaying the myth of Communism as the fruit of poverty. He shows that low standard-of-living peoples, the Turks, Spaniards, Irish, and Pakistanis, have resisted Communist infiltration, and that the French and Italians have not. Even in the United States, Communism has enlisted relatively fewer recruits among the lower income groups than among the exploited, at the rate of \$2,000 per week, in Hollywood. There is no significant correlation between Communism and a low standard of living. Yet the idea that Communism can be fought most successfully by raising standards of living is a corollary of the policy of containment. Though in certain cases Communism and poverty indeed walk hand in hand, an American policy which seeks to fight Communism chiefly by economic aid is bound to fail. People may rebel against hunger; extreme misery inhibits all initiative, even rebellious thought. The people on our side within and outside the Iron Curtain will launch themselves upon a crusade only if they are roused by a powerful idea. There are situations where man must be imbued by crusading zeal in order to muster the sacrificial courage to meet overwhelming odds. We find our-

selves, here and now, in precisely such a situation.

Mr. Burnham's good bad book raises more questions than it answers. I hope it will not be ignored, for Mr. Burnham possesses that inestimable virtue of the political writer, the courage of his convictions. This courage has led Mr. Burnham into some deep logical traps; it has, however, endowed him at times with the fortitude to drive further and harder than his more circumspect fellow experts have managed to do.

University of Pennsylvania

MARTIN, ANDREW. *Collective Security: A Progress Report*. Pp. 244, tables. New York: (distributed in the U. S. by Columbia University Press), 1952. \$1.25.

To all concerned with the attainment of a larger measure of international security and a more effective United Nations, this scholarly analysis, sponsored by UNESCO (United Nations Educational, Scientific, and Cultural Organization), of the lessons of 50 years of man's attempt to deal with the regulation of armaments, the pacific settlement of disputes, and the maintenance of international peace and security will provide instructive reading. Written by a professor at Oxford, this small volume contains an appraisal of the road that has been traveled and the problems now faced in attempting to gain international security through the United Nations that is rewarding and thought provoking.

Recognizing the imperfections in the present United Nations collective security system, the author believes that nevertheless there is a reasonable middle ground between the overoptimism of 1945 (and correspondingly of the League two decades earlier), and the pessimism of more recent times. It is admitted that some of the most serious threats to peace may, for a long time to come, have to be dealt with by improvisation, as in the case of dealing with the Communist aggression in Korea, and by recourse to the General Assembly with its restricted powers rather than by Security Council action as originally visualized. It is also acknowledged that the

action of the United Nations with respect to the Korean War leaves many uncertainties for the future, that there are questions whether the General Assembly will always be able to act with sufficient speed in an emergency, and whether the Members will hold adequate forces available for call by the General Assembly in accordance with the Uniting for Peace Resolutions. Nevertheless, the author feels the United Nations system "is viable in the long run, and, given sufficient moral cohesion among the majority of Members, it is even in the short run capable of curing the ill-effects of imperfect implementation." The present weakness of the United Nations "is the result not of a misconceived constitution, but of imperfect implementation of a workable one."

Discarding both the idea of preventive war to maintain a status quo and any immediate flight of fancy to world federation, the author prefers the course of "gradual transmutation of international relations into a closely integrated system" through successive amendments of the Charter when and as possible and by a sustained attack on the causes of war and insecurity. In this connection he sees the historically unprecedented, many-fronted study being given to the causes of international conflict by the economic and social agencies of the United Nations as one of the most auspicious factors of present world organization. For in the long run, collective security can be assured only by creating a state of affairs in which the incentives to violence are removed and all parties become aware that any attempts to commit a breach of the peace will be frustrated by overwhelming force. The chief fault which the author finds in the United Nations as presently constituted is the insufficient power which is reposed in it to bring about needful changes in the status quo by peaceful means.

A tabular "synopsis," contained in an Appendix, affords a handy reference guide to the disputes and situations threatening peace and security referred to the United Nations since 1946 and the measures taken with respect to them.

Massachusetts Institute of Technology

VARG, PAUL A. *Open Door Diplomats: The Life of W. W. Rockhill*. (Illinois Studies in the Social Sciences: Volume XXXIII, No. 4.) Pp. ix, 141. Urbana: University of Illinois Press, 1952. Cloth \$3.50; paper \$2.50.

It is difficult to understand why one of America's outstanding diplomats should have been neglected this long. W. W. Rockhill, the author of *Open Door Policy* was a diplomatic "sport," trained in the humanities and classics, and a career diplomat before the days the United States had recognized the need for professionalizing its foreign service. This introductory study is well written and suggestive, although it lacks the psychological, political, and sociological insights which might have contributed much to the understanding of the man and his contribution to society. Rockhill was a scholar whose accounts of Mongolia and Tibet were acknowledged by William Graham Sumner as having contributed greatly to the theory of social relativism. Because he knew the language and the history of China he became a symbol of the expert and well-trained diplomat whose modern counterpart can be found in Charles Bohlen or George Kennan.

But unlike either of the latter, Rockhill undervalued power assessments. This was indicated by his enthusiastic approval of Japan's annexation of Korea in 1905, his underestimation of Russian intentions in Manchuria in 1911, and his failing to see that Japan had won a victory at China's expense with the Root-Takahira Agreement of 1907. Again, his historical-anthropological training did not prepare him adequately to recognize the nature of the Chinese revolution brought about by nationalism. Unlike the American political scientist, Paul Reinsch, then minister in Peking, Rockhill praised the Empire and deprecated the attempts at democracy and modernization which had inspired the new Chinese government. Although he may have lacked an awareness of the concept of social change, his love of Chinese culture and religion and his appreciation of the oriental tradition may have made him less than enthusiastic in supporting the more extreme demands of the United States missionaries in the Orient.

But if Rockhill was occasionally betrayed by his historical perspective, he was never guilty of stupid, blundering policies like some of his colleagues. His superior officer, Charles Denby, who was Minister to China in 1886, knew neither French nor any other foreign language, spoke of "Hungaria," and believed that the Cossacks came from Corsica. Again, Robert Bacon, Assistant Secretary of State in 1906, so overestimated the power of China that he informed von Sternburg that it was a serious mistake for Russia to withdraw from Manchuria inasmuch as her presence there had provided a necessary check on China! It is unfortunate that this introductory essay gives no adequate explanation for the personal friendship of Alfred E. Hhippsley and Rockhill, nor an accounting for Rockhill's intimate acquaintance with Theodore Roosevelt, John Hay, and others. It was Hay who acknowledged Rockhill's expertise to the point of accepting his proposed open-door doctrine and the establishment of the Boxer indemnity funds for Chinese education in the United States.

MARX, DANIEL, JR. *International Shipping Cartels: A Study of Industrial Self-Regulation by Shipping Conferences*. Pp. xiii, 323. Princeton, N. J.: Princeton University Press, 1953. \$6.00.

It is impossible to do justice to a book of this substance in a brief review. As the author says in his preface, he has set himself the task of investigating the record of some of the earliest cartels in international trade. He devotes his first three chapters to a careful analysis of the economic aspects of ocean shipping, giving due attention to all the puzzles of alternative location for operations, joint costs, the effects of fluctuations in the general level of international trade, and other intricacies.

He then reviews the history of shipping conferences and their trade practices, relying on authoritative evidence collected by investigating agencies in Britain and the United States. Recognizing that these inquiries were made some years ago, he assembles a great deal of relevant informa-

tion on the current status of ocean shipping and government regulation of the industry.

His concluding chapters assess the practical possibilities worth consideration by the general public, shippers, carriers, and regulatory bodies. Here his conclusions are necessarily cautious; for he has already exposed the complexity of the problem. Nevertheless, he is willing to commit himself to some suggestions for action. He grants the need for some self-regulation by the industry, but suggests that an international agency and regulatory authorities in various countries could be of real value in correcting abuses and maintaining some degree of stability in shipping services and rates. These proposals are put forward temperately and carefully, and will doubtless prove disappointing to advocates of self-organization in industry as well as to avowed critics of cartels.

The whole book is free of the technical language which occasionally makes a work of economic analysis inaccessible to the layman. It can be heartily recommended to any citizen who wishes to learn as much as he can about an important and complex subject. Ample documentation, careful analysis, straightforward language all combine to assure such a reader that he is being reliably informed, and that proposals for action have been thoroughly and objectively weighed. This reviewer learned a great deal from the book—his previous knowledge being largely based on a limited reading of the novels of Joseph Conrad and the short stories of William McFee. The importance of ocean transport—though the skies are filling with airplanes—fully justifies careful study. This book admirably meets this need; and as the author modestly suggests, much of the record in shipping throws light on other transport problems of the twentieth century.

AMERICAN GOVERNMENT AND HISTORY

VANDERBILT, ARTHUR T. *The Doctrine of the Separation of Powers and Its Present-*

Day Significance. Pp. xiii, 144. Lincoln: University of Nebraska Press, 1953. \$2.50.

The three lectures which are assembled in this book were delivered at the University of Nebraska just a year ago. They represent the accumulated experience and mature thinking of one of the most puissant legal minds of our generation. The extensive study and distilled wisdom which have gone into them are the essence of the author—for many years an outstanding trial lawyer and contemporaneously dean of a great law school, and now, and for the past few years, Chief Justice of the State of New Jersey, the new constitution of which state he had a large part in farming.

The first lecture deals with the subject historically and geographically. The origin of the doctrine is traced back to Plato and Aristotle, down through the political philosophers of the medieval world, on to the thinking of Montesquieu "who first saw the light," and thence to its development and expression in modern Europe, in the Latin-American republics, and in our own Constitution.

The emergence and dictatorship of Hitler, the Soviet constitution of 1936, and the emergency clauses of the constitutions of fifteen of the twenty Latin-American countries, permitting the restriction or suspension of ordinary constitutional guarantees, afford him a splendid modern clinic for the demonstration of the readiness with which a strong executive may assume and, at least for a protracted period, maintain absolute control of a nation. Clothed with such power, the executive invariably assimilates the functions of the legislative and brushes aside those of the judicial branch, and the separation of powers no longer exists. He closes the lecture with a review of the origin of the doctrine in our own form of government and of its varied history from 1787 to the present day. "The contest between the three departments in national, state and local governments still goes on from day to day with varying results, but with all of the skirmishes, sometimes none too edifying, the goal remains constant—a government of law rather than of official will or whim."

The second and third lectures constitute an expansion, confined to the American scene, of this closing paragraph of the first. The author discusses the rapidly accelerating growth of the dominance of the power of the federal government over that of the states; the evolution and development of the President's legislative powers; the proliferation of administrative agencies; the finality of their decisions, due in part to legislative empowerment and in part to judicial deference; the rare but ever-threatening interference by Congress with the judicial process; and, finally, the absolute necessity of the insistence by the American people on the continued separation of the three powers of government if their way of life is to be preserved. He closes his masterly analysis with the admonition, "On respect for the doctrine of the separation of powers, not as a technical rule of law but as a guide to the sound functioning of government, rests not only the stability of this nation but of every other nation and the freedom not only of our own citizens but of the citizens of every other country."

ROBERT T. MCCracken

Philadelphia, Pa.

CROSSKEY, WILLIAM WINSLOW. *Politics and the Constitution in the History of the United States.* 2 vol. Pp. xi, 708; viii, 709–1410. Chicago: University of Chicago Press, 1953. \$20.00.

This is an amazing performance—a 1400-page initial segment of a proposed more extensive study, some of which is already "in draft." The thesis is that our constitutional development for more than a century and a half is not what the Fathers intended and that this "is a matter unknown, alike, to our accepted constitutional law and our conventional American histories" (page vii). There is no evidence that the author thinks it a cursed spite that he was sent to set it right. His dominant temper is that of the evangelist rather than that of the scholar, although he invokes the fruit of extensive and remote research to his purpose. He makes it clear that the Supreme Court in purporting to interpret the words of the Constitution has disregarded much contemporary usage, though one cannot

always be sure that all the usage was uniformly harmonious.

One may be well satisfied with the evidence that in 1787 "imports" and "exports" included goods crossing state as well as national boundaries and that Miller's rejection of Marshall's acceptance of this view was historically and linguistically unwarranted. Whether "among the several states" was so widely understood to mean "in" rather than "between" is less certain, but Marshall himself took the commerce subject to national control to include that "which concerns more states than one." Mr. Crosskey makes it clear from other clauses in the Constitution that there was no warrant for the view that the commerce grant to Congress was that of an exclusive power and therefore that it was illegitimate to rule that the commerce clause "of its own force" could preclude the exercise of regulatory powers by the states. We have long known that this was a judicial invention as much as the "original package" rule, and as much as the later view that judicial interpretation of the "silence of Congress" has authentic constitutional warrant.

Less credence can be given to Mr. Crosskey's other view that to a large extent the design of the document was to create something approaching a unitary national state. One who has read the debates in the state ratifying conventions may feel confident that such a design, if avowed, would have ensured rejection. And whence does the Constitution derive its authority? The Framers were informal proposers. It took the state ratifications to get the organization going, and then it started in disregard of the existing fundamental law of the Articles of Confederation.

So with reason it may be urged that the twentieth century burrowings into scattered and little known eighteenth-century documents and the invocation of contemporary popular usages cannot yield legally or constitutionally binding authority on the interpretation of the scheme of government which ultimately emerged. We can accept the view that this scheme is to a large extent a judicial creation—and indeed from time to time an undulating one—without agreeing that there is a Mt. Sinai

verbal compulsion to confine legitimacy to a very different structure and organism.

THOMAS REED POWELL

Harvard Law School

U. S. PRESIDENT'S COMMISSION ON IMMIGRATION AND NATURALIZATION. *Whom We Shall Welcome*. Report of the President's Commission on Immigration and Naturalization. Pp. xv, 319. Washington, D. C.: U. S. Government Printing Office, 1953. 75 cents.

When historians tell the final story of the Truman administrations, among the important results will be the disagreements between the President and the Congress with reference to immigration legislation. Mr. Truman "reluctantly" signed the Displaced Persons Act of 1948, and vetoed the Internal Security Act of 1950 and the Immigration and Nationality Act of 1952. The basic difference between the Congress and Mr. Truman was the underlying philosophy of such legislation. Mr. Truman wanted "liberalization" to afford relief for millions of persons in conditions of misery not of their making. Congress wanted complete security and biological and cultural homogeneity reflected in our immigration laws. Mr. Truman emphasized our responsibility to other nations; Congress insisted its responsibility was and is to the American people and their general welfare.

The Report under review, which deals with the McCarran-Walter bill (Immigration and Nationality Act of 1952), was the subject of more than 2,000 pages of testimony from September, 1952, to January 1, 1953, in eleven different cities from coast to coast. The Report summarizes the testimony and follows fairly closely the veto recommendations of Mr. Truman.

Among the issues involved were: (1) national origins as the basis for quota allocations; (2) the total number to be admitted under such quotas; (3) the question of quota, nonquota, and nonimmigrant categories; (3) the racial bias in quota computations; (4) the security provisions relating to subversives; and (5) the problem of unused quotas by large quota countries. Without a reasonable familiarity with the Displaced Persons Act and the

Internal Security Act, an understanding of the Immigration and Nationality Act of 1952 is impossible.

Our present quota allocations are based on the Johnson Act of 1924, limiting European quota immigration to about 150,000, based on the 1920 population, excluding Indians, Negroes, and Western hemisphere immigrants. This Report recommends basing immigration on the 1950 census, including those excluded in the 1924 Act. It further recommends a unified quota system under a separate Commission rather than under the Departments of State and Justice, as now obtains. It questions the racial basis as incorporated with respect to the Asia-Pacific triangle and colonial possessions in the Western hemisphere. The Report points out that we are departing from our historical role as a haven for the oppressed and persecuted.

The Report also maintains that the United States must assume the responsibility for affording worthy and honorable persons an opportunity to enter the United States so they may rejoin their families, and offer other unfortunates an opportunity to reorganize their lives and make a new beginning without fear.

The essential problem involved is one of policy. Is it the function of Congress to promote good will and win support for our way of life among the nations, or is it the function of our law makers to promote the general welfare of the people of the United States as they understand it? Apparently the Congress was concerned with what it considered best for this country. Whether it is or was wrong, is to be decided by each person for himself. Speaking only for myself, I should prefer complete elimination of national origins quotas and admission of 300,000 immigrants annually on a first-come-first-served basis so long as each applicant meets the requirements of our immigration laws and regulations.

J. P. SHALLOO

University of Pennsylvania

HOLMES, OLIVER W., and HAROLD J. LASKI. *Holmes-Laski Letters: The Correspondence of Mr. Justice Holmes and Harold J. Laski, 1916-1935*. Edited by Mark De Wolfe Howe. Foreword by Felix

Frankfurter. 2 vols. Pp. xvi, 813; v, 815-1650. Cambridge, Mass.: Harvard University Press, 1953. \$12.50.

Early in July 1916 Harold Laski accompanied Felix Frankfurter on a visit to Justice Holmes's summer residence at Beverly Farms, thirty miles north of Boston. Laski, a stripling of 23, wrote a thank-you note. Holmes, in his seventy-fifth year and already a venerable figure at the top of the legal pantheon, penned a reply. This exchange of notes was the source of a stream of correspondence which records the extraordinary friendship born of that first meeting. It is that correspondence, composed entirely of handwritten letters, which is compiled in these volumes. All the letters are included, except for a few trifling omissions, without abridgment or excision. The last entry is Laski's letter dated February 17, 1935, just a fortnight before Holmes died.

It is no light task to read these volumes through in their entirety. After all, even the discourse of titans becomes something less than nectar when poured into 1500 pages of fine print. The game is worth the candle, though, for the perusal of these letters is a rich and rewarding experience.

This correspondence is a veritable carnival of ideas, a kaleidoscope of persons, places, and things. It is peopled with the great and near-great from various walks of life in contemporary England and America. The writers ramble over the universe and run the gamut from Aristotle to Charlie Chaplin. They write with equal ease of the cosmic and the parochial, the trivial and the profound, and engage in free comment on law, religion, science, philosophy, literature, art, political theory, and government. They unbosom themselves in the intimacy of these letters and voice extravagances and heresies which will offend some readers.

The main currency of the letters is the exchange of ideas on political theory and law, and *métiers justes* of the correspondents. Some of the recurring themes in this respect are: the nature of law and the judicial process; the concept of sovereignty, on which Holmes and Laski seemed forever to disagree; Holmes's cryptic and challenging dictum that "all society rests on

the death of men." Holmes's view that "law is what the courts will do" finds frequent expression here. For instance, he says of Chief Justice Taft's opinion in the celebrated case of *Truax v. Corrigan*, decided in 1921: "I think the Chief's performance in the above-mentioned case is rather spongy—copious citations of generalities become platitudes which don't bring you any nearer to the concrete case. I always say that I will admit any general proposition that anyone wants to lay down and decide the case either way" (Letter of Dec. 22, 1921).

These letters clearly reflect the diverse temperaments of the writers. Holmes seems calm and dispassionate, sometimes almost detached in the expression of his views—all intellectual sinew, no emotional fat. Laski is effervescent, often vehement. It was precisely the exuberant and controversial strains in his character which his enemies resented. His admirers and friends, among whom were numbered many of the world's notables of the past half-century, have always argued that a core of intellectual greatness counts more than the husk of human failing. In the words of Zechariah Chafee, Jr., distinguished jurist and humanist: "There are few men with whom I have disagreed so often, and fewer still with whom I have passed so many happy hours and from whom I have learned so much." And Holmes's high esteem for Laski is revealed time and again in these very letters. Four years after their first meeting, when Laski was about to return to England, Holmes wrote: "I shall miss you sadly. There is no other man I should miss so much." And again, toward the end, he wrote: "One of the greatest pleasures of my waning life is a letter from you. Please keep on writing to me" (Letters of March 31, 1920, Nov. 27, 1931, Nov. 23, 1932).

Personal history has a telling way of illuminating present issues. There is in these pages an interesting commentary on academic freedom, a burning issue of our day. Laski's attitude and activity in the Boston Police Strike of 1919 offended many influential Bostonians. When Laski's dismissal from Harvard was urged, President Lowell declared: "If the overseers ask for

Laski's resignation, they will get mine," but he also told Laski "in confidence not to expect promotion from the University" (pp. 213-218).

Mr. Howe, Professor of Law at Harvard, and Holmes's official biographer, deserves a special word of high praise for his excellent annotations, which even tutored readers will find a necessary legend to many passages. Mention should also be made of the valuable biographical appendix (pp. 1485-1524), the detailed index (pp. 1527-1650), and the knowing Foreword by Mr. Justice Frankfurter, the "Felix" who haunts these papers.

The future readers of these volumes will, no doubt, include some who seek confirmation of their prejudgments of the correspondents, many who come as searchers in a source book, and others who crave the pleasure of tracing an adventure in ideas. They will not be disappointed in their respective quests, but each will discover anew that "the straightest way to the heart of a matter is an old letter."

BERNARD F. CATALDO

University of Pennsylvania

ROSENBLUM, MORRIS V. *Peace Through Strength: Bernard Baruch and a Blueprint for Security*. Pp. 325. New York: Farrar, Straus and Young, 1953. \$3.95.

This book I found interesting and well worth reading. It is written by an awed disciple of a great man. It is an admitted argument for Mr. Baruch's well-known positions. Yet it seems to me to ring true.

The words—wise, dedicated, unique—naturally associate themselves with the name Baruch. It is well to gather this record of his distinctive services and of his still so presently potent wisdom.

But the title "Peace Through Strength" and the subtitle "A Blueprint for Security" seem to me exaggerations. Neither Mr. Baruch nor any man alive can produce a real blueprint on which we can be assured of building either peace or security in today's tortured world. In such a world, strength will merely greatly increase our chances of surviving as free men.

So too the nine policies, the Blueprint for Security, with which the book is climaxed, appear to be in general sound principles—

but only principles. For example, the seventh is: "A realistic control plan for atomic and hydrogen weapons. . . ." Through no fault of ours, we are wholly unable to carry out such a plan so it produces no security.

The book appeals to me most in the shafts of light it casts on certain aspects of Mr. Baruch:

(1) *His willingness to yield any natural desire for high official position in order to be of the most use.* He declined President Wilson's offer of the Secretaryship of the Treasury because he "was more concerned in 1919 with international issues, and wanted . . . to be free to advise Wilson in Paris."

(2) *Both his time and his money were placed at the service of the Government, not only in war but during peace, over almost forty years.* In 1916, his salary was "nothing—and pay my own expenses." In World War I he found it necessary to send an official Government economic mission to England. At the last minute it was found that there was no money to pay for this expense. Mr. Baruch paid it from his own pocket. The cost was \$85,000. In 1937, Assistant Secretary of War Louis Johnson concurred with Mr. Baruch as to the acute need for strategic stockpiles but "doubted if he could get the necessary appropriation of \$3,000,000." Mr. Baruch "offered to foot the bill, but somehow Johnson eventually got the money from Congress."

(3) *"... one of my principal aims in life was to see that our country should never be caught again as it was in 1917, devoid of a plan for industrial preparedness. . . . Surely this was an aim which he never forgot.* In the book's Afterword, Charles E. Wilson (Electric Charlie) states that "Bernard Baruch's everlasting willingness to devote his time and energies to his country's problems is unique."

I like the phrase, "Baruch's reputation rests upon his lifelong habit of very often being right." As just one example, we may look from the hindsight of today at his prophecy of September 2, 1950: "I fear that the people in Washington do not realize the full extent of the difficulties that lie before us. They are going at it piecemeal, with all the tragic costs that will come from that kind of approach."

In the periods preceding and during three wars, the last of which is still going on, Mr. Baruch has inveighed against the "piecemeal" approach and the resultant unpreparedness and inflation. His habit has been to reach for the jugular of each crisis. In this he perhaps has often underestimated the political difficulties. The author states that Montagu Norman described these with the words: ". . . dictatorships could mobilize speedily and effectively, but only God Almighty could eventually mobilize a democracy." Certainly in this effort in three mobilizations the Lord has had a lot of help from Bernard Baruch.

TRACY S. VOORHEES

Brooklyn, New York

CHODOROV, FRANK. *One Is a Crowd: Reflections of an Individualist*. Pp. xiii, 176. New York: Devin-Adair Company, 1952. \$2.75.

This series of disjointed essays reflects the prejudices of an aging follower of Henry George who has, with advancing years, come to regard the income tax as the key to America's descent into collectivism. The introduction by John Chamberlain heralds the volume as "good instruction" and "first-rate entertainment."

Especially in the last respect, the volume lives up to expectations. The author is ardently championing an individualism so extreme in character as to leave the National Association of Manufacturers as an agent of collectivism. "To put it bluntly," he affirms, "Communism will not be imported from Moscow; it will come out of Wall Street and Main Street. . . . The cause of private property has been championed by men who had no interest in it; their main concern has always been with the institution of privilege which has grown up alongside private property."

Condemnation is heaped upon the State and upon accepted political institutions. For "the incontrovertible fact of history is that politics is purely an expense, a drain on the marketplace and cannot be anything else. . . . The income tax completely changed the character of the American politician." Its imposition "completely destroys the immunity of property. It flatly

declares a prior right of the State to all things produced." It "unashamedly proclaims the doctrine of collectivized wealth" and "must produce a slave psychology. . . . The repeal of the Sixteenth Amendment is the one thing that we can do to save America from the dust-pile fate of other civilizations."

Yet the income tax does not alone face condemnation. Minimum-wage laws—indeed "all legislation dealing with labor-employer relations—are concessions to the communist conception of wages." Governmental operation of the postal service is deemed monopolistic, inefficient, and, essentially, the creation of a politician's paradise. South Carolina is praised for passing a law which allows local communities to rent their educational equipment to private institutions.

Individualism, he concludes, is "the modern radicalism." "No creed in the history of the world ever captured the hearts and minds of men as has the modern creed of Statism. Men may differ in their rituals, they may call themselves Americans, Englishmen or Russians (New Dealers, Socialists or Communists), but in their adherence to the doctrine of the omnipotence of the State, they are as one. It is the universal religion. . . . And what is Washington but the shrine of the largest golden calf in the world?"

All this is most pleasant reading for one who wishes a simple answer to most complex problems. Just what should be done about such minor issues as national defense, the federal debt, public utility rates, or the monetary system does not emerge. Presumably Natural Law will provide the solution to these as to issues of social security, agricultural prices, or wages. And why the income tax is so uniquely charged with iniquity is not altogether apparent. It would be presumed that any tax is the exercise of the prior right of the state to a share in distribution.

COLSTON E. WARNE

Amherst College

EWING, CORTEZ A. M. *Primary Elections in the South: A Study in Uniparty Politics*. Pp. xii, 112. Norman: University of Oklahoma Press, 1953. \$2.75.

This study consists of a collection of statistics on primary elections in eleven southern states, covering a total of 3,843 contests (including those which were unopposed). The statistics relate to the number of candidates and the votes cast in primary elections for statewide offices, members of congress, state legislature, and the judiciary. It does not cover primaries for county and other local offices, except for judges. The great bulk of the statistics relate to the dominant Democratic primary, though some statistics are given on Republican primaries in several states. The author experienced considerable difficulties in compiling statistics on primary elections, which in most states are not published; while he states that the coverage is adequate, unfortunately he does not state precisely the dates, states, and contests for which data were collected.

The author states that the purpose of his study is "to examine the primary system of the South and to determine, if possible, whether the intraparty struggle produces results that are not at variance with the demands of democratic procedure" (p. 7). He does not, however, define the meaning of the "demands of democratic procedure," and his findings are, in fact, strictly statistical. Some of these statistical data are quite significant. For example, in the primary elections, 40 per cent of the candidates were unopposed. In states with runoff primaries 42.6 per cent of the candidates were unopposed, whereas in the single primary states the corresponding statistic was 32.7 per cent. But there was wide variation in offices and from state to state. Only 6.3 per cent of the primary elections for governor were uncontested, while 65 per cent of the county judicial nominations were unopposed. The largest percentage of contests were for state administrative offices and for United States Senator. In several states more than half of the primary elections were uncontested, but in Oklahoma over 90 per cent were contested. Surprisingly, there were relatively more contests in the Republican party primaries than in the Democratic, though the candidates usually had little or no chance of final election. As would be expected, incumbents had a far higher percentage

of unopposed candidacies than non-incumbents; 46 per cent of the incumbents received renominations without facing an opponent, while only 20 per cent of non-incumbents were unopposed.

Although a statistical study of this type is of value, it also has definite limitations, which the author does not indicate. The lumping together of statistics from the several states, each with its individual traditions and political systems, inevitably blurs the findings. The average number of candidates for each office, for example, is of interest, but would be of greater significance if the reasons for the variations from state to state, from year to year, and from one office to another were explored. The study throws little light on such problems as what causes persons to run for office, what factors affect the kind of persons who enter the race, what role the party organizations play in promoting candidacies and also in discouraging those who might desire to contest the nominee who has received the organization approval, whether the primary election system in the South tends to preserve the one-party system, and to what extent personal or factional contests take the place of party struggles in other states.

JOSEPH P. HARRIS

University of California
Berkeley, California

DEARING, MARY R. *Veterans in Politics*. Pp. xiii, 523. Baton Rouge: Louisiana State University Press, 1952. \$6.00.

The title of this study is somewhat misleading. The subtitle, "The Story of the G. A. R.," is more to the point. It is in no way a comparative analysis of veterans' pressure politics. Obviously, it would have been a more valuable contribution to the literature of American politics if it had been a comparative analysis. Even as a doctoral dissertation, it should have been written against the background of the mass of material already assembled concerning the Legion and other veterans' organizations.

Mrs. Dearing has done a magnificent mechanical job of examining and systematically assembling just about everything that has been said or written about the Grand

Army of the Republic. In fact one is a bit overwhelmed with the extent of detail. However, it is more of a mechanical than a mental exercise. True, Mrs. Dearing reveals a considerable amount of reflective thinking about the G. A. R. Nevertheless, she does not indicate any great familiarity with the literature of pressure politics in general nor even with the studies of veterans in politics in particular.

Students of pressure politics today want to know to what extent there is a pattern among veterans' groups. If there is a pattern, why do they seem to follow such a pattern? For example, why does there seem to be so much emphasis on nationalism and patriotism in veterans' groups? Why do they seem to believe they have a monopoly on tests of loyalty? To what extent do they use political parties or politicians to secure special privileges for themselves? Perhaps even more important today, to what extent do parties and politicians use veterans' organizations to accomplish their objectives?

This is not to suggest that we do not need the type of task which Mrs. Dearing has undertaken. Others can go on from here. Eventually the public will be well enough informed to respond more sympathetically to the kind of approach undertaken by Adlai Stevenson in the 1952 presidential campaign when he frankly informed the American Legion in particular and other pressure groups as well that if he were elected President such groups would be accorded no special privileges inconsistent with the public interest.

E. ALLEN HELMS

Ohio State University

H. HALE BELLOT. *American History and American Historians: A Review of Recent Contributions to the Interpretation of the History of the United States*. Pp. x, 336, 7 maps. Norman: University of Oklahoma Press, 1952. \$4.00.

A sincere book by a foreigner on American history should never be ignored. A competent, rich treatise such as this one by that rare species—a foreign professor of American history (University of London)—is a profound satisfaction. The existence of the ocean distance does not guarantee

perspective but it seems to help with refreshing insights.

Professor Bellot's purpose is to answer what American history is about. Bellot considers that most of the American history published before 1910 has been outmoded. He frankly admits that he has said little about and gained little from historical biography. He feels that during the past 75 years, three influences have shaped American history—the liberalization of the academic curriculum, the establishment of professional standards, "and the adoption of a distinctively American in place of what had been an essentially European point of view" (p. 1).

This is a good "briefing" volume for adults and for the specializing graduate student. Extensive bibliographies cluster around the seven chapters—Recent American Historiography, the Mainland Colonies in the Eighteenth Century, the Revolution and the Constitution, the Settlement of the Mississippi Valley, Sectional Conflict, "Integration and Reform," and the concluding chapter which is labeled, significantly, "New Complexities."

This is a well-written book, but not even an Englishman can persuade me that paragraphs must be so lengthy.

What does this distinguished scholar find missing in our scholarship and self-analysis? Here are a few examples.

He finds that American history has not been related to world history (although I must add that some persons are trying to do just this). "The competent study of American diplomatic history is of quite recent origin" (p. 287).

In the problem of the western lands, the conflict of interest between tidewater and back country, "and the relentless pressure of a continued passive balance of trade upon the economy of a debtor community" have not "received sufficiently penetrating analysis" (p. 59). Much remains to be done on the intellectual history of the seventeenth and eighteenth centuries (pp. 62, 102). He notes that the history of the lower Mississippi valley "has been much less adequately studied than that of the Middle West" (p. 145). And he concludes that national history cannot be fully understood without working through migra-

tion, immigration, public land, and transportation policy to get at the political experience of the several states in the valley (p. 148). He considers it a curiosity that so little expert attention has been given to the history of transportation.

The impact of the settlement of the Mississippi valley upon the Atlantic states and their domestic history, between 1815 and 1861 "have as yet been but imperfectly studied" (p. 197). The history of the nineteenth century in the North Atlantic states has lagged—"the historiographical counterpart" of the tardiness of the nations of Western Europe to write their own domestic histories during this period (p. 168). Further, he considers it remarkable "how little scientific work of the first quality has yet been done upon the history of the conduct of the American Civil War" (p. 189).

He feels that the history of citizenship in the United States is a highly complex matter awaiting satisfactory and exhaustive treatment (p. 216). The established parties have not received sufficient treatment (p. 249). The development of "total" business and "total" unionism, operating under the rule of success, and a challenge to "the new patriotism" as much as any sectionalism, has been imperfectly examined. The study of the history of labor in the states "has barely begun" (pp. 250, 254, 257).

There is wisdom in this book. "The solution of the problem of yesterday engages the public mind of to-day while the problem of to-day treads unnoticed upon its heels" (p. 214). RICHARD H. HEINDEL
Washington, D. C.

FREEMAN, DOUGLAS SOUTHALL. *George Washington: A Biography. Volume V: Victory with the Help of France.* Pp. xvi, 570. New York: Charles Scribner's Sons, 1952. \$7.50.

This volume covers six years in the life of the mature Washington. During this period (1778-1783) the responsibilities of his position produced incidents that tended to demonstrate further his already determined character and personality. Fewer than in the earlier years are instances in which a biographer can see obvious development of character. However, examples

of continued development are found in Washington's sound reaction to public adulation, and in his growing patience and consciousness of the restraints which the responsibilities of higher office place upon an individual. He was often exasperated, but only once or twice in these years did he let escape even in confidence any comment which, though accurate, might through phraseology create embarrassment if unexpectedly revealed.

After a decade of daily study of Washington, Mr. Freeman probably understands his subject better than any person now living. He is convinced: that Washington is not understandable otherwise than in terms of character; that few conspicuous mortals ever have so exemplified the incredible value in mature life of a clean youth; and that "Parson" Weems, even though he perpetuated several absurd stories, was much nearer the truth in his presentation of Washington's youth than some of the "debunkers" have been.

Mr. Freeman again demonstrates in this volume the finest combination of scholarship and literary ability. More detailed comments set forth in reviews of earlier volumes in this series are still fully justified but need not be reiterated. His survey of sources on Washington's contemporaries leads to the conclusion that "much of the history of the Revolution may advantageously be rewritten from sources now available." This is illustrated by an appendix on "The Wartime Speculations of Nathanael Greene." The Quartermaster General's caution, in keeping secret his private transactions, indicates that he knew them to be questionable even by the lenient standards of those days. Yet, a year later Greene unselfishly hazarded and lost all these profits and even much of his previously acquired property in order to feed his troops on the campaign in the South. Equally thought-provoking is the analysis of motivations back of the treason of Benedict Arnold and the incipient, but never consummated, plan for Ethan Allen to lead 4,000 troops down the Hudson to join the British in 1779. In Mr. Freeman's footnotes, students can find inspiration for many theses and even for full length biographies.

Scribner's generally admirable format is maintained in this series. Perhaps a signature of 32 pages over-inked to the point of illegibility, in the reviewer's copy, merely emphasizes the necessity of inspecting all books prior to accessioning.

CHARLES M. THOMAS

The Air University
Maxwell Air Force Base, Alabama

HORNER, HARLAN HOYT. *Lincoln and Greeley.* Pp. ix, 432. Urbana: University of Illinois Press, 1953. \$6.00.

It is unfortunately true nowadays that the imprint of the college press all too often presages authoritative and scholarly dullness. It performs the highly necessary function of making available important studies which appeal to an impressive but limited audience. Its function, therefore, is not particularly zestful.

But in the case of "Lincoln and Greeley" such is not at all the case. This monograph is at once scholarly and enthralling. It displays that most admirable form of research which selects material for a tingling quality as well as for its pertinence. A full, authentic picture emerges not only of the interaction of the two men, but of how they reacted to the historic problems which the times posed for them.

The contrast between Lincoln and Greeley is a most arresting one. Both combined first-rate intelligence with a basic love for humanity; both were honest, purposeful, and accustomed to getting things done. But here the similarity ends.

Lincoln was slow to make up his mind, and even slower to change it. It is well-nigh impossible ever to charge him with inconsistency, except when he adopted it deliberately in order to accomplish the purpose he had in mind. Expediency never clashed with his principles unless basic principle was involved. He was always ready to compromise, both in direction and timing, so long as his over-all aims were benefited and no major question of ethics was involved. His dealings with Greeley over Emancipation when in his own mind it was unalterably decided upon is an excellent case in point.

Greeley's heart was just as sound and his intentions equally good. But his judg-

ment was all too often at fault. For a man of such wide experience he was frequently quixotic, gullible, and capricious. Of all outstanding Americans I am inclined to class him with two of our contemporaries, Henry Wallace and Robert Taft; for they too combine first-rate intellects with amazing shifts of position and instability of viewpoint.

Consequently, Greeley was one of the most imposing failures in our history, while Lincoln is almost certainly its outstanding success.

ALPHONSE B. MILLER

Philadelphia, Pennsylvania

WARD, CHRISTOPHER. *The War of the Revolution.* Edited by John Richard Aldan. 2 vols. Pp. xiv, 476; vii, 477-989. New York: The Macmillan Company, 1952. \$15.00.

Recent books on the American Revolution have been criticized for their lack of comprehensiveness, for their neglect of some one phase of a many-faceted period. The late Christopher Ward, distinguished Wilmington lawyer and author of a splendid monograph on this period, *The Delaware Continentals*, skillfully anticipated and thwarted such criticism. In the first two sentences of his preface he wrote "This book is not a history of the American Revolution. It is a history of the war that was caused by the Revolution." He proposed to tell the story of land fighting, from April 19, 1775 to the cessation of hostilities in 1782.

Volume One opens with three introductory chapters which briefly sketch and summarize the background of hostilities. The volume closes with the start of Burgoyne's invasion and the Battle of Bennington. Every engagement receives the close scrutiny of the author—there are, for example, three chapters on the Battle of Long Island. Numerous maps are of real assistance in following the action. The interest quality is always high; for such chapters as those on Lexington and Concord this writer believes superlative are in order.

Volume Two opens with six chapters that conclude the account of the Campaign of 1777. Valley Forge, Monmouth, Newport, Stony Point, Morristown, Sullivan's cam-

paign against the Indians of New York State conclude the author's attention to northern campaigns. Two hundred and twenty-five pages, or about one-fourth of the entire work, are required to recount the story of the southern campaigns from Charleston to Yorktown. Some readers will consider these chapters the most graphic of all. King's Mountain, Cowpens, Camden, Ninety-Six, Eutaw Springs, Guilford Court House, and a host of minor engagements are described and analyzed. The editor has added a chapter on George Rogers Clark and the War in the West, apparently the only section Mr. Ward had not completed before his death.

While there have been comparable works during the past decade, notably those by John C. Miller and Willard Wallace, there is no need to justify another account such as this present study. The account of our war for freedom and of the men who made that freedom possible can be repeated often. In this particular case the story is thorough, vivid, and readable. Not in our generation, at least, has there been such a fascinating account of our first war with Great Britain.

RALPH ADAMS BROWN
State University Teachers College
Cortland, New York

MOSIER, RICHARD D. *The American Temper: Patterns of Our Intellectual Heritage*. Pp. xvi, 306. Berkeley: University of California Press, 1952. \$5.00.

The history of the American people began in the seventeenth century, the same century in which Isaac Newton brought the scientific revolution to its culmination and in which Puritanism emphasized a new theological picture of the cosmos and of the destiny of man. Puritanism, transplanted in the New World, became the starting point of American thought. It was destined to cast a long shadow forward over American history. Science, coming early to the New World, has also conditioned American thought almost from the beginning. The New World itself provided a stage on which men could work out their own answers to basic questions and, in so doing, manifest a unique response that may appropriately be called "the American tem-

per." These are the elements in the present volume. The first two are extensively treated; the third, the environmental setting, is largely implied.

Mr. Mosier announces his theme and argument in his opening sentences. "To the Puritans belongs a primitive synthesis of the American mind, in which sixteenth-century Calvinism was gradually transformed in the light of social-contract theory into a religion of reason. To the young republicans of the revolutionary age belongs the pleasure of an early enlightenment, made fresh in the mind by so many recent departures from it. To the transcendentalists belongs a transformation of romantic philosophy into terms suitable to the current American dream. To the pragmatists belongs the creation of a philosophy of technology, with its experimental temper and its instrumental purpose." Through all these phases of thought runs a single need, namely that of the necessity confronting the individual man to answer the questions: what is my relation to the cosmos? what is my relation to society?

Mr. Mosier brings a mature philosophical scholarship to his task. He is at home in the realm of ideas. His failure to deal with the changing and developing American social scene, however, gives the book a suggestion of the remoteness of the ivory tower. Yet the analyses of the various phases of thought is perceptive and valuable and the author's conclusions gain in clarity and emphasis through the elimination of discussion of social change. This is a useful and valuable contribution to the growing literature of the history of ideas in America. It deals with political and educational thought as well as with religious and philosophical.

Mr. Mosier rejects the cyclical theory of history. He frankly sets forth the temper of his own thought which, in this reviewer's opinion is an excellent expression of the traditional American temper, "But the creative womb of time will one day bear her fruit, and bring to its birth another creative moment in the making of the American mind. . . . The future of the American mind is great because the categories of its thought have not yet been frozen by history into the inviolable, nor by partisan in-

terest into the untouchable." Optimism, orientation toward the future, characterized the American outlook from the time when settlers from the Old World first hit the beaches of the New and began the conquest of the Wilderness. This volume is evidence that the outlook persists in a time which has been called The Age of Anxiety.

RALPH H. GABRIEL

Yale University

JEFFERSON, THOMAS. *The Papers of Thomas Jefferson*. Vol. VI: 21 May 1781 to 1 March 1784. Edited by Julian P. Boyd. Pp. xxxvi, 668. Princeton, N. J.: Princeton University Press, 1952. \$10.00.

In this volume, even more forcibly than in those which have preceded it, the reader is reminded that, through Jefferson, he becomes intimate not merely with the reflections of a man but also with the unfolding of an epoch. The correspondence and public documents collected here extend over a period of nearly three years beginning in May of 1781. The successful military conclusion to a long doubtful struggle is climaxed by the signature of a definitive peace. No documents are perhaps more profoundly moving—as no incident was more revealing—than those which record the ceremony at which Washington retired from his military duties and in person handed back his commission to Congress. This was a striking demonstration, which the Father of his Country deliberately sought, of the subordination of military to civilian authority as a pre-condition of republican government.

Among the public acts of Jefferson there are several in this volume which indicate the rare insight he possessed into the political needs of his time. A splendid example is his statesmanlike contribution to the notable decision of Virginia to cede its western lands to the Union. Jefferson was equally concerned to see that private companies should not be permitted to despoil the national patrimony, and that with the increase in settlement those lands should constitute states upon an equal footing with the original members. His solicitude for the Indians and his desire for interracial harmony are eloquently demonstrated

in a finely phrased address to a friendly chief. Moreover, from his observation of the Continental Congress, Jefferson became more and more convinced that structural improvements in the framework of central government were indispensable, and he proposed the formation of a Committee of the States to act as executive for the whole. Even the validity of the Peace Treaty was all but sacrificed by the failure of state delegations to provide a quorum within the time limit provided.

Of the correspondence, perhaps the most interesting are the letters that passed in some admirable two-sided exchanges between Jefferson and Madison. Here, as elsewhere, the rich versatility that characterized some leading figures of that age is well revealed. Pure science, secret diplomacy, constitutional niceties, and literary works—in all these the two statesmen were profoundly versed.

Two events occurred in this period to mar the happiness of Jefferson at the consummation of the war. The death of his beloved wife left him lonely, sick, and inconsolable. Furthermore the vindictive and abortive inquiry into his conduct of the Governorship caused him understandable pain. To the legislator who sponsored the investigation without specifying what charges were to be brought, Jefferson issued a protest in words which have a contemporary relevance: "It could not be intended just to stab a reputation by a general suggestion under a bare expectation that facts might be afterwards hunted up to bolster it" (p. 105).

LESLIE LIPSON

University of California, Berkeley

BOYD, GEORGE ADAMS. *Elias Boudinot: Patriot and Statesman, 1740-1821*. Pp. xvii, 321. Princeton: Princeton University Press, 1952. \$5.00.

The Calvinist groups played a notable part in winning American independence and in organizing the American Federal Republic. Inherent in their churches was the idea and the practice of self-government, often under the limitation of firm standards for church membership. As is well known, these groups, New England Puritans, Scotch and Scotch Irish Presby-

terians, Dutch and German Reformed, and French Huguenots, made a redoubtable phalanx of citizens. Not only were they men of character but also they formed a large part of the population.

Professor Howard Mumford Jones, in his notable volume, *America and French Culture*, estimates the number of Huguenot immigrants between 1660 and 1775 at 15,000. Often these men brought (1) capital, (2) industrial know-how, (3) organizational ability, and (4) artistic skills. They were welcomed by the rulers of all Protestant countries because they brought gifts without bringing a headache.

If they came in poverty, it was the usual colonial view that help for one year was enough to put these immigrants on their feet. They were important among our early capitalists and often became professional men. Remembering the terror of their expulsion from France, they made their homes in their adopted lands. Frequently they changed their names and faded into the surrounding populations.

M. George Adams Boyd has studied one of these men enabling Americans to follow the Huguenot story in America in the career of Elias Boudinot (1740-1821). This pioneer was in most ways a Presbyterian. He was a capitalist, successful in business; a patriot, who sank his fortune into the American cause; a supporter and trustee of Princeton University; a member and president of the Continental Congress; a representative of New Jersey in the first three Congresses under the Constitution; for ten years director of the United States mint; a hearty Federalist, who eyed Jefferson and Madison with suspicion; and the first president of the American Bible Society.

Boudinot founded the Cornwall Mission School in Connecticut. This school was attended by his namesake, Elias Boudinot, Cherokee Indian leader (1803-1839). For his part in leading his tribesmen into Indian Territory, he was assassinated by his fellow Indians.

In brief, the reader of Boyd's volume can relive the terrible days of the American Revolution and see again the desperate nature of that epic struggle. Desertion and bankruptcy faced the patriot leaders,

and Tory traitors filled the land. Throughout a lifetime Boudinot stood guard with Washington, Hamilton, and the other patriots in the fight for independence and financial stability.

FRANK J. KLINGBERG
University of California
Los Angeles

KAMINS, ROBERT M. *The Tax System of Hawaii*. Pp. xii, 194. Honolulu: University of Hawaii Press, 1952. \$2.50.

As the Territory of Hawaii has taken the road to statehood, this is a most opportune study. As the title indicates, the book deals with Hawaii's tax structure and is the first comprehensive study of the Territory's tax system. In Mr. Kamin's own words the study is an "attempt to describe critically the several taxes comprising the fiscal structure, to appraise the functioning of the entire tax system, and to suggest means whereby the tax laws might be improved in the interest of equity, effective administration, and desirable economic effects."

The first ten chapters deal with the background and analysis of the Hawaii tax system. The 21 separate taxes are treated under four distinct classifications: taxes on consumption, taxes on incomes and inheritances, taxes on specific businesses, and real property taxes. The last two chapters of the book contain the appraisal of the tax structure and recommendations thereon, which chapters may be treated "independently by those who must read in haste."

Mr. Kamin used the traditional tax standards, or value judgments: uniformity, equality, quality, neutrality, clarity, adequacy and flexibility. With these as his criteria, he made an appraisal of each tax in Hawaii and from his findings and conclusions thereon, he suggested several alternative tax programs whereby the tax system will approach the requirements of his standards. Comparisons are made with the tax systems of the mainland states but because of Hawaii's centralized system, the comparisons are of necessity precluded to specific phases and not on general basis.

With only 5 to 6 per cent of the tax revenues, aside from federal levies, in-

volved in the fiscal authority of the local governments, the centralized system in Hawaii approaches the ideal of students of public finance. The limited use of earmarkings of funds further suggests another desideratum of sound fiscal administration. These, however, are much more administrative goals and have limited relationship to the over-all impact of the taxes on the fiscal and economic structure of the territory.

Principally an administrative essay, the book may be recommended not only for officials and students of public finance but also for the public in general. Its minimum use of technical phraseology will enable most taxpayers to understand substantially the general impact of each tax studied.

Agano, Guam

ECONOMICS AND INDUSTRY

WARD, A. DUDLEY (Ed.). *Goals of Economic Life*. Pp. x, 470. New York: Harper & Brothers, 1953. \$4.00.

One of the cheering developments of recent years is the growing interest of church leaders in the affairs of this world. *Goals of Economic Life*, one of a series of books on "Ethics and Economic Life" being prepared by a Study Committee of the Federal Council of Churches, represents this emerging interest. It is a collection of fifteen papers by men representing economics and several other social sciences. Seven of the contributors are leading economists—social economists: J. M. Clark, Kenneth Boulding, Eduard Heimann, William Vickrey, Frank Knight, Clark C. Bloom, and Walton Hamilton. Other contributors are Clarence Danhof and Robert MacIver (political science), Alfred Emerson (biology), Ralph Linton (anthropology), Donald Snygg (psychology), Theodore Greene (philosophy), John Bennett (Christian theology and ethics), and Reinhold Niebuhr (applied Christianity).

Here are distinguished men, and the contributions are of a high order, a few of them very excellent indeed. They make up a book which is designed to give church-

men some idea of the principles and philosophy of economics and other social studies as related to ethical and religious problems—such churchmen as are able and willing to follow some fairly difficult analyses. The book should prove interesting and enlightening to most economists too, particularly to some of our straight-laced economists who take a narrowly restricted view of economic "science." Some of these papers, for instance, make clear how difficult it is to avoid value judgments, if indeed it is worth while to try to do so. The economic contributors are men of broad philosophical outlook.

Economists as well as churchmen can learn too from the contributors in other fields—political science, biology, anthropology, philosophy, psychology, and even religion. When Reinhold Niebuhr writes he always says something significant.

A collection of articles is usually a bit confusing, but Theodore M. Greene has outlined the general scheme of the book in an excellent introduction.

JOHN ISE

University of Kansas

WILLIAMS, JOHN H. *Economic Stability in a Changing World*. Pp. vii, 284. New York: Oxford University Press, 1953. \$5.00.

The central theme of these collected papers is, as the preface explains, "the relation of economic theory to public policy." In the first general part are three of the more recent essays on current issues; in the second, four papers on the Marshall Plan; and, in the third, two earlier discussions of "full employment" and its bearing on freedom. Following this arrangement, one comes occasionally to the flowering of hopes, of whose withering he has already read. Perhaps this is kinder than the historian's procedure of buildup before letdown. At any rate, it will be observed that Williams was sagely skeptical about the hopes to begin with. Perhaps the following characteristics of his work should be called to the attention of readers who have denied themselves the savor of his wisdom.

First, there is the rueful opinion of what has long been a prominent feature of

economic theory. That is, Williams notices that the habit of interpreting our unstable economy in terms of "equilibrium" does things to a man. At the same time, he is nothing if not emphatic about the importance to the world of "stabilizing" American production and employment at a high and rising level. He does not and cannot escape from the concept of balance. But this does not detract from the mellow charm of his misgivings.

Second, there is the recurring observation that theory is related to policy as follower rather than leader. Something happens; a policy is devised to meet the resulting situation; and then a theory is formulated to rationalize the policy. After that the theory is enthusiastically extrapolated into a future where events are likely to produce a different policy and a corresponding theory. During the last twenty years "fiscal policy," or government's manipulation of its taxes and spending and debt, evoked much the same exuberance that in the 1920's had been aroused by "central bank policy," or the control of bank reserves and loans and deposits. Thus pundits glowed with the discovery that we could all stay employed if our government managed its funds properly; and heaven help the administration, said Walter Lippmann, that failed to apply this knowledge to the postwar world! Nor is it merely journalists who rush in where economists (should) fear to tread. Economists, too, may now be seen in course of tiptoed withdrawal from their earlier rush into fiscal policy.

Third, there abides a concern for the effect of stabilization programs on freedom and efficiency. We can have as full employment as we had during war if we are willing to use the wartime controls. But the question is how far we can push these controls and keep the political liberties and economic freedoms which are the core of our way of life. Moreover, the idea that unemployment must be prevented at the cost of no matter how much public spending is a view that "covers leaf-raking and causeways to the moon as well as economically desirable expenditures."

U. S. PRESIDENT'S MATERIALS POLICY COMMISSION, *THE. Resources for Freedom*. Vol. I: *Foundations for Growth and Security*; Vol. II: *The Outlook for Key Commodities*; Vol. III: *The Outlook for Energy Sources*; Vol. IV: *The Promise of Technology*; Vol. V: *Selected Reports to the Commission*. Pp. viii, 184; x, 210; vii, 43; x, 228; x, 154. Washington: Government Printing Office, 1952. I: \$1.25; II: \$1.50; III: 50 cents; IV: \$1.75; and V: \$1.25.

The President's Materials Policy Commission was established in January, 1951 by President Truman, who charged it with studying the materials problem of the United States and the relation of that problem to the free world. *Resources for Freedom*, the report of the Commission, is in five volumes: I. *Foundations for Growth and Security*; II. *The Outlook for Key Commodities*; III. *The Outlook for Energy Resources*; IV. *The Promise of Technology*; V. *Selected Reports to the Commission*. In addition, the Commission prepared an 82-page summary of Volume I.

The first volume presents a summary and broad analysis of the nation's materials problems, along with the recommendation of the Commission for their solution. The two subsequent volumes analyze specific materials and energy problems. The fourth volume relates different aspects of the specific materials and energy problems to the potential accomplishments of technology. The last volume contains basic working papers which were prepared for the Commission's consideration in its deliberations.

Resources for Freedom has as its principal objective "an examination of the adequacy of materials, chiefly industrial materials, to meet the needs of the free world in the years ahead." The Commission chose as its period for review the quarter century from 1951 to 1975. The analysis and the conclusions of the Commission rest upon certain basic assumptions. The Commission has stated its belief in: (1) continuing national growth (the future rate is assumed to be about the same as that over the past 100 years); (2) the need for continuing balance between government and private industry in our economic af-

fairs; and (3) rejection of any policy of self-sufficiency on the part of the United States. A major premise for the report is: "The overall objective of the national materials policy for the United States should be to insure an adequate and dependable flow of materials at the lowest cost consistent with national security and with the welfare of friendly nations."

Our materials and energy problems generally derive from a consumption with far greater capacity for expansion than that of the resources from which the needs must be met. They are problems rooted in our immediate past, and they have become more intense recently because of: (1) the widening gap within the United States between requirements and our domestic means of satisfying them; (2) the weakness of western Europe, resulting from depletion of those nations' resources and the loss of colonial sources; (3) the new ambitions of nations with plentiful resources to industrialize rather than export their materials; (4) the disruption of normal trade patterns by the division of the world between the Union of Soviet Socialist Republics sphere and the free world; and (5) worldwide fear of future market instability.

The Commission shows that every person in the United States needs 18 tons of materials to support him in our present economy. Merely to take care of the additional 40 million people we should have in this country by 1975 will in itself be a tremendous problem of increasing materials production capacity. To meet this it suggests three general approaches: (1) getting beyond the technological, physical, and economic boundaries which presently limit supply; (2) promoting more efficient use by adopting materials saving designs and processes; and (3) obtaining as many materials from abroad as we can.

It is suggested that we pay attention to supply through exploration and discovery; through fuller use of known resources, through using lower quality resources, renewing renewable resources to their fullest, finding uses for presently unemployed resources, and synthesizing new materials. The Commission also suggests that use may be improved by shifting our materials where possible from scarce to abundant

resources, by making materials work harder and longer, and by giving materials a second life. To assist the nation in turning more and more to foreign sources of materials, the Commission sees need of action: (1) to stimulate private investment for the development of low cost production abroad; (2) to assist countries with surplus resources to improve progressively their productive capacity; (3) to eliminate trade restrictions on materials; and (4) to promote greater stability for international materials markets.

These general recommendations are succeeded by a series for particular phases of materials production and use. Specific recommendations are made for minerals, agriculture, forests, water, and energy. The Commission's conclusions are supported at length by specific studies of individual commodities, and of industrial use (for example, the building industry).

To secure adequate materials production and reasonable use, the Commission suggests reliance to the maximum extent possible upon the free price system as the allocator of resources, and upon private investment to organize production. The Commission summarizes its position in this manner: "We believe in a minimum of interference with these patterns of private enterprise. But to believe this is not to believe that this minimum must be set at zero. Private enterprise itself has from time to time asked for helps, or restraints, or counterpoises from government to keep the system working at its best. . . . As we see the future, the co-existence of great private and public strength is not only desirable but essential to our preservation."

Even a brief review of the content of *Resources for Freedom* illustrates the great range of subjects covered by it, and the comprehensiveness of treatment for the problems which the Commission undertook to consider. There can be no question that the report is a public document of first importance. It will be an important source of information for students of our economy for some time in the future. The careful organization and the high standard of workmanship should help to make these volumes useful to public administrator and legislator, to scholar and businessman alike.

The Commission is to be commended for taking an integrated approach to materials production and use, for the thoroughness with which it explored the background for materials policy, and for the forthright manner in which it faced some of our problems. The Commission's strong support of the principle of "least cost" in obtaining materials (we should abandon restrictions on imports to maintain domestic prices), its recommendations for enforced forest cutting regulations, and its condemnation of certain aspects of luxury consumption earn it a measure of respect for frankness.

The type of analysis used in the preparation of *Resources for Freedom* has been widely mentioned as an innovation in resource study. This generally refers to the use of demands or needs as a basis for determining policy along with analysis of the potentialities of production. It is true that the Commission's work was the first important public use in this country of the method. The Commission also carried its commodity analysis of demand to a point of refinement which is not paralleled in previously published information on materials. However, the balance of needs and production method was used previously in the preparation of the *Report on Japanese Natural Resources prepared in General Headquarters in 1948*, and at least two American universities in the past have offered courses on resource management with a similar technique.

For all of its excellence, the report will exhibit to professional students of resources and resource management some points for difference and some points of omission. It will seem regrettable to some that, having adopted the balance of needs and production as its point of departure for analysis, the Commission did not carry its technique to a point of further refinement. The report might have been even more useful had its organization taken full account of the important distinctions within each of the use groups which it presented, and of the principle of interchangeability among materials. In other words, the Commission makes the most important step away from our traditional habits of considering resources from the point of view

of resource use alone, but it does not carry its analysis of the total picture of production and use to the point of refinement which existing techniques would have permitted.

To some the forecasts which are given for future materials use may seem much more exact than our knowledge warrants. The Commission might have placed more emphasis on the wide margin of error which is inherent in any such calculation. For instance, past experience has shown that a 25-year calculation of energy demand is a scientifically hazardous undertaking. However, it should be noted that these studies of materials forecasts provide a useful framework for future reference, even though the predictions must in many cases be regarded as inherently fallible. It would be impossible to arrive at any integrated view of the materials problem without them.

For many students of long standing in this field, the outstanding omission from the report is the Commission's failure to consider problems of materials production and use in their regional setting in the United States. Perhaps study of the problems of regional development is too much to have expected, even from as distinguished and well-financed a study group as the Commission within the time it had for its work. Nonetheless, national policy which fails to take account of problems of regional development and use is without one important side of its foundation.

Another important omission is that of treatment of the problem of distribution of benefits from resource use among regions and groups of people in the country. While the Commission may be forgiven for studiously avoiding the public power issue of regional development and distribution of benefits in its treatment of energy (its forthrightness did not extend that far), it might have done well to consider the fundamental problems which gave rise to the public power and similar issues—problems of regional development and distribution of benefits.

The treatment of consumer conservation as part of materials use also was a surprising omission. While there is incidental reference, this subject would seem im-

portant enough for the United States to have warranted an organized specific section.

There are various other points of difference which some would like to argue with the Commissioners if they had opportunity. For instance, the Commission's endorsement of percentage depletion in the mineral industries certainly will be a controversial conclusion. On the whole, however, the country is fortunate to have a working document of the completeness and a view of the clarity which the Commission has given us in its report. The Commission and its staff have been faithful servants of the Nation in their efforts to make us understand matters which it is high time we understood.

EDWARD A. ACKERMAN

University of Chicago

COPELAND, MORRIS A. *A Study of Moneyflows in the United States*. Pp. xxxii, 338, 241. New York: National Bureau of Economic Research, 1952. \$7.50.

Consider the equation of exchange in its most familiar form: $MV = PT$; the amount of Money (including bank deposits) times its Velocity of circulation equals the Price level times the volume of Transactions, estimated in prices of same base year. The equation holds only approximately, because of certain statistical anomalies. But even if it held exactly, what is it good for? Why not, as one critical wag has suggested, say simply "A equals B," and let it go at that?

Our increasing volume of national income and product statistics give meaning to that part of the right hand or "goods" side of the exchange equation which relates to what are called the final products of the economy. These statistics break down part of PT (plus, it must be admitted, some items which have no monetary counterparts) into the income or product generated by various "sectors" of the economy (such as agriculture, manufactures, government). The national income statisticians go on to analyze each sector's purchases and sales of final products. The results are known as "The Nation's Economic Budget." Published quarterly, they are used for projections, for short-run fore-

casts, for suggestions on policy. More inclusive breakdowns, covering not only final but intermediate products, are being made by Professor Wassily Leontief and his followers at Harvard and in Washington. These "input-output" statistics, as they are called, are used for both quantitative planning and forecasting, particularly by the Air Force. But at the same time, no sectoral breakdown has been available for the left-hand or "money" side of the exchange equation.

It is this gap which Professor Copeland's ambitious and pioneering moneyflows study, product of seven years of intensive research, intends to fill. Copeland and his staff have broken the economy down into eleven sectors of major financial importance, not necessarily identical with those used in national income statistics or input-output studies. Over a period of seven years (1936-42, inclusive) they have estimated the flow of money to and from each sector, checking their results against estimates of the cash balances and other "loanfunds" available to each sector at the end of each year. These flows of funds can, it is hoped, be analyzed in a manner even more useful than the national income series for plotting the position of the economy, forecasting future movements, and making policy suggestions.

Copeland is not primarily interested in total moneyflows, or MV , as such, but in what have been called the "stuffings" of his tables—how much is flowing from where and to where. To him, the fundamental unit is the individual monetary transaction. Business activity and employment depend not only on the volume of final output, but likewise on the intermediate transactions, financial transactions, and transfer payments also represented in moneyflows. Furthermore, national income and product include "imputed values," like the rental value of owner-occupied houses, which have no transaction equivalents and whose movements have no direct economic consequences.

Comparing each sector's total moneyflows with that part which represents purchases and sales of goods entering into the gross national product, Copeland estimates for each period which sectors are

actively acquiring cash and other loan-funds, which are actively disposing of loan-funds for other assets, and which are more or less passive. These he calls, respectively, bears, bulls, and sheep. The bull and bear sectors, he believes, control monetary expansion and contraction; they exercise monetary discretion. Copeland concludes that, during periods of depression, this discretion is exercised not only by the government and the banking sector, as hoped by the apostles of monetary management, but likewise by nonfinancial businesses and by households, among others. This suggests to Copeland the limitations of over-all reliance on monetary policy as a weapon of economic stabilization. He makes an impressive case for periods of depression; the careless reader may also derive the view that inflation too is not amenable to control by the monetary authorities. This, however, is not Copeland's own position.

As a subsidiary point, Copeland insists that the best physical analogy to the moneyflow mechanism is an electrical circuit, whose reactions are immediate. It has been conventional in economics to use a hydraulic analogy, but in hydraulics there is a time-lag between a contraction at one point in the system and the corresponding expansion somewhere else. Copeland insists that there is no such lag in the money circuits, and that a great virtue of the moneyflow approach in economic analysis lies in its immediacy, in the fact that moneyflows precede their economic effects.

The major contribution of this century to economic science has been called "the development of massive pieces of apparatus to measure, define—and eventually, perhaps, predict—the structure of a country's economy in statistical terms." Introducing the volume under review, the eminent monetary economist Winfield Riefiler suggests that Copeland's work may rank, as a milestone in this direction, with that of Wesley Mitchell and Simon Kuznets—fathers of national income analysis—or with that of J. H. Williams on the balances of international trade and payments. So sweeping a generalization may be premature. Many of Copeland's figures are more precise than accurate, many of his

estimating procedures more convenient than realistic. His data cover a period ending ten years before his book appeared. Yet, aided by working papers included with the present volume and taking up over one-third its length, other workers may be able to correct these deficiencies. Still others may be able to use the results for improved analyses, predictions, and recommendations on fiscal and monetary policy. Work is already under way in the Federal Reserve System to bring a simplified version of the Copeland series up to date. Riefiler's bold prediction may soon come true.

University of Wisconsin

KUZNETS, SIMON, and RAYMOND GOLD-SMITH. *Income and Wealth of the United States: Trends and Structure*. (International Association for Research in Income and Wealth: "Income & Wealth Series," II.) Pp. 328. Cambridge, England: Bowes & Bowes, 1952. 35 shillings.

America's outstanding authority on national income statistics here presents, under the auspices of the International Association for Research in Income and Wealth, a survey of his principal findings for the 80-year period 1869–1948, with an appendix on data for earlier years. He is joined by America's leading authority on national wealth statistics, with a similar survey of his findings for scattered years over a somewhat longer period, 1805–1950. The result is both unique and valuable. It was not intended for textbook use, but this reviewer at least intends to adopt it in his own course in income and wealth.

Professor Kuznets has already given us since the War two digests of his results in national income investigation, *National Product Since 1869* and *National Income: A Summary of Findings*. Some duplication is inevitable. Added, however, is material covering 1939–1948, the decade of the Second World War, and results derived from Kuznets' study of *Shares of Upper Groups in Income and Savings*. One impressive new result: the percentage rate of growth of national income, which had declined for 70 years and was expected to continue doing so, suddenly reversed itself

in 1938–49. Another upset: the division of income between service income (labor plus entrepreneurship) and property income (interest plus rent plus dividends), constant at 80-20 for 70 years, shifted suddenly in favor of labor. (Kuznets' explanation runs in terms of fuller utilization of existing capital, combined with rent and interest rate control. He does not mention increased trade union bargaining power.) A third upset: the relative share of the top 15 per cent and 5 per cent of income receivers has fallen by nearly 50 per cent since 1929. (This has been referred to as "revolutionary" in its implications.) Kuznets' data also cast doubt on the famous thesis of Colin Clark, that economic development tends to increase the share of "tertiary" (service) industries. Only government and public utilities, he suggests, show any real upward trend in proportionate importance. As for omissions, the philosophical reader may miss Kuznets' searching methodological and definitional discussions, found in earlier works but not repeated here. Also absent are detailed correlations between income data and cyclical movements.

Dr. Goldsmith's contribution takes up less than one-fourth of the length of the volume. Justifiably so, since wealth analysis has revived only since the war after several generations of comparative neglect. Rather than measuring total wealth (including land and intangibles), Goldsmith has confined himself to a limited component called Reproducible Tangible Wealth (RTW). This forms an increasingly dominant portion of the whole; it can be measured with relative (but by no means complete) freedom from the nagging problems of valuation. As in the case of income, growth at decreasing rates is found until the final decade, when the trend is suddenly reversed. The 1945–50 growth rate (in constant prices) is the fastest on record. Another striking trend is the increasing importance of government as a wealth owner. By 1950, if military assets and monetary metals are included in the total, nearly one-fourth of all RTW is publicly owned! Agriculture and railroads, on the other hand, are examples of segments declining in relative weight. Eco-

nomic theorists will be interested in the disappointingly negative results of Goldsmith's attempts to isolate "deepening of capital" and the so-called "acceleration principle" in the relationships between wealth and income over the period 1897–1949, when annual series are available. In conformity with the relatively undeveloped character of national wealth accounting, Goldsmith finds it necessary to use a large proportion of the space at his disposal in defending estimation procedures, comparing his results and methods with those of predecessors and those of his predecessors with each other. One obtains from this paper more clearly than from Kuznets' a feeling for the difficulties involved and for the inaccuracy of conclusions however precisely stated in summary tables. On the other hand, the Kuznets paper is by far easier reading; its organization and direction are more readily apparent to the non-specialist in this field.

M. BRONFENBRENNER

University of Wisconsin

WOLD, HERMAN, in association with LARS JURÉEN. *Demand Analysis: A Study in Econometrics*. Pp. xvi, 358. New York: John Wiley & Sons, 1953. \$7.00.

This book consists of five parts. Part I gives a broad survey of the topics and findings. The theoretical and statistical methods used in this econometric study are explained in easily understandable terms. Part II gives an account of the theoretical assumptions underlying the demand analysis. This is essentially a restatement and elaboration of the articles published by the author in the *Skandinavisk Aktuarietidskrift* in 1943–44. Part III deals with some topics in the theory of stationary random processes. This treatment is based upon the author's thesis, "A Study in the Analysis of Stationary Time Series" (Uppsala: Almqvist & Wiksells, 1938), and the work of P. Whittle, "Hypothesis Testing in Time-Series Analysis" (*ibid.*, 1951). Part IV treats the theory and methods of regression analysis. Part V (by Wold and Juréen) presents empirical findings based upon Swedish family budget surveys in 1913, 1923, and 1933, and market statistics for the period 1921–1939.

This is without doubt one of the most important contributions to the young science of econometrics ever published. The mathematician, statistician, mathematical economist, and econometrician will find in this book many important and original contributions. All these cannot be appreciated without a thorough knowledge of mathematics and statistics as well as modern mathematical economics. But Parts I and V are very simple and easily accessible to any reader with some knowledge of modern economics and statistical methods. These portions of the book should be of great interest to any economist, agricultural economist, marketing specialist, and consumption economist.

The theoretical framework of the analysis is essentially the Pareto theory of consumer's choice, brought up to date. The author makes an excellent case for ordinal utility functions (indifference systems) and rejects cardinal utility. As much as statistical methods are concerned, he uses the classical method of least squares and rejects newer and more sophisticated methods. Certain corrections derived from time series analysis are used to modify the standard errors.

The main empirical results presented in this book are various income and price elasticity estimates for the demand of selected items of food in Sweden. These are given for a number of social classes and family types (number and age of children).

One particular successful feature of the book is a prediction of per capita consumption of various food items for 1949-50. This prediction is surprisingly accurate and shows the stability of the consumption pattern in Sweden.

This successful prediction contrasts favorably with prediction efforts of other econometricians. Predictions of consumption for 1960 and 1970 are also included.

A commendable feature of the book is very complete truly international bibliography. The writer has used many books and articles on mathematical economics, statistics, and probability in the following languages: French, English, Italian, Spanish, German, Norwegian, Swedish, Danish, Russian.

This book should make a very successful text for a somewhat advanced course in demand analysis. Nobody interested in the progress of econometrics can afford to neglect it.

GERHARD TINTNER

Iowa State College

NATIONAL BUREAU OF ECONOMIC RESEARCH, Conference on Research in Income and Wealth. *Studies in Income and Wealth*. Volume Fifteen. Pp. x, 230. New York, Bureau of Economic Research, 1953. \$3.50.

Ever since 1937, when the first volume in this series was published, the National Bureau's *Studies in Income and Wealth* have been required reading for specialists and nonspecialists alike. Volume Fifteen contains seven papers delivered at the June, 1950 meeting of the Conference on Research in Income and Wealth at Allerton Park, Illinois on the general topic of income size distributions. Published with an Introduction by E. D. Hollander of the Bureau of Labor Statistics, and concluding discussions by Professor Kuznets and Dr. Clark Warburton, the seven principal papers are as follows: "A Method of Comparing Incomes of Families Differing in Composition," by Milton Friedman, with an Appendix by Jean Mann Due; "Inequality of Income: Causes and Measurement," by George Garvy; "Some Effects of Region, Community Size, Color, and Occupation on Family and Individual Income," by D. Gale Johnson; "Income, Spending, and Saving Patterns of Consumer Units in Different Age Groups," by Janet A. Fisher; "Family Savings in Relation to Changes in the Level and Distribution of Income," by Dorothy S. Brady; "Effect of Income Concept upon Expenditure Curves of Farm Families," by Margaret G. Reid; and "Equivalent Levels of Living: Farm and City," by Mollie Orshansky.

With the exception of Professor Friedman's brief technical essay, the volume consists of exploratory studies in which some new data are analyzed and many old data re-examined. Anyone who comes to the book with the hope of finding it a mine of solid generalizations is likely to be disappointed. The data in this whole

area are notoriously poor, and more than one author raises serious doubts concerning the statistical evidence for functional relationships that have been regarded as tolerably well established. Indeed, the reader whose enthusiasm for the Keynesian consumption function is already restrained may need to remind himself that its foundations are not being undermined by the studies collected here.

The individual papers do not lend themselves to summarization, and most of their value is, in any event, in the details that summaries could hardly supply. The contents of the studies are accurately indicated by their titles, and the special interests of the reader will make one subject or another particularly significant to him. I call attention to Dr. Garvy's paper, however, as one that few readers of this journal will want to miss. The importance of income inequality to all students of society is sufficiently recognized, but most contemporary discussions of the subject seem to me to suffer from the sort of confusion that Dr. Garvy's admirable exposition does much to dispel.

RICHARD V. CLEMENCE

Wellesley College

RUML, BEARDSLEY, and THEODORE GEIGER (Eds.). *The Manual of Corporate Giving*. Pp. xi, 415. Washington, D. C.: National Planning Association, 1952. \$6.75.

ANDREWS, F. EMERSON. *Corporation Giving*. Pp. 361. New York: Russell Sage Foundation, 1952. \$4.50.

Industry in the past twenty-five years has begun to discover its external community, the community outside its own plants and markets. The history of this discovery has been strikingly parallel to the discovery of its own working force which began three decades earlier. First came legislation—tax bills through which corporations have involuntarily contributed billions to relief, welfare, medical care, education, recreation, and scores of other community social objectives. Then came, not unions, but highly organized campaigns by civic agencies with high pressure techniques of stimulating management contributions to philanthropic causes. In both cases, industry has again been the passive

partner, bowing to law or to community pressures. All too seldom has industry taken the initiative and used corporate philanthropic dollars to achieve community goals. Despite the obvious effect of these social services on the working force and upon community stability, many corporations have acted as though they had no goals for their giving.

Under the Revenue Act of 1951, corporations are allowed a tax deduction of up to 5 per cent of their net income for philanthropic gifts. Mr. Andrews estimates that deductible contributions in excess of two billion dollars a year would have been possible at 1951 income levels, and these gift dollars may cost the corporation only 48 cents—or, if they are in the excess profits bracket, only 18 cents each. No such level would be attained in the immediate future, but the provision potentially makes available each year a sum more than 15 times larger than the combined annual giving of all foundations as estimated in 1950. The so-called "giant" foundations are dwarfed beside the corporation potential.

To some corporations, as F. Emerson Andrews points out in *Corporation Giving*, this situation will be treated as a "business opportunity. If corporation giving gives tangible benefits in terms of good will, aid to employees, or other corporation advantage, then these benefits are purchasable" at bargain prices. But the modern corporation faces a larger challenge. The businessman who has long decried the bureaucrat and social worker, lumping them as "do-gooders," is given an opportunity to make an impact on education, social welfare, and health services.

Whether the businessman wishes to consider his new opportunity to mold the cultural and social pattern of his community, or whether he merely wishes to make a wise expenditure of his gift dollars, these two books are required reading: *The Manual of Corporate Giving* edited by Beardsley Ruml, published by the National Planning Association; and *Corporation Giving* by F. Emerson Andrews, published by the Russell Sage Foundation.

The Ruml book is a collection of essays, each written by men of experience in

various philanthropic fields. Introductory chapters deal with public policy, administration, and the legal aspects of corporate giving. Four chapters deal with community projects such as Community Chests, hospitals, museums, libraries, music, and parks and playgrounds. There are chapters on welfare, public health, scholarships, fellowships, public and private schools, and adult education as potential fields for corporate giving. Four chapters deal with the natural sciences, medical research, the social sciences, the humanities and creative arts. Four chapters describe philanthropic experience in international programs.

The Russell Sage Foundation has had a distinguished record of contributing to the professional skills and wise policies of American philanthropy and social services. The reader who is familiar with Mr. Andrews' 1950 study, *Philanthropic Giving*, will find *Corporation Giving* a welcome companion volume. It describes the history of corporate giving, tells who gives and how much, describes budgets, quotas, the development of corporate foundations and of corporate policies. It reviews the technique of the fund raisers, the ethical and unethical practices, and suggests methods of analyzing appeals. The law and taxation factors are set forth, and there are eighty valuable pages of appendixes dealing with the method of study, the Internal Revenue Code, the legislation of various states, significant cases at law, selected corporation policy statements, and a statistical review of corporate giving.

Community pressures and the importunities of friends have long since ceased to govern corporations in their purchasing and their employment policies. The administration of corporation gift dollars seems destined to become a new area of professional staff service. These two volumes provide eloquent evidence that there are professional standards and skills available to guide corporation policy in philanthropy. Many of the most awkward and onerous aspects of our welfare political economy may be remedied if corporations undertake a positive role with their gift dollars.

PHILIP S. BROUGHTON
Pittsburgh, Pennsylvania

RONKEN, HARRIET O., and PAUL R. LAWRENCE. *Administering Changes: A Case Study of Human Relations in a Factory*. Pp. xxviii, 324. Boston: Harvard Business School Division of Research, 1952. \$3.50.

This book, as the title implies and as characterized by Professor Roethlisberger under whose direction the study was carried out, deals with the human effects of technological change upon the day-to-day operation of a factory.

It lies in a field relatively newly discovered by psychologists who, ever since Elton Mayo and his associates first turned their attention towards the study of human relations in industry, have been finding more and more outlet for their energies and interests in this most pervasive field of collective human endeavor.

The general drift of these humanistic studies of managerial processes is in quite sharp contrast with that of the mechanical engineers of a generation or so ago who gave impetus to the "scientific management" movement of that day. This present day emphasis upon the human factors in industrial organization represents a needed redressing of the balance. It assuredly is nearer the mark than to assume that organization and administration is primarily a problem in mechanics, provided, of course, that this new emphasis is not overstressed to the point of confusion of motives and objectives.

One somehow is left with this muddled impression in attempting to read the book here under review. As a case study painfully dissecting the trivia of human existence in a rather typical factory environment, one can readily believe that the production schedule has fallen down on the assembly line because Mamie has had a tiff with Jennie and that quality is not up to expectations because Alice is frustrated because Bill, the inspector, didn't smile at her this morning.

Several generalizations (uniformities) are deduced as the result of this study, as follows:

1. Technological change involves changes in personal relationships in the organization.
2. Resistance to change arises around

these modifications of relationships rather than around technological change per se.

3. Technological changes are impeded until these new problems of personal relationships are resolved.
4. The critical element in the acceptance of change is the skill of the administrator in understanding these personal conflicts and in developing satisfying new relationships.

No seasoned and reasonably intelligent supervisor will be inclined to question these conclusions when stripped of their customary technical jargon, though he may wonder at the long drawn out process by which they have been ultimately distilled.

It is somewhat reminiscent of the over-anxious parent's relief at finding, after much reading of psychological treatises and trepidation in approaching the duty of acquainting Junior with the facts of life, that he already, by sound processes of observation and deduction, had somehow gotten a working knowledge of the subject without any very visible evidence of permanent warping of character and outlook on life.

W. N. MITCHELL

Chicago, Illinois

SMITH, WALTER BUCKINGHAM. *Economic Aspects of the Second Bank of the United States*. Pp. xii, 314. Cambridge, Mass.: Harvard University Press, 1953. \$5.00.

In this study of the economic aspects of the Second Bank, Professor Smith has made a noteworthy contribution to the history of American banking. The volume covers the period 1816-1841, which coincides with the life of the Bank.

Part One—The American Economy—is concerned with production and trade, money and banking, government finance, price movements, and the international context during the period. Part Two—Annals of the Bank—covers the three administrations of Jones, Cheves, and Biddle from 1816 to 1836 in four chapters and devotes a fifth chapter to the Bank's experiences under a state charter from 1836 to 1841. Part Three consists of a final chapter which comprises a verdict on the Bank

over its entire life, plus bibliography, footnotes, and index.

Professor Smith's contribution to the history of the Second Bank is several-fold. In discussing the American economy in its various aspects in Part One, he furnishes a valuable background for analyzing the actual operations of the Bank. It is impossible to render a fair, detached judgment of such an institution apart from the financial and economic environment of the time. Thus Smith is led to a much less critical appraisal of Cheves's administration of the Bank (1819-1823) than are some of the other historians of this institution.

Another facet of Smith's contribution is his detailed analysis of the Bank's operations under its Pennsylvania charter from 1836 to 1841, a period in the Bank's life that has been largely neglected by other historians.

The important foreign business of the Bank—its influence on the foreign exchange market and the predominant part played by it in English investment in American securities—is fully treated in the present volume and constitutes a definite contribution.

Finally, a highly significant phase of the Bank's work, its relation to the treasury and treasury fiscal policy, is given more detailed treatment and emphasis than has been accorded it by other writers.

The style is good and the format satisfactory. Altogether, the book should prove of very decided interest to all those interested in American banking history.

FREDERICK A. BRADFORD

Lehigh University

BRYSON, LYMAN (Ed.). *Facing the Future's Risks*. Pp. viii, 318. New York: Harper & Brothers, 1953. \$4.00.

In 1752, Benjamin Franklin and some associates in the Philadelphia volunteer fire-fighting brigades (p. 298) formed "The Philadelphia Contributionship for the Insurance of Houses from Loss by Fire," the oldest insurance company and the oldest business corporation in the United States. In 1952, in celebration of the bi-centennial, the mutual insurance companies conducted a conference in New York.

The volume being considered reports on that conference, and it is made up of thirteen chapters. The first chapter is a brief summary of the entire volume by the editor; the last chapter is mainly a more detailed summary of speeches of several executives in the mutual insurance companies, excluding life insurance, concerning major problems facing the industry, such as changing concepts of liability, problems of inflation, and problems of paper work. The intervening eleven chapters have been written by eleven scholars in different fields, each of whom surveyed his (or her) particular field since 1752, or before, and gave some idea of the future prospects or desirable changes in that field.

The eleven main authors and the fields surveyed are, in order: Louis Booker Wright, American Society; Warren Weaver, Probability and Statistics; Louis N. Ridenour, Physics; Wayne Dennis, Psychology; Ralph W. Gerard, Biology; Frank W. Notestein, Population; Florence Rockwood Kluckhohn, Women; Austin H. McCormick, Crime; Robert M. MacIver, Politics; Dexter Merriam Keezer, Foundations of America's Economic Greatness; and Ralph H. Blanchard, Risk and Insurance.

These chapters give the distinct impression that each author took the assignment very seriously. They are packed with information, they give an excellent idea of changes that have taken place since Franklin's time.

This reviewer was reminded of the breadth and sense of continuity which he had in reading the Beards' "Rise of American Civilization" years ago. It is seldom that one gets as much of a general education in one book.

Three brief selections may give an idea of the flavor of this excellent and provocative book. (1) "Certainly, we shall not survive because of our luxuries and gadgets, but in spite of them" (Wright, p. 31). (2) "This, then, is twentieth century science; no longer complacent with its past achievements, as science was in the nineteenth century, but somehow more confident of its powers . . . no longer wedded to unitary prediction and detailed cause-and-effect determinism, but content with statistical

law" (Ridenour, p. 78). (3) "In whatever part of the history of woman's role we look, we note that being a status symbol, a glamour girl, especially an old glamour girl, or even a culture bearer, does not bring many badges of merit in our kind of society" (Kluckhohn, p. 195).

University of Pennsylvania

KIP, RICHARD DE RAISMES. *Fraternal Life Insurance in America*. Pp. xi, 187. Philadelphia, 1953. \$2.75.

This well-written monograph is an excellent introduction to the author, who recently became Associate Professor of Insurance, Wharton School of Finance and Commerce, University of Pennsylvania. The book combines economics and law, history and statistics, so that it may well be the best and most comprehensive book on the topic. The fraternal organization of antiquity and the medieval guilds were the precursors of the English Friendly Societies. Their ideas were imported to our country, beginning with the Masonic Order in 1730. The first fraternal insurance society, the Ancient Order of United Workmen, started in Pennsylvania in 1868. The fraternal insurance society "combined the secrecy and sociability of the usual fraternal society with the financial cooperation in meeting contingencies of life." Fraternal in contrast to commercial insurance has no capital stock and is organized and carried on solely for the benefit of its members and their beneficiaries. It operates not for profit, but on a lodge system, and has a representative government. There are Grand or State lodges which band together the local lodges. They have various restrictions on membership, such as sex, age, nationality, religion, and labor groups. Through the medium of the Fraternals, life insurance could be offered to the wage earners.

The author explains with all details the technical development of the fraternal life insurance, the premium systems, the reserves, the mortality tables, and so forth. The fraternal orders differ in many respects from a life insurance company, especially from a legal point of view; they are not subject to the same regulations. With

the passage of time, however, the differences have been disappearing.

After having occupied "for three quarters of a century a prominent place in the affairs of thousands of comparatively poor Americans," during the twentieth century the fraternal societies "have lost their preeminent position." Whereas the fraternal total in 1908 was 49.3 per cent of the commercial insurance in force, it declined to 9.1 per cent in 1928 and reached 3.2 per cent in 1948. Also the trend in the size of the average certificate has been downward: in 1904 it was \$1,322, in 1948 it was \$834. After all, the highly attractive book seems to be a kind of funeral oration.

ALFRED MANES

St. Petersburg, Florida

SOCIOLOGY AND EDUCATION

SKINNER, B. F. *Science and Human Behavior*. Pp. x, 461. New York: The Macmillan Company, 1953. \$4.00.

From the time of Max Meyer's *Fundamental Laws of Human Behavior*, published in 1911, to Skinner's *Science and Human Behavior*, which appeared in 1953, behaviorism has passed through a number of stages. At first the behaviorists paid much attention to the nervous system or at least to the functions they supposed the nervous system possessed. Skinner's neobehaviorism, on the contrary, has been termed descriptive behaviorism since he does not rely on the "explanatory psychology" of the older theorists, that is, on neurology. Nor does he follow Watson in making Pavlov's classical conditioning the cornerstone of his system. In fact, this type of conditioning, which Skinner terms "respondent" or "stimulus substitution," is given a minor role.

The author's ideological parent would seem to be Thorndike whose Law of Effect becomes refined into operant (instrumental) conditioning. This is the process in which a response is made more probable, that is, more frequent, by the addition of a reinforcer. To phrase the matter more precisely, an operant reinforcement increases

the future probability of responses in the same class as the response which precedes it. Such a description allows Skinner to avoid words like annoyance, satisfier, reward, and the like, which often have a mentalistic flavor. Another interesting aspect of the Skinner system is that the stimulus which elicits a response one might wish to reinforce need not be known. Skinner is concerned only with probabilities of response occurrences.

The first section of Skinner's book is devoted to a spirited defense of science. In the second section his notion of operant conditioning is developed. Such terms as deprivation, satiation, emotion, aversion, avoidance, anxiety, and punishment are treated in this frame of reference. In the third section Skinner views the individual as a whole and in the next section the behavior of people in groups. This is followed by a description of "controlling" agencies: government and law, religion, psychotherapy, economics, and education. In the last section are discussed the need for and the difficulties with utopias, matters also treated by Skinner in his earlier book, *Walden Two*.

Skinner's system is already influencing both experimentation and class-room training in psychology. The present book is dedicated to F. S. Keller whose *Principles of Psychology* (with W. N. Schoenfeld) attempts to bring Skinnerianism to the level of the college sophomore. Like every other discipline, psychology has had its somewhat cyclic shifts from one theoretical orientation to another. The time now seems favorable for Skinner and the other neobehaviorists to bring psychological theory down to earth from the sometimes rarified air of gestalt- and need-psychology.

PAUL R. FARNSWORTH

Stanford University

FURFEY, PAUL HANLY. *The Scope and Method of Sociology: A Metasociological Treatise*. Pp. xiv, 556. New York: Harper and Brothers, 1953. \$5.00.

This volume is the most recent of perennial efforts of sociologists to stipulate the requirements demanded of their discipline if it is to achieve fully a scientific status. Furfey approaches his problem in clear

recognition that what is required of sociology is contingent upon the nature of science and the definition of sociology entertained. Accordingly, a *metasociology* is established.

Science, it is proposed, is a systematized body of knowledge which is not divided from common-sense knowledge by an absolute line of demarcation (p. 55). It is merely superior. Its superiority resides in its being knowledge which is "certain, causal, and general to a notable degree." Most secular sociologists will take immediate issue with the metaphysical implications in the doctrine of certainty and the teleology implied in the view of causality. Some may have reservations about the universalism suggested in the adjective "general." Their misgivings are not likely to be diminished either by the observation that this conception of science is essentially a derivative from the medieval Aristotelian-Thomistic legacy or by Furfey's reluctance to relate science to experience and his explicit disapproval of any endeavor to characterize science by its method (p. 59). Nowhere does the author suggest how typical is the notion of science he has drawn, though he does admit that there is controversy over precisely the metaphysical implications of these alleged characteristics of science.

His conception of sociology eventuates from an inquiry initially pursued inductively. Over a period of two or three years of intermittent research, formal definitions of the discipline were compiled from the works of recognized American and foreign sociologists and from standard general and technical dictionaries (p. 130). Since the sample thus obtained was chosen too casually to be adequate, definitions were eliminated "until, in the present writer's judgment, the balance constituted a sample fairly well stratified by country, date, and school of thought" (p. 131). The remaining 81 definitions were analyzed with reference to what object sociology was purported to study and the perspective in which the object was studied (the material and formal object). Although no attempt was made to view the definitions in the context of the entire work in which each appeared, Furfey asserts that they can

be best epitomized as "sociology is the science which seeks the broadest possible generalizations applicable to society in its structural and functional aspects" (p. 139).

Because each science has its special objects investigated from its own perspective, procedures must be devised to implement the generalized notion of science in the special sphere of the particular discipline. As a pure, nonformal, moral science, sociology is concerned with the realm of concrete men and events. The chapters presenting statistical analysis, participant and nonparticipant observation, the case study of individuals and communities, the cultural approach, sociological experiments, tests, rating scales, and questionnaires, and the use of documentary sources constitute the practical set of techniques by which "existent reality" treated by sociology can be implicated in its scientific structure.

But, however empirical the orientation of the techniques of a science may be, the fundamental structure of science is, in Furfey's opinion, logical. He is thus led to postulate a correspondence between the domains of empirical fact and logic. The questionableness of this assumption is particularly acute in sociology where social data are also cultural phenomena located concretely in time and space. How the desideratum of developing sociology "into a logically coherent system" can be reconciled with cultural relativism is an issue which is never raised.

ROSCOE C. HINKLE, JR.

University of Maine

BARNETT, H. G. *Innovation: The Basis of Cultural Change*. Pp. xi, 462. New York: McGraw-Hill Book Company, 1953. \$6.50.

An adequate theory of human behavior must account for those inescapable observations that suggest that man is a culture creator as well as a culture carrier, a determiner as well as a product of culture. Therefore, there is need for a theory of the novel and new as well as of the consistent and the clearly transmitted among human artifacts and ways of living. It is to this important but neglected theoretical task that Dr. Barnett, professor of an-

thropology at the University of Oregon, addresses himself in his useful and scholarly book.

Barnett begins by taking innovation as commonplace in human behavior, belief, and concepts, not as a special function of gifted individuals. Defining the novel as "any thought, behavior, or thing that is . . . qualitatively different from existing forms" with the chief criterion being the reorganization of elements rather than quantitative variation, he argues that a theory of innovation should be essentially psychological in character. Such a theory "should be a formulation of rules of thinking as they pertain to origins of new combinations of thought." While it is clear that the thought processes initiating cultural change are influenced by societal conditions, it is equally clear, Barnett points out, that innovation cannot be accounted for on the basis of modal factors in the culture.

There are two reasons supporting this contention. The first is that culture is an abstraction, not a fact of experience in the lives of individuals. What is implied by the term "American culture," for example, is far too huge and complex a thing to be more than sampled experientially by individual Americans. Consequently, knowledge of the central attributes of the culture does not lead reliably to knowledge of the inventive thought processes of any given innovator. Second, the tendencies acting upon individuals in the socialization process as "the culture" determines it are essentially conserving and not productive of novelty. It is in relatively idiosyncratic experience, then, and in the regularities of the thinking process that one can probably most profitably search for the raw materials of a theory of innovation.

From this sound start, Dr. Barnett goes on to describe with rich example the mental processes which produce novel ideas, things, and acts, and to consider the societal factors which stimulate innovative thinking. Not the least of the many virtues of this book is a final chapter in which he presents a careful and trenchant critique of investigations by gestalt psychologists on thinking. He finds that gestalt psychology has underplayed the role of previous ex-

perience in structuring present cognitions and suggests that the wellsprings of creativity lie precisely in the ways that past experience orders immediate perception and thought. For the leads offered here, psychologists must be grateful.

But in both his seminal attack on the problem of novel thinking and his consideration of the problem of why some people accept while others reject innovations, Dr. Barnett displays an unfamiliarity with the conceptual and methodological contributions of psychology to the area of his interest. When a work of this degree of solidity reflects this kind of defect, one wonders if the sciences of man have been unprofitably fractionated. Nevertheless, virtually all behavioral scientists will find much of value here and may be stimulated to engage in interdisciplinary research of a highly necessary kind.

EDWARD JOSEPH SHOEN, JR.

Columbia University

NISBET, ROBERT A. *The Quest for Community: A Study in the Ethics of Order and Freedom*. Pp. ix, 303. New York: Oxford University Press, 1953. \$5.00.

Dr. Nisbet's book is largely concerned with the impact of centralized power on the mind and spirit of man in Western society. It is a learned and exhaustive analysis which scholars in many fields will find exceedingly readable, useful, and provocative.

Not only totalitarianism but any kind of political bigness is viewed by Dr. Nisbet with disfavor. Like many of those who challenge economic bigness, he persuades us to share his sentiments without showing us how to cope with the appalling concentrations of power already established. Few will object to his ideal of "cultural diversity" on the level of the family, occupation, religious grouping, and locality. Many thoughtful people would gladly retreat entirely, if they could, into those local forms of "spontaneous association" which afford a comforting sense of individual and social well-being.

The practical difficulty in effecting such a retreat arises from modern technological and institutional developments which are obscured in Dr. Nisbet's book by an over-

whelming weight of interesting literary and theoretical material. The task of restoring cultural diversity and spontaneous co-operation, except for a few "escapists," depends today upon our being able to understand and control some vastly important new phenomena. There has been, for instance, a revolutionary development in communications, especially in the technology of mass education and propaganda. This development is a terrible fact of modern politics on which we find little guidance in past or present social theory. To advocates of rationalism and democracy, it presents a basic, inescapable challenge. Another unifying factor, equally baffling to the social theorist, is the creation of more destructive weapons. With the power to destroy multiplied many times over, fear is being substituted for tolerance as the dominant mood of our society, and the quest for security is absorbing an increasing amount of our energies. Still growing, moreover, are the concentrations of economic power which cannot be arrested by mere appeals to return to simpler forms of association. By what institutional means can such centralizing forces be brought into the service of Dr. Nisbet's humane ideal?

Is it not a sound instinct which has led modern man—faced with these world-unifying techniques—to insist upon some concept of human association going far beyond local cultural groupings and national boundaries? In the actual institutions and techniques which surround him today, the individual is constantly reminded of his inevitable role as a world citizen. If only because he has a realistic concern for his own security and well-being, he cannot ignore his relationship to the widening forms of association. As a practical matter, his quest for a global community has a powerful claim to a right of way. Will it not be fatal to democracy if its advocates limit their creative thinking to the local level while the demand of mankind for global engineering is answered only by the totalitarians?

ERIC BEECROFT

Washington, D. C.

SMITH, WILLIAM CARLSON. *The Stepchild*. Pp. x, 314. Chicago: University of Chicago Press, 1953. \$6.00.

This is probably the first book ever written on the stepchild from the inclusive standpoint of sociology. In fact, according to Dr. Smith, there is only one other monograph in print dealing with the subject, and it is devoted to the legal aspects of the step-relationships (Adele Stuart Meriam, *The Stepfather in the Family*, Chicago: University of Chicago Press, 1940). In his bibliography Dr. Smith lists eight articles in serious journals. While the stepchild is a common theme of folklore and literary endeavor, it is, as Dr. Smith puts it, the stepchild of scientific literature on the child. It might be illuminating had Dr. Smith undertaken to explain this unseemly neglect of the subject by serious students of childhood.

A stepchild is a child of one's wife or husband by a former marriage. What makes the topic significant is that it involves a role conflict for the stepparent. The relationship with spouse represents an achieved role, is a matter of choice, and is usually based on affection. On the other hand, the relationship with stepchild is an ascribed role, the consequence of the choice of a mate. This inheritance of a role which may be not to one's liking probably is the basis for the general idea that being a stepchild means neglect. At least the term is commonly used to indicate neglect. There is a stereotype of the stepchild as "a pitiable creature who suffers from cruelty and neglect." There is a general prejudice in our society against the stepmother, and she must be exceptional before she is considered good. The role of a stepmother is usually more difficult than that of a stepfather.

Dr. Smith traces the stepchild in popular usage, in folk literature, in drama, in fiction. A chapter on biography reveals many accounts that contradict the notion of the cruel stepmother, but these biographies constitute a selected sample of stepparents. There is some discussion of the step-relationship in other cultures and a brief and scanty chapter presenting statistical data on stepchildren.

Part III, "The Stepchild and his Adjustment," approaches the problem from the standpoint of age, social and economic status, intermediate care, preparation of

children for a parent's remarriage, and idealization of the departed parent.

Dr. Smith states in his Introduction that his study is exploratory, not definitive. It examines the literature and reports material in case records of several social agencies. There is need for reliable quantitative studies organized around specific significant hypotheses. Meanwhile, Dr. Smith has done a splendid service in opening up this subject for further inquiry. Many thousands of stepchildren and stepparents could profit by Dr. Smith's analysis of this problem and his examination of factors in its solution.

M. F. NIMKOFF

Florida State University

BISNO, HERBERT. *The Philosophy of Social Work*. Pp. xiii, 143. Washington, D. C.: Public Affairs Press, 1952. \$3.25.

Perhaps the title of this book should be "a philosophy of social work," for it represents the author's philosophy, which the late Eduard C. Lindeman in an introduction to the essay says should "probably be called scientific humanism."

Mr. Bisno begins his thesis with a definition of social work as "the provision of services designed to aid individuals, singly or in groups, in coping with present or future social or psychological obstacles that prevent, or are likely to prevent, full and effective participation in society." He then sets up a series of propositions concerning the nature of the individual, the relations between groups, the function and methods of social work, and social maladjustment and social change.

In support of his propositions he quotes from a variety of sources, among them social work, the social sciences, religion, psychiatry, and psychoanalysis. He concludes with "a program of action for social workers."

A definition of social work that can win general acceptance has yet to be developed. Mr. Bisno's definition is no exception to the rule so far as this reviewer, who would have preferred a different approach, is concerned. As the discussion proceeds the author seems frequently to be equating social work and social case work, and often in stating this or that philosophic position he

does not distinguish between psychiatry or psychoanalysis and social work.

Mr. Bisno has woven his many quotations together with great ingenuity, but what usually is a good device, namely, consolidating notes at the end of each chapter, forces one to a constant turning back and forward which makes it difficult to keep current with the various references and to tell which is social work and which is other.

Most of the author's propositions do not as stated seem startling, but his method is to emphasize difference. Mr. Lindeman points out in his introduction that the author "frequently attempts to clarify his position by comparing his principles with those advocated by Roman Catholic social workers. If he had sought greater inclusiveness he might also have included parallels representative of Lutheran, or Islamic, or Jewish social work."

One might add that Mr. Bisno does not give sufficient weight to the fact that social work grows in and out of various institutional settings; nor does he indicate the broad areas of agreement which have made it possible for public and private, sectarian and nonsectarian, Catholic, Jewish, and Protestant social workers to move together toward shared social achievements.

Social workers operate through organization and in administrative situations where the effort is to seek common ground and where they arrive at similar decisions, it may be for diverse, sometimes even for opposite, reasons. But, by the same token, social workers only too often are not philosophers. There is occasion, therefore, for the teacher or the student of social work to read this book, and, while he may not arrive at the philosophy of social work, if that is the term to use, he may perhaps find himself clearer about his own philosophy.

KARL DE SCHWEINITZ

School of Social Work
University of California
Los Angeles

DORF, PHILIP. *The Builder: A Biography of Ezra Cornell*. Pp. xii, 459. New York: The Macmillan Company, 1952. \$5.00.

This biography of a justly famous American has been woven patiently and skillfully

from voluminous primary and secondary sources, principally from the *Ezra Cornell Papers*, gathered by Cornell University through three quarters of a century; the collection of the DeWitt Historical Society; and the fruitful files of the *Ithaca Chronicle* and the *Ithaca Journal* for the period 1825-1875. The author quite properly observes that these provide a mirror not only of the man but also of the times in which he lived (p. vii). These and other sources have been handled with historical insight and scholarly discrimination of values.

Viewed in its entirety, the volume presents an interesting story of the life of Ezra Cornell. That life had many facets. He was the founder of the great university that bears his name; he pioneered in the telegraph and railroad industries, helped to establish scientific agriculture, and gave generously of his accumulated substance.

Within these pages the student of biography will find rich satisfaction; the economist and political scientist will discover much grist for their analytical mills; the economic historian can uncover a cross section of the industrial development of the United States; and the general reader may see the impact of human personality upon the evolution of a community and a nation.

Against a backdrop of rigid Quaker doctrine and discipline the life of Cornell is clearly unfolded. His youth was one of limited opportunity. His later years were characterized by expanding scientific and industrial achievement, almost immeasurable self-denial, the acquisition of a material fortune through strenuous effort and creative organizational vision, and the founding of an institution of higher learning (1865). Reverses and disappointments dominated the final period of his life; he lost most of his fortune in the panic and depression of 1873.

The character and disposition of Ezra Cornell are delineated with admirable restraint; much more dramatic treatment might justly have been given this interesting personality. Cornell obviously was a symbol of the sturdy pioneer spirit that conquered the forest primeval and subdued a vast continent. The qualities responsible for so interesting a life are carved in clear

outline. He possessed unlimited energy, a resourceful imagination, courage to assume calculated risks, astonishing patience, a keen sense of humor, a spirit of self-sacrifice, natural acquisitiveness, and broad human understanding and sympathy.

Ezra Cornell and the scholarly Andrew D. White, Cornell University's first President who served that institution for 57 years, were an incomparably able team. Both men were aware that institutions do not measure time as mortals do; they are built for eternity. Time has testified to the solidity of their building.

GORDON S. WATKINS

University of California
Riverside

KENT, DONALD PETERSON. *The Refugee Intellectual: The Americanization of the Immigrants of 1933-1941*. Pp. xx, 317. New York: Columbia University Press, 1953. \$5.00.

This is a sociological case study of the experiences of intellectuals among the refugees who came from Germany and Austria to the United States between 1933 and 1941, and of how they rebuilt their uprooted careers in a new country. The study is based on a sample of 1,509 cases, about 20 per cent of the total professional group. Only 645 replied to a questionnaire, and others were interviewed personally, so that the total returns represent 721 cases.

The history of the uprooted in every immigration has always been a composite of successes and failures. There is a striking parallelism with the intellectuals among the "Forty-eighters" who came a century ago as refugees of other revolutions in Central Europe. Then, as now, America was the hope of the world, though many were bitterly disappointed by their first impressions, and proceeded at once to act as critics and reformers instead of waiting to know the United States better. There has always been, especially among intellectuals, a certain "refugee psychology," which finds expression occasionally in arrogant statements about "bringing culture to the barbarians" and leavening American Puritanism with Continental liberalism. Such people made readjustment exceedingly difficult for themselves.

On the whole, however, the net result now, as a century ago, is a notable record of genuine integration and Americanization. In the 1930's, there were symphony conductors who had to teach piano to beginners, scholars forced to wash dishes in hotels, and journalists who worked as night watchmen or packers in a grocery. But there was also among the refugees a surprising number of Nobel Prize winners, and a high representation in *Who's Who*, *American Men of Science*, and bibliographies of published research and lists of patents. The bulk of these people were "non-Aryans." What they contributed to the intellectual life of the United States is almost self-evident.

The experience with Americanization of this unusual group of immigrants was reassuring and gratifying. They were quickly naturalized, became self-supporting and acquired their own homes, aided by the heroic support of wives who did so much in these early critical years to help their husbands strike new roots in a new land. Many knew some English before they came. Fifteen per cent changed their names. Seventy-two per cent of the men and 67 per cent of the women resumed their old professions here. Despite many hurdles, the doctors were the most successful. Teachers, frequently aided by American foundations, were equally successful, and many refugees retrained for an academic career in the United States. Lawyers and journalists, whose main tools are the use of words, had the greatest difficulty in continuing their professional careers, and dentists were handicapped by the lower standards of their profession in Europe.

This book presents the material for a moving story of "a mixture of heroic struggles, abject resignation, shrewd alms-getting, and routine labor" (p. 107). It is a sociological survey, rather than an historical narrative. It reveals a remarkable record of American tolerance and generosity, and of the kindness and help of friends, relatives, and social agencies. The author has included many tables, as well as letters of deep human interest from the refugees themselves, and a great variety of data dealing with the whole problem of social readjustment. The book will prove espe-

cially valuable to sociologists, social workers, and historians of immigration. One would wish that it might also come to the attention of policy-makers in government. They would profit by reading a story that ends so well, and of which America has every reason to be proud.

CARL WITTKÉ

Western Reserve University

PHILOSOPHY AND RELIGION

MACIVER, R. M. (Ed.). *Moments of Personal Discovery*. Pp. xi, 170. New York: Harper & Brothers, 1953. \$2.00.

This volume is a collection of essays based on lectures given at The Institute for Religious and Social Studies of the Jewish Theological Seminary of America during the winter of 1951-52. The lecturers were asked to address themselves to the theme "at that moment my imagination struck fire" and to search for some point, some moment of experience, that brought them a clearer sense of direction and some vision of a goal toward which henceforth they must move. The result is a series of interesting accounts of what a group of distinguished contemporary Americans conceive to be the distinctive ideas that have given direction to their life and thought.

The title of the book and the dust cover may lead the reader to expect something more dramatic and psychologically interesting in these autobiographical sketches than they have to offer. None of these sober and well-balanced gentlemen have anything startling to record in the way their bright ideas came to them. Most of them are hard put to it to locate a "moment" when the inspiration came, and the way they warmed up in response to their insights is overdramatized in the metaphor of the imagination catching fire. If there is any stroke of genius in these "personal discoveries," then it suggests that Carlyle's definition is sound—genius is simply "an infinite capacity for taking pains." Even here the word "infinite" is no small exaggeration. What one gathers is that these men, in most cases, worked hard at

their problems, and through the hard work some satisfactory solution gradually or suddenly dawned upon them.

In other cases they were unsatisfied by, or unappreciative of, the framework of thought they had received from their environment and training, and were fortunate enough to meet with some person or book which suggested to them a different outlook and one which appealed to them better. It is interesting to note, as examples of the latter type, that Douglas Auchincloss and Harold Taylor each crossed to the other side of the fence and ended pretty much where the other began, the former under the influence of some ideas of Arnold Toynbee and the latter under the influence of Max Otto, John Dewey, and David Hume. Each appears to think that he has found something both new and true.

Other contributors to the book are Douglas Moore, Harlow Shapley, Lawrence S. Kubie, Margaret Mead, Paul Weiss, Lyman Bryson, Joseph M. Proskauer, Harry Emerson Fosdick, Mordecai M. Kaplan, Richard McKeon, and W. G. Constable.

PASSMORE, J. A. *Hume's Intentions*. Pp. ix, 164. New York: Cambridge University Press, 1952. \$3.75.

This able little book starts from the premise that there are many Humes. Many themes, many "intentions," are interwoven in complex ways in Hume's various writings. The author's object is to "disentangle" these various themes and to show how they are related to Hume's central purpose. Despite the hodgepodge of different things Hume says on different occasions, despite the inconsistencies that critics have exposed, there is a unity to Hume's work. This is the unity given by "a single over-riding intention."

Among the many themes are phenomenalism, positivism, associationism, and, of course, scepticism. The single, overriding intention was to establish what we now call social studies on a firm basis. The subtitle of the *Treatise*, Professor Passmore thinks, is an exact description of Hume's purpose—"an attempt to introduce the experimental method of reasoning into moral

subjects." Moral science, understood as the science that "concerns itself with the human mind and with human relationships in society," is intended by Hume to replace metaphysics on the one hand and physics on the other as the basis for human knowledge. Metaphysics from Hume's point of view is of course mostly nonsense; what is not nonsense is "psychology in disguise." As for physics, it on occasion lays claim to a rational certainty it does not possess and so falls into dogmatism; in any case its validation depends on psychological considerations, on a knowledge of how the mind frames judgments and draws inferences.

Hume conceived the first step in establishing a science of man to be the creation of a new logic; to this task, according to Professor Passmore, the whole of Book I of the *Treatise* is devoted. The old logic "would not do. . . . It relied upon self-evident premises, which are entirely lacking, Hume argues, in any empirical science." What was needed was, therefore, "a logic of probability" which would be, in effect, a methodology of the social sciences. But since logic, so conceived, was itself one of the moral sciences, it was necessary for Hume to eliminate the formal elements, or rather, to show that they are no more than associative links; in a word, logic must be reduced to psychology.

Professor Passmore argues that this attempted reduction failed, and that Hume was unable to dispense with formal elements. Instead, he became involved in many "subterranean" devices as he sought in vain to "find a non-formal method of characterizing logical form." The difficulties in which Hume became enmeshed as he struggled to give an account of resemblance, negation, contradiction, existence, and other concepts are displayed by Professor Passmore in convincing detail.

It is impossible in this short review to trace the author's analyses of the other main themes of Hume's work. We must summarize Professor Passmore's position by saying that he holds that Hume failed to achieve his main purpose—he failed, that is, to work out a *via media* between dogmatism and scepticism; he emphasized man "at the cost of making a science of

man impossible." Nevertheless, Professor Passmore clearly regards Hume's achievement as substantial. Partly this achievement was negative—it consisted in showing that the theory of ideas "could never give an account of ordinary perception." But partly it was positive—it showed the way to "a quite different conception of science, in which speculation, not security, is the key-note."

While this book is perhaps intended primarily for students of the history of philosophy, it should have a wider appeal. Methodology in what Hume called the moral sciences is still a pressing concern—perhaps even more pressing today than in his time. The problems he discussed are still with us; some of the solutions he proposed have a vogue today which, if Professor Passmore is correct, they certainly do not deserve. Thus *Hume's Intentions* can be read with profit by social scientists generally.

Pomona College

JASPERS, KARL. *Tragedy Is Not Enough*. Translated from the German by Harold A. T. Reiche, Harry T. Moore, and Karl W. Deutsch. Pp. 123. Boston: Beacon Press, 1953. \$2.25.

This is a rendering of one section of Jaspers' big volume *On Truth*; it has also been published separately in German. K. W. Deutsch introduces the reader to the personality and the thought of the author; three notions are mentioned as fundamental: encompassing; man's experience of limit and transcendence; the will to communication. The first means that reality is inexhaustible and that its boundaries recede the more the farther one advances; the encompassing reality can neither be known nor charted. But man is compelled to transcend continuously the limits he encounters, and in doing so he may end in tragedy. Whenever awareness exceeds power, tragedy results. Facing this situation, risking destruction in the incessant effort to transcend himself and reality, man realizes his being. But the tragic attitude has to be genuine and not mere pose.

Being so brief, this volume does not allow for further condensation. For that,

it is too "dense"; often Jaspers only outlines without giving details, as in the two pages of historical survey of "tragic knowledge" from Homer to Nietzsche. Only with the awakening of this knowledge does man attain an understanding of himself. Jaspers holds that Christian salvation is opposed to tragic knowledge and that there is no Christian tragedy, because the hope of salvation annihilates the consciousness of the tragic. "Tragedy . . . is the measure of man's greatness in breakdown and failure . . . reveals itself in man's unconditional will to truth." It is manifest in battle, victory, and guilt. Tragic situations arise in battle and collision of the individual and the universal, in the clash of ways of life, the fight of man against the gods, and the fight among the gods. But the victor is not he who triumphs, but he who fails. In its apparent victory, the universal, the world order becomes questionable and gives way to a new order. However, in face of the existing order, man becomes guilty. Guilt is identical with human existence; it is man's destiny to be born guilty, and guilt is inherent in every action carried out freely. He is guiltlessly guilty, and reality "is split, truth is divided"; the colliding powers are true independent of each other, and the questions animating tragedy are, therefore: What is true? Who is right?

These ideas are rendered more concrete in an analysis of the tragedies of Oedipus and Hamlet. Tragedy, one gathers, is twofold: that of the protagonist and that of the spectator, whether the stage be reality or theater. In understanding his fate the hero finds deliverance, and so does the spectator. To both is revealed that human need and suffering are anchored in metaphysics. The insight thus gained does not lead into a "tragic world-view" which is rather a distortion of tragic knowledge; in the latter, tragedy and release are linked together; if only the dark side is envisaged, the result is that tragedy becomes a characteristic not of man, but of a human aristocracy. Furthermore, tragedy is not an absolute, but it opens up the vision of order, justice, love of one's fellow man. Tragedy is unavoidable, because man never possesses the whole truth. But, perishing

or surviving, man in tragedy stands before the truth.

A postscript by H. A. T. Reiche has interesting things to say on Jaspers' style. There are also a bibliography, an index, and four pages of notes with references and explanations of certain translations of terms.

Even with the introduction, the reader may find it difficult to follow the reasonings of the author, first because for a full appreciation a greater acquaintance with Jaspers' ideas is desirable, but also because he sometimes refers to problems and views only by implication. It is also important that one realize the place this philosophy holds within the set-up of today. To label the author simply an "existentialist" is quite insufficient. The book may well serve to arouse a greater interest in Jaspers' philosophy; but it has a wider significance too: it is indicative of what may be a new turn in philosophical thought by its emphatic reference to poetry. Heidegger has gone a similar way, and the relations of other "existentialists" to literature are well known.

RUDOLF ALLERS

Georgetown University

DUCASSE, C. J. *A Philosophical Scrutiny of Religion*. Pp. x, 441. New York: The Ronald Press Company, 1953. \$4.50.

This is an objective examination of religion by one of America's most distinguished living philosophers, whose Carus Lectureship (the blue ribbon of American philosophy) produced in 1951 the stimulating volume, *Nature, Mind, and Death*. As a religious thinker Professor Ducasse manifests no leaning to any form of traditional theology. As a philosopher he is an empiricist who betrays no bias against ideas of a kind to which the minds of empiricists are often closed. As a result this survey of religious ideas and practices is broadly sympathetic to religious faith but closely critical of its dogmatisms and extravagances.

The aim of the book is to understand religion in its various forms rather than to defend any one form. The early chapters are descriptive, with particular attention paid to Buddhism as an example of the fact that religion is not to be

identified with theism. The typical and fundamental concepts of religion are analyzed, and various definitions of it are discussed at length. In this way Ducasse arrives at the conclusion that the belief element in religion is central, rather than cult or feeling, and that, nevertheless, religion must be defined in terms of the *function* of belief, rather than in terms of its *content*. Its functions are then found to be two, (a) the *social* function, which is to provide motivation for just or altruistic conduct, (b) the *personal* function, to give the individual some measure of a serene assurance out of which flow courage, endurance, humility, conscientiousness, and moderation.

In succeeding chapters Ducasse shows how the various forms and features of religious faith perform these functions, some better than others, and how some developments of religion are perversions which militate against its functions. There are discussions of magic and mysticism, prayer, gods and spirits, and the life after death. On the existence of a personal, monotheistic deity Ducasse shows that the question is logically open but believes, with William James, that it is well if it can be cultivated by the will to believe. On the possibility of personal survival of bodily death he is convinced that the evidence from psychical research is favorable to belief.

This reviewer has only one important criticism of the book to offer, but it applies to the central thesis. The statement of the function of religion misses the essential point. Religion cannot be cultivated out of motives of prudence. It has no vitality unless it involves a spontaneous devotion to some object regarded as supremely worthy of such devotion. The forms of belief and cult that do not arise from a loving commitment to the object of devotion are a pale imitation of religion that misses the essence of it. It is this attitude of devotion that makes Communism and Nazism often genuinely religious while much of our church going is a spurious pursuit of eschatological loaves and fishes.

A. CAMPBELL GARNETT

University of Wisconsin

BROAD, C. D. *Religion, Philosophy and Psychical Research: Selected Essays*. Pp. vii, 308. New York: Harcourt, Brace & Company, 1953. \$4.50.

These eleven essays are selected from publications of the last 30 years. Their inclusion in the International Library of Psychology, Philosophy, and Scientific Method assure their easy availability. Something of their durable quality is suggested by the fact that "War Thoughts in Peace Time," delivered in 1931, required only a postscript underlining its main contentions. And why not? An implacable logic of Dr. Broad is always a delight and a profit. The discipline of such a journey cannot easily be forgotten. Once grant his presuppositions, and you will be carried along. His arguments are clear and as succinct as materials will allow. Their wealth of ideas defies condensation.

Four essays in Section Two on Religion make up the core of the volume, crowded closely by two political discussions. "War Thoughts . . ." and "Fallacies in Political Thinking" are distinguished by acute analysis and a judicious ethical emphasis. Together they bring rare wisdom for the citizen and the statesman. Not much improvement can be expected, Broad thinks, unless and until root causes in social and political events are fully explored.

In the first essay of Section Two Broad contends that God cannot be a person in the theological sense of Christian orthodoxy; and in a philosophical sense, God need not be. Here we must begin to face presuppositions. In Christianity the Trinity as a whole is God, and Trinity is not a person. Proof for the existence of God likewise flounders. Philosophically, existence of God is a convenient postulate made necessary by setting out from nature in an unnecessarily restricted sense. Classic arguments, Broad thinks, find their strength mainly in their cosmic reference. But unfortunately they favor two different gods, "one a ground and not a designer, and the other a designer and not a ground, of the rest of the universe."

Yet, is not argumentation on the "existence" of God a misconceived adventure? Even historical relevance lies buried in certain dubious assumptions. These argu-

ments set out from faulty definition, such as a concept of existence when applied to God. Again, what about the assumption that Christian theology is once for all set in a logical framework of by-gone centuries, made purely relative, for instance, to eighteenth century concepts; and that nothing has happened since or can happen to improve perspective? What about combining a highly selective field of evidence with a relatively abstract logical form? Often the kind of "proof" anticipated loses its relevance, once the concept of evidence is revised. Bishop Butler is a case in point. He is undoubtedly a great theologian, but natural religion of an eighteenth-century deistic type is not a serious issue for Christian theology. Much the same goes for the relation of science and religion, unless "specifically Christian doctrines" are limited to (1) early apostolic notions about Jesus, (2) a Bible used as history and cosmology, and (3) the evidential value of certain miracles.

Christianity is a fellowship, as well as a doctrine. Moreover, its doctrines are not to be sought within an ecclesiastical of any time, including our own. Occasionally theology may hide its intelligence within selected historical dogmas, and may deceive itself by allowing psychological certitude to parade as logical evidence. But once and again the ethical foundations of Christianity come into view, awaiting acknowledgment by a mind that is confronted by moral experience. How much relevance psychical research has for religion depends more upon basic presuppositions than upon historical color in basic concepts. With Broad's discussions these issues are brought to the fore. He has located certain timeless mountains on our horizon.

IRL G. WHITCHURCH

Kingfield, Maine

Function of the Public Schools in Dealing with Religion, The. A Report on the Exploratory Study Made by the Committee on Religion and Education. Pp. xiv, 146. Washington: American Council on Education, 1953. \$2.00.

Among the items of faith affirmed in 1947 and with some hesitation in the

present report by the Committee on Religion and Education of the American Council on Education are that the separation of church and state principle may not be ignored, that "teaching a common core of religious beliefs in the public schools is not a satisfactory solution," that students should be challenged to take a positive personal attitude toward religion, that "an intelligent understanding of the historical and contemporary role of religion in human affairs" is an essential.

Two questionnaires and eleven pairs of propositions were sent to selected groups of American educational and religious leaders for their reaction to exploratory research regarding the solution of the problem of the function of the Public Schools in dealing with religion.

What surprises the reader is the general lack of interest on the part of thousands of educators to whom the questions were put. For example, only 21 per cent of the superintendents of schools out of 3,360 replied to question one of the second questionnaire (p. 102), and only 50 per cent out of 456 among the professors of education; to question two, there were even fewer replies in both instances.

The findings (pp. 81-84) in summary state that three policies were discovered in public schools and higher educational institutions in regard to religion: *avoidance of religion, planned religious activities, factual study of religion.*

It is admitted that religion has not and cannot desert either the classrooms, the curriculum, or the campus of the American Public School. This is encouraging. For the committee might now undertake to interpret Waterman's definition of religion that "religion is man's persistent endeavor to adjust the reality within him to the most significant realities without for the purpose of preserving and enhancing the values of personality." See, for example, Philippians 4:8. But why limit religious expression to chronology, history, literature, art, and music? Now that the insight of the universal significance of religion appeals, we recommend a more intense study of Chave (not even mentioned in the bibliography), Madden (mentioned), and Moehlman, chapter seven (apparently over-

looked by the committee's compiler of bibliography).

The finding that the problem of religion and public education is daily becoming more complex for the committee is very significant. A solution cannot be "achieved easily or soon." Correct again! Why not reread Harrison Elliott's *Can Religious Education Be Christian?* (strangely missing from the bibliography) or some of George A. Coe's deliverances (also not there)?

Elliott consistently contended that "fundamentalist procedure and true education are incompatible." Personal religious faith is bound to be sectarian, and the public school cannot tamper with this. Back in 1922, the Religious Education Association reported "failure thus far . . . to achieve a social experience worthy of religious ideals." Indeed, in 1940, Mr. Shaver seemed to be pleading for the presentation of controversial religious issues in the Public Schools (*Religious Education*, 17, 1922, pp. 266-268). Moreover, careful studies have shown that "the correlation of moral knowledge (knowledge of right and wrong) with Sunday School attendance was slightly negative."

The decision of the committee to concentrate upon the "factual study of religion when and where intrinsic to general education" should ultimately issue in the finding that the experience of Public Education with religion is far more pertinent to the American way of life than any quantity of external study. Indeed, Wesner Fallow's wisdom in *Toward Spiritual Security* should not be neglected: "The goal of Protestant teaching has been too much concerned with giving information to the individual, to the exclusion of causing him to grow spiritually in his natural gropings. It cannot be repeated too often that the basic group, in and through which a person learns, grows and indeed comes to a person is the family."

CONRAD HENRY MOEHLMAN
University of Southern California

LECLER, JOSEPH. *The Two Sovereignities: A Study of the Relationship Between Church and State*. Pp. x, 196. New York: Philosophical Library, 1952. \$3.75.

This is a brittle yet useful essay on the sovereignty of the state in relation to the church. Its thesis is arrived at chiefly through an analysis and interpretation of the writings of popes, canonists, and a small group of philosophers, with some supplementary support drawn from European historical examples. If the reader is looking for a systematic treatment of the subject, a careful gradation, let us say, of the various ways states and churches can work in harmony or at odds, he will be disappointed. The book is valuable principally as an example of Catholic thinking today.

The stand of the primitive Christian Church was revolutionary. It demanded a complete distinction between the spiritual and temporal worlds. On the split-up of the Roman Empire, however, the secular powers that emerged were ignorant of administration, learning, and culture. Only the clergy knew about such things. It therefore had to lend a hand. This explains the Church's intrusion into the temporal sphere, a circumstance that Professor Lecler wishes clearly understood. When the principalities had grown to adult nations, the Church withdrew its intervention in temporal affairs and turned to its chief concern, man's interior life. This is the position of the Roman Catholic Church today, and this is the original and correct interpretation of the Christian doctrine of the two swords. There are those who charge that the Roman Catholic Church is out to dominate the temporal sphere and those who rebuke it for favoring a complete separation. Both are wrong. The Church is against both clericalism and the lay state.

The major failing of the book is the tendency of the author, a professor at the Institute Catholique in Paris, to forget every now and then that the world has seen other religions beside Catholicism. There is much to be said for treating the problem within the Catholic orbit as an admirable or revealed or logical solution, but when statements are made that implicate other religions, one expects some evidence from comparative religion or anthropology, and also some realization that the situation today is not dualistic but pluralistic. The

neglect of other creeds, to take one example, makes the book's practical handling of education shortsighted. As long as one has at the back of his mind a medieval dualism of church and state, a simple equal co-operation seems possible. Once remember that the problem is not state and church but state and churches, the pastoral scene vanishes and in its place appears today's familiar sight—secular education, compulsory and predominant.

This fact pierces the book's central thesis: the church's rule is over men's consciences. And if she never has a chance to develop and enrich those consciences . . . Professor Lecler would agree that the road runs dead end to the lay-state he fears.

SEBASTIAN DE GRAZIA
Human Resources Research Office
George Washington University

WHITE, EDWARD A. *Science and Religion in American Thought: The Impact of Naturalism*. Pp. ix, 117. Stanford Calif.: Stanford University Press, 1952. \$2.50.

The modern history of the antagonism between science and religion begins with the deists in the eighteenth century. A renewed attack on religion came in the mid-nineteenth century with the publication of the *Origin of the Species*. Scientific arguments were developed to cast doubt on the accuracy of the Bible and sociological interpretations of Darwinism clashed with fundamental Christian doctrine. This book emphasizes the impact of these two intellectual forces upon religious thinking in America in a group of essays on the relationship of science and religion in the writings of John W. Draper, Andrew D. White, John Fiske, William James, David Starr Jordan, and John Dewey. The longest essay deals with Jordan, whose private papers have been studied for this purpose. Actually, however, Jordan had much less influence than the others in undermining orthodox religious concepts, and it is to be regretted that a more complete analysis especially of Fiske and James was not included.

Dr. White has concentrated his study perhaps too exclusively on the publication of his subjects without giving an adequate

picture of the socioeconomic climate which helped create their ideas. The result is that the reader sometimes has the feeling that these ideas existed in a vacuum. This failure to place ideas in time-place perspective is disconcerting. However, let not this criticism obscure the merit of this book in presenting in brief compass the religious opinions of some of the leading thinkers of American life.

Draper, White, and Fiske had the widest popular appeal because they wrote without the technical jargon of philosophy. James and Dewey had the greatest influence over the long-run because they were able to perpetuate their ideas through their followers. From the positivism of Draper to the instrumentalism of Dewey there is a wide difference in sophistication, although a surprising area of agreement is to be found. Dr. White has made clear that each writer derived his views in favor of science against religion through varying philosophical assumptions and interpretations of everyday life.

ALBERT POST

Paris, France

GUTHRIE, DWIGHT RAYMOND. *John McMillan: The Apostle of Presbyterianism in the West, 1752-1833*. Pp. x, 296. Pittsburgh: University of Pittsburgh Press, 1952. \$3.00.

A recent estimate of the number of Scotch-Irish who found their way to the New World in the eighteenth century has placed the figure at 385,000. Constituting the last great wave of immigration to the colonies, the Scotch-Irish were compelled to push beyond the older settlements to find homes on the edge of the wilderness. As Theodore Roosevelt has said, in his *Winning of the West*, the Scotch-Irish were America's first frontiersmen. When the Revolutionary War began these hardy people constituted a fringe of settlement all along the frontier from New Hampshire on the north to Georgia on the south. Almost a hundred per cent Presbyterian in their affiliation, and with their tradition of an educated ministry, both in Scotland and North Ireland, together with their schools, which were considered a necessity in every

Scotch-Irish settlement, the Presbyterian Irish constituted the advance guard of Christian civilization west of the Alleghenies.

John McMillan, the subject of this careful biographical study, was a second generation Scotch-Irishman, born in Chester County, Pennsylvania, of devout Presbyterian parents. He attended John Blair's "Log College" at Fagg's Manor in his home county and later received his first baccalaureate degree at the College of New Jersey (Princeton) where he sat at the feet of John Witherspoon, but recently come from Scotland to assume the presidency of the college. Later he returned to Robert Smith's famous "Log College" at Pequea where he spent two additional years. Such was the preparation for the Presbyterian ministry then available to young Scotch-Irishmen, such as John McMillan. Thus there came to be an American trained Presbyterian ministry suited to the needs of an advancing American frontier. Another pattern of procedure which John McMillan typifies was the preaching tours through the back country previous to his settlement over congregations. In his extended tours McMillan came to know the Redstone country—southwestern Pennsylvania—where he received a call to two congregations, Chartiers and Pigeon Creek. Here he spent his entire ministry from 1776 to November 16, 1833, the date of his death. He was the first settled Presbyterian minister west of the Alleghenies.

The Presbyterian frontier minister combined school teaching with his work as a minister, and John McMillan, like many others, conducted a "Log College." The vast educational need all about him, as well as the necessity of increasing his means of livelihood, would naturally lead the college-trained minister to assume the schoolmaster's task, in connection with his ministry. John McMillan's school developed into Jefferson Academy, and Jefferson Academy into Jefferson College. The same thing also happened at Washington, Pennsylvania, only fourteen miles away, where another Presbyterian "Log College" was formed by Thaddeus Dodd, likewise a Princeton graduate, which later became

Washington Academy. In the course of time (1865) the two colleges merged, after a long "college war," to form what is now Washington and Jefferson College.

"Politics" is the title of an interesting chapter on the Whiskey Rebellion in western Pennsylvania and John McMillan's part in it. To John McMillan the "Rebellion" constituted a threat to the orderly life of the community, and he courageously took the side of law and order. In fact all the frontier churches stood for obedience to law and constituted islands of order in a sea of disorder.

The author has further served the cause of frontier history by including the hitherto unpublished *John McMillan Journal*, together with his brief autobiography in an Appendix.

WILLIAM WARREN SWEET

Pomona College

DAHMS, JOSEPH H. *The Prosecution of John Wyclif*. Pp. xi, 167. New Haven: Yale University Press, 1952. \$4.00.

In this study of John Wyclif's relations with his lay and clerical superiors, Mr. Dahms submits the often very inconclusive evidence to a thorough, if at times somewhat captious, re-examination. On one or two points, such as the exact number of propositions condemned by Pope Gregory XI in 1377, he has had no difficulty in setting right the mistakes of previous scholars. But the value claimed for his book as "an indispensable corrective to Workman's standard biography"—and the claim is his own—would be easier to allow had he not failed to take account of several primary sources long accessible in print.

A reading, for example, of the *Anonimale Chronicle*, edited more than a quarter of a century ago by Mr. V. H. Galbraith, might not have materially altered his narrative of Gaunt's stormy encounter with Bishop Courtenay in St. Paul's, but it would have prevented him from voicing the baseless opinion that "it is extremely improbable that Wyclif at any time had the honor of addressing Parliament." Similarly he has overlooked Mr. W. A. Partin's publication of a letter from Adam Easton to Abbot Litlington of Westminster; yet

this makes possible the correct identification of the "black dog" and his whelps whom Wyclif rightly blamed for bringing his erroneous doctrines to the people's attention. Nor do these exhaust the list of Mr. Dahms' oversights. Even less excusable in his patchy acquaintance with the principal secondary authorities. There is bound to be something unreal about a fresh attempt to explain "the political role of John of Gaunt" made in total ignorance of Tout's contribution to this difficult subject, while the works of both Professor Perroy and Father Aubrey Gwynn are scarcely less essential for the biographer of Wyclif. So unfamiliar is Mr. Dahms with the political realities of his subject that he is capable of describing the Commons as part of the government.

That England's lay rulers never silenced Wyclif in 1378 is one of his most cherished discoveries. He has no evidence for it except an ambiguous rubric added by the unknown compiler of that late collection of documents known as the *Fasciculi Zizariorum*. But he attempts to give it plausibility by misquoting Mr. Partin and by brushing aside the fact that Wyclif was still publicly disputing at Oxford long after 1378. The scholar's immunity is certainly a problem, but it cannot be solved in this summary fashion. Mr. Dahms' book has at least the merit of reminding us that such problems exist.

K. B. MCFARLANE

Magdalen College
Oxford University

FISHER, GALEN M. *John R. Mott: Architect of Co-operation and Unity*. Pp. ix, 214. New York: Association Press, 1953. \$3.50.

This relatively small book is not a biography of John R. Mott but a review of his vigorous leadership in establishing understanding, co-operation, and unity among Christian denominations and confessions on a world scale. The author wisely refrains from prejudging the results of Mott's influence on the ecumenical movement, preferring to leave that to the verdict of time. He furnishes us with an interpretation of foundational and world-

wide movements which Mott helped to establish. The record leaves little doubt that co-operation and unity among religious bodies will continue to advance during the years ahead.

In successive chapters the author reviews the main lines of Mott's endeavors, likening his major abilities and interests to tributaries which flow together to furnish a stream of influence felt in all parts of the world during much of the more than 60 years of remarkable leadership. The scope of his interests and global mindedness is indicated by the great number of organizations and activities which are briefly but effectively reviewed. A partial list of movements he either helped to establish or led includes: The World Student Christian Federation, the Student Volunteer Movement, the American-Canadian International Committee of YMCA's, the World's Committee of YMCA's, the International Missionary Council, the World Council of Churches, the Institute of Social and Religious Research, the Commission on Interracial Cooperation, the Committee on Friendly Relations Among Foreign Students. He headed the United War Work Fund of World War I. These and many more pass in review.

The author quotes extensively and frequently from available records, correspondence, and publications and statements furnished by about one hundred persons of many nationalities as to the influence of Mott upon them and their estimate of his contributions to the ecumenical movement. The record testifies to countless numbers influenced by Mott. He was constantly seeking out men of ability and assigning them challenging tasks. He believed with Dwight L. Moody that, "It is better to put ten men to work than to do the work of ten men." One wonders on completion of the book if Mott has not done both.

A key to Mott's influence is indicated by the great care with which he prepared for interviews with important personages or for addresses to be given to various types of groups. He took time to cultivate the friendship and understanding of key leaders and then skillfully related them to challenging tasks. He arranged and pre-

sided over conferences in a manner which enabled those who, while maintaining various religious convictions, discovered a basis of understanding and co-operation. The author's interpretation in these regards is admirable.

A weakness of the book is its inadequate treatment of Mott's policies and thought regarding Roman Catholicism. There is a partially satisfying treatment of his relations with Eastern Orthodox leaders but a much fuller treatment would be helpful and historically important. All in all a world-wide mission of a Christian layman has been covered in a readable and challenging way.

HERBERT L. SEAMANS

New York City

COMMONWEALTH OF NATIONS

FITZSIMONS, M. A. *The Foreign Policy of the British Labour Government, 1945-1951*. Pp. viii, 182. Notre Dame, Ind.: University of Notre Dame Press, 1953. \$3.25.

Throughout the postwar Labour regime "The question of a Socialist foreign policy," Fitzsimons concludes (p. 179), "arose only to become absurd. The continuity of British foreign policy prevailed because British interests remained the same and the suspicion of state for state survived." Ernest Bevin realistically, but with fumbling hands, adopted the principles laid down in Churchill's Fulton and Zurich speeches: pure expediency, not Socialist ideals, guided the course of British diplomacy, and expediency was ruled by the desire for, and the iron-clad need for, maintaining as much of the crumbling Empire as possible for as long as possible. A leading result is that much of the Commonwealth has been retained, and in the main this is good, for "few nations have defined their interests with the moderation and flexibility of British policy" (p. 2). Churchill, it is implied, would have kept more had he been in power, but only degrees of possible success, not differences in objectives, would have altered the outcome.

There is much to be said for this thesis,

but it leads the author to some curious contradictions. In the areas where some degree or other of difference between the initial Labour and Tory positions differed—most notably, in giving independence to India, Ceylon, Pakistan, Burma, and the Gold Coast (virtual independence)—the Commonwealth has won strength and not lost it. Contrariwise, where Churchillian policies have been most clearly followed, as in Malaya, the Arabic world, Persia, and South and Central Africa, Britain has everywhere lost strength and prestige. Much the same could be said for many British policies relating to continental Europe. For example, giving up the Labour program for nationalizing German heavy industry was a concession to the Churchill point of view, but it ruined the American decartelization program, set the stage for a swift and alarming revival of the same reactionary forces which once hoisted Hitler to power, and thereby put an almost insuperable obstacle in the way of an effective Franco-German accord. Many other instances might be cited.

In general the historical facts given are correct, but the interpretation is upside down. This holds for Commonwealth and Empire, for most of the British relations on the Continent, and much even of relations with the United States and the Communist power bloc. To say, for example, that "The great wrong of British imperialism has been not economic exploitation but the creation of an irresponsible temper among the victims of imperialism who are led to blame all their woes on British rule" (p. 64), is to misread the facts of separatist movement of the past two hundred years—from the Boston Tea Party to the Accra affair and Mau Mau. The undercurrent of innuendo that runs throughout this book at every turn of phrase or policy which even smacks of liberalism, let alone "socialism," is ungenerous to say the least; at the worst it is a support of the deadly forces of reaction which once again threaten freedom and democracy on all sides. Such exegesis is not only bad history; but also it helps to prepare us not for "the ways of peace, the footpath of good will," but for still more blundering steps in the many strategic byways where Americans are already win-

ning world records for losing friends and antagonizing people.

University of California

KEETON, G. W. *The Passing of Parliament*. Pp. vii, 208. London: Ernest Benn Ltd. (distributed in the U. S. by John de Graff, New York), 1952. \$4.50.

The learned author, Professor of English Law at University College, London, resumes the theme of Lord Hewart of Bury's *The New Despotism* who attacked the "petty despots of Whitehall" more than 20 years ago. He is deeply alarmed at the legislative and administrative scope and at the "contempt for legal process" which the "Departments" are increasingly inclined to show. This, to him, is "the Twilight of the Common Law" with which his first chapter deals, leading to "the Road to Moscow" that the second chapter sketches. The Conclusion to this chapter summarizes well Professor Keeton's central theme:

"Today in Great Britain we live on the edge of dictatorship. Transition would be easy, swift, and it could be accomplished with complete legality. Already so many steps have been taken in this direction, due to the completeness of power possessed by the Government of the day, and the absence of any real check such as the terms of a written constitution or the existence of an effective second chamber, that those still to be taken are small in comparison. . . . Today, virtually the only remaining constitutional safeguard is the habit of tolerance and the existence of a powerful political opposition, both of which owe their existence to the Revolution of 1688. If both these safeguards disappeared, our constitutional machinery would forthwith become the instrument of a totalitarian despotism."

This forthright and alarmist proposition, even though stated in conditional terms, the remainder of the book seeks to buttress by arguments from history and law. Needless to say, Professor Keeton does not concern himself specifically with the meaning of the terms "totalitarianism" or "dictatorship," and the specialist in these matters may well question their employment in this context. But even so, enough

remains to make his book a very challenging one.

He starts his argument by recalling the struggle over the Stuarts' effort to develop the constitution in an absolutist direction in the seventeenth century. The revolution of 1688, he presents in good traditional terms as resulting in the sovereignty of Parliament, that is to say, its "unlimited legislative power" and in the application of the ordinary common law to all men, whether subjects or public officers. "The Passing of Impeachment" shows how this revolution "established in these islands the liberal State founded on political toleration," surely a somewhat roseate view of that event, especially in the perspective of his own next chapter, entitled "The Transformation of Parliament." For here we find the author taking a rather negative view of the democratic quality of British politics which he thinks bears no relation either to its Greek prototype or to "philosophic expositions." Stressing the power of a disciplined party, and picking up an argument from Herbert Spencer's *The Man versus the State* on the way, Keeton depicts the aristocratic Parliament of the eighteenth century as the "true" one, from which the representatives of the ever-growing masses in the nineteenth and the twentieth have steadily receded. Quoting Wellington on the Reform Bill (shades of Hegel!), he notes with apparent dislike the fact that the forum where the views of the individual member may have some influence is the party meeting and the party conference.

We may note in passing here that virtually no attention is given to the diversified, vigorous, and highly influential activity of various associations and groups, which many today recognize as having all but replaced the local community of old. After these background studies in which the author's major theme appears in various contexts, he turns to "The Menace of Delegated Legislation," "Administrative Tribunals at Work," and "The Courts and the Executive." In these three chapters, Keeton sets forth the story of the growth of executive and administrative power along lines familiar from the writings of W. A. Robson and others. These he implements

by three chapters on "Taxation and Free dom," "Land in Chains" and "The Problem of State Monopolies." In each of these fields, he is able to demonstrate a parallel growth of power of the "Departments." Thus, he feels that whatever method of control may ultimately be adopted state monopolies have provided a "further adventure in departmental irresponsibility," that "new fetters have been forged for the land, the fetters of a new feudalism," and that financial tyranny is rampant in the more recent tax and budgetary legislation.

Keeton sees "The Constitutional Problem of Today" as "the difficulty of maintaining either any constitutional system in the real sense of the word [this remains undefined, however], or any security, either of person or property, in face of the continual and relentless encroachments of the executive." What are the remedies? It would appear that the learned author views with something bordering on envy the written Constitution of the United States, as well as its Senate, and that he would not mind seeing established some sort of High Administrative Tribunal such as the French *Conseil d'Etat* which Robson advocated many years ago. But he does not in fact advocate any of these devices. No attempt, he admits, was made by him to discuss the safeguards which might retard or even stop the forward march of what he calls "administrative tyranny." No existing safeguards can be effective, because of the power of a parliamentary majority to sweep them away. It is curious that a book which sets out to depict the "passing of Parliament" ends upon this note. For in the last analysis, all the changes to which Keeton objects have been the work of Parliament, and Parliament's undisputed power remains intact. For even though a different kind of Parliament than that of Walpole, it still is Parliament, and it remains the most distinctive feature of British government and politics.

The Passing of Parliament is a stimulating book, and the evolution it deals with is a vital one. But the note of alarm it sounds is too shrill, and the historical analogies upon which it rests are dubious. The lack of any convincing alternatives to

present trends for managing the great society may weaken the effect of what is in many ways a striking and broad-gauged analysis of "the rise of British bureaucracy" rather than of what the title suggests.

CARL J. FRIEDRICH

Harvard University

STOUT, HIRAM MILLER. *British Government*. Pp. ix, 433. New York: Oxford University Press, 1953. \$5.00.

This book, designed primarily as a text for college students, contains an excellent description of the organization and procedures of the British government and is probably the best brief survey of the functions performed by that government. Emphasis is placed on recent changes, especially on those brought about by the second world war and the rapid extension of the welfare services.

The first chapters describe the physical features of the country, the character of the population, the occupations of the people, the basic principles of their constitutional system, the methods of protecting civil liberties, and the general character of British public life. Many readers will prefer this kind of introduction to the more usual one of attempting in a chapter or two to sketch the historical evolution of the English constitutional system from Anglo-Saxon times to the present.

The greater portion of the book is devoted to an analysis of British political institutions: the monarchy, Parliament, parties and elections, budgetary practice, the national administrative organization, the civil service, the courts, and the institutions of local government including those of London. These chapters although they follow the traditional form of treatment are interestingly written and are based upon reliable sources. The sections dealing with elections, party organization and procedure, and the civil service are particularly satisfactory. The chapter on the operation of the civil service seems the best brief account available.

But good as the preceding chapters are, the greatest merit of the volume lies in its treatment of the administrative services dealing with national security, the social services, and the nationalized areas of the

British economy. The author is impartial and accurate, and he gives the reader an excellent overview of the governmental problems raised by the nationalization program and the extension of such social services as housing and the national health service. The important problem of reconciling the desired independence of the public corporations in charge of nationalized industries with their ultimate responsibility to Parliament is ably dealt with.

The volume ends with a discussion of Britain's changing relations with the Commonwealth and the Empire, and gives particular attention to the tendency to keep these relationships flexible enough to avoid serious conflicts with the rising nationalism evident in all parts of the Empire. Such informal and flexible understandings may tend to create a somewhat untidy constitutional system, but they seem to produce satisfactory results.

ELMER D. GRAPER

University of Pittsburgh

ROBSON, WILLIAM A. (Ed.). *Problems of Nationalized Industry*. Pp. 390. New York: Oxford University Press, 1952. \$5.00.

This symposium, edited by William A. Robson, analyzes the problems of the British public corporation—the instrument which the Socialists have used recently to nationalize basic industries. The book rests upon the assumption that nationalization overcomes "many of the drawbacks of profit-making enterprises" but does not in itself "resolve the problem of producing and distributing basic goods and services in an efficient manner" (p. 7).

The tone of the book, the editor hopes, is one of "constructive criticism." Its authors—all the friendly critics of nationalization—represent a wide range of experience in finance, engineering, industry, and public administration. Four have been members of Parliament, two with ministerial responsibility; six have been professors of economics or political science; three have held positions in nationalized industries; three have been high in Civil Service. This broad experience, however, has not been carefully assimilated, for the

editor has made no attempt to co-ordinate the diverse views of the thirteen authors.

The public corporation confronts the British Socialists with a dilemma. On one hand, the Socialists have sought to avoid political interference with efficient management; on the other, they have struggled to bring the corporation under public accountability. That they have failed to resolve this dilemma is implied in the legal status of the corporation as defined recently by the Court of Appeal in *Tamlin v. Hannaford*. "In the eye of the law," Justice Lord Denning ruled, "the corporation is its own master and is answerable as fully as any other person or corporation. It is not the Crown and has none of the immunities or privileges of the Crown. Its servants are not civil servants and its property is not Crown property. It is as much bound by Acts of Parliament as any other subject of the King. It is, of course, a public authority, and its purposes, no doubt, are public purposes. But it is not a government department, nor do its powers fall within the province of government (p. 41). Since the corporations are not considered as departments of government, the ministers have refused to answer the questions of Parliament concerning their day-to-day management. Nor have the public corporations become responsible to consumers. The Labor Government has too readily assumed that responsibility to consumers follows automatically from nationalization. The late attempt to organize consumer representation, however, indicates that responsibility to consumers does not flow directly from nationalization. But the Consumer Consultative Councils have not yet supplied effective representation of consumers in the management of the corporations.

The public corporations, according to the less friendly critics, have not demonstrated their superior efficiency over private corporations. Public administrators, Professors Florence and Walker believe, "are particularly prone to the diseases of security, conservatism, and procrastination." Another critic, Sir Arthur Salter, fears the danger of "excessive centralization of management to which bureaucracy always tends." The criticism of these essays, both

friendly and hostile, leaves one with the impression that the earlier zeal of the Socialists for reform has been exhausted by the details and technicalities of administration.

Lehigh University

PETRIE, CHARLES. *Monarchy in the 20th Century*. Pp. x, 223. London: Andrew Dakers Limited (distributed in the U. S. by The Macmillan Company), 1952. \$3.50.

Sir Charles Petrie has produced here an important piece of historical writing. He is a master in his field. This was shown in his previous work of a kindred nature: *The Story of Government* (1929). *Monarchy in the 20th Century* is a clear-cut analysis of only those conditions, forces, and personalities which affected favorably or adversely the course of monarchy in the twentieth century. The background or the tradition of monarchy or its absence is given in brief and broad strokes as a setting for the institution whose checkered career it is proposed to trace. In this background are found significant precedents and important figures to furnish a comparative basis for the clarification of complex situations in the subsequent story of the rise and fall of monarchies as well as of republics. His illustrations and examples of the assertion of the powers of monarchs in critical periods of both domestic and foreign affairs exhibit monarchy in its best light as a balancing agency of party strife and as a nonpartisan representative of the nation as a whole. This is the author's conception of "a Patriot King" which was the ideal that George III largely achieved and that Edward VII more completely realized. In this capacity monarchy makes a contribution and exercises a salutary control over the political order of the day. Half of the volume is devoted to the English monarchy which is not a disproportioned emphasis due to the fact that it represents the most continuous and uninterrupted development of monarchy which civilization has produced. With an illuminating background the story of the English Crown begins with the accession of Queen Victoria and covers the reigns

of Edward VII, George V, Edward VIII, and George VI and the accession of Elizabeth II. In general the line of development with the exception of certain peak points is that the Crown constantly lost power in its struggle with its ministers, though the monarch personally gained prestige and popularity. While Victoria had her way in some matters and in some instances practically selected Prime Ministers, her long period of mourning after the death of Prince Albert left the Crown in a much weaker condition than she found it at the beginning of her reign. Edward VII, though he had never been permitted to have any experience in royal affairs prior to the death of his mother, came to be the most popular ruler in the history of the monarchy.

Considerable emphasis is placed on the reign of George V who was primarily trained as a sailor but who played an important role in World War I and came to be well beloved by the English people. The transition from Edward VIII through George VI to Elizabeth II is almost the high-water mark of the book.

In view of the training for Kingship that Edward VIII had received, his popularity and interest in the social problems of the nation, and his extensive traveling and knowledge of imperial matters, the author considers that it was a great loss to the Empire and a serious blow to the prestige of the Crown for the King to exchange it for a woman. He does not feel that the English Crown is in danger from republicanism, but that its disappearance would be calamitous to both Great Britain and to the Commonwealth of Nations. Its symbol of unity of the Commonwealth could not be performed by any other agency. The discussion of monarchy on the continent is brief but suggestive and assuring. Experiments in republicanism have not been a success outside of France and even in France have lacked stability due to party strife. The author feels that a fairly strong monarchy is the most fitting instrument that has yet been devised to prevent national chaos from resulting from party disintegration.

The author leans a little toward monarchy as a stabilizing influence in society due to two main reasons: (1) that the

experience of the continent with republics has not been very encouraging, and (2) that political parties will not sacrifice their interests for the welfare of the nation. Their tendency is to rule or ruin and they will bankrupt a nation for their own selfish purposes. The nation as a whole is never truly represented. This thesis is well sustained. The book is a real contribution to interpretative history and political science. It is thought-provoking and well balanced. There is nothing like it in print.

C. PERRY PATTERSON

University of Texas

CHRMES, S. B. *An Introduction to the Administrative History of Medieval England*. Pp. xvi, 277. New York: The Macmillan Company, 1953. \$4.75.

Earlier scholars in medieval history, enamored of the political, legal, and particularly the parliamentary emphasis in constitutional history, almost wholly neglected its administrative machinery and methods. Scholars of the last two or three decades have been busy correcting this deficiency. The question they ask about the government of the Middle Ages is, how did it work? And their answers fill a sizable number of books and articles; more indeed than many college and university students have either the time, or in many cases the training, to handle. This and similar situations in other areas are responsible for the series, *Studies in Medieval History*, of which this book is the seventh volume. Their purpose is admittedly "to bridge the gap between textbook and learned monographs," and little or no effort is made on the part of the author to emphasize his own researches into original materials.

Certainly "to digest, put into perspective, and in some measure interpret" the work of specialists, as Mr. Chrimes further defines his objective, is not an easy task. Unless it is done with a great deal of skill and scholarly penetration, it is likely to result in vast oversimplification. Some of the experts whom Mr. Chrimes interprets may feel that he has not entirely avoided this error. To avoid it entirely would doubtless be to refrain altogether from attempting the "generalized survey." Cer-

tainly the author's own consciousness of the danger has helped him to minimize it.

Mr. Chrimes has likewise been on his guard concerning other pitfalls inherent in the nature of his task. Students inexperienced in the medieval field are warned against reading too much into what must be considered still as tentative conclusions. Throughout the book one encounters such phrases as, "It is misleading to assert without reservations," or "The circumstances cannot be determined with any precision. . . ." To give clarity and continuity to his own narrative the author chooses whatever authority on any given point he considers most valid; but conflicting interpretations are set down carefully in the footnotes with verse and chapter cited for those who wish to go further than his summary. He gives credit to Tout, and rightly so, for being the first to explore and exploit the mass of records on administrative matters; and he still makes use of some of Tout's interpretations. But he also draws on a host of later writers, Richardson, Sayles, Powicke, Treharne, Wilkinson, Johnson, Davies, Plucknett, and others, who have modified, sometimes corrected, and often carried much further Tout's work. This is certain to prove a useful book.

MILDRED CAMPBELL

Vassar College

Church Under Communism, The. The Second Report of the Commission on Communism appointed by the General Assembly of the Church of Scotland. Pp. 79. New York: Philosophical Library, 1953. \$2.75.

In 1949 the General Assembly of the Church of Scotland appointed a Special Commission to "examine the influence on our social life of secular movements and philosophies, and especially of materialistic Communism," and to suggest appropriate action to counteract such influence. In 1950 this Commission brought in an Interim Report. In 1951 it presented an able and detailed statement entitled "The Challenge of Communism," which analyzed the nature of Communism and investigated the reasons for its widespread appeal.

The present volume, called *The Church*

Under Communism, is the Commission's Report for 1952. It consists of three parts. The first section gives an account of the situation of the Christian churches in countries which have gone Communist—the Soviet Union, the satellite countries of Eastern Europe, like Hungary and Czechoslovakia, and China; and it comes to the conclusion that though there is theoretically freedom of Christian worship, there is no freedom of Christian education or propaganda, because Communism is unalterably opposed to Christianity, and pledged to exterminate it at all costs. The second Section deals with what the Report calls "lessons to be learned." Its main contention is that the Christian Church should recognize that Communism today is a threat to Christianity comparable to that of Islam in the seventh century, and should take every possible step to meet this threat. In particular, the Church must understand its own Christian Gospel more deeply and dynamically, and must express its Christian concern in social as well as individual terms. Concretely, it should be prepared to back every move by the Western democracies to give technical and economic help to the backward areas of Asia and Africa, since poverty and hunger are fertile breeding grounds of Communism. The third section of the Report, entitled "Suggested Action," proposes that the Church of Scotland should sponsor and organize a program of education in the meaning and implications of the Christian faith among its members.

This Report, of course, has been drawn up primarily with Scotland and its Presbyterian Church in mind. But it has at least a threefold value for the Christian churches of America—and indeed for Americans in general. First, it points up the deadly nature of the Communist menace, making it clear that Communism is not only a social or economic theory or philosophy of history, but a dynamic totalitarian pseudo religion, inflexibly opposed to Christianity. Second, it presents a factual summary of the conditions under which Christian churches have to exist in Communist-dominated lands today. Third, it sounds a much needed warning that Communism cannot be overcome by arma-

ments alone, necessary as they may be; it must be fought and conquered by positive action in the ideological and economic realms.

NORMAN VICTOR HOPE

Princeton Theological Seminary

BAILEY, SYDNEY D. (Ed.). *PARLIAMENTARY GOVERNMENT IN THE COMMONWEALTH. A Symposium.* Pp. v, 217. New York: Philosophical Library, 1952. \$4.50.

One of the major questions of the day is the ability of both the Congressional and Parliamentary systems to meet the pace and complexity of modern economic and political life. In the Congressional system the checks against the abuse of executive power at the same time work against the implementation of consistent policy. At a time when the world looks to us for leadership, it is not clear who speaks for the American people. Congress cannot lead but will not consistently follow. And, though the President may define policy, Congress is unlikely to enact it without considerable amendment.

In the Parliamentary system a major defect is not the division of power but its concentration. The things a president cannot do with Congress, a cabinet can only too easily do with Parliament. Drastic changes such as nationalization can be effected on the mandate of the smallest majority. And party discipline is such that the bitterest reaction in the country may not deflect a single vote in the division lobbies.

This little book does not seek to answer these and other problems faced by Parliamentary government. Nevertheless, it is a useful discussion of the system as it has developed outside the United Kingdom. As the various contributors show, differences have appeared in the application of the British system to other communities. Undoubtedly the test, as Professor Brady points out, will be most severe in the new Asian states where the religious and cultural roots of life are so different. Perhaps we are too often inclined to be oversanguine about the stability of our democratic institutions. A reading of this book, however, must leave the impression

that it is a delicate organism held together only, in Mr. King-Hall's words, "by a spirit of tolerance and willingness to compromise, a determination that differences shall be resolved by discussion and persuasion and not by violence." However, if too great a strain is not to be placed on this spirit, it is necessary also that no party push its principles too far and too fast, so that nature and the purposes of the state are continually brought into question. This is the issue which socialism raises. It is raised too by the racial issue in South Africa. The Parliamentary system is flexible, but there is no reason to expect it to stand the test of revolution.

EDWARD LITTLEJOHN

Detroit, Michigan

BRADY, ALEXANDER. *Democracy in the Dominions.* Pp. viii, 604. Second ed. Toronto: University of Toronto Press, 1952. \$6.50.

The second edition of Professor Brady's book is most welcome. The author possesses the gift of correlating a wide range of comparative material into an extremely readable whole. In Professor Brady's opinion, which is supported by a wealth of convincing data, inheritance and environment are the key to a fruitful understanding of Dominion development. The new Asiatic Dominions are excluded on the grounds that they have not been colonized by people of British stock and that the basic unity of the book would be impaired by a discussion of problems that have no bearing on inheritance and environment. Ireland was already excluded from the earlier edition on rather similar grounds.

Canada, Australia, New Zealand and South Africa are viewed in the light of their social, political, and economic development, and from this analysis certain problems which are common to all emerge—the growing power of the executive, the inexorable march of collectivism encroaching upon state's activity, increasing urbanization and industrialization. Perhaps a more critical survey of the problems of industrialization than Professor Brady attempts would have been helpful, for example in the case of Australian overinvestment which is distorting her economy.

The story of Dominion development has been brought up to date (mid-1952), and the final part of the book is greatly expanded by the addition of chapters dealing with educational systems, political parties, and threats to democracy, in which a comparative assessment is attempted. In Professor Brady's view, the threats to the democratic way of life are either ideological (Marxism and Nationalism) or they spring from the nature of the tasks which modern governments undertake. The author does not consider that bureaucracy constitutes a serious threat, but considers it rather as the handmaiden of social advance. More serious, in his opinion, is the growing apathy of the electorate in participating in local government activities.

If Professor Brady has a fault, it is that he sometimes uses a rather overemphatic style with the result that the reader is occasionally left with too indistinct a picture of what is really important and what is relatively trivial. But this is, perhaps, a small fault in a book which succeeds so admirably in drawing our attention to so much that is worth knowing.

At least one reader would have welcomed the addition of a few maps.

GEOFFREY F. ENGHOLM
Makerere College
The University College of East Africa

HUTCHISON, BRUCE. *The Incredible Canadian: A Candid Portrait of Mackenzie King; His Works, His Times, and His Nation*. Pp. x, 454. New York: Longmans, Green and Co., 1953. \$5.00.

Despite its sensational title and tone, this is in many of its parts a sincere and substantial book, which must be noted by students of Canadian affairs.

Appropriate space is devoted in this biography to the two great crises of King's career as Prime Minister of Canada from 1921 to 1930 and from 1935 to 1948. The first was the constitutional issue of 1926, the second the deadlock on conscription in 1944. To knowledge of the former Mr. Hutchison adds little that is new, but succeeds in taking account of all sides of the controversy. More important is his realization throughout the book of the long range implications of the outcome of the

crisis. The establishment of an unqualified right in the Prime Minister to a dissolution of Parliament in all circumstances whatever has made Parliament a puppet and the governor-general an automaton. The Canadian Prime Minister has become a mayor of the palace, with an authority unexampled since the days of the Tudors in Commons, cabinet, and country.

Mr. Hutchison's treatment of the conscription issue of 1944 is, of course, much more a matter of speculation. His thesis that King used a report from his Minister of Defence, General A. G. L. McNaughton, to the effect that the higher ranks of the Canadian Army were on the verge of open resistance to the policy of voluntary recruitment for overseas service, to induce his chief colleague from Quebec, Mr. Louis St. Laurent, to accept conscription for duty overseas, cannot at this time be either substantiated or denied. It does seem, however, that the eventual result of King's shifty, yet ruthless, handling of the crisis may mean that there will not be such another crisis. French Canada can surely ask no more of English Canada than the long-drawn agony of that crisis.

The space accorded these matters is justified. But perhaps of more significance is Mr. Hutchison's analysis of King's radicalism, expressed in his *Industry and Humanity* (Toronto, 1918; 2nd ed., 1935). The thesis of this early book, that the Community must be made a partner of Capital and Labour, was not one King could urge on the Liberal party until the Great Depression opened the way. Then he found allies in young Liberals under the influence of Keynes. The result was that in a massive series of social reforms King redeemed the promise of his far-off, fantastic youth and established, for good or ill, the welfare state in Canada.

One other thing of note is made clear: the stature of King as an international statesman, particularly in Anglo-American relations.

The book is a profoundly disquieting one. The success of the strange man who is its subject, the shy visionary consumed by will to power and sense of destiny, now seems to have destroyed all his opponents, the opposition parties, and much of the

Constitution. His party, the Liberal party, as Mr. Hutchison is uneasily aware, spreads in amorphous and smothering mass across the center of Canadian politics, supporting a government increasingly autocratic in a state dangerously near to becoming a one-party state.

W. L. MORTON

University of Manitoba

JONES, N. S. CAREY. *The Pattern of a Dependent Economy: The National Income of British Honduras*. Pp. xv, 162. New York: Cambridge University Press, 1953. \$4.00.

The subject matter of this monograph is broader than the title would indicate. Within its brief compass it does four things: gives a historical and geographical survey of British Honduras; estimates the national income for 1946; suggests a program of economic development for the country; and discusses the relation between economic change and political change in colonial areas.

It may be stretching the term "national income" to apply it to an area of less than 9,000 square miles, with a population of approximately 60,000, but Mr. Jones does a competent task of estimating it on the general lines developed by Miss Phyllis Deane for colonial areas, and of breaking it down on the basis of factor payments, products, and end use. The main theme of Mr. Jones's program is the development of agriculture, both to supply domestic needs and for export, and a reduction of the prices of essential imported foods in order to cheapen money wages so as to facilitate exports. In a number of places the author's use of terms is hard for an economist to follow, and sometimes it is not clear just what are the assumptions of the policy recommendations. Mr. Jones appears to have—at least within wide limits—a cost-of-living theory of wages; he speaks of high wages in the forest industries as creating "a sort of permanent inflation compared with the rest of the world" (p. 110) in a situation which most economists would simply describe as comparative advantage in the forest industries; and although his formal definition of the term "dependent economy" seems to be an economy which

"cannot raise the capital for its own needs within its own borders" (p. 110), in other places (pp. 98, 112) the emphasis is on the importance of foreign trade in relation to domestic production.

The comments on the relation between economic change and political change are shrewd and thoughtful, and reflect the author's experience in British Honduras, Northern Rhodesia, and the Gold Coast. He points out in Chapter XII, on "The Future," that economic distress of a short-run nature may bring about permanent political change; and he suggests the disturbing effects for an old order of "the growing urban populations . . . often existing in squalid conditions and without the social satisfactions of tribal life" and "the growth of an educated black class which cannot be easily absorbed into the ruling class and which feels frustrated in its reasonable search for power and position" (p. 5).

The book is a well-written account of the economic situation in a small tropical area, but its greatest appeal should be to those interested in a broader setting than British Honduras—the problem of the economic and political future of the residents of tropical colonial areas.

FRANK WHITSON FETTER
Northwestern University

SLAVIC COUNTRIES

BERMAN, HAROLD J. *The Russians in Focus*. Pp. xiii, 209. Boston: Little, Brown and Company, 1953. \$3.00.

At first glance, Professor Berman's book is a series of sketches about the major phases of life under Communism based on excellent command of published material and conversations with displaced persons. The individual sketches concern themselves in this sequence with the army, the collective farm, the factory, the family, education, medical care, the press, planning, law, the Communist Party, and "the discipline of terror." Out of these sketches, that on law and partly that on planning repeat, with condensation, material published by the author, in co-operation with B. Konstantinovskiy, formerly professor of law at

the University of Odessa and counsellor on the service of a big Soviet corporation, in a stimulating book entitled *Soviet Law in Action*.

Despite the somewhat loose structure of the book, one is able to single out a central theme. Dr. Berman puts "terror in the focus of the system as a whole"; he rightly believes that, if not the mass purges, then individualized terror of the preventive type is inherent in the Soviet system. The latter is a dictatorship based on "the urge to unity": the regime does not want the people merely to obey; it wants them also to believe in the rightness of the orders they are given. But the dictatorship tends to destroy the very unity upon which it is founded. By terrorism, the totalitarianism tends to split society asunder, to atomize the people. This undermines a unity which is artificial because it is unfree. This is an excellent integration of our knowledge about the society created by the Communists; but how different it is from the central theme of the author's earlier works, the "parental" aspect of Soviet law!

It is of course impossible to summarize the information contained in Dr. Berman's book. The achievements of the Soviets in the realm of education are exaggerated if, as Dr. Berman does, one compares the percentages of illiteracy in 1914 and 1939 relative to the total population. In 1914, the percentage of literacy in the younger generation was already high, and the unfavorable figure relative to the total population obtained was by sheer weight of the older age groups who had passed the school age before the efforts of the *Zemstvos* to overcome secular illiteracy had borne fruit. As to medical care, "the missionary spirit of Soviet physicians" is nothing new: before the Revolution, Russian medicine well reflected the spirit of social service which animated the intelligentsia.

In conclusion, two little items communicated by Dr. Berman deserve attention because they speak more than volumes: Soviet doctors are imposed "quotas" of certificates of health which it would be dangerous to overcome; and Soviet judges are afraid to acquit too many defendants in a row. The Soviets seem to plan not

only economics, but also sickness and crime!

The book could be very well recommended in any course on Communist society, because it is clear, concise and trustworthy.

Fordham University

HODGKINSON, HARRY. *Challenge to the Kremlin*. Pp. 190. New York: Frederick A. Praeger, 1953. \$2.75.

In this brief and well-written book the author seeks "to illuminate the motives and intentions of the Soviet rulers," principally through the examination of the Tito-Stalin break and recent Soviet pronouncements, such as Stalin's letters on linguistics and the revival of the coexistence doctrine. In all of these he finds symptoms of a general crisis in Marxist Communism, inside and outside the Soviet Union.

The Soviet leaders, he points out, have not been able to deal effectively with the problems confronting them. They have increased state power instead of aiding it to "wither away," and they have revised their ideological doctrines to "prove" that socialism advances *because* of a more powerful state.

In a sense, the Kremlin is faced with a dual challenge. The author sees in Tito's reduction of state power (not yet really demonstrated in my opinion) "the most formidable challenge" to Soviet ideology. Moreover, the Titoists have proclaimed openly "what many Communists have thought secretly, that Russian hegemony is retarding the development of spontaneous and genuine socialism. . . ." Secondly, Western rearmament is steadily forcing the Kremlin into an economic impasse, hence the revival of the coexistence policy.

The policy of coexistence, therefore, is not a compromise, but "the offer of a truce," an "attempt to prevent the American leaders from following up their advantage." To the Kremlin such a truce is necessary to a consolidation of internal control and "a gamble that the capitalists may be induced to prefer present profits to military glory," in which case coexistence might serve as "a device to secure the peaceful transition of a doomed capitalist

world to the Stalinist brand of Communism."

Throughout the book the author displays and makes use of his broad theoretical grasp of capitalism and democratic socialism, as well as Marxism. In his discussions of certain historical happenings in Yugoslavia, however, he has made a number of statements which are of doubtful validity. Only a few need be mentioned. It would be difficult to prove, I believe, that Communism triumphed in Yugoslavia "in spite of Moscow" (p. 138), or that "Tito's solution of the nationalities problem" (p. 154) consists of anything more than statements to that effect, coupled with laws which make it a crime to state the contrary.

Finally, it is a perversion of historical fact to say that in Yugoslavia there was "less of the horror and hypocrisy that attended the communization of other states: terror never reached such depths as the killing of Petkov in Bulgaria . . ." (p. 76). Quite the contrary is probably true. The Yugoslav Communists began their unbridled terror in 1941, while the other Eastern European Communists did not get into the swing until 1945. And does not the murder of Mihailovich rate with the killing of Petkov, just to mention one name?

ALEX N. DRAGNICH

Vanderbilt University

SHIMKIN, DEMITRI. *Minerals—A Key to Soviet Power*. Pp. ix, 452. Cambridge, Mass.: Harvard University Press (A Russian Research Center Study), 1953. \$8.00.

