In the early phases of treatment, when small doses are being used, the pressure falls fairly steeply and rises again to the previous level within three to four hours. With larger doses, and usually when tolerance has developed, the maximum fall tends to occur later and to be maintained for a longer period—that is, the whole curve becomes more rounded and obtuse (Fig. 1, *a* and *b*). The similar differ-

ences in shape between the curves of plasma levels suggest that this alteration may be due largely to differences in rate of absorption with large doses.

Fig. 2 shows a typical example (Case 14) of the behaviour of the blood pressure during 14 months of treatment; data were not available for the early stages, but it will be seen

FIG. 2.—Blood-pressure response during fourteen months' treatment with hexamethonium (Case 14). The upright heavy lines show the range of pressure on the day of observation—that is, the reading taken immediately before a dose and that taken one hour afterwards; the mean for the day is taken as half-way between these two. The dotted line shows the percentage fall in the standing systolic pressure in each instance.

that after the first six weeks the response to the drug remained fairly uniform with some phasic variation from time to time. Similar behaviour was shown in all cases treated over any length of time. In Table III the blood-pressure averages before treatment are compared with the mean pressures at time of writing for 19 patients who had had regular treatment for more than three months.

TABLE III.—Falls in Mean Systolic and Mean Diastolic Blood Pressures in 19 Patients Treated for More than Three Months (the Readings in the Standing and Sitting Postures are Averaged.)

Case No.	Months on Treatment	Mean Systolic B.P. (mm. Hg)			Mean Diastolic B.P. (mm. Hg)

36	3	210	170	40	117	100	17

Reduction in mean systolic pressure ranged from 20 to 90 mm. Hg and in diastolic pressure from 8 to 40 mm. Hg. On the out-patient days the morning dose is often two to three hours late, so that the pre-injection reading is probably higher than usual. In addition, for at least one or two hours the pressure is much lower than the mean value, as can be seen from the diagrams, and this complete or almost complete relief of hypertension, for a short period twice or thrice during the 24 hours, may have a more important effect on the course of the disease than we can assess at present.

It has been our experience that most of the tolerance (see below) which develops does so during the first four to six weeks of treatment. There remain three types of variation in the response of the patient to a constant dose:

(1) Sudden exacerbations of hypertension with little or no response to the usual dose have often occurred. These were very temporary, and when the patient was seen again in a day or so the response had returned to its previous level.

FIG. 3.—Blood-pressure response during 16 months of treatment (Case 16). The exacerbation of symptoms with diminished response to the drug began after 10½ months and lasted for some weeks (see text).

(2) Occasionally more prolonged exacerbations with diminution of response have been encountered. The best example is shown in Fig. 3, and the case history is as follows:

Case 16.—A married woman, with severe hypertension following pre-eclampsia. The exacerbation which occurred after a period of domestic stress was accompanied by a return of severe and incapacitating headaches for one week, followed in a few days by development of homonymous hemianopia, which was probably due to a cortical thrombosis. It was necessary to increase the dose threefold in order to obtain a satisfactory lowering of pressure. However, after several weeks the condition showed a steady improvement, and it was necessary, because of excessive hypo-

tension, to reduce the dose again in stages to an amount just above that on which she had previously been stabilized for months.

(3) In addition there is a very definite increase in blood-pressure fall when other causes of peripheral vasodilatation are operating: hot weather, unwonted exercise, and especially a feverish illness have all been repeatedly observed to be associated with an extra and sometimes excessive fall in blood pressure. The splanchnic vasodilatation which follows a meal can have the same effect, and there have been many instances of a postprandial dip in the blood-pressure curve during a six-hour follow-up. On the other hand, in cold weather nearly all the patients have shown a lesser fall. Temporary adjustments in dosage have been necessary in these eventualities.

In the presence of fever about half the dose produced the usual effect. Diarrhoea and vomiting are other potent hypotensive agents, and some very great falls of blood pressure have been seen when their effect became added to that of hexamethonium; it was deemed advisable to omit the drug altogether until the initial acute phase of the disturbance had been overcome, and then to give only about one-third of the usual dose until the blood pressure regained its former height. In both febrile and gastro-intestinal upsets the lessened requirements of hexamethonium have extended beyond the duration of the acute illness by several days, a fact which may be at least partially explained by temporary sodium depletion.

Headaches

Of the 24 patients who received regular treatment, 19 complained of typical hypertensive headaches, which in 10 were very severe and often incapacitating. They were almost completely relieved in 15, and in the other 4 they were much lessened in frequency and severity. The patients were all quite satisfied that this symptom had been greatly ameliorated by treatment. There have been quite frequent examples of development of a headache when an injection has been delayed for test purposes and in such cases the headache lessened and disappeared in parallel with the fall in blood pressure. The only example of complete failure to relieve headache was in a patient with cerebral angiomas.

Central Nervous System (Apart from Headache)

Recurrent giddiness was a feature in 10 of the 24 cases, and in all it seems to have disappeared. Nine had suffered from encephalopathy before treatment, and it has shown no recurrence in eight and only a very minor recurrence in the ninth, over periods of three to sixteen months. One patient had a cerebral vascular accident with almost complete recovery before treatment, and suffered a recurrence of almost identical nature whilst on treatment, but this also largely cleared up; treatment was continued because of the generally poor outlook without it (he also has cardiac involvement), and there has been no further trouble for six months. Another patient, already mentioned, had a small occipital cortical vascular lesion during an exacerbation, but it was related to excessively high blood pressure and would possibly have been more serious in the absence of treatment.

Optic Fundus Changes

In every case of malignant hypertension, even in those dying while on treatment, the papilloedema diminished in a week or so; later the haemorrhages absorbed and the exudates showed progressive hardening, shrinking, and clearing over three to six months.

Case 28, who had the most severe retinopathy ever seen in this department, showed a remarkable improvement after six months' treatment (Fig. 4).

Cardiac Strain

Shortness of breath on exertion was present in 13 treated patients and in 12 it was accompanied by radiological evidence of cardiac enlargement or by the electrocardio-

FIG. 4.—Case 28. Diagram of fundus changes in a case of malignant hypertension (a) before treatment, (b) after four weeks' treatment (temporary worsening after initial improvement), (c) after ten weeks, and (d) after seven and a half months. P=papilloedema. V.A.=visual acuity.

graphic changes of hypertension. In the early months of treatment most of these patients reported much improvement, but two have developed a different type of dyspnoea related to changes in the lungs (see below), which is possibly a complication of long-term therapy.

Paroxysmal nocturnal dyspnoea had occurred in six patients, and three of them had frank congestive cardiac failure on admission; one of these died after three months (see above), three have had no recurrence, and the other two were freed of attacks but relapsed after discontinuing treatment; their cardiac failure again cleared up with combined hexamethonium and digitalis therapy.

In one case cardiac asthma was dramatically relieved by hexamethonium treatment alone—and relapsed as dramatically when the drug was temporarily discontinued. There was a direct correlation between the lowering of the blood pressure and the relief of dyspnoea.

In eight patients the cardiac volume was estimated before and after three to six months' treatment (method of Carl Eric Friedman, 1951). Two were within normal limits and remained so; the remainder were initially between 100 and 250 ml. per m.² body surface above normal, and four of

FIG. 5.—Improvement in electrocardiographic changes after 15 months' treatment with hexamethonium.

these showed a significant reduction in size—that is, more than 100 ml. per m.² after treatment.

Electrocardiographic changes were followed in 22 cases. Six were normal and showed no change after 4 to 15 months; six initially showed well-marked evidence of left ventricular hypertrophy with much improvement after 3 to 16 months (Fig. 5); seven showed initially great or moderate evidence of left ventricular hypertrophy and were unchanged after 1 to 12 months; and three showed moderate degrees of left ventricular hypertrophy, which was slightly greater after 3 to 15 months' treatment.

Renal Disease

Among the seven cases which had a normal blood urea before treatment there is no instance of a rise having occurred during the period of follow-up. Of the five cases which showed a raised blood urea before treatment, three have had no further rise, and in the two which have shown a slow rise over many months there has been no evidence that hexamethonium has accelerated the progress of renal disease. (Owing to slower excretion in the presence of renal impairment, injections in these cases were given only 12-hourly or even once daily.)

Treatment of Side-effects

If the disability becomes acute from any of these effects it can be relieved promptly and completely by omission of 12 to 24 hours' treatment (an advantage of first importance when comparing parenteral and oral routes of administration). Dryness of the mouth, dysphagia, difficulty of micturition, and to some extent the pupil changes are usually relieved by giving 25 to 50 mg. of the urethane of β -methylcholine ("mecothane") sublingually at the time of the injection. This drug does not seem to have much effect on the constipation, and purgatives of the phenolphthalein type or even regular omission of a dose twice weekly have been necessary in a number of patients. Bladder difficulties are relatively uncommon and are always lessened by emptying the bladder just before an injection.

Tolerance

This interesting phenomenon shows a remarkable difference in severity among different patients. All those who could be followed closely during the initial phases of treatment showed a definite diminution in response after the first test dose, but, in some, little further tolerance developed, and they were stabilized within a week or ten days and their blood pressure remained controlled at the same level of dosage for many months. At the other extreme were patients who developed rapid tolerance to the drug, which continued to increase for several weeks, but usually reached a maximum within about six to eight weeks of starting treatment and thereafter remained static; in a few patients a slow steady increase in tolerance was seen over many months. In several patients 300–450 mg. thrice daily was required to overcome the tolerance, and in one instance up to 600 mg. thrice daily has been used.

Fig. 6 shows the development of tolerance in a typical case. Each time the dose was raised a more satisfactory blood-pressure fall was obtained, but the effect fell away during the next two to three days. Between * and * in the figure two further increments of dosage had no beneficial effect for some reason which is not understood, but after three days there was a sudden return of sensitivity, and the behaviour of the blood pressure thereafter followed the pattern indicated. Towards the end of the third week the development of tolerance slowed down, and from the fifth week onwards the patient maintained a fairly uniform response to the same dose which has now been continued for five months.

All gradations between the two extremes have been seen among different individuals. The development of tolerance in this series showed no relation to the type of disease, to initial severity of the disease, or to initial sensitivity of the patient to a test dose.

In Fig. 1, b the plasma levels after a dose of 450 mg. can be compared with the effects on the blood pressure in a patient with a high degree of tolerance. The expected amount of hexamethonium excreted by the kidneys over the period can be calculated from the plasma levels and from the glomerular filtration rate. In this instance the patient would be expected to excrete about 430 mg. in the eight hours of the observation. This indicates that in the presence of full tolerance there is apparently no destruction of the drug in the body, although it is obvious that the degree of lowering of the blood pressure is greatly diminished in proportion to the high plasma levels, when this is compared

FIG. 6.—Development of tolerance to hexamethonium. Blood-pressure responses to increasing doses of the drug are shown. The heavy line indicates percentage fall in standing systolic pressure and the dotted line percentage fall in sitting systolic pressure. (Pupil changes are assessed on a points system: one point for partial and two points for complete interference with light reaction, for each hour of a four-hours observation period.)

with the effects on normals or in a patient just beginning treatment (Fig. 1, a).

Relationship of Tolerance to Pupil Changes

It was noticed during observation of a patient who was developing tolerance of the blood pressure to smaller doses of hexamethonium that no pupil changes were evident with a dose below 50 mg. When, however, the dose was increased to 75 mg. partial interference with pupillary function was seen, and this increased as the dose was raised, in spite of the fact that the effect on the blood pressure was lessening. The observation was extended to other patients, and in several cases in which the necessarily detailed data could be obtained it was shown that during the first few weeks pupil changes increased in proportion to the dose given and, having reached a maximum, remained maximal indefinitely. In contrast to this the blood-pressure response was showing the pattern already described (Fig. 6). The relationship between blood-pressure response, pupil changes, and dose is also shown in Fig. 6.

Although not lending themselves to the same easy observation as the pupils, the dryness of the mouth and the constipation, as judged by patients' complaints, showed very much the same increase in proportion to the dose of the drug as did the pupil changes.

When the 21 cases which have continued with regular treatment for more than three months are divided into groups according to their present (stabilization) dose, the average disability from side-effects (calculated from a points system) can be compared with the average fall in mean systolic and diastolic blood pressure. In short, the tolerance shown by the blood pressure does not apply to these parasympathetic effects of hexamethonium (Fig. 7).

In patients exhibiting tolerance, discontinuance of the drug for several weeks or even days was followed by an increased sensitivity, so that caution had to be used in restarting treatment if hypotensive collapse was to be avoided. However, the tolerance, which formerly took several weeks to reach a maximum, became re-established in several days and the patient again required the same high dose.

Pulmonary Complications

Since the completion of this study three patients have developed lung changes which may be a complication of long-term hexamethonium therapy. Initially all three had

FIG. 7.—Relationship of (a) blood-pressure fall and (b) side-effects to the stabilization dose of hexamethonium. Points were given as follows for side-effects—one for moderate degrees and two for severe degrees of mouth dryness, constipation, and interference with pupillary function—maximum six points; the averages for the dose group were then calculated.

malignant or pre-malignant hypertension, two had congestive heart failure, and the third was a chronic nephritic with raised blood urea (80 to 120 mg. per 100 ml.). Up to the time of development of the pulmonary changes they had been improving satisfactorily, radiological signs of cardiac failure had completely cleared, and they had returned to an active life. Dyspnoea then developed quite suddenly after fifteen, nine, and seven months' treatment; shortness of breath was pronounced on any exertion, but, in contrast to previous cardiac dyspnoea, it was relieved by lying flat.

X-ray examination showed bilateral symmetrical opacities in the lungs, in the upper zones and mid-zones. Multiple sputum examinations were negative. Because of these changes hexamethonium treatment was discontinued in these three patients, and a week later one of them died from a cerebral haemorrhage. Necropsy showed a central induration of both lungs due to extensive cornification, regarded as the result of organization of an intra-alveolar fibrinous exudate (preliminary report from Dr. Doniach). X-ray examination of the remaining patients in the series has not revealed any other examples of these changes.

Discussion

These cases were studied in more detail than is necessary for routine treatment; but it is evident that there are few short cuts if adequate control is to be maintained. Each patient must be stabilized individually, and there is no set formula for dosage or period of stay in hospital; the out-patient follow-up is time-consuming and really requires a special clinic. The necessary work can be tedious for both patient and doctor at times, but this has to be set against the fact that this form of therapy, when adequately carried out, is a real advance in the treatment of both malignant and complicated hypertension.

Little can be said yet about long-term results, but the recovery of four out of seven patients with malignant hypertension from acute and serious illness, and their return to a reasonably active life for periods of three, seven, nine, and fifteen months, compares favourably with previous experiences of such cases.

The complications encountered during this study have been of two kinds: the occurrence of cerebral vascular accidents in four patients who were liable to them in any case (and two of whom had had attacks prior to treatment), and the recent finding of dyspnoea and radiological lung changes in three cases.

In two out of four instances of cerebral vascular accident the blood pressure was known to be poorly controlled at the time and was almost certainly high when the incidents occurred; two of them made a functionally complete recovery.

The pathogenesis of the pulmonary changes referred to above is still obscure, and further work is in progress. There is no definite evidence that the changes are due directly to hexamethonium. Although these three patients required large doses of the drug, others who required as much or more have remained well. Regular chest x-ray examination and immediate attention to any complaint of increasing dyspnoea are certainly indicated in view of these developments, but, as stated, radiography of the remaining patients in the series has failed to show any instance of unsuspected lung disease.

Our feeling is that the risk of these complications should not be regarded as a contraindication to the use of hexamethonium in severely ill hypertensive patients, whose outlook in many cases is very poor. They can often be relieved of most of their symptoms and returned to a more active life.

In the less advanced but complicated cases it is quite clear that symptomatically there has been great amelioration, and most of the patients were able to lead practically normal lives, whereas they had often been incapacitated and

wretched because of recurrent headaches for long periods. To attribute the continued relief that has been attained in these cases merely to the placebo effect of injections must seem nonsensical to anyone who has had experience of trying to alleviate these headaches by multitherapy in the past. The fact that the headaches returned when the blood pressure got out of control, and were again relieved when control was re-established, is further evidence against this. Whatever may be said about relief of headache, placebos could hardly be credited with the reversal of fundus and electrocardiographic changes. In patients like Case 28 (Fig. 4) the restoration of vision alone constitutes a very great advance and must make any unpleasantness and inconvenience from treatment a minor consideration to the patient.

The blood-pressure falls shown in Table III may not at first sight appear very dramatic, particularly the diastolic readings; but when account is taken of the fact that these figures represent the estimated lowering in the average blood pressure for the whole day, and moreover that it has been maintained pretty consistently for months on end, it becomes easier to connect the improvement in symptoms and signs with the actual changes in blood pressure. As already mentioned, there is the additional factor of lowering of pressure to normal or near normal levels for one to two hours twice or thrice in the 24 hours, and this may perhaps be the more important of the two considerations. The fact that relief of both headache and cardiac asthma can be correlated with the fall in blood pressure to a more moderate level must subscribe to the rationale of hexamethonium treatment as a practical measure.

The treatment of chronic renal hypertension has been as satisfactory as that of the other groups, and there is no evidence of further impairment of renal function as a result of long-term therapy.

Indication has already been made of cases considered unsuitable for treatment. These are, in summary, (a) patients over 60 years, because they run a high risk of thrombotic accidents and also suffer more severely from side-effects; and (b) patients under 60 years who have insufficient symptoms or adverse physical signs to justify the disadvantages of treatment.

In a recent review of the pathogenesis of hypertension, Schroeder (1951) draws attention to the evidence that psychoneurogenic factors play an important part in the aetiology, both of essential and of other forms of hypertension; the evidence from this small series that emotional disturbances were not only associated with established hypertension but could actively exacerbate the process in all groups is in agreement with his views. The importance of giving this feature of the disease due consideration in the management has already been pleaded, and one could go further and say that failure of hexamethonium treatment is more likely to be due to psychological than to physical causes.

The finding that "tolerance," so far as the blood pressure was concerned, was not accompanied by similar lessening of parasympathetic effects has suggested that true tolerance to the drug, in the sense of loss of ganglion-blocking power, may not occur to any great degree and that the word is in fact a misnomer. If instead one postulates that for some reason, and in certain cases, the factors maintaining abnormal arteriolar tone are further increased during the evolution of tolerance, the emphasis is shifted from the drug to the disease. It is conceivable that this could be brought about by a large increase in the number of impulses traversing the sympathetic vasomotor pathways (with therapeutic doses ganglion block is probably never complete); or other factors—for example, humoral agents produced in the kidney and elsewhere—may increase in effectiveness. The increase in effect every time the dose is raised (Fig. 6) must be due to blocking of further impulses at ganglia, as this is the only way the drug acts, and therefore favours the former view, but it is possible that humoral factors are also

increased. No evidence has been obtained why this phenomenon is seen to such a varying degree in all clinical groups, or why there is a maximum level of tolerance for a particular patient.

Summary

A study is presented of 39 hypertensive patients on treatment with hexamethonium bromide by subcutaneous injection. The patients were drawn from the complicated-essential, malignant, or renal groups of hypertension, and uncomplicated cases were not included.

Details of treatment routine and general management are given, as it is felt that these are of great importance in the achievement of successful results.

Five patients died whilst on treatment and it was discontinued for various reasons in six others, but 28 patients received regular therapy for periods varying between three and fifteen months and were seen at least once a month in the out-patient clinic.

After the development of a very variable amount of tolerance to the drug during the first four to eight weeks, all patients were able to be stabilized on a dose which gave an average blood-pressure level much below that found in the control period. Reduction in mean systolic pressure ranged from 20 to 90 mm. Hg and in mean diastolic pressure from 8 to 40 mm. Hg, and the maximum reductions—for example, one to two hours after an injection—were often twice as great.

Hypertensive headaches (often very severe and incapacitating) were almost completely relieved in 15 out of 19 cases, and lessened in frequency and severity in the other four. Giddiness disappeared and encephalopathic attacks did not recur, except in one instance. Shortness of breath from cardiac causes was generally improved and in several cases there was striking relief from acute cardiac dyspnoea. Diminution in cardiac volume was demonstrated in five out of seven cases after three to six months' treatment, and in seven out of 16 cases electrocardiographic signs of left ventricular hypertrophy were altered towards the normal. Retinopathy was strikingly improved in all severe cases, papilloedema subsiding, and extensive exudates and haemorrhages becoming reabsorbed, with restoration of normal vision after about six months' treatment.

One instance of coronary thrombosis and two major and two minor cerebral vascular accidents occurred during treatment, but in two of the latter the blood pressure was high at the time. No evidence of increased damage was found among patients with impaired renal function.

A recent development has been the occurrence of dyspnoea and symmetrical opacities in the lung fields on x-ray examination in three patients after fifteen, nine, and seven months' successful treatment. The pathogenesis of this is still obscure.

Side-effects were troublesome in proportion to the size of the dose and thus most severe in the cases developing a higher degree of "tolerance." The problem of "tolerance" is discussed and some suggestions are made regarding its nature.

I should like to thank Professor J. McMichael for his help and advice in carrying out this study and in preparing the paper, also Dr. W. D. M. Paton for estimating the plasma levels, Dr. J. F. Goodwin for the E.C.G. reports, and Dr. R. E. Steiner for the cardiac volume estimations. My thanks are also due to Messrs. May and Baker Ltd. for supplies of the drug, for technical assistance, and for a grant towards the expenses of this investigation.

EFFECTS OF HEXAMETHONIUM ON NORMAL INDIVIDUALS IN RELATION TO ITS CONCENTRATION IN THE PLASMA

BY

BRENDA MORRISON, M.D.*

Research Assistant, Department of Medicine, Postgraduate
Medical School of London

AND

W. D. M. PATON, B.M.†

National Institute for Medical Research, Mill Hill,
London, N.W.7

Since hexamethonium was introduced as a ganglion-blocking agent (Paton and Zaimis, 1948) a number of publications have reported upon its effectiveness in the treatment of hypertension and certain other disorders; but, apart from the original observations of Organe, Paton, and Zaimis (1949) and reports by Arnold and Rosenheim (1949), Arnold, Goetz, and Rosenheim (1949), Burt and Graham (1950), and Grob and Harvey (1950) on the production of hypotension in the recurrent subject with marked fall in blood pressure on standing up, subsequent attention has been directed mainly to the effects of the drug in disease rather than in normal individuals.

Clinical experience with a series of hypertensive patients being treated with hexamethonium at Hammer-smith Hospital revealed very early that the reactions were of a most complex nature, and correspondingly difficult to interpret. We felt, therefore, that a further study of the actions of this agent in normal man was necessary.

Clinical Method

Eighteen observations were made on 16 normal young adult volunteers (4 women and 12 men). Since the best clinical results seem to be obtained from regular subcutaneous injections (Smirk and Alstad, 1951), we have given our test doses in this way. After control observations for 20 to 30 minutes, doses between 20 and 100 mg. of a 10% solution of hexamethonium bromide were given subcutaneously. In all but two this was the first dose of hexamethonium. Blood pressure, pulse rates,

*In receipt of a grant from Messrs. May and Baker Ltd.

†Now at University College Hospital Medical School, University Street, London, W.C.1.

systolic pressures was seen in the erect position (mean 28%), but in the sitting and recumbent positions the changes were generally insignificant (less than 10 mm. Hg).

3. *Pulse Rate.*—Pulse rates were counted in the first eight subjects, and in all these the rate rose as the blood pressure fell, but the magnitude of the rise showed too great an individual variation to be of use in assessing the effects of the drug. For this reason routine counting of pulse rate was discontinued in the later tests, but tachycardia was usually obvious except in the two cases of bradycardia already referred to.

4. *Subjective Effects.*—Faintness or lightheadedness on standing, sometimes with nausea or sinking feelings in the abdomen, was complained of when the blood pressure fell below 100 mm. Hg in 10 subjects, although these symptoms were not noted in two subjects until the pressure had reached 80 and 55 mm. Hg. In the remaining subjects the blood pressure never fell below 100 mm. Hg and only very transient giddiness, or nothing at all, was noticed. The rapidity of the fall in pressure as well as the actual level reached evidently contributed to the severity of the reaction, and sometimes the faintness passed off whilst the blood pressure was still at a level at which they had previously felt faint.

Four subjects commented on a feeling of warmth in the feet, though none observed it in the hands. One said that his feet felt full, and that they squelched when he stood up. Another experienced a feeling of warmth in the abdomen "like eating a hot meal." Dryness of the mouth of slight or moderate degree was mentioned by 13 subjects.

5. *Objective Effects.*—Pallor of the face was conspicuous in eight subjects during the period of low blood pressure, and occurred mainly in those showing the greater falls. Conjunctival injection was not systematically looked for, but it was sometimes obvious, and one man complained of itching of the eyes. In about half the cases drowsiness was evident to the observer, and was usually confirmed by the subject.

Ocular Changes

Table II summarizes the pupillary changes observed in the 18 tests. The results are arranged in ascending order of dosage. Fig. 5 shows the relationship of ocular changes and plasma concentration of hexamethonium in one of the subjects.

TABLE II.—Observed Effects of Hexamethonium on Pupillary Function in 18 Normal Individuals, Arranged in Ascending Order of Dose Given. The Figures After the Plus Signs Refer to the Times of Onset and Offset of the Change

Dose Given (mg. per litre E.C.F.)	Increase in Pupil Size		Interference with Light Reaction		Interference with Accommodation	
	Degree	Duration (Hours)	Degree	Duration (Hours)	Degree	Duration (Hours)

8.6	+	1-4	+	1-1	++	1-4

Pupil Size.—There was no increase in pupil size at doses less than 2.7 mg. per litre of E.C.F., but above this dose level the pupils always increased in size except in one test. No attempt has been made to assess differences in degree of this change, but the duration was generally longer with the higher doses. The widening of the pupil was never maximal and, moreover, the outline was sometimes irregular, suggesting the paralytic or "dead" pupil rather than the

FIG. 5.—Relationship of ocular changes to blood pressure fall and plasma hexamethonium levels in a subject who received 100 mg. subcutaneously.

actively dilated pupil of sympathetic stimulation; this probably indicates an interference with both sympathetic and parasympathetic ganglionic transmission.

Interference with Light Reaction.—This was assessed in three grades according to whether the reflex was perceptibly diminished (+), very sluggish (++), or abolished (+++). No interference was seen with doses below 2.35 mg. per litre; above this level there was a rather variable effect: four cases showed no change at 2.6, 3.9, 6.5, and 6.5 mg., but one at 2.7 mg. showed complete paralysis. In the remainder there was a general increase in the degree and duration of reduction of the light reflex in proportion to the dose. When the light reaction was partially paralysed the contraction was often ill-sustained, although the pupil did not undergo the repeated fluctuations of true hippus. Poorly sustained contraction may sometimes be seen in normal pupils, but is much commoner under the influence of hexamethonium.

Interference with Accommodation Reaction.—No change in accommodation was seen below 4.9 mg. per litre, with the exceptions of an unusually late effect in a one-eyed subject at 1.5 mg., and a slight very transient effect in a second subject at 2.7 mg. With doses above 4.9 mg. per litre there was consistent interference with or loss of accommodation for periods between one and four hours. As this reaction has a considerable voluntary component it is possible that the slighter degrees of ganglion block by hexamethonium may be compensated by increased effort on the part of the subject. The convergence of the eyeballs is quite unaffected.

Concentration of Hexamethonium in the Plasma

Fig. 3 showed a typical graph of the rise and fall of concentration of hexamethonium in the plasma after a subcutaneous injection. To show the extent of variation in shape of such curves they have all been superimposed (Fig. 6). Correction for dose and body weight has not been made, since this would alter the height but not the form of the curves. Fig. 7 shows the standing blood-pressure changes and plasma-concentration curve for the subject who showed the most rapid absorption.

The three phases of the curve—that is, the rise, the peak value, and the subsequent fall—considered pharmaco-

FIG. 6.—Plasma concentration curves from all eight subjects, superimposed to show differences in shape (not adjusted for body weight). Two received 50 mg. and six received 100 mg.

logically, correspond to the three factors determining the plasma levels—that is, the rate of absorption, the volume of body fluid in which the hexamethonium is dissolved, and its rate of excretion by the kidney. These three aspects are considered in turn.

Rate of Absorption.—The rate of absorption can be estimated from the speed with which the peak concentration is approached. The highest value was attained in approximately half an hour or less in all tests. In every test at least half the peak value, and often much more, was reached in 15 minutes. If absorption is an exponential process—that

is, if equal fractions of the unabsorbed residue are assimilated in equal times—then half the total dose must usually be absorbed in about 15 minutes. A few of the plasma curves have been regular enough to allow an estimate of the rate of excretion to be made, and hence an estimate of the amount left unabsorbed at various times. When this is done the absorption—that is, the fall in the amount still unabsorbed—follows the postulated exponential course. These considerations imply that absorption should be seven-eighths complete within about one hour in most individuals.

Distribution in the Body.—The

TABLE III.—Peak Plasma Levels Found in Each Subject with Dose of Hexamethonium Injected and the Weight of the Subject. Columns 5 and 6 Show the Estimated Volume of Solution of the Drug at the Peak Times in Litres and as a Percentage of Body Weight Respectively

Subject No.	Dose Given	Wt. of Subject	Peak Plasma Level	Calc. Vol.	% of Body Weight
1	100 mg.	58 kg.	10 mg./litre	10 litres	17.2
2	100 "	92 "	4.5 "	22 "	24.2
3	100 "	76 "	5.5 "	18.2 "	23.9
4	50 "	64 "	6.4 "	7.8 "	12.2
5	100 "	76 "	12.8 "	7.8 "	10.3
6	100 "	70 "	8.0 "	12.5 "	17.9
7	100 "	70 "	3.5 "	28.6 "	40.9
8	50 "	51 "	3.5 "	14.3 "	28.0

peak plasma values in each test are given in Table III. They correspond in magnitude to a distribution of the drug in a volume equivalent to between 10 and 41% of body weight. Of these values four lie within the 15–25% range (which appear to be the extreme values for extracellular fluid given in the literature), two lie above this (28% and 41%), and two below it (10.3% and 12.2%). The range and average (23.1%) of these figures suggest that hexamethonium is in fact dissolving in extracellular water. Incomplete distribution outside the vascular compartment and a variable rate of excretion would readily account for individual discrepancies.

Excretion.—It is already known that about 90% of a parenterally administered dose can be recovered from the urine during the subsequent 12 hours (Zaimis, 1950; Milne and Oleesky, 1951; Wien and Mason, 1951; Harrington, unpublished). We have calculated the expected clearance of hexamethonium by simple filtration in our subjects from the plasma-concentration curves, assuming that the glomerular filtration rate (G.F.R.) remains normal under the influence of the drug (Moyer and Mills, 1953) and has therefore a mean value of 125 ml. per minute (s.d.=25 ml. per minute). The periods of observation were four to six hours, by which time the plasma concentrations had sunk in five subjects to 1 µg. per ml. or less, and in the remainder were below 1.6 µg. per ml.

In Table IV the expected amounts excreted have been calculated first from the mean G.F.R. and secondly from the upper and lower limits of the G.F.R. (taking $\pm$ twice the

TABLE IV.—Expected Amounts of Hexamethonium Excreted Over Four to Six Hours by Simple Glomerular Filtration, as Calculated from Plasma-concentration Curves and Normal Range of Glomerular Filtration Rates

Subject	Expected Total Excreted (mg.)		Dose Injected (mg.)
	From Mean G.F.R.	From 2 x S.D. Range of G.F.R.

8	44	26–61	50
Average	95		88

standard deviation for this purpose). Although the dose given differs in some instances considerably from the former calculated value, in one case only does it fail to fall within the range of the expected excretion. These results are compatible with the excretion of hexamethonium by simple filtration without tubular excretion or reabsorption—that is, like inulin—and in this our findings agree with those of Young, de Wardener, and Miles (1951), who made a direct comparison of inulin and hexamethonium clearances.

Correlation of Clinical Data with the Concentration of Hexamethonium in the Plasma

Blood Pressure

It has already been mentioned that the degree of reduction of blood pressure runs parallel to the rise and fall of

hexamethonium in the plasma. In Figs. 3, 5, and 7 this parallelism can be seen for three types of curve, and the same relationship was found in the remaining tests. The maximum blood-pressure fall always coincided within a few minutes with the peak plasma concentration, and the blood pressure returned to the control value when the plasma concentration fell to about 2 $\mu\text{g. per ml.}$ (1–3.5 $\mu\text{g.}$). In no case was there a detectable fall in blood pressure with a plasma concentration of less than 1 $\mu\text{g. per ml.}$ No observations of blood pressure were made during the first 10 minutes after injection, so that the plasma levels at the onset of the blood-pressure falls are not accurately known.

To reduce the standing systolic blood pressure below 100 mm. Hg (which was the usual level at which faintness occurred in normal subjects), plasma concentrations varying from 2.5 to 7.8 $\mu\text{g. per ml.}$ were necessary in different individuals.

The variability of these responses led to a more detailed analysis of the individual tests. In Fig. 8 all the plasma concentration values obtained in each of five subjects are

FIG. 8.—Relationship of percentage fall in standing systolic blood pressure to different plasma levels of hexamethonium in five subjects. Although the relationship is a linear one for each individual, the sensitivity of the different individuals is very variable.

plotted against the corresponding reductions in standing systolic pressure, making no distinction between the rising and falling phases of the curves. This graph illustrates the point made earlier, that a definite threshold value of hexamethonium in the plasma (about 1 $\mu\text{g. per ml.}$) is necessary before detectable changes in blood pressure occur. For each individual there is a surprisingly close relationship between the plasma concentration and the effects on the blood pressure; this relationship is unusual in that the effect of the drug varies directly with its concentration in the body rather than with the logarithm of its concentration. This regular relation for an individual subject contrasts strongly with a considerable variation in sensitivity between different subjects, and the latter accounts for the wide scatter in response to a test dose already shown for the whole group (Fig. 4).

It is possible to obtain an index of sensitivity for each individual from the slopes of lines shown in Fig. 8; this index is expressed as fall in blood pressure per unit concentration of hexamethonium in plasma. For the five subjects of Fig. 8 this index is respectively 3.45, 8.5, 11, and 25% fall in standing systolic B.P. for each $\mu\text{g. per ml.}$ It follows from this that there exists in normal individuals a basic variation in sensitivity to hexamethonium over at least an eightfold range, quite apart from differences in absorption, distribution, and excretion, or liability to "vagal" attacks of the kind mentioned earlier.

Dryness of the Mouth

This effect of hexamethonium was noticed by six of the subjects at minimum plasma levels of 2, 2, 3, 3.5, 4, and 8 $\mu\text{g. per ml.}$ In the other two subjects it was not present, but in neither of these did the plasma concentration exceed 3.5 $\mu\text{g. per ml.}$

Ocular Changes

Table II showed the relationship between dose of hexamethonium and interference with pupillary function. In the eight subjects in whom plasma levels of hexamethonium were estimated a more direct comparison of these changes with concentration of the drug can be made.

Increased pupil size was seen with plasma levels above 1, 1, 1, 1.5, 2, 4, and 5.5 $\mu\text{g. per ml.}$ In one subject no increase was seen, although the peak plasma value was 12.8 $\mu\text{g. per ml.}$

Interference with light reaction was observed in five subjects at threshold values of 1.5, 1.5, 2, 5, and 8 $\mu\text{g. per ml.}$, but failed to occur in three subjects in which peak plasma levels of 5.5, 6.4, and 12.8 $\mu\text{g. per ml.}$ were reached.

Interference with accommodation was observed in seven subjects at plasma levels above 1, 1, 1.5, 1.5, 3, 4, and 5.5 $\mu\text{g. per ml.}$, but not in the eighth subject, whose peak value was 6.4 $\mu\text{g. per ml.}$

These results are ranked in order of magnitude, as the three pupillary functions seem to be affected independently of each other in the individual subject; on the other hand, the ranges of thresholds for interference with the three functions are similar.

Discussion

The effects of hexamethonium in normal man have been examined in some detail because this substance may be regarded as a prototype of the drugs which, by paralysing autonomic ganglia, are likely to prove useful in the treatment of hypertension and certain other disorders.

In this study no effects of hexamethonium have come to light which cannot be explained on the basis of blocking of either sympathetic or parasympathetic ganglia, with the possible exception of the drowsiness which occurs in many subjects.

Under the conditions of this study and with initial test doses of 25–100 mg., the ganglia which appear to be most prominently affected are those of the sympathetic chain, since the fall of blood pressure with postural accentuation has been the earliest and most constant finding. After these blood-pressure effects the detectable actions of next importance are on the ciliary and salivary ganglia. With the doses used there was no subjective evidence of significant interference with intestinal or bladder autonomic nerve supply.

It is interesting to find that in a particular subject the pupillary resting tone, reaction to light, and contraction on accommodation may be affected to different degrees by hexamethonium, and also that the order of onset of interference with these functions may vary with the individual. Such differences in behaviour between ganglia, and also apparently between different pathways within the same ganglion, are already known in the response to nicotine, hexamethonium, and other substances in animals. The interest of these variations lies in the hope they offer that other ganglion-blocking agents may be found which will have an action directed more specifically towards ganglion pathways subserving different functions—for example, those controlling vasomotor tone.

Postural hypotension with hexamethonium has been recognized from the earliest reports, and all our subjects showed this phenomenon. Although the maximum blood-pressure fall was always seen in the standing position, the falls in the sitting and recumbent positions ran a parallel time course in each case. When the average maximal depressions in blood pressure for the whole group are compared, the falls in the sitting positions are about half and those in the recumbent positions are about one-third of those in the

standing position. It is interesting that the hypotension in the sitting position is not greater, and, in fact, that the blood pressure rises promptly on sitting down.

A great deal of attention has been paid in these experiments to recording blood pressure in the erect posture, using a fixed time limit as described. Standing systolic readings have proved to be a convenient measure of the total effect of the drug on the blood pressure, since the changes in these readings are bigger in proportion to the errors of technique than in the sitting or recumbent positions, and, moreover, they provide an important measure of the maximum effect of the drug.

The distribution of hexamethonium in the body and its excretion at a rate comparable to that of inulin correspond to its quaternary nature. Bases in general penetrate the cell membrane only in the un-ionized form (Höber, 1945). Salts of quaternary nitrogen when in solution are completely ionized, and hence can only traverse the cell membranes very slowly. Accordingly they must lead an extracellular existence in the body, and should be unable to be either secreted or reabsorbed by the kidney tubules.

The indication from clinical data (Fig. 4) that normal subjects vary considerably in their response to hexamethonium was borne out and further elucidated by the plasma-concentration curves. Part of this variation is obviously due to the differences in absorption, distribution, and excretion already described; but the main variation, and one that cannot be eliminated by changing the route of administration, lies in the actual response of different subjects to the same concentration of the drug in the plasma (Fig. 6). The immediate practical application is that it is not safe to give initial doses of more than about 30–40 mg. subcutaneously to ambulant patients, even though this dose may produce little response in many individuals.

The somewhat unexpected finding of a linear rather than a logarithmic relationship between the plasma concentration and the effect on the blood pressure has some practical importance in addition to its theoretical interest; when treating patients for hypertension the dose should not be increased too rapidly. Increments of not more than 25–50 mg. should be used according to the individual patient's sensitivity.

The manner in which these findings in normal subjects may be applied to hypertensive patients under treatment is being studied and will be reported later.

Summary

A detailed study of the clinical effects of a subcutaneous test dose of hexamethonium in 16 normal individuals is reported, and plasma-concentration curves are described in eight of these.

No effects have been observed which could not be attributed to ganglionic block, with the possible exception of drowsiness.

Calculations from the concentration-time curves of hexamethonium in the plasma indicate that the drug is evenly distributed through the extracellular fluid, and they are compatible with its excretion by glomerular filtration.

Considerable variation in the response of different individuals to hexamethonium has been shown to occur, in relation both to the dose given per kilogram of body weight and to plasma levels. The thresholds for reduction of blood pressure, for elevation of pulse rate, and for interference with three separate pupillary functions varied from subject to subject, independently of each other.

For a given individual there was a close linear relationship between the plasma concentration and the degree of blood-pressure reduction.

We should like to thank Professor J. McMichael for his advice and helpful criticism in the carrying out of this work.

FARMER'S LUNG

BY

T. C. STUDDERT, M.D., M.R.C.P.

Assistant Physician, Cumberland Infirmary, Carlisle

A condition conveniently named "farmer's lung," readily recognized clinically and radiologically, has been reported in the medical literature in the past, but some confusion has existed about the causal mechanism and the natural history of the disease. The purpose of this paper is to review the literature, to present a small series of cases, and to advance a theory to explain its aetiology.

Review of the Literature

Campbell (1932) presented case histories of a small number of agricultural workers from North Westmorland who were referred to his clinic as possible cases of tuberculosis. All gave a history of sudden onset of intense breathlessness, cough, slight fever, and, in some, loss of weight following exposure to dust from mouldy hay.

The clinical picture in each case was of a distressed, blue, dyspnoeic patient, and clinical examination revealed widespread crepitations throughout the lungs. Radiologically the picture was of increased lung markings with superimposed soft shadows. Spontaneous recovery in one to two months occurred, but some residual fibrosis and emphysema were noted in a few cases. One patient subsequently died, but necropsy showed coincidental cystic disease of the lungs (Campbell, 1950—personal communication). Through the kindness of Dr. Campbell it has been possible to study the x-ray films of one of his original cases followed up for 18 years. Some fibrosis and emphysema were the only findings.

Fawcitt (1936, 1938, 1940) studied the condition in West Cumberland and concluded from culture of similar moulds in the sputum and the hay dust that this was a fungous infection of the bronchi and lungs. He used the term "bronchomycosis fenesciorum" and advocated treatment with iodides. It should be stated that the condition described by Campbell (1932) and that of many of Fawcitt's (1938) cases were clearly not true aspergillosis, which is a distinct and well described clinical entity (Sayers and Meriwether, 1932; Smith, 1947). "Thresher's lungs," if aspergillosis is excluded, is an analogous condition in workers exposed to mouldy corn dust, and presents a picture identical to farmer's lung.

Duncan (1945), in a review of fungous diseases, stated that he had received specimens of sputum relating to this disorder from physicians in rural areas stretching from Cumberland to Devon. He cultured many varieties of

fungus from the specimens, but came to the conclusion that this only indicated exposure of the patient to dust containing the relevant spores, and was no criterion of actual infection. He put forward a theory that the symptoms could be explained by an irritation of the lungs from a fine vegetable dust resulting from breakdown of hay fibres by the fungus, and that the disease was comparable to byssinosis.

The *Lancet* (1948) made a plea for further investigation of this and allied conditions, but the *British Medical Journal* (1950) still quoted the fungus theory and recommended iodide treatment.

Distribution and Frequency

The distribution of reported cases is of interest, as the condition appears to be most common in the North-West of England. Possible reasons for this are the high rainfall at hay-time, and primitive methods of harvesting and storage in closed barns. The old threshing barns with fixed installation are still in use, and many farmers remember cases of sudden death following acute chest symptoms in men working all day in some of the old ill-ventilated barns. Threshing engineers and farmers are familiar with the clinical picture of farmer's lung, and refer to being "moulded." The white irritant dust set up when mouldy hay is disturbed is locally referred to as "stour" and treated with respect. "Broken-windedness" in horses is attributed to the feeding of mouldy hay, and is largely prevented by dampening the hay before feeding.

The rarity of the disease in hospital practice was in contrast with the evidence of the farmers, and so it was decided to circularize the practitioners of the area asking for information. The response was excellent, and a clearer picture of its true distribution emerged. Family practitioners in the smaller market towns were quite conversant with both the clinical picture and the natural history of the disease, and could advise the farmer suffering from these symptoms of his probable progress and time off work. As there was no problem in their minds, these doctors did not, as a rule, refer their patients to hospital unless radiological confirmation was sought. It was from conversation with Dr. A. G. Abraham, of Cockermouth, Dr. E. Braithwaite, of Egremont, and Dr. H. P. Nelson, of Brampton, that many valuable facts about the disease were learned.

The present series consists of six cases—confirmed radiologically, and six probable cases—radiologically inconclusive.

Proved Cases

Case 1.—A farm labourer aged 22 had no history of chest trouble until January–March, 1950, when he had bouts of mild bronchitis, often following exposure to hay dust. On August 4 he worked all day stacking poor-quality hay from which there was a lot of white irritant dust. By evening he was distressed, coughing, and breathless. After a rigor he started to sweat, felt very feverish, and vomited. After six days of persistent breathlessness and distress, despite sulphonamide therapy, he was admitted to hospital. The clinical picture was that of a cyanosed, breathless, and ill man. Clubbing of the fingers was not noted, and chest examination revealed generalized fine crepitations, without any localized dullness or signs of consolidation. There was no evidence of cardiac enlargement or failure. An x-ray film of the chest taken on August 10 showed: "An overall opacity of both lung fields, excluding the apices and costophrenic angles, with the greatest density in the lower mid-fields, and extending to the extreme periphery of the lung. In the areas of least involvement the opacity fades to a

fine granular mottling. . . . The detail of the lung roots is almost completely obliterated. There is no pleural fluid, and no cardiac enlargement" (Figs. 1 and 2). The sputum was cultured and yielded a good growth of *Bacillus subtilis*, but no fungi. A differential white blood cell count showed

FIG. 1.—Case 1. X-ray film taken on August 10, 1950.

no eosinophilia. Dust from the barn grew *B. subtilis* and various aspergilli. Skin tests showed no specific reaction to dust extracts or mould cultures. Treatment with mepyramine maleate, 0.1 g. thrice daily, was instituted without obvious effect, but the patient gradually improved, and a follow-up x-ray film taken four months later showed normal lung fields.

Case 2.—A married woman aged 47 was admitted to hospital on December 17, 1947. She had been quite healthy until two weeks before admission, when she and her son (Case 3) swept out a closed barn in preparation for the storage of some newly threshed corn. She became very breathless that night, and symptoms persisted until she was admitted. She complained of slight fever, a dry cough, and intense breathlessness out of proportion to her other symptoms. On admission her temperature was 100.4° F. (38° C.), pulse 100, and respirations 56. There were widespread fine crepitations, maximal at the left apex, and an x-ray film showed: "An opacity mainly of the left upper zone, but, in lesser degree, of both lower zones. As in Case 1, the opacity extends to the periphery of the lung fields, and fades to fine mottling. The root shadows also show loss of detail, particularly the left." The white blood count was 7,200 per c.mm., with 4% eosinophilia, the sputum was

FIG. 2.—Enlarged view of part of Fig. 1.

mucopurulent, but yielded no significant organisms or fungi. She was treated with diphenhydramine hydrochloride, and improvement was gradual. On January 1, 1948, she was discharged home and continued to do well.

Case 3.—The son of Case 2, aged 24, was seen on December 17, 1947, as an out-patient, complaining of cough with mucopurulent sputum, nausea, night sweats, weight loss, and intense breathlessness. On examination he was cyanosed, with rapid respirations and generalized crepitations. An x-ray film of the chest showed: "A complete ground-glass opacity of all zones, extending to the periphery and showing the typical granular mottling in areas of least density. The detail of the root shadows in this case is not obliterated." He was not admitted to hospital, as the condition was recognized and progress at home was uneventful. Follow-up x-ray examination in 10 weeks showed almost complete clearing and he was clinically well.

Probable Cases

Case 4.—On October 13, 1950, a man aged 48 swept out his barn containing old corn and oats prior to threshing day. The dust was very irritant and white, and that evening he became breathless and ill. He had never had chest trouble before, but he described himself as being "broken-winded" and ill for the next month, with a dry cough and night sweats. He was referred as a possible case of tuberculosis and on December 13, but by then he felt better and clinical and radiological examination revealed only non-specific changes.

Other cases in this group gave a clear history of exposure, but could not be classed as definite without clear radiological confirmation. If practitioners become aware of the condition and refer such cases for early chest x-ray examination it is thought that many more cases will come to light.

Clinical Picture

The clinical picture emerges of a non-specific lung irritation which may follow exposure to mouldy vegetable dusts of any type, but mainly contact with poor-quality hay and corn. It may occur during stacking, baling, threshing, forking of hay for animal feeding, or sweeping out a barn in preparation for new grain or hay. Before the severe reaction there may be minor bronchitic episodes following short contact, but this is not invariable, and a clear distinction must be drawn between true farmer's lung and an asthmatic attack following exposure to mouldy dust (see Case 5).

The main feature of the disease is the intense breathlessness and cyanosis which develop within 12 hours of exposure. If symptoms are delayed for more than 24 hours an alternative diagnosis must be considered (see Case 6). The onset is sudden, and may be associated with a rigor, vomiting, a dry cough, and a feeling of suffocation. Irritation of the eyes and nose commonly occurs after contact with the dust, but is not a feature of the disease. The picture at this stage resembles that of a case of acute oedema of the lungs, but there is no evidence of cardiac embarrassment. Widespread fine crepitations are found on examination of the chest, but no localized area of consolidation is detected. Pleurisy is not a feature, and the finding of clinical or radiological evidence of this makes the diagnosis suspect. No case presented with haemoptysis.

The clinical course is fairly constant, and clearing of the radiological picture and physical signs is usual in six to eight weeks. After the first two to three weeks the breathlessness becomes less distressing, but during this period loss of weight and night sweats occur.

After three months the patient appears to be well, but there is a tendency for the condition to recur on re-exposure, and some evidence to suggest that there is a predisposition to the development of some degree of emphysema and fibrosis. No diminution in vital capacity has been noted in the follow-up of the present series over one to five years, but Dr. Campbell's case followed for 18 years showed some fibrosis and emphysema. Dr. W. G. Scott-Harden describes

the radiological picture in the acute phase as a ground-glass opacity extending to the periphery of the lung fields, and fading to a granular mottling in the areas of least involvement. Although the distribution is most commonly in the mid- and lower-lung fields, with the exclusion of the apices and costophrenic angles, this cannot be taken as invariable. Case 2 illustrates this point, and it is of interest that this patient is the only female in the series and to postulate the relationship between this and the greater frequency of thoracic, as opposed to abdominal, respiration in women. The detail of the root shadows is usually obliterated by the opacity, and return to normal lags behind peripheral clearing. There is no case in the series in which there were dense localized opacities in the lung or evidence of pleurisy, and there was no cardiac enlargement. Clearing is gradual, starting at the periphery, and is usually complete in three months.

Pathological Investigations.—The red blood cells and haemoglobin remain unchanged. The total and differential white-cell counts show no specific change, the maximum eosinophilia being 4% of 7,200 white cells per c.mm. in Case 2. The E.S.R. is normal or slightly raised.

Sputum examination in proved and probable cases yielded a mixed growth of aspergilli in five, penicillium in four, *B. subtilis* in four, and monilia in five cases, in addition to the usual commensals.

Examination of the incriminated dust showed a comparable growth of mixed fungi, but this similarity of cultural characteristics in dust and sputum was only taken as evidence that the patient had recently inhaled the dust, but not in any way as proof of active disease in the bronchi or lungs (see Cases 5 and 6). Assessment of average particle size of the dusts was found to present some difficulty, and is the subject of further investigation, but the impression gained from two samples was that the average diameter of particles was greater than 10 μ .

Animal experiments were carried out by Fawcitt (1938) on a limited scale in an attempt to demonstrate the pathogenicity of spore-laden dust to animals' lungs, without conclusive results.

Skin tests with extracts of the offending dusts and stock solutions of aspergillus, penicillium, and mucor were carried out without obtaining specific reactions in any case.

Differential Diagnosis

1. **Asthma and bronchitis** brought on by contact with mouldy hay or grain is not uncommon in farmers, and seven such cases were seen.

Case 5.—A farm worker aged 62 was seen on September 16, 1950. There was one year's history of dyspnoea and wheezing, made worse by working in a closed barn with poor-quality hay, but no single explosive episode of breathlessness. Examination of the chest revealed signs of chronic bronchitis, with dry rhonchi throughout the lungs, and x-ray films confirmed an emphysematous picture without specific changes. Culture of the sputum yielded a good growth of aspergillus and monilia. Dust from the barn showed aspergillus, monilia, and *B. subtilis*. Skin tests with dust extracts showed marked reaction.

The finding of mixed spores in the sputum of this group of cases was invariable and of no significance beyond demonstration of contact with a potential allergen.

2. **Coincidental Pneumonia.**—Most cases were initially treated as pneumonia by the general practitioner, and if any doubt exists this is a wise precaution. It would be a disservice to the farming community if the diagnosis of farmer's lung was made too lightly. The points to be stressed are the dramatic onset within a few hours of exposure, and the absence of signs of consolidation, pleurisy, or haemoptysis in farmer's lung; but confusion may arise in the case of virus pneumonia.

Case 6.—A farmer aged 42, whose previous health had been good, was working a baler and putting through poor-quality hay on February 6, 1952. He had no untoward symp-

toms until 48 hours later, when he felt feverish and breathless, and complained of left-sided chest pain. He was referred after two days as a possible case of farmer's lung. Clinically and radiologically there was evidence of a patchy virus pneumonia, and treatment with chloramphenicol produced a dramatic response. It was the time interval of two days, combined with the patchy radiological appearance, including a basal pleurisy, which made a diagnosis of farmer's lung untenable, despite the finding of aspergillus in the sputum. The risk of converting such a case into true aspergillosis by intensive treatment with chloramphenicol is appreciated.

3. *Miliary tuberculosis* is often clinically suspected, but the mistake can be made only if the history of exposure to dust has not been elicited: also the radiological features are quite different.

4. *Miliary diffuse granulomatous pneumonitis* of unknown aetiology has been reported in men cleaning out a water-tower in Cincinnati which was heavily contaminated with pigeon excreta (Felson *et al.*, 1950). Similar radiological appearances occurred in soldiers clearing out dusty barns in Missouri (Idstrom and Rosenberg, 1944); in soldiers spending some time in a deserted storm cellar in Oklahoma (Cain *et al.*, 1947); and in 21 men who visited a deserted chalk pit in Arkansas (Washburn *et al.*, 1948). All of these cases have been reported as specific entities, but it would appear that, with farmer's lung, they constitute a non-specific lung reaction to a variety of irritants. In each case clinical and radiological clearing occurred in one to twelve months.

5. *Aspergillosis* is an infection of the lungs with pathogenic strains of aspergillus, particularly *A. niger* and *A. fumigatus* Fisher, which may occur in grain handlers. It is a true fungous infection, with active branching hyphae in the sputum, severe illness, and dense infiltration or cavitation of the lungs. There is no spontaneous improvement when the case is removed from the source of infection. It is possible that it may present as a miliary lung picture without serious systemic upset, and proceed to scattered calcification, mainly at the lung bases (Sayers and Meriwether, 1932). Skin tests are variable. Confusion with farmer's lung is unlikely, provided that the finding of the spores of aspergillus in the sputum is taken at its true value.

Treatment

Treatment is largely symptomatic. Fawcitt (1936, 1938, 1940) advocated iodides, but his results differed little from the spontaneous clearing noted in untreated cases. Anti-histamine drugs have been used in this series without obvious effect, and antibiotics seem to have a limited value in preventing secondary infection.

As the initial condition has much in common with acute pulmonary oedema, mercurial diuretics may be tried, but in the absence of cardiac enlargement their value is doubtful.

Discussion

The currently quoted view that farmer's lung is an actual fungous infection of the lungs does not bear close examination. The explosive onset, spontaneous clearing, and radiological picture are totally unlike any true fungous disease, and no real evidence has been produced to support this theory. The silica content of vegetable dusts has been analysed with reference to hay dust (Fawcitt, 1936) and dust in cotton mills (Prausnitz, 1936) and found to be negligible, so this may be excluded as a possible factor. That the condition is not simply a severe asthmatic reaction is shown by the distinct clinical and radiological pattern, although it is possible that personal allergy may play a part.

The two remaining theories which explain most aspects of the disease are: (1) irritation of the lungs by fungus spores or some noxious breakdown product; and (2) a mechanical irritation of the lungs by a fine vegetable dust of sufficiently small average particle size to allow deep penetration: this dust may be formed from the action of the fungus on hay fibres, which subsequently disintegrate.

In examining these theories it was considered reasonable to compare the clinical picture of farmer's lung with diseases thought to fall within these two groups, and note points of similarity. Group 1: (a) coniosporiosis (Towey *et al.*, 1932); (b) weaver's cough (Collis, 1915); and (c) possibly the miliary granulomatous lung lesions already mentioned. Group 2: (a) byssinosis ("monday fever"); (b) bagassosis.

Group 1 (a) *Coniosporiosis*.—Towey *et al.* described this as a pneumonitis in lumbermen involving 10% of the men working on one camp as maple-bark strippers. The cork layer of the bark was heavily contaminated with the black spores of *Coniosporium corticale*, which rose in a cloud when the bark was stripped. The men became suddenly ill with severe dyspnoea, cough, cyanosis, and variable fever. Widespread crepitations were noted on examination of the chest, and x-ray films showed areas of soft infiltration, tending to spare the apices, with generalized increase of lung markings and reticulation. Spontaneous cure occurred in six to eight weeks, but recurrence of symptoms followed re-exposure. Sputum contained spores of *C. corticale* and mixed monilia, but the latter were non-pathogenic. Animal experiments with the black residue of the spores were not entirely convincing, but the extract caused toxic effects on guinea-pigs' lungs. The authors postulated an irritative lung lesion with local reaction and giant-cell formation, and regarded the two months needed for clinical clearing as a reflection of the time necessary for phagocytosis of the spores to be complete.

Group 1 (b) *Weaver's Cough*.—This is a comparable condition occurring in workers handling mildewed cotton, which gives off a white dust of aspergillus, penicillium, and mucor spores.

Group 2 (a) *Byssinosis*.—On beginning to work in the card-room of a cotton-mill a transient irritative cough known as "mill fever" used to be very common, but this cleared with continued exposure. After a variable time a certain number of workers developed a tendency to an irritant cough and attacks of breathlessness when returning to the mill after the weekend—hence the name of monday fever. At first the condition wore off on re-exposure, but gradually symptoms spread over the whole week, with severe disability. After a rest of weeks or months they felt quite fit, but return to the mill resulted in an overwhelming recrudescence of symptoms, and eventual disablement from byssinosis (Prausnitz, 1936). X-ray films showed non-specific fibrosis and emphysema. The cardroom dust was mainly less than 10 μ in average diameter, and this is regarded as the critical level for deep penetration of particles into the lung (National Silicosis Conference, 1937). In certain conditions the dust contained mixed fungus spores and minute amounts of histamine and a cotton-seed lipid called gossypol. The view generally held (Caminita *et al.*, 1947) is that monday fever and subsequent byssinosis may be due to sensitization of the lung tissues to irritation by proteins in the dust. Haworth and Macdonald (1937) postulated inhalation of histamine-allergen as the cause.

The clinical similarity of coniosporiosis, monday fever, and farmer's lung is striking, but the radiological analogy with byssinosis is less complete. Weaver's cough, however, again appears to be identical with farmer's lung, and I have reached the conclusion that all of these conditions represent a lung reaction to a non-specific irritant, probably some foreign protein. There is obviously some degree of personal sensitivity, as there may be only one case of farmer's lung in a group of farm workers handling the same batch of mouldy hay, or one case of coniosporiosis in a group of ten lumbermen. It is felt that no useful purpose is served in attempting to give specific names to the conditions, and that "hay-dust irritation of the lungs" would be an accurate description of some cases, and "corn dust," "cotton dust," or "coniosporium-spore dust" irritation of others.

Comparison of x-ray films of farmer's lung with other conditions is instructive, and there is a close resemblance to many diverse diseases, notably the "bat-wing" appearance of uraemic pneumonia. It seems probable that some similar interstitial lung reaction may play a part in the production of the radiological appearance of these conditions, however dissimilar their aetiological basis.

Further work on the nature of this reaction is necessary before any definite hypothesis can be advanced, and animal experiments on lung reactions to a variety of contaminated dusts may provide the answer. Lung puncture in the acute phase would also be enlightening, but could hardly be justified in a disease without any appreciable mortality. It is felt that, on clinical and radiological grounds alone, there

is enough evidence to support the theory that farmer's lung is not a specific entity, but only a single facet of a similar lung reaction to a variety of irritants.

Summary

A small series of cases of farmer's lung is described, stressing the acute onset and tendency to spontaneous recovery in six to eight weeks.

The close similarity to coniosporiosis, byssinosis, and diffuse granulomatous pneumonitis is stressed.

The theory is put forward that the condition is a non-specific interstitial lung reaction to some material in the fungus-laden dust, rather than a true fungous infection of the lungs.

My thanks are due to Dr. W. G. Scott-Harden for his advice on the radiological aspects of the paper, to Dr. J. M. Campbell for access to x-ray films of one of his original cases, to Dr. T. McL. Galloway for permission to include reports of Cases 2 and 3, to Dr. J. S. Faulds and his staff for pathological details, and to the general practitioners of Cumberland and Westmorland.

INTRACTABLE GASTRIC CRISES RELIEVED BY CHORDOTOMY

BY

G. O. MAYNE, M.B., D.P.H.

Venerologist, Edinburgh Royal Infirmary

Stokes (1944) states that the figures of the American Co-operative Clinical Group show that 45% of patients with tabetic gastric crises are completely relieved by treatment and that an additional 22% are benefited. He adds that standard chemotherapy—that is, neoparsphenamine plus bismuth—is more effective than fever plus tryparsamide or intraspinal methods, and that "the whole surgical field for relief in gastric crises is at best a matter of last and desperate resort." Moore (1941) believes that routine treatment will produce relief of symptoms in 25% of cases, that tryparsamide is of little value, and that the use of fever in addition will relieve a further 25%. Of the 50% of cases thus benefited, however, only 10% may be regarded as cured, and he quotes Keidel's opinion that "if, as rarely occurs, severe attacks are almost continuous, operation may be the only alternative to starvation, morphinism, or suicide." He also states that later experience with penicillin suggests that it is inferior to fever therapy in the treatment of this distressing condition (Moore, 1947).

The following history demonstrates the extent of the problem presented by those cases which do not respond to antisyphilitic treatment and emphasizes the additional fact that neurosyphilitic patients may suffer from unrelated organic intra-abdominal disease.

Case History

A seaman aged 37 was first seen in September, 1947, having had intermittent "stomach pains" and vomiting during the previous nine months. The pains occurred approximately every three weeks, were not related to meals, but were alleviated by alkaline powders. During these periodic episodes the pain was not constantly present, but came in sudden bouts, each lasting about 15 minutes and recurring at frequent though irregular intervals. The pain consisted of a sickening steady ache in the epigastrium, and was accompanied by retching and vomiting. In the previous nine months he had lost 2 st. (12.7 kg.) in weight, and at the time of examination he weighed 8 st. 2 lb. (51.7 kg.). He also complained of shooting pains in both legs of about one year's duration.

On full clinical examination no abnormalities were found except for Argyll Robertson pupils. Serological examination of the blood showed: Wassermann reaction, weak to moderately strong positive (+ to ++); quantitative, five doses of complement fixed; Kahn, strong positive (+++). The cerebrospinal fluid showed: cells, 200 per c.mm.; Wassermann reaction, very weak positive ($\pm$); gold sol, 0111000000.

Antisyphilitic treatment was begun with penicillin, but as the condition was strongly suggestive of either peptic ulceration or neoplasm an exploratory laparotomy was performed on October 3 (Professor W. Mercer). No abnormality was found, but the opportunity was taken to remove a small fibrosed appendix.

Treatment with penicillin (100,000 units three-hourly) was continued to a total of 12,000,000 units, and on October 17 he was discharged from hospital. Thereafter he continued to attend for treatment as an out-patient while following his usual occupation of trawlerman, although symptoms recurred at intervals despite continuous treatment with oxophenarsine hydrochloride, tryparsamide, and bismuth. The attacks were the same as those previously described, and lasted sometimes for several days.

Serological examination on June 12, 1948, showed much improvement—blood: Wassermann reaction, weak positive (+); quantitative, four doses of complement fixed; cerebrospinal fluid: cells, 5 per c.mm.; protein, 20 mg. per 100 ml.; globulin, no increase; Wassermann reaction, very weak positive ($\pm$); gold sol, 0000000000.

In September, 1948, the patient ceased to attend after having received a total of 12,000,000 units of penicillin, 0.88 g. of oxophenarsine hydrochloride, 39 g. of tryparsamide, and 4.1 g. of bismuth. Later it was learned that in October a recurrence of crises had necessitated his admission to a distant hospital, where he was treated with 16,100,000 units of penicillin, 34 ml. of bismuth tryparsamide, and one session of inductopyrexia—five and a half hours at 104–105° F. (40–40.6° C.).

Between January and June, 1949, he received no treatment, but on June 28 he was again in hospital in a state of extreme misery after further crises. Serological investigation of the blood on June 27 showed quantitative Wassermann reaction ++ (six doses). On July 21 the cerebrospinal fluid showed: cells, 4 per c.mm.; protein, 40 mg. per 100 ml.; globulin, no increase; Wassermann reaction, 0.2 ml. $\pm$; 0.5 ml. +; 1 ml. ++; gold sol, 0000000000. On this occasion treatment consisted of penicillin (100,000 units three-hourly) to a total of 12,000,000 units, malaria (seven rigors), intravenous glucose-saline, pethidine (2 ml. intramuscularly as required). He returned home on September 2, but was readmitted on two further occasions for short periods (October 19 and

November 14) and treated symptomatically with intravenous glucose-saline, pethidine, and morphine.

In February, 1950, he was again in hospital, after another crisis which had lasted one week. Examination of the cerebrospinal fluid on February 17 showed: cells, 1 per c.mm.; protein, 30 mg. per 100 ml.; globulin, no increase; Wassermann reaction, 0.2 ml. negative; 0.5 ml. negative; 1 ml. negative; gold sol, 0000000000. At this time a test meal demonstrated histamine-fast achlorhydria, and a positive benzidine reaction was obtained with each specimen withdrawn. Radiography after a barium meal revealed a filling defect on the lesser curvature of the stomach, the appearance being more suggestive of carcinoma than of a simple lesion; gastroscopy confirmed the presence of an outgrowth on the lesser curvature (Dr. D. M. F. Batty).

Accordingly a second laparotomy was performed on March 24 (Mr. J. S. Jeffrey), and a diffuse area of thickening was found in the stomach wall on the lesser curvature with no enlargement of the associated glands. The distal two-thirds of the stomach was resected and subsequent histological examination showed the presence of a well-differentiated adenocarcinoma, with no evidence of spread. During convalescence the patient experienced further smouldering episodes of epigastric pain and vomiting.

He returned to his previous occupation and remained well until the first week of August, when continuous acute upper abdominal pain returned. On August 11 he re-entered hospital, and a further barium-meal examination showed a possible stenosis of the stoma. It was feared that there had been an extension of the neoplastic process, and a third laparotomy was performed (Professor Mercer), but no abnormality was found.

During the subsequent period of convalescence the crises continued to occur and were treated with morphine or pethidine hypodermically; neither drug gave complete relief from pain. Examination of the cerebrospinal fluid on December 27 showed: cells, 2 per c.mm.; protein, 50 mg. per 100 ml.; Wassermann reaction, negative; gold sol, 0000000000.

Finally, on January 8, 1951, the patient was admitted to the department of surgical neurology, where after a preliminary period of observation a right antero-lateral chordotomy was done at C. 3-4 level (Mr. F. J. Gillingham). This resulted in loss of pain and temperature sensation below the level of C. 8 on the left side, light touch remaining unimpaired. Five weeks later he left hospital and, after a short convalescence, resumed his former employment as a deep-sea fisherman. On March 27 the blood Wassermann reaction and Kahn test were negative. Nine months later he stated that he had had no further symptoms and had "never felt better."

Summary

A case of tabetic gastric crises is described which exhibited the following noteworthy features: (1) The occurrence of Argyll Robertson pupils as the only clinical sign of neurosyphilis in a patient with severe gastric crises. (2) A tendency for the crises to become more frequent and incapacitating, although both blood and spinal fluid became ultimately normal during adequate antisyphilitic treatment. (3) Suspicions of organic intra-abdominal disease strong enough to lead to laparotomy on three occasions and the discovery of a gastric carcinoma in a very early stage at the second operation. (4) Cessation of crises following unilateral chordotomy.

I wish to thank Dr. R. C. L. Batchelor for permission to publish this case.

TOXIC EFFECTS OF PHENYLBUTAZONE

BY

J. R. NASSIM, B.M., F.R.C.P.

Physician, St. George's and the Royal National Orthopaedic
Hospitals, London

AND

THOMAS PILKINGTON, M.D., M.R.C.P.

Medical First Assistant, St. George's Hospital, London

Whilst the aetiology of rheumatoid arthritis remains an unsolved problem new therapeutic measures will constantly be tested for their power to alleviate its symptoms and in the hope of throwing some light on its causation. Phenylbutazone ("butazolidin") has lately been advocated as a drug which is likely to be a potent weapon in the treatment of rheumatic conditions (Currie, 1952).

Since the release of the drug for general use an increase in toxic reactions, occurring in from one-fifth to one-third of patients, has been reported (Loxton *et al.*, 1952; Kuzell *et al.*, 1952; Rhys Davies *et al.*, 1952; Cudkowicz and Jacobs, 1953). A warning of the dangers of its uncontrolled use was given by Hart and Johnson (1952). The principal untoward reactions are rashes, anorexia, nausea, abdominal pain, looseness of the stools, and reactivation of peptic ulcers with bleeding. As phenylbutazone is closely allied to amidopyrine chemically, it is not surprising that agranulocytosis, fatal in two instances, has been reported in several patients (*British Medical Journal*, 1952; Bershof and Oxman, 1953; Etess and Jacobson, 1953; Stifel and Burnheimer, 1953). Oedema due to sodium retention is a common but avoidable side-effect (Green and Williams, 1953).

Present Investigation

This paper is a record of our experiences with phenylbutazone during the past six months. The drug can be given either by mouth or by intramuscular injection, but as the majority of patients treated were out-patients the former route was usually employed. All patients were warned of possible side-effects and were asked to restrict their salt intake; those who gave a definite history of peptic ulceration or cardiovascular or renal disease were not treated with the drug. Three patients were suffering from diabetes, which was not affected by phenylbutazone.

The series consisted in 109 patients (79 women and 30 men), their ages ranging from 12 to 73 years (average age 49 years). Of these patients 86 suffered from rheumatoid arthritis, 19 from osteoarthritis, and 3 from gout. One patient had a ligamentous strain of the knee. In 18 patients phenylbutazone was combined with cortisone, but in only 4 was the effect good enough to allow the hormone to be completely withheld.

The drug was given to 102 patients by mouth in tablets containing 0.2 g. in daily doses ranging from 0.2 to 1.2 g. (average dose 0.6 g.). Seven received intramuscular injections of 1 g. on four alternate days, followed by weekly injections. All patients were seen first at weekly, then fortnightly, and, later, monthly intervals. A check was kept on the white blood count and the sedimentation rate.

Results

Symptomatically 59 patients were greatly improved by phenylbutazone, but in none was there any associated fall in the sedimentation rate. In 15 improvement was only slight, in 25 the drug had no beneficial effect, and in 10 toxic reactions occurred before any therapeutic effect could be noted.

Toxic side-reactions severe enough to necessitate stopping the drug occurred in 46 patients. The following reactions, usually in various combinations, were noted: (1) Twenty-one patients noticed severe anorexia and upper abdominal pain, one of these also having looseness of the bowels. (2) Seventeen complained of dryness of the mouth and throat, and were found to have redness of the anterior faucial pillars and uvula. Two of these had actual ulceration, which in one caused a submaxillary abscess requiring surgical drainage. Blood counts remained normal in this group. (3) Sixteen developed punctate erythematous rashes. (4) Two had enlargement of the glands in the posterior triangles of the neck. (5) One patient suffered from severe vertigo. (6) One developed granulopenia, recovering after the drug was withheld; white blood count 1,700, neutrophils 39%. The white count before treatment was 12,000, neutrophils 79%. Several patients showed a transient eosinophilia. (7) Three patients had exacerbations of the rheumatoid lesions of their hands.

Sodium retention was thought to be responsible for the slight gain in weight noticed in most patients, but only two developed pronounced oedema. This disappeared in one after salt restriction, which had not been carried out as requested, but persisted despite these measures in the other.

Response to Phenylbutazone Compared with Toxic Reactions

Response	No.	No. of Toxic Reactions Noted
<i>In All Patients Treated</i>		
Complete symptomatic relief	31	15
Marked	28	11
Analgesic effect, "similar to" aspirin	15	7
No symptomatic relief	25	3
Drug not given long enough to observe therapeutic effect	10	10
Total	109	46
<i>In Patients Suffering from Rheumatoid Arthritis</i>		
Complete symptomatic relief	28	14
Marked	20	8
Analgesic effect, "similar to" aspirin	11	6
No symptomatic relief	20	2
Drug not given long enough to observe therapeutic effect	7	7
Total	86	37

These reactions occurred on the average after three weeks, and in only two patients after three months. They were not related to dose or mode of administration, and promptly disappeared when the drug was omitted. A change from oral to parenteral therapy seemed to make no difference.

The most distressing aspect of phenylbutazone is apparent when its antirheumatic effects are compared with its toxic effects: the drug had to be withheld from nearly half the patients gaining most benefit from it, and those suffering from rheumatoid arthritis relapsed after its withdrawal (see Table).

Conclusion

Conclusion

We have found, as have most other authors, that phenylbutazone is a most effective weapon in combating the symptoms of rheumatoid arthritis and acute gout. However, it induced in nearly half of our patients toxic reactions severe enough to make further therapy dangerous. Nevertheless, its trial in chronic disabling conditions seems justifiable, since there are a large number of patients who derive benefit without toxic manifestations; scarce supplies of A.C.T.H. and cortisone may thus be conserved. It has recently been suggested that if used in doses not exceeding 0.4 g. every 1 to 10 days only transient rashes are likely to be encountered (Lawrence, 1953). This mode of administration certainly deserves further trial.

Summary

Summary
Phenylbutazone was given to 109 patients suffering from various rheumatic conditions. Forty-six patients suffered from toxic reactions. These occurred in nearly

half of those deriving great benefit. The diabetic condition of three patients receiving the drug was not affected by it. Its use is justifiable where careful and continuous control is possible.

TOXIC EFFECTS OF PHENYLBUTAZONE WITH SPECIAL REFERENCE TO DISORDERS OF THE BLOOD

BY

J. C. LEONARD, M.D.

(From the Ipswich Borough General Hospital)

During the past nine months many reports on the use of phenylbutazone ("butazolidin") in rheumatoid arthritis and allied diseases have appeared in the literature. The incidence and severity of toxic reactions have varied widely, as may be seen from the Table printed overleaf. Thus Peebles-Brown and Currie (1952) described only five toxic effects out of 280 patients (an incidence of 1.8%). On the other hand, Cudkowicz and Jacobs (1953) reported an incidence of 52%, and Stephens *et al.* (1952) one of 44%. Details of the 356 reactions in 1,526 patients have now been reported—an average incidence of 22%. This figure agrees closely with the estimate of Loxton *et al.* (1952).

The most frequent complications are by now well recognized. Oedema occurred in 84 patients; it is due to retention of sodium and water, and has often precipitated cardiac failure. Various gastro-intestinal symptoms (nausea, vomiting, diarrhoea, "gastritis") are also common, but rarely have serious consequences; more grave, however, is the reactivation of peptic ulcer (17 patients) and haematemesis and melaena (13 patients). The latter was the cause of death in one case reported in the *British Medical Journal* (1952). Jaundice has been recorded in six patients. Skin rashes are common (51 patients) and seem to be protean in variety. Miscellaneous effects include vertigo, euphoria, conjunctivitis, haematuria, albuminuria, "haemorrhagic myelitis," and stomatitis.

The effects on the blood seem to include depression of any or all of the cellular elements. Thus Stephens *et al.* (1952) reported a fall in haemoglobin of 1 g. per 100 ml. or more in 18 out of 188 patients, and a fall in the platelet count below 100,000 per c.mm. was even more common (31 patients). Eleven cases of frank agranulocytosis, with one death, have so far been recorded, and there have been several other cases of granulocytopenia.

The case histories of two patients are described below; the first developed aplastic anaemia, and the second agranulocytosis, during treatment with phenylbutazone. The former seems to be the first case of this complication described in the literature, if one excludes the case of Kuzell *et al.* (1952a); this patient was already suffering

from monocytic leukaemia, and was receiving x-ray therapy simultaneously with phenylbutazone. One month previously he had also been treated with amidopyrine. The cause of the anaemia is therefore doubtful.

Case 1

A 64-year-old woman was admitted on September 16, 1952. Four years previously myxoedema had been diagnosed, and since then she had received 2 gr. (0.13 g.) of thyroid extract daily. In April, 1952, she complained of stiffness and pain in the knees, hips, shoulders, and neck. She was otherwise well. On examination there was swelling and limitation of movement in the affected joints, and rheumatoid arthritis was diagnosed. There was no clinical evidence of myxoedema, and her pulse rate varied between 80 and 100. Her erythrocyte sedimentation rate (Wintrobe) was 40 mm., and a blood count showed: haemoglobin, 77% (11.1 g.); white cells, 6,800 (polymorphs 75%, lymphocytes 25%). The serum cholesterol was 191 mg. per 100 ml. From October 11 to 26 she was treated with A.C.T.H., a total of 0.82 g. being given. This produced a satisfactory remission, but she relapsed immediately the drug was stopped. The haemoglobin on October 13 was 65% (9.3 g.). On October 28 she began a course of gold, receiving 0.44 g. in all. This produced a rash, and in view of the absence of symptomatic improvement the drug was discontinued on November 28. The white-cell count on November 25 was 5,400 (polymorphs 69%, lymphocytes 31%) and the E.S.R. 24 mm. She was discharged on December 2. When seen in the out-patient department on January 6, 1953, there was no rash, and, apart from general stiffness, she was well.

From January 14 she received 0.6 g. of phenylbutazone daily for 14 days. During this time there was slight bleeding from the nose and mouth, and on January 21 her doctor noted a purpuric rash on the legs. This was not thought to be of serious import and phenylbutazone treatment was continued, with satisfactory relief of pain. On January 28 she was found to be severely anaemic and breathless, and was readmitted as an emergency.

On examination there was evidence of bleeding from the nose, and her sputum contained small amounts of blood. There was slight congestion of the neck veins, but no oedema. Her pulse rate was 120. Her heart sounds were normal and blood pressure 124/60. Her respirations were rapid and laboured; there were coarse rales and rhonchi throughout the chest. Multiple petechial haemorrhages were present all over the body. Examination of the blood showed: haemoglobin, 26% (3.8 g.); white cells 3,200 (polymorphs 75%, lymphocytes 25%). A diagnosis of anaemic heart failure was made, and she was treated with a slow intravenous transfusion of packed cells. She died suddenly 24 hours after admission.

At necropsy a diffuse subdural haemorrhage was present, completely lining the dura in a thin layer. The lungs were deeply congested and firm. On the cut surfaces there

were many nodular areas, due to diffuse haemorrhage. Multiple haemorrhages were present beneath the surface of the pericardium. The heart muscle was pale and flabby. The stomach showed small haemorrhages beneath the lining, and contained a small amount of blood. The liver was extremely pale and rather flabby. The spleen was slightly enlarged. The thyroid showed replacement by homogeneous white fibrous tissue. The bone marrow of the sternum showed considerable fatty change. At the upper end of the femur the bone marrow was partly fatty; elsewhere in the femur and in the tibia it was completely fatty.

Microscopical examination of the bone marrow from the upper end of the femur showed that cells of the erythropoietic and megakaryocyte series were entirely absent. There was also complete cessation of leucopoiesis apart from the presence of occasional myelocytes. Most of the sinuses were filled with plasma cells; these were mainly of large size, with fine cytoplasmic vacuolation. Binucleate forms were frequent. Occasional larger cell aggregates were seen; these consisted of plasma cells, with lymphocytes and reticulum cells.

Case 2

A man aged 53 had had moderately severe rheumatoid arthritis for 35 years. He was treated with phenylbutazone for six weeks; during the first week he received 1.6 g. daily, and thereafter 0.8 g. daily. After five weeks his white-cell count was 8,700 (polymorphs 55%, lymphocytes 44%, basophils 1%). One week later he complained of a sore throat and was admitted to hospital.

On examination he was not severely ill. His temperature was 101° F. (38.3° C.). His throat was reddened, but there were no palpable cervical lymph nodes. The typical deformities of rheumatoid arthritis were present in the hands and feet. Subcutaneous nodules were present over both olecranon processes and along the posterior borders of the ulnae. The left supratrochlear gland was palpable. Examination of the blood showed: haemoglobin, 100% (14.5 g.); white cells, 1,600 (polymorphs 34%, lymphocytes 47%, mononuclears 5%, eosinophils 7%, myeloblasts and myelocytes 5%, plasma cells 2%); platelets "plentiful." Phenylbutazone was stopped and he was treated with penicillin; he made an uneventful recovery. He had received no other drugs known to affect the bone marrow.

Discussion

Case 1 immediately poses the problem of whether gold or phenylbutazone was responsible for the aplastic anaemia. In 1948 Fitzpatrick and Schwartz reported that 20 cases of aplastic anaemia due to gold had been described in the literature; one of the cases did not develop the anaemia until five months after gold treatment was stopped (Aubert, 1946). When one recalls how widespread has been the employment of chrysotherapy, it is evident that the condition must be exceedingly rare. It is possible that gold

was the cause of the bone-marrow aplasia in the patient under discussion. On the other hand, the patient was perfectly well (apart from arthritis) until treatment with phenylbutazone was begun; within one week she had developed epistaxis and a purpuric rash; and within two weeks a fulminating aplastic anaemia had led to death. It seems, on the whole, more reasonable to incriminate phenylbutazone, though it might be that in some way the patient had become sensitized to phenylbutazone by the previous course of gold.

Two further possibilities should be mentioned: that hypothyroidism or rheumatoid arthritis may have influenced the structure of the bone marrow in this patient. In hypothyroidism, hypoplasia of the bone marrow occurs, but the anaemia is not usually severe. As this patient had been adequately treated with thyroid extract for four years there is no reason to suppose that her myxoedema would affect the bone marrow. As regards rheumatoid arthritis, Leitner (1949) states that "in all our cases of rheumatoid arthritis we have observed plasma-cell proliferation" in the bone marrow. He cites Mester (1938), who "collected 75 cases and found an increase of plasma and reticulum cells in acute and chronic rheumatoid arthritis." Some relative proliferation of plasma cells is sometimes seen in idiopathic aplastic anaemia, but not to the same extent as in this patient. Infiltration of the bone marrow with plasma cells is, of course, a feature of multiple myelomatosis, of which there was no clinical or pathological evidence here. The relationship, if any, between plasma-cell proliferation and phenylbutazone remains to be determined.

Are the toxic effects of phenylbutazone due mainly to overdosage or to idiosyncrasy? With this question in mind, an attempt has been made to correlate the frequency of toxic reactions with the dosage of the drug administered. It seems, however, that no such broad correlation can be established, and this may indicate that idiosyncrasy to the drug is the predominant factor. Thus, on a dosage of 1 g. daily, Cudkowicz and Jacobs (1953) reported toxic effects in 26 out of 50 patients, whereas Currie (1952) reported no toxic effects in 81 patients. Loxton *et al.* gave doses varying from 0.4 to 0.8 g. daily, and reported toxic effects at each level. Of the patients with agranulocytosis, three had never received more than 0.8 g. daily, whereas two had received 1.2 g. daily. Of the present cases, Case 1 received 0.6 g. daily, a dosage normally regarded as safe, and Case 2 received 1.6 g. daily for the first week and 0.8 g. thereafter. It thus appears from these cases that the administration of small doses of phenylbutazone does not eliminate the possibility of developing serious blood dyscrasias. The possible dangers of phenylbutazone therapy are increased by its effectiveness, which encourages its employment in general practice. It would seem that its use should be closely controlled by frequent blood counts, and that it should be confined at present to patients in hospital.

Summary

Details of 356 toxic effects occurring in 1,526 patients treated with phenylbutazone have been collected from the literature (an average incidence of 22%).

A fatal case of aplastic anaemia is reported. Though the patient had also been treated with gold, it is contended that phenylbutazone was probably responsible for the anaemia.

A case of agranulocytosis due to phenylbutazone is also described.

The incidence of toxic effects does not seem to be related to the dosage of phenylbutazone, as reactions commonly develop in patients treated with small doses. It is suggested that the use of the drug should be confined at present to patients in hospital.

I wish to thank Dr. Ronald Jones for his help, criticism, and encouragement in the preparation of this paper, and for permis-

sion to publish Case 1; Dr. J. W. Paulley for permission to publish Case 2; and Dr. Trevor Shaw, who performed the necropsy.

ETHOPROPAZINE HYDROCHLORIDE IN TREATMENT OF CEREBRAL PALSY

BY

R. G. MITCHELL, M.B., M.R.C.P.Ed., D.C.H.

(From the Westerlea School for Spastic Children,
Edinburgh)

The use of drugs plays only a small part in the treatment of cerebral palsy, and so varied are the conditions grouped under this comprehensive term that a single agent is unlikely to be of value in every case. Barbiturates, anticonvulsants, and the belladonna alkaloids are the only drugs in regular use, but reports on recently developed synthetic drugs hold out hope of more effective agents in the future. Jersild (1950) reported encouraging results in congenital spastic paralysis with the synthetic spasmolytic substance caramiphen hydrochloride ("parpanit"), while improvement has been noted in cerebral palsy treated with muscle-relaxants. Some of these, such as mephenesin, may establish a place in treatment (Berger and Schwartz, 1948), while the value of others, such as neostigmine, has not been confirmed (Perlstein and Barnett, 1950).

The beneficial effect of antihistaminic and related drugs in parkinsonism (Sigwald, 1949; Palmer and Gallagher, 1950) suggests their possible value in cerebral palsy, especially in cases in which extrapyramidal signs predominate. Opinions vary on the relative merits of these agents in the treatment of parkinsonism; Garai (1951) found that improvement with benzhexol hydrochloride ("artane") was greater than with ethopropazine ("lysivane"), whereas Gillhespy (1951) considered that ethopropazine was superior to all other drugs of this series.

Effron and Schultz (1951) reported that benzhexol hydrochloride was relatively ineffective in the treatment of eight patients with cerebral palsy. In the present investigation, ethopropazine was chosen because of the favourable impression created by the treatment of a few selected out-patients with this drug.

Details of the Investigation

The trial of ethopropazine was carried out at a residential school for children with cerebral palsy. The school is equipped with physiotherapy, occupational therapy, and speech therapy departments, all of which took part in the investigation.

Observers included under "Others" column: Bourne (1953), Crowther and Elgood (1952), Hinz *et al.* (1953), Kuzell and Schaffarick (1952), and Ross and Baldwin (1953).

The 19 children at the school comprised 6 with spastic tetraplegia, 4 with spastic paraplegia, 7 athetoid, and 2 ataxic, their ages ranging from 5 to 14 years. None of them was mentally retarded and all were moderately to severely handicapped. The children were arranged in pairs of approximately the same age and type of palsy, and were then divided into two groups without further selection. The groups were therefore comparable in age distribution and in type and degree of disability; one group was given ethopropazine and the other constituted a control group.

The trial was confined to school terms, since in the holidays the children return to their homes, making supervision impossible. When the children return to school after the holidays some are usually found to have regressed slightly, so that the trial was not begun until three weeks after the beginning of term, to allow for the expected improvement. This left a period of about seven weeks for the trial, and it was decided to give the drug for four weeks in order to assess the child's performance before treatment and to ensure supervision for a week after stopping the drug, in case of possible withdrawal effects. Although four weeks is not a long period, it was thought to be long enough for any improvement to be evident.

The trial was divided into two parts, the 10 spastic children being tested in the first term and the 9 athetoid and ataxic children in the second term. This division was necessary because of the time involved in carrying out accurate tests, which imposed considerable extra demands on the staff of the school.

Dosage of Ethopropazine.—The ethopropazine was supplied in 10-mg. sugar-coated tablets, and the control tablets were identical in appearance but contained lactose. The tablets were administered in four divided doses during the day, each child in the control group receiving the same number of tablets as his equal in the trial group. In the first half of the trial the starting dose was 20 to 30 mg. daily, depending on age, and the dose was increased by 10 to 20 mg. a day at intervals of four days, until a maximum of 100 to 150 mg. daily was reached. In the second half of the trial the starting dose was 30 to 50 mg. daily, and the dose was increased by 20 to 30 mg. a day at intervals of four days, to a maximum of 200 to 250 mg. daily.

Methods of Assessment

Once a week, on the same day each week, the children's progress was assessed, using a number of tests designed to measure different activities. The time taken for each test was measured in seconds with a stop-watch, the final figure being the mean of at least three attempts. The tests used were as follows:

A tests measured ability to relax—for example, the time for which the child could maintain his lips together or could lie still without moving.

B tests measured balance—for example, the time for which the child could hold his head steady or could stand on one leg.

C tests measured active movement—for example, the speed of rising from supine to sitting or standing positions, or the time taken to flex and extend the elbow a given number of times.

D tests measured manual dexterity—for example, the time taken to transfer articles from one container to another, or to take out and replace pegs on a board.

E tests measured speed of rolling—for example, the time taken to roll a measured distance on the floor.

Every child was tested in at least three activities, and, although the tests were adapted to suit the individual child, each performed the same tests each week and did not carry them out at other times during the week.

Speech records were made before the beginning of the trial and again when the children were receiving the maximum dose. The school teachers were also asked to note any changes in ability in the class-room, and the children were under constant supervision by the resident nursing sister. The sister was the only person in the school who knew which children were receiving ethopropazine and which the control tablets.

Results

The results of the trial are presented in the accompanying table. A child's performance for each activity in which he was tested was recorded as having improved or as showing no change. An improvement was regarded as having taken place if either of two criteria was satisfied: (1) if progressive and uninterrupted improvement occurred while the child was receiving the tablets; or (2) if the mean performance during the trial period was at least 100% better than the mean performance when no tablets were being given.

Only one child, No. 3 in the table, improved in all tests. This was a girl of 13 years with severe spastic tetraplegia, and the improvement was maintained permanently after completion of the trial, so that it is difficult to attribute it to the ethopropazine. An assessment of improvement based on the total number of tests performed shows that 23.3% improvement occurred in the trial group and 22.2% improvement in the control group. When the different

Totals of 27 tests on 9 patients		6 (22.2%)	21 (77.8%)

types of cerebral palsy are considered, no consistent improvement in one type or in one activity is found, though the numbers in each group are too small for definite conclusions to be drawn.

The speech records made before and during the trial were carefully compared; two of the ethopropazine group and three of the control group were regarded as having improved slightly. The school teachers noted no unusual improvement in ability in any of the children.

Toxic Effects of Ethopropazine.—In the first half of the trial no toxic effects were noted. In the second half three children, aged 8½, 8, and 7 years, became rather drowsy and listless when a daily dosage of 140, 120, and 140 mg. respectively was reached. In none of these children were the symptoms severe enough to necessitate withdrawal of the drug. Total and differential leucocyte counts were carried out before and at intervals during the administration of the tablets. In no case did a significant reduction in the number of leucocytes occur. On completion of the trial, administration of the drug was stopped abruptly. None of the children showed symptoms of withdrawal except for one boy who developed severe constipation, which might possibly have been due to withdrawal. The three children who showed toxic symptoms became normally alert within 48 hours of stopping the drug.

Summary and Conclusions

The results of a trial of ethopropazine in the treatment of cerebral palsy are recorded. Ten children with various types of cerebral palsy were given ethopropazine and a comparable group of nine children received lactose control tablets.

There was an improvement of 23.3% in the children treated with ethopropazine, but a similar improvement occurred in those who received only lactose tablets. No evidence of a special effect of ethopropazine on any type of cerebral palsy or on any specific ability was obtained. It is therefore concluded that ethopropazine is of no value in the treatment of cerebral palsy.

This trial was carried out under the auspices of the Scottish Council for the Care of Spastics. I wish to thank the staff of Westerlea School for their willing co-operation and Messrs. May and Baker Ltd. for generously supplying the lysivane.

ADRENALINE NECROSIS

BY

G. LESLIE, M.D.

Senior Registrar, Department of Dermatology, Royal Infirmary, Glasgow

AND

D. MCPHEE, M.D., B.Sc.

Tissue necrosis due to adrenaline injections is a rare occurrence when it is considered how often the drug is administered.

Urbach (1936) reported a case in which multiple areas of skin necrosis followed the self-administration of adrenaline by a female patient who suffered from severe bronchial asthma. To gain relief she often gave herself "intention tremor" at the time of injection, which often took as long as fifteen minutes to complete. When the injection was given to the patient he was unable to get the slightest reaction in the skin. Again, when the patient herself administered an injection of normal saline there were no visible changes in the skin. In this way it was shown that the damage produced by the adrenaline injections was not due solely to mechanical irritation. Urbach concluded that the trauma caused by the "intention tremor" combined with the constriction of the blood vessels, due to the adrenaline, produced a necrosis of the superficial skin.

Necrosis of the tips of two fingers of the hand of a patient operated upon for Dupuytren's contracture was noted by Hanke (1936). The local analgesic used was a 1% procaine-adrenaline solution, the adrenaline being added in the correct dosage just before the injection. He thought that the explanation of this was that the anaesthetic fluid had acted over a prolonged period on the tissue devitalized by the gradual contraction of the palmar aponeurosis which is a feature of the disease.

The most recent case of tissue damage due to the self-administration of adrenaline was reported by Robertson (1951). In his case the tissue reaction was that of keloid formation, which was presumably a personal skin characteristic and due to trauma with a hypodermic needle.

Delaunay *et al.* (1948) conducted a series of experiments, injecting adrenaline in various strengths (1,000 µg., 200 µg., 100 µg., 50 µg., 33 µg., 25 µg., 20 µg., and 10 µg.) under the skin of the abdomen of guinea-pigs. The stronger solutions (1,000–25 µg.) produced changes in the skin visible to the naked eye. With the weaker solutions reactions were noted microscopically. These workers think that adrenaline is not directly toxic to tissues, but that adrenaline necrosis arises rather from various vascular disturbances. They suggest that both vasomotor upsets and disturbance of the permeability of the vessels play a part by interfering with the oxygen supply to the tissues and by inhibiting the diapedesis of polymorphs.

Because of the seeming rarity of skin reactions to the repeated use of adrenaline, and because trauma has apparently played some part in the causation of the cases reported, it was thought that the following case was worth recording.

Case Report

A joiner aged 35 developed asthma at the age of 14, and, after prolonged treatment with various remedies, he obtained relief only from injections of adrenaline. About five years ago his attacks became more frequent and severe, totally incapacitating him, and he found it necessary to give himself adrenaline by injection (1 ml. of 1/1,000 three or four times daily). He became so dependent upon the adrenaline that he administered it as a routine in anticipation of an asthmatic attack. These injections continued for two and a half years without any noticeable cutaneous reaction, the dose remaining the same. He first noticed, at the site of injection, a small red swelling which was painless and did not itch. The surface of the swelling then broke down and a necrotic central patch developed. A black eschar was eventually sloughed and a shallow ulcer remained. This sequence of events took seven to ten days. The ulcer healed slowly, leaving a foveated scar, which later became livid.

In spite of these reactions he continued to give himself the injections, in the same dose, for a further period of two and a half years, at which time he was seen by one of us (D. McP.).

On examination his appearance was startling. His buttocks, thighs, arms, and shoulders were covered by a multitude of active, healing, and healed necrotic areas of almost uniform size and shape. He was beginning to run short of accessible parts on the limbs and was encroaching on the chest (see Fig.). Until the onset of the skin reactions the right and left arms had been used alternately for the injection.

Photograph showing active, healing, and healed necrotic areas.

tions. His general condition was good and nothing abnormal was detected in any of the vital systems. During a series of readings the blood pressure remained in the region of 127/80.

Comment

Trauma does not seem to have played any part in the causation of the skin reactions in this case. The injections were administered for two and a half years without any visible skin change, and while, so far as the arms are concerned, trauma from repeated injections could have been a causative factor, this cannot be said of the new areas of skin used after the onset of the cutaneous reactions, as necrotic lesions developed on these even after the first injection into them, and continued to develop after each fresh injection until all accessible areas on the limbs had been exhausted and encroachment on to the chest wall had begun. This would suggest that the patient had developed a specific sensitivity to adrenaline, localized to the area of injection and affecting the blood vessels. This is in accord with Delaunay *et al.*, who considered, from their experimental work with guinea-pigs, that the skin reactions were of an allergic nature.

Summary

A case of necrosis of the skin after prolonged self-administration of adrenaline by injection, in an asthmatic patient, is described.

Trauma, which was a possible causative factor in some of the cases reported, did not seem to play a part in this case.

It is suggested that an allergy to adrenaline developed after repeated injections over a long period and that this is in accord with the experimental findings of Delaunay *et al.*

Medical Memorandum

Torsion of a Mesenteric Lymphatic Cyst

Intra-abdominal lymphangiomas or lymphatic cysts seem to occur most commonly in the great omentum, and it is extremely rare for them to develop in the mesentery (Macnab and Menzies, 1950). As they are usually discovered accidentally during an exploratory laparotomy, the following case is of interest.

CASE REPORT

Abdominal pain began at 3.30 p.m. on October 2, 1951, in a boy aged 3½ years. After a normal bowel action the pain disappeared, but it came back at 8 o'clock the same evening. The child cried throughout the night and complained of pain in the abdomen and back, and said that he could not sit up in bed. He did not vomit but his appetite was poor. He also complained of pain in the abdomen while passing urine, and, although this was clear, his mother noticed that it had a strong odour.

The child was admitted to hospital at 2 p.m. on October 3 and was obviously ill. His temperature was 100.4° F. (38° C.), pulse rate 140, and respirations 28. Abdominal examination revealed some tenderness and rigidity on the right side, mainly below the umbilicus. The tongue was coated and a little "smelly." Rectal examination revealed some tenderness on the right side of the pelvis. The heart, lungs, and nervous system showed no abnormality, and the urine was normal. The history and physical signs at this stage suggested an acute appendicitis. A few hours later the abdomen became completely rigid on both sides, more so below the umbilicus, and a laparotomy was decided upon.

Operation.—As soon as the child was under the anaesthetic a swelling in the abdomen was visible to the naked eye. This was about 3 in. (7.5 cm.) in diameter, was hard, and was freely movable in all directions. Its position was approximately central in the abdomen, and a hand could be placed beneath it above the symphysis pubis. A right paramedian incision was made and the peritoneum was opened. A small amount of serous effusion was found, together with clots of fibrinous exudate, which appeared to be mainly present on the common and external iliac vessels on the right side. The appendix appeared normal. The swelling was seen in the hypogastrium and looked tense and purplish in colour, and on its delivery through the wound it underwent a spontaneous untwisting. It appeared to be a multilocular cyst in the mesentery of the ileum, approximately 2 ft. (60 cm.) from the ileo-caecal junction. The cyst was in actual contact with the intestinal wall, enveloping the ileum on three sides in a U-shaped manner. It did not extend into the retroperitoneal tissues, nor was there any evidence of communication between it and the mucous lining of the intestine. The locules intercommunicated, and contained a blood-stained clearish fluid, together with blood clots and flakes of fibrin; the walls of the cyst except those adjacent to the ileum were excised, and the cut edges of the mesentery brought together with interrupted catgut sutures. There was no evidence of intestinal obstruction, the colour of the ileum improving after the untwisting.

A course of "distaquine" penicillin and "cremomera-zine" was given, the clips being removed on the fifth day, and the child began to take a normal diet. Recovery continued uninterrupted.

The section showed a cyst wall composed of fibro-elastic tissue and lined by a single layer of flat endothelium. The wall showed congestion, degeneration, and polymorphonuclear and round-cell infiltration. The pathologist stated that the appearance was that of a strangulated lymphatic cyst of the mesentery.

COMMENT

Considering the clinical aspects of mesenteric cysts as a whole, Aird (1950) states that usually the only sign is that of a floating abdominal tumour, which is painless unless the cysts become infected from the bowel, when they lose their mobility and adopt the features of a well-localized abdominal abscess. In this case there was no infection, and the tumour was not palpable before the anaesthetic was given. Macnab and Menzies (1950) say that these cysts do not produce a constant clinical picture. They may present as an abdominal catastrophe, as in this case. Severe pain, vomiting, and abdominal rigidity may predominate, or there may be just an ill-defined malaise. The history of each case seems to be determined by the complications which have occurred. One-third of the cases produced intestinal obstruction (Waters, 1946). The cysts may undergo torsion, as in this case, or produce an intestinal volvulus. They may rupture into the peritoneal cavity and simulate acute peritonitis, or ruptured tubal gestation in women. They may become infected and present as an acute appendicitis or diverticulitis.

Regarding their aetiology, Lord Moynihan (1897) stated that they were simple dilatations of lymphatic vessels. Illingworth and Dick (1949) favour the view that they are dilatations of lymph vascular networks present in embryonic life, like cystic hygroma in the neck.

My thanks are due to Mr. P. H. Merlin, consultant surgeon, for permission to publish this case.

Reviews

CORTISONE AND A.C.T.H.

Cortisone and A.C.T.H. in *Clinical Practice*. Under the general Editorship of W. S. C. Copeman, O.B.E., M.D., F.R.C.P. With foreword by Lord Horder, G.C.V.O., M.D., F.R.C.P. (Pp. 255; 35 illustrations. £1 5s.) London: Butterworth and Co. 1953.

In the four years which have passed since Hench and his colleagues of the Mayo Clinic discovered the dramatic effects of cortisone in rheumatoid arthritis, verdicts on its ultimate role in therapy have ranged from "elixir vitae" to "glorified aspirin." In this book seven distinguished British authorities, who have had special opportunities for the clinical investigation of cortisone and A.C.T.H., record their own experiences and present a sober appraisal of the writings of others. Each article bears a personal stamp and reveals how the initial unrestrained enthusiasms have been tempered by time and experience.

The rheumatic and collagen diseases are discussed by Oswald Savage and W. S. C. Copeman, diseases of the eye by Mary Savory and Arnold Sorsby, endocrine disorders and respiratory and allergic diseases by F. Dudley Hart, and skin diseases by G. B. Mitchell-Heggs, and diseases of the haemopoietic system by J. W. Stewart.

The specific value of these hormones in the diagnosis and treatment of both primary and secondary adrenal insufficiency is illustrated by a wealth of clinical material, and the important part played by cortisone in the post-operative care of bilateral adrenalectomy for such conditions as hypertension and basophilism is established. All authors emphasize that, apart from substitution therapy, these cortisone and A.C.T.H. are not curative; that these hormones do not replace, but where helpful are complementary to, established therapeutic measures; that the individual response is very variable; and that before these drugs are exhibited the possible therapeutic benefits must be carefully weighed against the gravity and severity of potential toxic and withdrawal symptoms.

In a few diseases—for example, disseminated lupus erythematosus and pemphigus—cortisone may be a life-erythematosus and pemphigus—cortisone may be a life-saving or life-prolonging measure. In conditions of limited duration, such as iridocyclitis, it may abort or control the inflammatory process in such a way that grave risks to vision may be circumvented. In others it relieves immediate discomforts, as in some allergic states; while in yet others it preserves function and avoids crippling, as in rheumatoid arthritis. In rheumatic fever its value is still in doubt. In the vast majority of diseased states cortisone is without significant effect. In some indeed it aggravates the pathological process—for example, by disseminating tuberculosis or by the perforation of a peptic or colitic ulcer.

