FOREWORD

WHEN James Boswell returned from a tour of Corsica in 1765 he wrote: "It is indeed amazing that an island so considerable, and in which such noble things have been doing, should be so imperfectly known." The same might be said today of Puerto Rico. Although more familiar to the general public in January 1953 than it was in January 1941, when "noble things" began to happen in the island, Puerto Rico is still imperfectly known in the United States.

The purpose of this volume is to remedy that defect. The essays attempt not only to describe in some detail the remarkable doings of the last twelve years but also to explain their significance for the world at large. Puerto Rico's achievements are significant because its problems are at once common and grave. They are to be encountered in many parts of this troubled globe, and nowhere are they being attacked so confidently or so successfully that lessons cannot be drawn from the Puerto Rican experience.

Like so many other places, Puerto Rico is an underdeveloped area. Before 1941 its economy was almost exclusively agricultural and devoted primarily to the cultivation of a single crop; its resources were meager save for manpower, and that was inadequately used; its widespread poverty was apparently endemic and ineradicable. Since 1941, however, strenuous and imaginative efforts have been put forward to raise the standard of living, to introduce industrialization, to diversify and increase agricultural production, and to discover new resources and make the most of those that were known.

Again like many other parts of the world, Puerto Rico has a population problem. A steadily high birth rate combined with a steadily declining death rate during the first four decades of this century had produced a tidal wave of humanity beating ever more destructively against the economic foundations of the island. Virtually unrecognized twelve years ago, the population pressures are today the object of serious concern and constructive planning.

In yet another sense Puerto Rico exhibits a not uncommon modern problem: that of accommodating a long-established culture, basically Old World in character, to the unsettling forces of rapid Americanization. Spanish in language, culture, and outlook for four centuries, the island suddenly in 1898 became subject to strong influences from the United States. The impact of these influences has increased each year, but the conflict between the old culture and the new has gradually lessened as patterns of adjustment have worked themselves out. During the last decade the island has become a training center for Latin American and other seekers after North American "know-how."

Finally, Puerto Rico presents (or rather did present until recently) a fairly typical instance of the world-wide problem of colonialism. From the early sixteenth century until the day before yesterday, the political status of the island was that of a dependent area. Under the jurisdiction of the United States since the close of the Spanish-American War, Puerto Rico learned the theory and (to the extent allowed by its American governors) the practice of democracy. Knowledge of democracy bred aspirations for self-rule; but awareness of economic difficulties inherent in the traditional goals of independence or statehood led to the creative

search for a third alternative. That search was rewarded on July 25, 1952, when the Commonwealth of Puerto Rico came into existence.

As this volume of *THE ANNALS* appears, a new era begins in Puerto Rico. For on the second day of January 1953, the Puerto Rican people inaugurate the first Governor to be elected under the Constitution which they themselves drafted and adopted for the new Commonwealth. In view of the results achieved during the past twelve years of democratic development, the future of the Commonwealth promises still more noble things to come.

Development Through Democracy

By LUIS MUÑOZ MARÍN

LANGUAGE was given to man to enable him to make himself understood by his fellow man. But one of the frailties of language is that there are some words which for a time prevent understanding. In Puerto Rico *patria*—the homeland—has been such a word. At first blush this may seem strange, as there is no people of the earth who love their native land more profoundly than do the people of Puerto Rico.

To the Puerto Rican, *patria* is the colors of the landscape, the change of seasons, the smell of the earth wet with fresh rain, the voice of the streams, the crash of the ocean against the shore, the fruits, the songs, the habits of work and of leisure, the typical dishes for special occasions and the meager ones for everyday, the flowers, the valleys, and the pathways. But even more than these things, *patria* is the people: their way of life, spirit, folkways, customs, their ways of getting along with each other. Without these latter things *patria* is only a name, an abstraction, a bit of scenery. But with them it is an integral whole: "the homeland *and* the people." Those who profess to love their country while taking an irresponsible attitude towards the destiny of its people suffer from spiritual confusion. The implication of their attitude is that we must save the country even though we destroy the people!

Love of country must mean love of all of the country—both the *patria* and the people. But some of us confused love of the homeland with the narrow

and bitter concept of the national state. We felt that love of Puerto Rico had as a necessary corollary the desire for separate independence. We had not yet comprehended that no law, divine or human, commands that countries must be suspicious, vain,* and hostile, that they must live separate from other countries whose peoples are a part of the broad equality which the Lord created on the earth. Because of the rigidity of our thinking, we could not disentangle the concept of love for our country from the fixed idea of separate independence. Anything other than independence seemed to clash with our love for Puerto Rico.

THE DAWNING LIGHT

The difficult process of clarifying these ideas began when the Tydings bill was introduced in Congress in 1936. On the one hand, this bill offered the separate independence for which many of us had asked because of our feeling for the abstract idea of the *patria*. On the other hand, it condemned the people of our homeland to extreme poverty from which they could never hope to escape. Suddenly what had seemed to be an integral idea—the homeland and separate independence—turned out to be two conflicting ideas: one, acceptable as an abstract idea; the other, a mortal enemy of the people. The Tydings bill would have made Puerto Rico independent; but it would have shackled the people with economic misery.

It was not easy to change our views on this subject. Our minds could grasp the point that if we could have separate independence only under the economic conditions of the Tydings bill, it would

* This is a speech delivered July 17, 1951 at Barranquitas, Puerto Rico. The speech has been translated into English and revised slightly for publication in *THE ANNALS*.

be not independence but a living death of hopeless poverty for Puerto Rico. Yet our emotions led us to search for other economic conditions under which independence would be possible.

At the time, our emotions were stronger than our powers of reasoning. Rationalization works where understanding is the servant instead of the master of emotion. Instead of using reasoning objectively to seek the truth, we used it to justify our emotions. Just as one might confuse the glittering uniform of a doorkeeper with that of a king, our powers of reasoning were led astray by rationalization induced by our emotions. We were the victims of wishful thinking in believing that separate independence would be feasible if the economic conditions in the Tydings bill came into effect over a period of ten years instead of immediately. This was also inadequate; but it served for a time to protect, in the minds of many of us, the preconceived idea of separatism.

THE UNTAUGHT WISDOM

We were gripped with this emotional confusion—wanting independence but not wanting economic upheaval—when the campaign to found the Popular Democratic party was running its course between 1938 and 1940. At this point, well aware of the great economic needs of our people, and knowing our simple people well, I set out to talk with them. I learned many things from these talks.

I learned that there is a wisdom among the people in the towns and in the countryside which education may lead, but cannot improve, in its magnificent human essence. I taught many of them something, but they taught me more. I learned that the people are wise—wiser than we think. I learned that to them freedom is something deep in the heart, in the conscience, in every-

day life, in personal dignity, in the furrow, the plow, and the tools. I learned that among the simple people the nationalistic concept does not exist, because in its place there is a deep understanding of freedom. I learned that in their wisdom they prefer—if they have to choose—one who governs respectfully from a distance to one who governs despotically from nearby. And that understanding is the unequaled basis and root of every great federalist concept, of great unions between countries and between men which cut across climates, races, and languages. The nationalistic concept prefers the despotic government of the nearby to the democratic government of the remote. Naturally, democratic federalism requires respect and liberty in the local as well as in the federal levels of government.

I learned many things, probably many more than I think I learned; for we learn by planting things in the mind which later bear fruit in understanding. And I learned better something I already knew: that it is unworthy of the conscience, that it is the denial of all ideals, to risk, for abstract concepts, the hope for a better life, the deep belief in the integral freedom of the good and simple people who populate the long paths, which sometimes cross the streets and squares, which are Puerto Rico. I learned all this, and I also learned that the great majority of the people of Puerto Rico prefer close association with their fellow citizens of the American Union and with all men on earth, to the bitter narrowness of separation.

I realized that with a program calling for separate independence we would never obtain the support of the people for economic development—equitable distribution and production—which the people needed so much. The profound intuition of the people was quick to point out the contradiction in a program which on the one hand talked

about the struggle to reduce their extreme poverty and on the other hand talked about separate independence which would destroy any hope of ever conquering that extreme poverty—which in fact would rapidly aggravate the seriousness of that poverty.

From the instinct of the people which I observed in my journeys among them, from the doubts in my own mind and the minds of others, and from the compulsion to deal with the great economic and social problems of so many good people in Puerto Rico, there emerged the formula which made possible everything that was to come, the formula that “the political status is not in issue.” The votes in favor of the Popular Democratic party would not be counted either for separate independence or for federated statehood; they would be votes in favor of an economic and social program. Our political status would be decided by the people on another occasion, wholly apart from the regular elections—presumably in a plebiscite.

This new concept of separating the economic from the political problem of Puerto Rico liberated the Popular Democratic party from a platform which was its own worst enemy—a platform in which the political plank could destroy the economic planks with the devastating fury of a tropical hurricane. This liberated those of us who had suffered from an intolerable perplexity of spirit. It enabled us to tackle the economic problems of Puerto Rico in a way that introduced a new, large movement of reform, creation, and hope. We are still engaged in that great task; in spite of the great deal which we have accomplished, there is much more to be done.

THE EITHER/OR CONCEPT PERSISTS

However, we were free of this perplexity of the spirit for only a short period. We continued to be preoccupied

as a collective group with the notion of a plebiscite in which we would be required to choose between separate independence and federated statehood—despite the fact that under either alternative the economic life of our people would be gravely threatened. It must be understood that it was not the people who were insisting on this course. This came from the political assemblies, who in this respect were not so representative of the people as they were in economic questions.

Those of us who participated in these assemblies were not insincere. With more learning and less wisdom, we continued to believe, although assailed by anguished doubts, that the choice must be between separate independence and federated statehood under economic conditions different from those in the Tydings bill and from those which existed for the states of the Union. We persisted in this view without examining closely the question of whether it would be possible to obtain these necessary economic conditions without any deviation from the two rigid alternatives. We were impaled on the horns of the dilemma which seemed to force an inexorable choice between separate independence and federated statehood. Actually, the instinct of the people used the idea of a plebiscite between these two classical forms of government to provide time for a better and autochthonous solution of the problem to appear. We can see this now. It was not easy to see it at that time.

In the 1944 campaign the promise to the people that the political status was not in issue was repeated. However, it was still imperative that we find a solution for that problem. The wisdom of the people, which I have mentioned, does not consist in a belief that the question of political status is of no importance whatsoever. Rather, recognizing that man does not live by bread

alone and is in part a political being, the people have wisely refused to be bound by the intellectual strait jacket of rigid and preconceived formulas which stifle the creative will and energy of men. It was this instinct of the people, which at times their leaders must channel into action, which engendered the happy thought that the solution might well lie in some form other than the two inflexible formulas upon which the political assemblies had long focused their attention.

A THIRD POSSIBILITY RECOGNIZED

We were thus one step farther along the road to reality: in a request to Congress for a plebiscite we used language which permitted consideration of solutions other than the two rigid classical alternatives. True, we committed the error, at the insistence of some of the members of the political assembly, of inserting a deadline; we asked for a solution of the problem when World War II ended. But we had freed ourselves from the tyranny of the labels, separate independence and federated statehood. We were making progress.

In 1945 I went to Washington for discussions on the question of the political status of Puerto Rico. As a result of this visit, a bill was introduced in the Senate by Senator Tydings and in the House of Representatives by Resident Commissioner Piñero. That bill presented *three* alternatives: separate independence, federated statehood, and dominion status. In the provisions for separate independence and dominion status the economic conditions were completely different from those of the original Tydings bill and from other Tydings bills. Under either of these alternatives, free trade between the United States and Puerto Rico would continue, the internal revenue taxes which now revert to the Treasury of Puerto Rico would continue to be cov-

ered into our Treasury, and federal aid for roads, hospitals, school lunchrooms, and many other public works and services would be extended for a long period of time.

During these consultations in Washington I became aware that such a bill could not pass. However, it did serve to present graphically to Congress and to the people of Puerto Rico the minimum economic conditions we needed in order to survive, irrespective of our political status.

THE OBJECT LESSON OF THE PHILIPPINES

In April 1946 I again went to Washington as a member of the Status Commission which was created by the Legislature of Puerto Rico and on which all the political parties with members in the Legislature were represented. Once more we tried to find a solution to the problem of status as we then saw it. During that time hearings were being held before congressional committees on a bill to establish the economic relations which would exist between the United States and the Philippines when the latter became a republic. I read carefully the record of those hearings because of their obvious bearing on the question we were raising. It convinced me that Puerto Rico would never obtain the right to choose separate independence in a plebiscite except under economic conditions which would be disastrous to the welfare of the people of Puerto Rico and which would destroy any hope of continuing to improve their standard of living. The most important factor which led me to this conviction was the most-favored-nation clause found in trade treaties between the United States and many other countries.

The plan at the time was to give the Philippines economic treatment which would preserve for them the advantages of union with the United States for only

eight years; this preference would be gradually reduced until the Philippines had no privilege whatsoever in their economic relations with the United States. The principal reason for this treatment of the Philippines was the most-favored-nation clause in trade treaties to which the United States is a party. Under this clause the United States is required to give each nation with which it has a trade treaty containing the clause the most favorable economic treatment provided in a treaty with any other nation.

Obviously, the United States could not maintain its present good economic treatment of Puerto Rico, which is vital to our continued development, if we acquired a status which had all the legal paraphernalia of separate independence. It became clear that only under some form of status in association with the United States in which we retained our American citizenship could we preserve the good economic conditions which are necessary for our survival as a people. It could not be gainsaid that any status for Puerto Rico which connoted loss of American citizenship and disassociation from the American Union meant the discontinuance of our present favorable economic conditions, except perhaps for a few years on a diminishing graduated scale. The hard fact was that the present free trade between Puerto Rico and the United States could not be continued if Puerto Rico were a separate, independent nation. To provide for such free trade would require the same treatment for all the most-favored-treaty nations. And this, of course, was out of the question. Moreover, added to our economic situation was the affection and mutual respect which had developed between the peoples of Puerto Rico and the United States within our common citizenship.

We concluded that we must stop wasting time groping for a solution to the problem of political status which we

knew beforehand was impossible for Puerto Rico to attain—impossible not for the American Union, but for us! The Philippines, with their greater territory and natural resources in relation to population, could manage under such stringent economic conditions. Our destiny lay in a different direction. It was incumbent upon us to devise creatively a realistically free form of political status which would not be at war with the solution of the economic problems of Puerto Rico and yet would protect the dignity of our people within our association with the American Union.

THE PATH OF PROGRESS

Once we forthrightly faced this task in the middle of 1946, things began to happen. The political status lost its role of enemy of the solution of our economic problems; instead we considered it in the light of and in harmony with the effort to solve the great economic difficulties of our people. We moved at an unprecedentedly accelerated pace which proved beyond peradventure that the log jam on status had finally been broken.

There had been no progress in self-government for Puerto Rico since 1917. Less than two months after this new approach to the problem of status had been adopted, the President of the United States appointed Jesús Piñero, who had been elected by the people of Puerto Rico as their Resident Commissioner in Washington, to the post of Governor of Puerto Rico. And it took only four years for Congress by Public Law 600 to offer to create a relationship between Puerto Rico and the United States based on a compact approved by the people of Puerto Rico and on a constitution written by the people of Puerto Rico themselves. Less than two years later, by means of a series of elections, the people of Puerto Rico approved the compact, elected delegates

to a Constitutional Convention, and approved the terms of the Constitution, which went into effect on July 25, 1952.

The wisdom of halting the divisive and futile debate on status, which paralyzed our progress towards self-government from 1917 until 1946, has been dramatically demonstrated by the swiftness of the events which occurred between 1946 and 1952. With this hindrance removed, the long-repressed political energy of our people soon created a new form of status, a new form of political relationship in the American Union and in all America, a new form of political freedom in harmony with the economic freedom of our people, in place of the rigid and sterile formulas which threatened the full development of Puerto Rico and which had immobilized for generations the great creative political powers of its people.

It should be made clear that what we have done has been to initiate a process of political creation in Puerto Rico, and not merely to invent just another formula. Precisely because it needs to grow in so many phases of its life as a people, Puerto Rico cannot become entangled in formulas. It must use its energy in development and continuous growth. Nothing could enslave us more than handicapping our great drive towards a happy future with a rigid, obsolescent, unprogressive, or inapplicable formula.

INTERPRETATION OF THE CONSTITUTION

Every constitution is subject to different interpretations which are made in good faith. But our thesis is that by their votes in the referenda in which Public Law 600 and the Constitution were approved, the people adopted the interpretations of these documents advanced by those who campaigned for their approval. We submit that when the time comes for judicial review of the compact and the Constitution, they

should be interpreted in accordance with the understanding of the people as to their meaning and scope when they approved them. We are confident that such interpretations will prevail, and that they will yield the results which will be most favorable and liberal to Puerto Rico and which will promote fraternal understanding between Puerto Rico and the American Union.

We are proud of the strictness with which the Constitution protects the rights of individuals and of minorities. By minorities I mean not only political minorities, but all minorities which are a part of every community: political, religious, racial, intellectual. Democracy implies that individuals have rights which cannot be destroyed by the will of the majority. The rights and duties of the majority are to legislate and execute plans of action in every area in which the public interest is involved, without impairing the basic rights of individuals or of minorities—including, of course, those basic rights without which minorities could never be converted into majorities. I refer to freedom of speech, of religion, of peaceable assembly, of petition: all the rights which a minority needs to convince a majority to adopt its points of view and its collective proposals. To be sure, some of these rights are safeguarded by the Constitution of the United States; but our Constitution goes further in the protection it gives these rights. In doing so it expresses the will of our people to reinforce the protection afforded to these rights.

EMPHASIS ON DISTRIBUTION

I turn now to economic questions. At the beginning of the present stage of our history, only twelve years ago, Puerto Rico was in the grip of the most extreme poverty. We had very poor distribution of the small amount we produced, and the resulting extreme poverty of the great majority of the people

was reflected in the relative poverty of other economic groups and the general insufficient prosperity of all the people.

In considering what measures were required at that time, we were more aware of the unjust distribution of what we had than of the insufficiency of what we produced. It was easier to be angered by men's injustice to one another than to be angered by the insufficiency of nature to provide us with abundance, especially when it was difficult to admit that our own carelessness in cultivating the land might be the root of the trouble. And so at first we expended more energy in correcting injustices than in increasing production.

We began to distribute land, and the first proportional benefit farms were established. The eight-hour law was improved, and the principle of minimum wages was initiated. The tax burden was redistributed so that those farther away from poverty would pay higher taxes for the general welfare of the people. The program of free school lunches and milk stations was quickly developed. A modest but much appreciated system of aid for the old and infirm was devised. Health centers were multiplied and improved for those who must depend on the government to safeguard their health. Labor legislation was modernized, extended, and fortified. But beyond these measures, an attitude of democracy and democratic effort towards the solution of their own problems and the protection of their rights was created in the spirit of our people. This gave strength, form, and practical expression to the instinctive dignity of the Puerto Rican people.

EMPHASIS ON PRODUCTION

As time passed, it became clear that we must also devote a great deal of effort to the creation of production. The constant increase of population, among other things, made it clear that it was

not enough to distribute one pound of bread among twenty people. We also had to produce more bread to mitigate the hunger of the twenty. As I pointed out in a speech, "Justice can distribute what there is, but it cannot distribute what has not been produced." Accordingly, we began the battle of production. Our position was that Puerto Rico must have all possible means for increasing production with four aims: first, to accelerate its speed in order to keep pace with the increase in population; second, to diminish the unemployment which already existed when this program started; third, to continue raising our standard of living above the subsistence level; and fourth, eventually to dispense with the substantial federal aid which is now required to assure the survival and development of the people of Puerto Rico.

Our first step in this direction was taken in 1941, when the Legislature enacted a statute providing for a partial exemption from income tax for anyone investing money in new industries and thus increasing employment in Puerto Rico. In 1942 the law was passed which created the Economic Development Company. We acquired a factory from the federal government and began the construction of four other factories in order to increase industrial production in Puerto Rico. We soon discovered that the Government of Puerto Rico would never have enough money under any conceivable circumstances to build government factories which would increase production and opportunities to the point needed and expected. The first factories served as pilot plants for us to obtain understanding of the difficulties of industrialization and to acquire that industrial know-how which had been unknown to Puerto Rico.

Experience has demonstrated that in order to expand industrialization we must provide stimuli for the private in-

vestment of capital and for the creation of new wealth. We wish to increase our new productive capacity and to expand new sources of employment for our people. In order to achieve this end we have been changing, improving, and intensifying the battle of production through tax exemption for certain new industries, through aid in the construction of factory buildings, through financial aid to whoever is willing to invest his own money in new production, and through a practical demonstration that the Government of Puerto Rico has the ability to maintain peace and order while adhering strictly to the protection of the democratic rights of the people and to democratic principles.

We have been fighting on many fronts at the same time: building roads and factories, fostering health improvement, raising our standard of living. This makes not only for a happier and more hopeful people but for a stronger people—one able to deal with their problems and to solve them at every level. We have tried whatever means were legitimate and promising for the general welfare. While we have made mistakes, we have learned from them. As we travel along this difficult road, we correct our mistakes and press forward. We still have a long way to go.

A STURDY POPULAR SUPPORT

If the people had not grown in understanding, we should have been unable to come this far, and it would be impossible to go farther. Our people have shown their democratic understanding

by supporting a difficult program while facing the demagoguery which feeds on criticism of whatever is difficult to understand and difficult to accomplish.

One form of demagoguery is to propose the easy way: easy programs easy to understand and easy to attempt. This way solves no problems. Any community can adopt an easy program; but in order to give support to one which is difficult and not rapidly attained, we need a people sustained by simple spiritual wisdom and great democratic power. Happily, these are the traits of the Puerto Rican people.

Another form of demagoguery is to criticize changes and to insist that whatever was started in a certain way must continue in that way though it lead to disaster. This is sometimes due to inordinate pride of opinion, despite the fact that thousands or millions of people suffer from it. It may be aptly called loyalty to error itself. But in pursuing our program we must make many changes by whatever honorable means exist. We must be always changing, adapting, improving, enlarging, and intensifying our way of doing things to keep it dynamic. This is so because, although we have a flexible means of attaining our objective, the objective is fixed and unchangeable. It has always been the same and will always be the same: it is to bring economic freedom, real freedom, full freedom, to the flesh-and-blood human beings who are our people, to the *patria*—"the homeland and the people." God willing, we shall achieve that freedom for the people of Puerto Rico.

*Luis Muñoz Marín, San Juan, Puerto Rico, is the first elected Governor of the Commonwealth of Puerto Rico. He was elected to the Senate of Puerto Rico in 1932. In 1938 he founded and became President of the Popular Democratic party, which became the majority party in 1940. He was president of the Senate of Puerto Rico from 1941 to 1948. After graduation from Georgetown University, he started his career as a journalist, and served as editor and publisher of various newspapers in Puerto Rico. He is author of *Borrones* (1917) and *Madre Haraposa* (1917); of a section on "Porto Rico, the American Colony" in *These United States* (1925); and of articles in many American periodicals.*

Puerto Rico and American Policy Toward Dependent Areas

By RUPERT EMERSON

THE postwar drive to put a speedy end to colonialism has produced not only a number of new and independent states but also a search for new inventions which would make it possible to maintain some of the old ties and at the same time remove the curse of colonial inferiority—or at least the appearance thereof. Despite the attractiveness of a slogan of full independence for all colonies, it is evident that there may be very real advantages for both sides in a continued association on terms of equality or some reasonable approximation of it. To devise the forms in which such an association should clothe itself is by no means an easy task.

Great Britain had an ideal instrument already at hand in the Commonwealth; but even in her case it has been necessary to create, or to adapt from the earlier experience of India and Ceylon, new transitional institutions such as those now being worked out for the Gold Coast, Nigeria, and the West Indies, among others. France has established the French Union with its several different types of component units, and the Netherlands has achieved at least a temporary union with Indonesia and is exploring new relationships with the Antilles and Surinam. For the United States the corresponding venture is the newly established Constitution of Puerto Rico, "in the nature of a compact" with the United States.

COMMONWEALTH STATUS IN PUERTO RICO AND ELSEWHERE

The new status which has just been gained by Puerto Rico is one for which it is difficult if not impossible to find

precedents anywhere, and certainly none can be found in the constitutional experience of the United States. "Commonwealth" is a rich and admirable word, of which it can perhaps be said that it bears so many connotations that, while it has an aroma all its own, it rouses such diverse memories as to wander off into diffuse uncertainty.

These lines are written in the Commonwealth of Massachusetts, but in this context the term can have no other meaning than that of state in the American Union, a status to which some Puerto Ricans may still aspire but which they have obviously not secured. Within the American orbit the word has also been used to describe the interim position of the Philippines in the last stages of the transition from colony to independent sovereignty; but in both substance and intent, the Puerto Rican position is markedly different from its Asian counterpart. In the remoter past there is the Commonwealth of Cromwell, and, to add confusion, the Commonwealth of Australia is a member of what until recently was called the British Commonwealth.

Nor does it greatly aid in securing a more precise definition or understanding of commonwealth status to turn to the Spanish phrase *Estado Libre Asociado* which the Puerto Rican Constituent Assembly declared to be, in the particular case, "equivalent to and an appropriate translation of the English word 'commonwealth.'"

In the traditional constitutional pattern of the United States there existed only two basic types of status: the states which were the equal components

of the federal union, and the territories which were bodies passing through an apprenticeship destined to fit them for a statehood assumed to lie closely ahead. The burst of imperialism of 1898 left us in command of peoples whose place in our system has always been something of an anomaly and whose status we have never been able properly to assimilate to our sense of the constitutional fitness of things.

The Insular Cases of 1901 attested to our difficulties and confusions but succeeded in laying the foundations for a series of decisions and legislative acts which piece by piece built up the legal and constitutional structure for the American empire. Gradually a pattern emerged which enabled us, if somewhat uneasily, to house our new imperial wards in a framework not limited to the old territory-state dichotomy.

So ample was the freedom which was left to Washington that in the case of the Philippines a door could be opened to full independence, and in the case of Puerto Rico another door led to the present unique experiment of a new-model Commonwealth, not to mention the cases of Guam and Samoa which were left to cool their heels indefinitely in the Navy's anteroom.

FEATURES OF NEW PUERTO RICAN STATUS

To identify briefly the distinctive features of the new Puerto Rican status is no easy matter, both because it is a complex and in some respects uncertain situation and because the different elements vary in importance depending on the angle from which they are viewed.

Implications for Puerto Ricans

From the standpoint of the Puerto Ricans it may well be, since they had already been conceded an elective legislature and governor, that the most dis-

tinctive element is that they now have for the first time in their history given themselves a constitution and given their free consent to their relationship with the United States. It was a striking feature of the ceremonies attendant upon the formal establishment of the Constitution on July 25 that so large a share of attention was focused upon the raising of the Puerto Rican flag, freely chosen by the Puerto Ricans themselves, side by side with the American flag. It is arguable that the status which they now have does not differ greatly in substance from that which they had before; but to press that argument too far would be to ignore the great symbolic effect of entering into a compact with the United States and of governing themselves under an instrument of their own fashioning.

From the standpoint of the outside world, much of what has taken place in Puerto Rico must seem an almost insoluble puzzle. According to all accepted maxims, colonial peoples should rise and do battle for their national independence; but the Puerto Ricans in the mass appear to take pride in reaffirming their union with the United States. An elected governor and legislature, untrammelled by the control or even the symbolic dignity of any representative of Washington in the island, should mean that independence has been either wholly or approximately realized; and yet, under the peculiar conditions of American federalism, the federal authorities and agencies operate as fully in Puerto Rico as they do in the forty-eight states, and the foreign relations and defense of the island are exclusively in Washington's domain. What has been achieved is clearly not statehood in the American sense, because there is neither full representation in Congress nor participation in Presidential elections by residents of Puerto Rico. Nor, equally clearly, is it statehood in the

international sense; but it is certainly far nearer the former than the latter. Despite the appealing Spanish title of "free associated state," the superficially tempting comparison with the British Dominions is wholly ruled out by the inclusion of the island within the American federal system.

Implications for Alaska and Hawaii

To Alaska and Hawaii the change which has been made in Puerto Rico's status presumably appears as a menace, rather than as an advance to be envied. Coveting statehood which has several times seemed almost within their grasp, these territories have lingered under organic acts dating four or five decades into the past and providing for Washington-appointed governors and other restrictions on their autonomy in domestic affairs. In company with Puerto Rico, they lack full congressional representation and are excluded from Presidential elections. Fiscally they are at a disadvantage in that, unlike Puerto Rico, they neither receive exemption from the federal income tax nor secure the return to their own treasuries of internal revenue taxes and customs duties. But the one goal to which they aspire is statehood, and it would be the coldest of comfort to them to think that they might be put off by having accorded to them the favor newly devised to meet Puerto Rico's needs. In its bearing on their own position, they could applaud the Puerto Rican solution only in the unlikely event that their own claims to statehood would receive kindlier treatment because of the removal of Puerto Rico from the list of current aspirants to the prize of becoming the forty-ninth state.

Comparison of status with Philippine Commonwealth

In the American experience the nearest approach to the Puerto Rican Com-

monwealth is the Philippine Commonwealth which came into being in 1935. The differences are, however, more striking and significant than the occasional similarities. Where the fate of Puerto Rico had always been uncertain, there had from the outset been the assumption in the case of the Philippines that the American connection was temporary and would in due course give way to independence. The nationalist aspirations of the Filipinos, which have never found a mass counterpart among the Puerto Ricans, served to emphasize the vast distance of these Asian islands from the United States, in contrast to Puerto Rico's location on the fringe of the strategically vital Caribbean.

Both Philippine and Puerto Rican Commonwealths came into being as the result of congressional legislation which authorized the election of constitutional conventions to draft new constitutions for submission to the electorates; but it is perhaps significant that in the Puerto Rican case congressional as well as Presidential approval of the new constitution was required. The intent of Congress in the two cases was, however, very different. The Tydings-McDuffie Act of 1934 proclaimed itself to be an act "to provide for the complete independence of the Philippine Islands" and specifically laid it down that American sovereignty would end ten years after the inauguration of the new government; whereas the corresponding Public Law 600 of 1950 was explicitly based on the assumption that the fundamental relations between Puerto Rico and the United States would remain unchanged. The Philippine Constitution of 1935 in its two final articles made provision for the forthcoming independence; the Puerto Rican Constitution of 1952 in its preamble affirms that the new Commonwealth is created "within our union with the United States of America."

The differences in status between the

two commonwealths are in keeping with the flat opposition of objectives. Where the Philippines was given full jurisdiction over all domestic functions and powers of government (foreign affairs remained under the direct supervision and control of the United States), Puerto Rico remains subject to all federal legislation not locally inapplicable; and in principle federal agencies operate there as in the states. Puerto Ricans retain the American citizenship bestowed on them in 1917 and have free access to the United States, while the Philippines was considered a foreign country for immigration purposes. Similarly, the inclusion of Puerto Rico within the tariff wall of the United States remains unchanged, whereas a series of progressive limitations were imposed on Philippine access to the American market.

In contrast to the Puerto Rican situation where the appointed governor gave way under congressional legislation adopted in 1947 to an elected governor, the governor generalship of the Philippines was in a sense divided in two, the executive power passing to the elected Philippine President and the representation of the United States to a newly created High Commissioner, appointed by and representing the President of the United States. Although the direct powers of the High Commissioner were virtually nonexistent, he filled a highly important role both as the principal point of liaison with the American government and as the watchdog of the complex set of restrictions and restraints imposed upon the Philippines by the Tydings-McDuffie Act. In general terms it might be said that the President of the Philippines was the executive head of an almost independent country, watched over by the American High Commissioner, while the Governor of Puerto Rico is the close counterpart of the governor of a state.

No other territory or possession of the United States has been accorded treatment comparable to that of Puerto Rico. Alaska and Hawaii, trapped in the webs of congressional politics and racial fears, have stayed within the traditional framework of the organized incorporated territory, symbolized by the appointed governor responsible to Washington.

Comparison of status with the Virgin Islands

The Virgin Islands, since their acquisition from Denmark in 1917, have moved slowly ahead on the path of self-government but are still behind Puerto Rico, Alaska, and Hawaii. Although American citizenship was bestowed upon their inhabitants in 1927 and they were transferred from Navy to Interior Department jurisdiction in 1931 (at approximately the same time that President Hoover labeled them "an effective poorhouse"), it was not until 1936 that an organic act was adopted which gave them a governmental structure and status roughly equivalent to the usual territorial pattern. They have not, however, been accorded the right to be represented in Congress by a voteless but vocal Resident Commissioner on the model of Alaska, Hawaii, Puerto Rico, and the Philippines prior to independence.

Early in 1952 the House Subcommittee on Territories and Insular Possessions held hearings on a bill to revise the Virgin Islands Organic Act, but the bill failed to make any substantial progress. Under its terms the islands would be given a status within hailing distance of that of Puerto Rico under Public Law 600, being empowered to elect both a Governor and a Resident Commissioner, and (a much-desired step) securing the return to the insular treasury of taxes collected under federal internal revenue laws. It is hazardous to seek to fore-

tell congressional action, but there seems little reason to think that so far-reaching a measure will be adopted by Congress in any near future without serious modification.

Comparison of status with Guam

Of the more remote Pacific islands, only Guam has achieved the dignity of an organic act, although American Samoa and the Trust Territory of the Pacific Islands are promised similar favors. For more than half a century Guam was governed by the Navy under the authority of an Executive order; but the events of World War II, the extension of American control over the neighboring Japanese mandated islands, and the new view of colonialism reflected in the United Nations Charter all combined to make both the administration and Congress more mindful of the need for change. In consequence the Navy gave way to the Interior Department as the controlling agency, as was also the case for Samoa and the Trust Territory, and Congress in 1950 adopted an organic act for the island which gave it much the same status as the Virgin Islands. American citizenship was bestowed upon the people of Guam, and their liberties were for the first time formally protected by a bill of rights.

The essential political structure consists of an elected unicameral legislature and a governor appointed by the President. As in the Virgin Islands, and in Puerto Rico prior to the establishment of the new constitution, under the Guam Organic Act bills which are re-passed by two-thirds of the legislature over the governor's veto may be referred by the latter to the President, with whom the final decision rests. No such Presidential veto exists for Alaska and Hawaii, but for all the territories there exists the right of Congress, which has never been exercised, to annul any ter-

ritorial legislation of which it disapproves.

As far as formal status is concerned, Guam was declared to be an unincorporated territory, and the legislative history makes it clear that there is no commitment as to statehood, express or implicit. Indeed, Governor Carleton Skinner went on record in a letter to the Senate Committee that "the people of Guam do not envision or desire statehood," and held that their political ambitions were satisfied by the Organic Act. It may be that at some future time the status devised for Puerto Rico will prove a useful instrument for giving Guam a larger measure of self-government.

THE PUERTO RICAN EXPERIMENT AND THE REST OF THE WORLD

Unique in the American experience, the Puerto Rican experiment may come to attract substantial attention in the world at large. The Latin American countries have inevitably watched with interest the fate of a people belatedly detached from Spain and hitched to the American imperial star, and Communists in those countries and elsewhere have made more than the most of every sin with which they could conceivably charge American rule in the island.

Furthermore, in the last decade the impressive progress which Puerto Rico has made in every sphere, and particularly in economic development, has established the island as one of the show places for technical assistance, Point Four, and similar enterprises. In the fiscal year ending June 30, 1952, a total of 273 persons were brought to Puerto Rico, under technical assistance programs of the United States and the United Nations. Of this number 222 came from Latin America and the Caribbean, but it is significant that a considerably larger number than previously came from other parts of the world: 31

from Asia, and 10 each from Europe and from the Near East and Africa.

If Puerto Rico's potentialities as a link between Latin America and the United States have been by no means exploited to the full, the developments of the last decade have brought a very considerable improvement, and the island's new status should serve to produce a different climate of Latin American opinion, at least for those who are not committed to opinions regardless of the facts of the case.

In inter-American relations the role of Puerto Rico, retaining its Spanish heritage and now freely consenting to its association with the United States, can be a real and substantive one; in the United Nations the issues raised by the island's new status are likely to be debated on more formal grounds but not without the possibility of heat and vehemence.

The U.N. and Puerto Rican-U. S. relations

Under Chapter XI of the Charter the United States has accepted the obligation not only to develop self-government and to do other good deeds in territories for which it is responsible and "whose peoples have not yet attained a full measure of self-government," but also to report regularly to the Secretary General concerning conditions in such territories. In the past the United States has scrupulously observed its obligations, reporting on all the areas over which it has jurisdiction, including Puerto Rico, Hawaii, and Alaska. It has now become an urgent problem to decide whether or not Puerto Rico continues to be a non-self-governing territory or has graduated to a point of self-government which makes continued reporting unnecessary and undesirable.

The lack of any fully agreed-upon criteria, and dispute as to where the

power rests to make such determinations, render peculiarly complex and uncertain an issue already complicated by the somewhat equivocal status of Puerto Rico. As the culmination of a long series of debates arising from the earlier action of other powers in unilaterally withdrawing several of their territories from the domain of Chapter XI, the General Assembly at its last session adopted Resolution 567 (VI), giving tentative approval to a list of factors which should be taken into account in such cases. This list, which lays proper emphasis on the necessity of the expression of the free will of the people of the territory in any change in status, is broken down into two main categories of territories which have achieved independence or have freely united or associated themselves on an equal status with other component parts of the metropolitan country.

Since Puerto Rico has obviously not achieved independence. (Governor Muñoz Marín has in fact contended that Puerto Rico is "part of the independence of the United States") its claims must be examined under the second of the two categories. Two general criteria specified by the Assembly appear to raise no problems: the Puerto Rican people have adequate political advancement to enable them to decide their destiny with due knowledge, and their repeated votes in connection with the Constitution testify to their free acceptance of the new status by informed and democratic processes, although it must be conceded that the choices which Congress was prepared to open to them were sharply limited, including neither statehood nor independence.

With one outstanding exception, the other factors listed by the Assembly, such as citizenship, suffrage, local rights and status, and local legislative autonomy, meet the Puerto Rican case

without undue stretching; but the exception is a troubling one. One of the essential factors listed is: "Representation without discrimination in the central legislative organs on the same basis as other inhabitants and regions." Here Puerto Rico clearly falls down, since it has not been brought into the American Union on terms of equality with the other component parts. The difficulty is made worse by the fact that the American delegates at the Assembly supported the inclusion of this factor, in part because of its general soundness, but also in part with an eye to the achievement by Alaska and Hawaii of their long-sought statehood.

Taking this factor alone, the best argument for the exclusion of Puerto Rico from the orbit of Chapter XI is that since the island is not subject to federal taxation, there is no taxation without representation, and that therefore—a large leap over a dangerous void—there is perhaps no need for representation. This argument ignores both the ticklish question of the great reserve powers of Congress under the Constitution to legislate across the board for the territories (query: is Puerto Rico still technically a territory?) and the more normal legislative powers of Congress, as, for example, in the highly important sphere of conscription. The factor of representation cannot, however, be taken alone, and the Assembly stated that no single factor could be regarded as decisive, and

that the circumstances should be studied separately in each particular case.

RECOMMENDATION: WITHDRAWAL FROM DEPENDENCY LIST

On net balance it seems a reasonable conclusion that the United States should withdraw Puerto Rico from the list of non-self-governing territories. The danger that other countries will cite the American precedent as justifying their similar withdrawal of territories but on lesser grounds of substantial validity is outweighed by the clear intent of both Congress and Puerto Rico to lift the island to a new status of dignity and equality. It is true that Puerto Rico has not achieved a status identical with the states of the Union, but as an area separated from the mainland by sea and inhabited by people of different language, having a distinct cultural heritage—to cite phrases from the Assembly's resolution—it has won a place fitting to its particular circumstances, acceptable to its people, and conferring certain special advantages. It is the contention of Governor Muñoz Marín that colonialism has been ended and that a new era of free association between Puerto Rican and continental Americans has been inaugurated within the American Union. The symbolism of freedom, dignity, and equality in status is of vast importance, and it would unquestionably be impaired by the continuance of Puerto Rico in the formal role of a dependency.

Rupert Emerson, Ph.D., Cambridge, Massachusetts, is professor of international relations and chairman of the Department of Government, Harvard University. In 1940-41 he was director of the Division of Territories and Insular Possessions, Department of the Interior, and subsequently served as regional administrator for the territories and possessions, Office of Price Administration. He has also served in the Foreign Economic Administration and in the Department of State. He is author of Malaysia (1937), The Netherlands Indies and the U. S. (1942), Government and Nationalism in Southeast Asia (1942), and America's Pacific Dependencies (1949).

From Colony to Commonwealth

By ANTONIO FERNÓS-ISERN

PUERTO Rico has been three times a colony and twice a commonwealth or associated autonomous state.

It began as a "colony" of Spaniards who settled the island, subdued and absorbed the Indian, and brought in the Negro. After three centuries of slow growth as a part of the Spanish Indies, it evolved into a province of the unified Kingdom of Spain, as proclaimed under the Spanish Constitution of 1812.

Thence, through the short Spanish constitutional periods of 1812-14, and 1820-23, as well as through the absolutist periods of 1814-20 and 1823-36, it continued to have an equal status within the realm with its sister provinces of the European peninsula.

From 1836 to 1868 the Spanish Constitution provided a special status for the overseas provinces. They were to be governed under special laws to be enacted by the Spanish Parliament. Pending the enactment of such laws the absolutist regime continued in Puerto Rico and Cuba. Both were deprived of representation in Parliament. The special laws supposedly intended to set up some degree of self-government never were enacted. In fact, from 1836 to 1868 there existed a constitutional regime in European Spain and an absolutist regime in Cuba and Puerto Rico. Again Puerto Rico was a colony; but this time it was colonial in the more modern sense of the word; it was subordinate and inferior.

The Spanish revolution of 1868 brought Puerto Rico back into the Spanish national councils, and it continued to be so represented until 1898. From 1868 to 1898, Spain went through a provisional government, a liberal mon-

archy with an Italian King, the First Republic, and the Restoration of the Bourbons. Under the restored monarchy a new constitution was adopted in 1876. Puerto Rico participated with the peninsula in its adoption. In 1897 Puerto Rico became autonomous.

In 1898 the Spanish-American War brought to an end the political ties which for four hundred years had existed between the island in the New World and the peninsula in the Old. Sovereignty over Puerto Rico was ceded by Spain to the United States. Puerto Rico became a "possession," this time under the rule not of a king or kingdom, but of a free people and a republic—the United States of America.

From the first day of settlement to the end of the Spanish *ancien régime*, which ended with the Napoleonic invasion, there was no attempt at separate self-government in Puerto Rico. Neither was there during the brief constitutional periods of the early part of the nineteenth century. It was only at the very end of the absolutist regime, ended for the island in 1868, that separation began to take hold in the minds of a few Puerto Ricans. While Spanish America broke away from the venerable empire at the beginning of the century, Puerto Rico remained loyal and, in fact, the haven of the loyalists who fled from Venezuela, Santo Domingo, and other parts of the seething Main.

POLITICAL CHANGES THROUGH THE NINETEENTH CENTURY

With the nineteenth century the rhythm of population growth in Puerto

Rico gained momentum. To the heavy immigration of loyalists was added an influx of French settlers leaving Haiti and Louisiana. Migration from Spain, theretofore directed to the Spanish Main, swelled the population of the island. This migratory stream from Spain, continuous throughout the nineteenth century, did not stop with the change of sovereignty. It was stopped only by the application of the United States immigration laws to Puerto Rico at a later date.

In September 1868 the idea of separation from Spain led to an abortive revolt in a mountain town of Puerto Rico. It was put down in twenty-four hours. The bulk of the population remained indifferent. However, from then on, although never too popular, the idea of independence gained strength.

Self-rule as an autonomous province or state within the realm was advocated by the people of Puerto Rico for the first time in 1887. Political parties had been first organized in Puerto Rico about 1868, when Puerto Rico was called back to participation in the national political life on an equal footing with the rest of the nation. From 1868 to 1887 there existed a conservative and a liberal party. The conservatives oscillated between the idea of the status quo and that of ultimate assimilation; the liberals, from immediate liberal reform to governmental decentralization or complete assimilation as an alternative.

Assimilation was soon found not to be the answer. Spanish electoral laws, as applied to the island, were restrictive enough to give undue advantages to the Tories. Puerto Rico's representation in the Spanish Parliament was thereby mostly controlled by the conservatives; laws adopted by the Spanish Parliament did not satisfy the liberals of Puerto Rico. The local administration, technically controlled from Madrid, actually was in the hands of the Tories of

Puerto Rico, regardless of political changes in Madrid.

By 1887 the creed of self-government, after the British pattern already operating in Canada, became the platform of the liberals. The conservatives denounced the move as disguised separatism. Ten years later, through the rationalization of the Puerto Rican self-government party, which became affiliated with the Spanish Liberal party, and on the latter's rise to power in Spain, self-rule was granted to Puerto Rico.

Under the self-government Constitution of Puerto Rico of 1897 certain national laws would continue to apply in Puerto Rico. Otherwise the Puerto Rico Parliament would exercise full legislative authority. This included monetary matters, the mails, banking, tariffs, and taxation in general. There would be a preferential trade system, on the basis of agreement, between Spain and Puerto Rico.

The Governor General would represent the Crown and the national government in Puerto Rico; but no act of his would become effective without the approval of a responsible minister. There would be a responsible cabinet; an elected house and an upper chamber with a majority of elected members. In fact, Puerto Rico became an autonomous state, federatively associated with its former metropolis.

CESSION TO THE U. S. UNDER THE TREATY OF PARIS

The Spanish-American War ended with the Treaty of Paris. The treaty provided for the cession to the United States by Spain of its sovereignty over the territory of Puerto Rico. With sovereignty, the royal domain was also ceded. But the properties of the province, of the municipalities, or of individuals were not transferred to the United States. The political status—the nationality—of the inhabitants of

Puerto Rico was to be determined by the Congress of the United States.

Therefore, the cession of Puerto Rico did not carry with it the same implication as, for instance, the cession of Louisiana. Puerto Rico was separated from Spain, but under the treaty it did not become integrated into the United States, although subject to United States sovereignty.

What authority the Crown of Spain and its government had in Puerto Rico was acquired by the United States under an international treaty. As to the authority that the Crown of Spain and its government had relinquished to Puerto Rico as an autonomous state, it does not seem that Spain could cede it, nor that the United States could acquire it from Spain. It potentially remained with the people of Puerto Rico, against whom no war was fought by the United States.

Since the Congress was to determine the political status, the nationality, of the people of Puerto Rico (theretofore Spaniards under the Spanish Constitution), it was deemed inescapable that the new national relationships would be predicated on no less autonomy than they already possessed. Therefore, not only did the people of Puerto Rico expect to retain, under the United States sovereignty, all political authority that Spain had relinquished to them as an autonomous state in 1897, but they looked forward to added freedom, if for no other reason than that the change of political allegiance meant a change from a monarchical system to a republican democratic regime.

It was obvious to the Puerto Rican people that a change from membership in a monarchical system to membership in a republican congressional system could not be made without a readjustment of relations. The fact that under the military rule of 1898 to 1900 the autonomous government of Puerto Rico

was dissolved and replaced by a temporary governmental organization created by the military did not alarm them very much. They expected early congressional action, and also that such action would be taken as a result of agreement with the people of Puerto Rico. In other words, they reasoned that if the transfer of authority from Spain to the United States was the result of a treaty between the United States and Spain, the relationships to exist between Puerto Rico and the United States as the new sovereign power should also be the result of an agreement, this time between the United States and the people of Puerto Rico.

CONGRESS FAILS TO RECOGNIZE PUERTO RICAN AUTONOMY

Therefore, it was a great disappointment for the people of Puerto Rico to see that the United States Congress, in its first legislative act for Puerto Rico, took the position of an absolute sovereign, and that, without consultation with the people of Puerto Rico, it created a governmental structure for the island and established political, economic, and fiscal relationships between Puerto Rico and the United States Government. The people of Puerto Rico were declared to be citizens of Puerto Rico under the protection of the United States.

By judicial decision Puerto Rico was declared "to be appurtenant to" the United States, albeit not a part of it—a mere possession. Apparently it was assumed that congressional authority over Puerto Rico, a possession, stemmed from Article IV, Section 3, Paragraph 2 of the Constitution of the United States, which reads:

"The Congress shall have power to dispose of and make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States; . . ."

Sovereign and proprietary rights and authority were apparently taken to mean one and the same thing as respecting Puerto Rico. Congress would be restrained only by basic injunctions to be found in the Constitution of the United States. Otherwise its authority over Puerto Rico and its people appeared almost unlimited. It is to the credit of Congress that it used this authority with an evident sense of benevolent paternalism.

Upon the change of sovereignty, and while Puerto Rico was still under military rule, the old parties dissolved and two new political parties were organized. Both declared their acceptance of the change of sovereignty and acknowledged need for a program of readjustment of the governmental structure and its relations in order for Puerto Rico ultimately to enter the Union as a new state. They expected United States nationality to take the place of Spanish nationality, and thought of statehood as full nationality.

Membership in a federal system, with local self-government, had been the philosophy of the Puerto Rican in aspiring to and attaining autonomy within the Spanish monarchy. The United States had been their model of freedom and democracy. To enter the Union now would simply mean the full attainment of their dreams. It would not only accomplish self-government; it would also bring about a republican form of government, essentially democratic and federal. Besides, it would mean membership in one of the most prosperous economies of the world.

ATTITUDE CHANGES TOWARD POLITICAL AFFILIATION WITH U. S.

That this unanimity of the people of Puerto Rico in their welcoming of political affiliation with the United States so rapidly disappeared, that admission into the Union as a goal was abandoned

by the majority of the people, and that separation and independent sovereignty became the romantic dream of many until very recent times must be ascribed primarily to the type of government set up under the Organic Act of 1900 and to the way it was administered.

The Governor and his Cabinet were to be appointed by the President. They had full executive powers and no responsibility to the people. In addition, the Supreme Court was appointed by the President.

The upper legislative chamber was made up of the Cabinet members plus five additional councilors also appointed by the President. A House of Delegates was elected by the people. Not until 1914 was there a majority of Puerto Ricans appointed in the Council, nor was a Puerto Rican appointed as a Cabinet member.

Legislation which would reflect the will of the majority of the people was next to impossible with an upper chamber so integrated. The results of these early mistakes are still to be found in Puerto Rico, even with the great progress in democratic development of later years.

Congress in 1900 tried to protect the people of Puerto Rico from being dispossessed of their land. Agricultural corporations were limited by law to five hundred acres; other corporations, to no more land than they would need for their fundamental purposes. However, this law was ignored by successive administrations. In a few years more than half of the best agricultural land of the tiny island, with one of the densest populations of the world, was owned or controlled by four sugar absentee corporations, whose local governmental influence kept taxes and wages down and would-be strikers within "law and order." In many ways a big sugar corporation was a state within the state. Thus the benefits of economic union

with the United States were largely lost to the people of the island.

1917 AMENDMENTS BRING SOME RELIEF

In 1917, after seventeen years of unceasing protest on the part of the majority of Puerto Ricans, Congress amended the Organic Act of 1900. The amendments were limited in scope, but they afforded relief.

The Executive Council was stripped of its legislative functions. Its membership was reduced to the Cabinet members. It was collectively to act in an advisory role only. An elective Senate was provided for. Four of the six Cabinet members were to be appointed by the Governor, with the advice and consent of the Puerto Rican Senate. Two Cabinet members were still to be appointed by the President, as were the Auditor and the Supreme Court of Puerto Rico. The Governor continued to be appointed by the President. Not until 1946 was a Puerto Rican appointed to that position.

The legislature could not override a Governor's veto. It could only take an appeal to the President. Most important, the constitution of Puerto Rico continued to be a mere Organic Act, a law Congress could amend at will. Congress continued to be an absolute sovereign over the people and the territory of Puerto Rico, albeit a benevolent sovereign.

Citizens of Puerto Rico were declared to be citizens of the United States. This gave them full standing as such citizens if they became residents of the United States, but of itself United States citizenship brought no changes as to civil or political rights to be enjoyed by the residents of Puerto Rico. This was so decided in fact by the United States Supreme Court.¹

¹ Balzac v. People of Puerto Rico, 258 U. S. 298 (1927).

Since 1900, under both the Foraker and the Jones Act, the people of Puerto Rico were to elect a Resident Commissioner in the United States, to be recognized by the executive branch of the United States Government. Under a House Rule adopted in 1904 he was given recognition in the House of Representatives in a position parallel to that of a territorial delegate.

No changes of any consequence took place from 1917 to 1947.

1947 AMENDMENT MAKES GOVERNORSHIP ELECTIVE

In 1947 the Jones Act was amended to make the office of Governor of Puerto Rico elective. All members of the Cabinet were now to be appointed by the Governor, with the advice and consent of the Senate of Puerto Rico. The Auditor and the Supreme Court judges continued to be appointed by the President.

It should be noted, in considering the governmental organization of Puerto Rico throughout these years, that the so-called insular government, as above described, had a scope of authority comparable to that of a state government. "The People of Puerto Rico" was a body politic by itself. The federal government, as such, operated in Puerto Rico separately from the insular, as in a state. Thus there always existed in Puerto Rico a Federal District Court, and federal agencies under the federal executive departments have operated under federal law equally as in the United States. With few exceptions, federal laws apply in Puerto Rico as in the United States.

Except for an annual report to be submitted by the Governor to the President and except for the fact that a federal executive department in Washington (Interior) acted as liaison between the insular and the federal administrations, the government of Puerto Rico

functioned as independent of the federal government, and the federal government as independent of the insular, as if Puerto Rico had been a state.

The so-called Organic Act of Puerto Rico could be said to consist of two parts: first, it created a structure of government for Puerto Rico; and second, it established the *modus operandi* of the federal government in Puerto Rico and the relationship of Puerto Rico and its people with the United States.

1950 LAW RETURNS LOCAL GOVERNMENT TO PEOPLE

Public Law 600, approved July 3, 1950, is based upon the above fact. That part of the former Organic Act which referred to the *modus operandi* of the federal government in Puerto Rico and the relationships between the government and people of Puerto Rico and the United States is continued as a Statute of Federal Relations. All sections of the former Organic Act which created a local governmental structure in Puerto Rico were repealed. This area of government was left for the people of Puerto Rico to occupy. The Commonwealth of Puerto Rico, created by the people of Puerto Rico under a constitution of their own adoption, has moved in and the former insular government has ceased to exist.

This change has come about as the result of a compact between the people of Puerto Rico and the Congress. By its terms, the people of Puerto Rico have given their consent to the Statute of Federal Relations and the continued exercise of federal authority as prescribed in said statute. On the other hand, the Congress, in approving the Constitution of the Commonwealth of Puerto Rico, has acknowledged the existence within the territory of Puerto Rico of a free and associated body

politic, whose political authority is limited by the coexistence of federal authority within the island, as prescribed by the Statute of Federal Relations.

Thus, government by consent has been established in Puerto Rico both at the Commonwealth and the federal level. The people themselves have created the Commonwealth and have accepted a federative association between them and the United States. Fundamental provisions of the Constitution of the United States as well as the Statute of Federal Relations, as determined by Public Law 600 of 1950, and the Joint Resolution of 1952 approving the Constitution of the Commonwealth of Puerto Rico, create such relationships.

Puerto Rico, after finding itself three times in the status of a colony and once in that of a commonwealth, finds itself again in this latter status, now federatively associated with a republican federal union, with Union citizenship as a common bond. The difference between the Commonwealth of 1897 and the present one is enormous. In place of membership within a monarchical system whose political institutions could not escape the effect of the decay and ruin into which the old realm had fallen, Puerto Rico now lives in equality, dignity, and security within the great republican system of freedom, democracy, opportunity, and security of the United States of America, with whose citizenship all Puerto Ricans are so proud to be invested.

ADDENDA

The foregoing refers to the evolution of the people of Puerto Rico from a benevolent colonial regime to the status of a community of free citizens, federatively associated, on the basis of mutual consent and common citizenship, to a larger free community. But the story of this development and the resultant picture would not be properly presented

if some reference were not made to the social and economic aspects of this evolutionary process.

With the first Organic Act for Puerto Rico, enacted in 1900, Puerto Rico was included within the United States tariff system, and free trade was established between the United States and Puerto Rico.

However, although tariff rates on foreign imports are the same in Puerto Rico as in the United States, customs collections in Puerto Rico are covered into Puerto Rico's Treasury, and United States Internal Revenue laws are not applicable to Puerto Rico. There exists, therefore, an actual customs union between Puerto Rico and the United States on the basis of the United States tariff.

United States statutory laws apply in Puerto Rico as in United States, except tax laws. Federal agencies operate in Puerto Rico equally as in the United States, but the Puerto Rican people are not taxed to support them. They are supported wholly by the federal government, without cost to Puerto Rico. Nevertheless, there is a contribution

Puerto Rico gladly makes to the Union: its share in the armed defense of our common heritage of freedom and democracy, within the framework of our federative republican institutions.

The economic and fiscal relationships, established at the beginning of the century, have not been altered by the creation of the Commonwealth. In fact they are now included in the compact; they are to be found in the Puerto Rican Federal Relations Act.

Within this economic and fiscal relationship Puerto Rico has been able to develop its sugar industry to tremendous proportions. Lately it has embarked on a diversified industrial program which holds promise to do away with the chronic unemployment problem. Education and public health have made amazing strides in Puerto Rico.

The creation of the Commonwealth represents, therefore, a political development, starting in 1900, which parallels the economic, social, and educational development. It means an outstanding victory for good will, mutual understanding, democracy, and freedom in these parts of the New World.

Antonio Fernós-Isern, M.D., Washington, D. C., is Resident Commissioner for Puerto Rico in the United States House of Representatives. Besides having been a practicing physician, he has been Commissioner of Health, head of the medical relief mission to the Dominican Republic, and chairman of the Puerto Rican chapter of the American Red Cross. He is the author of articles on public health, economics, and politics.

Congressional Conservatism and the Commonwealth Relationship

By PEDRO MUÑOZ AMATO

THE real meaning of the new political relation between Puerto Rico and the United States has yet to be clarified. But the unfolding of this meaning, whatever the nature of its outcome, will inevitably have significance in the present setting of world tensions. It is obviously a test for democracy and for American leadership in international affairs.

DEMOCRATIC DEVELOPMENT IN PUERTO RICO

Puerto Rico has emerged from anonymity in the last decade. After a long history of colonialism and poverty, its people are engaged in an enthusiastic effort to meet their formidable problem of economic scarcity in the face of a very dense and prolific population. And they go about this task with intense democratic fervor, making full use of the representative processes and protecting the individual and group rights that are indispensable in a system based on the control of government by the people.

These are not mere generalizations but concrete realities, easily confirmed by careful observation. Since 1938 the proofs of democratic development have grown more and more in their convincing impact. The eradication of vote selling, the intensive participation of the masses in political activity, the orderly and clean procedures of elections, and the protection of minority rights are all symptoms of the gradual improvement in the cultural constitution, in the collective climate that decisively determines the quality of politics.

These democratic forces have produced a general consensus that strongly favors government activity for the orientation of the economic processes, in order to increase production and make its distribution more equitable. The "popular will" has been manifested in the overwhelming majorities of the Popular Democratic party, which has been in power since 1940. In 1948 it elected all but three insular legislators and lost only one municipal administration. Last November it won in every municipality and representative district, electing all its candidates. The ideology has also affected the opposition parties, so that now their economic and social tenets are very similar to those of the Popular Democratic party.

The program has been in operation for twelve years, and the people are reassured in their political trust when they see that, unlike formerly, the objectives are not mere dreams or plans or rhetorical tricks, but result in proportional benefit farms, higher wages, more schools, new factories, and many other real gains. For in the process of this collective transformation, a factor of tremendous importance—both as cause and as effect—is the administrative effectiveness of the government.

The reforms in public administration started their new impetus in 1942 with the establishment of the Planning Board, the Bureau of the Budget, the Industrial Development Company, the Government Development Bank, the Land Authority, the Water Resources Authority, the Transportation Authority, the Communications Authority, and other agen-

cies. Since then the movement has multiplied in its momentum and specificity, including such landmarks as the development of the merit system in personnel administration, the launching of the industrialization program, the improvement of the University of Puerto Rico, and the rigorous intensification of honesty in the administration. Puerto Ricans are justifiably conscious of the fact that their government is an example of democracy, honesty, and effectiveness.

The problems of economic scarcity still remain. Although per capita income has increased by approximately 70 per cent in real terms since 1940, it is still one-half of that prevalent in the poorest state of the Union. Unemployment persists at a high 13 per cent, with partial and seasonal gaps affecting about one-third of the labor force. Net population growth is 28 per thousand every year, since the death rate has been reduced to 9.9, while the birth rate has declined only to 38.5. Migration has absorbed about two-thirds of the increase during the last six years, but this solution is precarious enough to leave the population problem as a serious menace.

It is in this context of democratic struggle against misery that the true significance of the new constitution and federal relations of Puerto Rico must be appraised.

CONGRESSIONAL CONSERVATISM

Public Law 600, passed July 3, 1950 by the Eighty-first Congress, stated in its preamble:

That, fully recognizing the principle of government by consent, this Act is now adopted in the nature of a compact so that the people of Puerto Rico may organize a government pursuant to a constitution of their own adoption.

In accordance with Sections 2 and 3, the Puerto Rican voters accepted the

act, elected a constitutional convention, and ratified a constitution, which was then found by the President of the United States to conform with the applicable provisions of Public Law 600 and the federal Constitution. The Constitution of the Commonwealth of Puerto Rico was finally approved by Congress, after some debates and amendments. It now supersedes the Organic Act of 1917, except for those provisions which were continued in force by Section 4 of Law 600, under the name "Puerto Rican Federal Relations Act."

The Constitution of the new Commonwealth is a faithful interpretation of the trajectory now followed by the Puerto Rican people, and its central theme is well expressed in the preamble:

We, the people of Puerto Rico, in order to organize ourselves politically on a fully democratic basis, to promote the general welfare, and to secure for ourselves and our posterity the complete enjoyment of human rights, placing our trust in Almighty God, do ordain and establish this Constitution for the Commonwealth which, in the exercise of our natural rights, we now create within our union with the United States of America.

In so doing, we declare:

The democratic system is fundamental to the life of the Puerto Rican community;

We understand that the democratic system of government is one in which the will of the people is the source of public power, the political order is subordinate to the rights of man, and the free participation of the citizen in collective decisions is assured;

We consider as determining factors in our life our citizenship of the United States of America and our aspiration continually to enrich our democratic heritage in the individual and collective enjoyment of its rights and privileges; our loyalty to the principles of the Federal Constitution; the coexistence in Puerto Rico of the two great cultures of the American Hemisphere; our fervor for education; our faith in justice

our devotion to the courageous, industrious, and peaceful way of life; our fidelity to individual human values above and beyond social position, racial differences, and economic interests; and our hope for a better world based on these principles.

In its Bill of Rights and in the articles organizing the legislative, executive, and judicial branches, the basic law incorporates the best elements of the great liberal-democratic tradition and provides the framework for the efficient functioning of an active government that is engaged in an ambitious program of democratic planning. Thus the opportunity to frame their own constitution has been intensively used by the Puerto Rican people and their leaders. It is a constituent act of great consequence in terms of real self-government.

Has Congress recognized constituent authority?

But the question was raised in Congress whether the constituent authority of the Puerto Rican people is to be fully recognized or not. The Constitution of the Commonwealth, as ratified by the Puerto Rican voters, contained a clause providing for amendments to be initiated by the insular legislature (or by a constitutional convention called by it) and ratified by the electors in referendum.¹ The United States Senate passed a modification of this clause which simply destroyed the meaning of the constitutional process. This modification stated:

No amendment to or revision of the constitution of the Commonwealth of Puerto Rico shall be effective until approved by the Congress of the United States.²

In a cablegram protesting against the Senate decision, Governor Luis Muñoz Marín said:

¹ Article VII.

² *Congressional Record*, Vol. 98, No. 110 (82d Cong., 2d sess., June 23, 1952), p. 7983.

... People here are dismayed with amendment that nullifies the significance of the whole constitutional process. To the limitations rightfully imposed on State constitutions and on the Puerto Rican Constitution the amendment adds an obvious colonial touch. The people of Puerto Rico in voting to accept law 600 in the nature of a compact, in which the principle of government by consent was "fully recognized" certainly had no idea they were consenting to any trace of colonialism. No self-respecting people would. Free men may live under such circumstances but they will certainly not go to the polls and vote that they love and cherish them. I fear that if the matter cannot be remedied in conference great moral harm will be done to our people and some moral harm to the good name of the United States in the world. You can rely on us to protect the good name of the United States.³

Fortunately this change of the Constitution's amendment clause was rejected by the Conference Committee, and in its stead the following was recommended by the committee and approved by the Congress:

... That except for the purpose of adopting the amendments to section 5 of Article II and to section 3 of Article VII as herein provided, Article VII of said constitution likewise shall have no force and effect until amended by the people of Puerto Rico under the terms of said article by adding to section 3 of Article VII the following new sentence: "Any amendment or revision of this constitution shall be consistent with the resolution enacted by the Congress of the United States approving this constitution, with the applicable provisions of the Constitution of the United States, with the Puerto Rican Federal Relations Act, and with Public Law 600, Eighty-first Congress, adopted in the nature of a compact. . . ."⁴

Thus, the Congress recognized that it is the exclusive right of the Puerto

³ *Ibid.*, No. 111 (June 24, 1952), p. 8060.

⁴ Conference Report (H. Rept. 2350) in *ibid.*, No. 115 (June 28, 1952), p. 8525.

Rican people to amend their own constitution. This it had not expressed before. However, the Constitutional Convention had worked on the assumption that the right was implied in the provision of authority to "organize a government pursuant to a constitution of their own adoption."

Past congressional behavior towards Puerto Rico

It is now clear that the amendment clause of the Puerto Rican Constitution prevails. But the fact that the Senate at first agreed to require congressional approval of amendments, seen in the light of all the deliberations, reveals how precarious is the understanding of Congress as to the right of the Puerto Rican people to govern themselves democratically, under a constitution of their own adoption, and in free association with the United States. This is more alarming, indeed, if we take into account the past history of congressional behavior towards Puerto Rico. It has been characterized many times by ignorance, indifference, and disregard of Puerto Rican ideals. There is ample proof of this in the Foraker Act of 1900, in the Jones Act of 1917, and in the way Congress resisted until 1947 the continuous demands for reform of the political relations.⁵

In this connection it is important to note that the will of the Puerto Rican electorate was further ignored by the decision of Congress to eliminate section 20 of the Bill of Rights, which read as follows:

Section 20.—The Commonwealth also recognizes the existence of the following human rights:

⁵ A detailed statement of this critical appraisal may be found in Pedro Muñoz Amato, "Major Trends in the Constitutional History of Puerto Rico, 1493-1917," *Revista de Derecho, Legislación y Jurisprudencia del Colegio de Abogados de Puerto Rico*, XII (1949), No. 3, pp. 242-99.

The right of every person to receive free elementary and secondary education.

The right of every person to obtain work.

The right of every person to a standard of living adequate for the health and well-being of himself and of his family, and especially to food, clothing, housing and medical care and necessary social services.

The right of every person to social protection in the event of unemployment, sickness, old age or disability.

The right of motherhood and childhood to special care and assistance.

The rights set forth in this section are closely connected with the progressive development of the economy of the Commonwealth and require, for their full effectiveness, sufficient resources and an agricultural and industrial development not yet attained by the Puerto Rican community.

In the light of their duty to achieve the full liberty of the citizen, the people and the government of Puerto Rico shall do everything in their power to promote the greatest possible expansion of the system of production, to assure the fairest distribution of economic output, and to obtain the maximum understanding between individual initiative and collective co-operation. The executive and judicial branches shall bear in mind this duty and shall construe the laws that tend to fulfill it in the most favorable manner possible.

This clause, essentially a declaration of ideals to orient future development, was based on Articles 22, 25, and 26 of the Universal Declaration of Human Rights approved by the General Assembly of the United Nations on December 10, 1948. The Senate Committee on Interior and Insular Affairs thought it was "unrealistic, confusing and misleading" because its provisions did not assert enforceable rights and duties.⁶ After several members of both houses repeatedly criticized it as contrary to American ideals of government, and

⁶ S. Rept. 1720, 82 Cong., 2d sess., submitted June 10, 1952, to accompany S. J. Res. 151, pp. 1-2.

even as "socialistic" and "communistic," the Congress excepted Section 20 when passing the resolution for approval of the Commonwealth Constitution. The Puerto Rican convention and electorate had decided that Section 20 was necessary in order to state some fundamental human rights not immediately enforceable but which the people in their constitution should endorse as obligations for the government to fulfill in the future.⁷

These examples illustrate the important fact that the whole arrangement of the new political relationship is just a compromise between the democratic aspirations of the Puerto Rican people and the conservative disposition of Congress when surrendering its imperialistic authority.

AMENDMENTS TO THE FEDERAL RELATIONS STATUTE

Only with this historical perspective can the true import of the Federal Relations Statute be grasped. The Statute preserves those sections of the Organic Act of 1917 which refer to American citizenship, federal property, applicability of federal laws, free trade with the mainland, exemption from payment of United States internal revenues, the refund of internal revenues to the Insular Treasury when paid on Puerto Rican products brought to the continent, the refund of customs dues collected in Puerto Rico on foreign imports, the position of the Resident Commissioner in Congress, the Federal District Court in Puerto Rico, the relation of the insular and federal judicial systems, the privileges and immunities of United States citizens, the imposition of taxes on exports, the sale of Puerto

⁷ Report of the Commission on the Bill of Rights, published in *Revista Jurídica de la Universidad de Puerto Rico*, XXI (1951), No. 1, pp. 1-32.

Rican bonds in the United States, and the reports of the insular to the federal government.

It also preserves some clauses which affect the local political organization and contradict the principle of self-government—for example, the one which defines the jurisdiction as extending "to the Island of Puerto Rico and to the adjacent islands belonging to the United States"; the one that fixes the limit on public indebtedness of Puerto Rico and its municipalities at certain percentages of the aggregate tax valuation of total property; the one which determines the qualifications for Puerto Rican citizenship; those that assert the applicability of congressional legislation; and others of less importance.

However, despite these exceptions, Congress ceded much authority when it repealed the other sections of the Organic Act, now superseded by the Constitution. Altogether, this has meant granting the Puerto Rican people self-government in local matters "pursuant to a constitution of their own adoption." But the cession has not been complete, because of two main reasons: (1) it is not yet clear whether the Federal Relations Statute will be amended exclusively by Congress, or bilaterally in consultation with the Puerto Rican people; and (2) Puerto Ricans do not have voting representation in Congress, although its laws are applicable to them.

Neither in the text of Public Law 600 nor in the congressional deliberations is it possible to find a definitive answer to the question of how the Federal Relations Statute will be amended.

By compact or unilaterally?

In its first article, Law 600 is defined as a "compact," and "the principle of government by consent" is recognized. Therefore, all the subsequent provisions, including those of Article 4 on the Federal Relations Statute, should

be considered part of the compact. When the people of Puerto Rico ratified the Law in a referendum, they understood that the federal relations clauses were included in the covenant, as had been emphasized by the leaders of the majority party.

If the Federal Relations Statute can be amended unilaterally by Congress, then there is no compact with the Puerto Rican people on these matters. Either it never existed or it is destroyed by the unilateral action, since the essence of a covenant is that it can be modified only by agreement of its parties.

If the compact was merely that the Puerto Rican people consented to the authority of Congress over the federal relations in exchange for the right to frame their constitution as to local matters, then the basis of the new political relation must be reappraised in its real worth, without exaggerating its democratic quality. It is well known from the history of liberalism and democracy that the passive consent of the governed is not equivalent to their democratic participation in the framing of the laws and the selection of the representatives that are to rule over them.

Considering that Puerto Rico does not have voting representation in Congress, the only democratic basis for amending the Federal Relations Statute would be to give the Puerto Rican people, through referendum or action of their legislature, the right to participate in the framing of the amendments.

This has to be clarified. The question was not raised in the Constitution. The congressional record on Law 600 and on the Puerto Rican Constitution does not reveal that the Congress has made a commitment to consult the Puerto Ricans. On the contrary, it contains evidence against the thesis favoring bilateral agreement for the amendments. But the Constitutional

Convention of Puerto Rico, in its Resolution No. 23, made the following "final declaration" upon approving the Constitution:

... Nothing can surpass in political dignity the principle of mutual consent and of compacts freely agreed upon. The spirit of the people of Puerto Rico is free for great undertakings now and in the future. Having full political dignity the commonwealth of Puerto Rico may develop in other ways by modifications of the Compact through mutual consent.

... The people of Puerto Rico reserve the right to propose and to accept modifications in the terms of its relations with the United States of America, in order that these relations may at all times be the expression of an agreement freely entered into between the people of Puerto Rico and the United States of America.

Will the Supreme Court decide?

The clarification may evolve in practice through the course of time. This is a normal way in the development of constitutional norms. It is even conceivable that the United States Supreme Court will sanction the obligatory force of the compact not only as to the sanctity of the Puerto Rican Constitution with respect to local matters, but also as to the bilateral nature of the Federal Relations Statute.

When, at the turn of the century, it was necessary to give Congress power over the new possessions acquired in the Spanish-American War, the Supreme Court found ways of reconciling the considerations of expediency involved in the imperialistic venture with the fundamental postulates of American constitutionalism and democracy. The Insular Cases recognized that Congress could legislate for the territories without being bound by all the individual rights and democratic principles promulgated by the Constitution as essential to the American system of government. As usual, the judicial conclusions were

reached on political and economic grounds, to fit the spirit of the time.

The same flexibility of the constitutional norms might be used now by the Supreme Court justices to derive from the principles of American constitutionalism the logical consequence that the compact made by Congress in this case implies the procedure of bilateral agreement for its modification.

Will Puerto Rican leaders insist?

But it is very doubtful that the Supreme Court will take this initiative. Most probably, it will follow the leadership of the political organs of the federal government. Those in Puerto Rico who now hope for a judicial clarification of the problem should not allow their juridical optimism to obscure the fact that these matters have to be settled in the political processes. If the relations with the Congress and the federal administration are conducted on the basis of mutual agreement and respect for local autonomy, practice may eventually be translated into constitutional norms. It is worth while to consider the possible advantages of an institutional device to channel and symbolize these activities. An amendment to the Federal Relations Statute may be proposed to Congress—to be ratified in a referendum of the Puerto Rican people as was Law 600—to the effect that the preamble and Article I of Law 600 be incorporated in the Statute. It would then read as follows:

Whereas the Congress of the United States by a series of enactments has progressively recognized the right of self-government of the people of Puerto Rico; and

Whereas under the terms of these congressional enactments an increasingly large measure of self-government has been achieved: Therefore

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, fully

recognizing the principle of government by consent, this Act is now adopted in the nature of a compact to determine the relations between the People of Puerto Rico and the People of the United States.

Another clause would provide that any amendment to the Statute shall "be submitted to the qualified voters of Puerto Rico for acceptance or rejection, through an island-wide referendum to be held in accordance with the laws of Puerto Rico," as expressed in Article 2 of Law 600. The remaining sections could be modified to eliminate the contradictions to the principle of self-government noted above, of which the most offensive is that defining the jurisdiction with the phrase "islands belonging to the United States."

Puerto Rican leaders are rightly conscious of the risk that submitting this or a similar proposal to Congress would entail. It would be too great a risk not only in terms of the probable failure of the Puerto Rican request, but also in terms of the respectability of Congress before the eyes of the world. The role of the United States in the defense of democracy is a major consideration for the Puerto Rican leadership, one which has been repeatedly cherished, sometimes to the detriment of the right of the Puerto Rican people to govern themselves democratically. However, the ideals of the democratic world will be better served in the long run if the Puerto Rican aspirations are defended in Congress with the greatest possible vigor.

LACK OF REPRESENTATION IN CONGRESS

Puerto Ricans do not have voting representation in Congress. Their Resident Commissioner is a member without vote in the House of Representatives. Yet, Congress legislates for Puerto Rico.

This is not a case of "taxation without representation," because federal

taxes are not imposed on the residents of the island. By the Foraker Act free commerce between the island and the mainland was established, internal revenue laws were declared inapplicable, and all customs duties collected in Puerto Rico plus all taxes on Puerto Rican merchandise entered into the United States were ordered to be refunded into the Insular Treasury.

These special fiscal arrangements, which actually went into effect in 1901, were made possible by the Supreme Court decision that Puerto Rico was a nonincorporated territory and that, in legislating for it, Congress was not bound by the constitutional clause requiring the uniformity of taxation.⁸ Precisely, one of the main reasons why the majority party and other groups in Puerto Rico do not favor statehood is that the fiscal obligations required by such a status would impose too heavy a burden on the poor economy of the island.

Congress so far has had authority to legislate for Puerto Rico beyond the limits which the Constitution fixes with respect to the states. For this reason the special taxation arrangements have been permissible, and the Taft-Hartley Act—for example—has applied generally in Puerto Rico, without being limited to interstate and foreign commerce. The ratification of Law 600 as a compact and the approval of the Commonwealth Constitution may have affected this situation so that Congress can no longer treat Puerto Rico as a nonincorporated territory.

POSSIBLE LEGAL INTERPRETATIONS

If the interpretation of some insular leaders prevails, the relation of commonwealth in "free association" with the United States imposes on the federal government limitations similar to those that protect the states, except in

⁸ *Downes v. Bidwell*, 182 U. S. 244 (1901).

so far as they are modified by compact in the Federal Relations Statute. This is a logical consequence of the postulates of self-government in internal affairs and mutual consent in federal relations. Whether it will be accepted by Congress and the administration remains to be seen. It is conceivable, although improbable, that the United States Supreme Court will find constitutional sanction for this interpretation.

From the judicial point of view, there is a more acceptable contention: that the approval by Congress of the Puerto Rican Constitution implicitly amends previous federal laws so that they no longer have effect in the island beyond the limits protecting local self-government. If the analogy of state jurisdiction is taken as the criterion to define the scope of local government, then the Taft-Hartley Act, for instance, can apply only to commerce with the territories, states, and foreign countries, and not to internal commerce. A reasonable construction of Law 600, the Constitution of the Commonwealth, and its ratification by Congress would support this conclusion that internal matters, as in the states, are to be governed by local legislation, with the exceptions agreed upon in the compact, specifically in Law 600 and the Federal Relations Statute.

It should be noticed that this argument is not based on the thesis (discussed above) of a constitutional impediment to the authority of Congress which would be general, permanent, and prospective, but rather on the premise that Congress has amended its previous enactments. Besides, it should be clear that these two interpretations are not presented here as mutually exclusive, but as complementary alternatives with different degrees of judicial probability. One obvious way of testing either one would be through proceedings in the Puerto Rican or the National Labor Re-

lations Board concerning the relative effect of the Taft-Hartley Act and the Puerto Rico Labor Relations Act.

In any case, even if congressional legislation has the same effects and limits in Puerto Rico as in the states, the lack of representation in the framing of these laws is contrary to the essence of democratic government.

The relation of "commonwealth" or "free associated state" demands an answer to the question of the applicability of federal laws. And, incidentally, this will be the most difficult obstacle if a petition is presented by the United States delegation to the United Nations for the exclusion of the Commonwealth from the list of non-self-governing territories.

One possible solution would be to give the legislature of Puerto Rico the authority to approve, reject, or modify such legislation, so that it will not become effective until mutually agreed upon. It is possible to arrange administratively, through a joint committee or the Resident Commissioner, the process of consulting the legislature of the Commonwealth. Without a participation of this kind, the reality of the "free associated state" is incomplete.

RECOMMENDATION: FREE ASSOCIATION WITHOUT STATEHOOD

Of course, it is easy to avoid these problems by providing either statehood or independence. But this would also imply discarding the present ideals of the Puerto Rican people. The outcome of the last two elections is evidence that the large majority prefer association with the United States to independence. It is, on the other hand, true that statehood does not command the support of the majority.

The referenda to approve Law 600, elect the Constitutional Convention, and ratify the Constitution prove that

the popular consensus is overwhelmingly favorable to the "free associated state" formula of the Commonwealth. It fits the special economic and cultural position of Puerto Rico within the American federation, making possible the ideals of association with democratic self-government. If these ideals are given full effectiveness in practice with respect to the Federal Relations Statute and congressional legislation in general, even more support will be created. The value of the compact, as the backbone of self-government and free association, will be vindicated. Then the new form of political relation can be proclaimed as an example for other dependent areas.

The democratic development of Puerto Rico is of great significance to the United States people. To a large extent, the collective achievements that have taken place in the island are due to the impact of the Anglo-American culture on the Latin American heritage. The fusion of the two cultural currents has already resulted in notable examples of respect for individual freedom, dignity, and security; intensive utilization of the representative processes; stable, honest, and efficient government; systematic democratic planning for the enrichment of the collective patrimony and the more equitable enjoyment of it by all; initiative for the use of science and technology in the development of productive enterprises; and a general climate of enthusiastic effort, so vividly synthesized in the slogan "Operation Bootstraps."

The proper cultivation of these creative forces is the responsibility of all American citizens, whether in the island or on the mainland. It is the birth of a new form of political association, whereby economically underdeveloped areas may join richer nations without surrendering their cultural idiosyncrasies or their aspirations for self-government. And, furthermore, it represents

a people rising above the insignificance of its material resources and power-status to fulfill an opportunity for greatness. Its collective pride is not the nationalistic prejudice of political exclusivism and cultural superiority. It is a feeling of devotion to the ideals of

human dignity and freedom, and to the principles of democratic organization of society, as conducive to the free association of states. The Congress of the United States still has to decide in the case of Puerto Rico whether it is willing to accept association on these terms.

Pedro Muñoz Amato, Ph.D., Rio Piedras, Puerto Rico, is dean of the faculty of social sciences and director of the School of Public Administration at the University of Puerto Rico. He has previously served as director of the university research staff which advised the Constitutional Convention of Puerto Rico, as visiting lecturer in social sciences at the University of Chicago, and as chairman of the 1952 international seminar on public administration held at Rio de Janeiro under the auspices of the United Nations and the Government of Brazil. He has published articles on law, political science, and public administration.

The Commonwealth Constitution

By VICTOR GUTIÉRREZ-FRANQUI and HENRY WELLS

THE political evolution of Puerto Rico during the last half-century has recently culminated in a triad of significant contributions to democratic statecraft. Though closely interrelated, each of these contributions—symbolized by the terms commonwealth, compact, and constitution—provides a model for political development elsewhere.

Puerto Rico as a commonwealth signifies something unique in the realm of bodies politic. Defying classification in any of the familiar categories, it is no longer a colony, and yet it is neither an independent nation nor a state assimilated within a larger union. Nor is it a dominion in the British sense: although similar to the constituent parts of the Commonwealth of Nations in being free and self-governing in local affairs, Puerto Rico differs from them in preserving legal ties with the former metropolitan power. The advantage of the latter arrangement is that it enables Puerto Rico to enjoy economic benefits which both statehood and independence would deny; yet it does not impair full local self-rule.

The legal basis of this ingenious form of political association is another happy invention: a compact between Congress and the people of Puerto Rico. Described more fully below, the compact represents on the part of Congress a voluntary and irrevocable vesting of power in the people of Puerto Rico with respect to the internal government of the island. It also implies that relations between Puerto Rico and the United States are no longer matters to be determined unilaterally by Congress but have become subject to consultation between Congress and Puerto Rico and

to determination on the basis of mutual agreement and consent.

These first two concepts, commonwealth and compact, may well prove useful to dependent peoples elsewhere as devices for achieving self-government in economic circumstances that preclude self-sufficiency. The third, the constitution, is likely to prove useful as a model for future constitution-makers in the states of the Union. Exhaustively considered and carefully drafted, the Constitution of the Commonwealth embodies the best contemporary thought on what a workable and democratic American constitution should contain. The following pages attempt to make clear its contribution to the enrichment of the American constitutional tradition.

THE LEGAL BASIS OF THE CONSTITUTION

For more than fifty years prior to becoming a commonwealth, Puerto Rico had been an unincorporated territory of the United States. As such it had had no constitution of its own, locally drafted and adopted, but had instead received its fundamental law from Congress in the form of Organic Acts. The gradual extension of local self-government under those acts, described elsewhere in this issue of THE ANNALS, signified congressional recognition of the ever increasing political maturity of the Puerto Rican people. But even the latest and most liberal concession of political rights, the "elective governor" act of 1947, left Puerto Rico in the status of a dependent body politic. Congress still retained the right to amend the Puerto Rican organic law as it pleased, and the law itself continued

in effect various federal controls over the government of the island.

Since 1950, however, these vestiges of colonialism have disappeared. Under the terms of Public Law 600 of the Eighty-first Congress, adopted July 3, 1950, Puerto Rico's status has changed from that of involuntary dependency to that of voluntary association. The federal controls and limitations have been superseded by a fundamental law drafted by the people of Puerto Rico. As a consequence, the Puerto Rican people's right to govern themselves is no longer based upon privileges conferred by Congress but rather upon the principle of the consent of the governed.

Public Law 600 could work this transformation because it was no ordinary Act of Congress. Rather, it was a compact between Congress and the people of Puerto Rico. Its first section declared the law to be enacted "in the nature of a compact," and its second section provided that the act as a whole could take effect only if approved by the Puerto Rican people. In the referendum of June 4, 1951 they voted overwhelmingly to approve Public Law 600, and thus made themselves a party to the compact and consented to its terms.

Provisions of the compact

Specifically, the people of Puerto Rico consented to the provision authorizing them, through representatives of their own choosing, to draft a constitution for Puerto Rico. They also consented to the provisions stipulating conditions which the constitution must fulfill: that it establish a republican form of government, that it contain a bill of rights, and that it be in conformity with the applicable provisions of the United States Constitution and with the provisions of Public Law 600. They consented to the provision that the constitution be approved by the people of Puerto Rico and, after certification by the President

of the United States as to its conformity with Public Law 600 and the Constitution, that it be submitted to Congress for its approval.

In ratifying Public Law 600 the people of Puerto Rico thus also gave consent to its last two sections, which taken together, in effect repealed the Organic Act and created a new system of relations between Puerto Rico and the United States. Section 5 lists a number of sections of the Organic Act relating to purely local affairs and provided that they would be automatically repealed when the constitution went into effect. Section 4 provided that the remaining sections of the Organic Act almost all of which dealt with relations between Puerto Rico and the federal government, would constitute the "Puerto Rican Federal Relations Act."

Although the provisions of the Federal Relations Act are identical with those of the Organic Act which were not repealed by Section 5 of Public Law 600, they actually represent a new basis for relations between the Commonwealth and the federal government. The Organic Act provisions were adopted only by Congress, whereas the provisions of the Federal Relations Act were adopted in a significantly different way—by being approved both by Congress and by the people of Puerto Rico. The latter gave their approval when they ratified Public Law 600. Hence the Puerto Rican Federal Relations Act, no less than the Commonwealth Constitution, is part of the compact embodied in Public Law 600.

FRAMING AND ADOPTING THE CONSTITUTION

On August 27, 1951 the people of Puerto Rico again went to the polls—this time to select delegates to a Constitutional Convention. They elected ninety-two delegates representing three of the island's four political parties; the

fourth, the Independence party, representing less than 10 per cent of the electorate, did not nominate candidates, and hence none of its adherents participated in the drafting of the Constitution.

The convention began its work on September 17 and was in continuous session for four and a half months. Its committees prepared preliminary drafts of articles after careful study of American and other precedents and after consideration of lay and expert opinion expressed in public hearings. The committee drafts were then debated and often substantially revised in open sessions of the convention.

Adopted by the convention on February 6, 1952, with only three dissenting votes, the Constitution was thereupon submitted to the people of Puerto Rico. In a referendum held on March 3, they ratified it by a vote of 373,594 to 82,877. The Constitution then went to the President, who found it to be in conformity with Public Law 600 and with the applicable provisions of the Constitution of the United States. In transmitting it to Congress on April 22, 1952, he recommended its immediate approval.

After committee hearings and floor debates in each house, Congress passed a joint resolution ratifying the Constitution on the condition that three minor clarifying changes be made in the document. In the process of adopting the joint resolution Congress considered but rejected certain changes that would have nullified the compact. Hence, the net effect of the approval resolution was to reaffirm the compact and to make its terms irrevocable by unilateral action on the part of Congress.

The President signed the resolution on July 3, 1952, and the Constitutional Convention then proceeded to study the proposed changes. Inasmuch as they were of minor importance, the conven-

tion regarded them as reasonable counteroffers in the final negotiation of the compact and readily accepted them in the name of the Puerto Rican people. Its action signified the fulfillment of the terms of the compact by both parties, and on July 25, 1952 the existence of the Commonwealth of Puerto Rico was officially proclaimed.

THE NATURE OF THE CONSTITUTION

The Commonwealth Constitution embodies the characteristic features of American constitutionalism. Like the federal and state constitutions on which it was modeled, it contains a bill of rights that guarantees the traditional liberties of the individual and the traditional protections of private right. Also like its models, it provides for the separation of governmental powers into three branches and for the balancing and interaction of those branches. Mr. Justice Jackson's recent description of the Constitution of the United States applies equally to that of Puerto Rico: "[it] enjoins upon its branches separateness but interdependence, autonomy but reciprocity."¹

Although squarely within the American constitutional tradition, the Constitution of the Commonwealth is no slavish copy of any American document. It departs from its models in a number of significant details in order to provide a fundamental law that is workable in terms of Puerto Rican traditions and consistent with contemporary Puerto Rican needs. Its bill of rights, for example, is broader in scope than traditional bills of rights, which tend to include only restraints upon governmental action. It not only increases the protections normally afforded to private rights but also goes beyond them to guarantee certain social and economic

¹ Concurring opinion, *Youngstown Sheet and Tube Co. et al. v. Sawyer*, 343 U. S. 579, 635 (1952).

rights that require positive governmental action for their fulfillment. Similarly the Constitution introduces certain innovations in the structure of the three branches in order to create a government competent to deal with the complex problems of an expanding and increasingly industrialized economy, and yet a government limited in power and responsible to the people.

As a result of this combination of modern and traditional elements, the Commonwealth Constitution is well designed to protect both individual and social rights, to promote the effective and responsible dispatch of public business, and to permit full local determination of purely local affairs.

THE BILL OF RIGHTS

The bill of rights, Article II of the Commonwealth Constitution, contains the fundamental guarantees of individual rights found in the federal and state constitutions. It expresses many of those guarantees in exactly the same language as that of their counterparts in Sections 9 and 10 of Article I of the federal Constitution and in its first ten amendments. Use of the same phraseology incorporates into these provisions of the Puerto Rican Constitution the wealth of meaning that has been built up around them during a hundred and fifty years of interpretation in the federal courts.²

In certain cases, however, the traditional guarantees are enlarged upon. For example, the familiar clause from the First Amendment respecting freedom of religion is amplified by the state-

² The Organic Act of 1917 also contained a number of clauses in its bill of rights (Section 2) which were copied verbatim from the federal Constitution. Interpretation of these clauses in the Puerto Rican courts prior to the establishment of the Commonwealth contributed to the new Constitution a body of meaning complementary to that provided by the federal courts.

ment that "there shall be complete separation of church and state." Freedom of the press is made more specific by a novel provision which prohibits the condemnation of printing presses and other publishing equipment and permits the condemnation of buildings in which they are housed only after a judicial finding of public convenience and necessity. A clause from the Fourth Amendment occurs in the constitutional provision guaranteeing security against unreasonable searches and seizures, but a modern note appears: "wire-tapping is prohibited." Evidence obtained in violation of this clause is declared to be inadmissible in the courts.

The Commonwealth bill of rights also contains protections for individual or private rights not ordinarily found in American constitutions. Equality before the law is emphasized in a provision which prohibits discrimination "on account of race, color, sex, birth, social origin or condition, or political or religious ideas." Two examples of the practical importance of this provision are that women have now become eligible to serve on juries and that illegitimate children born after the Constitution took effect have the same rights as those of legitimate offspring, including the rights of inheritance. Another provision gives constitutional dignity to the right of privacy.

Economic rights

In the field of social and economic rights the Commonwealth Constitution follows a number of state constitutions in prohibiting child labor in occupations detrimental to health or morals, and in recognizing the rights of employees. Such provisions mean that the bill of rights not only imposes restraints upon government but also requires positive governmental action, for only through the latter can social and economic rights be guaranteed.

The Puerto Rican bill of rights acknowledges the right to equal pay for equal work, the right to a "reasonable" minimum wage, and the right to an eight-hour day, with extra pay for extra work. It also recognizes labor's right to organize, to bargain collectively, to strike, to picket, and "to engage in other legal concerted activities." In recognizing these rights, however, the Constitution specifically states that they apply only to employees of private businesses and to employees of governmental enterprises of a business nature. Hence constitutional protection of the right to strike cannot be invoked by the police or other public servants engaged in ordinary governmental functions. The constitution also declares that these rights do not in any way impair the authority of the legislature "to deal with grave emergencies that clearly imperil the public health or safety or essential public services."

THE GOVERNMENT OF THE COMMONWEALTH

The broad outlines of governmental structure and powers as defined by the Commonwealth Constitution are so familiar that they do not need description or justification. Suffice it to say that they are based upon the tripartite system of checks and balances found in the Constitution of the United States and in the constitutions of all the states. Within this traditional framework, however, the Constitution of the Commonwealth introduces certain new features that deserve mention. All the changes are designed to make the traditional American system work as effectively and democratically as possible. To some extent they involve the adaptation of continental American experience to the rather different facts of Puerto Rican political life. To a greater extent, however, they attempt to improve upon the American experience by taking advan-

tage of the lessons it teaches and by putting into practice the suggestions of some of its more constructive and responsible critics.

The legislative branch

One of the striking features of Article III, "The Legislature," is its unique method of safeguarding minority representation. Special protections for minority parties were thought to be necessary because of Puerto Rico's electoral history. During most of its fifty-two years as a territory, local politics was dominated by one or another political party or coalition. The workings of the electoral system under the Organic Act often permitted the dominant party or group to capture nearly all the seats in the legislature despite strong minority-party opposition at the polls, and thus to become considerably overrepresented in each house.³

In order to mitigate the debilitating effects of this system upon minority parties, the Constitutional Convention included in the Constitution a formula for automatically increasing the number of minority-party Representatives or Senators (or both) whenever the results of an election show one party to have gained as many as two-thirds of the seats in either house. The formula in essence provides for the seating of enough additional legislators from the minority parties to make their strength in each house roughly proportionate to the strength shown by their respective candidates for Governor in the gubernatorial election.

³ For example, in the 1948 election the candidates of the Popular Democratic party won 38 out of 39 seats in the House of Representatives and 17 out of 19 seats in the Senate, or 94.8 per cent of all the seats in the Legislature. In the same election the party's candidate for Governor received only 61.2 per cent of the votes cast for the governorship—a percentage roughly comparable to that which resulted in the election of 94.8 per cent of the legislative seats.

natorial contest. The operation of this new scheme, which incidentally was proposed and warmly supported by the Popular Democratic majority in the Constitutional Convention, is expected to strengthen minority criticism and opposition—an essential element of the democratic process.

The Commonwealth Constitution improves upon most state constitutions in its provisions regarding legislative sessions. Many state legislatures can convene in regular session only once every two years and must end the session within two or three months. Such limitations usually lead to the last-minute adoption of a mass of ill-considered legislation and to frequent special sessions. The Commonwealth legislature is spared these difficulties by being declared a continuous body for the whole of its four-year term, by being required to hold regular sessions annually, and by being authorized to determine for itself the duration of its regular sessions.

Another feature of the legislative article that represents a great improvement over the Organic Act and over comparable provisions of a number of state constitutions is the section which establishes a clear distinction between accounting and auditing functions and assigns primary responsibility for the latter to the legislative branch acting through a controller.

The executive branch

Under the Organic Acts the Governor of Puerto Rico was in some respects a figure of more consequence in the political life of the island than a state governor normally is in the political life of his own state. Article IV of the Commonwealth Constitution attempts to provide for a chief executive more in keeping with the traditional American pattern. It does not restore the Governor's ties with the federal government

that were severed by Section 5 of Public Law 600, nor does it grant him the unusual powers that he enjoyed under both Organic Acts. No longer, for example, does he have the authority to suspend the writ of habeas corpus when in his judgment the public safety requires its suspension in case of rebellion, insurrection, or invasion. Section 13 of the bill of rights grants this authority exclusively to the Legislative Assembly. Similarly, Article IV decreases the Governor's power to declare martial law. Under the Organic Act his declaration of martial law stood unless countermanded by the President. Under the new constitution it must be immediately reviewed by the legislature, which can either approve or revoke it.

The powers granted to the Governor are in the main those traditionally associated with American chief executives. As to the power of appointment, Article IV follows the federal Constitution and the Organic Act in authorizing the chief executive to appoint the heads of the executive departments, all of whom hold office at his pleasure. Many state governors lack this power because their department heads are elected by the people for fixed terms. The latter arrangement is regarded as undesirable by virtually all advocates of administrative reform. The Puerto Rican system, on the other hand, is highly recommended, for it makes possible the coordination of executive departments and the concentration of administrative responsibility in one official, the Governor, whom the people can hold accountable for the performance of his subordinate officers.

An interesting departure from the American tradition, though not from the Puerto Rican tradition under the Organic Acts, is the provision that an appointed rather than an elected official succeeds to the governorship in the event of a vacancy in that office before

the expiration of the four-year term. In such circumstances the Secretary of State, ranking member of the Governor's cabinet, becomes Governor.

After considering methods of succession used in the states, the Constitutional Convention came to the conclusion that electing a Lieutenant Governor was an unsatisfactory solution to this problem. It could waste the talents of a good man if no vacancy occurred; it could catapult into office a weak man if a vacancy did occur. Filling the office by special election was also rejected: the expense involved, the disruption of public business that would ensue, and the possibly undesirable political strife that might develop, all counted against this method.

The appointive method, on the other hand, seemed to lack these defects and to afford positive advantages. The Governor could select as his possible successor a person in sympathy with the program which he was elected to carry out. That person as a department head would have duties in the executive branch and would be familiar with the over-all problems and policies of the administration. Finally, the government would be carried on with a maximum of continuity and efficiency if a vacancy in the office of Governor should occur.

With these considerations in mind, the convention decided that the successor should be the Secretary of State, that he should be appointed by the Governor with the advice and consent of both houses, and that he should have the same qualifications as those specified for the Governor elsewhere in Article IV.

The judicial branch

In drafting Article V, the Constitutional Convention sought to establish an independent judiciary and to assure the prompt adjudication of cases on

their merits rather than on technical questions of procedure or jurisdiction. These aims involved a thoroughgoing reform of the Puerto Rican judicial system as it existed under the Organic Acts. The groundwork for that reform was laid in the Constitution, and its details were filled in by a Judiciary Act of the Puerto Rican legislature which became effective on July 25, 1952, the day the Constitution took effect. Article V and the Judiciary Act together constitute an almost revolutionary reorganization of the court system and embody reforms well in advance of those adopted by even the most progressive states.⁴

Independence of the judiciary from the other two branches and from political and economic pressures is substantially achieved under the Constitution and the Judiciary Act. Together they provide for the appointment rather than the election of judges, for adequate tenure and salary, and for the transfer of administrative control over the court system from the executive branch to the judiciary itself. Article V also prohibits political activity on the part of judges: they cannot contribute to campaign funds or party coffers, participate in campaigns, hold party office, or run for public office without having resigned from the bench six months prior to nomination.

Under the Organic Act the administration of justice left much to be desired. Crowded dockets made for long delays in the adjudication of cases. Jurisdictional pitfalls and procedural snares beset the path of litigants. All too many cases were decided, if at all, on technicalities rather than on their merits.

⁴ See Charles E. Clark and William D. Rogers, "The New Judiciary Act of Puerto Rico: a Definitive Court Reorganization," *Yale Law Journal*, Vol. 67, No. 7 (Nov. 1952), pp. 1147-71.

The Constitutional Convention met the problem by unifying the court system for purposes of jurisdiction, operation, and administration. Most of the details of this general reform were left to legislative determination and have since been supplied by the Judiciary Act. The result is a modern and efficient judicial structure that may well serve as a model for the states.

The most original feature of this reform is unification of the courts for purposes of jurisdiction. It means that questions can no longer arise concerning the jurisdiction of the court in which a case is filed. All courts have the power to hear any case (though a change in venue may be in order), since all of them are parts of a single unified court.

Unification for purposes of operation means that the whole court system functions under the supervision and control of the Supreme Court. Article V grants to the Court the important power of adopting rules of evidence and of civil and criminal procedure for all the courts. The Judiciary Act authorizes the Chief Justice to assign judges from one bench to another when necessary to keep dockets clear, equalize case loads, and minimize delays costly to litigants. Although every judge, as in the past, will primarily serve his own community, he can be used elsewhere as needed.

Article V provides for unification for purposes of administration by authorizing the Supreme Court to adopt rules for court administration, by designating the Chief Justice as the administrative head of the court system, and by requiring him to appoint an Administrative Director. The functions of the latter are defined in the Judiciary Act, which makes him head of the Office of Court Administration. His duties include the collection of statistical data

on the state of dockets and the work of the courts so that the Chief Justice can assign or transfer judges as needed and otherwise co-ordinate the administration of justice.

THE AMENDMENT PROCESS

Article VII vests the right to amend the Constitution exclusively in the people of Puerto Rico and their representatives. This provision is the heart of Commonwealth status. It makes manifest the irrevocable relinquishment by Congress of power over the purely internal affairs of Puerto Rico.

Had Congress approved the Constitution on the condition that amendments to it be subject to congressional ratification before becoming effective, a proposal supported by certain Senators but finally rejected by both houses,⁵ the compact embodied in Public Law 600 and accepted by the people of Puerto Rico would have been nullified. Such action on the part of Congress would have constituted a unilateral and retroactive modification of the terms of the compact, and it would have reduced the people of Puerto Rico to the role of a drafting agency for Congress.

This is not to say, however, that Article VII permits the Puerto Rican electorate to amend the Constitution in any manner whatever, without restriction. Section 3 prohibits repeal of the bill of rights and alteration of the republican form of government. It also requires all amendments to be consistent with the provisions of the congressional joint resolution approving the constitution, with the applicable provisions of the Constitution of the United States, with the Puerto Rican Federal Relations Act,

⁵ See *Congressional Record*, Vol. 98, No. 92 (May 28, 1952), p. 6187; No. 110 (June 23, 1952), pp. 7981-83; No. 115 (June 28, 1952), pp. 8525-26; No. 116 (June 30, 1952), p. 8669; No. 117 (July 1, 1952), pp. 8905-6.

and with Public Law 600. These requirements safeguard the terms of the compact between Congress and the people of Puerto Rico upon which the Constitution itself is based.

PUERTO RICAN STATUS RESULT OF INVENTIVE STATESMANSHIP

The development of commonwealth status was foreshadowed as long ago as 1914 by Felix Frankfurter. "One of the great demands upon inventive statesmanship," he wrote, "is to help evolve new kinds of relationship so as to combine the advantages of local self-government with those of a confederated union. Luckily, our Constitution has

left this field of invention open."⁶ Public Law 600, the compact embodied in it, and the Constitution of the Commonwealth resulting from it together provide the new kind of relationship that Frankfurter saw the need of nearly forty years ago. Thanks to inventive statesmanship both in Puerto Rico and in Congress, a combination of the advantages of self-government with those of a confederated union has at last been achieved.

⁶ Quoted in *Hearings before the Committee on Public Lands, House of Representatives, 81st Congress, on H. R. 7674 and S. 3336* (Washington: Government Printing Office, 1950), Serial No. 35, p. 54.

Victor Gutiérrez-Franqui, Santurce, Puerto Rico, is a Senator at Large in the Senate of the Commonwealth of Puerto Rico. He has served as Second Vice-President of the Puerto Rican Constitutional Convention, as Attorney General of Puerto Rico, and in many other government posts.

Henry Wells, Ph.D., New Haven, Connecticut, is assistant professor of political science at Yale University. In 1951-52 he was visiting professor and research associate, School of Public Administration, College of Social Sciences, University of Puerto Rico, in which capacity he served on a research group that assisted the Puerto Rican Constitutional Convention. He is author of articles on Puerto Rico and the Philippines.

The World Significance of the New Constitution

By CARL J. FRIEDRICH

THE significance of constitution-making in our time is not so self-evident as Americans are prone to assume. Even in the heyday of constitutionalism, critical voices maintained the conservative view so persuasively set forth by Burke that sound constitutions cannot be made, but must grow. If Savigny doubted the calling of his time, a hundred years ago, for legislation, men of his general outlook might well be perplexed by the earnestness and determination with which men have set about in recent years to make constitutions. France, Italy, a dozen German states, the German Federal Republic, and India, not to mention the so-called people's republics of the Soviet orbit, have given themselves constitutions, and the six nations of the European Coal and Steel Community (Schuman plan) are now at work in the same pursuit.

Yet the spirit of all this activity is neither optimistic nor enthusiastic. Surely the temper of the men now setting about the European constitution is, in the words of *The (London) Observer*, "cool and set." Although many of these efforts are revolutionary in their implications, the outlook of contemporary constitution-makers is devoid of revolutionary élan; they are much more sure of what they wish to avoid than of what they expect to achieve; negations predominate in their thought about these constitutions.¹

AIMS OF CONSTITUTION-MAKING

If one inquires into the motivation of a number of these resolute constitution-

makers, he discovers that they are desperately determined to find some modus vivendi that will give them a workable government and protect them, internally and externally, against totalitarian conquest and subjugation. The classic constitutionalism which the United States Constitution ushered in was a decidedly hopeful effort to transcend traditional authoritarian forms. Its revolutionary pathfinders were animated by a profound faith in the rational potentialities of man. But there were several sharp differences between the United States Constitution and those made in France in that period. Among these, one has received less attention than it perhaps deserved. The United States Constitution sprang from an effort to organize an effective government where there had been none before, whereas the French constitutions sought to organize a constitutional, republican government to take the place of the antecedent autocracy. As events proved, the latter is a much more difficult task and one which is not likely to succeed at the outset.

This contrast between constitutions organizing a first government and constitutions replacing an overthrown government has continued since that time. Wherever a people living in colonial dependency has thrown off the yoke or emerged by stages from its dependent position, a constitution has been made and that constitution has usually lasted: Canada and Australia are outstanding examples. When people have tried to constitute themselves as a republic after overthrowing the established authorities, failure has often been their fate: Germany and China may be cited here.

Since the Second World War, a new

type of constitutional effort has made its appearance: the collapse of the counterrevolutionary totalitarian autocracies has generated an intense will to establish constitutional systems that will be able to deal with the totalitarian threat by making a government at once strong and incapable of abusing its powers. Here the German case has, of course, been particularly instructive; for the Weimar Constitution proved weak, and yet it enabled Hitler to abuse his powers with great facility.

Within this general context of post-war constitution-making, the Constitution of Puerto Rico appears as a clear case of the kind of self-liberating instrument by which a people who has lived in colonial dependency achieves genuine self-government. This augurs well for the permanence of the new charter. It puts it into the family of which the United States Constitution is the most ancient and most illustrious member.

POLITICAL STATUS OF PUERTO RICO

However, the Constitution of Puerto Rico should not be misinterpreted in this connection. Everyone in Puerto Rico is, of course, vividly aware, and most Puerto Rican citizens are keenly in favor, of the island's status as an integral part of the United States. The constitution itself leaves no doubt on this score, but emphasizes this status. Not only the United States constitution, but the applicable laws of the United States are by the Puerto Rican Constitution made the law of the island. That the Spanish version speaks of Puerto Rico as a free and associated state further emphasizes this close relation.

Thus, the Dominion analogy which crops up in various discussions about the status of Puerto Rico is very misleading. Typically, a Dominion is not under the constitution or the laws of the United Kingdom at all. No Do-

minion representative participates in the work of the House of Commons. No Dominion citizen serves in the armed forces of the United Kingdom; and so forth. Puerto Rico has come closer to the continental United States, because an associate is tied by adult sentiments of loyalty, solidarity, and common purpose which are often lacking in the relation of a dependent.

To be sure, the Puerto Rican has been a citizen of the United States since the Organic Act was adopted in 1917. But only the adoption of the Constitution of Puerto Rico has made of him a citizen roughly comparable in status to the citizens in the states of the Union. Sometimes it is stressed in opposition writings that he lacks the right to vote for the President or a member of Congress. This is true only as long as he remains on the island, and it is equally true of any other American citizen who goes to the island to live. On the other hand, any Puerto Rican who moves to the continental United States does participate in these elections. It is an anomalous situation, to be sure, but it does not alter the fundamental fact that Puerto Rico has achieved democratic self-government and a free and co-ordinate position within the American commonwealth.

Unique features

But let us not minimize the extraordinary features of the new status. Not only is it an unprecedented development within the ancient constitutional structure of the United States—something the men of Philadelphia certainly did not envisage—but it is also a novelty within the history of western constitutionalism in its entirety. Never before has a distinct community achieved constitutional self-government in just this form. Algeria is perhaps the closest approximation, but its sphere of autonomy is much more limited, while its

¹ See my "The Political Theory of the New Democratic Constitutions" in *Constitutions and Constitutional Trends since World War II*, edited by Arnold J. Zurcher, 1951.

participation in the government of metropolitan France is decidedly greater.

The status of Puerto Rico creates a new dimension of the federal principle, in that it places the old principle of "unity with diversity" on a new basis. It thus conceivably provides a striking model for future developments in the sphere of the liberation of colonial peoples who do not wish or may not be able to organize themselves as independent political communities. Substantial portions of Africa may thus become associated in the future with the European federation that is in the making. Significantly, the proposals for its constitution envisage the possibility that such dependent territories may in the future apply for membership in the federation.

SEPARATION OF POWERS

To a fair number of political scientists it may come as a surprise that the Puerto Rican constitution-makers opted for the American system of separation of powers rather than the parliamentary system, so-called, in which the executive branch depends upon the confidence of the parliament for its continuation in office. As a matter of fact, there never was any serious discussion of this alternative in the Constitutional Convention. It must be remembered that the Puerto Ricans had become accustomed to the United States pattern during the half-century of their political development under United States tutelage. When in 1948 the office of the Governor was made elective, and the leader of the dominant party, Señor Muñoz Marín, was chosen by the people in a free election, the idea of this type of executive leadership had already become so firmly established that a return to a system under which the Governor might have been at the beck and call of the legislature seemed inconceivable.

At the same time, a legislative body

composed of two houses had become quite generally accepted, even though there were no particularly deep-rooted divisions of the island that called for separate representation. Just as in many American states so also in Puerto Rico the idea of two houses had become associated with the thought of a separation of powers that would avoid the concentration of too much power in the hands of any one man or group of men.

Many a writer, enamored of the alleged responsibility of the British system of cabinet government, has argued that a single house controlling the executive would necessarily give more effective government, as well as sounder legislation. Now there can be no question that the government of Great Britain has been among the most effective in the modern world. On the other hand, it is striking that it has worked well only where Britishers have constituted the prevalent element in the population: the United Kingdom, Canada, New Zealand, Australia. What is more, with the coming of labor into power, some serious difficulties have made their appearance. Still, it works well in these countries. But the people of Puerto Rico were well advised to avoid this experiment, which has given unsatisfactory results wherever Latin peoples have attempted it.²

FAVORABLE FACTORS

The question remains, of course, whether the constitutional democracy of the United States type *will* work. In a number of Latin American countries, constitutions of the United States type have led to dictatorships, as most Europeans will assert is inevitable. The concentration of authority in the hands

² On this whole subject, see the author's *Constitutional Government and Democracy* (new and completely revised edition, 1951), especially Chapter XVIII, "Chief Executives and Cabinet Systems."

of a single man resulting from his election by a popular majority could easily be thus abused, but such abuse appears a remote contingency in the case of Puerto Rico.

For one thing, the people of Puerto Rico seem deeply attached to the democratic heritage. Furthermore, their new constitution contains strong judicial safeguards which are usually lacking in Latin America, and these are reinforced by a good deal of common-law thinking that has found its way into Puerto Rican judicial decisions. Also, the authority of the United States Supreme Court extends to the island and could be called upon to check any serious abuse of powers. Finally, the military power which has so often played a decisive role in the revolutionary coups d'état of Latin America remains firmly and completely in the hands of the federal authorities (as in all states of the Union), and can therefore not only not be employed for the overthrow of the constitutional authorities, but is available for their continuing and effective support.

All these considerations do, of course, *ceteris paribus*, apply to the chances of survival of any other constitutional pattern that the Puerto Ricans might have adopted. Still, with a strong party commanding a very substantial majority, the gubernatorial system ought to work well, as it will not be afflicted by the dangers of a deadlock that at times have made it appear in an unfortunate light in some of the states.

NEED FOR OPPOSITION

At the same time, one must hope that a more vigorous opposition will come into existence in the near future. The present situation, wherein the majority party is so strong numerically that it has to have recourse to various artifices in order to secure any kind of opposi-

tion at all, surely is not healthy.³ The situation suggests that a large part of the electorate is not as mature politically as a functioning two-party system requires it to be. It is well known that the present situation causes considerable concern to some of the wiser leaders, like the Governor himself.

The new constitution provides some rather sharp limitations on the Governor's power; in relation to emergencies, it is perhaps too much hedged about by limitations. One may ask whether it is sufficient that he can call out the militia in order to prevent or suppress a rebellion, invasion, or *any serious disturbance of the public peace*. These phrases have an antiquated ring. Some of the most serious problems of an emergency nature present themselves to modern communities in quite different garb from disturbances to the public peace. Be that as it may, when taken together with the absence of any really effective opposition, some rather troublesome situations may arise.

It would seem that a governor's council would have been more satisfactory than a senate in this connection. It would have made it possible to grant the Governor broader emergency powers, when acting together with his council, while at the same time clarifying the electoral picture so as to enable a relatively inexperienced electorate to crystallize an effective opposition.

INNOVATIONS

It would be interesting to analyze the many significant innovations which the Puerto Rican Constitution contains. Certainly, from a strictly constitutional viewpoint, it must be placed in the front rank of American state constitutions. Its provisions for the judiciary, for example, while not so perfect as was at

³ See Constitution of the Commonwealth of Puerto Rico, Article III, Section 7.

one time hoped, are in line with most advanced thought in the United States.⁴ Similarly, the establishment of an independent commission of three, headed by the Chief Justice, to deal with reapportionment is a distinct advance and ought to help to avoid the usual politicking in this field. Against these forward-looking provisions must be set certain omissions, such as the failure to provide for the merit system in the civil service, and the perhaps even more serious failure to provide adequate autonomy for local self-government.

BILL OF RIGHTS

The fact that the United Nations Declaration of Human Rights had been approved by the Congress of the United States caused some leaders in Puerto Rico to include substantial portions of this declaration in their drafts of the constitution. It was felt that the Congress could not in fairness reject what it had once accepted. Eventually the convention adopted a somewhat altered version of these rights, which takes account of the island's limited resources. The formulation chosen speaks of the progressive development of the Puerto Rican economy, but enjoins the people and the government to do everything in their power to realize these rights.

In spite of the fact that every one of these provisions is found in either constitutional or unchallenged ordinary legislation somewhere in the United States, these progressive provisions caused sharp criticism in Congress, with some critics going so far as to claim that this section "departs completely

⁴ In this connection, mention might be made of a very interesting comparison prepared by Gutiérrez-Franqui and Henry Wells showing the parallel paragraph by paragraph between the Puerto Rican Constitution and other American state constitutions. See also for further detail the article by the same authors in this volume.

from the whole philosophy of the Bill of Rights of our own Constitution." The claim is unsound on the face of it, especially in regard to education and social security. That the eighteenth-century framers of the Constitution did not include them has not prevented the United States from wholeheartedly developing them since.

But since the Congress insisted, the Puerto Rican convention was reassembled and struck these provisions from the constitution (as well as two others of minor importance). It was felt, however, that this congressional demand was so definite a challenge to the self-governing authority of the people of Puerto Rico that it was decided to re-submit this section to the people for formal amendment of the draft they had approved earlier.

It is generally expected that the amendment will be approved. But the very fact that such a referendum will have to be held will dramatize the unwisdom of Congress in making such a stipulation. Surely, the democratic rationale of the entire undertaking argued firmly for accepting the draft unless the objections were justified by clear and incontrovertible unconstitutionality. It is unfortunate that by this action, the generosity, the imagination, and the good faith of the Congress in enabling the Puerto Ricans to make their own constitution and thereby achieve the novel status of an associate state should have been put in jeopardy. Is it not also regrettable that by this action of Congress the United States should have been prevented from being the first country to embody substantial portions of the International Declaration of Human Rights in positive law?

The vision of Puerto Rico was entitled to greater sympathy than it received, surely. But even so, the new constitution is testimony to the remarkable flexibility of the American consti-

tutional system. It also is testimony to the fact that democracy can find ways of liberating colonial peoples by a gradual process of democratizing them. Here lies the world significance of the new constitution.

Carl J. Friedrich, Ph.D., LL.D., U.J.D. (hon.), Cambridge, Massachusetts, is professor of government at Harvard University. He has served as constitutional and governmental adviser to the American Military Governor in Germany; as consultant on the constitutional preparatory work for Puerto Rico; and recently as consultant to the preparatory constitutional commission for a European constitution, for which he has written a series of studies on federalism. His other recent works include Inevitable Peace (1947), The New Image of the Common Man (1950), The Age of the Baroque (1952), and Constitutional Government and Democracy, now in its third edition.

Transforming the Economy

By HARVEY S. PERLOFF

IN economic matters, as in most human affairs, the "little fellow" can often manage as well as others, provided that he has some sort of "equalizer." Puerto Rico, a small, crowded island with practically no natural resources other than its hard-worked soil, today provides for its people a level of living comparable to that of the richest nonindustrialized countries—that is, those nations which, like neighboring Cuba, enjoy great natural advantages and a favorable population-resource balance. Puerto Rico's "equalizer" arises out of its economic ties to the United States, the quality of its political leadership, and the political maturity of its people as characterized by the widespread and consistent support of a rational program of economic development.

That the latter aspects have been crucial is evident from the fact that forty years after Puerto Rico was brought within the United States economic sphere, it was still a poverty stricken island with a sick and stagnant economy. It was not until the internal elements were forged into a force for progress that the tie to a rich metropolitan power could be turned to net advantage. Any estimate of future expectations and possibilities must consider these equalizing elements as well as the many disadvantages of the negligently natural endowment and the still unfavorable population-resource balance.

FOUR DECADES OF U. S. RULE

The year 1941 marked a turning point in the economic development of Puerto Rico, as in so many other aspects of Puerto Rican life. It was in that year

that the people of the island, under a new leadership, undertook the task of transforming their economy and of providing the means for achieving their aspirations for higher levels of living.

Puerto Rico had been brought within the monetary and tariff structures of the United States at the turn of the century, and this, together with the large inflow of mainland capital, served to mold the insular economy. Under the protection of the tariff, the sugar industry, which had had a secondary role during the Spanish regime, grew rapidly until it dominated the entire economy. Not only did it provide the main outlet for employment and investment, but it gave the impetus for the development of a network of servicing industries—transportation, communications, power, banking, and others.

A number of other agricultural industries, especially tobacco and tropical fruits, also experienced some growth through the stimulus of mainland capital, but these never achieved more than a minor place in the economy. Coffee, which had been the primary crop during the nineteenth century, did not enjoy the protection of the United States tariff, and after a series of hurricanes and the loss of European markets, it became a bankrupt industry. Manufacturing did not attract a large volume of either external or internal capital, and its development was limited to the processing of sugar and the production of a small number of items chiefly for the home market. Needlework achieved some importance in the 1930's and provided a meager but much needed supplementary income for thousands of families.

In spite of the fact that the limitations of the natural resource base, together with the directing force of the United States tariff, had turned the Puerto Rican economy into an essentially one-crop one-industry economy, total output and income grew at a fairly rapid rate during the first three decades of American rule. Unfortunately, the economic expansion was outpaced by the growth in population, and the gains in total income were largely absorbed by the increases in the number of consumers. Thus, in spite of the sizable economic development which took place, underemployment and poverty continued to be the lot of the average Puerto Rican during this entire period. The economic situation, which even during the most prosperous years was far from favorable, deteriorated very much with the drastic fall in production, employment, and income which accompanied the Great Depression. Throughout the 1930's, most of the people of Puerto Rico experienced great distress.

AT THE TURNING POINT

By the end of 1940, when the newly formed Popular Democratic party was making its first bid for office, and at a time when most other areas had already achieved substantial recovery from the depth of the depression, the insular economy was still in a seriously depressed state and, more significantly, revealed dangerous imbalance and structural difficulties.

The sugar industry, the backbone of the economy, had stopped growing. Whatever inherent potentials for expansion it might have retained—and at best these were limited because most of the best land in the island was already in sugar cultivation—an actual lid on its growth had been imposed by the sugar quota system. Other agricultural industries were also past the peak of

their growth for a variety of reasons; the tobacco industry was suffering from the long-term shift to cigarette smoking and was in a disorganized state; fruits had lost out to mainland and offshore competition.

The important sectors of agriculture were subject to land monopoly and absentee ownership. According to the 1940 census, about one-half of 1 per cent of the farms contained one-third of the total arable farm land, and this was the best land in the lowlands. There was little effort at diversification, and when sugar production was limited, much of the land simply lay idle. The small farmer, characteristically owning or renting two or three acres on the side of a hill, found it difficult to make ends meet or to feed his own family. Most of those in agriculture were landless farm laborers dependent on a few months of low-paid work.

With the end of the period of growth of the major agricultural industries, employment in agriculture had leveled off, so that no more persons were employed in farming in 1940 than had been so employed in 1920.

Few new employment opportunities outside of agriculture were being created. The sizable flow of mainland capital during the earlier period had been sufficient for a spillover into a rather wide variety of local economic activities, but outside investment practically ceased with the advent of the depression. Internal savings were very limited, and whatever local capital there was shied away from any but the traditional investment outlets, in agriculture, real estate, and commerce. With a few exceptions as in the case of sugar and rum, the local manufacturing industries that were already in existence were generally small, poorly organized, and characterized by very low labor productivity. They rarely could develop markets outside the island, and often had difficulty

competing with goods from the mainland.

The labor force had increased by over 40 per cent between 1920 and 1940, yet no important new processing industries had been developed to help fill the large employment gap. The only significant expansion in manufacturing took place in sugar milling and in home needlework. Manufacturing employment, outside of these two categories, was at the same level in 1940 as it had been twenty years earlier, while total employment in manufactures reported by the census of 1940 was hardly greater than it was at the time of the 1930 census.

As a result of the divergent population and employment trends, some 18 per cent of the labor force was unemployed in 1940, while a large share of those who did find employment were working only a few months of the year or were engaged in peripheral service and trade jobs. Wages were pitifully small. Sugar workers, who averaged fifteen cents an hour, were the highest-paid in agriculture. Home needleworkers rarely received more than four or five cents an hour. In the face of the special difficulties arising out of the economic conditions and the severe unemployment, labor was poorly organized and its bargaining position was relatively weak. As a result of all these factors, poverty and distress were widespread. As late as December 31, 1940, some 40 per cent of the island's families were certified as "needy" by the Work Projects Administration.

Federal contributions in the form of relief expenditures and loans during the depression years were substantial, amounting to about \$230,000,000 between 1933 and 1941. Yet, in spite of the efforts of some of the federal agencies to develop new sources of income, the federal contributions were essentially relief handouts and did little

to strengthen the foundations of the economy.

The most striking characteristic of the total situation was a prevailing sense of hopelessness. Aside from the (sometimes) heroic efforts of the federally sponsored Puerto Rico Reconstruction Administration, very little was being done to create conditions conducive to economic development. Puerto Rican politics traditionally revolved about the political status of the island, and political parties formed and reformed about this issue without developing or carrying out any programs aimed at providing a foundation for economic expansion. The utility structure was inadequate and poorly organized; illiteracy was fairly high and very few workers had any technical training; sanitation and medical services were sufficient to keep the death rate surprisingly low (considering the economic conditions), but not sufficient to prevent the prevalence of debilitating diseases; credit for risk-taking new investment was practically nonexistent; government administration in general was not such as to generate confidence.

REFORM AND DEVELOPMENT

Upon taking office, the Popular Democratic party, which had abandoned political tradition to run on a platform of economic and social reform, undertook a series of programs and activities which over time was greatly to modify many of the basic aspects of Puerto Rican life. The various programs, as they have evolved over the past twelve years, have contained three main features.

The first of these is what might broadly be termed "social reform," and is concerned essentially with distributive justice. The Organic Act of 1917 provided that no corporation might acquire more than five hundred acres of land. This was not seriously enforced;

but under the Land Act of 1941, a substantial part of the land held in violation of that provision has been acquired and used to establish proportional benefit farms (with profits divided among the workers), small owner-operated family farms, and subsistence plots or lots for homes for *agregados* (landless farm workers). Other measures have been aimed at preventing abuses and bringing about a more equal distribution of income. These have included measures to protect workers and to strengthen the position of labor unions (the establishment of a minimum wage board and an insular labor relations board was motivated in large part by these objectives), to provide public assistance and the beginnings of a social security system, to regulate basic industries, and to develop a more progressive tax structure.

A second feature has been the improvement of the public services and facilities, both to lay the foundations for economic expansion and to encourage social progress. Thus, electric power facilities have been greatly expanded and an island-wide grid developed; transportation, communications, water supply, and sewerage have been made the concern of separate governmental "authorities," and the facilities have been continually improved and expanded; a substantial share of the public budget has been devoted to the expansion and improvement of education and health services; and a large-scale slum clearance and public housing program has changed the living conditions of many families.

A third and central aspect of the overall insular program has been the direct promotion of economic development, the attempt to enlarge sources of income and employment through the creation of new industries and economic activities, improvement and expansion of the

resource base, and an increase in investment and productivity. In the face of the reluctance of private enterprise to take risks in untried fields, the insular government in 1942 created an Industrial Development Company for the purpose of opening up new manufacturing opportunities and pointing the way for private enterprise. At the same time, it established a Development Bank to fill the need for a source of long-term investment credit.

The earlier phase of promoting industrial development through the activities of government-built and -operated plants gave way after World War II to another approach, which centered on the attempt to attract mainland industries and capital to the island through tax exemption, industrial services, the provision of factory buildings, loans, and special assistance in various forms. As a result of this effort, something in the vicinity of two hundred manufacturing plants have been established in Puerto Rico, with a heavy concentration in the textile and apparel fields and in assembly. An attempt to improve the situation of local industries has been made through promotional programs (especially for rum and beer), industrial research, and the provision of special services, including labor training.

The insular government has also sought to promote agricultural development through a wide variety of activities, including land reclamation, agricultural research and extension, marketing services, distribution of free improved seeds, conservation and crop insurance programs, a "tobacco adjustment program," tick eradication, land use studies, and an attempt to develop new crops and new agricultural processing industries. However, progress in increasing and diversifying agricultural production has been painfully slow.

A significant aspect of the far-reach-

ing developmental effort has been the institutionalization of co-ordinating and directing devices in the form of a Planning Board and a Budget Bureau. These staff agencies, through their central role in the design of governmental programs and in the guidance of public expenditures, together with strong executive leadership and a high degree of party discipline, have served to tie the widespread activities of the insular government into what can justifiably be characterized as a program of planned development. Certainly, measures and expenditures which have been made for purely political purposes have played no unimportant role. Yet it is the extent to which the essentially rational and planned features have predominated in public activities, especially in comparison to most other underdeveloped areas, that has given the special flavor to the Puerto Rican program of economic development.

The Puerto Rican economy has made great gains over the past twelve years. It has become substantially more productive. Output per man-hour has been increasing at an average rate of 4 per cent per year. Twice as much is being produced in goods and services as was produced a decade ago. Total income, in current prices, is more than three and a half times as large as it was in 1940. In real terms—that is, using constant (1939–40) prices as a measure—income per capita has almost doubled over the past twelve years. The material level of living of the average Puerto Rican is higher today than it has ever been in the past.

EVALUATION

It is evident that Puerto Rico's economic future is closely tied to trends and developments on the mainland. The most important elements in the island's prosperity at the present time and in the foreseeable future—the ex-

port value of sugar, textile, and needlework products, the volume of mainland capital invested in the island, and the flow of Puerto Rican migration to the continent—are dependent on business conditions in the United States. The very high level of economic activity in the United States since the end of World War II has clearly been a crucial element in the recent development of Puerto Rico. The strong continental market for the major Puerto Rican products has been the main factor in sustaining the relatively high postwar farm income; the attractiveness of the island location to continental businessmen has been correlated with the tightness of the mainland labor market and the rise in United States taxes; and the level of out-migration has closely followed the increase in employment opportunities on the continent. The volume of migration since the end of World War II has been sufficient to absorb most of the net annual increase in the labor force, so that the new job opportunities created on the island could serve to reduce the amount of unemployment. The number of workers leaving Puerto Rico within the past two years has been so large, in fact, that not only has the pressure on jobs been greatly relieved but significant increases in productivity have been registered largely due to the reduction of "hidden unemployment."

While it is true that the level of prosperity enjoyed by Puerto Ricans is in largest part outside their control, it should be noted that this is also true in greater or less degree of most other countries in the world today. Moreover, within the general economic conditions created by the external forces—what the economists refer to as the exogenous factors—the people of Puerto Rico can enjoy less or more family income, less or more economic security, less or greater scope for personal de-

velopment, depending on the effectiveness of their efforts to raise the productivity and income levels of their economy.

Certainly, the accomplishments to date have been substantial. An outstanding job has been done in building up the service and utility foundations for economic development and social progress, in transportation, electric power, water, education, health, research facilities, and so forth. An overall atmosphere conducive to economic development has been created: there is confidence in the stability of government, the honesty of administration, the sustained governmental interest in the success of private enterprise; also, there is a well-established tradition of orderly labor relations and a growing interest in economic development on the part of all sectors of Puerto Rican society. Substantial amounts of mainland capital have been attracted to Puerto Rico and many new job opportunities have been created by the effectively executed industrial development program. Most of all, there is hope in the island of Puerto Rico. There is a spirit of building and pioneering and there is justifiable pride in accomplishments to date.

UNFINISHED TASKS

Inevitably, in the face of the poverty of natural resources and the tenacity of traditional ways of living and working, many economic problems elude rapid solution. Also, when so much has to be done on so many fronts to initiate and sustain progress under difficult circumstances, it may be expected that certain measures and programs will not be altogether successful and some of the less pleasant tasks will remain undone. Among the more elusive problems and unsolved tasks, the following would seem to be the most important:

1. The problem of population growth

has not yet been tackled directly. The high rate of out-migration is giving the island a breathing spell in terms of the pressure on jobs, but it seems evident that it is difficult to make a rapid transition to a progressive economy and society when birth control is class oriented and when many parents have no choice as to the number of children they have to raise. It has been pointed out by some of those who have studied the problem that a policy of dependence on migration has three serious limitations: its continuance is uncertain, it may have unfavorable social and political repercussions in the United States, and it is likely, if present levels continue, to affect adversely the productive capacity of the island.

2. Institutions and techniques for generating internal savings are not as yet adequately developed, but the ability to tap the savings of the mainland keeps this from being as great a source of weakness as it might otherwise be. Local private entrepreneurship has not developed on anything like an adequate scale. Reliance on mainland business initiative is logical in the face of the lack of production know-how in Puerto Rico and the difficulty of opening up, from the island, market outlets in the States; but there are many disadvantages in making this a total reliance. For one thing, production for the home market is likely to remain underdeveloped. For another, the pace of economic development would tend to depend more on the specific conditions existing on the mainland (say, the tightness of the labor market) than on the general developmental opportunities in the island. Also, a continental businessman is likely to require more of a cost differential to make the island location attractive than would a local businessman. For these and other reasons, the speed with which native entrepreneurship can be developed will be a determining factor in the

long-range success of the economic development program.

3. Inadequate attention has been paid to the growth potential of industries. The government has encouraged and subsidized industry more or less on a catch-as-catch-can basis. This is understandable considering the urgent need for additional job opportunities, but the result is that the island has been attracting chiefly the stabilized or declining industries, which must now rely on cheap labor to survive. It has not been able to attract the growing industries and has not yet developed a policy to do that.

4. The effort to increase and diversify agricultural production has had only limited success. Here the strong force of tradition has to be reckoned with, and it may well be that there has been a certain impatience with the types of measures called for by the situation. When compared with the results obtainable in industry, where vested interests are relatively few and there is no drag of tradition, the inputs of time and money required to obtain even small improvements in agriculture seem disproportionately large. And yet improvements in farming are basic to economic development, especially since agriculture is still the mainstay of the Puerto Rican economy and since it pro-

vides practically the only local raw materials for processing.

5. The distribution sector of the economy remains extremely inefficient and greatly increases the problem of raising levels of living in the island. Possibly this has been the most neglected sector of the economy. The lack of success of an early and poorly conceived program aimed at promoting distributive efficiency and at lowering prices of foodstuffs to consumers through the establishment of a small number of government-sponsored retail grocery stores seems to have discouraged further attempts in this direction. Yet it is evident that the system of distribution is in very great need of improvement.

As suggested above, it is inevitable that certain obstacles to economic development should be especially resistant and that certain tasks should remain undone. The really significant thing, however, is that the spirit prevailing in Puerto Rico today is such that most of the problems tend to be accepted as a challenge and the subject of continued effort even after a series of setbacks. Under such circumstances, one cannot but view the Puerto Rican situation in an optimistic light despite the very great difficulties which the people of Puerto Rico continue to face.

He has served as economist with the Board of Governors of the Federal Reserve System, as consultant to the President's Water Resources Policy Commission, and as director of the Economic Division of the Puerto Rico Planning Board. He is co-author of Regional Resource Development (1942) and State and Local Finance in the National Economy (1944), and author of Puerto Rico's Economic Future (1950) and articles on the problems of underdeveloped areas.

Puerto Rican Lessons in Economic Development

By J. K. GALBRAITH and CAROLYN SHAW SOLO

THE general revival of interest in economic development and change makes it certain that the experience of Puerto Rico will be searched closely for clues to the broad problem of development. To the extent that current Puerto Rican efforts to promote industrialization meet with success, they are likely to become a model to be recommended elsewhere. The same is true of agricultural programs, improvements in social services, reforms in market organization, and other innovations. It is very interesting that at precisely the moment when the United States proclaimed its interest in Point Four, the people of Puerto Rico constituted themselves a kind of pilot plant to demonstrate the process.

The task of this paper is to explore the extent to which Puerto Rico constitutes a satisfactorily controlled experiment. We will urge that there is, indeed, much to be learned from the experience of the people of the new Commonwealth. We will also urge that, in drawing lessons for the underdeveloped world at large, it will be well to bear in mind some very marked peculiarities in Puerto Rico's situation. These latter we commend especially to those liberal enthusiasts who, having once performed the valuable service of putting Puerto Rico on our national conscience, are now suggesting that it is a beacon light or at least a spotlight for the whole underdeveloped world.

PROBLEMS IN COMMON WITH OTHER UNDEVELOPED COUNTRIES

At first glance, or even at second, the parallels between the problems of Puerto Rico and those of undeveloped lands are

deceptively numerous. Puerto Rico has behind it a long history of poverty and, as far as autonomous forces within the island community are concerned, of stagnation. This, as in the case of India, Indonesia, and South America, is related to a history of colonialism. The island is predominantly agricultural, and it is evident that there is an association between agriculture and economic stagnation. There is no industrialized country in the world that one would describe as static; there are not many agricultural countries which, while remaining agricultural countries, appear to have a strong predisposition to change.

There is in Puerto Rico a characteristically unsatisfactory relationship of people to land. Not only must a very large number of people make a living from the given land resources, but most of them are landless laborers. This problem is common to much of the undeveloped world, and in Puerto Rico it has a certain special intransigence. In much of South America there are large estates that could be broken up, and in many countries either such estates or lands now in public ownership have a great potential for increased production. In Puerto Rico the good land is now producing at something reasonably close to both its technical and its economic optimum.

Some very recent varietal developments possibly apart, there is no large reservoir of opportunity for increasing the efficiency of sugar production; there is no tenure pattern and no alternative land use which would return to those who work the land as much real income as cane cultivation by the present plantation system. The sugar industry in

Puerto Rico has not been unprogressive; on the contrary, it has maintained its position vis-à-vis its competitors in the United States market by a reasonably high rate of technical adaptation. While there are unexplored possibilities in Puerto Rican agriculture, the sugar economy is in no sense undeveloped. Hence, unlike many of the undeveloped areas, there are no great physical opportunities which are being held in suspense by the usual admixture of capital shortage, ignorance, a repressive tenure system, and the power interests of a landed ruling class.

There are three further obstacles to economic change which Puerto Rico faces in common with many undeveloped countries. There is, first, its tropical location. Anything that suggests belief in climatic or geographical determinism is an invitation, we have discovered, to a peculiarly indignant dissent. Yet it is evident that technological cultures, as distinct from other types, have not as yet flourished in the tropics. The fact that there is no major autonomous¹ industrial development in the belt surrounding the earth between the Tropics of Cancer and Capricorn must at least be marked down as interesting.

Puerto Rico also has an accumulation of social and cultural attitudes that reflect hostility or at least disinterest toward economic change. These perhaps manifest themselves most importantly in attitudes toward entrepreneurship—attitudes which are averse to risk-taking or even to excessively hard work, and which value the comfortable and secure revenues of real property ownership above those of a factory. Such attitudes appear common among the masses of the people as well as among the landowners. Theirs, too, is an

¹ That is, not related to the provision of materials or of market outlets for industries situated elsewhere.

amiable live-and-let-live approach which accommodates itself with difficulty to the disciplines of competitive enterprise, and which, incidentally, no one should identify with a lesser commitment to civilized values.

Finally, Puerto Rico shares with other undeveloped countries a Malthusian problem of starkly classical form. This is being dealt with elsewhere in this volume, and there is no need to speak further of it here.

A final word must be added, however, about natural resources. It is by no means clear that poverty in resources is the common misfortune of undeveloped countries. There is more than a presumption that some of them are exceedingly well endowed. Moreover, the correlation between resource endowment and development is exceedingly indistinct. But it must be made clear that nothing that is now happening in Puerto Rico, or that is likely to happen, can be explained by the richness of its natural resource base. There must be few parts of the world which Nature has endowed more sparingly. Fewer than two thousand workers are needed in all of the island's mines, and these contain clay and gravel rather than more valuable minerals. There is no coal, no oil, and no great potential of undeveloped water power.

ITS POLITICAL STABILITY UNIQUE AMONG UNDEVELOPED COUNTRIES

Having in mind these similarities—or special disadvantages—of the Puerto Rican case as compared with the other undeveloped lands, it is now possible to turn to the differences. By far the most important of these concerns the political context of Puerto Rico's development. It is doubtful if any country has launched itself on a durable program of economic development except under the aegis of a stable government. The problem of stability is a peculiarly difficult

one, for change must involve a series of attacks on vested positions which are invariably associated with the exercise of political power. Time and again, in Latin American countries especially, progressive governments have been overthrown because the change they sought was distasteful to those who possessed economic and ultimate political power.

In Puerto Rico this danger that the government might be overthrown has not existed. The Muñoz Marín administration, in the process of coming to power in 1940, did a singularly effective job both of defining the issues facing the Puerto Rican people and in developing a popular understanding and identification of the people with solutions and goals. This was a political achievement of the highest order. It must frankly be doubted, however, if even this inspired work would have ensured survival in other Latin American communities. The new government took from older vested groups the valued right of a monopoly of political power. In addition, its social welfare, land, housing, health, education, and even industrialization programs were, in varying measure, a threat to comfortably entrenched positions and prerogatives. There is an excellent likelihood that in another South American country, either the Muñoz Marín government would have spent a very large amount of energy keeping the army on its side, or control of the army would have passed to its enemies and the government would have been ousted.

This could not happen in Puerto Rico, because the island was within an extended framework of the United States constitutional process. This process allows elections to be bought—and the elimination of vote buying was fundamental in the appearance of the new administration, and one of its signal achievements. But the United States constitutional process also requires rea-

sonably honest counting of votes, and it requires that the results of the election be respected for four years. Thus, where other popular leaders might have to worry about reactionary seizure of the instruments of power, the Puerto Rican administration had no such worries. (Its nearest equivalent concern was the hearing that its enemies might get in Washington.) The sizable armed forces in Puerto Rico, as far as they were a factor at all, provided some kind of passive assurance of law and order and constitutional action.

OTHER ADVANTAGES—ECONOMIC AND SOCIAL

While the political context is the most important feature of the Puerto Rican case and one which, in combining growing autonomy with security for popular government, reflects a good deal of incidental credit on United States policy, there are other features of the Puerto Rican case which are also different. It need hardly be emphasized that the Commonwealth has been the beneficiary of a technical assistance program of considerable cost and exceptional duration. This has been implicit in the work of federal agencies on the island—the Department of Agriculture, the Puerto Rican Reconstruction Administration, and others—and more informally in the constant exchange of personnel between island and mainland.

One important result was that when the new administration came to power, it had a cadre of trained and expert administrators on which to draw. The University of Puerto Rico, the agricultural services, and the existing government departments were all in a position to contribute to the group of young, able, and vigorous administrators who have been so important in the work of the last ten years. The advantages of such a nucleus of trained administrators have been made evident by its presence

in other countries—most notably perhaps in India—and by its absence in many others.

Puerto Rico also has the advantage, important although not entirely unique, of a culturally homogeneous population in which racial and other tensions are at a minimum. Well-deserved attention has been given to the unpleasant legacies of Spanish colonialism, but, as compared with the situation in Anglo-Saxon areas, a taut color line is not one of them. Finally, there are the economic differences in the case of Puerto Rico which derive from its special relationship to the United States. These are well recognized.

PUERTO RICO IN THE U. S. ECONOMY

Puerto Rico is, of course, within the tariff, monetary, and—in a somewhat special form—fiscal systems of the United States. The first means that, as compared with all other areas seeking industrialization, Puerto Rico is in a unique position in its relation to the United States market. Its access to the mainland sugar market in the past has contributed an important measure of stability to the sugar industry, as compared with that in countries that have had to rely on the open market or resort to the dubious protection of international commodity arrangements.

While free access to the United States market is critical for the Commonwealth's hopes for industrialization, it should not be supposed that the advantage for industrial products will take the same form as for agricultural products, or even that it will be as nearly unqualified. For one thing, access to the mainland market means reciprocal competition from the mainland. Any judicious fostering of infant industries with the aid of a tariff is excluded, although an approximate equivalent of this policy—tax advantages—is feasible

and is being used. Moreover, the fact that Puerto Rico is part of the commercial system of the United States means that its lower wages, as a competitive weapon, are a transitory (although not for that reason an unimportant) advantage. Mainland tastes and standards, unions, and minimum wage legislation all operate against any permanently large wage differential in favor of Puerto Rico.

Puerto Rico's position within the monetary and fiscal system of the United States also gives it a position that is clearly unique. Both the extent of federal subventions to Puerto Rico and the role of federal payments—most notably for defense purposes—in the balance of payments of the island open up a large and somewhat disputable subject. There is some evidence from recent investigations at the Social Science Research Center at the University of Puerto Rico that the balance has been less heavily in the island's favor than has frequently been supposed. Thus, about 7 per cent of the total net income of Puerto Rico originates in federal government expenditures, as compared with 12.5 per cent of the United States national income. The application of federal grants-in-aid to the Commonwealth government is commonly limited, and these funds, on a per capita basis, are only a fraction of the grants to the forty-eight states.

In principle, there can be no shortage of capital for Puerto Rican development; theoretically there is a free flow of capital between the mainland and the island. The presence in the Commonwealth of branches of two large New York banks as well as of the Royal Bank of Canada emphasizes the point. In fact, however, there are impediments to capital flow to Puerto Rico. Interest rates for commercial paper are higher in Puerto Rico than on the continent in circumstances where there is no evi-

dent difference either in administrative costs or in risk premium. Apart from these institutional frictions or rigidities, which would repay careful study, there is the more important barrier of knowledge. Most capital moves into Puerto Rico in combination with specific entrepreneurship. It seems unlikely that much arrives "on its own" in response to high marginal efficiencies that are being exploited by local initiative. Nonetheless, the position of Puerto Rico in relation to capital supply is not only fa-

vorable in comparison with other undeveloped communities, but, again, is unique.

APPLYING LESSONS FROM PUERTO RICO

If the efforts now being put forward by Puerto Rico succeed, as everyone must hope they will, they will be worth watching for their lessons. But they are lessons which, in their application to other countries, will have to be applied with discrimination. Puerto Rico is a special case.

J. K. Galbraith, Ph.D., Cambridge, Massachusetts, is professor of economics at Harvard University. He has also taught at Princeton University and served as deputy administrator, Office of Price Administration, director of the United States Strategic Bombing Survey, director of the Office of Economic Security of the Department of State, and as an editor of Fortune Magazine. His books include American Capitalism (1952) and The Theory of Price Control (1952).

Industrial Development in Puerto Rico

By TEODORO MOSCOSO

DEVELOPMENT problems in Puerto Rico have, of course, their own special framework. In 1940 this was the framework of an island limited in natural resources, with a large and rapidly growing population, a low level of living, and scarce savings out of which to secure capital for the increase of productivity. As a possible offset against these disadvantages, Puerto Rico was linked to the United States of America, lying within its tariff area and enjoying a small share of the services and aids provided to the states and territories by the federal government.

During the early forties the island was still under the influence of the depression years that had brought us to the brink of disaster, and the outlook for a permanent solution was somewhat pessimistic. The outbreak of World War II, which brought relative economic prosperity to the continent, brought us unrestricted submarine warfare that almost severed our lifelines to the mainland. More than once our foodstocks fell to near starvation levels, and exports too were sharply cut.

EARLY PLANNING

The first planning for government action looking toward economic development grasped this nettle firmly. It was clearly recognized that increasing efficiency in agriculture would mean that the available land could not support many more people and that, while long-run influences might perhaps diminish the rate of growth of the population, there would be a substantial increase in the labor force for many years to come. The provision of alternative sources of employment, primarily indus-

trial employment, was therefore recognized as the most pressing need of the insular economy, and the Puerto Rico Industrial Development Company was created to deal with the problem.

Moreover, in the existing situation it is not surprising that early planning for industrial development had a strong emphasis on self-sufficiency. In the local market the problem of dealing with competition from the mainland was scarcely felt, since continental shipments, limited by defense priorities and blocked by enemy submarines, reached us only in dribbles. In industry, as in agriculture, our earliest thinking looked in the direction of making us less dependent on outside sources for our basic necessities.

The Development Company was organized along the lines of the Chilean Development Company which preceded it by several years, but without substantial initial capital appropriations. Its first and largest resource was the cement plant built by the Puerto Rico Reconstruction Administration, a federal agency, in 1939. The common stock participation of the insular government in this venture was transferred to PRIDCO, and thereafter the federal participation was paid in full out of profits. When, during the later war years, the revenues of the insular government began to rise rapidly as a result of the increasing taxes on sales of rum in the continental United States, appropriations were made bringing the capital of the company up to \$19 million by 1946.

As the capital of the company increased, it began to put into operation its planning for the construction and

operation of industrial facilities on the island. The cement plant was expanded considerably to meet the acute shortages of construction and road-building materials. A glass-container plant was constructed primarily to ensure shipments by the expanding rum industry, an important source of government revenue. A paperboard plant was built, and used machinery was installed, to provide material for the shipping cartons. Toward the close of the war a clay-products plant was planned to provide other building materials and to meet the anticipated shortage of sanitary ware. In the immediate postwar period a shoe factory was constructed to serve the local market, and plans were completed for a modern textile factory, also to produce for the local market.

EXPERIENCE WITH GOVERNMENT OPERATION

Operation of these factories provided interesting and constructive experience. The cement plant, protected as it was by the high cost of shipping cement from the continent and the scarcity of the product there, proved to be a consistently profitable operation, and it has provided a sound basis for the physical development of the island. The glass and paper factories met increasing difficulties immediately upon the conclusion of the war, with the decline of the continental rum market. The glass plant had been constructed to provide containers for the 1940 rum production capacity; but when the market collapsed, its capacity became temporarily too large. Operation of the paperboard mill became economically unfeasible because its jute board could not compete with the kraft board imported from the mainland. The sanitary ware section of the clay-products plant was never able to meet continental competition and had to be discontinued. In 1948 the operation of the shoe plant proved to

be unprofitable because the diversity of styles required for the local market meant too frequent changes in production setups.

Government operation of these plants also brought to the fore difficulties at the highest policy level. The Popular party had been elected with the vigorous support of industrial and agricultural workers who pressed for a strong social welfare program. Although the operations of the Development Company never became, as has often been the case in other countries, an object for political spoils and favoritism, over-all government orientation undoubtedly did influence the administrative policies of the company. Its production workers, for instance, were among the most highly paid in Puerto Rico. While desirable as a goal of economic development, this political determination of wage levels in plants under government ownership generally impaired the freedom of management in making such decisions, because of their political repercussions. This contributed to the difficulty of putting the plants on a profitable operating basis, thus limiting earnings that could be reinvested.

This experience vividly illustrates the problem in a "mixed economy"—such as exists in many areas to a far greater extent than was ever the case in Puerto Rico—in which the legislators and government supporters tend to be unwilling on the one hand to see government enterprises pursue a vigorous management policy, yet on the other hand insist that such enterprises be profitable and solvent.

AIDS-TO-INDUSTRY PROGRAM

Aside from the difficulties inherent in government management of diversified enterprises in a mixed economy, the leadership of the company began to realize as early as 1945 that the resources of the insular government in themselves

would not be sufficient to solve the problems that lay ahead. As a rough indication of the magnitudes involved, the employment provided directly by the existing government plants cost in the neighborhood of \$10,000 per job in capital expenditures, while total unemployment amounted to over 125,000. Even if the capital per worker were halved, and if one additional nonmanufacturing job sprang up for each factory job created, the cost of providing the necessary jobs would exceed \$300,000,000. Such an expenditure could not be attained in the face of the foreseeable decline in wartime rum revenues, nor could the government possibly acquire the highly diversified production and marketing know-how at the accelerated rate that circumstances required. The company therefore determined upon a policy designed to secure expanding capital participation from the United States, tapping a small part of the huge sums that are annually devoted there to plant expansion. This program was to be accomplished through the provision of aids such as rental buildings, long-term loans at favorable rates of interest, and other incentives.

Owing largely to the inexperience of the company and to the limited available resources, the program of industrial aids developed slowly. Not over ten small concerns were established with the assistance or guidance of the Development Company prior to 1947.

In 1946 and 1947, however, the company recommended passage of two industrial tax exemption acts, the second of which is still in force as a substitute for and a liberalization of the first one. The latter grants complete exemption from the Puerto Rican income tax, property taxes, and municipal license taxes for new industries and designated old industries and tourist facilities until 1959, and partial exemption until 1962.

Inasmuch as Puerto Rico is not subject to the federal Internal Revenue taxes (including income tax), the exemptions proved to be an effective inducement to industrialization, and it is expected that tax incentives to economic expansion will become a permanent part of the policy of the Commonwealth.

PERIOD OF 1947-50

As the aids-to-industry program began to mature, the policies of the Development Company (PRIDCO) underwent a gradual but thorough transformation. During this period the company was entrusted with the development of two new programs whose importance became increasingly apparent to the insular government. The first of these was rum promotion, the need for which was brought home by the devastating drop in postwar rum sales in 1947-48. PRIDCO received and managed insular government appropriations, which run to \$1,000,000 per year for the promotion of rum sales on the continent, with very successful results. The second program was tourism, the potential for which had long been recognized on the island. The company recognized, however, that without bold leadership and the provision of modern facilities, the visitors' trade would grow extremely slowly. It therefore decided to commit a large part of its resources to the construction of the Caribe Hilton Hotel—a decision which fortunately contributed to the desired effect. The expansion of the tourism program required at the same time the organization of a promotional campaign with annual expenditures approaching \$250,000.

Experience of the company with these new programs demonstrated that increasing effectiveness of the aids-to-industry program would require promotional activities in the continental United States. The company expanded

its public relations activities to acquaint Americans in general with Puerto Rico and its problems. At the same time it established an industrial promotion office on the mainland designed to present the specific advantages of Puerto Rico as an industrial location directly to mainland investors. A small office of industrial services was established to facilitate the solution of problems for industrialists who had already decided to locate in Puerto Rico.

Meanwhile, company operations expanded but in a changing direction. The shoe plant was closed temporarily and reopened under lease to a private concern producing shoes for the mainland market. A textile plant was constructed under agreement for sale to Textron Inc., and a similar arrangement was made with Crane China Company for the construction of a plant to produce institutional chinaware. In these cases, investment by the mainland corporations—the first large corporations to participate in the industrial development of Puerto Rico—was relatively small and the terms of the lease or purchase mortgage were generous to an extent not subsequently repeated. But these firms served as important illustrations and as bellwethers for future development.

Investment in these three large establishments, in the company's own operating subsidiaries, in the Caribe Hilton Hotel, and in a few smaller industrial buildings tied up the bulk of PRIDCO's operating capital. Few additional buildings could be constructed for lease or long-term sale. At the outset new small firms established on the island were able to find vacant industrial space, but by 1950 it became apparent that lack of suitable buildings was proving a serious bottleneck in the development program. At this time the legislature resumed appropriations on a small scale

to PRIDCO's capital fund and granted tax exemption to lessors of industrial buildings as an incentive to private construction.

The promotion campaign was becoming effective, but because of the untried nature of Puerto Rico as a site for industrial location, the industries attracted during this period were in most cases lightly capitalized and more heavily concentrated in the apparel trades than seemed desirable for a balanced economic development.

THE ECONOMIC DEVELOPMENT ADMINISTRATION

The experiences of the Development Company, referred to above, provide illuminating side lights on problems of public administration that can only be touched upon lightly here. Administration of its manufacturing activities proved to be much more difficult than administration of similar private enterprises. On the other hand, the public corporation may have been less than the ideal vehicle for managing the government-type programs. Public relations, rum promotion, tourism, industrial promotion, industrial services, and research accounted for expenditures of over \$1,500,000 in 1949-50, of which only \$1,000,000 was provided by prior appropriation. The other funds were expanded by the Development Company on a reimbursable basis but without prior control and commitment on the part of the legislature. The company found that not all expenditures would be considered reimbursable.

Because of these and other difficulties inherent in corporate management of government functions, it was recommended in 1950 that the industrial development program be reorganized. The Economic Development Administration was created as a regular department of the insular government, operating with

funds appropriated annually by the legislature. The administrator was vested with the powers of the Board of Directors of the Industrial Development Company, which thus became in essence a corporate subsidiary of the administration. At the same time, the previously independent Transportation Authority was made a part of the administration under precisely the same terms, with a view to consolidating further the development functions of the insular government and reducing the number of independent corporations reporting directly to the Governor.

The Development Administration itself was to discharge the functions of rum promotion, tourist promotion, industrial promotion, industrial services, industrial research, and economic research, and it was also to provide general management for PRIDCO and the Transportation Authority. In this way the Economic Development Administration was fully integrated into the budgetary process of the insular government and partially subjected to central controls over personnel, travel, and purchases.

The regular appropriation procedure has limited the uncontrolled growth of expenditures. But this control under procedures designed for old-line government organizations is proving incompatible with the dynamism and flexibility required of a development program. The Economic Development Administration and the central service agencies of the government are therefore actively seeking a more satisfactory solution to this problem. Moreover, inclusion of programs such as economic statistics in the Economic Development Administration and the operation of buses in the San Juan metropolitan area under the Transportation Authority has tended to cause a spreading of effort and a preoccupation with matters extraneous to the central problem of in-

dustrial development. Such a diversity of problems has tended to blunt the edge of the Development Administration's activities.

INDUSTRIAL DEVELOPMENT SINCE 1950

At the time that the Economic Development Administration was formed, a number of other new organizational steps were taken by the insular government, including the formation of the Economic Division of the Puerto Rico Planning Board. This division rendered its first report to the Governor in January 1951, bringing into sharp focus the developments of the preceding ten years, the role of the insular government policy in guiding these developments, and some of the problems that the economic development program would face during the succeeding ten years. The immediate effect of this report was to consolidate the feeling in government circles that agriculture and industrial development required considerably increased emphasis during the coming years if the goals of the people of Puerto Rico for increased employment and income were to be achieved. The report also furnished detailed confirmation of the correctness of the aid-to-industry program in its aim to attract private investment to accomplish a goal which was beyond the reach of the insular government resources.

As a result of this report, and of the general thinking in government circles that had preceded its preparation, the insular legislature appropriated for fiscal 1951-52 capital funds of \$8,300,000 for PRIDCO, \$400,000 for special incentives, and an increased operating budget for the Development Administration. In the following year this policy was continued with an additional capital appropriation of \$8,000,000 for PRIDCO, plus a continuation of the incentive fund. At the same time, the develop-

mental role of the Transportation Authority was increased through an appropriation of \$4,250,000 for the first steps in the construction of a waterside market facility designed to serve in a mutually supporting way the needs of agriculture, ocean transportation, and the development of water-based industries. This facility, together with the new international airport under construction since 1949, should greatly strengthen the connections of the island of Puerto Rico with other parts of the world.

The four manufacturing subsidiaries still held by PRIDCO in 1950 have been sold to private enterprise, which is now operating all four on a profitable basis. This sale, together with the new appropriations, has substantially increased PRIDCO's liquid assets, and these funds have been increasingly devoted to the provision of industrial buildings. Since the earlier stages of the program it has proved largely unnecessary for the Development Company to provide loans for capital equipment or working capital, especially since the Development Bank has begun to take an increasingly active role in this type of financing. Consequently, in recent years less than one-sixth of PRIDCO's available funds have been committed to loans other than mortgage loans on buildings constructed for private enterprise.

These buildings are of two types—those constructed to meet the specific needs of a given enterprise, and those constructed as standard buildings available on completion for widely varied types of industries. Specialized buildings must be constructed to meet the needs of a particular firm after a contract has been signed, and this entails delays of as much as one year between commitment and start of operations. Standard buildings (5,000, 10,000, and 20,000 square feet in area) are constructed without advance commitments.

Construction is more rapid and occupancy is quicker. Because these standard buildings are proving to be highly acceptable, PRIDCO is attempting to maintain a stock of approximately thirty of them in various stages of construction.

OVER-ALL RESULTS OF THE PROGRAM

As of June 30, 1952, the direct results of the industrial development program were roughly as follows: Somewhat over 200 new industrial firms had been recruited and established on the island, of which roughly 20 have gone out of business and 18 had not yet started operations. The 166 firms in operation had a total employment in excess of 12,000 persons, and annual payrolls approaching \$10,000,000. Potential employment of all firms recruited, at capacity operation, probably exceeds 20,000. Of the 12,000 people actually employed, 2,000 were home workers. The 10,000 factory workers constitute not only one-sixth of the total factory employment on the island, but also the bulk of the increase in factory employment since 1940.

Recent studies indicate that the 184 firms operating or getting ready to operate as of June 30, 1952 have assets totaling more than \$65,000,000, of which not more than \$20,000,000 will have been provided by the government. This total exceeds actual capitalization by the amount of loans and accounts payable, but it represents a correct measure of the total capital set in motion by the program. Capitalization per worker will thus average between \$3,000 and \$4,000. This is above the present capitalization of Puerto Rican industry, which leads to the fact that generally the jobs provided under the program provide higher wages than other manufacturing jobs on the island.

The foregoing is only a beginning of what we believe to be possible. Present

economic conditions in the continental United States, with a high level of activity and a shortage of available labor in many areas, are extremely favorable to the formation of new firms in Puerto Rico, especially in labor-intensive industries. As a result, 60 per cent more plants started operations in Puerto Rico last year than in any preceding year. Also, in the second half of fiscal 1952 (January to June, 1952) the number of businessmen inquiring about opportunities in Puerto Rico was higher than in any preceding full year. Moreover, an improvement in the industrial composition of the new firms is beginning to become apparent with an increasing number of producers of plastics, electronic equipment, metal goods, and so forth among those starting up and making inquiries. These indications of success may lead within a few years to a complete revolution in the Puerto Rican industrial scene.

PROBLEMS OF INDUSTRIAL DEVELOPMENT

The foregoing historical outline illustrates in itself many of the aspects of industrial development which are important in any general consideration of the problem. While the experience of Puerto Rico must be taken in the light of the peculiar circumstances of the island, which have both their negative and positive aspects, much of it is of value, directly or by analogy, to other areas.

The windfall income of Puerto Rico during the war years from the greatly expanded rum trade corresponds roughly with income which may become available to primary producing areas, such as Venezuela, from the exploitation of resources. The Government of Puerto Rico wisely chose to invest this windfall income primarily in economic development, and such a course should be

recommended to any other area with similar good fortune.

Welfare versus development

The problem of spending income, whether derived from windfall sources or not, also implies a judicious determination of the appropriate balance among various programs. A progressive, welfare-oriented policy has strong internal pressures for increasing expenditures on housing, schools, roads, aqueducts, sewers, and other services on purely humanitarian grounds, and without relation to the development implications. The implications of such a policy are manifold. First, these services, though manifestly desirable, are not inherently productive. Their provision diminishes the sums available for development activity per se. In the second place, such facilities generally, though not always, incur future operating charges which may be difficult to meet. These very drastic qualifications on the desirability of welfare must be constantly borne in mind, but not to the extent that they reduce such expenditures below the level compatible with economic development, as when the health and education of the labor force are not improved with sufficient speed. Thus the appropriate point of balance is very difficult to determine.

The welfare outlook of progressive thinkers and specialists in physical planning derived from sympathetic study of the experiences of well-to-do nations, and the preoccupation of Keynesian economists with the maintenance of purchasing power through welfare schemes, tend to predispose the solution in favor of more rather than less attention to welfare than is compatible with current resources. Despite the fine record of Puerto Rico in this respect, it may be noted that less than 20 per cent of the capital appropriations to insular gov-

ernment agencies during the forties were for economic development per se.

A special case of contradiction between development policy and welfare policy arises if economic development is to be financed largely by private sources. The modern tendency to finance welfare schemes through progressive taxation then comes into conflict with the necessity for high profits to provide both an incentive for capital investment and a fund out of which such investment may be expanded in the future. As has been indicated above, there is some difficulty hindering government participation in industrial ownership so as to engage directly in this capital accumulation, certainly short of an all-out socialist program. Such a socialist program, for its part, would probably seriously hinder eliciting the participation of outside capital in most cases.

Government participation and industrial climate

In a number of developing areas, the government has provided strong guidance and assistance to new industries by participating as a minority stockholder, and has thus at the same time reaped unusual benefits in successful cases. This has been specifically precluded in Puerto Rico by the law establishing the Development Company, which, probably with a view to political implications, does not permit PRIDCO to participate in any industrial enterprise without a controlling voice in the management. We would recommend that this limitation be avoided in other countries undertaking to set up development companies.

The entire problem of establishing a suitable "industrial climate" has been the subject of much discussion in planning and economic circles inside and outside Puerto Rico. Our experience leads us to believe that there are per-

haps three major elements in this climate. The first is the physical facilities which are available, the second is the human material, and the third is the governmental climate, including tax and other incentive policies. Each of these deserves brief discussion.

Physical facilities

I have previously touched on the bias in favor of providing physical facilities to excess. This problem is complicated by the fact that, once industrialization gets underway, there is a strong tendency for the population to gravitate towards large urban centers, often one urban center in a region. It is disputable whether in the long run the expense of providing adequate urban facilities is greater than that of providing adequate rural facilities, including roads and electricity; but the new urban resident undoubtedly reaches a high level of expectations rapidly upon arrival in the city. Hence, in a transitional period, efforts should be made to keep the population in the country as long as possible consistent with the mobilization of an adequate labor force. This objective, with the consequent dispersion of industry, conflicts with the tendency of industry to cluster, and with the cost of providing transportation and other facilities to scattered industrial establishments. The solution of this problem is ticklish both in concept and in execution, and we certainly cannot claim to have resolved the difficulty in Puerto Rico.

A special twist to the problem of location is given by the psychology of management. Insofar as foreign managers must be expected to bring know-how and capital at the start of industrialization, it may prove difficult to persuade them to locate far from the metropolitan zone, where they may find accustomed amenities. Even there, the

level of such amenities may be unsatisfactory. In this event, the simultaneous development of tourist facilities, where possible, has proved to have an excellent effect.

The human element

The human element is undoubtedly the most important single factor in the development process, outweighing in the long run even the availability of resources. Underdeveloped areas like Puerto Rico come to the twentieth century with a heavy burden of cultural tradition and family patterns that are not well suited to industrial living and production. In general, education, nutrition, and physical welfare aspirations are low in such areas. The lack of aspiration is an obstacle to the growth of sound work habits. Ignorance and low income create barriers to family limitation and intensify the population problem. The lack of opportunities for advancement dulls the desire for literacy, competence, and self-improvement. The prevailing low wages and lack of skills hinder the installation of labor-saving equipment and advanced technology, and thus perpetuate the low wages.

Here again, Puerto Rico is beginning to find its way out of these concentric vicious circles as a result of long years of relative prosperity, education, and sanitation under American auspices. The problem, however, is still so acute that the Development Administration must maintain an extensive program of worker selection, technical training, and guidance to manufacturers to facilitate the establishment of high levels of productivity and factory discipline.

Governmental climate

Those who are familiar with industrial operation under modern government know that the manufacturer has many responsibilities to different gov-

ernment agencies. These responsibilities are necessary and unavoidable, but insofar as there is a lack of co-ordination among departments of the government, the burden of compliance may be excessive. This problem can be satisfactorily resolved only where the urgency of economic development is recognized and strong efforts are made to co-ordinate and harmonize the policies of the various government agencies.

Another aspect of co-ordinated development policy involves the revision of legislation and administrative regulation which has been outmoded by economic events. Puerto Rico's commercial code and corporate law, for example, were written in another era and require drastic revision for effectiveness under present conditions. The same may readily apply to labor law, construction codes, marketing controls, tariffs, financial and insurance law, and similar matters, each of which may place unnecessary barriers in the way of development.

Most governments have at their disposal, in addition to the various powers of regulatory agencies, a most powerful tool in the management of fiscal policy. Puerto Rico's experience with tax exemption has demonstrated that tax incentives can be a powerful inducement to investors, like those in the United States who would otherwise be subject to heavy taxation. We believe, also, that tax incentives can help break down local traditional preference for investment in real estate and trade.

It is clear, however, that tax exemption, even for a limited period, is destructive of equity and progressivity in the tax structure per se, but that this effect may be more than offset by higher income for the economy as a whole. It must also be noted that the encouragement of local investment is an important political objective in most areas and that, in view of strong traditions

impeding investment in manufacture and in view of the small size of local savings, some price must be paid for the achievement of this objective.

Government officials and policy makers who are familiar with the traditions of their own area but unfamiliar with the traditions and conditions in advanced nations often regard the steps necessary for industrial development as favors extended to a special class of persons. Thus necessary measures frequently become politically unpopular, and this opposition tends to slow the elaboration of a comprehensive and effective industrialization policy.

In Puerto Rico we have fortunately been in contact with the American industrial scene and can see the many re-

spects in which our local conditions do not match American standards of opportunity for the investor. We realize that many of the measures we are undertaking to hasten industrialization are not incentives or subsidies in the true sense of the word, but represent equalizing measures to help bring conditions here toward par with those in the United States. Of the entire industrialization program, it is probable that tax exemption, coupled with the ready availability of labor, is the primary incentive for industrial expansion in Puerto Rico. The provision of buildings, loans, training, and other facilitating efforts does no more than reduce the disparity between our conditions and those on the continent.

Teodoro Moscoso, Santurce, Puerto Rico, is administrator of the Economic Development Administration of Puerto Rico, and from 1942 to 1950 was president and general manager of the Puerto Rico Industrial Development Company. Prior to that he served variously as general manager of Moscoso Hno. & Company, Inc., as president of the Porto Rican-American Drug Company, Inc., and as vice chairman and executive director of the Ponce Housing Authority.

The Role of Planning in Puerto Rico

By RAFAEL PICÓ

PLANNING is a process as old as mankind. In Puerto Rico, planning began in the days when the first towns and villages were laid out following a fixed pattern of rectangular streets in checkerboard fashion, as provided in the regulations established in the sixteenth-century Spanish "Laws of Indies" for the establishment of communities. Consequently, the existing similarity between the old sections of towns and cities in Puerto Rico and throughout Latin America is no mere coincidence.

In 1942 the Puerto Rico Planning, Urbanizing and Zoning Board was established by Act 213 of that year. The Planning Board guides the development of Puerto Rico through its master plans, co-ordinating the work of many different agencies within the framework of policy set by the Legislature and the Governor, and by acting as staff adviser to the Governor in matters of economic and social development, broad fiscal policy, and public works.

The Board is composed of three full-time members, the Chairman acting as executive officer of the staff. The Board has a technical staff organized in five line divisions: Urban Development, Finance and Special Studies, Economic, Engineering, and Bureau of Permits. In addition, there are the Administrative and Legal Divisions, and the Office of the Secretary.

The activities of the Puerto Rico Planning Board can be grouped into four major headings:

1. A main function of the Board is the preparation of master plans that constitute the basic policies adopted by the Board to guide the physical and economic development of the island and

its cities. They are also utilized by the Board to co-ordinate capital improvement projects of all government agencies.

2. The Board acts in an island-wide capacity as a city planning center for all its seventy-six urban communities. The Board guides the development and growth of urban areas through regulations, based on the master plan, controlling land subdivision, zoning, and ancient and historic zones, and by means of official maps of streets and roads.

3. The Board participates in the formulation of the fiscal policy of the Commonwealth of Puerto Rico by adopting every year a six-year financial program that is submitted to the consideration of the Governor and the Legislative Assembly of Puerto Rico.

4. Economic and social planning is a vital function in which other government agencies also participate actively, as in most of the planning process.

MASTER PLANS AND PROJECT REVIEW

The preparation and adoption of a Master Plan for the Development of Puerto Rico and the study of referrals are basic functions in the planning activities carried out by the Board.

The master plan is not a single document, but rather a set of plans, each dealing with a particular aspect of the development of the island and adopted after public hearings where all are free to express opinions and objections. The Board has already adopted five sections of this master plan, namely: district hospitals, major thoroughfares for the San Juan metropolitan area, insular and municipal roads, airports, and rural

communities. Furthermore, there are preliminary master plans for the physical development of the urban zones of Caguas, Carolina, Bayamón, Mayagüez, Ponce, and Aibonito, specially prepared for use in connection with the urban redevelopment program under the National Housing Act of 1949. On a regional basis there is a preliminary master plan for the San Juan metropolitan area. There are also sketch master plans for the urban development of twenty-four other towns of the island.

Master plans, even though projected towards the future, serve as a basis to guide current projects for capital improvement. According to the provisions of Article 22 of the Planning Act and Planning Regulation No. 2, the Board reviews all capital improvement projects submitted by agencies of the Commonwealth of Puerto Rico and the municipalities. In the last ten years the Board has approved 6,406 projects that represent an investment of approximately \$343,984,175. Many of these projects have been completed or are in the process of construction. Through this function of co-ordination and revision, the Board has saved the government over \$26,000,000 of public funds in the 797 projects it has disapproved.

The Planning Board is not only interested in preventing conflicts between the interests of the various government agencies, but is also concerned with preventing overlapping and with getting the most out of every improvement in which the government invests public funds.

URBAN PLANNING

In its regulatory aspect, city planning concentrates on the preparation and enforcement of subdivision and zoning regulations for urban areas, establishment of ancient and historic zones, and preparation of official maps for streets and roads.

As provided in the subdivision regulations, all subdivision of land must comply with certain standards of services and facilities that the subdivider has to provide in each new development before the Board gives its final approval. Since September 1944, when the subdivision regulations went into effect, 137 major subdivisions have been approved, including 16,429 new lots, which, added to the 17,688 simple subdivision cases approved, make a total of 34,117 new lots provided with facilities at a cost of more than \$12,500,000.

This represents an investment of private funds in minimum facilities necessary to modern living, such as streets with adequate pavement, curb, and gutters, sidewalks, aqueduct and sewerage systems, fire hydrants, and electrical distribution systems for the use and benefit of the future property owners and the community as a whole. Moreover, these facilities and services provided by the subdivider relieve our municipalities of a burden that they had to bear in the past. It should be noted significantly that all subdividers donate 5 per cent of the total area to be subdivided, for recreational purposes. Up to June 30, 1952, this provision had contributed 124.26 acres of land for parks, already dedicated and transferred to the Public Recreation and Parks Administration for the construction of recreational facilities.

The Board has adopted zoning regulations that are applicable to all urban areas of Puerto Rico, but they do not go into effect until a zoning map for a particular urban area is prepared. At present, zoning is in force in the entire San Juan metropolitan area, which includes the capital and adjacent towns, with a population of over 400,000 inhabitants.

The zoning regulations are applied by the Bureau of Permits, a dependency of the Puerto Rico Planning Board, whose

main functions are (1) to issue building and use permits for land and buildings and (2) to enforce the Board's regulations and all other laws and regulations affecting building construction in Puerto Rico.

Since 1946, when the Bureau of Permits was established, it has issued about 30,700 construction permits for buildings costing \$269,047,915.

Subdivision and zoning regulations aim to check the haphazard development of the urban areas and guide their future growth along orderly lines. They are mostly negative in character; that is, they regulate and restrict bad growth, but they do not compel the elimination of slums, the sore spots of our cities. The Planning Board is working closely with the housing authorities on plans for the elimination of slums and at the same time is working with the various agencies concerned with guiding the economic development of Puerto Rico so that people can afford better housing.

The Board estimates that some 18,000 families will have been moved out of San Juan slum areas by 1956. In the San Juan metropolitan area 3,298 low-cost dwelling units have already been completed since 1940 and there are 11,000 more scheduled for the coming four-year period. As of June 30, 1952, Puerto Rico had under construction, under the auspices of the National Housing Act, 8,799 public housing units costing some \$44,000,000.

The Puerto Rico Planning Board was the first in the United States to prohibit any kind of permanent development in slum districts until a plan for the improvement of those districts as a whole could be put into effect. This device, provided in the zoning regulations for areas shown on the zoning maps as the "M" districts, is in effect since 1946, and has been applied to local slum districts such as "El Fanguito" ("The Little Mud"). Plans for redevelopment

of this and other areas are well under way following the provisions of Title I of the National Housing Act of 1949, that also has been extended to Puerto Rico.

Another important feature in urban planning is the preparation and adoption of official maps of roads and streets. This process preserves, without immediate acquisition by the government, the rights of way for the construction of planned thoroughfares included in the master plans. This process is indispensable in a community that is not sufficiently rich to destroy valuable properties to make way for a needed traffic artery. For the past six years the Board has been working on official maps for the San Juan metropolitan area, and to date it has adopted official maps for thoroughfares having a total extension of 68.12 kilometers.

The regulation of ancient and historic zones is in effect since May 26, 1951. It aims to preserve the historic buildings and areas of Puerto Rico as a measure to stimulate tourism. Under the terms of this regulation and subsequent to a public hearing, Old San Juan was declared an ancient or historic zone. All new construction, reconstruction, and improvement have to be in harmony with the predominant colonial architecture of the zone.

FISCAL PLANNING

The Planning Board participates in fiscal planning for the Commonwealth of Puerto Rico through its six-year financial program. This document, which covers all phases of the financial structure of the government, is prepared after consultation with all government agencies and after public hearings are held. The financial program offers a picture of the island resources and expenditures projected for the following six years. It includes an analysis of the public debt, current expenditures, capital im-

provements, and contributions to public service enterprises. Thus, in a single document, government officials, as well as the public, have access to vital information as to public finances. The program is revised annually in order to take into consideration changes in the insular fiscal picture and the development of specific programs.

To date, nine financial programs have been submitted to the Legislature and they have served as a basis for most of the fiscal legislation and the expenditures approved during the last decade.

ECONOMIC PLANNING

Activities on economic planning are carried out by the Economic Division of the Board. Its work consists in studying the trends and developments in the Puerto Rican economy and making available information that would be useful in the formulation of economic policy. An additional function is to provide guide lines for the government's economic development programs. Industrial and agricultural committees collaborate in these activities.