Dr. Shimkin's encyclopedic study constitutes the first full survey in English of the production, consumption, and resources position of the minerals economy of the Union of Soviet Socialist Republics. In comprehensiveness and depth of analysis the Shimkin volume also goes well beyond the published accounts of minerals development in Russian sources. Indeed, his relatively complete and up-to-date picture was obtained only by a painstaking, imaginative synthesis of scattered and often ambiguous data.

The dense statistical treatment, profusion of technical terms, and scholarly docu-

mentation undoubtedly will restrict the book for the most part to reference use. It should be of interest, however, not only to specialists on the Soviet economy but also to students of economic growth in general.

The author stresses throughout the limitations of the underlying source materials. Probably less uncertainty attaches to the global results embodied in his Index of Mineral Consumption than to the estimates of the individual components, but for the post-1937 period at least, the magnitude of mineral consumption is subject to a large probable error. Shimkin's confident tone sometimes belies this possibility, but in drawing inferences on potentials readers will be well advised to adhere to his own repeated cautions.

As the title implies, the interest of the author centers more on problems of national power and development than on economics in the usual sense of the word. Little use, for example, is made of cost-price relationships or of the changing relative inputs on the factors of production in the several mineral industries. Shimkin's primary concern is to trace the output-consumption trends, nationally and by region, of six major groups of minerals (about 90 per cent of the total) for the period 1926 to 1950. He attempts also to estimate the adequacy of domestic and satellite reserves to meet the peacetime requirements of the Soviet sphere to 1970.

The Indexes of Mineral Consumption for the USSR and the United States are among the highlights of the book. Shimkin has followed the familiar practice of employing American prices as weights in preference to Soviet prices, which, he argues, are both inferior in quality and insufficient in number for the task at hand. The use of common weights greatly facilitates intercountry comparisons, but many difficulties of interpretation remain.

The most significant of the substantive findings probably in Shimkin's inference of a chronic over-all mineral shortage in the USSR relative to imputed demand. The shortage has existed in varying degree for the past 25 years, notwithstanding an average relative rate of growth of minerals output which was nearly twice that of the

United States during its fastest period of expansion. Shimkin's catalogue of the abundant Soviet mineral reserves, approximately equal to those of the United States, is more commonly appreciated. Except in nonferrous metals, these reserves, according to his calculations, are adequate to permit self-sufficiency for 20 years or more of intensive economic development.

Subsequent events may prove particular interpretations in error, but this volume will remain for many years an invaluable springboard to the analysis of Soviet power. It deserves the most careful study and a far longer review than here permitted.

TOMPKINS, STUART RAMSAY. *The Russian Mind: From Peter the Great Through the Enlightenment*. Pp. xi, 291. Norman: University of Oklahoma Press, 1953. \$4.00.

That the peculiarities of the Russian mind have long intrigued Russian as well as non-Russian scholars is demonstrated by the great number of works which deal, in one way or another, with *l'âme Slave*. Yet the czarist Russian mind is still considered something of a riddle; and the relation between it and the Soviet mind, a "riddle wrapped in a mystery." Professor Tompkins, armed with the strength of able and mature scholarship and disciplined in the knowledge of the limitations of scholarship, has begun a new exploration of that riddle. His findings and conclusions will be presented in two volumes. The one under consideration here, *The Russian Mind: From Peter the Great Through the Enlightenment*, will be followed by another bringing his study up to the present time.

The author's approach to this comprehensive study is one which leads him "to trace the main trends that have marked the period during which Russia has been exposed to the impact of foreign influence, to observe how these alien influences were either assimilated or rejected, and to arrive at some general ideas about which of these trends are fundamental and which may be regarded as ephemeral" (p. vii). For consideration in this first volume he

has selected the press, censorship, education, the social structure, historiography, Freemasonry, the peasants, and the Decembrists as topics through which to introduce and study the mental habits of Russia in the period from Peter the Great to the Crimean War.

In this period of nearly 200 years, Professor Tompkins finds several basic and interrelated constants. Of these he considers the most important to have been absolutism, the application of which was untempered by effective restraints and the scope of which was not limited by viable traditions. Absolutism as a practice served the throne, and as an ideology it caught the imagination of the most determined opponents of the throne, those who were prepared to counter imperial with revolutionary absolutism. Coupled with the tradition of absolutism was that of statism, which permeated the thinking of both the guardians of order and their enemies. And growing out of a belief in unified power and monolithic truth was the abhorrence of pluralism and its blood cousin meliorism.

This first volume of *The Russian Mind* will have to be measured, at a later date, against the larger and completed work. However it can now be judged as a member in very good standing of the small company of books in English on Russian intellectual history. Clearly and effectively written, well illustrated and printed (but marred somewhat by hasty proofreading), the book brings together much material which has hitherto been altogether inaccessible to the English reader and difficult of access to those who read Russian. It is a perceptive treatment of an important but obscure aspect of Russian history.

SIDNEY HARCAVE

Champlain College
State University of New York

KOLARZ, WALTER. *Russia and Her Colonies*. Pp. xiv, 335. New York: Frederick A. Praeger, 1953. \$6.00.

We have in this book a comprehensive treatment of the various policies followed from time to time by the Soviet government in the treatment of national minorities and the dovetailing of these groups into the economic and political

structure of the Soviet Union. The topic raises a number of problems, not the least of which is the question of the extent to which Soviet policy is based on that of the former czarist regime.

The writer has traced the development of the policy of the Soviet regime from the victory of the Bolsheviks in 1917 and the formation of a Commissariat of Nationalities with Stálin at its head in the first cabinet. The loudly proclaimed "new deal" for the national groups has had to adapt itself to the over-all changes in policy of the Soviet government. In addition to the successive constitutions which were adopted and the program of intensive industrialization inaugurated in 1929, perhaps even a more dominating modifying influence was the program of abolishing illiteracy—a program which called for the teaching of all of the inhabitants of the Soviet Union to read and write. This was almost a superhuman task since many of these peoples were without a written alphabet. This led to the two "alphabetic revolutions," the first being the introduction of the Latin alphabet for non-Russian peoples; the second, the substitution for the Latin of the Cyrillic alphabet. These successive changes involved great confusion. The effect of this latter revolution has been to tie the subject nationalities closer to the great Russian element in the Soviet empire, and at the same time to isolate them more effectively from the world outside.

The writer has drawn up a comprehensive catalogue of various minority groups and the various changes in the treatment to which they have been subjected. This part of the book constitutes a bewildering chronicle of tortuous twists of Soviet policy, and one that generally has sacrificed the interests of the minority groups to the external policy of the Union. For example, many of these groups were given a special status not in their own interests, but to embarrass neighboring countries. This has been especially true in Central Asia.

The most interesting part of the book, perhaps, for the average reader is the concluding chapter, "Soviet Nationalities as a World Problem," in which the writer compares and contrasts the Soviet policy to the policy of Great Britain with regard

to her colonial dependencies—a fairly useful analogy. But the writer has failed to grapple realistically with his problem as far as it affects the rest of the world. He assumes, somewhat naively, that Communist policy is concerned primarily with the welfare of these national groups; and that any ill treatment is the result of a breakdown of that original policy. He envisages at some future time the transformation of the highly centralized Communist state into a federal union in which the subject groups will be given their autonomy, ignoring the fact that the Communist government is engaged in a wholesale process of "social engineering" to transport and scatter minority groups—a practice which appears to foreshadow the fusing of all such nationalities in a homogeneous and undifferentiated mass assimilated, more or less, to the general great Russian pattern.

The writer has justly emphasized the Russian freedom from race or color prejudices constantly proclaimed to the world. Yet this is not inconsistent with the most brutal and inhuman treatment of the national minorities and the denial of all human rights. This seems to be in keeping with the practice in the czarist time, when, if we ignore anti-Semitism, the Russians showed themselves ruthless in the treatment of the non-Russians while at the same time showing a complete absence of any policy of discrimination on purely racial grounds.

STUART R. TOMPKINS

University of Oklahoma

SCHMIDT, DANA ADAMS. *Anatomy of a Satellite*. Pp. ix, 512. Boston: Little, Brown & Company, 1952. \$5.00.

The Soviet Union regards her satellites as mere appendages and satrapies, and, if one suspects some exaggeration in this statement, he should be led to this most recent and factual study of Czechoslovakia, in which the seasoned correspondent of the *New York Times* clearly shows how and to what extent the country is exploited by the minions of Moscow; how one-sided trade agreements are concluded and their terms fulfilled to the detriment of Czech econ-

omy; how the Soviets obtain Czech industrial goods below world price levels and then re-export them at high prices, while poor Czechs have to pay more for Soviet wheat than they would be paying for Canadian wheat (pp. 399-400); and how the once balanced economy of the country is upset and thereby the living standard is lowered by an unnecessary overemphasis on heavy industries.

Mr. Schmidt arrived in Prague in April of 1949, and was ordered out of the country on May 31, 1950, but his book is not based solely on his experiences of that stay. He had been there as a correspondent many years before unhappy Czechs were drawn behind the Iron Curtain; and the value of his book is enhanced considerably by his knowledge of pre-Communist Czechoslovakia. It is divided into five large, uneven parts. In the first sixty odd pages he gives a fairly useful sketch of Czechoslovak history, while in the remaining part he deals with Communist Czechoslovakia, giving a complete account of the police state, describing the means and the methods by which the entire social, economic, political, and even intellectual fabric of the country is sovietized. To the author sovietization means Russification. Confiscation, nationalization, regimentation, and endless planning—all these are fully dealt with. The breakup of the church is most adequately treated. We are once more told that to the Communists the Catholic Church was the main enemy, and therefore it had to be dealt with most severely.

The author reiterates the old refrain that Czechoslovakia actually fell to the Communists early in 1945, partly through the unfounded belief of Benes that the Czechs must learn to get along with the Soviets, and partly because of the West's failure to liberate Prague. When the provisional government was established at Kosice (in April, 1945) Communists had the upper hand in that government. From then on to the end of 1947 Czechoslovakia maintained an uneasy balance between East and West; but the Communist coup of February, 1948 could not be delayed, and when it came the whole democratic structure crumbled because Western democracies seemed to be helpless. Since then the

very soul of Czechoslovakia is being tormented and tortured while the West cannot even decide whether to condemn this "man's inhumanity to man" in plain language, or to dispatch additional notes of protest to Communist tyrants.

Library of Congress
Washington, D. C.

WESTERN CONTINENTAL EUROPE

SOMARY, FELIX: *Democracy at Bay: A Diagnosis and a Prognosis*. Translated from the German by Norbert Guterman. Pp. ix, 172. New York: Alfred A. Knopf, 1952. \$2.50.

From Zurich comes this thoughtful and scholarly discussion of the problems confronting democracy, by the European economist and banker, Dr. Somary, whose erudition and critical powers are most impressive in this tightly packed diagnosis of democracy's ills.

With his rather less than hopeful prognosis, however, there is likely to be some sharp disagreement in this country. What worries Dr. Somary greatly is egalitarianism. From his vantage point as a member of the educated and prosperous European élite, he dislikes and distrusts the common man—"the rabble"—and he is gravely concerned about the threats to the middle class in our modern societies. International organizations (such as the United Nations) are in his opinion "wretched substitutes" for the church, and social legislation as a means of combatting communism he does not regard as effective.

The author makes very convincing his analysis of the steps that led to the development of democracy in the West. But with some of his assertions, which reflect rather a more aristocratic than a democratic point of view, this reviewer cannot find himself wholeheartedly in accord.

Dr. Somary traces in logical steps the development of the democratic idea, pointing out that Christianity, which came from the East, "exerted lasting influence only in the West"—and made freedom a universal possession. He considers the French Revo-

lution genuinely idealistic, of more value to democracy than our own War of Independence. "The Americans," he says, "were not interested in proclaiming universal rights; it would scarcely have occurred to them to grant such rights to the Indians, the Negro slaves, or the French Canadians." In all fairness there is a large element of truth here, but it is hard to avoid the feeling that Jefferson and some of his fellow rebels were greatly influenced by Rousseau and the very French Encyclopedists who, says Dr. Somary, "had ideas far in advance of their age."

In his opinion the eighteenth- and nineteenth-century struggles for democracy defeated their own ostensibly idealistic purposes and led inevitably to the era of wars and to greater tyrannies than mankind had ever known. That this age has seen and is seeing ruthless tyrannies as horrible as any in mankind's long history can hardly be disputed, but can we agree with such assertions that "the common man no longer even knows what are the hallmarks of a free citizen"? He also deplores the growth of direct taxation and asserts that it is accepted without resistance.

He makes a strong plea for greater *laissez-faire* in economic matters; he argues for less taxation and a going-back to harsher treatment of delinquent debtors. If decided swings to what many would call extreme conservatism are the only hope for democracy, this book presents a discouraging outlook.

On the hopeful side, however, Dr. Somary says that "if a democracy is to endure it must not be brought into a country from without, least of all by an erstwhile enemy; it must grow organically." And it behooves us to ponder this solemn warning.

With all his urging of less government and greater freedom (especially for business) Dr. Somary feels that communism "... can be resisted only by a rigidly disciplined counter-organization. But this contradicts the basic principles of democracy."

In his guarded prognosis, Dr. Somary sounds a faintly hopeful note that, if democracy could transform itself, and if the right kind of leaders should appear, the best that democracy has in common with

Stoicism and Christianity might meet the challenge.

FREDERICK P. GRUENBERG

Philadelphia, Pennsylvania

MÜHLENFELD, HANS. *Politik ohne Wunschbilder*. Pp. 387. München: Verlag von R. Oldenbourg. 1952. RM 19.50.

Politik ohne Wunschbilder, in more meaningful translation "Politics without Ideologies," is a philosophical attempt to establish a new and more modern theory of conservatism. The author sees in our political tendencies a, what he calls, conservative turn. In view of the intellectual confusion of our times a re-examination of the conservative thought seems to him imperative. To him, of course, conservatism is not a somewhat feudalistic ideology of vested interests, of a selfish social-reactionary type tending to perpetuate and to preserve antiquated life situations. His conservative turn is rather a reaction to technological progress accompanied by an emotional regress. To the author the dream of progress with all its doctrines, programs, plans, and ideologies faded away after the catastrophe of the last world war and resulted in general search for a policy without ideologies, namely the new conservatism. Liberalism and even socialism are taking a conservative turn. It is, he maintains, important, to resist a process of radical changes in permanency in order to preserve the remnants of our existential stability. Reflections about the sense and the essence of our existence lead from the intellectual position of "progressive" thinking to the counterposition of conservatism.

To lay the foundations of his theory of conservatism as a defense mechanism against the bankruptcy of ideologies Mühlendorf gives quite a thorough description of the modern ideologies since the age of enlightenment. Ideologies to him mean an unchaining of emotional forces such as hatred and envy, selfishness, and hunger for power, doctrines of salvation eventually leading to political and cultural collapse. Liberalism, the ideology of modern liberty and progress, is analyzed in its humanitarian-idealistic contents as well as in its economic-positivistic aspects. However the development liberalism took created the

form of neo-liberalism as a conservative turn especially in its concept of economic decentralization. But also, according to Mühlenfeld, socialism in its idealistic and materialistic essence reveals through the transition to reform-socialism the same conservative tendency. Even communism in Marxian, Leninistic, and Stalinistic expression seems to change into different directions.

Depicting the origin of the conservative thought (Mooser and Burke) and the two forms of conservatism, the conservative romantics (Adam Mueller, Savigny, and the Historical School) and the conservative systematics (Hall, Hegel, and Stahl), he gives a clear representation of the origin of German Nationalism (Fichte, Hegel, and Treitschke) which he terms a pseudo-conservative aberration. In the eyes of the author all the ideologies of wishful thinking lead eventually to the destruction of human existence through the permanent intensification of a sinister correlation between rationale, the rational mind, and passionate drives. For the sake of counteraction it is the primary task of the conservative theory to reconstruct the inner human forces against the abnormal artificiality of the now existing order of life, against the encroachments of our rationalizing and mechanizing civilization. The conservative concept of state, society, and economic life believes in theory and practice in the expulsion of the mechanism of centralization with its leveling standardization and force. Last but not least, conservatism is deeply religious. It is, so ends this highly interesting book, the unity of theory and practice which distinguishes conservative politics from wishful ideological thinking and makes conservatism the foremost task of our time.

ROBERT SCHARF

Georgia Institute of Technology

MUHLER, NORBERT. *The Return of Germany: A Tale of Two Countries*. Pp. vi, 310. Chicago: Henry Regnery Company, 1953. \$4.50.

The book originated in on-the-spot observations for the *Reader's Digest*, *New Leader*, *Commentary*, and *Commonweal*,

by the German-born author, Doctor of Philosophy with Honors, in Political Economy, from the University of Munich.

It contains fourteen pungent chapters: Only Yesterday; Ruins, Reminders, and Rip van Winkle; Hitler's Post-Mortem; Old Nazis and Neo-Nazis; East Germany's Red Reich; West Germany's Kingless Kingdom; What Now, Über Alles?; Jews, Germans, Anti-Semites; Soviet Man of German Make; Land of Lonely People; Berlin, World in Village Focus; Welfare State and Workers' State; America in German Eyes; The Test of Tomorrow.

The author analyzes social, economic, political, and cultural groups, and outstanding figures of all shades, opinions, and trends. He evaluates their past and present as background for the future, in the setting of their particular interests, mutual relationships, and over-all attitude to the commonweal. Exposing their multifariously telescoped "ambivalences," he coolly proceeds to knock the props from under their tenaciously held positions, ruthlessly debunking their cherished "clichés" and "stereotypes."

Prior to the Hitler nightmare, German voters, exercising their hard-won franchise, splintered disastrously into more than 40 political parties representing sharply defined social, political, and cultural interests. Voting their pet peeves or fancies in the legislature, in the privacy of their homes they proclaimed as test of personal freedom complete detachment from moral and political consequences of their legislative commitments. In the "American imposed" democracy of the West German Reich, the voter, restricted in his choice within a drastically reduced party set-up, finds himself legally and factually saddled with the very responsibility heretofore disdainfully rejected. In the Eastern Reich's people's democracy, personal detachment of any kind is categorically opposed by the officialdom of the one and only Communist Party, as a danger to the collective freedom of the working class and treason to the Workers' State.

The text abounds in oversimplifications of this sort. Inherent in the subject, they defy reduction of equivocal reality to unequivocal analysis and definition con-

ceivable only in the entrancing domain of would-be scientific semantics.

To the meticulous, all too few of the many hundreds of quotations are documented. The same applies to statistics galore, many mercifully rounded, ranging up to multibillion status.

The staccato style is enlivened by a scintillating mixture of a somewhat exotic manner of speech and liberal dashes of plain American lingo.

The significance of the book is enhanced for American readers by Germany's evolving pivotal position in the global ideological and political tug of war, as it affects and concerns the United States.

JOHANNES MATTERN

Johns Hopkins University

GAY, PETER. *The Dilemma of Democratic Socialism: Eduard Bernstein's Challenge to Marx*. Pp. xvii, 334. New York: Columbia University Press, 1952. \$4.50.

This account of Bernstein's life, work, and impact fills a lamentable gap in the history of political ideas and social movements. As most students are aware, democratic socialist movements in Western Europe have been plagued by the contradiction of devotion both to the revolutionary dialectics of Karl Marx and to the ethical principles and political means of democracy. If the socialist stakes all on the methods of parliamentary democracy he may never attain power, or, having attained power by democratic, parliamentary means, he may be slaughtered by fascists or reactionaries. But if the socialist commits himself to the dialectical "algebra of revolution," the lack of organic harmony between means and ends may result in a gross and tragic distortion of professed socialist goals. This, as Dr. Gay shows, was the "dilemma of democratic Socialism" faced by German Social-Democracy and particularized in the life and thought of the genial and courageous Eduard Bernstein. Lenin believed that the parliamentary path was impossible and insisted that socialist deeds must match revolutionary Marxist theory. Bernstein took an opposite tack. He urged that German Social-Democracy abandon its revolutionary slogans and commit itself openly to democratic and reformist tactics.

Bernstein's tactical commitment was supported by a systematic critique of the foundations of Marxist theory. He insisted that the middle classes did not disappear, that impoverishment of the proletariat was not increasing, and that economic crises were diminishing in intensity and duration. Although denying that he rejected socialism as a final goal, Bernstein emphasized primarily the movement itself, particularly peaceful and democratic means of struggle. Consequently he rejected Marx's "historical prophesy" of revolution and catastrophe and adopted compromise, reform, and evolution toward socialism as an ethically desirable, but not scientifically predetermined, goal. In theoretical areas, Bernstein opposed an empiricism and tentative Neo-Kantianism to Marxism, discarded dialectics as superfluous to Marxist theory, and regarded the value theory as useful but somewhat metaphysical.

As the author indicates, while Bernstein exposed with shrewdness and accuracy some of the major weaknesses of Marxism, he sometimes muddled his own theoretical counterattack. He misconceived dialectic and was too optimistic, even fatuous, in his assessment of economic trends, middle-class dynamics, and political prospects. Furthermore, he failed realistically to assess the probability of peaceful surrender to a socialist majority in Imperial Germany.

Dr. Gay's book is a competent work, written in lively fashion, and thoroughly documented. The author's critical judgments are moderate, carefully drawn, and well substantiated. For the study of political theory, European political and social movements—the history of Social-Democracy in particular—this treatise supplies a wealth of interesting and rewarding material.

DAVID G. SMITH

Johns Hopkins University

VOEGELIN, ERIC. *The New Science of Politics: An Introduction*. Charles H. Walgreen Foundation Lectures. Pp. xiii, 193. Chicago: University of Chicago Press, 1952. \$3.00.

The title is misleading. Only the introduction deals with the new science of politics. The book's six chapters are given

to specific topics—political representation and modern gnosticism. They are meant to illustrate the allegedly new science, it is true. But they stand better on their own merits. For what the author calls a "new science" is exposed to the rejoinder, certain to be raised by nonbelievers, and not by them alone, that it is neither new nor science, but rather a revival of Thomism and an appeal for unscientific metaphysical speculations, while the chapters on representation and gnosticism are not open to this criticism. They are essentially scientific in the modern sense so ardently excoriated by the author, and yet they are new and important.

The first three warn us that over the democratic concepts of formal representation we must not overlook the need for "existential" representation, which has often been present under nondemocratic forms of government and may be dangerously absent under democratic ones. It must be rooted in the "self-interpretation" of society. Arresting illustrations are offered to show the interrelation between concepts of representation and religious or cosmological ideas and images. They include a striking correspondence between a thirteenth-century Mongol khan and the Roman pope, and a deep-digging analysis of Roman society in the imperial period. All these are first-rate scholarly contributions.

The same holds true of the subsequent three chapters on modern gnosticism. By this name Professor Voegelin calls all those movements that claim to know the course of *secular* history in advance, beginning with Joachim of Flora, who expected the era of the Holy Spirit on earth to begin at a definite date (1260); and continuing in ever more secularized variations to the present time, especially in modern progressivism, both left-wing (Marxism) and right-wing (Western). He points up the unrealistic elements in all these schools of thought and the grave dangers which spring from the fact that, even in their moderate variations, they fail to take full account of the true nature of man.

Some sort of a deep disgust has driven the author to preface these two important contributions to political science with a militant call for a complete renewal of that

science. Much of what he says against the scientific habits of this century is justified. Yet it seems that in the last analysis what he demands is a change in focus rather than in method, and a change in vocabulary—the term science to comprise metaphysical speculation—rather than a denial of the need for a distinction between proven propositions and unproven speculations. Certainly his chapters on representation and gnosticism do deal with men and ages engaged in metaphysical speculations. But the author himself hardly applies metaphysical or otherwise unusual methods in his treatment; with the exception of a few passages, these chapters could have been written by a scholar of the relativistic school as far as method is concerned. His entire fight against modern gnosticism is actually a fight against pseudoscientific speculations on the course of history, not essentially different from fights of other twentieth-century scholars against other, or the same, unscientific speculations. Was it not Max Weber who forty years ago launched a famous attack against scientific belief in progress? Voegelin strangely misrepresents Weber, whom he otherwise treats with great esteem, when he says Weber declared all values to be "beyond science," and "treated all values as equal." He did nothing of this. There is no space here to go into this matter, nor into the great positive merits of Voegelin's book, more deeply; I intend to do so in a forthcoming issue of *Social Research*.

ARNOLD BRECHT

New School for Social Research,
Graduate Faculty

KOESTLER, ARTHUR. *Arrow in the Blue: An Autobiography*. Pp. ix, 353. New York: The Macmillan Company, 1952. \$5.00.

This is a most valuable, a most stimulating, and a most problematic book, possibly the one autobiography since Rousseau's *Confessions* that stirs the reader most, forcing him to commute, as it were, between the two attitudes of looking away in emphatic shame and yielding again to gripping interest. It is the autobiography of one of those rare neurotics who "have

made good," not by overcoming their neurosis, but by achieving worth-while works.

Because of this combination of a lucid description of a neurosis (and its influence on attitudes, motivations, orientations) with the branching out and taking root of this neurotic personality in the world, this is a more valuable book than the famous autobiography of Henri Frédéric Amiel *Fragments d'un Journal Intime*. The Swiss author left as his only work the description of his inability to achieve anything else.

This neurotic, then, notwithstanding his anxieties, his shyness, his tendency to run away, his continuous masquerading, his assumed impertinence, was able to see, to understand, and to describe masterfully the social background of the life of *bourgeoisie* and *petit bourgeoisie*, in Budapest, in Vienna, in Jerusalem, in Paris, and, last but not least, of liberalism in Germany on its deathbed. As assistant editor-in-chief of the *Vossische Zeitung* in Berlin, Koestler was in a position to watch the foolishly suicidal mimicking of ultranationalism practiced since 1930 by this erstwhile pacifistic, individualistic, cosmopolitan, humanitarian paper.

In the following part of the book, "The Road to Marx," Koestler offers an analysis of the psychodynamics of Communism and totalitarian propaganda. Why did sober scientists like Bernal, Fuchs, and Joliot-Curie, career diplomats such as Alger Hiss, Guy Burgess, and Donald MacLean, fall for this type of propaganda? The answer is because, like all of us, they were unconsciously longing to breathe this "invigorating" All-Or-Nothing atmosphere. Their boyhood fantasies of Wild West, of Superman, Dracula, and Hopalong Cassidy could be satisfied by the typical conspiratorial secrecy of the communistic cells. They all, like himself, Koestler believes, stepped from an intellectually open into an intellectually closed world. "Marxism, like orthodox Freudianism, like Catholicism, is a closed system," and Koestler does not hesitate to refer such attitudes directly to the perpetual adolescence, or, in the words of Goethe, to the neurotic immaturity of the creative mind. A dangerous theory, and, as the critical reader will observe, a

no less totalitarian one than the ordinary brand of the Freudian school, which, by the way, is a far cry from the ideas of Freud himself.

The material of "The Road to Marx" was already used in Koestler's contribution to C. Crossman's *The God that Failed* of 1950. Let us say that we are looking forward to the continuation of this autobiography, and by the same token, let us say that we would like to see several years elapse between this and the forthcoming volume. Possibly, future maturation, together with a change of venue and values on the political scene will allow the author to develop his vistas and look at the precious raw material of his life from new angles. Our wish for the author is that he may give us an even richer "neuroergography."

NAMIER, LEWIS. *In the Nazi Era*. Pp. vii, 204. London: Macmillan & Co. (distributed in the U. S. by St. Martin's Press), 1952. \$2.50.

In this book a well-known historian of modern diplomacy has assembled a number of trenchant and illuminating reviews of various memoirs published after World War II. These include recent works by von Dirksen, German Ambassador in Moscow and Tokyo, von Weizsäcker, who was Ambassador in Rome, the brothers Kordt, who were Ribbentrop's associates in the Foreign Office, and the account of Paul Schmidt, Hitler's interpreter. The memoirs of former German generals are also reviewed.

In telling fashion Sir Lewis dissects the arguments which the survivors of the elite of the Nazi regime put up in their defense. He clearly shows how hollow and pointless these are. He reveals, for example, that the alleged plot against Hitler in 1938 and, in consequence, the "opportunity" which the British missed of checking Hitler's aggressive intent before Munich, are little more than myth. He points out so many inaccuracies and misinterpretations made by the writers of these memoirs that one is warranted to draw the general conclusion that most of the post-

war literature produced by those people who were in leading positions in the Nazi regime is wholly unreliable.

The book permits us to relive in vivid fashion the last few years preceding World War II and to see the various forces that were at work in perspective. The book concludes with a fascinating chapter which reviews the memoirs of the former French Ambassador, M. Robert Coulondre, in Moscow and, after 1938, in Berlin. The chapter is properly entitled "Memoirs of a Realist." From it we gain the insight that the truly missed opportunities arose from French and British ineptitude in handling their relations with Soviet Russia which put them in the position of having to support German moves for power in Europe. The dilemma that confronted diplomats before Munich and which appears to confront them still is succinctly revealed in the following passage written by M. Coulondre: "When I was starting for Russia, I did not discern the deepest reason . . . why it was essential, crucial, for France to avoid war. Only toward the end of my stay in the U.S.S.R. did I become aware of it. . . . Vanquished, France would be Nazified; victorious, she was bound, foremost owing to the destruction of German power, . . . to sustain, with the rest of Europe, the crushing weight of the Slav world, armed with Communist flame-throwers."

THEODORE ABEL

Hunter College

ANGELOPOULOS, ANGELOS. *Planisme et progrès social*. Pp. 403. Paris: Librairie Générale de Droit et de Jurisprudence, 1953. 1,200 francs.

M. Angelopoulos' book is a general argument in favor of national and international economic planning, to attain the purposes of the "welfare state." It draws principally upon Keynesian economic theory and the recent practical experience of Britain and the United States in the realm of international planning, with the intention of rendering this kind of social endeavor more understandable to the educated public opinion of western continental Europe.

The first four chapters, which are of broad scope, set forth the thesis that the

consensus as to what are the proper objectives of the state undergoes transformation from one age to another. Unless this evolution is accepted as legitimate, an era of crisis and revolution develops, such as that of 1789-1848. In our time, such an evolution is in mid-course, from the postulates of laissez-faire to those of the welfare state. This movement began in the aftermath of the First World War, under the impact of the labor movement. In the interbellum period, the propertied classes were still strong enough to thwart it, maintaining the "established order" as against the "new order." But now, after the Second World War, the evolution is inexorable. Hence the task of our generation is to expedite a smooth transition to the new epoch.

The remainder of the book is devoted to practical aspects of the problem. The crux of it is state control of the factors of investment and savings, so as to achieve full employment and a rising standard of living. This implies planning on an international scale, involving the integration of economic plans as among industrial countries and the systematic development of "underdeveloped areas." Moreover, it must envision constant economic and social progress, not merely stability and security.

American readers will find little new in the thesis or the argumentation. Yet the book is of considerable interest. It is an evidence of the degree to which educated opinion in continental Europe is approaching an acceptance of ideas now commonplace in America and Britain. It is also a useful survey and synthesis of the literature on the problem of planning which has appeared in continental Europe since the close of the war. The notes are a helpful bibliographical guide for this topic.

VAN DER VLUGT, EBED. *Asia Aflame: Communism in the East*. Pp. xiv, 294. New York: The Devin-Adair Company, 1953. \$6.00.

Communism makes headway where traditional value systems have broken down, whether among Western "intellectuals" who have lost their faith in God, or among Asians who have renounced their old values and are casting about for something to believe in. Having thrust aside the beliefs of their forefathers, they cease to be people, upon whom the whole concept of democratic sovereignty is based, and become the masses whom Communist demagogues are so thoroughly trained to manipulate. Mr. Van der Vlugt, barrister at the Court of Justice, Amsterdam, and founder of the journal *Le Monde Nouveau* in Paris and London, develops this analysis from many years of observation in Europe and from long experience in various parts of Asia.

Old forms of society in the West, though still in existence, are being "hollowed out from within," Mr. Van der Vlugt pursues, with important spiritual principles falling into disuse and discredit. In the East, this "hollowing out" process is far more dangerous. Millions of people there are searching convulsively for new forms of society, but whenever their leaders fail to extract the best from a combination of old and new, large numbers—especially the youth—merge with the masses and are thereafter prime prey for the Communists.

After delineating the Communist offensive in the Middle East, India, Indo-China, Indonesia, China, and Japan, Mr. Van der Vlugt faces up to the problem of how to mobilize an effective counterattack. Economic aid to free nations in Asia, the gradualistic granting of independence to remaining colonial areas, military strength and preparedness—all these, he believes, are of utmost importance. But the West can take such measures and still fail unless the free peoples of the world succeed in opposing Communist dynamism with a greater dynamism, "especially in the realms of ideas and emotions." Asia can be lost or won, he emphasizes, depending upon our own understanding and use of the dynamic force of essentially spiritual ideas.

In the opinion of this reviewer, Mr. Van der Vlugt blunts the edge of otherwise incisive arguments by protesting a little too much in defense of Dutch policies in

Asia and by the occasional introduction of undocumented innuendo against Mr. Dean Acheson and other American policy makers. He states, for example, that the Secretary of State was "doubtless" aided in his conception of Far Eastern policy by "two of his most trusted younger advisers: Mr. Owen Lattimore and Mr. Alger Hiss." Loose statements of this sort, however they are interpreted, do damage to someone. It is the opinion of this reviewer, therefore, that such assertions, if made at all, should be stated with precision and meticulously supported.

Asia Aflame carries a short foreword by General Albert C. Wedemeyer.

ROBERT C. NORTH

FRIED, MORTON H. *Fabric of Chinese Society: A Study of the Social Life of a Chinese County Seat*. Pp. xiv, 247. New York: Frederick A. Praeger, 1953. \$4.25.

It is always fascinating to view one's own familiar surroundings through the writings of someone else, particularly if the writer employs an approach appreciatively different from the conventional. He is apt to point out phenomena as typical or peculiar which one has always taken for granted and has frequently overlooked. A great number of books on China and the Chinese people have been written by talented journalists and learned Sinologists who have presented pictures of prominent characteristics and general outlines of the country in broad strokes. Comparatively few books have been written by sociologists and anthropologists who have confined themselves to intensive studies of local communities and have imbibed from the soil the cultural and spiritual sap which nourishes the inhabitants. Both approaches are perfectly legitimate, and both can lead to useful knowledge and interesting comparisons.

Fabric of Chinese Society is a book belonging to the latter category. Its author, Mr. Fried, selected Ch'uh-sien, a community in east central China, to make the microscopic cultural inquiry by employing the so-called "community study method."

In his book, he presents many valuable data and advances certain hypotheses which add significantly to the understanding of the Chinese cultural pattern. The scope of his emphasis includes not only the cultural constant but also the individual variable; in order to support his hypotheses, he has made many detailed case studies in a manner best known to anthropologists.

Ch'uhsien is a city not far from where I was born and spent my tender years. His descriptions of familial kinship and extra-familial relationships of the inhabitants of Ch'uhsien are accurate and penetrating which bring me an acute feeling of nostalgia. His conclusions also prove to be interesting and valid. Contrary to the popular belief that kinship relations form the basis of Chinese society, Mr. Fried points out that extrafamilial relationships sometimes constitute even more important factors in the alignment of economic and political forces.

However, the reader must be aware of the fact that the study was made just before the Communist forces swept that part of the country. Since the triumph of the Communist power in China, all cultural and social standards have been artificially altered. Although how significant a proportion of this change tends to be permanent remains to be seen, the cultural pattern of Ch'uhsien, undoubtedly, has changed beyond recognition since Mr. Fried made his study. This book, therefore, has a special value in that it will serve as a basis for comparison in the analysis of social changes when more studies of similar nature on the current pattern under the Communist impact become available.

DJANG CHU

New York City

OUTERBRIDGE, LEONARD M. *The Lost Churches of China*. Pp. 237. Philadelphia: Westminster Press, n.d. (1952). \$3.50.

Though writing as a prophet and exhorter calling to witness the history of five expulsions of "Christianity" from China in thirteen centuries, the author's historical data and generalizations on the previous four lie in our fields of culture contact and culture change; and his report and

interpretation of today's Chinese Communism and its psychological responses to different elements in American foreign policy, should be scrutinized by our social scientists as well as by government officers because of the paucity of such reports.

His book, however, is almost dual in nature. The latter half begins with the nineteenth century and reads like direct emotionalized reactions to his recent re-visitation of China to investigate the effects of Communism upon Christian Churches; the first half, devoted to the Nestorians, early Franciscans, and early Jesuits in China, reads like a semimonographic study out of his University of Chicago (Divinity School?) Ph.D. thesis of the same title.

In this first half his underlying interest is in [whipping the dead horses of] the ever fatal results of mingling church and state affairs, and of failing to tolerate, and to build missionary propaganda upon, the ethical and religious "truths" of indigenous beliefs. In the latter half he goes further and claims that, in undermining Confucian and Laotzian teachings on God and human personality, the Christian churches created a vacuum. They themselves tried to fill this vacuum with externals such as humanitarianism, institutionalism, and doctrine diverse instead of unified; but they left out the spiritual core needed to fill it. On the other hand, since the recent "tumultuous upheaval of China's millions is the struggle of the human spirit for a more abundant life" (p. 189), Communism, coming as "a social philosophy in which society is organized into passionate action to bring about the millennium without God" (p. 188), was able to enter that vacuum "like a rushing wind."

In this victorious stage of China's "unparalleled" revolution, moreover, the churches suffered the political fate they had deserved by allying themselves, for protection, with Western political forces. When the Yalta agreements inexcusably flouted prior promises of the Western democracies and peeled China's face, and Chiang Kai-shek failed to repudiate the agreements, in fact accepted them, the Chinese people turned against Chiang along with the Western democracies; his armies

melted away; and Chinese Communism, which "is but a temporary phase of a resurgent nationalism" (p. 189), merely took over.

Thus, as four times previously in China's history, the imported Christian institutions and their members were classified as political outs, especially since their God could no more be reconciled with Communism than could Confucian ethics. And they are being de-Christianized.

In spite of the author's imitation of current loose use of such terms as "revolution," "nationalism," and the "people," his naïveté regarding international Communism, and his simplistic explanation of Communist victories, his reporting of Communist activities and indigenous reactions during the last few years is worth examination.

MAURICE T. PRICE

Maxwell Air Force Base

RAWLINSON, H. G. *India: A Short Cultural History*. Pp. xv, 454. New York: Frederick A. Praeger, 1953. \$8.00.

The work under review is a revised version of the author's work on the cultural history of India first published in 1937. This excellent work was undertaken by the writer to rouse interest among English readers that they might be able to make a proper and sympathetic appraisal of the culture of the Indian people, with their great past and future important role in world affairs. In the preface of the work, this English scholar writes:

"English people as a whole have been singularly blind to the significance of India's contribution to world-culture; there has been a positive distaste, born of prejudice and apathy, for Indian spiritual and aesthetic values. Today, when India is once more emerging with that persistent vitality which has been her characteristic through ages, from eclipse, it is more than incumbent on us to realise the greatness of her past achievements in religion, politics, art and literature. . . ."

With this spirit, vast amounts of material on Indian history, covering more than 5,000 years, have been condensed within the short compass of 420 pages, avoiding details. In 22 short chapters, in

very clear and simple language, the work gives us a synthesis of Indian history depicting significant and distinctive aspects of achievements and contributions of the various peoples of India who were original inhabitants of the land and of others who migrated into the country and of others who were invaders but later settled in the country. The book, at the same time gives a connected history of India up to the fall of the Mogul empire; while the chapter on Modern India is rather meager, covering only 23 pages, although it contains a valuable synthesis of cultural forces behind the making of Modern India.

The work is enriched by 24 very excellent plates and 45 illustrations of Indian archeology, art, and architecture, covering the period from pre-historic Mohenjodaro era to eighteenth-century India. It contains twelve interesting maps. Such maps as Alexander's route to India, Indian Trade Routes (both east and west), Indo-Chinese Trade Routes (routes for intercourse with China, Tibet, and the Far East) are fascinating and at the same time most enlightening, showing paths of cultural expansion of India of the by-gone days. The author indicates that ancient India had intercourse with the West; and Indian thought influenced some of the Greek philosophers. "In the vision of Er the Pamphylian, with which the *Republic* (of Plato) closes, are clearly stated the Hindu doctrines of reincarnation and Karma, 'each returning to a second life, and receiving the one agreeable to his desire.' The Myth of the Cave in Book VII is an equally clear exposition of the Vedanta doctrine of Maya, the illusionary character of the objects of the senses. Plato's division of his ideal polity into three orders—Guardians, Auxiliaries, and Workers—is reminiscent of Indian Varnas, Brahmins, Kshatriyas, and Vaisyas. It is difficult to believe that these may be accounted for merely as coincidences" (pp. 55-56).

The western world was influenced by Arab contribution in the field of sciences. But what is known as Arabic notation and numeration, zero and decimal system came from India; and Arabs spread them to Europe. During the Gupta period of

Indian history, as early as fourth century, A. D., "universities for secular and religious studies flourished at Nalanda and other centres of learning. Medical science was widely studied and Sanskrit medical treatises were the basis of much of the later Arabian learning which reached Europe in the Middle Ages . . ." (page 131). There is no doubt of Indian influence in Chinese culture and all over East Asia, through a spread of Buddhism.

During the Buddhist period of Indian history, we find definite evidence of the application of the concept of supremacy of law—a civil service system and toleration of all religious beliefs in India. Ancient India's administrative system, its municipal government as well as its village community system, was essentially democratic in character. It should be noted that Indian cultural life has been enriched by contributions of other peoples who came to India and settled there. But the cultural life of the people of India under alien European rule during the eighteenth and nineteenth centuries was not vigorous and progressive until national awakening.

The author's estimate of the future of cultural life of India is sound: "At present India and Pakistan stand on the threshold of a new era. Political and social changes have followed in bewildering succession. The nationalist movement has created a revulsion against the indiscriminate imitation of the West which was the fashion in the Victorian era. When, however, occidental influence has been assimilated, we may look forward to the emergence of a new eclectic culture combining what is best in both; the future of India, in art, and literature seems to lie in the amalgamation of Western thought with her own immemorial civilisation." **TARAKNATH DAS**
Columbia University

PATEL, SURENDRA J. *Agricultural Labourers in Modern India and Pakistan.* Pp. xi, 169. Bombay: Current Book House, 1952. Rs. 4.

When Lord Cornwallis in 1793 introduced the zamindari system of land revenue in Bengal, Bihar, and Orissa, "the large masses of the peasantry began to roll down the social ladder first as tenants-at-will and then

as agricultural labourers" (p. 59). At about the same time the raiyatwari settlement was introduced in Madras, and was later extended to much of south, central, and southwest India. In the north and northwest the mahalwari or joint-village settlement became the prevailing form. Everywhere former owners of land found themselves at the mercy of a new class of money-lenders, who were "backed by the entire legal and political machinery of the state" (p. 59). Thus, under the aegis of the British Government "the whole social fabric of the old Indian agrarian society underwent a radical transformation" (p. 60).

This compact volume describes the transformation in Indian agrarian society, with particular attention to the agricultural laborers, the largest single group within that society. Against the historical background it analyzes the causes for "the remarkable tripling" of the relative proportion of agricultural laborers in the total rural working population in the half century prior to 1931, and for the regional differences in their distribution. They were most numerous in the "Southern Triangle," "the land of the landless labourers par excellence," and least common in the "Great North." This did not mean that the masses of the people were better off in the north of India; for "the landless labourer of the raiyatwari region had as his counterpart, the dwarf-holding sharecroppers and tenants-at-will in the zamindari and mahalwari regions" (p. 117). Moreover, "in the raiyatwari areas the cultivator was expropriated from the land; in the zamindari areas, however, he was exploited on the land" (p. 117).

Dr. Patel classifies agricultural laborers into four main types, and devotes a chapter to each type. These types are: (1) bonded or semi-free laborers, drawn mostly from the aboriginal and untouchable classes, forced by "the dire necessity of securing subsistence in some way or other" (p. 87) to accept a system which, while it is now legally abolished, still continues to exist; (2) "dwarf-holding labourers," small cultivators who were forced to work for others on a part-time basis; (3) underemployed landless laborers, a category which included

the great bulk of the landless laborers; and (4) full-time "free" wage laborers, divided into plantation laborers and "employees of other capitalistic and well-to-do farmers" (p. 131). Dr. Patel concludes that in 1931 categories (2) and (3) embraced some 72 million out of a total agricultural working population of 111 million, and that approximately 79 of the 111 million, mostly tenants-at-will and underemployed laborers, had no rights to the land. He calls attention to the "tremendous under-utilization of human resources" (p. 150), a condition which is one of the most apparent and most alarming features of the current Indian scene.

In spite of the paucity and unreliability of statistical information, and of the difficulties of classification, the author has made a contribution of first importance to an understanding of conditions in India and Pakistan today.

NORMAN D. PALMER

University of Delhi, India

BENTWICH, NORMAN. *Israel.* Pp. 224. New York: McGraw-Hill Book Company, 1953. \$3.75.

The creation of the state of Israel is a striking example of the complexities of social causation. A careful analysis of that development would make an illuminating study of how the respective roles of human purpose, human idealism and self-sacrifice, human cussedness, and the unforeseen changes and chances of the historical processes are woven together in a web of fate. Israel was the result of 50 years of heroic effort, but it required Nazi persecutions and the general revival of anti-Semitism for final achievement.

The author of *Israel* served under the British Mandate and later as professor of international relations at the Hebrew University. He has covered most of the main historical events and current problems. He has written sympathetically but with commendable objectivity, free from emotional extravagances, excessive partisanship, and wishful thoughts. He describes the land, the immigration, the political and economic institutions, and various aspects of the aesthetic, educational, religious, and social welfare activities, always clearly and with

marked brevity. He seems somewhat partial to the Histadrut or Labor Organization. One wonders whether the modern welfare state, with all the trimmings that have been introduced in developed industrial economies, is reconcilable with so struggling an economy as that of Israel. He seems to idealize somewhat the complete communism of the Kibbutz, where worship and work are one and the same; but he does note some cooling off of the white-hot idealism of the early pioneers as the immigrants contain a larger proportion of orientals. He notes that Israel is no longer a mere melting pot but a pressure cooker.

One cannot read this rather simple account without renewed realization that the problems of Israel are legion. Among them four seem crucial: Arab relations; population growth; economic self-sufficiency; and democracy versus theocracy.

Israel is surrounded by implacable enemies, and Professor Bentwich repeatedly emphasizes that peace between Arab and Jew is a primary necessity. Of the 1,200,000 Arabs in Israel territory in 1947 only 180,000 remained in 1951. While their flight was partly due to Arab directives and mass frenzy, it was fomented by Jewish terrorism. Arabs are now an underprivileged minority in their ancestral villages. On the other hand 300,000 Jews have been forced out of Arab lands. We have grown somewhat callous to this forceful seizure of territory and racial transfers: Greeks and Turks; Moslems and Hindus; and a dozen cases in Europe. The time for moral indignation, however, has passed in the Arab case. The 750,000 Arab refugees are now balanced by an equal number of recent immigrants. Israel stands ready to compensate Arab owners, and the author expresses sound historical sense when he concludes that it is now too late for the refugees to return; the rapid trend of events has cast the die on that issue.

Since this book was written immigration has been somewhat restricted, largely for economic reasons. The 1948 plan visualized one million immigrants each five years for the next decade and three million Jews before 1960. Even the reduced objective of two million Jews seems high in view

of the natural resources of the territory and the inevitable doubling of numbers in a generation or two. A large percentage of food must be imported; the hundreds of millions in gifts from America and elsewhere may dry up; exports have been only 25 to 33 per cent of imports, and it seems likely that some such ratio may continue. The Israel birth rate is one of the highest and the death rate one of the lowest in the world. The Jewish pound has three separate values, and none increases. Can economic balance be achieved, along with a reasonable standard of living, for a rapidly increasing population in such a poor environment?

Finally, one may note a problem upon which our author scarcely touches, namely, the struggle for control between those imbued with western democratic ideals and those typified by adherence to oriental mysticism, ritual, and priestcraft. The danger here arises from the increased proportion of orientals among immigrants and their unusually high fertility. The struggle between the democratic-secular and the traditional-authoritarian elements may be one of the most crucial in Israel's future.

One wishing a well-organized, well-balanced historical and descriptive account of the formation of Israel and its recent problems will find this book rewarding.

FRANK H. HANKINS

Smith College

ALLBAUGH, LELAND G., with the editorial assistance of George Soule. *Crete: A Case Study of an Underdeveloped Area*. Pp. xx, 572. Princeton: Princeton University Press, 1953. \$7.50.

Crete is an island with meager natural resources, untrained human resources and extremely limited capital resources. The farmers, who constitute 85 per cent of the total population, use tools and equipment averaging \$32 per family and earn an average cash income of \$249 per year. In 1948 the Rockefeller Foundation conducted a comprehensive survey of the island with two specific objectives: to discover whether it is possible to raise living standards, and to develop ways by which "... the knowledge and skills of industrialized countries might best serve and least injure an under-

developed area such as Crete" (p. 3). Hence this work has much more than purely local significance. It is designed to serve, in the words of the subtitle, as "a case study of an underdeveloped area."

The teams of scientists used various techniques in gathering information. They studied available literature, conducted field reconnaissance, and interviewed government officials, physicians, and other professional persons. Their most important contribution was a sample survey of households, farms, and communities carried out by specially trained Greek interviewers. The results were quite revealing, and the methodology that was evolved, and which is fully described in the appendixes, may serve as a model for factual exploration in other underdeveloped areas. The report includes specific recommendations for alleviating the water shortage, improving health conditions, raising agricultural productivity, decentralizing administrative procedures, and integrating the educational system with the practical problems of living.

The Foreword concludes with the following statement: "In view of the number of United Nations and United States agencies that have been working in Greece and Crete, The Rockefeller Foundation has not considered it necessary to implement the recommendations contained in this report" (p. x). This raises the question whether the Greek government or the international agencies are likely to act upon the recommendations. This question is of extraordinary significance today. The same question is being asked by the peoples of the underdeveloped territories throughout the world. International communism has an answer: revolution and industrialization planned and imposed from above. The philosophy underlying this study is that another course is possible and preferable: "... evolutionary processes set in motion at the grass-roots, geared to the real desires, capacities, and local needs of the people themselves" (p. viii). This survey demonstrates that "evolutionary processes" are technically feasible. The crucial question is whether they are also politically feasible.

L. S. STAVRIANOS

Northwestern University

LENGYEL, EMIL. *World Without End: The Middle East*. Pp. 374. New York: John Day Company, 1953. \$3.75.

Professor Lengyel has attempted an omnibus book which carries the reader through time and space so as to encompass the Middle East in breadth and depth within two covers. This has advantages and disadvantages depending on the reader's point of view. If the reader wants information readily packaged in easy-to-take doses, this book supplies it. But the serious student will find it disappointing. The latter will find too many oversimplifications, slants, and even errors in the text.

The text itself is divided into eleven chapters, entitled with journalistic captions such as "The Poorhouse of the World," "History Unlimited," "The Tortuous Story of the Straits," "The Imperial Lifeline—Suez," "People from Afar," "The Dead Man Lives," "The Curse of Too Much History," "The West in the East," and "Cherchez l'Huile."

Professor Lengyel is uniformly harsh in his criticism of Arab leaders. He blames the "Pashas" for most of the ills of the area. The description of nationalism (pp. 47-49) is a caricature rather than a portrait. This sometimes leads to contradictions. In one case (p. 309) the author states that ex-King Farouk and the "Pashas" seemingly wanted to continue the plight of the Arab refugees in their tragic situation in the Gaza strip so as to make use of them in their policy against Israel. Yet on page 359 he shows the desperate land shortage in Egypt which makes absorption of the Gaza refugees impossible. The treatment of the whole problem of the Arab refugees falls more in the field of propaganda than in that of a balanced study of facts.

Professor Lengyel is very sympathetic in his references to Israel. Comparative statistics show the Israelis at the top of the class in all categories. How much of Israel's amazing progress is "earned" and how much is sustained by "grant aid" from abroad is not analyzed. The author on page 286 repeats a common error: "In about two and a half years after the proclamation of the State, the population doubled." Reference to United Nations

documents, as well as many others (such as "The Arab Refugee Problem" by Joseph B. Schechtman, 1952, pp. 3-4), shows that on May 15, 1948, when the State was proclaimed, relatively few Arabs had fled—not over 200,000 and those mostly from Jaffa and Haifa. The great exodus of Arabs came in July from the Lydda, Ramleh, Acca areas, and in October-December 1948 from Beersheba, Galilee, Jerusalem, and other peripheral regions. Thus some 650,000 Arabs left the territory now occupied by Israel after the proclamation of the State. About 750,000 Jewish immigrants entered during the first 30 months. This means the total population on May 15, 1948 was not much less than at the present time. There was a "transfer" of populations or an "exchange" if one wishes to use those terms. The incoming Jews occupied the lands and assets of the Arabs who moved out.

The frequency of these inaccurate or partial statements seriously mars the value of the book for students. Yet anyone who attempts to include all the accurate and pertinent material on such a wide variety of subjects would be baffled by the decision as to what to exclude. As a popular essay, the book has a limited value for readers who have not been previously introduced to the Middle East. To the initiate in this field of study, the above-mentioned faults will serve as a mild but harmless irritant.

EDWIN M. WRIGHT

Johns Hopkins University

LETTERS TO THE EDITOR

Dear Sir:

Solely with the idea of contributing to a much needed improvement in the reviewing of economic books, I wish to criticize briefly THE ANNALS review of my book, *How You Really Earn Your Living* (January 1953). The basic weakness of the review lies in the ideological antagonism displayed by the reviewer. This induces an attitude and tone that make the review little more than an attempt to smear. Books that are consistently based upon one ideology should be reviewed on that basis.

The reviewer in this case being left of center is led by his bias to make positive misstatements:

(1) He asserts that my thought is not related to "a set of explicitly stated and consistent values." This is so far from the fact as to be conclusive evidence of prejudice. On page 1, I say "freedom of individual choice, for both consumers and producers, is the most basic of all rights," and constantly and clearly throughout the book I make my text of value the free choice of individuals to work or sacrifice to get things (for example, see p. 32).

(2) He asserts that my statement that the "New Welfare" economics ignores important differences among us and assumes equal income is inaccurate and misleading, thereby showing either bias or his own ignorance of the thought of A. Bergson, O. Lange, A. P. Lerner, P. M. Sweezy, and others. Let him read H. Myint, *Theories of Welfare Economics*, page 219, and my *History of Economic Thought*, page 899; also Lange, *On the Economic Theory of Socialism*, pages 100-103.

Of course, the members of the "New Welfare" group differ widely (including opinions as to the extent to which equal incomes are required to make the free choice of consumers acceptable as tending to their "optimum"). This I note specifically. How could they have (1) their "optimum distribution of income" with "marginal welfare per dollar" equal in all households, (2) marginal rate of substitution for all consumer goods the same for all households, (3) technical knowledge and tasks "given," and (4) social dividend determined independently of productivity, unless they fix incomes as equal lump sum per household or per size of household? Certainly the prolific Lange has at times assumed that under his system income may be distributed equally.

But, when all is said, perhaps the worst feature of this review, as of so many others, is that it gives no idea of the scope or coverage of the book reviewed. The emphasis placed by the reviewer on the gold standard and on "New Welfare Economics" makes his review a caricature.

LEWIS H. HANEY

New York University

Dear Sir:

Professor Haney has accused me of "ideological antagonism" to the values expressed in his book. I am not aware of such antagonism since I also happen to believe rather strongly in freedom of individual choice except in those cases where the actions taken by one individual or firm will curtail the freedom of others. Actually, however, whether or not our values coincide is not the issue since my objections to *How You Really Earn Your Income* are based instead on: (1) certain technical errors which exist in it; (2) the manner in which the author presents arguments against those economists who advocate policies different from his; and (3) the somewhat oversimplified treatment accorded several important problems of economic analysis.

In regard to Professor Haney's point (1), I do not believe my review implied that he neglected to indicate his values. Rather I tried to suggest that other, equally competent economists have advocated quite different policies from similar premises and that Professor Haney has not given reasons to suppose they are wrong. This is a different matter and whether I happen to agree (or disagree) with his policies has no bearing on the case.

Concerning point (2), my unfavorable reaction to Professor Haney's statements about welfare economics are, I am afraid, unchanged. May I refer the interested reader to the recent surveys of welfare economics undertaken for the American Economic Association by K. E. Boulding ("Welfare Economics," in *A Survey of Contemporary Economics*, Vol. II, ed. B. F. Haley, especially pp. 10ff.) and by A. Bergson ("Socialist Economics," in *A Survey of Contemporary Economics*, Vol. I, ed. H. S. Ellis, especially pp. 418ff.).

United States Leadership in a Divided World

By CHESTER E. MERROW

THIS is a crucial and decisive decade in the history of the United States, also in the history of freedom-loving nations. Our Republic occupies a destiny-given position of leadership in a sharply divided world. The United States, by far the strongest and the most powerful nation which has to date existed upon this earth, possesses an opportunity without parallel in the annals of mankind to exercise leadership. The free world is being attacked on many fronts and is being undermined from within wherever the Communists are able to make their sinister influence felt. In this universal struggle the forces of freedom must prevail, if ultimately there is to be fashioned an international society in which human beings can live free from molestation and free from the threat of tyranny and enslavement.

The United States is a comparatively young nation. In recalling history we recognize that this part of the world, the Western Hemisphere, has been known but for a brief period as projected against the background of unfolding time. Only 461 years have elapsed since Christopher Columbus charted the way to reach the Western Hemisphere. As we peruse the ancient records of past civilizations, we find, for example, that in Mesopotamia, the land between the Tigris and the Euphrates, the Sumerians succeeded in creating one of the oldest civilizations, 4,000 years before Christ. In the Indus Basin there are remains of a civilization either contemporary with or antecedent to the Sumerians. Compared to the long record of human activity, we have been on

the stage of world affairs but a short time.

It was in 1787 that the first architects of this Republic forged the Constitution of the United States in Philadelphia—166 years ago this summer. New Hampshire was the ninth state to ratify the Federal Constitution in 1788, and from that time the United States has risen steadily to the prominent position in human affairs it now occupies. The adoption of the fundamental charter of the United States launched the greatest, the most ambitious, and by far the most successful experiment in free representative government the world has ever known. The federal Constitution has been characterized by William E. Gladstone, one of Britain's most eminent Prime Ministers, as "the most wonderful work ever struck off at a given time by the brain and purpose of man."

HISTORICAL TURNING POINTS

We have reason to marvel at the ascendancy of our country during the past 165 years; but there is still more reason to be impressed by the phenomenal and meteoric rise of the Republic during the first half of the present century. The Spanish-American War marks a definite turning point in our history. At the time of that conflict, the United States began its role as a world power. Successful in two world wars, with nearly \$50 billion invested in foreign affairs since the termination of the Second World War and with interests in every section of the world, we have come now to a place of strength, influence, and responsibility that will

not only try the mettle of our people and our present leaders, but will continue as a challenge for decades to come. As the leader of the free world, our responsibility in the struggle to keep free and to help others achieve their freedom is of sobering magnitude.

To emphasize further and to clarify fully this crucial period during which our decisions will determine the future existence of free men, we do well to keep in mind that in the history of our country, two periods of the most profound importance have preceded this decade, periods in which the principles underlying the strength and power of the Republic were hammered out by the blood and toil of those who had the conviction to act and to fight decisively for what they believed to be right.

In the beginning years of this nation, General George Washington, who has been affectionately termed by his own and succeeding generations as the Father of his Country, displayed qualities of leadership and statesmanship not approached by any other individual in the supreme art of statecraft. Washington holds his place in history, constantly growing in stature, achieving immortality in the hearts of millions because of his unique contribution to his country. For three reasons he towers above other prominent figures in history: as leader of the Revolutionary armies, he won freedom for the United States; as president of the Constitutional Convention, he held the delegates together until they wrote what is beyond doubt one of the greatest documents created by man; and then, as first President of the United States, General Washington set laudable precedents for his successors.

Truly he was the chief architect of the Republic. Fortunately this leader of leaders had the foresight and vision to lay the foundation making possible the structure of the Republic which we

proudly possess in these hours of unprecedented trouble. Washington's work has become increasingly important and is of outstanding significance to the free world in this time of grave peril. The principles which guided his actions are the principles that must be established in the world today if men are to become truly free. Actually the entire free world is indebted to the work of Washington, for had it not been for his foresight and vision and for the ideas which motivated his conduct in public affairs, the United States would not have developed and would not now possess the power and freedom that it has today. No other general, no other statesman, no other diplomat has achieved the stature of General Washington.

The second most crucial period in the history of the Republic was at the time of the Civil War. During the decade of the 1860's, a leader in the person of Abraham Lincoln conducted the affairs of this nation through one of its most severe trials. Lincoln saw with deep perception that, if the work of Washington was to continue, then union was imperative. He further discerned with penetrating analytical insight the essentiality of union for the continuation of our national life, and at the same time he understood that freedom, the basic concept of the Republic, must be extended and preserved. His success laid the basis for the rapid development of the United States and made possible our rise as the leader of the free world.

On several occasions I have traveled in western Europe, and, as I have observed the differences existing on that strife-torn continent and as I have seen how the transcending issue in that section of the world is unity, my admiration for the statesmanship of Lincoln has constantly increased. European unity is the issue on the Continent at this moment. President Eisenhower has re-

peatedly stressed the importance of this basic question. Congress, in the Mutual Security Program, has stated again and again that the political unification and integration of the countries of Europe is the goal toward which we must strive, and we have conditioned aid to western Europe on the progress the countries are making in this direction. As I think of the disunity in Europe and as I think how important the achievement of unification—political, economic, and military—has become, my mind turns to the history of the 1860's in which Abraham Lincoln gave leadership to his country. His farsighted statesmanship prevented the division of our country and made certain the continuation of the United States.

CURRENT RESPONSIBILITY OF CONGRESS

Currently we are in a third crucial period which is as significant, if not more so, to the ultimate freedom of mankind as were the first two which I have discussed. The free way of life bought with so much treasure, sacrifice, and blood over many years, is being assaulted by a sinister and diabolical foe who would destroy all phases of freedom and who would finally enslave all nations. In this struggle which is joined in every section of the planet, either in the cold or in the hot war, we find the United States in a place of leadership which cannot be transferred to someone else and from which we cannot escape. We are carrying a responsibility that we can in no way pass to others. This struggle for the freedom of human beings is the greatest that has ever engaged the energy and efforts of free men from primitive beginnings to the present hour. As the undisputed leader of the free world, we find that upon our wisdom and determination in exercising leadership and statesmanship depends not only the

future of the Republic, but the shape the free world will take tomorrow. Here the Congress of the United States has an opportunity to make an outstanding contribution in leadership and statesmanship as legislation is passed to implement United States leadership in the free world.

The issue of our time can be stated in words that have become familiar to every schoolboy in America. In the first two sentences of the Gettysburg Address, President Lincoln said:

Fourscore and seven years ago our fathers brought forth on this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war, testing whether that nation or any nation so conceived and so dedicated can long endure.

We can appropriately state that now we are engaged in a globe-encircling struggle, testing whether free civilization or any civilization "so conceived and so dedicated can long endure."

This, in my opinion, is the current crisis. This, I believe, is the issue that we are in the process of deciding. Never before has the struggle for freedom been so widespread; never has the crisis been greater; never before has a nation been called upon to provide the leadership that the United States must give in this current conflict; never has the need for an effective Congress been more clearly seen than at the present time. Free men must make certain that free civilization "shall not perish from the earth."

It has been my privilege to visit much of the free world as a member of various study missions of the Foreign Affairs Committee of the House of Representatives. In this capacity I have participated in the writing of several reports on our relations with various countries. Our responsibilities are con-

stantly increasing. Daily our task becomes more significant. Our burden is heavy, but our opportunities are boundless. It has been repeatedly impressed upon me how unique is our position and how illimitable is our potentiality for making an imperishable achievement in constructing a better international society that will give to mankind a chance to live free and develop to the greatest possibility.

ROLE OF CONGRESS IN FOREIGN AFFAIRS

In rising to fulfill our unique position of leadership the Congress has a most significant part to play. During the past few decades the role of Congress in foreign affairs has been ever increasing. The national legislature has authorized and appropriated vast sums of money for both the creation and the implementation of foreign policy. On numerous occasions, policy has been developed by the Foreign Affairs Committee of the House of Representatives and the Foreign Relations Committee of the Senate, later approved by both Houses, and subsequently accepted by the Executive Department. In the future, the Congress will have even more extensive influence in the shaping of foreign policy.

Columbus, with indomitable courage, pushed the geographical frontiers of the then known world westward to this hemisphere. From his life and work we can gain the inspiration and determination to make still greater discoveries. In the arts and sciences, although fantastic progress has been made, the surface has just been scratched, and many discoveries lie before us and much creative work is yet to be accomplished. In literature the finest poetry and the most eloquent prose may yet be written. In music the most delightful combination of sounds is still to be put together. In

the physical sciences the magic of research is ever opening new realms of power. In economics and politics, particularly international politics, there is a frontier as foreboding and hazardous as any that man has yet tried to conquer. As long as warfare exists, as long as tyranny casts its dark shadow over many lands, and as long as evil men seek to enslave human beings, there is a frontier against which we must relentlessly press until we have achieved our purpose of actually discovering a new world of human relations.

Certainly in statecraft, upon which the lives of many people everywhere depend, the most astute, the ablest, and the finest statesmanship inspired by the deepest spiritual convictions is yet to be exercised as we continue the all-pervading task of the twentieth century, the preservation and the extension of free government.

THIS CHANGING WORLD

It is essential for us to become thoroughly familiar with the issue of our time as we ponder our leadership in a sharply divided world. This is a shrinking world. The continents have been brought closer together as a result of the phenomenal advancement in the sciences. The swiftness of the airplane, and now the jets, has brought nations so near each other in terms of time that we have become inextricably intertwined with problems arising any place on the earth.

Furthermore, this is an age of power, far exceeding that of Aladdin's magic lamp. We are in the early days of the atomic era. Man has split the atom; man has fused the atom. The United States fortunately holds the lead in the development of atomic energy. We have spent and will continue to spend billions in this endeavor. We can be certain that, as the future unfolds, the most

fantastic developments in the use of atomic power will crown our persistent efforts in the field of nuclear physics. Our success in this realm further emphasizes our responsibility of power and leadership.

The scientific and atomic world is politically sharply divided. On one hand there is the free world led by the United States, and on the other hand there is the Communist or enslaved world, led, directed, dominated, and tyrannized by the Soviet Union. This latter group of countries is directed by the dictatorship of the international gangsters in the Kremlin who seek to press down their system of brutal enslavement upon the brow of all mankind.

THE DEMOCRATIC EXPERIMENT

The democratic way of life has as its very core the noblest and highest ideals to which the human spirit is capable of aspiring. This way of life comprises the fundamental freedoms and the opportunity of the individual to develop according to his innate ability. Political freedom, economic freedom, and religious freedom undergird the democracy of the United States. These freedoms have made possible the unprecedented development of the arts and sciences in our country. They have made possible our rise to this present position where our influence penetrates throughout the world. Without these freedoms, the intellectual development and progress of any nation is not possible. These freedoms are prerequisite fundamentals in a free civilization. These principles are the basis for the success of the most ambitious experiment in free government that men have ever known, the experiment launched in the writing and adoption of the Constitution of the United States.

The Congress of the United States

has always been a prime factor in the success of this great experiment. The Congress, elected directly by the people, is the vehicle expressing the wishes and desires of the people. In the past few years, international affairs have taken more and more of our attention. Congress not only has had to decide many issues of policy, but has had to implement policy. Therefore, the role of the Congress in making this great experiment in free representative government work in a world complicated and beset by troubles due to growing international tensions is becoming more significant daily.

COMMUNISM TODAY

The Communists today, spearheaded by the Kremlin, control over 800 million people and are attempting to subjugate even more. Their inordinate appetite for domination is insatiable. The Communist world would erase and destroy the freedoms which have been so laboriously acquired by many generations of people who have been fired by Divine inspiration, convinced that the human being is the most priceless entity in creation. The Communists deny the fundamental dignity of the human being. They abhor economic, political, and religious freedom. Their system of militarism, materialism, and godlessness has become to them a substitute for religion, and they seek through the use of force to make slaves out of the human race. By their philosophy and by their actions they have served notice of their intentions on the free world. No one can doubt their ultimate purpose, and the fact that they have between 15 and 20 million people in slave labor camps is added evidence of the character of their inhuman system.

Communism is an international movement. Stalin himself once said: "Leninism is an international phenomenon."

The fundamental tenet of the Communists' philosophy is violent world revolution. From time to time their tactics change, but their final objective always remains the same; whatever they do is calculated to bring about the accomplishment of their evil designs. Their recent and current talks about their desire for peace are negated by their actions. At the time they were most vociferous in their peace protestations in reference to Korea, they were preparing and launching an invasion of Laos in Indochina.

The Soviet Union has a large military machine in the West. The Communists are poised for an assault upon the free world wherever they believe it will be to their advantage to perpetrate such an act. There is no sincerity in their proposals. If they are sincere in their peace representations, let them speedily agree to a settlement of the Korean problems, and abide by the agreements; let them terminate the fighting in Indochina; let them conclude a peace treaty in Austria; let them agree to a free election in Eastern Germany; let them cease their infiltration; let them lift the chains of slavery from the satellites; and let them abolish the Cominform. Yes, "by their deeds ye shall know them," and by their deeds the Communists have proved that they are liars, deceivers, and enslavers.

They talk peace while their philosophy of war and conquest remains the same; they talk peace when they have no intention of doing the things necessary to establish a peaceful world. Let us keep it clearly in mind that there can be no compromise with this monstrous evil. Let us keep in mind that this is a struggle for survival. Let us not forget that there is scarcely any hope of agreement until the Communists have changed their basic principles. The sooner we realize and understand that they are utterly and completely Machiavellian in

their approach to world affairs, the better it will be for us in charting our course of action. There is not a scintilla of evidence that the Soviet Union intends to honor any agreement or that the Communists have any intention of negotiating in good faith. The evidence of their sinister plans accumulates day by day, and the hard, cold facts of international life in this universal and besetting struggle must be kept in mind as we endeavor to form our policies with intelligent realism.

POWER NECESSARY FOR FREEDOM

In view of these facts, the United States as the leader of the free world must formulate policies calculated to increase rapidly the power of the United States and the strength of the free world. It has long been evident that the Communists respect only superior force and that the only agreement they will honor is one they cannot escape because they are faced with sufficient power to prevent them from doing so. So it necessarily follows that to check this ominous drive and to cause a cessation of assaults on the free world, overwhelming strength must be developed.

This means that the United States must be strong economically, financially, militarily, and spiritually. Our budgetary problems are many. The rising public debt, our present difficulty in the balancing of the budget, and the question of tax relief are all facets of the complicated fiscal picture. Nearly all our budgetary problems have arisen from the challenge of the drive by the Communists against the free world.

Economic and financial

The authorization and appropriation of funds for carrying out the federal budget is the function of the Congress. Expenditures have constantly increased

over the past few decades, and the major part of the work of Congress has to do with the appropriation of funds and the raising of the necessary revenue to meet our obligations. The complicated international situation has caused a tremendous impact upon our fiscal affairs. The unbalanced budget, the public debt, the question of tax relief, the limitation on the borrowing power of the federal government, the continuing deficit, and the decline of the dollar are all problems which have stemmed to a large degree from the confused and worsening international situation. These are all issues which the Congress must act upon, and, in the handling of our fiscal affairs, Congress must of necessity be closely associated with foreign relations.

Sound fiscal policy is prerequisite for a strong military defense. The economies of the nations of the free world are all tied to the economy of the United States. The fiscal affairs of our country are fundamental in connection with our leadership in a divided world. The Republic of the United States is today the first economic power on the planet. The industrial system of the United States has produced strength beyond anything else that has ever been developed or fired the imagination of man.

To keep the nation strong economically and financially, we must work toward checking inflation, tax relief, balancing the budget, and the proper management of the public debt. In other words, our statesmanship must make us economically impregnable, since upon a sound United States economy depends the superstructure of military strength in the free world. I cannot too strongly emphasize this important phase of our leadership. We must give the lie to Lenin's statement: "We will force the United States of America to spend itself into destruction." We do not propose

to spend ourselves into destruction. To prevent this the Congress is certainly the watchdog, since the Congress is the custodian of the public funds and the determiner of how much money shall be raised and spent. Here the Congress is a decisive factor in foreign affairs.

Military

For the foreseeable future there cannot be any slackening of our military efforts. General George Washington once said, "To be prepared for war is one of the most effectual means of preserving the peace." In increasing our military effectiveness and in assisting our allies in building up their defenses, we shall be in a position to defend ourselves against the drive of the Communists. We must not be fooled by the propaganda of the Communists calculated to bring about a relaxation in our preparations for any military eventuality which they may cause. We have learned the hard way and never again should disarmament cause the lowering of our guard.

Spiritual

Above all, the United States, as the leader of the free world, must possess an overpowering spiritual strength and look to the future with clarity of vision. We must unswervingly dedicate ourselves to bringing about a decent international society and to the establishment of a just and lasting peace. Zealously we should seek to preserve our free civilization. The cause to which we are dedicated is higher than and beyond ourselves. Christian ideals form the basis of free democratic civilization. From this exhaustless source of inspiration we can derive the spiritual strength required to sustain us in the exercise of our leadership. In addition to our economic, political, and military strength, we must be motivated and inspired by

spiritual fortitude, insight, and determination.

The problems of world leadership are heavy and difficult of solution. In seeking to resolve them, for resolve them we must, it is essential not to be discouraged or pessimistic, but to be optimistic and determined. Difficult as are the current days, and as difficult as the days may be that lie ahead, these are the only days we possess. The past is encased in an eternity to which man can never go back. As individuals or as a nation we can never retrace our steps and experience again what time has decreed as past. Individuals and nations must march forward because this is the only direction in which creation moves.

All nations have their day. Sumer, Babylon, Syria, Greece, Rome, the Ottoman Empire, and many others have come and gone. The United States is the power that holds the center of the stage in this twentieth century. We possess an opportunity to make a major, if not the greatest, contribution to the freedom of the human race. Let us be determined that time shall not take this opportunity from us unutilized.

On the Archives Building in the city of Washington, William Shakespeare, the Bard of Avon, the poet of poets, is quoted: "What is past is prologue." We must look to the future with optimism and with faith; we must look to the future resolved that the work which Destiny has decreed that we shall perform must be successfully completed. In the stupendous task of leading the free people in a sharply divided world, the United States has an unparalleled opportunity to direct the course of human events in maintaining and extending the basic freedoms dear to the hearts of free men.

"Where there is no vision, the people perish," and again from the wisdom of

the poet, "Tis not too late to seek a newer world." We are shaping the course of events for succeeding centuries. In this crucial period, the decade of the 1950's, the beginning of the second half of this turbulent twentieth century, we stand at the inception of a new era. We are girding ourselves to reach new and higher peaks of human liberty. On May 29 Mount Everest was scaled for the first time in history. Just as the summit of this heretofore unassailable peak was reached by the effort and determination of man's indomitable desire to conquer, so the Mount Everest of human freedom in this world will yet be scaled, and our Republic proposes to scale it.

CONGRESSIONAL AND EXECUTIVE CO-OPERATION

As a member of the Foreign Affairs Committee of the House of Representatives for the past eight years, I have seen how our responsibility as the leader of the free world has continuously increased. Today, more than ever before, effective United States world leadership involves co-operation between the executive and legislative branches of the government. In many instances, the Foreign Affairs Committee of the House of Representatives and the Foreign Relations Committee of the Senate have written foreign policy.

As United States leadership has grown, so has the necessity for legislative formulation and implementation of foreign policy correspondingly increased. In practice, the Congress has become a coequal partner with the Executive in giving substance to United States leadership. In many instances the Congress on its own initiative has supplied direction to American foreign policy by establishing principles which are now guiding the United States in its relationship to the rest of the world.

Furthermore, policy cannot be considered in a compartment by itself, separate and distinct from the practical means necessary to make that policy a workable instrument. In sum, the responsibility of the United States in a divided world involves a combination of moral strength, military preparedness, and expenditures of money sufficient to accomplish the task, while at the same time preserving our economic strength and stability at home.

The Congress of the United States is incessantly becoming more involved in foreign relations and in the development of foreign policy. There should not be a conflict between the executive and legislative departments in the field of foreign relations. There is need for teamwork since both the executive and legislative branches of the government are striving for the realization of the same goals. This co-operation should be carefully fostered in an effort to develop a smooth working relationship in the shaping of foreign policy.

Congress, since the proposals it acts upon have an effect in many parts of the globe, needs to know all that it possibly can about the various countries, and, furthermore, it is essential that the world know all it can about Congress. Practically every day, issues of universal importance are before the legislature for debate and action. There is scarcely any problem that comes before the Congress which is not in some manner tied to international affairs.

Congress is the reflector of public opinion, and, since it is necessary to have public support to put into effect any major policy, it is essential for the Congress to acquaint the public with the details of the many issues on which decisions must be rendered. Actually the Congress is the voice of the people, and the Congress is also a leader in public affairs and in molding our policy. The

Congress will become constantly a more important factor in dealing with international relations.

In the several articles in this volume of *THE ANNALS*, many of my colleagues both in the House and in the Senate, as well as others, have given generously of their time and their talent in discussing the varied phases of Congressional action and work in the field of foreign relations. As can be seen, Congress, in practically all areas of foreign relations, must exercise leadership and make contributions of the most vital importance.

CHALLENGE TO PRESENT CONGRESS

We have the opportunity of so conducting our affairs, with such fortitude and determination, that the historians of the future will be able in writing the annals of this and succeeding decades to say that the second half of this twentieth century was marked by the turning point of the greatest struggle for freedom men have ever undertaken—by the United States seizing the initiative in international affairs; by the United States giving inspired and efficient leadership in the struggle against Communism; by a more effective use of United States economic, military, and spiritual power as a decisive, telling force for freedom; by renewed efforts on the part of free people to achieve strength in the unity of their resources; and by a resurgence of the spiritual determination on the part of the free world to preserve free civilization.

May the historians of the future write of the second half of the twentieth century that it was during this period we exercised positive, realistic leadership in a divided world, that we so conducted our affairs, both domestic and foreign, that the outstanding characteristic of our time was the determined and inspired statesmanship of the United States in making decisions which

resulted in the preservation of free civilization. May they be able to state that this decade was marked by a decline of tyranny and by the beginning of freedom's greatest advance throughout every section of the planet. May they look back on the second half of the twentieth century and write that during this period the world under God had a "new birth of freedom."

Chester Earl Merrow, Washington, D. C., has been a member of the United States House of Representatives from the First New Hampshire District since 1943. He has taught at Kents Hill School, Maine, at Montpelier Seminary, and at Vermont Junior College, where he was dean in 1937-38. He served as a member of the New Hampshire House of Representatives in 1939-40. He has also served as a radio news commentator and lecturer on national and international affairs. He served as a delegate to a United Nations conference on education and cultural relations in 1945 and as Congressional adviser to the first conference of UNESCO in 1946, and is a member of the United States National Commission for UNESCO. He is a member of the Committee on Foreign Affairs and chairman of its subcommittee on International Organizations and Movements

The Place of Congress in Foreign Relations

By ERNEST S. GRIFFITH

THE traditional story of American foreign policy has been a story of treaties and diplomatic negotiations, interspersed with accounts of wars. Such treatment inevitably led to an emphasis on the roles of the President and his Secretary of State. Congress was regarded as either subordinate or obstructionist, or both. For example, in reflecting upon the events following World War I, in which the role of the United States Senate was to a large extent decisive, the emphasis even in the scholarly writings has been directed toward altering the two-thirds rule or circumventing the treaty-making procedure.

It is only recently that the co-ordinate and even affirmative role of Congress has been recognized in this tremendously important field. With this recognition has grown a realization that tactics directed toward promoting a given policy must be shifted from bypassing or handling Congress to convincing Congress. Over and above this, ways and means must often be found whereby the responsibility for policy formulation may itself be shared with the legislative branch.

In other words, the congressional role in foreign policy today extends far beyond mere treaty ratification. For example, the traditional role of a congressional committee in investigation and criticism is applied to foreign affairs as never before. The advice function, technically confined to the Senate, has come to include the House also, especially in the formulation of programs and in the implementing of these programs in the appropriation process. Over and above even this relatively new role, Congress performs a further function by playing

its part in the leadership necessary to enlighten public opinion as well as to reflect it. More and more in fact, as well as under the Constitution, Congress is a co-ordinate member of a foreign policy team; and this co-ordinate membership extends to the House as well as to the Senate.

CONSTITUTIONAL PROVISIONS

It was Corwin who bluntly stated that the constitutional status accorded the Executive and Congress was a standing invitation to struggle for control over foreign relations.¹ These provisions are familiar to the readers. Treaties are to be concluded by the President with the advice of the Senate, and ratified by two-thirds vote. Powers over foreign commerce are among those on which Congress is eligible to legislate; but such powers may also be exercised in treaties.

In recent years the role of the Executive has been enormously extended through the wide scope left for administrative action and through the delegated power to conclude reciprocal trade agreements. While Congress has retained the power to declare war, the President commands the armed services and controls many of the preliminary steps the taking of which may make the difference between war and peace. In his exercise of this command, the dispute as to whether the President may permanently station troops abroad has been left for some future consensus of legislature, executive, and judiciary. The Great Debate of 1951 left this issue

¹ Edward S. Corwin, *The President: Office and Powers*, 3rd Edition (New York, 1948), p. 208.

essentially unresolved, though it did secure an agreement by the President to consult, as well as a resolution by Congress requesting him to consult.

COMMITTEES

One must realize that the Foreign Relations and Foreign Affairs Committees are by no means the only committees importantly concerned with foreign policy. The Ways and Means and Finance Committees deal with the tariff, and Armed Services shares the responsibility with Foreign Relations for the use of our forces overseas—a use which makes foreign policy as well as executes it. The role of the Appropriations Committee is frequently decisive in programs. A degree less important but still important are committees such as Agriculture, Labor, and Commerce. The handling of the problem of internal security by the Judiciary Committees has foreign repercussions. The Committees on Government Operations to a major extent determine the structure and to some extent the interrelations of the organization of foreign affairs.

The Joint Committee on the Economic Report, with its over-all view of the domestic economy, inevitably finds itself involved in international considerations. The Public Works Committee of the House has before it the proposals for the St. Lawrence Seaway. Merchant Marine and Fisheries is constantly considering international issues. International finance is the prerogative of the Banking and Currency Committees, at least in its institutional expression. The Interior and Insular Affairs Committees have responsibility for the future of the islands of the Pacific insofar as we are involved in them. Even the committees on the District of Columbia find international considerations urged upon them in dealing with problems such as segregation, which interest other peoples.

It is hard to find a committee that is

not in some fashion concerned with foreign policy. The interrelations of contemporary society have no more striking manifestation.

CONGRESSIONAL RESOLUTIONS

The formal provisions of the Constitution have been supplemented by usages no less far-reaching in their aggregate effect. First of these to note is the congressional resolution. I am not referring here to the joint resolution, which in its legal effect is equivalent to an Act of Congress, but rather to the simple and concurrent resolutions through which Congress frequently expresses its views on a particular matter. These resolutions naturally form certain clearly defined categories.

Best known in recent years have been the ones which have sought to give the Executive advance assurance as to the attitude which it may expect in Congress. Thus, Congress pledged itself in advance to support an international organization at the close of World War II.

More usual are the resolutions which attempt to give directives to the Executive or guidance as to congressional attitudes on problems facing the nation. These have no binding effect, but they may and frequently do have very great influence. They include such subjects as a United States of Europe, support for Franco Spain or Chiang Kai-shek, or a United Ireland. Where they deal with the foreign policy of another nation, it is assumed that the State Department will so inform this other nation and possibly work toward the end in question.

Such resolutions may be embarrassing or they may be found helpful to the State Department, according to whether they coincide with the Department's own views and at the same time do not impair the public relations thereof.

Other resolutions may be of a negative or warning nature, indicating an

absence of support in connection with some policy which it is supposed is under consideration in the executive branch. Still others may deal with the congressional ideas as to the correct procedural relationship between Congress and the Executive.

In any event, the effect of these resolutions is by no means completely dependent upon whether or not they actually pass one or both Houses. The mere fact of their introduction itself is some indication of congressional attitudes, and usually results in State Department activity in congressional consultations and in exploration of ways and means of meeting congressional desires, or at least of ascertaining the extent to which such desires are in fact shared by others than those sponsoring the original move. They are also likely to influence in one fashion or another the other nation or nations involved in their substance.

There are many times in which Congress can make its views known somewhat irresponsibly without creating the type of severe reaction which would be created if the executive branch through ordinary diplomatic channels or through public pronouncements seemed to be resorting to pressure. The congressional resolution is just what it purports to be, an indication of opinion and attitude, and is not in itself overt in its results or effect. It is, however, often an interesting and significant counterweight or response to the increasing tendency on the part of the President to use the executive agreement as an instrument of international action.

CONGRESSIONAL INVESTIGATIONS

The weapon of congressional investigation is much in the public eye, in domestic as well as in international affairs. It is the popular opinion that its principal use is found in forcing accountability of the executive branch. While

this is doubtless true, the investigations fulfill a number of other functions of co-ordinate importance. These include the education of the public and the exploration of the feasibility of a new or changed government policy. The investigations of the dismissal of General MacArthur set out to be a calling to account of the Executive. They became much more an instrument in the education of the public; and in the end they resulted in a very considerable crystallization of congressional opinion as regards our whole policy in the Far East.

Moreover, accountability itself has many facets. It may involve conformity to the law; it may involve efficiency of performance; it may also involve loyalty matters. In any event, the investigative process is a major congressional instrument, and as the investigations of overseas information and of the China policy have shown, it can affect matters for good or evil in a fashion which has no real parallel in most other large nations. These investigations are part and parcel of our constitutional system. The reward of a successful investigation in service to the nation is very considerable, entirely apart from any effect on the political fortunes of the investigators.

In the publicity given to congressional investigations, it is sometimes lost sight of that most of the hearings of the standing committees of Congress are on concrete measures which have been introduced by individual Members, often at the instigation of the executive branch. This holds true in foreign affairs no less than in domestic legislation.

At what point the hearing on a specific measure ends and an investigation of the problem begins is by no means clear, nor need it be. In either instance the congressional hearing provides an excellent forum for bringing out into the

open the views of the various groups which make up the warp and woof of American political, economic, and social life. To the Congressman, who more often than not is a lawyer, the hearing is the counterpart, in the legislative process, of the courtroom in the judicial process. By means of a battle of protagonists, much truth may emerge. Cross-questioning of witnesses may bring out hidden meanings and lay bare motives.

With the presence of the press and even of television, popular education on the issues involved can be furthered. It is often the subject of comment that a Cabinet Minister in the British Government finds his reputation strengthened or impaired by the question hour in the House of Commons. Hearings before an American congressional committee are far more grueling and exacting, and the caliber of the man is more thoroughly tested. Likewise, the issues involved receive a much more thorough public airing, although, it must be admitted, at the expense of a great deal of irrelevance and repetition.

These public hearings are not necessarily very important in the formation of the Members' own opinions. Equal weight must be assigned to the give-and-take of discussion in executive sessions, the research of the committee staffs, the informal contacts, and the still fairly pervasive influence of political party. Nonetheless, the committee hearing has a major place among those institutions of the American Constitution which are the products of usage rather than of formal language. Even foreign governments must be prepared for exhaustive examination of their policies, even though the witnesses are American citizens.

These congressional hearings do not conform to the dignity and secrecy of traditional diplomacy, nor on the other

hand do they reveal the ambiguity, the double talk, the dodging of issues which likewise characterize its traditional methods.

FLOOR DEBATE AND SPEECHES

No account of congressional influence dares omit the very important role played by speeches both within and outside of Congress. These, too, are part of the processes of opinion formation, popular education, and congressional influence in foreign nations as well as in our own. To the totalitarian countries, unaccustomed to freedom of speech or to irresponsible pronouncements, it seems incredible that a speech by a Member of Congress in his home district does not in some fashion represent government policy as a whole. Protests occasionally arise from such talks, and resentment or appreciation is accorded them abroad, as well as here, according to the point of view. Even a single speech by an ordinary Member of Congress may threaten to produce an international incident and influence the policy of a foreign nation.

Those foreign nations who know us better will and do pay attention to these speeches, but they do not attach to them undue importance. They recognize such speeches as useful to themselves as well as to the American people in this fascinating, sometimes embarrassing, but always vitally important process of a democratic people making up its mind.

APPROPRIATIONS PROCESS

No account of the role of Congress in foreign policy could possibly be complete without indicating the tremendous importance of actions by the Appropriations Committees, and of the appropriations process in general. In foreign as well as in domestic affairs, the Appropriations Committees and their recom-

mendations and the bills as finally passed may more nearly represent the real purpose of Congress than do the authorizing acts. It is not an uncommon occurrence for a pressure group to have its way in the latter case, and for the real will of Congress to express itself at the time of appropriations.

Perhaps a more correct statement would be to the effect that an affirmative authorizing measure expresses the judgment of Congress on the issue involved, more or less devoid of its relationship to certain other issues. The appropriation bill, however, filters the views of the Members on the substantive measure through their modifying or sobering attitudes toward economy in general.

It is not that the appropriations process goes counter to the wishes of Congress; it is rather that it brings to bear another modifying or overriding point of view applicable to any measure involving the expenditure of money. When a given sum has been authorized at the time of passing the original act, it does not indicate by any means that Congress has decided that this authorization is the sum which is or should be appropriated. Congress is fully aware of the role of its Appropriations Committees, and expects these committees to go further into the problem of whether the sum in question is in fact necessary or whether the objectives of the act itself can be carried out more economically than the sum authorized would indicate.

Congress claims to be reluctant to legislate in appropriation bills, and such legislation is ordinarily subject to a point of order. However, by more or less general consent, most major appropriation bills are now reported to the floor of the House under a closed rule which prohibits the raising of points of order concerning them. Such restriction does not apply in the Senate, and conse-

quently points of order are more likely to prevail in the upper house.

Nevertheless, by one means or another, provisos or instructions are often inserted in appropriation bills which in effect determine or modify policy. Such determination or modification is over and above the necessary modifications implicit in ample or restricted funds. As more and more of our foreign policy is determined by programs of foreign aid, by the size of the armed services, and by the extent of the appropriations for the various branches of the State Department itself, so more and more the Appropriations Committees will, in fact if not in name, constitute themselves a kind of third house of Congress which will play its own role in policy formulation and adoption.

CHANGED NATURE OF FOREIGN POLICY

We have already had occasion to mention that this is an age of total war and of totalitarian governments. Perhaps we have not yet realized the inner nature of the response which democracies seem almost compelled to make to the threats thus involved. It is not that we are engaged at the present time in a total war in the ordinary military sense of the word. The situation is much more subtle and the nature of the struggle is much more sophisticated. Nonetheless, we do seem to be engaged in a total war, in the sense that our enemies are ready and willing to take whatever steps may seem to them to be necessary within the margin of their own safety to bring about our weakening and our destruction as a free people. In other words, we are engaged in a struggle for survival.

This introduces a new type of diplomacy and a new type of national conduct and national obligation. In the early days the objective of diplomacy and foreign policy was certainly to en-

hance the interests of the particular nation concerned. In relatively few instances did a *delenda est Carthago* motivate the peacetime conduct of a people or of a people's government. At the most, there was a desire to weaken a potential enemy, but not to destroy him, unless he had given overt evidence of the intention to destroy one's own state.

An exception may perhaps be found in the religious wars. The present struggle between the Soviet Union and world communism on the one side and the cluster of nations to which we are giving leadership on the other is more akin to a religious war than to the political or strategic war to which our textbooks are accustomed. If we use the hackneyed phrase of a war between ways of life or a war between civilizations or a war between philosophies, we can see the all-embracing nature of the struggle. It is a "total diplomacy" in which we are now engaged.

This involves much more than a realization that a nation's economic potential is itself a major safeguard of its military potential. Beyond economics lie the social and spiritual realms in which a nation's morale stands or falls. From their point of view, the Communists are completely right in realizing that they can best weaken others by spreading discord, suspicion, and internal conflict within the ranks of their enemies. Here is a weapon no less powerful than the atomic bomb.

In such a setting, foreign policy requires a degree of popular support in all its major sectors which was not necessary when considerations were predominantly military and when the issues were largely confined to foreign trade or colonial territory or border disputes or dynasties. The initiative of the Executive in diplomacy must be accompanied by more than a mere ratification of a

treaty. This is pre-eminently so today, when the "program" has emerged as the major instrument in foreign affairs. Such programs run the gamut from economic strength and aid to cultural interchange. They include psychological warfare and extension of trade and a number of other objectives only a degree less important.

CONGRESS AND POPULAR INTEREST

It is in this setting that the new role of Congress in foreign policy can best be understood. It is not merely the fact that these programs call for substantive legislation and substantial appropriations, tremendously important though both of these factors are in a congressional agenda. It is rather that popular interest has grown to a point never before reached in ostensible peacetime, and popular support is absolutely essential if these programs are to operate successfully.

This has its impact on Congress. Moreover, Congress rightly dramatizes these issues in its hearings and in its floor debates. Congressmen rightly stress such issues in their visits to their constituencies and states. The electorate, on its part, loses few opportunities either individually or collectively to manifest its interest in these matters. Editorial and news columns of newspapers, the script of commentators, the courses in colleges and universities, the sermons in churches, alike contain a far higher percentage of content regarding, and interest in, international affairs than ever before during our peacetime history.

Here is also the basic explanation of the enhanced role of the House of Representatives, a role becoming almost co-ordinate with that of the Senate. Here is the explanation of the tremendously important role played by party

leadership in Congress and by the Appropriations Committees.

Minority groups of special national origin have always been with us since the days in which immigration was a very considerable factor in our national life, and have figured in the subsequent political complexion of our national elections. A certain amount of this type of interest has always spilled over into our legislative body. What is different today is that to these special interests has now been added a more general literacy and sophistication on the part of millions of our people, which has rendered interest in foreign policy a much more balanced thing than in the days when the troubles of Ireland and the woes of Poland were the issues most felt emotionally.

THE EXPERIENCE OF CONGRESSMEN

The traditional picture of a Congressman has been long outmoded by the facts. We are dealing today, not only in the committees immediately responsible for foreign policy but in Congress in general, with a far more qualified group of men than is generally realized. For a dozen years foreign affairs have been at the very center of a large part of congressional deliberation and experience. Measures of foreign policy have been before one or more committees almost daily. Debates on the floor, even on issues presumably primarily domestic, have been filled with references to foreign affairs, and the number of debates on foreign policy itself has grown enormously. So also has a Member's correspondence in this field, and so also has the number of visits from constituents concerned with foreign matters.

In other words, through the sheer experience of discussions, debates, and conferences, a Member, however illiterate in this field he may have been prior to his coming to Congress, finds himself

precipitated into the very center of our international concern.

A world war and a world reconstruction and a world communism have been jointly responsible for this. However much an individual may long for the day when the United States can go its own way, the decision that it should not go its own way, the decision that it is inextricably involved with other nations, has been made, not so much by ourselves as by them. Paramount in this is the virtual declaration of war by world communism, whose world horizon requires a corresponding world horizon on our part.

Official trips abroad to study one problem or another are increasingly frequent, not only by members of the Foreign Relations and Foreign Affairs Committees, but by those from the Appropriations and Government Operations Committees as well. Nor are such trips confined to these three clusters of committees. Within the past year or two, a dozen others have sent one or more of their members overseas to study some problem within the jurisdiction of the committee. In connection with the original consideration of the Marshall plan, well over two hundred Members of both Houses made such overseas investigations prior to the final decision of Congress in the autumn of 1947.

The experience of members of the Foreign Relations and Foreign Affairs Committees is intensive in the extreme. It is not merely the constant consideration of problems in hearings and in executive sessions. Briefings by the State Department, the Mutual Security Agency, and representatives of other federal agencies are increasingly frequent. So also is the growing practice of informal luncheons and dinners and informal conferences either on Capitol Hill or in the precincts of the agency itself. Increasing use has been made of

Members of Congress in connection with international conferences, as delegates as well as observers.

Entirely apart from staff aids or other *ad hoc* facilities to be brought to bear upon specific problems, there are today in Congress highly qualified specialists on almost any major problem facing the nation. It must further be borne in mind that these specialists have commanded the respect and confidence of their own membership frequently to a degree exceeding that of the representatives of the executive branch. Whether these rival generators or experts in foreign policy are good or bad in the aggregate is not the point. It is the *fact* that we are registering. This specialized competence arising out of experience, even more than out of study, must be taken into account in policy formulation and in identifying centers of leadership in our government in general.

FORMAL EDUCATION OF CONGRESSMEN

Over and above the rich education which comes from experience is the fact that the Members of Congress today have a higher level and quality of formal education than before. College graduates have been increasing, and so also have those who hold graduate degrees. The percentage of lawyers remains very high, and the level of prelegal and legal education has been steadily rising.

It is important in calling attention to this increase in formal education that one does not overestimate its value. It by no means follows that persons with such an education are better legislators or better informed than those who have gained their knowledge through experience without the benefit of the more systematic but probably more esoteric training in university halls. All these considerations are under the heading "other things being equal." Congress, as well as the electorate as a whole, unmistakably reflects the higher and higher

level of education in the United States that has been such a marked phenomenon in recent years.

NONPARTISANSHIP

The role of partisanship in foreign policy must be considered along with the changing role of partisanship in Congress in general. Few people realize today how little there is of partisanship at the point of actual congressional decision. A considerable majority of the committees of both Houses are nonpartisan in their executive sessions. This does not mean that there are not differences of opinion, but the differences are not along party lines. Party does assume the responsibility for organization of Congress, and certainly the party which is not that of the President is constantly searching for points of vulnerability and criticism in the conduct of administration. This usually does not constitute opposition to policies as such, but rather to minor aspects or emphases.

In the field of foreign affairs, both this tendency to nonpartisanship and this tendency to criticize details are unusually prominent. There is in Congress a general feeling that our nation should present a united front to the rest of the world. This takes the form with many Members of a sense of high obligation not to make foreign policy, as such, a partisan matter. There is also a feeling that the partisan element in the opposition to the League of Nations following World War I and to the Versailles Treaty was a mistake not to be repeated. The Senate in particular has been extremely sensitive to the numerous proposals to alter the two-thirds rule required for treaty ratification, and also to the tendency to advocate executive agreements in place of treaties, so as to by-pass this particular constitutional provision. One reaction has certainly been a determination on the part

of large numbers of Senators to make the two-thirds rule workable in terms of international needs.

On the other hand, interest in foreign policy is widespread, and the scope of foreign policy is world-wide. This means that it involves a multiplicity of detail as regards particular areas, which necessarily offers vulnerable targets for detailed criticism. It was this tendency to detailed criticism on the part of the opposition which presented no special incongruity along with its general support of the administration's foreign policy. Chiefly, there was sharp criticism of certain aspects of its Far Eastern conduct. When this criticism more and more seemed to be warranted by what was felt to be the failure involved in the loss of China to the Communists, the criticism reached a rising tide, and bipartisanship broke down at this point.

Perhaps even this is not the correct way of stating this situation. There were Democratic critics and Republican supporters of the President as regards his Far Eastern policies. Especially following the hearings on the removal of MacArthur, a considerable consolidation of opinion as between parties and as between Congress and the President took place for the time being.

Actually, issues in foreign policy do not readily lend themselves to partisan orientation. Emphasis on Europe or on Asia as an alternative has nothing to do with being a Republican or a Democrat, insofar as these latter represent any regional or economic groupings. Even the tariff finds Republicans of the seaboard ranged against their own fellows in the interior.

All in all, partisanship has recently proved a relatively minor obstacle to any successful collaboration between the two branches of government. There have been obstacles in congressional activity, but they have for the most part not been of a partisan nature.

THE ROLE OF FOREIGN LEGISLATURES

Before concluding, it may illumine our appreciation of the role of Congress if we take a brief look at the process of foreign policy formulation and adoption in some of the other nations. Traditionally, in the British form of parliamentary government it has been the prerogative of the executive to formulate policy and conduct foreign relations. While responsibility for such policy belongs to the Cabinet and it is subject to criticism in the House of Commons, in practice this has meant that the permanent civil service in the Foreign Office has been the chief instrument and the greatest influence.

This largely accounts for the relative degree of continuity in British foreign policy without reference to a change of government. Parliament is seldom able to make an affirmative contribution toward change of direction, although the great tidal moves in British public opinion are eventually reflected in the attitudes of the Cabinet and to a less extent of the permanent officials as well. Such a subsidiary role on the part of Parliament, with the Cabinet armed with a majority, gives the course of British foreign policy an external appearance of consistency and direction which the American foreign policy seems to lack.

On the other hand, this appearance is itself somewhat deceptive in one important regard. The fact that Congress, as well as the American people, makes up its mind in public has much to do with the appearance of indecision. The reaching of decision is a process over which the British cast the veil of secrecy. There is little or no evidence in recent years to indicate that the United States is any less slow or more slow in arriving at an answer than is Britain. In the end, our foreign policy is likely to have the same directness and consist-

ency that the British has, and quite possibly it will possess a considerably greater backlog of popular support because the public has witnessed more of the process of formulation.

Of course this subsidiary role of Parliament in foreign relations is not unique in the British governmental process. It applies to almost every sphere of governmental activity, if we associate the ministry with the executive rather than with the legislative establishment—an association which of course does a certain violence to the total picture of British government. The real distinction is between the role played in policy by the committees of Congress and the role played by the ordinary members of Parliament. The role of the former is incomparably more influential.

In the multiparty democracies of the Continent, the contrast is rather different. Here the extreme instability of many of the governments, notably that of France, renders affirmative action on the part of the government in any field very difficult. Foreign policy is particularly fragile and particularly subject to irresponsible attacks. There is almost no counterpart to the bipartisan approach of the American Congress, in any of the larger democracies. Intransigence on left and right alike seems to be fostered by the various electoral systems producing the multiparty chambers. In France the role of the Chamber is especially negative. In Germany and Italy the sharp division in the parties between left and right or between left, center, and right has not been an insurmountable obstacle to producing a majority thus far, but it certainly has hindered production of the near unanimity which has characterized so much of the American foreign policy in the last ten years—a unanimity which resulted from participation in policy formulation and adoption by representa-

tives of both parties sitting down together as colleagues.

No matter which of the other nations we examine, we find that all alike share with the United States the virtual necessity for a broad popular base if foreign policy is to be affirmative and decisive on a world scale. It is at this point that the United States Constitution seems to have certain values which are not generally shared. This is true whether we take as our point of departure the dominance in foreign affairs of the executive in Britain, or in contrast the veto power at so many points possessed by the multiple parties in the legislatures of the other nations. These are factors in the apparent reluctance on the part of many European nations to make the necessary sacrifices and readjustments even for national safety.

CONCLUSION

In conclusion, our Constitution is not likely to be amended in the near future in any substantial fashion. Change will come, if at all, in the field of judicial interpretation and usage. As I wrote elsewhere:

We are a world power. Our cultural leadership, our military strength, our political influence, to some extent even our economic power—these have not been of our own seeking. There probably never was a more reluctant world leader in all history than the United States. Yet this very reluctance makes us less feared and more readily followed. Other peoples have tended to personify us in the shape of the individual who happened to be our President at a given time. They have assumed that the voice of the President was necessarily the total voice of America. Yet these other peoples that make up the world, free and regimented alike, need more than an understanding of our President: they need to understand the influence of our representative body, the Congress. They need

to see Congress as a living symbol, to see that our Republic has Congress too among its institutions of leadership—incorporating not only the hesitations and cross purposes of its people but also their sense of responsibility and the agreement on objec-

tives and instruments which these people's assembled representatives have produced following hard study and discussion.²

Ernest S. Griffith, D. Phil., Washington, D. C., has been director of the Legislative Reference Service of the Library of Congress since 1940. He was previously dean of the Graduate School of the American University, and dean of the Lower Division and professor of political science in the School of Citizenship at Syracuse University. During this past year he was visiting professor of political science on the Fulbright Program at Oxford University and gave a course there and at the University of Oslo on American foreign policy. He is the author of Congress: Its Contemporary Role (1951), The Impasse of Democracy (1939), and other books.

Congress and Foreign Relations Before 1900

BY DOROTHY BURNE GOEBEL

THE relations of Congress to the foreign affairs of the United States we think of today as something developed within the framework of the Constitution; but they are the outgrowth of an even older body of custom and experience. In point of time, the most immediate of these conditioning factors derived from the activities of the Continental Congress (1774-89). These in turn reflected in greater or less degree things learned and often resented over the many decades of colonial experience, when the North American colonies were mere counters in the game of European diplomacy. For all of a century, every major European war had had its counterpart on the far-flung American frontiers. Rivalry for control of Indian tribes and ambition for territorial conquest had invigorated the English-colonial contest against the French and the Spanish, whose possessions ringed the King's dominions; but the signal to attack, the decision as to outcome, rested with the chancelleries of Whitehall, Versailles, and Madrid. Moreover, in England had been spun the skein of political and economic regulation and prohibition that governed the British colonies in time of peace. The dozen years preceding the First Continental Congress had instructed that generation in resentment of imperial authority and its political and economic incidents. The Revolution was to create consciously American states; on the eve of independence, the colonies were already anti-British, anti-European.¹

¹ For some material on the colonial background, see Max H. Saville, "Colonial Origins of American Diplomatic Principles," III *Pacific Historical Review* (1934), pp. 334-50. See

POLITICAL BACKGROUND OF CONTINENTAL CONGRESS

Apart from these matters of sentiment and opinion, colonial experience exercised a determinative influence on procedures. In all the royal and proprietary colonies during the eighteenth century, the politics of the time had set executive and assembly in a recurrent state of opposition. There had been bred a profound distrust of executive authority, and equally a noteworthy reliance upon the legislative committee. When the first stirrings of real trouble with the mother country began, committees of the assemblies did valiant work, both in agitating public opinion and in promoting a sense of common cause among the several colonies. This was a significant part of the political training of the revolutionary generation, a training quickly reflected in the proceedings of the Continental Congress.

It is well to remember that when this body first assembled, localism, sectional jealousy, and diversity of interest among the thirteen colonies were very pronounced. This Congress was a convention of delegates of jurisdictions soon to claim individual independence. Consequently it was never, in its corporate capacity, the governing body of the United States; it was the agent for thirteen entities in combination.²

The history of congressional conduct

of foreign affairs begins properly with the Committee of Secret Correspondence established by the Second Continental Congress on November 29, 1775. This committee (after April 1777 the Committee for Foreign Affairs) was set up to correspond "with friends in Great Britain, Ireland and other parts of the world" and to seek foreign assistance. On March 3, 1776, the first agent, Silas Deane, was commissioned on a secret mission to France to obtain military supplies and, if possible, financial aid. A month later, April 6, 1776, the Continental Congress opened American ports to the trade of all foreign powers. Close on the heels of this declaration of commercial independence came the political break. The Declaration of Independence, July 4, 1776, thrust on the Continental Congress responsibility for formulation of the foreign policy and the conduct of the foreign relations of the Thirteen United States.³

FOREIGN POLICY AND GOVERNMENT BY COMMITTEES

The procedures of the Continental Congress followed the political traditions of the Colonial Assembly. Diplomatic agents were elected by Congress. All business—instructions and correspondence—was first deliberated in that body acting as a Committee of the Whole, then referred to select committees for report back for congressional decision. Despite the continued existence of the Committee for Foreign Affairs, a multitude of these select committees were spawned. Sectional conflict and factional controversy characterized government by committee. Dispersed responsibility resulted in inefficient administration, so that for months at a time American representatives abroad were left in ignorance of congressional inten-

³ Samuel Flagg Bemis, *The Diplomacy of the American Revolution* (New York, 1935), pp. 29-35.

tions. Although the drawbacks of the committee system were soon evident, aversion to executive power, state-rights sentiment, and suspicion of central authority retarded the abandonment of this procedure.⁴ Early in 1781, Congress was driven to a change of practice: on January 17 of that year, the office of Secretary of Foreign Affairs was established. Even after this innovation, Congress continued to consider problems of foreign relations in the Committee of the Whole, and to delegate particular matters to select committees.⁵

EARLY OBJECTIVES: PLAN OF 1776

The immediate objectives of the Second Continental Congress after July 4, 1776 were to obtain material foreign assistance and to secure treaties granting recognition, freedom of commerce, and a definition of neutral rights. No political or military alliance was, at that date, contemplated. These objectives were set forth in the "Plan of Treaties" adopted by Congress on September 17, 1776, and were further detailed in the instructions (September 24) for the new commissioners to France.⁶

None of the objectives were immediately achieved. From France money and military supplies were forthcoming, but for some time that country remained neutral. Spain grudgingly conceded slight financial aid. The other European powers, assaulted by "militia diplomacy," held aloof. During the Revolutionary War only France (1778) and eventually the Netherlands (1782), moved by self-interest, yielded to the persuasion of American agents.

The French treaties of February 1778

were a landmark in the development of American foreign policy. The Treaty of Amity and Commerce granted recognition of the United States, regulated commercial intercourse on a conditional most-favored-nation principle, and defined neutral rights in liberal terms. With slight modification, the principles of this treaty formed an integral part of American foreign policy into the twentieth century.⁷

The Treaty of Alliance with France, however, was a marked departure from the "Plan of 1776." This treaty provided for a defensive alliance in the event of war between France and Great Britain, a mutual guarantee of the French West Indies and of American territory, and a mutual pledge not to make peace without the formal consent of the other power.⁸ The critical state of the Continental cause outweighed mistrust of European entanglement. Despite later fears of members of Congress of French designs in regard to the peace terms, Congress adhered faithfully to the treaty stipulations. The American Commissioner's secret negotiation of Provisional Articles of Peace with Great Britain in November 1782 without consultation with the French ministry was, in fact, a direct violation of congressional instruction.⁹

AUTHORITY UNDER ARTICLES OF CONFEDERATION

The authority which the Continental Congress exercised in foreign relations was given definition in the Articles of Confederation, framed in 1777, finally ratified and proclaimed March 1, 1781. By this instrument, Congress was given exclusive power over war and peace (unless a state were invaded), the right to send and receive diplomatic agents and embassies, and the right to make treaties. The conclusion of commercial treaties, however, was subject to specific limitations, designed to safeguard the power which the several states retained of regulating commerce. Congressional action on any of these subjects required the assent of nine states. In addition, the states were forbidden to make alliance or treaties without the consent of Congress.¹⁰

The formal adoption of the Articles made little change in congressional conduct of foreign affairs. Although in January 1781 Congress had provided for the office of Secretary of Foreign Affairs, the powers of the Secretary were limited to those of a superior clerkship. During John Jay's incumbency (1784-89), Congress increased the Secretary's authority to some extent, such as granting him the power to frame instructions to diplomatic agents, but continued to keep a tight rein on the conduct of foreign relations.¹¹

The major achievement in this field during the period of the Confederation (1781-89) was the negotiation of peace with Great Britain by the Treaty of 1783, embodying the Provisional Articles of November 1782. Credit for this

¹¹ Wood, *op. cit.*, note 4 *supra*, pp. 111-21.

treaty, however, belongs not so much to Congress as to the astute American Commissioners, John Adams, John Jay, and Benjamin Franklin, whose disregard of congressional instruction won this diplomatic victory. Treaties of commerce were also obtained with the Netherlands (1782), Sweden (1783), and Prussia (1785).

During this period, also, Congress, acting under its power to regulate Indian affairs, took steps to quiet Indian title to the trans-Allegheny lands, ceded by the various states to the Confederation. Following colonial precedent, Congress negotiated treaties with the various Indian tribes. By the Treaties of Fort Stanwix (1784) and Fort McIntosh (1785), the Shawnee Treaty (1786), and the Treaty of Ft. Harmar (1789), the United States quieted Indian title to a part of the Old Northwest. Negotiations with the Indians of the Southwest (under the influence of the neighboring Spanish) were less successful, although the Hopewell Treaties of 1785-86 were secured with the Cherokee, Choctaw, and Chickasaw tribes.¹² The procedure of regulating relations with the Indians by treaty was to be followed into the third quarter of the nineteenth century.

In its relations with foreign powers during the postwar years, Congress was increasingly hampered by the inadequacy of its general governmental authority. Without the power to levy taxes, to control commerce, or to check

state legislation that violated treaty stipulations, Congress was bereft of bargaining power. Major negotiations with Great Britain and Spain for the settlement of pressing problems, such as commercial relations and frontier disputes, failed; these failures contributed materially to the demand for a stronger national government and to the calling of the Constitutional Convention.¹³

PROPOSALS ON FOREIGN RELATIONS BEFORE CONSTITUTIONAL CONVENTION

When the Constitutional Convention assembled, May 25, 1787, there was general agreement that the treaties of the United States must be supreme over state laws, although there was disagreement as to the means by which this should be achieved.¹⁴ Only Hamilton's plan dealt with the conduct of foreign relations; his proposals (June 18) vested the power to make treaties and to appoint ambassadors in the Executive, subject to the advice and approbation of the Senate.¹⁵ This plan was, however, temporarily shelved without debate in the Convention.

For weeks, the Convention wrestled with the problem of achieving basic compromise between the adherents of amended Articles of Confederation and the proponents of a strong national government. On August 6, a first draft of the new instrument was reported to the Convention. This centered authority over foreign relations in the Senate,

¹⁵ *Ibid.*, Vol. I, p. 292.

giving that body power to make treaties and to appoint ambassadors; the President was to receive diplomatic agents. It also provided that treaties as well as the acts of the legislature should be "the supreme law of the several States, and of their citizens and inhabitants," and forbade the states to make any treaties or alliances save with the consent of the United States legislature.¹⁶

These proposals called forth an amendment that no treaty should be binding on the United States unless "ratified by a law," thereby requiring concurrence of the House of Representatives. Fear was expressed that the Senate might, by the device of a treaty, exercise powers denied to Congress as a whole, such as levying an export tax. Although this amendment was defeated, the article was referred to a Committee of Eleven for further consideration.¹⁷

In the Committee of Eleven there was, reportedly, considerable debate as to where to vest control of foreign relations. The committee considered, and rejected, proposals to grant this to the Executive alone, to give power to the whole legislature or to the House of Representatives alone. General sentiment was against the House, on the ground that the secrecy required in delicate diplomatic negotiation might be imperiled in the more popular body.¹⁸ The final decision of the committee, incorporated in a revised draft of the Constitution (reported to the Convention on September 4), made a radical change, reviving Hamilton's earlier proposal and shifting the control of foreign relations from the Senate to the Presi-

dent and the Senate. The new clauses empowered the President to make treaties with the advice of the Senate, the consent of the members present being required, and to nominate, and with that body's advice and consent appoint, diplomatic agents.¹⁹ Renewed agitation for participation of the House of Representatives in the treaty process ensued, a proposal being made that the advice and consent of the House as well as that of the Senate should be required. Since treaties were "to have the operation of laws," it was argued, "they ought to have the sanction of laws also." The two-thirds rule was also attacked on the ground that it would give a minority control of foreign affairs.²⁰

These objections did not prevail. The Constitution, in final form, embodied the disputed clause.²¹ During the struggle for the ratification of the Constitution, argument was renewed, the Antifederalists protesting concentration of power in the Senate and demanding the concurrence of the House of Representatives in the treaty process.²² Despite their defeat and the adoption of the Constitution, these issues were to be resurrected.

UNDER CONSTITUTION CONGRESS COM- MITS ADMINISTRATION OF FOREIGN RELATIONS TO EXECUTIVE

The first years under the Constitution were critical in the development of precedents and policies, for that instrument was but a blueprint of govern-

ment. Early in its first session, Congress undertook the organization of executive departments which were assumed but not particularized in the Constitution. By the act of July 17, 1789, Congress provided for the establishment of a Department of Foreign Affairs. The Secretary for the Department was made the organ of communication with foreign nations. He was to perform such duties as the President should entrust to him relative to correspondence, instructions, commissions, and so forth, or "such other matters as the President shall assign," and was to conduct the business of the Department "in such manner as the President of the United States shall from time to time order or instruct."²³ Whatever may be inferred from the ambiguous half-silence of the Constitution respecting control of foreign affairs, it is clear that by this statute Congress committed to the executive branch the administration of foreign relations. Some weeks later (September 15, 1789) certain domestic functions were allocated to the Department, which was then renamed the Department of State.

During the first years of the Republic, Congress gave the President a free hand in the organization of the diplomatic service. By the Appropriation Act of July 1790, a fund of \$40,000 was placed at the President's disposal for the support of the foreign representatives of the United States, subject only to specified maximum payments to persons in the several ranks of minister, chargé d'affaires and secretary.²⁴ Lump sum appropriations were continued for twenty years. An act of May 1, 1810, particularizing maximum payments to

consuls at the Barbary ports, specifically granted the President a discretionary power over expenditures for foreign intercourse from a contingent fund, stating that he should annually account to the Treasury in all cases where, in his judgment, the expenditures "may be made public," and should merely submit certificates to the Treasury for such expenditures "as he may think it advisable not to specify." Such certificates were to be considered as sufficient vouchers.²⁵ Beginning in 1818, salaries and expenses of outfits for each particular mission were itemized by name in the General Appropriation Act, but the contingent fund to be expended at executive discretion was continued.²⁶

PROCEDURES DETERMINED BY PRECEDENT

Insofar as procedures are concerned, the early Congresses followed the precedents of the Continental Congress. Deliberation of business by the House acting as the Committee of the Whole preceded reference to select committees. Not until 1816 did the Senate establish a Standing Committee on Foreign Relations; six years later the House followed suit. New in the way of procedure was the adjustment that had to be made in the face of the new constitutional structure. Executive influence exerted in the caucus, consultation between Cabinet officers and congressional committees spanned the gulf between

²³ *U. S. Stat.*, Eleventh Cong., Sess. II, Ch. 44.

²⁴ Act of April 9, 1818, Fifteenth Cong., Sess. I, Ch. 45. On April 9, 1846, the House of Representatives called on President James K. Polk to furnish an account of all payments made on President's certificates from the contingent fund. This Polk refused to do on the ground that the act of May 1, 1810 was in full force, and that publicity might defeat the purpose of such expenditures. James D. Richardson, *Messages and Papers of the Presidents, 1789-1897* (Washington, 1899), Vol. IV, pp. 431-36.

the Executive and the legislature. The degree of co-operation between branches of government necessarily varied with changing political currents, but the precedent of conference was well established by the period of the War of 1812.²⁷

WASHINGTON'S PROCLAMATION OF NEUTRALITY 1793

The first important definition of the respective roles of Executive and legislature in foreign affairs was the result of the events of the French Revolution. These involved determination of a recognition policy with respect to the new French Republic (September 1792) and decision as to the extent of United States obligation under the Treaty of Alliance of 1778 in the war between France and Great Britain (February 1793). To these questions Washington and his Cabinet gave a purely executive answer.²⁸ Genêt (Minister of the new French government) was received, and a policy of neutrality adopted. On April 22, 1793, the President issued his famous Proclamation, warning the citizens of the United States against infractions of American neutrality. In amplification of the Proclamation, later executive orders specified particular prohibited acts.²⁹

Washington's Proclamation raised considerable furor. The competence of the

Executive to determine a policy of neutrality was denied; Washington's course was attacked as a usurpation of the powers of Congress. This gave rise to a spirited pamphlet debate between Alexander Hamilton and James Madison, "Pacifcus" versus "Helvidius."³⁰ The outcome of the controversy favored Presidential power; at the next session of Congress, both Senate and House expressed formal approval of Washington's actions.³¹ At Presidential suggestion, in June 1794, Congress enacted the first Neutrality Law, specifying prohibited acts and the penalties for such infractions.³² The precedent was thus established that the Executive has power to determine a policy of neutrality toward foreign nations, and Congress has legislative authority to enforce neutrality within the domestic jurisdiction of the United States.

The Neutrality Law stipulated our duties as a neutral power; the European war made imperative measures to secure our rights as a neutral. Both belligerents, from the onset of hostilities, interfered with American commerce; but British infractions of American neutral rights were graver. Popular resentment of this was aggravated by Great Britain's continuing refusal to evacuate the Northwest Posts or to negotiate a commercial treaty. Reflective of popular feeling, Congress passed a joint resolution, approved April 2, 1794, placing a 30-day embargo (extended

later to 60 days) on all ships in the ports of the United States, bound for foreign ports.³³ Before the close of the session, Congress gave the President discretionary authority to lay an embargo until the next convening of the legislature.³⁴ These acts constitute the first example of the use of Congressional control of commerce as a lever in foreign relations.

THE JAY TREATY RAISES CONSTITUTIONAL ISSUE

Further retaliatory action was averted by Jay's mission to Great Britain and the negotiation of a commercial treaty. When that treaty was made public, however, after its ratification by the Senate in June 1795, a veritable explosion of public wrath ensued, for in the negotiations Jay had yielded crucial American principles of neutral rights. When Washington forwarded a copy of the treaty to the House of Representatives, March 1, 1796, that body gave voice to the popular indignation. A motion, calling upon the President for the papers relative to the treaty negotiations, touched off an exhaustive debate on the legislative powers of Congress under the Constitution in relation to the treaty process.³⁵

The resolution calling for the papers finally passed the House but the demand was sharply rejected by Washington.³⁶ After further discussion, the House passed a resolution disclaiming any authority in the making of a treaty, but

asserting in strong terms that "when a treaty is made which requires a law or laws to carry it into effect," the House has a ". . . Constitutional right to deliberate and determine the propriety or impropriety of passing such laws, and to act thereon as the public good shall require."³⁷ After further debate, an appropriation bill requisite for the execution of certain clauses of the treaty was finally passed.³⁸ The constitutional issue, however, was to recur.

CONGRESSIONAL ACTION IN REGULATING FOREIGN POLICY

Abrogation of French treaties

By 1798, our relations with France, complicated by French displeasure over American neutrality and the American ratification of the Jay treaty, reached a crisis in the failure of the X. Y. Z. mission. In the spring of 1798, Congress took the bit in its mouth. Measures for the defense of the United States were enacted, the Alien and Sedition Laws were passed and, by the law of July 7, 1798, Congress abrogated all existing treaties with France.³⁹ Congressional action thus foreshadowed Jefferson's phrase, "no entangling alliances." After two years of an undeclared naval war, the conclusion of the Convention of 1800 confirmed Congressional action. For the price of our renouncing spoliation claims, the French yielded on the point of Congress' unilateral repudiation of the old treaties.⁴⁰ By Congressional direction, American foreign policy was set on a course of isolationism.

Louisiana Purchase

The outstanding event of Jefferson's first administration was the negotiation of the treaty for the purchase of Louisiana. This treaty involved a large Congressional appropriation but little was made of this issue. Early in 1803, in advance of the negotiations, Congress had appropriated \$2,000,000 for the purchase of New Orleans and the land around the Mississippi River.⁴¹ Although Jefferson was troubled by constitutional scruples, this Congressional action was seized upon as an expression of Congressional authorization for the larger purchase.⁴² When Congress was convened in special session in October 1803, debate on the treaty centered on the issue of the constitutionality of any addition of territory to the United States. Political expediency and economic interest dictated the Congressional answer. Ratification of the treaty, and passage of the necessary appropriation bills were rapidly secured.⁴³

Control of commerce: War of 1812

"Peace is our passion," wrote Jefferson in June 1803. Unhappily, renewal of the Napoleonic Wars dashed this hope; again American neutral rights were invaded, American commerce suffered depredations. From 1806 until 1812 Congress experimented, using its control of commerce as a weapon to

win respect for American neutral rights; to retaliate against the belligerent powers, and to keep the United States out of war. The first of these measures, the Non-Importation Act of April 18, 1806, was aimed directly at Great Britain.⁴⁴ Guided by Jefferson, on December 22, 1807, Congress enacted the more sweeping Embargo Act which tied up all commerce (other than coastwise trade) in the ports of the United States.⁴⁵ This was supplanted in turn by the Non-Intercourse Act of March 1, 1809, "Macon's Bill No. 2" (May 1, 1810) and again an Embargo Act (April 4, 1812).⁴⁶ These measures failed to effect Congressional purposes. Propelled by the "War Hawks" under Henry Clay's dynamic leadership, on June 1, 1812, the reluctant Madison sent to Congress a message on the relations of the United States with Great Britain which Congress promptly translated into a declaration of war.⁴⁷ Although derisively termed "Mr. Madison's War," this was a war of Congress' making.

The Treaty of Ghent in February 1815 re-established the boundaries of the United States on the basis of *status quo ante bellum*. Various problems, including the regulation of commercial relations, were deferred for later diplomatic discussion. Congress opened the

⁴⁴ *U. S. Stat.*, Ninth Cong., Sess. I, Ch. 29. By an act of December 19, 1806, the operation of this law was suspended until July 1, 1807, and the President was given discretionary power to suspend the law until the next convening of Congress in December 1807. *U. door to negotiations by an act of March 3, 1815, authorizing reciprocal termination of alien discriminations by particular conventions with foreign nations.⁴⁸ This freedom-of-trade principle was incorporated in the Treaty of Commerce subsequently concluded with Great Britain (July 3, 1815), prohibiting mutually any discriminations of import, export, or tonnage duties in direct trade between the United States and the British Isles.

Despite the previous blanket approval of the principle, the treaty produced strong Congressional reaction. Following ratification, the Senate passed a bill declaring inoperative any existing laws contrary to the treaty. The House of Representatives, however, mindful of its legislative control of commerce, countered with a bill enacting the clauses of the treaty seriatim. Again the issue of Congressional power in relation to the status of a treaty was debated, and earlier arguments pro and con Congressional authority refurbished. Finally, a compromise bill was enacted, without definitive settlement of the constitutional issue.⁴⁹

Congress and recognition policy

Executive leadership, in the skilled hands of John Quincy Adams, Secretary of State, governed American foreign policies in the years following the close of the War of 1812. The status of the revolting Spanish American colonies, however, furnished the occasion for the first Congressional challenge to executive authority in the determination of the recognition policy. Championing

the cause of the rising states, on March 24, 1818, Henry Clay sponsored a move in the House of Representatives to appropriate a salary for a minister to the new republic, the United Province of the Rio de la Plata.⁵⁰ As this ran counter to the administration's cautious policy, a spirited contest ensued, raising the issue of Congressional power, under the Constitution, to fix the government's recognition policy.⁵¹ Clay's proposal was defeated, but subsequently (February 10, 1821) the House passed a resolution giving its "Constitutional support" to the President, whenever he should consider it expedient to extend recognition to the new states.⁵² In May 1822, following a Presidential recommendation, Congress appropriated \$100,000 for the expenses of diplomatic missions to "the independent nations on the American Continent."⁵³ Executive leadership was maintained and Congressional influence vindicated.

Congress and Monroe Doctrine

Congress had no hand in the enunciation of the Monroe Doctrine, set forth

⁵⁰ *Annals of Cong.*, Fifteenth Cong., Sess. I, p. 1468.

in the annual message of December 1823, for this was a purely executive pronouncement, framed by the President and his Cabinet. A Congressional resolution of 1811, relative to East Florida, had, however, some bearing on its concepts. In this resolution, Congress foreshadowed the later "no-transfer" principle, stating that the United States could not see "with indifference, any part of the Spanish provinces adjoining the said States eastward of the River Perdido pass from the hands of Spain into those of any other foreign power."⁵⁴ It should be noted also that both Executive and Congress early recognized the declaratory nature of Monroe's pronouncement. Action under it would require Congressional authorization.⁵⁵

Nor did Congress make Monroe's declaration its own by effective action. In 1838, French intervention in the Republics of Argentina and Uruguay did provoke a House resolution premised upon Monroe's message. Sponsored by the national-spirited Caleb Cushing, chairman of the House Committee on Foreign Affairs, this resolution raised the question of French purpose, of possible American mediation. Ignored by the administration, the action was inconclusive.⁵⁶ The Senate upon various occasions refused to give formal endorsement to the declaration, notably by its rejection of the "non-colonization" resolution, proposed by Lewis Cass on January 3, 1853, during a discussion of the Clayton-Bulwer Treaty.

⁵⁴ Resolution of Jan. 9, 1811 in *Annals of Cong.*, Eleventh Cong., Sess. III, pp. 374, 379 (amended text). Cf. also p. 516.

⁵⁵ Dexter Perkins, *The Monroe Doctrine, 1823-26* (Cambridge, 1927), pp. 146-48, 190, 210-222.

The principles of Monroe's message, it was conceded, constituted an American "tradition"; further than this the Senate would not go.⁵⁷ The doctrine remained an executive declaration of principle.

Congress and territorial expansion

During the decade of the 1830's, the impulse of westward expansion was gathering a momentum that was soon to reach its crest in the slogan of "Manifest Destiny." Texas was the first objective, although by the Treaty with Spain of 1819 the United States had relinquished its claim to that province. The Texan declaration of independence, early in 1836, raised a popular enthusiasm for immediate recognition of the Republic; talk of annexation was in the air. While President Andrew Jackson counseled neutrality and delay, Congress reflected the people's sentiments. On July 1, 1836, the Senate adopted a resolution declaring that Texas should be recognized as soon as satisfactory information was received of the stability of the new state; four days later the House passed a similar resolution.⁵⁸

Both Houses thus put a stamp of approval on Clay's theory that Congress had a right to make its voice heard in this phase of foreign policy. President Jackson avoided joining issue, taking a temperate stand. He reaffirmed execu-

tive power in the extension of recognition, but conceded that, in cases where such action might provoke a war, the President should exercise this function in co-operation with Congress.⁵⁹ Some months later, Congress furnished this co-operation, including in the general appropriation bill an item for the salary of a diplomatic agent to the Texan Republic whenever the President should decide this to be expedient. Pursuant to this bill (approved by Jackson March 3, 1837) recognition was immediately extended.⁶⁰

For some years, pressure for the annexation of Texas was blocked by rising agitation against the extension of slavery. Early in 1844, however, stirred by fear of British and French influence in the neighboring republic, a move was made to annex Texas by a treaty. Defeat of this treaty made annexation a leading issue in the election of 1844. With the slogan "re-annexation of Texas and re-occupation of Oregon," James K. Polk, the Democratic candidate, carried the day. Interpreting this as a popular mandate, on March 1, 1845, Congress passed a joint resolution, expressing its "consent" to the admission of Texas as a state and specifying the conditions of admission.⁶¹ In accordance with this resolution, in December 1845, Texas was admitted into the Union.⁶² Four months later Mexican and American troops clashed at the Rio Grande, and

the Mexican War was on; the fruits of this war were to be the acquisition of California and the Southwest.

Meantime the Oregon Country (jointly occupied with the British under the Convention of 1827) had been a focus of expansionist enthusiasm which President and Congress alike shared, and which again uncorked the bottled animosities against the British.⁶³ Prompted by a Presidential message, on April 29, 1846, Congress passed a joint resolution, giving the requisite one year's notice of the termination of the Convention of 1827.⁶⁴ At this juncture, the outbreak of the Mexican War cooled American ardor for "Fifty-Four Forty or Fight." Later in the same year, by treaty the United States accepted the forty-ninth parallel as the Northwest boundary, Great Britain relinquishing her claims to lands south of that line.⁶⁵ In this dispute, the President had placed on Congress responsibility for a move that might have resulted in war.

During the decade before the Civil War, there were no significant contributions by Congress to the still unanswered questions of the scope of its authority in foreign affairs. Controversies over British activities in Central America engendered bitterness on Capitol Hill that,

⁶³ Notably during the 1830's the Northeastern boundary dispute had created a critical tension. In 1839 Congress recklessly passed a bill for the "defense of the Northeastern frontier" that might have precipitated armed conflict. President Martin Van Buren restrained congressional bellicosity. See *Cong. Globe*, Twenty-Fifth Cong., Sess. III, App., pp. 50, 158, 159, 161, 210, 223, 230. Cf. also Claude M. Fuess, *The Life of Caleb Cushing* (New York, 1923), Vol. I, pp. 245-48.

as respects the Clayton-Bulwer Treaty, was stored for later occasions.⁶⁶ But for all the bounce and bustle of President Franklin Pierce's expansionist policy, his designs for the acquisition of overseas dominion all came to nothing: absorbed with the slavery problem, Congress was hopelessly split on the reefs of domestic politics.⁶⁷

FOREIGN RELATIONS DURING CIVIL WAR

The outbreak of the Civil War posed new problems in American foreign relations. Great Britain's friendly attitude toward the Confederacy created a strong anti-British sentiment in the United States. When the *Trent* affair occurred in November 1861, Captain Charles Wilkes's high-handed action in stopping the British steamer and removing therefrom the two Confederate envoys was greeted with an outburst of popular joy.⁶⁸ Wilkes's action was in flat contradiction of the United States principles of neutral rights, yet the House of Representatives on December 2, 1861, passed a joint resolution extending the thanks of Congress to Wilkes.⁶⁹ In the Senate, action on this resolution was

⁶⁹ Resolution of December 2, 1861, *Cong. Globe*, Thirty-Seventh Cong., Sess. II, p. 5.

blocked by Charles Sumner, chairman of the Committee on Foreign Relations,⁷⁰ who urged that the administration be left free to deal with the affair, unembarrassed by expressions of Congressional opinion. In conference with the Cabinet, the Senator counseled moderation and was largely responsible for the administration's decision to surrender the envoys to Great Britain.⁷¹ Although upon later occasions, as Chairman of the Committee of Foreign Relations, Sumner was to be animated by partisan consideration, here he showed courage in defiance of popular emotion.

French policy likewise aroused outcry. French inclination to the Confederacy and French intervention in Mexico were viewed with increasing apprehension. Responsive to the popular view, on April 4, 1864, the House unanimously passed a joint resolution stating that "the Congress of the United States are unwilling by silence to leave the nations of the world under the impression that they are indifferent spectators of the deplorable events now transpiring in the republic of Mexico . . ." and declaring that ". . . it does not accord with the policy of the United States to acknowledge any monarchical government erected on the ruins of any republican government in America under the auspices of any European Power."⁷² This brave attempt at Congressional pronouncement on foreign policy failed; under Sumner's guidance the resolution was buried in the Senate Committee on Foreign Relations.⁷³

⁷⁰ *Ibid.*, p. 13. In the Senate the House resolution was buried in the Committee on Naval Affairs; *ibid.*, p. 874.

⁷² Resolution of April 4, 1864, *Cong. Globe*, Thirty-Eighth Cong., Sess. I, p. 1408.

⁷³ *Cong. Globe*, Thirty-Eighth Cong., Sess. I, pp. 1402, 1416. An earlier Senate resolution concerning the French war in Mexico (January 11, 1864) had been tabled. *Ibid.*, p. 1227.

The House's action, however, had reverberations in France. To relieve the resulting tension, Secretary of State William H. Seward tendered to the French Government an explanation of the House resolution, stating that Congress had no authority in the determination of the American recognition policy.⁷⁴ Seward's peccavi evoked new Congressional assertion of constitutional rights. The House of Representatives passed a resolution virtually censuring the Secretary of State's conduct, protesting his claim of exclusive executive authority. Recognition of new governments, the resolution declared, involved matters of national policy "on which the will of the people should be expressed in Congress assembled." The President should be the agent to execute that will.⁷⁵ There was no finale to this controversy, only a residuum of unsettled constitutional issue and of political malaise.

POSTWAR CONFLICT

At the war's end, animosity bred of domestic politics marked the relations of Congress and Executive. Factional purpose, as well as antiexpansionist sentiment and a tender concern for constitutional rights, motivated Congressional opposition to executive policy. The Senate, dominated by Charles Sumner, blocked Seward's proposed treaty for the purchase of the Danish West Indies (concluded October 2, 1867), as well as the Johnson-Clarendon Convention to settle the *Alabama* claims and other current disputes with Great Britain. Of all Seward's expansionist designs, the treaty for the purchase of Alaska, alone, won Sumner's approval

⁷⁴ Moore, *Digest*, note 40 *supra*, Vol. VI, pp. 497-98. Cf. also *Diplomatic Correspondence, Department of State, 1864-65* (Washington, 1865), Pt. III, pp. 76, 83.

and was ratified by the Senate (April 9, 1867).⁷⁶

The House displayed an even more refractory mood. On November 25, 1867, that body entered a caveat against the Danish West Indies treaty, disclaiming any obligation to vote money for any territorial purchase unless "greater present necessity" should transpire than then existed.⁷⁷ Moreover, considerable opposition was exhibited to the treaty for the purchase of Alaska. Debate centered on constitutional issues, for clauses in the treaty called for an exercise of the appropriation power, and conferred on the inhabitants of Alaska the rights of citizens of the United States, thus raising the question of Congressional legislative authority. On July 14, 1868, the House finally passed an appropriation bill, preceded by a preamble, asserting the authority of Congress over the subjects stipulated in the treaty, and giving its "assent" thereto.⁷⁸ The Senate promptly rejected this pretension; after conference, a compromise bill was effected, admitting only that certain clauses of the treaty could not be carried into effect "except by legislation, to which the consent of both Houses of Congress is necessary." In this form the bill was enacted.⁷⁹

The victory of the Radicals in the

⁷⁹ Text of Conference Report, *ibid.*, p. 4404. This was accepted by the House July 23 (*ibid.*, p. 4394), and by the Senate July 24 (p. 4404). For the act see *U. S. Stat.*, Fortieth Cong., Sess. II, Ch. 247.

election of 1868 gave promise of more felicitous relations between the Executive and Congress. This expectation was rudely shaken, early in 1870, by Charles Sumner's opposition to Grant's pet project, the annexation of the Dominican Republic. The Grant-Sumner quarrel resulted in the Senator's demotion from the Committee on Foreign Relations; the way was cleared for the negotiation of the Treaty of Washington with Great Britain and for executive leadership in foreign affairs, skillfully directed by Hamilton Fish, Secretary of State.⁸⁰

INDIAN AFFAIRS

One incident in this period strikingly raised the much controverted issue of Congressional legislative power in relation to treaties. Despite the fact that Justice John Marshall, speaking for the Supreme Court of the United States, had declared in *Cherokee Nation v. Georgia* (1831)⁸¹ that Indian tribes were "domestic, dependent nations," the government had continued to govern Indian relations by treaty. In 1870, the House challenged this procedure as an incorrect assumption of power by President and Senate, and refused to appropriate for the execution of certain Indian treaties. Although the Senate denied the principle of Congressional discretionary power as to the execution of treaties, the upshot of the contest was the insertion of a clause in the Indian Appropriation Act, March 3, 1871, prohibiting, in the future, recognition of an Indian tribe by treaty.⁸² The regulation of Indian affairs was thus properly removed from the field of foreign rela-

tions and placed under Congressional authority.

AMERICAN DIPLOMACY IN POST-RECONSTRUCTION DECADES

The post-Reconstruction decades have been labeled "the doldrums" of American diplomacy. In fact, they were the period of the gestation of the United States as a world power. Successive treaties with Hawaii (1875, 1887) confirmed American interest in that "outpost of empire"; controversy over the Samoan Islands (1887, 1889) increased interest in the Pacific. In the early 1890's the Harrison administration's ill-starred attempt to annex the Hawaiian Islands, following the revolt against the monarchy in January 1893, was checked by President Grover Cleveland.⁸³ On the other hand, Congress balked at any use of United States forces for the restoration of the monarchy, and, in 1894 passed resolutions of noninterference in the Hawaiian situation.⁸⁴ For some years, indeed, Congress reflected the division of popular opinion on the issue of expansion. A proposed treaty for the annexation of Hawaii under the McKinley administration (June 16, 1897) failed; annexation of the islands waited upon coming events.⁸⁵

Meantime, events in the Caribbean

absorbed Congressional attention. During the year 1895, two unrelated problems—the boundary controversy between Great Britain and Venezuela, and Cuba's revolt against Spain—fixed American interest on that area. The United States had earlier sought a peaceful settlement of the Venezuela boundary, a dispute of long standing. In 1895, Congress, by joint resolution, supported Cleveland's conviction that the two powers concerned should submit the matter to impartial arbitration.⁸⁶ Fortified by Congressional backing, the Executive presented this recommendation as a demand to Great Britain, threatening American intervention under color of the Monroe Doctrine, should Great Britain refuse arbitration. The British summary rejection of the American pretension roused the American public and spurred Cleveland to precipitate action.⁸⁷ In December 1895, the President requested Congress to make an appropriation for a commission to investigate the Venezuela boundary question, with the understanding that the United States would enforce such commission's findings. In a surge of anti-British sentiment, Congress promptly complied.⁸⁸ Although the affair brought the two countries dangerously close to war, cooler counsel prevailed. Eventually Great Britain agreed to resort to arbitration.

CONGRESSIONAL ACTION LEADS TO SPANISH-AMERICAN WAR

The Cuban revolution led to a complete reversal of the roles of President and Congress in our foreign relations. While in the Venezuela dispute, the President led with Congress close on his heels, in the case of Cuba, Congress dragged an unwilling Executive into an armed conflict. Throughout the nineteenth century, Cuba had been a subject of concern to the United States; American political, strategic, and commercial interest in the island was of long standing. On various occasions public anger had flared up over Spanish policy. By the early nineties, heavy American investments in Cuba reinforced traditional interest. The revolt of February 1895 evoked a rising tide of American sentiment, curiously compounded of the idealism of Don Quixote and the motives of a traveling salesman.⁸⁹

As the revolution continued, the spreading desolation in Cuba (trumpeted by the "yellow press") brought a nationwide demand for American action. The pugnacious mood evoked by the Venezuela crisis found in Spain a fresh target. Congressional humanitarian feeling and wrath erupted in a concurrent resolution (April 6, 1896) declaring in favor of recognition of the belligerency of the insurgents, and urging that the United States should tender its good offices to obtain from Spain recognition of the independence of Cuba.⁹⁰ Cleveland and McKinley, in turn, refused to adopt this course and

sought to restrain the Congressional temper.⁹¹

The sinking of the *Maine* in Havana harbor (February 15, 1898) was a fuse that set off a charge of pent-up emotion. Cries for war against Spain and for American intervention to liberate Cuba echoed in the halls of Congress. While diplomatic negotiations with Spain dragged to an unsatisfactory conclusion, McKinley surrendered to Congressional pressure. Following the Presidential message of April 11, 1898, Congress passed the famous joint resolution (April 19) declaring the independence of the Cuban people, authorizing American intervention for the liberation of the island, renouncing any intention of annexation.⁹² A few days later, Congress passed an act declaring that, as of April 21, war existed between the United States and Spain.⁹³

By its action, Congress abandoned the historic American principle of non-intervention, and set the United States on a new and uncharted course. The span of the Spanish-American War was brief; its results were both unanticipated and momentous, for the war was carried into the Pacific. Admiral Dewey's attack upon the Philippine Islands resulted, successively, in the annexation of Hawaii (endowed with a new strategic importance) by joint resolution of Congress, July 7, 1898,⁹⁴ and in the somewhat reluctant American decision

at the close of the war to retain the Philippine Islands. The treaty with Spain (ratified by close vote in the Senate in February 1899) recognized the independence of Cuba, transferred the Philippines to the United States for the sum of \$20 million, and ceded Puerto Rico and Guam to American possession.⁹⁵ A by-product of the crusade for the liberation of Cuba was, thus, the creation of an American overseas empire and the emergence of the United States as a world power. Not since the days of the American Revolution had Congress exercised so fateful an influence on American foreign policy.

END OF CENTURY FINDS AUTHORITY PROBLEM STILL UNSOLVED

In conclusion, it may be remarked that the questions regarding Congressional participation in foreign relations, raised in the Constitutional Convention, although often ventilated, remained without definitive answer at the end of the nineteenth century. In particular, the ambiguous subject of the "rival powers of legislation and Treaty,"⁹⁶ under the Constitution, remained unsolved. House and Senate quarreled over this issue, the House supporting legislative authority (especially in cases involving the appropriation power), the Senate denying Congressional discretion in the execution of duly ratified treaties. In respect to the scope of Presidential prerogative, the most notable examples of Congressional challenge were the several assertions of a right to a voice in determining the recognition policy of the United States. Here, too, matters were never battled to

⁹⁶ Farrand, note 14 *supra*, Vol. III, p. 370. Abraham Baldwin stated March 14, 1796, that the makers of the Constitution purposely left certain topics, including the treaty issue, to be "settled by practice or by amendments."

a decision, although the precedents established by practice in general favored executive authority.

Even before the adoption of the Constitution, as we have seen, Congress had elucidated the principles that guided American foreign policy until the close of the nineteenth century. On numerous occasions, too, Congress voiced what was contemporarily believed to be the will of the American people. Resentment of infringement of American principles or impairment of American inter-

ests found quick response in Congressional activity. In concurrence with Presidential view, or in opposition to executive intention, the elected representatives of the people, by debate, by resolution, or by legislative measure, gave tongue to popular opinion. The War of 1812, the annexation of Texas, the intervention in Cuba—these are markers in the record of the nineteenth century, witnesses to the determinative influence of Congress upon national policies.

Congress and Foreign Policy Since 1900

By MARY E. BRADSHAW

TIMES and policies have changed since the colonial era. Until 1900 the United States drifted along with a few policies, such as the Monroe Doctrine, neutrality, and recognition of stable governments. The world of 1900 was quite different from that of 1776 or 1789; likewise it was different from that of today. Neither in 1776 nor in 1900 did the nation seek world leadership, or any part in world leadership. Nor was there any appreciable demand for a more aggressive diplomacy. In the interval since the Civil War, most Americans had given their loyalty to the family, to the American way of life, with its deep roots in neighborliness, to sections and sectional customs, to personal freedom and private enterprise. They were, until early in the twentieth century, provincial in their tastes, proud of what was to them American strength, and doubly conscious of American ability to solve problems. Even the problems were largely internal in character. It was inconceivable that their problems within the next 50 years would be as much international as internal, and that they, as Americans, could not find solutions for every dilemma. It was equally unlikely that they would be expected to assume political leadership outside their own boundaries. With a sheltered position behind the British fleet, they were giving little thought to the security of the nation beyond the national frontiers, and no thought whatsoever to global diplomacy.

TWENTIETH CENTURY MAKES HEAVIER DEMANDS

George Kennan, writing in 1951 about the first 50 years of this twentieth cen-

tury, concluded that our forefathers in the course of their deliberations "... stumbled upon issues and problems basic to the health of our American civilization; that these issues and problems are ones which are still before us and still require answer; and that, whereas the men of 1898 could afford to be mistaken in their answers to them, our generation no longer has this luxury."¹ He was writing about the Spanish-American War and our involvement in that conflict "... on the basis of plans which, as far as we know, had never been seriously examined and approved by any competent official body. . . ."² Speaking in general terms of the period between 1900 and 1950, he has further noted:

... it is clear that there has been in the past a very significant gap between challenge and response in our conduct of foreign policy; that this gap still exists; and that, whereas fifty years ago it was not very dangerous to us, today it puts us in grave peril. We can afford no complacency about these things in the year 1951, and we have no choice but to face up unsparingly to our weaknesses.³

Some of these weaknesses stem from failure to secure information on time, which is less of a problem under the modern system of communication, lack of time to study information available and "... machinery in many respects ill-designed for the function."⁴

⁴ Robert A. Dahl, *Congress and Foreign Policy*, Memorandum 30 in Yale University Institute of International Studies (New York: Harcourt, Brace and Co., 1950), p. 1.

CONGRESSIONAL PARTICIPATION

Whereas the year 1900 is an acceptable starting point for a study of American diplomacy in recent times, it is not an appropriate point of departure for an analysis of active Congressional participation in foreign affairs. Early in our history the executive branch worked in closer harmony with the Congress; consequently, legislation of both domestic and foreign categories was more a product of collaboration than the work of one branch of the government, to which the other was forced to give consent. The area and degree of collaboration gradually diminished, and, with that development, there disappeared the working relationship of joint responsibility, based upon adequate debate and discussion. For over a century, beginning with the administration of Andrew Jackson, neither organ had sufficient confidence in the other to allow a choice of alternatives in the field of foreign policy.⁵

This lack of confidence, this failure to continue the early relationship of collaboration, plus "... a tremendous growth in the importance and inclusiveness of foreign policy decisions. . . ." has prompted Robert A. Dahl to make a strong case for active and continuing consent of Congress: "In the American democracy, as indeed in any other, much of the burden for securing responsible leadership, for maximizing agreement, and for developing a more rational understanding among the electorate ought to fall upon the legislative body."⁶ In his opinion "... it would be a major misfortune if organizational incapacities were to deny [to Congress] the role it ought to play."⁷

The instrumentality for Congressional

⁶ *Ibid.*, p. 261.

⁷ *Ibid.*, p. 5.

⁸ *Ibid.*, p. 1.

participation in foreign affairs is the standing committee, a device well known to the colonists. Their representatives created and used, somewhat ineffectively to be sure, a Committee of Secret Correspondence, which was renamed, more appropriately, the Committee for Foreign Affairs in April 1777. Under the Constitution, in fact until the year 1816, the Senate operated in the field of foreign affairs without the aid of a standing committee especially created for that purpose. The present Senate Committee on Foreign Relations, sometimes called the ranking standing committee of the Senate by virtue of its numerical place on the list of standing committees, came into being in the era of greater collaboration between the President and the legislative body. Although the volume and complexity of its work have changed beyond measure since 1816, the machinery under which it operates remains similar to that established in the nineteenth century.

The former position and significance of the corresponding committee in the House of Representatives—the Committee on Foreign Affairs—has been aptly described by Albert Charles Frederick Westphal as "ornamental." Its members seldom attained national prominence and in the past failed to become recognized experts in the field of foreign relations. That was of no grave consequence to the nation as the House of Representatives had very little responsibility for matters related to foreign policy. Today the House participates in the process of determining foreign policy; service on the Committee on Foreign Affairs is much more attractive than it once was. The average length of service in terms of years has gradually mounted since 1933 ranging from a low point of 1.80 years for 1933 to 6.96 in 1948 and to 6.48 in 1949.⁸ In the case of the Eighty-first Congress,

⁸ Dahl, *op. cit.* note 4 *supra*, p. 289.

more members of the House preferred a seat on this committee than on any other,¹⁰ indicating a radical change in the position and the prestige of the Committee on Foreign Affairs. Since in the United States "... effective legislative power lies with the committees . . .,"¹¹ which today means with *both* committees, it is good to note this change of attitude.

CONGRESSIONAL PARTICIPATION AFTER FIRST WORLD WAR

The possible effects of greater Congressional participation, both now and in the future, are worthy of understanding and deserving of considerable attention. If we desire to maintain a democratic regime "... under which executive policy rests upon the confidence of the legislative branch . . ." there must be "... a high degree of collaboration between executive and Congress in the formulation and conduct of foreign policy."¹²

Have we ever had such a degree of collaboration? If so, when and where? And what the results, if such collaboration existed at any time in our experience?

Vigorous Congressional participation in foreign policy, and parliamentary control of foreign affairs in certain other parts of the world, came in the course of the First World War. The fate of the Covenant of the League of Nations and the Treaty of Versailles is well known in this country. The experience of the British, French, Dutch, and German bodies and committees, wherever the latter existed, is revealing. They placed such stress upon *national interest* and *national honor* that any conciliatory line of policy was doomed to failure,¹³ notwithstanding the existence

of machinery for international co-operation.

Between 1920 and 1939 this nation did not pursue an active and sustained foreign policy. Like the nations of Europe we sought collective security in various ways, and to that end participated in a number of international conferences. We assisted in the economic and social work of the League of Nations. Our experience with plans for limitation of armaments and with the economic programs of some states disillusioned the less hardy internationalists and strengthened the isolationists in their beliefs. The result was the neutrality legislation of the latter thirties. The views and the actions of President Roosevelt in the period between 1937 and 1941 were certainly not in harmony with those of the prevailing group in Congress and so there was no solid basis for collaboration, indeed very little on which to agree, in the field of foreign affairs.

FOREIGN POLICY IN SECOND WORLD WAR

The coming of the Second World War changed the picture. The results of parliamentary control of foreign affairs in Europe and in the United States since 1939 are more encouraging. The change in relationship between the President and the Congress—the search for unity of purpose and maximum agreement on foreign policy—was an immediate result of Pearl Harbor.

Advisory Committees

Between September 1939 and December 1941, while the European states carried on military operations, some persons in the Department of State began to consider postwar American foreign policy. Organized preparation for the

ment and Democracy: Theory and Practice in Europe and America (Boston: Ginn and Company, 1950), pp. 346–348.

postwar period started in the month of December 1939, with the creation of an Advisory Committee on Problems of Foreign Relations. This committee, unlike its successor, the Advisory Committee on Post-War Foreign Policy, was a departmental committee, staffed by fifteen persons from the Department. Sometime in December of 1941, possibly on the twenty-eighth of that month, President Roosevelt set up the second committee, with representation from the public, other governmental agencies, and the Department of State.¹⁴

The President and his Secretary of State were both mindful of the errors and costly mistakes of the Wilson administration in the formulation of peaceful settlements, and each was anxious to avoid such blunders; furthermore, they realized that the situation facing the nation in 1942, and quite possibly at the end of hostilities, was not unlike that of 1919–1920 in its potentialities for trouble. The two officials decided, therefore, to take some Members of Congress into the Executive confidence, in the interest of "nonpartisan agreement upon foreign policy and harmony of views between the Executive and the Congress. . . ."¹⁵

The timing of this invitation to Members of the Congress is significant. It was extended in the form of a request for "... direct Congressional participation in the preparation on a basis of as nearly equal representation of the two major political parties as practicable."¹⁶ The selection of representation from the Congress required time and thought; consequently there was a delay of nearly five months between the creation of the Committee on Post-War Foreign Policy and the extension of the

invitation to the two designated Senators. Their invitation was actually dated May 27, 1942. In the interval it had been impossible for the committee to convene regularly; and in its four plenary sessions, beginning with the first meeting on February 6, 1942 and ending with its last session on May 2, 1942, the Advisory Committee concentrated on organizational and procedural matters. Congressional participation at that point was unessential, since the two Senators selected were able to be present for the early stage of deliberation and discussion. Consultation and collaboration, with greater representation as the bases for discussion were clarified and the problems analyzed, developed into formulation in the advanced and the final stages of postwar preparation.

Who were the Congressional participants? The list is a long one, growing as the consultation moved into the advanced stage. Certain names appear at every stage. These were key political figures in Congress, and the men with experience in the field of foreign relations. In most cases these Members of Congress were ranking majority and minority members of the Foreign Relations and Foreign Affairs Committees.

The first two men selected were Senator Tom Connally of Texas, Democrat and Chairman of the Foreign Relations Committee, and a minority member of the same committee selected by the Republicans, Senator Warren R. Austin of Vermont. On January 9, 1943, five other Members of Congress joined the Advisory Committee: Senator Walter F. George, Democrat of Georgia; Senator Elbert D. Thomas, Democrat of Utah; Representative Sol Bloom, Democrat of New York and Chairman of the Committee on Foreign Affairs; Representative Luther A. Johnson, Democrat of Texas; Representative Charles A. Eaton, Republican of New Jersey and ranking minority member of the committee.

Six weeks later an eighth name was added, that of Senator Wallace H. White, Republican of Maine.¹⁷ With the exception of Senator George, who had served on the Foreign Relations Committee, all were currently members of the two standing committees operating in the field of foreign affairs.

Special committees

In addition to the Congressional representation on the Advisory Committee, the following Members of Congress were invited to work on the various "special committees" of that committee. These were smaller units considering economic and social problems of a postwar nature. Only two, the Special Committee on Shipping and one on Communications, had any Congressional representation:

Democrats

Senator Scott W. Lucas of Illinois, Shipping
 Senator Claude Pepper of Florida, Communications
 Representative Schuyler Otis Bland of Virginia and his alternate, J. Hardin Peterson of Florida, Shipping
 Representative Alfred L. Bulwinkle of North Carolina, Communications

Republicans

Representative Richard J. Welch of California, Shipping
 Representative Charles A. Wolverton of New Jersey, Communications¹⁸

The actual connecting link in this maze of special committees and subcommittees was the Advisory Committee on Post-War Foreign Policy, the so-called full committee. The full com-

mittee had only four plenary sessions, the final one coming on May 2, 1942. Thereafter and for reasons of secrecy, as the entire committee was large and the danger of a serious breach of security great, the Political Subcommittee functioned as the principal subcommittee, discussing political problems and possible postwar issues. With its "select" public and Congressional representation, it developed into the normal channel for serious consideration of the whole range of postwar problems.

The work of the Political Subcommittee was both exacting and time-consuming. After some deliberation as to ways and means of proceeding, it decided to approach the work in "two rounds." In the course of the first round—October 1942 to December 19, 1942—this subcommittee undertook to "... analyze all international political problems likely to require the determination of American policy or attitude, to discuss them in an exploratory way, and to clarify the feasible alternative solutions."¹⁹ In the second round—January 2, 1943 to July 12, 1943—it considered recommendation "... based upon more mature understanding and study of the problems and of the possible solutions as judged in the light of existing facts and prospective circumstances."²⁰ It sought to clarify for its own guidance "... the fundamental concepts of American policy that should underlie its approach to the problems and uncertainties of the future."²¹ It decided to set a maximum program of sound and desirable international action, based upon the principles expressed in the Atlantic Charter and the United Nations Declaration.

The subjects under discussion during

the first round were organization of provisional governments and other reconstruction problems in liberated Europe, the treatment of enemy states and the disposition of enemy states, and immediate post-hostilities problems; next, the situation in the Far East, problems in eastern Europe, the future of Austria, and problems of the Middle and Near East and Africa; then, international trusteeship, and questions arising in the Western Hemisphere; and finally, policy problems presented by the Union of Soviet Socialist Republics, by Great Britain and the British Commonwealth, and by France. The time spent in discussion of each sequence of problems varied in accordance with the complexity and gravity of each issue and the relationship of such issue to others under consideration. In the second round, it was again necessary to consider the same problems, but in greater detail and with greater allotment of time.²² By that time the research staff had been able to provide studies covering many of the problems under consideration, thus speeding up the process of discussion.

The Political Subcommittee came to the conclusion that the postwar world must have some form of organization so that the small states could live in "... independence, peace, and security ..."; that the general organization should have power to act; furthermore, it concluded that the United States would face a complicated set of problems quite unlike those of the past and certain of the most significant policy decisions to be made would involve fundamental departures from the traditional American position.

The responsibilities of a major power had brought with them such need of international peace, security, and well-being that, in the view of the subcommittee, the policy

recommendations must propose new courses of American policy and action where necessary to American vital interests.²³

It is only too obvious that the exploratory phase of the consultations was drawing to an end and that the way was open for the stage of specific recommendation in document form and for a more definite round of discussion. Secretary Hull, in a letter sent to members under date of July 12, 1943, announced the suspension of the entire Advisory Committee structure, thus bringing to an end the activities of the Political Subcommittee.²⁴

The pattern of executive-legislative collaboration set by the Political Subcommittee, while unique and productive for the early period of consultation, was probably undesirable in the long run. Involving as it did almost weekly committee meetings with either the Secretary of State or his deputy, the Under Secretary, and eight Members of Congress, plus public and governmental representation, the technique was sound, however. In the atmosphere created it was possible to "hammer out the greatest possible measure of agreement" so that the government of the United States could speak to the world in the name of undivided America.²⁵

Preliminaries to United Nations

The transition from exploratory phase to commitments at San Francisco came in several stages, with Congressional consultation at every stage. Once again Secretary Hull took the initiative in approaching Congress. He consulted in-

¹⁸ *Ibid.*, p. 180.

formally with some Members of Congress; he talked with the B₂H₂ group—Senators Ball, Burton, Hatch, and Hill; he appeared before a joint session of Congress, explaining the agreement on a postwar security organization reached at Moscow and other details of the Moscow Conference; he stressed the necessity for “machinery of action.” One resolution in support of an international organization—the Fulbright resolution—had passed the House prior to the Moscow Conference, and the comparable one—the Connally resolution in the Senate—came after the Conference.

Returning to Secretary Hull and his activities in behalf of the general organization: In March 1943, he appeared before the Foreign Relations Committee to report on the possibility of detailed and direct negotiations on the subject of the general organization, explaining to the committee the status of American plans and proposals. To a liaison group of eight appointed by this committee he gave the “Possible Plan.” Four of the eight had been members of the Advisory Committee: Senators Connally, George, Austin, and White. The remaining four, like the first four, had promoted the Connally resolution. These men were Senators Barkley, Gillette, Vandenberg, and LaFollette, Jr.

Secretary Hull held a conference with twenty-four first-term Representatives, explaining to them the nature of the work completed at that time and the status of plans.²⁸ On June 2, 1943, he gave copies of the plan to seven members of the House Committee on Foreign Affairs: Democrats, Representatives Sam Rayburn of Texas, Speaker; John W. McCormack of Massachusetts, majority leader; Sol Bloom of New York, Chairman of the Foreign Affairs Com-

mittee; and Robert Ramspeck of Georgia, majority whip; Republicans, Representatives Joseph W. Martin, Jr. of Massachusetts, minority leader; Charles A. Eaton of New Jersey, ranking minority leader of the Foreign Affairs Committee; and Leslie C. Arends of Illinois, minority whip.²⁷

And finally, on June 22, 1943, the Secretary gave the plan to the B₂H₂ group, thus completing the round of Congressional consultations prior to the Dumbarton Oaks Conference. Although no Member of Congress attended the sessions, all had opportunity to mingle socially with the delegations and to converse informally with delegates. Four of the eight-man delegation to the San Francisco Conference came from among these Members of Congress listed above, and three had been representatives on the Advisory Committee on Post-War Foreign Policy. The Advisory Committee, although suspended in July 1943, was the connecting link with the past.

LEGISLATIVE ENDORSEMENT OF THE UNITED NATIONS CHARTER

The Charter of the United Nations, completed at San Francisco, passed the Senate by a vote of 89 to 2. This record vote in favor of participation in an international organization is due to a number of factors. Among these are two relating to the conduct of foreign affairs: the change in the American position of security, and the trend toward executive-legislative collaboration from the early stages to the point of negotiation, the reverse of facts accomplis.

In the wake of Senate action on the Charter came implementation based “. . . on the national legislative power, not on the treaty-making power . . . ,”²⁸

²⁷ *Ibid.*, p. 267.

²⁸ Edward S. Corwin, *The President: Office and Powers, 1787-1948* (New York: New York University Press, 3rd ed., 1948), p. 270.

the United Nations Participation Act, Public Law 264, 79th Congress, subsequently amended to enable the United States Government to co-operate with United Nations agencies. Thus by legislative act, the Congress provided for the flow of information between the President and the Congress concerning the activities of the United Nations and “. . . the participation of the United States therein.” Under the terms of Section Two, the representative appointed by the President to the United Nations became the representative of the United States in the Security Council, not the special envoy of the President. The Congress authorized (Section Six) the President to negotiate special agreements respecting the numbers and types of armed forces with the Security Council, the agreements to be “. . . subject to the approval of Congress by appropriate Act or joint resolution.”

Approval by joint resolution—the Green-Sayre Formula for Congressional participation in the negotiation of postwar pacts—gives to the House of Representatives a role of some importance. To this body has fallen the complicated and time-consuming task of implementing many of the postwar programs, most of which would be ineffective without the authorization of funds. Participation by the entire body of the House is desirable in the conduct of twentieth-century diplomacy, when time is of the essence.

EXECUTIVE-LEGISLATIVE COLLABORATION AFTER 1945

The practice of executive-legislative collaboration and consultation continued beyond the war. Negotiations of the United Nations Charter, using the device of the Advisory Committee on Post-War Foreign Policy, is an example of real collaboration, the Bretton Woods agreement another example; in the

cases of the Greek-Turkish Aid and the European Recovery Program there was, according to Professor Dahl, a lesser degree of collaboration.²⁹ In the first instance, the Department of State had not prepared for the oncoming emergency and was unable to operate with maximum efficiency. Secretary Marshall employed the technique of limited consultation in 1948, when he advised leaders of both committees about the crisis in Berlin and stated the line the Department of State expected to follow. In this instance there were plans to approve or disapprove, in an atmosphere of tension and great urgency.

Before the technique of collaboration-consultation can yield greater results, there must be better liaison between the Department of State and Congress, and more systematic planning for all types of situations. The Policy Planning Staff—created for that specific purpose—has become too involved in day-by-day operations to produce in quantity. Quantity and quality are both necessary if there is to be choice of alternatives.

Ernest S. Griffith, in his recent book dealing with the contemporary role of Congress, credits the Department of State with assisting Members of Congress in many ways:³⁰ the briefings of the two committees charged with the direction of foreign policy matters; the provision of facilities to travel to and visit scenes of international interest; the appointment of Members of Congress as delegates to international conferences—an excellent source of training for those who must become experts in the field of foreign policy; and finally the act of supplying confidential information from the files of the Department, which has far greater access to

²⁸ *Dept. of State Publication 3580*, pp. 259-60.

confidential material such as Congress often needs to carry on its work.

The only alternative to active congressional participation in the field of foreign policy is what Professor Dahl calls "complete executive discretion." All other courses of action would, in his opinion, result in situations of delay and conflict, such as we have experienced in

the past.⁸¹ The trend since 1942 toward executive-legislative collaboration and consultation. We may be moving in the direction of the balance prevailing in the period prior to the Mexican War, toward a working relationship of joint responsibility, based on adequate debate and discussion.

⁸¹ Dahl, *op. cit.* note 4 *supra*, p. 41.

Mary E. Bradshaw, Ph.D., Washington, D. C., is associate professor of history and political science in the Department of International Relations and Organization of the American University. She has taught at Hunter and Berea Colleges.

The Senate in Foreign Relations

By GUY M. GILLETTE

BY virtue of the power given by the Constitution to the Senate in matters of foreign policy, the upper house of the American Congress has always played a greater and more significant role in foreign affairs than the lower house. While in recent years the recurring need for large appropriations to finance various overseas programs has increased the proportionate role of the House of Representatives in foreign affairs (since all appropriations bills must originate in the House), the special place held by the Senate merits a separate discussion in any study of the broad topic of Congress and foreign relations.

My purpose is first to sketch briefly the function of the Senate in foreign policy as set forth in the Constitution and as it has evolved over the years. We shall then take note of the work load of the Senate in the face of the growing number and complexity of foreign relations problems which come before the Senate and which, of course, include, but are by no means any longer limited to, approval of treaties and nominations. We shall also look at the procedure and methods of operation by which the Senate conducts its business when considering various types of foreign relations matters, mention some of the more prominent figures in the Senate who have in recent times exercised important influences in foreign policy, and finally discuss the present share of the Senate in the formulation of the policies of our country in its increasingly difficult and ever more interlocking relationships with the rest of the world.

AS SET FORTH IN THE CONSTITUTION

The only reference in the entire Constitution to the powers of the Senate

with respect to foreign policy occurs in the second paragraph of Section 2 of Article II. This same paragraph also makes the only specific reference to the powers of the President with respect to foreign policy. Hence, from the beginning, the fundamental charter of our government has intimately interlaced the powers of the Executive and the Senate in matters of foreign policy, placing the two in a state of permanent tension.

The Constitutional provision refers only to the treaty-making and ambassadorial aspects of foreign policy:

He [the President] shall have Power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur; and he shall nominate, and by and with the advice and consent of the Senate, shall appoint Ambassadors. . . .

This is the only explicit provision in the Constitution relating to these powers, and I call attention to the marked difference between the two types of powers: that governing treaty-making and that regulating the nomination and appointment of ambassadors.

With respect to ambassadors, the clause states the President shall nominate; nomination is entirely his power. But the actual appointment can occur only by and with the advice and consent of the Senate.

Anomalous treaty provisions

With respect to treaties, however, the Constitutional language differs fundamentally: it says the President shall have power to *make* treaties, but the making of the treaty is conditioned on the phrase reading "by and with the advice and consent of the Senate." Ratifi-

cation of the treaty is further conditioned by the requirement that two-thirds of the Senators present shall concur.

One case provides for the initial step to be taken by the President alone—nomination of ambassadors. In the other case he must have the advice and consent of the Senate in making the treaty. This curious difference in the Constitutional provisions has long troubled many authorities. To me it has made unmistakably evident the need for clarification of the treaty-making power.

Of course, the framers of the Constitution had good and sufficient reasons for adopting such anomalous treaty provisions. What were some of these reasons? Why did they depart from the almost unbroken record wherein the handling of international compacts among sovereign nations had for centuries been wholly an executive function? Why did it become, under our procedure, a joint executive and legislative function? When it thus became a joint function, why was the legislative relationship limited to the Senate alone? What were the reasons for the very unusual requirement of approval of treaties by two-thirds of the Senators present?

Answers to these questions are readily found when we review the debates in the Constitutional Convention. In the Articles of Confederation under which the delegates to the Convention had been living was this provision: "Each State retains its sovereignty, freedom and independence, and every power, jurisdiction, and right which is not by this Confederation expressly delegated to the United States in Congress assembled."