There is a brief but adequate account of the physiology and pharmacology of cortisone and A.C.T.H. and of the gaps in our understanding of many fundamental aspects of their mode of action. But this is essentially a clinical manual and the emphasis throughout is on practical rather than theoretical problems. The bibliography is extensive, well chosen, and up to date, and careful editing has avoided undue overlap. In short, this book provides an accurate, informed, concise, and lucid survey of current opinions on the value and limitations of cortisone and A.C.T.H. therapy. There is, however, a major lapse which, while not detracting from the technical merits of the book, grieves the literary purist. The quotation attributed to Alexander Pope on the verso of the preface reads:

Be not the first to cast the old aside,
Nor yet the first by whom the new is tried.

But Pope wrote in his *Essay on Criticism*:
Be not the first by whom the new are tried,
Nor yet the last to lay the old aside.

And most of us will prefer the original.
HENRY COHEN.

TEXTBOOK OF PAEDIATRICS

Pédiatrie. Volumes I and II. By Robert Debré and Marcel Lelong. (Pp. 2,260; 388 figures. 14,500 francs.) Paris: Les Editions Médicales Flammarion. 1952.

This massive two-volume work is the latest of the series of publications under the general editorship of Dr. Valléry-Radot which are arranged on the loose-leaf system for annual revision. The two editors, Professors Debré and Lelong, are both paediatricians of international repute, and they have the assistance of 38 contributors. Unfortunately, the individual contributors responsible for the different sections remain unknown, for the editors have modified each chapter so as to provide uniformity of style and teaching to fit in with their plans. The work is up to date and well presented. The paper and printing are excellent, and the books make easy reading. The illustrations, photographic, radiological, and tabular, are magnificent, being well chosen and perfectly reproduced. Each volume has a table of contents, but the index is in Volume II only. The attachment of the pages to the covers is inadequate for such heavy books, and it is to be hoped that the binding system may be improved at the next printing.

As might be expected, eponyms abound. More than 160 eponymous diseases are listed in the index—most of them French. Acute rheumatism, for example, is referred to as Bouillard's disease, rheumatic nodules are Meynet's nodules, erythema marginatum is Besnier's erythema, and chorea becomes "la danse de Saint-Guy." The sections on tuberculosis and the cardiovascular system in Volume I and on the blood and haematopoietic organs in Volume II are outstanding. Treatment advised is not always in accord with generally accepted principles. Rectal administration of sodium salicylate in milk is unlikely to be widely used in the treatment of rheumatism, nor is a fixation abscess the treatment of choice in acute encephalitis. The strict dietetic restriction in acute nephritis, in vogue in 1826, is still recommended, and venesection is advised for convulsions in this disease. The modern conception of coeliac disease is not discussed, and no reference is made to the work of Frazer, Sheldon, and Dicke in this field. Von Jaksch's anaemia and Hanot's cirrhosis still find a place, though they have disappeared from most other modern paediatric textbooks. It is a pity that the exanthemata are excluded, for they are essentially paediatric, but they have already been covered in another volume in the same series.

For the postgraduate student of paediatrics and for the general practitioner this work is a distinct asset, and if the annual supplements for insertion maintain the standard set in these initial volumes their value will be enhanced still further.

WILFRID GAISFORD.

MICROSCOPY

Handbook of Basic Microtechnique. By Peter Gray, Ph.D., D.I.C. (Pp. 141; 57 figures. 12s. 6d.) London: Constable and Co. 1953.

Lecture Notes on the Use of the Microscope. By R. Barer, M.C., M.A., B.Sc., M.B., B.S. (Pp. 76; 8 figures. 6s.) Oxford: Blackwell Scientific Publications. 1953.

Dr. Gray's book sets out the fundamentals of histological technique for university students and laboratory technicians, especially in zoology and botany. Part I is a general account of the materials and processes of slide-making. Its various chapters are on apparatus, fixatives, stains, dehydrating and clearing agents, mounting media, wholemounts, smears, sections, and the cleaning, labelling, and storing of slides. Part II—the last third of the book—consists of fifteen specific examples of slide-making, which collectively form a complete introductory course in plant and animal microtechnique. The author's policy was to select a few well-tried methods and reagents from the many available and to describe them in detail; alternative methods are to be given in the author's larger reference work on *Microtechnique*.

CHILD CARE

Child Care and Management: From Pre-Natal Days to Adolescence. By Patricia Edge. (Pp. 497. £1 10s.) London: Faber and Faber. 1953.

This is quite one of the best books I have read on the care of children and the help that can be given to them in preparation for adult life. It is well written in an attractive, sincere style, and the author gives sound advice on most of the questions that parents may find some difficulty in answering. The first section is on the health and hygiene of the expectant mother, and gives useful information about preparing for the baby's arrival. Subsequent sections deal with the first two years of life, the pre-school years, and then school life and adolescence. The author covers diet, hygiene, physical and mental health, and all the essential aspects of child health; in addition there are sensible discussions on such topics as homework and examinations, pocket money, hobbies, and punishments and rewards. The section on adolescence is full of wisdom and is presented in just the right form, without any unnecessary emotional colouring.

Later in the book there are sections on emotional development and character training, recreation, sickness in the home, and on choosing a career. These headings will give some idea of the breadth of the book, and the information is of the detailed kind that gives just the practical help that parents so often need. For instance, there are the addresses of appropriate organizations that may be approached in regard to the different types of career, with the approximate cost of training and so forth.

In the next edition I would like to see more specific advice about the type of cod-liver oil (p. 71) that should be given to infants, because there is a real danger of giving insufficient vitamin D; and Dr. Gesell's name is incorrectly spelt on pages 117 and 118.

This book is well worthy of recommendation.

NORMAN B. CAPON.

The second edition has now appeared of *Problems of Fertility in General Practice* by Mr. John Stallworthy, Mr. Kenneth Walker, Dr. Joan Malleson, and Dr. Margaret Jackson (Cassell, 18s. 6d.). The first part is on the investigation and treatment of sterility, the second on clinical contraception, and the third on genetical problems in general practice. In *To Define True Madness* Dr. Henry Yellowlees discusses many psychiatric problems in a form intended to appeal to the educated layman. His observations on medico-legal psychiatry would be of interest to medical as well as lay readers. The book is published by Sidgwick and Jackson for 12s. 6d. The authors of *Food Sense* describe for housewives and others the principles of sound diet, discussing in straightforward language such topics as cleanliness in preparing food, special diet in illness, and the constituents of food. Written by Dr. S. S. B. Gilder, Mr. G. M. Chapel, and Miss Louise Davies, the book is published by Ward Lock and Co. for 15s.

New editions of two well-known dictionaries have recently appeared—namely, *Black's Medical Dictionary* in its 21st edition, and *A Dictionary of Scientific Terms* in its 5th edition. New material has been added to "Black's" to bring it up to date, while pruning here and there has kept it within reasonable bounds. The dictionary had been completely revised in its previous edition, which appeared two years ago. It is published by Adam and Charles Black for 30s. The *Dictionary of Scientific Terms*, revised by Dr. J. H. Kenneth, Ph.D., covers the biological sciences and is complementary to a purely medical dictionary such as "Black's." It is published by Oliver and Boyd for 32s.

That excellent annual publication the *Commonwealth Universities Yearbook* has now appeared in its 30th edition. It gives detailed information about staff, organization, and arrangements for study and leisure in all universities in the British Commonwealth. It is published for the Association of Universities of the British Commonwealth by G. Bell and Sons, Ltd., for £3 3s. *Alumni Cantabrigienses*, Part II, Volume V, compiled by J. A. Venn, gives biographical details of all known students, graduates, and holders of office at the University of Cambridge from 1752 to 1900. The alphabetical list of names treated is Pace-Spyers. It is published by the Cambridge University Press for £10 10s.

The instructions for section-cutting would interest technicians in anatomy, pathology, and bacteriology, but the material, methods, and reagents are those of the zoologist and botanist. The author is obviously a stylist as well as a scholar, for the book is most elegantly written.

Dr. Barer's book, despite its modest title, is a miniature treatise on the microscope—its structure, theory, use, and maintenance. A description of the microscope is followed by an illustrated account of the formation of the image, and careful explanations of such concepts as numerical aperture, resolving power, visibility, and contrast. Objectives, condensers, and eye-pieces are next considered, and there is an interesting account of various ways of getting a desired magnification. The second half of the book deals with the use of the microscope, methods of illumination, the care and cleaning of the microscope, and hints on a variety of practical problems. The book ends with suggestions for further reading, and appendices on experiments with the microscope and on special microscope lamps.

The book is thus wider in scope than the excellent but more strictly practical pamphlets issued by microscope makers, and contains all that the ordinary microscopist need know. The book would interest not only its intended audience—university students and senior schoolchildren—but also research workers, apprentice designers, and technicians responsible for the routine care or professional servicing of microscopes.

RAYMOND WHITEHEAD.

MALTHUS READ AGAIN

The Malthusian Population Theory. By G. F. McCleary. (Pp. 191. 15s.) London: Faber and Faber. 1953.

To the average layman and to many doctors the word "Malthusian" brings to mind lectures on "family limitation" and price-lists in plain envelopes. It is many years since a manufacturer of "specialties" perpetuated a common error by attaching the name to one of his products. In fact, in 1798 when the Rev. Thomas Robert Malthus published his *Essay on the Principle of Population* contraception was ineffective in practice and the prerogative almost solely of loose women and French aristocrats. It formed no part of his thesis and he condemned it as unnatural and vicious, a view he held to the end of his days. Among more widely read people, including reputable specialists in economics, he is equally misunderstood and misquoted as a gloomy prophet who saw in the amelioration of social conditions after the French Revolution a vision of an unchecked and idle population outgrowing its food supply. In fact he never set up as a prophet at all but was one of the first men to apply the objective methods of science to the description of existing trends in human communities.

Dr. McCleary, with his pioneer experience of problems of social welfare, and himself a demographer, sets out to remind us of what Malthus really said and of the historical and philosophical background of his theories. To this he adds an appraisal of their application at the present time notable for its clarity and humour and the absence of either medical or sociological jargon.

When he went down from Cambridge Malthus said of himself, "I had not acquired that command over my understanding which would enable me to believe what I wished without evidence," and he proceeded without rancour to take to pieces the theoretical Utopias of Condorcet and Godwin which were being hailed in England at the time and regarded as just round the corner. His originality is perhaps indicated by the fact that Darwin wrote that he was first moved to think of natural selection after reading the *Essay*. Those of us who have subscribed to some of the many misapprehensions about Malthus's theories perhaps owe it to him to reorient ourselves with the aid of this most readable and timely book.

ALEXANDER KENNEDY.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JUNE 13 1953

PROGNOSIS AND TREATMENT OF
HYPERTENSION

Essential hypertension is a progressive disease, and its variable rate of progression makes the prognosis in any individual case a difficult problem. In cases of severe hypertension with a diastolic pressure of over 130 mm. Hg the blood-pressure level itself will indicate a bad prognosis, but in the much commoner less severe cases the degree and rate of progression of the secondary cardiovascular, retinal, and renal changes are more helpful in deciding the prognosis than the level of blood pressure, to which too much attention is perhaps apt to be paid. In those cases with no evidence of myocardial damage, clinical or electrocardiographic, and only minimal retinal changes, the disease follows a benign course even if symptoms such as severe headache are present, and most of these patients will be alive at 65.¹ A faster deterioration is indicated by advanced retinal changes, cardiac enlargement, an electrocardiogram showing left ventricular hypertrophy or strain, or signs of previous cerebral accidents, and Hammarström and Bechgaard² found that only 38% of their male patients would survive for five years and only 13% for ten years; the corresponding figures for women were 70% and 45%. The presence of papilloedema and retinal exudates indicates a bad prognosis, fewer than one-fifth of patients of both sexes being alive after five years.

Leishman³ concluded that the stage which the hypertensive disease had reached could be best judged by the presence or absence of four clinical features—advanced retinal changes, albuminuria in excess of a trace, cardiac enlargement, and abnormality of the electrocardiogram. Malignant hypertension, whether the hypertension is primarily "essential" or renal in origin, is characterized clinically by papilloedema with a high diastolic pressure and pathologically by the presence of acute arteriolar necroses. Pickering⁴ has suggested that these arteriolar lesions are the consequence of the hypertension, and it has been shown that if the blood pressure can be lowered significantly the malignant phase of hypertension, whether essential or renal in origin, may be converted into the benign one with

retrogression of the retinal changes, improvement in the electrocardiogram, and presumed healing of the arteriolar necroses, with a considerable improvement in the survival rate. Good results have been reported from treatment with hexamethonium or the rice or low-sodium diets, and from surgical treatment such as sympathectomy, removal of a phaeochromocytoma or non-functioning kidney, or adrenalectomy. Morrissey, Brookes, and Cooke⁵ reported a striking increase in survival time after sympathectomy in cases of malignant or progressive hypertension, and pointed out that marked subjective and objective improvement may sometimes be seen even if the blood pressure does not fall much after operation.

In the opening pages of the *Journal* this week Dr. Brenda Morrison reports her results in a similar series of patients treated with parenteral hexamethonium. Five of her thirty-nine patients died during treatment, in four it was deliberately discontinued, six gave up treatment, and twenty-four continued with regular treatment. The results in this last group are impressive, for many were severely ill and steady deterioration would have been expected. Eighteen of the twenty-four patients treated for from three to fifteen months were able to lead practically normal lives, and the remainder were all much improved. A significant fall in both systolic and diastolic pressures was obtained, the degree of papilloedema diminished rapidly in every case of malignant hypertension, the electrocardiogram and signs of congestive failure were improved, and headaches usually disappeared. It is too soon to assess the effect of this form of treatment on survival time, particularly in view of the late occurrence of unusual pulmonary changes, but the immediate results are excellent.

The difficulties of hexamethonium treatment are well illustrated in this paper and in the accompanying one written in conjunction with Dr. W. D. M. Paton. A close study of these papers should discourage the indiscriminate or casual use of these drugs. Control of blood pressure with oral hexamethonium is unsatisfactory in most cases, and oral treatment might well be reserved for those cases with severe headache but without objective evidence of vascular degeneration in the hope that later remission of this symptom might occur. Morrison, and also Smirk and Alstad,⁶ have shown that adequate control of blood pressure even in severe cases can be obtained with parenteral hexamethonium, but the difficulties in controlling this

method of treatment with a potentially dangerous drug are such as to limit its general use. The variable response to the initial doses and the development of tolerance necessitate close observation during the early stages, and the treatment demands a degree of co-operation by the patient for an indefinite period which will not often be easy to obtain. When secondary vascular changes have occurred and steady deterioration is to be expected, inadequate medical treatment will be disastrous, and then sympathectomy with its known good results in this type of case will probably be the treatment of choice for most of such patients. The use of parenteral hexamethonium as pre-operative preparation for surgery has been insufficiently explored, but it might well be that two to three months' intensive treatment on the lines described by Morrison followed by sympathectomy would give results better than with either method used alone.

The use of the ganglion-blocking drugs such as hexamethonium in the treatment of hypertension has stimulated the search for other drugs which will avoid the obvious difficulties and disadvantages of hexamethonium treatment, and it is to be hoped that an efficient oral preparation will become available. Meanwhile it is well to remember that cases of malignant or rapidly progressive hypertension form a very small proportion of the total hypertensive population, and it is only for these relatively few patients that drastic medical or surgical treatment is indicated.

DISEASE, RACE, AND CIVILIZATION

Medicine as it is known and taught to-day is largely concerned with disease in the civilized white man. When the world is considered as a whole the white men are a minority group, and civilized man is a recent phenomenon in history. The study of little-known races living in primitive environments in medically unexplored territory can be expected to reveal new manifestations of disease, if not new diseases, which may well prove important in the general advance of medical knowledge. Further study of the differences in the incidence of appendicitis in different West Indian island populations,¹ for instance, might clarify the aetiology of this condition. It is especially important that such work should be done now, since primitive ways of life and even the people themselves are in danger of dying out.

Structural differences between peoples probably play some part in determining the racial incidence of disease. Thus the tendency of the Negro to develop umbilical hernia has been ascribed to the frequency among negroes of the "skin" type of umbilicus with

a tubular projection of the peritoneum into the umbilical cord.² The wide nasal cavities of negroid and mongoloid peoples seem to be associated with a diminished incidence of infective and obstructive diseases of the ears, nose, and throat. Racial variations in the anatomy of the teeth³ and of the mastoid process influence surgical methods. The pigmented skin of the Negro protects him from the effects of the sun's rays in causing sunburn and skin cancer, which is common in albino Negroes.

The racial incidence of disease is sometimes due to quite simple genetic differences between peoples. This is the case in haemolytic disease of the newborn, which does not occur in those Oriental people who are entirely Rhesus-positive, and also in Cooley's anaemia and sickle-cell anaemia.⁴ Variations in susceptibility between races are found in many other diseases, but whether they are due to genetic or environmental causes remains obscure. Primitive communities from four continents have been found to be almost completely free from hypertension, for instance, the blood pressure remaining stationary or falling with advancing age.⁵

Racial variations in neoplastic disease lie mainly in the frequency of different types of tumour. Quaint habits, such as smoking cigars with the burning part inside the mouth, and walking about with a firepot pressed to the belly, are responsible for some of these differences, and others are due to more obscure environmental influences. There is some evidence for a predisposition to cancer of those organs, notably the liver, which are affected by kwashiorkor, a disease which occurs in populations whose traditional dietary habits have been disrupted by the production of cash crops.⁶

The problem of race and infectious disease has been extensively reviewed by Perla and Marmorston.⁷ No example of racial immunity to an infectious disease is known in man, though examples of this occur in some domestic breeds of animals. Different populations do, however, show widely different mortality rates when attacked by infectious diseases. The nearest approach to racial immunity seems to be the

lack of the scarlatinal response in the American Indian and the Malaysian peoples.

Infections usually cause a high mortality in populations which have never before experienced them, and introduced infectious diseases have probably been the greatest cause of depopulation among primitive peoples. Further exposure may lead to an increase of resistance among the population by the action of natural selection. Lack of nursing care and starvation are, however, important causes of this high mortality. Since common infectious diseases tend to be diseases of children whereas newly introduced epidemics affect all ages, apparent racial differences in susceptibility may be due to age variations in susceptibility. Thus the susceptibility of virgin races to tuberculosis is partly due to the seriousness of the primary disease in adults, and the apparent immunity to yellow fever of the Negro from endemic areas in Africa may be due to the mildness of yellow fever in childhood. The partial immunity to malaria of rural tropical communities is probably acquired at the cost of a grave mortality in childhood which is difficult to detect where medical services are rudimentary.

The student of race and disease should consult Schottky's book⁸ on that subject, though much of the information is anecdotal, and many of the opinions expressed are those which were current in Nazi Germany. Detailed accounts are available of the diseases of the African⁹ and the American Negro,¹⁰ the Eskimo,¹¹ the Chinese,¹² and the Australian aboriginal.¹³

It is easy for the medical practitioner working in the "back of beyond" to feel that he is stagnating in his isolation, and yet it is not difficult for him to produce really valuable researches. He can study a particular disease, collect vital statistics,¹⁴ or make a disease survey.¹⁵ These can give valuable information to governments in pointing out the true medical and nutritional needs of the people. Medical survey work should ideally be carried out in conjunction with workers in other fields, such as physical and social anthropology, agriculture, and nutrition. The main requirements are adequate description of the methods and descriptive criteria used, sufficient background information on the people studied, and the collection of data in a systematic manner. Work of this sort is being carried out on isolated African populations by the M.R.C. Field Research Station in the Gambia¹⁶ and on Malayan aborigines by the University of Malaya. In these days of air transport, lack of laboratory equipment and skills can often be overcome by sending specimens to acknowledged world experts, who may be only too glad to have this opportunity of carrying their researches into new fields.

DOCTORS ON EVEREST

The climbing of Everest is a triumph already acclaimed wherever the victories of the human spirit are prized above those of the market-place. The silent challenge of its peak has attracted eleven expeditions—not all intended to gain the summit—and sixteen lives have been lost in meeting it. If courage and resource are the qualities pre-eminently needed to explore those wastes of rock and snow, solutions to the physiological problems of living strenuously at high altitudes were no less necessary to the success that added a further touch of splendour to Coronation Day.

Medical men have contributed much to make these expeditions possible at all, both in helping to design suitable equipment and in accompanying, and sometimes leading, the climbing parties; they have also to carry out the essential but less spectacular duties of looking after the members of the expedition in the long approach to the mountain. The doctor in medical charge of the expedition, besides advising on camp hygiene, may have to deal with almost any medical or surgical emergency in one of the most remote parts of the world, from setting a broken limb to treating heatstroke or frostbite. His is the duty also—a familiar one to regimental medical officers during the war—of looking out for early signs of the mental disturbances that can have such serious consequences if allowed to develop and spread among strained and tired men. In giving advice on acclimatization the experience of a mountaineer-doctor is invaluable to the leader of the expedition. At Himalayan altitudes, and especially above 20,000 ft., the benefits of becoming acclimatized are apt to be offset by a deterioration in health whose cause is not clearly known. Individuals vary greatly in their response to these stresses, but after a time nearly everyone suffers a diminution of nervous control and a loss of weight which may be severe. There are in addition the hazards of a violently fluctuating temperature, which specially designed equipment can only partially mitigate. Bright sunlight by day may cause heavy sweating, to be followed by sub-zero temperatures at night, and perhaps even more difficult to overcome than the low oxygen tension is the dehydration that these altitudes cause.

The doctors accompanying this year's expedition have indeed earned the plaudits of the profession.* The medical officer in charge is Dr. Michael Ward, who qualified at the London Hospital in 1949, and gained his first experience of Himalayan climbing in the 1951 reconnaissance expedition. Also on medical work, though as a physiologist, is Dr. L. G. C. Pugh, a member of the Medical Research Council staff and, during the war, physiologist to a mountain and snow warfare training centre. The third medical member is Mr. R. C. Evans, who was chosen to accompany the expedition primarily for his climbing experience, much of which has been gained in the Himalayas. He and T. D. Bourdillon, whose father, Dr. R. B. Bourdillon, had constructed an experimental closed-circuit oxygen apparatus for the expedition, were the first to attempt the summit this year, reconnoitring a route with the new apparatus.

Though they failed to reach the top with it, they have the satisfaction of being indispensable members of a team whose efforts have met with success. And it is a team comprising not only the climbers now out there but those many who have tried their fortune on the mountain previously, for they brought back that information and advice—again much of it medical—which were the foundations on which Colonel Hunt's men, with trust and daring, built their success.

TOXIC EFFECTS OF PHENYLBUTAZONE

The use of phenylbutazone ("butazolidin") for the relief of pain in rheumatoid arthritis and osteoarthritis raises problems which are described in detail in the papers by Drs. J. R. Nassim and T. Pilkington and by Dr. J. C. Leonard on pages 1310 and 1311. Reports on the use of phenylbutazone make it clear that the drug can be used with benefit, certainly so far as the relief of pain is concerned, and that in this respect it is more effective than aspirin, either alone or in the usual mixtures. But phenylbutazone has toxic effects, and these have led Dr. Leonard to conclude that it should be given only to patients in hospital. Some recent papers published in the United States¹ add to the evidence on the serious accidents that may result from phenylbutazone therapy. One patient aged 54 received 400 mg. by mouth daily for one week; he was then put on 600 mg.; nine days later there was a perforation of the first portion of the duodenum. In other patients there was bleeding from ulcers during the use of phenylbutazone, and another patient died from agranulocytosis. The formula of phenylbutazone is sufficiently similar to that of amidopyrine to make it likely that cases of agranulocytosis will from time to time occur.

The incidence of toxic effects has varied very much with different observers, from 1.8% to 52%. How is this variation to be explained? It is difficult to suppose that those who have noted few toxic reactions have missed effects which were serious or dangerous to their patients, but it is reasonable to suppose that they have overlooked effects which were not serious. On the other hand perhaps those who have described a high proportion of toxic reactions have included minor disturbances some of which the patients themselves might not have reported. It seems probable that the variation in the incidence of toxic symptoms is a reflection of the difference in the observers or in the conditions of observation. If so, too much attention should not be paid to the percentage of toxic reactions as an indication of the risks of using the drug.

Toxic reactions in a minority of patients may be set aside as an inevitable disadvantage of any substance foreign to the body, and doctors may decide to use a remedy in spite of them. The matter is usually decided by the doctor's own experience with the remedy, and if he sees no ill effects in his first fifty patients he will be likely to blame the patient rather than the remedy when the ill effects are seen in the fifty-first. As reports of serious toxic disturbances accumulate, so the time may come when no one will be willing to use the drug for the first time. Only those doctors will give it who

have already found it to be beneficial and who have not yet observed toxic effects.

Many of the patients for whom phenylbutazone is prescribed are old and have suffered for many years. On general grounds they would seem more likely to show toxic symptoms than younger people, since their detoxicating mechanisms, in particular those of the liver and kidney, are less efficient, and the blood-forming apparatus is more sensitive to attack. Should a doctor refuse to use a remedy which gives relief to a majority of such patients because it causes side-effects in 20% of them? One answer to this is that the doctor should use it only if he is satisfied that he has sufficient opportunity of keeping the patient under supervision. Another answer is that he should refuse to use it and wait until the pharmaceutical firms have produced less toxic remedies. That this may be possible is evident from the success of mepacrine, proguanil, and pyrimethamine against malaria. All are remarkably non-toxic, though they are substances foreign to the body.

INFLUENZA AS A WORLD PROBLEM

The first report¹ of the World Health Organization's Expert Committee on Influenza, just published, contains a lucid account of the present state of knowledge about influenza, and where opinions conflict or information is incomplete it frankly says so. The Committee met in Geneva last September and consisted of nine members from six different countries. Though there is a place for independent research on many and various aspects of influenza, there are fields where international collaboration is needed and where progress will be difficult without it. For instance, we read that "recent studies . . . have shown two possible methods by which epidemics may be originated. Geographical spread of virus from one country to another has been indicated in some studies, but others rather favoured the development of an epidemic from an endemic state." In fact, there is increasing evidence that the "two possible methods" are not mutually exclusive but that both operate. Here is one important field where countries can help each other to discover how the common enemy, influenza, conducts its campaigns. Influenza viruses, more than any other, vary from year to year: newly emerging antigenic variants appear and may cause trouble when they find a population relatively susceptible. This variability makes it more difficult to be prepared with appropriate vaccines. On the other hand, we can follow the distribution and spread of new antigenic types and thus perhaps learn more about influenza's secret operations than if it were a wholly stable entity. The report describes the methods used in different laboratories for comparing the strains of virus which turn up. Were there more uniformity among these methods, more might be learnt sooner on this difficult subject.

The report gives sound recommendations on how material for study can be collected and distributed, and how information on outbreaks of influenza can be quickly gathered and made available. Two appendices

give details of methods in current use for preparing antisera of various kinds and for performing serological tests, both haemagglutination-inhibition and complement-fixation.

Much has been done since W.H.O. set up in 1948 the World Influenza Centre in London and helped to organize collaboration throughout the world; but clearly much remains to do. On the immediately practical questions of control the report has much of interest. Vaccines are discussed and the difficult question of what strains of virus to incorporate in them. There seems to be great hope for the future in the use of vaccines containing oily adjuvants. These are likely to give a stronger, more durable, broader antigenic response than has been possible before. But more knowledge is required about their safety before they can be generally recommended.

Influenza to-day causes great economic loss and kills many of the old and infirm. But its ravages are trivial compared with those of the lethal pandemic of 1918-19. Now we study vaccines, therapy, quarantine, and so forth partly for our immediate needs but even more because we do not know whether another killing influenza may not come upon us nor when it may do so. Because there are at present no indications of such a calamity we must not be lulled into unpreparedness; it is as well that the Expert Committee is aware of the danger and is not too complacent about the efficacy of antibiotics. What the report has to say about quarantine measures is worth quoting:

"Quarantine at a national level would be likely to be effective only in the case of islands and geographically isolated communities. The role of quarantine in regard to large countries or continents cannot be assessed while knowledge concerning the spread of influenza is still imperfect. There is no evidence, however, that in the case of such large areas quarantine could be applied effectively. The probable value of restriction of travel between countries can be judged in the light of the above remarks; and particularly in the case of mild epidemics of influenza, it is totally unjustified."

At the modest price of eighteen pence the report should prove a good investment for many people interested in what is referred to as "one of the most important infectious diseases still unconquered."

PUBLIC HEALTH AWARD

The salary increases awarded by the Industrial Court to assistant medical officers in the public health service are not all that was asked for, but at least they are substantial. They indicate some recognition of the increased cost of living that has so harassed professional people since the war, and bring the salaries into better relation with those earned both in the public health service and in comparable posts outside. The minimum salary in the scale is raised £100 from £850 to £950, and the maximum goes up £150 from £1,150 to £1,300. Medical officers at the maximum of the old scale and therefore earning £1,150 are to go immediately to £1,250 on the new scale and thence to the new maximum of £1,300; while officers at other points go to the corresponding points on the new scale. The award takes effect from June 1.

Fuller details of the award, which are reported in the Supplement at page 278, show that, while it falls short of

the profession's claim by £50-£100, it is a considerable advance on what the Management Side of the Whitley Committee "C" was offering. That was a kind of cost-of-living allowance adding £25 to the minimum salary and tapering off until the same maximum salary was reached after the same number of increments. The niggardly character of this offer must have been as evident to the Industrial Court as it was to the medical officers concerned, and the award bears no trace of being influenced by any part of it. The scale claimed by the medical officers represented a 100% increase over the pre-war scale. In comparison with many other claims, especially those outside the professions, it was therefore a modest one. Even so, the Court did not see fit to decide wholly in its favour. But it should do much to mitigate the hardship of which some assistant medical officers have justly complained in recent years.

THE PAINFUL SHOULDER

In 1934 Codman¹ drew attention to the degenerative changes which occur in the conjoined tendon of the supraspinatus, infraspinatus, teres minor, and subscapular muscle. These changes affect the supraspinatus tendon more frequently than its neighbours. They are common in women at the menopause and in men with cardiovascular disease, and are the essential precursors of painful lesions of the shoulder. These were discussed by Withers in our Refresher Course series last year.²

The painful shoulder syndrome may be started off by occupational strains and minor injuries, particularly those causing partial tears of the supraspinatus tendon, by immobilization for such conditions as fractures of the arm and operations on the breast, and by pain referred from the cervical spine. Another factor is what Coventry³ calls the "peri-arthritis personality." This comprises undue sensitivity to pain and certain constitutional and emotional characteristics common in patients with stiff and painful shoulders.

Two chief clinical lesions are recognized: the local tendinitis, usually confined to the supraspinatus tendon, and the diffuse capsulitis of the conjoined tendon. In cases of local tendinitis movement may be only slightly impaired, but there is pain in the mid-range of abduction when the supraspinatus tendon impinges on the acromion—the "painful arc syndrome." In cases of diffuse capsulitis gross restriction of movement is common—the "frozen shoulder." Pain may be severe in the early stages, but as movement diminishes the pain subsides. In severe examples of this type pain may radiate down the limb to the hand, and there may be swelling and stiffness of the fingers, giving what is described as the "shoulder-hand syndrome."

Radiological examination may reveal the presence of a calcified deposit. These deposits usually lie in the substance of the supraspinatus tendon, but may occasionally invade the subacromial bursa. Deposits confined to the tendon commonly produce the symptoms of a

Eastern Provinces, the most heavily infected area, the incidence of the disease was estimated as being twenty times greater than in India.

Need for a Research Unit in East Africa

Dr. R. G. COCHRANE, medical secretary of the association, in his report, described his visit last autumn to East and Central Africa and to Nigeria, where the system of village colonies combined with large-scale out-patient work had been shown to be most suited to African conditions. Within the next decade the Eastern Provinces were likely to demonstrate complete control of the disease in that region. Dr. Cochrane paid a tribute to Sir Leonard Rogers, "architect and planner" of the association, to whom, and to whose successor, Dr. Ernest Muir, so much of the achievement was due. Thanks to Dr. Paul Brand at Vellore, South India, a new constructive approach had been made to the residual deformities of leprosy. The possibility of yet another effective line of attack was to be found in the recent attempt to increase resistance, particularly in children, by the use of B.C.G. Nevertheless, Dr. Cochrane added, any optimism about the control of leprosy must always be tempered with great caution; even the sulphone remedies had their drawbacks. The process of bacteriological cure was painfully slow, and there was difficulty in getting advanced cases to the stage at which they could tolerate an effective therapeutic dose of the drug. Many persons were found to be infective after years of treatment. For these reasons still more knowledge of the disease was needed, and there was call for further support to make the planned "Belra" Research Unit in East Africa an actual fact.

MEDICAL CORONATION HONOURS

The names of the following members of the medical profession were included in a Coronation Honours List published in *Supplements to the London Gazette* on June 1:

K.C.M.G.

Sir JAMES BENNETT HANCE, K.C.I.E., O.B.E., M.D., F.R.C.S.Ed. Lieutenant-General, I.M.S. (retired). Medical Adviser and President, Medical Board, Commonwealth Relations Office.

K.B.E. (Military Division)

JAMES MACCONNELL KILPATRICK, C.B., O.B.E., M.B., B.Ch., D.P.H. Acting Air Marshal, Royal Air Force. Honorary Physician to the Queen.

K.B.E. (Civil Division)

FRANCIS GORDON BELL, M.C., M.D., F.R.C.S., F.R.C.S.Ed. Formerly Professor of Surgery in the University of Otago, New Zealand.

Knighthood

The Hon. Mr. NICHOLAS ATTYGALLE, F.R.C.S., F.R.C.O.G. President of the Senate, Ceylon. For services to medicine.

DAVID CAMPBELL, M.C., M.D., F.R.F.P.S. President of the General Medical Council and Regius Professor of Materia Medica and Therapeutics in the University of Aberdeen.

FRANCIS MARTIN ROUSE WALSH, O.B.E., M.D., D.Sc., F.R.C.P., F.R.S. President of the Royal Society of Medicine. Consulting Physician to University College Hospital, London.

C.B. (Military Division)

JOSEPH CLINTON COLLINS, C.B.E., M.R.C.S., L.R.C.P. Major-General, late R.A.M.C. Honorary Surgeon to the Queen.

FREDERICK KNOWLES ESCRITT, O.B.E., M.R.C.S., L.R.C.P. Major-General, late R.A.M.C. Honorary Surgeon to the Queen.

C.M.G.

PHILIP STANLEY FOSTER, M.B., Ch.B., F.R.C.S., F.R.A.C.S. Consulting Surgeon, Christchurch Hospital. Chairman, New Zealand Medical Council.

GEORGE MACDONALD, M.D., M.R.C.P., D.P.H., D.T.M. Professor of Tropical Hygiene in the University of London and Director of the Ross Institute of Tropical Hygiene.

C.V.O.

JOHN NIGEL LORING, M.R.C.S., L.R.C.P. Apothecary to the Household of H.M. the Queen.

C.B.E. (Military Division)

KENNETH BARRON FRASER, E.D., M.S., F.R.A.C.S. Colonel, Royal Australian Army Medical Corps.

PATRICK BRUNTON LEE POTTER, O.B.E., M.D., D.P.H., D.T.M.&H. Air Commodore, Royal Air Force.

FREDERICK ELVY LIPSCOMB, M.R.C.S., L.R.C.P., D.P.H., D.T.M.&H. Air Commodore, Royal Air Force. Honorary Physician to the Queen.

SAMUEL GERALD WELDON, M.B., B.Ch., D.P.H. Surgeon-Captain, Royal Navy.

FREDERICK WILLIAM WHITEMAN, O.B.E., M.B., Ch.B. Colonel (temporary) Pakistan Armed Forces Medical Services.

C.B.E. (Civil Division)

WILLIAM GEORGE BARNARD, F.R.C.P. Dean of St. Thomas's Hospital Medical School and Director of Pathology at St. Thomas's Hospital. Professor of Pathology in the University of London.

GILBERT BROWN, M.B., Ch.B., F.F.A.R.C.S., D.A., of Adelaide, South Australia. For services in the development of anaesthetics.

THOMAS MORRIS DAVIES, M.R.C.S., L.R.C.P. Deputy Director-General of Medical Services, Ministry of Pensions.

ALAN TAYLOR HOWELL, M.B., B.Chir., D.T.M. Director of Medical Services, Tanganyika, Colonial Medical Service.

WILLIAM LESLIE, M.C., T.D., M.B., B.S., J.P. for the Borough of Penzance. For political and public services in Cornwall.

ARCHIBALD DANIEL MARSTON, F.R.C.S., D.A., F.F.A.R.C.S. Lately Dean of the Faculty of Anaesthetics, Royal College of Surgeons of England.

ARNOLD ASHLEY MILES, M.D., F.R.C.P. Director, Lister Institute of Preventive Medicine, London.

GILBERT INNES STRACHAN, M.D., F.R.C.P., F.R.C.S., F.R.C.S.Ed., F.R.C.O.G. For political and public services and for services as Professor of Obstetrics and Gynaecology in the University of Wales.

RICHARD ROBERTSON TRAIL, M.C., M.D., F.R.C.P. Medical Director, Papworth and Enham-Alamein Village Settlements for the Tuberculous.

M.V.O. (Fourth Class)

JAMES LAWRENCE BUNTING ANSELL, M.R.C.S., L.R.C.P. Surgeon Apothecary to the Household of H.M. the Queen at Sandringham.

O.B.E. (Military Division)

JOHN MANSEL REESE, M.R.C.S., L.R.C.P., D.P.H. Surgeon-Commander, Royal Navy.

O.B.E. (Civil Division)

FRANCIS WARD ALLINSON, M.B., B.S., F.R.C.S. Professor of Surgery, Medical College Hospital, Dacca, Pakistan.

CHARLES ANTHONY BOUCHER, D.M., D.P.H. Medical Officer, Ministry of Health.

CECIL BURNHAM, M.B., Ch.B., F.R.C.S.Ed. Lately Commandant, Star and Garter Home for Disabled Soldiers, Sailors, and Airmen, Richmond, Surrey.

WILLIAM JOHN HUGHES BUTTERFIELD, M.D., M.R.C.P. Member of the Scientific Staff, Medical Research Council.

RICHARD ALEXANDER SEYMOUR CORY, M.B., Ch.B. Senior Medical Officer, Colonial Medical Service, Tuberculosis Sanatorium, Jamaica.

KENNETH JOHN GRANT, M.B., Ch.B., D.P.H. Medical Officer of Health, Great Yarmouth. For services during the recent floods in the Eastern Counties.

EBEN STUART BURT HAMILTON, M.C., M.B., Ch.B., F.R.C.S.Ed. Commissioner, Duke of Lancaster's District, St. John Ambulance Brigade.

ALBERT JOSEPH HAWES, M.D., F.R.C.P., D.T.M.&H. Senior Specialist, Colonial Medical Service, Gold Coast.

GORDON KING, F.R.C.S., F.R.C.O.G. Professor of Obstetrics and Gynaecology in the University of Hong Kong.

JAMES SANDERSON MCGREGOR, M.D., D.P.M. Medical Superintendent, Saxondale Mental Hospital, Radcliffe-on-Trent, Nottinghamshire.

WILLIAM JOSEPH MOODY, M.B., B.Chir., F.R.C.S.Ed. Lately Medical Adviser to the British Political Resident and Chief Quarantine Medical Officer, Persian Gulf. Lieutenant-Colonel, I.M.S. (retired).

GEORGE RANKINE, M.C., M.B., Ch.B. General Practitioner, Dundee.

SARAH ANDERSON JAMIESON RANKINE, M.B., Ch.B. Medical Officer in charge of St. Margaret's Hospital, Poona, Bombay.

HENRY RICHARDS, M.B., B.S., D.P.H., D.T.M.&H. Assistant Director (Public Health), Sudan Government.

GEORGE ROBERTSON ROSS, Ph.D., M.B., Ch.B., D.P.H. Member of the Public Services Board, Southern Rhodesia.

EMRYS CADWALADR THOMAS, L.R.C.P.&S.Ed. Director of the Victoria Hospital, Damascus.

JOHN DUNCAN WHITE, M.B., Ch.B., D.M.R.E. Director, Radiodiagnostic Department, Hammersmith Hospital.

THOMAS MACFARLANE WILKS, M.B.E., T.D., M.R.C.S., L.R.C.P. Area Commissioner, St. John Ambulance Brigade, London. For services during the recent floods in the Eastern Counties.

DONALD BAGSTER WILSON, M.D. Director, East Africa Malaria Unit, Colonial Medical Service.

M.B.E. (Military Division)

JOHN WILLIS COOMBE. Lieutenant, Royal Australian Army Medical Corps.

M.B.E. (Civil Division)

HENRY SIDNEY ATKINSON, B.M., B.Ch. Chairman of Committee, No. 135 (Reigate and Redhill) Squadron, Air Training Corps.

DOROTHY DELBRIDGE, M.B., Ch.B., D.T.M. For medical services in Fiji.

FRANCIS JOHN GRAHAM, L.R.C.P.&S.I. For services to the community in New South Wales.

GEOFFREY BUCKLAND ORBELL, M.B., Ch.B., of Invercargill, New Zealand. For scientific work.

WILLIAM OLIVER PETRIE, M.B., Ch.B.Ed., D.T.M.&H. Medical Officer, Nyasaland, Colonial Medical Service.

RONALD REES POWELL, M.R.C.S., L.R.C.P. Chairman, Reigate Unit Committee and Southern Area Representative, Sea Cadet Council.

Soo HOY MUN, M.B. Honorary Medical Officer, Chinese Maternity Hospital, Federation of Malaya.

The Coronation Honours List includes also the appointment to the Order of the Companions of Honour of the Right Hon. Thomas Johnston, P.C., Hon.F.R.C.S.Ed., Secretary of State for Scotland from 1941 to 1945; Knighthoods for Alderman J. W. Bowen, C.B.E., chairman of the North-east Metropolitan Regional Hospital Board and the National Health Service General Whitley Council, Mr. H. N. Linstead, O.B.E., M.P., secretary of the Pharmaceutical Society, and Mr. Frederick Messer, C.B.E., chairman of the Central Health Services Council and lately chairman of the North-west Metropolitan Regional Hospital Board; and the C.B.E. for Mr. W. G. Senior, O.B.E., principal dental officer at the Ministry of Health.

MEDICINE UNDER THREE QUEENS

EXHIBITION AT THE WELLCOME MUSEUM

As part of its Coronation celebrations the Wellcome Historical Medical Museum has prepared an exhibition illustrating "Medicine Under Three Queens: Elizabeth I, Anne, and Victoria." The exhibition was formally opened on June 5. In introducing Sir Zachary, Dr. E. Ashworth Underwood, director of the Museum, explained that the three periods had been chosen because they brought out the characteristics of the British people: these characteristics were well shown by the medical men of the times.

Sir Zachary Cope, who gave a short address on "The Birth of Modern Medicine," paid a tribute to the trustees of the Wellcome Foundation for their maintenance of a museum and library invaluable to medical historians. He said that his theme was most appropriately illustrated by the progress of medicine during these three reigns. Progress was brought about by the effect of an idea on a fact. Up to the time of Elizabeth I no physician had acted upon this axiom, and true progress had been impossible. During

her reign modern anatomy and physiology had had their beginnings, the *De Fabrica* of Vesalius had been translated into English, and the first steps taken towards the conception of modern medicine. Harvey had been born, and his ideas on circulation had been formulated during this reign. English was being used considerably for the first time. During the next century little progress was made, and the quickening of modern medicine was left until the time of Anne. It was during her reign that Cheselden saw the need for the systematic teaching of anatomy. In 1711 he published a syllabus and gave lectures on the subject, and, with Hawksbee, on physics as related to the human body. There followed the foundation of more hospitals and medical schools. The Apothecaries Act of 1815 must be regarded as only a pseudo-gestation. The real birth of modern medicine occurred in 1858 with the passing of the Medical Act and the formation of the General Medical Council. In the same year Virchow had published his *Cellularpathologie* and Pasteur was completing his work on fermentation. A year later appeared Florence Nightingale's *Notes on Nursing*, and it could be said that nursing was born within a year of modern medicine. From the birth of Harvey to 1858 was a period of 280 years; the period of human gestation was 280 days. The last hundred years had covered the childhood, development, and adolescence of modern medicine, and to-day its position was greater and more powerful for good than it had ever been in any era of history. Sir Zachary wished that the reign of Elizabeth II had been included in the exhibition, for he felt that the present was a great moment in medicine. Revolutionary discoveries were on the way, and the fact that older members of the profession were often unable to understand papers now being published in the journals showed that something great might be pending.

A vote of thanks to Sir Zachary Cope was proposed by Sir Gordon Gordon-Taylor, and seconded by Sir Allen Daley. The exhibition, which includes books, portraits, instruments, etc., illustrating outstanding medical men and their achievements during the three reigns, will remain open until further notice.

CLIMBING EVEREST

SOME NOTES ON THE MEDICAL TEAM

The doctor in medical charge of the Everest expedition is Dr. Michael Ward. At the age of 12 he climbed the Matterhorn, and as a medical student at Cambridge he clambered round the roofs with its famous night climbers. In 1951 he went to the Himalayas with Shipton on the reconnaissance expedition which led to the present successful approach to the summit. He was the first then to see the footprint of the Abominable Snowman. Dr. Ward's main concern now is looking after the medical care of the party, and this duty has come first when it was thought he might be one of the men to reach the summit.

Dr. L. G. C. Pugh, a physiologist from the Medical Research Council, is not a climber, but accompanied the party in order to carry out tests on the physiological effects of high altitude. He accompanied Shipton's last expedition and was mainly concerned with the use of oxygen. Should it be given as a cocktail when deterioration is setting in, or should it be used all the time above certain heights, even when sleeping in one's tent? In this debate he has always been a firm supporter of the latter method. His duty has been to remain in the region of the base camp and perform physiological tests on climbers coming down from higher altitudes.

Mr. R. C. Evans, a surgeon in Liverpool, is regarded as one of the best climbers in this country, and has all the qualities of what experienced climbers call a "good executive technical mountaineer." A short, quiet, unobtrusive man, he learned his climbing in the Welsh mountains, and climbed in the Himalayas in 1950 and 1952. Strongly

fancied as one of the men most likely to reach the summit, he was selected with T. D. Bourdillon for the first attempt on it with a closed oxygen apparatus, but they failed to reach it.

Perhaps the most trying task has fallen to Dr. Ward. The medical problems appear the whole way from Khatmandu to the summit and back. In the swamps and jungles there are bites and stings and leeches, and a fair chance of contracting malaria. Proguanil was given to each man, and sulphaguanidine was part of the diet right up to the glacier, where water can be obtained from melted snow. On the way up Dr. Ward watched the acclimatization of the party and later deterioration, and took apparatus for testing the climbers at various levels. First and foremost came the job of caring for the health of the party. High on the mountainside sore throats and tonsillitis are a constant trouble—probably due to panting from oxygen-lack in an atmosphere of low humidity which can reach -20°C . Breathing apparatus used on previous expeditions failed in its purpose but cut down sore throats through retaining humidity. Carelessness can quickly lead to frostbite and snow blindness. A doctor on a previous expedition lost a finger-tip through pressing a camera-shutter with an ungloved hand.

For all the excitement in the Press, a good deal of the climbers' time has been spent in loneliness and monotony. They took books with them, and, according to Ward, their way of thinking and taste in reading changed greatly on Everest. Thought is mainly devoted to matters of food—hot meals being impossible when boiling water is only lukewarm. Over 17,000 feet one ceases to think of the opposite sex, he claims, and men who rarely read anything but crime stories crave for the classics. Dr. Ward took Jane Austen and the Brontës with him in order to defeat monotony, "because I have never been able to read them down here. On the last expedition we all read Trollope and enjoyed him, yet none of us had ever been able to read him before. It was because he gave such a vivid picture of the exciting everyday things."

CORMAC SWAN.

Nova et Vetera

A VANISHED CULTURE

Uttermost Part of the Earth. By E. Lucas Bridges. (Pp. 558; illustrated. £1 10s.) London: Hodder and Stoughton. 1951.

This unique book is the only one by its author. It appeared in his old age, shortly before his death, and took its place as a classic from the day of publication. Bridges was the last, and probably the first, educated Englishman who was born and reared among savages of a Stone Age culture. He acquired their language almost as early as his own, had an interest in their ways of life and thought, and travelled and lived with them for many of his adult years. He was a member of a family who, in their own ways, both boys and girls, were as intelligent and adventurous as himself. The book is long, but any one of the 48 chapters may be read separately, for each is a stirring tale of adventure. I know no better book for older boys and girls who love adventure, but it is also of great scientific interest. Medically it tells much of the powers of endurance of different races when long exposed to the most rigorous climatic conditions. It also tells of the reactions of different races to various medical and surgical conditions. Anthropologically it is not only by far the best record of a people now extinct but, above all, probably the only record of life among savages in terms of individual personalities. It displays the infinite variety of human character to be found no less among primitive peoples than among ourselves.

The "Uttermost Part of the Earth" is the irregular group of great islands known as Tierra del Fuego in the extreme south of South America and is the nearest to Antarctica of any permanently inhabited land. It is impossible to de-

scribe in a short space the pulse-stirring character of this book, and I shall confine myself to a few words first about the author's father—who is perhaps the real hero of the story—and then about the people among whom his life was passed.

Starting a Settlement

Thomas Bridges, father of the author, was adopted in childhood by a clergyman interested in missionary work among the Fuegians. Several missionary attempts had been made, but with considerable loss of life. At last it was suggested that a missionary base might be formed in the Falklands, and Keppel Island was given by the Government for the purpose. The clergyman with his wife and family, including Thomas Bridges still in his early teens, embarked in 1854 for Keppel in a schooner of 88 tons register. During the next years, with great difficulty and after repeated attempts, they persuaded a few Fuegians to settle in Keppel. These learned a few words of English and the missionary group learned a little of one of the native languages, but Thomas, still a stripling, applied himself to this task with special energy and skill. After some years it was decided to make another attempt to form a settlement on Tierra del Fuego. With a single exception the entire crew and the missionary party were murdered by the natives. After consideration the remaining missionaries on Keppel decided that the project was hopeless and returned to England. Thomas Bridges, now 18 but the only living expert in a Fuegian language, elected to remain and was left in charge of the settlement. He perfected his knowledge of the language and prepared in manuscript a dictionary and grammar of it which now, after many many adventures of their own—*habent sua fata libelli*—rest among the treasures at the British Museum.

Stone Age

He then made the voyage to Tierra del Fuego, where the natives were astonished to be addressed by a white man in their own tongue. By 1867 he had succeeded in establishing a small farm worked by a few natives on one of the outlying islands. Much of the best story-telling in the book is the life of this most gallant, able, and determined man. He returned to England, where he persuaded a lady to marry him and to go with him to Tierra del Fuego. They had three sons and three daughters, the remarkable lives of all of whom are indicated here. This splendid man died in 1898, apparently from haemorrhage from ulcer of the stomach, at a post that he had established in the land of his choice. He was about 57.

As to the people that he served: despite the severity of the climate and the tempests with which their land is swept winter and summer, they were normally naked, using mantles of skins only for special occasions. They were ignorant of metals, had no domestic animals, and did not cultivate the earth. They lived mainly on wild llamas that they were able to kill with their bows and stone-tipped arrows, combined with a few birds, plants, and fish that they gathered. The women fished and they alone could swim. The men seem normally to have had two wives. As between tribe and tribe they were very ferocious, making nothing of the life of one who could not speak their language, but they cared for their old people. They were not cannibals. Neither the author of this book nor his father was able to find a trace of anything that could be called a religion. They were expert in making their weapons, notably their complex bows and harpoons, on which they chiefly relied for their food.

The name of their country, "Land of Fire," seems to be due to the custom of small parties signalling to each other by lighting fires. They had no fixed settlements. An epidemic of measles that affected all the Bridges family led to the death of great numbers of the Fuegians. They were later practically exterminated by tuberculosis, syphilis, and alcohol. Hardly a memory of them can now survive, which makes this remarkable book at once a memorial of a people, of a language, of a family, and of a man.

Misuse of Drugs in Tuberculosis

SIR,—May I make a plea for the more thoughtful use of the new drugs in the treatment of tuberculosis? It is a not uncommon experience at this hospital to receive patients from general hospitals who have already received a very large dosage of streptomycin, amounting in one case to over 170 g. Although great improvement in these cases may have occurred, it is achieved almost inevitably at the cost of the development of resistance to the drug, even though it may have been given in combination, and risks of permanent damage to the eighth nerve at this dosage cannot be negligible. I do not need to stress the disadvantages of the development of resistance, which are well known, except to mention that patients received here in this connection for whom major surgery is contemplated are, as a result, rendered hazardous subjects, particularly if resection is envisaged.

There has always been a proper strategy in the treatment of tuberculosis, which must essentially be unhurried, and it is important to integrate these new and effective agents with it. I would suggest that, except in a very acute or military case, in the present state of our knowledge, streptomycin should be given in 1-g. doses on alternate days or even every third day, combined with a total daily dosage of 12–15 g. P.A.S. and/or 200 mg. of isoniazid, until 30 g. of streptomycin has been given; radiological improvement will usually continue for some weeks after the end of such a course, and the patient can then be reassessed. He is unlikely to have developed resistance to any of these drugs, and they can be similarly given again in further courses either to secure more improvement, to cover major surgery, or to treat the relapses occurring at a later date. It may also prove that the middle-aged "chronic" who is unsuitable for collapse therapy may be kept reasonably fit and rendered temporarily non-infectious by similar periodic courses, provided resistance has not been allowed to develop by maldosage.

Greatly improved results are possible in the treatment of tuberculosis following the introduction of these new drugs, and it is essential, therefore, to use them to the best advantage.—I am, etc.,

London, N.W.9.

Anticoagulants in Myocardial Infarction

SIR,—I thought that the questions raised by Mr. John Fry (*Journal*, May 16, p. 1109) and further elaborated by Dr. R. A. Murray Scott and Dr. John C. Ryle (*Journal*, May 30, p. 1223) had been adequately answered in the joint paper and correspondence with Dr. K. Shirley Smith.¹ The conclusions reached in a series of 200 cases of cardiac infarction agree with Mr. John Fry's statement that the incidence of severity of the disease is about equal in general and of severity of the disease in hospital practice. We were also able to show that the mortality figures in untreated cases of slight and moderate cardiac infarction (that is, in patients without intractable heart failure) for the first two months following infarction were only 2%. These patients made up more than half of the whole series; this means that anticoagulant treatment may not be required in half of the cases. The assessment of treatment is done on clinical grounds and is in the province of any experienced general practitioner. The objection that a slight cardiac infarction may complicate into a severe one is valid, although this is an uncommon event; the patient then has recurrent angina following the bout of infarction pain, and this in itself is an indication for anticoagulant treatment.

Ethyl biscoumacetate ("tromexan") was a distinct advance over dicoumarol, and so is phenylindanedione ("din-

devan") over ethyl biscoumacetate.² However, all require laboratory control, although phenylindanedione less often. If the patient is reliable enough to report discoloration of the urine or lumbar pain—haematuria is by far the most frequent haemorrhagic manifestation—anticoagulant treatment can be safely carried out at home if twice-weekly prothrombin estimation is practicable during the first fortnight and once weekly later.

I agree with Dr. Murray Scott that shock following cardiac infarction needs energetic treatment; I am not sure if leptazol-ephedrine injections will always be effective. The danger of persistent shock is so great that it far outweighs the danger of removal to hospital where only it can be effectively treated with intravenous infusions and pressor drugs.—I am, etc.,

SIR,—Mr. John Fry in his letter on anticoagulant therapy (*Journal*, May 16, p. 1109) raises several interesting problems, to some of which there would appear to be no easy answer.

The results in all large series of treated and control cases of coronary thrombosis so far published in this country and America agree on the value of anticoagulants in reducing the mortality and morbidity of this disease. Therefore, would it not appear to be our duty to use these drugs in all cases wherever possible? I. S. Wright¹ has argued against those who would only treat the severe cases in this way by pointing to the fact that the minor attack may be the herald of the major catastrophe.

In the decision as to which cases are in urgent need of anticoagulants the laboratory may be able to provide some help. Rosenthal,² using a simplification of the Waugh and Ruddick heparin tolerance test,³ found that in 14 cases out of 19 of recent coronary thrombosis a result below the normal range was obtained (i.e., clotting was accelerated). At Withington Hospital we have been using a simple heparin retarded plasma clotting test for some time. In 37 of 50 cases of recent thrombo-embolic disease clotting was found to be "accelerated" at the initial test. Heparin in addition to dicoumarol has been immediately administered in such cases. This type of test may also be of value in determining when anticoagulant therapy may be safely discontinued.—I am, etc.,

Poliomyelitis in Copenhagen

SIR,—In December, 1952, I was privileged to visit the hospital in Copenhagen where the poliomyelitis cases were treated. It appears, from articles in the *Journal* of May 30 (pp. 1208 and 1216), that Professor Lassen has, unwittingly, given the impression that he was responsible for the introduction of a new method of treatment of cases with respiratory paralysis. I am sure he would wish this to be corrected.

When, last summer, 27 of the first 31 of these cases had died under the methods of treatment orthodox in Europe, Dr. Bjørn Ibsen, then chief anaesthetist at the neighbouring university hospital, attended a conference called by Professor Lassen. Dr. Ibsen's everyday experience of the artificial control of respiration and his knowledge of the American literature enabled him to suggest certain radical improvements. When, eventually, his suggestions were accepted, he and his anaesthetist colleagues from the other Copenhagen hospitals took over this aspect of the treatment of these cases and provided continuous supervision through the months of the emergency. Early tracheotomy has previ-

ously been advocated for the proper control of pharyngeal secretions; the use of a cuffed tracheal tube and of artificial respiration by manual compression of a bag (techniques employed daily by anaesthetists, but unfamiliar to epidemiologists) with a high rate of gas-flow and a to-and-fro carbon dioxide absorber (not "closed circuit") were introduced and adapted to the demands of this emergency by Ibsen and his colleagues. They also trained and supervised the large number of medical students employed by Professor Lassen. As the method they used is likely to be developed further, it would be better left unnamed; if a name is to be attached, it must be that of Ibsen.—I am, etc.,

GEOFFREY ORGANE.

Acute Malaria Probably Precipitated by A.C.T.H.

SIR,—When about eighteen months ago I started the studies on the action of A.C.T.H. and cortisone in the complications of leprosy already recorded in the *Journal* of October 4, 1952 (p. 746), a correspondent informed me that it had been recorded that these hormones could precipitate an attack of malaria in a person harbouring a latent infection. In this area, malaria (*P. falciparum*) is highly endemic and many persons have latent infections. I have used A.C.T.H. and cortisone in many Africans, mainly adults, and, although a few of these patients have had malaria in the following days, I have seen no reason to ascribe these attacks to the hormone treatment. Recently, however, I have had occasion to give A.C.T.H. to a European who was taking pyrimethamine ("daraprim") as a malaria suppressant, and the hormone apparently provoked a fulminating attack of malaria. The details are here summarized.

A European woman, long resident in the Tropics, with a history of two attacks of malaria long ago, came to Nigeria in December, 1952, and had been taking pyrimethamine, one tablet once a week, as a malaria suppressant, with the complete absence of any signs of malaria. In April, 1953, she developed extensive inflammation and irritation of the skin, which here is frequently associated with filarial infection. Blood examination revealed no microfilaria, but eosinophils formed 38% of the white cells present. Local skin treatment brought no relief, and the condition was so distressing that a course of diethylcarbamazine ("hetrazan") was started. Within 48 hours there was, as usual, an intense exacerbation of the skin symptoms, which fact tends to support the diagnosis of filarial infection as the cause. Antihistamines gave little relief, so an injection of 50 mg. of A.C.T.H. was given, with immediate relief of symptoms. Diethylcarbamazine was continued, and three days later the dermatitis was markedly improved. Then, while diethylcarbamazine was still being given, there occurred a fulminating attack of malaria caused by *Plasmodium falciparum*; in addition to very high fever, there was intense purging and great weakness, and for 24 hours the patient's condition was critical. With prompt diagnosis and energetic treatment (quinine by injection, and chloroquine) the fever was controlled, and the patient is now convalescent. Some diarrhoea with mucus and many red blood cells in the stool has persisted for several days. Repeated examination for *Entamoeba histolytica* has given negative results; the diarrhoea has been completely uninfluenced by phthalylsulphathiazole. There is clear evidence of ulceration of the colon with slow healing. I am of the opinion that the bowel condition was caused by the malaria; profuse diarrhoea is a frequent manifestation of malarial infection here, particularly in children and non-immunes. In the present case the clinical picture from the onset of the fever was that of "choleraic malaria."

It is realized that it is unwise to argue from one case. This present case, however, was striking. A woman was, like many others, taking pyrimethamine for suppressing malaria, with very satisfactory results; she received one injection of A.C.T.H., and on the same day actually took, in my presence, a tablet of pyrimethamine. Three days later there was a fulminating malaria, with very severe intestinal symptoms, such as is seen only in non-immunes who are taking no suppressive treatment whatever. The evidence that the A.C.T.H. precipitated the malaria is, I feel, strong; moreover, the intestinal symptoms, if not due to malaria, could be due to the acute exacerbation by A.C.T.H. of a latent bowel infection. These ideas are in keeping with knowledge of the action of A.C.T.H., which can much reduce the tissue cell activity which is keeping an infection in check. So far, little A.C.T.H. or cortisone has been used in the Tropics; this is possibly the reason why incidents such as the present one have not been common.

This case indicates (a) that A.C.T.H. can give striking relief in the severe allergic reactions often seen in cases of filariasis being treated with hetrazan; (b) that it seems probable that A.C.T.H. can temporarily neutralize immunity to malaria (and possibly other infections) and provoke a fulminating attack in persons in whom such infections are latent; and (c) that therefore A.C.T.H. cannot be used with safety in such cases. It seems, however, possible that such dangers of giving A.C.T.H. can be overcome by the simultaneous use of energetic measures to combat such infections. If A.C.T.H. and cortisone are to be used in malarious countries, or in persons returning from malarious countries, this matter should receive consideration. Further studies of this matter are needed.—I am, etc.,

Uzuakoli, E. Nigeria.

JOHN LOWE.

Relief of Pain in Childbirth

SIR,—The letter of Mr. Ian Simpson (*Journal*, May 16, p. 1110) reminds us of Sir James Young Simpson's valiant attempt to help the woman in labour, and it is indeed fitting that just one hundred years after Queen Victoria received the benefits of analgesia, we should look more closely into the position of analgesia in labour to-day.

Recent correspondence in *Public Health*¹ and the *Medical Officer*² and the address of the late F. Neon Reynolds to the British Medical Association in Dublin, 1952, have shown that this position is far from satisfactory. I have received a number of letters from mothers in various parts of England, all telling a sad and sorry tale. One describes how she was given gas and air for her last pain only. This practice is not uncommon, and one cannot escape the conclusion that the gas-and-air machine is sometimes used as a face-saving device, as the patient who receives gas for only one pain goes down in the records as having received analgesia.

Another mother tells me that she did not get gas and air because the machine was empty. So the melancholy record goes on. It is perfectly clear to any honest and sincere observer that our girls are not receiving the attention which is their due. This, twenty years after the introduction of gas-air analgesia. Some hospitals have shown how great can be the benefits of modern analgesia to the woman in labour, and in domiciliary midwifery the County Medical Officer of Health for Hertfordshire has conclusively demonstrated what wonderful results can be obtained from his own inspiring leadership in this county. Taking England as a whole, the relief of pain in maternity falls lamentably short of what might reasonably be expected, and the help given under nationalized medicine compares very unfavourably, both in hospital and domiciliary midwifery, with that provided by the Hertfordshire County Council.

Let there be no misunderstanding. Whether we use chloroform or nitrous oxide or trichlorethylene, or any other thing, no satisfactory results can be expected until there is a genuine and sincere desire to provide relief from pain and unless the necessary organization for such a service is forthcoming.—I am, etc.,

New Barnet.

Haemophilia with Respiratory Obstruction

SIR,—The paper by Dr. A. C. Macdonald and his colleagues (*Journal*, May 23, p. 1144) recalls a similar case in which I was involved about a year ago.

The patient was a healthy young man of 24, who was well known by his doctor and dentist to be a "bleeder." He had attended the local dental hospital for toothache and it was decided to fill the cavity in the tooth under a local anaesthetic inferior dental nerve block. Unfortunately the needle used for the injection transfixated the inferior dental vessels and rapid extravasation of blood developed in the soft tissues of the left cheek. The swelling developed so rapidly that the dental filling had to be abandoned. He was admitted to hospital 12 hours

later with difficulty in swallowing due to gross extravasation of blood in the tissues of the left cheek and the floor of the mouth. The tongue was purple in colour, oedematous and filled almost the whole of the oral cavity. There was no actual bleeding into the mouth, and the condition seemed to be entirely one of extravasation into the soft tissues.

During the next 12 hours the swelling increased steadily. The tongue not only filled the oral cavity, but protruded from the mouth. There was a large swelling in the left side of the neck, which appeared to be fluctuant in places. By this time difficulty in breathing was obvious and increased rapidly. Surgical treatment became imperative. As in the case quoted by Dr. Macdonald, it was decided to explore the swelling in the neck. To our dismay, no localized collection of blood was found, only a diffuse interstitial extravasation of blood in the tissues of the neck and the floor of the mouth. To provide an airway, a formal tracheotomy was performed. It was considered unwise by our anaesthetic colleagues to attempt tracheal intubation through the nose. The patient's recovery was complicated by persistent oozing from both wounds. The wound on the left side of the neck broke down, and even after packing with fibrin foam soaked in thrombin solution and closing the wound by suture, the oozing still continued for several days. It took some 10 weeks for the swelling of the face and tongue to subside and the wounds of the neck to heal soundly. In all, the patient was given 24 pints (13.6 l.) of blood in the course of one week. Nine pints (5.1 l.) of this blood was fresh, taken on the spot from volunteer donors and transfused almost immediately.

It is generally recognized that transfusion of even one pint (0.568 l.) of fresh blood will diminish materially even severe bleeding from a haemophilic patient. In our case it was alarming to find that transfusion of large amounts of fresh blood did not have this dramatic effect. Two factors may have contributed to this. Although we had asked specifically for fresh blood, not more than 24 hours old, some of the blood sent to us as "fresh" from the Regional Blood Transfusion Service was found to be over 48 hours old. The transfusion of large amounts of stored blood over a short period must necessarily increase the concentration of citrate in the circulating blood. This might affect the normal blood-clotting mechanism in a patient who has already lost a large amount of blood. Those of us who have assisted at emergency gastrectomies for persistent haematemesis have often remarked upon the unusual amount of bleeding which occurs during the operation. Since all these patients have had large amounts of blood transfused both before and during the operation, overdosage with citrate is a possible explanation. I am not aware, however, that any proof has been adduced to support this clinical impression.—I am, etc.,

Salisbury.

MICHAEL N. TEMPEST.

Treatment of Ringworm of the Scalp

SIR,—Dr. B. A. Thomas (*Journal*, May 9, p. 1052) in replying to my letter (*Journal*, April 4, p. 780) has found it necessary to base his criticism on a flagrantly inaccurate paraphrase of my words. I did not, as suggested by Dr. Thomas, claim that "the majority of authorities are in favour of x-ray epilation for *M. canis* ringworm." My actual words were: "Most authorities agree that topical treatment may prove inadequate in some cases of *M. canis* ringworm" and in this connexion I would refer Dr. Thomas to Duncan,¹ Ormsby and Montgomery,² and Sharp.³

Dr. Thomas explains that the "frequency of erythema reactions and also of coincident glabrous skin involvement as a means of diagnosing *M. canis* scalp infections" renders as a means of diagnosing *M. canis* scalp infections. This is not in examination by Wood's light unnecessary. Beare accord with the observations of other investigators. Beare and Cheeseman⁴ and Hayvatt⁵ found that little or no inflammation was present in approximately half of the cases examined by them. Furthermore, *M. canis* scalp infections are not invariably associated with glabrous skin involvement. In consequence, I contend that the use of Wood's light in the diagnosis of *M. canis* scalp infections can hardly be dismissed as "unnecessary." If, as would appear to be the case, Dr. Thomas relied on simple clinical inspection of the school populations referred to in his

article and omitted Wood's light examination in assessing the "cure" in his series of 24 cases, it would seem that his conclusions can at best be regarded as of doubtful validity.—I am, etc.,

Glasgow, W.2.

Intestinal Reflux into the Bile Passages

SIR,—I should like to record the following case.

A frail lady of 71 was admitted with four days' history of central abdominal colic, vomiting, and intermittent abdominal distension. Four years before, a cholecystogram showed a failure to concentrate dye. Cystectomy had been advised but refused. Since then she had had mild recurrences of symptoms at intervals of a few months, the last attack being six months before admission to hospital.

Examination of the abdomen showed slight distension, no tenderness, presence of bowel sounds and waves of peristalsis from left to right across the upper sector. Splashing was elicited in the upper abdomen, while recumbent. A small left femoral hernia was reduced. Clinical findings suggested a pyloric stenosis. After a barium meal stomach and duodenum appeared normal, and barium passed as far as the ileum. Remarkably, however, the biliary tract filled with barium, outlining the common and hepatic ducts, and finer branches, in excellent detail (see illustration). The gall-bladder did not appear to fill.

The patient's condition was poor, and laparotomy was performed without delay. The obstruction in the small gut was not, as expected, a gallstone but a Richter's hernia in the neck of the left femoral canal. This was reduced. The patient's condition did not allow further exploration. There were no obvious adhesions in the upper abdomen. Recovery was uneventful except for tenderness over the liver for several days and a little pyrexia for about a week. A cholecystogram was done two months later. The gall-bladder concentrated poorly and emptied rapidly without the stimulus of a fatty meal. There was no indication of any abnormal communication between the biliary system and gut.

The interesting feature of this case was that x-ray examination after a barium meal showed a reflux of intestinal contents into the biliary passages. The clearness of the outline suggested that fluid had entered under slight pressure, presumably through a freely patent communication. The gall-bladder did not share in the reflux. The patient's mild symptoms did not suggest the earlier passage of a gallstone through the common bile duct. If a gallstone had quietly eroded its way into the small bowel from the gall-bladder, it is improbable that a widely open fistula would have persisted, and neither barium meal examination nor subsequent cholecystogram lent any support to this. On the other hand, a reflux of intestinal contents through the sphincter of Oddi may have occurred. The presence of an obstruction in the small bowel at the time, and the demonstration of a rapidly emptying gall-bladder subsequently, lend support to this. A subsequent barium meal was normal, and there was no evidence from the report of a barium meal four years previously of any reflux.

Should the diagnosis of retrograde flow into the common duct be correct, it raises the interesting possibility of this as a cause of cholangitis in obscure cases of cirrhosis.

My thanks are due to Mr. F. J. C. Matthews, under whose care the patient was admitted, for permission to publish this case, and to Dr. G. A. MacDonald and Messrs. Murphy, of the radiological department, for the x-ray investigations.—I am, etc.,

Covertry.

I. A. HARRIS.

Importance of Post-mortem Examinations

SIR,—In my experience, which extends to nearly 30 years in general practice, it is very rarely that the family doctor is informed even of the time at which a necropsy is to take place, let alone receives a report on the result—which in my case I can never remember happening. Is it not therefore time that someone was made responsible for seeing that this information was conveyed to the family doctor, for it is probably not always possible for him to attend in person? After all, he is much concerned in the matter. He may have attended the patient for many years, and he was in all probability called when the death took place. Furthermore, it was probably his decision that led to a post-mortem examination being carried out.

Post-mortem examination would no doubt sometimes throw interesting sidelights on the accuracy or otherwise of our diagnoses. Recently, when a myxoedematous woman of 75 died suddenly, and when perhaps a diagnosis of cerebral haemorrhage or coronary thrombosis would not have been unreasonable, the extreme and unusual pallor of the face, even in the dim light of the little scullery in which she was lying, led me to suggest that a post-mortem would be desirable. This eventually showed that my patient had, in actual fact, died of a ruptured aneurysm of the abdominal aorta; and this aneurysm was, in some way, probably the cause of the abdominal pain of which she had complained to her family for a fortnight before her sudden death.

In view of what Dr. F. E. Loewy (*Journal*, May 23, p. 1163) says upon the need for post-mortem examinations, one would like to ask him whether he is aware of the natural repugnance of people generally to post-mortem examinations on their deceased relatives. It is all very well to talk about the needs of medical science and educating the general practitioner. These are as nothing beside those feelings of sentiment and affection which are to be found in the generality of ordinary people.—I am, etc.,

Hove.

G. L. DAVIES.

Adrenaline Cream

SIR,—I have read with great interest the report (*Journal*, May 16, p. 1085) from the Walkden Clinic on the assessment of massage with adrenaline cream in the treatment of rheumatic disorders. At least one fact has emerged—that adrenaline cream has a definite therapeutic value as a palliative, thus refuting the findings of the Research Committee of the Empire Rheumatism Council, reporting on the controlled tests on 39 cases in all investigated at nine different centres in 1951. There are, however, certain observations I would like to make, as it is important to show why the results in recovery time obtained in this otherwise well-conducted trial differ from others previously reported (Moss¹ and Howell²).

It is a minimal dose of adrenaline acting in the skin that relieves muscle spasm and pain. I would refer future investigators on this subject to the work of Danielopolu³ on the double and antagonistic action of adrenaline in very weak concentrations on the intersympatho-parasympathetic mechanism, of Pasteur Vallery-Radot and Holzer⁴ and Morin⁵ on similar experiments using exceedingly weak concentrations of adrenaline, showing that it has a reversible action. I was therefore surprised to read that an adrenaline cream five times more concentrated than the one I have always employed has been used by this clinic in these tests.

In an assessment of recovery time the Walkden Clinic has based its trials on an early paper submitted to the *Lancet* in July, 1946, and published in the *Medical World* in 1949,⁶ and which dealt mainly with the treatment of "primary fibrositis." In all subsequent papers I stressed that all cases of osteoarthritis and cases of rheumatoid arthritis (the latter only treated in the rehabilitation stage) need a special technique of joint immobilization to get good results. I quote "patients should be treated daily in their homes and in their bed for the first few days. Freedom from pain and increased movements round the affected

joints are so marked, after five minutes of treatment, that if active movements are allowed a most severe 'tissue reaction' will follow (due to the stretching of muscular tissues and adhesions) after the 'anaesthetic' effect of the cream has passed off" (Moss⁷).

This technique has not been used and these cases have been treated only three times a week at an out-patient clinic, and, in all probability, walked home after treatment. It is not surprising that these patients took twice as long to recover compared with those treated with a simple cream which does not cause immediate relaxation and more freedom of movement. The treatment of disk lesions with adrenaline cream has never been suggested in any of my papers. The exciting factor in this condition causing pain and spasm is far too powerful to be beneficially influenced with adrenaline cream.

It would therefore appear that fully 60% of the cases treated for an assessment of recovery time with adrenaline cream (10 cases of disk lesions, seven cases of osteoarthritis, two cases of rheumatoid arthritis) have been treated by methods that would cause greater pain and further disabilities and delay considerably the recovery time and thus lead to a wrong assessment of the series as a whole.

The similarity of the findings with dry massage and adrenaline cream is of particular interest. It would appear that some "substance" is formed in the skin that blocks the pain chain mechanism. The theory advanced that the mode of action of the minute dose of adrenaline can be explained by systemic absorption has been discarded by the writer. If adrenaline cream is applied without massage to the skin (previously rubbed for a few seconds with a damp towel to remove surface impurities and weaken the horny layer) within a very few seconds pain is greatly relieved and the muscle can be felt to be relaxed. (Incidentally, the use of a simple cream will not have the slightest effect on pain or spasm.)

Furthermore, acting on my theory that it is very weak concentrations of adrenaline acting in the skin that produce these results, during the past 18 months I have been using intradermal injections of adrenaline 1/100,000 in association with adrenaline cream for the treatment of cases of rheumatoid arthritis—only in the rehabilitation stage—in cases of osteoarthritis and in those cases of fat and thick-set patients who suffer from primary fibrositis and who do not respond well to treatment with adrenaline cream (Howell²). Given subcutaneously, these injections have not the slightest effect upon pain or muscular spasm. Injections, in minimal doses into the skin, over the myalgic spots and referred areas of pain act almost within a second in the relief of pain and muscle spasm. It would be of interest to discover the weakest concentration of adrenaline that would have this effect.

A preliminary paper on this new technique, "Adrenalino-therapy Associated with Skin Therapy in the Treatment of Rheumatic Disorders," was the subject of a lecture demonstration that I gave to the Société des Praticiens de Paris on April 16 last.—I am, etc.,

Subcostal Pain Following Controlled Respiration

SIR,—Dr. T. T. Currie's medical memorandum (*Journal*, May 9, p. 1032) raises one or two important points. I was disturbed to read of the high incidence of apnoea lasting 5–10 minutes following the administration of both succinylcholine and gallamine triethiodide for such procedures as dental operations. I presume, although Dr. Currie does not specifically say so, that succinylcholine was given by the single-injection technique. Succinylcholine response varies so markedly from patient to patient in the lower-dose ranges (20–40 mg.), as far as both relaxation and apnoea are concerned, that I have largely abandoned this technique of single injections. I believe it to be a much more rational approach to titrate, as it were, the drug against each patient by the use of the continuous intravenous infusion of dilute solutions of succinylcholine, even when relaxation is needed for tracheal intubation only. In this way, excellent relaxation can be achieved with the minimum of succinylcholine for that particular patient, and with the avoidance of apnoea

in the very large majority of cases. If it does occur it is of extremely short duration (30 seconds or so). Although apnoea holds no dread for the well-trained anaesthetist, we must not lose sight of the fact that it is essentially an unphysiological state of affairs, as is the positive-pressure artificial respiration which must be instituted to maintain ventilation. Under certain circumstances, such as "bucking," restraining, and irregular patterns of respiration, manual respiration may be the lesser of two evils, but, on the whole, apnoeic states should be avoided unless specific indications exist.

My second point is one of semantics. "Controlled respiration" by our definition is that state wherein spontaneous respiration has been abolished by means of hyper-ventilation with oxygen, maximum elimination of carbon dioxide, overdistension of the lungs (inhibition of the Hering-Breuer reflex), and a varying degree of central respiratory depression, but in which spontaneous respiration will resume soon after manual ventilation has been discontinued. Paralysis with muscle-relaxants clearly does not come within this definition, as spontaneous respirations will not resume as long as the drug maintains its paralysing effects on the muscles of respiration and in particular the diaphragm. This type of respiration should be called what it has always been called—namely, "artificial respiration." The borderline between controlled and artificial respiration is not always too clear, and one may blend into the other; this occurs not infrequently after controlled respiration has been maintained for prolonged periods. Artificial respiration may not be as well-sounding a term as controlled respiration, but it is scientifically more correct in the case of apnoea from muscle-relaxants.—I am, etc.,

The Floating Spleen

SIR,—The case of a pedunculated cystic spleen described by Dr. A. H. Bartley (*Journal*, May 23, p. 1167) is so strikingly similar to a case of mine operated on in Northern Malaya some years ago that an interesting problem is raised.

This patient, a Malay woman of about 30 years, presented with a history of intermittent abdominal discomfort and a tumour so mobile that it was thought to arise from the pelvis. At operation a spleen measuring approximately 20 by 10 cm. was drawn out of the abdomen on a ribbon-like pedicle, the clear glossy surface of the organ being embossed with thin-walled cysts up to 4 cm. in diameter. Later, when the organ was cut, it was found that the bulk of the splenic tissue was replaced by isolated cysts as smooth inside as they were outside and containing clear straw-coloured fluid. There were no obvious cysts in the liver.

The point, then, is this. Is a cystic spleen more prone to become pedunculated than is the normal organ? Or do cysts develop secondarily in a mobile spleen through intermittent torsion of its pedicle?—I am, etc.,

Dundee.

Orthopaedics and Its Name

SIR,—There is a time when the original and accepted name given to a subject is no longer adequate or accurate and might usefully be changed. I feel this applies to the word orthopaedics, or -pedics in America. No doubt it has a good Greek origin from "the straight child" and I suppose was first applied to the correction of mechanical deformities in children. But now the subject covers a multitude of physical and mechanical disorders from the neck to the toes, and the name has long appeared inappropriate. This distortion of the meaning of words has been brought home to me recently by reading a most useful book entitled *Chiropodial Orthopaedics*—hands, feet, straight, children. This book is entirely devoted to adult feet. I gather that American "podalists" would be insulted by being called chiropodists, as the latter word stinks to them of chiropaxis.

But it is the word orthopaedics with which I am concerned. Why not orthosomatics, or some more accurately descriptive word? It could quickly and readily replace

the present word and would have an accurate meaning and sound well in the medical directory or telephone book. I feel seriously about the misuse of words, and wonder if the "orthopods" will agree to become "orthosomes" to their friends.—I am, etc.,

London, W.1.

R. D. LAWRENCE.

POINTS FROM LETTERS

Services Tobacco Concession

Dr. G. C. PETHER (Hitchin) writes: I recently examined for a job a youth of 20 years. He had just come out of the Army. He described attacks of bronchitis at intervals and also how he had smoked 180 cigarettes weekly while in the Services. He was still smoking 100 and was unable to calculate what it cost weekly or yearly. I took some trouble to instruct him in simple methods of calculation, which he had never learned at school. I submit that this "concession" of low-cost cigarettes is stupid, unnecessary, and most harmful to the exchange position, leaving the person supposed to benefit in worse health, reduced in pocket and even, as this case shows, incapable of estimating his outlay. Should not the Services sell tobacco at normal rates to those who want it, give a cash allowance in lieu, and spend a little more time in teaching simple arithmetic to those who need it?

Smoking and Cancer

Mr. GERALD SOLOMON (Manchester) writes: It is interesting to note that the statistics which are being used to show a relationship between lung cancer and tobacco smoking show that pipe smokers appear to be less likely to develop the disease than cigarette smokers. There is one implication of this state of affairs which I have not yet seen mentioned anywhere, but which does, I feel, merit investigation. The continual presence in the smoker's mouth of the stem of his pipe will surely stimulate the secretion of large volumes of saliva. Is it not possible that this solution takes up a carcinogen (or co-carcinogen) which the cigarette smoker inhales and the pipe smoker swallows? It would be interesting to see whether the incidence of carcinoma of the stomach is higher in pipe smokers than in cigarette smokers and non-smokers.

Barbiturate Poisoning

Dr. E. MACKERNAN (Birmingham) writes: In view of the increasing number of attempted suicides and cases of accidental poisoning by barbiturate tablets, capsules, etc., would it not be possible for the manufacturers to add 1–2 grains (65–130 mg.) of ipecacuanha to each so that in the event of a lethal dose of the former being consumed the emetic properties of the latter would take effect and the poison automatically vomited up? I believe some years ago I read a letter in the *Journal* from a Colonial member who adopted this method in his own dispensing practice.

Litigation Against Doctors

Mr. C. J. CELLAN-JONES (Swansea) writes: I agree with Mr. William Gissane (*Journal*, May 23, p. 1167) that increasing litigation against doctors menaces sound clinical medicine. Moreover, the happy relationship and the feeling of confidence which existed between the doctor and his patient are being replaced by mutual distrust. Recently, on reaching the theatre a patient said, as he waved an accusing finger at me: "They knocked my elbow as they wheeled me in. It may be nothing, but remember that I have warned you." The atmosphere of the operating-theatre is not improved nowadays by the gloomy thought that the surgeon, the anaesthetist, and the nursing staff must constantly regard themselves as potential criminals.

Asthma at Sea

Dr. G. L. ALEXANDER (Bristol) writes: In the *Journal* of December 10, 1949 (p. 1357), I commented on the sufferings of asthmatics in tourist liners to Australia. Even those who have not had attacks for months or years previously have frequent attacks during the voyage, and often go into status asthmaticus, which nothing relieves until they get off the ship. It is our experience that they suffer much less in the newer ships. In old ships, however high the standard, there is inevitably more dust from disintegrating paint, furniture, textiles, moulds, etc. Further, they are more heavily sprayed with compounds containing D.D.T. and pyrethrins to keep down cockroaches. I would therefore urge that practitioners should advise any asthmatic patient intending to travel by sea to book only in a relatively new ship, and to get the best first-class cabin they can possibly afford.

Obituary

C. B. LEVICK, O.B.E., M.B., Ch.M., F.R.C.P.

Dr. C. B. Levick, physician in charge of the cardiology department at St. George's Hospital, died at his home at Amersham on May 31 at the age of 56. He will be remembered first and foremost as a wise general physician. He was also a good teacher and skilled administrator.

Claude Blaxland Levick was born in New South Wales, Australia, in 1896. He was educated at Sydney Grammar School and Sydney University, where he held the Aitken and Cooper scholarships, the latter in classics, and the John West and Grahame medals. He qualified M.B. at Sydney in 1920 and Ch.M. in 1922. He then came to England, where he held house appointments at the Manchester Royal Infirmary before finally settling in London. Here he held a number of resident appointments at St. George's Hospital and at the Victoria Hospital for Children, Tite Street. In 1925 Levick was elected physician to out-patients at the Victoria Hospital and, in 1928, assistant physician to St. George's Hospital. His two main interests were in cardiovascular disease and diseases of children. He was one of the earlier physicians to use the electrocardiograph in clinical practice, and acquired remarkable skill in interpreting the standard leads. He always remained, however, a general physician, and saw each problem against the background of the whole patient; it was this, together with a remarkable care for detail, that made him such a valuable consultant.

Levick had a high reputation as a teacher, and instilled into his students a regard for fundamental facts which they never forgot. A keen and wise person, he was the most generous and helpful of colleagues, and a friend to his juniors.

C. P. P. writes: I knew Blaxland Levick for the 30 years he was associated with St. George's Hospital. He was a house-physician when I first came to St. George's, and was an excellent teacher with a precise mind: his students were trained to think and express themselves precisely and clearly. Later when he became resident assistant physician he showed that he was a first-class administrator, and this was constantly demonstrated throughout his life—both before and after the war with his advice over hospital matters and in committee, and during the war with the success that came to him in his Middle East appointment. Blaxland was a shy man, but as a friend he showed a variety of interests. In his early days at St. George's he was an enthusiastic skater and was often on the rink at Grosvenor House before the day's work began. He was a keen lawn tennis and squash player. He was fond of good music and had a large collection of classical records. He will be sadly missed by his colleagues and friends, with his sense of humour and devotion to work which remained until the end.

E. T. ROBERTS, M.D., F.R.C.P.Ed., F.R.F.P.S., D.P.H.

We record with regret the death of Dr. E. T. Roberts at his home at Portsmouth on May 11 at the age of 88. Appointed in 1909 on the inauguration of the school medical service as principal medical officer to the School Board (later the Education Authority) of Glasgow, he served in that city for over 20 years until his retirement at the end of 1929.

Born at Worcester, where his father was in practice as a solicitor, on April 24, 1865, Ernest Theophilus Roberts was educated at the cathedral and grammar

schools there and then went on to the University of Edinburgh, where he graduated M.B., C.M. in 1886, proceeding to the M.D. in 1889. After experience as resident physician and assistant (by competitive examination) to the professors of clinical medicine at the Royal Infirmary, Edinburgh, and as senior medical officer of the Children's Hospital and the City Fever Hospital, Birmingham, he entered general practice in 1892 at Keighley, Yorkshire, where he succeeded his uncle, Dr. Arthur Roberts, who then moved to Harrogate.

His interest in public health and children's diseases led him in 1909 to enter the field of school medicine at Glasgow, where under his guidance a comprehensive scheme of medical inspection and treatment was built up, including the provision of 10 special schools, mostly of the open-air type, for physically and mentally defective children as well as numerous special classes for blind, deaf, and myopic children. Exceptionally gifted and fond of study, he obtained the Cambridge D.P.H. in 1911 and the F.R.F.P.S. in 1918. He became a Member of the Royal College of Physicians of Edinburgh in 1929, and was elected Fellow in 1937. After retirement and at the age of 70 he passed the examination for the diplomas of M.R.C.S., L.R.C.P. in 1935 at the first attempt. He was examiner in public health for the Scottish triple qualification; for the Diploma in Public Health of the Scottish Conjoint Board; and in State Medicine for the F.R.F.P.S. When he retired in 1929 his staff, which was responsible for the health of nearly 190,000 children, numbered 14 medical officers, 5 dentists, and 70 school nurses. He was an honorary member and past president of the Association of School Medical Officers of Scotland. During the war of 1914-18 he served as a captain in the R.A.M.C.

Ernest Roberts was a handsome man of great personal charm. His wise counsel and ripe experience were at all times available to those who sought his help, while his quiet and never-failing courtesy endeared him to everyone. He had wide interests in church and social work, and was an eloquent speaker. He married Miss Rosa May Paddock, the youngest daughter of the late William Paddock, of Caynton Manor, Newport, Shropshire, in 1892, and Dr. and Mrs. Roberts celebrated their diamond wedding anniversary last year. Their son, Dr. T. E. Roberts, is medical officer of health for Portsmouth, and their daughter married Dr. J. C. Eaton, of Glasgow.—J. T. G. E.

HILDA J. GARDNER, M.B., B.S.

Dr. Hilda Gardner (née Florey) died on May 18 in the Royal Melbourne Hospital—the hospital which she served from the time of her appointment to the position of assistant bacteriologist in 1929.

Hilda Josephine Florey was born in 1890 at Malvern, South Australia, the daughter of Joseph and Bertha Mary Florey. She was one of a distinguished family, of whom her brother, Sir Howard Florey, is the best known. After leaving Miss Thornber's School for Girls in South Australia, she entered the University of Adelaide in 1908, and graduated M.B., B.S. in 1912. Her undergraduate course was brilliant: she occupied first place in her course for four of the five years, including the final year. Between 1913 and 1917 she held resident appointments at the Adelaide Hospital, the Adelaide Children's Hospital, and the Women's Hospital, Melbourne. In 1917 she married Dr. John Forrest Gardner, of South Australia, who practised at Richmond, Victoria,

JUNE 13, 1953

where he died in 1928. After her husband's death Dr. Gardner returned at once to professional practice and joined the staff of the then Melbourne Hospital as assistant bacteriologist, a position she occupied until 1934, when she was appointed bacteriologist and serologist to the Royal Melbourne Hospital. In 1951 she was awarded an honorary fellowship by the Royal Australasian College of Physicians in recognition of her distinguished service to Australian medicine.

Her career was characterized by an unswerving devotion to the fulfilment of her responsibilities, which, combined with her professional skill, brought her rapidly into the front rank of Australian clinical pathologists. Dr. Gardner made haematology her principal interest and study. Her opinion was always thoughtfully considered before being offered, and was supported by strict attention to the details of the case. Clinicians sought her advice because of these attributes. Alone, or in collaboration with others, she contributed many original papers, which, taken altogether, cover the fields of haematology and bacteriology in the widest sense. Her most important contributions, however, were not those she could record in medical journals.

Hilda Gardner's professional work invariably remained her first consideration, but, like every other great person, she maintained wide extramural interests. A sensitive discrimination, coupled with a keen appreciation, distinguished her contributions to artistic design; in other circumstances she might have contributed even more as expressions of her ideas.

She continued with her work to the end in the face of serious ill-health. It was typical of her courage that she spent her last hour in consultation about one of her patients. She is survived by her daughter, Dr. Joan Gardner, of the University of Melbourne.—J. H. L.

Sir ROBERT G. ARCHIBALD, C.M.G., D.S.O., M.D.

We are indebted to Sir ERIC PRIDIE for the following appreciation of the late Sir Robert Archibald, whose obituary notice was printed in the *Journal* of May 16 (p. 1112): Sir Robert Archibald established a personal reputation, which later became a tradition in the Sudan, for his devotion to duty, his consideration for others, and for inspiring men to try to follow in his footsteps. I first met him during the later stage of his Sudan career, when he had an international name in tropical medical research. His never-failing readiness to help those who needed his assistance, his enthusiasm for and brilliance in his work, and his deep sympathetic understanding of Sudan problems and of the Sudanese people made him the friend of all, deeply respected throughout the country. It was characteristic of him that after retiring from the Sudan he took charge of Chacachacare leper settlement in Trinidad. There can be few men who have exercised so great an influence over those with whom they have been associated, and Archibald's name will long be remembered with gratitude and admiration in the Sudan, which he served so faithfully, as representing all that is best in the British way of life.

Dr. MAXWELL SMELLIE died suddenly at sea on May 7 while on a voyage to the Far East and was buried at sea on May 8. Maxwell Smellie was born on January 10, 1902, at Hamilton, Lanarkshire, where his father was later to be at provost. He was educated at Hamilton Academy and at the University of Glasgow, qualifying by taking the Scottish triple qualification in 1931. He was a keen and active footballer, and captained the University's Association football team when it won the Scottish amateur cup. During the play in the final tie he sustained a fractured leg, and the consequent plating of the limb caused him a certain

amount of permanent inconvenience. His interest in the game, however, never declined, and he became president of the Dagenham Football Club. For over 20 years he practised in Dagenham and was a well-known and respected figure, a popular doctor, and a friend to many. During the last war he was a captain in the Home Guard and devoted all his leisure time to his unit. He returned to his native Scotland last year and before settling down decided to gratify his intense love of the sea. To his widow, sons, and daughter our deep sympathy is extended. Dr. Smellie's death will be keenly felt by all those who knew him or came into contact with him.—B. K.

Mr. E. R. DESOUTTER, whose light engineering firm until a few years ago was famous for the manufacture of artificial limbs, died on May 11 at the early age of 51.

We are indebted to Mr. K. I. NISSEN for the following appreciation: The death of Mr. Emile Robert Desoutter will be regretted by many surgeons and by thousands of patients who have worn the artificial limbs of that famous *marque de fabrique*. The Desoutter family have a remarkable record in modern engineering design and practice. As boys, Emile Desoutter and his four older brothers were all trained by their father in the art of making watches and repairing every type of antique timepiece. However, in 1912, one of them, Marcel, lost a leg in a flying accident, and it was the successful light-metal above-knee limb fashioned by another brother, Charles, that led rapidly to the establishment of an industry which flourished during and between the two wars and which set a new high standard of technical perfection in lower limb prostheses. Mr. Desoutter joined three of his brothers at the age of 19 and played an active part in the development both of the artificial limbs and of the light-weight pneumatic and electric tools which were at first designed for their assembly. He took part in the firm's unfortunate controversies with the Government of the day which arose first in 1933 and later in 1948, when he had reluctantly to discontinue the manufacture of artificial limbs. Among surgeons in general Mr. Desoutter will long be remembered for the keen personal interest he took in the fitting and training of amputees, particularly young children with congenital defects; for his support of surgeons practising the modified Syme's amputation; for his adaptation of a pneumatic tool to the needs of orthopaedic surgery, and for the sturdy electric plaster-saw now in general use in Great Britain. Those who knew him personally will remember his generous and kindly nature and his capacity for friendship. As the last of the four brothers of the original firm Mr. Desoutter latterly had heavy responsibilities, which were lightened by a very happy family life in the country at Little Gaddesden in Hertfordshire. His death came most unexpectedly, some ten days after a spinal operation, from which he appeared to be making a rapid recovery. He leaves a widow, a daughter, and two sons, one of whom is carrying on the engineering tradition of the family.

We record with regret the death at Shanklin on May 20 of Mr. J. A. GAYNOR, senior surgeon at the Royal Isle of Wight County Hospital, Ryde. He was 52 years of age. Joseph Alfred Gaynor was born on March 19, 1901. He studied medicine at Trinity College, Dublin, graduating M.B., B.Ch. in 1923, and winning the Houghton clinical medicine prize and prize for surgery at Sir Patrick Dun's Hospital in the same year. After graduation he went out to Newfoundland, where he was house-surgeon at the General Hospital at St. John's. When he returned to Britain he took the F.R.C.S.I. and settled in Shanklin, where he was surgical member of a group practice until the Health Service came into operation. Besides his appointment at the County Hospital, Gaynor was a consultant surgeon to the Shanklin Cottage Hospital and the Frank James Hospital, East Cowes.

We are indebted to H. S. H. W. for the following appreciation: It is difficult for one who has been a colleague and friend of Alfred Gaynor for over twenty years to write

of his passing at the early age of 52, when he was at the zenith of a brilliant surgical career. Benefiting from a sound surgical grounding at Trinity College, Dublin, and for many years at Shanklin, from the vast experience of John Cowper, doyen of Isle of Wight surgeons, Gaynor quickly gained the esteem and trust of practitioners throughout the island. After the death of Mr. A. A. Straton in an air raid during the last war Gaynor found himself, at an unusually young age, senior surgeon at the Royal Isle of Wight County Hospital, Ryde. He was of a cheerful and sympathetic disposition, and his Irish humour and sparkle endeared him to his many patients. He will be greatly missed, not only in his home town but throughout the island. To his colleagues his loyalty and helpfulness were invaluable. He never spared himself, and to every general practitioner with whom he came in contact he proved a friend and counsellor. His fortitude during a long and painful illness was an inspiration and example to us all.

Dr. PERCIVAL GEORGE QUINTON, who died suddenly on May 21 at the age of 59, received his medical education at University College Hospital and qualified M.B., B.S. in 1918, proceeding to M.D. in 1921 after service in the R.A.M.C. with the British Army of the Rhine. He was superintendent of St. Mary's Hospital, Paddington, before joining in 1924 the staff of the Royal London Homoeopathic Hospital, with which he was connected during the remainder of his professional career. At the time of his death he was physician with charge of out-patients and medical officer to the nursing staff, as well as secretary of the medical advisory committee of the hospital. He was a Fellow of the Faculty of Homoeopathy, which he served in many capacities, including that of secretary. He was in turn assistant editor of the *British Homoeopathic Journal*, hon. librarian, and vice-president. Dr. Quinton was a skilful physician, beloved by his patients and colleagues. He was also a pianist of talent and a good linguist—a gift which led him to a study of the methods of the French school of homoeopathy as represented by Dr. Leon Vannier. He was elected a vice-president of *Le Centre Homoeopathique de France*, and represented his colleagues in the United Kingdom at many congresses abroad. Two daughters survive him, one being a member of the medical profession.—W. R. McC.

Universities and Colleges

UNIVERSITY OF LONDON

The governing body of the British Postgraduate Medical Federation has approved the award of Postgraduate Travelling Fellowships for 1953-4, tenable for one year, to M. B. McIlroy, M.D., M.R.C.P., of St. Bartholomew's Hospital (respiratory function, U.S.A.); D. Marrack, M.D., of the Postgraduate Medical School of London (biochemistry, U.S.A.); T. A. J. Pranker, M.D., M.R.C.P., of University College Hospital (haematology, U.S.A.); and P. Story, M.D., of St. Bartholomew's Hospital (haematology, U.S.A.).

J. A. V. Butler, D.Sc., has been appointed to the Chair of Physical Chemistry tenable at the Institute of Cancer Research (Royal Cancer Hospital), from January 1, 1953.

Professor J. M. Mackintosh has been nominated for re-appointment as the representative of the University on the governing body of the Slough Industrial Health Service.

The following have been recognized as teachers of the University in the subjects indicated in parentheses: *Charing Cross Hospital Medical School*, Mr. L. R. S. Taylor (Oto-rhinolaryngology); *Institute of Neurology*, Mr. Harvey Jackson (Neurosurgery); *Westminster Medical School*, Mr. P. D. Trevor-Roper (Ophthalmology); *Institute of Dental Surgery*, Dr. C. F. Ballard (Dental Surgery (Orthodontics)). Mr. A. G. Leigh, who is already recognized as a teacher of ophthalmology at the Institute of Ophthalmology, has been recognized also as a teacher of ophthalmology at St. Mary's Hospital Medical School.

The degree of D.Sc. has been conferred on Professor A. D. M. Greenfield, Dunville Professor of Physiology in Queen's University, Belfast, and on Professor C. L. Oakley, Brotherton Professor of Bacteriology in the University of Leeds.

Medico-Legal

VICARIOUS LIABILITY

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

In recent years some legal decisions on the allocation of responsibility between hospitals and doctors have provoked disquiet in the medical profession. Some medical men consider that the holding of a hospital authority to be vicariously responsible for a doctor's mistakes will diminish his sense of responsibility and his independence of professional action. And, some have added, the natural tendency of the hospital authority will be to try by rules and regulations to minimize the possibility of error by the doctor. The converse view has also been expressed that, if hospital authorities are not to carry the responsibility for errors made by their junior medical and surgical officers, the morale of these men will suffer and applicants for hospital posts will be hard to find.

If either or both these views are right, then the effect of the present state of the English law will be disastrous both for the profession and for the community, which the profession exists to serve. It is therefore important to examine whether these views result from a failure to appreciate the true nature of the principle of law concerned, or whether the law is such as to justify them. If it is, then the sooner it is changed by Parliament the better.

Acts of Servants and Agents

The responsibility of the governing bodies of hospitals for the acts of their agents is one of the many examples of the fundamental principle of English law—*qui facit per alium facit per se*. In anything he does a man must take reasonable care not to harm his neighbour. His neighbour is anyone who he ought to realize will be affected by that particular activity. If a person chooses, or is obliged by circumstances, to carry out the particular activity through the medium of someone else, whether the someone else is in his employment as a servant or simply engaged as an agent to do that particular thing, that person cannot thereby divest himself of the duty to take reasonable care not to do his neighbour harm. And if the servant or agent fails to take reasonable care, and in fact does harm, not only is he personally responsible, but the employer is vicariously responsible also.

The owner of a ship that carries passengers from Capetown to London is accordingly under a duty to exercise reasonable care towards them in doing so. This is an activity which he cannot carry out himself. He employs the master of the ship to navigate her as far as Dover. From Dover to Tilbury he employs a Port of London pilot with the necessary specialist knowledge of the Thames and its estuary. The master of the ship is his servant; the pilot is his agent to pilot the ship on that particular voyage up the river. If the ship is cast away and the passengers are injured through the failure of the master to exercise reasonable care in navigating the ship between Capetown and Dover, or the failure of the pilot between Dover and Tilbury, the shipowner is in law just as responsible to the injured passengers as is the pilot or the master. The fact that he is vicariously responsible in no way diminishes the personal responsibility of his servant or agent.

In the same way the governing body of any hospital is under a duty to exercise reasonable care towards people in the hospital. This duty is owed not only to the patients but to its own staff. In so far as the patients are concerned, its duty is to exercise reasonable care over their nursing and any treatment which it sets out to give them or operation which it sets out to perform. None of these activities does it carry out with its own hands, any more than does the shipowner with his own hands navigate his ship. Nurses, physiotherapists, radiographers, house-men are all its servants, just as the master is the servant of the shipowners. Consultants, even if honorary and unpaid, are its agents, just

as the pilot is the agent of the shipowner. If the patient is injured through the failure of any one of them to exercise due care towards him according to the current state of medical knowledge and practice, then the hospital is in law just as responsible to the injured patient as is the nurse, the physiotherapist, the house-man, or the consultant whose failure caused the injury. But the fact that the hospital authority is vicariously responsible in no way diminishes the personal responsibility of doctor or nurse.

An Old Principle

There is nothing new about this principle. That it has recently been reaffirmed in its application to hospital authorities has in law nothing to do with the National Health Service Act, 1946, but is purely coincidental. In our report in these columns of the case of *Cassidy v. Minister of Health*¹ the original error stemming from *Hillyer v. St. Bartholomew's Hospital* in 1909 and its correction have already been described. In Cassidy's case the court was careful to rest its decision that the Minister as hospital authority was vicariously responsible for the negligence of the consultant on the broad principle stated above, not on the particular statutory duty imposed on the Minister or any particular statutory duty imposed on the Minister or the hospital authority by the 1946 Act. The principle of vicarious liability is as old as the Common Law, and probably originates in the responsibility of the master for the acts of his slave, who had no independent legal standing, but was absorbed in the family which his master represented and for which in primitive legal systems his master had to answer.