In January 1951 the Economic Division prepared an economic report entitled *Economic Development of Puerto Rico, 1940-50; 1951-60* that includes a review of the economic development of Puerto Rico for the 1940-50 decade and sets forth a program of accelerated economic development for the coming decade. The Governor referred very favorably to this report in his annual message to the Legislature that convened in February 1951.

In the 1951 economic report, the Division reviewed the development goals proposed in the previous report and concluded that it did not call for any basic shift in development policy, but justified a strengthening of the development efforts in the agricultural field. On the basis of the review the 1951 economic report outlined an economic

development policy which, briefly stated, includes recommendations for increased budgets for all direct development programs; tax incentives and establishment of investment facilities to divert private capital from trade and real estate and enlist it in manufacturing and agriculture; development programs, for both industry and agriculture, that are not only broader and stronger in themselves, but also much more closely linked together for mutual support and stimulus.

These recommendations are all in consonance with the aims of "Operation Bootstrap," whose success depends on allocating judiciously limited funds available, according to the developmental value of the various government programs, and in making sure that the programs themselves are soundly conceived and vigorously executed.

THE PROBLEM OF PRIORITIES

The preceding paragraphs offer a picture of the functions carried out by the Board in the planning of Puerto Rico's physical, economic, and social development, and some of the accomplishments during the last decade.

The Board has conceived a development program whose final objectives are social but require an intensive economic activity. The real ultimate goal is not just to improve the economy, but to raise the standard of living of our people for longer life, higher income, better nutrition, more and better homes, and higher educational and cultural achievements.

The island's development program has been framed to give major emphasis to industrialization as a fertile source of opportunities for employment and economic activity, and to the resurgence of an intensive agriculture both for export and for local consumption.

Experience has clearly shown us that in our environment and stage of development the central government has to

take an active part to achieve more industrialization and a better-balanced agriculture. In addition to the traditional services without which economic development would be impossible, the government must invest part of its resources together with private capital, and very often before private capital.

The everyday problem that confronts planners and administrators is how much should be invested in direct economic development and how much should be allotted to the essential services required by that economic development. Priorities for the investment of funds and resources are a flexible concept, varying in the light of specific situations in each area. Priorities for an underdeveloped area, for example, are necessarily different from those to be applied to a mature economy, inasmuch as an underdeveloped area normally needs to devote a larger share of its income to the enticement of investment capital.

Before an attempt is made to sketch a priority system, it is necessary that the economic and social conditions be inventoried and development goals established. The adoption of a system of priorities entails a profound analysis of the Puerto Rican reality. Such an analysis would show that:

1. The island is a part of the continental economy and there are no legal barriers between Puerto Rico and the mainland.

2. Our industrial development program depends on the continental capital market as the main source of industrial investment. It should be pointed out, however, that our industrial investment requirements constitute a negligible fraction of the annual industrial investment in the States, amounting to less than $\frac{1}{7}$ of 1 per cent. This is more easily understood in per capita terms. Annual industrial investment in the continental United States is about \$160 per inhabitant. This same per capita theoretical

distribution of the continental industrial investment would channel an annual investment of more than \$350,000,000 to the island. However, our capital requirements amount to only about \$30,000,000 annually.

3. The continental investor and his top technical personnel are accustomed to a high level of essential services, such as dependable and inexpensive electric power, good external and internal transportation facilities, an adequate level of academic and vocational education, and a good system of communications. These services are essential ingredients of what might be called an "industrial climate."

It is easy to overlook the role of services in a development program. The undeniable fact is that investors are not attracted unless conditions are offered which are commensurate with the risks and the difficulties of operating under different and comparatively unfavorable conditions. We must reasonably reduce the differential between the continental United States "climate" and our own if we are to enhance the importance of our advantages for economic development.

A BALANCED PROGRAM

The problem of the economic development of Puerto Rico, thus, is unique and does not necessarily follow an orthodox pattern of development applicable to other underdeveloped areas. It is evident that production comes first. It is also obvious that production, even though it comes first, does not arise in a vacuum, but must be very skillfully stimulated by attracting the necessary investment to develop the economic structure. Even for countries enjoying a wealth of natural resources, a development program entails very serious problems; for there are a multiplicity of factors of an essentially legal, political, economic, social, and psychological character that, taken as a whole,

give shape to the concept of an industrial climate. The development of this climate is one of the basic problems facing a country when it embarks on a program of industrialization.

The content of a balanced development program, which should be the goal of a good system of priorities, is not properly defined by the single word "production." It is considerably more

difficult of definition. The question is not one of public services versus production, for both are parts of the same picture. The real question is how much of what services are essential for production and attracting investments and how much of what kinds of services represent unessentials.

Planning's basic role is to determine this ideal balance and to try to obtain it.

Rafael Picó, Ph.D., Santurce, Puerto Rico, is chairman of the Puerto Rico Planning Board and director of the American Society of Planning Officials. He was on the faculty of the University of Puerto Rico from 1934 to 1943 and has been professor of geography ad honorem since 1950. He has been visiting professor at Northwestern University, the Catholic University of America, and the University of Miami. He was a member of the Caribbean Commission, 1946-51, and has served as consultant to the Government of El Salvador and PAS on a housing and planning survey, and as United Nations consultant to the Cuzco (Peru) Reconstruction Board. He is author of The Geographic Regions of Puerto Rico (1950) and other works, and editor of Special School Map of Puerto Rico.

The Puerto Rican Economy Linked with the Mainland

By WALTON HAMILTON

A FLASH from the front brings a message of victory for Puerto Rico. For the first time since births and deaths were first set down in the shorthand of statistics, the current year will show no net increase in population. A hope, as fervently as skeptically held, has become a reality. Policy, rather than rampant Nature, is in the saddle; at last the people of the island are in command of their own destiny.

The news item is more significant as symbol than as fact. As the island came to us from Spain, it brought along no more than a potential problem of population pressure. A colonial status has its own way of limiting numbers, for it matches an excessive birth rate with a negligently high death rate, and creates an equation whose terms are misery and poverty.

THE DEMOGRAPHIC IMBALANCE

As the island was reoriented towards the American Continent, the demographic balance, unstable and unhealthy as it was, could no longer be preserved. The urge to procreation was little touched by the techniques which elsewhere impose a merciful barrier between human impulse and the end Nature would have it serve. But the drive of science, though rampant in a host of technologies, in time claimed medicine; and the ways and means of sanitation, prevention and early detection of diseases, and up-to-date therapy were brought to the island. In due course, while the birth rate clung to the lower 40's in the gracious old Spanish way, the death rate began to drop and did not stop its decline until the continental

low of about 10 or less per thousand was reached.

A clash of cultures emerged, manifest in one of the most difficult problems in all human statecraft. The birth rate, indigenous to the island and blessed by Spanish tradition, was violently at odds with the upstart death rate imported from the mainland. Take the simple figure of 40 as the minuend; set the magic number 10 down as the subtrahend; a literal indulgence in subtraction gives as the remainder the startling figure 30. If for any year of the last twenty this remainder is multiplied by as many thousands as then made up the population, the product will show how very mischievous such a continuing figure can be.

At the turn of the century, the standard of life in Puerto Rico was nothing appropriate to a book on Utopia. As year has followed year, the squeeze play of this sequence of 30's has threatened the men and women of the island with an "iron law" as inexorable as any economist of the old school ever exhibited. However large the harvest of crops and of commodities, the harvest of babies was even larger. A threefold problem emerged: the flood of immigrants from Heaven had to be abated; jobs must be had, on the island or overseas, for a host of new workers; and the standard of life had to be driven ever upward.

TWO RETARDING FACTORS

A question of population pressure never exists in isolation. It has its demographic habitat and it is always conditioned by the culture within which

it is set. In Puerto Rico, two factors, which in another situation might be of little consequence, pile hazard on hazard to arrest its solution. The one is that Puerto Rico is an island; the other, far more serious, is the threat of insularity.

The geographic status of island is not in itself fatal. A people must possess an economy with which to provide the necessities, the comforts, and (is it too much to ask?) something of the frivolities of life. As a condition of existence, an island may continue to create its own economy. If, however, it is small, and Nature or Nature's god has failed to provide resources in adequate variety and quantity, it cannot in these modern times go it alone. It must step out into the world, accept the good old rule of catch-as-catch-can, and look about for a prosperous industrial system with which to fuse its own economy.

It is, however, distance, with its threat of insularity, which presents the greater barrier. Let some Heaven-sent catastrophe uproot the island and set it down intact as a peninsula off the eastern shore of Maryland, or even an island a score of miles off the New Jersey coast, and the distinctive problems of Puerto Rico would disappear over night; for then persons, the materials of manufacture, and commodities ready for human use would easily and cheaply move between island and mainland. But, as Nature has contrived it, distance now spells separation, the long journey, the ocean haul, movement beset with inhibitions, high expense, and vexations.

On the mainland the industrial systems of the several states are linked and their identities lost in a national economy. On the mainland the operation of the industry, agriculture, and commerce of the several states presents little need for the formulation of public policy and rarely becomes a matter of critical concern. In contrast, Puerto Rico must effect such linkage as it

can with the continental economy across twelve to sixteen hundred miles of ocean. To its people and government, the fusion of the insular into the mainland economy is a first—and ever conscious—objective of public policy.

LINES OF PUBLIC POLICY

Thus the pressure of population upon a people pent up in a small island, distant from the mainland, fixes the lines of public policy. The three answers to the instant question are a decrease in the birth rate, an exodus of surplus workers, and the provision of an expanding number of jobs. But each of these gives rise to other questions, until the whole orbit of policy is encompassed.

The reduction of births presents a kind of closed circle; for "planned parenthood" depends upon knowledge, education, and an advanced standard of life which it is the very purpose of the fall in the birth rate to effect. If migration is to provide a safety valve, passage must be available, reliable, and cheap—and Puerto Rico must consciously strive to make it so. If more and more jobs are to be found, industries must be brought to the island; and they do not come unless overseas markets for their products are assured. The whole design in industrial development must be shaped to overseas demand, and the agricultural system of the island must be made to provide peoples at a distance with fruits and vegetables which they cannot grow for themselves.

Thus, escape from a sentence to poverty can be had only along the long, narrow, and expensive avenues which stretch away from the island. These avenues have become tentacles, which, stretching out from an insular focus, hold in their grasp the destiny of Puerto Rico. They constitute a series of "life lines" which it is the dominant aim of public policy to cherish and enlarge.

CONTRAST WITH THE MAINLAND

The problem facing Puerto Rico has no likeness on the mainland. The several states have been the children of Providence. A continental area, an abundance and variety of resources, and an advancing technology blessed with the Midas touch have made the United States a land of potential plenty. To convert resources into wealth, men have needed only to seize the chances spread before them. The national economy has emerged as an unplanned entity shaped into greatness by an infinity of small plans. The detail of tasks essential to the creation of industrial empire has in general been left "to whom it may concern." The fixing of targets has had little place in public affairs; and in the creative process the craft of statesmen has had at best a minor role.

With the Commonwealth of Puerto Rico it has not been so. Nature has not handed it out on a silver waiter; its gifts have been so scanty as to demand of the people that they create their own opportunity. It could leave neither the creation of its own economy or its linkage with an over-all industrial system to fortune or to "the invisible hand" which guides money-making to appointed ends. If there was to be progress, there was no escape from the long-time view, the use of statecraft, the drawing and constant revision of plans, the fixing and attainment of targets. It could not entrust its destiny to persons, natural or corporate, whose dominant concern was with their own balance sheets and whose principal interests lay elsewhere.

Puerto Rico had alert, enterprising citizens, plenty of them; but their efforts had to be given direction. Individuals had to act for themselves, as they do in all free countries; but they had to act towards forging an economic

instrument which would ensure an ever advancing march. To this end the people made the government an agency of its will and entrusted to it the task, not of dominion, but of leadership in a co-operative venture. In response to public demand, a political structure emerged, with its complement of departments, agencies, and authorities, each of which had, as its distinct task, responsibility for a facet of public policy. And these various policies constituted a program for removing the insularity which distance had created.

In this venture Puerto Rico has driven the arts of statecraft to their very limits. It has had to brush off and furbish up for new uses techniques of political economy which had long been in repose. It was also compelled to play by ear, to improvise, and to invent, as its program was driven towards its goal. An initial question was to determine which way to face. Even if a choice is clear, the people of Puerto Rico like to be asked. Here, as elsewhere, the inevitable must be a matter of free will.

DIRECTION OF POLICY

Three alternatives, at least in form, were available. Puerto Rico might have directed policy towards the attainment of independence or of such an affectation of independence as Cuba sports. It might have aimed at becoming the hub of a great Caribbean economy. Or it might have sought industrial union with the continental states.

The sentimental case for independence was strong. There was too much pride in a traditional culture and too much reverence for the ancient liberties of Spaniards for Puerto Rico willingly to accept a colonial status. But on the material side, little was to be said for going it alone. At best, as a sovereign among sovereigns it could win for itself only a small and insecure place. An attempt to go it alone would have under-

written the fact of isolation. Independence, as a ranking official of the government puts it, "is a grand gospel for a man who has never studied economics."

A commercial primacy in the Caribbean was an all but impossible goal. Flags were many; a host of political barriers stood firm; and there was no instrument of transport adequate to the task of empire building. The alluring prospect was not to be forgotten; but for the immediate future, it could not be looked upon as the main chance.

The decision to look to the mainland, inevitable as it was, was not attained without a struggle. At first it seemed to involve a choice between economic union and political independence. The economic assets were all on the side of union; the arguments against union were all political in character. An advance in the standards of life could be achieved only through a place in a larger industrial system; but the people of Puerto Rico were unwilling to surrender, even to their fellow citizens of the several states, the power to shape their own destiny.

As late as 1949 there seemed no way to escape the dilemma. Puerto Rico was not content to remain a possession, a colony, or even a territory of the United States. Yet it was not ready or able to take on the responsibilities of a state of the Union.

Confronted with the necessity for choice, the people of the island resorted to political invention. In co-operation with the Congress of the United States, they set about creating for Puerto Rico a distinctive place in the federal union, shaped alike to its necessities and to its aspirations. The Organic Act was replaced by a Federal Relations Act; the citizens were endowed with the power to write their own constitution, establish their own system of self-government, and secure for themselves and their posterity the ancient liberties of

a free people. Faced with a question of "either or," they elected to have both.

MEANS OF TRANSPORTATION

But long before the constitution was ratified by the record-breaking vote of a politically minded people, the program for economic union was well under way. On the mainland we take for granted our avenues of trade and our instruments of transport. Although in times of crisis we have set up commissions, in normal times we are not disturbed at the capture of these agencies by the very interests they were set up to control. But to the people of the island, means for the movement of people and of cargo are more than mere facilities. They are alike instruments of policy and, in the insular language, "bridges" to the mainland. It is impossible to think of an item in the government's far-reaching and forward-looking program which for its realization does not demand access to adequate, inexpensive, reliable, and economical means of carriage.

This need is as imperative as it is obvious. On the continent people can move in short trips, and a handful of dollars is usually enough to get from here to there. Between island and mainland there must be a long journey or none at all, and for the ordinary persons the pinched savings of months are necessary to pile up the half-hundred dollars or more for passage money.

On the continent there are always at hand the alternatives of airplane, Pullman or railroad coach, highway bus, or a hitchhike. Between island and mainland, the railroad does not run; automobiles, whether of modern design or ancient vintage, are not available; and as the Governor has paraphrased Kipling, "There ain't no buses running from the Bronx to Mayagüez." So the airplane and the ocean carrier alone are at hand; and necessity has effected a

division of tasks between them. Although airplanes carry freight, the rates are prohibitive save for articles of high value and small bulk. And although one boat makes fortnightly trips between San Juan and New York, and all freighters have space for a few passengers, the ocean liner is outmoded as a carrier of persons.

EFFECTUATING AIR CARRIAGE

It follows, therefore, that air and ocean carriage present targets of public policy. From 1943 down to this date, the Government of Puerto Rico has been engaged in a struggle to secure to its people adequate and reliable air transport at rates they can afford to pay. Without such a service, executives of government and of business cannot easily come and go; the provision of jobs on the island is arrested; the tourist trade cannot cater to persons with modest purses; and the result is want of a means of sending the surplus of willing workers to jobs on the mainland.

At the end of World War II, Puerto Rico was badly served by a single air carrier. San Juan was not exactly a whistle stop on the way to Latin America, but rates were very high, schedules were inconvenient and not lived up to, and accommodations were bad and hard to get. There was in Puerto Rico a backlog of passengers for whom it would have taken months to find seats.

At the end of the war, surplus military planes became available to veterans at low prices. As a result, a number of nonscheduled carriers appeared to offer service at reasonable rates, to make available travel by air to thousands to whom it had been only a dream, and to break the congestion. In 1946 the Government of Puerto Rico had to intervene to prevent the Civil Aeronautics Board from grounding these

nonscheduled carriers. In 1948 the government instituted a proceeding before the Civil Aeronautics Board asking for the certification of a carrier to fly a "sky-bus" service between San Juan and New York, and of another regular carrier as a competitor to Pan American.

Almost at once, relief from isolation was forthcoming. Hardly had the petition been filed when Pan American announced a tourist flight at a figure of \$90 one way. As hearings on the petition piled up evidence of insular needs, Pan American reduced this tourist rate to \$75. The decision of the Board, announced early in 1951, granted Eastern a certificate to fly in competition with Pan American; and at once Eastern, in addition to its regular flights, announced a tourist service at a one-way rate of \$64, and Pan American followed suit. Riddle was also given a temporary certificate to carry cargo over the New York-Miami-San Juan route.

The tourist services thus forced upon Pan American and Eastern by the Government of Puerto Rico have served the reluctant carriers well. Eastern carries far more tourist than regular passengers; and the New York-San Juan run—a 1,200-mile flight without a stop—has become the most profitable leg in the Pan American imperium.

The officials of the government, however, have regarded a one-way rate of \$64 as no more than an intermediate point. It is far more than the masses of the people can afford to pay, leaves huge layers of potential traffic untapped, and imposes a barrier against the migration of workers to the mainland and the creation of new jobs at home. A series of careful calculations has indicated that a sky-bus business can be operated safely and soundly at a rate not to exceed \$42.50 each way.

On two occasions chairmen of the Board have suggested to officials of the insular government procedures by which

such a sky-bus service might be authorized; on each occasion the government, in applications to the Board, has followed these suggestions—only to have its petitions denied. Although the need has been acknowledged, the Civil Aeronautics Board has been studiously careless about implementing it. As this is being written, a third petition to the Board is being drawn.

FACILITATING OCEAN SHIPPING

The government has been likewise mindful of ocean shipping. Here, too, it has resorted to invention to give effect to its policy. The island reaches across the water for a large part of its food supply; brings in the greater amount of the materials which it fabricates; and sends to mainland markets the bulk of the crops and the commodities which it produces. As the level of shipping costs rises, the island is pushed away from the mainland; as it falls, the island is drawn closer.

In 1946 an arrangement was entered into, by the terms of which all tariffs are to be made by a process of collective bargaining between representatives of the government and of the ocean carriers. The procedure opens the carriers' books to the other party, provides for discussions with all interested groups, and eventuates in a series of joint meetings at which the schedules take shape.

The concern is alike with the level and with the structure of rates. It has been possible through this method to see to it that the total burden of costs is distributed among commodities in such a way as to be most easily borne. Promotional rates are granted to industries just getting started on the island, and food products for insular consumption are carried at the lowest rates which circumstances allow. Once framed, the tariffs are submitted to the Federal Maritime Board; and thus far they

have been approved promptly and without resort to formal hearing.

The whole realm of transportation reveals no precedent for this arrangement, no similar instance of the shaping of a tariff by all who are concerned.

A further venture in joint responsibility was recently taken. In August last, ranking officials of the government sat down with the high officials of the ocean carriers in the Puerto Rico trade for a three-days conference. This conference was held in New Orleans on the long-time problems of the Puerto Rico trade. The dominant theme was how costs—and accordingly rates—could be held to the lowest possible level. There was discussion of how a system of docks designed to serve a colonial port could be revised to meet the needs of a modern industrial community; of how ships could be scheduled to reduce the time of the turnaround; of how new methods and new devices could be made to speed and to cheapen the handling of cargo; and of how wastes could be eliminated and a new efficiency brought to the ancient arts of loading and unloading. It used to be said that "shipping follows the cargo"; it was the sense of the meeting that ocean shipping is an instrument for industrial development and the creation of cargo.

NECESSITY FOR TRADE

It is, however, not enough to broaden the "bridges" which connect island and mainland, or even to shorten them with every declining carriage charge. It is necessary also to take thought about the number of persons and the composition of the stream of cargo which can be made to pass across the stretch of water. On the eve of the first industrial revolution a Scot named Adam Smith argued that free play should be given to a division of labor, the pattern for which had been woven by Nature itself. As the second industrial revolu-

tion roars on, the target of Adam Smith stands as firm as ever; but the gifts of Nature and a hands-off policy by the government are no longer adequate to its realization. We know now that Nature provides only inert materials; that it is "the progress of the useful arts" which turns these stuffs into usable resources; and that it is only by taking thought thereto that a community can win for itself salvation.

It became obvious years ago that if Nature was allowed to take its course, Puerto Rico might as well cancel its date with destiny. If a people is to go it alone, Nature must be prodigal with its gifts. If, instead, a people is willing to set out into a world economy, a dearth along the physical front is not of necessity a handicap. In days of old it was Thebes, not Athens, upon which Nature had smiled; yet it was Athens, not Thebes, which became great in commerce and greater in culture.

The wealth of Malaya is today due in large measure to the cultivation of the rubber tree—a plant not even indigenous to the region. The great event in Malayan history has been the advent of the automobile in the United States—an event which a people halfway across the globe was quick to capitalize to its own advantage.

Scotland, as poor a land as ever the sun shone on, at the beginning of the eighteenth century piped down on its national glories, traded in its parliament for full rights in the rising British economy, and within a hundred years created for itself a highly skilled population which proceeded to conquer the Empire.

Providence has not lavished gifts upon Switzerland; yet the people who inhabit that mountainous region have managed to win for themselves as high a standard of life as any in all Europe. There was a beginning in the export of the Swiss Guard—as there was to the north

in the export of skilled archers. A way was found to export scenery by bringing in people to view it. The skill of eye and hand was developed; a host of handicrafts grew up. As skills increased, the products in which they were embodied became more valuable.

Today it is the value added by manufacture to products which go abroad that fetches in return the materials for living well and advancing culture. England was a sheep pasture headed for nowhere in particular, until it felt the quickening touch of overseas trade, which in turn led to an industrial revolution which converted it—for a glorious century and a quarter—into "the workshop of the world." Only as a people has forgotten its insularity and sought to discover for itself a set of tasks which it could perform in a larger economy, has opportunity come to knock at the door.

AGRICULTURAL TRADE

It has been necessary, therefore, for Puerto Rico to take stock of what the island had, or could contrive, to offer to the continental market. In keeping with its past, the inventory began with agriculture.

Under Spain there had grown up a plantation system with sugar as the staple crop. But, like the kindred staples of corn, wheat, cotton, and tobacco, sugar fell on evil days and became a candidate for farm relief. If a fair price was to be assured, there had to be a check on tropical growth. So Puerto Rico was content to accept the quota fixed under a succession of Sugar Acts. Although more acres were available and technical advances were still raising the yield per acre, sugar could no longer be depended upon to take care of the increase in population or to advance the art of living.

A coffee culture, which had been allowed to decline, was revived. By the

creation of species adapted to the local habitat, a pineapple industry was built up.

It was not, however, until 1949 that a program for the maximum utilization of soil resources moved into its stride. The growing season in Puerto Rico is an all-year-round affair. For that reason, the island can provide fresh fruits and vegetables even in the months in which the Rio Grande Valley lies fallow. Here air transportation, which is becoming available, allows Puerto Rican products of superior quality to reach Atlantic and midwest markets in a state fresh enough to command premium prices. An outgrowth of the recent New Orleans meeting is a venture which aims at the discovery of fruits and vegetables, easily grown on the island, for which a market exists, or can be created, in the region of the Gulf and the Mississippi River. Here, as always, the target of public policy is the creation of an agronomy as far as possible complementary to—rather than competitive with—that of the several states.

INDUSTRIAL DEVELOPMENT

But a population of two and a quarter million cannot live by agriculture alone. As with the England which sought to find a place for itself in the world, roles must be created for merchant adventurers and for honorable companies which will make the island their home. So the Industrial Development Company, an agency of public policy, was set up and given the all but impossible task of luring plants across the ocean to a land with an ancient tradition, where the requisite raw materials are hard to come by, and kindly channels of trade have not yet been driven. The advantages of insular location had to be demonstrated; an incentive had to be provided in exemption from taxes for a limited time; and

technical advice of many kinds had to be offered.

At first the Industrial Development Company went into the production of various articles—cement, glass, paper. But presently it became clear that the functions of the government and of private enterprise were complementary, not competitive. It was the office of the state to look ahead, to discover opportunities, to fit ventures into a flexible pattern which had meaning; it was the task of the company which came to the island to carry on as a going concern.

But from the first, industrial development has not been a thing apart, but an aspect of a larger program. It is a creature of population pressure and came into being to provide jobs to willing workers. If commodities are to be produced for which there is a continental market, it is imperative that "the new industry" make the maximum use of the insular labor supply.

The drive must take into account the most basic of all facts—that the dominant resource of Puerto Rico lies in the skills of its people. It must sell its labor in the mainland market in the form of value added by that labor to the raw materials of manufacture. Long ago, Scotland, England, and Switzerland learned that in the export trade, the value added to an article by unskilled labor is of little account; that it is the value added by highly trained skills that enhances the market price and brings real purchasing power in return.

The people of Puerto Rico are rich in potential skills; these skills are being made actual by expenditures on education, which represents a larger part of the government's income than is devoted to so creative a purpose by any state in the Union. It is for this reason that the reiterated beat for the program for industrial development falls not upon tall smokestacks and heavy investments, but upon the number and

the high degree of skills in the jobs brought into being.

SIZE OF THE TASK

All of this makes it clear that in Puerto Rico public policy has had to take on a gigantic assignment. In the cases of Scotland, Switzerland, and even England, time was indulgent, and centuries were allowed for gracious accommodation. The pressure of a population never adapted to its habitat commands haste. In recent years the task has been made easier by an exodus of thousands to the mainland. Here it is better for the island that those who migrate should be the unskilled; for skills are more easily picked up in the States, and the island cannot afford to squander training upon workers who do not remain.

Walton Hamilton, Ph.D., Washington, D. C., is with the law firm of Arnold, Fortas and Porter, which represents the Commonwealth of Puerto Rico in Washington. He has taught history, economics, and law at Yale University, Amherst College, and the universities of Texas, Michigan, and Chicago. He is author of *The Power to Govern* (1937), *The Pattern of Competition* (1940), and other books.

It is inevitable that the birth rate will experience a progressive decline. As its task of providing for additional souls becomes lighter, Puerto Rico will be free to direct its public policy at the larger target of advancing and enriching its standard of life. Value added by skilled labor to the commodities sent to mainland markets will bring in return an increasing stream of purchasing power. For Puerto Rico, the way to progress and prosperity lies in the conversion of dormant capacities into human skills and the employment of its highly trained labor in the production of commodities and services which all the people of the several states want. A proud people, true to its tradition and proud of its American citizenship, is hammering at the barriers of insularity. It lies ahead—but Puerto Rico is arranging its own rendezvous with destiny.

Labor's Role in Industrialization

By SIMON ROTTENBERG

IN the literature of the theory of location of economic activity, manufacturing industries are classified as materials-oriented if they tend to locate close to the source of raw materials; market-oriented if they tend to locate close to the market for the finished product; and labor-oriented if they tend to locate close to the supply of labor to be employed. In the special circumstances of Puerto Rico, in which natural resources which are commercially exploitable in the present state of the art of production are scarce, and in which per capita income is low and style consciousness is underdeveloped, it is residually true that manufacturing industry which locates in the island will be labor-oriented.

Labor-oriented industries are those in which materials and products are high in value, relative to weight and volume, and in which labor cost is a large part of the total cost of production. Industries of this kind search for low-priced labor. The entrepreneur who contemplates expansion of an old enterprise or the creation of a new one will calculate the cost of labor per unit of output in alternative places, and if he is rational he will locate where labor cost is least.

THE PRICE OF LABOR

With any given set of production techniques, labor cost is not a function of the wage rate but rather of the price of labor. The price of labor is the wage rate per unit of worker efficiency. A low wage rate in these terms becomes a high price for labor where workers are indolent, unenergetic, careless, and unskillful. Since the successful industrialization of Puerto Rico hinges on the achievement of lower labor cost, in

labor-oriented industries, than can be experienced in other places, it is quite clear that labor must be perseverant, energetic, careful, and skillful.

Comparison of wage rates in different places can be made with some assurance that truth is approximated, although even here large variation in job content, even where job titles are identical, raises comparative measurement problems of first-order magnitude. Comparison of the prices of labor in different places has not yet been done successfully, even at the level of approximation, because worker efficiency involves components which do not now seem capable of being measured. We know nothing, therefore, in objective terms, of the efficiency of the Puerto Rican worker compared to other workers in other places. Some research has been done in the comparative labor productivities of selected industries in Puerto Rico and the United States, but the statistics of labor productivity tell nothing about worker efficiency, since a host of other relevant variables are not held in *ceteris paribus*.

Despite the lack of objective evidence, we have a right to expect that the wage differential between this low-wage-rate island and other, higher-wage-rate, economically developed, places will be consumed at least in part by differential worker efficiency in favor of the higher-rate area. This is true of all cultures not dominated by the Puritan ethic and in which the history of industrial experience is short. However, the question which is relevant to industrial location and therefore to the prospects for industrialization of Puerto Rico is whether the rate differential is in fact consumed *only in part* or whether it

completely disappears. We know that the hourly wage rate in manufacturing in Puerto Rico is about 45 cents; in the United States it is about three times as high. What we do not know and what seems almost incapable of measurement is whether the ratio of worker efficiency in the two places is also one to three, or less or more than this.

If we cannot measure the components of the price of labor, we can at least speculate upon them. In the social sciences, informed and reasoned speculation, fortified by perceptive observation, may bring us to judgments as close to truth as we can come.

THE WAGE RATE

It has already been indicated that something is known about the wage rate component of labor's price in Puerto Rico. The general level of rates, compared to those in the United States, is low in all sectors of the economy. Prevailing rates tend to cluster at or just above the minimum rate established by federal and insular law; and the evasion of the legal minimum through extensive use of learners' certificates for the first months of employment and by violation of the law is widespread. It is not uncommon for establishments to pay a uniform hourly rate to all, or almost all, of its workers, and in these firms the wage structure consists of a single rate.

This practice may express the conviction of management that relative wages paid by the firm to variant occupational classes is not relevant to worker job satisfaction and worker output, because workers do not respond to wage incentives, or because their concept of justice is not related by them to the plant's wage structure. Or it may express a lack of awareness by managers of the influences that motivate workers to exert effort.

The economic explanation for these tendencies is clear. In an economy of chronic unemployment of human re-

sources, where labor is abundant relative to capital, wages will be low. The number of unemployed who are counted in a labor force survey will vary with the definition of unemployment and of in-the-labor-force status, and with the integrity with which enumerators use the agreed-to definitional standards. Counted as they are in labor force survey practice in Puerto Rico, about one-sixth of the labor force is unemployed, with seasonal variations above and below this as the time for taking in the cane crop comes and goes. Change in the age composition of the population over time and large-scale out-migration from the island in the past five years have not altered this proportion, or, if they have, the situation has been hidden by enumerative nonuniformities.

With unemployment as common as this, an enormous depressive pressure is exerted on the wage level. If trade unions could seal off job areas from these pressures, as they have successfully done on San Juan's water front, for example, they could force wages up beyond the general community level of rates for work of given skill; but it is difficult for unions to operate in closed shop ways when there is intense competition for available jobs.

Comparative wage level movement over time, as well as the level of prevailing rates at a given moment, is significant for the understanding of the locational problem and of the prospects for industrialization of the insular economy.

The same differential economic influences which cause rates to be low in Puerto Rico, relative to the mainland, also widen the absolute cents-per-hour gap between the two.

At this writing, the federal legal minimum wage in the United States is 75 cents per hour for industries producing for commerce. For most industries this rate is of academic interest, and prevailing rates for even their lowest wage

categories have moved past this figure. In Puerto Rico the 75-cent rate has no blanket application. The Administrator of the Fair Labor Standards Act has been authorized by Congress to set lower legal minimum rates, upon recommendations of tripartite committees which are assigned particular industries for which they are required to give their counsel. For most industries the legal minimum wage falls far short of 75 cents.

Since the supply of labor is large relative to the supply of capital in Puerto Rico, prevailing rates tend to be determined by the legal minimum rates, and the latter determine the volume of employment in the industry. The specific legal rates which are set for particular industries are affected by a constellation of complicated and psychological factors which need not be discussed here. It suffices to remark that upward wage movement by law has occurred at much less frequent intervals and in much smaller steps in Puerto Rico than has upward wage movement by nonlegal forces on the mainland. As a result, wage differentials have tended to widen rather than narrow, and it should have become more rather than less advantageous to locate in Puerto Rico than on the mainland, comparative worker efficiency being given.

What can be said of the nonwage components of the price of labor?

RECRUITMENT OF WORKERS

In some societies it has been difficult to recruit workers for wage employment of any kind, or for particular classes of employment, because of powerful influences which have obstructed the adaptation of the supply of labor to changes in the demand. These obstructions have tended to dampen the power of relative prices to allocate available labor among alternative employments, and have frequently brought economic development to a halt.

In total numerical terms, no recruit-

ment problem is encountered in Puerto Rico. Employment for wages is deeply rooted in the insular culture; the relatively well-to-do people are not encumbered by real property that restricts their movement; the practice of kinsfolk care of children loosens the tie to the family early in life; and there are no traditionally established ties to neighborhood or town. Internal population movement is old in the island.

The ease with which the people move may, however, have produced a new problem. Large-scale out-migration to New York City since the mid-1940's has created a Puerto Rican community there of such magnitude as to exert an attraction on those who have remained on the island. As this community grows in size, as families become broken between domicile in the island and domicile on the mainland, and as tales flood back to the island of employment opportunities to which high earnings attach, the "pull" on the island's inhabitants becomes more powerful.

If the propensity to mobility is enlarged by industrial experience, so that Puerto Ricans with a history of work in manufacturing establishments are more easily moved to go by virtue of their training, because they think they will be successful in the competition for jobs on the mainland, the island's economy may be a net loser from the out-migration.

Hand needlework crafts aside, there are no reserve pools of trained labor in the manufacturing arts in Puerto Rico. If a worker who has acquired operative skill is lost in the migration movement, he can be replaced only by the training of a green worker. To this problem the only solutions are either vast overtraining by giving skills to larger numbers than are needed, which involves cost to the community; or selective out-migration, which is difficult to administer in a free society in which people choose their vocations according to in-

dividual calculations of the net advantages of different employments; or the tying of workers to jobs by such a device as paying premium rates for length of service.

PSYCHOLOGY OF WORKERS

Training of green workers anywhere involves travail. In Puerto Rico, managerial and supervisory personnel must approach the task with perseverance, understanding, and compassion. Most workers in Puerto Rico are young. The median age of the population is about 19 years, compared to a median for the United States of about 30. Most workers brought into new manufacturing establishments will have had little previous work experience. If they are women and have been previously employed, they are likely to have been employed casually in needlework at home. If they are men and have been previously employed, they are likely to have been employed casually in agriculture or in a variety of self-employed or odd-job ways.

In casual employment, the worker chooses his hours of work and the effort he will exert in each hour. The casual quality of much of the employment in the island has had a profound influence upon the work habits of the people. Training of green workers, therefore, means not only transferring job skills, but also transferring the values which adhere to disciplined forms of work. On the mainland these values are already part of the culture of the worker community, so new workers have assimilated them in the subtle ways of informal learning.

The atmosphere of casualness leads the worker to find causes which he considers warrant his absenting himself from work. The absence rate will also be affected by the relationship between income levels and income aspirations. If a worker earns in four days what he aspires to earn in a week, and if he

can absent himself from a fifth day of scheduled work with impunity (without hazarding the right to earn for four days), he will tend to do so. Some have said that the earnings of workers in new plants in Puerto Rico are so high as compared to past earning experience and therefore as compared to their earning aspiration levels that precisely this phenomenon has occurred.

On the other hand, the opposite judgment suggests itself. At currently prevailing wage rates, daily earnings may be so low in relation to earning aspirations levels that the worker considers it more worth while to take the fifth day at leisure than to earn the marginal income to be derived from a fifth day of work. If the price of the day's leisure were eight or ten dollars, rather than three, the worker might consider it too high to pay. Which of these two hypotheses is relevant for the Puerto Rican worker is really not yet known, and indeed there may be individual differences in motivation for absence.

What other problems arise in pioneer plants in industrial frontier communities such as Puerto Rico?

WAGE INCENTIVES

There is, first, the problem of incentive wage administration. The special advantage of piecework over timework is that the former creates an incentive for greater output by paying the worker earnings in proportion to the quantity he produces. Assuming that workers are income responsive, an incentive wage system will telescope the period which transpires before the green workers in a pioneer plant have achieved output standards equivalent to those which prevail in the older industrialized regions. In the absence of wage incentives to output, this period will be prolonged.

The universal problem of incentive wage administration is to find the piece rate that will be high enough to moti-

vate the worker to apply maximum effort at work and at the same time low enough to prevent earnings that will be out of line with those of hourly rate workers in the same firm and with those of workers in other firms in the same labor market who are at similar levels of skill.

The problem is difficult to solve in pioneer plants, and it is quite common for the wage system in these plants to be administered in ways which cause it to lose its incentive effects.

Incentive wage systems are usually overlaid on base timework wages established either by law, by collective bargaining, or by administrative decisions of firms, unilaterally made. For a piece rate to constitute an incentive, it must be sufficiently high to enable the worker to exceed his guaranteed base timework rate with somewhat better than average effort. If enormous effort is required to bring earnings above the guaranteed base, the worker ignores the piece rate. The earnings are then determined by the base hourly rates, with worker output at a relatively low level.

As a matter of course, we can expect that green workers will produce little, since the capacity to produce in volume is something which develops with time and experience. A very high piece rate is necessary if the worker is to have an opportunity to exceed the base earnings which are guaranteed to him. If the piece rate is set high in the beginning, however, it may be too high when the worker has developed speed with the passing of time.

It is clear from the experience of American firms that rates do not fall easily. Frequently they cannot be reduced at all, without impairing management-worker relations, except by changing the job assignment so that the change in job content can be used as a pretext for the change in the rate.

The problem cannot be solved in a pioneer plant by finding the "correct"

piece rate, as it can be in an old plant. The rate which is "correct" for the green worker is wrong for the experienced one, and green workers will become experienced. There is no solution short of a willingness on the part of the workers to accept downward piece rate revision as they acquire skill.

WORKLOADS

Second, a problem occurs in the pioneer plant with respect to workloads and work assignments. In American plants, workloads, once established, become traditionally fixed. A worker who is asked to accept a workload higher than the standard of his community or his plant will feel oppressed and resentful and he will be subjected to the subtle social pressures of his work group, organized or unorganized, which will have defined, out of its own experience, what is considered to be a "fair day's work." Fast workers are slowed down to the group-accepted standard. But move a worker to a place where a higher standard prevails and is accepted by the worker community, and he will freely perform a volume of work which he would formerly have represented to be abusive.

In pioneer plants workloads are low. The green worker simply cannot handle large numbers of machines simultaneously. High workloads will cause machine stoppages, breakdowns, and unproductive operation. To assign too many looms to a weaver will mean that too many will be down while the weaver is repairing yarn breaks.

This is, of course, true of green workers even in old plants. But in the old plants, where the workload standards are relatively high, the green worker understands from observation that he will be expected in the end to tend the same number of machines as are tended by the experienced workers, and that the worker community accepts the high workload as proper and just.

In the pioneer plant, however, all the workers in the plant are tending few machines. Observation and experience tend to give traditional validity to the low workloads. Here the danger is that low workloads will become established in the work group's understanding of what is acceptable, and that every machine added to a worker's assignment will be considered oppressive and unfair.

The problem in the pioneer plant, therefore, is to find a way to make workers understand that the workloads assigned to them as inexperienced workers are temporary and tentative and that the goal standards are very much higher. Here, as in the case of the piece rate, labor relations policy needs to be pointed towards keeping standards flexible and preventing traditions from setting.

RURAL VALUES

Third, the pioneer plant quite frequently faces problems growing out of rural community value systems.

If the qualitatively superior part of the labor supply prefers to be placed in nonindustrial occupational capacities because work in industry makes a man a social pariah, only the rejects are available for the pioneer plant. If sharp interclass lines reduce social mobility and set upper limit rungs beyond which persons of lower-class origin may not climb on the occupational ladder, the pioneer plant must select personnel for particular classes of work from clusters from which some persons of talent have been excluded.

Precisely these situations have im-

portant influences in rurally dominated cultures. Own-account work on the land or work in the trades and service industries pays psychic wages; only "lintheads" go into the mills. Well-ordered rank associations of particular persons with particular stations in life limit the culturally realizable job aspirations of workers.

Both of these aspects of the rural value system have depressive effects on productivity prospects in the pioneer plant. Here is perhaps the most fundamental of all the problems of the industrial frontier—the problem of achieving the subtle envelopment of the frontier community by a culture pattern and value system which are favorable to industrial performance.

Envelopment of this kind means making revolutions in men's minds. In part it can be achieved quickly and through formal learning processes; in part it must come with a gradualness that the impatient must find distressing. Whether it will ever come to any society dominated by rural traditions depends, in great measure, upon the intelligence with which managers approach the task of managing.

The method of the whiplash, the order, and the menacing threat will not succeed. Neither will the transference into the factory of relationships implied in status systems defined by differentiated class origins of workers and managers in the extra-factory community. The charge of worker inefficiency is too often a cover for management blindness to some of the most elementary principles of sound and productive human-relations practices.

Simon Rottenberg, Ph.D., Chicago, Illinois, is postdoctoral fellow in political economy at the University of Chicago. He was director of the Labor Relations Institute and visiting professor of economics at the University of Puerto Rico, 1950-52, and director of the Social Science Research Center of that university, 1947-49. He has been active on numerous committees and missions in the Caribbean region in the field of labor and industry, and is author of many articles on those subjects.

Financial Institutions in Puerto Rican Development

By BEARDSLEY RUMI

ECONOMIC development in Puerto Rico proceeds irregularly along four distinguishable but related fronts—agricultural, industrial, distributive, and financial. Perhaps the professional should be mentioned—doctors, lawyers, engineers, accountants, and artists—but necessary as these talented people are to a workable society, it stretches the concept of economic development a bit thin to include them within it. Mineral resources and their development would be an element of the economic program, except for the fact that there are no known minerals in Puerto Rico worth mentioning.

Agriculture has long been a subject of developmental concern in Puerto Rico, and remains a major element in the Commonwealth's economic program. More recently, industrial expansion has been strongly emphasized and is recognized as essential in raising the level of living in a densely populated area devoid of important mineral resources. With agriculture, industry must contribute to a satisfactory balance-of-payments relationship which can support a better way of life for the people.

Distribution has long been seen as a problem of the first importance. Costs of goods at retail are high, availability is unsatisfactory, and those engaged in trade, by and large, do not profit greatly from their efforts. By modern standards, distribution in Puerto Rico is wasteful and inefficient, and it is a heavy burden on general economic development. But in spite of acute awareness of the problem, and persistent efforts of the government, the accomplishments in improving the system of distribution are negligible. Beyond the

technical difficulties, there is the fact that distribution is embedded deep in any culture in ways that are not strictly economic, and changes can be made only slowly and with difficulty. The causes that have prevented progress in distributive efficiency persist and will continue to make this area a tough one for economic development. A higher per capita income, the results of the educational program, and the heavy migration to and from continental United States will gradually produce a setting in which progress in the distributive arts can occur.

IMPORTANCE OF FINANCE

The financial aspects of economic development seem now to afford the greatest new opportunity for growth in the Puerto Rican setting. The adoption of the Constitution has given confidence in the political status of the Commonwealth and has opened the way to legislation that can facilitate the establishment and growth of financial institutions that are indispensable to a high-level industrial society.

The role of finance in economic development is not so often emphasized as are agriculture, manufacture, and distribution. Perhaps this neglect is because finance is less well understood, and appears to be a mysterious witchcraft that is somehow operated from London, Paris, Zurich, and New York in a manner both profitable and a bit sinister. And yet when the financial problem strikes agriculture or industry or distribution, it is as real as chemistry or physics or arithmetic; and until the financial problems are solvable, it is

impossible to get ahead properly with economic development.

The financial institutions important to the economic development of Puerto Rico are both governmental and private.

One government bank has been established, the Government Development Bank for Puerto Rico. This is not a "central bank," since Puerto Rico is not a sovereign state and does not have its own currency. The Federal Reserve System operates for Puerto Rico as for continental United States in the area of over-all monetary policy. The Development Bank is the fiscal agent of the government of Puerto Rico and handles the financing of security issues of the central government, of the several specialized authorities, and of the municipalities. It also is active in making loans to business in Puerto Rico, but these loans are made strictly on a prudent investment basis, except that the duration of the loans may be longer than that of a commercial bank. They are not a vehicle for indirect subsidy of economic development, no matter how appealing a particular case may be. Subsidies, in the form of uneconomic risk-taking from a banking point of view, are the concern of specialized agencies, such as the Puerto Rico Industrial Development Company, which have been organized and financed for that purpose, among others.

PRIVATE FINANCIAL INSTITUTIONS

Several types of private financial institutions have a part to play in economic development. These are (1) commercial banks, (2) specialized lending agencies, (3) savings organizations, (4) investment companies, and (5) international investment and trading enterprises.

Commercial banks

The basic functions of commercial banks are well understood. Puerto Rico

is adequately provided with these facilities, both by strong insular commercial banks and by well-equipped branches of major banks of continental United States and Canada. Projected growth of Puerto Rican industry and commerce will require additional capital for the local banks at some point if they are to hold their own with the resident branches, but such new capital may be expected to be available when needed, since the banks are profitable now, and growing business will make them even more so.

Specialized lending agencies

Specialized lending agencies serve the functions of factoring, acceptance, and discounting of assets arising in the process of production and distribution. These assets may take the form of inventories, work in process, accounts receivable, or other forms of customer liability. This form of intermediate capital is necessary to most businesses, and it is indispensable in any situation where development and expansion at a rapid rate are called for. It is obvious that the economic development of Puerto Rico on the scale and at the rate required by public policy makes the growth of these specialized lending agencies a matter of urgent necessity. At the present time, such facilities are rudimentary and the legal basis is inadequate. High on the agenda of new legislation should be laws that will encourage these specialized financial institutions.

Savings organizations

A program of economic development requires emphasis on increasing the savings of the people and channeling them into appropriate constructive use. This is necessary both to increase the money capital available for investment of all kinds and also to reduce the demand on existing output which would be currently

consumed. Governor Muñoz described the situation vividly in his address to the Seventeenth Legislature at its Second Regular Session on February 23, 1950. He said:

We must exercise our will power in order to invest as much as possible and spend as little as possible, since this is the way to put an end to the present situation, to enable our people to free themselves from want as quickly as possible, and achieve a modest degree of prosperity and security. . . . In pointing out the priority which investing should have over spending, I refer not only to the fundamental policies of the government, but also to policies which ought to take root in the whole community of Puerto Rico. At the most humble level, some grain for the furrow, not all for the loaf. On a higher level, fewer useless luxuries, more concentration of capital in the furrow of dynamic production.

Savings of the people are naturally a present element of the economy, but a better program for the future can be devised. More public emphasis on the desirability of saving and better methods of picking up small savings are in order. Attention should also be given to channeling savings into development. For example, on June 30, 1949 United States Postal Savings in Puerto Rico amounted to \$8,031,628. There were then 17,646 Postal Savings accounts with an average of \$455.15. It is understood that Postal Savings deposits in the island are increasing at a rate of about \$500,000 a year. Excellent as this instrument is for the individual saver, only a small part of the proceeds goes to help meet the investment needs of the Puerto Rican economy.

Investment companies

A financial instrument not now existing in Puerto Rico is the investment company which has proved so useful and so popular in the United States. The investment company serves a dou-

ble purpose: (1) it makes it possible for individuals with relatively small amounts of money to invest to place these sums in a diversified list of securities under continuous and expert management, and (2) it provides a pool of capital available for risk-taking equities. It would be possible in Puerto Rico to eliminate certain weaknesses in the continental United States laws affecting investment companies, particularly with respect to the treatment of capital gains.

With good laws, investment companies would flourish in Puerto Rico. Even though there be no limitation on the geographical location of an investment company or the residence of the stockholders (and there should be at most only a nominal one), the mere position of an investment company in Puerto Rico would attract the attention of the managers to opportunities for investment in Puerto Rican enterprise, and competition would inevitably result in flow of capital into local economic development that would otherwise not be available. Investment companies in Puerto Rico would improve the position of the Puerto Rican investor. It is not inconceivable that in time these companies would contribute strongly to making Puerto Rico an important financial center in a truly general sense.

International enterprises

An opportunity also exists to provide the legal basis for investment and trading companies which could operate all over the world outside continental United States. Such companies would contribute only indirectly to the economic development of Puerto Rico, but they would add to the prestige of Puerto Rico as a financial center. And if they were subject to even a minimum franchise tax, perhaps as small as 5 per cent on profits, they would contribute

a new and significant source of revenue to the Commonwealth government.

THE LONG VIEW

From the point of view of economic development of Puerto Rico, these financial institutions should be considered as means to an end—not yet as ends in

themselves. The time is not ripe for looking to Puerto Rico as a new financial center. However, there is no reason to think that over a period of time a new and powerful financial center will not arise, in view of the traditions of Puerto Rico and the unusual advantages which the Commonwealth affords under its new Constitution.

Beardsley Ruml, Ph.D., New York City, is economic adviser to the Government of Puerto Rico and is director of several business enterprises. He was formerly chairman of the Federal Reserve Bank of New York and has served variously as chairman of the board and in other capacities with numerous businesses. He is author of Tomorrow's Business (1945) and many articles, and editor of Manual of Corporate Giving (1952).

Culture Patterns of Puerto Rico

By JULIAN H. STEWARD¹

URBAN CHANGES

All segments of the Puerto Rican population have been influenced by industrialization, but the town and urban centers have responded most uniformly. Urbanization, itself a major trend, has entailed a number of characteristic changes. Not only do towns become much larger and comprise an ever greater percentage of the total population, but their functions and internal composition are being altered. The local communities mediate the national institutions to the countryside by serving as centers for marketing, wholesaling, retail trade, and credit; for governmental administration and for education, farm extension, health, and other public services; for the servicing and building trades and the transportation workers; for local political parties and labor unions; for religious and recreational functions; and for the distribution of certain mass media of communication.

While these new urban functions tend to create greater similarity between towns, they also differentiate the population within each town into special segments, classes, or sociocultural groups: wealthy commercial and professional personnel; civil servants, transportation workers, and servicing and building trades groups; and skilled and unskilled laborers. Most characteristic of these are the new middle classes of varied occupation and income. They represent a new trend, a new set of values which ascribes major importance to the symbols of personal achievement and wealth. Upward mobility in the socioeconomic hierarchy becomes a cru-

THIS essay will deal primarily with the culture patterns or life-ways of certain classes or segments of the Puerto Rican people, with special attention to how the processes of industrialization have modified a predominantly agrarian population. The term "industrialization" used in connection with rural people refers rather broadly not only to their involvement in a system of cash crop production and of consumption of mass manufactured commodities, but also, at least in the Western world, to the development of political democracy, an augmented role of the state in controlling and directing change and in providing services to its people, religious freedom, and other patterns which have accompanied technological progress and the growth of economic free enterprise.

In Puerto Rico, industrialization has produced certain general trends which provide a kind of common denominator to all classes of people. These trends began during the nineteenth century, but they were greatly accelerated during the twentieth century after the island came under United States sovereignty. Industrialization in Puerto Rico today is developing rapidly, and it involves not only general tendencies but certain economic patterns, a political ideology, a legal and governmental system, and other features specific to the United States.

¹ The present essay is a résumé of a forthcoming two-volume study written not only by the present author but by those who did the field research in Puerto Rico: Robert A. Manners, Sidney Mintz, Elena Padilla, Raymond L. Scheele, and Eric Wolf. My co-workers should share full credit and responsibility for the analyses herein offered.

cial goal; and individual effort, thrift, education, and utilization of governmental services and opportunities become means to the goal.

RURAL CHANGES

The rural population also is affected by these industrial trends. Cash crops or wage labor provides money with which to purchase desired items in the rising tide of manufactured goods offered by the town merchants, and to maintain a standard of living that carries prestige. The farm population is acquiring a cash-oriented value system, which is supplanting the older rationale of personal relations and services. The traditional patterns of labor exchange between small farmers, of personal favors and perquisites between landowners and laborers, and of kinship and ritual kinship duties and obligations are disappearing or being seriously modified.

However, the sociocultural groups created in the rural areas by industrialization are less uniform than those in the urban centers. Each rural region has a distinctive environment and therefore particular crop potentials. In each region the productive arrangement—the kind of crop, mechanization in field production or in processing, land tenure, capitalization and credit, and the nature of labor and of owner-worker relations—has created distinctive subcultures among the people involved. The present article is primarily concerned with the subcultures of the rural workers.

PUERTO RICAN CULTURE AND SUBCULTURES

In order to understand the cultural patterns of contemporary Puerto Rico, it is necessary to view the processes of industrialization against the background of the cultural tradition of the island. For four centuries the culture was essentially Hispanic, both in its national institutions and in its folk aspects.

Early in the island's history there were probably important subcultural differences between landowners, ecclesiastical and lay officials, craftsmen, merchants, subsistence farmers, and other groups. For an undetermined period there were probably also differences between ethnic groups—Indians native to Puerto Rico and from the continent, Africans, and Europeans of various origins and classes. But true ethnic minorities are not now important. The Hispanic heritage, however, was the basis of Puerto Rican culture and subcultures, and, despite the effects of industrial trends, many features of the tradition survive today: the Spanish language, certain familial patterns, religious practices, forms of recreation, food habits, and others.

Today, the Puerto Rican subcultures, or special regional and class groups, represent distinctive interactions between the Hispanic patterns, the local productive arrangements, the effects of industrialization, and the specific influence of Americanization. The subcultures are many and varied. Only certain of the more important types were selected for analysis: a representative *municipio* of the small farmers of subsistence crops and tobacco in the mountains, the so-called *jibaro*, who are in the tradition of the isolated and independent farmers of the island; the growers of coffee, both landlords and workers, who are of interest because they exemplify the traditional Hispanic paternalistic pattern of two closely interrelated classes; the sugar-cane workers on a corporate plantation and on a government-owned, profit-sharing plantation, both groups of whom comprise a rural proletariat; and the insular upper class, which consists of a few hundred families who live in San Juan, the capital, who represent United States commercial enterprises, and who are by far the most Americanized of any segment of the population.

In spite of these subcultural differences there is an over-all Puerto Rican culture, in that the Hispanic heritage provides a common background, the processes of industrialization are creating insular-wide trends, and most of the Puerto Rican people feel a sense of common origin and destiny. But the cultural common denominator can be overemphasized. The following pages will be concerned with the more important subcultures which have emerged from Puerto Rico's complex historical background.

THE SMALL FARMERS

The mountain farmers who grow their own foods as well as a cash crop of tobacco are of interest not only because they are numerically important but because they exemplify the adaptation of a formerly self-sufficient, isolated, and independent folk society to the demands of modern industrialization. During much of its history, Puerto Rico was somewhat distinctive among Spanish possessions in lacking important mineral wealth and in having little access to markets for such crops as it could grow. Until the nineteenth century the country was underpopulated, and there was ample opportunity for squatter farmers of Indian, Negro, and white ancestry to clear lands in the interior where they lived in comparative self-sufficiency and isolation from the state, the church, and the currents of world economy.

During the last century, however, world trends began to reach these farmers. Improved communications drew them more into the orbit of national affairs. The lure of manufactured goods stimulated their desire for cash, which they obtained primarily through growing tobacco. Tobacco can be grown at little risk, it can be rotated with other crops on small plots, and it requires no

expensive field or processing machinery. Moderate credit facilities will carry the producer over a year. Neither losses nor profits can be great. Owing to market restrictions, Puerto Rican tobacco production has not run to large plantations. It is the small farmer's source of cash income, whether he be landowner or share cropper.

Our study of a tobacco *municipio* shows that certain changes have accompanied the introduction of the cash crop. As the people still grow their own food, subsistence is not so vital a problem as it is in the monocrop sugar area, where all food must be purchased from wages. But cash goals have led to individualization of landownership, and, since population has increased beyond the agricultural resources, farms tend to be divided among heirs to the extent that individual holdings are often insufficient to support the family. This individualization of landownership has been a major factor in disrupting the extended family. Duties and obligations to the extended kin group have become secondary to responsibility for the immediate family.

The trends in land use and landownership have reduced the functional household and familial unit to the nuclear family. The somewhat patrilineal and patrilocal traditional Hispanic family has been modified in that residence and affiliation tend to follow lines of property, which may be inherited on either side of the family. The nature of the marital union, moreover, is affected by economic and social considerations. Where property or social status is involved, marriage is usually religious or civil; where neither counts, it tends to be consensual.

These tobacco farmers have a new value orientation based on monetary standards and the importance of individual effort. It is known that upward mobility in the socioeconomic scheme

can be achieved, and the people are eager to take advantage of all aids: education, farm extension services, health facilities, and the like. Simultaneously, interfamily relations based on labor exchange and other services lacking a monetary standard have declined. The goal of upward mobility has been facilitated by the constant fragmentation of landholdings, for it is possible for a thrifty and successful small farmer or sharecropper to purchase small parcels of land. Although few persons can acquire great wealth, there is considerable opportunity for upward as well as downward mobility in the socioeconomic hierarchy.

Social, political, religious features

The socioeconomic mobility in the tobacco region has influenced social relations. Class lines cannot be sharp, even though there are differences in wealth and corresponding differences in social participation, recreation, standard of living, and other features. Comparative equality is manifest in various ways, including the nature of the *compadrazgo*. *Compadres* (coparents, that is, godparents of one's children) are selected from among one's economic superiors and inferiors as well as among one's equals.

Political ideology of the tobacco farmers is consistent with other aspects of their culture. They are independent in their political as well as economic and social attitudes. Since they are actual or potential landowners, they stand less to gain than the proletariat of the sugar areas from a political program designed to benefit landless workers. The greatly expanded governmental services have been to their advantage, and they have utilized them perhaps more than any other rural group. But in the 1948 election, a much larger portion of the tobacco farmers than of any other rural group voted for the rather militant *Independientistas* rather than for the domi-

nant Popular Democratic party which has stood for rural and social reform.

The small mountain farmers are traditionally and nominally Catholic, but Protestant sects have begun to penetrate the area. It is perhaps too early to appraise this trend, but a factor which appears to favor the new faiths is the ideal of individual initiative and the concept of individual responsibility—the "Protestant ethic," which is part and parcel of the new socioeconomic trends. Another aspect of religious change is that the Catholic festivals, although still observed, have assumed a recreational rather than religious character.

THE COFFEE HACIENDA CULTURE

The coffee haciendas are of interest less because they involve large numbers of persons today than because they still exemplify in many ways a typically Hispanic pattern which once characterized much of the sugar area as well as the coffee area. The earlier pattern has been perpetuated through several factors.

First, coffee cannot be the poor man's cash crop, for it requires a fairly large capital outlay. Unlike tobacco, which can be grown on plots of any size and during brief periods, coffee requires a fairly large acreage in order to justify the processing equipment; and, since it does not bear for several years after planting, the owner must have resources to carry him over. There are a few small and medium coffee farms, but the tendency is toward large holdings which are worked by peasants or landless laborers. Because needed capitalization for coffee production has increased, coffee haciendas tend to become fewer and larger.

Second, since coffee production can be carried on profitably in isolated areas which lack improved roads and communications, the farm population tends

to remain socially and culturally isolated from the urban centers. Public services, political ideologies, and the effects of mass media of communication have been slow to reach the coffee workers.

Owner-worker relations

The productive arrangements of the large haciendas set the framework for the survival of the traditional culture. The owners are largely Spaniards, often third or fourth generation, and they constitute a well-defined upper class of highly educated and sophisticated persons who maintain close ties with the town. The laborers, both peasants and landless workers, are mostly native Puerto Ricans. The relationship between owner and worker is typically paternalistic, personal, face to face, and variable, as compared with the impersonal wage-based and legalized relationship in sugar production. Between owner and laborer there is a mutual dependency, a system of personal understandings and perquisites. The laborer is paid in wages, but since work is seasonal he is also granted favors in lieu of wages, such as a subsistence plot on which to grow foods, or the chance to burn charcoal on shares. The owner takes a personal interest in him, advising him in his affairs and looking to his welfare. In return, the worker renders unpaid services to his landlord and may even supply daughters as servants in the landlord's household.

The culture of the workers and peasants reflects the isolation and traditionalism perpetuated by the productive arrangement. The family is strongly paternalistic. The father manages its property and income, directs the labor of all its members, including the children, who usually perform useful tasks, and dictates the social behavior and marriages of his offspring.

Solidarity and reciprocity within the

working class are manifest in many traditional ways. There is labor exchange based on reciprocity rather than on monetary standards; there is visiting and participation in socioreligious events; there is choice of *compadres*; and there is intermarriage.

Between owners and workers, relations are reciprocal but unequal. They include the system of favors and services already mentioned. The workers seek *compadres* among the owners in order to strengthen their position, but the reverse is not true. They look to the owners for leadership in political as well as economic and social affairs. They are not yet sufficiently sophisticated to recognize the program of the Popular Democratic party as their own. They have too little economic opportunity to place value on individual effort, too little access to and use for education to recognize it as a means of upward mobility, and too little chance to utilize governmental services to feel that these are vital to them. They depend upon their landlord rather than upon unions, political parties, or the government.

Religion

The coffee workers are perhaps the most thoroughly Catholic of all farm people, but their Catholicism is not wholly orthodox. Partly because of limited contact with the church and the priests, the religion tends to center in a cult of saints. Formal church rites and priestly administrations are secondary to a system of household and village saints which constitute the principal supernatural functionaries. These saints receive prayers and supplications, and if they fail to respond they may be punished. At the same time, certain church rites such as baptism sanction *compadre* relationships and hence have great sociological importance. Moreover, the many religious festivals pro-

vide a traditional form of recreation, in contrast to other regions, where social dancing and sports have become popular.

SUGAR PLANTATION CULTURES

The sugar regions of Puerto Rico exhibit the most pronounced effects of industrialization upon the rural cultures. Since sugar is produced competitively for an outside market, it is necessary that the most modernized methods be used in field production and processing. The mills cost a half-million dollars or more, and in order for them to operate at maximum efficiency, cane from a vast acreage must be fed into them. Sugar, therefore, tends to be monocrop, and subsistence farming, which is so vital to the rural people of other areas, is virtually eliminated.

Earlier in Puerto Rican history, when sugar plantations had ox-driven mills and simple steam boilers, they were family owned. At one time they depended partly upon slave labor; later upon free labor. The productive and social arrangement was the family hacienda type. As technology advanced and the necessary capital outlay increased, there became fewer and larger mills and plantations. Less opulent families, which could not afford mills, contracted to have their cane ground at the large plants. On the arid south coast, however, where cattle ranching had prevailed and where irrigation projects were essential to sugar expansion, the costs were best met by corporate credit. Meanwhile, through its program of land reform, the government finally bought up many production units and made them into profit-sharing mills and plantations.

The corporate sugar plantation

The corporate community on the south coast consists almost entirely of a very homogeneous group of workers

who have a considerable Negro admixture, having descended in part from slaves. There is no upper class today, for the private owners have sold out and moved away. Their economic functions have been taken over by a handful of managers representing the American corporation. The middle classes of the community are small, for many of the services they would normally perform are carried out by the corporation.

The working class differs profoundly from that of the tobacco and coffee regions. It consists entirely of wage earners, whose employment is seasonal and whose income is barely adequate for survival. There are no subsistence plots, and there is no system of personal favors between owner and worker, as on the family hacienda. The workers even have difficulty to find dwellings. They live in clusters of houses on small plots on some of the older hacienda centers, along public highways, and on the beach.

There is remarkable similarity among all members of this class, since opportunities for advancement are absent, and the position of everyone is fixed by a uniform system of wages and agreements. The ideal of self-improvement which characterizes the tobacco farmers is absent. Escape from the fixed socioeconomic status can be achieved only through out-migration or through winning a stake in illegal gambling or bootlegging, both of which would be regarded by the highland people as unwarranted risks rather than as opportunities.

The sugar workers place little value on individual initiative. Their hope is not to achieve upward mobility through education, thrift, or effort, for the job hierarchy holds no place for them. Instead, they seek common goals through the collective means of the labor union, which not only is used to bargain with management but which is a political in-

strument that lends mass support to the Popular Democratic party in its legislative struggle for improvement of wages, hours, and working conditions.

In the typical labor-class family, all members who are old enough work for wages, which gives a measure of independence to each individual. Since neither property nor considerations of religious orthodoxy are important, marriage unions are largely consensual. Because divorce is frequent and children generally remain with the mother, the family has a matrilineal and matriarchal character. The *compadrazgo* has proliferated among the sugar workers, and a person may have thirty to forty *compadres*. *Compadres* are always chosen within the working class, however, for the American managerial staff will have no part in such arrangements. Ritual kinship, therefore, instead of binding together members of different socioeconomic classes as in the tobacco and coffee areas, serves as a surrogate for extended kin ties and as a means of furthering the security of the individual within his class.

The homogeneity and solidarity of the working group is also expressed to some extent in religion. Here more than anywhere else on the island, evangelical sects of Protestantism have made considerable progress. This seemingly reflects in part the traditional association of orthodox Catholicism with the ruling upper-class whites, and in part the need for a common emotional outlet which such religions frequently provide insecure groups. Despite the large Negro element in this community, no religious beliefs or practices of unquestioned African provenience were found.

The profit-sharing sugar plantation

The culture patterns and the attitudes of the workers on the government-owned, profit-sharing sugar plantations are very similar to those of the corpora-

tion employees. The workers do not have a sense of proprietorship and participation in plant affairs, because they do not manage the plant. In fact, they speak of it as "the corporation." The line of authority from worker to mill runs a devious course. The worker belongs to a union and supports the Popular Democratic party through the local organization. The party controls the government, which in turn appoints the plantation managers. The workers bargain directly with the managers through their union.

Two features distinguish the profit-sharing plantations from the corporate ones, but these have made little difference in the lives of the workers. First the workers receive proportional benefits, but this provision has been counterbalanced by the need to spread work as widely as possible, so the labor force is several times as large as it need be, and individual income is very low. Second, subsistence plots have been provided the workers, but since little value is attached to owning land and growing one's own food, the people turn during the "dead" season to activities which yield cash, and make slight use of their plots.

Fixed essentially in a proletariat class, the workers constitute a fairly homogeneous sociocultural group. The processes of industrialization have not affected them as deeply as on the corporate plantation, for they were fairly recently on family haciendas, and the older patterns survive in slight degree. But the nature of the family, life goals, economic activity and union organization, and political attitudes are substantially the same as under the corporation.

The greatest difference between government and corporation workers is in religion. The saint cult survives in some strength among the former, and there is considerable fear of witchcraft. A plausible explanation of witchcraft is that the general insecurity of the peo-

ple has led them to channel hostility toward competitors—in this case especially migrants from the highlands seeking jobs—into a fear of supernatural measures rather than to express it overtly.

THE UPPER CLASS

The Puerto Rican upper class is limited to a few hundred families which are distinguished by their wealth, their social prominence, and their extreme Americanization. Their income is usually over \$10,000 a year. Most of them are engaged in commerce, especially as representatives of United States business firms, although some also derive income from the land. Unlike the wealthy agrarian families such as the coffee growers, the primary economic allegiance of these families to the United States has been a major factor in their Americanization.

The necessity of carrying out business activities on American terms has profoundly affected the lives of the upper-class people. Children are indoctrinated at an early age in the status and role they will assume. They become accustomed to luxurious housing, automobiles, servants, and other evidences of a very high standard of living. They are educated in American social customs and business practices. Many of them are sent to the United States for their high school education and most of them for college education, which is taken in the business and professional fields. As adults, they are largely business executives.

Cultural characteristics of the Hispanic heritage are rapidly disappearing among upper-class families. They are bilingual, but it can hardly be said that they are bicultural. The nuclear family of man, wife, and children is acquiring independence of the extended kin ties, just as it is in the United States. There is a great love of children, but the num-

ber of children has decreased despite prevalent Catholicism which disapproves of birth control.

These families must deal with Puerto Ricans in their business activities, and consequently they understand Puerto Rican behavior. But to a large extent they force their own terms upon business associates and thus become an acculturating influence.

In their relationship to one another, the upper-class families constitute a strong in-group which moves in restricted circles. They belong to highly exclusive social clubs, and their patterns of visiting and entertainment involve only their equals. Social and recreational activities have assumed a predominantly American character. Political attitudes are conservative. The upper class has been opposed to the program of the Popular Democratic party, but since the latter seems to have moderated its social reform program, most of the class has supported it. These classes may also be described as conservative in religion, in that Catholic orthodoxy continues to characterize them.

SOME CONCLUSIONS

The acculturation of the upper-class families has resulted not only from the general processes of industrialization but also from conscious borrowing of the patterns of upper-class business families of the United States. These Puerto Rican families, however, have played only a minor role in acculturating other local groups. They have, no doubt, strongly influenced the lower echelons of the business classes with whom they have direct contact, but their subculture presupposes an economic basis and opportunities which are absent among the workers, the peasants, and the small farmers.

The tobacco farmers and the sugar workers are similar in many respects to

their counterparts in the United States, but the similarities are less the result of borrowing (these groups have had little contact with one another) than of the industrial trends which have introduced national institutions of a North American type into Puerto Rico. Many North American culture elements, such as manufactured goods, clothes, sports, and motion pictures, have also spread very widely in Puerto Rico, but they have been incorporated in local subcultures which are patterned quite differently.

This article has emphasized the subcultural differences, the distinctive life-ways, found among certain segments of the rural population, rather than the common denominator of Puerto Rican culture. There is, of course, much that all Puerto Ricans share. All groups speak Spanish, and they have in common something of the Hispanic tradition of familial patterns, the Catholic religion, the *compadrazgo*, music, dancing, and recreation. They were all once under Spanish political, economic, and

religious domination, and they have been under United States sovereignty for a half-century.

The new goals, values, and patterns created by industrialization have been mediated specifically by the United States, but they would undoubtedly have been much the same under any other sovereignty. They have set up new currents of political, social, economic, and religious activity. Fundamental and rapid change is always disturbing. Most Puerto Ricans quite understandably react to some degree against these trends; that is, they exhibit evidences of insecurity. Some are openly antagonistic to the United States, which they hold responsible for what is happening to them. If Puerto Rico can be said to manifest nationalism, however, it is a form of cultural rather than overtly political nationalism. It is the spontaneous and inevitable reaction of all segments of the population to profound changes brought about by a set of institutions which has been imposed upon them from the outside.

Julian H. Steward, Ph.D., Urbana, Illinois, is graduate research professor of anthropology at the University of Illinois. He has taught at the universities of Michigan and California and has served as senior ethnologist at the Bureau of American Ethnology, director of the Institute of Social Anthropology, and professor of anthropology at Columbia University. He is author of many papers and monographs on American ethnology and archaeology, editor of a six-volume Handbook of South American Indians (1946-50), and co-author of a forthcoming study of contemporary Puerto Rican cultures.

The Transformation of the Spanish Heritage

By FRANCISCO AYALA

WHEN I am asked to make a study of the distinctly Spanish elements in Puerto Rican culture and of the continuities and mutations of the Spanish heritage, so as to point out the transformation it has undergone, I believe it is necessary first of all to establish the fundamental facts which are generally unknown.

The particular nature of this island's political relations with the United States has hindered the knowledge of such facts to the point that today very little is known about Puerto Rico in the United States or in the Spanish-speaking countries; and even in Puerto Rico itself, false estimates are made of the effect caused by factors capable of influencing its cultural situation.

These political relations have spread widely the idea that Puerto Rico represents a field of cultural hybridism, a meeting place as well as a place of fusion of North American and Spanish "culture." An example of this wrong idea is the question put recently by Congressman E. H. Hedrick of West Virginia to Mr. Antonio Fernós-Isern, the Resident Commissioner of Puerto Rico, asking if the majority of the Puerto Ricans *still* speak Spanish. Mr. Fernós-Isern answered: "The community language of the island is Spanish. Puerto Rico is a community of Spanish extraction completely. Naturally, the people speak Spanish in the family, from father to child, as English is spoken in the United States." He added that about 30 per cent speak English fluently, and that "most of the population understand English to the

extent to which they have been educated."¹

The picture of a Puerto Rico where the Spanish language is retreating before the advances of English is widespread also in the Spanish American countries. The Puerto Ricans themselves exaggerate and dramatize their alleged idiomatic tragedy, considering the contamination of their language as something peculiar to them and a result of their political relations with the United States, whereas on the contrary it is a quite general phenomenon.

The language problem, to which I shall come back later, presents to us in the clearest form the subject of the alleged cultural collision in Puerto Rico.

AN INTRACULTURAL RELATIONSHIP

But before taking a stand on this problem, it seems wise to examine strictly the facts to be considered. First, let us discuss to what degree we may talk about "cultural collision" between the United States and the Spanish American countries. The opposition between the two is emphasized by the difference in language and especially by the historical conflicts of power; but it would be incorrect to postulate in absolute terms a true cultural dualism, the sole base from which it is legitimate to trace every problem by cultural impact.

In relative and indefinite terms it is acceptable, no doubt, to refer to a Spanish culture, as well as to a Puerto Rican, Colombian, New England, or Californian culture. This points out local

¹ *Congressional Record*, Vol. 98, No. 92, May 28, 1952.

variations, and there is no harm in it; we all understand each other. But in more precise terms, and taking the word "culture" in a strict sense, the United States and the Spanish American countries, together with England, France, Spain, and others, belong to the same Western culture, internally diversified, of course, until it reaches the social atoms which are human individuals. We may properly speak about impact, collision, overlapping, or assimilation, only when cultures of completely different and independent roots come into contact. This concept of acculturation or transculturation would be valid, for example, to study the relationships of the European conquerors, colonizers, or immigrants with the Indians of the Americas.

The cultural relations between Puerto Rico and the United States are of a very different nature, because when political contact started with the American invasion of the island, Puerto Rico was already a territory perfectly and completely incorporated into the Western culture, within the Spanish branch, just as the United States was, under the Anglo-Saxon branch. The cultural imbalances which the political dominion could have caused—which we shall examine in detail—would be, rather, maladjustments between two sections of the same culture, and only in these relative terms should they be considered.

Not even in the very fundamental aspect of religion should we speak about an impact of different cultures; for even though in one country the Reformed churches are prevalent while in the other it is the Catholic Church, they are both forms of Christianity, and the prevalence of each church is moderated and balanced by the respective influence of the strong North American Catholic minority and of the Puerto Rican Protestant minorities.

The second question to be made clear

is this: To talk about cultures as something immutable and stable is a result of mental simplification, since every culture is in motion, in evolution, and subject to constant changes. We have to examine, then, to what degree those supposed cultural imbalances of Puerto Rico under the political dominion of the United States are only minor disagreements within one culture essentially the same. We also have to consider whether or not the few or many alleged cultural influences of the United States on Puerto Rico are nothing else than the result of historic-social changes which the Puerto Rican community would have undergone anyway as part of the common Western culture.

THE POLITICAL SYSTEM

Having said this, let us now proceed to consider, in a very brief way, what I believe to be the decisive points in this case.

One primary factor of positive influence is that of government relationship. It was in this respect that the American dominion produced the most immediate and effective impact on Puerto Rico, since with the transfer of power all relationships of Puerto Rican society with the official authorities had to fit into the pattern of the American political system. The inevitable result was an adaptation of the island's political customs to American institutions and practices.

To attempt an evaluation of this cultural influence it is necessary to keep in mind that this division of culture—namely, political institutions and government procedures—is really a technique of social control. It is as communicable as any other technique. Countries often adapt their political regime to a definite model adopted from the outside. For instance, we see the influence of British constitutionalism over the rest of the world, that exer-

cised by the French Revolution, and that of the North American pattern itself over the constitutional law of Spanish America. History does not lack an example of a country which willingly adopts the constitution of another.

It is true that in the case of Puerto Rico there was no spontaneous imitation of institutions, but a forced inclusion in the American political order. But even so, this operation did not imply a violent distortion of well-rooted norms of political life—which did not exist—but rather a procedure of accelerated adaptation, imposed by necessity, to a regime which was then generally estimated as close to the ideal goal. However, an independence movement rose against it, nourished ideologically by the nationalist dogmas, and sentimentally by aversion towards the North American people or at least disgust towards a feared absorption. But that movement, which has no doubt had considerable influence on the further political development of the island, could not prevent its adjustment to the American institutional order, determined by the pressing requirements of reality.

We should ask ourselves whether that is a deplorable result. Personally, I do not think so. Puerto Rico has taken from American politics the sanest principles and practices, without yet spreading in the island certain pernicious aspects of continental politics. On the other hand, the liberal spirit of that system has permitted the development of a growing political autonomy of the island. This is reflected in the recent Constitution of the Commonwealth, which is subject only to the limitations of keeping the republican form of government and individual rights (limitations which I wish were imposed by international norms in my own country and in all countries, not excluding, of course, the United States), unless we

should consider it insupportable to be unable to show some attributes of that "sovereignty" which has become little more than symbolic to the great pre-war powers, and which would be ridiculous in the true conditions of an independent Puerto Rico.

THE LEGAL SYSTEM

Closely related to the political status of the island is the legal system in force. The presence of the Spanish system together with the American and with the new norms developed by insular legislative practices offers jurists and theorists of law a very interesting subject for study. Of course, even today, when the judicial order is declining everywhere, the juridical norms are still influencing social life a great deal.

The legal possibility and consequent practice of divorce may serve as an example of the effect of juridical institutions on the patterns and values of a community. The large number of divorces in Puerto Rico is usually attributed to North American influence, and many similar examples could be cited. But the truth is that these are social changes experienced with greater or less intensity everywhere by a spontaneous movement of the social body, placing the traditional patterns of society in contrast with new ones which evolve within it.

When sometimes we find in the same edition of a Puerto Rican newspaper news about the granting of divorces and judicial complaints based on American concepts, together with other news describing perhaps a criminal reaction caused by the old concept of sexual honor, or the use of the word "dishonor" referring to violation or seduction, we must not forget that similar contrasts can be found in the press of Spanish American countries not bound to the United States. In Cuba and Mexico divorce is practiced very much

in their middle and upper classes, while in the lower classes, as in Puerto Rico, there is not much divorce because originally the conjugal union was informal.

ECONOMIC RELATIONS

Together with the political and judicial consequences from the relationship between Puerto Rico and the United States, we should place the economic relations as a factor of cultural influence. Here as in the other aspects, I shall have to limit myself to some general indications.

To affirm that Puerto Rico is, from this point of view, a colony of the United States, could be admissible in the voluntarily imprecise terms of political propaganda, but not when we wish to describe reality with a certain rigor. Actually, there is nothing which could be interpreted as economic exploitation of Puerto Rico by that metropolis. The concrete terms of the economic relations between them might be criticized; whatever is detrimental to the island's interest should be improved; but, honestly, we cannot say that the United States is exploiting it. The existing problems in this respect are those characteristic of any relationship between a very powerful and highly industrialized economy, like that of the United States, and a basically poor and rural economy, which now starts its process of industrialization, such as Puerto Rico.

Substantially, the situation is identical with that prevailing between the United States and the rest of the Spanish American countries. I believe that the political links which exist here are reflected in a rather favorable way in the economic relation, so that Puerto Rico may be considered, given its limited resources and very bad prospects, in a privileged position as compared with the other countries in the American orbit. To mention just one aspect,

the migration of its excessive population to the United States is evidently favored by the existing political agreement.

CULTURAL EFFECT OF INDUSTRIALIZATION

Most of the influences considered as American in Puerto Rican culture are derived from these economic conditions. The introduction of products of an industrialized economy is reflected in the way of life of the people, imparting to them new attitudes, and thus giving origin to new patterns of conduct in all orders. The use of products of modern industry, which has developed so rapidly during the past decades, places human life within a net of devices which affects all our activities and which therefore modifies our whole experience, largely affecting the total culture.

The changes Puerto Rico has experienced at the beginning of industrialization are incomparably faster and more violent than the gradual changes of a society whose economy has not reached this technical stage. And that is why the countries at the head of this process, in which social life has first experienced the corresponding transformation, are considered by those left behind as the "guilty"—leaders by example in an alteration in the customs which is really caused by technological changes introduced everywhere little by little. Even in highly industrialized countries, as England or Germany, they talk of "Americanization" of customs to describe social transformations which occur in their midst. That influence will be felt even more where almost all products of industry are of American manufacture; not only in Puerto Rico, but in all countries in the North American orbit.

Technological advance brings changes not only in types of conduct but also in words. The new objects of common

experience have English names, and the techniques related to their management are often characterized by English words.

MODIFICATION OF LANGUAGE

And here we have once more the language problem, which, as we said at the beginning, presents in the clearest form (and perhaps also in the deepest form) the question of cultural relations between Puerto Rico and the United States.

To begin with, the smallness of the country, its isolation with respect to the Spanish-speaking world during the last half-century, and the speed of its industrialization in the last ten years have no doubt stimulated the introduction of English words—mainly related to technical and administrative procedures—into the common language. It lacked the resistance of a community relatively large and sure of its future, and the genius of its own language has taken the pitiful revenge of putting into Spanish the words introduced (*reportarse*, *chequear*) or of mispronouncing them. It is nevertheless curious to note that, while in the southern part of the American Continent they pronounce the word "nylon" in the English way, in Puerto Rico they call it "nilón."

But there have been other factors operating in the same way and contributing to the deterioration of the language of Puerto Rico. The main one was perhaps the attempt (prolonged for several years and of which some traces are still left) to teach everything in English. I shall not examine that attempt, which has been sufficiently studied and discussed by those who know the problem better than I do. But I shall point out the results of the educational confusion it produced, with the only evident profit of making the Puerto Rican hesitate whenever a name learned in English as a student comes up in the conversation. These are usually names of tools, places,

or institutions; in general, all those which are beyond the everyday experiences. The Puerto Ricans hesitate between the English word taken from their school texts and the corresponding Spanish word of which they are almost never sure.

However, the Puerto Ricans evidently exaggerate and dramatize the seriousness of their idiomatic situation, considering it very exceptional and attributing it completely to the political circumstances of their country. We have already seen that these only serve to intensify the invasion of Anglicans, which constitutes a phenomenon found also in all the other Spanish-speaking countries, not excluding those of the Iberian peninsula.

In short, the idiomatic situation of Puerto Rico differs only in value and degree from that observed in other countries of the same geographic zone. Therefore, we cannot talk of bilingualism (for this consists of the indistinct and alternative use of both languages), and much less of hybridism. The native language of the island is Spanish; and English is learned as a second language. Its knowledge is essential for practical and cultural reasons, so it is a general aspiration that it be spread and perfected as much as possible.

COMPARISON WITH PHILIPPINES

This situation may seem strange to those who, not well informed, compare the case of Puerto Rico with that of the Philippine Islands. These islands fell under American rule at the same time as Puerto Rico, and in them the English language is now predominant to Spanish. But the Philippine Islands were in very different cultural conditions. There, for reasons which we do not need to mention now, the Spanish colonizers, particularly the clergymen, preferred to adopt the policy of learning the local dialects, especially Tagalog,

instead of imposing Spanish; and when the transfer of power took place, most of the native population still spoke—as today—their own languages. When the Philippines were given their independence, Tagalog became an official language together with English and Spanish.

Therefore, we are dealing here with a true case of acculturation; for the Western culture, first brought by the Spaniards and then by the Americans, is penetrating little by little into a country of foreign culture. Once more the language problem is a revealing sign of cultural circumstances. Long before the American troops arrived, Puerto Rico had ceased to be a colony, sociologically speaking, and had become a territory perfectly incorporated into the Western culture under the Spanish branch.

CONCLUSIONS

Finally, from what we have said, we may arrive at the following conclusions:

1. Puerto Rico has kept intact the nucleus of the Spanish cultural tradition. The native tongue of the Puerto Ricans is still Spanish, although a great

number of them have learned and possess in a very variable scale—from a few words to a complete command—the English language.

2. The traditional culture of Puerto Rico is not static, of course; it has changed with time. The evolution experienced by Puerto Rico is parallel to the general line followed by other Spanish countries and by the rest of the world. The relationship of the island to the United States has no doubt stimulated and accelerated that evolution.

3. There is not a contrast of opposition between Puerto Rican and North American culture. The adaptations of the former to the latter, in certain points, were necessary to enable the sociopolitical conditions of Puerto Rico to profit from association with the United States.

4. For this same reason, the political links of Puerto Rico to the North American federation develop—as they are developing today—in satisfactory terms which permit most Puerto Ricans to feel comfortable holding American citizenship and participating in its common values.

Francisco Ayala, LL.D., Río Piedras, Puerto Rico, is chairman of the Basic Course of Social Science at the University of Puerto Rico. He has served as professor of political law at the Universidad Central (Madrid) and as professor of sociology at the Universidad Nacional del Litoral (Santa Fe, Argentina). Besides many translations from different languages in the field of the social sciences, he has written numerous original works, the latest of which are Ensayo sobre la libertad (México, D. F., 1945), Jovellanos (Buenos Aires, 1945), Tratado de Sociología (3 volumes, Buenos Aires, 1947), and Introducción a las Ciencias Sociales (Madrid, 1952).

Training and Research in Puerto Rico

By MILLARD HANSEN

RESearch and training in Puerto Rico are especially creative, effective, and economical.

CHARACTERISTICS OF PUERTO RICO

The Commonwealth of Puerto Rico is a frontier state on the border between North and South America. As Governor Muñoz Marín said in December 1950:

Puerto Rico is a Latin American country consisting of good citizens of the United States. It is united to the north by fraternal political ties, to the south by fraternal racial and historical ties; and to both by the cultures flourishing and mingling upon its soil.¹

Geographically, Puerto Rico is a cross-road between the continents of the New World and between the New World and Africa. The great planes flying south to Caracas, Port of Spain, Natal, and Rio, or east to the Cape Verde Islands or to Dakar on the coast of Africa, or north to New York, or west to Port-au-Prince, Kingston, Havana, and Miami, carry travelers, students, and the civil and military officers of government through Puerto Rico.

Politically, Puerto Rico is a Spanish-speaking commonwealth governing itself under its own constitution, which nevertheless is not separate from but rather freely associated with the United States: the Constitution, courts, citizenship, and many laws of the United States have effect here in no way different from that in the forty-eight continental states; and yet Puerto Rico is not a state of the Union. Since the establishment of the Commonwealth, Puerto Rico is not a

state of the Union, not a separate republic, and not a dependent territory; a new kind of polity is being created which, because it is new, fits awkwardly into the old familiar categories of political science.

Economically, Puerto Rico stands wholly within the tariff, money, shipping, and market boundaries of the United States, but it is on the border between the highly developed industrial economy of the United States and the less developed raw materials economies of Latin America, Africa, and Asia. Whereas there are 10 males per square mile employed in agriculture in the United States and 382 in Egypt, there are 170 in Puerto Rico.² Whereas in the world movement to industrialize, most Latin American economies are struggling to create the basic transport, public utility, and financial bases for industrial activity, Puerto Rico already has these foundations which are serving the growing number of factories; albeit, neither the services nor the factories are nearly as extensive as those of the United States.

As the head of the Planning Board said, "A decade ago the island would have been considered a typical underdeveloped area. . . . Now Puerto Rico may properly be called a country in an intermediate stage of development."³

Culturally, Puerto Rico, located on the border between the dominant cultures of the New World, displays a

² Kingsley Davis, "Population and the Further Spread of Industrial Society," *Proceedings of the American Philosophical Society* (February 1951), pp. 8-19.

³ Rafael Picó, "A Program of Technical Assistance to Economically Underdeveloped Countries," October 1950.

fusion of both. Nearly every inhabitant speaks both Spanish and English to some extent, and all the better educated—except the North Americans, who tend to remain monolingual—speak both languages with entire ease and fluency. Institutional structure, customs, and the underpinning values all display their dual origin and frequently the mark of innovation.

THE CREATIVE ELEMENT

The frontier is often a creative place, as Frederick Jackson Turner explained in 1892:

For a moment, at the frontier, the bonds of custom are broken and unrestraint is triumphant. . . . each frontier did indeed furnish a new field of opportunity, a gate of escape from the bondage of the past; and freshness, and confidence, and scorn of older society, impatience of its restraints and its ideas, and indifference to its lessons, have accompanied the frontier. What the Mediterranean Sea was to the Greeks, breaking the bond of custom, offering new experiences, calling out new institutions and activities, that, and more, the ever retreating frontier has been to the United States directly and to the nations of Europe more remotely.⁴

If Turner's insight is sound, Puerto Rico, this frontier, this border state and culture and economy, should display a creative ferment of innovation. It does. It is virtually a social science laboratory where in the compactness of 3,435 square miles and two and a quarter million people the scholar may study all the facets of rapid social change as well as the fusion and conflict of different cultures. For the same reasons, Puerto Rico is a technical assistance training ground of proved effectiveness.

⁴ Frederick Jackson Turner, "The Significance of the Frontier in American History," *American Historical Association, Annual Report* (Washington, 1893), pp. 199-227.

TRAINING GROUND FOR POINT FOUR

A few days after President Truman in January 1949 established the Point Four goal of technical assistance to the less-developed regions of the world, Governor Muñoz Marín offered the assistance of Puerto Rico, primarily as a training ground. Later, his office described the advantage of Puerto Rico for this purpose:

Puerto Rico is a unique example of an underdeveloped area, with all the problems common to such regions, in the early stages of an integrated development program. It provides, therefore, a working model of Point 4 in operation. . . . But Puerto Rico is more than an example of just a testing ground for the use of technical know-how to raise economic levels. It reveals, in microcosm, the problems and aspirations of all people who live in overcrowded and underdeveloped regions. It is irrefutable evidence of the practicability of militant democracy under such circumstances.⁵

The governments of the United States and of Puerto Rico then made an agreement for the joint administration in the island of a Point Four training program, and Puerto Rico appropriated \$50,000 to initiate the program.

Point Four, technical assistance, development, industrialization, all refer to a world movement of prime importance: the movement to narrow the gap between the prosperous, free, powerful nations enjoying the benefits of high-level industrialization and the advanced culture of modern western civilization, and the starving, usually authoritarian, weakly dependent nations still detained in the primitive economies of agriculture and mining and either ignorant of or hostile to the creative elements of western civilization. The United States, other advanced states, and the United Nations adopted the policy of technical assistance in the faith, at least

⁵ "The Point 4 Program," Office of the Governor, October 1950.

¹ "A People Moves Ahead," U. S. Information Service.

on the part of the United States, that the program would work against communism and military aggression within the underdeveloped regions and would strengthen them as allies of the West.

The underdeveloped regions seek the assistance and the development, whatever their reservations about industrialization and the western civilization as ways of life in contrast to their traditional cultures, because they prize the comfort, the freedom, and the power obviously associated with and presumably derived from industry and western culture. Arnold Toynbee suggested the proposition, which may be one of the profound insights of our time, that the rapprochement between the industrialized western world and the other regions may be the central challenge of our moment in history.

SCOPE AND EXTENT OF TRAINING PROGRAM

Students and government officers from the less-developed places of all the world have recently come to Puerto Rico to study, observe, and participate in the development and educational programs of the island. They have come from Chile, Uruguay, Japan, India, Haiti, Dominica, Trinidad, Colombia, Mexico, Brazil, Paraguay, Indonesia, Burma, France, Egypt, Pakistan, Singapore, Israel, Formosa, Guam, the Philippines, Jamaica, St. Vincent, Santa Lucía, Honduras, Antigua, Guadalupe, Curaçao, Tortola, Barbados, Cuba, the Dominican Republic, Costa Rica, Panama, and Nicaragua. Mostly they have come from Latin America.

These visitors have been concerned with electric power, water supply, road construction, agricultural practice and research, soil erosion and water development, organization and tenure of the land, capital and labor problems of industrialization, government planning, all the aspects of education, social work,

labor unions, and co-operatives. And many observers and students have been concerned with the total program of democratic development, searching for its basic principles, key relationships, and those central factors and patterns which speed or delay the whole development of the society.

In the University of Puerto Rico alone during the year ended in June 1952, there were 82 Latin American students (and one from Spain) from 17 different nations. They were studying twelve different programs: education, social sciences, public administration, medical technology, natural sciences, agriculture, engineering (chemical, civil, and mechanical), basic education, home economics, vocational education, the co-operative movement, and the role and management of trade unions.

In 1951 a total of 138 foreign students and observers came to acquire technical assistance training in Puerto Rico, in sharp contrast with the 43 in the island in 1950. Ninety-seven arrived in Puerto Rico for this purpose in the first three months of 1952, indicating a figure for the year much greater than that for 1951. The magnitude of the training program is expanding with astonishing speed.

VALUE OF TRAINING GROUND

The value of the Puerto Rican training ground is attested by the rapid expansion of its use. James P. Davis of the United States Department of Interior wrote:

With Puerto Rico—itself in the midst of a well-planned, integrated program to overcome poverty and economic limitations—serving as their laboratory, a number of technicians from Latin American countries are learning how development problems can be tackled and worked out in practical ways.⁷

⁷ U. S. Department of the Interior, "Point 4 in Action."

Dr. Alberto Lleras Camargo, Secretary General of the Organization of American States, recently expressed a similar judgment.⁸ A Costa Rican government official studying in Puerto Rico called the island "the predestined bridge for uniting the Hispanic-American peoples," and said he found here the institutions needed in his country to encourage development.⁹

The effectiveness of the training ground for Latin Americans is clear. The Puerto Rican development process can be as easily communicated in Spanish as in English. The scale of the development is more commensurate with the countries from which the students and observers come. (One of them told me of his depression upon seeing the Tennessee Valley Authority, and of his hope upon seeing in Puerto Rico a small hydroelectric installation which he could imagine reproduced in his country.) Puerto Rican development is in the process, which the observers must learn, and not merely a product which they seek. In Puerto Rico there are innovations which may be models for other lands with similar resources and aspirations. The Community Education program is teaching adults. The Land Authority suggests ways of organizing the tenure and management of the land without sacrificing efficient production or the poor countryman's desire for control of his own land. The Planning Board and the Economic Development Administration show what public authority can do to set goals and standards, to integrate and encourage and facilitate economic development.

Puerto Rico also extends its training influence into Latin America. Its delegation recently led a conference on home economics in Trinidad.⁹ The Technical Cooperation Administration

orients here technicians being sent to posts in Latin America.¹⁰ A large number of Puerto Ricans serve in Latin America; for example, Dr. Julio Morales, chief of the Department of Economics and Rural Welfare, Inter-American Institute, Turrialba, Costa Rica, who is being assisted by seven Puerto Rico associates.¹¹

A RESEARCH LABORATORY

Puerto Rico is a research laboratory as well as a training ground, and is one of the most fruitful places in the world to study development, swift social change, and the culture fusion of a border society. This is recognized by public authority, which supports research as fully as its resources permit, and which understands the necessity for accurate knowledge as the condition of successful policy and program. It is recognized by the eminent scholars who have devoted part of their time to the direction of research projects in the University of Puerto Rico within the last four years: Carl Friedrich, J. K. Galbraith, Paul Hatt, George Hill, Reuben Hill, Walter Isard, Wassily Leontief, Eleanor Maccoby, Daniel Marx, Jr., Harvey Perloff, Clarence Senior, Harry Shapiro, and Julian Steward. It is attested by research grants by the Carnegie Corporation, the Office of Population Research at Princeton, and the Rockefeller Foundation.

Some of the crucial questions of development and social change have been and are being investigated by government agencies and by the School of Public Administration and the Social Science Research Center, both of the College of Social Sciences in the Uni-

¹⁰ *Puerto Rico*, a Bulletin of the Office of the Government of Puerto Rico, Washington, May-June 1952.

⁷ *El Mundo*, July 28, 1952.

⁸ *El Mundo*, August 10, 1952.

⁹ *El Mundo*, July 14, 1952.

versity of Puerto Rico. What are the cause and the remedy for the disastrous spurt in population increase always associated with development, which reduces the incidence of death far more rapidly than the incidence of birth? What are the magnitude, the cause, and the consequence of migration? How can local and external capital be encouraged to spark the growth of industry? What are the priorities of investment between production and social and economic services—the utilities, housing, transport, health, and education which are required to service factories and to create a labor force able and willing to work in the factories? What change must the labor force undergo, and how can this be encouraged? How can well-administered trade unions be developed, and how can they find the wisdom to avoid the dilemma that excessive demands will discourage investment and diminish jobs, and timid demands will permit injustice to workers? What can co-operatives do to hasten development, and how will they influence the changing culture? What are the physical character and present use of the land? How should the land be used so that the half-acre per capita of arable land can sustain the people? How can the market system be improved to raise the real standard of living? What is the income distribution, is it just, can it be modified? How can the federal relations of governments of diverse levels and functions be organized and administered best, especially with respect to the Commonwealth of Puerto Rico, a new kind of polity associated in a new way with the American Union? What happens to the structure and function of the family in the midst of social change and economic development? What changes occur in the class system under the pressure of new modes of earning a living and the new values associated with them?

And for all these research problems, there is the necessity of adequate statistical measurement to show the magnitude and relation of the variables concerned and to mark the direction and rate of the changes occurring. There is the problem of what role government planning and operation should play. There is the problem of the schools and the university; what they can do for the changing society, what share of the public funds they should have.

ECONOMY AND STAFF

A good research laboratory needs more than adequate support and the presence of important problems; it requires economy and sufficient staff. Research in Puerto Rico is economical because of the scale of the field of investigation. The space of the island is 100 by 35 miles, and can be seen more coherently by the scholar than can the vast space of the United States. The time of the development process is compact; at most two decades, and in its decisive stage only one decade. The numbers of units to be studied are smaller—people, enterprises, dollars. The economical scale of research is indicated by the sufficiency of a sample of 6,000 for the study of the entire labor force, and a stratified sample of 13,000 for the study of the entire population. An input-output table of the economy can be made for less than \$30,000, and the consumer co-operative movement can be described and analyzed for about \$20,000. The facilities, the methods, and the costs of the external transportation system can be studied in about 8,000 man-hours.

Staff for the Puerto Rican laboratory has been available. The 719 members of the University of Puerto Rico faculty, nearly all with graduate research training, are a constant source of research workers, albeit the heavy teaching duties of a rapidly growing institu-

tion prevent their extensive use. Research workers have been obtained by more than a dozen government agencies, and the Agricultural Experiment Station is devoted exclusively to research. The Social Science Research Center maintains close bonds with several large United States universities and has invited, in the last three years alone, eleven United States scholars to work more than a year each in Puerto Rico and eight scholars to spend several weeks annually in the island and to provide consultation from their home station throughout the year.

SUMMARY

The Commonwealth of Puerto Rico is a small frontier society at the cross-

roads between North and South America and midway in the process of development. Increasingly used as a training ground for technical assistance programs, it puts to efficient use its mixed culture, language, economy, and polity. And its crossroad, mixed-culture characteristics provide in a small, economical laboratory rich opportunities for needed research. Important during four and a half centuries as the most strategic military base in the Caribbean, and then a famous example of how a country can rapidly transform its culture and make its way from colony to commonwealth, Puerto Rico is currently proving its merit as a technical assistance training ground and a superlative social science laboratory.

Millard Hansen, Ph.D., Río Piedras, Puerto Rico, is director of the Social Science Research Center and associate professor, College of Social Sciences, University of Puerto Rico. He has served as assistant professor of history at the College of the University of Chicago and as historical specialist with the United States War Department. He is an editor of The People Shall Judge, and is author of articles on eighteenth-century United States history, military history, and Puerto Rican affairs.

Puerto Rico: A Crowded Island

By KINGSLEY DAVIS

BY almost any definition, Puerto Rico is a "crowded island." With approximately 2,285,000 inhabitants in 1952, the island has 668 persons per square mile, a density exceeding that of Japan or the United Kingdom. If continental United States were as densely settled, it would have 1,989 million, instead of 157 million, inhabitants.

But from an economic standpoint, sheer land surface is not important. Some crowded countries such as Belgium and England are prosperous, while some of the less crowded ones such as Costa Rica and New Guinea are not. Is Puerto Rico crowded, then, in relation to its resources? Yes; it has 1,473 persons per square mile of arable land, whereas the mainland has only 220. Furthermore, Puerto Rico depends on its agricultural land for the support of its people more heavily than does the mainland. As of 1940 it had 58.3 per cent of its occupied males in agriculture, as compared with 22.3 in continental United States. The crowded character of its agriculture can be seen from the fact that Puerto Rico has approximately 170 agriculturally employed males per square mile of arable land, as compared with 9.6 on the mainland. With respect to nonagricultural resources Puerto Rico is even more crowded, because the island has no fossil fuels, a relatively small amount of potential hydroelectric power, and few ores. By any index, Puerto Rico has an exceptionally high ratio of people to resources.

THE GROWTH OF NUMBERS

Puerto Rico's present crowded condition is the result of an extremely rapid

population growth. Under the Spanish regime there was a fast increase, but it had begun to taper off toward the end of the nineteenth century. After the United States took over in 1898, the rate of increase again went up, as shown in Table I. It is clear that the

TABLE I—POPULATION INCREASE

Year	Puerto Rico		United States
	Population (Thousands)	Annual Per Cent Increase	Annual Per Cent Increase
1899	953		
1910	1,118	1.45	1.95
1920	1,300	1.56	1.44
1930	1,544	1.69	1.47
1940	1,869	1.94	0.70
1950	2,211	1.69	1.36

Puerto Rican growth was so fast that the population was doubling itself every forty years. The rate of increase, in fact, was higher on the island after 1910 than it was on the mainland. Such an exceptionally rapid population growth is all the more remarkable when it is realized that Puerto Rico has generally been a country of emigration, whereas the mainland has been a country of immigration. In other words, so great has been the island's natural increase that thousands could leave each year and yet the home population could double itself every four decades. Furthermore, this rapid growth was taking place *after* a high density of settlement had already been reached.

Puerto Rico's rate of natural increase—the excess of births over deaths in relation to population—has risen steadily during the last twenty years. The average annual natural increase per 1,000

population is as follows: 1932–36, 19.1; 1937–41, 20.1; 1942–46, 26.1; 1947–51, 28.7. The rate has recently been one of the highest in the world. The average rate for the decade 1942–51 is so high that, if continued without migration, it would double the population in approximately 26 years. This would give the island nearly 9 million inhabitants by the end of the century, nearly 18 million in 75 years, and soon there would literally be standing room only.

Obviously, such a trend could not persist very long. It would be impossible for Puerto Rico's population to grow so fast for more than two or three decades. Even if the rest of the world devoted itself exclusively to the task of maintaining Puerto Ricans, it could not long support such a rapid population increase on the island, for that would become not only economically but also physically impossible.

As a matter of fact, no fixed rate of population growth could be sustained indefinitely. The only difference between a fast and a slow rate in this regard is that the former must cease more quickly. In Puerto Rico, with its already crowded condition, the recent rate of natural increase would yield a population growth impossible to sustain for more than a short time. Anyone who doubts this does not understand the formula for compound interest.

Actually, of course, Puerto Rico's population has not been growing as fast as its natural increase would imply, because its people have been leaving the island for better opportunities in a less crowded land. During the 1940–50 decade, when the natural increase was at its height, there was a net loss of something like 222,000 persons, nearly all of whom came to the mainland. This amounted to more than a third of the natural increase for the decade, and consequently the population did not grow so rapidly between

1940 and 1950 as it did during the previous decade (the decade of the 1930's), when the natural increase was less but emigration was also smaller. Emigration has been Puerto Rico's demographic escape valve. In the future, unless emigration continues on a large scale, the rate of natural increase will inevitably be reduced, either by a drop in fertility or by a rise in mortality.

The reason for Puerto Rico's excessive natural increase is plain. Since 1900 great effort has been made to reduce the death rate, and this effort, as Figure 1 demonstrates, has been remarkably successful. The crude rate of 9.9 per thousand in 1950 and 1951 was only one-third of what it was prior to 1900, and less than half the average rate for the decade 1910–20. The greatest gain in saving lives has been made recently—since 1940. In less than one decade after that date the crude death rate dropped from 18.0 per thousand—a level typical of rates in the United States in the late 1800's—to almost the level that prevails on the continent today. This achievement is the result of modern sanitation, better medical treatment, and a higher level of living.

The five leading causes of death in 1932 all experienced sharp declines. The death rate from diarrhea and enteritis, the leading cause, dropped by two-thirds in only a few years. The rate for tuberculosis and pneumonia, the second and third causes, was cut in half. The most spectacular reduction was in malaria. This disease, the fourth most important cause of death in 1932, was reduced virtually to zero by 1950. Nephritis, the fifth most important cause in 1932, was reduced by 75 per cent by 1948. As a result of the improvements, the average expectation of life at birth rose from 38.5 years in 1919–21 to 55.5 in 1946–48. Thus Puerto Rico has telescoped into a few years the health

FIG. 1.—Birth and Death Rates in Puerto Rico, 1887-1951.

progress made in advanced countries over several decades.¹

Fertility, on the other hand, has until now been virtually static. As Figure 1 shows, the crude birth rate has remained almost unchanged for fifty years. A bit depressed in the 1930's, it rose somewhat with the postwar boom in marriages and has declined slightly but steadily since the high point of 42.7 per thousand in 1947. The crude rate of 37.2 in 1951 was the lowest recorded on the island since 1932, the year when birth registration became accurate. This figure, however, was still 53 per cent higher than that for the mainland in the same year. For the whole period from 1932 to 1951 the average crude birth rate on the island was 39.6, or double the average (20.0) for the United States proper.

There are signs that Puerto Rican fertility may soon start declining. The

¹ See Jose L. Janer, "Population Growth in Puerto Rico and Its Relation to Time Changes in Vital Statistics," *Human Biology*, Vol. 17 (Dec. 1945), pp. 267-89. A treatment of mortality will be contained in a book on Puerto Rico's population now in preparation by Jerry W. Combs, Jr., and the writer.

birth rate is becoming slightly sensitive to economic changes; the groups with the lowest fertility are expanding as a proportion of the total population; and there is a clear desire on the part of Puerto Rican women to reduce their fertility.² Yet there seems no likelihood that fertility will decline rapidly enough to reach very soon the low level already reached by mortality. One must therefore anticipate a high rate of natural increase on the island for at least three or four decades, resulting in continued competition between numbers and the level of living.

The rapid growth of population in Puerto Rico, although exceptional from the standpoint of past human history, is quite typical of what has been happening recently in the world. Public health has in the last few years brought

² See J. W. Combs, Jr., and Kingsley Davis, "The Pattern of Puerto Rican Fertility" and "Differential Fertility in Puerto Rico," *Population Studies*, Vol. 4 (March 1951), pp. 364-79, and Vol. 5 (Nov. 1951), pp. 104-16; Paul K. Hatt, *Backgrounds of Human Fertility in Puerto Rico* (Princeton: Princeton University Press, 1952), Chaps. 2-7. The Combs-Davis articles contain other references.

spectacular declines in mortality to such agrarian regions as Formosa, Ceylon, Cyprus, Malaya, Jamaica, El Salvador, and Mexico, without affecting the birth rate and therefore without avoiding extremely heavy increases in numbers. Not only have the declines in mortality been more rapid in many cases than they were in the industrial nations at an earlier period, but the progress of industrial and social development has not accompanied the decline to the extent that it did earlier.

The orthodox theory has been that the reduction of mortality is a product—and in many cases a late product—of the industrial revolution. But now, because of the international character of science, public health, and public aid, areas which are not noticeably industrializing are nevertheless experiencing a rapid growth in population. This circumstance will make it difficult to maintain the level of living in these areas and hence, in the long run, to maintain the gains in mortality. One fears that more people are being kept alive in order that they may live badly, and that this is necessarily a temporary condition, because the level of living cannot be reduced much without causing mortality to rise again to its former level.

EMIGRATION AS AN ESCAPE VALVE

In two respects, however, Puerto Rico is luckier than most crowded and rapidly growing areas. She has, first, an open door for migration into the world's richest country, and she has, second, a lively program of economic development. Although neither of these advantages can nullify the depressing effect of natural increase on the level of living, they at least temporarily alleviate this effect and strengthen the prospect of an ultimate decline in fertility.

As mentioned above, emigration is taking away a sizable proportion of the

natural increase. In recent years this proportion has been increasing. Whereas during the 1930's and during the late war there was little emigration, the movement assumed major proportions from 1944 on. During the eight years 1944 through 1951, approximately 240,000 left. The excess of births over deaths during the same period was 486,000. Thus for a period of eight years emigration from the island (nearly all of it going to the mainland) has taken almost half the natural increase. In the peak year of 1951, which saw some 50,000 leave the island, the emigration was equal to four-fifths of the natural increase.

This way of measuring the effect of emigration, however, is not adequate. The migrants are mostly in the young adult ages. If they had stayed on the island, they would have increased the birth rate and decreased the death rate. Their absence has therefore cut population growth more than the sheer number of migrants indicates. A conservative estimate of how much they have lessened the increase of population can be obtained by assuming that the emigrants would have had the same natural increase as the general population (actually, of course, they would have had a higher natural increase). The result is that if no emigration had occurred, the island would have added during the eight years 1944 through 1951 about 270,000 more to its population than it actually did. In other words, substantially more than a third of the island's theoretical natural increase during the period in question was conveniently lost through emigration.

Had this outward movement not occurred, Puerto Rico's plight would have been even more difficult than it was. Emigration has helped the island not only demographically but economically, because the emigrants earn more than those who stay at home, and they send

money back to the island. Furthermore, the net figures do not tell the whole story. It is well known that there is a substantial *seasonal* migration of farm labor to the mainland. In short, the island has been alleviating its demographic impasse, not at home but on the mainland.

ECONOMIC DEVELOPMENT AS A PALLIATIVE

To many observers, Puerto Rico already appeared hopelessly overpopulated in the 1930's. Yet the population continued to grow, as we have seen, and the level of living has risen. During the ten years between 1939-40 and 1949-50 the value of goods and services, in terms of constant prices, rose by 95 per cent. The net income of the island was doubled, and the gross output per man-hour probably increased by 46 per cent, or 4 per cent per year.³ As a result, the Puerto Ricans were living better in 1950 than they were in 1940, despite the fact that there were 342,000 more of them on the island.⁴

Does this mean that the island was not overpopulated in the 1930's, or that it is not overpopulated now? No. The concept of overpopulation does not imply that no rise in the level of living is possible, but rather that a lesser rise is possible with an increase of numbers. There is every reason to believe that the economic development of Puerto Rico, impressive as it has been, has been retarded and hindered by the growth of numbers, and that the level of living is much lower than it would have been had the population not grown at all. Evidence for this conclusion derives from (a) an examination of the manner in which the economic advance has occurred, (b) a comparison of per

³ Puerto Rico Planning Board, *Economic Development, 1940-50, 1951-60* (San Juan, Office of the Governor, 1951), pp. 7-16.

capita and national income, and (c) an assessment of the prospects for holding the gains.

The greatest single factor in stimulating economic improvement on the island was World War II, for it was then that nearly all the gain in output and income took place. During the postwar years there has been a definite leveling off. "Between 1939-40 and 1944-45, the value of goods and services produced on the island increased by 152 per cent. Between 1944-45 and 1949-50, a period of exactly the same length, the increase in output was less than 11 per cent." The expansion in the war years "was due almost entirely to the tremendous expansion of federal government activities in connection with defense and war." The net income from these activities increased by almost 550 per cent, whereas that from all insular sources increased by only 108 per cent.⁴ Seen in this light, the recent economic advance in Puerto Rico rests on a largely artificial and temporary basis.

It is true, however, that the insular government has vigorously promoted economic development and that it has had some success. Its developmental activity was made possible by the large budgetary surpluses built up during the war, chiefly from the rum tax. With these surpluses the government originated public enterprises which became a substantial part of the total economy, laid the basis for new private industries, and attracted mainland capital.⁵ Private business was also stimulated by the drawing down of assets accumulated by Puerto Ricans during the war in United States bonds, postal savings, and banks.

⁴ *Ibid.*, p. 18.

⁵ See W. Arthur Lewis, "Industrial Development in Puerto Rico," *Caribbean Economic Review*, Vol. 1 (Dec. 1949), pp. 153-76; K. Davis, "Population and Progress in Puerto Rico," *Foreign Affairs*, Vol. 29 (July 1951), pp. 627-31; Puerto Rico Planning Board, *op. cit.*, pp. 20-21 ff.

The result was a continuation of economic development after the war, but at a slower pace.

WARNING SIGNALS

Plainly, despite the advances made after 1940, there are several warning signals ahead.⁶

First, the postwar activity has resulted largely from the drawing down of assets (both public and private) accumulated during the war. As these are used up, Puerto Rico will have to depend more on its own economy to generate capital; but there is evidence that the assets may have been used too heavily to expand consumption and commerce rather than to build industry and capitalize agriculture.

Second, Puerto Rico's terms of trade have remained unfavorable and her trade balance negative. The rise in the level of consumption and in the total number of consumers has forced the importation of food and other consumption items at the expense of machinery and other capital goods. To make up her trade deficit, she has depended heavily on federal government transactions.

Third, Puerto Rico continues to bear a heavy burden of unemployment and underemployment. From 1946 to 1950 inclusive, the unemployed averaged more than 14 per cent of the labor force; the underemployed, 20.6 per cent.

Fourth, the productivity of Puerto Rican agriculture, trade, and manufacturing is still low, partly because of low capitalization and partly because of inexperienced management.

Fifth, despite the rise in output and the level of living, the average per capita income is still less than one-fourth that of the United States. Puerto Rico is still a poor country by modern standards.

⁶ The facts in this section are drawn from Puerto Rico Planning Board, *op. cit.*, *passim*.

DEPRESSING EFFECT OF POPULATION GROWTH

In most of these warning signs the role of excessive population growth on an already densely settled island can be seen. The most important evidence is the fact that the circumstances causing the insular net income (measured in constant prices) to double between 1939-40 and 1949-50 provided a rise of only 68.6 per cent in per capita income. "In other words, almost a third of the gain was absorbed by the increase in the number of consumers."⁷

Another evidence is found in the inability of even rapid economic advance to employ all Puerto Ricans. Although massive emigration occurred during the period in question, removing at least 115,000 workers from the island, there were still 103,000 unemployed in June 1951. There have been in recent times approximately 16,000 new entrants into the labor force each year; yet the eighty new industries added to the insular economy between 1942 and 1950 had only 13,715 employees in the latter year.

Modern economic advance means the substitution of equipment and inanimate power for human labor. The growth of population in Puerto Rico, by multiplying human labor, is making such substitution difficult. Moreover, the multiplication of human beings in relation to resources causes assets to be spent on direct consumption rather than on income-generating industry. During the decade from 1939-40 to 1949-50, the share of food products in all imports (by value) increased from 27.8 per cent to 31.4 per cent. At the beginning of that decade 46 per cent of all food locally consumed was imported, and by the end of it 54 per cent was imported.

The conclusion seems inescapable that the island is struggling against a strong current. Progress is being made, but it

⁷ *Ibid.*, p. 16.

would be much more rapid and secure if, despite emigration; an average of 30,000 to 35,000 were not being added to the population each year. Assuming that the island cannot dump *all* of its natural increase on the mainland, and that it does not wish a rise in mortality, the only way out is a lowering of the birth rate. Otherwise, one cannot help wondering whether the fortunate devel-

opments from 1940 to 1952 will prove temporary. The birth rate seems likely to fall in the next thirty years, but not fast enough to prevent rapid population growth. Only if the decline can be hastened deliberately, with continued stimulation of economic development and continued massive emigration, can the level of living keep on rising in the next few decades.

Kingsley Davis, Ph.D., New York City, is professor of sociology on the Graduate Faculty of Political Science at Columbia University, and director of the Division of Population Research in the Bureau of Applied Social Research at Columbia University. He has been connected with population research in Puerto Rico and has published several articles on the subject. In addition, he is author of The Population of India and Pakistan (1951) and Human Society (1949), and co-author of Urbanization in Latin America (1946).

Social Structure as Affecting Fertility in Puerto Rico

By ARNOLD S. FELDMAN and PAUL K. HATT

THIS article will not discuss the actual nature of a low fertility policy for Puerto Rico. Rather it aims at investigating the role of certain aspects of social structure as they at present affect fertility and related value areas. It assumes a low fertility policy, and asks the question: If *minimum* changes were made in socioeconomic levels, education, and urban-rural population balance, what accompanying changes might be expected which would produce or facilitate lower fertility behavior?

The important word in this question is "minimum." In other words, if we ask what would happen if major changes of this nature were to result in a heavily industrialized, highly educated population, with a well-developed middle class, we are not posing a realistic question. Internal fertility and value differentials associated with these variables have been shown to exist, but still, at best, one can only say that eventually, a high standard of living and greatly increased urbanization would probably lower the present crushing load of fertility.

However, it is clear that Puerto Rico's "bootstrap experiment" cannot hope for such major changes except as they are long-range prospects. And time, at present rates of natural increase, may make such achievements impossible. We aim, therefore, to see some of the ways in which fertility-related behavior and values are differentially distributed as between the very poor, the very uneducated, and those just above them, rather than the differences between the

extremely small middle-class group and the masses below them, and also to assess the importance of urbanization and age differentials.

We do not assume that were Puerto Rican standards of living to be lifted as a whole, fertility levels and values would necessarily change in the desired direction, though this is possible. What we suggest is that if the current efforts to raise the level of living for the most depressed classes were to succeed, it seems likely that their fertility behavior and values would come to approximate those of the classes just above them in the present social scale.

THE DESIGN

The data for this paper are from a survey done on the island in 1947 under the auspices of the Princeton Office of Population Research and the University of Puerto Rico's Social Science Research Center. The sample was composed of about 5,500 households selected on an area probability basis.

The present sample selected interviews in such a way that heads of households were included only when (1) married but not more than once, (2) married for at least nine years, (3) married between the ages of 19 and 29, and (4) reporting their age as between 27 and 49. These restrictions reduced the number eligible to 471. These in turn were sorted into groupings of those born in the country and residing in the country, who report no migrations (278 cases); those born in cities and residing in cities, reporting no migrations (104 cases); and those born in the country but residing in the city, reporting only one migration (89 cases).

¹ The authors wish to express their gratitude to the Northwestern University Graduate School for its assistance in making this research possible.

TABLE 1—MALES MARRIED ONCE, AT LEAST 9 YEARS, AGED 19-29 AT MARRIAGE

Years School Completed	Monthly Rent	Age	Rural Birth and Residence	Urban Birth and Residence	Rural Birth and Urban Residence
Less than 6	Less than \$3.00	27-38	88	17	7
		39-49	106	18	8
	\$3.00 or more	27-38	20	11	8
		39-49	32	23	16
6 or more	Less than \$3.00	27-38	11	4	8
		39-49	7	3	1
	\$3.00 or more	27-38	6	7	26
		39-49	8	6	30
Grand total, 471			278	89	104

Table 1 shows these groupings when further classified by level of education, monthly rental,² age, and rural or urban birth and residence. Males only are studied, since, as has been shown elsewhere,³ fertility behavior approaches more closely values held by men than those held by women. The restrictions on marriage and age are simply to provide an adequate and internally comparable amount of marital experience since World War I. The rural-urban classification is aimed at distinguishing various degrees of exposure to urban life. The split of education at six years of completed schooling and monthly rental at three dollars is as close to median values of the sample as was possible. The age categories are broken at the median, age 38, which provides a distinction between younger and older adults, with whatever implications this may have for change in time.

Within the above framework, this article aims to discover whether or not certain types of fertility and fertility-related value differentials exist. To this

² Paul K. Hatt, "Some Social and Psychological Aspects of Fertility in Puerto Rico," in *Approaches to Problems of High Fertility in Agrarian Societies* (New York: Milbank Memorial Fund, 1952), p. 46.

end, a measure of fertility and nine other variables already shown to be related to the problem were selected.⁴

1. *Fertility.* The index used here was the mean number of pregnancies within the first nine years of marriage in each of the categories. This has been shown to be a reliable predictor of subsequent fertility behavior.⁴

2. *Ideal number of children.* These were reported as actual numbers, except that nine or more were grouped together and also included such responses as "as many as possible" or "as God wills."

3. *Number of children in excess of ideal.* The expectations were estimated by adding the number of children presently living to the number which the respondent said he expected to have in the remainder of his marriage. These were grouped into seven class intervals ranging from (1) five or more children fewer than the expressed ideal to (7) five or more children greater than the expressed ideal.

4. *Acceptability of family limitation.* This was represented by values of 1

³ Paul K. Hatt, *Backgrounds of Human Fertility in Puerto Rico* (Princeton: Princeton University Press, 1952), *passim*.

⁴ *Ibid.*, pp. 294-95.

TABLE 2—INTERCORRELATIONS OF THE TEN VARIABLES*

Variables	1	2	3	4	5	6	7	8	9	10
1. No. pregnancies in first nine years of marriage	—									
2. Ideal number of children	.69	—								
3. No. of children in excess of ideal	.61	-.20	—							
4. Acceptability of family limitation	-.18	-.36	.09	—						
5. Acceptability of employment of women outside the home	.07	-.29	.01	-.30	—					
6. Ideal age for marriage of women	-.03	-.29	.09	-.10	.10	—				
7. Ideal age for marriage of men	-.03	-.19	.19	.03	-.05	.68	—			
8. Actual age at marriage	-.13	-.02	-.31	.22	.01	.01	.07	—		
9. Personal importance of religion	-.03	-.01	.10	-.20	.20	-.20	-.10	.21	—	
10. Amount actual age at marriage exceeds ideal age	.06	.13	-.10	-.06	.31	-.40	-.66	-.43	.05	—

* These are tetrachoric coefficients of correlation.

through 4, ranging from complete rejection, through qualified acceptance, to complete acceptance.

5. *Acceptability of employment of women outside the home.* This, again, is a four-point scale, ranging from complete rejection, through qualified acceptance, to complete acceptance.

6 and 7. *Ideal age at marriage.* These values are the actual reported ages expressed as ideal marriage ages for both men and women.

8. *Age at marriage.* These entries are simply the actual ages at marriage reported by the sample.

9. *Personal importance of religion.* This is reported as a five-point scale ranging from strong opposition to religion to the feeling that "religion is the most important thing in my life."

10. *Amount actual age at marriage exceeds ideal age.* This is reported as seven class intervals, ranging from five or more years less than the ideal to five or more years greater than the ideal.

The intercorrelations of these variables are shown in Table 2. It is possible to identify a chain of relationships by examining those coefficients which are significantly different from zero.⁵

⁵ The values in the table which reach .15 are significant at the 1 per cent level and are shown in italics.

Thus it is apparent that fertility behavior is directly related to the ideal number of children, the number of children in excess of the expressed ideal, and the acceptance of family limitation practices.

Fertility behavior is also, however, indirectly related to the acceptability of the employment of women outside the home through its correlation with ideal number of children and the acceptability of family limitation; to ideal age at marriage through correlation with ideal number of children and the number of children in excess of the ideal; to actual age at marriage through its correlation with number of children in excess of the ideal and the acceptability of family limitation; and to the personal importance of religion through its correlation with the acceptability of family limitation practices.

Still further removed from a direct relation to fertility behavior is the amount actual age at marriage exceeds the stated ideal age, since this is correlated only with four of the already indicated indirectly related variables.

If we consider, therefore, that the nine fertility-related variables were to be made the object of public policy, we should guess that they could be arranged from a tactical point of view,

much as they are ordered in Table 2. It is of further importance, in considering these variables as possible objects of public policy, to see the way in which each is related to the conditions of life considered as main effects in Table 1. This analysis will constitute the remainder of the paper.

ANALYSIS OF MAIN EFFECTS

The technique employed in the analysis of the simultaneous effects of age,

socioeconomic status, and birth-residence type is a modification of the usual factorial design, employing a *t*-test presented by Nathan Keyfitz⁶ as an application of F. Yates's analysis of multiple classifications with unequal numbers in the different classes.⁷

⁶ Nathan Keyfitz, "A Probability Sample for Family Size," unpublished paper presented to the Society for Social Research, Chicago, July 12, 1952.

⁷ *Journal of the American Statistical Association*, Vol. XXIX (1934), p. 51.

Table 3 presents the results of these tests. The symbols R and U in columns 1, 2, and 3 stand for *rural* and *urban*. The first of each pair describes the birthplace and the second the place of present residence. Thus, RU refers to persons born in the country but residing in the city. Urban is defined as places of 2,500 or over, and rural as open country only. The definitions of all other headings can be seen in Table 1.

The entries in the rows designated as "difference" are to be read as showing the amount of difference with the sign referring to the top member of each pair designated in the headings. Thus the entry in column 1, row 1, shows that a negative value of .04 of a pregnancy is, on the average, associated with urban birth and urban residence when this characteristic is compared with rural birth combined with urban residence. The *t*-values are one-tailed and in italics where they reach or exceed the .05 level of confidence which in this case lies at 1.97. This means that wherever the value is in italics, we can be reasonably certain not only that the two weighted means are different, but that one is significantly greater than the other.

The weighted differences between means are an average of the differences of the several sets of comparisons within each main effect, weighted by the relative numbers included in each comparison. Thus, within the urban-rural differences, eight sets of differences are used. For age there are twelve, and for each status difference, six.

Fertility and directly related variables

The fertility index and the number of children stated to be ideal show an identical pattern with the main effects. In these cases migrants to the city show the behavior and values of the urban

born residents, and both are significantly lower than those of the purely rural population.

The younger adults also show definitely lower fertility behavior and values than do the older people with respect to these two variables.

The analysis of the indexes of social status shows that education, rather than economic factors, is dominant in determining the low fertility pattern. Thus, even with education broken between five and six years of schooling, the greater amount results in significantly lower fertility behavior and values.

The number of children in excess of the stated ideal is the second variable directly correlated with pregnancy rates. However, its incidence pattern differs slightly from the ideal number of children as described above. While the two are identical with respect to the rural-urban factors and age, they differ with respect to the status variables. Thus urban residents, regardless of birth, show greater consonance between ideal and real fertility than do younger adults when compared with their elders. Whereas it is more education that determines lower fertility values, it appears that economic considerations are more important in connection with agreement between real and ideal fertility behavior.

The third variable directly associated with pregnancy rates is the approval of the practice of family limitation. Here a rather different pattern emerges. In this case the pure urban type is not significantly different from the pure rural type; but the migrants to the city are decidedly more accepting than either of the other groups.

Older adults are more willing than younger adults to accept the practice of contraception. It is also clear that both higher education and higher rental are associated with greater willingness to condone the practice of birth control.

Fertility and indirectly related variables

Age at marriage, whether real or ideal, for women or for men, seems not to be significantly related to any of the aspects of social structure here considered. The only exception to this is that urban migrants have a significantly higher ideal age at marriage for women than does the purely rural type.

The acceptability of women's employment outside the home is most clearly seen in the comparison between the urban migrants and the purely rural category, with the former the more accepting.

It can also be seen that approval of such employment characterizes the younger rather than the older people, and both extremes of the combined status indexes. Thus it appears that acceptance increases with low rent when education is low and with high education when rent is high, and approaches significance with education when rent is low.

The personal importance of religion is greater for the purely rural category than for the purely urban type. For both, however, it is definitely higher than for the urban migrants.

Older adults are more seriously concerned with religion than are the younger, as, in general, are those of lower than those of higher status, with respect to both rent and education.

The congruence between desired and actual age at marriage shows little relation to any of the main effects except that it is greater for the younger than for the older adults.

SUMMARY

It has been shown that none of the four variables dealing with age at marriage are significantly related to any of the aspects of social structure with which this paper is concerned, with only

the two exceptions noted above. Since these were generally found to show significant relationships when the whole population was considered in an earlier report,⁸ some observations on this should be made.

In the first place, the selection of cases in this study excluded persons who had married before age 19 or after 29, persons who had married more than once, persons reporting an age of 50 or over, and multiple migrants. It is quite possible that the loss of each of these increased the homogeneity of sample with respect to age at marriage, both real and ideal. In the second place, it was shown in the earlier report that age at marriage was generally more significant for women than for men. Since women are not included here, one would expect the relationships to be less marked.

This leaves six variables showing some sort of significant patterning with respect to the relevant aspects of social structure. When these variables and their related structural factors are simultaneously considered, four general propositions relating to policy can be formulated.

1. Urban residence, regardless of origins, is significantly related to low fertility itself and to its two most closely associated variables. More interesting, however, is the finding that rural-to-urban migrants show significantly lower fertility values than either pure type with respect to the acceptability of either birth control or the employment of women, and the personal importance of religion. To the extent that this represents the selection of the most secularized among rural residents for urban migration, it will have little net effect on fertility. To the degree, however, that it reflects the consequences of city life, it should have a depressing effect on pregnancy rates.

⁸ P. K. Hatt, *op. cit.*, *passim*.

2. Since, with only one exception (acceptability of birth control), the younger adults who are presently, and will in the near future be, contributing most of the island's births show both lower fertility and lower values, one would expect a decline in fertility, other things being equal. The one exception indicates the likelihood that education concerning the merits of a birth control program would be useful among the younger adults. It may be that its acceptance requires a longer period of exposure to learning than is desirable or necessary, since the older adults are the more accepting at the present time.

3. It is clear that the differences between the educational levels are real and substantial. Regardless of rental level, low education appears to be most

powerful in maintaining high fertility levels and values. One would conclude from this that raising the average level of education some three or four years would have the net effect of substantially reducing fertility within a generation.

4. Raising the economic level, as reflected by rental value, would apparently also aid in reducing fertility values. Its net effect, however, has to be seen as more long-range and indirect than that of education.

In general, then, this study should add weight to the argument that minimal changes in the rural-urban balance, the level of education, and the standard of living should have a measurable net effect in depressing the present high fertility level in Puerto Rico.

Arnold S. Feldman, Evanston, Illinois, is research assistant in the Laboratory for Social Research of Northwestern University, where he is engaged in research on Puerto Rican social structure and fertility.

Paul K. Hatt, Ph.D., Evanston, Illinois, is professor of sociology and director of the Laboratory for Social Research of Northwestern University. He conducted a field research on fertility in Puerto Rico in 1947, resulting in a preliminary volume entitled *Backgrounds of Human Fertility in Puerto Rico* (1952). He is editor of *World Population and Future Resources* (1952), co-editor of *Reader in Urban Sociology* (1951), and co-author of *Methods of Social Research* (1952).

Migration and Puerto Rico's Population Problem

By CLARENCE SENIOR

MIGRATION is contributing greatly to the reduction of population pressures in Puerto Rico. It is the only means, short of widespread death, of directly reducing the present population. That such reduction is needed to give the industrial, agricultural, educational, and other reconstruction programs a chance to work seems clear. The limits of the contribution migration might make to the long-range solution of overpopulation are not so obvious. Out-migration as the cure for overpopulated areas has been long debated. Puerto Rico's experience offers some clues as to the factors which must be considered.

THE DIRECTION OF OUT-MIGRATION

All but a handful of Puerto Ricans who move their homes from the island go to the continental United States.¹ There is little reason to assume that any significant numbers of them will go to the so-called countries of immigration in Latin America. Nationalistic restrictions on foreigners in the labor force, visa and customs difficulties, transportation costs, and other obstacles limit the possibilities, although there are Puerto Rican groups in the Dominican Republic, Cuba, Venezuela, Mexico, Brazil, and several other Latin American countries.² Probably a factor at least as im-

portant as American citizenship is the widespread acceptance of the ideas and aspirations flowing from the continental United States since the third quarter of the nineteenth century. Even before this country took over from Spain, there were Puerto Rican communities on the continent.

These factors have meant that the main migratory current has been directed toward the continental United States. There are only two significant exceptions aside from the Latin American countries already mentioned. Hawaiian sugar growers recruited cane-field workers on the island in the 1890's and thus laid the basis for a "colony" in those Pacific islands which numbers about 10,000 today. A minor current has flowed to the United States Virgin Islands in recent years, primarily to replace a dwindling labor force on the sugar-growing island of St. Croix. Interestingly enough, the Puerto Ricans are in demand largely because of the long-continued out-migration of those inhabitants of St. Croix who are in the productive age categories.³

By 1930 the census reported Puerto Rican-born persons in all forty-eight states. The largest numbers found by the 1940 census were in New York 63,281; California 1,892; New Jersey 780; Pennsylvania 607; Maryland 294; District of Columbia 289; Florida 272; Illinois 259; Texas 254; and Michigan 208. They were predominantly (96.3 per cent) city dwellers, and the over-

³ Clarence Senior, *The Puerto Rican Migrant in St. Croix*, Río Piedras: Social Science Research Center, 1947, 42 pp.

whelming majority were living in New York City. Only six other cities contained more than 200 each: San Francisco, Philadelphia, Washington, Chicago, Baltimore, and Los Angeles, in that order.

RECENT MIGRATION

Only since World War II has net out-migration helped significantly to reduce population pressures. About 4,000 persons per year were lost through migration between 1908, when dependable figures first became available, and 1945. The annual net outflow since has been as follows: 1945, 13,573; 1946, 39,911; 1947, 24,551; 1948, 32,775; 1949, 25,698; 1950, 34,703; 1951, 52,900.

A combination of factors produced the sharp upturn:

1. The disposition to migrate was founded on the heavy unemployment on the island, with all it implies in terms of low wages, lack of opportunities for advancement, and so forth. This provided the "push" which is found in all migrations.

2. The "pull" was provided largely by plentiful job opportunities on the continent at a time when unskilled and semi-skilled labor was in demand. The favorable labor market attracted those whose aspiration levels had been raised by schools, radio, newspapers and magazines, and the example of relatives, friends, and neighbors who had previously migrated and had advanced themselves economically.

3. The cost to the migrant influences the strength of the "pull." Boats, which took 4½ to 5 days and which cost around \$150, were largely replaced after the war by planes which made the trip in 8 to 10 hours. This resulted in the "first airborne migration in history." Much of the ensuing publicity has, in fact, arisen from the dramatic features of the movement rather than the num-

bers involved, which have never been large. Competition between the non-scheduled companies forced reduction of the fare to as little as \$35, but safety standards were also driven down. Several wrecks costing many lives led the insular government to add its own inspection requirements to those of the federal government. Now two regularly scheduled companies furnish passage for \$64 on 6½- to 8-hour flights.

Two streams of migration flow from the island; they differ significantly in origin, destination, and length of stay. One flows up in the spring and back in the fall; the other is "permanent." The first consists of farm workers; the second of city people.

THE FARM WORKERS

The Puerto Rican sugar cane season lasts from late fall to late spring, and thus workers are available when needed here. Most of them come under a work agreement formulated and enforced by Puerto Rico's labor authorities, and return at the end of the continental farm season. They are placed in areas of agricultural labor shortages in co-operation with the federal Farm Placement Service. Through the work agreement, the Puerto Rican Department of Labor strives to protect the workers from the abuses still so widely characteristic of labor relations in agriculture, which lags at least a century behind industry in this field.⁴

The work agreement provides that the local prevailing rate of wages shall be paid, and that the worker shall be guaranteed 160 hours of work or wages per month and acceptable housing, rent free. It requires the employer to bring the migrant under workmen's compen-

⁴ See *Migratory Labor in American Agriculture*, Report of the President's Commission on Migratory Labor, Washington: Government Printing Office, 1951, 188 pp.

¹ The only direct information on the outflow to other areas indicates that only 1.7 per cent of those leaving went to other countries. "Encuesta Sobre las Personas que Salieron de Puerto Rico en Noviembre de 1946" (San Juan: Negociado del Presupuesto, 1947), p. 11.

² The question is examined in Kingsley Davis, "Future Migration into Latin America," in *Postwar Problems of Migration*, New York: Milbank Memorial Fund, 1947; and Clarence

sation, since most states do not require such insurance for farm labor. It also requires the posting of a performance bond and the opening of the employer's books to the agents of the insular Department of Labor. The Migration Division of the Department, with offices in New York and Chicago, has a staff to investigate complaints, secure enforcement, and help both employer and worker to solve their problems. The chairman of the Senate Subcommittee on Agricultural Labor has praised the program as unique in the field and as tending to improve labor standards.⁵

The numbers involved in the farm-workers stream are increasing. Those protected by the work agreement numbered 3,000 in 1947 and had risen to 12,500 in 1952. Several thousand others established satisfactory relations with their employers during their first season or two, and now come each summer on their own. One obstacle to the program is the private labor contractor who wants to help some employers to secure workers without paying prevailing wages or assuming the responsibilities required by the agreement. Last season eight such agents were jailed for illegal recruiting on the island.

Continued high levels of employment on the continent will result in a chronic farm labor shortage for which the Puerto Rican supplies a highly satisfactory answer. Most of the season migrants work on sugar cane during the winter. Swinging a machete is heavy, grueling work in the tropical sun. Most of the "stoop labor" tasks on farms in the continental

United States are less exacting. The Puerto Rican worker is widely accepted as making an outstanding contribution throughout the Middle Atlantic and New England states, where he is best known.

THE URBAN MIGRATION

The other stream flows from the cities of the island to the cities of the mainland. It is the migration for settlement in a new environment; it accounted for a net outflow from the island of 249,918 persons in the decade 1942-51. These migrants enter urban service, trade, and industrial occupations. They settle in the industrial centers. About 80 per cent now live in New York City. The 1950 census showed 246,300 first- and second-generation Puerto Ricans there. The Welfare and Health Council of New York City estimated that on April 1, 1952 the figure was 321,000. Contrary to the general impression, the Puerto Ricans are not all concentrated in one or two areas, but are found in 351 of the 352 health areas into which the city is divided.⁶

Outside of New York the migrants are found in relatively small clusters in Bridgeport, Newark, Passaic, Trenton, Camden, Philadelphia, Pittsburgh, Buffalo, Youngstown, Cleveland, Lorain, Gary, Chicago, Aurora, Joliet, Savanna, and Milwaukee, and "points west" as far as Utah, Arizona, and California. The tendency is toward dispersion, and the government's policy is to encourage and facilitate such movement.

CHARACTERISTICS OF THE SETTLERS

What kind of person migrates? How does he compare with the rest of the population? A good deal of light can

⁶ *Population of Puerto Rican Birth or Parentage, New York City: 1950*, New York: Welfare and Health Council, 1952, 57 pp.

be shed on these questions. The answers will help us to evaluate migration as a long-range means of alleviating population pressure. The migrant is much more likely than the "average" Puerto Rican to come from an urban area; he is above his compatriots in literacy, in skill, and in occupational standing. He is slightly older than the average and is more likely to be in the labor force. He was, while on the island, employed more regularly than his peers, and he received a slightly higher than average income.⁷

The whole life pattern of the migrant displays urban characteristics as opposed to those of the Puerto Rican peasant. Ninety-one per cent of all persons in the sample had lived in the island's urban centers before coming to New York, compared with the 28 per cent of the total population classified as urban in the 1940 census. The two largest cities, San Juan and Ponce, accounted for the majority of the migrants. Overwhelmingly (79 per cent), they had been born in the urban centers and were not recent migrants from farm or village.

Occupational history reflected the urban origin: only 5 per cent had ever engaged in farming, although 39 per cent of Puerto Rico's workers were so occupied in 1940. Even more important is the contrast between the migrants and the 1940 labor force on the basis of skill: skilled workers, migrants 18

⁷ This picture is drawn from the results of two studies which agree closely on major features. One interviewed a sample of all persons migrating in November 1946 ("Encuesta," etc., *op. cit.*); the other analyzed the characteristics of 5,000 persons in 1,113 households in the two core areas of Puerto Rican settlement in New York City in 1948. (C. W. Mills, Clarence Senior, and Rose Goldsen, *The Puerto Rican Journey: New York's Newest Migrants*, New York: Harper & Brothers, 1950, 238 pp.) This study was more detailed than the one made in 1946, so data from it will be cited below.

per cent, island 5 per cent; semiskilled workers, migrants 41 per cent, island 20 per cent; unskilled workers, migrants 21 per cent, island 50 per cent. Thus it can be seen that skilled workers are represented among the migrants over three times as frequently as in the general population, the semiskilled twice, but the unskilled less than half.

Fifty-four per cent of the migrants were in the labor force, compared with 52 per cent of the urban adult population and 35 per cent of the total population. Only 4 per cent of those in the labor force were unemployed when they left the island, in sharp contrast to the 10 to 20 per cent annual average in recent years. Most of the migrants had quit jobs to make the change, and 71 per cent of those had worked steadily for the full year prior to their departure. The income of those who came just before the war averaged about 25 per cent above that of the island's industrial workers, but the gap narrowed during the war.

The schooling of the migrant is superior to that of the average islander; only 8 per cent of the migrants were illiterate, contrasted with 32 per cent on the island. The migrant is thus seen to be the end product of a selective process which has chosen those who, on the average, are superior to the average Puerto Rican in significant respects.

CONTRIBUTIONS OF MIGRATION

Migration from Puerto Rico makes both direct and indirect contributions to the economy of the island. Directly, the economy benefits from the draining off of part of the numbers added each year to a population which cannot now be supported adequately. This may be demonstrated by the following table showing year by year the percentage which net out-migration represents of the total annual natural increase during the past decade:

Year	Per Cent	Year	Per Cent
1942	3	1947	41
1943	6	1948	59
1944	21	1949	42
1945	26	1950	56
1946	74	1951	85

Thus, 1951 without migration would have showed an increase of 62,151. The outflow of 52,900 persons lowered the population increase to 9,251.

The direct loss for the decade 1942-51 was 249,918. The actual loss was greater, of course, since those persons would have contributed to the natural increase. Probably the predominantly urban origin of the migrants would have counterbalanced the concentration in the ages of greatest fertility, since the urban dweller in Puerto Rico has achieved lower birth rates. Thus, the rate of increase would presumably have been about the same as that of the general population. Therefore, if the migrants had remained at home, there would have been about 320,000 more persons on the island at the end of 1951 than there actually were; that is, the population would have been 14 per cent larger.

Planning Board calculations for the 1940-50 decade give a dramatic account of the meaning of migration for the labor force and unemployment:

From April 1940 to April 1950, the labor force increased by 160,000. Sufficient work opportunities were created in the island to absorb that increase and an additional 11,000 of the balance of unemployed at the beginning of the decade. Without emigration during the decade, everything else being equal, the present labor force would have been 886,000 instead of 786,000 and unemployment would have amounted to 201,000 as compared to an actual unemployment figure of 101,000 in June 1950. . . . The economic implications of such a contrast are obvious.⁹

⁹ *Economic Development, 1940-1960* (San Juan: Puerto Rico Planning Board, 1951), pp. 43-44.

There is an even more direct, financial, contribution now being made by the migrants. The seasonal farm workers under contract in 1951 earned about \$6,300,000. This amount was earned during a period when the vast majority would have had no income whatsoever. Not only did they support themselves; they sent home to their families between 2 and 2½ million dollars.⁹

Money orders from both rural and urban migrants have helped to reverse the balance of payments in the section of remittances. The 1949-50 money order payments were \$12,635,832; the following year they had risen to \$16,983,235.¹⁰

These direct results which are economic in character are paralleled by others of long-run importance. Returning migrants bring not only whatever money they may have saved, but also ideas, attitudes, and techniques of value to a developing economy.

QUESTIONS FOR THE FUTURE

The contributions are real and readily apparent. However, it would be the part of wisdom to keep certain questions in mind, even though data for the answers may not now be available.

First, what effect on the composition of the remaining population will a constant drain of the young, vigorous, better-trained, and more ambitious have?¹¹ It should be remembered that the major reason for the Puerto Rican migration to St. Croix is the lopsided age-sex

⁹ Figures based on a sample of payrolls taken by the Migration Division plus employer and post-office estimates of the amounts sent back to the island on paydays.

¹⁰ Data secured from postal authorities by the Balance of Payments Section, Economic Development Administration.

¹¹ The Netherlands is now raising the same question. See G. Beijer and J. J. Ondegeest, *Some Aspects of Migration Problems in the Netherlands* (The Hague: Martinus Nijhoff, 1952), pp. 22-28.

pyramid in St. Croix caused by continued out-migration over many years.

Second, the experience of the rest of the civilized world is that migration, industrialization, agricultural diversification, and education can raise levels of living only if, step by step with these developments, there is an increase in the foresight with which a family plans for the health and welfare of its children. This personal assumption of responsibility for living within one's means helps to reduce population pressures at the source, in the circumstances in which Puerto Rico finds itself. The migrants, however, come predominantly from those sectors of the population which have already to a considerable extent learned that consideration for the future of one's children is the mark of a humane and intelligent person. Thus their educational influence is removed just when it is needed as a supplement to the developmental program.

Finally, the possibility of a depression on the continent should never be ignored. Such an event would undoubtedly cause a reverse flow of migration to the island, as it has done in each of the major slumps since data became available.

Migration, it should be apparent, can and does contribute greatly to a solution of population pressure. It cannot be expected unaided to provide the solution; as in any other complex human problem, there is no simple solution.

GOVERNMENT POLICY

Labor shortages on the continent after World War II, coupled with expanded and cheaper transportation facilities from Puerto Rico, made the island a happy hunting ground for private, fee-charging, recruiting agencies. These agencies accepted fees from Puerto Ricans with little or no regard for the interests of the workers or the

continental communities in which they were placed. Many abuses resulted. Men and women were recruited for areas where they were not needed. Not only was there no work for them when they reached these areas, but the absence of such work and lack of funds created community problems of caring for stranded people. The picture was further complicated when the fee-charging agencies tied in with travel agencies whose interest was solely in selling tickets.

These abuses and the exorbitant charges of the recruiting agencies resulted in a 1947 law regulating labor contractors and abolishing fee-charging agencies in Puerto Rico. All contracts for workers recruited on the island must be approved by the insular Secretary of Labor. One basic policy decision was that no Puerto Rican worker could be recruited for the continent unless a labor shortage was certified by the responsible local, state, and federal labor officials.

These considerations, along with those steps already described which were taken for the protection of agricultural workers, apply to those recruited on the island. However, the majority of the migrants come on their own in search of "greener pastures." The official policy is that generally the government neither encourages nor discourages such migration. It early recognized, however, that the voluntary migration of substantial groups often gives rise to personal problems for the migrant and friction in his new community. It therefore maintains a Migration Division in the Department of Labor.

The Division co-operates with the 1,800 state and local offices affiliated with the United States Employment Service, to help Puerto Ricans move to labor shortage areas. It helps to interpret the economic and cultural back-

ground of the migrant to the local community and endeavors to speed the adjustment process by explaining to the migrant the new attitudes and habits required in his new situation. It maintains a staff of placement specialists, social workers, labor inspectors, community organizers, educators, and bilingual speakers to serve employers and workers and civic, labor, and social welfare organizations. It issues literature in both English and Spanish, produces and distributes educational films, organizes radio programs and conferences, and strives to build and maintain an atmosphere of good will and understanding between the migrant and the community.

Forecasts of widespread and serious continental labor shortages at the outbreak of the Korean war led the government to call the attention of employers and manpower officials to the presence of a substantial reservoir of unemployed and underemployed on the island. An Employment Development Section was created in the Economic Development Administration to canvass prospective employers outside of New York City, and a fund of \$100,000 to

underwrite transportation expenses advanced by the employer was voted. The failure of widespread shortages to develop hampered the program, and it was ended.

THE MIGRANT IN HIS NEW HOME

The situation the migrant faces either in New York City or outside is not essentially different from that faced by most of the 40,000,000 immigrants who have helped to build the United States. It is complicated at present by war-born shortages of housing, schools, and recreation and other community facilities. It is made somewhat easier by a more widespread realization today of the realities of culture contact and conflict and by the existence of a number of organizations seeking better understanding between ethnic groups.¹² The co-operation of such groups has been of inestimable value in helping to smooth the adjustment process and in aiding the migrants to enjoy the rights and responsibilities of full citizenship.

¹² Examples of such civic action are cited in Clarence Senior, *Strangers and Neighbors: The Story of Our Puerto Rican Citizens*, New York: Anti-Defamation League, 1952, 54 pp.

Clarence Senior, New York City, is consultant to the Department of Labor of Puerto Rico and teaches demography at Columbia University. Since 1936 he has specialized in inter-American relations. In connection with his service as director of the Social Science Research Center of the University of Puerto Rico he made several studies of Puerto Rican migration problems. He was associate director of the Columbia University study of the Puerto Rican migrant in New York City, and co-author of the report *The Puerto Rican Journey* (1950). He is author of *Puerto Rican Migration* (1947), *The Puerto Rican Migrant in St. Croix* (1947), *Strangers and Neighbors: The Story of Our Puerto Rican Citizens* (1952), and other works.

The Prospects of Birth Control in Puerto Rico

By J. MAYONE STYCOS and REUBEN HILL

WITH a quarter of its population illiterate, with an annual per capita income around \$400, and with about 85 per cent of its people Roman Catholic, the prospects for birth control in Puerto Rico would seem negligible. Such statistics, however, not only conceal the great material progress which the island has undergone within the past decade, but, perhaps more importantly, conceal striking attitudinal changes. Such changes have not only corroded many traditional impediments to the small-family mentality, but have largely replaced them by positive desires to practice family limitation.

Three major factors may be cited to explain the new outlook of Puerto Ricans: (1) Widespread government birth control stations and indirect propaganda have largely dispelled ignorance of the possibility of contraception. (2) Catholicism is or has become nominal and does not affect the majority of the population as regards birth control. (3) Rapidly changing social patterns in Puerto Rico have directly encouraged the adoption of small-family ideals.

These favorable factors are to some degree offset by the persistence of certain cultural patterns which are less susceptible to change. Such patterns frequently result in psychological blocks against the utilization of particular means of contraception. A differential rate of change among the various social institutions in a society is not peculiar to Puerto Rico, but here the situation appears to have reached the point at which a slight tipping of the scales would precipitate the population into a fertility decline. This paper addresses itself to a brief analysis of the positive

and negative cultural aspects of birth control in an effort to assess what can be done to ease the way for widespread adoption of birth control methods.

FORCES FAVORABLE TO BIRTH CONTROL

In many underdeveloped countries of the world, the lower classes are in ignorance of modern methods of birth control. While this situation is still characteristic of some of the rural lower class in Puerto Rico, it is by no means typical of the island as a whole. Both birth control stations and indirect propaganda have done much to eradicate sheer ignorance of the means to control births.

Attempts at birth control clinics were stifled as early as 1925, but in 1935 an active insular-wide program was initiated by a federal agency, the Puerto Rican Emergency Relief Administration. Mobile units with a physician and a social worker visited all the towns on the island several times per month, and considerable publicity in the way of leaflets and public meetings attracted lower-class Puerto Ricans into the clinics. However, pressure from Republicans fearing the power of the agency and from the Catholic hierarchy on the continent rapidly brought this program to a close.

Private funds continued the work until a court decision in 1939 legalized the distribution of birth control materials by physicians for medical reasons. Then 160 prematernal clinics were established, authorized to give free contraceptive materials to all individuals who desired them and who met broadly interpreted medical criteria. Although the private facilities were in some ways

expanded, the publicity given to the clinics was discontinued.

Equally or more important as a source of information for the lower class has been the propaganda against birth control issued by the Catholic Church and groups opposed to the present government. The barrage of pulpit and newspaper statements by the hierarchy and fervid laymen has undoubtedly informed many individuals of the possibility of means to limit their families. One physician, for example, reported that his clinic was swamped with inquiries the day following a pastoral letter read in the churches of the island. Moreover, the tabloid catering to lower-class readers has produced the largest headlines condemning the government's program. Copies of this newspaper are often passed from family to family, and have undoubtedly been a major source of information for lower-class families.

In the past two years, scores of articles attacking birth control, sterilization, and the overpopulation thesis have appeared in the insular newspapers, and several religious organizations have devoted all or a large share of their endeavors to anti-birth-control activity.¹ Certain political groups have joined with the church in attacking the government for its alleged program of sterilization. The leader of the *Independentistas*, for example, has accused the government of class genocide (the attempt to solve the problem of poverty by eliminating the poor)² and of using the poor as guinea

¹ The most virulent group is the *Unión pro Defensa de la Moral Natural*, which, among other things, has campaigned for the prohibition of divorce, artificial insemination, birth control teaching and propaganda, diffusion and sale of birth control literature and contraceptive materials, sterilization, and premarital medical examinations. Letter to the Committee on the Bill of Rights for the Constitution, *El Imparcial*, Oct. 5, 1951.

pigs in "clandestine experiments" (on birth control).³

Ineffectiveness of Catholicism

If pulpit and press have helped to alert Puerto Ricans to birth control, how have they affected attitudes toward it?

In using the birth control program as an issue with which to cudgel the Popular Democratic party, the opposition politicians are working on an erroneous premise—that the Catholicism of the Puerto Rican will be offended by a birth control program. Precisely the contrary is true.

It is readily apparent to any observer who attends Catholic services in Puerto Rico that religion "*es cosa de mujer*" (is a thing for women). It is customary for Puerto Rican males to remark that they are "not fanatic" about religion, or that they are "religious in their own way." But even women are hardly exemplary in performance of the mandates of the church. According to a study of 13,000 cases, close to three-quarters of the women attend church services less than once a month.⁴

For the lower classes, at least, Catholicism has become a series of rituals to be combined with social festivities, and a cult of saints to bring good fortune. As the Bishop of Ponce recently complained:

It is a situation that concerns us deeply, when we see in our pastoral visits how many people . . . do not even keep in touch with the most elementary principles of our sacrosanct religion. It is an indisputable necessity to defeat that ignorance if we do not want to continue losing more ground.⁵

³ *El Mundo*, Oct. 24, 1951.

⁴ Paul Hatt, *Backgrounds of Human Fertility in Puerto Rico* (Princeton: Princeton University Press, 1952), Table 23.

⁵ *La Milagrosa*, Jan. 10, 1951.

The preceding paragraph would suggest that large segments of the population either are not aware of the Catholic position on birth control or are aware and disagree. Results from several studies support these hypotheses. Hatt found less than 13 per cent of the population denying a couple the right to limit the size of its family.⁶ Cofresí found that among several thousand objectors to birth control, religious objections accounted for less than 5 per cent.⁷ In a study of 144 men and women of the lower class, a lengthy interview on birth control elicited mention of religion in less than one of every ten cases.⁸

The lack of objections stems partly from ignorance of the church position, but mainly from opposition to it. Thirty Catholic respondents were asked directly about the Catholic stand. Eighteen of the thirty were aware that the church was opposed to birth control, but fifteen disagreed with the church. The twelve cases who did not know the church position were asked what they would do if the church opposed the use of birth control. All twelve said it would not make any difference.

Despite the presence of 160 health units which have been dispensing free contraceptives for over a decade, highly vocal resistance from the Catholic Church has occurred only recently. Whether this effort has been due to recent dramatic increases in steriliza-

tion, to the church's interest in an issue to unite backsliding Catholics, or to political motives, cannot be ascertained.

Changing family ideals

In most agricultural societies, a high premium is put on having a large family. Not only does the large family yield economic benefits, but kudos is usually paid to the fecund man and woman. For the most part, however, neither the economic nor the social advantages of the large family exist in present-day Puerto Rico. Landlessness, child labor and child support laws, an early age of marriage, separate residence at marriage, and weakening family ties have considerably decreased the economic advantage of a large number of sons. There seems also to be a growing awareness that most sons either cannot or do not support their parents in present-day Puerto Rico. Moreover, the landless agricultural worker sees education as the only means of upward mobility for his children, and is equally aware that a large family will preclude this.

Perhaps for these reasons and the fusion of American cultural patterns, the high social value once placed on the large family is disappearing. One type of evidence is the relative absence today of female fears of sterility. Of 72 women questioned as to how they would feel if called barren, most were indifferent, and 10 per cent said they would be only too glad to be so called. Again, far from wanting "all the children God sends" (the statement which is usually attributed to all the Puerto Rican lower class), the average ideal family size as expressed by the lower class is three.

Another evidence of the desire for smaller families is the unusual number of sterilizations performed in Puerto Rico. In 1949, for example, 19.3 per cent of all hospital deliveries on the island were followed by sterilization. In

⁶ Hatt, *op. cit.*, Table 60.

⁷ Emilio Cofresí, *Realidad Poblacional de P. R.* (San Juan: Imprenta Venezuela, 1951), Table 36.

⁸ This study, directed by the authors, is the source of most of the generalizations used in this paper. For more detailed project descriptions see J. Mayone Stycos, "Family and Fertility in Puerto Rico," *American Sociological Review*, Oct. 1952; and "The Dynamics of Birth Control in Puerto Rico," *Revista Mexicana de Sociología*, forthcoming.

some hospitals the rate was as high as 70 per cent. In many places on the island, hospital bed space for sterilization is a plum held by the local *políticos*, and both they and local physicians complain that the demand far exceeds the available facilities.

For several reasons, sterilization has not yet greatly affected the birth rate. First, although the percentage figure quoted above appears high, the majority of Puerto Rico's deliveries occur in the home rather than in hospitals. Second, sterilization is a relatively recent development, dating back only a few years as far as large numbers are concerned. Third, most sterilizations occur relatively late in the childbearing period.

THE EXTENT OF BIRTH CONTROL

The incidence of birth control practice in Puerto Rico is not known precisely. The prematernal clinics distribute, among other contraceptives, several thousand diaphragms and over a half-million condoms per year. The authors' study suggests that a considerable amount of birth control is occurring. Despite the paucity of cases (72 families), these were chosen at random from lower-class members of seven rural and urban areas in the northeastern section of the island, and provide a possible indication of the general trend. Of this group of 72 families, 54 have practiced some method of birth control during at least some period in their marital histories.⁹

Unfortunately, this high incidence of birth control does not have striking effects on fertility. Despite the fact that the median age of the 54 women who

⁹ Two other studies have found that over a third of the women have at some time used birth control methods. Cofresí, *op. cit.*, Table 32; Gilbert Beebe and José Belaval, "Fertility and Contraception in Puerto Rico," *Puerto Rican Journal of Public Health and Tropical Medicine*, Vol. 17 (Sept. 1942), Table 4.

have practiced birth control is only 29, the median number of pregnancies for this group is 4. This indicates that birth control, while practiced, is not practiced very effectively. Beebe and Belaval found similar ineffectual use of birth control in their study of clinic patients.¹⁰

Two questions now require explanation: (1) Why is there a sizable proportion of the population who never attempt birth control? (2) Why among those who use it does it seem to be relatively ineffectual?

FORCES UNFAVORABLE TO BIRTH CONTROL

One of the strongest impediments to birth control is the complex of superstitious beliefs harbored principally by women but to some extent by men. Fears of developing cancer, and fears of failing health in general, prevent many women from trying contraceptives. Apart from the phobic mechanisms frequently constructed by the uneducated as defenses against a technical world, such beliefs have been encouraged and instigated by misinformed or biased medical advisers and by special interest groups.¹¹

But there are resistances more deeply imbedded in the culture and personality of the lower-class Puerto Rican, resistances which are the product of institutional structures peculiar to this or at least to Latin American culture.¹² For

¹⁰ *Ibid.*, p. 50.

¹¹ For example: "La Pia Union de Esposas y Madres Cristianas of San Germán . . . is currently active in carrying out orientation programs among the country women of that region, trying to prevent these women from being deceived and trying to convince them of the immorality of sterilization and Neomalthusian methods, which, in addition to being a most grievous sin, usually are causes of many diseases." *El Mundo*, Sept. 11, 1951.

¹² For more detailed discussion see J. Mayone Styco, "La Psicología Social del Control Poblacional," *Memorias de la Sép-*

example, men and women enter marriage with entirely different sets of attitudes and experiences toward sex. During childhood and adolescence the male is given a great deal of freedom in sexual matters, whereas the female is rigidly cloistered in the home and forbidden sexual expression. Consequently, in adulthood many women desiring birth control information are too modest to ask for it at public health centers, not only because there is a taboo on sex discussion for the female, but because they fear a vaginal examination by a man.

Many lower-class females transfer the fear and respect with which they regarded their fathers to their husbands, regarding the latter not as an equal but as a superior. Both modesty and status, then, put communication barriers between the couple, so that the wife is both afraid and ashamed to discuss matters of sex and birth control, even when she knows about these. Over half of the women in our sample do not discuss such matters with their husbands. As one woman put it, "I heard of the condom from a married friend, but did not dare discuss it with my husband. I don't discuss such matters with him; I am ashamed."

Husbands are equally uncommunicative. One reason is the corollary of the wives' attitudes; that is, the husbands tend to "respect" their wives, drawing a sharp distinction between prostitutes, easy women, and their wives. The former are women to be enjoyed because they are evil. The wife, on the other hand, is like one's mother—holy, pure, and saintly. This desexualization of the love object frequently helps to block communication on sexual matters.

Suspicion and hostility also impede communication, but frequently lead more directly to discouraging birth control. *última Convención de Trabajo Social de Puerto Rico*, to be published.

Husbands seem concerned about the fidelity of their wives and the chastity of the daughters to an almost phobic extent. The wives, well indoctrinated with the husbands' anxieties, tread extremely lightly so as never to incur the suspicion of their husbands. To put birth control in the hands of the women (who are by nature weak, according to the men) makes them "liable to use it for illicit purposes."

Defensiveness of the male

In the patriarchal type family which characterizes most of lower-class Puerto Rico, the wife's opinions on birth control count far less than those of the husband, since the latter's word is law. This makes examination of the husbands' attitudes on birth control strategic, for not only do they control the time and the frequency of intercourse, but they decide whether or not birth control shall be used.

First, there is the conception prevalent among many males that to allow the woman to use contraceptives robs the man of authority. Since it is the male who controls all significant family behavior, to allow the woman control over conception threatens the male sense of superiority. The threat to authority plus the idea that it gives the women sexual freedom (another prerogative of the male only) causes many men to react unfavorably to female methods of birth control.

But what do men think of *male* contraception? In our present sample of families, two out of every three men mentioned some objection to condoms. Two of the most frequent reasons were, (1) they give less pleasure and (2) they are dirty or for prostitutes.

We can understand these objections only by turning again to cultural factors. It is taken for granted that men will have sexual relations before and after marriage, but not with "good"

women; that is, not with virgins or with the wives of respectable men. For illicit sexual relations the male must turn to "bad" women or prostitutes. With these women he will use the condom to avoid both children and disease, and use it without complaint. In such cases the man uses contraceptives as a taken-for-granted technological instrument to achieve his ends. It is part of the normal, secular world, much as a machete is a taken-for-granted instrument for cutting cane.

When it comes to his wife, however, he enters another world—the world of the sacred. A combination of culture, religion, and psychodynamic mechanisms throws a veil of sacredness around the wife. Since he has already learned that the condom is to be used with the prostitute, he cannot bring himself to use this with the wife. It would be bringing the profane into the realm of the sacred, or much like bringing his machete to the altar rail.

Thus, to the *bokio*-sheltered *jibaro*, who lives without running water and standard sanitary facilities, the condom is dirty psychologically—not physically; and when he reports less pleasure from it, he means not only pure physical sensation, but diminished psychological pleasure because of the associations we have described above.

In some cases these mechanisms may prevent a family from using birth control at all. In others, despite the fact that birth control is used, the social-psychological obstacles are so strong that the methods will be used too late or too erratically. A major task of public agencies will be the removal of such psychological blocks to allow the full realization of small-family ideals.

SHORTCOMINGS OF EXISTING FACILITIES

There are few agencies in Puerto Rico which make any attempt at disseminat-

ing family planning ideals. Even their efforts are cautious, unsystematic, and timid. The only real program is in the hands of the Department of Health, whose 160 birth control clinics form one of the most extensive public services of its kind in the world. Nevertheless, the number of individuals who regularly avail themselves of its facilities has not been sufficient to affect the island's birth rate markedly. With due respect for the legal, political, and personal difficulties under which the Department of Health is laboring, an exposition of the weak spots in the prematernal program seems indicated.

There is no full-time staff devoted to the prematernal program in any of the public health units. The prematernal clinic is squeezed into a program including as many as nine other clinics. Clinics on venereal disease, prenatal and *post partum* care, tuberculosis, and crippled children are some of the weekly sessions which compete for the physicians' and nurses' time. Most prematernal clinics are open only half a day per week, and in some areas only one day per month.

Since the clinics are open so infrequently, many mothers are discouraged from attending. In many communities a woman will have to walk and climb many miles to reach the clinic. If shopping time does not coincide with clinic time, the prospects of another such walk will hardly promote regular attendance. Additionally, modesty patterns create a resistance to attending clinics at a particular morning or afternoon of the week, since the town gossips will know for what reason the patient has entered the health station.

As a general rule, the principle of local autonomy for health units operates to maximize the motivation of physicians and their associates. In this instance the very flexibility of the centers brings about an emphasis on programs

other than the prematernal clinics. The pressure of other clinics competes not only for time, but also for the interest of the staff. Physicians tend to emphasize the clinics which deal with their areas of training and interest, and few men have been trained in gynecology or obstetrics sufficiently to be vitally interested in birth control services. The prematernal clinics suffer in those centers where the members of the medical staff prefer work with venereal disease, tuberculosis, or crippled children. This is seen in the criticisms that have been made of the program by its officers:

1. A physician who is not particularly interested in the program will be careless about replenishing supplies of contraceptive materials. Since supplies are sent by the Health Department only upon request, an indifferent health officer may intentionally or unintentionally sabotage the program.

2. Whereas a physician interested in the program will refer many of his patients from other clinics to the prematernal clinic, an indifferent physician will treat only those who directly ask for advice and materials.

3. Visiting nurses are expected to appraise the home situations of both patients and nonpatients, and recommend visiting the clinics if a health reason indicates that such would be helpful to the family. Lack of sensitization to the problem, however, frequently causes such nurses to concentrate on more routine matters.

Program ignores husband

An obvious shortcoming of the existing program is its failure to take into account the vital role played by the husband in family limitation. The centers concentrate their entire attention upon mothers. This unhappy situation has come about because the law requires the center to determine a health reason for providing contraceptive information and

materials. Consequently, the male, who is the real barrier to effective birth control, is not made part of the co-operative arrangement between the center and the family.

Disregard for modesty patterns

Although manned by native Puerto Ricans, the centers appear to ignore the deeply ingrained modesty patterns of Puerto Rican women. These patterns make the prospects of a medical examination by a male physician something to be avoided at all costs. Yet the program requires that every woman who applies or is referred to a prematernal clinic be given a vaginal examination by a physician, who then decides whether or not birth control is indicated. Since there are few female physicians on the island, these examinations are conducted by male physicians. There is abundant evidence that women avoid the public health units precisely because they object to such examinations by male physicians. The husband feels even more strongly than the wife about the impropriety of such examinations.

If the modesty impediment is to be overcome, female physicians need to be trained and placed in these clinics, and nurses must be used wherever possible to replace the male physicians. This can probably be done profitably in the fitting of the diaphragm, thus freeing the physician for other, more technically medical, duties.

Seeming passivity

The program presents a curious paradox. It is one of the most ambitious and widespread programs of birth control in the world, and yet it is basically neutral in the educational approach to people. Relatively little initiative is taken in getting people into the clinics. The staff members of the clinics see themselves as passive instruments to be

used by those who desire to use the center's facilities. This seeming passivity is probably the program's most serious drawback at the present moment.

PROSPECTS

Studies by the authors and by others have left no doubt that the majority of the Puerto Ricans desire to limit their families, and that religious and moral objections are minimal factors in the frustration of such a desire. While rapid changes in Puerto Rico have supplanted the large-family ideal with desires for the small family, other cultural complexes have not changed so rapidly. Indeed, superstitious fears, modesty complexes, marital mistrust, lack of equality in marriage, and so forth, remain highly effective in preventing the realization of the small-family ideal. Existing medical and educational services, while fairly adequate in terms of sheer supply, do little to combat anticontraceptive prejudices, since by and large they service indi-

viduals who have already conquered many of these prejudices.

A large-scale campaign designed to crack the resistances outlined above would of course provide the quickest solution to the problem. A co-ordinated program might involve mass media, discussion groups, sex education, and premarital counseling. But even effective expansion of present facilities would go a long way. Doctors and nurses in public health clinics should be motivated to take a greater interest in the birth control aspects of their program, and measures should be taken to reduce reliance on the personal inclinations of the staff. Greater use of nurses and female physicians, greater attention paid to males, specialization of staffs, and added increments of clinic time are among the possible improvements.

Without such measures, Puerto Ricans will achieve their family ideals slowly but surely. With such measures, a rapid drop in the birth rate may be predicted.

J. Mayone Stycos, Río Piedras, Puerto Rico, is assistant director of the Family Life Project, Social Science Research Center, University of Puerto Rico, on leave from the Bureau of Applied Social Research of Columbia University. He has previously done research in the fields of marketing and international public opinion, and has contributed to psychiatric and sociological journals.

What Next for Puerto Rico?

By R. G. TUGWELL

SELDOM—in my experience or in my reading—have I encountered instances of such sudden, determined, and effective moods of enterprise as have risen and persisted in Puerto Rico during the last decade. Moreover, the movement seems to pervade all phases of economic, political, and social life, and by now to have reached so firm a resolution as to have more than an even chance of constituting the beginning of one of those progressive spirals that social theorists are learning to treat with so much respect. It is not too much to say that a transformation is in process which for a long time will be one of the wonders of human history.

It is entirely possible, of course, that I am too enthusiastic and that I exaggerate the possibilities in what is taking place. This could be because of my close association with the beginnings of the change from the old lethargy to the new enterprise, and because of my affection for so many of the Puerto Ricans involved in the transformation. But I do not think it is so. My disposition is skeptical rather than optimistic in such matters. And until rather recently I was not persuaded that the revolution had found a grip on the realities necessary to sustain it. Even now it seems to me that some of the policies being pursued are mistaken ones, in the sense that they contribute little or nothing to the establishment of a firm foundation; and that some others which are not being undertaken could contribute much. But these are reservations to a major admiration.

This admiration has gone on at some distance now since 1946. I have agonized some over what I believed to be

errors in public judgment. But I have had a growing conviction that the movement as a whole was gaining momentum and taking on an experimental quality which would carry it through inevitable bad moments and serve to find correction for errors.

Naturally, being familiar with the early incidents, and having followed the subsequent developments closely, what has happened seems less a miracle to me than it evidently does to some other observers. I can, I think, even understand a good deal about why events happened as and when they did—matters appropriate for an exploration I may not undertake here. Here my interest is to set down what seem to me to be the best—or the likeliest—developments for the immediate future in view of the present position.

POLITICAL STATUS

To speak of politics first and briefly, it is possible that what may seem to many Puerto Ricans an advance into very forward ground during the past years, and perhaps a status satisfactory for some time to come, may prove to be only preliminary to a much more radical step to be undertaken presently. Puerto Rico, I think, is likely to become a state.

I think this is so because no proud and achieving people can go on being excluded from participation in the highest political processes of the nation of which it is a part. It is ridiculous that Puerto Rico should send delegates to conventions which choose Presidential candidates but that the people in Puerto Rico should not be able to vote for the candidate chosen. And it is even more

ridiculous that they should be citizens of the United States and yet not entitled to participation in the national legislative activities, many of which affect them as vitally as they do other citizens. For instance, in questions of military service, once a decision is made, the responsibilities of Puerto Ricans are the same as those of others. Also in matters of trade policy, of social security, and of agricultural planning, they have an equal stake along with others.

The argument against statehood is well known. I have used it myself many times. I used it, however, with reference to the conditions at a particular time; and those conditions are changing. They were economic. And I was always clear that they were not political. I simply felt that, a decade ago, the insular economy could not bear the burden of the contributions to the federal union involved in statehood. But I think the time is coming soon when these burdens can and must be borne in the interest of self-respect and perhaps even of equal justice. For before long, Puerto Rico may well be more prosperous than many other regions of the Union.

I regard the decision against independence to be a final one. And I think, after long observation, that the well-known underlying hostility to the United States, so publicized by many observers, has proved to have an even deeper phase, closely akin to fellow feeling. In other words, Puerto Ricans, somewhat to their own surprise, have discovered that they have after all become part of us. We may be mutually critical; but our mutual criticism is much like that which Texans and New Englanders would also feel for each other, and not the bitter xenophobia that might well have been expected in an insular people held more or less in colonial condition for half a century.

There was, up to and including the Winship governorship, a good deal said by extremists on both sides, much of it for political purposes, which turns out not to have reflected any very deep conviction in the popular mind. And as for the Spanish cultural tie, its attenuation as a political phenomenon has tended to go on, even while Spanish scholarship has deepened at the University of Puerto Rico. There has been the same discovery made by other Americans, that pride in origin and the cultivation of inherited culture are not inconsistent with the development of an ardent Americanism. All the rest of us have a foreign origin, too, sometimes recent. We are not called on to regret it or to consider that it lessens our oneness with the New World nation. So too with Puerto Ricans.

I say Puerto Rico must become a state, even after apparent settlement on what is now called a commonwealth, because statehood is the recognized status worked out in discussion, in legislation and court decision, even in civil war, as our characteristic operating relationship. This relationship has evolved and is still evolving. It is not static and unchanging. But to be equal and responsible, Puerto Rico must enter with the rest of us, co-ordinately, into our future political experience, whatever it may be. This is the stable status which none of the advances of the past years reached, genuine though they were.

POLITICS AND ECONOMICS LINKED

There will perhaps be those who think that continued political progress until the further evolution of Puerto Rican institutions is merged in that of the whole nation is not so important in the insular complex as the economic changes which more directly affect the levels of living. In a way, they are right. Yet this is a more important matter to Puerto Ricans than most other Ameri-

cans realize, partly because until the 1940's political progress had seemed to be arrested and had acquired a psychological weight out of proportion to its living value. It is not accidental, I believe, that new political stirrings and accomplishments were concurrent with startling economic changes. Their interaction was very important. Consider, for instance, the significance to younger Puerto Ricans of escaping from the Washington psycho-complex of their elders and setting about to transform life at home without habitually asking for favors—or feeling that it was hopeless to ask for them if they were matters of justice.

Puerto Rico has been fairly treated in many respects in the last decade by the nation—not in all, in my opinion, but in many. The sugar quotas are inequitable, the ocean freight rates too high because of the coastwise shipping monopoly, the Navy has behaved very badly in Vieques, the Army has hardly met its responsibilities to the Puerto Rican establishment, and the Veterans Administration has even worse counts against it.

But admission to several titles of the social security arrangements without corresponding obligations has been generous. The development of education, vocational training, and agriculture has been, on a basis of equality with the states. These matters have been and are very important, and, together with the returned excise taxes on rum, have contributed very importantly to the favorable fiscal position of the government even while it undertook onerous engagements of new sorts in the interest of the economic transformation which was the basic objective of policy.

These were all political matters, more or less, and need not have been as they were. They were contributions to a complex of arrangements which had to be established before the revolution

could be said to be at all secure. It will be some time before that security will be stabilized. But that it is now much more likely to be stabilized than not to be, seems to me clear. When it is, the merging of Puerto Rican with national evolution can be made complete, and this, of course, will furnish an even firmer guarantee of permanence.

START OF INDUSTRIALIZATION

I have mentioned the word "complex." This is the key to consummating the ambitious economic aspirations which from the early forties were regarded as the *sine qua non* of the movement then being begun. To industrialize has now become a favorite—if sometimes inappropriate—cliché with planners for the underdeveloped areas of the world. But it was not so overused a cliché in 1942 as it has since become, and it has turned out to be realizable in Puerto Rico as it will not be in many other places.