The two-thirds concept

In this same document the few express delegations of power to the central authority were those providing for

the determination of peace and war and conferring authority to make treaties and alliances, and these were delegated not to an executive authority but to the Congress. It was specifically prohibited to make a treaty or alliance or declaration of war without the assent of nine of the 13 states; all voting was to be by states; and each state was to have but one vote. Here we see the first appearance of the two-thirds concept.

When, a decade after the Articles of Confederation became effective, the Constitutional Convention met, the delegates were therefore accustomed to a central Congress in which the states themselves, as sovereign and independent entities, voted as such on a basis of complete voting equality and with a requirement that more than two-thirds of those sovereign states should concur in the negotiation of all treaties with foreign nations. Congress was the sole organ of government. There was no executive, no national judiciary. Every treaty had to be negotiated and adopted by the ambassadors to this Congress from the associated state governments which appointed them, to which they were responsible, and from which they derived their power. Congress made foreign policy.

Some of the members of the Constitutional Convention were reluctant to admit the necessity for a national executive of any kind. They planned, rather, for the exercise of such central powers as were necessary by a national congress of the sovereign states. Even some of those who admitted the need for a national executive insisted that the powers to be conferred on an executive office be few indeed. Some of the first drafts proposed for a Federal Constitution reflected this deeply rooted suspicion of and antagonism toward a powerful executive. Under the Pinckney draft, for example, the only powers

a President could exercise in foreign affairs were to receive the ministers of foreign nations and to correspond with the executives of the different states.

The whole subject of treaty-making was debated at great length in the Convention. The decision to give only the Senate power to participate in the treaty-making process, rather than both Houses of Congress, seems to have been based mainly on grounds of secrecy. The delegates feared that if members of both Houses were privy to the diplomatic secrets involved in treaty negotiations the national security might be harmed by "leaks." There was probably a further reason, namely, that the House was to be based on popular representation in which larger and more populous states would naturally have greater weight, whereas the Senate was to be composed of ambassadors of equal rank representing sovereign states of equal standing who would participate in treaty-making in the names of their respective states.

A proposal was made to limit the number required to ratify a treaty to the majority of the whole membership of the Senate, but this was defeated by a vote of six to five. It will be noted that the provision now found in the Constitution came after the presentation of a welter of opinion and contention and then was adopted by a majority of only one vote. Had the representatives of the two other states been present, or had one of those present changed his vote, we should now have in the Constitution a provision for the ratification of treaties by a simple majority of the whole membership rather than a section based on the concept of an association of sovereign states with equal vote and equal power.

It is startling to realize in this connection that a treaty could conceivably be rejected by as few as 17 members of

the Senate. It is by no means probable that this would occur, but it is mathematically possible, since 49 members of the Senate constitute a quorum with full authority to consider a treaty submitted to it, and 17 of the 49 would be sufficient to prevent approval by two-thirds of those present.

Senate power to amend treaties

But there is still another anomalous aspect to the treaty-making provision. Most if not all of our authorities agree that the Senate has full power to amend and change any treaty laid before it for consideration. Without attacking this right of amendment, I call to mind that amendments can be adopted by a majority vote of a working quorum of the Senate. In other words, the Senate can amend, change, mutilate, or completely destroy a treaty proposal by a majority vote, but cannot give it approval in any form except by a two-thirds vote of assent.

From this brief historical review, it seems clear that one of the few weaknesses in the Constitution lies in the treaty-making provisions, and these in turn stemmed from the concept of the Founding Fathers that they were forming an association of sovereign states without accepting the full concept or the full consequences of a federal union. They could not depart entirely from state sovereignty. This was also the idea behind the creation of the Senate as a body in which each of the associated states would have equal representation without regard to size, resources, or population, and was also back of the repeated suggestions that the Senate, representing sovereign states, was in fact the executive center, and as such should handle foreign relations. When for this and other reasons, the Articles of Confederation were found inadequate and the new idea developed of setting up a

central executive instead of a consultative body of sovereign states, in order to secure ratification of the Constitution the states had to be accorded equality of representation in at least one of the branches of the legislature. It was because of the difficulty of framing a document acceptable to the states that the framers left the area of foreign affairs in such an inchoate form.

Since the provisions relating to foreign policy were adopted to meet the conditions and exigencies of that time, they do not and cannot properly meet and solve all the problems that more than a century and a half of phenomenal development of our country have posed. The antiquated machinery of treaty-making was based on concepts and conditions that have long ceased to exist. Even that machinery was a compromise designed to reach an accord among strongly contested viewpoints. As a consequence of that compromise, the machinery has developed such faults that, over the years, interpretations have been made by sufferance rather than by clearly accepted decision and conclusion. In too many instances treaties and agreements of tremendous importance and great potential value to the nation have been amended beyond repair, rejected outright, or allowed to lapse altogether, because of the absence of clear interpretative understanding of these treaty provisions.

EVOLUTION THROUGH THE YEARS

The struggle between the President and the Senate over control of foreign policy is inevitable in the structure of the Constitution. The conflict between them is a "built-in" feature of our basic charter. The conflict has persisted with varying degrees of intensity since the first years of the new Republic, and it will persist as many years more, or longer, unless and until there is a fun-

damental revision of the Constitution itself.

Treaty making

The conflicts of the period from 1789 to 1805 established the precedents for the battle that has continued ever since.¹ In this early period only thirteen treaties as such were submitted to the Senate. Not a single treaty was submitted between 1805 and 1815. From the latter date until 1841 there was a period of relative quiet in the struggle, and the real period of senatorial domination came in the years between 1869 and 1898. Treaty after treaty submitted by the Executive in that period was rejected or withdrawn. A second period of Senate dominance followed World War I, and there are certain signs that another such period may be dawning at the present time.

The framers of the Constitution had expected that the Senate would be consulted in advance of treaty formulation, as the Congress of the Confederation had been. President Washington at first attempted to carry out this practice, but the unavoidable conflict between the Senate and the Executive obliged him to abandon this procedure almost at the start.

Senators feared their constitutional prerogatives were being invaded, while the Executive Department feared its hands would be tied in international negotiation if the Senate tried to participate in every stage of treaty-making.

Using its power of amendment, the Senate up to the year 1901 had so altered between 80 and 90 treaties placed before it that almost one-third of them failed entirely or were abandoned. In the following 25 years, 58 proposed treaties were changed by the Senate, and of this number, almost 40 per cent

¹ W. Stull Holt, *Treaties Defeated by the Senate*, Baltimore: The Johns Hopkins Press, 1933.

were definitely abandoned or discarded because of these changes.

The Senate has also made frequent use of its power to confirm Presidential nominations to diplomatic posts.² In the early years the Senate used this auxiliary power not merely to determine the qualifications of a person named to a foreign post but also to determine whether a particular mission was necessary or not. When Presidents were about to undertake negotiation of a treaty they used to submit to the Senate the names of the persons who were to conduct the negotiations. The Senate could and did reject such nominations because it did not want the treaty to be negotiated. Even when the Senate did not reject a nomination outright, as in the case of the Jay Treaty of 1795, it could exert enough pressure to require the negotiator's name to be withdrawn in favor of another.

After 1815 the Presidential practice of submitting the names of treaty negotiators to the Senate was stopped, and the Senate thereby found its power to control or influence foreign policy through confirmation of appointments somewhat diminished.

In the twentieth century the Senate has used its power of confirmation to influence policy but has approached the matter in a different manner: by insisting that its consent is required for appointment of American representatives to any international organization. This approach was first used with respect to the League of Nations, and it has been followed in connection with the United Nations and its affiliates. It is also used in the case of the Economic Cooperation Administration and its successor, the Mutual Security Agency.

To sum up the conflict between the Senate and the President over control

of foreign policy, it seems clear that the cycle of senatorial or Presidential predominance corresponds with the cycle of weak and strong Executives in the White House.

The moment Senators sense that the hand of the President is weakening in foreign policy, there is an immediate rush to occupy the space vacated by the executive power. Like nature, politics abhors a vacuum. Sometimes the President's power is weak because of his own character and actions or failure to act, in which case the Senate's power simply flows into the area and pre-empts it. Sometimes the weakening of the Presidential power is the result of a conscious drive for control over foreign policy or particular areas of foreign policy by certain Senators, in which case the Executive is forced into retreat and his power is almost literally snatched from his hands by the advancing members of the Senate.

The best situation, of course, is one in which both the Executive and the Senate recognize each other's respective powers and responsibilities and work together in a co-operative spirit toward the achievement of the common goal. Rarely if ever in our history has this situation obtained to the degree it did in the years following World War II, but recent signs suggest that the era of Executive-Senate harmony in foreign affairs may be coming to an end.

SENATE'S FOREIGN AFFAIRS WORK LOAD

The tremendous increase in the foreign affairs work load of the Senate in recent years is, of course, a direct consequence and reflection of the growing participation of the United States in world affairs and the rise of this country to its present pre-eminent position as leader among the nations striving to establish a peaceful world community and to prevent totalitarian domination, whether by German and Japanese to-

² Felix A. Nigro, "Senate Confirmation and Foreign Policy," *The Journal of Politics*, Vol. 14, No. 2, May 1952, University of Florida.

talitarians before 1945 or by Russian and Chinese since.

Both Houses of Congress have been heavily burdened with questions relating to foreign policy: foreign relief, rehabilitation grants and loans, and foreign economic, technical, and military assistance. But the Senate's burden has been even greater because of its role in the treaty process. The United Nations Charter, the "satellite" treaties, the Rio Treaty, the North Atlantic Treaty and its several protocols, the Japanese Peace Treaty and the security treaties with the Pacific nations, and the German Contractual Agreement have all required tremendous work in the Senate that the House was spared.

In addition there have been the great foreign policy debates in which Senators have participated in greater number and with greater intensity than ever before, both in the struggle between isolationism and intervention in the years before Pearl Harbor, and in the other debates that have arisen in recent years as the bipartisan accord on foreign policy has partially broken down. The raging storm that followed the dismissal of General MacArthur for months engaged the full attention of more than a score of Senators in the Armed Services and Foreign Relations Committees as well as the time of many other Senators participating in the verbal struggle in the Senate and elsewhere. The Korean War and the political strife accompanying it in Congress have occupied an enormous amount of time of Senators.

Foreign policy has become a prime, if not the prime, issue in the political contests of the nation, and it is hence not surprising that the time of individual Senators and of the Senate as a body should be increasingly taken up with matters relating to foreign affairs.

While I have been unable to find a statistical analysis of the proportion of time occupied by foreign policy on the

Senate floor in recent years, it is beyond doubt that never before in history have Senators been so preoccupied with such questions and never before has foreign policy taken so great a portion of the time in floor debate and action.

One measure of the new importance of foreign affairs is the care which Senators seeking greater public recognition and advancement take to become expert in foreign policy.

Another token of the importance which Senators attach to foreign policy is the long and growing list of applications for seats on the Foreign Relations Committee. In the present session of Congress this committee has serving on it the chairmen of three committees (Interstate Commerce, Judiciary, and Labor) and the ranking majority or minority members of four committees, a record unmatched by any other committee of the Senate except Appropriations.

Wider scope of senatorial participation

Whereas for the first century and a half of the nation's history, the only matters of foreign policy to come before the Senate were treaties and nominations of ambassadors, today the Senate, as well as the House, is almost continually at work on some phase of the manifold problems of our new role in world affairs.

Military problems are so intertwined with foreign policy, and economic policy is so involved in both of them, it is no exaggeration to say that in the mid-twentieth century the Congress as a whole is concerned more with matters affecting, or affected by, the world at large than by all other problems together. Reciprocal trade, tariffs, imports and exports, foreign loans, economic, technical, and military assistance, exchange of students and other persons, foreign relief, displaced persons and refugees, overseas information and propaganda, espionage, atomic energy,

the United Nations, the North Atlantic Treaty Organization, military strategy and appropriations, international agreements of a hundred varieties, the organization and administration of vast and complicated programs—all these and many other subjects closely linked with foreign relations are constantly before the Congress. And I see no prospect that the load will diminish for years to come.

PROCEDURES AND METHODS OF OPERATION

With the exception of treaties, the procedures of the Senate in dealing with foreign policy matters are no different from those employed for any other legislation. Bills or resolutions are introduced by Senators, either on their own initiative or at the request of the administration, and are referred to the Committee on Foreign Relations.

If the measure is one of sufficient importance, the whole Committee gives it its consideration; if not, it is referred to a subcommittee for preliminary study. Public or closed hearings, or both, are held to obtain testimony from administration witnesses and private citizens. The Committee in executive session marks up the bill for referral to the Senate. A report is prepared by the staff on the basis of the testimony, the expressed views of Committee members, and the language of the bill as amended by the Committee, and finally the measure is reported to the full Senate and placed on the calendar to be called up as part of the normal legislative process. Sometimes the bill or resolution never sees the light of day after it reaches the Committee. Sometimes, though rarely, it may be reported unfavorably.

Debate on the floor precedes votes on amendments and on the bill. Amendments may be reported out by the Committee itself, or be proposed by any

Senator on the floor during the period prior to its consideration or adoption. If it is a bill originating in the Senate, after its passage it is sent to the House. If it originated in the House, and the Senate has amended it, it must return to the House for further action. In either case, differences are accepted or the bill is sent to conference between the two Houses to compromise the differences. When both Houses have approved the conference report, the measure goes to the President for signature.

In the case of treaties, the House, of course, has no function. The Executive Department files the document with the Senate under the seal of secrecy. It is referred to the Foreign Relations Committee, where the same procedure of consideration, study, and hearings is followed. If approved by the Committee, the treaty is placed on the executive calendar. If the Committee or any Senator wishes to change the treaty, a reservation is offered. If the reservation is adopted by the Senate, the treaty cannot become effective until the Executive has secured the agreement of the other signatories to the change. When debate on a treaty is ended, a two-thirds majority of the Senators present is needed to ratify the treaty, which, if ratified, is returned to the President.

In the case of confirmation of nominations to high diplomatic or foreign policy posts, the procedures do not differ from those used for any confirmation by the Senate of nominations to other government offices. A simple majority vote is needed in the Senate to complete the confirmation.

PROMINENT FIGURES IN THE SENATE

Limiting ourselves to the past 30 years or so, and omitting any present members of the Senate, a list of figures whose service in the Senate had a powerful, if not always decisive impact on

foreign policy, would have to include Senators Henry Cabot Lodge, Sr., James Reed, Hiram Johnson, William Borah, Arthur Vandenberg, Robert LaFollette, Jr. and Tom Connally.

Most of these Senators, it will be noted, were isolationists. Senators Lodge and Reed led the fight against the League of Nations. From the end of World War I until the dramatic change from isolationism by Senator Vandenberg in the last years of the Second World War, the Foreign Relations Committee was predominantly isolationist in character. The majority of the members opposed the foreign policies of both Presidents Wilson and Roosevelt, mostly because of their traditional isolationism and partly because of political motives. Senators Johnson, Borah, LaFollette, and, until his great change, Vandenberg, were uncompromising adherents and advocates of an isolationist and neutralist America. By his change Vandenberg made possible the development of the bipartisan accord on foreign policy that was of such momentous significance in the years following the drafting of the United Nations Charter and the end of World War II. Under Senator Connally, who, except for the 80th Congress, was chairman of the Foreign Relations Committee throughout this period until the present Congress, and with the leadership of Senator Vandenberg in the Republican party, the Committee altered its former outlook completely and became one of the staunchest supporters of the policies aimed at checking Soviet expansion. But in doing so, the Committee fully retained its independence of the Executive and upheld the power of the Senate in foreign relations.

THE SENATE'S SHARE IN FORMULATING FOREIGN POLICY

As I have remarked earlier, there has been a cyclical movement in the strug-

gle between the Senate and the President over control of foreign policy, with Senate predominance coinciding with weak or indecisive Presidents, and Presidential predominance coinciding with strong and determined Chief Executives.

Regardless of the fluctuations in relative party strength in recent years, by and large the two groups have worked together remarkably well, and the country as well as the free world has benefited thereby.

The preliminary studies leading to drafting the United Nations Charter brought the first close collaboration among leading Senators and the administration. The Senate's share in formulating our UN policy at that time was very great. It was the argument that the Senate would never ratify the Charter without the veto provision that determined American insistence on unanimous agreement among the permanent members of the Security Council. It is a source of irony to those of us who from the start opposed the veto provision to find that while the Soviet Union has abused the veto power nearly to the point of paralyzing the UN, the United States has never once had recourse to it.

Throughout the first five years of President Truman's tenure in the White House, the presence of a bipartisan majority on foreign policy in the Senate not only made it possible to carry out the major policies and programs required to organize the free world and check the Communist expansion, but also assured the Senate a large share of influence and responsibility in formulating the broad policy and programs. Many of the most important legislative enactments in foreign aid bills, for example, were amendments proposed by Senators.

Since the untimely death of Senator Vandenberg, the bipartisan accord has weakened considerably, but that has not

necessarily prevented many Senators from determining foreign policy to a greater degree, in some instances, than the Executive.

Largely because of the Far East disaster, foreign policy has frequently in recent years been a football of partisan politics. It is perhaps going too far to say that Senators who chose to make Far Eastern policy a domestic political issue were thereby able to share in formulating new policy, but in a number of cases they have been able to prevent carrying out of existing policy of which they did not approve.

Because the Senate is one of the greatest sounding boards in the world, with no restrictions on debate to prevent full development of a question, it is a natural platform for individual or group efforts to modify existing policy or institute new policies. Senate agitation was largely responsible for the gradual termination of the dismantling program in Germany, for tightening control over East-West trade, for changing the emphasis in the Far East and bringing about a drastic revision of policy regarding Formosa, for bringing Greece and Turkey into NATO, and for many other alterations and innovations in policy.

By amendments to the ECA and MSA legislation the Senate has taken the lead in urging the unification and integration of the Western community, particularly the European portion of that community. It was a Senate proposal that broke the deadlock on how ECA was to be administered. It was

a Senate proposal that brought about reorganization of the Mutual Security Agency last year.

The Senate has continued to exercise influence over foreign policy through its power of confirmation. Perhaps the outstanding case was that involving Mr. Paul Hoffman. Senate pressure was instrumental in securing the nomination of Mr. Hoffman, a Republican, as ECA Administrator in a Democratic administration, and thereby instrumental in keeping Congressional support of this major bipartisan project.

On the whole, the record of the Senate in recent years has been a commendable one. There have been a few misguided efforts to force the Executive to take certain steps which may well have not been in the long-term national interest, but when one looks at the lengthy list of major treaties and agreements that have gone through the Senate, and when one notes by what a large majority most of them have been approved, it can be seen that there has been a very considerable measure of bipartisan co-operation and also a very sizable measure of senatorial agreement with the general policies. This could have come about only because of the great care that was taken in securing the advice and consent of the Senate in the process of developing and maturing the policies and programs. The increasing use of Senators as delegates to international conferences is a highly encouraging tendency that promises even closer co-operation and understanding.

Guy M. Gillette, Washington, D. C., is United States Senator from Iowa. He is a member of the Committee on Foreign Relations and of the Rules Committee, also of several subcommittees. He formerly served in the House of Representatives and was a member of the Committee on Foreign Affairs. He helped to draft proposals preparatory to creation of the United Nations, and took part in formulating the program of the Food and Agriculture Organization. Before his election to Congress, he practiced law in Cherokee, Iowa.

The Committee on Foreign Relations

By ALEXANDER WILEY

THE Committee on Foreign Relations is one of the chief agencies for the determination and translation of United States foreign policy into law. The Committee is the instrument of the Senate and the Congress, for international purposes, and in these critical times it has assumed a greater importance than at any previous time in its history.

The Constitution does not provide for congressional committees, but they have been created for the convenience and efficiency of carrying out congressional business. In foreign relations matters, the Senate, as a rule, only speaks when the Committee on Foreign Relations has considered a treaty, a nomination, a bill or a resolution; and only when the Committee has made recommendations and reports on measures under Senate consideration. Most of the Committee recommendations are adopted by the Senate, giving great weight to Committee deliberations and judgments.

DEFINITION OF RESPONSIBILITIES

The Reorganization Act of 1946, Public Law 601, 79th Congress, 2nd Session, defines the responsibilities of the Committee as follows:

(i) Committee on Foreign Relations, to consist of thirteen Senators, to which committee shall be referred all proposed legislation, messages, petitions, memorials, and other matters relating to the following subjects:

1. Relations of the United States with foreign nations generally.
2. Treaties.
3. Establishment of boundary lines between the United States and foreign nations.

4. Protection of American citizens abroad and expatriation.
5. Neutrality.
6. International conferences and congresses.
7. The American National Red Cross.
8. Intervention abroad and declarations of war.
9. Measures relating to the diplomatic service.
10. Acquisition of land and buildings for embassies and legations in foreign countries.
11. Measures to foster commercial intercourse with foreign nations and to safeguard American business interests abroad.
12. United Nations Organization and international financial and monetary organizations.
13. Foreign loans.

MEMBERSHIP AND ORGANIZATION

The Senate Committee on Foreign Relations was created in 1816, by a resolution introduced by Senator James Barbour of Virginia. Previously, foreign relations matters had been dealt with by reference to a select committee, or directly on the floor of the Senate. Membership was raised from 5 in 1816 to 23 in 1933, whereupon it was reduced to 13 by the Reorganization Act of 1946 and then again increased to 15 in 1953.

The Committee reflects the two-party system that controls the operations of the Senate. According to the Reorganization Act, the proportion of seats held by each party is supposed to correspond to the respective strengths of each party in the Senate. At the start of each new Congress a committee of committees of each party makes up a list of assignments of party members for each committee. The criteria usually used in the

selection of members are length of service, geographical location, special experience, and personal preference. Membership on the Committee on Foreign Relations is now considered very desirable, with the result that most of the incumbents are men with long service in the Senate.

The chairmanship is determined by seniority, and since a Senator may be chairman of only one committee, he may forgo his claim upon the chairmanship of one committee in order to serve as chairman of another committee which office seems more attractive to him. When party control shifts in the Senate, the ranking minority member of the committee becomes the new chairman. The chairman of the Committee on Foreign Relations is charged with conducting legislation through the Committee, through the Senate, and through the conferences with the House of Representatives. It is difficult for him, although he frequently must speak as an individual senator, to dissociate himself from the chairmanship which he holds. He speaks both for the Committee and, in certain cases, for the Senate. He is regarded abroad as a spokesman for the government of the United States on some matters. Once chosen, he continues indefinitely in his position as long as his party remains in power. Only once, namely in the case of Charles Sumner in 1870, has the chairman of the Committee on Foreign Relations been removed against his will.

Past chairmen

A number of outstanding American leaders have held the chairmanship of the Committee since its inception. The chairmen of the Senate Committee on Foreign Relations have been James Barbour of Virginia, 1816-1818, 1820-1821, 1822-1825; Nathaniel Macon of North Carolina, 1818-1819, 1825-1826, 1827-1828; James Brown of Louisiana,

1819-1820; Rufus King of New York, 1821-1822; Nathan Sanford of New York, 1826-1827; Littleton W. Tazewell of Virginia, 1828-1832; John Forsyth of Georgia, 1832-1833; William Wilkins of Pennsylvania, 1833-1834; Henry Clay of Kentucky, 1834-1836; James Buchanan of Pennsylvania, 1836-1841; William C. Rives of Virginia, 1841-1842; William S. Archer of Virginia, 1842-1845; William Allen of Ohio, 1845-1846; George McDuffie of South Carolina, 1846; Ambrose H. Sevier of Arkansas, 1846-1848; Edward A. Hannegan of Indiana, 1848-1849; Thomas H. Benton of Missouri, 1849; William R. King of Alabama, 1849-1850; Henry S. Foote of Mississippi, 1850-1851; James M. Mason of Virginia, 1851-1861; Charles Sumner of Massachusetts, 1861-1871; Simon Cameron of Pennsylvania, 1871-1877; Hannibal Hamlin of Maine, 1877-1879; William W. Eaton of Connecticut, 1879-1881; Ambrose Burnside of Rhode Island, 1881; George F. Edmonds of Vermont, 1881; William Windom of Minnesota, 1881-1883; John F. Miller of California, 1883-1886; John Sherman of Ohio, 1886-1893, 1895-1897; John T. Morgan of Alabama, 1893-1895; Cushman K. Davis of Minnesota, 1897-1901; Shelby M. Cullom of Illinois, 1901-1913; Augustus O. Bacon of Georgia, 1913-1914; William J. Stone of Missouri, 1914-1918; Gilbert Hitchcock of Nebraska, 1918-1919; Henry Cabot Lodge of Massachusetts, 1919-1924; William E. Borah of Idaho, 1924-1933; Key Pitman of Nevada, 1933-1940; Walter F. George of Georgia, 1940-1941; Tom Connally of Texas, 1941-1946, 1949-1952; Arthur H. Vandenberg of Michigan, 1947-1948; and Alexander Wiley of Wisconsin, 1953-.

My predecessors have demonstrated that the chairman can exert great influence with respect to both treaties and legislation pertaining to international

affairs. It is also clear from their experience that the influence they exert depends upon their own inherent qualities of leadership, their grasp of the scope of their office, and their interpretation of the legal and constitutional rights of the Senate in those matters that pertain to foreign relations.

Subcommittees

In order to carry out its business of dealing with bills, resolutions, international agreements, investigations, and nominations, the Committee may operate in plenum or in the form of subcommittees. There are no permanent subcommittees. All subcommittees are *ad hoc* in nature appointed to deal with specific legislation referred to the Committee. There is in addition at present a system of subcommittees established by the Committee for consultation with the State Department on specific problems confronting the Department or to provide the Committee with information on situations and conditions abroad.

Staff

To aid in its work, the Committee is furnished with a staff. During the war the Committee was provided with six employees, and the chairman had only a small appropriation for clerical help. Since the employees were only clerks, it was the practice of the chairman to bring his own employees to the Committee, thus dividing his staff between his own office and the Committee. It was often impossible to distinguish between the two groups. There were no permanent employees or systematic records; this resulted in few files and rarity of experienced employees to aid the new chairman and the Committee. In 1946 the Legislative Reorganization Act provided that each standing committee of the Congress could appoint four professional staff members on a permanent nonpolitical basis to be as-

signed to the chairman and the ranking minority member of the committee. A clerical staff of not more than six members was also provided. Provisions were made for the conduct of hearings and the care of records, charts, data, and files. All records are the property of the Congress of the United States. These provisions, of course, applied to the Committee on Foreign Relations.

PROCEDURES AND FUNCTIONS

The normal Committee working procedure is to place upon its calendar all treaties, executive communications, bills, resolutions, nominations, and nonlegislative activities referred to it. After considering a matter on its calendar, the Committee may report the measure favorably or unfavorably, with reservations, with amendments, with interpretations, or it may let the measure remain on the calendar until the end of the session, when it will die. It can be considered again only if referred to the new Congress. Finally, the Committee may refuse to make any report on a measure. In such case the only way in which the matter involved may be brought to the Senate floor is for that body to order the Committee to report, or take the measure out of Committee hands.

Legislative function

The functions of the Committee are legislative, executive, investigative, and consultative. The legislative function consists of formulating, amending, and reporting bills and resolutions to the Senate. The executive function has to do with treaties, international agreements, and nominations under the Constitution. The investigative function pertains to securing information required by the Senate in the performance of its duties. A little known, but by no means unimportant, function of

the Committee is the consultative function already referred to.

In performing its legislative function the Committee is different from other committees of the Congress only as to the nature and scope of its subject matter. In general it follows the same steps as other committees do in analyzing a problem, studying alternative proposals, drafting bills, consulting with departments, holding hearings and amendments, making committee reports, debating on the Senate floor, and participating in conference consideration. The customary 28 steps in the enactment of a law govern the legislative activities of the Committee on Foreign Relations.

Like all bills before the Congress, Foreign Relations Committee bills may be public or private; that is, they may deal with classes of persons or with specific persons, corporations, or institutions. Foreign relations resolutions may be made by the Senate acting unilaterally (Senate Resolution); jointly with the House (Joint Resolution), expressing a policy with the force of law and frequently used in foreign relations matters; or concurrently with the House (Concurrent Resolution), which measure possesses the characteristics of a joint resolution but does not have the effect of law. In addition to these items the Committee handles messages, recommendations, petitions, and memorials concerning foreign relations.

Executive function

As for the executive function, the Senate has delegated to the Committee on Foreign Relations the initial consideration of treaties and international agreements submitted to the Senate. It is the only committee that has jurisdiction over such agreements. Elsewhere in this volume¹ consideration is given

¹ See Guy M. Gillette, "The Senate in Foreign Relations"; Mike Mansfield, "The Meaning of the Term 'Advice and Consent.'"

to the nature of agreements submitted to the Senate and the problem involved in executive agreements. Here it suffices to say that both the Senate and the Committee guard with care their Constitutional powers with respect to treaties. Speaking on the Connally resolution on October 25, 1943, Senator Vandenberg said:

The Senate and the House are rightly jealous of their own prerogatives. We assert these prerogatives in the pending resolution—precisely as did the House in the Fulbright resolution—when we declare that America's ultimate commitments shall scrupulously pursue the constitutional process. Those who thus defend their own constitutional prerogatives should be equally scrupulous in recognizing the constitutional prerogative of the Executive in respect to the initial negotiation of international engagements. I fervently believe it is of the highest concern that the Senate and the Executive should work in the closest possible cooperation in the evolution of the formulas of peace so that we may avoid the sterile deadlocks of 25 years ago. But I equally believe that we must respect each other's constitutional rights; and that we in the Senate are not the ones who should speak first in respect to any detailed blueprints of peace. We are entitled to "advise" the Executive in respect to the boundaries of our peace purposes. Beyond that we would be—certainly at the present moment—somewhat trespassing.²

As for nominations the Constitution provides that the President "shall nominate, and by and with the advice and consent of the Senate, shall appoint Ambassadors, other public Ministers. . . ." When the President nominates the Secretary of State and other high officers of the State Department and of the Foreign Service of the United States, the Committee determines whether or not the nominee is qualified for the office for which he has been designated. Sena-

² *Congressional Record*, Vol. 89, Part 7 (October 25, 1943), p. 8667.

tors from whose state the nominee comes are consulted. The Committee may also hold hearings if it so decides. Should the Committee action be adverse, the President may withdraw the nomination or he may leave the decision of approval or rejection to the Senate.

Investigative function

The Committee uses its investigative function principally in hearings where it secures the facts, analyzes solutions for the problems it confronts, and tests out public opinion both pro and con legislation under consideration. Studies, reports, and memoranda both from private citizens and public officials are also a part of the background the Committee seeks to secure.

Consultative function

The consultative function has assumed increased importance since the end of World War II. Not only has the executive branch sought and received the advice of the Committee on specific items such as the Japanese Peace and Security Treaties and the North Atlantic Treaty during the process of their formulation. A regular organization has been created for consultative purposes. The Committee Print devoted to this matter has the following to say:

The subcommittee system is designed primarily to foster more extensive consultations between the Foreign Relations Committee members and responsible officers of the Department of State. Since the war our role of leadership in the world has thrust new and important responsibilities upon the United States. Moreover, the problems which confront us in various parts of the world have increased tremendously in number and complexity. This means that a degree of specialization in the work of the Foreign Relations Committee has become desirable. By organizing along subcommittee lines set forth above, it is possible for the members to keep abreast of the more important developments within

each of the geographic and substantive areas in the State Department.

It should be emphasized that the subcommittees are for purposes of consultation and are not primarily designed to handle legislative matters. Treaties and legislative items on the committee's agenda are handled, for the most part, by ad hoc subcommittees.

It should be emphasized, too, that the existence of these eight subcommittees does not mean that consultations between the Secretary of State and the Foreign Relations Committee upon matters of major importance is diminished. What is involved is an additional mechanism which helps to insure that at least two or three members of the committee are kept currently informed with respect to events and anticipated developments in every quarter of the earth.

During the past few years consultations between the Foreign Relations Committee and the executive branch have taken place with increased frequency. These consultations have been extremely helpful in the formulation and execution of American foreign policy during a particularly critical time in world history. It is an important and a constructive endeavor, as we face the difficult problems that lie ahead, to encourage further legislative-executive cooperation through the continuation of the subcommittee system outlined above.³

Outlined below is a breakdown of the members of the Foreign Relations Committee into subcommittees for purposes of consultation with the Department of State. The subcommittee structure corresponds generally to the organization of the Department.

1. United Nations Affairs: Senator Tobey (chairman), Senator Smith, Senator Gillette, and Senator Mansfield. Committee staff member, Mr. Wilcox.
2. Economic and Social Policy Affairs: Senator Langer (chairman), Senator Tobey, Senator George, and Senator Humphrey. Committee staff member, Mr. Kalijarvi.

³ *Subcommittees for Consultation Purposes*, Committee Print, Committee on Foreign Relations, 83d Congress, 1st Session, p. 2.

3. Far Eastern Affairs: Senator Smith (chairman), Senator Hickenlooper, Senator Knowland, Senator George, and Senator Sparkman. Committee staff members, Messrs. Wilcox and Cahn.

4. European Affairs: Senator Wiley (chairman), Senator Taft, Senator Fulbright, and Senator Humphrey. Committee staff members, Messrs. Wilcox and Kalijarvi.

5. Near Eastern and African Affairs: Senator Taft (chairman), Senator Knowland, Senator Fulbright, and Senator Gillette. Committee staff member, Mr. Marcy.

6. American Republics Affairs: Senator Hickenlooper (chairman), Senator Ferguson, Senator Green, and Senator Sparkman. Committee staff member, Mr. Kalijarvi.

7. Public Affairs: Senator Knowland (chairman), Senator Hickenlooper, Senator Green, and Senator Fulbright. Committee staff member, Mr. Marcy.

8. State Department Organization: Senator Ferguson (chairman), Senator Langer, Senator Green, and Senator Mansfield. Committee staff members, Messrs. Marcy and Cahn.⁴

COMMITTEE RELATIONSHIPS

The jurisdiction of the Committee, it may be seen, is very extensive. In discharging its many functions it has a variety of important contacts and relationships. None is more important or more constant than that with the Department of State and with the Secretary of State. The Secretary and his officials in the Department must appear before the Committee in support of many measures the Committee handles. Their views and advice are sought on most measures before the Committee. The Secretary frequently consults with the Committee when he is engaged in the negotiation of treaties and participating in international negotiations. The Committee in its turn influences the Department and its officers through advice and constant contact. The Committee may as a body seek to influence executive policy through bills, resolu-

⁴ *Ibid.*, p. 1.

tions, reports, and consultation. To a lesser degree the Committee has similar contacts with other agencies; for example when studying the St. Lawrence Seaway the Committee consulted the Departments of Commerce, Treasury, Defense, and Interior, and the Bureau of the Budget.

With its counterpart in the House of Representatives, namely the Committee on Foreign Affairs, the Committee on Foreign Relations has constant legislative contact. The most common occasions for getting together take place when legislation has passed both houses and agreement is needed on amendments added by either house. It should be borne in mind that a number of measures such as treaties and nominations do not require House action, but bills and joint resolutions do frequently require the attention of the conference committee.

Another relation of the Committee grows out of that of the Senate with foreign nations. Although prime responsibility for United States contact with countries abroad rests with the President, the Senate does, on occasion, have relations with other countries. Before noting these relations, it should be emphasized that the primacy of the President in these matters has been clearly understood from the beginning of our history. It was John Marshall who on March 7, 1800 said, "The President is the sole organ of the nation in its external relations, and its sole representative with foreign nations." In the past there have been times when foreign officials have appeared before the Committee, but these were exceptional. Today, however, there is a steady flow of high officials from foreign countries who consult with the Committee. Some notable recent instances have been Chancellor Adenauer of Germany, Vice President Radhakrishnan of India, and Foreign Minister Georges Bidault of

France. The main Committee and some of the subcommittees on their travels are also in the habit of meeting with the outstanding officials in the countries they visit.

Another important relation of the Committee is that with the public. By means of hearings and opinions sought or sent in gratuitously, the views of groups and private individuals are attained. Organized groups representing labor, agriculture, religion, education, and many other kinds of interests testify before the Committee. So too with international lawyers, historians, and experts on foreign countries. A press conference after each meeting of the Committee, in addition to the public hearings and the reports of the Committee, serves to keep the general public aware of the Committee's doings and permits the public to react for the guidance of the Committee. In addition individual members of the Committee give personal interviews, write articles, deliver speeches, appear on the radio and television, participate in forums, and on the floor of the Senate give voice to opinion on matters under consideration. Thus the Committee is a focal point where information converges from many different sources and is interpreted to the public.

CHANGING WORK LOAD

A scanning of the history of the Committee on Foreign Relations leaves one with the impression that the Committee moved at a deliberate pace prior to World War II. It succeeded in keeping up with its calendar, and, if matters were left in abeyance at the end of a legislative session, it was for the most part because the Committee chose to leave them there. Following the war, in major measure because of the greater importance of the United States in world affairs, work has increased and the Committee finds itself under constantly

mounting pressure. During the present session (83d Congress, 1st session), the Committee has been sitting almost constantly in morning and afternoon sessions, and on occasion on Saturdays. Subcommittees on legislation and consultation are in steady meeting.

During the intersession period of Congress, the State Department usually makes up a list of the legislation it hopes the Senate and the Congress will act upon during the coming session. On such a list there are often 60 to 75 items of major interest to United States foreign relations. As a rule only a portion of this list is covered by the end of the session. Nevertheless the amount of work turned out by the Committee during a Congress is impressive.

During the 81st Congress, in addition to consultation, action on nominations, and miscellaneous activities, the Committee considered and acted upon the North Atlantic Treaty; two mutual defense assistance acts; ten acts of economic assistance, including the European recovery programs of 1949 and 1950; two Korean aid acts; Palestine refugees; China aid; relief for Yugoslavia; International Children's Emergency Fund; and the Institute of Inter-American Affairs; fourteen United Nations matters including among other items the International Convention for the Safety of Life at Sea, the Genocide Convention, and the Convention on Road Traffic; three matters dealing with the Department of State and its organization; three items dealing with the inter-American system including the Charter of the Organization of American States; four fisheries agreements; ten bills, resolutions, and agreements pertaining to bridges and boundaries; six resolutions pertaining to international meetings, exhibitions, and games; nine claims and other financial arrangements, including the Swiss bombing claims and the International Claims

Settlement Act; and two commodity agreements, namely the International Wheat Agreement and the Protocol prolonging the International Sugar Agreement. This work included 1,049 nominations, 25 treaties, and 38 bills and resolutions.⁵

This list does not include investigations by the Committee, as for example its examination of the North Atlantic defense setup in Europe and the work of the subcommittee investigating into loyalty matters. Nor does it make allowance for the seven special reports and prints issued by the Committee in the course of its activities. Nineteen subcommittees were set up to deal with specific legislative matters and the eight important conference committees were participated in.

When one considers that in addition there were many informal conferences in which members of the Senate Committee participated, some idea of the extent of Senate activity can be gathered. Needless to say, in addition the Senators were required to be on the floor of the Senate to participate in deliberations there and to attend meetings of other committees of which they were members. Nor should one forget in this

⁵ During the 82d Congress the Committee acted on 1,059 nominations, 18 bills and resolutions, and 39 treaties and international agreements.

analysis to take into account the constituent, who is a most important person whom the Senator must serve and whom he is never allowed to forget.

REPLY TO CRITICS OF COMMITTEE

As a legislative institution the Committee on Foreign Relations may leave something to be desired; but it has served a most useful purpose in the past, and at least to the present it has managed to keep abreast of the most important demands on the Senate in the field of foreign relations. There have been many criticisms addressed to the selection of members, to the designating of the chairman by seniority, and to the slowness with which the Committee on occasion works. But those who would change this institution must accept the burden of proof. They must provide a more effective method of operation. Any American citizen who wishes to be heard on an item before the Committee has the right to be heard and will be heard. In closing let it be noted that, as a human institution, the Committee can be improved upon and undoubtedly will be improved upon, but in spite of this the Committee has taken on an increased importance in the American governmental scheme in contrast with the diminishing influence of legislative committees in many other countries.

Alexander Wiley, Washington, D. C., is a Republican Senator from Wisconsin and has been chairman of the Senate Committee on Foreign Relations since January 1953. As chairman he has continued support of bipartisan policies for American leadership in international affairs. In the 80th Congress he served as Chairman of the Senate Judiciary Committee, and he is currently the ranking Republican member on that Committee, taking a particularly active role on matters relating to foreign affairs, notably the Bricker Amendment to the United States Constitution, S. J. Res. 1. He has served as an American delegate at numerous international conferences, including the Empire Parliamentary Conference, the Interparliamentary Union, and the American Mission to the Council of Europe. He served at the session of the Seventh General Assembly of the United Nations in New York in 1952. Before his election to the Senate he practiced law for over 30 years and served three terms as county district attorney.

The House of Representatives in Foreign Affairs

By JAMES P. RICHARDS

THERE is a well-entrenched notion that the President is responsible for the foreign relations of this country. Almost daily newspaper headlines and stories give support to this viewpoint. Not nearly as well understood is the role of Congress and its responsibilities in foreign affairs.

Let us take the Constitution as a point of departure. There are a few provisions, admittedly anemic, in the Constitution that touch on the President's powers, such as the right to exchange diplomatic representatives, and the right to initiate treaties and to conclude them by and with the advice and the consent of the Senate. Executive activity and judicial opinion have increased these powers over the course of American history. But Article I, Section 8 of the Constitution gives to the Congress certain powers: the rights to declare war, to maintain the Army and the Navy, to lay and collect taxes and import duties, to coin money, to maintain the postal system, and a host of other provisions. These powers, increasingly important in the operation of our foreign affairs, are relied upon today and used more widely than ever before by the Congress to participate in the foreign affairs field. The result has been a struggle between the Executive and the Congress, sometimes acute, particularly in times of national elections and national crises. In between there is a twilight zone, as Professor Corwin has observed, where the two branches compete for the remaining or unmarked powers in the field of foreign affairs. This twilight zone has helped to produce over the last half century a relationship, often changing and sometimes rather tenuous, between the Executive

and the Congress, depending upon the personalities at each end of Pennsylvania Avenue and the issues involved.

This is part of the vitality of American politics. It is nothing that can be regulated by constitutional amendment or by legislation; it must be recognized as an inevitable part of our process of division of powers. A problem that is faced in the foreign affairs field is to bridge the gap between the rather limited but defined powers of the President on the one hand, and the growing sense of power in the field of foreign affairs by the Congress, on the other hand.

There is an advantage, as I see it, to this lack of precision, or, if you like, to the existence of a gap. It permits a great deal of flexibility. If it did not exist, we should have to work out some kind of a statutory or constitutional provision to demarcate the role of these two organs of government. I am convinced that such a division would be unresponsive to the shifting elements that make up foreign policy. The very fact that we have not done that permits a flexibility in the adjustment of relations between the President and the Congress. The increased role of Congress today in foreign policy is not due to any constitutional change; it is not due to any statute; it is not due to any interpretation by the Supreme Court. It is simply attributable to the fact that the Congress has begun to use more fully and more completely the powers which have always been in the Constitution in the field of foreign affairs.

THE POWER OF THE PURSE

The power of the purse is the most important power that Congress possesses

in any domain—domestic or foreign. Any piece of legislation in the field of foreign policy that necessitates money puts Congress in a rather dominating position. In President F. D. Roosevelt's first Congress, the Seventy-third Congress, 1933–1934, the House Foreign Affairs Committee authorized appropriations of about \$200,000. In the Eighty-second Congress, which ended last January, the House Foreign Affairs Committee authorized about \$14 billion, most of it for the two bills pertaining to Mutual Security Assistance and foreign aid. In short, in twenty years the magnitude of fiscal considerations by the committee responsible for substantive matters in foreign affairs in the House has increased by 70,000 fold. Quite obviously, the mere process of handling bills of that scope has conferred upon the Congress, and particularly the Foreign Affairs Committee, enlarged responsibility and opportunity to study and deal with questions of foreign policy.

Not only has there been an increased role on the part of Congress in foreign policy making, but within the Congress itself there has been an equally important shift, that is, the greater participation of the House as part of the formulative machinery of foreign policy, often at the expense of the Senate. The Senate's role is defined in the Constitution and pertains to two fields in which the House has no jurisdiction, namely, the making of treaties and the confirmation of appointments to office. When the power of the purse is involved, the House is far more interested and far more lively in its debates on foreign policy than it ever has been in the past. The reason is that even though the treaty process is still used, many treaties need implementation in the form of supporting legislation. Thus a treaty, like the North Atlantic Treaty, in which

the Senate alone participated in the debate as to its acceptance, had to be implemented by military support. This process of implementation led to the initiation of the Mutual Defense Assistance Program. That program required statutory authority and meant that the House of Representatives was, and is, actively concerned with the whole North Atlantic Treaty structure.

CONGRESS AS A COMMUNICATOR OF PUBLIC OPINION

Another reason for the enhanced role of the House as against the Senate is that there is a greater popular interest throughout the country in foreign policy. It is not important or even desirable to argue whether that is good or bad. It is not a moral question; it is a fact. I think it is one that is going to continue as a basic fact in our government. More and more of our time, more and more of our concepts within the domestic sphere will be shaped by the course of foreign events. That means that the people will be more interested, that they will have views and attitudes that will be communicated to the Congress. You can bet that the Congress will communicate them to the Executive regardless of who holds the Presidential office.

Legislative policy making, whether in the domestic or the foreign affairs field, is always technical, usually complicated, and frequently not well understood. The rules of both the House of Representatives and the Senate, complicated as they are, have a single purpose, namely, to conduct public business in an orderly and expeditious manner. But the rules are no substitute for good judgment in handling a legislative measure. How and when something is done and the way it is done may mean the difference between success and failure in important policy decisions.

CONGRESS ASSESSES PROGRAMS PRESENTED

Every measure that the President presents to the Congress in the foreign affairs field is intended for the good of the country. I cannot conceive of any President's presenting a measure for any other reason. That does not mean, however, that the Congress accepts that judgment in its entirety. If it did, it would become merely a rubber stamp. The role of the Congress, therefore, is to make its own assessment of the program requested, including the mechanism by which the program will be executed.

PROCEDURE IN POLICY MAKING

Most major bills, like the Mutual Security Program, are considered in two stages: first, general debate, and second, reading for amendments. General debate permits an exchange of views which indicates to the leadership and those in charge of the bill what they may anticipate in the way of amendments when the bill is read for amendments. The time allotted for general debate calls for considered judgment. Too little time will lead to accusations of "gag" and Members immediately become resentful. If the amount of time is more than necessary, debate may lag, the proceedings become dull, and Members lose interest. Roll call votes late in the week may have a disastrous effect on a measure. I well recall that a vote on a Friday night certainly affected the Mutual Security Program in 1951. A motion to recommit with instructions to cut European economic aid funds by about \$300 million was made late Friday evening and carried by a close margin of nine votes; 69 Members did not answer the roll. I am convinced that the day and hour had much to do with the passage of this motion.

The initiative for legislative policy

making in foreign affairs is usually conducted on the basis of proposals submitted by the President. This is understandable when one considers the unique advantage enjoyed by the Executive. The President and his Secretary of State have access to a vast array of information that does not come within the possession of the Congress. The exchange of communications between the State Department and our missions overseas and the conversations carried on between our policy-making officials and those of foreign governments are focused in the hands of the Executive. Much of their content is highly classified. The Executive is probably more sensitive to the element of timing than is the Congress. When to say or do something may be as important as, or even more important than, what to say or do. Despite these considerations, if Congress is determined to act in legislative policy making in foreign affairs, it can do so. In the mid-1930's, the House took the initiative in putting through a series of so-called Neutrality Acts. More recently, Congress passed the "Battle Act" fixing the policy on control of trade with the Soviet Union and satellites. This act originated in the House Foreign Affairs Committee, not in the executive branch.

Compromise

One student of the American political scene observed that politics is the art of the second best. This is another way of saying that compromise occurs throughout the legislative process. I hasten to point out that compromise is not confined to congressional policy making. In the executive branch compromise is used constantly as policy formulation moves from the lower echelons to the higher. It is far more informal and fluid than that which prevails in the legislative branch. Once compromise has been achieved at any one of the

legislative steps it is exceedingly difficult to alter it. Once the Committee on Foreign Affairs has made a judgment on a proposal, it passes it on to the House. If the House accepts that proposal, it becomes the judgment of the House. Similar steps prevail in the Senate. Perhaps the most crucial compromise stage is a reconciliation of the differences between the two Houses. Under the rules of both Houses, a conference report brought back to each House can only be voted up or down; it cannot be changed. When the two Houses have compromised their differences, the measure is sent to the President. With his signature the bill then becomes a law and cannot be changed without additional legislative action.

Committees and policy making

The Committees of the two Houses have a rather unique function in the policy-making process. They are the links between the Executive, with its specialized knowledge, and the House or the Senate as a body with generalized knowledge or lack of knowledge. The first task of the executive branch is to convince the congressional committee that the policies or propositions it is advocating are sound, commendable, and necessary. The function of the Committee, in such circumstances, is to examine, to review, to question, to criticize, and then to make its judgment. Unless the Committee is convinced of the soundness of the proposal or policy advanced, one cannot expect the Committee to sell the entire House or the entire Senate. Woodrow Wilson, who was a student and professor of government, wrote a volume more than half a century ago, called *Congressional Government*. He recognized at that time that the committees really control the Congress. Nothing he said in that book about the nature of their activities

has in any way diminished. Indeed, their role has really been strengthened by a number of internal reorganizations and developments in both Houses. The Committee becomes, therefore, the distillation machinery between the executive agency and the particular body to which a proposal is submitted.

Contrary to popular belief, legislative policy making is informed and responsible. From twenty years of membership on the Committee on Foreign Affairs, I can honestly say the Committee is representative of the views of the American public. It mirrors the attitudes and reactions that prevail among any group of American citizens. Its Members as a body are able and hard working; they know what they are doing; and they consistently display talent of an extraordinary character in reaching their decisions. The fact that there are divergent views among the Members in no way detracts from the conscientious approach they bring to the subject.

PROCEDURE IN APPROPRIATING MONEY

* Thus far, I have been discussing the process of authorizing a particular program or policy. No less important is the process of appropriating money. In our government, no money can be spent without authorization or except as appropriated by law. Therefore, the legislative committees, such as the Committee on Foreign Affairs in the House, must submit a recommended authorization of maximum amounts and of how the funds may be spent. A budget request, based on the authorization, is presented to the Committee on Appropriations of the House. This Committee decides how much money should be made available. The amount recommended by the Appropriations Committee cannot be more than that authorized by the Congress. Usually it is less. In the Mutual Security Appropriation Act

13,330,851,756

of 1952, the amount appropriated was almost a half billion dollars less than the amount the Congress authorized. Quite clearly this reduction affected the various operations of the aid program.

Both the authorization and appropriation processes are not restricted to determining how the money will be spent. They permit the Members of the committees to review how the money has been spent and how the program or activity has functioned. Each year the Mutual Security Program involves a detailed analysis of our foreign military aid, foreign economic aid, technical assistance, and many other related matters. This review is made independently by the House Foreign Affairs Committee and by the Senate Foreign Relations Committee. After the authorization has been voted, the Appropriations Committees of the two Houses make a similar examination. In effect, this gives each House at least two opportunities to go over the whole program.

The accompanying table illustrates concretely the successive actions of the executive and the legislative branches on the Mutual Security Program for 1951 and for 1952.

FOREIGN POLICY IN THE JURISDICTION OF OTHER COMMITTEES

Earlier in my remarks I enumerated some of the powers conferred by the Constitution upon Congress that bear directly on foreign affairs. It is important to note, however, that these powers are not exercised in their entirety by the Committee on Foreign Affairs of the House or its Senate counterpart. The Legislative Reorganization Act of 1946 spells out the jurisdiction of the various committees of both the House and the Senate. The tariff question which is looming large in American foreign economic policy is not handled by the Foreign Affairs Committee of the House. It is handled by the Ways and Means

Committee. The Banking and Currency Committee, through its ability to alter the value of the dollar, can affect the foreign trade of this country and the scope of American activities abroad. The Armed Services Committee, through its determination of the strength of the armed forces, shapes the military posture of this country. All of these are parts of our foreign policy but they are outside the jurisdiction of the two committees most intimately responsible for foreign affairs. Thus, the Congress operates in many respects in a highly compartmentalized framework of consideration. If there is any criticism to make of the Congress, it is the lack of a focal point for an over-all consideration of policy.

SUBCOMMITTEES OF THE COMMITTEE ON FOREIGN AFFAIRS

The present size of the Committee (29 Members) and the multiplicity and complexity of problems coming before it have led to the growth of consultative subcommittees. These subcommittees approximate the major divisions of the Department of State. Four of them are geographic and five are functional subcommittees. One of the most helpful signs in collaboration between the executive and legislative branches has been a greater use of the subcommittees. Today the Assistant Secretaries invariably seek out Members of the appropriate subcommittee and arrange a meeting to impart the latest developments in their particular fields of responsibility. This approach has provided a tremendous sense of participation even though the Congressmen may be listeners. It builds up a mutual confidence on the part of both branches.

Another device for linking the executive and legislative branches has been the greater use of Members of both Houses on delegations to international conferences. This has been particularly

true since the drafting of the United Nations Charter in 1945. In 1951 two Members of the Foreign Affairs Committee were on the United States Delegation to the United Nations. Members of both Houses were in the delegation that signed the Japanese Peace Treaty and related documents.

SOURCES OF INFORMATION

One of the most persistent questions asked by those who study the role of Congress in foreign affairs is what are the sources of information upon which Congressmen can draw in order to reach their conclusions. There are, of course, available to the Members, various materials prepared by the executive branch, sometimes in the form of classified documents, sometimes unclassified. These may be studied individually by a Member, or they may be the subject of a subcommittee or group meeting. The hearings held before the Committee or subcommittees on various pieces of legislation provide a fruitful source of information. During the 82nd Congress, for example, the Committee on Foreign Affairs and its subcommittees held hearings covering 7,705 printed pages. Several hundred unprinted pages include the classified testimony of witnesses. The Committee and subcommittees were in session 440 hours and 9 minutes. These figures indicate something of the intensity of the hearing process. Each of the Committees under the Legislative Reorganization Act has a small staff. The Foreign Affairs Committee has

three professional staff members. Their task is to make an analysis of materials submitted by the executive branch, conduct independent investigations, and generally assist the Members in such a way as to make it possible for them to fulfill their obligations more thoroughly. Outside pressure groups do not play a great role directly in the Foreign Affairs Committee, though in certain areas, as in the tariff, their influence is quite considerable.

CONGRESSIONAL TRAVEL

Finally, there is that much misunderstood device of congressional travel, or, as some prefer to call it, "junkets." I may say a word in defense of this technique. If we in the Congress are to exercise fully our responsibilities, if we are to understand as thoroughly as we can the problems which our officials face in different parts of the world, if we are to benefit by direct consultation and exchange of views with members of foreign governments and with our officials in the field, we have an obligation to visit different portions of the world. So far as the Foreign Affairs Committee is concerned, there has been no abuse of travel. It is customary for Members traveling on Committee expense to submit reports of their findings, to direct attention to shortcomings of programs, and generally to impart the information they receive to their colleagues. All of this has proved most helpful in enabling the Foreign Affairs Committee to discharge its proper responsibilities.

James P. Richards, LL.B., Washington, D. C., has been a member of the United States House of Representatives from the Fifth District of South Carolina since 1933. Previously he served in the Infantry during the First World War, practiced law in Lancaster, South Carolina, from 1921 to 1923, and served as judge in the Probate Court of Lancaster County from 1923 to 1933. He is a Democrat and served for twenty years on the Committee on Foreign Affairs, of which he was chairman during the Eighty-second Congress.

The Committee on Foreign Affairs

By ROBERT B. CHIPERFIELD *

THE Committee on Foreign Affairs had its genesis in the Continental Congress, which had a "Committee of Secret Correspondence" even before the Declaration of Independence for the sole purpose of "corresponding with our friends in Great Britain, Ireland, and other parts of the world."

By the spring of 1777, the specialized nature of its work had become recognized, and its title was changed to "Committee for Foreign Affairs." However, specific problems in foreign affairs were occasionally dealt with by select or temporary committees appointed for the purpose.

The practice of utilizing select committees to deal with foreign affairs continued even after the Congress of the United States was organized under the Constitution. It was not until 1822 that the Committee on Foreign Affairs

achieved permanent status as a standing committee, beginning with a membership of 7 and gradually increasing through the years to its present all-time high of 29.

The present Committee has a political composition of 16 Republicans and 13 Democrats. Other parties have been well represented in past years, with the membership lists including National Republicans, Clay Democrats, Federalists, Union Democrats, Unionists, Liberal Republicans, Tammany Democrats, Readjusters, Independents, Independent Protectionists, Progressives, and members of the American Party, the Unconditional Union Party, and the Silver Party.

FAMOUS CHAIRMEN AND MEMBERS

The membership lists of the Foreign Affairs Committee contain names of many who achieved fame in long careers of public service. Outstanding among the early Committee Chairmen were such men as John C. Calhoun, Caleb Cushing, and John Quincy Adams.

Also well known to us are the names of my immediate predecessors: Sol Bloom, who presided during the consideration of the lend-lease program and the years of World War II; Charles A. Eaton, who headed the Committee during the launching of the Marshall plan; John Kee, who was Chairman when the House passed the first of the military assistance bills; and James P. Richards, under whose chairmanship the Committee acted to terminate the state of war with Germany and revised and extended the program for mutual defense.

* It is my wish to acknowledge and express my thanks for their assistance in assembling the statistical data and background material for this article to Mr. Boyd Crawford, the staff administrator of the Committee on Foreign Affairs of the House of Representatives, and to Miss Helen Mattas, staff assistant. No matter how closely a member participates in the work of the Committee, few besides the chairman are in a position to recognize fully the extent of the volume of work and the services rendered by the committee staff. The chairman necessarily follows more closely the vast amount of preparatory work in the scheduling of hearings and the programing of staff activities which result in the finished memoranda and background studies prepared for the members.

During hearings on major legislation, work pressure on the staff becomes very great. It would be difficult to overemphasize the devoted, intelligent, and efficient nature of their services. It is fitting to mention here my deep sense of appreciation for their contribution to the efficient conduct of the Committee's work.

It is not common knowledge, but the present Speaker of the House, the Hon. Joseph W. Martin, is a former member of the Foreign Affairs Committee. Senators J. W. Fulbright of Arkansas, Thomas C. Hennings, Jr. of Missouri, Mike Mansfield of Montana, Karl E. Mundt of South Dakota, and George A. Smathers of Florida served on the Foreign Affairs Committee during their terms as Representatives. Former Senator Tom Connally, for many years Chairman of the Senate Committee on Foreign Relations, obtained his early experience in international matters as a member of the House counterpart.

The late James W. Wadsworth, after a distinguished career in the Senate, served for a number of years in the House and during part of his service made a valuable contribution to the work of the Foreign Affairs Committee. Before leaving the House of Representatives to become the Governors of Massachusetts and Connecticut respectively, Christian A. Herter and John Davis Lodge took leading parts in the work of the Committee.

DUTIES AND FRAME OF REFERENCE

Since its establishment as a standing committee of the House in 1822, the duties and frame of reference of the Committee on Foreign Affairs have, in the broadest sense, covered "relations of the United States with foreign nations generally." The subjects covered have ranged from declarations of war, neutrality laws, and treaty termination, to international expositions and the regulation of whaling.

The present duties and frame of reference which are set forth in the current Rules of the House, list the present duties of the Committee in general terms as follows:

(a) Relations of the United States with foreign nations generally.

(b) Acquisition of land and buildings for embassies and legations in foreign countries.

(c) Establishment of boundary lines between the United States and foreign nations.

(d) Foreign loans.

(e) International conferences and congresses.

(f) Intervention abroad and declarations of war.

(g) Measures relating to the diplomatic service.

(h) Measures to foster commercial intercourse with foreign nations and to safeguard American business interests abroad.

(i) Neutrality.

(j) Protection of American citizens abroad and expatriation.

(k) The American National Red Cross.

(l) United Nations Organization and international financial and monetary organizations.

By tradition and precedent the Committee maintains a close watch over the operations of the Department of State and the executive branch with reference to foreign affairs. The Committee is authorized to exercise continuous surveillance of the execution of the laws within the Committee's jurisdiction by Section 136 of the Legislative Reorganization Act of 1946, which reads as follows:

Sec. 136. To assist the Congress in appraising the administration of the laws and in developing such amendments or related legislation as it may deem necessary, each standing committee of the Senate and the House of Representatives shall exercise continuous watchfulness of the execution by the administrative agencies concerned of any laws, the subject matter of which is within the jurisdiction of such committee; and, for that purpose, shall study all pertinent reports and data submitted to the Congress by the agencies in the executive branch of the Government.

In the past, it was customary for legislative committees to pass authorizing

WORK LOAD

The tremendous growth in the Committee's work load during recent years is apparent from a comparison of the funds involved in legislation considered. Thus, during the Seventy-third Congress the amount of money involved in public bills before the Committee was \$102,000, whereas the approximate total authorization considered by the Committee, passed by the House, and enacted into law during the Eighty-second Congress was \$14,121,758,750. And, as stated in the Survey of Activities of the 81st Congress,

There is every indication that the growing leadership of the United States in world affairs will continue to require the cooperation of the Congress on a scale unprecedented in our history. Thus, it may be expected that the heavy work-load of the Committee on Foreign Affairs will increase in intensity and will reflect more than ever before the importance of the legislative process in shaping the foreign affairs of our Nation.

A cross section of the great variety of subjects covered by legislation pending before the Committee during the 82nd Congress includes United States membership in and relationship to the United Nations; emergency food relief for the people of India; Communism; Arab and Israeli refugee relief; military, technical, and economic assistance covering all areas of the world (Mutual Security Program); international bridges; fluctuating water levels of the Great Lakes; diplomatic privileges and immunities; unjust imprisonment of American citizens by Iron Curtain countries; termination of the state of war between the United States and Germany; Foreign Service buildings program and annuities for retired Foreign Service Officers; establishment of a United States Peace

legislation with subsequent action and annual review by the appropriations committees only. In recent times, the practice has increased of passing authorizing legislation with fixed time limits, so as to require review and renewal of the authorization by the legislative committees. Examples are the Lend-Lease, UNRRA, and Foreign Military and Economic Aid bills, which have required annual reauthorization through the Foreign Affairs and Foreign Relations Committees before appropriations could be made.

In recent years it has become customary for the House to adopt resolutions increasing the Committee's authority and the scope of its activities. Of practical assistance to the Committee in the exercise of its watchfulness over matters within its jurisdiction is the latest of such resolutions, House Resolution 113, 83d Congress, passed by the House February 24, 1953, which reads as follows:

Resolved, That the Committee on Foreign Affairs, acting as a whole or by subcommittee, is authorized and directed to conduct thorough studies and investigations of all matters coming within the jurisdiction of such committee.

SEC. 2. For the purposes of this resolution, the Committee or any subcommittee thereof, is authorized to hold such hearings, to sit and act during the present Congress at such times and places as the Committee may determine, whether or not the House is in session, has recessed, or has adjourned, to require the attendance of such witnesses and the production of such books, papers, and documents by subpoena or otherwise, and to take testimony, as it deems necessary. Subpenas may be issued under the signature of the chairman of the committee and shall be served by any person designated by such chairman. The chairman of the committee or any member designated by him may administer oaths to witnesses.

Academy; and an international effort to discover a cancer cure.

Following is a statistical analysis of the work load during the Eighty-second Congress:

Number of meetings of conference committees	12
Number of bills and joint resolutions referred to the committee (Of this number 41 are duplicates)	141
Number of simple and concurrent resolutions referred to the committee (Of this number 129 are duplicates)	187
Number of bills and joint resolutions considered by the committee (Includes duplicate measures)	72
Number of bills and joint resolutions reported favorably (Includes separate bills incorporated by committee)	20
Number of bills and joint resolutions favorably reported by committee and passed by House (Includes separate bills incorporated by committee)	18
Number of bills and joint resolutions enacted into law (Includes separate bills incorporated by committee)	13
Number of simple and concurrent resolutions considered by the committee (Includes duplicate measures)	61
Number of simple and concurrent resolutions reported and acted upon in the House	9
Number of hearings (Open and executive)	260
Number of pages of committee hearings (Includes printed hearings, stenographic transcripts, and committee minutes of open and executive sessions)	7,705
Number of pages of reports before committee	866
Number of meetings with Rules Committee	360
Number of committee reports:	11
Reports on legislation	26
Minority reports on legislation (printed with majority report)	1
Conference reports	4
Reports on resolutions of inquiry	2

Subcommittee reports on legislation (printed and mimeographed)	14
Special reports	13
Number of messages from the President and Executive communications referred to the committee (Includes 13 subsequently printed as House documents)	66
Number of House documents referred to the committee	44
Number of memorials and petitions referred to the committee	146
Number of reports requested from Government departments and agencies on legislation referred to the committee	64
Approximate number of pages in Congressional Record of House consideration on bills and resolutions reported by committee	506
Number of members sponsoring measures referred to the committee	191
Number of studies and memoranda prepared for the members of the committee by the staff	263
Time spent in sessions:	
By committee:	
Executive, 225 hours, 3 minutes.	
Open, 78 hours, 16 minutes.	
By subcommittees:	
Executive, 130 hours, 30 minutes.	
Open, 6 hours, 20 minutes.	
Total	440 hours, 9 minutes

STAFFING

The enactment of the Legislative Reorganization Act of 1946 coincided with the mounting pressure of the Committee's need for more adequate staff facilities. No longer restricted to the services of a Clerk and one assistant, the Committee for the first time received authority to secure the services of four professional staff consultants and a substantially enlarged clerical staff.

The Committee approached the problem of acquiring an enlarged staff with the same degree of care that it was accustomed to give other phases of Com-

mittee work. Every effort was made to select staff members on the basis of their proven qualifications to meet the Committee's work requirements. In so doing, the Committee pioneered in spelling out staff qualifications and functions, making the services of all professional and clerical staff members available to each Member of the Committee, as needed on Committee work, on a non-partisan basis.

A 1951 bipartisan staffing subcommittee described the work of professional staff consultants in these words:

Studies prepared by the staff must aid the Committee in evaluating, analyzing and summarizing the testimony and documents given to the Committee during its hearings. This includes a great deal of statistical work. The staff prepares drafts of Committee reports on bills and prepares staff documents, through original research, for the use of the Committee and all members of the House on international problems. Staff members must have the ability to work under high pressure, must be able to serve the 27 [now 29] members of the Committee of both parties in independent research and, in addition, must be amenable to the routine direction and discipline of the Chairman and Staff Administrator. The individual opinions of staff members are valuable, but in many instances they will be expected to prepare and draft material which does not necessarily support their own opinions.

The professional staff consultants are individually responsible to the Chairman and to the Members of the Committee for the accuracy of their work.

The Committee Clerk serves as Staff Administrator. His duties have been described in a Committee resolution which provides that

he shall be responsible to the Chairman and the Committee for efficient administration, under the direction and control of the Chairman, of the work of the professional and clerical staff. He is expected to

achieve, as far as possible, a coordination in effort among the personnel of both branches of the staff.

PROCEDURES

All bills, resolutions, and documents introduced in the House of Representatives during the current Congress within the jurisdiction of the Committee on Foreign Affairs and referred to it for action by the Speaker of the House of Representatives are recorded in the Committee's legislative calendar and published monthly. As action is taken on these legislative items, it is posted in the calendar. This includes requests for and receipt of reports from pertinent Executive Departments; consideration by the full committee and the subcommittees, either in executive or open session; and disposition of the measure, such as the reporting out of the measure by the Committee, the debate on the floor of the House of Representatives, and the vote of the Members of Congress on the bill or resolution.

The procedures of the Committee on Foreign Affairs, like all standing committees of the House, are governed by the Rules of the House of Representatives. From time to time, however, the Committee has adopted supplemental rules which it has found particularly applicable to its operations. An example of such supplemental rules is the "five-minute rule" for interrogation of witnesses testifying before the Committee. A witness, having first made his statement to the Committee, is questioned by the members under this "five-minute rule" which was informally inaugurated during the 80th Congress and adopted formally February 26, 1953. The Chairman, following this rule, calls alternately on the majority and minority members according to seniority, granting each five minutes for interrogation of the witness. After all of the

members present have had an opportunity to question the witness for five minutes, the Chairman repeats the procedure until there are no further questions. In this way an equitable opportunity to question the witness is given to each member.

In the present Congress eight new members have joined the Committee on Foreign Affairs. To encourage the fullest possible participation by the junior members of the Committee, a variation of the "five-minute rule" has been initiated and used on some occasions, so that the Chairman calls first on the junior members, alternating from the majority to the minority side until the ranking majority and minority members have had an opportunity to question the witness for five minutes. This is an example of the Committee's adaptability as well as democracy in action.

Nonpartisanship

In taking action, the Committee has exhibited an outstanding degree of nonpartisanship. The nature of the legislative matters within its jurisdiction is such that more than ordinary care must be exercised in determining what legislative action to take. The extraordinary requirements in the consideration of foreign policy legislation were fully expressed during the Eighty-first Congress in a minority report by certain members of the Foreign Affairs Committee on the extension of the European Recovery Program (Report No. 323, Part 2), as follows:

We believe that politics should end at the water's edge for both parties. In fact, we believe that partisan politics in foreign affairs should end before our policies reach the water's edge. The party in power must not take political advantage of the requirements with reference to confidential information, and insist upon withholding from the Congress and the public matters that

are not military or diplomatic secrets, but are clearly political secrets. . . . For politics to end at the water's edge, there must be bipartisan participation in the formulation of policies; bipartisan agreement in the measures adopted; and bipartisan sharing of credit for the success of such policies.

We are now the minority party [Republican Party], the loyal opposition. We believe that we should avoid taking political advantage of situations that might in any way embarrass our country in the conduct of its foreign affairs; we believe that we have a duty to help, insofar as we are permitted, in the formulation and implementation of sound and righteous foreign policies; but we also believe that it is our duty to oppose, without fear or favor, wrong policies that our Government is attempting, to expose the failure of our Government in critical situations to arrive at any policy at all, and to offer constructive alternatives.

Minority reports

The records show that during the critical period beginning with Pearl Harbor in December 1941, until consideration of the first UNRRA (United Nations Relief and Rehabilitation Administration) bill (December 1943-January 1944), when there was an overriding objective—to win the war—the Committee was in unanimous agreement on the measures reported out. Since then there have been a number of minority reports, as follows:

MINORITY REPORTS ON COMMITTEE BILLS		
Congress	Report No.	Subject
79th	259, Pt. 2	Lend Lease
80th	239	Relief Assistance to the People of Countries Devastated by War
80th	314	Assistance to Greece and Turkey
81st	323, Pt. 2	Extension of European Recovery Program
81st	569, Pt. 2	International Children's Emergency Fund

MINORITY REPORTS (Continued)

Congress	Report No.	Subject
81st	770, Pt. 2	International Claims Settlement Act
81st	962, Pt. 2	Aid to Korea
81st	1265, Pts. 1 and 2	Mutual Defense Assistance Act of 1949
81st	1802, Pt. 4	Foreign Economic Assistance
82nd	185	India Emergency Assistance Act of 1951

These minority reports are not mere expressions of partisan views; they are the careful and deliberate thoughts of members whose views differ with the numerical majority. The minority report on the Mutual Defense Assistance Act of 1949, for example, cut across party lines and was signed by two Republicans and two Democrats. The minority report on assistance to Greece and Turkey was the expression of only one member—all other members of both parties constituting the majority.

Sources of information

Keeping informed on every aspect of foreign affairs is vitally important to the legislators who are members of the Committee on Foreign Affairs so that they may act in the best interests of the people of the United States whom they represent. They seek and receive information—factual, interpretative, and theoretical—from many sources, official as well as unofficial, written as well as oral. The Committee receives volumes of official data, classified as well as unclassified, concerning foreign policy generally as well as pertaining to specific legislation. On the original Marshall plan legislation, for instance, 40 pounds of written data were received.

Also, the Committee holds two types of hearings—(1) to obtain information in connection with specific legislation, and (2) to hear at first hand about cur-

rent foreign policy developments from those who are making or administering it. Witnesses include government officials as well as private citizens and representatives of private organizations. During the hearings held on the Mutual Security Act extension in March and April 1952, the Secretary of State and Secretary of Defense as well as the Chairman of the Joint Chiefs of Staff appeared twice; three Members of Congress gave testimony, 43 government officials appeared, and 12 private citizens or representatives of private organizations appeared. In addition, 18 statements were submitted by those who wished to appear personally but were not able to do so.

Throughout the years, it has been customary for the Committee to receive officials of foreign governments for informal discussions, particularly concerning relations between their countries and the United States. There are even occasions on record when representatives of foreign countries testified in support of pending legislation before the Committee on Foreign Affairs. The practice in recent years, however, has been to limit appearances of foreign officials to informal discussions. Since 1940 there have been over 50 such meetings, including meetings with the Crown Prince of Saudi Arabia; the Minister of Foreign Affairs of Luxembourg; the President of Czechoslovakia; the President-elect of Costa Rica; the President of the Norwegian Parliament; the President of Haiti; the Prime Minister of Poland; the British Minister of State for Foreign Affairs; the Prime Minister of Norway; a Member of the German Bundestag; the Minister of Foreign Affairs, Australia; and the Minister for Foreign Affairs of the Netherlands.

Informing the public

As often as practicable, meetings with witnesses are open to the public. Also,

when facilities in the meeting room make it possible, the general policy of the Committee has been to permit coverage of meetings by television and newsreel services. During and since the war, however, much of the testimony received by the Committee has involved matters concerning national security. Of the total of 440 hours of committee and subcommittee meetings during the 82nd Congress, it proved possible for only 84 hours of meetings to be held in open session.

Keenly conscious of the disadvantages of proceedings in executive session, the Committee has made a special point of publishing transcripts of these meetings after deletion of testimony involving matters relating to national security. Also, it is the Chairman's practice after executive session meetings to give the press a digest of information received or action taken during the meeting, carefully omitting references involving matters affecting the national security.

Practically all documents published for the use of the Committee, with the exception of those having a security classification, are available either for distribution to the public or for inspection by the public. These include the Committee's legislative calendar, legislative hearings, reports on legislation, reports of study missions, and background studies on special subjects. Also, it has become customary for the Committee to compile and publish a survey of its activities during each Congress, which is given public distribution.

SHARE IN FOREIGN POLICY FORMULATION

For more than a decade, major elements of foreign policy have involved increasingly the expenditure of vast sums for many forms of military, economic, and technical assistance to foreign nations.

There has been a notable shift in emphasis from the use of treaties to programs requiring congressional implementation. Key foreign policy programs requiring congressional approval to become effective have included the lend-lease legislation, Greek-Turkish aid, the Marshall plan, and the Mutual Security Acts.

With its constitutional power over "the purse" it was inevitable that the role of the House and the Committee on Foreign Affairs would be enormously enhanced by participating in the establishment of such foreign policy undertakings.

Increased participation has meant a corresponding increase in responsibility. Legislation sometimes has its origin in recommendations by the Executive; sometimes it originates in the Congress. Frequently legislation results as a merger of ideas emanating from both branches. This has been particularly true of legislation to implement the foreign military and economic assistance programs.

During consideration of the original legislation to effectuate the Marshall plan for foreign economic aid, the Foreign Affairs Committee initiated action on a military assistance program, going so far as to include language for that purpose in a Committee working draft of the bill. This was in March 1948. Executive support was not forthcoming, however, and the provisions were dropped in final Committee deliberations. The Committee's consideration had been anticipatory, and a year and a half later, on October 6, 1949, the administration-supported Mutual Defense Assistance Act became law.

To a very considerable degree, the "policy" clauses embodied in the foreign aid bills are legislative in origin, and a good share of the drafting of such provisions has taken place in the Committee on Foreign Affairs. The actual

programs have also been shaped to a great extent by Committee action, such as the decision to supply wheat to India on a loan rather than a grant basis. The course of foreign policy has also been affected by Committee reductions of requested fund authorizations.

Changes in Executive-Congressional collaboration

The expansion of committee activity and responsibility has necessitated substantial changes and improvements in the working relationships between the executive and legislative branches. Subcommittee systems have been devised to co-ordinate and facilitate briefing of Committee members on current world developments. The post of Assistant Secretary of State for Congressional Relations, with a sizable staff, has been established.

There has been another significant response to the need for closer Executive-Congressional collaboration and participation in basic decisions affecting foreign policy. This has found expression in the service by Members of Congress as members of United States Delegations to international conferences, such as the United Nations and its Specialized Agencies. Representatives John M. Vorys of Ohio and Mike Mansfield of Montana referred to this important development in the following words in their report to the Foreign Affairs Committee after participation as U. S. Delegates to the Sixth Session of the General Assembly of the United Nations:

Legislative membership on United States delegations to the United Nations began in 1945 when the Chairmen and ranking minority members of the Senate and House Foreign Affairs Committee helped draft the United Nations Charter at San Francisco.

... Bipartisan congressional delegates attended the London and New York meetings of the General Assembly's first session in 1946. Through them, the Congress received

first-hand information and a degree of participation in development of foreign policy never before experienced. The executive branch found itself in a better position to anticipate congressional reaction on questions requiring legislative implementation.

After 1946 United States delegations to the General Assembly functioned for 3 years without congressional participation. The compelling reasons for closer partnership which existed in 1945 and 1946 no longer seemed so urgent or pressing. The United Nations Charter had been ratified by the Senate and both Houses had passed legislation effectuating our membership. The United Nations had been launched on its career with overwhelming congressional support.

Substantial problems are involved in congressional representation on the Assembly delegations. Under our Constitution, as recognized in the United Nations Participation Act, the delegation acts under instructions from the President in representing the Nation. This places Members of Congress in a theoretically anomalous position. This problem did not arise as a practical matter while we were on the delegation. On the other hand, all United States efforts to create conditions of permanent world peace are being made within the framework of the United Nations Charter and this applies particularly to our major foreign economic and military aid legislation. More than ever before, matters of foreign policy require joint executive-legislative action. Appreciation has grown that advance consultation and discussion by the Executive with those having eventual responsibility for implementing legislation can contribute much to the mutual understanding necessary for efficient teamwork.

This appreciation led, in 1950, to the present system of appointing two Senators (not up for reelection) in election years and two Representatives in off-election years, to serve on United States delegations to the United Nations General Assembly.

The congressional members of the United States delegation this year were continually consulted, never ignored, never overruled. This was gratifying, but increased our responsibilities. The entire delegation and

staff proved very conscious of congressional opinion and of American public opinion as reflected by Congress. Many of the questions coming before the delegation had a direct relation to our work as members of the Committee on Foreign Affairs of the House of Representatives. As a result, our advice and suggestions were frequently asked on such matters. On other matters, we were always given the chance to voice our views. Whether our contribution was helpful is for others to report. We can report that the effort to understand and help was enlightening.¹

SUBCOMMITTEES FOR LEGISLATION AND CONSULTATION

Prior to 1945, the Committee on Foreign Affairs made only a desultory use of subcommittees and had no organized subcommittee structure. In that year the Committee pioneered in creating a system of standing (permanent) subcommittees. Five geographical area subcommittees were established to assist Members, through consultation and briefing meetings with officials of the executive branch, to keep more fully posted on world developments.

The subcommittee system evolved further during the succeeding years. Functional subcommittees were added to the geographical area groups in 1947, and considerable use was made of them and of *ad hoc* or temporary subcommittees, for preliminary processing of legislation before consideration by the full Committee.

The subcommittee structure has developed into the following eight standing subcommittees:

- Subcommittee on State Department Organization and Personnel
- Subcommittee on Near East and Africa
- Subcommittee on National Security
- Subcommittee on International Organizations and Movements
- Subcommittee on the Far East and the Pacific

¹ House Report 1453, 82nd Congress.

- Subcommittee on Europe
- Subcommittee on Foreign Economic Policy
- Subcommittee on Inter-American Affairs

The changed role of the House Foreign Affairs Committee has necessitated the use of still another type of subcommittee, groups which undertake study missions abroad to gather firsthand factual data for the Committee. Such special study missions are formed without limitation as regards membership on the standing subcommittees. For example, members of the Far East and the Pacific Subcommittee have not been barred from participating in a study mission to Europe or South America. Some of these study missions have been joint affairs, involving participation with the Armed Services and Appropriations Committees of the House, and the Foreign Relations Committee of the Senate.

The Committee's use of study missions has in a measure decreased its dependence on the Executive as the principal source of detailed information on our foreign relations. The knowledge thus gained has materially assisted the Committee in discharging its responsibilities. It is worth noting that after a joint study mission in 1951, the executive request of \$8,500,000,000 for the continuation of the Mutual Security Program was cut to an authorization of \$7,483,400,000—a difference of more than a billion dollars.

SUMMARY CONCLUSIONS

The need for a specialized legislative group to deal with foreign affairs matters was felt and met as far back as the days of the Continental Congress. The history of the Foreign Affairs Committee and its development is an example of the ability of the legislative branch to adapt itself to meet changed circumstances.

Developments in transportation and communications, and the elimination of

the formerly protective barriers of distance, through technological advances which have literally shrunk time and distance, have all heightened the importance of American foreign policy.

Our hopes for the winning and establishment of peace depend in great measure upon our foreign policy and the steps we take to implement it. That is why a Member cannot serve on the Foreign Affairs Committee without acquiring a special sense of accountability. It is recognition of this added responsi-

bility which has led to reorganization of the Committee, with its simple but effective subcommittee system. It is why there has been insistence upon having a more adequate Committee staff. It is the reason why the Committee voluntarily tightened its oversight functions and has insisted that each year legislation for continuance of the foreign military assistance program be renewed only after thorough review by the legislative as well as the appropriations committees of both Houses of Congress.

Robert Bruce Chipfield, LL.B., Washington, D. C., is chairman of the Committee on Foreign Affairs of the United States House of Representatives. He has been a Representative from Illinois and a member of the Committee on Foreign Affairs in the Seventy-sixth and all subsequent Congresses.

Committees Touching Foreign Relations Indirectly

By MICHAEL H. CARDOZO

A LITTLE-NOTED sentence in the Economic Cooperation Act of 1948 expresses the attitude of many people toward the foreign relations activities of committees of Congress other than the Foreign Relations and Foreign Affairs committees. At the end of Section 114, authorizing appropriations for the European Recovery Program, appeared the observation that "the authorization in this title is limited to the period of twelve months in order that subsequent Congresses may pass on any subsequent authorizations."

Why was it necessary to limit the authorizations to twelve months in order to let subsequent Congresses pass on future provisions of funds? Was it not enough to have annual appropriations under a simple authorization of the lump sum needed for the four-year program?

The answer is that it was not enough if each year the program was to have the benefit of a push in the form of a new evaluation from the committees most likely through experience to understand the basis of the policy and to appreciate the need for commensurate appropriations. Without requiring annual *authorizations*, as well as appropriations, the foreign relations committees would have no annual chance to call the friendliest witnesses and give the kind of strong send-off that big foreign spending programs need on their way through the reefs of floor debate. If the sums to be allotted were left to the appropriations committees alone, it was feared that the average congressman's natural concern for the welfare of his taxpaying constituents would so far outweigh the arguments for large

expenditures on foreign aid that the success of the program would be jeopardized.

CONGRESS-WIDE CONTACT WITH FOREIGN RELATIONS

If it is true that the "average" senator or congressman does not sufficiently appreciate the needs of our foreign relations, and that only the members of the committees directly charged with matters arising in the foreign field do appreciate them, there is real danger to our world position. Not only does every member of Congress have to vote many times in each session on foreign policy matters, but a very large number of them serve on committees whose responsibility includes subjects as closely related to foreign policy as those that come before the two foreign relations committees. One can be sadly mistaken if he thinks that the rules allocating to the foreign committees "all . . . matters" relating to "Relations of the United States with foreign nations generally" and "Measures to foster commercial intercourse with foreign nations . . ." mean that other committees are never concerned with the field.

Acts concerning tariffs and duties, the entry and status of aliens, quotas on imported commodities, claims involving other countries, representatives of the armed services attached to our embassies abroad, the property of alien enemies, ships and shipping, the secrecy of inventions in the field of national security, copyright, and other subjects were reported out by such "other committees" during the second session of the Eighty-second Congress. At least fifty public laws enacted in that session

in the field of foreign relations were reported out of committees other than Foreign Relations and Foreign Affairs.

Serving on those other committees were three-quarters of the membership—over 300 members of the House and about 75 members of the Senate who were not on their respective foreign relations committees. This means that nearly every member of Congress during the course of a session must consider in committee, and join in a report on, some matter of concern in the administration of our relations with other countries.

IMPORTANCE OF RELATED SUBJECTS

It would be an equally grave mistake to believe that the areas of responsibility assigned to the "other committees" are not of major importance in our foreign relations. One of the crucial issues of the day is whether we are to have "trade, not aid." If "aid," which is the responsibility of the foreign relations committees in the first instance, is to be replaced by "trade," the Committee on Finance and the Committee on Ways and Means will have to report on the measures that will tailor our customs and tariff rates and procedures to fit the needs of the slogan.

The constitutional amendment proposed by Senator Bricker to curtail the power to make international treaties and agreements is before the Senate Judiciary Committee. The public works committees pass on the requests for expanded facilities to handle the volume of imports and voyagers efficiently. The "Buy American" Act, so intimately bound up with the issue of substituting trade for aid, was originally part of an appropriation bill. The armed services committees deal with the size, strength, and disposition of our military forces and weapons—the stuff that the backbone of the free world is made of. The judiciary committees report on the laws

that say who may enter and stay in the country, whether they are mere tourists, businessmen engaged in trade, or officials of the United Nations.

The British loan of 1946 was handled in the banking and currency committees, though it had the same purpose as the foreign aid bills that later were the exclusive responsibility of the foreign relations committees. For a moment in 1949, however, it looked as if the Armed Services Committee of the Senate would get the proposed foreign military aid program, but agreement was reached to handle it through joint hearings with the Foreign Relations Committee.

Various committees deal with legislation to implement treaties, first considered by the Foreign Relations Committee and then ratified with the consent of the Senate. The Senate Finance Committee and the House Ways and Means Committee report on legislation to implement tax treaties such as those intended to avoid double taxation in the United States and other countries. Bills introduced for carrying out the United States responsibilities under treaties regulating deep-sea fishing, such as the halibut, salmon, tuna, whaling, and sealing conventions, are referred to the House Committee on Merchant Marine and Fisheries and the Senate Committee on Interstate and Foreign Commerce.

The latter committees also deal with the delicate subject of ships and shipping in international commerce—delicate because it provides such an obvious means of increasing the dollar earning power of other nations, but only at the risk of stepping painfully on the toes of an industry long favored with generous subsidies and served by influential labor unions depending on its prosperity.

Above all, the funds needed to carry out any policy must pass the tests of the appropriations committees. These hear much testimony that is hard to dis-

tinguish from what is said in the foreign relations committees, and their reports contain observations on foreign policy and evaluation of proposals fully as direct as those of the latter. The power of the purse, through conditions on expenditures and limitations on amount, can easily determine the course to be followed with other countries, and it has done so. Nothing in many years has irritated our relations with the French Foreign Office more than the controversy over the rights of American businessmen in Morocco. The statutory provision that finally landed us in a suit with France in the International Court of Justice was a condition in an appropriation act. Besides such conditions, the amounts themselves affect the size of an administrative staff, the strength of the armed forces, and the sums available for foreign aid. All are determinants of our policy toward other countries.

Ad hoc COMMITTEES

As if there were not enough standing committees in the two houses operating in the area of foreign relations, every once in a while a new committee is created in connection with a specific program. An example was the "Watchdog Committee" established under the Economic Cooperation Act of 1948. Its membership came in part from the two foreign relations committees. Its function was to keep an eye on the operations of the Economic Cooperation Administration in carrying out the European Recovery Program.

Some of the purposes served by such devices justify the encroachment on the responsibilities of the standing foreign relations committees. From the financial point of view, it provides an opportunity to use the program funds for committee expenses without augmenting the budgeted allotments of the stand-

ing committees. It permits the hiring of special assistants for the extra work, instead of adding to the duties of the existing staff. Perhaps most important, a joint committee, with members from various committees of both houses, can gather information for all the responsible groups at once, in lieu of duplicating trips and probes by each committee.

HOME AND FOREIGN ECONOMIES LINKED

World affairs today affect the life of everyone. In such times, the actions of Congress in even the most unexpected field are likely to affect our foreign relations in some degree. Bills to control the prices of goods sold in the United States, naturally referred to other than the foreign relations committees, can have a crucial effect abroad. The testimony of State Department witnesses before the responsible committees evidences legitimate concern. If prices in the United States are permitted to rise without control, two things happen to other countries. First, they find that their already scarce dollars are less effective in filling their needs. Second, scarce goods from other areas are attracted to the high-priced United States market, so other countries find it hard to get what they require for economic health.

Recognition of the importance of sound economies among our friends abroad has led us not only to give direct financial aid, but also to enter into voluntary arrangements for the sharing of scarce materials. The need for these arrangements led the State Department to defend them vigorously, on purely foreign policy grounds, before the banking and currency committees during consideration of the Defense Production Act. The same act contains the "fats and oils" provision limiting imports of commodities such as cheese. The Sen-

ate Banking and Currency Committee has referred to it as not "unduly affecting in an adverse manner our export trade or our relations with friendly foreign nations"—an evaluation which others in the foreign policy field have strongly contested.

EFFECTS OF INVESTIGATIONS

During recent months the influence on foreign relations of the various special investigations has grown markedly. Only occasionally is such an investigation conducted by the foreign relations committees. The investigation of our policy in the Far East during the "Great Debate" of 1951 was before the Senate Foreign Relations and Armed Services committees, sitting together. One major investigation conducted by one of the foreign relations committees was that by the so-called Tydings Committee into the loyalty of employees of the State Department.

During the current (Eighty-third) Congress, the Senate Internal Security Subcommittee, part of the Senate Government Operations Committee, has taken over this field and has been spending much of its time on the question of the trade between Red China and other countries. In the previous session it probed the causes of the "loss" of China. Its recent activities have led to acrimonious charges, on both sides, of interfering with the carrying out of foreign policy. It has held extensive hearings on the effectiveness and staffing of the Voice of America. In connection with surplus property disposals, it has dealt with legislation affecting overseas sales and the use of the foreign currency proceeds.

In the House, the Un-American Activities Committee has been checking into various aspects of Communist infiltration, by persons acting for the So-

viet Union, into activities all over the country.

All these inquiries touch upon responsibilities that come within the assigned functions of the foreign relations committees. It is undeniable that they have a noticeable effect on how our officials conduct relations with other countries and on the attitudes of other countries toward the United States.

DIFFUSION OF POLICY-MAKING

Certainly the complexities of our governmental machinery are increased by the wide diffusion of committee responsibility for the different components of our foreign policy.

The situation, of course, is not confined to Congress. In the executive branch, major parts of our foreign policy are administered in the Defense, Treasury, Commerce, Agriculture, and Justice Departments, and in independent agencies such as the Export-Import Bank, the Atomic Energy Commission, and the Mutual Security Agency. Supposedly policy is *made* in the State Department, under Presidential guidance and congressional control; but everyone who administers does a little policy-making in the process. This has been well recognized in the provisions of the Economic Cooperation Act and the Mutual Security Act, which prescribe consultation with the Secretary of State in the field of foreign policy.

The diffusion in Congress, however, adds new doubts abroad as to the true course the United States is planning to follow.

THE TARIFF DILEMMA

Unquestionably the height of our tariff wall is today one of the most controversial elements of our foreign relations. No longer is it a question of gaining mere good will abroad by letting other peoples sell their produce to

us. Now, many contend that the best way to relieve our own taxpayers of the burden of foreign aid is to let our friends trade with us and earn their own way. High tariffs, then, which help certain of our industries and the people who work in them, at the same time not only increase the cost of the goods to consumers here, but also add to the tax burden on all of us by continuing the need for aid.

The foreign relations committees of the Congress, when asked how the burden of expenditures that they are advocating in an aid bill is to be lightened, will suggest reductions in the barriers preventing other countries from trading with us. The appropriations committees may echo the sentiment. As a result, substantial sums made available for economic aid go to increase the exportable surpluses of Dutch cheese and Turkish figs.

Just before the product of this program is shipped, however, the Ways and Means, Finance, and Banking and Currency committees express their conviction that the welfare of the country is better served by protecting industries here from injury by the competition of goods produced by the low-paid labor available abroad. Their response is a recommendation that an "escape clause" be required in every trade agreement or that an import quota be placed on cheese competing with United States domestic production.

When the President seeks the advice of congressional leaders on the execution of these provisions, he invites the chairmen of the relevant committees, but they are not from the foreign relations committees. Thereafter, the executive machinery inexorably grinds out a ban on the very imports that the foreign relations committees hoped to encourage. Our position in the community of nations suffers because the dollar earnings of two good friends suffer commensu-

rately, and trade is no nearer to replacing aid. On the other hand, a domestic policy of protection for United States industry has been enhanced. The policies inevitably clash; the problem is reconciliation.

GENERAL OBSERVATIONS

It would be wrong to suggest that everything good in our foreign relations goes through the specialized committees in that field and everything bad comes from other committees. Whatever may be said against the Immigration and Nationality Act of 1952, for example, the two judiciary committees wrote into it the elimination of race as a bar to naturalization. This could only have a favorable effect on our relations with other peoples of the world as was fully recognized in the committee reports.

Many of the measures that cause trouble with other countries have no committee sponsorship at all. The highly controversial "Buy American Act" was never recommended by any committee having been attached on the Senate floor to the last appropriation bill sent to President Hoover in 1933. The requirement that half the goods exported under military and economic aid programs be shipped in United States flag vessels is another measure that delays the recovery of our friends to a self-supporting status. This provision has always been inserted in bills in which the foreign relations committees have proposed the exact opposite, namely, wider use of foreign flag ships as part of the recovery program.

These cases demonstrate one of the chief causes of difficulties in our foreign relations stemming from legislation namely, the absence of any informed committee action on many proposals that first appear after the committee report has been prepared. If ever, such proposal were made while some

committee was considering a measure, it could be tested in hearings and debated by members with some specialized knowledge of the likely effects. Radical proposals adopted without hearings, as were the Kem amendment on east-west trade in 1950 and the Morocco amendment in 1950, can cause important difficulties with our friends, and at the same time may be completely ineffective to accomplish a worthy purpose.

There are clear historical reasons for referring certain types of legislation to committees other than foreign relations. In the case of the reciprocal trade program, for example, Congress is dealing with tariffs, and at one time tariffs were "for revenue only." They naturally fell to the revenue-raising committees, Ways and Means in the House and Finance in the Senate. Immigration and naturalization matters used to go to committees charged with those fields alone. When the reorganization came in 1947, they were given to the judiciary committees, possibly in recognition of the fact that they were being administered by the Department of Justice and the courts. It is a field where domestic law and international law play an important role, and the committee choice may be most wise, even though it deals in the field of foreign policy at the same time.

GUIDANCE OF SPECIALISTS

The effect of this widespread participation of so many of the committees in the foreign relations field is to bring almost the entire membership of the Congress into the formulation of foreign policy. Under the committee system, it is understood that groups of specialists will consider each of the complex subjects that require legislation. The members of the appropriations committees, of course, are responsible for the whole range of governmental activity;

but those committees themselves have been subdivided into specialized subcommittees. It is only in the field of foreign relations that we find such general participation of members of committees that do not specialize in the subject. Foreign policy has taken on some of the quality of the "general welfare" which must guide every congressman in his consideration of proposals that require his vote. The question remains, however, whether the global complexities of our foreign relations can be mastered by every member, so that he need not have the guidance of the specialists on the foreign relations committees when he is confronted in committee by a matter affecting other countries that can change the course of our history.

As a matter of fact, all the Senate committees that deal with major legislation and issue reports on subjects that are not referred to the Foreign Relations Committee can expect to have guidance from at least one specialist from that committee. In the Eighty-second Congress, individual members of the Foreign Relations Committee served on eleven other regular committees, including Finance, Judiciary, Banking and Currency, and Atomic Energy—those dealing with such vital matters in the foreign field as tariffs, immigration and nationality, loans for exports and imports, and the control of atomic weapons. Oddly enough, there was no such overlap on the very important Armed Services Committee. In several instances where the responsibilities of the two committees coincided, however, the Foreign Relations Committee and the Armed Services Committee held joint hearings and rendered joint reports. Through such combined hearings and by the presence of the specialists from the Foreign Relations Committee, the other Senate committees are in a position to know the views and profit by

the experience of the group chiefly responsible for formulating congressional policy in the field. The policy committees of the two parties, with their aim of "Unity of Command," provide an additional source of co-ordination among the different committees.

The situation is very different in the House. Most of the members serve on only one committee. It would be unusual to find more than four or five of the members of the Foreign Affairs Committee on other committees. Such other committees are not likely to be of major standing, and therefore will not have a major role in foreign relations. How, then, are the specialists of the Foreign Affairs Committee to make available their presumably better-informed views in the deliberations of the other committees before crystallization in the form of committee reports? One means, of course, is through testimony and messages presented in the course of hearings. These are frequently used. Party discipline may, in addition, do much when it can be directed toward particular measures. As a general proposition, however, the House committees other than the Foreign Affairs Committee must operate largely without regular guidance from the specialists in foreign affairs who serve on the one committee responsible exclusively for foreign relations matters.

IMPLICATIONS OF WIDE PARTICIPATION

The participation of a large portion of the membership of Congress on committees operating in the area of foreign relations is a highly significant development in our governmental structure. It means primarily that more than ever the electorate must choose representatives who are qualified to act intelligently and responsibly on foreign policy matters. The hero of local political battles who is sent to Washington by

proud neighbors has always expected to meet a sudden broadening of his horizon to embrace national problems. Now, however, he finds himself in the midst of the world's agonies.

It is impractical to suggest that the committee work on foreign policy should be concentrated more in the foreign relations committees; they are already swamped with hearings, investigations, and reports on programs, bills, and treaties. More important, however, is the recognition that greater participation in these matters, through committee work, enables more of the membership to acquaint itself with the considerations behind the programs and thereby to exercise a more informed vote when foreign policy issues are before them. Widespread knowledge and understanding throughout the country of the problems and the needs of our foreign relations will make themselves felt in the selection of congressmen.

Schools and colleges can do much to achieve these ends among the voters. For the elected representatives, the frequent trips abroad taken by groups from the various congressional committees, as part of their effort to inform themselves on pending questions, help to give them an opportunity to understand the problems and reactions in other countries.

These travels, then, should be encouraged as part of a recognition that greater participation of the whole membership in the consideration of foreign relations measures is inevitable and desirable. If there should be any significant shift of responsibility back to the foreign relations committees from other groups dealing with these subjects, the country would probably be the ultimate loser. What might be gained from greater co-ordination and uniformity in committee operation could easily be lost through less-informed action on the

floor. We must hope rather that the elected representatives of a country with a world responsibility will themselves see the general welfare in ultimate benefit rather than immediate advantage.

Michael H. Cardozo, Ithaca, New York, is associate professor at Cornell Law School. He is a member of the bar and engaged briefly in private practice in New York City. He has served as counsel in the investigation of life insurance conducted for the Temporary National Economic Committee, in the Tax Division of the Department of Justice, in the Office of Lend-Lease Administration, and in the Foreign Economic Administration. He was Assistant Legal Adviser for Economic Affairs in the Department of State before entering the position he now holds.

Influence of Noncongressional Pressures on Foreign Policy

By FRANKLIN L. BURDETTE

ONE of the dilemmas of our time is the difficulty of maintaining democratic control of foreign policy in an age of tension. Woodrow Wilson spoke eloquently of open covenants openly arrived at, but few ever construed this language to apply literally to the processes of negotiation. Yet it is of the essence of democracy that public information must guide public decision.

The remarkable fact about American foreign policy is the degree to which it has been and is responsive to public opinion. In no other country in the world is the complex mechanism of shaping foreign policy more open to public inspection or more dependent on public support.

With the growing international role of the United States, the responsibility and work of Congress in international affairs have vastly increased. When Congress deals with public issues, its members invite and welcome both information and exhortation from interests which may be substantially affected. Legislative lobbying is based not alone on the doctrines of free speech, free press, and petition for redress of grievances. It is also encouraged by a responsible Congress eager to take into account the information and views of groups having weight in the country. Such weight is often but not always measured by numbers. Congress is responsive, and rightly so, both to political strength and to special competence. In dealing with current problems of national defense, for instance, Congress relies heavily upon expert opinion about such matters as aircraft design and de-

velopment. In matters political, pressure tactics are least effective when party strength and solidarity are greatest.

MAJOR INTERESTS

Economic groups

The most powerful domestic pressures which Congress encounters in the field of foreign policy, as in the case of most other areas of controversy, come from groups which expect to gain or lose financially from alternative courses of action. These economic interests have enough at stake to afford expensive participation in the legislative process. Much of the cost is connected with the maintenance of staffs and offices, with the preparation and publication of literature, and with the use of mass communication facilities. Among the most influential of the economic groups in the determination of foreign policy are organized farmers, shippers, labor, and trade associations.

In many instances economic groups benefit from defense and other contracts. On the one hand, such contracts give them vested interests to defend; but on the other, experience from contracts affords special opportunity to understand intricate policies and operations of which no other interest group can speak from firsthand knowledge. It is the task of Congress to chart the proper course, or at least the optimum course, between advantages and disadvantages.

In the case of the proposed co-operative venture with Canada for a St.

Lawrence Seaway, for instance, economic groups have shown a marked tendency to divide on geographical lines.¹ Economic groups within the area of the Great Lakes, including the powerful farmers of the midwest, favor the proposal. Interests on the eastern seaboard and in the southern states, including the railroads, oppose the project. Division of opinion in organized labor also tends to follow sectional lines.

These differences in self-interest illustrate the fact that American foreign policy, like other public policies, must be evolved through a struggle for political and economic power.

Professional and civic groups

A high level of informed opinion is characteristic of points of view about foreign policy expressed by many of the country's nonpolitical membership organizations. Support for postwar foreign policy has been forthcoming from such broad membership groups as the General Federation of Women's Clubs, the League of Women Voters, the United States Chamber of Commerce, the United States Junior Chamber of Commerce, the National Federation of Business and Professional Women's Clubs, the Foreign Policy Association, and many educational, civic, and fraternal bodies. The full power of these organizations has never been marshaled in peacetime in a unified effort for an objective in foreign policy, but their diversified strength is of enormous value in undergirding public support of American diplomacy.

Veterans

The whole field of foreign policy is of major interest to veterans' organizations, particularly with respect to aspects of national defense. The reputa-

tion of veterans for association with isolationism has been modified by the events of the past two decades. The American Legion and the Veterans of Foreign Wars are among the strongest advocates of universal military training as a major element of national security. The leading veterans' organizations have supported the United Nations, the European Recovery Program, and the North Atlantic Treaty Organization.

Religious groups

Protestant opposition to diplomatic relations with the Vatican has in recent years been a memorable episode in church participation in the making of foreign policy.² With respect to most issues, Protestantism is divided about the propriety of church activity in political controversy. Nevertheless, important segments of the Protestant churches have been represented in support of reciprocal trade agreements, the United Nations, aid to Europe, and the North Atlantic Pact. Catholic groups have likewise supported these measures.³ Catholic influence on behalf of American aid to Spain has been a noteworthy factor. On many issues of international concern, heavy congressional mail arrives from constituents who identify themselves as church members.

Ethnic groups

Exceedingly important in several key states is the political power of Americans who have deep concern for the lands of their ancestry. This phenomenon of politics is highly significant in the great cities of the east. Several hundred foreign-language newspapers and other periodicals with estimated circulations of several millions contribute to or-

ganized activity in foreign policy. Cultural and civic organizations of political importance are maintained by Czechs, Germans, Greeks, Hungarians, Irish, Italians, Jews, Poles, Scandinavians, Spanish, Yugoslavs, and others. An overwhelming majority of these Americans are firmly allied with the western nations against the policies of the Soviet Union and its satellites. They are especially active and influential in connection with measures affecting immigration, displaced persons, foreign aid, and recognition of the interests of their former homelands. The Jewish interest in Israel has in recent years represented one of the most important special claims upon American foreign policy.

The historic opposition to Britain by Americans of Irish descent has probably diminished as a major pressure, but examples of it are easily found in congressional proceedings. In 1950 the Senate Committee on Foreign Relations received the following testimony:

Mr. COSTELLO. Mr. Chairman, I am John M. Costello, former Congressman from California, and at present a Washington representative of the American League for an Undivided Ireland.

I might explain for the benefit of the members of the committee that the American League for an Undivided Ireland was created in New York in November of 1927 when delegates from practically all of the organized Irish societies in this country met there in convention. At that time they organized this league with a view of preventing the carrying on of the partition of Ireland.

I might say that those organized societies constitute well over a million active dues-paying members throughout the United States. So the League comes to you as a spokesman for all the organized Irish-Americans in this country, and unofficially I think it can speak for practically all of the Irish-Americans in the country, who number possibly between 30 and 40 million people. . . .

Mr. Richard F. Dalton of Long Island

City, N. Y., who is a member of the executive board of the League, is here to speak in behalf of the entire organization at this time. I will present Mr. Dalton.

Senator GEORGE. We will be glad to hear from you, Mr. Dalton.

Mr. DALTON. Thank you, Senator.

I am here, as Mr. Costello has described, to express the unrelenting opposition of myself as a taxpayer, and of all those taxpayers whom he has enumerated—and they are responsible and large taxpayers—to the sending of any further money to England under the Marshall plan so long as England shall continue to maintain occupancy by her forces of six of the northeasterly counties of Ireland against the overwhelming majority opposition of the Irish people.⁴

THE CHINA LOBBY AND THE IPR

Under legislation originally passed in 1938, agents of foreign governments, whether or not they are American citizens, must file statements every six months with the Department of Justice. Samples of political propaganda which they issue must also be submitted. Many governments are represented, for various purposes, both by foreigners and by citizens of the United States.

One of the most sensationally publicized of these organizations representing a foreign power is the so-called China Lobby, sympathetic with the regime of Chiang Kai-shek. The story of intrigue and aggrandizement surrounding it was portrayed in detail by a national magazine in 1952.⁵ An eminent American student of the Far East has described this account as one-third fact, one-third imagination, and one-third honest mistakes—but still the best we have. Activities of the Institute of Pacific Relations, allegedly infiltrated

⁵ *The Reporter*, Vol. 6, No. 8 (April 15, 1952), pp. 2–24; No. 9 (April 29, 1952), pp. 4–24.

with Communist sympathizers, were the prolonged object of equally sensational investigations by a subcommittee of the Senate Committee on the Judiciary, reported in 5712 pages of hearings.⁶ The basic strategy of the China Lobby was always more directly aimed toward influencing Congress than was that of the Institute, some of whose members emphasized administrative contacts.

THE PRESS AND THE COLUMNISTS

Because they are read by members of Congress and the administration, Washington newspapers are disproportionately influential in American politics. No other papers are more likely to be scanned by a majority of the members of Congress, although each member is prone to read a paper or two from home. The most influential of the capital's papers are *The Washington Post* and *The Evening Star*,⁷ although the *Times-Herald* (edited by Robert R. McCormick) and *The Washington Daily News* (Scripps-Howard, tabloid size) are not to be disregarded. Among other papers of great influence in Congress are *The New York Times*, the *New York Herald-Tribune*, and the *Christian Science Monitor* of Boston.

Reporters and columnists often form fast friendships with officeholders, legislative and executive, who respect both the power and the wisdom of the press. Some of the writers are valued counselors about public policy. Influential columnists in the Washington papers, most of them syndicated widely throughout the country, include David Lawrence,

⁶ *Institute of Pacific Relations, Hearings before the Subcommittee to Investigate the Administration of the Internal Security Act and Other Internal Security Laws, Committee on the Judiciary, United States Senate, 82d Cong., 1st–2d sess. (1951–52).*

⁷ *The Evening Star*, May 25, 1953, states that 95 members of the Senate and 406 members of the House buy its weekday issues.

Walter Lippmann, Drew Pearson, Dorothy Thompson, Constantine Brown, Marquis Childs, Joseph and Stewart Alsop, Thomas L. Stokes, Doris Fleeson, Gould Lincoln, Peter Edson, Robert C. Ruark, Eleanor Roosevelt, Jerry Kluttz, George Sokolsky, and Westbrook Pegler. A story carried by a major columnist is reflected in mail from home and therefore is of marked effect in the political atmosphere of the capital. Reporters of the stature of an Arthur Krock carry weight in the highest policy counsels. The Department of State, sensitive to the climate of the press, prepares regularly, for the guidance of its top officials, digests of press comment about international affairs.

THE PERSISTENT INDIVIDUAL

There is a common impression that only great organizations and vast campaigns play any appreciable part in the influences which shape congressional policy in foreign affairs. Ordinarily prestige, connections, and a large constituency are significant elements in pressure politics. Close observers are aware, however, that persistence, sincerity, and a command of facts are political weapons of great power even when exercised by a single citizen.

A notable illustration in the field of foreign policy is the experience of Robert E. Rodes, who for a year spoke on behalf of American businessmen in Morocco. His insistent persuasion in 1950 overrode the position of the Department of State on the floor of the Senate and gained congressional support for limitations upon American financial aid when American business faced economic discrimination.⁸ Before the Senate Committee on Foreign Relations he spoke at length after conferences with individual Senators.

⁸ 96 *Congressional Record*, 81st Cong., 2d sess. (1950), pp. 6488–89.

The CHAIRMAN [Senator Connally]. You have gotten a good ways from Morocco.

Mr. RODES. I would like to go back.

The CHAIRMAN. We would be glad if you would. . . . Are you on a salary basis over here?

Mr. RODES. I am not, sir.

The CHAIRMAN. For representing these men?

Mr. RODES. I certainly am not.

The CHAIRMAN. You do not mean you are doing it on your own?

Mr. RODES. I am not doing it on my own. I think at the present writing I am about \$4,000 out in expenses. The boys have paid some of my expenses. I have paid most of them.⁹

TECHNIQUES

The lobbyist in any area of foreign policy, like all other lobbyists, is most effective if he is master of his subject, straightforward in his approach, helpful to members of Congress in his contributions to the legislative process. Experienced heads in Congress are sure that earnestness and integrity are not only appropriate but also successful.

One of the major functions of lobbyists is the careful drafting of proposed legislation, either in the form of bills or of amendments. Supporting data justifying proposals are also of primary importance. Equally important is identification of the lobbyists' point of view with that of influential political elements. Contacts with leaders who are themselves influential with legislators are not to be overlooked. The organization of local, state, and national committees and other groups, with endorsements, statements, and resolutions, involves basic strategy in public relations. The modern lobby deals in all the facets of effective propaganda—and the genuine is usually the most effective.

⁹ *Extension of European Recovery—1950*, Hearings before the Committee on Foreign Relations, United States Senate, 81st Cong., 2d sess. (1950), pp. 289, 295.

It is the policy of the Senate Committee on Foreign Relations to permit testimony in hearings from responsible representatives from all major groups who wish to be heard. Moreover, the committee will receive for the record statements from persons and organizations. Adequate presentation of a case from the point of view of any interest group should involve not only complete data but also selected witnesses who represent, if possible, various important and widely distributed economic, professional, and geographic segments. Testimony of major news value, either because of the drama of the subject or because of the prominence of the witnesses can be made to turn hearings into a great national discussion.

When any substantial part of the American public is aroused over a legislative issue, letters and telegrams pour into congressional offices. Such messages are of great weight when they appeal to be spontaneous expressions from responsible citizens. At the time of the dismissal of General MacArthur, Congress was deluged with an unprecedented mass of communications which offered every evidence of sincerity and spontaneity. The political consequences of such a flood are greatest when public demands can be focused upon action which Congress is asked to take. Quantities of telegrams and mail in 193 contributed in large part to Senate defeat of the World Court protocol.

REGULATION AND THE COURTS

The well-known Federal Regulation of Lobbying Act, passed in 1946, has failed to meet the expectations of optimists. This somewhat involved statute has been the victim, in various ways and at various times, of noncompliance, of inadequate enforcement arrangements, and of partially successful court attacks. This law has required (1) quarterly statements from persons or organiza-

tions (except committees of political parties) collecting funds to be used to influence legislation; (2) advance registration of any person employed for purposes of legislative influence; and (3) quarterly statements of receipts and expenditures from any person registered. Provisions relating to paid lobbyists clearly do not apply to witnesses before congressional committees, to public officials, or to members of the working press. Upon conviction, violators are punishable by fines not to exceed \$5,000 in each instance and by imprisonment not to exceed a year. Persons convicted, recites the law, may not attempt to influence Congress for a period of three years under pain of possible penalties of a fine of \$10,000 and imprisonment for five years.

Any careful examination of the statute, or of the reports which have been made under it, will reveal confusion in interpretation and observance of the law. When is a person or organization collecting money to be used "principally"—a key word in the law—to influence "directly or indirectly" legislation in Congress? Should a veterans' membership association, interested in legislation as well as in numerous other activities, report its finances? Does the law require, because of the force of the word "indirectly," the report of all contributions, or simply the report of funds used principally to influence Congress? Opinions and reports have varied, with a multitude of different motivations. In actuality, financial statements are usually filed from a sense of civic responsibility or duty, even in cases of possible doubt; from belief that the spirit of the law requires reporting; or from indications in the social or legal climate that noncompliance may involve unfavorable publicity or other undesirable consequences.

In 1948 the National Association of Manufacturers sought a declaratory

judgment to clarify the lobbying statute and to enjoin the Attorney General of the United States from instituting prosecution against the NAM. On March 17, 1952, a special three-judge United States District Court for the District of Columbia unanimously held unconstitutional sections of the Federal Regulation of Lobbying Act which require financial reports from persons and organizations collecting funds to influence Congress. In the opinion of the court in this case, *National Association of Manufacturers v. McGrath*, Judge Alexander Holtzoff concluded that vague language in the statute violates the due process requirement of the Fifth Amendment to the Constitution. With equal emphasis the court considered a penalty prohibiting convicted persons from attempting to influence Congress a violation of the free speech and petition provisions of the First Amendment.

Upon appeal to the Supreme Court by the Department of Justice, the litigation encountered technicalities which leave the whole question unsettled. Because J. Howard McGrath had been succeeded as Attorney General by James McGranery, the Supreme Court, on October 13, 1952, ordered the case returned to the lower court with instructions to dismiss the complaint on the ground that it had become moot. A petition for rehearing and substitution of McGranery's name for that of McGrath was denied by the Supreme Court on November 17, 1952, despite the contention of Justices Reed and Jackson that the petition should be granted.

In a subsequent case in the District Court, *United States v. Harriss*, decided January 30, 1953, Judge Holtzoff held unconstitutional the section of the Lobbying Act requiring registration and financial reports by paid lobbyists, on the ground that the unconstitutional penalty which also applies to it cannot be separated from the operation of the

section. Moreover, the District Court expressed the view that the precedent set in the National Association of Manufacturers case was still binding on the court, since the Supreme Court had not reviewed the decision but had merely held that the case had become moot in the progress of the litigation. An appeal by the Department of Justice from this decision of the District Court is scheduled to be argued in the Fall 1953 term of the Supreme Court.

These disconcerting technicalities do not obscure the essential vagueness of many provisions in the Lobbying Act. The slowly developing legal situation discourages compliance with the statute and explains in part the diminishing number of registered lobbyists and financial reports. The statute is woefully in need of clarification and repair.

PROPOSED CHANGES

The House Select Committee created to investigate lobbying and headed by the late Frank Buchanan of Pennsylvania recommended several changes in the Federal Regulation of Lobbying Act.¹⁰ The committee suggested that no stigma should be attached to the words "lobbyist" and "lobbying," but it recognized that many persons have disliked the connotations of the terms. Moreover, neither word is used in the act except in the title. Further, the required filing of reports is not regulation. A short title proposed by the committee is "Legislative Interests Reports Act."

In addition, the committee favored expressly exempting radio and television broadcasting stations, since newspapers and other periodicals are already excluded from the coverage of the law. Elimination of the constitutionally questionable penalty prohibiting violators of

the act from attempting to influence Congress for three years was also suggested. Reduction of detail in required reports and exemption of persons spending less than \$1,000 per year to influence legislation were advanced as simplifications which would bring into the limelight more important activities. A prohibition of contingent-fee arrangements, by which lobbyists are paid on the basis of successful influence, was cited as a desirable feature to be borrowed from many state laws.¹¹

These suggested amendments are of course minor. While they would on the whole improve the law, they would not solve the problem of accountability of persons seeking to influence legislation. Other recommendations of the committee contemplated more careful legislative and administrative scrutiny of filed reports.¹² Present and proposed procedures, which make lobbyists accountable to Congress for information about activities and to the law-enforcing Department of Justice for noncompliance, do not attain the happy end of honor for straightforward lobbyists as distinguished from condemnation for occasional recreants.

INFLUENCE AND RESPONSIBLE GOVERNMENT

Whether the name be "lobbyist," "influence," "interest," or an entirely new term, there is rightly a place of honor for men and groups who properly bring information and points of view to the attention of legislators. Means should be found to prevent the improper use of influence, but the means employed should neither condemn nor discourage

¹¹ For a view that contingent fees are a legitimate form of business procedure, see Bertram M. Gross, *The Legislative Struggle* (New York, 1953), p. 47.

¹² *Report and Recommendations, op. cit.*, pp. 32-35.

participation in the interplay of political forces in the democratic process. Foreign policy, like every other aspect of public action, must involve politics in the broadest sense. Government by consent of the governed must be based on persuasion, and this basic maxim is no less true in the field of foreign affairs than in any other.

Proper recognition for public service well performed by persons and groups interested as citizens in legislative action would be an appropriate development. Accolades for those who deserve them could become a valuable encouragement in a period when condemnation for public activity is more easily acquired than praise. To that end, Congress and its committees might more frequently follow the example of the courts by expressing formal thanks for counsel properly offered.

A natural tendency to focus attention on the unusual and the sensational obscures the values of the normal discus-

sion of public affairs. The prestige of Congress itself, not only now but at most times in the past, has suffered from public misconceptions based on the bizarre. The consequent exclusion from the popular mind of any real understanding of Congress at work has led to opinions about the national legislature which are not helpful to responsible government. A truer picture of a working Congress, with admitted handicaps and faults, reveals a representative institution seeking information from all sides and accepting political responsibility for decisions and compromises which must be made in the midst of innumerable conflicts of interests.

Politics is a struggle, and Congress should not be censured for welcoming struggles which are better debated than fought. Organized debate in the area of foreign policy, appreciated and understood rather than criticized or denounced, will strengthen American leadership in a free world.

Franklin L. Burdette, Ph.D., College Park, Maryland, is professor and head of the Department of Government and Politics at the University of Maryland. Among his published works are Filibustering in the Senate (1940); Political Parties: An American Way (1945); and Lobbyists in Action (1950). He is political science editor for D. Van Nostrand Company, publishers.

Congress and the Department of State

By BEN H. BROWN, JR.

In the early periods of the Government the opinion and advice of the Senate were often taken in advance upon important questions of our foreign policy. General Washington repeatedly consulted the Senate and asked their previous advice upon pending negotiations with foreign powers, and the Senate in every instance responded to his call by giving advice, to which he always conformed his action. This practice, although rarely resorted to in later times, was, in my judgment, eminently wise, and may, on occasions of great importance, be properly revived. The Senate are a branch of the treaty-making power, and by consulting them in advance of his own action upon important measures of foreign policy which may ultimately come before them for their consideration, the President secures harmony of action between that body and himself. The Senate are, moreover, a branch of the war-making power, and it may be eminently proper for the Executive to take the opinion and advice of that body in advance upon any great question which may involve in its decision the issue of peace and war.

THESE words of wisdom, from a message to the United States Senate on June 10, 1846 by President Polk, are even more appropriate today than they could possibly have been then.

How often we are astounded at the wisdom of our forefathers! How often we read the Constitution and wonder how its drafters could possibly have provided so wise and just a document! How often we have read a statement by one of our earlier statesmen and found it as appropriate today as at the time it was made; indeed, in many cases more appropriate!

President Polk's statement is limited in its historical reference to negotiations with foreign powers and in its expres-

sion of opinion to the treaty-making power and the war-making power. To day we find that most authorities on the subject of the relationship between the President and the Congress in the field of foreign relations would broaden this concept to include lesser issues than those involving war and peace, and would broaden the participation to include the other house of the Congress. The desirability of a close working relationship is more evident today than at any time in the past.

Although the desirability of consultation has been recognized by many Presidents in our past, our first 150 years as a nation involved few situations urgently demanding such co-operation. Before World War II the United States was not definitely established as a leading power in world affairs; earlier because we did not have the necessary strength, later because we did not have the desire. Our venture into the field of international power during the First World War was, relatively speaking, more in the nature of a scouting expedition than of an invasion in force. We quickly receded into our shell. Only with the outbreak of hostilities in 1939 did this country become irretrievably launched into world affairs, to emerge from a devastating war with a position of unquestioned leadership which required a reassessment of all of our relationships, not only with other governments but also between branches of our own government.

INCREASED NEED FOR COLLABORATION

The broad subject of legislative-executive relations in the field of foreign affairs very quickly boils down to the

narrower subject of Congress and the Department of State. The President is the responsible officer with respect to foreign relations. The Secretary of State is his agent. As the President's representative in this field, co-operation with the Congress falls primarily on his shoulders.

For the most part, there was, until quite recently, little need for frequent contacts between the Secretary of State and the Congress, except in the field of treaties and in connection with the periodic appropriations by the Congress of funds for the administration of the Department of State and the Foreign Service. There was an unrecognized, and therefore unmet, need during the negotiations for peace following World War I. The tragic results of this failure to co-operate are well known.

The real need, on a permanent basis, for co-operation between the Executive and the Congress on foreign relations began with the outbreak of World War II, when it quickly became evident that the powers of the President alone in the field of foreign relations were insufficient to carry out this great nation's responsibility. Legislation was required to accomplish necessary measures which were beyond the authority of the President himself. First we had the Neutrality Act of 1939, that vain but hopeful effort to remain aloof from the problems of the world. This was followed closely by "cash and carry," then by lend-lease. After our entrance into the war, as the great needs of the devastated areas which were being liberated by the forces of the Allied nations were realized, there was the authorization for our participation in and contribution to the United Nations Relief and Rehabilitation Administration. All these war-time measures required the authority of Congress exercising its constitutional responsibilities. True, the leadership in

most cases was taken by the President, but without the Congress he was unable effectively to act.

Following the conclusion of the hostilities, we were faced with more problems requiring action by the Congress. There were the peace treaties to be negotiated and ratified by the Senate. There was post-UNRRA aid requiring the expenditure of funds. The Communist efforts to overthrow the government of Greece and the Communist threat to Turkey required American assistance to those nations. When it became evident that more than emergency aid was required, that national economies had to be rebuilt if freedom were to be maintained, the Secretary of State, General Marshall, proposed what later became known as the Marshall plan, or, officially, the European Recovery Program. Prior to the finalization of the Marshall plan, "Interim Aid" was required to bridge the gap in a few of the countries. Shortly thereafter, the North Atlantic Treaty was entered into; then the Mutual Defense Assistance Program, along with the continuation of the Marshall plan. To fight Communism by improving the underdeveloped countries, President Truman proposed as Point Four of his inaugural address what was later to be known as the Act for International Development. All these measures required the participation of both the Congress and the Executive.

The Korean outbreak, the peace treaty with Japan, the debates in the Senate on the question of sending American troops to Europe, and the problems in connection with the Far East made even more evident the fact that no longer can the President alone run the foreign affairs of this government, but a combined effort by the President and the Congress working toward the same end is required.

EXAMPLES OF CONGRESSIONAL PARTICIPATION

During the recent period under discussion, efforts were made to bring about greater participation by the Congress in the formulation of foreign policy. Near the end of December 1941 the President established an Advisory Committee on Post-War Foreign Policies. In May of the following year, members of the Congress were invited to participate in this committee. The first two Senators invited were Senator Tom Connally of Texas, chairman of the Foreign Relations Committee, and Senator Warren R. Austin of Vermont, ranking minority member of that committee. By January 1943, when the preparatory work had become more developed, congressional participation was increased. Senator Walter F. George of Georgia and Senator Elbert D. Thomas of Utah were invited to take part in that month, and later Senator Wallace H. White, Jr. of Maine became a member, as did Representative Charles A. Eaton of New Jersey, Representative Sol Bloom of New York, and Representative Luther A. Johnson of Texas. Subcommittees of the Advisory Committee were also set up, participated in by members of Congress.

In international negotiation, begun early in 1944 in the cultural, labor, economic, and financial fields, members of Congress participated. Two Senators and two members of the House of Representatives participated in the Bretton Woods Conference. In March 1944 Secretary Hull invited the Chairman of the Senate Foreign Relations Committee to name a congressional group for informal consultation on the possible plan then being drafted for a general international organization. A group of eight Senators was named, and this group had frequent meetings with

Secretary Hull. In addition, Secretary Hull discussed the plan at some length with a number of members of the House of Representatives. Prior to and during the international negotiations at Dumbarton Oaks, constant liaison and consultation with both the House and the Senate were maintained.

During this period congressional participation in international conferences was on the increase. At the Mexico City Conference in February 1945, we had as congressional advisers Senators Connally and Austin and Representatives Luther A. Johnson and Edith Nourse Rogers.

Further consultations were held before the United Nations Conference on International Organization at San Francisco, both on substantive matters and on the question of congressional representation at this conference. There were present at San Francisco as active members of the delegation Senators Connally and Vandenberg and Representatives Bloom and Eaton. Invited to consult with the delegation on fiscal matters were Senators McCarran and White and Representatives Rabaut and Stefan. All of these with the exception of Senator White, who was unable to attend, actually consulted with the delegation at the scene of the negotiations.

Finally, with the conclusion of hostilities and the beginning of the negotiations for the peace treaties, we find again the participation of members of the Congress in the great international conferences which were held. Since that date most international conferences of any significance have had congressional participation either as delegates or as advisers to the delegation. This congressional participation has been actual and active participation, both in the meetings of the delegations and in the meetings of the conferences. A great deal of consultation with the Con-

gress has also taken place on less important matters, not involving international conferences.

COMPLICATIONS

Spoken of in generalities, congressional participation in the formulation and carrying out of foreign policy would seem a simple matter. It is, however, an extremely complicated matter. The growth of the Department of State, required in order to fulfill our responsibilities, is in itself a complicating factor. The pressure of work upon the Congress is another factor. How best to bring these two organizations together, not only for consultation but for the transacting of necessary legislative business, poses a considerable problem. How should the Department be organized for consultation? How should a determination be made as to when consultation is required or desirable? With whom in the Congress should there be consultation?

It is disarmingly simple to indulge in platitudes and to maintain that the business of the government in the field of foreign relations can best be done by appropriate collaboration between the Executive and the Congress. It is challengingly difficult to work out a sound plan and procedure for consultation with the Congress. Many have made broad, ringing declarations of the necessity for co-operation. Few have proposed sound, workable plans for carrying out this effort.

ORGANIZATIONAL SETUP

Let us look to the organization of the Department of State for congressional relations. In the prewar years no particular organization was required, because of the limited amount of business which the Department had with the Congress. Thereafter, however, the responsibilities of the Department in

dealing with Congress became more complicated, and special assignments of this function in the Department were the practice. However, in almost all instances up until 1948, the official of the Department responsible for managing its relations with the Congress performed this task "in addition to his other duties." In January 1949, the Hoover Commission Task Force Report on Foreign Affairs contained, *inter alia*, the following recommendation:

The State Department should establish a coordinated program of Congressional liaison under the supervision of an Assistant Secretary with no other duties.

Recent experience has demonstrated the need for a full time Assistant Secretary of State for Congressional Relations. The present unsatisfactory status of State Department Congressional relations indicates that the job cannot be done on a part time basis by one of the Secretary's top level advisers.

The Assistant Secretary for Congressional Relations should actively participate in the top level policy formulation in the Department. He should be able to marshal personnel anywhere from within the Department to present to the Congress special phases of its programs. In this work he must have adequate staff to aid in the preparation of material, in following important issues and to perform helpful services for the members of Congress.

Shortly thereafter, when one of the assistant secretaryships then authorized in the Department of State became vacant, there was established an Assistant Secretary for Congressional Relations. In May 1949, when the Congress passed the State Department Reorganization Act, the report of the House Committee on Foreign Affairs made it clear that it was the intention of the Congress that one of the assistant secretaryships created by that act should be devoted to congressional relations and that the occupant of that post should have

no other function within the Department. Thus the office of the Assistant Secretary of State for Congressional Relations not only was created in response to the recommendation of the Commission on Organization of the Executive Branch of the Government, but also has statutory authority.

FACTORS IN SUCCESSFUL CONSULTATION

With the Department of State effectively organized to conduct congressional relations, the problem arose as to how best to carry on consultation on a constant basis with the Congress. Certain factors must go into the making of effective co-operation between the President and the Congress, or, more specifically, between the Secretary of State and the Department of State on the one hand and the Congress on the other. There must be a relationship between the principal officers of the Department and the members of Congress which is conducive to co-operative efforts in the foreign policy field. There must be a mutual understanding on the part of the members of Congress and the principal officers of the Department of the problems of the other. There must be constructive discussion of the problems involved in the foreign policy of this government, and a sincere effort jointly to work out solutions. Each of these factors involves numerous difficulties, many of which understandably can never be completely overcome. The effort must be to overcome as many as possible and to minimize those which cannot be overcome.

In this context when we speak of consultation with Congress, what do we mean by Congress? It is, of course, manifestly not possible even to inform all 531 members of Congress of the manifold problems involved in foreign policy, much less to discuss all of these problems with them. Therefore, when speaking of co-operation between the

Department and the Congress, one must consider both as institutions, not as individuals. Then one must determine who will represent Congress, the institution.

THE REPRESENTATIVE GROUP

This representation must be a group of limited proportions for consultation to be feasible. Obviously, no arrangement will be ideal. The most nearly satisfactory one would seem to be reached by looking at the manner in which the Congress organized itself as an institution. There is the "leadership" and there are the standing committees. Among these are, in the Senate, the Committee on Foreign Relations and, in the House, the Committee on Foreign Affairs, both set up by the Congress to advise the Congress on foreign affairs. When one considers the responsibility of these committees in connection with foreign policy legislation and the responsibility of the leadership of the two houses with respect to floor action on such legislation, one can logically conclude that the representatives most appropriate for consultation have been found. Obviously, the leadership does not have the time that is required for proper co-operation with the executive branch in the field of foreign relations. This means that the bulk of consultation must be with the Foreign Relations and Foreign Affairs Committees. These two committees are looked to by the leadership of both houses for guidance. What could be more appropriate than for this group to be the group with which the executive branch co-ordinates in the formulation of foreign policy, with, in addition, more direct approach to the leadership on matters of greatest importance?

It is difficult, of course, for some members of Congress who have a keen interest in foreign policy to accept such an arrangement. It has been said that

every man in the United States considers himself a Secretary of State, whereas there are few who feel that they have the necessary qualifications to be Secretary of Agriculture or Secretary of the Treasury.

But even these specialized committees are limited in time available to carry on consultation, by reason of their legislative functions which under present circumstances are extremely time-consuming. In attempting to meet this problem the committees and the Department have shown what in itself is an excellent example of legislative congressional co-operation. The two committees have each divided themselves into consultative subcommittees, which subcommittees have responsibility along the lines of the organization of the Department. Thus, a subcommittee having responsibility for European affairs is the proper body for consultation on foreign policy affecting Europe.

During the last four years there have been numerous consultative meetings between appropriate officers of the Department and the consultative subcommittees of the Committee on Foreign Relations and the Committee on Foreign Affairs. The subcommittees have been kept advised of the problems facing the United States in particular fields. The problems have been discussed, the views of the subcommittee members have been obtained. In many cases, in fact in most cases, a meeting of the minds has been reached between members of the subcommittees and the appropriate officers of the Department as to the suitable course to be followed by this government. There has been developed a true type of consultation which, though not perfect, is certainly a significant development. There has been established a procedure which can be built upon and further developed in order to bring about closer and closer co-operation between the executive and legislative

branches of our government in the field of foreign policy.

EXAMPLE OF SUCCESSFUL CONSULTATION

A specific example of successful consultation on a particular subject matter is the negotiation of the treaty of peace with Japan. When the present Secretary of State was appointed a special representative of the President with rank of Ambassador to negotiate the treaty of peace with Japan, he promptly met with the Far Eastern Subcommittee of the Committee on Foreign Relations and the Subcommittee on Pacific Ocean Area of the Committee on Foreign Affairs and discussed the many problems involved. Throughout the year during which negotiations took place, Mr. Dulles frequently met with these two subcommittees, considered developments since the previous meeting, outlined problems that had arisen, and discussed possible solutions to these problems. Consultation continued through the conference at San Francisco, when the treaty was signed by forty-nine nations. There were appointed as members of the United States delegation to the conference the chairmen and ranking minority members of the Foreign Relations Committee, the Foreign Affairs Committee, and the Senate and House Armed Services committees, as well as members of the Far Eastern and Pacific Ocean subcommittees of the respective committees.

The result of this splendid example of the possibility of collaboration between the Congress and the Executive was the prompt passage by the Senate of a resolution giving its advice and consent to ratification of the Japanese peace treaty.

Consultation with the Foreign Relations and Foreign Affairs committees should not operate to exclude other members of Congress from participating in foreign policy formulation. Other

committees have responsibility for matters affecting foreign relations. Other members have substantial interests in and responsibility for such matters. Consultation should be as broad as possible. But there must still be a hard core, a central focus, and that must be the Foreign Relations and Foreign Affairs committees.

INHERENT DIFFICULTY

Because of the constitutional division of powers between the President and the Congress, the conduct of the foreign relations of the United States in its present-day position of world leadership requires a close relationship between these two branches of the government. Such a relationship can be brought about only through honest attempts at full and frequent consultation.

At the same time it must be realized that this consultation in itself raises the problem of maintaining the division of powers provided by the Constitution. Such consultation increases the chances of invasion, by one branch of the government, of the field of the other.

President Polk in his message to the Senate in 1846 stated that "General Washington repeatedly consulted the Senate and asked their previous advice upon pending negotiations with foreign powers, and the Senate in every instance responded to his call by giving advice, to which he always conformed his action." Both the accuracy of this statement and the wisdom of such a practice are open to question. It is hard to believe that President Washington, who set the precedent by which many Presidents have refused to give the Congress certain requested information with respect to foreign relations on the ground that it would be against the interest of the United States to disclose such information, and who stalked out of a meeting with the Senate after at-

tempting "consultation" on an early treaty with the Indians, vowing never to return, "always conformed his action" to the advice of the Senate.

DIVISION OF POWERS MUST BE MAINTAINED

The President's constitutional authority in the field of foreign relations is not merely an authority but is also a responsibility. The same is true for the responsibility of the Congress. Neither the President nor the Congress can give up this responsibility to the other. President Polk's statement with respect to the treaty-making power is an oversimplification. The President, with his more intimate knowledge of relations with other governments and the factors which must be taken into account in the negotiation of a treaty, must, in carrying out his constitutional authority, seek to influence the Senate toward his position. There must always ultimately be a meeting of minds between the President and the Senate or there can be no treaty. This meeting of minds, however, must result from a process of give and take.

This basic issue must underlie any practice of consultation with Congress. In matters where the Congress has the authority, the Congress must ultimately make the decision by constitutional processes. In the situation where the President has the final authority and responsibility, the President must make the final decision.

Consultation is a process by which every effort should be made to reach an agreement and to bring about a co-ordinated approach by the President and the Congress. In the final analysis, however, this process must not be allowed to prejudice constitutional division of powers and the system of checks and balances established by the Constitution.

In a debate on the floor of the Sen-

ate on June 11, 1948, Senator Arthur H. Vandenberg said:

I think the Senate is entitled, at any time it pleases, to use the advice clause of the Constitution to tell the Executive what it thinks concerning foreign affairs. But I think it would be a tragic and unfortunate thing if the habit ever became general or too contagious because I respectfully submit . . . , only in those instances in which the Senate can be sure of a complete command of all the essential information prerequisite to an intelligent decision, should it take the terrific chance of muddying the international waters by some sort of premature and ill-advised expression of its advice to the Executive The Constitution places in the President the primary responsibility for the conduct of foreign

relations. He exercises that authority through his Secretary of State. When and where it is possible . . . for the legislature [and] the Executive to proceed from the beginning to the end of a specific venture so that all are consulted in respect to all phases of the undertaking, I think it is a tremendously useful thing

Consultation must consist of advice by the Congress to the President on decisions which under the Constitution he must make, recommendations to the Congress by the President on decisions the Congress must take, and a mutual discussion directed toward achieving a meeting of the minds on problems the solution of which must be found jointly by the Congress and the President.

Ben H. Brown, Jr., J.D., Washington, D. C., is Deputy Assistant Secretary of State for Congressional Relations in the Department of State. From 1939 to 1941 he engaged in private practice in Spartanburg, South Carolina. During World War II he served with Military Government in Italy and Germany, and in other capacities. He has been connected with the Department of State since 1946. In 1947 he was an adviser to the General Assembly of the United Nations. In 1948 he was a member of a Survey Mission to Germany and a member of the United States Delegation to an Inter-Governmental Conference to establish an International Authority for the Ruhr.

Executive-Congressional Liaison

By ESTES KEFAUVER

LACK of effective liaison between the executive and legislative branches of the federal government has been endlessly and increasingly troublesome over the years since the organization of our government. Serious conflicts between the executive branch and the Congress have brought back into active discussion means and methods of attaining a liaison between the two of such nature as to achieve a better functioning of both branches in the national interest.

Disputes and conflicts between these two branches of the federal government have been many and varied, arising from divisions as to policy; real, threatened, or imaginary encroachments upon the authority of one or the other; and similar causes. These differences, sometimes of an exceptionally sharp nature, have had wide repercussions in domestic affairs and politics. Wise representatives of foreign nations, both friendly and the reverse, have always paid careful attention to these divisions and to their meanings and possible consequences in our foreign relations; but it is only lately that the irritation sometimes caused by our divisions has reached such an intensity abroad as to cause important and responsible leaders among our friends and allies to comment on us publicly and critically in this regard.

The problem is one which we have long recognized at home—in fact, since the beginnings of our government—and proposals for its solution, none of which has been notably effective, have often been brought forward. The growth of our nation, the increasing complexity of an industrial society, and the vast expansion of man's knowledge in the

world of science, all have conspired to make the problem larger and vaster, and at least a partial solution increasingly compelling.

BRITISH SYSTEM NOT APPLICABLE

Our friends may be impatient with the results or lack of results which may appear to attend our divisions of authority between governmental branches. They will have sympathizers in the United States, where there has always been admiration on the part of many for the effectiveness of the parliamentary system, particularly as it works in Great Britain. But Americans have seen parliamentary systems of government fail elsewhere, and even the British system and British practice are capable of falling short of the ideal. Our Constitution was formed in an aura of libertarian ferment, among other influences, and the strong deterrents in that document to the possible establishment of despotism are thereby accounted for.

The British system, as some may not take into account, can permit a degree of personal government more easily than our own, no matter what the practice may have been. By this is meant that exceptionally strong, powerful, and persuasive leadership could achieve a degree of control of British government more easily than this could be done in the United States with its divisions of powers. There are also differences of character and tradition between the peoples of the two nations, despite a common cultural heritage, which would quite probably prevent any successful transference to the United States of the parliamentary system as such; and I, for one, certainly would not advocate it.

Fortunately both nations have effective two-party systems which tend to make possible responsible governments; but Great Britain, as well as having two major parties, each capable of governing, possesses a degree of party responsibility unknown in the United States.

Certainly we may borrow—and I think we should—such aspects of the parliamentary system as would, within the framework of our own Constitution and traditions, add to the effectiveness and facility of government in the United States. But even if it were possible of attainment, the merger in our country of leadership of both executive and legislative branches of government would create more problems than it would solve.

DIVISION OF POWERS INEVITABLE

The simple weight of our government, with all its vast duties, responsibilities, and size, is so great in modern times that division of authority and function would be required, it seems to me, if they were not already provided for by our Constitution. A member of Congress who also became directing head of an administrative department would promptly find that doing both jobs at once would call for the creation of deputies to carry out his legislative functions, as he would have such for his administrative functions, and the divisions would begin all over again.

It is this increased weight of government, more than any other factor, that produces the wedge between the legislative and executive branches. With the best of intentions, no member of Congress today can be an expert on the whole vast complexity of the governmental structure. He is sometimes faced, therefore, with the necessity of voting on technical matters beyond the scope of his own committee functions more or less blindly, as leadership, party, or interest group may direct.

Very often, perhaps most often, the difficulties which constantly occur between the executive and legislative branches arise because of lack of information. It is at this point that, in my judgment, we need most urgently to bring about improvement.

PROVISIONS FOR LIAISON

Every administration, naturally, has its own methods of dealing with Congress. Within administrations there is a wide difference as to methods employed by the various departments and agencies. In recent years the White House itself has employed at least one official whose function it is to provide liaison with the legislative branch.

At times this functionary may become immersed in settling matters of patronage more or less to the satisfaction of members of the administration's party in Congress. At other times he may deal principally with legislation and confine his efforts to obtaining support for bills sponsored by the President. If such is the case, his attention will be centered on the leadership of the Congress or of committees in whose jurisdiction such legislation will fall. Possibly this official will also be in charge of obtaining appointments with the President on behalf of members of Congress who wish to press certain ends upon him, or for the President with members of Congress whom he wishes to consult or whose support he wishes personally to obtain for legislation. In any event, this official's duties are informal and changeable and do not normally bring him into contact with the majority of members of the Congress.

One should not discount personal factors in the liaison or lack of it between the executive and legislative branches, and the practice of President Eisenhower of inviting each member of Congress for a meal at the White House has been a

pleasant social gesture which may or may not have other consequences.

The Department of State, largely because of a long series of difficulties with the Congress, has now, as it did in the administration of President Truman, an Assistant Secretary for Congressional Relations. No other department has a civilian official of such high rank devoted to liaison with members of Congress. Some departments and agencies, such as the Department of Defense and the Veterans Administration, maintain offices on Capitol Hill mainly to act as service agencies for members of the Congress. Some departments have no special officials for such purpose, and depend for the success of their relations with Congress on personal contacts made by various departmental or agency officials. Thus such efforts at better liaison as have been made by the executive branch have been chiefly informal, often sporadic, frequently personal, and in many cases largely intended to produce or protect appropriations. Congress, on the other hand, has limited its efforts to seeking the testimony of administrative officials in committee.

A QUESTION PERIOD

One of the most admired features of the British parliamentary system is the famous question period, in which ministers answer the questions of members before the full assemblage of the Commons. It serves, as perhaps no other method would, to enlighten all members of whatever party. It has a further important function in enlightening the public. This latter function in our country has in a fashion been filled by press conferences of the President, of members of the Cabinet, and of heads of agencies; but often enough such press conferences have been as much a weapon in skirmishes between the executive and legislative branches as they have been a means of informing the public.

A question period in which the heads of departments and agencies would appear before either or both Houses of the Congress could be established by means of a simple resolution, would involve no change in the established authority of either the legislative or the executive branch, and would contribute much to the knowledge of all members of the Congress. Thus, in the opinion of many, it would lessen the likelihood of confusion and bad judgment based on lack of knowledge.

To bring this about I introduced Senate Resolution 58 in the present session. As each House writes its own rules, the resolution under discussion would apply only in the Senate if passed. But it seems likely that if such a change in rules were to be approved by the Senate, it would be only a matter of time before the House of Representatives took similar action in reference to its own rules. The resolution is as follows:

Resolved, That rule X of the Standing Rules of the Senate is amended by adding at the end thereof the following new paragraph:

3. There shall be held in the Senate on at least one day in each period of two calendar weeks, but not oftener than one day in any one calendar week, a "question and report period," which shall not consume more than two hours, during which heads of executive departments and agencies are requested to answer orally written and oral questions propounded by Members of the Senate. Each written question shall be submitted in triplicate to the committee having jurisdiction of the subject matter of such question, and, if approved by such committee, one copy shall be transmitted to the head of the department or agency concerned, with an invitation to appear before the Senate, and one copy to the Committee on Rules with a request for allotment of time in a question period to answer such question. If the Senate desires to hear from an under-secretary or one of the secretary's principal assistants, this shall

be arranged by agreement between the secretary and the legislative committee. Subject to limitations prescribed in this paragraph, the Committee on Rules shall determine the date for, and the length of time of, each question period, and shall allot the time in each question period to the head of a department or independent agency who has indicated to the Committee his readiness to deliver oral answers to the questions transmitted to him. All written questions propounded in any one question period shall be approved by one committee. The latter half of each question period shall be reserved for oral questions which shall be germane to the subject matter of the written questions by Members of the Senate, one-half of such time to be controlled by the chairman of the committee which has approved the written questions propounded in such question period and one-half by the ranking minority member of such committee. The time of each question period and the written questions to be answered in such period shall be printed in two daily editions of the Record appearing before the day on which such question period is to be held, and the proceedings during the question period shall be printed in the Record for such day.

ADVANTAGES OF PROPOSED SYSTEM

I think that the system proposed under this rule is an improvement on the parliamentary question session—for it is both a *report* and *question* period. It not only gives the members of the legislative body an opportunity to inquire into the problems of the Executive, but it also gives the Cabinet members an opportunity to present their cause to the whole body. It gives them an opportunity to present to the members of Congress in their basic statement the goals at which they are aiming, and to acquaint Congress with the obstacles which they must overcome to achieve those goals.

Rather than increasing the work of the Cabinet members, it is my opinion that such a system would lessen their

work. They are now called upon frequently by various committees, each of which hears them separately. Under this plan, all members of the Senate or the House would be able to hear the same Cabinet member at the same time, and he would not be called upon to repeat his basic statement before so many different committees.

The proposed system is designed to assist, rather than harass, the Executive. It would give him an opportunity to assert his leadership. The Cabinet officers would have to make policy decisions before their appearance on the hill. They would have an incentive to have their houses always in order, for, as the banker does not know when the examiner will be by, so they would not know when they might be invited for a question and report period.

PRESS CONFERENCE INADEQUATE

It has sometimes been argued that the largely American innovation, the press conference, supplies in our system of government the function of the question period in the British Parliament. The press conference is frequently highly useful, but it alone does not fulfill this need. Presidents since Franklin D. Roosevelt have made regular use of the technique of the press conference in communicating to the people and not rarely to Congress itself. But the decision as to whether to use press conferences or not, or whether to use any alternative method of communication with the press if any at all, is a matter of policy. Members of the Cabinet and heads of the various agencies of the executive branch ordinarily follow the pattern set by the Chief Executive, but they are by no means required to do so, and often do not.

Since Cabinet members and agency heads are responsible for most of the actual details of operating the government, and are naturally more conversant

with these details than is the President of the United States, a lack of policy in providing a means of regular and frequent communication between Cabinet and agency heads and either the Congress or the public at large is unsatisfactory.

We have heard much about "government by press release." There has been some justification for this charge, as administrators have expressed their opinions and purposes through written statements to the press. These admit of no questions, and may give the public—as well as members of Congress as they constitute a part of the public—one-sided and mistaken views of actual situations. The same thing may be said of public addresses, however frequent in number. They are rarely followed, when the speaker is a high official of the government, by question periods to inform the questioners.

WIDER ACCESS NEEDED

Congress certainly has opportunity to question Cabinet members and agency heads, or at least committee members do, when those officials appear before committees. But with the exception of such officials as the Secretary of State and the Secretary of Defense, whose Departments have problems demanding an almost constant attention by congressional committees, some Cabinet members escape even committee questioning except at the annual hearings on appropriations and on rare occasions when the subject under discussion is likely to be quite limited and specialized.

And as has been pointed out before, these sessions are usually limited to those members of Congress who are members of the particular committee concerned. A member of the Senate Committee on Finance doubtless will have an opportunity during the course of a year to question the Secretary of

the Treasury on several occasions; but if he is not also a member of the Committee on Agriculture, he will have no opportunity to question the Secretary of Agriculture, although he is as responsible in the final analysis for legislation in one field as the other.

In my judgment, it is not conducive to the best government possible under our system to have our legislators dependent for the bulk of their information on what may or may not come to them as readers of the daily press, as indispensable as the press is as a source of information, or on the printed hearings of committees, which, it must be admitted, are often lengthy and sometimes contain nonessential matter.

One answer—and it will be admitted that it is neither the sole nor the perfect answer to keeping the members of Congress adequately informed—would be to bring before the whole body of the Senate, or the House if it so desired, such heads of departments and agencies as it wished to invite for questioning.

The fear has been expressed on a number of occasions that witnesses would be subjected to undignified treatment and improper questioning if this were done. This fear is based on the happenings in certain committee or subcommittee hearings which various persons have found objectionable. The floor of either of the branches of the Congress is, however, governed by stricter rules and greater formality than necessarily apply in committee hearings. Original questions would be passed on by the chairmen of the committees in whose field they lay. Questions could thus be screened for irrelevance. That some political advantage might be sought in the question period cannot be denied, but it cannot be said that this is not also a mark of the question period in the British Parliament.

Possibly we would require a period of trial and error before such a question

period became an entirely natural and useful function of our system of government. But it must not be forgotten that there are few more public places than the bar of the Senate of the United States, and inevitably the weight of public opinion would bear down, as it invariably has done eventually, on those who would misuse and abuse democratic principles in high places.

Today we have an ineffective system of communication and liaison between the legislative and executive branches of the federal government. It is a

problem of concern not only to those who are participants in government, but also to nongovernmental experts in the field and to all thoughtful citizens. The problem gives not the slightest indication of lessening; on the contrary, it grows more grave with each passing session of the Congress. The proposal discussed here will by no means provide a solution for all of the problem, but as it could be put into force by simple resolution, it might well be the easiest step which we could now take in the right direction.

Estes Kefauver, LL.B., Washington, D. C., and Chattanooga, Tennessee, is United States Senator from Tennessee. He was chairman of the Senate Committee to Investigate Organized Crime in Interstate Commerce, and was floor manager of the Armed Services Committee on legislation to institute a uniform code of military justice and to establish the Civilian Defense Program. He is co-author of Twentieth Century Congress (1947) and author of Crime in America (1951), and has contributed to numerous journals.

Information and Intelligence for Congress

By H. ALEXANDER SMITH

THE legislative process is an institution the function of which is the creation of rules and regulations by which the political community may operate. To be effective, it requires information and intelligence. While it is possible simply to issue laws and enforce them with physical might, in the long run such a procedure must be modified or eventually fail. Certainly, under a democratic government which operates on the basis of the "consent of the governed," a full understanding of the possible ramifications and repercussions of a given legislative proposal is essential if the law is to be effective. This is the basic reason why the whole legislative procedure, including that of foreign relations, is built around the process of acquiring information and intelligence with respect to particular conditions and situations, and the application of that information to the fashioning of laws.

THE LEGISLATIVE REORGANIZATION ACT OF 1946

Only with respect to subject matter are foreign relations different from other matters receiving the attention of the Congress. The same need for intelligence and information is required. It is particularly important under our system of checks and balances that this intelligence and information be as full and objective as it is possible for the Congress to obtain. Prior to the Reorganization Act of 1946, the Congress had grown increasingly dependent upon the executive branch of the government for its information. Congress lacked an independent, reliable source upon which it could depend. Obviously, when the

chief source of information was the executive branch of the government, Congress' views on legislative matters were largely colored by the Executive's interpretation. Since 1946, however, Congress has sought more and more to devise its own sources of information in order that it need not be completely dependent upon Executive direction and interpretation.

There have always been clerks and secretaries in the offices of the individual members. Many of them are able research workers, supplying senators and congressmen with facts and figures and preparing memoranda and speeches to be used for legislative work. In addition, there have been clerks of committees, some three hundred of them in fiscal year 1946, who have performed research and administrative work for committees and their chairmen. However, prior to 1946, only a few of the standing committees and special investigating committees had expert staffs. Notable among the standing committees were the Senate committees on Education and Labor, Military Affairs, and Appropriations, and the Joint Committee on Internal Revenue. In 1946, with the passage of the Reorganization Act, each of the congressional committees was authorized to hire a number of professional staff members. Section 72A of the act states:

Each standing committee of the Senate and the House of Representatives (other than the Appropriations Committee) is authorized to appoint by a majority vote of the committee not more than four professional staff members in addition to the clerical staffs on a permanent basis without regard to political affiliations and

solely on the basis of fitness to perform the duties of the office; and said staff members shall be assigned to the chairman and ranking minority member of such committee as the committee may deem advisable. . . .

The use made of this provision has differed from committee to committee. It has furnished both the Committee on Foreign Relations of the Senate and the Committee on Foreign Affairs of the House of Representatives with professional staff members capable of analyzing and checking the information supplied by the executive branch. These staff members gather material and supply the committee with an independent informational approach to each of the many items that appear on the committee calendars. The information thus organized for the committee members is immediately available for debate purposes on the floor, and for use as background material and in speeches of the members of the committee, and on occasion as may be required by individual members of Congress. It is the practice of many senators to call upon a committee staff to supply them with information on questions pending before the Senate.

A special source of information and intelligence in the long and intricate process of bill drafting is the office of the Legislative Counsel. This office, staffed by capable lawyers, assistants, and clerks, is of great help to members of Congress by providing technical advice on the writing of legislation. The importance of this office, as with the committee staffs, is its independence of the executive branch of the government.

Another innovation of the Legislative Reorganization Act was the creation of the Senior Specialist Staff of the Legislative Reference Service in the Library of Congress. The purpose of establishing this group was to provide experts capa-

ble of furnishing members of Congress, the committees, and the Congress as a whole with technical assistance and expert information on subjects under consideration. There was in existence after 1916 a Legislative Reference Service which provided Congress with general information, but only with the creation of the Senior Specialist section in 1947 was Congress supplied with an agency for the special collection of reference works, statutes, bills, reports, and documents required in the framing of legislation.

Previously the Legislative Reference Service undertook the work of preparing digests, indexes, and compilations. Now, as a result of the reorganization, when particular questions arise, members of both Houses of Congress may consult with competent experts on problems in which the members are interested, and members may secure aid in the preparation of material for speeches and analyses pro and con on various bills. This group of specialists may also provide facilities for the organization of committee hearings; they may furnish basic data studies of problems before the Congress or likely to come before the Congress; and they may be called upon to present unbiased information on any topic that will be useful.

The traditional attitude of the Legislative Reference Service on controversial questions is that of scientific impartiality, and staff members must operate in a nonpartisan capacity. Frequently the Director of the Service, in consultation with the chairman of a congressional committee, assigns a member of his staff for a given period of time to serve a committee. The Legislative Reference Service has a number of specialists in the field of foreign affairs.

CHIEF SOURCES OF INFORMATION

There are as many sources of information for congressional purposes as

there are types of information. The main ones are as follows:

1. Perhaps the most obvious sources of the congressman's information are the regular media of radio, television, and the press. These are basic, and form the general groundwork upon which the congressman builds his knowledge of current events. The other sources of information outlined below are all supplements to these more basic media.

2. For general purposes, Presidents' messages and communications to the Congress, accompanied by papers, reports, and observations of the secretaries and the departments concerned, are of the highest order. As a rule, these pertain to treaties and international agreements. They may also pertain to specific items of legislation. For example, when the President sends to the Congress his request for appropriations for foreign aid, it is generally in the form of Presidential message and is read in the two houses and referred to the committees concerned. At the same time, draft legislation and appropriate documents are supplied to the committees by the secretaries concerned and by their departments.

Executive branch material

3. Since much of the foreign relations work of the Congress is in response to requests of the executive branch, the reports of the executive departments and agencies are as significant a source of information as any with which the Congress is concerned. For example, whenever a bill is introduced in the Senate dealing with foreign relations matters, it is the practice of the committee to request the views of the executive branch before proceeding with consideration of the measure. Thus, when the so-called Wiley St. Lawrence Seaway Bill, S. 589 of the present session (83d-1st), was referred to the Commit-

tee on Foreign Relations, the Chairman immediately asked for the views of the Army Engineers, the Departments of Defense, Commerce, State, Treasury and Interior, and the Bureau of the Budget.

These reports are generally in the form of letters from the respective departments and are cleared through the Bureau of the Budget to assure appropriate co-ordination. On occasion when important legislation is handled such as the Mutual Security Act, the printed, mimeographed, and typed material supplied the committee by the executive branch is imposing. For example, in considering the Mutual Security Act during the Eighty-third Congress, first session, the two committees received communications in various forms running into hundreds of pages.

When the committee investigating the information programs of the United States abroad conducted its studies as a result of a Senate resolution during the Eighty-second Congress, second session, it was literally flooded with printed material from the executive branch. Reports are also secured through consultation between the consultative subcommittees of the foreign relations committees of the two Houses and the Assistant Secretaries, Under Secretary, and Secretary of State. This type of material is oral. In addition, the executive branch may be called upon to supply information during congressional hearings and investigations, and the response is often prolific. In the preparation of a committee report, the views of the agencies concerned are normally sought in order to verify the information on which the report is based.

Hearings and investigations

4. By far the most extensive source of information consists of congressional hearings and investigations relative to specific problems and legislative pro-

posals. Investigations and hearings may be conducted by an *ad hoc* committee set up by either House, or it may be conducted by a standing committee or a subcommittee of a standing committee of either House. Section 134A of the Reorganization Act is useful in this connection. It reads as follows:

Each standing committee of the Senate, including any subcommittee of any such committee, is authorized to hold such hearings, to sit and act at such times and places during the sessions, recesses, and adjourned periods of the Senate, to require by subpoena or otherwise the attendance of such witnesses and the production of such correspondence, books, papers, and documents, to take such testimony and to make such expenditures (not in excess of \$10,000 for each committee during any Congress) as it deems advisable. Each such committee may make investigations into any matter within its jurisdiction, may report such hearings as may be had by it, and may employ stenographic assistance at a cost not exceeding 25 cents per hundred words. The expenses of the committee shall be paid from the contingent fund of the Senate upon vouchers approved by the chairman.

It is a practice of the Foreign Relations Committee to hear any person who wishes to be heard during its hearings—the theory being that the right to be heard is a part of the constitutional right of every citizen to petition for a redress of grievances.

Obviously, investigations and hearings differ as committees and their chairmen differ. It is the practice of the Committee on Foreign Relations to hear the formal statement of a witness and then to question him on the presentation, although questioning can take place at any time. At such times each senator may ask such questions as he deems appropriate, and on occasion, committees may use counsel to carry on the questioning.

Various

5. As noted above, a major source of information is the committee staff. It is the function of the staff to prepare, by preliminary conference, interrogation, and otherwise, for meetings and hearings of the committee. The staff secures information about the people and agencies which should be heard, and also considers it part of its duty to see that questions are asked in order for the record to be as complete as possible for legislative purposes. This is done by means of staff studies, preliminary memoranda or memoranda supplied during the course of hearings, and preparation of questions and materials for use in connection with the hearings. Furthermore, it is a function of the staff to secure information for committee purposes either for the individual senator or for the committee as a whole at any point during the legislative process, and to supply information during the debates on the floor and to prepare speeches to be made in support of the committee position. Also, the staff is expected to secure and come prepared with technical information for committee use during conferences. After the legislation has been enacted, it still remains a staff function to supply answers to the questions which always come in following the enactment of a law.

6. Another source of information is the Legislative Reference Service of the Library of Congress. This has been previously discussed.

7. An additional source of information consists of travel by the committee and members of Congress. This is considered in a separate essay in this volume. Here it should suffice to point out that on-the-spot information is extremely important in the field of foreign relations. Since much of this information can be gathered by members of Congress only by visiting foreign lands,

it is the practice of the committee to travel for this purpose during the legislative session and between sessions. At such times, members of Congress have the opportunity to visit with foreign officials and to view local conditions and developments in areas affected by the legislation which they are called upon to consider. Such visits have proved to be an especially productive and rewarding source of information.

8. The headquarters of the political parties are another source of information. Each major party supports a research staff which prepares material on the major issues of the day. This material is available for use by members of Congress and their staffs.

9. Each party has its policy committee in each of the two Houses of Congress. These committees determine the position which the party is to take regarding the major issues coming before each House, and they maintain research staffs which prepare material for use by members of the party.

10. The various research organizations, such as the Brookings Institution, the Ford Foundation, the Carnegie Endowment for International Peace, and the Rockefeller Foundation, also serve as a source of information for the Congress. These organizations may be requested to prepare comments on specific pieces of proposed legislation, or, as in the case of the original Economic Cooperation Act, to make recommendations regarding the administrative structure of a proposed new agency.

11. Various veterans, labor, business, and other groups with specific interests employ lobbyists to present their particular views to members of Congress. These organizations, besides testifying before congressional hearings, seek to present their views to individual members of Congress. They print numerous pamphlets and flood congressional offices with their letters. Sometimes the

material is valuable and is used by the legislators. Often the representatives of these groups will visit the congressmen in person to present their views. Sometimes they will hold social functions or special meetings at which they can present their opinions to various members of Congress.

12. In addition to high-ranking American officers such as the Secretary of State and the Chairman of the Joint Chiefs of Staff, it is the practice of the Congress and the two committees concerned with foreign relations to consult visiting dignitaries or to hear them in joint session. Such people as Prime Minister Sir Winston Churchill of Great Britain, Premier Nehru of India, Chancellor Adenauer of Germany, Foreign Minister Eden of Great Britain, Minister of Defense Plevin of France, and Vice President Radhakrishnan of India have appeared before the Foreign Relations Committee. At such times, especially in executive session, the committee seeks to secure the views of such dignitaries, and legislation is frequently affected by the information the committee secures.

13. Finally, I wish to emphasize the importance of each legislator's own personal contacts, be they constituents, personal friends, or government officials. Acquaintances of this sort often provide congressmen with information which they could derive in no other way. Such personal relationships may frequently serve as a congressman's most important means of attaining valuable factual material.

FORMS AND CATEGORIES

It should be noted that the kind of information that the Congress seeks and secures is determined by the legislation in hand. It may be oral or written. It may be in the form of documents, memoranda, reports, transcripts, printed hearings, printed materials of all kinds, films, or records. This by no means

exhausts the list, but it will indicate the kind of grist that comes to the legislative mill and is used in connection with the making of laws. In a broad, general sense, such information may be divided into official and unofficial information, the official being that produced by government agencies, and the rest going into the category of "unofficial."

The information may be further broadly grouped as public, confidential, restricted, and secret. Public information is that which is made available to everyone. Confidential is that which may not be printed for public consumption. Restricted has reference to information which is confined to those who are authorized to use it. Secret information, generally pertaining to the security of the United States, is that which is for a relatively small group only, and the revelation of which constitutes an offense against the law.

The classification of information is often a difficult matter, in that the press and the general public seek to secure as much information as is possible, while the government officials and agencies concerned are prone to give the information that affects the security of the United States as high a classification as possible. Occasionally one hears of "leaks" from the agencies and congressional committees. This means that confidential or secret information has been unofficially revealed to an unauthorized person and has reached the press.

An interesting experience with respect to classified information occurred during the MacArthur hearings, when the Joint Committee on Foreign Relations and Armed Services of the Senate conducted the hearings in executive session but released the information as quickly as it could be transcribed, in a continuing process, page by page. In this instance, while the executive agencies indicated their classifications, the final decision on the matter was exercised by the committee.

In at least one instance, secret information was declassified by the committee on the basis that its revelation would be less harmful to the interests of the United States than keeping the general public uninformed on the matter dealt with.

CONCLUSION

Congress is steadily moving in the direction of increasing its own independent sources of information. If the Congress is to do an effective job under our system of checks and balances, it must not be completely dependent upon the executive branch in gathering its facts and figures. Of course the two branches will continue to work together closely in gathering and exchanging information. The Congress, however, is becoming better equipped to evaluate the material presented to it by the executive branch and to perform more effectively its role as a separate, coequal branch of government.

H. Alexander Smith, LL.D., Washington, D. C., United States Senator from New Jersey, is second ranking member of the Senate Committee on Foreign Relations, and chairman of its Far Eastern Subcommittee. He is also chairman of the Senate Committee on Labor and Public Welfare.

Congressional Travel Abroad and Reports

By A. S. J. CARNAHAN

THE process of legislating on behalf of the people of the United States involves heavy responsibilities for members of Congress. Not only must the legislator keep abreast of current events within his own congressional district, but he must also be prepared to cast his vote on a host of legislative measures which vitally affect every single person in the United States. In addition, through committee assignments, legislators must assume a fair share of their committee responsibilities. This involves not only attendance at committee meetings and participation in committee deliberations and drafting of legislative measures, but also membership in special congressional study missions within the scope of committee jurisdiction in order to keep fully informed through on-the-spot observations on matters within the scope of committee responsibility.

Congressional travel is a recent development in legislative practice. The year 1936 marks the first time that any member of Congress undertook, at government expense, inspection of the Foreign Service of the United States. At that time, the Honorable Thomas S. McMillan of South Carolina, chairman of the State Department Appropriations Subcommittee, visited twenty-eight of our diplomatic and consular posts abroad. Prior to World War II, members of Congress who went abroad did so ordinarily as tourists or limited their travel to inspection of government-owned facilities in the territories of the United States.

EXTENT OF TRAVEL ABROAD

During the Eightieth Congress, in 1947-48, a total of 125 members of Con-

gress made trips abroad: 112 members made one trip, ten members made two trips, and three members made three trips. The missions involved fourteen different committees. The purposes of these investigations ranged from foreign aid, the Voice of America, and military security to hoof and mouth disease in Mexico, public works in Hawaii, and the St. Lawrence Seaway in Canada.

Following adjournment of the first session of the Eighty-first Congress in 1949, 169 members of Congress went abroad. In 1951, during the Eighty-second Congress, 204 legislators went abroad, and the work involved thirteen committees of the House and Senate. Thirty paid their own way in 1951. It is estimated that the travel represented 2,000,000 man-miles, and a total of 4,000 days were spent by members on foreign travel during that year.

During the Eighty-second Congress, study missions of the Foreign Affairs Committee, of which I am privileged to be a member, made surveys in the following countries:

Australia	Haiti	Pakistan
Belgium	India	Panama
Brazil	Indonesia	Peru
Colombia	Iraq	Portugal
Denmark	Israel	Spain
Dominican Republic	Italy	Sweden
El Salvador	Jordan	Switzerland
England	Lebanon	Syria
France	Malaya	Trieste
Germany	Mexico	Turkey
Greece	Netherlands	Uruguay
Guatemala	Nicaragua	Venezuela
	Norway	Yugoslavia

On the basis of these missions, oral and written reports were submitted to

the committee and to the Congress and were made available to the public, such as:

"A survey of Political and Economic Developments during 1950 in Western Germany, Austria, Trieste, Italy, Spain, and Portugal," Report of Hon. Mike Mansfield, Montana;

"Special Mission to Uruguay to attend the Inauguration of His Excellency President Andres Martinez Trueba of Uruguay," Report of Hon. A. S. J. Carnahan, Missouri, and Hon. Donald L. Jackson, California;

"Special Mission to Brazil to attend the Inauguration of His Excellency President Getulio Dornelles Vargas," Report of Hon. Thomas S. Gordon, Illinois, and Hon. Robert B. Chipfield, Illinois;

"Special Mission to attend Australian Jubilee" (H. Report 1087), Report of Hon. A. S. J. Carnahan, Missouri, Hon. Daniel J. Flood, Pennsylvania (member of House Appropriations Committee), Hon. Karl M. LeCompte, Iowa (member of House Administration Committee), Hon. Chester E. Merrow, New Hampshire;

"The Inter-American Study Mission" (H. Report 1454), Report of Hon. James P. Richards, South Carolina, Chairman, Hon. Omar Burleson, Texas, Hon. Donald L. Jackson, California;

"Sixth Session of the General Assembly of the United Nations" (H. Report 1453), Report of Hon. Mike Mansfield, Montana, and Hon. John M. Vorys, Ohio;

"Special Study Mission to Germany and Certain Other Countries" (H. Report 1456), Report of Hon. Clement J. Zablocki, Wisconsin, Chairman, Hon. A. S. J. Carnahan, Missouri, Hon. Brooks Hays, Arkansas, Hon. Edna F. Kelly, New York, Hon. Chester E. Merrow, New Hampshire, Hon. Jacob K. Javits, New York;

"Supplemental Report on Israel" (H. Report 1455), by Hon. Jacob K. Javits, New York; "Supplemental Report on Austria, Yugoslavia, Italy and Spain" (H. Report 1834), by Hon. Clement J. Zablocki, Wisconsin, Chairman, Hon. Edna F. Kelly, New York, Hon. Chester E. Merrow, New Hampshire.

FINANCING TRAVEL

What about the cost of this travel? Actually, this item should not be referred to as "cost," but more appropriately as "expenses." Frequently the small expenses involved in congressional study missions are more than counterbalanced by the savings to the taxpayer made possible through resultant remedial legislative action.