The personal responsibility of the agent and the vicarious responsibility of the principal for the same act exist side by side. The practical result is that the injured person can sue one or other or both, and the consideration dictating which he sues is: Which will be able to satisfy any judgment he may obtain?

Before the era of widespread insurance it was usually the principal who was sued, because it was usually he alone who was worth powder and shot. Where the principal is the hospital authority, and where personal responsibility for the injury rests on a nurse or a physiotherapist or a hospital servant, who is not likely to be wealthy or insured, the hospital authority is the obvious target. Where the personal responsibility rests on the doctor, who is almost certainly insured whether he is a recently qualified casualty officer or a distinguished consultant, it does not matter to the injured person which he sues. If he is in any doubt whether the doctor is insured or where the personal responsibility will be found to rest—and this may be a difficult question—he will doubtless sue both.

Indemnifying the Principal

Sometimes a judge, having found a house-officer personally and the hospital authority vicariously responsible for a disaster, orders the house-officer to indemnify the authority as to the whole or part of the damages and costs. At Common Law an agent for whose fault his principal has been found vicariously liable is bound to indemnify his principal on the grounds that he ought not to fail to use reasonable care when about his principal's affairs. Under the Law Reform (Married Women and Tort-feasors) Act, 1935, where two people are responsible for the damage caused by the same failure to take reasonable care the court has power to order the one which it thinks to be really as well as legally responsible to indemnify the other, or to contribute to what the other has to pay to the plaintiff.

The result is that the plaintiff can sue whichever he thinks fit, and if he gets his judgment against both can execute it against whichever he thinks will be good for the money. His interests are therefore fully safeguarded. As between those legally responsible for the damages, the one who has to pay the plaintiff can, to the extent of the contribution or indemnity which has been ordered against the other,

¹ *British Medical Journal*, 1951, 1, 480.
² *Ibid.*, 1953, 1, 461.

recoup himself from that other, if the other has sufficient assets to recoup him. Moreover, the court has the opportunity to mark where in its view the blame as opposed to the legal responsibility really lies.

Such then is the state of the law in England, subject to the possibility that the Court of Appeal may hold that by virtue of the provisions of the National Health Service Act, 1946, and the Public Health Act, 1875, hospital management committees cannot be sued for negligence towards their patients at all.² But, whatever the law, a doctor's professional standards are imposed on him by the traditions of his profession and his conscience. The sanction for his failures is not that he may get judgment given against him. Since he can insure against the financial implications of a judgment, it does not matter to him financially how the responsibility may be apportioned between him and the management committee. The power of the court to mark where it thinks the blame lies is surely a salutary power. But in the ultimate analysis the relation between doctor and patient, and the standards of conduct the doctor sets himself, must be matters not of law but of conscience.

Vital Statistics

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported in each week during the nine years 1944-52 are shown thus -----, the figures for 1953 thus ————. Except for the curves showing notifications in 1953, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Infectious Diseases

Only small variations occurred in the trends of infectious diseases in England and Wales during the week ending May 23. The largest were an increase of 243 in the number of notifications of measles, from 10,034 to 10,277, and a decrease of 209 for whooping-cough, from 3,312 to 3,103.

The largest increases in the incidence of measles were 138 in Lancashire, from 1,489 to 1,627, and 63 in Somersetshire, from 295 to 358; the largest decreases were 102 in Durham, from 387 to 285, 100 in Sussex, from 413 to 313, and 90 in Gloucestershire, from 627 to 537. The largest falls in whooping-cough were 60 in Middlesex, from 219 to 159, 49 in Surrey, from 146 to 97, and 48 in Durham, from 153 to 105. 1,306 cases of scarlet fever were notified, being 20 more than in the preceding week. The largest local variation was an increase of 28 in Yorkshire West Riding, from 108 to 136. 19 cases of diphtheria were notified, 2 more than in the previous week.

29 cases of acute poliomyelitis were notified. These were 3 fewer for paralytic and 4 fewer for non-paralytic cases than in the preceding week. The largest returns were Surrey 5, Yorkshire West Riding 5 (Doncaster C.B. 2, Sheffield C.B. 2), and Essex 3 (Romford M.B. 2).

754 cases of dysentery were notified during the week, 18 more than in the preceding week. This is the fifth consecutive week that the incidence of dysentery has risen. The largest centres of infection during the week were London 123 (Westminster 42, Islington 13, Chelsea 12), Lancashire 78 (Liverpool C.B. 25, Manchester C.B. 13, Preston C.B. 10), Leicestershire 65 (Leicester C.B. 65), Bedfordshire 62 (Luton M.B. 40, Bedford M.B. 16), Durham 46 (Stanley U.D. 37), Norfolk 43 (Great Yarmouth C.B. 26), Essex 29 (Walthamstow M.B. 7), Yorkshire West Riding 29 (Huddersfield C.B. 7), Cambridgeshire 19 (Cambridge M.B. 19), and Northumberland 18 (Newcastle-upon-Tyne C.B. 9).

Week Ending May 30

The notifications of infectious disease in England and Wales during the week included scarlet fever 1,084, whooping-cough 2,476, diphtheria 21, measles 9,012, acute poliomyelitis 52, dysentery 505, paratyphoid fever 8, and typhoid fever 2.

A commentary on the national statistics for the years 1948 and 1949 is published in the Registrar General's Statistical Review of England and Wales 1948-9, Text, Medical (H.M.S.O., 10s.). It includes a tabulation of 1949 deaths in accordance with the 1948 International Statistical Classification of causes of death.

INFECTIOUS DISEASES AND VITAL STATISTICS
Summary for British Isles for week ending May 23 (No. 20) and corresponding week 1952.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available.

The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

* Measles not notifiable in Scotland, whence returns are approximate.

† Includes primary and influenza pneumonia.

§ Includes puerperal pyrexia.

Medical News

The Everest Doctors.—The Chairman of Council of the B.M.A. has sent Dr. L. G. C. Pugh the following telegram: "British Medical Association shares general delight at success of expedition and offers you and your medical colleagues warm congratulations."

Anaesthetists Honour Lord Nuffield.—The Faculty of Anaesthetists of the Royal College of Surgeons of England paid tribute to Lord Nuffield's great services to anaesthesia when he was presented with the diploma of Honorary Fellowship of the Faculty at a meeting of the board on June 3. At a luncheon at the Royal College of Surgeons after the presentation, Dr. B. R. M. Johnson, the Dean of the Faculty, proposed Lord Nuffield's health. He referred particularly to the great benefits to mankind which had accrued from the establishment of the Nuffield chair of anaesthesia at Oxford, and to the department of anaesthetic research which was to be housed in the Nuffield College of Surgical Sciences at the Royal College of Surgeons. Wearing the gown of the Faculty which Dr. Johnson had asked him to accept as a gift, Lord Nuffield said that anaesthesia was a subject near to his heart, for he had had some bad anaesthetics in his time. Although he had not established the department of anaesthesia at his plan to establish the department of anaesthesia at Oxford was not welcomed wholeheartedly at the time, "in Oxford they think to-day that I was right." It was the job of the surgeon to carry out the operation and leave the rest to the anaesthetist. Sir Cecil Wakeley, President of the Royal College of Surgeons, brought the agreeable occasion to a close by calling for three cheers for Lord Nuffield.

Corneal Grafting.—The British Red Cross Society has offered its services for conveying eyes to be used in corneal grafting. Details are given in a recent memorandum from the Ministry of Health (No. 95022/1/16/2, dated May 27). Eyes will usually be conveyed by rail or road, and if hospitals are unable to provide their own transport for any journey or part of a journey assistance from the British Red Cross Society can be obtained on application to the Society's local representatives. For journeys between hospitals and railway stations the Society will provide transport without any charge. For direct journeys between hospitals and the corneal-grafting centres the Society may seek payment from hospitals at the local hospital car service mileage rates. The Society has asked its county branches to get into touch with hospital authorities to settle local arrangements.

Disablement Benefit.—Relaxation of the conditions under which disablement benefit may be paid is the principal proposal of the National Insurance (Industrial Injuries) Bill, 1953. This Bill was presented to Parliament by the Minister of National Insurance, Mr. Osbert Peake, at the end of last month, and the text has now been published. At present disablement benefit can be obtained only if the damage resulting from the accident is substantial (assessed at over 20% disablement) or likely to be permanent. The new Bill allows benefit to be paid for any period during which the disablement is assessed at 1% or more irrespective of whether it is likely to be permanent. The additional cost of this and other changes proposed in the Bill is estimated at £140,000 a year.

Films on Rodent Control.—By arrangement with the United States Public Health Service a remarkable series of films on rats and their control was shown at the Royal Sanitary Institute in London on June 11. The five films, "The Rat Problem," "The Roof Rat," "The Norway Rat," "Rat Proofing," and "Rat Killing," were made by the American Army, with the advice of the Communicable Disease Centre of the American Public Health Service. In

order to make the films the rats in a heavily infested building were subjected to the glare of arc lamps for weeks ahead; and to allow every aspect of rat behaviour to be fully displayed the building was sliced in half, down to and below the foundations, and the exposed end covered with glass. The camera could then follow the rats into their burrows. The splendid pictures that have resulted amply repay the trouble taken to get them. One of the best sequences is a close-up of the birth of a litter; another highlight is a fight to the death between a brown rat and a black rat. The technical information is sound, and the only serious criticism is that the poison baits, wrapped in coloured paper, look remarkably like toffees. This could be dangerous if the baits were accessible to children. The films are intended for showing to technical audiences and not to the general public.

"Beauty and Health."—The American Medical Association is co-operating with Druggists Promotion Services, Inc., of Chicago in the production of a new popular health magazine, *Beauty and Health*. This 48-page magazine will be distributed by druggists to their customers. It will publish health educational articles and will stress the dangers of self-medication. Medical information for articles will be supplied by the A.M.A., which will also check copy for medical accuracy. The A.M.A. also publishes its own monthly popular health magazine, which began as *Hygeia* in 1923 and changed its name to *To-day's Health* in 1950.

London's Ambulances.—One section of the London Ambulance Service deals solely with emergency calls. It has 38 ambulances at 18 accident stations. The other and much larger part of the Service is responsible for the routine conveyance of sick persons to and from hospital. Last year the accident section was busier than ever before: it answered 87,691 calls. Of these 13,655 were to street accidents, and on average the ambulances took 7.2 minutes to arrive on the scene. Most of the street accidents occurred between 5 p.m. and 6 p.m. There were nearly 600 calls to attempted suicides, and over 1,600 to victims of assault. In about 5,500 of the calls answered an ambulance was found to be unnecessary. During the year the general section of the Service carried 660,206 patients a total of nearly 3½ million miles. The present strength of the Service is 249 ambulances, 10 ambulance-buses, 39 single-stretcher ambulances, and 21 sitting-case cars.

New Professor at Cardiff.—Dr. Archibald Sutherland Duncan has been appointed the first whole-time Professor of Obstetrics and Gynaecology in the Welsh National School of Medicine (University of Wales) as from October 1, 1953, on the retirement of Professor G. I. Strachan. Dr. Duncan qualified in 1936, and is at present Senior Lecturer in Obstetrics and Gynaecology in the University of Edinburgh and obstetrician and gynaecologist to the Western General Hospital, Edinburgh.

A Jacobite Physician.—The bicentenary of the death of Dr. Archibald Cameron was commemorated by a service at the Queen's Chapel of the Savoy, London, on June 7. Cameron, who is buried in the chapel, was a close friend of Bonnie Prince Charlie and one of the outstanding personalities of the '45. For his part in the rising he was condemned for high treason and hanged at Tyburn on June 7, 1753.

Register of Speech Therapists.—The 1953 *Register of Speech Therapists* has now been published, and can be obtained free on application to the secretary and registrar, Board of Registration of Medical Auxiliaries, B.M.A. House, Tavistock Square, London, W.C.1. Speech therapists are classified on a geographical basis, and, besides address and telephone number, information is given on qualifications, the type of appointment held, and whether private practice is undertaken.

Dr. Bernard Johnson and Dr. Cecil Gray have been elected respectively Dean and Vice-Dean of the Faculty of Anaesthetists of the Royal College of Surgeons of England.

states that in a factory where chlorine, sulphur dioxide, hydrofluoric acid, and combinations of phosgene with phosphorus oxychloride and phosphorus trichloride were manufactured "enough [hydrofluoric acid vapour] escaped into the atmosphere so that men with glasses could not work in the rooms, and the window panes were etched to the extent that the wind blew them out of their frames. The films of these men, employed at such work for four to ten or more years, showed no trace of reaction attributable to gas, and the incidence of tuberculosis was no greater than in persons employed in other parts of this large plant. Repeated examinations failed to demonstrate evidence of reactivation of several cases of latent apical disease that occurred in the group." He concluded that there was no evidence that any of the more common industrial fumes or gases alter susceptibility to tuberculosis.

Physiological Clocks

Q.—What part of the central nervous system is concerned in estimating the passage of time? Normal man is capable of estimating the passage of, say, half an hour with remarkable accuracy, provided that he maintains his concentration. Apart from the disturbances of consciousness (coma, stupor, mescaline intoxication, etc.), are there any known organic neurological disorders in which appreciation of time becomes so distorted that a second passing seems like a millennium?

A.—Nothing is known of any localized centre in the brain acting as a timekeeper. There is no particular reason why the brain as a whole, or many parts in semi-independence, should not act in this way, if their function tended to vary with time. Apart from sensory appreciation of changes in the external world, the body is provided with a number of possible clocks—for instance, the filling of the bladder or colon, the exhaustion of glycogen stores in the liver, etc. Subjective appreciation of the passage of time is, as is well known, strongly influenced by emotional attitudes. Did not Shakespeare comment on this point? "Who doth he gallop withal? With a thief to the gallows." (*As You Like It*: Act III, Sc. 2.) Appreciation of the passage of time is grossly altered in most disturbances of consciousness, deliria, etc. It is also very dependent on the formation of recent memories, and is therefore affected in Korsakoff's psychosis and similar states. A Korsakoff patient, after an hour's intensive investigation in an interview, may think he has been with the doctor for only a few minutes. There is a condition in which the passage of a second may seem a millennium—mescaline intoxication—but the mechanism is unknown.

Psoralens and Vitiligo

Q.—What are psoralens, and what is their place in the treatment of vitiligo?

A.—Reports, particularly in Egyptian and American literature, indicate that certain extracts of the fruit of the plant *Ammi majus*, which grows in Egypt, are effective in the treatment of vitiligo. Attempts are being made to synthesize these substances—ammoidin, ammidin, and majudin. They may be applied to the depigmented areas or may be taken internally, and subsequent exposure to ultra-violet light produces redness and blistering which is followed in a large proportion of cases by normal pigmentation of the affected areas.

Pains in the Feet in Addison's Disease

Q.—Are severe constant pains in the feet ever a feature in mild Addison's disease? If so, what are their cause and treatment?

A.—It cannot be said that severe constant pains in the feet are ever a feature of mild Addison's disease. Muscular cramps, usually in the calves, occur as a result of loss of sodium chloride and clear up with treatment with deoxycortone acetate and salt. It is possible that pains in the

feet may similarly arise, although it is unlikely in mild Addison's disease. Another suggestion is that the pains in question may be due to flat feet, produced by the muscular weakness which is a characteristic feature of Addison's disease.

Sleep-walking and Epilepsy

Q.—Is there any relationship between sleep-walking and the later development of epilepsy? What treatment is advised for sleep-walking of very recent origin in a boy of 6?

A.—It is obviously possible that in an individual case sleep-walking might occur as a post-epileptic automatism after a nocturnal fit. Such an occurrence would be most unusual, and it must be remembered that sleep-walking is very common. So far as is known, there is no general relationship between sleep-walking and epilepsy.

Often the best treatment of sleep-walking is no treatment at all. This is so when it occurs only on isolated occasions in an otherwise well-adjusted child. The doctor's job is then to reassure the over-anxious parents. He can tell them that about 50% of children walk in their sleep once or twice in their lives, that it is in fact normal, and very rarely indeed likely to involve a risk. If reasonable safeguards are taken against such dangers as falling downstairs, there need be no concern. If sleep-walking is frequent and persistent, rather more notice should be taken. It may then be but one sign of a more general nervousness—caused by an element of emotional discord in the home, for instance—which will need investigation and treatment. The symptom itself often responds to hypnosis and post-hypnotic suggestion.

NOTES AND COMMENTS

Heavily Furred Tongue.—Dr. A. LOWNDES YATES (Canford Cliffs) writes: The clinical picture described in this question ("Any Questions?" May 9, p. 1061) would apparently correspond to that found in invasion of the epithelium of the tongue with the penetrating form of monilia and/or with the fungus torula, since both not infrequently exist together. The forms of monilia and torula which are present in normal healthy mouths produce no symptoms, but in the penetrating forms the spores invade first the superficial and later the deeper layers of epithelium, and in the latter case cause ulceration. Such an invasion of the epithelium by the spores is often accompanied by the symptoms of oesophagitis, with which certain of the symptoms mentioned in the clinical history of the case would correspond. A smear taken from the tongue and stained would, if the diagnosis of monilial or torula infiltration is correct, show some of the cells derived from deeper layers of epithelium which have been invaded by the spores. If this provisional diagnosis is confirmed by microscopical examination of a smear, the most satisfactory though messy treatment is by means of application of coloured dyes to the surface of the tongue, while about three grains of sulphathiazole applied as powder to the contact surface of the dentures may hasten the disappearance of the symptoms, which, however, do not yield with great rapidity to any form of treatment with the exception of radiation, which latter is apt to be followed by distressing dryness of the mouth which lasts for weeks or months.

Correction.—In our leading article "Homage to Lind" (June 6, p. 1265) we should have added that the Royal Navy was also represented by Surgeon Vice-Admiral Sir Alexander Ingleby-Mackenzie, medical director-general, who took the chair at the afternoon session on May 22 and read an address on Lind.

BRITISH MEDICAL JOURNAL

LONDON SATURDAY JUNE 20 1953

OXFORD EPIDEMIC OF BORNHOLM DISEASE, 1951

BY

J. F. WARIN, M.D., D.P.H.
Medical Officer of Health

J. B. M. DAVIES, M.D., D.P.H.

Deputy Medical Officer of Health

(From the City of Oxford Health Department)

AND

A. D. VIZOSO, B.Sc.

F. K. SANDERS, M.A., D.Phil.

(From the Virus Research Laboratory, Department of Zoology, University of Oxford)

Sylvest (1934) gave a very full description of the recorded outbreaks of Bornholm disease up to 1931. Since that time there have been many valuable reports, but most of them have dealt only with the clinical features of the disease (Pickles, 1937; Howard *et al.*, 1943; Nichamin, 1945; Scadding, 1946; Hamburger and McNeil, 1947). Practically all the large outbreaks, reported have occurred in relatively closed communities, although Harder (1936) described an epidemic in the general population of Cincinnati, Ohio. So far as can be ascertained there has been no published report of any extensive outbreak occurring in the general community in this country.

This article is based on experience obtained during an epidemic of Bornholm disease in Oxford from September to November, 1951, a preliminary report of which was given (Davies and Warin, 1951) when the epidemic was still in progress. Following this preliminary report, several letters appeared in the correspondence columns, giving experience elsewhere, and from these, together with a number of private communications and information obtained through the Public Health Laboratory Service, it would appear that this country experienced a high incidence of Bornholm disease from about April until November, 1951. A total of 277 Oxford cases were eventually collected, of which 262 were visited by one of us (J. B. M. D.) or by the health visitor seconded to the investigation. From this material it has been possible to obtain useful information on the epidemiological, clinical, and virological aspects of the disease.

By following fortunate clues we were able to recognize the existence of the outbreak soon after it started, and so were able to draw the attention of the local medical profession to this largely unfamiliar disease, at the same time requesting the notification of all cases. There was a most gratifying response, and the notifications were received from more than half the doctors practising in the city. One doctor notified 26 cases, the next highest being 14, and there were 25 doctors who notified 5 cases or fewer. We believe that we were informed of most of the cases which sought medical advice. However, about half our cases never went to a doctor but were found by members of the

medical or health-visiting staff of the Health Department, and there is no doubt that many more mild cases remained undiscovered.

Epidemiology

It is now known that a few sporadic cases occurred in Oxford in August, but the epidemic began abruptly in the second week of September and extended over a period of six weeks, until the fourth week of October, when it ended as suddenly as it had begun, although a few cases were reported during the next three weeks. The incidence is shown in Fig. 1, and it will be seen that the peak occurred in the first week of October, with 53 cases.

The weekly incidence of cases given by Harder in the outbreak in Cincinnati (population 455,000) is

FIG. 1.—Weekly incidence of cases of Bornholm disease in Oxford during August–November, 1951.

remarkably similar to that observed in Oxford (population 106,400). It is of interest to note that the Oxford epidemic showed the same seasonal incidence as described by Sylvest and others.

Cases were spread throughout the city, but there were five distinct areas of high incidence. Two of these (North Oxford and Central Oxford) were situated on the west side of the Rivers Cherwell and Isis, which divide the city from north to south, and the other three (East Oxford, Marston, and Barton with Risinghurst)

tenfold dilutions into five one-day-old mice per dilution of $10^{-7.2}$. The LD_{50} of the second strain (Virus II) was $10^{-6.9}$. The two strains differed in incubation period, Virus I having an incubation period of four days in mice of this age, while that of Virus II was two days.

Both viruses caused lesions in the brains and viscera of young mice. The lesions included inflammatory and degenerative lesions of the brain, myositis, lesions of the fat pads between the shoulder-blades, myocarditis, and signs of damage to the liver as described by Godman *et al.* (1952). These lesions are all typical of those caused by Coxsackie viruses of Dalldorf's histological Group B (Gifford and Dalldorf, 1951), and in other respects our viruses also resemble them. Both kill mice readily up to the tenth to twelfth day of life; in older mice infection is sporadic, and mice more than 21 days old only occasionally succumb to inoculation by any route. Pappenheimer *et al.* (1951) found experimentally that injection of Coxsackie virus Group B, antigenic type 1 (Conn.-5) into older mice causes extensive lesions of the acinar tissue of the pancreas. This is also a characteristic of both the Oxford viruses, although they differ from Conn.-5 immunologically. However, two viruses isolated by Forrester and Tobin (1951) from cases of Bornholm disease did not cause pancreatitis in adult mice. Further study of the two Oxford viruses showed that they were of the same immunological type, and therefore they will hereafter be referred to as the Oxford virus.

Serological Tests

Paired sera taken in the acute and convalescent stage from each of 13 patients in which a definite diagnosis of Bornholm disease had been made were tested for the presence of neutralizing antibody against the Oxford virus. The technique of the neutralization test used was that of Melnick and Ledinko (1950). All sera were inactivated by heating to 56° C. for 30 minutes before use. Serum diluted 1/5, 1/50, and 1/500 was mixed with an equal volume of virus, so that each mouse dose contained 1,000 paralyzing doses of virus, and serum diluted 1/10, 1/100, or 1/1,000. The serum-virus mixtures were allowed to stand at room temperature for one hour and were then put up individually in sealed tubes and stored at -70° C. in a carbon-dioxide-ice cabinet. Mice approximately 24 hours old were used throughout the test. Litters born on the same day were pooled and the animals redistributed at random. Five to eight mice were given to each mother and one such batch was injected intramuscularly with each virus-serum mixture. As mice became available the appropriate virus-serum mixture was removed from the ice-box, thawed, and injected.

The results obtained in the 13 cases in which paired sera were available are shown in Table V.

In eight cases the sera taken during the acute phase of the disease showed little or no neutralizing power against the

Serum antibody titres are expressed as the highest dilution of serum which will protect mice against 1,000 LD_{50} of virus.

* Cases from which virus was isolated.

virus, but the serum specimen taken two to three weeks later showed a high content of antibody compared with that present in the first serum. It will be noted that this group of cases contains two individuals (R. D., P. D. S.) from whom viruses were isolated.

The other five cases had high antibody titres in both sera. This group included three patients (L. D., A. McL., and S. S.) from whom viruses were isolated. It is interesting that a similar occurrence of high antibody levels in both sera was found by Cheever *et al.* (1950) in an epidemic of "non-paralytic" poliomyelitis in Worcester, Mass.

A further group of three sera taken from children convalescent after Bornholm disease were tested for neutralizing power against the Oxford virus. Two cases showed a significant antibody titre, whereas in the third even the lowest serum dilution failed to protect infant mice against infection with the virus. It is interesting that this last case (D. C.) was the patient from whose faeces the Virus I strain was originally isolated. Nevertheless, this virus was undoubtedly concerned in the epidemic, since a clear-cut rise in antibody against it could be demonstrated in 8 out of 13 cases.

The findings place the viruses isolated from the Oxford epidemic in Group B (Dalldorf, 1950), which also includes those viruses which have been shown in the United States to be associated with epidemic myalgia. Preliminary cross-neutralization tests have been performed, using the Conn.-5 strain of virus—a strain of type B1 (Melnick *et al.*, 1949)—and the Oxford virus. Antisera against both viruses were prepared in hamsters by the technique described by Sickles and Dalldorf (1949). The results show that the Oxford virus does not belong to the same immunological type as the Conn.-5 virus. An epidemic of pleurodynia in the State of Washington studied by Lazarus *et al.* (1952) was associated with a virus of Group B antigenic type 3. Further tests are in progress to determine whether the Oxford virus corresponds to any of the four known antigenic types in Group B; but preliminary results indicate that it is not identical, although slight cross-reactions with type 1 may be shown by the use of high-titred antisera. Thus, while it is possible that Bornholm disease is always associated with Coxsackie virus of Group B there is now clear evidence that more than one immunological type of virus may be concerned.

Summary

A description is given of an epidemic of Bornholm disease which occurred among the general population of Oxford in the late summer and autumn of 1951. Detailed histories were obtained from 262 of the 277 cases traced.

The weekly rate of incidence rose rapidly to a peak in about four weeks and was followed by an equally rapid fall. Although cases occurred throughout the city, the epidemic was characterized by local areas of very heavy infection. The incidence was highest in young children. Spread within the family often occurred, but one-third of the cases were found to be single infections in a household. No connexion was found between cleanliness or overcrowding of the home and density of infection. Spread within schools was not a feature of the epidemic, but the experience of one infant school attacked is described.

The incubation period varied from 1 to 18 days, with the majority between two and five days. Symptoms were very diverse. The most useful single feature in diagnosis was the characteristic spasmodic nature of the pain. Pyrexia was usually present and severe headache was a common complaint. Other less frequent symptoms included vomiting, photophobia, shivering, sore throat, pain in the limbs or neck, dizziness, delirium, hyperaesthesiae, and paraesthesiae. In seven cases proved benign meningitis occurred as a complication, but the more probable figure was 16 (6%).

Orchitis was a complication in 3 out of 30 adult males infected. Relapses, both early and late, were a characteristic feature of the outbreak.

Viruses pathogenic for infant mice were isolated from the faeces of 6 out of 17 cases examined. Attempts to isolate virus from C.S.F., blood, and throat washings failed. The strain of Coxsackie virus isolated was identified as belonging to Dalldorf's Group B on account of the pathological lesions in mice. These included of the pathological lesions in mice. These included of muscle, fat-pad, and cerebral lesions in infant mice, and extensive lesions of the acinar tissue of the pancreas in adult mice.

Paired acute and convalescent sera were obtained from 13 patients and tested for the presence of neutralizing antibody against the Oxford virus. A marked rise in neutralizing power in the convalescent serum was demonstrated in eight patients, whilst the other five cases had a high titre of antibody in both sera.

Preliminary cross-neutralization tests, using the Oxford virus, indicate that it may be a previously unrecognized antigenic type.

The laboratory investigation of the Oxford epidemic of Bornholm disease was made possible by the generosity of the Nuffield Foundation, to whom we wish to express our gratitude. Our thanks are due to Dr. R. L. Vollum and Dr. G. T. Cook, Director and Deputy Director of the Oxford Public Health Laboratory, for their interest and practical help. The epidemiological study would have been very incomplete without the whole-hearted co-operation of the medical profession in the city. It is a pleasure to pay tribute to the thorough work of Miss H. Spickernell, the health visitor seconded to assist with the field investigations.

An Australian tree, the Duboisia, has become an important source for the production of atropine and hyoscyamine. Before the last war the Duboisia was little more than a botanical curiosity, but when other sources of supply of these alkaloids were interrupted in 1940 Australian scientists found that the Duboisia leaf had considerable possibilities. A chemical processing method was developed, and soon the major requirements of the Allies were being met. Present exports of the leaf, although exceeding 100 tons a year, do not completely satisfy the demand. Steps are being taken to make good the heavy inroads on the natural growth of the trees during the war. It has been shown that commercial yields of more than half a ton of dry leaf per acre are possible.

BORNHOLM DISEASE IN CHILDREN

BY

M. E. DISNEY, M.D., M.R.C.P.

E. M. HOWARD, B.Sc.

AND

B. S. B. WOOD, D.M., M.R.C.P., D.C.H.

With the assistance of the late

G. M. FINDLAY, C.B.E., M.D., Sc.D., F.R.C.P.,

under whose direction the virological study was begun

(From the Dudley Road Hospital, Birmingham, and the Pharmacy Laboratory, London University)

Now that one or more strains of the Coxsackie virus have been shown to be involved in Bornholm disease (Curnen *et al.*, 1949; Shaw *et al.*, 1950; Findlay and Howard, 1950), it should be possible by virus sampling to delineate more clearly the clinical features of the condition. Although the earlier literature suggested that Bornholm disease bred true to type, it has been suggested that "benign lymphocytic meningitis" (Macdonald *et al.*, 1937; Dummer *et al.*, 1937), encephalitis (Howard *et al.*, 1943), and pneumonitis (Hopkins, 1950) may be superimposed upon pleurodynia. From virus studies it appears that at least three other syndromes have been described as due to the Coxsackie infection—non-paralytic poliomyelitis (Dalldorf and Sickles, 1948), herpangina (Huebner *et al.*, 1951), and three-day fever (Webb and Wolfe, 1950). On the question of whether one strain of virus can give rise to several different syndromes, the evidence is inconclusive, though Bury and Tobin (1952) suggest that it can.

During the 1951 Bornholm epidemic in Great Britain 104 children with the clinical appearances of Bornholm disease were admitted to Dudley Road Hospital, Birmingham. This communication describes the clinical features of these typical cases and reports the results of a search for the Coxsackie virus among them; it also discusses the virological findings in 26 atypical cases which had clinical features differing slightly from true Bornholm disease but which for various reasons were thought possibly to be related.

Typical Cases

We have taken the following features as necessary to make the diagnosis: pain in muscles, usually of chest or abdomen; brief or recrudescence course, absence of demonstrable pulmonary or other lesions; and occurrence in epidemic form. We have therefore excluded all cases showing definite radiological changes in the chest.

The Epidemic.—On June 2, 1951, a girl aged 13 was admitted to the ward with a history of sharp stabbing pain in the right side of the chest for the past 18 hours. Although there were no abnormal chest signs she was treated as a case of pneumonia with penicillin and a sulphonamide. Next day she was much improved; the temperature was normal and the chest x-ray film clear, and the diagnosis of Bornholm disease seemed more likely than the original one of pneumonia. In the next few days further similar cases showed that we were in the midst of an epidemic, while retrospective examination of notes led us to discover a further six cases which had been labelled pleurisy, pneumonia, P.U.O., and the like. On June 12 one of us was asked to see a boy of 7½ who had been admitted to a surgical ward on June 9 with one day's history of sharp stabbing pain in the upper abdomen, nausea, and anorexia. His case was similar, and it caused us to take an interest

in the children's surgical ward, where admissions were subsequently seen to be on roughly the same scale. Table I summarizes the clinical findings in these cases.

TABLE I.—Clinical Findings in Typical Cases

Symptom or Sign	Medical		Surgical		Total	
	Cases	%	Cases	%	Cases	%

White count less than 10,500 per c.mm. ..	35/38	92	12/14	86	47/52	90

* Seven cases (including the six with meningism) had cerebrospinal fluid examinations, and in only one was it abnormal, with 40 cells per c.mm.

Virus Studies.—Attempts were made to collect stools, nasal washings, and sera as early in the disease as possible, and then to take another specimen of blood a few weeks later.

Isolation of Virus from Faecal Specimens.—Suspensions of faeces were prepared according to the method of Dalldorf *et al.* (1949); newborn mice were inoculated intracerebrally and intraperitoneally, approximately six mice being used for each sample. After 48 hours, mice showing weakness, tremors, or paralysis were killed; samples of brain and muscle were removed for passage, while further specimens were removed for section. The histological changes in positive cases were found to be typical of Coxsackie Group B virus infection; this has been confirmed by Dr. Dalldorf, who kindly examined the virus strain from Case D and found it to be Group B, type 3.

Neutralization Tests.—A virus strain from one of the cases (Case D) was used. The dilution of serum which protected 50% or more of the mice against 100 M.L.D. virus was taken as the end-point. The results are shown in Table II.

TABLE II.—Results in the Typical Cases

1. Virus isolation in stools: 17 tested	..	..	9 positive (53%)
2. Neutralization tests:	{	Case	
		A ..	1st Serum .. 2nd Serum ..
		B ..	1/10 (31) .. 1/1000 (65)
		C ..	1/10 (5) .. 1/100 (35)
		D ..	Not tested .. 1/100 (47)
		E ..	" " .. 1/1000 (69)

All four cases had positive stool findings. The numbers in parentheses following the serum dilution figures, both in this and subsequent tables, indicate the time in days from the onset of the illness on which these particular sera were taken.

Atypical Cases

The cases occurring at the height of the epidemic and resembling on clinical grounds some of the variants reported in the literature fell into four groups, which we have called: neurological, P.U.O. type, pneumonitis, infantile. They were investigated virologically in the same way as the typical cases.

1. **Neurological Group.**—These seven children had symptoms suggestive of encephalitis or meningitis; pain other

than headache was not a feature (see Table III). The sera of all but one (Case 7) were further examined as follows: (i) leptospiral agglutination with *L. icterohaemorrhagiae*, *L. canicola*, *L. sejeoe*, *L. grippotyphosa*, *L. bataviae*, *L. pomona* all negative; and (ii) complement-fixation tests for lymphocytic choriomeningitis negative. Complement-fixation tests for mumps virus were also performed on Cases 2, 3, and 4, and were negative.

2. **The P.U.O. Group** consisted of 10 rather heterogeneous cases in which there was a history of abdominal pain, vomiting, or headache, together with a sore throat and a generalized lymphadenopathy (see Table IV).

3. **Pneumonitis Group.**—There were four cases which would have been considered typical Bornholm disease but for the presence of radiological changes in the lungs (see Table V).

4. **The Infantile Group** are mentioned as possible examples of the young child's response to the infection, with screaming attacks, fever, malaise, and recovery unaffected by treatment (see Table VI).

Discussion

Our findings in the typical cases suggest that this epidemic was caused by Coxsackie virus Group B, type 3. Dalldorf (1952, personal communication) has found this strain to be associated with Bornholm disease in widely separated sections of the United States. The immediate diagnosis, however, remains a clinical one, and it is often necessary, especially in children, to treat each case at first as one of serious organic disease.

In the 26 atypical cases the virus was recovered from only 3 out of a total of 13 stool specimens examined, while neutralization tests showed the presence of antibody in 11 out of 17 children whose convalescent sera were tested.

Neurological Group.—While there is some evidence that Coxsackie virus can cause meningo-encephalitic changes (Curnen *et al.*, 1949), such reports with adequate virus study are infrequent; of 10 accidental infections in laboratory workers (Shaw *et al.*, 1950) only one showed a meningitic response, while of our typical cases only one had an abnormal cerebrospinal fluid. We have found no satisfactory evidence that an identical strain of virus has been isolated concurrently both from cases of epidemic pleurodynia and cases with meningo-encephalitic type of illness shown by a pleocytosis in the cerebrospinal fluid.

Cases of benign lymphocytic meningitis (Brown and Prinsley, 1951) and benign meningo-encephalitis (Galpine and Macrae, 1953) occurring in the United Kingdom at about the time of the Bornholm epidemic cannot necessarily be regarded as causally related. It may be that these syndromes were of different aetiology running alongside the other epidemic. It is interesting to note from Table III that Case 6, with a very strong contact history of Bornholm disease, had a turbid fluid with polymorphs predominating, as also did Case 4, whose neutralization tests showed the highest titre. It is possible that these two might have been examples of infection with the Coxsackie virus. The other neurological cases seem to be unrelated to the epidemic; the neutralization tests in Cases 3 and 5 are against a recent Coxsackie infection, and despite the contact history in Case 2 the bizarre symptoms and absence of virological support point the same way.

P.U.O. Group.—This would include the cases of herpangina (Huebner *et al.*, 1951), three-day fever (Webb and Wolfe, 1950), and the febrile illness of Kenyon *et al.* (1952). Even these, however, bred true to type within the epidemics and did not seem to produce variants; the two American reports found a Group A virus, while the Coventry cases were apparently due to a Group B type. Ours are probably a mixture of several different conditions, such as glandular fever, tonsillitis with abdominal pain, and other short-term fevers. Only towards the end did we suspect them to be related to the Bornholm epidemic; we therefore had only one stool examined virologically from a patient in the acute

TABLE III.—Neurological Group

* This patient's mother had a typical attack of Bornholm disease a week before he was admitted to hospital.

stage, though this was in fact positive. The findings in Table IV suggest that, of the four cases tested virologically, two may have had a recent Coxsackie infection.

Pneumonitis Group.—Although pneumonitis has not been generally recognized as a complication, it has been described (Hopkins, 1950), and in the one case tested here the virus was found and a rising titre demonstrated in the neutralization test. In view of the occurrence of virus pneumonia in measles and other virus diseases, its occurrence in Coxsackie infection is also possible.

Infantile Group.—Howard *et al.* (1943) reported eight children under 2 years presenting with convulsions amidst an epidemic of pleurodynia. We noted no increase in babies admitted to our wards at this time with convulsions, and, as Howard's adult cases (22) included five of encephalitis, it is possible that these authors were dealing with another disease running alongside the true pleurodynia. Both the patient reported by Forrester and Tobin (1951), aged 19 months, and our Case 26, aged 17 months, with a positive stool and a convalescent titre of 1/1000, had very atypical features and a prolonged course. Perhaps the human infant's response to the infection is, as in the mouse, quite different from that of the adult.

Conclusion

We recognize that our findings are rendered inconclusive by the small percentage of cases tested for virus, but the same criticism applies to most of the reported work. This is largely owing to the heavy demands of virological study upon both time and animals. Taking the isolation of virus from the stool as perhaps the most reliable guide, it is significant that over half (9 out of 17) of the typical cases tested were positive, while in less than a quarter (3 out of 13) of the atypical cases was the virus isolated. These findings in the latter group might be due to chance owing to the wide occurrence of the virus in nature (Huebner *et al.*, 1950); alternatively, the truth may be that a minority of these atypical cases were indeed caused by the Coxsackie virus and that the remainder were of different aetiology. Review of the case records in these atypical cases does not reveal any special features differentiating those with suggestive virological findings from those with completely negative results.

Until virus investigation can be applied more widely and to a much higher proportion of any clinical group, strong supportive clinical and epidemiological evidence is needed to maintain claims that virus findings from a small number of cases can be applied to a whole group; meantime, in the words of Dalldorf (1950), "we should be satisfied to observe and describe and suspend judgment."

Summary

The clinical findings of 104 typical cases of Bornholm disease in children are described. Nineteen of these have been investigated for evidence of virus infection.

Twenty-six cases suspected of atypical Bornholm disease are described and the virological findings in 17 of these are discussed.

A Coxsackie virus, group B, has been isolated from the faeces of patients in this epidemic.

The evidence in the atypical cases is inconclusive, the findings being briefly discussed in the light of recent published work.

We wish to express our gratitude to Professor G. A. H. Buttle for advice and criticism and for allowing the virological work to be carried out. We are indebted to Dr. G. Dalldorf for help in identifying the virus, and to Dr. A. D. Macrae for examining the sera of the neurological cases. We would also like to thank our house-physicians, Drs. A. Lerpinière, P. K. Murphy, A. Moffatt, and A. Freedman, for their careful note-taking and help with the collection of specimens. Finally, we are grateful to our surgical colleagues at Dudley Road Hospital for the opportunity of examining their cases and reporting on them.

THE ISOLATION OF A COXSACKIE VIRUS FROM TWO CASES OF BORNHOLM DISEASE

BY

R. H. A. SWAIN, M.D.

Senior Lecturer in Bacteriology, University of Edinburgh

AND

R. G. MITCHELL, M.B., M.R.C.P.Ed., D.C.H.

Registrar, Royal Hospital for Sick Children, Edinburgh

In the summer of 1951 South-east Scotland, in common with many other areas of the country, experienced an outbreak of Bornholm disease. A series of 24 cases occurring in May, June, and July was reported in West Fife by McNeish and Stewart (1952), and Sandilands (1951) saw many cases in general practice in Kirkcaldy.

During these same three months many children suffering from the disease were seen in the out-patient department of the Royal Hospital for Sick Children in Edinburgh, and 18 cases were admitted to the wards of the hospital. The principal clinical features of the latter group have already been reported (Mitchell, 1951), and the purpose of the present paper is to record the results of virus studies carried out on 2 of the 18 patients. The two children were not specially selected except in so far as they were quite typical of the group.

Case 1

A boy aged 3 years and 7 months was admitted to hospital on July 10, 1951. Four days before admission he had a sudden attack of upper abdominal pain on the right side, severe enough to make him scream. The pain continued intermittently for one day and then subsided. For the next three days he appeared well, though his appetite was poor, but on the day of admission the severe pain recurred. He did not vomit and his stools were normal. He had no cough.

Examination revealed a flushed feverish child with diminished air entry at the base of the right lung on auscultation. No friction rub was heard and his throat was not inflamed. A leucocyte count on admission was 8,800 per c.mm. with 79% polymorphonuclear leucocytes, the haemoglobin was 13 g., and the erythrocyte sedimentation rate was 32 mm. in the first hour. An x-ray film of his chest on admission showed no abnormality. His urine was normal and a

Mantoux test (1 in 1,000) was negative. The symptoms continued for a few hours after admission to hospital and then subsided. Recovery was rapid and complete.

The course of this child's illness was characteristic of the group, the only unusual feature being the rather high erythrocyte sedimentation rate, the average for the group being 19 mm. in the first hour. Specimens of blood were taken from an arm vein on the sixth and twentieth days after the onset of the first symptom, and a third specimen was taken eight months later. At this time the boy was very well and had had no further illness. A specimen of stool was taken at the same time as the first blood specimen.

Case 2

A girl aged 4 years and 4 months was admitted to hospital on July 11, 1951. Three days before admission she suddenly complained of severe pain in the upper abdomen, which continued intermittently all day, and then subsided. During the following day she had no pain but did not eat very much. On the day of admission the pain recurred and she also complained of pain in the shoulders. She did not vomit and had no diarrhoea.

Examination showed a rather thin flushed child, with a temperature of 100.4° F. (38° C.). There was a slight faucal injection; slight dullness to percussion, with diminished air entry, was found at the lung bases. No friction was heard. A leucocyte count on admission was 10,000 per c.mm., with 76% polymorphonuclear leucocytes, the haemoglobin was 12.6 g., and the erythrocyte sedimentation rate was 24 mm. in the first hour. An x-ray film of her chest on admission was negative, her urine was normal, and a Mantoux test (1 in 1,000) was negative. The symptoms disappeared rapidly after she was confined to bed, and she made an uneventful recovery.

Specimens of blood were taken from an arm vein on the fifth and nineteenth days after the onset of the first symptoms, and a third specimen was taken eight months later. At this time the child was very well and had had no illnesses since discharge. A specimen of stool was taken at the same time as the first blood specimen.

Virus Studies

A fresh sample of faeces was ground with physiological saline in a mortar to make a 20% suspension. Coarse particles were removed by centrifuging at 1,800 r.p.m. for 10 minutes and 20% of ether was added. After standing at 2° C. overnight the ether was removed by evaporation and the remainder was spun in an angle centrifuge at 4,000 r.p.m. The supernatant fluid, which was bacteriologically sterile, was used for animal inoculation.

Litters of suckling mice, not older than 24 hours, were used, and at first each animal received 0.01 ml. intraperitoneally, and at first each animal received 0.01 ml. intraperitoneally. Between the cerebra and 0.025 ml. intraperitoneally about one-sixth and eighth days after the first inoculation about one-quarter of the sucklings were found to be smaller than their litter-mates. The hind limbs, which were involved in the spasms of uncontrolled tremors, were dragged behind the animals when they walked. The limbs were capable of some movement, however, and were not paralysed. Mice so affected were sacrificed and used for transmission experiments.

A 10% suspension of the skinned and eviscerated carcasses of infected mice was prepared and penicillin and streptomycin were added. These suspensions, clarified by centrifuging, were used for subsequent passages. After the third passage all the animals inoculated were infected, and it was necessary to use only the intraperitoneal route (Table I).

In sections of the muscle of the affected limbs of the sucklings small foci of hyaline degeneration were seen. Necrosis of the muscle fibre was accompanied by proliferation of the sarcolemma and by infiltration with histiocytic phagocytes, some of which were seen to contain the products of tissue damage. The muscle lesion varied in extent; in some mice the lesion was quite small and easily overlooked, while in others large numbers of muscle fibres were

TABLE I

Passage	Route	No. of Sucklings Infected No. of Sucklings Inoculated	
		Case 1	Case 2
1	I.C. + I.P.	9/40	9/32
2	I.C. + I.P.	7/22	10/15
3	I.P.	13/13	6/9
4	I.P.	12/12	9/9
5	I.P.	11/11	
6	I.P.	5/5	
7	I.P.	5/5	

Virus isolations: I.C. = intracerebral; I.P. = intraperitoneal.

involved. The lesions were present in all of 20 mice examined histologically, and occurred in the masseter, and in the muscles of the thigh, the shoulder, and the abdominal wall.

The interscapular pad of fat in the majority of the mice was red and congested in appearance, and, histologically, areas of necrosis were observed at the periphery of the lobules. Similar areas of necrosis were present in the sucking pads and in the subcutaneous fat of the limbs and the abdominal wall.

In 3 out of 10 sucklings examined histologically a marked infiltration of the meninges with histiocytes and lymphocytes was seen and many small areas of necrosis were found in the subjacent brain tissue. No evidence of involvement of the spinal cord was obtained. The examination of the liver, pancreas, spleen, kidney, and heart muscle of these 10 animals revealed no lesions.

The virus was inoculated in a dose of 1,000 LD₅₀ into six 3-months-old mice by the intraperitoneal route; the animals all survived unharmed. Similarly, a litter of eight 3-day-old sucklings were unaffected by the injection intraperitoneally of 100 LD₅₀ of the virus. Preservation of the virus was achieved in buffered saline pH 7.4 at 2° C. for seven days; it was, however, more usually kept with the addition of 50% glycerol at -20° C. or by freeze-drying. The virus passed through a Seitz E.K. pad.

These findings indicate that the virus belongs to Group B of the Coxsackie viruses (Dalldorf, 1951). Since, even after repeated examination, no evidence of pancreatic necrosis following the injection of the virus was obtained, it is probable that the strain is not related to the Conn.-5 strain of Pappenheimer *et al.* (1951)—it may therefore belong to type 2 or 3. Thus the virus resembles strains associated with Bornholm disease in the United States, and appears to be similar to the strain isolated by Metcalfe Brown *et al.* (1952) during the outbreak in Manchester which occurred simultaneously with that in Edinburgh.

Neutralization tests were performed in which 100 LD₅₀ of the virus isolated from each child was exposed to the patient's own serum for one hour at room temperature. Samples of serum taken during the acute and convalescent phases of the illness, and again after nine months, were used. The results (Table II) show that antibodies to the

TABLE II.—Results of Neutralization Tests

Case	Days After Onset of Symptoms	Serum + 100 LD ₅₀ Virus No. Infected/No. Inoculated at a Serum Dilution of		
		1 in 5	1 in 25	1 in 125
1	6 20 247	9/9 0/7 8/8	6/6 0/6 7/7	10/10 0/8 —
2	5 19 244	6/6 0/7 6/6	9/9 0/7 8/8	— 0/8 —

virus had appeared by the sixteenth and twenty-second days. The mice were protected against both the virus strains isolated.

Attempts to prepare an active antigen for use in a complement-fixation reaction met with no success. The failure may have been due to the fact that extracts of the muscle never had an infective titre of over 10⁻⁵ and that no effective method of concentrating the virus was available.

An interesting finding was that gamma globulin prepared in January, 1952, from the pooled plasma of blood donors in the Edinburgh district had considerable power to protect mice against the virus. This activity was at least as great as the capacity of this sample to protect against measles, and thus there appears an indication that a considerable proportion of the adult population of Edinburgh had at some time been infected with the virus.

Unfortunately, no sample of gamma globulin taken before the epidemic was available for comparison. Before any epidemiological significance can be placed on this finding it will therefore be necessary to examine a further series of samples of gamma globulin obtained during non-epidemic times.

Discussion

Since neutralizing antibodies appeared in the serum, reached a titre of 1 in 125, and disappeared after eight months, it seems justifiable to conclude that both children were infected by the virus isolated.

The illnesses experienced by the two children were quite typical of Bornholm disease, being characterized by the sudden onset of severe intermittent pain in the upper abdomen, a short recrudescence course ending in complete recovery, and no evidence, radiological or otherwise, of an underlying pulmonary lesion. Occurring as they did during an epidemic, they fulfil all the criteria for the diagnosis of Bornholm disease (Scadding, 1951).

No sign of meningeal involvement was present either in the two children investigated or in the 16 other members of the group. In this there is a resemblance to the two cases described by Metcalfe Brown *et al.* (1952), but it is interesting to note that, in the epidemic which occurred at about the same time at Oxford, Davies and Warin (1951) reported a series of 79 cases, 4 of which had definite signs of meningitis. Bornholm disease may present a variable clinical picture with meningitic or myalgic symptoms predominating. It is possible that different strains of virus are associated with different clinical features, and that the Oxford epidemic was caused by a virus differing from that current in Manchester or Edinburgh at the time. On the other hand, it is well known that the same virus may cause both myalgic and meningitic illnesses.

The understanding of the epidemiology of Bornholm disease, of aseptic meningitis, and of non-paralytic poliomyelitis in this country may be expected to advance rapidly when more strains of the Coxsackie virus are isolated and their immunological characters are worked out.

Summary

In an outbreak of Bornholm disease a Coxsackie virus of Dalldorf's Group B was isolated from the faeces of two of the children affected. A rise and fall in the titre of antibodies in the patients' sera indicated that they had suffered a recent infection with this virus.

Our thanks are due to the physicians of the Royal Hospital for Sick Children in Edinburgh under whose care the children were; to Professor T. J. Mackie for help and advice; to Professor A. Murray Drennan for help with the histology; to Dr. R. A. Cumming for samples of gamma globulin; to Mr. J. Sutherland for technical help; and to Mr. J. Isaacson for the supply of suitable litters of mice.

THE BACTERIAL CONTENT OF THE HEALTHY HUMAN SMALL INTESTINE

BY

JUDITH CREGAN, B.Sc.

AND

NANCY J. HAYWARD, M.Sc., Ph.D.

(From the School of Bacteriology, University of Melbourne.

This work was undertaken to determine the number and kind of bacteria that inhabit the healthy human small intestine. The results showed that their number is so small that they must be regarded as transient contaminants passing through with the ingesta rather than a resident flora colonizing the tract. They are chiefly those Gram-positive species that are usually found in the mouth and throat.

Experimental

Clinical

Patients undergoing gynaecological operations without any history of disease of the intestinal tract or of its associated organs were selected for the investigation. In every case no inflammatory process was proceeding in the abdomen; the general health of the patients was good, and they were fasting for six hours before the operation.

Collection of Specimens

In order that the sampling should be as precise as possible, intestinal contents were taken direct from the bowel with a syringe when the abdomen was open at operation. The syringe needle was inserted obliquely into the antimesenteric border of the small bowel.

Generally the bowel contained so little material that a sample of its contents could be obtained only as a washing. This was procured by injecting 2 ml. of sterile Ringer's solution (chosen because of its low toxicity for micro-organisms) into the lumen of the bowel while constricting the bowel with the fingers about 1 in. (2.5 cm.) above and below the site of injection; washing the bowel lumen with the fluid by sucking it back and forth with the syringe; and then removing the resultant diluted intestinal contents. Although these samples were diluted they were satisfactory because interest centred only on the relative numbers of organisms at various anatomical levels of the intestinal tract. It was necessary only that the technique should be uniform; therefore the same volume (2 ml.) of Ringer's solution was used for every washing, both for the small intestine and for the mouth and large intestine when they were sampled as controls.

This technique was first practised by our colleague Mr. E. E. Dunlop, honorary surgeon to the Royal Melbourne Hospital, who concluded that it was not prejudicial to the post-operative progress of the patient. This was confirmed by Professor Townsend in the present investigation; the post-operative course of the patients showed no evidence of leakage into the peritoneal cavity from the puncture of the bowel.

Bacteriological Examination of Specimens

The same technique was used for all specimens, and was designed to give both quantitative and qualitative information about the flora of the small intestine. Within a few

hours of taking the sample the following media were each inoculated with two drops (about 0.06 ml.) of the bowel washings:

Incubated at 37° C. in air	Sheep-blood agar
	Sheep-blood potato extract* agar
Incubated at 37° C. anaerobically with 5-10% carbon dioxide	MacConkey's agar
	Beer-wort agar
	Sheep-blood agar
	Sheep-blood potato extract* agar

The range of media inoculated and the methods of incubation were devised to provide the growth requirements of all species of bacteria likely to be found in the intestine, including non-sporing anaerobes which have been reported to be in large numbers in faeces (Sanborn, 1931; Torrey and Montu, 1931; Eggerth and Gagnon, 1933). Generally the particular species present in only small numbers was positively avoided because an overall picture of the flora was desired, most importance being attached to organisms present in largest numbers. However, MacConkey's agar and beer-wort agar were included to detect coliforms and yeasts respectively.

The method of inoculation was to spread the original two drops over an area at one side of the plate (A) and then to make three successive sets of four or five strokes at right angles (B, C, and D), thus covering the whole area of the plate. The media were examined at intervals up to at least four days, and the degree of growth was recorded as follows:

Growth in areas A, B, C, and D	..	..	..	+++
Growth in areas A, B, and C, not D	..	..	..	++
Growth in areas A and B, not C and D	..	..	..	+
Growth only in area A	..	..	..	±
No growth	..	..	..	-

All species isolated were identified as fully as possible. The systematic table recommended by Swift (1948) was used for streptococci. Three combinations of characters that did not fit any named species were encountered, and the strains with these characters were called varieties 2, 3, and 4 (Cregan, to be published). Staphylococci were named according to the classification of Shaw, Stitt, and Cowan (1951); and for *Candida* the classifications of Benham (1931) and Martin, Jones, Yao, and Lee (1937) were followed.

Direct smears of all specimens were made by allowing four or five drops to dry *in situ* on a microscope slide. They were stained by Gram's method, and the numbers and morphological types of organisms were recorded. These observations and the results of culture generally agreed. The results by direct smears were not included in the final assessment of the flora, but they provided a check on the adequacy of the media used for culture.

Results

In assessing the quantitative results it was of theoretical importance (see Discussion) to decide the maximum number of viable organisms that could be interpreted as transient contaminants unable to multiply in the environment of the part of the intestine sampled. For example, in view of the part of the intestine sampled during sampling, it was necessary to know whether as large an amount of growth as + indicated a transient flora or whether it must be taken to indicate a resident flora. To this end the contents of two parts of the alimentary tract known to harbour a resident flora—the mouth and the large intestine—were examined quantitatively. The large intestine was sampled in the same way as the small intestine, in two cases from the caecum and in one from the transverse colon; and the mouth was sampled in five cases by gentle rinsing with 2 ml. of Ringer's solution. All the samples were examined by the same technique as was used for the small-intestine specimens. It was found that the minimum degree of growth was ++. It

*Slanetz and Rettger (1933).

was concluded, therefore, that + or ± growth could be interpreted as transient flora and ++ or +++ growth must be regarded as indicating a resident flora at the site sampled.

The decision that + and ± growth are not due to the effect of dilution during sampling has been strengthened by later experience in tests of samples from the small intestine in diseases of the digestive system (Cregan, Dunlop, Harrison and Hayward, to be published). In some diseases the small intestine yielded +++ growth, showing that the method of sampling does not over-dilute the intestinal contents when a flora is resident.

Fourteen cases were included in the present investigation, and the sites sampled were the upper jejunum, the mid-gut, and the lower ileum within 8 to 12 in. (20 to 30 cm.) of the ileo-caecal sphincter. The sites were determined by the anatomical appearance of the bowel and mesentery. The results are shown in the Table.

Flora of the Small Intestine

Site of Sampling	No. of Subjects	Quantitative Results			Qualitative Results	
		Sterile	Transient Flora	Resident Flora	Gram-positive Species	Gram-negative Species
Upper jejunum	14	12	2	0	<i>Lactobacillus</i> sp. (1) <i>Candida albicans</i> (1)	
Mid-gut (lower jejunum or upper ileum)	14	10	4	0	<i>Str. salivarius</i> (2) ,, <i>s.b.e.</i> (2) ,, <i>mitis</i> (2) ,, <i>acidominimus</i> (1) ,, <i>sp. variety 2</i> (1) ,, " " 3 (1) ,, " " 4 (1) <i>Lactobacillus</i> sp. (1) <i>Candida albicans</i> (1)	<i>Bact. coli</i> Type 1 (1) <i>Veillonella gazogenes</i> (1)
Lower ileum	14	7	5	2	<i>Str. salivarius</i> (3) ,, <i>s.b.e.</i> (2) ,, <i>mitis</i> (2) ,, <i>sp. variety 3</i> (1) <i>faecalis</i> (1) <i>Cl. welchii</i> (1) <i>Lactobacillus</i> sp. (1) <i>Candida albicans</i> (1) <i>Staph. aureus</i> (1)	<i>Bact. coli</i> Type 1 (3) <i>Bact. aerogenes</i> Type 1 (1) <i>Veillonella gazogenes</i> (4) Anaerobic Gram-negative bacilli (1)

Sterile = no growth. Transient flora = ± or + growth. Resident flora = ++ or +++ growth. The figures in parentheses indicate the number of times each species was isolated.

The maximum growth in any of the samples from the upper jejunum and mid-gut was +. In 22 of the 28 samples no growth at all occurred. It can be confidently concluded, therefore, that these sites in the healthy individual are virtually sterile. Twelve of the 14 samples from the lower ileum yielded + or less growth, indicating that in most cases the normal lower ileum contains only transient organisms.

The qualitative results set out in the Table show that the few bacteria that contaminate the small intestine are predominantly Gram-positive species of the general type more commonly associated with the mouth than with the lower intestinal tract. However, in the two cases in which there was a resident flora in the lower ileum the organisms found there were of faecal type.

Discussion

The technique of sampling intestinal contents with a syringe at operation in order to determine the flora of the small intestine has four advantages: (1) samples are taken by a direct route, so that the risk of contamination is at a minimum; (2) the level of the intestine sampled can be anatomically defined by direct observation; (3) patients whose digestive tracts are completely normal can be included in the investigation; and (4) investigations can be made on the living subject.

There are numerous reports of investigations of the flora of the small intestine in health and disease using other techniques sharing some but not all of these advantages. For

the majority—for example, most of the 14 references in German published between 1912 and 1928 and quoted by Licht, 1929–30; Venables and Knott, 1924; Bogendörfer, 1924; Knott, 1927; Thomson, Einhorn, and Coleman, 1930; Kanzler, 1932; Nichols and Glenn, 1939; and Frazer, 1949—samples have been obtained indirectly with tubes of different kinds passed via the mouth. A disadvantage of this technique is that it is exceedingly difficult to ensure that a specimen from the depths of the intestine is not contaminated with organisms from a higher level. In addition, it is evident, from published reports of relative lengths of tubing and intestine, that the intestine creeps up on the rubber tubing, making it difficult to ascertain, even approximately, the anatomical level of the intestine sampled.

A number of investigations have been made of specimens taken direct from identified levels by swabbing the lumen of the small bowel when it has been exposed at or after operation for removal of a diseased adjoining part of the tract (Cushing and Livingood, 1900; Hewetson, 1904; Paulson, 1929; Barber and Franklin, 1946). Although this technique is inapplicable to normal bowel, for the types of bowel disease to which it is applicable the results are reliable and informative. Normal bowel has been examined by direct methods within twenty hours of death (Garrod, 1925; Blacklock, Guthrie, and Macpherson, 1937) but it appears (see below) that reliable information could be expected only within a few hours of death.

The techniques used in former investigations are all open to objections which are overcome by the technique used in the work reported here.

The quantitative results (see Table) showed that the normal small intestine is exceedingly sparsely populated or unpopulated along its whole length. This finding is at variance with the results of studies of normal subjects using intestinal tubes.

By intubation the duodenum was found to be often sterile or to contain very few micro-organisms (Venables and Knott, 1924; Knott, 1927; Licht, 1929–30; Kanzler, 1932), but at other levels of the small intestine organisms were found to be numerous, of the order of millions per millilitre of intestinal contents (Bogendörfer, 1924; Thomson and others, 1930; Nichols and Glenn, 1939). If one accepts the findings with the direct sampling technique reported here, the results of intubation studies for the lower small intestine must be judged to be erroneous. They have misled the teaching over the last 30 years, presenting a picture of the small intestine as an organ containing virtually no organisms at its upper end, but along its length progressively acquiring a flora, including coliforms, until at its lower end it is very heavily populated. Thus Stevenson (1950) was misled into suggesting that *Bact. coli* D433 (O 111) might be the normal inhabitants of the duodenum or jejunum, and Walther and Millwood (1951) carried out a serological investigation of strains of *Bact. coli* isolated from the duodeno-jejunal junction of 51 subjects after death when in fact no type of *Bact. coli* is an inhabitant of the upper or middle healthy living small intestine.

Our findings are confirmed, in part at least, by the results of other workers with samples removed direct from the bowel lumen at or after operations for intestinal disease. These consistently point to the conclusion that generally the small intestine is either sterile or contains very few organisms along its whole length. The most interesting of these studies were carried out 50 years ago by Cushing and Livingood (1900) in the United States and by Hewetson (1904) in Great Britain. On the basis of very careful bacteriology both investigations led to the conclusion that the upper and middle small intestines are generally sterile, Cushing and Livingood distinguishing between permanent and transient organisms. Hewetson recorded some cases in which the jejunum was sterile although the stomach was contaminated.

Later, by direct swabbing, the ileum in three cases of ileostomy was found by Paulson (1929) to contain only a

few Gram-positive bacteria, and Barber and Franklin (1946) found that the duodenum was infected in only 7 of 50 cases of peptic ulcer or gastric carcinoma.

The upper jejunum and mid-gut were found to contain, if anything, organisms of oral type, predominantly streptococci not belonging to any of Lancefield's groups (see Table). In the lower ileum a similar population was found except in a minority of cases (2 out of 14) in which organisms of faecal type were present. This also is at variance with the findings of most intubation investigations, in which coliforms, although rare in the duodenum, were increasingly common at progressively lower levels of the small intestine.

The results of Blacklock and others (1937), who used the same sampling technique as ourselves, but who directed their attention almost solely to the detection of coliforms, are in agreement with our findings. They found that bacteria were scanty in the small bowel and failed to detect coliforms in all of nine specimens from the upper jejunum and in 12 of 18 specimens from the lower ileum. Samples taken within 12 hours of death contained coliform organisms in 11 of 36 duodenal specimens, showing that almost the entire length of the small intestine is invaded by organisms from the large intestine within a short time of death.

Since the small intestine is invaded so soon after death an antibacterial mechanism must operate in the living small intestine. The results of an investigation of the flora of the small intestine in cases of disease of the stomach (Cregan, Dunlop, and Hayward, to be published) show that the antibacterial mechanism of the small intestine is independent of the secretions of the stomach.

The nature of this antibacterial mechanism has not been investigated by us. Bogendörfer (1924) reported that there is a thermolabile antibacterial substance, of lipoidal nature and of molecular size similar to egg albumen, in the juice and mucous membrane of human small intestine. This has not been confirmed. Blacklock and others (1937) investigated the claim that bacteriophages were responsible, but their results were negative. Having discussed the literature they could draw no definite conclusion, and supposed that many factors combined to keep the small intestine fairly sterile.

Whatever the mechanism—chemical, mechanical, or cellular—it ceases to be effective in the region of the ileo-caecal sphincter. As in a minority of cases a profuse flora of faecal type was found in the lower ileum, it seems that the precise anatomical level at which the mechanism ceases to be effective varies from person to person and possibly also from time to time in the same person. It does not operate either in the environment of the large bowel or in the small bowel within a few hours of death.

Summary

The bacterial flora of the healthy small intestine has been investigated, using samples removed from the lumen of the bowel with a syringe at gynaecological operations.

The results have shown that the whole length of the small intestine contains only a transient flora, chiefly of Gram-positive species that are more commonly associated with the mouth than with the large intestine.

From the apparent inability of these organisms to become resident in the small intestine it is deduced that an antibacterial mechanism, distinct from the stomach mechanism, must be operating there.

Our thanks are due to Professor S. L. Townsend, professor of obstetrics and gynaecology, University of Melbourne, for taking the samples of intestinal contents for us. Without his willing co-operation this investigation would not have been possible. We also thank Professor S. D. Rubbo, professor of bacteriology, University of Melbourne, for his constant helpful advice, and the staff of the Women's Hospital, Melbourne, and Miss Marjorie Krohn for technical assistance. One of us (J.C.) was in receipt of a personal grant from the National Health and Medical Research Council.

CHLORAMPHENICOL IN PROPHYLAXIS OF INFANTILE GASTRO-ENTERITIS

BY

R. McLAREN TODD, M.D., M.R.C.P., D.C.H.
Senior Lecturer in Child Health, University of Liverpool

AND

EDWARD G. HALL, M.B., B.Sc.
Pathologist, Alder Hey Children's Hospital, Liverpool

Infantile gastro-enteritis is a condition which usually affects infants under the age of 1 year. It is characterized by diarrhoea and vomiting, but other features such as anorexia and loss of weight may be present. In some cases diarrhoea may be the only symptom, and in others toxæmia and dehydration may be marked, and in others diarrhoea and vomiting tend to recur. After reviewing the recorded outbreaks of neonatal gastro-enteritis, Kirby *et al.* (1950) concluded that the term "gastro-enteritis" had been applied to at least six different clinical syndromes.

In some patients with clinical gastro-enteritis, *Salmonella* or dysentery organisms may be the causative agents, but in others no specific organisms have been isolated. Since 1945 increasing attention has been paid to the occurrence of specific serological types of *Bacterium coli* in both sporadic and epidemic infantile diarrhoea and vomiting. In some outbreaks there has been a relatively high correlation between the incidence of the disease and the isolation of these specific types of *Bact. coli*. Kirby *et al.* studied an epidemic of neonatal gastro-enteritis associated with *Bact. coli* O 111 (D433) and showed that this organism might appear in the stools one to nine days before the onset of symptoms. Preliminary reports (Rogers *et al.*, 1949; Smellie, 1950) suggested that chloramphenicol was of value in the treatment of gastro-enteritis, and our own experience over the past two years has confirmed the value of the drug in established gastro-enteritis.

Present Investigation

This paper records our experiences with chloramphenicol as a prophylactic agent in infants from whom *Bact. coli* O 111 had been isolated, but in whom diarrhoea had not

developed. The investigations were undertaken between November, 1950, and August, 1951, in two of the wards of the Liverpool University Department of Child Health, at Alder Hey Children's Hospital, Liverpool. These wards, each containing 14 single cubicles, are used primarily for the treatment of infants under the age of 1 year suffering from gastro-enteritis, but infants with other diseases such as respiratory-tract infections are also admitted when beds are available.

Rectal swabs taken from all infants on admission, and at intervals of not more than four days thereafter, were examined for *Bact. coli* O 111 according to the technique employed by Kirby *et al.* (1950). Patients becoming cross-infected with this organism but who had not developed diarrhoea were included in the investigation, and alternate patients ("trial" group) were given chloramphenicol in a dosage of 75 mg. per lb. (165 mg. per kg.) body weight per day, in divided doses three- or four-hourly, for a period of seven days. The remaining cases ("control" group) received no chloramphenicol. The day on which *Bact. coli* O 111 was first isolated is referred to as day 0.

Sixty patients were observed, 30 in each group, but four patients in the trial group were subsequently excluded because chloramphenicol was not given until more than three days after the rectal swab became positive for *Bact. coli* O 111.

The first dose of chloramphenicol was given on day 0 in one case, on day 1 in 15 cases, and on day 2 in 10 cases. In the one patient who received chloramphenicol on day 0 the drug was initially prescribed because of symptoms suggestive of whooping-cough. The details of age, diagnosis on admission, antibiotic therapy, etc., are recorded in Tables I and II.

TABLE I.—Control Group

Age	Diagnosis on Admission	Specific Therapy for Primary Illness	Days Between Admission and First Rectal Swab	Days Between First Positive Swab and Onset of Gastro-enteritis	Gastro-enteritis

* Day 0 = day of first positive swab for *Bact. coli* O 111. † Given chloramphenicol for spasmodic whoop: ? whooping-cough. ‡ Developed no diarrhoea, but lost weight from day 3 to day 12; vomited twice on days 3, 4, and 5; anorexia days 3 and 4.

Of the 26 cases in the trial group, 21 (80%) did not develop gastro-enteritis and 5 developed a mild form. The onset of symptoms in three of these five cases was 11, 12, and 19 days after the first rectal swab positive for *Bact. coli* O 111, and 3, 4, and 10 days after chloramphenicol had been discontinued. In two cases diarrhoea developed before the second day of chloramphenicol therapy. In a further case, although no diarrhoea occurred, there was anorexia on days 3 and 4, loss of weight from days 3 to 12, and vomiting twice daily on days 3, 4, and 5. We have found that these symptoms often precede diarrhoea in patients from whom the organism *Bact. coli* O 111 is isolated.

Of 30 cases in the control group, 8 (26.6%) did not develop gastro-enteritis and 22 did; of the latter, 17 were mild at the onset and 5 were severe. Patients with mild symptoms were those in whom dehydration was not pronounced and who responded to oral glucose-saline followed by graduated milk-feeding, whereas severe cases received intravenous fluid therapy. In addition, some cases in both mild and severe groups received chloramphenicol after the development of diarrhoea. Statistical analysis shows that the difference between the trial and control groups is highly significant ($\chi^2=14.2$, $P<0.001$) and indicates that chloramphenicol had a marked therapeutic effect. The clinical features of the 22 patients in the control group who developed diarrhoea are recorded in Table III. This table

TABLE III.—Time of Appearance of Symptoms and *Bact. coli* O 111 in Stools in Relation to Onset of Diarrhoea in 22 Cases of the Control Group who became ill

Day:	No. of Cases													
	-14	-10	-9	-8	-7	-6	-5	-4	-3	-2	-1	0	1	2
Diarrhoea												22	5	2
Loss of weight		1	1	2		1	5	3	1	1	3	3	1	
Anorexia		1	1	1	1	1	1	1	1	1	1	3	3	1
Vomiting														
<i>Bact. coli</i> O 111	1			1	1	2	3	2	4	5	3			

shows that loss of weight and anorexia preceded the onset of diarrhoea in a high percentage of cases. Loss of weight was recorded in 20 patients, and in 13 of these it was observed before the onset of diarrhoea. Anorexia occurred before the diarrhoea in 5 out of 9 cases. In only 7 out of 18 cases did vomiting occur before diarrhoea.

Bacteriology

It is interesting to compare in the two series the variations both in the total *Bact. coli* flora and in the isolation of *Bact. coli* O 111. The day on which *Bact. coli* O 111 was

first isolated being day 0, further swabs were taken so far as was possible on days 2, 4, 6, 9, 13, and subsequently at four-day intervals thereafter until the patient was discharged. If diarrhoea and vomiting developed, swabs were taken at more frequent intervals. In the trial series, five patients were not swabbed after day 13, as they had been discharged well and remained so. In the control series, two patients did not develop symptoms and were discharged before day 13, and 12 were treated with antibiotics because they developed diarrhoea. The remaining 21 patients in the trial group and 16 in the control group were followed up until three consecutive negative swabs had been obtained.

In the trial group, the seven-day course of chloramphenicol was begun as soon as preliminary identification of the organism had been made.

A rough assessment of the number of colonies of *Bact. coli* type (as profuse, moderate, or scanty) was made visually from the initial MacConkey plates. Disproportionate inhibition was not observed at the site of inoculation when examining plates from patients under treatment, and it was not thought that carry-over of antibiotic from the faeces appreciably affected the results, an opinion reinforced by our repeated failure to detect the antibiotic in the tubes of broth in which the swabs were dispersed after inoculation of plates.

Of 121 swabs on days 0-13 inclusive in the control series, 8 gave a scanty growth of *Bact. coli* type colonies, and from 149 swabs in the trial series 32 gave a scanty growth.

From the fourth to the ninth day, at a time when one might expect any effect due to chloramphenicol to be most noticeable, there was a considerable difference between the two groups, in the proportions of swabs falling into the three classes mentioned above. In the control series, 54 swabs were taken, 45 showing profuse, 6 moderate, and 3 scanty growths of *Bact. coli* type colonies; in the treated series the corresponding figures were 70-23, 28, 19.

The two series showed differences in the isolation of *Bact. coli* O 111 similar to the differences in the total *Bact. coli* flora. These are shown in Table IV. From the fourth to the ninth day, only 5 of the 54 swabs in the control group were negative for *Bact. coli* O 111, compared with 36 of 70 in the trial group.

In the control group 16 patients were followed up after the thirteenth day. Of these, three were already negative for *Bact. coli* O 111, and remained so; the other 13 were positive for varying periods up to day 40. In the trial group, of the 21 patients, only 11 were positive after day 13, and later remained so for periods up to day 37. The average

TABLE IV.—Incidence of Isolation of *Bact. coli* O 111 from Rectal Swabs at Similar Periods in Control and Trial Groups

Day:	0	1-2	3-4	5-6	7-8	9-10	11-13
Control series:							
No. of swabs	30	11	25	10	15	12	18
No. positive for <i>Bact. coli</i> O 111	30	11	23	9	14	10	16
Percentage positive	100	100	92	90	93	83	89
Trial series:							
No. of swabs	26	17	25	25	9	23	24
No. positive for <i>Bact. coli</i> O 111	26	15	18	12	5	4	6
Percentage positive	100	88	72	48	56	17	25

period for which cases in the control series were positive for *Bact. coli* O 111 was 22 days; in the treated series it was 14 days.

These results suggest that the administration of chloramphenicol was associated with a moderate reduction of the total *Bact. coli* flora and a more striking reduction in the isolation rate of *Bact. coli* O 111. It is worthy of note that all except one of the trial group became negative for *Bact. coli* O 111 on one or more occasions during the days when chloramphenicol was given, but 11 of these became positive again shortly after the end of treatment.

Discussion

The dangers to the life and health of young babies which result from their admission to hospital are well known, and usually follow the development of respiratory, gastro-intestinal, skin, or mucous membrane infections. Epidemic diarrhoea is often the most serious of these infections, and may carry a high mortality, especially in babies who are already debilitated by their primary illness. In our experience during the past three years, in Liverpool, there has been a fairly close correlation between bacteriological cross-infection with *Bact. coli* O 111 and the development of gastro-enteritis. In addition, certain clinical features such as loss of weight and anorexia may be observed before the onset of diarrhoea, and often before the rectal swab is positive for *Bact. coli* O 111.

In spite of the application of the measures recommended for the prevention and control of cross infections (Medical Research Council, 1951) we have experienced from time to time small outbreaks of diarrhoea and vomiting. Our experience with chloramphenicol in established gastro-enteritis has been encouraging enough to warrant the trial of this drug as a prophylactic agent. Though in an attempt to obtain a representative control and treated cases we used as the criterion the appearance of *Bact. coli* O 111 in the stools, this was done only because at the time there was a clear association between cross-infection with *Bact. coli* O 111 and the onset of diarrhoea. We do not suggest that this is always so. In other circumstances the value of prophylactic chemotherapy would be much more difficult to assess. The administration of chloramphenicol is not a substitute for other precautions, but is an additional measure which might be tried when the generally accepted methods for control of cross-infection have failed.

No toxic effects from chloramphenicol have been observed with a dosage of 75 mg. per lb. (165 mg. per kg.) per day for seven days, but it is probable that a lower dosage for a rather longer period might prove equally effective. Three of our cases which received chloramphenicol developed mild diarrhoea 3, 4, and 10 days after the drug had been discontinued, and rectal swabs were positive for *Bact. coli* O 111 during this period. In the light of this experience we suggest that chloramphenicol should be given for 10 to 14 days in a daily dosage of 50 mg. per lb. (110 mg. per kg.).

The bacteriological data, though compatible with the suggestion that *Bact. coli* O 111 may be the cause of one form of infantile gastro-enteritis, are equally explicable on the basis that their occurrence is non-specific and that their suppression during treatment with chloramphenicol is merely a reflection of the general effect of this drug on the *Bact. coli* group. In our experience, so far, the occurrence

of *Bact. coli* O 111 has been so closely associated with the disease that we have felt that infants cross-infected with this organism should be closely observed for prodromal signs of gastro-enteritis.

Recent experience with small numbers both of clinical cases of gastro-enteritis and of those cross-infected with *Bact. coli* O 111 suggests that sulphadiazine may be as effective as chloramphenicol.

The prophylactic use of chloramphenicol or sulphadiazine is not considered necessary when isolated cases of cross-infection (both clinical and bacteriological) arise, but in the presence of widespread cross-infection not prevented by the usual measures the use of these drugs may be valuable.

Summary

Chloramphenicol was given to alternate patients in a consecutive series of 56 infants under 1 year who became cross-infected with *Bact. coli* O 111 after admission to hospital. The results in this small series suggest that this antibiotic might be of value in preventing the development of clinical gastro-enteritis.

H. R. MILLAR, A.I.M.L.T.

(From the Departments of Chemical Pathology and Diabetes, King's College Hospital, London)

Benedict's qualitative test is extensively used in clinical medicine, but its accuracy depends on the correct proportions of urine and Benedict's solution and on heating without "bumping" for the correct time. While these form no obstacle in a laboratory, many years' experience in our large diabetic clinic has shown how dubious the results may be when the test is performed by nursing staff, medical officers, and practitioners not connected with the clinic. Reducing substances have been found to be absent in innumerable urines referred to us for confirmation of a positive Benedict test found elsewhere. Such errors have been diminished but not eliminated by heating for five minutes in a boiling water-bath instead of two minutes over a flame.

In recent years the detection of reducing substances in urine has been simplified still further by the commercial production of tablets containing copper sulphate, sodium hydroxide, citric acid, and sodium bicarbonate in such proportions that when a tablet is dissolved in a measured amount of diluted urine enough heat is generated by solution of the sodium hydroxide, and by neutralization of part of it with the citric acid, for reduction of the copper to take place, giving green, yellow, or orange cuprous oxide colours, just as in Benedict's test. Such a test has many advantages, for with the commercial set of tablets a glass dropper is provided of such a size that the requisite volume is given by 5 drops of urine and 10 drops of tap-water. Under these conditions

the two cases reported here the intravenous injection of distilled water, first suggested by Leriche, was used with striking effect.

Case 1

A married woman aged 73 was admitted to hospital on November 29, 1949. Twelve days before admission she stumbled and struck her head on a rockery stone in her garden. She was slightly dazed, but walked about afterwards for a week, although headache of increasing severity appeared. She had been in bed for five days before admission, and during the past three days had become very drowsy and incontinent of urine and faeces.

On examination she could be roused, but answered questions inaccurately and with difficulty, being very confused in time and space. There was no papilloedema and the cranial nerves were normal. Movements of the left arm and leg were weak and clumsy, and the tendon reflexes were increased on the left side. The left plantar response was doubtfully extensor and the abdominal reflexes were absent. The cardiovascular system was normal: B.P. 150/100, pulse rate 64, temperature 98° F. (36.7° C.). A lumbar puncture showed: C.S.F. pressure 150 mm.; fluid faintly yellow; red cells, 425 per c.mm.; leucocytes, 22 per c.mm. (56% polymorphs, 44% lymphocytes); protein, 150 mg. per 100 ml.; globulin present, glucose, 61 mg. per 100 ml.; chlorides, 720 mg. per 100 ml.; Wassermann reaction negative.

A diagnosis of right-sided subdural haematoma was made and on November 30 bilateral parietal burr-holes were drilled under local analgesia. On the right side a recent subdural haematoma consisting of dark fluid blood containing a few clots was found and evacuated, about 60-70 ml. in all, and the cavity was washed out with warm saline. The surface of the brain was depressed to about 0.5 cm. below the dura.

On December 1 the patient's level of consciousness was higher, but she was still very confused and disorientated. Next day she was stuporous, only just rousable, and incontinent; no focal neurological signs were present. On the third the stupor was deeper. The C.S.F. pressure on lumbar puncture in the lateral position was zero and fluid could be obtained only in small amount by suction with a syringe. Respirations were 18 and shallow, pulse was 80, Temperature 97° F. (36.1° C.), B.P. 120/70. Her extremities were cold and cyanosed. The deep stupor persisted for the next three days, but no focal neurological signs appeared. On December 6 she was in deep coma and unrousable. Respirations were 16 and very shallow, extremities cold and cyanosed; temperature was 97° F. (36.1° C.), pulse 60, and B.P. 80/?. Still no focal neurological signs were present. The C.S.F. pressure was still zero.

In considering the possible causes of the coma and other symptoms it was thought that intracranial hypotension might be the explanation, and it was decided that the very simple procedure of injecting distilled water intravenously or saline intrathecally should be tried before reopening the skull to look for further haemorrhage. At 12 noon 30 ml. of distilled water was injected intravenously and within ten minutes there was a noticeable improvement in the grave condition of the patient. The first change was an improvement in the peripheral circulation; the coldness and cyanosis of the hands and feet disappeared and the blood pressure rose to 100/70. The coma rapidly became less profound and there was a feeble response to painful stimuli. At 3 p.m. the patient could be roused with difficulty and a further 40 ml. of distilled water was given intravenously. At 4 p.m. she was fully conscious and drank a cup of tea without assistance. At 4.30 p.m. the C.S.F. pressure was 60 mm.

On December 7 she was fully conscious, but complained of slight headache; B.P. 145/95; extremities warm; no neurological signs; C.S.F. pressure 80 mm. No further symptoms developed and the patient was discharged from hospital after 10 days. She has remained well since.

Case 2

A married woman aged 49 was admitted to hospital on March 13, 1950, complaining of severe frontal headache and noises in the head. The noises were described as buzzing in the ears on both sides, and had begun about one month before. Two weeks after this she developed pain in the frontal region and behind the eyes, which was constant and gradually increased in severity. She also complained of pain in the right ear on hearing loud sounds. She had been in bed for two weeks before admission with no relief of her symptoms. During the week before admission she noticed a weakness of her right hand and leg, but did not complain of any disability on the left side. She had been adequately treated for Addisonian anaemia for the previous eight years.

On examination she was slightly confused, with considerable delay in answering questions and in performing requests. There was a marked defect of memory for both recent and remote events. Her pulse was 84, B.P. 135/85. There were no abnormal physical signs in the heart or chest, and no signs of Addisonian anaemia. The cranial nerves were normal. There was no papilloedema. Clumsiness and weakness of movement of both arms were present. She had slight loss of motor power, more evident on the right side, but there was astereognosis and gross loss of position sense on the left side of which the patient appeared to be unaware. Fine finger movements were grossly impaired in the left hand and there was also a tendency to a grasp reflex on this side. The left leg also showed gross loss of position sense. The tendon reflexes were slightly increased on the left side as compared with the right, but the left plantar response was definitely flexor and the right extensor. The abdominal reflexes were absent.

A lumbar puncture showed: C.S.F. pressure 60 mm.; fluid faintly yellow, with a slight coagulum; 83 cells per c.mm. (polymorphs 44%, lymphocytes 56%); protein 340 mg. per 100 ml.; globulin present; Wassermann reaction negative. A blood count showed: red cells, 3,393,000; Hb, 78%; C.I., 1; white cells, 5,600; E.S.R., 60-103 mm. (Westergren).

A diagnosis of subdural haematoma was made and bilateral burr-holes were drilled in the posterior parietal region on March 14. A large right subdural haematoma was found, consisting of dark-brown fluid and many clots, about 120 ml. in all. It was washed out with warm saline. The brain surface was compressed to about 1 cm. below the dura. The protein content of the haematoma fluid was 8.12%. On March 15 the patient was rather drowsy, but much less confused. Minimal neurological signs were present in the limbs, but the right plantar response was still extensor. Severe headache was still present. The C.S.F. pressure was 10 mm. Next day she was much more drowsy, but rousable. Confusion was again marked. Her pulse was 64, B.P. 140/90, respirations 20, temperature 99° F. (37.2° C.). There were no focal neurological signs. The C.S.F. pressure was 30 mm. The lumbar puncture needle was left in position and 30 ml. of distilled water given intravenously. Within ten minutes the C.S.F. pressure had risen to 50 mm. and there was a definite lessening of the drowsiness, confusion, and, later, the headache. Later in the day she was quite alert and uncomplaining. On the 17th the headache had entirely gone, and she was alert and feeling well. On March 18 there were no symptoms or neurological signs. The right extensor response had disappeared. C.S.F. pressure was 110 mm.; the fluid was straw-coloured, and contained 120 cells per c.mm. (polymorphs 51%, lymphocytes 49%); protein, 430 mg. per 100 ml.

The patient returned home on March 25 and has remained well since.

Discussion

The clinical picture of intracranial hypotension is seldom clearly defined, and it is usually impossible to make the diagnosis unless a lumbar, cisternal, or ventricular puncture

is done and a low pressure is found. Whenever possible it is preferable to measure the ventricular pressure, as a falsely low manometric reading may be obtained on lumbar puncture in cases in which a tentorial or medullary pressure cone is present, and the withdrawal of fluid by lumbar puncture may be extremely dangerous (Krebs, Puech, and Brunhes, 1937). It is improbable that the diminished volume and pressure of the cerebrospinal fluid is in itself the cause of the many and varied symptoms associated with hypotension, but it is the only objective sign which will confirm an otherwise presumptive diagnosis.

Morice (1944) has classified the symptoms of hypotension under the following headings: (1) Disturbances of consciousness of a progressive nature, slowly changing from stupor to a more or less deep coma. (2) Affective disorder to a more or less deep coma. (3) Diffuse often of a depressive type, but rarely maniacal. (4) Headache of increasing severity, accompanied by nausea and vertigo. (5) Dehydration, characterized by dryness of the skin, shrunken facies, ocular hypotension, and polydipsia. (6) Normal respiration and deglutition and absence of bulbar involvement.

This list is not complete and other symptoms may be found. The temperature may be subnormal, as in my first case. Stiffness of the neck and Kernig's sign may occur. Hypothalamic symptoms are common, such as alterations in the pulse rate and blood pressure, diabetes insipidus, and even alterations in the depth and rate of respiration. Paralytic Cheyne-Stokes respiration has been described. Some French authors and convulsions sometimes occur. Some French authors say that papilloedema has been seen (*Proc. roy. Soc. Med.*, 1948), but it is difficult to imagine why this should occur. Chorobski (1950) says that the alteration in consciousness is distinct from the coma or semi-coma of intracranial hypertension and likens it to the state of "arrested consciousness" sometimes found in tumours of the hypothalamus. We must agree with Leriche that such varied symptoms, however they may be grouped together, cannot be regarded as pathognomonic of hypotension. They could equally well be associated with increased intracranial pressure or with cerebral softening or haemorrhage. In spite of this an awareness of the conditions in which hypotension is likely to occur should enable the clinician to suspect its presence when a clinical picture comprising some of the above-mentioned symptoms is encountered.

The associated pathological conditions are almost as numerous as the symptoms, and were originally classified under the following headings (Leriche and Wertheimer, 1921): (1) Lumbar puncture, especially for spinal anaesthesia, with loss of cerebrospinal fluid into the soft tissues. (2) Closed or compound craniocerebral injuries, with or without loss of cerebrospinal fluid. (3) Cranial operations. (4) Various medical or neurological diseases.

It must be seldom, if ever, that severe symptoms associated with hypotension follow lumbar puncture, but in this connexion Pickering (1948), in a study of lumbar puncture headache in 11 cases, found a low pressure on repeating the lumbar puncture. He ascribes the symptoms to a caudal displacement of the base and posterior parts of the brain, with tension on the anchoring structures, particularly the large arteries at the base. This mechanism may well play an important part in producing the symptoms associated with hypotension and is mentioned later, when the pathogenesis is discussed.

The association of hypotension with closed or open craniocerebral injuries is difficult to determine. The symptoms may be indistinguishable from those of the brain injury which may be present or of cerebral oedema. It is important to make the distinction, as it is dangerous to give hypertonic intravenous infusions when hypotension is present, as was first shown by Clovis Vincent (Krebs, Puech, and Brunhes, 1937). These workers in Vincent's clinic favour the diagnosis being made by ventricular puncture through burr-holes, owing to the previously men-

tioned danger of lumbar or cisternal puncture should a pressure cone exist. These aspects of head injury have not been widely recognized in this country and are worthy of further study. It is still a common practice to give hypertonic solutions intravenously without consideration of the possible harm it may do.

Intracranial hypotension following operations on the brain for the removal of space-occupying lesions is more widely recognized, and most of the recent literature on the condition stresses this association. As stated before, hypotension seems to be much more commonly associated with subdural haematoma than with other space-occupying lesions, and Gerlach (1949) puts forward the theory that the hypotension may actually precede the formation of the haematoma and facilitate bleeding into a potentially empty subdural space. The hypotension is then further increased by the osmotic attraction of fluid into the effused blood.

It is stated by some French authors that hypotension occurs in a large number of apparently unrelated neurological conditions. At the Anglo-French conference in 1948 it was stated that its incidence was 7.2% of all neurosurgical cases, but this is difficult to accept. It has been found in lymphocytic meningitis by Fontan, Verger, and Dabadie (1946) and in meningococcal meningitis by Debré, Thieffry, and Doumic (1946). Puech *et al.* (1942) describe a case in which the hypotension was apparently due to sclerosis of the capillaries of the choroid plexus and absence of C.S.F. production. Gloor (1951) is of the opinion that hypotension may be "primary" and apparently not associated with any other pathological process. Gloor also states that hypotension may be an accidental finding in almost any nervous disease; but as he regards a C.S.F. pressure of below 100 mm. on lumbar puncture in the lateral position as his criterion of hypotension the statement is unconvincing. Pressures of below 50 mm. would probably be a more acceptable criterion to most British neurologists.

Pathogenesis

The decreased volume and pressure of the C.S.F. observed in intracranial hypotension is probably only a secondary manifestation, and other causative mechanisms must be sought to explain the graver forms of the syndrome. "Hypotensive state" would perhaps be a better descriptive term, in that there is less implication that the hypotension is primarily concerned in producing the symptoms.

The simple loss of cerebrospinal fluid may cause hypotension (Jacobaeus and Frumier, 1923; Alpers, 1925; Kunkle *et al.*, 1943; Pickering, 1948), but the symptoms rarely consist of more than severe headache and perhaps neck rigidity. It is also rare to find severe symptoms following the loss of large amounts of C.S.F. from repeated drainage by lumbar puncture or from leakage through cranial fractures. It seems clear that the simple loss of C.S.F. is not a factor in producing serious symptoms such as occurred in my first case.

The rapid reversibility of the symptoms by the methods originally suggested by Leriche suggests that vascular mechanisms are very largely involved. Leriche suggested that spasm of the cerebral vessels following injury and a consequent ischaemia of the choroid plexuses was responsible for the diminished production of C.S.F. The distortion of cerebral vessels and pressure upon them by large tumours and subdural haematomata could easily produce ischaemia, and the tension on vessels produced by displacement of a brain unsupported by its normal bath of cerebrospinal fluid could easily perpetuate the deficiency of cerebral blood flow, particularly in the basal regions. Pickering (1948) invoked this explanation of lumbar puncture headache.

Chorobski (1950) suggests that the secretion of C.S.F. is controlled by nervous influences from the hypothalamus and that disturbance of blood supply to the hypothalamus may be responsible for the lack of C.S.F. production. It is certain that hypothalamic disturbances accompany the

hypotensive state, but it is not clear whether they are primarily responsible for the diminished secretion of C.S.F. or merely due to a general deficiency in cerebral circulation. Overt signs of hypothalamic dysfunction are found only in the more severe forms of the hypotensive syndrome.

In the present state of our knowledge of the syndrome it seems reasonable to speculate that impairment of cerebral circulation is the most important factor involved in its production, but the mechanisms are still obscure, apart from the possibility of spasm produced by trauma and vascular compression from space-occupying lesions. "Primary" diminution of cerebrospinal fluid production must be a rare occurrence, and it seems likely that in most cases it is a secondary effect of disturbed intracranial haemodynamics, particularly in the choroid plexuses. A brain reduced in size from collapse of the ventricles and lying in a relatively "dry" subarachnoid space could produce further circulatory impairment either by compression of vessels by its unsupported weight or by tension on them from its shifting in the cranial cavity. There is support for this idea in the fact that the symptoms of hypotension are often much relieved by lowering the patient's head by raising the foot of the bed, as, for example, in lumbar puncture headache.

Summary

Two cases of intracranial hypotension following the drainage of large subdural haematoma are described. The treatment, symptomatology, and pathogenesis of the hypotensive state are briefly discussed.

The syndrome is so far little recognized in Great Britain, and most of the literature is continental.

It is suggested that although intracranial hypotension is a definite clinical entity it is not a disease *sui generis*, and is probably a secondary effect of a disturbance of cerebral circulation, particularly in the basal vessels.

ADDENDUM.—Since this paper was written, a full account of intracranial hypotension has appeared in a paper by Page (*Lancet*, 1953, 1, 1). Four illustrative cases are described, including one following the drainage of a subdural haematoma and similar in most respects to my two cases. Page also describes a case with severe symptoms, including deep coma, following a lumbar puncture in which only 7 ml. of C.S.F. was removed. This contradicts what I have said above, but such cases must be very rare. There is an interesting reference to a statement made in 1825 by Magendie, who attributed symptoms following the removal of C.S.F. to pressure of the unsupported brain on basal vessels.

Half a million dollars will be spent on the first phase of a cholera control campaign in East Pakistan, under an agreement signed recently by the World Health Organization and the Government of Pakistan. The first part of the campaign will include demonstrations of cholera control methods, and will be followed by the extension over the entire endemic area of those methods shown to be most successful.

THE LONG-TERM PROGNOSIS IN INFANTILE ECZEMA

BY

M. J. PURDY, M.B., M.R.C.P.Ed.

(From the Department of Dermatology, the Royal Infirmary, Edinburgh)

It has long been known that some cases of infantile eczema are liable to develop asthma or chronic skin lesions or both. The particular skin lesions concerned are grouped under various names such as Besnier's prurigo (described by Besnier as "prurigo diathésique" in 1892), asthma-eczema, disseminated neurodermatitis, and atopic dermatitis of Coca and Sulzberger. Taylor (1899) first noted that cases of infantile eczema are liable to become asthmatic, but it was not until fairly recently that attention was drawn to the association of Besnier's prurigo with asthma (Rasch, 1914). In a review of cases of infantile eczema Abt (1909) said: "As regards the aetiological relationship existing between [infantile] eczema and asthma, several striking instances in confirmation of such a view have been noted" (my italics). Modern knowledge would regard such a statement as a fair illustration of meiosis.

Besnier's prurigo is often simply termed chronic or recurrent eczema by others than dermatologists, and may briefly be described as a chronic, pruritic, lichenified cutaneous disease with a predilection for the anterior aspects of the elbows and posterior aspects of the knees, and also usually, but not always, the fronts of the wrists, the forehead, the sides and back of the neck, and the upper part of the chest and back. During remissions there is merely lichenification to view, but during exacerbations itching is intolerable, the lesions may become widespread, papules with surmounting post-traumatic blood crusts are evident, and there may be a superimposed acute eczema from infection.

The literature contains no reference to any investigation aimed at discovering what proportion of babies with eczema of the restricted type implied but inadequately defined by the adjective "infantile" are destined to suffer from the above recurrent or chronic disorders. Consequently, authors of textbooks and articles on this subject are obliged to use vague terms such as "a minority" or "a few" when discussing the prognosis. Hill and Sulzberger (1935), who have contributed much to the knowledge of atopic dermatitis, can only say, "A great many infants with atopic dermatitis recover entirely towards the end of the second year . . . and are bothered no more with atopic symptoms of any sort the rest of their lives."

Bamber (1931) interrogated cases of Besnier's prurigo regarding previous history of infantile eczema and found it present in 51 of the 83 cases examined. The results provide no figures useful for prognostic purposes.

Thus it was thought that an investigation with a primary object of demonstrating what proportion of a group of former victims of infantile eczema has progressed to manifestations of asthma and Besnier's prurigo might prove of some general prognostic value *per se* or, at worst, might be used for such a purpose in later years in conjunction with similar surveys conducted elsewhere.

The Investigation

Edinburgh, with its environs, was chosen as a satisfactory area in which to attempt a long-term follow-up of infantile eczema cases for these reasons: the population is relatively static both by nature and because there was negligible war-time damage to homes; the department of dermatology of the Royal Infirmary has been in existence for over sixty years; and the necessary case records have been carefully preserved. Therefore accurate information about the details of eczema in infancy was available and there was a probability of finding many of the former sufferers at or through their addresses of fifteen to twenty-one years ago.

Consequently letters were sent to those patients who attended this department for infantile dermatitis during 1931-7 inclusive. The letter and interrogation were kept as simple as possible. As the youngest of the group would be only 14 years of age, mention was made in the letter of the desirability, when answering the questionnaire, of seeking the help of a parent or other person in a position to recall forgotten facts.

The following was the questionnaire:

1. Since you were last seen at the skin department, Royal Infirmary, Edinburgh, have you suffered from any of the following complaints? (a) Asthma; (b) frequent chest colds with wheezing; (c) bronchitis with wheezing; (d) migraine (sick headache); (e) hay-fever (running at the nose and eyes with much sneezing, especially in the morning).
2. Since last seen at the skin department, Royal Infirmary, Edinburgh, have you had any skin disorder? (a) At what age(s) have you had it? (b) How long did the attacks last? (c) If you saw your doctor about it, what was it called? (d) What parts of the body were affected? (e) Will you be willing to see me at the Infirmary if I make an appointment for you?
3. Have you suffered from any nerve troubles? If so, what kind?
4. Do you and others think you tend to worry unnecessarily?
5. What has been your usual position in examinations at school?
6. If left school, what is your occupation?
7. What other illnesses (of any sort) have you had?
8. Please give your present address if it is other than that to which I have sent this.

It will be seen that no inquiry about urticaria was made specifically. It is a diagnosis which may readily be reached only when an actual attack is present, and is a manifestation too vague to be put in writing for the laity.

The following criteria alone were followed in the selection of cases from the records: (1) the diagnosis must have been either "infantile dermatitis" or "dermatitis" unqualified by adjectives such as venenata, seborrhoeica, medicamentosa, etc. (note: the term "eczema" was not then in use here); (2) the face must have been clearly involved; (3) the baby must have been 24 months of age or younger when first seen with the disease; (4) the baby must have been 12 months of age or younger at the onset of the disease; (5) there must have been no apparent acquired predisposing disease such as scabies, pediculosis, antecedent napkin erythema.

In support of the above criteria I would claim that it is now generally conceded that classical infantile eczema almost always afflicts the face initially and that it begins in the first year of life. Hall (1908), in a study of 100 cases, found that 80% began in the first four months and cases, that the eruption started on the cheeks, forehead, temples, scalp, or ears in 96%. However, some of his cases may have been seborrhoeic or infective, and in the present series cases with only scalp and temples or ears afflicted were excluded in order that the cases selected might conform more to modern concepts.

Despite the above precautions it is conceivable that a few of the cases included may be classed now by some dermatologists as seborrhoeic, because it is doubtful if a sharp distinction was drawn here fifteen years ago and more similar distribution) in infants. It has yet to be shown that

the concept of the latter disease where there is frank involvement of the face is altogether safe and sound; moreover, as Russell Thomas (1950, personal communication) says, many cases which appear seborrhoeic in origin at first are undoubtedly allergic in the end. Hill (1942), in a survey, found that seborrhoeic dermatitis composed less than 4% of cases of infantile eczema. Thus it seems that failure to segregate the odd case of seborrhoeic dermatitis masquerading as one of infantile eczema is unlikely to affect this investigation seriously.

The question of heredity was not raised, as it was felt that it would complicate the questionnaire and reduce the number of responses. Moreover, it would be impossible to record the influence of various "strengths" of allergic family history upon the analyses. The usual evocation of a strong family history of hay-fever, asthma, or eczema in cases of Besnier's prurigo is an almost daily clinical experience. In assessing the final results no case was accepted as one of Besnier's prurigo without being interviewed personally or unless it had recently been seen by a consultant of this department.

Results and Discussion

An attempt to locate by letter persons whose last known address is that of 15 or more years ago is likely to meet with much frustration. This considered, the total reply rate of nearly 30% (Table I) is not unsatisfactory. Of the

TABLE I.—Result of Questioning

Total number of letters sent out	329 (246 males, 83 females)
"Dead" letters returned	165
Useful replies	93 (62 males, 31 females)
Useless replies (deaths at early age)	4
Not returned	67

letters supposedly received in the main by the addressees, nearly 60% evoked responses in the form of a questionnaire returned completed, many accompanied by a useful letter of added information. This, too, is satisfactory when it is realized that many would never even have heard before that they once had infantile eczema, and that subsequent good health renders them little disposed to "waste time" recording that fact.

Throughout the figures there is the modifying factor of the 67 unanswered and unreturned letters. It may with fairness be argued that those who have one of the disorders mentioned are more likely to answer the questionnaire, in the hope of receiving help, than those who are free of such diseases; the latter are therefore more likely to be represented among the 67 "lost" letters. It is most unlikely that these 67 persons should show a higher incidence of the sequelae studied than is displayed by the group of 93 who supplied answers. Therefore the figures throughout the tables are probably artificially high and represent the maximum incidence in this series. The theoretical minimum can be derived by assuming that none of the 67 suffers from any of the diseases. By this method the possible range of incidence of each disorder is computed below.

Table II gives the incidence of the generally accepted sequelae. The overall figure for asthma is nearly 40%,

TABLE II.—Results of 93 Replies (With Confirmatory Examination Where Advisable) to Questions 1 and 2

	Total No.	Asthma	Asthma Denied. Wheezing Admitted	Hay-fever	Besnier's Prurigo	Migraine
Male	62	25 (40.3%)	7 (11.1%)	24 (38.7%)	18 (29%)	7 (11.1%)
Female	31	12 (38.7%)	3 (9.7%)	15 (48.4%)	5 (16.3%)	0 (0%)
Total	93	37 (39.8%)	10 (10.7%)	39 (41.9%)	23 (24.7%)	7 (7.5%)

with no practical difference for the sexes. The minimum (calculated as above) is 23.1%. These figures are startling as they stand, yet do not embrace the figures for "frequent chest colds with wheezing" and "bronchitis with wheezing."