There were those who thought it unrealizable in Puerto Rico. Most of the public dissent was, however, so obviously interested as to be subject to heavy discount. The sugar interests, so predominant then, felt very strongly that they had much to lose and little to gain from industrialization, and they were active in opposition to undertaking any program which relied on it. This opposition was very useful to its proponents, for never had a class or group been more thoroughly discredited for shortsightedness and downright selfishness than these sugar interests in Puerto Rico.

At any rate, it was determined by the new group then coming into dominance that industrialization was the means by which escape could be made from the long overlordship of the plantocracy. It was also, as was gradually seen, the means of escape from the exploitation of the monopolistic circle of merchants so characteristic of insular economies,

and the way to development of a responsible labor movement which, if it escaped from captivity and political sychophancy, could contribute much to a freely functioning system of enterprise. These last were incidental, perhaps, but they had a reciprocal relationship with the main complex, which was important.

There were some favoring circumstances which, if taken advantage of, might be helpful. Temporarily Puerto Rico might be attractive to outside enterprise because labor was cheaper and taxes less than on the mainland. These never seemed to me reliable attractions. For one thing, the labor troubles incident to the early stages of trade union growth were certain to be so exasperating, and perhaps would be so costly, as to overcome the attractions of lower wages. And industries attracted by tax favors were likely to be those which would disappear when the favors were withdrawn. But both might be of some minor psychological assistance in attracting capital and in getting enterprises started.

These starts were in themselves important. They tended to show that there were possibilities; and they assisted in establishing a labor and minor management force which would be indispensable to any considerable success. And all the efforts of this sort to attract outsiders have proved to be justified on these grounds. But I argued that there were two sources of enterprise which would prove most remunerative. One was the spreading into Puerto Rico of parts of the going enterprise system of the mainland; the other was the development of a local enterprising group who not only discovered possibilities other than sugar, but risked their capital and their careers in them. These, I think, are and will prove to be the most reliable and creative members of the complex now coming into being.

But Puerto Rican planners need to make more strenuous efforts than they have made in the past to create a rounded, reciprocating organism of the industries they are attracting and helping to establish. It is of some obvious use merely to have miscellaneous factories. But these do not necessarily fit into the interacting network which will survive the artificial attractions of tax remission and wage differential. What is needed—and can be had—is a group of industries which buy from and sell to each other, can exchange members of the management and labor forces, and have a mutual interest in helpful government, in efficient and low-cost public utilities, and in vocational education.

ECONOMIC OBJECTIVES

Studying Puerto Rican progress through its amazing last decade, I have become even more convinced than I was when I was Governor that to ensure the continuity of the upward spiral there need to be clear and consistent economic objectives. The need for centering on the complex idea was one of these, but that was more methodological than substantive. The kind of complex to be developed is even more important. And here, I think, the promotional efforts are most to be criticized. The hopelessly miscellaneous nature of the first hundreds of industries is obvious. The promotional efforts not only do not form a complex, but they do not show any predilection for what is possible and permanent as against what is improbable and therefore very likely impermanent.

What promoters and planners must come to, I feel, in view of this insular situation, their geographic location and their demographic condition, is development with two objectives always in mind and rejection of all competing ones. One is those industries of small and medium size which specialize in

fabrication. These are relatively insensitive to location, because their materials and products show a growing tendency to move by air freight in any case, and are common to heavier industries which are very widely scattered. These smaller industries, also, are dependent on a skilled and specialized labor force far more easily developed in an insular situation, if earnest effort is made, than in any other. It is not very widely realized how necessary this type of industry has become and what its requirements are. As we reach the stage of industrialization at which computers, robot controls, and locked-series operations characterize the heavy trades, the manufacture of the control mechanisms becomes a more and more important specialty. There is an opportunity here, already seen by many Puerto Ricans and even tentatively exploited, which ought to be made a matter of deliberate and perhaps exclusive public policy.

INTENSIFIED AGRICULTURE

But there is another obvious field, and this, it can be seriously charged, has been unaccountably neglected. This is an intensified agriculture. It is a repetition of old pleas for me to insist that this neglect is inexcusable, and I risk a violation of the ex-Governor's code in reproaching my former colleagues for allowing an energetic beginning to be stifled. There was once a Puerto Rican Agricultural Development Corporation with at least the right intentions. It ought to have been made to work. Instead, the easy way of bowing to prejudice was taken. In this field it is hard for practical islanders to believe that anything but sugar can be important; and to an almost incredible degree, agricultural technology has centered on the production and processing of cane.

To this concentration I have only the objection that it is not nearly enough,

and that it is risky for an excellent reason: Puerto Rican sugar is high-cost sugar which can be produced only because it is artificially supported in competition with other areas—notably Cuba and the Philippines. There are other possibilities, not at all competitive with cane for land, which need to be explored and developed. To do this would require resolution, persistence, and prolonged capital expenditure; but I do not regard the results of such a program as in the least doubtful.

The world is entering on a time when, as the result of population growth and the exhaustion of good unused lands, foods and fibers are to be at a premium. This is a situation which may well affect the now accepted principle—one hitherto entirely justified—that industrialization is the means of salvation for underdeveloped areas. It is quite likely that shortly it will be recognized that an intensified agriculture is much more practical. What is involved in this, although the idea is for some reason yet novel, is not so different from the inducement of progress through industry. As a matter of fact, the new kinds of agricultural production are so like industries as to be indistinguishable. They rely on research and standardization and on reciprocal relations between various stages of growth and processing, and they need skilled management and labor, and not mere brutal work.

Puerto Rico is in an ideal situation to develop several specialties in great and growing demand—fruit products, for instance. But even more important, the climate and the labor force favor the development of what is certain to be an immense industry as protein shortages grow—the hydroponic culture of appropriate high-protein plants. For these, sun, water, and skill are needed as well as a high degree of capitalization. Puerto Rico is furnished by nature with

the first two, is intent on specializing on skill, and is committed to infusions of capital by government.

It has rather sadly to be said, however, that there is an unreasonable reluctance to open up this obvious resource—a reluctance which only leadership can overcome. One effort at development was allowed to die. And the vested interest of agricultural technologists is still powerful. It has been my contention that neither specialties, such as pineapples for continental consumption, nor hydroponic proteins for a malnourished world need to compete with sugar. The one grows generally where cane is least productive; the other is so intensified as to require but little space—surely an important consideration is Puerto Rico; but, in spite of these facts, there is a persistent reluctance to be overcome. If the same effort that has gone into the rejuvenation of coffee-growing had gone into more rewarding crops, their development might now be well under way. As it is, almost everything still remains to be done.

BASIC REASONS FOR ACTION

That there are imponderables in such an occurrence as the Puerto Rican uplift is quite obvious. That they are the most important component of the movement I would contend. This leads to saying that they ought not to remain imponderable. If they can be identified and made explicit, what is now a mystery may become much less that. It is even possible that by analyzing such developments, the now unknown principles of induced economic development may be revealed. That will not necessarily mean that duplication in other places is possible; but it could certainly mean that less capital and effort would be wasted, and that results—now not very encouraging for current efforts—could be improved.

As I look at the whole Puerto Rican

occurrence, I am impressed with its almost explosive nature. Such explosions do not happen spontaneously. There must have been prepared conditions. In Puerto Rico there most certainly were. In the first place, there was political tantalization built up by contact with free American institutions, persistently kept just out of reach by irresponsible congressional control. This induced patriotism of an intensity seldom equaled except in very similar circumstances elsewhere—in Ireland, for instance, or in India. The determination to expend every resource of intelligence and energy possessed in the service of Puerto Rico was completely characteristic of a whole group of patriots.

That this was most characteristic of intellectuals had its own results, because these intellectuals did not hesitate, in the service of patriotism, to abandon their careers and undertake the tasks required for revolution. The rise of the Popular Democratic party, and the acceptance, not only by the masses but by the ablest intellectuals, of the leadership in it of Muñoz Marín, furnished a necessary discipline, and within the discipline a rationale, which shaped up into a formidable movement. The intellectuals, together with Muñoz, worked out the program, and his leadership gained wide support for it. As a consequence, there were fewer of those mistakes, half-successes, and compromises than characterize most democratic efforts.

From this it may be concluded that political frustration and a popular movement to escape it is a desirable starter. But there was another situation in Puerto Rico which was equally important. The misery of the people was very nearly as deep as that of any people in the world. They were malnourished, were housed in squatter shacks, and lacked any hope of betterment. Their children died like flies; educa-

tion was available for only a few; and they themselves lived the precarious existence of the chronically unemployed.

All this was, however, in juxtaposition with—indeed under the political jurisdiction of—the most prosperous people in the history of the world. The intellectuals were part of that prosperity. They had continental education; their homes were characteristic of the American level of life. But they and their families were islands in a rising sea of filth, poverty, and starvation. They would have been less than men if they had not reacted by dedicating themselves to change. This too is perhaps a necessary ingredient—an able and conscientious elite, so determined to eliminate misery that if necessary it will participate in overthrowing the vested interests in the perpetuation of poverty, even if it involves the charge of traitorousness to class.

ELEMENTS OF SUCCESS

Such a stirred and sin-convicted group may induce and carry through miracles of change if they are given the opportunity. In Puerto Rico they were. But they are not always experienced or wise enough—being mostly young—to realize the necessity for rigorous planning, for self-discipline, and for converting fervor into administration. So such movements are often wasted and futile. The sophisticated observer awaits with some skepticism passage from the one stage to the other. Will what has been a natural political reaction to conditions of oppression and poverty become actually a rejuvenating movement?

It is the most interesting thing about the Puerto Rican case that this transition was successfully made. There were two elements necessary to success, and both were present. The first was that the temptation to play on xenophobia should be rejected; and the second was that the elements of recon-

struction should be rigorously conceived and persistently pursued. The conceptions were formulated by that exceptional group of intellectuals I have mentioned, and were made explicit by the organization of a thoroughly supported Planning Board. The persistence was furnished by an immediate reorganization of the administrative services and the enlargement of sources of future supply in the University of Puerto Rico.

But it was not enough that temptation to blame everything on outsiders, so characteristic of colonial demagoguery and once so prevalent in Puerto Rico, should be rejected by Muñoz and the others. It was necessary that the whole responsibility for change should be accepted and centered in themselves. Such risks politicians do not like to take. It is much safer to prepare a retreat by stressing opposition and difficulties. Muñoz, in contrast, has always said that Puerto Ricans had to find their own salvation, that under his leadership they could, and that if they did not he could be blamed. He even took the step so many powerful bosses are reluctant to take—he assumed the title along with power and became the first elected Governor. This was an admirable gesture. It gave the operators of the program a renewed sense of identification and responsibility which had been all along so notable a feature of the revolution. Together with the work of the planners and their commitment to rational direction, it completed the transition from fervor to administration.

The Puerto Rican effort is now centered in the endless and fruitful exploration of better things to do and better ways to do them, which is characteristic of a mature high-energy economy. That it will succeed, I, at least, have no longer any doubt. But there are some auxiliary occurrences, quite outside the Puerto Rican orbit of influence, which will help immeasurably in what might

otherwise have been a more distressing uphill fight on the part of the devoted operators. The world is entering on a period in which population growth will be much more easily controlled, in which power will be more cheaply produced and more universally available, and in

which size or resources or location will not count nearly so much as devotion to research and reason, to good administration and to social conscience. How fortunate this is for the Puerto Ricans may be easily seen. It will give a brave effort support from unexpected sources.

R. G. Tugwell, Ph.D., Chicago, Illinois, is professor of political science at the University of Chicago, and has taught at the universities of Pennsylvania and Washington and at Columbia University. He was Governor of Puerto Rico, 1941-46, and has served as Under Secretary of Agriculture, Resettlement Administrator, and chairman of the New York City Planning Commission. He is author of American Economic Life (1925), The Stricken Land (1947), and other books.

Constitution of the Commonwealth of Puerto Rico

We, the people of Puerto Rico, in order to organize ourselves politically on a fully democratic basis, to promote the general welfare, and to secure for ourselves and our posterity the complete enjoyment of human rights, placing our trust in Almighty God, do ordain and establish this Constitution for the Commonwealth which, in the exercise of our natural rights, we now create within our union with the United States of America.

In so doing, we declare:

The democratic system is fundamental to the life of the Puerto Rican community;

We understand that the democratic system of government is one in which the will of the people is the source of public power, the political order is subordinate to the rights of man, and the free participation of the citizen in collective decisions is assured;

We consider as determining factors in our life our citizenship of the United States of America and our aspiration continually to enrich our democratic heritage in the individual and collective enjoyment of its rights and privileges; our loyalty to the principles of the Federal Constitution; the coexistence in Puerto Rico of the two great cultures of the American Hemisphere; our fervor for education; our faith in justice; our devotion to the courageous, industrious, and peaceful way of life; our fidelity to individual human values above and beyond social position, racial differences, and economic interests; and our hope for a better world based on these principles.

ARTICLE I

THE COMMONWEALTH

Section 1.—The Commonwealth of Puerto Rico is hereby constituted. Its political power emanates from the people and shall be exercised in accordance with their will, within the terms of the compact agreed upon between the people of Puerto Rico and the United States of America.

Section 2.—The government of the Commonwealth of Puerto Rico shall be repub-

lican in form and its legislative, judicial and executive branches as established by this Constitution shall be equally subordinate to the sovereignty of the people of Puerto Rico.

Section 3.—The political authority of the Commonwealth of Puerto Rico shall extend to the Island of Puerto Rico and to the adjacent islands within its jurisdiction.

Section 4.—The seat of the government shall be the city of San Juan.

ARTICLE II

BILL OF RIGHTS

Section 1.—The dignity of the human being is inviolable. All men are equal before the law. No discrimination shall be made on account of race, color, sex, birth, social origin or condition, or political or religious ideas. Both the laws and the system of public education shall embody these principles of essential human equality.

Section 2.—The laws shall guarantee the expression of the will of the people by means of equal, direct and secret universal suffrage and shall protect the citizen against any coercion in the exercise of the electoral franchise.

Section 3.—No law shall be made respecting an establishment of religion or prohibiting the free exercise thereof. There shall be complete separation of church and state.

Section 4.—No law shall be made abridging the freedom of speech or of the press, or the right of the people peaceably to assemble and to petition the government for a redress of grievances.

Section 5.—Every person has the right to an education which shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms. There shall be a system of free and wholly non-sectarian public education. Instruction in the elementary and secondary schools shall be free and shall be compulsory in the elementary schools to the extent permitted by the facilities of the

state. No public property or public funds shall be used for the support of schools or educational institutions other than those of the state. Nothing contained in this provision shall prevent the state from furnishing to any child noneducational services established by law for the protection or welfare of children. (Compulsory attendance at elementary public schools to the extent permitted by the facilities of the state as herein provided shall not be construed as applicable to those who receive elementary education in schools established under non-governmental auspices.)

See footnote.

Section 6.—Persons may join with each other and organize freely for any lawful purpose, except in military or quasi-military organizations.

Section 7.—The right to life, liberty and the enjoyment of property is recognized as a fundamental right of man. The death penalty shall not exist. No person shall be deprived of his liberty or property without due process of law. No person in Puerto Rico shall be denied the equal protection of the laws. No laws impairing the obligation of contracts shall be enacted. A minimum amount of property and possessions shall be exempt from attachment as provided by law.

Section 8.—Every person has the right to the protection of law against abusive attacks on his honor, reputation, and private or family life.

Section 9.—Private property shall not be taken or damaged for public use except upon payment of just compensation and in the manner provided by law. No law shall be enacted authorizing condemnation of printing presses, machinery or material devoted to publications of any kind. The buildings in which these objects are located may be condemned only after a judicial finding of public convenience and necessity pursuant to procedure that shall be provided by law, and may be taken before such a judicial finding only when there is placed at the disposition of the publication an adequate site in which it can

Section 5 above shall have force and effect when amended to include the sentence inserted in parenthesis.

be installed and continue to operate for a reasonable time.

Section 10.—The right of the people to be secure in their persons, houses, papers and effects against unreasonable searches and seizures shall not be violated.

Wire-tapping is prohibited.

No warrant for arrest or search and seizure shall issue except by judicial authority and only upon probable cause supported by oath or affirmation, and particularly describing the place to be searched and the persons to be arrested or the things to be seized.

Evidence obtained in violation of this section shall be inadmissible in the courts.

Section 11.—In all criminal prosecutions, the accused shall enjoy the right to have a speedy and public trial, to be informed of the nature and cause of the accusation and to have a copy thereof, to be confronted with the witnesses against him, to have compulsory process for obtaining witnesses in his favor, to have assistance of counsel, and to be presumed innocent.

In all prosecutions for a felony the accused shall have the right of trial by an impartial jury composed of twelve residents of the district, who may render their verdict by a majority vote which in no case may be less than nine.

No person shall be compelled in any criminal case to be a witness against himself and the failure of the accused to testify may be neither taken into consideration nor commented upon against him.

No person shall be twice put in jeopardy of punishment for the same offense.

Before conviction every accused shall be entitled to be admitted to bail.

Incarceration prior to trial shall not exceed six months nor shall bail or fines be excessive. No person shall be imprisoned for debt.

Section 12.—Neither slavery nor involuntary servitude shall exist except in the latter case as a punishment for crime after the accused has been duly convicted. Cruel and unusual punishments shall not be inflicted. Suspension of civil rights including the right to vote shall cease upon service of the term of imprisonment imposed.

No *ex post facto* law or bill of attainder shall be passed.

Section 13.—The writ of *habeas corpus* shall be granted without delay and free of costs. The privilege of the writ of *habeas corpus* shall not be suspended, unless the public safety requires it in case of rebellion, insurrection or invasion. Only the Legislative Assembly shall have the power to suspend the privilege of the writ of *habeas corpus* and the laws regulating its issuance.

The military authority shall always be subordinate to civil authority.

Section 14.—No titles of nobility or other hereditary honors shall be granted. No officer or employee of the Commonwealth shall accept gifts, donations, decorations or offices from any foreign country or officer without prior authorization by the Legislative Assembly.

Section 15.—The employment of children less than fourteen years of age in any occupation which is prejudicial to their health or morals or which places them in jeopardy of life or limb is prohibited.

No child less than sixteen years of age shall be kept in custody in a jail or penitentiary.

Section 16.—The right of every employee to choose his occupation freely and to resign therefrom is recognized, as is his right to equal pay for equal work, to a reasonable minimum salary, to protection against risks to his health or person in his work or employment, and to an ordinary workday which shall not exceed eight hours. An employee may work in excess of this daily limit only if he is paid extra compensation as provided by law, at a rate never less than one and one-half times the regular rate at which he is employed.

Section 17.—Persons employed by private businesses, enterprises and individual employers and by agencies or instrumentalities of the government operating as private businesses or enterprises, shall have the right to organize and to bargain collectively with their employers through representatives of their own free choosing in order to promote their welfare.

Section 18.—In order to assure their right to organize and to bargain collectively, persons employed by private businesses, enterprises and individual employers and by agencies or instrumentalities of the govern-

ment operating as private businesses or enterprises, in their direct relations with their own employers shall have the right to strike, to picket and to engage in other legal concerted activities.

Nothing herein contained shall impair the authority of the Legislative Assembly to enact laws to deal with grave emergencies that clearly imperil the public health or safety or essential public services.

Section 19.—The foregoing enumeration of rights shall not be construed restrictively nor does it contemplate the exclusion of other rights not specifically mentioned which belong to the people in a democracy. The power of the Legislative Assembly to enact laws for the protection of the life, health and general welfare of the people shall likewise not be construed restrictively.

ARTICLE III

THE LEGISLATURE

Section 1.—The legislative power shall be vested in a Legislative Assembly, which shall consist of two houses, the Senate and the House of Representatives, whose members shall be elected by direct vote at each general election.

Section 2.—The Senate shall be composed of twenty-seven Senators and the House of Representatives of fifty-one Representatives, except as these numbers may be increased in accordance with the provisions of Section 7 of this Article.

Section 3.—For the purpose of election of members of the Legislative Assembly, Puerto Rico shall be divided into eight senatorial districts and forty representative districts. Each senatorial district shall elect two Senators and each representative district one Representative.

There shall also be eleven Senators and eleven Representatives elected at large. No elector may vote for more than one candidate for Senator at Large or for more than one candidate for Representative at Large.

Section 4.—In the first and subsequent elections under this Constitution the division of senatorial and representative districts as provided in Article VIII shall be in effect. After each decennial census beginning with the year 1960, said division

shall be revised by a Board composed of the Chief Justice of the Supreme Court as Chairman and of two additional members appointed by the Governor with the advice and consent of the Senate. The two additional members shall not belong to the same political party. Any revision shall maintain the number of senatorial and representative districts here created, which shall be composed of contiguous and compact territory and shall be organized, insofar as practicable, upon the basis of population and means of communication. Each senatorial district shall always include five representative districts.

The decisions of the Board shall be made by majority vote and shall take effect in the general elections next following each revision. The Board shall cease to exist after the completion of each revision.

Section 5.—No person shall be a member of the Legislative Assembly unless he is able to read and write the Spanish or English language and unless he is a citizen of the United States and of Puerto Rico and has resided in Puerto Rico at least two years immediately prior to the date of his election or appointment. No person shall be a member of the Senate who is not over thirty years of age, and no person shall be a member of the House of Representatives who is not over twenty-five years of age.

Section 6.—No person shall be eligible to election or appointment as Senator or Representative for a district unless he has resided therein at least one year immediately prior to his election or appointment. When there is more than one representative district in a municipality, residence in the municipality shall satisfy this requirement.

Section 7.—If in a general election more than two-thirds of the members of either house are elected from one political party or from a single ticket, as both are defined by law, the number of members shall be increased in the following cases:

(a) If the party or ticket which elected more than two-thirds of the members of either or both houses shall have obtained less than two-thirds of the total number of votes cast for the office of Governor, the number of members of the Senate or of

the House of Representatives or of both bodies, whichever may be the case, shall be increased by declaring elected a sufficient number of candidates of the minority party or parties to bring the total number of members of the minority party or parties to nine in the Senate and to seventeen in the House of Representatives. When there is more than one minority party, said additional members shall be declared elected from among the candidates of each minority party in the proportion that the number of votes cast for the candidate of each of said parties for the office of Governor bears to the total number of votes cast for the candidates of all the minority parties for the office of Governor.

When one or more minority parties shall have obtained representation in a proportion equal to or greater than the proportion of votes received by their respective candidates for Governor, such party or parties shall not be entitled to additional members until the representation established for each of the other minority parties under these provisions shall have been completed.

(b) If the party or ticket which elected more than two-thirds of the members of either or both houses shall have obtained more than two-thirds of the total number of votes cast for the office of Governor, and one or more minority parties shall not have elected the number of members in the Senate or in the House of Representatives or in both houses, whichever may be the case, which corresponds to the proportion of votes cast by each of them for the office of Governor, such additional number of their candidates shall be declared elected as is necessary in order to complete said proportion as nearly as possible, but the number of Senators of all the minority parties shall never, under this provision, be more than nine or that of Representatives more than seventeen.

In order to select additional members of the Legislative Assembly from a minority party in accordance with these provisions, its candidates at large who have not been elected shall be the first to be declared elected in the order of the votes that they have obtained, and thereafter its district candidates who, not having been elected, have obtained in their respective districts

the highest proportion of the total number of votes cast as compared to the proportion of votes cast in favor of other candidates of the same party not elected to an equal office in the other districts.

The additional Senators and Representatives whose election is declared under this section shall be considered for all purposes as Senators at Large or Representatives at Large.

The measures necessary to implement these guarantees, the method of adjudicating fractions that may result from the application of the rules contained in this section, and the minimum number of votes that a minority party must cast in favor of its candidate for Governor in order to have the right to the representation provided herein shall be determined by the Legislative Assembly.

Section 8.—The term of office of Senators and Representatives shall begin on the second day of January immediately following the date of the general election in which they shall have been elected. If, prior to the fifteen months immediately preceding the date of the next general election, a vacancy occurs in the office of Senator or Representative for a district, the Governor shall call a special election in said district within thirty days following the date on which the vacancy occurs. This election shall be held not later than ninety days after the call, and the person elected shall hold office for the rest of the unexpired term of his predecessor. When said vacancy occurs during a legislative session, or when the Legislative Assembly or the Senate has been called for a date prior to the certification of the results of the special election, the presiding officer of the appropriate house shall fill said vacancy by appointing the person recommended by the central committee of the political party of which his predecessor in office was a member. Such person shall hold the office until certification of the election of the candidate who was elected. When the vacancy occurs within fifteen months prior to a general election, or when it occurs in the office of a Senator at Large or a Representative at Large, the presiding officer of the appropriate house shall fill it, upon the recommendation of the political party of

which the previous holder of the office was a member, by appointing a person selected in the same manner as that in which his predecessor was selected. A vacancy in the office of a Senator at Large or a Representative at Large elected as an independent candidate shall be filled by an election in all districts.

Section 9.—Each house shall be the sole judge of the election, returns and qualifications of its members; shall choose its own officers; shall adopt rules for its own proceedings appropriate to legislative bodies; and, with the concurrence of three-fourths of the total number of members of which it is composed, may expel any member for the causes established in Section 21 of this Article, authorizing impeachments. The Senate shall elect a President and the House of Representatives a Speaker from among their respective members.

Section 10.—The Legislative Assembly shall be deemed a continuous body during the term for which its members are elected and shall meet in regular session each year commencing on the second Monday in January. The duration of regular sessions and the periods of time for introduction and consideration of bills shall be prescribed by law. When the Governor calls the Legislative Assembly into special session it may consider only those matters specified in the call or in any special message sent to it by him during the session. No special session shall continue longer than twenty calendar days.

Section 11.—The sessions of each house shall be open.

Section 12.—A majority of the total number of members of which each house is composed shall constitute a quorum, but a smaller number may adjourn from day to day and shall have authority to compel the attendance of absent members.

Section 13.—The two houses shall meet in the Capitol of Puerto Rico and neither of them may adjourn for more than three consecutive days without the consent of the other.

Section 14.—No member of the Legislative Assembly shall be arrested while the house of which he is a member is in session, or during the fifteen days before or after such session, except for treason,

felony, or breach of the peace. The members of the Legislative Assembly shall not be questioned in any other place for any speech, debate, or vote in either house or in any committee.

Section 15.—No Senator or Representative may, during the term for which he was elected or chosen, be appointed to any civil office in the Government of Puerto Rico, its municipalities or instrumentalities, which shall have been created or the salary of which shall have been increased during said term. No person may hold office in the Government of Puerto Rico, its municipalities or instrumentalities and be a Senator or Representative at the same time. These provisions shall not prevent a member of the Legislative Assembly from being designated to perform functions *ad honorem*.

Section 16.—The Legislative Assembly shall have the power to create, consolidate or reorganize executive departments and to define their functions.

Section 17.—No bill shall become a law unless it has been printed, read, referred to a committee and returned therefrom with a written report, but either house may discharge a committee from the study and report of any bill and proceed to the consideration thereof. Each house shall keep a journal of its proceedings and of the votes cast for and against bills. The legislative proceedings shall be published in a daily record in the form determined by law. Every bill, except general appropriation bills, shall be confined to one subject, which shall be clearly expressed in its title, and any part of an act whose subject has not been expressed in the title shall be void. The general appropriation act shall contain only appropriations and rules for their disbursement. No bill shall be amended in a manner that changes its original purpose or incorporates matters extraneous to it. In amending any article or section of a law, said article or section shall be promulgated in its entirety as amended. All bills for raising revenue shall originate in the House of Representatives, but the Senate may propose or concur with amendments as on other bills.

Section 18.—The subjects which may be dealt with by means of joint resolution

shall be determined by law, but every joint resolution shall follow the same legislative process as that of a bill.

Section 19.—Every bill which is approved by a majority of the total number of members of which each house is composed shall be submitted to the Governor and shall become law if he signs it or if he does not return it, with his objections, to the house in which it originated within ten days (Sundays excepted) counting from the date on which he shall have received it.

When the Governor returns a bill, the house that receives it shall enter his objections in its journal and both houses may reconsider it. If approved by two-thirds of the total number of members of which each house is composed, said bill shall become law.

If the Legislative Assembly adjourns *sine die* before the Governor has acted on a bill that has been presented to him less than ten days before, he is relieved of the obligation of returning it with his objections and the bill shall become law only if the Governor signs it within thirty days after receiving it.

Every final passage or reconsideration of a bill shall be by a roll-call vote.

Section 20.—In approving any appropriation bill that contains more than one item, the Governor may eliminate one or more of such items or reduce their amounts, at the same time reducing the total amounts involved.

Section 21.—The House of Representatives shall have exclusive power to initiate impeachment proceedings and, with the concurrence of two-thirds of the total number of members of which it is composed, to bring an indictment. The Senate shall have exclusive power to try and to decide impeachment cases, and in meeting for such purposes the Senators shall act in the name of the people and under oath or affirmation. No judgment of conviction in an impeachment trial shall be pronounced without the concurrence of three-fourths of the total number of members of which the Senate is composed, and the judgment shall be limited to removal from office. The person impeached, however, may be liable and subject to indictment, trial judg-

ment and punishment according to law. The causes of impeachment shall be treason, bribery, other felonies, and misdemeanors involving moral turpitude. The Chief Justice of the Supreme Court shall preside at the impeachment trial of the Governor.

The two houses may conduct impeachment proceedings in their regular or special sessions. The presiding officers of the two houses, upon written request of two-thirds of the total number of members of which the House of Representatives is composed, must convene them to deal with such proceedings.

Section 22.—The Governor shall appoint a Controller with the advice and consent of a majority of the total number of members of which each house is composed. The Controller shall meet the requirements prescribed by law and shall hold office for a term of ten years and until his successor has been appointed and qualifies. The Controller shall audit all the revenues, accounts and expenditures of the Commonwealth, of its agencies and instrumentalities and of its municipalities, in order to determine whether they have been made in accordance with law. He shall render annual reports and any special reports that may be required of him by the Legislative Assembly or by the Governor.

In the performance of his duties the Controller shall be authorized to administer oaths, take evidence and compel, under pain of contempt, the attendance of witnesses and the production of books, letters, documents, papers, records and all other articles deemed essential to a full understanding of the matter under investigation.

The Controller may be removed for the causes and pursuant to the procedure established in the preceding section.

ARTICLE IV

THE EXECUTIVE

Section 1.—The executive power shall be vested in a Governor, who shall be elected by direct vote in each general election.

Section 2.—The Governor shall hold office for the term of four years from the second day of January of the year follow-

ing his election and until his successor has been elected and qualifies. He shall reside in Puerto Rico and maintain his office in its capital city.

Section 3.—No person shall be Governor unless, on the date of the election, he is at least thirty-five years of age, and is and has been during the preceding five years a citizen of the United States and a citizen and *bona fide* resident of Puerto Rico.

Section 4.—The Governor shall execute the laws and cause them to be executed.

He shall call the Legislative Assembly or the Senate into special session when in his judgment the public interest so requires.

He shall appoint, in the manner prescribed by this Constitution or by law, all officers whose appointments he is authorized to make. He shall have the power to make appointments while the Legislative Assembly is not in session. Any such appointments that require the advice and consent of the Senate or of both houses shall expire at the end of the next regular session.

He shall be the commander-in-chief of the militia.

He shall have the power to call out the militia and summon the *pasce comitatus* in order to prevent or suppress rebellion, invasion or any serious disturbance of the public peace.

He shall have the power to proclaim martial law when the public safety requires it in case of rebellion or invasion or imminent danger thereof. The Legislative Assembly shall meet forthwith on their own initiative to ratify or revoke the proclamation.

He shall have the power to suspend the execution of sentences in criminal cases and to grant pardons, commutations of punishment, and total or partial remissions of fines and forfeitures for crimes committed in violation of the laws of Puerto Rico. This power shall not extend to cases of impeachment.

He shall approve or disapprove in accordance with this Constitution the joint resolutions and bills passed by the Legislative Assembly.

He shall present to the Legislative Assembly, at the beginning of each regular

session, a message concerning the affairs of the Commonwealth and a report concerning the state of the Treasury of Puerto Rico and the proposed expenditures for the ensuing fiscal year. Said report shall contain the information necessary for the formulation of a program of legislation.

He shall exercise the other powers and functions and discharge the other duties assigned to him by this Constitution or by law.

Section 5.—For the purpose of exercising executive power, the Governor shall be assisted by Secretaries whom he shall appoint with the advice and consent of the Senate. The appointment of the Secretary of State shall in addition require the advice and consent of the House of Representatives, and the person appointed shall fulfill the requirements established in Section 3 of this Article. The Secretaries shall collectively constitute the Governor's advisory council, which shall be designated as the Council of Secretaries.

Section 6.—Without prejudice to the power of the Legislative Assembly to create, reorganize and consolidate executive departments and to define their functions, the following departments are hereby established: State, Justice, Education, Health, Treasury, Labor, Agriculture and Commerce, and Public Works. Each of these executive departments shall be headed by a Secretary.

Section 7.—When a vacancy occurs in the office of Governor, caused by death, resignation, removal, total and permanent incapacity, or any other absolute disability, said office shall devolve upon the Secretary of State, who shall hold it for the rest of the term and until a new Governor has been elected and qualifies. In the event that vacancies exist at the same time in both the office of Governor and that of Secretary of State, the law shall provide which of the Secretaries shall serve as Governor.

Section 8.—When for any reason the Governor is temporarily unable to perform his functions, the Secretary of State shall substitute for him during the period he is unable to serve. If for any reason the Secretary of State is not available, the

Secretary determined by law shall temporarily hold the office of Governor.

Section 9.—If the Governor-elect shall not have qualified, or if he has qualified and a permanent vacancy occurs in the office of Governor before he shall have appointed a Secretary of State, or before said Secretary, having been appointed, shall have qualified, the Legislative Assembly just elected, upon convening for its first regular session, shall elect, by a majority of the total number of members of which each house is composed, a Governor who shall hold office until his successor is elected in the next general election and qualifies.

Section 10.—The Governor may be removed for the causes and pursuant to the procedure established in Section 21 of Article III of this Constitution.

ARTICLE V

THE JUDICIARY

Section 1.—The judicial power of Puerto Rico shall be vested in a Supreme Court, and in such other courts as may be established by law.

Section 2.—The courts of Puerto Rico shall constitute a unified judicial system for purposes of jurisdiction, operation and administration. The Legislative Assembly may create and abolish courts, except for the Supreme Court, in a manner not inconsistent with this Constitution, and shall determine the venue and organization of the courts.

Section 3.—The Supreme Court shall be the court of last resort in Puerto Rico and shall be composed of a Chief Justice and four Associate Justices. The number of Justices may be changed only by law upon request of the Supreme Court.

Section 4.—The Supreme Court shall sit, in accordance with rules adopted by it, as a full court or in divisions. All the decisions of the Supreme Court shall be concurred in by a majority of its members. No law shall be held unconstitutional except by a majority of the total number of Justices of which the Court is composed in accordance with this Constitution or with law.

Section 5.—The Supreme Court, any of its divisions, or any of its Justices may hear in the first instance petition for *habeas corpus* and any other causes and proceedings as determined by law.

Section 6.—The Supreme Court shall adopt for the courts rules of evidence and of civil and criminal procedure which shall not abridge, enlarge or modify the substantive rights of the parties. The rules thus adopted shall be submitted to the Legislative Assembly at the beginning of its next regular session and shall not go into effect until sixty days after the close of said session, unless disapproved by the Legislative Assembly, which shall have the power both at said session and subsequently to amend, repeal or supplement any of said rules by a specific law to that effect.

Section 7.—The Supreme Court shall adopt rules for the administration of the courts. These rules shall be subject to the laws concerning procurement, personnel, audit and appropriation of funds, and other laws which apply generally to all branches of the government. The Chief Justice shall direct the administration of the courts and shall appoint an administrative director who shall hold office at the will of the Chief Justice.

Section 8.—Judges shall be appointed by the Governor with the advice and consent of the Senate. Justices of the Supreme Court shall not assume office until after confirmation by the Senate and shall hold their offices during good behavior. The terms of office of the other judges shall be fixed by law and shall not be less than that fixed for the term of office of a judge of the same or equivalent category existing when this Constitution takes effect. The other officials and employees of the courts shall be appointed in the manner provided by law.

Section 9.—No person shall be appointed a Justice of the Supreme Court unless he is a citizen of the United States and of Puerto Rico, shall have been admitted to the practice of law in Puerto Rico at least ten years prior to this appointment, and shall have resided in Puerto Rico at least five years immediately prior thereto.

Section 10.—The Legislative Assembly shall establish a retirement system for judges. Retirement shall be compulsory at the age of seventy years.

Section 11.—Justices of the Supreme Court may be removed for the causes and pursuant to the procedure established in Section 21 of Article III of this Constitution. Judges of the other courts may be removed by the Supreme Court for the causes and pursuant to the procedure provided by law.

Section 12.—No Judge shall make a direct or indirect financial contribution to any political organization or party, or hold any executive office therein, or participate in a political campaign of any kind, or be candidate for an elective public office unless he has resigned his judicial office at least six months prior to his nomination.

Section 13.—In the event that a court or any of its divisions or sections is changed or abolished by law, the person holding a post of judge therein shall continue to hold it during the rest of the term for which he was appointed and shall perform the judicial functions assigned to him by the Chief Justice of the Supreme Court.

ARTICLE VI

GENERAL PROVISIONS

Section 1.—The Legislative Assembly shall have the power to create, abolish, consolidate and reorganize municipalities; to change their territorial limits; to determine their organization and functions; and to authorize them to develop programs for the general welfare and to create any agencies necessary for that purpose.

No law abolishing or consolidating municipalities shall take effect until ratified in a referendum by a majority of the qualified electors voting in said referendum in each of the municipalities to be abolished or consolidated. The referendum shall be conducted in the manner determined by law, which shall include the applicable procedures of the election laws in effect when the referendum law is approved.

Section 2.—The power of the Commonwealth of Puerto Rico to impose and collect taxes and to authorize their imposition

and collection by municipalities shall be exercised as determined by the Legislative Assembly and shall never be surrendered or suspended. The power of the Commonwealth of Puerto Rico to contract and to authorize the contracting of debts shall be exercised as determined by the Legislative Assembly.

Section 3.—The rules of taxation in Puerto Rico shall be uniform.

Section 4.—General elections shall be held every four years on the day of November determined by the Legislative Assembly. In said elections there shall be elected a Governor, the members of the Legislative Assembly, and the other officials whose election on that date is provided for by law.

Every person over twenty-one years of age shall be entitled to vote if he fulfills the other conditions determined by law. No person shall be deprived of the right to vote because he does not know how to read or write or does not own property.

All matters concerning the electoral process, registration of voters, political parties and candidates shall be determined by law.

Every popularly elected official shall be elected by direct vote and any candidate who receives more votes than any other candidate for the same office shall be declared elected.

Section 5.—The laws shall be promulgated in accordance with the procedure prescribed by law and shall specify the terms under which they shall take effect.

Section 6.—If at the end of any fiscal year the appropriations necessary for the ordinary operating expenses of the government and for the payment of interest on and amortization of the public debt for the ensuing fiscal year shall not have been made, the several sums appropriated in the last appropriation acts for the objects and purposes therein specified, so far as the same may be applicable, shall continue in effect item by item, and the Governor shall authorize the payments necessary for such purposes until corresponding appropriations are made.

Section 7.—The appropriations made for any fiscal year shall not exceed the total revenues, including available surplus, esti-

mated for said fiscal year unless the imposition of taxes sufficient to cover said appropriations is provided by law.

Section 8.—In case the available revenues including surplus for any fiscal year are insufficient to meet the appropriation made for that year, interest on the public debt and amortization thereof shall first be paid, and other disbursements shall thereafter be made in accordance with the order of priorities established by law.

Section 9.—Public property and funds shall only be disposed of for public purposes, for the support and operation of state institutions, and pursuant to law.

Section 10.—No law shall give extra compensation to any public officer, employee, agent or contractor after services shall have been rendered or contract made. No law shall extend the term of any public officer or diminish his salary or emoluments after his election or appointment. No person shall draw a salary for more than one office or position in the government of Puerto Rico.

Section 11.—The salaries of the Governor, the Secretaries, the members of the Legislative Assembly, the Controller and Judges shall be fixed by a special law and, except for the salaries of the members of the Legislative Assembly, shall not be decreased during the terms for which they are elected or appointed. The salaries of the Governor and the Controller shall not be increased during said terms. No increase in the salaries of the members of the Legislative Assembly shall take effect until after the expiration of the term of the Legislative Assembly during which it is enacted. Any reduction of the salaries of the members of the Legislative Assembly shall be effective only during the term of the Legislative Assembly which approves it.

Section 12.—The Governor shall occupy and use, free of rent, the buildings and properties belonging to the Commonwealth which have been or shall hereafter be used and occupied by him as chief executive.

Section 13.—The procedure for granting franchises, rights, privileges and concessions of a public or quasi-public nature shall be determined by law, but every concession of this kind to a person or private

entity must be approved by the Governor or by the executive official whom he designates. Every franchise, right, privilege or concession of a public or quasi-public nature shall be subject to amendment, alteration or repeal as determined by law.

Section 14.—No corporation shall be authorized to conduct the business of buying and selling real estate or be permitted to hold or own real estate except such as may be reasonably necessary to enable it to carry out the purposes for which it was created, and every corporation authorized to engage in agriculture shall by charter be restricted to the ownership and control of not to exceed five hundred acres of land; and this shall be held to prevent any member of a corporation engaged in agriculture from being in any wise interested in any other corporation engaged in agriculture.

Corporations, however, may loan funds upon real estate security, and purchase real estate when necessary for the collection of loans, but they shall dispose of real estate so obtained within five years after receiving the title.

Corporations not organized in Puerto Rico, but doing business in Puerto Rico, shall be bound by the provisions of this section so far as they are applicable.

These provisions shall not prevent the ownership, possession or management of lands in excess of five hundred acres by the Commonwealth, its agencies or instrumentalities.

Section 15.—The Legislative Assembly shall determine all matters concerning the flag, the seal and the anthem of the Commonwealth. Once determined, no law changing them shall take effect until one year after the general election next following the date of enactment of said law.

Section 16.—All public officials and employees of the Commonwealth, its agencies, instrumentalities and political subdivisions, before entering upon their respective duties, shall take an oath to support the Constitution of the United States and the Constitution and laws of the Commonwealth of Puerto Rico.

Section 17.—In case of invasion, rebellion, epidemic or any other event giving rise to a state of emergency, the Governor

may call the Legislative Assembly to meet in a place other than the Capitol of Puerto Rico, subject to the approval or disapproval of the Legislative Assembly. Under the same conditions, the Governor may, during the period of emergency, order the government, its agencies and instrumentalities to be moved temporarily to a place other than the seat of the government.

Section 18.—All criminal action in the courts of the Commonwealth shall be conducted in the name and by the authority of "The People of Puerto Rico" until otherwise provided by law.

Section 19.—It shall be the public policy of the Commonwealth to conserve, develop and use its natural resources in the most effective manner possible for the general welfare of the community; to conserve and maintain buildings and places declared by the Legislative Assembly to be of historic or artistic value; to regulate its penal institutions in a manner that effectively achieves their purposes and to provide, within the limits of available resources, for adequate treatment of delinquents in order to make possible their moral and social rehabilitation.

ARTICLE VII

AMENDMENTS TO THE CONSTITUTION

Section 1.—The Legislative Assembly may propose amendments to this Constitution by a concurrent resolution approved by not less than two-thirds of the total number of members of which each house is composed. All proposed amendments shall be submitted to the qualified electors in a special referendum, but if the concurrent resolution is approved by not less than three-fourths of the total number of members of which each house is composed, the Legislative Assembly may provide that the referendum shall be held at the same time as the next general election. Each proposed amendment shall be voted on separately and not more than three proposed amendments may be submitted at the same referendum. Every proposed amendment shall specify the terms under which it shall take effect, and it shall become a part of this Constitution if it is

ratified by a majority of the electors voting thereon. Once approved, a proposed amendment must be published at least three months prior to the date of the referendum.

Section 2.—The Legislative Assembly, by a concurrent resolution approved by two-thirds of the total number of members of which each house is composed, may submit to the qualified electors at a referendum, held at the same time as a general election, the question of whether a constitutional convention shall be called to revise this Constitution. If a majority of the electors voting on this question vote in favor of the revision, it shall be made by a Constitutional Convention elected in the manner provided by law. Every revision of this Constitution shall be submitted to the qualified electors at a special referendum for ratification or rejection by a majority of the votes cast at the referendum.

Section 3.—No amendment to this Constitution shall alter the republican form of government established by it or abolish its bill of rights. (Any amendment or revision of this constitution shall be consistent with the resolution enacted by the Congress of the United States approving this constitution, with the applicable provisions of the Constitution of the United States, with the Puerto Rican Federal Relations Act, and with Public Law 600, Eighty-first Congress, adopted in the nature of a compact.) See footnote.

ARTICLE VIII

SENATORIAL AND REPRESENTATIVE DISTRICTS

Section 1.—The senatorial and representative districts shall be the following:

I.—SENATORIAL DISTRICT OF SAN JUAN, which shall be composed of the following Representative Districts: 1.—The Capital of Puerto Rico, excluding the present electoral precincts of Santurce and Río Pie-

Except for amendments to section 5, article II, and to section 3, article VII, article VII above shall have force and effect when section 3 above has been amended to include the sentence inserted in parenthesis.

dras; 2.—Electoral zones numbers 1 and 2 of the present precinct of Santurce; 3.—Electoral zone number 3 of the present precinct of Santurce; 4.—Electoral zone number 4 of the present precinct of Santurce; and 5.—Wards Hato Rey, Puerto Nuevo and Caparra Heights of the Capital of Puerto Rico.

II.—SENATORIAL DISTRICT OF BAYAMÓN, which shall be composed of the following Representative Districts: 6.—The municipality of Bayamón; 7.—The municipalities of Carolina and Trujillo Alto; 8.—The present electoral precinct of Río Piedras, excluding wards Hato Rey, Puerto Nuevo and Caparra Heights of the Capital of Puerto Rico; 9.—The municipalities of Cataño, Guaynabo and Toa Baja; and 10.—The municipalities of Toa Alta, Corozal and Naranjito.

III.—SENATORIAL DISTRICT OF ARECIBO, which shall be composed of the following Representative Districts: 11.—The municipalities of Vega Baja, Vega Alta and Dorado; 12.—The municipalities of Manatí and Barceloneta; 13.—The municipalities of Ciales and Morovis; 14.—The municipality of Arecibo; and 15.—The municipality of Utuado.

IV.—SENATORIAL DISTRICT OF AGUADILLA, which shall be composed of the following Representative Districts: 16.—The municipalities of Camuy, Hatillo and Quebradillas; 17.—The municipalities of Aguadilla and Isabela; 18.—The municipalities of San Sebastián and Moca; 19.—The municipalities of Lares, Las Marías and Maricao; and 20.—The municipalities of Añasco, Aguada and Rincón.

V.—SENATORIAL DISTRICT OF MAYAGÜEZ, which shall be composed of the following Representative Districts: 21.—The municipality of Mayagüez; 22.—The municipalities of Cabo Rojo, Hormigueros and Lajas; 23.—The municipalities of San Germán and Sabana Grande; 24.—The municipalities of Yauco and Guánica; and 25.—The municipalities of Guayanilla and Peñuelas.

VI.—SENATORIAL DISTRICT OF PONCE, which shall be composed of the following Representative Districts: 26.—The first, second, third, fourth, fifth and sixth wards and the City Beach of the municipality of

Ponce; 27.—The municipality of Ponce, except for the first, second, third, fourth, fifth and sixth wards and the City Beach; 28.—The municipalities of Adjuntas and Jayuya; 29.—The municipalities of Juana Díaz, Santa Isabel and Villalba; and 30.—The municipalities of Coamo and Orocovis.

VII.—SENATORIAL DISTRICT OF GUAYAMA, which shall be composed of the following Representative Districts: 31.—The municipalities of Aibonito, Barranquitas and Comerío; 32.—The municipalities of Cayey and Cidra; 33.—The municipalities of Caguas and Aguas Buenas; 34.—The municipalities of Guayama and Salinas; and 35.—The municipalities of Patillas, Maunabo and Arroyo.

VIII.—SENATORIAL DISTRICT OF HUMACAO, which shall be composed of the following Representative Districts: 36.—The municipalities of Humacao and Yabucoa; 37.—The municipalities of Juncos, Gurabo and San Lorenzo; 38.—The municipalities of Naguabo, Ceiba and Las Piedras; 39.—The municipalities of Fajardo and Vieques and the Island of Culebra; and 40.—The municipalities of Río Grande, Loíza and Luquillo.

Section 2.—Electoral zones numbers 1, 2, 3 and 4 included in three representative districts within the senatorial district of San Juan are those presently existing for purposes of electoral organization in the second precinct of San Juan.

ARTICLE IX

TRANSITORY PROVISIONS

Section 1.—When this Constitution goes into effect all laws not inconsistent therewith shall continue in full force until amended or repealed, or until they expire by their own terms.

Unless otherwise provided by this Constitution, civil and criminal liabilities, rights, franchises, concessions, privileges, claims, actions, causes of action, contracts, and civil, criminal and administrative proceedings shall continue unaffected, notwithstanding the taking effect of this Constitution.

Section 2.—All officers who are in office by election or appointment on the date

this Constitution takes effect shall continue to hold their offices and to perform the functions thereof in a manner not inconsistent with this Constitution, unless the functions of their offices are abolished or until their successors are selected and qualify in accordance with this Constitution and laws enacted pursuant thereto.

Section 3.—Notwithstanding the age limit fixed by this Constitution for compulsory retirement, all the judges of the courts of Puerto Rico who are holding office on the date this Constitution takes effect shall continue to hold their judicial offices until the expiration of the terms for which they were appointed, and in the case of Justices of the Supreme Court during good behavior.

Section 4.—The Commonwealth of Puerto Rico shall be the successor of the People of Puerto Rico for all purposes, including without limitation the collection and payment of debts and liabilities in accordance with their terms.

Section 5.—When this Constitution goes into effect, the term "citizen of the Commonwealth of Puerto Rico" shall replace the term "citizen of Puerto Rico" as previously used.

Section 6.—Political parties shall continue to enjoy all rights recognized by the election law, provided that on the effective date of this Constitution they fulfill the minimum requirements for the registration of new parties contained in said law. Five years after this Constitution shall have taken effect the Legislative Assembly may change these requirements, but any law increasing them shall not go into effect until after the general election next following its enactment.

Section 7.—The Legislative Assembly may enact the laws necessary to supplement and make effective these transitory provisions in order to assure the functioning of the government until the officers provided for by this Constitution are elected or appointed and qualify, and until this Constitution takes effect in all respects.

Section 8.—If the Legislative Assembly creates a Department of Commerce, the Department of Agriculture and Commerce shall thereafter be called the Department of Agriculture.

Section 9.—The first election under the provisions of this Constitution shall be held on the date provided by law, but not later than six months after the effective date of this Constitution. The second general election under this Constitution shall be held in the month of November 1956 on a day provided by law.

Section 10.—This Constitution shall take effect when the Governor so proclaims, but not later than sixty days after its ratification by the Congress of the United States.

Done in Convention, at San Juan, Puerto Rico, on the sixth day of February, in the year of Our Lord one thousand nine hundred and fifty-two.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

TANSILL, CHARLES CALLAN. *Back Door to War: The Roosevelt Foreign Policy, 1933-1941*. Pp. 690. Chicago: Henry Regnery Company, 1952. \$6.50.

In the aftermaths of the world wars of the twentieth century it is the function of "revisionist" historians to reassess the record and, more often than not, to show that villains were heroes, heroes were villains, and all that happened was altogether different from what contemporaries assumed it to be. This task, when well performed, is useful and necessary for it serves truth by correcting the undocumented passions of foresight with the documented wisdom of hindsight. Among worthy contributions of this kind have been the writings of Harry Elmer Barnes, Sidney Fay, Charles A. Beard, and Charles C. Tansill, professor of American diplomatic history at Georgetown University, in his earlier work, *America Goes To War* (1938), dealing with 1917.

Professor Tansill's new book is, in form, in the best tradition of diplomatic historians (including the unorthodox scholars, who are obliged to be twice as scholarly as the orthodox), for it is replete with footnotes, bibliography, a good index, and based upon "access to the copious correspondence in the confidential files of the Department of State." Its purpose is to prove that the

Roosevelt Administration, while championing peace, was bent upon war and succeeded in inducing an isolationist Congress and public to accept war by the calculated device of provoking the enemy to attack the United States.

All of this is true. And it is good to have a fully documented account of the tale couched in these terms. This volume is nevertheless disappointing because the author, despite his scholarly eminence, displays no awareness whatever of what United States foreign policy is about or of what Fascist foreign policy was about.

American policy-makers, reluctantly supported by a confused citizenry, decided in 1940, as they had decided in 1917 and even in 1813 (see Jefferson's comments) and again in 1947-52, that American security would be endangered if any one Power or combination of Powers should conquer Europe and/or Asia. This balance-of-power calculus could not be presented to the populace in terms of power politics, which the American public equates with sin, and had to be clothed in legalistic-moralistic verbiage about "freedom of the seas," "the war to end war," "the war to make the world safe for democracy," the "Atlantic Charter," the "Four Freedoms," and other irrelevancies. The validity of the decision itself is open to question, though no one ever questions it. Fascist totalitarianism, by virtue of its inner dynamics,

could not stop, until smashed by superior force, at anything short of the conquest of the globe.

Dr. Tansill, unhappily, is innocent of any suspicion of these obvious facts of life—with the result that his monumental work is almost meaningless in its central thesis. Despite vast erudition, the thesis not only fails to challenge the basic assumptions of the Roosevelt administration but is warped by the narrowly conceived purpose of the author into the elaboration of a set of dubious or preposterous propositions. The first sentence of the book asserts: "THE MAIN OBJECTIVE in American foreign policy since 1900 has been the preservation of the British Empire." Among the last sentences are: "Was the preservation of the British Empire worth the blood, sweat, and tears not only of the men who would die in the agony of Pearl Harbor but also of the long roll of heroes who perished" all over the earth? Between these terminal points the author is obliged by his naïve thesis to argue, contrary to all reason, that "if we had not entered the war in 1917, World War I would have ended in a stalemate" (p. 9); "Germany had been baited into a war with Britain and France when she would have preferred a conflict with Russia over the Ukraine" (p. 557), causing one to wonder whether Tansill has ever read *Mein Kampf*; "the Nazi regime is placed upon an uneasy defensive" (p. 284); "Ickes widens the breach" (p. 350); "Beneš postpones too long a policy of appeasement" (p. 389); "Russia instigates war in the Far East" (p. 456); "Japan proposes a joint search for world peace, but Hull declines" (p. 481); "Stalin lights the fuse" (p. 525); "Roosevelt seeks a pretext for war with Germany" (p. 584); "Japan is maneuvered into firing the first shot" (p. 616); and others.

That all of this is nonsense is a great pity, since Americans need, now more than ever, a revaluation of foreign policy in the light of careful documentation and full awareness of the realities of world politics. Dr. Tansill is terrific at documentation and wholly ignorant of realities. He thus demonstrates anew that scholarship without perspective is sterile. Some day perhaps

some perceptive scholar will reassess the American record in the world wars of our time in terms useful for the future. This Tansill has altogether failed to do.

FREDERICK L. SCHUMAN

Williams College

CHANG, TSE CHUN. *Cyclical Movements in the Balance of Payments*. Pp. x, 224. New York: Cambridge University Press, 1951. \$3.75.

This inquiry into the fluctuations of international economic transactions consists of three parts. Part I begins with a theoretical analysis of how transactions on income and capital account in different types of country respond to changes in home and world income. Later chapters deal statistically with the foreign-trade multiplier and with the income and price elasticity of the imports and exports of a considerable list of countries. Parts II and III are devoted to case studies of the balance of payments. A detailed statistical analysis of Great Britain (a highly industrialized country deficient in raw materials) is followed by briefer studies of the United States (a highly industrialized and broadly self-sufficient economy), Sweden (a less extreme variant of the same type), Australia (an agricultural country), Chile ("a typical mining country"), and Canada (a "mixed" economy).

Dr. Chang relegates the classical price and species-flow mechanism to a minor role. He finds that the quantity of imports of a country is predominantly determined by movements of its national income, while the quantity of its exports is determined by the movements of world income. The principal influence of prices is not on the quantities that enter into trade, but on their values. If the real income of a country rises, it transmits an upward thrust to other nations by the expansion of its imports. If the real income of the rest of the world rises, the given country will soon benefit by expanding its exports. Thus the "foreign-trade multiplier" induces a tendency toward international synchronism of prosperity and depression. As far as income transactions go, industrial and mining countries "generally tend to show an alternate surplus and deficit in relation

to general world prosperity and depression; whereas the agricultural type tends to have the opposite pattern." But the transactions on long-term capital account are also geared to the world cycle, and they tend to offset the fluctuations in the income transactions. When the net import (export) of capital equals the deficit (surplus) on income account, a country's balance of payments is in "cyclical equilibrium." A tendency toward such a "natural harmony" exists, but it does not always prevail, and movements of gold or short-term capital therefore become necessary.

These, in briefest compass, are some of the broad conclusions of Dr. Chang's inquiry. They are bound to excite considerable discussion. How cogent is the theoretical or statistical argument in behalf of a natural tendency toward cyclical equilibrium in a country's balance of payments? Is the income of a nation determined solely by its home investment and exports, as Dr. Chang supposes? Do monetary and price changes receive their full weight in his analysis? What of tariffs and other political obstacles to free international traffic in commodities, services, and securities? Are the numerous equations, correlation coefficients, multipliers, and elasticities a reliable guide to economic prediction or policy? Are they even a reliable summary of past experience? Not all these questions would be answered in Dr. Chang's favor by the present reviewer. Nevertheless, I definitely feel that his bold and pioneering investigation deserves the careful scrutiny of all students concerned with its intellectual range.

ARTHUR F. BURNS

National Bureau of Economic Research
New York City

AMERICAN GOVERNMENT, HISTORY, LAW, AND POLITICAL THEORY

MOOS, MALCOLM. *Politics, Presidents, and Coattails*. Pp. xxi, 237. Baltimore: Johns Hopkins Press, 1952. \$4.50.

Many books have been written about the election of presidents, but the election of congressmen has attracted comparatively

little attention from our book writers, either popular or academic. The general neglect of congressional elections in the literature of American politics may reflect the lesser interest of the voters themselves in their representatives in the legislative branch of government. Successful candidates for the presidency, according to Professor Moos's calculations, have received on the average 7½ per cent more votes than their fellow candidates for the Congress, and even the unsuccessful presidential candidates have generally led their congressional tickets. Who these numerous but obscure voters are, that take the trouble to go to the polls in order to vote for a president, and then will not bother to vote for a congressman, Professor Moos does not say. Evidently they are not greatly interested in political parties or deeply concerned about the practical operation of our constitutional system of checks and balances.

Professor Moos is interested in both these topics, but his primary interest is in the relationship between the voting for presidential candidates and that for congressmen. The question, whether candidates for Congress should hope to ride into office on the coattails of popular presidential candidates, may not be important in the nearly three-fourths of the congressional districts in which the victory of one party or the other is practically certain in advance. But in the more than 100 districts which are ordinarily closely contested the answer to this question is important to practical politicians. Professor Moos makes it seem important also to political theorists. His conclusion, from an impressive array of statistical evidence, is that coattail influence is not a critical factor in national elections.

More important to most students of American politics will be Professor Moos's conclusions concerning the nature and tendency of the American party system. He has taken a close look at the election returns for some years back and convinced himself that what he calls "party politics—free style," that is, the traditional system of "principle-less" partisanship, is superior to the system of more strictly disciplined parties, which might result from a realign-

ment on a more rational basis, as advocated by some of our professional political scientists, notably the authors of the report of the Committee on Political Parties of the American Political Science Association. Professor Moos's argument in support of his opinion is vigorous and is supported with fresh evidence derived from the election returns. It is also set forth in a more lively style than is generally found in statistical treatments of political questions. This is a book which deserves the attention of all serious students of American politics, both amateur and professional.

ARTHUR N. HOLCOMBE

Harvard University

HOOVER, HERBERT. *The Memoirs of Herbert Hoover*. Vol. III: *The Great Depression, 1929-1941*. Pp. xv, 503. New York: The Macmillan Company, 1952. \$5.00.

Essentially this third volume of Hoover's *Memoirs* is his justification of his handling of the Great Depression. If he is conscious of a single error in his methods, he does not confess it. Ironically enough he had, throughout the 1920's, warned against the credit policies of the Federal Reserve Board that contributed to the market crash of 1929. To his everlasting credit he had no sympathy with Andrew Mellon's depression formula which he says was: "Liquidate labor, liquidate stocks, liquidate farmers."

Hoover spent most of his four presidential years inventing and applying devices to counteract the harrowing economic trend. In this he was limited by his inflexible social and economic philosophies. "National stability," he writes, "required that we balance the budget." So galloping deflation was accelerated by increased taxation and reduced federal spending. A similar policy in the Eisenhower administration, in case of even a recession, would probably finish the Republican party.

Sixteen months after the market crash Hoover was insisting: "The basis of successful relief in national distress is to mobilize and organize the infinite number of agencies of self help in the community," and this was said when personal incomes were wilting away. At the same time he was asserting the responsibility of local

governments for relief just when their dwindling revenues and borrowing potentialities were confronting them with impending bankruptcy.

Yet Herbert Hoover is convinced that he had whipped the depression by 1932. "If the New Dealers had carried on our policies instead of deliberately wrecking them and then trying to make America over into a collectivist system, we should have made complete recovery in 18 months after 1932, as did all the other dozen nations with a free economy." He points out what all the economic charts indeed confirm—that only World War II finally got us out of depression conditions.

A man from Mars landing on earth and having no other source of information about Franklin Roosevelt than this book could scarcely believe that such an earth being was possible. If President Roosevelt possessed one redeeming trait, Herbert Hoover apparently never noticed it. Roosevelt would appear to have been something of an economic moron particularly in his monetary manipulations. His misrepresentations of Hoover's dealing with the depression are thoroughly and convincingly documented. Under the circumstances the ex-president can be pardoned for frequent use of the epithet "lies," although he does suggest that Roosevelt was misled by his ghost writers. Hoover proudly declares that he never delivered a ghost written speech.

The meticulous care with which Herbert Hoover solemnly demolishes, detail by detail, the misrepresentations of Franklin Roosevelt, whether as a campaigner or as President, reveals Hoover's overestimate of the rational nature of the human race. He may be unaware of his own application to those who have philosophies different from his of such epithets as "demagogues," "pseudo liberals," "socialistic," "communist," and "fascist," to mention but a few. Moreover that still historically young institution, "free enterprise," is assumed to be the absolute ultimate in economic evolution, which only a potentially aberrant human race can prevent from prevailing when Gabriel trumpets the Judgment Day.

WILFRED E. BINKLEY

Ohio Northern University

CORSON, JOHN J. *Executives for the Federal Service: A Program for Action in Time of Crisis*. Pp. xii, 91. New York: Columbia University Press, 1952. \$1.50.

John Corson's *Executives for the Federal Service* has two unusual qualities—you can read it at one sitting, and the whole book makes good sense. The book is the result of a very workmanlike analysis of the "distressing scarcity" of top-level leadership to administer the increasingly diverse functions of the United States government. It is a successful attempt to establish some constructive guides to remedy our shortage of able public executives.

The author is herein concerned with the 3,300 executives (1950 estimate) required for the management of the executive branch. Although this group receives only 2 per cent of the federal salary budget, John Corson correctly stresses the great impact which, for better or for worse, this small cadre has upon the productivity and enterprise of the entire 2,250,000 members of the public service.

Consideration is first given to the "market" of supply and demand for executives where the supply does not now and never has equaled the demand. Mr. Corson suggests that one reason has been the lack of organized machinery to identify available and competent individuals with the peculiar talents required of those who assume key jobs in the Federal departments and emergency establishments.

As another problem in obtaining a favorable balance in the executive "market place," Corson points to the inability, and hence the hesitations, of many persons in private business to handle with a sure hand the appallingly complex tasks of government.

One of the most interesting parts of the book is the analysis of why individuals refuse to accept appointments to important and influential positions offered them. In addition to such "avowed reasons" as the inadequacy of compensation and unwillingness to accept the abuse which may fall upon public officials, Mr. Corson ferrets out some of the underlying, though rarely articulated, reasons. Among these are the inability of the prospective appointee to visualize the nature of the work to be

undertaken, the lack of a sense of genuine emergency need, the inability of some agency heads to attract and command the respect of competent subordinate executives, and the lower prestige which has developed for the public service as a result of destructive criticism of government and general indictment of public employees.

In addition to these, I should like to add what I have come to believe is the principal reason for failure of citizens to respond to a call to public duty: I refer to the lack of a sense of responsibility which has become so prevalent as Americans have become increasingly materialistic in their orientation. Acquisition of material possessions, self-indulgence, getting ahead, "making a killing" are values which are not only taking firm root in the market place but too often are the dominant note in our universities as well. When we have more unselfish, devoted, and concerned citizens, the reasons given by Mr. Corson will still be important factors requiring action, but they will not prevent the government from securing the services of persons it needs.

To alleviate these deficiencies, Corson sets forth a constructive program designed both for the immediate "executive crisis" and for the drawn-out state of emergency which is ahead. He stresses that an awareness of the critical emergency now existing must be created among the country's business and educational leaders. More specifically he proposes: (1) Better utilization of executive ability already within the government; (2) more resourceful methods in recruiting qualified persons from private fields; (3) rotation of individuals in top-level jobs; and (4) in the absence of a suitable salary structure, service without compensation. The key ingredient in each of these steps is provision within the federal government of adequate leadership to carry them out.

One incentive which Corson points to as important for the long pull in both attracting and retaining able individuals is that of establishing salary levels more comparable to those of private industry (where responsibilities in most cases are much narrower). Among nonmonetary incentives, attention is given to sabbatical leaves, provision for participation in professional

meetings at government expense, and other means for broadening experience and associations.

In recommending that a "pool of career administrators" supplemented by a "public service reserve" be established, the author places appropriate emphasis upon the continued necessity of a high degree of accountability on the part of government executives.

I would add, also, that both the pool and the reserve should be provided with an easily operated valve to let out those who will inevitably turn out poorly or otherwise develop attitudes and orientations which are inimical to the public service. Moreover, we should guard vigilantly that priceless fluidity of our civil service which permits entry into the federal government at all levels of persons from private institutions and state and local agencies. Efforts to *require* promotion from within in filling vacancies strike at the heart of this essential.

It is gratifying to learn that philanthropic foundations and professional organizations have been impressed with the merit of Mr. Corson's final recommendation for a thorough inquiry into this whole field. This splendid volume should provide a solid basis for the dual need of further study and current action.

DONALD C. STONE

Economic Cooperation Administration
Washington, D. C.

HARDIN, CHARLES M. *The Politics of Agriculture: Soil Conservation and the Struggle for Power in Rural America*. Pp. 282. Glencoe, Ill.: The Free Press, 1952. \$4.00.

Beginning with the depression following World War I there has been a very great increase in the relationships between government and agriculture. Farmers, as individuals, found themselves helpless to deal with the financial problems with which they were confronted following the sudden collapse of the prices of farm products in the early twenties and again in the early thirties. Their plight had a serious impact upon the entire economy of the country. To remedy the situation farmers organized more thoroughly than ever before in the

history of the country. As a result, they were in position to present their plight to the public and to the government more effectively than ever before. All parties concerned were convinced that something had to be done. But what?

This interesting, well-written, and well-documented study by Charles M. Hardin, associate professor of political science at the University of Chicago, gives a well-balanced picture of the efforts to find solutions to these problems which have been made to date. Part I deals with "The Interests" involved—the interests of farmers, the College of Agriculture, the Soil Conservation Service, and the Production and Marketing Administration. Part II takes up the Process of Policy Formation—the conflicts between the "interests" listed above, their attempts to "sell" Congress on the merits of their respective solutions to farm problems, the Hoover Commission and its task force for Agriculture, and the 1951 reorganization of the Department of Agriculture. Part III consists of recommendations and general interpretations.

It is an interesting story, impartially presented, of an exceedingly important period in the evolution of our governmental machinery for dealing with the problems of agriculture in the modern world.

As the curtain is drawn at the close of the book, one is left with the feeling that he is still in the midst of the play. The final outcome of this struggle for power is by no means clear. In our ponderous, slow-moving democracy the last act may take another quarter of a century. This reader was left with the hope that the author will write the final act in due time as a sequel to the present volume.

RICHARD BRADFIELD

Cornell University

CALKINS, FAY. *The CIO and the Democratic Party*. Pp. xiii, 162. Chicago: University of Chicago Press, 1952. \$4.00.

There are few tougher questions facing labor leaders today than those having to do with the extent and manner of labor participation in partisan politics. It is all very well to say "reward friends and punish enemies," but the question remains how best to do this in the countless particular

power situations which constitute American politics.

This book consists of five case studies of the way various units of the Congress of Industrial Organizations Political Action Committee (CIO-PAC) tried to answer that question in 1950. Each illustrates a different kind of interest group-political party relationship. In Ohio, PAC supplemented the Ferguson campaign against Taft, without success but with sufficient vigor to draw fire upon itself as a "radical" group which had captured the Democratic party. An extremely close competition between the two parties in Steubenville, Ohio, permitted PAC to organize independently and hold the balance of power. In Chicago, PAC in coalition with another liberal group entered the Democratic primary, only to fail resoundingly in its attempt to nominate a state senator in opposition to the machine candidate. The Rockford, Illinois, PAC entered the county party and formed a coalition with an Italian group; together they elected top party officers and controlled the party. A liberal coalition in Michigan, in which PAC was the strongest single group, captured the state party and elected a governor.

The author recognizes the limitations of the case-study method, and she does not claim that these cases are even representative. The five PAC's were chosen because they were, among the most active in the country; their relationships with the party therefore bring into sharp focus the kinds of decisions political activists in labor must make. In all the cases the same variables are examined; the studies can be integrated readily into further research. The data certainly support the author's conclusion that an interest group has to determine in each situation what relationship with the party will best serve its needs, and that it "operates at its best when it selects the most influential alternative it can afford with its limited political resources."

The book has neither notes nor index, but this is not so serious as it sounds: the book is brief and clearly organized, and the essential data are in the text.

The author seems undecided about her public for a moment in the beginning, when she addresses herself to the "average

American" who shudders at the mention of the word "pressure group." But the book is not for him; it is sophisticated scholarship, written with remarkable economy. It ought to be read by both the professional conservative and the professional liberal, who fume respectively at labor's menacing political power and labor's inexcusable political impotence. It may of course be ignored or received without gratitude by them, but not by those who can appreciate the value of sound empirical research in an area in which so many have been content to play by ear.

RALPH K. HUITT

The University of Wisconsin

BOLLENS, JOHN C. *Appointed Executive Local Government, The California Experience*. Pp. xi, 233. Los Angeles: Haynes Foundation, 1952. \$3.75 cloth; \$3.00 paper.

This is perhaps the most detailed study of appointed local government executives yet made in any state. Besides, it is extremely interesting reading and should be most helpful to all those who are actively promoting or considering the appointive executive for their municipality, county, or local unit.

There are two sorts of such executives in California: the manager and the chief administrative officer (CAO). One hundred and nineteen municipalities in the state, about two-fifths of the total of 306, are appointed executive local governments. Almost nine-tenths of all city inhabitants are living in these communities. More than one-fifth of California counties, thirteen to be exact, with 69 per cent of the population of the state, also operate under such governments. Of the grand total of 132 local units under appointed executive governments, 85 have managers and 47 have chief administrative officers. There have been 26 abandonments of the manager plan and 16 of the chief administrative officer set-up. The manager in California dates from 1914, the chief administrative officer since 1930.

The differences between a manager and a chief administrative officer, while real, are relative in character. The office of manager is more formal in its legal setting,

and the manager has a more complete administrative authority. The duties of the chief administrative officer are described in more detail and are more confined in scope. The most important differences are that the manager generally has the specific right to appoint and remove a considerable number of administrative employees including department heads, whereas the CAO are usually confined to making recommendations on such matters to the governing bodies. Likewise, managers have power to prepare the annual budget, while CAO collect departmental estimates and submit them to the governing body with their suggestions. But even in such cases, there is much similarity in actual practice depending upon the personalities concerned. The CAO is likely to increase his powers after two years of successful administration when the governing body has gained confidence in his work. This is an important point for consideration in other states. Communities first dubious of a manager-council plan might be willing to adopt a CAO as a starter; others not satisfied with the manager plan could adopt the less formal CAO. In California, there were eleven conversions from CAO to manager and nine transfers from manager to CAO.

The contents of this book cover the general field of this relatively new development in local government in a broad way. They include the growth of the council-manager and CAO plans within the state, the methods of adoption, and case studies thereon, the characteristics of appointed executives and their jobs, and the part they plan in intergovernmental and community affairs. The experiences in California, the leading state in adoptions of the appointed executive, are well worth extensive consideration throughout the nation.

HAROLD F. ALDERFER

The Pennsylvania State College

JORDY, WILLIAM H. *Henry Adams: Scientific Historian*. Pp. xvi, 327. New Haven: Yale University Press, 1952. \$5.00.

William H. Jordy's *Henry Adams: Scientific Historian* is a detailed and excellent analysis, not only of the work of the enigmatic Brahmin, but of his personality as

well. Jordy is much to be commended for his courageous recognition of the fact that while the pattern of a man's accomplishments and of his significance takes form only as the man himself begins to emerge, the finer subtleties of an extremely complex subject may defy category. Obviously, having presented a full roster of facts, Jordy might be excused—possibly even praised—for drawing the threads of his evidence together, however loosely, into a composite picture. Instead, he wisely leaves it to the creative reader to evoke his own image, recognizing, as Adams himself would have, the futility of forcing an Adams on a merely passive audience.

This delicate approach does not, however, preclude some exceedingly astute observations on Mr. Jordy's part. After the inevitable first chapter on the nomenclature to be used, the reader examines, with Henry Adams' penetrating eye, the problems facing science, history, art, and the world of practical affairs. These are seen within the context of one, who, however in advance of his age he might be in some respects, was nevertheless imprisoned within the emotional and intellectual climate of the nineteenth century. Add to this the peculiar background of the perfectionist who felt at once repelled by the realities of actual existence and drawn, both by family example and by his own inclination, into a belief that the function of an enlightened leadership was that of dominating the public will. Within this framework, the *raison d'être* of Adams' search for unity and meaning through a scientific history becomes evident.

Equally obvious is the resulting dilettantism of Adams' work, which, however fascinating, never quite attains a professional level. The man who sought to establish the university as the central core of a trained leadership, was himself unable, in the last analysis, to rise above the level of the cultivated amateur. His romantic conviction that learning would detract from the fullest realization of aesthetic values goes far in explaining his reluctance in adopting, without reservations, his own formulas; and it certainly, in Jordy's view, helps to explain the paradox, the sense of frustration, and the later pessimism of

Adams. It explains too, along with the Hamletian qualities of vacillation so characteristic of Adams, his ultimate reliance on intuition rather than on scientific method. That this could lead only to "failure" in the conventional sense in no way lessens the fundamental greatness of the man. Without in the least minimizing any of Adams' shortcomings, Jordy is able to portray the essential integrity and the substantial if erratic accomplishments of an outstanding transition figure in American history.

DOROTHY RICHARDSON RUDY
Cross River, New York

CARMAN, HARRY J., and HAROLD C. SYRETT. *A History of the American People*. Vol. I: *To 1865*; Vol. II: *Since 1865*. Pp. 746, xxi; 812, xxv. New York: Alfred A. Knopf, 1952. Text \$5.75 per volume; trade \$15.00 for boxed set.

This history of the United States from the time of the discovery of the American Continent up to the war in Korea is intended for the use of students, and it is truly the kind of a history which students should have.

First of all, it is dispassionate and objective. With few exceptions the account of events and the authors' comments upon them are severely judicial rather than argumentative. Then, too, the emphasis is all on economic, social, cultural, and religious developments rather than on wars and military personalities. Even though we Americans have been embroiled in fighting oftener than one would expect of a peace-loving people, yet it has not been along such lines that either our ethos or our principal growth has seemed to lie.

This fine even-handedness has been violated on only two occasions. When relating the political maneuvers which attended the early years of the Republic, I cannot help feeling that the scales have been tipped somewhat in favor of the Hamiltonian philosophy at the expense of Jefferson's ideas, so that the latter's stature diminishes unduly and John Adams emerges a more significant figure than most students adjudge him to be.

What seems to me a common error in evaluating Reconstruction measures ap-

pears here also. Emphasis is invariably placed on the uncompromising harshness of the final legislation, without giving sufficient importance to the constant evasions by the former Confederate States of the milder, looser regulations which preceded this.

But these blemishes are more than balanced by the virtue mentioned above, as well as by the brilliant fashion in which the authors have avoided the pitfalls rarely missing when historians essay to write about contemporary history. The story of the Roosevelt and Truman administrations has been told dispassionately yet warmly, and will, there is every reason to believe, stand up stoutly under the test of time.

ALPHONSE B. MILLER
Philadelphia, Pennsylvania

JOHNSON, GERALD W. *Pattern for Liberty: The Story of Old Philadelphia*. Pp. 146. New York: McGraw-Hill Book Company, 1952. \$7.50.

This book is certain to be popular. It is grateful to the eye, with its large clear text, its generous margins, and its spirited pictures in color. But it is grateful alike to the ear; for the story is told by an expert newspaper man who knows the value of direct approach, conversational ease, apt illustration, and epigram. One has the feeling of an experience in television—words and pictures going hand in hand, and all shrewdly timed. The reading can be accomplished in an evening. Perhaps, indeed, it is better that way. For this is not only a description of the Quaker City in the old time, though it is much of that; nor yet is it only a narrative of stirring events, though there are these in large measure. It is a story built about a two-fold pattern: first, that only in a new country, so situated, so peopled as America was then, could have been promulgated so dangerously novel a form of government as that outlined in the Constitution, at least without sanguinary repercussions. And second, that Philadelphia, because of the temper of its people, was ideally fitted to the proper shaping of that document.

Everyone will agree with the first theme, and it is pleasant to have the tale retold well. With the second one is more dubious.

Philadelphia was chosen as a meeting place for the delegates because of its central position. But that its people were gifted with such moderation as to make them a balance-wheel between the radical democracy of the North and the aristocratic tradition of the Southern states is quite another matter. One has only to read, alas often, of the violent, almost sanguinary quarrels that rent it almost in twain, to doubt whether the citizens were the comfortable, middle-of-the-road people the author finds them.

Mr. Johnson also states, oddly enough to one of Quaker City blood, that Penn's Green Country Town was a merry place. Now the Quakers who formed a large part of its population—a governing part—were sober folk. They allowed no pictures or ornaments in their homes. They eschewed finery in dress. And they made war quietly but effectively against such worldly diversions as the opera, the theatre, and dancing. They smiled. They hardly laughed. It is true that during the Captivity the city was decidedly gay. But that was due to the British officers, led by Major André. When they went, gayety went with them, along with the jollier Tory girls who left as their wives. And we have foreigner after foreigner to iterate his feeling of ennui with the primness of both architecture and entertainment. It looks a little as if the author were fitting his facts into a preconceived plan.

But the charm of the book lies not in its arrangement, but in its story. The author knows the value of little things. And just as E. F. Benson, in his study of Edwardian England, begins with a humble bead-cushion, so here we start with a chair and a carved sun upon it, that Franklin interprets as a rising sun: There is the theme. A young, adventurous people are given you: the shipbuilders and townfolk in the background; the merchant-adventurers like Morris, artists like Peale, inventors like Fitch, doctors like Rush, in the middle foreground; and the great national figures on the front stage. A complete and telling picture.

Pattern for Liberty will be of interest primarily to Philadelphia folk. But it will have its appeal also to any good American

who looks with pride on the sunrise of his country.

WILLIAM PAGE HARBESON
University of Pennsylvania

ROSSMAN, KENNETH R. *Thomas Mifflin and the Politics of the American Revolution*. Pp. xiii, 344. Chapel Hill: University of North Carolina Press, 1952. \$5.00.

This is the only published biography of Thomas Mifflin, with the exception of a brief sketch of twenty pages which was printed over a century ago. The neglect of Mifflin may have been in part a reflection of disapproval of the career of a man who was threatened with court-martial as quartermaster general at the time of Valley Forge, who was involved with Horatio Gates in the Conway correspondence, and who, on other occasions as late as 1793, was condemned by George Washington. However, a biography now seems well warranted for a man who was a prominent Philadelphia merchant, major general in the Continental Army, President of Congress under the Articles of Confederation, and three times governor of Pennsylvania.

Professor Rossman has used the few and widely scattered Mifflin manuscripts, but most of his sources have of necessity been drawn from state papers and the letters of Mifflin's contemporaries. In the first hundred pages the reader is in danger of losing Mifflin in the rapid summary of colonial life and the politics of the Revolution. Even here, however, there are gems, such as the following quotation which so well documents for the Colonial period the comments of Estes Kefauver (*THE ANNALS*, Vol. 280, p. 2) on the evolution of ethical standards of public morality. In considering civil government the fifteen-year-old Mifflin wrote in his school notebook: "... Men who have property will not be excluded from a Share of Power & Men in Power will exert it one way or other to obtain Property to support themselves."

Mifflin's conduct in resigning as quartermaster general is described as "unpardonable and almost criminal," but the reasons and excuses for it are explored. The analysis of his contributions to the Conway "Cabal" tends to confirm the more recent

interpretations of this episode, holding that cabal is too strong a word to use in describing the activities of those who criticized Washington during the winter of 1777-1778. Washington apparently understood, for he was a friendly associate and at times a guest in Mifflin's home during the next 20 years when Mifflin was prominent in Pennsylvania politics. The last 200 pages of this volume are devoted to Mifflin's career as a political leader in Pennsylvania, and provide one of the best analyses of local politics during the early Federal period.

A minor detail serves to illustrate the caution necessary to the researcher who uses newspaper accounts as sources. The "immense crowd" from Philadelphia never met Citizen Genet at Gray's ferry. The plans for the reception miscarried, but the editor of *The General Advertiser* did not change type on the excellent story he had set in advance. Both Jefferson and Hamilton mentioned Genet's entrance into Philadelphia under other circumstances in their letters written at that time.

CHARLES M. THOMAS
The Air University
Maxwell Air Force Base, Alabama

SYDNOR, CHARLES S. *Gentlemen Freeholders: Political Practices in Washington's Virginia*. Pp. ix, 180. Chapel Hill: University of North Carolina Press, 1952. \$3.50.

Aristotle rationalized the Greek city state into the perfect form of political organization. Professor Sydnor has nearly accomplished this task for the county government of colonial Virginia, not as applicable to other regions and other times, but for the social conditions of eighteenth-century Virginia. He has, indeed, made a very appealing case for the political system which produced Washington, Jefferson, Madison, Marshall, and Monroe. He describes a typical election in eighteenth-century Virginia, in which the gentry dominated, but where they were generous enough to "swill the planters with bumbo," an alcoholic drink.

The most important contribution of this study is an analysis of the county oligarchies. Here the prestige of family, long tenure, and irresponsibility to the people

did not lead, as one might expect, to bad government but to a remarkably successful system of federalism in local government. Despite his approval of this system, on the basis of results, Professor Sydnor has presented the opposite side as Thomas Jefferson saw it. Perhaps there is a lack of extant source material, but surely there must have been much other adverse criticism. All phases of government in the eighteenth century were firmly controlled by "the gentlemen of long-tailed families." But they seldom used their power to oppress the people, partly because Virginia was a homogeneous agricultural community and because government only lightly touched the citizens and provided few opportunities for exploitation of one class by another.

Professor Sydnor holds that the Virginia government of the eighteenth century was a happy blend of aristocracy and democracy. The only time that the people could vote was at the election of burgesses, and only a small minority did vote. Professor Sydnor has brought forward the interesting contention that a property qualification in the eighteenth century was actually intended to curb the influence of great landowners over their tenants and laborers who, under a system of oral voting, could be forced to vote according to the will of the landlord. This study of gentlemen freeholders in Virginia is written with charm and is a valuable contribution to the understanding of the eighteenth century in America.

CLEMENT EATON
University of Kentucky

BRIDENBAUGH, CARL. *Myths and Realities: Societies of the Colonial South*. Pp. xiii, 208. Baton Rouge: Louisiana State University Press, 1952. \$3.25.

In this volume, an outgrowth of his Walter Lynwood Fleming Lectures at Louisiana State University, Professor Bridenbaugh divides all the Late Colonial South into three distinct parts: the Chesapeake Society, the Carolina Society, and the Back Settlements. He sets off the Back Settlements as the area settled by many folk from Pennsylvania, largely Scotch-Irish and German, a region west of

the Monocacy River and the Blue Ridge Mountains as far south as Albemarle County where it spilled over into the Piedmont of Virginia, the Carolinas, and Georgia. The Chesapeake Society is defined as being situated east of the Back Settlements in Maryland, Virginia and northern North Carolina. The Carolina Society is a label reserved for the coastal region in southern North Carolina, South Carolina, and Georgia. The Chesapeake Society is described as being in an economic depression and the Carolina Society as being in a boom. Both are depicted as being intellectually passive, absorbing most of their culture from European centers—an indictment that was probably about as true of the rest of Colonial America.

Professor Bridenbaugh makes many excellent points and various penetrating evaluations of the societies of the Colonial South, but some authorities will probably disagree with a few of his conclusions. His emphasis, for instance, upon ruralness and slavery as most important influences in shaping the distinctive nature of Chesapeake Society may be regarded as a mild over-simplification, since tobacco culture, which was certainly of significance, developed before slavery and would have continued without it, and since ruralness was virtually a universal characteristic of Colonial America. Also, his assertion that "the toleration born of the Enlightenment and voiced by some liberal Tidewater Anglican gentlemen had no interior echoes before 1775" (p. 185) will likely evoke some scholarly polemics.

Professor Bridenbaugh challenges as a myth the belief that a political feud existed prior to the American Revolution between the Chesapeake Society of Virginia and its Back Settlements concerning the creation of new western countries, stating that he has "searched fruitlessly for evidence that before 1776 political sectionalism—western resentment of eastern overrepresentation and rule—was an issue, either open or covert, in Maryland or Virginia" (p. 157). His position seems a precarious one. Landon Carter, for instance, who was long a prominent political leader of the Chesapeake Society of Virginia, complained to Washington in 1776 against legislative en-

actments that placed all the tobacco warehouses at the heads of the rivers, adding: "The lowland men can fight against laws that oblige them to starve, as well as upland men can fight for them because they are made to please them. I foretold this effect from the constant dividing back Counties long ago" (*Tyler's Magazine*, XIII (1931), 255). Moreover, inhabitants of western areas repeatedly had to petition the colonial assembly to create new counties for them.

The statement that the men of South Carolina had shorter lives than the women because of their great intemperance and even less gentlemanly excesses (p. 85) makes one wonder if Professor Bridenbaugh made any allowance for the normal shorter life expectancy of males or took into account the greater exposure of the men of colonial South Carolina to malaria as they went about their duties in swamp and field.

ROBERT LEROY HILLDRUP

Mary Washington College

BINKLEY, WILLIAM C. *The Texas Revolution*. Pp. ix, 132. Baton Rouge: Louisiana State University Press, 1952. \$2.50.

Without essential modification this book reproduces four lectures delivered at Louisiana State University in 1950 in the Walter Lynwood Fleming series. They are based on researches dating back to Professor Binkley's graduate school days. Though undocumented, they obviously rest on the scholarly work that has been directed to this chapter of Texas history by various men, including Binkley, as in his edition of the *Official Correspondence of the Texan Revolution*. What is offered is primarily an interpretation of the institutional factors and development.

The essential cause of the revolution is found, not in any deliberate design, but in the interaction of a group conditioned by the Anglo-American frontier and a group and government stemming from centuries of autocratic Spanish rule. Points of friction accumulated, some of them political and others economic and social; indeed, there was an ominous piling-up of unsolved problems, which came to a climax in 1835 and 1836. One problem was how to relate

Texas interests with the contest between Centralists and Federalists in Mexico. The decision to resort to force was precipitated by the coming of a Mexican army, but military command and planning were most haphazard and the war aims were ill-defined. In November, 1835, the consultation voted for a goal short of independence. Two months later the provisional government split disastrously over whether to send a diversionary force to Matamoros. In the anarchy that ensued, the forces under Travis, Johnson, and Fannin—four-fifths of them recently arrived volunteers from the United States—could not withstand Santa Anna's army.

These military disasters, however, clarified the issue of the resistance and led to the declaration of independence. Chaotic uncertainties continued. With a hastily drawn constitution, the convention installed an ad interim government, which ruled in theory while Houston made his strategic retreat to San Jacinto. Even the victory there did not end the confusion. With after-the-battle volunteers from the United States predominant in the army, a deadlock developed between the military and the civil governments, and a crisis was only averted by a new menace from Mexico and the return of Houston as candidate for the presidency.

On a smaller scale, and perhaps with more gyrations, Texas between one autumn and the next had gone through a development roughly analogous to that of the United States between 1775 and 1789. Binkley's analysis of this experience in practical political science is both shrewd and lively. It is more than a working outline for a large book that might be written on this subject.

JOHN W. CAUGHEY

Los Angeles, California

ECONOMICS AND INDUSTRY

BAUMOL, WILLIAM J. *Welfare Economics and the Theory of the State*. Pp. 171. Cambridge: Harvard University Press (published for the London School of

Economics and Political Science), 1952. \$4.25.

The belief that the perfectly competitive market tends to maximize the economic welfare of the community is based on a simple consideration. Actions that will promote the welfare of an individual A depend either on A himself or on somebody else. In the former event, A will clearly undertake the action. In the latter event, A will try to induce B, on whom the action depends, by an offer of compensation to undertake it, and B will accept the offer if it covers his cost. If all these bargains are possible, as they would be in a perfect market, then all actions will be undertaken which benefit one individual more than they burden him or others. Hence a situation will result from which any change could only be for the worse; in the precise terms of Mr. Baumol's analysis, "any reallocation of resources . . . will so affect the various members of the economy that those who are better off as a result of the change will be unable to compensate those who are worse off as a result of the change and at the same time make a net gain for themselves" (p. 26).

Starting from this point, the author explains why many of the bargains that would be necessary to achieve maximum welfare through the competitive market are in fact not possible because the market is not perfect. Sometimes the obstacle is the technical difficulty of establishing contact among widely diffused interests—as in the case of the inhabitants of a city who would all wish to keep the air clean but who are just too many and too disperse to combine for an offer to the factory owners to buy them smoke consuming equipment. (The municipal government, of course, might interfere—but then we are no longer in a laissez faire society.) In other instances, an adequate compensation offer or other serviceable action may be prevented by the inability of many individuals to determine whether they are interested in a particular effect, and to what extent. In still other cases the attempt of individual members of an interested group to let the others pay for the desired action may frustrate a useful project, as might happen with farmers who all would profit from rain making but

each of whom wants the others to bear the cost of cloud seeding.

Through the impossibility of mobilizing all persons actually interested in a particular effect for concerted action, measures (or omissions) frequently become profitable for the individual on whom they depend although they benefit him less than they harm others. As Mr. Baumol shows, his scheme of deviations of social from private costs gives a place to many of the major weaknesses which critics have pointed out in the atomistic order: monopolistic restriction of output, inadequate provision for the future, waste of human and material resources by such socially useless practices as excessive advertising. Only inequality of incomes, as not being a property of an atomistic order per se, and the occurrence of depressions, as an essentially dynamic phenomenon, are not fully accounted for under Baumol's categories. Thus he has written a fairly comprehensive and excellently organized Bill of Particulars against the unregulated market economy. But in spite of some doubts about the concept of "consumers' sovereignty" as traditionally used in the comparison of economic systems, Baumol does not assume any superindividual goal: for him social action, like individual action, is intended to satisfy individual desires, and collectivism, insofar as he approves of it, remains a matter of method, not of ultimate ends.

The author has shown that welfare economics—that branch of economic theory which tries to clarify the concept of "material welfare of the community" and to determine the economic arrangements that would maximize this welfare—can do more than wrestle with its preliminary conceptual issues and the underlying philosophical problems. Although his claims are more modest, Mr. Baumol has supplied a number of important bricks for the construction of a theory of economic state functions. His excellent book has only one major limitation: the preponderance of arguments taken from economic statics. Baumol does not assume a stationary state of the economy, yet his analysis does not go deeply into economic dynamics, although the merits and demerits of a competitive as compared with a collectivist order stand

out more clearly when economic development is considered.

CARL LANDAUER

University of California
Berkeley 4, California

EGLER, WALTER P. *Economic Stabilization: Objectives, Rules, and Mechanisms*. Pp. xii, 264. Princeton: Princeton University Press, 1952. \$4.00.

Professor Egler has made an important contribution to the analysis of governmental policies designed to maintain economic stability. Students of public economic policy, especially those responsible for its further development and administration, will greatly benefit from it.

In the past, governmental stabilization policies have been carried out within a framework of relatively loose and undefined goals, such as the general prevention of depressions or inflation. The neglect of detailed analyses of goals stands in sharp contrast to a heavy emphasis on methods. It is the author's basic thesis that these goals are too indefinite and that, instead, the government's stabilizing efforts should be guided by a clearly defined objective, which becomes a binding target, a guarantee.

The author fully realizes that such an objective is inevitably political. He visualizes a great public debate, which would give the Congress guidance on the kind and degree of stabilization the American people want—that is, what the margin of tolerable fluctuations should be. After examining various indexes which would define such a margin, the author suggests that a constant or slowly rising price level should define the ceiling, while the floor should be set by an acceptable unemployment level. He finds these indexes most suitable from the point of public appeal, simplicity, compatibility with the long-run objectives of efficiency and growth, and ready availability of statistics.

Professor Egler puts great emphasis on permitting a relatively wide margin of fluctuations. He definitely wants no "full employment" policy, even though he seems to be willing to retain the slogan. The need for permitting economic swings within a relatively wide margin arises primarily

from possible inconsistencies between economic stabilization and other high ranking values, such as an extensive scope for collective bargaining, increasing productivity, a relatively limited governmental role, and political and economic freedoms. It is the balance between these values which is the essence of the required political decision.

The government must, of course, be given adequate authority to guarantee attainment of the objective. The author's interest in the necessary tools is clearly secondary, and his contribution here is less imaginative. He hopefully puts major reliance on monetary and fiscal controls, but would expand the President's authority to include "executive action under legislative veto," so as to permit imposition of controls after due notice to the Congress, and in the absence of a Congressional veto. The author recognizes the possible need for public investment to prevent unemployment above the maximum allowed, as well as for limited direct price and wage controls; in addition, "the highly monopolistic capitalism which we now have" must be made more competitive.

The study deals with such a great variety of problems that most readers will be disappointed in the treatment of some of them. Some may feel that the problem of long-run underemployment is more closely interwoven with economic stabilization than here presented. Others will regard an approach on the less ambitious level of eliminating the cumulative aspects of cycles as more desirable and "realistic." Still others will see in his recommendations a sure road to a planned economy—or away from it. All, however, will find Professor Egler's analysis significant and thought provoking.

HANS A. ADLER

Washington, D. C.

TINTNER, GERHARD. *Econometrics*. Pp. xiii, 370. New York: John Wiley & Sons, 1952. \$5.75.

Econometrics is the branch of economics which aims at formulating economic theory so that it can be tested statistically, and then going to the statistical data to perform the tests indicated. Mathematical economics need not be econometrics; it may simply formulate theories in mathematical

terms with no reference to observable variables, and therefore without involving any possibility of testing. Economic statistics need not be econometrics either; it may accumulate data and examine them for uniformities without any reference to economic theory adduced in other methods. Econometrics, then, combines one form of mathematical economic theory with one form of economic statistics to produce a distinctive compound of its own.

Both the study and the application of econometrics have grown by leaps and bounds in the 20 years since the formation of the Econometric Society. The subject is now studied formally in lecture courses and seminars at most of the leading graduate departments of economics in the English-speaking countries; it is sometimes introduced even to selected undergraduates. Econometric research units are active not only in the universities but in many government departments, international economic bodies, and in some private corporations as well.

The advance of econometrics, however, has been delayed by the paucity of suitable introductory textbooks. It is this lack which Professor Tintner has sought to fill. While valuable as a reference work, however, both his approach and its mathematical prerequisites make this book somewhat less satisfactory as a general textbook for the student whose primary interest is economic than is the recent translation from the Dutch of Professor Tinbergen's classic introduction to the subject. Tintner, after a beautifully complete and marvelously documented—if overconcise—Part I, considers econometrics mainly as an application to economic data of modern methods of mathematical statistics. Tinbergen, remaining throughout on the mathematical level of Tintner's first part, looks at the subject as an economist whose primary interest is the summary and criticism of the work being done in the field. The mathematician and statistician will probably find Tintner's approach preferable; the economist will probably disagree.

Tintner's *Econometrics* would have been better received, perhaps, had it followed rather than preceded Tintner's promised volume on mathematics for economists.

As university curricula in applied mathematics are set up (pointed primarily to the natural sciences and engineering), a master's degree in mathematics is probably a minimum essential to any sort of understanding of most of Tintner's Parts II and III. It is hoped that Tintner's forthcoming volume may fill the gap which exists between, say, Allen's standard text in mathematics for economists and the requirements of econometrics as represented by the volume under review.

The careful reader should obtain from Professor Tintner or his publishers a lengthy list of errata which is available in mimeographed form. As is inevitable in works of this type and degree of difficulty, errors in numbers and notation, while trivial individually, would otherwise mar the understanding of the text.

M. BRONFENBRENNER

University of Wisconsin

JORDAN, ELIJAH. *Business Be Damned*. Pp. xiv, 267. New York: Henry Schuman, 1952. \$4.00.

This wordy, provocative book represents a philosopher's scorn of business. The vigor of the indictment seems intended to shock the reader. "Business came into existence," says Professor Jordan, "through the exploitation, by private self interest, of the world's natural resources, by means of force and fraud. These exhausted, business proceeded to the exploitation and destruction of human resources and struck at life itself." "We are now witnessing," Professor Jordan concludes, "the final rape of culture by the businessman. He is now engaged in the destruction, by exploitation, of government and the public order and the entire institutional heritage which the ages have created."

As the argument proceeds, one finds touches of Veblen and John Ruskin in the analysis. Business has overtaken industry—unintelligent and immoral business. "Work is no longer the instrument of moral and esthetic expression and thus the means through which culture is effected. The harder and faster we work, the meaner the product, the more fraudulent, the less satisfying, the more irritating, the more degrading. In an infinite process of deg-

radation, a point has already been reached at which maintenance of any significant degree of culture is virtually impossible." Special condemnation is heaped upon the financier who "sits in the temple and corrupts and pollutes the stream of life at its source. . . . The stupidity of the banker is egregious, phenomenal, monstrous. He is the hijacking racketeer of the process of distributing goods."

In a word, business is, by Professor Jordan's standards, essentially immoral. It defrauds the consumer by producing a multiplicity of ever more shoddy goods. It destroys culture in all its forms, permeating education, politics, religion, and art.

The remedy is stated to be "to eliminate the owner, the power-monger, the bread-monger, the rent-monger, and, above all, their prostitute offspring, the advertiser and salesman. There can be no reason why any object, if a good, should ever be owned or sold." As a substitute, "rationalized industry" is suggested in which "every process is made a public function." Without the compulsion of ownership or the necessity of labor, the product will become a work of art. Industry would then "take its place in the scheme of culture along with politics and morals and education and religion and art." Then "the airplane would be a toy maintained as a relic of bestial crudity, like a whipping post. The automobile and the telephone would be forms of punishment for crime in a decently ordered world." The "monstrosity of business with its accompanying cupidity would give way to the Good Life. . . . The New Man steps forth upon the New Earth."

While Professor Jordan makes clear that his quarrel is not directly with the businessman as such but rather with the mechanism within which the businessman is pictured as operating, the volume abounds in unflattering references to that guild. The charges are completely undocumented.

Indeed, as one reads the work, the author spoils his case by his failure to allow room for distinctions between businessmen. Might it not be barely possible that a businessman, for example, might wish to sell a superior product and thereby gain consumer preference? Might there not be

an honest banker? Is all advertising completely deceitful? Does no salesman have a place in the economic system? Are all products lacking in artistic value?

Professor Jordan's book appears a refreshing but unconvincing touch of Ruskin tucked into the middle of the twentieth century. As a description of the economic process and as a guide to the future, it possesses scant merit. As a literary document, moreover, it is heavy, dull, and repetitious. While a forceful case can be made concerning the perversion of contemporary values by many business groups, this can more effectively be done by specific citations rather than by picturing an abstraction such as business as a monster and then decreeing that it should "be damned."

COLSTON E. WARNE

Amherst College

HANEY, LOUIS H. *How You Really Earn Your Living: Every Man's Guide to American Economics*. Pp. vi, 282. New York: Prentice-Hall, 1952. \$3.00.

The principal purpose of Professor Haney's little book is to persuade the reader that free competition is a Good Thing and that many of the policies now being undertaken by our government should be reconsidered. To do this he presents a simplified picture of the way in which a competitive economy based on private property would discharge the functions commonly attributed to an economic system. He then goes on to argue that policies such as abandoning the gold standard, incurring a large national debt, using taxes and subsidies to tamper with the allocation of resources and the distribution of income are Bad Things because they interfere with the "incentive to work, to save, to invest, and to engage in business—the cornerstone of the free enterprise system."

Those who believe with Professor Haney that "a gold standard has worked . . . better than any other that has been tried," that "the definite policy should be to keep [government] spending within the limits of taxation," that "it is within the bounds of possibility that once social controls over medical service were established . . . the leaders would decide that . . . experiments

in breeding a 'master race' would begin," such people will find much in this book to applaud. Those who do not agree with such statements, however, will find little to persuade them that they are wrong.

No one can object if an author chooses to make recommendations for public policy so long as his recommendations are related to a set of explicitly stated and consistent values. When other competent economists have advocated quite different policies for the achievement of similar values, however, an author is under some compulsion to demonstrate that policies opposed to his will not achieve the stated values or, if this cannot be done, that his recommendations are preferable on other grounds. This Professor Haney has not done. Instead he prefers to deal with his opposition by misrepresenting their views. For example, he dismisses all socialists by saying that "the essence of all their schemes is to abolish economic competition, and to put in place of free markets somebody's decision as to what we need or want." In his view, "the theory of the 'New Welfare Economists' . . . differs [from communism and socialism] chiefly in that it attempts to use mathematics for the central control of a managed economy. . . . They ignore important differences among us and assume equal incomes." Such statements are inaccurate and misleading. They suggest that Professor Haney is unfamiliar with the work of those he criticizes.

While many parts of *How You Really Earn Your Living* are satisfactory, they are overshadowed by those portions which are simplified to the point of error and those which are biased by Haney's private policy prejudices. These defects will disturb many of his colleagues. It is to be hoped that readers who are noneconomists will also recognize that this book does not present "the full story of our system of free enterprise, and the challenge it offers each of us."

JOHN BUTTRICK

Northwestern University

EINZIG, PAUL. *Inflation*. Pp. 223. London: Chatto and Windus (distributed in the U. S. by The Macmillan Company), 1952. \$2.50.

Dr. Einzig has made a name for himself as the author of some 40 books on economic and financial problems. Lively, informative, and generally devoted to some important issue of current interest, his works are models of economic literature addressed to the general reader. At the same time there are few specialists who will not find something stimulating and interesting in them. The present book, which follows upon Einzig's profound study of "Primitive Money"—written as a diversion during the war—again proves his astuteness and analytical insight as critical observer of the current scene. He is concerned with the general rise in prices which followed in the wake of World War II, a phenomenon so universal in its incidence that its discussion by Dr. Einzig is bound to have a large audience in England as well as in this country. Together with the famous series of articles on "The Age of Inflation" which the *Economist* published in the fall of 1951, chapters from Dr. Einzig's book should be required reading in any course on current economic problems.

The author starts out with an account of the various factors which have contributed to the price upheaval of the past decade. He then goes on to examine a number of public policies designed to resist inflation, and in a concluding chapter he discusses inflation from the point of view of individual financial hygiene. In the introductory chapter on the nature of inflation Dr. Einzig submits a number of standard definitions to a searching analysis. He finds fault with all those definitions which ignore the possibility of inflation of prices as distinct from monetary inflation, pointing out that frequently the expansion of money and credit lags behind the rise in prices instead of preceding it.

Reliance on faulty definitions of inflation, Dr. Einzig holds, has on occasion been responsible for inadequate public policies. In his discussion of these, a distinct note of resignation is conspicuous at places, calling to the reader's mind statements made in this country to the effect that stable prices, strong labor unions, and full employment are goals which it is hard to reconcile with one another. In another connection, Dr. Einzig scrutinizes the allegedly disinflation-

ary nature of high taxes, and he comes to the conclusion that severe taxation, especially if combined with increasing public expenditure, may well be inflationary rather than deflationary. His contribution to the current debate on the relationship between taxation and inflation is a substantial one and merits attention.

HENRY WILLIAM SPIEGEL
Catholic University of America

CLINARD, MARSHALL B. *The Black Market: A Study of White Collar Crime*. Pp. xvii, 392. New York: Rinehart and Company, 1952. \$5.00.

This description of so-called white collar crime, written by a Professor of Sociology at the University of Wisconsin, who was for almost three years a part of the enforcement staff of the Office of Price Administration, is a frank presentation of certain very unsavory aspects of American life which came to the front when restrictions of rationing, allocation of commodities, and price and other wartime controls set a limit on many cherished areas of individual action.

As one reads this book, he gains the impression that there was a general failure to co-operate in winning the war by submission to the various controls. Violations were rampant. Black markets were common in meat, gasoline, tires, sugar, and other commodities, while violations of rent control existed on every hand. The author believes that these things took place perhaps not so much because of low standards of ethical business conduct as because of failure to understand and to sympathize with the purposes of rationing and other controls. This reviewer, as he looks back over his experience as the chairman of a "local war price and rationing board" throughout the rationing period, shares this belief.

There is no way of measuring the extent of the black market. Statistics of violations are both incomplete and misleading. One OPA estimate was that over-the-ceiling prices on food added upwards of 5 per cent to the food budget. A similar percentage of gasoline seems to have passed through illegal channels by use of counterfeit or stolen coupons. The author believes

that a common estimate that one out of each five business concerns was in violation of control regulations of some sort is too low. Many violations were due to lack of information, inability to understand very complex regulations, or merely careless record keeping. Tie-in sales by wholesalers were a common practice, as was up-grading of many commodities. Counterfeit gasoline and sugar stamps were common in the earlier stages of controls, but later bogus meat stamps became the real problem.

A careful analysis of enforcement methods leads the author to conclude that they were ineffective to an alarming degree. Not enough paid enforcement men were available. Attempts to gather price violation information by committees of housewives assigned to local boards were a dismal failure. Businessmen, as a whole, were not willing to bear witness, even though many of those who refused claimed that they were themselves "being driven out of business" by advantages gained by their competitors who violated price or rationing controls. Publicity appeals to citizens generally to obey controls were effective, perhaps only with those who would not willingly have violated even the slightest control device. It seems to be certain that some troubles arose from the complexity of many regulations. Over six hundred price regulations were issued, as were about twenty general rationing orders. Some critics believe that the entire set-up was so complex as to defeat itself.

What has been learned? The experiences of World War II should have given a realistic start in the enforcement of price controls "after Korea." After a period of voluntary compliance failed, just as it did a decade earlier, regulations were issued without having either an experienced or a trained staff to promulgate and enforce them. Perhaps only the dire necessity of co-operation should atomic bombing take place in this country will bring about a realization of both the necessity for wartime controls, and, even more, realistic compliance with them. The consequences of not doing just this might, in another emergency, be more costly than in World War II.

H. H. MAYNARD
Ohio State University

CAMPBELL, W. GLENN (Ed.). *Economics of Mobilization and War*. Pp. v, 196. Homewood, Ill.: Richard D. Irwin, 1952. \$3.25.

This is a brief "analysis of the economic problems and policy alternatives that will be met in various stages of defense mobilization." It is designed primarily for use in college courses in elementary economics and in the economics of mobilization. The six contributors were formerly associated as teaching members of the Department of Economics at Harvard University. Mr. Campbell, the editor, is now research economist for the United States Chamber of Commerce.

The discussion is arranged in eleven chapters: Basic Problems, Organization, Productive Potentials (2 chapters), Production Controls, Inflation, Prices, Wages, Fiscal Policy, Monetary Policy, and Economic Aspects of International Security. Factual data and policy statements are drawn from official documents, such as: Reports of the Council of Economic Advisers, the Economic Reports of the President, Reports of the Joint Committee on the Economic Report, and Quarterly Reports of the Director of Defense Mobilization. Reference is also made to policy statements of private groups, such as the Committee for Economic Development and the United States Chamber of Commerce. For general ideas the authors rely heavily on the current work of Chandler, Galbraith, Hart, and Harris.

The authors accept the Wilson-Keyserling thesis that the American economy can sustain, with only minor adjustments and no untoward consequences, four concurrent booms—civilian consumption, capital formation, military production, and foreign aid. When economists thus accept uncritically the self-serving dictates of military planners, big business, and politicians, they abdicate a major professional responsibility. It is not for them to judge military strategy and requirements, but it is their proper function to determine the economic feasibility of military demands on the national economy. Unless they do so, economic policy decisions gravitate by default into the hands of militarists and their business and political allies.

Although the authors refrain from specific policy recommendations their analysis runs toward minimum interference with business. They would rely on the free price system to allocate resources; on indirect rather than direct controls; on subsidized capital formation; on limitation of consumer demand through sales taxes and increased taxation of low and middle incomes; on fiscal and monetary controls to combat inflation. The latter is a great evil, and fiscal and monetary controls alone will not suffice to contain it, but concern for preservation of the price system precludes more rigorous methods. Confronted with a hard choice between inflation and direct governmental controls, they seemingly prefer the former as a lesser risk.

HORACE M. GRAY

University of Illinois

ALLEN, EDWARD L. *Economics of American Manufacturing*. Pp. ix, 566. New York: Henry Holt and Company, 1952. \$5.25.

The purpose of this book is "to concentrate the emphasis on our industrial plant as it exists today." Nineteen industries ranging from aluminum to synthetic fibers "have been selected for detailed description and analytical treatment" (Preface).

There is a fine bibliography, covering fourteen double-columned pages, divided into sources of current statistics, periodicals, pamphlets, books, government publications, and trade associations. In this reviewer's opinion the last chapter "Sources of Data on Manufacturing Industries" lives up to the promise implicit in its title. The researcher and the report writer should be grateful for its inclusion. Two hundred and four photographs from 55 sources enrich the text. Identical end papers show maps of the iron and steel industry of the United States on January 1, 1951. The numerous charts, graphs, and tables are as up-to-date as they can be. There are a few cut-away reconstructions and models to show flows of materials and processes more clearly than any words can explain. Occasionally there are maps. A mistake in location is found on the map "Sources of Iron Ore" (p. 97) where one of the leading

iron mining regions is placed in western Cuba in Pinar del Rio, when the region is actually in the southeast in Oriente. But to point out this error is being captious in the face of the tremendous detail mentioned and shown by the varied methods of presentation employed.

The organization of the writing itself seems excellent. Each of the nineteen industries are subjected to the following treatment: relative size and importance, use pattern, export-import relationship, relations with the federal government, corporate ownership and control, location of the industry, technology of manufacture, input and cost factors, prices and pricing policy, profits, and future outlook. These treatment-headings are the author's. Where there is slight variation from the above, it is useful in view of the differences in industrial patterns.

In addition to being a treasure of information for almost anyone who is at all interested in our vast and rather wonderful productive equipment, the book has academic uses. It is far more than a textbook in manufacturing processes. In fact, it may not be sufficiently specialized for that. But it would serve admirably as the basic reading in a course introducing American students to manufacturing. The business student should have had his economic geography and his introduction to economics. Then this volume would be most useful. Another use would be found in the college library reference room. A shelf of six to a dozen copies should be a worth-while adjunct to many a business course (for example, introduction to business, government and business, and corporation finance). Professor Allen has rendered his colleagues an important service in marshaling his many facts in an interesting and significant way.

ROBERT ROCKAFELLOW

University of Rhode Island

WESTMEYER, RUSSELL E. *Economics of Transportation*. Pp. viii, 741. New York: Prentice-Hall, 1952. \$8.65.

This carefully written book is one among no less than six recent general textbooks (or revisions thereof) for college students

in the field of transportation. It contains 33 chapters classified into seven parts primarily on an agency basis: part one, the significance of improved transportation and the early history of domestic transportation in the United States; part two, railroad transportation; part three, highway transportation; part four, domestic water transportation; part five, air transportation; part six, pipe line transportation of petroleum and indirect carriers, such as freight forwarders, railway express, postal service, and Pullman service; and part seven, national transportation problems and policies. More space (fifteen chapters) is devoted to the railroad than to any other agency of transportation, as is proper, but four chapters each deal with highway, water, and air transportation. The material is organized in a parallel manner for each mode of transport, treating in order its development, regulation, and major problems and policies.

Like other writers of textbooks of reasonable length, the author of the present book has had to face the problem of relative emphasis upon different aspects of transportation. His treatment of the place of transportation in the economy and its relation to the organization and location of industry and to prices is sketchy, and he assigns less than half as many pages as two other leading texts to rates and rate making; but all the major facets of transportation are covered, and the analysis of transport problems and policies, especially with respect to the newer agencies of transport, is particularly thorough.

The discussion of problems and policies is judicious. The pros and cons of questions are impartially presented, and the author draws his conclusions only after a careful weighing of the evidence. Most students of transportation will probably agree with the majority of these conclusions, such as the need for an over-all national transportation policy and a system of user charges; but some people, including this reviewer, will question the wisdom of transferring any of the major functions of the Interstate Commerce Commission, except possibly safety regulation, to a Department of Transportation. Another de-

batable recommendation is the creation of an entirely new regulatory body. Furthermore, the author apparently has more faith than some writers in the creation of integrated transportation companies as a means of achieving operating co-ordination. Much can be accomplished in this direction without general approval of such companies.

Although competition among college textbooks in transportation is now keen, it is to be expected that the book under review will receive favorable consideration for adoption as the principal text for the beginning course in transportation, especially by instructors who prefer the agency as distinguished from the functional approach. Where it is not used as a basic text, it should prove valuable for collateral assignments on the problems of transportation.

TRUMAN C. BIGHAM

University of Florida

MANGUM, CHARLES S., JR. *The Legal Status of the Tenant Farmer in the Southeast*. Pp. ix, 478. Chapel Hill: University of North Carolina Press, 1952. \$7.50.

This highly technical treatise is primarily of interest to the student of law, but it fills a gap in the literature on the southern tenancy problem by contributing concise knowledge about the contractual relationship between landlords and tenants under southern statutes, and on the precedent of appellate court decisions.

First the nature of the tenancy relation and types of contracts and their duration are analyzed. Next holding over, possessory actions, eviction of tenants, and other processes are discussed. Seven chapters are devoted to all sorts of liens in favor of both parties to the contract. Chapter XXI treats peonage. The final chapter offers reforms to alleviate the plight of farm tenants and suggests modernizations pertaining to the landlord-tenant relationship.

As an agricultural economist with experience in the legal reform of Continental European farm tenancy and the conduct of litigation and arbitration of claims, this reviewer is impressed by several features of

the legal status of the tenant farmer in the Southeast made apparent by the author's lucid presentation.

Having grown from local custom and individual court and appellate court decisions, southern farm-tenancy law is replete with intricate technicalities, and in many instances lacks sufficient codification with reference to the many specific rights and obligations emanating from the lease contract. This helps to explain tenants' prevalent feeling of insecurity and the ill-advised wholesale condemnation to which the vital institution of farm tenancy has been subjected in this country. The laissez-faire philosophy underlying the legal arrangement of the landlord-tenant relationship in the United States maintains that the essence of the land-lease contract is the protection of private property rights.

Farm tenancy legislation in England, Denmark, Sweden, Holland, and Germany today emphasizes the prosperity of the farm enterprise as the common goal in which both partners, landlord and tenant, have a mutual interest. This concentration upon the functions of the farm enterprise also provides the synthesis between the public and the private interest.

The absence of consideration of this profound change disappoints the student of agricultural policy and rural sociology as he reads Mangum's final chapter. The author begins: "As the world has changed during the last two hundred years, the tenancy laws have remained more or less static. In fact there has probably been less development here than in any other important field of our jurisprudence" (p. 444). He does not point out that this situation prevails almost solely in the United States; he only surveys the mediocre attempts at the ill-oriented reform undertaken since 1933, with suggestions here and there for corrections; and he does not explore the basis for genuine reform.

While the last chapter does not live up to the promise of its title, this book is important reading for those wishing to deal with that chapter's subject, which remains a persistent challenge.

KARL BRANDT

Food Research Institute
Stanford University

MASON, LUCY RANDOLPH. *To Win These Rights: A Personal Story of the CIO in the South*. Pp. xvi, 206. New York: Harper & Brothers, 1952. \$3.00.

In 1937 Lucy Mason, middle aged, white haired spinster daughter of a distinguished Episcopalian minister, offered her services to John L. Lewis for the great organizing drive of the Congress of Industrial Organizations in the South. This book is an account of her experience in the labor movement in the past fifteen years principally in attempting to secure fair play for the labor movement in the South. This work she views as a continuation of the work of her great-great-grandfather, George Mason, who wrote the Virginia bill of rights.

Both enthusiasts and critics of the labor movement should be able to agree that Miss Lucy has been worth her weight in gold to the labor movement. Many a professional public relations expert should also turn green with envy at her accomplishments. Eminently respectable, related it would seem to almost everyone of any consequence past or present in the South, Miss Lucy has been able to present the cause of organized labor in the higher Southern circles of religion, law, and business to which the ordinary labor leader would not have access. Through the utilization of these groups she has been able in some instances to secure for ordinary people the rights that her distinguished relative sought to assure by law.

But Miss Lucy also relates instances of beatings, arbitrary arrests, and terror that have sometimes occurred in Southern communities when businessmen and local officials decided to stop the formation of unions. What may surprise many readers is that Miss Lucy's account of such instances of terror tactics does not end with the 1930's, but continues down to date. In the background limiting such activities, however, has apparently been the fear by local officials of the power of the federal government in regard to civil rights. Miss Lucy has made it her business to spell out for many a local official what the bill of rights means for Americans.

A foreword by Mrs. Roosevelt and several comments by other eminent Americans

on the dust jacket pay tribute to this remarkable woman who has fought hard and intelligently for our democratic heritage.

A. MORGNER

COTTRELL, R. H. (Ed.). *Beet-Sugar Economics*. Pp. xiii, 379. Caldwell, Idaho: The Caxton Printers, 1952. \$5.00.

This book, copyrighted by the Amalgamated Sugar Company of Ogden, Utah, is "the outgrowth of text material prepared for presentation to employees' classes in technology and economics." Mr. R. H. Cottrell wrote some thirteen of the twenty chapters. The remainder were contributed by industry specialists.

Comprehensive industry studies have a unique place in economic literature because they cut sharply across traditional subject matter lines and escape the compartmentalization of analysis and thought which so often characterizes the work of specialists.

Some of the chapters accomplish this integration in a very interesting manner, especially those dealing with managerial control. Other chapters, however, written on special topics by specialists, fail to realize the potentialities of the approach. The subjects dealt with range from human nutrition, agronomy, seed breeding, and chemistry of the refining processes through corporation finance, accounting, and personnel relations to government control. Due to the orientation (for classes of employees), the treatment of subjects is by and large elementary, and a great deal of procedural detail is included of little interest to the general reader.

Because of the original purpose for which the text materials were prepared, the wording is occasionally that of the personnel officer in the inspirational talk before new employees, and the authors' personal views of "the politician, the lobbyist and the theoretical economist" have not been retouched from employee lectures.

Nonetheless there appears from time to time a healthy note of self-criticism, and it is encouraging to note that the authors look hopefully to technological progress in both beet sugar fields and refineries to free

the industry from its present dependence on government quotas and subsidies.

The economist who vainly hopes to be taken into the secret places where actual cost data are shown and the inner workings of the pricing processes are revealed by industry spokesmen will find that these authors understandably stop short of taking him there. Lamborn and Company, sugar brokers, go to great length in the last chapter to demonstrate that arrangements under the Sugar Act of 1948 have not completely insulated the domestic sugar market from large economic forces operating outside territorial United States. In Chapter Six Mr. Cottrell discusses the price of beet sugar as being based on prices established by the large seaboard cane sugar refineries, a practice which gives inland mills some freight earnings or freight absorption. There are but nineteen corporations engaged in the processing of beet sugar in the United States, and the manner in which price changes spread throughout the industry reveals some oligopolistic traits.

There are some statistical difficulties, such as the use of official exchange rates in computing comparative prices of sugar, but the chapters dealing with managerial control and the attempts of the industry to balance elements of cost so as to maximize profits will provide interesting reading to students of management.

Although suffering from duplication and the slanting toward employee training, the total effect of this volume is to give a good impression of the complex of human, technological, and governmental problems which confront industry in present day America.

WILLIAM A. NEISWANGER
University of Illinois

DIES, EDWARD. *Behind the Wall Street Curtain*. Pp. 153. Washington, D. C.: Public Affairs Press, 1952.

Roughly half of this volume is about Wall Street personalities of a by-gone period. There are brief sketches of the early days of New York and the financial activities of Jefferson, Hamilton, and Burr, of later speculators and gamblers, such as Drew, Gould, Cornelius Vanderbilt, and

James Fisk, Jr., of capitalists such as Andrew Carnegie, John D. Rockefeller, and J. Pierpont Morgan.

The subject of the book changes with Chapter 11 from people to events. There is an excellent although brief survey of the 1920's with the boiling cauldron of speculation and the tragic events of the early 1930's, a brief side-trip to the wheat pit, and then four sober chapters on money and politics, the Wall Street dilemma, small investors, and "our money," in which the thesis is maintained that the stock exchange is a symbol of free enterprise and of democracy.

It is difficult to characterize this volume. Much of it consists of a series of short sketches, but there are also words of common sense on such subjects as government regulation and how to buy stocks. This volume is not a reference book and will probably never inspire many footnotes, but it is interestingly written and well worth reading by anyone with even a casual interest in stock exchanges.

ISARD, WALTER, and VINCENT WHITNEY. *Atomic Power: An Economic and Social Analysis—A Study in Industrial Location and Regional Economic Development*. Pp. xi, 235. Philadelphia: The Blakiston Company, 1952. \$4.75.

Amid the euphoric predictions set forth by most laymen and many scholars when they deal with the future of Atomic power, it is a pleasure to submit oneself to the astringent skepticism of this volume. Possibly some readers will think it excessively pessimistic, but this reviewer is inclined to regard it only as realistic. With a relatively rigorous and systematic analysis, combined with a modest sense of the limitations of the available data, the authors have torpedoed most of the current myths about nuclear fission as a possible source of energy for industrial uses.

The volume opens with a lucid and concise examination of the technical background, an introduction that will probably prove more enlightening for those who have forgotten most of their chemistry and physics than, say, the now famous Smyth

report; nevertheless, even this elucidation is no short-cut gloss on the technical problems involved but a useful little summary essay in its own right. The authors then go on to consider various cost estimates for atomic power and the probable consequences of atomic power for location of industry and industrial development under certain specified assumptions. There are special case studies of the cement, glass, iron and steel, and aluminum industries and of industry in Brazil to indicate, if not the answers, at least some of the relevant questions. Simply as a contribution to the theory of industrial location, the book appears to have significance.

Among other things the authors point out that:

(1) No satisfactory costs estimates can be made at present. (It is true that since this book was completed several Atomic Energy Commission contractors—in particular Monsanto Chemical Company—have evidently made considerable progress in constructing reactors for power production, but it is doubtful if the public information so far available would modify the authors' conclusion about the unpredictability of costs at this stage.) Although one might assume that, once this is established, there is little point in discussing atomic power further, some important if tentative conclusions can be drawn by postulating certain cost estimates.

(2) Even under the most favorable assumptions, nuclear engineers will have to bring about major changes before atomic plants can compete with modern conventional sources of power.

(3) For most industries, power is such a small proportion of total costs that few changes will be brought about even in the unlikely event that atomic power is significantly cheaper than conventional sources.

(4) Even among industries where power costs are an important component, so many other factors affect industrial location that predictions are hazardous.

(5) It is not necessarily true that cheap atomic power would lead inevitably to de-concentration and decentralization. The effect will vary with the industry. With aluminum, for example, the result would be increased concentration and integration

around large marketing areas, in order to avoid the heavy transportation costs now imposed by the need to separate alumina plants from the aluminum plants located now at cheap power sites.

(6) Low-cost atomic power would not necessarily stimulate industrialization of underdeveloped areas. Heavy capital costs, need for highly skilled technical, engineering, and labor forces, the economies of large scale operations, cultural resistances, and other factors might well mean that the heavily industrialized or industrializing areas like the United States and the Union of Soviet Socialist Republics would, and underdeveloped areas would not, exploit this new source of energy. Hence instead of leveling out existing inequalities in production, atomic energy might merely stimulate them.

There are many other equally suggestive conclusions, all set forth with careful attention to the available information and a disarming admission of the inadequacy both of the data and of any conclusions drawn from them.

ROBERT A. DAHL

Yale University

ANTHONY, ROBERT N., assisted by JOHN S. DAY. *Management Controls in Industrial Research Organizations*. Pp. xviii, 537. Boston: Harvard Business School, Division of Research, 1952. \$6.75.

Despite the title, notice of this book is appropriately given in a social science publication. Though the cases discussed are drawn primarily from the chemical, biological, electrical engineering, and other technical laboratories maintained by American companies, the control problem considered is familiar to a director of research in any field of inquiry: How does one maintain the environment of freedom and flexibility which fosters creative research and at the same time achieve a stated program or at least achieve it within a given financial budget? Or in Dr. Anthony's words, how does one "find the proper balance between . . . direction from the top [and] freedom at the laboratory bench."

Nor should this book be solely of interest to research administrators. It deals intimately with the operation of a relatively new social institution—the research

laboratory. To a large extent the quest for new knowledge, at least about the physical world, has become an organized activity. Therefore the problem of finding a proper balance between direction and freedom within a research agency is not merely a matter for "shoptalk" by research personnel; it is also a matter of grave concern to the nation. Though organization brings resources that the scientist could never hope to command, the price would be too high if it generally stifled creative imagination. In the words of an industrialist quoted by the authors ". . . if a research laboratory is to produce results, the men must be allowed freedom to be a bit crazy."

The Anthony-Day study is essentially a report and commentary on present control practices in industrial research based on information received in a special survey from 405 industrial laboratories and 41 commercial or consulting laboratories. Practices considered include the use of a formal annual project program and financial budget and interim progress and spending reports. Such formal devices are weighed against more personal methods such as the informal conversation between worker and supervisor. The authors observe, in this connection, "The real process of controlling the progress of technical work in most laboratories takes place in conversation and meetings of one kind or another."

Four areas of spending are singled out for special discussion: personnel, procurement, material carried in inventory, and travel. These are of course the most important areas of research cost; in addition their control, unless wisely administered, will at least seem to invade the personal prerogatives of a professional scientist. One contributing reason is that the laboratory may often have to conform to practices of a parent organization which is engaged in production rather than research. It will seem familiar to almost any director of research, regardless of field, to read, "Friction between the research organization and the purchasing department is common. Usually the friction arises from misunderstanding."

One gains the impression from this report on current practice that there is con-

siderable awareness among managers of industrial laboratories of the control problem, but few if any feel that they found satisfactory solutions, which is perhaps a wholesome thing. The authors do point out, however, that the functions most susceptible to formal control often receive little attention from laboratory managers because of their orientation toward research; these are the service and support activities such as technical or model-building shops, technical library, drafting offices, and motor transport. Yet industrial laboratories apparently are finding it necessary to increase the proportion of their budget devoted to these and other supporting purposes. The example was cited of one large laboratory for which over the twelve-year period, 1937 to 1949, salaries of technical personnel dropped from over half to about 27 per cent of the total budget.

SOCIOLOGY AND EDUCATION

COWELL, F. R. *History, Civilization and Culture: An Introduction to the Historical and Social Philosophy of Pitrim A. Sorokin*. Pp. xii, 259. Boston: Beacon Press, 1952. \$4.50.

This book is a highly praiseworthy attempt by an English historical writer to interpret and at the same time to evaluate the theories of the character, development, and decay of human societies which have been presented by Professor Sorokin in a number of significant works published since 1937, particularly his *Social and Cultural Dynamics* (1937); *Society, Culture and Personality: Their Structure and Dynamics* (1947); and *Social Philosophies of an Age of Crisis* (1950).

The first chapter contains a short survey of earlier explanations of historical change and a brief statement about Sorokin's life and writings. In the next chapter, the author explains Sorokin's view of the standards in evaluating cultural systems of the past, and expounds his theory of "three main types of 'socio-cultural super-systems'—the ideational, the idealistic, and

the sensate, to which all intermediate and variant types can be related. Chapters three to eight inclusive are devoted to an examination of the evidence which Sorokin has assembled to show that his "super-systems" are distinctive patterns of human culture whose unity finds consistent and integrated expression in the art, architecture, literature, religion, ethics, law, justice, and economic and social conditions of each. In chapters nine and ten, Cowell discusses Sorokin's study of wars and internal disturbances in connection with his cultural systems, and the relationship between the latter and types of personality and behavior. The concluding chapter sets forth clearly Sorokin's theory of the causes and character of cultural and social change.

It is quite evident that Cowell is most favorably impressed by Sorokin's theories and logic. He considers them to mark a distinct advance over those of Sorokin's predecessors. But he is very careful to point out the limitations of the evidence, particularly that of a statistical nature upon which the conclusions are based, although he holds that this evidence is more complete and dependable than that collected by other interpreters of the history of civilization. He also emphasizes that Sorokin's theories have been worked out only for Greece, Rome, and Western Europe, although they take account of some developments in Egypt and Asiatic countries.

The reviewer finds Cowell's work an extremely dependable and serviceable interpretation, but, as he believes the author would readily admit, no substitute for a careful study of Sorokin's own writings, as some readers unfortunately will assume it to be. There are numerous useful illustrations in the form of plates, charts and tables, and indexes of subjects and persons.

A. E. R. BOAK

University of Michigan

MONTAGU, ASHLEY. *Darwin Competition & Cooperation*. Pp. 148. New York: Henry Schuman, 1952. \$2.50.

In no field of human thought perhaps have we suffered so much from the tyranny of words as we have in our consideration of the factors which brought about our own

evolution. Practically everything about evolution capable of being misunderstood has been, and Darwin's hypothesis of natural selection is no exception. Indeed, men were not lacking who spent considerable effort to help along the inevitable misunderstanding. As we know, the more conservative religious groups reacted violently against what they called the "brutality" of evolution, and the poet Tennyson supplied the reactors with all the necessary horror words and phrases. We were told that we should "let the ape and tiger die" within us if we wished to be moral, and that the "Nature" of the evolutionists was "red in tooth and claw."

Natural selection, or the struggle for existence, was pictured as a sort of gladiatorial combat in which the loser was slain and the winner took all. But this was not all; natural selection was also attacked by the Communists, for Marx and Engels had set their party line in biology and had deplored Darwin's use of Malthusian population pressure as a selective agent. Today Lysenko, the leading Russian authority on Marxian biology, has gone so far as to deny that there can be any intraspecific selection or competition at all.

The role of Darwinian selection would have been settled long ago, of course, by the routine method of an honest evaluation of the available data if it had been purely a scientific hypothesis—one with no emotional or political overtones. Our records of the time show, however, that to many men of good will all data on the subject were simply irrelevant, and this non-logical attitude has persisted to the present. The author of *Darwin Competition & Co-operation* cites no crucial data at all. He confines himself merely to quoting the *conclusions* of a selected number of biologists who turn out in general to be quite humane fellows after all. He expresses high hopes for the conversion of individual biologists to a philosophy of sweetness and light although he is not so optimistic concerning the science of biology itself. He writes (p. 43) ". . . the orthodox canon of biological thought yet remains unaltered, namely, that the central doctrine of evolution is the principle that those organisms which are better adapted to their environ-

ment replace through competition the less well-adapted individuals of the species."

The technique of quoting the conclusions of biologists and not the evidence they have collected, and of quoting them as authorities rather than as sources of data seems a rather odd scientific method, somewhat out of date in our time. On the other hand, if the author had cited the data so that the reader could check his conclusions the book would have been several times its present size, and it would have cost the reader much more. Worst of all, it would have been understandable only to those who were technically equipped to judge biological data. Apparently an adequate technical presentation of the problem hardly seemed practical, but such a treatment is the only one which really protects the reader. It might be very interesting to determine how many different and contradictory conclusions could be reached on any subject by the method of quoting a collection of individual scientists as authorities.

In brief, the author holds that Darwin and Huxley and all the biologists who accepted their concept of natural selection were wrong. He maintains that the competition between the different variants which constitute a species and the consequent differential death rate was not the major factor in evolution although he admits that evolution is caused by the different reproduction rates of the several types. He even suggests differences in fertility as a possible factor which causes evolution to occur.

Actually the role of competition and co-operation in evolution is most complex. Any number of instances can be cited where the members of a biological group will both co-operate and compete with one another and do so at the same time. The very ability to co-operate itself has arisen through competition in that those who could gang up were able to defeat or displace those who could not. Gregariousness itself has evolved, and we can show that it has come into being and persists because it has survival value. But these are technical matters. If evolution impresses some as a vicious process, a case of nature being red in tooth and claw, there is no reason

why others might not consider it to be all love and kindness. If anyone must oversimplify, and apparently some must, we recommend the stand taken by Professor Montagu. His simplification is at least humane.

CONWAY ZIRKLE

University of Pennsylvania

LEVY, MARION J., JR. *The Structure of Society*. Pp. xvii, 584. Princeton, N. J.: Princeton University Press, 1952. Paper, lithoprinted, \$5.00.

This book is one of the latest contributions to a form of sociological literature which has undergone a considerable expansion in the past decade—that literature, namely, in which the central effort is devoted to the precise definition and systematic ordering of sociological concepts. As an intellectual and academic movement, it stems in considerable part from the leadership of Talcott Parsons; and in his preface and in footnotes Levy indicates indebtedness to Parsons, Robert K. Merton, and Kingsley Davis, among others.

That better-formulated concepts and more logically ordered theoretic systems are among the prime needs of social science will be agreed to by many sociologists; that the task of meeting this need involves difficulties not altogether apparent on the surface is a proposition that will also find wide acceptance. Nor is it clear that this, that, or the other method of procedure is best adapted to advance us toward the goal of an adequate theoretic system (or systems) for the science of sociology. The present reviewer finds it impossible to characterize in terms that he can be reasonably sure are correct and fair to the author, the method(s) by which Levy has arrived at the concepts and suggestions for a theoretic system which he offers (in an emphatically tentative way) in the present volume.

The countersuggestion may be ventured, however, that perhaps what is needed in the present stage of development of social science, and before we can proceed very far on the road of satisfactory system-building or conceptualization, is a great deal more effort devoted to the characterization of experienced or observed social phenomena in terms of a relatively low order of ab-

stractness and generality—terms conforming rather closely to the vernacular. When we have human society and its processes described at a low order of generalization, we may be in a better position to frame rigorous theoretic systems for the further analysis of these matters. I have some feeling, as I read and reread parts of Dr. Levy's book, that he has stated in unfamiliar terms, or in terms to which he has assigned (carefully stated) unfamiliar meanings, generalizations that are among the commonplaces of recent sociology; and that it would be more helpful, for the present, to keep the discussion as far as possible in the vocabulary of ordinary highly literary speech.

Nevertheless, there are numerous acute insights and distinctions set forth in this book. It is the fruit of a type of endeavor which, I am personally convinced, needs to be carried on vigorously; and Dr. Levy is to be commended and complimented both for his effort and for his accomplishment. Those teachers and advanced students of sociology who have the time and patience to give this book the sort of careful, thoughtful study that it needs, will be rewarded for their pains.

FLOYD N. HOUSE

University of Virginia

MILBANK MEMORIAL FUND. *Approaches to Problems of High Fertility in Agrarian Societies*. Pp. 171. New York, 1952. \$1.00 (paper).

If the modern techniques of food production and disease control are made available to the so-called "undeveloped" or "backward" peoples of the world, will the death rate drop so much more rapidly than the birth rate that the expanding population will shortly press even more dangerously upon the limits of its resources than it does now?

The answer of the papers which comprise this book is that it will, and this answer throws a cloud over all the fluorescent hopes of the many plans to help these vast areas of the world.

This is the problem of the "demographic gap," the spread between human fertility and mortality, between the birth rate and the death rate.

When Europe and the British Isles were in such a period of expansion the broad lands and rich resources of the Western Hemisphere were at hand to render their demographic gap harmless—but for the peoples of Asia and the Near East there is no such cushion today. Any population surpluses must be used within their borders, for the lands and markets of the world are open no more. Without new land, agricultural production will increase but slowly; without new markets, there will be no international trade of goods for food.

There seem to be but two choices—to die of disease now, or of starvation later. Most of the papers in this book suggest, however, a third possibility—to take quick and vigorous measures to reduce the birth rates commensurately with the death rates. It is a weak possibility, an outside chance, but it is still real. The major obstacles seem to be two: a change of value systems or basic attitudes which would approve birth control measures, and the development of some much more inexpensive and universally available technique suitable for use by relatively poor and unsophisticated people than exists now.

In general, the attitude changes may not be so difficult as has been assumed. Arthur Bunce, on the basis of years of Korean living, states "I do not think there would be any basic antagonism on the part of Oriental women toward fertility control." Paul Hatt reports a Puerto Rican study (5,739 households) which indicates an approximate two-thirds approval of birth control for the combined reasons of personal desire and economic necessity. N. V. Sovani of Poona, India, is more pessimistic; for that country he feels the "mental and social atmosphere is generally hostile to the spread of contraception," but he notes that there is much discussion of it. John Durand describes a very thorough study to be made in Italy by the Department of Social Affairs of the United Nations which should help to clarify knowledge of the situation.

Mexican factory workers, according to Wilbert E. Moore, tend to favor fertility control. Irene Taeuber and Marshall Bal-four report favorable attitudes in Japan, together with Japanese government activi-

ties toward furthering "eugenic protection."

The development of a truly cheap, easy to use, and widely available technique for birth control emerges from these papers as perhaps a more important matter than the change of attitudes. Clair Folsome and Warren Thompson emphasize this. The successful technique must be effective in the presence of lack of money, lack of skill, lack of storage facilities and lack of privacy in the family situation among these peoples who need it most. The suggestion is that some pill or other medicine to be swallowed might be the solution; or a change in the diet, or a sure and simple means for determining the most fertile point of the monthly female cycle.

Since publication of the book success in the use of a pill for fertility control has been reported on an experimental basis in the October 10 issue of *Science* by Dr. Benjamin Sieve of Boston. This may bring us nearer to the desired technique than we were at the time of the 1951 conference.

In any event this book, a presentation of the papers given at the 1951 Annual Conference of the Milbank Memorial Fund, teaches the reader that the way of the reformer, like the way of the transgressor, is hard.

Let us hope that in this case it is also sure.

WILLIAM G. MATHER

Pennsylvania State College

TEDROL, PETER. *500 Years of Hate*. Pp. iv, 116. Dallas, Tex.: Tol. Higginbotham & Co., 1952. \$1.50.

Mr. Tedrol has written a book on "the Negro problem." The problem, he says, "is realistically as simple an issue of whether you are for or against the United States becoming a nation of half-breeds." The Southerner, according to Mr. Tedrol, understands this problem. He also understands the Negro. Following are some random gleanings from Mr. Tedrol's understanding:

On the Negro's unhappiness away from Dixie: "Yes, the Negro likes the greater freedom of movement in the North, but when he is away from home he mourns the loss of the feeling of being watched over by his 'white folks.'"

On the run of Negroes: "... a high rate of social diseases in the ancestral background . . . has either diminished or prevented the development of the Negro's mentality. . . ."

On the occasional "smart" Negro: "Maybe the elite Negro is as smart as his white counterpart, but, to me, that is a disgrace and a thing of shame to society; not something to brag about."

On segregation in schools: "The Southerner is determined in his belief that should he allow a break-through at college level of his segregation laws . . . the effect on the lower echelons would ruin his entire school system instantaneously."

On Negroes in white collar jobs: "There have been many wild claims about the Negro's clerical, administrative, and executive ability. I have seen isolated cases where this is true, but by and large the Negro has no more business in an office than a piano has in a leg show."

On the morality of the Negro: "This condition (that Negro women outnumber Negro men) naturally makes the marriage and divorce laws nothing more than useful terms for the Negro's use in describing his status of two people living together and later making a change in their arrangements. This is not to say that no Negroes marry in a lawful manner, because many of their marriages are both lawful, moral and permanent."

Mr. Tedrol's plan for dealing with the Negro problem is to set up within each state having more than 100,000 Negroes a Commission for Negro Affairs—a part of the executive office—with the following commissioners:

An industrial commissioner "to determine . . . the actual possibilities and desirabilities for the Negro's industrial development."

A public health commissioner to oversee the "clean-up, patch-up, and build-up jobs on the Negro's blood stream, genitals and stomach."

A commissioner for Negro psychiatry to "develop programs for the correction of the Negro's emotional and mental imbalances, with special emphasis on developing the Negro's racial pride."

A commissioner for Negro education who

would give special emphasis "on training the Negro for natural occupational abilities."

A commissioner for Negro legal affairs to determine the "Constitutional rights and legislative needs of the Negro. . . . His duties would be separate from the Attorney General entirely."

A commissioner for Negro sociology to "investigate the Negro's natural social requirements, and logical position in the white man's society."

A commissioner for Negro philosophical development ("our clergyman under a fancy title") to determine "what true morality actually is where the Negro Problem is concerned."

Mr. Tedrol dedicates his book to "Mamie and Romie—and my many other friends of the Negro race who have honored me with . . . Their affection, their respect, and, most of all, their confidence—their thoughts."

E. W. KENWORTHY

The New York Times

WILNER, CHARLES. *Alimony, the American Tragedy*. Pp. xiii, 329. New York: Vantage Press, 1952. \$3.50.

If the author of this book had been content to call alimony an American tragedy, most of us would have agreed with him. To call it *the* American tragedy is to fall into the particularistic fallacy. There is little doubt that courts tend to favor women, that many women are punitive and vindictive in their alimony demands, that they use it to exploit men, and that a good deal of injustice results. But to claim that many women are deprived of the opportunity for marriage because men fear the alimony racket is to fly in the face of statistical trends which show a growing proportion of the population married, a larger proportion, indeed, than in many other countries. To see in alimony laws a plot of feminists to revenge themselves on men and control them seems a bit far fetched. To trace inter-racial mixture—which he deplures—to the evils of alimony can have its absurd aspects. To claim that alimony laws, by subordinating men to women, lower them to the point of effeminacy, is to court being taken lightly.

And to see in alimony a factor in juvenile delinquency stretches the data a bit thin.

The author has read widely, although a large part of his references are to old and outmoded works. The basic assumption on which much of the argument rests—that women are biologically weaker than men—has long since been refuted. One gets the feeling that whatever he has read over the last 40 years has become grist for his mill; if it did not fit in, he dragged it in. One looks in vain for firm documentation of his claims. Serious students of marriage and the family will probably not accept his theories however much they may agree with his purpose, the modernization of the concept and practice of alimony.

JESSIE BERNARD

Pennsylvania State College

GOODENOUGH, WARD H. *Property, Kin, and Community on Truk*. Pp. 192. New Haven: Yale University Press, 1951. \$2.50.

This ethnographic monograph, the first publication to come out of the war-born Coordinated Investigation of Micronesian Anthropology, represents a happy marriage of practical necessity and theoretical precision in the social sciences. The project began as an effort to prepare Civil Affairs Handbooks for use by military government personnel after the formerly Japanese Mandated Islands were occupied by the American forces. If the problems of reconstruction and peacetime administration were to be solved with dispatch and efficiency, those charged with the responsibility of such a task had to be well informed about the peoples with whom they were concerned. Thus, ethnographers became important from the point of view of the down-to-earth administrator of islands held under United Nations trusteeship.

Interestingly, this practical emphasis resulted in a more rigorous job of social science analysis than might otherwise have been the case. Goodenough writes:

"The problem of rendering an ethnographic account that can be of practical use to administrators boils down . . . to trying to give the reader a basis for learning to operate in terms of the culture described in somewhat the same manner

that a grammar would provide him with a basis for learning to speak a language. . . .

To summarize materials in the form of statistical means or modes is inadequate for such purposes. While they characterize a sociological situation at a given time, they do not state the cultural rules whose application results in that situation. . . . the ensuing account of Trukese social organization has sought to formulate rules and state the conditions governing their application in such a way that none of the available information contradicts them at any point" (pp. 10-11).

Scorning to pursue the will-o'-the-wisp, Trukese culture "as it really is," Goodenough has been remarkably successful in making a very complex society comprehensible by presenting it as his sophisticated analysis reveals it. He deals successively with the problem of property, the matrilineal kin groups through which lineage is traced, the system of kinship, the interrelations of status systems and kinship behavior, the role and development of residential kin groups as they involve the nuclear and extended family, and the type of territorial and political organization that defines the Trukese community. Throughout there is a close attention given to the social rules governing the behavior appropriate to various kinship statuses, to various relationships to property, and to the lines of authority and responsibility through the community organization of Truk. Not only the modal laws of "correctness" are clearly set forth, but the exceptional situations are adumbrated in some detail and with a full presentation of their logic within the framework of Trukese culture as a whole.

Anthropologists will value this monograph both for its reporting of culture materials and for its elaborated and sophisticated methodology. Other social scientists, in spite of the book's technical nature, will find it useful as one more demonstration that rigor is quite possible within the disciplines of man and that rigor is the most effective route to practical employment of the social sciences in the solution of human problems.

EDWARD JOSEPH SHOEN, JR.

Columbia University

BRODRICK, ALAN HOUGHTON. *The Tree of Human History*. Pp. 253. New York: Philosophical Library, 1952. \$4.75.

Writers as persons often are disappointing shadows of their rich and sprightly work, but one is eager to take his chances with Mr. Brodrick. *The Tree of Human History* reads like excellent talk and reflects a personality that is serious but never solemn and a mind that is well stocked and orderly with never a trace of pedantry. Rarely has so much archaeological erudition been worn with such gaiety or with so much explicit feeling for its significance for the troubled present.

While scholars themselves can read this book with profit, Brodrick introduces it as a "popular" work directed at a lay audience. Its purpose is the presentation of "a connected account of the events which led up to the appearance of civilizations and their arts." Thus, the book's concern is with protohistory, the study of those cultural epochs which antedate the development of writing.

After reviewing in successive chapters the archaeological knowledge available with respect to the major cultures of antiquity, Brodrick summarizes in a single chapter present thinking on the physical evolution of man and gives a general outline of prehistoric cultures. Finally, there is a postscript which invites the reader to participate in thinking through some of the possible resolutions of such queries as these: Why do some cultures rise rapidly in their complexity and richness whereas others develop slowly or hardly at all? Is there any evidence that any one people is more inventive than any other? Can we legitimately speak of any such thing as a "pattern" of history? What happens when cultures collide?

While primarily offering the main facts as they are known and allowing his audience to draw its own conclusions, Brodrick is by no means silent on what he considers to be some of the central ideas related to these vastly important problems. He suggests that peoples are equally inventive and that the ways of life that they evolve are dependent essentially upon the complex interactions among the circumstances with

which they must cope and on which they may capitalize. He scores purely economic interpretations of history as quite unable to account for such accomplishments as the modification of art forms, the evolution of writing, and the development of magical and religious beliefs. He suggests on the basis of the great variety in the social development of antique cultures that the "logic of history," far from being an immutable and transcendent force, is substantially a fiction seized upon by polemicists to support preconceived value theories.

While he makes a strong case for his own views, Brodrick cannot be charged with the least taint of dogmatism, and his charming, learned, and humane performance may well invest archaeology with new significance for both laymen and scholars in other fields who have for long regarded it as the most ivory-towered of intellectual cousins.

EISLER, ROBERT. *Man into Wolf: An Anthropological Interpretation of Sadism, Masochism, and Lycanthropy*. Introduction by Sir David K. Henderson. Pp. 286. New York: Philosophical Library, 1952. \$6.00.

This is a very unusual book; it is not a book at all, but an astonishing agglomeration of very worth-while knowledge presented in the form of notes. It is like a structure consisting of a very widely spread and luxuriously finished basement, and very little above that level. The theses of this book are the following: (a) Masochism and sadism are basic patterns of sex behavior. This thesis, while not absolutely new, is interesting and, in fact, might be used to establish the presence of psychosexual activity—for example, in criminal procedure. (b) Sadism and masochism are connected with different archetypes. The author thinks that following Jung's terminology he has gained new insight into the genesis of these two basic sexual attitudes.

In this reviewer's opinion, the main value of this publication is in the valuable source material which might be used by future scientists.

W. G. ELIASBERG
New York City

HARTLEY, EUGENE L., and RUTH E. HARTLEY. *Fundamentals of Social Psychology*. Pp. xix, 740, xvi. New York: Alfred A. Knopf, 1952. \$5.50.

The now trite truism that the cultural lag of the social sciences behind atomic physics and experimental biology not only stands in the way of a cultural Utopia but even threatens culture itself has led to a mushroom growth of new college texts in the social sciences. Of these, social psychology particularly will have to play a key role if modern cultural dilemmas are to be resolved. Consequently any new treatment of this genetically somewhat hybrid offspring of psychology, sociology, anthropology, economics, and political science must be seriously considered.

The Hartleys have given us a large text which is, on the whole, up-to-date, catholic in its purposes and scope, readable, and scholarly. A brief review cannot subsume the arguments of a book, which, although not pretending to be encyclopedic, approaches this on the problems it chooses for particular emphasis. In brief the three parts of the book include the following:

Part I (*Communication, the Basic Social Process*) covers the rapidly accumulating literature on the topic much more thoroughly than is usual in the elementary text. But it is uneven. Some of this material seems to me to be of the first importance. Perhaps even more is very dismal busywork, which describes social communication processes, obviously describable in English, in Teachers' Collegese at its worst.

Part II (*Socialization—The Group and the Individual*) gives a more conventional presentation of the subject matter. It is a little weak in its discussion of the contribution of both the psychoanalysts and the social anthropologists to the topic. Furthermore I fail to understand why Chapter XII, on "Delinquency" (in itself very good), was included to the exclusion of discussions of other a- and anti-social processes.

Part III (*The Individual and the Group*) is again somewhat more conventional than Part I. Its discussions on "social norms" and "role taking" are excellent. Again, however, two long chapters of Ethnic Attitudes exclude any adequate discussion of

conservatism, radicalism, fascism, communism. (Of these only radicalism appears, with only one page reference, in the index.)

My chief, and perhaps most meaningful, criticism of the book is concerned with the authors' bias. I feel that a social psychology which is going to have prognostic value and possible application should stress both the psychobiological and the psychosocial aspects of human behavior. I think the Hartleys are much too biased towards environmentalism—at times even a naïve environmentalism. This is particularly true in the so-called applied sections of their book. Appeal is made to well-meaning rationalism, to the neglect of some of the more deep-seated aspects of the human personality.

If I were offering a course in social psychology currently I might well adopt this text. But I would see that my students had a solid supplementary reading list of the more psychobiologically oriented theorists.

J. F. BROWN
Hollywood, California

CHAMBERS, M. M. *The Colleges and the Courts, 1946-50*. Pp. x, 202. New York: Columbia University Press, 1952. \$3.00.

This volume is the fourth in a series of publications prepared by Dr. Chambers covering decisions of state and federal courts affecting universities and colleges in the United States over a period of approximately a century and a half. "The basic volume, *The Colleges and the Courts*, published in 1936, carried the story of the early nineteenth century through 1935." The three supplementary volumes, of which this is the latest, carry the study down to 1951.

The 190 cases reviewed in the current study are presented in five categories: (1) university and college personnel, (2) state and municipal institutions, (3) privately controlled institutions, (4) fiscal relationships with governmental units, and (5) financial support from private sources, institutional property, and other matters. The author's summary statements, conclusions and legal projections are presented in a short introduction under the caption, "Some Trends of 1946-1950." The volume

carries also a short foreword prepared by Edward C. Elliott, President Emeritus, Purdue University, a table of cases, and an adequate index. Documentation is limited to case citations.

The volume is not a digest of cases, nor is it strictly speaking a commentary. It is rather a series of summary statements of essential facts, legal principles, and court decisions held together largely by the organizational scheme of the volume. Appraisal, criticism, and other editorial comments are infrequent. Editorial emphasis has likewise been minimized. Both significant and insignificant cases are given textual prominence. Cases turning on obscurity and unimportant procedural points receive attention equal to that accorded those cases raising significant and highly controversial constitutional issues.

As has been indicated, some of the 190 cases raise significant and controversial issues. The recent decisions bearing on racial segregation in state-supported institutions "did much to elaborate, implement and effectuate" the earlier judicial rulings which interpreted "equal protection" as requiring equal educational opportunities and facilities. The Supreme Court has not outlawed segregation, but it has consistently held that delays, evasions, institutional discriminations and make-shift facilities constitute denials of equal protection. Under the pressures of judicial mandates and financial burdens, "several Southern state universities have begun the practice of admitting Negroes to their graduate and professional schools. . . ."

The alleged intrusion of legislative authority upon the constitutional independence of some state-supported institutions is a continuing source of litigation. The rendering of certain peripheral services by some institutions and the financing of self-liquidating projects raised some interesting if not novel issues. Of special interest, in terms of modern educational trends, are the issues involved in institutional projects providing low-cost laundry and dry cleaning services and "the practice of charging students fees for water, heat and power on the campus, thus putting these utilities into the self-liquidating category."

An appraisal of the book is difficult. It

presents a useful collection of cases, provides ready reference to sources, and bears evidences of skilled workmanship. It is not a definitive and scholarly study; it was not intended to be. With few exceptions, the cases of the past five years have revealed no new legal concepts or demonstrated startling departures from established law. Many of the cases have been decided or dismissed on points of procedure, and those which have required disposition on their merits have been conveniently fitted into some branch of traditional law. In other words, there is little evidence of a developing law of higher education. Evidences of preferential treatment for educational institutions appear, but on the whole the courts have, as revealed by these cases, sought always to promote the general welfare by balancing the general public interests against the more highly specialized educational interests. Mr. Chamber's book may not reveal "the increasingly important part that education plays in shaping society," but it does provide an excellent summary of the impact of court decisions on current educational policies.

HAROLD M. DORR

University of Michigan

ABRAHAMSEM, DAVID. *Who Are The Guilty? A Study of Education and Crime*. Pp. xi, 340. New York: Rinehart and Co., 1952. \$5.00.

This book, written by a psychiatrist, represents an attempt to delineate the main essentials of an effective crime prevention program founded upon the social, physical, psychological, and emotional variables believed to be responsible for criminal behavior.

The first seven chapters are devoted to the presentation of the etiology of criminal behavior. The main theme of this discussion is succinctly stated by the author in the following paragraph:

"Every human being has as his conscious or unconscious goal the obtaining of pleasure and the avoidance of pain, but this goal is determined by his emotional strivings. These emotional strivings are rooted in the biological structure of man, and are always influenced by environment. As

the child grows into adulthood, his emotions are colored, consciously or unconsciously, by his biological experiences in childhood. Thus the psychological phenomena present in everyone, whatever form they take as social and antisocial behavior, arise as a result of the interplay between basic physiological needs and the influence surroundings have on those needs" (page 32).

As may be readily surmised from this statement of causation of criminal behavior any specific criminal act, according to the author, is the result of the interplay of a variety of factors. These factors are five in number and are called: constitutional, predispositional, nonpsychological (physical), emotional, and precipitating. Crime, according to Abrahamsen, like disease is a function of these different variables (pages 51-52). The author suggests that not all of these factors need always be present in order for a criminal act to occur; he does insist, however, that an understanding of criminal behavior must be predicated upon a thorough analysis of the way the several factors are related. The causation of crime according to Abrahamsen is a relative concept. This point of view leads the author to formulate three laws for criminology: (1) criminal behavior is the result of a multiplicity of causative factors which vary both in quality and in quantity in producing any specific criminal act; (2) different criminal acts are produced by different patterns of causative factors, thus precluding the development of any single explanation of criminal behavior; and (3) "A criminal act equals the product of a person's criminalistic tendencies elicited by the momentary situation, all of which results in his mental resistance being so decreased that he carries out the criminal act" (p. 67).

The remaining four chapters are devoted to a discussion of what may and should be done in order to make more effective attempts at the prevention of crime. The suggestions made stem from and are tied to the author's concept of crime causation. In this section the reader will find a great deal which is both sound and stimulating. Abrahamsen's discussion of the present prison system is especially penetrating and well done.

Whether we agree with the author's analysis of the factors employed to explain criminal behavior in the several cases employed as illustrations throughout the first section of the book should not detract from the value of Abrahamsen's treatise. The reader will find many things in the book which are thought provoking and interesting even though Abrahamsen's orientation is frankly psychoanalytical. •

ELIO D. MONACHESI

University of Minnesota

HIRSH, JOSEPH, with the assistance of SELMA G. HIRSH. *Alcohol Education: A Guide-book for Teachers*. Pp. 107. New York: Henry Schuman, 1952. \$2.50.

This 75-page booklet (plus 30 pages of index and bibliography) undertakes (1) to explain the need for education on the role of alcohol in human life; (2) to give historical, physiological, psychological, social, medical, political, economic, and other pertinent opinions and facts; (3) to present a blueprint to professional educators on how to prepare a course, integrate it with needs of students and the life of the community, and teach it; and (4) incidentally to comment on a program of action about alcohol problems in our time.

The very breadth of treatment makes the booklet impractical as a guide for professional educators. Only one chapter is concerned with educational policy, planning, and procedure. The attempt to do too much and to serve a popular as well as professional audience has left too little room for advice on a professional level by which teachers might profit.

The great breadth of purpose in a small book has had a similar effect on the bibliographies of films, filmstrips, and books. The films and filmstrips, some of highly questionable value for the student or teacher, are overgenerously recommended. Only two of the 20 books in the bibliography can be useful for teachers—*Alcohol and Social Responsibility* and *The Alcohol Problem Visualized*, but the 1950 rather than the 1948 edition of the latter. In addition, Montague and Spalding's *Alcohol and Human Affairs* and, especially, the Science Research Association pamphlet *Facts About*

Alcohol should be included. Strangely omitted are the activities, programs, and publications of the state departments of education—for example, the new and revised teaching manuals in Mississippi, Utah, Oregon, New Hampshire, and Connecticut.

Finally, educators should be defended against the author's unjust charge (p. 13) that, if they do not do better, "the schools of America can be held in large measure responsible for adding immeasurably to society's burden in connection with problem drinking and other problems associated with alcohol." The schools and teachers are not more responsible than anyone else for crime, race discrimination, unemployment, war, immorality, or problem drinking. Furthermore, they are more restricted than most groups in any attempt to lead new movements in attitude or action. It is doubtful that such threats win friends and influence teachers.

Educators do need background materials, classroom materials, and conceptual orientation in this field. But the author's excellent purpose has been dissipated both by the attempt to condense within 75 pages so much that has been written by a variety of authors on many subjects for all sorts of audiences and also by trying to combine in one booklet a popular highlighting of major facts and concepts, a background and stimulus for research, a guide for teachers, a text for students, and even a program for general amelioration of alcohol problems, especially alcoholism. Perhaps a Dewey could accomplish such a task, but I doubt it.

SELDEN D. BACON

Yale University

PHILOSOPHY AND RELIGION

SCHRÖDINGER, ERWIN. *Science and Humanism: Physics in Our Time*. Pp. 68. New York: Cambridge University Press, 1952. \$1.75.

Professor Schrödinger, one of the supreme living masters of physics, presents his conception of the total human significance of scientific inquiry in words of the mystic Plotinus. The value of science con-

sists in whatever ability it may have to answer the ineluctable question posed by thinking humanity and phrased by Plotinus as: "And we, who are we anyhow?" (pp. 4, 51). The thoughtful physicist addresses his audience: "I am born into an environment—I know not whence I came nor whither I go, nor who I am. This is my situation as yours, every single one of you" (p. 4). Unlike Plotinus, Schrödinger is prone to overlook, I think, that what man can do is not separable from what he is. (Burke somewhere observes that "art is man's nature," although he was no "progressive" instrumentalist and was a most impressive critic of "mass-society.") There surely exists too much "barbarous" specialization, but the keenest specialization is, after all, with comprehensive vision a prerequisite of valid integration. There is, however, a most instructive paradox suspended in Schrödinger's final reflections. He confesses his conviction (pp. 51, 67) that the present outcomes of microphysics are rather irrelevant for the proper characterization of the relation of morally free humanity to its puzzling world.

En route to his main conclusion he informatively sketches the evidence upon which many investigators of nature's fine structure have concluded that materialism's conceptual basis—continuous and complete determinism of cleanly individuated atoms—is now without meaning. For the contemporary reader he incisively raises issues concerning verification, theory construction, and human freedom which have long agitated philosophers. Typical of his masterly exposition are those paragraphs which most authoritatively report on the coexistence within wave mechanics of incomplete knowledge concerning observables and complete continuous determinism of "something" not sensuously observable (pp. 40–41). Occasionally there is a hasty pre-judgment of a philosophical problem such as the possible individuation of things and events by "shape" alone, or the permanent failure of ideally approachable models, or the "mysteriousness" of the mathematical continuum (pp. 19, 25, 34).

When he returns to the haunting question of Plotinus, Schrödinger confronts it chiefly in terms of freedom. The argument

of Jordan that Heisenberg's uncertainty principle can assure moral freedom to man is uncompromisingly rejected. It is judiciously contended that chaos cannot be the "correlate" of moral coherence. Hard inventive thinking is still a desideratum, Schrödinger perceives, to place such complex entities as free persons in a world determinate enough even in the image of wave mechanics (p. 61). As creative masters of science continue to philosophize sincerely a happy symposium of philosopher and scientist may yet, despite the vogue of positivism, re-examine an interpretation of science in which every crisis of science is essential to its heroic movement forward. "What we can do" might be incorporated into the complete conception of "what we are" by nicely relating "what we can do" to "what we ought to do." Kant's dictum: "You can, for you ought to" may still have its precious meaning, in microphysics and beyond.

HENRY A. FINCH

Pennsylvania State College

DODDS, E. R. *The Greeks and the Irrational*. Pp. xi, 327. Berkeley: University of California Press, 1951. \$5.00.

The Greeks have the fame of being more rational than other folk. Yet there was unreason in their lives, and their ways of dealing with it varied. The study of these is not easy, for little of this literature survives, and much has been misinterpreted. In Dr. Dodd's book the principal periods and topics are treated in eight chapters, each no longer than an hour's lecture, supplemented by notes and digressions, and by appendixes on "Maenadism" and "Theurgy" similarly enhanced. All this is only one aspect of Greek religion, in which the last century was little interested; but it has been revived by recent anthropology and psychology, which have found ancient Greeks as liable as modern folks to "primitive" modes of thought.

Homeric views have seemed remote from religion or morality, but recently F. Robert has restated them as beliefs of "believers," and Wölfel as showing how such personal gods came into being at all. Accepting them as rationalizing a large part of Greek experience, Dr. Dodds ex-

amines other parts which remained unrationalized—*Atê, Thymos, Menos, Moira, Erinys*, indeterminate *daimon*, nameless *theos*, easily recognized in the background of simple peoples. Following Nilsson (1924) he finds these "psychic interventions" so far externalized that Greece was "saved from daimonism" at the small cost of impulsive behavior such as the "heroes" display.

To distinguish "Homeric" from "Archaic" the terms "shame-culture" and "guilt-culture" are used, without very clear definition or explanation of the change. Admittedly much persisted. What was new after the "conquests" was a feeling of insecurity and helplessness. Deity is "jealous" and interfering; man, ignorant and clumsy, resents this. Yet gods, however reluctantly, had to maintain justice. Family solidarity, misused, is now resented too, and individual responsibility appears. The world is also now full of pollution; purification is necessary and possible, to avert *Atê* and other evil spirits, and there is personal destiny, guided by Zeus. Social conditions may explain much; perhaps also the loosening of family ties; and unacknowledged desires crave relief in the individual.

This is the beginning of a new process of struggle with irrational experience which continues throughout classical times. Major problems are what are here called the "Blessings of Madness," consigned to particular gods, and other things like epilepsy. Dreams change their character, from Homeric to classical, and types are undistinguished. Herodotus lets Artabanus perform the first dream-experiment; Hippocrates physiologizes; Aristotle's approach is at last purely scientific. But meanwhile incubation has become popular and is exploited.

From dreams it is easy transition to shamanism, which may have reached Greece from beyond the Pontus, where it is endemic. But in Greece what is significant is the relation between corpse and ghost, and between separable soul and body. Aristides, Epimenides, Pythagoras, and Empedocles illustrate various aspects and functions. Orpheus was Thracian like Zalmoxis, but Dr. Dodds separates him from Orpheus, which he inclines to think deep seated in

Greece, and responsible in a "guilt-culture" for Greek "puritanism."

The climax of fifth-century rationalism, the reaction of the many, in magic indifference and wartime hysteria, are more familiar ground. The central figure of Plato, trying both to liberate reason and to make the world safe for the old order, is judiciously presented, though his proposals were not carried out. And the "fear of freedom" which defeated the later philosophers presents an instinctive close to a learned and suggestive book.

JOHN L. MYRES

Oxford, England

ROBACK, A. A. *History of American Psychology*. Pp. xiv, 426. New York: Library Publishers, 1952. \$6.00.

Dr. Roback divides his *History of American Psychology* into four parts. In the first he passes from the founding of Harvard University in 1640 to the 1880's which witnessed the introduction of the German trained Doctor of Philosophy into the American psychological scene and the initiation of the vast developments of the last seventy-five years. In the second part the author deals at length with James, Hall, Cattell, Baldwin, Titchener, and Munsterberg as personalities and as psychologists. The third part contains an extensive treatment of the era of the schools of psychology with the author's attention being given (principally) to McDougall, Angell, Woodworth, Lewin, Freud, Wertheimer, Köhler, and Koffka. Again, each is considered as personality as well as psychologist. A final part, much briefer than the others, describes the various branches of contemporary psychology and lists the names of leading authorities in these branches.

Apart from its merit in bringing together materials which hitherto have been scattered in various places (one thinks of Fay's treatment of American psychology prior to the time of James, Boring's *History of Experimental Psychology*, and such works as Woodworth's *Schools of Psychology*, in this connection), Roback's history is of interest for various reasons. It is materially enriched by the author's personal contacts with the men and issues under

discussion. It contains an account of Thomistic psychology in the present day, a subject which is little known to those who are in the mainstream of contemporary psychology which is so strongly conditioned by antischolastic presuppositions. Also it succeeds in a way which neither Fay nor Boring could have succeeded (because of the nature of the tasks which they set themselves) in bringing contemporary American psychology into focus as the end-product of a crucible into which French, English, Scottish, German, and Austrian metals have been poured and from which has emerged that alloy which has no competition as the leading psychology of contemporary times.

The work has both name and subject index as well as 28 portraits of leading American psychologists and several tables and graphs which are helpful in perceiving ideological and temporal relationships.

MALCOLM G. PRESTON

University of Pennsylvania

STRAUSS, LEO. *Persecution and the Art of Writing*. Pp. 204. Glencoe, Ill.: The Free Press, 1952. \$4.00.

Professor Strauss aptly characterizes his book as a contribution to the "sociology of philosophy." No book is ever written in a social vacuum, and Professor Strauss proves that philosophical discussions have been no different—that, in other words, a surprisingly large number of philosophers felt constrained to write with full consciousness of the social as well as intellectual milieu in which they lived. The difference which this made is more evident in Moslem and Jewish than in Christian philosophical writings, because philosophy among the Christians was bound up with theology, so that its orthodoxy was assured, whereas Islam and Judaism made Law the center of life, so that a Jew or a Moslem was much freer to speak his mind on a philosophical subject. Consequently, Professor Strauss illustrates his thesis by analyzing the works of Maimonides, Halevi, and Spinoza.

The first essay, from which the book takes its name, is general in its discussion. It points out the likelihood that people adhering to views which may offend the

ruling powers of their day will "write between the lines." This would be true especially during periods of persecution or when power is in the hands of official guardians of the faith; but it may also be true of such philosophers as have a sense of responsibility toward their social group and hesitate to disrupt it by permitting their opinions to upset the majority and thus endanger social stability. In such cases authors tend to write books which may appear quite in harmony with commonly accepted ideas; read between the lines, however, the books teach something altogether different. Only the very astute and careful student of such writings, alive to every nuance of understatement, exaggeration, arrangement, and omission, will know what to discard as meant only for the comfort of the masses and what to retain as meant for the instruction of the thoughtful few. He will, in other words, learn to read between the lines.

The essay on "The Literary Character of *The Guide for the Perplexed*" illustrates the principles set forth in the previous chapter. In writing this book Maimonides faced the problem of how to point out the superior value of philosophy without hurting the basic attitude of Judaism which places Law above speculation. The nature of the *Guide*, the term *hibbur* by which Maimonides referred to it, its structure, its headings—Professor Strauss uses all of these to show that its author was as eager to hide his teachings from some as he was to guide the comparatively few others who were his specific concern.

An analysis of the *Kuzari*, the subject of the next chapter, shows that Judah Halevi likewise modified his presentation to conform to the social and intellectual situation of his day. His object was to defend Judaism specifically and religion in general. None but a pagan king, Professor Strauss proves, could serve Halevi's purpose in the first part of his task. As to the defense of religion, Halevi appears to have decided that the participation of an argumentative philosopher might hurt rather than aid it.

Spinoza's case was somewhat different. It has been assumed that Spinoza in his *Theologico-Political Treatise* attacked the Jewish Bible and Jewish dogma because he

was more familiar with this material than with the analogous Christian material. Professor Strauss denies this. The real motive was apprehension lest the ordinary adherents of the dominant faith would be stirred to opposition. Philosophically minded people, on the other hand, were bound to see that an attack on miracles and dogmas in Judaism applied equally to miracles and dogmas in Christianity. Spinoza wrote for those who could read between the lines.

These are inadequate simplifications of a few central ideas in this small but significant book. One derives rare intellectual satisfaction from reading it, with its documentation and fine analyses at which a review can only hint. The book demands concentration, but if carefully read it is lucid, absorbing, and convincing.

SOLOMON GRAYZEL

Philadelphia, Pennsylvania

BRADEN, CHARLES SAMUEL. *The Scriptures of Mankind: An Introduction*. Pp. xiii, 496. New York: The Macmillan Company, 1952. \$6.50.

In view of the growing interest in objective study of religion in colleges and universities and the increase in recent years in courses on religions of the world, *The Scriptures of Mankind* should find a large audience. The author says in his preface that he has long felt the need for such a book in his teaching of the history and literature of the world's religions to college students. Doubtless many others, particularly college teachers of religion, have felt this need. It is the belief of this reviewer that Dr. Braden's book will be useful to secondary school teachers of world history and world literature who are increasingly concerned with the role of religion in human affairs.

This book is not an anthology, as the title suggests, but a reading guide for college students to the sacred books of the living religions of the world. Here the student will find very limited selections from these many Bibles of mankind, each in a context of history, interpretation, and evaluation which constitutes the greater portion of the book—features largely omitted in anthologies. Copious documentation

should help the student make efficient use of the available anthologies and other translations of the various scriptures themselves. Each chapter is followed by a bibliography of the better known sources.

It is an ambitious task to present even an introduction to the sacred literature of the world within the confines of 500 pages. Frequently the author finds it necessary to explain why he must omit much that merits study. But he succeeds in opening vistas and providing the guides to great adventures.

The range is vast. The first chapter discusses the criteria which the author has applied for determining which writings should be considered sacred literature and how books become or fail to become part of the canon of the different religions. Not all the selections considered measure up to all four of the criteria, but he explains why they should be included in his survey nonetheless. The second chapter is devoted to preliterate sacred literature, which appears to be a contradiction of terms, but emphasizes the historical development of religions and the process by which the spiritual insights, accumulated wisdom, and moral codes of the past have been passed on to succeeding generations for centuries by story tellers, signs, paintings, inscriptions, and the folkways of peoples before they became embodied in written records.

But these chapters are background for and orientation to separate chapters which in turn are devoted to the sacred literature, or what has served the purpose of sacred literature, of the Egyptians, the Babylonians, the Hindus (Vedas, Upanishads, Epics, Gita, Puranas), the Buddhists (Hinayana, Mahayana), the Jains, the Sikhs, the Chinese (Confucianism, Taoism), the Japanese (Shintoism), the Persians (Zoroastrianism), the Hebrews and Christians (Old Testament, New Testament, versions of Old and New Testaments), the Moslems (Islam), and a brief treatment of modern sacred books of new sects (modern sects of Shinto, Bahai, Christian Science, The Church of Jesus Christ of Latter-day Saints, and the Father Divine Peace Mission).

CLARENCE LINTON

American Council on Education

LYTTLE, CHARLES H. *Freedom Moves West: A History of the Western Unitarian Conference, 1852-1952*. Pp. xx, 298. Boston: The Beacon Press, 1952. \$3.75.

No one is so well fitted to write the history of Western Unitarianism as is the author of this volume, for he has occupied the Professorship of Church History at the Meadville Theological Seminary for more than twenty-five years, and might fittingly be characterized as Mr. Unitarian. The appearance of this handsome volume also brings to a fitting close Professor Lyttle's long and influential relationship to the Meadville Seminary, since its publication date synchronizes with his joining the ranks of the emeriti.

It has been stated that the Unitarians are represented in *Who's Who in America* in larger proportion to their membership than any other religious body in the nation, which would seem to indicate that the Unitarians are far more influential than their small numbers would seem to warrant. Those who have previously written on American Unitarianism have confined their attention almost exclusively to the region around Boston, the home of its origin in America. This book therefore serves as a welcome corrective and tells the story, in great and sometimes tiresome detail, of the beginnings and development of Unitarianism in the Middle West. In the South, outside a few cities such as New Orleans and Louisville, it is nonexistent.

Unitarianism was first brought to the Middle West almost entirely by individual emissaries from New England, through whose efforts Unitarian societies were formed in Cincinnati in 1830 and in the same year in Louisville, Kentucky. James Freeman Clarke, the foster grandson of James Freeman who turned King's Chapel in Boston into the first avowed Unitarian Church in America, might fittingly be called the father of the Unitarian movement in the West. Other congregations were formed in St. Louis in 1835; in Alton, Illinois in 1836, and in numerous other towns on the upper Mississippi, as well as in west-central New York. The next step after the organization of these Midwestern societies was the formation of the Western Uni-

tarian Conference in 1852. It was a declaration of independence from the American Unitarian Association—irked by its failure to give the assistance and leadership which the western societies needed. It was the multiplication of Unitarian congregations in the Middle West which had already given rise to a movement to establish a theological seminary which would better serve the region. This led to the opening in 1844 of Meadville Theological Seminary at Meadville in western Pennsylvania, which in 1927 was moved to a site adjoining the campus of the University of Chicago.

Strange as it may seem to those outside the Unitarian fold, Unitarianism seems to have had more than its share of internal dissension. Though objecting strongly to formal creeds there have been from time to time numerous creeds proposed in the attempt to find some formula upon which they could agree. Professor Lyttle has labored valiantly and in great detail to make these differing positions understandable to the uninitiated. The most recent cause of Unitarian ferment is religious humanism, which is non-Theistic, and centers at Meadville Theological Seminary, and which, we are told, is now embraced by at least half of the Unitarian ministers of the Western Conference.