This of course applies with particular force to the work of the House Foreign Affairs Committee in the case of its special missions abroad. During the Eighty-second Congress the committee was authorized \$75,000 for all expenses, including travel abroad. Only \$20,765 of this sum was actually utilized, however. Indeed, it may be stated that one of the basic impulses behind the grant of congressional authority to the House Foreign Affairs Committee to maintain continuous watchfulness over the operations of the executive departments concerned with foreign affairs is the factor of economy, which inevitably results from an implementation of this authority.

Actually, insofar as the foreign aid programs of the United States are concerned, overseas expenses of congressional committees appropriately concerned with such programs may be, and usually are, met through the application of Section 527 of the Mutual Security Act of 1951, as amended. Under this section, counterpart funds abroad allocated to the use of the United States Government are made available to meet the requirements of "appropriate committees of the Congress engaged in carrying out their duties under Section 136 of the Legislative Reorganization Act of 1946."

Counterpart funds are local currencies which are deposited in special accounts by countries receiving economic assistance from the United States on a

grant basis. In return for the dollar assistance received, each country assumes an obligation to deposit in a special account its own currency in an amount commensurate with dollar-grant aid received.

Section 527 of the Mutual Security Act in effect recognizes that administrative expenses of the United States Government in running a foreign aid program abroad involve not only the administrative expenses of the executive branch but also those of the legislative branch. This is but one concrete demonstration of the principle that the foreign affairs of the United States involve the partnership of two co-ordinate branches of our government—the legislative and the executive.

It should be pointed out, however, that this method of meeting expenses of congressional study missions abroad first became operative upon the effective date of the Mutual Security Act of 1951.¹ There are other methods of financing congressional missions abroad. Occasionally this is accomplished by the device of a simple legislative resolution, authorizing a particular committee to conduct particular studies, followed by a companion resolution providing the necessary funds.

VALUE OF TRAVEL

Granted, however, that the cost, or, as already stated, the expenses, of congressional travel abroad are small and frequently involve no burden on the shoulders of the American taxpayer, the important question remains, What is the value of such travel?

There are many who feel that on-the-spot observation and study is an investment in good business management. It is actually the fulfillment of legislative responsibility. For the foreign policy committees, this inevitably involves

¹ Public Law 165, 82d Congress, approved October 10, 1951.

study missions abroad, attendance at particular international conferences, and representation of the United States to foreign countries on special occasions.

In point of fact, legislative travel abroad frequently acts as an articulate supplement to executive presentation in connection with an executive-sponsored bill of major importance. This is especially true in the field of foreign policy legislation. Executive-branch witnesses testifying on, for example, the impact of United States aid on a particular country can be assisted by those members of the committee who have studied at first hand the operations of the United States foreign aid program in that country. Not only can congressional study missions serve to supplement executive-branch information, but, as is often the case, they act as a double check on such information.

In this connection, I think it can be safely said that the knowledge by the executive branch that it is coming up to Capitol Hill to testify before a committee some of whose members have made on-the-spot investigations of the matters to be covered by the testimony, acts as a salutary stimulus to the benefit of all concerned, especially the American people.

TRAVEL AFFECTS LEGISLATION

The Herter Committee was one of the first postwar congressional groups to see conditions abroad with its own eyes in order better to judge the need for legislation extending assistance to prostrate Europe. By authority of a House resolution passed some seven weeks after General Marshall's historic speech at Harvard, a Select Committee on Foreign Aid was created and commenced operations under the leadership of Congressman Christian A. Herter of Massachusetts.² It was composed of members

² Mr. Herter is now Governor of Massachusetts.

of all the important committees of the House of Representatives which had responsibilities in the field of foreign aid. It was authorized to make a study of

1. actual and prospective needs of foreign nations and peoples, including those within United States military zones, both for relief in terms of food, clothing, and so forth, and for economic rehabilitation;

2. resources and facilities available to meet such needs within and without continental United States;

3. existing or contemplated agencies, whether private, public, domestic, or international, qualified to deal with such needs;

4. any or all measures which might assist in assessing relative needs and correlating such assistance as the United States can properly make without weakening its domestic economy.

The committee was divided into five subcommittees, each charged with area or functional responsibilities. Subcommittees dealt with Great Britain; Austria and Germany; France and the Low Countries; Italy, Greece, and Trieste; and finally, European agriculture. In its thorough investigation and study the committee interviewed government officials, as well as political, business, labor, and peasant leaders. Workers' and farmers' homes were visited; inspection trips were made through shops, market places, and factories; and every opportunity was given for unrestricted observation and study in all the free countries visited. A mass of data was accumulated, analyzed, evaluated, and published. The members of the Herter Committee devoted themselves painstakingly, assiduously, and sincerely to the task of acquiring on-the-spot, basic facts of Europe's needs. Objectivity was the keynote.

The overwhelming endorsement of the Marshall plan by the Congress is traceable, in large measure, to the legislative

expert guidance given by the Herter Committee following its study in Europe. As stated by the Honorable Jack K. McFall, former Assistant Secretary of State for Congressional Relations, and now United States Minister to Finland,

The widespread public approval of the work of the Herter Committee doubtless had much to do with the growing awareness in both the Congress and the State Department that much public good can flow from increased foreign travel by Congressmen. It came to be realized that travel abroad brings home to our legislators the realities of life and conditions in other lands and facilitates the solution of many problems important to the security and destiny of our own country.

The enactment of other important legislation has followed study abroad by members of Congress. A group from the House Foreign Affairs, Appropriations, and Armed Services Committees, in the late spring of 1951, studied at first hand the functions and purpose of the proposed Mutual Security Program. This probably played a major role in the program's acceptance by the Congress.

As a result of special study missions abroad made by members of the House Foreign Affairs Committee, recommendations made by such missions have frequently brought about changes in administrative practices and plans of the executive branch and have often resulted in legislative changes. In November and December 1951, a Special Study Mission of the Foreign Affairs Committee visited Germany, Austria, Yugoslavia, and Spain.³

AMENDMENTS TO MUTUAL SECURITY ACT

When the Mutual Security Act of 1952 was before the committee, several amendments recommended by the study

³ The report of this group has already been alluded to, above.

mission were adopted by the committee, then by the House of Representatives, and finally by the Congress. They are now part and parcel of the law of the United States. These amendments⁴ may be summarized as follows:

Spain. Section 3 (d) provides that not less than \$25,000,000 of the funds made available for western Europe by the act must be used for economic, technical, and military assistance to Spain as part of the Mutual Security Program.

Conditions. Section 7 (h) establishes the principle that mutual security can be realized only to the extent that the countries who receive our aid do their utmost to help themselves and co-operate among themselves and with the United States in achieving the objectives of a free world. The purpose of our aid is to bring about positive accomplishments toward mutual security. To this end, the Director for Mutual Security must ensure that no country receives United States assistance unless that country work together with other nations in its area and with the United States and participate in collective security programs.

Countries must also take steps to help themselves by making effective use of their own resources—fiscal, budgetary, political, military, and so forth. United States assistance will be given to the extent that recipient countries make progress in achieving such effective use.

Encouragement of private enterprise. Section 7 (k) provides that the Department of Commerce, in co-operation with private business groups and government agencies, must conduct a thorough study of the obstacles to private United States investment abroad and make recommendations to the Director for Mutual Security as to how these barriers can be eliminated or reduced.

The Mutual Security Agency, like-

⁴ All contained in Public Law 400, 82d Congress (Mutual Security Act of 1952).

wise in co-operation with business groups and governmental agencies, must broaden its guaranty criteria so as to facilitate the participation of private enterprise in guaranties—guaranties by the United States against expropriation or confiscation of United States property by foreign governments and guaranties of currency convertibility.

The Technical Co-operation Administration must award more private contracts to private industry and must, in co-operation with the Department of Commerce, find opportunities for investment and development and draw the attention of private enterprise to them.

Counterpart funds. Section 9 provides that up to \$100,000,000 of counterpart funds must be used in programs furthering private enterprise.

Section 9 (a) makes it clear that whenever a country uses counterpart funds for loan to another country, the funds, upon loan repayment, shall revert to the special account. The purpose is to ensure that the United States shall retain its supervision over the manner in which the counterpart funds are spent.

These amendments all strengthen and bring meaning to the phrase "mutual security" which appears in the title of the legislation. At the same time, the amendments are designed to assure the American taxpayer that he will be getting full value in terms of mutual security for every American dollar spent abroad.

TRADE CONTROL BEHIND THE IRON CURTAIN

In the summer of 1952, the Honorable Laurie C. Battle, Alabama, a member of the House Foreign Affairs Committee, headed a Special Study Mission to Europe to study the effectiveness of the administration of the control of trade with countries behind the Iron Curtain, pursuant to the Mutual Defense Assist-

ance Control Act, commonly referred to as the Battle Act. Following his return and prior to the submission of the formal report of the study mission, he wrote a letter to the Administrator of the Act making detailed suggestions for improvements in the administration of the program. In his letter replying to Congressman Battle's letter, the Battle Act Administrator referred to the fact that several of Congressman Battle's recommendations had been put into effect and that further action was being taken in this direction.

OF USE TO EXECUTIVE BRANCH

At times the executive branch itself has suggested that a study mission from a committee be undertaken. This was true in the case of the Special Study Mission to Pakistan, India, Thailand, and Indochina, on which I served, undertaken in April 1953. Other members of the mission included Hon. Chester E. Mellow, New Hampshire, chairman, Hon. Walter H. Judd, Minnesota, and Hon. Clement J. Zablocki, Wisconsin. On March 16, 1953, Hon. Harold E. Stassen, Director for Mutual Security, had addressed the following communication to Hon. Robert B. Chipfield, chairman of the Committee on Foreign Affairs:

It has occurred to me that it would be most constructive if certain members of the House Foreign Affairs Committee could, in the near future, visit some of the countries in which the Mutual Security Program is operating. Through such visits members would obtain much pertinent firsthand information on the program, which might be of great value when they consider the administration's request for legislation on this subject.

For example, in Europe important developments are taking place affecting the military buildup and the problems of the European Defense Community. Members of the committee who visit Europe would also have an opportunity to observe the

training and state of readiness of the troops of our NATO Allies and to find out how effective the buildup of defensive strength is in this area.

In other areas, such as the Near East or South and Southeast Asia, there would be an opportunity to observe at first hand the operations of the point 4 program and the economic and technical assistance programs of the Mutual Security Agency and to make an assessment of some of the significant and difficult issues, military as well as economic, which are being dealt with in these areas.

The thought occurs to me that an ideal time for such visits might be the period between April 3 and 13, during which I understand the House plans to take an Easter recess.

If this suggestion should prove acceptable to you and to the members of the committee, my office, in collaboration with the Department of State and the Department of Defense, would be very glad to suggest itineraries and to make all the necessary arrangements. As you know, the mutual security legislation makes it possible for official trips of this sort to be paid for through the use of counterpart funds.

Following its return to Washington, the study mission issued an oral report to the full committee and then a written report⁵ which has been made available to the executive branch, to the Congress, and to the public. The report of the mission has proved useful to the executive branch and to the House Foreign Affairs Committee in its consideration of the Mutual Security Program for 1954.

PROMOTE GOOD WILL

Past experience indicates clearly that such congressional study missions have an added important value. They create an atmosphere of good will and strengthen bonds between friendly countries, without which foreign relations can operate only in a vacuum.

Events and situations move and

⁵ H. Rept. 412, 83d Cong., 1st sess.

change so rapidly that the process of missions abroad recognize this acceleration. Keeping informed becomes constantly accelerated tempo and the necessity for keeping more complex. Congressional study ing pace with it.

A. S. J. Carnahan, Washington, D. C., is serving his fourth term as Congressman from Missouri. He is a member of the Committee on Foreign Affairs of the House of Representatives. He has held various teaching and administrative positions in the schools of Missouri, and served with the United States Navy during World War I.

The Meaning of the Term "Advice and Consent"

By MIKE MANSFIELD

DURING the greater part of the nineteenth century the United States was preoccupied mainly with domestic problems and issues. In the period between the signing of the Treaty of Ghent in 1815 and the opening of the Spanish-American War in 1898 there were few times when the American public, anxious to avoid the international difficulties endemic in Europe, was inclined to assign a priority of interest to foreign affairs. It required two world wars in the twentieth century, followed by a "cold war" which may be the precursor of a third world war, to bring the American people to a realization that technological progress has placed foreign relations at the top of the national interest.

While the external relations of the country have always occupied a place of importance, in the past generation they have become vital to the very existence of the nation. Since the national security now depends to a large extent on the success with which our foreign relationships are managed, the way in which they are conducted becomes a matter not only of considerable interest but also of practical consequence. Every American citizen ought, therefore, to have a fair understanding of the governmental processes that to a large extent control his fate.

HOW THE PATTERN WAS SET

The governmental machinery established for the conduct of foreign relations was devised and set up when the United States was a small country, when it had no responsibilities of consequence beyond its own shores and boundaries, and when, owing to the means of com-

munication available, time distances were great. The means then arrived at for the management of foreign affairs were designed more with reference to the origins and the political concepts of a young and novel republic than to the adaptability of the means to the exigencies which might have to be dealt with in the course of international relations in the future.

By and large, the criteria taken as the basis for the means of dealing with foreign affairs and embodied in the Constitution of the United States were in keeping with the other features of the constitutional scheme. Whether or not they were well conceived from the point of view of maximum effectiveness of United States foreign relations may be open to some question. They have, of course, undergone considerable evolutionary change since the beginning of the Republic, and further changes may still take place. Insofar as this can be made a conscious process, it should take note of our national institutional experience in dealing with other states down to the present time.

Of all branches of governmental activity, the conduct of foreign relations was the one in which the Americans of 1787 had the least experience to serve as guide. Prior to 1776 the foreign relations of the colonies had been the responsibility of the mother country, Great Britain. During the brief career of the emerging nation under the Article of Confederation, no particular effort had been made to give specific definition to treaty-making powers in the conduct of foreign affairs, since all authority had been exercised by the Congress. When the time came to devise

a constitution for the operation of a permanent federal union, it had been learned only that the conduct of foreign relations by an elected legislative body was not very satisfactory from the point of view of the establishment of national prestige abroad.

Nevertheless, during the early stages of the Constitutional Convention it was generally taken for granted that the treaty-making power would continue to be exercised by one or both Houses of the legislative branch. In the course of debate on the character of the Senate, however, sentiment developed for according some treaty-making functions to the Executive Office. There were advocates, also, for including the House of Representatives with the Senate in the control of foreign relations, for the reason that "as treaties . . . are to have the operation of laws, they ought to have the sanction of laws also." This proposal might have won but for the prevalent opinion that the necessity for secrecy in the forming of treaties was inconsistent with the legislative sanction.

At the same time, the almost morbid fear of an unfettered executive which pervaded the Convention ruled out any thought of concentrating treaty-making powers in the Chief of State. Since there was at that time no thought of or interest in making provision for the democratic control of foreign relations, and since the Senate represented the states, as had the Congress under the Articles of Confederation, it was not unnatural that the Senate should be given an important function in the treaty-making process and that two-thirds of that body should be given an absolute check on the making of contracts with foreign powers.

AN UNFORESEEN DIFFICULTY

The placing of strict limitations on the President's power may have thwarted

legislation enacted by the undemocratic process represented by the President's treaty functions. It did so, however, by establishing controls equally undemocratic. The senatorial two-thirds rule makes it possible for a minority of Senators to ruin a policy which may have the support of practically two-thirds of the Senate. Should the opposing Senators chance to come from the least populated states, an easily imaginable contingency in some types of issues, and should all members of the Senate take action on a proposed measure (a less likely contingency), it would be possible for thirty-three Senators, representing approximately one-twelfth of the population of the United States, to block a treaty supported by sixty-three Senators, representing the remaining eleven-twelfths of the population.

Nevertheless, the framers of the Constitution were content to believe that, in making provision that the Chief Executive should have power "by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur" (Art. II, Sec. 2), they had arrived at the most practicable method of applying the guiding principle of checks and balances to the conduct of American foreign relations. They seem not to have felt concerned in the least that, in thus creating a reciprocal treaty veto power of the President and the Senate, they might actually have opened the way to a stalemate in time of international crisis by arraying these forces against each other.

Political parties did not exist in 1787. Even the Founding Fathers were not able to foresee the likelihood that, for the sake of political advantage in domestic affairs, foreign policy on occasion might be placed in serious jeopardy. As the conduct of government, and even the election of the Chief Executive, came to be managed by organized

political parties, the role of the Senate in the conduct of foreign relations came to be very different from that envisaged by the authors of the Constitution. Not only did the senatorial term of office not coincide with that of the President, but, because of party politics, two-thirds of the Senate seldom represented the party which had placed the President in office. Inasmuch as the initiative in the conduct of foreign relations devolved upon the President, both by constitutional provision and by practical necessity, the real check on his treaty-making powers proved to be not two-thirds of the senatorial body, nor even two-thirds of the Senators present and voting, but approximately one-third of the Senate—a bare quorum plus one.

It is with this kind of treaty-making machinery that the United States must "make do" in the conduct of its foreign relations. "By and with the advice and consent of the Senate" thus has a connotation never envisioned by those who thought thus to protect the interests of the Republic. Repeated frustration, due to this circumstance, of efforts to resolve international situations by means of treaties prompted John Hay, when Secretary of State, to write: "A treaty entering the Senate is like a bull going into the arena. No one can say just how or when the final blow will fall. But one thing is certain—it will never leave the arena alive."

PRIOR CONSULTATION

Much of the difficulty which has been experienced in the making of contracts with other states has arisen from the expectation of the framers of the Constitution that the Senate would participate equally with the President in the negotiation of treaties and would have given its advice and consent prior to their signing. The terms inserted in the Constitution providing for the Senate's *advice*, as well as *consent*, cannot well

be interpreted otherwise. During the early years of the Republic, when needs for international engagements were few, some effort was made by the Executive to bring the Senate into prior consultation and to secure its advice on treaty matters before its formal consent was given.

President Washington's experience along this line is illustrative and also significant in its influence on procedures subsequently generally employed. On August 21, 1789 the President apprised the Senate of his intent to meet with that body on the following day "to advise with them on the terms of the treaty to be negotiated with the southern Indians." When on the appointed occasion it became apparent that the President wished only to obtain the Senate's immediate approval of drafts already prepared, members of the Senate moved to discuss the particulars in committee before taking action. Washington displayed intense pique at this hesitation to accept his judgment, and became convinced at once of the inadvisability of personal consultations with the Senate, although he continued to regard the Senate as a council to advise him on the conduct of foreign relations. Before the close of his administration, however, further experience had taught him the impracticability of attempting to obtain the approval of the Senate in all instances prior to the negotiation of international agreements.

SENATORIAL RESTRAINT

The outcome of early experience in the conduct of foreign relations thus was a growing conviction on the part of the Executive that, in order to take advantage of timely opportunity in diplomacy, actual negotiations must of necessity be carried on by agents of the Executive Office without the prior advice and consent of the Senate, while the latter became proportionately jealous.

ous of its constitutional prerogatives with respect to foreign relations. If the Senate was not to be consulted beforehand, it would be disposed to make full use of its power to reject or to amend treaties submitted to it. The upshot was a tendency on the part of the Senate, sometimes for the purpose of bringing political pressure to bear on the President, but always with a view to asserting the Senate's prerogatives and upholding its prestige, to be deliberate in its action on treaties, and either partially to approve by amending them or to reject them outright or through failure to take action at all.

There is no room for doubt as to the effectiveness of this attitude, which has become habitual, in restraining and even in disciplining a President and in making of the Senate something more than a legislative body. At the same time, this situation not infrequently has handicapped the United States in the conduct of its foreign relations. While there has been remarkably little protest on the part of foreign powers at the partial ratification of treaties, the lack of assurance on their part that an agreement successfully negotiated and signed will be ratified and become operative has clearly reduced their willingness to enter into negotiation with the United States on a number of occasions. John Quincy Adams once remarked: "I think amendments to treaties imprudent. By making them you agree to all the treaty except the particular you amend—and at the same time you leave it optional with the other party to reject the whole."

It should not be understood that the Senate, or for that matter the House of Representatives, may not have a part in the initiation of action bearing on treaty negotiation. The House on occasion has expressed in the form of resolutions its views with respect to situations calling for negotiation with foreign govern-

ments. Considerations of practical politics also occasionally have compelled a President to consult the House or to transmit to it information relative to foreign relations in advance of the termination of treaty negotiations in order to make certain of necessary appropriations.

The Senate likewise has essayed to take part in treaty negotiations on one occasion and another by setting forth, in the form of resolutions, what it has believed to be essential to have agreed upon in treaty form. The President, likewise on occasion, has found it prudent to take the Senate into his confidence prior to the opening of negotiations by presenting to that body the names of the plenipotentiaries or their instructions for confirmation and approval.

However, the President is under no legal obligation to consult with either body, and is entirely free to disregard their advice, although in such instances he maintains a free hand at the cost of possible retaliation in the form of withheld appropriations in the House, or inaction or adverse action in the Senate when treaty drafts are submitted for the Senate's "advice and consent."

EXECUTIVE INITIATIVE IN DIPLOMACY

Such consultation with the Senate as takes place nowadays in the matter of treaty making generally takes the character of informal consultation with members of the Foreign Relations Committee. The creation of this senatorial group as a standing committee in 1816 was a clear indication that even at that early period it had been found that the preliminary processes of treaty making could properly be attended to only through the initiative of the Executive Office. Actual experience thus has given meaning to constitutional provisions. The President alone has the power to negotiate with foreign govern-

ments. Also, only he has the means of negotiation. Those who carry on the details of negotiation, those skilled in diplomacy and their technical aides, are agents of the executive branch.

The Constitution, reflecting the earnest concern of the Founding Fathers to keep tight reins on the executive power, undertook to give the legislative branch some influence on the process as well as the outcome of treaty negotiations by providing (Art. II, Sec. 2) that "he [the President] shall nominate, and by and with the advice and consent of the Senate, shall appoint ambassadors, other public ministers and consuls."

In the early days this provision was usually observed liberally. Not infrequently nominations were accompanied by memoranda indicating the nature of the instructions which were to govern the work of the emissaries. However, the practice of sending private Presidential envoys or agents abroad without reference to the Senate dates from the first President. This practice evolved in time into that of entrusting diplomatic negotiations to members of the regular diplomatic service. For more than a century now, United States treaties have generally been negotiated, not by envoys whose nominations to that end have been submitted to the Senate for confirmation, but by the Secretary of State or by those under his immediate direction.

THE SENATORIAL VIEW

The Senate has observed these trends with a jaundiced eye and with assertions of its own constitutional prerogatives. In 1831 a Senator complained that "all the Presidents have . . . been violators of the Constitution." Three years later a Senate resolution stated that the Senate felt constrained

by a high sense of its constitutional duty to express its decided disapprobation of the practice of appointing diplomatic agents to

foreign countries by the President alone, without the advice and consent of the Senate.

Forty years later the Senate again, in advising and consenting to a treaty, resolved that this action did not

admit or acquiesce in any right or constitutional power in the President to authorize or empower any person to negotiate treaties or carry on diplomatic negotiations with any foreign power, unless such person shall have been appointed for such purpose, or clothed with such power, by and with the advice and consent of the Senate. . . .

In 1888 another resolution was introduced in the Senate asserting that

the President has no right, under his implied powers of making preliminary negotiations of treaties, to appoint, without the concurrence of the Senate, private citizens as plenipotentiaries to make and sign such treaties in behalf of the United States.

In order to give substance to its interpretation of constitutional powers and prerogatives, the Senate now and then has undertaken to define and circumscribe the limits within which the President may be free to act. The Connally Resolution of November 5, 1943, for example, which was directed to the waging of war "against all our enemies until complete victory is achieved," closed with the injunction that,

pursuant to the Constitution . . . , any treaty made to effect the purposes of this resolution . . . with any other nation or association of nations, shall be made only by and with the advice and consent of the Senate of the United States, provided two-thirds of the Senators present concur.

This, taken together with the custom of the Senate of attaching reservations to the ratification of treaties, well illustrates the traditionally restrictive role of the Senate in the conduct of foreign relations.

On occasion, however, the Senate has

essayed to take a more positive part in the process, and even to initiate, through instructions to the President, certain types of action in foreign affairs. The Vandenberg resolution of June 11, 1948, for instance, instructed the President as to the steps which he would be well advised to take, in accordance with the policy of the United States, "to achieve international peace and security through the United Nations."

These examples, selected from a multitude of others, may serve to show that the check so painstakingly placed by the Constitutional Convention on the power of the Chief Executive in the conduct of foreign relations has long since come to be employed, not so much as a check, but as an opportunity for the substitution of senatorial judgment and authority for executive judgment and authority.

EXECUTIVE AGREEMENTS

Inasmuch as the whole of the national experience thus far shows conclusively that there can be no substitute for the Presidential power to stake out foreign policy and to take all preliminary steps for implementing it in the form of international engagements, the constitutional checks placed in the hands of the Senate too often prove to be obstructions rather than safeguards. But there is an alternative to the treaty in the conduct of foreign relations. Before a treaty can be made—that is, completed and ratified—agreement must be reached between the United States and the foreign state or states concerned. An international engagement, prior to its reference to the Senate for advice and consent, is an executive agreement. Until it is submitted to the Senate it remains an executive agreement, and it can be continued and employed as an operable instrument in that capacity.

The executive agreement, as a substitute for the treaty, was not envisioned

by the makers of the Constitution; yet the powers conferred upon the President clearly give him authority to enter into such contracts. An executive agreement does not become a part of the supreme law of the land, and it can be nullified at any time by congressional legislative action. Nevertheless, it has come to be regarded as legally binding on the United States and has been found to be acceptable to foreign governments in lieu of treaties.

The essential difference between an executive agreement and a treaty, in many instances, lies merely in the fact that the latter has received the advice and consent of the Senate. Consequently, for the sake of preserving a consistency in foreign policy or for the sake of promptitude in the consummation of negotiations with foreign powers as pressures of time and circumstance increase in the modern world, Presidents have been compelled more and more to resort to the use of the executive agreement and thereby to avoid the cumbersome need of securing the Senate's advice and consent.

AN UNSATISFACTORY SITUATION

The increasingly frequent substitution of the executive agreement for the treaty in order to expedite a measure or to avoid the hazards of senatorial obstructionism involves, of course, the possibility of the substitution of one abuse for another. As long as executive agreements having the force of treaties can be entered into without the knowledge, much less the approval, of the Senate, or of either of the Houses of the Congress, and diplomatic agents and plenipotentiaries can be appointed without reference to congressional approval, the only check on the will of the Executive lies in the congressional power of the purse. This will not necessarily serve to prevent the conclusion of unwise or

unpopular engagements, the Yalta agreement perhaps being a case in point.

Under present circumstances, therefore, the American people are confronted with a dilemma in the conduct of foreign relations: the implementation of foreign policy is subject on the one hand to the delays and obstructionism almost certain to result from the political machinations of a minority in the Senate, and on the other hand to the vagaries of a single individual who by virtue of the workings of party policies has become the Chief Executive of the national government and who rarely can be called to account except on the occasion of quadrennial elections. Both methods are undemocratic to a large extent. Each is likely to result in arrangements unadapted to important realities, the Senate being, by its nature, largely unacquainted with the exigencies of the international situation, and the President not invariably attuned to the attitudes, outlook, and prejudices of the American electorate.

A SUGGESTED REMEDY

An improvement in this situation would not require constitutional change. It would be necessary only to return to the original intent of the framers of the Constitution in making provision for the Presidential conduct of foreign relations with the advice and consent of the Senate. It would be requisite only to adapt recent trends in the conduct of foreign

relations to our governmental structure.

Only the executive branch can handle actual procedures in our foreign relations. Executive agreements have come to stay. Little if any effectiveness would be lost should the whole process of treaty making be performed in terms of executive agreements discussed in advance as far as possible, not only with the Senate Foreign Relations Committee but also with the corresponding body in the House of Representatives. Opinion in the House, on the whole, is more representative of opinion in the country as a whole than is the opinion of the Senate. Also, it has a more direct bearing on the financial implementation of public measures. Joint resolutions of Congress, by which means so many vitally important steps have been taken in recent years, would strengthen the nation's prestige abroad.

Essential differences in point of view of President and Congress might much better be discovered in advance of a foreign engagement than after it has been negotiated, as has been amply demonstrated in the past. Moreover, as has been observed by experts on American government, the President versus Congress on foreign policy presents issues to the country; one-third of the Senate versus the President confuses issues internationally. The rule of advice and consent need not, should not, be discarded; it is needful only to adapt it to twentieth-century conditions.

Mike Mansfield, Washington, D. C., is United States Senator from Montana, and served five terms as a Representative. From 1933 to 1943 he was professor of Latin American and Far Eastern history at Montana State University and is now on leave from the university in that position. He has been a member of numerous surveys and investigating committees in foreign countries. As a delegate of the United States to the United Nations he debated with the Soviet Foreign Minister on his charge against the United States Mutual Security Act and the case of the American flyers forced down in Hungary, and presented the case for the United States on prisoners of war held by the U.S.S.R.

Making Treaties and Other International Agreements

By JOHN W. BRICKER

A HOST of centripetal forces operate to draw the family of nations into increasingly intimate relationships. It has become trite to link the speed of the airplane with the shrinking globe.

Rapidity of travel and communication is by no means the only coalescing influence in the modern life of nations. The threat of easily delivered mass-destruction weapons and growing economic interdependence are equally significant. The Communist drive for world domination, although a divisive influence in one sense, inspires the non-Communist world to seek increased safety in collective security arrangements, economic as well as military in character. All these influences have led in turn to proposals to curb the power of the nation-state by subordinating it to some measure of control by supranational organizations.

Despite the manifold forces drawing nations closer together, it is highly misleading to speak of "one world" or even of two half-worlds. Proximity and a common danger have left untouched the incredible diversity which has long existed among nations. In fact, wide differences in national traditions, political systems, religions, standards of living, and cultures create frictions and tensions today that were virtually unknown in the pre-atomic age. For the foreseeable future, treaties and other international agreements must cope with the vexing problem of creating peaceful cooperation among nations in a climate of political, economic, and social disparity.

Whatever the course of American foreign policy in the years to come or the political faith of its chief pilot, certain developments are inescapable. Major international agreements will be made

with a frequency unimagined only a decade ago. Moreover, such agreements will affect the course of domestic policy and the liberty and safety of the American people to an unprecedented degree.

Such are the general considerations compelling a thorough re-examination of legislative-executive relations with respect to the making of treaties and other international agreements.

PROPOSED AMENDMENT

On January 7, 1953, sixty-three other Senators joined with me in introducing a proposed constitutional amendment designed to prevent abuse of the treaty-making and other international agreement-making powers.¹ A secondary purpose of Senate Joint Resolution 1 is to clarify the constitutional responsibilities of the President, the Senate, and the Congress in pledging the honor of the nation. The Senate Judiciary Committee, after extensive hearings, reported S. J. Res. 1 with a favorable recommendation.² This proposed constitutional amendment has generated the widespread discussion and debate essential to the democratic formulation of major foreign policy decisions. Whether or not the treaty-making and executive agreement-making powers will be safeguarded, as provided in S. J. Res. 1, depends upon the extent to which the Constitution is still regarded as a healthy limitation on the power of elected representatives. Although opponents of the proposed amendment will challenge this statement of the issue, many of them will agree, nevertheless, that the great constitutional debate in-

¹ 99 *Congressional Record* 160, 161.

² S. Rept. 412, 83d Cong., 1st sess.

spired by S. J. Res. 1 is very much in the public interest.

CONSTITUTIONAL AMENDING PROCEDURE

One of the most respected analysts of the Constitution, Professor Edward S. Corwin, has concluded that what was once a constitution of rights has now become a constitution of powers.³ Depressing as this thought may be to those who revere the Constitution as written, it must be faced, for there is a substantial element of truth in Professor Corwin's observation. During the past twenty years we have experienced what many describe as a social and economic revolution—a revolution, if it be one, not sanctified by resort to the amending process established in Article V of the Constitution. Of course, no constitutional lawyer would maintain that every New Deal innovation or reform required a constitutional amendment, but it is significant that not even the most extreme socialistic proposals were thought to demand any change in a Constitution of limited and delegated powers. Curiously enough, some opponents of S. J. Res. 1 suggest that the attempted utilization of the amending procedure in Article V is an act of constitutional subversion.

Can President and Congress override Constitution?

Throughout the hearings on S. J. Res. 1 before the Senate Judiciary Committee, opponents of the resolution implied that the Constitution should be amended by evolutionary practices rather than by changing its text. For example, Secretary of State Dulles remarked: "The test of any constitution is not the way it reads but the way it works."⁴

³ Corwin, *A Constitution of Powers in a Secular State* (Charlottesville, Va., 1951), p. 2.

⁴ Hearings before a Subcommittee of the Senate Judiciary Committee on S. J. Res. 1,

Granted that the Constitution has been amended by usage, the function of the Electoral College being the most obvious example, the Constitution must work substantially as it reads or become a meaningless document.

The implication of Mr. Dulles' remark was made explicit in a statement filed on behalf of the Friends Committee on National Legislation in opposition to S. J. Res. 1. The author of the statement, Professor John P. Roche, said:

Furthermore, if American constitutional history teaches us anything, it is the impossibility of binding future generations to current convictions. Thus I would suggest that if an American President and a congressional majority were to agree to a substantial transfer of political power to an international body, no constitutional provision would suffice to block this action. The great virtue of our Constitution is its adaptability to new ways of thought, and in the event that the American people and their representatives decided upon a substantial transfer of political authority to an international organization, even the Bricker amendment, if adopted, would hardly stand in the way of this action.⁵

If the President and the Congress are omnipotent, as Professor Roche claims, all discussion of constitutional law in relation to foreign affairs could end at this point. The problem of "Congress and Foreign Relations" to which this issue of *THE ANNALS* is devoted could be resolved only in terms of political expediency and political power.

Can treaties override Constitution?

Another great constitutional debate rocked the nation in 1937. President Roosevelt's court-packing scheme was defeated on the ground that no generation has any right to make easy

83d Cong., 1st sess., p. 829 (hereinafter cited as "Hearings").

⁵ *Hearings*, pp. 742-43.

that which the Constitution deliberately made difficult. In the treaty-making power, as interpreted in *Missouri v. Holland*,⁶ a way has been found to amend the Constitution by resorting to Article VI⁷ in preference to the more difficult method laid down in Article V. Professor Lauterpacht, a distinguished international lawyer of Great Britain, accurately summarized the Supreme Court's interpretation of the treaty power in *Missouri v. Holland* as "dangerously approaching that of a constitutional amendment."⁸

Another well-known international lawyer, Mr. John Foster Dulles, confirmed Professor Lauterpacht's warning. Speaking before a regional meeting of the American Bar Association in Louisville, Kentucky, on April 11, 1952, Mr. Dulles said:

The treaty-making power is an extraordinary power, liable to abuse. Treaties make international law and also they make domestic law. Under our Constitution, treaties become the supreme law of the land. They are, indeed, more supreme than ordinary laws for congressional laws are invalid if they do not conform to the Constitution whereas treaty law can override the Constitution. Treaties, for example, can take powers away from the Congress and give them to the President; they can take powers from the States and give them to the Federal Government or to some international body, and they can cut across the rights given the people by their constitutional Bill of Rights.⁹

⁶ 252 U. S. 416 (1920).

⁷ Article VI, paragraph 2, of the Constitution provides: "This Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States, shall be supreme Law of the Land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding."

⁸ H. Lauterpacht, *An International Bill of the Rights of Man* (New York, 1945), p. 179.

⁹ *Hearings*, p. 862.

Even amending the Constitution by action of the President and two-thirds of the Senators present and voting is too difficult to suit some political tastes. For example, Myres S. McDougal and Asher Lans consumed 252 pages in the *Yale Law Journal* in 1945 in attempting to prove that treaties and executive agreements are wholly interchangeable instruments of national policy.¹⁰ Their conclusion was that the treaty clauses have become "a sort of constitutional vermiform appendix."¹¹ Significantly, Messrs. McDougal and Lans devoted 16 pages of their discussion¹² to the proposition that amendment of the Constitution by "usage" is preferable to "formal textual alteration."¹³ Under this view, the amending procedure specified in Article V would become "a sort of constitutional vermiform appendix." And if both Articles V and VI can be disregarded without "formal textual alteration," the same process could make the whole Constitution a sort of "vermiform appendix."

SENATE JOINT RESOLUTION 1

S. J. Res. 1, as amended by the Senate Judiciary Committee, contains the following three substantive sections:

Sec. 1. A provision of a treaty which conflicts with this Constitution shall not be of any force or effect.

Sec. 2. A treaty shall become effective as internal law in the United States only through legislation which would be valid in the absence of treaty.

Sec. 3. Congress shall have power to regulate all executive and other agreements with any foreign power or international organization. All such agreements shall be

¹⁰ McDougal and Lans, "Treaties and Congressional-Executive or Presidential Agreements: Interchangeable Instruments of National Policy," 54 *Yale L. J.* 181-352, 534-615 (1945).

¹¹ *Ibid.* at 535.

¹² *Ibid.* at 290-306.

¹³ *Ibid.* at 294.

subject to the limitations imposed on treaties by this article.

Section 1 subjects the President and the Senate to constitutional restraints in the exercise of the treaty-making power comparable to those which limit their action as participants in the enactment of ordinary legislation. This was, of course, the original intent of the framers of the Constitution and was reflected in early judicial dicta.¹⁴

Section 2 prevents the President and the Senate from using treaties as an instrument of domestic legislation without the participation of the House of Representatives. In addition, section 2 protects the reserved powers of the states by preventing Congress from acquiring by treaty legislative power which it does not possess in the absence of treaty. This, too, is in accord with the original purpose of the Bill of Rights¹⁵ and the contemporaneous constitutional construction of learned men.¹⁶

Section 3 removes any doubt as to the power of Congress to regulate the making of executive and other agree-

¹⁴ *The Cherokee Tobacco*, 11 Wall, 616, 620-1 (U. S. 1870). As indicative of the change in judicial thinking, compare the statement in *Geofroy v. Riggs*, 133 U. S. 258, 267 (1890) that the treaty power does not extend "so far as to authorize what the Constitution forbids" with the statement in *Missouri v. Holland*, 252 U. S. 416, 433 (1920) that treaties must be made "under the authority of the United States," which may mean nothing "more than the formal acts prescribed to make the convention."

¹⁵ *Hearings*, pp. 55-6, 106-111, 1111-3; see Bricker, "Safeguarding the Treaty Power," 8 *Fed. Bar J.* 77 (1952).

¹⁶ Thomas Jefferson, for example, said in his *Manual of Parliamentary Practice*: "By the general power to make treaties, the Constitution must have intended to comprehend only those objects which are usually regulated by treaties, and cannot be otherwise regulated. It must have meant to except out all those rights reserved to the States; for surely the President and the Senate cannot do by treaty what the whole Government is interdicted from doing in any way."

ments. In addition, section 3 places the same limitations on executive agreements as are placed on treaties by sections 1 and 2.

Objection answered

Though opponents of the amendment contend that it would revive treaty procedures embodied in the Articles of Confederation, the amendment actually brings the Constitution up to date in the light of an international environment dimly foreseen, if at all, in 1787. Of course the Constitution is flexible enough to meet a variety of new military, economic, and technological developments. To amend it with the rise of each new problem would result in a document having the specificity of the Internal Revenue Code. The problems dealt with by Congress under the foreign commerce clause¹⁷ did not change basically when transportation by steam and air supplanted the sailing vessel. On the other hand, the problems of international intercourse in an atomic age are for the most part novel and unprecedented.

In my judgment, adoption of the constitutional amendment proposed in S. J. Res. 1 would facilitate the making of treaties and other international agreements; clarify legislative, executive, and judicial responsibilities in the field of foreign policy; reduce friction between the Congress and the President; and, most important, firmly establish in the Constitution the principle that extensive participation in world affairs need not, and should not, result in any diminution of liberty at home.

UNDOUBTED CONSTITUTIONAL SUPREMACY AN AID TO TREATY-MAKING

At the present time neither the President nor the Senate can be certain that any treaty provision in conflict with the

¹⁷ U. S. Constitution, Art. I, sec. 8, par. 3.

Constitution would be set aside by the Supreme Court. Senators may not be quite so sure as Mr. Dulles was when he said that treaties "can override the Constitution," but almost all Senators recognize that there is at least a reasonable doubt concerning the supremacy of the Constitution over treaty law. As a result, some treaties, highly desirable in many respects, may not be signed by the President or approved by the Senate because of fear of undermining the constitutional rights of the American people. A prime example of the resulting dilemma is the Genocide Convention¹⁸ still awaiting action four years after its submission to the Senate.

The Genocide Convention had tremendous popular support from the lay public. Recent knowledge of Nazi and Communist barbarities created unanimous support for the avowed purpose of the treaty. Leaders of the American Bar Association stood virtually alone in opposing the treaty as written. Their analysis of the Genocide Convention disclosed a grave threat to freedom of speech and press, and the rights of persons accused of crimes.¹⁹ Proponents of the treaty denied that such dangers existed. Neither interpretation is unreasonable.

Accordingly, the Senate does not dare consider the merits of the Genocide Convention until it is convinced that no interpretation of the treaty can be effective to prejudice any constitutional right. Article III of the Constitution limits the judicial power of the Supreme Court to "cases" and "controversies." The Court cannot render an advisory opinion to guide the President and the Senate in the exercise of their treaty power.

¹⁸ Executive O, 81st Cong., 1st sess.

¹⁹ Hearings before a Subcommittee of the Senate Foreign Relations Committee on Executive O, 81st Cong., 2d sess., pp. 154-221.

No doubt all ambiguities and defects in the Genocide Convention could be cured by a series of reservations. However, this road to ratification was blocked by the International Court of Justice. In an opinion dated May 28, 1951, the Court held that substantial reservations to the Genocide Convention would nullify the act of ratification. In conformity with this opinion many proposed multilateral treaties expressly restrict the right to attach reservations,²⁰ or prohibit them completely.²¹

At the time the Constitution was adopted, almost all treaties were bilateral or limited to signature by relatively few nations. Consequently, the subject matter could be confined to problems of immediate concern to the parties, and the contractual obligation stated in precise language. Reservations to the treaty amounting to a counteroffer created no particular difficulty. Today, the multilateral treaty is the rule rather than the exception. With scores of nations involved, the use of precise language and an unrestricted right of reservation become virtually impossible.

Testifying in opposition to S. J. Res. 1, Secretary Dulles said he "would not press at the moment" for ratification of the Genocide Convention.²² Unless the Constitution is amended as proposed in S. J. Res. 1, the Genocide Convention is probably only the first of many multilateral treaties that will fail to be ratified by the United States because of uncertainty concerning the nature and extent of constitutional protection. S. J. Res. 1 would eliminate this embarrassing dilemma and facilitate ratification of many worth-while treaties.

CONGRESSIONAL OMNIPOTENCE A DETERRENT TO TREATY-MAKING

Section 2 of S. J. Res. 1 reverses the doctrine of *Missouri v. Holland*²³ which holds that a treaty may empower Congress to legislate in areas prohibited by the Tenth Amendment in the absence of treaty.

Reversal of *Missouri v. Holland*, according to Secretary Dulles, would cripple the treaty-making power by creating "a no man's land in foreign affairs," and by requiring "the concurrence of all 48 states" to make effective many types of treaties.²⁴ The calamitous results predicted will not come to pass upon the adoption of S. J. Res. 1.

Other federal states have participated effectively in world affairs without placing their constituent units at the mercy of an unlimited treaty-making power. Canada is perhaps the best example. It was held in *Canada v. Ontario and Other Provinces*²⁵ that labor legislation passed by Parliament to implement a treaty could not supersede conflicting legislation enacted under the powers reserved to the provinces.

In addition, the United States got

²³ 252 U. S. 416 (1920).

²⁴ Hearings, p. 829.

²⁵ (1937) A. C. 326. The following language from the Privy Council's opinion should serve as a timely reminder for those who have forgotten that the United States also has a system of dual sovereignties: "It must not be thought that the result of this decision is that Canada is incompetent to legislate in performance of treaty obligations. In totality of legislative powers, Dominion and Provincial together, she is fully equipped. But the legislative powers remain distributed. When Canada incurs treaty obligations dealing with Provincial classes of subjects, the exercise of the totality of powers requires cooperation between Dominion and the Provinces. While the ship of state now sails on larger ventures and into foreign waters, she still retains the watertight compartments which are an essential part of her original structure."

along very well for many years without benefit of the *Missouri v. Holland* doctrine. In fact, the case cited most frequently to prove that no amendment is necessary because no treaty can "authorize what the Constitution forbids"²⁶ involved a treaty entered into in 1853 with France on a reciprocal internal state basis.²⁷ As late as 1948 the United States and China entered into a treaty on the same basis. Section 2 of S. J. Res. 1 merely holds the State Department to this reassuring policy pronouncement made only last year:

Furthermore, where the subject matter covers fields in which the States have a paramount interest, such as the formation and regulation of corporations and the ownership of property, the treaty provisions have been worked out with the same careful regard for the States' prerogatives and policies that has traditionally characterized agreements of this type.²⁸

The argument was made in opposition to S. J. Res. 1, however, that unless the federal government can acquire power by treaty which it would not possess in the absence of treaty, the United States could not make the conventional commercial treaties, extradition treaties, treaties regulating traffic in narcotics, and treaties for the control of the mili-

²⁶ *Geofroy v. Riggs*, 133 U. S. 258, 267 (1890).

²⁷ Article VII of the treaty reads in part as follows: "In all the States of the Union, whose existing laws permit it, so long and to the same extent as the said laws shall remain in force, Frenchmen shall enjoy the right of possessing personal and real property by the same title and in the same manner as citizens of the United States. . . . As to the States of the Union, by whose existing laws aliens are not permitted to hold real estate, the President engages to recommend to them the passage of such laws as may be necessary for the purpose of conferring this right—"

²⁸ *Dept. of State Bull.*, Vol. 26 (June 2, 1952), pp. 881-83.

tary uses of atomic energy. These arguments completely ignore the fact that Congress at one time or another has found ample power, entirely apart from any treaty on the subject, to regulate the subject matter in treaties claimed to be outlawed by S. J. Res. 1. For a documented refutation, the reader is referred to the testimony of Dr. George A. Finch in support of S. J. Res. 1.²⁹

The federal-state clause

There can be little doubt that *Missouri v. Holland* represents a potentially serious roadblock to Senate approval of many treaties favored by the President. The Senate will necessarily be more sensitive to the impact of treaties on state powers than the President. The difference in the constituencies represented sets up a source of friction in legislative-executive relationships with respect to treaty policy. In the past, the full implications of *Missouri v. Holland* have been somewhat obscured by incorporating in treaties a so-called federal-state clause. A fairly typical federal-state clause is that found in Article 19 (7) (b) of the Constitution of the International Labor Organization, reading in part as follows:

In the case of a federal State, the following provisions shall apply:

(b) In respect of Conventions and Recommendations which the federal Government regards as appropriate under its constitutional system, in whole or in part, for action by the constituent States, provinces, or cantons rather than for federal action, the federal Government shall—

(i) make, in accordance with its Constitution and the Constitutions of the States, provinces or cantons concerned, effective arrangements for the reference of such Conventions and Recommendations . . .

²⁹ *Hearings*, pp. 1104–1175.

The language quoted above is applicable to some hundred ILO treaties. A similar clause may be found in scores of other proposed treaties. Prior to the debate on any treaty-control amendment, it was generally assumed that a so-called federal-state clause adequately protected the reserved powers of the states against invasion by treaty. It is now abundantly clear that such a clause, if effective at all, merely lifts from Congress any international obligation to exercise its full legislative power. The supremacy clause of Article VI as interpreted in *Missouri v. Holland* empowers Congress, acting pursuant to a treaty, to strip the states of their reserved powers under the Constitution. No federal-state clause can prevent that result.³⁰

Unless section 2 of the amendment becomes a part of the Constitution, the Senate, now realizing the ineffectiveness of a federal-state clause, may refuse to approve many treaties to which it might give its consent if states' rights were adequately protected. Or, by approving treaties containing an ineffective federal-state clause, the Senate would empower future Congresses to ride roughshod over the constitutionally reserved powers of the several states. Only by reversing the doctrine of *Missouri v. Holland* can the Senate be spared this Hobson's choice.

THE CLAIM OF EXECUTIVE OMNIPOTENCE IN FOREIGN AFFAIRS

Legislative-executive relations on foreign policy matters will, except for temporary periods, continue to be marred by friction and discord until such time as the constitutional responsibilities of the President, the Senate, and the whole Congress are more clearly delineated. The framers of the Constitution made no effort to fix responsibility with re-

³⁰ Statement of Carl B. Rix, past president of the American Bar Association, *Hearings*, pp. 75–83, 1024–1034.

spect to international agreements other than treaties. To complicate the problem further, "treaty" was not defined. No doubt the framers of the Constitution expected their omission to be corrected in the light of experience. That has not been done. In the meantime, what should have been a harmonious sharing of foreign policy responsibilities has too often been a contest of strength marked by mutual recrimination between the President and the Congress. A fully effective foreign policy cannot be formulated or carried out in such an atmosphere. The solution provided in S. J. Res. 1 is to confirm the power claimed by Congress to regulate the making of executive and other agreements, subject to the veto power of the President, but leave the President as the sole agent of the United States in the initiation and conduct of negotiations with foreign governments.

Though not specifically mentioned in the Constitution, the making of international agreements other than treaties is recognized by implication. The Constitution, though denying any treaty power to the states, provides that they may, with the consent of Congress, "enter into any Agreement or Compact . . . with a foreign Power."³¹ It would be most anomalous if the states had a power to make international agreements other than treaties which the national government lacked. This fact was recognized by Congress during President Washington's first term, when it authorized the Postmaster General to conclude postal conventions with the postmasters of foreign countries.³²

It was never intended, of course, that executive and other agreements should make resort to the treaty procedure optional at the discretion of the President. The alleged superfluity of the treaty-making clauses of the Constitution ig-

nores the careful consideration given to those clauses in the Constitutional Convention and in the state ratifying conventions. The argument amounts to nothing less than a plea for executive omnipotence in violation of constitutional processes.³³ Moreover, if executive omnipotence is conceded to exist with respect to the making of all international agreements, exclusive executive direction of domestic policy will be the inevitable aftermath.

DISTINCTION BETWEEN TREATIES AND OTHER INTERNATIONAL AGREEMENTS

What, then, did the Founding Fathers have in mind when they used the word "treaty" and took such pains to see that this vast power was not centered in one man? ³⁴ In the first place, as Hamilton said in *The Federalist*, No. 75, the treaty power "relates neither to the execution of the subsisting laws, nor to the enactment of new ones," the objects of the power being "contracts with foreign nations," and not "rules prescribed by the sovereign to the subject." In addition, all available evidence as to the framers' intent shows that they intended the word "treaty" to encompass all international agreements known to them as treaties and all agreements thereafter made possessing comparable characteristics and importance.³⁵ For example, the Founding Fathers relied heavily on *Le Droit des Gens* published in 1758 by

³³ See discussion above, under side head "Can President and Congress override Constitution?"

³⁴ As Hamilton explained in *The Federalist*, No. 75: "This history of human conduct does not warrant that exalted opinion of human virtue which would make it wise in a nation to commit interests of so delicate and momentous a kind, as those which concern its intercourse with the rest of the world, to the sole disposal of a magistrate created and circumstanced as would be a President of the United States."

³⁵ Henry S. Fraser, *Treaties and Executive Agreements*, S. Doc. 244, 78th Cong., 2d sess.

³¹ U. S. Constitution, Art. I, sec. 10.

³² 1 Stat. 232.

Emmerich von Vattel, the famous Swiss jurist and international lawyer.³⁶ Vattel's book drew this distinction between treaties and international agreements other than treaties:

Section 152. Treaties of Alliance and other public treaties. . . . A treaty, in Latin *foedus*, is a pact entered into by sovereigns for the welfare of the State, either in perpetuity or for a considerable length of time.

Section 153. Compacts, agreements or conventions. Pacts which have for their object matters of temporary interest are called agreements, conventions, compacts. They are fulfilled by a single act and not by a continuous performance of acts.³⁷

From Washington's day to this, Presidents have vigorously challenged the idea that the exclusive procedure for consummating international agreements of great importance or durability is the treaty method. Nevertheless, Vattel's distinction has shown an amazing vitality. As late as 1939, Assistant Secretary of State Francis B. Sayre said:

International agreements involving political issues or changes of national policy and those involving international arrangements of a permanent character usually take the form of treaties. But international agreements embodying adjustments of detail carrying out well-established national policies and traditions and those involving arrangements of a more or less temporary nature usually take the form of executive agreements.³⁸

The distinction blurred

In the past ten years the effort to use treaties and executive agreements interchangeably has been intensified. Dr. Wallace McClure, one-time chief of the Treaty Division, Department of State, wrote in 1941:

³⁶ *Le Droit des Gens*, bk. 2, c. 12.

³⁷ *Ibid.* at 7.

³⁸ Sayre, "The Constitutionality of the Trade Agreements Act," 39 *Col. L. Rev.* 751, 755 (1939).

The President, acting with Congress, where simple majorities prevail, can, in the matter of international acts, legally accomplish under the Constitution anything that can be legally accomplished by the treaty-making power as specifically defined in the Constitution. . . .

The result is that for controversial international acts the Senate method may well be quietly abandoned, and the instruments handled as executive agreements. But for large numbers of purely routine acts, about which no public opinion exists and no question as to their acceptability arises, the present [treaty] method is desirable as saving the time of the House of Representatives.³⁹

Senators know only too well that the McClure theory received at least partial acceptance in the Department. Many international agreements have been made by the President alone or approved by the Congress which were many times more important than treaties submitted to the Senate during the same period. Before reviewing the present administration's opposition to congressional regulation of executive and other agreements, it should be clearly understood that neither President Eisenhower nor Secretary of State Dulles subscribes to the McDougal-Lans-McClure theory that treaties and executive agreements are wholly interchangeable.

Speaking in opposition to congressional regulation of executive agreements, Secretary Dulles said:

It has long been recognized that there is an undefined, and probably undefinable, borderline between Executive agreements which may be made by the President alone and those that require validation by the Senate as treaties, or the Congress as laws.⁴⁰

EXECUTIVE SUPREMACY DECLARED

Mr. Dulles conceded that this "undefined" border line had caused contro-

³⁹ McClure, *International Executive Agreements* (1941), pp. 364, 378.

⁴⁰ *Hearings*, p. 828.

versy between the executive and legislative branches of government. He did not explain his reason for believing that the President was better able than the Congress to respect the "undefinable border line." However, in an obviously sincere effort to promote friendly co-operation, the Secretary of State was authorized by the President to announce the following policy:

Differences of opinion resulting from these difficulties have given rise in the past to disputes between the executive branch and the Congress concerning the handling of international agreements. It must be recognized that it would be extremely difficult, if not impossible, to fit all agreements into set categories. At times there may be disagreement as to the manner in which agreements are to be dealt with. While recognizing this, the Executive cannot surrender the freedom of action which is necessary for its operations in the foreign-affairs field. In the interest of orderly procedure, however, I feel that the Congress is entitled to know the considerations that enter into the determinations as to which procedures are sought to be followed. To that end, when there is any serious question of this nature and the circumstances permit, the executive branch will consult with appropriate congressional leaders and committees in determining the most suitable way of handling international agreements as they arise.⁴¹

The policy outlined above cannot assure friendly co-operation. It is as though one of three partners whose duties and responsibilities were not well-defined in the partnership agreement should announce that he, after consulting with the other two, would make all the final decisions on a vitally important phase of the business. The courts will resolve disputes stemming from an ambiguous partnership agreement; they have consistently refused to pass on the merits of "political questions," particularly those involving foreign relations.⁴²

⁴¹ *Ibid.* at 828-29.

OPPOSITION UNSOUNDLY BASED

The State Department's opposition to the executive agreements section of S. J. Res. 1 is based on a number of misconceptions. First, it was argued that S. J. Res. 1 as introduced would prevent the President from making any agreement for which Congress had not given prior authorization.⁴³ Although rather far-fetched, this objection has been overcome in the revised text recommended by the Senate Judiciary Committee.

A second misconception is Mr. Dulles' belief that the danger attached to agreements not ratified by either House of Congress "cannot be great" because such agreements "cannot constitutionally become law of the land."⁴⁴ The Secretary of State apparently overlooks the decision in *United States v. Pink*⁴⁵ holding that the unratified Roosevelt-Litvinov Assignment superseded the law of the State of New York. The Supreme Court said:

A treaty is a "law of the land" under the supremacy clause . . . of the Constitution. Such international compacts and agreements as the Litvinov Assignment have a similar dignity.⁴⁶

A third misconception is that Congress cannot be trusted to legislate wisely with respect to the making of international agreements other than treaties.⁴⁷ The fact is that Congress in recent years has authorized in advance or subsequently approved approximately 85 per cent of all major executive agreements.⁴⁸

⁴² *Chicago & Southern v. Waterman S. S. Corp.*, 333 U. S. 103 (1948).

⁴³ *Hearings*, p. 827.

⁴⁴ *Ibid.* at 828.

⁴⁵ 315 U. S. 203 (1942).

⁴⁶ *Ibid.* at 230.

⁴⁷ *Hearings*, p. 867.

⁴⁸ *Hearings before a Subcommittee of the Senate Judiciary Committee on S. J. Res. 130*, 82d Cong., 2d sess., p. 82.

Basically, the administration's objection to congressional regulation of executive agreements as a matter of right stems from an unsound view of the constitutional separation-of-powers doctrine. For example, Mr. Dulles asserted that the President had "exclusive jurisdiction in relation to the current conduct of foreign affairs."⁴⁹ A memorandum prepared by the Legal Adviser of the State Department reveals this basis for that conclusion:

Perhaps the unique feature of our Constitution is the provision for the separation of powers between the legislative, executive, and judicial, each supreme in its field, the whole constituting a system of checks and balances. The proposed amendment would destroy this separation insofar as it relates to the President's constitutional authority in the realm of foreign affairs.⁵⁰

Almost all students of government know that executive, legislative, and judicial powers are not contained in hermetically sealed compartments. Each branch, though primarily responsible in its own field, participates to a considerable degree in the work of the other two branches. The President, for example, is a partner in the legislative process and a very significant factor in the judicial process. The constitutional system of checks and balances was designed to ensure co-operation between three branches of federal government. It was not intended to inspire competition for power among three branches of government, each exercising a supreme and exclusive authority in its own field. This co-operative concept of governmental separation of powers is particularly important in foreign relations. All

⁴⁹ Hearings, p. 827.

⁵⁰ *Ibid.* at 837.

John W. Bricker, LL.D., Washington, D. C., is United States Senator from Ohio. He has practiced law in Columbus, Ohio since 1920 except when holding public office. He was Attorney General of Ohio from 1933 to 1937, and Governor of Ohio from 1939 to 1945.

Americans recognize today that foreign-policy decisions represent life-and-death issues. They insist that the determination of foreign policy, insofar as practicable, be made the responsibility of the President and all 531 members of Congress.⁵¹

CONCLUSION

Insofar as treaties are involved, S. J. Res. 1 does not limit the powers of the President in foreign affairs. By clear and unmistakable language, the amendment applies only to the domestic consequences of a treaty. The amendment is, in effect, a bill of rights against the treaty-making power.

With respect to executive agreements, the proposed amendment does have some international consequences. It would place other nations on notice that the power of the President to bind the United States without the co-operation of the Senate or of the Congress is not unlimited. It repudiates the claim that survival in an atomic age requires executive omnipotence in the field of foreign affairs.

Adoption of the proposed constitutional amendment would eliminate perennial sources of friction and discord in legislative-executive relations. Nothing is more important to the formulation and execution of a successful American foreign policy.

⁵¹ Many lawyers and members of Congress believe that section 3 of S. J. Res. 1 is merely declaratory of existing law. For example, regulation of executive agreements under the existing powers of Congress is provided for in the McCarran Resolution, S. J. Res. 2, 83d Cong., 1st sess. See testimony of Alfred J. Schweppe, chairman, American Bar Association Committee on Peace and Law Through United Nations, Hearings, pp. 1243-54.

Financial Aspects of Congressional Participation in Foreign Relations

By ELI E. NOBLEMAN

WHETHER the Founding Fathers intended to vest control over foreign relations in the President or in the Congress has been the subject of continuous controversy since the birth of the Republic. Whatever their intention may have been, when they wrote into the Constitution the clause "No Money shall be drawn from the Treasury, but in Consequence of Appropriations made by Law,"¹ they gave to the Congress a means of exercising control concerning which there can be no doubt.

A review of past events reveals that every President and every Congress since the first have been aware of this potential power; Presidents have paid deference to it, although somewhat reluctantly; and the Congress has never failed to make known, if only for record purposes, that it considers itself an equal partner of the President if the conduct of foreign relations requires the appropriation and expenditure of funds.²

¹ Art. I, Sec. 9, clause 7.

² No specific study has ever been made of the manner and extent to which the Congress has exercised this authority. However, most of the works dealing with the conduct of American foreign relations, the respective powers of the President and the Congress in this field, and executive-legislative relations in general, contain some reference to and discussion of the problem. See Daniel S. Cheever and H. Field Haviland, *American Foreign Policy and the Separation of Powers* (Cambridge, 1952); Edward S. Corwin, *The President's Control of Foreign Relations* (Princeton, 1917); *ibid.*, *The President—Office and Powers* (New York, 1948); Samuel B. Crandall, *Treaties—Their Making and Enforcement* (Second Edition, Washington, 1916); Royden J. Dangerfield, *In Defense of The Senate* (Norman, 1933); William Y. Elliott, et al.,

MEANS OF FISCAL CONTROL

For the most part, the Congress has used its fiscal primacy³ to exercise control over foreign relations by means of (1) its power to withhold all or part of appropriations necessary to the execution of a particular policy or program; (2) riders attached to appropriations measures; and (3) its constitutional authority over revenue-raising measures.

Exercising its authority to withhold all or part of the funds necessary to implement policies and programs, the Congress is free to refuse to appropriate funds required for the execution of treaties; it can snub the President's requests for funds needed to finance long-range, large-scale military, economic, and technical assistance programs; it can provide authorizations and funds for pet projects which are contrary to the President's policies; it can deny or limit the amount of money which the

United States Foreign Policy, Its Organization and Control (New York, 1952); George B. Galloway, *Congress at the Crossroads* (New York, 1946); Ernest S. Griffith, *Congress—Its Contemporary Role* (New York, 1951); T. H. Lay, *The Foreign Service of the United States* (New York, 1925); Robert Luce, *Legislative Problems* (Boston, 1935); John M. Mathews, *American Foreign Relations—Conduct and Policies* (revised and enlarged, New York, 1938); Albert C. F. Westphal, *The House Committee on Foreign Affairs* (New York, 1942); Leonard D. White, *The Federalists* (New York, 1948); Benjamin H. Williams, *American Diplomacy—Policies and Practice* (New York, 1936); Quincy Wright, *The Control of American Foreign Relations* (New York, 1922).

³ The author is indebted to Professor Leonard D. White for the term "fiscal primacy." See White, *op. cit.* note 2 *supra*, p. 323.

United States can contribute to international organizations, either as regular annual contributions or as voluntary payments to operating programs; and it can deny funds to enable the United States to participate in international meetings and conferences.

By attaching riders to appropriations bills, the Congress can take and has attempted to take the initiative in recognizing new states and issuing diplomatic instructions to United States delegates to international conferences; it can condition and has conditioned the use of funds appropriated upon certain contingencies, or upon the President's taking or refraining from taking certain specified actions; and it can take and has taken the initiative from the President by making policy declarations.

Finally, by exercising its authority over revenue-raising measures, it can dictate customs and tariff requirements, upsetting seriously Presidential plans and policies in this area.

CONGRESSIONAL POSITION ON TREATIES

The first great issue which arose in connection with the fiscal power of the Congress over foreign relations was whether the Congress was obligated to appropriate funds needed for the execution of treaties which had been duly negotiated and ratified by the President after receiving the required sanction from the Senate. A corollary question was whether, in view of the fact that action by both Houses was required for an appropriation, it was necessary that the House of Representatives be consulted somewhere along the line prior to ratification by the President.⁴

Although the controversy which ultimately raged around these questions did not come to a head until 1796, when the

⁴ See, in general, the works cited note 2 *supra*.

President requested an appropriation to implement the Jay Treaty, the evidence is clear that both the first President and his Secretary of State were seriously troubled by the problem several years earlier.⁵

The Algerine question

It appears that in 1792 Washington was contemplating the negotiation of a treaty with Algiers for the ransom of Americans who had been captured by the Barbary pirates, and to establish peace and amity between the United States and Algiers. Jefferson, then Secretary of State, records that on March 11, 1792, he was consulted by the President, who on the following day was to meet with "a committee of the Senate," to obtain Jefferson's advice on whether it was proper "to redeem our Algerine captives and make a treaty with the Algerines on the single vote of the Senate without taking that of the Representatives." Jefferson's advice, which was surprisingly appropriate to the temper of the contemporary scene, was as follows:

We must go to Algiers with the cash in our hands. Where shall we get it? By loan? By converting money now in the treasury? Probably a loan might be obtained on the President's authority but as this could not be repaid without a subsequent act of legislature, the Representatives might refuse it. So if [we] convert money in [the] treasury, they may refuse sanction to it. . . . Therefore, against hazard- ing this transaction without the sanction of both houses.

On April 9, 1792, Jefferson had another conference with the President on the same matter. His description of what transpired shows not only a singu-

⁵ The following account and quotations are taken from *The Writings of Thomas Jefferson* (Ford Ed.), Vol. I (New York, 1892), pp. 183-84, 190-92. Italics in original.

lar awareness of the fiscal primacy of the Congress by both the President and his Secretary of State, but also the beginnings of the Senate-House rivalry which we have come to know so well. Jefferson records:

The President had wished to redeem our captives at Algiers and to make peace with them on paying an annual tribute. The Senate was willing to approve this, but unwilling to have the lower house applied to previously to furnish the money; they wished the President to take the money from the treasury, or open a loan for it. They thought that to consult the Representatives on one occasion, would give them a handle always to claim it, and would let them into a participation of the power of making treaties, which the Constitution had given exclusively to the President and the Senate. They said too, that if the particular sum was voted by the Representatives, it would not be a secret.

It appears that at this stage of the discussion with his Secretary of State, the President was ready to declare "a plague o' both their houses"; for Jefferson continues:

The President had no confidence in the secrecy of the Senate, and did not choose to take money from the treasury or to borrow. But he agreed he would enter into provisional treaties with the Algerines, not to be binding on us till ratified here. I . . . added that the Senate were to be apprised, that on the return of the provisional treaty, and after they should advise the ratification, he should not have the seal put to it till the *two* houses should vote the money. He asked me if the treaty stipulating a sum and ratified by him, with the advice of the Senate, would not be good under the Constitution, and obligatory on the Representatives to furnish the money? I answered it certainly would, and that it would be the duty of the Representatives to raise the money; but that they might decline to do what was their duty, and I thought it might be incautious to commit

himself by a ratification with a foreign nation, where he might be left in the lurch in the execution; . . .

This advice, though both moderate and sound, appears to have enraged the President, for Jefferson records:

He [Washington] said that he did not like throwing too much into democratic hands, that if they should not do what the Constitution called on them to do, the government would be at an end, and must *then assume another form*. He stopped there; and I kept silence to see whether he would say anything more in the same line, or add any qualifying expression to soften what he had said, but he did neither.

Taking the practical approach, Jefferson concluded:

I had observed that wherever the agency of either or both houses would be requisite subsequent to a treaty to carry it into effect, it would be prudent to consult them previously if the occasion admitted. That thus it was we were in the habit of consulting the Senate previously when the occasion permitted, because their subsequent ratification would be necessary. That there was the same reason for consulting the lower house previously where they were to be called on afterwards, and especially in a case of money, as they held the purse strings and would be jealous of them. However, he desired me to strike out the intimation that the seal would not be put till both houses should have voted the money.

Although Washington appears to have left the conference in somewhat of a temper, he followed Jefferson's advice, at least partially, since on May 8, 1792, only a month later, he addressed a communication to the Senate asking if that body would approve a convention or treaty stipulating the payment of a ransom not exceeding \$40,000, or, if not, how much they would approve.⁶

⁶ James D. Richardson, *Messages and Papers of the Presidents*, Vol. I (Washington, 1896),

Jefferson's fears that the Congress "might decline to do what was their duty" by failing to appropriate the necessary funds to enable the execution of the treaty appear to have been unfounded. Despite the fact that Washington did not consult the House of Representatives in advance, substantial sums of money were made available by the Congress after the treaty had been duly ratified; following Senate approval.⁷

The Jay Treaty

In 1796, when the President requested an appropriation to implement the Jay Treaty, after it had been duly ratified and proclaimed by the President on February 29 and communicated to the Congress the following day, Jefferson's fears were fully realized.⁸ On March 24, 1796, a resolution was adopted by the House of Representatives, by a vote of 62 to 37, requesting the President to transmit to the House copies of his instructions to Jay, together with certain other papers pertaining to the negotiation of the treaty, which was one of the most highly controversial subjects of Washington's ad-

p. 123. In the same communication, Washington asked the Senate whether they would approve a treaty of peace with Algiers which provided for an annual payment by the United States of \$25,000. *Ibid.*

⁷ The Senate gave its advice and consent to the treaty on March 2, 1796, and the President ratified and proclaimed it on March 7, 1796; 8 Stat. 133-37. See David Hunter Miller, *Treaties and Other International Acts of the United States of America*, Vol. 2 (Washington, 1931), pp. 275-317. For the amount of money involved, see p. 316.

⁸ The following account is based on Miller, *op. cit.* note 7 *supra*, pp. 245-74; Crandall, *op. cit.* note 2 *supra*, pp. 165 ff.; White, *op. cit.* note 2 *supra*, p. 63; Henry St. George Tucker, *Limitations on the Treaty-Making Power* (Boston, 1915), chap. 8. An account of the political aspects of the Jay Treaty is found in Thomas A. Bailey, *A Diplomatic History of the American People* (4th ed., New York, 1950), pp. 63 ff.

ministration. This request raised directly the issue of the extent to which the House was entitled to participate in the treaty process through its undoubted power over appropriations. Indirectly, it raised the still unsettled question of the right of the Congress to request executive papers.

Washington, apparently fully aware of the importance of his decision as a precedent, notified the House committee which had presented the request that he would consider the matter. Before replying, however, he requested written opinions from the heads of various departments and he conferred privately with Hamilton.

Both in and out of Congress, a great debate ensued. Hamilton argued, in support of the administration, that in making treaties the supreme law of the land, the Constitution converted the obligation of a treaty at international law into complete constitutional obligation, and hence left the Congress no discretion.⁹ Madison and Gallatin, on the floor of the House of Representatives, replied that the very purpose of the Constitution in forbidding any money to be paid out of the Treasury except in consequence of an appropriation made by law was to leave the Congress a free agent in voting such appropriations. Madison pointed out, in a speech delivered on March 7, 1796:

It was an important, and appeared to him to be a decisive, view of the subject, that if the Treaty power alone could perform any one act for which the authority of Congress is required by the Constitution, it may perform every act for which the authority of that part of the Government is required. Congress have power to regulate trade, to declare war, to raise armies, to levy, to borrow, and to appropriate money, etc. If, by Treaty, therefore, as paramount to the Legislative power,

⁹ Edward S. Corwin, *The President—Office and Powers* (New York, 1948), p. 214.

the President and Senate can regulate trade, they can also declare war, they can raise armies to carry on war, and they can procure money to support armies. . . . The force of this reasoning is not obviated by saying, that the President and Senate would only pledge the public faith, and that the agency of Congress would be necessary to carry it into operation. For what difference does this make, if the obligation imposed be, as is alleged, a constitutional one; if Congress have no will but to obey, and if to disobey be treason and rebellion against the constituted authorities? . . .¹⁰

Gallatin argued that the power to make treaties was a general power, while the power to make appropriations was specifically vested in the Congress; that if the power to make treaties, as vested in the President and the Senate, were unlimited, the Executive with the Senate might, under color of a treaty, entirely eliminate the House of Representatives from legislation by substituting a foreign nation or some Indian tribe.¹¹

On March 30, 1796, in a carefully worded but firm message to the House of Representatives, Washington refused to comply with the request for the Jay papers, asserting that it would create "a dangerous precedent," that the treaty-making power was vested exclusively in the President and the Senate, that the intervention of the lower House had been specifically rejected by the Constitutional Convention, and that it was essential to the "due administration" of the government to preserve the boundaries fixed by the Constitution.¹²

In arriving at his decision, which was a momentous one, Washington's thoughts on the subject appear quite similar to those of any of our contemporary Presi-

dents in their relations with the Congress. In a letter to Hamilton, in which he displayed a realistic understanding of the importance of maintaining cordial relations with the Congress, Washington wrote:

From the first moment, and from the fullest conviction in my own mind, I had resolved to resist the principle which was evidently intended to be established by the call of the House of Representatives; and only deliberated on the manner in which this could be done, with the least bad consequences.¹³

The House of Representatives, however, seemed determined not to take this rebuff without further action. On April 7, 1796, it adopted a resolution by a vote of 57 to 35, disclaiming that the House had any agency in the making of treaties, but asserting:

. . . when a Treaty stipulates regulations on any of the subjects submitted by the Constitution to the power of Congress, it must depend, for its execution as to such stipulations, on a law or laws to be passed by Congress. And it is the constitutional right and duty of the House of Representatives, in all such cases, to deliberate on the expediency or in expediency of carrying such Treaty into effect, and to determine and act thereon, as in their judgment, may be most conducive to the public good.¹⁴

After thus stating its position, the House, on April 30, 1796, by a vote of 51 to 48, adopted a resolution providing that funds should be made available for the execution of the treaty, and on May 6 three acts were approved making the required appropriations for the Jay Treaty and three other treaties.¹⁵

ATTEMPT TO RECOGNIZE SOUTH AMERICAN STATES

In 1818 a controversy arose in the House of Representatives in connection with an attempt to recognize the South American states which had revolted from Spain, by attaching to an appropriation bill a rider providing \$18,000 for a minister to those states "whenever the President deemed it expedient" to send one.¹⁶ The rider, which was offered by Henry Clay, then Speaker of the House, before any definite action had been taken by President Monroe, was immediately attacked as "an act of usurpation [and] an invasion of executive authority," and, after some debate, it was defeated by a vote of 45 to 115.¹⁷

DELEGATION TO PANAMA CONGRESS

In 1826, when President John Quincy Adams requested funds to finance a mission to attend an international conference to be held at Panama, an attempt was made in the House of Representatives to issue instructions to the delegation and to prescribe certain conditions, by means of a rider to the bill appropriating such funds.¹⁸ In support of this action, it was argued that the power of the House to appropriate for the expenses of the mission carried with it the right to impose conditions.

¹⁶ *Annals of Congress*, 15th Cong., 1st sess., Vol. II, pp. 1468, 1500. See also Edward S. Corwin, *The President's Control of Foreign Relations* (Princeton, 1917), pp. 73 ff.; Mathews, *op. cit.* note 2 *supra*, pp. 482 ff.; Senate Document 56, 54th Cong., 2d sess., pp. 29 ff.

¹⁷ Corwin, *op. cit.* note 16 *supra*, pp. 74 ff.

¹⁸ Adams had previously advised the Senate that he had accepted an invitation to the conference, and requested its support in providing the necessary appropriation. Richardson, *op. cit.* note 6 *supra*, Vol. II, p. 318. See also Mathews, *op. cit.* note 2 *supra*, pp. 444-45; Senate Document 56, *op. cit.* note 16 *supra*, pp. 37 ff.

Opposing such action, Daniel Webster, on the floor of the House, argued, in language which is strangely reminiscent of any of the contemporary debates on important foreign policy issues:

... this amendment ... was unprecedented, nothing of the kind having been attempted before. It was, in his opinion, unconstitutional; as it was taking the proper responsibility from the Executive and exercising ourselves, a power which, from its nature, belongs to the Executive and not to us. It was prescribing, by the House, the instructions for a Minister abroad. It was nugatory, as it attached conditions which might be complied with, or might not. And lastly, if the gentlemen thought it important to express the sense of the House on these subjects, ... the regular and customary way was by resolution. ... we must make the appropriation without conditions, or refuse it. The President has laid the case before us. If our opinion of the character of the meeting, or its objects, led us to withhold the appropriation, we had the power to do so. If we had not so much confidence in the Executive, as to render us willing to trust to the constitutional exercise of the Executive power, we have power to refuse the money. It is a direct question of aye or no. If the Ministers ... may not be trusted to act, like other Ministers, under the instructions of the Executive, they ought not to go at all.¹⁹

Although the Congress appropriated the funds requested without the objectionable rider, the American delegates never attended the conference. After starting out four months late as a result of the extended debate, one delegate died en route, and the other, finding himself so far behind schedule, ultimately abandoned his efforts to reach Panama.²⁰

¹⁹ Benton, *Abridgments of the Debates of Congress*, IX, p. 91. See also Corwin, *op. cit.* note 16 *supra*, pp. 40-41; Mathews, *op. cit.* note 2 *supra*, pp. 444-45. A discussion of the political aspects of the Panama Congress issue is found in John W. Foster, *A Century of American Diplomacy* (Boston, 1900), pp. 451 ff.

mately abandoned his efforts to reach Panama.²⁰

QUESTION OF RECOGNITION OF TEXAN INDEPENDENCE

In 1837 another attempt was made in the House of Representatives to take the initiative in recognizing new governments, in the form of a motion to amend the Civil and Diplomatic Appropriation bill by providing funds for "an outfit and salary of a diplomatic agent to be sent to the independent Republic of Texas."²¹ Speaking on the floor of the House with respect to this amendment, John Quincy Adams said:

... that the act of recognition of a foreign power has heretofore always been an executive act of this Government. It was the business and duty of the President ... , and he [Mr. A.] was not willing to set the example of giving that recognition on the part of the legislative body without recommendation of the Executive.²²

Eventually the word "independent" before the words "Republic of Texas" was stricken out, and the bill was passed with the addition of a clause authorizing such action "whenever the President ... shall receive satisfactory evidence that Texas is an independent Power, and that it is expedient to appoint such a minister."²³

QUESTION OF MINISTER TO MEXICO

In 1842 a motion was made in the House to amend an appropriation bill supplying funds for the salaries of United States ministers to eight govern-

²³ *Ibid.*

ments, by striking out the provision for a minister to Mexico, on the ground that the commercial and other international relations between the United States and Mexico were not of sufficient importance to merit more than consular representation.²⁴

The following remarks of Representative Linn of New York, in support of the motion which he had sponsored, are particularly pertinent and interesting to our inquiry, since they constitute an early instance of a frank acknowledgment that the real control which the Congress exercises over foreign relations stems from its power to grant or withhold appropriations:

One of the most important functions bestowed on the Executive of this nation is the control of foreign intercourse. ... *The power of this House, as a coordinate branch of the Legislature, over our foreign intercourse, is rather incidental than direct or express; and yet may, as it should, be both potent and controlling. Accordingly, from the origin of the Government to the present time, this House has exercised this power, in the negative form, of either confining the appropriations within the limits of its own judgment and discretion, or of withholding them from particular branches of the service. ... From 1790 to the present time, the same control, and in the same form ... has been indisputably exercised by Congress; and at every session up to the present, this House, through its power over supplies—a power inherent and constitutional—has directed, sometimes by increasing, and sometimes by limiting, the Executive discretion; ...*²⁵

Replying to Mr. Linn, Representative Pickens of South Carolina stated that

he believed that some alterations in our diplomatic arrangements were necessary, but he was willing to leave that matter to

²⁴ *Congressional Globe*, Appendix, 27th Cong., 2d sess., pp. 513-14.

²⁵ *Ibid.*, p. 514. Italics supplied.

the direction of the Executive, who was constitutionally charged with it.²⁶

After considerable debate, the amendment was withdrawn.²⁷

THE ALASKA PURCHASE

In 1867, the issue of whether the Congress was obligated to appropriate funds to enable the execution of a duly ratified treaty arose again in connection with the treaty with Russia for the purchase of Alaska. After the treaty had been duly ratified and proclaimed, President Johnson requested an appropriation of \$7,200,000, the payment stipulated in the treaty, and legislation providing for the occupation and government of the new territory.²⁸

The House Committee on Foreign Affairs, which prior to 1920 was authorized to report appropriations, reported a bill which contained the legislation requested by the President, including the appropriation, stated that its right to review the merits of a treaty was now conceded.²⁹ When the bill reached the floor, on July 14, 1868, by a vote of 98 to 49 an amendment was added containing language virtually identical with that contained in the 1796 House resolution in connection with the Jay Treaty:

Whereas the subjects thus embraced in the stipulations of said treaty are among the subjects which by the Constitution of the United States are submitted to the power of Congress, . . . it being for such reason necessary that the consent of Congress should be given to said stipulations before the same can have full force and effect; . . . *Be it enacted, That the assent*

²⁸ Crandall, *op. cit.* note 2 *supra*, pp. 175-76; Westphal, *op. cit.* note 2 *supra*, pp. 143 ff.; Richardson, *op. cit.* note 6 *supra*, Vol. VI, p. 523.

²⁹ House Report 37, 40th Cong., 2d sess. (1868).

of Congress is hereby given to the stipulations of said treaty.³⁰

A second amendment, declaring "that the powers vested by the Constitution in the President and Senate to enter into treaties with foreign governments do not include the power to complete the purchase of territory before the necessary appropriations shall be made therefor by act of Congress," failed by two votes.³¹

The Senate refused to accept the House amendment, and when the bill emerged from conference the amendment had been altered to read: "and whereas said stipulations cannot be carried into full force and effect except by legislation to which the consent of both Houses of Congress is necessary." The clause "that the assent of Congress is hereby given to the stipulations of said treaty" was stricken out.³²

CONGRESS NOT BOUND TO SUPPORT A TREATY

It may be noted in connection with this problem that between 1868 and 1950 the House of Representatives never seriously contended that the Congress was under no obligation to make an appropriation in implementation of a treaty which had been duly ratified.³³

³⁰ *Congressional Globe*, 40th Cong., 2d sess. (June 30, 1868), pp. 3621 ff.

³¹ Crandall, *op. cit.* note 2 *supra*, p. 176; Westphal, *op. cit.* note 2 *supra*, p. 145.

³² *Ibid.*

³³ Crandall, *op. cit.* note 2 *supra*, p. 177; Westphal, *op. cit.* note 2 *supra*, p. 145. In 1871 the House adopted a resolution almost identical with that adopted in 1796 in connection with the Jay Treaty, but it was done under suspension of the rules and without debate. *Congressional Globe*, 42d Cong., p. 835. In 1950 the House Foreign Affairs Committee raised the question indirectly in connection with its consideration of pending legislation to raise the ceilings on United States contributions to international organizations to which this government is obligated to contribute pursuant to treaty or convention. See House Report 1257, 81st Cong., 1st sess.,

Although there is authority for the proposition that the Congress is under a moral obligation to supply the appropriations necessary to enable the government to carry out treaty commitments,³⁴ the prevailing view today, according to most of the leading authorities, is that the executive branch, even with Senate concurrence, cannot bind the Congress to make an appropriation in execution of a treaty commitment.³⁵ Professor Corwin observes that

although few, if any treaty provisions, have ever failed for lack of funds to carry them out, . . . it is well established . . . that whatever any department [of the Government] does in the exercise of its powers is frequently at the mercy of what another department may do—or refuse to do—in the exercise of its powers.³⁶

Perhaps the most realistic and pithy description of the situation is the observation of former Representative Robert Luce, who stated:

the fact is that whether right or wrong, the House has the whip hand by reason of its exclusive power to start appropriations, so that whenever it wants to, it can nullify any treaty that requires the spending of money in order to give it effect. This has made the real question one of morals rather than of mechanics.³⁷

p. 8. This action will be discussed at a subsequent point.

COMMERCIAL RELATIONS

Closely related to the fiscal power of the Congress in connection with the execution of treaties is the question of whether treaties and international agreements which purport to affect customs and tariffs, and which are entered into by the President with Senate concurrence, require congressional action by way of legislation to carry them into effect.

The problem arose originally because, although tariffs are clearly a legitimate subject of international negotiation, the Constitution expressly provides that "all bills for raising Revenue shall originate in the House of Representatives;"³⁸ and specifically gives Congress power to regulate commerce with foreign nations.³⁹

Although this question caused considerable controversy when it first arose, it presents no problem today, since the executive branch has generally recognized that treaties and agreements affecting tariffs and customs revenues should not be negotiated without prior approval of the Congress; and the Reciprocal Trade Agreements Act of 1934, and its subsequent extensions, give full recognition to this principle.⁴⁰ It may be noted, however, that the Congress has never hesitated to exercise its powers in this area, and the executive branch has, on occasion, been hampered by the necessity of obtaining congressional enabling

this power to itself and by practice and custom it is now said to have such authority. However, the Constitution is silent on the subject, and there is considerable evidence that the Founding Fathers never intended to give such power exclusively to the House.

³⁸ Art. I, Sec. 7, clause 1.

³⁹ Art. I, Sec. 8, clause 3.

⁴⁰ Crandall, *op. cit.* note 2 *supra*, chap. 13, especially pp. 195 ff.; Mathews, *op. cit.* note 2 *supra*, p. 576. A concise summary of the problem is found in Mathews, pp. 571 ff. See also Westphal, *op. cit.* note 2 *supra*, pp. 137 ff.

legislation for commercial dealings with foreign governments which are designed specifically to accomplish major objectives of foreign policy.

PRESIDENT GRANT'S PROTEST

During the period under consideration, one further instance of congressional fiscal action as a means of controlling foreign policy merits attention. On August 14, 1876, President Grant sent a message to the House protesting against a clause in the diplomatic appropriation bill for the ensuing year which directed the President to notify certain diplomatic and consular officials "to close their offices." "In the literal sense of this direction," he asserted, "it would be an invasion of the constitutional prerogatives and duty of the President."⁴¹

ARMY APPROPRIATION CONDITIONED

In 1912 Senator Bacon of Georgia proposed an amendment to the Army Appropriation bill for that year, which provided that, with certain exceptions, none of the funds appropriated by the bill should be used for "the pay or supplies of any part of the army of the United States employed or stationed in any country or territory beyond the jurisdiction of the laws of the United States, or in going to or returning from points within the same."⁴² When Senator Root objected that the amendment would encroach upon the President's powers as Commander in Chief, it was defeated without a record vote.⁴³

⁴³ Corwin, *loc. cit.* note 42 *supra*.

QUESTION OF INTERNATIONAL CONFERENCES

In 1913 the Congress attempted to limit the discretion of the President by adding the following provision as a rider to a deficiency appropriation bill: "Hereafter, the Executive shall not extend or accept any invitation to participate in any international congress, conference, or like event without specific authorization to do so."⁴⁴

This act, which is still on the statute books, and which was characterized by President Wilson as "utterly futile" and "in excess of the power of Congress, has elicited much comment."⁴⁵ Professor Wright states that "Congress has undoubtedly gone beyond its powers in thus attempting to control the President's foreign negotiations and the President has ignored the act, notably at the Versailles Peace Congress." He admits, however, that "the actual influence of Congress in this field depends upon the necessity for appropriations. If international conferences become frequent, this necessity would doubtless be controlling."⁴⁶

Professor Mathews observes that "by this stipulation Congress assumed to exercise the power of controlling the discretion of the President in this matter. If the provision were valid, he must secure in each particular case the prior authorization of Congress, . . ." He notes, however, that "since the passage of the act of 1913, the President has generally, although not invariably, complied with its provisions."⁴⁷

Lay, in his treatise on the Foreign Service, remarks that ". . . it is difficult to see how the authority to participate in an international conference

⁴⁴ Act of March 4, 1913 (37 Stat. 913).

⁴⁵ 22 U. S. C. 262. See Williams, *op. cit.* note 2 *supra*, p. 399.

⁴⁶ Wright, *op. cit.* note 2 *supra*, p. 328.

⁴⁷ Mathews, *op. cit.* note 2 *supra*, p. 447.

could be reserved to Congress, while the authority to negotiate with foreign nations is committed to the President." He concludes that although congressional control of the purse strings is an important factor, "should the President deem it advisable to undertake such participation upon his own responsibility, he might employ any of his regularly appointed diplomatic representatives, . . ."⁴⁸

Professor Corwin, commenting on the 1913 rider in the original edition of his work on the Presidency, states that "this measure is so obviously in conflict with the doctrines and precedents . . . that its successful defiance only awaits an adequate occasion."⁴⁹ In the 1948 edition of the same work, however, he makes only the following comment: "Shades of Cairo, Teheran, Yalta, Potsdam!"⁵⁰

This provision appears clearly to be an unconstitutional interference with the President's prerogatives. Since the United States participates in approximately three hundred international conferences each year, it is difficult to determine the extent to which attention has been paid to the act in recent years. In any event, it appears that when the Congress appropriates funds each fiscal year to enable United States participation in international organizations, either by way of regular annual appropriations for contributions and administrative expenses or for the international contingencies fund of the Department of State, implied consent is given.

CONGRESSIONAL INITIATIVE IN SEEKING WORLD PEACE

In 1916, the Congress attempted to take the initiative in foreign policy by attaching as a rider to a Navy Approp-

priation Act a provision declaring it "to be the policy of the United States to adjust and settle its international disputes through mediation or arbitration, to the end that war may be honorably avoided. . . ."⁵¹ This provision also authorized and requested the President, at an appropriate time, not later than the close of war in Europe, to invite

all the great Governments of the world to send representatives to a conference . . . charged with the duty of formulating a plan for a court of arbitration or other tribunal, to which disputed questions between nations shall be referred for peaceful adjudication and peaceful settlement and to consider the question of disarmament.

For this purpose, \$200,000 was appropriated, and the President was authorized to appoint nine American citizens to represent the United States. The President ignored these provisions, and no effect was ever given to them.⁵²

In 1921 a rider to the Naval Appropriation Act for the ensuing year authorized and requested the President "to invite the Governments of Great Britain and Japan to send representatives to attend a conference," charged with arriving at an understanding for the reduction of the naval expenditures and building programs of each government during the next five years.⁵³ This provision was inserted in the bill at the insistence of Senator Borah, who, according to Corwin, "had set up as a sort of State Department of his own."⁵⁴ It resulted in considerable controversy, and was adopted despite the fact that President Harding, who had previously ex-

⁵¹ Act of August 29, 1916 (39 Stat. 618).

⁵⁰ *Ibid.*, 1948 edition, p. 232.

pressed himself as favorable to the congressional request, subsequently took the position that it was too specific, in that it permitted him no discretion to enlarge the agenda of the proposed conference or to include other nations.⁵⁵

A similar provision in the Naval Appropriation Act of 1924, in which the President was requested "to enter into negotiations" with various foreign governments to reach an understanding for the limitation of certain types of naval armaments, appears to have been disregarded by the President.⁵⁶ The provisions of the 1921 act, however, are said to have had considerable influence upon his decision to call the Conference on Limitation of Armament.⁵⁷

THE OPIUM CONFERENCE

In 1924 the Congress, at the President's request, appropriated funds to enable an American delegation to attend the International Opium Conference at Geneva, but provided in the act that the delegation should sign no agreement which did not fulfill certain specified provisions.⁵⁸ When the delegation found that a treaty containing the required provisions was unattainable, the head of the delegation, Representative Porter, then chairman of the House Committee on Foreign Affairs, read from the statute paragraphs which he stated forbade him to sign any less comprehensive agreement, and withdrew the delegation from the conference.⁵⁹

A curious feature of this incident was the fact that Representative Porter was both the author and instigator of the detailed instructions in the appropri-

⁵⁵ Westphal, *op. cit.* note 2 *supra*, pp. 108-9.

tion act, as well as the head of the delegation. Thus, he not only originated the instructions, but also was appointed to carry them out.⁶⁰

U. S. AND PERMANENT COURT OF INTERNATIONAL JUSTICE

In 1932, after numerous futile attempts had been made to obtain Senate approval of United States adherence to the protocols of the Permanent Court of International Justice, Representative Linthicum, then chairman of the House Foreign Affairs Committee, sponsored a joint resolution authorizing the appropriation of a specific sum as the United States' share of the Court's expenses for the year 1932.⁶¹

This resolution, which was introduced too late in the session to receive the consideration of the House, was designed by its sponsors to ease the United States into the Court through the House's co-ordinate power over appropriations, leaving to the Senate the task of setting up whatever safeguards it desired. It is interesting because it demonstrates the unusual situation of the House's taking the initiative in attempting to implement Presidential policy, despite Senate opposition to that policy.

ATTEMPT TO SEVER RELATIONS WITH U.S.S.R.

One final episode during this period, which is particularly pertinent, occurred

⁶⁰ Williams, *loc. cit.* note 58 *supra*. In May 1931, when the United States was officially represented at another International Opium Conference at Geneva, its delegation co-operated fully in the work of the conference, and no attention appears to have been paid to the instructions contained in the earlier legislation. Fleming, *op. cit.* note 59 *supra*, pp. 227 ff.

⁶¹ House Report 1628, 72d Cong., 1st sess. (1932). The committee amended the original resolution providing for an appropriation to have it read "authorizing an appropriation." See Westphal, *op. cit.* note 2 *supra*, pp. 174 ff. and 174 n.

in the House of Representatives, in connection with an attempt made in 1940 to sever diplomatic relations with the Union of Soviet Socialist Republics by means of an amendment to the annual appropriation bill for the Department of State, striking out the salary for the United States Ambassador to the Soviet Union.⁶² In support of the amendment, Representative McCormack of Massachusetts, its sponsor, argued that the Soviet Government had breached its promise not to engage in subversive activities in the United States, which promise had been one of the conditions of renewal of diplomatic relations in 1933.

A number of Members supporting the amendment admitted that it was not the proper procedure to alter diplomatic relations in an appropriation bill. They pointed out, however, that this was the only course left to them, since bills designed to accomplish this had been shelved in the Foreign Affairs Committee, allegedly because of the State Department's influence. To these arguments, Mr. McCormack replied as follows:

This is the proper place. We have the responsibility of appropriating money. True, the question of diplomatic relationship in itself rests with the executive branch of the Government, but under the Constitution we have the power of expressing our own views as a body when appropriation bills are under consideration. In rare cases, such as in the case of the Soviet Union, we are justified in exercising our constitutional power.

The argument that this is not the place for this question to be discussed certainly is irrelevant if advanced from a constitutional angle, because the framers of the

⁶² The following account and quotations are taken from 86 *Congressional Record*, pp. 1172-79, 1192. For an interesting discussion of the probable effect of both amendments on United States diplomatic relations with the Soviet Union, see Westphal, *op. cit.* note 2 *supra*, pp. 129-32. Italics supplied.

Constitution left it with Congress to appropriate money. Congress has the power not to appropriate money for any particular purpose.

Representative Celler of New York, after assuring the House that he despised the Soviet Union and was perfectly willing to see the United States sever diplomatic relations with that government, raised the constitutional issue, as follows:

Since when do we in this Chamber, or in the cloakroom, conduct the foreign affairs of this Nation? We have a Secretary of State in whom I, and I am sure you, repose the greatest confidence, because he is, in truth and in fact, a great Secretary of State. . . . Has Mr. Hull authorized any one of us to bring forward an amendment of this character? No: He would frown upon such an amendment. He would ask you to vote against such an amendment, because you cannot carry on foreign affairs in this Chamber. . . . Does the President know about this amendment? Emphatically, no. . . . How ridiculous then to carry on diplomatic relations in such an emotionally forensic manner, without even the knowledge of the President or Secretary Hull. If such a motion as the gentleman from Massachusetts presents could prevail, then what would be the use of a State Department? Let the Appropriations Committee carry on our foreign affairs. I repeat, let us sever diplomatic relations in a decent, straightforward manner—not in this haphazard, unusual, unthinkable manner. . . .

On a division vote the amendment carried, 88 to 86. However, on a subsequent teller vote it was defeated, 105 to 108. Later in the day another amendment offered by Mr. McCormack, providing that no appropriation contained under the title "Foreign Inter-course" shall be used for the maintenance of an embassy in the Union of Soviet Socialist Republics or for salaries of officers at that post, was defeated by a vote of 38 to 95.

THE CONTEMPORARY SCENE

The events of the past twelve years have had a profound effect on the role of the Congress in foreign policy direction and control by means of its fiscal primacy. With the outbreak of World War II and during the period which followed, the United States assumed a position of leadership in world affairs which was, and continues to be, unparalleled and unprecedented in history. Traditional bilateral diplomacy, with occasional excursions into multilateral diplomacy, were all but replaced by a policy of wholehearted co-operation with other nations through participation in international organizations, and by large-scale foreign aid programs involving the expenditure of many billions of dollars each year.

Between July 1, 1940, the beginning of the first fiscal year following the outbreak of World War II, and March 31, 1953, the United States Government devoted a total of more than \$92 billion to the achievement of its foreign policy objectives, and legislation authorizing and appropriating these funds involved approximately 158 enactments by the Congress.⁶³ Of the total amount involved, more than \$49 billion was expended during the five-year period of World War II; and approximately \$43 billion was expended during the post-war period (since July 1, 1945), of which \$28 billion was advanced prior to June 25, 1950, the date of the outbreak

⁶³ United States Department of Commerce, *Foreign Aid by the United States Government, Basic Data Through March 31, 1953*, pp. A-5 ff. The figure given is gross foreign aid. The statutory compilation is found in United States Department of Commerce, *Foreign Aid by the United States Government, 1940-1951*, pp. 107 ff. For the 82d Congress, second session, see Report of the Committee on Foreign Affairs, House of Representatives, *Survey of Activities, Eighty-Second Congress*, pp. 19 and 64 ff.

of the Korean War, and nearly \$15 billion since that date.⁶⁴

For the most part, these funds were made available in the form of grants or credits and were applied to (1) military aid, (2) relief, (3) economic and technical assistance, and (4) contributions to international organizations. Of the funds devoted to these purposes during the World War II period, more than \$47 billion represented lend-lease; of the funds advanced during the postwar period, more than \$20 billion has been devoted to mutual security, including military aid and economic and technical assistance; the balance represents civilian supplies, emergency relief and aid programs of an interim nature, and various other types of aid.⁶⁵

Finally, from the beginning of the Eightieth Congress, through and including the Eighty-second Congress—a period involving six fiscal years (1948-53)—the Congress has authorized and appropriated more than \$34 billion for various mutual aid programs, in addition to some \$131 million for regular annual contributions to international organizations in which the United States participates.⁶⁶

Prominence of Congress

The significant feature of these amounts of money, apart from their astronomical size, lies in the fact that although they are usually said to have been appropriated or expended to further the President's foreign policy objectives, not a single dollar could or would have been made available without

⁶⁶ *Loc. cit.* note 64 *supra*.

congressional enactments. Thus, after occupying only a subordinate or supporting role in the foreign policy of the nation for 150 years, the Congress finally found itself in the "driver's seat."

Nor was the Congress slow in appreciating its new role. In a report of the House Committee on Foreign Affairs on its activities during the Eighty-first Congress, it was stated:

The solution of today's problems requires legislative action on a scale unprecedented in American history. Particularly is this true in the field of foreign affairs, which have to a considerable extent become global in scope and effect. The nature of the world commitments and the world aspirations undertaken by this Nation cannot be considered in a compartment separate from the concrete steps necessary to fulfill those commitments and to realize those aspirations. *To render their terms and objectives effective, the major foreign policy programs of our country involve heavy expenditures of public funds, so that the responsibility for the purse as it relates to our foreign policy cannot be separated from the root and substance of that policy. Thus, the Congress has become a significant, regular, and necessary participant in the conduct of the foreign affairs of this country.* . . .⁶⁷

Having finally achieved a full partnership with the executive branch in foreign policy control, if not direction, the Congress has never hesitated to exercise that control by scrutinizing with painstaking care the executive requests for funds for foreign aid and other international programs. Not only have these requests been examined exhaustively by

⁶⁷ *Survey of Activities*, Committee on Foreign Affairs, House of Representatives, 81st Congress, pp. 5-6, prepared by Sheldon Z. Kaplan, staff consultant. Italics supplied. For a similar statement by the House Appropriations Committee, placing greater emphasis on the fiscal powers of the Congress in international matters, see House Report 2316, 82d Cong., 2d sess., p. 50.

the Senate Committee on Foreign Relations and the House Committee on Foreign Affairs, but the Appropriations Committees of both Houses have also reviewed every item and reappraised every phase of almost every program exhaustively, despite the fact that the substantive committees had already performed that task and the authorization had become law.

Thus, in 1948 the House Appropriations Committee, after making a complete re-examination of the foreign aid program, ignored the authorization of \$6,533,710,228 for one year, and recommended an appropriation of \$5,980,710,228 for a period of eighteen months, thus reducing the amount by approximately one billion dollars. In defense of its action it stated, "It is admittedly impossible for anyone to state with any degree of assurance the actual needs of the participating countries within a billion dollars."⁶⁸ Only after the late Senator Arthur H. Vandenberg, then chairman of the Senate Foreign Relations Committee, appeared before the Senate Appropriations Committee and made an impassioned plea for restoration of the funds eliminated, was action taken to restore them.⁶⁹

In this connection it may be noted that from the outset the Congress made known to the President that it would appropriate no funds for the program if it were placed under State Department control and direction, thereby setting a course which is still followed today.

⁶⁸ House Report 2173, 80th Cong., 2d sess., p. 3.

⁶⁹ See *Hearings before the Committee on Appropriations, United States Senate*, 80th Cong., 2d sess., on Economic Cooperation Administration, H. R. 6801, pp. 423 ff. The Senate restored the funds and a compromise was reached in conference whereby \$4 billion was appropriated for 12 months, 1 billion dollars having already been made available through the Reconstruction Finance Corporation. Public Law 793, 80th Cong., 2d sess.

More recently, in the Eighty-second Congress, the executive requests for foreign aid totaling \$16,445,000,000 resulted in total appropriations of \$13,330,851,726—a cut of more than \$3 billion.⁷⁰

Added and reduced appropriations

Nor has the Congress restricted its use of the fiscal power to the foreign aid field. In 1948 an appropriation of \$400,000,000 was added to the foreign aid appropriation for aid to China, despite the President's objections.⁷¹ In 1950, despite strong and repeated objections on the part of the administration, a mandatory loan to Spain in the amount of \$62.5 million was included as a rider to the Omnibus Appropriation Bill. Rather than veto the bill, which provided funds for the entire government, the President signed it with the following announcement:

I . . . feel obliged to comment upon the provision of the bill which authorizes loans for the purpose of assistance to Spain. I do not regard this provision as a directive, which would be unconstitutional, but instead as an authorization, in addition to the authority already in existence under which loans to Spain may be made. Spain is not, and has not been, foreclosed from borrowing money from this Government. Money will be loaned to Spain whenever mutually advantageous arrangements can be made with respect to security, terms of repayment, purposes for which the money is to be spent, and other appropriate factors and whenever such loans will serve the interest of the United States in the conduct of foreign relations.⁷²

In 1951, when President Truman requested a supplemental appropriation of \$97.5 billion to accelerate the comple-

tion of certain broadcasting facilities for the Voice of America, which he stated were needed to overcome Soviet jamming efforts and make the campaign of truth more effective in countries behind the Iron Curtain, the House Appropriations Committee recommended a reduction of \$88 million, or 90 per cent, taking the position that existing facilities were adequate. Despite Presidential protests, the cuts were approved by the full House and Senate.⁷³ Shortly thereafter, the President's regular appropriations request for the Voice of America was reduced from \$115 million to \$85 million, a reduction of 26 per cent, and Presidential protests were again ignored.⁷⁴

Ceiling legislation

During the past few years the Congress has repeatedly asserted its authority in connection with United States participation in international organizations. Of particular interest is congressional action on the so-called "ceiling legislation."

When the Congress enacted legislation authorizing United States participation in and contributions to the Food and Agriculture Organization, the International Labor Organization, the World Health Organization, and the South Pacific Commission, dollar ceilings were established in each of the acts, limiting the amounts which could be appropriated for the payment of our annual contributions. Underlying these limitations was the concern on the part of the Congress that, since the budgets and the assessments levied on member governments were fixed in these agencies by a majority vote of the members at the annual conference of their governing bodies, and since these agencies were expanding and developing, this

government might be called upon to pay a disproportionate share of their expenses. Furthermore, it was felt that the inclusion of these limitations would assure a regular means whereby the Congress might review the programs and objectives of the agencies and appraise the results of United States participation.⁷⁵

When the budgets of these agencies increased and the United States assessment rose accordingly, the Department of State proposed legislation to remove these ceilings, as well as the ceilings on contributions to several older international organizations. In support of its proposal, the Department stated before a subcommittee of the House Foreign Affairs Committee that fixed statutory contributions were contrary to the principle of autonomous control of budgets and allocations of expenses, which, by the provisions of the constitutions of these agencies, is left to their governing bodies; and that these restrictions amounted in effect to a reservation upon United States membership, which, in turn, had resulted from a treaty or convention.⁷⁶ The net effect of this argument was to raise the old question of whether the Congress was obligated to appropriate funds needed to implement a treaty, and if it failed to do so, whether the United States would be in default of its treaty obligations.

Although the Committee on Foreign Affairs ultimately agreed to legislation raising the ceilings, it rejected the argument of the administration in language quite reminiscent of the early days of the Republic:

This Committee, . . . does not understand that the constitutional relations within international organizations are to be considered paramount over constitutional

relations within the member governments themselves. This committee feels that the constitutional system upon which this Government rests requires the interposition of the Congress as well as the Executive in the supervision on behalf of this Government of the operations of international organizations of which the United States is a member, and that this supervision goes to the substance. . . .

. . . United States participation in such organizations arises not from inherent Executive powers under the Constitution, but is in pursuance to laws enacted by the Congress. *The Executive cannot bind the Nation in this field, because contributions to international organizations involve the power of the purse, and that power belongs to the Congress. Since the Executive necessarily must seek the approval of the Congress before executing a commitment to an international organization involving the expenditure of United States funds, the question becomes simply the question of whether the Executive is to seek congressional concurrence from time to time on the broad question of magnitude and then annually also on the question of the precise amount or only on the annual question of the precise amount alone. . . .*

In the view of some, the fixing of a ceiling on the United States' contribution is an infringement upon the autonomy of the organizations amounting in effect to a reservation upon United States membership. The committee does not agree with this view. In any event, the constitutional difficulty is not removed by erasing statutory limits on contributions. There would still remain the necessity for the Executive to seek the concurrence of the Congress in subsequent appropriations. An element of constitutional contingency would still apply to the matter of United States support. The American people have by their Constitution vested the authority over appropriations in their Congress. This authority has not been yielded or transcended under any act of participation in an international organization. The Congress cannot convey elsewhere its ultimate obligations in this matter. It is a principle inherent in our Constitution. It is just as well that this be understood explicitly by other govern-

ments joining with this Government in international organizations.⁷⁷

In 1951 and again in 1952, the House of Representatives on the floor adopted amendments to the State Department appropriations bill for 1952 and 1953 respectively, flatly prohibiting the use of any of the funds so appropriated for the payment of a United States assessment to any international organization in excess of one-third of the total annual cost thereof.⁷⁸ Each year the Senate Appropriations Committee has softened the blow by proposing in its report on the bill a substitute amendment which was ultimately adopted.⁷⁹ In 1951 the amendment provided in effect that no United States representative to any international organization could thereafter commit this government to a contribution in excess of 33.33 per cent of the budget of such organization. However, it exempted inter-American organizations and provided that "in exceptional circumstances necessitating a contribution by the United States in excess of 33.33 per cent of the budget," a commitment could be made after consultation by United States representatives in

⁷⁷ House Report, *ibid.* Despite the dogmatic quality of the quoted language, the issue involved is by no means firmly settled. A more accurate statement of the principle might be that the Executive can bind the nation in this field, but cannot commit the Congress as to contributions or any other necessary implementing legislation. See text accompanying footnotes 34 and 35 *supra*. The Senate Committee on Foreign Relations inserted an additional provision limiting all financial contributions to the agencies covered by the legislation to the amounts specified therein, with certain exceptions relating to voluntary relief programs. Public Law 806, 71st Cong.

the organization or other appropriate Department of State officials with the Committees on Appropriations of both Houses.⁸⁰

As a result of this amendment, the United States Government, having been assessed 36.90 per cent for the 1952 calendar year of the United Nations, had to refrain from voting on the resolution approving the assessments, despite the fact that this figure represented a reduction for the United States. Although the Department of State had written to the chairmen of the Senate and House Appropriations Committees requesting permission to exceed the limitation, since the Congress was not in session and the Department received no answer, it took the view that no proper consultation had been had within the meaning of the statute.⁸¹

In 1952 the Senate Foreign Relations Committee again recommended a substitute amendment for the flat prohibition adopted by the House of Representatives, which was adopted.⁸² It provided that after fiscal year 1953, no United States representative in any international organization could commit this government to contribute more than 33.33 per cent of the budget of any international organization "for which the appropriation for the United States contribution is contained in this Act. . . ." This limitation was also made applicable to any future international organizations in which the United States might participate, in the absence of specific authorization. Inter-American agencies were again excluded, but no provision was made for consultation in the event

⁸² Senate Report 1897, *loc. cit.* note 79 *supra*.

of exceptional or other circumstances.⁸³

Since by January 1, 1954, United States contributions to all but one international organization will be 33.33 per cent or less, this amendment has caused the administration no serious embarrassment. It may be noted, however, that during the past few years all the reports of the House Appropriations Committee on the State Department appropriations bills have contained statements decrying the high percentage paid by the United States to the budgets of international organizations and urging and directing United States representatives to exert every possible effort to obtain substantial reductions in this government's assessments.⁸⁴

Communist China membership in U.N. opposed

The most recent use by the Congress of its fiscal primacy to control and direct foreign policy occurred in connection with the State Department Appropriations bill for 1954. In reporting the bill, the Senate Appropriations Committee recommended two amendments which would have had the effect of cutting off United States contributions to the United Nations automatically in the event of the admission of Communist China to membership in that organization.⁸⁵ These amendments, which appear to have had considerable support, were withdrawn, but only after the President had personally assured Senate leaders that it would be his policy to oppose vigorously any attempt to admit Communist China to the United Nations. However, the Senate unanimously adopted a substitute amendment declaring it to be the sense of the Congress

⁸³ Public Law 495, 82d Cong.

that the Communist Chinese Government should not be admitted to membership in the United Nations as the representative of China.⁸⁶

CONCLUSIONS

The foregoing review indicates that the Congress has never hesitated to use its fiscal powers freely in an effort to control or direct foreign policy and relations. Significantly enough, the basic question during the first 150 years of the life of the nation rarely involved money or the conservation of the nation's resources. For the most part, these actions, some of which were successful, were designed either to force the hand of the Executive in a particular matter or to assert legislative equality with the executive branch in the foreign relations field. In nearly every instance, the question at issue was whether the Founding Fathers intended to give the President powers and authority over foreign relations, superior to that given to the Congress. Finding itself unable to take the initiative, and fully realizing the futility of a joint resolution expressing policy if the President was not in accord, the Congress has resorted to its appropriations power as a controlling or directing device.

The outbreak of World War II and the subsequent assumption by the United States of world leadership have

⁸⁶ *Congressional Record* (daily edition), June 3, 1953, pp. 6202-4. This amendment was agreed to by the House and is contained in section 111 of Title I of the Departments of State, Justice, and Commerce Appropriation Act for 1954 (Public Law 195, 83d Cong.). It may be noted that section 110 of the same title prohibits the use of any funds appropriated in Title I to pay the United States contribution "to any international organization which engages in the direct or indirect promotion of the principle or doctrine of one world government or one world citizenship . . ." or for the promotion of such doctrine or principle.

had a profound effect on the role of the Congress in foreign policy direction and control. Because the basic foreign policy objectives of the United States have involved the expenditure of vast sums of money, the Congress has become, at the very least, a full-fledged partner with the Executive in the control and direction of foreign policy. Appropriations riders and policy declarations are still resorted to on occasion as a means of taking the initiative.

Whether or not the Founding Fathers

intended to vest control over foreign relations in the President or in the Congress has ceased to be of any great importance. The fact remains that as long as present world conditions exist and the foreign policy objectives and programs of the United States involve sizable appropriations and expenditures, the Congress will continue to exercise control and direction, and only at their peril will Presidents embark upon such programs without prior consultation with the Congress.

Party Responsibility for Foreign Policy

By JOHN M. VORYS

IT should be very easy to determine party responsibility for foreign policy. Every four years each of the great political parties has in its platform a section on foreign policy; candidates for Congress, the House and Senate, run on the platforms of their parties; for instance, in my state, Ohio, and in many others, each candidate takes an oath to abide by the principles set forth in his party platform. The successful party on coming into power has a legislative program based on its platform. This program always includes foreign policy measures. At the next election, if the people approved these party foreign policies, those who voted for them would be re-elected and those who voted against them would be defeated; and vice versa, if the voters disapproved of the policies, the candidates who supported them would be defeated and those who opposed them would be re-elected. Thus, we have the machinery for complete party responsibility for foreign policy measures.

Actually, it is not quite as simple as that, for at least three reasons: rival party platforms tend to be similar on foreign policy, unforeseen situations arise, and the voters may not decide on the basis of responsibility for foreign policy.

SIMILARITY BETWEEN PARTY PLATFORMS

There is usually considerable similarity between the platforms of the major parties on foreign policy questions. Cynics will say that this is because each party tries to be all things to all men. Earnest reformers will urge that the platform of the party of their choice

should contain only the things they approve, and the other party's platform should contain only the things they disapprove. Since American parties are human institutions, with voluntary membership, seeking to be inclusive rather than exclusive, their platforms hardly ever please the cynics or the reformers. Many thoughtful citizens take comfort, however, in the basic unity of our people on the broad principles of our foreign policy, which results in similar expressions of policy in the platforms of both political parties. It has been pointed out that

As compared with other democratic countries, the essential function of party in the United States lies not so much in presenting alternatives on public questions, as in presenting alternative candidates for election; and this is illustrated by the fact that people habitually pay less attention to the national party platforms than to the personal statements of the candidates for the presidency.¹

This statement is particularly appropriate in the realm of foreign policy, where there is general agreement on broad principles and where the President has paramount power and responsibility for the execution of policies. The interpretation of platform principles by a Presidential candidate is often more important than the platform itself in determining the party's foreign policy.

UNFORESEEN DEVELOPMENTS

Another reason why platforms do not determine party policy is that in foreign affairs great events develop after plat-

¹ A. Lawrence Lowell, *Public Opinion in War and Peace* (Cambridge, Mass.: Harvard University Press, 1923), p. 194.

forms are made. Neither party recognized in 1944, while World War II was still raging, that in 1947 a situation would arise requiring Greek-Turkish aid. President Truman acted promptly and decisively in this emergency, and the Republican Eightieth Congress responded promptly with the necessary legislation. The so-called Truman Doctrine would have been utterly ineffective without the support promptly furnished by the Republicans on Capitol Hill. Each party can justly claim a share of responsibility for the Greek-Turkish aid program, although it was not foreseen or forecast in party platforms.

CAMPAIGN ISSUES

The third reason why party responsibility cannot be determined simply from the action of voters on candidates who supported platform principles is that voters may have their minds on something else when election time comes. There are many instances where Congressmen and Senators have been defeated although their votes on foreign policy were not criticized. Domestic issues, personalities, and other considerations seemed more important. Such situations must be borne in mind in determining whether the people want more party responsibility for foreign policy. It is easy to argue that citizens ought to want it, and might be better served if they got it, but there is no known case where a party was turned out simply because the people were unable to determine whether it was responsible for success or failure in foreign policy.

Historically, there have been relatively few times when party foreign policy played an important part in elections. In 1796 and 1800 the Jeffersonian Republicans were pro-French and the Federalists were pro-British, or at least anti-French. In 1812 the "War Hawks" were pressing the President

to action. In 1844 the annexation of Texas was the all-absorbing issue in the campaign, in which James K. Polk, the Democratic candidate, defeated the Whig, Henry Clay. This was in reality a foreign issue, although it involved the slavery question. Polk became a proponent of "manifest destiny" and defeated the candidates who failed to come out squarely for annexation.

In 1900 William Jennings Bryan attempted to make an issue of imperialism, based on our involvements in our new possessions acquired in the Spanish-American War. He was defeated, although neither his supporters nor his opponents seemed to agree with him that this was the "paramount issue."

In the campaign of 1916 both parties were agreed on a policy of United States neutrality in the European war. The Republicans were split, and Wilson was elected on the slogan, "He kept us out of war," although he asked for a declaration of war soon after becoming President.

In 1920, although the platforms contained similar general statements of principles, the foreign policy issue of our entry into the League of Nations became paramount, because of the positions taken by the candidates, Harding and Cox. Regardless of the positions of the candidates, the election was as President Wilson had described it, a "solemn referendum" on foreign policy; for not only Democratic recommendations for the future, but war restraints and taxes and high prices were involved. Here was an election which involved party responsibility for foreign policy, and the party responsible was repudiated.

PARTY RESPONSIBILITY OBSCURED

The 1940 election might have furnished a test of party responsibility for foreign policy, in spite of the similarity of party platforms. Third-term candi-

date F. D. Roosevelt, by his campaign words, avoided this test in speeches that mark a record low in avoidance of responsibility for foreign policy. As his biographer and admirer, Robert E. Sherwood, said, "That Boston speech was a terrible one to prepare and also to remember . . . I burn inwardly whenever I think of those words 'again—and again—and again.'"²

The "Great Debate" preceding Pearl Harbor was fogged by similar lack of candor in the labeling and description of the measures presented to Congress, so party policy and responsibility became obscure. In history the line-up will probably continue to be labeled isolationists versus interventionists. Actually, each legislative step toward war was presented as a measure to keep us out of war. "Cash and carry" did not require "cash," and the "carry" was convoyed by American destroyers. "Lend-lease" involved hardly any lending or leasing at all. The debate involved such questions as Presidential powers and Presidential candor; only a few voices advocated intervention. In general, Republicans spoke and voted against these measures, and Democrats supported them.

WARTIME UNITY

The next congressional election came in 1942, after we were at war. The Republicans gained 10 seats in the Senate and 47 in the House, but there was unanimity in supporting the war, and the results of the election were not significant as a test of pre-Pearl Harbor policies. In 1944 there was no antiwar party, and foreign policy was not made an issue.

During the war, members of both parties, in and out of Congress, did a great deal of thinking about what happened

² Robert E. Sherwood, *Roosevelt and Hopkins* (New York: Harper & Brothers, 1948), pp. 191-201.

after World War I. No one wanted to repeat Versailles and the League of Nations fight.

The first formal action by any group in government on postwar policy came from the House Foreign Affairs Committee on June 16, 1943, when the Fulbright resolution was unanimously reported. It had been drafted in secret within the committee. In fifty-one words it recommended a policy of postwar participation by the United States in "the creation of appropriate international machinery with power adequate to establish and maintain a just and lasting peace." It was introduced by Mr. Fulbright, who was then a Democratic freshman in the House. The writer, a Republican, made the first speech on it. The summer recess prevented House action on the resolution, but during that recess the Republicans met in a conference at Mackinac Island and issued the historic Declaration of Mackinac.

In the fall, the House passed the Fulbright resolution with bipartisan support, and after Secretary Hull returned from Moscow the Senate passed the Connally resolution of similar import. Thus the principle of a bipartisan postwar policy of international participation was formed in the midst of war. It was established first by the Congress. The President had not taken the leadership for fear of precipitating a partisan division, but the administration encouraged and welcomed these statements of bipartisan foreign policy.

MEANING OF BIPARTISAN FOREIGN POLICY

Those words "bipartisan foreign policy" have not been used before because they have come to have a special connotation in the postwar period.

There should be nothing mysterious or esoteric about what is meant by a bipartisan foreign policy. We have bi-

partisan domestic policies involving veterans, agriculture, reclamation, social security, and other subjects. In the realm of foreign affairs, bipartisan policies are especially helpful. A united front makes us more effective in dealing with our friends and our enemies, with allies and with those we want as allies. How do we decide what policy is a bipartisan policy? We must first decide how to identify a party policy. Some of the difficulties have been discussed. Editors, columnists, commentators, and others who need to practice omniscience, have little difficulty in identifying a policy with a party, basing their conclusion on speeches or actions by the President or prominent party members in Congress.

Such assignments of party policy may or may not be generally accepted. The best way to make such a determination would seem to be as follows:

If a majority of the members of a party in Congress vote for legislation involving foreign policy, it then becomes a party foreign policy. If a President cannot obtain a majority in Congress for his policies, they are Presidential, not party, policies. If a majority of both parties vote for a foreign policy measure, it is a bipartisan measure. The *Congressional Quarterly*^a carries voting charts based on this simple, practical basis, showing "Party Unity" and "Bipartisan Support" on bills, including foreign policy measures. Its occasional analyses of party responsibility are, therefore, extremely valuable to those who seek objective information.

Bipartisan foreign policy, however, has come to have a special connotation. The great protagonist was the late Senator Arthur H. Vandenberg, who labored with rare wisdom, force, tact, and states-

manship, as ranking minority member and as chairman of the Senate Foreign Relations Committee, for postwar policies that would win united support. His work was particularly important in the Republican Eightieth Congress, when a series of monumental foreign policy measures were passed culminating in the European Recovery Program. The Vandenberg resolution which passed the Senate was the forerunner of the concept of the North Atlantic Treaty Organization. In later Democratic Congresses, his great influence was felt up to the time of his tragic illness and death. The area of bipartisan foreign policy, however, was limited. Senator Vandenberg in a Senate speech on March 18, 1947 said:

It also is necessary, now, to get the record straight. This bipartisan foreign policy has been confined within relatively narrow limits. It has applied to the United Nations. It has applied to peace treaties in Europe. It has applied to nothing else. I have had nothing to do, for example, with China policies or Pan-American policies except within the United Nations, and at times I have been satisfied with neither. The first I ever heard of the Greco-Turkish policy was when the President disclosed his thoughts ten days ago at the White House. I do not complain. But I do not propose to be misunderstood.

An example and an explanation of the bipartisan foreign policy came from the House Foreign Affairs Committee in March 1949 in the extension of the European Recovery Program. The members of the Republican minority on the committee were unanimous in voting to bring the bill to the floor; but in the minority views accompanying the committee report, the nine Republican members of the committee criticized omissions from the bill, particularly with reference to China aid, and at the end of the minority report gave their views

on the bipartisan foreign policy. The writer of this article had considerable to do with the drafting of this part of the report; it still represents his views; therefore, this portion is quoted in full:

THE BIPARTISAN FOREIGN POLICY

We Republicans believe that our country should have a bipartisan foreign policy. It is more important, however, for our country's policy to be right than bipartisan. Unity solely for the sake of unity may be disastrous. History is strewn with the wreckage of countries that were united, but in the wrong course. Whenever the loyal opposition is silenced, either by force or by its own failure to speak up, freedom is in danger. We Republicans are striving for a wise and worthy foreign policy for our country; we hope it can be bipartisan.

We Republicans have borne our full part in formulating and implementing the creation and support of the United Nations, the European Recovery Plan, and our national policy in the Western Hemisphere. These constitute bipartisan foreign policies. During and since the war we have co-operated in presenting a united front to our enemies; we have taken care to make no disclosures that would embarrass our government. The secret negotiations at Tehran, Yalta, and Potsdam, and the disastrous results, are not part of the bipartisan foreign policy. Our party was not consulted; the responsibility is solely on the administration. We will join, however, in the task of solving the resulting problems which our country faces, even though we had no part in creating them. The utter bankruptcy, economic, military, and moral, of our government's policy in China is not part of the bipartisan foreign policy. We will join in building a worthy and workable Chinese policy.

We believe that politics should end at the water's edge for both parties. In fact, we believe that partisan politics in foreign affairs should end before our policies reach the water's edge. The party in power must not take political advantage of the requirements with reference to confidential infor-

mation, and insist upon withholding from the Congress and the public matters that are not military or diplomatic secrets, but are clearly political secrets. There have been pressures to make the bipartisan foreign policy a mere "me too" policy for Republicans on anything the administration proposes. We have seen the administration attempt to take sole credit for achievements in which our party deserved at least equal credit. For politics to end at the water's edge, there must be bipartisan participation in the formulation of policies; bipartisan agreement in the measures adopted; and bipartisan sharing of credit for the success of such policies.

THE DUTY OF THE MINORITY

We are now the minority party, the loyal opposition. We believe that we should avoid taking political advantage of situations that might in any way embarrass our country in the conduct of its foreign affairs; we believe that we have a duty to help, insofar as we are permitted, in the formulation and implementation of sound and righteous foreign policies; but we also believe that it is our duty to oppose, without fear or favor, wrong policies that our government is attempting, to expose the failure of our government in critical situations to arrive at any policy at all, and to offer constructive alternatives.

CONTINUING BIPARTISANSHIP

Since these words were written in March 1949, there has been continuing bipartisanship, or unpartisanship, as Vandenberg called it, in the two congressional committees dealing with foreign policy. In the fall of 1949 there was even a bipartisan minority report from the House Foreign Affairs Committee, signed by two Republicans and two Democrats, on phases of the military aid bill, and the House followed their recommendations, rather than the bipartisan-majority report, in withholding half of the funds for military aid until NATO produced an integrated plan for defense. As Congress increas-

^a Published by the Congressional Quarterly News Features, 1156 19th Street, N. W., Washington, D. C.

ingly lost confidence in President Truman and Secretary Acheson, items of foreign policy, particularly the amounts to be spent on the foreign aid programs, were determined by a bipartisan coalition in Congress.

In 1951 the entire organizational framework for the Mutual Security Administration was written in the House Foreign Affairs Committee, rewritten in the Senate Foreign Relations Committee, and re-written in the House-Senate Conference, all in opposition to the plans proposed by the Executive. The Reciprocal Trade Agreements Act extension, including the "peril-point" provision, was a congressional, not an Executive, production. The Great Debate on troops for Europe ended with a resolution that upheld the Presidential contentions, but with limitations that made it acceptable to a bipartisan majority. The resolution opposing United Nations representation by Chinese Communists was, in timing and in passage, an excellent example of bipartisan teamwork between the Executive and Capitol Hill.

IS BIPARTISANSHIP DESIRABLE? *

The new administration has earnestly sought bipartisan support for its proposals. Secretary Dulles has urged that only when there is strong support by both parties in Congress for a foreign policy measure can other countries be assured of its continuity. In the first session of the Eighty-third Congress, every important foreign policy measure was passed with bipartisan support. The bipartisan approach to foreign policy, however, has its limitations, embarrassments, and handicaps. A former member of our committee, an able Democrat who had labored long in bipartisan efforts, said to me recently:

I am not so sure whether the effort is worth it. We Democrats often had to compromise on measures to obtain your

support. The danger is that the bipartisan approach reduces every measure to the lowest common denominator on each side. Perhaps it would be better for the party in power, in the administration and in Congress, to make their proposals and say to the opposition—here it is—we dare you to beat it, or vote against it.

He was suggesting party responsibility for foreign policy. It would have numerous advantages if the party in power had at all times a dependable, disciplined majority. Then bipartisanship would consist merely of the opposition's saying "me, too." This is the way bipartisanship has often been described in recent years—a description that has usually been without foundation.

COMPLEXITIES INVOLVED

But why is not party responsibility automatic, in view of the declaration of party allegiance required by law or expected by custom early in each candidacy and described early in this article? The answer is in the nature of the legislative process. Every bill contains provisions—details—that were not in the party platform or in Presidential speeches or in the candidate's own commitments. In voting, should the congressman follow his President, his party whips, the opinion in his district, or his own best judgment? The answer is, he should follow them all! As wise old Robert Luce, with whom I served, said, "Nobody without experience in a law-making body appreciates the variety and complexity of the considerations involved in voting."⁴

When in doubt, the emphasis should be on party responsibility; but a humble member will also consider the prevailing views of his district, knowing that he is not all wise, nor are his party leaders. Edmund Burke wrote a noble letter to

⁴ Robert Luce, *Legislative Procedure* (Boston: Houghton Mifflin Co., 1922), pp. 364-65.

the electors of Bristol—but for the rest of his parliamentary career he represented not Bristol, but a rotten borough.

THE HIGH AIM

During the New Deal, Presidential domination of legislation became the routine, and this habit has held over; so the legislative process is started by consideration of the "executive draft" of legislation. The new Congress, however, is not a rubber-stamp Congress. There are not enough Republicans who

are like-minded enough or disciplined enough to jam through foreign policy measures on a party responsibility basis, even under the leadership of President Eisenhower. Congress will have to do what the President deeply and sincerely wants its members to do—work out a bipartisan solution on foreign policy measures. If, instead of dropping to the lowest common denominator, Congress rises above partisanship, we may achieve a foreign policy worthy of our great responsibilities and opportunities.

John M. Vorys, J.D., Washington, D. C., has been a member of the United States House of Representatives from the Twelfth Ohio District since 1939, and has been a member of the House Committee on Foreign Affairs for fourteen years. He practiced law in Columbus, Ohio for several years and was a member of the Ohio legislature for two terms. He was a delegate to the Sixth Session of the General Assembly of the United Nations, and has been a member of several congressional committees for survey and investigation in foreign countries.

The Future of Congress in Foreign Relations

By THORSTEN V. KALIJARVI

THE articles of this volume show that congressional participation in formulation of foreign policy through the last century developed into greater and greater executive control at the expense of Congress. This was perhaps inevitable because basic compromises incorporated in the Constitution deliberately left unresolved several conflicts of the Constitutional Convention in Philadelphia. That Congress still suffers under this handicap is evidenced by the debate that has occurred over S. J. Res. 1, the so-called Bricker amendment, in the Eighty-third Congress.

During the twentieth century, especially as the aftermath of the Second World War, there has appeared a determination on the part of Congress to retrieve its lost ground and to insist upon an increasingly large share in the conduct of American foreign relations. This development makes all the more important the need to re-emphasize that the constitutional fathers contemplated a team in these matters—a team consisting of the executive and congressional branches of the government. In addition, it may be trite, but it cannot be too strongly emphasized that the Convention created a government by laws, as contrasted with a government by individuals. As we face the future, these thoughts are essential parts of a correct perspective on United States foreign relations.

Too often the teamwork contemplated by the constitutional fathers, and the institutionalized character of American government with respect to foreign relations, are forgotten.

Indeed, on occasion one wonders if these important facts are completely

understood. All too often scholars, lawyers, publicists, and officials in the executive branch tend to think of Congress as a roadblock in the path of progress, and they are prone to regard congressional action on foreign relations as obstructionist and blocking of what they consider to be the legitimate desires and programs of the Executive. These critics seem to feel that unless the Congress does substantially as the executive branch has recommended, it (the Congress) is acting contrary to the public interest; and some are so vitriolic in their condemnation that they regard Congress as almost subversive. One of the basic needs of American foreign relations is the correction of these erroneous views.

CONGRESS REPRESENTS THE PEOPLE

There are two important ingredients in an effective American foreign policy. The first ingredient is knowledge and information out of which the policy is fashioned; the second is acceptability of the policy to the American people. It goes without saying that a policy lacking the endorsement of the American people cannot long survive. Under our system of government much of the information is secured and provided by the executive branch, but the public acceptability of a policy can most appropriately be determined by the members of the Congress.

The failure to understand this fundamental principle has led to much confused thinking. It has caused at least one authority to suggest that the President should be given the power to designate the members of the two foreign relations committees of the Congress.

That such a proposal can have been seriously made is evidence of a misunderstanding of the basic philosophy of the American government. What is more, it fails to give adequate recognition to the role the people play, through their chosen representatives. It is elementary political science that the American people have the final say in American foreign relations. Executive control over foreign relations committees of the Congress is impractical.

One hastens to note in this connection that advocates of a strong Executive claim that the Executive, too, represents the people, and that it, too, keeps up with the times through polls, newspaper reading, and other devices, which give the Executive the feel of the public pulse. The answer is that no poll can be a substitute for the voice of the people themselves as they place their pressures immediately upon the members of the Congress. No newspaper account can be as persuasive as the voter writing, telegraphing, or calling on his Congressman or Senator. Again it is repeated that the Constitution made the Congress a partner of the Executive in foreign policy matters, and not a handmaid or a servant.

CONGRESS NEEDS REPRESENTATION TO THE PEOPLE

The Congress needs a spokesman and defender. The failure of Congress itself to realize this made it possible for the Eightieth Congress to be so stigmatized during the elections of 1948 that today it is difficult to find any agreement as to what that Congress actually accomplished.

But Congress will not attain a more important role in foreign relations merely by securing a special pleader or by having defenders and spokesmen. What is needed above all else is for the Congress to reassess itself constantly. Today, while the executive branch is

undergoing another series of reorganizations, the Congress might also, once again, give thought to its own improvement.

The Reorganization Act of 1946 was appropriately hailed both in Congress and outside of legislative halls as a notable strengthening of the congressional process. In 1953, close observers, and especially those who are members of Congress or must work with Congress, are fully aware that changing times and circumstances have made further changes in the operations of Congress imperative.

This is especially true of foreign relations, which place an increasingly heavy demand on congressional time. The work load that faces each congressional session in foreign affairs makes it impossible for any Congress to get through its program by closing time.

Nor is the matter improved by the popular impression that congressional life is easy. Nothing could be farther from the truth. Too often the public eye is fixed on the more dramatic delaying tactics of a few individuals who filibuster or sidetrack legislation. The public naturally concludes that much needs to be done, and that if the delaying tactics could be overcome, the major problem would be solved. Unfortunately, the solution is not quite so simple as that. There exists relatively little public appreciation of the real causes of the delays, which have been discussed throughout this volume, all of which in effect add up to a Congress struggling under an ever expanding work load.

PROPOSALS TO SPEED CONGRESSIONAL WORK

Several proposals have been made for the expediting of congressional work. Some thoughtful students have advocated that treaties and international agreements should be approved by a

majority of both of the Houses of Congress instead of by a two-thirds vote of the Senate. Such a provision calls for action by two Houses instead of by one. It is difficult to see how congressional operations could be expedited in this manner. It is, of course, reasonable to expect that the Executive in the future will tend to submit an increasingly large number of international instruments to both Houses by the joint-resolutions route—not because it will expedite matters, but rather because advocates of a stronger House of Representatives are growing more vocal in their demands for an increased share of the House in foreign relations. But this will constitute no solution of the congressional problem.

Another proposal has been made, namely, to increase executive-legislative consultation. Fruitful results are already flowing from the current consultation of the State Department with the Congress. Much more can be done along this line. In addition, the appointment of members of Congress to United States delegations to the United Nations and other international organizations and conferences can be expanded, especially between sessions.

The leaks that may possibly come from giving information to the Congress may be less hazardous to the foreign relations of the United States than the harm that will inevitably come from keeping information from the Congress, especially when the information has a direct bearing on legislation. Public indignation at Congress' not having been informed about the nature of some of the World War II agreements merely echoed the more caustic and vocal criticisms in the Congress itself. Subject to few qualifications, the executive branch, in spite of the irritation sometimes provoked by outspoken legislative criticism, will find that frank and open dealings with the Congress pay rich dividends.

But here again, while consultation and greater participation of Congress in international negotiations will improve relations between the executive and legislative branches, they will not greatly expedite congressional work.

Another technique advocated for speeding congressional action is the greater use of interdepartmental committees organized in the main problem areas of foreign relations and policies. Such committees, drawn from the different agencies of the executive branch and including the chairmen of the appropriate congressional committees, could go a long way toward facilitating the consideration of legislation pertaining to the respective fields. These committees would help to provide the American negotiators and the State Department and interested agencies with needed information and instruction. This would serve a useful purpose in the general expediting and clarification of American foreign policy matters. It would also help the Congress to discharge some of its more important responsibilities much more quickly and satisfactorily.

It has also been suggested that an increased use of subcommittees may be helpful. Both the Senate Committee on Foreign Relations and the House Committee on Foreign Affairs operate through subcommittees. The Senate sets up *ad hoc* subcommittees in response to the legislative requirements on a subject-matter basis during each session. The House Committee tends to operate on a more rigid pattern, setting up subcommittees on a geographic, more permanent basis. The practice of each responds to the needs of the committee involved. Outside the Congress, each committee procedure has its advocates. Each committee considers its practice to be the better. For the future, it would seem that an even greater use of subcommittees appropriately

staffed would conserve full committee time and make for speedier action.

These suggestions have been debated and discussed by students at considerable length. As indicated, they do not hold the solution of the problem. The remedy does not lie in a single solution or in a combination of solutions. Congress is a process, and, as such, is in constant flux. Problems arise, and, when settled, new problems clamor for attention in ceaseless procession. Thus the creating of new methods for expediting congressional business is a constant evolution.

The problem today, as always, is to create new devices consistent with adequate information for the Congress. Fuller use of professional staffs, between-session investigations, hearings by staff members where preliminary and technical information are concerned, are among devices that may be suggested. Still another is careful preparatory work before each session. At the opening of most sessions, precious weeks fly by as the Congress is getting under way. Careful advance planning and staff work can do much to prepare the committees for immediate action, once they are organized.

Noncontroversial legislation should be got out of the way early in the session. For example, in the list of State Department items awaiting action there are as a rule several noncontroversial agreements and items of legislation that can be handled in a single session of the committee and then reported to the calendar. Many of these cause little or no comment, and can be quickly and painlessly disposed of at the outset. If they wait until the middle of the session, or are held over to the end for action, they generally are swamped in the final legislative rush.

Another useful device is for the committees of both Houses of Congress to look forward to the between-session pe-

riods as the time for travel. It is a question how much travel should be undertaken while the Congress is in session. Dividing the travel work is also important, so that as large and extensive an area as possible can be covered for congressional attention. Moreover, staff representatives might very profitably be sent abroad where members of Congress cannot undertake the trip, for one reason or another.

EXECUTIVE CO-OPERATION NEEDED

Still another area in which improvement can be registered is the way in which the State Department and the Executive deal with the Congress on foreign relations. While the departmental liaison officers, who have to work with the Congress for the most part, are aware of the difficulties which beset the legislative leaders, it is not always clear that other officers in the executive branch are fully aware of the results of their own actions. For instance, both committees on foreign relations wait for several months each year for the executive branch to get its draft legislation and figures for the Economic Cooperation Administration and the Mutual Security Agency ready. By the time the hearings are over, the bills reported, and appropriate action taken, most of the summer is gone, and so is the legislative session.

The negotiation of agreements with a time limit within which ratification must take place, as in the case of the International Wheat Agreement, throws the Congress into a most difficult position. In the midst of a planned legislative program the instrument is presented to the Congress with the practical effect of a disruptive ultimatum—either you readjust your legislative program and agree to ratification, thus slowing down the congressional schedule of action, or else you abide by the consequences. In

the case of the International Wheat Agreement in the Eightieth Congress, Senator Thomas of Utah said this had the effect of determining the balance of votes in as many as nine states in the 1948 Presidential election.

The point need not be labored. The executive departments can do much more to aid the Congress in its work by thoughtful and considerate programing, so that careful congressional staff work can precede, as far as practicable, the beginning of a legislative session. Thus, for instance, if the MSA program can be so prepared and arranged that it will reach the Hill late in January, the measure may well be enacted into law by March, leaving much time for other congressional action. Or, if the International Wheat Agreement is negotiated so it can be sent to the Senate at the outset of the session, it can be considered in its appropriate relationship to other legislative matters. Finally, it might also be borne in mind that such an approach by a co-operative department would probably result in the enactment into law of a substantially larger number of its programs than is now the case.

These few suggestions are by way of illustration. They do not exhaust the list of possibilities, for they are meant only to show the direction in which Congress can and may move in the near future.

PLACE OF CONGRESS IN AMERICAN DEMOCRACY

A few words by way of concluding this entire volume.

Between the end of the Revolutionary War and the First World War, the United States was able to retire into a policy of isolation, and thus, largely unhindered by foreign conflict, was able to explore, settle, and lay the economic and social foundations for the greatest power on earth. It is not surprising

that during that time the pressures on the Congress in foreign relations were relatively moderate. It was possible for the first President and the first Secretary of the Treasury to dispense with the "consent" part of the "advice and consent" clause as it pertained to treaties and nominations of ambassadors and other high diplomatic officials, and thereby establish a practice that has been followed ever since. And the records show that no serious issue has been taken with this practice. At this distance in time and experience, it seems clear that the Founding Fathers intended to constitute the Senate as an executive council in the handling of foreign relations.

How well the Founding Fathers conceived of the foreign relations functions is shown by the fact that, after more than a century of deviation from their original prescription, increasing pressure of foreign relations on the United States has made necessary a return to the original pattern. In recent years the executive branch, out of sheer necessity, has had to seek a closer co-operation with the Congress. Consultations between the two branches of government have grown rapidly, thus providing more complete information and a better basis for action purposes. Liaison between the Congress and the State and other departments of the Federal Government has also been expanded, intensified, and improved.

For Congress, this trend and the rapid development of world affairs constitute a distinct challenge calling for a most uncomfortable decision. Congress must become increasingly bogged down with work, or else evolve techniques and procedures that will permit it to keep abreast of developments and thus withstand the perennial encroachments of the executive branch upon its functions. It is the same difficulty that has confronted democratic legislative in-

stitutions in many countries of the world; in many, it has been solved by the executive's taking over the reigns of government and making the captured legislature a tool of the dictator. American democracy in a major measure hinges upon the continued maintenance of its Congress as the democratic insti-

tution it now is. That maintenance is chiefly for the Congress to achieve. The fast-moving events of the world in which we live are a constant challenge to Congress, which must continually remain dynamic and alert, or else lose its equality with the executive and judicial branches of our government.

Thorsten V. Kalijarvi, Ph.D., Washington, D. C., is consultant to the Senate Committee on Foreign Relations, on leave from his position as Senior Specialist on Foreign Affairs with the Legislative Reference Service of the Library of Congress. He was formerly head of the Department of Government at the University of New Hampshire, and executive director of the New Hampshire State Planning and Development Commission. He is author or editor of a number of publications, including Modern World Politics (3d ed. 1953), Recent American Foreign Policy (1952), and the May 1948 volume of THE ANNALS, entitled Peace Settlements of World War II.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

DEAN, VERA MICHELES. *Foreign Policy Without Fear*. Pp. xii, 220. New York: McGraw-Hill Book Company, 1953. \$3.75.

This author is searching, fearless, essentially positive. Her main concern is that the morale of the American people is being undermined not only by fears of Communists and communism, but by distrust of ideas and proposed solutions of political, economic, and social problems, here and abroad, not regarded as authentically "American." Such "foreign" heresies are likely to be rejected without regard for the new times in which we live, and the new remedies which they require.

It is evident also that the author is perturbed at American complacency. Too often ignorant of other peoples, and of their different circumstances, needs, and talents, and seeing the United States as the Horatio Alger of history, we tend to be impatient and irritated when other nations show resistance to attempts to make them overnight into our own democratic image. This "America is a hell of a success" attitude, of course, does not endear us to those whom we would convert; for the Communists, and we ourselves to some extent, have conditioned them to look for feet of

clay rather than wings when they scrutinize us.

We properly abhor the rigid and sterile dogmatism of Soviet doctrinaires, but when we advance rigid dogmas of our own respecting the way to attain the good life for people everywhere we must recognize that we do not thus make friends and influence people abroad. Nor is it healthy or realistic to condemn mixed social systems, some exhibiting "creeping socialism," which may be better adapted to the needs of other peoples than our system of free enterprise. On the other hand, we should "permit, indeed encourage, the existence of non-conformist thought which fertilizes intellectual life and prepares the way for new advances in human relations" (p. 38).

That all our troubles can be traced to the Kremlin is not believed by our non-Communist friends abroad, although the Communists are quick to exploit and exaggerate our difficulties. Actually the economic, social, and political problems troubling many countries would exist had there been no Karl Marx, no Lenin, no Stalin. And the extinction of communism would in itself not solve these problems. Your reviewer remembers that Woodrow Wilson asserted shortly after 1917 that the revolution in Russia "is a protest against the way in which the world has worked." The protest is still with us, for as the author

points out, the world still faces "two great enemies—poverty and nationalism" (p. 17).

As regards the policy of the United States, "Our main preoccupation in the next fifty years will be *not* to discover how we can transpose *our* way of life to other continents by force, diplomacy, or financial inducement, but how we can fuse the civilization developed here with other civilizations of the world in such a way as to strengthen the fabric of international society" (p. 179).

FRANK M. RUSSELL

University of California

PIQUET, HOWARD S. *Aid, Trade and the Tariff*. Pp. vii, 358. New York: Thomas Y. Crowell Company, 1953. \$3.75.

This volume was prepared by a senior specialist of the Legislative Reference Service of the Library of Congress in response to a request of the Congressional Joint Committee on the Economic Report. Following the outbreak of hostilities in Korea it was considered important to know the extent to which trade barriers were accentuating the scarcity of certain raw materials and whether this in turn was stimulating inflationary pressures. By taking a list of commodities which accounted for four-fifths of the dutiable imports in 1951, an effort has been made to determine the effectiveness of trade restrictions and the reaction to follow a possible modification of these. The author is painfully aware of the impossibility of making any accurate predictions for the future of trade in either a gradual or an abrupt removal of trade restrictions. There are so many uncertain and unpredictable elements involved. But by using a limited list of items, representative of a fairly wide range, he sets forth possible results.

However, the persistent excess of United States exports over imports, and the consequent "dollar gap," poses for this country a major problem in foreign policy. If we are to assume the role of leadership in the Western World, there must be a rearrangement of international trade patterns. The countries with whom we hope to continue friendly relations are in a position to put some pressure upon the United States,

since without an increase in the exports to the west they must face the alternative either of trading with Communist-controlled countries or of having such a reduced standard of living that the populace may become susceptible to Communist infiltration and propaganda. Thus the cry for trade instead of direct aid.

Dr. Piquet's report is an unusual one. It will be an excellent reference volume for students of foreign trade and for certain industrialists who are beginning to see the far-reaching politico-economic consequences of restrictive trade barriers; it should be of concern to those on Capitol Hill for whom the tax payers provide the author's valuable services.

Dr. Piquet has been conservative in his approach. He has taken account of the possible consequences of relaxing restrictions. But he ends with the following pertinent point:

"Finally, it has been pointed out that even though across-the-board temporary suspension of trade barriers would not suddenly solve the problem of the 'dollar gap,' it might go far in that direction, and it would have an exhilarating psychological effect upon the other countries of the free world. The real problem is to weigh the total national interest against the interests of groups within the economy and to decide which imports would be in the national interest. The nature of the world economy of the future depends in large part upon decisions that only the United States can make" (p. 350).

JOHN DAY LARKIN

Illinois Institute of Technology

CRAIG, GORDON A., and FELIX GILBERT (Eds.). *The Diplomats 1919-1939*. Pp. x, 700. Princeton: Princeton University Press, 1953. \$9.00.

The editors are two among the seventeen contributors to this important book. Dr. Craig, on "The British Foreign Office from Grey to Austen Chamberlain," sets the tone for a discouraging picture of the futility of traditional diplomacy in a century of dictators on the European Continent and self-willed near dictators in America. His later chapter on "The German Foreign Office

from Neurath to Ribbentrop" elaborates the bypassing of a foreign office by the favorite of Hitler. Dr. Gilbert contributes scholarly and subtle chapters on "Ciano and his Ambassadors"—again an amateur in state navigation—and "Two British Ambassadors: Perth and Henderson." These latter were gentlemen, bewildered by the onrush of governmental barbarism.

To single out other chapters is perhaps invidious, but "Sweden: The Diplomacy of Östen Undén," by Eric Lönnroth, is perhaps the most novel for an American reader. Dexter Perkins on "The Department of State and American Opinion" writes with his customary grasp and mastery. William W. Kaufmann in "Two American Ambassadors: Bullitt and Kennedy" will please the "court historians" with his serene confidence that "the final act of war against the Axis resulted not from some tortured and secret plot but from the attack on Pearl Harbor" (p. 649). To the present reviewer this is naïve. Kaufmann is equally confident (p. 654) that Roosevelt was still open to conviction after Munich and that Bullitt and Kennedy had actually some influence. "Three Observers in Berlin: Rumbold, Dodd and François-Poncet," by Franklin L. Ford, was of special interest to this reviewer for its remarkable portrait of William E. Dodd, his one-time teacher. Under other circumstances the confronting of Adolf Hitler by an amiable Jeffersonian with strong anti-capitalistic views would have been comedy, not the tragicomedy which it proved to be.

The significance of "The Diplomats" lies, however, less in the always scholarly and often brilliant appraisal of individual diplomats but rather in its contribution to a literature of frustration so consistent with our unhappy century. In this book the villains are few, Ribbentrop being probably the foremost. Wicked, unfortunate, or inept were Matsuoka, Molotov, and Colonel Beck. But on the whole "The Diplomats" are men of good will.

Within the framework of an earlier diplomacy their work might have borne better fruit. In a twenty-year period which marked an unprecedented decline in international relations, the diplomats were corks upon a sea of despair. Character and tal-

ent alike were helpless to avert the coming storm.

LOUIS MARTIN SEARS
Purdue University

SMITH, O. EDMUND, JR. *Yankee Diplomacy: U. S. Intervention in Argentina*. Pp. 196. Dallas: Southern Methodist University Press, 1953. Arnold Foundation Studies, New Series, Vol. III. Cloth, \$3.00; paper, \$2.00.

This book is an interesting case study of the confusion and inconsistency that characterized the Latin American policy of the United States in the 1940's. As indicated by the subtitle, the case is that of Argentina. After three introductory chapters (63 pp.), the author devotes the rest of the book (117 pp.) to a detailed account of the fumbling efforts of the United States to handle this case in the period 1942-1950. As the author tells the story, the fumbling was largely due to the inability of the United States government to make a firm choice between the "hard" and "soft" policies, the interventionist and noninterventionist policies, represented respectively by Cordell Hull and Spruille Braden, and by Sumner Welles and Nelson Rockefeller.

Unfortunately, the narrative ends with the world crisis of June-July 1950, over Korea. For reasons that are not entirely clear, the author believes that at this time "relations between Washington and Buenos Aires were more cordial than they had been at any time since 1933" (p. 179). If he had carried the story on only a little longer, it would have shown that the pattern of United States-Argentine relations had not in fact changed for the better, because the summer cordiality of 1950 soon gave way to another winter of discontent. Inquiry into the reasons for this unhappy reversal would have highlighted a fact which is not sufficiently stressed in these pages. This is the fact that the Argentine government's "uncooperative" attitude, which was the main cause of trouble through all these years, was not peculiar to Perón and his predecessors in power, but was shared by the great majority of the Argentine people, including anti-Peronists, who were sometimes even more isolationist than Perón.

The author's opening description (which is not a definition) of intervention (pp. 3-

4) is broad enough to include all the acts to which in subsequent pages he applies the interventionist label; armed force was the only form not employed at one time or another. But none of them was employed for a long period or consistently, and the most effective parts of this book are those which describe the dizzy alternation of "hard" and "soft" policies throughout these years. The author's sympathies clearly lie with the latter policy.

He has relied almost entirely upon printed works published in the United States. The range of these is wide, but he has missed some obviously important items, such as the late Laurence Duggan's *The Americas: The Search for Hemisphere Security* (1949). There are a good many errors in detail, including not only typographical errors but also erroneous citations. There is no index or bibliography.

ARTHUR P. WHITAKER

University of Pennsylvania

ANISIMOV, OLEG. *The Ultimate Weapon*. Pp. xvii, 163. Chicago: Henry Regnery Company, 1953. \$3.50.

The only way to save mankind from the ultimate weapons of science, says Oleg Anisimov, is to develop the ultimate political weapon, a "militant democratic internationalism which submerges petty national differences and false pride in behalf of the dignity and survival of the individual." Mr. Anisimov is a thoughtful and experienced man, and he knows that this is more easily said than done. But he also perceives that the dreadful alternatives are ultimate destruction or the ultimate in regimentation.

Mr. Anisimov begins with an analysis of the change that has come over the minds of Europeans as a result of what has happened since 1914. He then examines, at somewhat greater length the state of mind of the Soviet peoples which he has had exceptional opportunities to study. After a short chapter on why the United States of America and the rest of the world are drifting apart, he discusses why our present methods of meeting the totalitarian challenge to freedom are inadequate and suggests some changes. All this is done

with an even-tempered clarity and on the basis of much knowledge unpolluted by the urge of self-justification or political partisanship.

Some of the points Mr. Anisimov makes are these: During the past fifteen years the political outlook of the average West European, Russian, and Asian has experienced a more revolutionary change than during the whole of the preceding century. War is no longer a means of settling issues; it is mass suicide or genocide. Fear of war sometimes makes neutralists and sometimes Communists. The basic issues are international, and they cannot be solved by appeal to national loyalties—to self-determination—but only by a supranational formula. There is a tendency to regard the issue of communism vs. democracy not as slavery vs. freedom but as "peace at the cost of freedom" vs. "freedom at the cost of peace." A very great many Russians hate the dictatorship, but that does not make them pro-American because they don't know against whom we are fighting or for what.

To claim we are for peace and freedom and have the highest standard of living in the world is not enough. Russians, Asians, Europeans—all know we suffered less from war than they did, and we do not bridge this psychological chasm by telling the world that our sole concern for the future is our own security. Turbines and tractors, vaccines and fertilizers are no match for plans for world peace. "The crux of the problem for the peoples of the world is whether they can realize their aspirations together with the Americans, without the Americans, or against the Americans." We ought to give the peoples a chance to help us help them! We cannot win the support of the world by promises of security, by piling up arms, or by a "know-nothing anti-communist creed . . . an excellent blue print for American defeat," or by containment or balance of power politics. To wage political warfare victoriously we must have a clear program and organization "to enable all who wish to fight for human freedom . . . to do so." This includes those behind the iron curtain who should be made to feel that they are surrounded by invisible friends, that the goal is liberation

from communism and all totalitarianisms and future integration in a world security system.

HAROLD H. FISHER

Stanford University

CASTANOS, STELIOS. *Critique du droit international public moderne*. Pp. 111. Paris: Recueil Sirey, 1953. 680 frs.

The title of this very interesting study is somewhat misleading, for it is not a critique of modern international law, but a critique of modern theories on the material foundation of international law. The author gives, first, a critical study of these doctrines: natural law (Le Fur, G. Renard); Theory of auto-limitation (Jhering, Jellinek); dualistic doctrine (Triepel); monistic doctrine (Kelsen); sociological doctrine (Duguit); biological doctrine (Scelle); and the totalitarian doctrines.

Each of these doctrines is briefly analyzed and critically evaluated. The critical arguments against the doctrines of natural law, of auto-limitation, of dualism, and against the totalitarian doctrines, are correct, although not new. It is equally correct to point out that Duguit's social solidarity is only a fact, indifferent to values, and can, therefore, not be a foundation of law, as every legal norm presupposes a judgment of value. That is why Duguit, contrary to his intention to deal only with facts, saw himself forced later to introduce the "sentiment of justice" as a second foundation. The author is also correct in asserting that Scelle, follower of Duguit, cannot remain strictly within pure biology. I would like to add that Scelle operates with his concept of "droit objectif" which, although allegedly a secretion of biological necessity, is, in the last analysis, the old-fashioned natural law in sociological disguise. But the author appreciates the value of Scelle's theory as to social interdependence in its double form, by similarities and by division of labor, as the generating factor of law.

The author also values highly Kelsen's monistic doctrine of the primacy of international law. It is only in the exposé of this doctrine that the author commits a serious mistake. He still holds that *pacta sunt servanda* is for Kelsen the funda-

mental norm of international law and directs against it fully justified criticisms. But he does not know that Kelsen himself abandoned this thesis many years ago. The author could have seen that from Kelsen's "General Theory of Law and State"; but his bibliographical note, unfortunately, includes nothing printed in English.

The author wants not only to give an exposé and critique of those doctrines, but also a systematic and organized view of them, to explain the differences and the sometimes contradictory character of these theories, to find the point in which they converge. First, he notes the transitory character of our epoch, lacking in direction and faith, and points to the evil of overspecialization and to the special complexity of the problem of international law. He takes the philosophical stand that every theory is necessarily limited, conditioned by a particular stage in the development of its object, and contains, therefore, only a part of the truth. The doctrine of natural law, wishing to anchor international law in a higher order, forms, in a Hegelian sense, the thesis. The voluntaristic doctrines form the antithesis and lead to a dualism. The modern monistic theories form the synthesis. Both Kelsen and Scelle have the great merit of showing the unity of the whole system of all law, and of the primacy of international law.

It is here that the author comes to the constructive part of his study. For him all law is indivisible and has strong connections with ethics; it is the social realization of ethics. International law has always existed—for there is inherent in law a rhythm of expansion, from the regulation of the conduct of two persons to the worldwide international community, although the greater the spatial expansion becomes, the greater are the difficulties. International law has gone through the Greek stage of a racial community, through the Roman stage of a community by domination, through the medieval stage of a community of faith to the present stage which the author calls the federative stage. As the spatial expansion is inherent in law, and as modern international law is the ultimate expansion to the whole world, international

law has the primacy, both from a normative and a utilitarian point of view.

JOSEF L. KUNZ

University of Toledo

LEDERMANN, LÁSZLÓ. *Fédération Internationale*. Pp. 171. Neuchâtel, Switzerland: Éditions de la Baconnière, 1950. 6 fr.

This volume is an outgrowth of Mr. Ledermann's work as a teacher of university courses dealing with federation, as a participant in international conferences, and as an author on subjects of international significance. In this book he sets for himself the task of promoting a realistic understanding of federation, which will admit both its potentialities and its limitations while avoiding the extremes of thinking so commonly directed toward it.

In Chapter I, Mr. Ledermann deals with "general considerations," including a discussion of the meaning of federation, the purpose and motives which it embodies, its moral basis, and its nature as a compromise. In Chapters II, III, and IV, respectively, he analyzes the theories and projects of Saint-Simon, Proudhon, and Frantz. The final chapter deals with federations of the past, and is followed by a few concluding pages in which the author summarizes his own views on the subject.

Mr. Ledermann's study presents a number of interesting generalizations and points of view. It mentions, for instance, the conditions under which confederations, federations and unitary states have come into existence or have given way to one another; no case is on record, so we are told, of fully sovereign states forming for themselves a strong federation without first joining together in a weaker union of some kind. Attention is called, too, to the utilitarian objectives embodied in federal unions: defense against a common enemy; defense of the liberties of the uniting groups; and the promotion of economic prosperity. The finest qualities of the study are its avoidance of extreme views, the objectivity of the author, and his clear recognition of the problems which projects for federal unions raise.

Although it is useful, Mr. Ledermann's volume will be disappointing to those of

its readers who are looking for a comprehensive study which will enable them to think through the problems posed by contemporary projects for federal union. Two-thirds of the book deals with the ideas of Saint-Simon, Proudhon, and Frantz; no attention is given to more recent projects. Chapter V on federal unions of the past deals only with federations of antiquity, those of the middle ages, and Germany of the nineteenth and twentieth centuries; nowhere in the book is more than casual reference made to the experiences of Switzerland, the United States of America, Canada, and the other federations of our times.

NORMAN HILL

University of Nebraska

FELLER, A. H. *United Nations and World Community*. Pp. xi, 153. Boston: Little, Brown and Company, 1952. \$2.50.

In this very interesting book the first General Counsel of the United Nations has given his considered views on the trends, achievements, and problems of the world's second general international organization. We are fortunate in having these seasoned judgments from Mr. Feller, for his tragic death, no doubt brought on in large part by his unflagging devotion to the United Nations, occurred not long after the publication of this volume.

The mere fact that the United Nations has managed to survive in spite of the constant crisis which has thus far characterized its existence does not prove its worth or its uselessness, observed Mr. Feller. In the long run the answer to the problem of war must lie in the establishment of a stable world, which most scholars believe can only be achieved by the development of world law and world community. However, some people are convinced that world government and world law can, and must, be established at once, while others contend that world law is impossible until after a world community has first come into being. It is quite evident that Mr. Feller shared the views of the latter.

Mr. Feller did not hesitate to take a position on controversial issues. In the final chapter, in which he discussed the "Present Crisis and Future Hopes," he declared the United Nations to be both a "security sys-

tem and a peace system." "In these un-easy times," he observed, "there can be no security without arms; yet arms alone, no matter how mighty, are not enough. To physical strength must be added moral strength." In this connection he paid his respects to the "neorealists" who berate what they call the "legalistic moralistic" approach and advocate a return to the methods of diplomacy and the advancement of the national interest. He reminded his readers that "diplomacy" and "national interest" are terms which have no specific meaning, and hence do not touch the heart of the problem, which is the question of objective. His judgment that "without power a nation may be impotent; without a moral standard respected by other peoples it becomes the focus of hostility and fear," is an example of his balance and wisdom.

Mr. Feller was a sober optimist about the future of the United Nations. His final conclusion deserves to be kept before us. "The forces of disruption and destruction are powerful. They can be kept within bounds and eventually dissipated only by the creation of physical and moral strength and the firm maintenance of a united purpose for peace. The United Nations cannot by itself accomplish this. It cannot be accomplished without the United Nations. The legal and organizational framework of the international community is far from perfect. It nonetheless exists in sufficient strength to enable the world to hold itself together and to progress towards the time when a real security can be achieved."

ARMY VANDENBOSCH
University of Kentucky

FELLERS, BONNER F. *Wings for Peace: A Primer for a New Defense*. Pp. 248. Chicago: Henry Regnery Company, 1953. \$3.50.

Few amateur armchair strategists have written works more replete with specious arguments than this book. The author harshly condemns all current State and Defense Department anti-Communist plans—containment, NATO, and the official military doctrine of reliance on ground combat to win a war—on the theory that

such policies will result for America in bankruptcy, a totalitarian regime, and a sure Russian victory. The overwhelming military might of the Communists shows the need for an entirely new strategy. Then the author presents his views regarding how to avoid war and how to win, if it comes.

He would abandon all traditional military concepts regarding the employment of land armies supported by the Air and the Navy. Preferably, America should gain global air superiority by building the world's strongest air force with an adequate Army and Navy in support. In war, action would be limited principally to strategic bombing to destroy the Russian air force on its bases and to cripple the enemy's war potential. Once the battle of the air is won, "the war would be practically over."

American planes would be based principally on air fields in the Dakotas, Oklahoma, and Texas, while strong bomber units would be stationed in the Arctic, the African deserts, and the Philippines—all beyond the range of everything except long-range Russian bombers. The Regular Army need consist only of a highly mobile airborne force of ten divisions, all stationed at the overseas air bases with the sole mission of providing for their defense. The mission of the National Guard would be to defend critical sites in the continental United States. The Navy could safely be maintained at its present strength. Under this plan the combined Army and Navy would number only 1,200,000 men, while the personnel of a 250-group Air Force would equal 1,500,000; or a total of 2,700,000 instead of the present estimated strength of 3,600,000. This would result in easing the manpower problem and in making huge financial savings. Out of a total defense budget of \$40 billion, \$13 billion would be allocated to the supporting arms and \$27 billion to the Air Force.

Although the author assumes that there will be no war if America strives for air supremacy, he admits this policy would result in an armaments race with the Communists, and "armament races usually end in war." To nullify this danger he suggests that we could quickly do what so far we have failed to do: convince the Com-

munists of our peaceful intentions through propaganda.

The book ends with a violent attack on the ability of all the present planners in the Pentagon; clearly, it is a case of "they are all out of step but Jim."

ARTHUR P. WATTS

Philadelphia, Pennsylvania

AMERICAN GOVERNMENT AND HISTORY

GROSS, BERTRAM M. *The Legislative Struggle: A Study in Social Combat*. Pp. xix, 472. New York: McGraw-Hill Book Company, 1953. \$6.50.

The title of this book is in a sense misleading, for what the author examines is not the legislative struggle generally, nor even that in the United States, but rather the struggle in Congress. His own experience as a staff member was exclusively congressional; the sources he relies upon are almost all works about Congress. The legislative struggle in the 48 state capitols is barely mentioned; that in other legislative bodies, such as city councils, is ignored altogether. These omissions are regrettable, because some of the aspects of the struggle he portrays have state and local counterparts; others do not; and we will not understand the legislative struggle when we look at it in only one place.

This is not a work on the technicalities of congressional procedure, although there are chapters on bill drafting, committees, the management of bills on the floor, and similar subjects. Rather, it is a discussion of social combat, with special attention on Congress. With such an objective in view, the author finds that "the social struggle spills over" into many areas of politics and economics, but he feels that a more focused treatment "would give a narrow and distorted picture." The broad objective, however, leads him to take up theories of political parties, primaries, preprimary conventions, nominating systems, the electoral college, the suffrage, and many other related (sometimes rather remotely related) topics. Politics is indeed a seamless web,

but to attempt to discuss so many of its threads in one volume is apt to lead the advanced student to conclude that some of the discussion is either repetitious of earlier course work or incomplete (for example, the federal judiciary).

The best chapters in the book are those on the strategies of legislative operations. Here the author writes from his own knowledge and experience, with a sure and confident touch. Instructors who may not find all of this book fitted for their needs may still wish to assign these chapters. The chapter entitled "Significant Avenues of Procedural Reform" is an excellent summary and analysis of its topic.

Mr. Gross is not particularly gloomy about Congress, and he is chary about predictions concerning its future. Agreeing with the common generalization that "both American society and American government are becoming increasingly complex," he believes that "both quantitatively and qualitatively the outlook is clearly one of a major increase in the total legislative burden over the decades that lie ahead."

DAYTON D. MCKEAN

University of Colorado

CHILDS, RICHARD S. *Civic Victories: The Story of an Unfinished Revolution*. With an Introduction by Thomas Harrison Reed. Pp. xvii, 350. New York: Harper & Brothers, 1952. \$3.50.

The optimistic title of this book is well justified by its contents; for *Civic Victories* is the picturesque and practical story of a political revolution in the public interest—a revolution which is still gaining ground, and for which the author deserves more credit than he modestly claims for himself.

Mr. Childs, as most readers of *THE ANNALS* must know, has been for more than four decades the foremost proponent of the council-manager form of municipal government. He has had the unique satisfaction of watching—and promoting, through the National Municipal League and other organizations—the spread of this form of city administration from one city in 1912 to more than 1,000 in 1952.

But *Civic Victories* is not merely the story of gains in government at the mu-

nicipal level. It sets forth three fundamentals for the efficient functioning of democracy at any level: (1) elective officers must be visible; (2) the constituency must be wily; (3) governments must be well integrated.

Mr. Childs devotes a chapter to the elucidation of each of these three rules, and the story of progress towards compliance therewith is set forth in the twenty chapters which form Part II of his book.

The subjects there discussed include the short ballot crusade; progress in state administration; legislatures and judiciaries; progress in municipal, county, township, and village governments, and in school systems.

There are chapters also on "Progress in the Coroner's Office," "Shortening Ballots by Lengthening Terms," "Progress in Intraparty Organization," "Progress Toward Precision in Representation," "Democrats in Unwieldy Private Constituencies," "Other Frustrations of the Democratic Process."

Civic Victories concludes with nine readings—"stories from the civic battle front"—and with outlines of the National Municipal League's Model State Constitution, Model County Charter, and Model City Charter.

Mr. Childs' penchant for picturesque prose adds a flavor to the book too seldom found in treatises on political science or municipal government. Touches of humor, snatches of practical philosophy, and items of personal experiences enliven the book. To cite one example:

"In the past we have approached the people as a pagan approached the waterfall—to worship and peer around for nymphs. We must today approach the people as the mill builder approaches the waterfall—open-eyed, unafraid, expecting no miracle, measuring its capacity, making allowance for its variations, and irreverently gauging its limitations in order that our mill shall not exceed them."

But this story of an unfinished revolution is no Pollyanna tale in which victories are claimed and no defeats are conceded. And the reviewer should make it clear, also, that this story of civic reform is intentionally concerned with democratic tech-

niques for getting high-grade men into public office, rather than with the day-by-day performance of their jobs when in office. Thus the book has to do with providing good tools for public administration—city, county, and state—and not with the actual operating of these tools through municipal departments and other public agencies.

As *The American City* has pointed out in its review of *Civic Victories*, here is a book that will be an inspiration to many a young man and woman looking forward to a career in civic or public service; and it will help to give courage and guidance to citizens' organizations in municipalities and counties that have not yet modernized their election and administrative machinery.

HAROLD S. BUTTENHEIM

New York City

THURSBY, VINCENT V. *Interstate Cooperation: A Study of the Interstate Compact*. Introduction by Carl B. Swisher. Pp. viii, 152. Washington, D. C.: Public Affairs Press, 1953. \$3.25.

This significant contribution to the literature dealing with the interstate compact, a device which has been used with increasing frequency and which has been extended into many new fields in recent years, consists of an Introduction and seven chapters dealing, respectively, with the following aspects of the problem: the setting, the meaning of the compact clause as interpreted by the courts, the controversy over Congressional consent, the crucial problem of enforcement, uses of the compact in a system of co-operative federalism, the utility of and the limitations upon the compact device, and conclusions.