Many patients with asthma are not aware, for reasons of concealment by their doctor or by reason of ignorance, of their true diagnosis. This is a common experience in general practice, and was often found during interviews in this survey. Wheezing in the above circumstances is unlikely to be due to any disease other than asthma in the age group under study, and it will, I think, be agreed that the majority of the 10.7% so afflicted are asthmatics of some grade. Thus we reach a final range for asthma of 23.1 to 50.5%, the minimum figure being absurd, as it entails the conception that none of the wheezing group of 10 people and none of the "lost" group of 67 people are asthmatic. If it is conceded that the wheezing group are asthmatics we reach what must be a more nearly exact minimum of 29.4%. The final range is thus roughly 30 to 50%, representing the proportion of infants with eczema which, in this series, have developed asthma.

Comparable figures for the general population are difficult to obtain. McGregor (1950) analysed the incidence of various diseases about which he was consulted in a general practice in a small Scottish industrial town. Asthma represented 2.4% of the population embraced in the 5-14 years age group and 1.3% in the 15-40 years age group. These figures represent only patients who were treated during that year and not those who did not consult him, and are useful here therefore only as a rough comparison. Kurtz (1950) found 1,043 cases of asthma in 300,000 people. There were 212 cases under the age of 11 years, the male:female ratio being 1.5:1, whereas in the 78 cases aged between 11 and 20 years the ratio was 1:1.3 in favour of females. This reversal may be partly due to the incidence of post-eczema asthma in the first decade, which, as found in the present series, is so much commoner in males, and which may tend to spontaneous cure in the second decade. (Fourteen cases in this series volunteered such information, and it is regretted that the question was not specifically asked in the questionnaire.) Thus, for all ages, Kurtz found the incidence of asthma to be 0.35%. Derbes and Engelhardt (1943), analysing 151,040 admissions to the Charity Hospital of New Orleans in five years, found the admission rate for asthma to be 0.66% of all admissions. Ellis (1933) describes the examination of 518 schoolboys in Port Sudan (where the asthma incidence is thought to be high in adults), only one with a history of asthma being found.

The figures for hay-fever include many cases of asthma and have been divorced from these in Table III, where it

TABLE III.—Regrouping of Cases from Table I

	Total No.	Asthma (or Wheezing Attacks) but No Besnier's Prurigo	Besnier's Prurigo but No Asthma (or Wheezing)	Both Asthma (or Wheezing) and Besnier's Prurigo	Hay-fever but No Asthma (or Wheezing)
Male ..	62	19 (30.6%)	5 (8.1%)	13 (21%)	9 (14.5%)
Female ..	31	8 (25.8%)	(1 probable) (3.2%)	7 (+2 probable) (22.6%; ?+6.4%)	5 (16.3%)
Total ..	93	27 (29%)	5 (?+1) (5.4%; ?+1%)	20 (?+2) (21.5%; ?+2.1%)	14 (15%)

is seen that 15% of those replying claim to have hay-fever without asthma. The range here would be 8.8 to 15%. Comparable figures for the general population are unobtainable in default of an investigation devised for that purpose. McGregor's (1950) figures are not applicable, because not all sufferers from allergic rhinitis ever consult doctors, let alone in any given year.

The figures for Besnier's prurigo are slightly complicated by the presence of three females who could not attend for interview. One describes persistent dry itching areas in the classical sites; another says the infantile eczema persisted to the age of 12 years and the arms and legs are still dry; and a third gives an account of eczema lasting to the age of 7 years, especially behind the knees. Although these three are assuredly cases of past or present Besnier's prurigo the figure representing them is placed after a query in parentheses. The total figures provide a range of 14.8 to 28%;

the minimum again presumes a complete absence of the complaint among the 67 who did not reply. This figure is likely to be artificially low, as the assumption is improbable. Among those who failed to reply there would be some with what they simply regard as a dry skin and of little importance and others who have been told that nothing can be done. Among cases seen in the course of this investigation were several who complained only of dry skin, who had never sought advice, and who were more-than-mild cases of Besnier's prurigo (whom treatment could markedly alleviate). However, for want of more accurate information the figures as stated must be accepted.

Migraine is a very doubtful outcome of infantile eczema. The range is 4.4 to 7.5%. The numbers are insignificant, but the complete monopoly by males is of interest when the average preponderance of females with migraine is recalled. Comparable figures are not available, and the self-diagnosis of sick headache by patients is as likely to be erroneous as correct.

Table III further analyses Table II. It indicates that asthma without skin involvement (other than the original infantile eczema) forms the most important isolated sequela from the frequency point of view, with a range of 16.9 to 29%. Asthma in conjunction with Besnier's prurigo is next, with a range of 12.5 to 23.6% (again with an improbably low minimum). Only 5 out of the 23 cases of Besnier's prurigo were free of asthma, as may be seen. Bray (1937) has postulated that at least one out of four cases of infantile eczema going on to Besnier's prurigo develops asthma. A survey to-day among large numbers of cases of Besnier's prurigo would, I think, show figures nearer to four out of five.

The incidence of hay-fever has been discussed above. In reference to the cases of Besnier's prurigo the impression was gained of the strong tendency for the skin condition to improve in many cases about the middle of the second decade, although no one would now agree unreservedly with Sabourand's observation that the malady disappears about the twelfth to fifteenth year. However, this study in no way attempts to determine the prognosis of cases of developed Besnier's prurigo, asthma, or allergic rhinitis, for this would entail a separate investigation.

Table IV gives further confirmation of the original manifestation of the asthma-xeroderma syndrome as infantile eczema. Indeed, it is but a step from dry skin of this type—which involves the flexures, whereas true ichthyosis spares

TABLE IV.—Other Dermatoses

	No. of Cases
Past brief attack of some vague disorder ..	12
Persistent dry skin (all with asthma) ..	4
Atypical, mild, transient neurodermatitis (and asthma) ..	1
Furunculosis ..	1
Urticaria ..	1
Alopecia areata ..	1
Tinea ..	1

them—to Besnier's prurigo, in which disorder a dry hypohidrotic skin is the rule. Of interest in this regard were two patients who have been five years without signs of prurigo, who have dry skin, and who often develop intense itching in the bends of the elbows and knees but, by virtue of experience, refrain from scratching. They found (as is again common experience) that the pruritus always came first and that the acute or chronic eruption developed only if they scratched or rubbed. With abstinence from such mechanical balm the lichenification also has subsided. One, however, might argue soundly that only patients in whom the condition tends to clear spontaneously could possibly refrain from scratching, especially during sleep, in that reflex manner which is so much an integral characteristic of the neurodermatitis.

It is usually alleged that sufferers from infantile eczema are of somewhat higher intelligence. I believe this. Sequeira, Ingram, and Brain (1947) wrote: "The affliction [infantile eczema] is the expression of a sensitive skin and of a sensitive and therefore bright, lively, intelligent, and

alert child who is likely to outstrip his fellows in the battle of life, provided he is not hampered by disabilities resulting from such reactions as eczema." Questions 3, 4, 5, and 6 were asked in an attempt to support or refute such statements. Failure to do either was certain unless the figures argued strongly one way. They did not, and therefore any method short of thorough psychological examination of each case cannot help in the matter. It is interesting to note that the only males confessing inadequacy of emotional make-up were those afflicted by asthma or Besnier's prurigo, or both.

The opinion is often quoted that the scalp is not usually affected in cases of infantile eczema which are destined to progress to Besnier's prurigo. In this series 12 of those with Besnier's prurigo had had scalp involvement as infants and 11 had not. However, almost 90% of the cases of Besnier's prurigo had had infantile eczema on the trunk and limbs (as well as on the face and/or scalp).

Conclusions

When the figures for hay-fever only, asthma only, Besnier's prurigo only, and both asthma and Besnier's prurigo are added together it is found that out of the 93 prurigo replies received, 63 describe at least one of the recognized sequelae of infantile eczema. Of these 63, 52 have had sequelae of no minor severity. Thus we find that, of the group of infants with eczema under study, between 33 and 56% were destined to many years or a lifetime of grave disability. This, when one is confronted with a case of infantile eczema, is a sobering thought. May it stimulate the continued untiring investigation of the problem.

Considerations of the restricted locale, the moderate numbers, the isolated period, and the wide range of percentages, which are all unavoidable components of this investigation, preclude generalization.

Sneddon (1951), in an excellent contribution, has emphasized the effect upon prognosis of a strong family history of eczema and asthma, the psychological background of the family, and over-protection. In an article which attempts to educe actual figures these undeniably important influences are relatively imponderable and have therefore not been considered.

It is hoped that others will find opportunity, in different centres, to follow up the cases of infantile eczema of years ago, so that eventually the figures will be large enough to give a high degree of accuracy.

Summary

An investigation of the incidence of sequelae following infantile eczema of fifteen to twenty-one years ago is described.

Between one-third and one-half of the cases studied have sequelae sufficient to encumber at least their first fifteen to twenty years of life.

Spasmodic asthma leads the field, affecting between one-quarter and one-half of the cases.

Besnier's prurigo has afflicted roughly one-fifth of the cases.

Allergic rhinitis is found in one-tenth.

I wish to record my gratitude to Professor G. H. Percival and Dr. Robert Aitken for permission to use their cases and for their advice and encouragement. I wish also to thank Dr. G. A. Grant Peterkin for suggesting the investigation in the first instance and for his subsequent invaluable help and criticism.

A CASE OF MALE PSEUDOHERMAPHRODITISM

BY

D. C. BEATTY, M.D., M.R.C.P.

Senior Medical Registrar, Royal Free Hospital

C. J. CHAMP, M.D., M.R.C.O.G.

Gynaecological Registrar, Royal Free Hospital

AND

G. I. M. SWYER, D.M., D.Phil., M.R.C.P.

Consultant Endocrinologist, Department of Obstetrics, University College Hospital

Schneider, Van Ommen, and Hoerr (1952) have refocused attention upon the condition of male pseudohermaphroditism. Williams (1952) refers to the condition as "intersex males with purely feminine external genitalia and bodily habits." These patients have a normal feminine mentality and normal or greater than normal libido. Breast development is normal, though the nipples and areolae tend to be small. The external genitalia are normal, but the labia are small. Axillary hair is absent and the pubic hair scanty or absent. There is a short vaginal pouch which ends blindly, the cervix is absent, and the uterus is absent or rudimentary. The gonad is usually intra-abdominal, most often in the position of the ovary, but not infrequently it is in the inguinal canal, when it may be associated with a hernia. A moderate degree of vaginal cornification is present and the 17-ketosteroid output is at the normal feminine level. There is often a familial incidence.

Schneider *et al.* laid down definite criteria for the diagnosis. These are: feminine habitus, primary amenorrhoea, absence or almost complete absence of axillary and pubic hair, blind vaginal pouch with absent cervix, and intra-abdominal testis. They could find only 12 cases in the literature which fulfilled their criteria, and reported six cases of their own. We would like to report a further case which was diagnosed clinically before the result of the previous operation was known.

Case Report

A single woman aged 25 was admitted on May 7, 1952, complaining of epigastric pain half an hour after meals and of backache of three weeks' duration. She had not vomited and her appetite was good. She had lost 14 lb. (6.4 kg.) in weight during this time. Recently she had become paler and had noticed that the stools were dark. She had a dry cough since the age of 18 which she attributed to smoking.

She had never menstruated. Breast development and some pubic hair appeared at the age of 16. At the age of 17 she was 5 ft. 2 in. (157 cm.) in height and weighed 9 st. (57.2 kg.). From then until the age of 21 she grew rapidly to 5 ft. 8½ in. (174 cm.), when she weighed 9 st. 7 lb. (60.3 kg.). Growth then ceased. She has a normal feminine outlook and was recently engaged to be married. The engagement was broken off by her fiancé because he found her sexually unresponsive. This led to her becoming somewhat introspective. There are no

Photographs of the patient

Past History.—She had measles and mumps as a child. At the age of 5 (in 1932) an operation was performed at Newcastle Royal Infirmary for left inguinal hernia. At the age of 18 she was again seen at that hospital. An examination under anaesthesia was carried out and the uterus was found to be absent.

Family History.—Her father died eight years ago from a cerebral haemorrhage. Her mother is alive and well, apart from indigestion. One uncle died from a stroke, one suffers from indigestion, and another is in Australia. One aunt died aged 26 years (cause unknown) and the other suffers from Bright's disease. She has one brother, who is married. One sister died from meningitis at the age of 5. Three other sisters are alive and well, married, and have families. Their periods did not begin until the age of 17 or 18. Pubertal development occurred between the ages of 13 and 14.

On admission the patient's height was 5 ft. 8½ in. (174 cm.); weight 8 st. 10 lb. (55.3 kg.); vertex to symphysis, 35 in. (89 cm.); symphysis to ground, 33½ in. (85 cm.); span of outstretched arms, 69 in. (175 cm.); feminine habitus. The voice was rather low-pitched and husky. The mucous membranes were pale. Numerous freckles were present over the face and arms. Axillary hair was absent; pubic hair fine and scanty. The nipples and areolae were small. The breasts were small, but mammary tissue was present. The external genitalia were normal, though the labia were small. **Cardiovascular system:** blood pressure, 130/70; heart sounds normal. **Respiratory system:** normal. **Abdomen:** tender in the epigastrium, but no mass or viscus felt. There was a scar from a left inguinal hernia operation; no herniae present. **Central nervous system:** retinal veins somewhat tortuous and slight filling of the optic cup; there was no other abnormality. **Rectal examination:** no uterus or cervix was felt.

Investigations.—Blood count: red cells, 4,400,000; haemoglobin, 9.2 g. (62%); colour index, 0.7; white cells, 12,500 (polymorphs 65%, lymphocytes 32%, monocytes 3%). Thorn's test—eosinophil count before A.C.T.H., 60 per c.mm.; four hours afterwards, 40 per c.mm. B.M.R., +5%. Plasma cholesterol, 150 mg. per 100 ml. Fractional test meal, normal acid curve. Occult blood, positive. Barium meal: there is a large ulcer crater on the posterior wall in the pars media and a small one just above the first. The duodenal cap is normal. Glucose-tolerance test (100 g.): fasting, 81 mg. per 100 ml.; after ½ hour, 121 mg.; 1 hour, 144 mg.; 1½ hours, 126 mg.; 2 hours, 126 mg. No glycosuria. Skull: no abnormality seen; sella turcica

of normal appearance. Wrists and knee-joints: epiphyses have fused. Output of 17-ketosteroids, 9.2 mg. in 24 hours. Urinary gonadotrophin output, less than 10 units in 24 hours. Urinary oestrogens: oestrone, 1.5 µg. in 24 hours; oestradiol, 2.5 µg.; oestriol, 2.0 µg. Vaginal smear: moderate cornification (++ to +++).

Discussion

On clinical examination this patient seemed to fulfil the criteria of Schneider *et al.* She was tall and slim, quite unlike the short stocky build resulting from ovarian agenesis. Furthermore, breast development was present. Ovarian agenesis was also excluded by the degree of vaginal cornification present and because the output of urinary gonadotrophin was not increased. Her height, her freckled appearance, and the presence of some pubic hair were equally unlike a primary pituitary dysfunction. This was confirmed by the normal basal metabolic rate, glucose-tolerance curve, and urinary output of 17-ketosteroids.

Exploratory laparotomy was contemplated to confirm the diagnosis. This proved unnecessary, however, as Professor Duguid kindly lent us the histological sections of the gonad removed at the operation for inguinal hernia when the patient was 5 years old. This showed the typical appearances of a cryptorchid testis.

The diagnosis of male pseudohermaphroditism should be considered whenever a patient with primary amenorrhoea is found to have absent axillary hair and absent or scanty pubic hair with nearly normal breast development and normal external genitalia, and in whom an examination under anaesthesia shows the uterus to be absent. Although there was no family history in our case, the condition is often familial. The presence of an inguinal hernia or the scar of a previous operation for the repair of one is common in this condition. The vaginal smear provides a simple means of demonstrating some degree of oestrogenic activity and of thereby excluding primary ovarian failure, as in ovarian agenesis, as the cause of the amenorrhoea. The diagnosis can generally be confirmed only by laparotomy and gonadal biopsy; it is probable that cases have been missed through the assumption that the gonad found on laparotomy was an ovary. As the testis is the source of oestrogens, castration is contraindicated: Williams described a case in which castration was followed by the development of menopausal symptoms and genital atrophy.

Summary

A case of male pseudohermaphroditism is presented. The clinical features of this condition are reviewed and suggestions made regarding methods of diagnosis.

Our thanks are due to Dr. Una Ledingham and Miss J. Moore for permission to publish the case, to Professor Duguid for kindly lending us the histological section, and to Dr. J. M. Tanner for the photographs of the patient.

ORAL THROMBIN IN THE TREATMENT OF HAEMATEMESIS

BY

VINCENT EDMUNDS, M.D., M.R.C.P.

Assistant Physician to Charing Cross Hospital Unit,
Mount Vernon Hospital; Medical Registrar,
Central Middlesex Hospital

(From the Department of Gastro-enterology, Central Middlesex Hospital)

The clinician is always interested in new methods of producing local haemostasis in cases of internal bleeding where the surgical principle of local treatment by pressure or suture is unfortunately not applicable. Various thromboplastins for enteral or parenteral use have been produced, but none have been convincingly successful in practice. The example of intravenous Congo-red solution in haemoptysis can be instanced, as also may the oral administration of adrenaline for haematemesis.

Thrombin is a substance which for many years has been much used in all branches of surgery, and particularly in neurosurgery, for the production of local haemostasis, and there is a sound scientific basis for this in that it is capable of clotting fibrinogen directly to fibrin in a few seconds. Needless to say, it is effective only when the bleeding is in the nature of a capillary ooze, and cannot be expected to work in the presence of severed vessels of any size.

Daly (1947) has recommended the use of thrombin orally in cases of gastric haemorrhage. Certain technical difficulties are involved in that the thrombin must be present in sufficient concentration in the stomach to produce clotting of fibrinogen; also the pH of the medium is important, since its action is impeded at pH 6.5 and the substance itself is completely destroyed at pH 4.3. Daly obviated this difficulty by administering orally an M/7 phosphate buffer solution five minutes before and again with the thrombin. Using this method, he was able to show that in a normal individual adequate raising of the pH and adequate thrombin activity were present for at least 15 minutes after the oral administration of 10,000 units of thrombin in 30 ml. of buffer.

Subsequently, Daly *et al.* (1949) published a series of 100 cases of upper gastro-intestinal bleeding treated with oral thrombin. The series was uncontrolled, though their impression, gathered from their previous experiences, was that "the method is a valuable adjunct in the treatment of upper gastro-intestinal haemorrhage."

Rogers (1948) reported dramatic improvement in two cases of severe continued haematemesis following the administration of thrombin in saline and without buffer solution. Unpublished favourable results in this country have been brought to our notice, and as a mode of treatment it would seem to have become an accepted practice, at least in some American centres (Wechsler and Odle, 1950).

In a review of the treatment of haemorrhage from peptic ulcer Crohn and Janowitz (1951) use these words: "... the use of 'gelfoam' and of buffered thrombin has been advocated. ... The administration of these substances by mouth during haemorrhage is very simple and is often followed by a cessation of haemorrhage;

this was the case in a few cases, and whether this was merely the result of coincidence remains to be established."

In view of the absence of any controlled investigation into the value of oral thrombin in the treatment of gastro-duodenal haemorrhage it was felt that such a survey should be attempted. Dr. Savage, of Messrs. S. Maw Son & Sons Ltd., kindly supplied us with thrombin and also an inert substance conveniently made up in doses of 1 g. (10,000 units) in separate bottles and ready for solution in phosphate buffer. These bottles were labelled with code letters and their identity was not revealed until the end of each stage of the investigation.

Method

The method adopted was based on that evolved by Daly, who had found that valuable information could be learned about the patients' progress if periodic gastric aspirations were made and the presence or absence of fresh blood was noted. Accordingly a Ryle tube was passed whenever possible on patients admitted with a history of recent haematemesis, and perfodic (usually hourly) aspirations were made. This had the added advantage that we were able to make regular pH readings and thus ensure that the buffering was adequate.

At the beginning of the investigation the stomach was aspirated and emptied hourly from the time of admission. If the stomach contents proved to contain fresh blood 50 ml. of phosphate buffer was administered down the tube followed after five minutes by 2 g. of powder—A (thrombin) or B (inert control substance)—dissolved in a further 30 ml. of buffer. In cases of fresh blood-staining this procedure was to be repeated at half-hourly intervals until either no further evidence of fresh blood appeared or it became obvious that successive doses of powder were not arresting the haemorrhage. Cases in which recent blood could not be aspirated from the stomach were not included in the series.

This method was later modified, using a fresh batch of powders—K (thrombin) and N (inert substance). On this occasion all cases with a history of haematemesis within the past six hours were given a dose of buffer followed by test substance on admission. A Ryle tube was then passed. Three hours were then allowed to elapse before a further aspiration. If on aspiration three hours after admission there was still evidence of fresh gastric haemorrhage, the method was proceeded with as previously.

Experience over some years at this hospital has shown that about 25% of cases of gastro-intestinal haemorrhage have episodes of recurrent bleeding after hospital admission, and it was felt that if we could reduce this percentage in our cases it would be a point in favour of thrombin therapy.

Cases on admission were allotted to alternate groups without any selection whatsoever.

Results

In spite of using a controlled series treated with an inert substance it was often found very difficult in assessing the results to decide whether or not a patient had benefited from the therapy. This is discussed later, but in any case in which there was the slightest suspicion that the subject might have gained even temporary benefit from the treatment then this was recorded as a success. The Table

INCIDENCE OF NEONATAL INFECTION IN HOSPITAL AND DOMICILIARY MIDWIFERY

BY

V. MARY CROSSE, O.B.E., M.D., D.P.H.

Consultant Paediatrician, Birmingham

AND

JEAN M. MACKINTOSH, M.D., D.P.H., D.P.A.

Administrative Medical Officer of Health for Maternity
and Child Welfare, City of Birmingham

A great deal has been written about the risk of infection to which the infant born in hospital is exposed. It is usually assumed that the hazard in this respect is less in domiciliary midwifery. It was felt that it would be of interest to study a series of infants from this point of view, some of whom were born in hospital and some in their own homes.

The Investigation

Records were kept of all infants born in Sorrento Maternity Hospital over a period of 12 months (Group A) and of all infants born over the same period in the practices of 22 domiciliary midwives in Birmingham, these midwives being recognized as district teachers by the Central Midwives Board (Group B). In Group A all attendants were masked, and visitors saw the infants only through glass. Mothers were not masked. Reasonable precautions were taken to prevent infection by contact or dust. In Group B the midwives were masked, but the mothers, relatives, etc., were not. Here, too, reasonable precautions were taken to prevent infection by contact or dust. The comparison was possible for only the first 10 days of life, as the majority of hospital patients were discharged on the tenth day. All babies under observation in both groups were seen daily for that period.

In Group A there were 1,459 births, of which 41 were stillborn. In Group B there were 1,846 births, 21 of them being stillborn. In Group A, 61 premature infants under

TABLE I

	Group A	Group B
Total births	1,459	1,846
Babies removed from observation:		
Stillbirths	41	21
Transfers within 48 hours:		
Prematures	61	21
Mature domiciliary births to hospital	—	9
Mature hospital births to home	13	—
Deaths under 48 hours among remaining births	8	7
Total removals	123	58
Babies exposed to risk of infection	1,336	1,788

4½ lb. (2 kg.) were transferred to the premature baby unit and 13 infants over 5½ lb. (2.5 kg.) were discharged for home nursing within 48 hours of birth. In Group B, 21 premature babies were transferred to premature baby units within 48 hours of birth and 9 babies over 5½ lb. (2.5 kg.) were transferred to hospital for various reasons. For the purpose of this investigation only babies in Group A who were nursed in the ordinary nurseries and those in Group B who were nursed at home were considered. Table I gives the numbers involved in each group.

The following definitions of infection were used. Discharging eyes: discharge from the eye, either watery (lasting for 24 hours) or purulent. Skin infection: sore buttocks or one single spot or blister. Umbilical infection, however slight. Otitis media or otorrhoea: in Group B this could be diagnosed only by discharge from the ear.

If a baby had more than one type of infection each was counted. On this basis it was found that there were 140 infections in Group A and 259 infections in Group B, giving a rate of 10.48 infections per 100 babies in Group A and 14.48 infections per 100 babies in Group B.

Table II shows the incidence and time of onset of each type of infection in each group.

TABLE II

Type of Infection	Day of Onset										Total
	1	2	3	4	5	6	7	8	9	10	
Group A:											
Discharging eyes	8	23	13	11	2	9	7	9	8	5	95
Skin infection	3	2	2	3	10	4	3	3	1	3	34
Paronychia	—	—	—	—	—	—	—	2	1	—	3
Nasal discharge	—	—	—	—	—	—	—	—	—	—	—
Respiratory infection	—	—	—	—	—	—	—	—	—	—	—
Otitis media	—	—	—	—	—	—	—	—	—	—	—
Thrush	—	—	—	—	1	—	—	2	1	1	5
Infected umbilicus	—	—	—	—	—	—	—	—	1	—	1
Abscess	—	—	—	—	—	—	—	—	—	1	2
Total	11	25	15	14	13	13	10	17	12	10	140
Group B:											
Discharging eyes	5	29	36	26	25	22	19	14	10	10	196
Skin infection	—	1	1	4	1	2	2	3	1	—	15
Paronychia	—	—	—	—	—	—	2	—	—	4	7
Nasal discharge	—	1	6	—	3	—	5	2	1	1	19
Respiratory infection	—	—	—	—	—	—	—	—	—	—	—
Otitis media	—	2	1	—	1	—	1	1	1	—	7
Thrush	1	—	—	—	—	—	1	—	—	—	2
Infected umbilicus	—	—	—	1	—	—	4	1	—	4	10
Abscess	—	—	—	—	—	—	—	—	1	1	2
Total	6	33	44	31	31	24	34	21	14	21	259

Table III compares the risk from various types of infection in the two groups.

TABLE III

Type of Infection	Group A (1,336 Babies)		Group B (1,788 Babies)	
	No. of Infections	Incidence per 100 Babies at Risk	No. of Infections	Incidence per 100 Babies at Risk
Discharging eyes	95	7.12	196	10.97
Skin infection	34	2.54	15	0.84
Paronychia	3	0.22	7	0.39
Nasal discharge	—	—	19	1.06
Respiratory infection	—	—	7	0.39
Otitis media	—	—	2	0.11
Thrush	5	0.37	10	0.56
Infected umbilicus	1	0.08	2	0.11
Abscess	2	0.15	1	0.05
Total	140	10.48	259	14.48

The most prevalent type of infection in both groups was discharging eyes, the majority of which were very slight. None resulted in permanent damage. In Group A there was a greater preponderance of skin infections owing to the increased risk of contact infection. In Group B there were more nasal discharges, discharging ears, and pulmonary infections, all of which might easily be explained by the greater hazards to which the infant born at home is exposed by visitors, small children, and others who are not masked.

Although in Group A the skin infection was minor in character and there was no diarrhoea, yet the potential danger of cross-infection inherent in hospitalization was always present. It is, of course, well known that the infant born in hospital is exposed to risks of this nature even when reasonable precautions are taken. It is not so well appreciated that the advantage which the baby born at home has in being less exposed to the hazard of cross-infection may be nullified by the danger he runs from respiratory infection acquired from unmasked relatives and visitors, and this fact should be impressed on all those responsible for the care of the newborn baby in his own home.

We should like to express our thanks to the staff of the Sorrento Maternity Hospital and the domiciliary midwifery staff for their assistance in this investigation.

Medical Memoranda

A Simple Pneumoflator

Though many anaesthetists may doubt the necessity for or value of full pneumoflator anaesthesia, I think all would agree on the convenience of frequent mechanical assistance during controlled respiration.

The machine illustrated was designed to act as a "mechanical hand" on the many occasions when the anaesthetist, working alone, had to relinquish the bag to fill syringes, etc. The prototype shown here was built of pressed steel by Mr. T. Eames, of Paddington. Further

machines have been constructed in the workshops of the National Hospital, Queen Square, and are enclosed in an outer casing, thus producing almost complete silence.

The motors used have been R.A.F. disposals predictor motors of the 10 KB/565, 230 A.C. type with worm drive gear-boxes. These motors run at 3,000 r.p.m., reduced to 23 r.p.m. on the output shaft. They give ample power. Suitable motors for further machines can be obtained from Messrs. Klaxon, 201, Holland Park Avenue, W.11.

The whole machine has been kept as simple as possible, and there is only one control—a rheostat that adjusts the rate of the motor. A 1-gallon (4.5-litre) bag is used. The pressure can be varied according to the flow of gas and consequent inflation of the bag. With a manometer it has been found that a pressure of 15–20 cm. of water may be obtained, which normally is ample.

The prototype has now run for about 100 hours and has shown no weaknesses. It has been used for its proper purpose as a mechanical hand and also continuously as a full-scale pneumoflator in many cases at the London Chest Hospital and the National Hospital, Queen Square. There may be a use for such an inexpensive and simple device in various fields, including the prolonged treatment of poliomyelitis.

The motor runs absolutely cool, but at present it is not suitable for use with explosive mixtures; in practice this is no disadvantage. Should such use be envisaged, both motor and rheostat must be of suitable type, and these are easily obtainable.

I would like to express my thanks to Mr. T. Holmes Sellors, Mr. Harvey Jackson, and Mr. C. H. Bateman for their kindness in allowing me to develop this machine during treatment of their cases.

R. ATWOOD BEAVER, B.M., F.F.A. R.C.S.
Senior Anaesthetist, London Chest Hospital.

Repeated Narcosis in a Young Child

It was decided to expose a child of 16 months to deep x-ray therapy for a retinoblastoma. The exposures were to be made on 10 occasions at two- to three-day intervals, and each treatment was to be for 24 minutes. The x-ray applicator was to be held in position by a plastic mask which fitted over the child's face, and during therapy the child had to be isolated in the treatment-room, under observation from a small window. We were asked to provide narcosis at the appropriate times. It was clear that inhalation anaesthesia was unsuitable and that the desiderata were: minimal disturbance of normal feeding and routine; certain response to narcosis; low toxicity; ease of administration; and non-inflammability. We felt that these conditions were best met by administering thiopentone sodium rectally. This method of narcosis has been described by Weinstein (1939), Schotz (1942), Burnap *et al.* (1948), and others.

TECHNIQUE

Diet was normal up to three hours before the treatment. A rectal washout was given one hour before induction on the first three occasions only. Its subsequent omission caused no inconvenience. Atropine, 1/150 gr. (0.43 mg.), was given subcutaneously half an hour before induction. The injection of anaesthetic solution was given slowly, per rectum, through a rubber catheter, which was then clamped and left *in situ*. The child fell asleep in four to ten minutes and remained asleep during the subsequent therapy, at the end of which any residual solution (amounting to 0–4 ml.) was allowed to drain away through the catheter. The treatment, including the time taken for adjustment of mask and refocusing on the contralateral eye, lasted for approximately 40 minutes. A paper flag placed on the child's abdomen during therapy facilitated our observation of the respiration. Oxygen was available in case of need, but was not required.

Dosage.—The child's weight was 25 lb. (11.3 kg.). The recommended dose of 0.5 g. was made up in 2½% solution. After the first three administrations the periods of undisturbed sleep were, respectively, two and a half, three and a half, and four and a quarter hours. We then felt that a residual effect was occurring. This was attributed to accumulation of thiopentone in the body-fat, as described by Lief (1951) and by Brodie (1951). Accordingly, the dosage was gradually reduced in subsequent administrations from 20 to 12 mg. per lb. (44 to 26.4 mg. per kg.). With these doses the period of undisturbed sleep varied from two and a half to three hours.

Complications.—The child developed a cold between the second and third administrations. This was not, in the circumstances, regarded as a contraindication to narcosis. It cleared up in a few days. There was no sign of rectal irritation. Bowel movement continued regularly and normally. The child was fed half an hour after awakening. No ill effects were observed.

Eight months later a second course of deep x-ray therapy was instituted, six treatments being given in 14 days. The dose of thiopentone required at first was 61 mg. per kg. This was gradually reduced first to 53 mg. and later to 45 mg. per kg.

Conclusion.—It seems to us that the technique described is safe and satisfactory for repeated narcosis in small children.

Our acknowledgments are due to Professor W. J. B. Riddell for permission to publish this case, and to Dr. H. H. Pinkerton for his encouragement.

Reviews

THORACIC ANAESTHESIA

The Principles of Thoracic Anaesthesia: Past and Present. By William W. Mushin, M.A., M.B., B.S., M.R.C.S., F.F.A.R.C.S., D.A., and L. Rendell-Baker, M.B., B.S., M.R.C.S., D.A. (Pp. 172; 217 figures. 42s.) Oxford: Blackwell Scientific Publications. 1953.

This book is probably unique in tracing the history of man's endeavours to overcome the great mechanical and physiological difficulties in opening the chest for the performance of major operations. The more one studies accounts of medical history, the more one is impressed by the truth of the Preacher's statement made some 3,000 years ago: "There is no new thing under the sun. Is there anything whereof it may be said, see this is new? It hath been already of old time which was before us." To quote two instances from this book: In 1555 Vesalius was able to keep animals alive after their chests were opened by insufflating air into the lungs through a tube inserted into a tracheotomy opening. Again, in 1788, Charles Kite clearly described nasal and oral intubation and advocated inflating the lungs through an endotracheal tube to resuscitate the apparently dead patient.

This book is full of instances of ingenious instruments and methods which were in use long ago, but which had fallen into desuetude and have recently been revived as original ideas by modern workers. The full title of the book correctly describes its contents, but we fear that many readers will be disappointed when they find that no detailed techniques are described for dealing with thoracic cases. Nevertheless, every anaesthetist should read it in order to broaden his outlook on his specialty and to realize how the many complicated appliances now at his disposal have been evolved.

The illustrations are profuse, and include many which have not hitherto been obtainable. Each chapter closes with a list of references, and there is a comprehensive index at the end of the book together with biographical notes of many of the surgeons, physicians, and anaesthetists who did pioneer work on the subject. This is a real contribution to medical literature.

C. LANGTON HEWER.

SIR JOSEPH BANKS

Sir Joseph Banks, K.B., P.R.S. The Autocrat of the Philosophers (1744-1820). By Hector Charles Cameron, M.D., F.R.C.P. (Pp. 341; illustrated. £1 5s.) London: The Batchworth Press. 1952.

It seems curious that the name of Sir Joseph Banks is to-day so little remembered. In the eighteenth century there was no one quite like him. A young man of wealth with great estates in Lincolnshire, he transferred himself at the age of 15 from Harrow to Eton and developed there his lifelong passion for botany. After leaving Oxford, in place of the conventional grand tour he undertook an expedition of exploration to Newfoundland and Labrador, returning with much botanical knowledge which was new, and which earned him an F.R.S. at an early age.

Two years later he persuaded the Admiralty to allow him to fit out an expedition under the command of his protégé Captain Cook to visit the South Seas. Not only did they explore Australia and New Zealand and bring back in the *Endeavour* much information that was new to science, but on Banks's mind a vision was formed of these unknown lands grown rich and prosperous because peopled by men of his own race—a dream which many years later he was to be chiefly responsible for transforming to fact. With these ideas of future Empire in mind he used his great influence with King George III to make of the Royal Garden at Kew a place of interchange of useful plants for these and all future dependencies of the Crown. To this

end he employed agents in all parts of the world, and at his own expense sent on botanizing and exploring expeditions to far countries such men as Mungo Park, Matthew Flinders, and Captain Bligh (of the *Bounty*). Later, when the first colony in New South Wales had been founded at his suggestion, he arranged by somewhat doubtful methods to obtain a small flock of the famous Royal Spanish Merino sheep, examples of which that country had resolutely refused previously to allow other countries to obtain. These he shipped to Australia, thus founding its present great industry.

At the age of 35 his influence and learning were such that he was elected President of the Royal Society, an office which he continued to fill until his death at an advanced age. During these years he invariably presided clad in court dress and wearing the Order of the Bath, a magnificent and formidable figure, as can be seen from Phillip's well-known picture, which is reproduced in this book.

Banks acted throughout life as the unofficial adviser to a succession of Governments. He resolutely refused to accept office, however, feeling that this would necessitate a partisan outlook on the problems of science and life, in which his views were generally accepted as final. His great Adams house in Soho Square (which was recently pulled down to make way for the offices of a film company) constituted the gathering-place for all the national and international men of science of his time, and his vast botanical and zoological collections under their learned and popular curator, Dr. Solander, were always at their service.

This is a fascinating book, and Dr. Cameron has not only rescued the reputation of this great man from near oblivion, but has had access to sources of fresh knowledge. It is well produced and well illustrated, and should be read by all who are interested in the story of science.

W. S. C. COPEMAN.

INJURIES TO THE NERVOUS SYSTEM

The Treatment of Injuries to the Nervous System. By Donald Munro, M.D., F.A.C.S. (Pp. 284; illustrated. £1 17s. 6d.) Philadelphia and London: W. B. Saunders Company. 1952.

The author informs us that this book is primarily for the use of the general surgeon and the general practitioner. As he points out, patients suffering from severe head or spine injuries cannot always be transferred to an appropriate special centre, however desirable it may be. In which case a surgeon may have thrust upon him the responsibility of dealing with a dangerous traumatic lesion in a field where he may have had little or no experience.

There is doubtless a need for a book which discusses simply (and if necessarily didactically) injuries of the nervous system. In such a book emphasis would be placed on the clinical diagnosis of the common surgical emergencies, whether of the cranium or the spine, and their proper treatment by operation or otherwise. And a careful judgment would be needed in apportioning space to the various sections. But to allot 50 pages to craniocerebral injuries, 126 to spinal injuries, 8 to cranial operations, and 14 to spinal operations (including lumbar and cisternal punctures) seems quite unbalanced. The presentation of the subject-matter here makes it very difficult to find, say, what would be the indications for exploring a patient suspected of an extradural haemorrhage. One reads the text and a sort of tabulated guide to diagnosis, but learns little about that particular patient. If the patient shows a "significant change for the worse" one is told to suspect temporal lobe herniation. Dr. Munro is a firm believer in routine lumbar punctures, though he admits that if temporal lobe herniation—due, say, to an extradural clot—is developing, then a lumbar puncture will have grave consequences. So he gives a list of five characteristics of what he calls a "critical" lumbar puncture, the first three relating to hydrodynamics and the last two to worsening clinical features. This "critical lumbar puncture" clearly constitutes for him the most reliable method of diagnosis. And to relieve herniation he describes an operation for the division of the

tentorium—a most difficult operation for even a highly trained neurosurgeon. He agrees that it may be impossible to predict beforehand "which patient is going to be adversely affected by lumbar puncture and therapeutic drainage." But this risk to life he confesses to accept because of the beneficial and life-saving effect of lumbar drainage in others. Beneficial—in many cases, yes. That it has ever saved a life is highly improbable; that it has killed patients when injudiciously carried out is certain; and in any case its risks are greatly diminished if postponed for a day or so, when the chances of clot compression have receded.

In the opinion of the reviewer the serious subject of head injuries is quite inadequately discussed, and some of the advice is dangerous for anyone except Dr. Munro to follow.

In the section on spinal injuries the advice on the care and rehabilitation of the paraplegic is excellent. Dr. Munro describes this in detail, including nursing care, and care of the bladder (36 pages, compared with a mere 6 pages on the compression of the brain); and various orthopaedic appliances are fully illustrated. It is unfortunately marred by a lack of clinical neurological advice in diagnosis, a fault evident throughout the book. It is difficult to see the value of an exploratory laminectomy to stimulate the cord electrically in order to determine whether there is total or only partial interference with cord conduction. Whether this is carried out in the stage of spinal shock, or many months later, a careful neurological examination would surely give the required information.

The reviewer's advice, therefore, is: Do not buy this book in order to obtain information on head injuries; but there is much useful advice on the care of patients with spinal injuries.

D. W. C. NORTHFIELD.

HYPNOSIS IN MEDICINE

Hypnosis in Modern Medicine. By Jerome M. Schneck, M.D. (Pp. 323. £2 14s.) Springfield, Illinois: Charles C. Thomas. Oxford: Blackwell Scientific Publications. 1953.

The object of this book is to present to specialists in different branches of medicine an account of how hypnosis can be used in their particular field, either by themselves or with the aid of a psychiatrist accustomed to the technique. The point is made at the outset that the medical hypnotist must know enough about physical illness for him to pay attention to detailed symptoms and the attitude of the patient towards them. The intention, therefore, is that each article should be proof against reasonable criticism from experts in hypnosis, in the medical specialties concerned, and in psychiatry.

The basic plan of the book is excellent and it is beautifully printed. The editor's introduction and chapter on hypnosis in psychiatry are clear and well-informed. There is also a most practical article on instruction in hypnosis by Professor Heron. Unfortunately most of the other contributors fall far below this standard and it is doubtful if medical and surgical specialists will be able to read some of the chapters without irritation. There is little evidence of co-ordination of effort and much duplication and irrelevance. Some of the chapters abound in uncritical acceptance of the sort of case report which characterizes the lunatic fringe of psychiatric literature. Works on psychopathology quoted have not always been fully digested, and some surprising theoretical constructs are illustrated by the triumphs of the writers' own consulting-rooms. The two articles by British contributors, in which the words "trance" and "cure" appear frequently, are on hypnosis in child psychiatry and in anaesthesia. These articles do not fairly represent British medicine. We are told to "detensionize the child with hypnosis and the anxiety will fall to pieces," and in the chapter on anaesthesia it is said of alcoholics that "their odd behaviour, somewhat violent at times, is really due to a form of autohypnosis." The unusual view is expressed that the subject who is under the influence of sedatives, or is drunk, is easier to hypnotize.

It is unfortunate that Dr. Schneck's idea in producing this book has been vitiated by the poor support he has received. Few of those for whom the book has been written will be likely to call in a hypnotist, and one fears that they may, after reading it, think that psychiatry as a whole has less to contribute than is actually the case.

ALEXANDER KENNEDY.

BLOOD PRESSURE

Normal Blood Pressure and Hypertension: New Definition. By A. M. Master, M.D., C. I. Garfield, M.D., and M. B. Walters, M.D., F.R.C.P.(Can.). (Pp. 144; 36 illustrations. £1 10s.) London: Henry Kimpton. 1952.

From time to time we are startled by having some well-established belief undermined by new work, and when the subject is so fundamental as the normal blood pressure our appreciation is sharpened. The book opens with a grand account of the history of sphygmomanometry. The contributions of Stephen Hales, Poiseuille, Magendie, Ludwig, Herrison, Vierordt, Marey, Gärtner, von Basch, Bloch, Potain, Mosso, Riva-Rocci, Hill and Barnard, Korotkow, and many others, are described in detail and with fascinating illustrations. This chapter alone deserves high praise. How the current standards of normal blood pressure came to be accepted is then explained. This is followed by useful information about the influence on the blood pressure of age, sex, emotion, sleep, weight, race, food, and other factors.

According to present-day standards, the majority of women over 50 and of men over 60 have hypertension, and yet many such men and women lead a normal life without complications related to blood pressure. The authors therefore believe that these standards should be revised. In the rest of the book they offer new evidence for what should be regarded as a normal blood pressure with reference to the age, sex, and weight of the individual, and discuss some of the clinical applications of the new standard suggested. There is much to be said in favour of the views expressed.

PAUL WOOD.

THE OPHTHALMIC SERVICES

The Ophthalmic Services under the National Health Service Acts, 1946-1952. By G. H. Giles, F.B.O.A.(Hons.), F.S.M.C., D.O.Rth. (Pp. 503. £3 3s.) London: Hammond, Hammond and Company. 1953.

The claims for the usefulness of this book that its author makes are somewhat wider than the book itself justifies. I have no doubt of its accuracy and of its usefulness to those predominantly engaged in the administration of the Acts and regulations governing the Service, but to the ordinary medical practitioner engaged in his daily work there is little of interest. It is a purely factual résumé of all the Acts and schedules and regulations under which the ophthalmic services are run, and it is made by a man whose double qualifications for writing it are that he is a barrister-at-law and secretary of various professional optical organizations. He has eschewed any temptation to express opinions of his own or to discuss any of the many discontents that the various unilateral alterations in terms of service have given rise to.

The book would have been equally useful and much more interesting if the author from his wide experience of the facts had added a section of his own on the disputes and grievances which have arisen since the beginning of the Service, and perhaps another speculative chapter on the future. We all know that both the medical practitioners and the opticians have been subjected to violent changes, ranging from opulence to penury and from gross overwork to relative unemployment, but there is no word of all this. Within the limits of his own intention I suppose the author has adequately performed his task, but I felt when I read the book rather as if I had opened a book on the Railways of Britain and found I was reading Bradshaw.

RICHMOND MCINTOSH.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JUNE 20 1953

THE LAW, THE HOSPITAL, AND THE DOCTOR

Doctors, especially those working in hospitals, have become increasingly alarmed at the growing number of actions for negligence against them. Have doctors in fact become more negligent? Are patients more litigious? Has the law changed or become more harsh in its judgments? Has the introduction of the N.H.S. any bearing on the matter? Possibly answers to these questions will vary according to whether they are given by a doctor, a patient, or a lawyer. The medical profession has undoubtedly had an increased burden of work on its shoulders since the appointed day in 1948, and if a man has too much work to do the possibility of human error is increased. But this does not mean negligence, and indeed it might reasonably be argued that the N.H.S. has enhanced rather than lessened the sense of professional responsibility. What has changed, and is changing, is the complexity of the doctor's work. Within the past two decades the therapeutic revolution has gone apace at an uncomfortable rate. The placebo has given way more and more to the potent drug. The old "rag and bottle" of the anaesthetist has been replaced by complicated machines and a range of powerful drugs that simplify the task of the surgeon, vastly ease the patient, and correspondingly test the skill of the anaesthetist. The new drugs and techniques, along with their brilliant promise of comfort and cure to the patient, have as their "side-effects," through accidental overdose or unpredictable sensitivity, co-incident hazards sometimes of great severity. Every medal has its obverse side. In the old days house-physicians and house-surgeons gave, and were expected to give, anaesthetics, but in a recent case the learned judge held that a hospital board should not have allowed a recently qualified doctor to administer thiopentone without the supervision of a senior practitioner. It must be asked at what moment in time after registration a qualified doctor is to be judged, and by whom, competent to perform this or that medical skill. Faced with such a precedent, what house-man will feel confident in giving any anaes-

thetic, however apparently simple; because in the event of any unforeseen accident the simplicity is immediately called into question. And when that house-man, avoiding giving anaesthetics during this year's or half-year's term of office, goes into general practice and has perforce to give an anaesthetic, is the passage of time after registration sufficient, in the eyes of the law, to give him competence? The medical student learns his craft and art under close supervision, a supervision reaching its climax at the qualifying examination. According to law he is on registration as a doctor competent to practise his profession. Of course, supervision of varying degree will continue during his postgraduate work in a hospital, and according to the nature of the work. Every doctor, at whatever age, must be a student, for he always has new things to learn. But if the law is going to determine the duration of tutelage in respect of the use of this or that drug or technique then medicine will be in a sorry state. One effect of this is already being noticed by teachers—a tendency among house-men to narrow the range of their responsibility for their patients.

Lawyers believe that the public is becoming more "compensation-minded," and the Legal Aid and Advice Act of 1949 makes it possible for an increasing number of persons to give expression to this. The citizen of the Welfare State is very conscious of his rights. The doctor and the nurse may save a patient's life, and in the process the patient may accidentally sustain a burn from a hot-water bottle—and subsequently win an action for damages. This is justice, but to some it may seem tinged with ingratitude. Many cautious observers see a changed public attitude to the doctor and the hospital in a State-provided health service. In some cases the patient's sense of rights appears to outweigh his sense of obligation. Or it may be he feels that the impersonal State which provides the service is fair game, and that it just cannot be helped if in the process of law the doctor gets knocked about a bit. This in itself is working a subtle change in the doctor-hospital-patient relationship—and a change for the worse.

The law, our legal colleagues constantly remind us, has not changed. But Dr. T. Lloyd Hughes,¹ in a recent thoughtful review, shows that the new administration of hospitals since 1948 has presented hospital authorities and workers with a new set of problems. Regional hospital boards, boards of governors of teaching hospitals, and hospital management committees are corporate bodies. They are liable in law as if they were principals. In the Hillyer case in 1909 it was held that the hospital governors of St. Bartholomew's were not liable for the negligence of their

medical staff. The patient's arm was burned during an examination on the operating table. When the theatre doors were closed, the learned judge maintained, the nurses and porters were under the orders of the surgeon and ceased to be servants of the hospital. "A narrower ground," Dr. Hughes writes, "on which the decision was supported was that the hospital authorities were not liable for the negligence of the consultant surgeon because he was not employed by them and that no case of negligence had been proved against the nurses and carriers." This view of liability was changed in 1942, when the Court of Appeal held that a local authority owning a hospital was liable for the negligence of its servants: in this case the radiographer (thought to be negligent) was under a contract of service. In 1947 a learned judge, finding negligence on the part of a house-surgeon and a part-time surgeon, held that the county council owning the hospital was liable for the negligence of the house-surgeon, but thought it was not liable for the part-time surgeon. "The liability of the hospital authority for the house-surgeon," Dr. Hughes says, "was said to arise from the contract of service . . . between the authority and the doctor, and distinction was drawn between a contract for services and a contract of service in that in a contract for services the master can only order or require what is to be done, while in a contract of service he can not only order or require what is to be done but direct how it should be done." (Our italics.) In the Cassidy case (1951) Lord Justice Denning, however, expressed the opinion that the hospital was liable for the negligence of a doctor on its permanent staff "whether he is employed under a contract of service or under a contract for services. It depends on who employs him. . . ." Doctors on State hospital staffs are now paid, and so are affected by this judgment. The Ministry of Health has issued a circular to the effect that hospital boards and committees, authorized to see to the legal defence of other staff, are not so authorized in respect of their medical staff. Moreover, the Ministry has instructed hospital authorities to take action to obtain from the doctor in question part or whole of the damages or costs awarded when the authority has been made responsible for the alleged negligence. (This matter is now under discussion between the Joint Consultants Committee and the Ministry.) Not only has the doctor-patient relationship been affected adversely, but also the doctor-hospital relationship. No wonder the medical profession is feeling uneasy about the situation, and little comforted by the assurance of lawyers that the law is unchanged.

Scotland in this respect seems to stand on less ambiguous ground than does England. As Dr. Forbes

put it in the discussion on Dr. Hughes's paper, the Scots appear "to regard the doctor as standing on his own feet and responsible in law for his own mistakes." It would seem to the non-legal mind that unless this is so the doctor patient relationship—on which all sound medical treatment must be based—is impaired to the extent that medical responsibility is shared with a third party—the hospital authority. If present English precedents are broadened then we may yet see hospital authorities not only requiring what should be done but directing how it should be done, and by whom. Any ambiguous diffusion of responsibility means that in the last resort no one knows just where responsibility lies, and so the tendency grows to avoid it. "Passed to you" may be a satisfactory watchword in administrative circles, and the law may delight in discovering who "you" are; but in the treatment of a sick person complete responsibility must rest on the medical man or woman.

BORNHOLM DISEASE IN BRITAIN

In 1930 Dr. Ejnar Sylvest,¹ a general practitioner in Denmark, recorded his observations on an unusual epidemic of myositis on the island of Bornholm in the Baltic. In a monograph published a few years later he presented² a detailed account of this disease, which he suggested should be called epidemic myalgia (Bornholm disease) by virtue of the two cardinal features, epidemicity and intermittent muscle pain. Subsequent reports, and they are numerous, showed that epidemic myalgia had a world-wide distribution.

The aetiology remained in doubt until 1949, when Curnen, Shaw, and Melnick³ made a preliminary report on the isolation of a Cocksackie virus from the faeces of four cases with a febrile illness resembling epidemic myalgia. Viruses of this type characterized by pathogenicity only for infant mice were first isolated by Dalldorf and Sickles⁴ in 1948 from two cases with paralysis. Although subsequent work showed that these viruses were widely distributed in nature and could frequently be recovered from patients with febrile illnesses resembling mild poliomyelitis,⁵ lack of information on the pathology of the disease, and the fact that both Cocksackie and poliomyelitis viruses could be recovered from the same patient, made it difficult to assess the exact part they played in human disease. More conclusive evidence of the causal relationship between Cocksackie viruses and epidemic myalgia has since been forthcoming. Shaw, Melnick, and Curnen,⁶ investigating different strains of the virus in cases of laboratory infection where symptoms of epidemic

¹ *Med. Legal J.*, 1953, 2, 17.

myalgia were present, were able to recover the particular strain and to demonstrate an increase in type-specific neutralizing antibody. Similar findings in the natural disease have since been made in the U.S.A.,^{7, 8} and now corroboration comes from this country. Three articles appearing in this week's issue of the *Journal* describe epidemics of Bornholm disease, associated with Cocksackie virus infection, which occurred in Great Britain in the second half of 1951. Reports already published indicate that Bornholm disease was epidemic in 1951 throughout Western Europe.^{9, 10}

In their appreciation of the clinical findings on 262 cases seen in the city of Oxford, Dr. J. F. Warin and his colleagues stress, as others have done in the past, that the most useful single aid in diagnosis is the nature of the pain, which is characteristically spasmodic. Pain was present in 91% of cases, and in over half was confined to the abdomen. As a high proportion of those infected were young children, the differential diagnosis from acute appendicitis or other acute abdominal emergency needing surgical operation was a real problem. Other features favouring a diagnosis of Bornholm disease were the epidemicity and symptoms of pyrexia often with severe headache. Vomiting and other symptoms were less common. Essentially similar findings on 104 cases (average age 4-6 years) in the Birmingham area are reported by Dr. M. E. Disney and his colleagues. Here again spasmodic muscle pain was the symptom of diagnostic importance. It is perhaps significant that until the nature of the first cases was recognized equal numbers were admitted to medical and surgical wards.

Bornholm disease was then also prevalent in South-east Scotland,¹¹ and in the third paper Drs. R. H. A. Swain and R. G. Mitchell report the result of virological investigations on two patients from whom they were able to recover a Cocksackie type B virus and to demonstrate an increase in neutralizing antibody. Similar findings on selected cases are reported in both the Oxford and Birmingham epidemics. In a number of cases antibody was found to be present in both acute and convalescent specimens, and as antibody may make its appearance very early in the disease, as it does also in poliomyelitis, acute-phase samples of blood should be collected as early as possible.

Kraft and Melnick¹² have shown that the neutralization test is more specific than the complement-fixation test.

Cocksackie viruses can broadly be classified into two groups on a histological basis.¹³ In type A the essential lesion is diffuse hyaline degeneration of skeletal muscle. In type B destruction of brain tissue is predominant, with focal necrosis in muscle and different viscera. Within these two groups there are many immunological types varying in tissue pathogenicity.¹⁴ Preliminary reports suggest that minor differences in the type B strain isolated in these three epidemics may exist. It is too early to ascribe with any certainty any of the individual disease conditions associated with Cocksackie virus to a particular strain type, but current work suggests that type B virus is found more often in epidemic myalgia (except for laboratory infections) and type A in paralytic and non-paralytic poliomyelitis. Additional evidence of this causal relationship has been produced by Lépine, Desse, and Sautter.¹⁰ Biopsy of affected muscle in two cases showed histological changes similar to those seen in the experimental disease; a Cocksackie virus was also recovered by the same procedure. Significant though these findings are—and they confirm Sylvest's¹ clinical appreciation of the pathology—this is a procedure which is better not repeated because of the possibility of dual infection with poliomyelitis virus.

Recognition of the sporadic, early epidemic, or atypical case is always a problem in communicable disease, and epidemic myalgia is no exception to the rule. Early notification of infectious disease and careful observations of this sort are of the greatest value. But diagnosis must first and foremost be a clinical one; the laboratory can assist by confirming it and working out the details.

MR. MACLEOD ON THE DRUG BILL

The cost of the national drug bill has given concern to all who have watched the National Health Service develop since 1948. The seriousness of this was underlined by Mr. Iain Macleod, the Minister of Health, when he addressed the Annual Conference of Representatives of Local Medical Committees on Wednesday this week. We publish elsewhere an account of what he said and of the response made by Dr. Talbot Rogers, chairman of the G.M.S. Committee. Mr. Macleod stressed that the Exchequer could not be expected to continue paying something like £40m. a year for drugs prescribed by general practitioners unless they were in fact essential for the proper treatment of patients. The drug bill for 1949-

50 was £31½m., and for the year 1953-4 it was estimated the cost would be £46½m. The factors in this rise in cost were an increase in the total number of prescriptions, an increased use of proprietary preparations, the introduction of new but expensive drugs, and a rise in the cost of ingredients. Last year 26% of the total number of prescriptions were in the form of proprietary preparations, which accounted for 44.5% of the drug bill. The Minister mentioned in particular a proprietary slimming preparation. If the standard preparation in the *National Formulary* had been prescribed instead, this would have effected a saving of nearly £250,000 in 1951. (It may be of interest to record that the discovery of the sympathomimetic substance which is now being used so extensively was discovered by Barger and Dale in 1910.) After giving other examples, the Minister went on to say that many preparations had no exact official equivalents, but he issued a special plea that doctors should make careful use of preparations in the *National Formulary* and also of the "Prescribers' Notes" issued by the Ministry of Health. He urged doctors to resist pressure from patients to prescribe particular preparations, and to refrain from ordering large quantities of a drug or dressing. To give further help to general practitioners the Ministry, he said, proposes to issue a price list of *Formulary* preparations and proprietary preparations frequently used so that doctors may be aware of the cost of what they were prescribing. Dr. Talbot Rogers said that the Minister's words would be most carefully studied by general practitioners, and added that the G.M.S. Committee had not been unmindful of the mounting costs of the drug bill. For example, the Committee had urged the Ministry to introduce a system of stock order forms as far back as 1948. It had also urged the Ministry to reintroduce the system of "area averages" so that the prescribing costs of a doctor could be compared with the average for the area. Finally, he assured the Minister that the G.M.S. Committee would do all it could in co-operation with the Minister's officers to stabilize the cost of the pharmaceutical service so long as this was not incompatible with the needs of the patient.

Undoubtedly the medical profession and the pharmaceutical industry will do all they can to grapple with this serious problem. Undoubtedly, too, the facts now being disclosed will make the doctor, whether in general practice or working in hospitals, more conscious than before of the cost of drugs. The reintroduction of "area averages" would go a long way to controlling excessive prescribing. Yet in comparing costs it must be borne in mind that the initiative of the pharmaceutical

industry has made the introduction of cheaper standard preparations finally possible; to some extent comparison of costs may be misleading because it takes no account of the initial cost and risks incurred by the industry. Again, every practising doctor knows that the ingredients of a placebo medicine will do little if anything to readjust a patient's disordered physiology; but he knows, too, that if the patient has a firm belief that he or she will benefit from such and such a remedy then some benefit will be experienced. For the patient there is much "magic" in a bottle of medicine, and in this respect the sick Briton is as primitive in his reactions as the sick savage. All this is not to deny that something can be done and will be done to reduce the cost of the drug bill, but the problem is not an easy one and all the answers to it have not yet been found.

PROBLEM FAMILIES

Speaking of a "militant approach" to the problem, the Minister of Health said¹ last week that maternity and child welfare workers must seek out problem families, not wait for them to come. He was opening the annual conference of the National Association of Maternity and Child Welfare in London. Many mothers did not take advantage of these services, he said, and "it is here, essentially, that our problem lies." These problem families, once the "submerged tenth" of Charles Booth, are now perhaps a fiftieth or a hundredth. But they still merit inquiry and investigation as a difficult group comprising a host of families and individuals who are shiftless, lazy, backward, incorrigibly ineducable, and who present a continuous problem to the medico-social worker. The extent of the problem, the conditions associated with it, how far it is preventable, and what preventive and remedial measures are necessary and practicable are questions which have occupied the attention of investigators before and after the second world war, and knowledge is accumulating about social-problem families and their characteristics. A useful addition to this work is an account of five inquiries sponsored by the Eugenics Society² and undertaken in different parts of the country under the general guidance of a Problem Families Committee.

Five areas differing in their social, geographical, and population characteristics were selected for survey, and the medical officer of health undertook the general supervision in each area. The main theme of the inquiry was an assessment of the varied antisocial characteristics of problem families, and an endeavour was made to enlist the co-operation of all agencies, statutory and voluntary, which might help in dealing with social problems of this nature. Essentially the work was an attempt

at ascertainment, and much useful information has been collated. The Wood Committee³ recognized in 1929 the existence of a subnormal or problem group, and, although its findings mainly concerned the incidence of mental defect, they focused attention on a section of the community comprising socially inadequate individuals or families. Other inquiries before the second world war, notably that of Caradog Jones⁴ on Merseyside, revealed the existence of a social-problem group which included not only families with one or more mental defectives but the unemployables, the shiftless, and the chronic slum dwellers.

The findings of the Problem Families Committee in relation to the intelligence of male heads of families and housewives largely confirm the conclusions of other observers that mental subnormality alone does not make a problem family. The observations were not based on formal tests; but the experienced investigators probably erred on the side of caution, and the conclusion that just over half the male heads of families and two-thirds of the housewives were classed as subnormal probably presents a fair picture. The bearing of mental deficiency in the mother on rehabilitation of the family is of prime importance, and Savage⁵ believes that it is not possible to reclaim the families where the mother is mentally defective within the meaning of the Mental Deficiency Acts. Fortunately mental deficiency of this degree is not synonymous with mental subnormality, and, as the valuable work of the Family Service Units among others has shown, rehabilitation is possible in more families than is indicated by the finding of subnormality among two-thirds of the housewives.

The incidence of problem families has been variously estimated as between one per thousand of the population and three per thousand. The estimate is complicated to some extent by difficulty in definition. The proportion of problem families per thousand families in the five inquiries with a presumably common basic definition varied between 1.2 per thousand in one area and 6.2 in the area with the highest proportion. The committee outlines difficulties in comparing these with normal families and is of opinion—on doubtful premises—that the proportion would probably be found somewhere between 1.5 and 15 per thousand. This investigation again draws attention to a matter of much concern to the medical profession as well as to others. The time would appear to be ripe for a complete inquiry at national level into the whole subject of social-problem families—their definition, incidence, and distribution, what preventive and remedial measures may be taken, and how the effort of all interested agencies, statutory and voluntary, should be directed.

SUPERINFECTIONS DURING ANTIBIOTIC TREATMENT

We referred last year¹ to the sometimes lethal condition which has come to be known as "superinfection"—the development during chemotherapy of a fresh infection by a micro-organism resistant to the drug being used. The subject has recently been reviewed afresh by D. T. Smith,² who takes the view that in those areas of the

body more heavily populated by bacteria each element plays a part in keeping others in check, not only by competing for pabulum but by some kind of antibiotic action. It is certainly true that, for instance, salivary streptococci form substances noxious to other species, either merely hydrogen peroxide or sometimes a more complex substance, and there is even some evidence that such action by the normal flora tends to defend their habitat against attack by pathogens from elsewhere. If an antibiotic therapeutically administered is present in this area for long enough, some part of the normal flora is suppressed: the balance, however maintained, is upset, and an abnormal proliferation of resistant organisms follows, sometimes causing actual lesions. When penicillin is given in large doses it escapes in saliva and pharyngeal and bronchial secretion in amounts sufficient to suppress most of the Gram-positive flora of the upper air passages, and coliform bacilli are apt to take their place. At the worst, *Ps. pyocyanea* or *Bact. Friedländeri* may in these circumstances attack the lung. Streptomycin, in general more active against Gram-negative than Gram-positive species, has occasionally, as Smith points out, been seen to have just the opposite effect. On the other hand, if both are given together, or any of the newer "broad spectrum" antibiotics, there is a more general suppression of bacterial growth, and the field is left clear for a class of micro-organism totally resistant to all the major antibiotics. These are the fungi, of which *Candida albicans*—a common mouth commensal—is much the most likely to make its appearance. Oral thrush and even pulmonary moniliasis, and extensive proliferation of the same organism in the bowel, usually with no worse result than pruritus ani, are now well recognized as possible consequences of giving aureomycin, chloramphenicol, or terramycin for more than a very few days.

Organisms proliferating in these circumstances usually belong to naturally resistant species, but there is at least one example of such activity following apparently acquired resistance. M. Finland and his colleagues^{3,4} describe the occurrence in patients treated with terramycin of superinfections due to resistant staphylococci. Although a few of these took the form of pneumonia, most presented as an acute enteritis, which was sometimes fatal. Possible examples of the same condition are now reported in two papers from Switzerland. G. Bernhart⁵ gave 1.5 g. of terramycin intravenously daily post-operatively for three days to two patients with a suppurating thyroid adenoma and gangrenous appendicitis respectively. After three and five days of satisfactory progress each suddenly developed severe watery diarrhoea and fever, proceeding to dehydration and vasomotor collapse, which proved fatal despite all obvious restorative measures. F. Meier⁶ had three patients who were given similar doses of the drug pre-operatively—in preparation for colonic resection for carcinoma in two and diverticulitis in the other. Each of these succumbed rapidly to a similar condition, the

¹ *British Medical Journal*, 1952, 1, 537.
² *Ann. Intern. Med.*, 1952, 37, 1135.
³ *Ibid.*, 1951, 35, 1175.
⁴ *Arch. Intern. Med.*, 1952, 89, 240.
⁵ *Schweiz. med. Wschr.*, 1952, 82, 1335.
⁶ *Ibid.*, 1952, 82, 1337.

onset of which was three days after operation. Neither of these authors had heard of Finland's observations at the time, and none of the patients' stools were examined for staphylococci. In the light of those observations they now consider that an acute staphylococcal enteritis must have been the cause of death in their cases. Both emphasize that they have often given terramycin in much larger total doses than this without ill effects. They suggest that the factors leading to this devastating complication were a major operation and advanced age: the ages of Bernhart's patients were 71 and 66, and of Meier's 47, 54, and 60. On this somewhat conjectural evidence it cannot be finally concluded that infection by a terramycin-resistant staphylococcus was the cause of these patients' deaths. Nor is it clear that terramycin therapy alone can have this consequence. It is nevertheless important that these observations should be widely known in order that surgeons generally may be on the look-out for this condition. Diarrhoea and circulatory collapse are banal and apparently non-specific conditions which may readily be attributed to other or unknown causes in a patient who has recently had a major abdominal operation. If they can in fact result from a specific superinfection after the use of a particular drug—a possibility which would not readily occur to anyone—the sooner this is widely recognized the better.

THE MEDICAL INSURANCE AGENCY

For nearly 50 years the Medical Insurance Agency, as many well-satisfied clients will stoutly affirm, has rendered to the medical profession services and benefits such as no other competitor in this field has approached. Founded, as it is pleasing to recall, by the then Editor of this *Journal*, Sir Dawson Williams, in conjunction with the then Editor of the *Lancet*, Sir Squire Sprigge, the Agency has two outstanding merits. It is entirely unbiased; the only guiding principle is the interest of the client. It can and does select from among the numerous first-rate offices that one whose rates and policy conditions are best suited to the client's needs. This is not a simple matter, for in the field of life assurance offices differ widely in their practice, and much depends upon the individual special factor—whether it be the age or sex group, endowment assurance as compared with a whole-life policy, a non-profit or profit-sharing plan, a damaged life, and so forth. The complexity of this quest on the client's behalf is illustrated by the fact that life assurance alone is distributed by the Agency among some thirty companies, of which about a dozen get the lion's share between them. The second advantage (almost but not quite so important) is that the Agency has no shareholders or proprietors to take profits out of it. Consequently clients obtain in most cases substantial rebates on their premiums (or on the amount payable when the policy is first taken up), and all surplus after the payment of overheads is given to medical charities. The board of management, all of whose members are doctors, get no fees and never have had them from the start. All this is fairly well known, but perhaps not so much as it should be—at all events to the most

junior members of the profession, who sometimes find themselves in the sphere of proprietary agencies whose activities, not in the least improper in themselves, are dictated by motives less altruistic than those of the M.I.A.

The charities chiefly benefiting are the Royal Medical Benevolent Fund and its Ladies' Guild, and the Royal Medical Foundation of Epsom College. The large sums these have received from the Agency have completely transformed their scales of relief and benevolence, and have enabled their managements to distribute help which seems princely compared with what was available only a few years ago. Another point emerging from the Annual Meeting of the Agency (briefly reported on page 1401) is that the sums assured under life policies completed in 1952 exceeded four million pounds for the fourth successive year. It is a matter for satisfaction that our profession is as alive to the necessity for adequate life assurance as these figures clearly indicate. But life assurance is only one facet of the Agency's work, which includes motor and fire insurance, third-party risks, and, in fact, every form of insurance; further, the Agency provides special house-purchase and car-hire-purchase services, which have proved a great boon to many practitioners in recent years.

THE ANNUAL MEETING

"Cardiff is once again eagerly waiting to welcome the B.M.A." With this warm promise Mr. Robert D. Owen concluded his account¹ in our pages last week of the great city where this year's Annual Meeting is to be held in July. A large and varied programme has been drawn up, and it is hoped that as many doctors as possible will be able to spare a few days, or even a day only, to take part in the discussions. Last year's experiment of plenary sessions was found to be a great success, and they are to be held again this year. Three subjects have been chosen, all prominent for the problems they raise in clinical practice—coronary disease, fibrositis, and overweight. The opening speakers take their various approaches to the theme, and anyone is then free to contribute his views. Participants at Dublin last year showed how instructive and fruitful such discussions can be. These plenary sessions and the Scientific Sections, which equally offer a welcome to all comers, provide a valuable meeting-ground for doctors from all branches of the profession. They may be seen indeed as a healthy corrective to those too many divisions that the times have wrought in what ought to be a single profession. As usual many diversions are being offered, some light and some more serious. One in particular—again introduced last year—is the scientific exhibition, at which many hospital and other departments will illustrate current research. It is good to know that Sir Russell Brain, P.R.C.P., will give the popular lecture on "Dr. Johnson as Scientist and Patient." The programme, published in the *Supplement* this week at page 282, gives a full list of the meeting's events. To its evident attractions must be added that other of which Mr. Owen reminded us—"the Welsh gift of hospitality."

¹ *British Medical Journal Supplement*, June 13, p. 273.

REFRESHER COURSE FOR GENERAL PRACTITIONERS

MYXOEDEMA

BY

A. W. SPENCE, M.D., F.R.C.P.

Physician to St. Bartholomew's Hospital, London

Myxoedema is caused by hypothyroidism, but most patients with hypothyroidism are not myxoedematous. This statement probably needs an explanation. The term "myxoedema" was proposed in 1878 by W. M. Ord, physician to St. Thomas's Hospital, because a deposition of a mucinoid substance was observed in the skin of one of his patients on whom a necropsy had been performed. Subsequent analyses of the skin of a number of patients with myxoedema showed that their skin contained no more mucin than that of normal subjects. In fact, true myxoedema is uncommon; most cases thus termed should, strictly speaking, be referred to as suffering from hypothyroidism, but common usage for so many years has universally established the term myxoedema, irrespective of whether the skin contains an excess of mucin or not. Hypothyroidism which arises secondarily to hypopituitarism should not be called myxoedema.

Aetiology

The usual cause of spontaneous myxoedema in Britain is an idiopathic degeneration and fibrosis of the thyroid gland, a disturbance which arises more often in women than in men, and most commonly at the time of the menopause. Juvenile myxoedema is due to a similar cause operating in childhood. Hypothyroidism occurs in about 4% of patients subjected to subtotal thyroidectomy for toxic goitre, but sometimes it persists for only a few months. It not uncommonly arises as a result of the treatment of toxic goitre with radioactive iodine, on account of the difficulty in determining the correct dosage. Chronic fibrosis of the thyroid gland (Riedel's or Hashimoto's disease) is usually accompanied by hypothyroidism, but malignant disease of the gland only rarely gives rise to it. In regions of endemic goitre myxoedema may be the end-result of simple goitre, and is then caused by exhaustion atrophy of the glandular epithelium.

Overdosage with antithyroid compounds—for example, methylthiouracil—in the treatment of toxic goitre may result in myxoedema; their action is to inhibit the synthesis of the thyroid hormone. Myxoedema has been reported as arising through the use of resorcinol ointment for ulcers of the legs, and occasionally during the treatment of pulmonary tuberculosis with *p*-aminosalicylic acid. Both of these substances seem to act similarly to the derivatives of thiouracil. The disorder was occasionally observed when potassium thiocyanate was used in the treatment of essential hypertension, a method of therapy, however, which has now been generally discarded. Thiocyanate causes hypothyroidism by preventing the accumulation of iodine in the thyroid gland, thus reducing the amount of thyroid hormone synthesized. In all instances of myxoedema caused by antithyroid drugs the condition gradually subsides when their administration is stopped.

Diagnosis

The clinical picture of myxoedema is well known and its description needs no repetition here. The complaints of the myxoedematous patient are often vague on account of the slowness of the mental processes, and information of greater value may be obtained from relatives who are aware of the change in the patient's appearance and demeanour. Early cases do not present the typical facies,

while some patients have a heaviness of the features and a slowness of thought which are part of their natural make-up and are not due to hypothyroidism.

It is commonly thought that thinning of the hair of the eyebrows, especially of the outer third, is almost pathognomonic of myxoedema, but this is erroneous, for it may occur in normal subjects of middle age. Another fallacy is that patients with obesity are suffering from hypothyroidism; analysis of large numbers of patients with proved hypothyroidism have demonstrated that only a small proportion of them are fat, while in the experimental field thyroidectomy performed on laboratory animals results in a decrease, not an increase, of body fat.

Myxoedema may present itself in a variety of ways. A clue to the diagnosis in the case of one patient attending hospital for some other condition was the large amount of clothing that she was wearing. Puffiness of the face may suggest nephritis, and evidence of impairment of renal function may of course be found in a myxoedematous patient as a fortuitous accompaniment. At the time of the menopause it may be difficult to decide whether the symptoms complained of are those of the climacteric or are due to hypothyroidism, or the clinical picture may be complicated by the presence of symptoms of both conditions. The possible existence of hypothyroidism should be borne in mind in women presenting with menorrhagia for which no local cause can be found and in sterility in both sexes. Rarely, anginal symptoms may be the presenting feature, and there may be no other clinical evidence of myxoedema apart from the typical changes in the basal metabolic rate and blood cholesterol.

Anaemia.—Anaemia may be a prominent feature of myxoedema and may mask the underlying disturbance. The anaemia of myxoedema is a simple hyperchromic anaemia in which the colour index is slightly above 1 and the haemoglobin rarely below 60%. It may or may not be associated with achlorhydria. It is thought to be caused by the increased oxygen tension in the tissues which arises as a result of the low metabolic turnover and which leads to decreased erythropoiesis; it is thus analogous to the anaemia which may be produced by exposing animals to atmospheres with a tension of oxygen greater than normal. Not being caused by a deficiency of iron or of vitamin B₁₂, it does not respond to the administration of either of these substances, but it improves slowly on prolonged treatment with dried thyroid. Two other types of anaemia occur less frequently: (1) hypochromic anaemia, which resembles an iron-deficiency anaemia, may be associated with a glazed tongue, brittleness of the nails, splenomegaly, and achlorhydria, and the administration of iron as well as thyroid is necessary to procure a complete remission; and (2) Addisonian hyperchromic anaemia, which is rare in combination with myxoedema, responds rapidly to combined treatment with thyroid and liver extract (or vitamin B₁₂), but not to thyroid alone.

Psychoses.—It is important to recognize that psychological disturbances may be so severe in myxoedema that they may dominate the clinical picture to such an extent that the underlying cause—hypothyroidism—may be overlooked. Failure to appreciate this may have unfortunate results. The psychoses which may arise consist in a wide variety of mental changes, and include disorientation, hallucinations, dementia, acute or chronic mania, melancholia, and paranoid and schizophrenic states.

Hypopituitarism.—Hypothyroidism which is secondary to hypopituitarism may closely resemble myxoedema: there are the same lethargy, dryness of the skin, thinning of the hair, increased sensitivity to cold, bradycardia, subnormal temperature, and decreased basal metabolic rate; amenorrhoea and anaemia may be present in both conditions. The differentiating points are as follows: in hypopituitarism the skin of the face may be finely wrinkled and it has a slightly yellowish tinge more often than in myxoedema; the malar flush which is often seen in myxoedema does not occur; there is loss of body hair due to reduced secretion of adrenal and (in men) testicular androgens; the blood pressure is low as a result of diminished adrenal cortical secretion, whereas in myxoedema it is normal or raised; hypothyroidism arises usually late in the course of the disease; there is often evidence of a pituitary lesion, such as a pituitary tumour, or a past history suggestive of a post-partum necrosis of the anterior lobe; there may be hypoglycaemia, whereas in myxoedema the fasting blood sugar is generally normal; and there is increased sensitivity to the injection of insulin, whereas this test is normal in myxoedema.

Laboratory Investigations.—In all cases in which myxoedema is suspected it is advisable, if possible, to have the basal metabolic rate and the blood cholesterol estimated before treatment with thyroid is begun. The basal metabolic rate is typically lowered in myxoedema; in the completely thyroidless person it is minus 40%, which may be termed the myxoedema level. The basal metabolic rate, however, is not always a reliable guide in the diagnosis of myxoedema. For instance, healthy persons may normally have a very low basal metabolic rate and, on the other hand, sometimes in undoubted cases of myxoedema the reading is normal. This latter finding may be because basal conditions were not obtained or because of the considerable variation which is found in the basal metabolic rate of normal persons, though this statement is denied by some authorities. The blood cholesterol (normal: 150 to 200 mg. per 100 ml.) is a more reliable index of the presence and severity of hypothyroidism than is the basal metabolic rate. It is invariably raised in myxoedema, an average figure being between 300 and 400 mg. per 100 ml.

Treatment

The treatment of myxoedema with thyroid substance affords a perfect example of effective replacement therapy. As there may be some variation in the potency of different brands of dried thyroid on the market, it is advisable to adhere to one particular preparation, for changing from one brand to another of different strength may lead to difficulties. Tablets of thyroid, B.P., contain 0.1% of iodine combined as thyroxine. Since the disorder is solely due to deficiency of thyroid hormone, no advantage is obtained by using preparations in which thyroid is combined with other substances.

With regard to the frequency of administration of thyroid, it is a tenet of therapeutics that those drugs which are rapidly destroyed in the body or are rapidly excreted should be given at frequent intervals, whereas in the case of those which exert a prolonged action this is unnecessary. As the action of thyroid hormone is prolonged, the preparation need be given only once daily, preferably after breakfast.

It is customary to begin treatment with small doses of thyroid and gradually to increase the amount until the optimal maintenance dose is reached. Starting treatment with a full dose of 3 to 5 gr. (200 to 320 mg.) daily may

FIG. A

FIG. B

Myxoedema: (A) Before treatment, (B) after six months' treatment with thyroid.

cause precordial discomfort, or even anginal pain, and muscular pain, and cramps. This is because the oxygen requirements of the tissues are increased beyond the capabilities of the heart and circulation at this stage to supply them: this relative inefficiency is caused by the hypotonicity of the myocardium, the anaemia, and the narrowing of the capillaries which has been observed in hypothyroid subjects. The daily dose of thyroid should initially be $\frac{1}{2}$ gr. (32 mg.), and should be increased each week by $\frac{1}{2}$ gr. (32 mg.) until signs of overdosage, such as tachycardia and irritability, begin to appear. Treatment should then be stopped for two weeks, and should be resumed in doses of 1 gr. (65 mg.) a day less than the overdose. The maintenance dose of tablets of thyroid, B.P., varies from 3 to 5 gr. (200 to 320 mg.) daily.

In patients with coronary sclerosis anginal symptoms may arise before the full dose of thyroid is reached as a result of the increased oxygen requirements of the myocardium. Such patients should be kept slightly hypothyroid, at a level at which angina does not arise. In the rare case in which angina is present before treatment is begun it disappears with thyroid therapy, but it may recur when the larger doses are reached. Striking the correct balance may be difficult.

Adequate treatment with thyroid causes the myxoedematous symptoms to regress. As mentioned above, the simple hyperchromic anaemia of myxoedema gradually disappears with thyroid alone, but the hypochromic type requires a preparation of iron in addition, and the Addisonian type requires liver extract or vitamin B₁₂. Another feature which disappears with thyroid therapy is the cardiac enlargement which is sometimes found in myxoedema and which may be due to myxoedematous changes in the myocardium and to generalized dilatation. If reduction in the degree of cardiac enlargement is not obtained the condition is due to some other cause.

Laevo-thyroxine Sodium.—Laevo-thyroxine is the form in which thyroxine exists in the thyroid gland. It was synthesized a few years ago and was found to be highly active when given by mouth. Before the synthesis of laevo-thyroxine, the thyroxine available on the market was the racemic form, which being relatively insoluble is much less active than dried thyroid when given by mouth; it had, therefore, to be administered by intravenous injection and consequently was not adopted as a method of therapy. Laevo-thyroxine sodium is as effective in the treatment of myxoedema as dried thyroid substance, and the principles of its use are the same. For practical purposes 0.1 mg. of

laevo-thyroxine sodium is equivalent in effect to approximately 1 gr. (65 mg.) of tablets of thyroid, B.P. As it is a pure substance there is no variation in its potency.

Juvenile Myxoedema

The term "juvenile myxoedema" is applied to hypothyroidism when it arises during childhood. It differs from cretinism in that the causative factor is not present at birth. When the condition arises during infancy the clinical features resemble those of cretinism, in later childhood those of adult myxoedema.

The treatment of juvenile myxoedema is the same as in the adult type; the dose of thyroid should be small at first and should be gradually increased. For a child aged 4 years the daily dose of tablets of thyroid, B.P., should initially be $\frac{1}{4}$ gr. (16 mg.) and should be increased each week by $\frac{1}{4}$ gr. (16 mg.) until the maintenance dose is reached; this is about 2 gr. (130 mg.) daily for a child of this age. Children require in proportion rather more thyroid than adults on account of their growth, and as growth proceeds the dose should be slightly increased each year. If evidence of hyperthyroidism is seen the administration of thyroid should be stopped for three or four days and should be resumed in smaller dosage. For no other reason should treatment be interrupted.

The prognosis of treatment in respect of juvenile myxoedema is better than in cretinism, because in the latter disease the disturbance arises *in utero* at a vital period of growth and development, when some of the damage inflicted may be irreparable. From the point of view of prognosis, therefore, it is important to differentiate juvenile myxoedema from cretinism, but this may be impossible when the disorder arises in infancy. The two conditions are distinguished by inquiring carefully into the early development of the child and by observing the degree of mental deficiency, dwarfing, and bone development.

Localized Pretibial Myxoedema

Localized pretibial myxoedema is characterized by irregular indurated swellings of the skin occurring symmetrically over the antero-lateral aspect of the lower half of the legs. The skin itself is erythematous or yellowish white, and the dilated dimpled hair follicles produce an appearance resembling pigskin. The swellings are due to deposits of mucin. The condition may be a complication of toxic goitre, and occasionally it disappears after subtotal thyroidectomy, but more often it develops after this operation. Treatment so far has on the whole been ineffective.

The cause of the disorder is unknown; it has been suggested that it is due to excessive secretion of the thyrotrophic hormone of the anterior pituitary lobe, and that it is thus analogous to exophthalmos, which is caused by oedema of the orbital tissues presumed to be due to the same factor.

Next Refresher Course Article.—"Breast-feeding Difficulties," by Dr. F. Charlotte Naish.

Refresher Course Book.—The first collection of articles of this series (fully revised) are available as a book containing 55 chapters, price 25s. Copies may be obtained either direct from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1, or from your bookseller.

The report of the Regius Professor of Physic, Cambridge University, for the year 1951-2 includes attendance figures for the monthly symposia for medical practitioners held during the year. The symposia, which took the form of lecture-discussions and case demonstrations, were attended by practitioners from a wide area. The total attendance for the year was 241, as against 209 the previous year, and of the individual symposia the most popular were those on diseases of the lung (41), obstetrics and gynaecology and cardiovascular diseases (38 each).

ROYAL MEDICAL BENEVOLENT FUND

The annual meeting of the Royal Medical Benevolent Fund was held on June 9, with Lord Webb-Johnson in the chair. The annual report, presented by the hon. secretary, Dr. R. Cove-Smith, stated that almost £12,000 had been received during the year by way of legacies. A similar figure had once again come in from the Medical Insurance Agency, whose generous donation of £6,420, being given by deeds of covenant, ensured a regular income of £12,000 until the covenants expired. Dr. Cove-Smith recalled that 20 years ago the maximum annuity that the Fund was able to provide was limited by lack of money to £40 per annum, which was often woefully inadequate; to-day the maximum annuity in payment was £200. At present there were 221 beneficiaries on the books to whom annuities were paid. In addition there were 418 beneficiaries who received gifts or yearly allowances; of these 97 were new applicants. The total number of individuals benefited, however, was considerably in excess of these figures, for in some cases the beneficiaries were married couples, others were widows with families, and money had been given towards children's education and support. The amount distributed as a result of the Christmas gifts appeal was £2,368. The total charitable distribution made during the year on all accounts, including the various trust funds, amounted to £44,410. This extensive work had been carried out within a working expense figure of 7½%.

Lord Webb-Johnson was re-elected president of the Fund, Mr. F. A. Juler honorary treasurer, and Dr. R. Cove-Smith honorary secretary, and the retiring members of the committee of management were re-elected as follows: Dr. H. A. Clegg, Sir Zachary Cope, Dr. D. F. Hutchinson, Mr. F. A. Juler, Miss E. C. Lewis, Sir Arthur MacNalty, Mr. W. H. C. Romanis, and Dr. P. Montague Smith.

In a brief address Lord Webb-Johnson said that the Fund deserved more general support from the profession, and this could only be secured by personal approach. He spoke with gratitude of the service of the auditors, Messrs. Deloitte, Plender, Griffiths and Co., who for 50 years had served the Fund in an honorary capacity. Others to be thanked were the Medical Insurance Agency, the Charities Committee of the British Medical Association, and the medical press, which, he said, always gave space to the Fund's appeals. He also paid a tribute to the Ladies' Guild, through which it was possible to give material assistance in the way of clothing, domestic and nursing help, and educational training.

CENTENARY OF WARLEY HOSPITAL

The Minister of Health, Mr. Iain Macleod, spoke at an Open Day at Warley Hospital, Brentwood, on June 9, held to celebrate the hospital's centenary. The hospital was opened in 1853 as the "Essex County Lunatic Asylum"; later it became the "Brentwood Mental Hospital." Mr. Macleod said that he regarded the mental health service as having first call on the increased capital expenditure which he hoped to see available in the near future. The Ministry was already allocating substantially larger sums to the mental health service. He had called urgently on regional boards for their plans. The first thing he did on becoming Minister was to ask the architects and administrators to find methods of building the accommodation needed. Overcrowding existed in practically every mental hospital in the country. Speaking of the waiting-list of nearly 9,000 mental defectives, Mr. Macleod said that it must never be forgotten how much mental distress was caused to families, particularly mothers, if they had to care for a mentally defective child.

The Minister was welcomed by Alderman C. E. S. Blackmore, chairman of the hospital management committee, who said that during the last five years the regional board had done all in its power to help the hospital. Alderman G. H. Spackman, the vice-chairman, thanking the Minister, said that, although the Essex County Council's scheme in 1939

for a new hospital was now impossible, he hoped they would be able to go forward with some scheme for a modern building.

In his speech the Minister drew applause when he praised an illustrated booklet written by Dr. G. S. Nightingale, the physician-superintendent, entitled *The First Hundred Years of Warley Hospital*. This book had been produced entirely in the hospital itself. Dr. Nightingale, speaking at the meeting, said that it was not conceived when the hospital was built that it would ever exceed 450 beds; now it had 2,000. The different styles of architecture of the buildings reflected the therapeutic outlook of their period. Dr. Nightingale referred to his predecessor, Dr. W. G. Masefield, whose term saw many improvements.

Warley Hospital admits 700 new cases a year, 54% voluntary, a lower proportion than at some hospitals, but, said Dr. Nightingale, they had not made a fetish of admitting patients on a voluntary basis simply for the sake of doing so. The figure did not include certified patients who on discharge stayed on as voluntary patients. It was also stated that since 1947 over 200 leucotomies had been performed. Referring to the shortage of nursing staff, which he thought was to a considerable extent owing to financial reasons, Dr. Nightingale said that the hospital could not have carried on without the large number of part-time nurses. They had also recently recruited 25 French student nurses, who were doing good work.

On display were some of the archives of the hospital. These included the earliest clinical record-book (male), 1853. The first entry concerned the case of a farm labourer "labouring under an attack of melancholia caused, as reported, by disappointment in love. On admission he was quiet and sulky and disinclined to answer questions. His mind seemed in a very weak state, but his bodily health was good." That entry was dated October 10. A further entry on March 16 of the following year was, "Mind quite lost."

Preparations and Appliances

FIRST-AID DEVICES IN COLLIERIES

Dr. T. A. HUNT, Area M.O., No. 5 Area, East Midlands Division, National Coal Board, writes: In the mining industry the employment of good first-aid men has been of paramount importance. There is, however, an important part of first aid which has recently received a great deal of attention here—namely, the transport of the patient—and a review was undertaken of the methods of getting a patient from the coal-face to hospital.

Single-bearer Stretcher Carriage.—The four-wheel stretcher carriage has many practical disadvantages in use underground, particularly when the road is full with loaded coal tubs and other obstructions common in underground workings. The advantages of a two-wheel device (Figs. 1 and 2) were apparent to many mining men.

The stretcher and carriage can, if necessary, be carried past obstructions or on the coal-face. The carriage can be further dismantled in two parts and rapidly reassembled. The stretcher carriage should be pulled. In this way the leading first-aid man can see where he is walking. The loaded stretcher carriage can be easily lifted over or round obstructions by two first-aid men.

Air Pillow Carrier.—Some support to the back of the head and neck is often needed, but the storage of pillows underground presents many practical difficulties. These have been solved by the use of a rubber air pillow, which should be stored with the stretcher. If stored loosely with the stretcher it may be lost or overlooked. The method used is to fasten a scrap piece of metal tubing to the middle of the stretcher. This tube will hold and preserve, ready for use, the rolled-up air pillow, which is further secured to the stretcher by a small length of chain to prevent its accidental loss.

Stretcher Rack Modification.—Most stretchers in general use in the pits have wooden side supports with a covering canvas sheet. When wood is stored under damp conditions it tends to warp and twist, and the legs of the stretcher splay either inwards or outwards. Ambulances are usually fitted with metal U-shaped grooves into which the legs of the stretcher are placed, and one or more legs of a warped stretcher may not fit into them. This problem has been solved by replacing one of the U-shaped runners in the ambulance by a flat strip of metal, as shown in Fig. 3. This modification has proved very satisfactory and has been in everyday use for over a year.

FIG. 1

FIG. 2

FIG. 3.—(A) Section of stretcher showing a good fitting. (B) A warped stretcher, where leg(s) will not slide securely into U-shaped runners. (C) Single U-shaped runner will secure legs of stretcher against lateral movement while the broad flat runner will support the twisted legs caused by warping of wooden stretcher supports.

a bed-pan, but did not complain of any dizziness or other symptoms. About ten minutes after the completion of the injection he began to regain his colour and by this time his bleeding had stopped.

When the patient was last seen about nine weeks after the injection of pituitrin, he had had no further haemoptysis nor even any staining of his sputum.

It is, of course, possible that this control was purely coincidental, but when the suddenness of the arrest of the haemorrhage is considered, together with the case reports of Rist and Trimble and Wood, it appears that this therapeutic measure is the only effective method available in the control of haemoptysis without resorting to ligation of the vessels, and even that is practicable only if the side from which the bleeding takes place is known.—I am, etc.,

Watford.

Reversible Diabetic Sixth Nerve Palsy

SIR,—The sixth is the cranial nerve most easily paralysed in intracranial disorders, especially in conditions of increased intracranial tension or basal meningitis. Diabetic neuritis has also been a recognized cause of a sixth nerve lesion, but considering the wide incidence of diabetes mellitus such involvement is a rarity. Even in India, where the vast majority of diabetics still spend a lifetime of uncontrolled and untreated diabetes and are often brought to light only when some surgical or medical complication forces them into a hospital, the cranial nerve lesions are hardly ever seen. The following case is reported from a hospital of over 3,000 admissions to medical wards yearly, and over 47,000 medical out-patients. Even in these numbers this nerve lesion is rare.

A man aged 50 years was admitted for diplopia of six weeks' standing. He had typical right-sided rectus paralysis. No other neurological lesion was elicited. There was no history of headache. He had had symptoms of polyuria, increased appetite and thirst for about two years, but he had never sought medical advice. He was of average build without any cachexia, but complained of some pain in his calf muscles. Dextrose tolerance test showed a mild diabetic curve with a fasting level of 140 mg.% rising to 240 mg.% after one hour and maintaining a blood-sugar level of 220 mg.% after two and a half hours of administration of 50 g. of oral glucose. He had glycosuria of 6% at the height of the blood-sugar curve. The Wassermann reaction and Kahn test were negative, and the blood count was normal. The field of vision of both eyes was normal. The vision of the right eye was 6/60 and the left eye 6/36, and there were old trachomatous follicles in both eyes. The urine was albumin free.

Treatment consisted of a diet of 300 g. carbohydrate, with fats 66 g. and proteins 76 g., insulin 30 units a day, and vitamin B₁ 50 mg. once a day. This kept the patient sugar-free and cured his sixth nerve paralysis within a period of four weeks as well as the pain in his calf muscles. He remained symptom-free for the next four weeks of observation.—I am, etc.,

Lucknow, India.

N. N. GUPTA.

Indian Medicinal Plant in the Treatment of Hypertension

SIR,—Cases of hypertension are fairly common, and the condition is seen in all age groups. Treatment is usually palliative, and consists of both medical and surgical measures. It is not possible to use one particular drug for a prolonged period because of the tachyphylactic nature of most drugs. Synthetic chemical compounds having sympatholytic and adrenolytic properties are used along with sedatives of the central nervous system.

Lately a medicinal plant growing in certain parts of India is gaining considerable importance in the treatment of hypertension. The plant is *Rauwolfia*, and belongs to the natural order *Apocynaceae*. Two varieties are now being extensively investigated for

hypotensive properties—(a) *serpentina* and (b) *canescens*. The writer has worked on both the varieties and has found them to be adrenolytic; *R. canescens* is a more powerful adrenolytic than the *serpentina*. The roots of *serpentina* and leaves of *canescens* are used, and several active alkaloids have been isolated. Besides its adrenolytic property, the plant is markedly sedative and has been found to induce sleep. For its central sedative action the plant is used in some forms of insanity associated with insomnia. *R. serpentina* appears to have more marked hypnotic action than the *canescens*. The hypotensive action of the plant is due to its depressing or paralysing the sympathetic component of the autonomic nervous system, the vasomotor centre of the medulla (as seen from the depression of the carotid sinus reflex), the myocardium, and relaxing the arterioles. Large doses or prolonged administration of preparations of *Rauwolfia* produce nausea, vomiting, bradycardia, and respiratory depression. In animal experiments I have found the usual mode of death to be due to respiratory failure. Another drawback of this drug is that it is without effects when used clinically for a prolonged period.

Preparations of *R. serpentina* sold in the Indian market consist of the alcoholic tinctures or liquid extracts with dosage varying from 10 to 30 minims (0.6 to 1.8 ml.) t.i.d., or tablets prepared from the roots of the plant containing all the active principles.—I am, etc.,

Calcutta.

M. D. CHAKRAVARTI.

New Rh Antibody

SIR,—The Hr factor recently described by Rosenfield *et al.* (*Journal*, May 2, p. 975) fits readily into the scheme of the Rh-Hr types, though it causes further difficulties and paradoxes for workers using the C-D-E notations and sponsoring the cross-over hypothesis. The new antiserum is said to cross-react with agglutinogens rh and Rh₀, determined by the corresponding genes *r* and *R*⁰, so that it simulates the reactions of anti-hr' and anti-hr'' sera, though pooling of the latter sera would give quite different results. Thus we are dealing with an antiserum for a new kind of Hr factor. We propose to call the new antibody anti-hr and the corresponding factor hr. Since the new antibody merely defines a new cross-reaction between agglutinogen rh and Rh₀ not shared by any of the other agglutinogens, and does not differentiate any new varieties of agglutinogens, no change in the names of the agglutinogens or genes is called for. If anti-hr serum becomes available for use as a diagnostic reagent, it would largely take the place of anti-hr' and anti-hr'' combined, though pooling the latter two sera would largely nullify one another's reactions.

For those using the C-D-E notations the situation becomes quite complex. Race proposes calling the new factor f, the absence of which he indicates by the symbol F. This is the reverse of the procedure generally followed, and here the C-D-E workers again become inconsistent, since they sometimes use small letters to indicate the absence of a factor designated by them with a large letter—for example, little *c*, *d*, and *e* to indicate the absence of large C, D, and E. Race states that the "simplest" genetic explanation entails postulating a new pair of genes *F* and *f*, so the rhesus "chromosomes" formerly supposed to contain triply linked genes now are postulated to contain quadruply linked genes. The supposed "advantage" of the C-D-E notations that they include all the Rh blood factors found in a blood now becomes more obviously a disadvantage, since type rh blood must now be called type cdef/cdef, or ccddeff_r (— — — + + +), etc., depending on the whim of the C-D-E worker of the moment. As many as 20 different methods of designating the Rh-Hr types in terms of C-D-E are in use. Race and Sanger's book uses five different symbols for the same Rh-Hr types, while the most recent issue of *Annals of Eugenics* gives three different C-D-E notations in three articles, though two of these are by the same author. As a result the C-D-E nomenclature not only says too much (by including little *d*, for which there is no test) or too little (by using symbol CwDe instead of CCwDe in the case of Rhw blood), but in addition the C-D-E nomenclature must be subjected to a complete revision each time a new blood factor is found, so that it becomes more and more cumbersome as more facts become available. The basic cause of the state of confusion prevailing among C-D-E workers is their failure to distinguish between blood factors and agglutinogens (Wiener and Wexler). Since the number of blood factors characterizing an agglutinogen depends mainly on one's industriousness

in preparing and studying antisera (Stormont *et al.*)² such workers will find it necessary to stretch the Rh-Hr "chromosomes" to accommodate more and more linked "genes," in addition to postulating more and more "deletions" and "duplications."

The cross-over hypothesis when applied to the new factor hr (or f) gives rise to still another paradox. According to Race *et al.*³ "chromosome" Dce (R⁰) (D, C, E is the arrangement postulated by Fisher and Race for the supposed "genes" D, C, E in the chromosome) arose in caucasoids by crossing-over of genotypes DCE/dce, DCE/dce, and DCE/dCE. However, in the last-named case (now DCEf/dCEf) this would result in the production of "chromosome" DceF instead of Dcef. It can readily be shown that crossing over in the other cases also yields "chromosomes" in addition to those listed in the article by Rosenfield *et al.* For a more complete presentation of the evidence against the cross-over hypothesis the reader should consult the recent articles by Wiener,⁴ Simmons *et al.*,⁵ and Rife.⁶ One of the main objections to the C-D-E notations is that no two workers use the symbols in the same way, and, in fact, the same worker may use several variations of the nomenclature in the same book or article. The first step to clearing up this confusion would be for the C-D-E workers to get together and agree on a single, uniform nomenclature. Editors of journals, at the same time, should insist that if the C-D-E notations are to be used at all in articles they conform to a uniform recognized standard.

An important question is whether the various Rh-Hr blood factors represent different chemical substances or structures within the same molecule. That they probably do not represent different chemicals is indicated by the interference between the reactions of the blood factors of the same agglutininogen. For example anti-rh' sera generally have a higher titre for type rh' blood than for type Rh₁ blood, and, similarly, anti-rh'' sera have a higher titre for rh'' than for Rh₂. Nevertheless, Rh₀ seems to be a structure separate from rh' and rh''. For example, shortly after the Rh₀ blocking antibody was discovered (Wiener⁷) we found that it was possible to block the Rh₀ reaction of type Rh₁ and type Rh₂ bloods without preventing their reactions with anti-rh' and anti-rh'' sera respectively (Wiener *et al.*⁸). At the same time these observations show that the Rh-Hr agglutininogen must be a relatively large molecule. Moreover, the Rh₀ blocking antibody must be a relatively small molecule as shown also by its ability to pass through the intact placental barrier (Wiener and Berlin⁹). On the other hand, the properties of the Rh-Hr agglutininogen molecule represented by the blood factors hr' and hr'' (and their reciprocals rh' and rh'') must either be in close proximity or overlap, as shown by the reactions of the new anti-hr (or anti-f) serum.—I am, etc.,

Anticoagulants in Myocardial Infarction

SIR,—I should like to support Dr. R. A. Murray Scott's plea for more energetic treatment of shock in this condition by the general practitioner (*Journal*, May 30, p. 1223). The severely shocked patient may not survive the journey to hospital, and a great opportunity to save the life of such a case lies in the hands of his own doctor.

I give nikethamide by intravenous or intracardiac injection, as an emergency measure, in moribund cases, and I believe it is often possible to keep these patients alive by combining this measure with the immediate institution of anticoagulant therapy by means of intravenous heparin. By continuing both therapies the critical first 48 hours can usually be tidied over. Pressor amines offer another hopeful line of treatment in combating shock, and the use of "mephentermine" (N-methylphenyl tertiary butylamine) has been reported¹ to reduce considerably the mortality in this type of case. On the other hand, noradrenaline has not proved so successful.² In this country injection of methylamphetamine hydrochloride ("methedrine") is freely available,

and as Bromage³ has shown this compound to be a powerful vasopressor drug its use might be considered in myocardial infarction. I have not yet had an opportunity to employ it, but am carrying a supply of ampoules in my bag for the next occasion which arises.

Dr. Murray Scott has suggested⁴ that a reduction of prothrombin level to 60–75% may be sufficient in the treatment of coronary thrombosis and convenient for domiciliary management in general practice. I would dispute this contention, as I have observed on more than one occasion a striking return of pain when the prothrombin level has been allowed to rise to 50%. The work of Payling Wright and Kubik⁵ has shown that recanalization of experimentally thrombosed arteries occurs rapidly under the influence of adequate anticoagulant treatment, although Payling Wright has pointed out⁶ that these experiments were conducted on normal arteries and the results may not be comparable when applied to atherosclerotic coronary vessels.

By using phenylindanedione ("dindevan") it is easy to obtain a consistent prothrombin reduction within the accepted therapeutic range without the necessity for unduly frequent prothrombin estimations, although I prefer to have the latter performed on alternate days when employing this anticoagulant.—I am, etc.,

Twickenham.

Importance of Post-mortem Examinations

SIR,—I wish to support Dr. F. E. Loewy (*Journal*, May 23, p. 1163) in his efforts to make post-mortem examination the rule on patients who die at home. I think it would be wrong, however, for this work to be loaded on to the hospital pathologist. Its value would be much greater if the general practitioner carried out the examination, and this would become a practical proposition if adequate mortuary accommodation and an assistant to open skull, etc., were available, plus a moderate fee.—I am, etc.,

Risca, Mon.

M. T. WADE.

Marooned Children

SIR,—I was surprised that neither Dr. Douglas Guthrie's article on King James IV of Scotland (*Journal*, May 30, p. 1191) nor your leading article (p. 1207) made mention of a much earlier attempt to discover what language children, isolated from the speaking world, would speak. Herodotus in his *History* describes a similar royal experiment, differing only in detail from King James's, performed by King Psammetichus of Egypt.