WILLIAM W. SWEET

Pomona College

COMMONWEALTH OF NATIONS

CAMPION, GILBERT, L. S. AMERY, D. W. BROGAN, J. J. CRAIG HENDERSON, ARTHUR SALTER, H. E. DALE, IVOR THOMAS, F. W. LASCELLES, E. C. S. WADE, CECIL CARR, A. L. GOODHART, and G. M. YOUNG. *Parliament: A Survey*. Pp. vii, 296. London: George Allen & Unwin (distributed in U. S. by The Macmillan Company), 1952. \$5.25.

This book is based upon a series of lectures given in 1950 under the auspices of the University of London by a group of well-known parliamentarians, lawyers, historians, and civil servants. The authors of this admirable collection of essays under-

take to determine how the ancient British parliamentary system is operating under the challenging conditions of the world today. Every important aspect of the system is examined in an objective spirit, without conscious political bias, yet with a common reverence for parliamentary traditions. The subjects selected for study are: the Cabinet, the civil service, and political party organization, considered in their relation to Parliament; the functions and procedure of the House of Commons and the problem of a Second Chamber; constitutional problems connected with the courts of law, subordinate law-making authorities and nationalized industries. The British is compared with the French and American parliamentary systems. Separate essays are devoted to the dangers and difficulties of the present phase and to the nature and future of British parliamentary government.

Several long-run trends are shown to be at work in the English system: a shifting of power from Parliament to the Executive, the rising burden of legislative business resulting from the continually widening scope of state activity, the steady growth of party organization and party discipline, and the changed status of representatives as a result of the doctrines of popular sovereignty and the "mandate."

In a lucid comparison of the three principal parliamentary democracies, Sir Arthur Salter shows the dangers of each: instability in the French system, deadlock in the American, and now Cabinet tyranny in the British. The causes of "Cabinet bureaucracy" are attributed to the two great wars with their concentration of power in the Executive, replacement of laissez-faire by planned economy, extension of the social services, a great growth of delegated legislation, the development of party discipline and organization, and the semi-professionalization of the House of Commons.

To make the governmental machine more efficient and to restore parliamentary control, certain remedies are suggested. These include: further development of the "Cabinet Committee" system, decentralization of policy decisions to local authorities, close delimitation of delegated powers, and the

formation of subject-matter committees in the House of Commons.

Thus would these authors redress the balance of power between Cabinet and Parliament. This excellent and readable volume contains much of interest to students of American government.

GEORGE B. GALLOWAY

Library of Congress
Washington, D. C.

MONCK, BOSWORTH. *How the Civil Service Works*. Pp. vi, 258. London: Phoenix House (distributed in the U. S. by The Macmillan Company), 1952. \$5.00.

The political literature and learning of any democratic country are enriched when one of its distinguished public servants, especially one with wide experience in a variety of posts, publishes a comprehensive critical analysis of its civil service. Great Britain is fortunate in having such a contribution in this book by Mr. Monck, who earlier was also chairman of a group which prepared the Fabian Society's *Reform of the Higher Civil Service*.

The title does not connote the breadth found in the actual contents. Although the last half of the volume covers a detailed description of functions and organization of each of the principal government departments, the first half embraces a critical review of parliamentary appropriation and legislative processes, the workings of the cabinet, political parties, and all the interrelationships thereof—as well as a comprehensive picture of the British personnel system and the position of civil servants vis-à-vis the public and “the Government of the day.” This first half would indeed be an admirable supplement to any text on British government or comparative government. The title might well have been: “How the Government Works.”

It is significant that the author refers to this section of his book as an effort “to describe the sort of people involved—all administration is fundamentally a human problem” and “to illustrate the processes of consultation.” Consultation, he observes, is “the heart of democracy.”

He says that “civil servants in general seem to me to be just as conscientious and

honest as they are reputed to be, and of much higher intelligence.” One of the conditions that receives the strongest adverse criticism is “the almost fantastic mumbo-jumbo of the State's accounting procedure” which is a whole century out of date and which, along with the demands imposed by Members of Parliament, accounts for the bureaucrats' traditional fussiness about detail.

The detail and analysis presented on the entrance to and constitution, pay, and handling of the administrative class, the professional service, foreign service, and other main categories of personnel constitute probably the most illuminating picture on record. The analysis is interspersed with constructive criticism.

Many facets of the book will be of special interest to Americans for comparative purposes. For example, the wider freedom for civil servants in the political arena contrasts sharply with our Federal Hatch Act restrictions and loyalty program. British civil servants can ordinarily serve on local councils, can take some part in party activities “provided no use is made of official knowledge,” and may even belong to the Communist party, the only prohibition being against “very active membership” in the latter organization.

Mr. Monck's general conclusions regarding the British service are favorable, but he observes: “The principal defect of the civil service . . . is that it is not a single service but a series of departmental services with certain common standards in such matters as pay and recruitment but no common standard of performance even in so simple a matter as filing. The organization and hierarchy of the civil service are such that while the top civil servants are overworked, the lower echelons are underworked, and the chain of command, save at the top, lacks clarity, thus neglecting the factor of morale in relation to purpose.”

O. GLENN STAHL

Washington, D. C.

LEWIS, BEN W. *British Planning and Nationalization*. Pp. xi, 313. New York: The Twentieth Century Fund, 1952. \$3.00.

Professor Ben W. Lewis of Oberlin has long been familiar with the British scene, and his knowledge of the economic and social background was of great value in enabling him to give a broad picture of the developments in nationalization and the social services which occurred under the two Labour Governments from 1945 till the autumn of 1951. The present survey opens with a discussion of postwar economic planning in Britain. The author then considers the general issue of nationalization in the light of the various arguments which were put forward to promote the policy. This is followed by short studies of the nationalization of the coal, transport, electricity supply, and iron and steel industries. Turning to the social services, Mr. Lewis describes recent developments in town and country planning, including control over the location of industry, the national health service, and housing. Lastly he deals with agriculture.

This is a very large assignment which no one could deal with adequately in a book of less than 300 pages of text. It would be insincere to suggest that Professor Lewis has succeeded in providing more than a superficial account of the principal measures which marked the successive administrations of Prime Minister Attlee, and we feel sure that the author would not claim to have done more than that. But, although necessarily superficial, the book reaches an exceptionally high standard of accuracy. Moreover, the author's comments on the events which he describes are usually to the point and often extremely shrewd. For example, in his chapter on economic planning he rightly concludes that British planning is tentative and hopeful; there is, he points out, “far more of prayer and prediction in its make-up than of project and precept.” Amplifying this statement, he says that criticism of government economic planning in postwar Britain has come on the one hand from those who regard it as an assertion of bureaucratic power, and on the other from those who believe it is wishful rather than effective—“a cloak for planners too unimaginative and too timid really to plan.” Professor Lewis believes that the second ground of criticism is

nearer the truth than the first, and the reviewer is disposed to agree with him.

The book was made possible by a grant from the Twentieth Century Fund which enabled Professor Lewis to visit Britain in the summer of 1949 and provided him with other facilities. The result is to provide a useful introduction to the subject.

and Political Science

BENTHAM, JEREMY. *Bentham's Handbook of Political Fallacies*. Edited by HAROLD A. LARRABEE. Pp. xxxii, 269. Baltimore: The Johns Hopkins Press, 1952. \$4.75.

This work exhibits Bentham's passion for system and classification and his usual insistence on precise definition as a means to avoid semantic confusion. At the same time, it escapes the labored heaviness of some of his legal and psychological treatises. Its reading requires, nevertheless, close attention, despite some judicious editorial pruning of irrelevancies and simplification of Bentham's language, though the changes and omissions are not indicated or emphasized in the text as a scholarly edition would properly demand. Bentham, it is worth noting, has been quite often unfairly abused for clumsiness and polysyllabic inventions by critics who were impatient readers or who lacked appreciation for the propriety of sacrificing misplaced elegance for real, as against pseudo-, scientific accuracy. The present work demonstrates very convincingly Bentham's acknowledged ability to write on occasion forcefully, and even with mordant wit, as well as his proper refusal to abandon requisite precision for popularity, or in the name of that easy reading which brings no returns save the delusion of comprehension.

In this *Handbook*, Bentham was at pains to distinguish his position from that of Gerard Hamilton. The latter's *Parliamentary Logic* was the work of a contemporary sophist whose intent was to teach men how to achieve political victory through debate, regardless of rightness. Bentham, convinced that the right was the useful, exposed error that others might use knowledge and awareness thereof to do

good. He failed, however, to see that the good motive which inspired his analysis was no guarantee against abuse by others of the analytical tools he himself provided. The very clarity of his disinterested vision could indeed equip sinister men with a better guide and aid to their own fell ends than could the biased practicality of one whose criterion was simply immediate success.

Nevertheless, as Larrabee also points out, the conviction that reason is man's most valuable instrument and a sustained determination to seek and ensure its effective use were no mean virtues, as our own time is slowly and belatedly coming to appreciate. Whether our statesmen and citizens will have the patience to read Bentham's still relevant analysis one may doubt. Nor, unfortunately, is a clear understanding of the fallacies he reveals any guarantee either that they will be spotted when used in the course of political oratory and parliamentary debate; or, what is more important still, that they will be effectively combatted when spotted.

On this score, as well as for scholarly illumination, it is to be regretted that Mr. Larrabee did not, even at the risk of delivering the indolent from the need to read the book, provide both a summing up and a critical evaluation of its main themes. Since this work, for all its relevance to present-day politics, and indeed to the politics of all times, is unlikely to be a best-selling aid to the practicing politician, or even to those categories of persons generally designated informed citizens and intelligent lay readers, it would have been very desirable, in making available again a legitimate classic in the method and psychology of politics, to do a thorough, but not merely heavy and burdensome, job of scholarly commentary and interpretation. For, while the work itself is the thing, and scholarship should not come between reader and text in such a way that the latter is overwhelmed and lost, the book here edited is today sufficiently unknown to make a genuinely popular reprint unlikely to succeed for the present. The edition here offered, for all its inevitable value, unfortunately falls between two stools. It is not the cheap edition; it is also not a job of

full scholarly rehabilitation and interpretation. Mr. Larrabee, one senses from his very nice introduction, has the talent for both tasks. It is unfortunate that he did not here perform the second.

THOMAS I. COOK

The Johns Hopkins University

CROSSMAN, R. H. S. (Ed.). *New Fabian Essays*. Pp. xv, 215. New York: Frederick A. Praeger, 1952. \$4.00.

The name of "Fabian" carries high prestige, in part because the famous essayists of 1889 indicated the direction and method of social changes which climaxed in the great legislation of the first Attlee government. These changes were followed, however, by a certain loss of momentum and the question of "What's Next?" This new series attempts a re-examination of socialist theory and an answer to the query.

R. H. S. Crossman's opening essay, "Towards a Philosophy of Socialism," maintains, contrary to Marx, that socialism is not the inevitable successor to capitalism; left to itself the historical process leads to totalitarianism and exploitation, so that the managerial society (the Soviet Union is classed as such) may be the normal outcome and socialism the exception. The latter has to be imposed upon immoral society by human will. C. A. R. Crosland, likewise disagreeing with Marxists, points out in "The Transition from Capitalism" that, instead of collapsing, Western capitalism has continued to expand and actually raise the standard of living of the working classes. The result has been not socialism but a mixed form of society retaining some capitalist features of ownership, but managerial in control and largely socialist in distribution. The goal of the classless society is still to be reached. The concept of equality is analyzed in Roy Jenkins' essay; it is advocated as an object of educational reform in that of Margaret Cole. Indeed, whereas the British have formerly spoken much of political liberty, the notes of equality and fraternity sound loudly throughout this volume. Austen Albu deals with the problem of democracy in industry; Ian Mikardo would change the outlook of the trade unions from that of defense against exploitation

to the more positive one of builders of the socialist commonwealth. These Fabians, unlike their predecessors, do not ignore foreign policy, so Denis Healey writes on "Power Politics and the Labour Party." His views will jolt those who have had faith in simple "utopian" solutions such as pacifism or mutual aid, because Healey is a realist who concludes that a successful socialist foreign policy will depend upon an understanding of power politics, on Britain's own strength, and upon a continuation of close ties with the United States. In the last essay John Strachey sums up the achievements of the British Labour government.

Even though there is no Fabian literary successor to G. B. Shaw, these essays are lucid and stimulating. The Marxist will find many of his fundamentals questioned. The American will find a friendly appreciation of his country's effort to shoulder new responsibilities.

CARL F. BRAND

Stanford University

BROAD, LEWIS. *Winston Churchill, 1874-1951*. Pp. xx, 611. 3rd ed. New York: Philosophical Library, 1952. \$6.00.

Although it is not so indicated on the title page, the book under review is the third edition of a work which appeared first in 1941. Five years later Mr. Churchill's war record was added to the story; this last installment carries the account through 1950. Each edition includes the earlier one practically unchanged and adds a new section which brings the story up to date. In the third edition is a sketch of Mr. Churchill's activities as leader of the opposition, 1945-1950.

The amount of printed material relating to the life of Mr. Churchill is enormous; he himself has taken good care that the public should become acquainted with what he has done, said, and thought throughout a long life. It is therefore not surprising that Mr. Broad bases his book wholly on printed sources. His story is well organized; significant episodes and incidents are skillfully chosen, and apt quotations enliven a narrative which moves forward easily and gracefully. The author wisely refrains from offering fanciful analyses and

interpretations of his hero's actions, moods, and motives. This reviewer deplures, however, the author's decision to speak of Mr. Churchill as "Winston"; thereby he injects a jarring note of false intimacy.

In common with the late Philip Guedalla, Mr. Broad is mainly interested in Mr. Churchill as a fighting man. His connections with the British fighting services, with wars, and with international politics are treated quite fully; but his work connected with British social and economic reforms is passed over lightly. Nearly one-half of the text is allotted to Mr. Churchill and World War II. Appendixes give his election record, his public offices, his books, and a listing of his family.

Mr. Broad belongs to the host of Mr. Churchill's great admirers. His book is not so scintillating as Guedalla's *Mr. Churchill*, but it is more informative. Both books have some of the characteristics of the best type of campaign biographies. Mr. Broad's *Winston Churchill* is interesting as well as useful for students of recent British and world history.

PAUL KNAFLUND

University of Wisconsin

WEBB, BEATRICE. *Beatrice Webb's Diaries, 1912-1924*. Edited by MARGARET I. COLE. Pp. xxviii, 272. New York: Longmans, Green and Co., 1952. \$5.00.

Faithful followers of the Boswell tradition give posterity an intimate picture of their period as well as insight into the intellectual achievement and character development of the diarist. Perusal of the pages written by Beatrice Webb from September 1912 to February 1924 (her personal journal was continued until ten days before her death, and additional portions will be published later) casts fresh light upon her brilliant partnership with her husband, her complex personality, her unabated ardor for social investigation, and, above all, her abiding faith in the Fabian Society and the Labor party.

The Webbs' role, as Beatrice once outlined it to her husband, Sidney, was to provide the labor movement with "middle-class brains." A recent English visit reinforces this reviewer's conviction that their influence continues in the Labor

party, the Fabian Society, the London School of Economics and the *New Statesman*, and elsewhere—notably in the general acceptance of the premise of a national minimum of income, health, housing, education, and leisure. Although some of their disciples are gone—Cripps, Keynes, and Laski, to mention but a few—the Webb philosophy is a motivating force wherever intellectual ideas and idealism are honored. Significantly, their many accomplishments were attained, as Lord Beveridge points out in the present volume's introduction, largely without official position or political influence, for the Webbs concentrated more on people than on palaces.

The *Diaries* have important implications for this generation of Laborites and Conservatives who are struggling to revive the flagging British economy. One would seem to be the necessity of discovering an intellectual partnership capable of carrying forward the Webb researches into modern times and, especially, of recasting some of their Socialist premises in the light of Labor party experience from 1945 to 1951. These tasks would fall most happily within the province of Margaret I. Cole, the editor of the volume under review, and her husband, Prof. G. D. H. Cole, of Oxford University, Chairman of the Fabian Society.

This initial instalment of Mrs. Webb's diaries concludes with the formation of the first Labor government in 1924, the writer expressing her foreboding that it might fail to measure up to her dreams of an orderly, efficient, and humane society. It is part of the rich heritage of the Fabian Society and offers great wisdom to the British Labor party, irrespective of whether it is at the helm in Whitehall or in the post of Her Majesty's Loyal Opposition.

MARY E. MURPHY

Los Angeles State College

ROTH, CECIL. *Benjamin Disraeli, Earl of Beaconsfield*. Pp. xi, 178. New York: Philosophical Library, 1952. \$3.75.

This book can be read as a case study in cultural dynamics. The author defines his target not as a biography but as an analysis of the Jewish factor in the career of this Prime Minister who was a Christian.

There appear to be four Jewish elements in Disraeli's cultural dynamism.

1. His heredity. The extraordinary personality who became the Earl of Beaconsfield had an amazing and complex hereditary background. Five generations of English citizens anteceded him. But Disraeli's family tree included the forebear who, in a time of contemptuous persecution of Jews, proudly chose the name *De Israel*, to be sure to be known as a Jew, as well as Italians, Spaniards, and Germans. The fires of Benjamin's Jewish cultural pride were kindled by social rivalry with politicians of distinction who boasted of their non-Jewish lineage, and expressed contempt of Disraeli's antecedents. It was only then, past the halfway mark in his life, that he paid attention to the Jewish aristocrats in his cultural heritage. Identification with the people of Moses, Solomon, and Jesus gave added power to his personality.

2. The psychological factor. Benjamin was baptized a Christian when fourteen, for then a dispute divorced his father from the synagogue. Benjamin remained a Christian for life, punctiliously attending to Christian observances and disciplines. The Christian world, however, never let him forget that he was Jewish. While religiously and politically a Christian, psychically he remained a Jew. Disraeli tried to bridge his bicultural existence by a fantastic Aryan racial theory which served only to reveal his deep subconscious concern and struggle.

3. The political factor. The English citizenry did not intend to have a person of Jewish culture enter Parliament. Until 1829 Roman Catholics were restricted from Parliament by law. Jews were barred until 1858. It was only Disraeli's accidental baptism at fourteen that made him eligible for exclusive schools, restricted social circles, and political involvement which led to election to Parliament. From that vantage point, however, the force of Jewish prophetic teaching about economic righteousness and political justice made its impact on English custom and law through Disraeli.

4. The religious factor. Disraeli's cultural experience led him to emphasize uni-

versal teachings. Every religious culture exerts two impulses: (a) the exclusive, with exclusive claims, restricted beliefs, and separatist practices; (b) the universal, with a vision relating its members to an integrated universe, a transcendent, divine nature, one brotherhood of man under a single moral law. This vision Disraeli supplied for the nineteenth century as the twin peaks of Judaism and Christianity in the same towering range of spiritual humanism.

Roth concludes his book with an intellectual claim for Disraeli's immortal influence upon Churchill's party today. "The Conservative Party that can accommodate itself to the spirit of the twentieth century, that can claim to look to the working man for support, that can provide a program which may be an effective alternative to the Socialist pattern, that can attempt to reconcile progressive social legislation with the maintenance of traditional institutions, that can propose the most far-reaching constitutional changes without any incongruity . . . is basically the creation of Benjamin Disraeli."

And the Earl of Beaconsfield was "a Jewish boy who, without forgetting his origins, became Prime Minister of England."

EVERETT R. CLINCHY

National Conference of
Christians and Jews
New York City

COBDEN, RICHARD. *The American Diaries of Richard Cobden*. Edited by ELIZABETH HOON CAWLEY. Pp. xv, 233. Princeton, New Jersey: Princeton University Press, 1952. \$4.00.

Richard Cobden's youthful and mature observations of the formative nation at two critical stages (1835 and 1859) provide a significant source for American social and economic history. Wide interests, sympathetic understanding of the American experiment, and rare adeptness in getting facts at all reaches and levels give definiteness and credibility to his findings. Organization, technique, labor systems, and management of farm and factory are recorded with the preciseness of an official survey. His overconfident investments in

the stock of the Illinois Central made him a participant in New World speculative promotion as well as an associate of the best business and legal minds of the period. Social mores and conventions, with standards of well being and of conduct, were no less his concern. Comparisons were shrewdly drawn for the regions visited as well as for the Republic and the Dominion. Appreciation of the strategy of the Great Valley leads to the confident prediction, in the Jacksonian era, that "here will one day be the head quarters of agricultural & manufacturing industry here will one day center the civilization, the wealth, the power of the entire world. . . ." The conditions and standards of both New World peoples were constantly contrasted with the Old, usually to the credit of the New.

As a relentless crusader for social reform, Cobden was especially interested in educational systems and opportunities. In the public schools of Albany, Boston, New York, and Dubuque, Iowa he observed systems and methods that he vowed to reproduce, in essentials, in England. The more conventional colleges seemed to interest him less than the popular foundations of Peter Cooper and Stephen Girard.

While recognizing the crudities and foibles of the adolescent nation, in contrast to the average foreign traveller, he was a frank admirer of the Americans and their institutions, at any rate of the free sections to which his journeys mainly extended. His errors of judgment were rather on the side of appreciation than of detraction.

The editor has evidently undertaken her task conscientiously and enthusiastically. Maps trace clearly the course of the travels, and numerous explanatory notes seek to identify persons and episodes, not always as definitely and discriminatingly as might be desired. The introduction, occupying well over a third of the volume, is a questionable addition to its value. For so well known a historical character a biographical sketch is superfluous. The detailed summaries of the diaries but anticipate information and conclusions that the reader can better get for himself. Most of the introductory material might well have been replaced by pertinent collateral cor-

respondence and other writings of Cobden and by representative contemporary comments on his visits.

EARLE D. ROSS

Iowa State College

WILKINSON, B. *Constitutional History of Medieval England, 1216-1399*. Volume II: *Politics and the Constitution, 1307-1399*. Pp. viii, 340. New York: Longmans, Green and Co., 1952. \$4.75.

This book represents historical work of the finest sort. Certainly it is no manual for a beginner, and its distinction can be recognized only by readers already possessing considerable knowledge of English history. The informed student and the scholar will note at once the excellence of all that is provided. Here they will find no dogmatic presumptions; no conclusions presented with an air of finality. The work is one of complete modesty, reflecting an awareness of limits imposed by the state of contemporary scholarship.

More than conscious of living in an age of tensions, we are perhaps more appreciative than were our forefathers of the achievements of the fourteenth century. One of these was the triumph of limited monarchy in England. From the story back of this triumph the historian, the social scientist, and the average man have much to learn. It is a century-long tale of bitter conflicts between the king and his people. It involved presumption on many sides; false resuscitation of outmoded claims; stress and strain of war on political, economic, legal, and feudal institutions; the deposition of one king and the murder of another; a contest to determine if England were to bow to the will of an absolute sovereign or to enjoy eventually a limited monarchy, permitting the preservation of ancient rights and allowing innovations with changing times.

Professor Wilkinson's aim has been to bring the study of fourteenth century problems close to the documents. He has enough experience, wisdom, even common sense, not to assume that difficult sources, which have long perplexed scholars, are to be correctly understood if read by themselves without aid such as he supplies. He writes first a lengthy essay to introduce

and comment upon the issues involved. If readers may wish that this could have been expanded, they will admire nevertheless the skill that provides so much in restricted space. These essays are ones to be studied again and again. Nine chapters contain selected pertinent documents for major episodes in the constitutional struggles of the fourteenth century. Each chapter has its own introductory essay, and references are given for recent literature pertaining to each subject. The importance of these is obvious. The topics discussed and for which topics are given are: The Coronation of Edward II; The Ordinances of 1311; The Statute of York, 1322; The Deposition of Edward II; The Crisis of 1341; The Good Parliament of 1376; The Crisis of 1386-7; The Merciless Parliament of 1388; The Deposition of Richard II. Professor Wilkinson's book is a rich treasure. It will aid the learned, guide the less well-informed, and challenge every thoughtful reader.

GRAY C. BOYCE

Northwestern University

RICHARDSON, W. C. *Tudor Chamber Administration, 1485-1547*. Pp. xv, 541. Baton Rouge: Louisiana State University Press, 1952. \$6.50.

The popular portraits of Henry VII, the skinflint mulcting his grumbling subjects, and of Henry VIII, the spendthrift playboy, have of course long disappeared from the historian's gallery. Now Dr. Richardson in his learned monograph tells us in detail exactly how these monarchs raised sufficient income to carry on domestic administration, diplomacy, and war. It is however important to note that, while the modern state was being created, the source of income was in the main medieval: the crown lands and the feudal rights of the monarch. Moreover, while the inefficient corrupt Exchequer was bypassed, the first Tudor used the ancient medieval household office, the King's Chamber, for the collection and auditing of his income. This change of procedure of course required honest and meticulous management, and Henry was shrewd in his choice of such men as Bray, Lovell, Heron, Belknap, and even the much-maligned Dudley and Emp-

son to administer this new treasury department. But the King himself was the chief supervisor and the final auditor of the Chamber's accounts.

During the reign of Henry VIII there was a gradual supercession of the simple Chamber treasury by a bureaucratic organization of four quasi-independent treasury departments. As long as a strong king was at the helm, this system worked fairly well, and it looked indeed as if the monarch had solved the problem of a "living of his own." But, if the revenues were to be controlled by the crown, constant vigilance was necessary, and after the fall of Henry's powerful minister, Cromwell, this was lacking. The corruption and laxity of the Chamber system of financial administration in Edward VI's reign led to its downfall and the Exchequer resumed its place as chief treasury of the kingdom. And yet the work of the new courts of revenue had not been in vain, for the Exchequer took over some of the more effective methods of collection and audit worked out over the past half century.

This carefully documented monograph will be of great interest to specialists in Tudor history; it should be equally important to the historians of the seventeenth century, who will find here so many of the financial expedients employed by the early Stuarts with consequences unfortunate for them, but fortunate for the political future of England.

ELMER A. BELLER

Princeton University

HERD, HAROLD. *The March of Journalism: The Story of the British Press from 1622 to the Present Day*. Pp. 352. London: George Allen & Unwin (distributed in the U. S. by The Macmillan Company), 1952. \$5.00.

If journalism is a romantic calling the explanation probably can be found in the fact that its history reveals an almost bewildering galaxy of editors who achieved greatness through their ability to appeal to the broad public through the printed word. Mr. Herd's scholarly and fascinating history of English journalism makes this point clear. From the founding of Defoe's *Review* in 1704 until quite recent years the development of the British press—both

newspaper and periodical—was largely the product of a number of men who became editors of great influence. This was particularly true in the nineteenth and twentieth centuries when editors like W. T. Stead, J. L. Garvin, C. P. Scott, and Alfred Harmsworth (Lord Northcliffe) fashioned the British press system into one of the greatest in the world.

Recent years, as Mr. Herd points out, have produced a change; one in which the publisher-owner of great chains of London and provincial newspapers has increasingly usurped the once dominant position of the editor. The history of the American press shows the same upheaval.

Mr. Herd deserves great praise for the manner in which he compresses in a scant 327 pages of text the tremendously fact-laden history of the British press. He does this by a judicious selection of those names and events which tell the basic story from 1622, when the newsbooks appeared, to the present.

With the exception of the periodicals, the British press attained little stature during the first 150 years of its existence. Newspapers were first licensed and then subjected to a stamp tax. They were, as the author stresses, superficial in content, poorly managed, and lacking in integrity. The periodicals, in contrast, benefiting from the writings of men like Defoe, Addison, and Steele, were of a much higher standard.

The nineteenth century brought great improvements in the editorial and business standards of the newspaper press, and the groundwork was laid for the emergence of an influential and powerful group of mass-circulated publications.

While the author makes no effort to draw parallels between the history of the British press and its American counterpart, the American reader of *The March of Journalism* can hardly but note them. Basically, there is a striking similarity in the two historical patterns: a beginning period of weakness, followed by the emergence of great editors who introduced a true popular journalism, climaxed by the ascendancy of the owner-publisher whose role is possibly best epitomized by the term "chain journalism." Differences, of course, are obvious,

and three deserve mention: (1) the tremendous influence of the periodical in English journalism, (2) the rather slow but steady conversion of English newspapers to American practices in physical presentation of content, and (3) the extremely close watch maintained by the British parliament and courts on the conduct of the press.

FREDERIC E. MERWIN

Rutgers University

DODDS, HAROLD W., LOUIS M. HACKER, and LINDSAY ROGERS. *Government Assistance to Universities in Great Britain: Memoranda Submitted to the Commission on Financing Higher Education*. Pp. xiii, 133. New York: Columbia University Press, 1952. \$2.50.

These memoranda, prepared for the Commission on Financing Higher Education by three distinguished educators, describe and comment upon the methods by which the British Government supports universities. While the devices employed are probably inapplicable to institutions in the United States, they are interesting for purposes of comparison, and their use raises questions of the relation between the state and the universities which have relevance to our own situation.

British, like American, colleges have been faced with the problem of rising costs and shrinking income. Particularly since the close of World War II it has become apparent that endowments, tuition, and private gifts are entirely inadequate even to maintain the status quo and of course are insufficient to permit expansion. In consequence, although with some reluctance, the universities have turned to the government for aid.

This aid has been supplied in a variety of ways, but most significantly through the University Grants Committee, an organ of the Treasury established in 1919. By a system truly British—that is, something completely incomprehensible which somehow works—recurrent grants for normal university requirements, earmarked grants for special programs, and nonrecurrent grants for capital expenditures are made according to plans worked out by the committee in co-operation with the universities both individually and collectively. Largely

due to this aid, the British universities have been able to survive the difficulties of the postwar era.

The memoranda comprising this book describe the various programs and indicate the essential character of the assistance which they have given. Dean Hacker has contributed the most detailed exposition of the whole subject, and his statement is replete with tables and analyses which clearly reveal the financial aspects of the problem. Professor Rogers has concerned himself with the operations of the University Grants Committee, while President Dodds deals largely with the basic policy questions involved.

To American readers the most significant question is the extent to which government aid may or will deprive the universities of control over the educational process and limit their freedom of inquiry. It seems to be the consensus that the government to date has made every effort to avoid even the appearance of dictating educational policy. This is said to be true largely because of the personal interest which members of the U.G.C. have in the universities and the informal process of reaching decisions through consultation, which is made possible by the pleasantly muddled organizational arrangements which prevail.

Among the three observers, President Dodds seems most fearful that the "thin wedge" of assistance through grants may ultimately result in government control. Growing pressure for more detailed accounting to Parliament and the necessity for increased training in certain areas are cited as indications of such a tendency.

Be this as it may, public assistance is undoubtedly essential to the survival of the universities. It is to be hoped that the traditional British good sense and dislike of uniformity will attain a balance between independence and control.

University of Pittsburgh

ROYAL INSTITUTE OF INTERNATIONAL AFFAIRS. *Great Britain and Egypt, 1914-1951*. Pp. viii, 216. Rev. ed. London and New York, 1952. \$2.25.

This important digest of Anglo-Egyptian relations is timely, owing to the recent

abdication of King Farouk of Egypt and continuance of the anti-British demonstrations in that country. The first such pamphlet appeared in 1936, covering the period 1914-1936. The new edition revises the former study and continues the record of relations down through the abrogation of the Anglo-Egyptian alliance in October, 1951.

While recounting the political and economic relations of Britain and Egypt the digest reveals in clear detail the continuous stream of difficulties confronting British policy in Egypt. The difficulties arise in the first instance from the nationalist upsurge among Egyptians. Nationalist feelings have been given forceful expression (and sometimes with violence) by partisans of the Wafd, Egypt's national party, ever since the ending of the British protectorate in 1922. The difficulties arise secondly because Egypt strategically links the Mediterranean and the western half of the Indian Ocean. Egyptians are inclined to dispute the primary place which Britain assigns to Egypt as a vital link in the chain binding the empire strategically. They discount the strategic factor, considering their own home problems as of paramount importance. The solution of these, they say, would be better if they were left to themselves. Thus in many ways the record of relations represents a detailed chronology of British attempts to circumvent the Wafd. Moreover, the Sudan has represented a very special bone of contention between Britain and Egypt.

The highlight of Anglo-Egyptian relations was their alliance of 1936, an arrangement which resulted from the threat offered by the expansionist policy of Fascist Italy. This treaty has had an uneasy life. The British, perhaps inevitably, have wished to make permanent a position regarded as advantageous to themselves; the Egyptians were just as intent on ridding themselves of a role which they considered humiliating.

Many new factors are affecting Anglo-Egyptian relations since the Second World War, among them a strengthening of the growing nationalism of the entire Middle East with the creation of the new state of Israel. As a sidelight, Britain's insistent claim to share with Egypt the defense of

the Suez Canal was once compared with the Soviet demand in 1946 to share with Turkey the defense of the Dardanelles.

This digest is based largely on British official documents and the British press and only to lesser extent on Egyptian sources. Thus it fulfills its avowed intention of giving the British point of view in greater detail than the Egyptian. The frequent footnote citations of references and the documentary appendix will be welcomed by all students of international affairs.

ABBAS, MEKKI. *The Sudan Question: The Dispute over the Anglo-Egyptian Condominium, 1884-1951*. Pp. xix, 201. New York: Frederick A. Praeger, 1952. \$4.25.

Mekki Abbas is well prepared by background and training to write upon the subject of this book. He is a Moslem Arab who was born in the Northern Sudan; he was educated in the Sudan and has spent most of his life working in significant teaching and governmental positions in the Nile Valley. He went to England from 1948 to 1951 on a Rhodes grant to conclude the research for this study. It is one of a series on colonial and comparative studies being edited by Margery Perham, senior fellow at Nuffield College, Oxford, England.

The book addresses itself particularly to the dispute over the Anglo-Egyptian Condominium from 1884 to 1951. In the past books dealing with colonial problems usually have been written by citizens of the colonial power; if prejudice has entered into the interpretation of the historical events or of existing problems the coloring has been shaded to the benefit of the colonizing nation.

This book makes its approach from the other side. Whereas the author presents his material in a straight-forward and objective way the uncolored facts reveal the "positiveness" or domination which lies back of almost any colonial governing.

The Nile area is divided into three major divisions: Egypt, the Northern Sudan, and the Southern Sudan. The Northern Suda-

nese are the product of Arabic, Caucasian, and Negroid crossing; the Southern Sudanese are Hamitic Nilotes (pp. 14-15). There have been disputes between the Sudan kingdoms and the people of Egypt ever since the fourth century B.C. At times the civilization and the strength of the Sudan seemed to equal or threaten those of Egypt (p. 26).

England entered Egypt in 1807 and has maintained a political foothold there ever since. In 1820 Egypt conquered the Northern Sudan areas and began a process of general exploitation (pp. 26 f.). Britain aided Egypt in the control of the Sudan, and by 1898, with the fall of Khartoum, England and Egypt gained control of the full length of the Nile. In 1899 England and Egypt set up, as a government over the Sudan, the Condominium which was a joint rule between them with the essential power in the hands of England (Chapter IV).

It can be seen at once that many problems ensued. In the first place there was disagreement about the use of waters of the Nile. If the Sudan peoples took out too much for irrigation purposes in the dry season the people of Egypt who lived farther down the river could be totally pauperized. On the other hand if the Sudanese diked up the Nile banks in the wet season to avoid Sudan floods, Egypt could be inundated, in fact almost washed into the sea (Chapter VII). Secondly, as the Sudan progressed their products, particularly cotton, were in competition with Egyptian products for European and world markets (p. 93). Finally, the growing educational achievements of the Sudanese led them to dissatisfaction with any outside rule and particularly a Condominium in which the two parts were not in accord with each other (Chapter X). This conflicting condition still prevails; tensions grow higher both between Egypt and England and between the Sudan and her disagreeing overloads.

Mr. Abbas suggests as a solution to this the immediate unification of the entire Nile Valley (p. 145). This could be done under the Egyptian government or under Egyptian direction, with a United Nations trusteeship, looking forward eventually to

a representative form of government for the entire valley (p. 152).

The book is well written and sets the problems forth clearly and with fairness. It is a valuable addition to the study of the Sudan.

D. W. BITTINGER

McPherson College

SACHS, E. S. *The Choice Before South Africa*. Pp. ix, 220, New York: Philosophical Library, New York, 1952. \$5.75.

The race problem in South Africa is one of those hardy perennials productive of a growing body of literature. As these appeals to reason multiply, one uneasily concludes that the final effort at a solution of the problem will be by resort to force. For more than 40 years the policy makers of the disturbed lands of South Africa have been getting a good deal of free advice as to what should be done; and they have been hearing dire predictions of an inevitable explosion if nothing is done. This book keeps to the tradition.

The author grew up in South Africa, where he has been long engaged in organizing labor unions, particularly those which do not discriminate between Europeans and non-Europeans. He is Secretary of the Garment Workers' Union of South Africa; his activities here and elsewhere have made him the sworn enemy of the Nationalist Government of Dr. Malan. To Sachs the Nationalist Premier and his followers are men of arrogance and ignorance, Fascist, Nazi, disciples of Hitler, and so on. The author repeats his conviction that there can be no progress for South Africa until the Nationalists are ousted from power. One is not surprised consequently to learn of Sachs's long record of difficulties with the various governments of the Union and of his very recent arrest under the Suppression of Communism Act, a law which he warmly condemns in the book.

It would be wrong to conclude from all this that the book is without value. It contains much of importance concerning industrial progress, agriculture, industry, mining, and labor organization, with statistical tables on population, urbanization, annual per capita income, mine workers, produc-

tion in mining and agriculture, and other subjects. The emphasis is on the economic. The author believes that the racial problem is more economic than racial. The policy of *Apartheid*, he says, is in effect a way of securing a reservoir of cheap labor for mines and farms. "The entire destiny of the South African people," he writes, "seems to have been sacrificed to the greed of a handful of international financiers and to the backwardness of a few wealthy landowners." Just when the reader is brought to the point of expecting unqualified condemnation of all that big business does, he experiences something of a jolt at reading of the great satisfaction felt by Sachs and others with the efforts of Sir Ernest Oppenheimer of the Anglo-American Corporation to set up a village system for native mine workers that would enable them to do more skilled work and to earn higher wages.

Here and there are clear suggestions for solving the problems. The oppressed colonial peoples must be accorded full democratic rights or they will be taken by force. Millions of Africans in the Reserves will make progress only after a radical alteration in the cheap labor policy of the Union government; general economic conditions will improve when the state takes over mining and encourages needed industries by a high tariff policy. Sachs tells his countrymen they are in error to believe that the natives, when they get democratic rights, will behave towards the Europeans as the Europeans now behave towards them. Some of this seems a bit unrealistic and suggests that other than economic elements enter into the thinking of the author.

HARRY R. RUDIN

Yale University

DVORIN, EUGENE P. *Racial Separation in South Africa: An Analysis of Apartheid Theory*. Pp. xii, 256. Chicago: University of Chicago Press, 1952. \$4.50.

Few national policies have occasioned greater international apprehension in recent years than the racial separation policy of the National government of South Africa. The policy with its implementive program, which came into prominence with the rise

of Dr. Malan's Nationalist government in 1948, is built on the theory of "Apartheid," according to which the peaceful coexistence of whites, blacks, and Asiatics in South Africa depends on their being effectively isolated from one another. Apartheid calls for the "parallel development of two groups of people in the union (the European and non-European). Each group is to be strictly segregated socially, politically and economically—only in this manner can either group attain its fullest development."

To Americans preoccupied with the melting-pot solution of their minority race problems the theory sounds intolerant, reactionary, and quite out of line with "one world" trends. To Indians, Malaysians, North Africans, and other dark skinned peoples, measurably successful in their quest for recognition of equality with the whites. Apartheid is an affront and an incitement to solidarity. To the two and three quarters millions of South African whites, however, surrounded and in danger of being swallowed up by 11 million non-Europeans of inferior culture, it seems more defensible, practical, and necessary than any variation of the melting-pot program.

Mr. Dvorin has undertaken a timely and dispassionate study of the traditional rootage of Apartheid, the logic of its development, its rationalization, its sanction by the Dutch Reformed Church, its effects on the non-European groups involved, and the significance of the issue it has created for other colonies in Africa and for other countries of the world. He undertakes neither to condone nor to condemn the policy but to present an unbiased analysis of it for the popular reader. Perhaps within 200 pages that is all that could be expected. It leaves the reader with many unanswered questions, particularly about the relationship of white and Bantu in industry under the new program. It is this phase of the program with which the native is most intimately concerned. In spite of the brevity of the book it is intriguingly interesting, readable, informative, and well documented, and it presents a synthetic bird's eye view of South African race relations since 1948.

SLAVIC COUNTRIES

SMAL-STOCKI, ROMAN. *The Nationality Problem of the Soviet Union and Russian Communist Imperialism*. With a preface by Lew E. Dobriansky. Pp. xxv, 474. Milwaukee: The Bruce Publishing Company, 1952. \$6.00 cloth; \$5.00 paper.

Professor Smal-Stocki has drawn up a severe indictment of American scholars in the field of Slavic studies for their neglect of nationality problems in the Soviet Union and of American foreign policy vis-à-vis the Soviet Union for its studied indifference towards the fate of the national minorities in that country. The charges the author makes are grave and include nearly all the well-known institutions and individuals concerned with Slavic studies in this country. In conclusion he calls for a complete overhauling of research and teaching in the Slavic field and a frank reversal of policy on the part of the government towards the national minorities in the Soviet Union.

There was for long evident in academic circles in this country a certain tenderness toward the Soviet Union and its policies, domestic and foreign, that went far beyond even benevolent neutrality. This was, however, as nothing to the ultra-generous treatment extended to the Soviet Union at the conclusion of the war by the Government of the United States which bestowed far-reaching territorial and economic concessions in Asia and acquiesced in the absorption of half of Europe. This benevolent attitude has now ceased, but the harm done by this generosity at the expense of other peoples remains, and we now feel the lack of staunch allies we might otherwise have had. But Professor Smal-Stocki raises the further question whether czarist and communist propaganda have not during the past century or more accustomed us to accepting their great empire as one indivisible national whole, rather than as a vast congeries of people forcibly incorporated within its boundaries and kept there against their will—whether these peoples are as entitled to the rights of self-determination as those satellites brought forcibly within the Soviet orbit in recent times; he holds that such a crime cannot be outlawed by time or

condoned through the acquiescence of nations that might have been expected to protest. But he goes even further and makes the claim that in the field of scholarship, this program has been continued by many *émigré* Russian scholars, most of whom are Great Russians who, despite their hostility to the Soviet regime, are at one with the Communists in claiming the indivisibility of the former Russian empire and in rejecting the claims of those nationalities, especially the Ukrainian, to self-determination.

We feel that the author has made out a strong case for some revision of our programs of Slavic studies on the question of nationalities in the Soviet Union; we agree with him also that the current policy of the State Department which frowns on exploiting national differences is a mistaken one and will have to be revised. But we cannot help feeling that he has been far too all-inclusive in his arraignment of those engaged in Slavic studies in this country. Many of our mistakes in policy are the result of ignorance and naïveté in approaching the problems of the Soviet Union.

Incidentally this book contains, so far as this reviewer knows, the only intelligent explanation in English of the Marx theory of linguistics, so long dominant in Russia and of the political reasons for this dominance. Though it has been ostentatiously discarded, Professor Smal-Stocki makes the point that this is a mere change in the Party line made necessary by the bringing into the Soviet orbit of so many non-Russian peoples (not least of all the Chinese). Yet contradictory as it may seem, this theory and its successor both were regarded by the Communists as one means towards making Russian the dominant language of the world.

STUART R. TOMPKINS
University of Oklahoma

GURIAN, WALDEMAR. *Bolshevism: An Introduction to Soviet Communism*. Pp. 189. Notre Dame, Ind.: University of Notre Dame Press, 1952. \$3.25.

On 105 pages of text plus 84 pages of well chosen quotations from the classic works of Marxism as modified by Lenin and Stalin, Professor W. Gurian performs

the remarkable deed of saying everything an educated man, but not a specialist in the history of ideas of political science, ought to know about Bolshevism. Bolshevism is a term used by Dr. Gurian to connote the Russian modality of Communism. He demonstrates its double root, Western and Russian. Already in the West, Marxism became a "political religion," a substitute for vanishing faith. In Russia, it met a kind of "religion of revolution" created by the intransigent opposition of the intelligentsia to the czarist government which, after all, in the days of Peter the Great embarked on the Westernization of Russia and thus made the rise of the intelligentsia possible. In Lenin's writings, Marxism was liberated of all its sophisticated features and became an instrument for political action. This trait, still accentuated in Stalin's works and deeds, has exerted an enormous attraction on Western intellectuals while the laboring masses, in Russia, in the West and now also in Asia, have been attracted by Bolshevism as a political religion promising them justice and freedom from want, a kind of earthly paradise.

Of course, nothing very new is told by Dr. Gurian. But he has brought together telling evidence, excellent quotations, and strictly logical reasoning to integrate knowledge already existing. He does not limit himself to Bolshevism as a theory, but shows how its characteristic traits helped it gain mastery over Russia, how its flexibility has helped Lenin and later on Stalin preserve and expand power in adverse conditions, and how it has become the world menace of today.

The only objection the present reviewer would like to raise against Dr. Gurian's image of Bolshevism is his overemphasis on consistency and continuity of the doctrine. It is true that the goal of the international Communist revolution has not been abandoned. But the meaning of the goal has been profoundly modified because the Communist society of present-day Russia and the satellites resembles but little the one Lenin wanted to build when seizing power. Religion is a recognized institution, the family is strong, Russian nationalism, at least on the official level, is stronger than

ever. These deviations from Communist orthodoxy are now seventeen or eighteen years old; they have lasted as long as the earlier phases of Bolshevism characterized by all-out efforts aiming at the realization of Lenin's views on the society of the future. They are not temporary deviations, but parts of a new pattern which displays the tendency to persist. Therefore, the goal is now world dominance to be exerted by those Russian leaders who seized power in the name of Communism, independently of whether the earthly paradise of Communism can or cannot be built up.

N. S. Timasheff

Fordham University

O'BRIEN, C. BICKFORD. *Russia Under Two Tsars, 1682-1689: The Regency of Sophia Alekseevna*. Pp. xiv, 178. Berkeley: University of California Press, 1952. \$3.50.

The period from 1682 to 1689, during which Peter the Great and Ivan V reigned but did not rule and Regent Sophia ruled but did not reign, is generally treated by historians as a rather unpleasant and messy prologue to the Petrine age and therefore one to be passed over as rapidly as possible. Professor O'Brien, in his *Russia Under Two Tsars*, sets himself the task of demonstrating that the seven-year regency was one of such positive accomplishments that it deserves rehabilitation by historians.

The argument that those years merit serious attention is convincingly presented by the author. On the basis of a wide study of the printed sources and secondary materials, he has shown that they were marked by extensive economic and cultural growth and change, by internal political consolidation, and by the strengthening of Russia's position abroad. In addition, he has shown that many of the policies and accomplishments of Peter had their antecedents in the regency.

Russia Under Two Tsars whets rather than sates the appetite. On the whole, Professor O'Brien has been more successful in fulfilling the promise of the title of his book than that of its sub-title. For what seem to be adequate reasons, he has chosen to give a rounded picture of economic and political institutions, intellectual develop-

ment, and foreign policies of the Russia over which Sophia ruled; but he has given little space in his monograph of less than two hundred pages to the personality and policies of Sophia herself. Nevertheless he has provided the student of Russian history with what appears to be the best and fullest study in English of Russia during her regency. His work, together with those of R. H. Fisher and G. V. Lantzeff (like the author, students of Professor Kerner), offers a broad and dependable introduction to an important but much neglected period in Russian history, the seventeenth century.

SIDNEY HARCAVE

Champlain College
State University of New York

VUCINICH, ALEXANDER. *Soviet Economic Institutions: The Social Structure of Production Units*. Pp. x, 150. No. 1 in Hoover Institute Studies, Series E: "Institutions." Stanford: Stanford University Press, 1952. \$1.75.

In modern times an economic system is commonly defined in terms of the economic institutions that are characteristic of it, or are considered essential to its continued operation. Having listed these institutions, some writers proceed to explain how they operate and perhaps "justify" them in terms of specific functions performed.

In Vucinich's treatise the approach is somewhat different. Although he gives a detailed description of five Soviet institutions (the factory, the kolkhoz, the sovkhos, the machine and tractor station, and industrial and artisan co-operatives), it is not his purpose to enumerate all economic institutions, nor is he concerned with all the functions performed by each institution. The subtitle—"The Social Structure of Production Units"—indicates in part, but only in part, the author's purpose.

As clearly stated at the outset, Vucinich's aim is to analyze certain production units "as social organizations, as loci of minutely ramified systems of social interaction, and as integral parts of the whole texture of Soviet society" (p. 1). He accepts "as established that it is the Politburo which directs the Soviet state and society," then proceeds to examine the

methods used by it to "actually govern one-fifth of mankind and remold . . . society . . ." (p. 2). This is accomplished in part by a detailed analysis of "the multitude of power instruments in Soviet society," which may be classified in terms of functions served as managerial instruments, control instruments, and instruments of social activism or social mobilization, and which, in terms of organizations, take the form of government agencies, Party agencies, public organizations (trade unions, the Komsomol), and "voluntary" associations.

The author points out that the five production units discussed fall into two basic types: state enterprises, illustrated by the factory, and co-operatives, by the kolkhoz. The factory, because of its bureaucratized structure and clearly defined status hierarchy, represents the Soviet ideal, and is viewed as an example of "consistent socialism." The co-operative, on the other hand, is regarded as a temporary concession to the backwardness of the peasant artisan and is used as a "school" for converting the peasant artisan into the desired Soviet man who will fit readily into the bureaucratic hierarchy of consistent socialism.

As a result of his detailed examination of each production unit and of the various policies and procedures followed in the numerous agencies and organizations, Vucinich concludes that there has been a systematic (and successful?) attempt "to establish a clear-cut differentiation between peasants, workers, and intelligentsia, as well as some differentiation within each group" (p. 3). There has also been a systematic attempt "to widen the spread in rewards and to eliminate equalitarian tendencies." Finally, he points out the growing dominance of the intelligentsia—a widening range of top positions restricted to them, and a greater tendency for them to dominate the Party.

Despite the difficulties involved in securing an accurate picture of what has taken place and is taking place behind the Iron Curtain, the author's conclusions appear sound. We can assume that most of the twists and turns that characterize Soviet policy have been taken into account—at least, up until the recently convened

Party Congress. The twelve-page bibliography includes at least fifty items bearing publication dates of 1950 or 1951.

Despite its limited aim, the present volume should prove quite acceptable as collateral reading in a standard course in comparative economic systems because of the wealth of information presented on the five production units covered.

CHARLES P. WHITE

University of Tennessee

WESTERN CONTINENTAL EUROPE

CLARK, J. G. D. *Prehistoric Europe: The Economic Basis*. Pp. xix, XVI, 349. New York: Philosophical Library, 1952. \$12.00.

This well-written, well-documented, logically organized, accurate book is concerned with early European man's competition with other forms of life since the end of the Pleistocene Ice Age—not just how he survived but how he raised his standards. In order to accomplish this aim, the author tackles his problem from two points of view—from that of the natural scientist and from that of the historian. His hope is that the book will prove to be interesting to the archaeologist, the geographer, the ecologist, and the historian. Here the reader sees the close interplay of several disciplines and realizes how impossible it is to present a thesis depending upon a single one.

The history of man differs from that of all other species in that it has been one of progressive emancipation from the thralldom of instinctive conformity with a pattern imposed by external forces.

The sustenance of prehistoric European man was drawn entirely from wild life—from plants, insects, eggs, and shellfish; from birds, fish, and mammals. Even after man learned to farm he did not discontinue hunting and food gathering; he could not neglect other sources of food.

According to the author, the most significant change in temperate Europe was the decline of the pig and the rise to importance of the sheep and horse, a change reflecting the progress of forest clearance

in the primary area of settlement. Since livestock depend for their existence on plant food, it can be assumed that, before the introduction of fodder crops in comparatively modern times, a particularly intimate relationship must have existed between the composition of flocks and herds and the character of the vegetation near settlements. This in turn must have resulted from the interaction between such factors as soil and climate and the effects of human activities like forest clearance, cultivation, and grazing.

Asserting that it was by their hands that the early Europeans dragged themselves out of the primeval mire of savagery and struggled up the long slopes of barbarism, the author then devotes much time and space to prehistoric man's working of flint and stone and later with metals.

In our present "Age of Steel" it might seem strange that iron, whose ores were so widespread and so easily reduced, should not have supervened directly on the working of flint and stone instead of following a stage of copper and bronze. However, a technique had to be devised for toughening the forged metal.

Prehistoric Europe is made more meaningful by the use of many excellent photographs, maps, and drawings. Without the maps, the reader would be completely in the dark and would quickly lose interest. At the end of the book is an excellent bibliography and an unusually complete index.

C. LANGDON WHITE

Stanford University

BONN, M. J. *Whither Europe—Union or Partnership?* Pp. 207. New York: The Philosophical Library, 1952. \$3.75.

This volume by a noted economist and political scientist is a brilliant study of the focal problem of contemporary Europe. In thirteen well-written chapters, the author considers: what is Europe, the parting of the continents, the partition of Europe, Atlantic reunion, the great rehearsal, European patterns, founders of western union, customs unions, the two Germanies, the defense of Europe, union or league, mid-continental union, and Asia's impact on Europe's union. Dr. Bonn has succeeded

in writing a monograph which has an appeal for the general reader and also for the specialist in international affairs.

In trying to view the problem against the historical background the author makes a number of breath-taking generalizations, didactic statements and comments. He points out incidentally the American flair for collecting and organizing relevant information and at the same time misunderstanding it. The "inglorious end of the United States' China policy" is cited as an example. Having proved that Americans worship documents, the learned doctor proceeds to marshal his own European documents, draw instructive parallels from the past, and then deviate from accepted conclusions.

The author tells us that European culture is neither an abstract concept nor a name but has its locus in the mid-continental area, that a customs union must precede a political union or a military unification, that the greatest obstacle to the Soviets as well as the greatest danger to their policy is nationalism, and that the fate of the European Union will be decided by Russia.

The core of this book is the scholarly analysis of the central problem of the two Germanies. In dignified prose, the author reviews the impact on central Europe of the various supranational agencies which were set up after 1945. His own proposed system of "multiple partnerships, joint institutions and limited working arrangements" recalls the Schachtian shackles which once isolated Germany from the economic complex of the western world. "The doctrine," states the author, "that a country must forego the particularistic national advantages with which it is endowed for the benefit of neighbors who do not reciprocate, is untenable."

Dr. Bonn presents in detail an impressive argument against the need for a Western European Union on a federal or American pattern. In fact he forecasts that it will take a long, long time for the United Nations of Europe to make the decision to call themselves the United States of Europe.

This book is stimulating, realistic, highlighted with good humor, and a commendable contribution to informed thinking

about the future of the European continent.

RALPH HASWELL LUTZ
Stanford University

SNYDER, LOUIS L. *German Nationalism: The Tragedy of a People—Extremism Contra Liberalism in Modern German History*. Pp. xiv, 321. Harrisburg, Pa.: The Stackpole Company, 1952. \$3.75.

One of the effects of the cold war in the last five years has been the decline, in quality and quantity, of German studies. During World War II, the literary market was flooded with analyses of the German problem, most of which were rather ephemeral in character and journalistic in approach. Yet at the same time the realization grew among more serious students of modern history and politics that the German problem was not conclusively solved by the military defeat of Nazism, and that no realistic long-term policies with regard to Germany could be formulated without a sound understanding of her background and history. The coming of the cold war so shortly after World War II put an abrupt end to the development of German studies on a broad basis, because the issue of communism and the policies of the Soviet Union increasingly attracted an almost monopolistic attention. Professor Snyder's *German Nationalism* is therefore doubly welcome as a serious and scholarly contribution at this time.

The author holds that the recent German catastrophe was deeply embedded in the pattern of German history, and that, in particular, there was "little new in Nazism other than the fanatical and ferocious method of genocide used to implement its ideology" (p. 19). Snyder judiciously concedes that there were German liberals, but—and this is the central fact of German politics—"they were always a relatively small and isolated group with voices crying in the wilderness" (pp. 19–20).

The work is supported by a wealth of carefully selected supporting evidence, refreshingly drawn, not only from conventional disciplines like history and literature, but also from anthropology, psychology, and the arts. Professor Snyder discusses in his introductory first chapter the issue of

a German "national character," and then dissects the specific forces that went into its shaping, such as education, literature, politics, historiography, music and art, religion, philosophy, and militarism. The last chapter on "Friedrich Meinecke's Historicism and the Tragedy of German Liberalism" is one of the most interesting in the entire work, showing the extent to which the thought of Germany's leading historian of the twentieth century was permeated by the Hegelian tradition of the cult of state.

Professor Snyder does not indulge in prophecy, and he refrains from providing a prediction of things to come in Germany. He is aware that the problem of Germany has, in some respects, become part of the larger problem of East-West relations, but the wealth of facts and ideas in *German Nationalism* is an indirect commentary on the complexity of the German situation. All in all, *German Nationalism* is a timely and valuable contribution to the field, and is likely to demonstrate its usefulness as time goes on. The limitation of the work is its stress on intellectual history as the key to an understanding of Germany rather than on social and economic forces; but within the self-chosen limitation Professor Snyder has performed an excellent piece of work.

WILLIAM EBENSTEIN
Princeton University

ANGLO-JEWISH ASSOCIATION. *Germany's New Nazis*. Pp. x, 76. New York: The Philosophical Library, 1952. \$2.75.

In the spring and summer of 1951, as major steps were taken to integrate the German Federal Republic into the political, economic, and military complex of Western Europe, the Foreign Affairs Committee of the Anglo-Jewish Association, feeling the need for reliable information and opinion on the political health of the Republic, commissioned the preparation of this booklet. The authors address themselves to questions which have been the subject of serious discussion among foreign officials and newspaper correspondents resident in Germany during the past two years. How firmly rooted are democratic institutions in western Germany? Is the danger greater from the radical Right or from the radical

Left? Should the federal and state governments be more aggressive in combatting manifestations of neo-Nazism? What can one expect from the newly organized veterans' groups? What is the significance of the electoral successes scored by Remer and his Socialist Reich party in Lower Saxony and Bremen? In summary form this booklet presents the facts and evaluates them.

While the presentation and discussion are objective and generally sympathetic toward the democratic forces operating in Germany, it is apparent that the authors are disappointed by the failure of responsible political leaders to take more positive and aggressive action against extreme nationalist and neo-Nazi elements. However, it should be noted that since this book was written, in the summer of 1951, a number of new and significant facts have been added to the chronicle of events in Germany. The personnel administration of the Bonn Foreign Office has been investigated by a Bundestag committee and a number of former Nazi party members dropped; the organized veterans have not become a strong national political force; the work of organizations, such as the Society for Christian-Jewish Cooperation, has made good progress; each of the four Land governments in the United States Zone has made generous lump-sum settlements with the Jewish Restitution Successor Organization (JRSO) in the difficult matter of heirless Jewish property; and quite recently an agreement was reached between the federal government and Israel on a claims and restitution settlement amounting to 822 million dollars. Meanwhile, on the political front, the Socialist Reich party has voluntarily disbanded (probably to go underground) on the eve of an expected decision by the Federal Constitutional Court on the legal power of the government to ban a political party. There is then today more solid ground for optimism than during the spring and summer of 1951.

In the reviewer's opinion, based upon two years of close observation in Germany, the crucial question with regard to neo-Nazism is this: Is it a historical survival, or is it a wave of the future? At

present it is the former rather than the latter. It is doubtful if warmed-over National Socialism can become a major political force. The danger in the German situation lies in the possibility that radical rightist groups may arouse and exploit latent German nationalism. This will depend upon the shrewdness and skill of their leaders plus the development of conditions foreign and domestic that would favor their purpose. West Germany has not presently reached that stage, and it need not reach it if political common sense, courage, and sound politics prevail.

ORON J. HALE

University of Virginia

VON DIRKSEN, HERBERT. *Moscow, Tokyo, London: Twenty Years of German Foreign Policy*. Pp. 288. Norman: University of Oklahoma Press, 1952. \$4.00.

This is an eye-witness account of the development of Germany's foreign policy from 1918 to 1939, presented in the form of personal memoirs by a former German career diplomat, whose experience in the Foreign Service and Foreign Office (1918-1928) and as Ambassador to Moscow (1928-1933), Tokyo (1933-1938), and London (1938-1939) amply qualify him to write authoritatively on the subject. Although this book does trace the development of German foreign policy during a crucial 20-year period, its primary purpose, according to its distinguished author, is "to give an account of a political career spent almost exclusively in Eastern European and Far Eastern countries" in an effort to determine "whether the task of an ambassador is limited in our technical age to that of a letter-carrier. . . ."

Unlike so many treatments of this subject, von Dirksen's work is not based merely upon an analysis of documents to which the usual scholarship and hindsight have been applied. It is rather a clear and accurate description of historical events which shook the world, written in the best traditions of classical autobiography by a man who was a very real participant in those events over a 20-year period. It is, in fact, far more than that. This work is a fascinating intimate account of events, conferences, daily business and social con-

tacts with world-renowned political and diplomatic personalities of many nations, and the burdens and pleasures of diplomatic life. Throughout, Dr. von Dirksen succeeds in blending skillfully his experiences in private life with an acute appraisal of social conditions and cultural habits in the world capitals in which he served, all of which add life and luster to his account of official experiences.

Unfortunately, it is not feasible in a review of this type to detail the many interesting revelations which appear. At best one can only highlight some of his observation and contemplate with amazement the extraordinary career of the author whose experiences appear to have left him slightly embittered but much the wiser.

Concerning Hitler, he has this to say: "No question has been addressed to me so frequently as that about my impressions of Hitler and my conversations with him. In all truth, I must confess that he failed to impress me at all. . . . Whilst I was keenly aware of the demonic spell which he was able to cast over his audiences by his gifted oratory, . . . he failed to introduce this hypnotism into intimate conversation, at least so far as I was concerned. He lacked the self-assurance and dignity of a truly strong character—qualities which are entirely independent of social standing."

Von Dirksen's contempt for National Socialism, Hitler, von Ribbentrop, whom he considered Hitler's errand boy, and the entire inner circle is undoubtedly sincere. Like so many of his associates with backgrounds of Prussian aristocracy he could not stomach their lies, deceit, and high-handed methods which he felt would bring disgrace to his beloved country. Although displaying considerable naïveté for a man of his experience, he is willing to place the blame where it may well belong. Thus, he states that "with the seizure of power by National Socialism, other principles came into force in shaping Germany's destiny, namely, the laws of revolution. Men of different caliber were washed up to the surface and occupied commanding positions. Fanatical revolutionaries, thoughtless demagogues, disregarding of law, decency, or the well-being of the nation, steered it on a course bound to lead to disaster. It is the

German people's tragedy that this company of revolutionaries was not replaced by men of the second and moderate line, as is the usual course of revolutions. It was Chamberlain's tragedy that he came to power too late to carry out his plans, which were sound in themselves; that he trusted men who were not statesmen, aware of their responsibilities, but nihilists, fanatics, and mad revolutionaries."

Characterizing his service in the three capitals, Dr. von Dirksen writes that the role of an ambassador depends largely upon the personality of the man concerned and upon the political situation of his country and of the country to which he is accredited. As to his own role, he observes that "the reader may come to the conclusion that I played an active role in Moscow, whereas in Tokyo I was merely an observer. . . . The task assigned to me by Hitler in London was that of a letter-carrier. My efforts to break the shackles imposed on me and to oppose a policy which was bound to lead to the catastrophe of the Second World War proved futile."

Concluding the main portion of his work which was written in 1947 and 1948, Dr. von Dirksen sounds the following warning: "Let the precept be taken to heart by statesmen of the post-war period, that the erection of a new Europe must be brought about before the voice of post-war Germany, a Germany willing to cooperate, has died away." Recent events have amply demonstrated the wisdom of this statement.

All in all, Dr. von Dirksen has written an important and worthwhile book which will amply repay those interested in the subject for their trouble in examining its contents.

ELI E. NOBLEMAN

Washington, D. C.

LANTER, MAX. *Die Finanzierung des Krieges: Quellen, Methoden und Lösungen seit dem Mittelalter bis Ende des zweiten Weltkrieges 1939 bis 1945*. Pp. 217. Lucerne: Verlag Eugen Haag, 1950. No price.

In this University of Zürich dissertation, Dr. Max Lanter has set himself the ambitious task of investigating the sources, methods, and solutions of war financing

problems from the Middle Ages to the end of the Second World War. Now, there is a real need of a comprehensive study of this sort to fill the lacunae in the literature on war finance; regrettably, however, Lanter's study does not meet this need. Because of the author's attempt to cover too large a field, his slim volume is a rather superficial and, in some respects, deficient treatment of the subject.

The two parts are preceded by a brief introductory section containing some general observations on the relation of war financing to national economies, particularly in the era of total war. Part I, entitled "Ideas and Solutions of the Past," is a discussion of the theories of leading economic writers and a comparative analysis of the development of war financing in the major nations in different historical periods. The author's objective is to discover how far the ideas of the economists have stood the test in time of war. Individual chapters are devoted to: "The Middle Ages"; "The Period until the Close of the 18th Century"; "The 19th Century until the First World War"; and "The Period since 1914." The latter is subdivided into the First and Second World Wars. Part I serves as a clarification of the problems involved in financing war and as a background for the author's formulation of the "Theory of War Financing" in the second part of the work.

Lanter distinguishes two broad eras of war finance: the era ending in 1914, when, in general, economists predominantly stressed the state's accumulation of monetary means for financing war—although the methods proposed varied in the aforementioned historical periods—and the era beginning with World War I, characterized by total war which demands the effective mobilization of all of a nation's resources. His interesting and lucid presentation of the ideas of the economists and his analysis of the empirical experiences before 1914 show that in the course of the centuries the original representations of the theories were only partially fulfilled in time of hostilities. It was always necessary to resort to "sources, methods and solutions" which were never considered before war came. It is indeed remarkable that, as late as the

beginning of the First World War, in none of the belligerent countries had economists previously thought through, or even had a presentiment of, the possible financial and economic effects of a conflict between major powers.

Although the treatment of the period ending with the First World War is, on the whole, satisfactory, the deficiencies of Lanter's study become apparent in his consideration of the experiences with war financing of Germany, Great Britain, France, the Soviet Union, the United States, and Japan in the Second World War. This discussion—covering roughly one-third of the text—is primarily factual and statistical. Unfortunately, however, the author has relied on such secondary sources as the annual reports of the Bank for International Settlements and the periodicals *The Economist* (London) and *Bankwirtschaft*, among others, for the facts and statistical data. There is no intention here to impugn either the authoritativeness or reliability of these sources; but, surely, in a dissertation published in 1950, the reader has the right to expect that the author has researched the wealth of official documents and other materials that have become available since the end of the war.

Lanter makes no original contribution in the "Theory of War Financing." All that can be said is that the theory contains a critique of the prewar German discussion on the subject, which, as a reaction to the disastrous experiences in the First World War, emphasized the material resources of the nation—the "Krieg ohne Geld" idea, and that it presents a good, convenient summarization of recent thinking which lays stress on the importance of maintaining in war financing a proper balance between the volume of money on the one hand and the supply of goods on the other.

Die Finanzierung des Krieges is not for the serious student; the general reader should find the book instructive.

ARTHUR LEON HORNIKER
Washington, D. C.

VON PÖLNITZ, GÖTZ FREIHERR. *Jacob Fugger*. Vol. I: *Kaiser, Kirche und Kapital im oberdeutschen Renaissance*. Pp. xii, 662. Vol. II: *Quellen und Erläuterungen*.

Pp. xi, 669. Tübingen: J. C. B. Mohr (Paul Siebeck), 1949 and 1952. I: DM. 19.80; II: DM. 49.40.

Volume one of this massive two-volume work is an exhaustive and superb biography of Jacob Fugger, largely based on hitherto unused documentary material dispersed in many archives and collections throughout Europe. The author, Dr. Götz von Pölnitz, a professor of history and director of the Fugger Archives in Augsburg, has spent twelve years in writing this biography, often under the most adverse circumstances. His study is of the highest scholarship and quality, and a magnificent literary production. It will remain an authoritative reference work on the life and time of Jacob Fugger for many years to come.

Von Pölnitz, in contrast to other biographers, is not interested in drawing a one-sided and exclusively economic picture of his hero—Jacob Fugger as the type of *Grosskapitalist* or captain of industry of the era of *Frühkapitalismus*. Throughout, he focuses his attention squarely on the real personality of this extraordinary man who stood on the threshold from the Middle Ages to modern times. Von Pölnitz writes with great sympathy of and deep insight into the character of Jacob Fugger.

Jacob Fugger (1495–1525) emerges from these pages a great and formative figure of his age. Deeply rooted in the Middle Ages from which he drew his religious and ethical strength, but also permeated by the spirit of individualism and rationalism of the Italian Renaissance, he contributed through his thinking and activities to the disintegration of his own and to the building of a new world. He carried on his work unperturbed by the political changes and by the vicissitudes of the times (his long life spanned the last years of Frederick III, the reign of Maximilian I, and the beginnings of Charles V), unperturbed by the violent criticism which his activities aroused everywhere, and in a steadfast belief in the righteousness of his ways. Von Pölnitz shows in great detail how Jacob Fugger created the historical alliance between emperor and capital through a powerful system of "political finance," fed largely from papal and church funds, and "under the protection of the House of

Habsburg" extended the international net of his enterprises throughout the European continent, thereby raising the Fugger firm to world prominence and to great influence on church, state, and society of the early German Renaissance.

The second volume is an unusual source book on Jacob Fugger and his era. It provides explanatory notes, excerpts from documents, and archival references for practically every page and every paragraph in the biographical volume. This serves to complete, as well as to enlarge, the scope of volume one. The second volume is designed principally to assist foreign scholars who may be stimulated to undertake further researches in the field. (Von Pölnitz already is at work on a "history of European and colonial politics, economics and culture in the 16th century.") The usefulness of this volume is enhanced by the fact that it contains numerous documents from archives which, unfortunately, were destroyed by the ravages of World War II, or have since the war become inaccessible to Western scholars.

The volume also contains a 47-page index of persons and places and a subject index of 26 pages to both volumes, and an interesting map of "Establishments and Trade Routes of the Fuggers in the Period from 1495–1525." The whole work is further enriched by a number of reproductions of portraits and paintings of Jacob Fugger by Albrecht Dürer, Hans Holbein, and other great artists of the German Renaissance.

The publisher J. C. B. Mohr (Paul Siebeck) in Tübingen is to be commended for the very fine technical production of this work.

ARTHUR LEON HORNIKER
Washington, D. C.

CHUDоба, БОHDAN. *Spain and the Empire, 1519–1643*. Pp. ix, 299. Chicago: University of Chicago Press, 1952. \$5.00.

This volume covers the period from the beginning of the reign of Charles V to the defeat of the Spanish army in the Thirty Years' War as an inevitable result of Philip II's life-long struggle against the Protestants. The author is associate professor

of history at Iona College. His previous books have been published in Czechoslovakia. His interest in the Spanish domination of Europe in the "Golden Century" started about 1931 when he began to see Spanish expansion through the eyes of the sixteenth century Europeans, much as Western Europeans today view with growing alarm the expansion of the Union of Soviet Socialist Republics. This personal interest of the author has led him to publish in the past twenty years a number of special articles on the Spanish influence in Europe between the discovery of America and the Thirty Years' War. The present volume represents the culminating synthesis of this interest.

In preparing this volume Professor Chudoba has examined original documents in the archives in Spain, Italy, France, Germany, Austria, and Bohemia. He does not claim to have produced a definitive work, but he has contributed a fresh viewpoint of the events he describes and of the actions and opinions of the contemporary participants. The result is an analysis of the Spanish will to lead and to control the defense of Europe and of Christianity in Europe and in the Americas.

The author writes: "The most puzzling aspect of the story of Spanish preponderance is the change of the battle fronts on which the Spaniards were successively engaged; the change from the defense against the Turks, which had culminated in the victory of Lepanto, into the conflict with the Protestants, which resulted in the defeat of Rocroi" (p. viii).

"The one hundred and twenty-five years covered by our story comprise an epoch which to many an observer may seem a time of transition. Old institutions were abolished, and new were created. Everything was on the move. The age which saw the quiet religious reformations and the Thirty Years' War was an age in which hardly anything appeared permanent. . . . The epoch of Spanish preponderance, however, has remained outstanding precisely because of its agitated course, of which the pandemonium of the Thirty Years' War was the culminating point." "Compared with the epic of Spanish conquests in Mexico, in Peru, in Chile, and in Cali-

formia, ours is perhaps a less adventurous narrative. The romantic haze of the high seas and of distant unknown countries is certainly absent from it. Nevertheless, it has other qualities that make it none the less interesting. What it lacks in risky undertakings of sailors and explorers it possesses in ambitious designs of kings and ministers. And the daring of the conquistadors is more than equaled by the intrepid faith of the protagonists on the European stage. The discovery and colonization of America has certainly immense importance for the subsequent expansion of Christian civilization. But the contemporaneous happenings in Europe were shaping and determining that civilization."

This study contains the portraits of the great actors of the sixteenth century, not the least of whom were Charles V and Philip II. It constitutes an interesting and intelligent approach to an oft-told tale. Moreover, the author has produced a coordinated story of Spanish and European backgrounds which can be read with profit by all students of the history of Spain in America.

A. CURTIS WILGUS
University of Florida

OTHERS

CALDWELL, JOHN C., in collaboration with Lesley Fröst. *The Korea Story*. Pp. xii, 180. Chicago: Henry Regnery Company, 1952. \$3.00.

Here is a hard-hitting account of events in Korea between the end of World War II and June 25, 1950, the date of the North Korean invasion of South Korea. It is written in simple, straightforward prose and appears to have been designed for the general reader. The author, John C. Caldwell, was born in China of an American missionary family which had been engaged in this activity for several generations. His is "a story of great opportunities not seized upon, of mistakes made and not corrected . . . [and] is in many respects an aftermath of our tragic mistakes in China." The result of this series of blunders is, in Mr. Caldwell's

opinion, the betrayal of the Koreans with tragic consequences to the United States.

Together with his Korean-born wife, also the child of American missionaries, Caldwell helped to establish a United States Information Service in Korea, assisted in directing South Korea's first democratic election, and worked among the numerous refugees from North Korea who used to stream over the Thirty-Eighth Parallel in the days before the fighting commenced in 1950.

Despite the presence of a horde of 2,000 Americans (some of whom were "misfits, security risks, and incompetents, not to mention alcoholics and homosexuals") to staff the American Mission in Korea, the net results of their labors was a huge failure which played its part in bringing on the war and which threatens ultimately to lead to the loss of all Asia. Appalling political stupidity, widespread weakening of morality, and sheer lack of organization combined to produce this debacle.

The chief target of the author's criticism is the State Department at whose doorstep he unhesitatingly lays the blame for a most dismal performance by the Americans in Korea. His charges are serious and not few in number. For example, he asserts that the State Department was informed two years before the invasion that the Chinese Communists would enter any conflict between North and South Korea. He is most unsympathetic toward State's efforts to picture to the American people the reason for China's entering the conflict as due to its security being menaced. Furthermore, he holds that it was a tragedy for the State Department to take over American operations in Korea at a time when the Department was still full of "the same naïve notions that had already lost us China."

Caldwell bemoans the failure to have presented the aims and ideals of the United States strongly and intelligently enough and feels that, at the same time, we neglected to understand the culture and inherent nature of the people with whom we were dealing. This combination of a firm presentation of our position and a sympathetic comprehension of the way of life of the people with whom we are dealing is, in the

author's opinion, the key to a successful American foreign policy, something our operations in Korea were woefully inadequate to achieve. Alien peoples can never be understood if they are considered to be "gooks" who are unfit for association. It is a strong point in Caldwell's bill of particulars that all Americans were forbidden to eat in any Korean restaurant or home and that Korean hotels and homes were off-limits to all American personnel.

The book, as can be seen from the above, is essentially critical although constructive suggestions are made from time to time. Favorable things are said about the work of the missionaries in Korea, both Protestant and Catholic, and General MacArthur appears to be deeply admired by the author. Whether you like something as unpalatable as this fare or not, you must conclude that it provides considerable food for serious reflection.

THOMAS H. D. MAHONEY
Massachusetts Institute of Technology

RIGGS, FRED W. *Formosa Under Chinese Nationalist Rule*. Pp. ix, 195. New York: The Macmillan Company, 1952. \$2.75.

Formosa has been under the rule of the Chinese Nationalists since 1945. Until 1949, when the fortunes of the civil war in China compelled the retirement of the National Government from the mainland to Formosa, the island was governed as a province under provincial officialdom appointed from the mainland. After 1949 it had to support both the National Government and its armies and its own provincial establishment brought immediately under the eye of the National Government. The new situation raised two questions: (1) whether Formosa under Chinese Nationalist rule could maintain such a dual regime, developing and maintaining sufficient strength to prevent Communist conquest of the island; and (2) whether the Nationalists could organize and develop Formosa sufficiently so that it could serve as a base from which they could operate to overthrow the Communist regime on the mainland.

The author of "Formosa Under Nationalist Rule" presents an analysis of and

data on Formosa since 1945 designed to establish a basis for finding an answer to these questions, from the military (Part I, Ch. 2), the political (Part II, Chs. 3-4), the economic (Part III, Chs. 5-8), and the social (Part IV, Ch. 9) points of view. Under all four heads he presents a disillusioning analysis of the use made of power by the early regimes, but finds military, political, economic, and social improvement since 1950. This has resulted from a combination of reform and American assistance and the method of administering it.

The continuing importance of the American assistance to the Formosa economy, however, raises a serious question as to whether or not, even if improvement continues as a result of new Nationalist policies, Formosa itself can develop enough economic strength to support a continental invasion. If it cannot, the present verdict of the civil war can be reversed (1) only if the Nationalists can re-establish themselves among mainland Chinese, on the basis of their record on Formosa, as a satisfactory alternative to Communist rule, or (2) if the United States gives sufficient additional assistance to the Nationalists to enable them to stage a successful invasion of the mainland. The answer to the question, if there is any answer available in advance, can best be found in the sort of analytical study that Mr. Riggs has made in this volume.

The book, it should be noted in conclusion, has the merit of giving the reader the Nationalist view directly through statements and reports which constitute appendixes to the text itself.

HAROLD M. VINACKE
University of Cincinnati

FITZGERALD, CHARLES PATRICK. *Revolution in China*. Pp. ix, 290. New York: Frederick A. Praeger, 1952. \$4.50.

Professor Fitzgerald of Canberra University has written a stimulating, if somewhat controversial, book about the Chinese People's Republic towards which he seems favorably disposed. Reference to authority or other source material has been deliberately omitted so that at best the book is only an expression of opinion based in

some measure upon personal experience. It is written in more of a journalistic than scholarly style. For example, the author says that, at the time of the Opium War, "The Westerners banged heavily upon the barred door of the Chinese world; to the amazement of all, within and without, the great structure, riddled by white ants, thereupon suddenly collapsed leaving the surprised Europeans still holding the door handle" (p. 18).

The main thesis, which appears correct, is that Chinese history teaches that China can be ruled successfully only when the rulers have the support of both the peasants and the scholars. As the Communists seem to have had this support, the author is convinced that they will continue to dominate because "to suppose that a Chinese party [Chiang] which could not retain power when all was in its hand could now regain it with limited foreign support, is to fly in the face of all history and, indeed, of common sense" (p. 213). To this reviewer, it seems a little premature to be so certain that the Communists will retain for long the voluntary support of the scholar (who by this time may have lost his intellectual freedom and become somewhat disillusioned) or even of the peasant (who may by now be heavily taxed).

The Kuomintang is painted too black and is criticized for "the attempt to modernize China without interfering with the land system, the endeavour to fit some rags of Confucian doctrine to a party dictatorship which itself was supposed to be temporary, to deny the practice of democracy and still pretend to be preparing the people for it, to proclaim and teach nationalism and yield to the national enemy" (p. 73). No credit is given the Kuomintang for the mass education technique of James Yen to which approving reference is made, or for the New Life Movement or numerous other progressive activities for which it was responsible. On the other hand, the Communists seem to be painted too white (or "red") when it is said: "Towards individual members of the people, the Communist is kindly, courteous, helpful and indulgent . . . the nature of the Communist good works is as closely related to the central doctrine of their faith as Christian

charity is to the Sermon on the Mount" (p. 150). One may perhaps be permitted to observe in accordance with the Chinese doctrine of Yin and Yang that the "coin may have two sides."

The author properly indicates that Russian communism is based upon the worker while Chinese communism is founded upon the peasant, the scholar being considered the "brain worker." He also asserts that communism in Asia is more national, and not so much interested in world revolution as in the expulsion of the foreign imperialist; that the strength of Chinese communism is derived in large part from frustrated nationalism; and that Mao has been able to accept or decline Russian advice at will. An attempt is also made to prove that the interests of America and China are now in conflict while those of Soviet Russia and China coincide. Whether or not one agrees with Professor Fitzgerald, his book is exceedingly interesting and should be read by all those who want to hear all opinions before passing any judgment upon Communist China.

ALBERT E. KANE

Washington, D. C.

DE GAURY, GERALD. *The New State of Israel*. Pp. 260. New York: Frederick A. Praeger, 1952. \$3.95.

The establishment in 1948 of the State of Israel aroused a great deal of enthusiasm in all parts of the world not only among Jews. Since then much of this enthusiasm has died down. Attempts to revive it by means of euphemistic propaganda seem to be not too successful.

It might be that a sober and unbiased statement of facts will be better able to enhance understanding and in this way produce more satisfactory results. A statement of this kind is Gerald de Gaury's *The New State of Israel*, which confines itself to a well-documented description of how the New State actually works. In this sense, the book offers itself as an up-to-date compendium on the Constitution and the political system of Israel; its leading government agencies, such as the Ministries of Interior and Justice; its religious organizations; its education and health system; its finances and economics; its de-

fense and military forces; its industry; its agriculture, fisheries, irrigation, and forestry; its transport and communication network; and its cultural life.

Two main issues emerge from this description: unprecedented immigration and unbalanced economy with its concomitants, excess of import over export and rampant inflation. The trouble with these two issues, De Gaury states, is that they exist together. "There are not enough goods for export or consumption, and there are too many people . . ." (p. 161). Since immigration, even if it might be somewhat dammed for a time, has to continue, Mr. De Gaury sees the problem as "very nearly insoluble." It probably is insoluble in terms of any normal economy. But the very circumstances under which the small country won its independence in a battle against overwhelming enemy forces show that what happens in Israel may not be measured against normal standards. In spite of all disenchantment, there still is a dreamlike air about Israel. The country is young, and so are its people; the spirit of utmost sacrifice is still alive; there is a strong will to make a go of it, as well as enough intelligence to support it; and there is an undaunted optimism which expresses itself in the phrase most common today in Israel: "Yihye tov," or: "It will be all right." Even a sober observer like Mr. De Gaury apparently cannot escape the contagion of the dreamlike quality of this optimism. For after having reviewed all the encouraging as well as the "almost alarming" prospects of the new state he still expresses his belief in a saving *Deus-ex-machina*. "History [he concludes], not economics, suggest that Israel will neither be destroyed by inflation nor immediately expand in the Middle East" (p. 173).

HENRIK F. INFELD

Group Farming Research Institute
Poughkeepsie, New York

SCHECHTMAN, JOSEPH B. *The Arab Refugee Problem*. Pp. xi, 137. New York: Philosophical Library, 1952. \$3.00.

This volume is an expansion of Dr. Schechtman's study *Arab Refugees: Facts and Figures and Resettlement Prospects*

made in 1949. Much of the material also appeared in the publication *The Arab Refugee Problem* which was submitted to the General Assembly of the United Nations in December 1951, and sponsored by a large number of prominent Americans. This is therefore largely a repetition of material already made known by earlier studies of the same author.

The book contains ten chapters which follow a chronological order. Chapter I, the Arab Mass Flight, lays the blame for the refugee problem on Arab leaders. Chapter II quotes various sources on the numbers of refugees. Chapter III states that repatriation is impossible, and a fait accompli in redistribution in Arab states must be accepted. Chapters IV-VII trace the efforts at United Nations negotiation over the thorny problem of repatriation versus resettlement in new areas and conclude that Arab refugees will be happier if they do not return to Israel. Chapter VIII argues that the Arab states need the refugee manpower and would do wisely by absorbing them. The last two chapters concern Arab refugee property in Israel and the new impasse which developed at the Paris United Nations session in 1951.

Dr. Schechtman's book should be read along with another appearing about the same time on the same subject. It is Fayez A. Sayegh's pamphlet *The Palestine Refugees* (1951), which follows somewhat similar forms in studying this problem. Both books are highly documented and replete with footnotes and give the same appearance of scholarly objectivity. Yet in their judgments and conclusions they are at opposite poles. The only conclusion that the thoughtful reader can reach is that a process of selectivity appears in the choice of materials. So much has been said by so many different speakers and writers that almost any conclusion could be "proven" by references selected from the mass of quotations—many of them by irresponsible authors—which form the raw research material on the Arab refugee problem.

An earlier publication of Dr. Schechtman's, *Population Transfers in Asia*, published in 1949, has an interesting summary of various older ideas about ridding Pales-

time of its Arab population. Dr. Schechtman (pp. 116 ff.) quotes from the words of various writers beginning with Israel Zangwill in 1919, followed by Dr. Weizmann, David Ben Gurion, the new Zionists, Sir Norman Angell, Walter Clay Lowdermilk, John Gunther, Herbert Hoover, and others who all advocated, at one time or another previous to 1947, that the Arabs should be transferred out of Palestine and thus make way for a purely Jewish population. Referring to the principle of Arab-Jewish exchange of population, Dr. Schechtman concludes: "It is the only constructive, long range solution. Other more orthodox solutions . . . are in reality no solutions at all. They lead nowhere" (p. 136). There one suspects is the dogma which governs the principle of selectivity when it comes to choosing source material. Therefore that material is collected which goes to prove this theory. He concludes this study by placing the blame for the present stalemate directly on the Western powers, who, he intimates, should impose and pay for the implementation of his solution on the Arab states.

EDWIN M. WRIGHT

Johns Hopkins University
Washington, D. C.

STRONG, WILLIAM DUNCAN, and CLIFFORD EVANS, JR. *Cultural Stratigraphy in the Viru Valley, Northern Peru: The Formative and Florescent Epochs*. Pp. xx, 373. New York: Columbia University Press, 1952. \$8.50.

This book is an admirably thorough presentation of the results of a scientifically controlled archeological survey and excavations. Typography is of the very best, far excelling the average archeological report. The 81 figures (many of them full page), 18 tables, 29 plates, three large detailed appendixes on Pottery Types, Plant Remains, and Textiles, the Bibliography, and the Index add up to a solid job.

The greater part of the text, however, is for specialists in Peruvian archeology, presenting in full detail the results of the excavations. Fortunately for the less cognizant, each section is followed by a resumé. The final chapters on "Cultural

Configurations in the Viru Valley . . ." and "Wider Cultural Relationships in Coastal Peru during the Formative and Florescent Epochs" embody the important results and conclusions of the authors and are the parts that will be most carefully read.

The book presents the results of the work of the Columbia University Expedition in the Viru Valley of northern Peru in 1946. This was one unit of the co-operative Viru Valley Project of the Institute of Andean Research. This Project envisioned the determination of the complete archeological history of this small valley. Expeditions from other collaborating institutions studied other temporal phases and are publishing their results.

The Formative and Florescent Epochs of Peruvian pre-history were two of the earliest phases, beginning with the introduction of maize and pottery and including the period of the maximum development of technique and art. The authors, probably wisely, refuse to assign dates, but less cautious students estimate the span as from 1250 B.C. to about A.D. 500. The best-known of the cultures of this period are Chavín, Salinar, and Mochica on the north coast, Paracas and Nazca on the south. In the Viru Valley Gualaquiza encompasses Chavín, and its Chicama Valley phase Cupisnique; Puerto Moorin is the local representative of Salinar; the earlier Mochica periods are replaced by Gallinazo, and the later ones represented by Huanaco. There seemed to be no temporal and practically no cultural break between the Incipient Agricultural Period (as represented at Cerro Prieto) and Early Gualaquiza. The latter period is divided into Early, Middle, and Late. Maize and pottery were introduced in the Early Period, llamas in the Middle Period; there was marked cultural advance in the later periods. The Puerto Moorin (Salinar) Period seems to have been a relatively short one and not certainly continuous with Gualaquiza. In the Viru Valley the Gallinazo Culture was long, important, and probably derived from Salinar. The earlier Mochica periods are apparently missing in the Viru Valley where the Moche seem to have arrived as the result of a sudden military conquest in full-blown or even decadent stage. The occu-

pation was brief and abruptly terminated, as if by some internal breakdown.

University of Pennsylvania

EALY, LAWRENCE O. *The Republic of Panama in World Affairs, 1903-1950*. Pp. xi, 207. Philadelphia: University of Pennsylvania Press, 1952. \$4.00.

This little book is probably a condensation of a doctoral dissertation in the field of history or of political science. There are eleven short chapters each followed by a long list of footnote references. These references, over 500 of them in total, cover some 30 pages, and an extensive bibliography and index 21 more. The exposition as such covers only about 150 pages. The book can be read in an evening by an informed and interested person.

After a short introductory chapter the author covers the history of Panama's participation in international political affairs during the half century since independence was gained in 1903. More specifically he deals with Panama's position in the Inter-American system during the first two decades of her national existence; her relations with other states during the First World War; her participation in the League of Nations, and in the Inter-American system during the years 1923-38; her relations with the United States, Germany, Japan, and other nations during the Second World War and her contribution to the war effort; her participation in the formation and work of the United Nations and in the Pan-American movement during the past few years. In the final chapter there is a brief discussion of present-day problems and prospects.

While this study is more historical than analytical in character it is a well-integrated work and one which evidences a high level of scholarship. There is the meticulous handling of details and references which often characterizes a doctoral dissertation. The author is acutely aware of the stresses and strains in the relationships between Panama and the United States. He is sympathetic with the desire of Panama to maintain a position of full sovereignty despite the overpowering weight of the United States and the absolute

necessity of close co-operation between the two nations. Panama's full support of all international organizations and her participation in them has been stressed. The author apparently believes that this is a reflection of an almost instinctive feeling among Panamanian leaders that international organizations serve as a counterbalance to the influence of the United States; that Panama is somewhat less vulnerable if there is the possibility of appeal to an international group if disputes arise with more powerful nations of the Americas. Still there is evidence in the history of Panama's participation in these groups that her leaders firmly believe in international co-operation quite aside from the possibility of immediate benefits. The author has named these leaders and followed in detail their work and influence in activities and decisions of various organizations.

Despite the difficulties encountered in the years 1946-48 over the continued use of military bases by the United States on Panamanian territory the author feels that there is only "a lingering, latent antipathy toward the United States in Panama" and that it will not prevent full co-operation between the two countries in the future; also that Panama will continue loyally to support and participate in the work of the United Nations and the Organization of American States.

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT. *Surinam: Recommendations for a Ten Year Development Program*. Pp. xxvi, 271. Baltimore: Johns Hopkins Press, 1952. \$5.00.

For those who believe that colonies are invariably exploited by the governing country and that they constitute an asset to the metropolitan power, Surinam stands as an object lesson to the contrary. Ever since 1863 Surinam has had trade deficits, and for nearly every year of this period there were large budgetary deficits. During the decade from 1931 to 1940, government expenditures exceeded revenues by an average of 40 per cent. The budgetary deficits were

met by contributions by the Netherlands government. While economic conditions have improved markedly during the past decade, largely as a result of the rapid rise in the production of bauxite, Surinam is still an economically backward country.

The people of the dependency quite naturally felt themselves neglected by the Netherlands. In the Netherlands there prevailed a feeling of hopelessness about the future of their Western dependency. Plans for the economic development of Surinam were repeatedly advanced and government surveys made, but all to no avail. In 1947, the Dutch government established a Prosperity Fund with a grant of 40 million guilders, to promote the economic and social development of Surinam. Part of the fund was used to establish a Planning Bureau whose function is the formulation of proposals for a development program. The Bureau prepared a preliminary report for a ten-year development program, which was submitted to the International Bank for suggestions. The Bank thereupon sent a mission to Surinam to examine its present economy and its potentialities for development. With the help of the Mission's report, the Bureau will formulate a definite ten-year program. The International Bank may be called upon to help finance a part of the program.

Surinam, with an area of over 55,000 square miles and a population of little more than 200,000 people with a low per capita annual income, is definitely an underdeveloped country. Can its standard of living be raised by a long-term economic program? The Mission believes that by the reconditioning of existing farm lands, the opening up of new lands, the extension of cattle-breeding and fisheries' production, and the development of the country's immense forest resources, Surinam could, within a decade, put an end to its dependence on external subsidies and grants while not only maintaining the present standard of living but slightly increasing it each year. The recommended measures would require a public expenditure of about \$53 million.

Colonialism, except in the Soviet satellite countries, is practically dead, but the social and economic problems of the former

colonial areas remain. The West is now determined to solve these problems by co-operative effort. We have here an example of the new determination and procedure.

MAY, STACY, JUST FAALAND, ALBERT R. KOCH, HOWARD L. PARSONS, and CLARENCE SENIOR. *Costa Rica: A Study in Economic Development*. Pp. xiv, 374. New York: The Twentieth Century Fund, 1952. \$3.00.

This book is the report of a study mission sent out in 1950 by the Twentieth Century Fund to assess the degree of economic development in Costa Rica and to suggest measures for improvement, with special reference to those which might involve outside assistance. This study is the third in a postwar series, the others dealing with Turkey and Brazil.

The introductory section of the report includes a rather general description of Point Four, a plea for case studies such as this one, and a brief sketch of the Costa Rican economy. The bulk of the report, including nine of the twelve chapters, surveys the economy and economic policy, stressing resources, problems, and projects. This survey encompasses agriculture; other extractive industries; manufacturing and processing; utilities and commerce; health and welfare; foreign trade and payments; capital investment and savings; and banking policy, government finance, and foreign exchange. The concluding chapter contains the mission's conclusions and recommendations, which urge a development program calculated to increase the efficiency of agriculture and to diversify the economy. Costa Rica would bear the primary responsibility, but foreign assistance would also be needed.

This report is a useful description of the Costa Rican economy, and it is also a careful if occasionally discursive analysis of that nation's economic problems and what can be done to solve them. This remains true despite the rather uneven quality of the chapters dealing with specific sectors of the economy, and the generally unquestioning attitude shown by the au-

thors toward the performance of foreign capital.

Despite the substantial merits of this report, it may not wholly merit the label of case study. The authors do rather casually explain their selection of Costa Rica as a case, but this explanation tends to make that nation far from representative—especially in its democratic political and social structure. The report, as a case study, also lacks focus. There is much detail but little generalization, and the reader learns more about Costa Rica than about the basic problems which she and many other countries confront. Neither is this analysis a case study in the application of Point Four, although that program is extensively discussed at the beginning of the book, mentioned again in the final chapter, and referred to incidentally throughout. One feels that this emphasis is somewhat contrived and that the report would be about the same if Point Four did not exist.

LETTERS TO THE EDITOR

Sir:

Professor Conway Zirkle has been kind enough to send me a carbon of his review of my book *Darwin, Competition, & Co-operation*. This review seems to me so wrongheaded I should be obliged to you if you will permit me to comment upon it.

Professor Zirkle attributes to nineteenth-century "conservative religious groups" the view that the "Nature" of the evolutionists was "red in tooth and claw," and also the view that "Natural selection or the struggle for existence was . . . a sort of gladiatorial combat." May I point out that "Nature" was pictured as "red in tooth and claw" by Tennyson even before Darwin's *Origin of Species* was published, and that natural selection as a gladiatorial combat was the image coined and used by Thomas Henry Huxley. As for natural selection being attacked by the Communists, it was welcomed with such enthusiasm by Karl Marx that he thought of dedicating *Das Kapital* to Darwin. In 1860

Marx reported to LaSalle and later declared to Engels, "Darwin's book is very important and serves me as a basis in natural selection for the class struggle in history." One of the gods of the Communist pantheon has always been Darwin. What contemporary Communists abhor is not Darwinism, but Neo-Darwinism.

In my book I have stated the theory of natural selection in terms which, I believe, most contemporary biologists, living outside the orbit of Communist domination, accept. Professor Zirkle makes no reference to this, but on the other hand concentrates his attention upon putting me in the camp of the Lysenkoists, whom I took particular pains to repudiate, and he does so in a particularly objectionable manner, not by direct assertion, but by association.

I am berated for citing the conclusions of biologists and not the evidence they have collected. Does Professor Zirkle question the soundness of these conclusions? If he does not, what point is there to citing the evidence in a book which claimed to be no more than an essay calculated to induce the reader to hang a question mark on a theory which he has, perhaps, too long taken for granted? In the book the nature of the evidence is made quite clear, and the conclusions of the authorities cited by me were presented as evidence of the fact that leading contemporary biologists challenge the soundness of certain of Darwin's original views. In essence, the evidence produced in the book is calculated to show that the Darwinian concept of natural selection put the whole understanding of the evolutionary process out of focus because too much emphasis was placed on an undefined competition and not enough attention given to co-operation and other factors.

Finally, in a journal which attracts so many readers from the social sciences Professor Zirkle says nothing of the historical sociological discussion which the book contains concerning the origin of Malthusian-Darwinian ideas and their extraordinary reception in the world of the nineteenth century. If Professor Zirkle's piece is a review, then this letter is a Greek tragedy.

The articles appearing in THE ANNALS are indexed in the Readers' Guide to Periodical Literature and the Industrial Arts Index.

FOREWORD

THE Common Man of our title has little glamor because he is thoroughly anonymous. His condition is not much improved when he masquerades, as he sometimes does in these pages, under the somewhat more rakish name of the "man in the street." It must be confessed, too, that he has less definition than his colleague the Reasonable Man, who has been pictured over and over again in judicial decisions. All that we can say by way of justifying his appearance here is that he serves as a convenient stand-in for the flesh-and-blood and quite individual if unexceptional people with whom the law deals in the usual course.

The first article in this symposium seeks to describe the attitudes past and present of the common man toward the legal system. Then a number of contributors in Part II consider how law impinges on him as litigant or party in various familiar settings ranging from the traffic court to the probate court, and from the small claims court to the court of general jurisdiction in which he brings his once-in-a-lifetime "big" accident case. But the common man is not only a subject and object of law; he is also a helper, as witness and juror, in carrying on the adjudicative process. He is examined as such in the articles in Part III, where a forthcoming piece of research into the jury as a working institution is also discussed. The costs of justice for the common man are analyzed in Part IV from a number of points of view. Part V, to some extent renewing and enlarging upon themes of reform which are sounded elsewhere in the volume, deals with certain improvements in the less esoteric reaches of legal procedure and with methods of bringing them about. The series ends with an article emphasizing the value of continuous inquiry into the actual consequences of legal administration.

It is well to note that our concern is with administration or procedure as distinguished from substance, although our contributors have wisely chosen not to limit themselves strictly. (The records of the Better Business Bureaus are a homely reminder that the common man may not be perfectly served by the substantive law.) And civil rather than criminal justice is at the focus; this follows from the traits we attribute to our protagonist. Yet he does turn up all too often in the inferior criminal court and the traffic court, and therefore the symposium takes in those institutions. Finally, we concentrate on courts as distinguished from other adjudicative agencies. This boundary is inconvenient, for not only is the common man affected intimately by the other agencies of law, notably various boards and commissions, but it is a natural and significant question whether the courts have anything to learn from the other agencies with which they are in a sense competing. We have invited some crossing of the boundary in connection with workmen's compensation and labor arbitration.

According to the habit of law teachers, the editors are content to leave the framing of conclusions to the reader, and especially so (to speak with candor) since they doubt that they have the art to impose any novel generalizations upon the totality of these separate studies. It would surprise no one, for example, to be told that in the second half of the twentieth century legal procedure still falls far short of reasonable and reasonably attainable goals.

It is equally plain that there are more than stirrings of reform in the field of procedure. The hardy spirit that brought about the well-known Federal Rules of Civil Procedure of 1938 still appears to be abroad in the land. The law has in fact reflected over a considerable period of time that special concern with process or procedure which, we are told, characterizes modern philosophic and scientific thought. But the common man seems as yet to have benefited less from this awakening than his more exceptional brethren, as witness the still unregenerate and dilapidated condition of so many of our local courts in the cities and counties, courts with which the public has closest contact.

It is evident also that there is a large amount of agreement among specialists and men of good will generally on the shape of useful reforms. Despite some differences among our contributors, they could, if put in one room, rather speedily construct a blueprint of many necessary and practicable improvements in the temples of justice. About the means of getting such reforms adopted, about the methods of promoting legal change, there would perhaps be less agreement and there is certainly less knowledge, although it is now accepted that broad public support is helpful and may even be indispensable. One field of investigation thus far little ploughed is the history of movements to reform procedure. Recognizing that there are variables from case to case we may still believe that from the history of changes made and changes aborted something can be learned about the mechanisms for bringing about change.

One need not be visionary to think that the profession and the public are coming around to the belief that there is a vast amount of legal procedure that can be safely approached in a frank spirit of experiment. The techniques for finding, measuring, and assessing the consequences of particular rules and practices are building up; so also is the scholarly and general interest in the ways in which diverse jurisprudential systems go about their daily business of handling cases. In all these signs and portents lies the hope for steady improvement in judicial administration.

Changing Popular Views About Law and Lawyers

By WILLARD HURST

THROUGH the nineteenth and into the early twentieth century, most people, when they thought of "law" or "going to law," thought of a proceeding in court, whether between a private plaintiff and defendant, or between a public prosecutor and an accused. The court was the law. Or, more accurately, the court as the arena of a lawsuit was the law. Some people and many corporations were interested in getting statutes passed or in trying to keep them from being passed; but these were usually specialized interests, remote from everyday living. Of still narrower interest was executive action, except as it was represented in the policeman—and the meaning of the policeman was that he might land you before the judge.

This popular focus on courts and lawsuits fitted our deeply ingrained middle-class belief in constitutionalism. Our greatest inheritance of social order from England was the idea that all life in society was lived under law. And this included the government and its officers, whom the citizen could call to account for unlawful actions. People believed in a law which they felt to be in being, ready to be invoked to stand for order and fair dealing. Our appeal for our "rights" in the years of tension with England strengthened popular conviction in the existence of legal principles which needed only to be authoritatively declared and applied. By tradition, and by virtue of being handily on the spot and in regular session, the courts were natural agencies to find and apply law. By easy identification, the courts became the law in the general view.

THE JUDICIAL POWER

This popular identification of the courts with the law had practical im-

portance for the power of judges in our society. Laymen do not think of judges as policy makers, but as officers whose business is to see to the fair application of legal doctrine which they find already at hand. It is still largely the special sophistication of lawyers to realize how much judges have made law. This means that the popular strength of the judiciary rests in people's confidence in judges as guarantors of fair procedure: procedural due process of law is the special trust which laymen have confided to courts. It is consistent with this that almost invariably, when courts have become a political storm center in our country, it has been—as in the case of the "court packing" fight of 1937—over judges' efforts to make policy, rather than over their application of law in particular cases.

This point has special meaning for this symposium. These essays deal mainly with the work of courts in applying the law to individual situations. That is, they deal with the kind of work which has given judicial power its distinctive legitimacy in the minds and hearts of our people. Insofar as these essays point to serious shortcomings in judicial administration, they deal with matters of peculiar danger to the general legitimacy of government in our society. Defective judicial administration concerns the institution that, for most of our national life, has been the chief popular symbol of the whole legal order.

OUTSIDE FORCES PLAY ON LAW

That everyone (including the official) is under law, and that law means fair application of the rules, are only two of many important values that knit our society together. Other widely held ideas or attitudes—some less law-cen-

tered than these two—have affected the role of law and of the courts as the symbol of law.

Three such points of view which have relevance to the place of the courts in the history of our society have been (1) our generally instrumental attitude toward all social institutions, (2) our increasing stress on the rationalizing, rather than the moralizing, of social relations, and (3) the greater importance we have begun to give to trying to prevent trouble, as compared with picking up the pieces that trouble leaves. On the whole, these attitudes or trends have had meaning for the social role and efficiency of the courts, not because they consistently affected the courts, but because, over a considerable lag in time, they failed to affect them.¹

After 1776 we marked our break with the colonial past by making constitutions. From this, and especially from the canonizing of the Federal Constitution, we reinforced a confidence natural to the Enlightenment, that we could ourselves make the structure of our society. In the relative simplicity of the early nineteenth-century United States, government was not and did not appear to be remote from ordinary living. Jeffersonian and Jacksonian Democracy preached that government was very literally the people's government: they made it, they could unmake or reshape it, it was nothing mysterious or calling for unusual talent, and the more often and widely government office was shared among the people, the healthier.

¹ "Is there any point to which you would wish to draw my attention?"

"To the curious incident of the dog in the night-time."

"The dog did nothing in the night-time."

"That was the curious incident," remarked Sherlock Holmes. (A. Conan Doyle, "Silver Blaze," in *The Complete Sherlock Holmes* [New York, 1936], p. 397.)

THE LAW AS A TOOL

Thus, at the same time as it took constitutionalism as a basic value, this agrarian-minded society treated the law with commonsense practicality as just one tool among other tools. If a worker finds that one tool is not suited to materials or job, he lays it down and picks up one that is suited, and he finds no troublesome problems of morals or justice in deciding which tool to pick. This attitude, rather than some inherent "lawlessness" in the American make-up, helps to explain a good deal of rather cavalier treatment of the law in our past.

Consider, for example, the "claims associations" which were once familiar in new-settled areas of this country. Squatters settled on public lands in defiance of law. But within their own communities, by their own election, they set up officers with whom to record their land claims and from whom to obtain decisions of conflicting claims. They abided by these records and these decisions, among themselves. On the other hand, on the day that the government land officer put up at public auction the tracts which these trespassers held, their "claims associations" assembled in force to frighten off free outside bidding and to see that no squatter had to pay more than the legal minimum. But, standing by the records and decisions of their own "association" officers, the squatters likewise did not try to contend with each other at the public sale; each man bid, or had the claims association representative bid on his behalf, only for the tract to which he had an association-validated claim.

These people took it on themselves to set aside federal land law policy because it did not fit their deep conviction that public land was for those who opened

it up. The same people set up their own system of land law and courts, and supported their system by overwhelming community opinion. There are elements hard to reconcile in such episodes, but two things are clear: (1) these people acted on the belief that law was made for them, and not they for law; and (2) they stood by what they regarded as fair application of law legitimized by popular consent.

THE WEDGE OF SEPARATION

The late nineteenth century saw us turn into a society whose dominant ways were urban instead of agrarian. One product of this change was a great shift away from the older, matter-of-fact, instrumental way of looking at law and courts. Like other institutions, law and its agencies became more remote from the daily knowledge and experience of city dwellers. Knowing men were emboldened to bring pressure on courts for favors such as they would have hesitated to seek in simpler communities where official activity was under closer public scrutiny.

Immigrants flooded our cities, wrenched from a background of peasant living. Unlike the American farmer, the European peasant had no experience of law as his tool. To the peasant, law was an alien and always oppressive force; the appearance of its officers always meant hard taxes or confiscation or the seizing of sons for the army. His experience taught him that his only help in trouble too big for the village to handle was to seek the aid of the man in the manor house to intercede for him outside of official channels. The peasant brought this attitude to his contacts with law in our cities. His was not the unabashed agrarian effort to shape law to his own purposes; rather, the bewildered immigrant found it natural to take his troubles to the ward

leader, who would "see" the magistrate off the bench or in the party clubhouse.

Moreover, the costs of seeking justice in court mounted with more complicated organization and the delays of crowded city dockets. This worked further to make the courts seem remote from the average man's service or concern.

So, while the times brought heavier challenges for the courts, circumstances cut them off from our traditional instrumental insistence on checking institutions to see that they worked properly as tools for people's well-being. This was heightened by the necessarily greater technical elaboration of doctrine and procedures that went with more complex affairs. Judicial administration was comparatively untouched by broad legislative reform, while sweeping changes remade the executive branch to produce the modern administrative process.

EFFICIENCY EXPERTS—BUT NOT FOR THE COURTS

The civil service reform movement of the late nineteenth century groped toward the expression of another popular attitude than the desire for "good" government. We had begun to turn away from the Jacksonian exaltation of the amateur; we were turning back toward the respect for professional competence in government that had had substantial place in public opinion in the generation of the Founding Fathers. As we moved into the twentieth century the statute book reflected a steady broadening of this tendency in the new categories of sanitary, labor, trade practices, conservation, and welfare legislation.

The new social legislation expressed two new value judgments: (1) In a society living closer, elbow to elbow, we had to pay more attention than before to the chain of cause and effect in so-

cial relations; a given event or practice might have wider ramifications than in a simpler day; and it took more specialized competence than before to trace and deal with these more intricate patterns of cause and effect. (2) As we became more crowded, and as we raised our notions of what made a satisfactory standard of living, we moved toward a cost consciousness that was new to Americans. We began to be uneasily aware that in many ways we had been living on our capital instead of on our income. We learned that "private" activities might have public costs. The statute book expressed a new conviction, that realism called for social cost accounting alongside of private cost accounting.

This was a working pragmatism, a matter-of-fact rather than a moralistic way of looking at life. It made us budget-minded as well as cost-minded. It produced the executive budget and the item veto, revised accounting and auditing procedures, and the study of public administration. On the national scene, it led us to conservation laws. On the local scene, it led us to ask what we were getting for our money in police and fire protection, streets and sewers. It was a major element in the growth of an enlarged and professionalized executive branch.

The drive for rationalization was slow to touch either the legislative or the judicial branch. As the arena of large-scale pressure conflicts, the legislature did not seem reducible to the terms of the efficiency expert. As an arena of professionals, hedged about with their own procedural mysteries and technical jargon, the courts presented a forbidding front to the questioning layman; cloaked with the dignity of an older tradition, which made them the very symbol of law, they could not readily

be asked blunt questions about costs and efficiency.

Only within the last thirty years have there been substantial movements to rationalize judicial organization. We have some recent beginnings of reliable and meaningful statistics of court business; but in most states it is still true that there would be a major political scandal if the legislature knew as little about the spending of executive appropriations as it does about what the public is getting for the money appropriated for the courts. We have some recent samples of centrally administered court systems, where a chief judge may shift judicial manpower and skill according to the demands of business; but most trial courts still run as one-man shows, accountable to no one for their industry or effectiveness. Rationalization has most touched the court system in the now common grant to appellate courts of a broad authority to make rules of procedure; but in most states there has been no very venturesome change under such powers.

PREVENTION BETTER THAN PENALTY

The stock nineteenth-century model of a legal rule was the admonition to be good, coupled with a penalty for being bad. Twentieth-century law saw a major shift toward preventive, positive, framework-building use of the power of the political community. This was a natural corollary both of the social facts that pressed us to rationalize social institutions and of the value that experience with rationalization taught us to put upon it.

Instead of leaving the debtor to plead the defense of usury when the loan shark sued to collect, we put lending practices under license and administrative scrutiny. Dissatisfied with the social costs of personal injury lawsuits,

we substituted compulsory insurance for employers' liability laws, and manipulated workmen's compensation awards and insurance premiums to induce factory safety campaigns. In the Tennessee Valley Authority, the Federal Deposit Insurance Corporation, and the Securities and Exchange Commission, we spelled out efforts to build social environments which would forestall waste, loss, or imposition, minimizing occasions for the law to step in to restore order or repair damage done.

Agrarian America had not been too discontented with the drama of lawsuits at the county seat. These did not cost too much, and they gave entertainment and gossip to lighten humdrum days. Urban America had plenty of cheap commercial entertainment, and it found the delays of litigation more and more costly, and the returns dubiously worth the outlay. Moreover, court remedies did not fit some of the socially costly troubles of a society which relied on broad, impersonal markets to supply its needs and luxuries. It was worth no man's while to sue for a small short-weight in the packaged product bought at retail; yet, taken the market over, the fraud spelled a big item in the social account.

Professional tradition, defining the "judicial power" which constitutions gave to courts, severely limited the kinds of action courts could take. Judges hold no roving commission to seek out and forestall trouble; typically, their business is to handle trouble which people bring to them, as far as the trouble can be reduced to the terms of a lawsuit. Judicial remedies are mainly negative—damages, forfeitures, penalties. The judges' main preventive weapon, the injunction, is available only where immediate and irreparable injury threatens a well-defined interest; only in late

years have the judges been armed with the additional device of the declaratory judgment.

Left to their own devices, courts lost ground in popular esteem in comparison with new-style administrative agencies which the legislatures endowed with flexible, affirmative powers. There were industrial commissions to help with factory accidents and wage claims; securities commissions to thwart the swindler; banking commissions to curb the loan shark; and the legislature authorized simple arbitration procedures to prevent costly lawsuits over business contracts.

Legislators' tardiness in equipping the courts with resources to play a more positive, preventive role cost the judiciary a good deal in terms of closeness to everyday life. Insofar as it cut costs, the drive of recent years to rationalize procedure and judicial administration helped to bring courts back to the people. But more direct effort was necessary, and in recent years we have had some useful experiments. There are new, specialized, simplified courts for small claims or traffic offenses. There are specialized courts staffed with aides drawn from other fields of expertness than the law: domestic relations courts, women's courts, juvenile courts. There are specialized courts with procedure and remedies focused on diagnosis, prevention, cure, education: the domestic relations and juvenile courts, and the best of the new traffic courts. But such innovations in judicial organization are still far from standard equipment the country over, and few of the experiments have been backed with budgets really adequate to fulfill the promise of new directions.

HOW PEOPLE LOOK AT LAWYERS

Courts have been the less able to serve the people effectively because law-

yers are poor businessmen and because lawyers as a group do not have good public relations. As far as concerns the average man, the economics of legal service is organized today pretty much as it was 150 years ago, despite the great shifts in the social environment. Legal aid societies have provided new kinds of legal service for charity cases. Big corporation law offices in large cities have developed new facilities and specialties, new methods of serving big business clients and wealthy individuals. Between these extremes, people needing a lawyer's help today get it, if at all, from the same stubbornly individualistic, one-man or small-partnership, general-practitioner office as would have served the client's great-grandfather.

Law practice today requires bigger and more costly law libraries. A lawyer needs a competent, relatively highly paid secretary. Service to even a small business client involves fields of specialized knowledge—taxation, labor relations, claims on government, workmen's compensation, common carriers—and it is expensive in time, effort, and books to keep abreast of any of these specialties. Cities of any considerable size generate business (landlord-tenant questions, for example) which is not novel because it is highly specialized in nature, but is novel because of its volume.

Looking at such facts, some lawyers have urged the need for experimenting with pooling of library and staff facilities, and with the creation of low-cost legal clinics for everyday clients, bringing specialists under one roof and perhaps offering economies gained by the specialist's capacity to turn out sound, routine work fast and in volume. But neither individual lawyers nor the organized bar has shown much initiative or willingness to venture capital of time or money in experiments. There are honorable exceptions (the "neighbor-

hood law offices" in Philadelphia, the Chicago Bar Association's "referral" system), but they are few and of limited scope.

Samplings of people of modest income show that there is probably a large amount of legal counseling and service that people need but are not seeking. Especially, the samples show a very large amount of preventive work that is not being done. The few studies we have tend to agree that ordinary people do not go to lawyers more, because (1) they have exaggerated notions of the cost of legal service, and many do not realize that they can pay simply for advice without committing themselves to more; and (2) they are ignorant of elementary legal aspects of everyday dealings which can get them into serious trouble (in connection, for example, with buying a house, assuming long-term credit obligations, or making a will). Very properly, the canons of professional ethics forbid an individual lawyer to advertise for business. But in the light of what the sample studies show, the bar as a whole has been failing in service to the community because of its failure to communicate better to laymen what legal service they ought to have, and on what terms they may expect to get it.

.

Thus, in mid-twentieth century the courts stand in an ambiguous position as to the general public. The old attitudes, which practically identify "the law" with courts and lawsuits, are tough and endure. But swift currents of change in popular attitudes toward social institutions, accompanying our transition from an agrarian to an urban society, have only belatedly touched judicial organization. Hence over the past seventy-five years the courts have been more and more out of touch with every-

day life. Given their important place in our political symbolism, this is an unhealthy state of affairs. Remodeling our judicial structure thus concerns values that reach far beyond immediate issues of administrative efficiency.

*Willard Hurst, LL.B., Madison, Wisconsin, is professor of law at the University of Wisconsin. He has served as law clerk to Mr. Justice Brandeis, in the general counsel's office of the Board of Economic Warfare, and in the Navy, and has been a director of the Social Science Research Council. His special fields in the law are the study of the legislative process and the study of American legal history. He is author of *The Growth of American Law: The Law Makers* (1950), and of articles in various legal periodicals.*

The Inferior Criminal Courts in Action

By MORRIS PLOSCOWE

TO the general public, a city magistrate, or police court judge, is first and foremost an enforcer of the traffic laws. It is in connection with traffic violations that most of the noncriminal public has its first experience with courts. All sorts of people drive automobiles, and all varieties of individual skills, personalities, and stages of irresponsibility are to be found among drivers.

The traffic rules prescribe minimum standards of safety and convenience. The rules are honored more in the breach than in the observance. It is common practice to break the traffic rules, and nobody likes to be haled into court to answer for the breach. In terms of sheer numbers, more traffic offenders are brought into our inferior criminal courts than those of any other category. In 1951, for example, of a total of 1,280,797 cases handled in the magistrates' courts of New York City, approximately 1,000,000 were traffic offenses.

A large proportion of these offenses were breaches of parking regulations. But large numbers of these violations are more serious in character. They run the gamut from passing red lights to dangerous driving, from going through play streets to speeding, from failing to give the right of way to emergency vehicles to leaving the scene of an accident, from disregarding stop signs to drunken driving and vehicle homicide. The consequences to individual defendants in these cases may be quite serious, ranging from substantial fines to imprisonment of varying duration, and revocation of drivers' licenses.

EXCUSES AND PRESSURES IN TRAFFIC CASES

A traffic court judge is inevitably besieged by many kinds of excuses and pressures. He does not have very much difficulty in dealing with the excuses, for they generally follow certain stereotypes. Traffic offenders are not usually endowed with much imagination. Cars in front of hydrants were pushed there, red lights change as the driver reaches the corner, doctors are on an emergency call when they are stopped for speeding, and so forth.

The pressures, however, are much more difficult to deal with, and can go far to ruin any scheme of traffic law enforcement if the judge is weak, supine, or in the habit of doing favors. Some plain, forthright honesty at the beginning of a career as a traffic court judge quickly discourages the "fixers" and the favor seekers. One then sees the remarkable sight of politicians queuing up to pay traffic fines, like ordinary citizens.

THE COURT AIDS THE ADMINISTRATORS

Any large American city is dependent, for the structural safety of its buildings and for the convenience and health of its residents, on the enforcement of a highly complex set of rules and regulations embodied in building codes, multiple-dwelling laws, and landlord-and-tenant statutes. Because of the chronic shortage of housing, many landlords have been operating their buildings in flagrant disregard of such rules, regulations, and statutes. It is the inferior criminal court that acts as the enforce-

ment arm of municipal departments that seek to obtain adherence to legal standards in the maintenance and operation of buildings. The criminal penalties that may be imposed upon landlords are the means of inducing them to make the repairs and alterations in their buildings or provide the services for tenants which the law requires.

Results are what counts in this area of law enforcement, and legal technicalities or niceties must be disregarded in order to bring about compliance with legal rules. Only too frequently, landlords seek to insulate themselves behind the corporate fiction. It becomes necessary to pierce the corporate veil and deal with individuals. Individuals may be sent to jail for failure to comply with legal standards. Corporations can only be fined, and this method may prove to be illusory, because the mechanism for collecting fines from corporations is ponderous and complex.

By bringing pressure upon individuals, compliance with legal regulations can be secured, not only in the area of building codes but also in the enforcement of health regulations, labor laws, workmen's compensation statutes, and other fields. The ordinary individual has a deep-seated repugnance against going to jail. The immediate threat of jail by the inferior criminal court judge is able to procure a compliance with regulations, which administrative officials alone are unable to achieve.

LIMITED POWERS OVER FAMILY DISPUTES

The husband-and-wife cases are hardy perennials in the inferior criminal courts. The underlying factors in these cases include unhealthy matrimonial relationships, alcoholism, nonsupport, brutality and sadism, psychopathy of one or both partners, temperamental incompatibility, and disagreements over children, moth-

ers-in-law, relatives, religion, recreation, and other points. The charge which brings the husband or wife before the court is usually assault or disorderly conduct. It is obvious to any judge who handles husband-and-wife cases that the criminal sanctions of jail or fine are next to useless in dealing with problems of marital discord. The imposition of criminal penalties simply embitters the family dispute.

In some courts the attempt has been made to come to grips with the factors underlying the matrimonial disputes. In the magistrates' courts of New York City, for example, the Home Term Court has been set up, staffed by probation officers, social workers, and a psychiatrist. These officials operate upon the notion that if a sick marriage can be restored to health, there will be no need for the imposition of jail or fines.

The efficacy of a progressive approach of this character, however, is marred by the fact that the inferior criminal court has only limited powers to deal with problems of the family. The Home Term Court of New York City, for example, cannot grant divorces or separations, nor can it grant custody of children, rights of visitation, or orders of support in nonsupport cases. The exercise of these powers is entrusted to the Supreme Court and the domestic relations courts. All that the Home Term Court can do is to try to persuade reluctant husbands and wives to live up to their obligations.

Thus, even under the best of conditions, an inferior court judge may do an unsatisfactory job in dealing with family disputes; for when persuasion fails, as it does in a large percentage of cases, there remain only the blunderbuss weapons of jail and fines. Actually, family disputes should be taken out of the inferior criminal courts entirely and turned over to a fully equipped do-

mestic relations court with plenary power to deal with all problems of the family.

HANDLING ALCOHOLICS

Every inferior criminal court handles large numbers of alcoholics. They are brought in under various charges—vagrancy, disorderly conduct, sleeping in the subway, begging, public drunkenness, and occasionally even larceny. The specific charges, however, are not very important. The inferior criminal court judge must be able to distinguish between the chronic alcoholic and the occasional drunk, between the person who needs a short period to sober up and get cleaned up and the individual who needs a long-term process of rehabilitation.

Even with alcoholics, there must be selectivity. Jail is not the panacea for alcoholism. A considerable proportion of alcoholics have not reached the hopeless stage. An intelligent city government can make the task of an inferior court judge a great deal easier by providing medical-social work screening facilities to distinguish between the various types of alcoholics. It will also provide clinics for alcoholics that can be rehabilitated, and vocational-agricultural colonies for the chronic, unclaimable alcoholics.

Unfortunately in most cities such facilities are lacking, and the inferior criminal court judge has the alternative of pronouncing a short jail sentence or sending the alcoholic back on the streets. The inevitable results of this policy are seen in the "skid rows" of our large cities, which are the principal depositories of the human slag caused by alcoholism.

A COURT OF EQUITY

People who have grievances run into the inferior criminal courts. The grievance may have nothing to do with crime.

But the inferior criminal court represents law and order to the average citizen, and he brings his grievance there. The mechanics are simple: a tale told to a clerk which may possibly involve a violation of a criminal statute, the issuance and service of a summons, and the appearance of the defendant. Through this means, the court is compelled to hear various kinds of complaints: cases of neighbors who annoy each other or fight over children, landlords who fight with tenants, merchants who receive bad checks, customers who feel that they have been "gypped" by merchants, the disputes of castoff boy friends and girl friends, lodgers who have been locked out of their rooms, and so forth.

The summons bears the criminal charge—assault, disorderly conduct, larceny, or malicious mischief. But what is required in the vast majority of these cases is no invocation of the ponderous machinery of the criminal law, but an attempt to do substantial justice, without too much regard for the niceties of civil and criminal jurisdiction. Bad checks should be made good; where property is destroyed, it should be paid for; injured persons should be compensated for damages sustained; neighbors should be instructed in their duties to each other, and directed to keep the peace.

In these cases an inferior criminal court judge sits as a sort of court of equity. It is the nearest approach to justice in the market place of the Oriental tradition. If the inferior criminal court judge has ever envisioned himself as a Solomon, his dreams will encounter brute reality in attempting to settle the disputes brought to court by the issuance of these civilian summonses.

Many of the disputes that come before the inferior court judge in these cases are insoluble, for both sides may demand the kinds of relief which the

law will not authorize. Many of the protagonists in the disputes are cases for a psychiatrist, rather than for an inferior court judge. However, good will, good judgment, the employment of unorthodox techniques to achieve equitable results, and a judicious combination of moral indignation, threat of punitive sanction, and persuasion, can do a great deal to settle many of the conflicts and perform the basic function of the inferior criminal court judge—that of conserving the peace of the community.

THE TRIVIAL AND THE SERIOUS

The inferior criminal court is the first court of contact with the large number of arrests which occur in every large city. These arrests take place for all kinds of offenses, from the person who has argued not wisely but too well with a police officer to the individual who is charged with armed robbery or homicide.

In dealing with these arrests, an inferior criminal court judge soon discovers that large numbers of ordinary people, who are not criminals, manage to get themselves embroiled with the law. Drunkenness, bad temper, a convenient weapon, or an inconvenient police officer is frequently the basic ingredient of many arrests of normally law-abiding citizens.

In many arrests, moreover, the seriousness of the criminal charge has little relation to the actual facts involved. More than one person has been charged with felonious assault because of a minor scuffle with a police officer. A police officer may overvalue an article stolen, so his record will show an arrest for felony rather than for a misdemeanor.

Many persons are also arrested and brought into court who are not guilty of any crime, or against whom no crime can be proved with the evidence avail-

able. When five adolescent youngsters are found in a stolen car on a joy ride, all five are arrested, although only one may have taken the car for the purposes of the ride. When card players gather around a table for a game of poker or pinochle for money, they may be arrested and brought to court on the wholly unprovable charge of disorderly conduct, making noises to the annoyance of neighbors.

It is obvious, as arrests are paraded before the inferior criminal court judge, that he must distinguish between the trivial and the serious, without too much regard to the offense charged in the complaint. He must handle differently the peccadilloes and wrongdoing of the ordinary citizen, and the crimes of the person who has had previous experience with the criminal law. He must be able to dismiss cases where the legal evidence of guilt is not present, whatever his opinion on the facts may be. He must not succumb to the judicial allergy against making decisions, or yield to the ever present temptation to "pass the buck" to the grand jury and the higher courts. Where an inferior criminal court judge has done his job well, the higher courts and the grand juries will not be overloaded with trivial or badly founded cases.

THE STEADY CUSTOMERS

Space does not permit any detailed analysis of many other categories of cases that are handled by the inferior criminal courts, through arrest or otherwise. Steady customers of the inferior criminal courts are the bookmakers, the policy collectors, the slot machine operators, and other violators of gambling laws.

The prostitute with her supporting cast of pimps, procurers, and madams is ever present in these courts, to teach a naïve inferior criminal court judge the facts of life in a large city. Sometimes

the prostitution that is charged is of the homosexual variety, though the inferior criminal court judge sees more frequently the nonprofessional homosexuals, drawn from all walks of life, who simply cannot restrain the public expression of their impulses.

Some of the most pitiful cases brought to the inferior criminal courts are the drug addicts, who appear on charges of possession of drugs or of larceny. Over and over again, parents come to these courts, pleading for help with adolescent wayward boys or wayward girls, who seem to be taking the first steps toward perdition. Frequently it is the inferior criminal court judge that first spots the serious mental disorder or psychopathy of an individual before him.

All of the aforementioned classes of cases present serious problems of adjudication. Perjury is an inevitable concomitant of many of these cases. But it is far easier to deal with perjury than with the paucity of treatment facilities and treatment techniques which a judge may require who has no illusions about the virtues of jail as a solution to all the ills of human society in a metropolitan community.

It is obvious that the burdens on a conscientious inferior criminal court judge are many and varied. These burdens are increased immeasurably by the fact that decisions must be made quickly, under constant pressure, and usually without help from lawyers, probation officers, or other auxiliary personnel. Mistakes are inevitable, but the judge cannot worry overmuch about

them—there is always the next case to be considered.

SUIT THE ACTION TO THE WORD

Dissatisfaction with the operation of the inferior criminal courts is inevitable in view of the character of the problems confronting them and the conditions under which they must operate. This dissatisfaction has been the moving factor behind numerous investigations that have been made of inferior criminal courts in various parts of the country from time to time. It is easier to investigate the courts than to devise remedies for unfortunate conditions, and easier to devise remedies than to secure their adoption.

It has been said that the inferior criminal courts are the most important tribunals of the land, because they influence for better or for worse far more lives than any other court. But this recognition accorded to the inferior criminal courts occurs in bar association speeches. It does not result in the adoption of better methods of selecting judicial personnel, better means of assuring judicial independence, and the more adequate organization of the inferior criminal courts. Nor does it secure the psychiatric, social work, probation, and institutional facilities without which even the best of judges is seriously handicapped. Until a community recognizes the importance of the inferior criminal court in these terms, it will continue to have an inferior level of performance from its inferior criminal courts.

Morris Ploscowe, LL.B., is a magistrate in the City of New York, and is executive director of the American Bar Association's Commission on Organized Crime. His lifetime work has been the study of the actualities of criminal law and its administration. Among his writings is Sex and the Law (1951).

The Traffic Problem, Traffic Laws, and Traffic Courts

By JAMES P. ECONOMOS

TRAFFIC cases exceed the combined total of all civil and other criminal cases filed in all the state and federal courts. Today the courts are gravely concerned with the traffic problem and they are actively participating in the efforts of the American Bar Association and President's Highway Safety Conference to improve the handling of traffic cases.

THE TRAFFIC PROBLEM

The traffic problem is created by congestion and collisions. Inefficient use and overcrowding of the highways, poor planning for parking facilities, and inefficient traffic control and supervision all contribute to congestion and collisions.

The three elements in the traffic problem consist of the highway, the vehicle, and the driver-pedestrian. To appreciate their extent, it is necessary only to outline the following:

The highway

3,300,000 miles of highway in all.
38,700 miles comprise the interstate system considered the nation's vital road network in peace and war.
518 billion miles of travel in 1952.

The vehicle

54,521,679 vehicles of all classes registered in 48 states and D. C. in 1951.

The driver-pedestrian

64,443,781 licensed operators in 47 states and D. C. (South Dakota has no driver's license).
150,000,000 potential pedestrians.

This combination of factors produced accidents for 1951 as follows:

32,500 accidents resulted in 37,300 fatalities.
950,000 accidents resulted in 1,300,000 nonfatal injuries.
3,300,000 accidents involved property damage over \$25.
5,100,000 accidents involved property damage of less than \$25.

At the end of 1952 the fatalities aggregated 38,000; nonfatal injuries 1,350,000; and property damage amounted to \$3.5 million. Since the invention of the automobile, more than one million have lost their lives in traffic accidents. The millionth death occurred in December 1951.

Any reduction in accidents by improving the safety of the highway or the vehicle must be accomplished through engineering. If all the latest engineering techniques were applied to make each highway as safe as the safest highway, the current estimates of some traffic safety experts indicate an over-all maximum reduction in accidents of only 5 to 10 per cent. While the percentage appears small, it nevertheless means a substantial reduction in quantity. With more than nine million accidents in 1951, a 10 per cent decrease for that year would reduce the total by more than 900,000.

Engineering more safety into motor vehicles until all vehicles are as safe as the safest vehicle would also produce a 5 to 10 per cent decrease in accidents. Periodic inspection would also assist in reducing the volume.

The only other way to achieve substantial cuts in the number of traffic accidents is to improve the perform-

ance of drivers and the habits of pedestrians. Through educational means and adequate enforcement there appears to be an opportunity to secure a maximum reduction of 80 to 90 per cent in traffic accidents. Therefore, while there is need for highway and vehicle improvement, there are greater opportunities for numerically greater reductions through improvement of the driver and the pedestrian.

It is in this latter respect that the traffic court can make its contribution. The traffic court should be used as a classroom and adequate corrective penalties should be assessed to achieve voluntary observance of traffic laws.

Bring violators into court

In order for traffic court judges to educate while adjudicating, they must have an opportunity to see the violators who are apprehended through traffic law enforcement. At the present time the number of traffic violators appearing in person in traffic courts is at a minimum. The exact number is not known, but there are sufficient statistics available to permit a reasonably sound approximation.

In 1951, 729 cities out of a total of 1,371 having a population of over 10,000 reported that 12,921,709 traffic cases were filed. Of this number only 3,213,293 were court cases, and the remainder of 9,708,416 were processed through the traffic court violations bureau procedure. Among the cases processed through the bureau there were 2,211,346 "moving violations" consisting of speeding, failure to stop at stop signs, failure to obey traffic signals, improper passing, and so forth. The total of all moving violations reported was 5,424,639.

These figures may be compared with those produced by the semiannual bulletin of the Federal Bureau of Investigation. The FBI reports for 1951 that

in 1,695 cities having a population of 52,424,704, traffic and motor vehicle violations were charged against 15,396,081 people. Approximately two-thirds of these violations arose out of non-observance of parking regulations; the remainder (approximately 5,000,000) arose from the breach of some rule of the road commonly called a moving violation. Any moving violation may be considered hazardous and should be subject to court action.

There is a way to determine the number of persons who should have been brought into court for corrective action. The guide used is known as the "enforcement index." This is the quotient of the number of convictions with penalty for hazardous moving violations divided by the number of personal injury and fatal accidents. An enforcement index of 15-25 is considered desirable. Using an enforcement index of 15, it would have been necessary for the courts to try enough cases involving moving violations to aggregate convictions of at least 15 times the total number of accidents resulting in fatal and nonfatal injuries. As there were about 982,500 such accidents in 1951, there should have been about 14,737,500 convictions.

It is apparent that, nation-wide, the traffic courts are able to exercise a deterring influence upon only about one-third of the maximum number of persons that should be charged with a traffic violation. Consequently, the opportunity of the courts to exercise a corrective influence on the violating public has been reduced.

Analysis of violators

To determine the kind of corrective influence that the judges should exercise, they must analyze the kind of defendants that appear before them and ascertain the primary cause of the violation. Traffic safety experts have sug-

gested that, considered from the standpoint of driver-improvement methods, there are three types of delinquent drivers—the "Can'ts," the "Don'ts," and the "Won'ts."

The "Can'ts" are those operators of motor vehicles who because of some physical or mental defect are unable to operate properly. Persons with defective eyesight, defective hearing, and other physical impairments are included in this group. Those with mental handicaps are also included. Neither a jail sentence nor a money fine will correct any defective physical or mental condition. To achieve any correction here, it will be necessary to re-examine the operator to determine the exact extent of the disability. If his defect is not correctable, the driver licensing authority should bar the driver from the use of the highways either upon its own action or upon the recommendations of the judge.

The "Don'ts" are those who lack knowledge in one of three respects: the rules of the road; ordinary skill in the operation of the vehicle; experience in operation. Again, jail sentences and money fines will have an inadequate corrective effect. Here the court can use its ingenuity in supplying the opportunities to eliminate the underlying defect. Traffic schools, the writing of essays, and additional driver's safety education may be suggested. There is a growing appreciation of the need for driver education for adults to improve driving habits, develop additional skill, and correct specific faults.

The "Won'ts" are those who because of a faulty attitude refuse to accept personal responsibility for obeying traffic laws and ordinances. They may lack respect for traffic laws because of some prior unfortunate experience. Their attitude may be due to the lack of uniformity in the enforcement of traffic laws. It may be due to bad handling

on the part of the judge, the prosecutor, the clerk, or others serving the court. It may be due to faulty traffic engineering which is not justified by conditions existing at the time and place, such as low speed limits on modern highways with wide pavements, divided parkways, and no intersecting highways. It may be due to poor police enforcement. The repeaters will most often be found in this group, and here the traditional fines, jail sentences, and license suspensions and revocations can be effective. There can also be effective use of the educational devices mentioned above.

The percentage of "Can'ts," "Don'ts," and "Won'ts" is not known exactly. However, the estimates of several judges from widely separated areas indicate that the "Can'ts" should not exceed 10 per cent, and that the "Don'ts" and the "Won'ts" are about equally divided, with many violators partaking of characteristics applicable to both groups.

To accomplish this analysis more personal attention must be devoted to each case, and this obviously may require more judges and prosecutors. The exact increase in judicial personnel cannot be ascertained, because there are no available statistics to determine the maximum case load that one traffic court judge should hear during any particular week, month, or year. Until those figures are available, the problem will have to be met in each city on the basis of trial and error until a sufficiently flexible formula has been worked out to accommodate to the needs of the particular community.

TRAFFIC LAWS

The first tool of fundamental importance is uniformity in traffic laws. With increasing interstate travel, there are driving practices which are legal in some states but which result in violations of the laws in other states.

To illustrate this divergence, the Na-

tional Committee on Uniform Traffic Laws and Ordinances, in its pamphlet entitled "60 Million Drivers Want Uniform Traffic Laws," supplied various examples of which only two need be cited:

Has your heart ever popped into your mouth as the driver ahead signaled for a left turn and then deliberately turned right—or suddenly braked to a stop? Well, the signal he gave is legal in about a dozen states!

Going straight through an intersection on the green light, have you ever been forced to swerve or slam on the brakes, because of a vehicle turning right from a cross-street? Laws in some states permit turning right on a red signal.

The need for complete uniformity in text of the rules of the roads has been spotlighted by the President's Highway Safety Conference and many other organizations. This "word for word" conformity will ease the task confronting the traffic courts in their educational work.

Adoption of the driver licensing provisions of the Uniform Vehicle Code is another requisite to assist in supervising and disciplining the drivers. While all jurisdictions except South Dakota have some form of law on this subject, their administration often leaves much to be desired.

The other parts of the Uniform Vehicle Code should be followed substantially to provide an effective regulation of the use and operation of vehicles upon the highways. Cities should also check their ordinances to ascertain the degree to which they conform with the Model Traffic Ordinance. Changes in both state and municipal laws to make them follow the nationally accepted standards on this subject will alleviate the court's task in dealing with the "Don'ts" and should reduce the number of "Won'ts" whose attitude is attrib-

utable to resentment against the lack of uniformity.

There is need for greater reciprocity in the administration of the driver licensing laws of the several states in order to secure more uniform respect for the issuance of court process designed to compel attendance of violators in traffic court through the suspension of driving privileges until appearance in court or other disposition. This problem is very acute, and was the subject of a special resolution presented by traffic court judges at the last meeting of the President's Highway Safety Conference in Chicago, October 18, 1952.

Uniformity of traffic laws, coupled with impartial enforcement without favoritism or special privileges, is essential to all improvements in the traffic courts.

TRAFFIC COURTS

There is an annual increase in the number of citizens who observe the American system of justice through their appearance in court to respond to an invitation—an invitation in the form of a traffic ticket. If the citizen is "fortunate" enough to be cited to one of the better traffic courts, the experience will be worth while and beneficial. If cited to one of the many unenlightened traffic courts, this contact with the law may be extremely disappointing.

Traffic violators—in great numbers—have firsthand knowledge of the operation of the traffic courts. To them this is the judicial system, because they rarely see any other court. As Chief Justice Arthur T. Vanderbilt of the New Jersey Supreme Court has so aptly stated in his David Beecroft Memorial Award address:

What they see and hear—and sometimes smell—in these courts does not tend to create respect for law or for the judges and lawyers administering law. And people are coming to these courts by millions each

year as defendants or as witnesses in traffic matters—20 million as defendants in 1951—in comparison with the relatively small number who experience justice from the courts of last resort in the state house. These local tribunals collectively can do more to undermine respect for law than the appellate courts can possibly overcome, try as they will. From the judicial point of view this aspect of the work of the traffic courts is quite as significant as the necessity of curbing the constantly growing loss of life and property. Thoughtful judges and lawyers do not need to be told that our kind of government cannot exist long, once respect for law is destroyed.

Traffic courts are all courts which have any jurisdiction over the violation of traffic laws and ordinances. The bulk of the violations are handled by trial courts of limited jurisdiction, such as municipal courts, city courts, magistrate courts, and similar courts found in urban areas, and justices of the peace, trial justices, trial magistrates, county magistrates, and other courts usually found in rural areas.

Sound state structure

The essential elements of a sound state structure of courts handling traffic cases would embody the viewpoint expressed by the Conference of Chief Justices during the annual meeting of the American Bar Association in New York City on September 16, 1951.

The first essential is full integration of these courts into the state judicial system. This should be followed by supervision of the work of these courts of first impression through the Chief Justice or some administrative director or official assigned to this task. Judicial statistics should be collected, collated, analyzed, and published to reflect the manner in which the work of these courts is being dispatched. By analysis of judicial statistics it is possible to upgrade efficiency and secure greater uniformity and simplicity of procedure.

It is imperative that rules of uniform procedure regulating the trial of traffic cases should be promulgated by the Supreme Court or any other agency charged with this responsibility. To keep all traffic judges in the state abreast of current developments, annual judicial traffic court conferences should be held and all judges and prosecutors assigned to these courts should be required to attend.

The model ticket

The final element in an improved system of state courts is predicated on the use of the "Uniform Traffic Ticket and Complaint" which has been developed by the American Bar Association Traffic Court Program. In New Jersey all enforcement agencies are required to use it, under a rule of the Supreme Court. In the state of Michigan 130 cities and 6 counties are using a similar kind of uniform traffic ticket and complaint. Cities in 22 other states are also using the American Bar Association model ticket. The experience gained in all these jurisdictions justifies the conclusion that the adoption and use of the model form by every enforcement agency in the state—including the city and the county—would improve traffic law enforcement even if none of the other suggested improvements were adopted. There are educational features to the ticket which have an appeal for the public and most officials connected with traffic law enforcement.

The model ticket sets out six violations which are the principle causes of accidents: speeding, improper left turn, improper right turn, disobeying traffic signal when light turned red, disobeying stop signs, and improper passing and lane usage. There are three degrees of seriousness set out in the form. To these are added conditions which increase the danger or hazard involved in the violations: slippery pavement, dark-

ness, other traffic present, caused person to dodge, just missed an accident, and in an accident. The form has places for showing whether the violation was committed in a business, industrial, school, residential, or rural area, and it classifies highways by type.

The Uniform Traffic Ticket and Complaint (1) permits uniform interpretation of traffic laws by all officers; (2) permits uniformity of instructions to all officers and administrative personnel within the police department; (3) permits prosecutors to secure more consistent and uniform case preparation; (4) acquaints the violator with the exact nature of the violation charged; and (5) acquaints the public with the kind of unsafe maneuvers which result in accidents.

If the premise is established that issuance of traffic tickets by police officers initiates the judicial process, control can be exercised by the courts over enforcement agencies which in and of themselves have no immediate responsibility for the administration of justice. Requiring a quarterly report on the issuance and disposition of traffic tickets will eliminate traffic ticket fixing provided the judge will use the power of contempt to discipline anyone tinkering with court process.

At present the only state which can boast of a system as complete as we have here suggested is New Jersey. California, under the state-wide reorganization of trial courts of limited jurisdiction which was in full effect on January 5, 1953, is next in line. The rest of the states present a rather weak picture under the criteria outlined above.

Steps in local improvement

But improvement need not await total reorganization. In most instances it is possible for a municipality, by action of

the traffic court judge alone, to improve the handling of traffic cases measurably.

A traffic court imbued with the desire to obtain the benefits of approved national standards would have to take the following steps:

1. Adopt the Uniform Traffic Ticket and Complaint, issue it to the police department, set up master controls to secure accountability, and require periodic reports.

2. Establish and promulgate rules of court to govern the procedure in traffic cases, patterning them along lines suitable for state-wide use.

3. Separate the trial of traffic cases from all other court trials in order to emphasize the importance of this type of case and to permit an evaluation of the relative seriousness of traffic offenses by comparison of similar offenses.

4. Provide for further separate sessions for the handling of juvenile violators.

5. Require the personal attendance of all persons charged with moving violations.

6. Organize a traffic violations bureau to handle all parking, standing, and nonmoving violations; assume responsibility for its operation; select the best "public relations" personnel to administer the work of the bureau; establish a schedule of graduated fines for first, second, and subsequent offenses, with mandatory court appearance, together with the requirement of written pleas of guilty, waiver of appearance and trial for all violations permitted to use this procedure.

7. Arrange for the assignment of a traffic court prosecutor at all traffic court sessions to assist in the prosecution and presentation of traffic cases.

8. Require the keeping of books, dockets, and records which will provide statistics on the work of the court and

its violation bureau, and analyze and publish the statistics.

9. Improve the appearance of the courtroom if need be, to achieve dignity and impressiveness; be certain that the courtroom is equipped with an American flag and either the state or city flag, whichever is more appropriate.

10. Participate in a traffic court conference sponsored by the American Bar Association, the Traffic Institute of Northwestern University, and one of the law schools co-operating in this program, and make certain that the prosecutor does likewise.

11. Furnish information requested in the American Bar Association Traffic Court Contest and endeavor to follow the suggestions submitted in the analysis delivered subsequently.

12. Suggest that the police receive additional and more adequate traffic police training, if needed, and encourage in-service training by the local police department.

13. Revise court procedure, if necessary, to provide for the following:

- a) Formal opening and closing ceremonies.
- b) Appropriate remarks about traffic safety at the beginning of each traffic session.
- c) Instructions on the rights of the defendants, the nature of a plea of guilty, and other court procedures.
- d) Administering the oath individually to each person testifying.
- e) Blackboards, traffic boards with model cars, and other aids to the explanation of traffic cases.
- f) Explanation of the reason for decision.

14. Create a traffic school to assist the court in the correction of violators, wherever necessary.

15. Arrange to obtain the defendant's record of previous convictions to be used after the finding of guilt in order to assess an adequate corrective penalty on repeaters.

16. Establish a procedure for immediate service of warrants whenever persons fail to appear in response to a traffic ticket.

17. Require prompt reporting of convictions of all violations called for by the driver's license, and instruct all clerks to comply rigidly with this provision.

18. Take adequate steps to select proper personnel for the court with immediate training in the responsibilities attached to the position and its importance to the judge and the administration of justice.

The judge's role

Beyond all this, the judge establishes the pattern of conduct of everyone in the courtroom by the manner in which he pursues his daily work.

The conscientious judge will not always be appreciated nor will he always be supported in his efforts to administer justice fairly and efficiently. The traffic problem, although acute enough, is still not serious to the average individual. He gives lip service to his demand for strict traffic law enforcement as long as it is for everyone but himself.

The court's activity needs public support, and leadership in initiating it must fall on the judge. Once he has generated public support, he must assist until the public group can stand on its own feet. Thereafter he may withdraw gracefully and permit the group to function independently—free to support the judge as long as he merits support.

Traffic courts, involved in the enforcement of the regulation of laws pertaining to the use of one of the most

popular machines ever made available to the public, have assumed an important place in the judicial sun. They require, and must receive, the benefit of the best court structure and best judicial personnel available.

James P. Economos, Chicago, Illinois, has been director of the Traffic Court Program of the American Bar Association since 1943. He is a member of the National Committee on Uniform Traffic Laws and Ordinances, the National Committee for Traffic Safety, and the Committee on Chemical Tests for Intoxication of the National Safety Council, and is secretary of the Committee on Courts of the President's Highway Safety Conference. He has directed traffic court conferences at many law schools, surveyed the traffic courts of several localities, and contributed articles on the subject to various publications.

The Small Claims Court in the District of Columbia

By FRANK H. MYERS

THE small claims court was made a "national phenomenon" when Congress in 1938 established a Small Claims Court and Conciliation Branch in the Municipal Court of the District of Columbia.¹ In THE ANNALS for September 1939 Judge Nathan Cayton² reviewed the background of the small claims movement and analyzed the provisions of the congressional enactment.³ I shall not repeat what was said there, but shall rather examine the operations of the District of Columbia court as a going institution.

One organizational change may first be mentioned. When the Police and Municipal Courts of the District of Columbia were consolidated into the new Municipal Court in 1942, the Small Claims Branch was retained as part of the Civil Division of the new court.⁴ One result of the merger has been to make available to each branch of the new court thirteen judges sitting in rotation.

During the fifteen years of its operation, this Small Claims Court has been acclaimed as one of the most far-reaching and effective of modern legal reforms. More than 325,000 cases have been filed and disposed of in a forum where informality of procedure and a minimum of delay, confusion, and expense have been the watchword. Here the ordinary citizen of limited means has been given opportunity to secure a

prompt decision of his claims according to law. Here also defendants have been given an opportunity to be fully heard in opposition to any unjust claim filed against them. The unanimously favorable report of the District Committee of the United States Senate included this comment which bears repeating at this time:

The purpose of this bill is to improve administration of justice in small civil cases and make the service of the municipal court more easily available to all of the people whether of large or small means; to simplify practice and procedure in the commencement, handling, and trial of such cases; to eliminate delay and reduce costs; to provide for installment payment of judgments; and generally to promote confidence of the public in the courts through provision of a friendly forum for disputes, small in amount but important to the parties.

That the congressional intent has been fully realized is attested by the widespread approval of the court, in legal as well as in communal circles.

DISTINCTIVE FEATURES

One of the outstanding features of the system is the provision which authorizes the clerk of the Small Claims Branch to assist all individual litigants appearing in their own behalf in the preparation and filing of their claims. This is a special service performed for individual plaintiffs only, at no additional cost to them; it is not extended to corporations, partnerships, or associations. Over the fifteen-year period the clerk has given counsel and assistance to over 9,900 litigants, primarily to plaintiffs but also to defendants, in the matter of the proper handling of their claims and de-

¹ Act approved March 5, 1938, 52 Stat. 103, c. 43, § 1 *et seq.*, District of Columbia Code, Title 11, § 801 *et seq.*

² Now Chief Judge, Municipal Court of Appeals, District of Columbia.

³ Volume 205, pp. 57-64.

⁴ Act approved April 1, 1942, 56 Stat. 190, c. 207, § 1 *et seq.*, District of Columbia Code, Title 11, § 751 *et seq.*

fenses. This is a striking example of a new departure in public service in the legal field and is a most effective and practical form of legal aid. The procedure has met with the approval of litigants and lawyers alike, for few members of the legal profession can afford to undertake representation of clients with such small claims.

The statute creating the court authorized, in addition to service by the United States Marshal (the only process-serving agency in the District of Columbia), a simplified method of service by registered mail. This means has been found most effective. Over the period since the court was established, 225,802 cases have been served by registered mail as compared to 59,386 cases by the marshal. In a test case involving the legality of registered mail service, the United States Court of Appeals for the District of Columbia in 1940 settled the point.⁵ Recognizing that constitutional rights must be preserved, the court upheld the legality of registered mail service as provided in the statute and implemented by conforming rules of the court⁶ "as sufficient to satisfy the requirements of due process of law."

By shortening the notice period, providing registered mail service, and refusing continuance except for illness or equally satisfactory reason, it has been found possible to bring the great majority of cases to a decision promptly. The granting of continuances remains, as elsewhere, within the discretion of the court. Over the years, however, the record shows that approximately nine

out of ten small claims cases have been decided on the return date.

Any litigant in the Small Claims Court who makes demand therefor by the return date of the case is entitled to jury trial. It is reassuring to note that this privilege has not been abused. A deterrent has perhaps been the \$10 fee which must accompany every jury demand. The records over the past fifteen years disclose that demands have been made for jury trial in only 282 cases, and of these only 171 have resulted in actual jury trials—a very impressive record.

APPEALS

When the Small Claims Court was first established, right of appeal was by application for a writ of error to the United States Court of Appeals. Four years later Congress created a new Municipal Court of Appeals for all local litigation. Included in the appellate jurisdiction of that court is a special procedure for review of judgments of the Small Claims Court.

Again the individual litigant who desires to appeal may seek the counsel of the clerk of the court, whose duty it is to prepare the application on a standard form couched in simple language and to file it within three days from the date of the entry of judgment. The present statute provides that if any one of the three appeals judges is of the opinion that the appeal should be allowed, that is done and the case is given a preferred status on the appellate calendar. If all three judges conclude that the appeal should be denied, the denial stands as an affirmation of the trial court from which there is no further appeal.⁷ This has assured full and fair appellate review, without promoting a litigious atmosphere.

Generally, appeals have been allowed

⁷ District of Columbia Code, Title 11, § 772(a).

when there has been a showing of apparent error on a question of law which has not been but should be decided by the appellate court.⁸

I shall have occasion below to show by example that the Municipal Court of Appeals has been at pains in its decisions to preserve the simple and informal procedure in the Small Claims Court, but that this objective has been furthered without any distortion of the principles of substantive law to accommodate to the fact that the claims are small in amount. The appellate opinions have indeed been meticulous in applying the substantive law and have been so clear as to serve the judges of the Small Claims Court as legal guideposts.

CONCILIATION MANDATORY

In one of the early cases it was pointed out that the trial judge, prior to trial, is required by statute to make an earnest effort to settle the controversy by conciliation. The court said:

The Congressional edict is mandatory; so is the rule. The judge is required in every case to do two things before ordering any case for trial: (a) to elicit from the defendant the nature of his defense; and (b) to make a real, not perfunctory, effort to compose the differences of the parties and if possible to bring them together in a mutually satisfactory settlement. In this the judge is more than a mere umpire. He is the "guiding spirit and the controlling mind" of the proceeding. He is charged with the positive duty of maintaining a conciliatory influence, and of inducing and arranging settlements whenever possible. From even a casual reading of the Act and the rules, it is apparent that *no exception was intended in this regard*. Conciliation procedure is mandatory in every case and the judge had no right to order the case tried without first making a real, "earnest" effort to settle the matter on a friendly

⁸ Ionescue v. Dettmers, 53 A.2d 287 (1947); American Storage Co. v. Briggs, 56 A.2d 557 (1948).

basis. Only when he had failed in his role as conciliator was he authorized to order a trial.⁹

In another case the court held that the small claims judge could not decide a case without hearing the defendant's testimony and that summary dismissals without a full hearing of both sides were not justified save in exceptional cases.¹⁰ Every litigant is entitled to his "day in court" which should be easy, accessible, understandable, and, as far as possible, a single, decisive day.

SUBSTANTIAL JUSTICE ACCORDING TO SUBSTANTIVE LAW

The Small Claims Branch is not bound by rigid rules of evidence; so, for example, a water bill prepared by an official charged with the duty of keeping records and collecting charges for water services was held to be admissible and to make a prima facie case.¹¹

On the other hand, the desire for simple and expeditious procedure should not lead to mechanical, assembly-line dispositions. Thus in 1951 the appellate court held that a refusal to grant a plaintiff a delay of ten minutes to produce records for trial was an abuse of discretion. After reviewing the number of small claims cases for the month involved and the customary procedure of the branch, the opinion pointed out that "dismissing the case for want of prosecution solved nothing and helped no one," for it would not prevent filing a second suit, and defendant's interests would have been better protected by waiting ten minutes and giving him a trial on the merits that day.¹²

⁶ The statute gave the court power "to make rules of practice, pleading and procedure, not inconsistent with law, and to modify and change the same from time to time, to insure the proper administration of justice." 41 Stat. 1310, Municipal Court Act, 1921.

The meaning of the rule that "the judge shall conduct the trial in such a manner as to do substantial justice between the parties according to substantive law" is that the substantive law is to be followed in order that substantial justice shall be done. Some examples will illustrate this meaning.

In one case it was held that the trial court could not ignore the substantive law rule that a holder in due course of a negotiable instrument was entitled to recovery in the full amount; it could not limit him to the unpaid balance on a note less the usual discount charged by holders for purchase of notes.¹³ So also it has been held that a prior judgment between the same parties acts as an estoppel on the cause of action;¹⁴ and that the mere proof that a watch had rusted and was not operating at the end of six months from the date of its repair did not sustain the burden of proving a breach of warranty.¹⁵

Under the rule of court permitting the judge, upon motion, after judgment based on a claim for wages for personal services to order the appearance of a judgment debtor for supplementary examination as to financial ability, the expression "personal services" was held not to have a wider meaning than the word "wages"; it did not include professional services rendered by a physician, dentist, or attorney at law.¹⁶ A judgment entered against an infant defendant was reversed by reason of the failure of the small claims judge to appoint a suitable and competent person as guardian *ad litem* to defend the action.¹⁷

In an action for a balance of \$11.95

¹⁴ Smith & Gottlieb, Inc. v. Cheatham, 31 A.2d 676 (1942).

¹⁵ Livingston v. Fuhrman, 37 A.2d 747 (1944).

¹⁶ Price v. Quill, 46 A.2d 311 (1946).

¹⁷ Gray v. Droze, 55 A.2d 340 (1947).

on the purchase of a \$15 pair of shoes by a laborer earning \$18 per week, the small claims judge stated that the plaintiff store had undertaken "either a gamble or a terrifically poor business judgment" and ruled that neither the act creating the Small Claims Court nor the rules thereof justified him in assuming jurisdiction. The appellate court reversed, holding that

there was no evidence in the record that the purchase was induced by fraud, misrepresentation or duress, or that the purchaser did not understand the transaction . . . an improvident or extravagant purchase may not be rescinded simply because it is contrary to the dictates of good judgment.¹⁸

The last-cited case serves to emphasize that while procedure in the Small Claims Branch should be informal, cases should not be decided on the basis of "personal justice" or sympathy for or prejudice against either party, but on the evidence and the law.

THE COURT IS NOT A GUARDIAN

Washington has its share of small furniture, clothing, and appliance stores selling on credit. They are frequent plaintiffs in the Small Claims Branch, suing for small balances due on purchases by persons in the low income brackets. Human nature being what it is, many such people buy beyond their means. This is due to high pressure salesmanship, or to an overwhelming desire for ownership of goods which the prospective purchasers feel they can secure only by installment payments. This weakness on the part of the buying public is not limited to persons of modest means. Frequently persons in higher income brackets are brought into court on claims for balances due on houses, motor cars, television sets, ex-

¹⁸ Universal Jewelry Co., Inc. v. McIver, 68 A.2d 226 (1949).

pensive clothing, and furs and jewelry, which they cannot afford and should never have bought.

All will agree that it is not the function of any court to act as guardian of the general public in determining the limit of each individual's buying ability. The law permits every citizen to contract freely even if unwisely. Of course, when duress or misrepresentation induces a purchase, all courts, including the Small Claims Branch, are in a position to protect the unwary buyer. But there is no principle of substantive law that permits any court to limit the buying capacity of the purchaser in accordance with his income and financial abilities. It is the privilege of every American to buy beyond his means, and he frequently exercises this privilege, as the records of all courts disclose.

Criticism has often been directed at credit stores because of their policy of overselling and entering into conditional sales contracts with individuals of limited financial means without first ascertaining their ability to pay. Much of this criticism seems justified, but correction of such abuses would seem to be the responsibility of the merchants themselves. Trade associations, credit associations, and civic groups like better business bureaus can also exert a moderating influence. Education of the buying public is another remedy,¹⁹ though no doubt this would be neither easy nor quick. The most that a small claims court can do is to keep a watchful eye on every transaction brought before it and invoke every legal (or equitable) defense that the evidence may justify.

PROPOSED AMENDMENTS REJECTED

There has been no occasion to amend the present Small Claims Act. In 1951

¹⁹ This was the suggestion made in the opinion of the *McIver* case, *supra* note 18.

a proposal was made to Congress for certain amendments to give the judge more "personal" latitude in deciding cases. This was rejected on the recommendation of the Board of Judges of the Municipal Court. Another suggested amendment proposed an increase in jurisdiction of the Small Claims Branch from \$50 to \$100. The report of the Judges on this point stated:

It must be conceded that as the amount of the jurisdiction increases, the court becomes less and less a "small claims" tribunal, where the poor litigant can come in without benefit of counsel and have his claims respecting wages or amounts due him, determined summarily, without delay, and by simple procedure. An enlarged jurisdiction will bring lawyers with jury demands; dilatory practices can be expected to follow when fees of more or less large amounts become involved. The presence of lawyers on both sides of cases changes the court into a "lawyer's" court and the flexible, easy procedure of the Small Claims Court, as originally established, does not lend itself to the orderly expeditious handling of these cases. Experience in several other jurisdictions has shown that when the small claims jurisdiction is enlarged the benefits of informal proceedings are lost and also the inevitable result is that it becomes a lawyer's court with all the resultant technicalities et cetera.²⁰

There is some belief that the jurisdiction could safely be increased to \$100, but no higher. However, the Judges' report opposed the increase at the time, and Congress left the jurisdictional limitation at \$50.

²⁰ From a written report dated May 14, 1951, prepared by Associate Judges Walter Casey, Thomas D. Quinn, and Frank H. Myers, approved by the Board of Judges June 7, 1951, and filed with the United States Congress in opposition to bills S. 1368 and H. R. 33.

CRITICISM REFUTED

Some criticism has been made that the Small Claims Branch has been used as a "collection agency" for the smaller stores. But the records will show that it has not acted in this capacity any more than other courts where the collection of larger amounts is involved. Its jurisdictional amount necessarily brings within its doors the collection of a greater number of small debts and accounts. The fact that the smaller stores have more of these unpaid accounts and bring more of these suits than the larger stores is not remarkable and should not be surprising. It must be remembered that if there were no small claims court, credit houses would continue filing just as many of these claims in other courts, where all the advantages are on the side of the plaintiff and none on the side of the defendant.

There seems to be universal agreement that it is far better to have these claims channeled into a small claims court where the defendant has the benefit of lower costs, assistance by the clerk, night sessions when necessary, minimum loss of time, mandatory conciliation by the judge, informal trial procedure, the privilege of installment payments, and the other attributes of a system which gives assurance that justice is not too expensive for the poor.

Frank H. Myers, Washington, D. C., has been an Associate Judge of the Municipal Court for the District of Columbia since 1948. During the same period he has been adjunct professor of law at the George Washington University Law School. He was previously engaged in the private practice of law.

CONCLUSION

The operation of the Small Claims Branch for the past fifteen years has definitely proved it to be an outstanding success in the judicial and social fields.

The poor litigant now knows from experience that he can have his day in court at minimum cost, his case informally and expeditiously handled without delay or confusion, and yet be assured that the same substantive law will be determinative of his case, whether he be plaintiff or defendant, as is applied in the higher courts in cases involving much larger amounts and the expense of legal counsel. As the late Justice Wiley Rutledge of the Supreme Court of the United States said:

We have a fine illustration in the District of Columbia of what can be done through establishing small claims courts. . . . The result is that the citizen does not feel that the system of justice is a system for the rich and the well-to-do, and not one for the average or poor man. He has entry to a tribunal which disposes of business, expeditiously and justly. . . .²¹

²¹ From an address by Judge Rutledge (then an Associate Judge of the United States Court of Appeals for the District of Columbia) before the Fifth Open Meeting of the Committee on Legal Aid Work at the Claypool Hotel, Indianapolis, Indiana, September 29, 1941.

Family Problems and the Court

By EARL LOMON KOOS

A PRESSING problem confronting the American social order is that of preserving and strengthening the family. It is no exaggeration to say that satisfactory family life is basic to all adequate social relations; for a primary function of the family is its contribution to the development and fulfillment of human personalities, and personalities that are inadequately developed or unfulfilled are incapable of assuming membership in the society.

It is no exaggeration, either, to say that American families have in recent decades been subjected to extraordinary stresses, and expected to meet unusual demands. The increasing urbanization, industrialization, and mobility of our society, the lessening of sacred controls upon our ways of thinking and doing, and the increasing and sometimes ill-defined emphasis upon personal freedom—coupled with the social effects of two world wars and a continuing "police action"—have all posed problems of impressive dimensions for the family.

Our society's efforts to aid the family have often been sketchy, sometimes ill advised, and rarely co-ordinated. Each discipline which views the family as its responsibility has moved with only a partial interdependence "to do something about the family." Governmental agencies have assumed responsibility, to an increasing degree, for measures aimed at stabilizing and guaranteeing the economic function of the family through social security measures of one sort or another. Social agencies have increasingly assumed responsibility for providing the family with counseling for its interpersonal problems, the school with guidance and therapy in the rearing of

its children, the church with religious indoctrination for its members, and so on. But divorce, desertion, nonsupport, and other evidences of family instability continue to exhibit themselves at an alarming rate, and with no significant decreases in sight.

FUNCTION OF THE FAMILY COURT

It is evident, then, that something must be done if the family is to perform adequately the tasks that are essential for the future welfare of the society. The answer lies, apparently, not simply in providing more and better social aids to the family, but in developing some one focal agency that can serve as an integrating and co-ordinating functionary. It is the thesis of this article that the family court (however named), differently conceived as to philosophy and revised as to function, may serve that purpose.

Such a thesis is based on two convictions that are shared by most people in our society: (1) that any complex society can function only within a framework of ordered, recognized, and accepted authority (which is not at all antithetic to democratic living), and (2) that the court, by virtue of its socially sanctioned position in the community, can move purposively in helping to solve human problems as no independent social agency can (which does not deny the rights inherent in personal freedom in democracy).

The latter statement may be countered with "You can't make people do what is good for them." In reply it need only be said that in matters where the public welfare is involved (for example, in matters of public health and

education), society constantly "makes" its members pursue certain courses of action by defining and enforcing penalties for noncompliance. No court can "make" its petitioners move from misery back to happiness, but it can insist that they expose themselves to such measures as may aid them in so moving. The final choice lies with the family members, but they will have been helped at least to the extent that they are able to accept and use that help. Beyond this point, no democratic society can go.

LEGAL CONCEPTS INAPPLICABLE

In considering the relation of the court to family problems, two concepts basic in law appear to need sharp modification. The concept of *guilt* appears to have little place in matters dealing with family interrelationships, since responsibility for the distortion of such relationships is very rarely unilateral; yet the courts are presently required to view family situations in terms of the guilty and the aggrieved, regardless of the evidence (implicit, if not introduced). Secondly, the concept of *justice*—now basic in the usual court actions regarding family problems—needs modification, since the family in trouble is less in need of "a determination of the rightfulness or lawfulness of conduct" than it is of having the family members *brought into a working relation with each other* in the light of their aspirations, drives, roles, and personality needs.

To the family sociologist, the latter appears to be the sine qua non of any effort to deal with the problems of the family. For the family in trouble is one in which the interrelationships either have never been adequately developed, or, once having been developed, have been forced askew by one or another happening, either intra- or extra-mural. The need of a family in trouble, therefore, is not to have guilt or innocence

adjudicated and the lawfulness of conduct established, but rather to have (1) the causes of its troubles assayed, (2) the social and psychological milieu evaluated for its strengths and weaknesses, and (3) proper institutional aids¹ made available in the correction of the conditions that create the problems.

SCOPE OF COURT ACTIVITY

To suggest that the court become the "nerve center" for the treatment of all family problems is to be unrealistic. The problems to which the family is heir range over a broad continuum. At one end are situations in which the maximum values of family life are not attained, but which have only very indirect social consequences. For example, in family A (representing this end of the continuum) the husband and wife have difficulties in their interpersonal relations because of an inadequate sexual adjustment. This couple have no desire to break the marriage; their children are neither abused nor neglected; their contributions to society continue. At the other end of the continuum is family B, in which the husband and wife have little in common, seek satisfaction of their needs outside the marital relationship, neglect their children (and contribute to *their* delinquency in so doing), and will do almost anything to break off the family relationships.

Family A's problem is hardly within the scope of court activity, unless we are willing to extend our philosophy of the place of the state in the life of the individual and the family. Family B's problems, in contrast, involve a violation of the laws or stateways—those expected ways of behaving deemed so important for the common good as to require definition and enforcement by the

¹ As used here, institutional aids are those agencies and professional personnel constituted by society for the alleviation of human needs.

state through the law and the courts. Family A's problem requires assistance if it is to be solved (or at least not to develop further), and society provides increasingly for such assistance, through clinics, social agencies, and professional personnel. Family B's problems, in contrast, require the intervention of the court, which is also provided by society. The clinic and the social agency would probably be inadequate to meet the needs of family B, just as the services of the court would not be required for meeting family A's problem at its present stage.

It is possible to draw a reasonably definite line between the cases to be served by the court and those to be treated in other ways, for there is a distinction between cases that involve violations of the law and those that do not. It is not possible to draw a sharp line between the professional resources to be used by the court and those to be used by other agencies: the court, in attempting to meet family B's problems *must bring into play the same resources that can meet family A's problems*, since the petition by a family member for annulment, separation, or divorce is itself a symbol of a need for more than adjudication.

ADJUNCT SERVICES NEEDED

It is no reflection upon the court (or its agent, the lawyer) to suggest that "outside" resources are needed for the meeting of family problems. As Judge Paul W. Alexander has indicated:

Too often when the lawyer relies on his own skills to reunite the estranged couple, he merely postpones the denouement. He hears all about the symptoms, the overt acts and omissions. But he does not discover the causal factor or factors and eradicate or change them. He corrects nothing. He effects no cure. He sends the same two people back together, the same as when they separated, and the same un-

derlying cause is still lurking there to get in its deadly work.²

It is precisely this need to "discover the causal factor or factors and eradicate or change them" that psychiatrists, marriage counselors, and family casework agencies are professionally equipped to meet. It is no disparagement of judges or lawyers to say that they are not equipped to make such discoveries or to effect such changes. Lawyers are specialists in one field; behavior scientists and practitioners in quite different fields.

This is not to suggest that "never the twain shall meet" or understand one another; it is to say that each specialist brings his own particular interests, abilities, and techniques to bear upon any given marital problem. Since marital problems rarely have a single or simple cause, more than one specialist needs to be brought into the picture.

Alcoholism, for example, may be the *precipitating* factor which moves a family into the position where divorce appears to be the only solution of the problem; but what factors underlie the "guilty" person's resorting to alcohol as a way out of his difficulties? And what means can be employed to restore this moribund marriage? The psychiatrist, the marriage counselor, the psychologist, the social worker, and even the internist—two or three or even more of these may have to be brought into the picture if the marriage is to be restored.

If the court grants a divorce after establishing only the "superficial" *fact* of alcoholism (as is necessarily the case in most jurisdictions today), it does nothing to further the lives of the individuals involved; *it only certifies the family's failure*. And failure of the family to achieve its goals is the very thing society hopes to prevent. It appears,

² "Public Services by Lawyers in the Field of Divorce," 13 *Ohio St. L. J.* 13, 19 (1952).

therefore, that the court, dealing as it does with those cases in which the problems of the family have become so acute as to involve violation of the stateways, needs to invoke all the extralegal services that it can command.

The court that can adequately serve the family cannot work in an icy apartness from such social agencies as the community affords. It would be naïve to suggest that the court contain within its own structure all the manifold services needed for meeting family problems. This would be unnecessary duplication of effort, and uneconomical of both money and personnel. It would, in fact, be almost impossible, since there is an acute shortage of most types of personnel needed for meeting family problems.

The need, then, is (1) that such a court be thoroughly conversant with all the services available for meeting family problems, (2) that it recognize its own limitations in providing diagnosis and treatment, (3) that it be willing to see treatment *per se* taken outside the confines of the court, and (4) that the social agencies be helped to see and to develop their possible contributions to the family *within the jurisdictional framework*.

FAMILY-RELATED DIFFICULTIES

To this point the discussion has been concerned with the problems associated with or expressed in marital relationships. These show themselves in the usual petitions: for divorce, separation, annulment, and so on. Other problems severe enough to involve violation of the stateways—and therefore the concern of the court—are equally related to the family's *not* being a "unity of interacting personalities."

The child brought into children's court for stealing, the father haled into police court as a result of his weekly "spree"

—these are only two examples of the antisocial behavior which can result from family dysfunction. Both of these individuals may have their aberrant behavior rooted in family situations. The child's delinquent behavior may be an unconscious compensation for his family's disaffection; the father's spree an unconscious effort to gain release from the tensions of living in too few rooms with too many children and a chronically ill wife. It surely is not enough to find the individual not guilty or guilty, to free or to punish him, and to assure him due process of law.

Society has long since accepted the idea that the child should be dealt with as an individual, and that the services of extralegal personnel should be brought to bear upon his problem. In at least a few cases, the psychiatrist and the psychologist have joined the probation officer-caseworker as members of the staff of the court. Time and interpretation have erased the early criticism of the "warping of the function of the court," where children are concerned, and the underlying philosophy of the juvenile court has been accepted as socially provident.

In some cases, similar acceptance has been accorded the so-called family court, although to a less degree. It needs to be kept in mind, however, that most of these so-called family courts are usually conceived of as marital-relations-problems courts. Their purpose is broadly defined, but their field of operation is narrowly confined.

COURT JURISDICTION

It is our conviction that such courts must be established where they do not now exist (at least in urbanized areas), and also that the family courts now functioning must be enlarged, as to both philosophy and jurisdiction. In a recent article, Judge Paul W. Alexander

TABLE 1—COURTS WITH JURISDICTION OVER VARIOUS FAMILY PROBLEMS*

Problem	Trial Court	Equity Court	Domestic Relations Court	Juvenile Court	Felony Court	Police Court	Probate Court

* This table is abbreviated from that given by Judge Paul W. Alexander in his "The Family Court of the Future," 36 *Journal of the American Judicature Society* 38 (1952). Used by permission of the author and the Journal. This is a bird's-eye view of the national picture. The jurisdiction of particular courts varies from state to state.

has pointed up the multiplicity of courts whose jurisdictions encompass family problems (see Table 1).

It is apparent from this compilation that there is not only a duplication of jurisdiction, but also—and more important—an uneven application of justice. Other things being equal, the quality of justice is likely to be lower in a mayor's or justice of the peace court than in a superior court; yet both of these (and three other types of courts) may adjudicate a case of bastardy. The picture is even more disturbing when it is realized that such a case may be "treated" in a court using specialized techniques, mentioned earlier (domestic relations or juvenile court), or adjudicated in the catch-as-catch-can atmosphere of the justice's court.

It is therefore sad but true that under the existing system there is no such thing as equal justice; the quality of justice depends upon the court in which the family happens to find itself. When this is coupled with the fact that only

the domestic relations and juvenile courts ordinarily use even in part the specialized techniques suggested, the plight of the family with problems involving the stateways is seen to be a serious one.

Many of the cases now reaching the broad array of courts are in no sense family-engendered; others are directly related to the family's dysfunction. In many of the latter it does not take a skilled family diagnostician to learn of the effective presence of a "family situation." Any police court judge, for example, can tell of innumerable cases in which the dysfunction of the family was apparent in the evidence placed before him. But he will also say that "it isn't my job to do anything about the prisoner's family"; "I've got only a few minutes to deal with the case, anyway"; "the prisoner broke the law or he didn't—that's all I have to decide; the rest is none of my business."³

³ These are the reasons given by a police court judge to the writer's students for his

There is no suggestion that the police court should deal with the family aspects of such problems, for we have already indicated that this is a matter for specialists. There is every reason to suggest, however, that such a case should not be allowed to end in police court, but should be referred to an appropriately staffed family problems court—not for adjudication of the act which placed the individual in jeopardy, but for possible assistance in meeting the family's situation. In effect this means that the several courts of the legal system become *channels* through which cases involving family problems reach a "court of treatment" rather than simply a "court of justice" (in the latter case with the family problem ignored or inadequately handled).

It will immediately be suggested that such an arrangement is in effect placing the individual in double jeopardy—that is, subjecting him to two adjudications for one offense. Such a suggestion can be made, however, only if one ignores the earlier statement that the function of the family-problems court is not one of determining guilt or innocence, but of providing a socially sanctioned milieu within which treatment can be had, if the individuals concerned are willing to accept such treatment.

PROBLEMS TO BE FACED

It is admitted, in this connection, that problems involving the interrelationships of the several courts must be faced, but these would appear to be no greater than those faced in past years as new courts and new procedures were introduced into the legal system.

It is also admitted that society faces an even more fundamental problem—that of defining the areas in which

neglect of "social" factors in hearing a case at which they were present.

courts function as adjudicative and as treatment agencies. It should be re-emphasized that the concepts of guilt and justice are of secondary importance in a consideration of the family's problems. As society accepted the philosophy of the children's court, so must it accept an even broader philosophy of the family-problems court. Instead of giving "serial consideration" to cases which involve family relationships, the emphasis will necessarily be upon a collateral consideration of those problems, as was suggested earlier.

It is fairly obvious that not all of this can be done under existing constitutional provisions, but the necessary changes are not impossible to make if contemporary social conditions require them. There is ample evidence in the history of American constitutional government to warrant this statement. It is in this area that the legal profession is challenged to do its most original and provocative pioneering, and to overcome the cultural lag that characterizes much of our thinking regarding the family and its problems.