The study is a scholarly one, based upon careful analysis of the sources. It is fully documented. Its conclusions, therefore, are not merely interesting; they provide, and should be used as, a guide in the development of future policy with regard to the application of the compact idea. Since the contractual nature of the compact tends to make it rigid and inflexible, it is well adapted to those subjects which require a definite and more or less permanent solution, ill-suited to fields which do not permit of a "strait-jacketed administration," or which are of a continuing nature.

This characteristic of the compact does, however, strengthen its usefulness by making the bargain enforceable by court decree and by act of Congress, even where the question of compelling a state is involved. Paraphrasing the author, Congress possesses the two-fold power to force the state's compliance with the judgment of the court and to add to existing judicial remedies if necessary. While the requirement of consent has been somewhat relaxed, it does, when operative, give Congress not only the power but the duty "to judge as to when and how its consent should be given" in the light of broad public policy as well as in the light of the compact's projected treatment of regional problems.

Twenty years ago, a number of scholars who made independent studies of the compact device for the purpose of evaluating its possible usefulness as a means of solving some of the pressing problems of the time all came to the same conclusion: that it simply could not be made to work. But today it is working, and working effectively, not merely with regard to such prosaic matters as the settlement of boundary disputes and the allocation of waters, but in the conservation of forests, oil, and waters; the protection of fisheries; stream pollution and sanitation control; public works; civil defense; interstate crime, parole supervision; and regional education programs. Approximately 40 agreements, involving individually as many as 48 states, and dealing with a dozen different subjects, have been put in effect since 1934.

On the basis of this record, and the analysis of the problems of public law presented in Professor Thursby's study, the compact device takes on a new meaning, offers new promise that the American brand of federalism may be made to work under conditions prevailing in the mid-twentieth century. No one who understands that system, and who believes in its fundamental soundness, can take issue with his judgment that the use of the compact system, as a method of tackling suprastate, subnational problems "would seem desirable wherever it appears applicable. That use may, indeed, be essential to preservation of the vitality and potency of the

States and to avoidance of an overlaid general government. And both of these may be essential to efficiency and to freedom. Certainly they are essential to federalism of the United States pattern."

W. BROOKE GRAVES

The Library of Congress,
Washington, D. C.

RIKER, WILLIAM H. *Democracy in the United States*. Pp. xiv, 428. New York: The Macmillan Company, 1953. \$2.25.

In this conscientiously contrived analysis Professor Riker has undertaken to interpret American political institutions "on the basis of an internally consistent theory of the democratic ideal" (p. vii). The author defines democracy as "a form of government in which the rulers are fully responsible to the ruled in order to realize self-respect for everybody" (p. 34). Much emphasis is placed on the methods of attaining electoral responsibility.

Obviously, Professor Riker has given himself quite a task. Even so, he has little new to say on the subject. It has been obvious for some time, at least to many political scientists, that there were many bottlenecks to the full expression of the democratic ideal. The architects of our political institutions did not have that objective primarily in mind.

Professor Riker is correct in suggesting that many modifications are in order. Suffrage is still unnecessarily restricted. The party system, which must operate within the framework of a constitutional system which was not designed to facilitate a smooth-working party system, is not as fully responsible as it should be for the implementation of national campaign pledges. Despite the Legislative Reorganization Act of 1946, leadership in Congress is not clearly defined and the seniority rule still remains in force. The President, as any intelligent observer in this year of 1953 must clearly recognize, does not always provide the leadership which is essential if the principle of separation of powers is to be at all workable. An independent judiciary, if it assumes the power of judicial review, is inevitably an obstacle at

times even if the judges do show a tendency to follow the election returns.

Some of the corrections which Professor Riker desires could be accomplished without change in the basic constitutional framework. An alerted people could bring them about. Certainly the right of suffrage could be extended and the party system made more responsible. Congress could further reorganize itself. Better methods of nominating candidates for the presidency could be devised. Even the Supreme Court, under the pressure of public demand, could be reformed somewhat. The turnover could be speeded up still further and more liberal judges could be appointed as vacancies occur.

The fundamental factors, however, are constitutional, and the principles of separation of powers and federalism are likely to be with us for a long time.

Professor Riker feels deeply about this subject and in this period of fear and suppression it is good to have people feel deeply about the preservation and extension of the democratic ideal.

E. ALLEN HELMS

Ohio State University

CLOUGH, SHEPARD B. *The American Way: The Economic Basis of Our Civilization*. Pp. ix, 246. New York: Thomas Y. Crowell Company, 1953. \$4.00.

Three years ago the University of Paris asked Professor Clough to give a series of lectures on American economic history since the Civil War. This book is an outgrowth of those lectures which he was invited to repeat at five other institutions in France, Germany, and Italy. He undertakes to describe and account for the tremendous progress this country has made and to indicate the cultural potential America has as a result of that economic progress. He handles his assignment well.

The approach is broad and philosophical rather than a survey of historical incidents, but he bolsters his statements with numerous and sometimes dramatic statistics. This is about the only good, recent, and short American economic history in existence. The book is divided into ten chapters. These are on resources, agriculture, transportation and trade, money and bank-

ing, population and labor, business organization, business cycles and the welfare state, and a conclusion. All but the business organization and business cycle chapters are in keeping with the customary treatment of American economic history, but they are well justified additions. The ten chapters are supplemented by some 44 tables and charts in an Appendix and these were so well chosen that it is unfortunate more of them were not included in the body of the text.

The tone of the book may be gauged from some of the following generalities and statistics. "In America there is not a tendency to tie up large amounts of savings . . . in unusable funeral vaults like the Pyramids, or to waste them away in lavish entertainment" as in Rome (p. 151). Gross capital formation has fluctuated around 20 per cent of national income since 1869 (pp. 7, 208). "In fact all the great civilizations appeared where transportation and trade were highly developed" (p. 80). The railroad consolidations between 1880 and 1900 reduced the number of companies from 1500 to 80 (p. 156), and at the later date 40 of them had half the world's mileage. Half of our retail stores last only two years (p. 93).

The stronger chapters are those on industry, agriculture, and transportation, for they are better organized and contain fewer statistics. The weaker chapters are those on money and banking and on labor, for they are less clear, more hurried, and contain too many minor errors. Andrew Jackson was not a cheap money man (p. 109)—he liked bullion better than banks; investment banks do not make long term loans (p. 117)—they sell securities; the Haymarket riot was in 1886, not 1866; the Pullman strike was not an A.F.L. affair (p. 142), and it was the Norris (not Morris) LaGuardia act that outlawed the yellow-dog contract (p. 144). It seems to this reviewer that some attention should have been given to the individuals who built America. What were John D. Rockefeller, Henry Ford, J. P. Morgan, Samuel Gompers, and John L. Lewis like, and why did they solve their problems as they did, providing a pattern in their respective areas for our economic development? A few

such examples would have made a good book a superb one.

Dr. Clough concludes that six fundamental functions account for American economic growth, namely natural resources, technology of industrial and agricultural production, the high level of investment, the large working force (partly because of immigration), a flexible transportation system, and an ideology in which the desire for material well-being plays an important role. To show that national well-being is leading to a higher civilization he points to the increasing number of Americans winning the Nobel prize, world famous American names in the physical and social sciences, the realization of nuclear fission on American soil, and the fact that Americans spend more money attending classical music concerts than baseball games. His conclusions provide an interesting contrast with those of his Columbia colleague, Dr. Lyman Bryson, who contended in his *The Next America*, which I reviewed recently for THE ANNALS, that a nation's greatest intellectual achievements are generally made in its accumulative rather than in its "distributive" stage which both men would appear to agree this country is in.

DONALD L. KEMMERER

University of Illinois

DUTEIL, H.-J. *The Great American Parade*. Translated from the French by Fletcher Pratt. Pp. 321. New York: Twayne Publishers, 1953. \$3.75.

This work belongs in that numerous collection of impressions of the United States written by foreign visitors after short sojourns in our midst. As such it is distinctly of second rank, not at all to be compared with the observations of a great compatriot of Monsieur Duteil, Alexis de Tocqueville. The author shares with de Tocqueville, however, the by now commonplace judgment upon American art and literature that they are distinctly inferior to those of Europe. This is so largely because of the unseemly and pecuniary appetites of its creators which induce them to cater to the masses. One hundred years ago de Tocqueville uttered the lament that the effect of democratic institutions is the destruction of taste and discrimination in

the arts. Duteil fully justifies his countryman's predictions. In fact, this lament is so familiar to Americans that some justification is necessary for uttering it again.

The major, in fact the sole, reason for giving any serious attention to Monsieur Duteil's rather superficial commentary upon the American scene is that this work has proved tremendously popular abroad. According to Mr. Pratt, the translator, *The Great American Parade* was a "runaway best-seller in France" and received wide critical acclaim not only in France but in Belgium, Switzerland, Spain, Italy, and elsewhere. If this means that the author has somehow impressed our trans-Atlantic neighbors with the aptness of his analysis, we had best mark what they appear to think of us.

Here then is America as Duteil's European readers see us. We are a nation of low taste and second-rate culture. Once upon a time, 1830-1860, we did create an indigenous and significant culture, but that time has long passed for we knew not how to sustain it. Since 1865, and until 1920, our nation has received distinctly second-rate citizens from abroad. The influx of Slavs, Italians, and Irishmen has especially contributed to the deterioration of American standards of taste and character. Our educational system is excellent in many respects but is weakened by vocational emphasis and by numbers. Productive efficiency is the great goal of American enterprise, but its standards of excellence are low and aim at quantity not quality. The preoccupation of our government and our scientists with agriculture is commendable but not completely efficacious. Racial antagonism toward the Negroes is exaggerated by our European critics who do not really appreciate that after all the Negroes are an inferior people and we have been more than generous to them. The greatest blot on the American scene is the remarkable incidence of crime. This may be attributed in large part to the inferior peoples who have settled in this land, especially the Negroes and the Southern European immigrants of the late nineteenth century. The hammer blows which industrialism and urbanism have rained upon the family as a

social institution have seriously undermined the real fiber of American character and contributed to the demise of American standards of taste and decency which are everywhere apparent.

Withal, we are a friendly, generous, kindly, optimistic, and industrious people. What saves us from total depravity is a small, cosmopolitan, intellectual elite which understands and appreciates the values of European culture and is best typified by the American university professor and the literary critic.

WILLIAM H. YOUNG
University of Wisconsin

EASTON, DAVID. *The Political System*. Pp. xiii, 320, x. New York: Alfred A. Knopf, 1953. \$4.00.

Among all the social scientists, those who deal with affairs political have certainly devoted their share of attention to self-examination and self-criticism. Possibly the habit is as old as the subject itself. In any case it is currently with us in a strongly accentuated degree. One manifestation was the critical study *Goals for Political Science*, published two years ago by the American Political Science Association. Another is the appearance of such books as the one under review, which bears the subtitle *An Inquiry into the State of Political Science*.

The author, who is Assistant Professor of Political Science at the University of Chicago, maintains that scholarship in his field is in a sorry state. Not that its votaries are lacking in industry or in thoroughness. There is probably as much assiduity in hunting down and piling up quantities of knowledge about things political as there is in any other realm. But students of politics have become lost in the jungles of empiricism with no beacon lights to guide them. They have become mere fact gatherers with no integrating theories to give meaning to their science. Since the 1880's they have been busily accumulating factual inventories which serve the uses of special pleaders with all sorts of conflicting interests. One group has been able to argue that planning and dictatorship are indissolubly linked; another can

prove the contrary. One school can maintain that the separation of powers is a bulwark against tyranny; another can prove that it opens the way to irresponsibility and the abuse of power.

The author conveys the impression that two distinguished writers of the past were largely responsible for leading American political scientists astray. One was James Bryce, who declared, while by no means despising theory, that "it is Facts that are needed: Facts, Facts, Facts. When facts have been supplied, each of us can try to reason from them." The other was Woodrow Wilson, who substituted the objective of reform for that of analysis and understanding. Dr. Easton propounds no special theory of his own, but he insists that political scientists will never be worthy of their craft until they make "systematic theory" serve the same purposes for them that great principles like the law of evolution do for the natural sciences.

ECONOMICS AND INDUSTRY

KUZNETS, SIMON. *Economic Change: Selected Essays in Business Cycles, National Income, and Economic Growth*. Pp. viii, 333. New York: W. W. Norton & Company, 1953. \$4.50.

There are some thinkers whose work never gets the attention it deserves because it is embodied in many scattered writings rather than in a systematic treatise. Dr. Kuznets, of the University of Pennsylvania and the National Bureau of Economic Research, has in some degree suffered this fate, and Norton and Company have performed a most valuable service, not only to the economist, but to the intelligent general reader, in publishing this collection of essays from widely scattered and often quite inaccessible sources.

It is impossible in a short review to convey the richness of ideas and information which these essays contain. The subtitle indicates the three broad fields which they cover. In time they cover a period from 1929 to 1950, and it is interesting to trace

the development of interest of the author. The first eight essays, covering business cycles and national income, are in chronological order; the last three, on economic growth, cover almost the whole period, and it is fairly clear, I think, that economic growth commands the author's deepest affection, and it is in this field that his most original contributions are made.

The essays on business cycles reflect the empirical and somewhat antitheoretical views of the National Bureau, which regards the business cycle not as a unitary phenomenon but as an aggregate consequence of many cyclical movements in different variables.

The essays on National Income are of interest in pointing out also the structural difficulties involved in the national income concept, particularly when it is used as a measure of economic welfare or for the purpose of making international comparisons. Kuznets' emphasis that many of the items which we proudly include in the total of our own national income are in fact "costs" of a complex industrialized society rather than "satisfactions," and should therefore not be included in the most significant "net" income totals, is a salutary check on our statistical pride. Let our pride be deflated as much as we can, however, the international comparisons of income point up the almost fantastic differences in income levels as between, say, the United States and China, and Kuznets rightly lays stress on differential rates of economic growth as the prime factor in creating these disparities. For all the wisdom and insight of his growth studies, however, one does not feel that he has yet achieved an adequate theoretical, or even statistical, structure to deal with the growth problem. We need, perhaps, still more exact quantification of the growth process before we can deal with it successfully, and Kuznets is well aware of the dangers involved in the simple projection of trends. It is indeed the structural consequences of growth to which he is most eager to call attention, and one hopes that he may go on to develop a general theory of structural growth. The essays are written for the most part in nontechnical language, and it is to be hoped that they will find a

circle of discriminating readers beyond the limits of the professional economists.

K. E. BOULDING
University of Michigan

MACHLUP, FRITZ. *The Political Economy of Monopoly: Business, Labor and Government Policies*. Pp. xvi, 544. Baltimore: Johns Hopkins Press, 1952. \$5.50.

MACHLUP, FRITZ. *The Economics of Sellers' Competition: Model Analysis of Sellers' Conduct*. Pp. xx, 582. Baltimore: Johns Hopkins Press, 1952. \$6.50.

Professor Machlup has written two very valuable and stimulating books. *The Political Economy of Monopoly* discusses such issues as the meaning and effects of monopoly, the many institutional sources of monopoly power, the various types of monopolistic business practices and monopolistic labor policies, and the attempted measurements of the degree of monopoly. There is also an excellent chapter which analyzes the various economic and political appraisals of monopoly.

One important value of this book is that it brings out very clearly the fact that the question of monopoly is not a simple issue and that the various methods of dealing with it are complex and often uncertain in their results. Professor Machlup is an eclectic. He does not accept the views of so many modern-day social reformers that there is an irreversible trend toward ever-increasing concentration of business, that monopoly is inevitable, and that state planning and control and public ownership of business are the only solutions. On the other hand, he just as vigorously eschews the views of those who believe that there is no serious threat of monopoly in modern economic life. Instead he studiously analyzes all the various manifestations of monopoly, evaluates their consequences, and suggests remedies. Amongst the remedies he discusses are stronger antitrust laws, changes in corporation laws, taxes, trade barriers, and patents.

One of the most important and most controversial theses of this book is that monopolistic practices occur in agriculture and labor as well as in industry. Two chapters are devoted to an analysis of the effects of union wage determination in

terms of monopoly prices and monopolistic restrictions. Those sensitive advocates of strong trade unionism who object to the phrase "labor monopoly" and consider it to be a slur on the objectives of the labor movement should keep in mind that the author's purpose is purely analytical, and neither legal nor political.

These two chapters contain much valuable insight into the impact of trade unionism on modern economic life.

The author presents the following appraisal (p. 227) of the antitrust laws: "The objective is fine and largely attainable, but legal prohibitions alone cannot do the job; many other things must be done besides; the laws could have been worded much better, but even as drawn they would have worked better had they been less narrowly interpreted and more effectively enforced; yet, even with all their deficiencies they have not been without success, but have achieved much if one considers what would have happened in the absence of the laws."

Professor Machlup feels that the law of collusion has had a very real influence on the development of the American economy. On the other hand, it is his opinion that the law of monopolization through merger and concentration of control has not worked at all. However, when evaluating the author's views on monopoly, it should be kept in mind that many leading authorities, such as Professors Slichter and Adelman, feel that the American economy is as competitive today, if not more so, as it was in 1900.

The Economics of Sellers' Competition covers the economic theory of competition in selling. The author uses the method of analyzing economic problems by constructing and manipulating well-designed and rigorous models of relevant human conduct. A good indication of the subjects covered is given by the titles of the six parts which form the core of the book: "Many Sellers," "More Sellers," "Many and More Sellers," "Few Sellers," "Few But More Sellers," and "One Seller."

Included in these six parts are chapters which carry such headings as "Perfect and Imperfect Polypoly," "Polypolistic Non-price Competition and Other Forms of Non-Perfect Polypoly," "Pliopoly," "Poly-

poly and Pliopoly Combined, When Both Are Perfect" and "Polypoly and Pliopoly Combined, When Either or Both Are Imperfect," and chapters on oligopoly, duopoly, and monopoly.

This book exhibits a high degree of skill in technical economic analysis. It will be of unquestionable value for intermediate and advanced students of economics and professors of economics. Some of the book's innovations will undoubtedly attract wide professional interest and controversy. But the lay public with only a general interest in economics will find this book too difficult. In one respect, this is quite unfortunate because there is much in this book which could be of value to practical men of affairs. Perhaps it should be mentioned that the lay reader is not going to find the first book easy going either, but that those who persevere will find it a rewarding experience.

EMERSON P. SCHMIDT

Chamber of Commerce of United States
Washington, D. C.

HEADY, EARL O. *Economics of Agricultural Production and Resource Use*. Pp. viii, 850. New York: Prentice-Hall, 1952. \$9.75.

Agricultural production economics is defined by the author as "an applied field of science in which the principles of choice are applied to the use of capital, labor, land, and management resources in the farming industry." He remarks that the field is the oldest and most widespread area of specialization in the economics of agriculture—in fact, that the science of agricultural economics originated as a study in farm production economics. Briefly stated, the purpose of the text is to provide a skeleton of key principles upon the basis of which problems in agricultural production and resource use can be analyzed. The method employed is that of "isolating and setting forth fundamental principles and relationships and of applying these to agricultural data."

Courses in the economics of agricultural production have been given in agricultural economics departments rather widely over the country for a number of years. What

they have included has varied with the instructor and the institution. In general, though, they seem to have borne a very close relationship and sometimes a striking similarity to courses in farm management. Again, they have had as their objective, as is the case with the book under review, that of furnishing the basic equipment for the economic analysis of farm production problems. So far as the reviewer is aware, there has been heretofore no over-all book in the field, so the courses that have been developed along these lines have taken the form of outlines, source materials, references, and problems, supplementing lectures of the individual instructor. Hence the new book of Professor Heady is timely, and one which will be warmly welcomed. At the outset there seem to be two counts against it. One of these is that it succeeds to an unusual degree in making some simple things appear more complex than would seem to be necessary, even in a text that is designed for advanced agricultural production economics courses. The other count inheres in the fact that the book is large and expensive for use as a text, except perhaps in relatively small advanced classes. Over the years the author has established his competence in the field about which he writes, and this book in a sense is a tying together of much of his earlier research and writing. The book is a leader, indeed a sort of "trail blazer," in an important field of concern in agricultural economics; and is calculated to meet with a wide acceptance and to exert a considerable influence upon the approach and content of future courses in agricultural production economics.

WILSON GEE

University of Virginia

ASHWORTH, WILLIAM. *A Short History of the International Economy, 1850-1950*. Pp. 256. New York: Longmans, Green and Co., 1952. \$3.25.

To write a history of 100 years of the international economy in a space of 250 pages is not an easy task. This little book, which undertakes the assignment, describes the development of the world's economy—principally that of the western world—

from a relatively simple and largely agricultural economy, to the present day complicated and delicately balanced organization of economic life. It discusses the major changes which have taken place in the economic interrelation of countries and regions during the period under review. The word "international" is used both in the sense of "common to many nations," and also that of "between nations."

In compressing the story into a brief space the author has had to select what he considered the significant events, trends, and developments of this period. There is room for differences of opinion as to the importance, meaning, and permanent influence of the numerous events which have taken place. On the whole the author has shown balanced judgment in his selection and analysis of what has happened to the world's economy during the last century. The account is both descriptive and interpretive, perhaps more the former than the latter.

The book contains a considerable amount of economic history and description of developments within individual countries. The author points out in the preface the necessity of including such data, and says that he has been concerned simply with their relation to the growth and working of a world economy.

The first part of the book, Chapters I and II, examines the significant economic growth of the world and the changes in industry, agriculture, and transportation which have taken place during the period covered. The author describes the great expansion which has taken place in production and in incomes, the increasing specialization of regions, changes in productive methods, and the establishment of large industries. The next three chapters consider some of the accompanying changes in the economic system, particularly in the fields of the management and organization of production, the status of labor, and the relation of government to economic activities.

The last three chapters are concerned with the emergence of an international economy in a more real sense, the increasing degree of interdependence of countries and of economic activities, the economic

and financial problems which have accompanied these developments, and international agencies which have been established to deal with them. The book is a well-written and worthwhile addition to literature on this increasingly important subject.

JOHN PARKE YOUNG

Chevy Chase, Maryland

PIERSON, FRANK C. *Community Wage Patterns*. Pp. xvii, 213. Berkeley: University of California Press, 1953. \$3.75.

There was a distinct tendency in the immediate postwar period to view money wage determination as reflecting, in considerable measure, the play of noneconomic forces. In particular, a stage piece was contrived in which the *dramatis personae* were composed largely of rival trade union leaders. With respect to wage policy, the basic motivation of these leaders was union power. In the calculus of power, economic considerations were, at best, of minor importance.

This view was not altogether mistaken. In wage decisions, as in decisions affecting other economic magnitudes, there is scope for a variety of motivations. Economic factors can be largely ignored by unions or employers. However, the price in terms of institutional survival is likely to be high.

In the present volume, Professor Pierson concludes that "wages in different industries and localities [in the United States] form a well-knit structure largely controlled by economic and social forces operating on a broad regional and national basis." He points out that "even the inter-industry wage structures within different communities exhibit many similar characteristics." Short-term changes in the relative wage position of a community, growing out of particular fluctuations in business conditions, should not obscure a real measure of stability in wage relationships with other communities over comparatively long periods.

Professor Pierson bases these and other findings on an analysis of the factors affecting general wage movements in local areas. Major attention centers on Los Angeles, with comparative data for a num-

ber of other large communities and for the United States as a whole. The data used are primarily average hourly earnings for broad industry groups for the period 1940-1949, and average annual earnings derived from the *Census of Manufactures* for the years 1919-1939. For the more recent period, indexes of wage rates in manufacturing and union scale data are also employed. The author fully recognizes the limitations of the available data for analysis of wage relationships within and among communities. Deeper insight into wage behavior in local labor markets depends on the accumulation of a substantial and consistent body of occupational wage data.

Professor Pierson describes the major factors influencing community wage levels, the movement of wages in Los Angeles and other selected communities prior to 1940 and in the 1940-1949 period, and, for Los Angeles, the economic environment within which wage changes were worked out in the 1940's. Several chapters are devoted to interindustry wage levels, with extensive use of ranking and rank correlation tests to establish relationships between wages and a variety of other factors. The book concludes with an interesting chapter on unions and local wage behavior.

This volume is more for the specialist than the general reader. Professor Pierson tackled a most difficult subject, and his book is a welcome addition to wage literature.

SOCIOLOGY AND EDUCATION

TYRWHITT, J., J. L. SERT, and E. N. ROGERS (Eds.). *The Heart of the City: Towards the Humanisation of Urban Life*. Pp. xii, 185. New York: Pellegrini & Cudahy, 1952. \$10.50.

RIEMER, SVEND. *The Modern City*. Pp. xi, 477. New York: Prentice-Hall, 1952. \$7.35.

The Heart of the City is a collection of working papers contributed to the Eighth International Congress of Modern Archi-

itecture (CIAM)—a week's session at a country place in Hoddesdon, England, in 1951, at which the *avant-garde* of architect-planners from three continents gathered, as usual, for provocative talk—Le Corbusier, Gropius, Sert, with their peers and disciples.

The central theme of the discussions this time was "the core" of the city, which Sert noted meant "heart." CIAM is no proponent of the garden city ("the idea was not a good enough one"—Holford, p. 88). But to put an end to "unplanned decentralization" "we must reverse the trend, establishing what we may call a process of recentralization," or, as Giedion puts it, "the return to the human scale and the assertion of the right of the individual over the tyranny of mechanical tools" (p. 17).

Brilliantly and precisely as these innovative thinkers handle space relationships, their resort to the written word tends to somewhat mystic statements: "the core is the repository of the community's collective memory"; "the key to the matter lies in the interaction . . . of visual dynamism with moments of repose." Miss Tyrwhitt, who ought to know, says that in London the core is split in four (p. 105); William Holford, who ought to know, says it is in two parts (p. 97).

Somehow, one writer after another finds the Piazza of San Marco in Venice the classic expression of what he seeks. A lively contribution to the book is an endpaper of that "core" by Saul Steinberg, of all people. There is a formal schema presented for analysis of five "scale levels" at which there must be "cores" in the "conurbation," from village or housing group to central metropolis. Prodigious effort has been devoted by younger members of CIAM to present to precisely the same scale and form more than 20 plans and studies of "cores" from Peru, Japan, India, the United States, and Europe. There is a profusion of provocative photographs to give color to this dashing, if somewhat fuzzy, portrait of a house party of Olympians.

Svend Riemer's volume, by contrast, is a sober book—intended as a college text in urban sociology—into which the sociologist-author has sought to integrate contributions

of the city planner, architect, economist, engineer, political scientist, and social psychologist toward an understanding of the urban community. Professor Riemer's own life work, both in Scandinavia and in the United States, has involved him closely enough in the world of action in housing reform and criminology to make him sensitive to many of these contributions. He ranges easily from architecture to culture, economics, philosophy, and religion (for example, the Christian Church as an urban phenomenon). He views as equal foci urban construction and urban social relations; he sees the neighborhood as a social, not a physical, phenomenon.

His Introduction, on *The City in Western Civilization*, relies on Pirenne, Gordon Childe, Max Weber, Lewis Mumford—a broad enough sweep. It is perplexing that so able an author should accept formal schemes from his authorities that show the resort town as an outgrowth of the "late industrialization process," when a moment's untutored reflection brings Pompeii and Herculaneum to mind.

Under "Urban Growth," Riemer develops with exceptional power the demographic factors. Under "Urban Environment" he rehearses in rather school-masterish fashion the "ecological approach" as defined by the natural scientists; but he makes no attempt, like Hallenbeck in his recent *American Urban Communities*, to see whether the ecological principles evolved by the natural scientists have meaning for students of urban society; the phrase remains a metaphor.

The other major parts deal with Urban Personality, Urban Leisure, Urban Social Organization, and Urban Planning. One can applaud the range of Riemer's scope; one can bemoan his confusion of mayorcouncil government with commission government and a dozen similar faux pas. They merely illustrate once more the extreme difficulty that faces a man grounded in one discipline in writing about so complex a set of phenomena as the city.

CHARLES S. ASCHER

Brooklyn College

GADGIL, D. R., and Staff. *Poona: A Socio-Economic Survey*, Part II. Pp. xi, 324.

Poona, India: Institute of Politics and Economics (Publication No. 25), 1952. Rs. 15 or 30 s.

This is the second volume of a detailed survey of a medium-sized city in India, a completion of what is probably the most valuable existent study upon an Asiatic city. (For further details see the review of Volume I in *THE ANNALS*, March 1946, p. 299.) The city had 300,000 people in 1941 but has grown rapidly since then (pp. iii and 169 ff.). This particular volume starts with details of the historical development of the city. Ch. II deals with the specific economic and social characteristics of wards and communities, but it must be pointed out that the term "community" as used here means social groupings in a sort of combined geographical, occupational, and caste sense as opposed to our Western primarily ecological use of the concept. The next deals with housing in the particular senses of number of rooms, density of usage, water taps, latrines, ownership, and rental charges. Ch. IV, of 50 pages, called "Community Organization," is really a study of caste organization and government (*panchayats*) which should be read carefully by all those who think our own society is complicated or that India still has the simple caste organization described in *Manu* and the earlier Sacred Books. Ch. V is a study of city government in terms of functions, activities, history, and cost.

The next chapter is a history of public and private education in the city, both primary and in the upper levels, which shows considerable progress towards minimum universality. Chapter VII on "Public Health and Use of Leisure" contains, in addition to what may be expected under this title, information upon poor relief, juvenile courts, and the sales of toddy, liquor, opium, ganja, and bhang. The final chapter is a sort of an urban sociology of knowledge, in which attention is drawn to general characteristics of the city and the significance of conclusions drawn from Poona as being typical of the total class—all Indian cities.

This last part of the study makes the two monographs invaluable to the student

of Indian life and to those in urban sociology who seek to understand the general implications of urban life upon man, as opposed to the historical and particular as in our country, or in Western society alone or in any particular temporal epoch. The other studies made by this institute and listed here show that the conclusions of general significance are based upon a broad sampling of Indian cities. Thus the work becomes an invaluable contribution to modern social science.

CARLE C. ZIMMERMAN
Harvard University

MINER, HORACE. *The Primitive City of Timbuctoo*. "Memoirs American Philosophical Society," Philadelphia, Vol. 32. Pp. xx, 297. Princeton, N. J.: Princeton University Press, 1953. \$5.00.

In 1940 Horace and Agnes Miner spent seven months in Timbuctoo, in an effort to study the urban structure of that community. The Social Science Research Council financed this expedition, and the American Philosophical Society saw that the final report was published. Miner states that his purpose was to see whether a primitive city is held together by the same structural framework as a Western city, and he found that it is not. He selected Timbuctoo because it is remote and comparatively untouched by Western influences.

Timbuctoo is situated on the Sahara desert at a point where the Niger River reaches its most northerly extension, and thus is a key location for trade by boat and by camel. The population of over six thousand persons lives in four main wards of mud-brick houses, each with a subdivision and a hut-village on its periphery. Three languages, Tuareg Berber, Songhoi, and Arabic, are spoken by its inhabitants, who are divided into three major and several minor ethnic groups, Tuareg, Sudanese Negro, and Arab being the basic components. Tuareg nobles visit the city but do not live in it. Their serfs pasture camels on its outskirts after the rains, and their male slaves work as farmers, tanners, donkey breeders, while the females of this slave class weave baskets and sell produce in the market. These Tuareg dependents

number about 1,000. Among the Songhoi-speakers is a group known as Arma, descended from Moroccan soldiers and local women, and their serfs, called Gabibi. The total of these Songhoi speakers is about 3,500. The Arabic speakers are the town Arabs, their slaves, some holy men, and some Badu off the desert, totaling 1,500.

This heterogenous population is held together by mutual dependence in an ethnic division of labor, so that only Arma make slippers which all need, and barbers have to take part in circumcision rites and other ceremonies; religious brotherhoods, common membership in mosques, and guilds bring people of different origins and languages together and give the city its structure. What Miner has found is closely parallel to the structure of Fez, which was minutely described by a team of French sociologists in the 1930's, and which can be found almost anywhere in the Middle East. The book is well written, well illustrated, and well produced. The coverage of every element in the urban population studied seems to have been excellent.

CARLETON S. COON
University of Pennsylvania

WARNER, W. LLOYD. *American Life: Dream and Reality*. Pp. xv, 268. Chicago: University of Chicago Press, 1953. \$3.75.

Dr. Warner has been studying American communities for the last twenty years, and these studies were preceded by field work among the Australian aborigines. Anthropologists would in general agree with him that the differences between contemporary and primitive societies are those of degree rather than of kind.

But Dr. Warner's choice of an example to illustrate this point is unfortunate. The book opens with a description of Memorial Day as "an American sacred ceremony." Following the theories of Radcliffe-Brown and Durkheim, he writes, "Memorial Day is a cult of the dead which organizes and integrates the various faiths and national and class groups into a sacred unity." He then describes the ceremonies in a small town after the first world war. But, our Memorial Day is not a cult in the

sense of a mortuary cult in a primitive society. There literally everyone in the community participates and, as far as one can judge, in a meaningful manner. In our observance of Memorial Day, a business man may drape his store with flags and donate to the local Veterans Organization because it is good business to do so; and for many families, particularly among those who did not lose a member in a war, the day may be the occasion for a picnic, for sports, or just another holiday. Oddly enough, in a later chapter the author discusses the increasing diversity and complexity of American symbolic systems, but takes almost no account of this fact in his description of Memorial Day as a cult.

The best chapter from this reviewer's point of view is, "Social Persistence and Personality Development." The analysis of the status and social structure of the school system—school board, teachers, and students—and the data on how eleven- and twelve-year-old children have already taken on the status values of their society is illuminating. So also is Dr. Warner's discussion of the personalities of business executives.

Among other topics discussed are social class and color caste, social change as illustrated in the relationship between factory and social system in "Yankee City," individual opportunity and social mobility, and mass media. But there are significant omissions. Metropolitan urban life is ignored. There is no mention of our changed international role over the last twenty years and its impact on American life. Nor are there the sharp insights and cogent themes of such books on contemporary American society, as David Riesman's *The Lonely Crowd* and C. Wright Mills's *White Collar*. Dr. Warner's book gives an impression of being somewhat "dated" and nostalgic.

HORTENSE POWDERMAKER
Queens College
Flushing, New York

ALLEN, H. B. *Rural Reconstruction in Action: Experience in the Near and Middle East*. Pp. xviii, 204. Ithaca, N. Y.: Cornell University Press, 1953. \$3.50.

This is a fascinating account of the more significant chapters in the work of the Near East Foundation (of which the author is Director of Education), carried out in the Balkans (Macedonia, Albania, and Greece), in the Middle East (Iran, Syria, Lebanon, Cyprus, and Palestine), and in East Africa (Eritrea). It tells the story of small-scale projects, in which personalities and man-to-man contacts were decisive factors, but which grew rapidly as a result of the people's wish to benefit from demonstrated advantages. Each project had a special focus: farming, health, home practices, recreation, illiteracy, rural education, and the application of scientific methods. The lessons which can be derived from the experiences of the people involved in these projects are many and should be carefully studied by all who plan or work for so-called "underdeveloped" countries. Only a few of these lessons can be mentioned here:

The most important single factor which can make all the difference between the success or the failure of a project is the personal relationship between the foreign director of the project, his local assistants, and the people whom the project is to serve. Demonstration is a thousand times more effective than theoretical explanation or oral persuasion. A good knowledge of local conditions and traditional mores is a basic prerequisite. Innovations and changes should be introduced gradually, slowly, and successively. Objections and suspicions as to the altruistic nature of the project have to be expected from the authorities as well as from the people themselves. The better the locally recruited personnel the greater the likelihood of success.

And one more extremely important point: Whatever the focus of a project, at whatever point it attacked one of the traditional scourges of the Near and Middle East, it soon got involved with many other aspects of the people's lives, thus forcefully demonstrating the necessity of planning, not just for the health, or for the education, or for any other specific culture complex, but for the total life of the people.

Rural Reconstruction in Action demonstrates not only that, given the right approach, the most traditionally-minded people are inclined to accept change, but also

that a practical working understanding between different cultures is possible.

Princeton University

MARTIN, WILLIAM E., and CELIA BURNS STENDLER. *Child Development: The Process of Growing Up in Society*. Pp. xxii, 519. New York: Harcourt, Brace and Company, 1953. \$6.50.

This book is one of several that have appeared recently, covering the general field of child development, and written by educators to meet a need for students of education. The underlying ideas of these books are that there is an interdisciplinary area in the behavioral sciences, including sociology, psychology, anthropology, biology, pediatrics, and psychiatry, which is concerned with the central theme of human development, and that its study through the stages of childhood and adolescence is of basic importance for educators. With this point of view, the present reviewer, who has sought to gather and organize and contribute to this material from the standpoint of the sociologist, finds himself in complete agreement.

The volume consists of four main parts. The first concerns itself with children as human beings: their common characteristics, the processes of their growth and development, and the differences in their physical and biological inheritance. Part II deals with the social and cultural background of personality development—culture patterns and participation, class differentials and their impact upon the personality. The third part is devoted to socialization, the processes of growing up in our society, the preschool years, the elementary school child, adolescence, with particular emphasis upon the goals of socialization. Finally, there is the section on the socializing agents, with inclusion of the family, the school, the peer group, and the community.

The authors, who are professors of Education at the University of Illinois, have employed numerous teaching aids. There are photographs of child life galore, tables, figures, reproductions of popular cartoons, and many questions and suggestions for further discussion. There are an ample

bibliography and, what is so often lacking in books, an adequate index. The emphasis throughout is upon the processes of development, the viewpoint is well balanced, and the style is readable. It is a useful book.

JAMES H. S. BOSSARD

University of Pennsylvania

DESPERT, J. LOUISE. *Children of Divorce*. Pp. ii, 282. Garden City: Doubleday & Company, 1953. \$3.50.

This is an intriguing book on how to make a success of divorce. Divorce need not be another word for disaster, says the author. Divorce means failure in marriage, but one can learn from failure how to succeed on the next try. Studies of divorced women who have remarried report that they are about as happy in their new marriages as the married women who have never been divorced.

This book is not concerned with the adjustments of the adults so much as with those of the children of divorce. The author feels that divorce in itself is neither a good nor a bad thing; it is bad only if it is laden with emotion and bitterness and produces anxiety in the child. Dr. Despert, one of America's leading child psychiatrists, gives many actual cases of children who have successfully weathered the experience of divorce, and she shows how others might have done so, had their needs been understood and respected. The book is rich in practical suggestions such as how and what to tell the child, the wisdom of sending the child away to school or of moving to a new community, and the ways in which the father who is separated from his child can convince his child that he has not deserted him. The child of divorce needs to know (1) that something is wrong with the relationship between his parents; (2) that he is not to blame; and (3) that his parents still love him.

This is the first book of its kind to be written, and that it should appear is of interest to the sociologist for what it signifies about American attitudes toward divorce in the middle of the twentieth century. In a privately printed doctoral dissertation (University of Pennsylvania, 1939), James H. Barnett, analyzing 50 novels published

from 1858 to 1937 in which divorce was the central theme, showed that they reflected the changing attitudes toward divorce from "concern over the fact of divorce to the effects of divorce on children, to the question of alimony and later to the problem of post-divorce adjustment." In the earlier period of our concern about the effects of divorce on children, the debate was whether divorce per se was bad for children and whether discordant couples should stay together for the sake of the children. This argument, it appears, has been settled in the negative; so we now have in this book the formulation of specific ways and means of safeguarding the children of divorce.

The book is written in a straightforward, conversational style, not bogged down with technical jargon. The author anticipates the many vexing questions that plague parents who are considering divorce.

M. F. NIMKOFF

Florida State University

DITZION, SIDNEY. *Marriages, Morals, and Sex in America*. Pp. 440. New York: Bookman Associates, 1953. \$4.50.

This volume by a historian is an encyclopedic survey of the ideas of around 700 authors on marriage, morals, and sex in America from Benjamin Franklin to Alfred C. Kinsey. The intriguing chapter titles are: Reason and Nature; High Individualism from Abroad; The Free Enquirers: Ferment of the Forties; Free Land, Free Labor, Free Love; Spiritual Wives; The Woman's Point of View; The Socialist View of the Family; Science Looks at Love and Life; Female vs. Male in the Twentieth Century; From Lindsey to Kinsey.

The central theme in this development of ideas from the colonial period to the present is that woman's right to equality with man is implicit in the accepted idea of democracy and is necessary for marital happiness and personal development of both men and women. Complicating this theme is the idea of free love as essential to human happiness, a romantic notion which plagued many advocates of the emancipation of women and obstructed the progress of the movement.

The author attempts to relate the development of the idea of morals, sex, and marriage to the social situations and events of the times. But to the reader these ideas often appear more or less detached from social behavior in American society. At best, the thinkings of the theorists often seem far remote from the main currents of American life. They appear to be the voice of protest of a small minority to be defined as "the lunatic fringe" or "pioneers ahead of their times," according to the prejudices of the reader. Perhaps they functioned to bring to the attention of the small intellectual public a wide range of ideas from the fantastic to the practical.

While the ideas of hundreds of writers and speakers are elaborated, there are a few surprising omissions. No mention is made of the writings of Mary Baker Eddy although her influence is a persisting one on the place of women in American society. Even more amazing is the failure to discuss Jane Addams and Julia Lathrop whose writings and achievements exemplified woman's distinctive contribution to human welfare. Silent treatment is also given to the pioneer scientific work on sex and marriage of Robert L. Dickinson, the gynecologist, of Gilbert V. Hamilton, the biologist, and of Lewis M. Terman, the psychologist.

No reference at all is made to the rise of organizations like women's clubs, the Woman's League for Peace and Democracy, the League of Women Voters, the Congress of Parents and Teachers, the American Home Economic Association, the Child Study Association of America, and the National Council on Family Relations, which have been translating into practice the ideas of sex and marriage, derived from psychological and sociological research, which are being incorporated into American society.

ERNEST W. BURGESS

University of Chicago

OVERHOLSER, WINFRED. *The Psychiatrist and the Law*. Pp. x, 147. New York: Harcourt, Brace and Company, 1953. \$3.50.

This little volume comprises the four Isaac Ray lectures delivered at Harvard

University by Winfred Overholser. The lecturer, one of the most eminent American psychiatrists and the recognized leader in legal psychiatry, was chosen to be first Isaac Ray lecturer by the Award Committee "by reason of his contribution to the improvement of the relations of Law and Psychiatry."

The lectures are entitled: The Substance of Psychiatry, Some Differences of Viewpoint, The Mental Patient and the Hospital, and The Psychiatrist as Witness. The first lecture is a wholly adequate historically presented outline for lawyers of the fundamentals of psychiatry. The second considers in moderate tones defects in laws and in legal processes, as viewed by the psychiatrist. It contains some judicial fiats and bulls that are gems. The third lecture, that on The Mental Patient and the Hospital, deals with a subject in which the lecturer, formerly head of the model state hospital system of Massachusetts and presently superintendent of the large government institution for the insane, St. Elizabeths, is the recognized authority. It is in this reviewer's opinion the best of the four lectures. The last lecture considers the manifold problems involved in expert testimony.

Unfortunately the author is somewhat reticent in proposing his own solutions of the more knotty and vexing problems. Apparently, he would favor abolishing the "not guilty by reason of insanity verdict," if some constitutional means could be found for doing so. He favors the English method of indeterminate detention and supervision for those defendants who have been acquitted by reason of insanity. He is a strong proponent of the use of neutral experts appointed by the court and of the establishment of psychiatric clinics in connection with criminal courts. He favors the creation in each state of a mental health authority under medical control, rather than under a lay board, to supervise private as well as state hospitals for the insane and all outpatient and other psychiatric clinics. Dr. Overholser reports favorably on a decade's experience with the Minnesota Plan for maintaining a high ethical and scientific level of expert testimony.

He states that the most necessary re-

forms of expert testimony are to be found in the Uniform Expert Testimony Act and suggests that its adoption by only two states, after a passage of fifteen years, is confirmation of the remark of the distinguished English psychiatrist, Dr. Henry Maudsley, "our legal dignitaries have not the least desire to be helped out of their dilemma!"

In this first series of the Isaac Ray lectures one will not come upon great discoveries nor startling pronouncements. But one will find in them the wise observations and sound opinions of a mature, liberal man and an able psychiatrist. Fortunately, one will look in vain for the muck raking and back biting that has so often marred writings on legal psychiatry.

MANFRED S. GUTTMACHER, M.D.

Baltimore, Maryland

WOOD, MARGARET MARY. *Paths of Loneliness*. Pp. xi, 250. New York: Columbia University Press, 1953. \$3.75.

"*Paths of Loneliness* has been written in the hope that it will bring more sharply into the foreground of social thought the problem of the individual who feels unrelated to others of his own group." This is the opening line of the preface and is a clear statement of the aim and purpose of the author.

As the title would suggest, this is not a scientific study of the isolate, nor does it derive from any objective research program. It would appear to have been written for the nonprofessional. The book is essentially a compilation of the writings of others, predominately derived from the field of sociology, less so from psychological and psychiatric sources. A large number of the references contain well-known concepts, some of which are so well known that they are almost common knowledge. The author gives no specific point of view of her own but presents theories or attitudes of others. Points of disagreement or opposing theories are seldom given.

Concepts involving personality traits or insight into deep psychological mechanisms are minimized. The greater amount of material deals with sociological forces and their influence upon the individual. The author is apparently convinced that so-

ciety, by exposing the individual to competition, segregation, and stratification, acts to create the isolated individual and to force him into the path of loneliness. Just why certain people respond in this manner to sociological forces and others do not is left untouched.

At many points in this book the author becomes introspective and cites her own experiences as examples. There is enough personal material presented in the aggregate to explain, in purely psychological terms, why one person felt alone in the world. The author, however, turns back to sociological concepts though the personal material would lead one elsewhere and perhaps to more productive areas if appropriately utilized.

The book is well written and well organized. It should be of considerable value in that it represents a collection of attitudes, concepts, and fragments of research bearing on this subject.

It is inevitable that a study of the isolated individual in our society, derived from a predominately sociological point of view, will leave large gaps in coverage. Within these limitations the book will have a definite value and can be recommended.

LEWIS H. LOESER, M.D.

Newark, New Jersey

HALMOS, PAUL. *Solitude and Privacy: A Study of Social Isolation, Its Causes and Therapy*. Pp. xvii, 181. New York: The Philosophical Library, 1953. \$4.75.

Paul Halmos' *Solitude and Privacy* is an original and important sociological inquiry into the widely recognized but little understood problem of modern man's aloneness. Starting with the assumption that the sense of belonging with others, the sharing of experiences and co-operative effort, is a fundamental and vital human need, Halmos contends that modern man's isolation—his neurosis and his material insecurity—is the result of the frustration of this biosocial need or drive. It is therefore a central issue, a cause in its own right, and not, as it is generally regarded, a derivative symptom or a by-product of some larger primary problem, as, for instance, the competitiveness of modern culture or the

Freudian concept of sexuality. To support these assumptions, Halmos turns to history and traces the trend, referred to as *desocialization*, in two examples of sociability, choral dancing and drinking, to show that man's opportunities for spontaneous, unreserved social participation have been reduced simultaneously with the emergence in modern society of formalized, rigid, and emotionally sterile, culture forms.

Halmos then discusses the influence of these frustrating social-cultural forms on the personality of the individual and shows that this influence may be both direct and indirect, that is, mediated to him through others during the formative years of early childhood. The interaction of both direct and mediated influences is constant. Both types of influences are interrelated parts of the social-cultural process which determines the personality of the individual. Hence, it is argued that the frustration of man's social needs, which is a culturally induced and sustained frustration, is responsible for man's neurosis; the social-cultural determinants precede and control individual-genetic development. Halmos tests this thesis by means of an empirical investigation into the attitudes of a group of college students. Correlations between the basic traits of anxiety and depression, acquired through mediation in childhood, and isolate behavior were statistically demonstrated. Halmos also supplements his theoretical conclusions by some appropriate case materials showing the therapeutic value of recreational group activities or community therapy.

In his discussion Halmos distinguishes between undesirable solitude and desirable privacy and suggests that the ideology of privacy and reserve, prominent in the value-systems of our Western culture, is largely a rationalization of unwilling solitude.

Halmos' theories are provocative of further discussion and research. *Solitude and Privacy* will well repay the reader for struggling with a somewhat difficult vocabulary and style.

MARGARET M. WOOD
Philippine Women's University

BRECKINRIDGE, ELIZABETH LLEWELLYN.
Effective Use of Older Workers. Pp.

224. Chicago: Wilcox & Follett Co., 1953. \$4.00.

Many people in business leadership, personnel management, development of labor policy, pension advisement, and in gerontology will welcome the appearance of this book. Growth of interest in the older worker has led to widespread demand for facts regarding worker characteristics; experience with utilization of older workers; current practices regarding selection, placement, transfer, retirement; and postretirement follow-up.

Recognizing the need for information, the Committee on Human Development at the University of Chicago obtained funds from the Rockefeller Foundation to conduct an interview-type "exploration of the ways in which companies were using older workers effectively and also of the procedures being devised to facilitate workers' retirement and subsequent adjustment in the post-retirement period."

The 90 participating firms were selected because they had been pioneering in this field and were willing to share their experience for the benefit of other firms and of the entire community. The report offers encouraging evidence that responsible business management is becoming aware of American aging and that important representatives of it are conscientiously trying to determine the implications for their establishments. In part, the book is a dynamic report of current thinking and growing awareness of the meaning of aging and retirement to the worker. Indeed, one of the high spots of the book is found in the passage on "The Effect of Problems of Aging on the Worker," pages 101-104.

Essentially, however, the book is an account of numerous examples of experiences regarding the hiring, placement and retention of older workers; the operation of flexible retirement systems; individual and group counseling procedures; and techniques used in preparation for retirement. The value of many of these accounts is enhanced by presenting them in the language of those who are responsible for the procedures reported. These chapters will be of great value to others who are casting about for program ideas. In short, it

is a useful manual based on present knowledge.

Effective Use of Older Workers raises many questions but gives final answers to few. This is in no sense a reflection on the study. Rather, it is an indication of the early stage of the development of the field and of the great variety of informational needs present among concerned representatives of management. It should be an effective stimulus to research.

The book is characteristic of Mrs. Breckinridge's writing. The presentation is logical and fluent. Identification of sources of information appears in profusion. The table of contents is detailed and informative. A carefully selective bibliography and a good index appear at the end. The typography adds to the readability of the book.

CLARK TIBBITTS
U. S. Department of Health, Education,
and Welfare
Washington, D. C.

RUMNEY, JAY, and JOSEPH MAIER. *Sociology: The Science of Society*. Pp. viii, 192. New York: Henry Schuman, 1953. \$3.00.

This little book is a revised and enlarged edition of Professor Rumney's *The Science of Society* which was originally published in England in 1938. As one might readily infer from the fact that the present edition contains only 172 not very large pages of text, it is not and was not intended to be a comprehensive treatise or textbook of sociology; it is rather a concise outline of the topics and questions, and in a very limited sense the materials, which are commonly studied in the courses of a department of sociology. It contains, however, almost no discussion of research methods and techniques used in recent years by students of these topics and questions.

Such a book might conceivably serve the general reader as a guide to the field of sociology; a college instructor might place it in his students' hands as a general outline for a course in which they were expected to use readings from various sources rather than a typical general textbook. It would not, however, in the judgment of the reviewer, be very illuminating for a reader who had no previous acquaintance with so-

ciology. It could, I believe, be helpful to a college student engaged in reviewing for final comprehensive examinations in sociology, or perhaps a graduate student reviewing for a comprehensive examination in sociology as a "minor" to a major in some other subject.

The authors' final chapter, "The Development of Sociology," is as excellent a review of the history of sociology as I have ever seen in equally brief compass. They have provided a list of "Selected Readings," classified to correspond to the chapters of the text; these appear to be judiciously chosen. The index seems rather inadequate.

FLOYD N. HOUSE
University of Virginia

CONANT, JAMES BRYANT. *Education and Liberty*. Pp. xv, 168. Cambridge, Mass.: Harvard University Press, 1953. \$3.00.

When the President of Harvard University and subsequently the High Commissioner of West Germany writes a book it is sure to attract immediate, respectful, and wide attention. *Education and Liberty* has attracted that kind of attention. How important it may be on its own merits is, however, a different matter. While it says some things that certainly are worth saying often, it does not begin to live up to the challenge connoted by its title, and it falls even farther behind the promise of its subtitle: "The Role of the Schools in a Modern Democracy."

In three lectures delivered at the University of Virginia and compressed to 87 pages (the remainder being notes), it would be impossible in any case to do justice to any substantial number of the great issues that, in one way or another, focus in the meaning of liberty for our hazardous time. Yet Dr. Conant is far from thorough about any of the three or four issues that he does discuss. His disproportionately lengthy comparison of the educational systems of England, Australia, and New Zealand with that of America leads to the startling conclusion that ours is better because more completely supported by public funds and open to a larger percentage of our youth. His proposals for improving the colleges and especially

the secondary schools include "work experience programs," special opportunities for gifted youth, increased scholarships for high school graduates, and widened general education. But none of these proposals is developed either distinctively or adequately, and they are weakened by frequent concessions to traditional subject matters traditionally organized. Indeed, Dr. Conant seems at least as often to echo the chronic eclecticism of the widely read volume by members of his Harvard faculty, *General Education in a Free Society*, as he does the relatively forward-looking if still cautious views of the Educational Policies Commission, of which he was a member.

Perhaps the most provocative part of his treatment is his continued insistence that the public school and not the private school is the genuine symbol of educational liberty—an insistence, it may be remembered, that got him into difficulties with those members of Congress who are always ready to listen attentively to the Church lobby. Dr. Conant is correct in his stand that tax support of religious schools would lead to very serious consequences for American democracy. His discussion of the knotty problem of religion in public education is, however, again feeble. He seems to assume with the Educational Policies Commission that the problem can be solved by the study and practice of "moral and spiritual values," whereas in fact this entire phrase as well as its applications by the Commission is question begging throughout. The only way that public education will ever be able to deal honestly with religious questions and contents is not by semantic evasion of key concepts but by approaching religion and all its attendant experiences with exactly the same respectful and careful, but nondogmatic and critical, attention as any other institutions of living cultures. With all the good will and concern that Dr. Conant manifests, he never comes to grips with this or any other issue of education in its pervasive relations to liberty.

THEODORE BRAMELD

New York University

MELBY, ERNEST O., and MORTON PUNER
(Eds.). *Freedom and Public Education*.

Pp. x, 314. New York: Frederick A. Praeger, 1953. \$4.00.

Ernest O. Melby, Dean of the School of Education, New York University, and recognized authority in educational philosophy and practice, seeks to determine what modern education is, why it is being attacked, and who the critics are. He is ably assisted by Morton Puner, who is a newspaper writer, editor, and consultant in intergroup relations and civil liberties.

The editors have brought together in one volume "Freedom and Public Education" a series of articles by many outstanding leaders, among them being Wilford M. Aikin, Harold Alberty, James P. Baxter, Harold Benjamin, William G. Carr, Marquis Childs, James B. Conant, Henry Steele Commager, William O. Douglas, John Foster Dulles, Benjamin Fine, Dan Fowler, Harold C. Hunt, William Heard Kilpatrick, Roy E. Larsen, Gordon McCloskey, Agnes E. Meyer, Arthur D. Morse, Virgil Rogers, Charles A. Siepmann, and George D. Stoddard.

This volume deals with most of the problem areas of modern education—federal aid, religion, academic freedom, fear, attacks, and criticisms—and concludes with heartening articles on securing good education founded on a democratic philosophy, a dynamic process, and a spiritual force.

The editors in a short preface dedicate this book to the understanding by as many Americans as possible of the issues confronting public education. It is in truth a combat manual for the war for freedom in public education.

The late Chester A. Rowell, brilliant editor and great international thinker, describes freedom in education as "the central liberty of civilization without which no other liberty could long survive or would be worth keeping." It is because freedom of education is basic to our public schools and our democracy that Melby and Puner have collected these excellent articles outlining what is happening to public education and suggesting how we can meet and prevent these attacks.

From their various viewpoints these scholars have set forth in clear readable form their opinions. This volume deserves

a high priority as *must* reading for administrators, teachers, school officials, parents, and all others who are concerned with the education of children and youth.

It should form the basis of discussion in education classes in our colleges and universities. It should be in the hands of all public school leaders; it should be widely read and discussed by interested parents everywhere.

WILLARD E. GIVENS

Mutual Security Agency
Manila, Philippines

CUTTS, NORMA E., and NICHOLAS MOSELEY. *Bright Children: A Guide for Parents*. Pp. ix, 238. New York: G. P. Putnam's Sons, 1953. \$3.50.

The book is written for parents of bright children and undertakes to tell them how to recognize superior ability, the problems that come with it in the home, in the school, and in the child's life in the community of which he is a part. It is well written, easily understood, simple, and nontechnical. It is refreshing to find a presentation of the problems posed for parents and teachers of gifted children that does not blink the fact that there are problems confronting those who have the responsibility for such children and which at the same time avoids the too frequently held attitude that these children are a sort of different "order" of beings.

In this book the bright child is a human being with the relationship all have and with the same problems of growing and learning and adjusting to life that all others have, but who is gifted with superior intelligence. The authors remind the reader that bright children usually have better health physically, mentally, and emotionally than their less gifted associates, and in case they do not, the authors are helpfully explicit in the steps to be taken in seeking competent medical or psychological advice. It is of course an oversimplification to say that the core of the problem usually presented by the gifted child is how to keep him working up to his ability. The authors do not say this, but it is back of much of their excellent treatment of the subject.

The book is to be commended for its

sane approach and for its practical suggestions on how to recognize unusual ability, how to direct it, and what resources are available to meet situations as they may arise. The chapters on the public and private schools are excellent. The authors recognize that each has its elements of strength and weakness and each is better for some children than for others. The decision for or against one or the other should not depend on whether the child in question is gifted but on other factors in the school itself or in the child's home life and associations.

The discussion of the choice of a vocation is useful for its explanation of the use of tests and for the unexpressed implication that the gifted child can probably succeed in a number of vocations and that there is no one particular occupation that must be found if happiness and success are to be attained.

The chapter on going to college is slanted in favor of college for most if not all bright children and properly so in the opinion of this reviewer. The book, although written for parents, should be read by teachers as well. Its approach is sound, its recommendations practical, and the resources it offers are well chosen and abundant.

J. H. BENTLEY

Wells College

BRIDGMAN, MARGARET. *Collegiate Education for Nursing*. Pp. 205. New York: Russell Sage Foundation, 1953. \$2.50.

In view of the increasing demand for nurses with a broad type of preparation this volume is both timely and challenging.

Much has been written of late concerning the critical shortage of nurses with emphasis upon quantitative needs. In this volume the emphasis is upon qualitative needs. In the words of the author "Inadequacies in the preparation of many nurses for their responsibilities are even more critical than the numerical shortages. Personnel for important functions lack both the foundation and the specialized training requisite for competence" (p. 25).

This book takes the position that "society requires the establishment by higher education of an effective system of appro-

priate types of preparation for diversified nursing functions and the maintenance of standards that will assure competence" (p. 197).

To understand fully the educational problem dealt with in this book some knowledge of the "nursing situation" is essential. The first three chapters present this needed background material which has been carefully selected from a wide variety of sources. Here "is offered a picture of the current situation: the deficiencies in the nursing services, both in the total number of workers and in the proportion of those qualified for various types of functions; the extent and nature of present and prospective demand; and the adequacy of existing educational facilities" (p. 19). This presentation should be particularly helpful to those who are not familiar with nursing literature.

The remaining chapters are devoted to a discussion of collegiate education for nursing—policies, problems, and trends. Four patterns of organization of undergraduate degree programs in nursing are analyzed and suggestions made for the content of a baccalaureate curriculum.

The author finds encouragement in the growing interest of institutions of higher education in nursing education but expresses concern over the failure of many of these institutions to apply to nursing education the same policies and standards as those applied to other professional curricula. "There is," Miss Bridgman states, "urgent need for clear understanding of the specific commitments involved in undertaking responsibility for a program leading to a baccalaureate degree in nursing" (p. 97), and she cautions that the qualifications of candidates for professional functions will not be heightened unless "policies applied to nursing are consistent with general standards of colleges and universities" (p. 97). The author's constructive suggestions for remedying the situation provide much needed guidance for those responsible for the development of nursing education in colleges and universities.

In preparing this book, a report of her study of collegiate education for nursing, made possible by the Russell Sage Founda-

tion, Miss Bridgman has made an outstanding contribution to better understanding of a complex educational problem. It is recommended to all who are concerned with the extension of higher education to nursing.

NELLIE X. HAWKINSON
University of Chicago

GINZBERG, ELI, and DOUGLAS W. BRAY.
The Uneducated. Pp. xxv, 246. New York: Columbia University Press, 1953. \$4.50.

The Uneducated, by Eli Ginzberg and Douglas Bray, is a carefully written little volume which realistically presents the problems created in modern society by the continued existence of the semilliterate and illiterate citizens of the nation. This is a fact-finding study; it centers around the disturbing discovery that almost a million and a half out of eighteen million registrants screened by the Armed Forces during World War II were illiterates, or so poorly educated that they could barely read and write. Of this number, 716,000 were rejected outright by the draft as "mentally deficient," a term which included the illiterate with innate intelligence as well as the individual truly handicapped by mental deficiency.

This conscientious exploration into the background of these facts goes beyond the usual comparisons of southern, northern, Negro, and white literacy to discuss the fundamental concepts underlying all educational policy in America. Such factors as the mobility of the labor force, the impact of immigration, and the financial limitations of the community are investigated. The vague and changing interpretations of what is meant by illiteracy are clearly stated. Frankly pragmatic, Ginzberg and Bray make it clear that their purpose in careful definition is to aid the reader in accurately evaluating statistics which must necessarily, at times, compare tables of not quite comparable content.

One section of the book deals with the specific record of 400 men who graduated from the Army's Special Training Units. It proves, rather conclusively, from the ex-

amples shown, that the illiterate and poorly educated can serve his nation better in time of peace or war if he is given the opportunity to acquire even the minimum essentials of education represented by the ability to read and write, and to do simple arithmetic. The authors trace the performance of the group from their prewar experience, through army training and life, to their postwar adjustment.

Acting upon their own advice that "Caution, modesty, and restraint are necessary virtues for the serious-minded researcher," the authors of this first volume in the projected series of Columbia University's Conservation of Human Resources Project have yet managed to present some very cogent arguments in favor of federal aid to education. Those readers who disagree with this solution of what all must acknowledge "still represents a challenge to the nation" will find it difficult to refute the expertly compiled information available in *The Uneducated*.

DOROTHY RUDY
Cross River, New York

GARBER, LEE O. *The Yearbook of School Law 1953*. Pp. vi, 114. Philadelphia: Lee O. Garber, School of Education, University of Pennsylvania, 1953. \$2.25.

The Yearbook of School Law 1953 presents a review of state and federal court decisions of the past year. The review is organized so as to facilitate the use of the Yearbook as a reference for those who wish to focus their attention on specific items.

Decisions of the past year have added to the precedents of past court decisions. It was found that school districts, as agencies of the state, have an existence of their own apart from the local units of government whose boundaries they may share.

Court decisions have tended to re-emphasize the right of the state legislature to alter or abolish school district boundaries and to affect administrative organization within constitutional limitations. The immunity of the state has been regarded as extending to the agencies and the agents of the state; hence, personal liability on the part of school officers seems to be lim-

ited to the extent that they were personally negligent.

As responsible for financing education, the state generally delegates to local boards of education the responsibility for levying taxes for public education. Questions involving racial segregation have been resolved on the basis of equality of opportunity. With respect to dependency allowances, the court warned that the board was "treading upon dangerous ground," adding that "school committees are not charged with the task of ironing out the inequalities of life or setting up systems of social welfare."

An added feature to the review of court cases for the past year is the summarization of what the courts have said, also prior to the past year, about church and public school relationships. The conclusion is that the principle of separation of church and state has not suffered and that that of religious freedom has been sustained.

Patent in the yearbook is the struggle engendered in the consideration of school district reorganization. One decision specifies the school district as an agency of the state with an existence of its own; another rules that school district property is state property held in trust. These rulings are particularly significant in view of tendencies to regard the school district as a department of city or county government and to look upon school property as belonging to these local units of government.

With respect to the question of state-church relationships, there seems to be an inclination to delineate less carefully, thus creating a common area of church-state operation at the expense of the public and of the public school program.

The foregoing indicates the general nature of the topics discussed and their importance to all who are concerned with public education. The yearbook is a ready source of currently significant actions and has particular value for all boards of education and their personnel. The conciseness of the yearbook and its organization guarantee that the time spent in reading this reference will prove to be time well invested.

University of Maryland

PHILOSOPHY AND RELIGION

KIRK, RUSSELL. *The Conservative Mind: From Burke to Santayana*. Pp. 458. Chicago: Henry Regnery Company, 1953. \$6.50.

What is conservatism? And what resources do conservatives have for "a democracy of elevation," in contrast to "a democracy of degradation"? Mr. Russell Kirk derives his answers to such questions from Tocqueville and from British and American thinkers in the line of Burke. His vigorous and informative exposition makes an important contribution to his subject and is at its best in his treatments of Burke, of the romantic opposition to Utilitarianism, of Disraeli, and of recent struggles of conservative ideas to ascendancy.

Conservatism, or respect for ancestral wisdom, as here presented, professes to value Providential Justice, enjoyment of traditions, natural leadership, the connection between property and freedom, control of impulses by prescription, and slow change through "Providential social forces." It sets itself against reliance upon human perfectibility and reason, upon political and economic leveling, and upon doctrinaire rationalism, romanticism, Utilitarianism, positivism, or socialism.

Conservatives are said to require Burke's vision of society as a spiritual unity; the common sense of John Adams, who advocated a balance of powers; the courage displayed by Randolph in his zeal for local liberties; Tocqueville's tolerance of individual differences; Calhoun's resolution in the protection of minorities; the stern justice in the appeals of Sir James Fitzjames Stephens to political, moral, and religious sanctions; and the catholic learning with which Paul Elmer More sought to persuade democracy of the need for aristocracy.

Partisan claims, however, raise more issues than they settle. Are religious sanctions necessarily conservative? When are conservatives or their opponents unreasonable, and when reasonable? Is British stability unquestionably due to conservative opposition to Utilitarianism rather

than the reverse or perhaps to agreement on rules by which decisions are reached or even to the thoroughgoing character of the reforms instituted in and after 1832? Does it conduce to "a democracy of elevation" to charge a democratic philosophy unsympathetic towards inadequate dualisms with finding in life "no aims but physical satisfaction" (p. 365)? This may look to some dualists (p. 384) like a necessary consequence but does not at all follow in a philosophy in which the assertion of continuity between the natural and the ideal, so far from "degrading" the ideal, actually "elevates" the natural!

In view of current threats to liberty and to the amenities of civilization, we may say a hearty Amen to "the deliberate revival of the concept of traditional wisdom." But we must insist that it be "wisdom."

RICHARD HOPE

University of Pittsburgh

BOULDING, KENNETH E. *The Organizational Revolution: A Study in the Ethics of Economic Organization*. Pp. xxxiv, 286. New York: Harper & Brothers, 1953. \$3.50.

This is the second in a series of six volumes on Christian Ethics and Economic Life sponsored by the National Council of Churches of Christ under a grant from the Rockefeller Foundation. Neither the Council nor the Foundation control the studies or assume responsibility for the findings. Part III, consisting of forty-nine pages, is devoted to criticism by several reviewers, the most significant being a seventeen-page Commentary by Reinhold Niebuhr.

Professor Boulding uses the term "organizational revolution" to describe a general movement in history, particularly during the last century, involving an increase in the number, size, and power of organizations, especially economic organizations, and a great increase in the economic activity of the national state. His purpose is to examine "the impact of this movement on the standards by which we judge economic policy and personal conduct." He is concerned with "practical," as distinct from philosophical, ethics, by which

he means the criteria employed in rating phenomena on some scale of goodness and badness.

Resorting to biological and mechanical analogies, Professor Boulding constructs a theoretical model of society in which the totality of organizations constitutes an *ecosystem*—a self-contained, self-perpetuating system of interacting populations in a state of general, but ever-changing, equilibrium. The behavior, growth, and survival of organizations are determined by their internal structures—the control mechanisms by which they maintain themselves and adjust to their environment. In economic activity the free market is an essential feature of the *ecosystem*.

Within this ecological system large-scale organizations emerge primarily because of improvements in the skills and techniques of organization, principally communication and control mechanisms. These permit expansion by pushing back the limitations of external environment and internal structure. Social needs, or demand, may exercise a minor influence but the major causative forces are to be found on the supply side.

Professor Boulding's *bête noir* is coercion—"no aspect of the organizational revolution is more menacing than the growing efficiency of coercion." Private economic power is bad but tolerable because its coercion is limited and evanescent; the political state, however, is a monster possessing a monopoly of coercive power, the exercise of which violates every principle of Christian ethics. The free market, while imperfect, is consistent with ethical principles because it is noncoercive. Hence, government should refrain from intervention in economic affairs, except to stabilize the economy by fiscal measures and to effect a diffusion of economic power. Policy should be directed toward "the great objective of a noncoercive society."

This is a stimulating, provocative book, full of brilliant insights and personal idealism, but it is essentially negative, mechanistic and deterministic in its ultimate implications. Social ethics can play only a minor role in Professor Boulding's naturalistic, self-contained ecological society. He is his own severest critic when he says:

"I am afraid of justice, seeing always behind it the specter of tyranny." Because he fears the political state he would deny it the right to control economic life in the interest of social justice. This is a fatal prescription for democracy.

HORACE M. GRAY

University of Illinois

JONES, HOWARD MUMFORD. *The Pursuit of Happiness*. Pp. xv, 168. Cambridge, Mass.: Harvard University Press, 1953. \$3.50.

In a judicial opinion of 1922, federal circuit court Judge Van Orsdel declared that "of the three fundamental principles which underlie government and for which government exists, the protection of life, liberty and property, the chief of these is property" (284 Fed. 613, 622). But Jefferson (and before him George Mason) substituted for the third of Locke's famous trilogy of values the more euphonious expression "pursuit of happiness." Certain writers, notably V. L. Parrington, have interpreted Jefferson's revision as significant, as marking "a complete break with the Whiggish doctrine of property rights that Locke had bequeathed to the English middle class." Jefferson had meant, Parrington says, to use language of "a broader sociological conception."

Thirteen years later, the French Declaration of the Rights of Man ignored Jefferson, returned essentially to Locke, and proclaimed "liberty, property, security, and resistance to oppression." Gilbert Chinard sees this departure from Jeffersonian phraseology as indicating a meaningful difference between American and European ideals. "The whole Christian civilization," Chinard observes, "has been built on the idea that happiness is neither desirable nor obtainable in this vale of tears, but as compensation Christianity offered eternal life and bliss after death." Chinard could not conceive of any nation asserting "pursuit of happiness" as a realizable goal except the people of ebullient eighteenth-century America.

The author of this volume of lectures, delivered in 1952 on the distinguished William W. Cook Foundation at the Univer-

sity of Michigan, does not permit himself to get embroiled in such squabbles. The persuasiveness of "happiness" in our cultural development is clear. Everybody knows its meaning, but nobody can define it. It was a commonplace notion among eighteenth-century Americans, not a Jeffersonian invention as the author of the Declaration of Independence would have been the first to concede. Jefferson's verbal refinements did not obscure Locke's main point, that revolution is merely the ultimate means of pursuing happiness.

The idea of pursuing happiness, in its varying manifestations and interpretations, is still at the center of American thought and action. Straying far beyond his own special ken, the Harvard Professor of English explores theological discourse, scientific writings, and leading judicial opinions. The effort is still inconclusive. Even court reports yield no final judgment. "In one case the pursuit of happiness implies happiness in the world to come; in another, it is happiness here and now, with no reference to felicity hereafter." For lawyers, judges, and business leaders, happiness has usually meant unimpeded pursuit of private profit—freedom of contract, "the right of those who own property to control it." Accordingly the judicial veto has been often interposed against state action regulating hours, wages, and other aspects of the employer-employee relation, though the plain intent of all such legislation was to promote happiness. As a corrective of these oversimplifications, the author turns to Emerson and William James—to the psychologists and psychiatrists, to considerations of happiness as "adjustment." The publication of James's *Principles of Psychology* in 1890 is seen as a turning point. "Happiness, decisions of the Courts to the contrary notwithstanding," the author concludes, "has been transferred from the sphere of law to the sphere of psychology. Not the public life of political science and economics, but the inner life of impulse and emotion—here in the twentieth century, most Americans seem to agree, is the sphere of felicity."

The author has ranged widely; his pages are crowded with apt quotations and dis-

cerning comments on American ideals. His book is completely satisfying.

ALPHEUS T. MASON

Princeton University

LAVAU, G.-E. *Partis politiques et réalités sociales: Contribution à une étude réaliste des partis politiques*. Pp. 169. Paris: Librairie Armand Colin, 1953. 525 fr.

Lavau's book consists, in its first part, of a series of arguments against those who regard systems of voting as dynamic agents, capable of bringing to bear the impact of political "form" on social "matter." Insofar as these attacks are detailed, their immediate object is Maurice Duverger's volume on political parties. Michel Debré and this reviewer also get into the line of fire.

The second part of the volume is given over to a discussion of the "real" (economic, social, and other) factors which, in his opinion, primarily shape the structure of a particular party system. The true implications of his approach become clearer in the introductions and in the conclusion than in the rather sketchy remarks on the party systems in Canada, the United States, Britain, Switzerland, Sweden, and France. Lavau's guns are not trained alone on Duverger, Debré, and Hermens, but on the entire discipline of political science. Perhaps, he says, there never will be a political science; certainly, there is nothing deserving of the name now (p. 6). Political facts should be analyzed with the tools of "law, sociology, geography, economic and financial science, statistics, and demography." What is called "political science" has but a "dependent and residuary character."

From a practical point of view it is, perhaps, more important that Lavau is a determinist. Hegel's *Alles was ist, ist vernünftig* is his guiding maxim; political scientists are suspect to him because they feel that certain political institutions have a dynamic influence of their own and can, therefore, act as instruments of social control.

The details of Lavau's determinism are, primarily, to be found in national characteristics and, secondarily, in a number of

other factors, of which the economic ones occupy first rank. Badly digested Marxism is an essential ingredient of this view. Lavau's insistence on the factors mentioned as the only ones constituting "reality" (see in particular pp. 164-166) is closely related to the failure of orthodox Marxism of distinguishing between society, with its inevitable multiplicity, and the state, with its equally inevitable characteristic of a unity which is primarily a unity of action but, to the extent that it is needed, also unity of thought.

If Lavau holds that social "matter" is everything, and political "form" nothing, it does not follow, of course, that the reverse is true. Social and economic factors do have their importance and, at times, they are decisive. Lavau is, however, amateurish in their analysis. For example, when asking himself why there is a successful Labour party in Britain and not in the United States, he overlooks the simple fact of the difference in the marginal productivity of labor. Nor is he, to take the case of geography and its political effects, aware of what he could have learned for a truly realistic understanding of the common characteristics of the political parties of Continental Europe by starting out with the discussion of militarism contained in Numbers 5-8 of *The Federalist* papers, and following through with the sociopolitical consequences of the facts described so lucidly by men who spoke of a "science of politics" and its possible contributions to social control, with competence and assurance, more than a century and a half ago.

Lavau congratulates himself (p. 161) on not having published his analysis of Hauriou. He would have had even more reason for self-congratulation had he given evidence of the same wisdom in regard to the present volume.

FERDINAND A. HERMENS

University of Notre Dame

REISS, SAMUEL. *The Universe of Meaning*. Pp. xi, 227. New York: Philosophical Library, 1953. \$3.75.

This book is the second by Mr. Reiss in the general area of semantics. The first (*The Rise of Words and Their Meanings*,

New York: Philosophical Library, 1950), summarized in an appendix to the second, expounded the novel theory that the stock words of any language are "action" words associated with the sound of striking—for example, "plop" and "bump"—all "non-striking" meanings being derivative of such by the poetic process of metaphor or imagined resemblance. The conclusion is that the bulk of our words now have meanings which are "effected in the mind" and which neither "reside in the word" nor "tag or clamp down" an object. Just how meanings are related to words and objects is the problem of the present book.

The author develops the answer in terms of three descriptive characterizations of meaning. First: Meanings are "autonomous conceptual constructs." The interpretative mind, stimulated by the flowing continuum of sensory data, creates meanings which, though suggested by sensory data, differ from them in being mutually exclusive items. Whereas sensed "red" and "green" flow into each other, the "meanings" of "red" and "green" never do so. Furthermore, once created, these meanings maintain a "semantic existence" autonomous of the experience which originally suggested them. The neglect of this "mathematical" character of meanings causes much confusion in human discourse.

Second: Every meaning has as an integral part of itself that element of its background with which it is in contrast. The sharper meanings of experiences occur in pairs, some of which are key concepts in thought and discourse, such as "right-wrong," "true-false," and "symbol-meaning." Neither one of a pair of "polar-related meanings" is significant except as thought in conjunctive contrast with the other.

Third: Though meanings are autonomous with regard to words and objects they are not so with respect to the user. No matter how formalized or "objective" a meaning may appear, there is always an essentially personal, "intended," or "postulated" aspect of it, even in scientific discourse.

Mr. Reiss uses these basic notions as weapons in a spirited attack on "formalism" in all areas and as keys to certain

paradoxes and problems of logic, mathematics, and general philosophy. This book, though sketchy throughout and philosophically thin in spots, is provocative and richly suggestive, perhaps in part by reason of its independence of the beaten paths through its region of discourse.

WILLIS MOORE

University of Tennessee

NIKHILANANDA, SWAMI. *Vivekananda: A Biography*. Pp. viii, 216. New York: Ramakrishna-Vivekananda Center, 1953. \$3.50.

This volume may be justly commended both for its subject, Vivekananda, Hindu apostle to the West, and for its object, the persuasion of Westerners to understand Hindu idealism and to count it of value as Indo-Western interests mingle. It is well written by an earnest, devoted, and competent disciple of the subject who would indeed commend the Ramakrishna-Vivekananda Gospel to Indians and Westerners alike. Whatever ground of criticism it holds is inherent in its theme—but the theme is worth attention and analysis.

Narendra Nath Dutt, or "Vivekananda," of the Hindu *kayasth*, or "writer" caste, was born in 1862 in Calcutta and died there in 1902. In these short years, however, he traveled widely, was introduced to America at the Parliament of Religions in Chicago, 1893, and founded in America in 1899 the Vedanta Society, having previously in 1897 founded in India the Ramakrishna Mission—all to carry on the work of a succession of reformers of the Hindu order who would make of this congeries of doctrines, rituals, and forms something pure enough for universal acceptance. As our author represents it, Vivekananda would have his people "go back to the perennial philosophy of the Upanishads" (p. 121) and to find peace of mind through "unselfish service" (p. 122).

But our author has much to struggle with! And the competent student of Hinduism may read much into the volume—or out of it—which it does not explicitly contain. It idealizes thoroughly what it deals with; it has to deal with inconsistencies and contradictions in the Hindu order for the sake of making Vedanta

comprehensive; it seems even to read late politics into earlier Hindu thought (cf. pp. 113, 125)—yet Vivekananda himself was something of a politician! It runs thin, in fact, in making out its case for "religious universalism" (p. 130).

Want of space, however, cuts down this review, and only a brief suggestion may be added with reference to Vivekananda's and the Vedantic teaching. Vivekananda's inspiration came from the mother-goddess Kali (pp. 141, 177) and his support from her and Shiva (p. 148). He considered essential Hinduism comprehensive, its idols mere symbols, the many deities aspects of the Eternal One, all religions fundamentally true (cf. Christ, p. 112). Yet he relied immensely upon solitude and meditation (pp. 3, 31, 45, 53, and others), upon "non-injury" (*ahimsa*), and had place for *maya* and transmigration as in the Hindu order. In the end he saw no union of East and West (pp. 162–163)! He has won many followers, however, in the West, and has his rightful place, as the volume shows, in the history of religion.

JOHN CLARK ARCHER

Yale University

ROSS, ALF. *Why Democracy?* Translated by David Gatley-Philip. Pp. viii, 249. Cambridge, Mass.: Harvard University Press, 1952. \$4.50.

"The purpose of this book is not to convert autocrats to democracy, but to get those who are democrats in their 'innermost selves' to understand as clearly as possible the implications of democracy."

Alf Ross, a Dane, composed this essay on democratic ideas and institutions, in response to the occupation of his country by the "Herrenvolk" in World War II. It has been translated for English and American readers by Mr. David Gatley-Philip of London. Considering the stimulus, the tone of this volume is unexpectedly diffident, measured, and restrained. Ross's essay will make no pulses rise nor hearts swell among the common or uncommon peoples of the earth. It is addressed to reasoning beings and demands some effort on their parts to appreciate its message.

The essay considers first the tradition of Western political thought with particular

notice to the ideological forebears of modern liberal democracy. In this connection, much more notice is given Rousseau as the great theorist of modern democracy than this reviewer would support. The modern criticisms of democracy are also reviewed. Ross next reviews the meanings of the word "democracy" in the contexts of politics, economics, and sociology. The ideology of democracy is analyzed in terms of political liberty, economic and social equality, personal freedom, and the use of peaceful procedures for reconciling individual and group differences. The criticisms of democracy by modern authoritarians of left and right are reconsidered and finally the relations of various democratic processes and procedures to the idea are considered.

The following propositions represent the major conclusions of this work: Democracy for its effective realization requires an adequate standard of living and a suitable and extensive system of general education and moral training. Democracy is a separate and distinct idea from nineteenth century liberalism in politics and from capitalism in economics. It is not necessarily dependent on either. Socialism and democracy are not necessarily incompatible, but the socialists must love freedom more than equality. Democracy cannot endure widespread economic exploitation and must offer tangible economic betterment to the masses. Democracy should not open its public offices or, in some cases, even its platforms to those whose real aim is to destroy it. The older conceptions of pure or direct democracy as reflected, for example, in the initiative and referendum are not as appropriate as formerly, and we must accept representative democracy, entrusting larger responsibilities to popularly selected leaders. To survive modern conditions, in fact, democracy must discover new techniques for holding managers and bureaucrats, upon whom we more certainly depend, responsible. The strongest support for democratic ideals is the Christian humanist tradition of the West.

Most of these propositions, as well as many others of less importance made by the author, are unexceptionable. They are also quite widely recognized and accepted

by American political scientists. Ross does, I believe, an adequate job of stating the meaning of, the case for, and the problems confronting the democracies of the world. He adds little, however, to what is already known and understood by thoughtful democrats in this country. All of the problems remain as before even though they are here very nicely, if a bit dryly, stated.

WILLIAM H. YOUNG

University of Wisconsin

WHITE, R. J. (Ed.). *Political Tracts of Wordsworth, Coleridge and Shelley*. Pp. xlii, 303. New York: Cambridge University Press, 1953. \$6.00.

This collection of cogent essays by three Romantic poets ("The Statesman's Manual" and "A Lay Sermon" by Coleridge, "The Convention of Cintra" by Wordsworth, and "A Defense of Poetry" and "A Philosophical View of Reform" by Shelley) is intended "for students of political thought." Texts not easily available are now gathered into one volume; they grapple with political problems from the high level of principle rather than of practical reforms (though Shelley, it will surprise some, is most specific and realistic on the subject of contemporary problems). The style of the essays is dignified with sundry passages of striking eloquence. The texts are not complete, but all that concerns political thought is retained. Shelley's "Defense of Poetry" suffers the severest cutting. The editor adds a clarifying introduction and thirty-six pages of informed commentary.

The introduction is objective but the editor is more sympathetic with Coleridge and Shelley than with Wordsworth. Is this because of the many examples of Coleridge's acute insight and the arresting sentences that so often call for admiration; is it because the sheer splendor and singing fervor of Shelley win the assent before the queries of logic can be raised? The editor does not say this, but simply contrasts Wordsworth's unshakable faith in the common man with Coleridge's address to "the higher and middle classes," and Coleridge's philosophy with Wordsworth's emotion and ardor. Wordsworth's essay is perhaps over-

long, but its faith in the people is not greater than Shelley's in *A Philosophical View*, and it was of course stimulated by a particular occasion. The best defense for it is the words of Bacon that Wordsworth prefixed to his essay: "... men cannot contend coldly, and without affection, about things which they hold dear and precious... a feeling Christian will express, in his words, a character of zeal or love."

It is this generous zeal and love for the melioration of mankind that inspire all these writers: Coleridge leaning toward a re-educated "clerisy" and revitalized church, Wordsworth stanchly maintaining his faith in the common man and suspicious of statesmen, Shelley leading forth the poets as "unacknowledged legislators" and entrusting the future to them but also to enlightened men of science. To zeal and love must be added Imagination (often called "Reason" by Coleridge and contrasted with the more limited "Understanding"), the power in which all these writers placed their highest faith. Imagination was not a single, separable mental faculty but the integral mind operating at its highest potential. Imagination discovered a vital and organic, not a mechanistic, universe. The universe and its inhabitants were not static or in a state of decline; they were dynamic, plastic, and improvable. Imagination and its product, the arts, could be a leading force in the regeneration of mankind. "For the great secret of morals is love; or a going out of our own nature, and an identification of ourselves with the beautiful which exists in thought, action, or person, not our own. A man, to be greatly good, must imagine intensely and comprehensively; he must put himself in the place of another and of many others.... The great instrument of moral good is the imagination...."

Colder spirits will decry such enthusiasm, but so long as sanity and realism are not sacrificed, it is as well to take a high as a low view of man's nature and capacities. Plato's *Republic*, the New Testament, and the Declaration of Independence might be cited.

NEWELL F. FORD

Stanford University

BAKUNIN, MIKHAIL. *The Political Philosophy of Bakunin: Scientific Anarchism*. Compiled and edited by G. P. Maximoff. Pp. 434. Glencoe, Ill.: The Free Press, 1953. \$6.00.

It is useful to make available in English adequate and topically organized selections from the works of Bakunin. It was a worthwhile undertaking, especially given the ephemeral character of much of his writing, and the incompleteness of any edition in any language, and indeed the rather fantastic lack of order which has marked partial or frustrated attempts to present the corpus of his thought. The present topical arrangement, with analytical subheads provided by the late anarchist thinker G. P. Maximoff, does make it possible to grasp the range and content of Bakunin's reflections on various major philosophical and political topics, though it will not be entirely serviceable to anyone concerned with the development of his ideas through his life. Bakunin's own style and the conditions under which he wrote did not, however, initially facilitate systematic presentation, which in any event was not in accord with the temperament of this activist propagandist of freedom through violence.

The text proper is preceded by a biographical sketch of Bakunin by Max Nettlau, itself a fascinating historical document, though not one greatly illuminating as to his ideas or revealing of his life apart from its continued unsettledness and his sustained determination and enthusiasm through insecurity, imprisonment, and conflict. This biography is in turn preceded by an introduction by Rudolf Rocker, which provides some useful guidance to Bakunin's writings and editions, as well as an appreciation of Maximoff.

The work proper, plus these two essays, constitutes a sort of monument to philosophical anarchism in its modern form. Preceding all of these is a so-called "Publisher's Preface" by Bert F. Hoselitz, which is highly useful as a brief essay on the history of anarchism, on the essence of Bakunin's thought, and on the nature of his contribution in and to the movement. Dr. Hoselitz perhaps puts too much emphasis

on the petit bourgeois nature of modern anarchism before Bakunin, though he properly stresses the significance of Bakunin in turning it from a theory of political speculation into one of political action, and notes its transformation into a doctrine for the proletarian masses. He also rightly emphasizes the two elements of libertarianism and of violence in Bakunin's thought, though the combination of the two constitutes a lasting puzzle in theory, if not in biography, which he does not here attempt to solve.

Whether, as Hoselitz claims, Bakunin's thought deserves greater attention than it has received in this country remains questionable. In any event this work, plus E. H. Carr's well-known biography, should provide sufficient information on Bakunin's life and ideas and a sufficient volume of his work for the enlightenment of all save specialists.

THOMAS I. COOK

The Johns Hopkins University

HIGGINS, H. RALPH. *Christianity and America's Social Problems*. Pp. 125. New York: Comet Press Books, 1953. \$3.00.

Vigorously written and wholesome is this little book on the challenge to Christianity of the contemporary social scene in America. It is in the high Kingdom-of-God tradition which has lately been enervated by a too grim theology and defamed by an intransigent social conservatism. The author, who is an Episcopal minister with professional training in the law, is essentially conservative in all his social and political judgments. "Western civilization," he affirms, "has achieved the best forms of society thus far developed among men." Yet he contends for an independent Christian testimony: "Christianity must stand in constant judgment upon the social order."

Dr. Higgins is strongly opposed to monopoly, of which he finds labor as well as business management guilty. He shares the current concern of business over the growth of governmental power. Yet he comments: "In a very general way business, commercial, and banking interests are striving for weak government except when

it serves their special purposes that the government be strong—for example, when labor forces a crippling railroad strike. Labor, on the other hand, feels that it is so politically powerful that a strong government will assure its victory in conflicts with business and industrial management."

With respect to political action the author makes the not uncommon plea that every citizen use the franchise and that "men and women who have proved themselves successful in their careers, and who are sincere in their basic Christian commitment" run for office. The problems here are much more complicated than the brief treatment suggests. It is questionable whether there is any simple duty to vote, period. If the prior duty to become an informed citizen is discharged, the "duty to vote" will probably take care of itself. And running for office is only the last act in a long process of participation in party politics for which probably few of Dr. Higgins' readers have the requisite patience and hardihood.

The author rightly includes among the many important issues he discusses the place of religion in general education. "Whatever may be one's personal view," he writes, "religion and ethics are part of our culture and it ought to be possible to convey the religious and ethical contributions of our heritage without surrendering to sectarian pressures." Unfortunately, this portion of the book was evidently written before the Supreme Court in the *Zorach* case had formulated its present doctrine, which is in sharp contrast to the rigid legalism that characterized the ruling opinion in the *McCullum* case. Closely related to this problem is the author's timely appeal for an improvement in Protestant-Catholic relationships.

Dr. Higgins has presented an analysis of Christian social responsibility that is realistic and judicial, yet free from the sophistication and somber pessimism that characterize much of the literature of Christian ethics in our time.

F. ERNEST JOHNSON

New York City

McFARLANE, K. B. *John Wycliffe and the Beginnings of English Nonconformity*.

Pp. 197. New York: The Macmillan Company, 1953. \$2.00.

This addition to the "Teach Yourself History Library" supports the claim of the general editor A. L. Rowse that the "most congenial . . . and practical approach to history is the biographical," for of Wycliffe the author writes: "As a scholar, politician, preacher and rebel he touched his times at so many points that to follow him through his various avocations is to learn much that is worth knowing about the England of his day." In preparing a book intended for both scholar and layman, K. B. McFarlane, has done an excellent job. He writes with a confidence born of a knowledge of the sources, and he writes with imagination. For example, "The St. Albans chronicler, barking from the security of his monastic kennel, was loud in his scorn for episcopal time-servers."

The study is most provocative—there are so many misconceptions to correct since most of what has been written about Wycliffe has appeared in "works of edification rather than of history." The picture Mr. McFarlane draws of Wycliffe is strange though not unhistorical. He finds him to have been a notable scholar and prodigious worker, yet "repetitive, disorderly and incomplete" and on doctrines such as transubstantiation "not sure himself what to think"; sincere and virtuous though inclined to be caustic and arrogant in controversy; politically inept and without the influence upon Lollardy, Hussitism, and Protestantism commonly attributed to him. Similarly strange is the open mind with which Dr. McFarlane views the intellectual traditions of Oxford whether in Wycliffe's day or after, the system of papal provisions, the career of John of Gaunt, Archbishop Courtenay's success against Lollardy at the university, and the proceedings of the English hierarchy in the eradication of that heresy. He calls these bishops "humane, hesitant, almost squeamish" in their movements. "That they have been depicted otherwise since the days of Foxe does not say as much for English historians." Particularly convincing is his description of the transformation Lollardy underwent, first as a consequence of the

defection of its Oxford leaders, then of that of the few knights who were associated with the movement prior to the fiasco of Oldcastle's revolt—if one may call something a movement which affected no more than an "insignificant minority." Because of the loss of its conservative elements, it was the Brownists and Independents, not the Anglicans, who fell heir to the Lollard inheritance.

To offset the unwarranted attack negative Protestants and nativists will mount against Dr. McFarlane's study, one may feel justified in withholding mention of the occasional tree the author has overlooked or misconstrued in his anxiety to keep his eyes on the woods.

JOSEPH H. DAHMUS
Pennsylvania State College

COMMONWEALTH OF NATIONS

BROWN, W. NORMAN. *The United States and India and Pakistan*. Pp. xi, 308. Cambridge, Mass.: Harvard University Press, 1953. \$4.50.

The tone and scope of this book are objectively analytical and successfully carry the reader through a labyrinth of data from the history of the Indian subcontinent. The story of India's evolution is narrated here according to (1) historic and geographical facts which have made India an economically indivisible land-mass area; (2) impacts of influences wielded by native and foreign personalities of distinctive character; and (3) geopolitical forces that have plunged India into recurring crises and which force her toward a new social order.

This has become a survey study of the ancient Indo-Aryan, medieval Muslim, and modern Western culture-conflicts which have been waged on the soil of India. It is a calmly confident study typical of the scholarship status of Dr. Brown and expressive of his background of missionary parentage and responsibilities of highly confidential research assignments during the Second World War. He states what the students of the Indian subcontinent know and what they often conveniently

fail to know. He indicates his deeper cultural sense, the vagaries of Western prejudices and aggressive superiority complex, and the numerous presumptions and pretenses of the Hindu-Muslim and the American minds.

This book is at once useful for the American foreign policy makers and for the general enlightenment of serious-minded Americans. If it should achieve popular appeal, it is likely to go far toward absolving Americans from the frequent accusation leveled at them for their superficial and sensation-seeking reading habits. Dr. Brown admits the difficulties in achieving such appeal even among the academically educated Americans. Unless such efforts to lay accusations in both the United States and in the Indian subcontinent assume real proportions, the facts of mutually damaging propaganda efforts will neither lose their influence nor will their impact cease to create embarrassing hurdles for all concerned.

All such products of heavy and comprehensive scholarship tend to acquire "retentive, revisive or revolutionary character." This effort of Dr. Brown's seems to this reviewer to be a product of a mixture of the first two trends and is likely to promote, at best, a revisive inspiration. It is not thought-provoking like the revolutionary analysis of facts and events which the British historian Arnold Toynbee has been marshaling to expound the shape of things to come. We are living in a world in which "partition technique" for political policies has locked horns with "provocative economic integration policies." Both being aggressively vital, they have challenged the validity of the American pattern which stands for a union of autonomous federal economy of interests. To make the American ideological pattern applicable to nations like India and Pakistan much more will have to be done. This book will serve well to provide groundwork and perspective. More forthright studies to make the American policy makers understand the need of making Americanism serve as a "third force" will have to be made in order to meet the challenge to modern scholarship.

Dr. Brown's scholarship status as an ori-

entalist and his first-hand familiarity with the details of events and temperaments of the leaders of Indian and Pakistani movements lend authority to his exposition.

RAJARAM VINAYAK GOGATE
Washington, D. C.

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT. *The Economic Development of Ceylon*. Report of a Mission organized by the IBRD at the request of the Government of Ceylon. Pp. xxxiii, 829. Baltimore: Johns Hopkins Press, 1953. \$7.50.

The Dominion of Ceylon, a land fascinating anthropologists, where remnants of an original Indo-Australoid race dwell, also is fascinating economists, agriculturists, and educators. The Government of Ceylon requested the International Bank for Reconstruction and Development, in May 1951, to send a mission to survey the potentialities of agriculture, especially rice cultivation, mixed farming, dairying, colonization, and resettlement; irrigation; fisheries; minerals; power; industrial development; inland transportation and shipping; vocational training; health, including housing and water schemes; and a general economic and financial survey consisting of public finance, money and banking, savings and investment, and balance of payments. The Bank organized the Mission, with the cooperation of two other international agencies. The chief agriculturist was nominated by the Food and Agriculture Organization of the United Nations, and the World Health Organization named the specialist in health.

The Report is divided into two parts. Part I outlines the main problems of Ceylon's economy. It contains the conclusions and recommendations of the Mission. Part II analyzes the background and problems of the various fields. The Summary (pp. 120-131) lists 78 of the most important practical recommendations of the Mission. A sampling of these recommendations shows the wide scope of the studies undertaken.

A Ceylon Institute for Applied Research should be formed. The Electrical Undertakings Department should be changed into

an agency comparable to the British Electricity Authority. Food subsidies should be eliminated gradually. Government policies should encourage maximum efficiency and research in the export industries (tea, rubber, and coconuts). Land tenure should be improved. The first step in this direction calls for the "Torrens system of registration." The present backward state of animal husbandry should be remedied by a 25-year plan based upon cattle breeding and development of the milk supply. Sound cottage industries should be encouraged. Civil aviation ground facilities should be modernized. The government should initiate a campaign to popularize the planning of parenthood in order to check the rapid increase of population.

The recommendations include ten relating to education and technical assistance. The University of Ceylon should be expanded with special attention given to the departments of agriculture and engineering. The advice of specialists from national and international organizations should be sought for the Agricultural Department, Irrigation Department, and Electrical Undertakings Department. Teachers' training colleges should be enlarged to provide for the graduation of 2,300 yearly.

The United Nations agent, the government official, the importer and exporter, the seminar director, the candidate for a higher degree—all will welcome this study of Ceylon and add it to those IBRD studies thus far published, dealing with Colombia, Cuba, Guatemala, Iraq, Jamaica, Nicaragua, Surinam, and Turkey.

RYAN, BRYCE. *Caste in Modern Ceylon*. Pp. ix, 371. New Brunswick, N. J.: Rutgers University Press, 1953. \$6.00.

Careful study of caste in South Asia indicates the degree to which color castes in the United States depart from a social structure founded on family honor and on subordination of marital choice to family integrity. This comparative insight, however, is only an incidental contribution of *Caste in Modern Ceylon* to the social sciences. The author sheds clear and wel-

come light on a long murky subject and on a world area that has been neglected sociologically.

Origins of caste in Ceylon are wisely passed over for examination of sound historical material. In a neat demonstration of the age-area hypothesis, Ryan suggests that the Sinhalese system may represent the caste structure of India prior to Brahmanical influences. A distinction is then drawn between the Brahmanically founded four-tier ideal caste system versus the actual manifestations of the caste structure—an analysis badly needed for the subcontinent. The reader is led to see how the caste system influenced the organization of foreigners who came into contact with the system. "Case material"—brief sketches of a series of villages distributed in different regions of the island—shows how the national picture is comprised of regionally distinct patterns of caste organization. These sketches are also a reminder of the thinness likely to characterize descriptions of national culture and call attention to the need for careful sampling by students who choose to work on this level. Anthropologists interested in area research can take several lessons from the author.

Contemporarily caste is less in process of disintegration in Ceylon than in reorganization. Caste as a prestige determinant is losing its former importance in favor of occupational and political factors. The system is manifestly incompatible with the revolution that has oriented Ceylon toward the nationalistic, democratic patterns of the West. Political scientists will be interested in how caste communalism manifests itself in voting behavior.

Bryce Ryan went to Ceylon in 1948 as first Professor of Sociology at the University of Ceylon. Extensive field research underlies the material of this book. The volume should become one of lasting value to students of social organization and to specialists in South Asian culture.

JOHN J. HONIGMANN
University of North Carolina

HUTT, ALLEN. *British Trade Unionism: A Short History*. Pp. 200. New York: International Publishers, 1953. \$2.25.

The author of this brief account sees four periods in British trade union history: (1) an early revolutionary one, (2) the mid-nineteenth century when the skilled craftsmen successfully organized, (3) the later militant "new unionism" of the semi-skilled and unskilled workers, and (4) the era of the great wars when labor tamely took its place as part of the social machinery of the State. He looks forward hopefully to a fifth period when unions will emancipate themselves, adopt forward looking policies, and play a radical and fundamental part in social reconstruction; this outlook is throughout so dominant that the book could serve as a political pamphlet. It is no accident that the index shows more references to the Communist Party than to the Labour Party and that citations reveal reliance upon Communist sources far out of proportion to that Party's importance.

As portrayed here trade union history is mainly a record of industrial strife. At the outset the author quotes Engels approvingly to the effect that the unions were schools of war to prepare workingmen for the inevitable revolution. At the end he does not account for the fact that the years following 1945 saw only one-sixteenth as many working days lost in stoppages as in a comparable period following the peace of 1918; Hutt records mainly the sporadic strikes, the left-wing minority movements, and Communist-inspired moves for "working-class unity." As the nineteenth-century moderates were the earlier targets of his polemics, so it is later with Bevin and Citrine. Always the rank and file are treated as essentially progressive and militant; actually, except in such periods as the Councils of Action of 1920 and the great strike of 1926, the movement has stood to the right of its leaders.

In the treatment of political issues the "Party line" shows clearly. Wartime collaboration after 1914 harnessed the working class to "the war chariot of imperialism" and to "the central organ of class rule, the State" (p. 69). There is a similar denunciation of the Labour leadership in 1939, although, needless to say, after the German attack on Russia all things become right that had been wrong before. The

postwar Labour Government's record is attacked as one of futility at home and of imperialism abroad; the only hope for the future, accordingly, rests in an alliance of Communists and leftists to provide "the resolute class leadership that the hour demands" (p. 195) and in a "linking with the peace forces in the world—the Soviet Union, the Peoples' Democracies, People's China—and a break with aggressive America" (p. 196).

Stanford University

TAWNEY, R. H. *The Attack and Other Papers*. Pp. 194. New York: Harcourt Brace and Company, 1953. \$4.50.

This is a slight volume of occasional essays, first appearing in print between 1916 and 1950, by the well-known English economist, who has become recognized for his efforts to reconcile in socialism the deep differences between economics and morals.

These articles are of varying interest and importance. Most engaging among them are the earliest ones, which have no connection with economics, but tell of Tawney's personal experiences in World War I. It is evident that the horrors and monotony and squalor of combat have made a deep imprint upon his imagination and imbued him with a fiery hatred for the brutality and stupidity of such a way for settling international differences. Yet, when he wants to express British ideals in World War II, he is forced to the conclusion—once more that for free men there can be a fate worse than extinction.

His approach to economic systems—and especially socialism—is at once sympathetic and sardonic. At one point he explains it by observing that "a large dose of imbecility is a necessary ingredient in any movement which aspires to be representative." But in another passage he interprets the ground swell which eventually brought the Labour Party into power, followed by such broad areas of industrial socialization, in this fashion:

"It is idle to blazen Liberty, Equality and Fraternity on the façades of public buildings, if to display the same motto in factories and mines would arouse only the cynical laughter which greets a reminder

of idealism turned sour and hopes unfilled. What men desire is, not paragraphs in constitutions, but results, in the form of arrangements which assure them the essentials of a civilized existence, and show a proper respect for their dignity as human beings."

He sees socialism as nothing sacred or perfect, but as a substitute which needs to be given its chance when laissez faire capitalism, enfeebled by two wars, fails to answer the economic needs of the nation.

ALPHONSE B. MILLER
Philadelphia, Pennsylvania

ORLAND, HAROLD. *Utopia, Ltd.: The Story of the English New Town of Stevenage*. Pp. xvi, 313. London: Routledge & Kegan Paul (distributed in the U. S. by Yale University Press), 1953. \$4.50.

This very interesting and readable book about an experiment in planning was never planned as written. As the author, an American cultural anthropologist, explains, he had set out to write a monograph on the old town of Stevenage, but gradually shifted his focus toward the problems posed by the "New Town" which the National Government began to develop immediately after the war as the first of the "Satellite Towns" which were to relieve the concentration of population in London County. In his own words: "finally he concentrated his attention upon the New Town and the sociological problems it posed," summing up his discussion in the question: "Must utopia, realized, always disappoint?" This is a curious misinterpretation of his own work by an author. At the time of his writing, the New Town of Stevenage was not yet a reality and could therefore neither pose sociological problems nor disappoint—or satisfy—anyone. In fact, the author deals with two rather separate subjects: first, with a theoretical discussion of the problems which the town is expected to pose in the future, if and when it will be built and inhabited; and second, with a description of the problems—and disappointments—which have arisen in the process of developing the town, in particular in its relations with the old town of Stevenage and the various interests and ideas of its inhabitants. "The resultant sequence of

events," as he states, "reproduced in miniature the cosmos of a modern democracy's relations with its citizens."

It is in dealing with this second theme that the author makes an original and valuable contribution, which is presented mainly in Chapters V, "Local Interests," and VII, "Council-Planner Relations." This is an excellent analysis of the social structure of the old town, of the interests and attitudes of its various groups and of their interaction, and of the functioning of local politics and local government in an unprecedented situation. It is illustrated by a vivid description of much significant detail and is only occasionally marred by the "cultural relativist's" absolute contempt for believers in cultural absolutes, such as the sneer at the "rural cult" as a "disease that has ravaged England remorselessly."

Chapters VI and VIII, on the workings of the Development Corporation and the Ministry, are able illustrations of the familiar theme of the functioning of bureaucracy. The first three chapters are well-written summaries of the history of the New Towns Act, of the old town of Stevenage, and of the Stevenage Project. The fourth, containing some incisive comments on the planning concepts of the "balanced community" and of the "neighborhood," but also a rather confused and unnecessary discussion on "flats versus houses," suffers somewhat from the author's limited experience of the problems discussed.

As the author acknowledges in a candid appendix, "some errors of proportion" may have given an unduly negative picture of the Stevenage enterprise. These errors are magnified by the loose use of such terms as "planners" and "utopia," as in the phrase: "The utopian design of improving the human condition by human means"; an interpretation which would make all and any human action "utopian." It might have been more pertinent to point out that the three main obstacles to the development of the New Town, described by the author—first, the acceptance of the proposal by the Town Council without participation by the citizens, in the spring of 1945; second, the discrepancy between the inflated market value of property and the

legal value for compensation, frozen at prewar levels; and third, the cutting off of all funds for New Towns in 1947 because of the dollar crisis—were all direct effects of war, present, past, or anticipated. If the story of Stevenage has a moral, it is that not only utopia and planning, but democracy and welfare as well, are narrowly limited without peace.

HANS BLUMENFELD
Philadelphia, Pennsylvania

WILLIAMS, FRANCIS. *Ernest Bevin: Portrait of a Great Englishman*. Pp. ii, 288. London: Hutchinson & Co. (distributed in the U. S. by the British Book Centre), 1953. \$4.50.

One of the occupational hazards facing the student of British Labour is the prevalence of the "Horatio Alger" approach to the writing of biography and autobiography. Mr. Williams is, therefore, all the more to be congratulated for this fine study. His careful assessment of Ernest Bevin's life, faults and all, lends depth to one of the spectacular success stories of recent times. Whether or not Bevin was quite the great Englishman of Mr. Williams' subtitle, he was certainly a key figure in the twentieth-century history of Great Britain and, it may be, of the world. At various points of his career, his impact was critical on the structure and aims of the trade union movement, on the direction of Labour party policy, and on the character of British foreign policy. His personality was as interesting as his work was significant. Ruthless and sentimental, vulgar and sensitive, egomaniacal yet genuinely devoted to the class from which he sprang, he was a great deal more complex than appeared from his public pose as a kind of workingman's John Bull.

All of this comes out quite strikingly in this biography. Bevin's first contacts with trade unionism in Bristol, his making of the gigantic Transport and General Workers Union, his role in the debacle of the Triple Alliance in 1921 and again in the General Strike of 1926, his struggle for collective security in the Labour party during the nineteen thirties, and finally his brilliant job at the Ministry of Labour during World War II are discussed with

candor and with an insight born perhaps of the author's own long experience on the *Daily Herald* and in the Labour party.

Somewhat less satisfactory is the treatment of Bevin at the pinnacle of his career, when he took over the Foreign Office in Britain's postwar time of troubles. There will perhaps be little quarrel with his emphasis on Bevin's importance in the slow forging of Western resistance after 1947 or with the argument that the Marshall Plan was to a large extent Bevin's own creation. But Mr. Williams tends to minimize mistakes which were made during this period as well. He plays down, for example, Bevin's stubborn mishandling of the Palestine issue, and attempts to place the burden of responsibility upon pressure groups in the United States—an analysis which may have some validity, but which hardly serves to explain Bevin's bumbling. On the whole, however, Mr. Williams makes few dogmatic claims for this part of Bevin's career. He is content to describe its high points and wait for the future to render final judgment. This will not be the definitive biography of Bevin, but until such a study becomes possible it will serve very well indeed.

HENRY R. WINKLER

EYCK, ERICH. *Pitt versus Fox, Father and Son: 1735-1806*. Translated by Eric Northcott. Pp. viii, 396. London: G. Bell and Sons (distributed in the U. S. by The Macmillan Company), 1950, 1952. \$4.50.

If one might use terminology of a five-year-old, this book is about "good guys" and "bad guys," about the Foxes and the Pitts. It is the political history of England 1735-1806 as illustrated by Henry and Charles James Fox and the Elder and the Younger Pitt. So dazzled is the author by his German "Liberal" prejudices that he had eyes only for the writings of Macaulay, George Trevelyan, and other perpetrators of the "Whig Legend." A better understanding of recent scholarship as exemplified by Namier, Barnes, Guttidge, and Feiling would have kept Mr. Eyck out of the many pitfalls into which he has stumbled. Yet one can understand

why such historians have been ignored. Their findings would have made it more difficult for the author to draw his shadings of black and white. The truth would have complicated the writing of history with a message.

Half-truths, partisan interpretations, and errors abound. Mr. Eyck's sympathies lie with the "Grand Whiggery" of the Rockinghams and the Foxes, who alone use pocket boroughs for the good of the people. Politicians desert or sell out to the Tories, but they nobly go over to the Whigs. The Younger Pitt is petty trying to force C. J. Fox from his Westminster seat—and he ran second not first—but Fox is intellectually honest trying to keep the dead Pitt out of the Abbey. Pitt is a low scoundrel for not pushing Catholic Emancipation in Ireland, but Fox's failure to cope with the same issue is ignored. Wilberforce condemned Pitt's rejection of Napoleon's peace overture, but two days later went along with Pitt, a point conveniently ignored as Mr. Eyck shows that even Pitt's best friend was with Fox. Pitt is castigated by means of a Fox speech for having no war aims, but no mention is made of Pitt's "Security" speech, which in some ways rivals that of Churchill's "Finest Hour." The Pitts, Grafton, and Shelburne are consistently labeled anti-Whig, yet the four to their deaths considered themselves to be members of that party. Mr. Eyck has no conception of the Pitt "men not measures" philosophy.

Certain well-established facts, moreover, seem to have slipped by him. Burke's attacks upon Hastings and the North-Fox India Bill had other motives than humanity. George III was not trying to resurrect the Tory party, and one did not have to be a Whig or Tory to have a seat in Parliament. Hester Grenville was an intelligent and able woman. England did not go to war in 1793 for the sole reason of crushing liberal doctrines, and everything was not bought and sold to make the peace of 1763.

The translation is excellent and the book lively and readable, but except for the greater emphasis on the four men, there is little which cannot be found in the works of Mahon, Lecky, and other historians of

the Whig school. So closely does Mr. Eyck follow his predecessors that the reader can predict which time-worn quotation will next appear. The only backneyed phrase omitted is the Younger Pitt's threat to "un-Whig" Fox in 1784. Perhaps the use of that statement might have tarnished the pure Whiggery of Fox and lightened the black Toryism of Pitt. Whatever the reason, Mr. Eyck in his book has "out-Whigged" Macaulay.

Indiana University

SLAVIC COUNTRIES

KOHN, HANS. *Pan-Slavism: Its History and Ideology*. Pp. ix, 356. Notre Dame, Ind.: University of Notre Dame Press, 1953. \$6.25.

The evolution of the idea of Slavic unity, from the initial conception of Herder in 1784 to the most recent interpretations of Soviet ideologists, receives in this study its first full exposition. In a style that will appeal to a wide audience, Professor Kohn passes in review the writings of many individual thinkers and the various political movements based on their theories. Included in this panorama is a broad sweep of ideas that at first glance appear to possess little inherent unity, but as the story develops significant patterns emerge.

It becomes apparent from Professor Kohn's narrative that Pan-Slavism represents a cluster of ideas that is suited to many purposes. It is interesting to note that for the Western and Southern Slavs in the first half of the nineteenth century, Pan-Slavism served principally as a means of national liberation from the Hapsburg and Romanov empires. Although the failure of Pan-Slavism in this role became apparent when its political weakness was revealed at the Slav Congress in Prague in 1848, its emotional appeal remained available for other purposes. It was soon taken up by Russian nationalists and became a significant instrument of Russian foreign policy. From the notable Pan-Slav Congress held in Moscow in 1867 until the de-

feat of Russia in World War I, Pan-Slavism served as one of the principal weapons of Russian propaganda and helped to set the stage for the fateful rivalry with Austria-Hungary in the Balkans.

Under Lenin revolution was substituted for nationalism as an emotional appeal, and the ideology of Pan-Slavism was vigorously attacked as an instrument of the "bourgeoisie." With the victories of Russia in Eastern Europe in the 1940's Pan-Slavism was nevertheless revived, and the Pan-Slav congress held in Belgrade in 1946 demonstrated that the propaganda value of this ideology is still serviceable. This time Pan-Slavism was wedded to Communism in an uneasy union, and today it is playing a familiar role in the service of Soviet foreign policy.

Professor Kohn demonstrates that Pan-Slavism rests on a solid theoretical heritage and fills powerful emotional needs, although it has never in practice been a spontaneously successful ideology. Lacking inherent political form, Pan-Slavism has been adaptable to various purposes and despite serious limitations its appeal in Eastern Europe has always been real. It seems probable that by now the force of this ideology has been just about exhausted by Soviet propaganda, but since the Slavic peoples of Eastern Europe are still in a state of unrest Pan-Slavism may well be heard from again. Whether it may serve once more as a rallying point against the Russian state, as it did a century or more ago, will depend as much on the skill of the rival propagandists as on its ideological content.

C. E. BLACK

Princeton University

FISCHER, LOUIS. *The Life and Death of Stalin*. Pp. 255. London: Jonathan Cape, 1953. 16s.

Louis Fischer is former Moscow correspondent and author of several books among which is his most eminent work, *The Soviets in World Affairs*. Compared with that two-volume study of Soviet foreign affairs, this latest book is a rather pallid and less original piece of work. Mr. Fischer refuses "to enter the miasma of prophecy," since this book was evidently

written before Stalin's death; it is therefore an attempt at an evaluation of Stalin's quarter of a century of unchallenged leadership. Yet, temptation is irresistible, and here and there the author indulges in speculations which at times are based upon rather unsound assumptions. Some of his statements are sweeping and as bold as they are inexplicable. Why, for instance, was a Russian theological seminary a "seedbed of rebellion"? Or why should it have required courage of Stalin to remain outside of the revolutionary movement while he studied at the seminary? The author states these things without any explanation, and to me they remain a mystery.

Many details cited by Mr. Fischer are more appropriate in the frame of a pulp magazine story than a historical account. Thus, the author knows that when the police knocked on the door of Stalin's lodging (at night of course!), Stalin, half-awakened, groaned "Why don't you let me sleep?" "The night," Mr. Fischer asserts further, "is made for arrests in Russia." Certainly night life in Russia served other purposes than merely an expected visit of the gendarmerie. Describing Stalin's "underground life," Mr. Fischer again states that Stalin would spend nights in a tea room, "order tea and sip it for hours," and "sometimes, between glasses, put his head on the wet, oilcloth-covered table and sleep."

Mr. Fischer refers frequently to sources about which the student of history would like to have more precise information as to their whereabouts and how some of the important assertions could be checked. It is exasperating at times to find scattered statements such as the following: Stalin made a speech on January 19, 1925, which was supposed to have been suppressed and published only in 1947. A less gullible reader might like to know where precisely did it appear and under what circumstances. The book fails to say. Mr. Fischer asserts further that when Stalin dismissed Litvinov in May 1939, he wired confidentially to all Soviet embassies and legations abroad to explain the dismissal. This was shown to Mr. Fischer by "one of the recipients." Readers must take the word of the author.

In interpreting the famous Stalin-Trotsky feud, the author uses needless superlatives. Surely the feud was not "the greatest of all times" since the Danton-Robespierre feud was no less sanguine even though of shorter duration. The assertion that Stalin had little acquaintance with world history can be seriously questioned when one recalls the impression he gave some world figures during the last war. Mr. Fischer sadly fails to comprehend the fact that the nature of the Stalin-Trotsky feud was more than a clash of personalities: its roots went deeper into the course of the revolution. The account presented in this book depends too much on Trotsky's autobiography, which is a fascinating book but a slightly subjective source for the historian. As to the analysis of the Stalin-Hitler marriage and divorce, the account is oversimplified and narrowed down again to personalities, a method which will never result in a correct picture of the inner springs of a sorrowful period of continental affairs; only then can this drama be completely grasped.

Altogether, the book is a "dated" piece of work which the author must have written because of the book market demand. It is too premature, and we are too emotional to account for such recent events. The sanguine age of Stalin remains a subject for a future von Ranke rather than for the "I saw Stalin many times" type of writer.

ANATOLE G. MAZOUR
Stanford University

RUNES, DAGOBERT. *The Soviet Impact on Society: A Recollection*. Pp. xvii, 202. New York: Philosophical Library, 1953. \$3.75.

This study of the Marxist ideology and its materialization in Kremlin controlled Bolshevism was written fifteen years ago by the philosopher Dagobert Runes and has fortunately been published this year by the Philosophical Library. A scholarly foreword by Harry Elmer Barnes reviews his own position on the Russian problem over against "the fellow travelling 'Genera-

tion on Trial' of the New Deal dispensation." Even if Dr. Runes and Dr. Barnes are wrong in their emphasis of certain points of Marxian doctrine and trends in twentieth century history, this work is a remarkably lucid and scholarly presentation of the impact of contemporary communism on the western world.

Part I of this monograph contains a brief biography of Marx and an analysis of Marxism. Part II reviews the development of the changing economic and social system in Soviet Russia. Part III traces Lenin's attempted colonizations in Hungary and Bavaria along with the foundation of Soviet imperialism in China. Part IV is a prophetic survey of the Communist Party in America.

Since Dr. Runes is neither a renegade Communist nor a former fellow traveller, his highly critical and consistent viewpoint of Marxian theory and Soviet practice, which was written long before the Cold War began, should serve as a popular textbook for anti-Communists. It may be noted that the author attacks the conviction of American Jews that Western support of Russia in June 1941 would assure the European Jews of an end to anti-Semitism after the allied victory over Nazism and Fascism.

In a case study of Communism in action more emphasis should be placed on the Bolshevik creed which offers an explanation of historical evolution and furnishes Communists, crypto communists, and beach combers waiting for the wave of the future with a guide to the past, the present, and the age to come. For Bolshevism must be understood as a social and political religion which now sustains the totalitarianism of the modern world. Moreover it is unnecessary to prove Marx's predictions to have been in error. The Soviet people-bureaucracy, red army, industrial proletariat, and peasantry are by 1953 well aware of the discrepancies between theory and practice. Stalin was an able and ruthless dictator, who also played a remarkable game of poker against the two best the Western camps produced. Yet more than any European of his age, Stalin understood the impact of modern industrialized society on village life and

therefore tried three different solutions of the agrarian problem.

"Stalin injected the race problem into the Marxist system," Dr. Runes states, "by segregating Jews from other Russians." It is however highly improbable that Birobidzhan, the phony republic in Siberia, will become the world's largest ghetto. Soviet anti-Semitism began in Lenin's dictatorship, and the latest atrocities can be traced back to the differences in the Party before Lenin's death.

Hitler's purge of 1934 convinced Stalin that Bolshevism must be buttressed by a new orientation of Russian nationalism. Lenin's famous 1915 article "About the National Pride of the Great Russians" did not prevent Stalin from suddenly reviving Great Russian national traditions and Russian imperialism. In "the palaeobolsheviks of 1936-39" leading Jewish members of the Soviet bureaucracy were not tried as Jews but as Trotskyites or members of the "bloc of rights." Stalin had thus liquidated more Jews than Hitler before 1939. Finally at the very close of his long dictatorship Stalin authorized a new anti-Jewish purge which was planned to secure the support of the Russians and many non-Russians in the U.S.S.R.

WESTERN CONTINENTAL EUROPE

ROMMEL, ERWIN. *The Rommel Papers*. Edited by B. H. Liddell Hart, with the assistance of Lucie-Marie Rommel, Manfred Rommel, and General Fritz Bayerlein. Translated by Paul Findlay. Pp. xxx, 545. New York: Harcourt, Brace and Company, 1953. \$6.00.

This is a historical source book and a commentary on modern war by one of its masters, but above all it is the story of an officer and a gentleman, a devoted husband and father.

The first part deals with the advance into France by Rommel's division. The debacle of the French is epitomized in Rommel's drive with a small escort through masses of French troops and their obedi-

ence to his order to lay down their arms.

Then comes Africa—an account of the operations with a running commentary on the merits and shortcomings of both sides. Rommel is honest and objective, with a genuine respect for his British and American enemies. In the African war he upheld "tradition in the field of soldierly ethics" while breaking with it in the realm of tactics. Here he developed new techniques which, as long as he had logistical and air support, kept the British on the run. At Alamein he was practically immobilized by shortage of gasoline and was forced to the type of warfare at which the British excelled.

In the retreat to Tunisia Rommel had barely enough fuel for each day's move and none for mechanized counter thrusts. He capitalized on Montgomery's caution though frequently unaware of his opponents' difficulties. Editor B. H. Liddell Hart, whose writings Rommel admired, has supplied notes giving the true British picture.

The concluding chapters cover the Normandy invasion, Rommel's wounding, and his death. Some of his most interesting commentaries were written just before his enforced suicide. Gaps in Rommel's own papers are supplied by General Bayerlein who was closely associated with him in various capacities and by his son Manfred, based on letters, notes, and conversations. There are also foresighted observations on political affairs as, "Russia and the West are like fire and water. There will be friction and probably war. Perhaps not immediately after our collapse, for the whole world is tired of war. The danger will come after a few years."

Whether one reads to study tactics, made difficult by inadequate maps, strategy, the principles of mobile war, or for a contemporary narrative of events, there emerges from this book a man who like Lee and Jackson fought on the losing side against superior numbers and equipment. Like them he won battles through greater mobility and by "bold operations."

A professional soldier, he despised Goering and Himmler but was loyal to the Führer until he realized that Hitler was prepared to destroy Germany rather than

abdicate. Rommel then took action which led to his refined totalitarian murder.

This is a human document and easy to read.

Brigadier General USA Retired
Washington, D. C.

KESSELRING, ALBERT. *Soldat bis zum letzten Tag*. Pp. 475. Bonn: Athenäum Verlag, 1953. 18 DM.

Soldier to the Last Day, the memoirs of Field Marshal Kesselring, is the story of the fateful intertwining of a man's career with history. The author introduces us to the beginnings of his military career before World War I, his service in the Reichswehr, and the substantial part he played in the creation of the Luftwaffe. A ten-page appendix on the rise and fall of the Luftwaffe is one of the few portions of the book which was written with insight and analysis.

An account of the military operations before and at the beginning of World War II is followed by a description of the war in the Mediterranean Theater, as seen from the vantage point of the German Supreme Commander, and valuable for that reason. Notable during that period were his ebullient optimism, leading him to make promises to Rommel which he could not keep, the correctness of his estimates of Allied intentions, and an extraordinary ability to assert freedom of decision against Hitler's interference.

Kesselring then depicts the last convulsive struggles of the Third Reich, remarkable because he visualized the mirage of a stalemate. He even thought of the Battle of Berlin as a decisive battle of the war. The final act of this personal drama is given to his imprisonment and the trial before a tribunal in Venice. Here Kesselring was indicted for his order to shoot 335 Italian hostages, and for inciting and commanding forces which killed Italian civilians. The death sentence pronounced at that time was commuted to life imprisonment, and he was released from the penitentiary in 1952. On the trial we hear the cogent evidence, now well known, that judicial proceedings served political ends, but of course nothing indicating that the

trial was a projection, right or wrong, of moral judgments.

It is clear that Kesselring was an energetic commander, not sparing of himself, solicitous for his troops, and considerate of man and culture. But it is clear also that he rendered devoted and skilful service to a cause of which he allows himself the luxury of denying judgment. Kesselring says that the flag oath must be the guiding star; profound juridical, philosophical, or religious considerations are not to be applied to it. His book gives evidence of an ethic which must necessarily become one of expediency. Thus he speaks well of the systematic working methods of the Nazi Regime, deplores Nazi "aberrations," accepts blindly Third Reich propaganda, as for example in the attack on Czechoslovakia.

The book has two basic flaws. The publisher should have induced the author to eliminate one: incomplete descriptions, thus leading to poor communication with the reader, and often meaningless presentations. The second flaw is related. He fails to gain insights, or to give the reader an understanding, of the genesis of events. For instance, nothing is said of the impetus given to the growth of the Italian partisan movement by the German forced labor policy. An uninformed reader would, on the basis of the author's story, have to look at the Italians as traitorous, even "diabolic," in following what they interpreted to be their national interest. Similarly, Allied acts seem willful and arbitrary, for there is not an iota of evidence of the revulsion the West felt over concentration camp, brutal occupation policy, or mass slaughter.

Thus, the greatest value of the book is probably the remarkable portrait it gives of the views and value systems, after the catastrophe, of an unreconstructed Nazi Field Marshal. To be sure, he was no rubber stamp like Keitel, but he was surely a loyal servant of his Master.

GROSSER, ALFRED. *L'Allemagne de l'Occident, 1945-1952*. Pp. 340. 6th ed. Paris: Librairie Gallimard, 1953. 680 fr.

American occupation officials in Germany have often confessed their difficulty in understanding French policies and attitudes; American students of German affairs have recognized the important role of the French since 1945, but they have not always found it easy to interpret French actions. A study by a Frenchman dealing with various aspects of West Germany is therefore of considerable interest in the United States. The professional experience of the author at the Sorbonne and the Institut d'études Politiques, his service as director of the French radio program for German youth and as associate director of the UNESCO office in Germany, and his extensive sojourn in Germany since 1945 make this particular publication of unusual significance.

In Chapter I, for background M. Grosser surveys the German-Soviet alliance, the Atlantic Charter, the Morgenthau Plan, Yalta, and Potsdam—his account of the role of France in the Allied Control Council is brief but of much interest. Chapter II deals with denazification, the Nuremberg trials, the re-education program, and the various occupation organizations of the Allies. Chapters III and IV consider the critical economic situation in Western Germany, the refugee problem, labor unions, and German youth. Chapter V suggests the author's special interest in intellectual and moral forces; it deals with such subjects as the churches, the film, the press. Chapter VI discusses the Basic Law, the establishment of the West German Federal Republic, and international relations. The concluding chapter, which discusses Franco-German relations since 1945, though relatively brief, will perhaps hold the greatest interest for many American readers.

M. Grosser notes the unusual difficulty of a serious analysis of postwar German problems, particularly within the scope of a single rather brief volume. His emphasis on the influence of economic forces on political developments, his concern arising out of the prominent role of former Weimar and Nazi officials in the West German Federal government, his apprehension caused by the reappearance of anti-Semitism, and his disappointment at the rather slow progress made by German uni-

versities in recovering their one-time position of greatness, all strike a familiar note in the minds of American scholars. The study is concluded with a bibliography which indicates that the author is familiar with the fairly voluminous literature dealing with postwar Germany which has appeared in the United States and Great Britain.

HAROLD ZINK

Duke University

MCCLOY, SHELBY T. *French Inventions of the Eighteenth Century*. Pp. x, 212. Lexington: University of Kentucky Press, 1952. \$4.50.

This readable and attractive book is a "must" for economic, industrial, and social historians who want a wealth of pertinent information on the beginnings of modern industry outside the familiar field of British invention. This is a fresh and illuminating study of a neglected phase of a great century, well documented, with its evidence clearly presented and closely evaluated. Throughout comparisons are made with developments in England and other parts of Europe, and connections are shown between eighteenth century interest in inventions and the Enlightenment.

The author employs a wide variety of sources, indicated by the extensive bibliography and copious notes. He leans heavily upon the four-volume *Merveilles de la science* (1867-1870) by Louis Figuier, and upon Ballot's *L'Introduction du machinisme dans l'industrie française* (1923), both little known among Americans. More important, McCloy explored, exhaustively, descriptions of inventions approved annually for patents by the Academy of Sciences.

The list of "firsts" in French inventive history is impressive. For example, eighteenth-century France produced the first automobile, the first successful steamboat, the first air travel, and the marvelous Chappe system of semaphore telegraph towers; also the first paper-making machines, gas illumination, silk loom, threshing machine, fountain pen, and the common graphite pencil. It also produced the metric system, and a forerunner of the modern Horn and Hardart "automats."

French inventors were seldom scientists, the author concludes, but were mainly from the apprentice-trained middle class with only a small number educated at the universities or in technical schools. The greater number were from rural districts but fully two-thirds came to Paris to live. Only the rare inventor benefited from his invention, the largest return to most of them being a modest government pension.

France, equal to England in inventive genius, failed to produce an industrial revolution partly because the French Revolution and civil turmoil blighted the late portion of the eighteenth century, but even more fundamentally because private business failed to utilize invention, in spite of government encouragement of the inventor.

In England the situation was the reverse, with private business taking the lead and exploiting inventions, a fact at the base of England's industrial greatness. Perhaps this excellent book has flashes of light to throw upon the struggle today between free enterprise and government control of industrial development.

THOMPSON, J. M. *Robespierre and the French Revolution*. Pp. vii, 180. New York: The Macmillan Company, 1953. \$2.00.

What can be contributed by a book of 180 pages on Robespierre and the French Revolution?

The answer is that insight into the past as it is related to the present does not always require great volume for presentation. The value of this book comes from a timely interpretation by a man who has done a larger study on the Revolution and who now gives a restatement on his best thought. The book is written as it might have been told to someone who had read well and who had now come on a Sunday afternoon to sit before the fire to ask the author, "Just what is the essence of your thinking about this man Robespierre?"

Professor Thompson, cognizant of experience with the rise of dictators in our own time, thinking of modern developments of human and civil rights, and know-

ing the growing tendency to think that a state has an obligation to furnish its citizens a degree of social security, tells of the life of this quiet, religious, mystical liberal of the end of the eighteenth century in such a way as to throw light upon all liberals and upon all revolutionary movements.

The United Nations Charter and the Covenant on Human Rights are given background, for instance, by the quotation from a Robespierre address of April 1793, in which we quote in part: "The most important rights of men are self-preservation and freedom. . . . These rights belong equally to all men. . . . Freedom is the right of every man to exercise all his faculties as he will. Its rule is justice, its limits are the rights of others, its source is nature, its guarantee is the law. . . . It is the duty of society to provide a living for all its members, either by procuring them work, or by assuring the means of subsistence to those who are unfit to work." Robespierre proved to be an inspiration to movements for free government, social welfare state, separation of church and state, and a number of other elements of our present freedom in the Western World. It is true that he became engulfed and frustrated by so much of his own work that he found himself to be the victim of his own ideas. This makes one wonder why we should call him a statesman. Professor Thompson also wonders. He finds one area of achievement which will justify the word—perhaps: When Robespierre established his Republic of Virtue by converting the Jacobin republic into one of compulsory Calvinistic virtue, distinctly French, and with a Deity who was a friend of the poor and lowly.

The author's interpretation of the Revolution and of Robespierre is in harmony with the best modern literature on the subject, although there is little footnoting. In a concluding chapter there is a brief sketch of the principal writings of the historians of the Revolution. This book is clearly for the general reader who wants to be free from the dramatic fiction of Carlyle, Dickens, and others. It is interestingly and well done.

W. HENRY COOKE
Claremont Graduate School

OTHERS

BLACKER, C. P. *Eugenics: Galton and After*. Pp. 349. Cambridge, Mass.: Harvard University Press, 1952. \$5.00.

Eugenics has had a rather unfortunate history. It was inevitable that the theory of evolution, which held that the human species was not unalterable, would stimulate a number of speculations as to what it was that changed human beings and in what direction it was desirable for man to evolve. At the time domestic animals had been improved enormously by what was called artificial selection and it was only reasonable to assume that man also could be improved and improved by analogous means. The difficulties, of course, were not realized. When Francis Galton coined the word "eugenics" the basic machinery of heredity was not known, and would not be known until Mendel's paper was discovered. How to change the genetic potentialities of a stock really presented a number of complexities which were not at all understood.

On the political side eugenics also met with a vigorous opposition as its presupposition cut right across the party line in biology which had been drawn by Marx and Engels in the eighteen seventies. Eugenists were denounced as reactionaries and backward lookers. On the other hand, eugenics became practically a religion to many of Galton's followers. In consequence eugenics has rarely been evaluated unemotionally. There is today a real need for a good history of the doctrine.

Dr. Blacker has written neither a history of eugenics nor a text book on the subject. He has, however, presented much valuable material of a historical nature and he tells very accurately what eugenics was and is. He is particularly concerned with the role played by Galton. Part I (pp. 19-128) covers Galton's scientific activity; part II (pp. 129-322) deals basically with the techniques of eugenic research developed since Galton's time. There are two appendices containing (1) Galton's views on race and (2) a Galton bibliography.

Today there is little research being done which is labeled "eugenics," but the study

of human genetics is making great progress, and the new discipline of population genetics takes as its field many of the problems investigated by Galton. The time may come when eugenics will be evaluated on its merits. When it does, Dr. Blacker's book will be found to contain valuable source material.

University of Pennsylvania

BALL, W. MACMAHON. *Nationalism and Communism in East Asia*. Pp. viii, 210. Melbourne, Australia: Melbourne University Press (distributed in the U. S. by Cambridge University Press), 1952, 1953. \$2.00.

Professor W. MacMahon Ball, Australian political scientist who has represented his country in Asiatic affairs, has become one of the most perceptive writers on Asia. Covering countries from Japan and China around the rim of Asia to India, this modest book is free from dogmatic solutions. It is a challenging commentary.

The turmoil of East Asia Professor Ball sees as a product of three main forces: a revolt against foreign political control, a social and economic revolt, and a racial revolt. There now exists a determination that the destinies of Asia are to be decided by Asians, and not by Europeans. Colonial powers have frequently miscalculated local sentiment, in the recent postwar period as well as earlier. In Burma, there were rich men, but no rich Burmese. India struggled for more than political power. It wanted "freedom from want and freedom from contempt." Indo-China was governed by Frenchmen for Frenchmen. The contrast between Dutch and Indonesian poverty and dependence weighed heavily in Indonesia. Chinese nationalism was "a revolt against the long train of humiliation she suffered from foreign powers." This has been the stuff of which both nationalist and Communist movements in Asia have been made. With regard to Communism, "it is not poverty but the way the people come to feel about it that may create Communists."

The realities, Professor Ball believes, may require different solutions for different areas. Thus: "To support the non-Communist Government of Burma would seem to be working with history, not, as in some other

countries in the region, to be working against it." The latter part of this statement should lead us to ponder. He also finds it difficult to make all the facts fit the thesis that international Communism controls all the actions of Asiatic Communists. He makes the thoughtful suggestion that it is important for the Western democracies to win the support of non-Communist nations of East Asia, not for their direct contributions or strategic usefulness, "but because without their support the United Nations would express only the interests or the conscience of the West." He believes that it is futile to assume that these peoples will always or generally accept Western moral judgments. As for the future, if this area "is to be saved from coming under the influence or control of the Soviet Union, it will not be by Westerners but by East Asians." He hopes the West will make this possible.

No one who ponders the fate of Asia should miss this book. It is excellent for its economic as well as for its political insights. It should be read widely, for it might help us to become a wiser people—in time.

DALE PONTIUS

Roosevelt College

DONNISON, F. S. V. *Public Administration in Burma: A Study of Development During the British Connexion*. Pp. vii, 119. London and New York: Royal Institute of International Affairs, 1953. \$2.50.

Mr. Donnison's aim is to explain why the British-built system of public administration, and indeed also the influence of that system, disappeared almost entirely from Burma, whereas in India and Ceylon independent governments are carrying on with the essentials of the British system.

Unlike India and Ceylon, Burma was interrupted in its progress toward self-government and her experience of British tutelage by three years of Japanese occupation from 1942 to 1945. Mr. Donnison believes, however, that, even if such an interruption had not occurred, the Burmese might not have been prepared to survive the grant of independence with a stable and effective administration. He feels that they were not ready for the steps toward self-govern-

ment which were introduced by the British in 1923. Being more isolated from the flow of world trade, they lacked the worldly knowledge and interests which were commonplace to the educated classes in India and Ceylon; and, though their elementary schools were better, the standard of their higher education was much below that of India. Likewise the author believes that Burma was unready for the next big step toward greater responsibility when, in 1937, further advances toward self-rule were made there as well as in India.

Mr. Donnison seems to imply that the lack of a genuinely Burmese regular army was an important factor in the failure of the administrative system in Burma. Instead of recruiting mainly indigenous people for the regular army, the British had long relied upon the hill tribes and upon Indians and Europeans. This further weakened the country for an effective defense against the Japanese; and, after the reoccupation, the Burmese Government lacked a strong, unified army which could preserve internal order and assist in bringing about a stable transition to a well-administered independent government.

In spite of its main title, this monograph does not attempt to describe or explain the present condition of public administration in Burma.

ERIC BEECROFT

Washington, D. C.

TSUNG-LIEN SHEN and SHEN-CHI LIU. *Tibet and the Tibetans*. Foreword by George E. Taylor. Pp. x, 199. Stanford, Calif.: Stanford University Press, 1953. 67 illustrations, 2 maps. \$5.00.

The two men who climbed Mount Everest on its southern, or Nepalese, side came as close to Tibet as any non-Communists are likely to do for some time, for since the Chinese Communist invasion in the autumn of 1950 the Roof of the World has been even more tightly sealed to outsiders than before. For this reason any account of Tibet, other than political propaganda, is most welcome. Lowell Thomas and his son gave us a most interesting description of their visit a few years ago, but since then there has been little but confused and contradictory press reports.

The latest substantial addition to the

literature on present-day Tibet comes from the pens of two Chinese who lived there for some years before the Communist conquest, about which they consequently do not appear very well informed. Their account falls into two main parts, the first of which is a summary of Tibetan history, religion, and culture, and the second of which is a description of life and society in contemporary Tibet based largely on the authors' personal observations.

Almost inevitably, the first of the two parts is the less interesting, although it is nonetheless a convenient and valuable summary of its subject. Much of it consists, appropriately enough, of a fairly detailed description of the organization and functioning of the various Buddhist sects and lamaseries. This presents rather heavy going for the nonspecialist, and the specialist will be displeased to note that the authors are somewhat casual in their transcription of Tibetan proper names, which they usually spell phonetically; they should perhaps have added a glossary giving the accepted romanizations for the benefit of those who wish to compare this account with others. This, however, is not intended as a serious criticism, for the authors have provided a useful description of a subject about which too little is known.

The last third of the book, which is generally well written, is of somewhat greater interest. In it the authors describe from their own experience the life and customs of the various classes of Tibetan society. The authors' attitude toward the subject is highly to be commended. They avoid both the nineteenth-century missionary approach of almost undiluted condemnation and the icy detachment with which the contemporary social scientist ordinarily dissects his specimens. They write with sympathy, but with discernment. It is hard to see how a good book on a strange land could be written in any other spirit.

HAROLD C. HINTON

Georgetown University

SCHONFIELD, HUGH J. *The Suez Canal in World Affairs*. Pp. x, 174. New York: Philosophical Library, 1953. \$4.50.

Mr. Schonfield has written previously on various aspects of the history of the Suez

Canal, including a life of *Ferdinand de Lesseps, Italy and Suez*, and *The Suez Canal*, the latter a Penguin volume which appeared some years ago. The present volume consists to a very large extent of the materials from the latter works, brought down to date. Intended largely for the general reader who may desire some acquaintance with the problem of the Suez Canal in a very troubled world, the author, in very broad sweep, carries the canal question back to the most ancient of days (2000 B.C.), brings it through the development and construction of the modern canal in 1869, outlines the issue as it stood in the two World Wars of our era, and ends his story with the project of the Middle East Command (1951-52) and the Anglo-Egyptian controversy over the subject.

The author feels that the current problems of the Near East are not insoluble, if moderation and realism prevail, and he notes that "the vulnerable position of Egypt," through which the Suez Canal passes, has directed attention historically to its strategic aspects. He hopes that "in the not too distant future," attention may be concentrated solely on the "unifying and universally beneficial aspects" of the Canal, to which the builder of the canal, Ferdinand de Lesseps, was devoted.

The volume contains a useful appendix, composed of (1) the firman of concession to Ferdinand de Lesseps, 1855; (2) the charter of concession and book of charges for the construction and working of the Suez grand maritime Canal and dependencies, 1856; (3) the Constantinople Convention, 1888; (4) the Anglo-Egyptian treaty of Alliance (Article VIII and Annex), 1936; and (5) statistics of total transits and tonnage, Suez Canal traffic, 1869-1951.

The general reader will find Mr. Schonfield's volume useful, although it is sketchy, because of its succinctness and brevity. But it is difficult to understand why it should cost \$4.50.

HARRY N. HOWARD

Arlington, Virginia

BLANKSTEN, GEORGE I. *Perón's Argentina*. Pp. xv, 478. Chicago: University of Chicago Press, 1953. \$6.50.

In 1950 Professor Blanksten received a fellowship from the Social Science Research Council, and went to Argentina to study the politics of that fascinating country. He remained for a year, and during that time he had a variety of experiences. The Argentine Congress branded his work as espionage, and outlawed his mission. Some of his friends advised him to leave the country. He was offered 20,000 pesos to write a pro-Perón book. The present volume gives ample evidence that he did not accept either the advice or the offer.

A great deal has been written concerning Argentina under the dictatorship of Juan Perón, but no other work presents so complete or so well-rounded a picture. There are substantial chapters on Perón's rise to power, the role of Eva Perón, the systematic obliteration of individual liberty, the forces for and against Perón, the present structure of Argentine government, the relations of Argentina with other nations. One chapter sets forth, more clearly than ever before, the doctrine of *Justicialismo*. This doctrine, says Perón, is Argentina's middle-of-the-road answer to the conflicting claims of communism and capitalism. Blanksten comes much closer to the heart of the matter when he says that *Justicialismo* is "an ingenious ideological device . . . invented as a disguise for what was considered Fascist."

Various adjectives may be used to describe the style of this book. Good *Peronistas* would doubtless call it impudent and offensive. Some good Americans will call it sprightly—a word heartily endorsed by this reviewer. But other equally good Americans, who value personal dignity rather highly, may say that the style is needlessly flippant. They will not be hard pressed to illustrate their point. "A 'strictly correct, instinctively do-the-right-thing career man' is not to be sneered at," says Blanksten with a sneer. "He can enter into an effective alliance with abeyance, refrigeration, and the South Pole." The volume abounds with such observations.

Factually this book is very accurate, though there are a few minor slips. Thus Professor Blanksten read the 1949 constitution a little too hurriedly when he reported that "all senators are to have six-

year terms and that the entire body is to be elected at the same time." (Article 49 of the constitution states that one half of the membership of the Senate shall be renewed every three years.) But such trivia can readily be forgotten. What must be remembered is Professor Blanksten's brilliant word picture of conditions in present-day Argentina. The book is a first-rate contribution to the literature of Latin American politics.

AUSTIN F. MACDONALD
University of California

KRACKE, E. A., JR. *Civil Service in Early Sung China—960-1067*. Pp. xvii, 262. Cambridge, Mass.: Harvard University Press, 1953. \$6.50.

This volume is a most interesting and valuable study of the Chinese civil service of nine centuries ago. Dealing with a period so remote in time and with a country so different from ours in outlook and tradition, the book appears at first glance to be merely an account for the curious, with little relevance for our own time and place. A perusal of its well-documented pages, however, quickly dispels this first impression. One finds that even in those days, in that far country, the problems of the civil service had much in common with those of a modern state in the western world.

Take, for example, the matter of recruitment and selection. The statesmen of the Sung dynasty were as much concerned as we are with the problem of bringing to the service of the state men of capacity and integrity. They anticipated by eight centuries the method of competitive examinations which Great Britain pioneered in its Indian civil service and which later the United States adapted to its own needs. The tests employed were scholarly, quite in contrast to our "practical" variety. As in American competitive examinations, however, the candidate's anonymity was preserved to prevent favoritism in marking. The Chinese, in fact, went quite beyond the American practice of merely substituting numbers for candidates' names on examination papers; by having the papers copied in another hand before they were read, they forestalled the possibility that

the examiner might recognize the handwriting of the candidate.

Dr. Kracke devotes special attention to the method of promotion through controlled sponsorship developed during the Sung dynasty. While merit ratings and examinations also were used in selecting men for higher posts, sponsorship by carefully chosen sponsors was the main reliance for filling upper grade positions. The sponsors were themselves men holding important administrative offices. Since "only the straight can know the straight," a sponsor was required to have high moral qualities. To increase his sense of responsibility in the making of recommendations, his own future was tied, by a system of linked penalties, to that of his principal, that is, the person recommended by him. Under this system, both the sponsor and the principal were punished for an offense of the principal, the punishment for the former being only slightly less severe than that imposed upon the latter.

The author has succeeded to a remarkable degree in reconstructing from ancient archives a close-up of China's early civil service system.

OXFORD BOOKS

The Electoral System in Britain 1918-1951

By **D. E. BUTLER**. The first section of this authoritative book discusses in detail the problems connected with the British electoral system during the last thirty years. The second part examines the actual mechanics (including cost and the effect of the university and business franchises), the implications and results of the last nine general elections, casting a new light on major political issues.

\$4.25

British Government

By **HIRAM MILLER STOUT**. A complete picture of Great Britain today, in which a prominent political scientist surveys her present political system in the light of wartime and postwar changes. Mr. Stout discusses today's problems of nationalization and Commonwealth relations and the modern functions of the Monarchy, Parliament, the Cabinet, and the Civil Service. "His pages are packed with information, presented in a clear style."—*Saturday Review Syndicate*.

Trade edition, \$7.00. College edition, \$5.00

FRENCH CORPORATIVE THEORY 1789-1948

MATTHEW H. ELBOW places twentieth-century French trends toward a corporative state, especially in the Vichy economic and social system, in the perspective of French historical thought. He emphasizes the early guild plans that united labor and employers to maintain social peace and examines La Tour du Pin, Social Catholic corporatism, syndicalism, solidarism, pluralism, and royalism. The interval between the two World Wars, Pétain's regime, and de Gaulle's recent statements come into clear focus. \$3.75

The articles appearing in THE ANNALS are indexed in the *Readers' Guide to Periodical Literature* and the *Industrial Arts Index*.

CARL KELSEY

1870-1953

ON October 15, 1953 Dr. Carl Kelsey passed away after several years of ill health. Born in Grinnell, Iowa in 1870, he was more than eighty-three years of age at the time of his death. From 1906 to 1941 he was a professor of sociology at the University of Pennsylvania, and since the latter date was a professor emeritus. He was the author of *The Negro Farmer* (1903) and *The Physical Basis of Society* (1916 and 1928).

Members and friends of the American Academy of Political and Social Science will recall his prominent association with the Academy. He was its secretary from 1906 to 1912, and since 1912 has been a vice president; was special editor of eight volumes of THE ANNALS from 1914 to 1923; and was the first person to be awarded an Academy Research Fellowship. As the recipient of this award he spent nine months in Haiti and the Dominican Republic, preparing a study entitled "The American Intervention in Haiti and the Dominican Republic," which appeared as a supplement to THE ANNALS of March 1922.

Throughout his life Dr. Kelsey was remarkable for the number of his friends and for their devotion and admiration. The Academy has suffered a great loss, and expresses in this most inadequate way the deep regret felt by the Officers and Directors and through them that of all the members.

Atomic Energy and the Democratic Process

By ROBERT A. DAHL

TO say that we have not yet discovered how to deal with atomic energy through democratic political processes may at first glance seem to be one of those pieces of dramatic and misleading hyperbole that are regularly invoked, unfortunately, in the attempt to discuss the social impacts of this new force. After all, the arrival of nuclear weapons, and in the United States the creation of a gigantic government-controlled industry to produce them, have assuredly not pushed us to the edge of dictatorship. Despite the shrill warnings of science fiction, the small group of Americans who initially make our atomic energy policies are quite patently not imposing a tyrannical will on a terrified public. What is more, as Senator Jackson shows in this volume, a body of popularly elected laymen in the Joint Congressional Committee on Atomic Energy exercises control over policy to a degree that is probably unique in congressional-executive relations.

Yet as a plain statement of fact, the proposition is scarcely debatable: the political processes of democracy do *not* operate effectively with respect to atomic energy policy.

To say so much is not to pass a moral or practical judgment on the fact. By the standards of anyone save a doctrinaire and utopian partisan of democracy, the political solution we have arrived at for atomic energy policy quite possibly may be preferable to a larger degree of democratic control. The difficulty is that so few of us can appraise the consequences of the various alternatives.

THE DISTINCTIVE FEATURES

As with so many other aspects of atomic energy, it is as easy to exaggerate the difference as to underestimate it. Once we get outside the models of the democratic theorists to the political life of the real world, we discover that polities which we in the West call democratic are in fact systems in which most policy is determined by a relatively small number of people. These people, leaders of one sort or another, act within ill-defined boundaries set by a "general" public—really a network of publics—that is passive and acquiescent except when its boundaries of tolerance are invaded, or at least when some leaders convince the "public" that this is so. Many individuals normally in the "general" public move into and out of the decision-influencing group whenever some particular type of policy is involved—farm prices, say, or labor legislation or copper imports or a local harbor improvement. At this point hitherto inactive individuals may become leaders in pressing for some line of policy, or—more likely—"attentive" citizens who follow this particular series of events with close attention and even some readiness to act in various politically relevant ways.

Hence when we say that the political processes of democracy do not operate with respect to atomic energy policy, we refer not to the fact that broadly dispersed popular control is lacking, but rather to these distinguishing characteristics: (1) Some of the consequences of atomic energy policy are of incalculable importance to the most highly

ranked goals of almost every individual. (2) The policy-making elite is *significantly* smaller here than with most other policy of comparable importance. (3) Outside this tiny elite, as Drs. Douvan and Withey show in their article, the "general" public are ill informed, passive, and acquiescent to an extraordinary degree considering the importance of the policy to them. And (4) the practice of secrecy makes it exceptionally difficult for attentive leaders to activate members of the general public who, in the absence of secrecy, *perhaps* could and would be activated as attentive citizens.

This last point is worth stressing. For, as Mr. Palfrey shows below, in surrounding atomic energy decisions with secrecy we have departed from a traditional way of meeting problems, without ever really debating the wisdom of this departure. It is not easy, as Mr. Palfrey warns us, to strike a balance: those who react adversely to secrecy often propose utopian alternatives. Yet it is perhaps time that we in the United States should begin to weigh the consequences of secrecy and at least to raise the question whether the probable costs may not exceed the probable gains, at any rate given the present forms of secrecy. Let us consider some of these costs.

COSTS OF SECRECY

1. Elite rule is an inevitable by-product of secrecy. Those who effectively influence policy can scarcely exceed the number of those who possess the information to act.

2. Insofar as this is not true—that is, insofar as individuals without valid information are activated and make their influence felt—irrational policy will probably result. This kind of irrational policy-making might happen if war should abruptly threaten the conti-

mental United States; an ill-informed public (ill-informed partly because the issues had never been openly discussed) might then from sheer panic force measures of attack or defense that would be catastrophic.

3. It is even possible, as Professor Wolfers suggests in this volume, that secrecy concerning our war strategy with respect to the bombing of urban populations increases rather than decreases the probability that our own cities would be bombed.

4. The need to protect secrets has required a program of investigating and screening individuals for "security," of proportions that a decade or so ago would surely have been regarded as an unjustifiable invasion of personal liberty. The Atomic Energy Commission, as Professor Brown shows below, has handled this program with admirable restraint; but as he also reveals, the program is not without its quota of injustices.

5. Perhaps most important, the need to protect "the secret" has contributed to a jittery climate of public opinion—at least among some influential publics—that seems to foster suspicion, distrust, fear of heterodoxy, support for a variety of measures of public and private repression, and the enhancement of the power of leaders who manipulate these sentiments.

One is tempted to add as a sixth consequence a certain amount of handicapping of research in the natural and social sciences; but this is a problem too complex for simple generalizations, and one would do better to read the careful analysis by Mr. Meier and Dr. Rabinowitch below.

In any case, the institutionalization of secrecy has concentrated, in the hands of a few people, control over decisions of a great magnitude for the values of a larger number of persons than in all

probability were ever affected by any old-fashioned authoritarian leader.

The main case in point is, of course, the mixed question of military strategy and civil defense. This issue of *THE ANNALS* was to have included a discussion of the impact of nuclear weapons on military strategy, by Dr. Bernard Brodie, one of this country's creative scholars in the field of military strategy. Because of his association with the Air Force, both directly and through the RAND Corporation, he was required to submit his contribution to the Department of Defense for security clearance. Unfortunately, the appropriate officials declined to clear it for publication. The incident illustrates one of the dilemmas created by secrecy. Those of us who do not have access to secret information cannot, on some issues, assess the alternatives intelligently; whereas those of us like Dr. Brodie who do have access to secret information may thereby be prevented from discussing the alternatives publicly—alternatives, by the way, that deeply concern our own lives and those of millions of others.¹

Alternative policies of great import are undoubtedly being debated at present within the tiny policy elite that controls decisions. Enough information leaks to the public to indicate that debates are taking place, and to some extent even what the debates are about; but not enough information comes out to enable us to appraise the alternatives, or even to know what they are.

SOME OF THE ISSUES

Some of the issues, surely, are those raised by Professor Wolfers and Dean

¹ An article on raw materials by Mr. John W. Landis was also to have appeared in this issue. Mr. Landis, until recently employed with the Atomic Energy Commission, submitted his article to the AEC, and at the time this volume went to press, the article had not been released by the AEC.

Cavers below. What general categories of targets on this continent and in Europe should be most heavily defended? And how? Dean Cavers shows some of the disastrous economic consequences that would ensue if a few of our cities were bombed, and indicates how little preparation we have made to head off these consequences. Professor Wolfers argues that precisely because the consequences of bombing large cities would be so enormous, the fear of retaliation reduces the probability that either side will bomb urban centers. Should we nevertheless prepare for the worst possibilities? How costly would such preparations be? Are our political leaders, in order to satisfy pressure for balancing the budget, underestimating—unconsciously perhaps—what needs to be done to build up civil defenses?

No one will deny that these are important questions. In view of the breakdown in international negotiations for controlling nuclear weapons, and the dim prospects of fruitful bargaining portrayed by Mr. Frase below, they are also immediate questions. The fact that a thermonuclear reaction is now known to have occurred in the Soviet Union on August 12, 1953 means that the time is approaching when that country will commence its stockpile of hydrogen bombs. Questions about the adequacy of our present plans for civil defense, then, are as fateful as any this country is likely ever to face. Yet they are questions which the attentive citizen cannot hope to answer. More than that, he cannot even know whether he should demand enough information from his officials to try to answer these questions. He has, then, delegated control over the survival of himself, his family, his neighbors, his fellow citizens, his nation, and a not inconsiderable portion of mankind to remote public officials, without having had much opportunity

to examine whether such extensive control is entirely necessary. The political mechanisms normal to a nation at war have to this extent displaced "democracy" even in the limited sense defined above.

SHALL PUBLIC EXAMINATION TAKE PLACE?

Let it be said again: Given the various alternatives, the present method of policy-making may be the most rational we can adopt. If so, we had better learn to accept it with the calm of the Stoic or the practical understanding of the pragmatist, as Dean Leys advises in a slightly different context below. But before we accept a fundamental alteration of our policy-making process—one far more drastic than the wildest dreams of any of our constitutional reformers ever envisioned—it might be well to conduct a more extended public examination of the issue than has so far occurred.

Yet how can this public examination take place? Here we approach the heart of the dilemma alluded to a moment ago. The pros and cons of secrecy cannot be evaluated abstractly. Probably most of the costs can be surmised. But can anyone who is not privy to official secrets rationally estimate what we are gaining by our secrecy? Furthermore, the problem is evidently not one of weighing the abstract pros and cons of secrecy in general; rather, as Mr. Palfrey points out, what is required is a whole series of judgments about secrecy measures of a particular kind or degree applied to some specific activity. Because of this need for a detailed examination, can anyone who does not already know what is secret intelligently discuss and pass judgment on the probable consequences of some alternative arrangement?

At first blush it might appear that the only possible answer is No. If that be

so, then there can be very little intelligent public examination of the secrecy problem. Those of us outside the small elite that makes atomic energy policy would then be well advised merely to urge that body of leaders constantly to re-examine the question among themselves, behind closed doors. We could hardly do more without fostering irrational disclosure. We would, then, not only delegate the secrets to the policy elite; we would *in fact* also delegate the final and unreviewable power to determine what should and should not be secret.

COMPETENCE OF AN OUTSIDER

Although this is substantially the existing state of affairs in atomic energy, it need not be. As a practical matter, individuals who do *not* know the substance of secret information can in many instances make an intelligent appraisal of the costs and gains of secrecy. Does it require precise knowledge of the nuclear stockpile to appraise intelligently the relative gains and costs of disclosure? Those who know the secret data can be required to explain in some detail what consequences they believe might ensue if the data were made public. It is not necessarily beyond the grasp of an outsider to appraise the validity of these statements about the alleged consequences and to compare the alleged gains with some of the known costs.

Hence it should be possible to have top policy-makers conduct a public discussion of the present dimensions of the secrecy problem and the various alternatives to it. And if secrecy could thereby be reduced, some of the alternative policies now debated within a restricted group (for example, the requirements of a program for coping with an atomic attack against this country) could be discussed among a somewhat wider public.

To be sure, it would be utopian to expect that large numbers of individuals would engage directly in such discussions or even participate indirectly as members of the attentive public. As we have already said, large numbers of individuals are rarely involved in deciding *any* public policy. What distinguishes the normal operation of our political system from its operation with respect to atomic energy is not primarily the difference in the numbers of individuals involved, although this is an important factor. The essential difference is that, normally, nongovernmental leaders can learn something about the alternatives to existing or proposed policy; and by activating sections of the public they can help to determine policy. Realistically speaking, this is not possible with most aspects of atomic energy policy at present.

THE INDUSTRIAL FIELD

There is, however, one important area where a more nearly normal operation of policy-making might be possible—that is to say, where secrecy is no longer a major determinant. This is the use of nuclear reactors for the production of electrical energy. Here, as several of the succeeding articles indicate, the secrets that present obstacles are mostly those classified by Nature, and they can be declassified not by fiat but only by research and experience.

Very roughly, the possible lines of policy here turn on at least two "techno-economic" alternatives and at least four administrative alternatives, or at least eight combinations in all.²

The two techno-economic alternatives are the dual purpose and the single purpose reactors. Adoption of the first would mean that reactors built to produce electric power would also produce plutonium for the United States Gov-

ernment and its bomb program. Following the second alternative, reactors for power would be designed to maximize the output of heat in a form usable for producing electricity, and plutonium would not be produced for the bomb program.

Choice between these two alternatives turns not simply on technological questions, but also on economic ones. Thus the dual purpose reactor might well provide a method by which the government would bear enough of the capital and operating costs of the reactor to bring the price of power within an economically feasible range. But because the allocation of costs would be to some extent arbitrary, under this program cheap power *might* result, in effect, from a government subsidy to power consumers. Moreover, there have been hints from the AEC that our supply of atomic weapons may shortly approach a point at which it would be wasteful for the government to agree to any long-term purchases of plutonium. Mr. Cisler argues below for the dual purpose reactor, and Dr. Weil presents the case for experimenting further with single-purpose reactors.

ADMINISTRATIVE ALTERNATIVES

The four administrative alternatives are, roughly, (1) operation and control of the reactors and their output by the government, following the analogy of the Tennessee Valley Authority and reclamation dams; (2) operation by private industry under government contract, and control by government over price, output, location, and other key decisions; (3) operation and control by a mixed nonprofit and governmental group, primarily for experimental purposes, as proposed by Mr. Weil; and (4) operation and control by private industry, as proposed by Mr. Cisler.³

³ It is worth emphasizing again that to reduce the alternatives to four is to oversimplify.

² This of course represents a vast simplification of the alternatives.

Spokesmen for industry range themselves on the side of the last alternative, although there are some interesting and important variations of detail in their proposals. At present, indeed, some form of the fourth alternative seems to be the only position that has much possibility of generating any significant political support within the relatively small group of individuals who will make the final decision. Hence the last alternative (probably based initially on the dual purpose reactor) is the one most likely to be adopted.

It is difficult to say whether this alternative would be adopted if there were a wider discussion of all the alternatives than is taking place. In any case, the other alternatives probably would not be so vigorously championed by groups equally effective politically. Thus in the one area where secrecy is not a genuine bar to the investigation

The range of alternatives is great. We have left to one side the question of alternative forms of ownership of the reactors. Various possibilities have been suggested. But the critical questions turn on operation and control; for the most part, ownership is relevant only to the extent that it is a condition for operation and control, including control over the disposition of earnings.

Robert A. Dahl, Ph.D., New Haven, Connecticut, is associate professor of political science at Yale University. He has worked in Washington for the Department of Agriculture and for the War Production Board. He is author of Congress and Foreign Policy (1950), and co-author of Domestic Control of Atomic Energy (1951) and Politics, Economics and Welfare (1953).

of alternatives, it is likely that policy will still remain the product of a rather tiny group of leaders, that the alternatives will not be examined except within this small group, and that sections of the public that in different circumstances might be activated in favor of other alternatives will remain inactive.

A NOVEL SITUATION

Thus, secrecy or no, atomic energy seems to present choices that defy wide popular understanding and control. So far, the control of such decisions is a kind of indigestible element in the operation of American democratic politics. In this respect, the atomic energy operation aptly symbolizes an era in which the opportunities for popular control have generally dwindled. To be sure, the unusual extent of elite control so far offered by atomic energy may be no more than a passing adjustment to a novel situation by an essentially vigorous and healthy democracy. But atomic energy appears to be one of a growing class of situations for which the traditional democratic processes are rather unsuitable and for which traditional theories of democracy provide no rational answer.

Superiority in Nuclear Weapons: Advantages and Limitations

By ARNOLD WOLFERS

AT the time this country alone possessed the atomic bomb, it was widely held that the Soviet leaders were being deterred from going to war by what they estimated to be the wartime advantages which monopoly in nuclear weapons offered the United States. Now, we must assume that such monopoly has ended. At best, we may be able to look forward to a period of uncertain duration in which this country will enjoy superiority in quantity and quality of nuclear weapons as well as in many of the other elements that make up nuclear war power. The question is whether considerable over-all superiority—which will need further definition—can offer sufficient advantages either to act as a deterrent or to contribute materially to the chances of victory. Clearly, in order to estimate these advantages one can no longer confine oneself to the study of what this country could do in war to maximize the military value of its nuclear stockpiles; it is equally necessary to speculate on the use which the "inferior" power can make of its facilities.

IMPORTANCE OF THEORY

It may seem hopeless for one who is not in on the secrets which shroud American nuclear preparedness to try to help improve this country's estimates of its relative advantages. Even the "initiated" are bound to be groping in the dark. Not only is the Soviet Union uniquely qualified for keeping its nuclear policy and power secret, but experience in nuclear warfare is almost entirely lacking. However, if the non-initiated lacks knowledge of facts, with-

out which the relative nuclear war power of the United States and the Soviet Union cannot be compared, he can devote his attention to the development of theory without which the knowledge of facts must remain meaningless.

An example will serve to illustrate the role of theory. If at a given time this country had 1,000 A-bombs while the Soviet Union had 100—two entirely imaginary figures—no valid conclusions regarding American superiority for war could be drawn except on the basis of some theory pertaining to the importance of a 10-1 superiority, with the inferior power possessing 100. In popular suggestions that we must have enough bombs by now to make us capable of a nuclear knockout blow even against an enemy possessing nuclear weapons, theory is implicit; a certain numerical superiority in bombs is deemed sufficient to render a knockout blow possible.

Theoretical reasoning can proceed, fortunately, without having to depend on information held secret. It can operate with hypothetical figures unrelated to existing conditions. Findings attained by means of theoretical war games, as it were, can later be applied and modified by the initiated through changing the assumptions so as to bring them in line with the actual facts or estimates. The following discussion cannot hope to offer more than an illustration of the way in which theory may be put to work.

HITS ON TARGETS

For the purpose of this illustration I shall limit myself to a single set of

greatly simplified assumptions. I shall postulate a situation in which the Soviet Union is capable of placing not fewer than 200 nuclear hits on targets of its choice, including targets throughout the United States, and in which the United States can expect to place at least 1,000, or five times as many, hits on targets of its choice. Obviously, since these figures are arbitrary, no valid conclusions concerning actual American superiority now or in the future can be drawn. For the purpose of simplification no account will be taken of probable differences in the damage inflicted by the respective hits which would result from differences in the potency of the bombs possessed by either side. Many other factors which come into play are either being left out of consideration or are implicit in the stated assumptions.

It is well to realize what forbidding difficulties our initiated planners encounter if they seek to estimate the actual American superiority at a given time in terms of hits on targets. The size of the respective stockpiles is only one of the elements entering into the computation. If a country had a 100-1 superiority in the size of stockpiles but had only enough carriers to deliver fifty times as many bombs to the target, the carriers would be the limiting factor, as well they might become in practice.¹ The same might be true for trained

¹ This holds true particularly if General Hoyt S. Vandenberg is right in his assertion (as reported in the *New York Times* on June 6, 1953) that "it would be a mistake to believe fewer bombers were required to deliver atomic or hydrogen bombs over an enemy target even though their destructive effect was many times greater than that of conventional high-explosive bombers." He explained this statement by saying that while two airplanes with atomic bombs could accomplish what thirty planes would do with conventional bombs, one would have to send thirty bombers along to protect the atomic mission.

crews, gasoline supplies, air bases, or any other of the elements that are a *conditio sine qua non* of nuclear striking power. Again, if one of the two countries were better able to intercept the carriers of nuclear weapons and had what is called a higher "killing rate," the other would have to make up for the difference through greater numbers of bombs and carriers in order to attain its assumed ratio of hits.

Hits on targets, moreover, are not of equal value as far as the outcome of a war is concerned. One country might cause ten times more physical destruction to its enemy and yet achieve inferior results, either if the targets it had chosen were less war-essential or if the enemy were less vulnerable to material damage, economically or psychologically.

Also, while superiority in hits on targets is obviously a highly important part of superiority in nuclear war power, it is by no means identical with it. It would help a country little to be capable of making 1,000 hits if with 100 hits the opponent could knock out its ability to continue the fight.

TARGET SELECTION

Superiority in nuclear warfare, then, depends on relative skill in target selection—and on relative target vulnerability—no less than on relative ability to hit chosen targets. Because target selection, the main strategic problem in a war of bombs, is essential to any estimate of the advantages of superiority, the following discussion will concentrate on it.

It was mentioned earlier that in a two-way nuclear war results depend on the nuclear strategy of both sides and thus on the large variety of combinations to which their respective blows and counterblows may lead. Again for the purpose of simplification I shall divide all

targets into a manageable number of categories or target systems and assume that both sides will direct their attack on one system at a time and decide on a specific succession among them. In reality, it would be a question of choosing between the advantages of causing moderate damage to many types of targets and of causing overwhelming damage to a few.

In principle, nuclear bombardment can be directed at the following six main target systems: (1) urban communities; (2) nuclear power in being; (3) nuclear power potential; (4) war-essential nonnuclear industries; (5) tactical targets in the battle zone; (6) targets located in third countries assumed for the purpose of this discussion not to possess nuclear weapons.²

The order in which these systems are listed is not intended to prejudge the order in which the two belligerents, if acting rationally, would place them in terms of priority.

CITIES

When nuclear warfare is discussed, nuclear bombardment of system No. 1, congested cities, looms largest in the public mind. This is obviously due in part to the exceptional horror which such attacks hold in store, and in part to the fact that nuclear weapons were used in this way against Japan and have never yet been used against any other target. For the Soviet Union, assumed here to be the inferior power, there would seem to exist an almost irresistible temptation to direct its attack on our major cities. With a relatively small number of A-bombs it could cause immense loss of life as well as great in-

² If Britain has nuclear weapons, or should come to possess them later, the effects on a war in which the Soviet Union and the United States were engaged would have to be taken into special consideration.

dustrial destruction. Moreover, if it undertook a nuclear "Pearl Harbor" against our city population, it might hope by terror to crack the morale of the American people at the very outset.