The children, who had been suckled by goats, spoke one word only, "becos," which was identified as the Phrygian word for bread. Thus the King concluded that the Phrygians were the most ancient people in the world. Is it possible that King James was acquainted with this story? —I am, etc.,

Windsor.

JAMES WHITBY.

Claims for Negligence

SIR,—I have read with interest the article by your medico-legal correspondent (*Journal*, April 25, p. 945), with which I am mainly in agreement. In particular I have noticed an increase of claims in this region as a result of the Legal Aid and Advice Act, 1949.

There is one point, however, which is causing hospital authorities and, I believe, their medical staffs much concern, where, if there has been no recent change in the law, there has certainly been a change in its application, and that is the tendency of the courts to extend the doctrine of *res ipsa loquitur* to claims where negligence is alleged during the treatment of patients in hospital. The effect of the doctrine, as your readers are no doubt aware, is to shift the onus of proof from the plaintiff to the defendants.

The case which has caused the trouble is *Cassidy v. Ministry of Health* (Fahrni—third party), a Court of Appeal decision in

1951. The plaintiff alleged negligence in connexion with his after-treatment in hospital following an operation on his left hand. The Court of Appeal held that the defendants were liable on the ground that the facts raised a prima facie case against them under the doctrine of *res ipsa loquitur* and that they had not explained how the plaintiff's condition could have arisen without negligence. That decision appears to conflict to some extent with the decision of the Court of Appeal in *Mahon v. Osborne* in 1939. In that case the alleged negligence related to the leaving of swabs in the abdomen of a patient following an operation. It was there held that the doctrine of *res ipsa loquitur* did not apply in the case of a complicated surgical operation, since an ordinary man, knowing the facts, could not without the help of expert evidence of the precautions necessary in such an operation say that the event which had happened must have been due to a failure on the part of the surgeon to exercise due care.

It is the view of a number of members of the legal profession with whom I have discussed the matter that the decision of the Court of Appeal in the Cassidy case—at any rate so far as it was based on the doctrine of *res ipsa loquitur*—might well have been reversed had there been an appeal to the House of Lords. In view of the repercussions since that case, it is hoped that a decision of the House of Lords will be obtained on the point as soon as a suitable opportunity arises.—I am, etc.,

Liverpool.

NIGEL RYLAND.

** Our Medico-Legal Correspondent discusses the doctrine of *res ipsa loquitur* at p. 1398.—Ed., B.M.J.

Treatment of Apoplexy

SIR,—I read with great interest the Refresher Course article on apoplexy by Professor F. J. Nattrass (*Journal*, May 23, p. 1158), but was surprised to find that he did not mention stellate ganglion injections in the treatment of vascular accidents, particularly embolism and thrombosis. It would be most helpful to learn his reasons for not discussing this vital mode of treatment, of which Professor René Leriche gave an excellent account (*Journal*, February 2, 1952, p. 231). Leriche and other workers demonstrated the effects of stellate ganglion block within an hour of the stroke, the improvement and recovery being most dramatic in many cases.—I am, etc.,

Glasgow.

RICHARD WOLFSON.

SIR,—In reply to Dr. Richard Wolfson, I refrained from reference to stellate ganglion block because I do not think this procedure is sufficiently established, or consistent in its results, to recommend as a routine, especially in general practice. It is being tried out by skilled operators in certain centres, and this is the right thing to do at present.—I am, etc.,

Newcastle-upon-Tyne.

F. J. NATTRASS.

The Catheter and Prostatic Obstructions

SIR,—In spite of the cogent arguments put forward by Mr. Wilson Hey and by Professor Charles Wells (*Journal*, January 10, pp. 99 and 100), the aseptic prostatectomy must be in reality very much of a *rara avis*, and the immediate operation irrespective of the patient's general condition certainly does not recommend itself in our surgical practice here, where the older male inhabitants are clinically undernourished, many with advanced arteriosclerosis, and all of them thoroughly terrified by their precipitous entry into hospital. Therefore if we start with the premise that preliminary diagnosis is necessary and desirable, the argument concerning the catheter and prostatic obstruction resolves itself into the route by which the catheter should be introduced. For those who favour retropubic prostatectomy any suprapubic puncture of the bladder offends against the principle of not interfering with the bladder at all. With any such method there is a danger of extravasation and consequent contamination of the retropubic space.

The penile catheter has the following disadvantages: infection may be introduced directly by the catheter; urethritis may be caused as a result of trauma; the inflam-

matory (and the normal) secretions are dammed back by the pressure of the catheter, especially a large one; subsequent troublesome stricture may form at the fossa navicularis; methods of retaining the catheter are clumsy and unhygienic, so that meatal ulceration may occur and the catheter is easily displaced; the drainage is not entirely dependent owing to the prepubic curve of the penile urethra.

The last point mentioned, that of dependent drainage, is probably the most important single factor in obviating infection, and with that object in view urethrostomy drainage fulfils all the criteria. I am surprised that no mention of this method has been made in your recent correspondence on this subject, for it eliminates so many of the disadvantages of an indwelling catheter while retaining the advantages. It does not seem to have been popular amongst British surgeons, being possibly associated in their minds with perineal urethrotomy, which is fraught with hazards, but Mr. John Sandrey¹ has published a clear and convincing account of the method in more than 300 cases. The technique is rapid and simple. He stresses the importance of making the opening in exactly the right place, 1 in. (2.5 cm.) in front of the perineo-scrotal angle. As he points out, two-thirds of the urethra is eliminated as a source of infection, the proximal third through which the catheter passes being much less liable to infection. The drainage is almost vertical and the catheter is retained satisfactorily with a stitch. A large-size catheter can be used without misgiving, and there is much less tendency for old gentlemen to pull them out. Stricture formation does not occur with a partial opening into the urethra at this site. One disadvantage is the difficulty in replacing the catheter if it comes out, but in fact this accident is very rare.

Perhaps the perineal region (it is not the true perineum through which the incision is made) is not the cleanest of skin areas, but contamination from the anus, if the incision is placed correctly, is easily avoidable. I have used, though this is not strictly necessary, a piece of aureomycin gauze-dressing round the base of the tube, and conditions conform quite reasonably to those labelled aseptic by Mr. Wilson Hey. Certainly at no time does the aseptic prostatectomist's finger or that of his assistant find itself in the rectum.—I am, etc.,

Jamaica, B.W.I.

Mental Hospital Service

SIR,—I appreciate the gesture of Drs. R. A. Sandison and A. M. Spencer (*Journal*, May 16, p. 1111) in acknowledging that the comments in their earlier letter (*Journal*, March 7, p. 560) were open to misinterpretation, and in turn I regret that I judged too hastily their attitude to the needs of the chronic patient. But now they indicate that, whilst they are very conscious of the occupational needs of chronic patients, they are unwillingly driven to advocate a policy of concentrating medical attention on acute patients because "with the available medical staffs in most mental hospitals to-day it is impossible for both acute and chronic patients to receive adequate treatment." They go on to suggest that the working qualities of chronic patients have deteriorated in recent years. I question the truth of that statement, for one could equally well attribute the decline in the occupations of chronic patients to a decline in occupational facilities. But, even supposing that it is true, we must admit that this state of affairs has occurred even in some hospitals despite a considerable increase in the medical staff. So I think it is unwise to attribute the problem to inadequate medical staffing, and to prescribe a palliative on that assumption.

I believe that any analysis of the factors leading to the decline in the occupation of chronic patients would be so lengthy as to be out of place in this correspondence, but I will quote some statistical evidence to counter the suggestion that by concentrating medical attention on acute cases in general one thereby makes any substantial reduction in the hard core of chronicity. Having followed up the fate of each individual one of the 5,897 admis-

sions to my own hospital in the period from January 1, 1945, to December 31, 1951, I can state the following relevant facts.

An average of 24.7% of the admissions in each calendar year remained in hospital one year after the date of their admission, and this figure did not vary by more than 3% from the average and in any year. Of 2,048 admissions over the years 1945, 1946, and 1947, 13% were still in hospital five years after the date of their admission. So it appears that at least half of those patients who remain in hospital one year after admission represent the hard core of chronicity, and therefore the number of those requiring more than one year's residence serves to indicate the trend towards chronicity. In the period reviewed there was a progressive intensification in the treatment of new cases through increased medical staff, improved methods of special treatment, and particularly by a vast increase in occupational therapy. Yet all these therapeutic efforts, albeit most worthy and well justified on prima facie grounds, but not the slightest noticeable tendency to reduce the actual number or percentage of admissions who proved to be more than one year in hospital. Thus, however well established it is that modern methods of treatment will cure a certain limited number of patients who otherwise would become chronic, my figures suggest that their number is insignificant in relation to the fate of new cases in general.

But before we draw any conclusions from such evidence we must have regard for the fact that at least one-third of mental-hospital admissions are readmissions. A very high readmission rate in a hospital that is severely overcrowded might indicate, *inter alia*, that new cases were being inadequately treated, and it has been suggested by Drs. Sandison and Spencer that inadequate treatment will augment chronicity. Apropos of that I have noted that in 1951, when my colleagues were particularly hard pressed to discharge patients because of overcrowding, 45% of admissions were readmissions. Taking the year 1949 for comparison, I find that readmissions then constituted 33.9% of admissions. But the percentage of admissions of those two years needing more than one year in hospital were 21.7 (1951) and 20.4 (1949) respectively; or an increase of only 1.3% in potential chronics, despite an increase of 11.1% in readmissions, and the actual numbers of potential chronics for the two years were 206 and 201 respectively. If one is to draw any inference from this it is that the number of admissions destined to become chronic, despite all therapeutic effort, is so great as utterly to obscure any effect which our therapeutic attention to new cases may have in reducing chronicity.

In conclusion I suggest, however, that the chronic patient is not likely to suffer detriment by being deprived of specialized treatments at the hands of doctors, but he sorely needs occupational treatment, which is a form of treatment mainly administered by persons other than doctors. But unless the doctor proclaims himself to be at least as interested in the occupational direction of the chronic patient as he is in his more personal and specialized treatment of the acute case, it is certain that interest and effort will deteriorate amongst those ancillaries to whom he allocates the occupational treatment of his patients.—I am, etc.,

Shenley, near St. Albans.

OTH O FITZGERALD.

Half-way Homes for the Elderly

SIR,—Your correspondent Dr. J. M. Greenwood (*Journal*, June 6, p. 1280) appears to be in doubt as to the function of the so-called "half-way homes" provided by King Edward's Hospital Fund for London, though this has been stated in more than one of its annual reports. For the benefit of those who are interested, may I say that these homes conform closely to the pattern suggested in the last paragraph of Dr. Greenwood's letter, though they could scarcely be described as convalescent homes in the usual meaning of this term. Each home is linked to an active geriatric unit, and the medical officer in charge of this unit is in medical charge of the patients in the home. Only those who have been patients in the unit are admitted, and those who have been maintained, so that, if the patient unfortunately fails to benefit by a stay in the home, he or she is taken back to the geriatric unit. Clearly these homes do release hospital beds, and the cost of maintenance, which is provided by the regional hospital board concerned, is considerably less than in hospital.

The general council of the Fund allotted £250,000, subsequently increased to £350,000, for the purchase, adaptation,

and equipment of 12 homes, three in each of the four Metropolitan regions. Seven of them are now in full working order and others are in active preparation. The Fund has also contributed substantially to three other homes of a similar type.—I am, etc.,

ARCHIBALD GRAY,
Chairman of the Distribution Committee,
King Edward's Hospital Fund for London.

London, W.1.

The Royal Touch

SIR,—Those of your readers who were privileged to see Queen Salote Tupou of Tonga passing in the Coronation procession may perhaps be interested to know that, like French and English kings and queens, her predecessors were credited with power to cure the King's Evil by their touch. Frazer, in *The Golden Bough*,¹ records that "the savage chiefs of Tonga were believed to heal scrofula . . . by the touch of their feet; and the cure was strictly homoeopathic, for the disease as well as the cure was thought to be caused by contact with the royal person or with anything that belonged to it."—I am, etc.,

London, W.11.

HUGH FORSYTH.

POINTS FROM LETTERS

General Peritonitis and Appendicectomy

Dr. R. E. LODER (Peterborough) writes: Children with appendicitis and generalized peritonitis, desperately ill though they may be, take a short, carefully given general anaesthetic very well. All experienced anaesthetists, however, must have seen how rapidly their condition deteriorates if there is any gross pulling on inflamed bowel and mesenteries. One notices that the more experienced a surgeon is the more often he is able to remove an appendix without great trauma and also the quicker he makes up his mind in doubtful cases to leave it in and just to drain.

Premenstrual Syndrome

Dr. W. S. INMAN (Portsmouth) writes: To the already mentioned irritability of mind and body in the premenstrual syndrome may be added a tendency to inflammation and even suppuration of the eyelids. During the last 28 years I have investigated in several thousands of sufferers the emotional factor in the causation of styes and tarsal cysts—the custom, extending throughout Europe, of cure by rubbing them with a wedding ring, a symbolic wedding, was a challenge not to be ignored—and I have formed the impression that in women these lesions were much more likely to occur just before the period than at any other time. After all, if menstruation means a missed pregnancy and the primary function of woman is to ensure continuance of the race, then anxiety, conscious or unconscious, about the fulfilment of her destiny is understandable, since man has been in emotional conflict about biological aims throughout history. . . . My experience with acute appendicitis is slight, but for many years I have noticed that virtually all the attacks in women have occurred during the premenstrual phase. My inability to interest my surgical colleagues in this curious association may arise from dissimilar experiences.

Cancer Research

Dr. J. B. HOBBS (London, W.C.1) writes: I was most interested in the article by Professor Ian Aird and Mr. H. H. Bentall (*Journal*, April 11, p. 799). It seems that a whole new vista in cancer research has been opened up. Having recently completed a junior appointment in a pathology department and spent many hours cross-matching blood, I have often pondered the following thoughts. It seems incredible that we can transfer many billions of living cells from person to person without transferring also either a carcinogenic agent or a predisposing factor, or perhaps sometimes even tumour emboli. Has any investigation ever been performed to determine the percentage with carcinoma in any site who have previously received transfusions of blood, and whether there is any correlation between the causes of death in a blood donor who died of cancer and patients who have previously received his blood? As an afterthought, and knowing that cancer susceptibility can be transferred via maternal milk in some animals, it would be interesting to know if malignant disease is common in dairy cattle, or would pasteurization in any case render the milk 100% safe?

Obituary

H. M. O. LESTER, O.B.E., Ph.D., M.R.C.S., D.T.M.&H.

Dr. H. M. O. Lester, whose sudden death at Penang on May 28 came as a great shock to his many friends, had a long and distinguished career in the Colonial Medical Service.

The son of the Reverend Henry Lester, Hugh Morley Oliff Lester was born at Walton, Cheshire, in 1902. He received his education at the City of London School and St. Thomas's Hospital, to which he went in 1920 with the City of London scholarship. He won numerous distinctions and scholarships, including the University of London Research Studentship for Physiology for 1923-4, and was demonstrator in physiology at his hospital. He graduated B.Sc. with first-class honours in physiology in 1922, and took the M.R.C.S., L.R.C.P. in 1925. In 1935 he obtained the Ph.D. degree.

After taking the London D.T.M.&H. Lester was appointed medical officer in Nigeria in 1926 and was immediately posted to the Tsetse Investigation Service, where his knowledge of physiology and biochemistry proved a valuable asset. He was early promoted to take charge of this service, and was made Deputy Director in 1930, a designation later changed to Deputy Director, Sleeping Sickness Service. Under Lester's guidance this service accomplished much. By 1942 420,000 cases of sleeping sickness had been treated, and the incidence of the disease had decreased from 20% in 1935 to 2% in 1942. During this time almost all epidemic and endemic areas in the country had been surveyed. Lester's work in Nigeria will be especially remembered for the creation of the Anchau Corridor. A large area in Northern Nigeria was rendered tsetse-free, and into this area a large population was moved and enabled to live in healthy conditions; and, with the co-operation of various Departments of Government, an entirely different standard of economic and social life was made possible. The Corridor has been visited by experts from various parts of the world and will remain as a monument to Lester's work. The O.B.E. was conferred on him in 1938. Realizing that the major attack on sleeping sickness had been successful, Lester felt that he should move into general medical administration, and he became A.D.M.S., Nigeria, in 1944. When the directorship in Palestine became vacant in 1946 Lester was the obvious choice for the post, and from then until 1948, during those difficult and bitter years, he built up and maintained the high morale of the medical service in Palestine at great nervous cost to himself. When the administration in Palestine passed out of the hands of the Colonial Office he was appointed Director of the East African Tsetse and Trypanosomiasis Research and Reclamation Organization. This was a post of some difficulty, requiring the services of a man of outstanding personality, as it entailed the welding together into one effective unit of the three organizations which this new organization replaced. That he accomplished this is everywhere acknowledged.

In 1951 it was essential to obtain as Director of Medical Services in Malaya a man of strong character and administrative experience to take over under the abnormal circumstances then prevailing. The choice fell on Lester, and he became Director in 1951. He himself would have preferred to remain in his post in East Africa, but characteristically accepted the challenge of

the more difficult position. In the short period left to him he accomplished much.

Hugh Lester had many of the attributes that go to make a great Director. He was a fine scientist, and in the field of trypanosomiasis contributed much to the literature, but his forte was as an organizer and administrator. He possessed a clear and analytical mind, and could very quickly see the essentials of any major problem, while at the same time he had a unique knowledge of the details necessary for the carrying out of a project. He was in many ways an exacting master, demanding of those serving with him the very highest standard, but he only asked for what he himself gave in full measure. Those who knew him best realized that underneath a somewhat stern exterior they were dealing with a man basically shy and retiring. He set himself the highest possible ideals, and wore himself out in an endeavour to attain and maintain these ideals. It was obvious that he was taking too much out of himself, but he could never agree to rest until his aim had been fully reached. He died in harness, working to the end to achieve a settlement of the urgent problems created by the emergency in Malaya.

Dr. Lester leaves a wife and two sons. No man ever had a better helpmate, and our sympathies go to his wife and family in their great grief.

J. L. M. writes: The news of the death, in Malaya, of Hugh Lester will be a shock to many who knew him in Nigeria, where he spent his first 17 years in the Colonial Medical Service. For all except the last few months of this time he was with the Tsetse Investigation and Sleeping Sickness Service. His great gifts were administrative, and by administration he meant getting something done. He usually knew exactly what he wanted to do and had, at least in Nigeria, an invaluable knowledge of the ways and thoughts of other officers, and of how they could most readily be persuaded to accept his plans. Lester did many things well: he became a notable hunter and a successful owner of racing ponies, and kept a lovely garden, a handsome house, and a delightful table. Among the many who knew him in Nigeria and whose sympathy will go to his widow and two young sons, there will be a handful of old headmen, hunters, messengers, and others who mourned Johnson's death so recently and now, again, will say a reverent "Allah ya jikansa" for Lester.

GEORGE SCOTT WILLIAMSON, M.C., M.D.

Dr. G. Scott Williamson, founder and medical director of the Pioneer Health Centre, Peckham, died suddenly at Tunbridge Wells on June 4 at the age of 69.

Born in Fife in 1883, George Scott Williamson was educated at Barnard Castle and Edinburgh University, where he qualified L.R.C.P., L.R.C.S. in 1907, graduating M.B., Ch.B. seven years later. After qualification he held appointments as pathologist at the Nordrachon-Dee Sanatorium and at Wakefield Mental Hospital. During this period he published papers on the cerebrospinal fluid in mental disorders. Then followed two years as assistant director of the Clinical Research Association, after which he was appointed lecturer in pathology at Bristol University and pathologist to the Bristol General Hospital. During the 1914-18 war he served for three years in France, where he commanded a field ambulance. He held the rank of lieutenant-colonel and gained the M.C.

After the war Scott Williamson came to London. He became director of pathological studies at the Royal Free Hospital, where his association with the late Sir James Berry gave him an unrivalled opportunity to study the thyroid gland. This led directly to his work on the

anatomy of the thyroid, which was embodied in his Arris and Gale lectures to the Royal College of Surgeons in 1926 and for which he received his M.D. with Gold Medal from Edinburgh University. After Sir James Berry retired Scott Williamson was elected McKenzie McKinnon Research Fellow and continued his thyroid studies in the laboratories of the Royal College of Surgeons under the direction of Sir Arthur Keith. He was also attached to the Medical and Surgical Unit at St. Bartholomew's Hospital, where the surgical work of Professor George Gask, Sir Thomas Dunhill, and Mr. Geoffrey Keynes gave him further facilities for his investigations.

It was at this time, in 1926, that Scott Williamson began to turn from pathology to the experiments in social medicine which were to lead 10 years later to the establishment of the Pioneer Health Centre. He began with a small club for working-class families in a house in Peckham. He quickly decided that for the understanding of health, in contrast to disease, the family was the proper unit for study. His aim therefore was to devise a method for attracting healthy families into a field of continuous observation. He regarded his family club as his laboratory. Soon Scott Williamson wished to extend his experiment, and such was his personality and enthusiasm that he was able to find the support and funds necessary for a much larger and more ambitious venture. In 1935 the Pioneer Health Centre was opened at Peckham, with himself and Dr. Innes Pearce, whom he later married, as its directors. At its peak the Centre catered for 875 families. The rules were simple: only local families could join; they were required to pay weekly subscriptions; and they had to submit to periodical medical examination. The building was so designed that the leisure activities of each member of a family, whatever his age, could be catered for: there were, for example, swimming-baths, a cafeteria, and a gymnasium, as well as rooms for social purposes and medical examination.

In *Biologists in Search of Material*, published in 1938, Scott Williamson records his views on the Centre and its method of working. After 4½ years the work was brought to an abrupt end by the outbreak of war. What had been achieved up to that date is recorded in *The Peckham Experiment* (1943), a book written by Scott Williamson's colleagues but inspired by him. After the war little remained intact but the human material of 550 of the 875 pre-war families. But a start was made, and the Centre reopened in 1947. Unfortunately the costs of running it far outran the income from the family subscriptions, and voluntary donations proved insufficient to bridge the gap. In 1950 it became necessary to close the Centre for lack of funds. Even then Scott Williamson did not give up. He tried to interest various official bodies, notably the London County Council, in the continuation of the work, but the conditions on which support might have been forthcoming were unacceptable to him. And it is fair to say that, though the social implications of the work at Peckham were widely acclaimed, there were doubts about some of the medical claims made for it. Finally, after protracted negotiations the L.C.C. bought the buildings and land with the intention of using them for a new medico-social research unit (*Journal*, February 9, 1952, p. 317).

To many observers the Peckham Health Centre was primarily a magnificent club where suburban families, normally living in uncomfortable isolation from each other, could come together in surroundings that pro-

vided ideal opportunities for physical and mental recreation. This social experiment was conducted in an enlightened and inspiring fashion, and its extension to other urban areas would give the citizen of our vast conurbations a "sense of belonging." But the evidence that the experiment advanced knowledge of the factors that make for health is tenuous; very little that is concrete seems to have emerged from the research that was being conducted. Scott Williamson certainly increased the sum of human happiness in Peckham, and this was no mean achievement.

We are indebted to one of Dr. Scott Williamson's colleagues for the following: Although Scott Williamson welcomed visitors, it must be remembered that the Centre had been devised by him for the purpose of making certain observations, not as a model for general application. This was in keeping with his genius; he was above all an observer, gifted with a rare understanding of what he saw, and content to leave the application to others. Some critics accepted the Centre as a valuable instrument, seeing clearly its possible use in their own fields of study—medical or social. They were often perplexed and disturbed that he refused to pursue such obvious studies, but adhered steadfastly to his own. The last four years led him to the conviction that health can be assessed neither by measurement of quantity nor by statistical method: it is a question of quality, of biological specificity. In fact, "living" cannot be covered by the methods of the physical sciences. Perhaps we might say that Scott Williamson opened a new door and looked into the future from its threshold.

Dr. H. Revilliod writes from Geneva: With a deep sorrow I have received the news of the sudden death of Dr. G. Scott Williamson. As I had the great privilege of seeing him and visiting the Peckham Centre several times in 1945 and the following years, I want to express my deep appreciation of the various results achieved by these colleagues of mine and their assistants in the field of human biology, together with their remarkable social and educational work. Like many scientists and practitioners interested in social hygiene, I consider the research work done in this Health Centre as a very precious contribution to the knowledge of human life in its various aspects and functions. This thorough study resulted in a new understanding of the problems of health and fitness, formerly neglected in medical teaching and practice. Its methods and conclusions are well presented in the numerous publications of Dr. Scott Williamson and his co-workers. Besides, I was impressed by the happiness and the physical and moral development of the people of all ages who, as members of the large Peckham family, voluntarily contributed to the investigations of the medical staff, and appreciated the resources offered to them in the Centre. May this scientific and humanitarian work, done with a rare competence and devotion by Scott Williamson, be pursued in the future for the good of the human beings he loved so much.

ALEXANDER MacLENNAN, M.B., C.M., L.M.

Mr. Alexander MacLennan died at Kilmun, Argyll, on May 31, aged 81 years. For more than 30 years, until he retired in 1938, he was a well-known surgeon and well-loved teacher of students in Glasgow. His elder brother, William, was at the same time equally distinguished as a physician and clinical teacher.

Alexander MacLennan was educated at Glasgow University, where, in 1894, he began his career by graduating M.B., C.M. with honours and being the most distinguished student of his year. At first he intended to specialize in obstetrics, and held junior appointments in London and at the Rotunda, Dublin, as well as studying abroad at Jena, Berlin, Berne, and Paris. Soon, however, he was appointed to the surgical staff of the Western Infirmary, where his reputation as a teacher

was made. In his early days there were few special branches of surgery, except otolaryngology, and a wide variety of conditions was seen in the out-patient department, including, of course, cases of venereal disease. MacLennan was certainly the first in Scotland to demonstrate the spirochaete of syphilis to students soon after the announcement of its discovery. His teaching was excellent, and his sessions in the out-patient department were always attended by crowds of students. He was very neat-fingered, and was early attracted to the surgical diseases and deformities of children. In 1914, when the new Royal Hospital for Sick Children, Glasgow, was opened, he was appointed surgeon and also the first Barclay Lecturer in Diseases of Childhood and of Orthopaedics in the University of Glasgow. In 1922 he was vice-president of the Section of Diseases of Children at the B.M.A. Annual Meeting which was held in Glasgow in that year.

No doubt when MacLennan retired, in 1938, to his charming house and garden in Argyll he regarded his surgical career as at an end; but this proved to be far from the truth. During the war years his area, reasonably accessible only by sea, was semi-isolated, and his surgical services at Dunoon Cottage Hospital were in great demand. His reward came when, in 1950, he was made the first Freeman of Dunoon in the presence of the whole community for miles around. This gave great pleasure to his friends, but especially to his wife, who was his devoted comrade and companion for so many years and who survives him.—J. W. M.

We are indebted to Mr. WM. A. CAMPBELL for the following appreciation: As one of the late Mr. Alexander MacLennan's oldest colleagues I would like to record my appreciation of him as a surgeon and a man. Alex died peacefully at Kilmun, alert and active till near the end. I fell under his spell over fifty years ago, and it was an inspiration to work under and for him. His clinical observations were keen and accurate, his operative skill unsurpassed. He was in the van of surgical progress. He had great strength of character combined with deep religious beliefs, not worn as a cloak, but woven into his being. His many surviving patients and friends will, I am sure, agree with me that his epitaph should be—"Well done, good and faithful servant."

WILLIAM FORBES, M.B., F.R.C.P.Ed.

J. P. A. H. has sent us the following appreciation of the late Dr. William Forbes: As a lifelong friend I feel that I can add a little to his obituary notice (*Journal*, June 6, p. 1283). Very early in his life Forbes manifested what was to be a great and lasting interest in science. While still at school he gained many prizes in botany, chemistry, and physics, and even in his early teens he was already acquiring books on anatomy, pathology, and medicine. His bent was always towards research, and, probably because of this, he early decided that pathology was his true *métier*. Unfortunately his research career was to be early interrupted by the advent of the war. Thereafter his time was more and more occupied by routine duties to which he gave of his all, leaving little time for original research. I feel certain that pathology has sustained a great loss by his early death.

As a man he was somewhat reserved until one knew him well. He always showed great kindness, and was willing to give much of his time to help those less fortunate than himself. To me he always appeared a very typical example of the Scots medical scientist. He had a keen dry sense of humour.

We record with regret the death of Dr. REGINALD STILWELL at the age of 80 on June 5 at his home at Hillingdon. For over 150 years members of the Stilwell family have cared for psychiatric patients at Moorcroft, Hillingdon. Reginald

John Stilwell was educated at Harrow and the Westminster Hospital, London, where he qualified in 1899. After qualifying he became a house-physician at the Westminster and Bethlem Royal Hospital, where he came under the influence of such men as Sir George Savage (then Dr. Savage), Dr. T. B. Hyslop, and Dr. W. H. B. Stoddart. He finally went to Moorcroft House in 1903, where he remained for the rest of his life. Interested in tennis and cricket, he was a member of the M.C.C. for many years. His other interests included painting and farming, and he was a Justice of the Peace for Middlesex, being a most conscientious attender at the Uxbridge Magistrates' Court. At Moorcroft he carried on the good work of his family and endeared himself to both patients and colleagues, who valued greatly his opinion and advice on difficult cases encountered in psychiatric practice. Stilwell married in 1907 his cousin Gertrude Stilwell, whose father, Dr. Henry Stilwell, was physician in charge of Moorcroft House from 1860 to 1906. The devoted service of Dr. and Mrs. Reginald Stilwell will be remembered by many who visited their charming house. Mrs. Stilwell died in 1947. Our sympathy is extended to Reginald Stilwell's colleagues and friends in the loss of a practitioner of great merit.

His many friends will have heard with deep regret of the death of Dr. ALBERT VICTOR WOOD at the age of 52. He died suddenly on May 25 after a long and painful illness borne with characteristic fortitude. His early life was spent in Skibbereen in Southern Ireland, where his family is well known and much respected. His father was forced to leave the country during the political troubles, but his heart was there, and he returned. Victor had the same love of his native country. He went to school at Cork Grammar School, and after being removed from the Royal Flying Corps, for which he had enlisted whilst under age, he entered Trinity College, Dublin, to study medicine. He qualified there in 1923, and then went directly to Blackpool, where he remained in general practice until the time of his death. He was a real family doctor, with a great capacity for making friends and many interests outside medicine. He was particularly gifted in the art of midwifery. He took a great interest in show-people and shows, especially the circus, and he counted a troupe of lions and a boxing kangaroo amongst his favourite patients. His lasting courage, his whimsical humour, and his zest for life will remain in the minds of those who knew him. Deep sympathy is extended to his wife and his three children.—D. K. L.

Dr. GEORGE W. RIPPON died suddenly at work, in his 51st year, on June 1, at the Royal Infirmary, Sheffield, where he had worked with devotion as a medical student, houseman, honorary anaesthetist, and as consultant in anaesthetics to the United Sheffield Hospitals. He graduated M.B., Ch.B. at Sheffield in 1925, and held appointments as house-surgeon to Sir Ernest Finch and house-physician to Dr. A. G. Yates at the Royal Infirmary; and later as house-surgeon to Mr. W. W. King at the Jessop Hospital, Sheffield. Rippon was in general practice for many years in Sheffield, where he was beloved by his patients for his courtesy and sincerity. His clinical skill and understanding earned for him a high reputation amongst his patients. His interest in anaesthetics began early, and when appointed in 1933 honorary anaesthetist to the Children's Hospital he applied himself increasingly to this specialty. For some years he carried on his general practice, but in 1949 he gave it up, having already been appointed anaesthetist to the Jessop Hospital and the Royal Infirmary, and devoted himself exclusively to anaesthetics. He was a ceaseless worker and an inspiration to all who served with him. To those privileged to be his friends, George Rippon was a charming and witty companion, with wide literary and artistic interests. He was exceptionally happy in his domestic life, and to be entertained in his home was something to be treasured in the memory. At this time of bereavement the heartfelt sympathy of all who knew him will go out to Mrs. Rippon, to her son in Korea, and to her two daughters.—J. W. and W. J. L.

Medical Notes in Parliament

AGENE IN BREAD

In the House of Lords on June 10 Lord TEVIOT drew attention to the high percentage of processed and chemically treated foods now consumed, and asked the Government to do everything possible to increase the availability of fresh food for the people. The report of the Ministry of Health covering the period from April, 1950, to December, 1951, stressed an increase in cases of dysentery and a lack of progress in reducing the stillbirth rate. The figures concerning cancer were deplorable and showed a marked increase. Outbreaks of food-poisoning in 1951 were greater in proportion where canned and processed food were consumed. He mentioned the case of a peeress who was never well and who was eventually discovered to be suffering from agene poisoning. In nearly every hotel one saw an automatic slot machine with stomach powders, aspirin tablets, and purgatives. Properly fed people did not need these drugs. Far too many people were making fortunes out of tampering with natural food and too many making vast sums out of the antidotes for bad food.

Lord HANKEY said the desire for white bread had caused adulteration of food for 200 years. Parliament between 1750 and 1800 had tried to foster the sale of a standard bread containing more bran, cheaper and more wholesome, but people clung to the adulterated white bread. When the use of steel rollers replaced the old grindstones, and robbed flour of essential vitamins and material, the dangers were only discovered some 50 years later. In spite of the improvement inaugurated during the war by Lord Woolton, the country to-day, Lord Hankey feared, was drifting back towards "poverty bread." In 1946 Sir Edward Mellanby published the fact that dogs fed on flour containing agene suffered nervous disorders, canine hysteria, and eventually death (*British Medical Journal*, December 14, 1946, p. 885).

The Governments of the United States and Canada then made the use of this flour a penal offence, but both permitted the use of another "improver"—chlorine dioxide. In 1950 the British Government at last decided to ban agene, but to permit chlorine dioxide. The Government gave warning that it would take a long time to provide the latter substance. To-day, seven years after Professor Mellanby's warning, the discredited agene was still in use and chlorine dioxide was suspect. On March 21, 1953, the *Lancet* had published a paper by Drs. G. C. Sheldon and Allan Yorke which described observations over many months in the case of a woman afflicted with skin disorders associated with loss of appetite and mental depression. Their evidence was that chemically treated flour was the cause. Nitrogen chloride—agene—was the original cause of the trouble, but chlorine dioxide was found to produce the same symptoms. Of eighteen nations in Europe and North America, nine permitted the use of agene and nine banned it. In France it was not used, and there had been nothing to compare with the great increase which had occurred in Britain in coronary thrombosis.

New Zealand Comparison

Lord HORDER said that Lord Hankey had asked about the increase in coronary thrombosis. Lord Horder wished that he knew what it was due to. He remarked that in New Zealand agene had never been used in preparation of bread, yet the incidence of coronary thrombosis was exactly comparable with its incidence in this country. He had not been convinced that agene produced any illness in human beings. If a man lived to be 160 he might by then begin to show some of the signs which dogs showed, because by then he would have had as much agene as Mellanby gave his dogs. He had yet to see a type of human illness analogous to canine hysteria in dogs. Therefore he believed the Government was wise in not being hustled over this question.

Lord BOYD-ORR said there was a remarkable improvement in the health of women and children in this country compared with the years before the war. He had great faith in the Ministry of Health and the Medical Research Council, and he believed they kept all the necessary factors in view. He was not alarmed by some of the things which had been said that day.

Lord DOUGLAS of Barloch said it had been proved that agene combined with some elements in the protein of the wheat and formed a definitely poisonous compound. He would like to see a prohibition against the substitution of artificial substances for natural foodstuffs.

Lord JESSEL said the milling industry wished to follow official recommendations on improvers, and awaited the results of research which was being carried out by the Ministry of Health and the Medical Research Council. The industry was confident that agene was in no way injurious to the health of the people.

Lord CARRINGTON said that the Government agreed with Lord Teviot about the importance of producing more fresh food. It had been decided to abandon the use of agene as soon as a suitable substance could be found, but the evidence did not justify the Government preventing the use of agene without knowing the effects of the substitutes which could be used. The only evidence the Minister of Food had of any ill effects from agene was the one case referred to in the *Lancet* last March. Joint investigations into the various alternatives were being carried out by the Ministries of Food and Health and the Medical Research Council in collaboration with research associations of the milling and baking industry. Difficult problems were involved, and the Government could not expect a quick answer to them. The makers of whiter flour would be required to restore the same amounts of the main nutrients as were present in 80% extraction flour. Iron, vitamin B, and nicotinic acid would be put back.

HEALTH SERVICES IN GAS INDUSTRY

Mr. STEPHEN SWINGLER on June 9 drew attention to the lack of an occupational health service in the gas industry. He said one of the responsibilities of the National Gas Council should be to establish such a service for gas workers. The Gas Council was almost alone among National Boards and National Councils in failing to establish an industrial medical service. The Medical Research Council recently decided to undertake long-term research into the incidence of lung cancer among gas workers. Therefore it was disappointing to find that only four of the twelve area boards which administered the gas industry had established full-time medical staffs.

Dr. BARNET STROSS supported the plea.

Government Reply

Mr. L. W. JOYNSON-HICKS, replying for the Ministry of Fuel and Power, said there was no hope of getting results from this inquiry within two or three years. It was likely to be considerably longer. There were, however, ample numbers of cases available within the four Boards to provide material for inquiry. Mr. Swingler was applying to the gas industry recommendations largely contained in the Dale Report. It was not the job of the Gas Council to set up a medical service for the industry. That was for each area board to do for itself. When the then Government appointed the Dale Committee on industrial health services in 1949 Mr. Attlee had announced that pending its report development in industrial medical services should be held up. In consequence little progress was made in the gas industry. The committee reported, and in 1951 the ban was removed by the then Prime Minister. The Minister of Labour then referred the recommendations of the Committee to a National Joint Advisory Council. Replies had been received from the British Employers' Federation and from each of the nationalized industries, but not from the T.U.C. Consequently, action on the recommenda-

tions could not be taken. The Scottish Gas Board had agreed to a permanent medical service, and the Gas Council had agreed. It was reasonable to expect that the remaining boards would take action.

The Health Service Inquiry

Mr. GEORGE THOMSON on June 9 asked the Secretary of State for Scotland to appoint a secretary from the Scottish Health Department as an additional secretary to the Committee of Inquiry into the National Health Service under the chairmanship of Mr. Guillebaud.

Mr. J. STUART replied that an experienced officer of the Department of Health for Scotland was being appointed to the secretariat of the committee to assist on matters specially affecting Scotland. Answering Mr. HECTOR HUGHES on the same day, Mr. Stuart declared that it was for the committee to decide, having regard to its terms of reference, the nature and scope of its review of the National Health Service in Scotland. The committee had invited memoranda from Scottish bodies and intended to hear oral evidence in Scotland, so that it would become fully aware of Scottish needs and circumstances. In reply to Mr. J. GRIMOND, Mr. Stuart said the committee's terms of reference gave it full scope to carry out all relevant inquiries. He had no doubt that it would have due regard to conditions in the Highlands and Islands of Scotland.

On June 11 Mr. SOMERVILLE HASTINGS asked whether the Minister of Health would take steps to ensure that full consideration was given by the Guillebaud Committee to the saving that would result from the replacement of part-time consultants by whole-time officers. Mr. IAIN MACLEOD replied that it was open to the committee to consider the point, but he did not think it would be appropriate for him specially to ask it to inquire into any particular topics.

Medico-Legal

RES IPSA LOQUITUR

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

When a plaintiff brings an action alleging that he has suffered damage as a result of the defendant's negligence, he has to prove if he can by calling evidence that the defendant has been negligent and that he has suffered damage as a result. If he fails to call such evidence, his action will be dismissed without the defendant being called upon to defend himself. But when the cause of the damage is shown to be under the management of the defendant or his servants, and the accident is such as in the ordinary course of things does not happen if those who have the management use proper care, the very happening of the accident affords reasonable evidence, in the absence of explanation by the defendant, that the accident arose from want of care.

It is this relaxation of the strict onus of proof that is labelled in English law by the maxim *res ipsa loquitur*, of which it was said by Lord Shaw of Dumfermline that no one would have called it a principle if it had not been in Latin.

Fact that Injury Happened

The difficulties in the way of the plaintiff which the maxim is calculated to relieve often occur in actions for negligence brought against hospital authorities and doctors. As a rule all the injured person is in a position to know or to prove is that he was in the care of the hospital and its staff for operation or treatment and that somehow or other, as a result of something which happened to him while he was unconscious, or while he was conscious but which he had not the technical knowledge to understand, he finished up with an injury. If the nature of the injury is such that

a reasonable layman knowing the facts would naturally infer that it could only have been caused by want of care by the hospital staff in the operation or treatment, all the plaintiff will have to prove in order to put the defendants on their defence is the fact that the injury happened, not how it happened. It is then for the defendants, the hospital authority or its staff, to show that the injury was caused by no negligence of theirs.

However, if the reasonable layman knowing the facts would naturally infer that the injury might have been caused by want of care by the hospital staff, but might also have been caused by something else, then the plaintiff must go further. He must call evidence to prove not only that the injury happened, but how it happened, and that it happened in fact as a result of the defendant's negligence. If he does not do so his action will be dismissed without the defendants being called upon to explain how the injury occurred or to prove that it occurred through no fault of theirs.

Two Cases

It is easy enough to formulate the two sides of the line, but in any individual set of circumstances it can be extremely difficult to decide on which side of the line the case falls. A classic example is to be found in the case of *Mahon v. Osborne*.¹ This was an action brought by the mother of a patient who on March 4, 1937, was operated on for a perforated duodenal ulcer. On June 12, 1937, he again became acutely ill, and at a second operation a swab was found that had been left in his abdomen at the first operation. On June 13, 1937, he died because of the swab.

The case was tried by Mr. Justice Atkinson and a jury at Manchester Assizes, and judgment was entered against the surgeon who had performed the operation. In the Court of Appeal Lord Justice Scott said that it was difficult to see how the principle of *res ipsa loquitur* could apply generally to actions of negligence against a surgeon for leaving a swab in a patient. The nature even of abdominal operations varied very widely, and many considerations bore upon this matter and presented a state of things of which the ordinary experience of mankind knew nothing. Accordingly there was no room for the reasonable layman knowing the facts to draw the inference necessary for the application of the rule.

Lord Justice MacKinnon in his judgment clearly indicated that in his view the proof simply of what happened was enough to put the surgeon to his defence and require him to explain how the swab was left in without negligence on his part. Lord Justice Goddard, as he then was, expressly said that in his view the doctrine of *res ipsa loquitur* did apply, and that it was for the surgeon to show that he had exercised reasonable care to prevent the swab from being left in the patient's abdomen.

Lord Goddard is, and Lords Justices Scott and MacKinnon were at that time, among the greatest masters of the Common Law.

A recent example of the application of the maxim was the case of *Cassidy v. Ministry of Health*.² The plaintiff was operated on for Dupuytren's contracture of the third and fourth fingers of the left hand. His hand was splinted for fourteen days under the care of the hospital staff, and on release it was found that not only were the fingers which had been operated on bent and stiff, but the two good fingers had also been affected. In the Court of Appeal Lords Justices Somervell, Singleton, and Denning all held that the mere proof of these facts would cause a reasonable layman to draw the inference that the injury could have been caused only by want of care on the part of the hospital staff, and was sufficient to call for an explanation from the defendants.

In truth, and putting aside Latinity and learning, the doctrine is fundamentally a matter of common sense. As with common sense, there will never be uniformity in its application.

Universities and Colleges

UNIVERSITY OF OXFORD

Dr. Janet M. Vaughan, Principal of Somerville College, and Dr. A. G. McD. Weddell, Reader in Human Anatomy and Fellow of Oriel College, were elected members of the Hebdomadal Council of the Royal College of Veterinary Surgeons for four years. In Congregation on June 6 the following medical degrees were conferred:

M.D.—*R. J. Dickson, R. D. Eastham, J. W. Fawcett, D. B. B. Whitehouse, G. Wetherley-Mein, R. E. Church, D. K. Ford, H. G. Dowler, J. Foley. *By proxy.

UNIVERSITY OF GLASGOW

On March 2 the degree of M.D. was conferred in absentia by diploma on 'R. S. Duff, and on April 25 the degree of M.D. was conferred on J. Joseph, I. A. Macdonald, and 'A. G. Melrose.

*With high commendation.

UNIVERSITY OF ABERDEEN

At a graduation ceremony on April 2 the following medical degrees were conferred:

M.D.—Joan M. Burrell, R. N. Johnston, S. J. H. Miller. M.B., Ch.B.—J. W. Davidson, 'Marion E. Mackay (with distinction in midwifery), 'C. G. Clark (with distinction in medicine), 'W. D. Wilson, J. B. O. Armstrong, R. A. Browne, C. I. T. Cruickshank, Christopher Donald, Annabelle M. Duguid, Mary E. Duncan, Eleanora J. Elmslie, G. Findlay, J. A. Fowler, C. V. Fraser, J. S. Fraser, R. D. Garson, G. M. Gill, A. J. Gray, Elizabeth N. Grieve, W. S. Hossack, Wilma E. M. Hoyte (née Cameron), A. G. Ironside, G. D. Laing, R. D. Laurensen, A. A. Lawrence, J. Lawrence, W. C. M. Lawrence, A. P. ham, D. Leslie, R. D. Little, I. M. Lowit, R. Lynch, A. P. McBain, A. M. McConachie, I. C. McLean, D. Macleod, J. Main, Helen M. Maitland, W. E. Mickleburgh, Jessie C. Millar, C. G. Mitchell, M. J. Mitchell, P. E. G. Mitchell, Dorothy N. Mortimer, D. A. E. Mowat, J. H. Palmer, J. A. Pattillo, G. T. Pollock (with distinction in surgery), I. F. Ralph, R. D. Robson, Gladys M. Riddell, G. M. McL. Robb, J. D. Robson, Lydia J. Rose, J. M. Ross, A. M. Semmence, A. W. Simpson, A. J. Smith, R. W. G. Stewart, R. W. Strachan, G. H. Swapp, P. G. Todd, A. H. Wade, G. W. Webster, J. H. Williamson, Jane M. Wiseman, J. R. Wood, M. B. Yorston. *With commendation.

UNIVERSITY OF MANCHESTER

The following candidates have been approved at the examinations indicated:

DIPLOMA IN PSYCHOLOGICAL MEDICINE.—Part II: K. J. R. Ford, O. J. Slowik. Part I: H. L. English, W. E. Robinson, D. P. A. L. Scott, B. F. Whitehead.

UNIVERSITY OF LIVERPOOL

The following candidates have been approved at the examination indicated:

DIPLOMA IN TROPICAL MEDICINE AND HYGIENE.—S. M. Akhtar, J. Bheennick, S. Bovornkitti, L. F. Cooper, Z. N. Dhabalia, J. F. Dick, D. W. Emuchay, T. Harinasuta, J. M. C. Henderson, A. S. Ismail, C. H. Lalgee, J. Mami, S. S. Moldi, G. S. Nelson (recommended for the award of the Milne Medal in Tropical Medicine), A. Palwala, J. E. Parry, F. A. Pearson, T. Rajcoomar, C. Runciman (recommended for the award of the Warrington Yorke Medal in Tropical Hygiene), T. Sukhanenya.

ROYAL MEDICO-PSYCHOLOGICAL ASSOCIATION

The following candidates have been approved at the examination indicated:

D.P.M.—Part I: R. E. Brandon, N. C. Connell, F. H. Corbitt, W. Johnston, R. E. Lovelace, J. Mukerjee, Elizabeth Schoenberg, D. C. V. Stewart. Part II: Ruth Hoffman, N. B. Jetmalani.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending May 30 (No. 21) and corresponding week 1952.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

* Measles not notifiable in Scotland, whence returns are approximate.

† Includes primary and influenzal pneumonia.

‡ Includes puerperal pyrexia.

Vital Statistics

Infectious Diseases

Infectious diseases were less prevalent in England and Wales during the week ending May 30. Falls in the number of notifications included 1,265 for measles, from 10,277 to 9,012; 627 for whooping-cough, from 3,103 to 2,476; 249 for dysentery, from 754 to 505; and 222 for scarlet fever, from 1,306 to 1,084.

The largest declines in the incidence of measles were 135 in Lancashire, from 1,627 to 1,492, and 106 in Essex, from 311 to 205. The largest exception to the general fall in incidence was an increase of 70 in the number of notifications of measles in Cornwall, from 235 to 305. The largest falls in the number of notifications of whooping-cough were 131 in Yorkshire West Riding, from 283 to 152, 111 in Lancashire, from 388 to 277, and 61 in Warwickshire, from 189 to 128. Small falls in the incidence of scarlet fever were recorded in most areas; the largest fall was 42 in Yorkshire West Riding, from 136 to 94. 21 cases of diphtheria were notified, 2 more than in the preceding week. No changes of any size occurred in the local returns of diphtheria.

The seasonal rise in the incidence of acute poliomyelitis appears to have begun. 52 cases were notified during the week; these were 8 more for paralytic and 15 more for non-paralytic cases than in the preceding week. The increased incidence was confined to the southern section of the country. In the combined area of London, the south-east, south-west, and south midland counties 38 cases were recorded as compared with 14 in the previous week. The largest returns were London 7 (Hampstead 2, Lewisham 2), Kent 7 (Beckenham M.B. 2, Chislehurst and Sidcup U.D. 2), Wiltshire 7 (Pewsey R.D. 4, Warminster and Westbury R.D. 2), and Surrey 6 (Croydon C.B. 2, Richmond M.B. 2).

The largest centres of dysentery were Middlesex 84 (Edmonton M.B. 22, Tottenham M.B. 15, Southgate M.B. 11), London 65 (Chelsea 13, Westminster 10), Lancashire 57 (Liverpool C.B. 22), Bedfordshire 38 (Luton M.B. 20), Yorkshire West Riding 37 (Leeds C.B. 18), Durham 35 (Stanley U.D. 31), Essex 29, and Norfolk 26 (Great Yarmouth C.B. 14).

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported in each week during the nine years 1944-52 are shown thus -----, the figures for 1953 thus ————. Except for the curves showing notifications in 1953, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Week Ending June 6

The notifications of infectious diseases in England and Wales during the week included scarlet fever 758, whooping-cough 2,371, diphtheria 10, measles 8,726, acute poliomyelitis 51, dysentery 397, paratyphoid fever 6, and typhoid fever 0.

The Services

The following appointment and mentions in dispatches are included in the Coronation Honours List in recognition of gallant and distinguished services in Korea, during the period July 1, 1952, to February 28, 1953:

M.B.E. (Military Division).—Major (temporary) D. K. Tucker, R.A.M.C.

Mentioned in Dispatches.—Captain P. G. J. Duncan and Lieutenant (now Captain) M. J. Scott, R.A.M.C.

The Coronation Honours List includes the name of Acting Wing Commander K. Bazarnik, M.B., Ch.B., R.A.F., who has been awarded the Air Force Cross.

The following appointments and mentions in dispatches have been announced in recognition of gallant and distinguished services in Malaya during the period July 1 to December 31, 1952:

C.B.E. (Military Division).—Brigadier C. W. Greenway and Colonel W. D. Hughes, late R.A.M.C.

M.B.E. (Military Division).—Major (Temporary) T. M. Robinson, R.A.M.C.

Mentioned in Dispatches.—Lieutenant-Colonels (temporary) W. M. Stewart and R. M. Vanreenan, Major (temporary) B. J. Mahoney, and Captains F. J. Brunton, W. A. Duncan, and L. Yearham, R.A.M.C.

Medical News

Regius Chair of Forensic Medicine.—The Queen has appointed Dr. D. J. A. Kerr to the Regius Chair of Forensic Medicine at Edinburgh University in succession to Sir Sydney Smith, who is retiring. Dr. Kerr was educated at St. Paul's School, London, and Edinburgh University, where he is at present Lecturer in Forensic Medicine. He qualified in 1920. Since 1929 he has been Police Surgeon and Medical Referee to the City of Edinburgh.

Plan to Cut Laundry Costs.—Hospital laundry bills are apt to be heavy, especially if laundries are not working to capacity or if services are duplicated or outside contracts necessary. To remedy such a state of affairs, in 1951 the Scottish Western Regional Hospital Board invited the British Launderers' Research Association to survey the hospital laundry facilities in their Region and to make recommendations. Under the scheme finally approved by the Board 26 hospital laundries have been chosen as potential centres, while 19 others are retained for the use of the parent hospitals only; 53 laundries are to be closed, and work from 46 hospitals now put out to contract will be sent to the central laundries. It is estimated that the development costs for these changes will be in the region of £150,000, but the saving should be between £50,000 and £60,000 a year.

Medical Insurance Agency.—At the annual meeting of the Medical Insurance Agency, held on June 11, with Dr. James Fenton in the chair, another year of success and progress was reported. Both in rebates of premium to clients (over £16,000) and in surplus distributed to medical charities the great records of recent years were well maintained in 1952. It is pleasing to record that the medical charities will benefit to the extent of over £23,000 as a result of the year's operations. The branches are all in a flourishing condition, and have proved to be very successful in enabling medical policy-holders in parts remote from London to have the advantages of personal interview without travelling too far from their practices. Sir John McNee, Mr. R. L. Newell, Dr. Henry Robinson, Sir Arnold Stott, and Dr. E. R. C. Walker were re-elected to the committee for three years. Dame Barrie Lambert and Dr. Charles Hill, at their own request, were not re-elected. Dr. Janet Bottomley was elected for the first time. Dr. Fenton was re-elected chairman and Dr. Robinson as honorary secretary.

Society for Relief of Widows and Orphans of Medical Men.

—The annual general meeting was held on June 10, with the President, Sir Robert A. Young, in the chair. The membership of the Society is now 198, and at the end of 1952 there were 35 widows in receipt of grants. At the present time widows over 65 receive £75 and those under that age £60 a year. In addition a present of £30 was made at Easter and again at Michaelmas. The total amount distributed in 1952 was £4,525. The treasurer, Sir Ernest Rock Carling, reported that during the year income exceeded expenditure by £723 and that a legacy of £18 5s. was received. The address of the Society is 11, Chandos Street, Cavendish Square, London, W.1.

Beit Memorial Fellowships for Medical Research.—In their report for the year 1952-3 the Trustees record the following elections: *Fourth-year Fellowship (£735 per annum)*—Dr. Joan E. Keilin, for work on derivatives of haemoglobin, at the Department of Biochemistry, Cambridge. *Junior Fellowships (£630 per annum)*—Mr. J. R. Cannon, M.Sc., for work on the chemical structure of vitamin B₁₂, at the University Chemical Laboratories, Cambridge; Mr. G. P. Lewis, B.Pharm., for an investigation into the relationship between the structure and action of drugs, at the National Institute for Medical Research, Mill Hill, London; Mr. W. L. Nicholas, B.Sc., for work on the growth requirements of nematodes, with a view to its

possible application to the chemotherapy of nematode infections, at the Department of Zoology, Liverpool; and Dr. Evelyn E. B. Smith, Ph.D., for work on glucuronic acid and related compounds, at the Department of Biochemistry, Glasgow.

Lady Tata Memorial Trust.—The Trustees of the Lady Tata Memorial Fund, on the recommendation of the Scientific Advisory Committee in London, have made the following awards for research on leukaemia and allied diseases during the coming academic year:

Grants for Research and Other Expenses:

Dr. Astrid Fagraeus and Dr. Bo Thorell (Sweden): Karolinska Institute, Stockholm (*renewal*).

Dr. Clarence Merskey (South Africa): Department of Clinical Medicine, University of Capetown (*renewal*).

Professor Charles Oberling (France): Institut de Recherches sur le Cancer Gustave Roussy, Villejuif, Seine (*renewal*).

Dr. Charles Cady Ungley (Great Britain): Royal Victoria Infirmary, Newcastle-upon-Tyne (*renewal*).

Dr. Jo Nordmann (France): Hôpital de la Salpêtrière, Paris (*new award*).

Dr. Jean Baptiste Gabriel Dausset (France): Centre National de Transfusion Sanguine, Paris (*renewal with increase*).

Senior Research Fellowships

Dr. A. R. Gopal-Ayengar (India): Institute for Cancer Research: Royal Cancer Hospital, London (*extension for two months*).

Dr. Jørgen Kieler (Denmark): Fibiger Laboratories, University Institute for Pathological Anatomy, Copenhagen (*new award*).

Scholarships

Dr. Ragna Rask-Nielsen (Denmark): University Institute of Biochemistry, Copenhagen (*renewal*).

Dr. Roger Robineaux (France): Hôpital Saint-Antoine, Paris (*renewal*).

Dr. Flemming Kissmeyer-Nielsen (Denmark): University Institute for General Pathology, Aarhus (*new award*).

Dr. Niels Aksel Stenderup (Denmark): University Institute for General Pathology, Aarhus (*new award*).

In addition, the period of tenure of a special scholarship awarded earlier this year to Dr. Gavino Negroni (Italy), for work at the Imperial Cancer Research Fund Laboratories, Mill Hill, London, N.W.7, will continue until April 30, 1954.

New Areas for Designated Milk.—The Minister of Food has announced his intention of extending the areas in which only "specially designated" milk—that is, "pasteurized," "sterilized," "tuberculin tested," and (until September, 1954) "accredited"—may be sold. The new areas are Manchester, Dewsbury, Huddersfield, Chesterfield, Woking, Watford, and St. Albans. Places where designation is already compulsory are: London and Portsmouth (specified in 1951); Bath, Bristol, Birmingham, Wolverhampton, Bournemouth, Liverpool, Bootle, and Nottingham (specified in 1952); Brighton, Sheffield, Southampton, and Stoke-on-Trent (1953); and in addition the Minister announced his intention last April of soon specifying Newcastle-upon-Tyne, South Essex, Reading, and Plymouth and South Devon. If all the new areas are included with those already specified, the milk of nearly half the population of England and Wales will be designated. Similar steps to extend the areas for designated milk are being taken in Scotland, in consultation with the Secretary of State.

The National Formulary.—The First Amendment, 1953, to the National Formulary, 1952, will be published soon. The greater part of the Amendment is concerned with amending formulae and titles in the National Formulary so as to bring this publication into line with the British Pharmacopoeia, 1953. Other amendments include the replacement of benzoic acid in liquid medicines by "Solution of Benzoic Acid."

Society of Apothecaries.—The Lord Mayor of London has issued a precept summoning the Liverymen of the Worshipful Society of Apothecaries to meet at Guildhall on June 24 at 11.45 a.m. for the election of Sheriffs and other Officers.

Coronation Honours.—The name of Leonard Jan Bruce-Chwatt, M.D., M.P.H., D.T.M.&H., Senior Malariaologist,

Nigeria, was omitted from the medical Coronation Honours published in the *Journal* of June 13 (p. 1328). Dr. Bruce-Chwatt was appointed O.B.E. (Civil Division).

Dr. Max Behr, formerly in practice in Kiel and London as an E.N.T. surgeon, has had his degree of Doctor of Medicine renewed by Bonn University, Western Germany, on the 50th anniversary of his graduation. This is a rare honour. Dr. Behr is now 75 years old.

COMING EVENTS

Concert to Aid Poliomyelitis Research.—A concert in aid of the National Fund for Poliomyelitis Research is to be given by the London Baroque Orchestra at the Royal Festival Hall on June 28 at 3 p.m. The conductor will be Karl Haas, and the soloists are Irene Kohler (pianoforte) and Sylvia Fisher (soprano). Tickets (prices from 21s. to 3s. 6d.) may be obtained from the Royal Festival Hall Box Office. Tel. Waterloo 3191.

Oxford Graduates Medical Club.—The Summer Dinner will be held in Queen's College, Oxford, on July 10 at 7 p.m. Dr. C. G. Douglas, F.R.S., will be in the chair. Tickets (price 2 guineas) may be obtained before July 4 from Mr. Selwyn Taylor, 3, Roedean Crescent, Roehampton, S.W.15.

Postgraduate Symposium at Cambridge.—A symposium on diseases of the ear, nose, and throat and diseases of the eye, organized by the Cambridge University Medical School, will be held at Addenbrooke's Hospital, Cambridge, on June 27 at 10.30 a.m. Those wishing to attend the symposium are asked to notify the secretary of the Medical School, Tennis Court Road, Cambridge, as soon as possible.

Faculty of Radiologists.—The annual meeting will be held at the Royal College of Surgeons on July 3 and 4. During the meeting Dr. S. Cochrane Shanks will deliver the Skinner Lecture, taking as his subject "Radiology in Relation to Medicine." Further details may be obtained from the Hon. Secretary of the Faculty, 45, Lincoln's Inn Fields, London, W.C.2.

Princess Tsahai Memorial Hospital.—The general meeting of the subscribers to the Princess Tsahai Memorial Hospital Fund will be held at Tuke Hall, Bedford College, Regent's Park, on July 7 at 3 p.m. After the meeting a garden party will be held in the grounds of "The Holme," which adjoins Tuke Hall, by kind permission of the Governors of the College. A film of the opening of the hospital will also be shown.

Genetics.—The ninth International Congress of Genetics will be held at Bellagio, Italy, from August 24 to 31.

The 1954 Health Congress of the Royal Sanitary Institute will be held at Scarborough from April 27 to 30.

NEW ISSUES

Thorax.—The next issue (Vol. 8, No. 2) will be available in a week's time. The contents include:

THE OESOPHAGUS LINED WITH GASTRIC MUCOUS MEMBRANE. P. R. Allison and A. S. Johnstone.
ATRESIA OF THE OESOPHAGUS WITH AN ABNORMAL TRACHEAL FOLD. R. H. Franklin and A. J. P. Graham.
THE PROGNOSIS FOR THE CONTRALATERAL LUNG AFTER RESECTION FOR PULMONARY TUBERCULOSIS. M. R. Geake and F. H. Young.
THORACOPLASTY AND CONTRALATERAL PNEUMOTHORAX. R. Abbey Smith.
A LONG-TERM FOLLOW-UP OF THORACOPLASTY CASES. F. Ronald Edwards.
G. LEBRAI, and H. MORRISON DAVIES.
A NEW APPROACH TO PULMONARY EMPHYSEMA. Osler A. Abbott, William A. Hopkins, William E. Van Fleet, and Joe S. Robinson.
A CASE OF UNILATERAL PULMONARY EMPHYSEMA. Paul R. Swyer and G. C. W. James.
DEATHS FROM ASTHMA IN ENGLAND AND WALES. D. A. Williams.
CYSTIC ENLARGEMENT OF THE MUCOUS GLANDS OF THE BRONCHUS ASSOCIATED WITH CHRONIC BRONCHITIS. A. Duprez and R. Mampuy.
LOCALIZED BILHARZIAL GRANULOMA OF THE LUNG SIMULATING A TUMOUR. S. H. El Mallah and M. Hashem.
THE BLOOD SUPPLY OF MALIGNANT PULMONARY NEOPLASMS. L. Cudkovic and J. B. Armstrong.
CHORIOCARCINOMA ARISING IN THE MALE MEDIASTINUM. M. J. G. Lynch and G. L. Blewett.
A CASE OF RETROSTERNAL DIAPHRAGMATIC HERNIA. R. Warwick-Brown.
HAEMOPTYSIS AS AN INDICATION FOR BRONCHOSCOPY. S. J. Mac Hale.

Issued quarterly; annual subscription £2 2s., single copy 12s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Applications should be made first to the institution concerned.

Monday, June 22

●POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Dr. W. Ritchie Russell: Poliomyelitis.
ROYAL EYE HOSPITAL.—5.30 p.m., Professor T. Nicol: Applied Anatomy of the Orbit.

Tuesday, June 23

ROYAL EYE HOSPITAL.—5 p.m., Miss Iris Kane: White Pupil and its Differential Diagnosis.
SOCIETY FOR ENDOCRINOLOGY.—At Royal Society of Medicine, 5.30 p.m., Dr. Charles Huggins (Chicago): Prostatic Glands as Targets for Steroids.

Wednesday, June 24

BIRMINGHAM MEDICAL INSTITUTE: SECTION OF PSYCHIATRY.—8 p.m., Dr. W. Mayer-Gross: Problem of the Symptomatic Psychoses.
BRITISH ASSOCIATION OF SPORT AND MEDICINE.—At Westminster Medical School, 5 p.m., discussion to be opened by Sir Adolphe Abraham and Dr. A. P. McDowd: Doplag of Athletes.
INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. H. Haber: Parapsoriasis, Poikiloderma, and Mucosus Fungoides.
POSTGRADUATE MEDICAL SCHOOL OF LONDON.—2 p.m., Dr. E. F. Gale: Mode of Action of Antibacterial Agents.

Thursday, June 25

●HAMPSTEAD GENERAL HOSPITAL.—3 p.m., Mr. A. J. Gardham: Difficulty in Swallowing; 4.15 p.m., Dr. Phyllis Wade: Radiotherapy in the Management of Thyroid Diseases.
INSTITUTE OF CHILD HEALTH.—5 p.m., Dr. W. C. Davison (North Carolina): Childhood Cancer.
INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. R. W. Riddell: Subcutaneous Mycotic Infections.
INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY.—5.30 p.m., Professor B. Gusic (University of Zagreb): Pathological Changes in the Blood Vessels and Nerves of the Oesophagus due to Corrosion.
●POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Colonel W. R. M. Drew, R.A.M.C.: Recent Advances in Malarial Problems.
ROYAL COLLEGE OF SURGEONS OF ENGLAND.—5 p.m., Ophthalmology Lecture by Professor Arnold Sorsby: The New Antibiotics.
UNIVERSITY COLLEGE, LONDON: DEPARTMENT OF BIOCHEMISTRY.—At Physiology Theatre, 4.45 p.m., Professor J. H. Quastel (Montreal): Action of Drugs on Enzyme Systems.
●WEST LONDON MEDICO-CHIRURGICAL SOCIETY.—At Apothecaries Hall, Annual Banquet.

Friday, June 26

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY.—3.30 p.m., discussion for general practitioners by Mr. A. Radcliffe: Chronic Rhinitis.
POSTGRADUATE MEDICAL SCHOOL OF LONDON.—2 p.m., Dr. C. E. Dent: Diagnosis of Hyper-parathyroidism.
●POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Professor L. J. Witts: Splenomegaly and Splenectomy.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Budden.—On April 6, 1953, at Woking Maternity Hospital, Surrey, to Dorothy (formerly Thompson), wife of Dr. Frank Budden, a brother for Margaret—Andrew Frank.
Falconer.—On May 15, 1953, at the Royal Infirmary, Perth, to Mary, wife of Dr. T. C. Falconer, of Skene, Lincs, late of Alloa, a son.
Hume.—At St. David's Hospital, Cardiff, to Rosamond (formerly Hyslop), wife of Dr. Michael Hume, a son—Charles Robert.
Johnson.—On June 8, 1953, at Romsey Hospital, to Katherine (formerly Broadfoot), wife of Dr. Peter Johnson, of Linden House Cottage, Romsey, Hants, a son.
Laing.—On June 4, 1953, at Queen Charlotte's Hospital, London, W., to Betty Patricia, wife of Dr. Basil S. Laing, a son—Simon Cluny.
Schofield.—On May 22, 1953, to Anne (formerly Davies), M.B., Ch.B., wife of Graham Schofield, M.B., F.R.C.S., 30, St. Alban's Road, Edinburgh, a daughter—Janet Gillespie.

MARRIAGES

Nicholas-Blackburn.—On June 13, 1953, at St. James's Church, Birch-in-Rusholme, Manchester, Arthur Stuart Nicholas, M.R.C.S., L.R.C.P., of Manchester, Lancs, to Barbara Blackburn, of Chorley, Lancs.

DEATHS

Baker.—On May 16, 1953, Frederick Charles Joseph Baker, M.R.C.S., L.R.C.P., of Neston, Raddan Stile Lane, Exmouth, Devon.
Carse.—On May 15, 1953, at "Foxbury," Dorking, Surrey, Garfield Carse, M.B., B.S., of 7, Devonshire Street, London, W.
Currie.—On May 12, 1953, James Scott Currie, M.B., Ch.B., of Saltford, Somerset.
Henderson.—On May 11, 1953, at "Brynmor," Southbourne Road, Bournemouth, Hants, Robert George Henderson, M.B., F.R.C.S.Ed., aged 81.
Rose.—On April 28, 1953, Leonard Mortimer Rose, B.M., M.R.C.P., of Woodside, Green Lane, Baldon, Yorks, aged 32.
Rowcroft.—On April 26, 1953, at Coonoor, South India, George Francis Rowcroft, D.S.O., M.R.C.S., L.R.C.P., Colonel, Indian Army, retired, aged 91.
Shaw.—On May 2, 1953, at 4, Palace Gardens Mansions, London, W., Evan Alan Sivell Shaw, L.R.C.P.&S.Ed., L.R.F.P.S.
Smith.—On May 1, 1953, Armstrong Smith, M.R.C.S., L.R.C.P.
Thompson.—On May 3, 1953, at Mill Lawn House, Burley, Ringwood, Hants, Charles Gurney Thompson, M.B., Ch.B., aged 86.
Wade.—On May 5, 1953, at The Driftway, Copthorne, Sussex, Albert Holland Wade, L.M.S.S.A., aged 91.
Wight.—On May 4, 1953, at Bank Place House, Leslie, Fife, Adam Ramsay Wight, M.B., Ch.B., J.P.
Williams.—On April 27, 1953, at Ferring, Sussex, Arthur Harold Williams, M.R.C.S., L.R.C.P., formerly of Worcester, aged 84.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

The Sacrifice of Healthy Canines

Q.—Are there disadvantages in retaining sound canines when an upper-jaw clearance for caries or pyorrhoea is being performed? I have sometimes seen them sacrificed when they have been apparently healthy.

A.—It is rarely desirable to retain two canines in the upper jaw when all the other teeth have been lost as a result of caries or pyorrhoea. The reason for this is that the retention achieved with a full upper denture is normally much greater than that to be obtained by making clasps or bands around the canines. An upper denture planned in this way would lack the stability of a full denture and tend to rock in an antero-posterior direction.

The situation is quite different in the lower jaw, where the difficulties of retention of full dentures are much greater and where as a rule two canines should be retained when possible.

Desensitization Against P.A.S. and Streptomycin

Q.—How may a patient best be desensitized against P.A.S. and streptomycin?

A.—When a sensitivity reaction develops during treatment with streptomycin and P.A.S. (para-aminosalicylic acid), the first procedure will naturally be to discontinue both drugs. The next step is to determine which of the drugs is responsible for the reaction. The method adopted will depend to some extent on the severity of the symptoms. If the symptoms have not been severe, a full dose of each of the drugs can be given in turn, when it can be expected that a reaction will develop to the drug to which the patient is sensitive. Occasionally, of course, the patient is found to be sensitive to both drugs. If the reaction has been severe, it may be thought wiser to proceed more cautiously, and to identify the offending drug by giving gradually increasing doses of each in turn. When this has been done, desensitization is carried out by the administration of gradually increasing doses. The size of the first dose will depend upon the degree of sensitivity. With streptomycin it may be possible to start with as much as 0.1 g., but if a reaction occurs to this the initial dose should be even smaller, down to 1 mg. or even in the most extreme cases less than this. The dose is then increased by 50% to 100% daily, avoiding reactions so far as possible. If evidence of a mild reaction occurs after a dose, the next dose should be reduced by 50%. In most cases desensitization can be carried out fairly rapidly, but in some much persistence and patience may be required. With P.A.S. similar principles apply, the oral dose being started at a level low enough to avoid symptoms, and then progressively increased day by day until a full dose is being given.

Children Who Refuse Milk

Q.—What is the best way of handling a small child who consistently refuses milk and other dairy foods? Is it better to provide the necessary nutrients in other ways, or are milk foods so essential that the issue should be forced and the child made to take them?

A.—There is no satisfactory alternative way of giving calcium to a young child other than by milk or milk products. Equally it can be asserted that a pint of milk (about 600 ml.) can be administered daily without a child being aware of it. Porridge, for example, can be made with milk instead of water. Milk puddings can be made attractive by the ample

addition of fruit, jams, or syrup. Milk jellies and milk shapes can use up a lot of the pint and can always be made attractive in colour and in shape (animals and so forth). Milk soups and milk "shakes" (with the specially prepared fruit juices which do not curdle the milk) can be very attractive also. If all these are scorned it is still possible to incorporate a lot of milk in other sorts of puddings, cakes, and scones. Junket will sometimes be accepted when milk is not. Good quality ice-cream is almost always popular, and contains most of the calcium and some of the protein that make milk so valuable. Another approach is through cheese and cheese dishes. Macaroni cheese, for example, can use up milk and cheese. Incidentally, even liquid milk may be taken willingly when sucked through a straw, and presumably the elementary methods of flavouring milk with chocolate, vanilla, coffee, etc., have been tried. The psychological implications of the question cannot be entirely ignored. Why does the child refuse milk? It would be wiser to try to find an answer to this before proceeding to "force an issue." It is not clear what methods are proposed to make the child take milk if it is resolutely refused, but it is unlikely that forcible feeding will be either very successful or free from harm.

Procaine in Fibrositis

Q.—Is procaine useful in the treatment of fibrositis?

A.—Procaine infiltration may give some permanent relief in the painful conditions of ligament and muscle which result from sprains, strains, and contusions. The major technical difficulty lies in placing the injection accurately in the structure from which the pain is arising. Infiltration where the pain is felt is ineffective in most instances because, owing to the false localization of pain from deep structures, the source of pain is usually elsewhere and its accurate definition is an essential preliminary. The best results are obtained with 1% procaine freshly made up in physiological saline; no adrenaline or preservative should be added. Since absorption from muscle may be rapid, not more than 10 ml. should be used, otherwise toxic and sensitivity reactions are likely to be frequent.

Filarial Elephantiasis

Q.—Recently I saw three cases of severe elephantiasis of the male genitalia. This district of China is not recognized as a filarial district, and no microfilaria were found in the blood on repeated examination. What else could account for the condition? What investigations would help in diagnosis? What treatment is advised?

A.—Elephantiasis of the genitalia may be congenital or hereditary, secondary to tuberculosis or other chronic inflammatory or neoplastic disease in the tissues or lymphatics of the pelvis, secondary to severe trauma to the pelvis or to long-continued application of local irritants. The latter are sometimes used in the Tropics as supposed remedies for infertility or lack of sexual vigour. The strong probability, however, in the cases in question is that they are of filarial origin, in spite of the absence of microfilariae from the blood; these are not infrequently absent in cases of elephantiasis.

As elephantiasis usually develops many years after the initial infection, it is important to find out whether the patients have ever lived outside the reputedly filaria-free district. Perhaps the district itself does not deserve its good reputation, but this could be established only by detailed clinical, haematological, and entomological surveys. Further, the distribution of insect-borne diseases is constantly changing, and an area now filaria-free may not have always been so. The presence of eosinophilia and a positive filarial complement-fixation test would strengthen the diagnosis.

The only treatment likely to be of benefit is surgical removal of the elephantoid tissue. Diethylcarbamazine ("hetrazan," "banocide") was at first thought to be of some value in these cases, but early claims have not been substantiated.

Post-traumatic Neurosis

Q.—I have a patient, a young man, who as a result of a trivial injury to his finger has sustained a severe and progressive post-traumatic neurosis, resulting in paralysis of the same arm and leg and rigidity of neck and spine. This condition has now been present for three years. I have been told that a satisfactory settlement of his claim for compensation will result in complete restoration of function. I disagree. What does your expert think?

A.—Where the disability is due to hysteria (purposive functional incapacity) alone, settlement may lead to restoration of function, but the process may take time, and rehabilitation measures will be necessary. More often the patient has to be given a period of light work while he recovers from the effects of his period of idleness and of the invalid attitude which has accompanied his symptoms. If the patient is of low intelligence, has a poor work record, or is not really capable by reason of age, fear, or other factors of doing his former job, the course of his illness is not much affected by settlement. Where injury is trivial, the neurosis is due more to the patient's inability to adapt himself to his work than to the injury and resulting claim. Only where his lawyer or compensation secretary have, in their enthusiasm, implied that the patient would be letting them down by recovering, and where very superficial self-deception or malingering are suspected, can full recovery be predicted with confidence.

It is important to remember that organic nervous disease not infrequently makes its appearance in the guise of a traumatic neurosis after trivial injury, and this must be carefully excluded if the disability progresses or if it has a hemiplegic distribution. Settlement will here improve neither the organic nor the functional component. Organic disease apart, the prognosis depends on the patient's personality, and it is unusual for a patient of sound personality to maintain symptoms for three years. Compensation may not be the most important aetiological factor.

Estimating the E.S.R.

Q.—What is the best way of taking and preserving blood for E.S.R. estimation in general practice? Please indicate any special precautions necessary for an accurate result.

A.—In general, sodium citrate is to be preferred to oxalate as an anticoagulant, because when oxalate is used the normal range is up to 20 mm. for healthy males and is higher in women, whereas with the Westergren citrate technique, with a 200-mm. tube, the upper limit of normal for healthy males may be considered as 4 mm. and in females up to 8 mm. In my experience a 200-mm Westergren tube and the use of sodium citrate as an anticoagulant is more satisfactory than the Wintrobe technique.

Almost any stand which will hold the tubes vertical may be used. The apparatus should be kept at an approximately constant temperature, because sedimentation depends on temperature. It is also desirable to set up the test as soon as possible after collecting the blood, because, if the blood is kept, aggregation of the cells may occur and the sedimentation rate may be falsely high.

Laboratory Investigations in Periarthritis Nodosa

Q.—What laboratory investigations are helpful in the diagnosis of periarthritis nodosa? Are there any changes in the plasma proteins?

A.—Most patients with periarthritis nodosa show anaemia and a leucocytosis of 10,000–25,000 with a left shift. Albuminuria, haematuria, and cylinduria occur in about two-thirds and eosinophilia in about one-third of all cases, the last almost exclusively among those with asthma. False positive Wassermann reactions and increased serum globulin are found in about half. Hyposthenuria and nitrogen retention occur in many cases, but usually in the terminal phases only. No detailed studies on the serum proteins have so far been published. The diagnosis of periarthritis

nodosa during life can be made only when it has been suspected on clinical grounds; and the most effective method of confirmation is by muscle biopsy.

NOTES AND COMMENTS

Food Value of Ice-cream.—Dr. D. LIVINGSTONE (Leamington Spa) writes: With reference to your question and answer on ice-cream ("Any Questions?" May 23, p. 1177) reference might well have been made to the legal minimum standards laid down by Statutory Instrument No. 828 of 1953, The Food Standards (Ice-Cream) Order, which came into force on June 1.

[N.B.—This Instrument lays it down that ice-cream (but not water ices or ice lollies) shall contain not less than 5% fat, 10% sugar, and 7½% milk solids other than fat. Alternative standards are provided for fruit-containing ice-cream and kosher ices.]

Treatment of Homosexual Tendencies.—Dr. CLIFFORD ALLEN (London, W.1) writes: I was surprised to read in "Any Questions?" (May 30, p. 1234) the assertion that it may be necessary to use narco-analysis to discover whether a homosexual patient is likely to respond to therapy. This is really an astonishing suggestion. I have never found narco-analysis necessary either to discover the prognosis or in the actual treatment of paraphiliacs. I am not averse to using narco-analysis in other suitable cases, but I cannot conceive how it can be of value in homosexuality. Rees long ago gave a number of factors upon which he thought prognosis should be based. These were age, duration of symptoms, intelligence, desire for cure, and social situation. I should like to add a number of others, which are: whether the patient has built up a homosexual environment and surrounded himself with abnormal friends; how much overt sexuality has developed or whether he merely has urges and fantasies; if the homosexuality is associated with alcoholism (when both are more difficult to treat). The ability to afford private treatment is also of importance, since it is very difficult to devote enough time to a patient of this type in an out-patient department. I have never heard of a case which was cured in prison in spite of the judge's invariable assurance when he sentences offenders that they will be treated adequately during their imprisonment. The essence of treatment is to unearth and dig away the emotional attachments and prohibitions which prevent normal development and then to encourage the patient to widen the environment into a normal sexual one. Many homosexuals are afraid of women and, once this fear is removed, will rapidly advance to normality. The will to recover is, perhaps, the most important factor, and without it nothing can be done. The oldest patient I have succeeded in curing was over 40, but it is much easier in youth.

OUR EXPERT writes: If Dr. Allen will consult my answer again, he will see that narco-analysis was not recommended as the ideal method of treatment in all cases of psychosexual inversion. The suggestion was that many psychiatrists may be able to obtain strong indications from one or two narco-exploratory sessions as to the likelihood of systematic analytical psychotherapy being able to bring about a reorientation of the sexual impulse. There is, by implication, the further suggestion that, however carefully the history may be taken, no other technique, if narco-analysis is skilfully employed, can provide so much valuable, relevant information with such economy of time.

Correction.—Dr. P. J. Fraser's communication on succinyl-monocholeline, mentioned in the letter of Dr. H. O. J. Collier and Miss Barbara Macauley (*Journal*, June 6, p. 1279), was made to the British Pharmacological Society, not to the British Pharmaceutical Society.

"Any Questions?" Book.—The second book of selected "Any Questions?" is available, price 7s. 6d. (postage 6d.). Copies may be obtained either direct from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1, or from your bookseller.

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 4499. TELEGRAMS: *Atiology, Westcent, London.* ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. DIABETIC MYELOPATHY

BY

HUGH GARLAND, T.D., M.D., F.R.C.P.

Physician-in-Charge, Department of Neurology, General Infirmary at Leeds

AND

DERYCK TAVERNER, M.B.E., M.D., M.R.C.P.

Lecturer in Medicine, University of Leeds

Neurological complications of diabetes mellitus have been recognized for nearly a hundred years (de Calvi, 1860) and during the present century the orthodox teaching has been that diabetes mellitus may result in a symmetrical polyneuritis expressing itself largely by tenderness of the legs, loss of knee- or ankle-jerks, ataxia, sensory loss in the feet, and perforating ulcers, constituting the picture of diabetic pseudo-tabes. Martin (1953) has said that neuropathy is "characterized by a diffuse and ill-localized pain, vasomotor disturbances, thermal paraesthesiae, changes in tendon-reflexes, and often an alteration in pain sensibility in the feet without much impairment of touch or pressure. If the disorder progresses shooting pains develop, vibration sense is lost and, lastly, sense of touch and position as well as motor power becomes involved." These statements accord well with textbook descriptions (Gowers, 1893; Collier, 1926; Brain, 1951) and are supported by the literature of the past fifty years.

Rudy and Epstein (1945), after an analysis of 100 examples of diabetic neuropathy, stated that pain and sensory disturbances were the commonest manifestations, and neither they nor Rundles (1945), in an exhaustive survey of this subject, make any mention of a purely motor form of diabetic neuropathy. Jordan (1936) and Woltman and Wilder (1929) also emphasized that the neurological changes in diabetes mellitus are mainly sensory and that motor disturbances are rare. Although there are many casual references to weakness and wasting of muscles in association with sensory disturbances, the important observations of Bruns (1890) have been overlooked or dismissed as irrelevant. He described three patients, aged 58, 59, and 70, suffering from diabetes mellitus of short duration; all three developed severe pain in the hip and thigh followed by weakness and wasting of leg muscles without objective sensory loss, and each recovered fairly quickly following dietary restriction.

The reality of diabetic neuropathy without objective sensory loss has become apparent to us from clinical observation of the following patients; the case histories are presented in the order in which the patients came to our attention.

Case 1

A man aged 56 was first seen by one of us (H. G.) on March 14, 1950. He gave a two-months history of pain in the lumbar region and down the back of the right leg to the heel and toes, with less severe pain down the back of the left leg, getting steadily worse, and numbness down the back

of the thighs and calves. There was no specific complaint of weakness, but there had been polyuria and polydipsia for one year, with loss of 28 lb. (12.7 kg.) in weight. He had diffuse and severe wasting and weakness of all the muscles of the right leg, including the gluteus maximus, with loss of the right knee-jerk and both ankle-jerks. There was no sensory loss. The blood pressure was 150/80 mm. Hg. He was found to have glycosuria, and was admitted to hospital. The diabetes was well controlled by a diet of 10 black, 8 red (10B, 8R) Lawrence lines, and 10 units of zinc-protamine insulin (Z.P.I.) daily.

Investigations.—The cerebrospinal fluid (C.S.F.) protein was 68 mg. per 100 ml.; Lange 0013331000; fasting blood sugar, 350 mg. per 100 ml. Radiography of the lumbar spine was normal.

When seen again on June 8 he was still taking tab. codein. co. to relieve pain. His disability was stationary or increasing, and the left knee-jerk was now seriously depressed. On readmission to hospital on August 15 there was considerable weakness of most muscles of the left leg and he was only just able to walk. C.S.F. protein, 105 mg. per 100 ml. Lange 1233310000.

In December, 1950, both knee- and ankle-jerks were absent and the plantar responses were extensor. He did not begin to improve until early 1951; by April he could walk with one stick, and in November he was walking quite well. In May, 1952, his urine was constantly sugar-free on 12 units of Z.P.I. daily. By July he was walking very well unaided, the knee- and ankle-jerks were still absent and the right plantar response was extensor, but the left was now flexor—he said himself that there was "almost incredible improvement."

Electromyogram (D. T.)—On September 25, 1952, strength-duration curves were normal except for slight partial denervation changes in the right tibialis anticus muscle. Needle electrodes in both tibialis anticus and quadriceps muscles showed a decreased sustained pattern of motor-unit activity on voluntary contraction, with prominent single units superimposed, which in places amounted to discrete motor-unit activity. There was no spontaneous activity.

In January, 1953, there was only a little aching in the legs. He was walking quite well without sticks and was just able to jump off the ground. There was no demonstrable weakness or wasting of leg muscles and tone was normal. The knee-jerks were just present, but the ankle-jerks were still absent. The plantar responses were both flexor. There was no sensory loss. The diabetes was fully controlled, and he had gained 50 lb. (22.7 kg.) in weight.

Case 2

A man aged 63 was first seen by one of us (H. G.) on June 1, 1950. There had been pain in the left buttock, radiating down both back and front of the left leg to the ankle only, for two months. The pain was improving and

Abnormal sensory signs are commonly present in association, and are the most frequent objective evidence of diabetic neuropathy. The most frequent abnormality is loss of vibration sense in the legs. Sensory change may occur in single or multiple areas, or it may be distal or limited to the area of distribution of one or more peripheral nerves. In one of our cases sensory loss was present in the zones of both ulnar nerves and one external popliteal nerve. There were parasthesiae, and the small muscles of the hands were wasted. In six months of excellent diabetic control one arm improved, one was unchanged, and the foot lesion deteriorated.

We have seen four examples of the "painful foot" syndrome (Fein *et al.*, 1940): severe burning pains in both feet were associated with diminished leg reflexes and sensory loss of distal distribution. One patient, a mule spinner (an occupation in which it is customary to work barefoot), had to wear slippers to alleviate the pains in his feet, but, nevertheless, preferred to tolerate the thirst of uncontrolled diabetes to the pain of walking to obtain a drink. A second case was also hyperglycaemic in type. Both responded to diabetic control, but two further cases were uninfluenced by treatment, including massive vitamin-B₁ therapy.

Three patients have been seen with clinical manifestations resembling active tabes dorsalis. A man of 45, who made a complete recovery within a year, had recent and uncontrolled diabetes. He had severe lightning pains, irregular pupils which responded poorly to light and briskly to accommodation, absent ankle-jerks, diminished knee-jerks, and absent tendon sensation at the heels. There was no other evidence of syphilis, and the C.S.F. and serological tests were normal.

2. Weakness and Wasting

The most striking component of diabetic neuropathy is weakness and wasting of the quadriceps femoris muscle. We have seen 12 examples.

Case 5.—A labourer aged 67 was admitted to hospital with a history of diabetic symptoms for one year, but his complaint was of pain in the right thigh, worse at night, of recent sudden onset. Diabetes was confirmed. Examination showed contracted pupils which responded sluggishly to light. The knee-jerks were diminished and the ankle-jerks absent. The right quadriceps femoris muscle was wasted. The C.S.F. showed a protein level of 72 mg. per 100 ml., but was otherwise normal. After three months, despite good diabetic control, symptoms and signs progressed. The C.S.F. protein was 78 mg. per 100 ml. and a myelogram was normal. Six months later he made a complete recovery and was sign-free, but had developed intermittent claudication and the pulses in his feet had been lost.

The condition may be associated with anterior crural pain and may occur in one or both legs. In one of our cases the legs were successively involved.

We have seen foot-drop in six patients. In one case the onset was bilateral; in another case sudden onset in one foot was succeeded some months later by an insidious onset in the other. Weakness and wasting of the small muscles of the hands has been seen four times. In one patient the condition recovered with diabetic control, but the other cases were unrelated to hyperglycaemia and abnormal signs were present elsewhere.

Auché noted that muscle involvement in diabetes might resemble the Aran-Duchenne or scapulo-humeral myopathies. We observed a patient of 74 with gross wasting and weakness of the pelvic and shoulder-girdle muscles far beyond the limits of senile change. The legs and forearms were spared. The condition was static and asymptomatic.

3. Autonomic Nervous System

We have observed four patients in whom diabetic gangrene appeared to have a neuropathic basis. In all, the gangrene was painless and recovered completely. In none were the peripheral pulses, colour, or temperature at the extremities abnormal, and all showed other evidence of neuropathy. In one case the condition relapsed three times, but amputation was averted by spontaneous healing with coincident improvement in the neurological state. One year later the foot remained in good condition.

The suggestion that certain cases of painless gangrene have a neuropathic rather than a vascular basis has practical importance. In the presence of clinically normal peripheral vessels and evident neuropathy, a prolonged trial of conservative management may avert amputation. Such a view is supported by the reports of Holt (1928), McKittrick and Root (1928), Bailey and Root (1942), de Takats (1945), and Joslin (1946).

We have seen one case of Charcot joint affecting the mid-tarsal region. Perforating ulcer and Charcot joints have been

described by Pryce (1887), Auché (1890), Bramwell (1907), Williamson (1911), de Takats (1945), Bailey and Root (1947), Morris (1947), Shore (1947), and Foster and Bassett (1947).

Painless distension of the bladder with retention and sometimes urinary infection were seen in four cases, and resembled the reports of Jordan and Crabtree (1935), Gill (1936), and Rudy and Muellner (1941).

A typical example of diabetic nocturnal diarrhoea has been studied. This resembled the cases of Sheridan and Bailey (1946). The apparently specific effect of liver injections is hard to interpret, but they make the recognition of the syndrome important. One of us referred to the use of vitamin B₁₂ in this condition (Hirson, 1951).

Case 6.—A housewife aged 63 had poorly controlled diabetes for eleven years and usually suffered paraesthesiae and pains in the legs. For seven years she had intermittent diarrhoea, worse at night, with faecal incontinence of "dirty brown water—like mud." Some attacks persisted for weeks. On examination there was marked retinopathy, and the ankle-jerks and vibration sense in the legs were absent. Gastro-intestinal investigations, including laparotomy, were negative, but the administration of crude liver extract by injection led to a complete remission, which, when she was last seen, had lasted for over a year. Previous remissions seldom exceeded two weeks. Diabetic control remained poor.

A fundamental study of the abnormalities of the autonomic nervous system in diabetes was made by Rundles (1945), who found postural hypotension, and visceral, vascular, and temperature-regulator abnormalities.

4. Cranial Nerves

We have seen a complete third-nerve lesion which we considered to be due to diabetes and which recovered completely and spontaneously (see Case 8 below). Similar lesions have been reported by Cerise and Bollack (1913), Ingelrans (1925), Root (1933), and Herson (1948). Most of the cranial nerves have been reported to be involved in diabetic neuropathies, usually as an active occurrence. We have twice seen Argyll Robertson pupils, also noted by Jordan (1936), Herman (1939), and Smith (1949).

5. Other Manifestations

While the conditions which we have so far described have clinically involved the peripheral nervous system, in a single case the central nervous system was also involved. The presentation resembled that of a subacute combined degeneration of the cord with peripheral nerve change, and later development suggested an encephalitis.

Case 7.—A housewife aged 65 had diabetes for two years, satisfactorily controlled by diet and insulin. She developed stiffness and weakness of the legs, with ataxia and paraesthesiae of the extremities. She was bedridden, and on admission to hospital showed a heavy glycosuria without ketosis. Both legs were spastic, the tendon reflexes were exaggerated, and clonus was present. Both plantar responses were extensor. There was widespread peripheral sensory loss. The blood and sternal marrow were normal. Despite stringent diabetic control and massive vitamin-B₁₂ therapy, the condition progressed. Trophic ulcers of the feet and sphincter incontinence developed, and there was mental confusion. She died unrelieved. Full neuro-pathological examination by Dr. E. Pollack revealed no specific lesions. There was considerable arteriosclerosis.

Griggs and Olsen (1937) and Rudy and Epstein (1945) reported similar cases.

Panatrophy (Kinnier Wilson) has been noted in four cases. This condition has not been fully described in diabetes before. Localized areas of profound wasting of muscle and subcutaneous tissues were found at sites far removed from possible insulin injections.

Although polyneuritis is commonly mentioned as a neurological complication of diabetes, we have not seen any example of the classical sensorimotor symmetrical polyneuritis running a typical course (Walshe, 1946). Further, we have found in the literature only a single case (Pitres and Marchand, 1917) which satisfied the usual diagnostic criteria.

The Cerebrospinal Fluid

The cerebrospinal fluid was examined 19 times in 18 of our patients. In six cases the protein level was above 50 mg. per 100 ml., the highest figure being 78 mg. per 100 ml. (in Case 5). Four months previously the same patient had shown a level of 72 mg. per 100 ml. Five of the six patients had severe active neuropathies, but one showed only mild change. Four patients (aged 40, 55, 63, and 70 years) had protein levels between 40 and 50 mg. per 100 ml. In all, the cell count and Wassermann reaction were normal.

These findings are in accord with those of Jordan (1936), Joslin and Root (1939), and Rundles (1945). We have not found the extreme levels up to 390 mg. per 100 ml. of protein previously recorded. There has been no direct correlation between the protein level and the degree of neurological change; although the highest levels have been found in severe neuropathies, some severe cases have shown normal levels. In the asymptomatic group the findings have been normal.

Aetiology

Two main causal factors have been proposed by previous workers—arteriosclerosis and vitamin-B deficiency. Arteriosclerosis shows a high incidence in diabetes, and Dolger (1947) regarded such change as "an associated concomitant" of the disease. The cyclic nature of some of our cases makes it seem unlikely that the lesions we describe are due to irreversible vascular change. We have seen neuropathies of all types in patients under the age of 30 and in older patients with clinically normal vasculature. By contrast, some severely arteriosclerotic diabetics have shown no nerve change.

To compare the neurological signs of diabetes with those of arteriosclerosis 100 elderly in-patients were examined. All were in the chronic wards of a former municipal hospital, and the only cases excluded from a consecutive series were those under the age of 50, those whose mental state prevented adequate examination, and those with fixed joints. We examined, in particular, the tendon reflexes, pupils, vibration sense, and tendon-pressure sensation. There was no significant difference in the findings in those patients with and those without normal palpable pulses at the ankles. Inevitably, in view of the multiple conditions present, no evidence of a consistent neurological picture emerged, but there was no overall similarity to that of our diabetic cases (Table I). Woltman (1929) and Critchley (1931) also commented on the varied findings in arteriosclerosis.

TABLE I.—Comparison of Abnormal Findings

	100 Consecutive Diabetic Out-patients (Av. Age 54.3 Years)	100 Consecutive Chronic In-patients (Av. Age 73 Years)
Knee-jerks absent	19	22
" diminished	31	9
" exaggerated	6	74
Ankle-jerks absent	63	42
" diminished	16	19
" exaggerated	0	37
Vibration sense absent at knee	27	71
" " " ankle	50	89
Achilles tenderness increased	4	39
" " decreased	32	8

Notes: (1) The findings in both legs are reported. (2) All patients in these two series were jointly examined by the same observers. (3) Of the chronic in-patients 13 showed significant pupillary change. Allowing for detectable disease (cerebral lesions, tabes, etc.), 12 patients showed unexplained reduction or absence of knee-jerks and 15 unexplained reduction or absence of ankle-jerks. The corresponding figures for increase of the reflexes was 20 and 14. In the only two diabetic patients in this group the diagnosis was suggested on the basis of the neurological findings only.

The pathological studies of Woltman and Wilder (1929), which have provided the main experimental evidence for a vascular aetiology, were conducted on limbs amputated for gangrene. This selection seems to invalidate their conclusions, but, even within this selected group, the authors notice that "there is not an accurate correlation between the degree of degeneration and the neurological symptoms."

We have been impressed by the disparity between the consistent picture of the chronic diabetic neuropathies and the diverse findings in arteriosclerosis. Taken in conjunction with the considerations outlined above, we think it unlikely that diabetic arteriosclerosis causes neuropathy.

The therapeutic value of vitamin-B₁ administration (Vorhaus, 1939; Aring *et al.*, 1939; Fein *et al.*, 1940) has been the basis of the deficiency theory of the diabetic neuropathies. We have been unable to reproduce such results in active or chronic cases, and have had no need to conduct a therapeutic trial in hyperglycaemic cases. We have found, in our patients, no other evidence of vitamin deficiency, which would be anticipated if the hypothesis were correct. Rowlands and Wilkinson (1938), Sinclair (1938), Needles (1939), and Pollack *et al.* (1941), found no biochemical evidence of vitamin-B₁ lack in their cases. Lowry and Hegsted (1945) found that rats rendered diabetic with alloxan had reduced vitamin-B₁ requirements.

The claim that a chronic vitamin deficiency can respond rapidly to specific treatment is in itself surprising, as late beriberi, for example, does not respond in this way. In acute lesions a response might be expected, but such has not been our experience, and, by contrast, spontaneous remissions often occur.

We have found that neither the sex of the patient nor the type or severity of diabetes is related to neuropathy. Table II analyses the findings in our out-patient group. In general, the asymptomatic cases occur in the older age groups and the more severe active cases are commonest in middle life.

TABLE II.—Neurological Findings in 100 Unselected Diabetic Out-patients

	No. of Subjects	No. with Neurological Abnormalities
Total cases	100 (av. age 54.3 years)	57 (57%)
Males	23 (" " 46.4 ")	13 (56.5%)
Females	77 (" " 58.1 ")	44 (57.1%)
Under 30 years	8 } 30	3 } 12 (40%)
30-50	22	
50-70	61 } 70	38 } 45 (64.3%)
Over 70	9	
Diabetes less than 1 year	15	7
" 1-3 years	23 } 63	14 } 37 (58.7%)
" 3-5 "	25	16
" 5-10 "	18 } 37	9 } 20 (54.0%)
" over 10 years	19	11
Controlled on insulin	68 } 82	39 } 49 (59.7%)
" without insulin	14	10
Uncontrolled on insulin	6 } 18	4 } 8 (44.4%)
" without insulin	12	

The role of hyperglycaemia in the causation can be interpreted only in relation to the classification groups. Most of the patients presenting with uncontrolled diabetes and neurological abnormalities respond rapidly to routine treatment. These form our first group. The rest, together with patients who are in good control and yet show nerve change, fall into our second and third groups. The significance of previous episodes of hyperglycaemia or ketosis cannot be assessed, since such states are almost universal, at least at the onset of diabetes. We will refer to cases in which neuropathy preceded clinical diabetes (Cases 8 and 9). Bonkalo (1950) finds that his experience "tallies well with the generally acknowledged fact that there is no direct connexion between blood sugar and neuritis."

In hyperglycaemic neuropathies the sole factor has been the failure of diabetic control. Neurological features occur only in a proportion of diabetics who are out of control, and no predisposing factors have been found in such cases. However, the frequency of pain in diabetic ketosis is well known.

Treatment

Symptomatic treatment, including heavy sedation, and physiotherapy are needed in most active cases. Optimum diabetic control will be indicated on general grounds, but this produced striking results only in our first group. It is justifiable, however, to observe the effects of insulin on any acute case even when control is apparently adequate on diet alone.

De Takats (1945) claimed that lumbar sympathectomy gave relief from leg pains. Sandstead and Beams (1938) advocated large dosage of sodium chloride, but we have had no success with a small group of cases treated by this method. Vitamin B₁₂ was not available at the time of these investigations.

Wagener (1945) noted, in respect to diabetic retinopathy, that present methods of diabetic control are unsatisfactory. We hold this to be equally true of diabetic neuropathy.

Discussion

There is no good evidence that the incidence of neurological change in diabetes is materially less than in the "pre-insulin" era. The onset of neuropathy may have been delayed in the diabetic life.

We have described and emphasized the more common presentations, but the obscurity of some manifestations is noteworthy. Root (1933), Jordan (1936), and Wilder (1940) have listed alternative diagnoses which have needed consideration. Our experience also has been of the need to exclude a wide range of neurological conditions and even of intrathoracic and abdominal diseases.

In two cases neuropathy presented in subjects in whom neither clinical evidence of diabetes was found at the time nor any alternative cause for their condition. In Case 8, one year after the first neurological illness, clinical diabetes developed with a second episode of neuropathy, and in Case 9 the type of pain, in association with the glucose-tolerance curve, indicated the true diagnosis.

Case 8.—A housewife aged 65 presented with a complaint of pain around the left eye and developed left-sided ptosis and external ophthalmoplegia. The C.S.F. showed a protein level of 45 mg. per 100 ml. and was otherwise normal. An x-ray film of the skull and the Wassermann reaction were negative. There were no constitutional symptoms and no glycosuria. Angiography was not undertaken, as rapid spontaneous remission occurred. One year later she complained of pain, worse at night, in the right breast and the thigh. The Achilles tendon sensation was exaggerated and vibration sense was lost in the legs. She had glycosuria and mild diabetic symptoms. The blood sugar rose to 278 mg. per 100 ml. The diabetes was controlled by diet alone. After three months she was sign- and symptom-free.

Case 9.—A housewife aged 55 attended hospital complaining of the symptoms of right ulnar neuritis. Sensation was impaired in the area of distribution of that nerve and examination was otherwise normal. Spurling's sign was negative. Gross radiological osteoarthritis of the cervical spine, suggesting a neurogenic arthropathy, was present. The description of the pain was typical of diabetic neuropathy. Pain was unrelieved despite prolonged immobilization of the neck in a plaster collar. Only one of a series of urine tests showed sugar to be present, but the glucose-tolerance curve, after 50 g. of glucose, gave half-hourly blood-sugar levels of 98, 172, 212, 188, and 141 mg. per 100 ml. Spontaneous remission of the pain occurred after four months.

Claude (1911) thought that neurological change might precede diabetes, and Jordan (1943) reported seven cases of neuropathy in patients without clinical diabetes who had abnormal glucose-tolerance curves.

Thus, even in the absence of glycosuria or constitutional symptoms we believe that the blood-sugar curve may be of value in the diagnosis of obscure neurological problems.

Our findings have a bearing on the fundamental considerations of diabetic pathology. They offer support to the view that diabetes is a disease-complex in which the metabolic disorder is only one manifestation, with neuropathy occurring not as a "complication" but as an integral part of a variable process. Dry and Hines (1941) presented

similar views with regard to arteriosclerosis in diabetes, writing that "an inherent weakness or abiotrophy exists which affects both the insulin-producing tissues and the vascular system which require, in each instance, only an additional stimulus to bring about pathologic change." Wagener (1945), studying retinopathy, added similar evidence, and Gilbert and Dunlop (1949) showed a variation from normal in the obstetrical history of females who later developed diabetes.