JUDGE AND LAWYER

Given the necessary changes in the traditional, constitutionally validated concepts, and with the problems associated with the interrelationships of the several courts solved, the family-problems court may still fall short of its goals. No court, however well conceived, can perform its functions if the judge thereof does not accept its basic philosophy or is incapable of guiding its activities. Whether the judge of such a court can best be chosen through a competitive general election or by special appointment is a moot question, but that the judge must have special qualifications seems indubitable.

The role of the judge in a court such as is here envisaged requires not only

a knowledge of the law and an ability to apply Aristotelian logic to the intricacies of a case, but also—and equally important—an intuitive sensitivity to the subtle nuances of human relationships. This last quality is not taught in law school; it is not learned; it is a component of a unique type of personality. In other words, not every judge, however competent he may be, is able to assume the roles demanded of the judge in a family-problems court.

The role of the lawyer in such a court is a minor one. It is doubtful, however, that the "technological unemployment" resulting from the establishment of such courts will be of serious moment, except in a few instances and a few localities. The lawyer is still needed for those aspects of the family's troubles that are handled by trial courts, and takes a minor role only in those aspects handled by the specialized court here proposed.

Also, as the writer has shown,⁴ there is a tremendous unmet need for legal services which will be satisfied only as the legal profession makes better known the scope of its supportive services to the "normal" family.

In summation, then, the family that is deep in troubles which involve the law and are family-engendered needs not justice and the fixing of guilt, but the skills of the counselor—the psychiatrist, the psychologist, and the caseworker. To provide these, society can only redesign its court structure so that cases with family dysfunction are channeled to a court which conceives its job to be that of aiding the family to re-establish itself, rather than of certifying its inadequacies.

Labor Arbitration and the Individual Worker

By LOUIS L. JAFFE

LABOR arbitration is bringing law into the life of the individual worker in a new, intimate, and exciting sense. Here due process for the individual is being made vividly real with the most surprising economy of means, and with an innocent simplicity which masks the significance of the achievement as it also glosses over the inevitable dangers which condition accomplishment.

We do not refer to the determination by arbitrators of the provisions of the labor agreement. However important that may be in settling from period to period the general terms of the worker's employment, his representatives rather than he are the actors in the drama. It is legislation rather than adjudication. But the day-to-day working relationship begets all sorts of questions—some of them questions of interpreting the basic agreement, some of them questions essentially of the worth and performance of the individual man. In the arbitration of such disputes—particularly the latter—the worker may have a distinctly personal stake.

ARBITRATION AN ADJUNCT OF COLLECTIVE BARGAINING

However, even when the arbitration concerns an individual worker, not he but a trade union is the formal party to it. Arbitration as an institution is an adjunct of collective bargaining. The situation is thus comparable to an international dispute, where, though the subject matter concerns the interest of individuals, the parties are sovereign states. It is, of course, possible for an employer and an employee to agree to arbitrate a dispute. But the worker

acting alone would have little chance to compel the employer adversary to agree to the appointment of an arbitrator. An employee's only resource is to quit or suffer discharge. In cases where he is seeking to retain his employment on his own terms, these devices are ordinarily ineffective. If the employer has broken a contract with the employee, the employee can appeal to the expensive process of the courts. But most individual employments are at will, and the discharge, however inequitable, is not a breach of contract.

There has been a phenomenal increase in the arbitration of labor disputes due to the growth of trade union strength. It was estimated in 1946 by the Bureau of Labor Statistics that fifteen million workers were covered by collective agreements; and, according to very recent estimates, 90 per cent of these agreements contain arbitration provisions. In 1947 a National Academy of Arbitrators was organized with 36 charter members. Today there are roughly 175 members. This growth is very recent, a product of the New Deal and the Wagner Act. During World War II the War Labor Board, partly in response to union demand, partly to relieve the industrial system of unsolved disputes, and partly to reduce its own dockets, ordered employers to agree to arbitration clauses.

Traditionally, labor has sought a contract, and—at least in recent years—as part of the contract, an agreement to arbitrate disputes arising under and during the life of the contract. One of the objectives has been to curb the absolute power of employers to discipline and discharge. The contract may con-

tain a specific clause prohibiting arbitrary layoff or discharge; but even where it does not, the agreement to arbitrate "grievances" will usually suffice to ground jurisdiction of a claim that a layoff or a discharge is arbitrary. Arbitration clauses vary, and some (for example one limited to questions of "interpretation" of the agreement) may be held to exclude questions of individual worker performance.

THE UNION CONTROLS ACCESS TO ARBITRATION

It follows from what has been said that the union controls the worker's access to the arbitration process. This is only the more obvious where there is not a permanent arbitrator, and the employer and the union must agree on an arbitrator for each dispute; but in any case, it is a corollary of the fact that arbitration is a term of the contract to which the employer and the union are the contracting parties. Furthermore, the union pays part of the arbitrator's fee, whether it is per arbitration or an annual stipend. The aggrieved employee must seek the good offices of the union.

Occasionally a union may arbitrate a claim which it believes ill founded, in order to please or placate the grieving employee. Thus the arbitrator, an outsider to the enterprise, is brought in to relieve the union of its primary responsibility of decision. This is thought by some to be an abuse of the process; but it may in some measure be justified insofar as arbitration is conceived of as individual rather than group protection. If the griever is not a member, the union may refuse to arbitrate his grievance. This may be a tactic to induce him to join. Even if he is a member, the union may believe that the claim is unfounded and may refuse to arbitrate, either because it is impolitic to harass

the employer or because it is not worth the expenditure of funds.

A claim of one employee—as in the interpretation of a seniority provision—may be essentially a claim against a fellow employee. The union may refuse to process the claim because it prefers one interpretation to another. In so doing, it may be acting in good faith or it may be favoring one group or person at the expense of another.

I do not make these points to belittle the great worth of arbitration to the individual, but rather to make clear the basic structure of the institution. Labor arbitration makes a vitally important contribution to individual justice, but the individual receives justice (when he does) as a member of a group whose mediation he must secure.

It is true that the Supreme Court has imposed limits on the power of a collective bargaining agent. It will be remembered that under the Wagner Act a union chosen by the majority of a bargaining unit is the exclusive bargaining representative of all employees whether they be members of the union or not. Indeed, it has been held at least by some administrative authorities that a union may be the exclusive agent of employees, Negroes for example, whom it refuses to admit to membership. But the Supreme Court has held that the union cannot unfairly discriminate against any of the employees it represents. Therefore, a nonmember might complain of outright refusal to make arbitration available. This is an important and valuable principle. But in practice, judicial action to compel equal treatment is clumsy and ineffective because of the necessarily large area of discretion of the union and its officers.

This whole situation once more illustrates the proposition that in many crucial areas of our society the individual's interest is protected only insofar as the

dominant groups are able and willing to give protection. Here it is they who establish the substance of the employee's rights and control the tribunal for their enforcement. It is true that a worker may secure a negotiated settlement without the intervention of the union, but the union is likely to resist being bypassed in this way.

The contract normally provides a route for processing grievances before resort to arbitration. The grievance procedure is divided into steps, each step involving a conference between a union official and a member of management of comparable rank. If the grievance is not resolved at the lower level by, let us say, a conference between a union shop steward and a foreman, it must go one step higher.

A union frequently demands that grievances be processed exclusively by its officials. It argues that the settlement of grievances is part of the collective bargaining process, and that, as the exclusive representative for collective bargaining, it alone is competent. But under the Taft-Hartley Act the employer is free to settle a grievance directly with an employee, though the union is entitled to intervene to prevent discrimination or misinterpretation of the contract. It is not clear, however, that the employer has any obligation to treat directly. When the employer's relation to labor is mature and effective, its policy may be to deal solely with the union.

ARBITRATION PROTECTS JOB RIGHTS

From the point of view of the individual worker, labor arbitration has two aspects. The more obvious and tangible is the creation and enforcement of job rights. Less obvious is the employee's participation in the enforcement process itself. The agreement ordinarily provides for rates of pay, overtime, job

classification, vacations, and seniority. Seniority may apply only to layoffs, or it may apply to promotions as well.

THE PROBLEM OF CONTRACT INTERPRETATION

Such provisions, however well drafted will from time to time require interpretation as unforeseen circumstances arise. The question may concern a great number of employees or only a few or one. I choose from my own experience as an arbitrator one case to illustrate the character of such disputes and the basic nature of the problem involved in them.

A corporation regularly engaged in engineering operated (during the last war) a foundry on leased property. The labor agreement provided that employees who had been "in continuous service one or more years as of July 1, 1946" should receive a vacation with pay at the employee's rate for the 8 weeks preceding July 1. The employee, to be eligible, must have worked at least 40 weeks during the year in question. Vacations were to be taken between July 1 and September 15. Early in June the company decided to discontinue the foundry operation permanently, and gave quit notices between June 14 and June 29. The union argued that the vacation was earned if 40 weeks had been worked in the year ending July 1. The company argued that the workers must be employed "as of July 1." It was clear that the parties drafted the agreement on the assumption that the plant would be in operation on July 1. The contract was drafted in March. Though it was known that the lessor would probably terminate the lease, it was apparently assumed (by the union at least) that another location would be found.

I decided the case in favor of the company.

Question of jurisdiction

One of the perennial problems of contract law is what to do when unforeseen circumstances arise. How far should a court seek from the specific contractual arrangements to generalize the purpose of the parties and from that generalization work out a solution which the parties might have made or which is "fair" as the court sees it? As far as the courts are concerned, there is no standard "answer" to this problem. But it takes on an additional dimension of difficulty in arbitration. It is argued by some that an arbitrator is meant to have broader powers "to do equity" than a judge, that he is to create solutions pursuant not only to the spirit of the contract but even pursuant to sound principles of labor relations. On the other hand, it is argued that the arbitrator's jurisdiction is to "interpret" or "apply" the agreement.

It is almost impossible to discover the expectation of the parties in this connection, or whether, indeed, they have a fixed expectation. Perhaps, since labor is usually the griever, it more often appeals to the "spirit" as against the "letter." But arbitrators have observed that labor can be as technical, indeed as ingeniously technical, as any lawyer when its purpose is thus served. This may be mere self-serving, but it may also be the layman's idea of "playing the game."

In every layman there is the root of a lawyer, sometimes unpruned and unmitigated by the potentially domesticating effect of a legal education. From time immemorial, the layman has easily fallen prey to word fetishism; and, after all, he argues, a contract is technical, precise, defined. This is his act. It is not for the arbitrator to substitute a different one.

Furthermore, it should be remem-

bered that a labor agreement resolves a large number of disparate issues. Agreement has probably been reached by compromise. Therefore, some of the solutions are arbitrary; that is, they fall short of the principles they may be thought to exemplify. If the arbitrator, then, isolates one provision and by reference to a generalization of its purpose shears that provision of its arbitrary excrescences, in appealing to the spirit of the provision he may be violating the spirit of the bargain.

The mood of the contract

Another way of putting the problem is that before a judge knows whether to decide according to the letter or the spirit he must (if he is to respect the autonomy of the parties) discover in what mood the contract was negotiated. There is thus no single right "mood" for parsing a contract; it may vary from plant to plant, from union to union, and from time to time.

This whole ambivalence of the parties concerning the arbitrator's role is one of its chief hazards. To maintain authority the arbitrator must accept the premises which in the view of the parties are the foundations and operative principles of his authority. The arbitrator who is thought to have violated either the letter or the spirit may be put down as pro-employer or pro-union, and his authority vanishes. Accordingly, there has in the past been a considerable turnover among arbitrators. Perhaps as arbitration becomes more common the parties will come to recognize that there is an ineluctable dilemma here which cannot be resolved by a mere change of arbitrators.

The permanent arbitrator may have an advantage in this respect, as he does in others. Because of his greater opportunity for observing the parties, he can discover their premises, and by ar-

gument and example he may enable them to arrive at a satisfactory consensus.

The vacation case

Was my decision in the vacation case contrary to the "spirit" or the underlying purpose of the agreement? Yes, if vacation is conceived of as no more than a contemporaneously earned increment to regular pay. No, if vacation is conceived of as a time for refreshment within the context of an ongoing relation.

This conflict in possible major premises shows the not uncommon difficulty of devising a substitute bargain for the one that the parties appear to have made. The assumption on which the contract was based had failed, but I had no assurance what the contract would have been had the circumstances been foreseen. I took note that many contracts of the time provided specifically for the treatment of termination or layoff and sometimes made different vacation provisions for such a situation.

I am not, however, insisting that my judgment was correct. My lawyer friends were in violent disagreement; and I found it the most troublesome of my cases. I offer it by way of illustration, not of self-justification.

THE DILEMMA OF JOB PROTECTION

The most significant of all cases for the individual worker arises when the employer seeks to discharge or penalize him for misconduct or inefficiency. Typically the American industrial worker has been employed at will and could be fired for any or no reason. It is still the case that he is not protected against layoff for lack of work. But the collective agreement may protect him against unfair discharge or penal layoff. This job protection is of growing importance in a society in which security has become a predominant concern. Further-

more, the collective agreement may provide a number of collateral advantages which depend on tenure, such as paid vacations, sickness benefits, and old-age pensions.

But if this is the most vital area of arbitration, it is at the same time the most sensitive and problematic. The infinite patience and pliability of the machine may blind us to the fact that at bottom the able and willing worker is an irreducible element of production. Responsibility for production must be squarely assigned, and under our system it is assigned to the employer. This responsibility is ultimately sanctioned by the financial success or failure of the enterprise; though, of course, many judgments can be made without fear of the ultimate sanction, and in large oligopolistic enterprise the day of judgment may be of almost Biblical remoteness.

Ability or willingness—or their absence—may to a considerable degree be measured or manifested by objective tests of performance and by commonly accepted signs. But there remains an area of the intangible where judgment must derive from an expert intuition. This is particularly true of those qualities of character which are necessary to the discipline and good order of the plant. A disposition to discredit management or sour the morale of the plant may be more easily detected than demonstrated.

Hazards of arbitration

There are obvious dangers, as there are advantages, in forcing management to submit its decisions to the overriding judgment of an outsider. The arbitrator will insist that management justify its activities by records and outward signs. Since by definition he is outside of the situation, he is removed from the cumulative effect of the infinite detail whose sum is intuition. Generally this

insistence on signs has great value, because it prods management to keep better records, to discover new devices for measurement, and thus to increase the resources for objective judgment. The arbitrator, too, if chosen permanently, may penetrate sympathetically through the overdefined surfaces to the stuff of the case. But the hazards of arbitration are unavoidable: the arbitrator cast in the seat of judgment is subject to the strong pressure of a particular man fighting for his job and his reputation, an interest more humanly appealing than the abstractions of management prerogative and responsibility.

Furthermore, the area of management power is undergoing continuous reinterpretation under pressure, for example, from the unions and the very arbitration process itself. The power necessary to ensure responsibility and the power which will be tolerated are in part determined by tradition, but the tradition is itself under attack. Arbitration is, therefore, a perilously intuitive process.

The gear-cutter case

I can perhaps illustrate the point in a small way by a case which I handled some years ago. A worker had, over a period of six years, progressed through the successive grades of gear cutter; that is, from the cutting of small standard gears to the cutting of large, expensive, custom-made gears. His work had for six years been exemplary; but eight months after going on the large gears he began a series of costly errors, two in May and the final one in September. The company discharged him, and then by way of settlement offered him a job as grinder, which was inferior to all the gear-cutter jobs. He refused the offer.

I decided that the worker was properly removed from the cutting of large

gears, but ordered that he be returned to cutting of small gears. It appeared to me that he was under the influence of some unexplained tension of a possibly temporary character; that his six years of good work should not go for naught, and that his skill should at least be tried out under circumstances involving less tension for him and relatively inconsequential risks for the company.

I was told that both union and company were much dissatisfied with my award; but only some years later, on the occasion of writing these remarks, did I inquire why. I found first that the parties had agreed to ignore my award and settle the controversy by putting the worker on a job just a notch above common labor, involving no skilled responsibility whatever—a job which he still holds.

The company believed that once I had found that he was not competent to hold his job, my function was exhausted; in assuming to "solve" the problem of future relationship I had exercised a responsibility and a jurisdiction that were not mine.

The union's explanation was more curious. The local union, it appeared, had decided that the grievance was not meritorious and had refused to process it. The worker had then appealed to international officers and they had brought pressure to bear on the local. My award put them in the wrong.

The reason, by the way, as it would now seem, for the worker's poor performance was that he was secretly working another shift in some other plant!

I do not mean to confess error, but the case is another example of how difficult it is for the arbitrator to determine his role. The arbitrator runs the risk of supplanting the responsibility not only of management but (as it appears here) of the union as well. The question of jurisdiction is not a mere quarrel over

technical phrases; it is the question of the effective allocation of spheres of responsibility.

So much, then, for the substantive aspects of arbitration as it affects the worker. It has its dangers and its costs, but it is among the most significant institutions in developing a jurisprudence for the rational protection of the ordinary man's job status, which of all his economic interests is the most central and pervasive.

ARBITRATION IS CHEAP AND EXPEDITIOUS

But the process itself has an interest for the ordinary litigant which among legal processes is probably unique. First let it be said (though this is not the primary point) that by the usual tests the procedure is extraordinarily effective and efficient. The individual, of course, pays nothing for it directly, though the union's share of the cost is covered by dues. But arbitration is comparatively cheap for the union. Arbitrators' fees are modest (with occasional exception). The case is presented by a group of union officials, some of them fellow employees and a few international officers whose salaries are also modest. Sometimes, but not often, a lawyer is brought in. The arbitration may be held in the plant. If neutral ground is desirable, a hotel room is hired. There is usually no stenographer. The number of awards appealed to a court is almost infinitesimal.

The process is exceptionally speedy: an arbitrator may be had on notice of a week to four weeks; the hearing itself will average a half-day (one to four hours); the award will be made in one to four weeks.

To all of these figures there may be striking exceptions, but they give, I think, a fair idea of the average. Nothing cheaper or speedier in the administration of justice could be imagined.

ARBITRATION IS EDUCATIONAL

Arbitration (and here is the point) is a school, an arena, a theater. Everyone both participates and observes. The whole company of actors—arbitrator, union and employer officials, the griever, and the witnesses (mostly employees)—sits at one table. Argument, assertion, testimony, charge and countercharge, even angry abuse—sometimes spontaneous, sometimes "for the record"—flow freely in quick, continuous intercourse. The arbitrator may let the discussion take its head for a moment, then rein it in; an occasional question, a request for clarification. Because the process is relatively free, it may assume many forms, some quiet and orderly, some volatile and discordant. The form is in fact a function of the general labor relations—of the maturity, the degree of mutual understanding and respect, the intelligence, of the opposing officials.

The administration of justice can be educational in a profoundly important sense. It attempts not merely to settle a dispute, but in settling it to exemplify the social premises in a fashion intended to heighten understanding and adherence. From this point of view, arbitration has advantages over the judicial process.

The court is by design raised above the stream of life, enshrined in a dignified temple, petitioned through a learned caste. Though it commands his respect, it may chill and baffle the understanding of the simple man.

Arbitration takes its stand in the very current of industrial life. The scene, the dramatis personae, the vocabulary, being familiar, raise no barriers to comprehension. The worker sees his case analyzed by his leaders, among whom I include employer as well as union officials. They reveal the clashing propositions at the heart of the grievance. The arbitrator relates his answer to

basic industrial premises. The worker is provoked to think and to feel in general terms, to see his predicament, as it were, *sub specie aeternitatis*.

Though the cost of the lesson may be too great to make it acceptable to the grieving worker, we must not forget that the arbitration is a co-operative, an organizational, process involving co-workers and supervisory staff. Everyone, too, may play a part in the actual proceeding, free of the hindrance of rigid judicial protocol—an opportunity for expression which is valuable in itself. Under optimum conditions arbitration can be an integral part of the industrial process, rationalizing it to the worker in a way to win his understanding and acceptance.

THE PERILS OF ARBITRATION

In all this there are great potential gains. We can hope that the two twin aims are promoted: the maintenance and recharging of the industrial process itself and a broadening of the base of personal satisfactions. But, because the arbitration process satisfies our postulates of self-expression, rationalization, and judicialization, because its forms appear to express the means and ends we loosely label "democratic," we must not be smugly oblivious of its dangers.

The success of an industrial enterprise, as of any other, requires a basic minimum of loyalty and identification, a willingness to co-operate. Our system vests in management the dispositive power and responsibility for production, with at most a veto in labor. Thus, one of the most powerful incentives to organization loyalty, the sense of participation, may operate weakly on labor. Labor may fail to cultivate a sympathetic understanding of the conditions necessary for effective operation, and is easily alienated.

Arbitration under favoring conditions

may promote the necessary understanding. A management and international union officials gifted in the arts of exposition and persuasion may find in arbitration an impressive forum. But the contentious character of arbitration does not always promote the psychology of integration. It originates in a sense of grievance, it intensifies personal factors. The articulation of differences is likely to exaggerate them. It emphasizes the dramatic moment of conflict at the expense of the ongoing process.

The worker, too, however shrewd or ingenious, may have a relatively limited experience and knowledge. He may lack the comprehension necessary for the understanding of the conditions of the enterprise or of enterprises in general. He may be unable to understand or accept as just a resolution of his very personal problem in terms of large generalities.

Arbitration shares with the judicial process certain weaknesses in fact-finding which are characteristic of litigious investigation. In some respects it exaggerates them. Self-interest is a notorious distorter. But loyalty to the worker group, and fear of it, operate more powerfully in arbitration than in court. It is sometimes pathetic to see a worker witness struggling with the truth in the presence of his co-workers. The very strength of arbitration, its closeness to the life situation, is here its weakness. The arbitrator lacks some of the judicial resources for coping with it. There is no formal sanction for truth-telling. Testimony is rarely given under oath. The arbitrator commands but few of the awesome resources of the judge, his principal reliance being his own personal moral authority. The fact-finding process is strongest where it rests on technical data, on a continuously observed sequence; weakest where disinterested observation is required.

A LITTLE ARBITRATION IS BETTER THAN A LOT OF IT

Arbitration has thus a limited utility. Frequent resort to it, particularly where marked by irascibility and ill will, may be a sign not of the triumph of law but of poor labor relations. Under such conditions arbitration at best provides a moment of uneasy truce, and at worst only exacerbates hostility.

In short, arbitration cannot itself undertake the task of evolving effective

labor relations. That rests on the creation by the parties themselves of the conditions of continuing agreement and co-operation. But once given these conditions, the occasional use of arbitration and its very availability sanction a rational, equitable application of the basic charter. Within certain limits, then, labor arbitration effectively protects the industrial interest of the individual worker. These private tribunals are among the best expressions of the American conceptions of democracy and due process of law.

Louis L. Jaffe, Cambridge, Massachusetts, is Byrne Professor of Administrative Law at Harvard University, and was formerly dean of the Buffalo Law School. He has had a varied experience in labor relations, having served with the National Labor Relations Board and the War Labor Board and as private arbitrator.

The Problem of Administering Small Estates

By PAUL E. BASYE

WHEN the head of a household passes away, one concern of his surviving family is quite naturally to obtain with minimum delay such resources as may be available in order to facilitate re-establishing its stability as a social unit. Distribution procedures are subject to considerable variation, however, not only according to the value of the estate but also geographically. Legislative revisions of procedure occur from time to time, based on the admixture in different degrees of such factors as efficiency and general progress. Study of existing legislation and of trends suggests that increasing attention is being paid to extending aid to dependents confronted with the necessity of seeking new sources of income for sustenance and for the schooling of children.¹

Every lawyer is familiar with laws of inheritance or succession and with laws of administration relating to distribution of funds and property left by the de-

cedent or brought into being by his death. The effectiveness of these laws in expediting the rehabilitation of surviving persons or family groups is of paramount importance and deserving of our best attention. Admittedly, every situation cannot be met with perfect foresight, but the fullest application of our legislative process to the problem should nevertheless be the goal.

SUCCESSION TO PROPERTY WITHOUT ADMINISTRATION

Life insurance

First, the decedent may have left life insurance. At the present time 75 per cent of all families in the United States own life insurance of some kind.² Indeed, more families own life insurance than own any other form of savings. For 1951, life insurance protection averaged \$5,500 per family,³ which corresponds closely to the annual average of national income per family.

Most American families have felt the need to maintain an insurance program, even though it be but a small one. Fortunately for many employees, group life insurance policies are now frequently available as a part of the usual employment relation, whether the individual is otherwise insurable or not. In addition, small industrial policies purchased on

¹ According to *Economic Almanac 1951-1952* (New York: National Industrial Conference Board, 1951), p. 183, the total amount of personal income received in the United States in 1950 was \$224,700,000,000. According to the United States Census for April 1950 the total population was 150,697,000 persons. This would give an "average" income of approximately \$1,500 per person. The average "household" was also given as 3.39 persons (*Economic Almanac 1951-1952*, p. 25). This would indicate annual earnings of approximately \$5,000 per "household." The *Life Insurance Fact Book 1952* (New York: Institute of Life Insurance), p. 12, estimated the national income per "family" to be \$5,500 for 1950 and \$6,200 for 1951. The sources given for these estimates were *Institute of Life Insurance*, *Speculator Year Book*, and *United States Department of Commerce*.

² *Life Insurance Fact Book 1952*, pp. 7-8. Ordinary, group, and industrial life insurance in force in the United States for 1951 approximated \$253 billion. This does not include U. S. Government life insurance of over \$2 billion in force in 1950 on 484,793 individuals. See *Statistical Abstract of the United States 1951*, p. 215.

³ *Life Insurance Fact Book 1952*, p. 7.

the basis of weekly or monthly premiums are not negligible in amount.⁴

Life insurance is payable directly to the beneficiary designated in the policy, and does not form part of one's estate which must be "administered." Furthermore, the proceeds may be paid out to the beneficiary in periodical installments similar to salary. The advisability of having insurance funds received in this manner will depend upon the amount of insurance involved, the age and needs of the beneficiary, and other factors peculiar to the particular family.

Social security benefits

Second, benefits payable under the United States Social Security Act⁵ constitute important resources available to surviving families. In addition to providing old-age benefits, this act provides insurance benefits to a surviving widow or widower and for certain dependent children. This important source of income becomes available to a decedent's family at the time of his death. In 1950 survivorship benefits totaling \$300 million were paid to slightly more than a million recipients under the Social Security and related programs.⁶ These also are usually payable directly to the surviving beneficiaries without administration. They, too, may be payable in monthly installments.

Joint tenancy property

Third, nearly every family owns or holds some property in "joint tenancy," or an equivalent form of ownership, such as tenancy by the entirety. Ordinarily upon the death of either owner the other immediately becomes entitled

to all such holdings. To the student steeped in the folklore of property law, this right of survivorship, or *jus accrescendi* as Blackstone termed it, follows from the proposition that during the joint lives of both tenants, each tenant is seised of the whole and not merely of a share.⁷ A survivor merely continues that seisin unencumbered by a like seisin of the deceased tenant. Here is another means of transmitting property directly without administration.

Among families of ordinary means, some form of joint ownership of property is the rule rather than the exception.⁸ It applies not only to real property, such as the family residence, but extends to bank accounts, shares of stock, deposits in building and loan associations, bonds, and in some states even to the contents of safe deposit boxes. United States Bonds may also be held in a form of co-ownership. Where small amounts of property are involved, this form of ownership has much to recommend it, because it enables the surviving joint tenant to obtain control promptly. With larger amounts it may be undesirable because of the possible effects of income tax, if the surviving joint tenant realizes a profit on the disposition of the property.

Succession by other means

There are other methods for bringing about the transfer of property at death, some effective and others totally ineffective, or questionable at best. People often make out, sign, and acknowl-

⁷ 2 Blackstone, *Commentaries* *183.

⁸ From recent studies made in Wisconsin it appears that more persons within the younger age groups than in older age groups hold property in joint tenancies. It also appears that there is no significant difference among persons of different occupations as to the frequency with which they hold property in joint tenancy. See Edward H. Ward and J. H. Beuscher, "The Inheritance Process in Wisconsin," 1950 *Wis. L. Rev.* 393, 397-399.

⁴ According to the *Life Insurance Fact Book* 1952, p. 8, there was \$58 billion of group life insurance and \$35 billion of industrial life insurance in force in the United States in 1951.

⁵ 12 U.S.C.A. §§ 301-1355.

⁶ *Economic Almanac* 1951-1952, p. 514.

edge a deed to the person they desire to receive their property after death. Only if these deeds are actually delivered do they accomplish their intended purpose. If an executed deed is never delivered, the hopes of the grantor will certainly fail. Similar observations apply to other attempted transfers, including stock and negotiable instruments in particular. Title companies and stock transfer agents will refuse to recognize the transferee as owner, if they know that the grantor has died or are suspicious of the circumstances.

Several well-recognized methods, however, do make transfers of property effective at death. A deed may be irrevocably delivered in escrow to be given to the grantee upon the grantor's death. If this is done, it is advisable to have clear, written evidence as to the delivery and of the grantor's intention as to its irrevocability.

Also, property may be conveyed reserving a life estate in the grantor. Property is often conveyed to a grantee with an oral agreement that the grantor shall have its use during his lifetime, but the possibility of the grantee's violating such agreement makes this method undesirable. Or property may be transferred to a trustee to pay the income derived from it in any designated way and ultimately to transfer it to the desired beneficiaries.

No probate or administration is necessary upon property transferred in any of these ways, although each may have certain disadvantages under particular circumstances. They should be employed only after legal advice and counsel.

Avoidance of administration

It is not necessary that the estate of every decedent be administered. Many persons, particularly young children, die without leaving property justifying for-

mal administration. Surveys made some twenty-five years ago showed that for approximately every four deaths only one required administration.⁹ More recent surveys indicate one administration for approximately every two deaths.¹⁰ According to the latter study, made in Dane County, Wisconsin, administration was had on 42.2 per cent of the estates of all decedents who died in the selected years 1929, 1934, 1939, 1941, and 1944. In four of the five years studied, professional people and proprietors as a group had the highest proportion of estates administered, with an average for all years of 66.2 per cent. Women had the smallest proportion, with an average of 33.1 per cent. The average for all other decedents was 45.6 per cent.

The highest frequency of administration according to age of decedents was in the age group 70-90, and the lowest in age group 20-50.

The average size of estate administered in the Dane County study was slightly more than \$10,000, but 45 per cent had a net worth of less than \$5,000.¹¹ The similar study made by Powell and Looker in 1930 indicated that between 62 and 70 per cent of estates in New York City courts had a value of \$5,000 or less.¹²

According to a recent study in Denver, Colorado, there were 2,100 administrations of estates out of 4,260 deaths in 1949. There were approximately 4,000 inheritance tax applications filed in that year, suggesting that substantially all decedents left some kind of estate, even

⁹ Richard R. Powell and Charles Looker, "Decedents' Estates," 30 *Col. L. Rev.* 919, 922, 923 (1930). See also Thomas E. Atkinson, *Law of Wills* (St. Paul, 1937), p. 538 n. 53.

though formal administration was not always required.¹³

We have seen that putting one's property in joint tenancy, conveying it during lifetime, or creating a trust may be legitimate means to avoid administration. Doubtless there is some dishonest or illegal avoidance, but even when persons leave property normally subject to administration, it has frequently been found legally possible to avoid it.

It is understandable that persons succeeding to property do not wish to wait six months to two years before having it distributed to them, as is required in most states to give creditors time to present their claims.¹⁴

Furthermore, there is a prevailing feeling that administration expenses will consume an excessive portion of the estate. This fear is not fully justified. The Wisconsin study cited above indicated that administration expenses, including court costs and fees of the personal representative and the attorney, ranged from 16.8 per cent in small estates from \$10,000 to \$15,000, to about 3 per cent in estates over \$15,000.¹⁵ However, much could be done to reduce these expenses. Meanwhile the feeling continues, and unquestionably accounts

¹³ Merrill A. Knight, "Simple Devices for the Transfer of Assets without Administration," 27 *Dicta* 277 (1950).

¹⁴ The trend is toward shortening this period. It has been reduced to four months in some states or in small estates. For a survey of these periods see Lewis M. Simes and Paul E. Baeye, *Problems in Probate Law* (1946), p. 325. For a factual study of the time consumed in one community, see Ward and Beuscher, *supra* note 8, at 403.

¹⁵ In almost every instance and particularly in the small estates, court costs exceeded the fees of the personal representative and the attorney combined. Much of this is paid out for legal publications and appraisers' fees. Many executors and administrators and also attorneys handle at cost or less estates for families who cannot afford to pay fees commensurate with the work required. See Ward and Beuscher, *supra* note 8, at 403-404.

for some avoidance of formal administration.

SUCCESSION TO PROPERTY BY ADMINISTRATION

Property subject to administration

Consideration now turns to property owned exclusively by the decedent as his own separate property and in his own right. As with life insurance and jointly owned property, the surviving spouse frequently feels automatically entitled to this property also. In certain instances the survivor is so entitled, but in many instances not, for children or other relatives may be entitled to a part.

But whoever is entitled, it does not follow that the right of possession can immediately be given effect. There are actual or possible creditors of the decedent, whose claims must be satisfied out of the property which constitutes the estate before the remainder can be turned over to the persons ultimately entitled to it. To determine the existence of claimants and the amount of their just and prior claims, American law employs the device of "administration," or "probate." These claims include funeral expenses, expenses of the last illness, and estate, inheritance, and income taxes, as well as ordinary debts which the decedent incurred during his lifetime.

Probate courts and judges

To carry out this process of administration some relative or other person is appointed as an executor if there is a will designating him; otherwise an administrator is appointed. This fiduciary is known as a personal representative. He functions under the direction and supervision of a special court established or designated in every state for this purpose.¹⁶

¹⁶ For a history and description of the various courts exercising probate jurisdiction see

It is probable that the amount and value of property annually subject to administration in probate courts often equals or exceeds that in controversy in other courts.¹⁷ It is unfortunate, however, that many probate courts are courts of inferior jurisdiction in some degree. It is also unfortunate that in some states the qualifications of probate judges have been extremely low; persons who know little or nothing about law have often occupied the position of probate judge. The desire to make the probate court close to the people no longer justifies this condition, if it ever did.

In other states, however, probate courts occupy a position equal to or coordinate with that of courts of general jurisdiction. A few states have vested their general superior courts with probate jurisdiction, providing for well-qualified judges who have adequate knowledge and experience to perform the important function imposed on them. They are not less close to the people, and they can do a much more effective job in helping to preserve estates and in seeing that they are eventually turned over intact to the persons entitled thereto. The trend is clearly toward probate courts of superior jurisdiction and probate judges adequately qualified to perform their task.

Simes and Baeye, "Organization of the Probate Court in America," 42 *Mich. L. Rev.* 965, 43 *id.* 113 (1944), reprinted in Simes and Baeye, *Problems in Probate Law* (1946), p. 385.

¹⁷ A study made by a Committee on Analysis of Probate Proceedings, Trust Division, California Bankers Association, shows that there were more than 7,000 estates administered in Los Angeles in 1937. Of these, 1,138 were in excess of \$15,000, with a total value of \$94,264,139. In addition there were the remaining estates of less than \$15,000, and those administered by the public administrator which alone had a value of \$552,347.

The process of administration

Normally, the first step in the administration process is for some member of the decedent's family or other relative to file a petition for the probate of the will, if there is one, and for the appointment of a personal representative. If the will names an executor, that person ordinarily is appointed. If the will does not name an executor or if there is no will, the court will appoint an administrator. The eligibility of the surviving kindred and the order of their priority are designated by local statute. Furthermore, certain qualifications, such as residence, age, intelligence, and morality, are often prescribed.

The essential duties of the personal representative are to collect the assets of the estate, pay the claims of creditors, and distribute the rest of the estate to the persons entitled. If there is no will, the law designates the persons who are entitled to the estate and the proportions in which they take; and if there is a will, the beneficiaries named will usually take the shares according to its provisions. But even here the law may require that certain relatives, particularly the surviving wife, be given a specified share. Otherwise she may elect to take what the law prescribes in spite of the will.¹⁸

In the process of administering the estate the personal representative will prepare and return an inventory and appraisal of the estate. He will also see that any estate or inheritance taxes which become due are paid and that income tax returns, both for the decedent and for his estate, are duly filed. He may do other acts in completion of contracts of the decedent.

At the conclusion of these duties the personal representative customarily files

¹⁸ Thomas E. Atkinson, *Law of Wills* (1937), p. 84.

a full report and account of his activities and requests permission to make final distribution of the remaining property. If he has faithfully performed his duties and his account is in order, the court will order distribution accordingly.

The whole process serves two purposes: (1) to protect creditors, and (2) to ascertain the persons entitled to the estate and to make orderly distribution.

These are the duties of the personal representative for the simple estate. In large estates his problems often become more complex and involved. He may need to apply to the court for authority or instructions as to various matters. There may be actions to prosecute or defend. Even in medium-sized or small estates his problems require much time and effort. Traditionally the law does not extensively distinguish between the large and the small estate. In most states, regardless of hardship to survivors, the same amount of time must always elapse between the time creditors are notified to present their claims and the time final distribution can be made.¹⁹

SIMPLIFYING ADMINISTRATION OF SMALL ESTATES

When an estate is small, there is a feeling that it should be made available to the decedent's family without the usual administrative procedure, for their need for it is likely to be great. If it can be shown that there are no unpaid debts or claims against the estate or if the rights of the family are paramount to those of claimants, there can be no justification in subjecting it to the usual expenses and delay of administration. A survey of existing statutes reveals considerable legislation adopted to achieve this very objective.

¹⁹ For a collection of all statutes on this subject see Simes and Basye, *Problems in Probate Law* (1946), p. 325.

Summary settlement by personal representative

First, rights of homestead and exemptions granted to the head of a household in the interests of family security are commonly transferred to the widow and minor children after his death. It is also usual for the probate court to authorize the personal representative to pay a family allowance in an amount sufficient to give a maintenance and support to the family members during the period of administration and until final distribution of the estate may be made. The amount of this allowance will vary according to the number of persons in the family, their standard of living, and the size of the estate.

To the extent that the property is subject to homestead or exemption laws or to the payment of a family allowance, it is not subject to the claims of creditors. Hence, if the total value of all property of the estate is less than would be required to satisfy these rights, it should be set off to the family immediately without requiring the full course of administration. Provision is made in approximately a dozen states for this procedure. When the personal representative distributes all assets of an estate in this fashion, he is then discharged and the estate summarily closed.

A similar type of legislation designed to accomplish this same purpose but dependent upon a stated money value of the estate has been adopted in an approximately equal number of other states. Values range from \$500 to \$3,000. If the estate does not exceed the stated amount, the court may order it distributed to the surviving wife or children and summarily close the estate. The money or property thus distributed is granted in lieu of a family allowance. Under laws of this kind there is lit-

tle ground for controversies over the amount to be granted as a family allowance.

In Texas the persons entitled to the estate may require the personal representative to distribute it to them upon furnishing bond in twice its appraised value conditioned to pay all claims which may be allowed against the estate. If an estate is entirely distributed, the personal representative is discharged and the administration is declared closed.

Four states—Texas, Washington, Arizona, and Idaho—permit an independent executor acting under a nonintervention will to function without judicial control and supervision in the absence of controversy. This settlement device is quite extensively used in Texas and Washington.²⁰

Summary settlement without personal representative

Abbreviated administration proceedings of the kind above described are complete. Early distribution to the family is possible because the small estate is entirely consumed in being set off as homestead and exempt property or in lieu of a family allowance. The existence of creditors or even of other heirs or beneficiaries under a will is unimportant here.

If these results are available for small estates under the control of a personal representative, it may well be inquired why they may not be achieved in one simple step by one order of court setting off the entire estate to the widow or children of the decedent without the

necessity of appointing a personal representative. As a matter of fact, legislation to this end has actually been developing.

The first legislation of this kind was adopted in Missouri in 1877 at the suggestion and under the sponsorship of Judge J. G. Woerner, judge of the probate court of the City of St. Louis, and author of the well-known work on *American Law of Administration*. Under this statute, if the estate of the decedent is less than that allowed by law as the absolute property of the widower, widow, or minor children, the court may officially determine that administration is unnecessary and order that no letters of administration be issued. The property is set off by the court to the widower, widow, or minor children, who are entitled to collect, sue for, and retain all property belonging to the estate. The existence of debts against the estate is immaterial, since the surviving spouse or minor children are entitled to the entire estate absolutely. Such legislation is necessarily confined in its operation to small estates. Nevertheless, it offers another inexpensive and expeditious procedure.

Similar statutes are now found in some twenty states, many of them modeled after the Missouri statute. All represent attempts to provide a direct and highly desirable method for the collection and distribution of small estates in the interests of the family of the decedent. The slight amount of judicial contact and judicial control over the estate under all these statutes is to be contrasted with that under statutes requiring a personal representative to be appointed.

Under legislation of this kind the estates must not exceed a stated amount in value. These values range from \$100

²⁰ For a description of legislation described under this topic see Basye, "Dispensing with Administration," 44 *Mich. L. Rev.* 329, 336-357 (1945), reprinted in Simes and Basye, *Problems in Probate Law* (1946), pp. 565-92; Comment, "Streamlining the Administration of Small Estates," 49 *Mich. L. Rev.* 111 (1950).

to \$3,000, most states ranging from \$100 to \$500. Obviously these limits need revision upward at the present time.²¹

Informal family settlements

Despite the existence of an established procedure for the administration of estates, heirs do not always avail themselves of this procedure. If the decedent leaves no debts or only such as the heirs are willing to pay, there may be no one to insist upon administration. And if the heirs can actually gain possession of the decedent's property or divide it among themselves amicably, there may be no real justification for administration.

It has often been said that the law looks with favor upon family agreements for the settlement of estates. That countless numbers of informal family settlements have been effected successfully is within the experience of most lawyers. Sometimes, however, difficulties of collection or distribution are encountered; occasionally unexpected creditors' claims interpose obstacles; or problems of marketable title to land, registered securities, or similar property arise long afterward.

Ability to make collection of assets belonging to an estate is obviously essential for a successful informal settlement. If the heirs are already in possession of all property or can gain control of it, the possibility of avoiding administration is good. But if some portion of the estate consists of property in the possession of, or claims against, third persons, these persons will hesitate to turn over property or pay money directly to the heirs, because they know that they may be asked by a personal representative appointed at

²¹ For a description of legislation described under this topic see Basye, *supra* note 20, *Mich. L. Rev.* pp. 357-84. *Problems in Probate Law* pp. 592-613.

a later date to turn over that same property or to pay that same debt again.

Nevertheless, the practice of requiring administration in many small estates which are not indebted or are but little indebted seems an unnecessary burden on the decedent's family. Ordinarily, assets of these small estates are made up of wage claims, bank accounts, or insurance, which would be not more than sufficient to pay funeral expenses and perhaps a small family allowance. Often they would be less than the amount to which the surviving family would be entitled as exempt property. In these instances means should be available to permit collection of these assets by the surviving family or other relatives, irrespective of the existence of debts against the estate. Administration could only decrease the net amount available to them and prolong the time of its realization.

A survey of existing legislation reveals that numerous statutes have been passed, particularly during the last decade or so, authorizing the payment of small bank accounts, wage claims, savings and loan shares, and proceeds of insurance policies to designated surviving members of the decedent's family. These statutes vary considerably in the kind of debts and property and in the amount or value which they permit to be paid without administration. All represent wholesome legislation, although the maximum amounts of money provided in many of them are appallingly small.

The singling out of particular kinds of property or debts for allowing payment direct to the heirs seems an unsound practice. Much of such legislation appears to be banking or employer legislation, rather than probate legislation. A better method would be to permit the payment, delivery, or transfer of any kind of debt or property where the total

amount of the estate does not exceed a stated sum. This is done in California, Delaware, Florida, Illinois, Montana, New Jersey, North Carolina, South Carolina, and Virginia. In some states, however, the amount thus payable must not exceed \$300. California and Illinois are more liberal, with a maximum of \$1,000. If administration is later granted, the person receiving such funds must account for them to the personal representative. In the great majority of small estates no administration is granted, and the collection and application of the money by the surviving spouse or other relative is never questioned or disturbed.

The procedure contemplated is for some member of the family to present an affidavit to the debtor to the effect that the total amount of the decedent's estate does not exceed the statutory amount. The debtor is thereupon entitled to accept and rely upon the facts stated in the affidavit.

When an estate consists partly or entirely of real property, another problem arises—that of marketable title. The heirs may be in perfect accord and may even make division and distribution among themselves. There is no one to question the validity of such a procedure. In fact, the heirs may continue to possess and enjoy the property so allotted to them for many years. Only upon a future sale to some third party will the question of the validity of the family settlement be presented. This future purchaser will want to know that the land is not subject to claims against the decedent and that those who participated in the settlement constituted all the heirs of the decedent. The passage of time will suffice in some states and a marketable title can actually be conveyed, if the owners can satisfy the purchaser that they are the rightful heirs. A proceeding to determine heirship is now available in a num-

ber of states. Elsewhere, only an administration proceeding carried to its conclusion can furnish a memorial of the passage of title to the heirs.²²

CURRENT EFFORTS TOWARD SIMPLIFICATION

The adoption of legislation designed to minimize the delay and expense in dealing with small estates has been gradual and sporadic.²³ On a national basis the pattern has varied greatly. Simplification in probate procedure in general has long been the wish of many thoughtful lawyers and judges. In 1940 the Section of Real Property, Probate and Trust Law of the American Bar Association proposed the preparation of a model probate code. After some consideration and planning, arrangements were made to have the research and drafting done by the research staff of the University of Michigan Law School in co-operation with a committee of the American Bar Association.

After more than two years of study and drafting, conferences and redrafting, the Model Probate Code was presented to the Real Property, Probate and Trust Law Section of the American Bar Association in 1945 and approved

²² For a description of legislation described under this topic see Basye, *supra* note 20, *Mich. L. Rev.* pp. 385-408, *Problems in Probate Law* pp. 626-58.

²³ Current interest in this field is obvious from very recent legislation, summarized in Comment, *supra* note 20. It is also suggested by a number of recent articles on the subject. See Gilbert T. Stephenson, "Streamlining the Settlement of Small Estates," 83 *Trusts and Estates* 478 (1946); L. H. Roseberry, "Streamlining Legal Requirements and Administrative Procedures in the Handling of Small Estates" (address before 21st Regional Trust Conference of the Pacific Coast and Rocky Mountain States, San Francisco, October 22-24, 1947); Harry S. Fox, "Summary Settlement of Small Estates," 1948 *Wis. L. Rev.* 453; LeRoy B. Staver, "Suggested Simplification of Laws for Administration of Small Estates," 29 *Trust Bulletin* 3 (October 1949).

in 1946.²⁴ This code was the product of a comparative study of all codes throughout the United States, combined with a consideration of appropriate modern procedural methods for administering estates of deceased persons.

Since the promulgation of this code, consideration has been given in several states to its adoption, either in whole or in part. There have been some adoptions, and interest in improving probate laws is growing.²⁵

In the specific matter of simplifying and improving the administration of small estates, further reform was suggested in 1949 by the National Conference of Commissioners on Uniform State Laws. The commissioners consulted the University of Michigan Law School, which had done the research and drafting of the Model Probate Code. It was finally decided to undertake the preparation of a Model Small Estates Act. The actual research and the drafting of this act were done by Professor Lewis M. Simes of the University of Michigan Law School, who had been in charge of the work of the

Model Probate Code, and by the author of this article. It was presented to the commissioners in 1950 and approved by them in 1951.²⁶

This act presents four distinct procedures for simplifying or dispensing with administration. First, it provides for the transfer of personal property without judicial proceedings in estates not exceeding \$1,500.²⁷ Second, it provides for the determination of title to real property without judicial proceedings in estates not exceeding \$1,500.²⁸ Third, it provides for a summary, but judicial, distribution of estates not exceeding \$3,500 to a surviving spouse or minor children without the necessity of formal administration.²⁹ Fourth, it provides for a simplified procedure which, in the discretion of the court, may be employed in the administration of any estate not exceeding \$10,000.³⁰

This act will not solve all the problems of every small estate. It can, however, greatly simplify and speed up the entire process of administration as it now exists. And it will call fuller public attention to the fact that the whole proceeding of administration can be readily streamlined to serve modern needs more efficiently. Plans are under way to introduce this latest act in legislatures this year in the belief that its accomplishments can extend over a wide area. The need for such improvement becomes ever more apparent.

Workmen's Compensation and the Claimant

By SAMUEL B. HOROVITZ

FOR many years the average layman thought of workmen's compensation as a new system of law creating a panacea for the injured worker. And so attractive was the "contagious principle of workmen's compensation" that many people clamored for its extension to automobile, railroad, and seamen's accidents.

But the last decade has cast considerable doubt on the wisdom of extending the compensation principle. The Congress of Industrial Organizations has published a pamphlet entitled "Workmen's Compensation—A Story of Failure."¹ Recently an American Federation of Labor newspaper editorial attacked workmen's compensation as "shockingly inadequate."² A group of over 2,500 lawyers, organized as the National Association of Claimants' Compensation Attorneys (NACCA), now opposes any extension of workmen's compensation principles to the tort, railroad, or admiralty fields.³ It is being persuasively argued that the tort remedy in the railroad field is superior to workmen's compensation.⁴

Where, then, lies the truth? Have the expected benefits of the workmen's

compensation system been realized? Is it efficient and inexpensive? Are adjudications fair? What do the injured worker and his dependents, after actual contact with the system, think of it?

The writer has specialized in the trial of workmen's compensation cases for over thirty years, almost entirely on the injured workmen's side. It is the claimants' or workers' viewpoint that will find expression in this article.

COMMON LAW FAILS TO PROVIDE AN ADEQUATE REMEDY

With the burgeoning of great industries and the development of high-speed machinery, work injuries multiplied. Yet, in the early business era, corporate and other employers felt that the cost of human accidents should not be saddled on them—that the worker usually brought the injury upon himself. They argued, moreover, that the risk of injury in dangerous employment was reflected in increments in the wages paid.

Courts were early led to believe that financial ruin would overtake these budding industries unless stringent common-law tests were applied to all work injuries. The courts declared that the employer was not liable, no matter how serious the injury, unless he was at fault, that is, negligent. And even if the employer was negligent, the worker forfeited all recovery if he contributed, even in a slight degree, to his injury: "contributory" negligence was a bar. Furthermore, the injured worker could not collect where he rightly could be said to have "assumed the risk"—a broad phrase with many meanings but almost always signifying that the injured worker could not recover.

¹ Pamphlet 202, reprinted from January 1952 issue of *Economic Outlook*, published monthly by the CIO, Washington, D. C.

² *The Weekly Dispatch*, Nov. 14, 1952, p. 2. Published by an AFL union, San Antonio, Texas.

³ 9 *NACCA L. J.* 271-72 (1952); 10 *ibid.* 32-33 (1952).

⁴ See B. N. Richter and L. G. Forer, "Federal Employers' Liability Act—A Real Compensatory Law for Railroad Workers," 36 *Cornell L. Q.* 203 (1951); cf. A. F. Conard and R. I. Mehr, *Costs of Administering Reparation for Work Injuries in Illinois* (Urbana-Champaign, 1952).

And finally, the courts sanctioned the so-called "fellow-servant" defense: it was the employer who had to be negligent; if the negligence was that of another employee, the employer was insulated against liability. In large establishments it was generally the fellow worker that caused the accident. No wonder, then, that the fellow-servant defense was cherished by employers; and no wonder, under the common-law system, that 80 per cent of the cases were lost or went uncompensated, and in the 20 per cent of successful cases the lawyer's fees, doctor's bills, and other expenses often ate up a substantial part of the award.

THE GREAT DEBATE

The workers wanted an entirely new system—one in which negligence, contributory negligence, and all the restrictive common-law rules were forever banned. They wanted speedy justice, without litigation and without delays. They wanted employers to pay adequate damages for work-incurred injuries, so that industry, not charity, should bear these losses. And the damages, they hoped, would include full wage loss, medical bills, pain and suffering, and the like.

In the early 1900's legislative committees were appointed to study the problem. They learned that Germany had adopted a workmen's compensation act in 1884, and England in 1897. The English act appealed to many. Negligence was there abolished as the basis of liability; it was enough that the employee received "a personal injury by accident arising out of and in the course of employment." In such a situation he received a weekly compensation payment, plus his medical expenses, to tide him over until he returned to work.

American employers and insurance companies opposed the introduction of these foreign ideas. They argued that

the costs would be ruinous to our industries; that it was unconscionable, un-American, and unconstitutional to make an employer pay for injuries for which he was not to blame; and that negligence had so long been the basis of liability that even legislatures could not create this new liability, unrelated to fault.

The workers and their friends, however, argued that when a machine broke down, the employer replaced it, regardless of who was at fault, and charged the cost to the buyer of his product; that work injuries were inevitable in a fast-moving industrial world; that when a human being was injured, the industry responsible therefor should make him whole as far as money and medical treatment could do it; that the employer could and should pass the cost on to the consumer of his goods; and that this could readily be done through private or self insurance, or through a state agency—a state fund—acting as insurer.

WORKMEN'S COMPENSATION STATUTES A COMPROMISE

The compensation acts were compromises. Employers insisted, and the state legislatures provided, that the workmen's compensation remedy was exclusive: as long as the injury was a compensable one under the workmen's compensation system, the employee could no longer sue his employer on any other basis. At present, in every one of the forty-eight states the compensation-insured worker must accept his compensation payments, no matter how small or inadequate they may be, and has no other recourse against a negligent employer.⁵

On their part, the employers agreed, in theory at least, to give up all their

⁵ Employees may still sue an employer for willful injuries, and in a few states for gross negligence. 10 *NACCA L. J.* 126-29 (1952).

former common-law defenses and pay workmen's compensation even where they were not at fault, as long as the injury arose out of the work. But the employers refused to pay full tort damages. They would pay reasonable medical bills and they would pay subsistence, but not full wages. To this extent, industry would relieve charity of industry-produced burdens.

Further, early legislators were urged to begin cautiously. It was feared that full benefits might ruin industry; it was urged that payments should start on a low basis and gradually increase as industry could afford them. So another compromise, allegedly temporary, was accepted: arbitrary maxima were put on the amount of the weekly payments of compensation and medical benefits, and on the duration and total of these payments. Massachusetts, for example, started with a maximum of \$10 a week, not to exceed 500 weeks or \$3,000, whichever was less; medical treatment was not to exceed two weeks.⁶

Time marched on, and every state in the Union adopted a compensation act (Mississippi was the last to join in 1949). In 1952 our gross national product of goods and services rose to the amazing total of \$350 billion. In the same year industry's profits after taxes stood around \$17 billion. But how did the rights of the workers grow?

PERSISTENCE OF ARBITRARY RESTRICTIONS ON AWARDS

A few jurisdictions kept their promise, in part at least, to remove the arbitrary restrictions. Arizona wiped out attempts to maintain benefits at poverty levels, and today pays 65 per cent of he wage, up to \$150 weekly. Alaska allows 65 per cent of wages without fur-

ther limitation. Federal employees may now get up to \$121.15 a week.⁷

But arbitrary maxima have continued in the other states. Attempts by labor unions and others to remove them have been countered by the argument that increases would drive industry out of the state. As of January 1952 the shocking truth was revealed that forty-seven states pay less than subsistence amounts. Although a family of four needed over \$60 weekly merely to subsist⁸—to live in a low form of decency, not in comfort—the maximum benefits averaged less than \$30 weekly. Alabama was still paying only \$23 weekly; Arkansas, Kansas, Mississippi, Oklahoma, South Carolina, South Dakota, Tennessee, Texas, Vermont, and West Virginia had a \$25 maximum; and others ranged from \$24 in Georgia to \$32 in New York, \$36 in Connecticut, and \$30 in Massachusetts for a worker without dependents. A married worker in Massachusetts receives \$2.50 additional for his wife and for each child.

Equally appalling was the limitation on the total payments possible. Unfortunately many men and women have been totally and permanently disabled through industrial accident by loss of both legs, arms, or eyes, or otherwise. Their working days have been forever ended. Eighteen states recognize their right to weekly compensation for life; but thirty states throw them on the

⁷ 10 *NACCA L. J.* 32 (1952); U. S. Department of Labor, Bulletin 125, Table 7 (Sept. 1950). For recent U. S. Department of Labor statistics on workmen's compensation payments nation-wide, see *State Workmen's Compensation Laws, Revision of tables 4, 5, 6 and 7 in Bulletin No. 125* (pamphlet dated April 1, 1952), showing legislative changes through January 1952.

⁸ The publication *supra* note 1, states (p. 2) on the basis of budget studies of the Department of Labor that \$78 per week "is necessary to maintain a city family of 4 at an 'adequate but modest' standard of living."

⁶ Mass. Stat. 1911, c. 751, pt. II, §§5, 9.

charity scrap heap—often after inadequate payments week by week—when the total payments reach a stated amount, usually less than \$10,000. In Alabama, permanent total disability payments do not exceed \$9,200; in Arkansas, \$8,000; Maryland ordinarily stops at \$10,000, Mississippi at \$8,600, New Hampshire usually at \$9,000, South Carolina at \$8,000, Tennessee at \$7,500, and Virginia at \$7,800. Yet similar permanent total disabilities in eighteen states paying compensation for life may produce weekly benefits exceeding \$50,000, and in a few instances, adding medical costs, have actually cost insurers as much as \$100,000.⁹

In Massachusetts the loss of both legs gives the worker with a wife and three children, earning \$60 a week, the right to \$40 a week for life, reducible as the children reach the age of 18. Assuming a life expectancy of twenty years, the worker receives about \$40,000 plus \$10,000 additional in specific benefits for the amputation or loss of use of the legs, plus \$2,500 for the disfigurement—a total of about \$52,500. Insurance officials have published statements showing that over \$100,000 is theoretically possible. Yet just across the line in New Hampshire the maximum would be \$9,000, and in Vermont \$6,500.

These inequalities have no rational justification. Where the unions and employees' groups are strong, the amounts slowly approach the subsistence level; where they are weak, insurance and employers' lobbies succeed in maintaining the arbitrary maxima, and impoverishment of injured employees continues.

⁹ See *Guse v. A. O. Smith Corp.*, 260 Wis. 403, 51 N.W.2d 24 (1952); \$56,837.46 paid, including medical benefits. But for a maximum of \$7,500 for loss of both legs, see *Keffer v. Capitol Transit Co.*, 182 F.2d 808 (D. C. Cir. 1950).

MEDICAL PAYMENTS

The medical-payment picture is more encouraging. By September 1950, thirty-one states had removed arbitrary maxima on such treatment. Injured workmen in those states can now receive medical treatment as long as necessary, provided the industrial commission so orders. But seventeen states still insist on cutting off assistance either after a given length of time or after a given amount of money has been spent. For a broken back or other injury requiring treatment for life, Kansas still stops medical benefits at 120 days or \$100 (whichever is cheaper for the insurer), with the right reserved to the commissioner to extend the amount to \$750. Alabama remains at \$500 and 90 days; Tennessee at \$800; and Pennsylvania has a shocking limit of 90 days and \$225 for doctors, and a like amount for hospitals.

THE SERIOUSLY INJURED AND SURVIVORS

Fortunately the bulk of the two million injuries annually suffered in industry are of short duration, and the medical bills in such cases are usually less than even these low maxima. But for the serious injuries, as far as both weekly payments and medical treatment are concerned, in the great majority of states, workmen's compensation has become a snare and a delusion. Starved week by week, deprived of medical treatment in a few months, and their compensation cut off completely in a few years in the majority of states, many of the permanently injured workers can only await an early death to relieve them of both financial and physical wreckage. And this occurs in the richest country on earth!

Why our healthy industries in thirty states allow such injustices to continue

when for a slightly increased premium they can join the eighteen states giving compensation for life is hard to explain. It is difficult to understand this callousness and indifference to human suffering.

The plight of the widows and orphans is equally bad. Only in eleven states do widows receive compensation until remarriage or death. In Oklahoma, which has the best death statute, dependents obtain \$13,500 in a lump sum. In thirty-six states they are given pitifully small amounts weekly (a maximum of \$11.54 in West Virginia plus \$3.46 for each child; \$32.20 in Ohio), ceasing usually on death, remarriage, or receipt of a total amount ordinarily less than \$9,000. In Vermont \$6,500 is the maximum; in Virginia \$6,600. Yet in actual payments, because young widows usually remarry and old ones die, the "average case cost" to insurers for the death of the breadwinner is less than \$5,000 in the majority of states. In an average state such as Illinois it is \$3,972; and in one of the highest states, New York, which pays compensation for life, it is \$8,828.¹⁰ The *Economic Outlook* gloomily remarks: "A human life, if it is lost during working hours, apparently isn't worth very much under our workmen's compensation system."¹¹

¹⁰ See S. A. Riesenfeld, "Basic Problems in the Administration of Workmen's Compensation," 8 *NACCA L. J.* 36 (1951). The *Atlantic Journal* of March 23, 1952, in an article entitled "Worker Compensation Loss Heavy," complains that in Georgia in 1949-50 the average cost of a death claim rose from \$3,720 to \$4,270, and permanent total disability from \$5,960 to \$6,850. To us it seems shameful that a life is worth so little in a world where "prize bulls sell for \$200,000; race horses, violins, and famous pictures have been known to bring as high as \$500,000." 10 *NACCA L. J.* 764 (1952).

¹¹ *Supra* note 1 at p. 4.

"DECEPTIVELY SIMPLE AND LITIGIOUSLY PROLIFIC"

The early promise of "slot machine" justice, without litigation, without lawyers, without judges, without delays¹² has withered and died. As long as there is a profit motive in workmen's compensation insurance, litigation is inevitable.

It was once thought that if the statutes used words already interpreted by the English courts, our courts would have little work to do. So most acts adopted those essential words: "personal injury by accident arising out of and in the course of the employment." For the resulting "disability" the worker was to get his weekly payments and medical treatment.

These words now give rise to over 100,000 *litigated* cases a year. The defenses raised by insurance company ingenuity baffle description. Persistence by astute insurance attorneys has persuaded some courts to make the followings rulings:

Personal injury. Dupuytren's contracture of the hand caused by handling tools for fifteen years is not a "personal injury," but merely noncompensable "wear and tear."¹³ The breaking of wooden legs, false teeth, and the like are not personal injuries, but "property" damage,¹⁴ and not chargeable to the employer or the insurer.

By accident. A broken or injured back due to the heavy lifting usual on the

job, without a slip or unusual twist, is an injury, but not "by accident."¹⁵

Arising out of. A man sent on an errand during a storm is struck and killed directly by lightning. This is an act of God,¹⁶ and the widow and children whose home was far away from the storm, where the husband would have been safe, must look to charity for their support.

In the course of. A workman en route to work slips on the icy sidewalk in front of the factory. There is no liability,¹⁷ as he was not yet "in the course of" his work. Again, a worker is obliged to enter the factory by crossing a railroad track adjacent to the factory, and is struck by a train. A leading court ruled that there was no liability,¹⁸ as the railroad track belonged to a third party, and the case is like the sidewalk case.

The employment. A worker chops wood for a compensation-insured city or town in order to earn his weekly welfare allowance. He gets hurt. There is no compensation, as the employment was not for "wages" but was required by statute, and the victim was a mere "ward of his municipality."¹⁹

Disability. Tens of thousands of hearings are held annually to determine

whether the injured worker is "disabled."²⁰ The insurance carriers, with their vast funds, find it easy to obtain doctors to testify that injured workers are not disabled but merely suffering from a "discomfort," or, if they are disabled, that the disability is traceable to something other than the employment or injury. In many states the insurer does not pay for the first week of disability (the "waiting period"), and thereby escapes payment in many thousands of cases.

Students of workmen's compensation problems have rightly labeled this branch of the law "litigious."²¹ The flood of decisions coming down each year is not subsiding. There is need for able judges and lawyers on both sides to try to bring common sense into statutes intended to abolish the common law.

COSTS AND RATES

Insurance companies are engaged in a fierce struggle with labor unions on the problem of costs. Insurers claim that they are efficient and need 40 per cent for overhead expenses, including administration and acquisition costs. Unions retort that insurance companies do not belong in the field of social security; that the state which compels compensation coverage should supply the vehicle—an exclusive state fund—at cost, without profits to anyone; that exclusive state funds exist in seven states and operate at costs of 3.76 to 11.7 per cent.²² Employers' associations and

²² *Stop Profits from Human Misery*, joint pamphlet of Mass. Federation of Labor and Mass. State CIO, Boston, issued in connection with their bill (H. R. 1037) for an exclusive state fund. Competitive state funds exist in

chambers of commerce usually side with the insurers on the principle of private insurance, though recently an employers' group, enraged at the ever mounting rate increases, engaged insurers in legal battle and won in the Minnesota Supreme Court.²³ This group produced evidence that rates were based on actuarial theories in which the insurers consistently guessed in their own favor, collecting an excess premium of \$9,676,451 in five years.

Some students of workmen's compensation, interested solely in the injured worker, and not in unions or insurers, feel that the rate problem is only indirectly of importance. They prefer \$30 a week in a private insurance state to \$25 a week in a jurisdiction with a state fund. It is not the vehicle of insurance, but the amount thereof, that interests them. That state funds charge the employer lower rates is hardly arguable; that state funds are better for employees is still an open question in the minds of many workmen's compensation experts.

FAIRNESS OF ADJUDICATIONS

In most states adjudications are by commissioners, usually appointed by the governor. Many of the commissioners are laymen. Five states still have court administration, and in seven states jury trial is still possible.

Claimants' lawyers generally favor a system in which jury trial is available on appeal from a commission determination. The right to such a trial is a safeguard against decisions by overconservative commissioners. Commissioners, desiring a large measure of administrative

²³ *State ex rel. Minnesota Employers' Assn. v. Faricy*, 53 N.W.2d 487 (Minn. 1952).

finality on the facts, generally oppose appeal to a jury. Insurers by and large prefer commissions to juries. They usually resist legislation designed to provide jury appeal, and are seeking to abolish jury trials in Texas and elsewhere.

However, regardless of the agency by which workmen's compensation cases are heard, lawyers on both sides agree that, viewed on a nation-wide basis, adjudications in the majority of cases are fair and equitable.²⁴ Complaints have been made against individual commissioners and particular judges; but the consensus of opinion is that most administrators and judges are conscientiously trying to do an adequate job.

THE WORKER'S VIEWPOINT

In states where the fees to claimants' attorneys in workmen's compensation cases are large enough to attract able counsel—15 to 25 per cent of the recovery would figure as adequate for this purpose—claimants feel that they can get justice. Unfortunately in some states administrators allow such low fees²⁵ that it is almost impossible for a poor man to obtain representation in a litigated case. Insurers never suffer from lack of attorneys, investigators, doctors, or claims men. Unequal representation arouses bitterness, and workers often feel that the cards are stacked against them.

And even if satisfied with his lawyer, the seriously injured worker is rarely satisfied with the poverty levels of workmen's compensation payments. Loss of a leg or an arm in the majority of states actually gives the worker a compensation of less than \$5,000, and

²⁴ *Horovitz on Workmen's Compensation* (1944), p. 390.

²⁵ See *Thatcher v. Industrial Comm.*, 115 Utah 568, 207 P.2d 178 (1949), 5 per cent fee held inadequate; see 4 *NACCA L. J.* 100-107 (1949).

two legs less than \$8,000; at the same time he reads in the paper that other workers receive \$50,000 or more for like injuries.²⁶ To be told that his brother workers come under a different law, and that this explains the tenfold or greater recoveries, does not strike him as a satisfactory explanation. His leg is as indisputably gone as the railroad worker's or the seaman's.

In respect of minor injuries—and fortunately these represent over three-fourths of the injuries—the workers usually feel that they are getting a fair measure of justice from workmen's compensation. Generally these cases are not litigated. Often it is cheaper for the insurer or the employer to pay than to contest. Weekly checks are usually prompt, and the worker is back on the job before he feels the financial pinch too keenly. And usually the insurer or employer pays all the medical bills, which in these cases are likely to be smaller than the statutory maxima.

But the complaints of workers are increasing daily in regard to cases involving months or years of disability, for compensation allowances have failed to keep pace with increased costs of living. The great labor unions have finally decided to do something about the matter; the NACCA group of lawyers has become active; and insurance companies, fearing inroads on their profits and even a challenge to their existence, have begun attacks on the unions and NACCA.²⁷ So the problem

²⁶ See *Affolder v. New York, Chicago & St. Louis Rd. Co.*, 339 U. S. 96, 70 S. Ct. 509 (1950), \$80,000 for loss of one leg; *Southern Pac. Co. v. Guthrie*, 186 F.2d 926 (9th Cir. 1951), \$100,000 for loss of right leg between hip and knee, 58-year-old engineer; *Kieffer v. Blue Seal Chem. Co.*, 196 F.2d 614 (3d Cir. 1952), 10 *NACCA L. J.* 265 (1952), \$250,000 for burns and blindness.

of compensating injured workers, believed to be on the way to solution a generation ago, seethes anew.

PORTENTS AND PROPHECIES

The solution is still far from clear. England thought she solved her problems some years ago when in 1946 the government ousted private insurance companies from workmen's compensation and placed the subject matter under its state-administered social security scheme. In Canada all provinces have state funds exclusively. But neither in England nor in Canada are workers completely satisfied, for weekly payments are below decent subsistence. Litigation has been reduced to a minimum in Canada by making fees of claimants' attorneys so low as effectively to discourage such legal practice and by substantially wiping out appeals from administrators' rulings. But this has not reduced the dissatisfaction of workers denied their compensation.

In this country both the AFL and the CIO have come out for exclusive state funds and for increase of weekly payments to subsistence levels. The great majority of claimants' attorneys agree with the latter objective but are not convinced that state funds are themselves a solution, for state fund jurisdictions have their share of litigation and low benefits. Claimants' attorneys are directing their efforts toward making benefits tie in with costs of living. They believe also that there should be a right of appeal to court and jury, and, finally, until compensation benefits are adequate, that there should be restored to the injured worker his common-law right to sue a negligent employer, the amount of compensation payments to be deducted from the tort judgment.²⁸

Ruin," *Reader's Digest*, Sept. 1952, p. 79. Cf. 10 *NACCA L. J.* 17, 295, 334, 335 (1952).

²⁸ England deducts only one-half of the workmen's compensation paid, since employees

Insurers argue that state funds are the beginning of socialism. They contend, despite recent increases in rates, that their necessary administrative costs and payments to injured workers are tending to put them in the red.

Employers feel that the rates are too high and that they cannot afford to increase workers' benefits; and so they join the insurance lobby in the fight against keeping benefits abreast of living costs.

We can predict for the long range either that the employers and insurers will yield to the demands of seriously

contribute to the compensation premiums. John Munkman, *Employer's Liability at Common Law* (London: Butterworth & Co., 2d edition, 1952), pp. 21-22, 422-25.

injured workers and pay real subsistence benefits, forgoing the luxury of litigation in close cases and charging reasonable rates based on actual losses and not on self-favoring guesswork, or that disgusted legislators will eventually follow England and wipe out private insurance in workmen's compensation.

Alternatively, legislatures may give workers a tort suit for negligence as an additional remedy. It is not beyond possibility that they will replace the workmen's compensation principle with a new one, the nature of which will depend on the current legal climate.

But for the immediate future we see the prospect of constant strife before legislatures and public opinion on the question of decent subsistence allowances.

Samuel B. Horovitz, LL.B., Boston, Massachusetts, is editor in chief of the *NACCA Law Journal*. He was a co-founder of the *National Association of Claimants' Compensation Attorneys* in 1946. He has for many years represented workers in compensation cases, and is senior member of a law firm engaged chiefly in this practice. He is author of *Horovitz on Workmen's Compensation* (1944) and other books, and contributes to professional journals.

Workmen's Compensation and the Insurance Carrier

By LESLIE P. HEMRY

THE common man has a great stake in the workmen's compensation laws and their administration, and insurance carriers play an important part in administering these laws. Therefore the common man has a substantial and quite legitimate interest in the way in which compensation insurance carriers operate and in their current problems, which are many. In order properly to discuss the problems of insurance companies, it is necessary to locate them in the over-all compensation system and touch upon the things which they do and do not do.

Workmen's compensation insurers are groups of highly skilled and experienced specialists rendering a variety of services while at the same time acting as a conduit of funds collected from employers and distributed to employees. As a business, workmen's compensation insurance is peculiarly subject to governmental control. The carrier's product is an insurance policy by which it agrees with an employer to discharge his obligations under the compensation statute and aid him to prevent accidents. In a sense, the company's product is largely designed by the state legislatures, its distribution processes are supervised by another branch of the state government, the Industrial Commission, and its prices are controlled by a third branch, the State Insurance Commissioner.

ACCIDENT PREVENTION

The carriers are particularly proud of the job they do in the area of accident prevention. The accident rate in American industry has been reduced to one-third of the rate twenty-five years ago, and the severity rate has been reduced

nearly as much.¹ While many factors have combined to bring about this improvement in safety in American industry, insurance carriers have made a very substantial contribution.

The pooling nature of insurance has enabled carriers to develop, and make available to insured employers, expert safety engineering service superior to that which any but the very largest employers could individually afford. And the carriers have done effective research in analyzing the causes of industrial accidents, have developed effective and economical safety devices and procedures, and have educated employers and employees in accident prevention. They have developed and placed in general use merit rating plans which create a strong financial incentive for employers to co-operate in accident prevention. Their problems in this area center largely around a determination of how best to expend the limited funds allowed for accident prevention in their regulated rates.

It is obvious that the worker is better off when injury is avoided than when receiving benefits, and the carriers' achievements in industrial safety are unquestionably their most significant contribution to the common man.

MEDICAL CARE AND THE PROBLEM OF LIMITS

But in spite of the best efforts of employers and insurance carriers, thousands of work accidents occur. After

¹ In 1926 there were 31.87 disabling injuries per million man-hours of work in all major industrial groups. In 1951 the rate was 9.06. The severity rate decreased from 2.50 to .97 in the same period. National Safety Council, *Accident Facts* (1952), p. 28.

the accident, the carriers step into the shoes of the employer to discharge his statutory obligations, the first of which is to furnish or provide medical care. They advise employers in setting up first aid facilities, furnish technical manuals and textbooks for the first aid personnel, and arrange for the doctors to be supplied or consulted.

The degree to which carriers participate in selection of the attending doctor varies from state to state. As a general rule, they agree with the employer as to the doctor to be furnished. However, some compensation laws prohibit the employer or his carrier from designating any doctor, and the injured employee has the free choice of all doctors on the panel approved by the Industrial Commission. In this age of specialization in medicine, it would seem that a carrier is in an unusually good position to select and secure the services of the most expert and experienced doctors, and most carriers feel that the free choice doctrine frequently results in less expert treatment, which is uneconomical in the long run.

More and more the insurance carriers' objective in regard to medical care is becoming that of industrial rehabilitation. This involves not only the injured worker himself but members of the injured worker's family, the first aid worker or nurses, the employer, the physical therapist, the occupational therapist, the vocational counselor, the placement officer, and others. All must work together. The insurance carrier co-ordinates the activities of the many technicians and social agencies involved, serving as a clearing house for information and acting as a guide to the worker as he goes through the long and often arduous rehabilitation process.

The states do not seem to agree as to whether or not compensation statutes should place an upper limit on the amount an employer should be com-

pelled to pay in medical costs. Eleven states and the District of Columbia place no limit on required medical payments. There is a limit in the time or the amount of medical payments required in the other states, although in fourteen of such states the administrative authority may require unlimited additional payments.²

Where there is a substantial chance of rehabilitation, unlimited medical treatment is justified on purely economic grounds, and frequently employers and insurers have voluntarily exceeded a statutory limit in such cases. Where unlimited medical treatment is required by statute, carriers have found that medical costs of \$50,000 or \$100,000 or more per case are not unusual. Many cases are completely hopeless, and rehabilitation is out of the question. From a humanitarian standpoint, all would agree that workers should receive medical care; but the states which have limits on medical payments apparently feel that costs over the limits should not be charged against the employer.

Somewhat the same considerations are involved in the question of whether amounts payable in permanent total disability cases and in pensions to dependents of workers killed should have any upper limit, and here again the laws vary.³

In general, workmen's compensation theory has accepted limitation on benefits as a matter of practical economics. If there is any limit to the cost industry can bear, then there is a very real social and economic question whether the over-all purposes of the workmen's compensation acts would not be better

² U. S. Chamber of Commerce, *Analysis of Provisions of Workmen's Compensation Laws and Discussion of Coverages* (1952), p. 12 and Chart VII. All private accident and health insurance plans place a limit on the total amount of medical benefits payable.

³ U. S. Chamber of Commerce, *supra* note 2, Charts I and II.

served by spreading the extremely high amounts sometimes paid to or on account of one injured worker among other injured employees in the form of higher weekly benefits.

BENEFIT PAYMENTS: SPEED AND CERTAINTY

The second employer obligation discharged by insurance carriers after injury occurs is payment of the cash benefits provided by the compensation laws when they become due. The author believes that insurance carriers have made a sincere effort to interpret workmen's compensation laws as remedial statutes for the benefit of the injured worker and his family. Recognizing that the injured worker's income usually ceases at the time of the injury, every effort is made to make payments promptly when due. There is a great deal of competition among carriers in this regard, stimulated by the industrial boards of certain states which publish statistics on relative promptness of payment by individual companies.

In view of the practical difficulty in assembling the information necessary for the first payment, the over-all record is good, although there is still room for improvement. The following table, drawn from reports by the state agencies, shows the percentages of first payments made on or before the due date in the first six months of 1952:

	ALL CARRIERS	SELF- INSURERS	STATE FUND
Michigan	75.2	72.8	33.9
New York	75.4	70.8	84.6
Wisconsin	88.1	87.3	no S. F.

One of the objectives of workmen's compensation acts was to reduce controversy and litigation by clearly defining the injured employees' rights to benefits, and this objective has been accomplished to a substantial degree. Because of variations in the laws, no

precise generalization can be made; but as an example Wisconsin can be cited, where hearings were held in 4.1 per cent of the cases disposed of in 1951.⁴

It is perhaps inevitable that there will be some differences of opinion in individual cases between the employer who pays and the injured employee who receives the benefits and these are troublesome cases for insurers, employers, and administrators alike. In general, the insurance carrier's economic interest in regard to specific cases is somewhat closer to the interest of the employer than to that of the injured worker, as the insurer assumes the employer's obligation. But the final burden of payment rests with the employer, and through the operation of merit or experience rating plans, the insurer's economic interest in disputed cases is largely insulated.⁵

NONMERITORIOUS CLAIMS

One of the more troublesome types of cases is the so-called "indeterminate" case, where it is difficult or impossible to determine when disability has ended—the back cases, head injuries, and neuroses where there are no objective symptoms but only subjective complaints of pain. Insurers are morally satisfied that millions of dollars a year are paid out on claims of this nature which are not meritorious, and additional thousands are spent in adjudicating these cases. It would certainly seem that very substantial sums could be saved here and made available to other, more deserving, claimants without increasing the economic burden of the acts. One ap-

⁴ Wisconsin Industrial Commission Release, Insurance 102, April 22, 1952.

⁵ Experience rating plans are widely used, and are of two types. Prospective experience rating plans increase or decrease the employer's premium in future years to reflect benefits paid in the current period. Retrospective experience rating varies the current premium to reflect current benefits paid.

proach would be to establish more rigid "rules of thumb," even though such rules might work hardship in a few deserving cases.

The payment of nonmeritorious claims can be encouraged by the attitude of the appointed agencies set up to administer the acts and adjudicate claims thereunder. Most of the workmen's compensation boards and industrial accident commissions are appointed by the governors of the particular states. Taken as a group, these boards are unquestionably either dominated by or definitely oriented to the employee interest.

Such an orientation is proper in interpreting and resolving legal questions as to the coverage of the acts, and is in fact directed by the "liberal interpretation" provisions of most acts. However, these boards also determine disputed questions of a factual nature, and any bias in the determination of matters of fact is questionable. It seems self-evident that no social purpose is served by compensating malingerers, and that it was not the intent of the legislatures to grant higher benefits to an injured worker than have been prescribed for the disability which in fact exists.

Where the issue between the parties is factual, the proper standard of judgment required by the acts or implied by the legislative policy is that of determination in accordance with the weight of the evidence. While the record varies from state to state, and within each state, carriers and their attorneys feel that some hearing officers determine questions of fact in favor of the injured worker and against the employer if there is any conceivable way of doing so, or if there is any scintilla of evidence to support the worker's claim. To the extent that this situation exists, it encourages the submission of questionable and exaggerated claims.

The author feels that a very strong case can be made for the thesis that if a better balance in orientation and a more evenhanded justice in administrative agencies were general, employers or their insurance companies would prevail in a higher percentage of the disputed cases. This would again tend to make additional funds available for deserving claimants.

The remedy probably lies in several directions: in reforms made by the administrative agencies themselves, in legislative consideration of the administrative fact-finding function, and perhaps in legislation making possible more effective review of administrative findings of fact by courts of law.⁶ In passing, it may be pointed out that most carriers agree that the "direct payment system" (in general hearings only on disputed cases) of administration as typified by the Wisconsin and Michigan laws is far superior to the "hearing system" (in general hearings on all cases) as typified by the New York law.⁷ Carriers have perhaps been too much in the background in fighting for administrative reforms, because of reluctance to antagonize the administrative tribunals which rule on disputed claims.

These, then, are some of the things insurance carriers do, and some of their problems in administering the benefit provisions of the compensation laws.

⁶ A recent study in California revealed that less than 1 per cent of the cases appealed were eventually reversed by the courts, and that 80 per cent of the appeals met with a summary denial. Mort L. Clopton, "The Extent of the Right of Review in Workmen's Compensation Cases" (paper read before the Insurance Section of the American Bar Association, San Francisco, September 16, 1952).

⁷ Marshall Dawson, "The Development of Workmen's Compensation Claims Administration in the United States and Canada" (paper delivered at the August 1951 convention of the International Association of Industrial Accident Boards and Commissions).

RATE STRUCTURES

Carriers also function as conduits of funds collected from employers and distributed to employees, and they have pricing problems related to this function.

Workmen's compensation rates are more highly regulated than any other line of insurance. This has been true for many years, in fact since the original workmen's compensation laws were passed. The result of this regulation plus the keen competition—not only among insurance companies themselves but also among insurance companies, self-insurance, and state funds—has been the development of rates and rating plans which are more scientific and elaborate than any others in the field of insurance.

Rating techniques are complicated, but in essence, manual rates by types of employment are set in advance by predicting the benefits to be paid and adding a percentage for the operating expenses of insurance companies. This percentage is tailored very closely to the needs of all stock companies. The prediction of benefits to be paid is made by taking the aggregate amounts of benefits paid and incurred for the latest policy years for which figures are available, and adjusting such amounts for known changes in the benefit levels and some known trends. These manual rates are very closely fitted to the actual experience of the industrial groups, and the manual rates are further tailored to the actual losses of individual employers through the use of experience rating plans. Thus workmen's compensation insurers do not make much money, and very little margin remains for *unforeseen* developments.⁸

⁸ The total country-wide premium collected by all companies reporting to the National Council on Compensation Insurance from the inception of the acts in the various states

It should be noted that the money allowed insurance companies for their cost of doing business comes from a rating structure which treats expenses as a percentage of the amounts paid out in benefits and which adjusts itself more or less automatically to benefits actually paid out. Hence, the higher the benefits, the greater the total amount or fund allowed insurance companies for paying their operating expenses.

This rating system functions with a high degree of accuracy to adjust rates for known or foreseeable changes, such as legislative increases in the benefit levels. Hence carriers and their trade associations have consistently taken the position that the benefit levels are issues to be determined by the state legislatures after hearing the arguments of both employer and employee interests.

Companies freely give their estimate of the cost of proposed benefit levels on the request of any of the interested parties, including labor unions; but they have not actively participated in the battles which have raged over the benefits provided, and they should not be blamed for inadequacies in the benefit level.

Nevertheless, labor union spokesmen have blamed insurance carriers as a reason for urging monopolistic state funds which would take private insurers out of the picture. They argue that the state can perform the insurance function more cheaply than private insurers, and that insurers oppose benefit increases. Perhaps the weakness of both arguments is the reason why the active

until December 31, 1951 made provision for losses which exceeded the losses actually incurred by an amount equal to only 1.37 per cent of such premium. The National Council, which compiled these figures, is the national rate-making organization for workmen's compensation insurers, and makes or participates in making the officially approved rates in practically all states where private insurance is permitted.

opposition of insurance companies to these proposals has been so generally effective.

RATES AND DEFERRED LOSSES

Insurance companies' rate problems relate to the unforeseeable developments, rather than the foreseeable, and to certain other areas of the rating system. There is a problem, currently important to carriers, of getting deferred loss developments into the rates. Compensation benefits are payable over a long period of years in many cases, while the rating and pricing practices assume that the total costs of an accident will be charged to the year in which it occurs, by means of an estimate of future benefits, or a reserve. Carriers now find that the estimates which they made years ago, then reasonable on the basis of past experience and known factors, are inadequate in the aggregate, and now must be increased.

Increases in these estimates made shortly after the accident year are recovered through the operation of "loss development factors" in the rates, but much of the increases in the reserves for accidents that occurred years ago is lost in a rating system justifiably tied to more recent accident years. A part of this loss development is attributable to the increase in medical costs now payable in old open cases.⁹ An important part, too, is traceable to awards for disabilities that continue beyond the period indicated by past experience.

The problem is most acute in those states whose laws make it easy to hold open or reopen cases. If, as has been alleged, this is a conscious or uncon-

⁹ For example, the index of Hospital Rates in the United States has increased from less than 110 in 1941 to over 280 in 1951. U. S. Department of Labor, Bureau of Labor Statistics, Consumers' Price Index, Miscellaneous Section.

scious retroactive liberalization of the laws by administrative action, it is difficult to defend. Neither employers nor their insurers charged prices contemplating such retroactive adjustment of their costs long after the accidents occurred.

RETROACTIVE INCREASES OF BENEFIT LEVELS

A somewhat similar problem would arise if any of the legislative proposals to increase benefit levels for accidents which have occurred in past years should be adopted. These proposals involve profound social and economic questions, for it is obvious that industry has not been able to pass on the cost of such retroactive increases to the consumers of the products gradually in the years of the accidents. Nor have insurers or self-insurers set up reserves for such increases in benefits chargeable to old cases.

Insurers as a whole probably could collect sufficient funds from employers to pay for retroactive increases, although the charge to employers might be high. But there would be difficult rating problems to be recognized and solved to ensure that the total costs would be fairly charged to the proper individual employers and made available to each insurer proportionately as it had assumed the individual employers' obligation to pay increased benefits.

AN EMERGENT QUESTION

Compensation for industrial loss of hearing was at one time restricted to cases of traumatic damage to the auditory mechanism. More recently this has changed and some courts have allowed recovery for loss of hearing not causing any loss of time from work or any loss of earnings.¹⁰ And very many

¹⁰ Particularly in New York and Wisconsin. See *Slawinski v. J. H. Williams & Co.*, 298

claims have been filed alleging temporary or permanent partial disability because of some degree of deafness resulting from noise in employment.

The cost of compensating all loss of hearing is potentially very high. Carriers can raise their rates to cover these costs, but some industries are very noisy, and the necessity of suddenly compensating loss of hearing gradually developed in the past might bankrupt some employers, since no allowance was made in the price of their products already made and sold. Nor have insurance carriers set up reserves for these cases. This problem is similar to the silicosis problem existing in the 1930's, and the general solution then adopted was a legislative scale of benefits low at first and gradually increasing over a period of years.

The author suggests that the problem of whether and how loss of hearing should be compensated might best be solved by the legislatures after consideration of all the practical and social problems involved—measuring loss of hearing, relating loss of hearing to industrial noise and to noise on a particular job, and determining the effect of total or partial deafness on earning capacity.

N.Y. 546, 81 N.E.2d 93 (1948); but see *Green Bay Drop Forge Co. v. Wojeck*, Circuit Ct., Dane County, Wis., Nov. 10, 1952. (The Wisconsin Circuit Court reversed the Industrial Commission award. Appeal will probably be taken.)

Leslie P. Hemry, Boston, Massachusetts, is vice president and general counsel of the American Mutual Liability Insurance Company. He is now serving on the legal committees of the National Council on Compensation Insurance, the American Mutual Alliance, the Mutual Insurance Advisory Association, and the Mutual Insurance Rating Bureau, and as a member of the Council of the Insurance Section of the American Bar Association.

CARRIERS CAN HELP TO IMPROVE THE LAWS

While all three problems arising from unpredictable developments, just described, either have caused or might cause serious financial difficulties, they will yield to reasonable rate-making procedures and to fair and understanding consideration by the public authorities involved. Carriers perform the necessary servicing functions under workmen's compensation acts expertly and economically. As rating problems yield to solution, companies tend to become mere conduits of funds. They occupy a middle ground between the differing viewpoints of workers and employers, and to some degree are insulated from the financial effect of changes in benefit levels and patterns.

Such insulation should breed objectivity, and the author believes insurers can make constructive suggestions so that the acts will better serve their social purposes in a compensation system which is not yet finished or perfect but which is dynamic and does adapt to conditions. These adaptations create problems for the three important private groups directly concerned: employees, employers, and insurers. If each of these groups would consciously strive for a better understanding of the legitimate interests of the other two, solutions would be easier to find. Such solutions would also be the best solutions for the common man.

Accident Litigation: The Common Man Sues

By JOSEPH SCHNEIDER

THE attitude of the common man in the field of accident litigation is as varied as human beings are different. It is impossible within the scope of a short paper to give one's impressions, gained after almost thirty years in the preparation and trial of injured people's cases, of what the injured person thinks, what he wants, and what, in the last analysis, the lawyer who represents him thinks is best for him. I will therefore limit this paper to the history of one common man's accident, and give some general impressions in connection with that case.

THE ACCIDENT

On July 19, 1950, William Doherty, 45 years of age, a longshoreman, was admitted to a hospital with injuries to the lower back and legs, sustained by his being struck by a truck while he was at work. He suffered fractures of his right ankle, fractures of the great toe and the second, third, and fourth toes of the right foot, and a dislocation of the left hip. He was in the hospital four months and three weeks.

When Mr. Doherty had been in the hospital for one week, a representative of the company which carried the longshoremen's insurance came to visit him and asked him whether he would like to receive the allowance of \$35 a week. Mr. Doherty had never had any experience with accident claims before, and wanted to know what his rights were. He was informed that he could receive longshoremen's compensation up to a limit of \$10,000 if he were disabled long enough to accumulate this total; or, in the alternative, that he had a right to sue the company that operated

the truck and whose employee had carelessly run over him, in an ordinary accident suit, where the limit would be not \$10,000 but the fair compensable value of his injuries. Mr. Doherty, after he had been in the hospital one week, had a nurse telephone me to visit him there, which I did.

FIRST INTERVIEW

The lawyer's first interview with the common man seriously injured and beset by the problem of making a decision in a matter involving his entire future is one calling for sympathetic understanding and appreciation of human nature, qualities which are found developed to the highest degree in the mature physician at the bedside of a person who is critically ill and who has hidden in the recesses of his mind the fear of impending death. In this interview the lawyer usually finds anxiety and suspicion in the injured person—anxiety often heightened by the specter of inability to support himself and his family because of his loss of earning capacity; and suspicion that it is not the primary purpose of the unknown lawyer, or of anyone else who has approached him, to serve the best interest of the injured man.

It is the lawyer's duty at the first interview to dissipate these fears as far as he reasonably can, by making full disclosure of the legal probabilities in the light of the information then available, and to allay all suspicion that the attorney has any other desire than to serve with the greatest fidelity the best interest of the injured person, to the end that his economic life may be saved. Cool and dispassionate explana-

tion, some well-warranted encouragement, and illustrations from the lawyer's experience with other injured people whose prospects were as dark and forbidding as this man's and whose cases were successfully handled, are reassuring ingredients of a proper first interview. There must be no hurry, impatience, or lack of sympathy with the injured person's disturbed mind.

At this hospital interview, I carefully read and explained a form of power of attorney and discussed the charges to be made for legal services, all in the presence of the man's wife and a friend in whom he reposed confidence. A form of authorization to obtain police reports, hospital reports, doctors' reports, and information from his employer was also submitted and signed. At the conclusion of this interview, the common man, who had appeared lost and forlorn, had some hope restored and his faith renewed. His outlook was not so bleak as he had first thought, for he had assurance that his rights would be prosecuted with diligence and fidelity to duty.

PREPARATION OF THE CLAIM

The preparation of the claim was now in order. An investigator was engaged who is adept and experienced in obtaining information in a form which can be useful at a subsequent time, whether in negotiating for settlement or in presentation of the claim in a courtroom. The police report was examined, upon which appeared the version of the accident given by the driver of the truck, the measurements and observations made by the police who were called to the scene of the accident immediately after the accident had taken place, and the names of witnesses who had seen the accident. It was learned that there were newspaper versions of the accident, and that while no photographs had been taken by the news-

papers or the police, an amateur candid-camera enthusiast had taken some pictures of the man as he lay injured and of the truck as it stood immediately after the accident.

WITNESSES' STATEMENTS

In the preparation of a case for settlement or trial, the statement of a witness should be taken in his own language, and preferably in his own handwriting if this can be managed. For the thought must be kept in mind always that the statement, both in its language and in its thinking, must reflect the personality of the witness who is ultimately to appear in the courtroom to testify.

These statements, when taken properly, are of great value. They give the lawyer the feeling of the atmosphere which may be created in the trial court. They inform him of the strength or the weakness of the person giving the statement. If favorable, they encourage a strong bargaining attitude in the settlement of the case; if dangerous to the injured person's cause, they warn the lawyer not to push too hard. They have value in the event that the witness dies before the trial, being made admissible in evidence by statute in many states as the statements of deceased persons made on their own knowledge and in a bona fide attempt to tell the truth before the court litigation has started. They also serve the useful purpose of preventing the witness from becoming hostile and the subject of improper advances. Finally, they are a record of the witness' memory, made when it is fresh, and may be used to refresh his recollection if either intentionally or otherwise he suffers a lapse of memory in the courtroom.

COMPLETING THE PROOF OF LIABILITY

Copies of the police records were obtained, particularly copies of the

sketches, so that they might not be lost, as sometimes happens in the maelstrom of police record-keeping. The candid-camera enthusiast was interviewed and prints of the various pictures he took were obtained, together with his affidavit of the circumstances under which he took the pictures, verifying the authenticity of the pictures, stating that they were fair representations of what he actually saw, and fixing the precise time he took them.

The names of all employees working with the injured man were obtained from his employer, and every employee was interviewed so that all available witnesses who knew anything affirmatively were recorded, and those who did not know anything about the accident were eliminated as possible sources of danger in the future.

Pictures of the general location were taken so that a pictorial record of the place could be preserved in the event that changes took place before the trial of the cause which would make a view of the location of dubious value.

A transcript of the work record prior to the accident was obtained from the injured person's employer, showing the man's industrial record, the continuity of his work and his average earnings, so that this information would be readily available both in the negotiations for settlement and for purposes of trial.

All this work was done with a view to preparing evidence on the liability aspect of the action. There are always two aspects of an injured person's claim: the fault of the party against whom the claim will be asserted, and the extent of the injuries and the consequences to the injured person.

NEGOTIATING A SETTLEMENT: BIDDING TIME

The next matter to be considered in the handling of the injured person's case is, When should the attorney start

to negotiate a settlement of his client's claim? Here is the rule which I follow. I call it the antithetical rule of "Bide your time and hot pursuit." Much has been said about the injured person suffering as long as his claim remains unsettled, and in some books on psychiatry and neurology we find men in the medical profession even classifying a group of symptoms as litigation neurosis, and attributing a great many symptoms to malingering. This may be true in some instances. The fact remains, however, that the injured person's claim cannot be taken up for settlement before it is possible for qualified medical men to forecast his future probable course with a high degree of certainty.

It is, of course, always best to settle a case as soon as reasonably possible. This is in the best interest of the injured person, both to ensure his peace of mind and to put him on an economically sound and secure basis. But the lawyer of experience must remember that many an injured person's claim has been settled in haste, only to have the injured person develop consequences directly traceable to the injuries received in the accident, for which recovery could have been had if settlement had been properly deferred. So I follow the course of "bide your time" with respect to the injury.

Biding your time in a major case thus means that you are not discharging your duty to the injured person if you attempt to settle his case before you are reasonably satisfied that you can evaluate the full extent of his injury.

THE DOCTRINE OF HOT PURSUIT

But the antithetical principle of "hot pursuit" must not be forgotten.

What is this concept? In my experience it means the use of all energetic measures to pursue the remedy to bring about compensation for the wrongs

visited upon the injured person in the earliest possible time allowed by law. This is not to say that you should institute suit the day you are retained as counsel. Bring the suit when you know approximately, within reasonable limits, what your case is worth. The doctrine of hot pursuit is that a person who has his property stolen from him has a right to use reasonable force to recover it if he runs after the thief and grabs him with the stolen goods. This is an analogous situation. There is no moral turpitude involved, but if you have been wronged you must pursue the wrongdoer with great diligence and intensity and you must bring the writ in an amount which will allow for all the recovery you may reasonably expect—the outside limit—but not a fantastically high figure, because the day of reckoning comes when you step before a court and jury to make your opening.

There are many reasons justifying an early institution of suit and the adoption of the most energetic measures in its prosecution.

In most counties in my state there is a delay of approximately three years between the time a suit is instituted and the time it will be reached for trial. It can be readily seen that where the injured person is indigent, this long delay is a very great factor in bringing about inadequate settlements, settlements which reflect the claimant's inability to bargain on even terms with an insurer or corporate defendant who merely has to say "No" to any figure that the claimant is willing to take. As time goes on and his need increases, the injured person is compelled to bid against himself in an effort to get some financial relief. The institution of suit at the earliest moment at least tends to level out this inequality as far as the attorney can do this, and puts his client's claim in numerical order to be reached in its turn as soon as possible.

In the last few years in my state there has been an added reason for early institution of suit, namely, that the verdict carries with it an additional amount equal to 6 per cent per annum on the verdict from the date the suit was begun. This amount is added to the verdict as an administrative act by the clerk of the courts.

This remedial legislation was calculated to act as a compelling factor upon the insurer or the corporate defendant to make it more amenable to settlement negotiations at the earliest possible time in order to save the "interest penalty" added to the verdict. In large measure, it has not had the beneficent effect envisioned by the legislators. It is the experience of most counsel for injured people that a good bargain must be made in favor of insurers or other corporate defendants to bring about a settlement. Otherwise, they make up the interest while the litigation is pending, merely by having the money in their possession and invested in securities yielding income at a rate approximating the interest, so that they just about break even.

THE LONGSHOREMAN'S CASE

In the case of William Doherty, whose accident took place on July 19, 1950, and who retained me on July 26, 1950, I was able, after several consultations with the surgeon in charge of Mr. Doherty, to come to some fair basis of evaluation, and, leaving myself sufficient latitude, I instituted suit on July 28, 1950. This is an example of a little hotter pursuit than is customary, but it was warranted here because of the definite nature of the injuries sustained and the reasonable definiteness of the medical prognosis.

The suit was entered the first Monday of September 1950. The defendant's answer, filed in the required twenty-one days, pleaded the usual general denial

and contributory negligence. It was now necessary to file promptly a set of interrogatories eliciting from the defendant under oath all the information available to it.

In my state, attachments are permitted at the institution of all suits. This was done when this suit was started. It goes without saying that in a case of such serious consequences a thorough investigation of the financial resources of the defendant was made as part of the original investigation. We were thus assured that whatever insurance coverage there might be, the financial responsibility, for all practical purposes, was unlimited. An attachment of generous proportions was made of defendant's real estate holdings to safeguard and ensure the collectibility of any judgment which the injured person might ultimately receive.

TIMING THE SETTLEMENT TALKS

When should the settlement negotiations be started? Recall that we must not attempt settlement of the case unless we have definite assurance from qualified medical men of what the future of the injured person will be. It is necessary for the lawyer to exercise great restraint upon the injured person, who is usually financially beset and distraught and whose importunities for settlement become more frequent and more cogent as his necessity increases.

In William Doherty's case, the first effort to negotiate a settlement was made around January 15, 1951, about six months after his injuries were sustained. At that time there was available a photostatic copy of the entire hospital record, and there were in the file written opinions from an eminent surgeon and an eminent neurologist, each giving a fairly definite prognosis.

In the meantime, I went to the injured person's home and observed for myself what his conditions were. I talked with him and his wife about

their financial situation, and found that through the years by dint of unremitting industry and economical living, if not sheer frugality, they had accumulated savings which were adequate, in their opinion, to sustain them in their station in life for possibly one year longer.

While this information indicated to me that there would not be any undue pressure upon me to negotiate a settlement at least during 1951, any delay beyond that time might militate against my ability to negotiate a fair settlement. I therefore set about giving the insurance company all the information available to me, including copies of the hospital records and the doctors' reports. I allowed the injured person to be examined by a physician for the insurance company, and at the end of a further wait of nine months, in September 1951, I granted the insurance company a second medical examination to have it determine the condition of the injured person, who was still disabled from his work.

THE SETTLEMENT FIGURE

In January 1951, six months after his accident, although I had made as full a disclosure of everything that was in my file as was possible, I got no further than merely being asked how much I had in mind for settlement.

A lawyer with experience in trying cases will be very circumspect in putting a figure on the value of a case in his first talk with the insurance company or corporate defendant. He must keep in mind that everything he says to the representative of the insurance company or the defendant goes into a file. It is recorded, and unless there are circumstances which very strongly warrant an increase in the figure at a later date, he is met with the amount he asked for originally as a ceiling on the value of the case. How can one arrive at a figure early enough to get a sub-

stantial settlement in a serious case and yet not overestimate the value of the claim or put so high a figure on the claim that it stops all negotiations? The formula I have evolved is the expectation of a favorable result times the probable collectibility of the ultimate recovery. While this formula sets up the two factors which dominate one's thinking, it is entirely a different thing to use this standard of measurement and see eye to eye with the person paying the money.

THE CRUCIAL NEGOTIATION

The intervening nine months to September 15 were spent largely in checking with the doctors as to the progress of the injured person's condition. Then, after the case had been in the courts for about a year, in order to bring the case closer to a successful conclusion, I made a motion to advance it for speedy trial on the grounds of the continuing total disability of the injured person and the necessity for financial relief in the not too distant future. This was allowed, and in December when the case was reached for trial and sent into a court session, the negotiations to dispose of the case took a very realistic turn. The insurance company, which carried a \$30,000 policy, offered its entire policy. The defendant corporation which was financially responsible added \$15,000. In light of the disability of the client for a period of about a year and a half, and his hospital and medical expenses, it was my opinion that a jury would probably give him a verdict of somewhere between \$40,000 and \$60,000.

I have always recommended to the injured person that a settlement of 75 to 80 per cent of the probable recovery

should be accepted. I have always felt that the uncertainty inherent in every personal injury lawsuit and the wide spread in the verdicts of variously composed juries compel the acceptance of such an offer. In this instance the injured person accepted my recommendation, and the case was brought to a successful close.

A FURTHER RESPONSIBILITY

I felt that I had a responsibility beyond serving the injured person up to the time of the distribution of the money. As the sum was a substantial one and a large portion of it would be left in his hands after the payment of all outstanding charges, I recommended, and the injured person accepted my advice and suggestion, that he invest his money in widely diversified investment trust certificates so that he would have a monthly income which was sufficient to cover most of his needs. It had been determined at the time of the settlement that, within three to six months after the settlement, the injured person would be able to do clerical work, such as checking or keeping time records, or other work connected with the longshoring business, although it was highly uncertain whether he would ever be able to be a longshoreman and do the laborious work of that trade again.

The lawyer's gratification comes from his knowledge that the client is satisfied with the way the lawyer has handled the case and the client. In Mr. Doherty's case, after having made the charge which is customary in my community for legal services rendered in this type of action, I received in the new year of 1952 an eloquent symbolic expression of his satisfaction, a fine box of cigars.

Joseph Schneider, a practicing lawyer in Boston, Massachusetts, has had many years of experience on the plaintiff's side of accident cases. He is vice president of the Massachusetts Bar Association, a member of the House of Delegates of the American Bar Association, and treasurer of the National Association of Claimants' Compensation Attorneys.

Accident Litigation: The Insurance Carrier Defends

By WALLACE E. SEDGWICK

INSURANCE is the foundation of the credit structure of the country. Credit is indispensable to production and distribution and to our way of life. Money will not ordinarily be loaned on uninsured property, and collateral of many kinds and types must be insured before credit can be extended upon it. No factory could operate without insurance on its workers and its physical properties and to cover its other legal liabilities. It has been said that without insurance freedom would be lost because only a few of the wealthy could hire men or borrow capital; there would be no labor unions; and the economic structure upon which our system of free enterprise and opportunity is based would be impossible.

Why then have juries been so frequently tolerant of efforts to dissipate the assets of insurance companies on unmeritorious claims? One answer may be that because of the nature of the business many persons continually pay insurance premiums for which they receive no actual individual return. In any case, records indicate that during recent years many courts and juries have been unduly generous in distributing insurance company reserves without careful consideration of the merits of the claims involved. When the insurance company defends accident litigation, this is one of its problems. It must begin by recognizing also that the justness and correctness of its position must be very clearly demonstrated if it is to succeed in a lawsuit.

THE ECONOMIC PROBLEM OF ACCIDENT INSURANCE

Casualty companies have lost hundreds of millions of dollars on liability

insurance during the past decade. While stock companies in this field have shown an over-all underwriting loss for the past 30 years, the increase in such losses during recent years from automobile liability insurance is of particular significance.

An adequate insurance market must be available to the average automobile owner for a price which he can afford to pay. If rates continue to increase substantially, there is danger that private automobile insurance will be priced out of the market, or else that the private insurance industry will not be able to provide an adequate market to supply the demand for automobile insurance. The result of either alternative would be socialized automobile insurance, with the consequent creation by statute of various bureaus, commissions, or boards to hear and adjudicate claims. In this event, the word "insurance" would no longer have the same meaning. It would mean compulsory and semicom-pulsory taxes, collected and administered by politicians who are too often actuated by motives other than a true interest in the welfare of the general public.

Meanwhile mass production has made it financially possible for most people to own automobiles, and the number of accidents increases yearly. The questions of who did what to whom and of how and by whom resulting damages are to be paid have become important to greater numbers of people.

THE THEORY OF LIABILITY

Can a person injured in an accident recover money damages from another for the injuries sustained? The common law holds that an injured person

may be so compensated only when the other party was negligent and the injured person himself was free from fault contributing to his own injuries. This is still our fundamental theory, and proponents of socialistic concepts advocating changes in the direction of liability without fault have found little favor or support.

Accident cases fall into one of the three following categories:

(1) The plaintiff has a meritorious case and should be reasonably compensated for the actual injuries sustained. This type of case should be settled if possible without the expense and delay of litigation.

(2) The plaintiff has a meritorious case for liability, but a good defense is available on the question of damages, since the injuries claimed are nonexistent or grossly exaggerated.

(3) The defendant has a meritorious defense against liability, and under the law and facts plaintiff is not entitled to recover any damages at all. This type of case should usually be defended through trial if necessary.

Fortunately, during the past several years it has become an increasingly rare experience to meet a claims representative or defense attorney who adopts the attitude that only a very few claims are legitimate and that nearly all claims should be denied and opposed. The vast majority recognize the economy of disposing of fair and legitimate claims upon an equitable basis without delay. This is the theory on which insurance claims practice is today predicated.

It will be possible in this article only to comment briefly upon some outstanding features in the settlement and litigation procedures in accident cases as seen through the eyes of counsel for the insurance company.

PRETRIAL INVESTIGATION

When an accident is reported to an insurance company, its first action, after verifying the fact of coverage, is to assign the case for preliminary investigation. After interviewing the insured, the adjuster will endeavor to talk to all known witnesses and attempt to obtain signed statements regarding the facts of the accident. He will also usually attempt to interview the injured person if he is not yet represented by counsel and if his physical condition will permit such an interview. In a large percentage of cases the injured party is represented by an attorney prior to the time the insurance company receives its first report of the accident.

If photographs are indicated, arrangements for them are made promptly. If the case is one in which scientific evidence may be of value, qualified experts are employed in order that any observations, tests, or experiments can be made that may be helpful as a foundation for later expert testimony.

The day is past in most areas when the defense attorney could confidently assume that the investigation of the accident made by the insurance company would be made earlier in point of time, and be better and more complete than that available to his adversary. In actual fact the contrary is now often true.

SETTLEMENT NEGOTIATIONS

Upon completion of the preliminary investigation, supervising claims personnel carefully review the facts and information developed. They then make a decision as to the merits of the claim from the standpoint of liability and also attempt to determine its reasonable settlement value. A reserve is established,

the amount of which reflects the supervising official's estimate of the approximate value of the claim.

The adjuster then attempts to institute settlement negotiations either with the claimant direct or with his attorney if or when he is represented by counsel.

The majority of cases are settled before suit is commenced. Many more are settled before actual trial. Insurance companies are usually anxious to settle claims before the expense of litigation is incurred. In the very nature of the situation there is room for a wide divergence of honest opinion as to the value of a particular claim. There is no exact rule for measuring damages or for accurately forecasting what a jury will do in a given instance. There are many imponderables in any case, and emotional factors often cloud the issue. Conscientious company claims representatives may undervalue a particular claim. Conversely, the injured party or his attorney may vision the pot of gold at the end of the rainbow. Serious bodily injury or death to a loved one is one of the most real of human experiences, and the strong consequent emotional disturbance frequently makes a dispassionate discussion of the actual value of the case extremely difficult.

FILING SUIT

If the case cannot be settled, or if suit is filed while negotiations are still in progress, then the case is referred to defense counsel. There is a rapidly growing custom developing among plaintiffs' attorneys in accident cases of filing suit immediately upon being employed. One reason for this procedure is the crowded condition of court calendars in many localities; suit must be filed promptly to bring the case to trial with least delay. And especially with the spirited competition among lawyers for this type of business, an early report of tangible progress may be thought

advisable to satisfy the client. This tactic increases the number of actions filed, but does not necessarily affect the number of cases actually tried.

DILATORY TACTICS DISCOURAGED

Following receipt of the insurance company's file and a review of the pleadings and investigation reports, the defense counsel will usually confer with the adjuster or investigator who has previously handled the case. He then prepares a preliminary written report to the company giving his analysis of the fact situation and any legal questions involved; and requesting additional investigation if necessary. Thereafter the defense attorney and the insurance company representatives work closely together in their joint efforts either to make an equitable settlement or to prepare and try the case to a satisfactory conclusion.

Insurance companies and their attorneys are concerned about the increasing cost of litigation and thus are reluctant to perform unnecessary legal research, or to file motions and make court appearances on matters that do not materially contribute to the actual disposition of the case on its merits. Nevertheless, defense counsel must first satisfy himself that coverage under the policy is in order as to the particular defendants he is to represent and that proper service of process has been made upon them. He must also consider the question of jurisdiction and venue. But dilatory tactics and technical motions and procedures are not favored.

Too often the indiscriminate use of motions or demurrers serves only to increase the cost of litigation, which no client appreciates, or to educate opposing counsel as to the dangerous or the weak points of his case or mistakes in pleading. These can usually be corrected by amending the pleadings and revising the theory of the case; thus the

opponent's position may be strengthened without any particular advantage to the moving party.

DEPOSITIONS

The most common device of pretrial discovery is the deposition. It is almost universal practice now to take the depositions of all adverse parties. It is particularly valuable for defendants to take the depositions of all plaintiffs. The facts of the accident can be inquired into minutely and the plaintiff's theory of liability fully disclosed and explored. All claimed items of loss and expense may be elicited and investigated. The plaintiff can be questioned in detail regarding the nature and extent of all injuries alleged, treatment received, and complaints still existing. The deposition of the plaintiff is not only the finest source of information available to the defendant, but it also serves to crystallize the theory of the plaintiff's case and his contention as to damages and, in general, to establish permanently the facts upon which the plaintiff must rely at the trial. In addition, it affords the defense attorney an opportunity to observe the opposing parties and form an opinion as to their credibility and value as witnesses and the impression they are likely to make upon a jury.

PHYSICAL EXAMINATIONS

In most states in an action for personal injuries the defendant is allowed an examination of the plaintiff by a physician prior to trial. Usually there is a right to obtain reasonably necessary X rays and other diagnostic tests not involving surgery or unreasonable danger to life or health. This is one of the most valuable pretrial procedures available to the defendant and is often a major factor in the decision as to settlement or trial.

Cases known to be completely fraudu-

lent are relatively rare, but they do appear occasionally. The development of scientific evidence and techniques has done much to defeat the fraudulent claimant.

Much more serious in the over-all picture are the malingerer and the person who consciously or unconsciously grossly exaggerates his complaints and injuries. Here again a major defensive procedure is the medical examination. It is most effective when made after the plaintiff's deposition has been obtained and hospital records reviewed so that the examining physician has much information in his possession at the time of the examination. Usually a defendant is allowed only one such examination. If trial is necessary, it is highly important to the defendant that his one medical witness be a man of recognized integrity and ability.

Summing up on the pretrial stage, it is now generally recognized that the thoroughness and efficiency of the preparation are all-important whether the case is destined for settlement or trial.

SELECTION OF JURORS

The selection of the jury presents many interesting problems. The majority of insurance attorneys believe in and support the jury system. With all its faults, they usually prefer to have cases decided by a jury rather than by a judge. Most people called as jurors will try to perform their civic duty honestly and conscientiously. The exceptions are persons whose lack of intelligence prevents practical understanding of the issues involved, persons of poor health, persons socially maladjusted whose background or environment has created strong prejudices or antagonisms, and persons who do not understand the purpose and duties of a jury as an integral part of the judicial process.

A most peculiar situation often arises

when the plaintiff's lawyer is questioning prospective jurors. Nearly all courts in the United States have held that it is improper for the plaintiff's attorney to ask questions or make statements during the trial informing the jury that the defendant is protected by liability insurance. However, these same courts allow plaintiff's attorney while questioning prospective jurors to ask them if they have any financial interest in a liability insurance carrier and usually even permit them to name a particular insurance company. The effect of asking such a question is to inform the jury that the defendant is insured and that any judgment will be paid by an insurance company and not the named defendant. In many cases the amount asked by the plaintiff far exceeds the amount of insurance protection afforded the defendant by his insurance policy, but this fact cannot be divulged to the jury and is generally overlooked by them.

Many able defense lawyers take the view that after the plaintiff's attorney has asked this question defense counsel should inform the jury that the defendant is in fact insured and then freely question prospective jurors as to whether the fact of insurance will affect the juror's decision in the case. It is felt that jurors will resent the obvious effort to influence their decision. Other defense counsel believe it is better just to ignore this situation. They assume that most people will suppose the defendant is insured, but believe that to make an issue of it merely emphasizes the interest of the insurance company.

OPENING STATEMENTS

The plaintiff's counsel usually makes a rather long and detailed opening statement of the facts intended to be proved on behalf of the plaintiff. The defendant's right to make an answering opening statement should not be neglected.

It is the defendant's first real opportunity to present his side of the case to the jury. It can be of great value in assisting the jury to understand, correlate, and evaluate the evidence as it is presented. Moreover, first impressions when strongly implanted are difficult to overcome. Hence defendant's counsel will usually try to present his side of the story to the jury at the earliest opportunity.

NEW TRIAL TECHNIQUES

There is an increasingly successful program throughout the country to educate and train plaintiffs' lawyers in techniques and procedures calculated to assist in obtaining more and larger verdicts. The emphasis at present seems to center around a popular catch phrase, "demonstrative evidence." The use of this kind of evidence is not new, but the manner and extent of its use as now advocated and practiced are new.

Literally hundreds of plaintiff's lawyers from all over the country attend national or regional meetings each year and receive an intensive, concentrated course in traumatic and forensic medicine. They get a short but very practical course in up-to-date courtroom technique and tactics, evidence, pleadings, oratory, and other categories of both substantive and procedural tort law.

More specialized legal information and additional medical knowledge in the hands of honest and conscientious attorneys can be of great value. They can aid in the proper presentation of meritorious cases, and are of benefit in realistically and sensibly evaluating cases for settlement purposes. However, such information in the hands of unscrupulous practitioners can be extremely dangerous. It can lead to exaggeration and misrepresentation with the consequent stifling of settlement negotiations, or it may result in a verdict excessive for the actual injury sustained.

This is a very human problem. The tendency of some people to exaggerate testimony in the hope of personal gain is a recognized factor in personal injury litigation. The amounts involved are now often so large that the temptation is strong to exaggerate or color facts concerning the happening of the accident and the various elements of damage claimed.

The trial of an accident case today bears little resemblance to the type of proceeding most lawyers were accustomed to some years ago. It is not uncommon now to see in court complete neurological skeletons; wax dummies with come-apart sections; colored photographs showing various injuries; positive photographs of X-ray negatives, sometimes colored; artists' drawings of injured portions of the body, graphically illustrating the type of injury alleged; motion pictures; and other similar means of presenting evidence to the jury dramatically and sensationally. An observer must often receive the impression that he is watching a well-managed stage production instead of the traditional dignified courtroom procedure.

Plaintiffs' attorneys often use several blackboards for the trial of a case. One blackboard may be used to illustrate a long opening statement. On it may be listed the names of all witnesses that are to be called, a list of the injuries claimed, the amounts of special damages alleged, and computations showing how the general damages figure is estimated. These may include calculations based on a certain number of dollars per day for pain and suffering for the period of life expectancy of the person involved. The purpose is to influence the jury by leaving these figures constantly in front of their eyes during the progress of the trial. The assumption is that visual impressions are stronger than those received through the ear.

EXPERT TESTIMONY

In the presentation of medical evidence, a plaintiff has a distinct advantage over the defense. The physician who actually attended or treated the plaintiff from the time the accident occurred is in the best position to testify regarding the character and duration of the injuries. Plaintiff may also have as many special examinations as is desired, and thus produce as witnesses as many doctors as he feels advisable. He may have specialists in several different fields, and take many X rays and other diagnostic tests. All these X rays and records are readily available to the plaintiff. The defendant usually is allowed only one medical examination, and has no access to early X rays or information regarding other tests until after the plaintiff produces this evidence at the trial.

Consequently, the cross-examination of the plaintiff's medical expert is a delicate and important part of the case for the defense. Most doctors are honest and competent. Long and vigorous cross-examination of one who is both honest and competent is dangerous and often futile and harmful. The most successful cross-examination of such a witness is usually short and intended only to bring out evidence favorable to the cross-examiner which was avoided on the direct examination. Exaggerations or opinions based on misinformation may profitably be developed and used as foundation for contradictory evidence later. But the generally accepted rule is to avoid attempting to prove the defendant's medical case by cross-examination of the plaintiff's expert medical witnesses.

The use of expert testimony is developing and expanding at a rate difficult for the lawyer to follow. The types of expert testimony familiar to most at-

torneys are in the fields of medicine, handwriting, and building construction. But the use of experts is becoming more and more common in other fields.¹ This is a real contribution to finding the truth.

Experiments performed both in and out of court have become a strong weapon of the defense both in determining and demonstrating the true facts. The value of this type of evidence, carefully prepared and presented, cannot be overemphasized.²

CLOSING ARGUMENTS

The plaintiff ordinarily has the privilege of opening and closing the arguments. The defendant must make his summation before the plaintiff has made his closing argument.

The plaintiff's final argument presents peculiar difficulties to the defense lawyer. He must try to anticipate plaintiff's closing remarks and also, as far as possible, refrain from giving plaintiff's attorney new ideas for an effective closing argument.

The summation for the defense should rarely be a long one. More cases are won with short arguments than with long ones. Unimportant details should be ignored. The day has long since passed when loud and flowery oratory was convincing to a jury. Logical, orderly, and restrained discussion of the facts of the case is now far more effective. Belief in the justness of one's own

¹ These include accounting, agriculture, animal husbandry, aviation, chemistry, physics, lumbering, surveying, mechanical and electrical engineering, combustion, electronics, navigation, public health, mining, photography, radiography, plastics, and pharmacy.

² Experiments have been used successfully to show the cause, force, and extent of an explosion; the cause and result of failure of machinery; the strength and weight-bearing load of structural members; stopping distances of vehicles under varying conditions; how far sounds could be heard.

side of the case is essential, as few men have the ability to convince others of the truth and justice of a proposition in which they do not themselves wholeheartedly believe. Courtesy and sincerity are the keynotes of most successful arguments or summations.

INSTRUCTIONS TO THE JURY

The court's instructions to the jury regarding the law to be applied to evidence are considered by many eminent authorities to be the most unsatisfactory part of a jury trial. The language used in many instructions is archaic and practically unintelligible to laymen. Efforts are now being made by leading educators and lawyers to improve this situation. Certainly there is great room for improvement, and drastic changes of procedure will no doubt be made in the foreseeable future.

To illustrate the confusion which the instructions leave in the minds of many jurors, Judge Cook of the Circuit Court of Missouri recounts in an article for the Missouri Bar³ the statement made to him by a juror following a case in his court:

"You see, Judge, it's like this—we all talked about the instructions a long time and didn't seem to be getting anywhere. John Doe had gone off to college for a couple of years, so we asked him to read them and see what they meant. He went over in the corner while the rest of us talked about the case. We got in a terrible argument about the defendant carrying insurance; some of us thought he had insurance, some others said there wasn't any evidence about insurance and that that lawyer was just trying to trick us by asking us those questions about the insurance company. I knew ———"

³ Cook, "Instructionese: Legalistic Lingo of Contrived Confusion," 7 *Journal of the Missouri Bar* 113 (1951).

wouldn't ask us about insurance if he didn't have insurance. Finally Doe came back over and said if he had more time maybe he could figure them out, but there were just too many 'if so's' in there for him. So the instructions didn't help us. We were about evenly divided on the insurance. But we didn't have any trouble deciding who caused the accident and how much the plaintiff should get."

Judge Cook concludes:

"Still, after half a century, we find ourselves in the embarrassing position in regard to instructions to the jury in plain, ordinary automobile accident cases, in which the lawyers do not know how to write the instructions, the trial judges do not know whether or not they are correct, and only God understands them."

Court decisions in recent years in the accident field have shown great liberality on questions of coverage under insurance policies, rules of evidence and

substantive law, and amounts of judgments. It is most unusual today for a court to grant a nonsuit or directed verdict in defendant's favor. The defense of contributory negligence survives on the books, but in practice the trend is toward some form of "comparative" negligence. To this liberality on the part of the courts must be added the policy of the insurers themselves to attempt to make some settlement in almost all injury cases. And with medical payments coverage available for many motorists, persons injured in an automobile accident by and large have a practical opportunity to secure a fairly compensable settlement.

The problem of discovering and defeating fraudulent, exaggerated and unmeritorious demands remains. Available resources for equitable payment of proper claims should not be dissipated on unworthy cases.

Greater public understanding of the problems of accident litigation can do much to promote social justice.

Wallace E. Sedgwick, San Francisco, California, a member of the firm of Keith, Creede & Sedgwick, was formerly district manager of the State Compensation Insurance Fund of California, and Northern California claims manager of the General Insurance Company of America. He is a member of the International Association of Insurance Counsel.

Automobile Accidents and Financial Responsibility

By FRANKLIN J. MARRYOTT

IF the American motorist occasionally thinks about how different things are today from what they were twenty years ago, he probably thinks about changes in the appearance and mechanical design of the automobile he drives and about changes in the concept of what constitutes a modern highway system. If he is a thoughtful fellow, he may also reflect upon the enormous increase in the number of privately owned automobiles (today there are about 52 million in this country, or about one for every three people¹) as an indication of the extent to which the twentieth-century American revolution has progressed toward its ever moving goal of more of everything for more and more people.

Perhaps he also has some awareness of the price society has been paying, in terms of injuries and deaths from highway accidents, for this increase in the number of vehicles being operated and the failure of our society to become indignant as well as appalled at the mounting human toll and to demand full use of all available knowledge of how to reduce the number and severity of accidents. The 1952 figures may show an all-time high of 40,000 deaths and 1,250,000 injuries.²

That the statistics are not worse is a tribute to the highway safety work which is being done. Much more can be done to reduce the toll; but it can hardly be expected that we shall ever reach the point where the problem of compensating the victim of the highway

accident is not one which demands solution.³

LEGISLATIVE CONCERN

But even if the average motorist is strangely apathetic on this problem, our legislatures have become increasingly aware of and concerned with it.

From the viewpoint of the victim of an automobile accident, the question of payment for his damages or injuries is paramount.

Unless a prompt settlement is offered, he must face a very unfamiliar problem. Should he bring a lawsuit? The answer to this question, if it is to be arrived at on a practical basis, will require him to determine whether the defendant is financially able to pay the judgment for damages which may be obtained. "Is the defendant financially responsible?" is quite as important a question as "Is the defendant liable?" And in a very large number of cases, the first question translates into "Is the defendant insured?"

If the defendant is financially responsible on the basis of his own personal wealth, the question of insurance becomes less important to the victim, but

¹ F. M. Kreml, "Traffic Law Enforcement," *Public Safety*, November 1952, p. 18.

² National Safety Council, *Accident Facts* (1952 ed.), p. 60.

³ Even in Detroit, Los Angeles, and Seattle, where excellent safety programs produced reductions in traffic deaths of 41, 38, and 28 per cent respectively (Kreml, *supra* note 1), the traffic deaths in 1951 were 227, 269, and 47 respectively. National Safety Council, *supra* note 2, p. 67. In New York, where the death rate per 10,000 registrations had dropped from 13.2 in 1931 to 5.1 in 1951, there were 2,101 traffic deaths in 1951. Industry Committee on Motor Vehicle Accidents, Foreword of *Program for Highway Safety in New York*, Nov. 18, 1952.

it becomes vital to the defendant. From his viewpoint, the presence or absence of insurance may determine whether he faces financial disaster and the end of his dream of economic security. That these dreams may be fulfilled is not only his personal goal but the goal of much of what has been going on these last twenty years, and it would be strange indeed, during an era when the desire of people for security has been at least partially fulfilled in so many respects, if the subject of security for automobile accident victims, and for defendants in automobile cases, had not

occupied the attention of the legislature of every state.

The most frequent legislative response has been to enact some sort of "financial responsibility" legislation.

For present purposes let us take this term as referring to a law which encourages all automobile owners to become financially responsible with respect to damages arising from automobile accidents. None of the laws require that the purchase of automobile liability insurance be the means to the end, but since this way of quickly becoming "financially responsible" is so

TABLE 1—PERCENTAGE OF TOTAL MOTOR VEHICLES INSURED, 1950, BY STATES

Percentage	Type of Financial Responsibility Law			
	Type 1 ^a	Type 2 ^b	Type 3 ^c	Type 4 ^d
90 or over (8 states)	District of Columbia	Delaware, Maryland Virginia, Washington	New Hampshire New York	Massachusetts
80-89 (14 states)		California, Colorado Connecticut, Illinois Iowa, Ohio Pennsylvania, Wisconsin	Indiana Maine Michigan New Jersey Oregon Vermont	
50-79 (20 states)	Kansas Missouri New Mexico No. Carolina So. Dakota	Arizona, Idaho Kentucky, Minnesota Nebraska, Nevada No. Dakota, Oklahoma Rhode Island, Tennessee Texas, Utah West Virginia, Wyoming	Florida	
Less than 50 ^e (7 states)	Arkansas	Alabama, Georgia Louisiana, Mississippi Montana, So. Carolina		

^a Old type financial responsibility law requiring no security to satisfy any judgments rendered, but only proof of future financial responsibility, and that only after judgment or conviction.

^b Financial responsibility law requiring security, but not proof, following accident.

^c Financial responsibility law requiring both security and proof following accident.

^d Massachusetts has a compulsory automobile insurance law.

^e Of the states having less than 50 per cent of motor vehicles insured, Louisiana, Mississippi, and South Carolina had no financial responsibility law prior to 1952; and Alabama, Georgia, and Montana enacted the modern type law after 1950. Arizona, Connecticut, Delaware, New Jersey, Ohio, Rhode Island, Texas, Utah, and West Virginia have adopted modern type laws since 1950.

TABLE 2—PERCENTAGE OF TOTAL MOTOR VEHICLES INSURED, 1950, BY AREAS

Area	Total Registrations	Number Insured	Per Cent Insured		
			Minimum	Maximum ^a	Midpoint
Massachusetts	1,088,629	1,088,629	100	100	100
New England (except Mass.)	1,482,422	1,083,180	73	81	77
N.Y., Middle Atlantic, Ohio, West Virginia	12,322,761	9,785,926	79	88	84
Middle West	13,752,534	9,717,774	71	79	75
Pacific Coast	7,246,677	5,381,816	74	82	78
South	7,676,567	3,807,103	50	56	53
Southwest	4,405,288	2,174,156	49	54	52

^a Based on reducing total registrations by 10 per cent to adjust for duplication in registration counts.

conveniently available, the laws have sometimes been referred to as "semi-compulsory insurance" laws. Indeed, administrators and legislatures are inclined to measure the degree of success of such a law in terms of the percentage of automobile owners who have purchased automobile liability insurance as a result of the persuasions it creates.⁴

Such laws now exist, in some form, in all states except Massachusetts, which has a compulsory automobile insurance law. Not all of these laws are of a modern type, but the number of up-to-date security type financial responsibility laws may be larger by the end of current legislative sessions.

It is believed that in 1950 about 33 million automobiles were insured for automobile bodily injury liability—73 per cent of the then total. The distribution by states is shown on Table 1, and by areas on Table 2. Probably the 1951 percentages are somewhat higher, and there seems to be no good reason why a percentage of insurance of 90 or more should not finally be attained under modern type financial responsibility laws if good enforcement exists.

⁴ N. Y. Commissioner of Motor Vehicles, *Safety Responsibility Annual Reports* (1944-51).

THE NEW YORK LAW

Let us have a closer look at a modern financial responsibility law. For this purpose we shall select the New York law,⁵ which has been notably successful in that the percentage of automobile owners carrying automobile liability insurance increased from about 30 per cent in 1941 to about 95 per cent in 1951.⁶

The New York law became effective January 1, 1942. It provides that every person operating a motor vehicle which is involved in any accident resulting in personal injury, or damage to property of some person in excess of \$50, must report that fact to the commissioner within 48 hours. Not less than 10 days nor more than 60 days after receipt of this report the commissioner shall suspend the license of the operator and registrations of the owner unless and until (1) security is given to satisfy any judgments which may be recovered by any person suffering such injury or damage, and (2) proof of "finan-

⁵ N. Y. Vehicle and Traffic Law, Art. 6A. The first law of this general type was enacted in New Hampshire in 1937.

⁶ N. Y. Commissioner of Motor Vehicles, *supra* note 4.

cial responsibility" for the future is furnished.

The requirement that security and proof be furnished does not apply to any owner or operator who had in effect at the time of the accident a standard-provisions automobile liability insurance policy which provided bodily injury limits of at least \$10,000 to \$20,000 and a property damage limit of \$5,000.

Proof of financial responsibility for the future may also be required of a person who is convicted of certain offenses involving the suspension or revocation of his operator's or chauffeur's license.

The statute likewise requires the commissioner to suspend the operator's or chauffeur's license and all registration certificates issued to any person upon receiving an authenticated report that he has failed for a period of 15 days to satisfy any judgment for bodily injury or for property damage in excess of \$50 arising out of his operation of an automobile in any state or Canadian province.⁷ A person who has been required for any reason to furnish proof of financial responsibility under the statute is ordinarily relieved of that requirement after three years since such proof was furnished if he has not within that period been convicted of a violation of the motor vehicle law and has no charges of such offenses pending against him.

The statute also provides that a person whose license or registration was suspended or revoked on account of an accident may secure the issuance of another license or registration without furnishing proof of financial responsibility if (1) one year has elapsed since the accident, (2) nine months have elapsed since the compliance with any order of suspension made against him

⁷ A discharge in bankruptcy is not under the terms of the law an adequate satisfaction of any such judgment.

because of such accident, (3) he has not paid or agreed to pay anything for damages resulting from such accident, (4) no suit for damages in respect to the accident has been brought against him, and (5) he has not been otherwise required to furnish or maintain proof of financial responsibility.

Proof of financial responsibility may be made by posting a bond in the same limits as the insurance required or by a deposit of cash or securities of \$25,000.

The distinguishing features of the New York type law are the requirements that security, in the form of cash or equivalent, be posted respecting the accident which has happened, and that proof of future financial responsibility be furnished, unless motor vehicle liability insurance was in effect at the time. The obvious inconvenience of being required to post cash or equivalent sufficient to pay for the accident, as contrasted with becoming financially responsible in advance through the purchase of automobile liability insurance, is the source of the persuasion which the New York law applies.

SECURITY AND PROOF REQUIREMENTS

Older type financial responsibility laws lack the "security" requirement⁸ and several fairly recent laws lack the "proof for the future" requirement.⁹ The older laws provide that a person who has been in an accident which resulted in an unsatisfied judgment against him shall not be permitted to operate in the future without insurance or its equivalent.¹⁰ These are the so-called "first bite" laws and are relatively ineffective, largely because few claimants will go to the trouble of securing a judgment against an

⁸ See the laws of the states under Type 1 on Table 1.

⁹ See, e.g., the recent enactments in Mississippi, Rhode Island, South Carolina (all effective January 1, 1953), and New Jersey (April 1, 1953).

¹⁰ See, e.g., the North Carolina law.

uninsured financially irresponsible defendant.

Both the older type laws and the security type require proof of financial responsibility for the future in the event of convictions for certain offenses, such as drunken driving, reckless driving, and leaving the scene of an accident.¹¹ These provisions have not served to accomplish very much in terms of persuading people to carry automobile liability insurance, apparently because relatively few motorists are convicted of such violations, and because fear of such conviction is not a persuasive force.

The Uniform Motor Vehicle Code, drafted and recommended by the National Committee on Uniform Traffic Laws and Ordinances, now includes as Act IV a model financial responsibility act. Act IV has contained, since the 1944 revision, the "security" provisions which distinguish the newer laws from older types.¹² It requires "proof for the future" (three years only) for certain convictions or failure to pay judgments, but not for accident involvement itself.¹³

Financial responsibility laws do not make any effort to change the existing rules of law applicable to motor vehicle accident cases. They are superimposed upon the existing legal system, which requires that the claimant prove that the defendant is legally liable, that is, that he was negligent. However, as a result of a high percentage of insurance, most victims are paid; but this is because insurance companies settle a very large percentage of all claims made against their policyholders. In a very great majority of the cases payment is made

¹¹ Compare the North Carolina and New York laws.

¹³ *Ibid.*, §43.

promptly, but with heavily congested court calendars in some areas, very long delays sometimes occur. And of course there are many cases in which no payment is made because the defendant was not at fault or because the plaintiff was guilty of contributory negligence.

WEAKNESSES OF THE SYSTEM

From the viewpoint of the victim, financial responsibility legislation is not a wholly satisfactory answer. It may be the best available answer, but certainly it is not perfect, and it should not be expected that it can cure such difficulties as are virtually inherent in applying the common-law rules of negligence and courtroom procedures to automobile accident cases.

From the viewpoint of the insured defendant, who is not himself injured in the accident, the financial responsibility system is fairly satisfactory. His need for protection from the possible economic disaster of a judgment against him is admirably met by modern broad-coverage insurance. From the viewpoint of a defendant, the shortcomings of the system are that its persuasions, being rather indirect, may have failed to cause him to do what he should have done, namely, become financially responsible by purchasing insurance, and that the minimum limits named in the law are too low to safeguard him against the jumbo-sized verdicts so common today.¹⁴ Also, it is barely possible that

¹⁴ For examples in recently reported cases, see *Garippa v. Wisotsky*, 108 N. Y. Supp. 2d 67 (1951), *affd.*, 113 id. 772 (1952) (\$75,000); *Loerzel v. Carnright*, 279 App. Div. 825, 109 N. Y. Supp. 2d 400 (1952) (\$75,000); *Robinson v. Butler*, 234 Minn. 252, 48 N.W.2d 169 (1951) (\$54,000); *Dworgansky v. Glenn Cartage Co.*, 192 F.2d 166 (2d Cir. 1951) (\$65,000). There are many cases not reported in the law books. For some examples, see *Oakland Tribune*, July 14, 1951 (*Allen v. Eoff*—\$200,000); *Oklahoma City Times*, Dec. 18, 1951 (*Fielder v. Landry*—\$116,584); *Houston Post*, Feb.

the accident is not covered by the policy. If the defendant himself is injured, his usual desire is for something more than protection against liability. Under such circumstances, his need and desire are that payment be made. But the common-law negligence system itself, rather than any defect of the financial responsibility system, is the reason why the negligent defendant is not compensated for his own injuries.

The most obvious shortcoming of the financial responsibility system is that it fails to produce 100 per cent coverage. It appears that a gap of about 10 per cent will remain in a state in which enforcement procedures are about normal and in which there are no special circumstances. Some of the worst cases have a perverse way of falling within these gaps, with the resultant publicity directing fresh attention to the fact that the problem is not completely solved.¹⁵ Legislator-lawyers with clients who cannot collect for their injuries are not easily answered by the statement that such instances are rare.

STRENGTHEN THE SYSTEM, OR CHANGE IT?

Thus, one of today's pressing problems is whether and how far to move from where we are. Should we push toward 100 per cent insurance coverage or its equivalent? Should we now close the gap in such states as New York where the financial responsibility law has been in effect for a long enough time and has been well enough enforced to indicate that its approximate maxi-

mum effect has been attained? If we should, how can it be done? Or should we consider some other system, perhaps a system based on the workmen's compensation idea, which would contemplate that all automobile accident victims would be paid even though they could not establish negligence on the part of the one causing the damages or injuries?

Obviously, no financial responsibility statute can be completely effective. Those initially persuaded that insurance should be carried may drop the coverage before the accident occurs, and some who were insured at the time of accident involvement may be uninsured at the time of the next accident. Some further device is needed if we retain the system but want the gap to be closed.

One way of closing the gap is to move from the status of semicompulsory insurance that exists under modern financial responsibility laws into full compulsory insurance, as has existed in Massachusetts since 1927.¹⁶ Many insurance people are opposed to the Massachusetts system, holding that the difficulties which have prevailed in Massachusetts (inadequate rates, low commission scales for agents, constant and unjustified criticism including threats of a state fund from some politicians, tight markets causing considerable public inconvenience, and so forth) are likely to be attendant upon outright compulsion. There is also some question as to whether a compulsory insurance system will bring about a lower total of insurance protection in force, because people may decide to buy only the minimum coverage required by law. And there are those who feel that compulsory insurance smacks of socialism and thus is somehow evil in itself, and, being evil, should not receive serious consideration as a solution.

¹⁶ Mass. Gen. Laws (Ter. Ed.), c. 90, §1A, as amended.

22, 1951 (Jenkins v. Arnold Transp. Co.—\$200,000).

¹⁵ Deputy Superintendent George H. Kline and Special Assistant Carl O. Pearson in a report to Superintendent of Insurance Alfred J. Boblinger under the title *The Problem of the Uninsured Motorist* (1951), p. 10, note that of 1,450 accident files in fatal cases reviewed, 246 (17 per cent) involved uninsured owners and operators.

It should be added that there are those who believe that compulsory insurance got off to a bad start in Massachusetts because it came at a time when only about 30 per cent of cars were insured, thus making the transition much too abrupt; and it is said that the unsatisfactory conditions there are not likely to occur elsewhere. Many people see nothing inherently wrong with the idea that financially irresponsible persons should be denied the use of the highways, or that insurance or its equivalent should be required as a condition precedent to registration.¹⁷

Another and very interesting method of increasing the percentage of motor vehicle owners who allow themselves to be "persuaded" to make themselves financially responsible has been employed in British Columbia¹⁸ and in Manitoba.¹⁹ It is the enactment of "impoundment" statutes, that is, laws which require the impoundment of uninsured vehicles involved in accidents.

Another device which might be used, but has not been regarded with favor, is that of requiring those involved in accidents while uninsured to establish proof of future financial responsibility on a permanent or at least a long-term basis. This shares the unpopularity of the compulsory insurance approach. It is, however, on a very selective basis, and would arouse resentment, if it did so at all, only among a comparatively small

¹⁷ Governor Dewey has recommended the enactment of compulsory automobile insurance legislation in New York. His January 7, 1953 message states his belief that "the time has come to challenge the right to drive of that small minority who continue to operate vehicles without insurance or other evidence of ability to recompense the victims of their accidents," and that there would be "no necessity to increase the coverage or limits now provided in the standard automobile liability insurance policy."

¹⁸ Chapter 227, Revised Statutes of British Columbia, 1948, as amended.

¹⁹ Manitoba Highway Traffic Act, Chapter 23, Statutes of 1945, as amended.

group—uninsured persons involved in accidents. It would seem that this device would, over a period of years, have the effect of materially lessening the number of uninsured automobile owners.

There would remain the problem of how to persuade new owners to become insured, because in a sense all financial responsibility laws permit a sort of "first bite" before they compel anything.

In 1951 New York made an effort to get at this particular gap by enacting a compulsory insurance law applicable to registrants under twenty-one years of age.²⁰ Perhaps this narrow area of compulsion could be broadened somewhat, say to age twenty-five; and if in such form it served to require almost all new owners to carry insurance, its effect when combined with a stiff "future proof" provision in the financial responsibility law would be to produce very close to 100 per cent coverage by methods a little short of the sweeping compulsions of the Massachusetts law.

AN UNSATISFIED JUDGMENT FUND

A scheme not for closing the gap but for dealing with the cases which would be within the gap is the creation of some sort of an unsatisfied judgment fund out of which judgments against the financially irresponsible could be paid.

New Jersey has the perhaps dubious distinction of being the first populous state to enact an unsatisfied judgment fund law.²¹ It did so in 1952. The

²⁰ This has since been broadened and now applies to minor operators as well as owners. N. Y. Vehicle and Traffic Law, Art. 3, §§11a, 20a. See also Art. 4, §41a, requiring insurance as prerequisite to registering motorcycles of minors.

²¹ Laws of 1952, c. 174. North Dakota has had such a fund since 1947 (Revised Code, c. 39-17). It applies to judgments in excess of \$300 and to residents only. Since 1951 it is also applicable to "hit and run" cases (H.B. 585). The *Journal of Commerce*, Nov. 19, 1952, reported that the fund "may be depleted before the year runs out."

law contemplates that there will be a fund managed by the state through a board on which employees of insurance companies will serve along with the State Treasurer. The fund will be created, beginning in 1954, by charging uninsured registrants a fee of \$3.00 and insured registrants a fee of \$1.00, and by a tax on insurance carriers of $\frac{1}{2}$ of 1 per cent of premiums. This tax will find its way, of necessity, into the rates for insurance and will thus be paid by insured motorists.

Judgments in motor vehicle cases which are not collectible from the defendant will be paid by the fund. Cases will be investigated by insurance companies, and presumably the costs incurred in these cases will likewise find their way into the rates paid by those who do insure. Defendants who do not pay up will be off the road.

Not all plaintiffs can collect. If the plaintiff is driving or riding in an uninsured car owned by himself, his spouse, his parent, or his child, he is not permitted to collect from the fund. Those who are entitled to workmen's compensation benefits because of the injury in question cannot collect from the fund. No nonresident can collect from the fund unless he owns a motor vehicle registered in New Jersey. Those entitled to life insurance, accident and health insurance, or other benefits cannot recover their full damages, the amounts of such benefits being deducted from any possible recovery from the fund. The first \$200 in damages are not recoverable from the fund in any event. The spouse, parent, child, or guest occupant in the motor vehicle operated or owned by the judgment debtor cannot collect.

OBJECTIONS TO NEW JERSEY LAW

Objections to the New Jersey law, apart from questions as to its constitutionality, are that it is grossly unfair

because it puts the burden of paying all judgments on those who voluntarily insure, instead of trying to induce the irresponsible to become responsible, and that it does not prevent the economic disaster which the irresponsible defendant sustains when he cannot pay a judgment and loses his right to drive motor vehicles, upon which his livelihood may depend. Also, there will still be some economic catastrophes among injured claimants, because many of them can collect nothing from the fund and will be as badly off as before.

The fairness of a law which makes those who are entitled to workmen's compensation benefits and those who have provided benefits for themselves (such as accident and health beneficiaries) ineligible for its full benefits has also been a subject of discussion. It must be admitted, however, that the New Jersey system will assure the payment of some cases which would not be paid under a successful financial responsibility law. Whether the method will seem, upon further consideration, to be too obnoxious in terms of fairness, or too expensive to responsible motorists, or to involve overmuch statism, is an unsettled question.

LET US NOT BE HASTY

While much of the discussion in recent years has pointed up the ultimate dilemma of what to do about the gap which remains after a modern financial responsibility law has accomplished its maximum result, it may be that a complete solution of this particular problem should be deferred a little while. Certainly we need to know what effect an impoundment act will have in a state like New York when, effectively enforced, it is superimposed upon a modern well-enforced security type financial responsibility law. We need to know how far we get with a compulsory insurance law applying to minor (or

young) owners. And we must not make the mistake of requiring an abrupt transition.

It is, of course, entirely possible that public impatience with the shortcomings of the negligence system as applied to automobile accidents will compel changes in the system itself. Such changes would not necessarily take the form of complete abolition of the negligence basis for recovery and the substitution of a system similar to a workmen's compensation system.²² The formal adoption of some type of comparative negligence doctrine, a curb upon excessive fees of lawyers, special courts for automobile accident cases, much better use of pretrial procedures, the development and use of simple and reliable methods for the detection of the faker and the malingerer, the use of court-chosen medical experts, a curb on flagrant courtroom histrionics, and better education and instruction of jurors, are all matters which should receive careful study before concluding that the present system cannot be made to produce satisfactory results in automobile accident cases.

Insurance carriers are prone to identify

²²No state now has a system which requires payment to automobile victims regardless of fault. It is reported that Mr. Arthur A. Ballantine, who in 1932 advocated a compensation system for automobile injuries, has modified his views and now favors an impoundment statute along with a strong financial responsibility law. This formula is also recommended by the Association of the Bar of the City of New York, Report dated December 7, 1952. See *Journal of Commerce*, December 29, 1952.

themselves with their policyholders in establishing their own motivations. Thus, insurance carriers are sometimes inclined to seek the correction of shortcomings of the present system, such as long delays, excessive verdicts, high contingent fees for lawyers, occasional unsavory "hookups" between doctors, lawyers, and claimants, false or exaggerated claims, and witnesses with superperfect memories. How to obtain public support for needed reforms without placing the system itself in jeopardy is not only a delicate problem in public relations but one which few would wish to resolve on a pragmatic basis.

But much can be done without making, and perhaps should be done before making, ultimate choices. There are still several states without modern security type financial responsibility laws. Thus it would perhaps be well if the emphasis for the next few years could be upon changing old type financial responsibility laws into new type laws, and upon effective enforcement, rather than upon closing anticipated ultimate gaps. Placing the emphasis upon speeding this process may result, in the aggregate, in much progress in making it possible for more victims to be paid and for more defendants to avoid economic catastrophes. Narrowing by proved methods the substantial gaps which exist in several states instead of becoming preoccupied with ultimate complete solutions will also make for a much easier transition to whatever system we shall finally evolve as a solution of the motor vehicle accident problem.

Franklin J. Marryott, Boston, Massachusetts, is vice president and general counsel of Liberty Mutual Insurance Company, with which he has been associated since 1931. He was formerly assistant professor of law and assistant dean at New Jersey Law School. After early insurance experience as a trial attorney, he served as a member of the Joint Forms Committee which drafted the standard provisions for automobile liability insurance policies and other standard provisions. He was chairman of the Insurance Law Section of the American Bar Association for the 1951-52 term and currently represents that section in the House of Delegates. He is a contributor to legal and insurance journals.

The Jury System in America

By CURTIS BOK

A GREAT many people attack the jury system as if they thought it could be abolished. To do that would require constitutional amendments whose passage no sane politician would be brave enough to attempt.

The right to trial by jury exists in the national Constitution and in the constitutions of the states, and stems directly from the common law of England. Like the rights of due process and of free speech, religion, and assembly, it is such a familiar column of our liberties that a direct attack upon it would arouse a furor out of all proportion to its merits and demerits as an actual working system.

The nature of our legal system must not be forgotten. Having no divine origin, the common law developed by a sort of capillary attraction from case to case, and the applicable rule emerged as a consensus of judicial opinion over the years. When these rules were hoisted out of the reports and codified, their essential nature transferred to the code. It was primarily a pragmatic effort to solidify the past and guide the future; and either way, the law, code or common, has grown to be the anvil on which we hammer out our social experiments. The solidified past is the tougher anvil, but our rapidly changing mores compel us to beat upon it with unrelenting vigor.

As long as the jury system lies on the anvil, it is proper to subject it to both attack and defense; but to lift it off and throw it away is another matter. Our books are littered with the corpses of dead laws. Possibly we neglect to repeal them on the analogy of the old pair of shoes—they may come in handy some day. Our interest ceases once the social experiment has beaten the life from a law, and we leave it where it lies, the victim of an occasional, after-thoughtful whack, or to serve by way of analogy for a further experiment.

LIMITED USE OF JURY

Time will take care of the jury system, one way or the other. At the present, it appears to be in a state of slow disintegration. In England it is disappearing rapidly: in civil cases it is rarely used, and in criminal cases it is used only for the major ones. It never existed, in either England or the United States, in equity cases (except most infrequently and then only as advisory to the chancellor's conscience), or in admiralty, which administers the law of the sea. Congress has very rarely granted the right to try cases against the United States before a jury. In certain parts of this country juries are used almost as infrequently as in England, and the growth of nonjury civil trials and of misdemeanor trials on waiver of jury proceeds steadily. In some jurisdictions it may be waived in the criminal trial of major felonies short of first degree murder. It persists very strongly in capital cases, and in most civil cases it can be demanded by one party. Nonjury trials are quicker and help to clear the docket.

The massive growth of arbitration and of practice before administrative tribunals has resulted in the settlement of disputes whose number would sink the courts twelve judges deep if they had to be solved within the legal system, with or without juries. Hence in proportion to the number of existing human disputes, those now settled by juries have shrunk to a small minority. Most of these are criminal cases: of the civil cases, from 75 to 85 per cent are accident cases.

ENTERTAINMENT AND ILLUSION

The courts were once the country's greatest theater. People came from miles around and hung on every syllable while the lawyers talked for days.

Happy was he who could sit in the jury box and be directly thundered at. The resulting public hangings drew huge crowds, with choice window seats going at fancy prices. Court term in country districts brought in the neighbors to see the artful lawyers and hear the speeches even for the ordinary calendar. It is not generally recognized that the change in the courts' status from theater to workshop has been a major revolution within the legal system. There were fewer rules a century ago, either statutory or decisional, and hence there was greater play for the ingenuity of lawyers. Nowadays the great new problems that arise from the changing economy are matters of law for the court: they do not filter down to the jury box.

Justice has always been entertainment. At its noblest, it is education of the soul or mind: at its lowest, burlesque. Universally it is what the litigants and the spectators take home with them from court—the shoddy, the covered Grail, or the balance of divided truth. And to some extent, greater or less, justice is an illusion. Even in the clearest cases about specific bits of property or obvious promises, the hinterland has all the peaks and valleys of human pressure that produce the most impersonal-looking legal situations. A promissory note may be given in the routine course of business or it may be a desperate man's last hope; but the law merchant applies evenly to both cases, and the man who purchases such notes in good faith takes them free of their unequal equities. The goddess with the bandaged eyes and the scales can be either a prophet or a vixen. Her eyes are covered and so we cannot know which, nor do we always want to know, since the law does not pretend to do more than keep average conduct average. A host of illusions arise from that fact alone, and our best wisdom, pend-

ing slow improvement, appears to be content with it.

A child of eight is killed by a train. The law says that its heirs are entitled to the economic value of its life. An appalling situation at once confronts the fact finder, whether judge or jury, and even those who assert that the law is a science approve what must be done. The facts and only the facts are to be found, directly or by inference from other facts. The following are considered facts: the child's earnings until it should have become of age, minus what must have been spent to keep it; its pain and suffering, if it lingered for a while in agony before dying; the loss of its earning power throughout its probable life, often determined with the help of mortality tables; in measuring its loss of earning power, consideration must be given to the kind of person it was likely to grow up to be, the sort of labor, trade, or profession it was likely to enter, the slowing down of ability and activity towards the end of its mythical life, the amount of illness it was likely to endure, the possibility of its marriage, and similar bits of prophecy.

In such situations the Greeks went to the oracle at Delphi. We go to the jury, and the jury sits down, perhaps for the first time in its experience, to figure out what the average life is worth. All it has to go on in the way of actually proved facts are a few words from the child's parents to show their walk of life, the neighborhood in which they live, their economic level, and perhaps a picture of the child. And once the lost earnings are evaluated, the jury must reduce them to their present worth, a mysterious procedure without help from the court, to reflect the general idea that a lump sum given now is more valuable than a long series of future wages paid weekly.

One further illusion we cling to. It is that the jury will do its necromancy

accurately and with unassailable logic. We usually require of it only what is called "the general verdict," which means the announcement of a result, without reasons. If we required a reasoned argument in support, the jury system would blow up in a week; and hence we wisely do not require it. Judges look with alarm even upon asking a jury to answer special questions, and do so only in complex and difficult cases.

No less illusory is the jury's choice between two verbal recitals of a case, each diametrically opposed to the other. How the jury unravels truth from fiction, with all the shadings of both, is a mystery around which we reverently draw a curtain.

All of this brings hollow laughter from the opponents of the jury system, who would like us to grow up and be done with childish nonsense. Instead of a jury, the court, composed of one or more judges, should apply their trained minds to the findings of fact. This can certainly be done, even if a judge's mind may be less well trained to the ways of the alleys and the back fences than the minds of the neighbors. Judges are as good at necromancy as anyone else, and better at rationalizing the process: they could give splendid reasons, out loud or on paper, and when they, rather than the jury, find the facts, they are in effect required to give their reasons. Maybe that is why the public regards its judges with reverential awe and mistrusts them not a little. People are suspicious of a clever head unless they are first assured of a good heart under it.

The real trouble is with finding facts. Hauling facts out of the past into the present is one of the most refractory processes known to man, and is directly responsible for our constant juggling with procedure in the effort to let the slippery things through with the least distortion.

LAW AS SCIENCE

Talk about the law as a science is at a minimum among the judges and the lawyers who work the trial courts. Science accepts nothing as a law until it has been proved by experiment to govern the given material without error or exception. There are few legal rules that fill this bill. We present to a jury an assorted set of facts and ask it to apply a legal principle and decide if it fits. To do that with a chemist would be to invite him to blow himself up. Not even appellate judges work like scientists. They are given a set of facts fixed by the jury and are expected to find the handiest legal principle that applies. To do this in the laboratory would be to invite the next chemist who handles similar material to blow himself up: in court the next batch of material is only similar, not like.

The law has been called a science "because its principles have been classified and digested and arranged so as to be available for use." Few courtroom professionals think much of that idea: as well call restaurant cooking a science because there is a menu, or railroading because there are timetables.

The law tried to be a science at least once. The early English system of pleading that penalized the omission of a stamp or a videlicet and erected a neat system of rejoinders, surrejoinders, rebutters, and surrebutters brought about such an intolerable pattern of injustice that the system of equity was invented to counteract it. Hard cases make bad law, but the law is capable of making hard cases possible. Nor does it follow that easy cases make good law.

Furthermore, good law is not necessarily the most efficient law. If the law were scientific, it would also be efficient. It could be made so. If we took three months over the case that now takes three days to try; if we checked the

background and record of every witness; if the court had the unlimited help of doctors, psychiatrists, social workers, investigators, and crime laboratories; if five judges instead of a jury had to sit on every case; if each trial were put on film for use on appeal; if a host of other gadgetary innovations were applied—if all these things were done, we should undoubtedly reach more accurate results. But the road to naked efficiency leads to dark places, and the German legal system under Hitler was well on its way. Why not sterilize, castrate, or simply kill off the difficult people? And who are the difficult people if not the enemies of efficiency? Certainly they are whoever are opposed to those who have power enough to be thoroughly efficient.

Thus far the argument sounds like a defense of the jury system, but it is intended as a defense of only two ideas: one, that the jury system cannot be abolished by law but only by the attrition of time, and, two, that democratic society has an inherent efficiency of its own in the conduct of essentially human institutions like the trial of cases.

THE RIGHT TO TRIAL BY JURY

The point lies in the constitutional guarantee of the right to trial by jury. It is the right, and not trial by jury, that is guaranteed. Had trial by jury been guaranteed, we could easily get rid of it, and probably would have done so long since. It would be crippling if every trial had to be before a jury, since the march of progress has shown many kinds of dispute to be too complex and difficult to be solved by an assortment of the neighbors, and has created many other kinds that are solved apart from the legal system entirely.

The public seems willing to experiment with different ways of settling litigation, as long as it has the right to use the old one when it feels the need. It

felt the need very urgently during the days of prohibition, when the neighbors rather than the judges could be counted on to acquit even in the face of the tightest evidence. Juries had as much as anyone to do with the repeal of prohibition; and the idea that prohibition bred a disrespect for the law may have been true at the political level, but not in the courtroom. With undiminished and perhaps increased respect for the courts for doing their duty, juries listened soberly, turned almost everybody loose, and probably went home to their own bootleg.

It is the existence of the right to trial by jury that makes possible experiments with other methods. There is considerable thought being given in the profession to the abolition of the grand and coroner's juries, which in various jurisdictions are not within the constitutional right and seem pretty clearly to be near the end of their usefulness. There is discussion of verdicts by a majority of the petit jury. The rules of evidence are less strict than when the courts were good theater, and cases are tried more briefly, with fewer objections, and with a minimum of drama. There is respectable opinion that the exclusionary rules of evidence should be further relaxed, and the neighbors in the jury box trusted with the full story, fair and unfair, relevant and irrelevant, to the end that they might decide cases in court as they do in their business, their neighborhood, and their homes. It is indeed odd to keep from jurors a bit of hearsay as if it carried the black plague, but at the same time to trust them to grasp the full significance of complex legal rules when the judge charges them at the end of a case.

QUESTION OF CONTROL

The truth is that the jury system is like the tooth nerve that retreats before a deepening cavity. It remains useful

in its accustomed area, but the area is shrinking. Much of the criticism of juries comes from acquittals in criminal cases. There is no redress whatever, since the accused may not be tried twice for the same offense; but the lack of redress is to a degree counterbalanced by the fact that in most cases the public rather likes to see the hunted elude the hounds. But in the few instances where the public looks for blood, an acquittal can raise a storm. Witness the M'Naughten Rules, now over a century old, by which we still measure the defense of insanity in criminal cases: these rules resulted from an acquittal in a famous English case.

In other types of cases there is a fairly effective control, despite the mystery of the general verdict. Convictions can be reviewed at the request of the accused, and the courts can make a pretty shrewd guess at what influenced the jury. Even if they cannot, but are shocked by the result, a new trial can be granted even on the court's own motion. In civil courts most cases of any importance are reviewed at the request of the loser, and while the facts as found by the jury are usually considered binding, palpable injustice can be corrected either by the trial court or by the appellate courts.

POSSIBILITIES OF THE JURY SYSTEM

Since trial by jury cannot be abolished, it is important to use it as well as possible and abide the event. Partly because a system built for efficiency would take too much time and cost too much money, and partly because people feel instinctively that justice is relative, the public wisely does not want the best of all possible systems in the best of all

possible worlds. What the public has is a reasonably effective way of getting close to the truth but not too close. Absolute truth is something that no one wants to face: the covered Grail, and only a little of that, is quite enough, and we prefer faith, our most necessary commodity, in the unseen.

The best improvement of a going system like trial by jury is exquisite use. At its best, a trial is the joint effort at top capacity by judge, lawyers, and jury. A noble person on the bench, earnest and able lawyers at the tables, and conscientious jurors in the box can be counted on to produce a quality of justice quite splendid enough for most human needs. The judge can make the law clear and simple if he puts his mind to it, and his character can raise the whole tone of the trial. The lawyers can present all available facts with orderly clarity. The jury, if chosen from a true cross section of the neighborhood, can be counted on to pay good attention and provide shrewd solutions. It is a pity to make the jurors the whipping boy for the ills of the jury system: judges, lawyers, and the public must share the blame for its defects and take part in its evolution.

The jury system is not necessarily a bad system. If it fails, it will be because it is worked at less than top capacity and intensity, which is the reason why most things fail. Even so, it might no longer be considered flexible enough to fill the bill. In that event, legal solutions will be left to judges or to fixed administrative tribunals; but whatever happens, the social fabric will not be rent asunder. Thus far no better guaranteed method has been found than a verdict by a jury of the vicinage.

Hon. Curtis Bok, Philadelphia, Pennsylvania, has worked with juries since 1937 as President Judge of the Court of Common Pleas No. 6 of Philadelphia County, Pennsylvania. He is the author of The Backbone of the Herring (1941) and I, Too, Nicodemus (1946).

A Projected Study of the Jury as a Working Institution

By BERNARD D. MELTZER

THE proposed study of the jury system, which I have been asked to describe,¹ is one of four projects in a research program in law and the behavioral sciences to be undertaken at the University of Chicago Law School. This research, which has been made possible by a grant from the Ford Foundation, will be conducted over a three-year period. The program "will represent a major effort to bring to bear on the problems of law the research techniques of the behavioral sciences and, at the same time, to enrich the behavioral sciences by a study of legal institutions."²

AN INTERDISCIPLINARY STUDY

Trial by jury is a many-sided and controversial institution, which is a promising subject for interdisciplinary study. The jury plays an important role in the administration of justice. It is also a powerful symbol of our democratic faith, with an important place in our political theory. Furthermore, the jury, as an *ad hoc* collection of amateurs who generally must act unanimously to resolve a dispute, is a dis-

tinctive group which can be of special interest to students of small-group interaction.

The jury³ has so often been called the "palladium of our civil rights" that this phrase has found a place in our dictionaries. At the same time, there has been continuous and lively criticism of the fitness of jury trial for some types of modern litigation.⁴ As a result, there have been significant reforms, both in this country and in England, and proposals for additional reforms.

The discussion has often involved untested assumptions about the actual workings of the institution and community attitudes toward it. In addition to such matters, which can be illuminated by empirical investigation, the debate involves fundamental and pervasive issues, such as the proper role of the expert and the amateur, the proper distribution of power between the official and the citizen, and the extent to which particular values represented by basic institutions should override any operational inefficiencies which they may involve.

Such issues cut too deep into our social fabric to be resolved by even the

¹ This paper reflects the work of a faculty committee at the University of Chicago Law School. This committee has consisted of Walter J. Blum, Harry Kalven, Jr., Hans Zeisel, and the writer of this paper. More recently, Philip B. Kurland, who will soon join the University of Chicago Law School faculty, and Dale Broeder, research associate, have participated in the committee's discussions. In addition, this paper reflects many suggestions made by our colleagues on the law faculty, by social scientists and psychologists at Chicago and elsewhere, and by lawyers and judges.

² See Levi, "The Development of a 'Missing Fundamental,'" 41 Ill. Bar J. 89 (1952).

³ The term "jury" or "jury system" is obviously an abstraction which, although convenient, is misleading insofar as it suggests that separate juries are equivalents. The use of this abstraction is, of course, not intended to obscure the varying composition of particular juries, or the varying problems raised in different regional areas (for example urban and rural) and in different types of cases (for example criminal cases generating major public interest as contrasted with complicated commercial cases).

⁴ Because of space limitations, no effort will be made here to acknowledge the pertinent literature.

most comprehensive study. But a study could give us a store of reliable information about the actual workings of the jury in various contexts, and the rules and usages which tend to promote or frustrate the various purposes ascribed to the jury. It could, for example, shed light on the criteria which should control eligibility for and exemption from jury service; on those rules of evidence which are based on assumptions about jury behavior; and on the proper application of elastic concepts, such as "reversible error," which are also based on such assumptions. In addition, a study could make clearer the actual impact of particular rules of substantive law when they are to be applied in the end by a more or less random group drawn from the community.

SOME SUBJECTS OF STUDY

From the many facets of the jury system which might be examined, the following have been selected for initial emphasis in the study:

1. The functions assigned and imputed to the jury.
2. The principles, if any, on which jury trial is or is not made available to litigants; the assumptions behind the decisions of litigants to elect or to waive a jury; identifiable classes of cases in which jury trial appears to involve special inconvenience.
3. The legal rules, the administrative practices, and the litigants' choices, which determine the composition of particular juries.
4. The decisional process—the determinants of the jurors' individual judgments; the nature and effect of group deliberation.
5. Workable criteria for appraising particular verdicts.
6. The rules and usages which promote, or interfere with, informed and rational jury determinations or the efficient use of the jury in adjudication.

7. The significance of the jury as a form of democratic participation—community attitudes regarding the jury.

8. The social and individual costs of the jury system in various classes of litigation.

9. A re-examination of the functions of the jury in the light of data regarding its operations.

In a paper of this length it is possible only to illustrate an approach to some of these questions.

FUNCTIONS OF THE JURY

With respect to the first question, the functions assigned or imputed to the jury are of two types: First, there are those explicitly defined in formal rules. Under these rules, the jury's primary function is to adjudicate the facts and to apply the law according to the judge's instructions. Another explicit function, but one which in theory is more limited, is that of making interstitial rules for particular cases where the controlling legal rule is so general that the jury must complete or particularize the rule for the case at hand. The most familiar and prominent example of this is the jury's role in the negligence case, where it must make more precise the general standard of reasonable care.

Beyond these formally defined functions, commentators have ascribed a number of more sophisticated tasks to the jury. Most familiar is the idea that the jury is to mitigate the general rule of law when it operates harshly in the particular case, and the related idea that the jury is to adjust the law to the morality of the man in the street. It is striking that particular juries are expected to perform these and other sophisticated functions even though they are in effect forbidden to do so by the judge's instructions.

Several questions are suggested by this conflict between what the jury is expected to do and what it is told to

do. The first is whether and to what extent particular juries are aware of these subtle and, in a sense, illicit functions which they are expected to perform. Is the reliance on the jury as "the safety valve" of the legal system misplaced because particular juries will accept the judge's more restricted definition of their duty? Another question relates to the competence and the values which are represented in the random group which is expected to apply and reshape the law. Finally, to the extent that a random group of amateurs, unconstrained by the traditions which limit a judge's discretion, reshapes the law, what is the impact of such law-making on legitimate expectancies, on the ideal of equality under the law, on the volume of litigation, on explicit and public changes in the law?

There is need for both a searching analysis of the functions assigned and imputed to the jury and a re-examination of those functions in the light of data about the actualities of jury behavior.

ASSUMPTIONS ABOUT JURY BEHAVIOR

The most distinctive and challenging aspect of the study will be a sustained attempt to shed some light on these elusive actualities—on the nature and significance of the deliberative process and on the determinants of verdicts in particular cases. This is the area of greatest controversy, greatest uncertainty, and greatest importance to an understanding of trial-by-jury as a working system.

A useful starting point for this phase of the study is the rich and conflicting body of assumptions about jury behavior. These are dealt with in a substantial literature and in a substantial number of judicial opinions. In addition, there is an unwritten body of know-how or myth which is passed on to each new generation of lawyers by

the administrators of the jury system—jury commissioners, bailiffs, court reporters, as well as judges and lawyers.

These assumptions, whatever merit they may have, influence lawyers both in their selection of juries and in their attempts to persuade them. These assumptions also influence the application and reformulation of the rules relating to the composition of juries, to their deliberations, and to the kind of proof and persuasion which may be presented to them. For these reasons, and because they are the working hypotheses of the system, these assumptions should be systematically examined. They can be derived from treatises, from judicial opinions, and from interviews with representative groups of professionals.

RECONSTRUCTION OF JURY OPERATIONS

These assumptions about jury behavior will first guide the study of jury operations in particular classes of actual cases and then will themselves be re-examined in the light of the resultant data. Since the jury room is not open to direct observation and since the general verdict, which is the usual form of a jury verdict, discloses nothing more than a general conclusion, it will be necessary to attempt to reconstruct the operations of the jury indirectly.

A variety of techniques may prove useful for this purpose. First, cases will be classified according to various criteria, which cannot be spelled out here. These cases will be studied prior to trial and observed in court by a lawyer and a social psychologist. After the jury has returned its verdict, the individual jurors will, with the permission of the courts involved,⁵ be inter-

⁵ For a report of jury interviews which were permitted by the Ohio courts, see Hunter, "Law in the Jury Room," 2 *Ohio St. L. J.* 1 (1935); but cf. the report of greater difficulties in Judge Jerome N. Frank's introduction to Hoffman and Brodley, "Jurors on Trial," 17 *Mo. L. Rev.* 235 (1952).

viewed under conditions assuring anonymity and with appropriate safeguards worked out with the courts.

These interviews will be based on two types of questions: (1) a general set of questions reflecting general presuppositions about the determinants of jury behavior in particular types of cases, and (2) a set of questions prepared by the lawyer-sociologist team based on the specific events of the trial.

These interviews should reveal the response of individual jurors to the trial; their capacity to follow and organize evidence, and to understand and apply the judge's instructions; the nature and effect of the group deliberations; and the determinants of, or influential factors in, particular verdicts. These interviews should also yield data regarding the general personality and skills of the individual jurors and the impact of jury service on their attitudes regarding the jury and the administration of justice.

Some of the difficulties raised by the techniques described above deserve mention. Many of the cases on the jury calendar are settled before or during the course of the trial. The time spent on the study of a case which is settled will not, however, be time lost. The study of such cases promises to shed light on this dark corner of the law-in-action. It should, for example, disclose how expectations regarding jury behavior and the trial process affect the process of real or spurious compromise.

Another difficulty is that individual jurors may not be wholly aware of, or may not be able to reconstruct accurately, either their personal responses or the group activity. An even more fundamental difficulty relates to the possibility of fruitful generalization, given the complex of variables from case to case.

However formidable these difficulties may be, it seems likely that this phase

of the study will produce a much clearer and more useful picture of the actual operations of the system than we now have.

PARALLEL BENCH VERDICTS

The data produced by intensive case studies of jury behavior will be supplemented by data designed to disclose the differences between judge and jury determinations. To facilitate such comparison, judges presiding over jury cases will be asked to keep records of such cases, to indicate, prior to the return of the jury verdict, the verdicts they would have reached if they had absorbed the jury function, and to suggest explanations of significant differences between their "as-if" and the real verdict. In order to deepen the study of particular cases, the judges' parallel verdicts will be sought in cases which will be the subject of interviews with the jurors. In some cases, the judge may, of course, wish more time for reflection than is taken in the jury room. A record of such cases and the judge's subsequent "verdict" would be instructive.

Judges on their own initiative have in the past undertaken such comparisons, and we look forward to their cooperation in this and other phases of the study. We recognize that the judge's as-if verdict may diverge from the verdict which he might have reached if he were in fact disposing of a man's liberty or property. But the fact that judges often sit without a jury reduces this difficulty. The traditions and habits which produce the real verdict will presumably not be abandoned for the simulated verdict.

It is not suggested that the judge's parallel verdict will be a criterion for judging the quality of the jury verdict. Such an assumption would beg the essential question—the proper role of the citizen in dispute settlement—which underlies the debate about the jury sys-

tem. The comparison would indicate differences in approach and result where the judge supersedes the jury. It would also produce insights as to how the judge conceives his role in cases where the jury has been waived. Does he, for example, attempt to react as he believes a jury would?

SIMULATED JURIES

The study will use not only simulated bench verdicts but also simulated juries. A variety of techniques, which can only be mentioned here, may prove useful. A simulated jury drawn from the same general group as the real jury or from special groups or from both could be asked to follow an actual trial and to assume the role of the real jury. This device would permit direct access to the simulated jury room and would facilitate subsequent interviewing. Mock trials would serve a similar purpose and would be more manageable. Movies with interchangeable parts, designed to test the effect of variables such as wealth or race, are also being considered.

All of these devices involve the risk of the distortion which may be inherent in the simulated situation. This risk will be appraised in the light of the experience with both the real and the simulated juries. In any event, the contrived situation should at least indicate the group's capacity to understand the material and the issues before it, and the usefulness of devices such as note-taking by the jury or written instructions by the judge.

Psychological tests may also yield useful data on the capacity of groups composed like the jury to follow the judge's charge and to perform the other tasks imposed on the jury. In addition, such tests may throw light on the incidence and the persistence of different forms of bias in various segments of the commu-

nity. These tests will be so devised as to reflect the consideration that the juror's comprehension may increase as the particular trial unfolds and that antecedent bias may yield to the events and the ceremony of the trial.

EVALUATION

The data produced by the foregoing techniques as to how and why particular verdicts were reached will furnish a basis for appraising the quality of both the methods and the contents of jury verdicts. Definitive appraisal obviously requires generally accepted criteria, which are lacking. But here, as in other areas of legal analysis, the absence of authoritative standards need not inhibit critical evaluation. It should, for example, be possible to determine whether particular juries relied on considerations outside the record and extraneous to the issues before them.

It should also be possible to assess the jurors' understanding of the key events in the trial, to assess their inferential processes and the premises of fact and values underlying them, and to determine whether the procedures of the jury room were conducive to rational deliberation. Indeed, one useful test may be whether the jurors' comprehension and their inferential and deliberative processes were conducive to an informed and rational decision. Juries, like others, sometimes reach "good" decisions by apparently illogical routes. Hence this test, while relevant to the rational component of the jury process, will not serve in itself as an index of the quality of the final verdict.

GENERAL PROCEDURES

It is necessary to pass over the specific techniques which will be used in tackling the other topics listed above, in order to touch generally on procedures which will be employed throughout the study. There will be a sustained at-

tempt at close and concrete collaboration between the lawyers and the representatives of other disciplines, at every stage of planning and execution. Such co-operation should enrich both the study and all of the disciplines involved. It should also serve to test generally the usefulness of interdisciplinary techniques in the examination of legal institutions and to suggest other areas where they might effectively be employed. In addition, there will be close working relationships with the bar and the judiciary. This again should serve to promote useful co-operation in other areas of inquiry. Finally, as a further aid to the program, the law school will appoint advisory committees drawn from other universities, the bar, the judiciary, and the several relevant disciplines.

One final word about method: Initially, the emphasis will be on the workings of the jury in a particular community. This will make it possible to relate the resultant data to the general structure of the community and to search for the ways in which the various parts of a working system are accommodated to one another. Thereafter, the study will be broadened and enriched by the use of the comparative method. A variety of practices prevailing in various American states, in England, and in continental legal systems will be critically examined. These will range from the modification of the requirement that jury verdicts in civil cases be unanimous, in states such as New York and Ohio, to British reforms making the availability of the jury in most civil cases a matter for the judge's discretion.

Bernard D. Meltzer is professor of law at the University of Chicago Law School.

SOME DIFFICULTIES

It is tempting to speculate more concretely on the final form of the study and on its possible impact both on the administration of justice and on legal education and research. But there has already been too much prophecy in this paper. It seems more appropriate to turn to some of the difficulties presented by the study which have general implications.

Not the least of these is a more or less explicit feeling that ignorance about the jury may be bliss. This is a curious notion in a society which is based on free inquiry and yet which is relatively uninformed about the operations of its key institutions. There is a related notion, that the examination of an important legal institution is necessarily animated by hostility to the institution, which is completely inapplicable to the projected study.

Neither of these notions should be or will, we believe, be accepted by the bar, the judiciary, or the other interested disciplines. Because of their common interest in a better understanding and a continual improvement of the administration of justice, we are confident of getting their indispensable co-operation.

Any description of a plan for research is more an exercise in prophecy than in reporting. Accordingly, this prospectus is presented with the caveat that it is tentative and that my colleagues have saved their rights. This prospectus also carries with it an unrestricted invitation for critical comment. Indeed, it is the hope of such comment from lawyers and nonlawyers alike that is the primary justification for this premature delivery.

Why the Good Citizen Avoids Testifying

By A. S. CUTLER

IT was a bright, clear day. The traffic light ahead was an unblinking, undeviating green. He was driving just under the legal speed limit of forty-five miles. He observed that the car which had been following him at a respectful distance for some miles was also being driven by a conservative, who had not attempted to pass. This was refreshing. Nearly always he was being impatiently honked off the road because he was one of the few who obeyed speed laws.