Fortunately for us, this is only half of the story. An attack concentrated on cities leaves the enemy's nuclear power in being almost 100 per cent intact. In the case just mentioned, we would be left as capable of a retaliatory blow as before the attack, unless our government surrendered before our strategic air force had taken off for reprisal in kind—an almost unthinkable contingency. This means, then, that the Soviet Union would have to count not only on suffering the same damage to its cities but on seeing many times as many of its own cities laid in ruin. The whole enterprise thus turns out to be a suicidal venture, unless the death of millions of human beings and the ruin of scores of major urban communities be considered anything but suicidal.

It must be emphasized in this connection that an American attempt to knock out the Soviets first by a blitz against their cities would be no less suicidal from the point of view of this country, given the assumptions of our model and provided we had not first regained a monopoly or near-monopoly of nuclear power. If the Soviet Union preserved the capacity we have postulated, our superiority would not diminish by an iota the damage the inferior striking force could inflict. An exchange of blows against cities would in fact be likely to make third countries the sole winners.

This self-destructive character of blow and counterblow on cities is no guarantee against their occurrence. Even if both countries refrained in the beginning, inadvertent hits on cities, not readily recognizable as such, might easily start a vicious circle. Moreover, one

side might think that its people could "take it" while the other side could not, and many other miscalculations might be made even by governments seeking to pursue a highly rational strategy.⁸

There exists an even greater danger in this respect. One or each of the belligerents may so plan its strategic air forces as to make them capable of little but indiscriminate mass-area bombing, not realizing the suicidal consequences of such a strategy. Instead, one country may become so convinced of its enemy's intentions of using this type of strategy and of seeking to hit first that it will initiate the exchange of blows against cities, possibly by a sneak attack, Pearl Harbor style, if only for fear of striking too late. Actually, it makes no difference whether one is hit by the first blow or by the reprisal blow which immediately follows. Therefore, to hurry for the sake of striking first means taking a useless and tremendous risk.

We talk and do a great deal about nuclear secrecy; but if it were our intention to exercise maximum restraint in regard to bombing of mass areas, it would be essential to give this fact the utmost publicity before our opponent had committed himself to war plans for a crippling blow or counterblow against our cities. In any case, it must be concluded that no belligerent can cease to fear for his cities and city population as long as the enemy's nuclear power in being has not been crippled.

⁸ It has often been said that the Soviets will show no restraint, because the loss of the lives of their own citizens and of their own cities will make little impression on the men in the Kremlin. I myself wrote in 1946 (see "The Atomic Bomb in Soviet-American Relations" in *The Absolute Weapon*, edited by B. Brodie, p. 135) that we cannot "feel satisfied that the Soviet leaders would under all circumstances shrink from sacrificing their cities if they felt sure of ultimate victory." I now contend, however, that an attack on our cities would mean suicide for them rather than ultimate victory.

NUCLEAR POWER IN BEING

From this it follows that the ideal target for either side, though not necessarily the exclusive one, is target system No. 2, the enemy's nuclear power in being, provided there be any practical chance of reducing it substantially. Here superiority of the right kind can pay its highest—possibly its decisive—dividends. This country would have to commit fatal mistakes if the two hundred atomic hits with which the Soviet Union is being arbitrarily credited here were enough to knock out a major part of our target system No. 2.

It should be remembered, however, that in order to be successful in this respect the Soviets would not have to hit our stockpiles of bombs or even our precious stocks of carriers. The loss of any one element essential to nuclear striking power is enough to eliminate nuclear power in being. For example, either side would cease to have such power while its air bases were out of commission, assuming planes to be necessary for delivery of nuclear bombs. While little can be known today about what it takes to "neutralize" an air base by means of an atomic attack—or even an attack with H-bombs—or about the degree of damage which would have to be repaired after an attack, it stands to reason that the chances of success will rise in proportion to the number of hits, and drop in proportion to the number of bases at the disposal of the other side.

How much the United States could hope to achieve with its superior numbers cannot be guessed without knowledge of many facts; but the difficulty dare not be underestimated of knocking out the nuclear power in being of any opponent credited with a substantial number of bombs, planes, and bases, many of unknown and distant location. While this country with its assumed

great quantitative superiority would surely not wish to miss the unique chance which target system No. 2 offers to regain nuclear monopoly and safety for its cities (even a reduction of enemy nuclear power in being is a distinct gain), the United States could hardly dare to pay exclusive attention to this target; the results might be disappointing.

NUCLEAR POWER POTENTIAL

I have called nuclear war potential the target system No. 3. It includes all industrial plants and facilities by means of which nuclear weapons, carriers, and other elements essential to nuclear power can be produced and reproduced. It need hardly be said that this set of targets is attractive to both sides. Not only is it likely to be highly vulnerable to bombardment, but it is of great use to a belligerent whose initial stocks fail to carry him through the war. The United States would have far more to gain than the Soviet Union from knocking out the nuclear war potential of its opponent, because without it the Soviets would be limited to their far inferior initial stocks. Even if their stock of carriers were plentiful or even superior to that of the United States, it would help them little once they ran out of bombs. In view of the vulnerability of at least a major part of the installations considered here, it should be possible for the superior power to cripple target system No. 3 and reduce the inferior power to its initial stocks.

But if on our assumption the Soviet Union would have to count on losing its capacity for nuclear production almost immediately, the same might be true for the United States as well. It would certainly be unwise to rely heavily on the contributions which nuclear industries and plants producing long-range bombers could make, once two-way nuclear hostilities had started. It is true

that the Soviet Union would have less to gain from eliminating target system No. 3, unless we found ourselves short of long-range carriers, having relied on their replacement, or unless our stockpiles of H-bombs were low at the start; but the inferior power could ill afford to allow its opponent to go on producing nuclear weapons—however time-consuming such production may be—while left to exhaust its own limited stock.

NONNUCLEAR WAR INDUSTRIES

Target system No. 4, comprising the nonnuclear productive facilities which serve the war—including the major part of either country's industries and transport facilities—may need fewer comments because it has become the traditional target of aerial warfare. However, it must be pointed out that the area of destruction being what it is even in the case of A-bombs, not to speak of H-bombs, many of the targets in this category would have to be spared if large cities were not to be destroyed in the process of attack. This constitutes a more serious handicap for the United States, because the Soviet Union, with its superior stockpiles of nuclear weapons, would have an incentive to proceed along a highly selective pattern anyway.

Both sides would want to concentrate their attacks on installations which would tend to create bottlenecks of serious duration and which lie sufficiently removed from major cities to minimize the risk of unintentional city destruction. Even presupposing a large measure of self-restraint on both sides, this country with its quantitative superiority should be in a position to cut far deeper into the enemy's war-essential industries than he could cut into ours; however, better intelligence or better target detection might tip the balance in favor of the Soviets.

Much would depend, too, on the relative degree to which the two economies

were exposed to bottlenecks. In a protracted war it is at least theoretically possible that this country, with the superiority we have assumed, could bring Soviet war production to a virtual standstill, as Allied forces succeeded in doing in the case of Germany during the last phase of World War II. In a nuclear war this could be achieved without prior attainment of control of the air over Soviet territory.

TACTICAL TARGETS IN THE BATTLE ZONE

In order to do justice to the large number of variables which come into play, a theoretical discussion of target system No. 5, tactical targets within the battle zone, would have to go into more detail than can be covered here. The military tactics used by both armies, the character of the terrain, the offensive or defensive intentions of the belligerents, the nature of their lines of communication, and many other factors affect the number and the vulnerability of targets which might present themselves here to bombs, rockets, and atomic artillery shells. Large numerical superiority would permit the United States to make lavish use of nuclear weapons even on elusive and ever recurring targets of the kind to be found in a battle area and along enemy supply lines. Because precious crews and costly, perhaps non-reproducible, planes can be saved by the use of nuclear weapons, it will always pay to employ them, given sufficient stockpiles, where they can accomplish as much as conventional bombardment.

Despite the fact that the inferior power would be under heavy pressure to economize in the use of nuclear weapons for tactical purposes, it would surely not hesitate to expend them on this target system if this country and its allies were exceptionally vulnerable to attacks against certain points of concentration

in the battle zone. I shall discuss this very kind of vulnerability in connection with the next target system when speaking of the ports on the Atlantic.

TARGETS IN THIRD COUNTRIES

Finally, there remains target system No. 6, targets in third countries, specifically in western Europe. It may be assumed that any country which succeeded in staying out of the war would be spared all but accidental bombardment; all other countries risk becoming victims of nuclear bombardment by either side, whether in the course of battle, of conquest, or of liberation. It is this danger, characteristic of countries lying between belligerents possessing nuclear weapons, that rightly frightens the people of Europe and of some other "in-between" nations. In the early stages of a Soviet-American war the question would be whether targets in western Europe would have high priority on the Soviet list of targets; or, more specifically, whether they would be sufficiently rewarding to divert attacks from targets in the United States. Before discussing the possible fate of Europe's major cities, it may be well to review briefly the other four target systems in regard to that region.

Some of our nuclear power in being, especially in the form of air bases, is almost certain to be located on European soil. The Soviets would have special reason to want to knock out air bases in that area from which nuclear carriers could take off, because they are located relatively close to its borders. Areas on both sides of the Iron Curtain from which rockets with atomic war heads could be launched might also come in for much attention by both sides, although rocket launching sites might prove one of the most elusive targets, even for A-bombs.

Little if any of our nuclear war potential is likely to be on European soil

except perhaps for some of Britain's and continental Europe's aircraft industry. But European nonnuclear productive installations would be particularly likely to attract Soviet attack, assuming the war were being fought in Europe. Their output could reach the battle front with a minimum of logistical difficulty. However, the Soviets might leave them intact with a view to using them after overrunning Europe and thus they might later become an American target.

As far as tactical targets are concerned, they would obviously be in large part in western Europe if a battle line ran through any part of the Continent. Of one such set of targets—the ports of Europe—more will be said in a moment; but first a word should be said about Europe's cities in general.

A nuclear terror blow against Europe's large urban communities, including Paris, Rome, and London, might profit a Soviet war effort immensely, or so at least the Soviet leaders might believe if they expected it to lead to an early surrender of our allies. However, the Soviet Union would be taking excessive risks if its leaders had reason to believe that we would retaliate in this case against their cities as if they had struck at our own. As a matter of fact, it might be hard to convince them prior to the event that such was our intention; particularly difficult if we hesitated to make such a commitment in the case of Europe's port cities, where such intention, as we shall see, could open the door to the vicious circle of blows and counterblows. Europe could have even less hope for its cities if, prior to a war in which Europe were to fight on our side, the Soviets had convinced themselves that we would strike at their cities anyway, irrespective of how much they might be inclined to restrain themselves in this respect.

The port cities are a special problem. They present a tactical target of unique

attraction to the Soviets. Because this country is separated by the ocean from any potential battle front in Europe, and thus from Soviet as well as Allied armies fighting at that front, almost all the vast supplies of arms and men which would be required to feed that front would have to be funneled through American ports of embarkation and European ports of disembarkation. The only exception would consist of supplies flown in by air or landed on scattered beaches.⁴ Here, then, are the "Naples" and "Antwerps" of a Soviet-American war. The temptation for the Soviets to put them out of commission by means of a logistical knockout blow, probably carried out with the aid of ships as well as planes, might prove irresistible whatever the costs. Priority would surely be given to the European ports, both because of their proximity and because of the chance that we might not enter upon a round of blows and counterblows against cities if European rather than American port cities were destroyed in an attack on port facilities.

SOME LIMITATIONS

On the basis of the preceding considerations it is possible now to draw some conclusions concerning the advantages of superiority as they would result from the conditions posited in our model, and assuming rational target selection by both sides. But it must be emphasized again that no conclusions can be drawn pertaining to the position or superiority which the United States actually possesses today or may possess tomorrow. It can only be said that we may enjoy the advantages suggested by the model

⁴ It should be noted that this situation is not arbitrarily created by our commitments under the North Atlantic Treaty. From nowhere could our armed forces reach Soviet soil, as well they might have to if we wished to win, except from territories lying on the other side of the oceans.

to the extent to which the actual relation of nuclear weapons between the two countries happens to approximate the assumptions laid down here.

Limiting ourselves, then, to our single analytical model and the six target systems posited above, it can be said that some advantages for the superior power stand out clearly, while others which might be supposed to exist are, to say the least, doubtful. Thus, to begin with the latter, nuclear superiority of the kind under discussion here does not give assurance of quick or final victory. This is so because of the inescapable hazards of mutually devastating blows at cities which might reduce even the superior power to the rank of a minor belligerent and because the inferior power might cause deficiencies in vital elements of nuclear weapons or insuperable bottlenecks in transportation and war production.

SOME ADVANTAGES

With its assumed superiority, the United States would have a reasonable chance of dissuading the Soviets from undertaking a "Pearl Harbor" on its cities or initiating terror blows in the course of hostilities. In order to do so, the United States would have to keep superior retaliatory power in being and act with a maximum of self-restraint even if its own cities or allied cities were hit inadvertently.

Most important, superiority would offer us an excellent chance of preventing the enemy from crippling our nuclear weapons in being to a point where our country would cease to possess substantial nuclear striking and retaliatory power. We, on the other hand, might be successful in knocking out his nuclear weapons in being, though our superiority would be seriously lessened if the Soviets knew the exact location of our air strips and our carriers while we

did not possess the same knowledge of the location of theirs.

If, despite this handicap, we succeeded in greatly reducing Soviet nuclear weapons in being, our near-monopoly of nuclear striking power thereafter might force quick recognition of defeat by our opponent, if only after a token use of bombs on his cities. In this case—the case of one-way nuclear war—the Hiroshima-Nagasaki type of nuclear strategy would again become militarily and morally justified as the surest means of bringing hostilities to a quick end and saving millions of lives.

It has been said earlier that we could hardly have more hope of retaining our nuclear war potential than could our opponent; but with our assumed far superior initial stocks, at least of bombs, we could better afford to lose the facilities falling under this heading.

In regard to other war-essential industries, the superior power could count on coming out on top unless its economy proved much more susceptible to bottlenecks. The country relatively more dependent on productive facilities located inside of cities would have much to gain from avoiding a mutually destructive round of blows on cities.

In the field of tactical bombardment, quantitative superiority offers immense advantages irrespective of whether the nuclear weapons are delivered by plane, guided missiles, or cannon. However, this advantage would evaporate in the case of the United States if the stream of men and materials necessary to operate overseas air bases and carriers and to feed an overseas battle front were interrupted for any considerable length of time. This leads one back to the American "Achilles' heel," the ports of disembarkation.

DEFENSE PRIORITIES

In our assumptions it was implicit that neither side possessed defensive

means sufficient to prevent the enemy from making the number of hits on targets which we have postulated. If it were possible to develop such defenses for some targets, the priorities accorded to certain targets by the United States might materially affect its advantages. It would appear that top priority should be given to the protection of nuclear power in being and especially to vital and exposed air bases, it being assumed that maximum care would be taken anyhow to protect storage sites of bombs and carriers. Next would come the ports of embarkation and disembarkation, with the former included lest after the latter had been rendered invulnerable the former should be raised to near the top of the Soviet priority list. One way of making these ports less attractive to a would-be attacker would be to stockpile war materials in Europe—a risky procedure if Europe were likely to be overrun—or to provide lavishly for alternative unloading facilities, making minimum demands on ports and harbors.

In this order of defense priorities it would seem as if defense against the most dreaded and deadly attack, attack against urban communities, were being neglected. But these communities are not unprotected as long as we retain sufficient retaliatory power in being to make an attack on them suicidal for the enemy, and as long as we restrain

ourselves from undertaking blows at Soviet cities.

THE QUESTION OF DETERRENCE

It may be asked, finally, whether superiority of the kind assumed here offers the advantage of serving as a deterrent to war or at least as a deterrent to all-out use of nuclear warfare. Superior nuclear power for war could render no better service to this country and to the world. Unfortunately, there is no way of making sure that any amount of superiority will deter an opponent, because deterrence depends on his estimate of this superiority and its consequences, as well as on his willingness to take risks and to suffer losses.

It should only be pointed out that secrecy which hides our strength, whatever other benefits it may bestow, runs directly counter to a policy of deterrence.⁵ Serious attention should be given, therefore, to the development of a rational policy not only of secrecy but also of disclosure and publicity where our strength and our intentions of restraint are involved.⁶

⁵ It would be ironical, after all, if it were ever left to Soviet spies to impress their government with the extent of our nuclear strength and thereby to deter it from acting against us.

⁶ For a discussion of policies of disclosure—limited to the disclosure of new weapons—see Bernard Brodie, "Military Demonstration and Disclosure of New Weapons," *World Politics*, Vol. V, No. 3, April 1953.

International Control of Nuclear Weapons

By ROBERT W. FRASE

INTERNATIONAL control of atomic energy is as much a psychological and political problem as it is a technical one. There is undoubtedly more than one way in which effective controls could be established, and the choice made will depend upon the dominant currents of thought at the moment.

For the past two or three years interest in the subject has practically died out. This is true not only of official action of governments and in the United Nations, but also of unofficial discussion and writing on the subject. In reviewing the literature recently, for an international bibliography on the non-physical-science aspects of atomic energy for the period since July 1950, the author has been impressed with the very small number of articles on international control. The subject of greatest interest by far in this past three-year period, as reflected in both professional and popular writing on atomic energy, has been civil defense, with atomic power in second place. This is a reflection of the mood of the times, not only in the United States but in the rest of the world as well.

If general interest in the subject of international control of atomic energy revives (and the revival of such interest may be a necessary condition of the renewal of major governmental activity), circumstances will undoubtedly be quite different from those in 1945-46; and to be realistic, the types of control schemes explored should reflect these changes. There would not be much point in reviewing the control plans presented to the United Nations in the 1946-48 period, and the negotiations on those plans, with any idea that

if the subject is revived the negotiations will pick up precisely where they left off. It is of interest and value, however, to look at these plans and negotiations to see what the basic technical problems are and how the particular proposals advanced were influenced by the mood and the assumptions of the time. We may then be in a better position to assess the problem of what kind of control plan would meet the political, military, psychological, and technical requirements of the period into which we are now entering.¹

THE ACHESON-LILIENTHAL PLAN

It was in 1945 and early 1946 that the United States Government took the initiative in proposing the international control of atomic energy. The impetus for this move, and its acceptance and support by the public, came from the shock of the mass destruction made possible by this new weapon; the horrors of Hiroshima and Nagasaki; the desire to be done with war after the recent experience with a major conflict; and the fear of a future war with a potential enemy coalition headed by the Soviet Union, combined with the hope that this potential enemy might be induced to reform its totalitarian and expansionist ways.

The actual proposal developed and put forth by the United States—the

¹ For a detailed and documented review of the evolution of United States policy on the international control of atomic energy and negotiations in the United Nations Atomic Energy Commission through the year 1949, see the series of three articles and technical appendix in the *New Republic* for April 3, 10, and 17, 1950, prepared by Robert W. Frase and James R. Newman.

Acheson-Lilienthal plan modified in one major particular by Baruch—also reflected this psychological mood. The central and unique feature of this control plan, as compared with earlier plans to control and reduce armaments, was the establishment of an international co-operative enterprise for the development and then the production of electric power, using fissionable materials as fuel. There had already been enough experience with Soviet secretiveness to persuade the drafters of the Acheson-Lilienthal plan that any system of control based solely on limitation and enforced by inspection would be unacceptable to the Soviet Union in the first place, and would break down in practice if initially accepted. It was thought that some positive inducement other than the obvious mutual advantages of controlling this destructive new force had to be held out.

The additional positive benefit offered to the Union of Soviet Socialist Republics was, of course, the prospect of a new source of electric power, to be made available at a much earlier time than the U.S.S.R. could do it alone through the contribution of United States and British know-how (or "secrets").

The substitute for the inspection system was the development and actual production of atomic power by a new international agency in whatever country the plants were located. There would thus be no need for much inspection of the production plants themselves, because the international agency would itself be conducting the atomic enterprises in the U.S.S.R. as well as in other countries. Inspection would be confined to ensuring that no secret or illegal production plants were built or operated.

FOUR FACTORS IN FAILURE

There was much to commend this approach in the circumstances of the time.

It failed, however, to secure Soviet acceptance over the two years from June 1946 to September 1948, when there was more or less active negotiation in the United Nations Atomic Energy Commission. In retrospect, and on examination of the record, the failure appears to have stemmed from four main factors. There may have been others (including the personality of Stalin), but only someone privy to the secrets of the Kremlin would be able to speak with any authority on that point. The four factors, not necessarily in order of importance, were the Soviet fear of contact with the West, the Soviets' suspicion of joint enterprises in which they considered themselves to be in a minority position, the lack of any immediate and tangible prospects of economic benefits from atomic power, and the hedges which were placed around the offer of a joint international enterprise to develop and exploit atomic energy for peaceful purposes. Each of these deserves some further discussion.

Fear of contact with the West

To some who participated in the United Nations atomic energy negotiations, the major reason for the Soviet rejection of the United States proposals was thought to be the breaching of the Iron Curtain. The control system would have introduced internationally recruited inspectors and other employees into the Soviet Union on a long-term basis. The Soviet rulers were thought to be resisting any such development on two counts: for political reasons because it might lead to unrest and subversion of the Soviet population, and for military reasons because it would reveal Soviet military secrets in fields other than atomic energy.

There can be no doubt that Stalin would not have welcomed this breach in the Iron Curtain, but there is perhaps

some question as to whether this was an absolute barrier to Soviet acceptance of an international control plan. Might it have been overcome if the advantages had seemed great enough? One fact bearing on the question was the acceptance by the Soviets—after a great show of resistance—of the two internationally staffed missions of the United Nations Relief and Rehabilitation Administration which were in the Ukraine and Byelorussia for over a year in 1946–47. When it became clear in late 1945 that if there were no missions there would be no UNRRA relief programs, the Soviet Government agreed to the missions.

Suspicion of joint enterprises

In the original form of the Acheson-Lilienthal report, the Russians would have had to overcome their fear of being outvoted in an international atomic enterprise, and this would not have been easy for them to do; but they might have had a somewhat easier time of it without the modification of the plan developed by Baruch and presented as the official United States proposal in June 1946.

The Acheson-Lilienthal report imposed no new machinery of sanctions for violations of the proposed atomic energy control treaty. The plan was designed to provide what W. T. R. Fox later called "a reliable fire-alarm system"—a system which would provide timely and reasonably certain notice that fissionable materials were being secretly and illegally accumulated for the purpose of making bombs. The theory was that if such violations occurred, other nations would take such action, including collective action, as the circumstances warranted—even to war or the threat of war.

To this concept Baruch would not agree, and he won the support of Secre-

tary Byrnes and President Truman over the opposition of some of the authors of the Acheson-Lilienthal report. Baruch added to the scheme a proposal to remove the veto in the Security Council with respect to collective action following violations of the atomic energy treaty. The Security Council, under this proposal, could by majority vote invoke sanctions for atomic treaty violations, including collective military action.

This aspect of the Baruch plan was the principal ostensible cause of the Soviet objection to the United States plan in 1946. Subsequently, the Baruch proposal on the veto was more or less disowned in a quiet fashion by the United States negotiators who followed Baruch; but the question of the veto at the very least provided an issue, as Chester Barnard predicted in advance that it would, on which the Russians could "dance up and down indefinitely."

Lack of immediate prospects for atomic power

There was a good deal of optimism in early 1946 about the prospects for developing economic electric power from atomic energy, and this was also thought to be a major inducement to the Russians to enter into a co-operative international atomic energy enterprise. Less than two years later this prospect for economic atomic power had receded into the more distant future—so much so in fact that the "Majority Plan" for atomic control finally voted by the United Nations Atomic Energy Commission in September 1947 was based on the explicit assumption that the international atomic authority would not be in the power business for some years. A little-noticed provision of the plan required an amendment of the basic control treaty after a showing of the technical and economic feasibility of beneficial uses, before any

large-scale accumulation of plutonium would be permitted.

This amounted to a finding—now confirmed by experience—that economic atomic power was some years away and that the international atomic development authority would not be heavily engaged in this area until the basic atomic control treaty had been amended. The Russians were apparently equally aware of the long-term problems involved in developing electric power from atomic energy on an economic basis, despite their propaganda bombast at times which charged the United States "monopolists" with trying to curtail peaceful atomic development in order to preserve their present investments in electric power production based on conventional fuels. As Professor Skobeltsyn, technical adviser to the Soviet delegation, stated in the summer of 1947 (in the indirect quotation used in a United Nations document):

If the opinions of experts on the subject were to be accepted, it might be decades before atomic energy could be utilized in industry; and this would result in the simplification of the whole problem of the structure of the system of control. He [Skobeltsyn] felt that some of the members were incorrectly basing their discussion on the belief that the application of atomic energy could be realized in the near future.

Even today, six years later, the era of large-scale economic atomic power is still being placed a decade or two in the future. In the recent hearings of the Congressional Joint Committee on Atomic Energy, United States private enterprises seem not yet to have come forth with a firm offer to enter this field with their own capital without government support, such as the sale of by-product plutonium for bombs to the United States Government. Thus a key element in the original Acheson-Lilien-

thal plan which was designed to attract the Russians with economic advantages, soon turned out to be an overoptimistic assumption in the short run, and was actually formally so designated in a key provision of the United Nations Majority Plan of September 1947.

Hedges in United States proposal

The principal hedge in the United States proposal of 1946 actually antedates the Acheson-Lilienthal report itself. This was the matter of "stages," which was included in the Truman-Attlee-King declaration of November 1945, and subsequently elaborated in the final section of the Acheson-Lilienthal report. In brief, the idea suggested in these documents was that the international atomic control and development agency would take over atomic operations in stages, starting with a survey of raw material resources and progressing up the production chain to the plants which produce fissionable materials.

To this the Russians made violent objection, and proposed as early as February 1946 that the international control agency take over operations of all kinds at one time. The actual sequence or timing of stages was never discussed in detail at the United Nations Atomic Energy Commission at any time, nor was it incorporated in the Majority Plan of 1947.

The objection of the Soviets to starting with a wide-ranging survey of raw materials was that it would reveal to the West many nonatomic military secrets—such as the location of industry and airfields—prior to their getting any "secrets" from the United States, for example the methods of operation and the capacity of the large United States production plants like Oak Ridge and Hanford.

The reasoning behind the United States proposal on stages was to pre-

serve our principal atomic secrets until a test of Soviet good faith had been made in the survey of raw material resources and other early stages in the plan.

This, then, was the United States proposal, its evolution in the United Nations in 1946-47, and the reasoning behind it. The Soviet counterproposals are not worth discussion in any brief analysis such as this; they were inadequate, rigid, and unimaginative. Only in its comments on and suggested amendments to the United States plan did the Soviet delegation occasionally reveal its understanding of the nature of the problems involved.

ATOMIC AND OTHER ARMAMENTS LINKED

Since 1947 little has been done in the United Nations in elaborating a concrete plan for atomic energy control. At the Assembly Session in 1950, the United States proposed the merging of the United Nations Atomic Energy Commission and the United Nations Commission on Conventional Armaments. The latter had accomplished even less than the former. In the 1951 Assembly Session this proposal was approved, and early in 1952 the two previous Commissions were dissolved and were replaced by a new Disarmament Commission. United States working papers on disclosure and verification of armaments and armed forces and on essential principles of disarmament were submitted to the new Commission early in 1952; these were followed by a British-French-United States working paper on setting numerical limits on armed forces.² On April 8, 1953, the Assembly adopted a resolution requesting the Disarmament Commission to continue

² *First Report of the Disarmament Commission*, United Nations document DC/11, May 29, 1952, 6 pp. mimeo.

its work and to report to the Security Council and the Assembly not later than September 1, 1953.³

The United States move to combine the consideration of limiting conventional armaments and the control of atomic energy was officially stated to be a reversal of the previous United States position. It made much sense both in terms of the United States interest and in terms of the technical problems of developing a workable and acceptable control scheme for atomic energy.

The initial move of the United States in 1946 to secure atomic control first, when we had atomic bombs but had demobilized our vast war machine while the Russians had a large army but no atomic bombs, would actually have weakened the United States and strengthened the U.S.S.R. in the world military power balance. Baruch was conscious of the problem, as indicated in a letter he wrote to Representative Vorys of Ohio early in 1947 in response to an inquiry from Vorys as to whether we had not better try to secure control and limitation of the Red army along with atomic energy control.

In addition to these considerations of immediate self-interest, it seemed possible that combining conventional armaments control with atomic energy control might help to secure agreement and to make possible a more certain method of control. It might help to secure agreement because any system of inspection which would be sufficient to enforce a limitation of armed forces and conventional armaments would have to be so detailed as to be capable of serving the needs of atomic control as well. It might strengthen the control of atomic energy because if, for example, bombers capable of carrying atomic bombs were to be prohibited, this would provide an additional protection against surprise

³ United Nations document A/L. 149, April 8, 1953.

atomic attacks; both the bombers and the atomic bombs would have to be secretly manufactured by an aggressor in violation of the control treaty and without detection by the inspection system.

So much for what is past. What are the elements in the present situation which would shape a new beginning on the atomic control problem?

LACK OF QUANTITATIVE INFORMATION

The most important question, of course, is whether there is any point in considering a new beginning. J. Robert Oppenheimer, the physicist and probably the chief shaper of the Acheson-Lilienthal report, has recently suggested that not much can be done about controlling the destructive aspects of atomic energy unless some additional facts are made available for public discussion.⁴

The most important of these facts is approximate quantitative information on the destructive potential that the United States and the U.S.S.R. have piled up in atomic bombs. Oppenheimer's opinion is entitled to great respect because of his knowledge of the technical aspects of the problem obtained behind the curtain of secrecy, plus his experience in the drafting of the Acheson-Lilienthal report and later participation in the panel of consultants to the State Department on the problems of disarmament in 1952. This group, consisting of Vannevar Bush, John Richey, Allen W. Dulles, Joseph E. Johnson, and Oppenheimer, was appointed in the spring of 1952 and apparently spent a good deal of time later that year in reassessing the problem of disarmament and atomic control; but neither their report nor any suggestion of what is in it has been made public.⁵

There is much to be said for Oppenheimer's view that it is difficult to con-

⁴ *Foreign Affairs*, July 1953.

⁵ *Department of State Bulletin*, p. 792, May 19, 1952.

duct any intelligent public discussion unless at least the rough outlines of the quantitative situation are available. Oppenheimer himself, however, has not attempted to supply any such outline (although he suggests that it can be estimated by any competent military intelligence organization), except for his personal impression that the Russians are about four years behind the United States in atomic development. This would place them in mid-1949. At that time various public data suggested that the United States might have some 200 bombs of at least the caliber of the Hiroshima or Nagasaki type; so the U.S.S.R. may have about that number now. Since then, United States production of fissionable material has undoubtedly been stepped up, and the efficiency of the use of uranium 235 and plutonium increased.

ROUGH ESTIMATES

As a rough estimate, we may have doubled our scale of production since 1949 and thus may now have the equivalent of at least 600 bombs of the early type. The number of bombs the United States has been willing to expend in test (41) also suggests that our stockpile is quite substantial. Precise figures are to a considerable extent, not so important as Oppenheimer's expert opinion that the Russians are about four years behind us. If the figures of 200 and 600 are too high now, they will not be two or three years hence; fissionable material does not deteriorate, and can be progressively accumulated without loss for an indefinite period. The development of the H-bomb does not change the essential nature of the problem, since the newer weapon requires an A-bomb as a detonator.

With respect to the equally important question of the means of delivering atomic bombs, the Russians probably

have a sufficient fleet of several hundred B-29-type planes which are capable of reaching the United States, particularly in one-way suicide missions. Our own air defense system has not been officially claimed to amount to much now, especially with respect to the warning system. Thus the United States is undoubtedly already vulnerable to atomic attack on a substantial scale, and various government studies hinted at in the press indicate a growing official concern about the need to provide a greater measure of protection than we now have.

On the offensive side also, the odds have probably evened somewhat between us and the Russians in the air-atomic field. The acquisition by the Russians of good jet fighters makes our B-36's vulnerable except in night and bad weather attacks. We have, in fact, apparently abandoned further production of these rather slow piston engine planes and shifted the bulk of heavy bomber production to jets. The jets, however, have a much shorter range, and depend much more heavily on air bases in Great Britain, Europe, North Africa, the Middle East, Japan, and Okinawa.

THE RISK OF CONFLICT

Thus, although we could now injure the Russians much more than they could punish us in an air-atomic duel, we are vulnerable and will probably become more so. The atomic weapon is no longer a deterrent to war in the way that it used to be—a force which could strike the Russians without their being able to strike back directly at the United States. It is still a deterrent, of course, in the sense that we are in the position of a man with a carbine facing one who now has a pistol, whereas formerly he had only a club. The man with the pistol is not likely to start shooting if he is guided by purely rational considerations.

Actually, of course, this analogy will not hold in the area of international affairs. Even the action of individuals is frequently influenced by nonrational considerations. International politics is far more complicated than, and probably not so rational as, dealings between individuals. An accident, a miscalculation, the pressures of internal politics, the action of an ally, the irrationality of a key individual—any one of these could start a conflict which would lead to the use of atomic bombs and the destruction of a large part of the urban civilization of the U.S.S.R., western Europe, and the U.S.A. Five or ten years from now such a conflict might destroy almost all of the urban industrial area in all three regions.

The crisis, in a sense, is no nearer in any tangible way than it was five years or eight years ago. No one can say that 1955 or 1957 or 1960 will be the crisis year. But the destructive potential continues to build up at an increasing rate, and one spark, one lapse of rationality, might set it off.

There remains, therefore, the same rational incentive that has existed from the beginning to keep trying to achieve international control of atomic energy, to keep sounding out the Russians through diplomatic channels every now and then to determine whether their position has changed. In the flux and upheaval resulting from Stalin's death it is conceivable that their policy in this field may be subject to reconsideration, just as other policies appear to have been reviewed.

FEATURES OF CONTROL PLAN

It may, however, take more than a mere general sounding out of the Russians to get serious negotiations started again. We may require a concrete plan—at least in its main outlines. What kind of proposal is most likely to meet

all the requirements of the present situation?

It is here that the lack of information particularly handicaps intelligent thinking and public discussion, to such an extent that the functioning of the democratic process almost ceases to operate in this area. It is possible, however, to consider two of the major features of any armaments control plan and to reach some tentative conclusions as to what is required with respect to each of them in the present situation. These are the questions of what is to be limited and controlled, and whether the limitations on major weapons are to be partial or an outright prohibition.

As already noted, the United States position most recently has been to insist on the control of all major armaments, including atomic weapons, and the components of armed forces. This is a reversal of an earlier position of insisting on control of atomic energy first. The control of conventional armaments along with atomic energy still appears to be a wise policy, although it is not so obviously important in the United States interest as it was a few years ago, when we had a monopoly or near-monopoly of atomic bombs, and a limitation of atomic energy alone would have weakened our power position vis-à-vis the Red army. But even now, if only atomic energy were controlled, a race in other armaments might contribute to the danger of war; and under the pressures of a long major conflict the atomic control scheme would no doubt break down.

LIMITATION OR PROHIBITION?

The second major question—should there be limitation or prohibition—is particularly important with respect to the control of atomic energy. The original United States proposal, as we have seen, was to outlaw only the use of atomic bombs, but to permit and even

to encourage the production of electric power from fissionable material. Outright prohibition of the production of fissionable material would have provided greater safeguards, a longer period of warning if the control scheme broke down, and a simpler control plan. Prohibition of production was rejected because we did not ourselves wish to forgo the potential economic benefits of atomic power, and we felt that a joint international atomic enterprise would be both more attractive to the Russians and more durable as an inspection and control device. Subsequently, in 1947, in the United Nations Majority Plan, we took a middle position which probably had most of the defects of both extremes. We continued to insist on the international development authority, but we put off to some indefinite time in the future the functioning of such authority on a significant economic scale.

We still have a hard choice to make on this question, and the facts on which to make the choice seem as inconclusive and baffling as they have always been. Electric power has now been produced from atomic reactors, both by ourselves and by the British. A test of how cheaply such power can be produced from a reactor which is designed only for power still seems five or more years away. Thus if we continue to propose an international atomic development authority, we shall still be proposing, as we were in 1947, an agency which would be engaged primarily in research and development for the next few years. Such a proposition might be even less attractive in an economic sense to the Russians than it was six years ago. The U.S.S.R. has been working on atomic energy during all of the intervening years, and may be almost as far along as we are with respect to the development of reactors for power. Pooling of knowledge might not advance their progress by much.

ATOMIC POWER BALANCE

The problem of the atomic power balance under a plan calling for large-scale production of electric power from fissionable material also seems no easier of solution now than it has ever been. This problem remains precisely where it was when discussed in the Acheson-Lilienthal report; it was never subject to negotiation in the United Nations Atomic Energy Commission. The Acheson-Lilienthal report proposed simply that the atomic power plants (which would also produce or be capable of producing large amounts of fissionable material usable in bombs if electric power were produced on any large scale) be distributed around the world in a "strategic balance"—a kind of atomic balance-of-power arrangement. If the Soviet Union or some other aggressor were to denounce or violate the atomic control treaty, the remaining nations of the world would have sufficient fissionable production capacity in their power plants to exceed the aggressor's bomb-making capacity. But the problem of allocating this power-and-bomb capacity was so formidable that it was never tackled. It remains just as formidable today.

In the present-day world it hardly seems conceivable that the Soviet sphere would accept less than half of the world's total atomic power and bomb production capacity, or that the rest of the world would grant the Soviet bloc that much.

Perhaps there have been technical developments behind the curtain of atomic secrecy which would make atomic power plants less dangerous in the political sense—plants which would "burn" natural uranium but would not be efficient producers of plutonium if seized by an aggressor. This seems unlikely, however. If such a development had occurred it could reasonably be expected

to have resulted in a new initiative for atomic control based on this simplifying factor. The recent public technical discussions of reactor development rather suggest the contrary; the emphasis is tending more and more towards the "breeder-power" reactor, which would produce electric power from the heat of the process and also produce more plutonium or U-235 than was consumed. This is the promising economic development, the only real hope of large-scale production of power from fissionable material, because it would permit the utilization of far more than the one part in 140 in natural uranium which is fissionable.

THE ALTERNATIVE PROPOSAL

Here again we seem to be back where we were in 1947 in the Majority Plan. There is now, as there was then and even earlier, the alternative of frankly proposing an interim control plan for a period of years, based on an absolute prohibition of the manufacture of fissionable material, as well as of the production of bombs, and the enforcement of this limitation by inspection. Inspection there has to be in any event, even with an international atomic development authority, to assure that secret and illegal production does not occur.

This alternative has been proposed by various students of the control problem through the years from 1945 to the present day, but it has never been officially discussed in the international negotiations. The nearest approach to such discussion was when the Majority Plan of 1947 accepted the premise of this scheme, an interim period of no significant production of fissionable materials pending the demonstration of the economic utility of atomic power, but continued to insist on international ownership and management of all atomic activity by the international authority.

The alternative proposal offers a solu-

tion—if only a temporary one while atomic power is not an economic reality—to the problem of the geographic allocation of atomic production capacity that seems so insoluble politically in the present-day world. Perhaps this is the time to bring it forth for discussion with the Russians. If the new Soviet rulers are not disposed to make another try at atomic energy control, they would probably greet this proposal with a propaganda campaign about United States monopolists' trying to stifle technical and economic progress. If they are ready to try again, they might find this an acceptable alternative which would meet many of their announced objections to the United Nations Majority Plan. From the point of view of workability and safety for the West, it should be at least as acceptable to us as our earlier proposal.

NEW DIFFICULTIES

It should be pointed out that whatever control plan is now proposed will present a good many more difficulties than any plan discussed in 1946, when only in the United States was there production of fissionable material and that was on a relatively small scale.

We now have a great accumulation of U-235 and plutonium, and a large investment in production plants. The Russians have a smaller stockpile and fewer plants, and the British still less. What is to be done under an international control scheme with these stockpiles of fissionables, and with the plants at Hanford, Oak Ridge, Savannah River, and Paducah in the United States and similar British and Soviet installations? The absolute monetary value of both stockpiles and plants is small in terms of their usefulness with respect to any future development of atomic power on a self-sustaining economic basis, but the popular psychological value placed on them is likely to be very great.

The other new and difficult question is how we can be certain, now that production has so increased, that all the fissionable materials produced prior to the time of the signing of a control treaty could be properly accounted for. How could we be sure that a secret stockpile sufficient for a considerable number of bombs had not been held out? Some writers have suggested that this may be the "point of no return"; that a control treaty may not be feasible for this reason alone, once production and stockpiles have grown to a certain point.

CONCLUSION

The world seems to have become numb, even paralyzed, with respect to doing any thinking or taking any action about warding off an atomic catastrophe. Even defensive measures, which at best may be palliatives, are not vigorously pursued. Secrecy seems to have become a comfortable and habit-forming sedative.

No one can forecast the course of events, especially in a unique situation. Perhaps the two atomic "scorpions in a bottle," to use Oppenheimer's term, will remain torpid indefinitely while the poison in their tails increases year by year. For some time after the First World War there was a popular theory that the destructive power of modern weapons had made large-scale war obsolete on rational and practical grounds. The price of victory would far outweigh its benefits. Then came Hitler.

The seekers of great power are not noted for their rationality. Nor is the vast destructive potential in the present and prospective atomic stockpiles any more of an assured war preventative than was the lesser power of conventional weapons prior to World War II. Some major elements of the old plan of atomic energy control now appear to be obsolete. There can be no guarantee of

success in any new attempt at international control—the odds are poor as they have always been; but the responsible statesmen of the West would

seem to have an obligation to keep sounding out the Russians from time to time with a new and modernized proposal.

Robert W. Frase, Falls Church, Virginia, economist and political scientist, is economic consultant to the American Book Publishers Council. He has been a student of the problem of the international control of atomic energy and other armaments for some years, has written articles on the subject for United States and British journals, and has served as consultant to the United Nations in the preparation of international bibliographies on the political, economic, and social aspects of atomic energy published by that organization.

The Economic Consequences of Atomic Attack

By DAVID F. CAVERS

IN a nation which is spending billions to equip its military arm to wage war against a dangerous enemy, yet begrudges millions to protect its own citizenry against that enemy's attack, other paradoxes in thinking about the problems of defense are, I suppose, to be expected. Yet I continue to wonder at the persistent tendency to treat civil defense against atomic attack as a problem of protecting simply against *physical* damage and injury. The economic consequences of atomic attack and the measures, legal and economic, required to reduce its impact have received startlingly little attention.¹

This is all the more surprising in view of the intricacy of the economic, social, and political relationships which make the United States a national community instead of merely a collection of people and buildings set in space. Much study and organizational work are being devoted to the design of warning systems, shelter arrangements, fire-fighting operations, medical treatment of casualties, and, to less extent, the feeding and housing of refugees. Some planning has gone to the maintenance of order and certain basic governmental services in

¹ Peculiarly to blame for the present imbalance, in my judgment, are the members of my own profession, the lawyers. They are the experts in contingency on whom governments, business firms, and individuals alike have traditionally relied to devise workable arrangements to prevent, mitigate, or liquidate the consequences of disappointed expectation, accident, and even disaster. Some planning for clients has, of course, taken place, but legislative and institutional arrangements have not even reached the discussion stage. An article by a leading Los Angeles attorney, Homer D. Crotty, "The Administration of Justice and the A-Bomb," *American Bar Association Journal*, Vol. 37, No. 12 (Dec. 1951), pp. 893-96, is an isolated exception.

stricken areas, and a few voices are still raised in advocacy of dispersal policies.

Preoccupied with physical damage, these studies have given little attention to the economic activities pursued in stricken areas, and the effects of their disruption (as well as of threats of further attack) on the rest of the country, most of which will remain *physically* intact, even under protracted atomic bombardment. Attention is paid, to be sure, to industrial production, especially of war plants, but this is considered primarily in terms of the physical activities being carried on, not the economic organization of which they form an integral part.

BUSINESS CENTERS AS CRITICAL TARGETS

One of the explanations for this monumental oversight may be the often encountered assumption that the prime enemy targets would be steel mills, atomic reactors, airplane factories, and other key industrial plants. Of course these would be targets of any enemy possessed of enough H-bombs and A-bombs to spend them freely and to sustain heavy delivery losses. But if thrift in using bombs were important to the enemy, and particularly if it sought the advantages of initiating war by a paralyzing surprise attack, then the great financial and commercial centers on the seacoasts or within guided-missile range of the ocean would seem by far the most attractive targets, especially if our current state of utter unpreparedness should continue.²

² I need scarcely add that that fat sitting duck, Washington, though rather less accessible, would repay a considerable expenditure of guided atomic missiles or other vehicles of atomic attack. Unless and until assured to the

These centers are the ganglia of a vast network of business relationships through which the United States carries on its economic life. With the impact of a blow on the solar plexus, the atomic destruction of these centers, especially by a surprise daytime attack, would set off a series of shock waves that, unless cushioned by advance preparation, would disrupt the functioning of American business and impose terrific strains on the nation's capacity to mobilize for war.

TYPES OF PROTECTIVE MEASURES

Fortunately, this is a problem that, however complex, can be tackled. The job calls for the investment of a great deal of hard thinking and planning but a relatively small amount of money. We must design and adopt a secondary network of stand-by relationships which can go into effect immediately after attack. Even if such a network were in existence, great and widespread harm would be sustained; but the relevant comparison is between panic and its attendant chaos, on the one hand, and the orderly treatment of grave economic injury, on the other.

The measures needed fall into three categories: (1) legislation, state and federal, in a number of fields, substituting new procedures, rules, and principles to govern private relationships during the period of disruption; (2) private arrangements in contracts, leases, mortgages, wills, trusts, and so forth, to meet contingencies arising out of atomic attack, many of which could be effected under existing law, while others would have to await authorization under the new statutes; (3) a basic plan concerning compensation for the injury and death of persons and the damage and destruction of property by atomic at-

contrary, I think we should consider Washington prostrate within the first hour of warfare.

tacks. Whether or not the compensation plan uses the war risk insurance principle, whether or not it purports to be comprehensive in its coverage, little other legislation and private arrangements can be wisely planned unless the extent to which the federal government is prepared to underwrite losses can be gauged.

Before I attempt to discuss these measures further, let me be more explicit concerning the nature of the hazards that are involved in the exposure of our great commercial and financial centers to attack.³ The dominant fact, I think, is the vital role played by credit in the operation of the vast and intricate set of contractual and proprietary relationships that constitutes our economic system.

STRAIN ON THE CREDIT SYSTEM

The strain that successful though limited attack would impose on the credit system would be terrific. The alternative to an epidemic of runs on banks would be a grim bank holiday, covering the stricken cities initially, and perhaps rapidly expanding. Despite the aid that the Federal Reserve System and the Federal Deposit Insurance Corporation could extend, if not themselves prostrated by losses in executive manpower, staff, and facilities, a tremendous financial operation would be required to evacuate deposits from New York City alone—and remember that banks and business firms all over the country keep

³ Incidentally, the effect of successful attacks on only a few such centers—for example, New York, Houston, and San Francisco—upon the functioning of similarly exposed centers such as Boston, Philadelphia, New Orleans, and Los Angeles might be almost as disruptive as actual attacks on the latter centers. Will an automobile-owning American citizenry helplessly await extinction in an obvious target area? And for how long? And how, without careful advance preparation, will the businesses operating in those areas transport their activities elsewhere?

large sums on deposit with New York banks. Of course, New York as a financial center is no stronger than its window glass. Once attacked, it would be out for the duration.

But, like the stock exchanges which would promptly be closed where they were not obliterated, banks represent only a conspicuous starting point. The immediate losses (physical and economic) sustained in the stricken areas alone would render insolvent a great many firms with all or major parts of their businesses in those areas. Few would escape even if a comprehensive scheme of war risk insurance or compensation existed and became immediately operative (the latter a highly dubious condition, being economically dangerous and administratively impracticable). Solvency ordinarily depends on the maintenance of a going concern, not on the existence of claims for compensation.

A secondary wave of insolvencies would soon follow. The areas which we have assumed would first be stricken are great consuming, manufacturing, and distributing centers. An upstate dress factory or a New England gadget maker would have a good set of accounts receivable one day and a long array of bad debts the next. Worse still, he would have lost half his customers and would wonder—with reason—about outstanding contracts and new orders from the other half, most of them in target areas. Would he meet his payroll? Would he meet his bank loan?

A factor to be reckoned with in assessing credit problems is the power often reserved by creditors in extending business loans to accelerate the maturity of term obligations if conditions arise which render the creditor insecure. These provisions would, if unchecked, operate to render immediately payable a great volume of debt that would otherwise fall due over a considerable

period of time. They might trigger a credit collapse.

The reader need scarcely be reminded of the billions in consumer credit outstanding and the dependence of great industries on its continued flow. Added to consumer credit losses in the stricken areas would be the rapid expansion of such credit losses elsewhere as payrolls felt the force of the secondary wave of insolvencies and as a general spirit of uncertainty gripped city after city. (Just how many refrigerators would a finance company repossess? My guess is that, in exposed areas, cars could be repossessed only at gun point.)

CONTRACT PROBLEMS

In addition to credit problems of the ordinary sort (of which I have noted only a part), we should have a wide range of problems based on the effects of attack on long-term contracts. Let me instance only a few categories: (1) supply and requirements contracts, frequently entered into by manufacturing firms for periods of years, the price and volume terms of which presuppose a reasonable continuation of the status quo; (2) long-term leases, many of which, though on unscathed buildings, would become economically oppressive; for instance, a lease on store property in a Westchester suburb after Manhattan had been bombed during business hours; (3) long-term employment contracts; for example, contracts of high-salaried executives and research men with firms which would still be in business but would suddenly have little need for their services; (4) pension plans, hard hit in their portfolios and meeting simultaneous waves of retirements and of reductions in employer contributions.

None of these, it should be noted, is a problem confined to bombed-out areas.

Where ordinary business practice is to deal on a short-term contractual basis (which means that one party is in

effect giving credit to the other and is carrying it by his working capital or bank loans), new sets of uncertainties would arise. How far would the reasonably safe firm in, say, Scranton or Elkhart or Nashua go in selling to old customers in still unhit target areas like Baltimore, Philadelphia, Pittsburgh, Detroit, Cleveland, Boston, or Providence? What should its new contract terms be? Multiply this example by one hundred thousand or so.

LIMITATIONS OF GOVERNMENT ACTION

As these economic dislocations were occurring (during a period of horrible human suffering and countless personal tragedies), should we assume that this process of economic "transition" would be smoothed over by government action and that the dislocated persons (like automobile salesmen in World War II) would find themselves absorbed in war production or in public administration? The answer, I think, is clear. In the absence of careful advance preparation, this could come about only gradually and after we had muddled through the economic disruption I am forecasting.

We have seen the slowness with which our unimpaired government machinery shifted gears in 1950 when the Korean invasion and the Chinese attack made rearmament essential. Yet that task seems simplicity itself when contrasted with the countless adjustments to be worked out by the survivors of a government that had been blown out of its capital city and was trying at once to wage war and meet the minimum survival needs of millions of refugees. Moreover, if atomic attacks were also being sustained by the industrial establishment, it might well be shrinking rather than expanding.

In appraising the functioning of the federal government, consider only one operation that atomic attack would entail: price control. Most of the prob-

lems faced by the Office of Price Administration in World War II were solvable because of the underlying stability of the wartime economy. The slack in the demand for certain products was taken up by others. Savings were huge. The pattern of demand was relatively normal. However, as the war continued, conditions began to change, and OPA was, as I know from personal observation, hard pressed to adapt its policies to the new situations. Yet I encounter many people with price control experience who still think of fighting the economic battles of an atomic war with the weapons forged in World War II and recently refurbished for the Korean crisis. This is folly. A wholly new planning job is needed, integrated with planning for other economic controls on a much broader front, and taking account of the fantastic departures in both directions from normal demands for goods and of new tendencies both to hoard and to squander.

MANAGERIAL PROBLEMS

The limitations of improvised governmental action to cope with the crisis would be matched by the managerial problems of private business. A surprise attack on New York alone, if in business hours, could decapitate a wide segment of American business. Closely held corporations might lose not merely their officers and directors but also their shareholders. Plants in the country would survive when top management was lost. Even if a protracted crisis, preceding attack had led many firms to put into effect existing plans to keep skeleton forces of officials and trained staff out of the target area, the burden thrust on them would be far heavier than the full complement had been used to carrying.

The existence of records on microfilm might help, but the difficulties of its use (what would be the supply of "read-

ers"?) and the sudden irrelevance of many of the recorded data would mean a drastic slowdown in operations dependent on them.⁴

LEGAL AND JUDICIAL BOTTLENECKS

The legal profession would form another bottleneck if a surprise daylight attack succeeded. The attorneys are the very people to whom the stricken banks and business corporations would ordinarily turn to meet problems of the sort that would multiply immediately in the wake of an attack. But the attorneys and their offices are just as vulnerably located as the banks and corporate offices. Those who survived would face perhaps twenty times the normal demand for their services. Yet they would be handicapped by loss of offices and files and by the general disorganization of the community⁵ and particularly of its courts.

In normal times, the court system is directly involved in only a small fraction of the community's affairs. Only a small part of the nation's firms go bankrupt, even in a depression year; only a tiny fraction of all contracts give rise to disputes involving litigation; only a relatively few propertied people die each year. Atomic attack would alter this situation drastically. As insolvencies multiplied, demands for bankruptcy and arrangements would expand explosively. Contract disputes would also proliferate as the basic presuppositions of the contracting parties were destroyed.

The pressures on the courts handling

⁴ An official of a large insurance corporation told me a year or so ago of a machine that his company had acquired to print microfilm records on cards at an almost miraculous speed. He remarked that there were then *two* other such machines in existence.

⁵ Manhattan business offices would doubtless be unusable after an attack, especially during the cold seasons. If the enemy were thought still to have deliverable atomic bombs, rehabilitation efforts would be futile.

decedent estates and such family relationships as guardianships would mount fantastically in the areas that had sustained attack. A hard-boiled attitude might be that this is luxury business; let the propertied widows go live with their brothers-in-law. But apart from the dislocation of the lives involved, the problems of ownership that would arise if estates were frozen could seriously impede economic adjustments. Who votes the stock in closely held corporations, the shareholders of record being dead or missing? Who is entitled to manage and sell property, to compromise disputed claims, to have custody over minors and incompetents? In normal times the orderly settlement of estates enables us to answer these and many like questions, albeit slowly, after a man of property has died. But suppose the death rate among such men in certain large cities has mounted 1,000 or 2,000 per cent?

And just where, literally, would one find the courts having jurisdiction over these corporate and property problems? Where, for example, would be the United States District Court for the Southern District of New York, which has its seat in lower Manhattan? This is the court which would have jurisdiction over the thousands of insolvencies that would arise in New York City and its New York suburbs. Where would the Surrogate's Court of New York County be? It has jurisdiction over the estates of Manhattan residents.

PROSPECTS FOR PRECAUTIONARY PLANNING

If the picture I have drawn has given the reader a sense of hopelessness, I think he is wrong—in part. The prospect of solving these and countless other problems of like nature for the first time *after* atomic war has begun is truly desperate. If, however, collectively and individually, we had planned

and put into effect measures of the three general types I have outlined above, I believe we could keep post-attack problems to manageable proportions. Indeed, the very process of thinking them through might lead to a wholesome simplification of a good many existing laws, procedures, and private arrangements.

Such study as I have been able to direct to foreign experience in World War II is encouraging. With the outbreak of war, England and Germany, for example, put extensive laws into effect to provide for the handling of war-created legal problems, and the German laws and regulations multiplied as bombing attacks grew. Moreover, I understand we have, in the captured files of German companies now on microfilm, great quantities of elaborate contracts that were devised to meet wartime exigencies. In contrast, I am told, Japan took virtually no protective measures. To do so would have been unpatriotic; the Army had said, "It can't happen here."

We dare not rely too much, however, on European experience as a guide. The problems created by a gradually accelerating tempo of bombing, chiefly at night and by conventional bombs, differ in crucial respects from those which sudden mass obliteration by A-bombing could produce.

EXAMPLES OF NEEDED MEASURES

No single article could canvass the diversity of measures that minimal protection would call for. I shall list only a few of them to indicate some of the principal lines that should be carefully examined without further delay. In this survey I shall omit the problems of health, safety, and order which have been receiving attention, and also the very serious problems of providing adequate stand-by arrangements for the executive arms of local, state, and federal governments—a field thus far covered with various degrees of adequacy

by legislation, chiefly at the state level. My concern will instead be directed to the neglected business of keeping in motion the wheels of our free enterprise, credit economy.

State and federal legislation (except compensation laws)

The credit problem calls for attack in a number of directions. Provision should be made for automatic transfer of bank deposits (either in whole or in part) from stricken areas to predetermined recipient banks, microfilm being used in the mechanics. Moratory laws, carefully tailored to meet a variety of situations, should be devised, a short blanket moratorium to be effective upon attack, to be followed by others of limited applicability. Authority should be given for the prompt appointment of conservators (ordinarily designated in advance) to be vested with wide powers over business and personal estates. Streamlined procedures for administering financially embarrassed corporations are needed; existing ones are hopelessly slow and cumbersome for emergency use. Procedures might even be devised for excising damaged segments of a corporation from the rest of it, prorating creditors' claims against each part so as to enable the undamaged part to become eligible for fresh credit. Government backing of short-term credit, administered by banks, could free business dealings frozen by war hazards, even where no war orders were involved. The need for working capital would probably be urgent; without it, the promise of property restoration or compensation might be like offering an artificial leg to a dying man.

The *force majeure* escape clauses which most well-drawn contracts contain in troublous times might actually prove disruptive. Courts might be given power to keep contracts in effect but to rewrite their provisions equitably, a measure for which both English and

German experience provides precedent. Estate administration would require speedy new procedures, with special attention to the problems of providing survivors with ready resources, even where wills and trust provisions had to be overridden, and freeing property and businesses from dead hands. Flexibility in corporate governance would also be needed. Proof of death should be facilitated.

Effective administration would require a stand-by system of courts, even though this might entail some disregard of state lines. The whole apparatus of notice and time limits governing current procedures would have to be reviewed and revised. Many judicial powers would have to be vested in special masters and referees, especially in stricken areas.

Private arrangements

The arrangements made by individual banks and insurance companies which have come to my attention are ingenious, but I think give inadequate weight to the disruptions occurring outside their walls. The insurance company that has reserved an institution near New York for its staff overlooks the waves of desperate humanity that will engulf the community chosen if an attack really comes. Working out co-operative plans with the government on a much more comprehensive scale seems called for.

Ordinary business concerns, with less public responsibility than the financial corporations, should review their long-term contracts and leases to seek ways of flexibly adjusting obligations to meet atomic war problems—a task which could be given both impetus and guidance by wise trade association leadership. Firms with managements and directorates concentrated in target areas should provide for the automatic transfer of authority to persons outside the area, upon attack. Appropriate voting

trusts might help to meet the problem of shareholders similarly concentrated. Trust companies should enlist safely situated understudies to help them handle the overwhelming duties that would fall on them as trustees for bondholders and as transfer agents.

Estate plans should be reviewed with the contingency of atomic attack in view. The drastic changes in the expectations on which existing plans are based suggest the possibility of vesting in persons outside the danger zone extensive powers to revise estate plans post mortem, pursuant to broad standards that the testators and the settlors could lay down. Safely situated substitute executors, trustees, and guardians should be provided in advance, and arrangements worked out for easy shifts of responsibility.

The law firms have a special responsibility: to provide stand-by correspondents in safe areas who are kept sufficiently abreast of the activities of exposed firms to enable the correspondents to help in an emergency, and who also can make some provision for working space for survivors. If, for example, Philadelphia and Boston were hit, nearby cities like Reading and Worcester could become the seats of much of the legal work of the bombed areas.

Compensation measures

The problem of compensation tends naturally enough to be cast in terms of war risk insurance for property damage, a reflection of the system successfully used in World War II which sustained losses only in the Philippines and made a net profit. It is clear, however, that if atomic attacks were made on metropolitan centers, the volume of war risk insurance carried in World War II would be a drop in the bucket. Moreover, it seems clear that to pay out large sums upon the infliction of damage would simply augment inflationary

dangers. Some combination of limited liability war risk insurance (perhaps with rates graduated to reward the new plant located in accord with dispersal needs) with a long-range program of government compensation, not necessarily providing full coverage, even together, might prove feasible.

The abortive "War Disaster Act of 1951," a bill⁶ drafted by the Bureau of the Budget and the National Security Resources Board and introduced by Senator Frear (by request), never emerged from committee. It not only provided property damage reimbursement but also gave payments to injured and needy victims of attack and to the families of the killed. Provision was also made for reconstructing essential plants and community services and for postwar aid to public bodies. A moratorium on insurance obligations was authorized. The bill was attacked by insurance companies. Whatever the merits of their complaints, it seems evident that the bill amounted to little more than a gallant first attempt to tackle an intricate set of extremely serious problems. In a more thoroughgoing study, incidentally, problems of tax abatement—local, state, and federal—ought to be included.

The problems of planning, public and private, to keep the economy a going concern after atomic attack are hard problems. Two or three years of work would at the shortest be needed to design and install an adequate system. Work should already have been well advanced. It is disquieting, therefore, that the recent Project East River, charged with recommending "the opti-

⁶S. 1848, 82d Cong., 1st sess., introduced July 12, 1951.

David F. Cavers, B.S. in Econ., LL.B., Cambridge, Massachusetts, is Fessenden Professor of Law and Associate Dean of the Harvard Law School. During World War II he served as Associate General Counsel for Price in the Office of Price Administration. He is an associate of the Special Committee on Atomic Energy of the Association of the Bar of the City of New York, and is author of a number of articles on the international control of atomic energy, chiefly in the Bulletin of the Atomic Scientists.

mum combination of non-military measures which will assist . . . The Federal Civil Defense Administration to discharge its responsibilities for preparing to minimize the effects of attack . . . on the population and industry of the United States," reported in its long, unclassified report that it had "not had an opportunity to make an intensive study of war risk insurance or of possible systems of war indemnity," the only phase of the economic defense problem which it recognized.⁷

A TASK FOR THE PUBLIC

Planning to design adequate economic defenses is not a task for federal officials working under security and classification restrictions. It is a job for businessmen, bankers, lawyers, and public officials, aided by research help where needed, able to discuss dangers and remedies freely and publicly. Not only would a better set of plans result from this process. For responsible citizens to face the dangers squarely and to learn, through participation in their design, the measures that would be put into effect in case of atomic attack would mean sounder attitudes toward the risk of such attack while peace is maintained and a far more effective response to its terrible impact if war should come.

⁷In Part I of Project East River's report, completed only in October 1952, there is a "Check List of Recommendations," 31 pages long, containing 263 numbered recommendations. Exactly one of these (No. 92)—more research on war risk insurance—deals directly with the problems discussed in this article. The report was prepared under Signal Corps Contract No. DA-49-025-SC-96 by Associated Universities, Inc. (a nonprofit university group which operates the Brookhaven Atomic Laboratory).

Economic Technology of Nuclear Power

By JAMES A. LANE

THE utilization of atomic energy depends on the reactions that occur between neutrons and the nuclei of atoms. These reactions can occur in a variety of ways. In the most common nuclear reaction, the nucleus "captures" the neutron forming an isotope of higher atomic weight. This isotope is usually radioactive and decays to form a new element. In the "fission" reaction, the nucleus splits into two parts forming a variety of lighter elements and releasing a number of additional neutrons.

Although many heavy nuclei undergo both fission and capture reactions with neutrons, only a few have a higher probability of fission than capture. Since these few generate excess neutrons and are capable of sustaining a nuclear chain reaction, they are called "fissionable" nuclei. The most common fissionable materials are uranium 233, uranium 235, and plutonium 239. Of these, only the uranium 235 occurs in nature as 0.71 per cent of normal uranium. The remaining 99.3 per cent is uranium 238, which has a very low fission-to-capture probability and does not fission enough to sustain a nuclear reaction. If normal uranium is bombarded with neutrons, two primary reactions occur. These are:

The first reaction is the nuclear fission reaction, and the second is a neutron capture reaction. Only the first

produces the energy for power and neutrons necessary for continuing the reaction.

If the nuclear fuel consists of pure U-235, there will be 1.5 excess neutrons created per fission, and in a mixture of U-235 and U-238, less than this, depending on the relative amounts of these elements present. In natural uranium, the above reactions occur in approximately equal amounts, which means that there are only 0.5 neutrons excess per fission.

Although the neutron reaction with U-238 uses up a neutron, this capture reaction produces an unstable atom U-239 which decays to neptunium 239, and this in turn to plutonium 239. Since Pu-239 is fissionable, each neutron capture in U-238 produces a new atom of nuclear fuel. In a like manner, thorium 232 will capture a neutron and produce U-233 as follows (Pa-233 means protactinium 233):

The large amount of energy released from the fission reaction arises from the fact that the combined masses of the fission products do not quite equal that of the fissioned nucleus, the difference being converted to energy. This manifests itself primarily in the form of kinetic energy of the fission products. These create heat on impact with surrounding atoms of the nuclear fuel.

REACTOR COMPONENTS

A nuclear chain reaction will be initiated spontaneously in a block of pure fissionable material if the number of

neutrons leaking from the surface is less than the excess neutrons generated. A simple system like this, however, is not practical as a source of power, for a number of reasons. First, a large fraction of neutrons leak out; second, there is no method of stopping the reaction; and third, there is no method of removing the heat generated. Consequently, to achieve a practical power generator, it is necessary to add other materials to the nuclear fuel to create more heat transfer surface and remove the heat and to control the rate of heat generation. Thus, the core of a nuclear reactor usually consists of a nuclear fuel, fuel diluent, coolant, and control elements, plus any structural materials necessary to contain or support the components.

In addition to the heat removal components, it is often advantageous to add a certain amount of "moderating" material to the core to slow down the neutrons from their original high velocities. Each time a neutron collides with a moderator atom it loses a fraction of its energy, until finally it is moving at the same velocity as the moderator atoms themselves. At this velocity, or energy, it is said to be "thermal," and nuclear reactors containing moderators are called "thermal" reactors. Conversely, reactors containing no moderating materials are known as "fast" reactors. Since the probability of occurrence of a neutron fission or capture reaction, measured by the nuclear cross section of the atom, changes with the velocity of the neutrons, thermal and fast reactors have considerably different properties.

By using a moderator, one takes advantage of the fact that fissionable materials absorb slow or thermal neutrons more readily than fast neutrons. For this reason, a chain reaction can be sustained in natural uranium with thermal neutrons but not with fast neutrons.

Although many materials of high atomic weight fission to a certain extent with fast neutrons, a fast fission chain reaction can be sustained only in nuclear fuels which contain relatively large percentages of U-233, U-235, or Pu-239. *Thus, fast reactors normally require large inventories of these fissionable materials.* However, such reactors have a considerably higher neutron economy than thermal reactors, and open the possibility of breeding more nuclear fuel from uranium 238 than consumed.

The design of a nuclear power reactor must satisfy two sets of requirements. The first deals with the nuclear system, or in other words the problem of maintaining and controlling the nuclear chain reaction; and the second, the problem of heat removal. To satisfy the nuclear requirements, the production of neutrons must exceed all losses due to absorption and leakage. To do this, the amounts of various materials in the reactor must be so adjusted that there are always excess neutrons available. Since all of the reactor components compete with the nuclear fuel for the capture of neutrons, only certain elements with low neutron absorption cross sections are suitable for use in the reactor. A constant rate of fission or constant heat production rate is obtained by adding neutron absorbers to maintain a delicate balance between neutron production and losses.

CONTROL OF REACTORS

Although the neutron multiplication process takes place in times of the order of milliseconds, not all of the neutrons are emitted instantaneously. Because a small fraction, less than 1 per cent, are emitted from short-lived fission products and are "delayed" as much as a few minutes after the fission occurs, the time between successive generations is

effectively increased. Thus, the delayed neutrons make the control of a reactor practical with mechanically driven rods containing neutron absorbers.

HEAT REMOVAL CONSIDERATIONS

The heat removal requirements of a nuclear power reactor usually dictate the size of the reactor core, although for each nuclear system there is a minimum size or critical diameter necessary to sustain the chain reaction. When the required size is larger than the critical diameter, the excess reactivity is adjusted by adding more neutron absorbing material to the reactor core. This may be either a nonproductive absorber, such as cadmium or boron, or a fertile material such as U-238 or Th-232 which will generate new reactor fuel.

The design of a nuclear power plant usually starts with the selection of the nuclear system with particular reference to the choice of coolant. The most important coolants are air, helium, water, heavy water, and sodium, although others may have merit for specific applications.

For the most efficient power production, the temperature of the coolant as it leaves the reactor should be as high as possible. This determines the thermal efficiency of the system and is an important factor in the economy of nuclear power production. Most of the development effort associated with nuclear power production centers on the problem of operating nuclear reactors at high temperatures. Superimposed on this is the fact that all materials become radioactive and undergo changes in their physical properties in a field of radiation. The combination of radioactivity, radiation damage, and high temperature performance, added to the nuclear requirements, considerably limits the number of materials suitable for use in a nuclear power reactor.

RELATIVE IMPORTANCE OF BREEDERS AND CONVERTERS

Since excess neutrons from fission will react with the fertile materials U-238 or Th-232 to produce fissionable Pu-239 or U-233 respectively, it is possible to generate as much or even more fissionable material in a reactor as it operates than is burned or consumed. The efficiency of this process depends on the relative amounts of fuel and fertile material present, and the extent of the neutron losses due to absorption and leakage. As long as there is some fertile material in the reactor, new nuclear fuel is produced. However, the added contribution that this new fuel makes to the original supply of fissionable material does not become significant until the ratio of new fuel produced to fuel consumed, after allowing for chemical losses, approaches or exceeds one.

The nuclear characteristics of the U-238-Pu-239 system are such that in a fast reactor it is theoretically possible to produce more plutonium than consumed. This type of reactor is commonly referred to as a "fast breeder" reactor, or simply breeder reactor. Thermal breeders may not be practical with Pu-239 as the fuel and U-238 as the fertile material, because of the non-fission-capture of neutrons by the Pu-239 to give Pu-240. However, properly designed thermal reactors which have a high plutonium regeneration ratio may play an important part in an industrial nuclear power program.

In the case of the Th-232-U-233 system, breeding is also theoretically possible in fast and thermal reactors. The relative merits of each type of reactor for nuclear power production from thorium depend more on design and economic considerations than on the nuclear characteristics. Many experts feel that since the difference in neutron economy between these two types is

small, a thermal thorium breeder may have an economic advantage compared to a fast thorium breeder.

The relative importance of the fast breeder, the thermal uranium reactor, and the thermal thorium breeder for nuclear power production will depend on the availability and potential supply of natural uranium and thorium, and the extent of the contribution of nuclear energy to our power supply problem. While it is true that breeder reactors make the most use of natural uranium or thorium, the question is essentially one of economics, since one always has the option of recovering more of these materials from the relatively limitless low-grade sources. The difference between the cost of maintaining a high neutron economy in the reactor in order to regenerate new fuel from the last few neutrons and the cost of recovering low-grade ores may well favor the latter. However, until this is established, the prospect of breeding is attractive enough to justify an extensive development effort in this direction.

Uranium requirements for industrial power

The uranium requirements for fast and thermal power reactors are an important factor in determining the relative merits of these reactors for economic power production. In both types of reactors, a certain amount of natural uranium is required to provide the fuel and fertile material for the initial loading, to supply inventories in the chemical processing plants, and to make up for uranium consumed. In reactors which do not breed, the additional amount of natural uranium required periodically to make up for the net fuel burned or lost during reprocessing is significantly higher than for breeder reactors, increasing with decreasing regeneration ratios.

The reactor inventory requirements

per unit of power produced depend on the efficiency of the heat removal and power production systems. In general, there will be an upper limit to the amount of power that can be extracted from a given amount of fuel, set by practical considerations of coolant pumping power, fuel element design, and reactor operating temperatures. Calculations of the heat transfer characteristics of the core of a reactor indicate that the minimum natural uranium requirement for fuel inventories will be in the neighborhood of 0.2 kilogram per installed kilowatt of electrical capacity for thermal reactors.¹

Since the annual fuel consumption in breeder reactors is negligible, reactor fuel inventories become the important factor in establishing the maximum utilization of nuclear fuels in this type of reactor. Generally, because of the high ratio of fertile material to fuel, the inventory for a fast reactor is approximately two and a half times as large as for a thermal reactor. If the thermal reactor were only to achieve an initial conversion of between .85 and .9 gram of plutonium for each gram of U-235 burned, the total yearly requirements would be equal for both types. This is shown in Table 1, which gives the hypothetical amounts of natural uranium required to produce the initial fuel charge in various thermal reactors and a fast reactor to supply the total power produced in steam plants in the United States in 1951.

Economic considerations

From an economic standpoint, the relatively large uranium inventory in fast reactor systems tends to offset the advantage of lower annual fuel consumption. If one assumes that the annual fixed charges against fuel inven-

¹ J. A. Lane and S. McLain, "The Design of Nuclear Power Plants," *Chemical Engineering Progress*, Vol. 49 (1953), p. 287.

tories, which are a nondepreciating investment, amount to 10 per cent, these inventories are one-tenth as important in determining fuel costs as charges against fuel burned. On this basis, one can calculate an "effective fuel requirement" in fast and thermal reactors by adding one-tenth of the reactor inventories to the annual consumption. The results shown in Table 1 indicate that both the fast breeder and thermal converters have roughly the same effective fuel requirements. In this regard, advances in technology which lead toward lower fuel inventories favor the fast reactor system.

The fuel inventory requirements for fast breeder systems shown in Table 1 assume that each reactor is fueled initially with enriched U-235 produced from virgin ore. After the first few fuel cycles, the plutonium produced is used exclusively as the nuclear fuel, and it is subsequently possible to produce excess plutonium for other reactors. Not only will the sale of excess plutonium reduce the cost of power, but it is possible to expand a nuclear power system based

on fast breeders by successive doublings of nuclear fuel inventories using plutonium plus depleted or waste uranium only.

This freedom from additional virgin ore is usually stated to be the most important attribute of fast breeders. However, the effectiveness of such a system depends on the characteristics of each particular reactor which determine the doubling rates of reactor inventories. For many designs, the fuel doubling times are too long to achieve a significant rate of expansion of the nuclear power system. Even with high doubling rates, there is still a question as to whether it is more economical to expand the nuclear power system through breeding or by mining new uranium ore.

DUAL PURPOSE VERSUS SINGLE PURPOSE REACTORS

In production reactors, as contrasted with power-only reactors, the Pu-239 produced by neutron capture in U-238 is removed periodically rather than allowed to burn in the reactor. As long

TABLE 1—NATURAL URANIUM REQUIRED TO SUPPLY TOTAL U. S. STEAM-PLANT-PRODUCED ELECTRICAL POWER IN 1951

Installed Electrical Capacity = 70×10^6 kw.
Power Produced = 326×10^6 kwh. per year

e. $g_0^* = 0.85$	15,000	3,500	5,000
f. $g_0^* = 0.80$	15,000	5,500	7,000

* g_0^* = Initial regeneration ratio, defined as the atoms of Pu-239 produced per atom of U-235 consumed at the start of the cycle.

** Effective annual requirement = one-tenth inventory plus annual consumption.

as a military requirement for atomic weapons exists, the plutonium has a strategic value greater than its value as nuclear fuel. The revenue obtained by operating a reactor as a dual purpose reactor, producing plutonium for military use and power for industry, is greater, therefore, than that for a power-only reactor. Studies by industrial participation groups indicate that because of the enhanced value of plutonium, the by-product power from dual purpose reactors is economically competitive with power from conventional sources. Consequently, dual purpose reactors provide an economic incentive for industry to develop nuclear power technology.

Although the dual purpose reactor approach provides a short-term incentive for industrial nuclear power, the long-range implications of such a system are not great. First of all, the economics of power production are closely tied to the requirements for weapon-grade plutonium, which cannot be predicted with certainty. Second, the economics of dual purpose reactors favor designs which emphasize plutonium production and minimize power production. For this reason there is a question whether such a program is a direct step toward economic power. Finally, the contribution that the available natural uranium can make to our industrial power supply via the dual purpose approach is limited to that obtained by burning a portion of the U-235 present. For the case considered in Table 1, the annual uranium requirement in dual purpose reactors amounts to 15,000 tons, compared to 200 tons for the breeder.

PROBLEMS OF ESTIMATING PROBABLE COSTS

Most estimates of the cost of a nuclear power plant start with the premise that the reactor and its associated facilities replace the boiler and fuel handling equipment in a conventional plant—in

other words, the steam-producing facilities. The remainder of the plant, which includes the turbogenerator, the condenser, and the accessory electrical equipment, is usually considered to be unaffected by the substitution of a nuclear boiler plant for the conventional fuel-fired boiler, if the steam conditions remain unchanged. If limitations of reactor operation prevent achieving conventional high-pressure steam conditions, turbine and condenser costs must be adjusted to allow for lower-pressure operation.

Thus the starting point of probable nuclear power plant costs is the average cost of a conventional plant. For large plants with capacities of 100,000 kilowatts or greater, this is estimated to be \$150 per kw. capability, or \$170 per kw. of rated capacity. The first of these two numbers, which takes into consideration the fact that on an average plants actually operate about 14 per cent above the rated load, is probably the most realistic basis. Since one-third of the investment cost is represented by steam-producing facilities, the cost of the turbogenerator section of a nuclear plant amounts to about \$100/kw. as long as such a plant produces steam at 1,200–1,500 pounds per square inch pressure. For operation with steam at 500 pounds per square inch pressure, this cost would be \$110/kw., and at 200 pounds per square inch, about \$130/kw.

With regard to the cost of the nuclear portion of the plant, estimates vary widely. Early guesses range from \$50/kw. to \$250/kw. More recent studies by industrial participation groups have failed to narrow the range, and vary from \$140/kw. to \$700/kw., depending on the type of reactor considered. For the most promising types of thermal reactors, such as pressurized water reactors, aqueous homogeneous reactors, or sodium graphite reactors, the esti-

mated costs lie between \$140/kw. and \$300/kw. Total plant costs for these systems will range from \$270/kw. to \$430/kw.

The cost of power due to these investment costs depends on the rate of fixed charges and the load factor or number of kilowatt-hours produced per kilowatt of capability. Depending on plant locations and other factors, fixed charges will vary from 10 to 15 per cent, and load factors from 70 to 90 per cent. Taking an average fixed charge of 13 per cent and an 80 per cent load factor, the investment costs in a nuclear power plant will be between 5 mills/kwh. and 8 mills/kwh. With less optimistic assumptions, investment costs might be one or two mills/kwh. higher.

The problem of estimating probable fuel costs in nuclear plants is more difficult, since this involves unknown factors such as the ultimate cost of uranium ore and uranium metal at various enrichments, and the cost of fabricating complex fuel elements and reprocessing irradiated fuels. In addition, the market value of the plutonium produced in the fuel, as well as other possible by-products, may have an appreciable effect on the net cost of nuclear fuels.

In spite of uncertainties, it is possible to arrive at an order of magnitude of fuel costs from published values of the cost of natural and enriched uranium. W. H. Zinn² gives the cost of natural uranium metal as \$35 per pound, and of enriched uranium as at least \$20 per gram. Using the effective annual fuel requirements of various types of reactors given in Table 1 as a basis, the corresponding cost of fuel varies from 0.5 mills/kwh. to 1.5 mills/kwh. for natural uranium. The cost of enriching and reprocessing the fuel is not included. If enriched fuels are required, costs may

² W. H. Zinn, "Basic Problems in Central Station Nuclear Power," *Nucleonics*, Sept. 1952.

be considerably greater than the minimum values given here.

Since there is no experience available on the operation of a nuclear power plant, it is difficult to predict how the added complexity of such a plant will affect operating costs. The best guesses to date indicate that operating costs of nuclear plants may amount to about 2 mills/kwh., or twice the average of conventional plants.

The total cost of electricity at the bus bar in large nuclear power plants, based on the most recent published information, is seen to vary from 7.5 mills/kwh. to 11.5 mills/kwh. Corresponding costs for average new conventional plants of the same capacity amount to 6.7 mills/kwh., which means that nuclear plants are not competitive at the present time.

AEC REACTOR DEVELOPMENT PROGRAM

The present Atomic Energy Commission reactor development program, although motivated primarily by the need to build mobile reactors for military use, has made great strides toward establishing the conditions under which various nuclear systems are suitable for power production. At the present time there are at least five nuclear reactors being developed in Commission-owned laboratories, which are capable of producing power. These are:

1. Submarine Thermal Reactor—Westinghouse Argonne National Laboratory
2. Submarine Intermediate Reactor—General Electric Company
3. Aircraft Reactor—General Electric Company Oak Ridge National Laboratory
4. Experimental Breeder Reactor—National Reactor Testing Station, Idaho Argonne National Laboratory
5. Homogeneous Reactor Experiment—Oak Ridge National Laboratory

Only the last two of these reactors are aimed directly at the industrial power program and have actually succeeded in producing electricity; however, the primary objective of all approaches has been technical feasibility. In order to achieve industrial nuclear power, it remains to extend the technology of these and other promising nuclear systems along lines leading to greater economy of nuclear fuels and reactor investment costs.

As a supplement to the technical development effort in the laboratories, members of the Commission's staff have been constantly examining reactor designs which promise economical central station electric power, and about two years ago were joined with some of the country's best power talent. Most of this effort has been applied to dual purpose reactors, on the assumption that the simultaneous production of plutonium and power is attractive. Sharing costs would lower the cost of each product, it was reasoned, and in this way plutonium production would aid the development of power reactors. Subsequent review of the need for plutonium from dual purpose reactors has lessened interest in these reactors and has shifted the emphasis to power-only systems.

INDUSTRIAL PARTICIPATION STUDIES

Independent studies of reactor technology and promising reactor designs have been made by several firms interested in the commercial possibilities of nuclear power and reactor products. This activity, known as the industrial participation program, placed initial emphasis on dual purpose units; but now the participants are seeking economical designs whose primary product would be electric power. Increased interest in nuclear power production is evident, since the number of member firms participating in the four original study

groups had increased from eight in 1951 to more than fifty in 1953. A fifth group with eight clients started a new series of studies in September 1952.

The four groups in the first round of studies submitted reports in the summer of 1952. Condensed, declassified versions of these reports have been published by the Government Printing Office.³ The characteristics of the reactor designs studied are summarized in Table 2.

All four industrial groups concurred in the belief that dual purpose reactors were technically feasible and could be operated in such a fashion that the plutonium credit would make the cost of power competitive with that from conventional coal-fired plants. Conversely, all agreed that no reactor could be constructed in the very near future which would be economical on the basis of power generation alone. As a final comment, all four groups expressed willingness and desire to continue their efforts with more detailed studies and component development.

FUTURE PLANS AND ALTERNATIVES

The conclusion of the first round of economic studies by industry and the successful demonstration by Commission laboratories of the technical feasibility of various nuclear reactors for producing power bring to an end the first phase of the program directed toward industrial nuclear power. This may be also a turning point in the road toward economic nuclear power, with emphasis shifting from a military-motivated, government-sponsored program to a purely industrial program.

The rapidity with which the responsibility will shift, however, depends on

³ "Reports to the U. S. Atomic Energy Commission on Nuclear Power Reactor Technology," Washington: Government Printing Office, May 1953, 25 cents.

the solution of a number of legal problems which act as barriers to the entry of business into this field on a private investment basis. These are largely the result of provisions of the Atomic Energy Act passed six years ago to meet conditions existing at that time. For this reason, new legislation is being recommended by the Commission which will create a more favorable environment for private investment in nuclear power production.

The major changes proposed permit groups other than the Atomic Energy Commission, including private enterprise, to own nuclear equipment and fuels with appropriate safeguards, more liberal patent agreements, freer dissemination of required technical information, and a more realistic policy regarding reactor isolation measures. Although the legislation being recommended contains no commitment for purchase of plutonium, it does include provision for government purchase of all reactor products, if it is in the interest of national security.

Since future plans are governed by the outcome of the proposed legislation, the government program for nuclear power development cannot be defined at the present time. In general one of

four possible courses of action may be adopted. These are:

1. Create favorable legislation and let industry develop nuclear power on its own. This means an essentially long wait until rising coal prices or normal technical developments bring nuclear power into a competitive position with respect to conventional plants.

2. Underwrite the cost of the nuclear portion of the plant by owning and renting to industry the reactor and nuclear fuel. This not only sidesteps the need for legislative changes, but absorbs the risk involved in the first generation of nuclear power plants which public utilities are not in a position to assume.

3. Encourage industry to build small-scale power plants by supplying uranium fuel inventories and processing depleted fuel elements at minimum cost, and support such effort by research in Commission laboratories.

4. Continue the development program on its own initiative on a parallel to the industrial effort to the point where reliable and economical nuclear power is a reality.

Whatever be the outcome of the proposed legislation and the various debates concerning government (including non-AEC units such as a municipal sys-

tem) or private development of nuclear power, it is becoming increasingly evident that some form of co-operative program between the Commission and industrial groups is desirable. Certain features of such a program will remain government responsibility; for example,

controlling and supplying fissionable materials, and supporting nuclear research in existing facilities. On the other hand, the phases of the development program which deal with application of nuclear energy to commercial power production will be the responsibility of industry.

James A. Lane, M.S. Chem. Eng., Oak Ridge, Tennessee, is director of the Reactor Experimental Engineering Division of Oak Ridge National Laboratory. His interest in atomic energy work started in 1942 at the University of Chicago, where he was employed as a research associate on loan from the E. I. du Pont de Nemours and Company. He continued in the nuclear field as assistant director of the Technical Division, Clinton Laboratories; chairman of the Long Range Planning Group, Oak Ridge National Laboratory; and chief of the Evaluation Staff of the Reactor Development Division, Atomic Energy Commission, Washington. During World War II he served as scientific consultant on the Alsos Mission to Germany.

Economic Feasibility: The Dual Purpose Reactor

By WALKER L. CISLER

THE term "dual purpose reactor" as used herein refers to those nuclear power reactors which produce both useful power and fissionable materials, uranium 233 and plutonium. Included in this category are several different types and designs of thermal and fast reactors, whether breeder reactors or other.

The fissionable materials produced by dual purpose reactors might be used either for commercial purposes or for weapons. There is no implication whatever that they necessarily would be purchased by the government.

Inasmuch as commercial-size reactors intended for these purposes have not been fully designed or built, construction and operating cost data are not available. Any discussion of economic feasibility, therefore, becomes a consideration of the objectives in building such reactors and of the reasons it is believed that one or more designs of dual purpose reactors hold promise of meeting those objectives.

In such a discussion we should remember from the start that by its nature, any nuclear reactor produces heat, neutrons, and fission products. The main difference between dual purpose and single purpose reactors is largely the completeness with which these products are used. With power-only reactors, the main effort is directed to the utilization of the heat. In dual purpose reactors, an effort is made to conserve and utilize the neutrons by transmuting fertile materials into fissionable materials.

MAIN OBJECTIVE—UTILIZATION OF HEAT ENERGY

While it is recognized that the atomic energy development may have many

diverse influences on our economy, the main objective of the power industry is the utilization, on a commercial, competitive basis, of the heat energy which is made available by nuclear fission. The most promising use of that heat energy at present is in the generation of electric power, but other industrial applications for using that heat may be developed at some future time.

We in the United States are fortunate in that we have available vast resources of energy in the form of fossil fuels and, to a lower degree, falling water. By comparison with the rest of the world, the cost of fuels is low in most parts of our country, and, as a result, abundant supplies of electric power are available at quite low costs in all but inaccessible and remote parts of the United States.

The peacetime uses of atomic energy should be considered as a normal industrial development similar to that which has occurred in our coal, gas, and petroleum industries. The development will extend over many years into the future, and the things we do now may greatly influence the ultimate accomplishments. Many important factors must be taken into account when considering the type of reactors which may be economically feasible. Four of these are discussed in the following paragraphs.

LONG-TERM ECONOMIC CONSIDERATIONS

The method of utilizing nuclear fuels for the generation of electric power must be compatible with the long-time economic needs of our country and of the world. The potential heat resources of uranium and thorium are extremely large if they can be completely utilized. These heat resources, however, consid-

ering only natural fissionable material, U-235, are but $\frac{1}{140}$ as great as the energy in uranium alone.

For the practical commercial generation of electric power, the processes should aim to utilize all the potential heat in the fertile and fissionable materials, and not just a fraction of that heat. From the standpoint of long-time economies, the discarding of a large part, or even a significant part, of those potential heat resources cannot be justified.

From our appraisal of present-day reactor technology and processing techniques, we believe that the breeder reactor with a suitably integrated fuel element and blanket processing system still holds the greatest promise of meeting this condition. A breeder reactor, after its initial charge of fissionable material, would produce its own fuel from fertile but nonfissionable atoms. It would make use of the full potential heat resources in the uranium which it used. It is even possible that fertile but unfissionable atoms which have been discarded as waste from the present production operations of the Atomic Energy Commission might be utilized.

Breeder reactors, because of their ability to produce more fissionable atoms than they consume, hold the promise of making our country independent of foreign sources of raw uranium. Our domestic resources of uranium, whether vast or not, will be adequate for our needs for a very long time if we further develop and exploit the technology of "breeding." This perhaps is one of the most important matters in the entire atomic development.

There is some evidence that certain thermal reactors can be operated so as to approach and perhaps even reach the goal of using all the heat resources of uranium. Information concerning the technical problems which are involved

has not been released for publication. It can be assumed, however, that fissionable material would be produced in such reactors and that they would come under the dual purpose classification.

COMPETITIVE ASPECTS

The use of nuclear fuels for the generation of electric power must be competitive with other methods. The cost of electric power produced with nuclear fuels must be no more, and preferably substantially less, than the cost of power produced with conventional fuels or with hydraulic energy.

There are in the United States today abundant fuel resources, particularly coal, available at comparatively low cost. Naturally, the actual cost of the fuel depends to a large degree upon the cost of transportation to the location where it is used, but there is adequate fuel for the generation of electricity for many years. In certain sections of the country there are large hydraulic resources, but the more economical sites have been developed or will be developed in the near future.

The thermal generation of electric power is highly developed, and new advances are being made continually. Each year shows a small additional decrease in the average amount of heat energy required to produce a kilowatt-hour of electricity.

Through a network of transmission lines and distribution systems, electric power is available in all but the most remote areas of our country; and for those areas, power can be supplied in several proved ways when the real need arises, at a cost which is not exorbitant.

The use of nuclear fuels for electric power generation in the United States, therefore, must be fitted into an existing highly developed, efficient, electric power supply system. And nuclear fuels, if they are to become a part of that system, must bring a further ad-

vance by making the cost of power to the customer less than the cost of that from conventional sources.

Since there are obvious advantages in developing the practical commercial use of this new heat resource, every possible method of making its use competitive must be given full consideration. One possible means is the reduction in cost of reactors and processing. Another is the production of reactor by-products, fissionable materials and fission products, which can be sold for private use or for weapons.

Plutonium has an inherent value as a fuel, one gram having the equivalent of 23,000 kilowatt-hours of heat energy. Many possible uses of plutonium as a fuel are being considered, and their development will come rapidly when plutonium becomes available for such purposes.

If the operation were regarded as the production of power, with plutonium as a by-product, then the operation would be credited with the net value of the plutonium. This could go far toward making the use of nuclear fuels competitive, and is one of the promising methods for further development.

In the Dow Chemical-Detroit Edison Nuclear Power Study Project, it has been assumed that for commercial purposes the method which would produce the greatest total return per unit of heat handled should be the most attractive. This has led to the conclusion that the breeder reactor has the greatest potential economic feasibility.

With the breeder reactor more fissionable atoms would be produced by the transmutation of fertile atoms than would be consumed in the process. Thus, in addition to producing all of the fissionable atoms required for its operation, fissionable materials would be available for sale for other purposes.

The lack of specific data concerning construction and operating costs pre-

vents any real evaluation of competitive costs. We can rely upon the judgment of those familiar with potential future developments, that at some time competitive conditions are within reach if full advantage is taken of all possibilities. Dual purpose reactors, because they can produce fissionable materials which ultimately will be in industrial demand, are believed by many to have the best possibilities in this respect.

PRIVATELY OWNED ATOMIC ENERGY INDUSTRY

If atomic energy and nuclear fuels are to assume their proper places in our competitive industrial system, then an entire atomic industry must be established. Nuclear fuels for the generation of electric power should be available through normal commercial channels, and industry should not be dependent for fuel requirements upon government-owned facilities intended for military purposes.

If such an industry is to be established, it should have commercial sources of the feed materials, natural uranium and thorium, as well as the fissionable material. Since it is improbable, because of their very high cost, that facilities for the isotope separation processes will ever be built by private industry, the fissionable materials obtainable for commercial operations in the long run will of necessity be reactor products, either plutonium or U-233.

Dual purpose reactors intended primarily for power generation will probably be the chief source of fissionable material for industrial use. They can thus be the foundation for the broad use of nuclear fuels for power generation and other purposes.

Much of the current discussion concerning dual purpose reactors assumes (1) that the plutonium which is produced by power reactors must be sold to the government and (2) that the

supply of plutonium will soon exceed the requirements for weapon use. Certainly if all financial risk is to be avoided, an agreement for purchase by the government would be most helpful. This, however, is not wholly consistent with our free enterprise principles.

If we have faith in the future of the atomic energy development, the lack of a government-guaranteed market for plutonium should not be a limiting factor. The successful development and operation of a nuclear power reactor which is commercially and economically justified will be followed by the construction of additional reactors. There will be a growing and expanding industry. Ultimately the use of nuclear reactors should expand to propulsion units for commercial ships and perhaps for other purposes.

As the industry grows there will be an increasing demand for fissionable materials for the initial inventory and for operating fuel. A little thought will indicate that these needs can be met only by industry's own facilities, and that there is little likelihood that there will be a surplus of fissionable materials which can be used for commercial purposes for many years once successful power reactors actually are demonstrated.

These thoughts can lead to the conclusion not only that dual purpose reactors have greater economic feasibility but that the atomic industry as it is envisioned probably cannot develop unless reactors of this kind have a pre-dominant role.

NATIONAL DEFENSE

Any facilities using nuclear fuels should be of a kind that can contribute to the military strength of our country in time of need. It has been the history of our country to depend upon its peacetime industrial strength to carry the major burden in time of war. We

could not survive otherwise. When the need develops, automobile factories manufacture airplanes, tanks, and artillery. Button manufacturers produce gun sights and all manner of military devices.

Atomic weapons are becoming an increasingly important aspect of our national defense. While plans may be made for the production of adequate amounts of fissionable materials, experience has shown that in times of distress there is always a need for more and more military materials.

Dual purpose reactors would be particularly appropriate for this situation. Under normal circumstances, they could be operated for maximum power or maximum plutonium production, as economics warrant. They would be an added item of our industrial strength which when needed could assume a most vital part in defense activities. The government, therefore, would not need to have in stand-by, production facilities capable of supplying the entire wartime needs of fissionable materials.

SUMMARY

The atomic energy development is still in its early stages. Our efforts in carrying this development forward should be directed toward providing an atomic industry which will contribute most effectively to the economic and social advance of our country and the world. To that end, we should seek to develop nuclear power reactors which will be most effective in creating a thriving peacetime atomic industry, independent of foreign sources of raw materials, and which will also be capable of helping to meet our military needs.

One of our most important needs is sources of fissionable materials which can be used for competitive industrial enterprises. Dual purpose reactors, and in particular breeder reactors, appear to

be the only means of meeting this need on a competitive industry basis.

In the future, after this need is met, after the commercial availability of fissionable materials is established, there will be numerous possibilities with respect to reactor development. It is possible to envision whole families of reactors—power-only units for the propulsion of commercial ships and of some land-based power plants where the use of very high quality fuel can be justified. In such an economy there will

surely be a place for nonbreeder reactors which have a high conversion factor.

All of these, however, must await the establishment of adequate sources of fissionable materials. The most likely source of fissionable materials on a commercial basis is dual purpose power reactors.

Thus it appears that dual purpose reactors, and especially the breeder reactor, have the greatest economic feasibility.

Walker Lee Cisler, Detroit, Michigan, is president of the Detroit Edison Company. He has spent his entire business career in the electric power industry. During World War II he was chief of the Public Utilities Section of SHAEF (Europe), and later of the same section of the Office of Military Government, Germany. He has served as consultant to the State and Army Departments and the Atomic Energy Commission; is chief consultant to the Foreign Operations Administration on electric power in connection with the Marshall plan; and is a member of an ad hoc study group of the Defense Department. Since 1947 he has been deeply interested in peacetime uses of atomic energy, and is author of many technical articles on the subject.

Economic Feasibility: The Single Purpose Nuclear Power Plant

By GEORGE L. WEIL

THE hope that nuclear energy can supply a substantial fraction of the world's future energy requirements is based on the potential economic performance of power-only nuclear plants. These so-called single purpose plants would be designed with the sole objective of producing power as cheaply as possible. They might simultaneously produce by-products having a market value, the revenue from the sale of which would be used to offset a part of the power production costs. Nuclear fuel is certain to be one of the by-products of the special type of single purpose plant known as a "breeder." However, in the case of the single purpose plant it is assumed that the value of the by-products, including nuclear fuels, will be a relatively small fraction of the value of the power, and therefore will not have a significant influence on the design and operation of the plant.

DISTINCTION BETWEEN SINGLE AND DUAL PURPOSE PLANTS

The purpose of this article is to discuss the prospects for competitive power from single purpose nuclear plants, considering both plants that might be constructed within the next few years and plants based on improvements in design and operating characteristics that might be expected in the long term. At the outset, it is important to recognize the basic distinction between the type of plant which makes power its primary product, and the dual purpose type of plant which has been proposed as a way to produce cheap nuclear power now. The dual purpose plant would

produce plutonium for the military as its major product, and power as a by-product. Its economic feasibility would be guaranteed by a military demand and price for the plutonium.

The technical feasibility of the dual purpose operation, like the potential economic feasibility of the single purpose operation, is inherent in the dual nature of a nuclear reactor, since both energy and neutrons are released in the basic fission process. The energy can be converted to useful forms; the neutrons can be utilized to produce new fissionable material, for example plutonium. This, in the case of the single purpose plant, would be returned to the plant as a fuel, or, in the case of the dual purpose plant, turned over to the military for use in atomic weapons. Because of the disproportionately high value of plutonium as material for atomic weapons as compared with its value as a nuclear fuel, a dual purpose plant must be designed and operated to maximize performance for the production of plutonium at the expense of power. This requirement compromises its value as a source of reliable information on the capability of our present technology to produce cheap nuclear power.¹ Because the production of nuclear power, if it is to be a useful and widely used industrial operation, cannot be tied as a by-product to relatively limited and uncertain military needs, our interest in this article will be confined to examining the competitive status

and potentialities of power production from single purpose plants.

PLANT DESIGNS

Many variations in design of a power-only nuclear plant have been developed by groups engaged in the field of reactor development. There are alternatives in the selection and combination of moderator, coolant, fuel, neutron energy, and other basic elements of design. Some designs use heavy water as moderator, some light water or graphite; some use light or heavy water as coolant, others a liquid metal or gas; some use solid fuel, some liquid or molten; some use natural uranium, others slightly or highly enriched. Many of the possible designs are in advanced stages of development and appear to be equally feasible. Large-scale plants could be constructed within the next year or two with confidence that they would operate satisfactorily as planned. Other designs are in the conceptual stage, and require various amounts of research and development before confidence can be placed in their technical feasibility. In all cases, however, including even those plants of most advanced design, there are substantial uncertainties with regard to the construction costs and over-all economic performance as power producers. These uncertainties increase rapidly with the decrease in development of the plant design.

Combined with our inability to make good cost and performance estimates is the fact that many cost elements necessary for even a qualitative evaluation of the economics of nuclear power plants are classified secret. In spite of the present limitations, consideration of the information that is available and can be discussed throws some light on roughly where we stand today, on the future prospects of competitive nuclear power, and on the major technical problems

that must be attacked if nuclear power is to become a significant factor in the world's industrial economy.

Today one cannot make a choice as to what plant among the possible designs would provide the cheapest energy for application in either the immediate or the long-term future. Though one design may use a cheaper material, it may be less efficient or more expensive in some other respect. No attempt will be made in this article to analyze and compare the advantages and disadvantages of all the possible basic designs. Within the precision of our ability to predict performance and make cost estimates, the discussion that follows may be considered to be generally applicable to the single purpose type of nuclear power plant.

COST ELEMENTS

It is convenient to discuss the economics of nuclear power production from single purpose plants by comparing the major elements that determine the unit cost of energy with the corresponding breakdown of costs of energy from conventional plants. The cost of production of electric energy may be allocated to three general categories: (1) fixed charges on investment in plant and equipment, (2) cost of fuel and fuel handling, and (3) operating expenses exclusive of fuel handling. Table 1 shows the percentage contributions of these elements to the present average cost of energy from conventional plants.

We will first compare the contribution of fixed charges to the cost of energy from nuclear power plants. The contribution of the fixed charges to the cost per kilowatt-hour is determined by (1) the cost of plant and equipment (including land) per kilowatt of electric generating capacity; (2) rates for insurance, interest, taxes, and plant amortization; and (3) the plant ca-

TABLE 1—BREAKDOWN OF AVERAGE COST OF ENERGY FROM CONVENTIONAL POSTWAR THERMAL ELECTRIC POWER PLANTS

Type of Cost	Energy Cost ^a	
	Mills/kwh.	Per Cent
Fixed charges on investment in plant and equipment	4.75	55
Fuel and fuel handling	2.65	35
Operation and maintenance	1.00	10
	8.40	100

capacity factor, or number of kilowatt-hours produced per year compared to the plant's maximum capability.

For large modern conventional plants, with generating capacities in the range of 200,000 kw., the investment cost per kilowatt runs between \$150 and \$200. In comparison, current estimates for nuclear power plants run considerably higher. A nuclear power plant will incorporate standard turbine and generator equipment for converting heat energy into electric energy. The nuclear reactor and its associated equipment will merely replace the conventional boiler and fuel-handling equipment. Although no detailed estimates are available that refer strictly to single purpose power plants, there are estimates for dual purpose plants studied by industrial groups. These are shown in Table 2. Within the precision of the estimates, these costs may be taken as a guide to the range of cost of power-only plants. The average plant cost of \$530 (\$382 before contingencies, overhead, and so forth) per kilowatt of electric generating capacity (from Table 2) indicates that one of the major problems facing the development of cheap nuclear power

is the design of plants with low capital costs.

It is worth noting that if nuclear fuel and fuel handling costs can be made negligible, then a higher investment per kilowatt of generating capacity can be tolerated and still provide power at a cost competitive with that in conventional plants. Under the best of circumstances, this credit for fuel might allow a doubling of nuclear power plant cost per kilowatt compared to present costs of conventional plants. However, little will be gained economically if all the credit that can be obtained from the unique potentialities of costless nuclear fuel must be used up in covering greater expenses in plant and equipment.

It is not difficult to understand why the estimated capital costs for a nuclear plant are high. Reactors are complicated machines, they use special materials of exceptionally high purity, and they require, for public protection against hazards, extraordinary plant design features and substantial land for plant sites.

The broad objectives of a development program concerned with plant design must be (1) application of imaginative technical development and design engineering to reduce the capital costs per unit of generating capacity; (2) development of processes for production of cheap reactor materials; and (3) development of designs and components which will assure that nuclear power plants represent no more serious public hazards than are acceptable in other industrial operations.

The annual fixed charges on investment in plant and equipment are determined by taxes, insurance, interest, and depreciation (including obsolescence). Of these, the one having the largest uncertainty and the greatest effect on the over-all cost per kilowatt-hour is depreciation.

^c The plant and equipment costs do not provide facilities for processing or fabricating fuel. These costs are customarily treated as part of the fuel expenses.

^d This item not provided by source. Assumed 20 per cent of plant and equipment cost.

^e This item not provided by source. Assumed 15 per cent of total direct cost.

It is usual for power utilities to depreciate plant and equipment over a twenty-year period. The economic justification for this rate is based on a great deal of practical experience with conventional power production. No such experience is available for the reactor and its associated equipment in the case of nuclear power plants. Over and above the usual effects that determine the useful life of conventional plant and equipment, the nuclear reactor must contend with the effects of intense radiation on the life of the materials that are integral parts of the plant, and the feasibility of maintaining vital components. Because there is no reliable method of estimating the useful life of the reactor portion of a nu-

clear power plant, the tendency is to be conservative and assume a five-year period. Perhaps 70 to 80 per cent of the total investment in a nuclear power plant might be subject to a high rate of amortization. Table 3 shows, for private utility financing, the effect of different amortization periods on rates of fixed charges. The table indicates that for an amortization period of five years, the annual rate of fixed charges would be more than double that used for conventional plants.

The combination of high annual rate of fixed charges and high capital cost per kilowatt of generating capacity represents a substantial initial handicap that nuclear power must eventually overcome.

TABLE 3—FIXED CHARGES FOR DIFFERENT AMORTIZATION PERIODS^a
(Per cent of capital)

Total	28.7	18.6	13.6

^a Fixed charges, not including depreciation, equal to 10.6 per cent.

Source: Pacific Gas & Electric Co.—Bechtel Corp., *op cit.* Table 2, note b, p. 84.

The contribution of annual fixed charges on plant investment to the unit cost of energy produced depends upon the total number of kilowatt-hours produced by a plant during a year. For every kilowatt of plant generating capacity, a yearly maximum of 8,760 kilowatt-hours of energy is possible. The percentage of this actually produced is referred to as the plant capacity factor. For conventional postwar plants, this factor averages 75 to 80 per cent. Clearly, nuclear plants, because of their anticipated high annual fixed charges, will have to be operated at high capacity factors, as close to 100 per cent as possible, in order to reduce the amount of fixed charges allocated to each unit of energy generated.

Table 4 shows the fixed charges portion of the cost of electric energy, in mills per kilowatt-hour, for a range of values of unit plant cost and for different amortization periods. For comparison, the fixed charges for large conventional steam-electric plants run about four to five mills per kilowatt-hour.

FUEL COSTS

We consider now the contribution of fuel costs to the cost of electric energy

generated by nuclear plants. It should be evident from the preceding discussion of fixed charges that the successful development of large resources of negligible cost nuclear fuel will be a prerequisite to large-scale competitive nuclear power, since this is the only way in which higher fixed charges for nuclear plants can be offset.

The large potential economic advantage that nuclear fuel has over conventional fuels lies in its much greater concentration of energy. One pound of nuclear fuel is equivalent in heat content to roughly 1,300 tons of coal. The consumption of one pound of nuclear fuel in a nuclear power plant would produce about 34 billion B.T.U.'s (British thermal units) of heat energy. If this thermal energy were converted into electric energy, with a net efficiency of say 25 per cent, we would obtain 2.7 million kilowatt-hours, as compared to about one kilowatt-hour which is obtained from one pound of coal consumed in a conventional steam-electric plant.

Although such comparisons indicate at least a weightless fuel, the important question is whether in practice it is a costless fuel. In exploring this question we find ourselves limited because

TABLE 4—CONTRIBUTION OF FIXED CHARGES TO COST OF ENERGY FOR DIFFERENT AMORTIZATION PERIODS

Capital Cost per Kilowatt Generating Capacity	Energy Costs ^a (mills per kilowatt-hour)		
	20-year amortization (13.6%)	10-year amortization (18.6%)	5-year amortization (28.7%)
\$100	1.7	2.4	3.7
\$200	3.4	4.7	7.3
\$300	5.2	7.0	11.0
\$400	6.9	9.4	14.6
\$500	8.6	11.8	18.3
\$600	10.4	14.2	22.0

^a Plant capacity factor of 80 per cent assumed.

certain information on process costs and fuel utilization are withheld for security reasons. However, it is possible to arrive at some general conclusions with regard to the current range of nuclear fuel costs, the major technical problems that determine these costs, and the developments that will be required to maintain lower costs as raw materials become limiting. This discussion is necessarily oversimplified.

We begin with an official Atomic Energy Commission price of \$3.50 per pound for uranium oxide contained in ore averaging about 0.2 per cent uranium oxide.² Since no further official information is available, we must now extrapolate to establish a reasonable cost for the nuclear fuel after it has been refined from the ore and fabricated into fuel elements ready to be charged into a nuclear power plant. One possible approach has been to assume that the refining and fabrication process increases the original cost by a factor of ten, or to \$35 a pound.³

If we could load a nuclear power plant with uranium at \$35 a pound and operate the plant until all the uranium was consumed, we should produce 2.7 million kilowatt-hours of electric energy for each pound of uranium initially charged, with a fuel cost of .013 mill per kilowatt-hour. Even ten times this fuel cost would be negligible compared to fuel costs of about 3.0 mills per kilowatt-hour for coal-fired thermal electric plants in this country. If these low fuel costs can be achieved, the cost of energy from future nuclear plants

will be determined almost entirely by the fixed charges on capital investment in plant and equipment.

What are the technical problems involved in the utilization of nuclear fuel, and what sort of costs may we expect in practice?

Only one part in 140 of a natural uranium fuel element is fissionable. This is the isotope U-235. The other 139 parts consist of U-238, which is not fissionable. Fortunately, however, some of the neutrons that are released by the fission of U-235 can be utilized to convert some of the U-238 into plutonium, which, like U-235, is fissionable and can be used as a nuclear fuel. Thus, it is technically and practically feasible to regenerate nuclear fuel as it is consumed.

How much is regenerated compared to the amount consumed is determined by the design of the nuclear reactor. It is not technically difficult to regenerate say 0.8 as much new nuclear fuel as is consumed. Obtaining high regeneration factors becomes more difficult since greater and greater care must be taken in utilizing the neutrons. However, it is possible, as has been demonstrated recently, to regenerate more nuclear fuel than the amount consumed—in other words, to have a regeneration factor greater than 1.0.⁴ In this case the reactor is called a "breeder," since it produces more fuel than it consumes, and essentially adds to the world's supply of fissionable material.

Theoretically, therefore, the process of regeneration of fuel in a nuclear power plant can lead to substantial, and in some reactor designs to complete, utilization of the original uranium fuel. For example, in a plant with a regenera-

² It should be noted that this price is arbitrarily established, since the AEC is the only customer for uranium in this country. In a free market the price might be less. tion factor of 0.8, 3.5 per cent of the total uranium could, in principle, be utilized.⁵ Table 5 indicates the fraction of fuel utilization that can theoretically be achieved as the regeneration factor is increased toward unity.

In practice we are faced with major difficulties which now prevent us from realizing the potential costlessness of nuclear fuel. As mentioned above, the technical problems increase as one attempts to push the regenerative factor to allow greater utilization of the fuel. Moreover, even with high regenerative factors, there are three major technical limitations which now require that fuel elements be discharged from the reactor after only a small fraction has been utilized.

The first limitation, which applies particularly to plants with relatively low regeneration factors, is the fact that as the fuel is consumed a point will be reached at which there is not enough fissionable material left to make the reactor critical, and the plant will automatically shut down.

The second limitation is the fact that as the fuel is consumed it produces fission products and other isotopes which, if allowed to remain in the fuel, poison the chain reaction and cause the plant to shut down.

⁵ $0.7\% [(0.8) + (0.8)^2 + (0.8)^3 + \dots] = 0.7\% / 1 - 0.8 = 3.5\%$.

The third limiting factor is that metallic uranium fuel elements suffer structural damage as a result of the severe radiation effects to which they are subjected while in a reactor. This damage is made evident by pronounced physical distortion of the elements, which, beyond a certain amount, cannot be tolerated for continued safe operation of the plant.

Because of these effects, singly or in combination, currently developed types of fuel elements must be discharged before an appreciable fraction of the energy that is potentially available has been utilized.

THE "ONCE-THROUGH" OPERATION

What may we expect to achieve in practice in the way of fuel costs? First let us assume that a nuclear power plant having a regenerative factor of 0.8 could be designed and operated within the next few years. The fuel would have a potential maximum utilization of 3.5 per cent, or 95,000 kilowatt-hours of electric energy per pound. However, because of the chemical and physical changes in the fuel elements, perhaps only the order of 0.5 per cent, or 13,500 kilowatt-hours, could be utilized before the fuel would have to be replaced. In this case the fuel, at \$35 per pound, would contribute 2.6 mills to the cost of production of one kilowatt-hour. Thus, even this relatively inefficient type of nuclear power plant operation would provide a fuel cost comparable to conventional fuel costs.

The type of plant which would operate in this fashion has been referred to as a "once through" plant, since the fuel is not recycled.⁶ Although there are at present technical hindrances to realizing even this efficiency of operation, of all the types of plants, this one holds most

⁶ Partially utilized discharged fuel would of course be stored for later use in plants having improved utilization characteristics.

promise for achieving useful and economic nuclear power at the earliest date. By concentrating on technical developments which would allow increased fuel utilization before discharging became necessary, low fuel costs could be achieved. Table 6 shows how fuel costs contribute to the cost of electric energy for different percentages of utilization per cycle.

The once-through operation has one big disadvantage. That is that only a small fraction, say 1 or 2 per cent at the most, of the raw material can be utilized. There would be no objection to this if raw materials were unlimited. However, this is not the situation. Raw materials are limited, particularly in the case of the high-grade ores which provide the cheapest fuel. An attempt to expand a nuclear power industry on the basis of once-through reactors would reach a stage at which rising raw material costs would increase fuel costs beyond the point of economical operation. The once-through type of plant, as well as offering the first possibility of producing competitive nuclear power, may have a continuing but limited role to play in a nuclear power industry. However, if nuclear energy is to be a significant factor in meeting the world's fu-

ture energy requirements, then we must find an economical way of utilizing a major fraction, if not all, of the resources of nuclear fuel.

RECYCLING OF FUEL

Recycling the discharged fuel elements would be the next logical step in the direction of improving utilization of raw materials and maintaining low fuel costs. Thus, the fuel discharged from a plant with a regenerative factor equal to 0.8 after only 1 per cent utilization could be recycled after certain reconditioning. This reconditioning would involve chemical processing to remove objectionable fission products, and refabrication of the fuel into a form ready for recharging into the plant. In addition, fresh fuel would have to be provided to make up for consumption of fissionable material. Assuming that material rejected from the reprocessing plants contains negligible amounts of fissionable material, the fuel make-up would amount to 30 per cent of once-through requirements.

Handling of the discharged fuel is complicated by its intense radioactivity. Because the information is classified, it is not possible to quote a unit cost for the reprocessing of fuel, but for the pur-

TABLE 6—CONTRIBUTION OF NUCLEAR FUEL COST TO COST OF ENERGY FOR DIFFERENT VALUES OF PER CENT FUEL UTILIZATION PER CYCLE *

Fuel Cost per Pound	Energy Cost (Mills per kilowatt-hour)

* The uranium requirements shown in the table do not include plant inventory requirements.

^b Thermal efficiency of 25 per cent assumed.

^c Equivalent electric generating capacity, assuming a plant capacity factor of 0.80.

pose of this discussion it is only necessary to point out that the cost, including fixed charges on necessary plant and equipment, is substantial. An upper limit to the reprocessing cost per pound of fuel that can be tolerated for a given fuel cost per kilowatt-hour is given by the difference between the cost of make-up fuel per cycle and the cost of fresh fuel for once-through operation. For example, if fresh fuel elements cost \$35 per pound, and make-up per cycle amounts to 30 per cent, then one could afford to pay \$24.50 per pound for chemical reprocessing and refabrication.

The recycling of fuel can, at most, reduce raw material requirements to an extent determined by the regeneration factor of the nuclear power plants. For example, if the industry is based on plants having a regeneration factor of 0.8 and a utilization of 1 per cent per pass, then annual raw material requirements per plant may be a third as much compared to requirements for once-through plants. When energy demands grow, without a corresponding increase in raw materials at economic prices, the need for improved material utilization will have to be met by the development and use of plants having higher regen-

eration factors. The actual operating fuel costs will not be reduced unless the processing costs per cycle are reduced and/or the percentage of energy utilization per cycle is increased. Table 7 shows the annual uranium requirements for different values of per cent utilization and for different annual energy demands. It may be noted that the total production of electric energy by steam plants in the United States during 1951 amounted to 2.6×10^{11} kilowatt-hours.⁷ Moreover, production is expanding at a rate that doubles capacity every ten years.⁸

An appreciation for the potential significance of uranium as a source of energy can be obtained by comparing the requirements shown in Table 7 with recent unofficial estimates of 1,000 tons per year for current rate of production and 25 million tons of recoverable reserves in the world.⁹

⁹ Karl Cohen, *op. cit.* note 2 *supra*. Recoverable uranium is defined as that which is obtainable at \$100 per pound or less for metal

VALUE OF BREEDER PLANTS

The limit to utilization of recoverable raw materials is reached when plants have been developed with a regeneration factor essentially equal to unity.¹⁰ At this point, the electric power generating capability of a nuclear power industry can be expanded only if more fissionable material can be produced than is consumed. This is the significant role that the breeder plant can play in the growth of an industry. It promises a solution to the problem of meeting growing energy requirements when all economically available raw materials have been mined. It does not promise more total energy from the same raw materials than could be obtained by plants having regeneration factors equal to unity, nor does it promise cheaper energy, since the basic elements of fuel cost, percentage of utilization, and cost of reprocessing per cycle will still be present. The development of efficient breeder plants will allow us to burn up our nuclear fuel resources faster to meet large annual energy requirements.

The development of efficient breeders will place a premium on achieving high fuel utilization per cycle and low fuel reprocessing costs. The reprocessing problem is rendered more acute since small materials losses, which would be multiplied by the number of cycles required for complete consumption of the

in billets. By the same definition, the world's thorium reserves are estimated to amount to 1 million tons. Palmer C. Putnam, *Energy in the Future*, New York: D. Van Nostrand Co., Inc., forthcoming in 1953. Analogous to the production of plutonium from uranium 238, thorium can be utilized to produce the fissionable material uranium 233. Although the discussion in this paper has referred specifically to the use of uranium, most of the economic aspects apply equally well to the use of thorium in nuclear power plants.

¹⁰ It is assumed here that material losses during reprocessing are negligible.

fuel, can seriously affect the breeding factor. Although little can be said at this time with regard to either the plant investment or the fuel costs for breeder-type plants, there is no reason to believe that the major problems cannot be solved to provide competitive nuclear power from such breeder plants.

DISPOSAL AND OPERATING COSTS

The large-scale production of nuclear power, by regenerative and/or breeder plants, will create a serious problem associated with the disposal of radioactive wastes, principally fission products, from fuel reprocessing plants. The cost of safe disposal operations, which may be significant, must be included in the over-all fuel cost charged to the production of energy. However, the development of large-scale by-product uses for these fission products in industrial operations is not out of the question. Such uses might provide a net revenue which could be applied to reduce the production cost per kilowatt-hour of energy.

In concluding the comparison of energy costs from nuclear power plants and conventional plants, there is one common element left to be discussed. This is the cost of operating, maintaining, and providing supervision and administrative management for, the plant. Qualitatively, one would expect that this item would be relatively more costly for a nuclear plant because of the necessary activities related to security and health in addition to the activities common to both types of plants. In fact, it may be a real problem to keep the operating costs of a nuclear power plant down to the value achieved in conventional plants, of about one mill or less per kilowatt-hour.

In summary, the above comparison of power costs emphasizes the present large uncertainties inherent in any estimate of nuclear power plant performance.

Without realistic information on the cost of raw materials, the cost of fabricating fuel elements, the depreciation rate of nuclear plants, and the per cent utilization of fuel elements, one can place no confidence in paper estimates of the over-all unit energy costs. This discussion has attempted to indicate that the cost of nuclear power from single purpose plants would be considerably higher today than conventional power costs in this country. On the other hand, when one examines the power situation outside of this country, the economic feasibility of single purpose nuclear power plants appears much more promising for the immediate future. A recent survey of possible foreign markets for reactor power plants indicates that there are areas in the world where plants to supply 5,000 to 50,000 kilowatts of electric power "in the cost range from 25 to 40 mills per kilowatt-hour could be competitive with existing power supplies or could supply needed power that does not exist now."¹¹

PROGRAM FOR THE FUTURE

The discussion has pointed out that there are no technical reasons that would lead one to question that the cost of nuclear power can ultimately be lowered to the point of being competitive with and perhaps even significantly cheaper than conventional power costs in this country. This objective will not be easily or rapidly obtained. Its achievement will require a costly development program, concentrating on five major technical objectives: (1) designing of reliable, safe, and long-lived plants at low costs per kilowatt of generating capacity; (2) development of inexpensive processes for the recovery

¹¹ Howard C. Gary, "Foreign Market for 'Package' Nuclear Power," *Nucleonics*, Vol. 11, No. 5 (May 1953), pp. 14-15.

of source materials from low-grade ores; (3) development of inexpensive fuels that can provide a relatively high percentage of utilization before they must be replaced; (4) development of inexpensive chemical processes for the recovery and re-use of discharged partially utilized fuel; and (5) development of inexpensive and safe methods of radioactive waste disposal, including revenue-producing by-product uses.

Much can be done in moving toward these technical objectives by an extensive program of component research and development. However, the over-all technical performance and economic feasibility of nuclear power plants can be realistically appraised only by actual experience with operating prototype plants. Only by building single purpose plants can imaginative engineering be stimulated to reduce capital costs. It is much more likely that these costs will be reduced by the application of many relatively small design improvements which cumulatively can provide large savings than by the application of a few sensational ideas.¹²

In view of the very questionable current economic feasibility of single purpose nuclear power plants in this country, support of a program to construct one or more prototype plants must come from public and/or private groups that are concerned with promoting our national interests, both long-term as related to our own economic and industrial development and short-term as related to the part we can play in strengthening the economic welfare of friendly nations. These groups include govern-

Reproduced in Joint Committee Print "Atomic Power and Private Enterprise," Appendix A, Washington: Government Printing Office, December 1952.

ment agencies and private nonprofit organizations.¹³

Whether the government undertakes a program wholly with public funds or whether private funds are involved, it seems that our national interests would be best served by a program that would

¹³ George L. Weil, "A Role for Private Non-profit Organizations," *Bulletin of the Atomic Scientists*, Vol. 9, No. 5 (June 1953), pp. 165-68.

concentrate on the technical and engineering problems that must be solved if the full potential economic benefits of nuclear power are to be realized. Only by establishing a program with the single purpose of determining how cheaply we can produce power from nuclear plants shall we be able to evaluate the uses of nuclear power for peaceful purposes and to obtain benefits from these uses in the near future.

George L. Weil, Ph.D., Washington, D. C., is consultant to the United States Atomic Energy Commission and other organizations in the field of nuclear reactor technology, and is lecturer in the Department of Engineering at Johns Hopkins University. He served with a number of the organizations which worked on the Manhattan Engineer Project. In 1945 he was U. S. scientific representative to the Joint Canadian-U. S. Atomic Energy Project. From 1947 to 1952 he served in various capacities with the Atomic Energy Commission. He has prepared a "Prospectus" for a program for the development of nuclear power, and has contributed to various journals.

Some Economic Consequences of Nuclear Power

By WALTER ISARD and ROBERT A. KAVESH

AN examination of the engineering and industrial literature on nuclear power development during the last year or two discloses a new mood of optimism among those concerned with this subject. According to a number of informed scientists and observers, power produced from either dual or single purpose reactors seems to be within the margin of economic feasibility.

Whether or not the government implicitly or explicitly subsidizes the production of power, by purchasing fissionable materials, by underwriting or directly assuming construction costs of nuclear installations, or by other methods, these persons contend that nuclear power can be produced within the relatively near future at a cost which would be competitive with power produced in the higher cost areas of the United States and other parts of the world. Further, it is held that, as sources of fossil fuels become more and more exhausted, the competitive standing of nuclear power is likely to improve markedly. And, finally, there are those who visualize in the far future major technological developments in nuclear engineering and hence significant reductions in the cost of nuclear power.

Although available information does not lend any support to this last and most optimistic outlook, it is useful to examine what the implications of nuclear power might be if it were to develop generally as a cheaper source of power. At the least, such an analysis will provide some insight into the benefits from the use of nuclear power for domestic and foreign areas where high power costs prevail and where reduction of power costs incident to nuclear development may be in the offing.

IMPACT ON INDUSTRIAL LOCATION

An indication of the importance of power in industrial production in the United States is furnished by the ratio of fuel and purchased energy to value added by manufacture. At no time within the past fifty years has the ratio exceeded 7 per cent (in 1909); by 1939 it had fallen to 5 per cent and by 1947 to 4.5 per cent. Clearly, any marked decline in power costs does not signify large direct savings in production outlays. However, the major effects of innovations on output are not direct, but indirect. Cost savings in one industrial sector are passed on to other sectors and in turn are reflected back to the initiating sector and again recirculated in continuing round fashion, although with dampened force. Unfortunately, current techniques of economic analysis have not been able to assess and anticipate resulting increases in productivity and per capita output. However, it is possible to analyze the differential effects that cheap, ubiquitous power has on industrial location; and to that manageable area we now turn.

In general, industries may be classified into a few broad, overlapping groups, when dependence upon power is the identifying criterion. Without doubt, nuclear energy would be of little consequence in the location of industries such as leather, tobacco, and numerous steel fabricating activities, which are minor power users. Another group comprises industries which may consume fairly large amounts of power, but whose locations are determined almost unequivocally by other factors.

Examples of this group are pulp and paper mills, dependent upon power to a

marked extent but located near forest sites because of the need to reduce weight and bulk at the material source in order to keep shipping costs within reasonable limits; cement factories, which locate centrally with respect to markets and raw materials, again to ensure low transport costs; and manufactured ice, which is market oriented in light of the perishability of the product and its consequent prohibitive transport costs in relation to value.

These industries—minor users of power and strongly material, market, or otherwise oriented (except to power)—would appear to be affected inconsequentially by the availability of cheap nuclear power.

Aluminum and similar industries

Another group to be considered is that in which power is a prime locational determinant. Aluminum production is perhaps the best illustration of this class. Its locational structure is split into three parts. The conversion into alumina of bauxite ore, which is supplied to the United States chiefly from Dutch Guiana and the West Indies, entails a weight loss while at the same time requiring considerable amounts of heat. The alumina then is electrolytically reduced into aluminum ingots, a process which requires 18,000 to 22,000 kilowatt-hours of electric power per ton of aluminum ingot.

It can be demonstrated that the saving in outlays on power achieved by locating the reduction works at a cheap power site—even one so remote from the New York City market as the Pacific Northwest—more than balances the additional transport costs involved when the various raw materials are not shipped directly to the final market for ingots (such as New York City) but take the long, roundabout route via the Pacific Northwest. Hence, it is not surprising to find that, aside from the relatively small amount of activity based on

domestic ores, the weight-losing bauxite is converted into alumina at Gulf Coast ports (Mobile and Baton Rouge), which, on the routes to such cheap power areas as the Pacific Northwest and the Tennessee Valley, are the points in the United States closest to the sources of the bauxite ore.

At the same time, these Gulf ports have access to cheap natural gas via pipeline. Once produced, the alumina is for the most part shipped to, and converted into aluminum ingot in, the Pacific Northwest, the Tennessee Valley, Texas, and northern New York State. And, finally, the aluminum ingot is transported to various aluminum fabricators which are located at the market points for the finished aluminum products. These fabricators are located at the market points rather than at the reduction sites because it is less expensive to transport one ton of aluminum ingot, which is charged a relatively low freight rate, than an equal or greater tonnage of finished products, with their high rates.

Given this roundabout pattern of shipments, and given cheap, ubiquitous nuclear power, is it reasonable to believe that the bauxite could be moved directly to the major markets, and that an integrated operation using nuclear power as a source of both heat and power would take the place of the geographically split production process?

Clearly, in such a situation large savings in transport costs could be achieved. However, the answer to our question tends to be negative. Even if the kilowatt-hour cost of nuclear power were to fall to the very low level of four mills (a level which represents a very high degree of optimism with respect to future technology), it can be shown that it would still be more economical to adhere to a split pattern of location in order to obtain hydropower at about two mills per kilowatt-hour. Hence we

may conclude that cheap nuclear power is not likely to affect the location of existing aluminum capacity.

But, to the extent that cheap hydroelectric sources, such as the Pacific Northwest, become fully utilized in the future, and to the extent that high-cost power sites—three- to four-mill sites—must be used, the possibility of locating new aluminum capacity at major market sites such as Chicago and New York, granted the existence of nuclear power at four mills, becomes real.

Thus we conclude that for activities highly sensitive to cheap power—particularly the electroprocesses such as aluminum—existing and future capacity will remain at or seek the cheap hydro sites while they are available. These activities will not be pulled by cheap nuclear power until the sources of cheap hydropower become exhausted.

The glass type

Still another group of industries can be identified, which are not so sensitive to cheap fuel and power as aluminum. Though the orientation of these industries is to fuel and power sources, it is only within a framework in which other locational factors are almost as important. The glass industry is a good illustration. Natural gas is used extensively in the production of glass. In fact, the tie between natural gas and glass has been so close that historically the industry has moved from one gas site to another for adequate supplies. The location orientation, however, is not entirely one of fuel. Transport costs on raw materials and finished products are high, and there are indications that if cheap fuel and power, such as four-mill nuclear power, were made available at major market sites, new glass capacity would tend to locate there.

It is this type of industry, and not the type extremely sensitive to cheap power, that, paradoxically enough, is

likely to be most affected by nuclear power in the near future.

In general, we foresee no drastic relocations of industry, no decentralization or breaking up of existing industrial concentrations or metropolitan centers within the United States.

SOME CRITICAL CONSIDERATIONS FOR UNDERDEVELOPED ECONOMIES

This tempered outlook on the probable effects of the introduction of nuclear power in the United States might be reconsidered with respect to development within foreign nations. Several basically new factors are pertinent. Capital costs involved in the construction of a nuclear power plant will exceed those of an efficient steam (or hydroelectric) plant. This is necessarily so because in the nuclear plant the reactor and chemical and metallurgical facilities substitute for the boiler of the standard steam plant, whereas the conventional turbines and generators are retained.

Increased capital costs in turn signify increased interest charges, whether these charges are actually paid or subtly subsidized by government underwriting or investment. Coupled with this is a world-wide pattern of interest rates in which low rates characterize the United States, Great Britain, and other heavily industrialized areas, and high rates prevail in underdeveloped areas such as Latin America and parts of Asia and Africa. As a consequence, underdeveloped areas, with high interest rates, must labor at a great cost disadvantage relative to developed areas in the production of nuclear power. To be specific, if an area such as Canada must pay 5 per cent for capital, whereas Egypt must pay 10 per cent, this *alone* would tend to make the cost of nuclear power in Egypt approximately four mills greater.

Such a significant obstacle for the underdeveloped areas in a competitive

trading world, together with the lack of skilled personnel and complementing industrial facilities, casts a good deal of skepticism upon grandiose ideas for a nuclear powered industrialization of these economies.

Still another factor to be considered in assaying the probable impacts of nuclear power on underdeveloped nations is that of economies of scale. Indications are that nuclear power plants will be most efficient at high capacities. Average unit costs will continue to decline at larger capacities for nuclear power plants than for steam plants. For steam these economies are currently not significant beyond 75,000 to 100,000 kilowatt capacity. In contrast, for nuclear reactors certain types of equipment and facilities will be so invariant with size of station that economies of scale may still be realized up to capacities of 500,000 kilowatts.

The above consideration means that costs per kilowatt-hour will be lower for giant plants than for small. Yet those nations that are capable of absorbing the output of these larger plants and thus realizing these economies of scale are the more highly industrialized ones. And finally, when it is recognized that nuclear power development requires some previous subsidy through pilot atomic energy plants and experimentation at government expense, which only the industrialized nations can afford and which are in essence capital subsidies, the outlook for such development in the less industrialized nations must be seriously qualified.

In sum, any statements about the equalizing effects of nuclear power upon resources at the command of the industrialized and underdeveloped nations and upon their economic potentials must be viewed with considerable restraint. Capital costs, interest rates, demand conditions, and subsidy requirements—as well as various cultural factors—do not add up to a very optimistic outlook

for the economic utilization of nuclear power in these underdeveloped nations.

SOME ECONOMIC ASPECTS OF POLICY QUESTIONS

With these considerations as background, it is also interesting to inquire into certain implications for policy decisions. Limited space permits us to illustrate only one possible area in which decisions may have to be made. But it is clear that the kind of analysis involved in making these decisions will in general characterize the type required for the various economic evaluation problems which will confront the Atomic Energy Commission and the Congress. Since in the recent discussions of economic feasibility most attention has been focused on the dual purpose reactor, we shall base our illustration upon aspects of its operation. Nevertheless, what we have to say has bearing for decisions on other types of reactors.

Suppose cumulated experience leads to the conclusion that nuclear power in fact cannot compete with conventional power. At the same time let it be decided that for military and political reasons atomic energy installations should be kept in operation in order to maintain capacity to produce fissionable materials. Such a situation necessitates that part of the costs of nuclear power shall be borne by the military. Generally speaking, the Congress and the people of the United States are interested in maintaining such capacity in operation at the lowest cost to the taxpayers. A priori, it would seem that a decision should be made to locate such capacity in areas where high power costs, and hence revenues, obtain, such as Puerto Rico and New England. It may be reasoned that the higher the revenue from power sales, the less cost the government or military would have to incur for the operation of the atomic energy establishment.

This a priori reasoning, however, must be qualified. It is necessary to consider the ability of an area to absorb the output of power from any atomic energy installation. Even though a high price for power exists in an area, additional output of power may be absorbed only by considerable reduction in the power charge, with the result that total revenue will not be so great as initially anticipated. Another area where the current price for power is not so high may be better suited for such an atomic energy installation, because it can easily absorb the additional power at the going price.

Thus far the analysis places a premium on high power cost areas in which simultaneously the demand for power is increasing rapidly—conditions which, for example, tend to characterize Puerto Rico, but not New England. The policy question, however, is still more involved. New England is a high power cost area. Its consumption of power is not growing as rapidly as that in other regions. Too, its economy is forging ahead more slowly than that of most other regions in the United States. At the same time, the establishment of an atomic energy works which produced power to be sold at a rate below the prevailing high charges, would have a stimulating effect on the industrial development of New England.

It can thus be argued that the construction of nuclear energy installations in a region such as New England is one way of attacking its unemployment problem and the associated high social costs. It can also be viewed as a means

for counterbalancing exodus of industry, particularly textiles. And by those persons who contend that New England does not receive a fair share of public works construction, it may be considered as a way of rectifying the imbalance between federal expenditures in New England and federal receipts from New England. In these lines of reasoning, maximizing power revenue is only a secondary issue when compared with reaping the benefits to be achieved through influencing the course of industrial development.

Other individuals, from different regions or with different sectional interests, may agree with the contention that power revenue ought to be a secondary consideration; but in contrast with the New Englanders, they will point to the low per capita incomes of the South and Puerto Rico, and argue for using atomic energy installations as a means to equalize per capita incomes through fostering industrial growth in poor areas. When the question of choosing among several low per capita regions is posed, unfortunately we have no solution to the benefit-cost problem which arises.

In short, we have sketched some of the numerous and perplexing considerations that face an authority in underwriting or subsidizing a nuclear power development, which may be of such a magnitude as significantly to affect regional economic welfare. The answer to some of the policy questions which will confront the government cannot be simple, and will require all the analytical acumen and intuition of social scientists and administrators.

Walter Isard, Ph.D., Cambridge, Massachusetts, is associate professor of regional economics and associate director of the Center of Urban and Regional Studies at the Massachusetts Institute of Technology. He has also taught at Harvard University and served as a consultant for the Tennessee Valley Authority and other government agencies. He is co-author, with Vincent Whitney, of *Atomic Power: An Economic and Social Analysis* (1952).

Robert A. Kavesh, Ph.D., Hanover, New Hampshire, is assistant professor of economics at Dartmouth College. He has taught at Harvard University, where he was on the staff of the Harvard Economic Research Project.

Some Sociological Consequences of Atomic Power

By VINCENT HEATH WHITNEY

FUNDAMENTALLY, the sociological study of atomic power is only a special case of the sociological study of innovation. The history of any one novel idea has, of course, no determinative value so far as any other new configuration of ideas goes. There are nevertheless some general principles of innovation, based on an analysis of innovation as a mental process and on consideration of the experience of prior inventions among diverse social groups.¹ The application of certain of these principles to atomic power can serve two purposes. First, it can replace the aura of mystery and glamour which in the last few years has too frequently substituted for a more rigorous frame of analysis. Second, it can prevent the kind of unwarranted speculations about the far-reaching changes in social organization which are likely to be logical derivations of any consideration of nuclear development based principally on unbridled imagination and wishful thinking.

INNOVATIONS AS IDEAS

Atomic power is ordinarily conceived of in terms of the physical components in its production. It is not only correct but necessary to understand the requirements in terms of raw materials, generating and auxiliary facilities, and so on, in coping with problems of nuclear development and in attempting to assess future consequences. It is also neces-

¹ Among others, see H. G. Barnett, *Innovation: The Basis of Cultural Change*, New York: McGraw-Hill Book Co., 1953; S. C. Gilfillan, *The Sociology of Invention*, Chicago: Follett Publishing Co., 1935; and Hornell Hart, *The Technique of Social Progress*, New York: Henry Holt and Co., 1931.

sary to see that, like all other innovations, atomic power represents a novel configuration of ideas. If we assume that technical problems are adequately solved, the use of atomic power in a specific industry or area, or by a given group of people, becomes a function of the two variables of demand and resistance, which are also mental phenomena.

Viewed at this level, it is clear that any innovation may produce one of three results when it is introduced, either by local invention or by diffusion, into the context of an existing social order. It may be generally viewed as harmonious with established culture patterns and value systems, and encouraged, provided it is feasible and functions as an acceptable means to a positively valued goal. It may be interpreted as incompatible, and be actively discouraged where a conflict of ideas occurs. It may be viewed with indifference and fail to become established, through the passive resistance implied in lack of demand.

THE CULTURAL SETTING

It is true, as many have pointed out, that both the technical knowledge and the fissionable material necessary to operate a nuclear generating station are theoretically transportable anywhere. The same is not true of value systems and of cultures. The complex structure of beliefs and institutional practices of one people may be favorable to change in general and to technological innovation in particular. The social, cultural, and psychological milieu may thus be suitable for the introduction of atomic power. It is certain, however, that op-

posite and unfavorable conditions will exist among other peoples and in other areas, and that there is nothing inherent in atomic power which will in itself alter these arrangements.

Like any novelty, atomic power can be developed only in the context of some social organization. This means that established procedures exist which have the sanction and force of the customary—and therefore right—way to meet a specific situation. Every culture is composed of interdependent parts. Thus, the introduction of something new always involves some degree of strain and loss. This is why an innovation must be positively wanted by enough people, or by persons with the necessary authority or prestige, if it is to be accepted.

Even the absolute desirability of an innovation is not likely to be the overriding consideration in determining its use or rejection. Rather, it is the desirability of atomic power, or of any other innovation, *relative* to the losses involved in its acceptance. This helps to explain why the assumed benefits of a new energy source are not always apparent to another people. Some consequent degree of industrialization or urbanization may be viewed not as productive of a rise in material standards of living, but simply as a threat to a customary and positively valued way of life. In short, the initial premise, widely held in the United States and other industrialized nations, that atomic power will be "good" is by no means universally accepted.

INDUSTRIALIZED AREAS

In westernized countries, the long process of the industrial revolution has led both to a general acceptance of the usualness of change and to a specific willingness to promote and to utilize technological developments. In coun-

tries like the United States, people encounter a steady stream of competing ideas and values; therefore, paradoxically, the unfamiliar is not necessarily the strange. Moreover, the strong emphasis upon getting ahead individually and raising living standards nationally favors acceptance of innovations similar to those which have played a part in these processes in the past. Clearly, in these countries atomic power provides the identification with previous experience which is essential if assimilation of a novelty into the social organization is to occur.

As an innovation, atomic power is quite unlike the new style of dress, or birth control, or the ideology of brotherhood, which, in the last analysis, individuals either adopt or do not adopt as parts of their unique life organization. The development of atomic power has necessarily been largely a government monopoly everywhere, and for some time can be expected to involve at most a limited number of private enterprisers. The latter will need both government blessing and some form of subsidy, whether outright or disguised in such forms as continuing government research laboratories or prices for plutonium high enough to make the private sale of nuclear-based power competitive. The vast majority of individuals will simply continue to buy electricity for household and industrial uses, whether it is generated in conventional or in atomic stations. In this sense they can hardly be said to have to face the question of acceptance or rejection of atomic power at all. Certainly, their lives will not be immediately affected whether atomic power is introduced or not.

There is, however, a marked and very real difference between the consequences of atomic power use for the relations of individuals in the already industrialized countries and in those which are eco-

nomically underdeveloped. In the former regions, atomic power can be a useful adjunct to continuing industrial growth, but there is no evidence that it will alter the nature of the daily routine for the majority of persons. Its most noticeable effect here may be simply to increase the concentration of industrialization already apparent,² and, in doing so, to intensify urban-industrial life orientations for the people of such areas.

UNDERDEVELOPED AREAS

In underdeveloped regions the expectation is quite different. Outside of a few specialized projects, it is hard to conceive of any extensive use of atomic power in such areas except as part of an expanding market for power in transportation and industry. This in turn implies population aggregation as part of the development of a concentration of facilities for production. Culturally, this suggests an orientation quite at variance with what is actually found today over much of the globe. Each area is, of course, unique in many ways, and meaningful studies must derive from a detailed analysis of empirical situations rather than from arbitrary classification schemes. Nevertheless, the existing data allow the generalization that economically "advanced" and "underdeveloped" societies are not to be equated either in terms of their willingness (as distinct from their ability) to utilize atomic power or in terms of the consequences for each, of such use.

In the underdeveloped regions, we find resistances to nuclear development not only in such concrete factors as lack of capital, transport facilities, cheap fuel, trained technical personnel, and so

on, but more broadly in the economic imbalance and lack of integration, the Malthusian populations, the unstable political organization, the low levels of living, the educational poverty, and the well-entrenched sets of customs and values which are either indifferent or actively hostile to the changes implied by economic development.³

In these areas the mass of individuals are indifferent to atomic power because it has no reference to their experience—if, indeed, they know of it at all. Acceptance in such cases really means the prior acceptance of urbanization, of industrial employment, of the changed fabric of social customs and human relations inherent in continuing economic development. If revolutionary change of this kind occurs, atomic power will be theoretically acceptable as an assimilable component of the new configuration.

In such regions the relatively small elite, who hold interlocking positions of social, political, and economic dominance, are likely to understand that economic development can prove a threat to the special privilege they derive from carefully established positions. Change demands readjustment, and the outcome is never wholly predictable. The colonial area is a special case, in the sense that changes which are not actively desired locally may be imposed from without to some extent.

³ See, for example, Vera Anstey, *The Economic Development of India* (London: Longmans, Green, and Co., 1952), fourth edition. Dr. Anstey notes: "... certain religious ideas and conventions, and the rigid social stratification and conservatism based upon those ideas and conventions, still pervade every sphere of life, and limit economic development at every step" (p. 471). Among others, cf. Olen E. Leonard, *Bolivia: Land, People and Institutions*, Washington: The Scarecrow Press, 1952; T. Lynn Smith, *Brazil: People and Institutions*, Baton Rouge: Louisiana State University Press, 1946; and Nathan L. Whetten,

² For the reasoning behind this statement, see Walter Isard and Vincent Whitney, *Atomic Power: An Economic and Social Analysis* (New York: Blakiston Co., 1952), Part II.

Even in the industrialized nations, the heads of major companies, which may have the technical competence to assist in the development of atomic power facilities, must consider against the possibility of being "left out" in a new field the hard facts of heavy investment in conventional power plants and equipment and, especially in the United States, the general adequacy of present power sources, particularly in relation to the rather firmly established pattern of industrial and population distribution. If there is a period of additional declining employment, power production may become overproduction, further decreasing income. There are also the resistances in terms of relative power cost, size of market, industrial location, and so on (discussed by Dr. Isard in another article), and the impelling factor of subsidization by government for a variety of reasons concerned with war as well as with peace. Limited space prevents further consideration of these.

Generalized discussions of the use of atomic power and of the consequences of such use are meaningless. It will bear repetition to stress that atomic power can never be introduced into a vacuum, and that consequently it can be fruitfully studied only in the context of specific and intricate social organizations. Every people is in some degree unique. For some, atomic power will suggest compatibility and efficiency. For others, it will not.

Summarizing my conclusions elsewhere, it seems likely that atomic power will prove less useful to underdeveloped areas than to those industrialized nations which already have social and economic organizations to which it is fairly readily assimilable. But even here, the strength of resisting and impelling factors will vary from country to country,

Rural Mexico, Chicago: University of Chicago Press, 1948.

with the Soviet Union and Great Britain, for example, likely to press more strongly for atomic power under present conditions than the United States.⁴

SOCIAL ORGANIZATION AND ATOMIC POWER

In discussing atomic power as an innovation, an attempt has already been made to indicate in general terms how the pattern of social organization operates to influence the probability of a specific invention and its subsequent acceptance and use. Here attention will be focused briefly on certain details of the way in which the social organization operates as a permissive or limiting mechanism, and, additionally, on some possible consequences of the introduction of atomic power for social organization. Ideally, this would involve an empirical study of several areas. Since this is impossible in the space available, consideration will be limited to two arbitrary groupings—the urbanized-industrialized nations and the underdeveloped areas where population is primarily oriented to subsistence agriculture.

Manifestly, there are no grounds for considering any pattern of social organization as causative in the adoption of an innovation. On the other hand, given certain cultural arrangements, it is inconceivable that a particular novelty will be created or utilized. Atomic power itself could hardly have been developed in most parts of the world today. Relatively few areas combine a social organization in which complex technological innovation is stressed, with the requisite natural and human resources, the needed capital, and the necessary incentives. The existence of such a combination of factors is, of course, no guarantee of anything. It has no inevitable consequences. But it

⁴ For the argument and supporting data, see Isard and Whitney, *op. cit.*, ch. 9.

does make a particular innovation possible, and, in this sense, may be described as a permissive milieu. A lack of factors compatible with the production or use of a novel idea similarly serves to limit or exclude that idea—whether the latter be democracy or television or atomic power.

RESTRICTIVE SOCIAL ORGANIZATION

Among some one-half to two-thirds of the population of the world today, social organization is of a type I would consider limiting or excluding as far as atomic power goes. Most of Asia, Africa, and South and Central America would fall in this category. It is not that these largely underdeveloped regions lack communication with the rest of the globe, or that they have no people capable of understanding the technical details of nuclear fission or atomic plant operation. It is not merely that they lack capital or other specific economic prerequisites for atomic power production and utilization. More fundamentally, such lacks are symptomatic of the basic demographic and social situation.

This situation varies from country to country. Nevertheless, it can be described for the majority of underdeveloped countries as one in which a subsistence agricultural economy, largely uncontrolled vital rates, and a non-western value system function continuously to maintain one another. Both human and natural resources are employed with marked inefficiency, judged by western standards. Levels of living are low.

Let us for the moment put aside certain very real doubts, and make the assumption that relatively low-cost atomic power can be made available to areas of this description. Exactly what would this mean?

Some have intimated that it would mean the transformation of economi-

cally backward areas into industrial regions which would eventually attain the living standards and way of life of the western world.⁵ The result would be a more uniform economic development of the world's major regions.

In view of the multiple economic, political, and social resistances to the widespread use of atomic power, I see no reason to expect that it will in any reasonably near future be employed on anything like a universal scale. If it were, this would, of course, mean that national differentials in access to energy would be diminished. But this is quite different from saying that uniform levels of economic development would be achieved. Access to energy is not at all the same as development and use of these resources. And it is not only possible but, in my judgment, probable that any advantage gained by an increased availability of energy would be negated by the continuing existence among regions of other differentials in human and natural resources.

CULTURAL DIFFERENCES

* Let me try to state this another way. It is evident that fundamental differences exist in the ethos of national cultures. In terms of ideal types, an analytically useful distinction can be made between those in which over-all cultural orientation involves a relatively high degree of emphasis on competitive and aggressive behavior patterns directed to the attainment of individualistic ends, and those in which co-operative and nonaggressive behavior patterns dominate and group goals are emphasized. Very roughly, these types can be equated respectively with the industrialized and the nonindustrialized regions of the world. On the personal level the development of the individual

⁵ Cf. P. M. S. Blackett, *Military and Political Consequences of Atomic Energy* (London: Turnstile Press, 1948), ch. 8.

self involves the internalization of these culture patterns. Consequently, despite the wide variation in individual behavior universally found, attitudes and values, sentiments, roles—in short, a way of life—develop which distinguish any region from any other region.

These diverse orientations make it unrealistic to discuss the impact of nuclear energy except in terms of the expected interaction of the innovation with the multiple factors in the specific social organization under consideration. The introduction of atomic power in India is not the same as its introduction in the United States or in Argentina or even in China. Nevertheless, it may be postulated in general terms that the use of atomic power will tend to be fostered in varying degrees by the behaviors associated with technologically advanced culture patterns, and to be retarded in varying degrees by those typical of the overpopulated and underdeveloped regions. The point to be emphasized is that the introduction of atomic power into the latter types of societies will not ipso facto alter the social organization or remove the hindrances to general economic development which already exist. Unfortunately, nuclear energy has sometimes been confused with magic.

In Brazil, for example, we have a country rich in undeveloped minerals and other natural resources, although deficient in quality coal and developed oil resources. Although Brazil has made some impressive industrial gains in recent years, principally in São Paulo, its resources remain largely unexploited. This lack of development has frequently, and not inaccurately, been attributed to a scarcity of cheap fuel and to inadequately developed power resources. But these are not the only obstacles. The country has been handicapped by negligently transport resources and markedly insufficient transport facilities, by lack both of capital and of technical per-

sonnel, by labor scarcity and inefficient distribution of population, by poverty, sickness, and illiteracy among the great body of its people, and by a past record of political instability in an unintegrated economy. There is no reason whatsoever to believe that atomic power alone will alter these fundamental conditions. Over time, it could, of course, be one factor among many which would help to do so.

Brazil is now completing a major hydroelectric development on the São Francisco River. It is still true, however, as is the case in many of the underdeveloped areas, that existing and accessible hydropower at first-class sites remains unexploited. India's potential energy resources are largely unrealized. Rhodesia has not achieved any considerable degree of economic advance, despite the presence of the renowned Wankie coal deposits and the vast energy potential of the Zambezi River system. Expansion has been limited by a lack of consumers aside from the railways and the copper mines in the north.

Such conditions suggest that it is an error of first magnitude to ascribe the low ratio of developed power to land area, characteristic of many underdeveloped countries, to a lack of access to energy resources. The fact is that these very areas are quite commonly far from exploiting whatever energy resources they do have. In view of this, it hardly seems probable that the technical availability of another energy source, atomic power, would produce an economic renaissance or revolutionize firmly rooted cultural configurations. The very existence of such undeveloped resources suggests the tenacity of the existing patterns of social organization.

It is not to be denied, of course, that future industrial growth may be more rapid than that which characterized European expansion. The opportunity to profit from past experience and to bor-

row, rather than to initiate and perfect, industrial techniques makes this possible. It will still be true that in an economy based on peasant agriculture, the over-all social organization will tend to be a drag on rapid industrialization, whether it be stimulated by a new energy source or by some other factor.

In short, the crucial problem is that of maintaining a rate of technological growth in excess of the rate of population growth. If this is not done—and whether it can be is a tight argument—the use of atomic power will be restricted not only by lack of growth of markets, but more fundamentally by continuous diversion of potential surplus capital to the support of increased numbers at approximately the same low levels of living. Under such conditions, atomic power cannot serve to spark continuing rounds of economic development or to promote fundamental changes in social structure and values, even with subsidization.

POPULATION AND ECONOMIC DEVELOPMENT

One of the principal reasons for this is the population pattern characteristic of the underdeveloped areas that contain more than half the present population of the world. These are the agricultural areas ordinarily described as "overpopulated," in which any increases in productivity are largely absorbed by increases in numbers, with little or no net gain in levels of living. Because birth and death rates are largely uncontrolled, gradual economic development is not enough to resolve the fundamental problems involved in the pressure of numbers on available resources.

Economic development implies some degree of control over death rates. In comparison with a similar degree of control over birth rates, decreased mortality is easily achieved both because relatively cheap technical means of re-

ducing grossly high rates are available and because these can be applied with little or no interference in the daily life of the people of an area, and without conflict with established customs and values. Illustrations are improved transportation systems, minimizing local famines; the sanitation of the religious centers in India which had served as centers of infection because of the pilgrims who returned to all parts of the country;⁶ or the dusting of an area with a few hundred pounds of DDT, which in Ceylon resulted in a rapid and sharp decline in mortality.

If atomic power is to serve as a stimulus for industrialization in such countries, rapid control over births as well as deaths appears essential. This suggests the pressing need for research into cheap and effective methods of achieving control over births in the face of patterns of social organization which are frequently hostile or indifferent to the spread of family limitation. The problem is less pressing in areas like much of the Middle East or Soviet Siberia or Brazil or other parts of South America which cannot be termed overpopulated. But for the underdeveloped, overpopulated regions, the long process of closing the demographic gap by a gradual change in values as an urban-industrial base slowly develops is apparently unworkable.

The last few paragraphs may seem a digression. Actually, they are essential to demonstrate the unrealistic optimism in the view that an economic revolution will be produced in agrarian economies by the mere availability of atomic power—or even by its actual use on a limited scale, which is hard to envisage given the lack of capital and the lack of demand. The demographic characteristics

⁶ Kingsley Davis, "Demographic Fact and Policy in India," *Demographic Studies of Selected Areas of Rapid Growth* (New York: Milbank Memorial Fund, 1944), p. 47.

of such areas are simply one of several principal obstacles to economic development in general and to the use of atomic power in particular. I am not implying that they constitute obstacles which cannot be overcome, any more than I am denying that the use of atomic power could increase the productivity of specific industries in such areas. I am simply underlining that while cheap power may be a necessary condition for industrialization, it is not a sufficient one. Successful utilization of atomic power in the underdeveloped regions is hampered by present social organization. Its use could, conversely, be one of the factors leading to modifications in cultural arrangements and behavior, but only as it successfully induced general economic development.

WESTERN SOCIAL ORGANIZATION

There is space for only a brief further word about the industrialized nations. What has already been said suggests that their social organization is generally receptive to the use of atomic power. Social change is a usual condition. Technological innovation is expected and welcomed as a means of attaining higher standards of living. The demographic situation is favorable, since the degree of control exercised over both births and deaths makes it possible to maintain a ratio of numbers to available resources which will permit further increases in productivity to be applied to production and consumption needs rather than to the support of a mushrooming population. Economic arrangements too are more favorable than in the underdeveloped countries, though there is national variation in the availability and cost of capital, the investment in competing power sources, the size of market, the need for additional power or energy resources, the mobility of the labor force, and so on.

There is no evidence that in these countries atomic power will effect the revolutionary changes in social organization which have frequently been predicted in popular and semipopular literature. It is not likely to create a new type of family or of economic system or of class structure. Rather, it will fit readily into established economy and society, and at most promote social changes already in process. In partially industrialized countries like Argentina, it can speed such changes considerably if it is actually utilized.

ECOLOGICAL AND DEMOGRAPHIC CONSEQUENCES OF ATOMIC POWER

In the short space remaining, I want to mention briefly certain implications of the use of atomic power for community and population patterning. The underlying premise here is, again, that atomic power will in the next several decades prove a valuable adjunct to other power sources but that it will not lead to revolutionary changes in economic organization, settlement pattern, or population trends. Obviously, if atomic power combines with other factors to induce lasting industrialization in any presently underdeveloped countries, the latter part of this assumption will be modified for those areas in ways suggested above.

It is technically possible to build atomic power plants in the most remote areas of the world. The possible should not, however, be confused with the probable, and, except for portable units for such specialized jobs as breaking down icebergs, I see no logical reason for such an undertaking. Only in a few industries, like the electroprocess group, is cheap power of sufficient importance in inducing plant location ever to outweigh other single locational factors such as transportation, markets, labor force, raw materials, and agglomeration economies. An atomic power

station in Spitsbergen, or even in Aroostook County, Maine's northern potato empire, would have no function without a market. For a plant of optimum size, a major industrial agglomeration would be required; but other locational factors militate against such a possibility. Hence, atomic power is not likely to develop new population aggregations at remote points.

It is at least conceivable that military considerations might lead to uneconomic industrial concentrations, supported by subsidy, in distant areas like that around Arco, Idaho. It is more likely that, as in the United States in World War II, the concentration of industry in present locations will be strengthened because of their established locational advantages, the investment already made in these areas, and so on.⁷ In this country the industrial areas of the Northeast and along the Great Lakes rim are best suited as locations for atomic

⁷ Atomic power is unlikely to lead to the relocation of basic American industries. This is true even when the use of atomic power to allow new industrial processes is considered. For the evidence, see Walter Isard and Vincent Whitney, "Atomic Power and the Location of Industry," *Harvard Business Review*, Vol. 28, No. 2 (March 1950), pp. 45-54.

Vincent H. Whitney, Ph.D., Providence, Rhode Island, is professor of sociology and chairman of the Department of Sociology at Brown University. His major research and writing have been in the areas of population, community, and regional economic development. He has contributed articles on atomic power to a number of journals and is co-author, with Walter Isard, of *Atomic Power: An Economic and Social Analysis* (1952).

plants, since they constitute principal areas of demand for power.

It seems probable that atomic power will serve to increase still further the concentration of industry, and therefore of population, in these established areas. It could also spur the industrial growth of such a region as southern California if it became competitive in cost with other power sources. Ecologically, this means a continuing expansion of the major metropolitan districts, presumably with a further dispersion of subcommunities within the metropolitan areas. It does not suggest any more uniform distribution of population in the major industrialized countries, or that such present population centers as New York or London or Moscow or Tokyo will become "ghost towns."

These remarks are necessarily extremely abbreviated. They can only suggest that existing demographic and ecological patterns are likely to be highly consequential for atomic power utilization everywhere. At the same time, they imply that any probable peacetime use of nuclear energy is unlikely to modify radically these same demographic and ecological arrangements.

Congress and the Atom

By HENRY M. JACKSON

FEW students of government would acknowledge the birth of the atomic age as a landmark in the history of American constitutional law; yet the pattern of relations which has evolved between the Congress and the executive branch in atomic energy is almost as unique as the splitting of the atom itself.

The ordinary government agency functions in a glare of publicity. Through the sheer force of public opinion, the people can themselves often shape official policy. But not so in atomic energy. The world of the atom is covered with a veil of secrecy. And even if secret data were more widely circulated, few laymen could understand their full import unless prepared to spend long and arduous hours in a study of atomic problems and issues. Against this background, five Atomic Energy Commissioners, whose only tangible link with the American people is their appointment by the President and their confirmation by the Senate, have been empowered to make decisions which not only affect our hopes for material advancement, but which may very well determine our national survival.

RESPONSIBILITY OF THE JOINT COMMITTEE ON ATOMIC ENERGY

These were the considerations in the mind of the Congress when, seven years ago, it created the Joint Committee on Atomic Energy to oversee the national atomic energy program on behalf of the Congress and the American people. The McMahon Act of 1946, which established the civilian Atomic Energy Commission, also created the Joint Committee and required it "to make continuing studies of the activities of

the Atomic Energy Commission and of problems relating to the development, use, and control of atomic energy." In turn, the Commission was required to keep the Joint Committee "fully and currently informed" concerning its programs.

As long as one speaks in the traditional language of constitutional law—with its black-and-white divisions between co-ordinate and coequal branches of the government—it is difficult to define the Joint Committee's precise role in atomic policy-making. This watchdog group has been accused both of running the atomic energy program, and of acting as a mere captive of the Commission. Neither view is correct. In truth, the Committee and the Commission jointly run the atomic program. Fundamental policy, though normally originating within the Commission, tends to be made with the advice and consent of the congressional committee. And in the case of certain vital policy decisions, the urging from the Joint Committee has played so powerful a role that it can be said the Committee made the decisions, with the advice and consent of the executive branch.

Some may lament this dual responsibility, arguing that it blurs vital divisions of authority between legislators and administrators. Others may insist that, in atomic energy, the power of Congress must be very great, in order to offset the immense authority afforded the executive branch in the McMahon Act. However history may judge this unique Committee-Commission relationship, it cannot be doubted that it now merits the closest possible examination by students of political science.

The McMahon Act entitles the Committee only to be kept "fully and currently informed" concerning the activities of the Commission. This mere right to know, with no legal authority to direct or supervise, may seem at first glance a frail foundation for Committee authority. Yet in atomic energy, this simple right to know highly classified information in and of itself confers immense powers of moral suasion upon the Committee. Here, in a most literal sense, knowledge is power.

Apart from the highly classified documents which the Atomic Energy Commission regularly transmits, the Joint Committee itself originates many secret papers covering all phases of the atomic program. It keeps in daily and intimate touch with the defense establishment, the State Department, the Central Intelligence Agency, the Federal Bureau of Investigation, and the National Security Council. Every effort is made, through a twenty-four-hour armed guard over the Committee offices and through appropriate use of vaults, safes, soundproofing, electronic devices, exclusion areas, FBI investigations of staff personnel, and the like, to maintain standards of security vigilance at least as high as those maintained within the executive branch.

ROLE OF THE JOINT COMMITTEE

The great fund of secret knowledge entrusted to the Committee has created a number of dilemmas for its membership. From a strictly legal standpoint, the watchdog group is required only to keep itself abreast of atomic developments. Should it therefore play a passive role, accepting the information furnished it and expressing no opinions of its own? Or should it assume an active role? If the latter, should it pass judgment on decisions of the executive branch only after they are made? Or should the Committee take a position

before far-reaching issues are decided? And if the Committee is to regard its mandate in this active sense, where should it draw the line in intervening in the affairs of the executive branch—where does prudent stewardship end and destructive meddling begin?

The question may be asked in specific ways. Should the Committee urge the building of certain plants which it feels that the interests of national security require? The Committee has in fact made such urgings. Should the Committee have access to confidential FBI reports on atomic employees? The Committee in fact has such access—the only group of Congress that does. Should the Committee insist upon seeing the internal staff papers of the Commission and the minutes of the Commission's meetings? The Committee has never so insisted, because the members respect the Commission's need for a certain privacy in its internal functioning. Should the Committee be informed of Commission decisions before they are reached, or only afterward? In actual practice, it knows about the big issues well in advance of any solution, but on lesser matters it is often advised following a decision.

How about the awarding of contracts, the hiring of Commission personnel, and the selection of plant sites? Should the Committee participate in these matters? In practice, it has not participated. It has followed a strictly hands-off policy—and rightly so, I believe.

COMMON-SENSE WISDOM

It may be wondered how the Committee—composed as it is of laymen—can possibly know enough about the technical facts of atomic energy to formulate sensible policy conclusions. The Committee, true, has come to rely upon the advice of its small but highly trained professional staff. Yet I do not believe this goes to the heart of the

matter. If the Joint Committee members can make rational decisions on high questions of atomic policy—as I believe they do—it is, I think, primarily because laymen may well be better qualified than specialists to play the role of basic policy-makers. After having worked with atomic problems for some years, I am deeply convinced that wise policy—in the sense of basic programmatic decisions—depends far less than most people imagine upon an exquisite technical acquaintance with atomics. A minimum understanding of the specialized lore of atomic energy is of course indispensable. Yet such knowledge can be translated into rational public policy only by decision-makers who can relate it meaningfully to the totality of human and historical experience.

A few examples may help to make my point. Just a few years ago, many technically trained people insisted that the supply of uranium raw materials was rigidly limited, and that such fixity of supply placed a sharp upper limit on the output of atomic weapons. Not a single member of the Joint Committee possesses a mining degree. But even as laymen, they knew that in the case of copper or iron or gold or almost any raw material which can be named, greater exploration and mining effort pays off in greater production. So, the views of many technicians to the contrary notwithstanding, the members of the watchdog group concluded that our nation could procure uranium in far greater quantities if it was willing to pay the necessary price; and of course this turned out to be so.

Again a few years ago, many military experts insisted that atomic bombs could never be carried by fighter planes against tactical targets; they argued that the bomb simply could not be made small enough or light enough. Once more, no member of the Joint

Committee really understood the intimate details of weapons technology. But as laymen, they could recall no piece of ordnance within human experience which could not be refined or improved or reduced in size. In addition they sensed that even the experts in the infant science of atomics had no more final knowledge about atomic weapon than the experts had final and complete knowledge of aerodynamics at the time the Wright brothers flew at Kitty Hawk. Many of the Committee members therefore urged—years before the doctrine gained wide acceptance in the Pentagon—that atomic weapons could and should be adapted to tactical uses.

Perhaps this is only another way of saying that the congressional watchdog committee has served as the guardian of the obvious in atomic energy. I have tried to make sure that the simple propositions and the everyday truths are not overlooked in the world of atomics, as they can be so easily in a subject which is synonymous with complexity. Ours is an age, if I may be permitted a philosophical digression which revels in complicated technique and subtle philosophies. We peer into the most distant reaches of the universe and try to divine the ultimate meaning of things. But in so doing, we may sometimes overlook what is standing directly in front of our faces. The memorable admonition of Justice Holmes, that the vindication of the obvious is as important as the elucidation of the obscure, has not lost its relevance in this atomic age.

LEADING RATHER THAN RESTRAINING

Not that the history of these first years of the atomic era will ever be entitled "The Joint Committee was always right." Far from it. Although the Committee has consistently led the executive branch in its insistence on an all-out weapons production program,

regret that it did not press for an expanded effort even earlier and even more vigorously than it did. And the same holds true on the peacetime side of the atom. The Committee's present chairman, to his great credit, is urging that our nation achieve a practical demonstration of useful atomic power as soon as is humanly possible.

This much, at any rate, is clear: This watchdog group simply does not conform to the popular stereotype of a congressional committee. Most people think of legislative committees as veto groups—as bodies overridingly concerned with holding the executive branch in check and preventing capricious acts. This is of course one of the vital jobs of the Joint Committee, and it performs it as best it can. More often than not, however, the Committee finds itself saying to the executive branch not "Do less; do it more cautiously," but "Do more; do it more boldly." And for every time the members ask "Isn't this program too ambitious?" they find themselves asking a dozen times "Isn't this program too cautious?"

This often surprises newcomers to Washington and to the executive branch. Having been reared on the doctrine that the executive branch proposes and the Congress disposes, they appear for the first time as Joint Committee witnesses, expecting to earn their battle stripes through defending their plans against charges of excessive boldness. But, to their surprise, they normally find themselves winning their Purple Hearts while fending off charges of excessive timidity.

PROCEDURE AND LEADERSHIP

The Committee is not very often in the headlines—which, I believe, is all to the good. Its work proceeds informally, with a minimum of fuss and feathers and klieg lights. In conformance with necessary security require-

ments, about three-quarters of the hundreds of meetings the Committee has held have taken place in executive session. The members have heard testimony from virtually every ranking government official, scientist, and military man connected in any way with atomic energy. At least once a year members or staff representatives inspect each field installation of the Commission, of which there are dozens. Trips to such major sites as Hanford, Oak Ridge, Los Alamos, Savannah River, and Paducah occur routinely at much more frequent intervals.

The performance of any congressional committee in large part reflects the quality of its chairman. On this score, the Joint Committee has been singularly fortunate. It is impossible to overestimate the contributions of the late Senator Brien McMahon to the national atomic energy program. He will be long remembered as sponsor of the Atomic Energy Act of 1946, and as a magnificently able chairman of the Joint Committee. Senator Bourke Hickenlooper, the first chairman of the Joint Committee, earned this nation's gratitude for his largely singlehanded—and successful—fight to save the atomic energy appropriations during the waning hours of the Eighty-second Congress. Congressman Carl Durham took the initiative in pressing for hearings on atomic power. The Committee's present chairman, Congressman Sterling Cole, has already won the respect and admiration of his colleagues on both sides of the aisle. In the Joint Committee, this aisle has become of less and less significance; the Committee has a firm, long, and growing tradition of bipartisanship.

APPROPRIATIONS PROCEDURE

When the McMahon Act was under consideration, Congress tended to believe that both international control and

industrial power from the atom might soon become realities. It therefore seemed sensible to furnish sweeping authorization for the appropriating of funds, since such authorization, besides smoothing the path of the civilian Commission in its first year or two in office, might shortly give way to different provisions. But what may have made sense in 1946 does not necessarily make sense today.

The Joint Committee, even now, is not empowered to report out authorizing or enabling bills—to the great detriment, I think, of the atomic program. If the Department of Defense wishes to construct a radar network or a new air base, four steps are necessary to secure congressional approval. The relevant legislative committees—that is, the Armed Services Committees of the House and the Senate—must report out an enabling or authorizing bill, which the Congress must pass. The Appropriations Committee must then report out a bill providing funds for the project in question, and the Congress must also pass this.