Jordan and Randall (1936) and Jordan, Randall, and Bloor (1935) described changes in the lipid content of nervous tissue from patients with diabetic neuropathy which was not present in control material from arteriosclerotic subjects. Sirek *et al.* (1950) record abnormal levels of blood phospholipids in their cases. These findings require further study.

Conclusions

About half of all cases of diabetes mellitus show evidence of neurological disease.

Diabetic neuropathy may be divided into three groups: (a) hyperglycaemic—related to failure of control and rapidly relieved by routine treatment; (b) active—the most serious form, present in about 3% of all cases, unrelated to diabetic status and with a tendency to remission and relapse; and (c) asymptomatic—chronic, permanent, and not disabling.

There is no good evidence that arteriosclerosis or vitamin-B₁ deficiency is a causal agent. The neuropathic process seems to be inherent in some cases of diabetes.

The glucose-tolerance curve is of value in the investigation of obscure neurological disease.

The production of gangrene, neurogenic bladder, and joint change by diabetic neuropathy is of practical importance.

We are indebted to Professor R. E. Lane, Dr. M. L. Thomson, and Dr. J. S. Parkinson, physicians at Salford Royal Hospital, for their kindness in allowing us to examine and report on many patients under their care. Dr. G. G. E. Smyth and Dr. W. Morrell Roberts have also been kind enough to permit us to study patients. We also wish to thank Dr. W. Mackay for permission to examine the series of elderly patients in his wards at Hope Hospital, Salford, and Dr. R. Herring, in whose department most of the pathological investigations were undertaken.

well-balanced diabetic. To overcome this it is advisable to raise the carbohydrate content of the diet to 200 g. and give the mother a morning injection of soluble insulin and a second injection before tea of soluble insulin mixed with enough P.Z.I. to render the morning urine free of acetone bodies. If ketosis persists the addition of about 20 g. of glucose to each of the four meals usually clears it up. It is now well known that the maternal mortality rate can in this way be kept to a very low figure, but less is known about maternal morbidity of diabetics following pregnancy. The following points were therefore investigated: (1) insulin requirement following pregnancy; and (2) incidence and aggravation of diabetic complications: (a) retinitis, (b) hypertension, and (c) albuminuria. In none of the last 80 pregnancies of the K.C.H. series was there any significant increase in insulin requirement following pregnancy and attributable to it.

As regards retinitis, four cases were of interest—two were patients of Dr. Lawrence's and two of mine. Both of Dr. Lawrence's cases developed severe retinal haemorrhages, mostly of the flame or linear variety, and in one case these were associated with oedema of the optic disks; in both, the retinal lesions disappeared after the pregnancy. In my cases—both long-standing diabetics of 21 and 13 years' duration—there were previous ocular complications; in the former severe bilateral diabetic cataracts which made it difficult to exclude the presence of early retinitis, and in the latter typical early retinitis. During pregnancy the former developed definite aneurysms, blob haemorrhages, and patches of early exudate, and these have since progressed to retinitis proliferans with severe loss of vision. In the other case the retinitis has progressed since pregnancy. In both cases there has been an increase in albuminuria and a rise in blood pressure. These two cases are mentioned in detail because, from the maternal point of view, they are of great importance in connexion with the decision whether or not, in long-standing diabetics, pregnancy should be advised or be allowed to proceed. In the remaining 10 cases with retinitis at the onset of pregnancy there has been no appreciable change or evidence of deterioration, although two of them have been through two pregnancies. It is possible, therefore, that the progression of the retinal complication in the two cases would have occurred quite apart from the pregnancy, as, in fact, it very often does in such long-standing cases.

The question of hypertension and albuminuria is considered in connexion with toxæmia of pregnancy.

Toxæmia of Pregnancy

It is generally recognized that toxæmia is a relatively frequent complication of diabetic pregnancy. It is referred to again in connexion with foetal mortality, but I thought it would be worth while trying to follow up the toxæmic cases with a view to finding out whether they showed an unexpectedly high incidence or rapid development of hypertension and albuminuria following pregnancy. Interpretation of results is made difficult by the small number of cases and the fact that diabetics are apt to develop hypertension and albuminuria quite apart from pregnancy; some help, however, is to be gained from the relatively young age of the patients studied and the recognized association between these complications and the duration of the diabetes.

Of the last 222 diabetic pregnancies at King's College Hospital, 24 have been complicated by toxæmia, which on two occasions has occurred with successive pregnancies in the same patient. Three of the 24 cases are untraced, one died with eclamptic fits and cholaemia a few hours after delivery of a normal child which survived, and one had uraemia due to chronic nephritis. The remaining 19 cases have been followed with special reference to hypertension, albuminuria, and retinitis. In 13 there is no evidence of change in any of these respects following the toxæmic pregnancy, the only instance of hypertension being in a woman who had a benign essential hypertension before the pregnancy,

PROGNOSIS IN DIABETIC PREGNANCY

BY

WILFRID OAKLEY, M.D., F.R.C.P.

Physician, King's College Hospital

The observations in this communication are based on two series of diabetic pregnancies: (1) 275 pregnancies supervised and delivered at King's College Hospital, referred to as the K.C.H. series; and (2) 458 pregnancies, details of which were collected from different centres in Great Britain, and referred to as the Q series. A detailed analysis of some of this clinical material has already been published (Peel and Oakley, 1949).

I will first deal briefly with the maternal aspect and then pass on to the more controversial and less satisfactory problem of the fate of the foetus.

The Maternal Aspect

In the Q series of 458 pregnancies 13 mothers died—in eight the cause of death was diabetic coma, and three of these died undelivered. Of the remaining five deaths two were due to peritonitis and one each to pneumonia, pulmonary embolism, and eclampsia, giving a maternal mortality rate of 2.8%. In the K.C.H. series of 275 pregnancies there were four deaths due to pulmonary embolism, septicaemia, cholaemia, and massive collapse of the lung; there were no deaths in diabetic coma and none of the patients died undelivered—giving a mortality rate of 1.4%. These figures show that death attributable to diabetes still does occur, but it can always be prevented by proper supervision of the mother.

In this connexion the insulin requirement in at least 75% of cases rises during the second and third trimesters, and what is perhaps more important—the renal threshold in about the same percentage falls at about the fourth or fifth month of pregnancy. This constitutes one of the chief difficulties from the point of view of control of the maternal diabetes, and is usually first recognized by the development of heavy glycosuria and often severe ketosis in a previously

* Two toxæmic pregnancies.

which was no worse after it. The remaining six cases are summarized in Table I. It will be noted that both patients who had two toxæmic pregnancies are included in this small series. It is also interesting that in all six cases the diabetes had been present for 10 or more years; but this makes the interpretation of results more difficult, as diabetes of this duration may, quite apart from pregnancy, be associated with some hypertension, albuminuria, and retinitis. In these circumstances, it would be quite wrong to conclude that toxæmia of pregnancy constitutes a graver danger to the diabetic than to the non-diabetic mother, and I think the same can probably be said regarding the child.

Fate of the Foetus

Let me now turn to the prognosis in diabetic pregnancy from the point of view of the child. That an abnormally high percentage of these pregnancies result in stillbirth or neonatal death cannot be denied, that many different theories have been put forward to account for this high foetal loss also cannot be denied, but the fact that we still know little or nothing of the cause of this loss, if not actually denied, is being obscured, in my opinion, by the unwarranted acceptance of unproved theories and uncontrolled experiments. The results of the two series of pregnancies—733 cases in all—are applied to some of the theories put forward to account for this high foetal mortality rate in order to show that none of these theories will stand up to a critical analysis of a sufficiently large series of diabetic pregnancies.

(1) Control of the Maternal Diabetes

In 1942 Lawrence and Oakley recorded 54 diabetic pregnancies and showed that, if these were divided into three groups according to the degree of control of the maternal diabetes, the foetal mortality rate in the worst group was

TABLE II.—Relation of Foetal Mortality to Age of Onset of Maternal Diabetes

Age of Onset of Diabetes	No. of Babies	Foetal Mortality
1-15	70	21 (30%)
16-24	105	24 (23%)
25 and over	92	29 (31%)

70% and in the best 23%, the intermediate group being 50%. These results suggest that poor control will raise the foetal loss rate, but also that good control will not lower it below the high figure of 23%.

(2) Severity of Maternal Diabetes

Gilbert and Dunlop (1949) have shown that there is no significant difference between the foetal mortality rate in non-insulin-treated and insulin-treated diabetic mothers; this finding has been confirmed by other workers and by me.

(3) Age of Onset of Maternal Diabetes

The relationship between the age of onset of the maternal diabetes and the foetal mortality from maceration, stillbirth, and neonatal death has been studied by Forgen

Pederson (1949). In a series of 147 babies he found that when the onset of maternal diabetes was during the ages of 1 and 15 the foetal mortality rate was 42%, during 16 and 24 years 29%, and over 25 years 6%. He therefore concluded that when diabetes begins in childhood the foetal mortality rate is high; when the patient is grown-up before the onset of her diabetes the foetal mortality is far less. In order to test the validity of this statement the mortality rate in a series of 267 babies delivered of diabetic mothers at King's College Hospital was related to the age on onset of the maternal diabetes (Table II); the results obtained fail to confirm the existence of any direct relationship.

(4) Duration of Maternal Diabetes

It has also been suggested that the duration of the maternal diabetes may be a factor in the production of the high foetal mortality rate. A series of 665 pregnancies was therefore analysed from this point of view (Table III). These

TABLE III.—Relation of Foetal Mortality to Duration of Maternal Diabetes

Duration	Q Series				K.C.H. Series			
	Cases	S.	N.	Total	Cases	S.	N.	Total

S.—Stillbirths. N.—Neonatal deaths.

figures show: the high foetal loss rate for all durations, the absence of any relationship between duration and foetal mortality, and the significantly lower mortality in the K.C.H. series, to which reference is made later.

(5) Diabetic Complications

As foetal loss could not be accounted for in terms of control, severity, or duration, it was decided to see whether the presence of retinitis or albuminuria in the mother before the onset of pregnancy could be a causal factor. Hypertension was not seriously considered, as it is almost always an indication for advising against pregnancy or, alternatively, for termination.

In spite of the relatively large number of pregnancies, these complications were found in comparatively few; 12 mothers had retinitis at the time of conception. In these 12 cases 14 pregnancies resulted in 12 live children and 2 neonatal deaths, a loss comparable to the uncomplicated pregnancies. Albuminuria, especially when associated with hypertension, is so well recognized as being associated with high foetal loss rate, even in non-diabetics, that it is not surprising that only six patients had persistent appreciable albuminuria at the time of conception and were allowed to continue; all six cases gave birth to live babies, and all survived and did well.

(6) Complications of Toxaemia of Pregnancy

Much stress has been laid on the frequency of toxæmia in these cases and upon the danger of this condition to the child. Table IV shows the results of toxæmic pregnancies in the K.C.H. and Q series. It will be seen that the toxæmic cases had a slightly higher foetal mortality rate

TABLE IV.—Relation of Foetal Loss to Toxaemia of Pregnancy

	Cases	Toxaemia					Total Foetal Loss
		No.	%	Live	Dead	Foetal Loss	
Q series	455	86	19.0	48	38	44.2%	40.3%
K.C.H.	274	31	11.3	21	10	32.2%	26.7%

than the others; but toxæmia is clearly not the answer, nor can one expect that any form of therapy directed against it will appreciably lower the foetal death rate.

Smith and Smith (1938) put forward the view that toxæmia of pregnancy is related to a disturbance of hormone balance and, pursuing the same line of thought, Priscilla White (1947) claims to have greatly lowered the foetal mortality rate by giving stilboestrol in increasing doses together with a daily injection of progesterone. In order to test the validity of this claim the Medical Research Council in England has organized an investigation in which a series of pregnant diabetics—selected at random—have received hormone therapy from an early stage of pregnancy, the controls being given inert tablets of identical appearance. The only ways in which treatment differed from that advocated by Priscilla White were that progesterone has been given by mouth in the form of ethisterone—daily injections being impracticable in the conditions existing in England—and the patients have not been admitted to hospital as a routine measure at least two weeks before delivery. Neither the physicians nor the obstetricians in charge know which cases have received active and which inert therapy, and it is hoped that, in this way, results of statistical significance will be obtained. Unfortunately, the results of this investigation are not yet available, but in a series of 50 pregnancies in which hormone therapy was given at King's College Hospital, 21 resulted in stillbirth or neonatal death, giving a foetal mortality of 42%.

(7) Mode and Time of Delivery

It has been shown in Table III that the foetal loss rate in the K.C.H. series was very significantly lower than that in the Q series; there are several possible causes for this. Where large numbers of cases are treated greater experience is apt to produce better results; close co-operation between diabetic and obstetric departments is also of great importance, as is regular diabetic and antenatal supervision. The main cause of the difference, however, is to be found in the time and mode of delivery.

TABLE V.—Relation of Foetal Loss to Mode of Delivery

Mode of Delivery	Q Series					K.C.H. Series				
	Cases	Live	S.	N.	% Loss	Cases	Live	S.	N.	% Loss
Spontaneous labour	129	83	23	23	35.6	17	14	2	1	18.0
Induced labour	126	91	23	12	27.8	36	23	9	4	36.0
Caesarean section	115	97	3	15	15.7	156	127	1	28	18.5
Total	370	271	49	50	27	209	164	12	33	21.5

S.—Stillbirths. N.—Neonatal deaths.

Table V shows the high loss rate associated with spontaneous labour in the Q series, the much lower figure in the K.C.H. series being due to the fact that all the cases so delivered went into labour spontaneously at or before the thirty-sixth week, at which time they would otherwise have been induced or had caesarean section. The figures for induction are high but comparable—primiparae giving a higher foetal death rate than multiparae, as might be expected. The figures for caesarean section are much lower, and again are comparable. It would appear, therefore, that in the Q series the large number of pregnancies allowed to continue to spontaneous labour accounted for the higher foetal mortality, and incidentally also for the fact that three mothers died undelivered. It will be seen from Table V that the practice in the K.C.H. series of terminating the pregnancy at about the thirty-sixth week by caesarean section or, in the case of those who have had a previous normal delivery, by induction has resulted in a great reduction in stillbirths but a considerable neonatal mortality. Until some reliable method of preventing death *in utero* in the last few weeks of pregnancy has been discovered—and I am not convinced that such a method yet exists—I feel that we are most likely to reduce the loss rate

by obtaining a live baby and directing our efforts to prevent it from dying. This brings me to my last consideration—namely, the newborn baby.

The Newborn Baby.—The majority of neonatal deaths occur within 48 hours of delivery and are due to what appears to be respiratory failure; the baby has recurrent attacks of apnoea with cyanosis, in one of which it dies. Other possible causes of death are foetal hypoglycaemia and congenital deformities. The latter are relatively common, and 19 instances were observed in 221 consecutive diabetic pregnancies at King's College Hospital, giving an incidence of 8.6%. Such deformities could not be related to duration or control of maternal diabetes, and, although all the mothers were receiving insulin, there was no evidence that hypoglycaemia was more frequent or more severe than in those pregnancies which resulted in normal children.

(8) Foetal Hypoglycaemia

Although once regarded as a likely cause of neonatal death, there has recently been a tendency to discount this possibility. In order to arrive at a more definite conclusion it was decided to estimate blood sugars at two-hourly intervals on a series of babies, half of whom received no glucose and the other half 50% glucose hourly by mouth. In all, 17 babies received glucose and 18 no glucose, the respective neonatal deaths being two in the former and four in the latter series. The number of cases is too small to allow of any definite conclusions, but certain findings are of interest. In one of those that received glucose and died there was no demonstrable sugar in the blood one hour before death, while in the other the blood sugar at the time of death was 175 mg. per 100 ml. In the same series eight of those that lived had blood sugars of 30 mg. or less in the first six hours, and in four of these the level fell to 20 mg. or less; one survivor had no demonstrable blood sugar at two hours after delivery. Of the 18 babies that received no glucose, three of the four that died showed levels of 35 mg. or less per 100 ml. within six hours of death, and the remaining one had a blood sugar of 78 mg. four hours before it died. The blood sugars of six of those that lived fell below 35 mg. per 100 ml., and in four of these it was less than 20 mg. It is difficult, therefore, to say more than that death may occur with a normal blood sugar and survival with a very low one or even without any demonstrable sugar in the blood. This problem clearly needs further study.

Conclusion

Great emphasis must be laid on the importance of the nursing and management of the newborn infant. The use of an isolette in which both oxygen content of the air and temperature can be controlled, and regular suction if there are any signs of respiratory embarrassment, may help to reduce neonatal mortality. The use of continuous low-pressure suction and some form of mechanical respirator are under consideration in our department, and electrolyte and hormone studies are being carried out on these babies in the hope that they may shed some light on the present obscure problem of the high foetal mortality in diabetic pregnancy.

I acknowledge my indebtedness to Mr. John Peel, who was not only responsible for the obstetric management of these cases but also played a large part in the collection and analysis of the questionnaire series. I am grateful to Dr. R. D. Lawrence for access to the records of his private patients.

FATAL HYPOGLYCAEMIA IN A DIABETIC PATIENT WITH PITUITARY NECROSIS

BY

RICHARD I. ALEXANDER, M.B., Ch.B.

Lately, Resident House-Physician, Victoria Infirmary,
Glasgow

Case Report

The patient, a man aged 36 at his final illness in 1952, had no illnesses of importance in childhood, and his development was quite normal. In 1933, at age 17, he was admitted to hospital in diabetic coma. After treatment he was maintained on a diet and insulin, and remained well until 1940, when he was admitted to hospital in hypoglycaemic coma. He responded to treatment with glucose, and thereafter the diabetes was controlled by three daily injections of soluble insulin. In November, 1951, he was admitted to hospital after having been knocked down by a vehicle while in a hypoglycaemic state. He was dismissed, apparently in good health, on a diet of 212 g. of carbohydrate (2,352 calories) and two injections of soluble insulin a day—40 units in the morning, and from 25 to 30 units in the evening.

He seems to have been free of symptoms and regularly at work until April 29, 1952, when he complained of headache and nausea. He took his food and insulin as usual, and went to bed at 11.30 p.m. Two hours later he was found in coma and having convulsions. He was given sugar orally, and he recovered. Throughout that day he remained well, but at 10.15 p.m. he was seen to be acting as though drunk, and an hour later was again comatose and sweating profusely. Oral sugar revived him. Next day he felt well and took his food and usual insulin. At 10 p.m. he was seen staggering along the road, and at 11 p.m. was found completely comatose. He was given sugar by mouth, and at 12 midnight he was sitting up in bed talking and smoking. He had some tea to drink containing 12 teaspoonfuls of sugar. He did not take any more insulin. Two hours later, at 2 a.m. on May 2, he was once again comatose and having convulsions. It was found to be impossible to give him anything by mouth. At 9 a.m. his doctor gave him 50 ml. of 50% glucose intravenously, and 50 ml. of 10% glucose subcutaneously. This had no effect. He was admitted to the Victoria Infirmary at 1 p.m., having then been in coma for 11 hours.

On admission he was seen to be slimly built, but well nourished. He was completely comatose and was sweating profusely. His limbs were spastic, and irregular twitching movements were present. Plantar responses were extensor. Pupils were equal and reacted to light. There was nothing abnormal in the chest or abdomen. Axillary and pubic hair showed normal distribution.

Treatment and Progress

Blood was withdrawn for sugar estimation, and 100 ml. of 50% glucose was given intravenously. No change occurred in his condition. Intravenous glucose was repeatedly administered throughout the afternoon until a total of 300 g. had been given. The blood sugar on admission was 8 mg.

FIG. 1.—Showing intravenous therapy and insulin treatment, degrees of acetonuria and glycosuria, and blood-sugar levels.

Pituitary necrosis, not associated with shock or haemorrhage, is occasionally encountered in post-mortem examinations. Plaut (1952), in a routine series of necropsies, found pituitary necrosis in 13 out of 149 cases, but does not correlate these findings with clinical findings. Kraus (1920, 1926a, 1926b) noted the relative frequency with which pituitary necrosis is found in diabetics, and particularly in young diabetics, and described certain "diabetic changes in the hypophysis." Kiyono (1926) could find no characteristic changes in the pituitary glands of diabetics, but described two cases in which there was necrosis. Another two cases of pituitary necrosis in young diabetics were reported by Baló (1923).

When pituitary insufficiency complicates diabetes mellitus, conditions exist analogous to those in the Houssay animal. Houssay (1936) showed that diabetes produced in an animal by pancreatectomy was alleviated by subsequent hypophysectomy. Such an animal was readily rendered hypoglycaemic by fasting, and showed pronounced hypersensitivity to insulin.

This phenomenon has been observed in the human subject on a few occasions. Apart from a brief reference by Calder (1932) to a case of Simmonds's disease which showed amelioration of pre-existing mild diabetes, nine cases have been reported (Lyll and Innes, 1935; Kotte and Vonderahe, 1940; Feldman *et al.*, 1947; Vandenbroeck and Félin, 1947; Bastenie, 1949 (quoted by Poulsen, 1953); Marzullo and Handelsman, 1951; Williams, 1952; Israel and Conston, 1952; Poulsen, 1953). The ages of these nine cases (three male, six female) ranged from 29 to 53, with an average of 39. Three cases showed a great improvement in the diabetes (including, in Poulsen's case, disappearance of diabetic vascular lesions in the eye) and remained alive. In each case there was clinical evidence of pituitary damage. Of the six fatal cases necropsy was performed in every case. In the sixth case there was clinical evidence of pituitary insufficiency. In all the fatal cases there was a disappearance of signs of diabetes of either gradual or sudden onset, and in five of the cases death was associated with marked hypoglycaemia. In the remaining case the blood sugar was not estimated.

Irradiation of the hypophysis, leading to amelioration of diabetes, has been reported by Merle (1935) and by Balfour and Sprague (1949). Similar results following surgical removal of the hypophysis have been reported by Chabanier *et al.* (1936) and by Luft *et al.* (1952).

Another case of pituitary insufficiency in a diabetic is here reported.

Necropsy Report

Necropsy was carried out, four hours after death, by Dr. J. E. Craik, of the Department of Pathology, Victoria Infirmary. There was no evidence of bruising of the scalp or of an old fracture of the skull. The C.S.F. was increased in amount but was clear. There was oedema of the brain with flattening of the convolutions and a slight pressure cone on the inferior surface of the cerebellum, but not on the medulla or pons. The cerebral blood vessels were unusually healthy for a diabetic: they were thin and did not contain any

FIG. 2.—Low-power view of pituitary, showing two areas of necrosis. (H. and E. $\times 7$.)

plaques of atheroma. The brain weighed 1,510 g. The cut surface was moist, but there were no petechiae or larger haemorrhages. No softening or macroscopic abnormalities could be found.

The respiratory, circulatory, digestive, and genito-urinary systems showed no macroscopic abnormalities. The pancreas weighed 55 g.

The suprarenal glands were much enlarged, the right weighing 12 g. and the left 10.5 g. On section it was seen

FIG. 3.—High-power view of anterior pituitary, showing recent necrosis to the right and normal pituitary cells to the left. Outlines of necrotic cells are still preserved, but nuclei are small and pyknotic, and the cytoplasm is losing its specific staining reactions. (H. and E. $\times 100$.)

that they had undergone simple hyperplasia, the proportions of cortex and medulla being normal. The pituitary and thyroid appeared normal.

Histology.—In the pancreas, islets of Langerhans were extremely scarce; in a search through two blocks of tissue only one islet was found. It was probably a little on the large size, but otherwise appeared normal. The thyroid showed histological evidence of hyperfunction. The acini varied greatly in size, some being so small as to be almost solid. They were lined by thick cubical epithelium, which was often folded. Colloid was well coloured but did not fill the acini completely, and often there was peripheral vacuolation. Both suprarenals were large, but the hyperplasia was proportional in the medulla and all the layers of the cortex. There was no histological abnormality. The pituitary showed peculiar patchy necrosis in the most anterior part of the anterior lobe. The necrosis was early;

FIG. 4.—High-power view of anterior pituitary, showing older necrosis with gross granulocytic and lymphocytic infiltration. The architecture of the pituitary is almost completely destroyed. (H. and E. $\times 100$.)

per 100 ml. After one and a half hours this had risen to 148 mg., but the patient showed no improvement. Periodic convulsive attacks lasting 10 to 15 minutes occurred, separated by periods of relative calm lasting 24 to 40 minutes. At 4 p.m. a catheter was inserted and, from this time, frequent analyses of urine were made. Blood-sugar estimations were carried out regularly. At 6 p.m. continuous intravenous fluid was started, beginning with 5% dextrose in normal saline. Penicillin, 1,000,000 units, was given, followed by 500,000 units twice daily. Later in the day the convulsions became less severe, but generalized twitching movements persisted. At no time did he respond to cutaneous or aural stimuli.

May 3.—Throughout the day the patient's condition remained unchanged. The skin was moist and twitching movements were still present. Overnight the blood sugar had fallen to severe hypoglycaemic levels (11 mg. per 100 ml.), but subsequently rose and was maintained at between 300 and 400 mg. per 100 ml. Lumbar puncture was performed at 11 a.m.

May 4.—There was no improvement in his clinical state. A heavy glycosuria persisted, and on account of the appearance of ketonuria, increasing in amount, 10-unit doses of soluble insulin were given, up to a total of 60 units. The blood sugar, which throughout the earlier part of the day was maintained at between 200 and 300 mg. per 100 ml. suddenly fell to extremely low levels (14 mg.) with disappearance of ketonuria and glycosuria. Glucose, 150 g. was administered intravenously. The blood sugar then rose to between 100 and 200 mg. Lumbar puncture was repeated at 3.30 p.m.

May 5.—The patient's condition was still unchanged. During the afternoon twitching movements became less marked, and by 6 p.m. were no longer present. Hyperventilation developed and acetone appeared in the breath. Glycosuria and ketonuria increased, and the blood sugar rose to 651 mg. In spite of this hyperglycaemia, sweating remained profuse. Small doses of insulin up to a total of 25 units were again given, resulting in a fall of blood sugar to 78 mg.

May 6.—The limbs were now flaccid. Sweating was still occurring. The blood-sugar levels fluctuated between 118 and 561 mg. per 100 ml. The patient died at 11.10 a.m.

During this period in hospital there was an irregular pyrexia, with a terminal rise to 104.4° F. (40.2° C.). The blood pressure was maintained at about 115/75 until two hours before death, when it fell to 90/50.

The biochemical findings in blood and C.S.F. are summarized in Tables I and II. The fluctuations in blood-sugar readings, with details of therapy, are shown in Fig. 1. The Wassermann reaction of the blood and C.S.F. was negative.

TABLE I.—Biochemical Findings in the Blood

Date and Time	Urea (mg./100 ml.)	Chlorides (mg./100 ml.)	Alkali Reserve (Vol. CO ₂ %)	Potassium (mg./100 ml.)	Calcium (mg./100 ml.)	Phosphorus (mg./100 ml.)	Alkaline Phosphatase (K-A Units)
2/5/52 4 p.m.	46	416	48.1	18.9	—	—	—
3/5/52 11 a.m.	27	591	52.8	—	—	—	—
4/5/52 1.30 p.m.	39	627	45.3	18	9.7	1.15	8.2

TABLE II.—Biochemical Findings in the C.S.F.

Date and Time	Glucose (mg./100 ml.)	Chlorides (mg./100 ml.)	Protein (mg./100 ml.)	Cells (per c.mm.)	Granulocytes (%)	Lymphocytes (%)
3/5/52 11 a.m.	80	749	44	35	80	20
4/5/52 3.30 a.m.	208	767	54	23	76	24

in some patches the cells were still well preserved but had pyknotic nuclei; in some the cells were only just discernible; and in others the cells were lost, but the general architecture of the pituitary was still preserved (see Figs. 2, 3, and 4). It was thus obvious that the various patches of necrosis were not of the same age, though none was of more than a few days' duration. In the brain, sections from the pons showed various degrees of degeneration of ganglion cells. A few appeared normal. Most showed moderate or severe chromatolysis up to complete loss of nuclei. Shrinkage of ganglion cells was a feature, most being surrounded by a clear zone. There was no evidence that glial proliferation had begun. In the liver, glycogen was increased, as was to be expected. Otherwise the histological appearances were normal.

Comment

The notable feature of this case is the sudden development of a series of severe hypoglycaemic episodes in a diabetic patient who seems to have been under at least moderately satisfactory control for 19 years. The last of these episodes, which terminated in coma lasting four and a half days and death of the patient, began two hours after he had been treated successfully for an insulin reaction, and in spite of the fact that additional glucose, but no insulin, was given. In hospital, extremely large doses of glucose were required to raise the blood-sugar level, which, however, fell spontaneously to a severe hypoglycaemic level. Later, when small doses of insulin were given to combat ketosis, the blood sugar fell to unexpectedly low levels even while glucose was being administered by intravenous drip. This state of affairs suggests suddenly acquired extreme insulin sensitivity, and the explanation for this may lie in the pathological changes found in the pituitary.

Death in this case resulted from extended hypoglycaemia. Since the brain can utilize only glucose for its metabolism, if this is virtually absent from the blood for a considerable period irreversible changes may be expected in the brain cells. These changes have been studied by Baker and Lufkin (1937), Baker (1938), Sahs and Alexander (1939), and Lawrence, Meyer, and Nevin (1942). The duration of hypoglycaemia required for these changes is not known exactly, although Lawrence *et al.* state that hypoglycaemic coma of one to three hours is compatible with recovery. In the above case the patient had been in coma for 11 hours before admission, and remained in coma despite the rise of blood sugar. Cellular changes in the brain similar to those reported by these observers were, in fact, present.

Summary

Pituitary necrosis is occasionally encountered in routine necropsies. Its occurrence in diabetic subjects is noted.

The Houssay phenomenon is described, and cases are cited of this phenomenon occurring in man.

Irradiation of the hypophysis and hypophysectomy as a treatment of diabetes is mentioned.

Another case of pituitary insufficiency in a diabetic is reported.

Extended hypoglycaemia as the ultimate cause of death is discussed.

I wish to thank Dr. Ian Murray, of the Department of Metabolic Diseases, Victoria Infirmary, for his help and encouragement in the preparation of this article, and for his permission to publish this case; also the staff of the Department of Biochemistry, and Mr. Grey, of the Photographic Department, for their assistance.

FRIEDREICH'S ATAXIA COMBINED WITH DIABETES MELLITUS IN SISTERS

BY

D. W. ASHBY, M.D., M.R.C.P.

Physician to the Gateshead Hospitals

AND

P. S. TWEEDY, M.D., M.R.C.P.

Late Senior Registrar, Bensham General Hospital

The combination of Friedreich's ataxia with diabetes mellitus in families has been mentioned mainly in Continental literature. Schlezinger and Goldstein (1940), in the only comprehensive survey in the English language, list 18 patients from the literature with two of their own. The comparative rarity of the association prompts us to record its occurrence in two sisters.

Case 1

A woman aged 28 was admitted to hospital on September 15, 1950. She had been a full-term normally delivered infant. During her childhood her family noticed that she tended to stumble, to walk on her toes, and to be unable to play or skip normally. The stumbling increased, until at the age of 14 she could just walk along a narrow passage by supporting herself with her hands on the walls, and at this time she could not sit upright in a chair. From the age of 22 she had been partly confined to bed, being able to get around only by holding on to objects in her room, and from 27 she had been wholly bedridden. In 1948 she had been investigated for joint pains and was found to have diabetes mellitus. She was put on a diet without insulin, to which she had since adhered. Menstruation had been scanty, only two to three days every three months, following menarche at 16.

Physical Examination.—The patient sat slumped in a chair and was unable to walk even with assistance. No abnormal signs were found in the heart, lungs, or abdomen. The blood pressure was 108/80. **Skeletal system:** Scoliosis and bilateral pes cavus were present. **Central nervous system:** The patient was fully co-operative. Well-marked head-nodding, particularly during questioning, slurred and slow speech, and coarse lateral and rotary nystagmus were noted. The pupils were equal and reacted briskly to light and on accommodation. The fundi were normal. Right eye 6/12, left 6/6. Colour vision was normal. Other cranial nerves were normal. The upper limbs showed gross hypotonia, ataxia, dysmetria, dysidiadochokinesia, intention tremor, and diminished power, particularly of grip. The biceps, triceps, and supinator jerks were present and equal though diminished, and there was no wasting or sensory change apart from absent postural sensibility of the finger. The legs showed hypotonia, incoordination, dysmetria, an

ataxia. Knee- and ankle-jerks were absent, plantar responses extensor. Postural and vibration sense were absent in lower limbs. **Endocrine system:** The pubic and axillary hair normal, no facial hirsuties. There was no abnormal pigmentation. Breast development was normal. The thyroid was of normal size. The reproductive organs were hypoplastic.

Investigations.—The urine contained sugar but no acetone or albumin. On a 140-g. carbohydrate diet and 38 units of soluble insulin morning and evening, blood sugars after a 40-g. breakfast were: 8 a.m., 163 mg.; 10 a.m., 135 mg.; 12 noon, 120 mg. per 100 ml. The fasting blood sugar (receiving insulin) was 140 mg. per 100 ml. A chest radiograph showed normal lung fields and heart shadow. A radiograph of the skull showed a normal sella. Electrocardiograph: Sinus rhythm, 100 a minute; standard leads showed left axis deviation; P-R interval 0.1 second, QRS 0.08 second, T2 flat, T3 inverted, ST3 0.5 mm. depression; leads V4 and V6 showed low-voltage and notched T waves. The serum Wassermann reaction was negative; serum sodium, 300 mg. per 100 ml.; blood cholesterol, 85 mg. per 100 ml. The basal metabolic rate was within normal limits. Cerebrospinal fluid: Normal pressure, normal chemistry and cytology; Wassermann reaction, negative. The 17-ketosteroids were normal, 13 mg. per 24 hours.

Case 2

A woman aged 26, a sister of Case 1, was admitted to the same hospital on February 6, 1951. Schooling had been normal until the age of 13. She had had scarlet fever at 7. After this she had begun to stumble like her sister, to be unable to skip, and to walk on her toes, so that her shoes became worn beneath them. At 19, after an influenzal illness, she was no longer able to walk without help. Her symptoms progressed without remission until the year before admission, from which time she had been confined to her bed, although able to walk with assistance. Two years previously she had been losing weight and her doctor had discovered sugar in her urine. She had been stabilized on insulin with diet. Her menstruation was normal, with menarche at 15.

Physical Examination.—Although confined to bed during the previous year, she was able to walk with aid or with a walking-machine. No abnormal signs were found in the heart, lungs, or abdomen. The blood pressure was 110/85. Lower limbs showed acrocyanosis. **Skeletal system:** Pes cavus on right was present. **Central nervous system:** She was less affected by ataxia than her sister and was brighter mentally. There were oscillating movements of the head and restless movements of the arms, and nystagmus with coarse component to the right. Pupils were equal and reacted briskly to light and on accommodation. Other cranial nerves were normal. The fundi were normal; right eye 6/18, left 6/6. Colour vision was normal. The upper limbs showed hypotonia, dysmetria, and dysidiadochokinesia. The right biceps-jerk was diminished. There were no wasting and no sensory changes. The lower limbs showed weakness without wasting, hypotonia, absent knee- and ankle-jerks, and bilateral extensor plantar responses. Weakness was more marked in the proximal segments; the grip and ankle movements were fair, shoulder and hip movements weak. Vibration sense was absent at the ankles, but other forms of sensation were normal. **Endocrine system:** The pubic and axillary hair were normal; no facial hirsuties. There was no abnormal pigmentation. Breast development was normal. The thyroid was of normal size. The reproductive organs, though hypoplastic, were more developed than her sister's.

Investigations.—The urine contained sugar but no acetone or albumin. On a 100-g. carbohydrate diet with 35 units of soluble insulin morning and evening, blood sugars after a 30-g. carbohydrate breakfast were: 8 a.m., 215 mg.; 10 a.m., 150 mg.; 12 noon, 140 mg. per 100 ml. Fasting blood sugar (receiving insulin) was 180 mg. per 100 ml. A radiograph of the chest showed normal lung fields and heart shadow. A radiograph of the spine showed no spina bifida.

The serum Wassermann reaction was negative. Electrocardiograph: Sinus rhythm 100 a minute; low voltage QRS complexes, P-R interval 0.12 second; T waves—changes in all leads, particularly diphasic in T1 and T2, inverted aVL flat in V6. A radiograph of the skull showed the sella, though small, to be within normal limits. The serum sodium was 315 mg. per 100 ml.; blood cholesterol, 206 mg. per 100 ml. The basal metabolic rate was within normal limits. Cerebrospinal fluid: normal pressure, normal chemistry, and cytology; Wassermann reaction negative. The 17-ketosteroids were normal, 10 mg. per 24 hours.

Family History

Among the patients' parents and their siblings there was no history of clumsiness of gait, foot deformity, twisted spine, or diabetes. III(4), III(6), and II(3) (see Fig. 1) were found to be free from neurological disorder, glycosuria, and

FIG. 1.—Family tree.

congenital deformities. The urines of III(1), III(5), and III(7) did not reduce Benedict's reagent. The eldest brother, III(2), is stated by the sisters to have had a nervous disease similar to their own and to have died from the effects of diabetes at the age of 31. Records of his death have not been available. There was no consanguinity between their parents. Information about the grandparents was scanty.

Recorded Cases of the Combination

Since Schlezinger and Goldstein's paper Segall (1948) has described diabetes in taste-blind identical twins, one of whom had a peculiar dragging walk; both had pes cavus and gradually developing muscular incoordination. Although

FIG. 2.—Photograph of the two sisters. Case 1 is on the right.

the diagnosis of Friedreich's ataxia was not made in these twins, it seems reasonable to suppose that this was in fact the diagnosis. Dassen, Soto Romay, and Fustinoni (1939), have described two cases, not included in Schlezinger and Goldstein's review. Further mention of the combination comes from Bell (1939), who records one patient and a sibling with Friedreich's ataxia, not previously recorded, and from Richards (1946), who described three patients with Friedreich's ataxia in one family, of whom two were diabetic, both males. The present pair brings the total to 29 patients, 20 being females, one pair of these being twins. They are members of the seventh family to be recorded.

Onset of Ataxia and Diabetes

The onset was usually in the first two decades of life, and the Friedreich's ataxia has always preceded the diabetes, which began acutely, requiring insulin for its control or leading to death. However, one of the patients described by Schloss (1932) had merely glycosuria after a high carbohydrate diet, while Mollaret's (1929) patient had only a single episode of severe diabetes mellitus, leading to coma, then subsiding, ultimately requiring no treatment.

Pathogenesis

Schlezinger and Goldstein discuss, apart from coincidence, theories of hereditary predisposition, chromosome linkage, diabetic myelopathy, and neurogenic diabetes.

Coincidence

That the association of Friedreich's ataxia with diabetes mellitus is more than a chance coincidence has been claimed by Curtius, Störing, and Schönberg (1935), and re-emphasized, though with little further evidence, by Schlezinger and Goldstein. A demonstration that the incidence of diabetes mellitus is greater in people with Friedreich's ataxia than in the general population would rule out coincidence. The former authors give the estimated incidence of Friedreich's ataxia in Switzerland as 1 in 90,000. If the incidence were the same in this country there would be about 400 to 500 cases. Taking the total number of diabetics as 150 to 200,000 (Lawrence, 1944)—an incidence of about 1 in 250—one might perhaps expect two of the cases of Friedreich's ataxia to have diabetes mellitus. There is no way of confirming these estimates, but Bell (1939) lists 846 cases of Friedreich's ataxia and hereditary spastic paraplegia (which may be due to a similar genetic fault), including five cases of the combination with diabetes. This is a somewhat higher incidence of diabetes than in the general population, although the numbers involved are small and are a highly selected group.

The most striking thing about the Friedreich's ataxia and diabetes mellitus combination is that the diabetes occurs only in those members of the affected families who have ataxia. There are five members of the sibships concerned who have ataxia alone. The recorded incidence of diabetes then is evidently more in the ataxics than in the other members of the family. It is not known how far the various authors looked for diabetes in the families of patients having Friedreich's ataxia by itself. Curtius *et al.* investigated 41 out of 51 relatives of their two patients with the combination, and found evidence of neither diabetes nor neurological disorder among them. The incidence of status dysraphicus, comprising such conditions as enuresis, funnel-shaped sternum, kyphoscoliosis, asymmetry of breasts, contracture of little finger, pes cavus, spina bifida, acrocyanosis, lumbarization of first sacral vertebra, and cleft palate, was, however, higher than in random samples of the population.

Chromosome Linkage and Genetic Factors

Juvenile diabetes is thought to be inherited as a recessive, though the frequency of manifestation is low in those with appropriate constitution (Gates, 1946). Bell and Carmichael (1939) state that approximately two-thirds of their cases of ataxia were inherited as recessives. If linkage occurs two types of sibships should result: (1) three normal siblings to

one with both diseases, and (2) two normal siblings to one with ataxia and one with diabetes. The second type should be three times as common as the first. Most of the reported sibships containing diabetes and ataxia are of the first type, though some also contain one or more cases of ataxia alone, which could be explained on the basis of failure of manifestation of the diabetes. Sibships of the second type seem very uncommon. There are none in Bell and Carmichael's series, and it seems unlikely that diabetes has been missed in the family histories, as it is such a striking disease to the relatives. Moreover, in the pedigree of Curtius *et al.* the histories of 96 members were elicited, 41 out of 51 living members being examined and no diabetes being found.

The lack of sibships with individuals showing one condition or other, and not both, also tells against a hypothesis of looser linkage with cross-overs.

There are three other possibilities to be considered: (1) the ataxia gene may occasionally give rise to diabetes; (2) there may be two separate genes, one giving rise to ataxia only, the other giving ataxia and diabetes; and (3) the ataxia gene may express itself in different ways according to the genetic pattern of its environment.

The first possibility does not explain multiple cases of diabetes and ataxia in the same sibship. It would be supported if a high percentage of subclinical diabetes could be found in ataxic families without manifest diabetes. With regard to the second hypothesis, it is known that there are at least three different genetic types of ataxia—dominant, recessive, and sex-linked recessive (Bell and Carmichael). There is no definite proof that these three types are each due to a single gene. Ataxia combined with diabetes may well be a hereditary syndrome due to a gene different from that of recessive ataxia; the combination of these two diseases may represent the fully developed syndrome, ataxia alone being a milder form with failure of manifestation of the diabetes. This would explain the occurrence of both diseases in one or more members of a sibship and ataxia alone in another. The third possibility is attractive because it would link diabetes with some of the other dysbiotrophies mentioned later and would also effectively explain the multiplicity of cases of diabetes and ataxia within the one sibship. Both diabetes and other dysbiotrophies could result from the effect of certain genetic environments on the ataxia gene. For instance, retinitis pigmentosa has been reported as occurring in the siblings affected by ataxia in two different families (Claus, Frenkel, and Dide, quoted by Alpers and Waggoner, 1929).

Neurogenic Diabetes

No neurogenic lesion causing permanent diabetes has been described. Claude Bernard (1855) produced transient hyperglycaemia by puncture of the fourth ventricle, stimulation of the posterior part of the hypothalamus having a similar transient effect. Stimulation of the ventro-medial nucleus also causes hyperglycaemia, while destruction of these nuclei protects the animals from diabetes normally produced by pancreatectomy (Le Gros Clark *et al.*, 1938). Clinically, such conditions as basal meningitis, cerebral haemorrhage, trauma, and neighbourhood tumours may all produce transient hyperglycaemia, but not permanent diabetes. Friedreich's ataxia does not produce irritative neurological phenomena, and it is difficult to see how a degenerative lesion of the above-mentioned hypothalamic nuclei could cause a diabetes presenting clinically as what Lawrence (1951) calls the "insulin-deficient type." Further evidence against the concept of neurogenic diabetes is afforded by the lack of correlation between the course of the diabetes, which develops acutely over a few weeks or months, and the slow course of the Friedreich's ataxia. In those patients who died in coma there is no report of any dramatic increase in signs of damage to the central nervous system. Moreover, other symptoms of hypothalamic disturbance, such as changes in sleep rhythm, polyphagia, hyperthermia, hyperhidrosis, diabetes insipidus, excessive emaciation, or obesity, have not been described in those cases which have diabetes. Of the 26 patients described in detail, two were physically

underdeveloped and had menstrual irregularity, and three (including our Case 1) showed an infantile uterus with amenorrhoea or oligomenorrhoea. These are the only symptoms which might conceivably be put down to hypothalamic damage. Records of histological examination of brain stem and hypothalamus are scanty. Rossi (1893), quoted by Schlezinger and Goldstein, described areas of degeneration subcortically, including the basal ganglia; and Wichtel (1943), cited by the same authors, reported degenerative change in the dorsal vagus and dentate nuclei, but normal basal ganglia and tuber cinereum. Köhne (1941) demonstrated normal supraoptic and paraventricular nuclei. The pituitary gland showed only an excess of eosinophil cells. There is thus little or no positive evidence in favour of the hypothesis of neurogenic diabetes.

Diabetic Myelopathy

As Friedreich's ataxia precedes the onset of diabetes mellitus, and is unlike any recognized neurological complication of it, theories of diabetic myelopathy need not receive serious consideration.

Dysbiotrophy

Endocrine disturbances in Friedreich's disease are almost always due to hypofunction of one or more glands of internal secretion—for example, myxoedema, genital infantilism (Curtius *et al.*; Schlezinger and Goldstein). As diabetes can be a manifestation of islet-cell hypofunction, it can be regarded as analogous to these and other non-neurological dysbiotrophies that occur, such as spina bifida, supernumerary digits, etc. The occurrence of some of these conditions, particularly the endocrine disturbances, may be determined by the genetic milieu of the ataxia-bearing gene, thus providing cases analogous to those with diabetes mellitus and Friedreich's ataxia.

Summary

Cases of Friedreich's ataxia and diabetes occurring in siblings are described; the previous literature is reviewed and theories of causation are discussed. Of these, the hypothesis that the combination is either a hereditary syndrome or an effect determined by the genetic milieu of the ataxia-bearing gene seems most satisfactory.

We are indebted to Dr. C. N. Armstrong for his helpful criticism and suggestions; to Mr. David F. Smith for his report on the pelvic organs; to Dr. A. C. Crooke for his estimation of the urinary 17-ketosteroids; to Miss U. Phillip for help with the genetic aspects of this paper; and to Dr. Julia Bell for reading the manuscript.

ADDENDUM.—Since this paper was submitted for publication Dr. H. A. Dewar has kindly drawn our attention to two further sisters. One, aged 16, has recently been under his care at the Royal Victoria Infirmary, Newcastle-upon-Tyne. She has mild ataxia, optic atrophy, and diabetes mellitus requiring insulin for its control. Her sister died in diabetic coma at the age of 19, and is said to have had ataxia and optic atrophy as well.

TIME OF ERUPTION OF PERMANENT TEETH IN BRITISH CHILDREN IN 1947-8

BY

E. M. B. CLEMENTS, M.B., B.S.

E. DAVIES-THOMAS, M.R.C.S., L.R.C.P.

AND

KATHLEEN G. PICKETT, B.Sc.

(From the Department of Anatomy, University of Birmingham)

The most recent study of the times of eruption of the permanent teeth in British children is the survey made by Ainsworth in 1925. The object of the present paper is to bring the subject up to date, both by the assembly of new data and by the use of modern methods of analysis. Graphical techniques have usually been employed for estimating the mean eruption times of human teeth—for summaries of the data see Schultz (1934), Dahlberg and Maunsbach (1948), and Gödény (1951). Dahlberg and Maunsbach, and Gödény, have based their own analyses upon the observation of Klein, Palmer, and Kramer (1937) that the frequencies of erupting teeth at successive ages follow the normal probability function. The precision of the statistical methods for analysing integral responses of this function has been greatly improved over the past twenty years by the development of probit analysis (see Finney, 1947), and it is now possible to specify the statistical error of the estimates.

This paper is based on the analysis of dental observations made during the course of the Birmingham Anthropometric Survey on 1,427 boys and 1,365 girls attending elementary schools. The children, who ranged in age from 5 to 13 years, were unselected and were drawn from 87 infant, junior, and secondary modern schools representing all types of area in the City of Birmingham.

Survey

Dental Examination.—The children were examined by one observer throughout (E.D.-T.). Examination was made in a good light with a dental mirror and probe. The observations were dictated to a clerical assistant, who recorded the findings on a standard form. unerupted and extracted teeth were recorded as not present. The number of teeth extracted during the period of eruption will be very small, and will not have affected the analysis materially. A tooth was classified as erupted as soon as the gum was pierced. Clinical observations on the teeth were also recorded, but these have not been analysed in this paper.

Social and Anthropometric Data.—The Birmingham Anthropometric Survey recorded the occupation of either the father or the family's chief wage-earner. This information was coded into the appropriate socio-economic classification of the Registrar-General by reference to the Classification of Occupations. Class I comprises the professional, Class II the intermediate, Class III the skilled, Class IV the semi-skilled, and Class V the unskilled occupations. The development of puberty was assessed and scored on a four-point scale, using a scheme based on the classification proposed by Greulich *et al.* (1942). The age in months was recorded from the school records to the month below—that is, the age reached. The mean eruption times which are presented have not been adjusted for this grouping. At the examination an index number was allocated to each child to identify both the child and its school.

Combination of the Dental and Anthropometric Surveys

The index number allocated to a child in the anthropometric survey was used in the dental survey. This common index number has linked the two surveys and has been the means of associating the information collected in each.

The records of the dental survey were coded into a numerical form suitable for punching into standard 80-column Hollerith cards. The basis of this coding was that each column represented a tooth, and permitted up to 12 subdivisions. One of these was used to represent each of the possible classes of "absent" and "present" teeth, combined with observations on the incidence of caries.

A set of punch cards was prepared by a mechanical "reproducer" from the master cards of the Birmingham Anthropometric Survey to include only the index number, the age, and other coded information, the punches being made only in the first 19 columns. These cards were passed through a "mechanical interpreter" which printed the index number on the card so that it was easily legible. These "reproduced" punch cards were then matched with the coded dental records, and the dental information read from the records was punched into the remaining columns.

The last preparatory procedure was carried out only to facilitate the computing, and consisted in converting the ages, so far recorded in months, into periods of a quarter of a year by grouping them in threes. The different groups were numbered in numerical order—for example, the ages, 060, 061, 062 (in months) were all numbered 01 (first quarter year) and so on. Each group had the number punched mechanically into the cards. The various manual steps in the coding and punching have been verified at each stage.

Statistical

A preliminary tabulation was made of the number of boys and girls in each age group. The number of erupted teeth in each group was then tabulated for each tooth. The probability of observing erupted teeth in each age group was computed from these data. These probabilities were graphed for all the teeth in the right lower jaw. They were transformed into probit values, and these were also

Chart showing the observed probability of eruption of boys' lower right canine teeth at different ages.

graphed. The best-fitting straight line was fitted to these points, and from this line the corrected probit values were read off and transformed into probabilities. These corrected values were plotted on to the original graphs, and were found to smooth the observed data well. These findings indicate that the normal probability function will form the basis of a satisfactory analysis. As an example the probability of finding erupted lower canine teeth at different ages is shown in the Chart, and the smooth probability curve has been fitted in the manner described.

The analysis has been made by the probit method. The computations were based on the observed probabilities of finding the teeth erupted at various ages. The technique used was that devised by Black (1950), and the coefficients were corrected for the effects of grouping by the technique of Tocher (1949). Errors of estimate for the various statistics have been computed, and the various tests of significance have been made using a "t" test. There is no evidence of heterogeneity of departure from the fitted probit lines. In the main samples, too, in which the development groups and social classes are pooled, the values of "g" are all less than 0.1, and all except two of them are less than 0.05.

Results

For convenience the following abbreviations have been used in reporting the findings: I_1 for the central incisor tooth; I_2 for the lateral incisor tooth; C for the canine tooth; Pm_1 for the first premolar tooth; Pm_2 for the second premolar tooth; M_1 for the first molar tooth; M_2 for the second molar tooth. No erupted third molar tooth was seen.

Mean Eruption Times of the Teeth.—The data for the teeth of the right upper and lower jaws have been examined in detail, and these form the basis of the various comparisons which have been made. The mean eruption times of the teeth in the upper and lower jaws are given in Table I for both sexes, with the standard error and the 5% and 95% fiducial limits of the mean. The statistics presented in Table I are based on a relatively heterogeneous

M ₂	136.87	0.84	138.53	135.22	134.15	0.89	135.89	132.40

sample. Thus, children from all classes of the Registrar-General's (1931) socio-economic classifications are included, and in the older age groups adolescents are grouped with children who do not yet show external signs of puberty. The data have been examined to see if these factors influence the mean eruption times of the teeth.

Mean Eruption Times of Teeth in Different Social Classes.—The data were sub-classified into the social classes previously specified. Class I was combined with Class II, and Class IV with Class V. Probit computations were carried out on the data for the right lower teeth in boys. None of the differences are statistically significant, although a trend towards an earlier eruption in Classes I and II

TABLE II.—Mean Eruption Times and Standard Errors of the Teeth in the Right Lower Jaw for Social Classes I and II Combined and for Class III in Boys*

* For explanation of classes see text.

combined is apparent. The statistics for Classes I and II combined and for Class III are given in Table II. Classes IV and V combined follow Class III very closely. The mean difference between the classes, over all the teeth, is 3.36 ± 1.13 months, a finding which indicates that the differences between the mean eruption times are important. Further analysis was unprofitable because of the small number of children in Classes I and II.

Variation in Mean Eruption Time Associated with Puberty.—The data were sub-classified into two groups: (1) those showing no onset of pubertal development; and (2) those showing obvious signs of such development. The mean eruption times were computed for the right lower C, Pm_1 , Pm_2 , and M_2 teeth of boys and girls, and are given in Table III. A trend towards the earlier eruption of teeth

TABLE III.—Mean Eruption Times and Standard Errors of the Lower Right C, Pm_1 , Pm_2 , and M_2 Teeth in Boys and Girls With and Without the Physical Signs of Puberty

Tooth	Boys		Girls

in the pubescent group is apparent in both sexes, although the differences between the mean eruption times are not statistically significant. The mean difference between the two groups, over all the teeth, is 1.95 ± 1.0 months for boys and 4.13 ± 0.72 months for girls; values which indicate that the differences between the mean eruption times of the groups are important. No sub-classification was made into the various stages of puberty, although it was apparent that the few boys and girls who were well advanced all had their M_2 teeth, whatever their age. This observation indicates that if children are examined on several occasions during their growth the early eruption of the M_2 tooth may be found to be associated with early puberty.

The effect of a possible interaction between the social and developmental classifications of the data has been ignored in making these examinations, but the findings indicate that, whilst the mean eruption times of teeth recorded in Table I

may apply to elementary schoolchildren generally, because slight variations in the constitution of this population from place to place may be ignored, they should not serve as standards for other groups of children.

Mean Eruption Times of the Dentitions on the Right and Left Sides.—The mean eruption times have been computed for the right and left upper and lower teeth. The differences between these times are set out in Table IV. No significant difference was found between the mean eruption times of the teeth of the right and left sides of the upper and lower jaws in boys and girls.

Sexual Differences in the Mean Eruption Times.—A comparison of the mean eruption times of the teeth in the right upper and lower jaws of boys and girls is given in Table V.

* Probability of less than 5%.
† Probability of less than 1%.

In the upper jaw the mean eruption time of every tooth with the exception of the M_1 was significantly later for the boys than for the girls. In the lower jaw the mean eruption times of the teeth in boys were significantly later than those for the girls. (The level of significance of the difference in the case of the M_2 tooth is only at the 5% level of probability.) This finding confirms the previous observations made by Ainsworth (1925) and Leslie (1951).

Comparison of the Mean Eruption Times of the Corresponding Upper and Lower Teeth.—The differences between the mean eruption times for boys and girls are given in Table V. It is apparent that the mean eruption times of the teeth in the upper jaw are later for both sexes, with the following exceptions:—Boys: The lower Pm_1 and Pm_2 teeth erupt about 11 and 10 months respectively after the corresponding upper teeth (a difference statistically significant at the 1% level of probability). The difference between the upper and lower M_1 teeth was not significant. Girls: The lower Pm_1 and Pm_2 teeth erupt a matter of nine and seven months respectively after the upper teeth (both differences are statistically significant at the 1% level of probability). The difference between the mean eruption times of the upper and lower M_1 teeth was not significant. The observation that the mean eruption time of the lower Pm_1 tooth is significantly later than that of the upper for boys and girls, whereas generally the teeth in the upper jaw are later than those in the lower jaw, has also been made in previous surveys.

Sequence of the Mean Eruption Times.—The order of eruption of the teeth determined from the mean eruption times is set out in Table VI. It is found that the order is the same in boys and girls, but that the order is different in the upper and lower jaws. The eruption times of the I_1 and M_1 teeth and the Pm_1 , Pm_2 , and M_2 teeth are so similar that sampling variation can give rise to a different order of eruption in a proportion of determinations. The order of eruption of the teeth has been determined from the mean eruption times found in some recent surveys, and the results are included in Table VI. It is apparent that the

anticipated variations in the order resulting from sampling variations have been found, but, apart from this, the order of eruption is the same in each survey.

Discussion

Although the statistical significance of the differences cannot be assessed satisfactorily, comparison of the mean times of eruption of teeth found in this survey with those reported by Ainsworth (1925) suggests that to-day the mean eruption times of teeth are, with the following exceptions, a few months earlier in each sex: the upper and lower Pm₂ teeth in both sexes, the upper and lower Pm₁ teeth in boys, the lower Pm₁ teeth in girls, which are all a few months later than they were 25 years ago. Except in the case of the premolar teeth, the mean eruption times found in 1947-8 also tend to be a few months sooner than those which are indicated by the data for English children published by James and Pitts (1912).

These comparisons suggest that there has been a tendency for the mean eruption times of all teeth, except the premolars, to become earlier in this country during the past 40 years. The later eruption of the premolar teeth may be attributable to a fall in the rate of extraction of the preceding temporary molar teeth, and may be a change towards a more normal time of eruption (see Leslie, 1951). The indications that mean eruption times of teeth, other than the premolars, may be earlier in children from a better socio-economic environment, which are provided by the present survey and which are supported by the observations of Hellman (1923) on the incisor teeth, suggest that this trend may reflect a progressive improvement in the socio-economic condition of the nation. The conclusions Hellman drew from his data were based mainly on the findings for the premolar teeth, and differ from ours on this account.

The likelihood that socio-economic and general physical status have an influence on the time of eruption is given further substance by the observations that children who show physical signs of puberty tend to have earlier mean eruption times than children who are still prepubertal.

The mean eruption times of teeth as determined in the Birmingham Survey appear to be a few months in advance of those found by Leslie (1951) for New Zealand children. The method by which his statistics are computed introduces errors due to rounding, and thus makes the statistical significance of any detailed comparison with our data uncertain, but the differences would probably be statistically significant for about half of the teeth. The mean eruption times of the teeth of Birmingham children tend to be earlier than those of other European children, except for the lower premolar teeth, and the differences are slightly greater than they are in the New Zealand data (Dahlberg and Mauns-

bach, 1948; Gödény, 1951). These findings suggest that the physical development of British children to-day, in so far as it is reflected in changes in the mean eruption times of teeth, is slightly in advance of that of other children of European stock, and those from New Zealand, about which we have information.

Summary

The mean times of eruption of human teeth have been computed from observations on 1,427 boys and 1,365 girls aged 5 to 13 years.

The mean times of eruption of teeth of children who are either of a superior socio-economic group or are pubescent tend to be earlier than those in other children.

The mean times of eruption of the corresponding right and left teeth do not differ significantly in either the upper or the lower jaws.

The mean times of eruption of the teeth of boys are, with the exception of the upper M₁ teeth, later than those of girls.

The mean times of eruption of teeth in the upper jaw are later than those in the lower jaw, except for the Pm₁ and Pm₂ teeth, which are earlier, and the M₁ teeth, which do not differ significantly.

The order of eruption of the teeth determined from mean eruption times is the same, within the limits of sampling variation, as that found in other stocks of European origin.

This work would have been impossible without the ready help of the City of Birmingham Education Committee and its administrative, medical, and teaching staffs, too numerous to mention individually. We gratefully acknowledge our debt to them, to Professor S. Zuckerman and Mr. M. J. R. Healy for much assistance and advice.

ORDER OF ERUPTION OF THE PERMANENT HUMAN DENTITION

BY

E. M. B. CLEMENTS, M.B., B.S.

E. DAVIES-THOMAS, M.R.C.S., L.R.C.P.

L.D.S. R.C.S.

AND

KATHLEEN G. PICKETT, B.Sc.

(From the Department of Anatomy, University of Birmingham)

Whilst the order of eruption of teeth as determined from mean eruption times is relatively constant (Clements, Davies-Thomas, and Pickett, 1953), the times of eruption of individual teeth are very variable, and consequently individual children may be expected to vary greatly in the order in which their teeth erupt. This is shown by Table I, which provides estimates of the 5% and the 95% limits of the ages of eruption in children examined in the course of the Birmingham Anthropometric Survey. It is also evident from Table I and the Chart that eruption times overlap considerably. The explanation is clearly that the eruption times of each tooth are distributed at random, so that late eruption of a tooth with a relatively early mean eruption time may occur after the early eruption of a tooth with a later mean eruption time.

Chart showing standardized frequency distribution of the eruption times of the permanent teeth in the lower jaw for boys.

Little or no variation would be found in the order of eruption if the early eruption of one tooth was associated with the early eruption of the others. Alternatively, if the times of eruption of the various teeth were independent, all possible variations in the order of eruption would occur. The data on tooth eruption collected in the Birmingham Anthropometric Survey were therefore examined to determine whether or not the order of eruption of teeth which have their mean eruption times close together is constant, and, if variations occur, to estimate the probability of different patterns of eruption.

Method

The records of a tooth have been classified as erupted (the tooth having pierced the gum) or unerupted. Each of these classes has been sub-classified into two further classes by sorting the records of another tooth into classes of erupted and unerupted teeth. The records of two teeth comprise the simplest case, and for these a fourfold table may be constructed to indicate the number of occasions on which (1) both teeth were present, (2) neither tooth was present, and (3) either one or the other tooth was present. Additional teeth may be similarly sub-classified to give 16 possible combinations for four teeth. Only the records of children who were of such an age that erupting teeth might be expected to occur have been examined.

TABLE II.—Occurrence of Erupted and Unerupted I₁ and M₁ Teeth in the Jaws of Children Aged 5-9 Years

Teeth Erupted	Boys	Girls	Total
<i>Upper Jaw</i>			
I ₁	7 (4.7%)	8 (6.6%)	15 (5.6%)
M ₁	142 (95.3%)	113 (93.4%)	255 (94.4%)
Number of occasions when 1 tooth was erupted	149	121	270
<i>Lower Jaw</i>			
I ₁	55 (53.9%)	45 (54.2%)	100 (54.0%)
M ₁	47 (46.1%)	38 (45.8%)	85 (46.0%)
Number of occasions when 1 tooth was erupted	102	83	185

Factors which may tend to accelerate or retard the eruptions of certain teeth, such as the early eruption of the premolar teeth following on the early loss of the deciduous teeth, may also affect the frequencies of the orders of eruption (see Leslie, 1951).

Results

The order of eruption of the I₁ and M₁ teeth has been examined in 644 boys and 633 girls aged 5 to 9 years. In each sex the records were divided into a group in which the upper right I₁ tooth had erupted and one in which it had not. The same was done with the lower teeth. Each of these classes was then divided into a subgroup in which the M₁ tooth had erupted and another in which it was still unerupted. The findings are given in Table II. Either one

or the other of the two upper teeth was seen alone on 149 occasions in boys and 121 occasions in girls; the corresponding figures for the lower jaw were 102 occasions in boys and 83 occasions in girls; upper I₁ occurred alone seven times in boys and eight times in girls; lower I₁ was seen alone 55 times in boys and 45 times in girls; upper M₁ was seen alone 142 times in boys and 113 times in girls; lower M₁ was seen alone 47 times in boys and 38 times in girls. These proportions are similar for both sexes ($\chi^2=0.46$ and 0.02 (1 d.f.) respectively).

+ = erupted; the tooth has pierced the gum. 0 = unerupted. There were approximately equal numbers of children in each age group.

The records of the C, Pm₁, Pm₂, and M₂ teeth have been sorted in a similar way for 1,135 boys and 1,077 girls from 7 to 14 years old, and the results for the right and left upper and lower jaws are given in Table III. This table should be read as in the following example, reading from line 9 of Table III for the right upper jaw: "Two teeth were erupted and two unerupted on 88 occasions in boys. The Pm₁ and M₂ teeth were the erupted teeth on 11 occasions (12.5%). Two teeth were erupted on 85 occasions in girls and the eruption of the Pm₁ and M₂ teeth together was seen five times (5.9%); and so on for the left side.

All the combinations of these four teeth have been seen, the combinations varying greatly in their frequency. The differences between the distributions have been tested for significance. The frequencies found in the right and left sides in the same sex do not differ statistically. The difference in the frequencies found between the sexes are all significantly different at the 1% level of probability except for three classes: (1) where three teeth have erupted in the lower jaw; (2) where two teeth have erupted in the lower jaw; and (3) where one tooth only has erupted in the upper jaw. The values of χ^2 for the teeth in the upper and lower jaws respectively, are: for three teeth 6.46 and 14.26 (3 d.f.); for two teeth 22.35 and 13.76 (5 d.f.); for one tooth 23.86 and 0.36 (3 d.f.). The distributions are very different in the upper and lower jaws of the same sex.

The frequencies of the various orders of eruption for different combinations of only two or three teeth out of the four teeth tabulated in Table III may be obtained by combining the appropriate lines of the table so as to omit the tooth not required.

Discussion

The present observations substantiate, what is already well known, that there is considerable variation in the order in which human teeth erupt, and extend this knowledge by providing estimates of the frequencies with which different patterns of eruption may occur in British children.

The most frequent order of eruption of the upper and lower I₁ and M₁ teeth, and the upper and lower C, Pm₁, Pm₂, and M₂ teeth, in both sexes is the same as that given by the mean eruption times. These are: the M₁, I₁, and the Pm₁, C, Pm₂, M₂ teeth in the upper jaw; the I₁, M₁, and the C, Pm₁, M₂, Pm₂ teeth in the lower jaw.

The mean time of eruption of the upper I₁ tooth is later than that of the upper M₁ tooth by 11 months in boys and eight months in girls, and this implies that the distributions of these teeth will overlap only slightly. On the other hand, the mean eruption times of the lower I₁ and M₁ teeth hardly

differ in either sex, and so the distributions of these teeth will almost coincide (see Chart). The upper right I₁ tooth was seen to erupt before the corresponding M₁ tooth on 5.6% of occasions, and the lower I₁ tooth on 54.0% of occasions. These observations agree well with the expected values computed from the data of Table I assuming independence. On this assumption I₁ erupts first in 4.0% and 54.8% of all cases in the upper and lower jaws respectively.

Erupted Pm₁, Pm₂, and M₂ teeth were observed without an erupted C tooth 27 times, or on about 10% of occasions, in the right side of the upper jaw, and three times, or on about 1% of occasions, in the right side of the lower jaw. On the assumption that the order of eruption of teeth on the right side is independent of that on the left, both sides will show these three teeth to be erupted on about 1% and 0.1% of occasions in the upper and lower jaws respectively. This condition was observed, however, 13 times in the upper jaw and once in the lower jaw. These observations do not accord with the estimated frequencies, and indicate that the eruption times of corresponding right and left teeth are correlated.

All possible combinations of the orders of eruption of the C, Pm₁, Pm₂, and M₂ teeth actually occur in the Birmingham records. The frequency with which departures occur from the assumed normal order of appearance of the teeth, as given by the mean times of their eruption, implies that the times of eruption of these four teeth are independent of each other.

A similar type of analysis to that undertaken in this study was made by Livy (1885). He compared the eruption times of the corresponding upper and lower teeth in children; he also found that the order of eruption was reversed in a variable proportion of cases in each age group.

It is apparent that many instances of abnormal orders of eruption of teeth which are encountered in the field of orthodontics simply represent extremes of the normal variation; the only sense in which they are abnormal is that they are infrequent.

Summary

The order in which the I₁ and M₁ teeth and the C, Pm₁, Pm₂, and M₂ teeth erupt in British children was investigated and considerable variations were found in both the upper and the lower jaws.

The frequencies of occurrence of the different patterns of eruption were estimated. The most frequent order of eruption was found to be the M₁ tooth followed by the I₁ tooth, and the Pm₁ tooth, followed in succession by

the C, Pm₂, and M₂ teeth in the upper jaw; and the I₁ tooth followed by the M₁ tooth, and the C, Pm₁, M₂, and Pm₂ teeth in that order in the lower jaw.

The analysis indicates that the times of eruption of teeth with similar mean eruption times on the same side are independent of each other, but that the eruption times of corresponding teeth on the right and left sides are correlated.

We gratefully acknowledge the receipt of a grant from the Medical Research Council, and much assistance and advice from Professor S. Zuckerman and Mr. M. J. R. Healy.

MAMMARY ABSCESS

DISADVANTAGES OF ANTIBIOTICS IN ITS MANAGEMENT

BY

C. P. MILLS, F.R.C.S.

(From the Department of Surgery, Postgraduate Medical School of London)

In days gone by the cardinal signs of inflammation, heat, pain, redness, and swelling were all too familiar. Just as the classical picture of lobar pneumonia with its typical crisis is seen no more, so the clinical features of acute pyogenic infections have been greatly altered since the general introduction of antibiotics. No one will deny their immense value in combating what were earlier most severe infections, but in less severe cases they can be a mixed blessing if not used with judgment and restraint. The need for surgery is as great as ever, although its extent may be much restricted. Since antibiotics can mask so effectively many of the arresting features of acute infections, the timing of an operation is becoming more and more important.

A good deal of suffering can, in my opinion, be avoided by a general appreciation of the limitations of antibiotics in the treatment of acute infections, and this point I want to underline by citing the records of four cases of acute mammary abscess. Cases of this sort are no doubt the everyday experience of most active general surgeons, but it is their very frequency which has prompted me to record the following cases.

Case 1

The patient was aged 26. Immediately after a normal delivery her left nipple became sore and cracked, and led to weaning. Two weeks later, 24 days after her confinement, she developed a painful swelling in her left breast. On the twenty-ninth day she was seen by her own doctor, who noticed a painful, red, indurated area in the lower half of the left breast. "Distaquaine penicillin," 400,000 units, was given daily, together with local applications of heat for four days. She was admitted to hospital on the thirty-sixth post-partum day, and 12 days after the onset of symptoms.

The left breast was fuller and more pendulous than the right, which seemed quite normal. There was an obvious swelling in the lower and outer quadrant. Peau d'orange was not seen. The nipple was not retracted, but the lower half of the areola was tethered to a hard, slightly tender non-fluctuant mass, measuring 8 by 8 cm., and easily felt

by the flat of the hand. The skin over the mass was not discoloured and was no hotter than the surrounding breast tissue. There was some fixity of the mass to the underlying pectoral fascia. Glands were not palpable in the axilla.

When she was first seen in hospital the absence of the signs of inflammation and the size, hardness, and fixation of the mass in the breast strongly suggested the diagnosis of a lactation cancer.

On the following day a radial incision was made over the most prominent part of the mass. A very thick-walled multiloculated abscess cavity was entered, which was involving most of the lower half of the breast. Free drainage was established. The pus yielded a profuse growth of a coagulase-positive *Staphylococcus pyogenes*, resistant to penicillin but sensitive to aureomycin, streptomycin, and chloramphenicol. Streptomycin, 0.5 g., was given twice daily for four days. Two weeks later the wound was completely healed, and there was no more than a diminishing thickening. Her total period of disability was 26 days.

Case 2

The patient, aged 32, noticed pain, tenderness, and swelling in her right breast three days after a normal confinement. For the next ten days she was given daily injections of distaquaine penicillin, 300,000 units, and local applications of kaolin poultices. The swelling became less painful but no smaller. On the twenty-fourth post-partum day the baby had to be weaned, when the patient developed a generalized rash. On the thirtieth day her own doctor again prescribed injections of penicillin of the same dosage as previously because the breast and upper arm had become stiff and swollen.

On admission to hospital on the thirty-fifth day—that is, 32 days after the onset of symptoms—her temperature was 98.4° F. (36.9° C.), pulse 80, respirations 20, and white blood cell count 11,000. She was looking in the very best of health. The left breast was normal. The right breast was enlarged and deformed by a large, easily visible swelling in the right lower quadrant. There was no peau d'orange, but a little reddish discoloration and oedema over the centre of the swelling. The upper part of the areola was tethered to the tumour. The mass was hard, smooth, and slightly tender, non-fluctuant, and a little hotter than the surrounding breast tissue. It was fixed to the underlying pectoral fascia. There were three firm, tender glands in the right axilla. There were even fewer signs and symptoms of an acute inflammatory condition in the breast than in Case 1. The patient was a very healthy-looking woman with no evidence of fever or toxæmia, complaining only of a large, slightly tender mass in her right breast.

The fixity of the mass to the skin, areola, and underlying fascia; the oedema of the breast and the upper arm; and the presence of enlarged glands in the axilla were once again very suggestive of a lactation carcinoma. The next day a radial incision was made over the most prominent part of the mass. A great depth of dense inflammatory tissue had to be penetrated to find one small loculus of pus in its centre. Bleeding was profuse and difficult to control. Culture of the pus yielded a profuse growth of *Staph. pyogenes* resistant to penicillin but sensitive to streptomycin, aureomycin, and chloramphenicol.

A section from the abscess wall showed an inflammatory reaction with infiltration by foamy macrophages, plasma cells, and polymorphonuclear cells. There was an area of fat necrosis.

Streptomycin, 1 g. twice daily, was given for six days. She was discharged on the sixteenth post-operative day with a clean granulating wound but still some residual thickening in the breast.

Case 3

This patient, aged 28, was confined five weeks before coming to hospital, and complained of pain in the left breast for two days immediately prior to admission.

The left breast was diffusely swollen and tender. There was no discoloration or oedema. After eight days of distaquaine penicillin, 300,000 units daily, the breast was indurated in the left upper and outer quadrant, but less tender and still non-fluctuant.

Chloramphenicol, 0.5 g. four times daily, was given for seven days, by which time fluctuation had developed. Exploration revealed a multiloculated breast abscess with a thick and densely hard wall. Brisk bleeding was encountered, and this could be controlled only by packing. Six daily doses of 300,000 units of distaquaine penicillin were then given, the wound being dressed every third day. The patient was discharged on the thirty-fifth day after the onset of symptoms. She returned, however, one month later with a recurrence of symptoms. Distiquaine penicillin, 600,000 units daily, was given for seven days, and then streptomycin, 1 g. a day for a further seven days. The old incision was then reopened, and pus encountered which grew a penicillin-resistant coagulase-positive *Staph. pyogenes*. The patient was discharged with the wound well healed 54 days after the recurrence of symptoms. In all, she had been attending hospital 116 days, with a brief respite in the middle, after first being seen with a simple acute breast abscess.

Case 4

This patient, aged 32, complained of pain and swelling in the right breast on the thirty-first day after her confinement, and came to hospital four days later.

The left breast appeared normal. The right breast was red and swollen, with a very tender, smooth lump measuring 5 by 5 cm. just below the areola.

Stilboestrol, 10 mg. thrice daily, was given for five days, and 5 mg. for a further ten days. At the same time a dose of 600,000 units of distaquaine penicillin was given daily until the tenth day after the onset of symptoms. The lump was then still the same size but distinctly less tender.

On the thirteenth day a large breast abscess was drained. Daily injections of 600,000 units of distaquaine penicillin were continued until the nineteenth day, when the wound was still discharging and a new area of induration and tenderness had appeared above the areola. Two days later a second thick-walled abscess was drained of approximately 5 ml. of pus, which again yielded a penicillin-resistant *Staph. pyogenes*. After a further 17 days the wound was well healed. The patient took 34 days to recover from an acute breast abscess.

Discussion

Cases 1 and 2 serve to illustrate how the symptoms and signs of an acute breast abscess, by prolonged penicillin therapy, can be masked to such an extent that the condition may be difficult to differentiate from a lactation carcinoma.

Cases 3 and 4 illustrate well how an abscess can be so attenuated by antibiotics that the need for early incision is not appreciated and an undue amount of disability results. Perhaps it might be said that all that these last two case histories make evident is a lamentable lack of judgment in timing a surgical excision. This I freely admit, but claim in extenuation that the giving of antibiotics so relieved symptoms, and so modified the local tissue reaction, that the necessity for incision was less evident. Further, I claim to be not alone in making these mistakes.

Lake (1952) makes it quite clear that there is a growing awareness of the dangers and drawbacks of the indiscriminate use of the antibiotics. My experience in the casualty department of a large general hospital has certainly made me acutely aware of their obvious limitations. Used early and vigorously, they undoubtedly abort completely what were previously the most severe and disabling infections; one can confidently expect prompt resolution with complete

restoration of function. When, however, their administration is not begun until the infection is firmly established, complete resolution unaided is most unlikely. Gratifying as may be the alleviation of symptoms and the abatement of the toxæmia, timely surgical incision to drain what may be only a small collection of sterile pus is no less necessary than it was in earlier days. Antibiotics in many instances render surgical intervention no less necessary, though they may greatly modify its extent. The relief of pain which their use affords makes it only too easy to defer a necessary incision until long after the proper time. Meantime there develops a dense local inflammatory reaction which, when operation is ultimately undertaken, bleeds alarmingly, and which interferes considerably with the establishment of free drainage.

Perseverance with the administration of antibiotics long after they have ceased to have any value is a malpractice which is in no way confined to the management of acute mammary infections. The same mistakes are made in infections at other sites, but more evidently in situations like the finger pulp or the parotid, where the clinical sign of fluctuation is in any event long delayed.

My experience suggests that their abuse presents, in the case of breast infections, a problem peculiar to this situation—namely, the development of a hard, painless, fixed mass which in its clinical features mimics very closely a lactation carcinoma. This problem in diagnosis is especially seen when the patient first presents for treatment at hospital, having been previously under the care of her own practitioner. This point has recently been briefly alluded to by Stammers (1953).

It may well be that the unsatisfactory treatment of some of these infections can be attributed to the presence of resistant organisms. This is undoubtedly all too often the case in mammary abscess, especially if the patient is confined in hospital, where by a process of selection a permanent reservoir of resistant strains seems to be maintained. This was true of one of the above cases.

Heavy dosage with, say, penicillin will in the case of a light infection lead to clinical improvement so long as the local production of penicillinase does not build up to an effective level.

Stammers has suggested that in the presence of antibiotics the character of the local inflammatory reaction is greatly modified. There may, however, be a simple explanation. On the one hand, we have an infection with prompt antibiotic treatment which clears up quickly and completely. At the other end of the scale we have the old-fashioned abscess of the pre-antibiotic days, a large collection, representing a considerable loss of tissue. Somewhere in between, when the forces of invasion and those of repair are closely matched, it seems reasonable to assume that there may develop a hard inflammatory mass surrounding a small collection of pus such as was encountered in the breast cases described above.

Summary

The management of four cases of acute mammary abscess is reported. Treatment was primarily with penicillin, one case receiving in addition a seven-day course of chloramphenicol.

It was observed that the classical signs and symptoms of acute inflammation were considerably altered by the use of antibiotics.

A dense hard mass of fibrous and granulation tissue surrounding a loculus of pus was a feature of all the cases. The vascularity of the mass presented a real danger when it was explored surgically, in the form of torrential haemorrhage (as illustrated by Case 2). The undue delay of operative drainage because of the masking of symptoms and signs led in turn to a long and tedious recovery.

The lessons that might be learnt from these observations are: (1) Antibiotics, though of immense value in the treatment of acute infection, especially the localization of the disease in the breast, have their limitations. (2) The treatment of a localized collection of pus is still by surgical drainage, the timing of which is now as important as ever.

My thanks are due to Mr. Maurice R. Ewing for encouragement and help in the preparation of this paper.

PROSTHETIC MUCOSAL HYPERTROPHY IN THE MOUTH, SIMULATING MALIGNANCY

BY

J. WALTER, B.M., M.R.C.P., F.F.R., D.M.R.E.

Consultant Radiotherapist, Sheffield National Centre for Radiotherapy; Clinical Teacher in Radiotherapy, University of Sheffield

Now that a realization of the importance of early diagnosis and treatment of cancer is spreading, not only in the medical profession but among the lay public, it is more than ever necessary to separate those benign lesions that mimic malignancy. This paper seeks to focus attention on one type that is common enough to merit detailed discussion—the mucosal hypertrophy due to chronic irritation by dental prostheses. Experience both at a large centre dealing primarily with cancer and at a general hospital dental department shows that this lesion is a regular cause of suspicion and alarm among patients, their general practitioners, general surgeons, and dental surgeons. Descriptions of the lesion are hard to find outside the dental literature. The only account that I can trace in recent general medical literature is by Simmons (1941). More recently, recognition seems to be increasing among dental surgeons. With the relative increase of the older age groups, and the increased number of dentures supplied under the National Health Service, many more of these lesions are to be expected in the future.

Clinical Picture

There are two principal sites: (1) the alveolo-buccal sulcus, immediately adjacent to the alveolus, more commonly lower than upper; and (2) the hard palate, more or less centrally grouped round the midline.

First Type (Alveolo-buccal).—The typical lesion is a projecting elongated fleshy mass or tag on the mucosal surface adjoining the outer side of the edentulous alveolar margin (Figs. 1 and 2). Its length, parallel with the alveolus, ranges from a few millimetres to several centimetres, and its width up to about 1.5 cm. Its surface is ridged, with one or more deep furrows, and if the patient inserts his denture the edge can be seen to lie accurately in, or slip easily into, a furrow. The alveolus is atrophic and the denture fits very loosely; usually it will be found to be an old one, commonly dating back ten years or more. The mass is fairly soft in the early stages, becoming harder with age and fibrotic changes, but there is not the spreading induration at the base that characterizes

malignancy. There may be ulcerations of the furrow with a little bleeding; inflammation may cause tenderness and increased induration at the base, which can arouse suspicion of malignancy. The patient may complain of a little lump which has inconvenienced or alarmed him, or of intermittent pain due to sepsis. In some cases the lesions are not noticed by the patient at all, but are discovered by the dental surgeon when the patient attends for new dentures. Histologically there is considerable acanthosis and thickening of the surface epithelium but no evidence of invasion; there may be increased fibrous tissue secondary to inflammatory changes.

Second Type (Palatal).—Here the presenting lesion is on the hard palate, in the form of one or more flat or pedunculated papillomatous patches, typically a few millimetres across. There may be a complete ring of separate or fused patches, corresponding with the relief chamber or suction ring on the upper denture. The surface of the denture may be roughened and irregular. Ulceration and bleeding are uncommon. The patches may also appear at the posterior end of the hard palate, on a transverse line due to the "food line" at the back of the denture.

Case Material

The clinical material over the last eight years at the Sheffield National Centre for Radiotherapy has been reviewed. Twenty cases were found; 10 of these were of the first type, 8 of the second, and 2 were in atypical sites, and not definitely of similar nature. (These numbers are small in comparison with the material in a dental department; for example, at the Sheffield Royal Hospital 24 cases were seen in the dental department in a single year (1951) and approximately the same number were seen in the facio-maxillary surgical unit.)

Alveolo-buccal Cases.—Of the 10 cases in this group nine were in females. The lower jaw was the site in all but two. This preponderance in females and the lower jaw was also found by Simmons (1941). Ages ranged from 37 to 78, the mean being 51 years. The length of history varied between three weeks and three years, usually two to four months. Most lesions were 1–3 cm. long; one unusual case showed hypertrophy extending symmetrically along nearly the whole length of the lower alveolus on both sides. The age of the denture was not routinely recorded in all cases, but was typically at least several years, the oldest set being 16 years.

Palatal Cases.—In the eight cases the sex distribution was equal. Ages ranged from 39 to 75, the mean being 63 years. The length of history ranged from a few weeks to a few months. None of the individual lesions was larger than 1 cm.

Atypical Cases.—The first case was a proliferative papilloma, 2 cm. across, on the floor of the mouth just behind the alveolus. The other was a hypertrophic patch at the posterior end of the lateral border of the tongue, apparently an enlarged papilla.

Treatment

The only danger these lesions are likely to cause arises from a mistaken diagnosis of cancer leading to radical

FIG. 1

FIG. 2

FIG. 1.—A typical hypertrophic mucosal lesion on the upper alveolus. FIG. 2.—The lesion in Fig. 1 in relation to the denture.

treatment by surgery or irradiation. Simmons (1941) mentions such a case treated by implanted radium to full carcinoma-lethal dosage; the tumour itself proved completely resistant to the radiation, but there was some troublesome necrosis in surrounding normal tissue. If the possibility is borne in mind, these cases are not likely to cause real difficulty, but experience suggests that this clinical entity is not widely recognized.

The important part of the treatment clearly rests with the dental practitioner, to whom the patient should be referred. If the denture is left off, and the source of the irritation thus removed, there will usually be some improvement, with disappearance of inflammation and reduction in size of the mass, especially in recent cases. Occasionally the mass may almost completely disappear; this applies particularly to small papillomatous patches on the palate. However, it will almost always be advisable to replace the denture by a completely new model. Simple trimming or adjustment may prevent contact with the mass and remove the symptoms, but the fundamental defect—that is, the unbalanced occlusion—will remain.

How should the offending nodule itself be treated? Simmons (1941) advised excision of the ridges with the diathermy loop and coagulation of the base with the diathermy button, after which healing took place in about a month. Excision, of course, provides the speediest means of removal, and is usually to be advised, especially in the alveolar cases. The later history of the present series was as follows.

Alveolo-buccal Cases.—In all cases the patient was advised to discontinue the wearing of the denture and to visit the dentist as soon as possible. In five cases the nodules were excised by the dental surgeon, either at once or after two to three months; one was removed after eight months—this was the case mentioned above with the extensive hypertrophy all the way along the lower alveolar edge. In the other five cases no removal was carried out after the denture had been adjusted or replaced (or simply left off). The nodule regressed spontaneously, till in the course of two to six months it had either disappeared or been reduced to a tiny tag giving no trouble.

Palatal Cases.—Conservative treatment was the rule here. One nodule was removed for biopsy and the base carbolyzed. The other seven were left alone and the denture attended to; all seven more or less disappeared in one to five months.

Atypical Cases.—The papillomatous mass behind the lower alveolus was excised, as it was comparatively large (2 cm.). The hypertrophic patch on the back of the tongue was left alone, after reassurance of the patient; it did not change, but no active treatment was necessary and the patient was discharged after six weeks.

Discussion

This hypertrophic reaction to continued trauma is now mentioned and even illustrated in standard textbooks for dental practitioners (Thoma, 1941; Stones, 1951). The former calls it "areolar hyperplasia." However, it continues to arouse special interest, as evidenced by descriptions of individual cases in dental literature (Vandory, 1937; Clark, 1947; Holland, 1949). Histological examination shows no evidence of malignancy, but there is proliferation of epithelium and reactive overgrowth of granulation and connective tissue that can resemble a fibroma. Campbell (1944) describes a case that showed masses of epithelioid cells, giant cells, and dense fibrous tissue with many lymphocytes, the whole picture suggesting a sarcoma.

Guardo (1945) calls the lesions "paraprosthetic," and distinguishes two types—acute and chronic. The acute form heals as soon as the irritant is removed; the chronic type stops growing if the cause is removed, though excision is needed before function is restored. He mentions the possibility of malignant change, but quotes no specific instances of this; no other author among those I have

been able to trace mentions this important change as actually occurring, and one would like to have further details before accepting it. As an agent of cancerphobia, the potency of the lesion is attested by Hecht (1939) and Holland (1949); our own experience and that of any radiotherapeutic or dental centre amply underline this danger. One general practitioner was distressed (perhaps justifiably) by my not considering it necessary to take a biopsy but contenting myself with reassurance of the patient and his doctor.

Runnerstrom (1940) emphasizes the importance of servicing dentures after fitting; after dental extractions there is physiological resorption and atrophy of the alveolar process, and most sets of old dentures will be found to have incorrect relation to the jaw, with unbalanced occlusion; the lesions therefore are due primarily to lack of service, with a combination of mechanical trauma and bacterial infection.

In treatment most authors naturally favour simple surgical removal. This is certainly the best treatment for the great majority of cases, in which irreversible change with fibrous overgrowth has taken place. The present series, with appreciable spontaneous improvement in half of the alveolar cases and practically all of the palatal cases, shows that conservative treatment may sometimes be useful, if only as a preliminary measure. Even if disappearance is not complete, it may occasionally be enough for practical purposes; in any case, whatever shrinkage does occur will minimize the extent of surgery required. Active measures seem to be unnecessary in the case of small flat patches on the hard palate, as shown by the spontaneous satisfactory resolution in seven of the present eight cases. Anything larger would need active removal; advanced palatal papillomatosis and hyperplasia have recently been described by Thoma (1952) and Fisher and Rashid (1952).

Hecht (1939) is emphatic about the necessity for surgery; if the tissue returns to normal after leaving off the denture there may be a scar, which may interfere with the proper fit of a denture. He advises, for the palatal papillomatous hyperplasia, radical excision through the periosteum: this would undoubtedly be effective, but in the light of the present series seems unnecessarily drastic as a routine. In some alveolar cases, especially those in which the margin is extensively involved on both sides of the midline, it may be necessary to carry out the operation of "buccal inlay" after excision of the hypertrophic tissue, in order to leave a sulcus deep enough to give a denture adequate seating; a skin graft is inserted in the hollow outside the mandible, bridging the gap between the alveolar and buccal mucosae and folding to form a deep enough groove.

In general, therefore, surgical removal may be said to be the treatment of choice, with occasional exceptions, notably in small patches on the hard palate. In all cases the denture must be overhauled, and nearly always will need replacement; simple easing or trimming may relieve irritation for a time, but leaves the root cause—that is, malocclusion—untreated.

Summary

Attention is drawn to the hypertrophic tumours in the mouth due to irritation by badly fitting dentures. The commonest sites are the alveolo-buccal sulcus of upper and lower jaw and the hard palate. They are apt to be mistaken for malignant tumours. Treatment is usually by simple excision; spontaneous resolution may be adequate in the occasional case, especially for small lesions on the hard palate. A completely new denture is nearly always necessary.

I am much indebted to Mr. R. Rastall, senior hospital dental officer, Royal Hospital, Sheffield, for invaluable discussion and advice as well as for the illustrations; also to Mr. J. J. Hodson, lecturer in dental pathology, University of Sheffield, for some recent references.

SIMPLE DEPRESSED FRACTURE OF THE SKULL

BY

LAMBERT ROGERS, V.R.D., M.D., M.Sc., F.R.C.S.

Professor of Surgery, University of Wales

(From the Surgical Unit, the Royal Infirmary, Cardiff)

Whether or not to advise elevation of a simple depressed fracture of the skull which is symptomless is a recurring, albeit an infrequent, problem. Most depressed fractures are compound, and the indication for operation in these cases is absolute.

When a child is seen with a slight depression, an unbroken scalp, and a complete absence of symptoms, there may be a natural inclination on the part of the medical adviser and the patient's relatives to leave well, or what is apparently well, alone. X-ray films may merely confirm the depression and the electroencephalogram may be normal, but nevertheless a piece of the inner or vitreous table of the skull may have been driven through the dura mater into the brain. This is illustrated in the following case.

Case 1.—A boy aged 9 fell from a swing and dented his left parietal region. He was unconscious for about 20 minutes and then recovered completely and walked home. When seen at the Cardiff Royal Infirmary some five months later he had no symptoms and presented no abnormal features except a shallow depression in the left parietal region which was confirmed by x-ray examination. The nervous system was normal, as was also the electroencephalogram. At operation an in-driven fragment of the inner table of the skull was found to have penetrated both dura and brain, and to have anchored the brain at the site. A flap of bone, including the depression, was removed, reversed, and replaced after cutting away the projecting bony fragment which had entered the brain, and after smoothing the rather uneven surface of the inner table, which was now lying outwards. The boy made a good recovery, and it was concluded that freeing the anchored and developing brain was desirable in order to avoid possible complications in the future.

Depression in the Newborn Child

At birth and in infancy the skull bones are so soft that in these cases there is indentation without fracture, but it is convenient to regard them in the same category, as they are examples of traumatic depressions nevertheless.

Case 2.—A male baby delivered by forceps had a deep indentation in the left fronto-parietal region. He appeared in all other respects normal, and was seen at intervals until 2

months old; but as during this time there was no indication of the restoration of the normal contour of the skull by the disappearance of the indentation, this was effected by operation, with a satisfactory result. After turning down the scalp, a flap of bone was cut with scissors and with the thumbs the depression was pushed out and the osteoplastic flap replaced. The baby thrived and now has a skull of normal appearance, and what was a considerable reduction in intracranial capacity due to the deep indentation has been restored to normal.

Diagnosis of a Simple Depressed Fracture

A depressed fracture is usually obvious, but is not always so, especially if lying beneath the temporal muscle and its overlying fascia. In these circumstances x-ray examination in strictly antero-posterior as well as lateral planes may also fail to detect the depression. Films taken after slight rotation of the skull will make it obvious, however, as in the following case.

Case 3.—A naval stoker aged 26 fell from a plank on to the quayside at Cardiff docks and lost consciousness, which he regained in an ambulance on the way to hospital. He developed a swelling over the right side of the forehead, on which there were some abrasions, and the left eye showed subconjunctival haemorrhage. No depression could be felt, but slightly rotated antero-posterior views of the skull showed a depressed fracture underneath the left temporal muscle. Six days after his admission to hospital the depressed part of the left squamous temporal bone was elevated after first reflecting the temporal muscle. Recovery was uninterrupted.

Any error in diagnosis is usually in the opposite direction, of suspecting a depressed fracture when none exists, and what is felt and thought to be a depressed fracture is in reality a haematoma with a soft centre and firmer periphery.

Operative Treatment

If a depressed fracture is compound the question of whether to operate or not does not arise. Operation is indicated, as it is in the case of compound fractures occurring elsewhere in the body, and for a similar reason. It is suggested that simple depressed fractures should likewise be operated upon. Two points in technique may be referred to. (1) It is advisable to operate early, before union has taken place. In this early phase the bony fragments can be elevated, but after union has occurred this is no longer possible. To try to lift up the depression, which is really a reversed bridge, is like applying pressure to the arch of a cantilever bridge, and is quite futile. In this phase a block of skull comprising the fracture should be removed, reversed, and replaced. (2) The best way to deal with the indented skull of the infant is to cut out a flap of bone with a pair of scissors, reflect it on its base as a hinge, press up the depressed area with the thumbs, and replace the flap.

Drawing of baby boy aged 2 months with persistent depression in left frontal region (Case 2).

Conclusions

Further cases might be quoted, but these serve to illustrate that simple depressed fractures should be elevated to restore the contour and capacity of the skull and to free what may be an anchored brain in the hope of avoiding future complications such as epileptic attacks. Early operation is advisable; not urgently as in compound fractures, but at a time convenient to patient and surgeon. Secondly, in the case of fractures in the temporal region, depression should be suspected and special x-ray examination made to ascertain whether it is present and masked by the temporal muscle and a tense overlying temporal fascia. Lastly, deep depressions in the skulls of the newly born should be pressed out within a few months of birth, if during this time no tendency is observed for natural restoration to take place.

I am indebted to Miss J. M. Williams, of the Welsh National School of Medicine, for the drawings.

TEEPOL IN THE PREPARATION OF SPUTUM FOR TUBERCLE CULTURE

BY

P. BROWNING, M.B., Ch.B.

K. M. CALVER, Ph.D., B.Sc.

AND

E. E. PATERSON, B.Sc.

(From the Bacteriological Service, Hawkhead Laboratory, Paisley)

Demonstration of tubercle bacilli in sputum is necessary for diagnosis and for controlling risks to contacts, and is also, owing to recent developments in chemotherapy, of increasing importance in assessing treatment. Thus identification of this organism constitutes a growing duty of public health laboratories.

Pottenger (1930-1) showed that microscopical examination of a Ziehl-Neelsen film for 10 minutes will reveal less than 88% of positive specimens. The value of selecting a purulent portion of sputum for preparing films has been re-emphasized by Spendlove *et al.* (1949), who clearly demonstrated the superiority of this procedure as compared with concentration by alkali treatment and centrifugation, which seems to reduce the acid-fast properties of the organism. Corper (1928) stated that over 100,000 tubercle bacilli must be present per millilitre of sputum before they can be detected microscopically in a fairly thick film, while according to Cruickshank (1952) the number is from 10,000 to 50,000. Thus adequate direct examination of sputum films is time-consuming, and even when thoroughly carried out some 10% of positive specimens probably escape detection. Culture methods also have their defects, and some microscopically positive sputa fail to yield growths. Cruickshank noted as high as 27% failures with weakly positive sputa in general, and 68% when chemotherapeutic agents had been administered. However, it is clear from the work of Dubos (1946) that the tubercle bacillus is fickle in its reaction to artificial nutrient environments.

Direct examination and culture are complementary, and should be carried out in parallel in order to minimize false-negative results. This is all the more important since the valuable method of guinea-pig inoculation can be performed only on a limited scale and also has its failures. Recently the Public Health Laboratory Service Working

Party on the Diagnosis of Tuberculosis (Report, 1952) described very thorough experiments to determine which of four techniques for homogenization and culture of sputum yielded the greatest proportion of positives, and concluded that "sodium hydroxide proved significantly better than any other methods." We have obtained promising results by a different method which is exceedingly simple and rapid as compared with the alkali technique.

Method

The detergent "teepol," stated by the manufacturers to be a solution of sodium higher alkyl sulphates, was used to homogenize the specimen and kill contaminants. Trial sputa, mainly from sanatorium patients and received after one to three days in transit, consisted of 3-10-ml. specimens in 1-oz. screw-cap universal containers with "blackol" liners. First a direct smear was stained Ziehl-Neelsen and examined for five minutes by each of two people. The number of tubercle bacilli found in positive films during the 10-minute search varied from abundant to only one or two. To each specimen was then added an equal volume of teepol, the mixture being shaken once or twice for a few seconds and kept at room temperature for six hours in the case of a third of the specimens, the others being left for 24 hours. The result was a homogeneous and syrupy mixture. The whole surface of a slope of Löwenstein-Jensen medium in a universal container was inoculated with three small (2-mm.) loopfuls of each mixture and kept at 37° C. for six weeks.

Results

Of 142 specimens, 41 were positive microscopically, and growths of tubercle bacilli were obtained from all but one of the latter. Of the 101 microscopical negatives, eight proved positive on culture, two of which were examined for virulence and found to be virulent to the guinea-pig. Three further specimens, microscopically a positive and two negatives, were discarded because of contamination. Growth was usually observed in the third or fourth week.

It is not yet known whether the shorter exposure will yield a larger proportion of positive results, or whether the carry-over of a small amount of detergent benefits the culture, but apparently it is not harmful. The effect of larger inocula has yet to be tried. A 50% watery dilution of teepol often fails to homogenize and so to sterilize even in 48 hours, coliform organisms and yeasts mainly surviving. The method is apparently applicable to other types of specimen, urines having been successfully cultured.

The seventh annual report of the Institute of Child Health (University of London) includes an account of research undertaken or projected at the Institute during 1952. In January a full-time physiologist was appointed and is at present engaged on investigations of renal function. The Institute has undertaken supervision of the Population Investigation Committee's survey of growth and development being carried out by Dr. J. W. B. Douglas. At the Child Study centre the investigation into normal growth and development is proceeding, and the report of the results of the pilot survey was produced during the summer. Improved techniques of measurement have been introduced; x rays have been used to determine tissue depth, and an accurate method for assessing this has been determined. Dr. A. P. Norman has continued his clinical investigations of fibrocystic disease of the pancreas and (with Dr. L. I. Wolff) of hepatic and renal function in full-term and premature neonates. Dr. J. Dean and Mr. D. I. Williams have continued their work on nocturnal enuresis.

Medical Memorandum

Congenital Tracheo-oesophageal Fistula Without Oesophageal Atresia—With Resultant Asphyxial Death

Congenital tracheo-oesophageal fistula in the presence of a normal oesophagus is an extremely rare occurrence. The literature contains only isolated reports of this condition: two cases are described in which correction had been attempted (Imperatori, 1939; Haight, 1948). Haight reports having observed this anomaly in two out of a series of 65 cases of oesophageal anomalies.

CASE REPORT

An African woman aged 38 was brought to the Government mortuary. She had been found in a kitchen apparently dying, and soon afterwards, at hospital on October 27, 1950, was certified as dead.

At necropsy she was found to be well developed; weight 145 lb. (65.8 kg.); height 64 in. (163 cm.). There were bright red bilateral subconjunctival haemorrhages and subaponeurotic petechial haemorrhages over the frontal region of the scalp. The brain was congested and oedematous, and there was coning of the medulla. The heart muscle was flabby and friable; otherwise the heart was normal. The blood was very dark and fluid. Ruptured air vesicles were found along the surfaces of the lungs, which were slightly ballooned, congested, and oedematous, with mucus in some bronchioles. Midway down the oesophagus, and in the posterior wall, there was an old fistulous communication with the trachea, measuring 1½ by ¼ in. (4.4 by 1.9 cm.). The edges of this fistula were well rounded and firm. Lodged in the trachea, between this fistulous opening and the hypopharynx, was a single bolus of meat (see illustration). Curling of the epiglottis was noted. The liver, spleen, kidneys, and gastric mucosa were congested. The stomach contained a partly digested meal. The rest of the bowel was normal.

Photograph of specimen. Note the fistula in the otherwise normal oesophagus; also note the lower end of the bolus of meat showing in the upper part of the fistula while still impacted in the trachea.

A histological report on the lung read as follows: "Section of this lung shows that it is congested, with patchy extravasation of red blood cells and oedema fluid into the alveoli. In one of the small bronchioles there is an acute inflammatory exudate. The lymphoid foci in the lung substance are hyperplastic, with plasma-cell infiltration. The histological features suggest an early bronchiolitis." Histological examination of the edge of the fistula showed no evidence of any pathological condition in the tissues. The cause of death was asphyxia due to impaction in the trachea of a regurgitated bolus of meat through a congenital tracheo-oesophageal fistula.

The C.I.D. subsequently obtained the following history of the deceased up to the time of death: "Deceased had been employed for the past four years in domestic service by a Chinese woman in the City of Johannesburg. During this time she was periodically indisposed, and was treated at hospital; the nature of her complaint was not known, but it appeared that she was receiving injections in her breast, since she once reported to her employer that she intended discontinuing her hospital visits because the breast injections were too painful. On the night she died she was found by her employer lying on the kitchen floor 'shivering and with her tongue darting in and out of her mouth'; she was unable to speak. That evening she had been given soup-meat for supper. She was a small eater. She had always complained of pain in her chest."

Despite all efforts by the police no evidence of previous hospital treatment could be found. Such evidence at the best of times is extremely difficult to trace, let alone in the case of a deceased person.

DISCUSSION

The rarity of congenital tracheo-oesophageal fistula without other abnormalities of the oesophagus is substantiated by a review of the literature (Haight, 1948). The symptoms consist of choking and coughing coincident with the ingestion of food and particularly liquids. Leven and Lannin (1945) remark that because of difficulties in establishing the diagnosis the condition may continue to remain unrecognized and untreated, giving the impression of being an acute recurring pneumonitis. Also in patients who have survived more than a few days a recurring pneumonitis has been the reason for frequent admissions to hospital.