He had just passed the intersection. The light was still brightly green. Without warning, a car drove out of the crossroad against the light, narrowly missed his car, and smashed full tilt into the unlucky automobile just behind him.

He had always thought of himself as a good citizen. He made sure to vote regularly, was president of his civic organization, and insisted that his wife be active in the parent-teacher association. He was scrupulous about paying his income taxes, though he unfailingly grumbled about their size, and was a stanch advocate of the reciprocating privileges and duties of good citizenship.

He took his foot off the accelerator for a moment. Wasn't it his duty to get out and assist a fellow human in distress? Was it not his solemn obligation to stop and report the occurrence? An innocent victim had been either maimed or killed. But for the grace of a few feet and a fleeting fraction of a second, it might well have been himself. How could he proceed when he was probably the only eyewitness to a vicious, unprovoked assault?

Nevertheless, his foot pressed down again on the gas pedal. He continued

his journey as though nothing had happened.

WHY DID HE SHIRK HIS DUTY?

Why did a man who prided himself upon being a good citizen fail so significantly in his civic, legal, moral, and social obligations?

The answer is simply that experience in court proceedings has unfortunately persuaded otherwise excellent neighbors to avoid being involved in any matter wherein legal procedure may eventuate.

Not very many years ago, we would help a stranger in distress, even at the risk of our own lives. A man riding a horse or walking through the woods would unhesitatingly go to the aid not only of the fair damsel, but of any other person who was being assaulted or robbed or hurt. In this effete civilization, where radio, television, airplanes, monorail trains, and high speed cars are all commonplace, the desire to help another in distress has sped out of the hearts of the citizenry. Perhaps in a more leisurely age we took the time to be compassionate and vigilant to aid another. Can it be that the electric age has shocked and paralyzed the American sympathetic nervous system?

Why does the average good citizen fear and deny his impulse to help, to stand up as the innocent bystander, or to stop and assist when he observes a flagrant violation of another's peace, security, and bodily welfare?

We repeat. The answer is, experience has taught even the highest-minded witness to avoid being snarled up in the red tape of judicial procedure. For the truth is:

THE WITNESS VICTIMIZED

The truly forgotten man at the trial is the innocent bystander, the witness who is compelled to come forth and testify because by the coincidence of time occurrence he happened to be present.

The court zealously guards the rights of the litigants. He genuinely takes a fatherly interest in making sure that the jurors are comfortable and relaxed. His tender solicitude for the lawyers is manifested frequently throughout the trial. But no one seems to consider the poor forlorn witness under subpoena, compelled to testify because of happenstance only. To that poor unfortunate, it is as though time means nothing. No matter how busy he is, or how important his personal affairs, he is annoyed and bothered by strangers armed with the court's subpoena, until he vows never to get mixed up again in a lawsuit.

First he is interviewed by the lawyers, investigators, and emissaries, both for the plaintiff and for the defense. They inundate him with cleverly worded statements, so that the simplest phrase needs a Philadelphia lawyer to interpret it. He is importuned to change his version of the occurrence. His memory is refreshed by photographs and charts and maps. He is frequently sworn at pretrial examinations and compelled to weigh every word, knowing that one counsel or the other will pounce upon him if he nods for a moment.

Then he is compelled to wait around the courthouse, under subpoena, for days on end. Everybody else's time is zealously guarded. His time is of no moment to anyone.

And finally he accomplishes his fullest measure of civic duty by taking the witness stand at the trial. Are his troubles over then? Not at all. They have only begun.

DIRECT EXAMINATION

Having been carefully coached by the side for whom he is testifying favorably, simply because he is telling the truth, his direct examination is fairly easy. Even then, contretemps occur which serve to make him lose faith in judicial procedure. The famous story frankly told on himself by the great trial lawyer, Henry W. Taft, is illustrative of what may happen to a witness even on direct examination.

Mr. Taft was trying a case for a defendant steamship company. Plaintiff had fallen down a hatchway because of the claimed negligence of the defendant as to the appliances furnished and the danger in the place where plaintiff had to work.

Mr. Taft's main witness was a carpenter. After his witness had furnished his name and address, Mr. Taft's preliminary question was, "What were you doing there at the time of the occurrence?" The witness was supposed to answer, "I was a carpenter doing my work." Instead, misunderstanding the intent of the question, he said, "I was just standing there."

"What were you doing?" persisted Mr. Taft. The witness, becoming a bit more red-faced, repeated his answer. Mr. Taft, likewise vexed at the seeming stupidity of his own chief witness, repeated, "Won't you tell the court and jury what you were doing there that day?"

If he had had the foresightedness to ask the witness, "What was the nature of your employment on that ship?" the answer would have been forthcoming immediately. Instead, the witness persisted, "I was standing there."

Whereupon the great trial advocate really and truly exasperated at last stepped nearer to his witness, waved menacing finger under his nose, and repeated, "Can't you tell us what you

were doing there?" To which the witness, perhaps just as exasperated, replied, "You know I was standing there so I could be a witness for the steamship company when the case came to trial."

Yesterday in court, a lawyer not in Mr. Taft's category, but nevertheless experienced and able, instead of making his witness relaxed and comfortable, at least during questioning on the direct, was dissatisfied with his own witness' answer.

Instead of smothering this feeling and saying, "I am sorry. I don't seem to be very clear myself this morning. It's my fault. Let me put the question in another way," this exasperated counsel admonished a witness appearing in court for the first time in her life: "Don't you know better than to repeat your answers? You just listen to me and maybe you will learn how to answer questions. I will put the question again, word for word. Pay attention and try to understand. Don't be so stupid."

That his witness collapsed entirely and went into a fit of hysteria, from which she did not emerge until an adverse verdict had been rendered, was entirely the lawyer's fault, and not that of the poor unprotected witness.

Good lawyers, of course, realize that direct examination is not so glamorous as the opening address to the jury, not so spectacular as cross-examination, not so dramatic as a summation. It is the direct examination, however, the putting in of your own evidence, that makes or breaks your case. The less the lawyer says, and the more the witness is permitted to say, within limits of materiality, the better the direct case. That is why leading questions are proscribed, not prescribed.

ODIOUS OBJECTIONS

Furthermore, short, simple questions serve another useful purpose. They prevent an opponent from having any valid objections to your questions, and thus prevent him from confusing the jury. Nothing can be so irritating to the layman as the rapid-fire shooting of objections all through the testimony. How can the jurors get a connected story? First they hear one lawyer, then they hear another attorney objecting at great length. At last the court rules upon the objection. By then the witness has forgotten the question, and the jury is surely lost in the vast uncharted sea of words.

In English courts, objections seldom interrupt a trial. No wonder their cases are tried so much faster than ours. The pepper of objections is sparsely used, whereas in our country the heavy hand of too much seasoning irritates and infuriates our juries.

If the lawyers only realized the effect of an objection on the jurors, the bulk of objections in American trial procedure would be vastly reduced. After all, if the jurors feel you are trying to hide something from them by an objection to a question, you have done your client no service even if your objection is sustained. Too many objections, even if sustained, spoil a good case, as too much cream spoils the flavor of a good cup of coffee. If the jurors think of a lawyer as an obstructionist, they are likely to pay slight attention to the merits of his cause.

We repeat, good lawyers know this by bitter, painful experience. Nevertheless, the lot of the average witness in a courtroom today is not improved and comforted by the hair shirt of omnipresent objections.

The layman, and indeed many lawyers, think that the lawyer talks too much. "Oh, he is making a speech again" is the standard reaction of the layman to the lawyer in every gathering.

BULLIED BY THE CROSS-EXAMINER

Usually, of course, a tender consideration for his own witness is considered good trial tactics by the experienced advocate. But the cross-examiner feels bound by no such limitations. Indeed, he has usually persuaded himself that if only he can confuse and anger and prod the witness into losing his temper, this is the ideal way in which he can beat down the chief witness against him and win his case.

So he begins. First he takes up the question of time. "Exactly what time was it that this happened?" While most of us are aware of the passage of time in a general way, it is almost impossible for us to remember the precise time of an occurrence that happened years ago. Even if the impossible occurs and the automobile clock is working, a driver's attention should be glued to the road rather than to the clockface.

Then comes the question of place. Elaborate blueprints are drawn from the lawyer's capacious brief case as a magician draws rabbits from a hat. A witness was peacefully and legally driving along on a road where he had the right to be. He knew where he had come from, and to what place he was proceeding. He had not taken the trouble to observe every single landmark or intersection on the road. He can quickly become confused.

Then comes distance. How far was he from the intersection when he first observed the defendant's car? How far past the light had he gone? One would suspect that he should have a surveyor's level with him on his journey and stop

every few seconds to check the distance.

But that is only the beginning. He is asked the confusing question, "Did you speak to anyone about this case before you took the stand?" He thinks quickly. Apparently, if he admits he did, that renders his testimony less veracious. So he quickly answers no, and has fallen into the trap which is still successfully sprung hundreds of times daily in courtrooms throughout the nation. "Do you mean to say you spoke to no one about the case?" The witness becomes more stubborn and sticks to his negative answer. Precious minutes are then consumed to show that he is willfully lying; that he must have told someone, or he would not have been subpoenaed. He must have signed a statement for someone. He must have spoken to the lawyer who put him on the stand. Therefore, his testimony is unworthy of credence.

Then his own personal life is exposed before an eager and avidly curious dozen of laymen. "Why were you proceeding to your destination?" "With whom were you riding?" The questions are not quite so devastating as "When did you give up beating your wife?" but they are just as embarrassing. If he was alone, he was asleep while he was driving. If he was with a customer or a business associate of the feminine gender, the implication is that he was out on a party. And isn't it a shame to leave one's wife and poor little children to go out on a drunken debauch, just so one can be a witness in a lawsuit?

Soon the issue before the court seems to be not whether the defendant was negligent in grievously injuring the plaintiff, but rather whether the witness is a person of high moral character, or a low-life.

Is it any wonder that the witness becomes confused and disgusted? It seemed so simple to come forward and

tell the truth. But apparently that is not what the lawyers and the courts desire. Otherwise how could he be subjected to humiliation and chagrin for merely doing his duty as a good citizen?

As long as such tactics are tolerated by a court on the pretense that the cross-examiner is entitled to test a witness' credibility, so long will the innocent bystander be reluctant to come forward and testify.

THE POSITION OF THE JUDGE

A firm, courageous judge can do much to defeat unfair tactics of trial lawyers. A more alert and understanding attitude on the part of our trial judges would prevent sharp practice and unfair maneuvers in our courtrooms against witnesses. There are certain stock situations which every lawyer and judge recognizes almost by instinct. Should a judge hold the scales of justice so evenly that he refrains from taking any part whatsoever in the trial?

We know an upstate judge who, when a wily advocate would ask "Did you discuss this case with anybody before you took the witness stand?", would immediately say, "Of course, you know that he must have discussed this case with the lawyer, or the lawyer would not have permitted him to take the stand."

Supine judges allow this and other stock situations to occur every day, with the result that many of the witnesses, inexperienced on the stand, finally wind up confused and discouraged, even though they are only telling the exact truth as they remember it.

Similarly, the lawyer who rushes up to within a foot of the witness and gesticulates under the witness' nose and tries to browbeat him by his menacing and ferocious manner should be admonished by an alert court. As the great English philosopher Jeremy Bentham said long ago, "Browbeating is

that sort of offense, which can never be committed by any advocate, who has not the judge for an accomplice."

Judicial conduct has at least as much effect on the willingness of witnesses to come forward as any other one cause. Should a judge be a mere arbiter with a do-nothing attitude? Or should he be more like the third man in the ring, who is there not only to see that the rules are obeyed, but to prevent fouls and unfair practices on the part of either contender? A referee deems it his duty to warn a boxer who is guilty of unfair tactics. Should a justice be any less a referee in the contest taking place before him?

THE WITNESS IS ENTITLED TO PROTECTION

After all, although there is a plaintiff and a defendant in each lawsuit, there is a third entity interested in the outcome of the litigation. We mean the public interest that justice be done. And public interest should include a genuine protection of the witness. The court should not permit a Roman holiday to be made of the witness. He is not an imprisoned animal or slave to be baited into hysteria and then made way with or callously thrust aside.

Our rules of evidence, developed over the centuries, have striven to be more than fair to the litigants and the lawyers. But in their public workings they have been manifestly unfair to the innocent witness. We realize it is difficult for lawyers and judges to change their habits. They cling tenaciously to the rules of evidence, so laboriously learned in the classroom and by bitter experience in the courthouse. That is their stock in trade, and they do not relish being threatened with deprivation.

But we here suggest a remedy which requires no constitutional amendment, no world-shaking change in reported

opinions. There will be no genuine limitation upon the freedom of the trial lawyer to show out of the mouth of a witness, if he can, that the latter is not telling the truth.

We merely advocate a greater awareness on the part of the court of the proposition that an innocent witness is entitled to the judge's protection. A ward of the court is entitled to his guardian's solicitous attention. Is not a truthful witness a ward of the court?

There are many lawyers who are scrupulously fair in their treatment of witnesses, and who are always gentlemanly, courteous, and considerate. Too often, however, do we meet the other kind, who ride roughshod over a bloody and battered witness only by reason of the court's unwillingness to interfere.

We respectfully suggest that the court's attitude should be positive. If the jewel of truth is a rarity, we should guard it carefully. Under legal procedure the truth can be heard only from the witnesses and the documentary and physical evidence. In order to make the innocent bystander come forward, instead of reluctantly running away, our courts should zealously protect everyone trying to tell the truth on the witness stand from the assault of too clever counsel.

It is a truth, sadly to be admitted in our innermost hearts and minds, that an honest, hesitant, reluctant, confused witness frequently will be misunderstood and discredited by a jury. At the same time the glib, prepared, clever, forewarned liar gives such a cloak of verisimilitude to his story on the witness stand that the jury eagerly swallows it.

If the court unbent and acted more like a game warden, instead of blind justice merely holding the scales, more legal fish would remain in our unpoluted streams of justice. The poachers upon our legal preserves would be discouraged.

When that time comes, our citizens will eagerly come forward to testify to the truth. They will know they can rely on an enlightened judiciary in the few cases where shrewd, unscrupulous lawyers attempt to take advantage of legal maneuvers.

TO MITIGATE THE PUBLIC DUTY

The court could also prescribe rules preventing unnecessary waste of time of a witness, either in pretrial procedure or at the courthouse.

The matter of his physical convenience is entirely ignored. He is compelled to sit on a hard bench in a public courtroom for hours and days at a time. No one seems to care that his business is necessarily neglected in the interim, and the sacrifice he makes to perform a public duty is emphasized by the treatment he receives.

Why could not his time be conserved in more businesslike fashion? Why need he be actually summoned until a few moments before he mounts the witness stand? Why need he wait while all the court red tape is unwound before him? Should he not be given a part of a room with a desk and a telephone, where he can work on his interrupted business affairs, when a necessary and unexpected delay in putting him on the witness stand occurs?

These suggestions might tend to make the task of the innocent bystander who wishes to testify to the truth, convenient and painless, instead of aggravating, annoying, and exasperating.

There is a growing tendency in American jurisprudence to liberalize the rules of evidence. In an ancient day all these formalized precautions were essential to assure justice to the litigants. In modern times the tendency to allow the triers of the facts, whether a court alone or a court and jury, to hear all the evidence and sift out the wheat from the

chaff is becoming more and more pronounced. In arbitration, the triers of the facts are not limited by rules of evidence. They hear what they wish to hear, sort out the relevant from the irrelevant, and pass on the essential facts of the controversy in their findings.

Perhaps in the not too distant future the witness will be accorded the right to tell his own story in his own way, untrammelled by parol evidence and hearsay rules and other artificial restrictions. We have enough faith in our fact-finding bodies to believe they will have

enough sense to weed out the garden of facts to produce the most flourishing flora of justice, right, and truth in their verdicts, judgments, and findings.

Enough has been shown, we submit, to justify the consideration and study of the question, "How can we induce the witness to come to court and tell the truth, as an integral and most important function of the judicial process?"

But we must act before it is too late—before the genus Willing Witness shall have disappeared from the courtroom.

A. S. Cutler, New York City, has practiced law for thirty-six years, and has served for many years as secretary of the Law Reform Committee of the New York County Lawyers Association. He specializes in the trial of cases and has lectured widely on his specialty. He is author of Successful Trial Practice (1949) and of numerous articles.

The Impact of Expense on Injury Claims

By ALFRED F. CONARD

THE expenses of controversy enjoy a position in legal literature somewhat like that of sex in Victorian society. We all know the expenses are there; we think about them a good deal, and some of us make a pretty good thing of them; but we do not seriously discuss them.

When, for example, a legislature provides for liability for wrongful death, it decrees in one breath what the defendant shall pay and what the claimant shall receive. If the claimant is entitled to receive \$10,000, then \$10,000 is the amount which the defendant is liable to pay. Legal philosophers express this idea when they say that a "right" is correlative to a "duty," meaning that the law entitles the claimant to receive the same sum which it commands the defendant to pay.¹

THE FALLACY OF LOSS-SHIFTING

This symmetrical theory of justice has been carried on in the functional analysis of legal processes. Dean Roscoe Pound in his professorial days described the processes of compensation laws as a procedure for "loss-shifting."² According to this interpretation, when an injured claimant has suffered a loss

valued at \$5,000, we make the defendant pay this sum, thereby "shifting the loss" from the claimant to the defendant.

The concepts of "right-duty" and "loss-shifting" have given us an important perspective on the tangled skeins of controversy. At the same time, they have directed our eyes away from a large constituent of the tangle—the element of expense.

The expense of controversy appears in many forms. One I will mention first because we can set it aside. That is the expense to taxpayers, who pay judges and jurors in order that the more litigious of us may have our disputes settled. I will not further discuss this expense item, because it has little or no impact on the payment of claims.³

A second element of expense is the claimant's expense in prosecuting his claim. When a law says that a careless driver must pay a careful one whom he has injured, it does not automatically result in the payment's being made; it merely gives the claimant a tool to force the payment. To use this tool he must at the very least spend time, taken either from his work or from his leisure. Usually he must spend money, too. If the injury is to the claimant's body, he must procure doctors to testify to its extent; if it is to his automobile, he must procure appraisers to prove his damage. If overtures of settlement fail, he must hire a lawyer.⁴

³ See the article by Leland L. Tolman in this issue.

⁴ See section on "Administration of Liability Acts by a Process of Bargaining," in U. S. Railroad Retirement Board, *Work Injuries in the Railroad Industry 1938-40* (Chi-

Suppose then that the defendant pays \$5,000, and that this is the precise amount which, by law, the claimant should receive. The claimant does not get it. He gets the remainder, after deducting his expenses for lost time, expert witnesses, and attorneys.

A third element of expense is the defendant's claims expense—what it costs the defendant to determine the extent of his liability and to resist demands for more. He too loses time—usually the time of employees who report on the accident. To obtain the facts, he usually hires "adjusters" who investigate and make reports. In addition, he pays expert witnesses who testify on the issues of personal or property damage. Finally, he too pays lawyers if the controversy reaches the stage of litigation.

Supposing still that the defendant pays out \$5,000 to the claimant, this is only a portion of the defendant's total cost, to which must be added his expenses in handling the claim.

A fourth element of expense, for the great majority of defendants, is insurance expense. This item is not incurred by the few large companies—especially the railroad companies—which are prepared to cover any possible liability out of operating funds. They are known as "self-insurers." But most defendants—the great mass of small business enterprises and private automobilists—cannot bear the risk of a large claim against them. They pay insurance companies to bear the risk. The insurance companies in turn incur expenses in selling insurance, administering their affairs, and returning a profit to their investors.

In consequence, each amount paid out to discharge an ordinary defendant's liability is accompanied by the expense of maintaining insurance to do the job.

With these kinds of expense in mind, let us look again at the effects of lia-

bility laws. As Dean Pound observed, they do result in relieving the claimant of some part of his primary loss and imposing it on the defendant. That is, they do "shift" a part of the primary loss. But they also impose on the defendant at least three types of secondary loss—the claimant's claims expense, the defendant's claims expense, and the defendant's insurance expense. These secondary losses are just as real a burden on the defendant as that part of the claimant's primary loss which is relieved. But they are not created by the original injury. They are created by the laws of liability.

Liability laws, we must recognize, do not result merely in loss-shifting; they result also in loss-multiplication. The loss which is incurred in the process of shifting a part of the primary loss, I will call the "operating expense" of liability enforcement.⁵

HOW HIGH IS EXPENSE?

In individual cases, expense of administration reaches extreme ratios. In one case, thousands of dollars may be spent to prosecute and defend a case on which the ultimate payment is only a hundred dollars. In another, a settlement amounting to tens of thousands may be made although less than a hundred dollars has been spent to investigate and adjust it. In the former case the expense ratio would be several hundred per cent, while in the latter it would be less than one per cent. Hence, expense ratios in individual cases mean

⁵ The RRB survey used the term "administrative cost" to comprise claimants' and defendants' "administrative expenses," but at another point used "administrative cost" apparently to describe only the expenses of the government. See RRB survey, pp. 180-84, 215. The expense problem is described under the general term of "wastefulness" in Walter F. Dodd, *Administration of Workmen's Compensation* (New York, 1936), pp. 21-23. Hereafter cited as "Dodd."

cago, 1947), pp. 47-51. Hereafter cited as "RRB survey."

little. Only as aggregates or averages for large numbers of cases do the ratios gain significance.

Probably the best-known liability expense ratio is the one reported for New York employers' liability, before the adoption of workmen's compensation.⁶ According to the commission, the ratio for insured defendants was \$175 in total expense (insurance and claims handling) for every \$100 paid on claims.⁷ Claimants had about \$23 of expense per \$100 of claims paid,⁸ so the whole system showed \$198 of expense to parties for every \$100 paid in gross claims.⁹ The commission naturally found the ratio disgraceful, and recommended adoption of a workmen's compensation system.¹⁰

In 1932 a distinguished committee reported on a study of automobile liability, showing that defendants were spending \$85 in expense for every \$100 paid out on claims,¹¹ while claimants'

⁶ New York Commission to inquire into the question of Employers' Liability, First Report to the Legislature (1910), hereafter cited as NYCEL. This report is very scarce, but has been influential through quotation in Dodd, and standard labor economics books.

⁷ NYCEL, p. 31. The report showed that \$36.34 per \$100.00 of insurance premiums was applied to pay claims. The rest of the hundred dollars—\$63.66—was "expense," and equaled 175 per cent of \$36.34.

⁸ NYCEL, p. 30, taking the largest and most conservative of several samples reported. The estimate of claimants' expense is not based on the same sample as the estimate of defendants' expense.

⁹ "Expense to parties" excludes expense to the government. Estimates of government expense in relation to claims are reported in the Illinois study (note 20 *infra*).

¹⁰ NYCEL, p. 19. The NYCEL ratios are very dubious by modern standards, being apparently based on claims paid and premiums received. In a period of increasing dollar volume, the time lag between the two figures results in a gross understatement of the loss ratio and overstatement of the expense ratio.

¹¹ Report by the Committee to Study Compensation for Automobile Accidents (Philadelphia, 1932), p. 51, hereafter cited as "Comp.

expenses ranged from 25 to 50 per cent in litigated cases.¹² They recommended a switch to a compensation system.¹³

In 1947 a comprehensive study of employers' liability in the railroad industry appeared, with an indicated ratio of defendants' expense to claims paid of 17 per cent, while claimants were incurring expenses equal to 9 per cent of aggregate claims paid.¹⁴ Total expense therefore equaled 26 per cent of the gross claim payments.¹⁵ These figures were far less than automobile liability had shown, and incomparably lower than reported for New York employers' liability in 1910. But the surveyors found them shockingly high, and recommended substitution of a compensation system.¹⁶

Expense of workmen's compensation

Meanwhile, most writers seem to have assumed that workmen's compensation was free of the expense curse.¹⁷ How-

Auto. Acc." The report cites a ratio of 54 per cent for claims incurred to premiums earned in public liability automobile insurance; this indicates an expense-to-premium ratio of 46 per cent and an expense-to-claims ratio of \$85 per \$100, as stated in the text.

¹² Comp. Auto. Acc., p. 152. The study offers no estimate of ratio of total claimants' expenses to total paid claims.

¹³ *Ibid.*, p. 217. The committee was chiefly concerned with nonpayment of claims by uninsured defendants, and was probably willing to increase defendants' expenses to the end of increasing defendants' claim payments (pp. 202-6). But the committee evidently thought claimants' expenses would drop under a compensation system (p. 152).

¹⁴ RRB survey (note 4 *supra*), pp. 180-84.

¹⁵ *Ibid.* The survey also reports the ratio of expense to net benefits, which was 29 per cent.

¹⁶ *Ibid.*, pp. 183, 187 *et seq.*

¹⁷ Dodd (note 5 *supra*) and the RRB survey (note 4 *supra*) both made extensive reports on parties' expenses in "employers liability" systems, but made no comment on parties' expense in "workmen's compensation" systems.

ever, published expense ratios of insurance companies, available since 1914,¹⁸ would have shown to anyone interested that most buyers of workmen's compensation insurance were paying almost as much for operating expenses as for claims.¹⁹ A study of certain Illinois companies, published in 1952,²⁰ showed that claimants' and defendants' expenses combined amounted to \$105 for every \$100 paid on workmen's compensation claims.²¹

With such wide variations in expense ratios, there are only a few things we can say definitely. First, there is no evidence that the features of a statutory system, like workmen's compensation, make it any less expensive than a common-law system, like employers' liability or automobile liability. Second, a large part of the expense in most systems is the expense of insuring; the only modern system which indicated a total expense substantially less than 100 per cent of claims was the railroad employers' liability system, which operates without insurance.²² Third, there

¹⁸ Alfred M. Best Co., *Best's Insurance Reports—Casualty and Miscellaneous, 1914-1952*, and *Best's Fire and Casualty Aggregates and Averages, 1940-1952* (New York, annual). Hereafter cited as "Best's Reports" and "Best's Aggregates," respectively.

¹⁹ Best's shows claims and claims expense combined amounting to 31 per cent of premiums in 1913 (Reports, 1914, p. 5), 62 per cent of premiums in 1939 (Aggregates, 1940, p. 112), and 64 per cent of premiums for 1940-49, as the average for stock companies. Reasonable assumptions regarding adjustment expense would place claims at 50-55 per cent of premiums for recent years.

²⁰ A. F. Conard and R. I. Mehr, *Costs of Administering Reparation for Work Injuries in Illinois* (Urbana-Champaign, 1952), based on observations of the years 1946-49, inclusive. Hereafter cited as "Illinois study."

²¹ Illinois study, p. 43. The study shows expense totaling 108.2 per cent of claims, including taxpayers' expense. Eliminating taxpayers' expense reduces the total to 104.6 per cent of claims.

²² See Illinois study, p. 43.

is no report of any system of liability operating without substantial administrative expense.²⁴

HOW EXPENSE AFFECTS CLAIM PAYMENTS

While analyzing expense, we have deliberately indulged a fallacy of our own. We have treated "claims" (paid or incurred) as a concept interchangeable among liability systems.

But claims vary widely in relation to losses suffered. Some claims are paid which are complete frauds; some wholly meritorious claims are never paid at all. In the best of faith, parties' estimates of the economic loss which an injury will cause are likely to vary 50 per cent in either direction.

Knowing these facts, we have good reason to believe that different samples of claims also vary widely. One company may be "easy pay," passing a host of overpayments and even fraudulent mispayments. Another may be a hard bargainer, turning away penniless the softer claimants, and underpaying a good part of the others. A few companies fail to pay claims because they are insolvent and uninsured.

What determines the level of claims payments? The answer is simple: *expense*. Any company can lower its level of payments by spending more money to combat claims. Any company can save claims expense if it is willing to pay claims at a higher rate. For every solvent company there is a break-even point, at which additional dollars spent on claims expense fail to save additional dollars on claims payments. For an insolvent defendant, the solution is sim-

²⁴ The lowest expense ratio on record is that for uninsured employers under the New York Employers' Liability Act, which was excoriated for wastefulness! Defendants' expenses amounted to only 11 per cent of total gross benefits (cash and medical) to injured workmen. See figures in NYCEL (note 6 *supra*), p. 29.

pler—to pay neither claims expense nor claims themselves.

These facts should be remembered when we are tempted to jump to quick conclusions about the wastefulness of insurance. On paper, it looks very expensive; but there are at least three justifications for it. First, many of the small defendants who carry it would not be able to pay their claims at all if they were uninsured. Second, the same small defendants would not be able to handle their claims, if they tried to, with the low expense ratios which large self-insurers show. Finally, insurance companies probably settle claims cheaper, on the whole, than do self-insurers. They maintain highly skilled and equipped organizations for combating excessive claims, and they are little tempted to settle "high" just to get rid of a case.

Claimant's position weaker

Expense works for claimants too. When a defendant has decided to fight, the claimant gets paid only by spending money on investigators, lawyers, doctors, and other witnesses. If the claimant is willing to spend neither his time nor his money, he will be paid on the facts as the defendant sees them—which may mean no payment at all.

This does not mean that every claimant has to advance money to back his claim. Injury claims are generally taken by lawyers on contingent fees. But claimants—or a substantial portion of them—have to be prepared to split their take with a lawyer, and prosecute their claims. This is the threat that makes defendants settle.

Though expense works on both sides of each controversy, it does not work in just the same way on both sides. The claimant who has not hired a lawyer is in a weak bargaining position. If he does hire a lawyer, he expects to part with one-third of his claim payment. Therefore he had better accept one-

third less than he thinks a jury would give him if the case were tried. Moreover, having no lawyer he has little ability to guess what a jury would give him, except on the basis of what the defendant's adjuster tells him.

After the claimant's case is in the hands of counsel, the claimant's position is slightly stronger. The lawyer is presumably a more sophisticated bargainer than the claimant himself. However, it is he who will have to advance the money to pay court fees and investigators' wages, and sometimes to sustain the claimant himself during the long period before trial. He too will settle for less than he expects a verdict to yield.

On the defendant's side, expenses have less softening effect. Most defendants are represented by insurance companies. To an insurance company, an expense is justified not by what it saves in a particular case, but by what it saves in an infinity of cases which may be influenced by the result of one test case. Hardly any expense is too great to defeat an "out-of-line" claim. The large self-insurers, such as the railroad companies, view the matter in a similar light.

The small claims

For these reasons, the usual effect of expense is to lower the settlement level below what a court would award.²⁷ One important exception to this rule is the small claims which are said to have "nuisance value," because it costs more to fight them than can be saved in even a considerable number of settlements. A tendency to overpay small claims has been observed in relation to automobile liability,²⁸ and is indicated also in rail-

²⁷ See RRB survey (note 4 *supra*), pp. 47-51, with table, p. 50, showing differences between initial offers and final payments, and between cases with and without attorney representation.

²⁸ Comp. Auto. Acc. (note 11 *supra*), pp. 56-57, 78.

road injuries.²⁷ This tendency probably does not result in an aggregate overpayment of all small claims, since there is also a tendency to omit payment on a larger percentage of the small claims.²⁸ This perhaps is a reflection of "nuisance un-value." To nonlitigious claimants, small claims may not be worth asserting.

In short, small claims as a class probably produce a larger percentage of both overpayments and underpayments. Both phenomena are a function of expense—resulting from the fact that neither side feels it can afford to determine the "true value" of all the small claims.

"Just value" not obtained

The over-all effect of expense is, therefore, to cause most claims to be settled for less than a court would order paid. If we take court orders as the standard of justice, the average claim is settled for less than its "just value." The claimant, after paying his expenses, gets even less than the settlement figure. At the same time, the whole affair (including the defendant's expenses) may cost the defendant considerably more than the "just value" of the claim against him.

THE FIGHT AGAINST EXPENSE

History records a few abortive attempts to eliminate the expenses of controversy by doing away with lawyers. A contemporary essayist informs us that legal fees were forbidden in ancient Rome, but that grateful clients evaded

²⁷ See RRB survey (note 4 *supra*), App. C, Tables C-23a and C-23b showing overpayment of wage loss in "temporary total" cases by as much as 200 per cent both under "employers' liability" and under "workmen's compensation."

²⁸ See *ibid.*, Tables C-22a and C-22c, showing percentage of unpaid injuries decreasing as length of disability increases, both under "employees' liability" and under "workmen's compensation."

the law by showering their advocates with munificent gifts, and the prohibition became a dead letter.²⁹

A more realistic approach to the expense problem is seen in attempts to shift the expense of controversy to the defendant. This is done by making the claimant's attorney fee taxable to the defendant in the event that the claimant wins. An old legislative favorite is one which provides that when livestock is killed on a railroad which the company has failed to fence, the farmer can recover an attorney's fee as well as his monetary damage.³⁰ Other statutes have made railroads liable for fees as well as direct damages arising from fires set by locomotives, from overcharges for freight, and from failure to furnish cars.³¹ Insurance companies have also been regarded as fit subjects for attorney-fee liability, as have governmental agencies in eminent domain cases.³² All these defendants are natural candidates for burden-bearing, whether we apply the crude philosophy of "soak the rich" or the more sophisticated one of "shifting the expense to the person best able to distribute it."

Defendants without the same aptitude for loss-bearing have also been made the butt of expense-shifting, but only in the interest of specially favored claimants. Attorney fees have been awarded to successful claimants in wage claims and mechanics' liens.³³ Only one statute has been uncovered in which an attorney fee is awarded to a personal injury claimant. This law imposed the fee upon an employer who had failed to

accept the provisions of the workmen's compensation act.³⁴

Results unknown

We have no information on the working of these devices. The ideas we have gained from careful observation of personal injury cases lead us to expect that the devices would greatly increase the bargaining power of claimants against defendants. If small injury claims are frequently overpaid, as some evidence indicates, they are likely to be even more overpaid in the presence of these "corrective" devices. The large claims, which are generally underpaid in personal injury cases, should be underpaid less often when attorneys' fees are imposed.

The most noteworthy feature of the devices for shifting loss to the defendant is their apparent disregard of the amount which a defendant should be forced to pay. If a defendant has caused an "economic loss" of \$25, he may be forced to pay \$100. If the defendant passes on his costs to his customers, as economists generally assume, the customers foot the bill for much more than the primary loss caused by the satisfaction of their demands.

A glance at the infrequent laws in which these cost-shifting means have been employed suggests that they are accepted only where lawmakers are moved by an unusually strong desire to deter or punish the defendants.³⁵

Expense need not be shifted only to defendants. If claimants are being overpaid, defendants' expense may be shifted to them.³⁶ This is a rare device, but

³⁴ See *Marshall v. Foote*, 81 Cal. App. 98, 252 Pac. 1075 (1927).

³⁵ When laws imposing attorney fees on a losing defendant are challenged on constitutional grounds, the standard justification is that the law imposes a "penalty" for statutory violation. See Annotation, note 30 *supra*.

³⁶ See Annotation, note 30 *supra*, at p. 894; also *Scherzer v. Keller*, 321 Ill. 324, 151 N.E.

was recently adopted in New York and other eastern states to protect corporation officers and directors from the demands of discontented shareholders.³⁷ The result has been, naturally, a substantial reduction in shareholders' suits.³⁸ So far as I know, this technique has not yet been applied to protect railroads from suits of injured workmen, or employers from their employees.

Can expense be distributed?

Instead of shifting expense from one unfortunate party to another, we might prefer to distribute it widely among an affected class. This in effect is done by most defendants, through the medium of insurance. As we have suggested, the system gives defendants a considerable advantage in bargaining power. Presumably claimants could likewise increase their bargaining power if they could contribute to a joint prosecution fund—for instance, by hiring a lawyer from union funds who would represent any claimant. Although this may appear to be only the converse of what defendants do, it is presumably illegal because it involves a nonprofessional organization (the union) in the practice of law.³⁹

An alluring solution of the expense problem might be to pay both parties' expenses from public funds, thus spreading the cost of justice among the entire population of taxpayers. I cannot find that this has been tried either in Com-

915 (1926), assessing defendant's attorney fee against plaintiff on dissolution of injunction obtained by plaintiff against defendant.

munist Russia or in Socialist England. In the early days of the Soviet, Hazard reports that lawyers were salaried by a public agency; but even then, the litigant paid a fee to the Commissariat. Subsequently, payment of attorneys seems to have reverted to the familiar basis of fees paid by litigants.⁴⁰ Under the English legal assistance plan, successful claimants' attorneys' fees continue to be assessed against losing defendants, just as before the plan was adopted.⁴¹

Whether expense be "shifted" or "distributed," we may be sure that the "shift" will involve secondary expense, just as the primary expense was occasioned by attempts to shift the original loss. The secondary expense may in turn be shifted, but only at the price of tertiary expense. So perfect justice eludes our pursuit.

REDUCING EXPENSE

While a good deal of ingenuity has been exercised in pushing the burden of expense from one party to another, lawmakers have given little attention to the possibilities of reducing the burden. However, the protagonists of workmen's compensation from 1910 to 1950 seemed to believe that the bulk of the expense would be eliminated by a switch to workmen's compensation. The New York Commission on Employers' Liability complained of the expenses of the employers' liability system,⁴² and the Railroad Retirement Board Survey made like complaints of a much lower expense ratio thirty-seven years later.⁴³ The RRB Survey denounced these expenses as "inherent in the [employers' liability] system, which compels both

⁴³ RRB survey (note 4 *supra*), pp. 180-84.

parties in many instances to employ legal counsel to protect their respective rights."⁴⁴

In the same year in which the RRB Survey was denouncing the wastefulness of employers liability and advocating workmen's compensation, an English barrister was denouncing workmen's compensation in almost the same terms. He observed:

Money, time and professional skill have for nearly half a century been squandered in a scandalously wasteful manner in settling these [workmen's compensation] claims. The fundamental reason is that, instead of a claim being determined on the grounds of public interest, it is opposed and obstructed at every stage by the adverse interest of the employer or his insurance company.⁴⁵

The hopes of workmen's compensation protagonists were based in part on eliminating the troublesome question of "negligence."⁴⁶ Experience has shown that the circumstances of the accident now enter into controversy under the question of "arising out of and in the course of the employment."⁴⁷ Hopes rested also on the thought that the schedule of payments would eliminate the arguments of medical witnesses.⁴⁸ The schedules list the amounts to be paid for loss of a leg, an eye, or a finger joint. This would solve all problems if

⁴⁶ See RRB survey (note 4 *supra*), p. 205.

⁴⁷ See observations on time devoted to this question in Illinois study (note 20 *supra*), pp. 50-53. See also remarks of judges on this "litigiously prolific" phase assembled by Samuel B. Horowitz in "Current Trends in Basic Principles of Workmen's Compensation," 12 *Law Soc. J.* 508 (1947), reprinted as separate volume under same name (Boston, 1947), p. 508.

⁴⁸ See RRB survey (note 4 *supra*), p. 205, stating that if a compensation act had been in effect for the injuries surveyed, "payment under it would have been uniform and predictable."

accidents would come in the form of clean surgical severances at the joints enumerated in the statute. Coming as they do in the form of mangling, shock, lingering pain, and elusive failures to regain strength, they give the medical witnesses the same causes for dispute that they had before.⁴⁹

The earliest reports on workmen's compensation suggest that it was at least as expensive as employers' liability had been. Insurance companies reported a loss ratio (which is inverse to an expense ratio⁵⁰) of 31.3 per cent for 1913,⁵¹ as compared with 36.34 per cent for employers' liability in 1906-8.⁵² In recent years, workmen's compensation leads the parade in loss ratios with a 64 per cent average for 1940-49, in stock companies.⁵³ Even so, it is only a few points ahead of automobile liability for the same period, which shows 61.4 per cent.⁵⁴ Other figures indicate that where comparison is possible, workmen's compensation is slightly less economical than employers' liability

⁴⁹ See RRB survey (note 4 *supra*), App. C, Tables C-22c and C-23b, showing substantial variations in payment for similar injuries under workmen's compensation. See also Illinois study (note 20 *supra*), pp. 50-53.

⁵⁰ A "loss ratio" is usually a ratio of claims to premiums, or claims-plus-claims-expense to premiums. I have used "expense ratio" to mean the ratio of premiums-less-claims to claims.

⁵¹ Best's Reports (note 18 *supra*), 1914, p. 5. This is a ratio of claims-plus-claims-expense to premiums, but may be based on claims paid, rather than claims incurred. See comment in note 10 *supra*.

⁵² NYCEL (note 6 *supra*), p. 31. This is reported as a ratio of claims (without adjustment expense) to premiums, so the gap between the two systems was even greater than the figures show.

⁵³ Best's Aggregates (note 18 *supra*), 1950, p. 109; compare automobile liability (61.4 per cent) and liability other than auto (47.4 per cent). These loss ratios include claims expense.

on the railroads.⁵⁵ Apparently the expense ratio improves as the concentration of units increases, regardless of the structure of the reparation system.

Some unexplored areas

A coolheaded attack on expenses, based on careful observation of claim-handling processes, remains as fresh an idea in 1953 as it was in 1910. Because it has never been tried, there is still reason to hope it would succeed.

The most encouraging single factor is the great variation in expense ratios of different companies. One insurance company is spending \$70 to process each \$100 claim, while another is charging \$90.⁵⁶ Immense gains could be made merely by bringing the highest down to the level of the lowest.

Another contrast which invites study is the gap between expense ratios of uninsured defendants and insured defendants. Possibly many more defendants could qualify as self-insurers if the law encouraged them;⁵⁷ the third of their premium dollar which now goes to insurance expense might be saved, or used for higher claim payments.⁵⁸

"The battle of the experts"—the war of words between claimants' and defendants' physicians—calls for analysis and experimentation. Lawmakers have

⁵⁵ Illinois study (note 20 *supra*), pp. 42-46. Of course figures must be adjusted to eliminate "insurance expense" before comparison is made.

⁵⁶ Comparisons of companies may be found in Best's Aggregates (note 18 *supra*), or with somewhat greater detail, but for a smaller sample of companies, in National Bureau of Casualty Underwriters, Insurance Expense Exhibit (New York, annual).

⁵⁷ Some states require all employers to contribute to a state fund; others require all to acquire private insurance; others permit self-insurance subject to difficult financial and administrative requirements.

⁵⁸ See calculation of insurance expense in Illinois study (note 20 *supra*), Appendix, pp.

at various times called for the hiring of "impartial experts," but no active use of them has been reported.⁵⁹ No one knows what might result from a vigorous application of this device.

While sources of expense are studied, effects on settlement levels cannot be ignored. Expense ratios may be easily enough reduced by opening the doors to all kinds and conditions of claims. Study of expense must be accompanied at every step with a study of the direct costs of claim settlements.

CONCLUSIONS

Operating expense is the enemy of justice. Expense prevents the claimant from getting enough, at the same time that it makes the defendant pay too much.

⁵⁹ An experiment in the use of impartial experts now under way in New York is outlined in the article by William C. Hecht, Jr. in this issue.

In the last half-century of "reform" in administration of injury claims, not much has been done about expense. Those who have been concerned with it have accomplished little because they imagined it was something that would melt away with a more rational reparation system. Those who understood it—because they made their living from it—have not devoted themselves to its abolition.

A productive approach to expense must start with recognizing that it is here, and will always be here. Like other kinds of expense, the expense of controversy can probably be reduced by scientific management. This must start with observation of the activities in which expense is being incurred. There are considerable variations in expense experience of different defendants, and of the same defendants under different conditions. These variations give rise to justified hope that average expense ratios can be greatly reduced.

Alfred F. Conard, Urbana, Illinois, is professor of law at the University of Illinois. He has practiced law privately in Philadelphia, and as staff attorney for the Office of Price Administration and the Alien Property Custodian in Washington. He is editor of a casebook on Agency and Employment Relations (1950); author of Studies in Easements and Licenses in Land (1942); and co-author (with R. I. Mehr) of Costs of Administering Reparation for Work Injuries in Illinois (1952).

Availability of Low Cost Legal Services

By EMERY A. BROWNELL

IN dealing realistically with the ever changing problem of judicial administration, there is one inescapable constant: the necessity for the expert service of lawyers. No system of law was ever devised that managed to avoid for long the development of a specialized professional group to advise the citizen of his rights and responsibilities under the law, and to assist him in the pursuit of his legal remedies through the appropriate tribunals. It is reported that although the organized bar of Russia was officially abolished by the Revolution in 1917, Soviet jurists from the outset recognized that ordinary citizens required assistance in the courts, and tolerated a form of law practice which has since attained a formal and disciplined status in the courts.¹

Under the American concept of democracy, whose strength stems from individual rights and equal justice, the law plays a more vital and indispensable role in the everyday life of the citizen. Moreover, changes in our economy and way of life are increasing the number and the complexity of the laws which guide our multiplicity of relationships: the relations of employers and employees, of buyers and sellers, of landlords and tenants, of husbands and wives, of parents and children, and many others. It is an unavoidable growth, consistent with our belief in the use of law instead of force in preserving individual freedom and opportunity. But it puts the citizen in greater need than ever of expert legal counseling.

¹ J. N. Hazard, "Law Practice in Russia," 35 A. B. A. J. 181 (1949).

PUBLIC RELUCTANCE TO CONSULT LAWYERS

The need for legal assistance now goes beyond affairs of business. Recourse to lawyers can no longer be viewed as a last desperate step when an individual's rights are actually invaded or threatened and a lawsuit is imminent. The preventive legal services are of equal importance to our well-being: advice, investigation of facts, negotiation, the drafting of documents, and the settling of disputes without litigation. Professor Koos's study for the Survey of the Legal Profession, conducted in six typical American cities, showed that two of every five representative families in the lower and middle income brackets had one or more problems which called for the help of a lawyer.² It is significant that three-fourths of the families having such problems recognized their need, even though only about half of them consulted a lawyer. An Iowa poll of public opinion resulted in similar findings.³

Legal aid organizations, which in this country have had a seventy-five year history of observing the legal needs of people with the smallest means, have long been aware of this expanded need for lawyers' services on the part of the rank and file. Although their own services were strictly limited to those unable to pay the fees of the lawyers in their communities, these organizations saw

² E. L. Koos, *The Family and the Law*, mimeographed, 1949.

³ Iowa State Bar Association, *Lay Opinion of Iowa Lawyers, Courts and the Law*, April 1949.

that many persons of middle income circumstances, well able to pay the fees involved, were being put to needless personal and property loss for failure to consult a lawyer. Despite the traditional willingness of the legal profession to render services on a generous basis of ability to pay—or perhaps because of it—the average citizen has tended to seek the help of a lawyer only in a crisis clearly related to the law. In this respect there is similarity with the experience of the doctor, who not so long ago was consulted only when a physical ill was acute and clearly beyond home or amateur remedies.

This failure on the part of the public to use lawyers' services preventively may be due partly to the popular misconception of the law as being punitive and restrictive rather than a constructive and helpful framework for better relations between individuals, and partly to an unwarranted fear of the costs involved. But it must be said in all fairness that the profession itself has not until recently been aware of the lawyers' broadening field of responsibility. Much of the gap between the public's real need for legal service and its relatively narrow use of so basic a service is due to the lack of effective public relations and the difficulties of adapting the profession to modern conditions of practice.

As the Standing Committee on Lawyer Referral Service of the American Bar Association puts it:

In an age of drum beating and salesmanship, we are unable, without violation of the canons of ethics, to tell people of their need for advice. At a time when the complexities of the simplest form of existence challenge the ingenuity of the specialist in a multitude of fields, nothing like the chain store has been grafted into the legal profession to enable it to cope with the perplexities of people in all walks of life. As a result, until very recently the clientele of the attorneys of this country was little

broader than it was in the days of the Civil War.⁴

EXTENT OF NEED IN CIVIL CASES

Considering first the field of civil practice and the experience of legal aid organizations, an average of 461,000 persons a year who are unable to pay fees need legal service in the United States.⁵ This is a minimum figure for cities having a population of 25,000 or more, and is based on the records of forty-three representative legal aid organizations over a twelve-year period, 1936-47 inclusive, showing an over-all average of 7.5 cases per thousand of population.⁶ Since a number of the reporting organizations were not well established, and other facilities for free legal service existed in some of the cities represented, the potential is substantially higher. Although many of these cases require no more than a consultation, well over 20 per cent of them on the average require more involved services, including representation in court. It should be noted that there is also a need, as yet unmeasured and probably somewhat less, for some form of organized legal aid service in smaller places.

There is every reason to believe that the need for legal services among persons able to pay fees is very much greater. In the first place, there are four times as many persons able to pay fees as there are persons unable to pay fees, because the legal aid clientele is drawn almost exclusively from the 20 per cent of the population at the lower end of the economic scale. In the second place, the mode of living of people

⁴ *Handbook on the Lawyer Referral Service*, 1952.

⁵ Using the U. S. Bureau of Census population count of 61,425,669 for cities of 25,000 or more as a base.

⁶ A. Fisher and E. M. Woods, *A Standard of Measurement for Determining the Need of Legal Aid Services in Urban Areas*, mimeographed, 1948.

of larger means, their social and business activities and property concerns, generate more legal problems. Eliminating the group served by legal aid and an estimated 10 per cent who might be considered to have lawyers on a retainer or regular consultative basis, there are approximately 105,500,000 persons or 34,700,000 families in the United States whose needs for legal service are not now being adequately met.⁷ On the basis of the Koos study already cited, this means a potential of nearly 14,000,000 families with legal problems, of which only about half are using lawyers. There are no figures on the actual volume of private law practice, but assuming the need of the middle income group to be only slightly greater than that of the legal aid clientele, it is abundantly clear that there exists an unhealthy gap in the availability of lawyers' services.

EXTENT OF NEED IN CRIMINAL CASES

What about the need in criminal cases? Most persons now take it for granted that every person accused of crime ought in the interest of justice to have counsel represent him. The right to counsel in criminal cases, as a legal principle, is, however, not fully established, although each year courts and legislatures extend its protection to more types of cases or to more jurisdictions. Mr. Justice Sutherland succinctly stated the need in an opinion:

The right to be heard would be, in many cases, of little avail if it did not comprehend the right to be heard by counsel. Even the intelligent and educated layman has small and sometimes no skill in the science of law. If charged with crime, he is incapable, generally, of determining for himself whether the indictment is good or bad. He is unfamiliar with the rules of

⁷ Calculated on a total U. S. population of 150,679,000 and an estimate of 49,580,000 families. U. S. Census Bureau Report, Series PC-7, No. 1, February 1951.

evidence. Left without the aid of counsel he may be put on trial without a proper charge, and convicted upon incompetent evidence, or evidence irrelevant to the issue or otherwise inadmissible. He lacks both the skill and knowledge adequately to prepare his defense, even though he have a perfect one.⁸

Regardless of the matter of principle, it can be stated categorically that a person needs a lawyer when he is charged with any offense which may affect his record, his property, or his freedom. In 1951, according to *Uniform Crime Reports*, there were 1,882,160 arrests made on criminal charges in the United States. A high proportion of the defendants in these cases—at least 60 per cent⁹ and possibly 80 per cent¹⁰—were unable to employ attorneys. How many of the others actually engaged a lawyer is conjecture; presumably most.

FACILITIES AVAILABLE FOR LEGAL AID

In the legal aid field on the civil side there has been a steady and recently accelerated growth in the number of organizations. For the most part, they have been established as privately supported community services. At the present time there are 123 legal aid offices and 53 volunteer legal aid committees of bar associations in the United States, and in 1951 these organizations provided assistance in over 200,000 cases. This represents a growth from 33 offices in 1920 to 110 in 1950. In the single year 1951, there were 13 new offices opened for service.

The most common type of legal aid organization is the incorporated chari-

¹⁰ J. E. Lumbard, Jr., "For Equal Justice—A Public Defender," *New York Times Magazine*, No. 2, 1947.

table society of which there are now 75 in the country. Others include bar association offices (23), departments of social agencies (11), law school clinics (8), and public bureaus (6).¹¹ Included in these figures are only those law school clinics which provide direct and independent service to clients.¹² There are 21 other clinics which are conducted co-operatively by a law school and one of the legal aid organizations classified above.

Financial support for these organizations comes 60 per cent from community chests, 9.5 per cent from tax funds, 8.5 per cent from bar associations and lawyers, 6 per cent from clients, and 14 per cent from other contributed funds.¹³

The organization of facilities for providing adequate legal service in criminal cases has not progressed so uniformly or so rapidly. As reported in a study made for the Survey of the Legal Profession, published in 1951:

Fewer than half of the counties of the United States provide paid counsel to indigent persons accused of major criminal offenses. In a majority of these the fee paid is not compensatory and takes no account of expenses incurred or time consumed for investigation. A small proportion of other counties, 15 per cent of the total, provides legal assistance on a paid basis only in cases where the punishment is death or life imprisonment. In 38 per cent of the counties, no help whatever is provided except the private charity of individual lawyers.¹⁴

Defender offices, similar to legal aid offices on the civil side with paid staff

¹¹ National Legal Aid Association, *Statistics of Legal Aid Work in the United States and Canada*, Year 1951.

¹⁴ *Ibid.*, p. 246.

attorneys, have grown from 5 in 1917 to 38 at the close of 1951. Of these, 31 are public, tax-supported services and 7 are privately supported offices of which 4 are conducted by legal aid offices and 3 are independent organizations.¹⁵

The conviction is growing that the only practical, effective way to provide counsel for indigent defendants in the larger cities is by a defender office. The assigned counsel system, adequate when cities were more isolated and the country less highly industrialized, is becoming more and more discredited. There are relatively few lawyers specializing in criminal practice, and yet an adequate defense to balance the modern, specialized prosecutor's office requires a high degree of proficiency. Assignments of counsel in most jurisdictions are made only in the more serious offenses and then not until after most of the consequential steps have been taken, the impecunious and usually friendless defendant meantime being confined without opportunity to investigate the charges or examine possible witnesses, although he is theoretically presumed innocent under the laws prevailing in every state.

LAWYER REFERRAL SERVICES

For the great number of people who can pay fees, there is a rapidly growing system being fostered by bar associations to overcome the bogey of high costs and make it easier for the uninitiated to find a lawyer. The plan recognizes the fact that the great majority of people in all the larger communities do not know a lawyer and are ignorant of their legal rights or what constitutes a legal problem. Essentially, it is nothing more than a bar association mechanism for the introduction of persons who need legal advice to qualified members of the bar. For a fixed fee ranging from \$5.00

¹⁵ *Op. cit. supra* note 11.

for a half-hour in some of the larger cities down to \$2.00 or \$3.00 for a full hour's consultation in some of the smaller places, people who do not have a lawyer are encouraged by various publicity media to call or visit the lawyer reference service of the local bar association. There, with a minimum of formality and a maximum of consideration for the needs of the applicant, referrals are made to individual lawyers on a rotating basis.

This practical and logical adaptation of professional service to the needs of the times is the combined fruit of legal aid experience, the wartime legal assistance program of the armed forces, and a number of individual experiments among which the Neighborhood Law Office plan of Philadelphia was outstanding. For years legal aid organizations had found it necessary in the interest of public service to develop referral lists in co-operation with their local bar associations for applicants who were ineligible for legal aid but who did not know any attorney and whose circumstances made it difficult, if not impossible, to find a lawyer willing and able to assist at the fee that could be paid.

A wartime measure

The recognition by the War Department that the legal problems of servicemen constituted a serious threat to morale resulted in the establishment of a comprehensive, uniform system of legal aid service in co-operation with the American Bar Association, state and local bar associations, and established legal aid offices. Launched officially by War Department Circular No. 74, March 16, 1943, and subsequently Navy Department Bulletin R1164, July 1, 1943, the plan created legal assistance offices throughout the two services where military and naval personnel and their

dependents could obtain legal advice and assistance from lawyers in the service (designated as Legal Assistance Officers), and provided for the reference of cases to civilian attorneys and legal aid organizations where court appearances or other services away from the serviceman's station were required. When the Air Force acquired a separate status, it adopted the plan.

The objective was the prompt furnishing of counsel to those who needed it, with the question of compensation secondary. Where payment of a fee was not possible or would work a hardship, service was given by legal aid organizations and war work committees of bar associations. State and local bar associations accepted general responsibility for the referral of all matters whether or not a fee was possible. Although the undertaking was prompted and sustained by a deep sense of patriotism and a desire to help the war effort, the experience clearly demonstrated that the ordinary citizen was beset with many more legal problems than even the bar suspected, and that the citizen not only needed the help of lawyers but would seek that help if the way was made easier.

It remained only for another of the reports of the Survey of the Legal Profession¹⁶ to distill the fundamentals and thereby guide and encourage the formation of lawyer reference services in a fast growing number of cities. In 1949, when that report was published, there were approximately 20 referral plans in operation. Since then the number has increased to 45 in cities of 100,000 or more population, in addition to several state-wide plans and a number of services in smaller communities.¹⁷ It is reported that clients are applying to these

¹⁶ C. O. Porter, *Lawyer Reference Plans, A Manual for Local Bar Associations* (1949).

¹⁷ T. Voorhees, "The Outlook for the Lawyer Referral Service," 38 *A. B. A. J.* 193 (1952).

services at the rate of around 35,000 a year.¹⁸

OUTLOOK

Let no one be deceived by the progress which has been made in establishing up-to-date means of making needed lawyers' services more readily available. Much remains to be done—especially, as has been indicated, in criminal cases. Two significant developments, fortunately, give promise that the encouraging rate of achievement of the past several years will continue for at least several more years and that the momentum will carry the program eventually to fulfillment.

In the fall of 1949 the National Legal Aid Association was incorporated, absorbing and extending the usefulness of two predecessor organizations that had served the national field since 1911. As now constituted, the association provides an effective instrument for coordinating the legal aid work of national, state, and local bar associations, the interest of individual leaders of the bench and bar and other organizations concerned with improving the administration of justice, and the spirit and practical experience of the personnel attached to the growing number of legal aid agencies themselves. That association has already instituted a large-scale plan for extending and strengthening legal aid service in both civil and criminal fields and is currently engaged in raising funds to implement the plan.

The immediate objective is the establishment or reorganization of legal aid facilities in about a hundred large cities which now either have no such service or are poorly served by makeshift volunteer efforts. The long-range goal comprehends the following specifics set forth in the report *Legal Aid in the United States*:

¹⁸ *Ibid.*, p. 195.

1. In every city with a metropolitan area population in excess of 100,000 and in smaller ones which are definitely urban in character, a legal aid office should be open at least 30 hours a week at regular times, and not less than one full-time attorney with the necessary clerical assistance should be present except as his duties take him away from the office.

2. In every other city or county with a population in excess of 50,000 there should be an office with some paid clerical personnel open for at least 12 hours a week at regular times, and preferably with a lawyer in constant attendance during those hours except when taken away from the office on business. The lawyer may, however, be a volunteer or one of several volunteers operating on a division of time basis. In large counties with separated centers of population, the plan of operation may need to be modified further to provide for more than one office for the reception of cases.

3. In every other county a committee or volunteer lawyer or other agency should exist to take care of legal aid matters throughout the county. Such service will usually require no more than a chairman or secretary with sufficient clerical assistance of his own either to undertake a case himself or to see that it is referred to a lawyer able and willing to handle it.

4. In every state there should be a state bar association committee to supply overall supervision and support.

5. In all of the larger cities there should be an organized defender service for criminal cases, conducted either as a co-ordinate function of a legal aid office or as an independent publicly or privately supported agency, to provide competent counsel at every stage of the proceedings in all felony cases and other serious offenses.

6. Adequately compensated assigned counsel, of equivalent character and coverage, should be provided in all counties not served by a defender office.¹⁹

The second promising development is the awakened and determined interest

¹⁹ *Op. cit.* *supra* note 13 at p. 249.

of the organized bar and the steps that have recently been taken by that group to provide continuing leadership for the establishment of both legal aid and lawyer reference services on an adequate basis. The American Bar Association and its influential Committee on Coordination of Bar Activities have made this one of their major long-range projects. In turn, the Conference of Bar Presidents and a substantial number of the larger state bar associations have undertaken programs to foster interest and encourage the setting up of needed facilities. Two strong standing committees of the American Bar Association—one on legal aid and one on the lawyer reference plan—are providing direction and drive within the profession.

Emery A. Brownell, Rochester, New York, has been executive director of the National Legal Aid Association since 1940. He was executive attorney of the Rochester Legal Aid Society from 1927 to 1950, and has lectured on law and social work at the University of Rochester and served as chairman of the Judiciary Section of the Post War Planning Council of Rochester. He is author of Legal Aid in the United States (1951).

THE PRICE OF FREEDOM

Underlying all these efforts is the conviction expressed by Harrison Tweed, president of the National Legal Aid Association, shared also by those who are advancing lawyer reference plans:

The world seems to be divided into two camps—in one the individual is of no concern, he is completely subservient to the state; in our camp the individual citizen with his rights and privileges, is the first concern. But the price of freedom as well as of peace is eternal vigilance. In upholding the high principle of equal justice for all and in striving to furnish the needed legal services to everyone, the legal aid lawyer stands in the front ranks of the fighters for freedom.²⁰

²⁰ 10 *Legal Aid Brief* Case 114 (1952).

The Taxpayers' Stake in the Courts

By LELAND L. TOLMAN *

ALTHOUGH relatively few Americans ever participate as plaintiffs or defendants or as witnesses or jurors in a case in court, yet most of them as taxpayers have a substantial financial stake in the judicial establishment. Indeed, aside from the direct expenses of litigation, attorneys' fees, court costs, and similar expense necessarily incurred by those who prosecute or defend their cases in court, the cost of the judicial process is largely borne by the tax-supported public treasury. This being so, the quality of the administration of justice is a direct responsibility of the taxpayer and depends to a large degree upon his dollar support.

As one of the three co-ordinate bodies of American government, the judicial branch, like the legislative and executive branches, cannot function as it should unless it is adequately staffed and equipped. Judges, clerks of court, bailiffs, probation officers, interpreters, stenographic reporters, secretaries, law clerks, and librarians all ought to be paid enough to attract and hold persons of ability, and there ought to be enough of them to permit the work of the courts to be done with efficiency and dispatch. Courthouses should be dignified, functional, and adequately furnished and equipped. Lawbooks, which are such important instruments of the profession, must be made available to the judges in sufficient quantity and variety. These and a myriad of other

daily necessities must be obtained from the public fisc, and without them the judicial institution as we know it will not function.

COST OF FEDERAL COURT SYSTEM

But in the over-all public appropriation for government, the share allowed the judicial branch is only a small fraction. In the federal system, the estimated expenditures for the courts in the fiscal year that will end on June 30, 1953 total approximately \$27,500,000. This is to provide for the support of all the federal district and circuit courts, the Supreme Court of the United States, and such special tribunals as the Court of Claims, the Court of Customs and Patent Appeals, and the Customs Court. While as an absolute sum it is a large amount, yet in reality its relative bulk in the estimated expenditure for the federal government as a whole in 1953 is only $\frac{1}{27}$ of 1 per cent of the \$74.6 billion total; and even if military expenditures are deducted, the judicial expense will be only $\frac{1}{11}$ of 1 per cent of the \$30.2 billion that remain.¹

Furthermore, even this amount is offset to some extent by the earnings of the courts. Fees charged to litigants for services in cases concerning them and amounts collected as fines and penalties by the clerks of court are turned into the Federal Treasury as earnings of the courts. It is estimated that in 1953 the total receipts in these general accounts will amount to over \$4,500,000, and that the special accounts from fees

* In view of the author's connection with the Administrative Office of the United States Courts he desires to note that the views expressed here are not necessarily those of that office or of any of the officials of the federal judiciary, and they are not responsible in any way for the accuracy of the facts stated.

¹ Judiciary Appropriation Act, 1953, approved July 10, 1952, Public Law 495, 82d Cong., 2d sess.; Budget of the United States, 1954, pp. M8, M12, 37 ff.

in bankruptcy cases, from which all salaries and expenses of the referees in bankruptcy of the federal courts are paid, will total in the neighborhood of \$2,500,000.²

Thus the actual cost to the taxpayer for the operation of the federal court system is now running at the rate of approximately \$20,000,000 a year. And there are those who argue with great force that this amount is far from enough.³

COST OF STATE AND LOCAL COURT SYSTEMS

The costs of maintenance of the court systems of the various states and of the local governments seem to be much the same in their relative proportion of the total costs of the governments of which they are a part. In New York State, for example, the judiciary is shown by the annual report of the State Comptroller to have required a total expenditure from general state funds of something over \$7,500,000 in the fiscal year ending 1952, out of a total state budget of about \$994,000,000, which includes state funds appropriated for the financial assistance of units of local government. Thus the share of the courts in the cost to the state of all governmental services was $\frac{3}{4}$ of 1 per cent of the total state budget.⁴ And in California in the fiscal year 1952, out of total expenditures of \$1,055,000,000 from state-controlled funds for the cost of government, the amount allotted to the

judicial establishment was only \$1,258,000, or $\frac{1}{8}$ of 1 per cent.⁵ In Florida, in the fiscal year 1951, there was spent for the judiciary, including the supreme, circuit, and other state courts, a total of \$1,049,000, or about $\frac{1}{5}$ of 1 per cent of total state disbursements of \$463,029,000.⁶

These figures are of course not fully comparable among the various states. In California, for example, the judicial appropriation includes only the supreme and appellate courts, the Judicial Council, and the state's share in the retirement fund for judges of the supreme and appellate courts; and so it excludes the very much more substantial expenditures for the operation of the trial courts throughout the state. These basic judicial expenses appear to be borne in many states entirely from the funds of the local units of government where they operate. In 1951, New York City spent for city and county judicial purposes a total of \$20,137,500 out of an aggregate cost of city government of \$1,237,843,000. Thus the proportion for the judiciary of the total local government cost was about 1.6 per cent.⁷ The aggregate amount spent for the courts in New York City alone was somewhat greater than the cost in that year of the entire national judicial system, including both the trial and appellate courts.

It would require an extended and entirely uncharted study to develop from the greatly diversified budgets and financial systems of the forty-eight states and of the thousands of local governmental units complete data on the costs of the judiciary that could be used accurately

for comparison with similar items in the federal budget. This seems to have been a field of research overlooked or at most only touched upon by students of government. Scholarly examination of all the facts in this regard might yield useful results not only by improvement of the efficiency of the courts but also in the general public service and in better utilization of the tax dollar. However that may be, the figures now available do show a startling disproportion in the share for which the courts are accountable in the over-all costs of government. And experience in the federal system in recent years has demonstrated that with greater financial support from the appropriating bodies, the courts are better able to provide for the public the prompt and careful judicial service and the essential protection of public and private rights that it is their function to furnish.

MAIN ITEMS OF EXPENSE

An accurate analysis of the items of expense that comprise the total cost of upkeep of the judicial department is impossible without the data, which are not now available in any usable form, to show the condition in the courts maintained by state and local governments. But the elements of cost in the judicial system of any governmental unit are essentially the same everywhere. For our present purpose, the components of the judicial appropriation in the federal system will serve to show approximately what it is that constitutes the cost of maintenance of the American court structure in general.

In the federal system, as in many of the states, there are three primary layers of courts. At the top is the Supreme Court of the United States, with nine justices. In 1952 the estimated expenditures of that Court were \$1,302,050. The aggregate salaries of the justices and the officers and employees of

the Court, which totaled \$980,000, were the largest single element of expense in the appropriations made to the Court. Other costs, including the expenses of printing and binding court opinions, the care of the building and grounds, and a small item for miscellaneous expenses, round out the total amount.⁸ Also, the Court receives an appropriation through the Library of Congress (\$22,500 in 1952) for the maintenance of its library.⁹ In addition to the nine justices, the personnel of the Court consists of the law clerks and secretaries of each of the justices, the librarian and the library staff, the reporter of decisions and his staff, the marshal of the Court and his staff, and the clerk of the Court and the other employees in his office.

Next in the federal judicial hierarchy are the United States courts of appeals, one for each of the eleven judicial circuits into which the United States has been divided. These are the intermediate courts, and in most cases their decisions are final. In 1952, the total cost of operating these courts was approximately \$2,735,526.¹⁰ This included principally \$1,253,486 for the salaries of the sixty-five circuit judges and \$414,204 for the salaries of the clerks of the courts and their deputies and assistants and the court librarians; \$738,431 for the salaries of law clerks, secretaries, messengers, and other miscellaneous employees; \$170,612 for impersonal services, such as lawbooks, office equipment, and the like, and for printing and binding (chiefly the printing of opinions of

² Budget of the United States, *supra* note 1, Special Analysis C, pp. 1094 ff.; 1954 Budget estimates as submitted to the Bureau of the Budget, Administrative Office of the U. S. Courts, October 15, 1952, Statement of Receipts (not paged).

⁸ Budget of the United States, *supra* note 1, p. 38.

⁹ *Ibid.*, p. 30.

¹⁰ These figures and all those that follow are prepared from material in the files of the Administrative Office of the United States Courts. The author is greatly indebted to Mr. John C. Brown, Jr., the chief of the Budget and Accounting Section in that office, for his careful compilations of these statistics.

the court); and \$90,190 for travel expense of judges and their employees.

The courts of first instance in the federal judicial system are the United States district courts. In 1952 there were 215 judges serving in these courts in 86 federal districts scattered throughout the forty-eight states and in five similar courts in the District of Columbia and the territories. The total cost allocable to the maintenance of all the district courts in 1952 was about \$19,640,652. Of this, \$3,727,849 was for the salaries of active and retired judges; \$4,461,378 was for the salaries of the clerks of the courts and their deputies and assistants; \$2,354,510 was for the salaries of probation officers and their clerks, who supervise the conduct of persons convicted of crime and placed on probation without imprisonment or released from imprisonment by parole before expiration of their sentences; \$544,359 was for salaries of court criers who serve as bailiffs and messengers; \$591,000 was expended for the compensation of United States commissioners who serve on a fee basis as the committing magistrates in criminal proceedings in the federal courts; \$3,032,000 was for the compensation, subsistence, and travel of trial and grand jurors; \$2,169,004 was for the salaries of law clerks and secretaries of the judges, interpreters, and the like; \$619,967 was for the costs of travel of the judges and court personnel incident to the holding of terms of court at places away from their official residences, and for other required travel; \$577,217 was for the provision of impersonal services such as office equipment and lawbooks; and \$1,071,028 was for salaries of the 218 official shorthand reporters who record verbatim all trial court proceedings.

SPECIAL ITEMS OF EXPENSE

In addition, there were expenditures from special funds of the bankruptcy

system collected from litigants in bankruptcy cases and earmarked in the National Treasury for support of the bankruptcy officials of the district courts: somewhat less than \$2,000,000 for the salaries and expenses of the 103 referees in bankruptcy and their 304 clerical employees.

Aside from these items of expense, the judicial system of the United States Government includes a number of special courts, for which the appropriations are separately maintained. Serving all of them (except the Supreme Court which is self-administered) is the Administrative Office of the United States Courts, which, under the direction of the Judicial Conference of the United States, performs the essential house-keeping duties such as preparing budgets, auditing accounts, and fixing salaries of supporting personnel, collects statistical information on the condition of the judicial business, and makes studies of the judicial procedure in all the courts. The total cost of this office in 1952 was \$560,943, or about 2.5 per cent of the total appropriation for the courts.¹¹

The mere recital of these figures is not very informative, but it may serve as well as any method to show what it is that the public pays for when tax-

¹¹ For a description of the duties of this office, which acts under the direction of Mr. Henry P. Chandler, see his article "The Administration of the Federal Courts," 13 *Law & Contemp. Prob.* 182 (1948). See also for details of the federal judicial system the Annual Reports of the Director of the Administrative Office of the United States Courts, and the Reports of the Judicial Conference of the United States (published together), 1940, 1941, 1945-1952. Data as to the number of personnel employed in the federal judicial system and the nature of their duties appear in the 1952 report at p. 48. Each report contains a table of amounts available, expended, and unexpended by the Administrative Office during the fiscal year at Table H 1 (1952 Report, p. 193).

collected funds are expended for court maintenance; and it indicates the relative size of each of the various essential items that make up the total.

There are items of expense not listed above, which bulk large in the over-all costs. These include the services of the custodial force of the Post Office Department and the General Services Administration, which are responsible in the federal government for the care and upkeep of all federal buildings. In the same category is the cost of the construction and outfitting of courthouses and other quarters for the courts, which are similarly provided from appropriations made to the Post Office Department and the General Services Administration. It is impossible to allocate to the judiciary a reasonably accurate proportion of the total federal expense incurred for such services, but certainly it is a very considerable sum and a most essential expenditure.

HARD TO DETERMINE COST PER CASE

To those who have an interest in the cost of the judicial system, the question most often presented and generally unanswered concerns the cost per unit of judicial business. The attempt to answer involves some preliminary explanation of the difficulties involved.

In measuring statistically the work of any court, the case is the unit that is counted. But the burden of individual cases upon the court in terms of the amount of work which each requires is extremely variable. In most courts, particularly those in heavily populated industrial areas, many of the cases that are begun are ultimately settled by agreement of the parties without trial or other court action. Others are disposed of with relatively little trouble at some intermediate stage of the litigation process. Some of them cannot be concluded without the taking of evidence and the final judgment of the

court either upon a jury verdict or upon findings of the judge sitting without a jury. Most trials of this character are concluded within a few days, but a few last for months or even years. The trial of the eleven Communists before Judge Harold R. Medina in the Federal District Court in New York City is a well-known example of this sort of case.

Thus it is difficult to say with any degree of exactness how much it costs the taxpayer for the disposition of each case, and any effort to do so must of necessity be a mere approximation. Again, figures to compute even a rough guess are not conveniently available for any but the federal system. For what they are worth, in the light of these weaknesses, the federal figures which follow have been computed from the accounts maintained by the Budget and Accounting Section of the Administrative Office of the United States Courts. For comparative purposes they have been prepared to cover the fiscal years ending in 1945 and in 1952.

COST PER CASE IN DISTRICT COURTS

In 1945 the total estimated cost of the maintenance of the district courts, including the proportionate share of the compensation of judges and all their supporting personnel, as well as the proportionate expense of the maintenance of the probation system, traveling expenses, and allowances for supplies, lawbooks, and equipment and a share of the cost of the Administrative Office of the Courts, was \$9,762,807. In 1952 this figure had more than doubled, and amounted to \$19,640,652, largely because of dollar inflation, salary increases, and the addition of court reporters to the permanent judicial staff. In 1945 there were 91,655 cases (many of them simple price regulation enforcement proceedings) terminated by the district courts. In 1952 the number terminated was 90,038 (less because of

the elimination of the price regulation cases, but actually much greater in total work load because of the great increase of time-consuming private litigation). The average over-all cost of each case terminated by the district courts was therefore approximately \$106.52 in 1945, and \$218.14 in 1952.

By a similar method of computation, allocating to the criminal jurisdiction the entire costs of United States Commissioners and the probation system, and the proportion of the remaining over-all district court expenditures that the number of criminal cases terminated bears to the total number of civil and criminal cases terminated (42.94 per cent in 1945; 40.97 per cent in 1952), it seems that the average cost per case of the 39,355 criminal cases closed by the district courts in 1945 was \$128.38; and for the 36,888 criminal cases ended in 1952 it was \$265.28. The corresponding figure for the 52,300 civil cases of 1945 was \$90.06, and for the 53,150 civil cases terminated in 1952 it was \$185.42.

These computations standing alone are misleading, for they do not reflect the very substantial increase above the average that arises when a case receives the "full treatment" of judgment after trial either by the jury or by the court. Any computation of averages for such cases is extremely vulnerable, for there are involved arbitrary allocations that cannot be accurate. But, largely because the subject is one that should be studied, and because to do so may stimulate critical analysis, tentative computations of the costs of federal district court trials in the fiscal year 1952 have been made. They show that the average cost per trial of the 6,668 civil cases tried in that year was \$1,477.98; or \$1,928.72 for each of the 2,489 civil cases tried by jury, and \$1,209.51 for each civil case tried without a jury. The trials of criminal cases

averaged \$2,873.86 for each of the 3,405 trials; \$3,064.22 for each of the 2,238 criminal jury cases tried, and \$2,508.82 for each of the 1,167 criminal nonjury trials. The average cost per trial day for civil jury trials, based on an average of 2.40 days for each trial, was \$803.63; and for criminal cases, which lasted on the average 1.8 days each, the daily jury trial cost was \$1,683.64.

These figures seem somewhat high, and this may be due in part to the fact that accurate allocation of total court expense between cases tried and those not tried is so difficult as to be well-nigh impossible. However, they are not wholly incompatible with the figures developed by Professor Alfred F. Conard and his associates for the recently completed Illinois work injury study.¹² There the researchers show, contrary to general belief, that adjudication of the rights of injured workmen by means of the Illinois Workmen's Compensation Act was more expensive to the taxpayer than adjudication of comparable questions under the Federal Employers' Liability Act in the federal district courts. The taxpayers' expense for a full-blown Federal Employers' Liability Act jury trial of six days' duration is shown to be about \$1,900. This figure appears to be based on a cost of \$10 a day per juror and a proportional cost for judicial and court attaché time of \$1,058.¹³ Thus it does not include any allowance for physical equipment or for over-all administration, which are necessarily part of the estimates that are given in this discussion. Whether the system used in the Illinois study or that used here is better, is questionable. In any event, the fig-

¹² Alfred F. Conard and R. I. Mehr, *Costs of Administering Reparation for Work Injuries in Illinois* (Urbana-Champaign, 1952); see also Conard, "Is Workmen's Compensation More Efficient Than Employers' Liability?" 38 A. B. A. J. 1011 (1952).

¹³ Conard, *supra* note 12, at 1014.

ures are not so far apart as to indicate that either is essentially wrong.

OTHER ELEMENTS OF EXPENSE

The government's share in the costs of judicial administration is of course not limited to the elements which have been discussed here. There are large and important costs which the taxpayer bears for the prosecution of criminal cases—the support of district attorneys and other public prosecutors, the provision in some jurisdictions of legal aid at public expense and of public defenders for the assistance of persons who are indigent or of low income and who are charged with crime. And in civil litigation, there is the cost of the government's law department, and of providing legal services for poor persons. These elements of the taxpayers' expense are not within the scope of this discussion, but they add up to a substantial total, and they are in reality essential parts of the American judicial system.

DETAILED STUDY NEEDED

But even the elements of expense which are here discussed—those that directly bear upon the maintenance of the court structure—are clearly and substantially a part of the taxpayers' share of the costs of government. Though they do not bulk large in over-all governmental costs, they are great enough as absolute sums of money to constitute

for each of us a real stake in the American judicial system. The costs of the judiciary deserve further study both by the courts themselves and by the public at large.

Such a study may raise questions: whether the jury is the most desirable system of fact determination in our modern, mechanized civilization; whether our judge power is effectively used, and whether by greater financial support its quality can be improved; whether we have enough judges, and whether they have adequate assistance; whether either the taxpayer or the litigant should bear a larger or a smaller share of the entire expense of litigation.¹⁴ All of these are problems that involve a study of the details of cost.

If the courts, as one of the three great branches of our government, receive the attention and support that study of this kind can develop, there is real ground to hope that the administration of justice will better fill its important place in our governmental structure.

¹⁴ See, for example, the very challenging questions of judicial administration raised in the monograph of the Committee on Public Administration of the Social Science Research Council, *Research in Judicial Administration, An Outline for Suggested Research Topics* (Washington, 1942). And compare the thought-provoking suggestions regarding the need for jury trials in personal injury actions made by Presiding Justice David W. Peck of the Appellate Division, New York Supreme Court, First Department, "Report on Court Conditions," 129 N. Y. L. J. 1 (Feb. 6, 1953).

Leland L. Tolman, Ph.B., J.D., Washington, D. C., is Chief of Business Administration in the Administrative Office of the United States Courts. He has served with the United States Supreme Court Advisory Committees on Rules of Civil and Criminal Procedure, and as an attorney in the Anti-Trust Division of the Department of Justice. He is a member of the Council of the American Bar Association's Section of Judicial Administration, and served for four years as its secretary. He is the author of a number of government reports on various aspects of judicial administration, and of articles on the subject in legal publications.

Expediting Trial of Cases in New York County

By WILLIAM C. HECHT, JR.

THE bench, the bar, and the public should always be concerned with the prompt disposition of lawsuits. To quote an oft-repeated phrase, "Justice delayed is justice denied."

Liberalization and streamlining of rules regarding practice and procedure in the courts have been a source of constant study. Many jurisdictions in this country, including New York, have created judicial councils whose main work is the continuous survey of the administration of justice. Their accomplishments in making court organization more efficient and court procedure less cumbersome are well known.

I think it a fair statement that delay in the trial of cases in New York is not occasioned by intricate or involved court procedures. Rather, other factors are responsible for the situation.

The problem is principally found in the metropolitan area which consists of the five counties in New York City and the surrounding counties of Westchester, Nassau, and Suffolk. There was a tremendous increase in population in this area from 1940 to 1950. In 1940 the population in the eight counties was 8,632,656. In 1950 it reached 9,466,667. This alone would account for a normal increase in business brought into the courts.

THE SITUATION IN NEW YORK COUNTY

For the purpose of this discussion I will confine myself to the problem as it exists in the Supreme Court of New York County, which, for practical purposes, is most illustrative of the conditions we are faced with today. The county is the main center of business

activity, and while its residential population has not increased as drastically as the others, its daily working population is fed by the surrounding counties which are mainly residential. It has been estimated that 500,000 people come into the city each day to work.

Our experience here in New York County has been that in the last six years the amount of business brought into the court has increased enormously. For the period 1941 through 1945 the average number of cases added to the calendars was 4,200 a year. Then came 7,078 in 1946, 8,420 in 1947, and the high of 9,565 in 1948.

We have been able to keep abreast of our contract or commercial litigation so that cases are disposed of promptly after being placed on the calendar. The Appellate Term and special calendars for tax certiorari, condemnation, and so forth, are also up to date. The equity calendar is only four months behind—a satisfactory condition. The problem lies in our tort jury calendar, which is forty-five months behind. The nonjury tort calendar was up to date until recently, but has fallen behind temporarily because of the adoption of a procedure which I will discuss later on. About 80 per cent of the cases brought into the court on the tort calendars are negligence cases.

With the end of World War II and the lifting of gasoline rationing, automobiles were put to greater use. The return to civilian life of hundreds of thousands of servicemen and the demand and need for cars only served to heighten an already bad situation. Furthermore, our streets were never planned with an eye to the great use to which

they are put by trucks and automobiles. The statistics of the Police Department of the City of New York show that there were 15,008 accidents in 1945, while in 1951 there were 25,676.

Although many accident claims are adjusted by the casualty companies before suit is commenced, it must be realized that in a great majority of instances the sequel of an automobile accident is a lawsuit. My own observation, based on my experience in the courts, is that today more than ever before, the average person is claim conscious and litigation minded. It is the familiar practice that persons involved in an automobile accident discuss the question of insurance, and prospective defendants are not loath to encourage litigation on the part of those who claim to be injured by informing them that they carry insurance. This is often true even though the accident may not have occurred through the negligence of the party having the insurance.

Furthermore, psychologically there is absent the pressure of the need for care on the part of the driver of an automobile. He has already paid for someone else to assume the burden of an injury which he may cause.

Problems of proper safety measures, adequate supervision of drivers, and intelligent city planning, however, are not the burden of the judicial system to solve. The courts must take up the burden at the point where it is presented to them.

PROPOSED REORGANIZATION OF COURT STRUCTURES

Several years ago Presiding Justice David W. Peck of the Appellate Division suggested to the New York Legislature a plan for court reorganization which was unsuccessful of passage.

The present organization of our court system in New York is cumbersome and

inefficient. In the City of New York we have a Municipal Court, a City Court, and a Supreme Court which handle civil litigation. There are a Magistrates Court, a Court of Special Sessions and a Court of General Sessions, and county courts which handle criminal matters. In addition, there are the Surrogates' Court for the administration of estates, and a Domestic Relations Court. The judges are elected or appointed to these courts and are confined to them in their judicial activities.

A simple plan of court organization would call for a court of inferior civil and criminal jurisdiction which might also include the Domestic Relations Court, and a court of superior civil and criminal jurisdiction. This, in essence, was the plan suggested by Justice Peck; but the legislature, for a number of reasons which it is unnecessary to go into at this time, did not take kindly to the proposal.

MOBILIZING EXISTING JUDICIAL MANPOWER

Some people find an easy solution of delay in the trial of cases by recommending an increase in the number of judges. Such an increase would bring with it financial problems of salaries for the new judges and for the usual help of secretaries, clerks, and court attendants, and of increased physical facilities which would have to be provided by new buildings. With strained governmental budgets, the solution has to be found in the use of the existing judicial manpower. In fact, the statistics show that a nominal increase in the number of judges for the purpose of trying cases would afford little relief.

An amendment to the constitution was proposed in 1951 which provided for the temporary and emergency transfer of judges from one court to another. With

this proposal it would be possible to mobilize the judicial manpower in those courts where the litigation load was heaviest.

The proposal was passed by the legislature in the spring of 1951 and again this year. It will be submitted to the public for a vote at the election to be held in November 1953. If adopted at that time, the presiding justices of the First and Second Departments, which comprise the counties within the City of New York, will then be able to make these transfers effective as of January 1, 1954.

USE OF PRETRIAL PROCEDURE

Because of the time necessary to bring about organic changes in the organization of the court or even the adoption of the proposal for the emergency transfer of judges between courts, other means had to be found to help combat the evil of delay in the trial of cases.

It has always been true that if the respective attorneys for the parties could be brought together before a judge, the possibility of settling a case was greatly enhanced. The court could listen to the contentions of both sides, and with his experience, tact, and judgment indicate to the attorneys the relative values of their positions and point the way to a fair disposition of the matter. Consequently, in January 1948 a pretrial procedure for negligence cases was adopted in the First Department. Two judges were assigned each month to hold a pretrial calendar. Approximately thirty cases a day were taken up by each judge in an attempt to bring about a settlement of the cases.

The effectiveness of the pretrial procedure is indicated by the fact that approximately 30 per cent of the cases disposed of in the Supreme Court during 1951 were disposed of at the pretrial parts.

A PREFERENCE RULE

The experience with the pretrial procedure has been excellent, but in and of itself that procedure did not solve our problem. As I have indicated, the number of incoming cases had risen steadily from an average of 4,200 a year in 1941-45 to a high of 9,565 in 1948. Something more was needed.

The Municipal Court of the City of New York had jurisdiction in civil matters up to \$1,000, and the City Court had jurisdiction to \$3,000. The Supreme Court has unlimited jurisdiction. It was the considered judgment of the justices of the trial bench in the Supreme Court that many of the personal injury cases being brought into the court should have been initiated in a lower court because the nature and effect of the injuries did not warrant their being in the Supreme Court. The judges felt that this litigation should in some manner be transferred to the court of proper jurisdiction.

Attorneys, on the other hand, claimed that their cases had a greater settlement value if action was instituted in the Supreme Court. The difference in court costs was not sufficient to deter the attorneys from following this practice.

As a result of a study of the problem, the court adopted what is known as the "preference" rule, which became effective in April 1949. This rule requires that in a personal injury action the complaint must be verified, as well as a bill of particulars containing certain required information, and the attorney must file a certificate that the items contained in the bill of particulars are true to the best of his knowledge and information. If this is done, the judge presiding at the calendar part will examine the complaint and bill of particulars and decide from those papers whether the case should be tried in the Supreme Court.

Since the court does not have power on its own motion to transfer a case to another court, a device has been worked out whereby the court marks a case properly here with the words "case marked preferred." If the court does not feel that the cause is properly here, it is marked "preference not warranted." Each month, therefore, the causes marked "preferred" are added right behind the causes marked "preferred" for the prior month, and those causes which are not marked preferred are dropped down. The causes not marked preferred will never be tried in this court until the court has finally disposed of every case considered properly on this calendar. The nonpreferred cases are placed on a special calendar call and the attorneys given the opportunity to transfer them to the proper court.

The effect of this rule has been startling. As indicated above, the high point in incoming cases was reached in 1948 when 9,565 cases were added to the calendar. In 1952 only 4,844 cases were added to the calendar, bringing it back to the point which existed ten years ago when the court was practically up to date.

ENLARGEMENT OF JURISDICTION OF LOWER COURTS

It has been the opinion of the bench and the bar for quite a while that with the advent of inflation, the jurisdictional limits on the Municipal Court and the City Court were unrealistic. It was also obvious that the judges of those two courts were able to cope with a greater case load than was present. The result was that in 1951 the jurisdiction of the Municipal Court was raised from \$1,000 to \$3,000 and that of the City Court from \$3,000 to \$6,000. This also aided in the reduction of the number of cases brought in the Supreme Court.

The experience during 1952 indicates

that the increased case load in the City Court and the Municipal Court by reason of the change in the jurisdictional amount and the operation of the preference rule in the Supreme Court has not created undue congestion in the lower courts. In fact, to aid the City Court in what would appear to be a growing problem of delay, the preference procedure outlined above has been adopted by that court as a means of forcing cases to be brought in the Municipal Court instead of the City Court.

IMPARTIAL PHYSICAL EXAMINATION

In the fall of 1952, through the efforts of Justices Peck and Botein, a plan was developed, with the aid of the New York Academy of Medicine, the Ford Motor Company Fund and the Alfred P. Sloane Foundation, for impartial physical examination of plaintiffs. In the usual accident case, with its controversial atmosphere, conflicting medical testimony is given by the experts retained by the parties. The result is that trials are prolonged and the judge and jury are often confused and left without reliable medical testimony.

Under the new plan, the New York Academy of Medicine in conjunction with the New York County Medical Society will appoint a panel of experts in the various branches of medicine, and when the case is brought on the pretrial calendar, the judge, after consultation with both sides, is empowered to designate a qualified physician from the panel to make an examination of the plaintiff. Copies of his report will go to the court and respective counsel. If the parties are unable to reach a settlement and the case goes to trial, the court may request the doctor to testify at the trial. This, of course, will not prevent the litigants from presenting their own expert witnesses.

Members of the panel will be compensated for their time and effort in an

amount to be fixed by the court in each case, and the expense will be borne for the first year from moneys contributed by the Ford Motor Company Fund and the Alfred P. Sloane Foundation. As Justice Peck stated at the time of the announcement of this plan and the adoption of the necessary rule of court:

This undertaking represents the co-operation of two great professions in meeting a problem which is common to both, and will be a great service to the administration of justice. It may well be a historic milestone in judicial progress and become a pattern for the court system through the nation. The Alfred P. Sloane Foundation and the Ford Motor Company Fund have our warm thanks for their public service contributions to enable us to make the experiment and study.

One recent change in our rules of procedure needs mentioning. For a long time the right to an examination before trial in negligence cases was severely limited in the First Department. In 1951 the Appellate Division adopted a new rule which allows each side to examine the other freely on all issues in the case. This procedure should lend itself to greater settlements by removing the elements of hide and seek from litigation.

THE "HARD CORE" OF DELAY

All these outlined changes were excellent for the future, but the court was faced with a large backlog of cases. In June 1949 there were 13,489 law cases awaiting trial with a delay of 32 months. In June 1952 only 7,979 cases were awaiting trial, but the delay had increased to 49 months. The court was trying cases put on the calendar in May 1948. At the time of the adoption of the preference rule in 1949, it was conceded that it would be unfair to make the rule applicable to cases pending on the calendar at that time.

In the summer of 1952 a survey was

made and it was ascertained that approximately 1,100 cases were pending on the tort jury calendar which had been noticed prior to April 1949. This was called the hard core of delay in the Supreme Court. It was agreed at the opening of the fall term of court in 1952 that eight judges would be specially assigned to try these cases.

The cases were divided according to defendants. The reason for this was that the attorneys who try cases for the casualty companies move from court to court or within the Supreme Court itself and would have several cases ready for trial at the same time. Therefore, in order to keep trial counsel in the one part and aid in the more expeditious disposition of these cases, the assignment of cases was made on the basis of the major parties involved, that is, the casualty companies and the City of New York (the latter had approximately 15 per cent of the cases).

The eight judges assigned to this work applied themselves constantly to the disposition of these cases, and when court closed for the 1952 Christmas recess only 143 were left, and the court was prepared to try April 1949 issues. With this hard core of cases out of the way, the number of months which a case has to await trial will be greatly decreased.

A GOAL IN SIGHT

As indicated above, the number of cases coming into court since the adoption of the preference rule has steadily declined. And of these cases on the tort jury calendar, only 4,650 have been preferred. The court can be expected to keep up the rate of dispositions which it set in September-December 1952 when it disposed of 950 cases in the "hard core" drive. If another 1,000 tort jury cases are disposed of in the first six months of 1953 before the summer recess, then the issues of June 1950 will have been reached and the court

will be only 36 months behind. This will be a gain of 13 months over the previous year.

In fact I can make the prediction that by June 1954 the delay in the disposition of tort jury cases will not be more than 18 months. With the reduced number of cases coming into the court and the availability of extra judicial manpower due to the emergency assignment of judges, the court will keep abreast of its calendars. It seems to be the considered judgment of attorneys for both plaintiffs and defendants that a year's delay between the bringing of the suit and trial is necessary for complete investigation and ascertainment of the permanent extent of the injuries.

CO-OPERATION TO EXPEDITE CASES

In January 1952 Judge Peck appointed a committee to expedite the disposition of personal injury cases in the First Department, and I had the honor of being appointed chairman of that committee. It consisted of the four calendar judges in the Supreme Court in New York County, the Chief Justice of the City Court, the President Justice of the Municipal Court, the Superintendent of Insurance of the State of New York, the Corporation Counsel and the Comptroller of the City, attorneys who specialize in tort litigation as representatives of plaintiffs and defendants, and executives of several types of insurance companies writing casualty insurance.

Emphasis in the first instance was placed on an attempt to encourage settlements at pretrial, in the calendar parts and in the trial parts. Because of the broad base of representation on the committee, great headway was made in this regard. The insurance companies realized that while delay worked to their advantage, the situation could become so intolerable that some substi-

tute for court disposition of cases might have to be resorted to as the result of public pressure. Attorneys for plaintiffs also realized the danger of the situation. All agreed that the present system must and could be made to work.

The second point emphasized was to get the parties to waive jury trials both as to cases already on the calendar and as to those that would be brought in the future. Experience shows that a judge can try at least twice as many nonjury cases as jury cases in the same length of time. The tort nonjury calendar being up to date, it was determined to offer the opportunity of an early trial to parties facing delay on the jury calendar. A special calendar call was had, and 945 jury waivers were obtained. As a consequence, an eight-months delay has appeared on the tort nonjury calendar; but beginning in January 1953 four judges have been assigned to nonjury parts, and the delay should quickly disappear and the promise of an early trial should be fulfilled. But even for the last four months of 1952, the parties who had waived were being reached for trial much faster than if they had waited on the jury calendar.

OTHER SUGGESTIONS

Other suggestions have been proposed, such as the abolition of the right to a jury trial in negligence actions. This is the law in England today, the birthplace of the jury system. I am not prepared to debate this suggestion here, and if we reach our goal in proper time we may never have to reach that problem.

It has also been suggested that the law be amended to provide a comparative negligence test for recovery instead of our present test of lack of contributory negligence. Certainly this would be a realistic appraisal of what happens in the jury room. The formulation of

the doctrine would lend itself to quicker settlements, as both sides would be better able to appraise the value of their case after full examination before trial. In addition, a comparative negligence doctrine would tend to increase waivers of jury trials.

.

This is the story in New York County, the hub of New York City. We have not achieved wonders in the few years

we have been at work on the problem. We have evolved improvements in our system and found that the bench and the bar can be counted on to co-operate in finding solutions to our problems. We had a high hurdle to overcome at the outset, and while it has only been moderately reduced in size at the present writing, all indications point to the ultimate achievement of reducing delay in the trial of a tort case to a reasonable period.

William C. Hecht, Jr., New York City, has served as a justice of the Supreme Court of the State of New York for more than ten years. He is now acting as chairman of the Committee to Expedite the Disposition of Tort Jury Cases.

Improving the Structure of Courts

By MAXINE BOORD VIRTUE

MULTIPLICITY OF COURTS

IT is pointless to consider the structure of courts apart from their operation. As the design of an automobile relates to the driver's skill, the road conditions, and the density of traffic, so the structure of courts can be analyzed usefully only by taking cognizance of the caliber of the judges, the subject matter comprising the case load, the incidence of business, and the participation of the bar. The best court design will not result in good judicial administration if operating techniques and personnel are not of good quality. Given these things, the most cumbersome and outmoded court structure can be and is being made to purr like a 1953 Cadillac.

The point is being labored because most discussions of court structure are sooner or later thrown out of focus by an assertion that all will be well if every judge will come to work at nine and stay until five, or that juvenile delinquency will disappear and divorce cases cease to be difficult if judges hearing such cases will (1) remember to be kind and (2) take a course in social work. The object of this article is to discuss court structure, though not in a vacuum. It will be assumed that the structure sought is that which will offer the most scope to good personnel and provide maximum protection against bad personnel, and that good operating techniques must be enforced in order to give meaning and utility to the machinery.

It may be useful to look at some typical defects in present court structure, the results of the defects, and the methods being evolved to achieve court reform.

In 1948 there were 145 separate tribunals in the Detroit metropolitan area, of which 104 were township justices, 18 city justices, and 6 municipal courts.¹ In 1932 there were 556 autonomous courts in the Chicago region, of which 205 were in Cook County.² A recent state-wide Minnesota study lists 19 state district courts, 48 probate courts, 80 municipal courts, and 690 justices of the peace—a total of 837.³ Judicial council reports or any standard court study will yield further evidence of the plethora of autonomous judicial tribunals existing in most states. This multiplicity is most exaggerated in metropolitan areas.

Reasons for the costly and inefficient piling up of courts include (1) retention of the outmoded justice of the peace system, (2) population shifts resulting in demand for new courts, and (3) ephemeral local pressures to create a new court for each specialized set of issues. In metropolitan districts, multiplication of courts is only one manifestation of the tangle of overlapping governmental units characterizing these centers of population, in which more than half our inhabitants dwell. "Sibling rivalry" among these governmental units, and heavy case loads in congested popula-

² Albert Lepawsky, *The Judicial System of Metropolitan Chicago* (1932), p. 41.

³ Forrest Talbott, *Intergovernmental Relations and the Courts* (1950), pp. 23-24, 47, 54, 61.

tion centers, also contribute to the pressure for more courts.

Justices of the peace

Local justices of the peace constitute the overwhelming majority of courts in most states. Originally established to serve communities wherein litigants went to court on horseback or in buggies traversing muddy country roads, the system is tenacious of life, though superseded in usefulness by local tribunals easily accessible by automobile in our generation. The best-known studies of the subject are those of Edson R. Sunderland, who wrote in 1932 of the Michigan township system of justices that in six typical counties having 290 justices in all, 269 justices did no business whatever; the other 21 did all the business that was done outside the cities.⁴ Professor Sunderland said:

These figures show that the supposed popular demand for a Justice of the Peace court in every township . . . does not exist. The people do not want them and will not use them. . . . A county court, properly organized and housed, having a trained judge, a competent clerk, office equipment sufficient for the keeping of proper records, and sitting . . . as the needs of the community should indicate, ought to replace the obsolete Justice of the Peace courts.⁵

The same scholar in 1945 presented a comparative survey of constitutional and other provisions governing justices of the peace in all states, and an analysis of requisites for an adequate state-wide minor court system.⁶ But though these researches originated in Michigan, ironically the justice of the peace system still obtains there. It is said that an

association of justices, formed to combat the county court bill, was able to accomplish its objective.

Several other states have also felt the strength of the opposition which can be rallied when an outmoded court system is threatened. But in Missouri, Kansas, and California, *inter alia*, efforts to replace justices of the peace by flexibly designed minor tribunals structurally integrated into state-wide court systems have been successful. Chief Justice Vanderbilt discusses the present status of the justice system in his *Minimum Standards*.⁷

The problem of adequate judicial manpower

The general problem of judicial selection is touched upon elsewhere in this symposium. It suffices here to note that multiplicity of courts is accompanied by difficulty in obtaining enough qualified persons adequately to discharge the judicial function. The "lay justice" evil has been mentioned. Another is that of the lay probate judge. In states having a separate probate court in each county, the rewards of judgeship are insufficient (particularly where the fee system still obtains) to interest good lawyers except in heavily populated areas. In 1950 I found that more than half the probate judges in Michigan were not listed as lawyers by Martindale-Hubbell. The Minnesota study previously cited notes that of 87 probate judges in Minnesota in 1950, only 38 were members of the bar.⁸

It is surprising that the bar and the public have shown so little concern about this widespread problem, for the basis of probate practice is the making of a precise record and the adequate discharge of many minute and complex procedural requirements. Where the

⁷ Arthur T. Vanderbilt, *Minimum Standards of Judicial Administration* (1949), pp. 314-16.
⁸ F. Talbott, *supra* note 3, pp. 47-49.

judge is unequipped to comprehend the professional problems, the burden of the attorney increases manyfold.

Further, in many states this separate county probate court exercises jurisdiction in juvenile cases, through a separate division or otherwise. Here the legally unqualified judge is particularly damaging, for the juvenile case load comprises an area where attorneys appear infrequently, where the need for social techniques tends to outweigh legal rights and procedural requirements, and where inadequate legal practices often produce results which are bad both legally and socially.

COMPLEXITY IN STATE-WIDE COURT SYSTEMS

The court system of Massachusetts has been described as a "statutory omelet"; that of Chicago, in the phrase of a local reporter, is "as full of tangle and movement as a canful of angeworms"; Professor Fuller of Harvard says that the Pennsylvania system "presents an imposing complexity probably unequalled in any other state." It seems generally perceived that ephemeral changes in population, in case load, and in the aggressiveness and skill of court personnel have brought about haphazard piecemeal shift and redistribution of court structure until most present systems are mere conglomerations. Defects most often complained of are those arising out of lack of integration and poor jurisdictional coverage.

Lack of integration relates not only to court structure but also to the scope of the rule-making power of judges. Where many courts independently coexist, judicial manpower is immobilized so that individual judges may not be assigned in accordance with current need. This same defect is expressed as needless duplication and conflict in case handling, lack of proper uniform record and statistical methods, and a general

dearth of good housekeeping practices such as a strong presiding judge with authority over the entire system can develop.

Overspecialization is another manifestation of lack of unified structure. As special dockets (for instance traffic, domestic misdemeanors) are carved out and assigned to judges having a special interest in or flair for such cases, they tend in time to develop into separate courts, cut off first in practice and then in structure from the parent tribunal. An example is the Detroit traffic court, an offshoot of the recorder's court, itself a specialized criminal tribunal with jurisdiction in part carved out of that originally exercised by the Circuit Court of Wayne County.

Jurisdictional defects

Jurisdictional defects inevitably occur when many separate courts are evolved haphazardly without over-all planning. Typical jurisdictional faults are the following:

There are gaps, such as lack of effective legal procedures to control known sex offenders, lack of jurisdiction over actions against municipal corporations, or lack of court authority to enforce a mother's duty to support children.⁹

There is duplication, such as that found in Detroit whereby any one of six legal procedures in any one of four courts may be chosen to deal with paternity out of wedlock. In Chicago, the circuit and superior courts, serving the same physical community, have completely duplicating jurisdiction but are functions of different units of government. In the city of New York we may choose from among many examples that of the Municipal Court (civil jurisdiction to \$3,000) and the City Court (civil jurisdiction to \$6,000).

⁹ Examples chosen at random from those coming to mind through recent contact with Michigan courts and statutes.

⁴ Judicial Council of Michigan, *Fourth Annual Report* (1934), p. 169.

⁵ *Ibid.*, pp. 169, 172.

⁶ Judicial Council of Michigan, *Fifteenth Annual Report* (1945), p. 57; see *Sixteenth Annual Report (Tentative Draft of an Act to Establish County Courts)* (1946), p. 67.

Overlap is perhaps the most frequently encountered jurisdictional defect arising out of structural complexity. Actions involving small amounts may often be brought either in the justice court (or its municipal successor) or in the court of general jurisdiction. In one year three-fourths of the work of the Circuit Court of Wayne County was done in cases involving less than \$1,500, which thus might, and most of which should, have been brought in the Court of Common Pleas.¹⁰

Another facet of the same overlap is provision for trials *de novo* of small claims and other cases appealed to the court of general jurisdiction. In Detroit, Chicago, and New York, to the writer's knowledge, the maximum monetary jurisdiction of local small claims courts has recently been increased, and various localities have done away with the *de novo* appeals. These devices are said to have a tremendous ameliorating effect upon docket congestion in the court of general jurisdiction. Whether the trend will in time adversely affect the existence of small claims courts as such, is a question which needs attention.

Conflict of jurisdiction is most often experienced in the family problem area. In a recent article, Judge Jayne notes eight different courts in Detroit which may deal, without co-operation or even knowledge of one another's efforts, with the same family breakdown situation. Personal guardianship proceedings for minors are often used to undo the work of a divorce court's child custody and support decree. Space limitations prevent citing further examples, which are legion in this type of case. Judge Alexander lists half a dozen courts involved

¹⁰ Ira W. Jayne, "The Mouse in the Mountain," 16 *The Detroit Lawyer* 237 (1948); see Judicial Council of New York, *Fourteenth Annual Report* (1948), pp. 63-66.

in an Ohio problem family case;¹¹ a recent Connecticut comment shows domestic relations jurisdiction parceled out among six different courts.¹²

INTEGRATED COURT MOVEMENT

In 1938 the American Bar Association took the lead in trying to bring about a unified judicial system in each state, with power and responsibility centered in one judge. The American Judicature Society, the National Municipal League, and many state bar associations have been striving towards the same goal. A recent check of judicial council and bar association reports from ten states, selected at random, shows that in all ten, bar associations or similar professional groups either have committees working on studies leading to court reform, or are actively pressing for a fully integrated system.

But such reforms are hard to bring about, partly because it is difficult to interpret this need to a sufficient portion of the public to kindle the requisite enthusiasm at the polls, partly because up-state legislators are deeply unwilling to bestir themselves about changes which they believe will principally benefit city dwellers, and partly because politically entrenched personnel and structures take a good deal of dislodging.

The excellent Minnesota plan¹³ has had more effect in exciting interest outside Minnesota than in bringing about remedial legislation in that state. Important changes recommended by the Connecticut court study have not been

¹¹ Paul W. Alexander, "The Family Court of the Future," 36 *J. Am. Jud. Soc'y* 38 (1952); see also Professor Koos's article in this volume.

¹² 26 *Conn. Bar. J.* 303 (1952).

¹³ Judicial Council of Minnesota, *Report of the Committee on Unification of the Courts* (1942).

accepted by the legislature.¹⁴ A long succession of studies and reform programs in New York (where, it is said, hundreds of thousands of pages have been written about the inefficiency of the system) has thus far resulted in no basic changes. The present status of the court reform movement can be learned by consulting the summaries of judicial administration legislation published periodically by the *Journal of the American Judicature Society*.

The New Jersey court reorganization is the inspiration for all groups working for better court structure. In 1947 a new constitution was adopted there which

attains most of the objectives for which the American Judicature Society and others have contended. . . . The three-level system of supreme court, superior court and county courts is set up just about as most of the numerous court unification plans chronicled in these pages through the years have envisioned it.¹⁵

METROPOLITAN COURT SYSTEMS

Dean Pound called attention several decades ago to the distinctive nature of the problems of metropolitan trial courts, pointing out that Huck Finn's father could not have had as good a trial in a big city, even if the same number of man-hours were applied to it, as he did in the home town which knew him deeply. The American Judicature Society came forward in 1916 with a model act for a metropolitan court divided into several specialized divisions but comprising a single tribunal.¹⁶

After the abortive "municipal court" movement of the twenties and thirties, no attention was given to the special

¹⁶ IV-B *J. Am. Jud. Soc'y* 1 (1916).

problems of metropolitan trial courts until 1947. Then the Section of Judicial Administration of the American Bar Association, through a special metropolitan trial court committee under the chairmanship of Judge Jayne, embarked on the first of a series of studies designed to determine what the special metropolitan court problems are, and, finally, to serve as the basis for recommendations concerning the proper structure, organization, and procedures for such courts.

The first study of Detroit was financed and supervised by the University of Michigan Law School. The Section of Judicial Administration is sponsoring similar inquiries in at least half a dozen metropolitan areas with various cultural and court problems. Plans for studies in New York and Philadelphia, to be conducted by Columbia Law School and Temple University Law School respectively, have been approved by the section and by local directors. A local committee is working on a prospectus for Los Angeles, and consultations are under way to develop studies in London, in San Francisco, and in other metropolitan areas.

Each local study is to be independently directed and financed, with continuing section sponsorship to ensure objectivity and to obtain fully comparable data through co-ordination of all the studies. A representative of the section's special committee is to integrate the studies and direct the over-all operation, which will include (1) the development of local plans and joint preparation of a written prospectus for section approval in each area, (2) the making of selected intensive studies in various localities during the local study period, and (3) the preparation of a final analysis and recommendation based on the completed series.

The first study has demonstrated that the metropolitan trial court, with its

many specialized and departmentalized employees and multi-judge courts, and with a predominance of mental, criminal, and domestic relations cases in its case load, has unique problems not only of procedure but also of subject matter. In his foreword to the Detroit study, Judge Jayne remarked that "it appears that court administration in a metropolitan district is a problem distinct from the administration of courts in the state as a whole,"¹⁷ and that this special problem could not be solved by state-wide court integration alone.

As one reviewer pointed out,¹⁸ this does not mean that state-wide integration of all courts is not proper and of pressing importance. It does mean that integration of all courts in the state,

Mrs. Maxine Boord Virtue is a practicing lawyer in Ann Arbor, Michigan and lectures in the School of Social Work of the University of Michigan. She is secretary of the Metropolitan Trial Court Survey of the Section of Judicial Administration of the American Bar Association, and, while she was a research associate of the University of Michigan Law School, she conducted and wrote the report of the survey of metropolitan courts in the Detroit area. She is author of a forthcoming volume on the basic legal structure of children's services in Michigan, and has been conducting a series of court studies for the Interprofessional Commission on Marriage and Divorce Laws. She was formerly assistant attorney general of Kansas.

including the metropolitan courts, is a major goal to be pursued with spirit and determination; and that integration of courts on a state-wide basis will not alone solve the problems of metropolitan trial courts, which in addition to being integrated with those in the state must also be closely co-ordinated, both structurally and in operation, with other courts in the same metropolitan area.

SUMMATION

In conclusion, then, achievement of good court structure appears to this writer to require a program containing all of the following components: (1) state-wide integration; (2) metropolitan integration for metropolitan districts within the state-wide system; and (3) county and/or circuit integration of petty tribunals in rural districts.

Work of the Modern Administrator of Courts

By WILLARD G. WOELPER

THE title of the subject assigned for this article may be misleading in part; it may suggest to some that court administrators are now becoming modern, whereas the fact of the matter is that until very recent years there was no such official as a court administrator.

It will be even more surprising to the lay citizen, however, to learn of the almost complete lack of any truly effective system of administrative supervision and control in most of our state judicial establishments today, and in our federal system prior to 1939. Any business executive during the past century guiding and directing a large organization, whether it dealt with the manufacture of products or the furnishing of services, would recognize and insist upon the basic importance of effective administrative control and co-ordination over each department of his company and over all personnel. Strangely enough, only during a little more than the past decade have such ideas found any substantial acceptance in the judicial world. Although comprehensive revisions of the judicial structures have been made in many states, the emphasis has been placed largely on the judicial work to be performed by the judges, rather than on the problems of internal management of the judicial system.

It was not until 1939 that a pattern for effective judicial housekeeping was set by the establishment of the Administrative Office of the United States Courts.¹ Under the distinguished leadership of Henry P. Chandler as administrative director, that office soon demonstrated its vital importance in the federal judicial system.

¹ The legislation is now set forth in Title 28, U. S. Code §601 *et seq.*

Notwithstanding the fine example this model afforded, in only a few states has any real progress been made in establishing comparable offices. Connecticut has made provision for an executive secretary who audits the expenses of the courts under the direction of the judges, prepares the judicial budget, prepares payrolls, and acts as purchasing agent.² North Carolina has an executive assistant to the chief justice, and in West Virginia provision is made for an executive secretary of the Court of Appeals.³ In New Jersey specific provision was made in the state constitution for an administrative director of the courts,⁴ and in the integrated judicial system there established in 1948, the administrative office has had its most extensive development. In 1948, pursuant to a proposal made by the Section of Judicial Administration of the American Bar Association, a model act to provide for an administrator for the state courts was approved by the Conference of Commissioners on Uniform State Laws.⁵ Recently statutes have been enacted establishing administrative offices of the courts in Michigan, Rhode Island, Virginia, and Puerto Rico.

FORMER JUDICIAL SYSTEM OF NEW JERSEY

The layman will gain a better understanding of the problems of judicial administration in general, and of the functions of a court administrator in par-

ticular, by a consideration of the actual experience in New Jersey. Prior to the constitutional reorganization in that state, the judicial system consisted of some seventeen courts and classes of courts, manned by more than five hundred full-time and part-time judges. There was virtually no centralized administrative supervision or control, and except to a very limited extent each court or class of courts was independent in matters of administration. The actions of a local justice of the peace, for example, were subject to *judicial* review, but in matters of administration he was virtually a sovereign.

Aside from the ineffective theoretical control that might exist in the form of impeachment or removal, or the fear of failure of reappointment, the local judge was subject only to the uncertain control of tradition and the dictates of his own judicial conscience. Occasionally, in some of the few cases appealed, administrative misconduct might appear on the record and a reprimand in the form of an appellate opinion might be forthcoming. In the great majority of cases, however, inexcusable judicial delays, judicial bad manners, violations of the Canons of Judicial Ethics, and other similar abuses were not within the responsibility or power of any official or administrator to correct.

It is an interesting pastime to theorize about the value of a businesslike administration of the courts, but real accomplishments depend on a basic step: the vesting of power and control over administration in a specified agency with defined responsibilities. And judicial administration cannot be truly effective unless there exists not only the power to acquire knowledge of the status of the work of each of the courts and judges and the staffs connected therewith, but also a power to correct the shortcomings which the research discloses.

PRESENT JUDICIAL SYSTEM OF NEW JERSEY

The effectiveness of the administrative office of the courts in New Jersey can only be accurately appraised in relation to its role as a part of the modern integrated judicial system which was established under the constitution of 1947. The system of seven basic courts is headed by the Supreme Court which is given complete power to make rules governing the administration of all the courts in the state and the practice and procedure therein.⁶ In fulfilling its constitutional obligations in this respect, the court has promulgated a complete set of rules modernizing and simplifying the practice and procedure in each of the courts and making them uniform throughout the state. Of greater interest here, however, is the comprehensive set of rules adopted by the court governing the administration of the courts and the conduct of all judicial personnel.

Under the new constitution the chief justice is made the administrative head of all the courts in the state⁷ and is given broad powers to assign judges from court to court and county to county as the status of judicial business may require.⁸ In establishing a simplified system of courts, in vesting in the Supreme Court power to make rules of practice, procedure, and administration governing all courts and judges, and in making the chief justice the administrative head of the entire system with power to assign judges, the constitution has provided the framework for a truly integrated judicial system which can be effectively administered.

⁶ N. J. Const. 1947, Art. VI, §II, par. 3; see *Winberry v. Salisbury*, 5 N. J. 240, 74 A. 2d 406 (1950), *cert. denied*, 340 U. S. 877, 71 S. Ct. 123 (1950).

⁷ N. J. Const. 1947, Art. VI, §VII, par. 1.

⁸ Art. VI, §VII, par. 2; Art. XI, §IV, par. 5.

Under these provisions the chief justice and the Supreme Court must accept the responsibility of making certain that approved and effective practices and procedures are followed in all judicial proceedings throughout the state, and in addition they are charged with the duty of fixing standards governing the administrative aspects of the work of the judges and all other personnel in the judicial system. With that responsibility and duty is granted power to correct abuses by the enactment and enforcement of rules, and, indeed, provision is made in the constitution to vest powers in the Supreme Court to remove judges for cause,⁹ although this provision has not yet been implemented by the legislature.

EFFECTIVENESS OF THE SYSTEM

The effectiveness of such a system may be easily demonstrated by a simple illustration. The Supreme Court has provided by rule that the conduct of all judges in our state shall be governed by the Canons of Judicial Ethics adopted by the American Bar Association.¹⁰ In New Jersey, all judges are selected under an appointive system, and accordingly under the Canons all judges are barred from engaging in any partisan political activity.¹¹ Shortly after the new court system was established, a report came to the attention of the Supreme Court that one of the local magistrates was campaigning actively for the office of mayor in his community. Under the former system, the more reputable members of the bench and bar would have disapproved of such conduct, but the magistrate could not have been impeached or compelled to withdraw. How was the problem handled under the new system?

⁹ Art. VI, §VI, par. 4.

¹⁰ Rule 1: 7-6.

¹¹ Canon 28, Canons of Judicial Ethics of the American Bar Association.

When it became apparent after inquiry that the magistrate was knowingly violating the rule, the Supreme Court entered an order directing the magistrate to show cause why he should not be held in contempt. Thereupon the magistrate, apparently realizing that the court expected to enforce its rule, promptly submitted his resignation upon the return day.

There can be little doubt that this one proceeding quickly became known to all members of the bench and bar throughout the state, and that the action taken was most effective in preventing any occurrence of such conduct elsewhere. Where it is known that a power exists which will be used promptly to punish abuses, such abuses are much less likely to arise.

NEED FOR ADMINISTRATIVE DIRECTOR

Provision is made under the new constitution for the appointment of an administrative director by the chief justice to serve at his pleasure.¹² The outline of the broad rule-making and administrative powers of the Supreme Court and the chief justice will have already indicated to the reader the need for such an office. Obviously such powers cannot be exercised effectively and intelligently unless the chief justice and the Supreme Court have the aid of an administrative staff which can devote its full time and energies to the task of keeping them advised as to the status of judicial business, and which can execute the details of the basic policies which have been established by them. It will be observed that the Supreme Court has as its principal duty and function the consideration and disposition of appeals as the court of last resort, and of necessity it can only devote a limited portion of its time to administrative problems.

¹² Art. VI, §VII, par. 1.

The magnitude and the variety of the potential administrative problems inherent in the new judicial system may be also indicated by referring briefly to the volume of judicial business and to the size of the personnel. During the past court year 1951-52, the courts of New Jersey disposed of some 60,000 civil cases alone. On the criminal side the municipal courts disposed of 619,233 traffic cases. In appraising this volume, it should also be noted that the chief justice has under his supervision a total of 579 full-time and part-time judges, not to mention the clerks, the sergeants at arms, the stenographic reporters, and a host of others working in the courts. Finally, it should be kept in mind that there are approximately 8,500 licensed attorneys in the state, of which number it is estimated that at least 6,000 are engaged in the active practice of law. The need, then, for an administrative staff is manifest.

GATHERING OF DATA

The necessary foundation for all sound administrative decisions must be the factual data relating to the problems under consideration, and accordingly the collection and analysis of current statistical data on the work of the judges and the status of judicial business has been the major undertaking of the administrative office. The emphasis has always been twofold: (1) to obtain operational figures, such as any board of directors of a business concern would want in directing the operations of a corporation, and (2) to obtain figures reflecting the current status; for an analysis of figures reflecting operations long since passed will have little operational value, albeit the figures may have historical interest.

Statistics have been gathered and analyzed in New Jersey on a weekly, monthly, and quarterly basis. In general, the basic inquiries for each period

have been (1) what matters have been disposed of during the period, in comparison with past periods, (2) what additional matters have been added during the period, and (3) what matters await disposition at the end of the period and how long have they been pending. This basic approach was made necessary by the large arrearages that existed on many court calendars at the time of the reorganization of the courts, and was particularly essential to enable the chief justice to utilize the available judicial manpower at maximum efficiency.

The statistics have been gathered principally from reports submitted by the judges themselves and by the clerks of the various courts. The Supreme Court has provided by rule¹³ that each judge shall submit a weekly report in duplicate to the administrative director. The reports are in general so designed that they show the number of hours the judge presided on the bench, the cases heard, the nature thereof, and the outcome. Each judge also reports on any cases or motions submitted to him which are pending undecided.

USES OF DATA

These reports are received on Monday, and a brief summary and analysis of the major items is submitted to the chief justice on the next day. The reports disclose to what extent the judge has been occupied in court, and will immediately reveal any deficiencies in the manner in which the calendar is being managed. On the other hand, when fewer than the standard number of hours are being spent on the bench,¹⁴ an investigation of the report may indicate that the deficiency is not caused by improper handling of the local calendar, but rather by a calendar which is so current and light that it is insufficient

¹³ Administrative Rule A14.

¹⁴ Administrative Rule A1.

to keep the judge or judges working on it fully occupied. This will serve to inform the chief justice that such judge or judges are available for assignment to other counties or divisions where the calendar is more congested.

Finally, the weekly reports have proved invaluable as a means of bringing to the attention of each judge at the end of the week the status of his own work. Where cases or motions are pending heard and undecided because counsel have failed to submit briefs, the judge will be reminded to take action to secure their prompt compliance. Rule A13 of the Rules of Administration provides:

As a matter of routine, all motions heard by the trial courts in any week shall be decided at or before the opening of the court the next week. As a matter of routine, all cases submitted to trial courts shall be decided within four weeks after submission.

Where the weekly report indicates that motions or cases have been pending undecided for a longer period of time, the chief justice directs the administrative director to communicate with the judge in question to obtain a special report on the status of such matters. Such reports will ordinarily show that the matter pending was particularly involved or difficult but will be disposed of within a short time, or that the judge has been overburdened with other matters and requires assistance. Occasionally the report will disclose that the matter is being held pending an appeal or binding disposition in a related or test case, or for other special reasons.

Where a judge has been unable over a long period of time to meet the general standards in a major portion of his cases, his failure will suggest that he is not well qualified for the work to which he is assigned. Experience has demonstrated that many extremely able trial

judges on the law side are relatively poor in performance in appellate or chancery work, and the converse has been equally true. Effective judicial administration demands that to the extent possible, judges be assigned to the work for which they are most suited.

In any event, the weekly report with the administrative "follow-up" has been completely successful in solving the problem of long delayed decisions which existed in New Jersey under the former system, and which has plagued many other judicial systems. Under the former system the judge in this respect was accountable, for all practical purposes, only to himself. Litigants and lawyers were not in a position to insist upon prompt disposition, since they would fear that such insistence would only result in possible prejudice and a prompt *adverse* decision.

MONTHLY REPORTS

Supplementing the weekly reports submitted by the judges, the administrative director receives a monthly report from the clerk of each of the courts or divisions showing the status of each of the calendars therein. The calendar reports generally show the total number of cases pending at the beginning of the month, the number disposed of during the month, the number of new cases added during the month, and the total awaiting trial at the end of the month. The figures indicate the number of cases which are on the military list and therefore not available for trial, and in addition a breakdown is given of the total number of active cases pending at the end of the month showing the periods in which they were instituted by the filing of the complaint.

Customarily, from time to time the chief justice announces a "target" for each division and a date by which it is hoped that all cases started before a specified date will be disposed of. At

the end of the period judges with cases still pending instituted prior to the target date are requested to submit special reports as to the circumstances which made trials and disposition impossible.

This procedure has been based on the philosophy that the expedition of trials is a public responsibility of the courts. When litigants resort to the courts they must expect to proceed promptly to a disposition. Delays caused by lawyers and litigants for their own personal reasons all too frequently are forgotten at a later date when criticism of the law's delays is voiced to the detriment of the reputation of the entire judicial system. Complaints from litigants received in the administrative office shortly after the reorganization revealed that all too frequently delays were caused by requests for adjournments and postponements by counsel for their own convenience and not that of their clients.

TEMPORARY ASSIGNMENTS

By the analysis of these basic statistics the administrative director is enabled to advise the chief justice and the Supreme Court at all times as to the current status of the judicial work in each court and county, and the situation of each judge. Where the calendar of a particular judge is light, his availability for assignment elsewhere is noted. Where a calendar is congested and a judge is falling behind, the need for assistance immediately becomes apparent.

It has been the practice in New Jersey for the chief justice to review the status with the administrative director at least once each month, and more frequently if necessary. The chief justice determines which courts and counties shall be given the help of additional judges and which courts and counties do not need their full complement.

The extent to which the temporary assignments are used is illustrated by

the schedule published each year in the annual report of the administrative director. During the court year ending August 31, 1952 it will be noted that 31 different judges were given temporary additional assignments for periods totaling approximately 830 man-days. Most of this time would have been lost to the state, but for effective administration. Under the former system, a conscientious judge confronted with a calendar breakdown had no real alternative other than to adjourn to his chambers for possible research, or, if he were not so conscientious, for less productive activities. No agency or official was charged with the responsibility of supervising his activities and calendars for the public benefit.

ADMINISTRATIVE TASKS

The foregoing has indicated briefly the principal functions of an administrative office in aiding in the administration of judicial business in general. Judicial business in this sense has been limited to the administrative problems attendant upon the preparation, hearing, and disposition of litigated matters. It must be remembered, however, that in any judicial establishment there are a variety of other problems of internal management, not directly associated with the trial and hearing of cases, but nevertheless of real and vital concern to the courts and to the judges, which afford a real opportunity for economy and efficiency.

Among the more important administrative tasks in this category are the purchase of law libraries, supplies, and other equipment for the judges; the establishment and maintenance of courtrooms and chambers; the supervision and direction of court clerks and their offices; the preparation and administration of judicial budgets; the supervision of stenographic reporters, probation officers, sergeants at arms, constables, and

other court personnel; and the investigation of complaints relating to the operations of the judicial system.

Space will not permit a detailed discussion of these items, but their mere statement should indicate to the reader a field of administration which should be kept within the control of the judiciary, and yet which should not be a burden to be borne by the chief justice, or indeed any judge or court. Here again the need for an administrative officer to handle the detail and account to the chief justice and the supreme court is manifest.

SPECIFIC ACHIEVEMENTS

Again drawing upon the experience in New Jersey, the possibilities for achievement in this field of administration may be illustrated. At the time of the reorganization of the courts there, the Clerk of the Superior Court, I. Grant Scott, installed improved and modern systems of docketing and indexing. The clumsy and traditional space-consuming filing of legal documents in folded form was abandoned and flat filing was introduced.

A major project in microfilming was launched to solve the expensive and continuing problem of preserving legal records. The entire files of all completed cases in the former court of chancery over a period of ten years were microfilmed and the original files were then placed in dead storage. For a trial period of one year the members of the bar, searchers, and abstracters desiring to consult the records in these cases were required to use the micro-

films, and when it became apparent that the project was a success the original records were destroyed. The savings to the state in the long continuing expense for the preservation of such legal records in the future will be most substantial.

Another, equally impressive, example of the use of modern business methods in the administrative work of a judicial system is found in the use of microfilming units in enrolling judgments. In 1946 in New Jersey it was the practice to copy all final decrees in the court of chancery in full in enrollment books. At that time a staff of some thirty stenographers was almost three years behind in this work. In 1947 this staff was replaced with a microfilming team, and with three people handling the work the backlog was eliminated within the year and the work has continued completely current. Equipment has also been installed which permits the production of full-size photostatic copies directly from the microfilm. Aside from the savings in time and expense, the system has eliminated the possibility of errors arising out of inaccurate transcriptions.

In conclusion, it may well be said that the growing emphasis which is being placed upon the importance of effective administration in our state judicial systems holds great promise for the future. If the courts are to meet the challenge of modern times, they must not only be prepared to mete out justice wisely, but they must do so expeditiously, efficiently, and with reasonable economy. This, then, is the task for the modern administrator of the courts.

Willard G. Woelper is a practicing lawyer in Newark, New Jersey. He served as Administrative Director of the Courts of New Jersey from 1948 through 1952. He is a member of the Institute of Judicial Administration and of the American Bar Association's Section of Judicial Administration, Committee on an Administrative Office for State Courts. He conducts a seminar course in judicial administration at the Law School of New York University.

The Essentials of Modern Reform in the Litigative Process

By HERBERT PETERFREUND

TO secure "the just, speedy, and inexpensive determination of every action"¹ has long been an end of human endeavor. For centuries it has engaged the attention of kings and popes, reformers and legislators, lawyers and judges, and, needless to add, the public. And yet, despite constant dissatisfaction with legal machinery because of undue delay, unnecessary technicalities, and unwarranted evasion of the merits of controversies, procedural reform has come slowly. One need only read of the long struggle for reform in England² and in many civil law countries³ to recognize "the inveterate nature of the incongruity between procedure and substantive law—the former petrifies while the latter is in its budding growth," and, all too often, the "conservatism of the lawyer preserves the incongruity."⁴

Spearheaded by the masterful writings of Jeremy Bentham, codification became the pattern of nineteenth-century reform in America. So great was the influence of the Field Code⁵ that by the turn of the century more than half the states had adopted similar codes. In our own century, although

widely recognized as outmoded, procedural codes persist, notwithstanding constant legislative revision and occasional inhuman treatment by the judiciary. All too obvious today are the weaknesses of complicated codes formulated and amended by a body which has little or no contact with the machinery of justice.

The greatest single step in procedural reform during the twentieth century has been the adoption of the court rules embodied in the Federal Rules of Civil Procedure. In force since 1938 and eminently successful in the federal system, the rules are and will continue to be a model for practice reform throughout the United States. It will be the purpose of this paper to explore the salient features of the rules, the extent of their influence, and their effect upon the administration of justice in this country.⁶

COURT RULES VERSUS LEGISLATIVE CODES

Two features of the Federal Rules invite immediate attention. First, they are the product of judicial rather than legislative rule-making. The Supreme Court of the United States, granted rule-making power by the Congress,⁷ appointed an advisory committee to

⁶ Space limitations will not permit examination of the Federal Rules of Criminal Procedure, which became effective in 1946. For a discussion of these rules see George F. Longsdorf, "The Beginnings and Background of Federal Criminal Procedure," 4 *Federal Practice and Procedure* (Barron) 7 (1951).

⁷ Supreme Court Enabling Act, 48 Stat. 1064 (June 19, 1934, ch. 651), 28 U. S. C. §§723-b, 723-c, now §2072.

draft the rules which the Court eventually adopted. Secondly, the rules form a "code" in the broadest sense of the word, that is, as a fairly complete system of procedure which operates as a guide in federal cases. However, as contrasted with the definite and detailed legislative mandates of the past, the rules are scarcely a codification. One need only compare the succinctly stated 86 Federal Rules with the mass complexity of the 1,578 sections of the present New York Civil Practice Act to recognize that a new technique in procedural drafting has evolved.

The power of courts to make and alter rules of procedure has actually existed for centuries, but, until our century, has seldom been exercised in the United States, except as supplementary to a set of statutory rules. Yet the advantages of the plenary rule-making power are manifest. Procedural rules must of necessity be flexible and capable of speedy and informed amendment. Courts, because they maintain close contact with the machinery of justice and are responsible for its efficient administration, should be empowered to make changes when needed. On the other hand, legislated rules are largely formulated *a priori* by a body which is distant from the scene, presumably concerned with questions of more public import, and often, unfortunately, subject to political pressures. Little wonder, then, that legislative rule-making for the courts has inevitably led to an inflexible procedure on which haphazard tinkering has merely developed an overparticularized, complicated, cumbersome machinery. Legislative codes have typically specified the minutiae of practice in an attempt to be all-inclusive. As a result, courts in code states have been inundated with questions of interpretation which have served only to create undue delay, unnecessary expense, and mis-

placed emphasis on procedure as an end in itself.

In most states today, courts do possess the rule-making power in some degree.⁸ The exercise of the power has been quite another matter. Unless the responsible court has expert research and drafting agencies, little is accomplished. Unless the work is done under the supervision of the responsible court and with the co-operation of bench and bar, the reform may fail. Ideally, the complete rule-making power for civil and criminal procedure should be placed in the highest court of the state and a permanent advisory committee selected to draft rules, check on their operation, and advise the court of necessary amendments, as a continual process. These steps were taken in the case of the Federal Rules. The challenge has already been met in a few states and is being met in several others. These stirrings in procedural reform in the states augur well for the future. The salient features of court-made rules demonstrate their value.

SIMPLIFIED PLEADING

A basic feature of the reformed procedure is the abolition of technical rules of pleading. The plaintiff's complaint merely sets forth in plain, simple English a concise statement of his claim for relief. In turn, the defendant's answer contains "in short and plain terms" his claimed defenses and such denials as he may choose to assert. If the defendant has a claim against the plaintiff, he asserts it as a counterclaim in the answer, and the plaintiff must interpose a reply thereto, also simply and concisely stated.

The following is an apt illustration of a complaint under the Federal Rules:

1. Plaintiff is a citizen of the State of Connecticut and defendant is a citizen of

⁸ Arthur T. Vanderbilt, *Minimum Standards of Judicial Administration* (1949), pp. 91-145.

the State of New York. The matter in controversy exceeds, exclusive of interest and costs, the sum of \$3000.

2. On February 1, 1952, in a public highway called Broadway, defendant negligently drove a motor vehicle against plaintiff who was then crossing said highway.

3. As a result plaintiff was thrown down and had his leg broken and was otherwise injured, was prevented from transacting his business, suffered great pain of body and mind, and incurred expenses for medical attention and hospitalization in the sum of \$1000.

Wherefore plaintiff demands judgment against defendant in the sum of \$10,000 and costs.⁹

Pleading has not always been so streamlined. At common law there was a tedious interchange of cumbersome pleadings until, it was hoped, an issue—one issue—of law or of fact would emerge. Pleading was an esoteric art reserved for “pleaders” learned in formalism, and all too frequently it led to the unjust disposition of cases on purely technical grounds. Even under the codes the emphasis has been on “facts, all the facts and nothing but the facts.” The pleader is required to state facts sufficient to constitute “a cause of action”¹⁰ or a defense, as the case may be. But the definition of what are the “facts,” as distinguished from what is law or evidence, is not so certain as the codifiers seemed to think. Under the reformed procedure, the pleader is required to give no more than reasonable notice of the litigant’s claim or defense to his opponent and to the court, without unnecessary elaboration. When

⁹ Fed. R. Civ. P., Form 9.

¹⁰ Although many important pleading problems turn upon the meaning of “cause of action,” application is frequently very difficult. The Federal Rules prefer the phrase “claim for relief.” At least they “are not hampered by the morass of decisions as to whether a particular allegation is one of fact, evidence or law.” James W. Moore, *Federal Practice* (2d. ed. 1948), Vol. 2, p. 1647.

combined with provisions permitting freer joinder of claims and parties, virtually unrestricted amendment, and liberal pretrial procedures, the modern civil action can be disposed of expeditiously, completely, and with a minimum of technical proceduralism.

JOINDER OF CLAIMS AND PARTIES

The reformed civil procedure permits free joinder of claims and parties, subject to the court’s power to order separate trials. All claims which the plaintiff has against the defendant may be joined in a single complaint, regardless of consistency and irrespective of their legal or equitable nature.¹¹ Unlike the restricted code practice, claims need not come within specified classes or arise out of the same transaction, nor need they affect all the parties to the action. Moreover, a defendant may now assert as a counterclaim any claim that he may have against the plaintiff, even though it does not arise out of the transaction forming the subject matter of the plaintiff’s claim. For instance, in an action to recover for slander, the defendant may counterclaim for goods sold and delivered.¹²

Equally liberal are the provisions permitting joinder of parties where “they assert any right to relief jointly, severally, or in the alternative in respect of or arising out of the same transaction, occurrence, or series of transactions or occurrences and if any question of law or fact common to all of them will arise in the action.”¹³ Thus, as in one New York case¹⁴ (under a modern facet of its code), it would be possible to join in

¹¹ Fed. R. Civ. P., 18(a).

¹² Fed. R. Civ. P., 13(b). Where the defendant’s claim “arises out of the transaction or occurrence that is the subject matter of the opposing party’s claim,” Rule 13(a) provides for a compulsory counterclaim.

¹³ Fed. R. Civ. P., 20(a).

¹⁴ *Akely v. Kinnicutt*, 238 N. Y. 466, 144 N. E. 682 (1924).

one lawsuit, as plaintiffs, as many as 193 persons induced by the fraud of a single defendant to purchase shares of worthless stock. Conversely, in a suit to enjoin the fraudulent sale of securities by use of the mails, plaintiff is permitted to join as defendants not only the persons allegedly engaged in the fraudulent sales, but also those aiding and abetting.¹⁵ In such cases, of course, the court has power to order separate trials to avoid embarrassment, delay, or expense.

Modern procedure permits a defendant to implead, that is, bring into the action as a party thereto, a third person who “is or may be liable to him for all or part of the plaintiff’s claim against him.”¹⁶ Thus the defendant who is entitled to contribution or reimbursement from a third party may have such claim adjudicated, so that if the defendant is held liable to the plaintiff, he may recover judgment in turn against the third party. This provision enables the court, in one action, to adjust all the rights and liabilities which arise out of the same claim.

DISCOVERY

Another outstanding feature of the Federal Rules is their provision for almost unlimited discovery. At common law and under many current codes, the formal issues are determined by the pleadings and by various methods of testing their technical validity.¹⁷ Under these systems, however, no effective

¹⁵ *Securities and Exchange Commission v. Timetrust, Inc.*, 28 F. Supp. 34 (N. D. Cal. 1939).

¹⁶ Fed. R. Civ. P., 14(a).

¹⁷ The most important is the demurrer or its code substitute, the motion to dismiss, which raises issues of law only, and occasionally makes a trial unnecessary. In practice, it usually leads to amendment and thus serves largely as a dilatory tactic. The Federal Rules abolish the demurrer in favor of an omnibus motion or answer, and the making of objections *seriatim* is discouraged.

method exists for formulating the *actual* issues in the case, or, even more important, for ascertaining in advance of trial the evidence to be offered by each party. Under this “sporting theory of litigation,” formal issues are raised and each party plays the “game”: plaintiff is permitted to conceal his evidence until the day of trial, as is the defendant. Obviously, trial counsel may enjoy surprising his adversary during a trial; his client may not be so pleased, however, with the realization that opposing counsel is just as astute. The evils of the game work both ways.

Fortunately, this extreme view of adversary litigation has been changed in modern procedure by provision for an efficient, yet well-guarded, system of pretrial discovery. To develop the real issues before trial and reduce surprise at the trial, four devices are made available: depositions, interrogatories, requests for admissions, and inspection of documents, persons, and things.

Under the Federal Rules, a party may take a deposition of any person “upon oral examination or written interrogatories for the purpose of discovery or for use as evidence in the action or for both purposes.”¹⁸ Inquiry may be made not only to ascertain the facts, evidence, and sources of evidence for one’s own case, but likewise of the opponent’s. It is no longer ground for objection that the testimony may turn out to be inadmissible at the trial, as long as “the testimony sought appears reasonably calculated to lead to the discovery of admissible evidence.”¹⁹ Although limitations on the taking of depositions are slight, the use of such depositions at the trial is restricted in order to preserve the traditional safeguard of oral testimony in open court.²⁰ As a separate

¹⁸ Fed. R. Civ. P., 26(a).

¹⁹ Fed. R. Civ. P., 26(b).

²⁰ In effect, Rule 26(d) provides that, unless otherwise agreed, the deposition of a witness

means of discovery, a party may choose to serve written interrogatories on his opponent.²¹ Examination by this method has the same scope as examination by deposition, but, since the questions and answers are in writing, is not so effective as the oral deposition. A party may also request from his opponent an admission of the genuineness of "relevant documents" or "the truth of any relevant matters of fact set forth in the request."²² Finally, upon a showing of good cause a party may obtain a court order requiring his opponent to produce and permit the inspection and copying of certain documents,²³ or requiring him to submit to physical or mental examination by a physician.²⁴

It is quite apparent that, under the Federal Rules, the discovery devices achieve various purposes. They supplement the simplified pleadings by enabling the parties to particularize and compress the actual issues in the case. They facilitate preparation for trial and proof at the trial by making available to all parties the evidence and sources of evidence. No longer is the old cry of "fishing expedition" a bar to discovery. When the true nature of the case is revealed, the trial is materially shortened and frequently dispensed with through settlement in the light of the revealed facts.

Most lawyers and judges agree that liberal discovery has worked well.²⁵

ness (including a party) is admissible only where the witness cannot be produced in court, or for the purpose of contradiction or impeachment.

²¹ Fed. R. Civ. P., 33.

²² Fed. R. Civ. P., 36(a). Rule 37(c) provides a sanction in the event that a sworn denial is furnished and the party requesting the admission proves the matter at the trial.

²³ Fed. R. Civ. P., 34.

²⁴ Fed. R. Civ. P., 35(a).

²⁵ The discovery rules are very popular in practice. A recent study indicates their use in over 25 per cent of the cases filed; see William H. Speck, "The Use of Discovery in

Criticisms, some justifiable, have been forthcoming in recent times. Professional complaint has been made that the lawsuit is returning to trial by deposition. More serious is the objection that a disproportionate amount of time and expense is required by pretrial discovery, so that "the whistle is bigger than the engine."²⁶

Equally serious is the charge that the liberal discovery rules have sometimes been used to harass an opponent into settlement by causing delay, increasing expenses, and evoking embarrassing facts. Perhaps these difficulties arise not so much from the rules themselves as from the failure of the courts to use their power to prevent abuse.²⁷

Fortunately, the Supreme Court of the United States has taken steps to restrict one kind of abuse which might have had serious consequences, namely, the attempt to invade the privacy of the attorney.²⁸ "The work product of the lawyer"—oral and written statements taken from witnesses, the attorney's impressions, his memoranda, and so forth—cannot be discovered in the absence of a showing of necessity or good cause. Unlimited discovery in this area would penalize the diligent attorney and seriously impair the efficiency of our adversary system of litigation.²⁹

United States District Courts," 60 *Yale L. J.* 1132, 1134 (1951).

²⁶ George P. Dike, "The Practical Operation of Federal Discovery," 12 *Federal Rules Decisions* 131, 146-147 (1951).

²⁷ Rule 30(d), for instance, authorizes the court to terminate or limit examination upon a showing that it is "being conducted in bad faith or in such manner as unreasonably to annoy, embarrass, or oppress the deponent or party."

²⁸ *Hickman v. Taylor*, 329 U. S. 495, 67 S. Ct. 385 (1947).

²⁹ The boundaries of the "work product" concept are now being worked out by the lower federal courts. See Charles R. Taine, "Discovery of Trial Preparations in the Federal Courts," 50 *Col. L. Rev.* 1026 (1950).

PRETRIAL CONFERENCES

Of all modern procedural reforms, probably the most widely accepted is the pretrial conference. As the name implies, it is in essence a conference between the court and counsel for the purpose of simplifying the issues and shortening the trial. Under the Federal Rules, for instance, the court in its discretion may direct the parties' attorneys to appear for a conference on (1) simplification of the issues, (2) the necessity or desirability of amendments to the pleadings, (3) obtaining admissions of facts and the genuineness of documents, (4) limitation of the number of expert witnesses, (5) preliminary reference of issues to a master for findings to be used as evidence in a jury trial, and (6) such other matters as may aid in the disposition of the action.³⁰ After the conference, the court makes an order which reflects the results, if any, achieved and limits the issues for trial to those not disposed of by admission or agreement of counsel. Thus the pretrial conference, like discovery, clarifies the real issues in the case, simplifies preparation for trial, streamlines the trial itself, and stimulates an early settlement of the case wherever settlement is possible.

The pattern of the pretrial conference varies considerably, depending on the jurisdiction and the particular judge who handles the matter. Many problems do not as yet yield categorical answers. Should the pretrial conference be mandatory, or optional? Should it be used in all types of cases? Should attendance of counsel be compulsory? Should the conference be held on the eve of trial, or earlier? Where should the conference be held—in chambers, or in the courtroom? Should settlement be a primary objective of the conference,

or merely a by-product; should it even be discussed? To what extent should counsel be compelled to co-operate by preparation before the conference and by participation at the conference? What sanctions should the court have at its disposal? To what extent should the order be held binding? On many of these and other questions considerable diversity of practice and of opinion exists.³¹

Perhaps the only fair generalizations that can be made about the pretrial conference are that it has been successfully employed in thousands of cases, has reduced the expenditure of time, effort, and public and private funds at trials, and has disposed of a large proportion of cases by settlement. Here, certainly, is a procedural device which has great potentialities. It is a device which, in the hands of a capable judge and co-operative attorneys, is a practical and effective method of improving the operation of our courts.

OTHER PROVISIONS

Space limitations do not permit extended discussion of other salient features of the Federal Rules of Civil Procedure. Several, however, deserve at least passing attention.

The Federal Rules authorize either party to obtain a summary judgment in any civil action where "there is no genuine issue as to any material fact and . . . the moving party is entitled to judgment as a matter of law."³² In effect, this pretrial motion furnishes a means for speedily disposing of an action on the merits where no real defense or claim is shown to exist. Moreover, it serves to supplement the previously discussed pretrial procedures in affording a comprehensive method for the

³¹ See Harry D. Nims, *Pre-Trial* (1950), pp. 62-97.

³² Fed. R. Civ. P., 56(c).

³⁰ Fed. R. Civ. P., 16.

formulation of issues not apparent from the simplified pleadings in the action.

The rules also simplify and improve trial and appellate procedure. For instance, the taking of exceptions to the court's rulings during the trial are now unnecessary; rights on appeal are preserved without them. If certain steps are taken, judgment may be granted notwithstanding an adverse verdict, thereby avoiding a new trial when the jury's verdict is erroneous. No longer does a court lose control over a judgment because the arbitrary "term of the court" has expired. The method of appeal to the United States Court of Appeals has been simplified. Several devices have also been authorized to provide for an adequate "record on appeal" of the proceedings at trial with the least possible expense and trouble. While the subject of appellate jurisdiction remains unchanged by the rules, the mechanical steps required to obtain review and even the extent of review in certain instances have been largely overhauled. All these are merely examples of the many improvements incorporated in the 86 compact subdivisions of the Federal Rules.

INFLUENCE OF THE FEDERAL RULES

The Federal Rules have now been in use for fifteen years. How have they been received by those directly concerned with the administration of justice? What influence have they had upon the states?

The rules have met with almost overwhelming approval from the bench. They have proved simple in application, flexible, and wanting in few details.³³

³³ Amendments to the Federal Rules have been made at various times, the most significant taking effect in 1948. They have been relatively few in number and have not changed the basic pattern, but have rather improved or clarified specific provisions.

Judges have applied the rules in accordance with their intent and spirit—in sharp contrast to the "cold, not to say inhuman, treatment" given the Field Code.³⁴ After applying the rules for several years, an experienced trial judge remarked with some chagrin that he had yet "to note an instance in which they have been found lacking."³⁵ Perhaps the finest tribute was paid by a distinguished appellate judge: "It is now almost universally conceded that these rules have given to the federal courts in their civil jurisdiction the best code of practice to be found anywhere in this country, or for that matter in the world."³⁶ Not only do court decisions attest to the success of the rules, but articles, textbooks, and changes in law school courses on procedure demonstrate the ever increasing and salutary impact of the rules on the administration of justice.

What of the bar? While lawyers are notoriously hostile to changes in procedure, they have usually accepted the Federal Rules in good grace and have appreciated their value, both immediate and ultimate. It is striking that, as an aftermath of the adoption of the rules, the bar has evinced a new interest in procedural reform. Led either by bar associations or by individual zealous lawyers, reform movements have sprung up all over the country. This phenomenon is in interesting contrast to other procedural reforms (for instance in England), stimulated largely by laymen.

And what of the states? A number of them have already adopted the Fed-

³⁴ Chief Justice Winslow in *McArthur v. Moffett*, 143 Wis. 564, 567, 128 N. W. 445, 446 (1910).

³⁵ Judge William C. Chesnut, "Improvements in Judicial Procedure," 17 *Conn. Bar J.* 238, 243 (1943).

³⁶ Judge John J. Parker, Book Review, 57 *Harv. L. Rev.* 735, 736 (1944).

eral Rules substantially in toto: Arizona (1940), Colorado (1941), New Mexico (1942), New Jersey (1948), Utah (1950), Minnesota (1951), Nevada (1952), and Kentucky (1952). The highest court in Nebraska actually adopted the rules, only to have them repudiated by the legislature prior to their effective date. Of the states named above, perhaps New Jersey furnishes the most heartening example of progress. Under the informed leadership of Chief Justice Arthur T. Vanderbilt, outmoded court organization and procedure were transformed within a matter of months into the most modern and efficient system yet achieved by any state in the Union.

Other states have adopted substantial portions of the Federal Rules. Delaware and Maryland, for instance, have taken the rules almost in their entirety as a basis for practice in their courts of law. Florida, Iowa, Missouri, and Texas have adopted many of the rules but have chosen to combine them with parts of the local system; here the transition has been conservative. Still other states have incorporated only isolated provisions into their local system without making any basic reforms; here the transition has been halting.³⁷ Among the provisions most often adopted are those governing joinder, impleader, discovery, pretrial conferences and summary judgment. In all but a very few of the states, some semblance of reform or agitation for reform traceable to the federal experience is clearly discernible.³⁸

³⁷ Strangely enough, New York, which led the reform movement a century ago, has shown little inclination to place the complete rule-making power in its courts or to adopt the Federal Rules. That state has, however, incorporated a few of the rules into its Civil Practice Act.

³⁸ See Charles E. Clark, "The Federal Rules in State Practice," 23 *Rocky Mt. L. Rev.* 520 (1951).

CONCLUSION

Chief Justice William Howard Taft said not very long ago:

If we were asked in what respect we have fallen furthest short of ideal conditions in our government, I think we would be justified in answering . . . that it is our failure to secure expedition and thoroughness in the enforcement of public and private rights in the courts.

Our courts exist to vindicate substantive rights and enforce substantive duties. Where the machinery used by the courts is too slow, too complicated, or too expensive, it is a source of irritation to judges, lawyers, and litigants alike. Worst of all, perhaps, these conditions tend to breed disrespect for law at a time when the public should be certain that only through law can individual liberty be secure.

A system of simple, flexible, and workable rules of procedure is an indispensable requirement of effective judicial administration of law and justice. The reforms embodied in the Federal Rules of Civil Procedure have provided a composite of the best in modern procedures: simplified pleading, liberal joinder of claims and parties, broad pretrial devices, and efficient trial and appellate procedure.³⁹ That these rules can and do work is evidenced by their remarkable success in the federal courts for the past fifteen years. They have also served as a model for procedural reform in the several states. Surely, in the light of our experience thus far, the day is not distant when all the states will unite "willingly [to] route up the

³⁹ Two basic features of the Federal Rules, the merger of law and equity and the one form of civil action, have not been mentioned, because they were part of most state codes over a half-century ago.

thornie grove of cavils and sophisticall wrangelinges which had mingled themselves with good and reasonable exceptions, and, scouring the streame of such weedes and sedges," will make "a

smoothe and more easie passage for Justice."⁴⁰

Herbert Peterfreund, LL.B., LL.M., New York City, is associate professor of law at the New York University School of Law. He has practiced law at the New York Bar, to which he was admitted in 1937. He is a contributor to the Annual Survey of American Law and the Survey of New York Law.

The American Bar Association Program

By HAROLD J. GALLAGHER

EVERY student of government will agree that "The True Administration of Justice is the Firmest Pillar of Good Government."¹ Yet there has been and still is much popular dissatisfaction with the administration of justice. The criticisms have been particularly directed to the high cost of litigation and to the interminable delays, technicalities, anachronisms, and general inefficiency of the judicial process. That such dissatisfaction prevails is, and should be, cause for deep concern of lawyers and laymen alike.

What, then, have bar associations done and what are they doing to correct the conditions responsible for this public dissatisfaction? This article summarizes the program of the American Bar Association, and comments upon the methods used in its promotion and the difficulties which have been encountered.

Other articles in this volume refer to certain elements of the program, but it may be convenient to sketch the whole picture here.

THE MEANS OF OBTAINING JUSTICE

An individual may need legal advice to escape involvement in violations of law, or to prevent the loss of his personal or civil rights, or to protect his property. He may want to make a will, settle an estate, or cope with strained marital relations. Under the Constitution, all persons are entitled to equal justice under the law. As a practical matter, however, this is an empty catch phrase unless adequate representation is available to them. Legal rights are not

self-executing. They must be prosecuted or defended in court or before administrative tribunals by persons skilled in law. The American Bar Association has adopted as an objective "the promotion and establishment within the legal profession of organized facilities for the furnishing of legal services to all citizens at a cost within their means."²

The Survey of the Legal Profession, initiated by the association a few years ago and carried on under the direction of Reginald Heber Smith of the Boston Bar, has found that there are millions of persons in the United States who need legal services but do not get them. Several reasons are ascribed: they often do not realize that they have a legal problem; they do not know a lawyer to whom they would wish to entrust it; and they are apprehensive of the cost.

It should be understood that preventive law, like preventive medicine, is the best and least expensive in the long run. It is better and wiser to avoid worry, heartache, and financial loss by obtaining competent legal advice before rather than after entering into a transaction. By such foresight litigation may be avoided.

The association, through encouraging the promotion and establishment of offices of the so-called "Lawyers' Referral Service" by the local bar associations, particularly in the largest communities of the country, has sought to make legal services available to persons of moderate means at a cost clearly within their capacity to pay. Efforts are constantly being made to improve existing legal referral service offices and to extend the program into communities where such

¹ From the façade of the New York County Supreme Court building.

² See 76 A. B. A. Rep. 276 (1951).

referral plans have not yet been established. The plan is simple: A local bar association establishes an office where those seeking legal services at low cost may be referred to a lawyer who will advise them. The bar association selects a panel from its members who agree to work under the plan and to accept referrals. These are made on the basis of a rotation system except where a particular specialty may be called for.

The initial fee may be \$5.00 for the first conference of a half-hour or perhaps longer. Very often this is sufficient to take care of the individual's need. If more services are needed, the fee may be fixed by agreement, often with the provision that if any dispute arises the bar association will fix the fee.

The association's program calls also for furnishing legal aid to those who can pay nothing. This is a charitable work aided in many localities by community chests or other voluntary contributions, as well as by the efforts of lawyers.

During the past several years the association and state and local bar associations have sought to extend legal aid in every major community in the country. The aim is to establish legal aid societies where any need exists.

The accomplishments and the foreseeable future of the referral plan and legal aid have been ably described by Mr. Brownell in this volume.

REMOVING THE "CAUSES OF POPULAR DISSATISFACTION"³

For nearly a quarter of a century prior to 1938 the American Bar Association had sought to bring about simplified procedures through restoring to the courts the power to make rules governing litigation. Finally, under the

sponsorship of Attorney General Homer Cummings, Congress in 1935 enacted a law conferring upon the Supreme Court of the United States the power to adopt rules of civil procedure for the United States district courts, and in 1938 such rules were promulgated. Shortly thereafter, the Supreme Court under similar authority of Congress formulated modern rules of criminal procedure for the district courts. The adoption of these rules and the creation of the Administrative Office of the United States Courts have resulted in notable improvements in the handling of both the judicial work and the business affairs of the federal courts.

Attention has now turned to the states. In 1937-38 the association, through its Section of Judicial Administration, made a study of the basic needs in the reform of state judicial procedures and administration. At the annual meeting of the association in 1938, seven distinguished committees submitted reports "suggesting needed reforms and . . . formulating standards which may serve as guides to all who are interested in improving the administration of justice."⁴ It was emphasized at the time that the reports "make no attempt to scale the heights of perfection or to reach out for the idealistic. They are entirely utilitarian in their objective."⁵ They laid down *minimum, practical* standards. Adopted (with a single exception regarding appellate practice) by the House of Delegates of the association, the recommendations of the Section on Judicial Administration, together with certain other stated objectives of the association, embody the program for the states.

The major points of this program may be summarized as follows.

First: The integration of the judiciary, including the establishment of an administrative office of the courts in each state judicial system.

Unifying the judicial system throughout the state and placing administrative responsibilities and the business management of all courts in one judge, such as the chief justice of the state, with assistance of the kind which can be furnished by an administrative office, will serve "to eliminate duplication of functions, . . . and to insure uniformity and efficiency in the handling of judicial business."⁶

As is shown in Mr. Woelper's study in this volume, the power to transfer judges from one assignment to another, firmly exercised, will relieve congestion of dockets and utilize judges to the best advantage. The experience in New Jersey, which adopted the basic recommendation as part of its constitution, has fully demonstrated the value of the proposal. There has been a marked improvement in the efficiency of every court in the state; the work of the courts has become current, delays in reaching cases for trial have been greatly reduced, and this has been accomplished without over-all increase in manpower.

A model act to provide for an administrator of state courts has been prepared and approved by the National Conference of Commissioners on Uniform State Laws.⁷

Second: The delegation of rule-making power to courts of highest jurisdiction, and through exercise of that power, the improvement of pleading, trial practice, pretrial hearings, and appellate procedure.

This proposal is deemed indispensable to the most thoroughgoing and effective

realization of the program. The courts originally had the power, but starting in New York in 1848 with the Field Code, the movement to divide responsibility between the courts and the legislature spread to a large number of states, and rules of procedure came to be prescribed by the legislatures. It has been difficult for the state courts to recapture from the legislatures the power they once had of prescribing their own procedure; but today it is reported that in about twenty-four states the highest court has the power to regulate practice and procedure in all, or practically all, of the courts of the state.⁸

The courts are experts in the matter of procedure, and the members of the legislature are not. The courts are held responsible for the administration of justice, and they should have the power to correct defects in such administration.

Third: The improvement of the jury system and the methods of selection of jurors.

The 1938 report of the Committee on Trial by Jury of the Section of Judicial Administration commented:

. . . Jury service today is the chief remaining governmental function in which lay citizens take a direct and active part, and trial by jury is the best means within our knowledge of keeping the administration of justice in tune with the community. It is highly important that everything be done which can be done to insure the most efficient methods of jury selection and trial procedure.⁹

Jurors should represent a cross section of the community. At the same time they should have "as high a degree of intelligence, morality, integrity and common sense as can be found by those who make the selection." Accordingly the association recommends

³ The phrase is taken from Roscoe Pound's famous speech to the St. Paul meeting of the American Bar Association in 1906.

⁹ 63 *A. B. A. Rep.* 559 (1938).

that jurors should be selected by commissioners appointed by the courts in a scientific and representative manner and free of partisan or political consideration.¹⁰

In addition, the objective is to provide for the better handling of jurors with more consideration for their physical comfort while they are engaged in the performance of their duties, and to reduce the cost of jury trials.

Fourth: The simplification of the rules of evidence.

The American Law Institute in 1942 prepared and adopted a Model Code of Evidence which recognizes that "most of the law of evidence is good" but also that there are definite defects which should be corrected and that there is need for clarification and simplification of accepted principles. The Model Code not only incorporates the limited number of improvements suggested by the 1938 Committee of the Association's Section, but restates the whole law of evidence in 116 rules of general governing principles.

The Section of Judicial Administration has recommended that local committees in each state initiate and carry through a definite program for a revision and modernization of the law of evidence in that state.

Fifth: The improvement of administrative tribunals and the practice before them.

The growth of administrative tribunals in the national and state governments in recent history has been phenomenal. These agencies exert tremendous influence in nearly every conceivable field of business and labor and on the individual's rights and duties under many complicated laws. Duties of legislative, executive, and quasi-judicial nature are often combined in the agency. It often acts as prosecutor, judge, and

jury in matters before it. These powers, if exercised arbitrarily, can result in irreparable damage to those affected. Often it has been provided that the decisions of fact of these agencies are final and not subject to review except as to matters of law.

The association has long worked to prevent the abuse and regulate the exercise of power by federal administrative agencies.¹¹ Adequate judicial review of the administrative process is required, the right to review all questions of law and the evidence and to reverse if the findings are unsupported by substantial evidence. But this right of review is not enough. "To be effective, reform must begin with the administrative process itself, and even before that, with the selection of administrative officials."¹² After years of effort, the Federal Administrative Procedure Act was adopted in 1946.¹³ This act treats of procedure as well as the right to judicial review and seeks to establish rules of conduct of hearings, all to the substantial improvement of the administrative process. Efforts made by the association and congressional leaders to remove exemptions from the act given under the guise of threatened war emergency, which have vitiated the effectiveness of the act, may meet with success in the Eighty-third Congress.

A proposed State Administrative Procedure Act was drafted by the association's Section of Judicial Administration¹⁴ and served as a basis for the Model State Administrative Procedure Act adopted by the National Conference of Commissioners on Uniform State Laws in 1946.¹⁵

¹⁰ Handbook, *supra* note 6, pp. 65-66.

Sixth: The improvement of methods of judicial selection.

Judges of the federal courts are appointed by the President and have tenure during good behavior. The need for the exercise of the utmost care by the appointing power in selecting judges solely on the basis of character, ability, and judicial qualification, rather than as a reward for political service, is obvious.¹⁶ The association has a Committee on the Federal Judiciary which offers its advice in passing on the qualifications of nominees for judicial appointment, and it has performed a useful service.

In most of the states the judges are elected by popular vote. In many cases they are nominated in a party primary, and in some instances by party conventions. This method of selecting judges has long been opposed by the association. Since 1937 it has advocated a plan by which judicial vacancies would be filled by appointment by the executive or other elected official from a list named by a nonpolitical nominating commission. This commission would be composed partly of high judicial officers, and partly of other citizens selected for the purpose holding no public office. At the conclusion of the appointed period of service and periodically thereafter, the appointee would go before the public on his record, with no opposing candidate, the people voting on the question, Shall Judge Blank be retained in office?¹⁷

This plan has been accepted in Missouri and has proved most satisfactory. Much work is being done by the organized bar in other states to have the same plan adopted, and significant progress is being made.¹⁸

FORWARDING THE PROGRAM

Despite the fact that improvements in the administration of justice are vital if our system of judicial determination of rights is to survive, the promotion of the minimal objectives above set forth¹⁹ has proved to be no easy task.

The job is of course magnified by the fact that we have forty-eight separate states, each with its own distinct and diversified code of procedure, practice, and pleading, rules of evidence, and manner of selecting judges and handling juries and dealing with other procedural matters. Lawyers and judges familiar with existing practice are naturally reluctant to change the rules. It is indeed amazing that lawyers for so long have been uninterested in procedural reform and oblivious to the needs of the times. Legislatures have often been loath to return the rule-making power to the courts or to adopt other needed measures, and sometimes the people have been appealed to in vain.

In recognition of the fact that the program must be promoted locally if it is to succeed, the Section of Judicial Administration works in close co-operation with committees in each state.²⁰ A Director of State Committees follows the progress of the work and assists the committees by furnishing information, or otherwise as may be desired. The Conference of Chief Justices established in 1949 and the National Conference of

¹⁹ Improvement of metropolitan trial courts and traffic and justice of the peace courts has also been a major concern of the American Bar Association.

²⁰ The 1952 handbook, *supra* note 6, p. 9, recommends to local committees "that the whole program be reviewed anew. Much can be learned as to the methods to be used in securing the adoption of the program from the experience of the past fifteen years. What was thought unfeasible in a particular state in 1939 may on a second look appear entirely practical now."

Bar Presidents organized in 1950 are also available to aid in forwarding the program.

But the bar, even if well organized and aggressive, needs help from other sources. The movement to enlist the support and active co-operation of influential laymen in problems of judicial administration is comparatively new. It may be said to have had its origin in 1945 in Washington, D. C., under the initiative of Chief Judge Laws. As Judge Laws indicates, the American Bar Association now has a national com-

mittee devoted to the subject. The movement is spreading, and there is reason to expect increasing achievement. The extension of the movement should be actively encouraged by the state and local bar associations. Such co-operation will surely bring about a better and clearer understanding by the lay public of the problems of judicial administration. It will help to remove the aura of mystery surrounding court proceedings, and at the same time lend a powerful influence to the bar in bringing about bar-sponsored reforms.

Harold J. Gallagher, a senior member of Willkie, Owen, Farr, Gallagher & Walton of New York City, has for many years been active in the affairs of the American Bar Association, and served as its president in 1949-50. He is now a member of the association's House of Delegates.

Lay Assistance in Improving Judicial Administration

By BOLITHA J. LAWS

NO one would deny that the focal point of all judicial proceedings is the layman, whether as juror, litigant, or witness, or simply as citizen whose well-being is dependent upon the integrity and effectiveness of the judicial process. Traditionally, however, little heed has been paid to the practical corollary of this proposition, namely, that the layman, being the person most directly affected by the administration of justice, is entitled to a prominent role in efforts to improve it. It is true there have been occasional judicial reforms brought about by laymen, such as the improvements in the organization of the English courts in the late nineteenth and early twentieth centuries. These reforms, however, were not the product of co-operation between the laity and the legal profession. Rather, they were triumphs by the laity over the inertia, and in some instances the active hostility, of lawyers and judges.

WHERE LAYMEN CAN HELP

In the present era, the layman is in a position to make greater contributions to the administration of justice than ever before. Through growth in population and increased complexity of society, more and more segments of the country are coming to have a direct stake in judicial administration. The courts, to an ever greater extent, are becoming involved in "big business" operations, with all the administrative problems which go with such operations. In every large city, courts with probate and equity jurisdiction are supervising the management of estates and trusts worth millions of dollars. Through bankruptcy and reorganization proceed-

ings, the courts become involved in the complexities of innumerable fields of trade and commerce. Increases in automotive traffic are bringing countless numbers of people into contact with the courts as parties to civil suits or defendants in traffic violation proceedings, who would otherwise have no contact with the judicial process.

These are merely illustrative of numerous other aspects of judicial administration which have a direct connection with the everyday affairs of laymen. There is, therefore, a broad area in which the layman can render material assistance to the bench and bar in working out means for the efficient administration of the ever growing volume of judicial business. The failure of bench and bar to solicit the viewpoint of the laity is reflected in large measure in the growing trend of laymen to seek resolution of their disputes before administrative bodies and arbitration panels rather than in the courts.

THE DISTRICT OF COLUMBIA PROGRAM

In 1945, giving heed to these considerations, the District of Columbia's American Bar Association Committee for Improving the Administration of Justice invited laymen to participate actively in its work. The idea of lay co-operation with bench and bar rapidly caught the imagination of leading citizens. From its inception, the program's most active participants have included editors and publishers of major Washington newspapers, heads of civic associations, and leading bankers, businessmen, and educators.

The laymen are organized into subcommittees which work side by side

with judges of all courts in the District of Columbia and with lawyers. At present, laymen's subcommittees are active in the following fields; traffic courts; youth correction authority; expediting testimony and providing comfortable space for witnesses; rehabilitation and parole of prisoners; selection and instruction of jurors; treatment of persons who are mentally unbalanced but not legally insane; and domestic relations.

A NEW COURTHOUSE

A brief review of some of the concrete achievements which the laymen have been instrumental in bringing about will show the potential value of lay co-operation. The product of the laymen's program most apparent to the physical senses is the District of Columbia's new United States Courthouse, which was officially opened in September 1952 as the new home of the United States District Court for the District of Columbia and the United States Court of Appeals for the District of Columbia Circuit. Some idea of the tremendous volume of business of these courts can be had when it is realized that, in addition to the usual business handled in other federal courts and in state courts of major jurisdiction, they handle the bulk of the vitally important litigation involving the federal government. Together, these courts employ the services of twenty-five judges.

Until completion of the new courthouse, the physical facilities of these courts were appalling. Their personnel, including the judges, were scattered throughout ten different buildings. The central building was 125 years old. A substantial part of the district court's work was conducted in the semifinished attic floor of a private office building. The detrimental effect of these makeshift surroundings on judicial administration can be readily perceived. Ju-

rors, witnesses, parties, and court personnel all suffered serious inconvenience.

Soon after the laymen's program was started in 1945, judges, lawyers, and laymen began working for the new courthouse which has now been completed. Laymen gave unstintingly of their time in planning facilities in the new courthouse for the convenience of jurors, litigants, and witnesses. As a result of their efforts, this striking new building has comfortable lounges for jurors and witnesses, conference rooms for litigants and their counsel, and private dictating rooms where businessmen called as jurors or witnesses may dictate to secretaries or confer with associates while waiting for cases to be called. There are also comfortable sleeping accommodations provided for jurors who must be kept together overnight deliberating decisions of cases.

Laymen were also highly instrumental in making known the need for the new courthouse by appearing before congressional committees and in other ways. Members of the press on the laymen's committee rendered especially valuable service in this respect. The public has been quick to appreciate these new court facilities. One of the most salutary results has been that fewer citizens called for jury service have asked to be excused.

IMPROVING THE JURY SYSTEM

Another notable achievement of laymen has been their contribution in improving the District of Columbia's jury system. Before the laymen's program was started, the jury list in the District of Columbia was so small that the same jurors were often called for service year after year. This caused many able members of the community to avoid jury duty because of personal hardship. It also tended to create a class of "professional" jurors whose chief interest in

the administration of justice was receipt of their juror's fees. In addition, jurors were assigned to cases without any preliminary instruction as to their duties.

Outstanding laymen, serving on the Jury Commission at a nominal compensation out of all proportion to the value of their services, have succeeded in expanding the jury list until jury service is no longer a burden except in special cases. This has also solved the problem of the "professional" juror. The Jury Commission has further improved the quality of jurors through questionnaires directed to prospective jurymen, followed up by personal interviews where a questionnaire leaves the matter in doubt. The problem of adequately instructing new jurors in their duties is being met in part by booklets, distributed to jurors at the beginning of their term of service, which explain the functions of the jury. Laymen rendered valuable aid to the judges and lawyers in composing a booklet which is not only technically accurate but also readily understandable by the average person with no legal training.

As a further step in this direction, laymen associated with the public schools and other educational institutions are now working with lawyers and judges on a program of instruction for high school students dealing with the obligations of jury service and with the functioning of jurors in both civil and criminal cases. Texts have been prepared by school officers, in collaboration with judges and lawyers, to point out procedures by jurors, their duties, and their functions. These are planned to be used as supplements to the instruction of students with regard to the history of the adoption of jury trial in England and the United States.

Representatives of the press in the laymen's program have made a notable contribution by sampling public reaction to jury service. This has been ex-

tremely valuable in enabling judges and lawyers to "see ourselves as others see us." The results indicate, incidentally, that most jurors appear to have a genuine appreciation of the importance of their duties.

A CONSTRUCTIVE APPROACH TO THE TRAFFIC PROBLEM

Mention has been made earlier of the importance of traffic courts as a point of contact between the layman and the institutions of justice. In this branch of the law the District of Columbia is more fortunate than some other jurisdictions, since its traffic cases are presided over by qualified judges in the dignified and impartial atmosphere of a regularly constituted court. In these favorable conditions, a very active subcommittee of laymen has assisted the judges in maintaining a traffic court system in the District of Columbia which is recognized as outstanding throughout the nation. Among other things, the laymen have been instrumental in the establishment of a safe-driving school to which traffic violators are "sentenced," thereby permitting the judges to take a constructive approach to problems of traffic safety.

STUDYING PERSONNEL NEEDS

As a final example of the concrete achievements of lay co-operation in the District of Columbia, mention should be made of an exhaustive survey of the personnel requirements of the district court which was recently made by a group of leading businessmen and bankers. Because of the district court's large volume of business, it employs a supporting staff of more than 150 persons in addition to 16 judges. Included within this number are clerical and secretarial personnel, as well as people of such divergent occupations as accountants, appraisers, domestic relations commissioner, and probation officers.

The distinguished group of laymen just mentioned gave generously of their time and valuable business judgment in investigating the personnel strength and job classification requirements of the court in the light of sound business principles. They also studied the use of modern machines and other equipment in the dispatch of the voluminous business transacted in the courts. Their conclusions and recommendations are being used to obtain legislation, long overdue, which is necessary to enable the court to render efficient service to the community through adequate numbers of competent employees.

AN AROUSED LAY INTEREST

The foregoing, while not an exhaustive enumeration of the accomplishments of the laymen's program, will afford some indication of its success. The program, of course, is a continuing endeavor, and its future accomplishments will be as valuable as those of the past. Perhaps more important than any of its specific accomplishments has been the active interest in good judicial administration which the program has fostered among lay members of the community. The courts thus have been afforded an excellent means of promoting public relations which hitherto has been neglected in many instances.

THE OUTLOOK IN THE NATION

On the national scale, the future of lay co-operation appears equally promising. Outstanding laymen have appeared as feature speakers at federal judicial conferences. The American Bar Association has established a Committee on Cooperation with Laymen as part of its Section of Judicial Administration. Movements are under way to establish joint committees of lawyers, judges, and laymen, similar to the one in the District of Columbia, in several states. Demonstrations of lay co-op-

eration in which outstanding laymen participate have become a regular feature of regional and national meetings of the American Bar Association.

The first attempt to spread the program of laymen's co-operation on a national basis was made on the occasion of the American Bar Association's annual meeting in 1945 at Atlantic City. Governor Earl Warren came from California to join with a prominent educator from the District of Columbia in key-noting the program. A demonstration held at the American Bar Association's September 1951 meeting in New York aroused such keen interest that its high lights were published in a pamphlet for national distribution entitled "Cooperation with Laymen in Improving the Administration of Justice." A demonstration was held at the regional meeting of the American Bar Association in Louisville, Kentucky, in April 1952, which was addressed by the distinguished executive editor of the *Courier-Journal* and the *Louisville Times*, James S. Pope. Another was held on the occasion of the American Bar Association's meeting in San Francisco, September 17, 1952, where Dr. Robert Gordon Sproul, president of the University of California, delivered the principal address. A program has also been arranged for presentation at the annual meeting of the American Bar Association at Boston on August 26, 1953.

All of these meetings have been attended by judges of United States as well as state and municipal courts and by laymen and lay women. The attendance on each occasion has taxed the capacity of the place provided for the demonstration. Without exception, the laymen have responded with enthusiasm to participation in these meetings.

WHERE THE INITIATIVE LIES

In carrying out a successful program of lay co-operation, the lawyers and

judges, particularly the judges, must take the initiative. The layman is not likely to take an active interest in improving the administration of justice unless he feels that his efforts are genuinely wanted by the bench and bar.

Some judges and lawyers may be apprehensive that the layman, once admitted to the councils of bench and bar, will seek to do away with fundamental principles of our legal system. These fears have been demonstrated by experience to be unfounded. Through friendly give-and-take conferences with the judges and lawyers, the laymen quickly come to realize that many problems in judicial administration require legal training and experience for their solution.

On the other hand, the lawyers and judges will come to realize that many aspects of modern judicial administration lie within the special experience and training of laymen. An example of this is the survey, mentioned earlier, which District of Columbia bankers and businessmen made of the district court's personnel requirements. Similarly, laymen can render valuable advice with re-

spect to efficient management of accounts and records which a court having probate or bankruptcy jurisdiction must maintain.

If the judges and lawyers approach their problems with the fresh viewpoints which lay minds can suggest, they may find that some procedures traditionally believed to be inviolable are really outmoded hindrances to attaining the true objectives of the judicial process. It was formerly considered upon high authority that a party had a right to keep his case concealed from his adversary until the very moment of trial. Today this view is rapidly becoming discredited and is being replaced by the philosophy that a lawsuit is a scientific contest to determine true legal rights based on full and equal disclosure of material facts.

In all parts of the nation where the program has been projected there has been a uniformly favorable response to the efforts of judges and leading lawyers to obtain the active assistance and co-operation of laymen in improving the administration of justice. There can be no doubt that such co-operation will be invaluable to the courts.

Bolitha J. Laws, Washington, D. C., is Chief Judge of the United States District Court for the District of Columbia. He is chairman of the American Bar Association's District of Columbia Special Committee for Improving the Administration of Justice, and vice chairman of the American Bar Association's Committee on Cooperation with Laymen. In 1945 he was chairman of the Section of Judicial Administration which arranged the program of co-operation held in Atlantic City, and he has conducted the demonstrations in New York, Kentucky, and California. He has lectured extensively on the laymen's co-operation program.

Need for Continuous Study of Law in Action

By EDWARD S. GREENBAUM

BECAUSE "a work stoppage would immediately jeopardize and imperil our national defense," former President Truman signed his Executive Order taking over the country's steel mills. That was on April 8, 1952. On June 2 the Supreme Court declared this action illegal. That ended the celebrated case. During the intervening seven weeks the newspapers were flooded with news and comment about the case. Full-page advertisements told us how this "threat to American freedom" affected the future of every one of us. On the air we heard that this was the first step towards dictatorship. Others told us that they agreed with the President's action because a strike would stop the flow of weapons to Korea and increase the danger of our troops fighting there.