The wisdom of such a procedure has been demonstrated again and again. The relevant legislative committees which first evaluate a new construction program of the executive branch are uniquely equipped, through their specialized knowledge and experience, to decide whether it is desirable. If these committees place their seal of approval on the project through a favorable authorizing bill, the Appropriations Committees are subsequently assisted in considering the project from the point of view of how much money should be voted on its behalf, and how such sums will fit into the nation's over-all budget. The legislative committees, in these cases, serve as programmatic experts in their respective fields, and the Appropriations Committees serve as general fiscal experts.

The logic of such a procedure would seem especially compelling in atomic energy. Here, it is simply impossible to estimate the desirability of Commission-sponsored construction programs unless one has great familiarity with the atomic project—a familiarity which can be acquired only through day-by-day contact with the program. Although they are men of great judgment, ability, and experience, the members of the Appropriations Committees have immense demands on their time, and they have not acquired specialized competence in matters atomic. For the most part, their acquaintance with the program is transient and casual.

The ensuing difficulties can be illustrated by a hypothetical case. Suppose the Commission plans a reactor development program which may ultimately cost hundreds of millions of dollars. Suppose the Joint Committee, after holding detailed hearings, believes that the program is undesirable. Suppose it believes that construction of the proposed reactors is premature at this time. Let us even suppose that the Committee becomes convinced, on the basis of expert scientific testimony, that building the reactors would represent an extravagant waste of resources, or that the possibility of a radiation accident might endanger the lives of people living near the reactor sites. In any such cases the Commission would remain legally free (so broad is its present authorization) to proceed as it saw fit, provided it secured funds from the Appropriations Committees.

The resultant danger of ill-advised action is less acute in the Senate than in the House. Senate rules permit three members of the Joint Committee to sit as ex officio members of the Senate Appropriations Committee when the atomic budget is being considered. The regular members of the Appropriations Committee have come to heed the counsel of

their ex officio colleagues, and the Senate has exhibited great responsibility and rare discrimination in its handling of atomic energy appropriations.

Efforts to institute a similar arrangement on the House side have so far proved unavailing. Fearing encroachments upon its prerogatives, the House Appropriations Committee has denied requests for ex officio participation in its deliberations by Joint Committee members when the atomic budget is being studied. The House approach to appropriations in the atomic field has accordingly suffered, and on several occasions dangerous cuts have been restored only when the appropriations bills of the two Houses have been reconciled in conference.

Last year, for instance, the House Appropriations Committee—with the laudable objective of encouraging economy, but with mistaken notions of how to bring it about—reported out an atomic energy appropriations bill whose restrictive riders would have seriously delayed completion of the vast plant expansion program which had just been launched by the executive branch. The Senate—thanks in good part to the missionary work of its Joint Committee members—resisted the House-endorsed bill. After a dramatic all-night debate which delayed the adjournment of the Congress, the Senate view prevailed and the atomic expansion program was permitted to go forward unimpaired.

"THE ATOMIC EQUATION"

It would be both impractical and unnecessary to desire that every legislator acquire in atomic energy the kind of competence possessed by Joint Committee members. The whole point of the committee system of operation, after all, is to provide for specialists in public policy—for experts whose knowledge of some particular field transcends that of their congressional colleagues. So it should occasion no alarm if not all legislators are qualified to decide whether the Commission should build plant X or plant Y, or whether it should concentrate on developing this or that model of atomic weapon.

What can and must be asked, however, is that every last member of the Congress understand the meaning of "the atomic equation"—the terrible portent of the growing stockpiles of atomic weapons now being amassed on both sides of the Iron Curtain. What can and must be asked is that every member of the Congress recognize the imperative necessity of maintaining and increasing our atomic lead over the Soviets. What can and must be asked, finally, is that the entire Congress recognize that the atom has two sides—that the same materials which can destroy society in the form of atomic weapons can immeasurably enrich our lives if harnessed in the form of perceptive applications of atomic energy.

Henry M. Jackson, Washington, D. C., is United States Senator from the state of Washington, and served as a Member of Congress in the Seventy-seventh through the Eighty-second Congress. He was a House Member of the Joint Committee on Atomic Energy. He also served on the House Appropriations Committee, and was United States delegate to the International Maritime Conference in Seattle in 1946.

The Contractor System

By RICHARD A. TYBOUT

ATOMIC energy is a contractors' industry. It was so created by the wartime Manhattan Engineer District and has been so continued by the Atomic Energy Commission.

Approximately 95 per cent of the total expenditures of the Atomic Energy Commission in fiscal year 1953 were made through contractors. Private concerns under contract construct the plants, refine the uranium, produce the fissionable materials, fabricate the atomic weapons, and develop new atomic engines for war and peace. Academic bodies search for new knowledge under contract. Contractor employees numbered 142,000 of the 149,000 persons in the atomic energy industry in June 1953. The remaining 7,000, exclusive of 65 or 70 military personnel, were employees of the Atomic Energy Commission.

ORIGINS OF THE CONTRACTOR SYSTEM

The talent for conduct of industrial and academic work of the type required in the atomic energy program resides primarily in private firms and in the universities. Cognizant of this fact, the Manhattan Engineer District provided the physical facilities for the atomic bomb project at government expense, but engaged private contractors for their operation. No one asked for, expected, or wanted private investment, though the services of operation by private concerns were highly desired. The result was government ownership and contractor operation under the cost-plus-fixed-fee contract form, which was then and still remains the key to contractual relationships in atomic energy.

With the passage of the Atomic Energy Act of 1946, the contractor system

received legislative sanction. Government ownership of the major portion of the atomic energy industry was required by statute. The Atomic Energy Commission was authorized and urged to continue the practice of relying upon private concerns for services of operation. And a new ingredient in atomic energy, the promotion of peacetime applications, was incorporated in domestic policy. This last made the Commission responsible not merely for the support of research in fields giving promise of peacetime applications, but also for the creation and preservation of competition in any future private atomic energy industries. At the present stage in the development of peacetime applications, however, the only means for the introduction of competition center around the contractor system, which, it will be shown, necessarily provides but limited scope for the independence essential to effective competition.

TYPES OF CONTRACTS

It has already been noted that all the major installations of the atomic energy industry are government owned and contractor operated. For these operations, cost-reimbursement type contracts, of which the cost-plus-fixed-fee is the most important, are almost invariably used.¹ Cost-reimbursement contracts typically account for 85 per cent by value of all prime contracts of the Atomic Energy

¹ The only exception is the case of certain government-owned plants for the production of uranium metal and uranium compounds, where the contracts are ostensibly unit-price contracts but permit price redetermination at three-month intervals. In practice, cost-reimbursement principles have prevailed in the redetermination process.

Commission. The remaining 15 per cent are fixed-price contracts, which are used in peripheral areas and in the procurement of standardized goods and services.

Fixed-price contracts

Fixed-price contracts may be either lump-sum or unit-price contracts. There is no fundamental difference between the two, but only a difference in the manner of expressing a fixed commitment. The contractor may agree to construct a building for a stated lump sum or to deliver so many tons of a chemical at a given unit price per ton. If there is free and open competition for such contracts, they provide all the built-in safeguards of a market-directed economic system.

But experiences of the Atomic Energy Commission in using fixed-price contracts are significant for the modifications which have been necessitated by the conditions of atomic energy contracting. As one moves more in the direction of contracts for nonstandardized goods, the probability of encountering classified plans and designs becomes greater, and the possibility of public advertising for competitive bidding becomes less. The special qualifications of individual contractors assume more importance, the unknown facts of new technologies become more significant, and the likelihood that fixed-price contracts, if they are used at all, will be placed by negotiation is increased. The consequences are progressive reduction in the effectiveness of competition and a tendency toward explicit coverage of the contractors' costs, with explicit allowance for increasing risks in the form of contingency adjustments, and explicit allowance for "profits."

The ultimate in the transfer of risks from the contractor to the government is found in the cost-reimbursement contracts.

Cost-reimbursement contracts

Cost-reimbursement contracts are of two major types—the cost contract and the cost-plus-fixed-fee contract—distinguished by the fact that the latter includes a fee to the contractor negotiated in advance and fixed for the life of the contract.² In both cases, all expenses properly charged to the services rendered are paid by the Commission, invariably from working capital advanced to the contractor.

Cost-reimbursement contracts are used where it is not feasible to require risk assumption by the contractor or where such risk assumption would serve no useful purpose. They are not limited to the operation of government-owned plants, but may be used under other circumstances also. Because of urgency, a construction job may be started before all the details have been sufficiently developed to permit contracting for a firm price. In this case a cost-plus-fixed-fee contract is used.

Cost contracts, as opposed to cost-plus-fixed-fee contracts, are particularly suitable for research programs carried out by academic and nonprofit institutions, either in their own or in government-owned laboratories. Research endeavors, by definition, are inquiries into the unknown; consequently it is not possible to make precise determinations of costs in advance of achieving given research goals.³

Cost-plus-fixed-fee contracts

The cost-plus-fixed-fee contract is not confined to atomic energy work. It was

² Government contracting on the inefficiency-rewarding cost-plus-percentage-of-cost basis is prohibited by law.

³ The so-called "lump-sum" research contract is also employed in financing research. It provides a fixed sum, not usually the anticipated total, for a given research undertaking in a nongovernmental laboratory.

used extensively in World War II, accounting for about 30 per cent of all contracts by value, but a negligible proportion by number.⁴ Studies of wartime experience reveal differences of opinion on many points, but there is unanimity among commentators, academic and otherwise, as to the suitability of cost-plus-fixed-fee contracts for the industrial operation of government-owned facilities, if the facility is one for which private enterprise will not assume the risk of investment or the risk of production for a market.

Is this an industry in which private enterprise should assume the risks of ownership and production? The answer depends in part upon the expected stability of defense needs in atomic energy, and in part upon the prospects for peacetime applications of atomic technologies.

One needs no special insight, but merely the public statements of all responsible officials, to know that expectations for stability in the atomic energy industry are nil. Continuous change in weapon design is implied by the existence of the Los Alamos Scientific Laboratory and by the frequency with which public announcements are made regarding weapons tests. It would appear that changes in quality and quantity specifications are the rule rather than the exception. At the other end of the production system, changes in the grade of domestic ore processed are of sufficient importance to warrant specific contract adjustments, to say nothing of the fact that the United States is heavily dependent upon the Belgian Congo and Canada for high-grade uranium ores, which introduces the complexities of foreign policy into production planning.

All the foregoing considerations intro-

⁴ War Production Board, Bureau of Program and Statistics, *Cost-Plus-Fixed-Fee Contracts in the War Program* (March 1945), p. 1.

duce a high level of variability into production activities, a variability which is close to national military planning. It is hard to see how private risk assumption, presumably operating through markets, could better serve the national interest under these circumstances than can the atomic energy industry (as a defense industry) working under direct governmental control.

The second part of the answer envisages an entirely different situation. If there is a peacetime market for fissionable materials, and if there is an established social utility in diverting fissionable materials from defense to peacetime applications, then there is the usual expectation that private ownership and private risk assumption will redound to the public benefit. It is reasonable to expect that at the beginning, at least, a peacetime atomic energy industry would be one of rapid obsolescence. There would be need for a continuing public policy to assure the essentials of competition and free entry, and perhaps a continuing need for public sponsorship of atomic research.

Thus, for the foreseeable future of defense contracting, public ownership and the cost-plus-fixed-fee contract device are likely to be of continuing importance. For the more distant future of peacetime applications, other arrangements, to be discussed at a later point, may be more appropriate.

COST-PLUS-FIXED-FEE AND EFFICIENCY OF OPERATION

The strongest criticism of the cost-plus-fixed-fee contract form is that it provides no incentive for efficiency in operations. The contractor is assured a fee, or "profit," which does not vary with performance under the contract. There is, of course, the possibility that the contractor may be interested in securing additional contracts, and for this

reason would wish to turn in a creditable performance. But it would seem just as valid to argue that the cost-plus-fixed-fee form provides an incentive to inefficiency if costs are kept up on one contract to establish higher estimated costs and therefore higher fees on subsequent contracts.

Despite the logical presumption that the cost-plus-fixed-fee form is inferior from the standpoint of efficiency of procurement, this proposition has by no means been satisfactorily verified. Indeed, J. P. Miller⁵ cites statistical evidence indicating lower over-all costs incurred by cost-plus-fixed-fee contractors than by fixed-price contractors in the production of identical airplane engines and propellers. This outcome seems to have resulted from the fact that the unit-price producers insisted upon a wide margin to meet the great uncertainties as they saw them. Since the cost-plus-fixed-fee contractors were not called upon to bear the risks, they did not require the large safety margin. The government was called upon to pay only those operating costs actually incurred, plus the fixed fee, which did not raise costs to the government to the same level as under the unit-price contracts.

The example is not regarded as typical of World War II experiences, but indicates that the cost-plus-fixed-fee device may sometimes be desired from the standpoint of over-all costs of procurement, even when the contractor is willing to operate under a unit-price contract. Presumably, there is some unit price which would be sufficiently attractive to induce private investment with full risk assumption in fissionable materials plants. That such a price may be entirely incomparable with present unit costs, whatever they may be, is suggested by previous discussion of the

⁵ John Perry Miller, *Pricing of Military Procurements* (New Haven, 1949), p. 132.

implications of full risk assumption in the atomic energy defense program.⁶

THE FIXED FEE

It is the intent of Commission policy that cost-plus-fixed-fee contractors emerge from their atomic energy operations financially whole in all respects and that they receive a fee which provides a financial return over and above all direct and indirect costs. The fee is fixed for the life of the contract, as long as the contract is not amended in a way that adds significantly to the work to be done by the contractor.

The size of the fee received by different contractors varies widely. A few of the largest atomic energy contractors operate for the purely nominal sum of one dollar for the life of their contracts. Other contractors are content with a fee which covers home office expenses attributable to atomic energy activities. Such expenses are reimbursable under cost-plus-fixed-fee contracts, but the practice of having them covered in the fee is sometimes preferred because it avoids the necessity of having the Commission audit home office costs. Still other contractors receive fees in the range of 3 to 7 per cent of estimated operating expenses under their contracts.

The economic logic of the fixed fee is tenuous at best. The fee is not a payment for risk assumption in an immediate financial sense, since the Commission takes considerable pains to ensure that contractors sustain no losses as a result of atomic energy work. A more satisfactory explanation views the fee as a compensation to the contractor in

⁶ In the event that costs are sufficiently well known in advance, an incentive schedule of fees might be established. The Bureau of Ships, Navy Department, employed such an arrangement with some success. For details see Glen A. Lloyd, "Pricing in War Contracts," *Law and Contemporary Problems*, Vol. 10 (Winter 1944), pp. 151-52.

lieu of profits⁷ which might otherwise have been earned by the employment in more profitable ways of persons assigned to atomic energy work. But the longer the time since such persons were committed to atomic energy activities, the more likely it is that their former places in the contractor's organization will be satisfactorily filled by others. Thus, the real sacrifice of the contractor in terms of profits forgone is related more to problems of replacement of individuals and organizational disruption of lucrative undertakings. These are transitional matters which have their greatest importance in periods of adjustment, as upon the assumption of contract responsibilities.

Other intangible and inexact measures affect the size of the fixed fee. The nominal one dollar "fee" is sometimes chosen as a means of offsetting the public opprobrium which may be connected with the production of war goods for a profit. On the other hand, a nominal fee does not necessarily mean an absence of compensation. What is not received in the form of a fee may be received in terms of nonfinancial benefits accruing to the contractor. The situation raises the question of the exact nature of private interest in atomic energy contracting—a matter which can best be explored in terms of the administrative relationships described in the following paragraphs.

COST-PLUS-FIXED-FEE ADMINISTRATION

It has been shown that cost-plus-fixed-fee contracts seek to establish administrative relationships for the conduct of a task which can be described only in

⁷ A distinction is often made between risk assumption and uncertainty bearing as a functional role of profits. Frank H. Knight, *Risk, Uncertainty, and Profits*, Boston, 1921. This distinction may be neglected for purposes of the present discussion.

the most general terms in the contract. This is in direct contrast to the situation in traditional contract arrangements, epitomized in the fixed-price forms, where advance commitments regarding the details of the contractual job are the essence of the contract device. The novel and close working relationships to which cost-plus-fixed-fee contracts give rise are the most significant aspects of these contracts, and, at the same time, present broad social questions regarding the nature of the economic institutions which they create.

Cost-plus-fixed-fee administration begins with a review of the qualifications of individuals assigned to atomic energy work by contractors. The Commission is interested in the quality of the team with which it must deal in working out the contractual relationship and in the conduct of the tasks to be undertaken by the contractor. This aspect of contract administration is of such importance that the letting of particular contracts is often dependent upon the contractor's assigning specific individuals to atomic energy work. As a result of the variability in the work to be done under cost-plus-fixed-fee contracts, the ultimate safeguard of the Commission's interests can be found only in these terms.

Other aspects of contract administration look toward achievement of an appropriate balance between effective control of contractors' activities and preservation of adequate latitude for freedom of contractor operation. At the top executive level of program direction, quantity and quality of product outputs are determined by the government. At the next executive level, co-ordination of activities among the different production and research installations is a direct Commission function, with some degree of private participation in the case of a few of the largest contractors, who are engaged in the operation of more than one installation. Finally, at the

various production sites, Commission officials and their staffs exercise continuing review down to a management level comparable to that of the contractor's plant superintendents.

The result of the administrative intimacy of the Commission and its contractors has been the creation of an atomic energy organization consisting of interlarded strata from the public and private sectors of the economy.

Such is the nature of the administrative organism which has grown up in the no man's land between public and private. It leads a relatively autonomous existence, separated by a layer of secrecy from the main stream of public and private institutions from which it has borrowed. From all publicly available information, it appears to have done a creditable job of producing war goods. Whether this is a consequence of the unique arrangements here involved or of transfusions from other sectors of the economy cannot be answered simply. The answer, which no attempt is made to give at this point, must be found in the details of the relationships studied in the previous paragraphs, interpreted in terms of the contemporary functioning of private industry elsewhere in the economy.

PEACETIME APPLICATIONS

Cost-plus-fixed-fee contracts have significance not only as effective instruments of procurement in atomic energy, but also as harbingers of the industrial structure of future peacetime atomic energy industries. The latter role, which will be discussed in the following paragraphs, is one in which cost-plus-fixed-fee contracts have been cast by the circumstance that the field of atomic energy is possessed of both peacetime and wartime applications. They are not intrinsically well suited to the development of a competitive structure for

peacetime industries, but have been somewhat adapted to this end, subject to the overriding objectives of national defense.

The terms of atomic energy contracts, consistent with the spirit of the Atomic Energy Act, seek to keep all industrial atomic energy knowledge in the public sphere. Thus, all patentable discoveries in the field of atomic energy and all technological information—data, notes, drawings, and so forth—become the property of the Atomic Energy Commission. A considerable number of government-owned patents in unclassified areas have been released for non-exclusive royalty-free licenses, and a large volume of unclassified technological data has been published. Presumably the same will be done with other patents and atomic energy information, including what must be a sizable literature relating to the development of power-generating reactors, when and as they are declassified.

The intended effect of the foregoing policies is to reduce the private advantage of atomic energy contractors that lies in the industrial experience, training, and know-how which members of their staffs receive while engaged in atomic energy work. But it is the writer's observation that at the two major production installations, Oak Ridge and Hanford, operating personnel tend not to be closely tied to particular contractors. They would probably be just as available to a large number of private firms as to the firm for which they are nominally working.

More vigorous efforts to develop a cadre of specially trained personnel within their own ranks are made by contractors in reactor development work—that part of the atomic energy industry closest to peacetime applications. Centrally conducted reactor development training programs for contractors' employees have long been sponsored by

the Commission, and the rotation of personnel between a contractor's home installation and reactor development installation is in accordance with accepted policy.

Manifestations of private interest in reactor development have been numerous, but it is significant that the initial proposals for private action in this area came from two groups—the Monsanto Chemical Company and the Dow Chemical Company, the latter in combination with the Detroit Edison Company—which had had long and absorbing contacts with atomic energy. Without such contacts, their proposals could hardly have been conceived. The field is technologically complex, and secrecy restrictions introduce a necessary waiting period before firms outside the atomic energy program can even begin to think about the problems involved, to say nothing of making proposals for their solution.

DEFENSE VERSUS PEACETIME INDUSTRIAL STRUCTURE

Further constraints upon the competitive structure of peacetime atomic energy industries are inherent in the attributes of cost-plus-fixed-fee contracting. Private concerns have been engaged in order to bring special talents into atomic energy, but the particular private concerns most likely to have sufficiently specialized talents are generally the largest in an industrial segment. Moreover, large firms are best able to supply a variety of specialists to meet changing technological requirements, and management talent in depth at each level to meet shifting needs in volume of output.

Not only is the case predisposed in the direction of large operating contractors, but the inherent rigidities of the contractual relationship tend to keep contracts in the hands of their present

holders. The intimate administrative contacts upon which cost-plus-fixed-fee contracts depend require time for their establishment and are not lightly severed by the Commission. Compounding these difficulties are the secrecy restrictions which, however necessary on other grounds, seriously obstruct competition from without the circle of the initiated.

THE FUTURE OF INDUSTRIAL ATOMIC ENERGY

Despite the bent of the present contractor system in the direction of established interests, it is entirely possible that normal competitive relationships could be developed under the aegis of the government, at least in limited sectors of the field.

If and when atomic energy defense needs permit a limited relaxation of cold war production patterns, much by way of disseminating industrial know-how might be accomplished by increasing the number of firms participating in the operation of selected atomic energy installations. And if full and current release of relevant industrial information can be achieved without impairing national security, while keeping rights to atomic energy knowledge in the public sphere, as they now are, then the most serious roadblocks to a future competitive structure in peacetime applications will have been substantially reduced.

The atomic energy industry is in the first stage of its development. The contractor system under which it operates has been well adapted to the needs of this stage, namely, the production of atomic weapons. Now, as a result of technological advance, the problems of the gestation of a peacetime atomic energy industry are becoming more acute, and point, for their solution, toward increasing emphasis on a new order of business-government relationships. But

only after a broad base of competitive industrial participation has been developed will it be consistent with the public interest in this new field to move on to the later stage of full-scale private ownership and operation.

Richard A. Tybout, Ph.D., Ann Arbor, Michigan, is instructor in economics and research associate in public administration at the University of Michigan. He is preparing a monograph on business-government relationships in atomic energy based on his doctoral dissertation, Atomic Energy Control and Promotion (1952).

The Problem of Secrecy

By JOHN GORHAM PALFREY

THE impact of atomic secrecy on the conduct of atomic affairs and on the processes of government, science, and industry is no longer an unexamined subject. Whenever seriously examined, this impact, despite the multiple language used in defining it, has almost uniformly been regarded as unhealthy, and in some degree unnecessary.

It has often been stated that secrecy has been overrated by the government and has not accomplished what was expected of it. Particularly, it has been said that the cost of secrecy has outweighed its contribution, and that a more balanced evaluation of both could reduce the cost without reducing the actual contribution to our safety.¹

SIGNS OF FERMENT

Heretofore, these appraisals have not led to noticeable reform. But by 1953 there are signs that a change may be imminent. For one reason, critical judgments have come from sources that cannot be described as inconsequential. Two former chairmen of the Atomic Energy Commission,² the present and a former chairman of the Joint Committee on Atomic Energy,³ the former chairman

¹ For critical evaluations of atomic secrecy, see Walter Gellhorn, *Security, Loyalty and Science* (Ithaca, 1950), p. 34 et seq.; Alan Barth, *The Loyalty of Free Men* (New York, 1951), p. 177 et seq.; Ralph Lapp, *The New Force* (New York, 1953), p. 206 et seq.

² David E. Lilienthal, "Free the Atom," *Collier's*, June 17, 1950, p. 13; Gordon Dean, Press Conference, June 25, 1953, AEC press release.

³ Representative W. Sterling Cole, "The Hydrogen Bomb: A Panacea?" 96 *Congressional*

of the Commission's General Advisory Committee,⁴ and just recently the President of the United States,⁵ all have concluded, some more emphatically than others, that more atomic information should be disclosed.

For a second reason, the signs of disenchantment and discontent have been coupled with pressures from interested groups who have a particular reason for demanding that the assumptions of 1946, behind the provisions of the law, be re-examined in the light of present circumstances. The Joint Committee on Atomic Energy has been currently holding hearings on the enlargement of industrial participation in atomic energy, preliminary to the consideration of amendments to the Atomic Energy Act in the next session of Congress. Among the amendments may be one modifying the secrecy provisions of the law.

THE BASIC QUESTION

The criticisms of existing secrecy and the possibilities of change are of profound importance (and our survival may well depend upon the attention they receive and the corrective action taken), but the core of the problem is what these criticisms imply. Behind the evidence of the damage produced by an excess of secrecy lies the fact that

Record A-5316 (1950); Senator Brien McMahon, Interview, *Bulletin of the Atomic Scientists*, January 1952, p. 6.

⁴ J. Robert Oppenheimer, "Atomic Weapons and American Policy," *Foreign Affairs*, July 1953, p. 525.

⁵ Dwight D. Eisenhower, Press Conference, *New York Times*, July 9, 1953, text p. 4, col. 1.

despite the country's most earnest intentions, it has lived with the problems of the secret atom for eight years without yet learning what the experience has had to teach it, and without correcting the errors of its ways.

Despite the current signs of ferment, it is not clear that the remedy for excessive secrecy will be produced by specific disclosures or by amendments to the law. Nor is it clear that the remedy will be provided by any contrived solutions to individual problems. The genuine remedy may require a larger pursuit and less immediate results. It may have to begin not with the devising of solutions but with an understanding of the flaws in the whole process of conducting atomic affairs, which, in the course of eight years, has not generated its own correctives as experience has demonstrated the need for them.

It is therefore worth while to consider what has gone wrong, and what has led to the government's failure to identify and maintain the balance between secrecy and openness which would help us most and hurt us least.

Any complete explanation requires a study of the whole varied and intricate political experience, and the changing context in which atomic affairs have been conducted. But in the course of a survey of that experience, one factor does constantly emerge, which, while not determinative of all that has happened, is at least a significant accompaniment of many episodes in many areas affected by secrecy. These episodes involve behavior of the Congress, the Atomic Energy Commission, the President, or the military, which in retrospect seem illogical and costly. And the source of this illogic and expense seems frequently to have been the same: an indiscriminating and unexploratory acceptance of the uniqueness of all atomic secrets in their nature and importance.

SECRECY PROVISIONS OF ATOMIC ENERGY ACT

One can trace this attitude in part to the secrecy provisions of the Atomic Energy Act, although it was more implicitly than explicitly expressed. There was nothing in the policy directives of the information section itself that instructed the Commission to lean over backwards in the interest of concealing and protecting atomic secrets. In fact, the policy declaration plainly provided for a control of secret information by the Commission which would strike the optimum balance between secrecy and openness. The Commission was fully apprised by the act, as amplified by the Senate Committee Report, of the two "vital objectives" of disclosing information that would help scientific progress, and of concealing information that would help the progress of other nations. They were recognized as objectives which "compete with or are in direct conflict with one another," raising "policy considerations of opposite tendency."⁶ The section was designed to frame a program that would "reconcile their apparent divergence."

Nevertheless, in other provisions of the information section there were to be found such compelling indications of the unique importance attached to atomic security precautions as to make the contemplated balance between secrecy and

⁶ Sec. 10(a)(1) and (2) provides as follows:

(1) That until Congress declares by joint resolution that effective and enforceable international safeguards against the use of atomic energy for destructive purposes have been established, there shall be no exchange of information with other nations with respect to the use of atomic energy for industrial purposes; and

(2) That the dissemination of scientific and technical information relating to atomic energy should be permitted and encouraged so as to provide that free interchange of ideas and criticisms which is essential to scientific progress.

openness difficult to achieve. These provisions were, ironically, a manifestation of the same qualities that characterize so much that is admirable about the McMahon Act as a whole: a thoroughness and care, coupled with a sense of ferment, produced by the atom's formidable characteristics which made the exception the norm, inventiveness the criterion, and reassessment and departure from ordinary ways acceptable.

SECURITY MEASURES

The difficult problems of atomic secrecy, approached in this spirit, were thought to require more than conventional security measures, and new ones were devised that seemed appropriate to the importance of the subject. In the first place, rather than permit the Commission to determine what information should be concealed, the act made substantially all atomic energy information secret by statutory definition, and established a new category for such information, labeled "restricted data."⁷ The Commission was then authorized to declassify information, removing it from this category, as the Commission decided the information could be published without endangering security.

While this device had practical reasons to support it, particularly from an administrative point of view, it had important drawbacks. It gave statutory support to the assumption that all atomic information, unlike other government information, is "born secret,"

⁷ Section 10(b)(1) provides as follows:

(1) The term "restricted data" as used in this section means all data concerning the manufacture or utilization of atomic weapons, the production of fissionable material, or the use of fissionable material in the production of power, but shall not include any data which the Commission from time to time determines may be published without adversely affecting the common defense and security.

and it placed on the Commission the burden of justifying the disclosure of information rather than of justifying its concealment, as is ordinarily the case with other "sensitive" agencies.

In the second place, the framers of the act were not satisfied with the adequacy of existing criminal laws, such as the Espionage Act, as protection against unlawful disclosure of atomic secrets. They therefore wrote into the information section special and very severe criminal sanctions.

Lastly, the Congress concluded that personnel security clearance of those with access to secret atomic information could not be left to the agency's discretion, as is customarily the case. Instead, uniformly stringent clearance procedures were provided for all personnel with access to any level of classified information. Except in case of emergency, a full investigation of character, loyalty, and association by the Federal Bureau of Investigation, and Commission clearance, were required, whether the employee was a scientist at Los Alamos working on weapon design, or a temporary construction worker engaged in the rudimentary stages of plant construction. The assumption was plain. Even the lowliest atomic secret merited as much protection as top secret military information.

PRECAUTION ACCENTUATED

The net result of these provisions was that the Commission, in controlling information, was encouraged to conclude that something more than the conventional calculations was required before an atomic secret was declassified or a security precaution modified. If the act itself did not specifically instruct the Commission to adopt this view, both Democrats and Republicans in the Congress made it plain to the Commission, over the years, that such

was their interpretation of the meaning of the law. Senator Tydings typified this attitude when he said, in 1949,⁸ that the atom was not a case of a new 75 millimeter cannon or a supersonic aircraft, but a question of whether or not we were to survive on this planet. Therefore, he concluded, until the world prospect brightened, the Commission would do well to err on the side of secrecy.

What made this attitude particularly important was the fact that it was impressed upon the Commission from the outside, by the public and its representatives in Congress. It therefore accentuated the natural inclinations of the Commission, like any other government agency, to proceed with a superabundance of caution in controlling information. The reasons for this tendency are obvious: Unwise disclosure is irrevocable and exposes the offending official to criticism, while, on the other hand, unwise concealment can always be rectified, and, meanwhile, the act of concealment and the reasons for it are themselves shielded from public observation.

Traditionally, in activities involving military secrets, for example, this inherent tendency toward overconcealment has been at least partly counterbalanced by the jaundiced eye with which the press and, on occasion, the Congress, have regarded military security. Thanks to this outside alertness and aversion to excessive security measures, to a constant pressure to ferret out information, and to the airing of intramural controversy within the military establishment, considerable information has been disclosed and an uneasy balance between secrecy and openness maintained in defense affairs.

Until recently, at least, the situa-

⁸ Hearings before the Joint Committee on Atomic Energy on the AEC Report to Congress, 81st Cong., 1st sess., pp. 15, 18.

tion was just the opposite in atomic energy. The initiative for disclosure came largely, if at all, from within the Atomic Energy Commission, and furthermore, a penalty was often exacted for such initiative, as the Commission learned in 1949 during the Hickenlooper investigation. As a result, such efforts to disclose more information were not likely to be self-sustaining.

EXAMPLES OF SPECIAL HANDLING

Thus, from the outset, the Atomic Energy Commission was provided with many incentives to play "extra safe" and to err on the side of secrecy. One might debate abstractly the question whether atomic secrets did or did not justly merit this unique protection, either during the period of our atomic monopoly or afterward. But such debate would lack meaning. Concrete illustrations of the types of special handling atomic secrets did receive lead one to a sharper and more fruitful debate. At the same time, these illustrations demonstrate the ways in which this special handling has contributed to much that is both significant and mischievous about the impact of atomic secrecy.

Personnel screening

One major aspect of the secrecy experience was the operation and consequences of the personnel security clearance program. This is a subject discussed in another article. Here, it merits brief discussion only to illustrate one occasion of illogic produced by the concept of playing "extra safe." This occasion demonstrates that Congress not only demanded special clearance to protect all levels of secret information, but also demanded it, as a precaution, even when no secret information was involved.

The dispute over the Commission's fellowship program was an important part of the Commission's investigation by the Joint Committee in 1949. It erupted in May with the discovery that an avowed Communist had received an AEC fellowship, and that the Commission had conducted no security screening of fellows working in nonsecret fields. Three committees of Congress bitterly attacked the Commission for lax security. The Commission, in turn, defended its practice on the ground that no secrets were involved. While it subsequently yielded to the extent of adopting the requirement of an oath of loyalty and affidavit of non-Communism (a customary service to assure the proper spending of public money), it steadfastly opposed any security clearance procedures as an unnecessary and dangerous extension of security into nonsecret fields.

The Commission failed to persuade Congress. The outcome was a rider in the Commission's annual appropriation, requiring an FBI investigation and loyalty clearance of the recipients of AEC fellowship awards.⁹ The undeviating congressional attitude was bluntly stated: This special precaution was needed because there was always a chance that a person, even if studying in a nonsecret field, might "hit upon a super-duper atomic bomb, and be off to Russia."¹⁰ In "whatever it does" a "special responsibility" was said to rest upon the Commission "to be particularly sure that it does not contribute to the defeat of the United States in the cold war."¹¹

¹¹ Representative Francis Case, *Additional Hearings before the Subcommittee of the Com-*

A year later, the National Science Foundation was established. It was provided with authority to grant fellowships in fields of study which included those covered by the Commission's nonsecret fellowship program. An oath and an affidavit but no loyalty clearance were required of fellows in the unclassified field. In the following period, the Commission therefore began to transfer much of its original program to the Foundation—a government agency not saddled with special precautions, because the question of security had been determined on its merits, not on the fact that it was a program of the Atomic Energy Commission.

Noncommunication within the government

In very different areas of the Commission's information control activities, such as the flow of secret information within the government, or the communication of secret information between us and our allies, it has again been the special handling afforded the atom and its secrets that has caused most of the complications.

One can find numerous instances, early and late in the postwar period, where atomic information was regarded as so secret, and therefore so tightly "compartmentalized," that even top officials in the government, military and civilian alike, had no knowledge of it. For example, a wartime agreement in 1943 between the United States and England, not to employ atomic weapons without mutual consent, was kept secret from all members of Congress until mid-1947, when Senators Vandenberg and Hickenlooper first discovered its exist-

mittee on Appropriations, House of Representatives, on the Independent Offices Appropriation Bill for 1950, 81st Cong., 1st sess., p. 69.

ence. It was also kept from Secretary of the Navy Forrestal until he was elevated to the position of Secretary of Defense, and then he was informed of it, not by executive officials, but by the two Senators.¹²

There are more recent illustrations. In the spring of 1951, during the MacArthur dismissal hearings, General MacArthur indicated in a reply to a question of Senator McMahon that, although he was Supreme Commander of the United Nations forces in Korea, he did not possess any information about the nature and portent of the atomic weapons tests then taking place in Nevada.¹³ These tests, in fact, marked an important stage in the development of atomic weapons for tactical use on the battlefield.

Barriers to international exchange

These special barriers to communication within the government, however, were minor indeed in comparison to the limitations on any communication of classified atomic information with our closest allies. While military and diplomatic secrets continued to be shared with them after the war, all exchange of atomic secrets, even with our wartime atomic partners, ceased with the passage of the Atomic Energy Act in 1946.

The act prohibited any sharing of restricted data of an industrial or military nature until Congress was satisfied with the adequacy of international safeguards. This provision, however, was enacted before hopes of international control of atomic weapons had faded, and before the mounting hostility of the Soviet Union, and the Soviet atomic explosion, put an entirely new light on

atomic collaboration with those nations which had again become our formal military allies.

The two steps which have been taken in the seven years since the act represent only negligible progress toward establishing a relationship in keeping with the military collaboration we have undertaken in the collective effort to defend the free world. The first step was an executive agreement with Great Britain and Canada in 1948, permitting a rigidly limited exchange of classified information, primarily of a research nature. Even this much exchange of this information was accepted by the Joint Committee largely because the agreement also rescinded the wartime restriction on the use of atomic weapons, noted above, and established a favorable arrangement with England in the distribution of Belgian Congo uranium ores.¹⁴

For the next three and a half years, any move to enlarge co-operation was effectively resisted by Congress, even after the signing of the North Atlantic Treaty. In July 1949, for example, a proposal of the executive branch of the government to explore the possibilities of a new atomic partnership with England and Canada was stopped in its tracks by the categorical opposition of Senator Vandenberg and other Senators.¹⁵

Finally, in the fall of 1951, Congress was persuaded to amend the act to permit the exchange of restricted data with foreign countries, which could include information on reactors and the production of fissionable material.¹⁶ However, no sharing of atomic weapon information was permitted, and, before any ex-

THE ANNALS OF THE AMERICAN ACADEMY

range whatever could take place, a formidable list of twenty conditions had first to be met, which included a unanimous vote of the Atomic Energy Commission, formal approval of the National Security Council and the President, and a thirty-day interval for Congress to scrutinize the arrangement.

In 1953 there has yet to be any exchange of atomic weapon information broad, despite the success of both our enemies and our allies in the field. No such data can be shared with our allies, whether it relates to the design and production of weapons or to the very different type of weapon information concerning effectiveness and methods of utilization, and the quantity and types available for the defense of western Europe. It is no conventional relationship among military allies to have all but one of the members kept in ignorance of the capability upon which, soundly or unsoundly, they are greatly relying for their combined military effectiveness.

Public discussion rejected

There is one final illustration of special behavior towards atomic secrets which illuminates both the Commission's declassification problems and the political problems of congressional control and public accountability.

In a speech in January 1949, Senator McMahon addressed himself to the question: "Should we reveal the size of our atomic stockpile?"¹⁷ He did not answer the question; he merely said it must be publicly asked and the issues publicly weighed, so that whatever the answer, it would be a considered one. "Perhaps our military needs absolutely dictate that atomic production figures be kept secret," McMahon continued, "but if so, we were risking the 'tested

traditional principles of free and constitutional government," and we must be sure that the risk had really been calculated.

McMahon went on to identify the issues. On the one hand, concealment of production figures, even from the Joint Committee, kept knowledge from Congress which it needed to discharge its duties in providing for the national defense, and compelled Congress to purchase an atomic "defense package sight unseen," which might be the equivalent of a large army or merely a regiment. Equally important, without this knowledge, proper Joint Committee appraisal of the Commission was impossible, as was proper public appraisal of the Joint Committee.

On the other hand, McMahon said, disclosure of production data would tell the Russians what they had to do to rival our progress, what damage we could inflict, and what countermeasures they needed. Even the intermediate possibility of secretly informing the Joint Committee had its drawbacks. Since the information could not be reported publicly, the rest of Congress, in voting on the proper size of the defense forces, would be forced to rely purely on the unexplained "say-so" of the Joint Committee members.

A few days after McMahon's speech, President Truman was asked by the press about the desirability of public debate on stockpile disclosure. The President answered with a categorical No, and indicated that no part of this topic was a fit subject for public discussion.

Senator McMahon had thought the country should at least stop and consider the political consequences of existing secrecy and decide whether it was justified. The President, in flatly rejecting such an idea, plainly revealed how dangerous this experiment with atomic secrecy had proved to be. Once

launched, it not only hampered criticism—it defied examination.

Public discussion considered

Within the past few months, however, there have been some signs of a change in the government's approach to this topic, and of a modification in the absolute distinction hitherto drawn between atomic and nonatomic information. In an article published in July 1953, Dr. J. Robert Oppenheimer wrote that while there were secrets important to be kept today, including some in the field of atomic energy,

knowledge of the characteristics and probable effects of our atomic weapons, of—in rough terms—the numbers available, and of the changes that are likely to occur within the next years, this is not among the things to be kept secret. Nor is our general estimate of where the enemy stands.¹⁸

In contrast to the President's prompt rebuff of Senator McMahon's speech in 1949, top officials have displayed a respectful attitude toward the more positive conclusions of Dr. Oppenheimer in 1953. Both Chairman Dean and President Eisenhower indicated that they were not unsympathetic to many of Dr. Oppenheimer's views, and were aware of the importance of the issues. One can conclude, at least, that the issues themselves will no longer be regarded as unfit for public discussion.

THE QUESTION OF UNIQUENESS

These three illustrations, covering a variety of activities and governmental problems, lead to the conclusion that many of the dislocations produced by atomic secrets have not been due to the existence of secrets and security precautions per se, but to the accompanying frame of mind which has led the government to put the problems posed

¹⁸ Oppenheimer, cited note 4 *supra*, p. 532.

in a special category outside the orbit of normal security practices.

This, in turn, leads to a deeper question, and one which defines the real issue posed by past behavior. The crucial problem is not whether Congress was right in regarding atomic secrets as unique in their importance, but whether the proper measuring stick has been used to determine this uniqueness, its extent, and its consequences. The mischief has been done as a result of the view that, since the atom is unique, any information relating to it is unique, and therefore justifies, by definition, and without further thought, unprecedented departures from customary behavior.

The expression "atomic secrets" has accordingly been considered as a blanket term covering a single subject, which has been discussed in a collective, undifferentiated sense. It has rarely been considered as a label describing various types of data which constitute, to a greater or less degree, information worth keeping to ourselves, for a variety of important and less important reasons.

Actually, restricted data can be broken down into the same categories of information found in other secret operations. Some of it includes operational facts—what we are doing, what we are planning to do. Some of it is program status information—how many weapons we have, of what types, and how fast they are being produced. Some of it is information on weapon design, on production details, or on scientific techniques. Some of it is information on the characteristics of the weapons, their effectiveness, their method of employment. Some of it is intelligence data—information and sources of information on the status of other nations' progress. These are all traditional categories. Similarly, the various reasons for concealing restricted data are traditional reasons—to avoid helping potential enemies to rival our progress, and to

¹⁷ Brien McMahon, "Should We Tell How Many Atom Bombs?" 95 *Congressional Record* A-4051 (1949).

avoid telling them our accomplishments, our difficulties, and our plans.

The failure to distinguish between different types of information has obscured the basic point that a given type of atomic secret may have more in common with its counterpart in other secret government operations than it has with other types of atomic information. As a result, few have asked the kind of question that needs answering. For example, what are the differences, in nature, importance, and appropriate methods of handling, between top secret information on atomic bomb design, stockpile, or effectiveness, and similar top secret information on guided missile design, stockpile, or effectiveness?

Perhaps there are differences, but unless there are, one may legitimately question why Congress is informed more about guided missiles than about atomic bombs. Since we have found special barriers to communication and special precautions hampering, we should do well to avoid them wherever possible, and to demand no more barriers and precautions than are regarded as sufficient for nonatomic government secrets of the same security classification.

SPECIAL FEATURES

At the same time, the salutary impulse to bring the atom "down to size" and to relate its secrets to others in the government should not lead to the equally false conclusion that there is nothing special about the atom and its secrets. This conclusion has been the source of much ineffective criticism. Even highly informed critics too often recommend that damaging secrecy in atomic energy could be minimized by limiting secrecy to the final weaponizing stages, as it is limited with aircraft, artillery, and other military gadgets.

Such use of the analogy of atomic op-

erations to conventional military operations is likely to be unrealistic and unhelpful. The production of steel for a new gun does not correspond to the production of fissionable material for an atomic bomb. One is an essential but rudimentary process; the other is 80 per cent of the job of constructing the finished weapon. In atomic energy, a sharp line cannot be drawn between the preliminary processes and the final product, or between peacetime and wartime applications. Even between basic scientific discovery and its technological application, the line may no longer be clear. With regard to the last couplet, the virtual elimination of the time lag between discovery and its application, in the past decade, has produced a new situation, with new secrecy considerations. It is a fact that we would be unwise to ignore in an atomic weapons race.

In the political field of policy decisions in atomic energy, analogies may also be misleading. One may argue that major atomic decisions, like other major decisions in the past, involving basic moral, political, and international considerations, should receive the type of public debate through which government by consent is traditionally maintained. Perhaps this is true, but in the case of the atom and in the course of the cold war there have been genuinely new and ambiguous circumstances that demand a fresh evaluation. Many of the major atomic policy decisions have raised policy issues which are intermeshed with technological details and with facts of program status and international cold war strategy, much of which is properly considered highly classified information.

One would be just as unwise to conclude that the atom has raised no new problems of secrecy as to conclude that all its problems are essentially new. What seems to have totally escaped us

however, is a third conclusion which the eight-year experience should have made plain. While there are genuinely new problems posed by atomic secrecy, and occasions where departures from precedent in coping with them are justified and important, these problems and these occasions are identified by an open-minded examination, not by a blanket assumption or a definition. The proper response to the position that atomic secrets merit unique protection is not a denial but a series of questions and a demand to be shown.

THE DEMOCRATIC PROCESS

This analysis suggests that the significance of the atomic secrecy experi-

ence can be defined in rather basic and inclusive terms. The atom and its secrets led to the temporary capitulation of a democratic society to the apparent demands of an apparently important subject. In the process, that society failed to reserve to itself the capability of putting any departures from custom, which it imaginatively decided to make, to the irreverent test of justifying themselves in operation. It is by this process, in the past, that the most unknown and frightening subjects have been made familiar and have been effectively assimilated. In the complicated present, we should do well to remember and apply this great resource of a free society.

John Gorham Palfrey, LL.B., New York City, is lecturer in law and government at Columbia University. He was formerly a member of the Office of the General Counsel in the Atomic Energy Commission, and later a member of the Institute for Advanced Study, Princeton, while engaged in a study of the history and political aspects of atomic secrecy. A book on the subject is in preparation.

Personnel Security

By RALPH S. BROWN, JR.

IN view of the obsession with secrecy in the atomic energy program, the measures that have been taken to exclude poor security risks seem surprising mild. The Atomic Energy Commission's policies and procedures are cut from the same general patterns that are in use throughout the federal establishment by agencies bearing a far lighter burden of concealment.¹ In the most general terms, personnel security contemplates the rejection of anyone whose employment potentially endangers the "common defense and security"—a recurring phrase in the Atomic Energy Act.

To protect the "common defense and security" against harm from employees requires, of course, more than the keeping of secrets. The employee may also commit sabotage, either in the classic way by wrecking the machines, or more subtly by wrecking the administration. He may even hopefully be lying in wait for the revolution when he will try to seize a key installation and hand it over to the enemy. Such threats of careless or faithless behavior are the proper subject matter of security measures. But the statute and the course of events have combined to emphasize, if not to over-emphasize, the single threat of espionage.

STATUTORY EMPHASIS ON KEEPING SECRETS

In the act the mandate for personnel screening is found in Section 10, on "Control of Information." At the heart of that section lie drastic criminal sanc-

tions, supplementing in an intricate way the general Espionage Act. They are directed against anyone who discloses or otherwise misuses "restricted data." "Restricted data" is a statutory catch-all to encompass any information about atomic weapons and fissionable material, except what the Commission decides can be published without "adversely affecting" the overworked "common defense and security."² Only after threatening malefactors with a death penalty does the statute go on to lay down preventive measures. No contractor's employee may have access to "restricted data" unless the Federal Bureau of Investigation has investigated his "character, associations, and loyalty" and the Commission has cleared him. A similar FBI investigation is required for all employees of the Commission itself.³ Language in another punitive provision of Section 10 has some bearing on sabotage;⁴ but one gains the impression that these phrases, along with the personnel screening measures just described, are but reflections of Congress' anxiety over the secrets of the atom.

ATOMIC ESPIONAGE

While the Atomic Energy Act was still under consideration, the revelation to Canadian authorities by a Russian code clerk of the operations of an elaborate spy ring led to the arrest and prompt conviction in March 1946 of Dr. Allan Nunn May, an English nu-

² Sec. 10 (b) (1) and (2).

clear physicist, for reporting to the Russians what he knew about our own as well as the British and Canadian installations. The House of Representatives, during debate on the bill, was especially alarmed by the exposure of the Canadian ring, and by vague rumors of leaks from Oak Ridge.

For the next three years tension was maintained by a series of dramatic but on the whole insignificant exposés. The House Committee on Un-American Activities uncovered some Communists among scientists who had worked on the wartime atomic projects, and developed some evidence of contacts with Russian agents. One George R. Jordan, who had been stationed at the Great Falls, Montana, air base from which air freight went to the Soviet Union, produced some lurid "diaries" describing shipments of uranium and classified documents. In due course it was established that some uranium was sent on lend-lease requests so as not to alert the Russians to our unusual interest in that metal. Jordan's other allegations appear to have been equally unsubstantial; but they served to keep the pot boiling.

Similarly, in the course of the major investigation of the Commission by the Joint Committee on Atomic Energy in 1949, Senator Hickenlooper and the press made a great deal of uproar about the disappearance from the Argonne Laboratory of about an ounce of uranium 235, which was later retrieved from a scrap heap. This incident demonstrated "how easily the American public could be frightened and their alarm turned to political mischief."⁵ Part of the "political mischief" of the 1949 investigation was a further charge by Senator Hickenlooper of softness in

the personnel security program, which the full committee found to be unsubstantiated.

Of far greater gravity than all the other spies and spy stories put together was the case of Klaus Fuchs. The most sober estimates have it that this German-born, English-naturalized physicist by his betrayals advanced the Soviet program at least a year. His confession in early 1950 was followed by further shocks: the FBI closed in on Harry Gold, courier for the principal espionage apparatus in the United States, and, through him, on David Greenglass. A technician and not a scientist, Greenglass confessed that he had been able to communicate important details of bomb construction from his Army job at Los Alamos. He and Gold implicated the obdurate Rosenbergs. The long legal and propaganda struggle to prevent their execution kept the perils of atomic espionage in popular view until the death sentence was carried out in June 1953. Meanwhile, Bruno Bontecou, another top-ranking British physicist of Italian origin, disappeared with his family in September 1950; it seems to be officially presumed that he is in the Soviet Union.

COMMISSION'S COURSE UNDISTURBED

When one considers the development of the AEC security program against this history of grim reality and irresponsible charges, the remarkable conclusion is that the Commission seems to have proceeded steadily in the direction of giving the employee an opportunity

⁵ The best survey of all these episodes is U. S. Congress, Joint Committee on Atomic Energy, *Soviet Atomic Espionage*, Joint Committee Print, Washington, 1951; see also Joint Committee Report, *Investigation into the United States Atomic Energy Commission*, 81st Cong., 1st Sess., Rept. 1169, Washington, 1949, pp. 1-2, 57-79. Cf. Ralph E. Lapp, *The New Force* (New York: Harper & Bros., 1953), pp. 213-16.

⁶ See James R. Newman, "The Atomic Energy Industry; An Experiment in Hybridization," *Yale Law Journal*, Vol. 60 (Dec. 1951), p. 1325, n. 123.

¹ See generally Eleanor Bontecou, *The Federal Loyalty-Security Program*, Ithaca: Cornell University Press, 1953.

to clear himself. From the Manhattan Engineer District it inherited what may be described as rough-and-ready personnel security methods.⁷ Its own procedures were arbitrary, and its standards not clearly formulated, until the period 1949-50. Then, just as it was under public attack for softness in not dismissing employees, and just as the hammer blows of the 1950 revelations fell on a frightened public, the Commission carried through a series of reforms. There has been no announced major alteration in the program since that time.

Two hypotheses may be suggested why the Commission was able and willing to move against the seeming tide of alarm and opinion. First, none of the substantial derelictions was its responsibility. Either they occurred during the period of Army control, or, as was the case with May, Fuchs, and Pontecorvo, the offenders were certified by the British to be eligible for whatever access they had to our operations. Second, the Commission and its staff were responsive to those critics (scientists' committees and others) who were quietly pressing the unfairness of the rough-and-ready procedures.

AEC STANDARDS AND PROCEDURES

The "Criteria for Determining Eligibility," adopted by the AEC in 1949,⁸ established two categories. Category (A) includes conduct and associations which in themselves establish a presumption of risk; category (B), those which must be "weighed"—presumably against all other information available on the individual. The first category includes—aside from such obvious disqualifications as a record of attempted

⁷ See Walter Gellhorn, *Security, Loyalty, and Science* (Ithaca: Cornell University Press, 1950), p. 81.

⁸ Reprinted in Gellhorn, *op. cit.*, pp. 238-44.

espionage or of serious disregard of security regulations—membership in subversive organizations, as identified by the Attorney General, or advocacy of violent revolution. People whom the FBI could ascertain to fall within this category would be unlikely to aspire to employment in a sensitive agency like the AEC.

Category (B) includes some criteria of a nonpolitical character, such as inability to safeguard restricted data, and homosexuality. But most of it takes the investigators and the Commission into the shadowy world of "sympathetic interest in . . . subversive political ideologies," "identification with an organization known to be infiltrated . . .," and "close continuing association with individuals . . . who have subversive interests and associations."

These criteria do not differ in scope—though there are marked variations in form and arrangement—from those that were promulgated by other sensitive government agencies, or from those now applicable to the whole executive establishment by President Eisenhower's transformation of the employees' loyalty program into a security program. It should be noted that his Executive Order 10450 does not trench upon the security operations of agencies like the AEC with a specific statutory mandate.

The administration of the program is nominally decentralized. Authority to grant clearance in the normal case, where no derogatory information appears in the investigative report, is delegated to the Managers of Operations. But only a suggestion of doubt is required to put the case in the hands of the Security Division in Washington. Either Washington or the local security officers may require further investigation or interview the employee. If substantial doubts remain, an opportunity is afforded for a hearing before a three-man board, preceded by a statement of

the derogatory information "as specifically as security considerations permit." The board does not decide the case; it makes recommendations to the manager, who, in making his decision, is enjoined to consider the effect of a denial on the atomic energy program. An appeal lies to a Personnel Security Review Board in Washington. It in turn makes recommendations to the General Manager, who acts finally for the Commission.⁹

All these administrative arrangements are again quite similar in outline to those of the military and other departments that have similar responsibilities. The chief superficial difference is that most AEC cases necessarily involve not its own staff, but contractors' employees needing access to restricted data. This is so simply because the latter are at least ten times as numerous. The magnitude of the Commission's concern with the politics and associations of persons nominally in private employment is in direct proportion to its remarkable reliance on private contractors.

A BALANCE SHEET OF THE AEC PROGRAM

We have now considered the statutory basis for the Commission's personnel security program, with its emphasis on safeguarding secrets. The development of this program, we have observed, has been one of orderly evolution, and does not appear to have been deflected by the shocks and alarms of atomic espionage. That evolution, in its major aspects, has paralleled the growth of other security programs in the national government. It is now appropriate to attempt an audit of the assets and liabilities of the AEC's record.

⁹ The hearing and review regulations are reprinted in Bontecou, *op. cit.*, pp. 341-48. For the internal procedures, see the Commission's release accompanying the hearing and review regulations, Sept. 19, 1950, and its current General Manager's Bulletin 80.

ASSETS

1. The Commission, since September 1950, has made its hearing and review procedures available to applicants for employment. No other federal agency does so for its own employees. This practice is desirable from the government's standpoint, because a hearing often overcomes doubts raised by an FBI dossier. Thus the government is not needlessly deprived of a man it wants. From the employee's standpoint, the opportunity to clear himself of an imputation of disloyalty is obviously desirable. The main objection to giving applicants hearings seems to be the administrative burden. The AEC has borne it with satisfactory results.¹⁰

2. The Commission has maintained a high-caliber independent review board. If, as is reasonable, initial hearing boards are recruited from the staff and sit at locations convenient for the employee, they may be competent, or they may not. The awesome task of a security board is, in the absence of automatically disqualifying factors, to appraise the whole man. On the basis of his total history and personality, is he a good risk? Sometimes the man may be bigger than the board. A judgment by Lilliputians needs to be reviewed.

Elsewhere in the government the composition and performance of review boards, to the limited extent that they can be appraised, have been spotty; and the trend seems to be to dispense with them.

3. The Commission claims to have exhibited restraint in requiring formal hearings prior to clearance. A hearing, though an important privilege for the employee, is nevertheless an ordeal. The Commission report attributes the low number of formal hearings to the

¹⁰ Atomic Energy Commission, Fourteenth Semiannual Report (Washington: Government Printing Office, July 1953), p. 71.

fact that informal interviews with the employee are extensively used, and often serve to "eliminate doubt."¹¹ Some security staffs avoid like the plague the one informant who knows most about the case—the employee himself. Others misuse the interview as a lever to force the employee to resign. The AEC approach is clearly superior.

4. On the asset side must also be put the recent abandonment of the routine use of the lie detector at the Oak Ridge production plants.¹²

LIABILITIES

1. The strongest criticism that is leveled at all federal loyalty and security programs, AEC's included, centers on their reliance on unidentified informants who cannot be examined before the hearing board. This routine denial of confrontation is itself justified on security grounds (undercover sources must be protected), and, less vigorously, on grounds of administrative convenience (the employee knows what he has done and said, so let him establish his trustworthiness). The difficulty and unfairness of making a man prove that he has *not* had subversive associations, when he is unable to challenge the informant who says that he has, are obvious. The convenience argument is in-

¹¹ AEC, *op. cit.*, p. 70. The statistical material which is presented to support the claim of relatively few formal hearings (there have been 287) is not exactly comparable with any other published figures. The report states that out of about 400,000 investigations, derogatory information has appeared in 4,000, mostly on applicants. "Slightly more than half" of these cases were not carried to a conclusion. This large proportion of unresolved cases may variously reflect (1) the unavailability of hearings for applicants before September 1950, (2) unwillingness of employees to wait for or to face a decision, (3) transfer by the employer to unrestricted work, or (4) circumvention of the review procedure by dismissals before adjudication.

¹² *Ibid.*, pp. 71-72.

defensible. In an activity that is a target for penetration by spies, there is some force to the security argument, but it is often overplayed.

However, the right to confrontation has no present effective official (or judicial) support in the case of government employees. The author believes that the legal case is stronger when government control of private employment is in question; there, questions of due process of law are still open.¹³ This approach might be pertinent for some contractor employees; it would depend on the gravity of excluding a man from access to restricted data. In the case of a casual construction worker, the denial of clearance might be of little import; in the case of a nuclear physicist, it could blight his career.

2. Another common failing of security programs is that they cast their net too wide. The strict statutory definition of "restricted data" is initially responsible for the unduly large number of employees who must be investigated and cleared. The Commission compounds this liability by intense physical security measures resulting in far-flung "exclusive areas" and the like. People working in these areas must also be cleared. As a result, scientists whose proposed research is entirely open and who are abstractedly incurious about official secrets may have to run the gantlet if they are to work at Brookhaven or Oak Ridge.

The statute is further at fault in requiring a full FBI investigation of all Commission employees and all contractor employees with access to restricted data. The result is expense and delay in having full field investigations, hearings, and so forth, for people who in fact learn nothing on their

¹³ See Brown and Fassett, "Security Tests for Maritime Workers: Due Process Under the Port Security Program," *Yale Law Journal*, Vol. 62 (July 1953), pp. 1191-1200.

job that "would be worth a glass of vodka in Moscow," as the respondent in one Army security case put it.

The Commission has been trying to get congressional permission to use its discretion and check names and fingerprints against security files without doing more. This reform would cut down the investigative burden for the Commission and for the 99 per cent of the applicants on whom there is nothing derogatory anyhow (in the security sense; routine name checks turn up a lot of other unemployables). It would make the mesh of the net a little coarser; but the cast would be as wide as ever.

Questionable decisions

3. One's acceptance of security programs as a necessity of the times needs to be jarred by the occasional reading of a transcript of a hearing. The author has had the privilege of examining two recent AEC cases. One was a young chemist who wanted the job; he was denied clearance. The other was an outstanding research man whom AEC wanted; he was finally granted clearance after appealing a denial to the review board; he then turned down the job. The two cases are much alike in their deplorable aspects, and have many parallels in other cases from other agencies; but it should be repeated that these aspects are reported from only two recent AEC cases.

Decisions in both cases were unduly delayed. The time span from the firm offer of the position to the final termination of the case was, in each instance, more than two years. In both of them many months passed between the initial hearing and the notification of denial.

Both cases involved courteous but extensive questioning about the applicants' private beliefs, both political and religious. The apparent intent was to

look for parallels to Communist lines. The result was a rather pointless and, one should suppose, painful probing.

Another touchstone for the board (and for the AEC counsel assisting the board) was epitomized by a ground on which denial of clearance was based in both cases: unwillingness to recognize Communism as subversive (or as a "threat to the security of the United States"). All that this means, in the author's opinion, is that the applicants did not exhibit the currently correct degree of anti-Communist fervor. Does this justify an inference that they are likely to become spies or traitors?

4. Just as a pathologist may come to believe that disease is everywhere, so security officers are prone to suspect Communists under every cabbage leaf. This excess of zeal leads to occasional absurdities—or outrages, depending on the observer's boiling point. On the evidence to date, the exclusion of a Member of Congress, R. L. Condon of California, from one of the Nevada weapons tests in May 1953 was inexcusable.¹⁴

5. There is one peculiarity in the AEC's relations with its contractors that it has never explained, satisfactorily or otherwise. The Congress of Industrial Organizations has complained of a practice of turning over to the contractor-employer investigative information that is unfavorable but not substantial enough to warrant further proceedings by the AEC.¹⁵ These are known in security jargon as "invite" cases, and the question inevitably arises, what is invited? Unceremonious dismissal by the employer? It appears that the Commission has restricted the freedom with which this information was formerly conveyed, but there is no indication

¹⁴ See *New York Herald-Tribune*, July 6, 1953, p. 1; *New York Times*, July 15, 1953, p. 13.

¹⁵ Newman, cited note 5 *supra*, p. 1385.

that it has either abandoned the practice or justified it.

ASSET OR LIABILITY?

The author is uncertain whether the Commission's security policies with respect to labor unions and their officials should be entered as an asset or a liability. The Commission has taken a stiff position that it has the power to forbid its contractors to bargain with unions it deems to be Communist-dominated (notably the United Electrical Workers, expelled from the CIO), and to investigate the loyalty of union officials who exercise any authority over employees working on restricted projects. In a legal challenge to the exclusion of UE from atomic energy installations, the Commission was upheld in 1949.¹⁶

General provisions from the Atomic Energy Act about the Commission's and its contractors' security obligations are adduced in support of these firm measures against left-wing unions. Doubts arise not so much about their legality as about their consistency with whatever national policy has developed on the touchy issue of left-wing unions. The AEC has rushed in where the Department of Defense and the Congress have feared to tread. There has been protracted agitation, but as yet no legislation to supplement the ineffective oath requirement of the Taft-Hartley Act. The AEC's actions may turn out to have been only premature, and not unwise.

STRIKING A BALANCE

The chief gain from the personnel security operations of the Commission is the absence, *as far as we yet know*, of any defections among its people. This

¹⁶ *United Electrical, Radio and Machine Workers of America v. Lilienthal*, 84 F. Supp. 640 (D. C. 1949); see Newman, *op. cit.*, pp. 1383-88.

means more than the keeping of "secrets." Confidence that every reasonable measure is being taken to ensure the integrity of the organization must also make for smoother operations. The Hiss case and, especially among scientists, the Fuchs case left their mark in a smear of mistrust. It is a pathetic commentary on our times that many of us need the tacit assurances of a vast security apparatus before we can wholly rely on the loyalty of fellow workers. These are unverifiable observations, but who will deny them?

The chief loss to the nation is the talents of those who were, but need not have been, excluded from the Commission's service, and of those who refuse to consider it because of the hazards and indignities of screening. In the long run, the greater loss may fall on the individuals who have willingly or unwillingly adjusted themselves to the standards of the security officer. To have to account for, to extenuate, to recant associations and sympathies that were in no way illegal is degrading; but that is what is required of those whose views have inclined toward the left of the political spectrum.

Is there any preferable alternative? The AEC is a high-priority target for espionage and sabotage.

You can have all the guards you like; you can put all the barriers around the plant that you like; but if the people involved in carrying out your programs are not loyal persons, you might as well not bother to put up the alarms, to put up the fences, and to hire the guards.¹⁷

Mere physical security is not enough.

The wartime program, while it was drastic in packing off those who talked

¹⁷ Tyrone Gillespie, chief security officer, Dow Chemical Co., "Security Maintenance in Industrial Enterprise," in Michigan Summer Institute, *Atomic Energy Industrial and Legal Problems*, Ann Arbor, 1952, p. 200.

to the wrong people, took successful chances on some leftist scientists who could not conceivably be cleared today. But they were totally unsympathetic to our then enemies, so the parallel fails. Besides, it is said that the Army kept such persons under surveillance. Being shadowed is not particularly preferable to passing a loyalty test.

In the search for alternatives, proposals have been made for more expert appraisals of the man, and for less burrowing into his politics in the 1930's. If the security judgment were absorbed into the general assessment of suitability for the job, then, it is argued, the stigma of a security denial would disappear.

Perhaps—doubtless—the tests could be improved. But the issue of past

politics and associations cannot be ignored, so long as it is recalled that Fuchs had been a Communist in Germany, and that the Pontecorvo family in Italy includes some Communists. And as for the formality and the finality of the present procedures, it should also be recalled that they were evolved to aid, not to oppress, radicals. They were required because when appraisals were informal the security issue was decided arbitrarily by the security officers. Because the omnipresent question of loyalty goes to a man's character and his future, because it is entangled with issues of free speech and free thought, it is of a different order from decisions on competence and personality. It cannot be decided by officials to whom security considerations are overwhelming.

Ralph S. Brown, Jr., LL.B., New Haven, Connecticut, is professor of law at Yale University. He is author of various articles in legal periodicals, and co-author, with Robert A. Dahl, of *Domestic Control of Atomic Energy* (1951). The present paper is part of a comprehensive survey of loyalty and security programs affecting employment, supported by the Louis S. Weiss Fund, Inc.

Some Attitudinal Consequences of Atomic Energy

By ELIZABETH DOUVAN and STEPHEN B. WITHEY

AN alert visitor to the United States might well arrive at the conclusion that atomic energy, in one form or another, is a primary focus of attention for members of our society. The broad area is accorded extensive coverage in our newspapers and magazines. Titles of public lectures, books, and articles on quite unrelated topics often include the phrase "in the atomic age." The inquisitive visitor would find frequent references to atomic energy in motion pictures, radio dramas, comic books, popular fiction, and a great number of other sources. He would have substantial evidence for his conclusion.

The social scientist might well draw a similar inference from these data. The mass media and channels of folk expression may be viewed as a screen on which public interests are projected, or as a set of stimuli almost continuously confronting the public. Either view would lead to the conclusion that the position of a subject in the mass media must be related in some meaningful way to the position it has in popular attitudes and thought.

Empirical studies of attitudes toward atomic energy reveal a different picture. In general, it may be concluded from these studies that this new phenomenon has strikingly little place in the conscious life of the American people. In contrast to the quantity and variety of consideration it has received in the mass media, the role of atomic energy in public opinion appears narrow and stereotyped.

EXTENT OF KNOWLEDGE

Consider first opinion regarding the atomic bomb and atomic warfare—the

most sensational and most publicized application of the broader discovery. Virtually every adult in the United States has heard of the atomic bomb. As far back as the time of the Bikini tests, less than 2 per cent of the population had not heard of it.¹ Such a finding is not commonplace. No other event in national or international affairs has registered so broadly in public awareness. "People who have never heard of the United Nations and have neither interest in nor knowledge of world affairs know that a new and tremendous force has been discovered."²

When we move beyond this minimum knowledge of the existence of the bomb to questions involving greater information, the number of informed respondents decreases substantially. In 1950³ and 1951⁴ approximately two out of three urban residents reported having read or heard something about the effects of atomic bombs "in the last year or so." About the same proportion had heard of "radioactivity or atomic rays or something like that in connection with the bomb."⁵ Since at the time of these studies there was considerable information available about radiation and

³ *Public Thinking about Atomic Warfare and Civil Defense* (Ann Arbor: Survey Research Center, University of Michigan, 1951), p. 130.

⁴ *The Public and Civil Defense* (Ann Arbor: Survey Research Center, University of Michigan, 1952), p. 61.

⁵ *Ibid.*, p. 65.

other bomb effects, we may assume that the fact that a third of the sample had heard nothing of them is a reflection of lack of interest rather than lack of opportunity to learn.

Level of information is another index of interest in a subject. It requires greater interest in a field to obtain adequate and accurate information than to be able merely to report having heard "something." Only one out of five urban dwellers has a realistic conception of the effects of an atomic bomb explosion.⁶ Half the population has conceptions which can be classified "exaggerated" or "highly exaggerated." Another fifth of the population will not venture a guess as to the effects. When asked what materials are used in making an atomic bomb, less than a third can give an even partially correct answer.⁷

EXPRESSED UNCONCERN

Since the atomic bomb is a threatening phenomenon and since the general tendency is to exaggerate its destructiveness, one might expect that people would be quite worried about it. The data available do not, however, bear out this expectation—at least if we consider conscious worry which people are willing to discuss.

In 1946 half of the American people said they were not worried about the atomic bomb. Only one out of every eight individuals spoke about deep personal concern.⁸ The atomic bomb cannot, of course, be viewed outside the context of international tensions, and it is true that in 1946 relations between the United States and the Soviet Union had only begun to deteriorate.

However, as late as the fall of 1950, when people were asked if there were

⁶ *Ibid.*, p. 62.

⁷ *Public Reaction to the Atomic Bomb*, *op. cit.* note 1 *supra*, p. 28.

⁸ *Ibid.*, p. 96.

anything in the national or international situations which worried or disturbed them, only 1 per cent spontaneously raised the issue of the atomic bomb, although a substantial group referred to the possibility of war as a source of concern to them.⁹ In 1952, when international tensions were extreme, 40 per cent of the employed people of Detroit said that they were not personally concerned, even though in this case the atomic bomb was placed in the context of war threat.¹⁰

Is this verbal nonchalance concerning the bomb the result of differentiated thinking about the problem and a conscious judgment that the situation does not demand worry? Do people hold optimistic attitudes about world affairs which would logically justify this lack of concern? Our data indicate that such is not the case.

BELIEF IN CONTROL OR MONOPOLY OF BOMB

For example, the American people are not very hopeful about the prospects for international control of atomic energy. In 1947 only 35 per cent considered the outlook even "fair," and less than one person in seven felt it was "good."¹¹

The idea of a permanent United States monopoly over the bomb—combined with a belief that here the bomb is in safe hands—does not prove to be a widely held source of optimism, either. As early as 1946, between one-fifth and one-quarter of the population felt that

⁹ *Public Thinking about Atomic Warfare*, *op. cit.* note 3 *supra*, p. 17.

¹⁰ *The Impact of Atomic Energy on Society*, Survey Research Center, University of Michigan, manuscript in preparation under sponsorship of the university's Phoenix Memorial Fund.

¹¹ National Opinion Research Center survey, reported in Gabriel Almond, *The American People and Foreign Policy* (New York: Harcourt, Brace and Co., 1950), p. 111.

some other country might already have the information necessary to build the bomb, and only 2 per cent held such ethnocentrically secure views about science as to state categorically that "no other nation will be able to make it."¹² There is no reason to believe that the experience of the last seven years—including the announcement of the Soviet Union's atomic tests—has increased the proportion of the population which relies on the notion of monopoly as a source of comfort in the face of the atomic bomb.

WAR EXPECTANCY

On the question of the American people's expectations of war or permanent peace, the results of opinion surveys are somewhat unclear. Shifts and incongruities appear in the data, which may be explainable on the basis of question wording changes—an important factor in areas where opinion is uncrystallized. However, relatively cautious generalizations may be made.

The fact that the American people want and hope for peace is reflected in a survey conducted at the time of the first Korean peace talks (August 1951). Despite the flow of warnings issued to prevent overoptimism concerning the truce talks, 56 per cent of the residents in major metropolitan areas reported that they felt more hopeful for peace at that time than they had prior to the opening of the talks.¹³ There is evidently a readiness to accept even small signs as a basis for hope.

However, the general level of war expectancy remains high. The percentage of people expecting war in the next ten years was very large (74 per cent) by March 1948, and had been steadily ris-

ing since March 1946.¹⁴ The proportion of urbanites expecting another world war in "the next year or two" was 51 per cent in 1950 and 32 per cent in 1951.¹⁵ Even when the time perspective is so short, there are fairly large groups who take the pessimistic view that a world war will occur. Optimism about peace cannot be the keystone for widespread unconcern about atomic warfare.

ADEQUACY OF DEFENSE

A more generally held support for such unconcern lies in the belief that the government has the ability to provide adequate protection against an atomic attack. In 1946, 40 per cent of the population expressed the opinion that the United States would work out a defense before other countries could make the bomb.¹⁶ Despite pessimistic official pronouncements on air defense potential, by 1950 about 50 per cent of the residents of major United States cities thought that the military establishments of our country would be able to provide "complete protection" or "prevent heavy damage" to our cities in the event of atomic war. This figure had increased to 68 per cent by the following year.¹⁷

In view of frequent warnings by authorities that defense would at best be partial and is at present almost nonexistent, this seems an unstable foundation for statements of lack of concern about the atomic bomb. And considering the population's own pessimism about international affairs, it seems safe to conclude that verbal statements of lack of worry do not reflect well-developed, highly differentiated thinking

¹⁴ Almond, *op. cit.* note 11 *supra*, p. 91.

¹³ *The Public and Civil Defense*, *op. cit.* note 4 *supra*, p. 9.

about the bomb. Little logical structure appears at the foundation of these statements.

ILLOGICAL AND UNSTABLE THINKING

An inspection of the reasons people offer for their indifference lends support to this conclusion. In an early study, less than one in five of the respondents who described themselves as "not worried very much" or "not worried" about the bomb gave reasons which implied that there was no danger in it for people in this country. "Half the people who say they are not worried indicate a recognition that the bomb is a threat—often that it is a very grave threat."¹⁸

In a more recent study in Detroit, less than 40 per cent of those who said that they felt no concern about the possibility of atomic war gave reasons which were logically consistent with a feeling of security.¹⁹

Lack of structure not only describes the attitudes of those who say they are not worried, but is a characteristic discernible throughout public opinion toward the bomb. A report of one national study cites the following examples:

A large group of people argued in the survey that the development of the bomb had made peace easier to keep rather than harder, because other countries were afraid of it and would not dare to provoke a war with us. Many of these same people, in answer to the direct question, declared freely that other countries would probably develop the bomb within a relatively short time. The information they had apparently absorbed had not shifted our monopoly of the bomb from the central position it occupied in their thinking.

¹⁸ *Public Reaction to the Atomic Bomb*, *op. cit.* note 1 *supra*, p. 99.

¹⁹ *The Impact of Atomic Energy on Society*, *op. cit.* note 10 *supra*.

Most of the people who opposed turning the secret over to the UN had expressed the opinion, just before, that other countries could develop the bomb fairly soon; yet many of them made no acknowledgment of the bearing of that probability on the question of UN control of the bomb.²⁰

There are individuals who think there is danger of American cities being subjected to atomic attack, who nevertheless say there is no need for civil defense preparations. On the other hand, there are many who do not admit such a possibility but feel rather urgently that preparations should be undertaken. Finally, there are those who think their city should take immediate preparatory steps toward caring for survivors of an atomic attack, despite the fact that they think a single atomic bomb would entirely obliterate that same city.²¹ In general, systematic and consistent attitudes toward the bomb have not been evolved.

Further evidence of the unstructured nature of popular thinking about the bomb can be cited. In many questions relating to the bomb we find large proportions of the population—in some cases a third or more—unable to state an opinion or venture a judgment. Only in the case of highly structured questions, where respondents are asked to select from among stated alternatives, is the proportion of "Don't know" responses consistently small.²² There are evidently people who have not thought enough about the topic to have opinions.

In addition to being unstructured, attitudes toward the bomb appear to be somewhat labile. Thus, the proportion of respondents expecting war within a two-year period decreased from 51 per

²⁰ Eberhart, *op. cit.* note 2, p. 148.

²¹ *Public Thinking about Atomic Warfare*, *op. cit.* note 3 *supra*, Chap. 5.

²² See, for example, the studies referred to in footnotes 3 and 4 above.

cent in 1950 to 33 per cent in 1951. The percentage who felt that the armed forces could at least prevent heavy damage to our cities in the event of atomic war increased from 48 per cent to 68 per cent in the same period.²³ Comparable fluctuations are discernible in many attitudes in this area.

The picture of public thinking about the atomic bomb is now relatively clear. We have seen that despite the magnitude of the destructive power represented by the bomb, and the unprecedented publicity it has received through the mass media, its importance is not reflected in the role it holds in the conscious life of the population. There is relatively little known about it outside of simple recognition of its existence and gross conceptions of its destructiveness. A large part of the public reports no psychological involvement in the issues of the bomb and atomic war. Moreover, people's attitudes are characterized by contradictions, lack of structure, and instability. The atomic bomb may be part of the raw material of popular fantasy, but it is not a substantial factor in the day-to-day interests and thinking of the general population.

ATTITUDES TOWARD PEACETIME USES

Before attempting to analyze the factors that account for this peculiar situation, let us look briefly at public opinion toward nondestructive aspects of atomic energy. Since the atomic bomb does not preoccupy people, we would expect the less publicized peaceful applications to play an even less significant role in public opinion. This is essentially what the available data reveal.

The study from which the following findings are drawn had as a major ob-

²³ *The Public and Civil Defense*, op. cit. note 4, p. 12.

jective the comparison of attitudes in atomic installation communities with those found in similar noninstallation communities. The nature of the sample required for this purpose limits even tentative generalizations to Americans living in small and middle-sized cities.²⁴

The attitudes of this group include a generally positive evaluation of atomic energy and a recognition of the potential importance it holds for peacetime living. There is, on the other hand, little evidence of strong interest in or information about the topic.

Nearly 60 per cent of the respondents in the study thought that "considering all its uses in peace and war" we would be better off for having discovered atomic energy. Many of the remaining 40 per cent were uncertain rather than negative in their evaluation of the discovery.²⁵ About 75 per cent of the group indicated that they considered atomic energy of *potential* importance, by their responses to the question: "How important do you think it will be for those young people (of high school age) to understand atomic energy?"²⁶

LACK OF INTEREST

Despite this gross recognition of the importance of atomic energy for the future, half of the respondents said that they felt indifferent toward atomic energy information when they came across it in their reading.²⁷ Only about 10 per cent reported discussing atomic energy with family or friends more than "once in a while." Half said they rarely or never did.²⁸ When asked whether there

²⁴ Burton R. Fisher, Charles A. Metzner, Benjamin J. Darsky, *Peacetime Uses of Atomic Energy*, Ann Arbor: Survey Research Center, University of Michigan, 1951, Vol. I.

²⁵ *Ibid.*, p. 87.

²⁶ *Ibid.*, p. 70.

²⁷ *Ibid.*, p. 86.

²⁸ *Ibid.*, p. 66.

was anything about the subject they wondered about (in addition to information they already had), about half of those questioned were "disinterested in further data about atomic energy."²⁹

This last fact gains significance when viewed in relation to the information level of this sample, for we find that the group had very little information about atomic energy. About two-thirds reported having heard of it in connection with something other than the bomb, but their knowledge was fragmentary. One person in five either "denied any impression that there were other uses than the bomb [or] did not report the vaguest concept of even general areas in which atomic energy could be used in peacetime."³⁰ In answer to a question on what atomic energy is or what it is like, about one person in fourteen was able to give an informed response. Almost half the respondents said simply that they did not know.³¹

In summarizing the section of their investigation dealing with information, the authors of this study concluded:

The field of atomic energy seemed to exist as bits of information, varying interests and reactions that related to one or another specific uses, problems, or policies. It clearly did not exist as a rather well-structured phenomenon that fitted within a relatively well-defined area of interest for the overwhelming number of . . . respondents.³²

A question was asked which combined elements of both interest and information: "Do you think that the average person can understand enough about atomic energy to make it worth while for him to read things about it?" About half of the respondents thought this amount of understanding was not within

²⁹ *Ibid.*, p. 69.

³⁰ *Ibid.*, p. 36.

³¹ *Ibid.*, p. 37.

³² *Ibid.*, p. 26.

reach of the average person.³³ Generally, people have meager knowledge of the development, and, in addition, many do not feel that rewards of increased understanding are available to the untrained individual. Under these circumstances it is not surprising that atomic energy, as such, is peripheral to the interests of many Americans.

Attitudes toward peaceful uses, like those relating to the bomb, are characterized by lack of structure and clarity. There is nothing in the picture of opinion toward this aspect of atomic energy to contradict our earlier conclusion that the development lacks salience for the population.

SPECIAL PUBLICS

This conclusion may be less applicable to certain special groups in the population. Attitudinal differences appear among the standard demographic groupings (education, age, sex, or income groups), but they are not unique to the area of atomic energy, and have therefore been excluded from this discussion. We have presented only a general picture of public opinion in the area.

Two populations which have somewhat special associations with atomic developments merit brief attention. The first comprises people living in cities near atomic installations. The study which compared this group to residents of matched noninstallation communities indicated that there were few, if any, differences between the two populations.³⁴ People living in installation areas showed no more fear or susceptibility to rumors than other people; they were neither more informed nor more interested in atomic energy. If anything, they had slightly less interest in the development. The authors of the study concluded that geographical prox-

³³ *Ibid.*, p. 97.

³⁴ *Ibid.*, p. 93.

imity did not ensure the psychological relevance of atomic energy.

A group for which we would expect atomic energy to have relevance consists of those people who work with it—particularly scientists. There is some indirect evidence concerning the effects of atomic energy on the attitudes of this group. For example, the fact that the *Bulletin of the Atomic Scientists* has assumed a political-social character seems to indicate that a change of attitude or a change in expression of attitudes has occurred among scientists.

There have, on the other hand, been very few systematic investigations of this group. A study by Kay and Gitlin⁵⁵ includes some attitudinal information on a group of scientific and executive personnel of a major atomic project. This group of respondents *thought* that their own views about atomic energy differed from those of the general population, and in cases where it was feasible to contrast their attitudes with those of a national sample, differences did appear. However, these results can only be considered suggestive, since methodological considerations prohibit their generalization.

REASONS FOR THE PARADOX

To return to the attitudes of the general public, we are still faced with the problem of understanding the following paradox: While atomic energy—particularly the atomic bomb—is of obvious significance for our society and has been broadly publicized, survey results reveal that the general population is uninformed and uninterested, and has no clearly structured system of thinking about it. In short, atomic energy does

not, to any great extent, absorb people's conscious day-to-day thoughts.

Fear suppression

A number of psychological explanations are possible. One hypothesis is that fear accounts for this attitudinal complex. If the individual knows of the bomb (as almost all people do), and is very fearful of it, one possible means of defense against this fear is to suppress or turn away from the dangerous topic. This, in turn, would lead to the kind of undifferentiated, contradictory thinking about the bomb which has been observed in public attitudes—both because suppressed fear is disruptive and because turning away from the issue cuts off information. Such a theory holds that verbal statements of lack of concern do not necessarily mean that the individual is in fact free of anxiety.

The theory of fear suppression has been considered by most researchers who have dealt with attitudes in this area. Almond says that "the typical attitude in the United States [about atomic policy], instead of sober calculation, ranges from ironic horror to simple evasion and escapism."⁵⁶ He gives primacy to the fear-suppression mechanism in his explanation of the primitive state of public opinion toward the bomb.

The evidence indicates that anxiety-motivated suppression is a factor in the attitudes of some individuals. One study demonstrated its existence by means of a projective device.⁵⁷ In interviews a few people state explicitly that they do not want to think about the atomic bomb because it is too terrible. More often we find people who say they are

⁵⁵ Almond, *op. cit.* note 11 *supra*, p. 15.

⁵⁷ W. A. Scott, S. B. Withey, and D. F. Miller, *Fear of War Catastrophe: A Projective Assessment by Interview Survey*, Ann Arbor: Survey Research Center, University of Michigan, 1953.

not concerned about the threat of atomic war but give reasons for this attitude which are highly fearful and fatalistic.⁵⁸ In these cases it seems likely that the verbalized indifference indicates a denial of fear, rather than its absence. A recent study has shown that such people are more likely to manifest gross thinking and uncrystallized attitudes about atomic developments than either those who admit their concern or those who have fairly consistent and rational attitudinal bases for their stated lack of concern.⁵⁹ Fear suppression seems to lead to some of the attitudinal characteristics which we have observed in public opinion.

On the other hand, if fear were the primary reaction of the population, we might expect wild rumors and bizarre ideas to spread easily. Although such ideas exist, successive studies have shown that they are *not* accepted to any great extent by the population.⁶⁰ While fear is one factor to be considered, it is probably not the sole determinant of popular attitudes toward atomic energy.

Impotence

A second factor which seems to diminish the role of atomic events in the conscious lives of people is a widely held feeling of lack of power or competence in such matters. One respondent in discussing this feeling said: "Why should I worry about the bomb. There's not a thing I can do about it except make myself sick. If there's a war or not, bombs or not, the people in Washington decide—not me."

This sense of impotence in the face

⁵⁸ *The Impact of Atomic Energy on Society*, *op. cit.* note 10 *supra*.

⁵⁹ *Ibid.*

⁶⁰ Fisher, Metzner, and Darsky, *op. cit.* note 24 *supra*, p. 58. See also the studies of civil defense referred to in footnotes 3 and 4 above.

of the bomb is probably closely related to fear, but has a significance of its own. It is not without a certain reality base. Atomic energy is a technical matter, and policy decisions regarding it have necessitated expert opinions. More and more such decisions are being made outside the open political arena. It is not surprising that many people feel they can have little or no influence on them. The feeling of impotence—especially combined with the impetus of fear—may easily lead to the person's turning away from the entire topic of atomic energy.

Ambiguity of stimulus

Another possible reason for uncrystallized public opinion is ambiguity in the stimulus itself. Atomic developments are a new class of phenomena. Most people do not understand them. Their irreality is intensified by the remoteness of their consequences. No one yet sees these consequences in his own life; his automobile is not run by atomic power, it has not changed his job, his diet, his house, or his recreation. Even the atomic bomb is remote—the references are to future wars and usually to bombing of distant places.

It is an adjustive aspect of man's psychological equipment that he holds his emotional energy and attention in store for those things which have clear relevance to his life. No normal person can maintain a continuously high level of tension concerning an event which may or may not occur. The obvious remoteness of atomic developments probably plays a part in flattening the public's response to them.

In addition to ambiguity of this kind, stimuli may lack clarity because of contradictory elements. In the case of atomic developments, conflicting authoritative statements have often been

⁵⁵ Lillian Wald Kay and Irving J. Gitlin, "Atomic Energy or the Atomic Bomb: A Problem in the Development of Morale and Opinion," *Journal of Social Psychology*, Vol. 29-30, 1949, pp. 57-84.

made. At one point leading scientists held that no defense against the bomb could be devised, but the military differed. Currently the military places little stock in defensive theories, but scientists are more encouraged. Announcements have been made of atomic explosions in the Union of Soviet Socialist Republics, but authorities have publicly doubted that the U.S.S.R. has the bomb. Predictions on peaceful applications have, if anything, been even less consistent. The reaction of the ordinary citizen may be: when the experts make up *their* minds about what this thing is and what it implies, I'll think about it and react. At the moment it's hard to know what to react to, much less how to react.

Relative importance of factors

It seems likely that all these factors and probably others operate to keep atomic energy at the periphery of people's lives. We can speculate about the relative importance each of them has in attitudes toward different aspects of the problem. It is probable that the fear-suppression hypothesis and the feeling of powerlessness are more applicable to attitudes toward the bomb, while ambiguity is more effective in attitudes toward peacetime uses.

The problem of underlying motivations in this area is at present only a field of speculation. The data are suggestive, but the task remaining is the systematic attempt to establish the motivations and gauge their relative weights in depressing the public's interest in and thought about atomic developments.

THE BROADER EFFECTS

Before closing this discussion, a final point seems appropriate. Any new pub-

lic event may have two levels of effect on people's attitudes. It elicits attitudes toward the specific event, which obviously could not have existed before the event occurred. Second, a new event may change or restructure old attitudes and feelings which were part of the individual's psychological structure before the event occurred. In this discussion we have considered only the former kind of effect—primarily because systematic data are available in this area. This does not imply that it is the most important attitudinal effect of atomic energy.

A number of interesting problems present themselves when we consider the broader effects that atomic energy may have on people's attitudes. One may ask, for example, whether this new discovery has caused an increase in the general level of anxiety in the population. Has the incidence of anxiety neurosis increased? Has people's time perspective changed because of the atomic bomb? Do people look less into the future, and with less optimism, than they did before "the atomic age"? Is the sense of personal powerlessness on the increase in our society?

In another area we may ask how this development has affected attitudes toward science and scientists. Have the scientists become the authoritative figures of our day? Do people feel conflictive about the productions of these men? What kind of behavior do they expect of them?

These are a few of the additional questions which need to be investigated before we are in a position to say what effects atomic energy has had on attitudes. At this stage we know that people are much less interested in and informed about atomic developments and are thinking much less actively about them than we might expect. We can theorize that this apparent indifference

masks fear, or that it stems from other factors in the present situation. The final statement of its meaning, as well as realistic appraisals of the broader effects of atomic energy on attitudes, must await further systematic investigation.

Elizabeth Douvan, Ph.D., Ann Arbor, Michigan, is a study director in the Public Affairs Program, Survey Research Center, University of Michigan. She has collaborated on several studies of public attitudes toward atomic developments and is one of the authors of The Impact of Atomic Energy on Society, to be published shortly by the Survey Research Center.

S. B. Withey, Ph.D., Ann Arbor, Michigan, is director of the Public Affairs Program of the Survey Research Center, University of Michigan. He serves on the executive committee of the Doctoral Program in Social Psychology and teaches survey research methods in the Psychology Department. He has served as research consultant on the combined agency project "East River," also to the National Research Council and the Division of Community Education in Puerto Rico. He is author of Attitudes Toward United States-Russian Relations (1948) and Big Business as the People See It (1951).

Scientists Before and After the Bomb

By R. L. MEIER and E. RABINOWITCH

THE Second World War and the atomic bomb have greatly changed the patterns of scientific activity, particularly in the United States. All scientists old enough to remember feel the difference in their bones; and many of them are not very happy about it.

Even before the war, the United States led the world in the output of scientific work, but it was generally acknowledged that the most original researches continued to come out of Europe. The migration of Jewish scholars from Europe tipped the scales.

This has meant more than a mere shift in the geographical distribution of scientists; the typical organizational forms and fundamental attitudes of scientists have been affected. In the past, these forms and attitudes have been a reflection of those long established in Europe, tempered by the lower prestige of scholarship and greater emphasis on practical achievement in America. Now, after the massive double infusion of European theoretical insights and vast American financial resources, science in the United States is largely on its own. It is setting the pace for the world and developing its own type of *homo scientificus*, formed by native ideas and domestic events.

When we compare science and scientists before and after the war, we are thus confronted with a twofold transformation—the change from the leisurely and innocent era “before the bomb” to the feverish and troubled times “after the bomb”; and the change from the deeply etched relief of European cultural tradition to rapidly shifting patterns of American life.

CHANGE IN DIMENSIONS

Easiest to assess is the growth of the profession. There are now 600,000 professional scientists and engineers in the United States, as contrasted with 375,000 before the war. Of these 375,000, approximately 8 per cent were chemists and approximately 1 per cent were physicists. These two groups—the physicists in particular—have been most strongly affected by the change, although a few other branches also have become deeply involved.

Before the war, physicists were mainly engaged in teaching and academic research, most of which had—or seemed to have—no practical implications. In the decade of the thirties, according to Hollis,¹ less than one-third of the new Ph.D.'s in physics took positions in government or industry; the other two-thirds stayed on as teachers in universities and colleges.

Today the several societies affiliated with the American Institute of Physics have 15,000 members, of whom 10,000 belong to the American Physical Society. In other words, the profession has four times its prewar contingent. Yet the number of those whose primary occupation is teaching physics has not increased significantly. The wartime and postwar graduates in physics went largely into research, and most of them carry on this research not in academic laboratories, but in the big installations of the Atomic Energy Commission, in sprawling military establishments such

¹E. V. Hollis, *Toward Improving Ph.D. Programs*, Washington: American Council of Education, 1945.

as the Naval Research Laboratory, and in rapidly expanding physical laboratories of private industry such as the Bell Telephone Laboratories. The three presently favored branches of experimental physics—nuclear physics, electronics, and solid state physics—all have great practical importance, and much research in these fields is applied research.²

The chemists had spilled over into industry and government even before the war. According to Hollis,³ in the thirties many more Ph.D. degrees were granted in chemistry than in any other field, not excluding education; fully two-thirds of these graduates cut off their ties with academic life upon graduation. In fact, so many Ph.D.'s entered the chemical industry in those years that chemists who had merely a bachelor's degree were often employed only as routine analysts; the wartime mobilization of the chemical industry was needed to move them into positions of professional responsibility. This must be the main reason why the growth of the American Chemical Society⁴ has outpaced the growth of the total number of graduates in the field (which can now be estimated at 90,000).

ECONOMIC STATUS

Expenditures for research and development by American industry, educational institutions, and the government passed the billion-dollar mark in 1943.⁵ In relatively slow-moving industries, up to 1 per cent of total sales may now be regularly allocated to research; in industries subject to rapid technological change, the allotment may be 3 or even

10 per cent. Other firms appropriate for research 10 to 20 per cent of their total expenditure for capital investments and replacements. About 2 to 3 per cent of the American military budget has been consistently earmarked for research and development since the end of the war. According to DuBridge,⁶ nonmilitary research expenditure increased from 1940 to 1952 by a factor of four; but military research and development—including the activities of the Atomic Energy Commission—have grown by a factor of forty!

It is now more difficult than ever to separate the grains of “research” from the matrix of “development” in which they are embedded. The National Science Foundation estimates, however, that as much as 40 per cent of the federal funds assigned to “research and development” are being spent for “applied and basic research.”⁷ Expenditures for basic research alone are estimated at 7 per cent of the total, or 140 million dollars per year; about one-half of this sum goes as research grants to universities and private nonprofit research institutions.

With so much more money devoted to research and development, and with the much-publicized scarcity of research personnel,⁸ it is striking to find how little scientists as an economic group have profited from the change. Before the war, new Ph.D. graduates in science received \$2,000 to \$3,500, with the academic salaries nearer the lower limit. At present, with the cost of living just

⁴The membership of the American Chemical Society grew from 25,000 to 62,000 in the forties, as compared with an increase by only 8,000 in the previous decade.

about doubled, beginning salaries in the science departments of universities are in the range of \$4,000 to \$5,000; in industry, \$6,000 to \$8,000. In other words, industrial scientists have kept only slightly ahead of inflation, while academic scientists have been left slightly behind. Scientists with several years' professional experience have fared even worse. Civil service and the academic promotion system hold their salary increases in check, despite active demand and short supply. Even corporations are developing bureaucratically organized research laboratories with rigid pay scales.

Physicists are the only group of scientists whose average real pay has increased considerably since before the war; and this is mainly due to the fact that many more of them are now employed by industrial organizations. On the whole, it may be said that the increase in prestige, power, and authority of scientists within academic, governmental, and industrial organizations has not resulted in a significant improvement of their real income. Those who control the salaries must feel that, for scientists, income is a lesser motivation than new equipment and plentiful technical help. In that, they are probably correct. At least, a recent survey of the chemical profession has elicited from a considerable majority the expression of satisfaction with their lot.⁸

SECURITY PRECAUTIONS

No report on today's status of scientists in America would be complete without mentioning loyalty checks and security investigations. These are the new "occupational hazards" which affect the enjoyment of a scientific career and the public standing of the profes-

sion. It has been said that the first two associations which the word "scientist" presently evokes in an average newspaper-reading American are "bomb" and "spy." All scientists in government employment have to undergo screening when applying for the job, and often again in the course of employment. The same is true of scientists in many industrial laboratories (firms often prefer to have "cleared" employees "just in case" a secret government contract should come their way), and of the many academic scientists who serve as consultants or visiting investigators in government laboratories.

Despite the safeguards which have been added to the clearance procedures, they remain vexatious and fraught with unpredictable losses of income and reputation. The initial wait for clearance may mean incomeless months and loss of other opportunities; a rejection is a stigma that is difficult to live down, and, at this stage, little if any chance of appeal is provided. Withdrawal of clearance from those already employed—often after years of satisfactory employment—is an even more traumatic experience, despite the possibility of appeal.

Every scientist who works or has friends working at government laboratories knows of cases in which clearance troubles have been caused by entirely inadequate—often outright ridiculous—reasons. After a year or two of worry, and several thousand dollars spent for counsel and witnesses, such cases usually end in reinstatement; but the expenses of the procedure are not reimbursable, and the moral scar may never heal.

When it comes to traveling abroad, scientists, particularly those cleared for secret work, are subject to a special investigation which may delay the issuance of a passport by weeks or months. The difficulties of foreign scientists

wanting to visit America are another and still sadder chapter.⁹

Whether aversion to this kind of supervision diverts some well-qualified young men—perhaps the ones with the most active minds—from scientific careers, or at least influences their choice of discipline in science, is a matter which deserves study by those concerned with the future of American science.

CHANGES IN ORGANIZATION

In the not very distant past, the ideal picture of a scientific organization was the classical one of the Greek academy—a teacher surrounded by pupils. The leading role in science was played by such "schools." In biology and psychology, different schools often disagreed in their basic beliefs and engaged in violent arguments. In physics and chemistry, where all theory has long since become subject to immediate and rigorous experimental test, such polemics disappeared around the turn of the century; instead, each group excelled in a special field. Scientists from all over the world came to the Cavendish Laboratory at Cambridge to work on electronic physics under J. J. Thompson, and, later, on nuclear physics under Sir Ernest Rutherford; theoretical physicists traveled to Niels Bohr's institute at Copenhagen. Other laboratories specialized in atomic spectra, proteins, hormones, yeasts, the pigments of flowers, and the like. Figuratively, at least, a young scientist "sat at the feet of his master," as Plato once sat at the feet of Socrates.

From the postwar crop of scientists, there have emerged few if any new great leaders. A typical picture of the science organization in the postwar era is that of a crowd of intelligent and competent young men assembled, not

around a master, but around a giant atom-smashing machine—a cyclotron, a betatron, or a cosmotron.

Scientific teams

Large scientific teams appeared in the field at about the same time as the large machines. In the past, most papers in scientific journals were signed by a single author, sometimes by two—usually a professor adding his name to the work performed by his student. Sometimes two scientists associated themselves as equals in a team which stayed together for a long time, like Hahn and Meitner in nuclear physics, or Wills-tätter and Stoll in organic chemistry. On the Manhattan Project, where speed of progress was the main consideration, research teams of five or ten were brought together, interchanged, and dissolved at a moment's notice. They often wondered how the authorship of this or that discovery, or the rights to this or that patent, would later by disentangled. This pattern has not ended with the war. Papers signed by half a dozen collaborators, none of them qualifying as the "senior author," have become common in scientific literature. The teams created nowadays often cut across the borders of individual disciplines; physiologists or psychologists are associated with physicists or chemists.¹⁰

Postwar research does not seem to have led to those brilliant insights that characterized the research of the preceding decades, but it would be rash to say that the present generation of scientists contains no one of the stature of Rutherford, Pasteur, Gauss, or Emil Fisher. The impression may be due in part to the fact that as soon as an interesting possibility opens up, there are

now numerous laboratories willing and able to investigate, whereas before the war there might have been only one or two. As a result, even a major breakthrough may be reported in fragments and small pieces that make the advance less impressive.

Furthermore, such flashes of genius as the gravitation principle of Newton, the periodic system of Mendeleev, the quantum principles of Planck and Bohr, or Einstein's relativity, which suddenly brought order and logic into what had appeared a hopelessly tangled congeries of facts, can come only after a preparatory period in which those facts are accumulated and many vain efforts made to sort them out. A sudden new understanding of the structure of the universe, of the nucleus of the atom, or of the nucleus of the cell, may come at any time; but so far the postwar era has been, above all, a time of rapid expansion of factual knowledge, and has led to more than its share of puzzling and contradictory results.

The meetings of the big professional societies—the American Physical Society, the American Chemical Society, the Federation of Biological Sciences, the American Association for the Advancement of Science—are like anthills to which thousands of ants each bring a pine needle or a small straw to throw on the heap. Every meeting seems to exceed the preceding one in the number of participants and the length of the list of "contributed talks," with the ten minutes allotted to each monitored by an electric clock and enforced by a stern chairman. Serious scientific discussion has become almost impossible at such meetings, where it flourished a decade or two ago. Special conferences, in which only a single topic is discussed by an invited group of scientists, have become the new fashion. Almost every week a conference of this type is being held on one of the American campuses,

or in a resort hotel out of season, in which twenty or fifty scientists interested in a special topic—adrenal hormones or nuclear resonance or smog control—come together to exchange ideas and keep abreast of developments in at least one small enclosure in the vast domain of science.

The research contract

One cannot leave the subject of organization without mentioning the research contract. This device was developed during the war by the Office of Scientific Research and Development. The research contract ties the unpredictable business of research to the regulated functioning of a bureaucracy. It specifies the problem area to be attacked and the amount of funds to be allocated over a period which is often set in advance. A liaison organization is created to supervise the contracts and keep the contractor organization informed regarding the progress of the research. Appraisal and review committees of respected scientists are set up in order to advise whether new proposals should be accepted and old ones extended.

This system has led to the programming of fundamental and applied research to a degree not foreseeable before the war; indirectly, but inevitably, it reduces the exploratory investigations, particularly in directions which are not in the spotlight at the moment. The research contract arrangement has become popular also with industry, municipal governments, and trade associations, as well as spreading throughout the federal government. A major problem in the organization of science at the moment is to establish new forms of contracts and liaison arrangements which would restore to science some of the flexibility and spontaneity that has been lost in recent years.

Camouflaged support

Another sensitive point that makes many scientists uneasy is the "wrong flag" under which much research in the United States is now forced to sail. It was an old story in industrial laboratories that fundamental research projects had to be sold to unsympathetic directors or stockholders as promising direct contributions to the profits of the company. The same phenomenon has spread since the war into much of the government-financed research. A large proportion of fundamental scientific research (in some branches, such as nuclear physics, almost all of it) is financed, directly or through contracts, by the armed services—the Office of Naval Research, the Air Force, and smaller branches of the military.

When this type of sponsorship developed immediately after the war it was considered as temporary, to be soon relieved by the creation of a civilian authority with the express purpose of supporting the national research effort in the basic sciences. (With the advent of the age of cosmotrons and electric brains, the support that universities can give to research has become hopelessly inadequate.) However, even since the birth of the National Science Foundation, after several congressional miscarriages, its appropriations (\$3.5 million in 1952, \$4.75 million in 1953) have been so small that there can be no question of a substantial relief for the military agencies, whose research expenditure is of the order of \$100 million per year.

The services are too realistic to ask the research they support to masquerade as military research; they have sound understanding of the long-range importance of healthy basic science for national strength—military as well as economic and intellectual; but when Congress appropriates large sums for these

military agencies and doles it out to the National Science Foundation, it does so in the satisfaction that it supports "militarily important" research.

The situation is as unhealthy as if the states and municipalities failed to provide funds for the maintenance of public schools, and the military "jumped in," in the recognition that a literate and educated population was important for the quality of future draftees. That the situation is also precarious is illustrated by the recent pronouncement of the Secretary of Defense, that "pure science" should not be the concern of the military, but should look for support outside the Pentagon.

Another example of the same unhealthy situation is that much of basic research in biology is supported in America by funds earmarked for "research on cancer" or "heart disease." Again, it is true that in the long run, any progress in the understanding of life phenomena may contribute to the solution of the cancer problem or to relief of arteriosclerosis; but it is a sign of immaturity of those who hold the purse strings that they cannot be made to support fundamental biological research without a pretense of direct medical benefits.

CHANGE IN ATTITUDES

The psychological outlook of scientists, their attitudes toward their profession and the world, are changing even faster than their economic and social status. Not so long ago, theirs was a small, dedicated group, keeping rather aloof from the rest of the world in what were referred to as "ivory towers" but were more often grimy basement laboratories. They lived in intense communion with their colleagues all over the world—an international fraternity which even wars and revolutions could not altogether disrupt.

The present generation of American

scientists is the first one without first-hand experience of this community. On the other hand, this new and more numerous American-born and American-bred generation shifts much more freely between laboratories and industrial plants, universities and government offices, than was customary of old, and shares much more fully in the affairs and attitudes of the people at large. Some of them, who grew up with the atomic spy scares, restrictions on scientific publication, and curtailed international exchange, may find it easy to look at scientists in other countries as competitors, if not enemies. Scientists of the previous generation (and many of the younger one, since it takes more than one generation to interrupt a tradition!) will never be able to do so. For them, the ideal of the "open world" of science, eloquently restated in 1950 by the great Danish physicist, Niels Bohr,¹¹ remains valid—even if they recognize how incongruous it appears in the age of iron (and paper) curtains.

Scientists of the prewar era did not doubt the fundamental worth and virtue of their avocation. Probing into the mysteries of nature was for them a sublime intellectual adventure, in which there could be no evil. Science at its purest was a disinterested search for truth, and had no relation to daily human affairs; but whatever practical results could emerge from it in the long run were bound to make man wiser and better, and to improve his fate. The short path from the discovery of nuclear fission to Hiroshima has shattered their feeling of remoteness of science from the folly of man's pursuit of power over man, and from the crime of nations warring on nations.

Technology never was so remote from the evils of society as science. Engi-

¹¹ Niels Bohr, "For an Open World," *Bulletin of the Atomic Scientists*, Vol. VI (July 1950), pp. 213-17, 219.

neers have traditionally built weapons for war. However, in the United States military engineering was so insignificant compared to the technology directed toward the increasing of human welfare that in the past its existence could not affect the American engineer's firm belief in his constructive mission. If science was all goodness, technology was all progress.

This age of innocence is past. Not that the majority of scientists have uneasy consciences because they developed the atomic bomb or prepared for bacteriological warfare. A few may have such sense of personal guilt; but the majority believe that they had no choice—in the same way as a soldier has no choice on the battlefield, or a workman no choice in a war factory. The uneasiness experienced by many of them is born out of loss of belief in the unquestioned moral goodness of their pursuit—at least in the framework of the present-day political organization of the world. Since the atomic bomb, science is no longer pure intellectual enjoyment, from which nothing but good can arise for mankind; it is also playing with hell-fire.

Political activities

Immediately after the end of the war, in 1945, the potentially disastrous implications of modern science for a society to which peace had never been but an interval between two wars, became the obsession of many scientists. It led to their sudden entry into politics. They successfully agitated for the transfer of atomic energy development in America from the military to a civilian authority. They were instrumental in formulating the program of international control of atomic energy and making this program the official aim of American foreign policy. They established the Federation of American Scientists (FAS), with headquarters in

Washington and chapters in many centers of scientific research, to give organizational form to their concern with the use (or misuse) of science by nations. They founded the *Bulletin of the Atomic Scientists*—a monthly magazine dedicated to science and public affairs, now in its ninth year of publication.

In 1945, activities on behalf of civilian control of atomic energy in the United States, and its international control in the world claimed the support of a vast majority of American scientists. The news of these activities, carried to Europe, created a considerable impression among scientists there; an Atomic Scientists' Association was founded in England. However, the traditional European detachment of academic life from political power made it even more difficult (and less congenial) for scientists in Europe to seek and acquire influence on national policies than proved to be the case in America.

Fear of atomic war

Since 1948, disappointment in the outcome of United Nations negotiations, and the general trend of domestic and international affairs, have dampened the enthusiasm, and cynicism and confusion have taken hold of many American scientists. Many try to keep the tormenting picture of a future atomic war out of their consciousness, believing that there is nothing they can do about it. The pressure of security regulations and loyalty checks, and the—sometimes imagined but often real—threat to professional status arising from any public activity, favor this trend. The inducement of secure and relatively well-paid positions, with opportunity and plentiful funds for successful research, helps to encourage scientists to forget the potentially disastrous implications of their work, and to think only of professional

achievement and the incomparable satisfaction of discovery.

A minority, however, are unable to take their minds off the terrifying picture of an impending scientific war. A small group, imitating the example of conscientious objectors, found solution in a refusal to undertake any research having military implications. They banded together in a Society for Social Responsibility in Science, centered around the Quaker-sponsored college at Haverford.

A larger and undoubtedly more representative group follows the Federation of American Scientists, which has emerged from the crisis as an impetuous but stubborn and enthusiastic organization with over a thousand members all over the country. The practical work of this organization is now concerned mostly with analyzing and trying to influence government policies in scientific matters, such as security procedures, National Science Foundation, and so forth. The real *raison d'être* of the organization lies, however, not in these vital but transitory issues, but in the concern of its membership with the terrifying possibility that science may become the gravedigger of Western civilization, if not of mankind itself.

The *Bulletin* attempts to educate its 14,000 readers, in fifty-six countries, in the realities of the "atomic age." A small number of prominent scientists who have emerged from the war as top government advisers on matters of scientific strategy use their position to attempt a similar education on a different level. Their primary assignment is to keep America's lead in the perfection of scientific weapons; but in doing so, they can try to impress the political leadership with the inevitability of other nations' acquiring the same or similar devices and with the madness of the mutual holocaust of a war fought with them. There is, unfortunately, more

concrete evidence of their success in the first than in the second endeavor.

THE PRESENT PICTURE

This, then, is the American scientific scene ten years after the chain reaction that led to the atomic bomb: a greatly expanded army of scientists, with vastly increased funds for research but with little improvement in their own economic status; enjoying new respect in society and new influence in academic and industrial organizations and yet looked upon askance as a group of doubtful loyalty and an almost demonic capacity for evil; consulted by the Executive and rubbing shoulders with the legislature, but frustrated in at-

tempts to make the national leadership fully understand the nature of science and its fearsome implications.

In the face of this contradictory picture, the majority of scientists, particularly of the younger generation, tend to seek refuge in apolitical professionalism; while a minority remain intensely concerned with the way in which the "age of science" dawns upon mankind. They are depressed by their incapacity to make the world understand that eager acceptance of new scientific gadgetry for war and peace without the acceptance of a new rational code of political behavior is a path to disaster. They feel restless, frustrated, and apprehensive.

Richard L. Meier, Chicago, Illinois, is assistant professor in the Program of Education and Research in Planning at the University of Chicago. He worked for six years as a chemist in industrial laboratories in this country and Great Britain before moving into social science. He was executive secretary of the Federation of American Scientists from 1947 to 1949, and he has written articles analyzing the economics and sociology of scientific research.

Eugene Rabinowitch, Ph.D. (University of Berlin), Champaign, Illinois, is a physical chemist and is research professor of botany at the University of Illinois. His main interests are photochemistry and photosynthesis, and photosynthesis is a problem of plant physiology as well as of physics and chemistry. He is editor of the Bulletin of the Atomic Scientists, of which he was co-founder in 1945. He was senior chemist with the Manhattan Project during World War II.

Human Values in the Atomic Age

By WAYNE A. R. LEYS

THE fear of the bomb is not the beginning of wisdom. Fearful men have a kind of foresight, but in their partial view of the future all signs point to a foregone conclusion. How else could the frightening consequences of nuclear fission justify both McCarthyism and pacifism? McCarthyites, thinking only of alien threats, discover in the bomb a reason for aerial Maginot lines and subterranean loyalty investigations. Pacifists, horror-stricken by the worst conceivable results of war, find in the bomb a reason for wishfully accepting the imaginary benefits of an unborn social order.

The contributors to this volume are striving for a balanced interpretation of atomic energy, an evaluation of probabilities not dictated by the strength of passing emotions. Presumably, a clear-headed view of the facts should help men to make policy decisions with due regard for all legitimate human interests and not merely for the calming of fears. An impartial weighing of predicted consequences should do justice to the very fears that make emotional "isms" attractive, but not at the expense of other values.

Unfortunately, fact-oriented policy deliberations sometimes fail to reckon with the values that people find in highly charged ideologies. Fact-oriented studies are, in many instances, tentative, piecemeal, and bewilderingly complex. They may offer no immediate satisfaction to persons who crave peace of mind, a sense of direction, and a sense of importance.

The strength of all-or-nothing ideologies lies in their response to the exasper-

ating tensions that accompany the development of a world-wide economy and a new political process. The Communist and the emotional anti-Communist both yearn for a final showdown; they want to get it over. The pacifist wants to have nothing on his conscience. None of these people can tolerate unfinished moral business.

In estimating the ultimate impact of atomic energy on the ends of life, are fact-oriented policy thinkers missing something? Is there something of worth in the extremists' demands for finality, for emotional security and morale? Are the military repercussions of the A-bomb and the industrial uses of energy properly evaluated by a cold calculation of public benefits?

I do not question the desirability of prediction and farsighted planning, but perhaps not all the planning should be at the public level. It may be that public policy-making can succeed only if we recognize a disparity between public good and private good. A review of public policy deliberations will show, I believe, that subjective and emotional adjustments are required by the very attempts to solve the military and industrial problems of atomic energy.

MILITARY PROBLEMS

Immediately after the announcement of August 6, 1945, there was a great deal of utilitarian probing into the military consequences of A-bombs. The concern with future consequences ran through the report of the Secretary of State's Committee, the Acheson-Lilienthal report, the work of the United Na-

tions Technical Committee,¹ and many issues of the *Bulletin of the Atomic Scientists*. Most of the forecasters came to the conclusion that scientific knowledge could not be monopolized, that several nations might be expected to manufacture the new bombs, that within a few years no nation would be able to defend itself against attack, and that atomic war would be catastrophic.

Such predictions led to proposals for the international control of fissionable materials and their manufacture. The Secretary of State's Committee recognized doubts about the acceptability of an international control agency, but concluded: "... one should ask oneself 'What are the alternatives?'—We have, and we find no tolerable answer."²

Four wars and seven years ago that was the way things looked to the official thinkers. The eventual alternatives may not have changed in the meantime, but is the alternative with the horrible consequences still intolerable? Any hope of speedy action to prevent an atomic armaments race has now been dashed. Within a year or two after Hiroshima it was evident that the Soviet Government would not consent to international inspection and effective control. More ominous were the signs of a policy of relentless aggression.

If the Soviet Union had not blasted the hope of international control, American politics would have offered a major obstacle. There has been a reversion to nationalism. The constitutional amendment recently proposed by Senator Bricker represents only the extreme form of this reversion. Sentiment seems to have been swinging away from ex-

ecutive agreements in the international field. If every faltering step toward international control must have the two-thirds vote of the Senate, it should be recalled that Senators representing 92 per cent of our population do not constitute two-thirds of the Senate.

The first major recommendation of atomic scientists and policy thinkers appears to have been a "political impossibility." Yet, no problem is solved by calling the future "intolerable." If intolerability is meant seriously, we might all embark on a revolutionary course of action, waging ruthless class war as the Communists and the emotional anti-Communists do.

The class warfare ideologies are not the only possible reactions to "intolerable" situations. Several systems of ethics have grappled with the predicament of individuals whose power is exceeded by the power of society. Two of these systems—stoicism and pragmatism—seem to me to merit the consideration of men who cannot persuade their governments to adopt their plans for preventing atomic warfare.

THE STOIC VIEW

Stoicism is, of course, preatomic. It flourished in the Augustan age; but it is well to recall that the Augustan age was a time when conscientious men were experiencing uncertainty and defeat. Their dilemmas were probably as distasteful as the situation that confronts men who believe in the international control of uranium and plutonium. Seemingly ruinous policies were being adopted in spite of the Roman Stoic's warnings. As a Stoic, he did not follow the Epicurean to a suburban retreat. Instead of that, he asked, "What is within my power and what is not within my power?"³ This question led him to

¹ The Scientific and Technical Committee, created by the United Nations Atomic Energy Commission in 1946.

² *A Report on the International Control of Atomic Energy* (Washington: Government Printing Office, March 16, 1946), p. 31.

³ The *Discourses* of Epictetus are timely reading for public officials, industrial executives, and labor leaders.

admit that he was only a small factor in the universe; he was a small factor in the Roman Empire. Although he could not be sure of success in any political controversy, it was within his power to try to do his duty. This virtuous intention would preserve his self-respect, and the achievement of a sense of integrity therefore was his proper objective. In a word, the Stoic found it necessary to distinguish between his personal goals and the goals of government.

Today the man who understands the need for atomic defense measures, as well as the man who believes in the demilitarization of atomic energy, is in the Stoic's predicament. He is not omnipotent. He may even concede that he is not omniscient. If he tries to do what he believes to be right, he is outvoted and outmaneuvered. He may be committing political suicide. But if he asks what is within his power, he may find something to live for, in spite of the fact that his proposals in behalf of the public good are laughed out of Congress.

THE PRAGMATIC VIEW

Pragmatic philosophers also recognize the difference between the power of individuals and the power of governments. Pragmatism is opposed to the stoic view in many respects, but the two philosophies deal with the same problem. The pragmatist asks, "What is the problem? What is *my* problem? How is thought about atomic energy related to my own activity?" While the pragmatist usually believes that public events are influenced by individual effort, he never confuses himself with the whole of society. He does not think it intelligent to try to solve problems-in-general. Public actions are joint products, and the individual's part in public action is always contributory. If idealistic programs are

not related to the limitations of the individual's actual situation, the ideals will turn out to be irresponsible talk.

When pragmatic criticism is applied to statements about the control of atomic energy, we find that many of the most sweeping assertions are made in an action vacuum. Take, for example, the first comment on atomic energy occurring in the publications of a study committee of the National Council of Churches. On page 62 of the second volume the reader is suddenly told by an economist that "... as gunpowder finally made the city-state impossible, so airplanes and atom bombs have probably made the nation-state impossible because indefensible."⁴

The interesting circumstance is that this assertion is not preceded nor is it followed by a review of the economist's special relation to atomic energy. In Volume I fifteen contributors outlined their investigation of the "values that are promoted (or not promoted) by our complex economy." They talked about capital accumulation, national defense, Communism, centralized government, nationalism, power, and economic progress. But they did not mention atomic energy in Volume I. The sudden questioning of fundamental loyalties on page 62 of Volume II, therefore, is one of those fitful deliberations in which discussion suddenly turns from subjects that economists are in the habit of discussing to atomic energy in general. Atomic energy is not approached from the economist's point of view as bearing upon the actions that the economist is actually influencing.

The difficulty is not peculiar to the authors referred to above. If you look at the index of the latest books on public policy, there is only a fair chance that you will find "Atomic Energy"

⁴ *The Organizational Revolution*, by Kenneth E. Boulding (New York: Harper & Bros., 1953), p. 62.

among the topics. When you do find the subject listed, it is the exceptional author who relates it to the main argument of his book.

An increase in available power (controlled energies) may not increase the political power of most human beings. It may actually decrease their power as leaders and as citizens. Even though, in one sense, there are now more means available for the achievement of some public ends, political action becomes more complicated. Hard-working leaders have to wait longer to see their efforts rewarded. Their contributions may be scarcely recognizable in the results finally obtained.

Anyone who tries to demilitarize atomic energy will experience the kind of frustrations that send the McCarthyites and the Communists off into a rage. The stoics and the pragmatists, in their differing ways, have thought about these frustrations. They acknowledge the difference between the power of individuals and the power of states, and they offer alternative ways of finding personal goals that are sufficiently independent of the success of public goals to make work in an unpopular cause tolerable.

INDUSTRIAL PROBLEMS

The industrial application of nuclear science also presents value problems that do not readily suit the planning frame of mind. The planning frame of mind is impatient with any sentiment that delays the setting of goals and the matter-of-fact determination of efficient methods for reaching those goals.

The goal-and-efficiency type of policy thinking is illustrated by the Iowa Plan for Atomic Energy Education. Between 1950 and 1952 the Iowa State Department of Public Instruction issued five study guides for use at every level from the elementary school to the adult

forum.⁵ The authors did a pioneering piece of work in making a lot of new knowledge understandable. They tried to satisfy the prescription which they quoted from David Lilienthal: "The discovery of the release of nuclear energy is so important, so fundamental, that the country will be wary of those who seek to treat it as just another weapon, just another invention."

In spite of this admonition, the Iowa planners focus attention upon atomic energy as a means of achieving ends to which Iowa educators were committed in the preatomic age: the increase of agricultural production, the control of disease, and the national defense.

However commendable the courageous Iowa enterprise, it is doubtful whether productivity, health, and national security are the uses which many persons really want to make of atomic energy. It is doubtful whether efficient planning for these purposes will satisfy the politically active citizenry.

The intrusion of unstated goals into legislative deliberations has occurred under the guise of appeals to traditional liberties and precedents. Thus, the debate over the Atomic Energy Act of July 30, 1946 has been carried on by spokesmen for the traditional supremacy of civilians in government and by spokesmen for the traditional freedom of private enterprise. Scientists have complained about restrictions on their time-honored freedom to publish and exchange information. Labor has worried over limitations placed on collective bargaining in atomic energy installa-

⁵ The titles are *The Iowa Plan for Atomic Energy Education; Preparing Elementary Pupils for the Era of Atomic Energy; The Atom and You: A Unit for Secondary Schools; Iowa Citizens Investigate the Atom; and Scientific and Social Aspects of Atom Energy: A Source Book for General Use in Colleges*. Published by the State of Iowa and issued by the Department of Public Instruction, Des Moines, Iowa.

tions. The champions of civil liberties have objected to loyalty investigations and the introduction of political tests of the right to work. Others have viewed with alarm the absence of the traditional practices of home ownership and local self-government in Oak Ridge, Richland, and Los Alamos. The residents of Ellenton, South Carolina, protested the decision to take a quarter of a million acres in their neighborhood for an Atomic Energy Commission project, and sympathetic reporters played up the action as "unprecedented." There has been growing objection to the appropriation of public funds without public hearings, in view of the congressional tradition of requiring administrators to justify the number of paper cups requisitioned for use at office drinking fountains.⁶

CONFLICTING INTERESTS

When the phrase "military necessity" loses its magic, the discordant opinions may be expected to become even more conspicuous than they have been during the last eight years. If, in an abstract way, people are generally agreed on the desirability of increased economic production, they are not agreed on the division of costs and gains, nor are they agreed on the extent to which traditional privileges shall be sacrificed for the sake of progress.

The conflicting interests of the whole world are involved in the politics of atomic energy. Nehru told the Pan-

⁶ Most of these controversies are well known. The following references may be useful for two of the less familiar debates: Donald B. Straus, *The Development of a Policy for Industrial Peace in Atomic Energy*, Planning Pamphlet No. 71, National Planning Association, July 1950; Lyman S. Moore, "Democratic Local Government in AEC Communities," *Bulletin of the Atomic Scientists*, January 1951, pp. 19-22. Also, "Report on Operation of Atomic Energy Commission Towns," prepared for the Atomic Energy Commission, April 20, 1948.

Asian Conference in March 1947 that Asia would play her part in the atomic age, not as a pawn but as a partner. "Peace," he said, "can only come when nations are free and also when human beings everywhere have freedom and security and opportunity." But freedom means votes and vetoes, not only by progressive leaders but also by those "who, if they have eyes left to weep with, spend sleepless nights in cursing God because he has allowed these civilizers to get into their land."⁷

The release of atomic energy seems to foreshadow more conflict rather than less conflict. Increases in productive capacity multiply the possibilities of mutual interference, particularly in the case of hitherto subject or silent peoples. The diffusion of knowledge means that more diverse demands are articulated and become the source of political pressuring. It is not only vested interests that get in the way of economic progress; it is also parochial versions of universal good that men will fight for. Mankind seems to be afflicted with small ideals at the very moment when the means for great achievement are available. It is the old story of the ditch-digger who won the Irish sweepstakes; his first thought on learning of his good fortune was that he should buy a new pick and shovel.

Pacifists cannot believe that the collective intelligence of humanity will always sacrifice great common benefits for little, local privileges and slogans. Pacifists call for an act of faith to give direction to the universal longing for peace.

The plausibility of pacifism has been attacked by a long line of "realists" who have doubted the strength of peace-loving motives. The doubters began with an attack on the most famous organic political philosophy, Platonism.

⁷ Radhakrishnan's description, a generation ago, of the attitude of some men of the East.

They observed that Plato was bothered by the inconsistency of human purposes and that he proposed the pursuit of the common good. But the critics also observed that Plato was not averse to a centralized management of every citizen's private life—a high price for harmony. The critics also recall that, since Plato's time, there have been other idealistic philosophies whose practical followers have sometimes resorted to dictatorship.⁸

TWO KINDS OF PEACE

The impracticability of plausible political idealisms may be explained by the confusion of two kinds of peace—political peace and peace of mind. Plato related "harmony in the state" to "harmony in the soul." He insisted that there was a necessary connection between these two kinds of peace. Contemporary pacifists make the same assumption. They confuse the universal desire for peace of mind with devotion to political peace.

The more we learn about political peace, the less is it identifiable with peace of mind. The causes of industrial peace, for example, are not the disappearance of disquieting antagonisms. Industrial peace comes when antagonisms are channeled into the political processes of negotiation.⁹ Although exhausting and disgusting, the raucous bargaining of managers and union men is what informed people mean by industrial peace. Wherever there is no challenging and no denouncing, one finds the dictatorship of one party and, quite

⁸ A helpful review of the organic philosophies and the philosophies of political realism will be found in an essay on "Political Morality" by Herbert Schneider in *American Philosophy Today and Tomorrow* (H. M. Kallen and Sidney Hook, editors), New York: Lee Furman, Inc., 1935.

⁹ See pamphlet series, "The Causes of Industrial Peace," National Planning Association, 1948—

possibly, the seeds of violent revolution

International peace, likewise, does not descend upon the earth as an era of good feeling. International peace is time when resentments are being talked out and decisions go to those who argue loudly (but not to those who "argue best in platoons"). In a world of human diversity and ingenuity, peace is not conducive to peace of mind. Peace means noisy debate. Peace means uncertainty and many of the irritations that we associate with the "cold war."

The impact of atomic energy, like the impact of other life-complicating inventions, is widening the gap between public necessities and personal satisfactions. To secure the benefits of atomic energy without a massacre, we must maintain political processes that are unpleasant and nerve-racking.

We must be reminded of engineering installations so vast and so intricate that, in addition to the engineering there is a personnel problem. The engineers become exhausted and have to be pulled off the job; or they quarrel and cannot co-operate. The existing blueprints for the atomic age specify technical tasks under such difficult conditions that morale and sanity are imperiled.

The plain fact of the matter is that very few human beings are willing to accept the rigors of peaceful negotiation. They do not have the patience to do so. They do not know how to find the tolerable minimum of personal satisfaction in strenuous, unisolated life.

It seems that political peace (a public condition) is very different from peace of mind (a private possession).¹

¹⁰ In one way or another many recent philosophers have given up the quest for a panacea that will provide both political peace and peace of mind. See Paul Arthur Schlipf (Ed.), *The Philosophy of George Santayana* (Evanston, Ill.: Northwestern University, 1940), pp. 3-30, 560-73; T. V. Smith, *Atomic Power and Moral Faith*, Claremont, Calif.

Political peace is a matter of agreements and acquiescences in public measures. Peace of mind may be fostered by public measures, but only indirectly and—to a large extent—by measures that are different from those that mediate the great social conflicts.

Two inferences may be drawn from the ambiguity of "peace." The first inference is that the weaker interest, the desire for political peace, needs education. The release of atomic energy is completing the destruction of the isolation of human communities. It probably means more gigantic human organizations. It creates industries that affect the public interest not only in a national sense but in an international sense. Education for the politics of such a society must build an appreciation of negotiations that resolve conflicts, no matter how annoying and personally offensive the in-fighting.

The second inference is that the stronger interest, the desire for peace of mind, must find more satisfaction in private pursuits. Peace of mind may be fostered by improvements in education and recreation, by the encouragement of the fine arts, by the betterment of local communities, by movements that secure a wider distribution of deference. Morale may also be preserved by making provision for periodic relief from arduous political duty. Whereas public agencies must never relax, officials need week-ends, vacations, and

Claremont Colleges, 1946; Richard McKeon, "The Philosophic Bases and Material Circumstances of the Rights of Man," *Ethics*, Vol. LVIII (April 1948), p. 183; John Dewey, *The Quest for Certainty*, New York: Minton, Balch & Co., 1929; Karl R. Popper, *The Open Society and Its Enemies*, Princeton: Princeton University Press, 1950; Georg Simmel, "Der Streit," in *Sociologie*, Leipzig, 1908.

Wayne A. R. Leys, Ph.D., Chicago, Illinois, is vice president and dean of faculties of Roosevelt College of Chicago. During 1948-49 he was a member of the National Board of Officers of the American Philosophical Association. He is author of *Ethics for Policy Decisions* (1952).

times out of office. Whereas the price of good government is eternal vigilance by an organized citizenry, one requirement for good citizenship is the emotional balance that comes to the person who can get a good night's sleep.¹¹

CONCLUSION

Knowledge is power; but the more men know about the atom, the more they need to know about themselves. Our heavy investments in the release of atomic energy could have the effect of stampeding us into some single-minded folly of avarice, hatred, or fear. I have tried to show how the sense of personal responsibility cannot be fulfilled without some appreciation of the limitations of the power of individuals. I have also indicated how citizens may be victimized if they insist upon finding peace of mind in public action. The contrast between public values and personal values has been heightened. A half-educated and overpropagandized world needs an enrichment of private life as well as an appreciation of politics (which has little intrinsic value but is necessary to secure the public good). Knowledge becomes wisdom when coupled with respect for the plurality of values. Then, no objective can be worshipped so idolatrously that it will seem to justify the sacrifice of all other human purposes.

¹¹ The reference to sleep is illustrative only. The limitations of space do not permit a comparison of escapist and nonescapist private activities. I would not want any reader to interpret my statement as placing equal value on all private activities. I do not, for example, recommend a general retreat to the place on Avenue O, which an enterprising tavern keeper has named "The Atomic Cocktail Lounge."

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

SNYDER, HAROLD E. *When Peoples Speak to Peoples*. Pp. xiii, 207. Washington: American Council on Education, 1953. \$3.00.

This small volume, published by the American Council on Education, is a most useful publication for persons interested in international cultural relations, and the excellent way in which Mr. Snyder has treated his subject should lead to a greater and more exact knowledge of this highly important field. Indeed within less than two decades the American public has become very conscious, through the activities of governmental agencies and an ever-increasing number of private organizations, as well as through the enthusiastic interest of influential private citizens, that intercultural understanding constitutes one of the most fundamental bases of lasting peace. This subject is not "presumably boring," as the author suggests on the first page of Chapter 1, but is replete with items of the most lively human interest.

The title of the book, "When Peoples Speak to Peoples," is especially apt. Governments speaking to governments, or governments speaking to peoples, are not nearly as vital or thrilling as "When Peo-

ples Speak to Peoples." It reminds one of the distinction between the words of the Covenant of the former League of Nations, "We, the Contracting Parties . . ." and of the Constitution of the United Nations, "We, the People. . ." There is a world of significant difference between the two! Because of his experience in the United States and abroad, as director of the Commission for International Educational Reconstruction and the Commission on the Occupied Areas, Mr. Harold E. Snyder has had very signal and rare opportunities to write on the need of coordinating the great number of activities designed to improve international understanding that developed during the last years of World War II and in the period that has followed.

The first part of the volume is devoted to "Cultural Relations in the Postwar World," and the second part to "Making Action Programs Effective." In the Appendix, there is a useful list of addresses of agencies operating in this field, and also a brief bibliography of books on this subject. That this topic is of recent emphasis is attested by the fact that of the fifty titles listed in this Bibliography only three antedate 1945, or the close of World War II. The three in question were published in 1940, 1941, and 1944. Perhaps a more

careful check should have been made of the list of addresses of agencies. The Committee on Friendly Relations Among Foreign Students, with which the present reviewer has been associated for many years, moved several years ago to 293 Broadway, New York City; and also the address of the Institute of International Education is given on page 183 as 857 Fifth Avenue, and on page 185 as 1 East 65th Street. Those two addresses are the same building, but it would be less confusing to use only one of the addresses. There may be other slips as well.

There are some very telling and vivid descriptions in this volume, as well as those of very practical usefulness. Among these is the description of the growth of the United States cultural programs, the work of the CIER in educational reconstruction, the differences in American and European attitudes at the end of World War II, as well as the plight of education at that time, the relation of the United Nations Educational, Scientific, and Cultural Organization (UNESCO) to CIER, the universities and international education programs, and some very sage comments on the criteria for developing voluntary action programs. There are various wise cautions in the discussion about those who represent us abroad either officially or as travelers, on understanding the common man, on racial prejudice, and on the interaction of domestic and foreign influences. Different chapters in Part II are devoted to the Interchange of Individuals, the Interchange of Groups, and the Interchange of Materials.

This reviewer looked in vain for any single reference to the short-lived International Education Assembly, with which he was intimately associated, and which was successively under the leadership of Dean Grayson N. Kefauver, of the School of Education of Stanford University, and of Dr. William G. Carr, of the National Education Association. The International Education Assembly was a pioneer organization during World War II, which, in a very real sense, prepared the way for the organization of UNESCO. The work of the IEA should not be lost to sight.

All persons actively engaged in interna-

tional cultural activities should have available a copy of Mr. Snyder's book, and the volume should also be accessible to any persons generally interested in this significant field.

EDGAR J. FISHER

Amherst, Virginia

BARRETT, EDWARD W. *Truth is Our Weapon*. Pp. xviii, 355. New York: Funk & Wagnalls Company, 1953. \$4.00.

This timely book is a persuasive plea for a sustained propaganda campaign abroad as an indispensable instrument of America's world leadership, and as a possible peaceful means of winning the cold war. Edward Barrett is admirably qualified to present this case. Experienced in the field of newspapers and magazines, he served in executive positions during World War II in psychological warfare under General Eisenhower and in the Office of War Information, and he then helped to establish the Voice of America. Returning to government service in 1950 as Assistant Secretary of State, he had charge of propaganda abroad during two critical years.

In Part One, Mr. Barrett reviews briefly the historical background of our propaganda efforts, the postwar decline of interest paralleling the thoughtless military demobilization, the slow revival after the inauguration of the Marshall Plan, and President Truman's announcement of the "campaign of truth" in 1950. A chapter on "The Voice of McCarthy" deals forthrightly with the Wisconsin senator. Part Two considers "The Foes We Face." In the front rank, the author naturally places the men of the Kremlin and their purposes of world revolution and world domination, but he also includes as foes those on our side who are defeatists, advocates of preventive war and of liberation through insurrection. In Part Three, he offers much wise counsel. Propaganda alone, without adequate military strength and suitable policy decisions, will not be effective. He would revise the present procedure of congressional control to prevent irresponsible attacks, stabilize appropriations at a small fraction of the total defense costs, make the higher posts more attractive to the best qualified men, assure a close associa-

tion with policy making authorities, and centralize strategic decisions in Washington while leaving discretion in tactics to the responsible deputies in the field.

The author writes with "a deep sense of urgency." He sees in propaganda, or in "persuasion" as he prefers to call it, the one possible escape from a third World War. "The right words striking the right persons at the right time can change the course of history." Certainty is impossible, and doubt results in disruptive propaganda which goes beyond resistance to Communist imperialism. In this connection, the inclusion of sample broadcasts as delivered to the peoples of the Soviet Empire would have been helpful.

E. MALCOLM CARROLL

Duke University

DENNETT, RAYMOND, and KATHERINE D. DURANT (Eds.). *Documents on American Foreign Relations*. Volume XIII: January 1-December 31, 1951. Pp. xxiv, 626. Princeton: Princeton University Press (for the World Peace Foundation), 1953. \$7.50.

The World Peace Foundation's *Documents* series has long since been established as an indispensable tool to the specialist in foreign affairs. This latest volume fully meets the high standards which the editors have previously set. For breadth of coverage, convenience of arrangement, lucidity of editorial notes, and sheer quantity of key documents presented, it is unmatched by any other publication, governmental or private.

The pattern of the book follows that of previous volumes: sections on general themes appear first (Principles and Policy, Conduct of Foreign Relations, National Defense, Economic and Military Cooperation, International Peace and Security), followed by sections dealing with functional topics (Dependent Areas, Trade and Finance, Transport and Communications, Agriculture and Natural Resources, Labor and Social Problems, Cultural Relations), and the whole is concluded by documents on relations with geographic regions (Western Hemisphere, Asia and the Pacific, Europe, Middle East and Africa).

The year here covered (1951) was a

turning point in the cold war—as perhaps every year since 1947 has been. It saw a low tide in American and United Nations fortunes in the Korean war with the Chinese Communist onslaught, and saw that onslaught eventually slowed to a halt. It saw the dismissal of General MacArthur and the resulting "Great Debate" on foreign policy. It was the year of the Japanese peace treaty and the Pacific defense pacts with Japan, Australia, New Zealand, and the Philippine Republic. It was the year of Universal Military Training, of the Mutual Security Agency. If a single term could characterize it, perhaps "consolidation" would do: American opinion seemed to move steadily toward support of long-range commitments and arrangements in foreign policy and defense on a scale and of a permanency to match the ubiquity and the tenacity of the foe.

With this thirteenth annual volume, the World Peace Foundation ends its sponsorship; future volumes will appear as a supplementary series to the Council on Foreign Relations' annual publication *The United States in World Affairs*, and will be published by that organization. While deeply appreciative of the subsidies, time, talent, and eyesight expended on the series by the Foundation and its able staff, this reviewer feels the new arrangement is to be welcomed. The two series are intrinsically supplementary. Under whatever sponsor each will gain in usefulness (and one hopes in use) if planned and produced by a co-ordinated editorship.

OLIVER BENSON

University of Oklahoma

WILSON, ROBERT RENBERT. *The International Law Standard in Treaties of the United States*. Pp. xii, 321. Cambridge, Mass.: Harvard University Press, 1953. \$4.50.

The term international law or law of nations appears explicitly in treaties to which the United States is a party over 200 times and references to the concept are implicit on many other occasions. About a third of these are in treaties providing for pacific settlement of disputes. Extradition treaties, treaties relating to war and neutrality, treaties concerning diplomatic and consular

officers, treaties concerning rights of resident aliens, and treaties of commerce also contain such references.

In this volume Professor Wilson explains the diplomatic background of many of these treaty provisions, their legal significance, and their practical utility. In doing so he includes interesting and little known items of diplomatic history and judicial reasoning.

The discussion illustrates the relationship between conventional or special international law on the one hand, and general or customary international law on the other. All treaties are made against a background of general law without which the meaning of terms would often be obscure and the intent of the whole instrument illusive. More specifically, international law is referred to as the basis for dealing with disputes; as the source for interpreting terms such as "piracy," "neutrality," and "domestic jurisdiction"; or as the standard to be applied in dealing with aliens. The standard of international law may be more favorable than "most-favored-nation" or even "national" treatment.

Professor Wilson has had practical experience in the Department of State and makes some use of unpublished documents. He writes carefully on a hitherto unexplored topic. His book is for the profession rather than the general public, but it constitutes an important contribution to the understanding and perhaps to the effectiveness of international law. In this period, when "power politics" dominates so much thinking in the international field this contribution is valuable. He suggests important functions of international law, not always appreciated but susceptible of development.

Appendixes stating the practices of other great powers in utilizing the international law standard, indicate that the United States has taken an advanced position.

The process by which treaties continually introduce new principles, modifying the old law, while at the same time the general law governs the interpretation of, and provides standards for, treaties, suggests how order and progress, law and politics, may be combined in an evolving

system of stable and progressive international relations. Studies like this indicate the superficiality of the criticisms of international law by some "realists" in the international field.

QUINCY WRIGHT

University of Chicago

KUHN, ARTHUR K. *Pathways in International Law*. Pp. xi, 240. New York: The Macmillan Company, 1953. \$4.00.

Mr. Kuhn's "personal narrative" is above all an account of his lifelong and eminently successful activities—studies, practice, teaching, creative pioneering—in the field of international law. The story offers but glimpses of the nature of problems in this field, none of which is profoundly analyzed as such. Each problem of issue is described just sufficiently to explain the background for the author's views which are mostly quoted verbatim from lectures, speeches, or previous publications. The problems he mentions range over the entire field of international law—from collective security and peace-making to private international law (conflict of laws) with such questions as the validity of treaties and nationalization of foreign property in between. Together, they add up to a panoramic picture of the manifold and fascinating situations to which international law is supposed to apply. No less interesting are the author's views, which demonstrate a felicitous sense of balance between what is desirable and what is possible in the international field.

Regret arises from the fact that the author has failed to elaborate and state the underlying philosophy that may have guided him in formulating his opinions. His conservative position on the problem of promotion of human rights by international organization (he strongly attacks the classification of social and economic advantages as rights) strongly contrasts with his "progressive" views on the Nuremberg trials which, along with the Genocide Convention, he hails as unquestionable gains. What are the fundamental political theories that would give meaning and consistency to Mr. Kuhn's various judgments? The reader would have greatly profited had Mr. Kuhn's narrative penetrated to

this deeper and more important layer of thought.

GERHART NIEMEYER

Council on Foreign Relations
New York

ROBERTS, HENRY L., and PAUL A. WILSON. *Britain and the United States: Problems in Cooperation*. A Joint Report. Pp. xvii, 253. New York: Harper & Brothers for the Council on Foreign Relations, 1953. \$3.50.

This joint report of two unofficial study groups of the Council on Foreign Relations and of the Royal Institute of International Affairs, completed in October 1952 after 18 months of exchanges, is a masterly work of critical self-examination and the exposition of agreements and disagreements. It is a substantial contribution of insights and information to the Anglo-American bookshelf which is by no means overflowing. It is also a demonstration—considered by the participants to be the “real achievement”—“that with patience, inquiry and frank discussion, it is indeed possible for the citizens of one nation to gain a comprehension of the motives and methods of another, a necessary first step in the resolution or composition of their differences in foreign policy.”

“... Cooperation between the two countries will not occur automatically.” Also, “It is wholly to the good that the Anglo-American community is not monolithic.” The importance of closer co-operation permeates the study—“to each the other is its most important single ally.” Yet the two groups successfully avoid the impression of advocating the “ganging up” of Britain and America against their partners in the Western alliance and the rest of the free world.

The issues, essentially handled as case studies, range over the bases and obstacles to Anglo-American co-operation, the interplay of domestic politics and foreign policy, problems of general economic policy (containing, *inter alia*, a brief, understandable exposition of sterling balances and convertibility), the economic impact of rearmament, global military problems, the United Nations and collective security, and relations with the Soviet Union and East-

ern Europe. Separate, lucid chapters are then devoted to Western Europe, the Mediterranean area, the Middle East South and Southeast Asia, and the Far East.

The study group points out that it did not have time to tackle issues such as the standardization of weapons, the stationing of American troops in Britain, and the exchange of information concerning atomic energy, and to probe more deeply colonialism, Commonwealth relations, the international oil problem, and the functioning of the United Nations.

One of the differences likely to intrude between us is that “the British believe that to many problems there is no quick, tidy and final solution.” A successful effort in trying to distinguish and describe the predominant band or bands in the spectrum of informed opinion in the two countries could help predict divergences. The book is not filled with predictions, but an illustration is given—we tend to be nervous about the British moving too hastily in the Middle East, and the British tend to be nervous about our responses in the Far East (p. 249). “It is the part of statesmanship to foresee possible divergences between allies before they arise. This can be achieved only through continuous study and consultation” (p. 250).

The co-operative procedure of this study is no doubt an expensive one. Yet one wishes that the technique could continue to be applied—not only to Anglo-American relations, but to other crucial areas of international relationships. Possibly modest adaptations could be devised by additional institutions and groups.

RICHARD H. HEINDEL
Washington, D. C.

OSGOOD, ROBERT ENDICOTT. *Ideals and Self-Interest in America's Foreign Relations*. Pp. xii, 491. Chicago: University of Chicago Press, 1953. \$6.50.

Professor Hans J. Morgenthau's well known position on power politics is being refined and implemented by publications of the Center for the Study of American Foreign Policy which he directs at the University of Chicago. Dr. Osgood's book is one of these publications, and it makes

a threefold contribution to the Morgenthau thesis. In the first place, United States diplomatic history from the time of the Spanish American war to the present is evaluated in terms of the power politics position. Furthermore, diplomatic history, so written, becomes more than a mere record of events. We have here a study of the motivations of key opinion leaders and the response of the general public to this leadership. Finally, the Morgenthau concept of realism as stated in *In Defense of the National Interest* is redefined. Osgood would condemn “Realists” (which he spells with a capital R) along with idealists and would accept a happy compromise whereby the visionary, long-run goals of the latter would be joined by the short-run power considerations of the former. As Quincy Wright wrote in 1952, both power and values, both conditions and symbols, both passion and reason, both necessities and choices have influence in human affairs, and Osgood would call a policy which takes into account these considerations “realistic” (spelled with a small r).

For the social scientist, Dr. Osgood's book has many of the delights of forbidden fruit. His analyses of motivations are absorbing and penetrating although not always convincing. That Henry Cabot Lodge was not motivated primarily by his hatred of President Wilson but rather by his realistic evaluation of the League of Nations (pp. 282, 292) suggests that Dr. Osgood, like many realists, places reason before emotion as a motivating factor. Assuming the function of the Devil's Advocate the author blames the idealists, not the realists, for destroying Wilson's fourteen points (p. 288), defends the 1935 neutrality laws (p. 367), and blames Colonel Stimson for supporting blindly collective security for the sake of collective security (p. 354).

But the question a reader must eventually ask himself, if he has not already done so, is what useful service to the field of international relations do the obviously ambiguous terms “Realism,” “idealism,” and “realism” render? It would not be difficult to disregard the demands of the militaristic jingoists or the molly-coddle pacifists. But is there an alternative policy

upon which “realists” themselves might always agree? Finally, it seems to this reviewer that Dr. Osgood's “realism” is weighted on the side of the “Realists.” It does not embrace a consideration of long-run as well as short-run policies, of human as well as national interests, of co-operative as well as oppositional policies. Nonetheless, Dr. Osgood has produced a well-written work which is both provocative and entertaining.

MARTIN B. TRAVIS, JR.

Stanford University

WILLERT, ARTHUR. *The Road to Safety: A Study in Anglo-American Relations*. Pp. viii, 184. New York: Frederick A. Praeger, 1953. \$3.50.

Sir Arthur Willert has written a very timely and penetrating commentary on a crucial phase of Anglo-American diplomatic history. *The Road to Safety* dips into Sir Arthur's own memoirs and the memoirs of those key figures in the harrowing story of Anglo-American relations in the first World War—Lord Northcliffe, Lord Reading, Mr. Balfour, President Wilson, Colonel House—and especially it dips into the unpublished notes from the fantastic career of Sir William Wiseman, the “Lawrence of Diplomacy.”

Sir William Wiseman moves through the pages of this narrative as the confidential Englishman who suddenly became the intimate of Colonel House and of President Wilson, and who so quietly and effectively worked to straighten out the tangle of Anglo-American relations during those crowded years.

Toward the end of 1916 the Old Diplomacy represented by Sir Cecil Spring Rice and the British Embassy in Washington began to bog down hopelessly at the job of breaking through the crust of formality which stood between Wilsonian idealism and British pragmatism in London. “The routine relationships of the Embassy,” writes Sir Willert, “were carried out conscientiously by a grossly overworked staff. But in high affairs it had virtually ceased by the end of 1916 to be regarded by Washington as the link with London.”

In the meantime, the American Ambassador in London, Walter Hines Page,

had "fallen into equal disfavor with Washington as being too much in the pocket of the British to be fit to fight their diplomatic battles." Into this situation was projected Sir William Wiseman, the understanding and always sagacious, young, and charming Englishman from the information section of the Embassy. Colonel House first met him in the Autumn of 1916 and in their first interview, finishing official business in a few minutes, kept him talking for two hours. Other meetings followed at House's invitation, and the foundations of their intimacy soon placed Wiseman's relation with House almost on a plane of that of "son to father." "It was odd," concludes Sir Arthur, "that Winchester and Cambridge and Texas could have produced two men with so much in common in spite of the difference of their ages."

From this warm friendship with Colonel House, Wiseman soon found himself on terms of comfortable familiarity in the White House and possessed of a real insight into the mind of President Wilson. And so it was that the Wilson-House-Wiseman relationship, with Spring Rice's blessing, became "a bridge across the chasm" which separated the Embassy from the Administration. "Do what you like," Rice is quoted as saying, "go where you like, and, of course, don't tell me anything you think I oughtn't to know." This was the combination which handled the succession of top problems which the tumultuous days of the early years of Anglo-American partnership thrust at the heads of the British and American governments.

There are places in the swift narrative where students of the period will wish that the author had found it possible to widen the limitations of the all too brief text for a fuller discussion of weighty matters—for example, in the section on "Unconditional Surrender." But perhaps this may follow in a later volume. Certainly, however, Sir Arthur's most readable study is convincing evidence that no history of the Anglo-American partnership can be complete which fails to highlight this fascinating chapter in the brilliant career of Sir William Wiseman's mission in understanding. This is the chapter which supplies

the insight into how the bridge was first built between the old diplomacy and the new. Others were to follow twenty years later—Hopkins, Harriman, Roosevelt, and Churchill—but Sir Arthur Willert's story marks the beginning of this great enterprise.

GEORGE L. RIDGEWAY

New York City

POSSONY, STEFAN T. *A Century of Conflict: Communist Techniques of World Revolution*. Pp. xx, 439. Chicago: Henry Regnery Company, 1953. \$7.50.

One of the central problems of international politics today is whether those who direct Russian policy still adhere to the Marxist doctrine that Communism must be world-wide or whether they believe that at least for a workable future of a generation or two Communism can exist peacefully in a world part of which is organized on other principles. Professor Possony believes firmly that the present government of Russia is thoroughly committed to the first doctrine, that they believe that a world divided between Communism and Capitalism—in any of its forms—cannot stand; and he holds that they are determined to make the world Communist.

Professor Possony is an admirable historian, and he spends some two-thirds of his book in a careful and well-documented account of the development of orthodox—that is, Marxist-Leninist-Stalinist—Communism in Russia as a revolutionary force in the world. He neglects neither theory nor practice, which he well knows are subtly and constantly related. His main emphasis is on Communist concepts of revolutionary tactics and strategy, which he convincingly shows to have been based from Marxist beginnings on a supple willingness to use force, intrigue, propaganda, burrowing from within; or, put negatively, on a complete contempt for the basic Western belief in a fundamental moral order in politics.

Marx himself seems to have believed, not exactly that Capitalism would fall of itself, from its own "internal contradictions," but at least that it was slowly but surely rotting and would need no more than a final shove from the leaders of an

organized proletariat. Professor Possony does not believe that the men in the Kremlin today are naïve enough to hold this primitive Marxist doctrine; they have in their thinking introduced a variant. "Where Marx was inclined to expect spontaneous and natural developments," he writes, "the modern communists act to infect capitalism artificially. Communism is seen not as the product of relatively uncontrolled historical processes but as the consequence of sociological warfare" (p. 375).

The book concludes with an analysis of the complex methods, and especially the military methods, the present generation of Communist leaders are trying to use to bring to pass what Marx appears to have considered the inevitable working out of historical dialectic. But it is a careful, firm, and realistic analysis, by no means a frightened one. This is not a book that finds Bolsheviks under the bed, not a book to lead sensible readers to alarmist measures that will destroy our democracy in the effort to preserve it—that will, in fact, do just the work of Communists want us to do. Professor Possony by no means believes war with Russia inevitable. "The objective of our strategy should," he writes, "be to make all-out war an *extreme risk* for the Soviets, and to work toward a gradual modification, contraction, and replacement of Soviet rule" (p. 422).

CRANE BRINTON

Harvard University

MEISSNER, BORIS. *Russland, die Westmächte und Deutschland*. Pp. 372. Hamburg: H. H. Nölke Verlag, 1953. DM. 12.—

This scholarly treatise presents a chronological survey of Soviet policy toward Germany from 1943 to the end of 1952, and its relationship to the policies pursued by Western powers. It is, in the words of the author, "only a preliminary study of a later investigation into international law." As such, it furnishes the reader with a carefully annotated documentary basis for further study, since it contains little interpretation or evaluation of the objectively presented materials. The thoroughness of

the documentation is attested to by no less than 1,150 footnote references and citations.

The work covers two historical periods, the first extending from the Teheran conference in 1943 to the Potsdam conference in 1945, and the second period from Potsdam to the end of 1952. Until the Potsdam conference, Germany and Poland occupied the focal point of Soviet foreign policy. "But with the surrender of Japan and the atom bomb, her policy was extended to the near east and the far east, where it came in contact with the vital, common interests of Anglo-Saxon powers, who were no longer ready to tolerate a further extension of Soviet power, without corresponding concession" (p. 77).

Basic to an understanding of the divergent policies advocated by the Soviet Union and the Western powers, respectively, in dealing with Germany, particularly since 1945, are fundamental ideological differences, stressed by the author. "Marxian-Leninist schooled Soviet thinking expresses itself in the first instance in economic and sociological categories. Demilitarization, denazification, and democratization have always been interpreted, from the Soviet viewpoint, merely as means to a profound social transformation" (p. 49).

It is these differences which must be borne in mind, when interpreting frequently changing Soviet policy toward Germany since 1943. Strategy and tactics are altered with changing conditions, but the primary objectives, to extend Soviet power and to maintain a "cordon sanitaire" have remained unchanged. All this is clearly demonstrated in the documentary evidence presented by the author. Tactics, involving the peace offensive in 1950, yielded to so-called defensive measures, following the inclusion of West Germany in the North Atlantic Pact in 1952.

Charges of ambitious aims of world domination appear in quotations from statesmen in both the Soviet Union and the United States. Thus the recently discredited Beria is quoted as saying, "The seizure of world rulership is the chief goal of American foreign policy," while former President Truman is quoted, "the danger of world conquest by the Soviet Union

threatens our freedom and threatens that world in which the free spirit of man can continue to exist." The threat of aggression is dramatized by spokesmen of the Soviet Union and of the Western powers alike. But charges and countercharges do not conceal the power struggle between East and West, in which Germany has been playing a buffer role.

Time alone will tell how this struggle, insofar as Germany is concerned, will be resolved. The issues seeking settlement at the conference table, if they are not to culminate in open conflict, are so vast and so complex that they challenge human ingenuity to find their peaceful solution. In the author's concluding observations, "The Soviet will to understand and the possibility of a compromise solution, will, to be sure, permit itself to be judged only after a new meeting of the 'Big Four.' Such a meeting might smooth the road for a European peace congress, with all of Germany participating" (p. 360).

This invaluable source book of first hand documentary materials pertaining to Soviet and Western Powers policies toward Germany should prove an indispensable addition to the library of every student of international politics.

KARL SCHOLZ

University of Pennsylvania

PENROSE, E. F. *Economic Planning for the Peace*. Pp. xiv, 384. Princeton, N. J.: Princeton University Press, 1953. \$7.50.

Economic Planning for the Peace is based largely on the author's personal experience in London, from 1941 to 1947, as economic adviser to Ambassador Winant. It deals with events with which the author was associated and reflects the results of contacts with individuals and of participation in groups of international specialists devoted to the task of leading a warring world towards orderly recovery and peace. The book is based less on the customary documentary research than on notes, memoranda, and first-hand knowledge acquired from the "inside" during the period when plans were in process of formulation, integration, and adoption.

The central thesis maintains that the

errors of the peace were the result of omissions and of a faulty sense of proportion in planning for different aspects of postwar international economic activities. Accordingly, the treatment is based on three broad classifications of postwar activities, the specific aspects of which are traced in chronological sequence. Long-term measures of international economic organization include the specific subjects of international finance and investment, international raw materials agreements, and international trade. The problem of relief distinguishes between two aspects, namely, food relief and the establishment of an international relief organization. The third classification deals with reconstruction under two subgroups dealing, respectively, with the liberated Allied countries and the ex-enemy countries. Changing political conditions and the impact of great personalities upon the emerging plans left their final mark in great successes, such as the saving of Europe from immediate postwar disaster, and in the kind of serious errors which permitted the crisis of 1947. Plans for short-run measures and those for the long-run became increasingly separated as time passed. The more successful efforts lay in planning for the long-run while consideration of the area between immediate relief measures and long-range measures was piecemeal and often belated.

The book is a major contribution to both the economic history and the economic thinking of the period even though admittedly slanted somewhat towards the British point of view. In attributing to the lack of shipping (p. 341) the inability of the Latin American countries to meet their wartime and early postwar import demands, the author failed to mention the more fundamental reason, namely, the almost complete unavailability in the United States of the goods Latin America was eager to purchase with its large accumulation of dollar balances. Such omissions are few and usually fade into insignificance as the author outlines, in clear nontechnical language, the issues with which men and governments struggled during the fateful years after 1941 towards a system of ultimate stability and peace. Special merit attaches to the concluding chapter, *A Sum-*

ming Up, in which the main threads of the story are woven into an excellent interpretative summary, followed by a review of the underlying influences that determined the shaping of economic postwar plans.

AMOS E. TAYLOR

Washington, D. C.

AMERICAN GOVERNMENT AND HISTORY

NOURSE, EDWIN G. *Economics in the Public Service*. Pp. xiv, 511. New York: Harcourt, Brace and Company, 1953. \$6.00.

When the President submits important recommendations to the Congress, they are likely to languish unless expounded and supported by those who in the public eye are his primary advisers in the area involved. That the Council of Economic Advisers should perform this function *in re* the President's Economic Reports was fully recognized by Dr. Nourse when appointed Chairman of the Council in mid-1946. But when the Congress became Republican in 1947, Dr. Nourse told his colleagues that, unless Council members dissassociated themselves from the economic policy recommendations of President Truman, a new Republican President in 1948 might change the membership and that this would make the Council "political." He also argued that there necessarily were "political" overtones in any such presidential recommendations to the Congress and that consequently somebody in the Democratic National Committee rather than "economists" should support these recommendations. His two colleagues, regarding continuity of tenure less important to the successful future of the Council as an institution than trueness to its designated function, disagreed in principle with the Chairman without questioning his sincerity, thus producing the only serious and prolonged split within the Council.

The core of Dr. Nourse's book is a defense of a position which plunged him as Chairman into numerous inconsistencies. Avowing the desire to keep the Council

out of controversy, he publicly indicted his colleagues as "political" for wanting to appear before the Joint Congressional Committee on the Economic Report even during the two years when they refrained from doing so as a concession to him; refusing as a "confidential adviser" to support publicly even those policies he had recommended to the President, he made many speeches implying other disagreements with the President; professing a desire not to embarrass President Truman by engaging in "political" relations, he wrote a letter to Senate Majority Leader Taft in mid-1948 seeking a confidential discussion of Council affairs, and then made contacts with Governor Dewey's group to explore "the future of the Council" if Dewey became President; complaining about being ranked lower than cabinet officers at social functions, he abjured the public responsibilities which cabinet rank necessarily entails.

By late 1949, Dr. Nourse felt frustrated and resigned. His book, written before full recovery of perspective, is designed to demonstrate that, on most problems which arose within the Council, the Chairman displayed not only the practical touch but also moral elevation, while his colleagues were not only unwise but also suspect because they sought to help gain acceptance of policies which they deemed to be in the national interest. Such a book on its face is not a careful study in economics or political science, despite copious excerpts from a "personal diary" to reinforce undocumented allegations.

From early 1950, when the Council assumed responsibilities compatible with its duties, it became a more effective voice in the development of integrated and comprehensive national economic policies. Largely responsive to the Council's stress upon the nation's great economic potential, programs were adopted which sustained a rapidly increasing defense effort and at the same time expanded our general economic capacity and product enough to overcome inflation while maintaining a rising standard of living and full employment. The Council's 1950-53 commitment to "economic expansion," now vindicated by experience and widely accepted, was held up

to ridicule by Dr. Nourse in his first book after his resignation (*The 1950's Come First*), just as in 1948-49 before Korea he had insisted that defense outlays substantially above 13-14 billion dollars a year would be so inflationary as to seriously threaten our economic health. But in a very recent speech, with defense outlays at four times the pre-Korean level, Dr. Nourse fears a disastrous deflation on the ground that our productive power is more than we can absorb.

As to Dr. Nourse's "political" cause *celebre*, fortunately President Eisenhower has ended it by stating unequivocally that the Council of Economic Advisers should work closely with its counterpart in the legislative branch. And Dr. Burns as the new Chairman has already supported before a Congressional committee recommendations which, presumably after obtaining his advice, the President submitted.

LEON H. KEYSERLING

Washington, D. C.

COLE, WAYNE S. *America First: The Battle Against Intervention, 1940-1941*. Pp. xi, 305. Madison: University of Wisconsin Press, 1953. \$3.50.

Salutary reading for an understanding of domestic influences on American foreign policy is provided in this thoroughly documented study of the principal isolationist opinion group of the pre-Pearl Harbor years. The author has drawn heavily on the files of the America First Committee and on interviews. The result is a study noteworthy indeed for the abundance of first-hand material it supplies.

Stranger bedfellows never couched together than the weird company which followed the leadership of General Robert Wood under the broad blanket of America First. Lindbergh and Norman Thomas, Lillian Gish and Philip Jessup, John T. Flynn and Chester Bowles, Coughlinites and pacifists, Bundists and socialists, all used it as a vehicle for their views. Their only common denominator was a foolish notion that the oceans were moats.

Minute in its detail, the study reviews several charges made against the group. The author finds it was little infiltrated by

Nazis (though several German agents did use the organization); it was more guilty of sheltering anti-Semites (though half-hearted efforts were made to disclaim them).

Less satisfactory are the author's conclusions on effects of the America First campaign. He seems to link failure to defeat Administration measures to aid Britain with failure to keep us out of war. Despite his scholarly objectivity, this tends to the view that the Firsters were right in their claim that their principles would have avoided war. In his account of the Committee's tactic of urging a vote in Congress on "the real issue, war or peace" (as General Wood put it), he concludes that the "Committee's opportunity to win the battle against intervention lay in getting the debate on the narrow issue of war or peace. Its inability to do so and the Japanese attack on Pearl Harbor insured the defeat of the America First Committee." Does this equate the propaganda failure of the Committee with Pearl Harbor as a cause of the war? Would a vote in Congress have prevented sailing orders to the Japanese task force? This may not be the author's meaning, but if not his analysis requires sharpening. No criticism is meant here of his excellent research contribution, which is so considerable as to dictate the book's permanent place in the literature of American foreign policy.

OLIVER BENSON

University of Oklahoma

QUINT, HOWARD H. *The Forging of American Socialism: Origins of the Modern Movement*. Pp. xi, 409. Columbia, S. C.: University of South Carolina Press, 1953. \$6.00.

While the Socialist party of the United States of America was not organized until 1901, the socialist activities of the prior decade and a half, from 1886 to 1901, constitute an important and fascinating chapter in the development of the American socialist movement. In *The Forging of American Socialism*, Professor Quint, Associate Professor of History of the University of South Carolina, has presented on a broad canvas a clear, scholarly, and

accurate picture of socialist thought and action during this period.

In his book, Professor Quint patiently reviews the activities in the late nineteenth century of the Socialist Labor Party, the Social Democracy, the Brotherhood of the Commonwealth, the Nationalists under Edward Bellamy, the Christian Socialists, and others, and vividly describes the impact upon the socialist movement of that time of such leaders as Edward Bellamy, Henry Demarest Lloyd, Daniel DeLeon, Morris Hillquit, J. A. Wayland, Eugene Victor Debs, Victor Berger, Meyer London, George Herron, and W. D. P. Bliss. The author also gives a valuable picture of the various ventures of the early Socialists in Populist, Labor, Single Tax, and old party politics and of the relations between the Socialists and the trade union movement of that day.

After reviewing the variety of socialist schools, Professor Quint concludes that "the upsurge of socialism in the United States at that time was only in part inspired by the classic doctrines of the European Marxists." In point of fact, he contends, "it came primarily as a protest against the social iniquities resulting from the tremendous economic concentration taking shape in these hectic years of industrial growth."

While Professor Quint deals separately with a number of schools of Socialist thought, he indicates time and again that it is difficult to pigeonhole socialist leaders into one school to the exclusion of others, since many of them, as was the case with Debs, represented a cross section of many schools of thought.

While the author, in his Preface, dwells on the social injustices of the day as accounting for the development of the socialist movement, he, for the most part, unfortunately leaves these injustices to the readers' imagination. He fails to give an adequate analysis of what constitutes Marxism, and his inferences that advocates of the class struggle necessarily believe in the "malevolent intent of one group of individuals to oppress another" convey a false conception of this theory.

Despite these inadequacies, Professor Quint's volume provides the best and most

authoritative volume on American Socialism during these crucial years that has thus far issued from the press.

HARRY W. LAIDLER

League of Industrial Democracy
New York City

ROSSITER, CLINTON. *Seedtime of the Republic*. Pp. xiv, 558. New York: Harcourt, Brace and Company, 1953. \$7.50.

In this book Professor Rossiter has dealt with the development "of the political ideas that sustained the rise of liberty in colonial and Revolutionary America." Holding the view that the ideas of the Revolution were the product of a long process of growth in the colonies, he has devoted over two-thirds of the book to what he calls "The Circumstances" which gave rise to this body of doctrine in the colonial era and to essays of from 20 to 34 pages each on six representative colonists—Thomas Hooker, Roger Williams, John Wise, Jonathan Mayhew, Richard Bland, and Benjamin Franklin.

The circumstances, as well as the ideas, of the Revolution are treated more briefly. And where the topical analysis of the first two-thirds of the book is devoted to conditions and causes—governmental, religious, economic, societal, and intellectual—that method is employed in the discussion of the political principles of the great period of first maturity, 1765-1776.

In a book so organized, particularly one written after long study of the sources as well as secondary materials, it is not surprising that one does not find the free-wheeling quality of Parrington's *Colonial Mind*, but then all too many of that lively author's conclusions were formulated, not only without fear, but also without research. That charge cannot be made against Mr. Rossiter. But it is, I think, fair to say that though his carefully documented book will be invaluable to every future student working in this field, it probably will not be read by very many nonprofessional citizens. And it may also be said that there is relatively little that is new in the book, though many of the comments made in passing are excellent and, at least to one worker in this particular vineyard, highly satisfactory.

If Mr. Rossiter's treatment of the political principles of the Revolution is lacking in the readability possible in a series of essays such as one finds in Parrington, or, in more stately procession, in Tyler, the systematization of Revolutionary ideas which he does provide will be more helpful to the historian of ideas than another group of essays. My only general criticisms of his topical analysis in Part 3 are: first, that some of those discussions tend to leave the impression that there was no substantial change or growth during the Revolutionary years; second, that many of the topical treatments are too brief to be as helpful as they might have been. There were a good many examples of such growth, particularly between 1765 and 1776, but also in the two or three years after 1776, for example, as between the Virginia Constitution of 1776 and that of Massachusetts written three years later. They clearly came from and reflect the same heritage, but they differ in such significant respects as the method of ratification and the application of the principles of separation of powers. What is said about the separation of powers is good, but in two pages (as compared with 20 pages on Hooker or 34 on Bland) the concept could not be given the analysis its importance warrants.

BENJAMIN F. WRIGHT

Smith College

MADISON, JAMES. *The Complete Madison*. Edited by Saul K. Padover. Pp. ix, 361. New York: Harper & Brothers, 1953. \$4.00.

The bicentennial, two years ago, of James Madison's birth brought a new interest in his life and achievements. The most notable manifestation was the monumental biography by Irving Brant, of which three volumes have already been published. The present work is a compilation of most of Madison's significant writings. Its content belies its title, however, for it omits even such important summations as the Virginia Resolutions and the Report on the Virginia Resolutions. Although it will certainly be useful, it would be even more so if less space were given to the Federalist Papers and

more to the role of the courts and the province of government.

The author presents a view of Madison as a "middle-of-the-road liberal." How well this is justified can only be discovered from an intensive reading of all his writings. He was undoubtedly liberal in regard to the suffrage (but so was Hamilton) and on such issues as freedom of the press and subordination of the military to the civil authority. But the author himself admits that Madison's view of human nature was Calvinistic, and that he conceived of government primarily as a device for playing off factions and interests against one another. This is brought out particularly in Madison's ideas on freedom of religion. "Is a bill of rights a security for religion?" he asked, and answered by saying that the religious freedom enjoyed by Americans "arises from that multiplicity of sects . . . which is the best and only security for religious liberty in any society." "Divide et impera," he declared, is, "under certain qualifications, the only policy by which a republic can be administered on just principles." His attitude toward coercion as the essence of government was essentially Hamiltonian, and his position on the tariff would seem to be a shade less than middle-of-the-road liberal. He had scarcely been inaugurated President when he urged upon Congress the enactment of laws that would "more especially protect and foster the several branches of manufacture which have been recently instituted or extended by the laudable exertions of our citizens."

No one who wishes to understand the theory underlying our constitutional system can afford to neglect Madison's writings. Spokesman though he often was for the forces of order and stability, he nevertheless evolved a number of doctrines readily adaptable to liberal purposes. Dean Padover's book is a valuable contribution to an appreciation of Madison's achievement.