In the above case the initial appearances—namely, subconjunctival haemorrhages, subaponeurotic haemorrhages, cerebral congestion and oedema, colour and fluidity of the blood, ruptured air vesicles, and ballooning of lungs—all suggested an asphyxial death, and a very rapid one. Loubser (1945) states that when the process of asphyxiation is very sudden and complete, especially in those cases due to obstruction by foreign bodies, death takes place rapidly, with marked signs of asphyxia, and especially small subconjunctival or subaponeurotic haemorrhages.

The sequence of events suggested is that this woman was attempting to swallow a large bolus of gristly soup-meat (which aptly describes the impacted bolus), or that, owing to some sudden disturbance, she involuntarily swallowed the bolus, which passed partly down the oesophagus; and then, because of some vagal inhibition, spasm with regurgitation occurred, the bolus shooting upwards and backwards through the fistula and into the trachea and lodging there, with resultant complete obstruction and rapid asphyxia.

The question that immediately arises is, How did this woman live for so long with so large an asphyxial potential? The histopathology suggests that minute fragments of foreign material were inspired via the oesophagus through the fistula and via the trachea into the lungs, with resultant inflammatory foci. This would also explain her story of ill-defined chest pains for which she received hospital treatment over a number of years. Professor R. H. Mackintosh, medico-legal pathologist to the Union Government, suggested that a major catastrophe was prevented all these years because of purely mechanical reasons—namely, involuntary contraction of the oesophagus and trachea with swallowing, resulting in almost complete closure of the fistula as food or liquid passed down the oesophagus. This must be the accepted view.

I am indebted to Professor R. H. Mackintosh for permission to publish this case and also for helpful discussion. My thanks are also due to Sergeant D. J. van Schalkwyk, Assistant Curator, Government Mortuary, for photographing the specimen.

BENNIE KRAUSEY, M.B., Ch.B.,
Additional District Surgeon, Johannesburg.

Arrangements for priority and special rations for invalids are set out in a new edition of a Ministry of Food Memorandum, Med. 2 (1953). The Food Rationing (Special Diets) Advisory Committee of the Medical Research Council has recommended two changes in this edition. Patients suffering from an organic disorder affecting swallowing are to be granted an extra ration of fats in addition to the extra sugar which they are allowed at present, and the extra ration of fats and meat given to children with coeliac disease on a gluten-free diet has been extended to cover all adult cases of tropical sprue and steatorrhoea. The Memorandum is being distributed to all registered medical practitioners in the United Kingdom.

Reviews

FOUNDATIONS OF MODERN
PHARMACOLOGY

Adventures in Physiology, with Excursions into Auto-pharmacology. A selection from the scientific publications of Sir Henry Hallett Dale, O.M., G.B.E., F.R.S., M.D., F.R.C.P. With an introduction and recent comments by the author. (Pp. 652, with many figures. £6 6s.) London: Pergamon Press. 1953.

There are thirty papers and lectures in this book, chosen for continuity of interest; they are mainly on humoral transmission and histamine. One might wonder at first, as the author says he did, whether it was worth reprinting papers which were readily accessible—and, what the author did not say, papers which are already part of contemporary knowledge and regularly consulted by physiologists and pharmacologists the world over. The answer is that we have here, in collected and convenient form, a series of papers that have played a large part in the foundation of modern pharmacology, and indeed have made history. Moreover, the author has now added some valuable comments, or second thoughts, bringing the papers under the light of more recent knowledge. It is these comments which provide the really fascinating part of the book. They show that the author has not only continued to read widely, but has adjusted his earlier views to modern conceptions. Often, in preface and in comments, he refers to instances "in which accident seems to have favoured, or even to have prompted, some scientific enterprise of mine." And indeed, if we are to believe the author, not even the Three Princes of Serendip were more fortunate in their serendipity than he. One can only agree with him up to a point: in the extract above quoted the operative word is "enterprise." The crucial accident was that the author happened to be endowed with the genius and the enterprise to follow up the unexpected events which happen from time to time no doubt, though so often with no further consequences, to all of us.

Yet in spite of this good fortune, as he calls it, that eternal spirit of discontent which is part of the equipment of the scientific mind shows through at times. What he seems to regret is not having been endowed with precognition: "Doubtless I ought to have seen that *nor*-adrenaline might be the main transmitter" (in 1910); and, "Even more curious, however, is the fact that, by this time (1914), both Elliott and I seem to have become shy of any open allusion to the 'chemical transmission' theory, which he had originated ten years earlier." The title of the book is an apt one, for few research workers can look back on their earlier work with the same satisfaction, and with such searching self-analysis, and see that in retrospect it was more adventurous than appeared at the time. No better book could be studied by the young research worker needing stimulus and encouragement. There is a bibliography of 253 papers and lectures by the author.

The work has been well printed, and the illustrations have come out well; the opportunity has been taken for the correction of some misprints in the originals, not, however, without introducing some others—for example, in title No. 11, p. 26, where "retraction" should read "retractor."

C. LOVATT EVANS.

INFECTIOUS MONONUCLEOSIS

Infectious Mononucleosis. By Sidney Leibowitz, M.D. Modern Medical Monographs 5. (Pp. 164. \$4.75.) New York: Grune and Stratton. 1953.

This monograph is based on 25 cases studied in detail by the author and a review of the literature whose thoroughness is attested by a list of 377 references. It is possible to speak of various phases in the history of infectious mononucleosis: the clinical phase, in which glandular fever was recognized; the haematological phase, in which the changes in the blood picture were studied and the identity of acute mononucleosis and glandular fever was established; the serological phase

associated with the Paul-Bunnell reaction; and, most recent of all, the pathological phase. Knowledge of the pathology has come partly from biopsies of the glands and the liver, but chiefly from the 38 fatalities which have accumulated over the years, some from accidents and some from the disease itself. Infectious mononucleosis is not a killing disease, and the rare deaths are usually the result of rupture of the spleen or respiratory paralysis from involvement of the central nervous system. The picture at post mortem is one of widespread perivascular lymphocytic infiltration.

Readers of this monograph will probably be impressed by the frequency of involvement of the liver, the common occurrence of abnormalities in the electrocardiogram, and the seriousness of involvement of the central nervous system. When this last occurs, there may be few of the usual clinical features of infectious mononucleosis, and the mortality is high—about 11%. Dr. Leibowitz believes that the frequency of positive serum reactions would be increased from the present 83% to 100% if the tests were adequately performed, and he is sceptical of the existence of cases with a persistently negative Paul-Bunnell reaction. There is certainly evidence of the existence of an undefined virus disease or diseases which have a clinical resemblance to glandular fever but do not show the typical haematological and serological reactions. This is a clearly written, useful, and well-produced monograph, which gives a good account of this interesting disease.

OBSTETRICS IN PHILADELPHIA

Clinical Obstetrics. By Members of the Staff of the Pennsylvania Hospital. Edited by Clifford B. Lull, M.D., and Robert A. Kimbrough, M.D. (Pp. 732; 392 illustrations and 8 coloured plates. £4.) Philadelphia and London: J. B. Lippincott Company. 1953.

This book is written by 20 members of the staff of the Pennsylvania Hospital with Dr. Clifford B. Lull the editor initially. Unfortunately he died in 1951, and thereafter Dr. Robert A. Kimbrough assumed the leadership of the team and dedicated the work to the memory of the first editor. By and large it is an account of the practice of the division of obstetrics and gynaecology of a hospital whose history goes back more than 200 years. It is intended primarily for the use of the hospital's own students and as an adjunct to the practical instruction which they are given. Nevertheless, it is not far short of being a complete undergraduate textbook, and omits little which any student should know. Its style, presentation, and illustration are unusually attractive, and are worthy of study by anyone with ideas of writing a book.

This sumptuous production has clearly been a labour of love by a staff devoted not only to their work but to their hospital, whose tradition and eminence they wish to see maintained. So the foreword consists of a history of the Pennsylvania Hospital, and the closing chapters are concerned with maternal and foetal results obtained in their hospital, city, and state; with an analysis of avoidable factors in the deaths; and an indication of the training, standards, and obligations of obstetricians of the present and future.

Probably few in Britain will find themselves able to buy this expensive book, whose strongest appeal is to those connected with Philadelphia. Nevertheless the idea behind it and the excellence of its execution might well be copied by some of the older and larger teaching institutions here, those whose tradition for service, scholarship, and research deserves handing on to the new generation.

PATIENTS' ART

Experimental Studies in Psychiatric Art. By E. Cunningham Dax, M.B., D.P.M. Foreword by Sir Stewart Wilson. (Pp. 100; 51 illustrations. 18s.) London: Faber and Faber. 1953.

The earliest form of human communication known to us was in drawing and painting. The cave artists painted because they liked painting and not because they were sick. It gave expression to their creative imagination.

Dr. Dax, aware that the arts had been used extensively in mental hospitals, set himself the almost impossible task of organizing the output of the creative activity of the mind under standard conditions. Thus might we use the arts scientifically in psychological medicine. Scientific assessment of this work would, he believed, enhance its diagnostic and therapeutic value. This applied also to the playing of selected music to patients. He attempted experimentally to correlate the effects of music with the production of paintings. A record was played to the patients, and then followed nine and a half minutes of painting. These results were thought to be "statistically significant." Individual experiments were a failure because spontaneity was lost in the process, while group products were awkward material for evaluation and the results inconclusive.

Far and away the most important part of this interesting and original book is Dax's description of the facilities for art work at Netherne Hospital. He had an enthusiastic and invaluable collaborator in Mr. E. J. Adamson, who was in charge of the groups engaged in painting and drawing. He showed genius in establishing the right atmosphere in which the creative imagination of the patients could easily find expression. Mr. Dax is unnecessarily apologetic about the lack of scientific validation in the artistic productions of his patients. The invisible and unrecordable accompaniments which to the artist and others are the picture cannot be measured. The "art therapy" enthusiasts (and the doubters) will find this book well worth reading. They need not worry when they cannot prove the value of the painting.

E. A. BENNET.

BIBLIOGRAPHER'S DELIGHT

Jacob de Castro Sarmiento. By Dr. Augusto d'Esaguy. (Pp. 119. No price.) Lisbon: Edicoes Atica.

Jacob de Castro Sarmiento (1691–1760), an able and versatile physician of scientific tastes, practised very successfully in London during most of his active life. His career provides enough puzzles for the most ardent bibliographer, for his name appears in several forms and with several initials. He wrote in six languages, and all his works are rare and some very rare indeed. It has even been suggested that there were two or more men of the same or similar names.

Sarmiento was born at Braganza of Jewish parents who practised secretly the rites of their religion. Jews had been expelled from Spain in 1492. The Inquisition took longer to enter Portugal, where it never obtained the same hold. In that small country a certain number of Jews did succeed in maintaining an underground existence until able to declare themselves in quite modern times. Sarmiento at any rate gained some slight knowledge of Hebrew. He studied at the Universities of Evora and Coimbra and practised at Lisbon. In 1720 he came to London. There he attached himself to the synagogue of the Spanish and Portuguese Jews, acting as the physician to its members.

In London Sarmiento was one of the very earliest to advocate the practice of "variolation." This had been very recently introduced from the East by Lady Mary Wortley Montagu. It consisted in inoculation from the pus of a mild case of smallpox and preceded Jenner's vaccination by some 60 years. Sarmiento's first publication (London, 1721) was on variolation and was in Latin. In 1723 he printed a work of conventional Jewish piety which leaves no doubt that he had openly reverted to his ancestral faith. His rise in practice was rapid and was maintained. He was licensed by the College of Physicians in 1725, was elected to the Fellowship of the Royal Society in 1729 and to that of the College in 1739. He maintained a correspondence with scientific men in Portugal and Brazil, and in both countries his opinions continued to be highly esteemed. He introduced the Newtonian philosophy into his native land by his accounts of parts of Newton's works in Portuguese. He also translated into Portuguese certain works of his own edition of the works of Francis Bacon. Sarmiento's writings on *materia medica* long held the field. Late in life he left the synagogue. He had two sons, one of whom became a British general.

The writings of Sarmiento were chiefly in Portuguese and are very numerous, while he himself is credited by Dr. Augusto d'Esaguy with no fewer than 28 works. His reputation was maintained by editions of his works or of works ascribed to him for nearly three-quarters of a century after his death. The late Dr. Maximiano Lemos wrote a learned book on Sarmiento, but Dr. d'Esaguy has been able to add considerably to his list of Sarmiento's writings, though he does not include his contributions to the *Philosophical Transactions* of the Royal Society. Dr. d'Esaguy's reproductions of the title-pages of some of the rare and less accessible works of Sarmiento will be specially welcomed by bibliographers.

CHARLES SINGER.

SYPHILITIC OPTIC ATROPHY

Syphilitic Optic Atrophy. By Professor Walter L. Bruetsch. (Pp. 138; 30 illustrations. £2.) Springfield, Illinois: Charles C. Thomas. Oxford: Blackwell Scientific Publications. 1953.

This monograph appears at an opportune time. The development of blindness in the late stages of syphilis, coming on slowly and inexorably some 20 years after the infection had been incurred either in the congenital or acquired disease, had been recognized in a vague way for over a century and was fully established as a clinical entity in the 1880's by such writers as Fournier, Erb, and Westphal. To-day, although the incidence of the disease is much less in this country than it was a quarter of a century ago, it is still an important cause of blindness, while in the United States it has been variously estimated that there are between 25,000 and 50,000 persons blind from this cause. From time to time many theories have been advanced to explain the implication of the optic nerve, and until the revolutionary work of Lere in 1904 it was generally accepted that the main lesion lay in the ganglion cells of the retina; the atrophy was thus considered, and is usually called, "primary" optic atrophy. Pathological examinations have been relatively few, but the histological material gathered by Bruetsch fully bears out the view of the early French author that all cases of the disease have the characteristics of a secondary atrophy due to an inflammatory meningitis at the base of the brain affecting usually the intracranial portion of the optic nerve and the chiasma. It would therefore seem logical to substitute the term "syphilitic" for "primary" optic atrophy.

While the pathological material presented in this monograph is of very great value, the therapeutic corollary is of still greater importance, for the author contends, and backs up his contention with impressive material, that if diagnosed in its early stages the progress of the disease can be arrested. This is a novel view to take of a condition hitherto considered hopeless, and it depends upon the results of newer methods of therapy by malaria and penicillin. In the author's view these should replace therapy by the arsenamines. Early diagnosis in suspected cases—a matter which depends chiefly on a close study of the peripheral visual fields—is thus of paramount importance and holds the key to the eventual elimination of a disease which hitherto has been almost uniformly associated with tragedy.

The monograph is short, easily read, beautifully illustrated, and persuasive in its argument. It will be of unusual value to the syphilologist, neurologist, and ophthalmologist as well as the general physician.

STEWART DUKE-ELDER.

The new edition of the *Medical Directory*, in its handsome red-and-gold covers, contains the usual information about members of the medical profession and medical institutions. We learn from a table that nearly a quarter of the 46,000 doctors in England live in London, and that the 8,917 doctors in Scotland are 2,000 fewer than the London doctors. Published by J. and A. Churchill, the price is 72s. (two volumes). The *British Journal Photographic Almanack* 1953, as well as containing much of interest to any doctor whose hobby is photography, includes a section specifying the suitability of many photographic materials to special subjects in medical photography. It is published by H. Greenwood, London, for 5s. (cloth bound 7s. 6d.).

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JUNE 27 1953

SIR HENRY DALE'S OPUS

Not often has the work of one man and his associates been so richly fruitful as that inspired and carried out by Sir Henry Dale, O.M. Publication of some of his writings in a book (reviewed at p. 1434) is a reminder of the pervasive influence his work has had on the progress of medicine in the first half of this century. It was from 1904 to 1914, when Dale was working with Laidlaw at the Wellcome Laboratories, together with Barger, Carr, and Ewins, that the outstanding work was done which determined the lines of much that followed later. If the lectures are excluded, the papers from that period occupy nearly half the book.

Few papers have been written which have maintained their importance for so long as that published in 1910 by Barger and Dale on the chemical structure and sympathomimetic action of amines. It remains even to-day the principal contribution to this subject, the importance of which for all doctors is evident when we reflect on the extensive and still-growing use of substances like ephedrine, amphetamine, and isoprenaline. Closely connected with this work was that on the specific alkaloid which Barger and Carr obtained from ergot and called ergotoxine. Dale's exhaustive study of its action revealed that it prevented many of the motor effects of adrenaline, leaving the inhibitory actions unaffected. During the last twenty-five years there have been continuous efforts to find other substances with similar properties though more suitable for clinical use. A compound which can prevent the vasoconstrictor action of adrenaline may also lessen the vascular tone maintained by the sympathetic system and so be used to lower blood pressure in hypertension; but such a substance must not, like ergotoxine and ergotamine, itself cause vascular spasm and so be liable to cause gangrene. Almost every year recently a new substance has been introduced for this purpose, with varying success.

The development of the study of histamine, which was made together with Laidlaw and later with Richards, had important results for physiology and physiological methods, for pathology, and finally for therapeutics. The problem left unsolved by the papers written with Laidlaw in 1910 and 1911 was how to explain the fall of blood pressure which histamine

caused when injected into an animal, in view of the fact that it caused vasoconstriction on perfusion through the vessels of an organ. The results published in 1918 with Richards put forward what was then a revolutionary conception. This was that the capillary bed can vary greatly in size, can constrict or expand independently of the arteries, and plays an important part in determining the level of the blood pressure. It was found to be on this capillary bed, which did not function in conditions of perfusion as carried out until that time, that histamine exerts its action in the body. But for the publication of Krogh's work almost immediately afterwards, which came to similar conclusions on capillary activity by more direct methods, Dale and Richards would have received greater recognition for their discoveries than they did. Their results were obtained by devising conditions in which the vessels of the perfused organ behaved as they behaved in the body. The perfusion methods were developed further later on, and culminated in the Dale-Schuster pump, described in 1928, which has been an invaluable tool.

For pathologists the study of histamine was important on two grounds. First, the phenomenon of histamine shock described by Dale and Laidlaw in 1919 led them to conclude that "a large group of poisonous substances of animal or bacterial origin" could increase capillary permeability and thereby cause oedema and circulatory collapse. Secondly, the study of the action of histamine was related by Dale to his work on anaphylaxis, which he showed in a most convincing manner was due to the reaction between antigen and a precipitating antibody inside the cell. He explained the similarity of the effect of histamine in certain species to anaphylaxis in that species as due to the release of histamine by the antigen-antibody reaction, and expressed his belief that allergic responses arose in the same way. Therapeutics has gained finally because it is on the basis of this work that the antihistamine compounds have been found useful in so many allergic and other conditions.

But perhaps it is for his investigations on acetylcholine that Sir Henry Dale is best known. In 1914, before Loewi had given his demonstration of the humoral transmission of vagal stimulation, Dale wrote, "One can conclude that there is some degree of biochemical similarity between the terminations of voluntary nerve fibres in striated muscle and the mechanism connected with the peripheral termination of craniosacral involuntary nerves." In his book Dale now refers us to arguments set out by T. R. Elliott (to whom the *Adventures* are dedicated) in 1905 and 1907 for regarding the motor end-plates of striated muscle fibres as homologous with autonomic ganglion cells. No matter how the credit for this remarkable

prescience should be distributed, this 1914 paper of Dale's and the papers with Gasser in 1926 and with Gaddum in 1930, form a series of imposing preludes to the final demonstration in 1936 of acetylcholine as the transmitter of impulses passing along the voluntary motor nerves, in which Brown and Feldberg and Vogt all assisted. From this work has come the use of neostigmine in myasthenia gravis and as an antagonist of D-tubocurarine in anaesthesia. The work was followed by the demonstration of humoral transmission in ganglia, and from there the path has led to the methonium compounds and the use of hexamethonium to ensure a bloodless field in surgery.

This record, truly impressive in itself, is a justification too of the need for single departments of pharmacology and biochemistry where organic chemist, biochemist, and biologist should be able to study a problem together. We may fittingly conclude by quoting from a leading article in this *Journal* on the occasion of Sir Henry Dale's election as President of the Royal Society in 1940: "His life has been spent in the service of experimental medicine, and it is a remarkable fact that his major researches in the laboratory have subsequently found important application in clinical medicine."

TEAMWORK IN GENERAL PRACTICE

As last week's *Journal* went to press during the Annual Conference of Local Medical Committees it was not possible to include a complete account of the Minister of Health's address to it. Space and time only allowed us to report and comment on Mr. Macleod's observations on the rising cost of the pharmaceutical service and measures proposed to stabilize this. Confronted by a picked audience eager to hear him speak, Mr. Macleod responded by going beyond his prepared brief and quickly established a relationship with the Conference which should have wide repercussions. Maybe he will find it possible to repeat this experiment by addressing, one day, the Representative Body. What he said was in effect a straight answer to Left-wing assertions that the present Government is out to destroy the Health Service. Mr. Macleod sees in the N.H.S. a possibility to realize more fully than before "the full conception of the family doctor." The general practitioner must be, he declared, the leader of the domiciliary health services. More patients should be treated in their homes, in their own familiar surroundings, and fewer in hospitals. This would greatly enhance the value and interest of the work of the

general practitioner. He stressed the importance of direct consultation between family doctor and consultant. The general practitioner should be promptly informed when his patient leaves hospital, and when he referred a patient for consultation he should always receive a considered opinion from a senior member of the staff. The general practitioner should have direct access to x-ray and pathological facilities. He should be considered part of the hospital service of his area. There should be complete liaison between the general practitioner and the local health authority, particularly in preventive work. In this matter conditions varied in different parts of the country. Some feared that where many people were concerned with the welfare of the patient there was a danger of the general practitioner's being crowded out. Here Mr. Macleod emphasized once more that the general practitioner should be the clinical leader of the team. "We are engaged," he remarked, "in a great experiment in social medicine, but it must not be strangled by too much administration or too much central direction." He ended with a plea for co-operative effort between himself and his department and the professions engaged in the Service: "It is only in partnership that we are going to solve this problem and achieve the true potentiality of the National Health Service."

The Conference responded with enthusiasm to a Minister who did not hector or lecture to them, who spoke, indeed, not as a politician wishing to score debating points but as someone engaged in a different capacity in the same kind of work as others and wishing to make the best of it with them. The problems of general practice and of the general practitioner are not peculiar to this country. With local variations they are fundamentally the same in all countries able to make the fullest use of the resources of modern medicine. These resources cannot be brought to the sick person by any one practitioner working in isolation from his colleagues. Nor can they be parcelled out piecemeal by this or that expert on a conveyor-belt system. The service of the health visitor, of the physiotherapist, of the consultant and the specialist, of the clinical pathologist, must be co-ordinated and controlled by someone if the patient is finally to be treated as a whole person and not as an assembly of bits and pieces of disordered physiology. Mr. Macleod puts the general practitioner firmly in the centre of the picture as the clinical leader of the team whose various special skills are brought to bear on the diagnosis and treatment of the person whose mind or body is afflicted. And it is only the general practitioner who is in a position to relate all this to the individual circumstances of the patient as

a member of a family and to his work. Integration and co-ordination are in danger of becoming vogue words, but what they stand for is what is urgently needed in the practice of medicine to-day. The Minister of Health sees this work of integration and co-ordination in clinical work as the responsibility of the general practitioner. This is no novel conception; general practitioners have for years consistently pressed the Ministry for just those facilities and responsibilities which the Minister of Health now says should be theirs as of right. Mr. Macleod has driven it home in direct terms at a time when this was needed. General practitioners will be eager to respond to his challenge, and in doing this they will feel encouraged to look at their work, and the way they do it, in a fresh perspective—a perspective in which the N.H.S. becomes one instead of three separate services developing independently of each other.

COMPLICATIONS OF DIABETES

The complications of diabetes may affect any system of the body, and relatively few diabetics escape them completely. Elsewhere in this issue, for example, Drs. C. Hirson, E. L. Feinmann, and H. J. Wade report finding neurological abnormalities in 57 of 100 unselected diabetic out-patients; and Semple¹ found evidence of arterial disease in 42 of a similar series of 100 patients. The designation of the various non-metabolic lesions of diabetes as complications has been criticized on the grounds that there is often no relation between the duration and severity of the diabetes and their onset, and in fact that they often appear before the symptoms of the so-called primary disease. Beaser² found that only 65 of 190 diabetics (34%) had classical diabetic symptoms at the time of diagnosis, and in 36 (19%) diabetic complications were the presenting complaint. There are two possible explanations for this apparent paradox. The clinical onset of diabetes may be preceded by a long silent phase during which pathological changes develop in different parts of the body. Colwell³ went so far as to deduce from a study of insulin requirements at different ages and at different stages of the disease that diabetes begins at birth and has run half its course before it is recognized clinically. The alternative theory, supported by Dr. Wade and his colleagues, is that the metabolic upset is but one manifestation of a more general process and that the

manifold effects of diabetes arise from a common unknown aetiology. The answer should be found in studies of the relative incidence of so-called complications in patients with well and poorly controlled diabetes, but here the evidence is conflicting. Wilson, Root, and Marble⁴ found that, whereas 62 of 247 young patients with long-standing diabetes (25%) had diabetic nephropathy, all the 37 patients who had achieved good control of their diabetes had escaped it. On the other hand, Croom and Scott⁵ found no correlation between retinal and vascular changes and the severity or control of the diabetic state.

Wade and his colleagues classify the diabetic neuropathies into three clinical groups: first, hyperglycaemic neuropathies, characterized usually by pain and paraesthesiae without objective signs and quickly relieved by control of the hyperglycaemia; secondly, active neuropathies, more severe and complex neurological syndromes with a striking tendency to relapse and remission unrelated to alteration in diabetic control; and, lastly, asymptomatic neuropathies, found in 54% of their out-patients and characterized mainly by areflexia in the legs, absence of vibration sense and deep pressure sensation, and, sometimes, abnormal pupillary reactions. On page 1405 Drs. Hugh Garland and D. Taverner report under the title "Diabetic Myelopathy" five cases of a syndrome originally described in 1890 by Bruns. The patients were between the ages of 56 and 73, and all had relatively mild diabetes of short duration, the longest history being three years. All complained of severe pain in the legs, always symmetrical and tending to be greatest in the hip and thigh. The leg muscles were wasted and there was impairment or loss of the tendon reflexes in all five patients; three had unequivocal extensor plantar responses; none had any objective sensory disturbance; four had raised protein in the cerebrospinal fluid. The authors suggest that the cord changes responsible for this syndrome may well be secondary to atheromatous degeneration of the spinal arteries. The complete recovery of four of the patients when their diabetes was controlled is perhaps against this theory: and Wade and his colleagues concluded that there was no evidence to incriminate either arteriosclerosis or vitamin B₁ deficiency as causal factors in their cases. Whatever the cause of these neuropathies, the very rare association of diabetes with Friedreich's ataxia, reviewed in this issue by Drs. D. W. Ashby and P. S. Tweedy, appears to be genetically determined.

Some practical points emerge from consideration of the complications of diabetes. The importance of routine urine testing, whatever a patient's presenting complaint, should hardly need stressing; but even in

the absence of glycosuria a blood sugar curve may occasionally be helpful in diagnosis. Secondly, full clinical examination of all diabetics at regular intervals is clearly essential. Not only will this often lead to the finding of lesions in the nervous system, the vascular system, the eyes, and the kidneys, but now and then it will bring to light an associated disease such as haemochromatosis. This condition is probably not so rare as was formerly thought, its recognition has been simplified by the discovery of characteristic serum iron changes,^{6,7} and its early diagnosis assumes more importance in view of the possibility of treatment by phlebotomy, to which Houston⁸ recently drew attention.

ANTIBIOTICS IN NATURE

The publicity given to the intensive search for new antibiotic-producing organisms during the past decade has tended to obscure the biological role of antibiotics. Microbiologists have been interested in the general phenomena of the action of micro-organisms on one another since the first serious attempts to cultivate them were made,¹ and both beneficial and harmful relations were recognized and studied before any specific stimulatory or inhibitory metabolic products were isolated. The battles often so strikingly displayed on laboratory culture media probably also took place under natural conditions in the soil, and plant pathologists were quick to appreciate that their study might lead to new methods of controlling plant diseases, especially those caused by soil-borne root-parasites. For example, Weindling² found that the soil fungus *Trichoderma lignorum* produces a lethal substance which enables it to parasitize a number of pathogenic fungi. Attack on *Citrus* seedlings by *Rhizoctonia solani* in sterile soil was largely prevented by adding spores of trichoderma to that soil. Other examples of this kind have been recorded in the vast literature that has accumulated.^{1,3} As a result of all this work it is now known that several different kinds of antagonistic association take place in culture or in soil.

Direct parasitism of one organism by another is a form of antagonism, and many examples of it have been found among the fungi.² For example, species of *Piptocephalis*, moulds belonging to the Mucorales, are obligate parasites on other moulds of the same order. However, the majority of soil fungi are saprophytes and exert antagonistic effects in other ways.⁴ Many fungi are able to suppress the development of other organisms by bringing about growth conditions generally unsatisfactory to them. They produce simple chemical compounds—e.g., citric acid, ammonia, carbon dioxide—which are in a sense antibiotics but act non-specifically and mainly by causing large changes in soil acidity. Other fungi—e.g., *Penicillium* spp.—and particularly filamentous

actinomycetes of the genus *Streptomyces*, produce specific inhibitors, toxins, and lytic enzymes (true antibiotics). Finally, competition between micro-organisms for some limiting nutrient is also a factor which may retard their growth and may affect some organisms more than others in the mixed population.

The effects of antibiotics are frequently so striking in culture that they might well be thought to be very important in nature in controlling the microbial populations in soils. However, soil is complex and heterogeneous, both chemically and in physical structure, and in it exist vast numbers of organisms of many types in very close association with each other. All types of antagonistic and beneficial association are taking place at once, and it is impossible with present techniques to disentangle the different effects and assess their relative importance. Antibiotics undoubtedly will be produced in certain soil conditions, but it is less certain that the organisms producing them will benefit by it. Many antibiotics are inherently unstable and unlikely to persist; they may be adsorbed on to soil particles, and they are often broken down enzymatically by other micro-organisms not susceptible to their inhibitory action. For instance, Daines⁵ found that a substance produced by *Trichoderma lignorum* was toxic to *Streptomyces scabies* (the organism causing scab of potatoes) in artificial liquid medium but was rapidly destroyed when added to soil.

The artificial addition of antibiotics in quantity to the soil might prove of value in farming or horticulture, but in view of the complexity of soil the prospects are not very bright. Very little work has so far been done in this direction, and it is not known what changes in soil fertility or partial sterilization might be induced. The converse process, artificial addition of living bacteria, has, however, been studied in the hope that organisms capable of producing antibiotics against the added bacteria would be stimulated to develop. Enrichment of soil in this way does usually lead to the enhanced development of various groups of organisms in it, and in some cases new antibiotics have thus been found. Dubos⁶ added various pathogenic cocci to soil at intervals over a period of two years and succeeded in isolating *Bacillus brevis*, which produced antibiotics (gramicidin and tyrocidin) active against them.

However, in general there is very little proof that organisms so stimulated have necessarily produced or are able to produce antibiotics against the introduced organism. Indeed, it is difficult to see why the ability of one organism to produce an antibiotic against another should encourage it to develop in the presence of its victim, unless it is also able to utilize the cell substance of the inhibited organism. This has been shown to occur at least in culture with some of the myxobacteria, which not only produce a bactericidal secretion but a lytic substance which enables them to draw their nutrients from lysed bacteria. Have antibiotics a significance in evolution? So far it has not been possible to prove that those formed naturally in soil can influence the balance of microbial populations there, and therefore ability to produce an antibiotic is unlikely to favour the survival or development of the organism which makes it. Antibiotics may be only excretion products which accidentally at the most confer advan-

tage by cutting down the competition for available foodstuffs. As yet it is not possible to pronounce definitely, and the biological role of antibiotics remains somewhat of a mystery.

PROGNOSIS IN DIABETIC PREGNANCY

The successful solution of a problem in medicine often brings in its train other, if less serious, problems. So with diabetes mellitus: the adequate treatment of it by insulin has provided an increasing number of pregnant diabetics to perplex physician, obstetrician, and paediatrician. In a paper at p. 1413 of this issue of the *Journal* Dr. Wilfrid Oakley has concerned himself with the outlook for the pregnant diabetic and her baby. He confirms that the insulin requirement usually rises after the fourth month of pregnancy at a time when the renal threshold for sugar usually begins to fall. This may lead to heavy glycosuria and severe ketosis in a previously well-controlled diabetic, but with proper supervision there should be no maternal deaths from diabetic coma. Oakley found it difficult to assess the remote effects of pregnancy on the march of the disease, because increased insulin requirement, retinitis, and hypertension and albuminuria can all occur independently of an intervening pregnancy, but he does not consider that pregnancy increases the chances of such complications developing. In particular he concludes that toxæmia of pregnancy does not involve a greater risk in the diabetic than in the non-diabetic of precipitating permanent hypertension.

But if the outlook for the pregnant diabetic in terms of mortality and morbidity continues to improve, the prognosis for the baby remains clouded by a foetal loss of over 25%, a high rate which Oakley finds largely unexplained. He is unable to support views that the foetal loss is related to the duration or severity of the diabetes or to the age of its onset. In particular his figures deny that toxæmia is the cause of the high foetal death rate, and he therefore concludes that any form of therapy directed against toxæmia cannot appreciably increase the foetal salvage rate. This conclusion is diametrically opposed to the views of Dr. Priscilla White in Boston, as expressed most recently in a full account of 525 viable pregnancies in diabetic women treated between 1936 and 1951.¹ She considers that the four factors affecting the foetal mortality are the disturbed metabolism of diabetes, sex hormonal imbalance, the degree of maternal vascular disease, and congenital malformations. She emphasizes that the second of these is at least as important as the first, for it favours toxæmia, premature labour, and intrauterine death, and that it is just as amenable to treatment. The hormonal imbalance is said to be characterized by a high level of serum chorionic gonadotrophin, a low level of serum oestrogen with abnormal ratios of its degradation products, and a low level of urinary pregnanediol excretion—findings which have not been fully confirmed by others.² This imbalance is said to be correctible by the administration of increasing doses of stilboestrol and progesterone, which for the best results

must be given parenterally; the response to them can be assessed by laboratory tests. The theoretical basis for this hormone therapy is not generally accepted, and it is interesting to note there has been some change in emphasis from the claimed stimulative effect of such treatment on the placenta to its substitutional value. Yet the results in White's treated group, in which hormone therapy was a very important but not the only feature of management, are remarkable, 345 out of 380 babies being born alive. Consequently the results of the current controlled investigation by the Medical Research Council in this country into the value of such hormone treatment are eagerly awaited.

If Oakley and White differ on the question of treatment with oestrogen and progesterone, they apparently agree on several other points of management. Thus, although others may disagree,^{3,4} they both regard caesarean section at about the 37th week of pregnancy as the method of choice for delivery. One result of this interference is to shift the emphasis from stillbirths to neonatal deaths. Discounting the importance of hypoglycaemia, and disregarding those deaths due to congenital malformations, both agree that neonatal death most often occurs within 72 hours of birth and is usually due to respiratory failure, which White attributes to hyaline membrane disease. This is a field of neonatal paediatrics which requires further illumination, and it is encouraging to note that research is being pressed forward both in London and in Boston.

CHRONIC OTITIS EXTERNA

The term chronic otitis externa covers a multitude of different clinical appearances, though with few exceptions the essential lesion is an eczematous inflammation of the skin lining the meatus and concha. At one time chronic middle-ear discharges were commonly seen, and it is perhaps surprising that the skin of the external meatus was not more often the seat of pyoderma. Indeed, otitis externa is limited in most cases to the outer third or cartilaginous part of the meatus, the inner part and the drum remaining healthy.

The affection is most often seen in middle adult life and is probably more common in men. Scalp dandruff and other signs of the seborrhoeic state are often present, and when the eruption extends from the meatus to the concha and the neighbouring skin of the neck and face it usually takes on the characteristic appearance of that disease. But this is saying little more than that such a patient appears to be particularly susceptible to eczematous eruptions with local, low-grade, superficial infection of the skin; he is at the same time particularly liable to develop epidermal sensitivity and to give adverse reactions to antiseptics and antibiotics applied locally. Of the underlying nature of the seborrhoeic diathesis, of its relation to endocrine function, diet, and infections of the upper respiratory tract, there is no precise knowledge.

Otitis externa often starts insidiously with a slight scaling and irritation of the outer part of the meatus, accompanied by scalp dandruff and possibly low-grade seborrhoeic dermatitis of the head or trunk. The skin

of the meatus is tightly bound down to the cartilage, leaving little room for oedema swelling. It is well known that severe pain may result from comparatively slight oedema of the meatus, and it seems likely that irritation is also accentuated. Scratching is violent and paroxysmal, and paves the way for secondary infection. Emotional tension will usually increase itching and scratching, so that the patient's mental attitude may assume great importance and account for the intractability of the otitis.

For some years past it has been said that fungus infections are common in this situation, though current experience in the United Kingdom does not seem to support this view. More often the common streptococcus and staphylococcus are responsible, and since antibiotics began to be used *Pseudomonas aeruginosa*, which is resistant to them, has often been found. Scratching, the mild trauma of dressings, and ear-syringing may all predispose to the development of secondary infection, and exacerbations often seem to result from exposure to water in swimming. Periodically infection of the epidermis spreads to the dermis and subjacent tissues with the production of cellulitis, which may be exceedingly painful; localization of this to actual furunculosis is unusual. The occurrence of secondary infection, seeming to prolong and exacerbate the original disorder, naturally suggests treatment with antiseptics and antibiotics. But if this treatment is continued for more than a few days epidermal sensitization to the application is apt to develop, resulting in a rapid spread of weeping dermatitis to the pinna and surrounding skin. When this stage is reached the aetiological factors are confused and may be most difficult to unravel. It is then far easier to do harm with treatment than good.

Treatment is almost entirely a matter of local applications, but great caution should be exercised in the use of local antiseptics. The common hospital practice now is to identify infecting organisms in culture, to determine their antibiotic sensitivities, and to give treatment accordingly. Although this is, no doubt, the theoretically correct procedure, it is doubtful whether in practice it yields particularly good results. Organisms seem to change their sensitivity, and superinfection with resistant organisms so readily occurs, that better results are often obtained with antiseptics having a wider bactericidal effect. Proprietary preparations containing chlorhydroxyquinoline or iodochlorhydroxyquinum ("quinoxin" cream and "vioform" cream) seem at present to offer a good compromise between antiseptic activity and the possibility of irritation or sensitization. Even so, it is probably best to limit their use to a few days while the worst of the infection is overcome, and to cease the application before the skin has had time to become sensitized. Four or five days' antiseptic treatment is nearly always safe and is nearly always sufficient. After this the treatment is that of eczematous dermatitis and varies according to the degree of activity of the inflammatory process. At all stages emulsified bases such as unguentum aquosum B.P. are likely to be preferable to purely greasy applications, though in the more chronic stage Lassar's paste can hardly be bettered. As an antipruritic 2% or 3% liquor picis carbonis may be added to the application. The antihistamines have proved, as

was expected, to be inclined to cause epidermal sensitization and contact dermatitis when applied locally; their use in otitis externa involves considerable risk of this complication and is seldom advisable. X-ray treatment can be extremely successful. It is probably best withheld until the condition has reached a quiescent stage, whether with treatment or spontaneously, when repeated small doses of superficial x rays will often prevent recurrence.

POISONOUS FISH

Such scientifically highly civilized parts of the world as the British seaside are virtually free of fish lurking to sting or lacerate the unlucky bather. Nor do the sea fisheries of Western Europe trawl up fish poisonous to eat, and anyone who has been served with a Mediterranean fritto misto of starfish, sea cucumber, squid, and other members of the molluscan, arthropod, or echinoderm phyla will testify to the fact that most sea creatures are amazingly innocuous to the digestion. But it is otherwise in the Tropics. The director of fisheries in Malaya recently lectured¹ to the Malayan Branch of the B.M.A. on the various kinds of catfish, sting rays, and scorpion fish provided with sharp spines and puncture poisons of unknown composition, and on the puffer fish, which blows itself up like a football when disturbed and is dangerous to eat. Sea snakes also are common around Malayan shores, the commonest species being four or five feet long and its venom eight times as poisonous as that of the cobra, of which it is a relation. It is good to know that "sea snakes are gentle and inoffensive creatures, and do not bite unless they are provoked."

The treatment of injuries caused by fish appears to be best carried out by sucking out the poison and spitting it away, opening up of the wound as quickly as possible, and washing with permanganate. Cortisone may be a useful adjuvant in severe cases, for it has been found helpful in cases of snake-bite poisoning.² The Malay peoples have various "cures" for catfish poisoning, some of which are herbal, and it would be interesting to know whether they have a useful pharmacological effect or are purely magical. As for the puffer, whose body contains alkaloids which produce respiratory and cardiac failure, it is apparently a Japanese delicacy. If all its viscera are removed immediately it is caught it is said that the poisons have no time to diffuse into the adjacent flesh, which is then quite wholesome. But accidents have been recorded.

At the annual general meeting of the Royal Statistical Society on June 24 the Guy Medal in Gold was awarded to Professor A. Bradford Hill, who, in the words of the report of the council of the Society, "has occupied for many years a pre-eminent position in the field of medical statistics, in which he commands the highest regard not only in this country but also overseas. It was a tribute to his international reputation that he was recently elected an honorary fellow of the American Public Health Association 'in recognition of his outstanding services in the field of public health.'"

REFRESHER COURSE FOR GENERAL PRACTITIONERS BREAST-FEEDING DIFFICULTIES

BY

F. CHARLOTTE NAISH, M.D.

Feeding difficulties fall naturally into two divisions: overfeeding and underfeeding, but the former is far less common and less important than the latter. When the supply of milk is abundant and it flows freely an active, greedy baby may take too much. Perhaps six out of ten of these babies promptly vomit the excess and make normal gains in weight; these present a laundering difficulty but not a feeding difficulty. Perhaps two more retain the excess and make exceptional gains in weight: as the food is well balanced, the growth is well balanced, and so, again, there is no feeding problem. The remaining two babies may suffer from frequent loose stools, through overloading their stomachs. Since frequent loose stools are also (and much more commonly) a sign of underfeeding, the first essential is to verify by test-weighing that the baby is really taking an exceptional quantity. If this is found to be so, then no immediate treatment is necessary, for the condition is not serious and usually rights itself. In no case should treatment aim at reducing the milk supply, for such treatment nearly always overreaches itself and creates an underfeeding problem. If it is considered essential to reduce the bowel action, this should be done by giving an emulsion containing 2 minims (0.12 ml.) of castor oil and 20 gr. (1.3 g.) of mucilage of acacia to the drachm (3.5 ml.) of water. One drachm before feeds is a suitable initial dose, and the dosage can be freely varied according to the result obtained.

In all other cases of difficulty the baby gets too little milk.

Recognition of Underfeeding

The number of babies classed as underfed will depend largely on the doctor's standard of satisfactory weight gain. There is wide variation in this. From the fourteenth day to the end of the third month the weekly gain is independent of the birth weight and should not be less than 6 oz. (170 g.). Eight ounces (230 g.) is a reasonable target for boys and 7½ oz. (210 g.) for girls. This does not mean that these gains can be looked for every week: such progress often occurs, but probably cannot be ensured in any way. But it does mean that every baby gaining less than 6 oz. (170 g.) is to be classed as momentarily underfed, and corrective measures applied so that it shall gain from 18 to 24 oz. (500 to 700 g.) in any and every spell of three weeks. It is not enough merely to get back to gains of 6 oz., but the arrears should also be made up.

Though it is true that loose greenish stools are generally a sign of underfeeding, the bowel signs are ambiguous. It is better to base treatment on weight and use the return to normal stools as a check on the adequacy of the measures taken.

When dealing with mothers who are not satisfied with the progress of their babies, one must remember that the babies are under constant observation by people who are concerned for them; in consequence the number rightly referred to a doctor greatly exceeds the number referred unnecessarily. Moreover, if the mother worries without cause it is bad for the baby; so much so that there will ultimately be a feeding difficulty if the case is dismissed without study and explanation. Often, however, the history will be overlaid with interpretation, so that in its first form it is useless: the essential facts may need to be elicited by cross-examination.

The main causes of underfeeding are mechanical difficulties, which may be in connexion with the mother, the baby, or both; infections; and insufficient flow or secretion of milk.

Mechanical Difficulties

In the baby, difficulty may be caused by nasal obstruction. There may be a congenital malformation of the nasal passages which, if severe, results in great respiratory distress, as the infant's reflexes are not adapted to purely oral breathing. Such cases are not primarily feeding problems, and are unsuitable for domiciliary treatment. Partial nasal obstruction may result from an upper respiratory infection, and may be treated with nasal drops before the feed. Chlorbutol and menthol nasal drops (N.F., 1952) are useful for this.

Hare-lip and *cleft-palate* constitute a bar to feeding at the breast, but not necessarily to feeding with human milk, provided the mother is good at manual expression of her milk. Breast pumps are in general unsatisfactory because they work by suction alone, without expression. This does not produce enough milk from the breast to maintain the supply.

Tongue-tie has been so often diagnosed in error that some teachers have reacted so far as to deny its existence. Although it is rare, I believe that it does occur and is well worth treating. Part of the process of getting milk from the breast consists in compressing the nipple against the palate by drawing the tongue along it. Occasionally the tongue is not mobile enough to carry out this movement. In some babies labelled "bad suckers" it can be observed that the tongue never comes forward beyond the lower lip or, in extreme cases, beyond the lower gums, and, as a confirmatory sign, the tongue does not point normally in the forward position, but shows a double curve and central recess. If the fraenum of such a tongue is snipped the tongue will point normally—sometimes at once but more usually after about three days. The "bad sucking" is completely cured.

In the mother, *malformed nipples* are a fairly frequent cause of difficulty. If observed early they can be cured by the wearing of "Woolwich-type" nipple shields for the remainder of the pregnancy. Even if the condition is not observed until near the confinement it is still worth ordering the shields; though, as their action is gradual, they will not be nearly so effective.

If the practitioner does not see the mother until the nipples are actually causing difficulty in feeding, then the matter is serious. A breast pump may sometimes be applied just long enough to draw out the nipple to its fullest extent, and the baby immediately substituted; but this will not be enough in severe cases. The most generally applicable method of feeding an infant on human milk when the mother's nipples are not usable is for her to express the milk by hand. Her ability to do this well usually depends on her having practised daily expression of colostrum for six weeks or so before the confinement. A breast pump should not be used to obtain milk, for the reasons given above. Faulty nipples, if not treated in time, may spell defeat, even though everything else is propitious.

Cracked nipples are even commoner than malformed nipples, and, like them, can be almost entirely avoided; if they occur, they constitute a very serious difficulty. The two main causes of cracked nipples are: (1) failure to keep the skin soft by oil-massage during pregnancy and, in the worst cases, deliberate hardening by scrubbing and spirit lotions; and (2) excessive suckling during the first three to four days after the birth, before the milk has "come in." It is most regrettable that much traditional teaching advocates both these faulty procedures.

A cracked nipple cannot heal while it is in use, so that suckling must be temporarily given up. Also, every cracked nipple is liable to infection and needs to be softened—ends which can be met by the exhibition of penicillin cream during the resting period. If there is a yield of milk to be preserved manual expression should be performed. The breast pump is even more definitely contraindicated than in the treatment of malformed nipples, for the suction, in elongating the nipple, opens the crack, and is just as painful as suckling. Nipple shields of the type through which the baby sucks are to be classed as pumps in these respects. If cracked nipples due to both hardening of the skin and excessive suckling coincide with engorgement the position is more serious still, as the epithelium of the nipple becomes oedematous and liable to further damage.

Some degree of engorgement is usual between the third and tenth day after birth. If it is severe and not properly handled the breasts may become swollen, hard, hot, and superficially oedematous. The areola, under which lie the main collecting sinuses, will be too taut for the baby to grip and squeeze between its jaws, and in consequence feeding is impossible until the tension subsides. This will happen after two or three days; but those are days of starvation for the infant, of acute discomfort with a high liability to mastitis for the mother, and of internal damage probably leading to partial involution for the breasts themselves. Treatment is therefore advisable, and the most effective method of shortening the engorgement is the exhibition of stilboestrol: three doses of 5 mg. at four-hourly intervals. In the most severe cases a larger first dose, up to 20 mg., has been recommended. Stilboestrol treatment is suspected of having some permanent effect on the lactation in a fair proportion of cases, but it reduces the danger of mastitis and the period of starvation.

If the doctor is at hand at the beginning of engorgement, then the best way of forestalling the acute phase is to institute a regime of frequent but short feeds, perhaps two-hourly feeds of five minutes each side. The baby is usually hungry enough at this stage of its life to accept such a regime and feed vigorously, provided that its rest is not cut down too much; this is one reason for keeping the feeds short. Such feeds may be followed by careful expression by hand (by the mother, because she is less liable to damage the underlying tissues), but care should be taken to see that she does not get too anxious and exhausted. This regime is most successful when it has been explained in the course of ante-natal education: it is quite impossible if, at the same time, the nipples have been allowed to become cracked.

Infections

Many babies with infections do not present only a feeding difficulty, and the doctor will quickly sort out those with a frank pyrexia, with obvious respiratory difficulty, or with acute diarrhoea. However, the class of infected babies includes many more than these. There are many mild infections which are very difficult to recognize. On the whole subject of infection in infancy, no one should omit to study Cruickshank (1945) and Moncrieff (1953). A history of loss of appetite, or of vomiting of sudden onset, or of offensive stools is suggestive of an infection; abnormal redness of the mucous membranes or of the finger-tips (as though a number of whitlows were forming) is a sign pointing in the same direction. There may not be actual loss of weight, but the gain is sure to be low. Many such infections pass unrecognized.

The treatment of an infection should be the immediate exhibition of penicillin by injection, in doses of 300,000 units (suspended) every 24 hours. Without prejudice to the question of how antibiotics should be used in adults, there must be no delay in giving them to infants, in whom an infection may not provoke any physiological reaction.

Inhibition and Failure of Lactation

It may be difficult to distinguish clinically between inhibition of the flow of milk and failure of secretion as causes of underfeeding.

If, when the baby is taken away from the breast after about two minutes, milk is seen to be squirting from the nipple it can be assumed that there is no inhibition of the flow of the milk. This simple test is either positive or indecisive, never negative. On the other hand, if a baby takes the breast eagerly, but soon refuses to suck, cries vigorously, and will not make another attempt, it can usually be assumed that the contraction of alveoli and ducts in response to the stimulus of sucking has been inhibited. Once more the absence of this behaviour means nothing. The time at which underfeeding occurs is some guide to the probable cause. Since the growing baby demands more and more milk, the later underfeeding occurs the more likely it is to be due to a lack of active tissue in the breast. The same line of reasoning indicates that a gradual drop in the baby's gains is probably due to inadequate secretion; a sudden drop to inhibition of flow.

The causes of inhibition of flow are psychological, but fortunately they are usually superficial. It is extremely common at the moment when the mother takes sole charge of the infant and at the same time resumes her household duties. Worries quite unconnected with the nursing couple may inhibit the flow at any time. So may uncongenial people in the entourage; a midwife or mother-in-law may easily prejudice the success of breast-feeding.

Either cause of underfeeding may produce the other. If the mother is worried because the baby's growth is slowing down, this may add failure of flow to failure of secretion. And if the inhibition of flow, when secretion is plentiful, leads to stretching of the breasts the secretion will be reduced. In addition, underfeeding through failure of the flow is a self-aggravating condition—that is, the fretfulness of the underfed child worries the mother and so prolongs her inability to give the milk which is present in the breast. This underlines the need for prompt and firm treatment when a baby is gaining insufficiently; it is important to deal with the situation before secondary causes come into operation.

Treatment of Underfeeding

The first line of treatment is complementary feeding. Provided a good technique is used (see below) this method will ensure immediately an adequate intake, with the highest possible proportion of human milk, it will ease the mother's anxiety, and permit a return to full breast-feeding if the flow or secretion of milk is restored. It is also largely self-regulating.

Other treatment may also be required. If the mother is nervous or the baby cross, sedation may be advisable; for the baby syrup of chloral, 15 minims (0.9 ml.), should be given half an hour before the feed. If inhibition of the flow of milk from the gland is the cause of underfeeding, some psychological exploration of the situation will be necessary. Simple measures, such as feeding in physical comfort, in solitude and quiet, and without haste at the start, are often all that is needed. If the secretion is inadequate the mother's output will be increased by shortening the interval between the feeds, for this keeps the gland in full activity for more of the day. The length of the feeds should not be increased; it may have to be cut down if the frequency of feeding is reducing the baby's sleep. In a few cases of only slight underfeeding, treated early, this method may take precedence over complementary feeding. In cases in which failure of flow is the primary cause of underfeeding there is no indication for feeding more often, and to do so might increase the tension already present in the situation.

The technique of complementary feeding deserves careful attention. Any normal artificial-feeding formula will serve for the complement, for, though the baby is unaccustomed to any but human milk, the amount of complementary feed that it will have to take is usually small. The complement should be offered immediately after the breast-feed; it must therefore be prepared beforehand and kept warm during the feed. It should be given by spoon from a cup; the quantity to be given is what the infant will readily take. If the complement is given from a bottle, only the second of the four

purposes of complementary feeding (allaying anxiety) will be fully achieved. There have been disputes on this question, and many cases have been cited in which an adequate intake was immediately secured and the mother's anxiety was allayed. But no cases have yet come to my notice in which the proportion of human milk in the diet was the highest possible or in which a return to full breast-feeding was practicable without a sacrifice of weight gain.

Conclusion

Finally, brief mention must be made of three conditions which may worry either the doctor or the mother—namely, failure to establish lactation, vomiting, and constipation.

Non-lactation is often diagnosed too soon. It is important at all times to give sips of sterile water (with or without sugar) to allay the baby's thirst, as this interferes with its rest more than hunger does. But artificial feeds should not be given until the eighth day or until the baby has lost 15% of its birth weight, whichever is the earlier; and they should not exceed 1 oz. per lb. (60 ml. per kg.) of body weight a day until the fourteenth day. If by that time the milk is still not coming in in effective quantities it may be doubted whether lactation can be established.

Vomiting is a constant cause of complaint. Few mothers (strange though it seems) expect milk to be curdled in the stomach, so that the curds in the vomit alarm them. Vomiting should be judged in relation to test feeds and weight gains. If it seems that the baby's progress is affected by the vomiting, and there is no infection, then belladonna, 5 minims (0.3 ml.) of the tincture in water, or atropine methonitrate, 2 to 5 drops, should be given before the feeds. Even when the infant's progress is not affected, this treatment may be necessary to quieten the mother. If the vomiting continues in significant quantity, a stomach wash-out should be given to determine whether there is mucous gastritis; if large quantities of mucus are found the treatment should be repeated daily until the condition remits. The only cases of vomiting needing weaning are those which follow on puerperal sepsis.

Constipation is usually a false report. What is nearly always meant is that the motions are infrequent, but the stools are normal in themselves and passed without strain. The condition demands no treatment whatever. In the rare cases in which the stool is hard and difficult to pass (and pyloric stenosis has been excluded) a mild laxative should be given, such as mist. magnes. hydrox., B.P., $\frac{1}{4}$ to 1 drachm (1.7 to 3.5 ml.), or syrup of senna, 15 to 30 minims (0.9 to 1.8 ml.).

The number of points at which prevention is not only better than cure but also much simpler is worth stressing. Regular supervision will always lead to greater success than can be secured by interventions to deal with difficulties.

LINGUA MEDICA

A STUDY IN MEDICAL SEMANTICS*

BY

FFRANGCON ROBERTS, M.D.

Socrates: He who first gave names gave them according to his conception of the things which they signified, and if his conception was erroneous . . . shall we not be deceived by him?—PLATO, *Cratylus*.

The meaning of anything is usually another name for the same thing.—CHARLES CHAPLIN, *Limelight*.

The language of medicine has more than utility value. It enshrines the ideas about disease which were held by primitive societies, the gradual evolution of medical knowledge in 2,500 years, and the geographical course which this knowledge has taken. It illustrates the mental processes by which men in all ages have found names for natural phenomena, incidentally giving us glimpses of their domestic, agricultural, and military background, and it explains why medical concepts, however modern, are still most accurately expressed in the language of Hippocrates.

Sources

The principal sources of medical words are five: Saxon, Graeco-Roman, Romance, Arabic, and Modern German.

Saxon

This source comprises our native Anglo-Saxon, together with Scandinavian, Teutonic, and other languages of North-west Europe. The words which it furnishes are all short, and express simple ideas—*head*, *hand*, *ache*. Their derivation is of no interest except to students of these languages.

Graeco-Roman

This is, of course, the most prolific source. The Greek component derives from early Greek, Minoan, Egyptian, and Asiatic sources, and first appears in organized form in the writings of Hippocrates (b. circa 460 B.C.). On the decline of Greece proper the words were taken over by the Greeks in Alexandria and later by the Romans. The Romans were in the habit of employing Greeks as their physicians, among them Galen (A.D. 131–200), but they also practised medicine themselves either as professionals or as amateurs. The head of a household, at any rate in the provinces, would dispense medicines to the members of his villa. But whether Greek or Roman, professional or amateur, they were bilingual, and used Greek and Latin words according to convenience. This explains the double nomenclature of the present day: *nephros*, *ren*; *orchis*, *testis*; *encephalon*, *cerebrum*. Andrews (1947) maintains that Latin words were completely suppressed except for a few such as *anus*, *penis*, which might be used in vulgar jokes. This is manifestly incorrect, as the writings of Celsus and others abundantly show.

Romance

Romance words are those which, though of classical derivation, arose in Italy, France, or Spain. From Italy we have *belladonna* (beautiful woman, from the effect of the drug on the eyes), *malaria* (bad air), and

* In this article the following abbreviations are used: Ar., Arabic; E., Modern English; M.E., Middle English; F., Modern French; O.F., Old French; G., Greek; L., Latin; Lit., Literally; Pop., Popular.

influenza. From France come *goitre*, *tic douloureux*, *grand mal*, *petit mal*, *chancre*, *trocar*, and many others. From Spain, *mosquito* and *quarantine*.

Arabian

During the long eclipse of Western culture in the Middle Ages (A.D. 476–1453) science was pursued to a high level by the Moslems, whose empire extended from Arabia, through Egypt and the north coast of Africa, to Spain. To them we owe algebra and our arithmetical notation. They translated the Greek and Latin medical texts, the use of which was proscribed by the Christian Church. At the Renaissance the Humanists, experiencing great difficulty with the Arabian translations, and finding a new pride in their long-neglected heritage, sought the original sources. Consequently few Arabian words survive. Most of these are names of chemical substances: *sugar*, *syrup*, *alcohol*, *alkali*, *elixir*, *naphtha*, *senna*. Of medical words there seem to be only four:

Nucha, neck.

Mater (dura and pia), from the Arabic word for *mother*. The Arabians were, and still are, in the habit of using flowery language, with a special preference for family relationships. *Mater* therefore means either mother of membranes or, more probably, mother or protector of the brain.

Cephalic (vein), from Ar. *alkifal*, outer.

Basilic (vein), from Ar. *basilik*, inner.

The *Oxford English Dictionary*, however, derives *cephalic* from the belief that this vein influenced the head, and *basilic* from the fact that this was the chief, therefore royal, vein used for bleeding (G. *basileus*, king). With all due respect I think the Arabian origin the more probable.

Modern German

For reasons given below these are very few—*magenstrasse*, *magenblase*, the hybrid *kernicterus*, and some psychiatric terms.

Corruption

In their migration across Europe many words have become corrupted. In some—for example, *shingles*, from *cingulum*, belt—the phonetic resemblance is obvious. In others, the process is more gradual. L. *botellus*, pudding or sausage, late pop. L. small intestine, O.F. *boel*, M.E. *buel* or *bouel*, E. *bowel*. G. *plege*, a blow, L. *plaga*, O.F. *plage*, M.E. *plage*, E. *plague*. *Hydropsie*, *dropsy*. Cf. pop. *polio*, *flu*.

The Construction of Modern Words

In constructing modern words classical words are invariably used, never the Saxon. For this there are several reasons. First, Saxon words go no further than primitive folk-medicine. In the classics, on the other hand, we have an elaborate verbal system invented for much more advanced concepts. Moreover, until the eighteenth century Latin was the universal language of scholarship. Secondly, Latin was the universal language of medicine allies itself with other by using classical words medicine allies itself with other sciences. *Proto-*, first, is used in physics and medicine; *cortex* and *medulla* are used in botany and medicine.

Thirdly, in English, minor parts of speech—pronouns, prepositions, and auxiliary verbs—play an essential part. By their use main words can be kept small, a fact which contributes to the richness of our language in poetry and literature.

" . . . he fell from off the seat backward by the side of the gate, and his neck brake, and he died; for he was an old man and heavy." (I Samuel, iv. 18.)

By reason of its simplicity and directness this passage might serve as a model for a medical witness at an inquest.

In describing more complicated matters, however, it is essential to eliminate minor parts of speech and to use portmanteau words. Take *agranulocytosis*—a, neg. or alpha privative; *granulum*, granule; *kutos*, cell or vessel; *sis*, a state of; a state of deficiency of the kind of cells which have granules. One word of 15 letters does for 12 words having a total of 51 letters.

Fourthly, we can express recognized diseases. *Acromegaly*, lit. large ends. To say "a man with large hands and feet" might mean anything, since many normal men are so built.

It is fortunate for us that this country stood in the stream of classical culture. The Germans, who, living too far north, were outside this stream, had to build up their medical language on their native Teutonic foundations. Hence the clumsiness of their vocabulary, which is full of such words as *zwölffingerdarmgeschwür*, *zweifingerintestineulcer* for duodenal ulcer, and *wormfortsatzentzündung*, *wormlikeprojectionburning*, for appendicitis. International communication now compels the Germans to abandon such words for the classical.

When there is the choice of a Greek or a Latin word the rule is to use the Latin only in adjectival forms and with prefixes (apart from hyphenated words such as *cerebrospinal*), and to use the Greek when two nouns or a noun and a verb are joined. *Renal*, *suprarenal*, but *nephropexy*; *testicular*, but *orchidectomy*. (I exclude names of pharmaceutical preparations. With the erudition of commerce I cannot keep pace.) This practice is in the best classical tradition, since the Romans did not adopt the Greek habit of joining major parts of speech together.

Hybrid Forms

Medicine is riddled with hybrid Greek-Roman words. For instance, the G. *-itis* is suffixed to words of both languages. Despite the pundits there is no objection to hybrids (though this *Journal* might get rid of its *addressograph*). Ordinary speech would, in fact, be very difficult without them. In *On the Art of Writing*, by the late Sir Arthur Quiller-Couch, Professor of English Literature, Cambridge University, there occurs this unfortunate passage:

"I was waiting, the other day, in a doctor's anteroom, and picked up one of those books—it was a work on pathology—so thoughtfully left lying in such places; to persuade us, no doubt, to bear the ills we have rather than fly to others capable of being illustrated. I found myself engaged in following the antics of certain bacilli generically described as 'Antibodies.' I do not accuse the author (who seemed to be a learned man) of having invented this abominable term: apparently it passed current among physiologists, and he had accepted it for honest coin. I found it, later on, in Webster's invaluable dictionary: Etymology, 'body' (yours or mine, 'anti,' up against it: compound, 'antibody,' a noxious microbe.

"Now I do not doubt the creature thus named to be a poisonous little wretch. Those who know him may even agree that no word is too bad for him. But I am not thinking of *him*. I am thinking of *us*: and I say that for our own self-respect, whilst we retain any sense of intellectual pedigree, 'antibody' is no word to throw even at a bacillus. The man who eats peas with his knife can at least claim a historical throwback to the days when forks had but two prongs and the spoons had been removed with the soup. But 'antibody' has no such derivation. It is, in fact, a barbarism, and a mongrel at that. The man who uses it debases the currency of learning."

This is severe enough. But read the first sentence again. The censorious professor himself uses the word "anteroom"—a mongrel if ever there was one, half Latin, half Teutonic.

The Persistence of Obsolete Ideas

As everyone knows, the humoral theory, which dominated medicine from Greek times to the middle of the nineteenth century, is indelibly imprinted in our speech—in *sanguine*, *phlegmatic*, *choleric*, *melancholic*, and in *humour* itself. From the Greek age we also have *hysteria*, *hypochondria*, *phrenic* (frenzy), *spleen* (or ill-temper); the boiling out of the humours in *eczema* (G. *zelein*, boil), and the

secretion of *pituita* (mucus) from the brain through the base of the skull into the nose. The arteries, being empty at death, were believed to carry air, hence their name (G. *aer*, air, *tereo*, carry).

Derivation by Association or Transfer

Innumerable names are derived from resemblances to animals, plants, parts of buildings, musical instruments, articles of adornment, tools, and weapons. Of greater interest are words derived by association or transfer. Several types can be recognized:

1. *Transfer from the Thing or Animal Used.*—*Histos*, loom. In *histology* the meaning is transferred to the material made from the loom. *Vaccination*, from *vacca*, cow. *Graft*, from G. *graphein*, write, through O.F. *graffe*, F. *greffe*, and M.E. *grift*. The Gauls were taught horticultural grafting by the Romans, who used slips shaped like pencils. In *inoculate* we have a similar idea, the bud to be grafted being the "eye" (oculus)—cf. the eye of a potato.

2. *Transfer to an Attribute.*—*Anopheles*, harmful (insect). *Jejunum*, empty. *Trachea*, rough; originally *arteria trachea*, rough air-vessel—cf. pop. *whites* for leucorrhoea.

3. *Association Through a Common Characteristic.*—*Anthrax*, coal, and *carbunculus*, little coal, the common idea being burning. John of Trevisa (1535), translating the great thirteenth-century encyclopaedia, *De Proprietatibus Rerum*, by Bartholomew Anglicus, a work probably used by Shakespeare, has: "Anthrax is a postume whyche cometh of ful wood matere and venomous. It is callyd also 'carbunculus,' for it brennyth like a coal." *Alopecia*, from *alopex*, fox, the common idea being manginess. Trevisa, from the same source, has: "By that euyl callyd *Allopicina* nourysshynge of heer is corrupte and fayllyth, and the fore-party of the heed is bare, such men fare as foxes."

4. *Indirect Association.*—*Quinsy*, from G. *kuon*, dog, *achein*, throttle, through O.F. *quinancie* and F. *esquinancie*. The idea was no doubt derived from the self-strangulation of a dog straining at the leash. At first it was applied to any obstruction of the throat. *Carotid*, from G. *karos*, sleep, from the Greek practice of producing unconsciousness by compressing these arteries—cf. F. *garrotter*. *Pupil* (of the eye) from *pupilla*, little girl or doll; so-called from the small image of oneself seen in another's eye. *Oestrus*, gadfly, a modern example. In some animals sexual excitement resembles excitement caused by a sting. *Idio-*, in *idiopathic*, *idiosyncrasy*, of course means peculiar to itself. In Greek times *idiotes* meant a private person, private in the sense that he kept himself to himself and took no part in civic affairs. Hence by easy gradations through *non-expert*, *layman*, *ignoramus*, *foolish*, to *idiot*.

Change in Meaning

Change in meaning takes various forms:

1. *Simple Change.*—*Asphyxia*, lit. no pulse. It retained this meaning until the eighteenth century. *Atheroma*, from G. *athere*, porridge, originally meant sebaceous cyst, from the consistency of the contents. The somewhat similar appearance of the aorta led in the middle of the nineteenth century to its present meaning.

2. *From the General to the Special.*—It has always been customary, when the true nature of a disease is unknown, to name it from its main characteristic. *Pyrexia* of unknown origin is a modern example. *Typhus*, from G. *typhos*, mist, figuratively expresses the stuporous mental state in fevers. *Eclampsia*—ek, from *lampas*, light—was first applied to any illness arising suddenly like a flash of light. *Herpes*, creeping, was applied to all spreading skin infections.

3. *From the Special to the General.*—*Nausea*—G. *naus*, ship—at first meant sea-sickness, but had acquired its modern meaning by the time of Hippocrates. *Thele*, nipple, has acquired a wide application in *epithelium*, *endothelium*.

4. *Complete Reversal.*—*Nyctalopia* was used by the ancients for day-blindness as well as night-blindness.

Phlegmatic, cold, indifferent, comes from G. *phlegma*, burning, inflammation. The contradiction is more apparent than real. Catarrh, which was regarded as the typical form of inflammation, results in the secretion of *pituita*, mucus, which Hippocrates, in *The Nature of Man*, describes as the coldest of the humours. It is a remarkable fact that, although we use several Greek words meaning heat, we do not use *psuchos*, or any other Greek word meaning cold. Those interested in the medical aspects of Polar and Himalayan exploration have not yet learnt to call themselves psychologists. *Symposium*, in Greek times, meant a drinking-party (for men only). High thinking was, however, far from being neglected. In fact, the purest gems of philosophy, including Plato's *Symposium*, arose in those enjoyable gatherings. The Greeks got more inspiration from their wine-cups than we get from our tea-cups.

Words of Obscure Origin

The search for origins is sometimes rendered difficult because the ancients, like ourselves, used a word in widely different meanings. In M.E., *reins* meant feelings as well as kidneys. In the former sense it appears several times in the Bible. "God trieth the hearts and reins" (Psalms vii. 9), "My reins shall rejoice" (Prov. xxiii. 16).

Amnion meant lamb and also bowl for receiving the blood of sacrificial animals. Its first application to a foetal membrane appears in the writings of that flamboyant philosopher Empedocles (504–443 B.C.), but there is no reason to suppose that he derived this use from either of its other meanings, capable though he was of supersonic flights of imagination.

Astragalos had no less than eight meanings. Both in the *Iliad* and the *Odyssey* it is used for the first or second cervical vertebra. Hippocrates gives it its modern meaning. It was also used for knuckle-bones and for any other bones used as dice in gambling.

Thymus—G. *thumos*, thyme—originally meant any warty excrescence, from the supposed resemblance to a bunch of thyme. Galen was the first to apply it to the gland. English butchers sometimes call it sweetbread of the neck to distinguish it from the pancreas, but although thyme suggests sweetness the idea that this is the connexion is too far-fetched.

Cataract, in addition to its present meaning, also meant something which impedes a cataract—namely, a sluice-gate. Ambrose Paré (1550) has *cataracte ou coulisse* (portcullis).

Misnomers

Medicine teems with verbal inaccuracies. We must remember, however, that much of medical jargon is incorporated in popular speech, and therefore partakes of the general sloppiness. Take, for instance, the word *catch*. Who does the catching and who gets caught? We say, "It catches me in the neck" and, "I caught pneumonia" (cf. F. *la grippe*, influenza). The truth is of course, that only the bacteriologists can catch the pneumococcus; the rest of us can no more catch one than we can catch a train. Then there is our incorrigible habit of blaming the environment for raining *attacks* and *strokes* upon our offending persons. We have an attack of indigestion when it is almost certainly our own fault. So we have *impetigo*, from L. *impetere*, attack; *epilepsy*, from G. *lepis*, attack; *plague* and *hemiplegia* from G. *plege*, blow.

Prefixes are very often used as arbitrary means of making distinctions, regardless of their true meaning; *ortho-*, *meta-*, and *para-* in organic chemistry; *epilepsy*, attack upon, and *catalepsy*, attack down; *analysis*, loosening up, and *catalysis*, loosening down. (We say *break up* when we might as well say *break down*). Verbs, too, are used with no strict regard to their meaning; *syndrome*, running together, and *symptom*, falling together.

But, this said, there remain some words which should be suppressed. The worst offender is *haemophilia*, love of blood. Almost as bad is *parenchyma*, beside-in-jive.

Ecchymosis should be *echaemosis*, since it is blood that is poured out. *Lithotomy* should be *lihtectomy*, since the stone is cut out. Unwarranted liberties are taken in the use of *-sis* (*-osis*, *-asis*). The meaning of this ending should be restricted to a state of, to distinguish it from *-itis*, inflammation. It can indicate an attribute, as in *cyanosis* (G. *kuanos*, blue), the presence of an abnormal constituent as in *anthracosis*, a non-inflammatory disease as in *sarcoidosis*, or a condition associated with disease as in *acidosis*. *Diverticulosis* should mean merely that diverticula are present; *diverticulitis*, that they are inflamed. In *leucocytosis* the prefix *hyper-* is understood by ellipsis. *Nephrosis*, a state of kidneys, is nonsense. *Neurosis* is no better, but can perhaps be sanctioned by the popular expression "state of nerves." *Aponeurosis*, a ridiculous word, perpetuates the inability of the Greeks to distinguish between nerves and tendons.

The Plural

In forming the plural we should be guided by general sanction rather than by strict adherence to etymology or consistency (cf. *gladioli*, *antirrhinums*). Since we are writing English, we may regard the classical words which we use as naturalized into English. Moreover, we cannot expect people who know little of the classics to appreciate the difference between feminine Latin nouns ending in *a* and Greek neuter nouns ending in *a*. *Stigmata* is usual, but *enemata* is pedantic. *Empyemas* is, I think, preferable to *empyemata*. In Latin nouns of the fourth declension—for example, *sinus*—which are the same in the singular and plural, the English plural avoids confusion. Incidentally, *sino-auricular* should be *sinu-auricular*.

American Usage

American usage differs from ours in the following ways: (1) Reversal of *r* and *e*; *fiber* for *fibre*. Our usage is better. (2) Suppression of *u* after *o* in such words as *color* for *colour*, *humor* for *humour*. This is more correct, but our forms are too firmly established to be changed. (3) Suppression of the final *al* after *ic*; *physiologic* for *physiological*. This again is more correct, since *al* is redundant, but the position is complicated by the conversion of many adjectives ending in *ic* into nouns: *logic*, *economics*. Note that *economic* and *economical* have different meanings. (4) The use of *e* instead of the ligatures *æ* and *œ* (wrongly called diphthongs). The ligature is a clumsy device and causes great difficulty to typists. Moreover, *æ* fails to represent the original sound *oi*. The G. *oisophagos* was represented better by the Early English *ysophagus*. *Fetus* is better Latin than *foetus*. I think the ligatures should be abolished. We get on quite well without them in *economy* (*oikos*, house, *nomos*, law) and similar words. In holding this opinion I find myself in the good company of Fowler.

Conclusion

"The Man of Science," said Sir James Barrie, "appears to be the only person who has something to say just now—and the only man who does not know how to say it." This stricture, if justified, should be directed not against the language, but against its misuse. The function of a language is to express men's thoughts elegantly, accurately, and unambiguously. To achieve this end a language must be supple, adaptable, free from pedantry, and prepared to welcome immigrants. For science it must, in addition, be able to cope with the housing problem created by a rapidly expanding verbal population. Despite occasional lapses and the inevitable inclusion of technical jargon, we have forged in *Lingua Medica* an instrument of remarkable efficiency. It is up to us to keep it untarnished.

For the elucidation of several obscure and disputed points I have had the great advantage of consulting Dr. W. H. S. Jones, whose knowledge of Greek medical literature is encyclopaedic. I thank him most warmly.

AMERICAN MEDICAL ASSOCIATION ANNUAL MEETING IN NEW YORK

The 102nd Annual Meeting of the American Medical Association was held in New York City from June 1 to 5. There were over 16,000 members present, and another 16,000 guests. At the opening session the retiring president, Dr. LOUIS H. BAUER, discussed the medico-political situation in the U.S.A. and described some of the work done for the medical profession by the A.M.A. Touching on the subject of professional ethics, Dr. Bauer said that unethical procedures must be completely stamped out. The president-elect, Dr. E. J. MCCORMICK (Toledo), in his address to the House of Delegates made suggestions towards solving some of the outstanding professional problems. "We must," he said, "be conscious of our twin roles as physicians and statesmen." Another speaker was Mrs. O. C. HOBBS, Secretary of Health, Education, and Welfare in President Eisenhower's cabinet. She stated that any Government programme of compulsory medical care would be undemocratic and uneconomic. The Government's role would be to protect public health, foster research, care for those unable to pay, and rehabilitate the disabled.

Dr. ALFRED BLALOCK, of Baltimore, well known for his contributions to the surgery of the heart, was awarded the American Medical Association's Distinguished Service Award for achievement in medicine. The award carries a gold medal and citation.

The Scientific Sections

More than 400 papers were read at the scientific sections and 21 medical films were shown. Colour television programmes, presented on screens 5 ft. by 6 ft., featured, on a closed circuit, clinical and surgical demonstrations of sinusitis, peptic ulcer, mitral stenosis, cancer of the cervix, essential hypertension, and breast tumour. A few of the papers which were read are reported below.

Cancer of the Digestive Tract

Improved methods for the early detection of cancer of the digestive tract, which is responsible for 41% of the cancer deaths in the United States each year, were demonstrated as one of the 260 scientific exhibits by a University of Chicago research team. The new method, it was asserted, has led to the diagnosis of cancer of the digestive tract with an accuracy of 90%. The technique is based on the Papanicolaou method for the early diagnosis of cancer through the recovery and identification of exfoliated cancer cells. The method, developed by Professor George N. Papanicolaou, of the Cornell University Medical College, has so far been applied most successfully in the detection of incipient cancers of the uterus and the cervix. Its application to the detection of early cancers of the digestive tract and other internal organs has proved difficult because of the difficulty of recovering exfoliated cells. The Chicago investigators believe they have succeeded in developing improved methods for the recovery of incipient cancer cells, if present, from the oesophagus, stomach, and colon, thus promising to extend the Papanicolaou technique to the early detection of the disease in those organs. A special device consisting of a balloon covered with an abrasive net, like a coarse hair-net, is inflated inside the stomach. The stomach is then washed with chymotrypsin, a natural digestive substance that dissolves the mucus in the organ's lining and frees any cells, cancerous or otherwise, that are embedded in it. This makes it possible for the abrasive surface of the balloon to gather the loosened cells for examination by the Papanicolaou method. Studies are now under way, it was learned, to determine whether a chymotrypsin "bath" may not be used by itself, without the balloon, as a satisfactory method for screening patients for possible stomach cancer. Preliminary findings were described as "encouraging." Similar methods for irrigating

and washing, it was reported, have been successful in the recovery of cells from the upper part of the colon and from the upper part of the small intestine.

Ulcerative Colitis

Drs. H. E. BACON and H. D. TRIMPI, of Philadelphia, reported a series of 302 cases of chronic ulcerative colitis treated since 1940; of these, 67 (22.4%) were operated on. Total colectomy with excision of the rectum was performed in 34 patients, and 29 of these have been completely rehabilitated. Operative mortality was nil. Five carcinomas were discovered in 5 of the 34 excised specimens: of these, four were unsuspected pre-operatively. The authors recommended a two-stage operation, the first consisting of ileostomy and colectomy, and the second of excision of the rectum. Ileostomy was not indicated unless it preceded or accompanied colectomy. In the opinion of the authors, surgery offered the removal of a precancerous bowel, a cure of the disease, and the arresting of secondary arthritic, kidney, liver, and thrombo-embolic disease.

Arterial Transfusion

Dr. SAM F. SEELEY, of Washington, D.C., spoke on arterial transfusion, saying that it had attracted wide interest in the resuscitation of patients in profound shock due to severe blood loss. He did not recommend arterial transfusion in mild or moderate shock, or even in sudden deep shock, provided adequate amounts of blood were given intravenously. In his opinion the most important contribution resulting from studies of pressure transfusions had been the recognition that even greater quantities of blood were necessary for resuscitation than was surmised even during the second world war.

Endometrial Hyperplasia and Carcinoma of the Fundus

Dr. E. R. NOVAK, of Baltimore, spoke about the relationships of endometrial hyperplasia and adenocarcinoma of the fundus. Endometrial hyperplasia was normally produced by unopposed oestrogen stimulation and could similarly be produced by exogenous oestrogens. This histological entity might be found in either pre-menopausal or post-menopausal patients, and atypical hyperactive variants occurred at any age. Hyperactive forms which were indistinguishable from true fundal adenocarcinoma might follow prolonged oestrogen therapy. Oestrogen was considered as a possible carcinogenic factor, and, since this steroid could definitely lead to extremely proliferative forms of hyperplasia, the relationship between oestrogen, hyperplasia, and adenocarcinoma had to be considered. Dr. Novak then discussed the difference between pre-menopausal and post-menopausal hyperplasia, with particular reference to its premalignant role and its treatment.

Bilateral Adrenalectomy for Severe Hypertension

Dr. R. F. BOWERS, of Memphis, reported the results of adrenalectomy in 28 patients with severe hypertension. He left a small piece of viable adrenal tissue on the left side. Pre-operative therapy with cortisone and deoxycortone acetate was given for 44 hours prior to the second-stage operation. Eight deaths occurred, all in very severe cases. The blood pressure fell to normal in all but two of the survivors, and all 20 of the survivors showed signs of mild hypoadrenalism. Maintenance dosage of cortisone ranged from nil in three cases to 60 mg. daily in one case.

The Mechanical Heart in Human Surgery

Dr. F. D. DODRILL, of Detroit, described a mechanical heart, which had been used to by-pass either the right side or left side of the human heart. The right-sided substitution was done for congenital pulmonary stenosis. A left-sided by-pass of the human heart had also been successfully carried out during the operative treatment of mitral valve disease.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Intrinsic Factor Activity in Solid Material

SIR,—Further to our article (*Journal*, February 28, p. 467) we wish to announce the isolation of a solid material with high intrinsic factor activity. In this case the source was a concentrate derived from pig gastric mucosa kindly supplied by Dr. T. Jukes of the Lederle Laboratories Division. We understand that this material produced good clinical and reticulocyte responses when given orally in a daily dosage of 40 mg., together with 10 µg. of vitamin B₁₂ for ten days. Lower dosages have also been effective. The electrophoresis technique was applied to a solution of the material in buffer, and the latter was subsequently removed from the appropriate fraction. Absorption of radioactive vitamin B₁₂ after oral administration was used as a test of biological activity.¹ This was carried out in collaboration with Dr. F. T. Farmer and Mr. C. Clayton.

In one patient 2 mg. of the new material produced better absorption of vitamin B₁₂ than was produced by either 25 mg. or 100 mg. of the original concentrate. A second aliquot of the same concentrate fractionated in the same way yielded material which was definitely active in a dose of 4 mg. and possibly active in a dose of 2 mg. The material is homogeneous when subject to electrophoresis at pH 6.4, but is decomposed at pH 8.6 in barbitone buffer. Further evidence has been obtained that intrinsic factor is mucoprotein in nature, and most of its amino-acid and carbohydrate constituents have been identified. It is interesting to note that lysine, histidine, and tyrosine are apparently absent.

Tests are proceeding upon solid material isolated in a similar manner from human gastric juice.—We are, etc.,

Tropical Diseases in Britain

SIR,—I too have read with great interest and not a little nostalgia the annotation on this subject (*Journal*, May 16, p. 1096). I should be the first to agree with the writer upon his insistence that a microscopic examination and the discovery of malaria parasites in the blood is an essential preliminary to treatment of an attack of this fever. Early and accurate diagnosis and early and effective treatment should be the watchword for all forms of malaria; but this, alas, proves sometimes to be the counsel of perfection. As one who has seen and practised both sides from the laboratory and clinical angle for some 40 years I feel that I should qualify this statement. As Dr. W. Melville Arnott has written (*Journal*, May 30, p. 1219), the academical standpoint assumes a much more serious aspect in the case of subtertian malaria (*P. falciparum*), and it is always within the bounds of possibility that this parasite may crop up from time to time in travellers arriving by air or sea from one of the endemic areas of the disease. I can call to mind many instances where there has been no time to undertake microscopic diagnosis, and it has been necessary to act as in an emergency and inject quinine in order to save life.

I remember particularly a young man who was lying in a coma in a London hotel, having just arrived by air from South Africa. His main complaint had been acute tonsillitis, which was thought to account for the high fever, and for which appropriate treatment had been applied, when he suddenly became comatose. Intravenous quinine given without delay undoubtedly saved his life, but the diagnosis was later confirmed in the laboratory from blood films taken before quinine therapy was undertaken. One is comforted by the idea that even if the diagnosis had not been correct no real harm would have been done.

There have been others, too, in which no parasites were found in thick and thin blood films at the time of examination, but where the balance of evidence was in favour of subtertian malaria. It is undoubtedly true that occasionally, especially in the most acute and dramatic cases, the ring forms of the parasite may be particularly difficult to find in blood preparations. I have seen relapses of benign tertian malaria as well in which the same obtained but where the character of the rigor, the subsequent hot and sweating stages, and the enlarged painful spleen could leave no doubt in the clinician's mind of the correctness of the clinical diagnosis. Sometimes the discovery of malarial pigment in the mononuclear cells is confirmatory evidence.

In quartan malaria I have in mind two cases in which, although the fever and quartan periodicity were suggestive, thin blood films were searched for hours with a negative result. Finally, in one instance, however, after 2½ hours' scrutiny a single quartan parasite hove into view in a thick blood film. Intramuscular injections of quinine in these instances clinched the diagnosis by abolishing the fever when other antimalarial drugs, including mepacrine ("atebrin") and proguanil, had failed.

The same principle similarly obtains in amoebic dysentery. It is curious that here, too, in the most acute cases with profuse diarrhoea *E. histolytica* in its active stages may be most difficult to demonstrate. I can recollect a fulminating case of this disease of an acuteness and toxicity rarely encountered, but when the proctoscope was brought into use, and scrapings made from the bleeding mucosa, these parasites were present in large numbers and the diagnosis became obvious. Another instance I can call to mind was that of an officer who when playing tennis at Wimbledon was attacked with acute diarrhoea with blood and mucus. Such was the character of the stools and the severity of the illness that he was regarded as suffering from ulcerative colitis till some three weeks later emetine was injected as an experiment and at this point the attack began to subside. Sigmoidoscopy was then performed, and active amoebae were present in the exudate in large numbers, in spite of the fact that the stools had been examined microscopically many times with a negative result. It then transpired that as a boy of 11, some 15 years previously, he had contracted amoebiasis in Mauritius.

Another difficulty crops up in intestinal amoebiasis where the lesions in the large intestine are typical of amoebic ulceration but no actual evidence of the parasite can be secured. I have had experience of many of these—some of which had been subjected to treatment for ulcerative colitis on previous occasions. Here surely is a basis for experimental therapy and for the verification of the "proof of the pudding is in the eating." If the patient recovers, and the ulcerations heal on emetine and emetine bismuthous iodide therapy, then the original clinical diagnosis must have been correct.

In these somewhat exceptional instances I am always reminded of the analogy of the rabbit. How many of us have seen their very characteristic burrows and other evidences of occupation, without obtaining so much as a glimpse of the owner, but it would be a foolish man who could swear that the occupant of the burrow is not somewhere or other ensconced inside, and this little parable is peculiarly applicable to *E. histolytica*.—I am, etc.,

PHILIP MANSON-BAHR.

London, W.1.

Primary Red-cell Aplasia

SIR,—We were interested in the medical memorandum from Dr. Michael Donnelly (*Journal*, February 21, p. 439) and the letter from Drs. A. G. V. Aldridge and P. Kidd (*Journal*, March 28, p. 729) regarding cases of red-cell aplasia in infants.

We have described a case of this condition fully in a male adult African (*J. Path. Bact.*, 1953, in press). He was referred to us for anaemia, and when we saw him was gravely ill. He said he had been getting progressively weaker for about nine weeks, and had been getting general body pains, weakness, and dyspnoea. His heart and lungs were normal, there was no oedema, the spleen was and liver were not enlarged, there were no petechiae, there was no icterus and no sign of riboflavin deficiency. There was histamine-fast achlorhydria. He gave no history of having been exposed to toxic substances. He had been taking mepacrine, but only in the usual doses, for suspected malaria. Blood examination on admission showed: red cells 1,320,000 per c.mm.; haemoglobin 2.3 g.%; mean corpuscular volume 54 µ³; reticulocytes nil; white blood cells 5,650 per c.mm.; platelets 700,000. A sternal puncture done on admission showed complete red-cell aplasia, with normal white and megakaryocytic elements.

He was kept under observation in hospital for eight days, during which period there was no reticulocytosis. He was then

given 4 mg. daily of riboflavin for 14 days and 2 mg. daily for nine days. Seven days after the first dose of riboflavin reticulocytes began to appear in the peripheral blood (0.5%) and reached 27% on the twelfth day after the commencement of treatment. The reticulocyte response was therefore specific and reached the expected level. The red cells and haemoglobin doubled themselves in 21 days. The patient was discharged after six weeks in hospital with a blood count of 4,290,000 and 11 g.% of haemoglobin. Eight months after commencement of treatment the patient is perfectly well and has a red cell count of 5.5 million per c.mm. and a haemoglobin of 14.5 g.%. A sternal puncture done five days after the commencement of treatment showed 5% early erythroblasts, no late erythroblasts, and no normoblasts. A third marrow biopsy 12 days after the start of treatment showed 15% early erythroblasts, 27% late erythroblasts, and 34% normoblasts. Two more marrow punctures were done 23 and 30 days respectively after the commencement of treatment, and revealed that the early and late erythroblasts had decreased in number and the marrow had become predominantly normoblastic.

In view of the fact that so far all cases of true red cell aplasia have proved fatal, with the exception of one of Heilmeyer's cases and the two mentioned above, we think that our findings, if confirmed, may have a useful place in the treatment of this grave condition.—We are, etc.,

Who Was Geminus?

SIR,—To the many with a dilettantish interest in medical history the articles in your May 30 issue must have given special pleasure, although some statements may have caused surprise—for example, that the 1511 Act governing medical practice "did not apply to medical graduates of Oxford and Cambridge" (p. 1179). Were there any home-produced university medical graduates in 1511? By that date Aberdeen alone had given academic recognition to medicine, but it was merely studied as one subject in the general course, and no separate medical degrees were awarded at that time.

Some of the information about Geminus (p. 1187) seems to go further than the ascertained facts warrant. What is the evidence that he was "almost certainly a surgeon"? An individual (or individuals) with the name of Thomas Geminus (Gemynous, Gemynus, Geminie, Gemyne, etc.) is mentioned in various contemporary records—as a surgeon in the list of Edward VI's disbursements (1547-52), in the *Annals of the Royal College of Physicians* (1555), in the *Register of the Stationers' Company* (1555) as a stranger (foreigner) who was fined for calling a brother of the company a false knave and later as a benefactor to the "Brydewell," but he is not mentioned in the *Annals of the Barber Surgeons*. In addition the cognomen is associated with an excellent engraver, a printer, a cartographer, an instrument maker, and a putative author of books on anatomy. If one man possessed such widespread skill and erudition he must have been versatile indeed, and, although it is possible there was only one Geminus, an unusual name does not necessarily imply the same individual.

It is doubtful if the Geminus associated with the *Compendiosa totius Anatomie delineatio* was a medical man. Nicholas Udall in his "Address to the Reader" refers to him as a "workman," an unusual designation even in those days for a surgeon, anatomist, and author. When Vesalius complained of the plagiarism of his work by "that Englishman," he was not referring to Geminus, as your contributor infers, but almost certainly to Dr. John Caius, who had once lived and studied with Vesalius at Padua and who had returned to England in 1544, the year after the *Fabrica* and *Eptome* were first published. The Latin text used in the first two editions (1545, 1552) of the *Compendiosa* is a résumé of the *Fabrica*—it is the Vesalian *Eptome*—but in the third edition (1553), which purported to be a translation by Udall from the original Latin into English, the text actually used was a modified version of Vicary's (1548) *The Anatomie of the Bodie of Man* (itself largely pirated from de Mondeville's work), rearranged to follow the order of Mundinus's *Anathomia* (1316), which may be regarded as the first manual of practical anatomy, whereas Vesalius's *Fabrica* is a systematic treatise.

As Vicary raised no objections, while Vesalius did, we must assume that the former knew and approved of this use of his recently published work; but it is difficult to understand why the help of Nicholas Udall, *quondam* headmaster of Eton, prebendary at Windsor, and author of *Ralph Roister Doister*, was reputedly required to translate a book already in the vernacular (perhaps he translated only the plate legends which are copied

from the original Latin), or how the deception was not apparently commented upon by those familiar with Vicary's book. Caius has been blamed for instigating the plagiarism of Vesalius's great work, and it has also been suggested that Geminus is a punning pseudonym hiding the identity of Dr. Thomas Twyne, who translated other Latin works, but the association of the Vesalian plates with the Vicary script seems rather to implicate Vicary as the possible moving spirit behind this piece of artistic piracy.

There are other mysteries concerning Geminus, and not the least intriguing are how exactly his copperplates were acquired for French editions of the *Compendiosa* by Jacques Grevin, the French humanist, or how the same or similar copperplates were available for the *Anatomia Deusch*, first published in Nuremberg in 1551, and for other German and Dutch anatomical works. Apparently Geminus had widespread connexions. Other points arise from Dr. Underwood's remarks on Geminus, and one of topical interest will be mentioned. Is the engraving on the title-page of the 1559 edition of his book a portrait of Elizabeth I? It was intended to be Queen Mary, but Queen Elizabeth had ascended the throne before the edition could be published, so the engraving (possibly with a few alterations) remained, with a fulsome dedication to the new Queen added.—I am, etc.,

Manchester.

G. A. G. MITCHELL.

The Judet Operation

SIR,—Mr. T. M. Hennebry (*Journal*, May 23, p. 1166) has stated a case in favour of the Judet operation for osteoarthritis of the hip. I would like to question some of the points he raises.

It is not reasonable to compare the results of the Judet operation for osteoarthritis with those following a fractured femoral neck. In osteoarthritis the acetabular cartilage is grossly abnormal at the time of operation. In my experience it has been unusual to find a fractured neck of femur with marked osteoarthritis. It is likely that many of the cases of fracture following the Judet operation will subsequently become osteoarthritic and painful owing to the incongruity of the surfaces. This certainly occurs after other causes of incongruity. It may, however, require a number of years for these changes to occur, and I think it is fair to say that no one yet is in a position to assess the frequency of this complication. As the majority are in the elderly, with a high mortality in the ten years after operation, it is probable that a satisfactory statistical survey on this point will take many years. This last fact justifies its use in these cases.

I would agree that many cases of osteoarthritis have a thickening of the capsule and periarticular structures which restrict movement and are certainly, in part, responsible for the pain. Your correspondent suggests that it is in this type of case with a marked contracture that the Judet operation may fail. Osteotomy in this case is almost uniformly successful in relieving the pain. This, after all, is the predominant, and often the only, complaint of the patient.

As Mr. Hennebry says in his letter, this prosthesis is "far from being the final solution." This is becoming increasingly obvious with the passage of time. His suggestion that displacement osteotomy is a retrograde step is surely a failure to recognize its indications.—I am, etc.,

Harlow Wood, Notts.

Treatment of Pulmonary Emphysema by Pneumoperitoneum

SIR,—We have read with particular interest the report of Drs. R. D. C. Brackenridge and A. Thelwall Jones on the treatment of pulmonary emphysema by pneumoperitoneum (*Journal*, May 23, p. 1135). For the past twelve months we have been engaged on, and have now terminated, a similar investigation on this very problem. Without wishing to anticipate the results of our report, which are now ready for publication, we wish to pass the following comments on their paper.

Vital capacity is an obsolete yardstick in the assessment of respiratory function. Three-second spirometric tests presuppose a high degree of experimental accuracy, and assume the absence of inspiratory dyspnoea.¹ Maximum breathing capacity is a much more accurate index of lung function, and there is much to commend its employment.² However, even here the skill, degree of experience, co-operation, and education of the patient are factors which have to be taken into consideration in the assessment of readings.

Broadly our findings are not as encouraging as those obtained by Drs. Brackenridge and Jones. Yet in a number of instances our emphysematous patients, after pneumoperitoneum, have expressed themselves as being subjectively improved in health and have stated that their dyspnoea has lessened. However, a critical evaluation of some of the variable factors involved in the assessment of dyspnoea—season, climate, intercurrent infection, bronchial spasm, and wishful thinking on the part of the patient—ought to make for the greatest caution by investigators in their interpretation of slightly beneficial or equivocal results. We feel that this view is probably true of the role of pneumoperitoneum in the assessment of pulmonary emphysema.—We are, etc.,

Halifax.

The Degradation of Flour and Bread

SIR,—I was interested to see Dr. E. H. M. Milligan's letter on the above subject (*Journal*, May 2, p. 994), for L. J. Harris¹ states that "most expert opinion now agrees that the average working-class diet in this country is so frequently low in vitamin B₁ that it would be an advantage to encourage an increased consumption of wholemeal bread." But of late there has been an increasing tendency for cases of vitamin B₂ deficiency to arise, as instanced by the frequency of beefy sore tongues and undoubted pellagrous dermatitis masquerading under the pseudonyms of neurodermatitis or even industrial dermatitis. According to Harris,² it is not uncommon for pellagra to occur in mental patients in this country, although it appears that the medical and nursing staffs escape this condition. It is open to question whether the hospital diet is at fault, or whether they are long-standing unrecognized cases of B₂ deficiency which had reached the last stage of all—dementia. When Sydenstricker visited this country during the late war he found a similar state of affairs. The fact that, despite the so-called restoration of flour, cases of nicotinamide deficiency do arise makes one ponder that all is not well; and it appears that matters will worsen when the extraction rate of flour is again raised. Furthermore, cases of acute encephalopathy and confusional insanity are known to arise, especially in the elderly, after severe operations such as hysterectomy or prostatectomy, which are similar in most respects to delirium tremens and curable with adequate doses of nicotinamide.—I am, etc.,

PHILIP TURTON.

Antabuse Addiction

SIR,—All those who deal with alcoholics have observed the variability of the antabuse-alcohol reaction in different subjects. This variability is to be expected, for the aversion effect of antabuse therapy does not depend on the physical symptoms when alcohol is taken—the vasodilatation, headache, tachycardia, and nausea—but on the concurrent subjective state of the patient. This is a feeling of impending personal catastrophe which, like tolerance of pain, varies from subject to subject. A great many psychopathic drinkers show a magnificent tolerance for acetaldehyde, and considerable bravado. They often claim that a small gin

makes them feel like several doubles when on antabuse. It is noticeable, however, that they prefer to omit their antabuse. The more labile psychoneurotic is often profoundly disturbed by the antabuse-alcohol reaction and avoids alcohol.

A small group of patients has emerged, however, who, in spite of recurrent terrifying experiences with the reaction, repeatedly ask to be put back on antabuse. Their assertion that they are now certain that this will stop their drinking appears to be a rationalization, for in a short time they proceed to drink again, even carrying antabuse tablets with them in some cases and swallowing more of them whilst drinking. These patients obviously tend to become rapidly confused, restless, and uncoordinated whilst indulging in this procedure. They also seem to show an increased tendency to self-reproach when sober. Can it be that these patients incorporate antabuse into their drinking pattern not only to achieve more rapid escape from insupportable tension but also to inflict simultaneously the punishment demanded by a harsh super-ego which is, of course, part of that tension?

However this may be, these patients show the surprising tendency to seek antabuse as an adjunct to their drinking, and they thus appear to be unsuitable cases for treatment with the drug.—I am, etc.,

Twyford.

L. C. F. CHEVENS.

Smoking and Cancer of the Lung

SIR,—Mr. P. G. Moore's letter (*Journal*, June 6, p. 1281) obscures very nicely the point which we wish to make (*Journal*, May 16, p. 1105), and is far from giving the precision he suggests. Diphtheria has been virtually wiped out as a cause of death in this country. This has had very little effect on the expectation of life, because the large number of children who never had the disease are included in this figure. But the chance of dying between the ages of 1 and 15 has been materially decreased, because diphtheria used to cause a considerable proportion of deaths between these ages. In exactly the same way, even if lung cancer were abolished, the expectation of life would not be changed very much, but the chance of dying in middle age would, because lung cancer is an important cause of death at this age.

The expectation of life, or mean future life time, at any age, if considered by itself, has the same limitation as any other mean value in that it gives no information concerning the shape of the distribution from which it is calculated. It is for this reason that it is rarely used by actuaries in the comparison of mortality. Mr. Moore's figures, if taken in conjunction with those in our letter, will serve a most useful purpose in providing a practical demonstration that an apparently small difference in the expectation of life may conceal a substantial difference in mortality.—We are, etc.,

R. G. BARLEY.

Limb Injuries in Coal-miners

SIR,—Dr. C. T. H. Whiteside in his letter (*Journal*, May 30, p. 1222) remarks that it would be interesting to know if the high percentage of limb injuries which he found in the country's coal-mines colliery in Kent is representative of the country's coal-mines as a whole. A very detailed accident analysis is made by the South Western Division of the National Coal Board and the figures showing the part of the body injured can be extracted. In the year 1951, among a population of 106,000 miners, injuries to the limbs accounted for 61% of all injuries causing absence of more than three days' duration (upper limb 36%, lower limb 25%). These figures support Mr. Whiteside's contention that limb injuries constitute the greater proportion of all injuries sustained in the coal-mines. The analogy which he draws between war, in which about 50% of the total injuries are limb injuries, and coal-mining is in my opinion particularly appropriate. If a little thought be given to the nature of coal-mining operations it will not seem so surprising that limb injuries are predom-

inant. A more appropriate analogy might be the proportion of limb injuries in heavy industry other than coal-mining.

Dr. Whiteside's estimate that there are about 250,000 accidents per year, each causing absence of more than three days, among the total mining population is fairly accurate, and it is undeniable that this is a startling and appalling figure. It should be borne in mind, however, that this figure may be swollen by changes in the law relating to compensation and that the fatal accident rate, which cannot be thus affected, has been falling steadily for many years. The number of fatal accidents between 1922 and 1940 remained around or above 0.40 per 100,000 man shifts worked. After a rise in 1941 and 1942 the rate declined more or less steadily to 0.25 in 1948 and 1949, the 1952 figure being 0.23.

The mining industry is well aware of the seriousness of the accident problem, and is systematically attacking it in a number of different ways. The industry is also fully seized of the necessity for active research, and the N.C.B. are at present supporting two research projects which have the aim of, *inter alia*, defining the causes of accidents in all their technical detail. In these investigations the importance of limb injuries, which Dr. Whiteside has emphasized, will not be overlooked.—I am, etc.,

J. S. McLINTOCK.

Transverse Arrest of Head

SIR,—May I refer to some of the points raised in the discussion on transverse arrest of the head? When I wrote my article (*Journal*, April 18, p. 865) I was not aware of the teaching of Mr. Wilfred Shaw on this subject, and I regret, therefore, that I did not refer to the very clear account of this complication which he gave in 1933.¹ Also the monograph by Mr. Parry Jones on the Kielland forceps² had not yet appeared. This important work is a credit to British obstetrics, and should be studied by all who use or intend to use this instrument.

Much of the discussion has centred around the use of the Kielland forceps, and there is now general recognition of its value. Its introduction has constituted, I believe, a big obstetrical advance, not because it possesses any inherent magical properties, but because its use demands a careful study of each case and a proper cephalic application. Mr. Parry Jones in his letter (*Journal*, June 6, p. 1278) has drawn attention to the important point that the "wandering method" of application is almost as classical as the one involving rotation of the anterior blade.

I did not intend to give the impression, as Mr. A. P. Bentall suggests (*Journal*, May 16, p. 1107), that cases of transverse arrest can only be dealt with by those who have mastered the use of this instrument, nor did I intend, as Mr. Rutherford Morison fears (*Journal*, May 16, p. 1107), to exclude the general-practitioner obstetrician from using this instrument. I believe, however, that all who may be up against this complication will be the better able to deal with it if they have studied the technique of using the Kielland forceps. Mr. Bentall disagrees with my statement that deep general anaesthesia is necessary for manual rotation. He admits, however, the necessity for rotation of the shoulders with this manoeuvre, and Munro Kerr and Chassar Moir³ refer to the need for "deep surgical anaesthesia."