On the same day that the Executive Order was signed a workman was badly hurt in an automobile accident in New York City. His case has not yet been tried. It will be several years before it is tried. During the intervening time there will be nothing about the case in the newspapers, on the air, or anywhere else. It will continue to be of not the slightest interest to anybody; that is, to anybody except the injured man and his family. He will continue to be without salary or compensation while his case leisurely awaits its turn on the slow-moving calendar. He will have to find some way to pay his rent, to feed his family, and to get them clothed.

How was it possible to dispose of a matter so important and far-reaching as the steel case in less than two months? And why does it take years for an ordi-

nary accident case to be reached for trial?

There is no easy answer to these questions. The decision in the steel case had to be swift. The nation's supply of steel and its entire defense program were in jeopardy. Public interest required speedy action. The case was an extraordinary one, requiring extraordinary measures. The usual procedure was brushed aside and short cuts improvised. But there is no public interest in the accident case. It is merely one of many in the grist of judicial business.

A BAD SITUATION

This is not to say that the situation is ignored by responsible judges. They are keenly aware of it and try to correct it. "A shaming and explosive document could be written about the human tragedy of these cases which are denied recourse to the courts for the redress of their wrongs for four long years," said Justice David W. Peck in a notable address last year.¹ As Presiding Justice of the Appellate Division in New York's First Department which covers New York and Bronx counties, he has taken the leadership in an effort to improve conditions which have been called "appalling and disgraceful."² Elsewhere in this issue Justice William C. Hecht, Jr.

¹ "The Pillar of Justice," 127 *N. Y. L. J.*, No. 10 (January 15, 1952) (an address delivered at the Association of the Bar of the City of New York).

² Robert P. Patterson, then president of the Association of the Bar of the City of New York, to the Judicial Council of the State of New York at a public hearing in December 1949.

has well described some of the steps that are being taken. Whatever progress is being made is due to the courageous and able work of these justices and some of their associates.

But, in spite of all that has been done, Governor Thomas E. Dewey has said that the situation "cries out" for improvement. In his message to the 1953 legislature he seeks a commission that will, he hopes, find ways to give New York State a "truly twentieth century court system" to replace the costly, complex, and clumsy one that it now has.

CURES AND QUESTIONS

Justice Peck feels that "jury trials have become an unsuitable medium for handling the mass of civil litigation in New York City courts." "The only real solution within the court system," he says, "is the settlement of cases in much greater volume at much earlier stages."³

Another experienced Supreme Court justice, sitting across the East River in Brooklyn, Hon. Thomas J. Cuff, thinks that we should "blush for shame when cases are settled on unjust terms because a litigant cannot afford the long time a trial and appeal will consume." His solution is: "Let the court determine the damages at a trial long in advance of the trial of the liability issue"; then the jury will only have to decide the question of liability. He feels that this two-trial method would actually expedite matters because the jury trial would then be considerably shortened.⁴ But we know that even a nonjury trial can take quite a while. Although it has not yet come up to the run of "South Pacific," the investment bankers' anti-

⁴ "A Suggested Procedure for the Shortening of Jury Trials," 127 *N. Y. L. J.*, No. 100 (May 22, 1952).

trust trial before Federal Judge Harold R. Medina celebrated its second birthday on December 1, 1952.⁵

Another able judge, sitting in Boston on the United States District Court, Hon. Charles E. Wyzanski, Jr., feels that the calculation of damages in a tort case "can best be made by men who know different standards of working and living in our society." He says that some judges who have to determine damages without juries under the Federal Tort Claims Act confess that they try to "make their judgment correspond with what they believe a jury would do." (He does not tell us by what vicarious mental process those judges determine what would have been the judgment of the nonexistent jury.) He goes on to say that some judges would prefer to have such cases tried by juries, but that Judge Jerome N. Frank of the United States Court of Appeals has assumed that no judge would have such a preference.⁶

How can authorities so eminent differ so widely on so simple a question as the use of juries? Maybe it is because the question is not so simple.⁷ Before undertaking to answer the general question, we should ask such questions as these:

Do we mean jury trials under existing rules of evidence?

And under existing rules as to contributory negligence?

Do existing rules serve to lengthen the time of trials by jury?

How much longer does it take to try

⁵ "A birthday cake bearing two candles, indicating that the trial was entering its third year, was placed on Judge Medina's desk at the beginning of the session." *New York Times*, December 2, 1952.

⁶ "A Trial Judge's Freedom and Responsibility," 7 *Record of the Association of the Bar of the City of New York* 287, 305 (1952).

⁷ See Institute of Law, Johns Hopkins University, *Study of Civil Justice in New York* (1931), p. 37.

a jury case than an identical nonjury case?

What has been the experience in other jurisdictions with the trial of tort cases?

When we know the answers to these and other questions we may be better able to determine whether, for example, abolishing jury trials would eliminate—or even lessen—delay in tort cases. But if we could be sure that it would, what could we do to abolish such trials? This would require a constitutional amendment, and that is not easily attained.

EXPERIENCE ELSEWHERE

We should try to find out if there is some other and easier solution. It would be helpful to study the experience in other countries, a subject about which Maitland says we have "very complete and traditionally consecrated ignorance." Dean Roscoe Pound called this professional ignorance "not merely widespread but dense."⁸

Here are some contrasts in three groups of recent accident cases similar on their facts—cases in which liability was undisputed. The amount of damages was the only question to be decided.

On the morning of October 8, 1952 a railroad collision at Harrow killed 109 people on their way to work in London. A few days later the railway executive admitted liability. Only in those cases in which the parties could not agree on the damages was it necessary to make application to the court to assess damages. The measure of damages in each case was determined under the provisions of the Fatal Accidents Act and the Law Reform (Miscellaneous Provisions) Act. Information indicates that most of the cases have now been disposed of.

⁸ "Professional ignorance with respect to what is going on in foreign countries in law, legislation and juristic thought, is not merely widespread but dense." Letter dated April 2, 1908, Dean Roscoe Pound to Justice Oliver Wendell Holmes.

This collision was similar to one that happened nearly two years before on the Long Island Rail Road. On Thanksgiving Eve 1950, while returning from work in New York City, 79 passengers were killed and many others injured. The courts held early pretrial hearings and otherwise co-operated in seeking prompt disposition of these cases. But a year after the accident, all these efforts had disposed of only 22 of the death cases. Another year went by and 16 death cases and 57 injury cases were still pending. The legal expenses, even in some cases that were settled without trial, ran as high as 50 per cent.

At Woodbridge, New Jersey, 87 commuters were killed when a Pennsylvania Railroad train jumped the tracks. That was on the afternoon of February 5, 1951. All but 4 of these cases were disposed of within two years; 63 were settled without suit being started. (A sequel, of little comfort to the victims, was the recommendation of the county prosecutor that criminal action against the Pennsylvania Railroad should be dismissed, because the trial would cost \$25,000 and the maximum fine could only be \$1,000. The prosecutor said that this would "provide punishment for the County rather than the Pennsylvania Railroad.")⁹

STUDYING LAW IN ACTION— NOBODY'S JOB

If it were anybody's business to do so, it would be interesting to find out what made it possible to dispose of the English cases so rapidly. It might be not only interesting but important to find out what, exactly, New Jersey did to bring about changes in its judicial system. Such studies of law in action would show how courts can be made to meet the changing social and economic needs of modern society.

⁹ *New York Herald Tribune*, December 19, 1952.

But that is nobody's job. The judge is busy trying cases, the lawyer is busy with his own practice, and the law professor is busy with his classes. In spite of the heavy pressure of their own immediate tasks, many give generously of their time to these other problems, but such work is necessarily part time and extracurricular.

Whatever legal research the law teachers have time for usually concerns itself with nothing so sordid as delay and expense in the judicial process. Until recently it has rarely included the study of the effects of that process upon the life of the individual and the community in which he lives. The emphasis on such subjects in Chief Justice Vanderbilt's recent exciting casebook on *Modern Procedure and Judicial Administration* offers hope that the law schools will develop lawyers who will devote themselves to these problems.

Lawyers work on law reform through their bar association committees. The work of any one committee is limited to one part of a larger problem. Generally the work is done by only a few members of the committee, and even those who work hardest can give only part of their time. Many of these committees have done fine work and made excellent reports. The Section of Judicial Administration of the American Bar Association has given us an extremely valuable guide in its publication of *Minimum Standards of Judicial Administration* under the direction of Chief Justice Vanderbilt. This work shows that except in New Jersey and a few other jurisdictions we have not attained even those minimum standards. It makes it clear that action is needed to supplement the work of bar association committees.

AN UNEXPLORED FIELD

The fact is that we do not "know very much about the operation of the

procedural machinery of the law, except that, in general, it is slow, cumbersome, and expensive." Judge Herbert F. Goodrich said that twenty-three years ago. He added:

Until very recently all our information about economics and sociology consisted of the opinions of learned men, derived not from detailed study of how men act, but reflection upon how they should act under given conditions. If we are beginning to study realities in the law, we are only doing what students of natural science have already learned, and what students in other branches of human affairs are now learning to do.¹⁰

To be sure, we do know a great deal more about our procedural machinery than we did in 1930. We have judicial statistics gathered by judicial councils and the Administrative Office of the United States Courts. We know the number of suits started and cases tried, and we have much other valuable information. But we know very little about the practical effect of these cases upon the persons concerned. Case histories are lacking not only about delayed accident cases but also about the effect on the family of the cost of administering small estates, about the heartaches of those whose domestic affairs bring them into court, about small claims and other types of litigation referred to in other articles in this issue. The cases are rich with material that has been largely unstudied and unexplored and could be the subject of scientific study.¹¹ We have failed to employ the techniques that have been used by the medical profession and in other fields of science.

¹⁰ "The Improvement of the Law," 4 *Temp. L. Q.* 311, 324, 325 (1930).

¹¹ L. C. Marshall, *Unlocking the Treasures of the Trial Courts* (1933).

EXPERIMENTS IN THE LAW

We lawyers never knowingly experiment.¹² We are unable to do so. Chemists, physicists, and other scientists constantly experiment. So do doctors. Many of them spend their lives in research. They are free to try out new ideas. They have laboratories for this purpose. From them come many of the products and most of the ideas that have revolutionized medicine and other sciences.

But a lawyer cannot simply go ahead and try out his ideas for improved court procedures. Such change may require a new rule, or an act of the legislature, or even a constitutional amendment. Before the experiment can be tried, the court, the legislature, or the voters must be persuaded to make the change. This is not easy, especially since the new idea can rarely be supported by advance proof that it will accomplish its purpose.

A judge can experiment. He can do so to the extent that he has the power to make the changes in the rules needed to conduct the experiment. Forward-looking judges have demonstrated what can be done in this manner. Judge Ira W. Jayne with his pretrial calendar is an outstanding example. Presiding Justice Peck's court-appointed panel of medical experts has just been started in New York and may have far-reaching results.¹³

But an experiment is only a beginning. It is a test, a method of finding out. It may not work. Prohibition

¹² "There has been no counterpart in law to clinical medicine. We have concentrated on formulating legal rules; we have paid little attention to how they worked. We have devoted ourselves to conceptions rather than realities. This leaves the man in the street in a critical frame of mind." B. L. Shientag, "Simplification of the Law" (lecture delivered in the College of the City of New York Series of Lectures on Law, January 8, 1930).

¹³ See Justice Hecht's article in this issue.

was not the only noble experiment that failed. In a larger sense, every rule or statute on the books, no matter how ancient, may be viewed as an experiment. But in how many cases do we know how they work, or have we made any effort to find out?

NEED FOR RESEARCH

The experiment of the medical expert panel is being currently studied by the new Institute of Judicial Administration. The importance of such steady, grass-roots study, following the law and legal procedures into their effects in practice, cannot be overemphasized. Such was the method used in the 1930's by the Institute of Law of Johns Hopkins University,¹⁴ and by the New York Law Society.¹⁵

The Institute of Law felt that the subject of judicial administration was entitled to the intensive research and study that other fields of work were receiving. It believed that the actualities of the administration of justice were a proper subject for scientific analysis.¹⁶ Its task was defined by Herman Oliphant in this way:

Problems as to the administration of justice arise in unbroken succession and are becoming so intricate that more special training and more adequate facilities are required to deal with them effectively. These the work and resources of few judges, lawyers and laymen supply.

For these and other reasons, their work has not carried and cannot carry us deeply enough into a sufficient number of our multiplying problems.

¹⁴ Introduction (p. xviii) to E. S. Greenbaum and L. I. Reade, *The King's Bench Masters and English Interlocutory Practice* (1932).

¹⁵ F. James, Jr. and A. H. Stockman, "The Work of the New York Law Society," 27 *Geo. L. J.* 680 (1939).

¹⁶ H. E. Yntema, "The Purview of Research in the Administration of Justice," 16 *Iowa L. Rev.* 341 (1931).

What these problems need is full-time, continuous and unhurried study by a sufficient number of men with appropriate training and adequate facilities for such work. The work of these men can build on the materials gathered and the results obtained by present agencies but there is need for much more labor and a practical division of it.¹⁷

A CO-OPERATIVE ENDEAVOR

Just as war is much too important a business to be left to the generals, so the business of law reform is much too important to be left to those learned only in law. "Almost every profession is pushed forward by men who do not belong to it," said Woodrow Wilson.¹⁸ History shows how true this has been for the improvement of the administration of justice.

The principal work will always have to be done by the bench, the bar, and the law schools; but they cannot accomplish the task alone. The knowledge of the legal profession should be supplemented by the experience of men of science and others skilled in research. We have neglected the methods long used in the physical sciences and now being used in the social sciences. Management engineers and businessmen are also needed. To the extent that their methods are applicable to the study of the administration of justice, they should be utilized. Their fresh viewpoints should be of great value.

It is important that the public have accurate information as to what hap-

¹⁷ Institute of Law, *supra* note 7, p. 7.

¹⁸ Quoted by H. N. Rosenfield, "Experts Are Never Right," *Antioch Review*, Spring 1949.

pens in court in specific cases and how court procedure is actually operating. "Nothing would more stimulate a demand for greater speed in the disposition of civil cases on behalf of the litigating public than the truth as to the delays and congestion in civil dockets," said Chief Justice William H. Taft.¹⁹ Facts are very persuasive. But to persuade, the facts must be made known. Representatives of the press, the radio, and others from other fields of public relations are needed to bring the facts home to the public.

GETTING RESULTS

But something more is needed. Unless corrective measures are taken, where needed, research will be fruitless. It will have the same fate as so many of our best efforts that dead-end in fine reports. To avoid this we should find out how procedural changes were brought about in other jurisdictions and learn the techniques that were there used to accomplish such changes. This knowledge should enable us to take similar steps and enlist the help of civic leaders, labor leaders, and others in public life whose support is necessary to make our judicial machinery work.

Besides the learning and detachment of the scientist and the scholar, we need the zeal and conviction of the reformer and the skill and knowledge of practical men of affairs. Their combined efforts may bring to the little man—the man whose case involves no great issue—and to everyone else who seeks it, the opportunity to be heard promptly and fairly.

¹⁹ Institute of Law, *supra* note 7, p. 3.

Edward S. Greenbaum, New York City, is a senior member of the law firm of Greenbaum, Wolff & Ernst. He has long been interested in law reform and is chairman of the New York Committee of the American Bar Association's Section of Judicial Administration, and was formerly president of the New York Law Society. During World War II he served as executive officer to Secretary of War Robert P. Patterson, with the grade of brigadier general. He is co-author (with L. I. Reade) of *The King's Bench Masters and English Interlocutory Practice* (1932) and has written various articles on legal subjects.

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

NORTHROP, F. S. C. *The Taming of the Nations*. Pp. xii, 362. New York: The Macmillan Company, 1952. \$5.00.

Point IV and the technical assistance programs constitute one of the great gambles of history. Through them the Western democracies are endeavoring to equip the free underdeveloped areas of the world with the knowledge and technical skill to build these societies into solid thriving bulwarks against the twin threats of poverty on the one hand and the spread of Soviet totalitarianism on the other. What are the chances of success? Particularly, what is the likelihood of achievement in key areas of Asia where the struggle is joined politically, economically, and even in arms? Can the East and the West meet to work out a harmonious order which will ensure the dignity of individual man in a world of material sufficiency?

Attempts to graft Western methods of production and Western constitutionalism upon Asia have seen conspicuous failures in the past. Where Eastern leaders have tried to transplant Western economic ways to native cultures generally it has begat militarism and chaos, or an aggressive imperialist power has taken over.

The failures, according to F. S. C. Northrop, have stemmed from failure to reckon with basic cultural differences between the Confucian, Buddhist, Taoist, and Hindu cultures and the West. The basic difficulties, he finds, arise from divergent viewpoints on the relationship of man to nature. The Eastern view is a naïve conception based upon personal experience. The Western cuts beneath the surface of personal experience and seeks to know nature through determinate laws, inductively formulated, and experimentally verified.

Consonant with the Eastern view of nature is the Eastern cultural pattern—the primacy of the family and the loyalty of man to family above other institutions. Filial piety is above loyalty to nation, and the Western idea of a higher law which requires one to treat all men with a higher loyalty than one's family is unnatural and hence immoral. In the Eastern view, moreover, all material things are of transitory character and the ultimate objective of all men is to achieve Nirvana, a formless, all-inclusive blissful oneness without personality. This is in sharp contrast to the Islamic and Western theses of the equality of all men before a universal law, and a determinate God, and the immortality of human personality.

Northrop believes there is ground for

hope if the West sees the "Revolt in Asia" not as nationalism but as a return to Asianism, and appeals to the Eastern mind since the philosophical bases of the Greco-Judaic-Christian West are closer to Asia than is Soviet Marxism.

There is so much provocative material in this compact volume no brief review can do it justice. The author has incisive commentary on the conspicuous failures of socialism in international affairs, on the strength of the American pragmatic approach with its free inquiry, and stress upon human dignity, and of the hope for a peaceful pluralistic world based upon agreement on fundamental moral values in place of power politics. It is a volume so rich and rewarding it will be read and reread.

WILLIAM J. RONAN

New York University

SHARP, WALTER R. *International Technical Assistance: Programs and Organization*. Pp. xi, 146. Chicago: Public Administration Service, 1952. \$2.50.

The "Point Four" program, which President Truman outlined in his inaugural address of January 20, 1949, has now progressed far enough to warrant an inventory of the major administrative problems involved. Such an inventory was sponsored by the Public Administration Clearing House, the outcome of which is the present excellent study by Dr. Walter R. Sharp, Professor of International Organization, Yale University.

The author has not attempted to set forth the rationale of technical assistance for economic development or to evaluate the substantive results thus far achieved. Instead he begins (Part I) with a brief historical summary of private and public technical assistance before 1949 which serves to remind the reader that the "bold new program" had its roots in the past at least as far back as the early nineteenth century. Parts II, III, and IV describe the current programs of the United States government and of the United Nations, as well as the special regional programs under multilateral sponsorship such as the Colombo Plan for South and Southeast Asia. In slightly less than 100 pages, a well ar-

ranged account of the latest information on the subject has been prepared.

Part V identifies the chief administrative difficulties which have arisen in launching the technical assistance programs and offers suggestions as to ways of improving their operation. This section is written with real insight and judgment and is a particularly valuable contribution to the literature of international administration. Those who talk glibly about Point Four would do well to read Professor Sharp's penetrating analysis, not omitting the quotation, "Here lies the bones of an Englishman who tried to hurry the East"—the epitaph on a tombstone in India recently visited by an American official. The usefulness of the study is enhanced by the bibliography, the glossary of abbreviations, and the index.

ROGER H. WELLS

Bryn Mawr College

STEBBINS, RICHARD P., and the research staff of the Council on Foreign Relations. *The United States in World Affairs, 1951*. Pp. xiv, 473. New York: Harper & Brothers, 1952. \$5.00.

As a new administration takes over the responsibility for our government, it is important to examine the United States in world affairs. Perspective is essential for any realistic picture. This book helps provide perspective.

In 1951, the United States struggled to rally the free world against encroaching communism. We materially increased our military strength, but the economic discomfort caused by the effort to arm left many of our allies less than enthusiastic. Added to the consequent restlessness in Europe and South America was a series of explosions in the East. Nationalism and anti-imperialism flared into crisis after crisis. In Iran, Egypt, and India, the United States was forced to pick its way delicately between the sharp horns of more than one dilemma. Should the United States support Mossadegh in Iran? If he fell, the Communists seemed almost certain to take over. Yet, the British opposed him because he had nationalized the oil industry. Should we send grain to famine-threatened India because we needed to take every possible measure to keep her from

going Communist even though she refused to support our China policy? Should the United States press for a decisive victory in Korea, even at the risk of an all-out-war with China, and at the expense of the defense of Europe?

The last question provoked the second phase of the Great Debate. Earlier there had been a discussion on an unprecedented scale of isolationism versus internationalism, particularly in respect to our relations with Europe. Now the MacArthur controversy made the argument global in scope. The Great Debate, highlighted by the MacArthur incident, the Soviet proposal for truce negotiations which sparked a change of pace in their policy, the Japanese Peace Treaty, the shift in emphasis from economic aid to rearmament, growing nationalism and anti-imperialism flowering into a revolt of the underprivileged, are all brought sharply into focus and shown in their proper relationships in this revealing volume. The material presented is not exhaustive, but it is well organized. The helpful delineation of basic changes makes an excellent background for the understanding of United States foreign policy. The analysis is honest, objective, and well-stated. It makes stimulating reading.

The bibliography is one of the most useful features of the book. The library of the Council on Foreign Relations is largely responsible for this interesting list and the reference service which helped make the book possible.

This book is one of a series of annual reports on the United States in world affairs sponsored by the Council of Foreign Relations. The author states that the purpose of the series is "to present the record, fully and fairly, in the light of what would seem to be the permanent interest of our own nation and of the larger civilization in which we form a part," and in the belief that "nothing can help those cleavages [in American opinion] so effectually as a fuller understanding of the problems, aims, methods, and global repercussions of our foreign policy." Mr. Stebbins' book should do much to further such understanding.

ALLEN T. BONNELL

Drexel Institute of Technology

BAUER, JOHN. *Make the UN Effective for Peace*. Pp. 160. New York: Richard R. Smith, 1952. \$2.50.

Mr. Bauer, a public utility expert, urges the President of the United States to offer the world a peace plan consisting of (a) the prohibition of the use of force among nations, (b) the complete and irrevocable demilitarization of all nations, and (c) reconstitution of the United Nations into an agency capable of enforcing the dual prohibition of arms and force. Yet he does not propose world government, since the executive power of the UN would not extend beyond the field of arms control and peace enforcement. Should Russia accept the proposal, so he argues, war would forever be banned, and should she refuse, we would at least have the advantage of a constructive goal for which the American people and the entire non-Communist world can "unite, work, and sacrifice."

The book is a curious mixture of real insight and political naïveté. Mr. Bauer correctly analyzes that the expectation of violence in international relations is likely to prevail as long as nations are armed, even if only for defense against each other, "because defense could quickly be turned into attack." Logically he demands that nations renounce not merely arms races but the very function of armed security. At the same time he is quite willing to wave aside—even though recognizing their existence—such obstacles to negotiating that kind of revolution as the deep inherent distrust between democratic America and Communist Russia. His optimism about the proposal is based on an estimate of political realities best characterized by the following statement: "There is really no irreconcilable conflict between communism and democracy . . . if once the two forms have reached mutual understanding and tolerance, and have adopted positive arrangements for peace." Again, while he can find no good reason why Stalin should distrust or reject his plan of definite universal disarmament under the UN, he thinks it quite natural to insist that "the dominant voice in the reconstructed UN will be ours."

The book once more demonstrates that

the problem of war, like that of disease, is a perennial hunting ground for mental efforts unguided by the best available expert discipline, to which charge Mr. Bauer could obviously reply that the best available expert thought has not been good enough to eliminate either evil.

GERHART NIEMEYER

Washington, D. C.

DIEBOLD, WILLIAM, JR. *Trade Payments in Western Europe: A Study in Economic Cooperation, 1947-51*. Pp. xvii, 488. New York: Harper and Brothers (for the Council on Foreign Relations), 1952. \$5.00.

Mr. Diebold's valuable book provides an account of the record of Western European co-operation in the field of trade and payments from the end of the war to mid-1951. The narrative is accompanied by much useful analysis, setting forth explanations, arguments, and counterarguments concerning the great number of issues, both economic and political, that arose in this field during the period.

The book consists of four parts: Part I reviews the various payments arrangements in Western Europe, from the bilateral agreements of the immediate postwar period to the European Payments Union. Part II is concerned with the record in removing trade barriers. Part III takes up the question of customs unions and contains a thorough discussion of the Benelux experience as well as of other customs union proposals which have advanced less far. In Part IV the author considers the problems of European trade and payments co-operation in relation, on the one hand, to Europe's balance of payments with the rest of the world and, on the other, to the burden of rearmament.

In each part, Mr. Diebold presents the facts clearly and comprehensively, describes the programs and institutions involved, and discusses the various problems that arose. The EPU and the related trade liberalization program of the Organization for European Economic Cooperation (OEEC), which represent the latest stage in Western Europe's progress toward trade and payments "integration," receive a large share of the author's attention.

While there has been little further progress in this field since the book was completed—in fact, both the United Kingdom and France have been forced to retreat from trade liberalization—there has occurred in Europe a shift in emphasis from the importance of intra-European trade and payments to the importance of Europe's trade and payments with the rest of the world.

The desirability of substituting trade for aid in Europe's economic relationship with the dollar area has become generally accepted in recent months. It is no criticism of Mr. Diebold to note that, were his book being written at the present time, it would concern itself even more with the relationship between intra-European trade and payments and Europe's trade and payments with the rest of the world.

Mr. Diebold's book is a highly useful history not only because it presents the record objectively, but also because its review of Europe's efforts to act and "think multilaterally" (p. 149) provides many important lessons for future action toward trade and payments co-operation over a wider geographic area.

ROBERT SOLOMON

Washington, D. C.

OLIVER, ROBERT T. *Verdict in Korea*. Pp. 207. State College, Pa.: Bald Eagle Press, 1952. \$4.00.

Many popular books have been written about the war in Korea by journalists who have gone in with the troops and have tried to put into print their experiences. *Verdict in Korea*, by Robert T. Oliver, has been created by one who was inside Korea before the bleak days of 1950. The author, chairman of the Department of Speech at the Pennsylvania State College, has served as counselor to President Rhee in Korea, to the Korean Commission in Washington, and to the Korean delegation to the United Nations at Paris and at Lake Success.

Mr. Oliver divides his study into fourteen chapters. Here can be found, in vigorous English, the glory and the suffering and the hopes of the people living in the "Land of the Morning Calm." Here also can be found many facts and stories showing the

way of life of the Koreans fighting in the "bastion of democracy in Asia."

The final chapter of *Verdict in Korea*, "The Meaning of the Korean War," is an excellent summary of the conflict. The author finds eight meanings. (1) The war has taken the United States out of post-war indifference and isolationism. (2) The United Nations first gained, and then lost, prestige. (3) The war has given the free world a challenge it is slowly meeting. (4) In spite of lack of success in the beginning, the United Nations intervention prevented a tremendous failure. (5) Korea served as an "alarm bell" to force upon the free nations a program of preparedness. (6) The Korean war has served as a valuable training ground for all the powers. (7) During the months of fighting the "Communist Empire has been proved to be monolithic and tightly organized" (p. 197). Unless Korea can show the strength of the United Nations, the effects upon Asia will endanger the free peoples of the world.

Aside from these eight conclusions, Mr. Oliver discusses several controversial issues. First, American leadership should stand for friendship with all peoples fighting Communism. Second, the United States should make democracy attractive to the underdeveloped nations. Third, the United States should "get tough" with her Allies as well as herself. Fourth, the policy of containment has proved too sterile to serve as a basic foreign policy for the Soviet Union, one of the two strongest nations on earth. Mr. Oliver ends with a clear statement, "If decision is substituted for indecision . . . the Korean war may prove to be the 'preventive war' that diverts Russia from its course of unilateral imperialism" (p. 207).

THOMAS E. ENNIS

West Virginia University

HABE, HANS. *Our Love Affair with Germany*. Pp. 247. New York: G. P. Putnam's Sons, 1953. \$3.00.

In 1945, with her cities in ruins and her people stunned and bewildered, Germany at last seemed to have been graduated from her status as the problem child of the world. Today, eight years later, while France and England are struggling for sur-

vival, the nation of poets, thinkers, and drill sergeants has an industrial output 59 per cent higher than in 1936. From being the biggest debtor in the European Payment Union, she has become its largest creditor, with cumulative credit of almost \$480 million by December 1952. Her exports today are seven times those of 1951. It is a recovery almost without parallel in history.

All this, says Hans Habe in this vitally important book, is mainly due to our favoritism toward Germany, which has received from the United States the unparalleled amount of \$3.4 billion as a gift on the mere promise of remilitarization. Once again we are faced with the specter of a resurgent Germany risen from the ashes.

Hans Habe, author of the memorable account of the fall of France, *A Thousand Shall Fall*, is well equipped by background and experience to write about the current German situation. The Hungarian-born newspaperman and author was a major with the United States Army in Africa and Europe during World War II. In 1945 he was editor-in-chief of eighteen United States-sponsored German language newspapers in the occupied territory and founder of the Military Governor's effective *Neue Zeitung*. He went back to Germany in 1949 as chief-editor of two important weeklies and has returned recently to the United States.

The picture Mr. Habe paints of the situation in Germany and of our German policy is a most disturbing one. He believes that we and our Allies have missed the boat badly, and actually may have brought World War III nearer by our amazingly contradictory and unsound policies. He claims that our insistence upon unconditional surrender and our declaration of collective guilt of the German people unnecessarily prolonged the war. When we needed the Germans to fight Communism, we had to retract everything we had previously said. Because we overstated our case first, we had to apologize in the end.

Mr. Habe is critical of the Nuremberg Trials on the ground that, where the conclusions were right, the process was wrong. Wrongly timed, badly prepared, using "impartial" Russians, the trials turned into one

of the most powerful weapons neo-Nazism has today. "Without discussion," says Mr. Habe, "we condemned a whole nation, then took months to prove the culpability of a few mass-murders."

Further signs of our grave failure in Germany, according to Mr. Habe, are the unsuccessful denazification program, the unpopular remilitarization policy of the present, and the revival of neo-Nazi movements on a disturbingly large scale. He criticizes the work of Eisenhower, Clay, McCloy, and other U. S. officials, who just did not seem to understand the German mentality. He describes the return of anti-Semitism, the neglect, bungling, and mishandling of re-education, and the process by which German democrats have been driven underground.

As for the future, Mr. Habe predicts that, within a short time, not later than 1954, Germany will be the most powerful country in Europe; remilitarization will get out of hand and backfire; West Germany will trade much more with East Germany and Russia's satellites; there will be a stepped-up drive for reunification of the Fatherland; the slogan of *Volk ohne Raum* will be revitalized; and Germany will return to a form of government which may not call itself National Socialist but which will correspond basically to that description.

It is a sorry picture. What can be done about it? Mr. Habe recommends an end to our childish idealism, a realization of our transgressions and errors, brutal and humble self-criticism, and a new start if we intend to avoid international suicide. We must, he says, (1) discourage the German conviction that in militarizing Germany again they are doing us a tremendous favor; (2) prevent renazification in the course of remilitarization; (3) halt the spread of Communism and Nazism; (4) allow rearmament only and strictly under French and British leadership; (5) abandon our opposition to German unity; and (6) once these steps are taken, make every effort at a moral rehabilitation of Germany.

This is a voice of reason speaking at a critical juncture in the world's history. It is to be hoped that Washington will pay

serious attention, even though the hour is late.

LOUIS L. SNYDER

The City College of New York

McAULIFFE, W. R. *Modern Asia Explained*. Pp. ix, 163. New York: The Philosophical Library, 1952. \$3.25.

Some Facts About Asia might have been a better title for this small volume, because Asia simply cannot be "explained" in something less than 50,000 words. This volume offers a quick "run-down" of the current situation in 36 different Asiatic political areas (including Egypt and the Sudan), these country-by-country resums being supplemented by several sections of more general character. The author gives free expression to his opinions and judgments about the forces underlying the political turmoil in these many Asiatic countries, but the reader must still seek elsewhere for basic explanations of these phenomena.

Of the five chapters of this volume (The Near East, Central and High Asia, The Successor States of the Indian Empire, South East Asia, and The Far East), the chapter dealing with India and Pakistan is perhaps the most lucid and interpretive. But the entire volume needs to be handled with great care, because errors of factual statement abound: the Sudan is declared to be "an area larger than Europe" (p. 28); King Farouk of Egypt is characterized as a "long-headed" monarch (p. 30); Moslem refugees from Israel are estimated to be in excess of 5 million (which is many times the number of Moslem residents of Palestine in recent times) (p. 39); Sinkiang is characterized as "in most respects similar to Mongolia" (p. 65); the U.S.S.R. is stated to have "regained" the Kurils under the Yalta Agreement (p. 68); and "the success of Communism in China put the tag 'Communist' on to existing Chinese bandits in Malaya" (p. 134)!

The entire volume is strongly influenced by a pro-British tone, with resulting aberrations. For example, the Egyptian "fellaheen would be better off if Egypt became part of the British Sudan, and the Egyptian government is anxious to prevent their

realizing it" (p. 29)! American support to Chiang Kai-shek "has driven Mao closer to Russia" (p. 151), while the British have based their recognition of Red China on the view that China may yet "be drawn into a peaceful comity of nations" (p. 154). McAuliffe seems to believe that the peoples of Asia turn to Communism from "want and despair" (p. 145), but he does not suggest the helplessness of Asiatic peoples in the face of Communist organization and tactical operations.

In any event, this little volume leaves the reader in no doubt that Asia has entered upon a new chapter of history. The old is gone or disappearing; the new has not yet emerged in definitive form.

H. ARTHUR STEINER
University of California at Los Angeles

JORDAN, GEORGE RACEY, with RICHARD L. STOKES. *From Major Jordan's Diaries*. Pp. 284. New York: Harcourt, Brace and Company, 1952. \$3.50.

The diaries to which the title of this book refers were kept by Major Jordan from May, 1942 to June, 1944, during which time he served as an expeditor of lend-lease aircraft and air freight to the Soviet Union. Major Jordan contends that certain highly placed American officials co-operated too zealously with the Russians, and that the Russians abused the privileges granted them in this country during World War II.

Inasmuch as his diaries do not prove these contentions, Major Jordan introduces other material to support his case, including statements by several ex-Communists. Unfortunately, some of these statements deal at considerable length with other subjects—such as Father Orlemanski's wartime visit to the Soviet Union—thus serving to confuse the primary issues and to detract from the value of the original material Major Jordan presents.

In his diaries, Major Jordan discloses that Russian nationals frequently entered the United States without the knowledge or consent of immigration officers. He describes the elaborate preparations which were made to assure that uranium supplies destined for the Soviet Union were secretly and expeditiously handled. He tells also

of the time he broke into a large shipment of black suitcases on board a C-47 transport about to take off for the Soviet Union, and discovered that they contained a good deal of revealing data about our domestic economy.

It is not likely that this book will cause many of its readers to alter their opinions on the primary issues raised. The case which Major Jordan attempts to build is overdrawn, and is colored by an obvious personal bias against the policy of granting lend-lease aid to the Soviet Union. While such a bias may be justified, it does not necessarily follow that the officials who supported our policy of lend-lease aid to the Soviet Union were disloyal or unwise. The fact is, of course, that other wartime allies of the United States enjoyed a greater measure of co-operation and lend-lease assistance than the Soviet Union. In addition, it can hardly be denied that our lend-lease aid to that country did help to shorten World War II and to save the lives of countless American soldiers.

LEO FISHMAN
West Virginia University

BASSETT, R., *Democracy and Foreign Policy: A Case History—The Sino-Japanese Dispute, 1931–33*. Pp. xxiii. 654. London: Longmans, Green and Co. (for the London School of Economics and Political Science), 1952. 42/— (\$8.50).

This is an analysis of the relationship between public opinion and foreign policy in the United Kingdom during the period between World War I and World War II. Using the Sino-Japanese crisis of 1931–33 as a case study, the author, a lecturer in political science at the London School, traces the movements of public opinion on foreign policy by presenting the opinions expressed at each stage of the crisis, followed by subsequent versions of what was said and done during the crisis. He then considers the charges made against British foreign policy in the light of what was known at the time the charges were made. The chief subsidiary purposes of the book are, in the words of the author, "... to throw light on political behaviour, the methods employed in political controversy,

the formation of 'public opinion,' and the relationships between 'public opinion' and foreign policy."

Divided into six parts and containing 25 chapters, this work is an exhaustive study of virtually every possible phase of the crisis. Parliamentary proceedings, press coverage, influential commentaries, and public remarks of leading figures in England and abroad are all subjected to critical and, sometimes, caustic examination. Throughout, an attempt appears to have been made to place the crisis (as Mr. Bassett calls it) in the wider setting of the changing domestic and international situation. Variations in public concern and interest are brought out and reference is made to the attention paid to the situation by various groups within the community at particular stages of the controversy.

Several of Mr. Bassett's conclusions may be of particular interest. For example, he feels that the evidence suggests that neither in the United Kingdom nor "in any other country would the requisite support have been forthcoming at any stage for coercive measures against Japan. . . . The policy of conciliation . . . had at the time almost general, if sometimes reluctant, approval. Differences of view related essentially to the methods by which it could most effectively be promoted. . . . In all quarters there was resolute opposition to any unilateral British action of a coercive nature. There was also general refusal to take the risks of a Far Eastern war."

Mr. Bassett is of the opinion that the policy of the United States may well be regarded as the crux of the whole matter. In this connection, he observes that "... the more familiar charges against the British Government in connection with the crisis rest . . . upon the alleged refusal of that Government to cooperate effectively with the United States." So important is this phase to the author that the problem of Anglo-American co-operation, the extent to which it was achieved, and the nature of American policy as known at the time and revealed later are the subjects of exhaustive treatment in five chapters.

The general reader, even though he be a political scientist or a lay student of political phenomena, may find this work tedi-

ous and difficult. Students and scholars who have a particular interest in the subject matter of the book or in methodology will find it rewarding. To this reviewer, Mr. Bassett's major contribution lies in his painstaking scholarship and in his masterful handling of a mass of materials in the best scientific traditions.

ELI E. NOBLEMAN

Washington, D. C.

AMERICAN GOVERNMENT AND HISTORY

AGAR, HERBERT. *A Declaration of Faith*. Pp. viii, 237. Boston: Houghton Mifflin Company, 1952. \$3.00.

Herbert Agar's latest book would be an important contribution to the political literature of the times, even if it were the work of an unknown writer. For he analyzes the contemporary state of world politics with impressive lucidity and sets forth his conclusions, regardless of momentary popularity, with courage as well as with literary skill. But this book acquires special significance, when regarded as the logical sequel to the author's earlier writing on the problem of war and peace. For Agar is one of our publicists who has not hesitated to urge a resort to war as an instrument of national policy, when such a course seemed to him the clear duty of Americans with a proper consciousness of their country's responsibilities in the modern world. But now he comes forward with a plea that we know ourselves better and mend our ways in order that, if again we are forced to make this choice, we may make it not only with good conscience but also with a better prospect that we shall win the peace as well as the war.

Agar's first point is that Americans can not afford to approach the problem of war and peace from a strictly American point of view. We are not only Americans, but also men and women of the West. And the Western point of view transcends that of any one so-called sovereign state, even one as powerful and nearly self-sufficient as the United States. Another point which he makes with persuasive emphasis is, that we

can not safely assume that all the right is on our side and that the other side can properly be portrayed in sheerest black. He calls for humility as well as better self-knowledge, to the end that we may lead the West by our moral force as well as by material considerations.

Agar's hope is, that by timely preparations for right action the West may be spared the necessity of fighting another world war in our time. His argument should not be judged on the narrow ground that it covers only a portion of the case. His concern is with a portion the existence of which is too often ignored or even denied. The preparations he advocates lie in the political and moral rather than in the military field. The experience of the ages points to the conclusion that in the long run this area of preparedness is the most important.

A. N. HOLCOMBE

Harvard University

CHAFEE, ZECHARIAH, JR. *How Human Rights Got into the Constitution*. Pp. ix, 81. Boston: Boston University Press, 1952. \$2.50.

In these times of loyalty investigations and of charges and countercharges about danger to American liberties, thoughtful discussions of the bases of those liberties are of prime importance. This little book, by an author who has devoted much of his career to the study of liberty, goes back to the establishment in our Constitution of the guarantee of basic rights. It goes back, indeed, well beyond the constitutional period. Of most of the rights here guaranteed, Professor Chafee finds little basic discussion at the time of their inclusion in the Constitution. Constitutional debates were most unsatisfactory, for the reason that even at that early date the fundamental character of the rights in question was so well established that little discussion was required. Debate took place only where there was difference of opinion. To get back to the origin of legal protections of the rights in question, it was necessary to make use of early state constitutions, the Declaration of Independence, colonial charters, and cases, statutes, and documents of

constitutional significance in British history. Depending on the right in question, the author at times had not merely to go back to the Constitution but back decades or centuries, even as far as Magna Carta, to find the beginnings of entrenchment in government protective devices.

In one chapter—or in one of his three lectures, which were delivered as the Gaspar G. Bacon Lectures at Boston University for 1951–52—Professor Chafee analyzes in detail the history of what he regards as “the most important human rights provision in the Constitution,” that forbidding the suspension of the privilege of the writ of habeas corpus. His selection of the most important provision of its kind is not the one most often made by others, or at least it is not the one casually thought of as foremost at the present time. So well protected is that right, indeed, that we give little thought to the possibility of its invasion as rights of freedom of speech or of press or of religion may be invaded.

It is a long time since we have had any major difficulty with political incarceration of prisoners merely to get them out of the way or to vent personal spleen, without the right of access to courts to determine the validity of the imprisonment. Yet it is true, as the author says, that “when imprisonment is possible without explanation or redress, every form of liberty is impaired. A man in jail cannot go to church or discuss or publish or assemble or enjoy property or go to the polls” (p. 51). The author's concern, however, is with the development of machinery for protection rather than with the fundamental nature of rights themselves. He is not concerned with the question whether rights derive from God, from the nature of the universe, from the power of the dominant elements in society, or from some other source. He shows us rather the way in which the experience of Anglo-American people in different periods led to the establishment of governmental protection of rights now assumed to be fundamental. The book is well worth careful reading by thoughtful people.

CARL B. SWISHER

Johns Hopkins University

HALE, ROBERT L. *Freedom Through Law: Public Control of Private Governing Power*. Pp. xvi, 591. New York: Columbia University Press, 1952. \$7.50.

This is a study of judicial decisions, that embodies a lifetime of learning by one of the very few teachers of law whose training included also a doctorate in economics. Its target is the dogma of equality before the law, the idea that if the state enforces the laws equally against all violators, it will, as an impartial arbiter, have fulfilled its reason for being. Instead, the author argues, the state is the necessary partner in the establishment of every individual in his unique and unequal estate, rich or poor, and in every decision by which he comes to terms with those who can help him to what he wants or those who can get what they want by driving him toward what he seeks to avoid. In this view, distinctions between coercion and choice, between threats and inducements, are irrelevant. Every individual's economic decisions, on his employment and his consumption, are choices of the seemingly least unattractive among available alternatives. The state, in short, acting through law as enforced in the courts, defines what “property” and what “liberty” it will protect, and in so doing fixes and limits the bargaining powers individuals can exert; and “. . . inequalities in wealth result from inequalities in the coercive bargaining power of the different members of the community” (p. 37). It follows that court decisions on property and liberty, and the attendant inequalities they enlarge or diminish, are legislative acts of public policy, to be judged, here and now, by the criteria of public policy in a twentieth century democracy.

In the development of this theme the author examines painstakingly a broad range of cases from English and American state and federal appellate courts during the past century, beginning with common-law torts and moving to constitutional guarantees. A large section is devoted to criticism of Supreme Court doctrines about public utility rate regulation, but a good share of American constitutional law comes in for analytical notice along the way.

The central argument of the book was iconoclastic in the days when the American

bar seemed near success in attempting to write Herbert Spencer into the constitution. To this generation the didactic explanation of economic choices as rational calculations, and the unquestioning acceptance of appellate court decisions as the sole evidence of what the “law” is, will seem as quaintly formalistic as some of the judicial doctrines the author attacks. But not many readers will leave the book without a debt to the author for enriching their understanding of modern legal history, as well as a feeling of relief that courts do not settle everything.

HARVEY C. MANSFIELD

Ohio State University

GOSNELL, HAROLD. *Champion Campaigner, Franklin D. Roosevelt*. Pp. viii, 235. New York: The Macmillan Company, 1952. \$3.50.

The theme of this book was probably best stated by F. D. R. himself in October, 1940 when he said, “I am an old campaigner, and I love a good fight.” Gosnell has singled out this one aspect of Roosevelt's career and has woven an exciting chronological story of the late President's eleven campaigns. In only two of these did Roosevelt fail—the 1914 battle for the Democratic nomination as United States Senator and the one for the Vice-Presidency in 1920. It seems doubtful if few men in our national history had more campaign experience—a fact often overlooked until the appearance of this book in the growing body of Rooseveltiana. This work will not only become highly useful to teachers and students of party politics but will appeal to the general reader, for it is written in the language of the layman.

For persons over 40 years of age and more particularly those who have read the books written by Frances Perkins, Edward Flynn, James A. Farley, and Robert Sherwood, the chapters on F. D. R.'s four presidential campaigns do not contain a great deal of new data but provide some interesting anecdotes and interpretative material. The author, however, has done a magnificent job of integration and documentation in this and all other sections of the book. The development of the Roosevelt personality and campaign techniques prior to 1932 is not well known to readers,

and herein lies a major contribution of the book. Professor Gosnell brings the political setting and environment into each campaign and shows how Roosevelt and his managers attuned themselves to it. The author has drawn upon the tremendous storehouse of information found in the newspapers, biographies, and manuscripts in the Franklin D. Roosevelt Library at Hyde Park.

In the final chapter, "The Pattern of Success," Gosnell summarizes what he believes made Roosevelt so successful in winning elections. The late President's detractors will not be satisfied with his explanation, for "easy money" and "give away" programs are not regarded as the major reasons. Rather, Gosnell sees a superb sense of timing, "a realist in politics," and "the great faculty of giving the impression that he liked the person to whom he was talking" as highly important. Moreover, Roosevelt as a campaigner had "charm, optimism, confidence, generosity, faith, a vibrant voice, a handsome physique, a good memory, courage, a fine sense of humor, an excellent digestion, freedom from worry, a great gift for words, calmness, poise and patience." This reviewer read this six-page chapter several times and wishes Gosnell had expanded it considerably. Notwithstanding its tetseness, it is probably the best statement of the reasons why F. D. R. was a champion campaigner.

HUGH A. BONE

University of Washington

KIPNIS, IRA. *The American Socialist Movement, 1897-1912*. Pp. x, 496. New York: Columbia University Press, 1952. \$6.00.

In 1951 the Socialist Party of the United States celebrated its fiftieth anniversary, the party having been officially launched at the so-called Unity Convention in Rochester, New York, in 1901. During the next eleven years the party increased in membership to over 120,000, elected more than 1,000 of its members to political office, obtained the passage of a considerable body of legislation, and won the support of one-third of the American Federation of Labor. Its presidential vote reached nearly one mil-

lion. Following 1912, its membership began to decline.

The author describes the developments of these years—the most active in the party's history—as well as those leading to the formation of the party, clearly and vividly, and presents to the reader much valuable material laboriously culled from convention proceedings and a host of educational and propaganda articles, pamphlets, and books written during this fascinating period.

Dr. Kipnis' volume, however, fails in a number of respects as a definitive history of the party's decade of greatest growth. It gives the reader little insight into the personalities of the leaders of the movement and of their sacrificial efforts in behalf of a co-operative social order. It emphasizes many of the differences in tactics among the members of the party as shown in convention debates, but gives no indication of the underlying spirit of unity among tens of thousands of the party's members which spurred them on to years of dedicated service. Nor does it give sufficient insight into the impact of the movement on the social and cultural thinking of the times.

In his account of the internal party struggle between William D. Haywood, leader of the Industrial Workers of the World, and the moderates, led by Morris Hillquit, Victor L. Berger, Eugene V. Debs, and others, Professor Kipnis bitterly attacks the moderates for their successful attempt to eliminate Haywood and his syndicalistic following from the party, but gives no indication as to what would have happened to the Socialist party if it had fallen into the control of the Haywoodites with their advocacy of direct action, sabotage, and strikes leading to a general strike, as their main instruments for gaining power.

It is in his Conclusion that Dr. Kipnis leaves aside all objectivity and makes wholesale charges against the "constructive" or moderate Socialists for social attitudes which were utterly alien to the spirit of the party as a whole. In discussing the reasons why the party lost ground following 1912, the author takes practically no account of underlying social, economic, political, and

psychological forces in American life from 1910 to the present day. Although Dr. Kipnis has presented material of much value to students of the movement, a fair and balanced history of the Socialist Party in the early twentieth century is yet to be written.

HARRY W. LAIDLER

New York City

GUTTMACHER, MANFRED S., and HENRY WEIHOFEN, *Psychiatry and the Law*. Pp. viii, 476. New York: W. W. Norton & Company, 1952. \$7.50.

Perhaps the dominant factor in the history of the criminal law in the first half of the twentieth century is the unrelenting pressure of the new science of psychiatry for the recognition of its claims in the administration of that law. The impatience of psychiatry with the unscientific premises of the criminal law has led to extravagant claims for psychiatry's ability to solve the problems of crime. Popular annoyance and judicial outrage when some of these claims were not borne out have seriously hampered those who seek to make psychiatry a major participant in the administration of the criminal law. Those psychiatrists, lawyers, and judges who are working to this end—for there are many lawyers and judges doing more for this cause than the psychiatrists can do—will welcome this book.

A joint work of practitioners of the two disciplines, it exposes equally, with clarity and without heat, the judge who holds to a precedent against solid scientific evidence of its invalidity and the psychiatrist whose claims outreach his performance. A lawyer's regard for the value of decision by precedent and the danger of sudden breaks with tradition makes for a sympathetic treatment of those judges who keep the pace of the march toward scientific procedure too slow for fear of vague harms, a fear which they feel but cannot always justify. This in combination with the authors' scientific caution—not exaggerating the claims of psychiatry, but merely presenting the data in support of them—should be more helpful in obtaining acceptance in the courts for those points of

view than the colorful calls to arms of some less temperate members of the psychiatric profession.

While the authors devote more space to the criminal law and criminal responsibility than to any other single subject, they attempt a broad statement of all that a psychiatrist should know about the law and procedure in the courts, and all that a lawyer should know about psychiatry. The book should be very useful to both the groups at which it is primarily aimed. It describes lucidly the pitfalls to which the psychiatrist is exposed on the witness stand, the situations in which he may be subjected to legal liability and the juridical necessity for legal procedures not to his liking. For the lawyer, the various types of mental diseases, deficiencies, and abnormalities are described and discussed in terms which he should easily understand, without any attempt to oversimplify what is not too clear to the psychiatrists themselves, as the chapter on the psychopath shows.

There is a particularly illuminating chapter on veracity. Here we find some persuasive reasons for admitting lie detector tests in trials under proper limitations and instructions, a discussion of the propriety of introducing at the second Hiss trial the opinion testimony of Doctor Binger as to the veracity of Whittaker Chambers, and some treatment of leading questions and other suggestions to witnesses, pathological lying, blood tests, and confessions. This short summary of only one of the book's nineteen chapters suggests the breadth of its coverage.

The legal discussions may appear superficial to the lawyer, and the book purposely omits most of the legal authorities without which the lawyer is apt to feel uncomfortable. The clinical material is very helpful, but it is to be regretted that, no doubt due to space limitations, it is somewhat sparse. The authors have made a substantial contribution to interprofessional understanding which should help in the task of achieving a more scientific administration of the criminal law.

GERALD F. FLOOD, Judge

Court of Common Pleas
Philadelphia, Pennsylvania

RIENOW, ROBERT. *Introduction to Government*. Pp. xix, 583, xiv. New York: Alfred A. Knopf, 1952. \$5.00.

This text is designed as an introduction to the study of government. Its greatest usefulness will be for those students who find place for only one course in government in their educational program.

The comparative approach is used. The study is given largely to the theories and practices found in the governments of Great Britain, France, the Soviet Union, and the United States. Approximately one-half the space is given to the United States.

The three chapters of Part I, 44 pages, deal with the Idea of Government: its nature, dynamics, and structure. Part II, 95 pages, contains a thumb-nail sketch of the structure of the four governments. Part III, 96 pages, deals with the basic foundations: the place of revolution, constitutions, natural rights, federalism or unitary government, and separation of Powers. Part IV, 232 pages, is devoted to the process of transforming public opinion into law: the electoral machinery and the legislative process. Part V, 78 pages, deals with the carrying out of the law: executive, administrative and judicial. Part VI, 18 pages, is given to local government, and Part VII, 25 pages, treats on Global Government.

The theory and the practice of each topic, for instance, nominations, found in each of the four countries are discussed in the chapter devoted to that subject. The governmental process rather than the government of any country is stressed.

The book is elementary and introductory in character, a necessity for a book of this range. A college course based upon it would not seriously conflict with more extended courses on these countries. It is well written and very readable. Any person planning an introductory course in government, especially where the introductory course is the terminal course for a great number of the students, may well give this approach serious consideration.

FRANK PADDOCK

Temple University

DE VOTO, BERNARD. *The Course of Empire*. With maps by Erwin Raisz. Pp. xxi, 647. Boston: Houghton Mifflin Company, 1952. \$6.00.

"History," according to Herder, "is geography set in motion"; or, as Kant put it, "Geography lies at the basis of history." While denying any undue devotion to geographic determinism, De Voto, in his extensive review of American explorations, never wanders very far from this general concept. He has taken as his theme the first impact of civilized man upon the North American wilderness, and the wilderness, to begin with, held out stubbornly against its would-be conquerors. Wiser in retrospect than the explorers had any chance to be, the author recounts with infinite patience and skill their efforts, often painful and bumbling, to lay the foundations of empire. Much of the time they did not even know what they were about. They sought a Northwest Passage and found instead a continent; they assumed the existence of a great River of the West and found only mountains and desert where it was supposed to be. They competed frantically to divide among European empires an area that was in reality indivisible and that became almost of necessity one empire, the United States.

It is seldom, in these days of concentration on the present and the "usable past," that a writer will spend so much time on beginnings. But De Voto sees that these beginnings are important. He is interested in details to a degree that would satisfy the most exacting antiquarian, and he has as good an eye for a colorful story as the most incurable romanticist. But he is also looking for meaning. What made men devote their lives to the difficult and dangerous tasks of exploration? What effect did the lives they led have on them? What did their coming do to the primitive tribes they encountered? What difference did the knowledge they turned up make to the rest of mankind and to future generations? Answers to these questions are not simple, and De Voto does not try to make them so. But at least he makes it clear that there are answers, and that the an-

swers, however complicated, are worth seeking.

The scope of this narrative is impressive. It begins with the earliest Spanish Conquistadores and continues forward for two and three-quarters centuries through the explorations of Lewis and Clark. The writer shows throughout an amazing familiarity with the original records, and with the vast body of secondary material to which they have given rise. And he knows also, with rare intimacy, the geographic setting against which he has deployed his principals.

JOHN D. HICKS

University of California
Berkeley

KING, ERNEST J., and WALTER MUIR WHITEHILL. *Fleet Admiral King: A Naval Record*. Pp. xv, 674. New York: W. W. Norton & Company, 1952. \$6.75.

This account of Admiral King's career, from his birth and days at the Naval Academy through World War II, contains much that is fresh both to the student of the early twentieth century Navy and to those interested in global Allied decisions during the recent war.

Chief regret is the poor execution of the volume. Being neither biography nor autobiography, it lacks both detachment and intimate insight into the subject's character. The reader learns, for example, that King was the instigator of the attack on Guadalcanal, but, relying on this work alone, would never dream that one of the principal obstacles in setting up that attack was the question of command leading to an interesting clash of services and personalities. Again, the problem of commanding Army Air Corps bombers on anti-submarine duty receives a slanted treatment. The Navy had a good argument in terms of integration, co-operation, and the functional use of weapons; but the Army's plea for utmost flexibility to scour the seas where the U-boats were at any given moment concentrating was at least equally strong—a point somewhat belatedly conceded by King, one infers, when the Tenth Fleet was finally established.

Less important, perhaps, but likewise confusing, is the use of footnotes to convey so many facts or ideas relevant to the

text. But that may be just as well, since the style is a battleship gray, and every effort to break the monotony, consisting mainly of a plethora of exclamation points, falls with the dullness of chipped paint.

All this is unfortunate since it will curtail the audience of a valuable book. King served his country superbly, and his strategical concepts seem to have been as sound as the steel in a gun turret. One can speculate at length about the course of history if Allied strength had not been drained into the Mediterranean and an earlier landing effected in Normandy, or if the Burma Road had been opened in 1942-43 and Chiang Kai-shek had been liberally supplied when he really needed it. These and other equally important, thought-provoking themes reward the persevering reader throughout this unusual work.

J. A. ISELY

Princeton University

SMITH, WILLARD H. *Schuyler Colfax: The Changing Fortunes of a Political Idol*. Pp. xiii, 475. Indianapolis: Indiana Historical Bureau, 1952. \$4.75.

Schuyler Colfax was an amiable politician who served as Speaker of the House under Lincoln and as Vice-President during the first Grant administration. In 1872 his career was brought to an abrupt end through his coming into disfavor with Grant and through revelations that he was involved in the Credit Mobilier scandal. Professor Smith labors valiantly to try to prove that Colfax has been maligned in being considered no more than a mediocre scoundrel. He has succeeded in casting doubt on whether Colfax was a scoundrel but has failed to prove him better than mediocre. This is a first-rate scholarly biography of a second-rate figure.

Colfax was a South Bend, Indiana newspaper editor, strongly opposed to slavery expansion, who early in the 1850's helped organize the Republican Party in the state and simultaneously embraced Know-Nothingism. He soon dropped the latter and repeatedly proclaimed that the issue was not "so much whether black men shall be slaves, but whether white men shall be free." In 1855 he was elected to the House, where his ingratiating ways made

him popular. His nickname was "Smiler"; he was said never to have lost a friend or made an enemy. Throughout the Civil War and Reconstruction he retained this popularity by trailing just behind the vanguard of the most advanced Republican position. He was a rather cautious Radical, and party loyalty was his most distinguishing characteristic. Consequently, he was a logical choice for Speaker of the House in 1863, a position which he filled competently enough until 1869.

As a campaigner, Colfax was a fluent if platitudinous speaker. Senator John J. Crittenden described him as one "whose patriotism always overflowed and inundated him on every occasion." He was ever the friend of the Negroes and one of the more emphatic wavers of the bloody shirt. Although sufficiently fierce in his denunciations of President Andrew Johnson, he was more popular than Ben Wade and had a reputation for being temperate, pious, and morally impeccable in his private life. Consequently, he, rather than Wade, was nominated for the vice-presidency in 1868. But as Vice-President he passed the peak of his popularity, in part perhaps because, as the *New York World* declared, he carried "more wind than weight, even in his own party," in part because he was ambitious for the presidency. In 1872, Grant dumped him for Henry Wilson of Massachusetts.

Thereafter his downfall was rapid. He was accused during the campaign of owning Credit Mobilier stock, asserted in a misleading speech that he had never been given any (technically true), and was later proved to have bought some. In order to refute the charge that he had received a \$1,200 dividend, he declared he had received the money from an envelope manufacturer who had government contracts—and was in deeper than before. If not dishonest, he had at least been careless with the public trust and was politically through. A correspondent for the *New York Tribune* was so unkind as to suggest that the name of Mount Colfax in Yosemite National Park be changed to "Buzzards' Roost."

FRANK FREIDEL

University of Illinois

THOMAS, BENJAMIN P. *Abraham Lincoln: A Biography*. Pp. xiv, 548, xii. New York: Alfred A. Knopf, 1952. \$5.75.

About 4,000 books and pamphlets have been written on Lincoln. Some are worthless and trivial, others are outmoded, and still others are in all their essentials incorporated into works produced during the past thirty or forty years. Even so, Lincoln scholars list approximately 100 titles of current value. In such listings we find the works of Josiah G. Holland (1866), Isaac N. Arnold (1885), William H. Herndon (1889), Ida M. Tarbell (1900), Lord Charnwood (1917), and, of course, the ten-volume biography by Nicolay and Hay (1890), and Carl Sandburg's classic (1926-1939), six volumes of poetry-set-to-prose.

Why, then, another biography of Lincoln? The answer is easy. Each generation must interpret the great men of the past in order to make them alive in the present, and each generation, each decade, has available more material (this is particularly true of Lincoln) for such interpretation than the preceding one. Until 1952 many of us went to Lord Charnwood for the best one-volume biography of Lincoln. Excellent as that work is, it will probably give way to the present volume whose author had the advantage of new sources and the fertile modern Lincoln scholarship.

A lifelong student of Lincoln, a scholar who as editorial adviser for the forthcoming *Collected Works of Abraham Lincoln* has fully explored the Robert Todd Lincoln Collection in the Library of Congress (available only since 1947), a man of humor with some gift for the happy phrase, Benjamin Thomas has probably written the one-volume biography of Lincoln for our time. Drawing neither from folk tales nor from his imagination the author has given us a volume quite acceptable to the scholar and most satisfying to the general reader.

Thomas neatly distills the new facts from the legend of Ann Rutledge, gives a balanced appraisal of Mrs. Lincoln, and notes (without in any way disparaging Lincoln's noble letter to the mother) that two of the

widow Bixby's five sons were deserters. In this volume one gets a close-up view of Lincoln as a log-rolling member of the Illinois legislature, sees him, as he grapples with a great issue, transform the craft of a politician into the art of a statesman, and follows him as he, ever increasing in wisdom and understanding, in gentleness and charity, in humility and patience, saves the Union and joins the immortals.

CLAUDIUS O. JOHNSON

State College of Washington

GREENBIE, SYDNEY, and MARJORIE BARSTOW GREENBIE. *Anna Ella Carroll and Abraham Lincoln*. Pp. xvii, 539. Penobscott, Maine: University of Tampa Press, 1952. \$6.00.

In 1940 Mrs. Greenbie published *My Dear Lady*, a biography of Anna Ella Carroll, who, said the author, was an unofficial member of Lincoln's Cabinet, a great political propagandist, and the deviser of the strategy that defeated the Confederacy in the West. Miss Carroll was a neglected figure in American history, Mrs. Greenbie contended, because she was a woman. Now Mrs. Greenbie's husband has joined forces with her, the pair having found some new evidence, to produce another life of Miss Carroll that is even more belligerent, extravagant, and impossible than the first.

If the Greenbies had known when to stop, they would have made a valuable historical contribution. They are right in saying that Miss Carroll has been wrongly neglected by historians. She was a very intelligent and charming woman, she was a gifted political writer, and she had access to the great, many of whom advised with her and used her. But the Greenbies go beyond moderation. Their Anna was, with a "perhaps," the greatest woman in our history; she was a greater presidential adviser than Tom Paine, Colonel House, or Harry Hopkins; she framed the greatest piece of strategy in military history; one of her pamphlets was second in influence only to *The Crisis*, and another was the most potent force in our national life since the Declaration of Independence. Such extravagant claims cast doubts on the validity

of the entire book, as do the many scenes, labeled "synthetic" in the footnotes, in which Anna holds detailed and improbable conversations with Lincoln, Jefferson Davis, General Scott, and Secretary Stanton.

The most controversial contention of the Greenbies is that Anna devised and caused the government to execute the so-called Tennessee Plan, by which Union forces were to operate on the Tennessee River line parallel to the Mississippi and flank the Confederates out of their positions on the latter river. Thus she was responsible for Grant's victories at Forts Henry and Donelson. Also she, in effect, conceived and managed Grant's Vicksburg campaign. Space does not permit an analysis of the Greenbies' case, but it is weak. Anna did give the War Department on November 30, 1861, a document recommending a move on the Tennessee line. As she once admitted, she did not know what the Department did with her memorandum. No single contemporary document indicates that Grant advanced because of her influence; in fact, the contemporary documents disprove the Greenbie thesis. Grant summarized the matter well when he said that a movement on the Tennessee was so obvious almost anyone could have thought of it.

The Greenbies handle evidence in a fascinating way. They take any situation that is not completely explicit and make it relate to Anna. Thus the House of Representatives debates a resolution on who is responsible for the Western victories. Several members say they do not want the wrong person to get the credit. Obviously they are aiming at General-in-Chief McClellan. Not so, according to the Greenbies. The House is trying indirectly to honor Anna. Lincoln makes a speech after the fall of Vicksburg and does not mention Grant. Why? Because Anna was the real planner of the Vicksburg campaign. Grant receives his commission as lieutenant general and in the exchange between him and Lincoln nothing is said about Grant's victories. Why? Because Anna was the real architect of those victories. The final blow is that the vacant chair in Carpenter's painting of the Signing of the Emancipa-

tion Proclamation is for Anna. It must be, for whom else could it be?

SANGER, DONALD BRIDGMAN, and THOMAS ROBSON HAY. *James Longstreet*. I: *Soldier*, by Donald Bridgman Sanger; II: *Politician, Officeholder, and Writer*, by Thomas Robson Hay. Pp. xi, 460. Baton Rouge: Louisiana State University Press, 1952. \$6.50.

The high historical merit of this publication was virtually guaranteed by its authorship. Though the subject is general, the treatment is monographic. Much acquainted with the milieu in which Longstreet moved, the authors have avoided irrelevant trappings and closely adhered to the intent of the title.

Dr. Sanger reveals Longstreet as a superb battlefield soldier and a great corps commander. But there is no uncritical adulation. Indeed, the many shortcomings of Longstreet are clearly indicated. The author mentions (p. 234) "the limits of his ability as a soldier." In particular (p. 250) Longstreet "failed to measure up to the standard required for the role of an independent commander." Here, in fact, was the crux of matters. Throughout the critical year 1863, Longstreet was bitten by the bug of independent command.

Dr. Sanger has not cleared up uncertainties about Longstreet at Seven Pines in May 1862, at Suffolk in early 1863, at Gettysburg in July 1863, and later in the Tennessee Valley. This, however, was, for lack of satisfactory evidence, relatively impossible. The footnotes, mainly of source references, are without flavor.

The section on postwar Longstreet by Hay is noteworthy historical writing. The role of Longstreet as politician, officeholder, and writer is clearly set forth. In addition, light is thrown on his business adventures, his private life, his character, and his personality. The meticulousness for which Hay is well known is very evident. Chapter V, "The Soldier's Story," represents a magnificent bibliographical accomplishment, which has high value as a guide to the large Confederate postwar military writing.

Hay's estimate of Longstreet is in agree-

ment with that of Sanger. Longstreet had (p. 383) "not too much capability." A London newspaper is cited (p. 384) describing Longstreet as "a man of no intellectual brightness." Hay points out that Longstreet was a poor business man and asserts (p. 444) that "On his own, Longstreet was never an effective force, either in peace or in war."

Defects in the volume are minor and few. One may well question the particular interpretation (pp. 328-329) of Radical Republican reconstruction motivation. Such words as "aftereffects" (p. 238) and "commencementtime" (p. 348) seem erroneous or unduly modernistic. The parenthetical arrangement (p. 396, fn. 48) is distracting, and a sentence (p. 405, e. 10) seems out of place. But the authors and publishers are to be congratulated on putting forth a work of much contribution to historical scholarship and historical literature.

MIRSKY, JEANNETTE, and ALLAN NEVINS. *The World of Eli Whitney*. Pp. xvi, 346. New York: The Macmillan Company, 1952. \$5.75.

The story of Eli Whitney's invention of the cotton gin is familiar to millions of Americans. While employed as a private tutor in the family of General Nathanael Greene, on a Georgia plantation, Whitney succeeded in inventing a simple machine for removing the cotton seeds from the fiber. Removing these green seeds by hand had been the greatest bottleneck in cotton production. With the invention of the cotton gin, plantation owners increased their holdings, bought and bred more slaves, expanded their production, and laid the foundation for a one-crop economy in which Cotton became King. All this has been set forth in text books over the past century and a half. Important as was the invention of the cotton gin however, it was second to Whitney's other contributions to America's industrial revolution—namely, the introduction of the system of interchangeable parts, which in turn made possible mass production.

At long last the hitherto unpublished collection of the Whitney family papers

was placed in possession of two competent historians, Jeannette Mirsky and Allan Nevins; and now for the first time we learn of Whitney's greatest contribution to American technology.

The birth of the machine tool industry resulted from the threat of war. When in 1798 war between France and the United States seemed inevitable, President Adams and his cabinet, realizing how totally unprepared we were, quickly accepted Whitney's offer to manufacture 10,000 stand of arms for \$13.40 each. By devising a system of interchangeable parts and assembling the identical parts into a finished gun, Whitney pioneered the system of mass production. Fortunately, the threat of war passed before the contract was filled, but the system which Whitney had introduced set a pattern that was later followed by Samuel Colt, Singer, and more recently, and on a grander scale, Henry Ford. It has become synonymous with American industry.

The authors have done far more than merely give us a narrative of Whitney's achievements. They have, as the title of the book implies, given us an insight into the world of Eli Whitney. His associations with Adams, Jefferson, Madison, Monroe, Gallatin, the secretaries of war, and his dealings with the bureaucrats of that day receive lengthy and sympathetic treatment from the authors.

One hundred and fifty years is a long time to wait for a definitive biography of a man as important as Eli Whitney—and an appraisal of the world in which he lived. But perhaps it was worth waiting since his epoch-making contribution to mass production will be more widely appreciated in this technological age.

TRYON, WARREN S. (Compiler and ed.). *A Mirror for Americans: Life and Manners in the United States 1790-1870 as Recorded by American Travelers*. Vol. I: *Life in the East*; II: *The Cotton Kingdom*; III: *The Frontier Moves West*. Pp. xx, 230, v; viii, 231-466, v;

viii, 467-793, v. Chicago: The University of Chicago Press, 1952. \$14.50 the set, or \$5.00 each vol.

A Mirror for Americans reprints well-selected extracts from the contemporaneous writings of some forty Americans who traveled in the United States. Extracts from the voluminous literature written by foreign travelers have already been compiled, and, during the past quarter-century, it has been possible for Americans to "see ourselves as others saw us" through the simple perusal of collected commentaries. It is strange that hitherto no similar effort has been made to collect and extract for present-day readers the works of Americans who also journeyed about the country and set down their judgments as to what their countrymen were like. As natives in their native land these writers possessed certain advantages. They kept their feet pretty well on the ground. Their patriotism was restrained. Sectional or personal prejudices often motivated their comments yet they could be amazingly objective.

Life in the East includes 40 extracts from the writings of fourteen authors. These range from the *Letters Written during a Tour through the Northern and Eastern States of America* in 1793 by John Drayton, who was subsequently to become Governor of South Carolina, through *The Pleasures of New York* as recorded by James Kirke Paulding, a leading member of the New York literati, and Davy Crockett's coonskin impressions of America's chief cities, and conclude with several descriptions of both high and low life in the eastern cities and countryside of 1850. Almost half of the pages of *The Cotton Kingdom* are devoted to extracts from the writings of Mrs. Royall, Joseph H. Ingraham, and Frederick Law Olmstead. Other selections cover the period from the Creoles of Louisiana in 1812 to the desolation and problems of 1865. The fifty selections in *The Frontier Moves West* are grouped in two parts—the Middle West and the Pacific West. The latter includes the Rockies.

Professor Tryon has selected these extracts with skill. He has given attention

both to the interests of the general reader, who may seek a panorama for pleasant evening reading at home, and to the requirements of the teachers and students who seek source material in an easily available form. The University of Chicago Press is to be praised for the good format of the set, and for the clear type, large enough to be easily readable. The selections are generally from the first editions of the original narratives. Obvious mistakes in grammar, punctuation, and spelling have been corrected where the original obscured or impeded the meaning. Passages have frequently been deleted without the use of ellipses, and rearrangement of material for the sake of clearer organization has sometimes been made. The bibliographical note at the end of the third volume is highly selective, but contains references to twice as many sources as are represented by extracts in this collection. Each volume is indexed separately. The fifty illustrations are chosen from contemporary prints and etchings.

Maxwell Air Force Base, Alabama

COOK, GEORGE ALLAN. *John Wise: Early American Democrat*. Pp. ix, 246. New York: King's Crown Press, 1952. \$3.50.

This biographical study depicts John Wise (1652-1725) as a liberal, democratic thinker living before his time. The author uses primary sources extensively in describing the career and utterances of this New England minister who contributed significantly to colonial religious and political thought.

Wise was the son of a brewer and former indentured servant, graduate of Harvard College, and minister of Chebacco parish near Ipswich, Massachusetts for 45 years. In 1688 he was jailed, fined, and temporarily removed from his ministry for leading Ipswich townsmen in opposing a tax they considered illegal since it lacked approval of the colony's elected representatives.

Wise gained further recognition by defending the autonomy of the individual congregation and opposing proposals that

a privileged ministerial hierarchy govern Congregational churches. In his *The Churches Quarrel Espoused* (1713) and *A Vindication of the Government of New England Churches* (1717) Wise used principles of natural law (borrowing from Pufendorf) to defend the liberties and democratic character of Congregational churches. His advocacy of separate, democratically organized church and state was unusual in the waning New England theocracy.

To what extent was Wise a democratic liberal living before his time? He used natural law doctrine to support liberty and democracy and also to uphold private property and commercial freedom. Perhaps he more actively supported free enterprise than political democracy. His advocacy of paper money had economic as well as political significance. Cotton Mather, his conservative ecclesiastical opponent, also favored paper money. But unlike Mather, Wise accepted the development of business society and the concomitant decline of Puritan theocracy.

Wise welcomed a growing middle class desiring greater religious, political, and commercial freedom. He and this class wanted a limited, representative type of democratic government sensitive to its economic needs. Propertied taxpayers should control the government taxing them and should have a monetary system which would increase population, manufacturing, exports, and profits. To obtain such benefits, Wise favored creation of a private land bank controlled by wealthier merchants and landowners.

Wise's income far exceeded his ministerial salary, thanks to his landholdings and part ownership of two or three merchant vessels. Three of his sons were merchants, one a farmer, and one a minister. He did not oppose indentured servitude (in 1712 he advertised in Boston for a runaway servant) or religious and property qualifications for voting. Although he advanced democratic thought (using natural law to defend liberty, equality, and property), he accepted the interests and views of the rising colonial merchant class.

University of California, Berkeley

ECONOMICS AND INDUSTRY

WELLS, HENRY A. *Monopoly and Social Control*. Pp. ix, 158. Washington: Public Affairs Press, 1952. \$3.25.

This book is a paradox. It is both profound and superficial. Its profundity, unfortunately, results in obscurity, its superficiality in overstatement and inadequacy. It is so obscure that I find it hard to understand and harder to summarize without doing Mr. Wells an injustice. But I shall try.

Wells believes that our economy is steadily becoming more monopolistic—a term which he uses so broadly that it describes any interference with freedom of access to economic resources. "In a feudal economy it assumes the form of control of land by feudal lords; in the present day industrial countries it manifests itself as private control of channels of trade, the means of industrial production, and financial facilities" (p. 1).

According to Wells, the "law of causality," which governs both physical and social phenomena, shapes man's destiny. Man cannot change the principles "governing causal sequences," but in dealing with physical phenomena he has learned "to place them under conditions under which they will act to attain a desired goal" (p. 17). Man has not done so well in dealing with the operation of the law of causality in social relationships. Without being wholly aware of this principle he has tried at various times—but to no avail—to devise social utopias. Plato, Étienne Cabet, Saint Simon, Owen Fourier, skilled craftsmen though they may have been, devised institutional patterns and set social goals which were never achieved.

But all this was before scientific Marxist socialism, "the first comprehensive attempt to analyze historical and social phenomena by tracing the dynamic operation of the law of causality" (p. 38). According to Marx's historical materialism, changing methods of production come into conflict with property relationships (p. 40), and this conflict inevitably eventuates in social revolution. Wells is more optimistic. He believes that the distinctive psychological and

cultural characteristics of a given nationality, if strong enough, may control the economic forces making for revolution and thereby avoid a violent explosion. The disruptive forces in the American economy which threaten the American way of life are monopolies and cartels. But unlike that of other countries, "the history of America presents a remarkable blend of social and economic factors which point towards peaceful evolution progress, through a conscious social control free from subservience to blind historical forces" (p. 54).

Although we are at a critical moment in world history, Wells believes that we can disprove the Marxian doctrine by re-establishing a competitive economy. Our pragmatic, individualistic philosophy, the product of a frontier environment, should help us. But our failure to block in their infancy the forces making for monopoly have greatly complicated our problem. Or, as Wells abstrusely puts it, "The origin of the fatalistic pressure of these forces on our economy is to be found in the lag of time between the appearance of conditions which give rise to monopoly, and the historical moment when the impact of the monopoly-generating force is felt and recognized" (p. 115). Our antitrust legislation is the only legislative weapon we have to prevent a debacle. "Its success means the fulfillment of our historical ideals; its failure augurs protracted economic crisis, an increasing sharpening of economic maladjustments and an accompanying social fermentation" (p. 104).

This summary of Wells's thesis does not do justice to the range or intricacy of his ideas. He is obviously grappling with complex and profound social phenomena. In my judgment he does not fully master them. The result is a coalescence of obscurity and profundity.

Wells's superficiality lies primarily in his discussion of the facts, the institutional significance of which so greatly troubles him. In discussing the extent of economic concentration and the types and prevalence of monopoly practices, Wells relies largely on secondary sources whose findings support his thesis. Economists disagree on the extent of industrial concentration and on whether competition has declined in our

economy. Wells ignores writers who deny that industrial concentration has increased and who contend that competition has taken on more viable but nonetheless effective forms. My preconceptions are similar to Wells's and I agree with a good deal of what he says, but I do not believe that his study helps to reconcile this controversy.

My difficulty with Wells's historical and philosophical discussion, which is his major preoccupation, may reflect on my scholarship rather than on his. Wendell Berge, who writes an introduction to Wells's study, pronounces it "the most illuminating document [on the subject of monopoly] written in our time." I commend it to all those who are interested in the relationship between the state of the industrial arts and social and political institutions and who enjoy hard thinking.

GEORGE W. STOCKING

Vanderbilt University

ABBOTT, CHARLES CORTEZ. *The Federal Debt*. Pp. xvii, 278. New York: Twentieth Century Fund, 1953. \$4.00.

This is an analytical-historical study of our management of the public debt during the war, the immediate postwar period, and the Korean emergency. Beginning with an historical survey, the author finds that at least until March 1951 the government pursued a cheap money policy marked by the following main features: (1) a controlled interest structure, low and stabilized both as to level and interrelationships; (2) consistent use of the Federal Reserve System to support security prices by buying at par and at the seller's option; (3) heavy and increasing reliance upon short term and demand obligations, the former largely adapted to the needs of banks; (4) subordination of the Federal Reserve authorities to the Treasury and of monetary policy to other controls; and (5) little interest in debt retirement for its own sake.

This program was ill-adapted to a predominantly free economy, to the needs of non-bank investors, and to the use of time-honored monetary policy to prevent the undue expansion of credit. It broke down under the inflationary pressures of Korean defense after great harm had been done to

the economy. Higher interest rates of and by themselves would have proved no great deterrent to expansion, but indirectly they would have achieved this end by supporting reserve requirements and distributing more of the debt to nonbank purchasers.

The second part of the book deals analytically and statistically with problems relating to the maturity factor, the instability of ownership among various types of owners, and the case for the repayment of the debt. Insurance companies particularly have shown instability of ownership, unloading bonds when other attractive outlets for funds appeared.

A Committee (Arthur Upgren, Chairman) presents a policy statement with a bill of recommendations aiming at reversing our historical practice on all the major points mentioned above. We should return to the free market with emphasis on longer term issues adjusted to the needs of nonbank investors.

With the benefit of hindsight, the reviewer is receptive to most of this strong bill of fare. However, he has a considerable number of reservations, of which space will permit him to raise one only: Assuming that credit could and would have been curtailed by the effective control of reserves during the first nine months after Korean hostilities began, do we have any assurance that this could have been done so as to check undesirable outlays without interfering with the necessary expansion of war facilities and production?

Reservations notwithstanding, all can agree that the author and the Committee have presented a highly provocative, informative, and readable account of a very significant subject.

HAROLD M. GROVES

University of Wisconsin

WENGERT, NORMAN I. *Valley of Tomorrow: The TVA and Agriculture*. The University of Tennessee Record Extension Series, Vol. XXVIII, No. 1. Pp. xv, 151. Knoxville: Bureau of Public Administration, University of Tennessee, 1952. \$1.50.

In this compact little book *Valley of Tomorrow*, the author gives a rather complete story of the development of the Tennessee

Valley Authority from the initial construction of the Muscle Shoals Dam in 1916 to the present. As the TVA was the first regional agency organized under federal government control, the author is quite justified in devoting some space to a consideration of the subject of regionalism although it seems unfortunate that he quotes only from sociologists in discussing the topic and gives no credit to work done by numerous regional geographers.

The correlation between the work of the TVA and the conservation movement in the United States is analyzed, and in a general way the major details of the plan of development of the TVA are discussed. In an early chapter the natural environment of the region is considered briefly, followed by a consideration of economic conditions particularly as related to farming within the valley, with such topics as "phosphate fertilizer," "water control," and "agricultural development" being emphasized. A brief but enlightening chapter on the "Test-Demonstration Farm" shows in some detail how the farmers of the region were persuaded to co-operate with the government agency for the improvement of their lands.

The rest of the book, and by far the major portion of it, is devoted to the various and complex dealings that have developed between the TVA and other federal, state, and local agencies, and between TVA and the colleges within the region. These show very clearly the difficulties that can arise when a regional agency such as the TVA is established, which cuts across certain vested rights and privileges previously under the control of older established agencies. Not only did the TVA encounter opposition from community organizations, county organizations, and the Farm Bureau, but it had to correlate its work with the extension services of the colleges in the region and with the United States Department of Agriculture and its numerous bureaus and agencies. Perhaps the greatest conflict in regard to area and function arose from the overlapping activities of the TVA and the Soil Conservation Service. This is described in detail in a chapter called "TVA and SCS," and it gives the reader a good view of the competi-

tive nature of the various government agencies.

In the final chapter the author summarizes the work of the TVA in an overall appraisal, which constitutes the most interesting part of the last section of the book.

The volume is a contribution to the extensive literature on the Tennessee Valley Authority, but it might have been made more readable through the insertion of a few maps and photographs.

EDWIN J. FOSCUÉ

Southern Methodist University

GIVEN, WILLIAM B., JR. *Reaching Out in Management*. Pp. ix, 175. New York: Harper & Brothers, 1953. \$2.50.

This book is the sequel to the author's well-known *Bottom-Up Management* (1949) which described the delegation of responsibility down the line. *Reaching Out in Management* presents some administrative methods for "making the most effective use of the authority that accompanies responsibility so that all phases of business activity may be benefited to the maximum extent."

At the root of the author's idea of "reaching out" in management is the goal of enabling every employee in an organization to find personal fulfillment of his satisfactions in his work. In presenting the concept of reaching out in management the author explains that it goes much farther than the practice of "decentralized management" as most executives understand it. The former concept assumes that management's responsibility is not adequately discharged unless it succeeds in actually leading members of an organization to take and capitalize upon the opportunities that lie about them.

Offered as one phase of an effective approach to the general problems of executive development and work satisfaction, the philosophy of reaching out is dependent upon the following principles: (1) management must assure that the goals of executive development are made the subject of continuous attention and effort. There must be sincerity of interest in company people; (2) management must provide opportunities for executive development all

down the line. There must be a willingness to gamble on the abilities of people within an organization; and (3) management must have a policy of using company people within an organization to fill newly created opportunities or positions, even if the odds are small from the standpoint of the length of their experiences.

Business executives, educators, and students who are interested in management philosophy and executive development may find in this book a report of the author's personal views and experiences in following the previously mentioned philosophy and principles in his own organization, The American Brake Shoe Company. Many illustrations are cited for specific business operational areas such as: research, sales, purchasing, and accounting. More general illustrations are applied to medicine, education, and the Church prior to a treatment of the social responsibilities of management.

According to the author, few men in top management now have the opportunity to accumulate any impressive amount of capital because of mounting income and estate taxes. If ambitious men in top management positions can no longer have a goal of accumulating personal wealth, then their drives and ambitions must be changed toward some other goal. The author presents and describes his views and experiences concerning alternate goals of top management such as the development of people to realize greater personal satisfactions and the building of better business organizations more successfully to accomplish management service and social goals for the employees, communities, and public.

Mr. Given's descriptions of his personal philosophy and principles are interesting, readable, and constructive. The reader's acceptance of the concepts and practices presented will greatly depend upon his own beliefs and experiences. Because of the philosophical nature of the text material, the reactions can be controversial.

JOHN F. MEE

Indiana University

TAYLOR, GEORGE W. (Ed.). "Labor Arbitration Series." Philadelphia: Labor Relations Council, University of Penn-

sylvania, 1952. \$10.00 the series, or separately.

BACKMAN, JULES. *Economic Data Utilized in Wage Arbitration*. Pp. vii, 56. \$1.00.

FREIDIN, JESSE. *Labor Arbitration and the Courts*. Pp. vi, 58. \$1.00.

HANDSAKER, MORRISON, and MARJORIE HANDSAKER. *The Submission Agreement in Contract Arbitration*. Pp. vii, 101. \$1.50.

KENNEDY, VAN DUSEN. *Arbitration in the San Francisco Hotel and Restaurant Industries*. Pp. vi, 113. \$1.50.

KUHN, ALFRED. *Arbitration in Transit: An Evaluation of Wage Criteria*. Pp. xiii, 203. \$3.00.

SIMKIN, WILLIAM E. *Acceptability as a Factor in Arbitration Under an Existing Agreement*. Pp. vi, 67. \$1.00.

SKILTON, ROBERT H. *Industrial Discipline and the Arbitration Process*. Pp. vi, 76. \$1.00.

TRIPP, L. REED. *Wage-Reopening Arbitration*. Pp. vi, 108. \$1.50.

WITTE, EDWIN E. *Historical Survey of Labor Arbitration*. Pp. vi, 64. \$1.00.

This arbitration series edited by the dean of American arbitrators, Dr. George W. Taylor, fills a variety of needs on the part of arbitrators, management and labor people, economists, and other social scientists.

The thousand or so people who every year arbitrate a labor case or two and feel their lack of rich, varied experience with arbitration despite their likely past work with the War Labor Board in World War II will find the series particularly helpful. Freidin's study will provide them with a good view of how the courts are likely to regard their work, Skilton's work on discharge will prove most useful in handling the type of case that they are most likely to be confronted with numerically, and the rest of the series will widen their view of the arbitration process. It should be understood, however, that the studies are scholarly discussions of important facets of arbitration and are not intended as a manual for arbitrators.

Labor and management should find the whole series a very valuable insight into

what goes on in the minds of arbitrators, since with the exception of Backman all the authors have had substantial experience as arbitrators. Backman's study on the use of economic data in wage arbitrations will provide both sides with an excellent summary of just what their economic arguments must ultimately boil down to.

The social scientist and the economist are likely to be the only parties who will put the series down with some disappointment. The former would probably particularly like to hear something from both labor and management on just what they think about arbitration. The economist is likely to be disheartened by the predominantly legalistic and pragmatic approach to labor matters which marks all the studies, even by those writers in the series who are known as economists.

The economist is likely to want to know what the economic impact of arbitration is likely to be on our economy. Should the objective of arbitration be simply to duplicate the answers that the parties would have reached by collective bargaining including resort to the strike or lockout as part of the collective bargaining process? Since the power of society stands behind the arbitrator, may he not have some responsibility to society at large in his work, rather than responsibility just to the parties in the case? But if so, what criteria should he employ? Simkin's study, while not concerned with these questions, does consider what makes an award acceptable to the parties. It discusses matters that all social scientists concerned with labor relations must be concerned with. From here the social scientist must carry on.

A. MORGNER

Texas Agricultural & Mechanical College

JOHNSON, GERALD W. *The Making of a Southern Industrialist: A Biographical Study of Simpson Bobo Tanner*. Pp. viii, 84. Chapel Hill: The University of North Carolina Press, 1952. \$2.00.

This is a case where the reviewer feels like querying the publisher. Yet the jacket flaps—if these are the publisher's preserve—are not more specific on a cardinal point than is the text itself. Is this a family memorial, prompted by the well-placed af-

fection of relatives? It has earmarks of this, though the writing and manufacturing job are highly professional, in contrast to the effort often appearing under private imprint. Is it a sociological or cultural offering like so many that have distinguished the Chapel Hill press? There are hints that it may be designed as exhortation for the young people of North Carolina, a sort of out-of-school reader in the contribution of the industrial enterpriser to the admirable character of their state.

If it is a personal tribute it is deserved and skillfully executed. Mr. Johnson's long and first-hand knowledge of North Carolina and its history and his special acquaintance with the process of industrialization there enable him to illumine the public implications of a private life. But if the essay is intended to explore an area and era of public significance, then—paradoxically—it ought to be more private. If the reader is to learn about the resurgence of the cotton mills he has a right and a need to be given particulars of capitalization, credit, mechanical equipment and operation, wages, hours, and relations with commission houses. Generalities of energy, independence, kindly despotism toward workers, and imagination in developing markets do not reveal as much as a faithful narrative of year-to-year industrial contrivance. The real appreciation of an achievement must spring from plain, patient statement of a large number of concrete items.

One may say the book is too small for that—not much more than 20,000 words. Accepting this limitation, and dismissing quantity, the reader is justified in judging quality. The positive accomplishment of the textile mill builders of North Carolina in the generation commencing with the 'eighties in helping to rescue the society from the penalties of slavery, secession, and civil war is expertly put. However, in spite of saving clauses which Mr. Johnson is careful to insert, the portrayal is not critical. True, we must take those tycoons in their time and remember that the industrial discipline, suddenly imposed, had harsh features inseparable from the demands of the situation. But by their own lights the cotton mill kings, of whom Tan-

ner was typical enough, fell short of public approval, not only since but while they lived and worked. Nothing is said in these pages about child labor, which the mill men fostered and on which they battered. The most elaborate, determined, and—unhappily for North Carolina and America—successful legal defense of child labor commenced in Tanner's own Charlotte. Maybe Tanner deprecated what the organized cotton manufacturers of North Carolina did to John and Reuben Dagenhart, and through these boys to the children of the section and the nation. We are not told.

Each man to his own manner, and Tanner's success in supplying coolie cloth was notable. But others, among them D. A. Tompkins, whom the author mentions, performed more and on more fronts. Nor were the persevering successes of North Carolina mill enterprisers superior to those of their South Carolina and Georgia neighbors, as Mr. Johnson, with pardonable state pride, seems to suggest.

BROADUS MITCHELL

Rutgers University

SOCIOLOGY AND EDUCATION

ELDRIDGE, SEBA. *The Dynamics of Social Action*. Pp. vii, 119. Washington, D. C.: Public Affairs Press, 1952. \$2.50.

This well-written and well-informed book is intended for laymen interested in community activities and social problems generally. It contains brief but adequate references to the many citizens' groups, as Eldridge calls them, which operate in professional and voluntary capacity in American communities. He discusses how the practice of community membership is carried on and how to begin it: how specialized groups operate as the means for citizen and community co-operation, and how political democracy is practiced in this country. The book also includes a brief discussion on the use of mass communication agencies in promoting community affairs. There is an excellent chapter on professional contributions showing how social problems are being handled by vocational specialists. The author stresses the impor-

tance of individual initiative in the solving of social problems and the dependence of improvements upon social inventions.

Of theoretical interest is the clear evidence presented by Eldridge that social activities in communities are based upon primary group functions organized in terms of community interests. Furthermore, his discussion of the field takes cognizance of the fact that all planned activities follow the same pattern of growth which is characteristic of social change in general.

THEODORE ABEL

Hunter College

MANNHEIM, KARL. *Essays on the Sociology of Knowledge*. Edited and translated from the German by Paul Kecskemeti. Pp. viii, 327. New York: Oxford University Press, 1953. \$6.00.

This volume contains six essays written by Mannheim between 1923 and 1929 not previously available in English. The sponsors correctly point out that since Mannheim's *Ideology and Utopia* was issued in 1936 there has been a considerably increased interest in the sociology of knowledge. In their belief that the ideas in this new volume will "greatly help in clarifying the important issues" they are perhaps overly optimistic.

It seems unlikely to this reviewer that the volume will add much to the late Professor Mannheim's reputation. It will, however, afford a glimpse for those interested as to the development of his thought in these years, especially viewed against the background of his later, and perhaps best-known work, *Ideology and Utopia*.

This judgment is precisely because so much has been written in this area in the last decade and a half. Despite the patient, meticulous, detailed, and sometimes tortuous development of his argument, Mannheim could not foresee this development, could not anticipate considerations which again and again the reader expects him to deal with. Unfortunately the space allotted this review does not permit a discussion of this point nor of the central ideas of the essays.

Mannheim several times stresses the strong influence of the culture upon society and the intellectual development of

man within a given culture. The work reveals more than once that he was the product of a cultural background different in important respects from the one shared by the readers of this English text. Moreover he was writing in a different historical period. Sociology itself, like all the social sciences, has made considerable progress since 1929. One wonders if the Marxist learning Mannheim shows at several places in this volume would have survived the events of the years since his death in 1947.

A word of very real appreciation should go to the editor, who, with Mrs. Jean Floud, was also translator. Dr. Kecskemeti's introductory chapter is not only an excellent summary of the development of Mannheim's *Sociology of Knowledge* and of some of the work which influenced him; it also contains a clear-cut critique, though one which does not take into account some of the more recent work.

EDMUND DE S. BRUNNER

Columbia University

MARIANO, JOHN H. *A Psychoanalytic Lawyer Looks at Marriage and Divorce*. Pp. vii, 276. New York: Council on Marriage Relations, 1952. No price.

This book stresses the conviction that the solution to our marriage and divorce problem is not to be found in the courtroom. What the sick marriage needs is diagnosis and therapy. This is probably a wholesome emphasis, considering the present state of divorce policy and procedure in the United States. And yet it would be unfortunate to ignore the law altogether in discussions of divorce. Since marriage is a legal status, individuals seeking a divorce need the equal protection of the law.

There are other evidences that the writing and thinking in this book are a bit loose. The author states that "divorce does not cure anything" and then qualifies the statement by adding that this is true for any spouse who is emotionally immature. Again, we are told that "divorce is an effect, never a cause." How can any social phenomenon not be both a cause and an effect? Perhaps for certain purposes,

divorce as effect should be stressed, but this is no warrant for ignoring the possible reform of the divorce laws. "Divorce reform directed at strengthening our laws," writes Mariano, "is like treating effects and ignoring causes."

Again, Mariano writes: "Speaking broadly, it is widely believed that the grounds for marriage failure exist outside the home and are rooted for the greatest part in our economic system and our socially competitive order. Rejecting such theory, the author's theme is that the major causes for marriage failures rest basically inside the individual." Here again is failure to see the interdependence of factors; in this case, the individual and his society.

The author designates himself as a "psychoanalytic lawyer," at least in the title of the book, but the analysis is at an elementary and sometimes superficial level. The professional student of the family will not find anything new in this book, although it may bring a fresh message to some lay readers. This book has some added significance as a sign of a trend among lawyers to combine law with psychological and social science.

M. F. NIMKOFF

The Florida State University

GELDENHUYS, NORVAL. *The Intimate Life, or The Christian's Sex-Life*. With a foreword by Dr. Charles R. Erdman. Pp. 96. New York: Philosophical Library, 1952. \$2.75.

This book is a brief discussion of intimate phases of married life, apparently for engaged and newly-married couples.

The contents include seven chapters with headings as follows: The Sexual Side of Human Nature; Choosing a Life Partner; Love's High Places; His Resolutions; Birth Control; Wife and Mother; A Firm Foundation.

The chapter on birth control includes schedules worked out for representative menstrual cycles. The fertile period has been determined by application of the well-known principles of Drs. Ogino-Knaus.

The author approaches the problem from

a spiritual and idealistic viewpoint, as well as with a reasonably practical outlook.

EDMOND J. FARRIS

The Wistar Institute
Philadelphia, Pennsylvania

ALLEN, DAVID D. *The Nature of Gambling*. Pp. vi, 249. New York: Coward-McCann, 1952. \$3.50.

Those who profit from large scale gambling sedulously propagate the view that gambling represents instinctual behavior on the part of large masses of our population, that it cannot be suppressed and should therefore be controlled through legalization, which would enable states and municipalities to share in its profits. The forthcoming sessions of state legislatures will undoubtedly see a rash of bills introduced, sponsored by the gambling interests, which will provide for the legalization of various forms of gambling. At the present time a New York legislative commission is holding hearings on the advisability of legalizing off-track betting.

David Allen's book on the nature of gambling should be placed in the hands of all legislators and newspaper editors who lend their support to proposals for the legalization of gambling. It is apparent from this book that legalization is no solution to the social, economic, and political problems raised by gambling. This conclusion is reached after a calm and dispassionate analysis of data on three basic questions: (1) Is gambling a fundamental human activity? (2) Is gambling harmful? (3) Is gambling suppressible?

Allen comes to the conclusion that gambling is encountered in various forms wherever group life is found. His analysis of the historical evidence clearly indicates that gambling "is as harmful now as in the days when it was first banned," and that the social cost of gambling "is prohibitive." One of the major factors in producing this social harm in the United States is the exploitation of gambling by organized crime. Allen also concludes, after examining data from many different jurisdictions, that professional gambling can be suppressed through adequate laws, properly enforced, backed by a favorable public opinion.

All arguments advanced for the legalization of gambling are found by this book to be "based on falsehood" and spurious. According to Allen the only possible policy which can be adopted concerning gambling is the suppression of its professional aspects (p. 168). Allen presents various useful suggestions for improving the strategy and tactics in connection with the repression of professional gambling activities.

It should be noted that the American Bar Association Commission on Organized Crime has recently attempted to carry out one of the major suggestions made by Allen for dealing with gambling, namely, an improvement in the gambling laws. This Commission formulated a model anti-gambling code for adoption by the various States.

Debate on the problem of what to do about gambling is charged with a great deal of emotion and a great deal of self-interest. It is obvious that Mr. Allen has performed a useful public service in examining factually and dispassionately the data concerning the legalization of gambling.

MORRIS FLOSCOWE
City Magistrate

New York City

HOHMAN, ELMO PAUL. *Seamen Ashore: A Study of the United Seamen's Service and of Merchant Seamen in Port*. Pp. xxiii, 426. New Haven: Yale University Press, 1952. \$5.00.

This book is the second of a series being published under the Fund for Merchant Seamen Studies, a fund made available by the Woman's Seamen's Friend Society of Connecticut. There is an advisory committee, with one member as director of the fund. The book has a foreword written by William S. Newell, President, United Seamen's Service, and by E. S. Land, Vice-Admiral, United States Navy (Retired).

Part I deals with The United Seamen's Service which had its origin in Pearl Harbor and the Second World War that magnified the historical problems of crews, ships, and waterfronts. The social scientist interested in the origin and natural history of an

organization in a crisis situation will find this section extremely valuable.

Part II provides the main title of the book and considers merchant seamen in port. This is the disappointing part of the book. One finds himself searching in vain through meaningless generalizations for empirical data. Instead, one finds that this "may" or that "might" happen. Frequent use of indefinite terms—possibly, perhaps, likely, appears, inclined—so often takes the place of facts. This is surprising when one knows that the author spent "two decades and more" in the study of the problems of seafaring labor. He has visited "every large port of Europe and the Orient with actual visits to practically every significant waterfront institution in those ports." He visited "every large port in the United States." The author had a half-year of service on the North Atlantic in 1918. He has been on several important commissions of a maritime character.

Despite these experiences one does not get a picture of the American seamen in Shanghai, Cadiz, Genoa, Melbourne, Helsinki, or San Francisco with adjustment difficulties demanding The United Seamen's Service. Instead one learns only that "The ports and harbors of the world present a variety which is both bewildering and fascinating." The seaman lacks buyman-ship. With unfettered self-expression he turns to alcoholic drinks and his eyes are fixed upon alluring goals of amusement, gaiety, and camaraderie. The sea is a magnet for various types of nonconformists, escapists, and individuals who sow their wild oats. These generalizations take as much space as concrete data.

One feels that Professor Hohman must have files filled with empirical data, but, if he has, he decided not to share them with the reader. It is a fair bird's-eye view of seamen ashore and of The United Seamen's Service, but this section cannot be handed to a graduate student as a good example of empirical research.

Part III deals with services other than that of The United Seamen's Service. Part IV is an appraisal and includes appendixes and a short selected bibliography.

L. GUY BROWN
University of Rhode Island

TINDALL, GEORGE BROWN. *South Carolina Negroes, 1877-1900*. Pp. xii, 336. Columbia: University of South Carolina Press, 1952. \$5.00.

This book begins with a discussion of Governor Wade Hampton's racial policy. Although elected on a platform of white supremacy, his program did not include the complete elimination of Negroes from public life or the taking away of civil rights already won. Hampton pledged himself to "know no race, no party, no man, in the administration of law." He kept that pledge by appointing the best qualified Negroes to minor offices and by providing a school system. The program failed. Hampton moved on to Congress. His successors were not able to carry out a policy to which most whites were opposed. Fraud and intimidation deprived the Negro of his ballot despite the Fifteenth Amendment. Racial animosity and agrarian discontent swept Benjamin R. Tillman into the governorship (1890). His anti-Negro propaganda culminated in a disfranchising convention (1895) whereby most Negroes lost their political rights.

Several chapters treat of Negro social and economic institutions. The author traces the rise of the share-crop system and the difficulty Negroes had in establishing themselves as landowners. Economic discontent was one factor in the migratory urge. He shows the influence of the church in Negro life, as a religious institution and as a social center. The need for economy resulted in retrenchment. Negro schools suggested themselves as one place where government expenses could be cut. Subsequently they lacked properly trained teachers and adequate salaries. Fear of "social equality" led to violence. Lynching was defended as the only adequate deterrent to murder or rape. Supporting prisoners in idleness led to the convict-lease system with its attendant evils of exploitation and neglect.

A pattern of segregation was established by Negroes themselves during reconstruction days. They seldom mingled with whites on a basis of equality. A civil rights law remained on the statute books until the late 1880's when Jim Crowism obtained a legal status. Despite the law prohibiting

interracial marriage, no action was taken against illicit relationships between white men and Negro women.

The book is well written and the author has gathered his material carefully. His use of manuscript material is extensive although not exhaustive. Naturally, he has used the manuscript collections of Duke University, the Charleston Library Society, and the Universities of North and South Carolina, as well as official records and many newspapers. There are only three references to manuscript collections from the great resources at the Library of Congress. These would have made the work more complete.

JOHN G. VAN DEUSEN

Hobart College

FRENCH, DAVID G. *An Approach to Measuring Results in Social Work: A Report on the Michigan Reconnaissance Study of Evaluative Research in Social Work Sponsored by the Michigan Welfare League*. With Analyses of Four Evaluative Studies prepared by John G. Hill, Leon Festinger, Helen L. Witmer, and Alfred J. Kahn. Pp. xiv, 178. New York: Columbia University Press, 1952. \$3.00.

In an effort to come closer to the problem of the nature and limitations of the research contribution to social work and the ways in which this contribution can be realized, the author presents a vivid analysis, in nontechnical terms, of the problems and requirements of evaluative research in the field of social work. This analysis, in turn, leads to the conclusion that an institute of welfare research attached to a graduate professional school of social work, closely affiliated with the social science departments of a university, provides the necessary dual orientation to social work operations and to social science basic for effective research.

In 1950 the State of Michigan invested over \$105 million through governmental agencies and \$20 million through voluntary agencies in social work programs. Less than one-tenth of one per cent was spent on any kind of research either to determine or improve the effectiveness of these programs. With this example of the com-

munity's investment in social work, the author reviews the problems amenable to research which confront social work and considers the technical obstacles that stand in the way of getting answers to these problems. Past research efforts, he believes, clearly demonstrate that neither the social sciences nor other professions can contribute much to the many problems listed by caseworkers, agency administrators, community organization specialists, educators, and others in the field of social work. Effective research, if it is to be done, will have to be stimulated and sponsored by social work itself. On the other hand, however, the author is equally convinced that even when such work starts from problems of unique interest to social work, it can proceed effectively only if it builds upon the knowledge already established and going forward in the human sciences. These beliefs convince him of the promise for a dynamic relationship between social science and research in social work.

The foregoing partnership, however, requires the acceptance by social work of the goals and knowledge of the social sciences and identification by the social sciences with the social work profession in the sense of accepting its own ethical norms and its fundamental objectives. Such a relationship is most likely of achievement when structured by the proposed graduate school institute.

Well written, readable, and provocative, the text should certainly further the objective it seeks.

C. WILSON ANDERSON

Minneapolis, Minnesota

HATT, PAUL K. *Backgrounds of Human Fertility in Puerto Rico*. Pp. xxiv, 512. Princeton, N. J.: Princeton University Press, 1952. \$5.00.

The book is so full of interesting and important facts on Puerto Rican fertility that just to summarize them in a neat and well-co-ordinated fashion is quite a task in itself. The findings brought out by this study may be grouped, however, in two categories. First, there are the general facts on the Puerto Rican population, most of them already well known. Then, there are the specific facts on fertility. And

here Dr. Hatt's study throws considerable light on many interesting problems. We shall summarize these facts in the order stated.

The study shows once more, among other things, that Puerto Rico's population is predominantly rural; that its standard of living is low, judged by American standards; that the people are predominantly Roman Catholic; and that marital fertility varies inversely with socioeconomic status. These things were already well known; but the book confirms them once more. The study gives, for the first time, reliable information on the per cent of Roman Catholics in the population (85 per cent), a thing which was hereto merely a matter of guess.

The real merits of the book lie, however, in the large amount of information which it furnishes on fertility differentials. Thus, it shows that education is a more potent factor in determining low fertility than rental value—something which we all suspected, but which had not been clearly pointed out before. It also gives some rather striking facts on rural-urban differences. For example, it shows that there is no difference in age at marriage between rural and urban people, and that there is, likewise, no correlation between form of marriage and place of residence. That is, consensual unions are just as common in the country as they are in the city, or vice versa. The data on age differentials are also illuminating. First of all, no difference was found in age structure between rural and urban places. Then, the younger generations are marrying earlier and have a more favorable attitude towards family limitation than the older generations. The latter is quite a hopeful sign in itself! As would be expected, desertion, separation, and divorce are more common among the younger generations.

It is a pity that the author made no effort to collect data on contraceptive practices. This is all the more puzzling in view, not only of the importance of the subject itself, but also of the growing popularity of these practices. But the large amount of information gathered on sterilization more than compensates for this deficiency. Sterilization is quite a fad nowadays in Puerto Rico. It is also a very controversial subject. And

Dr. Hatt's study shows, among other things, that the per cent of sterilized women varies directly with the rental value of the home, is larger in urban than in rural places, and has increased during the first four decades of this century. It also points out the fact that three-fourths of the sterilized women react favorably to the operation—a fact which is very suggestive in itself!

EMILIO COFRESE

University of Puerto Rico
Mayagüez

WINSLOW, C.-E. A. *Man and Epidemics*. Pp. ix, 246. Princeton, N. J.: Princeton University Press, 1952. \$4.00.

A year ago the World Health Organization in Geneva awarded its Léon Bernard Prize to Dr. Winslow. In doing so this highest health organisation wished to express that there were few people in the world who had contributed so much to the advancement of public health and social medicine as Dr. Winslow. After 30 years of research and teaching at Yale University, after many more years of practical and administrative work in various positions and as a member of numerous committees, Dr. Winslow is now professor emeritus and looks back on the development of public health at large and particularly on the thrilling period in which he took such an active part. A few years ago he gave us a fascinating book, *The Conquest of Epidemic Disease* (Princeton University Press, 1943), and now a new book has come from his pen which, we hope, is the first of a series that will not only trace the history of modern public health, but will, at the same time, make the lay reader aware of its achievements and problems.

Thirty years ago Dr. Winslow defined public health as the "science and art of preventing disease, prolonging life, and promoting physical and mental health and efficiency through organised community efforts toward a sanitary environment; the control of community infections; the education of the individual in principles of personal hygiene; the organisation of medical and nursing services for the early diagnosis and treatment of disease and the development of the social machinery which will ensure to every individual in the com-

munity a standard of living adequate for the maintenance of health." This is a definition that cannot be improved, and the present volume discusses the first of these five major objectives, namely, organized community efforts toward a sanitary environment.

It seems only natural to us today in America that we may drink water from the tap without running the risk of becoming sick, that the milk is brought to the house every morning, pasteurized and in sterilized containers, that the food we buy in the store has been inspected and is clean and wholesome, that human wastes are disposed of without causing harm and without molesting us, that scourges such as cholera, typhoid fever, malaria, and yellow fever which used to work havoc on the North American continent have practically disappeared. Yet these things are far from natural, but the result of long developments and heroic struggles which Dr. Winslow narrates in this book in a scholarly and yet popular way.

If we look at the world at large we soon find that our health problems are far from solved. In the underdeveloped areas, two-thirds of the world's population are constantly undernourished and their life expectancy at birth is of 30 years only, while it is 63 years in the economically advanced countries. Public health still has a great task ahead.

HENRY E. SIGERIST, M.D.

Pura, Ticino, Switzerland

CANNON, IDA M. *On the Social Frontier of Medicine: Pionering in Medical Social Service*. Pp. xiv, 273. Cambridge, Mass.: Harvard University Press, 1952. \$4.75.

Ida M. Cannon in her *Social Frontiers of Medicine* has written a book which is both fascinating and challenging. She shows the slowly developing relationship of medicine and social work at Massachusetts General Hospital over a period of forty years. She credits this union of the two professions to the creative imagination and courageous pioneering of Dr. Richard C. Cabot who lives vividly in these pages. But the reader senses that the success of Dr. Cabot's crusade could not have been

achieved without the enthusiasm and conviction of Ida M. Cannon herself. Together they learned, and their experiment proved, that poverty, disease, and ignorance must be attacked co-operatively by doctors, nurses, social workers, hospital administrators, educators, and the clergy in order to develop good public health.

This book is both historical and biographical as the writer goes back to the inception of medical social work. She traces its rise from the centuries-old hospitals of London for the "sick poor" where the earliest hospital social workers were known as Almoners. In this country in 1853 Elizabeth Blackwell, the first woman medical graduate, established a dispensary for women and children in the lower east side of New York. Almost at once Dr. Rebecca Cole, a Negro physician, was sent out as "Sanitary Visitor" to carry intelligent guidance and sympathy into the homes of dispensary patients. Throughout the book many others are named and recognized for their contributions and sacrifices in developing this new teamwork in caring for the sick.

Miss Cannon's book is also a narrative of astounding health developments during her years of service. The writer shows how pandemic tuberculosis, especially among the poor, was the opening wedge for social work in hospitals. She depicts the growth of public health measures in the control of tuberculosis and other preventable diseases—typhoid fever, diphtheria, child-birth fever, and others. She traces the change in character of hospital service to include the sick of all classes rather than of the poor alone. Slowly emerged the pattern of the mental hospital giving treatment rather than mere incarceration. Society came to accept the open fight against venereal disease; the need for sex education with interpretation and inspiration. There arose the new fields of physical therapy, occupational therapy, industrial medicine, psychosomatic medicine, and geriatrics.

Miss Cannon shows with tact and understanding the change in the attitude of medical men themselves. Unselfish as persons, doctors have sometimes been jealous of their profession, maintaining an aloofness perhaps engendered by the Aesculapian

Oath itself. Here in this book we see them slowly and carefully testing this wider service to ailing humankind before accepting it as a part of good and necessary hospital service.

This book should be read not only by every doctor and social worker but by all professional people. It should be required reading for young people in pre-professional training. It is that kind of book which does not end with the past or even the present; the challenge of the future is its strongest feature.

AULEENE MARLEY JAMISON

University of Pittsburgh

FINER, HERMAN. *Administration and the Nursing Services*. Pp. xiv, 333. New York: The Macmillan Company, 1952. \$4.00.

This book offers a solution to some of today's deficiencies in quantity and quality of nursing services, especially in hospitals. The author presents in a highly persuasive manner the promise that incorporation of adequate instruction in administration in the basic nursing curriculum will increase the effectiveness of nurses by perhaps 25 per cent, and will at the same time raise the quality of nursing care.

The author, professor of political science at the University of Chicago, draws heavily on his own and other experience in the teaching and practice of public administration. Also, specific study of nursing administration and education was afforded by the W. K. Kellogg Foundation, which brought together for a continuous five-month seminar 36 outstanding nurse educators and administrators from fourteen American universities, Sweden and Denmark, the United States Army, Navy, Air Force, and Public Health Service, and the National League of Nursing Education. In addition to directing the seminar, Professor Finer visited several schools of nursing. Also, outstanding figures in medical, hospital, and nursing care met with the seminar individually and at two large conferences in Chicago.

Although influenced greatly by the participants in the study, the findings and views stated in this book are those of the

author as an individual. His chief recommendations are:

1. Major courses in administration and the social sciences should be incorporated into the basic nursing curriculum. In-service training for those now in administrative positions is recommended, but with much lower priority.

2. Existing college departments should be used wherever possible in giving these courses to nurses, rather than expecting nurse-instructors to pick up a smattering for relay to students.

3. A library of actual experiences in nursing service administration should be built up for instruction by the case-study method. The history of nursing should be rewritten in a scientific style rather than in today's romantic style.

4. Thorough research in nursing administration should be developed, "far wider and subtler than the current time and motion studies."

Much space is devoted to dispelling two widely prevalent misconceptions about nursing: first, that a nurse should act as an obedient technician, without necessarily understanding her position and actions in relation to others in the same general field and the broad aims of society; second, that administrators are born, not made. The author succeeds, but in his anxiety to be convincing he tends to dwell at unnecessary length on principles and to multiply examples excessively. These factors, plus a classical style of writing, make for difficult reading. The fault is more than overbalanced, however, by the many carefully framed, sometimes vivid, expressions that the reader will wish to underline or otherwise mark for recall and future reference.

This book is highly recommended to all interested in the administrative and educational aspects of nursing, hospital, and medical care, and as well to those who may be asked to educate nurses in administration and the social sciences.

PAUL A. LEMBCKE

Johns Hopkins University

PETERSON, A. D. C. *A Hundred Years of Education*. Pp. 269. London: Gerald Duckworth & Co. (distributed in the

U. S. by The Macmillan Company), 1952. \$3.25.

In this rapid survey of developments in education in western Europe and the United States during the past century, the author, Headmaster of Adams' Grammar School, frankly admits that he was forced to omit important names and events, and he also confesses to some diffidence that the work should have been undertaken "by a practising schoolmaster rather than an educational expert." He says that educational books by educational experts often seem to be written for the educational experts themselves, and because of their peculiar terminology are "very heavy-going for the school teacher and general reader."

There is much stimulating material in this book, which notes the prominent fact that during the past century the state has taken an increasing part in education in the western world. The influence of educational theorists and practitioners is probably too briefly discussed, but attention is called to the school's assuming so many functions once performed by other institutions and agencies, a view of education which is attributed to the strong influence of John Dewey.

Discussions of reform in the secondary curriculum during the second half of the nineteenth century, of the slow breakdown of social barriers, and of "secondary education for all" throw interesting light on persistent issues in education above the elementary level. Students will find interesting also the discussion of the systematic higher education of women which seemed to have developed during the past century in part because of the necessity for better teachers. Peterson says that confusion in the definition of higher education, the health of which is limited in practice by "finance and human weakness," makes that subject difficult to discuss unless it is known what it is and what it is not. Academic self-government, freedom of instruction, and freedom of learning remain crucial issues. The German concentration on research has been difficult to "acclimatise in America," and the various "accrediting agencies" in the United States may have done some damage by undertaking to judge the merits of an "institution by the number

of Ph.D.'s on its staff." The most crucial educational issue in the countries covered by the study is "provision of enough good teachers. No educational research, no building regulations, no systems of grants or compulsory attendance, no supervision of curricula can hope to be effective unless there are enough good teachers in the school."

In the "Epilogue" Peterson expels a few personal bees from my bonnet. Educational administrators, he says, are infatuated with "the measurable and the complicated" because they see it on paper and can answer criticisms by "unimpeachable figures." He considers "the administrative mind" and the heavy emphasis on the expansion of administrative "services" to the neglect of the important relationship between teachers and those taught as most dangerous tendencies in education. Expenditures on physical facilities have far exceeded those on good teachers, a dismal condition which often leads to "the diversion of educational resources."

EDGAR W. KNIGHT

University of North Carolina

KELLEY, EARL C., and MARIE I. RASEY. *Education and the Nature of Man*. Pp. 209. New York: Harper & Brothers, 1952. \$3.00.

Education must be fitted to the nature and needs of the human being, and we now know enough about the nature of man to see that educational practice is in great need of overhauling. This is the theme of the book before us.

Living tissue is purposive, say the authors. It strives, and in the human organism it strives in a way to create conscious experience progressively richer without known limit. But this can occur only if the required conditions are present. It is the business of the school to set up these conditions. Indeed, providing these conditions is the sum and substance of education.

Communication "by which one human being can to a degree know what another thinks, feels or believes . . . is the source of all growth except body building" (p. 78). "Two barriers to this kind of communication must be overcome. Overcoming these barriers is the problem of educa-

tion. One barrier is inability to perceive and understand if prior experience has not built up a readiness for what is presented. The second is the defense which everyone rears against the disapproval of his associates, against loss of prestige and other painful experiences arising out of interchange with others. When these barriers to communication are removed the individual spontaneously, under the inherent driving propensity of the living tissue of the human organism and the inquiring mind, will progressively achieve those experiences which expand the range of what he can know, feel, and control.

With this understanding of human nature, the whole problem of education becomes obvious. It is to place the child or other person in a situation where the individual will have new experiences which he is ready to receive and interpret. Above all education requires a social situation where communication is free and full and where the individual does not feel the need to protect himself against disapproval or other painful interchange with associates. All too frequently the school provides a situation quite otherwise.

The kind of communication which progressively creates the mind and personality of the human being is ordinarily best facilitated when the communicating individuals are co-operatively engaged in striving to achieve a common goal. Hence co-operative undertakings are an important part of education.

The book has its defects, particularly a lack of logical precision in formulating concepts and developing ideas. Nevertheless it carries a message of great importance and should command the attention of all concerned with the problem of education.

HENRY N. WIEMAN

University of Houston

TABA, HILDA, ELIZABETH HALL BRADY, and JOHN T. ROBINSON. *Intergroup Education in Public Schools*. Pp. xii, 337. Washington: American Council on Education, 1952. \$4.00.

This is the final report of the Project in Intergroup Education in Cooperating Schools, carried on from January 1945 through August 1948. During the second

year when most of the experimental work was done, eight staff members were involved in "more than 250 local projects in 72 individual schools or community groups in which some 2,500 classroom teachers, school administrators, and community workers had a part."

As a summary of what was learned in the Cooperating Schools project, this volume will be welcomed by all those people who have known about the most important and productive project in intergroup education to date. The reviewer, however, would recommend that prospective readers postpone this study until they have gone through at least one of three earlier publications: *With Focus on Human Relations* by Taba and Elkins, *Elementary Curriculum in Intergroup Relations*, and *Curriculum in Intergroup Relations: Secondary School* by members of the Project Staff.

In the present volume the authors show how educating for better democratic intergroup relations is wider and deeper than developing people who differ in respect to race, religion, or ethnic group membership. What they say incorporates the most recent emphases in modern social psychology: that personality is mostly an emergent through interactions in which people strive to satisfy their needs through the role behavior ascribed and achieved as a result of their various group memberships. While the authors acknowledge the contributions of cultural anthropology, nowhere do they develop the implications of the concept of culture for a democratic educational philosophy. The point developed is that better intergroup relations must be developed through improved interpersonal relationships, from which can grow the increased knowledge, emotional sensitivity, reflective thinking, and skills to deal with intra- and inter-group relations. The fundamentals of intergroup education turn out to be the fundamentals for democratic education in a complicated, multigroup society.

The succeeding chapters on curriculum development, group life in school, school-and-community projects, and ways of working contain superb materials on what schools can and must do if our democratic values are taken seriously. The thought will not,

however, fail to come to mind, when the original purpose of the project is kept in view, that more light might have been shed on the tremendously pressing problems of race, religious, social class, and ethnic group relations if the project supervisors had chosen their sub-projects after they had focused their thinking more on school and community situations in which the more narrow conception of intergroup relations was a crucial concern. Moreover, a clearer understanding of the unique character of representative roles vis-à-vis groups would have enabled the project workers to get a clearer conception of the distinctive part which intergroup relations of all kinds play in the lives of individuals and groups.

MARTIN P. CHWOROWSKY
University of Pennsylvania

MOTT, FRANK LUTHER. *The News in America*. Pp. x, 236. Cambridge, Mass.: Harvard University Press, 1952. \$4.50.

Frank Luther Mott, the dean of American academic journalism, has written a very wise and a very useful book, a book which explains the functions and the workings of American newspapers better than almost any book published in the last decade.

Dr. Mott, who has been a reporter and editor, a teaching journalist and head of two of the best schools of journalism in the nation, has drawn upon his experience and his wisdom to put the press in its proper political and sociological perspective. So well has he done the job that the book will raise considerable question in the minds of many as to the sense of expending huge sums of money for shoddy reports by such organizations as the Commission on Freedom of the Press.

Where the report of the Commission on the Freedom of the Press, headed by Dr. Hutchins, repeated, distorted, and emphasized unfounded accusations against American newspapers, Dr. Mott, with the same kind of incisiveness which won for him a Pulitzer Prize in American History, has cleared away many of the dead cats which have been hurled at the newspapers by several generations of "eggheads."

This is not to say that the book is noth-

ing but a paean of praise for American newspapers. On the contrary when the newspapers deserve criticism, Dr. Mott has no hesitancy in making it. The difference between the kind of criticism found in this book and the kind found in many social science tracts lies in the informed and knowledgeable basis of Dr. Mott's criticism. Of particular interest is the point that Dr. Mott makes about the newspaper penchant for "soft" news, although his argument in this connection is open to considerable debate.

The book consists of 20 chapters, beginning with a description of what news is and why it is important. These comprise the core of the book and are required reading for social scientists everywhere. The last four chapters of the book, titled "News Controls," "To Lead or To Follow," "The Responsibilities of the Reader," and "Looking Toward the Future," offer a number of new insights into the function of the newspaper in a democracy and would be well worth reading if they stood alone. These chapters, coupled with the earlier chapters in the book on the nature and purpose of the news, make Dr. Mott's contribution almost a classic in the news field. It is, I should say, of the same order and level as Walter Lippmann's *Public Opinion* and Herbert Brucker's *Freedom of Information*.

This is not to say that the book is without fault. In some cases Dr. Mott seems to hesitate or to have a reluctance to draw the obvious conclusions from the evidence which he presents. But these, in general, are minor criticisms.

The book will find wide appeal among general readers. It will find its greatest use among social scientists, political scientists, sociologists, economists, and anthropologists—who need the levelheaded approach which Dr. Mott has provided to a very difficult problem.

W. C. CLARK
Syracuse University

VEILLÉ, ROGER. *La Radio et les hommes*. Pp. 233. Paris: Les Éditions de Minuit, 1952. No price.

M. Veillé has overlaid a solid base of the celebrated French *clarté Latine* (itself lately lacquered with the tired defeatism of

postwar disenchantment) with that "practical" veneer which is the special mark of the ulcerated Purple Hearts of the broadcasting industry. Six years as director of audience relations for the French State Radio have left him somewhat preoccupied with the limitations of the medium, chief among which he lists the fickle listener. "La radio, c'est les hommes!"

So it is man as well as the machine in the corner of the living room that he explores; and before he is through with them both, the machine is upstairs on the bedside table, soothing the vulgarity-drugged cadavre of Western Man.

Still, what we have here is what the doctors call a "thorough physical checkup"; and outpatient rooms are never cheery. As a somewhat brutal diagnosis, "La Radio" is sufficiently clinical to satisfy the most footnote-hungry German. And tyros who recently have transferred to television such ecstatic clichés as "tremendous potential for good" will do well to read it for those shattering statistics which, as the author notes, are always available to those who feel compelled to go about letting the air out of optimists.

There are only 130 million radio sets. Not all of them are on at any given moment. Not all that are on are tuned to the same station. Not all tuned to the same station are being listened to. Those that are are usually emitting vulgarities. Dixieland fans do not listen to symphony, and vice versa. Lies are more exciting than the truth. There is no common denominator of dramatic taste, and the nearest thing to it is pretty low. Advertising sponsorship of programs is bad, but state ownership can be worse.

So what we wind with, after thirty years—what we must manage to live with for perhaps another 300—is something as variegated and complex and incomplete as the theatre, movies, the schoolroom, the pulpit and the printed page . . . and as unlikely to become the wonder drug that will heal society's malignant cancers, or even lower its recurrent fevers. The comforting part of the conclusion is that, now the novelty has worn thin, it is equally obvious that a medium of mass communication which

lacks the force to better man lacks also the power to destroy him.

Meantime the larger battle between the dreamers and the chroniclers of man's inherent limitations undoubtedly will go on, and will be as likely to be won at Strasbourg or Luxembourg as in any Paris sound studio. One could feel more confident of the issue if the French, those onetime touchstones of intangible, wildly illogical hope, were less keen these days on cataloguing the ever-present empirical reasons for despair.

LLEWELLYN WHITE
Washington, D. C.

PHILOSOPHY AND RELIGION

VIERECK, PETER. *Shame and Glory of the Intellectuals*. Pp. xvi, 320. Boston: The Beacon Press, 1953. \$4.00.

One can speak of this book only in superlatives. In more than twenty years of reviewing, the present writer can recall few books to match this one for its originality of ideas, its provocative challenge, its penetrating wit, and its sheer brilliancy of expression. It is becoming increasingly obvious that in Peter Viereck the nation possesses a truly great creative thinker. Poet, historian, and tough idealist, he combines the sensitivity of the poet and unusual insight into historical causation with a rare quality of fighting humanitarianism.

Viereck's fundamental thesis rests on four assumptions: (1) The plain duty of every intellectual is to fight the totalitarian evil. (2) The contemporary form of the totalitarian evil is, above all, Communism. (3) The glory of the twentieth-century liberal intellectuals is the vigor with which they took the only possible position towards the Nazi threat. (4) The shame of the twentieth-century liberal intellectuals is their failure to expose and fight Stalinist totalitarianism with exactly the same vigor they showed against its brown-shirted version.

With these assumptions as a basis, the author uses a technique composed of free association, surrealist dialogues, historical analysis, challenging quotations, letters,

satire, and his own Pulitzer Prize-winning poetry. Very little escapes the acid of his pen, from William F. Buckley of Yale to Ezra Pound of St. Elizabeth's Hospital, from Joseph McCarthy to Alger Hiss, from the *National Guardian* to the *Nation*, from genocide to neutralism. But out of this variety of subject matter emerges a firm unifying theme—the true basic American value lies in ethics, not economics, in the lasting Christian-Judaic ethics rather than in any changing economic system. This is the platform he urges to the West against the Soviet aggressor: to be the conserver of this ethical code can be the glory of the intellectual; to be its materialistic destroyer can be his shame.

Vigorously opposed to mushy liberalism, Viereck has been called the principal standard bearer of the "New Conservatism," which believes in and will defend the tradition of a humanistic democracy. Since he regards Winston Churchill as "the Cassandra of freedom," he dedicates his book to the great Englishman, "whose career . . . against both Nazism and Communism has made him the inspiration and world-symbol of the independent new conservatism now being born out of the agony of the 1950's."

It is impossible to give more than a glimpse of this stimulating and eloquent book. Every page sparkles. Viereck creates the character of Gaylord Babbitt as the symbol of the new Babbitt ("Babbitt Senior wanted to cover the torn wallpaper with 'Whistler's Mother' while Babbitt Junior insisted on a Picasso" [p. 26]). The author's "vignettes about the monsters Hitler and Stalin" ("twins but not identical twins") are among the most devastating portraits ever etched in the English language of the two dictators. He rewrites a portion of the Communist Manifesto, ending his version with this call: "Human beings of all classes, unite!" (p. 5). He defends the long-run aspects of British imperialism against the Lenin-Hobson view and denounces the baiting of business and Catholics.

Viereck's ingenious phrasemaking reminds one of George Orwell ("the palaeobolshevikode of 1936-39"; "the Stalinoid mentality"; "communazism"; "Comrade

Blimps"; "Lumpen-intellectuals"). His ruthless satire recalls that of Jonathan Swift ("Old George Babbitt merely hates art. Gaylord Babbitt hugs it to death" [p. 65]). His thunderous denunciations have a Savonarolean ring ("All were terrorists who believed in bad means to bad ends; down with all of them!" [p. 142]). His wit is as delicate as Oscar Wilde's ("The danger to students of being branded for life by a socialist is less than that of being blanded for life by a socialite" [p. 304]).

It is certain that every reader will find something to annoy him in this book. Some will object to its bitterly sardonic, often violent, style. "Nobody writes gracefully against disgrace," writes Viereck in explanation. But it is important to realize that he has struck a powerful blow against the local American phenomenon of standardized thinking of both right and left. It is obvious that behind the thundering voice is the heart of an apostle of decency and a great humanitarian.

LOUIS L. SNYDER

The City College of New York

CORNFORD, F. M. *Principium Sapientiae: The Origins of Greek Philosophical Thought*. Edited by W. K. C. Guthrie. Pp. viii, 271. New York: Cambridge University Press, 1952. \$5.00.

It is an abiding achievement of F. M. Cornford to have shown that early Greek philosophy represents no contradiction of the principle, *natura nihil facit per saltum*, but is rather the result of a gradual development out of mythological thinking. So it was that Ionian thought applied to physical phenomena the principle of retribution which is so deeply entrenched in popular sentiment and its proverbial expression.

The first part of this book, *Empiricism versus inspiration*, begins with antithesis between the natural philosopher and the physician among the Greeks—the physician claiming to build up from experience a body of knowledge and the philosopher occasionally observing but never devising experiments.

Epicurus serves as an instance of dogmatic assertion, outrunning both sense-experience and reasonable inference there-

from, in contrast with the professed empiricism of Hippocrates "On Ancient Medicine." Plato knew medical theory and medical practitioners (for example, Eryximachus in the *Symposium* and his doctrine of Recollection is presented as a serious attempt to answer the question of how the mind acquires the type of knowledge which Socrates had equated with goodness). The solution was afforded by the Pythagorean idea of pre-existence accompanied by some degree of recoverable memory of previous life. Dialectic was essential, but it was not enough; other things were to Plato, at least in certain moods, "something more than fantasy." Even the sober Socrates paid heed to dreams and oracles (see E. R. Dodds, *The Greeks and the Irrational*, p. 217); and, if Plato could, in the *Phaedrus*, speak of "divine madness," Democritus had his theory of inspiration and his view of intuition as higher than sense-perception. Aristotle quoted the classification of reasonable beings as either gods or men or beings like Pythagoras; some men could see or could come to see further and deeper than others.

All this is illuminating, just as it is beautifully presented. When, however, Cornford introduces the general concept of shamanism as supposedly involving "the union of prophet, poet and wise man in the same person" he is on less sure ground. If such a combination had ever existed in Greece (and I see no reason to believe it), it lay in a remote past; the tales of Abaris and Aristeas and the fact that Epimenides, as later Empedocles, shows comparable features (see M. P. Nilsson, *Gesch. d. gr. Religion*, I, 582 ff.) do not justify generalization). Certainly Cornford's contention that that the quarrel of philosophy and poetry arose from the differentiation of the three types—poet, prophet, and sage—out of the single figure still extant in the shaman, lies outside the area of historical inquiry. Nevertheless here, as in the second part, *Philosophical Cosmogony and Its Origins in Myth and Ritual*, Cornford is eminently worth reading. In editing this posthumous work, Guthrie has deserved well of all who are concerned with the origins of Western thinking.

ARTHUR DARBY NOCK

Harvard University

FOSDICK, RAYMOND B. *Within Our Power: Perspective for a Time of Peril*. Pp. x, 114. New York: Longmans, Green & Co., 1952. \$1.75.

This is a kind of sermon, giving an interesting analysis of our time, with proposals for "beginning the world again." We must overcome fear; we must not be afraid of change; our understanding of human behavior and social relations must become more nearly equal to our scientific achievement; many forces are working to make our world "one world," if only we can keep numerous divisive forces from interfering; the Russian system is doomed to ultimate failure because the human spirit cannot forever be imprisoned; diversity of thought and belief is not incompatible with peace; even today we must have freedom to speak out the principles of the Declaration of Independence without fear of being branded as subversive. All of this to the good.

The author frankly says that his own generation got off the track, that it cannot escape bitter condemnation. But where and how did this happen? "Surely we did not plan it this way. . . . We entered the twentieth century imbued with the hopeful philosophy of Herbert Spencer. . . . Then came the bewilderments of 1914 and 1929 and 1939, and we began to realize that society had been less humanized than we thought. But why? This reviewer cannot help but feel that the past generation made its great mistake when it accepted the humanistic philosophy of Spencer. It is disappointing therefore to find the author proposing nothing better than the same humanism with which to remake the world. His text is the words of Thomas Paine: "We have it within our power to begin the world over again" (italics reviewer's). His hope for the future is found in the fact that medicine has wiped out malaria in one generation; that science has added so much to our understanding of man. This is our age searching for truth. This "represents man at his best." "It is impossible to believe that this strange and indeflectable being is now going down in defeat before forces which he himself has created. Rather, we catch a glimpse of him as a heaven-storming creature, the purposeful

architect of his own fortunes. . . . This is the hope we live by." Does humanism have the power with which to storm the gates of heaven? This reviewer does not think so.

The book contains one prize illustration of a world which was made over again. Had the author used this as his text and developed it, his conclusion would have been different. It is the story of Saint Jerome who, upon learning that the Goths had sacked Rome in 410 A.D., cried out: "What is left if Rome perishes?" Not despairing, however, Jerome turned to his monastery cell and produced the Vulgate, thus proclaiming the power of God and the Christian faith which eventually dispelled the barbarian blight. The power by which Jerome's world was remade did not rise from below to storm the gates of heaven. It flowed down from the gates of heaven. This reviewer is of the opinion that our present world can be made over again only as these same gates are reopened and as power comes down from above with which to lift man upward and onward. He also believes that our neo-orthodox theologian friends, though underrating man's capacity to respond to that power, have nevertheless evaluated humanism more accurately than our author has.

GUY F. HERSHBERGER

Goshen College

HOPPER, STANLEY ROMAIN (Ed.). *Spiritual Problems in Contemporary Literature*. Pp. xvi, 298. New York: Harper & Brothers, 1953. \$3.00.

This volume is based on a symposium given at the Institute for Religious and Social Studies of the Jewish Theological Seminary of America. Eighteen interpreters of current literature grappled, each in his own way, with "the basic problems of civilization" as "mirrored in its literature" and, in particular, with the artist's communication of "modern man's search for a soul, for comradeship, for inner peace, for 'a place in the cosmos,' for hope, for creative satisfactions." Each finds himself and his contemporaries confronted with problems which are essential religions.

The editor says in his Foreword that the book aims "to bring together both literary and theological opinion upon these themes, with a view to throwing some interpretive light upon the problems shared by artist and religious interpreters alike."

Under the general heading "Religion and the Artist's Situation," which constitutes the first part of the book, James Johnson Sweeney discusses "The Literary Artist and the Other Arts"; Albert Salomon discusses "Sociology and the Literary Artist"; Irwin Edman discusses "Philosophy and the Literary Artist"; Horace Victor Gregory deals with "Mutations of Belief in the Contemporary Novel"; Theodore Spencer deals with "Man's Spiritual Situation as Reflected in Modern Drama"; and Delmore Schwartz discusses "The Vocation of the Poet in the Modern World."

The second part of the book is entitled "Religion and the Artist's Means." Here David Daiches discusses "Theodicy, Poetry, and Tradition"; Kenneth Burke and Stanley Romaine Hopper discuss "Mysticism as a Solution to the Poet's Dilemma"; Harry Slochower deals with "The Use of Myth in Kafka and Mann"; Cleanth Brooks deals with "Metaphor and the Function of Criticism"; William Barrett discusses "Existentialism as a Symptom of Man's Contemporary Crisis"; and Stanley Romaine Hopper discusses "The Problem of Moral Isolation in Contemporary Literature."

The third and final part of the book has to do with "Religion and the Artist's Beliefs." Denis de Rougemont deals with "Religion and the Mission of the Artist"; George R. Kernodle discusses "Patterns of Belief in Contemporary Drama"; Judah Goldin discusses "The Contemporary Jew and his Judaism"; Wallace Fowle presents "Catholic Orientation in Contemporary French Literature"; Amos Niven Wilder discusses "Protestant Orientation in Contemporary Poetry"; and Emile Cailliet discusses "The Literary Mind and Religion's Responsibility."

Despite the varied views of the contributors this symposium achieves a unity of purpose rarely attained in such efforts. It is a book to read and ponder because it does succeed in communicating some of the

spiritual problems of contemporary civilization.

CLARENCE LINTON

Columbia University

DE GRAZIA, SEBASTIAN. *Errors of Psychotherapy*. Pp. 288. New York: Doubleday & Company, 1952. \$3.00.

The author is a man both of "passion" (p. 252) and of thought, as his portrait and his writing proclaim. His thesis is that neurosis is a moral disorder, that anxiety is guilt, that cure is contingent on forgiveness authoritatively given and truly accepted. The poignant essence of the book speaks in the first paragraph of the Introduction: "Small gods walk up and down the land. To them people pray. They pray for relief from disordered passions, but so long as they beseech small gods their peace will be small. They are like children crying for parents they do not know are dead."

The pathos of that opening paragraph haunts the reader throughout the book; and especially so if he be a psychiatrist. The author's analysis of the so-called statistics of therapeutic results is devastating. His description of the nonmoral, "non-directive" methods of psychotherapy is chilling, even frightening. He explodes the fallacy that psychotherapy, or any form of human relations, can exist without the bipolar factor of some form and degree of authority and acceptance.

Dr. de Grazia is not a psychiatrist and has not faced the therapeutic problems and responsibilities of a psychiatrist. He reveals his ignorance in his discussion of shock treatment. He states, quite correctly, that psychotherapy is based on communication; but he seems to think that the use of material things is also only psychotherapy. Giving a man a bottle of vitamin pills is, to be sure, a form of communication; but the communicative aspect of the gift does not in itself correct the vitamin deficiency and the behavior disorder resulting from it.

The same can be said for the shock treatments. To the author, shock treatment is immoral (p. 197). "Though it is undoubtedly cleaner than the maligned practices of bygone days, the treatment may or may not be as brutal. Once one gets into the re-

finements of cruelty, one cannot say exactly." But it would be cruel indeed to deny shock treatment to the patient tortured by black despair and the delusions that go with it. This reviewer has seen faith in God and man restored, and peace and comfort replace anguish, by shock treatment alone. Scholastic elegance and philosophical speculation must yield to human need and suffering. Any other view would be immoral.

This book is well worth reading. But the discussion of shock therapy especially must be read critically, with extreme skepticism. One could wish that the author might work for a time as nurses' aide or attendant in a well-run psychiatric hospital. His humanity and intelligence would be a God-send to the patients, and he would learn from them.

J. A. KINDWALL, M.D.

Wauwatosa, Wisconsin

COMMONWEALTH OF NATIONS

TOYNBEE, ARNOLD. *The World and the West*. Pp. vii, 99. New York: Oxford University Press, 1953. \$2.00.

Arnold Toynbee's reprint of the Reith lectures of 1952 on *The World and the West* is a foretaste of topics which will be published in four new volumes of his monumental *A Study of History*, scheduled for 1954. It is a general study of the impact of western civilization on the rest of the world—a very large "rest," since in the author's meaning it includes Russia, as well as Islam, India, and the Far East, in fact the whole vast area "stretching south-eastward from Danzig and Trieste to Calcutta and Singapore" (p. 73). In all these countries there have been invasions by western armies, western goods, western administrative and industrial techniques, and western ideas, ranging from Christianity to nationalism.

To this invasion the eastern peoples have reacted variously. Some, like Peter the Great of Russia and Mustapha Kemal of Turkey, have tried to swallow and digest the whole dose of westernism; some, like the Young Turks of World War I, tried to

take over certain superficial aspects of the West, such as militarism and industrialism, while retaining their old traditions otherwise; some, like the desert fanatics of Islam, or the Orthodox "Old Believers" in seventeenth century Russia, have tried to repudiate all things foreign without discrimination. All three methods have led to wars, revolutions, and deep psychological strain on individuals caught between the old and the new.

For centuries the current has flowed one way, but now there is a turn of the tide. Communism is a Russian weapon, but a weapon of western origin "like bombs, aeroplanes and guns," which is now being turned against the West, and has "served Russia as a weapon for bringing into the Russian camp the Chinese quarter of the human race" (p. 14). It may make a further appeal to "a depressed Asian, African, and Latin American peasantry." But the East has other spiritual weapons. Mr. Toynbee reminds us that Greece and Rome, after conquering the Mediterranean world with the swords of Alexander and Caesar, were in turn conquered by the Christian religion arising out of tiny Palestine, and a similar ideological conquest may once more await the modern West.

PRESTON SLOSSON

Ann Arbor, Michigan

ROBERTSON, D. H. *Utility and All That and Other Essays*. Pp. 207. New York: The Macmillan Company, 1952. \$3.50.

This volume by one of Britain's best known economists brings together sixteen of his postwar lectures and essays dealing with basic economic theory and public policy. They are grouped under four main headings: economic fundamentals, capital and interest, international economic relations, and money.

No brief review could adequately set forth or appraise the substance of Professor Robertson's trenchant argument, nor convey its inimitable savor. This is a book to be read, not merely talked about second-hand. By no means its least significant feature is its captivating readability, which entices one along even where the analytical path is far from easy.

Here is an absorbing spectacle, as one

who is himself no mean hand at forging and utilizing keen-edged analytical tools proceeds, with beguiling wit and disarming good humor, to discomfort the architects and occupants of some of the elegant structures that bedeck the landscape of present-day economic thought and policy. Have we not (he wonders) been somewhat overhasty in deserting the humbler conceptual edifices of older craftsmen, to dwell bemused in esoteric halls and hold discourse in words that have slight meaning for the common man?

Has all been won and nothing lost in the effort to banish the notion of cardinal measurement of utilities from the discussion of consumer choice and economic welfare? Contemplating the formidable mechanism of ordinal comparisons, heavily buttressed by mathematical symbolism, Professor Robertson questions whether the attempted purge has not largely missed the boat. After all the fuss and fury, might not some sound sense be regained by a judicious revival of the not-quite lifeless corpses of measurable utilities and consumers' surplus?

Have we gained much ground on Marshall's treatment of the pricing process since "Geometry ascended the throne left vacant by philosophy and common sense; and ingenuous youths and maidens, beguiled into the belief that here at last was a true picture of the real world, spent the best moments of their young lives in memorizing (generally wrong) endless fantastic patterns of tangencies and intersections." But of course "they also serve who only waste their time."

On matters of public policy Professor Robertson makes bold to urge a second look at some of the prescriptions of the older doctors of economic liberalism, in a day when many are disposed to substitute the wisdom of authority for the dispersed and fumbling strivings of free consumers and enterprisers. Are the directive capacities of bright young men (or old), and the manipulations and monkeyshines of functional finance, of carrot-laden taxes and subsidies, of exchange controls, of planned investment, of allocations and quotas, singularly more promising of a viable economy and the general welfare?

Why not let time and economic forces sometimes play a part? Intervention? Yes, but sparingly; not as a nostrum for every passing chill or runny nose.

A. M. McISAAC

Syracuse University

CRITCHLEY, T. A. *The Civil Service Today*. Pp. 150. London: Victor Gollancz, Ltd. (distributed in the U. S. by John de Graff, Inc., New York), 1952. \$3.00.

Although the present volume is not primarily intended for professional administrators, it should nevertheless be high on their list of required reading. With rare insight and good humor and with what is even rarer among the professionals—a felicitous English prose—Mr. Critchley examines the general scope and functions of the Civil Service and some major problems of personnel organization and administration. Among these are the problems of administrative reorganization, of recruitment and training, of "red tape" and record keeping, of political responsibility and the relations of civil servants to politics and the general public.

It becomes clear that the British Civil Service has been struggling with problems not dissimilar from those with which Americans have become painfully familiar. As Big Government has evolved to meet the needs of an industrial civilization, as the laissez-faire state has given way to the welfare state, the Civil Service, as the most visible sign of these Promethean changes, has increased not only in size and importance but in complexity. Gone are the days when civil servants could be described as the "black coated proletariat" of the Royal Household. The British Civil Service of today includes not only the administrative, executive, clerical, and foreign service classes—not only diplomats, typists, bookkeepers, and clerks—but a new Scientific Civil Service employing some of the most distinguished scientists in the world. Although, as Lord Beveridge observes in his Introduction to Mr. Critchley's book, the British civil servant must still take vows of "poverty, anonymity, and obedience," his prestige has grown as society has become increasingly dependent on him.

Not all of the new functions of government have devolved upon the Civil Service as such. Upwards of 200 independent boards, commissions, councils, and corporations are more or less outside Her Majesty's Civil Service. "The only feature common to them all," says Mr. Critchley, "is that while they are 'official,' none of them lies within the strict orbit of the Civil Service; they are independent of Parliamentary and sometimes Treasury control to an extent that no Government Department is." Hence it is that the vast expansion of governmental functions through nationalization of the economy has had comparatively little effect on the Civil Service. Nevertheless this development, both in England and America, poses a crucial problem for responsible democratic government. It emphasizes the central importance of administrative management—if we are to insure efficient dynamic leadership in these enterprises, without sacrificing the equally important principles of political control and responsibility. Our dilemma, as Mr. Critchley puts it, is that of "creating a manageable number of unmanageable departments—or an unmanageable number of manageable ones."

Some time-honored principles will need careful re-examination if we are to see to it that the new Social Service State does not degenerate into what Mr. Belloc called the Servile State. The classical distinction between "politics" and "administration," and the traditional pattern of hierarchical internal organization—of "unifunctional" agencies—may need drastic revision. "Policies," says Mr. Critchley, "like elephants are more easily recognized than defined." And how policies are formed not only from Parliamentary debate—but from the process of administration itself—becomes clear in his illuminating description of how departmental policy emerges from a hundred or more "administrative" decisions.

The true greatness of the British Civil Service is not to be found in any single principle or practice but in a complex combination of political, economic and social factors, which appear only by inference in Mr. Critchley's volume. But for Americans struggling with the difficult problems

of Big Government and Big Bureaucracy—this modest book has much to offer.

PETER H. ODEGARD

University of California
Berkeley, California

DRUMMOND, J. M. *The Finance of Local Government, England and Wales*. Pp. vii, 206. London: George Allen & Unwin (distributed in the U. S. by The Macmillan Company), 1952. \$4.50.

The people of England and the United States all speak "English," but only the people of England will understand Mr. Drummond's book. The language is highly technical even for the "ratepayers," "taxpayers," and others in England and Wales. Many terms and references are unfamiliar to Americans.

The book is at its best in Chapter I, the introduction and summary. Here the author speaks about principles and general conclusions from English local government financial experience. Here, too, his language is less technical and his writing clearer to the ordinary reader. The book as a whole, however, does not live up to the author's statement that "these pages are intended primarily, not for the practitioner, but for the lay reader. . . ." Like other English books on local government accounting and finance, it deals largely with legal requirements and little with principles.

Local governments in England have as their principal source of income their "rates" levied on the *occupiers* of property as opposed to the general American plan of levying local taxes on *owners*. While the English fix a theoretical income on which they levy the "rate," the difficulties and inequities appear to be at least as great as those of applying the general property tax in this country.

American readers may be amazed to learn that in England new valuations for local tax purposes were last made in 1934, that three-fourths of the "rate" burden was removed from industry, and that agricultural property has been completely relieved of local rates. Mr. Drummond does not comment on the propriety of this discrimination.

The English local government budget has "the primary function . . . to fix the rate

in accordance with statutory requirements . . . and the secondary object . . . firm control of an authority's finances." Concept of the budget as a work program seems to have been omitted. But the English fall into the same error as American local governments, that is, their emphasis on the "paper work" of the budget and on the mechanics of making and using the budget. American practice seems to place more emphasis on responsibility for and control of expenditures. English devices for budgetary control seem less adequate than ours.

Mr. Drummond's discussion of government grants is good. How like the United States it seems when he says, "The local authorities are prepared to surrender their freedom in return for the financial assistance . . . and the central government not unnaturally do not dislike the control and supervision which the percentage system affords them."

Local government borrowing in England appears to be dominated now by the central government. All borrowing must be done from the Public Works Loan Board unless the Treasury approves otherwise. The Board fixes the terms of payment and the rates of interest. One small advantage is the fact that small communities can finance themselves at about the same rate as the larger places. English local governments do not appear to have the advantage of a highly specialized and usually highly competitive corps of specialized dealers in municipal loans.

Mr. Drummond's book has nine chapters besides the introduction. The chapters are entitled "Rating and Valuation," "The General Rate Fund and the County Fund," "The Budget," "Control of Finance," "Government Grants," "Capital Expenditure and Borrowing," "Trading Services, including Housing," "The Finance Department," and "Miscellaneous Financial Matters."

Mr. Drummond's book is authoritative. There is enough of interest in it to justify the difficult task of reading it. But the same subject matter can be presented in a more readable manner as demonstrated by the article, "The Financial Structure of the City of London," appearing in the December, 1952 issue of the *National Tax Journal*.

Mr. Drummond's book would have been improved, even for English readers, by a definition of terms, a clearer explanation of the organization of local government, and more evaluation of English experience.

CARL H. CHATTERS

American Municipal Association
Chicago, Illinois

The Durban Housing Survey: A Study of Housing in a Multi-racial Community.

By the Research Section of the Department of Economics and certain specialists in other departments of the University of Natal. Pp. xii, 508. Durban, South Africa: University of Natal Press, 1952. 35 shillings.

This sober study merits careful reading by every student of social and racial tensions. Though it deals with one of the world's most troubled areas, the authors are unaffected by the pressures of the majority or the sensitiveness of the affected minorities. They have produced a rich 500-page fondue of facts, into which anyone may dip for his inferences, and be rewarded.

Durban, largest port city on the African East Coast, has a mixed population of 13,000 Coloreds, and Indians, African Natives, and Europeans numbering about 125,000 each. Industrialization and economic opportunity have zoomed the population, and in 1932 alone, some 20,000 Europeans, 51,000 Indians, and 21,000 Natives poured into the area. Competition for the few suitable sites set in, and tensions, already high, mounted still further. The Europeans were outnumbered but not outvoted. They brought the law to their side.

Segregation was legalized by racial zoning ordinances. It was both vertical and horizontal segregation—vertical for the Europeans who like the fresher breezes and the view; horizontal for the others. Greenbelts, rivers, valleys, and other barriers keep the less desirable within distant enclaves, and a two-hour wait for the bus that takes them to their slums is not unusual.

Demolition of several thousand native dwellings and the inflowing population brought more shack towns and more slums. Some 45,000 to 50,000 urban Natives live in sheds and lean-tos of corrugated sheeting

or flattened iron drums that are grouped in huddled clusters and cling precariously to the hillsides. "Vermin, flies, cockroaches and other pests flourish in the uncovered food, overflowing pits, neglected refuse dumped a few yards from the shacks and general filth . . . there were 92 deaths from gastroenteritis in children under two years of age during one period of 24 days." Lice and tuberculosis are plentiful, dysentery is exported, hospitals crowded.

Such Native housing as is built is financed through municipal sales of beer consumed by the Natives themselves. Hence, the more municipal beer the Native drinks, the better his prospects of getting a roof over his head. Not all Natives, however, are accommodating, and all too many abandon beer for shimiyané or the home-made brews of the Skokiaan queen; the report does not censure them, conditions being what they are.

A committee on Durban's current racial zoning dilemma asks: "Where will the people go who are now living in areas zoned for another race, and how will they re-establish themselves? Our illegal shack areas demonstrate only too clearly how ineffective segregatory laws can be when they merely prohibit a group from living in a certain place but do not provide adequately for them elsewhere."

Durban's dilemma is a growing one wherever cheap labor is being drawn from the hinterland to do the tough and menial work in the burgeoning economies. The older settlers benefit from the labor, and the industries need it desperately, but no one wants them to live nearby. Fear of losing social status is exerting its influence widely. South Africa has backed it up by law, but few will say it has as yet proven itself the right way.

CHARLES ABRAMS

New York City

FAY, C. R. *Round About Industrial Britain, 1830-1860*. Pp. ix, 227. Toronto: University of Toronto Press, 1952. \$5.50.

These informal and discursive essays originated as a series of lectures delivered in 1950 at the University of Toronto. They possess the intimate flavor of reminis-

cence, as though the author were recalling stories told him in his youth by his father. Professor Fay's recollections, added to those by his father, who began his apprenticeship in a textile factory of Manchester in 1860, extend over almost a century of industrial growth. He has not, however, relied upon memory alone, but has documented a great variety of incidents that have attracted his attention.

Professor Fay has studied at length the reciprocal relation of technology and industrial evolution. Feeling his own knowledge of various techniques to be inadequate, he has elicited the co-operation of ten experts on several phases of technology. Acting on the assumption that "technology is the skeleton on which economics is the flesh," he has in the first place arrayed information under the chapter headings of "The Stream of Industrial Invention" and "Patent Law and Commodity Study." He supplements these chapters later on with a biographical study, "With Faraday in London," which is a museum cabinet of curios somewhat related to Faraday, London, and technology.

More extensive than the studies on technology are the essays on important industrial places of a century ago. On this historical tour of industrial Britain, Professor Fay visits nine different places and relates scattered information—not history but the stuff of history—about each. At Merthyr Tydfil he pauses long enough to paint a "depressing picture" of a town "thrown up in Britain's wealth-grubbing scramble," and to add a few titbits on the Welsh Chartists. His treatment of the several towns varies greatly in scope, ranging from a telescopic view of the economic and political panorama of Birmingham to microscopic pin-points in Sheffield. He observes "ten facets of Sheffield life and work . . . taken from contemporary sources," three of which relate to the technical skills and processes of knife making in 1840, the Bessemer process, and the making of armor plate in 1862; other facets pertain to working conditions, low wages, inadequate housing, and poor health of workers as revealed by the vital statistics of 1840.

The same great diversity of information occurs in the essay on the textile towns.

At Manchester he is concerned only with the cotton famine of 1860 resulting from the American Civil War; but at Bradford he carefully tells the story of its rise and triumph as the center of the worsted trade. On finally reaching the Port of Glasgow he exults in the history of the Clyde, which "has held first place among the rivers of the United Kingdom for output of ships and engines" from the time of the first iron ship to the *Queen Elizabeth*.

Such are the essays of this volume. Unlike a well disciplined Clapham history, they afford materials for browsing and bits of both useful and curious information not readily accessible elsewhere. The students of general economic history, as well as students of early Victorian England, will find this a useful and an entertaining volume.

RAYMOND G. COWHERD

Lehigh University

HOYLES, J. ARTHUR, *The Treatment of the Young Delinquent*. Pp. xi, 274. New York: Philosophical Library, 1952. \$4.75.

The Treatment of the Young Delinquent is a study of modern psychological and sociological developments in the handling of youthful antisocial persons from the standpoint of the Church. The author is an English—though apparently not an Anglican—clergyman who has worked closely with leaders in progressive juvenile courts. He is convinced that their methods hold greater promise for social betterment than do the traditional attitudes of impartial justice and retribution, and he has written this book to demonstrate that they more nearly conform to Christian principles as well.

Speculation about such issues as free will versus determinism provides the groundwork for a thoughtful justification of the individualized case-work approach to the youthful offender. The review of modern thinking about the etiology of crime and delinquency, which quotes Burt, Healy, Lange, and other twentieth-century writers, also derives support for their viewpoint from such unexpected sources as Jeremiah, Ezekiel, and St. Augustine. Mr. Hoyles's conclusion that crime results from no single cause, but from combinations of factors

—personal, familial, and environmental—is just as surely reached as by the statistics and equations of the Gluecks.

Familiar fallacies which seem to have religious sanction are analyzed in the middle third of the book. The first chapter in this section deals with the fallacy that a given offense can be equated with a predetermined amount of punishment. Revenge, appeasement of a tribal god, expiation, satisfaction of an abstract principle, represent evolutionary stages of the theory of retribution. But having outgrown the theory of retribution, man in his attempt to rationalize his animal craving for vengeance on those who offend developed the idea that the infliction of pain or the deprivation of privilege possesses a magical virtue in itself, cleansing those who have violated moral laws from the remorse or guilt which is believed to be the natural consequence of crime. This, too, Mr. Hoyles repeats as being inconsistent with either psychology or religion. And he also has nothing but contempt for the theory that fear of punishment is either an adequate motive for good behavior, or a potent deterrent to crime. For his point of view, Mr. Hoyles quotes Biblical as well as contemporary authorities.

As a substitute for the punitive approach, Mr. Hoyles advocates the methods of the more advanced British juvenile courts, utilizing personnel trained in psychiatry and counseling. Warning that the mere rejection of outmoded superstitions is not enough, he is fearful lest new fallacies replace old. He points out that gratitude for the withholding of punishment is not a reliable force to insure good conduct, that the well-meaning friendly supervision of the untrained may compound error. He argues, therefore, that there must be treatment and that this treatment must be exactly scientific at the same time that it is scrupulously individualized. Only in this way, he holds, can the treatment of the youthful offender fulfill the requirements of Christian justice.

In all probability, the book will best serve to orient theological students to ministry among the maladjusted and to help them understand as too few of the clergy do today the aims and methods of

guiding child development utilized by courts and other community agencies. But it is an interesting volume for the general reader.

Trenton, New Jersey

INNIS, HAROLD A. *Changing Concepts of Time*. Pp. vii, 142. Toronto: University of Toronto Press, 1952. \$3.00.

The late dean of the Graduate School at Toronto, interested in the negative effects of communication systems and the United States, intends in this collection to elaborate the ideas developed in his *The Bias of Communication* (1951) and *Empire and Communications* (1950). The title is more philosophical than are the essays, which are caustic, outspoken, and stimulating, but, for this reader, not so conclusive or precise as they might be.

The five essays, which are somewhat repetitious, are entitled "The Strategy of Culture," "Military Implications of the American Constitution," "Roman Law and the British Empire," "The Press, a Neglected Factor in the Economic History of the Twentieth Century," and "Great Britain, the United States and Canada." A major point the political economist desires to get across is that power and force, "the natural enemies of intelligence," have become more serious as "the mental processes activated in the pursuit and consolidating of power are essentially short range" (p. v). The essays are pervaded by a strong current of Canadian nationalism and an acute awareness of American influences.

It is perhaps the fairest course to select a few random quotes which may arouse the curiosity of the reader. "We must rely on our own efforts and we must remember that cultural strength comes from Europe" (p. 2). "A Canadian is too close to make an effective study [of the United States] but he has the most to gain from it" (p. 21). Dr. Innis expressed "A firm belief in the impossibility of the spread of Communism in common law countries and in the danger of American imperialism in exploiting us through its propaganda about Communism . . ." (p. 76). He refers to

the idea that the "instability of public opinion which follows the introduction of new inventions in communication designed to reach large numbers of people is exploited by those in control of the inventions" (p. 102).

RICHARD H. HEINDEL

Washington, D. C.

REYMOND, LIZELLE. *The Dedicated*. Pp. x, 374. New York: The John Day Company, 1953. \$4.50.

This is not merely a biography of that great Irishwoman Margaret Noble, who, as Sister Nivedita, consecrated herself to the service of India, but also of Swami Vivekenanda. The book also vividly portrays political conditions in India at the opening of the twentieth century. It is beautifully written, but I wonder if the author did not inject some of her own personality in describing the saintliness of Nivedita, as it is difficult to reconcile her political activities with the spiritual aspect of her life in which she took the three vows of poverty, chastity, and obedience, subordinated her own free will to that of her 38-year-old religious teacher Vivekenanda, and often lost herself in prayer and meditation.

The first years of the twentieth century were for India a time of "exceptional deadness in political life," although it produced some great spirits such as Aurobindo Ghose, Gopal Krishna Gokhale, Bal Gangadhar Tilak, Ram Mohun Roy, and Rabindranath Tagore, all of whom were counted among Nivedita's friends. On the side of daily life and political thought, she was "drunk with India," and her house became a refuge with food, money, and maps for Indian nationalists who had to escape. She was marked down by the British for allegedly subversive activities. Her mail was opened and she was in constant danger of deportation. On a return trip to England, she acted as a liaison between scattered Indian nationalist centers in England, in the United States, and on the continent, and reorganized by clandestine methods the publication and distribution in India of banned newspapers. When she came back to Bombay, it was under an assumed name and in disguise.

Hers was the initiative on which several flourishing private enterprises were founded in Bengal. She started the Swadeshi movement—the first attempt at nonco-operation and boycott of English goods—and she was among the first to peddle native woolen stuffs in Calcutta. She passionately believed in the necessity for action in India itself since "What countries grow to is good, and what is done for them is painted show." She wrote: "I pray that I may be reincarnated to cry 'Young India' when the time comes to snatch the country's freedom from England." She told Hindus to go and learn how to shoot and handle a weapon, and at the same time she sent groups of young men to England, the United States, and Japan for professional training to be ready when the time came. She prophesied India's freedom for 1921 but it came in 1947.

As a "Mother of the People," as Tagore called her, she opened in 1903 a school for girls from "orthodox circles" to whom all book learning had been forbidden, and supported the school mainly from the earnings derived from her lectures and writings. The school embroidered the national flag for exhibition as early as 1905.

Ill, and in the evening of her life, she "lived like a leaf detached from the bough with no will and no desire." Although the symbol of Kali, the Mother of Energy, had entered into possession of Nivedita's life, she began to worship passivity and passed away at the early age of 44. Paraphrasing Vivekenanda's teaching: "With desire all gone, with all the chords of her heart broken, she attained immortality."

This is a "must" book for a real understanding of the intertwining of religious and political life in India.

ALBERT E. KANE

Washington, D. C.

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT. *The Economic Development of Jamaica, Report by a Mission*. Pp. xvii, 288. Baltimore: Johns Hopkins Press, 1952. \$5.00.

The Report consists of two parts of about equal length. The first embraces findings of the Mission in agriculture, mining, manufacturing, tourism, transport,

power, and social services, and specific recommendations on financing a program of development in each field. The second—thirty-five annexes—gives additional factual details on aspects of the economy or further analyses of the Mission's recommendations.

As three-fourths of the basic activities of Jamaica are directly related to agricultural production and processing, any major plan of economic development must emphasize improvements in farming and activities related thereto. The Mission is convinced that potentialities of agriculture are far from full realization. It strongly recommends a complete aerial and ground survey to provide the necessary data for effective planning of land use and for carrying out essential developmental works. The Mission believes that it is possible and feasible to add 150,000 acres of cultivated land and to increase per acre yields substantially. Recommendations are made for an Agricultural Developmental Program, embracing soil conservation and rehabilitation, reforestation, pasture improvement, irrigation and land reclamation, rural housing and water supply, and agricultural credit. If the recommendations are put into effect, there would result a substantial increase in the output of beef and dairy products, sugar, bananas, coffee, cacao, citrus fruits, rice, and other food crops. However, will an increase in foodstuffs be more than offset by the increase in population unless the rate of net population increase slows down? Although several mineral deposits may be developed, mining will employ relatively few workers in the future. Present manufacturing industries, which consist chiefly of processing local agricultural commodities and of making simple consumer goods, can be increased, though not greatly. Jamaica does not have the basic raw materials for major manufacturing industries and the local labor, considering the stage of technical knowledge and efficiency, is expensive. Prospects of expansion of the tourist industry are promising.

The annexes of the second part of the Report contain a wealth of statistical and other information. In several instances they contain specific recommendations and

suggestions for desirable lines of development.

The Report is sound in its basic assumptions, analyses, and recommendations. The recommended program of development is a bold ambitious one, conceived on a scale unprecedented for Jamaica. Nothing less than a bold expensive venture will solve the problems of widespread poverty and chronic unemployment, wasteful and ineffective use of the land, and the rapidly increasing population.

SLAVIC COUNTRIES

MEHNERT, KLAUS. *Stalin Versus Marx: The Stalinist Historical Doctrine*. Translated from the German by E. W. Dicks. Pp. 128. London: George Allen and Unwin (distributed in the U. S. by The Macmillan Company), 1952, 1953. \$2.00.

Klaus Mehnert, a German journalist, who, more than 20 years ago, wrote a book on Soviet youth and who later lived in Hawaii and Shanghai, published in 1951 a short book in German called *Weltrevolution durch Weltgeschichte*. It has now been translated into English. It is a popularly written but accurate and concise treatise on what might be regarded the most fundamental change in the transition from the Leninism of the early 1920's to the Stalinism of the early 1950's. Though Lenin's theory and practice were fundamentally not different from those of Stalin as regards its totalitarian and terrorist character, its hatred and contempt of Western civilization, and its messianic utopian expectations, there are nevertheless far reaching developments which have changed the face of the Soviet Union in the last 30 years. This is nothing astonishing. After all, the United States and Britain are today in many ways very different countries from what they were fifty years ago, though they were liberal democracies then as they are now. The main change in the Soviet Union has to do with the relation to nationalism and

to the past. The Leninist revolution intended a clear break with the past, the beginning of an entirely new era for the Russians and for mankind in general. The Czarist past and the Orthodox Church were thrown on the same junk heap of history as was Western civilization.

Since then, there have been two great changes. One happened in 1934, when Stalin was apparently deeply impressed by Hitler. He became convinced that in the present age socialism does not command the loyalty of the masses to a sufficient degree and that nationalism is the great emotional force of the present. Therefore he suddenly began to emphasize the Russian past, to revive Russian national traditions and attitudes, and to stress Russian imperial glory and power. This new national socialism found its expression in the reintroduction of czarist officers' uniforms in the Red Army and the celebration of the anniversaries of figures and events of the prerevolutionary period.

World War II confirmed Stalin's new theories; of all the peoples of the Soviet Union, only the Russians supported the Soviet government fullheartedly. From then on, the Russian people and Russian history were no longer regarded as of equal value with other peoples and their past in an international class society. The Russian people were, after 1945, extolled as the leading people of the Soviet Union and of mankind, an incomparable people, to the genius of which all the great inventions and all the progress of mankind are due. Dr. Mehnert describes in detail how this new doctrine was formulated, especially by the Soviet historians. He sees in the new historical view a factor, deeply weakening the Soviet Union. It drives the Russians "into a disastrous isolationism"; it confuses them because it has plunged them, within a few years, from the thin air of ice cold dialectics into the oppressive heat of a gospel of salvation by national magic; the belief that the Russian people are the chosen people of history has fallen on fruitful soil among the Russians, but has estranged the many non-Russian peoples of the Soviet Union.

The new anti-Semitism, which was only expressed after Dr. Mehnert finished his

book, is another facet of the national socialism into which Stalinism has transformed the terrorist-utopian socialism of Lenin.

HANS KOHN

City College of New York

FISCHER, GEORGE. *Soviet Opposition to Stalin: A Case Study in World War II*. Pp. ix, 230. Cambridge, Mass.: Harvard University Press, 1952. \$4.00.

This book is a brilliant study of the organized opposition of captured Soviet officers, soldiers, government officials, and civilians to Stalin and the Soviet government. The author, at present a junior fellow in Russian history at Harvard University, was born in Russia and educated in Soviet schools before coming to America and graduating from an American university. His work is based on available wartime documentary material including the files of the three Vlasovite papers, the official German documents concerning Soviet defections, and the records of the Refugee Project of Harvard University.

In his opening chapters, the author considers the revolt school of thought and the surprise attack school in order to understand the causes of the early Soviet defeats and the capture of very great numbers of Soviet soldiers, who later formed the hard core of the wartime opposition movement. He reaches the conclusion that the vastness of these early defeats cannot be explained without a study of the primary concept of inertness.

The Nazi policy toward the Union of Soviet Socialist Republics was so harsh and ruthless that it seemed almost designed to prevent any collaboration between captured Russians and the German government. Goering's plan, Himmler's propaganda, and above all Hitler's *Ostpolitik* rendered it difficult for Rosenberg to sell from "the Rosenberg shop" his own master plan for four great blocs of Eastern peoples against Soviet Russia.

A search for a Soviet leader to head a German sponsored opposition to the USSR ended with the designation from a group of six captured generals of Lieutenant General Andrei A. Vlasov as leader of KONR, the Committee for the Liberation of the

Peoples of Russia. In September 1942 he had signed the first propaganda pamphlet against the "Stalin clique," the destroyers of millions of honest people. It was however as late as September 1944 that Himmler in a meeting with Vlasov agreed to the formation of a new committee and an armed force of Soviet nationals to fight Bolshevism. Mr. Fischer prints an English translation of the Prague Manifesto of KONR, November 14, 1944, which seems like one of the most effective revolutionary platforms for any large group organized to overthrow Stalin's tyranny.

The author concludes with a penetrating analysis of the latent opposition within the government and the army to the rule of the Kremlin, an opposition which in the foreseeable future will need military victories by an anti-Soviet power before it can overthrow the Soviet regime. While the author notes the various waves of unrest that have swept over Russia since the civil war, he regards the mood of inertness as the greatest obstacle to the overthrow of the dictatorship. Mr. Fischer has demonstrated a mastery of the complexities of the Soviet System, an ability to forecast the likelihood of opposition to this system, and a command of contemporary history, which should gain for his study a wide circle of readers.

RALPH HASWELL LUTZ

University of California
Los Angeles

MANNING, CLARENCE A. *The Forgotten Republics*. Pp. xii, 264. New York: Philosophical Library, 1952. \$2.75.

Professor Manning of Columbia University's Department of Slavic Languages has written a useful and sympathetic general historical survey of the three Baltic states. This intriguing area of overlap in which Germans, Scandinavians, and Slavs have clashed together with Catholicism, Orthodoxy, and Lutheranism has been rather neglected. Professor Manning's introductory study serves as a valuable corrective.

The first nine chapters deal with the period preceding Russian domination, which began in the eighteenth century, and cover the main trends—the early tribal movements, the arrival of German traders, the

establishment of the Teutonic Order and the subsequent subjugation of the natives, the rise of Lithuania, and its union with Poland. Professor Manning places the rise of Muscovy in proper historical perspective and gives considerable treatment to Russian rule in Estonia and Latvia and later in Lithuania.

The greater part of the second half of the book deals with developments in the three countries which occurred during and after World War I. The primary focus is on the establishment and maintenance of the independent national governments and their difficulties in dealing with Soviet Russia and Germany. Lithuanian-Polish relations, which contributed to the breakdown of the *cordon sanitaire*, are given considerable attention as well as the question of agrarian reform and the emergence of "strong men" as heads of the governments of all three states. The Nazi and Soviet occupations are dealt with in three of the concluding chapters.

The treatment is not exhaustive nor does it lay claim to being scholarly in the sense of monographic documentation replete with footnotes and appendixes. Some reviewers might take issue with the author for having omitted a particular detail or date, but one must judge the book for what it is, a general historical introduction, and in terms of that goal Professor Manning has succeeded in producing a convenient and compact volume. However, this reviewer wishes that Professor Manning had given more attention to the Krivians or Byelorussians in his treatment of Lithuania and Poland. A better map would have added to the book.

JOHN S. RESHETAR, JR.

Princeton University

WESTERN CONTINENTAL EUROPE

BERGSTRÄSSER, LUDWIG. *Geschichte der politischen Parteien in Deutschland*. Pp. 337. Munich: Isar Verlag, 1952. Paper DM 10.80; cloth DM 12.—.

MOMMSEN, WILHELM. *Deutsche Parteiprogramme: Eine Auswahl vom Vormärz bis zur Gegenwart*. Pp. 198. Munich:

Isar Verlag, 1952. Paper DM 6.80; cloth DM 8.40.

The study of the history, ideology, and social background of political parties has been inadequately pursued so far in most countries, although it forms an integral part of any realistic approach to politics. In Germany, as in other nations with an essentially authoritarian background, such studies are particularly important if a new kind of political science is to develop, replacing the traditional *Staatslehre*, based primarily on history and public law, with a broader approach going beyond descriptive accounts of formal structure.

Professor Bergsträsser's *History of Political Parties in Germany* was first published in 1921, and now appears in its seventh edition. It is characteristic of the poverty of political literature in Germany that his little book has established itself as the leading text in the field. It has its virtues: the style is clear and easy to read, and the work contains the essential data in a nutshell. Yet the nutshell was not big enough to include any sort of real analysis or interpretation; the bibliographical data appended to each section of the book are useful for the beginner in the field, but it is almost pathetic how little the author has used—not necessarily through his own fault—non-German literature on German government and politics. Reading the book one has the impression that it could easily have been written in 1932; the passage of the last two decades and the impact of Germany on the outside find little reflection in the account of essentially formal structures. The author is objective and judicious; yet somehow he does not succeed in relating the development of political parties in Germany to her major social and economic forces in the last century.

Mommsen's *German Party Programs* naturally supplements Bergsträsser's account. It is not an analysis of the various programs of German parties, but an anthology of excerpts from the major programs of the major parties. The collection starts with the early nineteenth century, and ends with present-day parties. Covering such an extensive territory, the all-too-short book is bound to appear fragmentary at times, but it will be found useful by

students of German politics, because it contains pieces which are relatively less well known. The excerpts from various party programs since 1945 will be found particularly interesting in the light of current developments in Germany.

WILLIAM EBENSTEIN

Princeton University

JÖHR, WALTER ADOLF. *Die Konjunkturschwankungen*. Band II of *Theoretische Grundlagen der Wirtschaftspolitik*. Pp. xvi, 675. Tübingen: J. C. B. Mohr (Paul Siebeck); Zürich: Polygraphischer Verlag, 1952. Br. DM 36.—; Lw. DM 39.60.

This treatise, written by a well-known Swiss economist, is the second volume of an ambitious work on the "Theoretical Foundations of Economic Policy." Its subject, the business cycle, is treated skillfully in its various aspects, and there is an abundance of references to the modern literature. Professor Jöhr has analyzed a huge amount of material in a workmanlike fashion. Most of this material originated in the English-speaking countries, and much of it is bound to be new to the continental reader. Professor Jöhr has approached his task of interpretation with a high sense of perspective. He has built a solid structure out of many blocks. That he was successful in this enterprise may in no small part be due to his very detachment, which would have been wanting if one of those who carved the blocks had attempted his task.

Professor Jöhr is principally concerned with the causes of economic fluctuations. He distinguishes between structural elements of the economy and impulses, and develops a classificatory scheme of both. Of the impulses, some—technological change, new gold deposits, new territories—are considered as especially important for the nineteenth century; at the present time, they are supplemented by such other impulses as social upheavals and the expectation of these, industrial conflicts, aggressive trade union policy, war and fear of war, and inflation generated by budgetary deficits. The structural elements, broadly speaking, are in the nature of a disposition to cumulative change. This disposition can be interpreted either with

the help of mechanical analogies or of considerations of social psychology.

A feature of the book which is of especial interest to American economists is indeed the systematic emphasis on social psychology, which is given greater prominence than is customary in the standard treatments of the business cycle. Another feature which deserves study is the protracted attention given by the author to *Betriebswirtschaftslehre*, a sort of managerial economics which has been intensely cultivated on the continent of Europe and to which Swiss economists have made a number of significant contributions. Students of this discipline, which has no exact counterpart in English or American economics, have in the past furnished some interesting interpretations of the business cycle. References to these can be found in the works of Mitchell and Haberler. For those who wish to trace the more recent developments along the same line, Professor Jöhr's work will serve as a readily available guide.