EDWARD MCN. BURNS

Rutgers University

BOORSTIN, DANIEL J. *The Genius of American Politics*. Pp. ix, 202. Chi-

cago: University of Chicago Press, 1953. \$3.25.

The author of these lectures has spent a year abroad as a Fulbright beneficiary in Italy. His experience in talking about the United States to Europeans and in listening to the Voice of America have given him concern. We are not understood abroad, and we are not remedying this lack of understanding by our efforts to explain democracy to the world. He believes that we are hamstrung by our effort to broadcast a theory of politics when we have none and by our attempt to extend democracy in places where it can't exist. This book is designed to show why we have no political theory and are therefore impotent in ideological warfare, and to advise us to adopt revised attitudes toward the rest of the world based upon more realistic understanding of ourselves.

We have no political theory, he maintains, because we have never needed any. Our ancestors came to an almost uninhabited wilderness, and their institutions were shaped by what they knew and what their environment made it necessary for them to do. Metaphysics was not necessary. In several penetrating chapters Boorstin shows that our most devious experiences, the Revolution, the Civil War, our religious differences, and our two-party system have never stimulated any conflict of theory. There has always been basic agreement as to underlying values. The Revolution was just a quarrel over the proper interpretation of the British Constitution. The Civil War was just a conflict over the correct operation of the Federal Constitution. Religiously and politically our disagreements do not arise out of any doubts about the need of religion or any change in the system which the two parties guide, but over ways and means of operating the accepted. In other words, we always take the basic values for granted and consider our institutions as continuous and without need of radical change.

Now, however, our new position in this bad new world of the twentieth century has brought us face to face with European ideological warfare, and we have become hypersensitive because of what Europeans

say about us and because of the designs they have upon our wealth and power. So we have begun to fight back, and, in so doing, seek a theoretical weapon which we haven't got, and expect other people to become democratic and fight for democracy. Boorstin's remedy is self-study; let us really understand that we became what we are because of our migration to this peculiarly rich and empty continent, and then let us stop trying to remake the world in our own image, with our own money. He believes that while we are seeking this self knowledge, we should defend ourselves and not pay heed to what demoralized Europe is saying about us.

Regarding the first thesis, that we have no political theory, it may be presumed this depends upon how theory is defined. While we may not have a fine-spun metaphysical system of concepts, I believe we have a reasonably well-defined theory of political behavior which serves the same purpose. The historical analysis of our political attitudes which Boorstin uses, on the other hand, is well worked out and convincing. As to the mistakes we are now making in our attempt at ideological warfare, most of them must be admitted. Let us hope that those who are making them will read this book and profit by it. In the meantime, our chief concern should be to continue to conserve and improve our own achievement. It is unique. If this smacks of intellectual isolationism, I presume the author would say, "Make the most of it."

ROY F. NICHOLS

Philadelphia, Pennsylvania

LILIENTHAL, DAVID E. *TVA: Democracy on the March*. Pp. xxiv, 294. Twentieth Anniversary Edition. New York: Harper & Brothers, 1953. \$3.50.

Ten years ago Chairman Lilienthal discussed the Tennessee Valley Authority in a book which subsequently crashed the pocketbooks market. This volume adds another decade. Chairman Lilienthal can now be called "Mr.," and his present volume, besides recording the significant changes which have occurred in the Valley, maintains a candor which the bureaucracy would not permit even to a chairman. Mr. Lilienthal now speaks of senators by name; his

writing occasionally is more flatly assertive than it formerly was.

Perhaps the most important new section of the present edition is the new preface, in which Mr. Lilienthal seeks an answer to the question: why are there no more TVAs in the United States? The answer lies, the author believes, in the determined opposition of the Washington bureaucracy—bureaus in the Departments of Interior and Agriculture and the Army Corps of Engineers. The whole book is an argument for the TVA concept of centralized authority and decentralized administration. Although the argument may be put too one-sidedly in this volume, the reviewer believes it to be basically sound. But we must look further than the Washington bureaucracy for an explanation of the failure to use the idea elsewhere. Mr. Lilienthal too greatly discounts local opposition to the Authority idea in other regions. The Washington bureaucracy could not hold the line if Congress really wished to use the form elsewhere.

Mr. Lilienthal's second edition appears at an opportune time, for TVA faces tough days ahead. The "General," who carried Tennessee after a campaign studded with public assurances of regard for TVA, has, after inauguration, applied those dread words, "creeping socialism," to the organization. In the current Congress, the resources funds of the agency were partially rescued only at the late stage of a Senate floor fight. TVA needs to produce more power, for with hydro plants it started something in the South which now requires more steam plants. Congress is proving reluctant at this point, although the power operations of the Authority are paying off handsomely enough. The South is concerned that the great change to an urban society, which Mr. Lilienthal chronicles, may be hampered by the present Administration. The people of the Valley have every reason to hope that the Anniversary Edition will be widely read outside the Valley.

University of Tennessee

McCONNELL, GRANT. *The Decline of Agrarian Democracy*. Pp. 226. Berkeley:

University of California Press, 1953. \$3.75.

This interesting, well-written, and well-documented book might have been more descriptively entitled, "The Rise of the Farm Bureau." The introductory argument is that agrarian democracy of the type associated with the names of Thomas Jefferson and John Taylor and of the type reflected by the Populist Movement of the 1890's has declined. In fact, it is concluded that the agrarian democracy has "gone from our scene."

Nineteenth century agrarianism with its broad political base, distrust of power, and largely economic sources of discontent is contrasted with a rise of a structure of political power during the first half of the twentieth century which is based on farm organization. The revival of farm organizations during the first two decades of the present century was during a period of upswing in the business cycle. The changes from nineteenth century agrarianism "implied a narrowing of the public interests of organized agriculture; each involved a sharper conception of farmers as a particular class."

Mr. McConnell's main emphasis is on analysis of the development of the present structure of power within agriculture. Attention is concentrated on the interrelationships among the United States Department of Agriculture (particularly the Extension Service), the Land-Grant colleges, and the American Farm Bureau Federation. The Farm Bureau Movement is described as a "direct outgrowth of the county agent system." Farm Bureau activities during the "trial-and-error" years of the farm bloc, McNary-Haugenism, and the Federal Farm Board are analyzed along with those of the "success" period of the 1930's. The "successes" of the Farm Bureau are related to the 1933 Agricultural Adjustment Administration (AAA) and its 1936 and 1938 successors.

Mr. McConnell traces the development of the Farm Security Administration as an agency interested in what is today often referred to as the "welfare" aspects of agricultural policy (as opposed to the "production and price" aspects).

A chapter entitled "Attack" presents his

interpretation of American Farm Bureau Federation attitudes toward the Farm Security Administration. The Farm Bureau is given full credit for the "death" of FSA while administrative organization was "the crux of the entire battle." A succeeding chapter is devoted to other Farm Bureau "maneuvers" in "the large campaign" which were directed at the land-use planning system, the Bureau of Agricultural Economics, and the Soil Conservation Service.

In an analysis of the rationale of organization of the Farm Bureau, Mr. McConnell concludes that the basic policy is one of self-preservation of the organization.

Some of Mr. McConnell's charges may seem to be severe to many directly concerned with agricultural policy formation and program administration. However, there will undoubtedly be agreement that he has made a real contribution to the understanding of the power structure in agriculture.

TAYLOR, CARL C. *The Farmers' Movement 1620-1920*. In "American Sociology Series." Pp. vii, 519. New York: American Book Company, 1953. \$5.50.

This book adds another volume on rural problems to the American Sociology series—in addition to Lowry Nelson's earlier one on *Rural Sociology*. Its overall theme is that the economic and political revolts, upheavals and efforts at organization of American farmers during three centuries have been no more than episodes in what the author calls the farmers' "movement." Although there has admittedly been no real consistency, coherence, group solidarity, or common structure in the multitude of episodes, Dr. Taylor defends his concept of "movement" by the need for some term and some concepts by the use of which one can classify and make meaningful such phenomena.

The book contains a historical sociological survey on a long line of farmers' protest actions, revolts, organizing efforts, and movements. These phenomena are the multiple counterpoint to the Leitmotiv of rising American capitalism. Veering at times toward agrarian socialism and other ideologies, they have contributed a good

deal to the evolution of constructive thought on political and economic reform and to the nation's ideas about agricultural policy.

As such a survey, on the longest secular run, the book is a highly welcome contribution. It is well documented, written in a lucid style, and with full command of the vast literature on the subject. Its straightforward brevity brings the often highly dramatic features of movements and actions to the fore and keeps the colorful story interesting to the very end. Well selected evidence from newspapers and journals of the time reveals the prevailing ideas and arguments. The epic quality probably rests to some degree on the unconcealed and warm partiality of the author to the cause of the farmers in their struggle for equity against monopoly, corrupt politics, and unfair advantage of other vested interest groups.

Inevitably the main body of the book is devoted to the period 1850-1920, and the account of stirrings in the preceding 230 years is very brief. Yet the analysis of Shay's Rebellion of 1787, the Whiskey Rebellion, and Fries Rebellion and the particularly well written analysis of the panic of 1837 and its aftermath are an excellent prelude. It leads up to the dramatic history of the impact of Civil War inflation and its succession of agricultural expansion, depressed prices, and other economic hardships for decades to come.

The reader will find a concise and well written brief history of every important farmer movement of the United States and become familiar with the specific economic circumstances as well as the grievances of the farmers and their main ideas of protest or reform and the success and failure of their action. The bibliography, the result of 35 years of the authors' continuous interest in the subject, covers it thoroughly.

KARL BRANDT

Stanford University

MERRILL, HORACE SAMUEL. *Bourbon Democracy of the Middle West, 1865-1896*. Pp. xi, 300. Baton Rouge: Louisiana State University Press, 1953. \$4.50.

In spite of the hundreds of volumes written on the subject, most of the political

history of the period from the Civil War to Bryan remains to be written. Until state and regional histories meeting the requirements of modern scholarship are produced, the larger task of synthesis must be held up. Those who despair of the length of time we must wait can take comfort from the publication of such works as C. Vann Woodward's *Origins of the New South, 1877-1913* and the present volume.

Merrill's basic idea is that the leadership of the Democracy was in the hands of Bourbons, "wealthy, self-esteeming, self-appointed guardians of an already fixed pattern for living and making a living." The Bourbons of the Middle West were not so much interested in winning elections as they were in keeping their party safe and sane through denying power to dissident farmers and wage earners. There was some truth in General Weaver's remark that the party "has simply camped every four years exactly where the Republican party camped four years before."

It may well be that distrust of the Democrats on the part of agrarian radicals of the present day is in part a consequence of the reputation built up in the Middle West by the party under such leaders as J. Sterling Morton of Nebraska and William F. Vilas of Wisconsin. It was Morton who said that *The Wealth of Nations* was "to political economy as the New Testament is to the Christian religion," and it was Vilas who invoked the divine right of loggers: "That no reproduction of the valuable pine takes place, a worthless species only springing up in its stead, seems a pregnant testimony that the purpose of this great provision was for temporary uses, more durable mineral material being substituted in after-developed prosperity."

Merrill is a lively controversialist as well as an able historian, and he does not try to hide his glee when the Bourbons finally lose control of their party in 1896. "During the second Cleveland administration," he notes, "the Bourbon Democracy outdid itself in effrontery and finally collected its just reward."

Based solidly upon manuscript collections, chiefly in the libraries of the State Historical Societies of Wisconsin and Minnesota, the book is attractively designed and

complete with a full, excellent index. Merrill has produced both a major contribution to United States history and an eminently readable book.

ROBERT E. BUNKER

University of California
Berkeley

SUMMERS, FESTUS P. *William L. Wilson and Tariff Reform: A Biography*. Pp. xi, 288. New Brunswick, N. J.: Rutgers University Press, 1953. \$5.00.

On February 1, 1894 the Wilson Bill making substantial reductions in American import duties passed the House of Representatives by a vote of 204 to 140. After twelve years of struggle against the forces of protectionism as representative of a West Virginia constituency, Wilson, Chairman of the Ways and Means Committee, was the leader of a triumphant Democratic majority. This was the climax of his career. His party, controlling both executive and legislative branches, seemed after a generation of defeat and frustration to be in a position to reverse the postwar protectionist trend. But in the Senate high tariff Democrats joined with Republicans in a "criminal operation" which completely changed the character of the Wilson Bill. Their 600 amendments made it moderately Protectionist. In disgust, President Cleveland allowed it to become law without his signature. Wilson, his hopes blasted, his health wrecked, soon came to the end of his political career. Defeated for re-election, he was appointed Postmaster General. In 1897 he was named President of Washington and Lee University, a position he held until his death three years later.

Dr. Summers' scholarly book is based largely on Wilson's diaries and correspondences and on the papers of his contemporaries. He has given us a portrait of a high-minded public servant, a gifted scholar, and a persuasive orator battling to the limit of his powers against forces too strong for him. The book presents also a revealing, well-documented view of national and local politics in a turbulent era of American history.

PERCY W. BIDWELL

New York City

NEW YORK CITY. *Modern Management for the City of New York: Report of the Mayor's Committee on Management Survey*. 2 vols. Pp. xvii, 307; x, 876. New York, 1953. No price.

Luther Gulick had courage to undertake this survey of a government the size and complexity of which is second only to that of the United States government itself. He was faced from the beginning with a series of political changes complicating a huge assignment which was already difficult enough from a technical standpoint. The resulting report is an important document and can teach us much of the science and art of how to study municipal government and effect improvements therein.

The general recommendations call for greater decentralization in the departments of government in this vast public service; the development of the central government as a management directorate; a clearer definition of the departmental functions; a modernization of the personnel administration and of the budget; relief to an overworked mayor as chief executive with a director of administration to assist him, and a public relations officer to institutionalize what used to be known as the "Grover Whalen" function; strengthening the Board of Estimate; strengthening of the other management co-ordinating agencies; modernization of the internal organization of the departments; standardization and modernization of executive salaries; enlistment of the aid of qualified committees, and the provision of adequate funds, manpower, and office space to accomplish these objectives.

Perhaps the recommendations for a reorganization of the mayor's office through increased staff to assist him in his impossible combination of roles is the most important, although the financial recommendations and a more economic rate structure for the transit system must be given high priority. Eventually the City of New York will have to reconsider the structure and functions of its unique Board of Estimate more critically than in any study made to date.

The question still to be answered is whether the dose prescribed is digestible, or whether this type of survey may not

arouse so many resistances at once that the recommendations—even the best of them—tend to cancel each other out. There is the further question whether the outside survey by battalions of experts handing in a public report is any longer the most effective method of governmental managerial reform. Is it not preferable for the outside consultant to work long enough on the inside to develop from within the will and the skill for change and improvement—wills and skills without which very little may happen to correct managerial ills.

Public management surveys can be judged only over a period of time. A fair appraisal of this one will have to wait for at least five years to determine whether sick old Father Knickerbocker has seen fit to follow some of the prescriptions. In spite of the Cassandras who have repeatedly prophesied that Megalopolis on the Subway would die of its own gigantism and that it was on the brink of decay, dispersion, suffocation, and bankruptcy, there is still hope for a patient who can command so many able consultants and who has survived so many past crises.

HERBERT EMMERICH

Public Administration Clearing House
Chicago, Illinois

CARROLL L. *The People's Right to Know: Legal Access to Public Records and Proceedings*. Pp. xxiv, 405. New York: Columbia University Press, 1953. \$5.50.

This is a lawyer's brief prepared for the American Society of Newspaper Editors. Despite an elaborate apparatus of scholarship, which includes over a thousand notes inconveniently assembled at the end of the text, appendixes, a classified bibliography, and an index, the work is not a presentation of the results of scholarly research. In fact the author practically admits in his preface that it "is something of a call to battle, with some sacrifice of neutrality and objectivity."

Nevertheless, the data assembled, though not very well organized, will have some value to students of American history and of sociology and to those interested in

"public records" in general. The term "public record," which appears frequently in the book, is always used in the sense of government records that are or, in the opinion of the author, ought to be open to inspection by the public, especially by newspapermen, and never in the sense of publicly owned records. Considerable attention is devoted to definitions of records, but the author is interested in definitions in statutes pertaining to records administration only to the extent that they may be used in connection with questions of accessibility of records, especially current records, to newspapermen.

The author finds the situation, from his point of view, much more satisfactory as respects state and local than federal records, and he is much concerned over the fact that, in many cases, the heads of federal agencies decide what records are suitable for public inspection. From the point of view of the research scholar, the archivist, and the records administration, the situation is reversed—by and large, federal records are better administered than are state and local records. Moreover the mere right to inspect records is of little value if the records desired are non-existent or cannot be found.

The author devotes five chapters to discussion of federal records and statutes and regulations pertaining to them, but he makes no mention of the Federal Records Act of 1950 (Title V of Public Law 754—81st Congress), which requires the heads of agencies to "cause to be made and preserved records containing adequate and proper documentation of the organization, functions, policies, decisions, procedures, and essential transactions of the agency and designed to furnish the information necessary to protect the legal and financial rights of the Government and of persons directly affected by the agency's activities" (Sec. 506. a). No mention is made either of the definition of records originally incorporated in the Records Disposal Act of 1943 (44 U. S. C. 366), which has been given more general application by the Federal Records Act of 1950 (Sec. 511. a).

SOLON J. BUCK

Washington, D. C.

RAGER, EDWARD. *The Rat Race*. Pp. 288. New York: Vantage Press, 1952. \$3.50.

This book is an interesting and a stimulating discussion of New York city and state politics. Fortunately, the discussion is cast in the form of a novel. The word "fortunately" is used advisably since the discussion if it were not presumably fictitious would be libelous on almost every page.

The characters in the cast are thinly disguised representations of very important people in New York state and city politics. The machinations of these characters at the hands of Mr. Rager are lecherous, illegal, and wondrous to behold. It should be added that there is a substantial amount of opinion that Mr. Rager's descriptions of New York politics and its goings on are not far from the truth. If anything, it is probable that he has avoided telling the truth, the whole truth, and nothing but the truth.

Mr. Rager, an attorney, joined the Republican party in New York city in 1926 in the hope of destroying the Tammany machine. As chairman of the committee for prevention of election frauds, he fought illegal voting for years. In 1937 he became recording secretary of the National Republican Club and editor of its Bulletin. Mr. Rager gave up this work in 1947 after his election to the New York City Council. Shortly thereafter he decided that the best way to defeat bossism was not in making sporadic speeches and newspaper headlines which are easily forgotten, but through novels which would hold the reader's interest and convey the lessons of politics to the public.

The Rat Race is the first of these novels.

As a novel *The Rat Race* has the distinction of holding the reader's interest, particularly the reader who is concerned with New York politics. Nevertheless, it is apparent that Mr. Rager is not primarily a novelist but an attorney and a political reformer. Despite a very marked effort to inject into the book the customary ingredients of the novel, the pages still give the impression of being largely an attempt to conduct a political discussion.

There is, however, a substantial portion

of earnestness in the book which makes for a large amount of interest, and perhaps this is due to the fact that Mr. Rager has drawn so much on his own life and experiences for the material which he presents.

It is apparent that Mr. Rager is no Charles Dickens. Nor is this book likely to result in any major reforms in politics as practiced in New York City. Nevertheless, it is full of shrewd insights and should prove to be an eye opener to those of the political laity who read it.

W. C. CLARK

Syracuse University

ECONOMICS AND INDUSTRY

BOWEN, HOWARD R. *Social Responsibilities of the Businessman*. Pp. xii, 276. New York: Harper & Brothers, 1953. \$3.50.

Within the past quarter century much has been written and many lecture platforms eloquently held to analyze our economic structure in terms of satisfying the common weal. Dr. Bowen's book provides a fine summarization of these approaches and opinions of many businessmen, religious leaders, and community experts.

On the premise that the vast majority of the American people are purposely and determinedly wed to our system of free enterprise and the exercise of the right to private property, this book addresses itself to the several hundred largest firms in this nation as "vital centers of power and decisions" touching the lives of our people at many points. Much responsibility is therefore placed upon them, not only in setting patterns of practice in relation to profits and competitive standards, but in labor-management relations and the solution of social problems as well.

A report prepared under the sponsorship of the National Council of Churches of Christ, it is fair and reasonably thorough in its representation of what has already been accomplished by the businessman and the industrialist. But, almost uniformly, it asserts that these accomplishments have been promoted principally in the spirit of self-interest and protection of profits rather

than through the presence of higher motives. At the same time, the pages of Dr. Bowen's work are filled with statements, extracts of speeches, and examples of accomplishments by American industry establishing standards of social justice apart from any immediate or direct return to the firms or individuals involved.

A constant problem in the search for solutions of socio-economic problems has always been the part which government should play in regulation or supervision of industry and business. In this instance, our author establishes an area of proper interest by government, not as a competitive force with labor and industry but as the representative of the general welfare of all.

There is wide agreement on the propriety of this function of government among economic leaders throughout the free world. John Maynard Keynes has expressed himself in that "a high level of private business activity is compatible with a government that assumes power over fiscal policy . . . to become an ally rather than a foe of the private businessman." He points to government serving as a stimulant of private investment as "the one way of avoiding the destruction of economic forms . . . and as the condition of the functioning of private industry."

Dr. Bowen does not attempt to define government's role in any terms as specific as these. Rather, he sets forth clearly and well several channels for the review and correction of our economic ills to the exclusion of communism and amoral materialism. Here government is suggested as a restraining force in an economy built on voluntary assumption of social responsibilities by businessmen. It is to be hoped that future volumes in this study will define equally well the obligations of other areas of economic and social activity including labor, small business, education, and more general civic forces.

The book is a good review of our problems and might well be studiously read by those who now lead our business and social thinking and those who aspire to do so.

ALBERT M. GREENFIELD

Philadelphia, Pennsylvania

VINER, JACOB. *International Trade and Economic Development*. Pp. 154. Glencoe, Ill. The Free Press, 1952. \$2.75.

This series of lectures delivered by Professor Viner at the National University of Brazil in 1950 is a vigorous restatement of the truths of the classical economists and their application to the theory of foreign trade. Mr. Viner does not pretend that economic theory must not be relevant, and he accepts the necessity for bringing the classic theory of foreign trade into relation to the facts of our contemporary world, which it admittedly no longer fits. He has some lucid and pointed criticisms of the theories of Keynes which deserve noting as they bear on the same point.

Some of the most interesting passages in this little book, which probably were not well received by his South American audience, point out the fallacies of equating all agricultural economies with poverty and industrialization with high national per capita income. There are some excellent analyses also of the qualitative, as well as quantitative, differences in the contribution of what the classical economist used to call "labor" to efficiency and, hence, to cost. Perhaps these do not go quite far enough in the consideration of the factors of social rigidity, the prerequisite of large-scale markets within a single fiscal system, and the intangibles of management ability. Professor Viner recognizes these in some degree, though often a little obliquely.

In his lecture on "The Influence of National Economic Planning on Commercial Policy," he might have reinforced his case against even the indirect contribution of Keynesian theorists. This would have served to supplement the strong case he makes against national economic planning as breaking up the flexibility of adjustments on which the classical theory of international trade and most of our basic world economic development depended in the nineteenth century. There are psychological factors, unchained by Keynesian steps, which often lead to cumulative effects, then to having to compensate against the initial remedy, and so to destroying such natural factors of adjustment as might otherwise come into play. Quite apart from Keynesian remedies, the rigidities

which are induced by politically easy, and sometimes economically fatal, limiting effects through a social security system like that of France, and perhaps even like that of England, make the ordinary rules of capitalistic economies almost impossible to apply in their fundamentals.

The deeper difficulty with Mr. Viner's proposals, however, is that he recognizes only in a marginal way—though he admits, theoretically—the overwhelming power of politics, in the broadest sense, to warp economies for reasons that lie beyond mere human nature and political pressures. In the discussion that Mr. Viner engaged in with several of us at the Princeton Bicentennial meetings, the basic issue was whether or not a struggle between what now is called the free world and Moscow would not force a complete revision of economic policies to fit into new assumptions about national security involving the issue of survival itself. Countries like Brazil are under the pressure today not only of their natural desire to industrialize, at least on a primary basis; they have behind them the compulsion of memories induced by shipping shortages and the inability to get manufactured goods from a world at war. More than that, they are confronted by the prospect that a world at war again may see so great a destruction of the industrial economies that no nation will be left as intact as was the United States, even if one could be found willing to assume the burden of Atlas, through largesse, on a world scale necessary for reconstruction after atomic war.

Professor Viner himself is willing to consider the need for international lending organizations to take counter-cyclical steps. His remarks about the genuine merits of the classic economic theory, alas, apply only to conditions which make it possible or sound. He himself sees how far they are from thinking relative or applicable to a world such as we confront today. Security policy completely dominates trade policy to a degree unique in modern times.

One can only feel that, by limiting his economic analysis to rules that in the main cannot apply, Professor Viner has been more nostalgic than presently helpful. But the exercise brings out many of his

usual lucid and telling points in exposing the "quack" character of some familiar nostrums. The difficulty is that the learned medical practitioner who admits to having no real remedy is apt to be passed over for the quack in times of desperation.

WILLIAM Y. ELLIOTT

Harvard University

MEADE, JAMES EDWARD. *A Geometry of International Trade*. Pp. 112, plus pamphlet. London: George Allen & Unwin (distributed in the U. S. by The Macmillan Company), 1952. \$5.00.

The use of geometry has long been common in the exposition of the theory of international trade. Professor Meade has systematized and extended the geometrical exposition of such topics as the advantages of free trade, the effects of various (increasing, constant, and decreasing) cost conditions, the impact of taxes and subsidies, and the relationship between a trade deficit and the rate of exchange. These situations and problems are represented in 51 diagrams that are contained in a little pamphlet found in a pocket in the back cover of the book. The entire text is given over to a description of the diagrams.

The diagrams are ingeniously constructed, and, what is perhaps rarer, they are clearly drawn and lucidly explained. The basic diagrammatic device that is employed links the quantities exported and imported to domestic consumption and production. (Since two-commodity, two-nation trade is assumed, the diagrams are of the ordinary two-dimensional variety.) Indeed, domestic production and consumption as represented by transformation and indifference curves, respectively, are the starting points. From these are derived the whole apparatus of quantities traded, domestic prices, offer curves, terms of trade, and so forth.

Books dealing with geometry are not usually intended for the general reader, and this one is no exception to the rule. The orientation of the work is toward the exposition of the problems through the use of geometrical analysis rather than toward the application of trade theory to the current problems of the real world. As the author states in the preface, the book aims more at a technique of analysis than

at the solution of real problems. It should be mentioned, however, that the selection of topics was obviously made with the world's practical problems uppermost in mind. This probably reflects the origin of the book. The author indicates that the book is an outgrowth of the diagrams that he worked out for his own use in the course of preparing a more general work entitled *The Theory of International Economic Policy*. The first volume has appeared under the title *The Balance of Payments*. The well informed non-technical reader who seeks an authoritative statement of the contribution that theory can make to the world's present imbalance should consult this more general book rather than the author's geometry. The specialist in international trade theory, however, will find this little geometry a valuable addition to the literature.

IRVING B. KRAVIS

University of Pennsylvania

BUTTERS, J. KEITH, LAWRENCE E. THOMPSON, and LYNN L. BOLLINGER. *Effects of Taxation: Investments by Individuals*. Pp. xxxiv, 533. Boston: Harvard Business School, Division of Research, 1953. \$6.25.

This study is the fifth and last in a series conducted through the Harvard Graduate School of Business Administration on the effects of taxation. Its four predecessors dealt with the effects of taxation on inventory accounting and policies, on corporate mergers, on executives, and on executive compensation and retirement plans.

The problem to which this book is addressed is a fiscal one. Its solution, and the greater part of the book, however, turn on the subject of the distribution of wealth and income in the United States—what proportions of the population own and receive what proportions of the country's wealth and income. After presenting and analyzing data on this subject drawn from a number of sources, the authors establish the proposition, long generally accepted in nonprecise form, that a substantial proportion of investable wealth and income is accounted for by a minute fraction of the population. This minute fraction is an

important source of equity and venture investment. It is not the only, or even the most important, source; ploughback of business profits outweighs it.

Progressive income and estate taxes cut into the capacity of this group to make equity and venture investment, but are far from obliterating it. For one thing, "effective" progression on large incomes is much milder than commonly supposed, because of the effectiveness of various tax minimization procedures. The investment policies of this group of investors is influenced to a considerable extent by tax considerations—the severity of upper bracket income tax rates, the favorable tax treatment of capital gains, the estate tax. But these tax effects operate both ways—toward greater conservatism with some individuals, toward greater venturesomeness with others. There is a slight balance of conservative effect.

The author's conclusion is that our tax system has some effect in reducing equity and venture investment, but less than had generally been surmised. The reduction of the capacity of the upper wealth and income groups to invest is more significant than the influence of taxes upon their policies.

The authors find that the tax-exempt holdings of the wealthy are smaller than might have been anticipated, but they note the expansion of the volume of such securities as a potential threat, under high tax rates, to sound national investment policy. They confirm the opinion that the capital gains provision of the federal income tax tends to accentuate security fluctuations, especially on the up side.

In this book the reader is overprovided with summarizations. There is a four-page "Abstract" as a cover insert. The first fifty pages are a summary of the book. Each chapter carries a one- or two-page "Conclusion." All of these summaries are beyond question helpful to a running reader, but they make for repetition, and are a temptation to jump the body of the chapters.

The body of the book tends to be too much a coverage of the worksheet stage of the study, an account of the research done rather than of the results. Still, the

materials and tabular data presented in overabundance will be a mine that can be profitably worked by students in many fields besides Public Finance.

WILLIAM J. SHULTZ
College of the City of New York

SAYLES, LEONARD R., and GEORGE STRAUSS.
The Local Union: Its Place in the Industrial Plant. Pp. xv, 269. New York: Harper & Brothers, 1953. \$3.50.

The vast literature dealing with the American labor movement contains relatively little that is concerned with unionism at the local level, and much of what exists is of indifferent quality. Sayles and Strauss, of the New York State School of Industrial and Labor Relations at Cornell, now help to fill this gap with publication of a volume based on intensive study of seven locals and less thorough observation of thirteen others.

The Sayles-Strauss research focuses on three areas in the internal life of the local union—the grievance process, the officers and stewards, and problems of union democracy. The authors prove themselves to be keen observers, with considerable insight into the complex of forces that shape union policy and with an appreciation of the effect of factors such as changing relations with management upon the internal life of the union. The volume contains a number of shrewd observations upon such matters as the decline of the steward's position as union-management relations improve, the criteria used by union officers in the selection of grievances, the social characteristics of union officers, and the differences between union leaders and inactive members in the attitude toward union activities.

Methodologically the volume is not precise, as the authors frankly admit. The twenty cases that were studied, representing small and moderate-sized locals in a variety of industries, were located in four northeastern communities, and the authors relied for their material on observation, informal discussion, more formal interviews, projective tests, and documentary data. The authors point out that the selection neither of locals to be studied nor of workers to be interviewed was determined

on a random basis; they are tentative and exploratory in their judgments, and carefully note that they are raising questions rather than providing proof. In the judgment of this reviewer the methods employed are defensible in the present stage of very limited knowledge about local unionism, though more attention must be paid to methodological problems if our knowledge is to continue to advance.

The volume is a stimulating and provocative one, that adds substantially to our knowledge of local unionism. It should prove of considerable value as supplementary reading in courses in industrial relations; and the authors' generalizations, often framed tentatively in the form of hypotheses for further study, should stimulate others to attempt more precise studies and so build on the foundation that Sayles and Strauss have so competently helped to lay.

JOEL SEIDMAN
University of Chicago

BOWEN, E. R. *The Cooperative Road to Abundance.* Pp. xiii, 169. New York: Henry Schuman, 1953. \$3.00.

This is a strong plea for the further development of Co-operation with a capital C, supported by ethical, economic, and scientific arguments. Although the author claims (p. 105) that "we do not have to change human nature" to bring about this development, the verb "should be" is much more conspicuous than "is" throughout the book. "Simply let social human nature develop and suppress our selfish natures" (p. 105) does not seem so simple to this reviewer.

The author insists that competition has failed to result in either efficient use of resources or equitable distribution of product. Moreover, it not only has proven economically unsound, but it is ethically and morally vicious. "Competition is simply to declare war" (p. 81) is quoted with apparent approval. Still further, the competitive system appears to be on its way out. "The first half of the twentieth century saw the full flowering and the collapse of the competitive system. Since 1929 this system has been kept alive by

infusions in the form of subsidies from the public purse" (p. 39). The reasons for the collapse are summarized under six headings: the system is unstable, unjust, inefficient, undemocratic, leads to dictatorship, and to war (pp. 44-48). It is implied that a change in the order of our thinking from Liberty, Equality, Fraternity, to Fraternity, Equality, Liberty (p. 17) is on the way, will further reduce the role of competition, and will lead to a better social order under Co-operation.

One of the interestingly provocative sections in the book is the parallel comparison of the old pro-slavery arguments with the present pro-competition arguments (pp. 69-72) grouped as economic, political, moral, scientific, and general. The conclusion: "time may prove that the arguments which are used today to support our economic system are as false as were the arguments formerly used to support slavery" (p. 72). Certainly some of the points listed will already be branded as sophistries.

The author is unrealistic at times. For example, he says that with an ideal economic system "everyone would be able to choose the occupation that would best satisfy his desires" (p. 11). This seems to imply the belief that somehow the total of our desires to produce would nicely match our total desires to consume. But perhaps too many of us would choose to be like Ferdinand the Bull as producers while we were gourmands as consumers. Or perhaps I am the best mountain climber ever born, but I just do not like to climb mountains. What is the "ideal" economic system (Co-operative or any other) going to do about it; get along without the most efficient mountain climbing—or do I climb? Fantastically complex decisions as to who will do how much of what will always need to be made, and perhaps the old adage that where McGregor sits, there is the head of the table will continue to suggest how the decisions will be made under any system of political economy.

Someone sagely has said that the only failure of the Christian doctrine is that it never has been tried. If nearly everyone really lived the eleventh commandment "that ye love one another," Co-operation might really flourish. But we seem to love

ourselves and our immediate groups first, with only a modicum of somewhat arrogant compassion for people generically. With all respect for Mr. Bowen, I am afraid the triumph of Co-operation does require a change in human nature, at least a change in the balance between the force of personal ambition and greed on the one hand and the mutual love for mankind on the other. If and when that change matures, the details of the system of political economy will be relatively unimportant.

University of Minnesota

SOCIOLOGY AND EDUCATION

REDFIELD, ROBERT. *The Primitive World and Its Transformations*. Pp. xiii, 185. Ithaca, N. Y.: Cornell University Press, 1953. \$3.50.

Finding his inspiration in the writings of Childe, Braidwood, Toynbee, and Whitehead, Dr. Redfield searches for a few universals around which to weave a simplified but suggestive account of the history of the human race, much as did the earlier "fathers of anthropology." He aligns archaeology, history, and anthropology to bear upon two principal problems: First, "What can be said that is general and true about the condition of mankind before civilization?" Second, "What were the transformations which turned folk society into civilized society?"

He finds that archaeologists have been able, from their study of material remains, to piece together a picture of the small, homogeneous communities of precivilized society, which largely supports the notion of the "primary condition of mankind" obtained by anthropological studies of present-day primitive peoples. Emphasis is placed on the food-producing and urban revolutions as most fundamental in bringing about civilization, with perhaps greater significance attributed to the latter. He attempts to view history "from the bottom up" instead of becoming involved in the often dazzling theories of Toynbee, Spengler, or Sorokin. He seems to rely largely upon the old comparative method in an-

thropology which still proves provocative.

The author has profound respect for the power of the "moral order" over the lives of men, stressing the claim that the early societies were held together, as are present primitive groups, by largely undeclared but continually realized ethical concepts. He does not feel that the moral order has diminished since the coming of civilization, but rather that its character has changed. With the binding together of larger and larger units, it has become more independent, and in itself an agent of change. "It is the spirit of reform, the making of man's world by man's design, which makes civilization so different a thing from pre-civilized living."

This book does not claim to be a finished product or a final answer to any of the fundamental issues raised; but it is a stimulating experience to share his thinking as this writer comes to grips with them in his sincere and profound way. There is throughout a simplicity and human touch about the man that captivates the reader. While Redfield suggests that we do not want ethnologists so balanced that they lack humanity, in him we find both humanity and balance.

CAROLYN ZELENY
LEO W. SIMMONS

Yale University

RADIN, PAUL. *The World of Primitive Man*. Pp. xi, 372. New York: Henry Schuman, 1953. \$5.00.

Dr. Paul Radin's new book cannot be summarized, still less criticized, in 400 words. One of its interests and values, to specialist and layman alike, is its insistence (renewed and somewhat extended from earlier books of Radin's), that aboriginal or primitive man was (and is) a many-sided and competent man: competent technologically, politico-socially, and philosophically; and conscious and competent in his institutions directed toward socialization, personality development, and mental, even psychosomatic, hygiene. This insistence is by no means as unique to Radin as his book implies; and its thesis is developed with uneven adequacy, varying from lucidity to what may appear as im-

pulsiveness and, in places, murkiness. A few specifications follow:

Aboriginal societies usually were not simple but complex, often extremely complex while at the same time functionally and psychologically integrated. They were organic-democratic, not monolithic-coercive. They conferred on the child, the woman, and the aged, adequate roles. They affirmed, in practice and symbolically, individuality and the inalienable rights of personality. They insured, to all, those "irreducible minima" of food, shelter, and social belonging, which later, more massive, societies have denied to many or to most. Their economic systems, based on giving back more than one received, and on distribution to and through means of the community, were competent systems. These propositions are set forth and are supported factually and on the whole adequately in the book, although with what may appear as insufficient acknowledgment that they have been made and supported many times heretofore by scholars from Prince Kropotkin to Karl Polanyi. And Radin makes a statement which surely is important though not exhaustively accurate: that the real judges of the accuracy of anthropological interpretations are the peoples being specifically interpreted, rather than the social scientists of often conflicting and ephemeral schools.

In Radin's book, the more labored and, by intention, more important, portion is its psycho-cultural interpretation; and space, here, forbids a critique of this. In sum: Radin insists that man always has—since the dawn of the world—confronted those agonies and achieved those triumphs, of individuation, socialization, and discrimination between the inner and outer worlds, which many thinkers have assumed to be agonies and achievements of rather recent epochs. He furnishes evidence, as from myths and "personal documents." He seeks to push back the psycho-cultural horizon very far into human time. He is not first in this effort, nor alone, and his thought appears as uneven, his literary exposition not firmly knit, and his humility and respect for fellow-workers not impressive. The thesis, not his alone, is fundamentally important toward the under-

standing, inadequately attained as yet, of man and world as functions of each other.

JOHN COLLIER

City College of New York

LEWIS, ROY, and ANGUS MAUDE. *Professional People*. Pp. vii, 284. New York: British Book Centre (distributors for Phoenix House, London), 1953. \$4.00.

The publication of *The English Middle Classes* several years ago established Lewis and Maude as sprightly social historians and keen observers of the contemporary British scene. The present volume represents an extension of their concern for the destiny of middle class people and culture under the English welfare state, focusing on those occupations which are broadly known as the professions. On one level the reader will find uncontroversial information about the historical development of English medicine, the law, engineering, education, and so forth, the rise and proliferation of professional associations, present methods of entering the professions, and prospects of remuneration. On a deeper level, these facts are set against the authors' interpretation of the cumulative impact of increasing specialization, the growth of big business, and, most saliently, the rise of the collectivist state.

The dominant theme of the book is that the welfare state, while it has increased the quantitative employment of professional people, has undermined their economic rewards, lowered their social status, and diluted the quality of their educational preparation and their work. The evidence presented on all but the very last of these points is not unpersuasive, although whether all these results will be considered entirely undesirable will depend on one's value-judgments and a consideration of developments in other sectors of English society. There is little mystery about the authors' viewpoint. It is clear from their cumulative work that they regard the upper-middle class English way of life as *summum bonum*, and while they are quite prepared to see orderly recruitment to it from lower orders (they are by no means unreconstructed Tories), they frankly oppose any fundamental threat to its status, culture, and economic advantage. Their de-

fense of this position is a sophisticated one—a neat blend of the old-school-tie attitude and selected social research.

Their most cogent warning, for this reviewer, concerns the dangers inherent in a situation where the state is the sole employer in a particular profession and there are no alternatives in the pursuit of one's career. Only doctrinaire collectivists will fail to be impressed. On the other hand, one might well wish that the authors had devoted some attention to the comparative opportunities for native ability to rise to its natural level of achievement in the old order and the new. This would have added a great deal to the palatability of their concern for upper-middle aristocracy.

MILTON M. GORDON
Haverford College

MACE, DAVID R. *Hebrew Marriage*. Pp. xvi, 271. New York: Philosophical Library, 1953. \$6.00.

This useful book is essentially a critique of the McLennan brand of evolutionary theory as applied to the early Hebrew family system portrayed in the Old Testament. After defining his terms in the light of modern anthropology, Dr. Mace states the four assumptions of the older evolutionary theory. These assumptions were: (1) a simple unfolding of Hebrew culture, (2) totemism among the early Semites, (3) a system of "mother right" preceding the patriarchal regime, and (4) polyandry among the early Semites.

In four successive chapters these assumptions are demolished or reinterpreted. Cultural syncretism is revealed, the patriarchal system rather than totemism is regarded as basic, and a stage of matriarchy is rejected, at least as to significance. While widespread polyandry is denied, the levirate is regarded as a custom which was cherished as a means of providing continuity to the Hebrew patriarchal system.

In the second part of the book it is argued that while polygyny was freely practiced by prominent men, monogyny was the more general practice. For the common man infertility justified the taking of a second wife, although the monogamic

ideal later flourished with changing conditions.

The analysis of mating regulations suggests a cycle of change as to social endogamy and emergence of exogamy with respect to affinity. Secularly arranged marriages with exchange of gifts and transfer of masculine authority seem to have been the rule.

With respect to the status of woman, Mace makes a distinction between the wife and concubine and stresses the special father-child relationship with respect to legitimacy and parental authority. A double standard of sex conduct flourished. Attitudes toward sex expression were colored, however, by religious attitudes toward the practices of heathen cults. Mace agrees with most authorities concerning the early male divorce privilege which was later curtailed.

The charge of beating dead horses might be made against the book. Yet in the course of such beating, the reader is offered a clear, useful, and admirably arranged account of a patriarchal way of life which still exerts influence upon the present day world.

CLIFFORD KIRKPATRICK
Indiana University

RUMNEY, JAY, and JOSEPH P. MURPHY. *Probation and Social Adjustment*. Pp. xvii, 285. New Brunswick, N. J.: Rutgers University Press, 1952. \$4.50.

This welcome volume is an expression of the healthy striving within the field of probation to achieve full professional status. It may be expected that "accountability" for consequences will become a central concern as probation tends, increasingly, to represent a systematically taught and conceptualized means of contributing to the adjustment of offenders through the application, to their particular circumstances, of what is known of the art and science of helping. The measurement with public announcement of the results of one's activities is, of course, an excellent form of reporting and accounting.

While Rumney, Murphy, and the Davella Mills Foundation which backed them are to be congratulated for a responsible undertaking, a reviewer must add that their

endeavor is helpful and suggestive but not successful. It provides leads and warns future researchers of difficulties, but does not achieve its purpose of measuring the results of probation with 1,000 persons as of a date eleven years after court disposition.

To be commended, in addition to the decision to make the study, are the interdisciplinary approach to the choice of criteria and instruments, the painstaking follow-up and review of records, and the careful pursuit of all possible leads in the data analysis. These are not enough, however, to compensate for methodological and procedural deficiencies too numerous for full listing in a brief review.

The basic premise is correct: for lack of appropriate "control" groups, adjustment must be measured against community norms. However, if, as the authors warn, it was necessary to place two-thirds of the study population on probation without presentence investigation, this is hardly an appropriate group for use in research seeking to appraise a method which specifies investigations. Second, adjustment ratings were made on the basis of obviously inadequate data and in terms of very questionable criteria. Several systems of classification were developed for purposes of analysis but prove to be confused and not mutually exclusive. Moreover, the probation service being examined consisted of many different things—or nothing at all—done to or for probationers as varied as truants, husbands in support courts, and hardened criminals. Elaborate statistical processing does not overcome problems such as these. Quite properly, the authors turn from rather forced minor findings to sound discussion of what a court needs for developing sound services.

New York School of Social Work

GOLDHAMER, HERBERT, and ANDREW MARSHALL. *Psychosis and Civilization: Two Studies in the Frequency of Mental Disease*. Pp. 126. Glencoe, Ill.: The Free Press, 1953. \$4.00.

With the widespread current emphasis upon the mental health of the nation and its implications for literally every aspect

of contemporary life, analyses of the frequency of mental illness have particular significance. The most recent consideration of the problem of the incidence of mental illness, *Psychosis and Civilization*, by Herbert Goldhamer and Andrew Marshall consists of two studies. The first, and more extensive, is entitled "A Century of Mental Hospital Admission Rates in Massachusetts," and the second, "The Conditional Expectancy of Mental Disease."

The data for analysis in the first study consisted of first admissions to hospitals for the insane in Massachusetts beginning with 1840 and total admission rates for Oneida County, New York, 1843-65, together with comparable data on a wider basis. By careful and imaginative handling of the data the authors develop their analysis based on the hypothesis that there has been no increase in the frequency of psychoses during the past hundred years. Using the age distribution of first admissions rather than total admissions, the authors find no increase during the last century in the incidence of psychoses among persons under the age of 20 or in the population 20 to 50 years of age. On the other hand, they find a marked increase in the age-specific admission rate in the age group over 50 years which they ascribe primarily to the increased tendency of hospitalizing persons with the mental diseases of old age. They also suggest the possibility of some actual increase in the incidence of these disorders. They properly point out the limitations of their conclusions due to the fact that they exclude consideration of neuroses and psychoneuroses and changes in the incidence of psychoses with an organic basis.

In the second paper the authors examine in greater detail the frequency of major mental illnesses and develop an expectancy measure for the risk of such illness during the life span of an individual or at a specified age. Computations are based upon data for New York State. Estimates are also made of the frequency of psychoses that are not hospitalized.

The findings of the two studies should be of especial use to administrators faced with the problem of determining need for

hospital facilities. A summary of the concrete findings, eliminating much of the technical methodology, would be helpful for practical purposes. For the technically trained reader, the methodology merits careful study. The references to the more important earlier studies of the incidence of mental illness are useful in evaluating the contribution of these two papers.

ELLEN WINSTON

State Board of Public Affairs
Raleigh, North Carolina

SHERIF, MUZAFER, and CAROLYN W. SHERIF. *Groups in Harmony and Tension: An Integration of Studies on Intergroup Relations*. Pp. xiii, 316. New York: Harper & Brothers, 1953. \$3.50.

Groups in Harmony and Tension is both a summary of various approaches to the study of groups and a report of a specific research illustrative of the author's preferences in method. In summarizing the various approaches to this field, the authors, while overcritical of anything which suggests psychoanalysis, do an excellent job of showing how the behavior of groups, or of leaders within the group, must be viewed in interactional terms. That is to say, both the characteristics of individuals and the standards and norms of the group must be analyzed before an understanding and a prediction of group behavior may be derived. By showing the inadequacies of methods and theories which rely primarily upon any single approach, the authors demonstrate their contention that an essentially interdisciplinary approach to the study of groups is desirable.

Throughout the book, the authors blend statement of preference with theory and with fact, quoting liberally from many other authors and studies to show how previous work relates to their theories. In two chapters toward the end, the authors report two experiments conducted to relate the various hypotheses upon intergroup relations which they developed in the discussion in earlier chapters.

The importance of the topic discussed by the authors can hardly be questioned, either in its theoretical aspects or in its practical implications for complex social living. In

their analysis of these topics, they discuss various factors previously utilized in studies of groups and intergroup relations: deep-seated instincts, the inherent characteristics of race, national character, individual frustrations, special characteristics of leaders. While remaining essentially critical of all these approaches, they concede they all do have a place in a total analysis of intergroup problems. They insist, however, and probably not without good reason, that the essential feature of intergroup relations requires that consideration be given to all these and other factors within the setting of the particular case of intergroup relations being studied. Intergroup relations, they observe, is the outcome of an interaction of forces; some internal—needs, motives, attitudes—and some external—situational, organizational, socioeconomic. A point of special interest made by the authors is that the study of the factors operative within a given group may not be identical with the factors determining the behavior between two or more in-groups. This relationship has properties determined in the course of interaction, features which are not discernible from the study of any single group.

While implications for social action are inherent in the discussion, they are only infrequently made explicit. This volume will be of interest to a person with some knowledge and experience in the field of social psychology and with an interest in the development of theory in that field.

WILLIAM E. HENRY

University of Chicago

BREESE, GERALD, and DOROTHY E. WHITE-MAN (Eds.). *An Approach to Urban Planning*. Pp. xi, 147. Princeton: Princeton University Press, 1953. \$2.00.

This short anthology, derived from a conference, by its title suggests a coherent approach to the planning of cities. This is not the case. Rather, these are five approaches to different phases of urban planning by five nimble minds. These five essays are prefaced and epilogued by a pair of succinct declarative commentaries on the state of urban planning by the editors. Hugh R. Pomeroy in the initial essay on the planning process, among other

things, cautions against commitments in current planning that would irrevocably bind communities to future decisions. It is a plea for flexibility and also humility. It is a paper that ranges over a tremendous number of problems and within a very brief amount of space makes useful comments on those problems. The subject range includes the early history of the city planning "movement" in this country, the nature of the so-called master plan, and the various forms in which citizen participation in city planning may take place.

The succeeding papers are of a different, somewhat more specific, nature. Thus the second paper, on land use and zoning, by Norman Williams, Jr., tends to note the main devices and practices in the controlling of land for residential, industrial, commercial, and other uses. Similarly, the essay on housing and urban redevelopment by Charles K. Agle and the paper on metropolitan transportation by C. McKim Norton attempt to cover the main problems that have been faced in practice.

The land use and zoning essay starts with an abbreviated statement on commonly accepted goals and the legal instruments for controlling land use. The stress of the paper is on zoning devices such as minimum building size and garden factory districts. The housing and redevelopment essay in a "homey" style emphasizes the different housing requirements of the family in various stages of its life cycle. Problems mentioned include the deficiencies of housing standards, congestion and the lag between technology and consumed desires. Both possibilities and limitations of a publicly aided urban redevelopment program are indicated. The transport essay treats circulation not as an independent variable but as part of the community fabric. There are comments on metropolitan organization, parking, and transportation.

The concluding essay, by Walter H. Blucher on fiscal programming, returns to the critical over-all vein of the opening essay of Pomeroy. It briefly dissects the rule of thumb decisions that have been made in allocating funds for public development proposals, and it stresses analysis of a social and economic way of life as a basis for capital programming and for the

comprehensive planning to which such programming to be rational must be allied. The questions raised in this paper make me wish there had been more room in the volume to help develop the "basic principles and perspectives" mentioned in the preface.

Like most anthologies, this one does not present a consistent image of the subject. What it does do is to provide a set of stimulating essays (and an annotated bibliography) of interest and use to local government officials, to students and others involved in community planning, and to interested laymen.

MARTIN A. D. MEYERSON

University of Pennsylvania

FISHER, LLOYD H. *The Harvest Labor Market in California*. Pp. xi, 183. Cambridge, Mass.: Harvard University Press, 1953. \$4.50.

This is the most recent of the studies sponsored by the Jacob Wertheim Research Fellowship. It is an outstanding contribution to our understanding and knowledge of the casual farm labor market. The plight of the migratory agricultural worker has long been the subject of study by many agencies and groups which have proposed programs for improving his life. The recommendations made by these studies show a wide area of agreement on the necessary reforms. But as Professor Fisher points out, the record of accomplishment is very scanty. After reviewing the record with respect to the persistent exclusion of agricultural workers from the protection of the major labor legislation of the Roosevelt Administration, he comes to the conclusion that "the power of government is not available for every task which logic or ethics may set for it." The brightest hope for the solution of this problem of the seasonal agricultural worker, he believes, lies with the elimination of the jobs upon which they depend, largely as a result of farm mechanization and of the transfer of workers from agricultural to industrial labor markets.

In an exceedingly able and interesting exposition, Professor Fisher points out in Chapter I that the California agricultural labor market is "structureless" with no sys-

tem of job rights or preferences, no personal relationship between employer and employee involving informal obligations and various types of moral tenure. The work is largely unskilled, the method of compensation by unit of product, and, finally, the operations require very little capital or machinery. Such a market has many advantages to the employer. He can employ any kind of labor. In fact, the market for harvest labor is organized to maintain the advantages of disorganization. Prejudice and labor union restrictions play an important part in immobilizing the farm worker.

Succeeding chapters of the book discuss the history and functions of contract labor in California and wage fixing by employers associations and by the government.

Administrators of the United States Employment Service will be particularly interested in Fisher's discussion of the relatively minor role played by this Agency in organizing the agricultural labor market in California as contrasted with the position of the labor contractor.

The foreword of the book states that Professor Fisher died at the age of 41, just a few days before his book was to be published. His untimely death will be regretted greatly by all who read this book. Surely he richly deserves the encomium paid him, by Clark Kerr and John T. Dunlap in the foreword.

E. J. EBERLING

Vanderbilt University

KOGAN, LEONARD S., J. McVICKER HUNT, and PHYLLIS BARTELME. *A Follow-up Study of the Results of Social Casework*. Pp. 115. New York: Family Service Association, 1953. \$2.50.

The latest publication of the extended program of research in social casework of the Institute of Welfare Research of the Community Service Society of New York, this study presents an attempt to discover whether there is any carry-over from a client's experience with a social agency, in his future living. Designing a form of follow-up method, the researchers used a group of 38 cases which had been assessed by the Institute's "Movement Scale" while

they were being helped by the agency and which had then had no contact with the agency for five years. The determination of the predictive validity of the earlier judgment was a secondary goal of this study. The data on which the study bases its conclusions are derived from interviews held by one interviewer in unannounced direct contact with 80 individuals in these 38 cases. Discussing their previous and present experience with surprising willingness with this stranger, these former clients produced convincing evidence that they had held on to their gains and had in reasonable measure improved their status. Though the researchers found no significant relation between the amount and direction of change experienced while being helped and the amount and direction of development during the five-year interval, they concluded that there was an indubitable, beneficent result from the casework experience, still operative in the lives of these former clients.

The clients' expressed feelings about their experience with the agency were on the whole most positive. Even individuals who had been judged by the "scale" to have had little or no development, considered themselves in retrospect to have been helped. The predictive validity of the original judgment of movement was questionable on this score as well as on others. Submitting the old records to new predictive study by a team of skilled caseworkers yielded more positive correlation, thus indicating that case records contain a yet untapped resource for study, best understood by skilled caseworkers.

Presented as an exploratory study in the use of the follow-up approach, it is creative in its attempt to quantify intangibles. It courageously uses assumptions and draws inferences, and has a healthy respect for empirical results. However, the quantification of the results of these 38 cases for the purposes of measurement ignores all the great differences of problem presented in them and of time and money spent on them by the agency, and thus reduces the help given to a common denominator which to this reader seems meaningless. We have yet to discover what process was really being evaluated as to its worth to society.

The results of this study, tentative as they are, nevertheless give "the assurance of firm fact" which substantiates the community's belief in the social agency as an instrument of social betterment. Thus it encourages social workers who could not operate without that belief to continue to collaborate in the search for facts which may reveal new connections between their faith and the acts which they perform.

ROSA WESSEL

University of Pennsylvania

School of Social Work

GOLDMARK, JOSEPHINE. *Impatient Crusader: Florence Kelley's Life Story*. Pp. xiii, 217. Urbana: University of Illinois Press, 1953. \$3.50.

For those of us who knew Florence Kelley and the dedication of her life, it is good to have her story spread out before us and to see from the distance of the years that have passed since her death the pattern and design of her accomplishment.

Reading *Impatient Crusader* I am impressed with the fact that Mrs. Kelley was more interested in preventing the disease than in nursing the afflicted; she preferred safeguarding the worker to giving charity to his widow. She believed in using the tools of intelligence and research for the facts, and in bringing about cures by improving the laws of the land. Her *veni, vidi, vici* was "investigate, educate, legislate." Her ability to plan and organize her campaigns for her objectives was extraordinary; the passion of her sincerity without any hysteria was, of course, convincing and invincible.

And what a group of women developed and grew into real servants of their country within the old brick walls of Hull House: Jane Addams, Julia Lathrop, Alice Hamilton, Florence Kelley! And what allies Mrs. Kelley had when she came to New York to take up her work in the Consumers League: Lillian Wald and Paul Kellogg!

There is always a danger, when looking back, to feel that the big souls who carved out the wilderness were made of firmer and better stuff than are the crusaders of today. Miss Goldmark's beautifully told re-

view of Florence Kelley's life is an antidote for such stultifying thoughts; it is a challenge and a quickening for anyone who looks about him and sees he has a job to do as a citizen.

It is especially fitting for this simple story of a wonderful woman to have been told by her close friend and associate, Josephine Goldmark, but as we read of the long struggle for legislation concerning wages and hours, employment of children, and protection for mothers and infants, we cannot be content to call Mrs. Kelley "impatient." Her impatience was of the sort that kept her constantly working, keeping alive these most important issues; it was the impatience only of the patient, of the sure, the right.

It is appropriate, too, to have the preface and the chapter in retrospect of this fine book written by Elizabeth Brandeis, the daughter of the great man, Chief Justice Brandeis, who did so much to aid in the accomplishment of Mrs. Kelley's purposes, and the foreword done by Chief Justice Frankfurter, another clear-thinking, hard-working friend of Mrs. Kelley and of her causes, which we of today consider as parts of our inheritance.

CHARLOTTE CARR

New York City

PHILOSOPHY AND RELIGION

STUBER, STANLEY I. *Primer on Roman Catholicism for Protestants*. Pp. xii, 276. New York: Association Press, 1953. \$2.50.

It has been said, and with more than a modicum of truthfulness, that "nothing on earth consumes a man more quickly than the passion of resentment." Which could explain why Dr. Stuber, an observant Protestant, alert to the dangers threatening many of his co-believers, besieged as they are with a marked misrepresentation of things Catholic, sought to do something about the avalanche of recent literature that has, in some circles, at least, built up a mountain of Protestant resentment and ill will toward Catholics. What he has

done is to write what must be regarded as an admirably objective and highly irenic manual. For this, Catholics as well as Protestants can be grateful. It can unquestionably help both.

Carefully detailing beliefs and practices in a manner that savors of the Baltimore Catechism, he has set them forth in contrast with what he feels can honestly be stated as "Protestant" convictions. The result is a happy one: a calm and informative book which, while hardly a profound dissection of intercredal differences, is none the less a noble effort to bring about a greater understanding between all Christians.

Minus the long, tiresome harangue so characteristic of the Blanshard books on the subject, this volume is pleasantly different. Its treatment of Catholic beliefs, whose orthodoxy has been carefully substantiated by a competent priest, is a balanced and commendable one—something that cannot be said, however, in regard to all the author's reactions to such beliefs. Frequently, he can be found jumping to conclusions. And nowhere is this more evident than in the recognition of his not-too-disguised thesis that the Catholic Church is an admirable organization if it restricts its beliefs to its own followers and stays within the confines of the sanctuary.

In this conviction, Dr. Stuber turns up with the expected in his treatment of the usual points of intercredal controversy—birth control, papal infallibility, religious freedom, and divorce. Unfortunately, his conclusions are sometimes open to question. As an instance, he writes: "Roman Catholicism, because of its hierarchy, does not adjust easily to democratic principles and practices."

However, no matter how much one may find it necessary to disagree with Dr. Stuber in his reactions to Catholic beliefs, it must be admitted that he is probably as impartial concerning the Catholic Church as any convinced Protestant can be. His frank admission of suspicion and misgiving about the intentions of the Church indicates, to be sure, his fundamental Protestantism but it also establishes the not-to-be-denied tragic fact that the Catholic

Church has a great job to do in explaining its most elementary principles and practices.

JOHN H. DONNELLY
University of Pennsylvania

DAWSON, JOSEPH MARTIN. *America's Way in Church, State, and Society*. Pp. vii, 189. New York: The Macmillan Company, 1953. \$2.50.

This is the credo of a remarkable person, the closest approximation of Roger Williams produced by the twentieth century. Joseph Martin Dawson, now on the eve of his retirement from the position of executive director of the Joint Baptist Committee on Public Affairs, was for many years a Baptist minister at Waco, Texas, deep in the heart of the Bible Belt and White Supremacy. Yet he stoutly defends secularism (a term that he shows has wrongly become identified with atheism), the United Nations, a liberal immigration policy, freedom of political expression, and racial equality.

A Baptist's espousal of the principle of separation of church and state is not surprising. No group, certainly no religious group, contributed more to the evolution and establishment of this principle in the United States than did the Baptists, and for this America owes them a great debt of gratitude. But the contribution is not a matter merely of the historic past; it is a continuing contribution, and one of especial value today. For recently the principle of separation has been subjected to a steady campaign of attack and criticism whose effect, if not purpose, is to equate separation with secularism and secularism with atheism. A defense of separation by secularists such as Dewey, Kilpatrick, and Kallen fortifies rather than rebuts the equation of separation and atheism; but a passionate defense of separation by a revered spokesman of the most theologically conservative major Protestant denomination in the country cannot be so readily dismissed.

Mr. Dawson's book is deeply religious in its tone and argument. Perhaps it claims too great a role for religion in the fashioning of the American democratic so-

ciety. Yet none can deny that the social gospel has had a tremendous influence in American life, and this book recounts briefly the meaning of that gospel to one of its most devoted adherents. The book discusses the Americanization of the Protestant churches and the concomitant secularization of the American government. It discusses and defends that interpretation of the First Amendment's ban on laws respecting an establishment of religion which bars government from any intervention in religious affairs even to the extent of according material benefits to religion on a nonpreferential basis. It takes issue with Protestant no less than Catholic critics of the secularism of our public educational system and quotes Ben Franklin's pungent remark that "When a religion is good . . . it will support itself and when it cannot support itself and God does not care to support it, so that professors are obliged to call for help of the civil power, it is the sign . . . of its being a bad one."

It supports church participation in the struggle to better this life rather than merely to prepare men for the next. Opposing Marxism, it nevertheless urges a progressive labor policy. It sets forth an approach of reason rather than blinding passion to the problem of divorce; it urges integration of the Negro in American society as a command of Christianity and finds in the charter of the United Nations "an approximation of Christian principles." All in all, this is an interesting book by an interesting personality.

LEO PFEFFER

American Jewish Congress
New York City

FINKELSTEIN, LOUIS (Ed.). *Thirteen Americans: Their Spiritual Autobiographies*. Pp. xii, 296. New York: Harper & Brothers, 1953. \$3.00.

These are essays by thirteen persons who are contributing to the preservation and advancement of civilization, including Negro and white, Christian and Jew; twelve men and one woman. Eleven of the essays were delivered as addresses at The Institute for Religious and Social Studies of the Jewish Theological Seminary of

America, and two were especially written for this book.

It is rarely that the admiring bystander has a chance to look behind the scenes and see the inner motivation of the men and women who are shaping his generation, and the influences which were most potent in shaping their lives. These essays give that opportunity, to almost an embarrassing degree in some cases.

One is struck first of all by how much these men and women have in common, diverse as they are in background and religious faith. There is the early home influence, and in most cases also that of a childhood church and community, to which almost without exception they give the credit for what they have become.

Again, there is the recurrence of tribute to some great teacher or other personality who at some formative time gave sense and direction to a young life seeking a mission or just drifting.

All are persons of action, men and women who are resolved to do something toward the betterment of human persons and society. Their contributions are being made in many different directions, but with a singleness of purpose that transcends personal comfort or gain.

In all cases, social idealism is permeated by a belief in God and a dependence on the power of God for the achievement of ultimate ends. There is no labored theological argument. Each stands in humility and awe before the Creator, confessing his own sense of mystery.

Though representing many faiths, these leaders profess a breadth of religious sympathy and understanding which is able to go far beyond the petty differences which divide men. Of such is truly the Kingdom of Heaven.

The nature of the material in these essays, and the fact that most of them were delivered as addresses, sometimes give the reader the impression of an old man reminiscing about the past. This is in part due also to the reticence with which a humble person will speak about such intimate matters. The impression of the whole, however, is one of having been in communion with persons of real spirituality and humility. One could wish that many

Americans, especially young Americans, might have the inspiration of these examples of religious living at its best.

PAUL H. VIETH
Yale University Divinity School

BUTTERFIELD, HERBERT. *Christianity in European History*. Pp. 63. New York: The Macmillan Company, 1953. \$1.75.

This slender volume contains the 1951 Riddell Memorial Lectures delivered at Durham University by the distinguished British historian whose learning and sagesse have become renowned, and who in these days of renewed interest in the achievement of Lord Acton may be regarded in part as his avatar in our generation. These compact lectures continue the theses developed in such works as *History and Human Relations* and especially *Christianity and History*. The author's previously formulated admonitions against the oversimplification, overdramatization, and lurking distortion of historiography, his emphasis on the power factor inherent in social organization, and his crystallization of a Christian philosophy of history, penetratingly summarized in an earlier composition by the somber judgment that what history does is to "uncover man's universal sin," continue operative in the present book. Clearly, a brief notice is incommensurate with the magnitude of its theme and its erudition and wisdom.

The first lecture, "The Making of Christendom," re-examines the diverse factors in the expansion of Christianity in the Roman Empire and appraises the consequences for the world of the European triumph of a religion oriental in origin but subsequently largely confined to and identified with Europe. In the postclassical world Christianity performed the function of helping to create a new social order out of the chaos of barbarism, thereby producing Europe as an historic entity. This section replete with sociological observations on the origin, diffusion, and functioning of Christianity and, by extension, of other world religions, is terminated by an analysis of what Butterfield terms the "uncanny nature of the parallelism between modern communism and the Christianity of the post-classical period."

In the second essay on Christianity and Western Civilization, we survey the medieval achievement and follow the transformation of the formal religion of the mass-converted barbarians of Europe as Christianization is achieved by missionary endeavor, gospel preaching, pious example, and subtle exertion of influence. In this discourse Butterfield also traces the Great Secularization since the seventeenth century with its manifold effects, among which are an increase in the urbanities of living, the spread of unbelief among the intelligentsia, and the neutralization of the state in regard to religious matters. Like the humanism of the Renaissance not a few of the humanitarian manifestations of the Age of Reason were by-products of Christianity and persisted as hangovers from the age of faith. Modern humanitarianism, liberalism, and internationalism are interpreted as translations into a secular tongue of aspirations originally of religious provenience, which undergo attenuation and occasionally even inversion as the alienation from religious origins proceeds apace.

The last lecture is concerned with the relationship of religion to ethics and society, and it computes Christianity's achievement in man's eternal struggle for self-transcendence and collective redemption. Like other religions, Christianity as a historical manifestation cannot escape the operation of various forces which have shaped their emergence, expansion, structure, and influence. Butterfield stresses, however, that it has enriched history uniquely by its teaching and exemplification of charity; yet he does not exaggerate its beneficent influence on mundane affairs, nor gloze over the unChristian record of many of its practitioners. An iridescent *mystique* shimmers through the closing pages where the author evaluates the potential contribution of New Testament Love to the tranquillization and rectification of today's alarmed world.

EPHRAIM FISCHOFF
American International College
Springfield, Massachusetts

RICH, EDWARD CHARLES. *Spiritual Authority in the Church of England: An*

Enquiry. Pp. xxiv, 218. New York: Longmans, Green and Company, 1953. \$4.50.

This book is an attempt to examine the question of authority in Christianity, particularly as it affects the Church of England, of which the author, Canon Rich, is a distinguished clergyman.

Dr. Rich begins by describing the break-away of the Anglican Church from the papal allegiance in the sixteenth century, and the "appeal to sound learning" by which, in the hands of its great apologists, Jewel, Hooker, and Andrewes, it sought to justify and defend its position. Then he considers the several other kinds of authority which have subsequently been put forward in England—the Puritan reliance on Scripture alone, the rationalism of the Arminians and even more of the Deists, and the appeal to experience which found ultimate expression in the Quaker doctrine of the "Inner Light." This historical section closes with an account of John Henry Newman's attempt, in his *Lectures on the Prophetic Office of the Church* (1837), to think out afresh the relation of the Church of England to Roman Catholicism.

In the second section of his book Canon Rich seeks to work out a constructive solution of this problem of religious authority. He rejects the extreme biblicism of the Puritans and the rationalism of the Deists as well as the "Inner Light." While acknowledging that ultimately Christian doctrine must come home to the individual in his personal experience and freely authenticate itself to him, he contends that the final authority must be the Scriptures and tradition. These two, however, are not to be regarded as mutually disparate, but rather as constituting an inseparable unity, both being produced by that revealing act of God which culminated in Jesus Christ, and tradition merely making explicit what is implicit in Scripture. To the question of who has the right to decide as to which elements in the tradition are congruous with Scripture and therefore authoritative, Dr. Rich answers that it is the Church which has been entrusted with this responsibility.

It is at this point, however, that some

will find Dr. Rich's book least satisfactory. For outside the Roman Church, which regards the Pope as infallible when he speaks *ex cathedra* on questions of faith and morals, there is no group or body which is regarded as having the right to decide authoritatively on questions of Christian doctrine.

The value of Dr. Rich's book lies not so much in its conclusion as in the fact that it raises a question of great importance for all Christians, and discusses this question with learning and in a spirit of sweet reasonableness.

NORMAN VICTOR HOPE
Princeton Theological Seminary

LEE, MAURICE, JR. *James Stewart, Earl of Moray: A Political Study of the Reformation in Scotland*. Pp. xi, 320. New York: Columbia University Press, 1953. \$4.00.

Histories of the Reformation convey the impression that John Knox was not simply *magna pars*; he was in fact just everything in the Scottish Reformation, an impression which is not contradicted by Knox's own history of the events. One comes away with the uneasy feeling that the role of one man may have been exaggerated. This book redresses the imbalance.

The Reformation in Scotland would never have succeeded without the aid of the nobility. Among them none was more significant than James Stewart, Earl of Moray, the half-brother of Mary Queen of Scots. He was at once a convinced Protestant and an astute diplomat, and in addition was strategically situated in a turbulent time to steer Scotland toward two momentous objectives, the establishment of the Protestant religion and an alliance with England. The Earl paid for his tenacity with his life. Under James VI of Scotland (and James I of England) he was vindicated, and thereby Protestantism was quite probably also saved for England and the continent, for had Scotland remained Catholic and in league with France, England might well have been unable to maintain the breach with Rome, and had England failed, the Low Countries might also have succumbed. The achievement of Lord James was great. Here he receives his due

in a careful, well-documented and readable account.

ROLAND H. BANTON
Yale Divinity School

MUELDER, WALTER GEORGE. *Religion and Economic Responsibility*. Pp. xvii, 264. New York: Charles Scribner's Sons, 1953. \$3.50.

The concept of economic responsibility is a sign of immeasurable progress. A reign of physiocratic theory with its fiction of impersonal process is not easily overthrown. Echoes are still heard of Ricardian assumptions about a horde of unorganized individuals, shackled by egocentrism and motivated solely by self-preservation or self-interest. Respectable superstitions die hard. The demise of those twin monstrosities of abstract thinking, the economic man and the law of supply and demand, would call for a celebration. Every year their progeny multiply physical and mental disorders among "tired" business men, and in reaction some college graduates are beginning to resent a policy of "making a fast dollar" off your neighbor.

Dean Muelder's theme therefore brings the foresight of an ethical setting for vital economic and political values. He writes with keen perception and patience with factual material. He has drawn upon a host of supplementary authorities. His bibliography would enrich the library of many an educational institution. He allies himself with voices and movements bent upon humanizing social relationships, dealing plainly with such topics as postwar planning, government by cartels, decaying imperialism, Soviet totalitarianism, and the Point IV program of the United States government.

What about religion in all this? Here and there courageous persons speak out for a higher righteousness, but religious institutions generally have carried the flag of convention. Charity, philanthropy, and stewardship as yet scarcely venture beyond a shrewd meliorism. In this discussion ethical science is first reduced to "social" ethics and then suspended from a theological monism. Accent falls accordingly upon achieving an inclusive common good and elaborating the commutarian na-

ture of personality. These two emphases, together with cognate assumptions, displace what is of prime importance—the vertical dimension of a higher justice. Without that prime concern social and religious theory alike wither at the root.

IRL G. WHITCHURCH
Kingfield, Maine

SABINE, PAUL E. *Atoms, Men and God*. Pp. x, 226. New York: Philosophical Library, 1953. \$3.75.

This is a very good book, and a useful one. It gives a clear thoughtful answer to the question that must trouble a good many who are important in community leadership. The question is this: How can I believe the latest teachings of science and also believe in the Incarnation of Jesus Christ? As Sabine correctly states, most religionists and most scientists keep their science and their religion on opposite sides of watertight doors. This book safely opens the doors.

The author is a physicist, and his history and analysis of the development of scientific thought from the earliest days to Einstein and the waves or particles of light, is a model of clarity and simplicity.

It is fortunate that we have come through the period of the atomistic and mechanistic view of inert matter moved by mechanical and electrical forces, running down toward the fatal climax. That was appropriate for a world of hatred, strife, and greed. Now we have a mathematical world image of vital energy, not running down, but *becoming*, in an infinite rhythm of destruction and creation. In this physical world as described by the observer's mind there is evidence of purpose. The system of heating or cooling the human body to keep an even temperature beats the usual physical laws of loss of energy, and so do the hemoglobin of the blood, and the chlorophyll of the plants. That is what they are there to do, not just by chance. Either this physical world evidences pure thought in the mind of God, or it is not real at all.

Besides the physical world, there is the self that I know, which includes not only all my past individual experiences and the influences of my parents, but a whole un-

broken chain of ancestry. I am like an omnibus carrying innumerable ghosts of all who have gone before me, with their good and evil urges, but also with the psychic drive of their religion, something that seems essential in the evolution of the human spirit. Evolution is part of this process of a boundless vital urge, which expresses itself in adaptive variations and radical mutations. The first life on the planet and the arrival of the conscious mind were surely two of the most radical creations.

In this process of evolution in the human soul, in the days of Caesar Augustus the tribal Jehovah had become one God of justice and mercy for all people. Jove, the human emperor on Olympus, had become the divine Reason of the Logos. And many had conceived the idea of the redemptive sacrifice of a God ending in a mystical union with the believer's soul. The world was disintegrating, and yet looking expectantly for something. In Jesus and the Christianity he began they found their goal. Is there any real stretch of the scientific mind to see from these variations the sudden mutation we call the Incarnation?

The book is commended to every troubled religionist. He will find real spiritual food. It should help the parsons, too.

CHARLES P. TAFT

Cincinnati, Ohio

COLWELL, ERNEST CADMAN, and ERIC LANE TITUS. *The Gospel of the Spirit*. Pp. 190. New York: Harper & Brothers, 1953. \$2.50.

The volume's title is not provocative, but what it says should invite Christians to repent and make atonement for the traditional misinterpretation of the last week in Jesus' life. What has been the esoteric property of a few professors and students now may become the possession of any who study this volume.

There is general agreement among historians that the Fourth Gospel was composed at Ephesus in the second century but not by one of the Twelve Apostles. The facts collected in this argument compel the conclusion that its author was not

a Jew but a Gentile since he assumed that the high priest's office rotated annually, knew naught of Hebrew parallelism as a poetic form, and had stones available in the Jerusalem temple to throw at the Nazarene.

The purpose of this Gospel was to interpret the significance of Jesus to puzzled mid-second century Greeks and Romans who were calling Christians atheists and accusing them of sacrificing an infant in connection with the evening rites of the Lord's Supper. Hence he composed this philosophical treatise from which he deliberately and purposely omitted over 80 items found in the Synoptic Gospels, adding some 9 more or less new ones, transforming Synoptic materials he retained, reconstructing what he had read in available Pauline materials and perhaps in the Acts by the Spirit through the Apostles, and coming to terms with the Oriental mysticism everybody around him was so excited about.

According to the Fourth Gospel, Jesus was born of Joseph and Mary as a human being. There is no virgin birth and no immaculate conception in "John." But at the baptism, the Spirit descended upon him and abode on him. Thus Jesus became incarnate God through the possession of the Spirit to accomplish these divine ends: to die upon the cross and to bestow the Spirit upon his adherents. So the sentence of Jesus to death by Pilate was the execution of a primeval divine decree. The cross was not tragedy but triumph and exaltation. "The trial of Jesus was the trial of a god."

Judas is reconstructed in this Gospel. Jesus chose Judas as one of the Twelve in order that Judas might betray him (John 6: 64). The "disciples do nothing to prevent the betrayal." Jesus himself sends Judas out to betray him (John 13: 27-30). Judas makes no bargain with the enemies of Jesus, nor does he kiss Jesus to point him out.

Jesus is not the trembling man of Gethsemane the Synoptic Gospels describe but takes charge at his arrest. He acts as a god ought to act, and his trial is that of a god. In the Synoptic Gospels, Jesus enters Jerusalem "humble and riding on an ass";

in John "humble" has vanished! The cross is no surprise to Jesus here. He faced it from 1:29 on.

What now? Since the Fourth Gospel has become symbolism, it must no longer be interpreted as fact and the Church year in its Lenten phase demands revision.

CONRAD HENRY MOEHLMAN
University of Southern California

KIMPEL, BEN. *Faith and Moral Authority*. Pp. 186. New York: Philosophical Library, 1953. \$2.75.

The author of this book is a professor of philosophy at Drew University. He presents a well argued critique of those philosophies which hold that no general principles can be known for the dependable direction of life. He maintains that an individual cannot achieve a morally ordered life without some directives which have been learned from others and preserved in an institutional tradition. He does not contend that such principles can be intuited as self-evident but that they can be sifted, formulated and reformulated, justified, or rejected, by the processes of rational criticism. This critical search for adequate principles is an expression of moral faith which, we are told, "is a conviction that an individual has a responsibility to find out what can be known about the ways in which a more abundant life can be secured for himself and for others" (p. 105). This faith is served and guided by "moral insight" which is "a discovery of a way to act which will be beneficial to human life" (p. 109). The defense of this faith and this interpretation of moral insight lies in the argument that they are in practice essential to the moral life of the individual and society.

The author justifies his position chiefly through a comparative discussion of Socrates, Plato, Aristotle, and the Sophists, with some slight reference to contemporary naturalists. There is nothing fresh in this part of his argument. From this, however, he goes on to a discussion of contemporary existentialists, especially Jaspers and Gabriel Marcel. This forms the larger and most interesting part of the book. He argues that the phenomenalism of their

theory of knowledge and the pessimism of their interpretation of the human situation make their philosophies an inadequate basis and guide for the moral faith man needs.

A. CAMPBELL GARNETT
University of Wisconsin

WIDGERY, ALBAN G. *What Is Religion?* Pp. xi, 330. New York: Harper & Brothers, 1953. \$5.00.

Widgery's qualifications amply guarantee a work of outstanding merit. In acknowledgment of how perspective and main results in a study stem from theory of knowing, he makes that subject an early chapter. He adopts a theory of knowing by acquaintance. Mystical intuition gives the best example. It enables religion to stand on its own feet.

But can "history of religion" carry that load? What does religion say out of the rather nebulous "religious" assertions, or "religion in general," "the religions," and "religion"? Reference to many religions adds up essentially to multiplication of illustration, with a minimum of critical evaluation of ideas. The fact that many religions, for example, feature the "golden rule" is singularly unimpressive. It tabs an elementary sense of justice. At its worst it falsely glorifies any individualistic idea of justice, and at its best presents only a general admonition to be fair in our dealings. To identify justice with some abstract generalization about it is confusion, while to assume a universal knowledge of its ideal is devilish mischief.

Writers generally have slighted the emotional and practical expressions of religion, Widgery thinks. "History of religions" corrects this false step. Idea-versions also indulge in invidious comparisons. But it is far from clear that such a correction validates a religious intuitionism. Indeed that carries the seed of incalculable damage to the human spirit and to religion itself. When preferences are bathed in emotional fervor and implemented by ritual, it is a sorry day for the spirit of reasonableness. Questions about evidence are overshadowed by concern for abstract "proof," so that solipsism turns out to be

irrefutable. Or, can theism be satisfied with a consolation that "it is not inferior" to alternatives? In a time when actual religions are almost hopelessly enslaved by emotive preferences and customary practices, should reason be confused with some of its children of specialized abstraction or made to stand over against experience? Are assertions about the reality and "existence" of God the peak of religious understanding? Talk about the "existence" of God seems especially barren.

Knowledge in any field, with its beginning in abstract generalization, can move ahead toward concrete comprehension—provided reason's back has not been broken. This is admirably illustrated in later chapters on sin and suffering, significance of religious practices, emotional attitudes, and ideals. On these themes the religious judgments of mankind show remarkable unanimity. To have set out these insights with a spirit as commendable as it is rare, contributes much to religious sanity and development. Those who seek the quintessence of religion at its highest reaches cannot expect one book to do everything.

IRL G. WHITCHURCH
Kingfield, Maine

SEELY, CHARLES S. *Philosophy and the Ideological Conflict*. Pp. 319. New York: Philosophical Library, 1953. \$5.00.

This book undoubtedly belongs among the *curiosa* of sociophilosophical literature. It reminds one of Fourier's *Les Quatres Mouvements* in the manner in which phantasy, fact, misinformation, sheer mystical vision, and sharp insights are combined, but, unfortunately, it lacks the high imagination, poetry, and prophetic power of the earlier work. It is written in a matter-of-fact, almost childish naïve style, as if everything said in it is unquestionable truth and so obvious that no evidence is required in substantiation.

The author's intellectual temerity is colossal; he covers the whole history of the social role of idealism and materialism from the beginning of human history, assigning to both specific and, in general, antithetical roles in the struggle of man to establish an ideal society. To idealism,

he assigns the social role, in general, of keeping man in darkness, superstition, and subjection; to materialism, the social role of leading man out of darkness, superstition, and social subjection. Idealists, in general, are totalitarians, haters of the people, defenders of supernaturalism, opponents of science, and perpetrators of ignorance and superstition. In short, they are a bad lot. Materialists, in general, are humanitarian, democratic, idealistic, lovers of knowledge, adamant enemies of ignorance and superstition everywhere. In spite of this rather severe condemnation of idealism and high praise of materialism, he nevertheless insists that idealism and materialism as philosophies have nothing to do with ethics or morality; they are simply metaphysics—that is, conceptions of the origin and nature of the universe.

The author's knowledge of philosophy is obviously gained at second hand; and he shows no compunction about interpreting a philosopher to suit his own convenience. Thus he describes Heraclitus as a scientist of the modern stamp, although it is well known that the "obscure" philosopher attacked empirical science as an obstruction to true knowledge. Skepticism, which modern investigators have shown is the precursor of modern conceptions of scientific methodology, is described as a "philosophy of decline," a rationalization of the defeat of the Greeks.

His ignorance of modern philosophy is incredible. John Dewey, for example, is described as an idealist. The author knows nothing of modern empirical philosophy; and his interpretation of "modern materialism," which he identifies with Marxism and socialism, is one built out of an exotic amalgam of wish-fulfillment, misinformation, and sheer imagination.

While this book is full of incredible generalizations, the sheer products of dreams, it is not wholly this. The author is frankly a socialist and firmly believes that the future belongs to socialism. The evidence he affords is impressive.

The author's most interesting insight is that philosophy is today the basic instrument in the struggle between the old and the new order. The masses must become philosophers in order to decide which so-

cial order will best serve them—the socialist or the nonsocialist.

RUBIN GOTESKY

University of Georgia

MONNEROT, JULES. *Sociology and Psychology of Communism*. Translated from the French by Jane Degras and Richard Rees. Pp. 339. Boston: The Beacon Press, 1953. \$6.00.

Those who attempt to understand Communism as a political movement, and the Soviet Union as a social system and a national state, by approaching these phenomena through a study of Marxist-Leninist ideology are faced by a persistent difficulty. Fairly consistently, on the level of explicit meaning there seems to be remarkably little congruence between the ideology and social reality. Much of the difficulty, of course, stems from the fact that Western scholars display an understandable propensity to treat Marxism-Leninism predominantly at the level of the exoteric ideology and to deal only with manifest content, neglecting the esoteric ideology and the implicit, latent meanings of the exoteric ideology. Jules Monnerot's extraordinary book goes a long way in bridging this gap in our understanding of the relation between Communist ideology and Communist behavior.

Monnerot's starting point is that Communism may be understood as a secular religion, which anticipates the disintegration of capitalist society and the arrival of a new order on grounds of immanence in history, and which contains an imperative for action in this world to achieve the millennium. The prophet of this religion suffused with technological messianism is Marx, who designated the proletariat as the chosen people and founded a sect of the elect to prepare for the coming of the new day. Lenin stands in the role of the apostle who built the church, which is the Party, organized on the hierarchical principles of an army and stressing orthodox conformity. With the first successful seizure of power in Russia, the movement was transformed into a state characterized by a seigniorial and territorial despotism and by tyranny—"an internal regime imposed by a minority on the majority." As it develops this re-

gime is transformed into a "Super-state" which operates as a twentieth-century variant on medieval Islam, "the union of a religion and people for the purpose of conquest, the chiefs of this people tending to wield power beyond its frontiers by means of religion."

Ideas of this kind about Communism have recently been widely current, although one should not neglect the fact that this book first appeared in 1949. The distinctive quality of this study, therefore, stems from the great range of available insights brought together, and from the fact that they are presented in a systematic framework. In this respect there is no book in the field known to this reviewer which even approaches Monnerot. Furthermore, the summary given above of Monnerot's central thesis hardly begins to reflect adequately the impressively succinct and penetrating analyses he provides of such diverse phenomena as the Marxist principles for disorganizing society, the psychology of the intellectual's adherence to Communist movements, the nature of crowd behavior and its relation to political movements, and the sociopsychological dynamics of police surveillance and terror.

Despite these impressive achievements, Monnerot can hardly be said to have produced a successful or satisfying book. Except for scattered comments he does not deal with Communism as a system of social organization of the type developed in the Soviet Union. And even at the level which he does treat Soviet society, namely that of the political system, he fails almost completely to deal adequately with the patent contradiction involved in describing the Communist Russian empire as both a "tyranny" and an "Islam" in the sense in which he defines those terms. In addition, the book is painfully repetitious, and terribly diffuse. Indeed, Monnerot has so much difficulty in sticking to his subject, and he goes down so many historical by-paths, that his book might more appropriately have been entitled "Some Reflections on Despotism, Absolutism, Tyranny, and other Forms of Sociopolitical Organization." Regardless of these deficiencies, the richness of its insights, the range of its understanding, and the vigor

of its presentation will make this volume rewarding and stimulating reading. It adds significantly to our understanding of Communism as a political movement and a world power.

ALEX INKELES

Harvard University

COMMONWEALTH OF NATIONS

BULMER-THOMAS, IVOR. *The Party System in Great Britain*. Pp. vii, 328. New York: The Macmillan Company, 1953. \$5.00.

This is an original, useful and stimulating book. One of the great gaps in descriptive political science in Great Britain is the absence of realistic and scholarly analyses of the party system and the party machines. The material available to the student of American politics is far superior in quality and quantity. Only in recent years has a serious effort been made to redress the balance, and this book is one of the weightiest contributions to that highly desirable end. Its author, it is true, has very special qualifications. He is at once a distinguished academic, a distinguished journalist and an experienced politician, a former M.P. and former minister. It is also not a handicap that he began his political life as a member of the Labour party and passed over to the Conservative party.

Mr. Bulmer-Thomas wisely interprets his subject broadly. We are given discussions not only of party machinery or of the law (such as it is) that affects party campaigns but a realistic account of the role of party in central and local government and in the day-to-day running of the House of Commons. Other political forces affecting the party structure are dealt with. There is a succinct account of the role of the press which gains much from the author's wide experience, but it is written entirely from a London point of view, and it is surely an odd sense of proportion that finds room for the *Morning Advertiser* and none for the *Manchester Guardian*. Even from the point of view of London

circulation "the M.G." is more important. Indeed, the main interest of the *Morning Advertiser* is that its most famous nineteenth century contributors were Marx and Engels. In the section dealing with clubs, something might have been said of the ill-fated "1917" club, and the history of the Bonar Law college has been more checkered than is suggested here. Some other minor criticisms might be made. There is, for example, no "schools question" in the religious sense in Scotland, which is important in a country where religion plays a more active part than in England and where the Catholic population is proportionately greater.

On one more important point I am naturally not in agreement with Mr. Bulmer-Thomas. As one of the faithful remnant of Liberals, I do not accept the view that the party was doomed to its present role. Accident played a great part. It may be a white dwarf now (Mr. Bulmer-Thomas has a natural fondness for astronomical metaphor natural in one of his academic background), but in political as in physical cosmology there are accidents as well as predetermined events. And, if the prospects of a party are to be assessed by its appeal to intelligent youth as is suggested on page 146, Liberal prospects are brighter than the author—or the reviewer—thinks them to be. But this is an excellent book.

D. W. BROGAN

Cambridge University

GORDON, STRATHEARN. *The British Parliament*. Pp. 247. New York: Frederick A. Praeger, 1953. \$4.25.

Although this handbook has appeared previously in Great Britain and in other countries, the fourth edition is the first to be published in the United States. Written for the Hansard Society by the Librarian of the House of Commons, the current edition is in part offered "to all the Americans whose interest is so intensely flattering to our [British] institutions."

Mr. Gordon's purpose is to explain in simple terms how Parliament has developed, what it is, how it works, and how it affects people's lives. This multiple objective is accomplished within 175 pages of text which is well larded with illustra-

tions and tables. The rest of the volume comprises eleven useful appendixes, including a glossary of parliamentary terms, and an index.

The author begins with two chapters on the origins and history of Parliament and the British Constitution. He then covers the functions of Parliament, the members and their duties, work of the Commons and Lords. In another chapter he sets forth criticisms of Parliament and discusses them. He concludes with a few pages on the subject of "Benefits and Responsibilities."

Altogether Mr. Gordon has done a splendid job of synthesizing. In keeping to his objective of simplicity, the author boils down much of his material into generalizations. It is his manner of presentation, however, that lifts this work above the ordinary. Mr. Gordon displays great writing skill which makes his book highly readable. He has a knack of selecting apt examples to clarify or illustrate his points. Extensive use is made of quotations from English statesmen and scholars; these quotes always fit snugly into context and give the reader a sense of depth. Another technique is to raise and answer questions; this variant is a further aid in maintaining the interest of the reader.

Clearly, this work was not designed for the expert on British institutions, yet as an over-all survey of Parliament it has values which even the well-informed will appreciate and find useful. Mr. Gordon has packed his guidebook with worthwhile materials. It is an admirably written introductory survey of the British Parliament.

DAVID G. FARRELLY

University of California
Los Angeles

KNAPLUND, PAUL. *James Stephen and the British Colonial System, 1813-1847*. Pp. ix, 315. Madison: University of Wisconsin Press, 1953. \$5.50.

Raised in the evangelical and humanitarian atmosphere of the "Clapham Sect," James Stephen was drawn toward the Colonial Office by his concern with the condition of the slaves in the West Indies. In 1813 he became legal adviser, with the duty of scrutinizing colonial legislation. His

keen and active mind was soon discerning many implications other than the strictly legal in the enactments which he was surveying, and these crept into his reports. His industry, knowledge, and insight were such that his superiors learned to treat his advice with respect, and often to follow it implicitly. He was thus already a power at the Colonial Office when in 1834 he became assistant undersecretary and, in 1836, undersecretary.

As undersecretary it seems fair to say that he, more than any other man, governed the British Empire insofar as it was governed from Westminster. He worked in relative seclusion, for all official action was taken in the name of the Secretary of State. But secretaries of state came and went, and James Stephen remained. Some of his contemporaries recognized his influence, and deemed it invidious. The attacks of Charles Buller upon "Mr. Mother-country" and "Mr. Oversecretary Stephen" were particularly severe, as well as unjust, for they presented Stephen as an opposer of colonial interests and of colonial self-government. Nothing could have been further from the truth. He indeed sometimes opposed measures and policies emanating from the colonies. Yet wherever a colonial society had emerged sufficiently from the pioneering process to have leisure for political affairs, and where it was not handicapped by the existence of a caste system, Stephen was convinced a decade and more before the coming of responsible government that it should be permitted to work out its own problems and learn from the experience of its own mistakes. On the abstract principle of responsible government he declined to comment, but there can be little doubt how he stood on the issue.

Colonies would have become self-governing, mercantilism would have died, and slaves would have been emancipated even though Stephen had never lived, but it does not detract from the man's greatness that he served the needs of his day. Nor would the outlook of the era have been quite what it was had he played no part in creating it. Operating from a uniquely influential focal position, he was able to expedite and ease inevitable transitions, as

well as to occasion many salutary minor developments which might otherwise never have occurred at all.

To survey the results of decades of work by a laborer as indefatigable as Stephen has demanded labors hardly less indefatigable. Nor was it any mean task to fit the results into the confines of the present modest volume. The author quotes at considerable length from Stephen, and one is happy that he does so, for as a writer Stephen was no unworthy contemporary of Macaulay and commands much the same magnificent style. Both for its scholarship and for its exposition Professor Knaplund's work is to be highly commended. No study in the field of nineteenth-century British imperial history was more needed than this one.

LEONIDAS DODSON

University of Pennsylvania

CRANKSHAW, EDWARD. *The Forsaken Idea: A Study of Viscount Milner*. Pp. ix, 178. New York: Longmans, Green and Co., 1953. \$3.25.

"It will almost certainly be pointed out that this book is biased," Mr. Crankshaw writes in the foreword. That the author should himself make this criticism, however, does not excuse the fault. It may be true that Lord Milner's critics have held the field for half a century, but a biased approach can hardly be expected to restore the balance and give a "true appreciation" of Milner's qualities.

We cannot quarrel with Mr. Crankshaw's purpose, namely, to rescue from the heat of controversy some of the permanent ideas in Milner's writings. But we must maintain against the author's polemic the right not to share his enthusiasm for his hero's central idea.

His argument proceeds thus. Milner believed above all in the survival of Britain and the British race throughout the Empire. All he said was related to this theme. Whether the subject was tariff reform, imperial preference, education, sweated labor, or political parties, the health of the Empire was the touchstone of judgment. Here, Mr. Crankshaw asserts, in place of the disconnected compromises of party policies was a coherent policy, constructive and

unifying; and, if steadfastly pursued, it might have saved the world from two great wars. In discarding the imperial idea for the attempts to organize world peace, first through free trade and then through the League of Nations, "we threw away the substance for the shadow."

It is hardly necessary to point out that this is a somewhat sweeping conclusion, leaving many questions unanswered. In the first place, it ignores the changing power situation, in short, the decline of British predominance. And, quite apart from Britain's ability to organize peace, it assumes that others would have been willing to remain outside and see peace organized in the British manner. Moreover, the Empire itself would not have accepted Milner's views. To say, as Mr. Crankshaw does, that the liberals frittered away all chances of imperial union, assumes that there were, in fact, real chances. The fact is that the support for imperial union, even in Canada, South Africa, and Australia, was negligible. And if we look beyond this central core of the present Commonwealth, the prospects for imperial union will be seen as even less hopeful.

In the South African issue, Crankshaw sees little more than Milner's wisdom and the home government's failure. Apparently, he believes that had his advice been heeded, South Africa would have become a key unit in his design of imperial union. But the author gives no reasons to support the view that what the moderate peace of Vereeniging failed to do, the stronger medicine Milner might have administered, would have succeeded.

The failure of Milner's imperial idea cannot be wholly ascribed to the stupidity of his opponents. It never was within any distance of broad support in the Empire overseas. The Commonwealth is today a reality, and imperial federation is dead, because the one did and the other did not take account of the growing aspirations of dominion and colonial nationhood. Lord Milner undoubtedly was a great statesman. His work has not always received its due; but this book does not achieve its purpose of setting the record straight.

EDWARD LITTLEJOHN

*Detroit, Michigan

HAMMOND, J. L., and M. R. D. FOOT. *Gladstone and Liberalism*. Pp. xi, 219. New York: The Macmillan Company, 1953. In the "Teach Yourself History Series," edited by A. L. Rowse. \$2.00.

The study of English constitutional and political history in the Victorian age is to a considerable degree the study of the career of William Ewart Gladstone. Consequently, he has been the object of research in monographs and biographies, and the chief figure in many other publications. *Gladstone and Liberalism* is a brief study which combines political history and biography in order to interpret his contribution to liberalism in the last century. This book, which Mr. Foot completed after the death of Dr. Hammond in 1949, is an able, friendly study whose only weakness is its brevity.

Gladstone's political career is chronologically presented, with space only in Chapter Three for a glance at industrial England in the first half of the century. This is a logical approach because of the nature of his career. He entered politics as a Canningite Tory, and the first half of his life represents his transition from Tory to Peelite to leadership of the Liberal Party. The authors assert that he forced himself on the party as its "indispensable leader" by the sheer weight of personal and intellectual superiority, a true statement but one which does not wholly explain its acceptance of him. Most of us would agree that his party leadership was inevitable after he became leader in the House of Commons in 1865.

Gladstone's career after 1865 continued to be one of movement and transition in political and constitutional controversies. As this book illustrates, one cannot discern his final position in either political theory or practical politics in any particular decade or event. He quickly won the confidence of the working classes after 1865, fought almost constant political wars with the "upper orders" whom he admired so much and believed to be an essential part of England's social stability, and finally challenged the constitutional power of the House of Lords in his last speech in Parliament. Yet this great "conservative liberal," as the authors correctly label him, declared

in the House of Commons in February, 1866, that the great pillars of civilized society are "property, authority, and religion."

Readers for whom this series was designed, especially if they are Americans, may miss the important fact that Gladstone's liberalism rested upon his frequently and carefully expounded concept of the "Social State." A. V. Dicey said that he made England a practical as well as a theoretic democracy, but most of Gladstone's program was confidently predicated upon what he believed to be England's "frame of society." Until nearly the end of his career, he advanced democratic proposals with reiterated statements that the newly enfranchised electorate would continue to let the old "governing class" govern. No people can govern itself, he asserted; they can only choose and hold responsible those who by inherited station, education, leisure time, and financial independence can govern. Only in the end did he assert that the upper orders had defaulted on their obligations and forfeited the right to govern exclusively.

It might have been possible to analyze somewhat better the great conflicts in which he explained his political and constitutional principles. Some will disagree with the assertion that his intellect was keen enough to discern and his moral sense strong enough to assert distinctions so fine as to be imperceptible to ordinary men. For example, although Lord Kilbracken could describe him as the strongest anti-socialist he ever knew and his liberalism a negation of socialism, Lord Acton pointed to the "latent socialism" in Gladstone's philosophy and asserted that he was the most illustrative representative and most eminent practical teacher in the world of "academic socialism."

Although one detects that the book is friendly toward its subject, the authors do point out flaws in his leadership and his lack of understanding of social and economic conditions. The book is an accurate, coherent study of one of England's greatest statesmen; hence, it is an important book.

ALVIN H. PROCTOR

Kansas State Teachers College
Pittsburg, Kansas

JONES, S. W. *Public Administration in Malaya*. Pp. viii, 229. New York: Royal Institute of International Affairs, 1953. \$3.00.

Students of government will welcome this account of the administrative system of Malaya, which is also a contribution towards an understanding of the requirements for efficient public administration in all the countries of southeastern Asia. Its author was colonial secretary for the British Straits Settlements from 1940 until the Japanese conquest of early 1942 and was an officer of the Malayan civil service for some thirty years.

The region includes the federated and the "unfederated" states of the Malay peninsula, together with Singapore and other neighboring British islands. A number of administrative experiments since the Second World War produced many administrative and constitutional changes, notably the creation in 1948 of the Federation of Malaya. This federation is made up of four federated and four "unfederated" states, together with the "settlements" of Penang and Malacca. Singapore remained a crown colony but lost Labuan to the new crown colony of North Borneo to which it is adjacent. Brunei retained its status of a protected state but passed under the administration of the new crown colony of Sarawak.

Public administration in Malaya is the product of British rule and influence. The author in wide sweeps summarizes its administrative history and problems, including its transfer from the East India Company to the Colonial Office in 1867 and the gradual entry of the British government thereafter into the administration of the native states. Administrative programs furthered local development in such fields as health, education, agriculture, forestry, and mining.

Inevitably, many political problems emerged—local, British, and foreign in nature. There was a decided weakness in the first Malayan federated administration, headed up by a combined governor and high commissioner, for the first federation failed to provide adequate central machinery for the shaping of policy. The Federation of Malaya is now governed by

executive and legislative councils, the high commissioner serving as President.

Economically, foreign buyers of Malaya's rubber and other products included Americans and non-British Europeans. Taxation had always been light. Britain sought through preferential tariffs to attract more trade with itself. But Malaya liked free trade. The Japanese vied with Europeans for economic profits in Malaya in the 1930's, doubtless accentuating Anglo-Japanese rivalry elsewhere. Masses of Chinese laborers poured in each year, as exports and prosperity increased. Yet for many of the upwards of five million inhabitants the oppression of hardship and poverty persisted. Many of the Malays and Indians were in a chronic state of indebtedness, in contrast with the prosperous Chinese element.

Recovery, reconstruction, and reform have been under way, economically and politically, since the British reconquest of Malaya in 1945. Rehabilitation has stressed an active medical department, the extension of education, social welfare programs, better housing projects, and the curbing of crime.

VERNON J. PURYEAR

University of California

MUKERJI, KRISHNA PRASANNA. *The State*. Pp. xxiv, 382. Madras: Theosophical Publishing House, 1952.

Western students of government and political theory will be interested in and will profit from a study of this work by an Indian professor of politics at the University of Bombay as it gives a valuable insight into the character and direction of political thought in a newly created State which has increasingly become an important factor in Asian and even in world affairs. This volume gives important clues on the trend of sociopolitical thought in India; it illustrates the traditional intuitive-philosophical approach of Hindu thought; and it quite expectedly concludes with a justification of Hinduism in general and of classical Hindu political institutions in particular.

Pervading this work is the belief that the State is an agent of a moral society estab-

lished for a moral purpose. The State "is wedded to the realization of a moral purpose, viz., to the making of justice available to all on equal terms" (p. 22), and political science must be "the science of justice or dharma." The author finds his inspiration of what the State should be mainly in the classical religious and political treatises of Hinduism with their "transcendental view of reality," their "moral view of the State," and their "philosophy of spiritual reality." Western political thinkers would certainly agree that the State should coincide with freedom, justice, growth, and the best elements in natural law; but an inductive study of states of the past and even of the present would, in their view, show no essential connection between the State and morality. This is unfortunate but it is the lesson of history.

Professor Mukerji is very critical of the sovereign-nation society of the West and in fact of the entire pattern of culture composed, as he sees it, of industrialism, capitalism, imperialism, and nationalism. He refers to this pattern as the Nici-ethos order of things which, it is claimed, came to its real end in 1914. As the logical successor the author calls for the Soco-ethos of socialism and the co-operativeness of a real world order. "Our social ideal can be pursued morally only by democratic socialism and through the instrumentality of a world-State" (p. 286). Perhaps the two most interesting chapters in this book are those that present the author's defense of the welfare or socialistic state and his analysis of the failure of world government in the case of the League of Nations.

In Appendix I there is an eloquent defense of the Hindu Way of Life in which the caste system, at least in its classical form, is defended; and in Appendix II the Hindu view of the State is examined. The author maintains that the State in India always had a constitutional, even a democratic basis and has no sympathy for those who have associated Indian government with capricious tyrants. Again there is the claim that the essential philosophy of the welfare state goes back to the sacred Hindu laws of Manu. The majority of political thinkers, it seems to the reviewer, would

agree that a world order of some sort is becoming more urgent. Urgency, however, has little to do with the capacity and zeal of man to fashion this complex structure; and, further, urgency does not miraculously remove the many obstacles that must be removed before a real parliament of man is created. And in answer to the author's contention that the western state system was uniquely designed to bring about wars, it can be said: (1) that Hindu theories of the State did not reduce war or alleviate anarchy in ancient or medieval times—nor did they deter Indian imperialistic expansion in southeast Asia; (2) that the only reason why India has not engaged in power politics in modern times is because she was a dependency of Britain; (3) but now she has again become independent India in her conduct and objectives of foreign policy is acting no differently than do the other States in preserving what they deem to be their vital national interests.

T. WALTER WALLBANK
University of Southern California

KNOWLES, K. G. J. C. *Strikes—A Study in Industrial Conflict: With Special Reference to British Experience Between 1911 and 1947*. Pp. xiv, 330. New York: Philosophical Library, 1952. \$8.75.

During recent years, the emphasis on the mutuality of interest between labor, management, and the general public may have led to the development of a serious blind spot among certain observers of industrial relations. Perhaps we need such a study as this to remind us that behind every collective bargaining session is the threat of a work stoppage.

In presenting this analysis of strikes and the possibility of strikes, the author points out that while such studies have been made in the United States, no systematic treatment of work stoppages, their causes, their nature, their consequences, and what is being done about them has been attempted for Great Britain.

This work is primarily statistical. Full use is made of available statistics on work stoppages and a number of worthwhile suggestions are offered for improving the Eng-

lish statistical series. The author ventured far afield from pure statistics, however, ranging into economic history, political science, economics, and even social philosophy and psychology, to present a *tour de force* of labor-management relations in Great Britain. Statistical and descriptive demonstrations are presented of the effects of unemployment, relatively full employment, alterations in union policies and objectives, the growth of union responsibility through participation in government, the growth of employer organization, and the changed role of government, both as an arbitrator of disputes and as an employer of labor.

While the attention of the author is centered on the period 1911–1947, material is presented bearing on strikes and attitudes toward them back to 1867; thus the discussion tends to range back and forth over extended periods, during which the attitudes of the participants have changed quite drastically. The author does not, however, seem to make allowance for these changing attitudes—as though, for example, pre-World War I syndicalist theories may still have validity in the thinking of union leaders.

While an intimate knowledge is displayed of events and developments in England, no such detailed and up-to-date grasp is demonstrated in frequent allusions to things American. We are told, for instance, of cities, counties, and even states in the United States where union organization is impossible. Gary, Indiana and Longview, Washington are cited (in the present tense, but based on a 1938 footnote!) as "mill-towns" where workers are prevented from union organization by company domination; both of these cities have for a number of years been highly unionized.

This is emphatically a British book. The repeated use of abbreviations to designate English unions, of strike terms and working habits unfamiliar to American readers, and of episodes in English strike history which have little or no meaning to the American student demonstrate that while we both use the same language, colloquialisms, at times, make it difficult to comprehend what is being said.

One concluding question: Why the high

price of this book? In recent years we have seen book prices advance, along with those of most other commodities. Yet \$8.75 for a 330-page book, even with nearly 600 words in painfully small type on each page, seems excessive. As a believer in international trade, this reviewer cannot feel that it will be advanced greatly by this scholarly, but high priced, export item.

JOHN NEWTON THURBER
U. S. Department of Labor
Washington, D. C.

HAYNES, WILLIAM WARREN. *Nationalization in Practice: The British Coal Industry*. Pp. xviii, 413. Boston: Harvard University School of Business Administration, 1953. \$4.00.

This painstaking and scrupulously fair study of the present-day British Coal Industry has two aspects of particular interest to political scientists—the analyses of, first, the administrative organization of the nationalized industry, and, second, the means by which the industry is made publicly accountable. In dealing with the administrative problems, Professor Haynes joins Edmund Burke in decrying, justifiably, "the closet philosophers" with, here, their organizational blueprints. He emphasizes that time must be allowed for an ethos to develop amongst the 750,000 employees, and that personal relations and a widely diffused understanding of the aims of the Coal Board are of far greater importance than any particular organizational principle.

To the problem of public accountability, Dr. Haynes gives only one chapter, despite its urgency for democracy and the Coal Board. Clearly the Board has been seriously affected in the decision-making process by the feeling that Parliament was "peering over its shoulder." Unfortunately in this connection, Dr. Haynes tends to confuse nationalization with government control and fails to make clear the considerable degree of independence accorded the Board by Parliament. For example, the Public Accounts Committee can only *examine* the published accounts and cannot

"investigate" them [p. 254 (5)]; likewise to describe the Coal Board as being "attached to the Ministry of Fuel and Power" (p. 102) much exaggerates the powers given the Minister by the Act.

Professor Haynes devotes the first quarter of the book to the prenationalization scene and includes a history of the industry; in the next third he describes the 1946 Act and the consequences thereof, especially for labor relations; and the rest, excepting two chapters on pricing and investment policy, is on the administrative organization. Had the first section been reduced, by referring the student to the very adequate sources—here fully acknowledged as being heavily drawn upon—space might have been found to analyze those problems which have arisen solely because of nationalization. This would have involved a comparison with other nationalized industries, with such ventures as TVA (the Tennessee Valley Authority), and with the histories of private businesses in the United States, many of which, in their earlier days, experienced problems very similar to those of the newly formed National Coal Board.

Undoubtedly this book could be used with advantage by an advanced seminar, or, if used alone, it provides a very comprehensive single textbook upon this industry, which is of such basic importance to the whole of the British economy.

HENRY MADDICK

University of Birmingham
Birmingham, England

GOLLANCZ, VICTOR. *My Dear Timothy: An Autobiographical Letter to His Grandson*. Pp. 439. New York: Simon & Schuster, 1952. \$5.00.

This book is a tonic, refreshing and energizing. The author, a successful British publisher, loves people, music, and life. He writes, "The world is so beautiful, I have always loved the world; it is because I cannot bear that it should suffer torture and deformation that I am writing this book."

During two long periods, when a young teacher of boys, he saw the good and beautiful in everything—in trees, people,

and objects. He saw himself in others in crowded railroad cars and saw others as part of himself. During one of these periods he was opposing Nazism and deeply moved by the suffering of the Jews when he was organizing the National Committee for Rescue from Nazi Terror.

Here is a sage who has compiled the wisdom of the sages of all periods and absorbed much of their wisdom, who was, at the same time, a successful business man and a political figure in England. Gollancz offset the stress and fret of business striving with a love of wisdom culled from the sages of all times and all cultures.

Another of his books, *Man and God*, a selection of passages chosen and arranged to express a mood about the human and divine, is rich with the wisdom of Jewish literature as well as that of Asia and Europe.

The writer is able to communicate his enthusiasm to the reader. He loves great music including Beethoven, noble architecture including Gothic, and would travel by rail from London to Paris in one day to hear his favorite opera singers, the next day returning at midnight to London.

During one period of his life he examined the rules of Jewish orthodoxy, and, if they did not make sense to him, he discarded them. He describes the long movement of his mind that carried him out of the intense Jewish orthodoxy of his upbringing into an engulfing preoccupation with the reality of Christ and yet never led him to cut the cord binding him to the traditions of his race.

Gollancz examines everything with a fresh eye, and therefore the reader sees afresh much he had previously taken for granted.

The writer's philosophy is that the combination of evil and our struggle against it is what makes us capable of reaching our best possibilities. Therefore, evil is a means toward good. When there is no struggle against evil there is no progress. The only serenity worth having comes after a successful struggle. This is certainly good medicine for our own age of struggle, and is prescribed by one who took this medicine in sufficient quantities to become a successful publicist, philanthropist,

ator, moral crusader, and all around human being.

OTTO T. MALLERY

Philadelphia, Pennsylvania

FINER, S. E. *The Life and Times of Sir Edwin Chadwick*. Pp. xi, 555. London: Methuen & Co. (distributed in the U. S. by The British Book Centre), 1952. \$9.00.

This is a careful scrutiny of the career of Edwin W. Chadwick, the British civil servant who probably is best known as the "father of the sanitary idea" and whose report on the *Sanitary Condition of the Labouring Population of Great Britain* (1842) set in motion the public health movement. The justification for a full-length biography is that the range and depth of Chadwick's influence in a period when modern British governmental institutions were forming has not been measured.

Professor Finer has worked his way through an array of documents and contemporary accounts (these are listed in an excellent bibliography) to produce a mature analysis of Chadwick's life. This book is distinguished not only by scholarship in the usual sense but by a writing style that manages to keep interest alive throughout Chadwick's interminable controversies over the size of sewer pipe.

Chadwick was born in 1800 and early fell under the influence of Bentham and the Philosophical Radicals. He began his career in 1832 as an investigator for the Poor Law Inquiry. Subsequently he drafted the major portion of the report upon which the new legislation was based and served as secretary of the new Poor Law Commission. From the start, his ideas and methods generated opposition. Soon he was excluded from poor law matters, and in 1847, as the price of peace, he was dismissed.

Impressed by the connection he found between disease and pauperism, he had meanwhile begun the health inquiry. Ironically, this celebrated report escaped suppression only after a compromise was worked out whereby it was to appear under Chadwick's name, as his own opinions. The report won wide recognition and led to his appointment to the new general Board of

Health on which he served, again as the center of controversy, until 1854 when he was pensioned off. Although he hoped and tried to return to active service, Chadwick spent his last 36 years as a savant on the margins of officialdom. Events ultimately reshaped his reputation, and in the last year of his life he was knighted.

Chadwick's interests and activities ranged widely—police reform, child labor, tramways, and postal reform are some of the most important. He was a tireless digger for facts and a constructor of logical administrative systems. Although not an original thinker, he left his mark on nearly everything he touched. It was the systematizer in Chadwick which was at once his strength and his weakness. As Professor Finer says, he did not really understand that England was not "governed by logic, but by Parliament." Chadwick's perfect state was one in which the legislature—if there was one—obediently enacted the plans made by able bureaucrats. Thus, Chadwick's difficulties with his political superiors and the public were due only in part to an aggressive, dogmatic personality. At the root lay his antidemocratic bias—that policy should be made scientifically by experts whose prime aim would be to avoid waste. On Chadwick's side, it should be said that his political superiors were, with some exceptions, a mediocre lot.

Yet, despite these faults, Chadwick made notable contributions to sanitary reform and to the development of effective central-local government relationships. Perhaps his main achievement was the wide support evoked for the principle of sanitary reform; yet not until later was Parliament willing to say that no community had the right to be "dirty." Chadwick's impressive documentation and analysis of problems was a step forward, and perhaps was the most refreshing aspect of Benthamism at work in administration, coupled as it was with the belief that through knowledge man's lot could be bettered. Among Chadwick's accomplishments also should be cited the stimulus he gave public health pioneers elsewhere, like Shattuck in the United States.

JAMES R. DONOGHUE

University of Wisconsin

SLAVIC COUNTRIES

DEUTSCHER, ISAAC. *Russia: What Next?* Pp. ix, 230. New York: Oxford University Press, 1953. \$3.00.

This is a clever and provocative little book, written in great haste during the weeks following the death of Stalin. It is saved from superficiality by the fact that the author has for some years been engaged in research in original sources on the life and times of Stalin and Trotsky. While many readers—and this reviewer is one of them—may consider that Mr. Deutscher's conclusions are far from convincing, the book certainly does give evidence that the author has long lived with his material. However, he has a very strong tendency to interpret this material schematically, in terms of a version of Marxism which owes much to Trotsky.

Despite the title of the work, about two-thirds of it is devoted to a brief history and analysis of the Soviet Union under Stalin. Most of what the author says in this portion of the book he has said before in his biography of Stalin and in journalistic articles. He seems to take a more negative attitude toward Stalin in this book, however, than in his well-known biography. Stalin, Deutscher argues, was the inevitable product of his time. Inferior to Trotsky in most respects, he defeated Trotsky because he alone among the Bolshevik leaders could preserve and carry on the revolutionary regime in isolated and backward Russia. But in his last years, Stalin became more and more of an anachronism. Stalinism was suffocating Russia in its last years. Yet Stalin, a slave to his past, could not change.

While Stalinism brought "primitive magic" into Russian Marxism, its economic achievements were destroying its reason for being. Deutscher eloquently presents statements and statistics regarding the progressive cultural revolution brought about by Stalin's economic policies. This is presented rather glibly, with a minimum of documentation. The author is at pains to demolish the arguments of anti-Soviet writers, including Soviet refugees, who have argued that the collective farm system, for example, was

unpopular and should be drastically modified. He is convinced that all elements in Soviet society are "socialist" and that both the collective farm system and the planned industrial system are accepted by all elements of the Soviet population and cannot be eliminated or radically changed. It is a pity that the work of the Soviet émigré, Herman Achminow, *Die Macht im Hintergrund*, which presents a completely opposed argument, is not available in English.

Now that Stalin is dead, continues Mr. Deutscher, there is a good chance for a "democratic regeneration" of Russia. Stalin created the necessary economic basis, and his successors can gradually restore Leninist democracy. The process, if it occurs at all, will be gradual and it will require peace, continues Mr. Deutscher. It is rather difficult to appraise Deutscher's arguments and conclusions, because they are stated in such vague and broad terms. Certainly no such concrete analysis of Soviet society is offered as would perhaps furnish a foundation for such optimistic conclusions. The Beria affair, which of course occurred after the book was published, casts some doubt on the author's insight into the power and personal relations among the new rulers. Mr. Deutscher apparently regarded Beria as a "Malenkov liberal." However, in fairness to Deutscher, it should be noted that not a single political commentator predicted Beria's downfall.

We should welcome this optimistic book, whose position is so different from that of most other writing on contemporary Soviet affairs. Taken with plenty of salt, and as a change from heavier fare, the book can be stimulating and refreshing. It is useful to be reminded again that Russia is the least static of the great powers, that it is changing rapidly, and that the Western World will have to be imaginative, alert, and constructive in order to cope with its challenge. This, I think, is the greatest merit of Deutscher's book.

At the same time, the strong element of wishful thinking in the book serves as a warning of some of the attitudes and ideas with which American policy and our information services, if they are allowed to function, will have to cope increasingly in

the future. There is a great deal of vagueness and looseness in statement, and a few serious errors of fact, such as the assertion that the attack on Varga began in 1946 (instead of 1947) or that Beria was "called in by Stalin" in 1939 (actually in 1938). Much more serious are the glib, ambiguous, and often misleading or almost meaningless statements which occur here and there in the book. Let us hope that Mr. Deutscher's prophecies will bring a bit of sweetness and light to angry pessimists, without plunging wishful thinkers more deeply into their illusions.

FREDERICK C. BARGHOORN

Yale University

Soviet Science. A symposium arranged by CONWAY ZIRKLE and HOWARD A. MEYERHOFF. Edited by RUTH C. CHRISTMAN. Pp. vii, 108. Washington, D. C.: American Association for the Advancement of Science, 1952. \$1.25.

This is a symposium consisting of papers delivered at the Philadelphia meeting of the American Association for the Advancement of Science in December 1951. All have been prepared by scholars thoroughly familiar with the state of particular branches of science in the Soviet Union. Seven are devoted, respectively, to genetics, physiology, psychology (including psychiatry), the social sciences, soil science, physics and chemistry, and mathematics. The eighth deals with science and intellectual freedom in general; the last, written by Conway Zirkle, is a general appraisal. Most of the papers discuss not only the state of science in Russia today, but also its state on the eve of the revolution. The contributors agree that Russian science, though young, was already an important phase in the advancement of science on the international level.

Naturally, the sad story of science under the Soviets occupies the major part of the papers. The situation varies from field to field. Mathematics, in practice, is free from interference. In physics and chemistry, the impact of Communism is confined to the imposition, on the scholars, of an obligation to pay lip service to the great masters of Marxism and to denounce "the idealistic science of the West." But

genetics, physiology, psychology, and soil science are badly hurt. In each field, a kind of official deification of one or another authority, similar to the official worship of the late Stalin, prevents the scholars from reasoning along truly scientific lines and forces them to make statements which they know to be wrong. Even when the authority is well chosen, such as Ivan Pavlov in physiology, the men of science are inhibited in their efforts by not being allowed to go beyond the statements of the masters; this condemns them to sterility. In genetics, they must, in fact, go back to Lamarck.

Unfortunately, the paper on the social sciences, which is probably the subject of greatest interest to the readers of THE ANNALS, is the least satisfactory in the symposium. The author, R. L. Ackoff, confines himself to generalizations about the low status of the social sciences in the Soviet Union, the dominance of historical research and subservience to propaganda purposes of the government. Quite interesting stories, parallel to those concerning themselves with the natural sciences, could be told relative to economics and jurisprudence. The identification of sociology with historical materialism could have formed another interesting chapter. One misses also the discussion of linguistics where the development has been spectacular: after 25 years of unquestioned dominance of the doctrine of Ya. Marr, Stalin's edict on linguistics (of June 20, 1950) caused a kind of counter-revolution.

Despite these omissions, the volume contributes much valuable material to the sociology of knowledge, more exactly, to a yet unwritten chapter on directed, or managed, knowledge. A comparison of the state of Russian science before and after the Communist revolution points to a significant impoverishment of culture. "We are all poorer because Russian science has been injured by Communism," says Zirkle in one of the last sentences of his concise and illuminating appraisal.

N. S. TIMASHEFF

Fordham University

TOMASIC, DINKO. *The Impact of Russian Culture on Soviet Communism.* Pp. 287.

Glencoe, Ill.: The Free Press, 1953. \$4.50.

No thinking man can in these days fail to be challenged by the question of the sources of Russian conduct. The search for satisfying explanations of past behavior and future reactions on the part of Soviet leaders and followers goes on endlessly. Are geographical factors basic? Is race, in spite of our reluctance to resort to racial thinking, a clue to the enigma? Or are personality and policy, whatever their remoter causes, fundamentally Russian rather than Communist, going back perhaps to Rurik and to Byzantium in a history and tradition more than millennial? Power-mad cliques and individuals are the explanation of many. Still others attach real importance to Marxism-Leninism and its teachings in the production of a new and different Russia. Of these and other factors the possible combinations are almost infinite, and from Custine to Crankshaw, John Fischer, Soloveytchik, Barrington Moore, Berdyaev, and Gurian the changes have been rung on them.

It is my belief that no one has written of these problems more judiciously, with fuller knowledge, or with greater wisdom than Professor Tomicic. It is a shame that the jargon which he has picked up from American social science and the slow chronological progress he makes from the most remote history to today's newspaper will discourage many readers. Those who persevere will find their reward in an understanding of the Russians which owes little to the superficialities of statistics, nor does it egregiously abuse intuition.

By examining seriatim the ancestral society of steppe warriors and of Old Slavonic plowmen Tomicic concludes that there was a blend of "two conflicting worlds" that "formed the basis of Russian Society." Nomadic invasions completely shattered "the social stability which existed in the Old-Slavic Society" and already led to a "sense of emotional and physical insecurity which fostered destructive aggression and mass violence." We begin to see the relevance to our contemporary situation. The Byzantine church helped to foster complete dependency and fatalistic resignation rather than personal and social

responsibility. That a resigned people is also a revolting people Tomicic is quite aware, and he has a partial explanation in the eighteenth-century reforms which undermined the whole realm of the sacred.

The structure of Russian Society is followed into family life and personality in a rather successful effort to understand the total context. Totally unsatisfactory to a Communist, and partially unsatisfactory to any Russian, Tomicic's study seems to this reader, who is neither, as well rounded and insightful as anything we have. Or am I merely taken in by an interpretation of history so up to date that it can talk with the psychiatrists of the release and redirection of hostilities?

W. REX CRAWFORD
Salzburg Seminar in American Studies

GURIAN, WALDEMAR (Ed.). *Soviet Imperialism: Its Origins and Tactics*. Pp. vii, 166. Notre Dame: University of Notre Dame Press, 1953. \$3.75.

This symposium has more unity than most. The contributors have conscientiously adhered to the question posed: Is Russian Imperialism or Soviet Communism the enemy? They are divided in their answers to the question and have approached it from different vantage points which do not overlap.

N. S. Timasheff argues that the Soviet territorial acquisitions in 1918-22, 1939-40 and 1944-45 would probably have been made by even a non-Communist government of Russia. The formation of the satellite states and the conquest of China, however, are at variance with the historical pattern of Russian expansion.

Richard Pipes finds that Russia's Mohammedan subjects fared better under czarism than under Communist rule. The Soviet policies of Russification and genocide make Communist expansion a historically new phenomenon in his opinion.

Frederick Barghoorn's analysis reveals that the Soviets have chosen the symbols of nationalism to disguise their totalitarianism. He stresses that the major propaganda themes in the Union of Soviet Socialist Republics continue to be Marxist rather than Russian.

Michael Pap asserts that the fate of the Ukraine under the Czars and the Reds has been much the same, except that the latter have been more vigorous in their imperialist policy of suppressing non-Russian people.

Soviet policy in Poland is a continuation of Russian imperialism by different means, according to Wiktor Weintraub. For example, the Czar tried to Russify the Poles by school curricula in the Russian language; the Soviets use Russian books in Polish translation instead.

Ling Nai-jui argues that the objectives of Soviet diplomacy in China are identical with those of the Czar.

The book does not convince the reader of the practical importance of the dichotomy: Russian Imperialism versus Soviet Communism. America is faced with a double-barrelled shotgun—the Communist ideology and its 1953-homeland. Both barrels are aimed in the same direction by the same marksman for the same expansionist purpose. To attempt to disassociate one from the other is to disregard deadly reality. Even assuming such disassociation were possible and that, for example, the enemy were found to be "old-fashioned imperialism" and not Communism, could such imperialism be resisted in this age of bi-polar power, H-bombs, and psychological warfare as it was in the era of classical imperialism? Or, what is the threat of an ideology not backed up by guns and a strong home-base? The attempt to isolate factors of Russian expansionism from Soviet expansionism may be useful in academic analysis; the usefulness for policy formation is not persuasively demonstrated in this otherwise excellent and informative volume.

C. DALE FULLER

University of Denver

BERGSON, ABRAM. *Soviet National Income and Product in 1937*. Pp. xi, 156. New York: Columbia University Press, 1953. \$3.75.

While this is a monograph for specialists, its results should be of wide general interest. Professor Bergson has reconstructed, from hundreds of pieces of detailed evi-

dence in Soviet sources, an organized set of national income and product accounts for the Union of Soviet Socialist Republics in 1937. They give a cross-section view of the Soviet economy which permits objective measurement of many features of the Soviet system hitherto discussed mainly in strident political slogans.

The study surmounts formidable problems. Probably the most difficult relate to the lack of institutional correspondence between Soviet and American society. This is, of course, far more than a statistical or definitional problem; social and legal contrasts prevent any simple transfer of familiar concepts. The author, himself a notable contributor to the pure theory of income analysis, devotes a portion of this essay to broad consideration of the content of his statistical boxes. A derivative set of problems arises in eliminating various taxes and subsidies in order to approximate the desired categories. The underlying problems of ferreting out adequate raw data, while by no means negligible, were not as prohibitive as might be supposed. Students of the U.S.S.R. have found that official Soviet data are not, in general, pure fabrications. Concealment rather than invention seems to be the rule, and 1937 was chosen partly as the last year for which relatively abundant information had been released.

In simplified form, one of the fundamental differences between the Soviet economy and our own can be seen from the following percentage breakdown of the use made of the two gross national products (derived from data on pages 75 and 95):

	U.S.	U.S.S.R.
Consumption	74%	56%
Gross investment	15%	23%
Government	11%	21%

The forced industrialization drive of the Bolshevik regime has channeled almost a quarter of the country's output into gross capital formation. As a consequence, Soviet citizens are left with a much smaller share of the pie, and of course the Soviet pie is much smaller than the American to begin with, especially on a per capita basis.

For details of Professor Bergson's other

interesting findings, such as the enormous role of sales taxes, the continued massive share of agriculture in this "industrialized" economy, and the presence of "surplus value" in the U.S.S.R., the reader may profitably consult the text itself. Its 99 pages (plus 45 pages of appendixes) do not make easy reading, but they provide objective, scholarly evidence bearing on crucial issues of our time. For example, those concerned with the theory and practice of "Point Four" development overseas would do well to examine this study for comparative insight on the limitations of totalitarian industrialization.

HOLLAND HUNTER

Haverford College

SWETTENHAM, JOHN ALEXANDER. *The Tragedy of the Baltic States: A Report Compiled from Official Documents and Eyewitnesses' Stories*. Pp. xi, 216. London: Hollis and Carter (distributed in the U. S. by The British Book Centre), 1953. \$2.75.

The author, a former member of the Displaced Persons Division of the British Control Commission for Germany, has compiled a report from official documents and eyewitnesses' stories, in the hope, he says, that the countries which have opened their doors to the Baltic refugees will understand something of their background and will welcome and love them as they deserve.

His summary of history of the Estonian, Latvian, and Lithuanian nations—the record of their economic, social, and cultural achievements during the twenty years of political independence and the story of their forcible incorporation into the Soviet Union—is indeed an interwoven pattern of texts and facts, but also a seizing narration.

Mr. Swettenham gives a first-hand illustration of the conditions in which the 250,000 Baltic refugees had to live in Germany and other countries, that were only "a transit halt" (Britain included). In July, 1947, the message to Congress of President Truman opened the gates of the United States to substantial numbers of the Balts. Those admitted under the Displaced Persons Act of 1948 showed them-

selves "hardy and resourceful" as the President expected them to be. Yet so many thousands were left behind. May the special immigration bill of 1953 now give a new chance to these qualified witnesses and resisters against Communist imperialism and slavery.

The Tragedy of the Baltic States is a valuable contribution to the record of the Nazi-Soviet conspiracy, of which the Poles, Balts, and Finns were the first victims. It arrives in proper time, when a special committee of the United States House of Representatives is engaged in investigation of the predatory proceedings by which the Baltic States have been pushed in the Soviet tideway.

Former Estonian Foreign Minister
Glenwood, Long Island, New York

WESTERN CONTINENTAL EUROPE

HITLER, ADOLF. *Hitler's Secret Conversations, 1941-1944*. With an introduction by H. R. Trevor-Roper. Pp. xxxi, 597. New York: Farrar, Straus & Young, 1953. \$6.50.

The character is a familiar one in every German *Bierstube*. Self-educated, shrewd, arrogant, he holds forth on every subject under the sun, from food to world politics, from music to military tactics. Pompous and omniscient, he refuses to discuss his ideas but, instead, issues dicta and ukases. He mistakes his intuitions for scientific fact. He knows all the answers to the meaning of history. He lives in a curious dream world and dismisses as insane anyone who disagrees with his judgments and disconnected monologues.

Adolf Hitler's unguarded, all-night, off-the-record table talks were taken down in shorthand by his party associates. A few quotations will suffice to give the quality of the mind of this fanatically egocentric, hate-laden dictator: *Racial Nonsense*: "It's our duty continually to arouse the forces that slumber in our people's blood" (p. 29). *Self-glorification*: "There was a time when one could say that there was only one Prussian in Europe and that he lived in

Rome. . . . There was a second Prussian. He lived in Munich, and was myself" (p. 66). *Delusions of Grandeur*: "When one enters the Reich Chancellery, one should have the feeling that one is visiting the master of the world" (p. 67). *Psychotic Suspicions*: "I never met an Englishman who . . . didn't say [Churchill] was off his head" (p. 153). "There's no doubt about it, [Roosevelt] is a sick brain" (p. 147). *Hostility*: "There's nobody stupider than the Americans. . . . I'll never believe the American soldier can fight like a hero" (p. 149).

Some of the world's worst literature is paraphrased here in Hitler's familiar gutter style, including Arthur de Gobineau's *Essay on the Inequality of Human Races*, Houston Stewart Chamberlain's *Foundations of the Nineteenth Century*, Alfred Rosenberg's *Myth of the Twentieth Century* (though Hitler denies any debt to Rosenberg), *The Protocols of the Elders of Zion*, and an ill-digested assortment of interpretations of Nietzsche, Schopenhauer, Mackinder, Haushofer, Frederick the Great, and Carlyle. One can imagine what kind of civilization would have emerged had this hypomaniac succeeded in his ambition of conquering the world.

In a brilliant introduction, Trevor-Roper describes this mind: "A terrible phenomenon, imposing indeed in its granite harshness and yet infinitely squalid in its miscellaneous and yet infinitely squalid in its miscellaneous—like some huge barbarian monolith, the expression of giant strength and savage genius, surrounded by a festering heap of refuse—old tins and dead vermin, ashes and eggshells and ordure—the intellectual detritus of centuries" (pp. xxix-xxx). Yet, despite Trevor-Roper's extraordinarily keen analysis, it is becoming increasingly clear that an understanding of the mind of Hitler cannot be achieved by the historian without the assistance of the psychologist, the psychiatrist, and the psychoanalyst. Clues in Hitler's reading give only a part of the story. His character, like that of every human being, was molded in his early years by the acculturation process of interpersonal relations. The fears, anxieties, hatreds, and hostilities, the neuroses and psychoses exhibited on every page of this book, call for study by those

specialists whose first concern is with abnormal behavior. The historian can note objectively that Hitler rationalized mass murder and slave labor; the psychiatrist is better equipped to learn why he held such views.

Trevor-Roper judges these talkfests as indisputably authentic. Hitler, in his colossal vanity, undoubtedly believed that this record would take a place alongside Eckermann's *Gespräche mit Goethe*. As a contribution to world literature, it reaches the level of *Mein Kampf*.

LOUIS L. SNYDER

City College of New York

PASCAL, ROY. *The German Sturm und Drang*. Pp. xvi, 347. New York: Philosophical Library, 1953. \$4.75.

The Romantic movement of the early nineteenth century was heralded throughout the Western World by premonitory stirrings, passionate outbursts, and prophetic voices which disturbed the philosophical composure of the Age of Reason and Enlightenment. Nowhere was this prelude to the Romantic revelry more powerfully intoned than in Germany, the country that, exhausted and disunited after the devastation of the Thirty Years' War, had long been the Lazarus in the community of European nations. The movement, called *Sturm und Drang* after a play by Klinger, ushered in the Renaissance of German literature and philosophy which was to reach its climax in the republic of letters at the court of Weimar. Goethe and Schiller, later the central figures of this "Court of the Muses," belonged with their early works in *Sturm und Drang*, though Schiller had no personal contacts with the group of writers whose chief members were Hamann, Herder, Goethe, Merck, Lenz, and Klinger.

Professor Pascal, postponing to a later volume the critical analysis and appraisal of *Sturm und Drang's* poetic and literary achievements, devotes his attention chiefly to persons and ideas. He distinguishes and competently discusses the various aspects of the *Weltanschauung* which emerged in the treatises, plays, and poetic outpourings of those literary men who were revo-

lutionists of a peculiar type. Their meta-physical ardor and the remoteness of their thought from contemporary reality blunted the edge of their scathing criticism of society. Their rebellious strokes were designed to overturn minds and sensibilities rather than thrones. One by one their ideas concerning the state, social classes, religion, genius, reality, history, and poetics are competently reviewed and analyzed in Professor Pascal's scholarly study. This departmentalization of a living thought, closely interwoven and richly individualized as it was, prevents the critic from achieving the grandly synoptic picture which seems warranted by his subject-matter. On the other hand, clarity, comprehensiveness, and balance of exposition are the rewards of a method employed by the author with openness of mind and fairness of judgment. As an introductory survey the book is highly to be valued.

HELMUT KUHN

Munich, Germany

OTHERS

KIRK, GEORGE E. *The Middle East in the War (1939-1946)*. With an Introduction by Arnold J. Toynbee. Pp. xiii, 311. Second Impression, Revised. New York: Oxford University Press, 1953. \$10.00.

This is a volume of "The Survey of International Affairs," covering the war period of 1939-1945 and devoted to the general area of the Middle East, published by the Royal Institute of International Affairs, under the editorship of Professor Arnold J. Toynbee. While a few sections have been written by specialists, Mr. Kirk, the author of the great body of the volume, is already well known for his *Short History of the Middle East* (1946) and other works.

Essentially the volume is divided into four parts which deal with (I) Political Motives in the Middle East, 1939-1945, including a discussion of Arab nationalism, Zionism, and the interests of the major powers in the region; (II) The Development of the War to El Alamein, 1939-

1942; (III) The Recession of the War, 1943-1945; and (IV) The USSR and the Middle East, 1939-1945. Within this framework, Mr. Kirk treats not only of military operations in the Middle East, but of the effects of the war on the peoples, governments, and national movements during the period, together with the political and economic policies of the belligerents as thus far known on the basis of available evidence. Particularly interesting, in this connection, are the discussions of the Arab national movements, for example, in Morocco, Tunis, the former Italian colonies, Egypt, the Levant States, and Iraq, and the development of Zionism, which ultimately (1948) led to the establishment of the state of Israel. The contribution of Mr. Guy Hunter concerning The Middle East Supply Center is a very welcome and succinct account of this important aspect of operations in the Middle East during World War II. A special section is devoted to the USSR in the Middle East, more particularly to its policies and activities in Turkey, Iran, and the Arab States, although Soviet interest in the area as a whole is discussed in other parts of the volume as well.

Informed opinion will vary as to the author's treatment of different aspects of his story, which is necessarily fragmentary in spots. Nor is the evidence by any means "complete" for so recent a period of history. Although only first published late in 1952, the volume has already been revised, apparently because of some of the author's reflections as to the problem of Zionism and Palestine. It may be doubted that French students of the Middle East will be much pleased by his treatment of the French position, either in North Africa or in the Levant States, during this period. The author might well have filled out the picture of Soviet policy, especially among the Arab States. Leaving these matters aside, however, *The Middle East in the War* should be required reading for all serious students of Middle Eastern problems, for it is not only well written and generally well balanced and objective, but it is the product of very extensive research and study. Another volume, covering the period since 1946, should pull the story

neatly together, and should well serve the end of a better understanding of this highly critical area in a much-troubled world.

HARRY N. HOWARD

Arlington, Virginia

STAMP, L. DUDLEY. *Africa: A Study in Tropical Development*. Pp. vii, 568. New York: John Wiley and Sons, 1953. \$8.50.

This new geography textbook on Africa comes at a time when interest in that continent is growing at a very rapid rate because of postwar economic and political developments in almost every major part of Africa. Professor Stamp, one of the best-known British geographers, places his emphasis on tropical Africa, although his book covers the entire continent from the Mediterranean shores to the Cape of Good Hope.

The book is divided into three parts. Part One: *The African Continent* treats the physical and cultural aspects of the continent as a whole. Special chapters are devoted to the history of exploration and partition, geology, climate and water, soils, vegetation, peoples and their ways of life, diseases, and transportation. Part Two: *The Countries and Regions of Africa* consists of eleven regional chapters, of which six are devoted to tropical Africa, one each to South Africa and the African seas and islands, and three to North Africa and the Sahara. The organization of these regional chapters varies somewhat, but in almost every instance each chapter presents the essential features of the physical environment, a brief sketch of the historical background, and a picture of the peoples and political organization, and discusses then quite fully the modern economic development, trends, and problems. Part III: *Africa Today* is disappointingly short, having only one brief chapter treating rather superficially past, present, and future problems.

It was a good idea to keep statistical data as much as possible out of the regional chapters and present them in a *Statistical Summary* that can be easily kept up to date. Wherever possible, the pertinent data on population, land use, crop

acreage, livestock, mineral production, and trade are given.

The purpose of the book, according to its author, is to look at the continent dispassionately and objectively, without racial or political bias, "to consider its geographical background as an environment for human activity and to study the responses which have been evoked from its African inhabitants and those who, in the last few centuries, have penetrated its fastnesses and molded its fortunes." Here in Africa we find side by side the colonial dependencies of Britain, France, Belgium, Portugal, Italy, and Spain, which invites comparisons. Each one of these colonial powers pursues its own policy in guiding the growing political consciousness of its African subjects; but the policy is greatly affected by the size of the European population and its role as either permanent settlers or sojourners. The distribution of European sojourners and permanent settlers, as well as many other problems, can be understood only when examined in its geographical setting. Rightfully so, Professor Stamp stresses that to a large degree man's life in Africa is controlled by the physical environment, in particular by the geofactor water.

The book is well illustrated with photographs and has excellent maps. Some of the chapters have a brief bibliography at the end, others have footnotes. Occasionally one comes across an interesting quotation, the source of which is not given either in a footnote, or in the bibliography at the end of the chapter. It is hoped that this will be corrected in a later edition. The book will be welcomed not only by geographers but also by other social scientists who are looking for a modern geographical treatment of Africa.

KARL J. PELZER

Yale University

THAYER, PHILIP W. (Ed.). *Southeast Asia in the Coming World*. Foreword by William O. Douglas. Pp. xii, 306. Baltimore: Johns Hopkins Press, 1953. \$4.75.

Southeast Asia today is not the unknown area it earlier was in the United States. The early postwar years have seen a num-

ber of volumes providing at least an overview of the culture, economy, and political status of the millions of inhabitants of Burma, Thailand, Indo-China, Malaya, Indonesia, and the Philippines. The stage has now been set for a presentation of basic problems facing emerging or newly-created states of Southeast Asia.

In the summer of 1952 a conference on "Southeast Asia in the Coming World" was sponsored by the School of Advanced International Studies of the Johns Hopkins University. Twenty-one conference papers form the contents of this book, mostly written by Americans who have studied the area, while several contributions come from Southeast Asians.

Five papers falling under "Political Science" discuss our foreign policy in Southeast Asia. The efforts of these authors, recognized as authorities, provide insight into our past, present, and future political relations to individual Southeast Asian states. Another five papers deal with "Economics," covering aspects of what may well be crucial factors in the current position of these states. Included are a contribution from Professor Dobby of Malaya on "Food and the Changing Function of Southeast Asia," as well as one from Professor Vu Quoc Thong of Hanoi on future economic development of Vietnam. "Ideological Problems in Southeast Asia," by Richard Gard, introduces the part entitled "Culture" providing an exposition of concepts basic to development of Southeast Asia in future decades. Implications of these concepts underlie contributions throughout the volume. The effect on Southeast Asia of cultural borrowing, including communism, makes up the remainder of this part. The fourth part is devoted to "Law," a welcome addition since law is frequently neglected in general area studies. Illuminating papers are offered by the Rector of the University of Rangoon and the President of the University of Indonesia both dealing with the customary or adat law of their respective countries. The role of Southeast Asia in international law and in international relations is also presented. The last part, "Proposals for the Future," seems repetitive

since all authors dealt with the future, as well as the past and the present. The final paper adds something new, however, in highlighting possible interaction between American and Southeast Asian universities.

An extraordinary amount of effort is evident, in the lucid presentation to educator, government policy maker, businessman, or interested general public, of the problems which must be met and solved if there is to be integration of Southeast Asia into the modern world. We need detailed documented studies of various segments of political, economic, and social life of Southeast Asia in the United States, supplementing the many prewar Dutch, French, and English studies. This volume poses the questions. We cannot be satisfied until facts upon which the definitive solution must depend are further investigated.

A. ARTHUR SCHILLER

Columbia University
School of Law

ZINKIN, MAURICE. *Asia and the West*. Pp. xii, 304. New York: Institute of Pacific Relations, 1953. \$3.50.

At the very outset this reviewer must indicate that he does not agree with some statements made by the author, such as: "The West did not set out on a deliberate tour of conquest [of Asia]. As a rule it went to the East to trade, and its blind weight broke the Eastern countries." According to the author, the very fact that Japan did not become a victim of Western expansion "is an interesting proof that Europe was not bent on conquest for its own sake. It was trying, more or less consciously to create political systems which would stand the wear and tear of industrial age." This statement is a very inadequate rationalization to support Western imperialism and conquest of Asia, as if to help the peoples of Asia, which is not historical fact.

Asia and the West is, however, an excellent study of social and economic conditions of Southeast Asian countries. One chapter is on "the Eastern Village and Western City," implying that the very idea of city is Western. If the Oriental industrial cities of modern type are of recent

growth, they have grown fast. The modern cities of the West are the outgrowth of industrial revolution, but this is also the case in the Orient. The patterns of social changes in the East and West are not entirely different in character, but the time element makes the difference striking.

The author makes it clear that during the quarter century of Japanese occupation of Manchukuo outside investment and industrial development surpassed anything the Western powers had accomplished in their colonies. But he thinks that such a development did not benefit the Chinese workers. The reviewer thinks the author has a double standard in appraising British imperialism in India and Japanese imperialism in Korea.

The author suggests that America has lost China because we supported the Kuomintang and Chiang-kai Shek and cites "the White Paper on China" to substantiate his position.

The author believes that the future of Asia as it will affect the West will depend on what happens in India. The real purpose of the book can be deduced from the following passage: "The Indian sub-continent, and in particular India, dominate the whole area from Aden to New Guinea. If they go, all Asia will go with them. If they can give their people food as well as freedom, factories as well as democracy, then Communism will be stopped on the Chinese borders more effectively than by many divisions. Asia is determined to be richer, even if it means liquidation on the Chinese scale, but it would prefer its bread without bullets. There could be no better investment for America than to help India and Pakistan in showing that liquidations are not essential to welfare. This book is intended as a contribution to the study of the Asian background against which such a policy must be planned."

In one chapter Zinkin examines the Five Year Plan of India. He indicates that India needs foreign capital investment, but needs sums much smaller than those given to Japan and Germany by the United States. In the Postscript he pleads: "Whether Communism or democracy is chosen [by the Asian people] will depend

not on ideologies but on facts. If the West, which in this context means the Commonwealth and the United States, wants freedom to win, then it must make sure that India offers a more successful model for imitation than China. That will be expensive; it may cost as much as £200 million a year for India alone; and other countries will doubtless want their share. But it is much cheaper than a series of Koreas."

The book is a valuable contribution in the field of Asian affairs.

TARAKNATH DAS

and New York University

HSU, FRANCIS L. K. *Americans and Chinese: Two Ways of Life*. Pp. xix, 457. New York: Henry Schuman, 1953. \$6.00.

This book includes a stimulating and instructive analysis of Chinese culture. But even more enlightening to Americans is its objective and thought-provoking analysis of our culture. The author, a Chinese cultural anthropologist who completed his graduate training in England and has lived for nearly a decade in the United States, is unusually well qualified to make such a study.

It is Professor Hsu's basic premise that the American and Chinese ways of life are in diametric contrast, with the American individual-centered and highly emotional and the Chinese situation-centered and little swayed by his emotions. These contrasts appear to be somewhat forced at times, but the author is honest enough not to allow his theories to prevent the presentation of the pertinent facts. The facts tend to support the individual-versus-situation-centered part of the premise; it is more difficult to accept without reservations the author's conclusions about emotions.

Part One of this book is concerned primarily with the origin of differences in the American and Chinese ways of life in the family and in the school. Part Two examines the differences in the psychological orientation of Americans and Chinese as illustrated in their attitudes toward mar-

riage, class, personal success, government, economic life, and religion. Part Three is devoted to American problems, Chinese weaknesses, and the challenge of Communism to both societies.

In the opinion of the reviewer the author is most convincing when discussing social and political phenomena. Students of religion are likely to question various points in his interpretations of Buddhism and Christianity; and his brief excursions into art and literature are so weak that they would have been better omitted altogether. Some historians of China will feel that he underrates the changes that have occurred in the Chinese way of life during the twentieth century, that he does not distinguish sufficiently between traditional and contemporary Chinese society. But it must be said that he is consistent in upholding the thesis that there is no essential difference between Chinese attitudes today and those of the past—that the recent changes in China are no more than adjustments that have been compelled by the aggravation of ancient ills by the impact of the West. Even the acceptance of Communism is no more than the latest attempt to solve such problems. While recognizing the risk that Communism may change China, Professor Hsu feels that it is at least as likely that China will change Communism. Moreover, he believes that "despite the fact that Communists have triumphed in China while they have at least been brought to a temporary standstill in the West, . . . in the long run the West stands in more serious danger of succumbing totally and irrevocably to Communism or some other brand of totalitarianism than does China" (p. 435).

The book is clearly written, with occasional summaries that are helpful to the general reader. It grinds no political ax, and is fresh and stimulating. Its occasional sweeping generalizations and exaggerations are presumably intended to emphasize important points or to provoke thought. It is to be hoped that *Americans and Chinese* will reach a wide audience, for it could be read with profit by all Americans.

KNIGHT BIGGERSTAFF
Cornell University

MORAES, FRANK. *Report on Mao's China*. Pp. 212. New York: The Macmillan Company, 1953. \$3.75.

This readable, informative, and impressionistic account of Communist China today is written by an experienced Indian journalist. Mr. Moraes was in Chungking and Kunming as a war correspondent in 1944 and 1945 and made a tour of Communist China from April to June 1952 as a member of the Government of India's cultural delegation. Mr. Moraes covers all the main aspects of China today—the look of the towns and the countryside, relationships with Moscow, brain-washing, public works, the top Communist leaders, the emancipation of women, economics, culture, hate campaigns, and foreigners, both friendly and unfriendly, still resident in China. He concludes with a somewhat forced comparison between Gandhi, Nehru, and Mao, and some interesting comments on India and China.

Mr. Moraes looks at the world through the spectacles of his own country, but he is definitely anti-Communist and far more objective about what he sees in China than have been a good many American reporters. He feels that the Communist regime depends on the army first, and on propaganda second. The brain-washing of the young is more important than that of the old. Russian influence is strong and growing stronger. Mao emerges as a realistic and practical man who uses Marxism-Leninism as a useful tool in gaining power. He will be no Tito. His greatest weakness is his ignorance of the West.

The effort to emancipate women from the old family system is not going as rapidly as had been hoped, but the liberated ones are quickly harnessed to the all-powerful State. The theme of the all-powerful State runs through everything—culture, education, politics. Mr. Moraes in fact feels that democratic India and totalitarian China are struggling for the leadership of Asia.

Mr. Moraes sees the Chinese side of the Korean conflict more sympathetically than we do. It is hard to follow his argument that United States policy has driven Peking into the arms of Moscow—especially in view of his scoffing at the possi-

bility of Titoism. On the other hand, one can agree that China would like an easing of the tension in Korea in order to avoid a continual drain on her manpower and resources. "In other words, she wants neither war nor peace but a state of stalemate calculated to tie up the U. S. forces in Korea without placing too much stress and strain on her own economy." Mr. Moraes has no illusions about the ambitions and designs of a militaristic Communist China.

SAVAGE, HOWARD J. *Fruit of an Impulse: Forty-Five Years of the Carnegie Foundation, 1905-1950*. Pp. viii, 407. New York: Harcourt, Brace and Company, 1953. \$6.00.

This strangely titled book is an able history of the Carnegie Foundation for the Advancement of Teaching, written on assignment by Howard J. Savage, staff member of the Foundation since 1923. It joins a rising tide of similar foundation histories, ten- and five-year summaries, and newly initiated annual reports, all testifying to a quickening consciousness within foundations of accountability to the public and the necessity for a wider understanding of this relatively new instrument of philanthropy if its greatest asset, full freedom to experiment, is to survive.

One approaches staff-written histories with misgivings. Will it be a glory book, or a dull catalogue of dates and names? This one is neither. It has its arid patches and shows no genius for portraiture, but it does have pleasant narrative touches and presents an important institutional history with every attempt at honest objectivity. Outstanding successes are duly noted, such as Abraham Flexner's notable report on medical education—though Mr. Savage gives too modest an account of his own dynamiting inquiry into college athletics. Failures and near misses, too, are noted. For example, *Bulletin No. 5* "was not too favorably received. Some scientists saw it as showing little comprehension of what a university was all about." Tremendous

controversies raged about the Foundation when long-lived annuitants, falling interest rates, and—it is frankly admitted—inadequate preliminary study forced a reduction in the retirement allowances professors were expecting. These are noted and the problem is explained at great length, though it was too much to expect that the most vituperative comment would be presented.

For the student of philanthropy here is the documented history, covering nearly half a century, of a simple, even naïve, attempt to do good with ten million dollars, and its unexpected results to the whole field of American higher education. Andrew Carnegie saw college professors, grown old in worthy service, living on in penury; he decided to help them with free pensions. But free pensions were not a good idea. Mr. Savage admits that in the light of present-day knowledge Mr. Carnegie's "gift to the teachers might have taken another form. Conceivably it would not have been made at all." It was made, but with unexpected consequences. Since the pensions were for "college" teachers, it became necessary to define acceptable colleges. The attempts of colleges to qualify worked a revolution in the standards of higher education.

Meanwhile the Foundation's firm-minded president, Henry S. Pritchett, saw the educational studies of the Foundation as potentially more important than the pensions, and after years of resistance won over Mr. Carnegie to permitting a modestly endowed Division of Educational Enquiry—a shift in course which the winds of experience have brought to many other philanthropists and endowed charities. The pensions, even when later curtailed, demanded many more millions than Mr. Carnegie originally gave or intended. The research program, helped though it was by grants from the Carnegie Corporation, seldom had substantial funds; but under direction of presidents Pritchett, Henry Suzzallo, Walter A. Jessup, and Oliver C. Carmichael (who has just resigned) it has made outstanding contributions to American education.

F. EMERSON ANDREWS
Russell Sage Foundation
New York City

DAHL, ROBERT A., and CHARLES E. LINDBLOM. *Politics, Economics and Welfare*. Pp. xxvi, 557. New York: Harper & Brothers, 1953. \$5.00.

This is a book which needs and deserves to be read more than once. Its forays into the further reaches of economics and political science, its carefully reasoned construction of a conceptual framework, and its use of a technical and in some part novel vocabulary—all make the book difficult reading. But its virtues demand the effort and justify the advertised enthusiasm of those who read the manuscript in draft and pronounced it "first-rate."

In an immediate sense, the book is the result of collaboration between two Yale professors, one a political scientist and the other an economist. Having discovered some years ago that their separate seminars on "planning" differed more in terminology than in content, the two formed a partnership in teaching and in ideas. The result was a joint seminar, and the use of the combined theoretical and technical resources of two disciplines to provide the beginning of an answer to their basic question: "What are the conditions under which numerous individuals can maximize the attainment of their goals through the use of social mechanisms?"

Their "beginning of an answer" is impressive, both in substance and in method. Though no summary can do it justice, the gist of their answer is carried in the following set of propositions:

1). Welfare must be treated as a broad concept, embracing the ultimate and immediate goals of both the "political" and the "economic" man.

2). The essential requirement in maximizing welfare is not that a once-for-all choice be made between the extreme alternatives posed in the Great (but passing) Debate over Planning and the isms. Maximizing welfare requires a commitment, not so much to a particular set of means as to the general processes of rational calculation and control; and these in turn require a great variety of specific and changing techniques.

3). Choice of these techniques need not be hit or miss. It should be governed by a rigorous appraisal of the "marginal ef-

fectiveness" and consequences of alternative methods.

4). The first step in such an appraisal is to reduce the array of available techniques to a few elemental types, best defined and analyzed in terms of the social processes to which they relate, and the varying patterns of social relationships which they involve (thus the subtitle of the book: "Planning and Politico-Economic Systems Resolved into Basic Social Processes"; and the listing, for example, of "Four Basic Control Techniques"). So fashioned, these basic processes and techniques become the common denominators of economic and political analysis and the starting point of a significant venture in political economy.

The reader will recognize from these summary propositions the extent to which the book is an amalgam of established methods and points of view—its borrowings range from the marginal analysis of contemporary economics, and the jargon current among social scientists, to the Fabian emphasis on gradualism and the efficacy of techniques. (It is difficult to forgive the jargon, though no more difficult, I suppose, than to avoid it in these days and with such refractory material. The temptation, certainly, is to write too easily and obscurely, leaving the reader to wonder whether, after all, "the emperor's clothes are woven of naught but artful invention.") The original and real contribution of the authors lies in their resourceful use of familiar materials to provide a new and badly needed analytical system.

Among many uses to which the book should be put, one is to serve as a text in a survey-review course for seniors majoring in economics and political science. Whatever the use and whoever the user, an important bit of advice is to read the "Postscript" first, which is much more significant and helpful than its modest position and title would indicate.

PAUL N. YLVIKAKER
Swarthmore College

CRAVEN, WESLEY FRANK, and JAMES LEA CATE (Eds.). *The Army Air Forces in World War II*. Vol. V: *The Pacific: Matterhorn to Nagasaki, June 1944 to*

August 1945. Pp. xxxvii, 878. Chicago: University of Chicago Press (for the Air Historical Group, USAF), 1953. \$8.50.

In many respects this volume of the projected seven-volume history of the Army Air Forces in World War II is far superior to volumes I, II, and IV, and is only equaled by volume III which deals with the campaign in Europe from January 1944 to May 1945. This is largely accounted for by the fact that it was not until 1944 that the Air Forces overseas had competent historical divisions attached to their headquarters; indeed, General Kenney's Far East Air Forces did not accept the assignment of an historical section until May 1945. Consequently, while the history of the early period of the war is handicapped by a comparative paucity of source materials, volumes III and V are based upon a huge mass of original manuscripts which were available to historians before they were destroyed by hard-pressed adjutant generals who were forced to seek filing space for current papers.

Although this volume presents an excellent account of the most complex and often bewildering campaigns in the Philippines, the naval advance from the Marianas, and the activities of the Air Forces in China and the Burma-India theaters, it is concerned mainly with the strategic bomber offensive against the Japanese homeland. The war against Japan was unique in our whole military history in that it was the only case where the role of the ground soldier was primarily a supporting one. Because of the publicity given to the long and often bitter debate that has raged since the war as to whether the Air Force or the Navy was primarily responsible for the defeat of Japan, one reads this volume in the hope of finding a definite solution to the problem. The extreme supporters of the doctrine of victory through air power alone will get little encouragement out of the contents of the book.

This whole question is analyzed in a brilliantly written "appraisal" in the final 20 pages of the work, and the editors come to the conclusion that it is quite impossible to determine to which Service the credit

should be given. It appears that the basic cause of Japan's failure was the inability of her industrialists to produce war materials in sufficient quantities for a large scale, long protracted struggle. At best they had only 10 per cent of the industrial production of the United States, and this declined rapidly in the latter half of the war. In the words of the editors: "it must be admitted that there would have been real difficulty in studying the effect of strategic bombardment as an isolated problem, for the B-29 offensive—to take but one example—had reached true effectiveness only after a blockade implemented chiefly by U. S. submarines had had a telling effect on Japan's capacity to prosecute the war."

The editors conclude that "if any one factor, aside from the weakness of Japan herself, deserves principal emphasis, it is the high degree of effective joint action achieved among the American armed services."

ARTHUR P. WATTS
Lt.-Col. USAFR

Philadelphia, Pennsylvania

LETTERS TO THE EDITOR

Dear Sir:

Reviewing our book, *Anna Ella Carroll and Abraham Lincoln*, T. Harry Williams, in 600 words, says, "Space does not permit analysis" of its case. Had he avoided offensively weighted words and toploftical misstatements, he would have had room.

1. It was not *we* who called Miss Carroll "the great unrecognized member of Lincoln's cabinet." It was the card catalogue of the Library of Congress, which quotes authorities of Lincoln's own time. Can Williams not read quotation marks?

2. Williams, echoing another Williams, says Miss Carroll did not know how her outline of strategy of November 30, 1861, was used. She made no such admission. Guarding her words to Senator Howard, Chairman of the Senate Committee on Military Affairs, in order to get him to commit himself, she drew from him a signed statement to the Senate that she

"had furnished the government with the information which caused the change of the military expedition which was preparing to descend the Mississippi River from that river to the Tennessee" (House Misc. Doc. 58, 45th Cong., 2nd ses.).

3. There is no truth in Williams' statement that "no single contemporary document indicates that Grant advanced because of her influence." On February 20, 1862, Elisha Whittlesey, of the Comptroller's Office, Treasury Department, enclosing copies of Miss Carroll's strategy outline, wrote "They are very extraordinary papers as verified by the results. So far as I know or believe, our unparalleled victories on the Cumberland and Tennessee rivers may be traced to her sagacious observation and intelligence."

Again, Senator Benjamin Wade testified (see p. 323 of our book) that within a few days of the fall of Forts Henry and Donelson, while the movements projected by Miss Carroll were still in progress, "With the knowledge of the author [Miss Carroll] I interrogated witnesses before the Committee to see how far military men were cognizant of the fact." These records were aired in the testimony before the Military Affairs Committee of the House in 1876 (House Misc. Doc. 179). Senator Wade stated in a letter prefixed to House Report No. 386 (see our book, pp. 300-301 and 304) that hearing of Anna's plan from Assistant Secretary of War Scott, he (Wade) himself urged Lincoln to override McClellan and Halleck and put it in execution with secrecy, and appoint Edwin Stanton as Secretary of War to carry out her plan, "since he [Stanton] fully believed it was the only means of safety as I did." Again, the testimony of Colonel Scott (who was Assistant Secretary of War during the Tennessee advance), which he gave seven years after the Civil War, is absolutely explicit (see our book, p. 305).

Will anyone say that the testimony of an official of comparable position made today to the Committee on Military Affairs with regard, say, to the North African campaign, could be dismissed as not "contemporary"?

Williams adds, "in fact, the contemporary documents disprove the Greenbie

thesis." Where are those documents? He cannot produce one. Grant never claimed this strategy. True "almost anyone could have thought of it." But nobody did.

4. Now to our "fascinating use of evidence" in the Conkling speech. Transcripts of this speech were submitted to the Military Affairs Committee, as evidence that that action was taken at once to prepare for future recognition by Congress of Anna's work. Williams' ignorance of this fact does not alter it. It only makes his claim about McClellan more ridiculous.

5. Williams runs riot against our "improbable conversations" which we call synthetic. Our conversations are based on actual words in written documents, or on known actions in similar situations. But Williams prefers improbable generalizations. With Freudian self-confidence, on page 26 of his book, he says: "McClellan would have been a better man had he encountered some humbling reverses in his first battles by actual or possible defeat." Through what special conversation with God does Williams know this? Many generals were defeated without being improved. This is not synthetic. It is pure eyewash.

Our first attempt to answer Williams took us 1,200 words. Since we are given only 550, we shall have to let him go at that. We find it ten times harder to answer his egregious errors in that brief review than he did to cover the errors in our 539 pages.

SYDNEY GREENBIE

Castine, Maine

Dear Sir:

I expected the Greenbies to write a letter protesting my review. They seem to make a practice of protesting reviews that do not accept their claims. I expected the letter to be of the nature it is. I have no desire to get into a squabble with the Greenbies. One cannot argue with people who are dedicated to a case.

ETHICS FOR POLICY DECISIONS

By WAYNE R. LEYS, Professor of Philosophy and Dean of Faculties, Roosevelt, Chicago

This is a study of ethics applied to the making of everyday decisions—in government, business, education. It will enable teachers in departments of philosophy to discuss the kinds of cases which are presented by the social sciences and the professions, resulting in closer relations between philosophical ethics and other parts of the curriculum. Case Studies are provided for discussion and analysis—in personnel administration, school politics, community organization, family conflict, labor relations, public administration, business expansion, and the like. Studies reported in this book were sponsored by a Rockefeller Foundation grant-in-aid. 416 pages . 5 3/4" x 8 3/4" . Published March, 1958

GOVERNMENT BY THE PEOPLE:

The Dynamics of American National Government

By JAMES M. BURNS, Williams College, and JACK W. PELTASON, University of Illinois

Here is a text that students will want to read—a study of American government that stresses people and dynamic processes, rather than minutiae of laws and institutions. Examines the major problems facing the American people today: the use and abuse of Congressional investigations, civil liberties for Communists, non-voting, public opinion polls, the role of TV, spending and taxes, defects of Congress, Presidential power, foreign policy balance between economic and military defense, etc. In a lively style, with numerous case studies to dramatize government at work, and a wealth of illustrations, cartoons and charts, the authors make facts meaningful and thought-provoking. 396 pages . 6" x 9" . Published February 1958

PROBLEMS IN AMERICAN GOVERNMENT

An Introduction to Political Analysis

By ROBERT E. LANE, Yale University

This new and unique text is a student's workbook of political cases, for the most part accounts of political events, processes, or decisions, such as the last-minute voting shift in the 1948 elections, the recall of General MacArthur, etc. Thirty-seven problems or cases cover national, state, and local government. Emphasis is on both politics and ideology. 375 pages . 7 1/4" x 10 1/4" . Published 1958

WESTERN POLITICAL HERITAGE

By WILLIAM YANDELL ELLIOTT, Harvard University; and NEIL A. McDONALD, New Jersey College for Women

A monumental collection of excerpts from the writings of significant political thinkers from Biblical times to the present day—plus masterly interpretative essays to integrate their institutional background. Examines the basic moral and philosophical concepts that have run through human history. 975 pages . 6" x 9" . Published 1949

TOTAL ATOMIC DEFENSE

By SYLVIAN G. KINDALL

If the atomic bomb can blast cities from the face of the earth, what good will air-raid shelters be? None, says *Total Atomic Defense*, but it insists that cities can be made unrewarding targets for atomic bombings, and consequently in no danger of being attacked, if their areas are adequately expanded and all target factories are removed to their perimeters.

What of Washington, where a single hydrogen bomb could end our nation? *Total Atomic Defense* recommends moving the nation's capital to Colorado, and spreading it over an immense area.

What of gigantic dams, whose waters released by atomic bombing will destroy all cities along the rivers below? *Total Atomic Defense* shows how the building of low dams in series, for power purposes, and replacing of ditch irrigation by sprinkler irrigation will make unnecessary the building of another Shasta or Grand Coulee.

What of the incendiary parchment? *Total Atomic Defense* recommends measures which, if put into practice in time, can prevent it from sending up in smoke and flames all the wheat fields and forests of our Western states.

"*Total Atomic Defense* is an excellent blueprint for the right kinds of efforts which will spare our homes, industries and resources from the devastating effects of atomic warfare."—DAVENPORT TIMES. "Presents the common sense long range preparations and policies which would make a real defense against the atomic bombs."—DAILY OKLAHOMAN.

Though grim in its warnings, this is probably the only book to insist that America can be made completely safe from atomic warfare. Everyone should read it. Buy it at your local bookstore, borrow it from your local library, or send \$3 to:

Notice of

ANNUAL BUSINESS MEETING

of the members of

THE AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE

In accordance with the By-laws of the Academy, the Annual Business Meeting of the members will be held on Monday, January 25, 1954, at 3 P.M., at the offices of the Academy, 3937 Chestnut Street, Philadelphia.

The Annual Report of the Board of Directors will be presented, three directors elected, and other business transacted.

JAMES C. CHARLESWORTH
President

ENERGY IN THE FUTURE

By Palmer Putnam, Consultant to the
U. S. Atomic Energy Commission

An examination of the maximum plausible demands for energy during the next fifty to one hundred years, compared with the ability of nuclear fuels and all non-nuclear sources of energy to meet these demands at low cost. About 586 pages with 14 pages of halftones, 159 line illustrations, many charts and tables, indexed.

Published Nov. 20. \$12.75

SOURCEBOOK ON ATOMIC ENERGY

By Samuel Glasstone

The most complete and authoritative one-volume reference work on atomic science. 5th printing.

\$3.40

RADIATION MONITORING IN ATOMIC DEFENSE

By D. E. Gray and J. H. Martens

A practical manual for all those concerned with the measurement of radiation for defense

\$2.50

D. VAN NOSTRAND COMPANY, INC., 250-4th Ave., New York 3

OXFORD BOOKS

Problems of Capital Formation in Underdeveloped Countries

By RAGNAR NURKSE. The weakness of investment incentives in low-income areas, the potential sources of saving in rural underemployment, and the difficulties presented by the attraction of advanced living standards are discussed within a framework of economic theory and specific observation.

\$9.00

The Rebirth of Austria

By RICHARD HISCOCKS. The first comprehensive account of post-war Austria. It describes the re-creation of the Austrian Republic after the liberation, and discusses the revival of political, economic and cultural life from 1945 to the spring of 1953.

\$3.50

Soviet Policy in the Far East—1944-1951

By MAX BELOFF, author of *The Foreign Policy of Soviet Russia*. One of the most important books yet published on Russia, Asia, and the West. It discusses the whole problem of international relations in the Far East—from the Yalta Agreement and its implications up to the beginning of the Korean truce talks.

THE RAT RACE

By Edward Rager

A realistic study of contemporary and recent New York politics by the distinguished former Recording Secretary of the National Republican Club and member of the New York City Council, treating the processes of corruption.

Cleveland Plain Dealer

"Rager exposes the tie-ins between politicians and gangsters, of bribery and graft in the courts and in all phases of the city government . . . certainly a book that should be read and discussed by the American public."

Montreal Gazette

"I believe it is a book that every citizen who worries about graft and corruption in government should read—and I don't think anyone can rightly be called a citizen if he doesn't worry about these evils."

Toronto Telegram

"This probably is the most bitter book ever written about U. S. politics. If you parallel the story with New York's history, the implications are shocking."

"The Republican and Democratic parties are shown working in cahoots to bamboozle the apathetic, yea, stupid citizenry. Partly because of a press which is easily bought off, the public never gets a chance to think they aren't being well governed."

Michigan (Indiana) News-Dispatch

"The 'Rat Race' is a challenge to the American voter, for his is the responsibility for existing governmental double-dealing. Eric's explanation of the importance of primary elections ought to be posted and printed in all available space before every such election . . . the theme he has chosen is of importance to the world."

VANTAGE PRESS, INC.

220 West 31st Street, New York 1, N. Y.