HENRY WILLIAM SPIEGEL

The Catholic University of America

Cambridge Economic History of Europe, The. Vol. II: *Trade and Industry in the Middle Ages*. Edited by M. Postan and E. E. Rich. Pp. xvi, 604. New York: Cambridge University Press, 1952. \$14.00.

This second volume of the *Cambridge Economic History* is centered around two long chapters. One, by Postan, is on the trade of Northern Europe in the Middle Ages; the other, by Lopez, is on the trade of Southern Europe in the same period. This arrangement gives greater continuity and clarity to the volume than is usual in co-operative works of history; we have, for the first time, a survey of medieval trade in relatively brief form. It is consoling to those who like to consider medieval Europe an economic unit to see that the two authors agree fairly well that major fluctuations in economic activity affected both North and South. For example, they both see a serious depression in the fourteenth and early fifteenth centuries, followed by

partial recovery as the sixteenth century drew near.

As usual in medieval economic history, statistics about prices and volume of trade are scarce. Postan furnishes what figures he can; Lopez makes less effort to collect this scattered material. Neither the presence nor the absence of statistics affects the quality of the chapters. We shall never have a solid statistical base for medieval economic history; valid conclusions about this period will always depend on wide reading and good judgment. Both authors possess these qualities, and their work is as good a summary of our present knowledge as is possible.

Around these two closely-integrated chapters are arranged six others dealing with special topics. Childe discusses trade and industry in barbarian Europe before the Roman conquest and shows how early some of the major trade routes were established. Walbank deals with trade and industry in the Late Empire and makes some very interesting suggestions about the causes and the incidence of economic regression. Runciman's chapter on Byzantine trade and industry is a little too compressed. It does pose clearly the curious problem of a state which possessed great power in economic affairs but had no well-defined economic theories.

Carus-Wilson's discussion of the woolen industry and Nef's treatment of medieval mining and metallurgy will interest the general reader for two reasons. Both authors give good examples of that medieval interest in technical improvements and labor-saving devices which was so characteristic of the age and so important in laying a foundation for modern technology. Both demonstrate the extreme ingenuity of medieval men in forming organizations to accomplish difficult tasks. Jones's chapter on building in stone is to some extent a summary of his own earlier, and excellent, articles. Though brief, it is clear and gives most of the essential information about the building trades.

JOSEPH R. STRAYER

Princeton University

OTHERS

BALLANTINE, JOSEPH W. *Formosa: A Problem for United States Foreign Policy*. Pp. xi, 218. Washington: Brookings Institution, 1952. \$2.75.

This compact study of Formosa as a problem in United States foreign policy is focused on the developments of the war and postwar periods, since, as the author puts it: "The Second World War thrust Formosa for the first time into the orbit of United States interest and concern. Post-war developments in China, with the resulting withdrawal (in 1949) of the National Government to Formosa, brought into existence the 'problem of Formosa' with which the United States is now inevitably confronted" (p. 173). In the above statement, the author indicates that Formosa has become a problem for United States foreign policy not in and of itself but on account of the problem of China. Thus, after a summary of the demography of Formosa, of its early experience with Chinese rule, its development as part of the Japanese Empire (1895-1945), of wartime planning as it affected the island, and of the conditions of Chinese reoccupation (1945-47), the author approaches his subject through treatment of the "Collapse of National Government on China's Mainland" (Ch. 5). In these early chapters the background for understanding of the present situation is admirably summarized as accurately as the tightness of the treatment permits. The author then presents a careful description of the governmental arrangements on Formosa, where a National Government has to function within a province of China beside the provincial government and be supported on provincial resources which must also support the provincial government.

The last four chapters are devoted to the dilemmas which Formosa presents in the development and application of United States policy, directly and also indirectly in connection with the United Nations and the Japanese Peace Treaty. After an objective description of the development of United States policy in its early phases, the author notes and discusses the shift in

policy which resulted from "the state of American public opinion, the outbreak of the conflict in Korea, and the intervention of the Chinese Communist regime in that conflict" (p. 130). But while the shift in policy is evident, its ultimate implications are not so clear. "In fact," writes the author, "the biggest unresolved element in the problem of Formosa is the question of the ultimate direction in which policy will move. Much of the weight of decision in this matter will fall upon the American public" (p. 203). It is this which justifies the hope that such objective treatments of the subject as this will be widely read, and that the alternative available courses of action which the author analyzes will be soberly considered.

HAROLD M. VINACKE

University of Cincinnati

KAHIN, GEORGE MCTURNAN. *Nationalism and Revolution in Indonesia*. Pp. xii, 490. Ithaca, N. Y.: Cornell University Press, 1952. \$6.00.

This book affords a comprehensive account of the two factors chiefly responsible for the creation of an independent Indonesia: the nationalist movement and the struggle against the Dutch. Political, social, and economic conditions of nineteenth-century Netherlands Indies, coupled with a consideration of many factors contributing to the growth of nationalism, afford background for insightful treatment of nationalist leaders and activities of various groups to 1945. With the establishment of the Republic of Indonesia the book's scope broadens. Kahin provides an exhaustive account of internal political development of the young Republic, deliberations with the Dutch, and of negotiations with the United Nations to the summer of 1948. Then a fascinating chapter gives the story of the struggle for power within the Republic, climaxed by the Communist rebellion. Political parties and the platforms they professed following this conflict are thoroughly analyzed.

Kahin then turns to the Dutch program of "divide-and-rule," maintained, he alleges, by indirect control of individual states of a future federal union. This point may be challenged. Was the creation of

autonomous states a device to preserve colonial rule? Might not a federal union better have served the needs of Indonesians than does the present unitary state? Today's emphasis on decentralization suggests one answer. Kahin himself admits that the speedy liquidation of the federal state derived from Indonesian desire to eliminate a "Dutch-instigated" government rather than from opposition to a federal union. This chapter on the *negaras* (states) and the interim federal government fails to portray the conscientious effort of civil servants, Indonesians and Dutch, to fashion self-government at the local level. In the reviewer's observation, this effort was appreciated and availed of in Indonesia Timur, one state having the opportunity to follow through. Though the political development of Indonesian territory outside the Republic of Indonesia is not within the scope of Kahin's book, that picture must not be overlooked.

In describing the final struggle for independence, the author emphasizes the role of the United Nations Commission for Indonesia and the pressure upon the Dutch exerted by our own Department of State. Kahin rightly observes that when the Federalist group, representing the states, lent its support to the Republic, the transfer of sovereignty was bound to occur. Conversion from the federal to a unitary state is ably recounted. Achievements of the "revolution" are summarized and major problems faced by the new nation are suggested in a final chapter.

This is a first treatment of the nationalist movement and struggle for independence both exhaustive and fully documented. The author's courageous and persistent efforts while in Indonesia provide first-hand reports. The general reader wishing to be well-informed about this part of the world will be amply repaid. The work serves as a first-rate reference volume for the specialist. It is a job well done.

A. ARTHUR SCHILLER

Columbia University
School of Law

CAMACHO, J. A. *Brazil: An Interim Assessment*. Pp. viii, 116. London and

New York: Royal Institute of International Affairs, 1952. \$2.50.

Even though this small volume is based largely on what the author could glean from the writings of others it should be useful in helping make Brazil and the Brazilians better known throughout the world. The sources to which he gives most credit are *Brazil*, edited by Lawrence F. Hill (University of California Press, 1947); J. Fred Rippy, *Historical Evolution of Hispanic America* (Crofts, 1945); and the annual statistical publications of the Brazilian government. The 43 works listed in the Bibliography do not include any by Pandiá Calogeras, Fernando de Azevedo, Euclides da Cunha, Rocha Pombo, Arthur Ramos, Pedro Calmon, Giorgio Mortara, Emilio Willems, Caio Prado, Jr., Karl Lowenstein, Charles Wagley, Donald Pierson, or Roquette Pinto.

The small volume is divided into a short introduction and six chapters: Chapter I, "Contrast: Geographic, Economic, and Demographic," contains brief summary materials relating to the main geographical features, climate and rainfall, geographical zones, mineral wealth, population, living standards, racial origins, and occupations of the population. The second chapter is entitled "Experiment: Racial, Economic, and Political," and is given over to brief statements relating to the causes of miscegenation, racial elements and immigration, early economic development, economic cycles, early political history, and political history from 1822 to 1889. Then follows a chapter entitled "Emancipation: Political, Economic, and Cultural," which focuses attention upon political history from 1889 to 1932, industrial development, transport, foreign investments, cultural development, literature, music and the other fine arts, and science, technology, and medicine. Chapter IV is entitled "Example: Colonization and Foreign Policy." By far the most ambitious part of the book and the one that seems called for by the title is Chapter V, "The Scene Today: Political, Economic, and Social." In this the author organized his materials under the following sub-headings: the first Vargas Regime, the 1945 elections, political developments from

1945 to the 1950 elections, religion, the Dutra administration, economic position today, hydro-electric power, steel, staple foods, coffee, cotton, fruit and cacao, rubber, other vegetable products, terms of trade, banking system, education, press, radio, and constitution. Chapter VI, "The Future (and the Salte Plan)," gives a brief explanation of the Salte plan along with a statement of the amounts of funds provided for health, food production, transport, and power in its budget. This plan calls for the expenditure of 20,000 million cruzeiros (about one billion dollars at the official rates of exchange) in the period 1950-54 for the improvement of health facilities and services, increased food production, the extension of renovation of the transportation system, and the development of power.

Four small maps are helpful; and there also is an index.

T. LYNN SMITH

University of Florida

LETTERS TO THE EDITOR

Dear Sir:

I have only recently become aware of a queer error that has crept into the printed version of my review of *Communism in Western Europe* by Mario Einaudi, Jean-Marie Domenach, and Aldo Garosci (May 1952 issue of THE ANNALS, pp. 256-57). In the next to last paragraph of that review as it appears in print the personality sketches of leading French and Italian Communists in the book are called "part caricature and part idealization." This I had not written. On the contrary, I had said that these sketches kept equally far away from caricature and from idealization—in other words that they were very good.

OXFORD BOOKS

The Quest for Community*A Study in the Ethics of Order and Freedom*

By **ROBERT NISBET**. Modern man finds himself rootless and alone in today's society which tends increasingly toward centralization and uniformity. Can he rediscover his sense of community and, at the same time, preserve his freedom? Tracing the role of the state throughout history, Mr. Nisbet presents "a thought-provoking analysis which gets at the root causes of our moral malaise. . . . It will well repay reading."—*Saturday Review*. 1953. 301 pages. \$5.00

International Relations: Documents and Readings

By **NORMAN HILL**. Illustrations. Maps. 1950. 552 pages. \$5.00

A Short History of International Affairs, 1920-1939*Fourth Edition*

Has fear of Russia made us
prudent...or paralyzed?

Vera Micheles Dean

examines the outlook for

**Foreign Policy
WITHOUT FEAR**

► In her new book, the research director and editor of the Foreign Policy Association, sets forth 'the realities' which confront the Eisenhower administration. Considering America's alternatives for action in Asia, the Middle East and Western Europe, she suggests that we throw off the fear of Russia that has dominated foreign policy and "boldly act on our often-proclaimed but, in practice, often watered-down principles."

**FRONTIERS OF
LEGAL AID WORK**

(September 1939)

Edited by **JOHN S. BRADWAY, LL.B.**, Secretary of the National Association of Legal Aid Organizations, and Professor of Law and Director of the Legal Aid Clinic at Duke University, Durham, North Carolina

The twenty-one contributors to this volume, most of whom "have pioneered at desks in the offices of legal aid societies," according to Professor Bradway, have surveyed the need, the technique, and the structure of legal aid work.

The price of this volume has been reduced to 50 cents per copy.

FOREWORD

THROUGH the medium of the July issue of THE ANNALS we are able to extend the addresses made at our Annual Meeting to many who were not present at that meeting, held this year on April 10 and 11.

This volume includes also an article by Dr. D. F. Fleming and one by Dr. Austin F. Macdonald.

THORSTEN SELLIN

The Presidency of the Academy

AFTER more than twenty-three years of service as president of the American Academy of Political and Social Science, Dr. Ernest Minor Patterson has asked to be relieved of the increasingly heavy duties and responsibilities which the office entails. This wish has been honored by the Board of Directors, which has elected as his successor Dr. James C. Charlesworth, professor of political science at the University of Pennsylvania, who took office on June 1, 1953. At that time Dr. Patterson became president emeritus by unanimous vote of the Board.

Dr. Patterson was first elected president in 1930, succeeding Dr. Leo S. Rowe, director general of the Pan American Union. As professor of economics at the University of Pennsylvania, he had already earned recognition as an authority on questions of international economics, and had lectured widely at home and at international institutes at The Hague and in Geneva. Continuing his teaching at the University, where he was for many years chairman of the Department of Economics and one of the leading figures in the Wharton School of Finance and Commerce, he gave freely of his time and organizational abilities to the Academy, even before he retired from his professorship in 1950.

He took office at the beginning of the depression, but with the aid of able and faithful associates he has succeeded in maintaining the organization on a sound basis without having to appeal for financial aid. Under his guidance the Academy has doubled its investments and its membership. He left his office with the knowledge that his successor would take charge of an organization having the support of over seventeen thousand members in all parts of the world.

Only those who have worked closely with Dr. Patterson during his term as president can fully appreciate the unselfish devotion, the skill, and the meticulous care with which he discharged his task. He has earned the deep gratitude of his fellow members of the Board of Directors and the respect of all who know the Academy and its activities.

Dr. James C. Charlesworth has for several years been identified with the work of the Academy as associate editor of *THE ANNALS*. He joined the faculty of the University of Pennsylvania in 1939. Well known as a writer on public administration, he brings to his new office a wide experience as a scholar and an executive, and under his leadership the Academy can look forward with confidence to the future.

Atlantic Union—Freedom's Answer to Malenkov

By CLARENCE K. STREIT

MY topic was originally "Atlantic Union—Freedom's Answer to Stalin." But since that title was selected, Stalin has died, leaving the free facing a more formidable danger and a momentous opportunity. Atlantic Union, however, remains freedom's answer to Malenkov. I want to give you some of the reasons why it answers our present Soviet problem with all the force of a surprise attack. But first let me tell you briefly what we mean by Atlantic Union. It is simple enough.

WHAT ATLANTIC UNION MEANS

We mean to unite the democracies by the same free federal union principles that unite the people of our own forty-eight states through our Constitution. We mean to unite them as fellow citizens of a great union of free men and women with an executive and a congress—a senate and a house—elected by them. We mean a system where on election day you will each vote not only for your choice for governor of your state and for your state senator and member of the legislature, not only for your choice for President of the United States and for your United States senator and congressman, but also for your choice for the executive of the Atlantic Union and for your senator and representative in this new congress.

You can see from this that you sacrifice none of your sovereignty as a citizen by constituting this great union. Instead, you gain sovereignty, gain power, gain rights, gain a vote where you personally have none whatever now, and you gain this citizen sovereignty in the very fields where you personally need it most—the fields on which peace and war depend.

What are those fields which you would begin to help govern through your representatives in the new union government? Its creation would involve no change in the structure or powers of your state government. Nor would it involve any change in the basic structure of the United States Government. It would involve only the transfer of certain powers from the United States Government to the Atlantic Union government. Which powers? Only some of the powers which the people of our thirteen original states transferred from their state governments to their federal representatives when they replaced the Articles of Confederation with our present Federal Constitution.

By this transfer of power they created a common defense force, a common foreign policy, a common citizenship, a common currency, and the great common free market which has been the making of our prosperity.

How far should we go now in this direction in constituting a great Atlantic Union with the other democracies? In my personal view, we should go the whole way. We know from experience that this combination creates prodigious power and freedom. We had better take no chances these days in having too little of either power or freedom if we wish to risk the lives of no more of our sons. That is my personal conviction. Others believe that a union concerning only defense and foreign policy would suffice for the present.

FEDERAL CONVENTION PROPOSED

How far we should and can go depends of course not only on agreement among us Americans, but on agreement with the other democracies. The best

way to reach agreement on this, and on the other obvious problems Atlantic Union involves, is to send delegates to a convention to thresh these things out with delegates from the other democracies and report whatever agreement they reach back to the people for action by them. That is the way the United States Constitution was created through the Federal Convention that met in Philadelphia in 1787. And that is how the Atlantic Union resolution proposes to tackle the problem. Here is the text of its resolving clause:

Resolved by the Senate (the House of Representatives concurring), That the President is requested to invite the democracies which sponsored the North Atlantic Treaty to name delegates, representing their principal political parties, to meet this year with delegates of the United States in a Federal Convention to explore how their peoples, and the peoples of such other democracies as the Convention may invite to send delegates, can apply among them, within the framework of the United Nations, the principles of free federal union.

The other sponsors of the North Atlantic Pact which the resolution would have us meet in convention are Canada, the United Kingdom, France, the Netherlands, Belgium, and Luxembourg. These seven drafted the Atlantic alliance, and then they extended it to some others. The resolution follows this successful precedent.

Two other points in the resolution should also be noted: (1) The union would be kept within the framework of the United Nations, but it would require no action by the Security Council. The Soviet Union could not veto it, any more than it could block formation of the North Atlantic Pact. (2) The convention would be limited to exploring how far we and the others could go in federating. The resolution involves no commitment to union. The people retain full power to reject any union the

convention proposes if they do not like it when they see it.

STATUS OF THE RESOLUTION

This resolution was introduced in the Senate by Senator Kefauver and nineteen others in 1949. It is yet to be acted on by Congress. The Canadian Senate has already showed its approval by adopting practically the same resolution with only one negative vote.

Backing the resolution on the citizen side in the United States, is the Atlantic Union Committee. Its president is former United States Supreme Court Justice Owen J. Roberts. The vice presidents of the Atlantic Union Committee are Will Clayton, former Under Secretary of State, and Mrs. Robert Patterson, widow of the former Secretary of Defense. Its council includes more than five hundred nationally known leaders in all fields.

OPPORTUNITY AND DANGER

I want to turn back now to the situation resulting from Stalin's death and show how Atlantic Union fits into that picture.

Stalin's death gives the free a rare opportunity to win without another world war. At the same time, it faces them with grave danger of suffering war and losing it to Communism by sinking still deeper into the errors that have already built up dictatorship so formidably.

Dictatorship weakened now

The immense opportunity the free now have comes from the fact that, by its nature, a dictatorship is most vulnerable (a) in the period when the dictator's successor is not yet firmly established, and (b) in the areas farthest from the throne, nearest the alternative, and most weakly held. All this applies with special force to the Communist dictatorship now.

For many reasons, the Kremlin is particularly exposed to the usual dangers of succession in a dictatorship. Malenkov must follow a man who was in power an unusually long time, who had the prestige of a founding father and a World War victor, and who had been semideified by years of propaganda. The contrast between Malenkov and Stalin is bound to be sharply to the former's disadvantage for a long time.

Death took Stalin before he had had time to fix firmly Moscow's rule over China and the nations of eastern Europe, where Yugoslavia had already successfully defied Stalin himself. They are all distant from the centers of Moscow's power, and in more ways than one near to the western democracies. Even if they are not likely to feel that now is the time to assert themselves, Malenkov is bound to suspect that they will.

Freedom's real danger

The grave danger the free now face comes from the fact that, by its nature, freedom encourages people to go their own independent ways. Result: they almost always require immediate danger to unite them; even then, they often unite too little and too late; and if they fail to form an enduring union while the peril is most imminent, its recession is only too likely to cause them to fall apart again. All this applies with peculiar force to the Atlantic democracies now.

Twice within this half-century the Atlantic democracies have suffered world war and near disaster from failure to unite effectively in time. This taught them so little that, when blockaded in 1948 in Berlin by their Russian ally, the best they could do was to fall back on the system that had twice failed them before, and form another alliance, the North Atlantic Treaty Organization.

NATO was a step in the right direc-

tion, but even when it was taken, it clearly was much too small a step. Yet even when Communism extended its sway through China, and Stalin himself was at the height of his power, the danger to freedom did not suffice to induce the Atlantic democracies even to explore the possible advantage of replacing the alliance with something strong—a federal union.

The first wartime alliance of the Atlantic democracies fell apart when the Kaiser no longer threatened. They quickly relaxed and went their separate ways again when the Nazi and Japanese dangers were ended. Now that Stalin's death has lessened the pressure on them, they cannot guard too much against their fatal tendency to fall apart when not in dire danger.

DISTRUST AND DISUNION

To take advantage of our present opportunity and avoid its danger to us, we need to begin by understanding clearly the vital weakness both in the Soviet dictatorship and on our own side. Unless we are aware equally of their Achilles' heel and our own, we can neither bring them down nor save ourselves.

Communism's Achilles' heel can be summed up in one word, *distrust*. And so can freedom's: its inherent fault is *disunion*.

Freedom takes faith. Freedom with union requires even more trust. Such unitary nations as the United Kingdom and France, and such federations as the United States and Canada, are standing proof that freedom does flourish on organic union of the free, and that the people of the Atlantic area have attained a relatively high degree of faith. But they have yet to show enough trust in each other—and in the free principles on which each of their nations is based—to form an Atlantic federal union.

COMMUNISM'S DISTRUST

Communism is union unlimited by freedom, and therefore without mutual trust. Its dictatorship fears that freedom would destroy its union, even more than the free fear that union might destroy their freedom. Its philosophy puts its faith in mass Man and distrusts the individual; its police incarnate and increase this distrust. Mutual distrust pervades its people far more than any other. The more powerful the positions individuals are in, the more they are bound to distrust one another in this dictatorship.

Stalin's death makes the Achilles' heel of both Communism and freedom much more vulnerable than before.

The Communist system is shot through with distrust and suspicion to an exceptional degree now, because of the uncertainty regarding the succession. This is true despite the smooth and swift transfer of office to Malenkov. It must continue to be true until his hold of the power of that office is no more doubted than Stalin's was. That need not take him as long as it took Stalin. He knows how Stalin did it, and he has people to deal with whom Stalin broke in for him. Still, it will take time—more than a few months. During that period, and particularly in the next few months, his distrust of his colleagues and subordinates is bound to be at a peak, and so must be their suspicion of him and of each other. This must be especially true as regards the relations between the Kremlin and the Communist dictators in China and the satellite states of eastern Europe, particularly Czechoslovakia.

FREEDOM'S DISUNION

Freedom's world is exposed now more than before to the dangers of disunion because Stalin's death weakens so obviously the Communist bloc and thus les-

sens the immediate danger from it. Freedom permits any amount of different guessing on what is going on behind the Iron Curtain and what to do about it. The resulting confusion makes for inaction, particularly now when Moscow is most vulnerable. So, too, does the fact that in all three of the strongest democracies—the United States, Great Britain, and France—the present government has a very weak majority. Add that each of the three jealously guards its sovereign right to follow a separate foreign policy, and the odds against effective united action by the Atlantic democracies in this critical period seem heavy indeed.

Nor is this all. Malenkov is already following the conciliatory policy toward the West that is most likely to accentuate its disunion. For many reasons, I believe that he will continue to pursue Stalin's policy of the "phony peace." Let me cite but two:

1. *War aids Malenkov's rivals.* War tends to strengthen those in control of the army, and, to a less extent, the secret police. It would not build up Malenkov, whose strength lies in his control of the Communist Party machine, so much as it would his main rivals. The less international tension there is, the weaker the position of those who lead the army and the police, and the stronger that of the skilled politician.

2. *Stalin nominated no one.* It is a noteworthy but little noted fact that before his death Stalin made no public statement naming clearly his successor, though this would have helped safeguard his regime from the present dangers. Nor was any testament or other public statement by Stalin produced during the funeral period to remove all doubt that Malenkov was Stalin's choice. This would have been a natural thing to do. Its absence is bound to

cause suspicion and weaken Malenkov's position. The western powers, no doubt, will let no one in the Soviet bloc forget this point.

STALINISM MALENKOV'S HOPE

Even if Stalin had explicitly designated Malenkov as his successor, the latter would need to identify himself closely with the dead dictator's policy. The lack of any such designation makes it all the more likely that Malenkov will begin by sticking to the policies of Stalin. If he grows in power, he may well interpret these later to suit himself; but just now he has every reason to establish himself unquestionably as the loyal continuer of Stalin's policies. This is the course that Stalin himself followed when he wrapped Lenin's authority about him. Malenkov must be inclined to follow this example, since he rose to power through many years of close association with Stalin. The experience and the prestige he thus gained form, perhaps, his best card now.

Stalin's death adds to the importance of his long statement of policy on October 2, 1952, for this was his last such declaration. In this statement Stalin came out for what I call a "phony peace." It was aimed at the Achilles' heel of the western democracies—their disunion. Stalin held that they were so prone to disunion that they could be counted on to come into conflict with each other again in their struggle for markets. He found war among them much more probable than war between them and the Communist bloc. The conclusion was obvious: The Communists need only follow a peaceful policy and wait for the capitalists to cut each other's throats and thus leave the world to Moscow. In the October statement that has now the weight of a "farewell address," Stalin declared:

These comrades are mistaken [who] affirm that the United States has sufficiently subjected other capitalist countries to it to prevent them from fighting among themselves and weakening each other, [and] that the progressive people of capitalism have been taught sufficiently by the experience of two World Wars . . . not to permit themselves again to drag the capitalist countries into a war among themselves.

MALENKOV'S PROBABLE POLICY

The more I study the situation produced by Stalin's death, the more I am led to conclude that Malenkov will continue to seek "peace" with the West, particularly western Europe, with a view to (1) increasing the disunion in the West, and seeking to bring on an economic collapse in the West, by lessening the Soviet pressure which has done so much for unity and full employment in both Europe and the Atlantic; and (2) meanwhile gaining time to consolidate his power at home and in the Soviet bloc, so that later he may be in position to take over the disunited democracies, one by one, preferably by civil war. Malenkov's present weakness makes Stalin's "phony peace" policy in his hands an even greater danger to the free than it was last fall, when General Eisenhower called it a "deadly challenge."

I have long feared that Moscow would adopt this policy. That is why I have been urging so insistently for years that we take advantage of the aggressive period in Soviet policy to unite the free solidly, organically, and not simply by such flimsy ties as the NATO. Thus, in February 1949, during the Berlin blockade, I wrote in our magazine, *Freedom & Union*:

The Kremlin dictatorship can have no desire for a strong Union of the Free. Sooner or later it is likely to see that its own inept policy in the West, and not the

vision or courage of Western statesmen, is the main force uniting the democracies. The Kremlin knows from experience it can abruptly reverse itself without losing its hold on its Russian slaves or its dupes abroad. Suppose it wakes up soon to its present folly. Suppose it seeks to exploit the latent divisions among the democracies, their longing for peace, their wishful thinking. To do this it need only profess a policy of conciliation in the West. . . .

Such considerations might conceivably lead the Kremlin to turn to a policy of conciliation in the West temporarily—long enough for it to gain most of the rest of Asia by concentrating its aggressive activity there. Suppose it did this. Where then would be the snailish statesmen of the West who depend on Russian pressure in Europe—not on any positive policy of freedom and union—to unite their peoples and win the friendship of Asians? These statesmen now seek to build a solid wall by pouring gravel between concrete forms without adding any internal cement to hold it together. Where will these blundering builders be when Stalin suddenly removes the concrete forms he now supplies? . . .

INSUFFICIENCY OF NATO

Where will they be? Where they are now—with little to show for the past four years except the NATO. On April 2 last year General Eisenhower, in his report to it as Supreme Allied Commander, Europe, warned:

Peacetime coalitions throughout history have been weak and notoriously inefficient. . . . Nevertheless, we were expecting NATO members . . . to work and sacrifice together over an indefinite period.

Only recently I heard the NATO Deputy Commander, Field Marshal Montgomery, speaking at the National Press Club, warn of NATO's weakness even more bluntly. He agreed—as I would—that "the achievements of NATO have been tremendous," but he held that they were not nearly good enough for present conditions. Listing

the "really vital needs" of the West, he said:

The first need: Political unity and agreement on our problems and how to solve them. . . .

The second need is a central organization to direct the agreed political policy and military strategy on a global scale. . . .

The third need is an agreed master plan to handle the present cold war, and a future hot war if it ever should burst upon us. And that master plan or grand design . . . must be based on political-military-economic facts. It must be. You haven't got it. I have given you three things—you haven't got any of them.

The fourth need: The closest possible link-up of interest—political, military, economic—between national communities in geographical areas. . . . You cannot have true unity without . . . some small sacrifice of sovereignty for the common good.

Because none of these "really vital needs" have yet been met, Montgomery said: "There is in the nations of the West an enormous dissipation of effort and strength . . . a tremendous waste of effort." That is what we have to show for all the billions we have spent and all the daydreaming we have done since the cold war began. "I am convinced myself that we have to explore other methods," Lord Montgomery said, and it is high time we began that exploration.

FREEDOM'S ANSWER

What should the free do to meet the greater, though less immediate, danger Stalin's death brings them? What is their answer? They should protect their Achilles' heel on which Malenkov has his eye, and make his own their target. The Atlantic democracies need to move swiftly now to end the disunion among them which Malenkov seeks to develop; and to develop, instead, to the crippling point, the distrust within the Commu-

nist dictatorship which is its Achilles' heel.

Malenkov does not need to foment disputes among the democracies in order to develop their disunion to where it cripples them and they fall easy victims. All he needs do is remove the pressure that now unites them a little, and provide the "peaceful" climate in which disunion naturally grows among the free. Similarly, the free need do little directly to foment distrust within the Communist empire; they, too, have only to produce the conditions in which this distrust will best grow of itself.

The free have this great advantage: they need but cure their own Achilles' heel to make that of dictatorship grow cancerously. By moving now toward Atlantic Union they not only overcome their own worst weakness, but they create conditions in which distrust must endanger the Soviet dictatorship increasingly. They set in motion forces that can gradually bring it down from within, beginning in eastern Europe.

UNITED STATES MUST LEAD

If the free are to move toward union before Malenkov has time to consolidate his position, the lead must come from the United States, preferably teamed closely with Canada. European Union would leave the free divided into the United States, the British, and Little Europe. It would not remove the divisions on which Malenkov is counting. A European Union could worsen the struggle for markets which Stalin foresaw among the capitalist countries.

If the United States fails to lead toward Atlantic Union, even the little unity that has been painfully achieved in Europe is now likely to be lost. Before Stalin's death, the ratification of the European Defense Community treaty was already in great danger, especially in France. Even then, many of the French were skeptical about Soviet Rus-

sia's attacking, and fearful of German domination of western Europe. As Malenkov lessens the fear of Soviet Russia, French fear of Germany is certain to increase.

The adroit Molotov is now the sole survivor of the makers of the Moscow-Berlin deal of 1939. If he dangles before the Germans enough hope of peace negotiations in which they would achieve unity, the strong opposition in West Germany to the European Defense Community may well make it a dead letter. Indeed, the mere prospect of reopening of the German peace negotiations by Moscow and the West is likely to make both French and Germans want to await developments before carrying out EDC.

Only by swiftly supplementing its present EDC policy with a dramatic move toward Atlantic Union can the United States be sure to keep both France and Germany on its side, while undermining Malenkov in eastern Europe. Only by calling the proposed federal convention to explore Atlantic Union can it now reasonably hope to hold together the western European countries it has been rebuilding and rearming at such cost.

Clearly, the calling of the proposed Atlantic federal convention could lead to union. It might, of course, fail to end the present disunion, but that is a risk which every policy faces. The alternative—refusal to explore the possibility of union—is certain to fail to end the disunion of the free. And if we continue trying to end it by alliance, we are certain to fail to win without war, as all history teaches.

PEACE BY SURPRISE

Why would convocation of the proposed Atlantic federal convention set in motion forces that could gradually bring down the Soviet dictatorship from within, without war? For one thing, it

would come with the force of a great surprise.

Why do we seek to win only war—never peace—by surprise attack? Surprise attack is the best way, in peace as in war, to win "the mostest with the leastest," as General Forrest would say.

George Washington won his first battle by doing the unexpected, taking the Hessians by surprise, crossing the Delaware the night after Christmas. In our time, we Americans let ourselves be taken by surprise at Pearl Harbor—and thus Japan at one blow took control of the Pacific.

By its principles and practices, dictatorship is far better prepared than democracy to win by war through surprise attack at the start. Democracy's best hope is to win by surprise attack without war.

How can anyone reasonably expect to win against Moscow without war except by taking it by surprise? Then why have we not yet even tried to do this? To take Moscow by surprise, the free need merely to unite effectively.

Can we surprise Moscow merely by strengthening NATO by adding a consultative assembly or otherwise? The effort is useful, but the hope is vain. Stalin held NATO in such low esteem that in his "farewell address" he did not even mention it as a factor in the situation, in telling the Communists why he considered the West incurably disunited.

TO UPSET THE REDS

By calling now for the proposed Atlantic federal convention to explore the possibility of uniting all the democracies in the effective federal way, the United States can reasonably hope to take Malenkov by surprise and throw him off his still shaky balance. Such a United States move, coming now, would prove, as nothing else could, that his patron saint, Stalin, did not know what he was talking about.

If we want to set the Communists at each other's throats, why not jump at the chance to prove that the "comrades" whom Stalin silenced in October were right in affirming that the West had learned enough from two world wars to unite, and that it was Stalin himself who was wrong? Why shouldn't we hasten to make a fool of him where it hurts most—in the Kremlin itself and in the Communist Party in the Soviet Union—by beginning at once the work of federating the free?

Stalin remains the stable factor in the period of seething uncertainty and distrust his death has opened up behind the Iron Curtain. Anything that weakens trust in him, as an Atlantic federal convention would, is demoralizing indeed. This would cause Malenkov himself to doubt his master and chief source of wisdom. It would reopen the debate behind the scenes which Stalin's October dictum aimed to end. Malenkov could hardly concede that Stalin was wrong and that the "comrades" whom he had slapped down were right. Malenkov's prestige is so linked with Stalin's at this stage that he would probably have to continue to uphold Stalin's belief in the ineradicable disunion of the capitalist nations, despite the evidence to the contrary which the Atlantic convention would give. But to fly thus in the face of facts is no way to keep one's authority long; it is a good way to arouse distrust of oneself and encourage rivals.

DEVASTATING CONTROVERSY

Not only to Stalin but also to most western statesmen, the prospects of Atlantic Union have hitherto seemed remote. His death will make such union seem still more remote to most people. The calling of a federal convention to explore Atlantic Union would leave plenty of room for doubt that it would succeed, and plenty of skeptics in Mos-

cow as well as in Atlantica. But it would be enough to replace with controversy Moscow's present confidence that it can bank on the disunion of the free. It must be a matter of basic concern in Soviet Russia whether the Atlantic democracies are likely or not to federate. Doubt and controversy on this major factor among Moscow's top ten (and among the satellites) would be much more dangerous to its dictatorship—particularly at this already shaky period—than would be certainty of either Atlantic disunion or union. Certainty unites, but uncertainty divides; and controversy on so basic an issue has in it the makings of paralyzing fear and a devastating purge in Malenkov's distrustful domain.

The controversy that an Atlantic federal convention would cause among the Soviet rulers would go very deep. It would bring into doubt not only the good judgment of Stalin and Malenkov, but the soundness of basic Communist dogma.

EARTHQUAKE FOR COMMUNISM

Communism makes its dictator peculiarly vulnerable to the surprise blow that federation of the free would constitute. Why? Because doctrine has great weight in the Communist system. In assuring the Communist Congress last October that the "comrades were wrong" who believed there was now more danger of war between Communism and capitalism than between the capitalist countries, Stalin was upholding the classic Marxist dogma he imbibed as a boy. He was making the classic Marxist case for economic determinism, that the all-important factor in every capitalist nation was not individual life, liberty, happiness, or dignity, but the desire for "profits," the "struggle for markets," the selfish exploitation of the poor by the rich, whether individuals or nations. All this, he held, was still valid, despite

all appearances to the contrary. How could he argue otherwise, without betraying all the basic beliefs on which his whole life had been built, and that of all Soviet Russia?

But, then, if the event should prove that all this foundation was false, how devastating the surprise! What an earthquake of a blow, not only to Malenkov but to Communism itself, if the capitalist democracies should sacrifice their "struggle for markets" to save the lives and liberties of their citizens; if the rich democracies should unite with the poor on an equal basis for the equal dignity and happiness of the individual; if the very nations that fathered capitalism and gave the world such terms as "bourgeoisie," "market," and "Wall Street," if the lands of Turgot, Adam Smith, and Henry Ford, if the French, British, and Americans themselves, should voluntarily end their disunion by forming an organic federation! What an earthquake surprise to Malenkov and to all who believe as Stalin did!

Only those who have had their profoundest belief in someone or something proved undeniably false can imagine how devastating and demoralizing to the Communist dictatorship an Atlantic Union would be. And even they need to remember that it would undermine faith not only in a dictator but in a whole system—prove not only that Stalin was a fool, but that Communism is a fraud. What more can one ask? Is not any plan worth trying that may do all this?

To fan doubt and distrust within the Soviet dictatorship, it is particularly necessary that the proposed Atlantic convention should be explicitly called to explore the possibility of forming a federal union along the lines of the United States and Switzerland, as the Kefauver resolution provides. If it is watered down to be merely another conference seeking greater "co-operation"

or "unity," it will lose most of its psychological impact.

TO DISRUPT EASTERN EUROPE

In eastern Europe the calling of an Atlantic federal convention would have an especially disruptive effect on the Soviet dictatorship. This is particularly true of Czechoslovakia, Poland, East Germany, and Hungary. All these peoples have close ties with the West; many families in them are linked with the United States by emigrants. They have little faith in alliances; they have too often seen them fail to prevent war—have suffered too much from them. That is why NATO has captured no one's imagination in Europe. But the United States itself still means strength, freedom, equality, a high standard of living, to Europe's common people, especially those behind the Iron Curtain.

Nothing else in the political field could capture the imagination of people in eastern Europe and rouse their hope as would the fact that the United States was trying to bring itself permanently to their door in the shape of an Atlantic Federal Union.

STALIN FEARED APPEAL OF U. S.

Though he had never been to the United States, Stalin himself knew of its unique magnetic appeal to eastern Europe. When its nations were under Hitler instead of the Kremlin, he sent a personal message in 1941 to President Roosevelt by Harry Hopkins, in which he said:

Hitler's greatest weakness was found in the vast numbers of oppressed people who hated Hitler and the immoral ways of his government. . . . These people . . . could receive the kind of encouragement and moral strength they needed to resist Hitler from only one source, and that was the United States.

Hopkins reported that Stalin "repeatedly said that the President and the

United States had more influence with the common people of the world today than any other force."

Since Stalin did not need to travel much to know this, one may assume that Malenkov is aware of this, too, though he has not been beyond the Iron Curtain. Certainly the Communist dictators in eastern Europe must know and fear the hope which the United States by its very name evokes among their people.

THE PSYCHOLOGICAL ASPECT

How does it come that the United States in recent years has been losing its prestige with the common people abroad? Partly because of the Red propaganda against it, but more because it has been preaching its principles of freedom and federal union to the Europeans but refusing to practice its principles with them, and has appeared too often, instead, as just another great power seeking to dominate satellites. But it has not yet hurt itself too much.

Let the United States now set out to explore with Europeans the possibility of federating with them in a greater United States of Freedom, and all the old magnetism would return with a rush. The mere calling of an Atlantic federal convention explicitly modeled on the one that constituted the United States of America itself would have incalculable psychological power. Malenkov, already fearful that his European satellite dictators may be tempted by his present weakness to follow Tito's example, would have still greater cause to distrust them.

Even if they hewed to Malenkov's line, they would fear that he distrusted them and that their rivals would seek to exploit his distrust. And they would distrust above all their own people, fearing that the possibilities Atlantic Union could offer would lead them to

plot to restore their liberties, even before such plotting began.

This is perhaps enough to show how doubt, suspicion, and fear could grow of themselves in these conditions until this cancer of distrust destroyed the Red dictatorship.

ELECTRIFYING OURSELVES

For the United States to call now the proposed Atlantic federal convention would, of course, surprise not only Malenkov, but also many Americans, British, Frenchmen, and others. To surprise the enemy, one must first surprise oneself; for one must do more

than one thought one could do. But to outdo oneself—what gives more satisfaction, a greater thrill? By surprising ourselves, we electrify ourselves and all our friends.

Malenkov with his peace policy is already seeking actively to develop the disunion among the free until it destroys their freedom. When will we give freedom's answer—Atlantic Union? When will we Americans begin the federation of the free that alone can save them, while destroying the Communist dictatorship through its own Achilles' heel? The question is not rhetorical. The answer depends on each of us, on you as well as me.

Clarence K. Streit, Washington, D. C., is president of Federal Union, Inc., and editor of its magazine, Freedom & Union. He was a foreign correspondent of the New York Times for fifteen years, ten of which he spent in Geneva covering the League of Nations. He is author of Union Now (1939), which pioneered the concepts of the Atlantic community and federal union of the Atlantic democracies.

Declaration of Interdependence

By OTTO TOD MALLERY

A VILLAGE in Puerto Rico is divided by a small stream, easily forded except after heavy rains. Children jump from rock to rock or wade through it on their way to school. When a heavy shower occurs during the morning, the children are not allowed to go home for lunch across the stream, as a freshet in the mountains may send a roaring torrent through the village. One day a sudden cloudburst upstream sent down a torrent which drowned a school girl on her way home.

The villagers agreed that a bridge must be built, but the governmental authorities said the village was too poor to afford it. A few determined villagers met. One offered to cut planks, another to transport them, and another to supply nails. The village carpenter brought a set of plans from the nearest town. By this time the interest in the project had grown so much that a large number of willing workers were ready to put the planks together.

A moving picture of the villagers at work, shown throughout Puerto Rico, encouraged the undertaking of many other co-operative projects.

WORLD BRIDGES

The world, like this village in Puerto Rico, is divided by many streams. Bridges between peoples are lacking. The Declaration of Interdependence, designed to be one such bridge, has nineteen planks assembled by people from thirty-two nations.¹ The initiative came

from the Interdependence Council with headquarters in the city of Philadelphia where the Declaration of Independence of 1776 was signed.

Communism is not the only stream that divides the world. Another flows through the middle of Jerusalem, separating the Arab world from Israel. Another cuts across the subcontinent of India. In parts of the world color and caste are dividing lines. Within the West, streams flow between governments of varying degrees of state socialism, mixed capitalism, and fascism. In the Western Hemisphere mental frontiers resist the transformation of the Organization of American States into a federation.

In spite of all these divergencies, the Declaration of Interdependence asserts that "people are more alike than they are different," and proceeds accordingly.

Of the many bridges needed to cross these dividing streams, some are already built or under way, including the Food and Agriculture Organization; the World Health Organization; the Mutual Security Agency; Benelux (the economic union of Belgium, the Netherlands, and Luxembourg); the European Coal and Steel Community (the partial economic union of France, Germany, Italy, Holland, Belgium, and Luxembourg under the Schuman plan); the North Atlantic Treaty Organization; the European Consultative Assembly; the Colombo plan; and the United Nations Technical Assistance Administration.

¹ Copies of the Declaration of Interdependence and of the Declaration of Brothers (a poetic version of the same) may be obtained from the National Education Association, 1201 Sixteenth Street N.W., Washington 6, D. C.,

at 2 cents each in quantities of 25 or more. They are obtainable free from Interdependence Council, 9006 Crefeld Street, Philadelphia 18, Pennsylvania, when ordered from outside the United States.

INDIVIDUAL INITIATIVE

All these are bridges built by governments between governments and super-governments. The Declaration of Interdependence connotes a bridge built by individuals between individuals. This is a basic difference. The Declaration of Interdependence aims to make it easier for governments to build stronger bridges with wider public support.

Individuals, as such, had to write this Declaration, because if representatives of governments did so, it would be too much diluted in the process. Moreover, any government may change from right to left or vice versa, from internationalist to isolationist, from strong to weak. Even in the United States, breeders of suspicion in high office might paralyze the United States Government. Also, the promises by representatives of one government will not always be honored by their successors. The word of a party in power is not as good as that of a trustworthy individual. Therefore, the Declaration of Interdependence is not written by governments and is not a contract between governments. It has been written by individuals in thirty-two countries and is an agreement between individuals across frontiers.

Written in English and translated into many languages, available through regional representatives on each of four continents, the Declaration has the advantages of simplicity and brevity. Complex ideas are repeated in figurative language within the comprehension of untutored people. Its moral principles have been widely discussed and are acceptable to Mohammedans, Buddhists, Jews, Christians, and believers in other religions. Its strength comes from ideas that are common to people of many faiths and many cultures. Therefore, it is not an exclusively western or Christian document, for people

from many cultures have freely participated in its drafting.

What is the necessity for such a declaration? What, exactly, is it? How can it be made effective?

WHY?

The reasons for a Declaration of Interdependence are: (1) Ideas rule the world. (2) A declaration of faith is needed to overcome the creeping paralysis of the thought that another world war is inevitable. (3) Nothing is so irresistible as an idea whose time has come. (4) To remain independent today requires wider interdependence than ever before.

Ideas rule the world

Morale makes armies fight and morale is formed by deeply planted ideas. But the army today is composed of the whole population. Therefore, a war is won without combat if the minds of the masses of the world have been captured.

Communism has been notably successful in winning the minds of the masses in certain parts of the world because its promises are definite, persuasively expressed, and circulated by ardent believers. Equally definite promises, circulated by as ardent believers, are necessary to state the case of the free world.

A declaration of faith

A declaration of faith is needed to offset the creeping paralysis resulting from the fear that a world war is inevitable. The Declaration expresses a dauntless conviction that war is not inevitable and that there are definite alternatives. The Greek world, which had attained great heights of creative achievement 2,300 years ago, disintegrated under the pressure of fear. Other civilizations have decayed from within or fallen apart. Such disintegrating

forces are at work today. The Declaration is an instrument to allay fear in time of troubles and to increase faith—first among a few persons in many nations and, through the few, to an ever widening circle.

The Declaration enables those who believe that war is not inevitable to assert themselves and to know and recognize one another. This is a necessary process toward forming a human chain composed of durable links of faith.

People all over the world do not know that such a chain exists, or that such specific promises are being made for peaceful progress. They have had dinned into their ears alluring Communist promises of spurious progress by revolution. Now an honest prospectus from the free world comes to them, simple enough for study in the schools and by the newly literate. Its potentialities are incalculable, because it relies on spiritual strength to transform the physical world.

A timely idea

Nothing is so irresistible as an idea whose time has come. In this time of troubles, as in 1776, people are more ready to join hands to save themselves by helping one another. The Declaration of Interdependence recalls the American Declaration of 1776 because both were launched in periods of stress when necessity demanded a change of direction. Only then did hidden truths burst to the surface under seething pressures.

The American Declaration of 1776 begins with "a decent respect to the opinions of mankind." The Declaration of Interdependence begins in a similar manner, appealing to "men and women of many races and religions, children of a Supreme Being through whom all men are brothers, to unite their needs and aspirations." It em-

phasizes diversity of culture with similarity of needs. Out of this diversity of culture it aims to form a durable partnership to fill these needs. It says, "Power is generated by fusion or agreement among unlike elements."

This democratic belief contrasts sharply with the totalitarian effort to crush diversity and impose uniformity of thought. The Declaration places the preservation of diversity and of the rights of the individual above economic security. If economic security were the first law of national life, as Karl Marx and Friedrich Engels assert, a prisoner in a well-managed prison would be its perfect consummation.² A prisoner has food of good quality in sufficient quantities. He is well sheltered and warm in winter, with no mortgage payments to make. He has excellent, quick, free medical attention. His laundry goes and comes back regularly. A barber is in attendance. He has no bills to pay and no installment loans to stall off. He is exempt from all forms of taxes, and is never called on to contribute to charities or churches. He has no family responsibilities or worries. A prisoner is economically secure and at the same time often more miserable than a beggar who does not know where his next meal is coming from. His criminal personality is not healed by security. He will remain at war with society unless an inner change takes place unrelated to his economic security. In the absence of a different set of characteristics from the ones which brought him into prison, he will remain a menace. And so will every government whose only national policy is security.

Are not nations who feel themselves bound together by common aims more secure than those which are linked by military alliances? Has not the time

² Starr Daily, *Through Valleys to Victories*, New York: Harper & Brothers, 1952.

come to develop interdependence as the foundation of security?

Independence through interdependence

The final reason why the Declaration of Interdependence is written today is because nations can remain independent only through attaining greater interdependence. This is a relatively new idea. Ever since World War II, some people in the United States have looked upon our time as "the American century," with the United States the sole possessor of overwhelming force, and the rest of the world standing respectfully at attention. Strong lobbies in Congress, including the American Tariff League, assert that American prosperity depends upon the exclusion of many foreign goods and upon weakening the Reciprocal Trade Agreements Act.⁸

By contrast, British Foreign Minister Eden realizes that even the wide British Commonwealth of Nations is too small a portion of the world to be profitably shut in by preferential tariff barriers. Mr. Eden sees that the economies of several nations are greater than the sum of their separate parts. This means that the total production and exchange of two or more countries will be greater if they are not isolated economies. Reciprocal trade agreements, for example, produce more trade than discriminatory trade barriers.

In the Declaration this proposition is simplified to read: "Whether the people eat more and live better depends in part on how widely goods can be exchanged with mutual gain." Not only in trade and employment but also in international relations, greater interdependence is the best guarantee of continued independence for the nations of the non-Communist world.

⁸"Hot Fight Impends Over Tariff Issue," *New York Times*, March 29, 1953, sec. 3, col. 1.

WHAT?

The Declaration consists of (1) four parts, (2) nineteen planks, (3) an agreement upon essentials.

1. The Declaration is what George Washington would have called "a standard to which the wise may repair." It is in four parts: Foreword, Preamble, Program, and Compact. The Foreword emphasizes the importance of the individual; the Preamble is on the theme that no nation can stand alone; the Program offers nineteen definite goals; the Compact is a pledge by its signers. All four parts are assertions of faith that by common sense, conscience, good will, and enlightened self-interest a bridge may be formed across the rivers of distrust.

2. An analysis of the nineteen planks in the bridge shows only four to be economic, placing the emphasis on fifteen spiritual, human, and political planks. The first planks are concerned with human dignity, mutual understanding, and freedom. Here the Declaration of Interdependence resembles the Bill of Rights of the Constitution of the United States, in that it states what ought to be, not what is. The following purposes are declared:

Reverence life and human dignity, abolish racial barriers, and repudiate all doctrines of supposed superiority based upon national origin, color, creed, sex, or caste—people are more alike than they are different—

Foster mutual understanding and respect for one another's beliefs and cultural values—many keys are required to unlock all the gates of truth and beauty—

Uphold freedom to think, to read, to listen, to look, to speak, and to assemble—opinions, like the roots of a tree, require nourishment from all sides; ideas ultimately rule the world; an open mind leaves an opening for a valuable idea to drop in; mutual confidence can be approached only

through open minds and reliance upon free discussion; the earth is strewn with the ruins of great powers, but great ideas survive—

Protect the individual against suppression or exploitation by those misusing political or economic power; each individual is the ultimate minority—to protect minorities is to safeguard each human being; government has evolved for the benefit of the individual, not the individual for the benefit of government.

Whoever you are, you are in a minority. If you are an American, a free man, a Protestant, a Catholic, or a Jew, you are a part of a world minority. An Arab, a Chinese, a Hindu, a Negro, a white man, a yellow man, or a brown man, each is part of a world minority and may be dependent at some time upon the protection of the majority of the other culture groups—the protection offered by the united signers of the Declaration of Interdependence. If the Declaration brings home the truth that people of every culture are interdependent world minorities, it will become a new Magna Charta of the peoples of this earth.

The purposes of the four economic planks are to overcome ignorance, to eliminate forced labor, to increase productive employment, to effect land reform (a basic issue in Asia and Latin America), and to lower trade barriers in order to raise standards of living. Most of these nineteen planks are stated twice, first in exact terms and then figuratively; for example, "It is hard to make an empty sack stand upright." All are basic aims which people, however much they differ on other matters, can agree on, and which they can attain only by concerted, patient, unrelenting co-operation.

Comments

The present draft is characterized by a distinguished United States educator

as follows: "It is a creative manifestation of humane intelligence and belongs among the great historical documents of mankind."

A Venezuelan government official views the Declaration as "a magnificent seed to fructify the tree of peace."

A French Army officer of the resistance foresees that "it will take its place in the re-erection of the West."

A Colombian publicist writes: "It is a recognition of a historic reality, an ardent appeal for mutual understanding to obtain the benefits of modern civilization for all peoples."

"I see history forming around it."—"It is the basic imperative of these times."—are the conclusions of two United States authors.

Communism, as such, is nowhere attacked or even mentioned in the Declaration. The latter omits denunciations and states affirmative aims. It rests on the conviction that if its nineteen-point program advances in a country, the supposed attractions of Communism will gradually evaporate. No effort has been made to introduce the Declaration into the Soviet Union, but a West German entering the Eastern Zone on a visit was found to be carrying several copies in English. When the Russian police demanded to know what these leaflets were, he could not explain because he did not know. His wife had put them in his overcoat pocket without his knowledge. (Never underestimate the influence of the little woman!)

The symbol of interdependence is a wheel. The wheel lifted man out of the mud and made him mobile. It is a symbol of mechanical progress. But in Asia it also has a religious significance. Each spoke of this imagined wheel, whether it be an individual, a community, or a nation, is essential to the whole. Each has its place in holding the circle true. All spokes proceed from a common hub—faith. From this hub

of faith spokes radiate beyond visible limits toward the infinite. The wheel rolls best when the hub is strong and the circle is true.

How?

We have now examined why and what the Declaration is. How can it be made an effective bridge and a potent influence?

Six steps are planned between 1953 and 1955.

1. The first step is to find a few hundred (not million) people who are in active sympathy with its aims and methods. So far five hundred have been found in thirty-two countries who have signed as in sympathy with the Declaration.

2. The second step is to encourage the signers to correspond with one another, to develop a feeling of unity in aims, and to increase the realization of the potentialities of co-operative action. All over the world they will circulate the Declaration until it snowballs.

3. Out of the most interested and active signers will be selected a few score who will be authorized to write and speak interpretation of the Declaration. These principal participants are called Delegates of the Interdependence Council, with one vice chairman in each region, four of whom are already functioning.

4. It is hoped to bring the delegates together once a year; in 1954 in the United States of America; in 1955 in Europe or South America.

5. The delegates will adopt the final text of the Declaration based on proposals made during 1953-54. Since delegates are expected from most cultures, it will be a truly intercultural document. They will accelerate the first three steps: the finding of more signers, their correspondence with one another, and the choosing of more delegates.

6. After the adoption of the final text of the Declaration it will be proclaimed in each country on the same day with solemn ceremonies. In the United States the appropriate place would be Independence Hall.

The experience gained during these first six steps will reveal what the subsequent ones will be. The end of such a far-reaching project cannot be seen from the beginning. If the direction is right, the goal will be ever clearer. As Jean Monnet, father of the European Coal and Steel Community, said, "The most important thing in life is to have a goal and to know that there is no turning back." Gradually the technique of building intercultural and international bridges will be improved.

THE COMPACT

The final clauses of the Compact are the following:

KNOWING that with the assistance of Divine Guidance we will succeed,

BELIEVING that it is better to light a candle than to curse the darkness,

VOICING the longings of all people for peace, freedom, justice, security, and equal opportunity for every man to do his best,

DESIRING to help one another to mount, step by step, toward these high summits of human aspiration,

We hereby agree as partners to champion and cherish the Declaration of Interdependence, its aims and ideals.

(Signature)

So far, about four hundred persons from thirty-two countries have signed this compact and are in communication with one another to accomplish some of its objectives. They include university presidents in four countries, professors in most of the thirty-two countries—including many professors of philosophy and the social sciences—religious leaders, editors, writers, teachers, students,

and women active in public affairs. Only a few hundred more signers are sought by the Interdependence Council. Small minorities have achieved most of the progress of mankind up to this point, and will continue to do so. The

Interdependence Council is seeking signers only among those who believe that there are alternatives to war and are ready to explore them boldly in the company of like-minded men and women of good will of many lands and cultures.

Otto Tod Mallery, Philadelphia, Pennsylvania, is chairman of the Interdependence Council and a member of the Board of Directors of The American Academy of Political and Social Science. He has been economic adviser to the United States Government at international conferences. He is author of Economic Union and Durable Peace (1943) and of More Than Conquerors: Building Peace on Fair Trade (1947).

The Scope of Strategy

By F. CYRIL JAMES

IT is my purpose to look at the North Atlantic Treaty Organization not from the viewpoint of Europe but from the viewpoint of North America, inhabited by 172,000,000 Canadians and Americans. NATO is an evidence of our feeling that we need additional protection. It was created to defend western Europe, which is the cradle of western civilization.

COMPARATIVE WEAKNESS OF EUROPE

I wish to begin with a simple statement which is the premise for all that I have to say. I disagree somewhat with Mr. Nagorski:¹ Europe, in spite of its tremendous cultural importance, in spite of the fact that it is the cradle from which each one of us ancestrally sprang, is a comparatively small part of the world. The population of Europe outside the Soviet orbit is only 392 millions out of the world population of 2,200 millions exclusive of North America.

And although we have rather flattered ourselves for a good many years by thinking of the peoples of European stock, because of their longer tradition and greater industrial skill, as man for man better than other peoples, I think that is a delusion, not only culturally but even in the practical economic and military aspects in this day of semi-automatic machinery and semiautomatic weapons.

The combined population of western Europe and North America is substantially less than one-fourth of the population of the world. And although western Europe developed its natural resources earlier than the rest of the

¹ See Zygmunt Nagorski, Jr., in this volume.

world in the opening chapters of the industrial revolution, it has now very substantially exhausted those resources. We know that under the soil of Russia, China, Burma, Malaya, and South America, as well as under the soil of Canada and the United States, there repose vastly greater quantities of raw materials, strategic and industrial, than those that are known to exist in western Europe or elsewhere.

In fact, if you look bluntly at the situation, NATO is a practical expression of our North American realization that western Europe by itself, in terms of manpower and natural resources, is unlikely to be able to defend itself from potential aggression by the Soviet Union with its 193 million people, reinforced by the 900 millions of China, Manchuria, and the satellite countries, knowing that in those two areas of the great Russo-Chinese land mass we have one of the most important sources of basic raw materials and natural resources in the world.

Europe is one point on the periphery of what we call the "cold war" between the ideals which have their focus for the moment in North America and the ideology that has its focus in the Kremlin and perhaps a slightly different focus in Peiping.

FOCAL POINTS OF STRATEGY

Once we recognize that fact, the premise with which I begin, let us quietly look at any globe showing the terrestrial distribution of the earth. It becomes immediately apparent, tragically apparent, that "the scope of strategy" is not confined to the area covered by the North Atlantic Treaty

Organization. Traveling east from western Europe, we find that the Russo-Chinese land mass is contiguous to many countries whose welfare is essential to our peace and prosperity. It borders on Turkey, which is one of the bastions of the Middle East command and which is contiguous to Iran. Iran is a powder keg in the international situation, with internal conflict between the Prime Minister and the Shah, with a substantial Communist party, with international relations at present exacerbated by its arguments with England and, by implication, with the United States.

Farther east, that half-forgotten country of Tibet (which has been quietly, and almost without notice by the western world, reoccupied by the armies of Communist China during the last two years) not only abuts directly on northern India but runs parallel with Kashmir. Kashmir is another powder keg, where peace has been preserved during the last three difficult years only because of the extraordinary wisdom and patience of the governments of both India and Pakistan.

The borders of Tibet are contiguous to those of the little kingdom of Nepal, where there have already been two revolutions, and which itself is close to that difficult border between India and East Pakistan (that part which comprises East Bengal). Here the frictions and wraths of the last three years have created such an explosive situation that in my judgment it is vastly more serious to the peace of the western world than even the present situation in Iran.

Let us go still farther east. There are persistent rumors that Chinese troops are already in the mountainous areas of the northern chain states of Burma, a country where two civil wars have been going on at the same time and where, for the last three years, it has not been possible, except for a few days of the

year, to travel safely from Rangoon to Mandalay, the only two major cities.

Still farther east, in Indochina, France has already, in bitter war, suffered more casualties than the total casualties of the United Nations in Korea.

Though Malaya does not border that Russo-Chinese land mass, it is sufficiently close and sufficiently embroiled in that major conflict of opinions with which our strategy is concerned that it cannot be left out of focus.

Right around that central land mass of the world, with its thousand million people, with its tremendous raw materials, there are focal points, at every one of which war is a potential, and at several of which war on a serious scale already exists; and the holding of every one of these focal points of strategy is essential to the ultimate peace of Canada and the United States, and to the ultimate preservation of the pattern of life in which we believe.

THE HISTORIC ANALOGY

At first glance that prospect may appear frightening. It is bad enough to think about Korea at one end, and western Europe at the other, without paying attention to each one of these intermediary situations. But, in the light of history, I do not think it is frightening. We look back nostalgically today to that century between the Battle of Waterloo and the German invasion of Belgium in 1914 as a century of peace, progress, liberty, and human happiness, as one of the great centuries in the development of western civilization—and it was. But let us remember that throughout that century peace depended upon the maintenance of the balance of power, and that throughout the latter part of that century the western world was compelled four times to stop the aggression of an older Russia, the ancestor of Communist Russia.

The Crimean War was the price that was paid to prevent Russia from coming down into the eastern Mediterranean; the treaty in regard to the split of Persia, and the establishment of zones, reinforced by military troops and continual watchfulness, maintained peace in that area. On the northwestern frontier of India, for a century there were garrisons continually standing on guard and there were local wars often, in which men bought with their blood the peace that the rest of us enjoy; and the thing that prevented Russia from moving out into the Pacific and occupying Manchuria, and other large areas, was the decisive naval battle in Tsushima Strait, where the Japanese Navy stood guard and prevented that expansion.

The focal points of strategy then were almost the same as they are today. They stretch again from the Caspian Sea all the way around to the Yellow Sea, to Korea. And I would suggest to you that it is conceivable that we can win and maintain in the twentieth century a pattern of peace not unworthy of comparison with that of the nineteenth century if we continually keep in mind two fundamental things.

THE PRICE OF PEACE

In the first place, the scope of our strategy must be as wide as the whole world, which is now interdependent and connected. Second, we must never forget that the price of liberty in this century or any other, in terms of the old adage, is eternal vigilance and constant effort. I think nothing is more to be deplored than the reaction in the United States and Canada, that the prospect of the cessation of hostilities in Korea, and the Soviet peace overtures in Europe, should immediately be reflected in the reduction of armaments and the promise of a reduction in income tax, in order that we may go home and forget the whole problem.

I should like to underline, with all the emphasis that I can command, that the peace of the nineteenth century had to be bought by a practical strategy, relying on the appropriate use of force wisely distributed. It was not often invoked, simply because it was there and the policing was grimly done. I know of no more colorful piece of writing than that magnificent essay by John Galsworthy where he contrasts the "Diamond Jubilee" with the "Death of the great Queen Victoria." At that "Diamond Jubilee" in 1897 the tragic price of peace was evidenced by tens of thousands of troops, with skins of every color, with a great variety of uniforms, belonging to every region of the world—men who had come from Malaya, from the northwest frontier of India, from hundreds of other places, in small contingents, offering tangible evidence of the unrelenting human effort which preserved the peace of the world throughout that memorable nineteenth century and purchased the peace and liberty and prosperity on which we all depended.

I should like to emphasize that point and to impress that picture clearly on your minds; because I think there is a great tendency in our generation to think that we can obtain peace simply by talking about brotherhood, as if we could abolish crime in either Philadelphia or Montreal by abandoning police forces and getting everybody to swear to be good.

THE INHERITANCE OF DEMOCRACY

I wish to revert to that picture of 1897 for another reason. The troops then were British. They came from an empire of which at that time most people were proud. But in the twentieth century the concept of empire and of colonialism is not appropriate. In central and eastern Asia and in Africa the concept of nationalism has taken root and has grown abundantly, so that

what were once dependent states are now vigorous self-governing communities. England and the United States can be proud of that development.

An extraordinary series of articles appeared not long ago in *Eastern Economics*, published in Delhi by John Di Costa, in which he discussed a fundamental point that we often forget, namely, that in six thousand years of Indian history there is nothing of democracy. Democracy has no part in the Hindu religion or the Buddhist religion, and not very much in the Moslem religion which came later. And yet, on the very first anniversary of independence in that great country of India all members of the government, spontaneously, without discussion, decided that the kind of government they wanted to establish in India was the kind they had learned from Great Britain, the country from which they had so recently gained their freedom. The same thing is true of other countries which have become free.

The fact that these countries have learned democracy, have accepted some of the ideals which we practiced as well as preached, is something of which we can be extraordinarily proud. At the same time, it constitutes problems. It means that in determining and executing strategy, we can no longer give orders.

Canada and the United States are but two among the many countries comprised in NATO. They are but two among the still larger number of countries of the world. As Mr. Mallery has said,² we, like everybody else, are a minority. If we are going to develop strategy and carry it out, it is necessary that we should win friends and allies. How are we going to do that? Today these countries of which I have been speaking are not new and undeveloped

² See article by Otto Tod Mallery in this volume.

countries. They think of themselves, perhaps not unjustly, as having civilizations much older than anything we can boast of in North America; and this is confirmed by archaeological explorations and by the Pyramids of Egypt.

THE SPIRITUAL FORCE

There are two things that are significant. The first is spiritual force. That may come strangely from an economist; it may seem disappointing to those who think it impractical. But no less practical a man than Field Marshal Montgomery, when asked the factors on which the success of NATO depended, said it depended first on a clear, cold, ringing statement of the aims and ideals of western nations which could be transmitted to all the countries of the world. It is not a question of unity of ideas, it is not a question of exploiting minor differences of opinion. It is a question of stating the central, fundamental points—personal freedom and democracy; opposition to aggression; a guarantee to any country that is liberated of complete freedom to do what it wants to do; simple things like that.

There was an earlier day when the great and formidable Spanish Armada was sailing up the English Channel and seemed likely to be successful in bringing about the destruction of the government of England, the mother country of so many of the North American people. In that country there were Catholics, Protestants, Calvinists, people of every shade of religious opinion. There were those who believed that the Queen had no right to be there and that Queen Mary had been sacrificed. There were tensions as deep as any that exist in the world today. But the challenge was never: Are you a Catholic? Are you a Protestant? Do you support the Queen? The challenge, the "bloody question" was

it came to be known, was clear and straightforward—If the Spanish troops land, do you fight for England or do you fight for Spain?

We need nothing more complicated than that. What is the simplest expression of the things for which men are willing to give themselves—to sacrifice their lives? The quality of the great documents of Magna Charta, the Declaration of Independence, and the Declaration of the Rights of Man, is not to be found in their wording. It is not to be found even in the ideals that they embody; for many men sitting quietly in their studies have thought and have expressed the same ideas. Not this quality is to be found in the swords of the barons at Runnymede, in the muskets of the men at Valley Forge, and in the armies which, because of their conviction, fought under Napoleon in various parts of the world.

If we recognize that, and if we go one step farther, we shall see that all of these declarations and all of our traditions go back to but one source—Christianity—which is the basis of all western civilization.

The members of another great religion of the world, the religion of Islam, accept the words of the prophets and the teachings of Christ. The Islamic countries are today undergoing a deep and moving reformation quite as serious and quite as disturbing as that which affected western Europe in the sixteenth century. Strategically, the Islamic countries form a most important section of the world, stretching from Morocco through Tunisia, Egypt, Saudi Arabia, Turkey, Iraq, Iran, Afghanistan, Pakistan, and part of India, down to Indonesia, comprising more than three hundred million people whose fundamental ideas are not very different from ours.

We must convince these people, in General Montgomery's phrase, in clear,

cold sincerity, that those ideals are something which we practice, on which we operate our lives, and that the friendship that we are offering them is a friendship between equals—a partnership in the attempt to build up and organize the strategy of the free world in a form which will advance our common cause in peace, not at the expense of a third major war, than which nothing could be more devastating.

THE QUESTION OF AID

The second half of the pattern is implicit. It is the whole question of mutual aid, the co-operation between partners. I will not touch on that lengthily. This tangible evidence of our friendship is a thorny question—one of those things of which we have perhaps got tired a little too quickly and easily.

We tackled the problem with great enthusiasm about four years ago, with Point Four, the Colombo plan, and the United Nations Technical Assistance program. In each country and at the United Nations this year, there is a tendency to cut the appropriations and to criticize the scheme. Why? Because some of the countries that we helped, for instance Iran and Egypt, started an argument instead of acting as they were expected to act. But the purpose of the program was not to buy people to do what we wanted them to do. Too often the people who came to help wanted these countries to do what the Americans or the English or the Canadians thought was right, instead of trying to help them to do what they wanted to do.

The plan is lagging partly because of extreme disturbance in some of the receiving countries, and partly because some of the grandiose schemes were so fabulously expensive that it would take two or three generations to raise the money locally, and suddenly no money was coming from outside.

THEIR VIEWPOINT

We have made a big mistake; we have also been impractical. We must not forget that in India, in China, in Pakistan, in Indochina, the average income per capita, in United States dollars, is just a trifle more than \$50 a year, and in no one of these countries is it over \$100 a year. We must remember that the infant mortality in India is five times what it is in the United States. I need not elaborate the picture. Our imagination can see what those two statistics mean in terms of health, nutrition, and welfare, and of the potentially dangerous deep restlessness. We can see how these people view some of those who were sent to advise them, often without very much understanding.

We need not be greatly surprised if some of those people occasionally say, as I heard some of them say at Calicut, Why shouldn't we take advice from Russia? Russia, according to the inaccurate myth very effectively used, was a country of poor peasants; Russia exterminated its exploiters; Russia by its own unaided efforts, and in the teeth of opposition from the rest of the world, succeeded in raising itself to the position of the second world power and building a great economic organization. You and I know it is not true; but it is a very effective argument to people who feel that they are not really getting the kind of aid that they want, and that they are simply being bought and dictated to. This may not be what we intended, but it is often what they think.

ALLIES ARE NECESSARY

Those two things—a clear statement of ideals, and generous assistance to our friends—are, after all, the opposite sides of the same medal. The cold facts of the strategic situation make it imperative that we do not plan our

strategy without allies. We need a NATO in southeastern Asia just as much as we need it in Europe, because neither the United States nor Great Britain, nor even the United States and the Commonwealth combined, can provide troops to defend that area strategically. They have never been able to do it, and they never will.

If there is to be a strategy even as effective as we had in the nineteenth century, it must be a co-operative pattern in which we are working alongside all those other countries, having convinced them of our common ideals, having assisted them with our greater wealth. We are not going to raise their standard of living to ours in generations; we are not going to be able to build large cities, dams, and factories everywhere. But at least we can make a more sincere contribution than we are now making towards helping them to work out their own destiny in their own way, emphasizing that we are equal partners according to our share and their share in the manpower and the organization that strategy requires.

The "scope of strategy" encompasses the world. It depends, in the very first place, upon the existence of an effective military and naval force, organized and planned by such a wholeheartedly collaborative organization as NATO has become in western Europe. It demands clear aims, it demands cold and clear wisdom, neither emotion nor sudden fits and starts, and it demands the recognition of and the belief in those ideals that are so important that they transcend the ordinary frictions of life and make men willing to fight for a cause in which they believe.

UNITED BY A COMMON DANGER

In conclusion, may I remind you of that danger to western Europe four hundred years ago, when the great leader of the Saracens, Suleiman the

Magnificent, undefeated in sixty battles, had swept the armies of Europe aside on the plains of Hungary and at the Battle of Mohács in 1526, and was moving steadily westward. The Catholic island of Malta was under siege from his navies in 1565, and likely to collapse. In that distressed world of sixteenth-century Europe, in that period of religious wars, of burnings at the stake, of executions, when brother was against brother and families were distraught—in that period it was the Protestant Queen of England and the

Protestant King of France who ordered prayers in all churches for the welfare of Catholic Malta. And it was able to withstand the siege.

And that danger was stopped at Lepanto in 1571, and the opportunity for Christianity, peace, and freedom was preserved, by a fleet of ships sent by seventeen countries, united only by a common danger, which fought together under the single banner of Don John of Austria and effectively defeated the common enemy by their united strategy.

F. Cyril James, Ph.D., LL.D., D.C.L., has been principal and vice-chancellor of McGill University, Montreal, Canada, since 1940, and was formerly professor of finance and economic history at the University of Pennsylvania. He has been or still is member and in many cases chairman of numerous public and private committees in Canada and in the United States; is the author or co-author of many books, particularly on financial subjects; and is a vice-president of The American Academy of Political and Social Science.

Civil-Military Relations in Mutual Security

By HERMAN MILES SOMERS

THAT the present role of the United States in world affairs represents a revolutionary departure from past traditions and practices has received wide notice. Inadequate attention has been directed to the question whether the political institutions developed during 150 years of preoccupation with domestic affairs are adequate to the new problems and demands.

Every literate person now inquires, What is our foreign policy? But few seem concerned with the fact that the answer to the question lies in *how* foreign policy is made and where, and by whom it is controlled and operated.

THE MILITARY EMPHASIS

For the first time in our history, we are committed to a world-wide network of military alliances, of which the North Atlantic Treaty Organization is but one. Our military establishment is at its highest peacetime level, and military expenditures completely dominate the federal budget. This is a situation which can be considered independent of the hostilities in Korea, since we have committed ourselves to a firm military posture for the duration of cold war, a posture expected to be supported by about 15 per cent of the national income.

In short, for the first time, Americans must contemplate living for an indefinite period with a large military establishment, constituting far the major portion of government expenditures and personnel. We are now faced with a new and enduring challenge: In a context of "permanent mobilization," can we keep military considerations in balanced proportions within an over-all security program encompassing also po-

litical, economic, social, and moral factors? Can we maintain clear political and civilian authority over military affairs?

Without civilian control of the military, our democratic institutions and traditions stand in jeopardy. Unless military aspects of foreign policy are balanced with the other essential elements, we may end up with only superficial aspects of unrooted military power, a latter-day Maginot line.

My own impression, based on recent observation of our efforts in Europe, is that we are not evidencing a capacity to administer a rounded defense program, and that a striking and increasing imbalance among the elements which make up security is manifest. The military alliance of NATO is being made unnecessarily tenuous because of a thinning down of American foreign policy and administration to a primarily military activity.

Let me hasten to add that I do not attribute this to alleged aggrandizing propensities of the military. We may, in fact, consider ourselves fortunate that during the past few years we have had at the head of our Joint Chiefs of Staff Omar Bradley, an officer who has not only acted with a statesman's sense of public responsibility but who has evidenced a keen concern for maintenance of the principle of political supremacy over the military. Partially the problem appears to lie in our political and governmental institutions, and in part it stems from a timorous abdication of civilian authority.

Recent developments in the Mutual Security Program may illustrate the point.

THE MARSHALL PLAN

We moved into the Marshall plan in an enlightened spirit and with understanding of the mutuality of interests of the North Atlantic community. We made it clear that the economic and political stability of friendly nations was a common concern. We appeared to accept the principle that ultimate security rested on a broadly based "united morale."

It was a courageous proposal, and its presentation to Congress as a four-year program represented a long-sighted view. But as time went on, the exigencies of the annual appropriations procedures resulted in a "strategy" of emphasizing the crisis or temporary character of the assistance, to the neglect of the increasingly apparent fact that the basic relationship with Europe, which lay at the root of the particular program, was a matter of indefinite duration.

After the Korean outbreak, it appeared necessary to augment the economic and political aspects of the Marshall plan with a program of military assistance to our allies. There is nothing incompatible between Marshall-plan objectives and military assistance. A program of mutual assistance, or burden-sharing, may well encompass all elements of mutual concern.

But by 1952 the civilian authorities were caught up in the mesh of their earlier "strategy" in dealing with Congress. The Marshall plan was a success, by every measure available, but success had been represented as being synonymous with conclusion—an end to the program—rather than as part of the continuum in a long-range relationship in regard to long-range problems. In its presentation to Congress in 1952, the executive branch chose not to make the latter case but to hail the successful conclusion of the Marshall plan, and

then rationalized virtually the whole of our continued political and financial relationship to Europe on a military basis. Pitching the entire program to the need for military assistance, the role of the Mutual Security Agency appeared justified only as an appendage to the military. Developments into 1953 are increasing this one-sided tendency.

"DEFENSE SUPPORT"

The rationale is simple. Congress, it is alleged, will not hear of further economic assistance to Europe, but is ready to accept the need for military assistance. Economic aid is still needed in modest, but nonetheless essential, amounts. To get it, runs the argument, the justification must be intimately identified with the military.

This has led to the labeling of virtually all European economic aid as "defense support," under which expenditures must be justified in terms of their contribution to the military build-up. It was argued that only the necessity of the post-Korean European defense development created the circumstances for continued aid.

Most observers regarded this as too optimistic an estimate of the real situation, especially as applied to such countries as Italy and Greece, and most Congressmen appeared to recognize the argument as mainly an appropriations justification. At the 1952 hearings, Senator after Senator rightly pleaded that the issues would be clearer to him if the \$1.8 billion requested for "defense support" were clearly labeled economic aid. In point of fact, since an entire economy may be considered to be "defense supporting" because the modern military base represents total resources, the aid under that label consists of conventional economic goods not essentially different from the Marshall-plan aid. But it is most signifi-

cant that we now officially claim to be almost solely involved in military assistance.

OFF-SHORE PROCUREMENT

A second method of delivering needed economic assistance is developing rapidly under the name of Off-Shore Procurement, or OSP. This involves using military assistance moneys for purchase of military items from European nations to be delivered by us to the same or other European allies. Needed dollars are thus brought into Europe, and the Mutual Security Agency hopes it can build an economic and political program around this indirect device.

For fiscal 1953 it was planned to employ \$1 billion for OSP. Plans for fiscal 1954 talk of \$1.5 or \$2 billion for OSP, and it may substantially replace all other forms of economic assistance to Europe. At the moment, it appears to be regarded as the most salable package available for purposes of congressional appropriation, and the congressional hearings this summer will probably burgeon with imaginative descriptions of the virtues of OSP.

The claims made for OSP are numerous and diverse enough to engage wide support. Here are a few: (1) Since we must give Europe military equipment in any event, OSP provides a method of furnishing both the matériel and the equivalent number of badly needed dollars at no additional cost. (2) OSP will help develop and keep in usable condition important European facilities and manpower which might otherwise be left to deteriorate. (3) OSP dollars can be more fully directed and controlled by us toward the achievement of political objectives, such as encouraging factories with anti-communist labor, or increasing employment at strategic points, for example, in Italy before the June elections.

How all these and other alleged aims of OSP are to be achieved while at the same time obtaining the proper military items when and where needed—presumably the primary objective—is not made clear.

OSP cannot perform all that is claimed for it. As one method of furnishing military assistance, it can have effective results if used selectively. But as a substitute for economic assistance, it is deficient and wasteful. In a country where there are existing but idle industrial plants and manpower, capable of making suitable military items at reasonable cost, and the country is now unable to expand its own military budget, an opportunity exists for our military buyers to place a limited amount of dollar contracts and thus create employment, use idle resources, and boost dollar exchange reserves, while obtaining needed military equipment—in a few cases even at a financial saving. But these ideal circumstances do not often prevail. In most cases, the economic objective of furnishing dollar assistance and otherwise propping up political morale is likely to be in conflict with the military objective of obtaining needed goods of acceptable quality at a reasonable price.

In an economy already operating at or near full capacity, and where the military budget is at a satisfactory level, as in England, OSP dollars do not have the same effect as economic aid dollars. American military dollars mean a diversion of industrial capacity from products for civilian consumption or from expanding dollar-earning capacity on a solid, long-range foundation. No net gain in dollar earnings may result, and the long-range economic struggle for stability and sufficiency may be retarded. OSP provides a highly uncertain source of future dollars. As a leading British industrialist told me, "We're

converting some of our very scarce capital structure to get your OSP dollars. We are willing to do it, if your people feel it essential, but we're worried. We know that as soon as your own munitions production lines catch up on their contracts and need more to keep them going, neither your Congress nor your military will want to justify placing contracts here for goods you can make in the United States."

If contracts are to be placed on a straight business basis of where needed items can be produced most efficiently, the great bulk of contracts will land in Germany and Belgium, which need them least. If we purchase goods without due regard to relative quality and price, we cannot expect much respect for our exhortations to improve methods and efficiency in the European economies.

ENLARGED SPHERE OF MILITARY AUTHORITY

Most important, we are not told that the technique of Off-Shore Procurement throws into military hands large additional authority over civilian aspects of foreign policy!

This type of purchasing is performed by the military. The procurement officers are not attached to, or responsible to, any civilian agency. Upon entering a particular nation in Europe they are not under the authority of the American Ambassador as part of the "country team," as are other American functionaries (although they are instructed to seek the counsel of the MSA mission, as well as that of the Embassy). They report only to military superiors in Europe and the United States.

Civilian authorities, in diminishing numbers, still nurture a hope that they can maintain authority for "programming" of OSP, country by country; that is, that they can retain basic decision-making control, leaving to the military,

in addition to the inescapable function of weapons specification and approval, the sheer mechanics of buying.

We and other countries have had long experience with the issues of programming and procurement. It was a *cause célèbre* here during World War II, and it is important that civil authorities shall not forget what was so obvious then.

Procurement is not merely buying. It inevitably includes responsibility for setting specifications, for inspection, and for delivery. If the procurement officer is to be held accountable for the produce, he must be satisfied that the plant with which he contracts is able to deliver. He must follow the manufacturing process and make sure that scarce materials or manpower does not jeopardize production. If transportation problems interfere, he must move in on those. Inevitably, the manufacturer turns to the buyer, the man who holds the purse strings, when problems arise which threaten fulfillment of the contract. It was not surprising that with its multi-billions of procurement responsibility in World War II the military found itself in the midst of the business of every civilian war agency—production, manpower, transportation, labor disputes, shipping—and that it soon assumed a most powerful voice in the decisions of these agencies.

All experience, as well as the simple logic of the purchasing function (even in the department store business), confirms that procurement cannot sensibly be detached from broad responsibility. Procurement responsibility carries with it programming responsibility in practice, wherever else it may be placed by law or regulation. This is and will be true in Europe as well as in the United States.

In short, if economic assistance is to be channeled through military Off-Shore Procurement, then economic assistance

to Europe will be administered by the military.

"As OTHERS SEE US"

European trust and good will are not enhanced by our sending men in uniform to negotiate with their industry and labor on business and political matters. They not only fear the implications for American policy, but are distressed by the tendency to promote military influence in their own countries.

Most of those responsible for our economic programs abroad are aware of the rising importance of the military in their business. They are not unmindful of the fact that if their major role is to advise on wise placement of contracts, the military may soon decide to employ its own economists for such functions.

The issue of Off-Shore Procurement is used here only for illustrative purposes. Whatever its merits and demerits, as presently employed it is clearly part of a pattern of increasing transfer of key elements of American foreign policy into military hands. The total tendency is a dangerous imbalance; in fact, in the eyes of European allies, almost a total concentration upon military objectives. And no matter how broadly defined, as in the case of NATO, military objectives alone cannot indefinitely evoke the sustained allegiance of free peoples.

Whether we think it wise or unwise, Europe has its heart and mind more concentrated on its continuing problem of economic insecurity than upon military security. In the eyes of Europeans, we appear to have given up our broader-based participation as a partner in a mutual security community, and are relating all our efforts and contributions to the present cold war.

While military alliances may appear an exciting new enterprise to many Americans, they have been commonplace for centuries to Europeans, who understand that unless reinforced by

substantial bonds of economic or political mutual interest, the military commitment becomes void. Regardless of our NATO commitment, it is feared that if the Russian threat appears to subside we may walk out, and this casts doubt upon our reliability as an ally in the larger sense.

Inadvertently we are adding fuel to the fires of Communist propaganda, which alleges that our purposes are imperialistic. The widespread feeling among Europeans that we are pushing them too far, too fast, militarily, in terms of their whole welfare, is augmented by the concentrated emphasis on military affairs. We appear to have lost sight of the familiar precepts which we preach so often, that arms alone are not the measure of a nation's military strength—that it must be in a mood to use them with determination. We are enhancing the risk that we may be producing only a façade of power.

Clearly, one can recognize fully the need for military strength and preparedness, here and abroad, and yet recognize the dangers of defining security in military terms alone. It has recently been effectively pointed out that

Ten groups of tactical air force can be effectively neutralized if the bases from which they are to fly are surrounded by hostile populations. It may require a 10 per cent increase in our fleet to assure access to raw materials that are no longer available because of improvident management of our domestic resources. Ten divisions may be added to our team because we have successfully mediated in a solution of the Egyptian problem. Security is not to be defined in military terms alone and in a cold war situation it would be disastrous not to have factors over which civilians are responsible kept front and center on the council tables.¹

¹ James A. Perkins, "Administration of the National Security Program," paper delivered at annual meeting of American Society for Public Administration, March 7, 1953.

FACTORS IN IMBALANCE

Let us examine briefly into the factors which are pushing us into this precarious imbalance. A full and accurate analysis of the causal factors requires and deserves the attention of our best research talent, and I hope that more of the resources of our research foundations will be applied to these problems. All I can do here is to suggest the scope of the considerations.

There are some who feel that in a period of mobilization, the superior strength and influence of the military in the counsels of state is inevitable. First, there is the sheer overwhelming magnitude of numbers. Civilian employees of the Department of Defense alone represent more than 50 per cent of all employees of the Federal Government, not counting the millions in uniform. The budget controlled by that Department is considerably more than the total for all other government functions. The Department of Defense has far more *civilian* employees stationed abroad than all other government agencies combined.

In a mobilization period, such prodigious bulk is combined with a public psychology of power, in the raw sense, as the avenue to security, and it enormously augments the prestige and status of the military. Such a period simultaneously brings about a lower degree of public confidence in the "talkers," the "negotiators," the "diplomats," who, by the very fact of the need for mobilization, appear to have failed.

The element of military secrecy causes a serious disability for civilian agencies which must negotiate with the military. Information is a form of power, and its denial to one and availability to another is a forceful element determining relationships.

Interest group influence

The great volume of military expenditures creates large "stakes" in the military establishment for powerful groups in our society. With a sizable proportion of the national income being directed through military channels into private plant construction and profitable contracts, a closer relationship is developed between the military and the business community.

Similarly, the idea of using military expenditures for economic ends is not confined to the OSP program. At least one business advisory service has been warning its clients that only higher military expenditures can avoid a business recession, and it accused Mr. Lovett of favoring "depression" because his proposed budget was not large enough.

While powerful interest groups gravitate toward the military, the Department of State continues in a political limbo, devoid of the essential support of any important organized pressure group. It bears the burden of popular suspicion toward an agency which frequently must appear to be representing foreign interests. The Hoover Commission defined well, a few years ago, the institutional bases of congressional suspicion of the Department.² Among other annoyances, it usually appears in the role of asking Congress to give away something—money, tariff barriers, sovereignty—without the customary related rewards at the ballot box. The Department is inevitably a favorite whipping boy for Congressmen. The lack of a constituency makes it virtually the only large department of government which can be attacked with abandon and with impunity.

² See Commission on Organization of the Executive Branch of the Government, *Foreign Affairs* (Washington: Government Printing Office, 1949), pp. 5-8.

Governmental structure

Governmental structure is probably more fundamental in explaining the phenomenon of military pre-eminence. Both Mr. Forrestal and Mr. Lovett have pointed out that we do not have civilian control in the military departments. We now speak only of Presidential control as distinguished from broader civilian control, and even the President's authority is diluted in peacetime.

The civilian secretaries have relatively little power to exercise their proper authority over the basic decisions of the services. This fact is contributed to by law, custom, and relations with Congress. The amended National Security Act of 1947 names the Joint Chiefs of Staff as the principal military advisers to the President, not through the Secretary of Defense, but directly. This has led, in military quarters, to the interpretation that the civilian secretaries are in charge of "housekeeping functions," while the Joint Chiefs are in charge of military affairs.

While the Secretary of Defense is the statutory representative of the military on the National Security Council, the Joint Chiefs of Staff are named the principal military advisers to the Council. The Secretary's influence in the highest policy council has been seriously diluted by divided representation.

Congressional committees

The organization of Congress and the "checks and balances" system induce a fragmentation of executive control and responsibility. The system of committee "proprietaryship" has led individual congressional committees to take policy and administrative protectorship over particular security agencies or portions of agencies. Increasingly, military units (not unlike some other favored bureaus)

have solidified direct horizontal relations with Congress, circumventing higher executive authority.

This not only enhances the powers of the military but also loosens the administrative authority of the President and civilian secretaries. It reduces the possibility of the President's effective management of an over-all security program with balanced consideration to military and nonmilitary factors.

All of this has induced a conviction in civilian agencies with foreign affairs responsibilities that the more nearly they can present their program in military terms the more likely that program is to receive congressional approval. As already indicated in the illustrations from the Mutual Security Program, security considerations will be presented as military appendages wherever possible.

Civilian timidity

While Congress is thus a major factor in weakening civilian elements in our foreign affairs programs, the civilian agencies have failed to stand up for their responsibilities forthrightly. To this observer, it appears from the 1952 mutual security congressional hearings that the officials of MSA evidenced far more passion for genuflection before the military than did the Congressmen. One of its high officials excused it by saying, "What's the use of presenting ideal foreign policy to Congress if you can't get any money for it?" The proceedings give substance to the interpretation of one military man, "They told Congress that the only business they have is our business."

The Department of State has recently appeared woefully timid in its stated role as the center for foreign affairs. Evidencing considerable initiative and enterprise for a period after World War

II, it was not long before its political vulnerability drove it into the background and disarmed it. In the circumstances in which the Department finds itself, one large error like the misvaluation of Red China is sufficient to make it a free target for abuse and to undermine effective influence.

Thus, more recently the Department of State has not exercised effective leadership in shaping our cold war strategy. A recent report of the Woodrow Wilson Foundation, by six distinguished scholars, emphasizes the "wholly unwarranted disposition" of the State Department "to limit narrowly the area of its interests, especially with the Department of Defense." It claims that the more recent tangles between the two agencies "are at least in part, the result of a basic and preliminary surrender of authority."³

The Department has been slow to accept responsibility for comprehending military aspects of foreign policy, and has failed to make official posts in the Department for this aspect of its job. Recent studies share the view that "as a general proposition . . . there are more military officers who have a first-hand knowledge of diplomatic matters than there are State Department people who have an equivalent knowledge of military affairs" and that "military officers are far better grounded in broad security affairs than are our top civilian officials."⁴

This represents an acute, and partially self-imposed, disability on the part of civilians. In part, it derives from differences in tenure. The turnover in top civilian officials reduces their capacity

to compete in knowledge and experience with the top military career men.

Until the civilian agencies take more forthright and firm view of their responsibilities, they cannot rest on the assertion that the difficulty is entirely in Congress. Many Congressmen are crying for assistance in keeping military requests and military authority in proper over-all balance. For example Senator Hickenlooper pleaded at the 1952 hearings:

It seems apparent to me that we are rapidly going from a civilian government into a complete military-controlled government in this country, which is an ominous trend . . . we are passing from the point where the civilians in this country are directing policy. They are merely O.K'ing or putting the rubber stamp on what the military testified to in such a broad program that no human being could test it or go into it or tell whether it is right, wrong, or indifferent . . . we have to take the word of the military, and we have no equipment, we have no staffs that are trained . . .⁵

The Woodrow Wilson Foundation report summarizes the issue well by saying,

If in recent years military men have occasionally played a somewhat outsized role in policy-making, the cause is to be found more in the timidity and indecision of civilians than in any grasping "militarism." . . . It is not our military men who must be weakened; it is our makers of policy who must gain strength.⁶

But the study recognizes that basically it is not so much a matter of personalities and viewpoint as it is a profound issue of governmental institutions

³ W. Y. Elliott and others, *United States Foreign Policy—Its Organization and Control* (New York: Columbia University Press, 1952), p. 100.

⁶ W. Y. Elliott and others, *op. cit.*, p. 113.

and it ends up by calling not only for reorganization but also for constitutional reforms.

A GRAVE ISSUE

Clearly, the factors in the issue are complex and comprehensive. It is not my task to offer solutions, but to present the elements of a problem of profoundest implications for our future. The challenge to our society is great. We appear to be embarked on a period

which has pessimistically been called "permanent mobilization." Do we have the wit and the will to face up to the necessity of reforming our institutions to permit a balanced program of security together with clear democratic civilian control?

Our experience to date with the Mutual Security Program indicates a lazy drift in the opposite direction. Fortunately, there are yet time and opportunity to reverse the course.

Herman Miles Somers, Ph.D., Haverford, Pennsylvania, is professor and chairman of the Department of Political Science at Haverford College and has returned recently from a European tour during which he was officially engaged in an evaluation survey of the Mutual Security Program. He also served a tour of duty in Europe after the Second World War as Lieutenant Colonel in the Army. He has taught at Harvard University and Swarthmore College, and is a consultant to the United States Department of Labor. Among his publications is *Presidential Agency: Office of War Mobilization and Reconversion* (1950).

The Failure of Western Policies

By D. F. FLEMING

FORTY years ago the West was the world, in the sense that it controlled all of this planet. The vast populations of Asia and Africa were helpless before its sway. Even the moribund Czarist empire of Russia was a part of the European concert.

Today a strange new East holds the vast mass of the world's largest island firmly in its grip, while the West clings precariously to the fringes of Eurasia, and the United States strives to organize the remaining "free" nations, some of which suffer from hunger or oppressive rule, into a great bloc to resist or roll back the East.

In this moment when world politics is in a more fluid state than it has been previously since 1945, it may be useful to inquire how this astounding reversal of fortunes took place. How did the mighty, omnipotent West happen to lose its grip on the world and find itself on the defensive in four short decades? There must be some discoverable reasons for an overturn so gigantic, and understanding them may prevent us from plunging on to irremediable disaster.

POLICIES WHICH FAILED

The balance of power

As 1914 opened, the six great nations of Europe were delicately balanced in two rival alliances, with Britain, the traditional balancer, swallowed up in one of them. The deadly cycle of fear, arms race, and war was whirling rapidly toward a great catastrophe which would shatter three great eastern European empires and weaken the democracies of western Europe almost fatally.

Europe was living in a state of anarchy, about which nobody did anything until it erupted into the pitiful desolation and slaughter of World War I. Ten million men killed, many more wounded, countless homes destroyed, and 400 billion dollars of wealth destroyed—this was bad enough, but the loss of moral authority in the rest of the world was equally decisive.

The suppression of Bolshevism

There were other reasons for the great Allied invasions of Russia from 1918 to 1920. There was justifiable concern lest the great dumps of American supplies lying at Murmansk and Archangel fall into German hands. There was some hope of reconstituting a second front in Russia against Germany, after the collapse of the Czarist government. The repatriation of the 60,000 Czech troops in Russia through Vladivostok also supplied first a reason and later an excuse for Allied intervention. Nevertheless, the main purpose of the western interventions was to destroy Bolshevism at its birth.

To this cause Great Britain contributed supplies worth half a billion dollars, including enough to equip an army of 100,000 men for Admiral Kolchak, and her contributions to General Denikin in the south were equally massive.¹ Stéphen Pichon, French Foreign Minister, once listed 840,000 Allied troops of many nationalities as em-

¹ George Stewart, *The White Armies of Russia* (New York: The Macmillan Co., 1933), p. 321; Winston Churchill, *The World Crisis: The Aftermath* (New York: Charles Scribner's Sons, 1929), pp. 246-50.

ployed in southern Russia.² Drives on Petrograd and from Murmansk were supported. American troops fought in this area and helped occupy Vladivostok, where 72,000 Japanese troops tried hard to carve out an empire in Siberia. Britain and France also laid out zones of occupation and influence in southern Russia.³

In short, the West did everything that its war-weary peoples would permit to stamp out the Communist revolution in Russia; but all of these attempts, from four sides of Russia, failed. Seven million more people died, in the most savage kind of slaughter, from plagues, hunger, and cold, and the chaos in Russia was made infinitely worse, but Bolshevism survived, for two reasons: (1) because the union of foreigners with Russia's reactionaries drove the people to the side of the Reds; and (2) because the issue of survival compelled the Communists to forge the sternest police-state methods. This might have happened anyway, but the western interventions forced the Soviets into extreme measures.

All this is long forgotten in the West, but these events "deeply branded Bolshevik thinking."⁴ In the Soviet Union the projected American campaign to roll back the Iron Curtain is likely to be viewed as the fourth western attempt within forty years to invade Russia.

Isolation

Isolation was our own great contribution to the decline of the West. After World War I had demonstrated the desperate need for some international machinery to keep the peace, we rejected the League of Nations and re-

² *Current History*, May 1919, pp. 280-81.

³ Stewart, *op. cit.*, p. 157; K. Zilliacus, *Mirror of the Past* (New York: A. A. Wyn, 1946), pp. 191-92.

⁴ Paul Sethe, *The Frankfurter Allgemeine*, March 3, 1953, quoted in the *Foreign Policy Bulletin*, April 15, 1953, p. 8.

lapsed into an angry and selfish isolation. For a time we sought to kill the League by ignoring it, then we cooperated with its nonpolitical agencies, and finally in the Manchurian crisis of 1931 we tried fitfully to bolster its peace-keeping function from the outside.

The British and French governments were equally self-centered and blind. They would not defend the League's law in Manchuria, and they perpetrated an elaborate hoax on their own aroused peoples in the Ethiopian crisis of 1935, seeming to defend Ethiopia while guaranteeing Italy's conquest, until the Hoare-Laval deal revealed their duplicity.

Then when the fascist powers proceeded to conquer the Spanish Republic, the British and French governments fled from Geneva to London and organized the famous Non-Intervention Committee which for three years held a blanket over the destruction of the Republic.

These acts make it uncertain that a League of Nations led by the United States could have succeeded. The big governments might have emasculated the League anyway. What is incontestable is that the period after 1918 was the time for an all-out, devoted trial of collective security. Then there were still seven great powers left, only one of which, the United States, could have defied the others united to keep the peace. The Soviet Union was too weak to threaten anyone.

In these conditions strong American leadership in the League of Nations could have kept the peace and prevented World War II. Instead, we sought to shield ourselves behind three successive paper walls of neutrality laws, which forbade all the things which might conceivably have prevented World War I, and which in themselves constituted a green light to the three fascist aggressors.

In the midst of the still vaster calam-

ity of World War II we resolved to correct the mistake of staying out of the League and to create another one which we would lead. The United Nations resulted, but we did not recover the opportunity lost in 1920. By 1945 there were only two great powers left in the world, both of them rapidly expanding their power and influence, and both too big to be disciplined by the U.N. without precipitating a third world war. In affairs of this magnitude, history does not give any second chances. Events move on remorselessly.

By abdicating in 1920 the responsibility which went with our power, we opened the gates to World War II, not only by our negative action but also by speculative money-making which finally resulted in the world depression that began here in 1929. This catastrophe in turn made it safe for the Japanese to begin the conquest of China in 1931, and catapulted Hitler to power in Germany.

Appeasing fascism

There were some defensible reasons for the appeasement which London and Paris practiced in the thirties: a feeling that the Versailles treaty was too harsh; that perhaps Hitler should be allowed to practice some self-determination; that another war was unthinkable; and that the Allies were militarily weak.

Yet the two democracies cannot escape responsibility for assisting the fascist dictatorships to destroy the public order in Europe. In helping to strangle the Spanish Republic and in relentlessly crucifying Czechoslovakia they deliberately sacrificed two of their own, and at the same time opened all central and eastern Europe to Nazi control. This was not done inadvertently. Prime Minister Neville Chamberlain wrote, on November 26, 1937, "Of course the Germans want to dominate eastern Europe"; and on November 1, 1938 he declared that Germany must

be conceded "a dominating position" in that region.⁵

We need to remember often that it was the Munich Conference in September 1938 that turned eastern Europe over to communism. Of course the Munichards did not intend that. They thought they were surrendering that great region to fascism. They did not foresee that when the giant forces which they turned loose came to rest, after grinding back and forth across the face of Europe, it would be the Soviet armies that controlled everything east of the Stettin-Trieste line.

There should be an arresting warning here for those Americans who think that just one more world war would end the menace of communism forever.

Containing communism

It was natural that the conservative forces which control the West should be unable to accept the chief political result of World War II in Europe. They could not deny that eastern Europe had moved diplomatically into the Soviet orbit, that it had to be a glacis protecting the Soviet Union instead of a *cordon sanitaire* confining her, but they did hope to keep this area in the West socially and economically.

This was the real meaning of the Yalta compromise. The states of eastern Europe would be allies of the Union of Soviet Socialist Republics, but "free and unfettered elections" would keep them from being communized. It was a goal for which the West was bound to strive; and it was an attempt to achieve the impossible. Anticommunist governments in eastern Europe could not be loyal allies of the Soviet Union from the defense standpoint. The invasion

⁵ Keith Feiling, *The Life of Neville Chamberlain* (London: Macmillan & Co., Ltd., 1946), p. 333; J. W. Wheeler-Bennett, *Munich: Prologue to Tragedy* (New York: Duell, Sloan and Pearce, 1948), p. 295.

gates from the West would not be closed and firmly held by anticommunist regimes. To understand this we need only to consider how much we would have trusted a communist Germany or France to be a part of our defenses during the past five years.

The Yalta compromise was doomed to fail, at the very moment when the atomic bomb seemed to give Secretaries Byrnes and Bevin the power to enforce it. The diplomatic drive they began in the Balkans two weeks after Hiroshima forced some outward observance of free elections there, and a really free one in Hungary; but the end result everywhere was a communist dictatorship. The influence of the Red armies on the ground could not be annulled from distant western capitals.

The bitterness engendered by the communization of eastern Europe is the source and the continued feeder of the cold war. After it developed, the wartime Churchill-Stalin deal dividing the Balkans between them broke down and the Greek Communists received sustaining aid from the Communist neighbors of Greece—an offense which led President Truman to promulgate the Truman Doctrine, on March 12, 1947.

This sweeping declaration said "that it must be the policy of the United States to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressure." This doctrine, which came close to forbidding any kind of revolution, since nearly all revolutions have been the work of armed minorities, was soon spelled out into a holding operation at all points around the vast perimeter of the Soviet orbit. Before assuming this gigantic task, Mr. Truman might well have pondered the warning of William Graham Sumner in 1903:

"If you want war, nourish a doctrine. Doctrines are the most frightful tyrants to which men ever are subject, because doc-

trines get inside a man's reason and betray him against himself. Civilized men have done their fiercest fighting for doctrines."⁶

At the time when Truman declared his doctrine forbidding any more communist revolutions or infiltrations, a communist revolution in China was already well on its way to success. After 1947 it proceeded to roll over the whole of China, in spite of all our efforts to prevent it. We ferried hundreds of thousands of Chiang Kai-shek's American-trained troops into North China and Manchuria; we furnished them bountifully with money, supplies, and weapons; but it was all to no avail.

The tragedy of western intervention in Russia from 1918 to 1920 was repeated on an equally colossal scale. In both cases the reasons were the same: the mandate of Heaven had passed from the old regimes, and the people deeply resented the western interference. In each case, also, the West had staged a world war which had turned Red revolution loose in great areas.

In the light of these experiences, would it be wise to risk the fate of India, the Middle East, and Africa in a third world war? No genuine conservative can answer that question in the affirmative.

Though it failed abysmally in China, the containment policy has enabled the West to maintain control of the Mediterranean and cling precariously to two key peninsulas in Asia. It would, however, be rash to predict that Korea and Indochina can be held indefinitely against the pressure of the vast weight of a unified China becoming industrialized.

In Europe a façade of armed strength has been created, but everyone knows that there is very little space in which to maneuver it, and no hope of survival

⁶ Frederick Schuman, *The Commonwealth of Man* (New York: Alfred A. Knopf, 1952), p. 244.

if war comes. In the recent words of André Siegfried, Europeans know that for them another "war is death, pure and simple, the end of everything."⁷

At the best, containment offers the grim prospect of permanently holding an iron ring of air bases around the communist world. At the worst, it means the grand smash that is inherent in every arms race.

ROADS TO DISASTER

Rolling back communism

Since neither prospect offers much hope, Secretary of State Dulles has advanced the policy of rolling back communism, both in eastern Europe and in China. On August 27, 1952, at Buffalo, he advocated the promotion in eastern Europe of such "quiet" methods as passive resistance, non-co-operation, discontent, slowdowns, and industrial sabotage, together with a public refusal ever to recognize the Soviet conquests in that area.⁸

In other words, we would engage in subversive war behind the Iron Curtain to the extent necessary to break the communist grip on those countries. We would adopt the very methods we charge the Communists with using. But would we be able to use them with the same fanatical devotion and conspiratorial skill?

It is very unlikely that we could disintegrate police-state regimes from the outside, after they have had years in which to consolidate their power. We might embarrass them a bit, but any real success would be met by executions and other retaliations which would be only too effective in suppressing our friends.

⁷ *Foreign Policy Bulletin*, April 15, 1953, p. 8.

⁸ *New York Times*, August 28, 1952. For Dulles' refusal to "tolerate" the "unholy" alliance between China and the Soviet Union, see the Senate Committee on Foreign Relations *Hearing* on his nomination, January 15, 1953, p. 5.

The revolutionary nature of a policy of engaging in subversive war in time of peace has been soberly described by George Kennan in his warning that we should be

extremely careful of doing anything at the governmental level that purports to affect directly the governmental system in another country, no matter what the provocation may seem. It is not consistent with our international obligations. It is not consistent with a common membership with other countries in the United Nations. It is not consistent with the maintenance of formal diplomatic relations with another country. It is replete with possibilities for misunderstanding and bitterness. To the extent it might be successful, it would involve us in heavy responsibilities. Finally the prospects for success would be very small indeed; since the problem of civil obedience is not a great problem unfortunately to the modern police dictatorship.⁹

Kennan added the admonition of John Quincy Adams that America "goes not abroad in search of monsters to destroy."

The roll-back and disintegration idea is a natural response to the frustrations of containment, but it is a self-defeating campaign for democracies to undertake. It points more toward the acceptance of police-state methods for ourselves than toward the liberation of Communist-ruled peoples. It points also toward an ever deepening commitment to subversive war that would merge into all-out lethal war. This is not a way to peace. It is a direct road to disaster for everyone, especially for the Europeans.

Excessive reliance on military force

Emphasis on military force is another certain route to catastrophe. The illusion continues that civilization can somehow be reconciled with atomic war.

⁹ Quoted from Kennan's address to the Pennsylvania Bar Association, Harrisburg, Pa., January 16, 1953.

The delusion that "victory" can still be achieved persists, even after the recent report of a distinguished body of physicists and engineers to the President that the Soviets have about 150 atomic bombs and 700 big bombers to deliver them to our cities. The committee hoped that the expenditure of 12 to 16 billions would give us a "defense."¹⁰ But could it?

Two things need to be clearly distinguished here. Neither the United States nor the Soviet Union can be conquered by the other; and neither has any "defense" against the most devastating attack.

Too great dependence upon military force must also at some point transform us into a garrison state, in which a military caste will control our destinies and our conduct. The Defense Department already expends such a huge share of the national budget that nobody can comprehend what it does with the money.

A childlike faith that the Communists "understand nothing but force" can also blind us to the fact that the Communist threat is mainly ideological, not military. At bottom, the Communists offer a bootstrap method of rapidly industrializing a depressed country by dictatorial methods. If we are to stop their inroads we have to offer better methods, and guns alone cannot do that.

The first requisite for the survival of the West is a clear understanding that these world wars are outmoded, and it is equally essential to know that they are revolutionary. They destroy lives, livelihood, homes, factories, institutions, and faith in old ideas. Everything that conservatives love perishes, including freedom. Democracy requires peace, the absence of terrible tensions, and the processes of slow growth. Communism thrives on chaos and war.

¹⁰ Alistair Cooke, *Manchester Guardian Weekly*, March 19, 1953.

Viewing coldly the results of World Wars I and II, one can expect that at the close of a third world war "the West" would be confined to the North American Continent, with some kind of fascist government ruling it from Denver in a desperate effort to maintain order and the vestiges of property rights not already destroyed by the A-bombs. For those who love the West, the very first commandment is the avoidance of another world war.

POSITIVE POLICIES WHICH CAN SUCCEED

Negotiating settlements

It does not follow from the demonstrated fact that world wars spread communism that the Communists yearn for more of them. Their cost to the Soviet, satellite, and Chinese peoples in blood and tears is already beyond the ability of unravaged Americans to imagine. These peoples know what another war would be like.

It is, accordingly, extremely fortunate that new administrations have come to power in Washington and Moscow at nearly the same time. The Truman administration had put the cold war into such a deep freeze that it was helpless to thaw it out. Stalin gave evidence in his Christmas Eve, 1952 message to James Reston that he would like to negotiate with Eisenhower, but he did not push the matter as his successors have done.

Now there is a fluidity that would have seemed impossible six months ago. Much can come of it, if each side can recognize the legitimate defense needs of the other.

Thus far, it does not appear that such mutual recognition exists. The address of Secretary of the Treasury George M. Humphrey on April 20 evidenced a belief of the Eisenhower administration that we are so overextended as to im-

peril our security and our solvency.¹¹ President Eisenhower's remarkable address on April 16 also created a worldwide demand for peace, but in power terms it called for unconditional surrender—the old Yalta demand for free elections in eastern Europe, western Europe organized by our plans, and fool-proof inspection of armaments in the U.S.S.R., along with a Korea unified by free elections, our style.

Presumably these are maximum demands. If they are, then we may be able by degrees to consider with some objectivity propositions such as the following:

Eastern Europe is a legitimate defense zone for the Soviet Union. Three great invasions through it in four decades have not left this open to argument in Soviet minds.

Western Europe is a legitimate defense zone for the United States. Its Sovietization would leave us too little elbow room in the world, far too few friends and allies.

Germany is of immense importance to both the U.S.A. and the U.S.S.R., and neither can permit the other to dominate her, at least for some years. Of the interests involved here, the Soviet is the deeper. Germany has disturbed our lives seriously twice within forty years, but on each occasion she ravaged Russia to the point of dissolution. It is probably true that Germany has lost both the will and the capacity to do this a third time, but the Russians and the Poles and the Czechs must have assurances on this score.

The complexity of this problem makes very timely the thoughtful attempt of James P. Warburg to outline a German settlement which would provide for: (1) unification of East and West Germany with some additional agricultural land in the east returned to Germany; (2) a

¹¹ Walter Lippmann, *Nashville Tennessean*, April 26, 1953.

United Nations settlement of the Saar dispute; and (3) German neutralization and disarmament for a short term, to give democracy a chance to grow.¹²

Such a settlement should greatly lessen both Soviet and American pressures on Europe, giving new forces a chance to develop and permitting both sides to retain their defensive arrangements.

Like Germany, Japan must come to terms with both the East and the West. Neither can be prosperous without trade with the communist nations.

The new China, backed by all of Asia that matters, will not long tolerate western control of Indochina or Korea. Western imperialism in Asia is finished, especially its remnants on the borders of China. It will no more be tolerated than we would tolerate Red imperialism in Mexico or Newfoundland. No puppet governments in Indochina which leave the great bulk of the wealth and the control of foreign affairs in French hands can last very long.¹³ We may be able to support independent governments in Indochina or Korea which are not communist, but they will have to have friendly relations with China.

Formosa is not essential to the defense of the United States. If it is, then Cuba is necessary to the defense of the Soviet Union. Neither side can push its zone of defense that far. Formosa is Chinese, and must be returned to China or made really independent. It cannot remain in hostile hands, a threat to the security of China.

Neither side can dictate terms to the other. The Reds appear to have more military strength in being than we have, and ours is not likely to become de-

¹² See Warburg's more detailed plan in *France, Germany & Nato*, Current Affairs Press, 25 Vanderbilt Avenue, New York 17, N. Y.

¹³ See the significant statement by the King of Cambodia, *New York Times*, April 19, 1953. In economic matters, he said, the French "have our hands and feet tied."

cisively superior under a retrenchment minded Republican administration, and after the relaxations of the current peace offensives.

Fostering world trade

With cold war and Korean war objectives in mind, we have forced western trade with the East down to very small proportions. The result is that the economy of western Europe is stagnant.¹⁴ We have forgotten that western Europe is not viable economically without its Asiatic empires and without its former colonial hinterland in eastern Europe. The whole area, Britain included, urgently needs a large trade with the East, a trade which the Russians have repeatedly tried to reopen.

Japan, too, will face a slump as soon as the Korean war ends, and our own vast production must have a place to go, if not into bombs and guns. The fact is that the world is already an economic unit, and neither side can split it in twain without grave damage to itself. If the split is forced, it is the Communist nations that are most likely to forge a self-sufficient unit, painfully but effectively. They start with living standards low enough to leave nowhere to go except up.

Developing the co-operative side of U.N.

Though the U.N. cannot coerce either side, it can help to draw them together if attention can be centered on its healing, constructive functions.

Instead of holding this side of the U.N.'s work down to tiny proportions, we should be channeling a large fraction of our excess production through the U.N. into building up the backward countries, with no strings attached. President Eisenhower's proposal that all nations devote a portion of their arms

¹⁴ See the two significant articles in the *New York Times* on April 14 by Hoffman and Belair.

savings to "a new kind of war . . . upon the brute forces of poverty and need" was the most inspiring part of his April 16 message, provided the funds are administered internationally and unselfishly.

A great U.N. development authority, modeled on the world's successful experience with lend lease, the United Nations Relief and Rehabilitation Administration, and the Marshall plan, could quickly change the political atmosphere of the whole world, and remove the incentives for communist revolution at the same time.¹⁵

It would be a constructive thing, also, to move the headquarters of the United Nations out of the United States to Switzerland or some other small country, where the U.N. would not be subject to the indignity of American investigating bodies pursuing American leftists in its employ, and where the tremendous pressure of our cold war emotions would not play upon the delegates.

Welcoming diversity and evolution

Inherent in the containment policy was the insistence that everyone on this side of the line must be as we are, strongly capitalist, unfriendly even to democratic socialism. This was our foil for the Communist world revolution, and a crusade to disintegrate the other side is the logical next step.

Yet there are two laws of life which work to defeat the forcing of the world into two molds, or only one. One is the law of evolution. No social system ever stands still. Each and every one is in motion, going somewhere, and no human power can prevent this process. The bureaucratic state capitalism of Stalin is very different from the communism of Marx or even of Lenin, and the Russian system will be still differ-

¹⁵ See the powerful book on this subject by Stringfellow Barr, *Citizens of the World*, Garden City, L. I.: Doubleday & Co., 1952.

ent twenty-five years from now, as will our own, in spite of all efforts to prevent the evolution of both.

The law of diversity is equally inexorable. "We must face life as it is and understand that diversity is its most essential feature. . . . Fear of difference is dread of life itself."¹⁶ Nor is diversity to be feared. Neither Adam Smith nor Karl Marx encompassed the whole of human wisdom. Tito's communism will develop quite differently from Stalin's. Mao's will certainly take different forms, if we remove our tremendous pressures upon China. India cannot be prevented from evolving a mixed system, unless we surrender her to communism in a third world war. Democratic socialism in western Europe could be a much better shield and buffer for us than an anemic monopoly capitalism.

A world in which there were a number of competing systems, all different and all changing, would be a far safer and happier place than one in which two embattled ways of life seek to make all peoples conform to one set of rules.

Our chances of avoiding a communist world dictatorship will also be much better if we conform to the law of diversity. Other peoples will fight for their own ideas much more stoutly than for ours.

Promoting freedom in the free world

The promotion of freedom in the free world is the ground upon which the West will survive, and thrive, or it will lose its soul and deserve to perish. Lately it has seemed, too, that the latter fate may be ahead of us. Under the lash of Red hysteria we have voluntarily yielded much of our own hallowed ground to "the enemy." We have gone far toward adopting the infamous doc-

trine that a man is guilty unless he can prove himself innocent, reversing centuries of hard-won practice on the opposite principle. We have reversed one of the basic principles of any free society, that every man is free to associate with whatever people and groups he likes, as long as he commits no illegal acts, and we now destroy reputations and livelihoods on the terrorizing rule of guilt by association—often fortuitous association that could carry no stigma in any free man's mind. We have permitted investigating committees to ruin lives without due process of law and to encroach heavily upon the functions of both the courts and the executive, threatening to destroy our tripartite system of government outright. We have allowed our most precious birthright, freedom of speech, to be so repressed that most Americans are afraid to speak and write and teach and preach what they believe to be true, lest a taint of unorthodoxy be put upon them.¹⁷

Unless there is a mighty and indignant revulsion among us against this kind of thing, we shall have nothing to oppose to the living death of the police state, communist or fascist. We need to remember daily that freedom is our chief stock in trade, and to stop congressional committees from demonstrating to the world continually that we do not believe in freedom. We need to be poignantly aware that we have been the world's leading exemplar of freedom for a century, and to practice freedom here at home, and wherever we go, so vigorously and faithfully that no one will doubt where the best way of life lies. If we abandon freedom, we shall not only wound the deepest yearning of the human heart everywhere, but surrender the world itself to the totalitarians. If we ape their repressive methods, we shall

have no moral defenses or weapons left. Nor can we beat them at their own game by suffocating ourselves.

This is the field of struggle upon which we shall survive or perish. We cannot blast freedom into the Communist-ruled countries with atomic bombs, but we can set up such a competition of free thinking, speaking, and living that no unfree system can avoid evolving in our direction. Here is the ultimate battleground, in the hearts of men, where we can win real and bloodless victories if we stick resolutely to our own heritage. Rivalry in destroying humanity cannot save us; but the ever widening practice of freedom is a kind of competition which we were born to win.

Creating deterrent strength

Many of my readers would have placed the creation of deterrent strength first in their list of constructive policies. I place it last, not because I think it is the most important, but because it is indispensable. In a world in which powerful sovereign states still seek to impose their wills upon each other, large armaments cannot be avoided. In the current situation we must have arms sufficient to deter our opponents from any attempt at world conquest, and vice versa.

Heretofore the divergent views of rival powers as to what armaments were defensive have led to war, but it must not happen again. This time we must achieve, in the words of Treasury Secretary Humphrey's April 21 speech, "that delicate balance which will give us the necessary defense against outside attack while always maintaining our economic strength at home." Here is a reasonable standard, until some real measures of world disarmament can grow out of political settlements and out of the feeling that the world is to be permitted to live.

THE FUTURE

The West has suffered a cataclysmic decline during the past forty years because its policies, if they could be called policies, have been negative and self-destructing. It suffered its unruly members to begin two world wars which devastated the West and opened the way for two huge advances of communist revolution, both of which it unsuccessfully sought to stamp out. The leading western state retreated into isolation and plunged the West into an economic disaster, while its European leaders appeased fascism to the extent of turning most of Europe over to it. Reacting to the other extreme, the weakened and truncated West tried to apply a containment policy to the expanded East which was beyond its power to enforce, and it now projects a roll-back campaign which would involve its final destruction in a third world war.

The West can still save itself by adopting and pursuing positive, constructive policies; by negotiating settlements, fostering world trade, developing the co-operative side of the United Nations powerfully, welcoming diversity and evolution in the world, creating deterrent strength against armed aggression, and practicing freedom so vigorously, at home and abroad, that no other way of life can resist its contagion.

Is such a shift from negative to constructive action feasible? The omens in the United States are mixed. The international wing of the new Republican administration knows that lower American tariffs and freer world trade are essential, but the protectionist wing appears to have the power to bar any tariff reductions. Authoritative articles in the *New York Times*, on April 18 and 19, forecast that Europe's "Trade Not Aid" appeal would be rejected, that she would get neither trade nor aid, and that Point Four aid would be de-

¹⁶ Mary Parker Follett, *Creative Experience* (New York: Longmans, Green & Co., 1924), pp. 300-301.

¹⁷ Arthur Hays Sulzberger, "Have We the Courage To Be Free?" *New York Times Magazine*, February 15, 1953, p. 12.

emphasized. The remedy appeared to be the encouragement of American private investment abroad, a solution which may look like American imperialism to other countries.¹⁸

The Bricker resolution, which is now before the Senate, signed by sixty-six Senators, also points toward a self-enforced isolation for the United States more total than that of the twenties. Its attempt to make our already difficult treaty-making machinery still more formidable, coupled with a near prohibition of power to the President to make executive agreements with other governments, would make any flexible or constructive conduct of our foreign affairs impossible. The fear betrayed that some future Senate might ratify a United Nations

¹⁸ See the articles by Felix Belair, Jr. on April 18, and by Brendan M. Jones, on April 19, 1953.

D. F. Fleming, Ph.D., Pe.D., Nashville, Tennessee, is professor of international relations at Vanderbilt University. He is a long-time student of balance-of-power politics, concentrating since 1947 on the conflict between the Soviet Union and the West. He is the author of The Treaty Veto of the American Senate (1930); The United States and the League of Nations, 1918-1920 (1932); The United States and World Organization, 1920-1933 (1938); Can We Win the Peace? (1944); and The United States and the World Court (1945).

treaty concerning race relations or human rights indicates a state of mind that does not augur well for responsible long-sighted leadership of the noncommunist world. In it, only we in our majesty and power are afraid of the comparatively feeble efforts of the United Nations to establish some common standards of human rights.

On the other hand, some of the President's advisers have shown real understanding of the changed world we live in, and of the urgency of conserving what we have left. The American people have been capable of great leadership in time of war, and they have a deep common sense which should enable them to play a stable, constructive role in the world. It is imperative that they do so, since there is no time left in which the West can indulge in isolation or depression or world war.

Middle East Power Vacuum

By EMIL LENGYEL

THE Middle East extends from the western boundaries of Egypt to the eastern frontiers of Iran, comprising a territory of close to four million square miles, if we include also the Sudan. It is a sparsely populated region with a population estimated at eighty millions. One half of these are Arabs, and the rest of them are Turks and Iranians. In the very heart of the region is Israel, with a population of one and a half million.

This is one definition of the Middle East. There are at least half a dozen of them. One of these days an international authority with recognized reputation will have to make a pronouncement about the exact limits of this area. Judging by the absence of such a pronouncement, the delimitation of the region seems to be a major undertaking, in lieu of which each worker in this field has to provide his own definition.

The importance of the Middle East has become a commonplace. We know that it has the largest known oil reserves of the world. Fabulous treasures have been revealed to dazed eyes beneath the forbidding desert sand of the Persian Gulf area. Word has just reached the outside world about new vast finds in the neutral zone between the sheikdom of Kuwait and the kingdom of Saudi Arabia. Superficially, that region is so barren that it was shunned even by the hungriest nomad when in search of food for his emaciated sheep.

"Middle" is a descriptive name for this region, indeed, since it is the center of great transglobal routes. The Suez Canal looks like a murky ditch from the air, but in reality it is a vital ar-

tery. Cut that artery and see what happens. When it was severed during World War II, the Western world was on the point of bleeding to death. Luckily we controlled the secondary lifeline around Africa and were masters of the Middle East bastion, Iran. Had we lost that shahdom, would Hitler have dictated his terms to us from London's 10, Downing Street?

There is no need to dwell on the importance of the Straits, either. Those Straits have been continuously in history since the first recorded annals which are available to us. Their commercial value is great, but even greater is their significance as strategic outposts of the West.

MEANING OF "POWER VACUUM"

The Middle East is a power vacuum; and because of that, it has become a major problem. The dictionary defines "power" as the "ability" to do something. Power vacuum means lack of ability. Lack of ability to do what? For a country, to assert itself among nations. Frankly speaking, and leaving aside the diplomatic cant, most of the world represents a power void these days. Can once mighty Britain pursue a policy of sovereign independence in the field of international relations, and can it be done by *la grande nation*, France? To ask the question is tantamount to answering it. Proud Albion knows her contemporary role, and she cocks a wary eye in the direction of Washington before taking an important step. England has a bicameral system these days, consisting of the House of Commons and the Congress of the United States.

If that is true of the United Kingdom, how much truer it is of the countries of the Middle East! They are represented at the United Nations as independent countries; they accredit ambassadors and ministers to other nations. They have their courts and judges and jails; they are sovereign in the domestic field. In the diplomatic field, however, their position is different. Turkey is the strongest of them, ensconced behind her martial virtues, strong in self-confidence and her sense of historic mission. Yet the same Turkey had to plead for American help when Britain's hands began to falter after World War II. What could the Arab countries and Iran do in the face of Soviet aggression? We recall what happened when the Arab nations converged upon Israel. How many hours could pitiful Iran hold out against the threat of aggression from across the northern mountains? These countries are still there, not because of their strength but because of their peripheral location in relation to East and West. Like that other Middle Eastern phenomenon, the Prophet's coffin, they are suspended between heaven and earth. The Middle East is a power vacuum, indeed.

AN OMINOUS PRECEDENT

It has been said that the only thing one can learn from history is that one can learn nothing from history. An infinite variety of combinations bars the recurrence of identical situations. However, it has also been said that one can learn a negative lesson from history—not to commit the mistakes of the past. One of the most forceful formulators of this pragmatic view was José Ortega y Gasset.

We can learn something as to how to approach the problem of the power vacuum by turning to a similar situa-

tion in the past. One of the world's most persistent power voids was southeastern Europe, the Balkans. The relation of that region to the rest of the world was startlingly similar to that of the Middle East. It belonged neither to the East nor the West, and was peripheral to great-power gravitational pulls. For a long time, too, it was a buffer, keeping major powers at bay by its very existence. It, too, was adjacent to Russia, in close proximity to western vital arteries. Like the Middle East, the Balkan Peninsula had oil, even though not in fabulous quantities. The only petroleum sources of Europe were situated in that Balkan power vacuum, at the foot of the Carpathian Mountains, around Rumania's city of Ploesti.

Today southeastern Europe is no longer a power vacuum. Most of it belongs within the Soviet sphere of influence. Perhaps it would be more correct to say that Rumania, Bulgaria, and Hungary belong to the Soviets. Albania is hanging in mid-air, detached from the Soviet physically, immune to western interference for fear of precipitating a tragic conflict. On the other hand, Greece and Yugoslavia belong in the western sphere of influence, the one actively and the other still on probation.

If we include all of eastern Europe in the power vacuum, as it was at one time, we need not dwell too long on the potentialities of such a condition. Certainly it can be no coincidence that the most disastrous international conflicts of modern times have started in that region. This is true of the First World War, with a conflagration focus at Sarajevo, and of the Second World War, with the immediate issue at Danzig. What we call the cold war, which it would be more correct to describe as the Second and a Half World War, flared up in the mountainous regions of northern Greece, along the Balkan fron-

tier lands of Bulgaria, Albania, and Yugoslavia.

Power voids are dangerous diplomatic earthquake zones, where the lack of stability of the foundations usually leads to great tectonic changes. What can we learn from the fate of that region, and how can that lesson be applied to the Middle East?

BETWEEN THE WARS

My memory goes back to the years between the two world wars. Southeastern Europe was definitely a power vacuum then. The countries that filled it out on the map were not masters of their destiny in international relations. They created a variety of diplomatic combinations, some of them attaching themselves to France, others to Italy, and, in the end, nearly all of them to the Third Reich. All of these combinations were strategic ones. France was building up an eastern glacis against Germany, the latter's ex-ally, Austria, and Hungary. Also, this system of alliances of the little brethren was to be fitted into the *cordon sanitaire* against the Soviet Union.

Italian Fascism was busily cementing the southeastern power vacuum in order to create a series of flanking positions against the kingdom of Yugoslavia, which seemed to bar the aggressive Fascist way toward the east. Hungary and Bulgaria were the pivots of this strategic line-up. These combinations were blown to pieces by the Nazis. To them this region was the *Aufmarschgrund*, staging area, against the Soviet Union. The Nazi attack against Russia was launched in immediate conjunction with the filling out of the southeastern power vacuum.

The keynote was "defense," and it solved nothing. On the contrary, it aggravated the situation. The countries were engaged in a warfare among themselves. Theirs were flaming frontiers

kept in that condition by hatred directed against the neighbor. "Hate thy neighbor" was the commandment of the area. This was the prevailing mood, too, not merely policy. The neighbor hated the neighbor not because of some innate desire or even self-seeking interest. He hated the neighbor at the behest of outside forces interested in weakening his own resistance by keeping him engaged in the debilitating task of passivity. "Divide and rule" was the conscious policy of the powers bent on neutralizing the area's forces of potential resistance.

The solution of this problem would have been regional unity. There was an attempt made in the interwar period to fill out the power vacuum and make the countries interdependent instead of intermeddling. However, the intermeddlers won, and the tragic results are known to all of us.

Periodically, nation inhabitants of the power vacuum made pleas to western powers to save their souls. Through the close interconnection of soul and body, it could have been accomplished by salvaging their bodies from the ravages of poverty. It was said at that time that the British could have won the Hungarians to their side by contracting to purchase a few hundred thousand geese. That, however, would have cost a few hundred thousand dollars, and no western country was ready to expend it on such an operation. The western countries were ready to sink billions of dollars on retrieving operations after the power vacuum had erupted in their faces.

We can apply the lesson we have learned in the case of one power vacuum. The Middle East is adjacent to the Soviet Union along a much longer frontier than southeastern Europe. Also, there is immeasurably more oil in the Persian Gulf region than in the Lower Danube area. But before applying the

lesson we have learned, let us see what obstacles we encounter.

SIMPLIFICATION AND THE PUSH BUTTON

It was Jakob Burckhardt, Switzerland's notable contribution to man's understanding of art and culture, who coined the phrase: *les terribles simplificateurs*. If the terrible simplifiers were dangerous in Burckhardt's nineteenth century, how much more dangerous are they in our own age! The peril is particularly great in the United States, the scene of the greatest triumphs of the machine. Technology has placed us in the van of contemporary civilization. We can look at the rest of mankind from dazzling peaks of creature comforts. Technical advance is closely linked to reducing the complicated to the simple, specialization, the one-track mind.

The terrible simplifiers believe that there is no problem that is not amenable to a push-button solution. If it is not, we had better leave it alone and turn our attention to another problem. To worry about such imponderables as national ways, historic traditions, irrational aberrations, human failings, merely irks the terrible simplifiers. They have no time for petty details, and so they do their utmost to deepen the abyss of the power vacuum and to spread the fable that Americans cannot deal with complex international relations.

Akin to these simplifiers are the "democratic autocrats," who brook no contradiction on the issue that people should be coerced into accepting the American way of life, which seems to them not only the best but the only acceptable one under any latitude and at all times. The simple solution for any problem is for America to set up two parties in any part of the world: Democratic and Republican. That will solve the problem of the power vacuum and

all the other problems. If people cannot see the light, it is because it is hidden from them by Communists, who should be given short shrift. Clearly, anybody who does not agree with them is a subversive.

Another variety of the same species is the fellow who believes in the curative power of the dollar, not only as a patent medicine but as a miracle drug, more effective than all the sulfas, penicillins, and aureomycins of the world. How shall we fill in the Middle East power vacuum so as to keep it out of Soviet hands? Nothing can be simpler than that. If five billion dollars is not enough, then fifty billion dollars will surely do the trick. Money is the answer.

"No, that's wrong," clamors another group. "Let us pour arms into the Middle East. We have armed the Turks, why not arm the Arabs and the Iranians?" These terrible simplifiers cannot understand why the government of the United States is so sluggish in doing the obvious.

These people do not seem to realize that arms need men. Today we know that it was we who armed the Chinese Communists by sending arms to Chiang Kai-shek. Those arms reached the enemy soldiers through corruption and weakness.

Corruption is no less great in Iran. Who could carry effective arms in a land which exists only because of the inertia of history? Those underfed, disease-ridden Iranians could not hold their own for a day against a well-disciplined army. Nor is the situation much better in the Arab lands. There we find an ethnic group with a splendid background. Where would Europe be if it had not been for their ancestors who kept the flame of culture alive in the age of great darkness? What other ethnic group could boast of such amazing feats of valor as the Arabs? These were the

people whose arms encompassed all the known world, from the gates of Paris to the great plains of the Indus.

This is true enough, but it is also true that when the descendants of these stout warriors were called upon to wipe Israel off the map in the spring of 1948, a handful of people inflicted one of the world's most surprising defeats on them. The Arabs did not lack arms, they lacked the spirit of resistance. What should they fight for? The men carrying the arms had no stake in this war.

PLIGHT OF THE MIDDLE EAST

Should the North Atlantic Treaty Organization fill out the Middle East power vacuum? We have seen enough of the world to realize that arms alone never fill out the vacuum. A defense organization can never be the foundation; it can only be the superstructure. The foundation must be a healthy, vigorous, strong group of people. Most of the Middle East belongs in the land of D.I.P.—disease, ignorance, and poverty. A recent American survey showed that the Egypt of today is afflicted with far more than the ten Biblical plagues, and that about 90 per cent of her people have one or more debilitating afflictions. And Egypt is far more of the West than of the East; she is the most populous and advanced Arab country. A United Nations survey has shown how widespread is illiteracy in the region, ranging from some 25 per cent in the Republic of Lebanon, the most cosmopolitan Arab country, to 95 per cent or more in the Yemen and Saudi Arabia. Likewise, a United Nations survey disclosed the low economic standards of the Middle Eastern Arab world, where the annual per capita income ranges between \$50 and \$100—a totally misleading figure, as the authors of the survey have pointed out, in that it includes the income of the *richissimi*, whose annual

incomes swell the earnings of the poor—on paper.

The foundation must be the improvement of economic conditions. The Middle East has been tragically immune to such improvement. How is that possible, since this area has been the recipient of the oil windfall? How is it possible, since the area is astir with wonderful plans of improvement—irrigation, land improvement, land reforms, social services?

Possibly, all these benefits will percolate to the people. There is very little to see as yet. Oil royalties go into the pockets of Middle Eastern potentates and governments. They have launched land improvement projects with this money, but the amounts are relatively small. The oil bonanza has widened the span between the rich and the poor. The rich are becoming immeasurably richer, while the poor are becoming only a little less poor. When such readjustments take place, the critical conditions leading to an explosion may materialize.

When people are very poor, they are apathetic, unable to budge and to assert themselves. The crisis is reached when they are somewhat better off. Then they gain a measure of strength, and dare to move and take action. They compare their condition with that of the privileged ones. The treasure-trove's lavish content, they hold, should also be theirs by right. It belongs to the country and its people.

The social structure of the Middle Eastern Arab and Iranian world is such as to accentuate the extremes of wealth and poverty. This is a fact which is very hard to explain. Islam, which is the creed and way of life of most of this region, is a democratic religion. The Prophet minced no words as to what he thought about the soulless rich. But, then, it has always been the fate of prophets that people listened to them without heeding their words.

The strong have seldom been able to refrain from taking advantage of the weak. But conditions seem to be far worse in the Arab and Iranian Middle East than in comparable areas. There must be a special reason for this curious fact.

The poverty of the area in natural resources is one of those reasons. Where those resources are more abundant, the weaker, too, have a chance to scratch for food. But where the bounties of nature are as limited as over most of this territory, the strong have to be stronger and more ruthless in order to make their mark. The poor, on the other hand, are pushed below the level of normal human effort. They become discouraged, apathetic, take to daydreams and drugs, let themselves be swept into an unthinking, inactive way of life. When people find that they cannot live, they will merely vegetate. That is why fate, karma, plays such a crucial role in the East.

HISTORIC OPPRESSION

Where the weak become weaker, the strong are bound to become stronger. This trend has been reinforced by historical forces. The Arab region in question was part of the Ottoman Empire for several centuries. The ruling Turks were Moslems, as were the majority of their subjects. But they were different, with a different background, speaking a different tongue, and, above all, subscribing to a different set of tenets. They were selected to rule over the natives of the soil. This age-old system of oppression depressed the spirit and the will power of the majority. The strong, on the other hand, were strengthened. They became the henchmen of the Ottomans.

Conditions did not change when the Turks lost their ruling position in the Arab world after World War I. The native masters carried on in the spirit

of the former oppressors. It made no difference that the oppressor and the oppressed now belonged to the same ethnic group. On the contrary, the condition of the underdog became worse, since the top dogs were familiar with their subjects' dodges and wiles.

Still more paradoxical was the impact of the enlightened western world on the social, political, and economic conditions of the region. The newly created Arab countries were placed under the tutelage of two of the most progressive countries of the world, France and Great Britain. What countries could boast of more advanced social improvements? Yet they joined the forces of darkness in the Middle East, not because they wanted to, but because of the inescapable consequence of their role.

Their mission was to train these regions for self-government and to give them a regime of law and order. In doing so, they had to accept the prevailing framework of social and political institutions. Those institutions were in the hands of the oppressive ruling classes. To change the framework would have entailed upsetting the reign of law and order, and that would have been diametrically opposed to the mandatory great powers' frame of reference. Thus, they had to uphold the existing order of injustice. Elsewhere in the Middle East, where the western powers lacked jurisdiction, the revolutionary *élan* of the new age held its sway. Particularly, this was the case in the republic of Turkey, which had thrown off the heritage of the backward Ottoman Empire.

A REVOLUTION FOR THE MIDDLE EAST?

Supreme Court Justice William O. Douglas advocates America's setting off a revolution in the Middle East. Revolutionary changes in that region are needed, but once a revolution gets

started, it is more likely that it will move toward the Soviet ideology. Revolutions have the distressing quality of not being amenable to regulation. Also, it cannot be the mission of the United States to set the revolutionary fires in different parts of the world.

However, America can be instrumental in launching some of the desired changes. We have already started it with Point Four, a program to extend technical assistance to backward and underprivileged countries. The first application of the program was in a Middle Eastern country, Iran. The execution of the program promises success in some regions, while it may not succeed in others. How can we make it successful throughout the area?

An important reason why the Middle Eastern countries are inclined to frown at this plan is because of our insistence that it is not the aim they seek, but an instrumentality of our own making. Our outlook on the world scene today is simple. Everything seems to be subordinated to the objective of beating the Soviets in the cold war. We are active in the Middle East—we tell the world—not because we want to help the region; we use it merely as an arm in the armory of the cold war. Nobody likes to be an instrument, and particularly not people who have been instruments for centuries. They have now become independent, in some ways, and they are sensitive to our methods.

When we launched our Point Four we presented it also to the United Nations, which started a parallel project of Technical Assistance. We could disarm much of Middle East resistance to this plan if we were to operate through the United Nations. One of the most successful postwar projects was the United Nations Relief and Rehabilitation Administration, and it was carried out under the aegis of the United Nations.

Would this mean that we should have

to make the greatest contribution and receive only a part of the profit? It would mean precisely that, because we have greater ability to help than all the other countries. And why should we worry about the exact allotment of the credit, as long as the ultimate aim promises to be reached? We can afford to be generous in claiming credit.

We have said that our Point Four program got its start in the Middle East. That is a fact, but it is also a fact that it has not got very far. In the spring of 1953 there were only 1,500 technicians serving on the United States rolls in technical assistance capacity, and they were working in 35 countries all over the world. More of them are needed in the Middle East alone. We have these skills in soil improvement, water preservation, labor efficiency, co-operative organization, and many cognate problems. The Middle East needs also a measure of industrialization. The beginnings are bound to be halting, since the area lacks the social setting. It also lacks skills, proximity of markets, and many raw materials. Yet the region is bound to remain in colonial subjection until it is able to make such a beginning. Industries inject a higher tone of life into backward regions and raise the standard of living.

AMERICA'S VITAL CONTRIBUTION

The Middle East lacks native technical skills, which have to be provided if standards are to be raised in the region. Today the United States is the Mecca of foreign students eager to learn the latest body of knowledge in a large variety of fields. We are justly proud of the fact that there are some 30,000 foreign students in our midst. That is a sizable figure, but far from adequate. The Middle East alone could provide a larger contingent. Experience teaches that its young men are malleable enough to pick up technical knowledge. Re-

turning to their native country, each of these young people should be the head of a school of eager youngsters.

Technical knowledge is not enough, of course. We believe that a more thorough knowledge of the American way of life would also be of great use to the Middle East. We have shown that it is possible to fuse the most disparate ethnic elements into a common aspiration of constructive nationhood. We have not solved all such problems, but we seem to have the good will to seek the right path. The best we have produced in this respect is good indeed; let us be the missionaries of this ability.

This brings us to another important point. The people we send into the Middle East are, no doubt, a selected group. They seem to know their fields of specialization and apply themselves to their jobs with great energy. However, there is a tendency among them to keep company only with their own kind—to keep aloof from the "natives." One can understand such inclinations. One of man's strongest desires is to be part of a congenial and homogeneous group. This urge has to be subdued. We cannot become a nation of introverts abroad, a group of supermen, dispensing the law from our individual Mount Sinais. Each American abroad must consider himself a dedicated person, a missionary, ready to give far more than the terms of his contract specify. And he must do so on a footing of equality with the local people.

THE INTEGRATION OF THE MIDDLE EAST

One of the main reasons why the Middle East is a power vacuum is that the countries in it neutralize one another. This is true even of the Arab nations. They have an Arab League, supposed to integrate their efforts on a broad field. There is no need to call attention to the fact that it has integrated

its members only in a negative way: in their opposition to Israel. Jealousy and recriminations are the order of the day among the Arab countries.

The Middle East is a natural unit. Most of it belonged to the Ottoman Empire for centuries, and it was united by strong connecting tissues. Under the present conditions the region would be unable to make even a small contribution to its defense. A state of war still exists in the very heart of the area, between the Arab countries and Israel. This is an anomalous situation which cannot last long without dire consequences for the entire region. The western powers could certainly induce the Arabs to make their peace with Israel. So far, no determined effort has been made along that line.

After peace has been achieved, the entire region, and not merely the Arab countries, must explore the possibilities of a higher integration. That is in the interest of strategic security as well as economic improvement. The South Asian countries have been trying a measure of economic integration in the Colombo plan. If they can do it, over a tremendously large area covering the most diverse ethnic groups and ways of life, why can the Middle East not seek to find a common denominator? It is far more compact, and its interests are far more interrelated. The great western countries should use all their diplomatic resources to get such a project launched.

WHAT ABOUT DEFENSE?

The question has been asked whether the Middle East should join the NATO? It has already been pointed out that a defense organization can never be the foundation, but must be the superstructure. If it were to be the foundation, it would be sucked into the bottomless abyss of the power vacuum.

Turkey is a member of the NATO,

together with Greece. Whatever their official status, they serve in auxiliary capacity. These two countries appeared to be along the route of Soviet expansion. For countries in the eastern Mediterranean to be members of a North Atlantic Treaty Organization may be a geographic curiosity, but that is beside the point. Historic necessity indicated the need of such an integration.

And the bulk of the Middle East? Here again there is serious danger that sensitive Middle Easterners will assay our efforts to organize them in a defense body as being in harmony merely with our own interests. If a defense organization in the region is needed, let it be organized under its own colors, including all the units of the area—Arabs, Israelis, Turks, Iranians.

It has been suggested by Middle Easterners themselves that they should set up their own organization. Would they be able to do so, lacking so many

of the qualifications and wherewithals of such a complex body? It would be far better to follow the inclinations of the Middle Eastern countries, especially since they would have to turn to us with many of their problems. Once such an organization is set up, they are bound to solicit our assistance in a variety of ways, and we should be more than ready to help. They need expert knowledge and the tools of defense, all of which we have.

Let us not seek defense merely in the force of arms. It was in the Middle East that man's conscience was first revealed. It was there that the greatest religions of the West proclaimed that there was salvation and that its name was peace. Let us hope that the Middle East will help us again to find our human selves, and that it may yet become the inspirer of man's ability to solve his problems without resorting to the criminal insanity of erasing the problems by erasing mankind itself.

*Emil Lengyel, J.D., New York City, is professor of education at New York University. He is the author of many books, of which the latest are *World Without End: The Middle East; Turkey; and America's Role in World Affairs*. He regularly visits the Middle Eastern area, with which he is thoroughly familiar.*

Tension in the Arab Near East

By FARID S. HANANIA

THE Middle East today is one of the weakest links in the collective defenses of the West. Except for Turkey and Greece, which are part of the North Atlantic Treaty Organization and, technically speaking, are not really part of the Middle East, the Arab Near East is neither part of NATO nor part of the chain of the several defense organizations of the West.

Now, why is it that the West is leaving this very important link so exposed, so dangerously exposed? The region which I wish to survey with you lies on the eastern and southeastern shores of the Mediterranean, south of the Anatolian Plateau and west of the Persian highlands, including both the Nile Valley and the Arabian Peninsula.

This region, which lies at the junction of three continents—Europe, Asia, and Africa—has the longest continuous history of any area. From time immemorial it has witnessed the passage of both vanquished and victorious armies and has been the coveted prize of contending empires. It has known the armies and rule of Egypt, Babylon, Assyria, Persia, Rome, Byzantium, the Arabs, and the Turks, and today the waning heir to all this grandeur is Great Britain.

IMPORTANCE OF THE NEAR EAST

In modern international power politics this area is important on at least three accounts: its strategic importance, its role in world communications, and its richness in oil. I do not think the North Atlantic Treaty Organization can be wholly successful in Europe unless the Middle East is made into a separate defense organization, because control of

this area or its denial to the Union of Soviet Socialist Republics is absolutely vital to the western world. If the West were in possession of it, effective blows could be directed against the Soviet industrial and oil concentration in the Caspian and Black seas. Conversely, if the U.S.S.R. were to possess it, it could cripple naval operations both in the Mediterranean and in the Indian Ocean, and strike at western bases on the African Continent.

General Eisenhower called this area the most important area in the world strategically. Senator Vandenberg, leader of the Republican majority in the Senate, said in April 1947 that if the Middle East fell within the orbit of the aggressive Communist expansion, the repercussions would echo from the Dardenelles to the China Sea and westward to the rims of the Atlantic. Indeed, in this foreshortened world the Middle East was not far enough from our own New York. These were the words of Senator Vandenberg.

A further illustration of this is Mr. Winston Churchill's decision made in December 1940 to send strong British reinforcements to the Near East at a time when his own country stood in hourly danger of a German invasion. Churchill knew, and subsequent events proved him right, that the Battle of Britain could be as effectively fought on the banks of the Nile as in the skies of London.

As to world communication, you only have to cast one look at the map to see the importance of the area, for through it pass the shortest sea, land, and air routes connecting the Western and Eastern hemispheres. Of course, the Suez

Canal could be easily destroyed by war, but even then the area would remain of utmost importance for east-west air and land routes connecting the two hemispheres.

Finally, there are the Near East oil resources, which are the richest in the world. These Arab countries, including Iran, contain something like 42 per cent of the world's oil resources, as compared to 35 per cent in the United States, 12 per cent in Venezuela, and the remaining 11 per cent in the rest of the world. The problem seems to be, as I understand it, to draw as much as possible upon these Near Eastern oil resources in time of peace, and leave the more safely tucked-away reserves for time of war.

So it will be seen that, whether in peace or in war, the Arab Near East is of vital importance to the western world. It therefore seems natural that there should be increasing American curiosity about this region, about its inhabitants, about their feelings and thoughts and problems, and particularly about their attitude toward the West and toward the eastern camp.

GEOGRAPHY AND GOVERNMENT

In this area there are seven Arab states: Egypt, Jordan, Lebanon, Syria, Saudi Arabia, Iraq, and Yemen. In addition, there are small principalities south of Arabia and on the eastern shores of the Persian Gulf. The total population of this area is some fifty or sixty million, ranging from the greatest number in Egypt, twenty million, down to four million in Iraq, Saudi Arabia, and so on.

Monarchy is perhaps the commonest form of government. Even since Faruk's ejection from Egypt, there are more monarchs, as it were, per square mile in this area than anywhere else in the world. The monarchies, however, vary from the old medieval type, as in Saudi

Arabia and Yemen, to the modern constitutional type, as in Iraq and Jordan.

In Egypt and Syria we now have military dictators, ruling, so far, as benevolent dictators. In Lebanon there is a republican form of government, a mixture between the American and the French.

Syria, Lebanon, Saudi Arabia, and Yemen are completely independent, insofar as any country outside of the United States and the Soviet Union is completely independent nowadays. Egypt, Jordan, and Iraq are technically independent but are tied to Great Britain by military treaties providing for British bases and occupation forces in the more secluded parts of the country. Britain has also a predominant political influence in the principalities along the southern shores and the Persian Gulf, and it has a crown colony in Aden.

ARAB SOLIDARITY

There are two things to remember about the population of these countries—first, they are Arab; second, they are predominantly Moslem. By Arab I mean that (in varying degrees) they have Arab blood in their veins; their spoken and written language is Arabic; their intellectual and philosophical outlook is conditioned by Arabic literature and thought; they take great pride in the Arab achievement of the past; and so on.

In addition to these racial, linguistic, cultural, and historical ties, there is another tie which binds the Arabs even closer together, and that is the spiritual tie of Islam.

It is to be noted that not every Arab is a Moslem, nor is every Moslem an Arab. There are hundreds of thousands of Christian Arabs in the Middle East. When I say "Christian," I mean the indigenous Christians, the original Christians that emanated from that part of the world.

Also, there are many more non-Arab Moslems than there are Arab Moslems, the Arabs forming only one-eighth of the main body of Moslems. The world of Islam stretches at its farthest limits from the North African coastline in the west to the East Indies and the Chinese mainland in the east. It includes some four hundred million souls between whom there lies a deep spiritual affinity and feeling of community comparable to nothing similar in modern Christendom.

But if the Arabs only form a minority among the Moslems, their influence is paramount. This is so for many reasons. The Moslems' prophet, Mohammed, was an Arab. Their holy book, the Koran, is in Arabic. The holy cities of Islam—Mecca, Medina, and Jerusalem—lie in the heart of the Arab world. The greatest centers of Moslem civilization are the Arab cities of Cairo, Damascus, and Baghdad. The highest Moslem theological center is the University of al-Azhar in Cairo.

REPERCUSSIONS IN THE ISLAMIC WORLD

It follows, therefore, that what happens in or to the countries of the Arab Near East is likely to have wider and more far-reaching repercussions than their present material or military strength would seem to warrant.

But the repercussions in the world of Islam need not be immediate, need not be tangible. They tend to take the form of a deep-felt brooding impression, which may very well find cataclysmic expression at some point of great historical intersection sometime in the future.

Manifestly, then, the Arab Near East is doubly important to the West both in terms of its own strategic importance and in terms of its intimate relations with so many millions of Moslems lying, as they do, along the southern border of the Soviet Union. For here we have

a double chain reaction. On the one hand, Arab attitude to the West is largely conditioned by western treatment of the Arabs; and on the other hand, the attitude adopted toward the West by the Arabs may largely condition the attitude of the whole Islamic world to the western camp.

ISLAM AND COMMUNISM

But it may be said, Well, by our own western military standards and industrial potential, they are of no great account, and therefore their friendship is not of much importance.

Well, the first part of that statement may be true, but not the second, for the real importance of the Moslem countries lies in their relation to the U. S. S. R. Should the Soviet Union devise a formula acceptable to Moslems, should Communism and Islam hands, then the whole of Asia and of Africa would have to be written by the West, for then the Moslem countries would become what the Soviet Union would make of them.

Do not think I am exaggerating, do not think I am being an alarmist in any way. What happened in China can, unless we keep our eyes open, happen also in the Moslem lands. In the Moslem lands, as in China, there are millions upon millions of toiling masses living on the border line of animal existence. In the Moslem lands, as in China, the past record of the western imperialistic powers is anything but happy or suited to win loyalty. And in the Moslem lands, as in China, there is a tremendous social and intellectual ferment which is seeking violent and revolutionary expression today.

So it is upon these three bases of poverty, bitterness against the West, and intellectual confusion that Communism may try to join hands with Islam. Needless to say, it cannot come to

terms with the true Islam; the pure monotheistic faith of Islam and the atheistic and amoral Communism are incompatible. But it can join hands with a warped Islam, with an embittered, frustrated, or chauvinistic Islam.

I feel that Moslem estrangement from the western camp would be all the sadder because in Islam the West has potentially one of the greatest Asiatic allies against Communism, for any religion deriving from divine revelation is a natural enemy of a pure materialistic creed such as Communism.

Moreover, Islam has succeeded in retaining its spiritual influence over its adherents to a remarkable degree for the last thirteen hundred years, and even those Moslems who have been western-educated and have discarded the outward practices of their faith still feel a very deep attachment to it.

IN CASE OF WAR

This is a symptom of the age that when we discuss a nation, the first question we ask about it is, How will it behave in the next war? This is, so to speak, the topic of the day. Accordingly, if we were to assume an outbreak of war tomorrow and ask this question about the Arab states that I have just mentioned, I very much regret to say that no Arab country would be likely to declare itself wholeheartedly on the side of the West. That is why there has not been a regional defense organization in the Middle East. That is why NATO has not been successful in penetrating into the Arab lands.

This is not to say that all the Arab governments are Communist. On the contrary, Communistic activity is officially banned in all the Arab countries. In fact, in Iraq it is a capital offense. Indeed, the only country in the Near East with a large and well-organized Communist party is Israel.

Arab refusal to side with the West is not so much the result of love for the Soviet Union as of bitterness against the West. It is this situation that western and particularly American statesmanship must put an end to, and put an end to soon, before a greater threat would endanger not only the western world but the Arab world as well. And I am very glad to see that the new administration in Washington has been conscious of this very important area of late.

ROOTS OF THE TENSION

What is the cause of this tension? The explanation is usually quite simple. You read it in your papers. The answer is given as fanaticism, as xenophobia. But I do not think that is the answer at all. The answer is to be found after a thorough perusal of the history of that area during the last 150 years. For even fanaticism and xenophobia do not spring forth entirely without a cause.

The root of this tension stretches right back to the nineteenth century. That was the century of European economic and political expansion at the expense of the weaker, less technically advanced countries. Between 1813 and the outbreak of the First World War most of the Arabic-speaking countries lying on the fringes of the Ottoman Empire were invaded and occupied by one European country after another. Most of these conquests were effected in the face of fierce resistance from the Arab inhabitants, who were finally overcome by sheer military force.

But the turn of the other Arab countries, of the Ottoman Empire, was soon to come. After the First World War these provinces were sliced and divided between Great Britain and France. From administrative units belonging to one central government and sharing one common citizenship, these provinces were now turned by France and Britain

into separate states with different administrations, different currencies, different passports, different legal systems, and even different official languages.

Thus the modern countries of Lebanon, Syria, Iraq, Palestine, and Transjordan came into being on the basis of arbitrarily drawn frontiers that had no correspondence with cultural, national, or ethnic considerations. France assumed her mandate over Syria and Lebanon. Britain assumed her mandate over Palestine, Transjordan, and Iraq.

Under the Ottoman Empire the Arabs had had a share in the administration of their empire. There were sixty Arab deputies in the Ottoman Empire. There were Arab cabinet ministers, generals, ambassadors, provincial governors, and so on. Now they were told that they were immature and could not govern themselves.

Arab disillusionment with the West was still greater because they had fought against the Turks and on the side of the Allies during World War I with the express understanding, as they believed at the time, that they would be given union and independence in the Arabic-speaking countries of the Fertile Crescent and the Arabian Peninsula. But the peace conference after World War I was an eye opener to the Arabs. The western democracies, as the Arabs now saw them, paid only lip service to the fine conceptions of freedom and self-determination that were propounded by Woodrow Wilson.

INDEPENDENCE BUT CHAFING TIES

Gradually, however, as the years passed, the imperial powers of Britain and France had to yield ground to growing national strength, and of the five countries that I have just mentioned, Lebanon and Syria achieved independence in 1945. Iraq achieved independence in 1932, but had to sign a military

treaty with Britain with which she still frets. Transjordan achieved independence in 1946, but that was obviously nominal, because Britain still controls the country, not only by military treaty but also by the British-officered Arab legion. Egypt achieved her independence in 1922, but again was tied to Britain with a military treaty which she deeply and passionately resents.

So the tension between the Arabs and the western European democracies springs from past disillusionment, bitter memories of the independence struggles in the interwar years, and present restlessness at the shackles of dictated military treaties. To understand the point of view of these countries, it must be made clear that they regard these military treaties with Britain not as freely negotiated arrangements with equal allies, but as the tactics of an imperialistic power calculated to perpetuate her rule in the country. The British forces in Egypt, for instance, are not looked upon as an asset, as, say, the American forces stationed in England are by the British. They are rather looked upon as the Allied occupation armies are by the Germans.

THE HARD CORE OF RESENTMENT

These considerations alone are enough to poison, as they do poison, the relations between the West and the Arab Near East, but there is another factor.

If you say that western imperialism is considered as a phase through which Europe passed at one time and is now abandoning, as is evidenced by the withdrawal of the British from India, for instance, there still remains one western action which can never be forgiven or forgotten by the Arabs. Indeed, time perhaps cannot heal it and no amends can make up for it. As one American author put it, it will ever remain a wound to the international honor. If

an Arab today were asked to point to one particular problem which more than any other problem stands in the way of an Arab-western rapprochement, or an Islamic-western rapprochement, he would with all sincerity and unhesitatingly point to Palestine.

It is impossible for me to convey to you in words the deep sense of injury, of pain and bewilderment, felt by the Arab people over the western policy in support of Zionism in Palestine. That policy, ending as it did in the mass exodus of the country's indigenous population, both Christian and Moslem, to make way for an alien one, seems in Arab eyes altogether to empty western democratic concepts of all meaning and significance.

Western democracy may be a fine thing, is the universal cynical comment; it sounds excellent on paper, it is no doubt practiced in the western countries themselves, but we haven't seen it here. It is obviously not for export.

Britain is, of course, regarded by the Arabs as the original culprit, for it was Britain that conceived of the idea of the Balfour Declaration and pushed it through, and it was Britain that crushed continued Arab opposition over the last quarter-century. But in the last few years it is the United States that has come in for most of the blame. The United States succeeded in three years in doing what it took Great Britain thirty years to do, namely, to antagonize the Arab countries; for it is considered by the Arabs that but for American moral, diplomatic, and material assistance to the state of Israel, Israel would not have arisen.

In particular, the Arabs resented the personal character of the United States President's Zionist declarations, which were motivated as much by good will toward the Jews and ignorance of the Arab case as they were by internal political considerations.

DOMESTIC POLITICS AND FOREIGN POLICY

On this question of the impact of the internal American policies on American policy toward Palestine, I can do no better than refer you to a revealing book called *Forrestal's Diaries*. I will just quote one or two of Forrestal's remarks.

26 November 1947: Lunch with Senator McGrath. Prior to it I had him read the secret report on Palestine. I said to McGrath that I thought the Palestine question was one of the most important in our American foreign policy, that if we were talking about lifting foreign affairs out of domestic politics, there is nothing more important to lift out than Palestine, with all its domestic ramifications.

Forrestal derived several points from McGrath's conversation:

In the first place, Jewish sources were responsible for a substantial part of the contributions to the Democratic National Committee, and many of these contributions were made with the distinct idea on the part of the givers that they would have an opportunity to express their views and have them seriously considered on such questions as the present Palestine question. I said I hoped that Senator McGrath would give a lot of thought to this matter because it involved not merely the Arabs of the Middle East but also involved the whole Moslem world with its 400,000,000 people, Egypt, North Africa, India, Afghanistan, et cetera.

If you are interested in this phase of the Near East, you will find very interesting passages in Forrestal's book.

In the words of Professor Gibb, of Oxford University, who is perhaps the greatest orientalist today:

The methods by which Near Eastern policy of the United States was forced through the Assembly of the United Nations in 1947 not only undermined at one stroke through much of Europe and all of Asia the authority of the United Nations but also undermined respect for the integrity of the United States.

Professor Gibb is not only a friend of the Arabs, he is also a friend of the Americans.

THE REFUGEE PROBLEM

I wish, however, to make it quite clear that my statement of the Arab attitude regarding Palestine does not reflect wanton disregard on my part of what is perhaps the greatest tragedy in human history and certainly the ugliest blot on modern Christian Europe, namely, the abominable Nazi persecution of millions of innocent Jewish men, women, and children. This tragedy is of such unprecedented dimensions that man-made immigration laws should have been swept aside to receive the remnants and the refugees, and I, as a Christian, must say that I feel the deepest sense of shame because of the failure of the Christian countries, and particularly of America, to rise to the situation.

All that America and the other western countries could think of was to demand immigration into Palestine—a land torn by hatred and civil dissension and surrounded by hostile hinterland; a land limited in economic absorptive capacity; a land, moreover, which had already received, between 1920 and 1948, as many as a half-million Jewish immigrants in a total population of 1,700,000; a land where continued Jewish immigration was bound to lead sooner or later, as it did lead, to the creation of precisely that kind of tragedy it was calculated to solve, namely, a refugee problem. In this case 860,000 Arab homeless persons are now entering their fifth year, living under the most abominable conditions, on international charity doled out to them at the rate

of seven cents a day per person to include their clothing, food, and existence.

WHAT OF THE FUTURE?

The wounds then, inflicted by the West upon the Arabs, are many and deep; but it would be not only foolish but suicidal for the Arabs to turn their backs upon the West, for the face that the West has hitherto shown was perhaps not its real face, not its Christian face. The West was cruel to the Arabs because perhaps it was cruel to itself. The United States of America has compromised itself over the Palestine issue, but perhaps, unlike older imperialistic powers, it has a clean record, and the American violently Zionist policy is now generally believed to be a thing of the past.

I do not wish to imply from all this that the outlook is hopeless, that the Middle East cannot be joined in a regional defense organization or made part of NATO; that need not be so. The interests of the Moslem world are inextricably bound with those of the West. If the Near Eastern people find it hard to live on agreeable terms with the West, they will find it harder to live at all with the Soviet Union. Of this I have no doubt. As a man who has spent half his years in England, as I have, I have come to realize what western democracy really stands for, and what western democracy really stands for is the only basis for a decent human existence. So it would be a great tragedy, a great tragedy indeed, if my people and your people should, just because of lack of mutual understanding and mutual respect, find themselves at cross purposes.

Farid S. Hanania, L.L.B., M.A. (Cambridge, England), barrister-at-law (London), is chairman of the Department of Political Science at the American University of Beirut, Lebanese Republic, and visiting professor of foreign affairs at the Woodrow Wilson School of Foreign Affairs, University of Virginia, Charlottesville.

The Meaning of NATO for France and Europe

By JEAN DE LAGARDE

AMONG the decisions which have certainly had the most far-reaching effects, which may last for centuries, the signing of the North Atlantic Treaty four years ago and the subsequent organization of a joint defense between countries on both sides of the Atlantic will take the first place. It has been really revolutionary, not only for your country, which for the first time has signed a treaty of alliance in peacetime, but also for the countries of western Europe, which have concluded arrangements which were never before made in peacetime.

THE THREAT TO EUROPE

If such revolutionary decisions were taken, it was because the countries of the free world were facing revolutionary situations. For the first time since the fall of the empire built by Charles the Great in the beginning of the ninth century and since the invasion of the Moslems, the old civilization of Europe was threatened by a great danger, and for the first time there was no possibility of a combination of nations in Europe to check that danger.

In 1945, indeed, there was only one country standing, more powerful than ever—the Union of Soviet Socialist Republics. All the other nations which had led Europe for centuries—England, France, and Germany—were greatly weakened by the terrible struggle. The Marshall plan prevented the European economy from falling to pieces and bringing about social upheavals. The funds given to western Europe, especially to France, served to buy the raw materials which were lacking and to re-

place the machine tools destroyed or worn out during the war. After four years of the Marshall plan, European, including French, industry and agriculture had not only recovered from the losses sustained during the war but were far ahead. Some figures for France will show this:

Steel, 10 million tons in 1952 compared with 6.8 millions in 1938 and 8.7 millions in 1929.

Coal, 57 million tons in 1952 compared with 47 million in 1938 and 53 million in 1929.

Electricity and oil refineries, three times more than before the war.

Agricultural tractors, 150,000 in 1952 compared with 25,000 in 1938.

At the same time, the birth rate has increased in France. There was a population increase of 300,000 in 1952 compared with a loss of 35,000 in 1938. For the first time the French population will reach 43,000,000 in July 1953, in spite of the fact that France lost 600,000 men and women in World War II.

But although through the Marshall plan and the work of the French people the economy was being restored, hundreds of Russian divisions were still in the east, and the history of eastern Europe has shown that where those divisions are, Russian imperialism is about to enslave countries; the Red tide was in full swing. It was necessary to organize the defense of countries which had the same ideals, the same belief in human liberty, and in general the same civilization stemming from Greece, Rome, and Christianity. So the North Atlantic Treaty was a recognition of the fact that on both sides of the ocean

countries exist with the same interests and ideals. That is the meaning of the North Atlantic Treaty Organization for France and western Europe: the organization of the defense of civilization.

REARMAMENT AND ECONOMIC SUPPORT

For that purpose, steps have been taken in the last four years in the field of rearmament. As in the case of the Marshall plan, the United States has taken the lead. Tons of arms, thousands of tanks and armored vehicles, of guns and planes, have been shipped over the Atlantic to the armies of France, England, Belgium, and other countries. At the same time, the countries of western Europe have been glad to offer the armies of the United States and Canada barracks and airfields for their forces which are stationed permanently on the soil of Europe. For the first time in peace, we see foreign troops garrisoned in allied countries; the general staffs composed of officers of different countries are preparing a common defense. Some ten years after that terrible struggle of World War II, negotiations are going on to unite the former foes and rearm them. The treaties of Bonn and Paris, signed by eight governments, provide for the rearmament of Germany and their approval by the different parliaments, and are now on the agenda of those assemblies.

In the field of armament, the French have furnished a great effort. They have built an army of twelve divisions and are going to have fourteen plus about thirteen overseas. Their contribution in men in the armed forces is on the same level as those of Great Britain and the United States. If you consider that the French had to start again nearly from scratch, you will realize that this is really an achievement.

But modern economy and the extraordinary intricacies of economic and for-

eign policies require more than military men and equipment. As Mr. Bidault, French Foreign Minister, has pointed out in the last few years, it is necessary to pool not only armament but also economic resources to make the defense of the countries effective. It is not only necessary to give tanks and planes to the armed forces, but we must also make the national economies sound, so that the burden of those armed forces can be supported by their countries and the morale of the troops will be as good as the guns they have in their hands. For the French people, NATO means not only common defense but also sharing everything that makes that defense outstanding. That is why Mr. Mayer and Mr. Bidault recently discussed with your President and his assistants the question of Indochina and of the European Army. That is why Mr. Mayer has launched the idea of building construction in France and expansion of international trade. There is no separate compartment in the world policy of today. The French soldier fighting in Indochina is needed in Europe; the money spent in Indochina is needed to build houses in France.

BURDEN OF INDOCHINESE WAR

The war in Indochina, as Governor Dewey said recently in a speech at Hunter College, is at the heart of the French problems: financial, because it is costing the French more than 450 billions of francs a year, which is more than they invested in Indochina; military, because 26 per cent of the French regular officers and 34 per cent of the noncommissioned officers are engaged in Indochina, thus preventing the formation of new divisions or weakening the divisions already existing in Europe. If you also remember that 500 billion francs (14 million dollars) is devoted to the rebuilding of the houses destroyed and

that only a quarter of them have been rebuilt, you will understand what those commitments inside and outside represent for France. Considering that the fight in Indochina is for the same cause as the fight in Korea, and that the situation in southern Asia would become catastrophic if the French Army were obliged to give up, it is only fair that those who have the same interests share, in some way or other, the burden the French are obliged to support in that part of the world.

It is erroneous to say that the French are not paying taxes. On the contrary, as Mr. Mayer pointed out, 38 to 39 per cent of the nation's income go for taxes. If you take into consideration social security and local taxes for small cities and villages, it is a very heavy burden. Only one is higher, and that is Great Britain's. It is higher than in Germany, in Italy, or in the United States. If you also take into account that the average income in France is only \$433 compared to \$1,435 in this country and \$755 in Great Britain, that burden appears even higher. The government is fighting tax evasion that could have developed into large fraud. It has been shown that if the American tax system were applied in France, the revenue would be 1,334 billion francs instead of 2,312 billion francs.

From these figures and the impact of the Indochinese war on the French economy and the French military forces, it is possible to understand why some French people are requesting guarantees to enter the European Army project, and why the French Government has asked for different protocols. To build an army able to fulfill French commitments in the European Army, it is necessary that the French be able to pull some officers and noncommissioned officers out of Indochina; and at the same time, because of the commitment of the French forces, it is just as neces-

sary that the French be able to pull some of the officers and noncommissioned officers out of the European Army to bring them overseas in case of emergency.

THE SAAR

As Mr. Mayer pointed out in Washington, the European status of the Saar must be fixed by treaty. The treaty must certainly put an end to any disagreement between France and Germany, so that the Saar dispute will be settled. The difficulty comes not from the political regime of the Saar, but from her economic status. Knowing the importance of the Saar to the French economy, it is natural that the French are asking that the union that exists between the two countries shall not be dissolved until European economic union becomes a reality. Nevertheless, the French Government is fully confident that a settlement with the German Government can be worked out.

NEED FOR UNITY

All phases of the problem are linked together. NATO cannot be considered merely as a defensive military alliance, but must be regarded as part of a global friendship and understanding in every field of economy, foreign policy, and military defense among countries that have the same aim and ideals. NATO is not an end in itself; it is only part of a greater job—building a secure free world. In short, NATO is only the defensive part of the life of the Atlantic community, a community in which the different countries have to share their responsibilities as well as their burden. It is not possible for your country to be prosperous and secure if Europe collapses; neither is it possible for western Europe to have a bright future if the United States is not strong and prosperous. We are fighting in the

right direction; let us stay united. As the *New York Times* remarked on April 4:

The Continent has had time to organize and unify itself. That process is now un-

der way. It would be the supreme irony and catastrophe of history if Soviet Russia, whose pressure brought the free European nations together, should now succeed, by easing that pressure, in wrecking the growing unity.

Count Jean de Lagarde is Minister Plenipotentiary in charge of the Consulate General of France in New York City, having served in a similar capacity in San Francisco. He has served his country in Warsaw, Bucharest, Damascus, Beirut, and Copenhagen, and has been in the United States since 1948.

NATO and the Underdeveloped Areas

By CHARLES H. BONESTEEL, III

THE immediate problems confronting the North Atlantic Treaty Organization in its task of building armed forces for the defense of the West are complex, but they are generally well defined and reasonably well understood. Not so clear is the question of what will be done after these armed forces are created and military imbalance with the Soviet bloc is rectified. Even less clear is the question of how NATO, or, in broader terms, how western civilization, can develop its fullest potential to meet and resolve all aspects of the Communist menace to the free world and to contribute to a lasting peace.

The Soviet-Communist conspiracy has, as we know, only one long-term goal, but it has almost infinite flexibility in time and method in its march towards this objective. We have recently observed some seemingly drastic shifts in Soviet foreign policy. It is too early to evaluate their motivation, but one thing remains clear. The most direct and effective approach by the Soviets towards their objective combines the threat or application of military force with subversive action by the tightly organized and rigidly disciplined zealots of the Communist Party. This direct approach can be checked only by force in hand and by organization. The free world cannot risk relaxation in its efforts to create the organized strength needed to make this approach continuously unprofitable to the Kremlin. Today the strongest, and in fact almost the only, even partially organized resistance in the free world centers in that amorphous entity known as western civilization.

The most active elements of this resistance in the West are NATO and the nations which have banded together to form NATO. These nation-states and their peoples, drawn together in loose assemblage through common moral heritage and the present danger, are acting collectively to build a focus of organized strength and power. Without this strength, the entire free world would lie nearly helpless in the face of Soviet-Communist power whenever the Soviets chose to employ it. It is proper that all who cherish freedom and independence, wherever they may be, should recognize the vital importance to the whole free world of this effort.

THE LONG-RANGE GOAL

Thus, there can be no doubt that the creation of adequate military strength within NATO remains, today, an urgent and almost overriding necessity. It might well be shown, however, that past concentration of effort in this direction, without effective attention to seemingly longer-term problems, is now resulting in 'actually slowing down the completion of this military task. If this be true, it is one of many proofs that the western world needs consciously to clarify, and establish the relation between, its short- and long-range objectives.

Informed persons speak of the bipolarized world of today. As though by implication, others less well informed draw a picture of a world divided into two sharply opposing and hostile armed camps—the Soviet bloc on one side and the "free world" on the other. Such a picture is dangerously false in many re-

spects, the more so because of the vast and important portions of the world, mostly in the so-called underdeveloped areas, where millions of persons and their governments want only to develop themselves peacefully in unprejudiced independence. Although freedom means much to them, there are some who wish, for varied reasons, to underestimate the threat of Communism, and who are hesitant to be counted with the West in openly opposing its spread. In only one sense is the oversimplified picture true, and that is in the Soviet-Communist sense. In Communist eyes one is either for them or against them; if not positively for them, one is an enemy, to be used perhaps, but eventually to be enslaved.

This should help to clarify some of the longer-term objectives both of the West and of the whole free world. True peace, security, and stability in the face of the many-faceted Soviet threat can be attained only on a world-wide basis and only when, at a minimum, an enervated and dwindling Soviet bloc has lost its ability and desire to expand by force, and common purpose throughout the free world has become stronger than the false universalisms of Communism. Therefore, it should be considered no end in itself for NATO to construct armed forces sufficient to deny the Atlantic community to Soviet aggression, even though this be a necessary prerequisite to greater success. The tide must also be stemmed and slowly turned, everywhere else; and this means strength, well-being, and the creation of a valid community of purpose within all the free world.

NATO, then, or the western civilization, or the nation-states of the West, have a twofold task. First is the present job of building a hard core of military strength as a shield for the free world. But the infinitely more difficult job is to fit the West into a greater and

more constructive order of affairs within which the underdeveloped countries can also accommodate themselves, and which can better meet the aspirations, allay the fears, and develop the physical and intangible potentials of all peoples not enslaved by Communism. If this can be done, or if even the *intention to do it* can be made manifest, a common purpose may be given to all the free world.

ECONOMIC FEAR

It is far easier to speak such pious truisms than to reduce them to practical application. To look towards some realistic possibilities of progress, it is necessary to examine specific problems and see what they imply. Take, for instance, some of those involved in the immediate and vital task of building NATO military strength.

Later this month, in Paris, the NATO Council will meet to conclude its "annual review" of progress and to set further goals for the military build-up. This annual review was originally scheduled for completion last November, but it bogged down last autumn and faces further difficulties at the coming meeting. There are many reasons for this—political, economic, and military—but it is no exaggeration to say that the basic trouble was, and is, economic uncertainty. There are political reasons, such as divergencies of view on the immediacy of the threat of Soviet aggression or on the wisdom of creating a European Defense Community. There are military reasons, mostly centering on whether or not it is necessary to build great "conventional" armies at enormous cost when perhaps new weapons involving atomic explosives will make profound changes in future warfare. Accepting the pertinency of such arguments, it remains true that many of the basic inhibitions to NATO agreement are economic. If resources were readily

available to meet the most pessimistic or the most demanding of military judgments, there would be far less argument. But these resources are not readily available.

Economic fear is the vulnerable point of the western alliance. We in America are hard put to comprehend how stultifying is the European's concern for his economic future, particularly when he views it in the context of today's economic nationalism. NATO is founded on the principle of the free association of sovereign, independent nation-states; yet there is not one of them—not even the United States—that is in fact economically independent. Recognizing this, but without seeing any other practical solution to the problems of national viability than the preservation of national economic entities, until slowly and perhaps miraculously some better way is found, the NATO governments are faced with a frustrating series of inconsistencies. Nowhere is this clearer than in the conscious or subconscious retention of the "economic spheres of influence" concept on the part of European states still endowed with dependencies.

REASONS FOR CONCERN

In arguing along these lines, no invincible criticism is intended. It is literally true that no feasible alternative to economic nationalism appears to present itself to the harassed governments of the economically interdependent European nation-states. On the one hand, they are faced by the threat of the unified, autarchic, and inimical supercontinental power of the Soviets—a threat which requires military strength-in-being in the West to counteract it, and greater economic strength to support the military strength. On the other hand, they are becoming increasingly dependent for raw materials and for markets on the vast underdeveloped

areas where anticolonialism and intense political and economic nationalism are growing and bid fair to break down international economic balances. It is understandable why economic fears are real factors inhibiting European governmental action.