Dr. J. D. Martin (*Journal*, May 16, p. 1107) himself admits the difficulty of comparing the various figures for the foetal risk for the various methods of instrumental delivery in the true occipito-posterior positions. I feel, however, that my figures showing only one foetal death in 55 primigravidae delivered in the face-to-pubes position with forceps justify the claim that this method of delivery has a low foetal risk. Admittedly with this technique the strain on the soft tissues is great, and the risk of severe lacerations in unskilled hands is high. Manual or forceps rotation, however, is also not free from serious risk in this respect.—I am, etc.,

Middlesbrough.

Obituary

S. A. WINSTANLEY, M.B., Ch.B.

We record with regret the death on June 1 of Dr. S. A. Winstanley. The announcement of his death to the Annual Conference of Local Medical Committees last week evoked an expression of very real regret at the passing of a long-familiar figure and an old friend and counsellor. For more than a quarter of a century Winstanley had always been in the Lancastrian group at such Conferences, and though he was not a frequent speaker, either there or in the Representative Body, and certainly claimed no gift of oratory, his advice, modestly proffered, was highly valued, if not always followed. The place in which he excelled was the committee, and not many men have a longer record of committee work on behalf of the Association. His membership of the Insurance Acts Committee and its successor, the General Medical Services Committee, lasted unbroken for nearly a quarter of a century, and was relinquished only a couple of years ago.

Sydney Adams Winstanley was a Lancashire man by birth and education. His whole career was spent within a few miles of Manchester City Hall. He was born at Pendleton by Salford on November 25, 1878, and was educated at Manchester Grammar School, from which he went on to Victoria University, graduating M.B., Ch.B. in 1914. After acting as house-surgeon at St. Mary's Hospital, Manchester, he settled in general practice at Urmston, a town a few miles to the south-west of Manchester. He was from an early stage in his career what would now be called a general-practitioner specialist, his interest being in obstetrics. As long ago as 1922 he published in the *British Medical Journal* notes on 259 cases of labour conducted by "twilight sleep," a subject which at that time was arousing particular interest. A few years later Winstanley served on a sub-committee of the British Medical Association set up to report on the general question of anaesthetics in midwifery. But he was a typical general practitioner, if such a being exists, much liked by his patients and colleagues. Among other appointments he held was that of medical officer to the Urmston Cottage Hospital.

Joining the British Medical Association in 1919, Winstanley soon began to take a part in local and eventually in central affairs. His first official appearance at Headquarters appears to have been as a newly elected member of the Insurance Acts Committee in 1928. For some years he was a member of the executive of that body, also of the negotiating committee which was formed in 1944 and continued until after the National Health Service was well established. He was a member of the Medical Planning Commission set up in 1940, for ten years a member of the Services Committee, for four years a member of the Association committee concerned with the problems of demobilization, and from 1938 to 1951 a member of the Central Medical War Committee. His help seems to have been sought in all the various problems of the National Health Insurance service—remuneration, regulations, prescribing, additional benefits, organization of public medical services, and so on. There were subcommittees set up at various times to deal with these matters and Winstanley was a member of them all. He served also on the Spens Committee set up in 1945, which had its repercussion in the Danckwerts

award. Like so many Lancastrians, Winstanley had a highly developed business sense. National Health Insurance practice, he once said, was never at any time a sound business proposition, except in so far as it was subsidized by private practice, and he foresaw, several years before the advent of the National Health Service, that this "subsidy" would diminish in value. In 1942 he moved to instruct the Insurance Acts Committee to apply for a wartime capitation fee of fourteen shillings, and, failing satisfaction, to call upon practitioners to give the requisite notice of withdrawal of service, adding, however, that this action did not imply a strike, because the insured population would obtain their attendance by the application of the "own arrangements" clause. He failed to carry the Conference with him.

In his own Manchester area Winstanley was prominent in medico-political affairs—a member for many years, and eventually chairman, of the Local Medical and Panel Committee for Lancashire, chairman of the Manchester Division in 1935–6 and again from 1946 to 1950, and year by year he was sent up to the Representative Meetings. He was also a member of the Manchester Medical Society and of the North of England Obstetrical and Gynaecological Society. He was a man eager to serve his profession, as was shown by the mass of varied committee work he undertook, but there was about him a certain shyness which accounted for the fewness and brevity of his interventions in debate. His alert and likeable personality will be greatly missed.

Dr. ARTHUR B. MCMASTER, formerly medical officer of health for Dover, died at his home at Dover on May 25, in his 79th year, after a long illness. Arthur Berry McMaster was a native of Athlone, the posthumous son of a clergyman. By means of scholarships and exhibitions he was able to pay for most of his education. At Queen's University, Belfast, he was a distinguished student, taking many prizes, including the Gold Medal for Midwifery. He qualified M.B., B.Ch., B.A.O. in 1898, and proceeded M.D. in 1902. For some years McMaster was in general practice, first at Rochdale and later at Stockport. But his health was never robust, and in 1909 on medical advice he gave up general practice. After taking the D.P.H. at Manchester he specialized in public health, holding his first appointment at Crewe. In 1920 he was appointed M.O.H. and port medical officer, Dover. Here he reorganized to a high pitch of efficiency the public health department and port medical service. He retired in 1939, but continued for the duration of the war as M.O.H. for the Borough of Sandwich and East Kent No. 2 District. For over 50 years he was an active member of the British Medical Association, being chairman of the Dover Division from 1927 to 1929, and president of the Kent Branch in 1929. He was also deeply interested in the work of the St. John Ambulance Brigade, and was an assistant district commissioner. As a man McMaster was quiet and reserved. Apart from his profession, his chief interests were in reading and his garden; he played an active part in parish affairs, and was churchwarden for many years. Dr. McMaster was twice married, and leaves a widow and two sons.

We record with regret the death of Dr. DAVID GAMBLE MADILL on May 27 at his home at Sutton, Co. Dublin. The son of a Presbyterian minister at Garvagh, Co. Armagh, Madill was educated at Coleraine Academical Institute and Trinity College, Dublin, where he graduated M.B., Ch.B., B.A.O. in 1908. Whilst he was a student at Dublin he obtained the Haughton Medal and the Surgical Travelling Prize. After qualifying he became a house-surgeon at Sir Patrick Dun's Hospital, and later became assistant to Dr. Henry Jellett there. Madill subsequently became assistant

master of the Rotunda Hospital. In 1929 he became a founder Fellow of the Royal College of Obstetricians and Gynaecologists.

We are indebted to B.S. for the following appreciation: David Madill was one of my greatest friends in Trinity College, Dublin, where he was a medical student in the year junior to mine. He had entered the University before me, but had decided to take a special degree in experimental science, and succeeded in obtaining a first-class moderatorship. After he entered the medical school he was a very successful coach for students competing for the examinations in botany and zoology. He joined Sir Patrick Dun's Hospital, where later he became house-surgeon, and this post was followed by his appointment there as assistant to Dr. Henry Jellett. When Dr. Jellett became Master of the Rotunda Hospital he nominated Madill as his assistant. This proved to be a first-class choice. He was an excellent teacher and operator, and was very popular with post-graduates, students, and nurses. A couple of years after he had completed his time as assistant master he was appointed gynaecologist to the Adelaide Hospital, where he continued his successful career. He was also gynaecologist to Monkstown Hospital. He acquired a large practice and was beloved by his patients. Madill did not publish a great deal, but he acted as co-author in Dr. Jellett's widely read large textbook on midwifery. Unfortunately, Madill was bedridden in his last two or three years. He married Miss Georgina Lauder, of Sutton, who was one of the most popular figures in Ireland and who was in the championship class in golf. Madill himself took up the game, but never achieved distinction. They had one daughter, and to his wife, daughter, and grandchild we extend our heartfelt sympathy.

Dr. JOSEPH R. MUTCH died at his home in Aberdeen on June 2 at the age of 58. His illness and death came as a profound shock to his many friends, colleagues, and patients. As until a few weeks before his death he was apparently in good health. Joseph Raeburn Mutch was a native of Cornhill, Banffshire. He was one of a large family, and like so many successful doctors his upbringing was humble. Opportunities were not presented to him, but he was endowed with a high intelligence and a tremendous capacity for hard work. He was dux of the village school, but was unable to continue his education. He became apprenticed to a watchmaker. During this time he developed a disease of his hip-joint which incapacitated him for two years and left him with a limp. However, during the 1914–18 war he served in the Gordon Highlanders as a clerk, and in the Royal Flying Corps as an instrument-maker. After the war Mutch opened a business in Aberdeen as a watchmaker. He then proceeded to qualify as an optician; but this did not satisfy him, and only stimulated him to higher endeavour. He began to study medicine at the University of Aberdeen when he was 34. He graduated M.B., Ch.B. in 1934. The following year he passed D.O.M.S.Eng., and in 1936 he proceeded M.D. Mutch's one consuming interest was the eye, and it is small wonder that he devoted his professional life to it. He was soon appointed to the staff of the Aberdeen Royal Infirmary. He carried on a large private practice, but on the introduction of the National Health Service he became a full-time consulting ophthalmologist to the North-Eastern Regional Hospital Board. His professional life was short, but he accomplished what many would consider a lifetime's work: he published many papers and did much original research. He was particularly interested in the effect of diet on the eyes. He had many outside interests: he made a collection of barometers, clocks, and spectacles; he loved gardening and photography; he was an active member of the B.M.A.; and he was an elder of the kirk and a keen Rotarian. Success left Joseph Mutch unspoiled. His struggle did not harden his heart, but gave him a sense of real values. He could not tolerate sham or humbug. In spite of his somewhat gruff approach he was the gentlest of men. The world is the richer for his living, and he will be missed.—C. B. G.

We are indebted to Dr. FRANK COLEMAN for this appreciation of Dr. ALFRED NOLAN FELL, whose death was recorded in the *Journal* of May 23 (p. 1169): As a school-friend of Nolan Fell I should like to express my appreciation of his sterling qualities and integrity of character. I knew him in the 'eighties while we were together at Nelson College, New Zealand. He played cricket and Rugby football for the college for three years. Whilst at Otago University he was considered the best attacking three-quarter in the colony of New Zealand. At Edinburgh in 1901 he captained the university fifteen during their phenomenal year when they played sixteen matches without a loss, and he subsequently played for Scotland against England, Wales, and Ireland. He won the Muir Cup at Edinburgh University in 1900, and in the same year obtained a double blue. Fell's academic record was almost as brilliant. Whilst in practice at Colchester yachting was one of his favourite pastimes, no doubt acquired from his father's love of this sport in the harbour of Nelson.

Medical Notes in Parliament

DEATH OF A SOLDIER

Wing Commander N. J. HULBERT on June 16 asked the Secretary of State for War if inquiries were completed in regard to the death of Private Donald Harrison, of Stockport, who died in Moston Hall Military Hospital in April.

Mr. ANTHONY HEAD in reply said that Private Harrison, aged 18, was called up for military service in January, 1953, when he was passed as medically fit. On March 13 at Wrexham he reported sick with a pain in his back, which the medical officer in charge of his unit diagnosed as fibrositis. He again reported sick on March 26, when the medical officer diagnosed "Query hysteria" and ordered his admission on March 26 to the Military Hospital at Chester. On admission he was given by the admitting medical officer a preliminary medical examination, which included a detailed examination of the central nervous system, for the purpose of allotting him to the appropriate medical division of the hospital. The admitting officer made a firm but not final diagnosis of hysteria. This preliminary examination was correct in so far as Harrison was undoubtedly suffering from hysteria. The fact that it was not discovered that he was also suffering from a rare and malignant disease was not necessarily at this stage due to negligence, since a more detailed subsequent examination should have taken place after admission to the ward.

After admission Private Harrison was required by the medical staff of the hospital to fend for himself, and other patients were forbidden to help him. The treatment of hysterical patients did require that they should be encouraged to help themselves, but in no circumstances should it entail harshness. Although he complained that he could not use his legs, he was left to get about as best he could by himself. This treatment continued for five days, during which time Harrison's condition deteriorated, and he (Mr. Head) was satisfied that the continuance of this type of treatment was due to negligence and undoubtedly resulted in harshness. A full physical examination was always required before a diagnosis of hysteria could be justified, and should have been made on the first day in the ward. The medical specialist looking after Harrison should have satisfied himself that this had been done. This he neglected to do. Furthermore, although during these five days Harrison frequently complained of pain in his legs, thighs, and back, and although this was recorded by the subordinate nursing staff, the day sister in charge of the ward never drew the attention of the medical specialist to Harrison's repeated complaints. This wrong and harsh treatment was continued despite the comments and protests of at least one other patient in the ward.

It was not until Tuesday, March 31, that Harrison was seen by a psychiatrist and thereafter received sympathetic

handling, but even at this stage a full examination had not been made.

On the night of April 1 the medical orderly became worried about Harrison's condition and called the orderly medical officer, and then for the first time Harrison was given a full medical examination. The orderly medical officer realized at once that Harrison was dangerously ill, and from this time he was treated for the malignant disease from which he was suffering. Harrison died early on the morning of April 5.

Irregularities and Mistakes

At the time of his admission to hospital Harrison's illness had undoubtedly reached a stage when death was inevitable, since malignant disease of this type in youth, though rare, grew very rapidly. He (Mr. Head) did not suggest that this in any way excused the mistakes made in the handling of the case.

After Harrison's death it should have been abundantly clear to the commanding officer of the hospital that serious irregularities and mistakes had occurred. Yet, so far as he could ascertain, no thorough inquiry was instituted by the commanding officer, although on May 18 he stated that a full inquiry had already been made by himself and that he was satisfied that there was no truth in the allegations that there had been ill-treatment of patients.

This serious occurrence was caused not by any fault in the method of procedure laid down for Army hospitals but by the failure of certain individuals to carry out their duties. The commanding officer would be called to account for his conduct and be tried by court-martial. The medical specialist concerned, who left the R.A.M.C. in May, would be reported to the General Medical Council. The day sister concerned, who was a civilian, had had her contract terminated and would be reported to the General Nursing Council.

Nurses Sensitive to Penicillin

Asked on June 18 what number of district nurses had developed a sensitivity to penicillin and could not undertake further nursing duties, Mr. IAIN MACLEOD said the total number of district nurses affected was not known, but a special inquiry had shown that in 70 local health authority areas 73 nurses had become sensitive to penicillin and had to give up nursing for varying periods. There was evidence that the incidence could be reduced by strict observance of technical precautions. He had at once obtained advice on this from his Standing Medical Advisory Committee and was circulating this advice urgently to local health authorities and others concerned. Mr. Macleod further said that nurses who had to give up work by reason of sensitivity to antibiotics were entitled to the normal sick-leave allowances and could, in appropriate cases, qualify for incapacity benefit under the National Health Service (Superannuation) Regulations. They might also, when the circumstances warranted it, qualify for industrial injuries benefit. The numbers, if any, who might have to give up nursing permanently were not yet known.

Casualties in Korea.—United Kingdom casualties in Korea between July 1, 1951, and June 1, 1953, were 2,237 officers and men, of whom 447 were killed or died of wounds. For the same period, total United Nations casualties, including South Korean and United Kingdom casualties, were about 180,000, of whom about 35,000 were killed.

Coronary Thrombosis.—On the advice of the Advisory Committee for Medical Research in Scotland, five grants from National Health Service funds have been made for research on coronary thrombosis. At March 31, 1953, £5,100 had been paid, and £11,600 remained to be paid during this year.

Chalk in Flour.—In the 12 months ending May 23, 1953, 11,369 tons of calcium carbonate were added to national flour. The whole of the supplies conformed to the specifications of the *British Pharmacopoeia* and were obtained from home sources.

Physiotherapists.—There were 4,178 physiotherapists employed in hospitals in the National Health Service in England and Wales on December 31, 1952; 3,250 were full-time and 928 part-time.

Universities and Colleges

UNIVERSITY OF EDINBURGH

The Queen has appointed Dr. D. J. A. Kerr, Lecturer in Forensic Medicine at Edinburgh University, to be Regius Professor of Forensic Medicine, in succession to Sir Sydney Smith, who is resigning on September 30, 1953.

UNIVERSITY OF LONDON

Miles Weatherall, D.M., Senior Lecturer in Pharmacology at London Hospital Medical College, has been appointed to the University Readership in Pharmacology tenable at that College. L. F. Lamerton, M.Sc., Ph.D., Senior Assistant Physicist at the Royal Cancer Hospital, has been appointed to the Readership in Physics applied to Medicine tenable at the Institute of Cancer Research, Royal Cancer Hospital.

Dr. A. d'A. Bellairs, Lecturer in Anatomy in the University of Cambridge, has been appointed to the Readership in Anatomy, tenable at St. Mary's Hospital Medical School.

Dr. K. W. Cross, Senior Lecturer in Human Physiology at St. Mary's Hospital Medical School, has been appointed to the Readership in Human Physiology tenable at the school.

The title of Reader in Anatomy in the University has been conferred on Dr. J. T. Aitken in respect of the post held by him at University College.

Donald Arthur McDonald, D.M., Senior Lecturer in Physiology at St. Bartholomew's Hospital Medical College, has been appointed to the University Readership in Physiology tenable at the College.

W. C. J. Ross, Ph.D., D.Sc., has been appointed to the Readership in Chemistry tenable at the Institute of Cancer Research (Royal Cancer Hospital), from January 1.

Dr. D. Robertson Smith has been appointed Lecturer in Clinical Pathology in King's College Hospital Medical School and Honorary Assistant Clinical Pathologist to the hospital, and Dr. D. G. Rushton Junior Lecturer in Morbid Anatomy in the Medical School.

Mr. L. H. Savin, senior ophthalmic surgeon at King's College Hospital and the Royal Eye Hospital, has been appointed a Fellow of King's College, and Professor R. Milnes Walker, professor of surgery in the University of Bristol, a Fellow of University College.

The following scholarships at the Royal Free Hospital School of Medicine have been awarded for 1953-4: *A. M. Bird Entrance Scholarship*, Miss G. Freeman (City of London School for Girls); *Mrs. George M. Smith Scholarship for Women*, Miss M. L. Shaw (Pontefract and District Girls High School); *MacIntyre Evans Scholarship for Women*, Miss G. R. Perry (Royal Free Hospital School of Medicine); *Elizabeth Garrett Anderson Scholarship for Women*, Miss D. I. Hawkins (Royal Free Hospital School of Medicine); *Dr. Margaret Todd Scholarship for Women*, Miss R. D. Low (Royal Free Hospital School of Medicine); *A. M. Bird Scholarship for Clinical Studies*, Miss A. M. Horn (Royal Free Hospital School of Medicine).

The following candidates at the London School of Hygiene and Tropical Medicine have been approved at the examination indicated:

ACADEMIC POSTGRADUATE CERTIFICATE IN PUBLIC HEALTH.—J. Carlton, G. J. Glynn, Winifred M. Hiscock, K. A. Rahman, S. Sandmo, D. Ungar, D. Yarom.

UNIVERSITY OF LIVERPOOL

The following candidates have been approved at the examinations indicated:

Ph.D.—*In the Faculty of Medicine*: E. S. Jones.
FINAL M.B., CH.B.—*Part II*: J. D. Agnew, J. A. Barlow, A. G. Bowers, M. J. A. Britten, N. T. Burnett, B. J. Charlack, R. W. Coffee, J. S. Comaish, J. R. Cope, G. W. Danger, K. S. Davies, R. J. G. Downie, Florence M. Dukensfield, D. P. Duffield, T. R. Evans, R. Finn, J. G. Foley, D. Gardner, Anne M. Godfrey, D. H. Goldsmith, Mary Gregson, Patricia O. Grundy, W. B. Hanley, P. A. Harrison, J. W. Hill, H. B. Hilton, E. J. M. Hopkins, C. L. Imison, R. A. Johnson, P. L. Jones, P. King, J. B. Laine, V. Leach, C. L. Levene, G. Lloyd, B. A. Lowe, Joan K. McCann, Anne D. Micah, J. B. Middleton, J. M. Nichols, F. T. O'Brien, B. J. O'Dowd, L. Ratoff, M. R. Rayman, A. Roberts, S. S. Rubenstein, M. J. Samuels, H. Savage, Eleanor K. Scott, T. F. Shelley, Mary E. Shepherd, A. Speakman, D. Taylor-Robinson, D. A. Thomas, R. S. Todd, V. Tonge, A.

Turner, M. R. B. Wallace, W. P. Walsh, P. K. Wilson, Elizabeth A. Witham, N. C. Woodier, G. H. Worsley, I. Wort.

DIPLOMA IN PUBLIC HEALTH.—*Part I*: C. Sudhipongse.
DIPLOMA IN RADIOLOGY.—*Radiodiagnosis, Part I*: B. K. Bajaj, W. C. Heron, P. McCann, P. N. Newsam. *Radiotherapy, Part I*: H. J. J. Beyleveld.

D.T.M.&H.—K. M. Aboud, A. N. Basu, S. N. Bhattacharya, K. R. I. Hariharan, R. Hecker (recommended for the award of the Milne Medal in Tropical Medicine and the Warrington Yorke Medal in Tropical Hygiene), E. S. Jones, G. Moles, Y. Na Songkhla, H. C. C. Nwankwo, T. Viriyakul.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

At a quarterly meeting of the College held on May 5, with the President, Dr. W. A. Alexander, in the chair, the following were elected Members of the College: D. S. Nand, G. R. B. Kumarakulasinghe, W. MacLeod, S. N. Wanchoo, L. K. Ganguli, W. D. L. Fernando, N. Y. McCallum, E. W. Moore, M. Hasan, R. A. Gulmohamed, I. F. Sutherland, D. A. I. Grewar, B. Senior, N. Feldman, Y. Ho, Q. G. Quah, S. K. Biswas, W. S. A. Allan, T. H. Maniar, K. Z. Hasan, M. M. Baig, W. L. F. Hatchuel, A. Sandler, I. N. Marks, A. T. Lambie, J. K. McKechnie, C. Nwokolo.

The College approved of regulations permitting suitably qualified persons to read in and borrow from the library. The College library, the use of which has hitherto been restricted to Fellows, was founded in 1681 and is the oldest medical library in Scotland. It is almost entirely restricted to medicine and contains nearly 200,000 volumes.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH

At a meeting of the College held on May 20, with Professor Walter Mercer, President, in the chair, the following candidates, having passed the requisite examinations, were admitted Fellows: A. J. C. Allison, A. E. Amoils, E. S. Chellappa, A. F. G. C. Christie, D. C. Cooke, E. C. Edwards, J. C. Foster, J. D. Fraser, D. R. Gunn, I. A. Harris, H. H. Martin, J. S. Mehta, M. N. Menzies, L. L. Ptak, K. Rubinstein, U. N. Shahi, M. R. Shirazi, J. D. C. Sim, I. M. Stewart, G. G. Vashi, R. D. Venn, W. F. Walker, I. Wilson.

SOCIETY OF APOTHECARIES OF LONDON

The diploma of L.M.S.S.A. has been granted by examination to the following successful candidates: G. Hamlet, J. V. Parson, A. McL. Keil, J. S. Bennett, P. M. Teng, N. Kaan, W. J. G. Hughes, F. L. D. Steel, C. E. Lay.

The following candidates have been awarded the Diploma in Industrial Health: M. S. Bopari, P. K. Bose, J. Fairlee, A. Munn, P. N. B. Peacock, S. Mukherjee, W. E. Scott, D. K. Ramadwar.

Mr. E. J. Dearman, Bedel of the Society, retired on February 28, after 52 years' service with the Society.

CONJOINT BOARD IN SCOTLAND

The following candidates, having passed the final examination, were admitted L.R.C.P.Ed., L.R.C.S.Ed., L.R.F.P.&S.G., on March 7: I. D. Archibald, B. R. Bayne, I. C. Beard, S. C. Bose, S. Burton, Lydia F. G. Cowan, J. A. W. Dressler, Catherine B. Gregor, L. A. Harris, M. L. M. Izzadeen, C. R. Lee, W. T. M. MacNeish, D. N. Randeria, R. H. Rosen, M. R. Soliman, Sheila C. Spark, D. C. Stevenson, Margaret J. Taylor, J. R. Ward, G. J. Whiston.

CONJOINT BOARD IN IRELAND

The following candidates were successful in the Spring post-graduate examinations:

DIPLOMA IN OPHTHALMIC MEDICINE AND SURGERY.—G. E. C. Hewson.

DIPLOMA IN PSYCHOLOGICAL MEDICINE.—S. Lennon, D. E. Munro, E. O. Lundholm, B. G. Fleming, C. McP. Smith, M. A. Rahill, J. W. Sandler, R. A. Robinson, B. A. O'Connell, D. H. A. Irwin.

DIPLOMA IN CHILD HEALTH.—G. Bheek, F. P. S. le Roux, Margaret Magill, A. J. MacDonald, A. J. Edwards, E. O'Connor, T. D. Shanahan.

The following candidates were duly admitted licentiates in medicine and midwifery on March 27, having passed the final examination in medicine, surgery, and midwifery of the Conjoint Board of Ireland: J. M. Anklesaria, C. P. Carey, T. H. Chillingworth, J. A. Davies, I. H. C. Lynch, E. A. Moore, I. Parbhoo, W. V. Reynolds, D. Ryan, J. F. L. Watson.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending June 6 (No. 22) and corresponding week 1952.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

CASES in Countries and London	1953					1952				
	Eng. & Wales	Land.	Scot.	N. Ire.	Eire	Eng. & Wales	Land.	Scot.	N. Ire.	Eire
Diphtheria ..	10	2	3	0		24	1	11	1	1
Dysentery ..	397	68	70	3	1	276	25	84	4	1

* Measles not notifiable in Scotland, whence returns are approximate.

† Includes primary and influenza pneumonia.

‡ Includes puerperal pyrexia.

Vital Statistics

Food-poisoning in Lancashire

Over 1,000 persons are believed to have suffered from food-poisoning last week in an epidemic which affected a number of towns (including Preston and Blackpool) and sanitary districts in north-west Lancashire. For the following information we are indebted to Dr. A. Dodd, divisional medical officer of health, Division No. 3 of the Lancashire county administrative area.

During the period June 13 to 20, 135 cases of food-poisoning were notified from 6 of the sanitary districts in the division. In addition 129 cases were known but not notified, giving a total of 264 cases. Three county boroughs and other districts of the administrative county were affected, some earlier and more severely than No. 3 Division. The vehicle of infection is believed to have been a large batch of meat pies manufactured on June 10 and 11. It may be that some pies baked on June 9 and 12 were also infected. A report on the morning of June 13 of the occurrence of two cases of food-poisoning and the information that meat pies, among other foods which had been eaten, resulted in a decision the same morning to stop production of meat pies. Staff at the place of manufacture were interviewed, excluded from work when justified by circumstances, and faecal specimens submitted for investigation. Distribution lists of meat pies were passed to appropriate local authorities in order that unsold meat pies could be destroyed or subjected to laboratory test and consumers traced if possible.

Salmonella morficans bovis was isolated from faeces of persons affected and from meat pies. No pathogenic organisms were isolated from powdered gelatin, flour, fat, or a first sample of the main carcass meat used in the manufacture of pies. It was not possible to obtain meat from each source for test. *Salmonella* organisms were isolated from several persons employed at the bakery who were probably infected by eating meat pies, but the finding in one case may prove to be significant. Investigations continue, particularly concerning meat supplies.

Clinical reports show that the incubation period varied from 6 to 30 hours, usually about 18 to 24 hours. Shivering or abdominal colic or vomiting (sometimes very severe) was followed by diarrhoea, accompanied by headache, pains in the limbs, and general prostration. The duration of illness was from eight hours to five days. The severity of symptoms was very variable. At the time of writing these notes only two persons are known to have been admitted to hospital from No. 3 Division of the Lancashire county administrative area, but it is understood that more were admitted to hospital from other districts, and that two deaths may have been due to the infection. Primary cases are still being reported, and also a few secondary cases.

Thanks are due to Dr. S. C. Gawne, Lancashire county medical officer of health, for permission to supply these notes.

Week Ending June 13

The notifications of infectious diseases in England and Wales during the week included scarlet fever 1,055, whooping-cough 3,545, diphtheria 17, measles 7,532, acute poliomyelitis 73, dysentery 486, paratyphoid fever 5, and typhoid fever 6.

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported in each week during the nine years 1944-52 are shown thus -----, the figures for 1953 thus ————. Except for the curves showing notifications in 1953, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Infectious Diseases

The incidence of infectious diseases fell in England and Wales during the week ending June 6. The falls in the number of notifications included 286 for measles, from 9,012 to 8,726; 326 for scarlet fever, from 1,084 to 758; 129 for acute pneumonia, from 446 to 317; 108 for dysentery, from 505 to 397; and 105 for whooping-cough, from 2,476 to 2,371.

The largest declines in the incidence of measles were 141 in Yorkshire West Riding, from 1,046 to 905, and 104 in Cornwall, from 305 to 201; while the largest rises were 168 in Surrey, from 132 to 300, and 94 in Lancashire, from 1,492 to 1,586. A small fall in the number of notifications of scarlet fever was recorded throughout the country; the largest declines were 35 in London, from 72 to 37, and 34 in Essex, from 75 to 41. The largest fluctuations in the returns of whooping-cough were falls of 68 in Lancashire,

from 277 to 209, 57 in Durham, from 130 to 73, and 50 in London, from 228 to 178, and a rise of 66 in Yorkshire West Riding, from 152 to 218. 10 cases of diphtheria were notified, 11 fewer than in the preceding week; this total was the lowest ever recorded, being 1 less than the previous lowest level.

51 cases of acute poliomyelitis were notified. These were 6 more for paralytic and 7 fewer for non-paralytic cases than in the preceding week. The cases are concentrated in the south of the country. 24 cases were notified in the south-eastern and south-western counties (excluding London), while only 8 cases were notified in the combined area of Yorkshire, north-western, and northern counties. During the past 10 weeks 386 cases have been notified, compared with 96 to 10 weeks 269 for the corresponding periods during the years 1947 to 1952. The largest returns during the week were Essex 5 (Southend-on-Sea C.B. 2, Ilford M.B. 2), Southampton (Bournemouth C.B. 5), Wiltshire 5 (Calne and county 5), Chippingham R.D. 3), Surrey 4, and Yorkshire West Riding 4.

The largest returns for dysentery were London 68 (Chelsea 13, St. Pancras 9), Middlesex 52 (Willesden M.B. 12, Edmondston M.B. 10), Lancashire 49 (Liverpool C.B. 16), Bedfordshire 35 (Luton M.B. 30), Durham 31 (Stanley U.D. 30), Yorkshire West Riding 24 (Leeds C.B. 11, Sheffield C.B. 9), and Leicestershire 21 (Leicester C.B. 21).

Medical News

First World Conference on Medical Education.—This conference will be held in London from August 22 to 29 this year under the auspices of the World Medical Association, with the collaboration of the World Health Organization, the Council for International Organizations of Medical Sciences, and the International Association of Universities. The president of the conference is Sir Lionel Whitby and the vice-president Professor W. Melville Arnott. The conference will meet in plenary session on Monday, August 24, when Sir Lionel Whitby will give his presidential address on "The Challenge to Medical Education in the Second Half of the Twentieth Century." There will then be addresses by Sir Richard Livingstone on "What is Education?"; by Professor John F. Fulton on "The History of Medical Education"; and by Colonel S. M. K. Mallick on "Medicine—a Technology or a Profession?" During the rest of the week the work of the conference will be done in the following four sections: (1) "Requirements for Entry into Medical Schools"; vice-president, Dr. Victor Johnson, of the Mayo Foundation; rapporteur, Dr. Raymond Whitehead. (2) "Aims and Content of the Medical Curriculum"; vice-president, Sir A. L. Mudaliar, of the University of Madras; rapporteur, Dr. A. Morgan Jones. (3) "Techniques and Methods of Medical Education"; vice-president, Dr. A. Hurtado, of San Marcos University, Lima, Peru; rapporteur, Professor Ian Aird. (4) "Preventive and Social Medicine"; vice-president, Professor René Sand, of the Université Libre, Brussels; rapporteur, Dr. Charles Fletcher. The conference is open to all interested in its work. A registration fee of £4 gives entry to all the sessions and to the excursions and entertainments in connexion with the conference. Early registration is advisable so that places in the excursions may be obtained; the registration bureau will also be opened on Saturday, August 22, on the night of which the B.M.A. Council, acting as the host organization of the conference, will give a reception. The sections will meet in B.M.A. House and the Friends House, Euston Road. Application for registration should be made to Dr. E. Grey Turner, secretary of the local arrangements committee, B.M.A. House, Tavistock Square, London, W.C.1. Communications on the programme of the conference should be addressed to Dr. Hugh Clegg, secretary of the programme committee, *British Medical Journal*, B.M.A. House.

The Lister Institute.—An impressive description of work in progress occupies the greater part of the annual report of the governing body of the Lister Institute of Preventive Medicine, the director of which is Dr. A. A. Miles. The studies carried on at the Institute are divided into three main groups: (a) bacteriological, immunological, and pathological; (b) biochemical; and (c) biophysical and physico-chemical. The Institute also houses the blood group research unit and the blood group reference laboratory of the Medical Research Council. In concluding the report, Sir Henry Dale, O.M., chairman of the governing body, writes of the growing output of important and distinguished work from the different departments of the Institute, and continues: "Such a healthy growth of activities in a period of steeply rising costs inevitably gives cause for some anxiety on financial grounds; but the governing body will explore every possible source of such additional revenue as may be needed to meet any proper development."

"Family Doctor."—An article by Dr. J. A. Hadfield entitled "Is Punishment the Answer?" a profile of an M.O.H., and some facts about sunshine are included in the July issue of *Family Doctor*, which is now out. Other contributions include an article about summer diet, a first-hand account of having a spinal anaesthetic by Harry Cooper, some instructions on life-saving methods, and factual information about contact lenses. Robert T. Lewis has something useful to say about children's comics, and Roger Pilkington contributes another part to the series "How Your Life Began." Seasonable contributions include suggestions for the enjoyment of holidays free from the misery of travel sickness, methods for discouraging germs and flies, as well as a description of animal life on the sea-shore.

Tissue Transplantation.—At recent conferences in London and New York workers in plastic surgery, cancer, zoology, and other fields discussed common problems in tissue transplantation, and in the U.S.A. efforts to increase the exchange of information on this subject have culminated in a proposal to issue a quarterly *Transplantation Bulletin*. This will maintain, and publish at least once a year, a register of all medical practitioners and research workers interested in transplantation problems. The register will cover the fields of plastic surgery, endocrinology, cancer, genetics, immunology, experimental morphology, etc., and will be international in scope. The *Bulletin* will provide a medium for exchange of information and will maintain a bibliography covering the various branches of the subject, but will not publish formal papers. Those interested are invited to send their names and fields of interest to Dr. E. J. Eichwald, University of Utah College of Medicine, Salt Lake City, Utah, U.S.A. The subscription fee to cover cost of the *Transplantation Bulletin* and maintenance of the register and bibliography is \$3, payable after the first issue of the *Bulletin*, which is expected in August, 1953.

Poliomyelitis Research in Scotland.—Two units are to be established in Glasgow for the investigation of cases of poliomyelitis with respiratory paralysis. In addition workers at a special laboratory at the Ruchill Hospital are to study the poliomyelitis virus and the types occurring in Scotland. The Advisory Committee on Medical Research and the Medical Research Council will co-operate with the Western Regional Hospital Board in this research work.

Edward VI and St. Thomas's Hospital.—The charter refounding St. Thomas's Hospital, Bridewell, and Christ's Hospital was granted by Edward VI on June 26, 1553, ten days before his death. To mark the quatercentenary of this event, St. Thomas's is to hold a banquet at the Hospital's sports ground at Stoke d'Abernon on July 4.

Dr. J. O. Irwin has been awarded the Guy Medal in Silver by the council of the Royal Statistical Society in recognition of his contributions to statistical methodology, particularly in the field of bio-assay. Since 1948 Dr. Irwin has been editor-in-chief of Series B of the *Journal of the Royal Statistical Society*.

COMING EVENTS

Contraceptive Technique.—A lecture and demonstration on contraceptive technique will be given by Dr. Marie Stopes, Ph.D., at the Mothers' Clinic, 108, Whitfield Street, London, W.1, on Thursday, July 2, at 2.30 p.m. No fee is charged, but tickets must be obtained in advance.

Royal Medico-Psychological Association.—The annual meeting of this association will be held at Barnwood House, Gloucester, from July 7 to 10, under the presidency of Dr. G. W. T. H. Fleming. The annual dinner will be held at Barnwood House on July 8 at 7.30 p.m. Further information may be obtained from the secretary, R.M.P.A., 11, Chandos Street, Cavendish Square, London, W.1.

NEW ISSUES

Archives of Disease in Childhood.—The next issue (Vol. 28, No. 139) will be available in a week's time. The contents include: TESTS FOR THE ADULTERATION OF HUMAN MILK. R. A. Miller and R. W. B. Ellis. PULMONARY ATELECTASIS IN YOUNG CHILDREN. Margaret Griffiths. ATYPICAL PNEUMONIAS IN CEYLON CHILDREN. C. C. de Silva and G. H. Cooray. RECURRENT PAROTITIS IN CHILDREN. H. Everley Jones. PULMONARY THROMBOSIS AND ITS ASSOCIATION WITH UNEXPECTED DEATH IN CHILDHOOD. John L. Emery. BLOOD SUGAR STUDIES ON PREMATURE BABIES. O. Conner Ward. INTRACRANIAL BRUISES IN INFANTS AND CHILDREN. Robert Hughes and R. McLaren Todd. RUPTURE OF THE FOETAL HEART DURING LABOUR. R. A. McInroy and Anne L. M. Graham. VASCULAR RING: A CAUSE OF CONGENITAL STRIDOR. Richard W. Smithells. CONGENITAL STIPPLED EPIPHYSES. J. N. Briggs, J. L. Emery, and R. S. Illingworth. INCREASED HAEMATURIA IN NEPHRITIS DURING CORTISONE AND A.C.T.H. ADMINISTRATION. L. Michaels and G. Walters. HYPERPYREXIA IN THE POST-KERNICTER SYNDROME. W. H. Patterson and R. M. Forrester. HODGKIN'S DISEASE IN CHILDHOOD. Donald M. Douglas and Albert E. Claireaux. SOME SOCIAL AND ETHNIC VARIATIONS IN THE PHYSIQUE OF SOUTH AFRICAN NURSERY SCHOOL CHILDREN. H. T. Phillips. A HISTORY OF INFANT FEEDING: PART II. SEVENTEENTH AND EIGHTEENTH CENTURIES. Ian G. Wickes.

Issued six times a year; annual subscription £3 3s., single copy 12s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Applications should be made first to the institution concerned.

Monday, June 29

● POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Colonel W. R. M. Drew, R.A.M.C.: Recognition and Treatment of Dysentery. ROYAL COLLEGE OF SURGEONS OF ENGLAND.—3.45 p.m., Arnott Demonstration by Dr. F. Stansfield: Paranasal Sinuses. ROYAL EYE HOSPITAL.—5 p.m., Mr. R. A. Burn: Ophthalmic Problems of the General Practitioner. UNIVERSITY COLLEGE.—At Physiology Theatre, 5 p.m., Dr. W. S. McCulloch (Massachusetts): Some New Techniques for the Electrophysiological Study of the Central Nervous System.

Tuesday, June 30

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. A. R. French: Medico-legal Problems and the Dermatologist. ROYAL COLLEGE OF SURGEONS OF ENGLAND.—3.45 p.m., Arnott Demonstration by Professor R. J. Last: Knee Joint. ROYAL EYE HOSPITAL.—5 p.m., Mr. R. P. Crick: Ophthalmic Complications of Pregnancy and the Puerperium.

Wednesday, July 1

OXFORD UNIVERSITY.—At University Museum, 5 p.m., Litchfield Lecture by Professor Wilder Penfield, O.M., F.R.S.: The Learning of Languages —A Consideration of the Neurophysiological Mechanisms of Speech and Some Educational Consequences. POSTGRADUATE MEDICAL SCHOOL OF LONDON.—2 p.m., Dr. E. F. Gale: Mode of Action of Antibacterial Agents. YORKSHIRE SOCIETY OF ANAESTHETISTS.—At Leeds General Infirmary, 8 p.m., Symposium arranged by Dr. T. C. Gray: Facts about Dosage; opening speakers, Dr. J. W. Dundee, Thiopentone; Mr. H. F. V. Riddle, Nitrous Oxide; Dr. T. C. Gray, Relaxants.

Thursday, July 2

EMPIRE RHEUMATISM COUNCIL.—At Royal Society of Medicine, 8.15 p.m., Special Coronation Lecture by Sir Henry Cohen: Concept of Collagen Disease. ● HAMPSTEAD GENERAL HOSPITAL.—3 p.m., Dr. Harold Davis: Bleeding Peptic Ulcer: 4.15 p.m., Brains Trust. INSTITUTE OF CHILD HEALTH.—5 p.m., Professor G. Fanconi (Zurich): Renal Dwarfism. OXFORD UNIVERSITY.—At Radcliffe Infirmary, 5 p.m., Litchfield Lecture by Professor W. B. Castle (Harvard): Speculations About the Cause of Polycythaemia Vera. ROYAL COLLEGE OF SURGEONS OF ENGLAND AND INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY.—At Lincoln's Inn Fields, W.C., 5.30 p.m., Otolaryngology Lecture by Sir Henry Dale, O.M., F.R.S.: Histamine and its Antagonists.

Friday, July 3

INSTITUTE OF NEUROLOGY.—5 p.m., Professor Warren McCulloch: Cerebral Control of Carbohydrate Metabolism.

APPOINTMENTS

EDWARDS, J. R. G., M.B., B.S., F.R.C.S., Senior Registrar in Plastic Surgery Service of Newcastle-upon-Tyne Regional Hospital Board. FARQUHAR, JOHN BURNS, M.B., Ch.B., F.R.C.S., M.R.C.O.G., Part-time Consultant Surgeon in Obstetrics and Gynaecology to the United Leeds Hospitals and to other hospitals in the Leeds district under the control of the Leeds Regional Hospital Board. GLENN, ROBERT, M.B., B.Ch., D.P.H., Medical Officer of Health, School Medical Officer, and Port Medical Officer, Grimsby. GUYMER, R. F., M.D., D.P.H., D.I.H., Part-time Lecturer in Occupational Health, St. Bartholomew's Hospital Medical College, and Chief Medical Officer to Lloyds Bank, Ltd. HAY, ARTHUR WILLIAM, M.B., B.S., D.P.H., Deputy Medical Officer of Health, County Borough of East Ham. HILL, J. NORMAN, M.B., Ch.B., D.P.H., Medical Director, Mass Miniature Radiography Unit based on St. James's Hospital, Leeds. HOSPITAL FOR SICK CHILDREN, Great Ormond Street, London, W.C.—Joseph Luder, M.D., M.R.C.P., D.C.H., Medical Registrar and Pathologist; M. J. Simpkins, M.B., Ch.B., M.R.C.P., Assistant Medical Registrar; Doreen B. Pallot, M.B., B.S., D.A., Junior Resident Anaesthetist; F. L. Richardson, M.B., Ch.B., and Joan M. Wagner, M.B., Ch.B., M.R.C.P., House-physicians; F. C. Hoyte, M.B., B.S., House-surgeon to Orthopaedic and Plastic Departments; D. L. B. Farley, M.B., B.S., F.R.C.S., Surgical Registrar. LAWSON, JAMES GLEN, M.B., Ch.B., M.R.C.O.G., Lecturer in Obstetrics and Gynaecology, University of Aberdeen. LEDINGHAM, LESLIE ANDREWS, M.B., Ch.B., M.R.C.O.G., Consultant Obstetrician and Gynaecologist, Northern Regional Hospital Board, Inverness. LIVERPOOL REGIONAL HOSPITAL BOARD.—G. J. Harrison, L.R.C.P.&S.I., D.P.M., Medical Superintendent (Consultant) to Winwick Hospital; J. Winter, M.B., Ch.B., M.Rad., D.M.R.D., Consultant Radiologist to Mill Road, Newsham General, and Bootle Hospitals; R. Marcus, M.D., Ch.M., F.R.C.S., Whole-time Assistant Consultant General Surgeon to Hospitals in Central Wirral area; L. Couper, M.B., Ch.B., D.P.M., Whole-time Deputy Medical Superintendent (Consultant) to Winwick Hospital; J. Winter, M.B., Ch.B., D.M.R.D., M.Rad., Consultant Radiologist to North Liverpool and Fazakerley Groups of Hospitals. LYONS, SAMUEL E. C., M.B., B.Ch., D.P.H., Medical Officer to Strabane Hospital, Co. Tyrone, Northern Ireland. MURDOCK, JAMES RONALD, M.D., D.P.H., D.C.H., Medical Officer of Health and Chief School Medical Officer, County Borough of Huddersfield. WEIR, IAN B. L., B.Sc., M.B., Ch.B., D.P.H., D.P.A., Medical Officer of Health for the City of Dundee. WHITHEAD, J. P. S., M.R.C.S., L.R.C.P., Assistant Pathologist (S.H.M.O.), Scarborough, Whitby, Bridlington, and Malton Group Hospital Management Committee.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Allbrook.—On June 11, 1953, at the Mengo Hospital, Kampala, Uganda, to Mary, wife of Dr. David B. Allbrook, a brother for Roland—Malcolm Oliver Frith. Clark.—On June 13, 1953, at Aberdeen, to Constance (formerly Eames), wife of Norman S. Clark, M.B., M.R.C.P., D.C.H., a son. Khosla.—On May 31, 1953, at the West Middlesex Hospital, Isleworth, Middlesex, to Sarol, wife of Dr. H. Khosla, a son—Rajiv. Langford.—On June 15, 1953, at British Military Hospital, Hamburg, B.A.O.R., 3, to L08, wife of Colonel R. C. Langford, A.D.M.S., Hamburg District, a daughter.

MARRIAGES

Chovil—Béland.—On June 26, 1953, in Paris, France, Alan Chovil, M.B., B.Chir., of Fareham, Hants, to Mariella Béland, of Quebec, Canada.

DEATHS

Boyd.—On May 19, 1953, at his home, Mount Side, Ilsham Valley Road, Torquay, George Samuel James Boyd, M.R.C.S., L.R.C.P., late of Four Oaks, Sutton Coldfield, Warwick. Cran.—On June 1, 1953, at Grassington Lodge, Dorking, Surrey, Hugh Rose Cran, M.R.C.S., L.R.C.P., late of New Malden, Surrey, aged 75. Grieve.—On May 30, 1953, at Fontainebleau, France, Stewart Cameron Grieve, M.B., Ch.B., Flying Officer, R.A.F., of 8, Meadowbank View, Kirknewton, Midlothian. Harry.—On May 25, 1953, at his home, Dolebury House, Churchill, Somerset, Philip Anthony Harry, M.D., D.P.H., formerly of Rochdale, Lancs. Kessler.—On May 9, 1953, in a London Hospital, Denys Edward Kessler, M.R.C.S., L.R.C.P., of Windwhistle, Ringwood, Hants. Lawlor.—On May 12, 1953, at King's College Hospital, London, S.E., Geoffrey Leo Thomas Lawlor, L.M.S.S.A., of 133, Camberwell New Road, London, S.E., aged 69. Macbeth.—On May 9, 1953, Alison Nicol Macbeth, M.B., B.S., aged 56. Macbride.—On April 1, 1953, Henry John Macbride, M.D., of 103, Embassy Court, Brighton, Sussex, formerly of London, W., aged 60. McCall.—On May 6, 1953, in a nursing-home, James McIntosh McCall, M.B., C.M., M.R.C.V.S., late of Chalfont St. Giles, Bucks, aged 87. McEwan.—On May 26, 1953, at Nakuru, Kenya, George Clazy McEwan, M.B., Ch.B., D.P.H. Mackay.—On April 26, 1953, in Melbourne, Australia, Charles Vincent Mackay, M.D., F.R.A.C.P. McNaughton.—On May 16, 1953, at Lushoto, Tanganyika, James Garvie McNaughton, M.D., M.R.C.P.Ed. Main.—On May 14, 1953, William Robert Main, M.B., Ch.B., of the Garden House, Buckingham. Nicoll.—On May 13, 1953, in a hospital, Exeter, George Stalker Nicoll, M.B., Ch.B., of Low Barley, Gatehouse-of-Fleet, Castle Douglas, Kirkcudbright. Smith.—On May 22, 1953, at Tunbridge Wells, Kent, Mary Anne Smith, L.R.C.P.&S.Ed., L.R.F.P.S., aged 90. Speirs.—On May 11, 1953, at his home, Furze Bank, Diss, Norfolk, Hugh Meredith Speirs, M.D., aged 75. Style.—On May 23, 1953, at Hadleigh, Suffolk, Arthur Hurrell Style, M.D., aged 79. Walker.—On May 23, 1953, at St. Thomas's Hospital, Hydestile, Surrey, Norman Dunbar Walker, O.B.E., M.B., Ch.B., D.P.H., Lieutenant-Colonel, R.A.M.C., retired, aged 76.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Long-standing Warts

Q.—What is the best treatment for long-standing (five years) warts on the arm of a woman?

A.—The most suitable treatment of a crop of common warts on the arm depends to some extent on the number of warts present. If there are not more than half a dozen it will probably be best to treat them individually by freezing with carbon-dioxide snow. Treatment should be sufficient to raise a blister, and, in this situation, 30 to 45 seconds to firm pressure will probably be suitable. If the warts are very numerous it may be better to remove them with the curette. This is not at all difficult, but seems to require a knack of scraping off the warts completely and smoothly in the right plane. Preliminary freezing with an ethyl-chloride spray provides fairly good analgesia, but in nervous patients a short general anaesthesia may be best. After curettage, the areas should be covered with a dry dressing, which is left in place, and kept dry for a week or 10 days. The areas should not be completely occluded with "elasto-plast." At the end of 10 days they will be healed, and if curettage has been complete recurrence is not very likely.

Cartridge Syringes

Q.—Certain syringes in which disposable cartridges are used preclude aspiration of blood before injection. The syringes are obviously convenient, but do the dangers from not being able to tell if a vein has been entered make them unsafe for use in domiciliary practice?

A.—These syringes are convenient, and for most purposes quite satisfactory, despite the objection referred to in the question. On the other hand, when the medicament to be injected is one that can cause untoward effects if it enters a vein, it would seem advisable to use another type of syringe. Among such medicaments are suspensions in oils, and preparations of procaine and other newer forms of penicillin, the accidental intravenous injection of which is believed to have caused serious effects. It would likewise be unsatisfactory to use these syringes for the intravenous injection of drugs which cause local damage when they escape into the tissues.

Vitamin B₁₂ in Pernicious Anaemia

Q.—As a pernicious anaemia patient receiving 50 µg. of vitamin B₁₂ fortnightly and feeling perfectly fit, I often wonder how this microscopical amount of intramuscular B₁₂ meets up with the non-existent intrinsic factor from my achy stomach. The greater would be my wonder had I suffered total gastrectomy. The latest writers on haematology concur in agreeing that pernicious anaemia only rarely follows total gastrectomy. There certainly can be no intrinsic factor in a non-existent stomach. Can you please explain this to me?

A.—In a normal person Castle's extrinsic factor, which is now thought to be identical with vitamin B₁₂, combines with epithelial cells of the small intestine. Here it is bound with another substance and passes to the liver to be stored. The person suffering from pernicious anaemia lacks intrinsic factor, and so fails to absorb the minimum amount of vitamin B₁₂ necessary for the normal maturation of red cells. The average diet in this country contains about 5 µg. of vitamin B₁₂, much of which is not absorbed even by the

normal person, and this explains why the average amount by injection of 3 µg. a day required by the patient with pernicious anaemia is so small.

Total gastrectomy is usually performed for carcinoma of the stomach, and many such patients do not survive long enough to develop a megaloblastic anaemia. In those that do survive, anaemia is not uncommon. Thus, of 53 cases surviving for more than three years, 12 had developed macrocytic anaemia and 5 an anaemia of doubtful nature; only 10 of the remainder had definitely received no liver therapy.¹ It seems probable that intrinsic factor may be present in the duodenal mucosa² of some normal individuals, and that in patients with pernicious anaemia atrophy of the glands producing intrinsic factor is not confined to the stomach. The question is fully discussed by Conway and Conway.³

Herpes Zoster and Chicken-pox

Q.—Is it established that an attack of herpes zoster in a child will result in immunity to chicken-pox? If so, is the immunity invariable and lasting?

A.—This is a difficult question to answer outright—unless perhaps by saying simply, so far as the first part of the question is concerned, that it has not been established; there is, indeed, no evidence one way or the other that an attack of zoster may result in immunity to chicken-pox. The two infections are, of course, due to the same or closely related viruses. Second attacks of either disease are rare. But chicken-pox does not prevent the development of zoster in later life, possibly, it has been suggested, because zoster results from the reactivation of virus which has remained latent within the body since the original attack of chicken-pox. The collection of adequate evidence in the reverse direction is rendered difficult because chicken-pox is predominantly a disease of childhood, whereas zoster is more frequently encountered in adults.

Ergometrine for Retained Placenta

Q.—Is it a good thing to give intravenous ergometrine when there is a retained placenta?

A.—The use of ergometrine in cases of retained placenta depends very much on the circumstances of the case. If, in addition to retention of the placenta, there is also haemorrhage, and if the attendant is working under conditions of domiciliary practice, then 0.5 mg. ergometrine should be injected intravenously without hesitation. This may or may not be followed by delivery of the placenta, but it will almost certainly control the bleeding. The advantage is that, even if the placenta remains in the uterus, the immediate threat to life is arrested, and the attendant has time to obtain assistance and to make proper preparations for manual removal of the placenta to be carried out as a planned operation.

If the placenta is retained but no haemorrhage is taking place, opinions and practice vary. If the patient is in hospital with all facilities at hand there is much to be said for manual removal of the placenta, delaying the intravenous injection of ergometrine until the moment the placenta is withdrawn. The same is true for domiciliary practice, provided help can be obtained for carrying out the operation without undue delay. There may be circumstances, however, in which ergometrine can be given with advantage, for it may lead to expulsion of the placenta, or promote its separation so it can be expressed. If it fails, however, the placenta still has to be removed manually, and this operation may then be rather more difficult because of uterine spasm. Nevertheless, this difficulty tends to be overrated.

COMING EVENTS

Contraceptive Technique.—A lecture and demonstration on contraceptive technique will be given by Dr. Marie Stopes, Ph.D., at the Mothers' Clinic, 108, Whitfield Street, London, W.1, on Thursday, July 2, at 2.30 p.m. No fee is charged, but tickets must be obtained in advance.

Royal Medico-Psychological Association.—The annual meeting of this association will be held at Barnwood House, Gloucester, from July 7 to 10, under the presidency of Dr. G. W. T. H. Fleming. The annual dinner will be held at Barnwood House on July 8 at 7.30 p.m. Further information may be obtained from the secretary, R.M.P.A., 11, Chandos Street, Cavendish Square, London, W.1.

NEW ISSUES

Archives of Disease in Childhood.—The next issue (Vol. 28, No. 139) will be available in a week's time. The contents include:

TESTS FOR THE ADULTERATION OF HUMAN MILK. R. A. Miller and R. W. B. Ellis.
PULMONARY ATELECTASIS IN YOUNG CHILDREN. Margaret Griffiths.
ATYPICAL PNEUMONIAS IN CEYLONESE CHILDREN. C. C. de Silva and G. H. Cooray.
RECURRENT PAROTITIS IN CHILDREN. H. Everley Jones.
PULMONARY THROMBOSIS AND ITS ASSOCIATION WITH UNEXPECTED DEATH IN CHILDHOOD. John L. Emery.
BLOOD SUGAR STUDIES ON PREMATURE BABIES. O. Conor Ward.
INTRACRANIAL BRUISES IN INFANTS AND CHILDREN. Robert Hughes and R. McLaren Todd.
RUPTURE OF THE FOETAL HEART DURING LABOUR. R. A. McInroy and Anne L. M. Graham.
VASCULAR RING: A CAUSE OF CONGENITAL STRIDOR. Richard W. Smithells.
CONGENITAL STIPPLED EPIPHYSES. J. N. Briggs, J. L. Emery, and R. S. Illingworth.
INCREASED HAEMATURIA IN NEPHRITIS DURING CORTISONE AND A.C.T.H. ADMINISTRATION. L. Michaels and G. Walters.
HYPERPYREXIA IN THE POST-KERNICTERUS SYNDROME. W. H. Patterson and R. M. Forrester.
HODGKIN'S DISEASE IN CHILDHOOD. Donald M. Douglas and Albert E. Claireaux.
SOME SOCIAL AND ETHNIC VARIATIONS IN THE PHYSIQUE OF SOUTH AFRICAN NURSERY SCHOOL CHILDREN. H. T. Phillips.
A HISTORY OF INFANT FEEDING: PART II. SEVENTEENTH AND EIGHTEENTH CENTURIES. Ian G. Wickes.

Issued six times a year; annual subscription £3 3s., single copy 12s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Applications should be made first to the institution concerned.

Monday, June 29

●POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Colonel W. R. M. Drew, R.A.M.C.: Recognition and Treatment of Dysentery.

Winter, M.B., Ch.B., D.M.R.D., M.Rad., Consultant Radiologist to North Liverpool and Fazakerley Groups of Hospitals.
LYONS, SAMUEL E. C., M.B., B.Ch., D.P.H., Medical Officer to Strabane Hospital, Co. Tyrone, Northern Ireland.
MURDOCK, JAMES RONALD, M.D., D.P.H., D.C.H., Medical Officer of Health and Chief School Medical Officer, County Borough of Huddersfield.
WEIR, IAN B. L., B.Sc., M.B., Ch.B., D.P.H., D.P.A., Medical Officer of Health for the City of Dundee.
WHITEHEAD, J. P. S., M.R.C.S., L.R.C.P., Assistant Pathologist (S.H.M.O.), Scarborough, Whitby, Bridlington, and Malton Group Hospital Management Committee.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Allbrook.—On June 11, 1953, at the Mengo Hospital, Kampala, Uganda, to Mary, wife of Dr. David B. Allbrook, a brother for Roland—Malcolm Oliver Frith.
Clark.—On June 13, 1953, at Aberdeen, to Constance (formerly Eames), wife of Norman S. Clark, M.B., M.R.C.P., D.C.H., a son.
Khosla.—On May 31, 1953, at the West Middlesex Hospital, Isleworth, Middlesex, to Saroj, wife of Dr. H. Khosla, a son—Rajiv.
Langford.—On June 15, 1953, at British Military Hospital, Hamburg, B.A.O.R., 3, to Lois, wife of Colonel R. C. Langford, A.D.M.S., Hamburg District, a daughter.

MARRIAGES

Chovil—Béland.—On June 26, 1953, in Paris, France, Alan Chovil, M.B., B.Chir., of Farcham, Hants, to Mariella Béland, of Quebec, Canada.

DEATHS

Boyd.—On May 19, 1953, at his home, Mount Side, Ilsham Valley Road, Torquay, George Samuel James Boyd, M.R.C.S., L.R.C.P., late of Four Oaks, Sutton Coldfield, Warwick.
Cran.—On June 1, 1953, at Grassington Lodge, Dorking, Surrey, Hugh Rose Cran, M.R.C.S., L.R.C.P., late of New Malden, Surrey, aged 75.
Grieve.—On May 30, 1953, at Fontainebleau, France, Stewart Cameron Grieve, M.B., Ch.B., Flying Officer, R.A.F., of 8, Meadowbank View, Kirknewton, Midlothian.
Harry.—On May 25, 1953, at his home, Dolebury House, Churchill, Lancs, Somerset, Philip Anthony Harry, M.D., D.P.H., formerly of Rochdale.
Kessler.—On May 9, 1953, in a London Hospital, Denys Edward Kessler, M.R.C.S., L.R.C.P., of Windwhistle, Ringwood, Hants.
Lawlor.—On May 12, 1953, at King's College Hospital, London, S.E., Geoffrey Leo Thomas Lawlor, L.M.S.S.A., of 133, Camberwell New Road, London, S.E., aged 69.
Macbeth.—On May 9, 1953, Allison Nicol Macbeth, M.B., B.S., aged 56.
Macbride.—On April 1, 1953, Henry John Macbride, M.D., of 103, Embassy Court, Brighton, Sussex, formerly of London, W., aged 60.
McCall.—On May 6, 1953, in a nursing-home, James McIntosh McCall, M.B., C.M., M.R.C.V.S., late of Chalfont St. Giles, Bucks, aged 87.
McEwan.—On May 26, 1953, at Nakuru, Kenya, George Clazy McEwan, M.B., Ch.B., D.P.H.
Mackay.—On April 26, 1953, in Melbourne, Australia, Charles Vincent Mackay, M.D., F.R.A.C.P.
McNaughton.—On May 16, 1953, at Lushoto, Tanganyika, James Garvie McNaughton, M.D., M.R.C.P.Ed.
Maha.—On May 14, 1953, William Robert Main, M.B., Ch.B., of the Garden House, Buckingham.
Nicoll.—On May 13, 1953, in a hospital, Exeter, George Stalker Nicoll, M.B., Ch.B., of Low Barlay, Gatehouse-of-Fleet, Castle Douglas, Kirkcubright.
Smith.—On May 22, 1953, at Tunbridge Wells, Kent, Mary Anne Smith, L.R.C.P.&S.Ed., L.R.F.P.S., aged 90.
Speirs.—On May 11, 1953, at his home, Furze Bank, Diss, Norfolk, Hugh Meredith Speirs, M.D., aged 75.
Style.—On May 23, 1953, at Hadleigh, Suffolk, Arthur Hurrell Style, M.D., aged 79.
Walker.—On May 23, 1953, at St. Thomas's Hospital, Hydestile, Surrey, Norman Dunbar Walker, O.B.E., M.B., Ch.B., D.P.H., Lieutenant-Colonel, R.A.M.C., retired, aged 76.

Any Questions?

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Long-standing Warts

Q.—What is the best treatment for long-standing (five years) warts on the arm of a woman?

A.—The most suitable treatment of a crop of common warts on the arm depends to some extent on the number of warts present. If there are not more than half a dozen it will probably be best to treat them individually by freezing with carbon-dioxide snow. Treatment should be sufficient to raise a blister, and, in this situation, 30 to 45 seconds with firm pressure will probably be suitable. If the warts are very numerous it may be better to remove them with the curette. This is not at all difficult, but seems to require a knack of scraping off the warts completely and smoothly in the right plane. Preliminary freezing with an ethyl-chloride spray provides fairly good analgesia, but in nervous patients a short general anaesthesia may be best. After curettage, the areas should be covered with a dry dressing, which is left in place, and kept dry for a week or 10 days. The areas should not be completely occluded with "elastoplast." At the end of 10 days they will be healed, and if curettage has been complete recurrence is not very likely.

Cartridge Syringes

Q.—Certain syringes in which disposable cartridges are used preclude aspiration of blood before injection. The syringes are obviously convenient, but do the dangers from not being able to tell if a vein has been entered make them unsafe for use in domiciliary practice?

A.—These syringes are convenient, and for most purposes quite satisfactory, despite the objection referred to in the question. On the other hand, when the medicament to be injected is one that can cause untoward effects if it enters a vein, it would seem advisable to use another type of syringe. Among such medicaments are suspensions in oils, and preparations of procaine and other newer forms of penicillin, the accidental intravenous injection of which is believed to have caused serious effects. It would likewise be unsatisfactory to use these syringes for the intravenous injection of drugs which cause local damage when they escape into the tissues.

Vitamin B₁₂ in Pernicious Anaemia

Q.—As a pernicious anaemia patient receiving 50 µg. of vitamin B₁₂ fortnightly and feeling perfectly fit, I often wonder how this microscopical amount of intramuscular B₁₂ meets up with the non-existent intrinsic factor from my achyllic stomach. The greater would be my wonder had I suffered total gastrectomy. The latest writers on haematology concur in agreeing that pernicious anaemia only rarely follows total gastrectomy. There certainly can be no intrinsic factor in a non-existent stomach. Can you please explain this to me?

A.—In a normal person Castle's extrinsic factor, which is now thought to be identical with vitamin B₁₂, combines with an intrinsic factor present in gastric juice and enters the epithelial cells of the small intestine. Here it is bound with another substance and passes to the liver to be stored. The person suffering from pernicious anaemia lacks intrinsic factor, and so fails to absorb the minimum amount of vitamin B₁₂ necessary for the normal maturation of red cells. The average diet in this country contains about 5 µg. of vitamin B₁₂, much of which is not absorbed even by the

normal person, and this explains why the average amount by injection of 3 µg. a day required by the patient with pernicious anaemia is so small.

Total gastrectomy is usually performed for carcinoma of the stomach, and many such patients do not survive long enough to develop a megaloblastic anaemia. In those that do survive, anaemia is not uncommon. Thus, of 53 cases surviving for more than three years, 12 had developed macrocytic anaemia and 5 an anaemia of doubtful nature; only 10 of the remainder had definitely received no liver therapy.¹ It seems probable that intrinsic factor may be present in the duodenal mucosa² of some normal individuals, and that in patients with pernicious anaemia atrophy of the glands producing intrinsic factor is not confined to the stomach. The question is fully discussed by Conway and Conway.³

Herpes Zoster and Chicken-pox

Q.—Is it established that an attack of herpes zoster in a child will result in immunity to chicken-pox? If so, is the immunity invariable and lasting?

A.—This is a difficult question to answer outright—unless perhaps by saying simply, so far as the first part of the question is concerned, that it has not been established; there is, indeed, no evidence one way or the other that an attack of zoster may result in immunity to chicken-pox. The two infections are, of course, due to the same or closely related viruses. Second attacks of either disease are rare. But chicken-pox does not prevent the development of zoster in later life, possibly, it has been suggested, because zoster results from the reactivation of virus which has remained latent within the body since the original attack of chicken-pox. The collection of adequate evidence in the reverse direction is rendered difficult because chicken-pox is predominantly a disease of childhood, whereas zoster is more frequently encountered in adults.

Ergometrine for Retained Placenta

Q.—Is it a good thing to give intravenous ergometrine when there is a retained placenta?

A.—The use of ergometrine in cases of retained placenta depends very much on the circumstances of the case. If, in addition to retention of the placenta, there is also haemorrhage, and if the attendant is working under conditions of domiciliary practice, then 0.5 mg. ergometrine should be injected intravenously without hesitation. This may or may not be followed by delivery of the placenta, but it will almost certainly control the bleeding. The advantage is that, even if the placenta remains in the uterus, the immediate threat to life is arrested, and the attendant has time to obtain assistance and to make proper preparations for manual removal of the placenta to be carried out as a planned operation.

If the placenta is retained but no haemorrhage is taking place, opinions and practice vary. If the patient is in hospital with all facilities at hand there is much to be said for manual removal of the placenta, delaying the intravenous injection of ergometrine until the moment the placenta is withdrawn. The same is true for domiciliary practice, provided help can be obtained for carrying out the operation without undue delay. There may be circumstances, however, in which ergometrine can be given with advantage, for it may lead to expulsion of the placenta, or promote its separation so it can be expressed. If it fails, however, the placenta still has to be removed manually, and this operation may then be rather more difficult because of uterine spasm. Nevertheless, this difficulty tends to be overrated.

Absence of Axillary Hair in a Man

Q.—An athletic young man of 18 suffers considerable embarrassment when changing with other men, as he has no axillary hair and a feminine distribution of his pubic hair. He does not need to shave. His genitalia are normally developed, and he has heterosexual interests. What are the likely causes of this condition, and what treatment is advised?

A.—The usual cause of failure of growth of sexual hair is deficient secretion of testosterone by the interstitial tissue of the testes. On the other hand, it may sometimes be due to resistance of the hair follicles to the normal stimulation of testosterone. This latter cause is probable in the present case, since the patient's genitalia are normally developed. If this is so, there is no effective treatment. However, I suggest that a trial be made with testosterone propionate injected intramuscularly in doses of 50 mg. twice a week. Several months' treatment will be necessary. If injections prove to be inconvenient, methyl testosterone may be given by mouth in doses of 25 mg. daily.

Barrier Creams for Oily Materials

Q.—What barrier creams are useful against oily materials in industry?

A.—Various creams have been advocated as protection against oily materials in industry, but objective laboratory tests¹ have shown that they are penetrated, even when liberally applied, by cutting oils within three-quarters of an hour. The most effective type of cream consists of soap, inert filling powder, and water with small amounts of glycerin; such mixtures certainly facilitate removal of grease and dirt from the hands—for example, of car repairers. But daily application of soapy creams is probably undesirable on many skins. In general, hygienic measures such as good washing facilities and suitable cleansers are more likely to be valuable. The emollient cream of anhydrous lanolin (65 parts) and castor oil (35 parts) described in an earlier question² also assists washing and skin protection.

Castellani's Paint and Myxoedema

Q.—Is there any chance of the resorcinol in Castellani's paint (pig. magent., N.F.) being absorbed through the skin and having an anti-thyroid effect? The paint contains 8% resorcinol. I am using it for recurrent fungus infection of the skin, and treatment may well be prolonged, say, up to a year.

A.—Resorcinol has been shown to be capable of producing myxoedema when applied to varicose ulcers of the leg. In the recorded cases the patients all had large open ulcers, and the ointment had been applied for a long time. It is, however, possible to affect thyroid function if resorcinol is applied to unbroken skin for a sufficiently long time. It seems unlikely that a fungus infection would affect a sufficiently large area of skin to cause a significant risk of myxoedema from the application of 8% resorcinol as a paint. Nevertheless, it would be advisable to keep the possibility in mind, and to note particularly any alteration in tolerance to cold, in the dryness of the skin, in the hair, or in the voice.

Prognosis of Orthostatic Albuminuria

Q.—What is the long-term prognosis for a young man in whom, after full investigation in hospital, a diagnosis of orthostatic albuminuria has been made?

A.—Orthostatic albuminuria is a benign condition; it may disappear spontaneously, and the long-term prognosis is excellent. It would be a wise precaution, however, to maintain contact with the patient for several years and check occasionally the amount of albumin in specimens passed at different times of the day.

NOTES AND COMMENTS

Oestrogens and Vasomotor Rhinitis.—Dr. J. PEPYS (London, S.E.1) writes: The observation of your correspondent on the beneficial effect of oestrogen treatment in a case of vasomotor rhinitis at the menopause ("Any Questions?" May 23, p. 1177) corresponds with that reported by Lucas and Pepys.¹ A very good response to oestrogen treatment was described in 39 women who developed rhinitis at or about the menopause, and a further eight similar cases have been seen by me since that time. These patients correspond in every way with other cases of typical allergic rhinitis, and present the same clinical history of sneezing, itching of the nose, nasal obstruction, and rhinorrhoea; the same nasal mucosal appearances; and the same response to oral administration of palliatives such as antihistaminic drugs or epinephrine. The nasal secretions frequently contain significant numbers of eosinophil cells, and skin testing and clinical trials support their histories, which suggested chiefly inhalant allergens. Treatment by oestrogens alone without any allergic treatment was effective in 33 cases, and six cases required both oestrogen and allergic treatment to obtain the best results. In these cases the response to oestrogens, either ethinyl oestradiol 0.05 mg. daily or stilboestrol 1 mg. daily, is rapid, often complete, and is contemporaneous with their administration. Cessation of treatment can lead to a recurrence of symptoms, which are rapidly controlled again on resumption. Treatment must be continued over a long period just as with the use of oestrogens for other menopausal symptoms, and the best time for tapering off the oestrogen is occasionally found in female asthmatics at the menopause; in one case of severe intractable asthma a remarkably beneficial result was obtained. A possible explanation of this response to the oestrogen treatment is that the hormonal disturbance has lowered the clinical threshold and upset the "allergic equilibrium," thus enabling clinical manifestations to appear.

REFERENCE

Spontaneous Combustion of Alcoholics.—Professor B. BRENDAN HICKEY (Khartum) writes: With reference to "Spontaneous Combustion of Alcoholics" in "Any Questions?" (*Journal*, April 4, p. 793) and the subsequent note by Dr. H. H. MacWilliam (*Journal*, April 18, p. 896), I should like to draw attention to a further account of the alleged occurrence in fiction. Captain Marryat in *Jacob Faithful* describes in a most dramatic fashion the death of Jacob's mother, a confirmed alcoholic who rarely ever left her bunk in a barge. Coming as this description does from so experienced an observer as Marryat, and coinciding so accurately with other descriptions, it is perhaps legitimate to conclude that combustion, spontaneous or otherwise, was seen macabre features usually described.

[The account of this incident is to be found in Chapter 1 of *Jacob Faithful*. It reads as follows:

"Nothing was burning—not even the curtains to my mother's bed appeared to be singed. I was astonished—breathless with fear, with a trembling voice, I again called out 'Mother.' I remained more than a minute panting for breath, and then I ventured to draw back the curtains of the bed—my mother was not there! but there appeared to be a black mass in the centre of the bed. I put my hand fearfully upon it—it was a sort of unctuous, pitchy cinder. . . .

"As the reader may be in some doubt as to the occasion of my mother's death, I must inform him that she perished in that very peculiar and dreadful manner, which does sometimes, although rarely, occur, to those who indulge in an immoderate use of spirituous liquors. Cases of this kind do indeed present themselves but once in a century, but the occurrence of them is too well authenticated. She perished from what is termed *spontaneous combustion*, an inflammation of the gasses generated from the spirits absorbed into the system."

Correction.—The outbreak of food-poisoning caused by the *dansz* variety of *Salm. enteritidis* mentioned in the reply to a question on "Dangerous Mouse Poisons" (May 30, p. 1233) occurred in 1951, and not in 1950 as stated in the answer.

REHABILITATION THROUGH ALTERNATIVE
WORK

HELP FROM THE GENERAL PRACTITIONER

BY

ROBERT PIPER, M.B., B.Ch., D.P.H.

Imperial Chemical Industries Ltd., Paints Division, Slough

The use of the words "fit for light work" on medical certificates causes waste of man-power to factories, and discouragement and loss of earnings to the patients thus described. "Limited" and "alternative" work are better terms because they encourage man and management to ask the questions, "Limited in what way?" "Alternative work of what kind?" Unfortunately, medical practitioners outside industry are not often able to know what information will help managers best to fit such men into productive work and are seldom in a position to recommend alternative employment for medically handicapped persons. The diagnosis itself would not often help, since managers, as a rule, have insufficient medical knowledge to make good use of it. The aim of this note is therefore to suggest briefly what information in such cases would be of most assistance to managements in placing employees in work which is productive and at the same time consonant with their medical requirements.

Classification

There are four main headings under which the information would be helpful: (1) likely duration of disability; (2) environment in which a patient should not work; (3) physical limitations of the patient (a) with respect to travelling to and from work, and (b) at work; (4) fitness for part-time work.

Duration.—It is most useful to group patients into: (a) *Short-term cases*, whose disability is unlikely to last more than a few weeks—e.g., many convalescent cases, minor injuries, etc. For these, managements are unlikely to make elaborate arrangements for finding special work, except in large organizations with rehabilitation centres. (b) *Medium-term cases*, whose disabilities are likely to last a matter of months, up to about a year. Many of these are post-operative convalescents and will be able to resume their original jobs in due course, but it is often worth while, with men possessing any skill, for managements to place them temporarily in alternative work, which is usually rewarding both in terms of money and satisfaction to the patient and to the industry. (c) *Long-term or permanently disabled men*. These include most industrial

workers over 45 years of age who encounter serious illness, accident, or the surgeon's knife, partly because the prolonged absence from work during illness causes loss of the habit and rhythm of work. It applies particularly to work involving heavy lifting. In relation to the effect of age on limitation of work, it has been shown that over the age of 40 years the proportion of handicapped workers increases *pari passu* with the age of the group (Piper, 1951). As our country has an ageing population, it is evident that the proportion of these men who will require placement in industry will increase steadily for some time. At present it is believed that the proportion of handicapped men is somewhere in the region of 7% of all workers in industry.

Conditions of Work

Environment.—Consideration of the environment is particularly appropriate for cases of chronic respiratory disease and chronic skin disease. With the former, the special points often needed are protection from damp, cold, and irritant fumes and dusts. With the latter, the word "dermatitis" is sufficient to cause most managers to take steps to guard against recurrence, but is frequently misleading; it is probably better to say, "Should not be in contact with skin irritants." The guidance of a physician with industrial experience is often needed in these complicated cases if a man is to continue in his industry.

Physical.—The commonest restriction is that of not lifting heavy weights—the only true use of the term "light work." If it is possible to say the maximum weight permitted, it will sometimes be found that the man can continue with his ordinary work. But there are many other restrictions which could with advantage be mentioned separately. Facilities for occasional sitting are needed for many lower-limb cases, and seats where work can be performed sitting are now a statutory requirement in workshops wherever possible. Persons subject to fits can work safely only where there is no danger of serious injury if they fall. Thus they cannot safely work at heights, on scaffolding or ladders, or on boats, or near moving machinery or railway lines. Usually the patient must tell his management frankly what is wrong, but the practitioner can give much help by pointing out that the patient can do a full job apart from this restriction. Peptic ulcer cases are usually best kept off heavy lifting and work where stooping and bending is a feature, at least for some months after an acute attack. Further, working on the three- (or four-) shift system with the weekly change-about of shift, meaning weekly changing of meal times and probably many sandwich meals, does not give an already handicapped digestion a fair chance of maintaining itself in health.

Part-time Work

It is possible for many patients to return to work part-time long before they are fit to do full-time. It is generally unlikely that anyone except the medical practitioner will think of this, and it is therefore his duty to mention it to the patient when he considers the patient fit enough to do so. The sufferer from pulmonary tuberculosis is one who falls frequently into this category, and the healed quiescent case is able to recommence some work long before fit for a full day's work including travelling. As the latter is often an arduous task in itself, particularly during rush hours, some managements will agree (on a doctor's recommendation) to a patient's arriving half an hour late and leaving half an hour early to avoid the rush.

Form of Certificate

Probably the most useful form of words for the type of certificate that the practitioner can use to help the industrial worker and the industry is: "Fit for ordinary work except . . . (the restriction or restrictions then being specified) for . . . (likely duration)."

Needless to say, it is anticipated that the certificate would be handed to the patient for transmission with his agreement to the management.

Summary

A simple scheme is suggested by which medical practitioners would help disabled persons, convalescents, and so on to more productive and more interesting work, and at the same time assist industry in its struggle for more productivity.

Notes and News

The New B.M.A. Lounge.—The new members' lounge is a welcome addition to the amenities of B.M.A. House. A transformed Hastings Hall is now underlined by blue carpet, and punctuated by the glow of red leather upholstery and polished mahogany. The discreet professionalism of the writing-desks, drawn a little apart to the windows, harmonizes with the emblazoned symbol on the glass entrance screen, the Roll of Honour, and the portraits of Sir Charles Hastings and Dr. Guy Dain facing each other above opposite fireplaces. And, as a concession perhaps to the feminine element, an occasional alcove attractively lit supports a gay vase to complete the transformation. The whole effect is tasteful and restful, and is a distinct advance on anything that B.M.A. House has had to offer its members or show its guests before.

Civil Service Medical Officers in Northern Ireland.—It is understood that certain Civil Service medical appointments in Northern Ireland are likely to become vacant in the near future. No advertisements for such vacancies have appeared, and it will be remembered that the Representative Body of the Association at the Dublin meeting last year recommended that no advertisement should be accepted for Civil Service appointments owing to the present inadequate salary scale. This applies also to Northern Ireland.

Negotiation and Joint Consultation in Public Services.—Commencing on February 2 the Institute of Public Administration is presenting a series of seven weekly critical discussions on the machinery and procedure for negotiation and joint consultation in various major public services, including the health services. The series will end with a debate on the motion: "That separate standing organizations for negotiation and for joint consultation are wasteful and unlikely to maintain confidence between official and staff sides." Tickets may be obtained from the Director, Institute of Public Administration, Haldane House, 76a, New Cavendish Street, London, W.1 (Langham 8881).

Questions Answered

Car Expenses—Deduction for Private Use

Q.—The inspector of taxes wishes to deduct one-seventh for my car expenses to allow for private motoring. I am in a semi-rural district, averaging 24,000 miles annually, and this would represent just over 3,000 miles. However, I do not agree that the one-seventh should be taken from the car expenses as a whole, but from the petrol and oil bills. Large repair bills and renovations are entirely due to the heavy wear and tear received during practice calls—rough cart tracks, frequent stopping and starting, often from cold.

A.—The point taken by the questioner—i.e., that the cost per mile of motoring over the rough roads in his rural area is greater than the mileage cost of private motoring—seems to be a good one, but needs to be considered in connexion with the amount charged in his yearly account for repairs and renovations. The greater that amount is in fact the more force there is in his contention. Judging from such cases as we have seen a common rate of restriction is one-tenth, and the questioner would apparently be justified in pressing for the substitution of that proportion for the one-seventh proposed by the inspector of taxes.

Maintaining a Larger Flat

Q.—For the convenience of patients on a new housing estate I am taking a larger flat with a view to seeing patients there by appointment and when necessary. Can I claim a proportion of the rent (£250 per annum inclusive), lighting, etc., against my general practice expenses? I have also to provide living accommodation for a married assistant and family. The inspector of taxes asks me to keep a list of every patient I see here and the exact time taken with each. Is this obligatory?

A.—The questioner is undoubtedly entitled to some deduction from his gross receipts for the general expense of maintaining a flat in which he sees patients and does other medical work, but it is obviously a matter of considerable difficulty to estimate what would be a reasonable proportion of the general expenses to regard as incurred in the conduct of the practice. One factor which would affect the estimate would be the number of patients seen at the flat, and the request of the inspector of taxes for information on that point is not unreasonable. On the other hand, the major consideration is the extent to which parts of the flat are used either wholly or partially for the reception of patients—e.g., if one room is set aside for that purpose it is immaterial whether the weekly number of patients using the room is 10 or 50. It is suggested that, if the facts support the proposal, the questioner should offer to agree to an allowance of, say, one-sixth of the expenses, undertaking at the same time to keep a record from which the number of patients calling at the flat can be ascertained and the question reconsidered as regards future years.

Registrar's Retention of Seniority on Moving

Q.—Is a registrar, going from one post to another of similar grading, allowed to continue on the maximum salary of that grading? If so, would you please give the official reference?

A.—A practitioner holding an appointment in one of the registrar grades is permitted, on being appointed to another post in the same grade, to retain such seniority and increments of salary as he has already received in the post he has left. (R.H.B. (50) 44, paragraph 3 (b).)

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

Correspondence

Medical Establishment of Teaching Hospitals

SIR.—In the *Supplement* of November 22, 1952 (p. 206), you kindly gave me the opportunity of commenting upon a circular letter sent shortly before by the Ministry to boards of governors of teaching hospitals concerning their medical establishments. Following a recent meeting between the Joint Consultants Committee and the Ministry, I am now able to give some further information about the Ministry's letter which may go some way to relieving the disquiet it has caused among members of boards of governors and their senior medical staffs.

At this meeting the Joint Committee was informed that the proposals on medical staffing sent to boards of governors are simply the recommendations of the inspecting teams which had carried out a survey of hospital staffing. They are not, and should not be regarded as, the conclusions which the Ministry itself has formed or is seeking to impose upon the boards. It is thus open to each board of governors, and particularly to its medical staff committee, to consider the proposals freely and without prejudice, and to interpret them in the light of their local knowledge.

Boards of governors and their medical staffs will, I feel certain, be glad to know that their hands are not tied and that the Joint Committee has been promised further consultations with the Ministry before firm decisions are taken. In these we shall discuss with the Ministry the security of tenure of consultants and senior hospital medical officers, and the possible effects of a reduction in establishments upon the prospects of senior registrars.—I am, etc.,

London, S.W.1.

W. RUSSELL BRAIN,
Chairman, Joint Consultants Committee.

Integration of Medical Practice

SIR.—Before attempting to consider the points raised by Dr. D. Saklatvala (*Supplement*, December 27, 1952, p. 237), I wish to register my resentment at his uncalled-for attack on the preventive medical services of this country, which are acknowledged all over the world to be without equal, and which have played a big part in the improvement of the social and health conditions of our nation.

Did the local authorities really "rush in" to set up personal health services? Surely Dr. Saklatvala as a member of a local health authority knows that local authorities are rarely eager to put up their rates despite the pressures from medical officers of health. These services were surely due in part to just such an evolutionary process within the medical profession as he denies, in that they were initiated, extended, and guided by the minority of doctors who were particularly interested in preventive medicine and had an acute sense of social responsibilities that had led them to become medical officers of health—never the most lucrative posts available to competent doctors.

While it can be argued, not unreasonably, that the ambulance service should be managed by the hospital service, it is quite naive to suggest that a glib, catchpenny phrase reminiscent of the hustings, such as "liaison at the bedside," will solve all the problems of socio-medical care and of personal health services. How can the G.P. coping with an influenza epidemic manage to attend a school health examination (which entails the giving of advice to mother as well as examining and classifying the child) to which parents have been invited some days previously and at which a school nurse is booked to attend, let alone arrive punctually, as he must, in order to cope with staggered appointments for mothers? How can he attend both Mrs. A.'s unexpectedly early confinement and also on the same afternoon the regular child-welfare clinic which has been held on that afternoon for the last twenty years? Who will hold the balance between the claims of G.P.s competing for the services of nursing staff? How is this G.P. at the bedside to cope with the machinery of the Lunacy Acts, the medico-social care of mental illness in

the home, and the medico-legal niceties of the Mental Deficiency Acts? Lastly, are the personal health services designed to "by-pass the general practitioner" or, in fact, to pick up cases of early deviations from health which otherwise most doctors would never see, and this through no fault of theirs?

In conclusion, allow me to quote from *Life and Letters* by Creighton: "It is a cheap line to denounce—it satisfies the sense that something ought to be done; I am weary of denunciation. . . . The world's evils are many and patent. We can all do much to cure them. 'Here a little and there a little,' but do not let us expend our energy in meaningless abuse. Mankind will not be saved by that."—I am, etc.,

Exeter.

J. H. WHITTLES.

Cost of Prescribing

SIR.—As a hospital pharmacist, Mr. F. R. Elkins (*Supplement*, January 3, p. 5) is fully entitled to his own views on the relative therapeutic value and prices of branded medicines and official preparations. There could be no justification, however, for misuse of public money in establishing, as he proposes, an "official office" devoted to propaganda against the prescribing of ethical proprietaries.

This association has no interest in excusing extravagance, or in commenting on prescribing, which is of course the province of the medical profession, but since the cost of ethical proprietaries comprises only around 4d. in the £ of the bill for the National Health Service, the initial saving to the nation, if Mr. Elkins's plan for reducing prescriptions to official preparations was to be effective, would be far outweighed in the resulting gradual decline of pharmaceutical progress. The removal from the laboratories of the pharmaceutical houses of all incentive, not only for original research but for development, implicit in Mr. Elkins's proposals, would have far-reaching and disastrous effects on the health of the nation.—I am, etc.,

London, W.C.1.

GORDON SMITH,
Secretary, Association of British
Pharmaceutical Industry.

SIR.—Mr. F. R. Elkins (*Supplement*, January 3, p. 5) appears to want the best of two worlds. Whilst he is quite prepared to take advantage of what he terms "new chemical entities exhibiting new types of pharmacological activity," he is not willing to allow the famous drug-houses, whose money and research make the discovery of these possible, the means to make the necessary profits to continue this valuable work. It would be tragic if the leading drug-houses felt that, due to economic pressure, they had to cut down their research programmes.

Most practitioners will testify that a very high percentage of the special preparations introduced frequently by these firms are of the highest possible value, and it would be most unjust to regard them as unremarkable mixtures in what Mr. Elkins terms "group 2."—I am, etc.,

Shipley.

J. A. FRAIS.

Interests of Whole-time Specialists

SIR.—In recent weeks several letters have been published in the *Supplement* expressing dissatisfaction with travelling allowances and income-tax allowances as applicable to whole-time specialists. In many cases the whole-time specialist has a greater need of a motor-car and does a larger monthly mileage than many of his part-time colleagues. This is particularly evident in hospital groups in country districts, where registrars and housemen are sometimes difficult to get and may not be considered necessary in certain specialties by the regional hospital board. This is the case in the anaesthetic department in the West Dorset group of hospitals, where the majority of the emergency anaesthetics are administered by my senior whole-time colleague and myself. There is no specialist in this group who has more need of a motor-car than we have. Our total monthly mileage compares favourably with any, and is greater than most, of the part-timers. Even in cases where "home to duty" mileage is paid there is a con-

siderable disparity between the two systems of payment. This is obviously wrong.

Similarly with income tax; I cannot see how anyone can argue that the need of the whole-timer to maintain a library, to join learned societies, and to attend medical meetings is any less than that of the part-timer.

I consider the most urgent problem for discussion is "betterment." I think most hospital doctors are agreed that the general practitioner is worth his 100% on Spens. Do all general practitioners realize that our betterment factor is 15% to 20%? Are they satisfied that this is fair and just? This does not affect only the whole-time specialist; many part-timers are making very little in private practice and only remain on a part-time contract because of the income-tax allowances and increased travelling allowances. Merit awards, too, are a minority distinction. Is it not possible and reasonable that, because the value of money has declined so considerably since 1948, a revision of the betterment factor should be pressed for? Many of us had hoped that by now some comment would have appeared in the *British Medical Journal* on this matter. One is forced to the conclusion, which many have reached, that the Association is concerned primarily with the general practitioner. Of the specialists, the part-timer is worthy of some consideration but the whole-timer is not worth bothering about. I have accordingly resigned my membership.

This letter represents the feelings of many specialists, and perhaps it may stimulate others to express their views.—I am, etc.,

Osmington, Dorset.

JOHN WARWICK.

Branch and Division Meetings to be Held

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Tuesday, January 20, 8.30 p.m., meeting. Lecture by Reverend Canon B. S. W. Green, B.D.: "Medicine and Religion."

BOURNEMOUTH DIVISION.—At Royal Victoria Hospital, Boscombe, Friday, January 23, 8.15 p.m., meeting. Address by Dr. Robert Cruickshank: "The Use and Abuse of Antibiotics" (illustrated).

COVENTRY DIVISION.—At Coventry and Warwickshire Hospital, Stoney Stanton Road, Tuesday, January 20, 8.30 p.m., clinical meeting. Discussion and demonstration by Mr. A. J. Watson: "The Treatment of Fractures in the Aged."

FINCHLEY DIVISION.—At Finchley Memorial Hospital, London, N., Friday, January 23, 8.45 p.m., meeting. Mr. Basil Hume: "The Practitioner and Surgery To-day."

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Royal Oak Hotel, Alderley Edge, Wednesday, January 21, 8.30 p.m., meeting. Film: "Studies in Human Fertility."

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, January 20, 8.45 p.m., meeting. Dr. Robert Forbes: "Legal Hazards." All members of the medical profession are invited.

ROCHDALE DIVISION.—At Red Lion Hotel, Rochdale, Monday, January 19, 8.30 p.m., clinical meeting. Dr. R. M. Corbet: "Malignant Gynaecology as seen in General Practice."

SOUTHAMPTON DIVISION.—At Conference Room, Civic Centre, Southampton, Wednesday, January 21, 8 p.m., Ladies Night. Professor W. T. Williams: "Some of the Medical Problems of Sherlock Holmes." Members' wives are invited.

STIRLING BRANCH.—At Falkirk Royal Infirmary, Tuesday, January 20, 8.30 p.m., clinical meeting. Dr. R. H. Girdwood: "Recent Advances in the Investigation and Treatment of Blood Disorders."

WEMBLEY DIVISION.—At Myllet Arms, Wednesday, January 21, 8 for 8.30 p.m., dinner dance.

WIGAN DIVISION.—At Lewis's Restaurant, Wallgate, Wigan, Thursday, January 22, 8.15 p.m., third clinical meeting. Lecture by Dr. H. Coates: "Psychiatric Problems in General Practice" (illustrated by sound film). To be followed by short general meeting and supper.

WILLESDEN DIVISION.—At Central Middlesex Hospital, Park Royal, N.W., Thursday, January 22, 4.30 p.m., meeting concerning Central Middlesex Hospital out-patient arrangements.

H.M. Forces Appointments

ARMY

Colonel (Temporary Brigadier) A. Sachs, C.B.E., Q.H.P., late R.A.M.C., to be Brigadier.
Lieutenant-Colonels H. C. Benson and W. R. M. Drew, C.B.E., from R.A.M.C., to be Colonels.

ROYAL ARMY MEDICAL CORPS

Captain D. L. Scott to be Major.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major (Honorary Lieutenant-Colonel) P. R. Mitchell, O.B.E., T.D., from T.A.R.O., to be Major, and has been granted the acting rank of Colonel.

National Service List.—Captain A. P. Dignan, from R.A.R.O., National Service List, to be Captain, and has been granted the acting rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Captain J. Newall to be acting Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Major (Honorary Lieutenant-Colonel) H. E. W. Waters has relinquished his commission.

Captain (War Substantive Major) (Honorary Lieutenant-Colonel) D. H. Thompson, O.B.E., has relinquished his commission.

ROYAL AIR FORCE

Squadron Leaders R. Mortimer, P. H. Blackiston, and D. W. Boatman to be Wing Commanders.

Woman Officer Employed with the Medical Branch, R.A.F.—Squadron Leader L. G. Moore to be Wing Commander.

British Medical Association

PROCEEDINGS OF COUNCIL

A meeting of the Council of the British Medical Association was held at Tavistock Square, London, on January 14. Dr. E. A. GREGG was in the chair.

Congratulations were tendered to those members of the Association whose names appeared in the recent Honours List.

The deaths were reported of Dr. David Lawson, a former member of Council, Dr. Harold Orr, President of the Canadian Medical Association, and Mr. C. Wontner-Smith, successor to the late Sir Edwin Lutyens as architect to the Association, and the Chairman was authorized to send letters of condolence to the relatives.

An invitation was received to appoint delegates to the first World Conference on Medical Education, to be held at B.M.A. House, London, in August, and the following were appointed: the Chairman of Council, Sir Henry Cohen, Dr. R. P. Liston, Mr. Nicholson-Lailey, Dr. Talbot Rogers, and Dr. F. M. Rose.

It was reported in connexion with the establishment of a Branch of the Association in the Gold Coast that the chairman of the Overseas Committee found it impossible to go there and that Mr. Ian Fraser, of Belfast, had consented to do so. In addition to his immediate mission Mr. Fraser would give demonstrations and lectures in surgery.

Other appointments were made to representation of the Association on outside bodies and at forthcoming conferences, and nominations were made in connexion with vacancies on the Central Health Services Council and certain of its standing advisory committees.

Visits Overseas

An increasing number of requests were received by the Association for the sending of representatives overseas to attend conferences or perform other functions. The CHAIRMAN said that the Association was naturally anxious to give all possible help in such matters, but the question of expenditure, in view of the straitened economy of the Association, presented a great difficulty.

Dr. J. C. ARTHUR asked whether some general statement of Government policy in such matters could not be sought. Would it not be possible for the Government to make some grant towards the cost of such journeys? The Foreign Office should be made aware of these repeated requests.

The CHAIRMAN reminded the Council of the visit paid to India last March and of recent visits to other parts of the Commonwealth. It was very important that advantage should be taken of these opportunities, but equally important that the right sort of people should go—knowledgeable people and without political prejudice. It was not possible for the Association, with the greatest good will in the world, always to pick such persons "from the shelf." Many people who would be most acceptable in these capacities had very full commitments in this country.

Mr. LAWRENCE ABEL suggested that there were still in this country some wealthy persons who, especially now that some calls for benevolence had ceased, would be willing with a little encouragement to subsidize enterprises of this kind. Every effort should be made to raise voluntary funds for providing people and organizations for this sort of work.

It was agreed to approach the Foreign Office and the Commonwealth Relations Office on this matter.

Annual Meetings

Arrangements were mentioned in connexion with the proposed Annual Meetings in Cardiff, 1953, Glasgow, 1954, Toronto, 1955, and Brighton, 1956. Thanks were extended to the Northern Ireland Branch for an invitation to hold the meeting of 1957 in Belfast. This last proposal was left over for later decision.

Joint Emergency Committee of Professions

It was reported that the Joint Emergency Committee of the Professions, which was formed at the time of the Durham "closed shop" policy after the associations (which included the B.M.A.) had failed singly to persuade the Durham County Council to resolve the deadlock, had asked

its six constituent organizations to consider the desirability of establishing some permanent joint professional committee.

Dr. J. M. GIBSON supported the proposal. The Emergency Committee had proved a very effective weapon, and something of the kind ought to be continued. The Council approved the proposal in principle and authorized the Secretary to make certain inquiries.

Association Finance

The TREASURER (Mr. A. M. A. Moore) said that the Finance Committee had considered a memorandum on the operation of budgetary control, prepared by Messrs. Harold Whitehead and Partners Ltd., in which each item of Association income and expenditure was related to one of the "spending" committees, which would have to submit a budget each year. Mr. Moore added that it was obvious from a first inspection of the preliminary figures that the Association would have still to pursue a line of strict economy. At the next meeting of the Council the accounts for last year would be available in detail. It was absolutely vital to economize if the decision of the Representative Body was to be implemented whereby 50% of the additional revenue from subscriptions following the recent increase would be earmarked for debt redemption.

He was informed that up to date the subscriptions for 1953 of just over 16,000 members of the Association had been received, which was approximately the same position as at the corresponding date last year. Every year there was a certain hard core of resignations, which usually fluctuated between 300 and 500; this year it was just over 1,000. Since January 1, 1953, 480 new members had joined the Association, compared with 270 in the same period the previous year.

Mr. DOUGAL CALLANDER suggested that a more vigorous personal contact might be made through secretaries of Divisions with those who were not members of the Association. He was quite convinced from what he had been able to do in his own Division that if they made up their minds to go into this campaign with vigour there was no reason why they should not increase the membership by 1,000 or 2,000. Mr. LAWRENCE ABEL suggested that the Assistant Secretaries at Headquarters should devote a certain part of their time to assisting divisional secretaries to gain new members.

In putting the report of the Finance Committee to the Council the CHAIRMAN drew attention to the closing paragraph:

"In the meantime the Finance Committee asks the Council to draw the attention of chairmen of committees to the need for the strictest possible economy, particularly during the early months of the present year, until the probable income and expenditure can be more accurately assessed."

Advertisement Policy

The report of the Journal Committee, presented by Dr. O. C. CARTER, contained a reference to the policy to be adopted with regard to advertisements for houses for sale. The Journal Committee had resolved that in normal circumstances all advertisements for the sale of houses should be accepted, but that a general cautionary note be published to the effect that the appearance of an advertisement did not imply the possibility of opening up a practice.

Dr. H. H. D. SUTHERLAND moved that it be an instruction not to accept advertisements for houses or consulting-rooms against the wishes of the local medical committee of the area concerned. A statement or request from the local medical committee if it did not favour acceptance might be regarded as removing the case from "normal circumstances." Dr. D. F. HUTCHINSON seconded, and said that on quite a number of occasions the Middlesex Local Medical Committee had been asked its view as to whether such an advertisement should be accepted, and from its local knowledge had urged that it should not. Such an advertisement would give a man contemplating setting up in the area a wrong idea of the position.

Mr. LAWRENCE ABEL asked why, for example, a medical officer of health or a private practitioner should be debarred from taking any premises. He reminded the Council that there were 2,000 doctors not in the National Health Service and the Association had equally their interests at heart. What had the local medical committee to do with it if he wanted to buy or sell a house? Dr. SUTHERLAND said it was naturally assumed that the local medical committee would on any specific occasion give its reasons. There had never been any attempt to dictate what the policy of the Journal Committee should be.

Dr. W. E. DORNAN said that what it really boiled down to was that many house agents thought that a doctor would be a good tenant. There were instances where a doctor's house was advertised and bought but the man who bought it, although he had a medical qualification, actually practised dentistry and there was no possibility of practising medicine from those premises at all.

The amendment was lost, and the statement of policy set out in the Journal Committee's report was approved.

In dealing with matters concerning *Family Doctor* Dr. CARTER reported that many of the main difficulties in connexion with the magazine were now under control. The fundamental consideration was to run *Family Doctor* during 1953 at no cost to the Association funds.

Central Consultants and Specialists

In the absence of Dr. T. Rowland Hill, owing to illness, the report of the Central Consultants and Specialists Committee was presented by Mr. H. H. LANGSTON. It was agreed, on the recommendation of the Committee, that a meeting of honorary secretaries of regional consultants and specialists committees be arranged annually for an informal discussion of current problems and matters of common interest. Recommendations varying the constitution of the Anaesthetists Group and the Venereologists Group were approved.

Dr. WAND raised the question of the representation of whole-time officers. He understood that this unrest on the part of whole-time officers was being expressed by a higher number of resignations from that group than from any other. Here was the germ of some major difficulties in the not too distant future.

It was agreed to refer these matters to the Central Consultants and Specialists Committee.

The Association Building

Mr. DOUGAL CALLANDER, chairman of the Building Committee, referred to negotiations which had been proceeding for the acquisition of the Burton Street site at the rear of B.M.A. House, an area of about 10,600 sq. ft. In the opinion of his Committee the site would make a valuable addition to the existing accommodation and provide space for the future needs of the library and other departments. It therefore recommended the Council to accept a lease from the Bedford estate and to compensate the present leaseholder for the surrender of his rights. Thanks to the services of the architect and the Association's Financial Comptroller, a substantial reduction had been obtained on the amount originally proposed for the ultimate rental and on the compensation to be paid to the leaseholder.

The recommendations of the Committee were approved. Dr. H. R. FREDERICK said that some members of Council were able to recall the work of the late Sir Robert Bolam in securing the Tavistock Square premises nearly 30 years ago. The events had justified his vision.

The Report on General Practice

The associated questions of the report of the General Practice Review Committee and of the evidence to be tendered by the Association to the Committee on General Practice of the Central Health Services Council (the Cohen Committee) again came forward. The CHAIRMAN reminded the Council that at its last meeting it had been agreed that the report of the Review Committee was not to be pub-

lished as a report of the Council, but as a report of the Committee itself, and that before publication it would be edited by the Committee. The report would be considered by the Divisions and local medical committees, again not as a report of the Council, nor necessarily embodying its views, but as the report of a very important special committee which the Council had set up. The date of publication would be subsequent to the giving of evidence before the Cohen Committee, the preparation of which was the immediate task.

Filling of Vacancies

Dr. TALBOT ROGERS, in presenting the report of the General Medical Services Committee, said that the Committee's attention had been drawn to partnerships which had been formed between an established single-handed doctor who intended shortly to retire and a doctor who was new both to the practice and the district, the intention being to enable the latter to secure a succession to what was essentially a single-handed practice. This was against the best interests of the Service, and it had therefore been agreed with the Ministry that in future the Medical Practices Committee would not, unless there were special circumstances, accept one partner as a logical successor to another who had died or resigned unless the partners had been in active practice together for about a year. The Medical Practices Committee would, of course, retain full discretion if the circumstances of any particular case merited special consideration.

Dr. J. A. GORSKY moved that this should not be accepted until the principle had been more fully discussed. A draft E.C.L. seemed to introduce into the National Health Service a new principle. It suggested that the attention of the Ministry had been drawn, presumably by the General Medical Services Committee, to what were considered to be "phony" partnerships. It might be true that there had been such partnerships. Bad law in 1946 made worse law when E.C.L.s were introduced. He was told that the onus was upon the new partnership to prove that it was not "phony." That was a new principle in English law. It was for the Department itself to declare that a partnership was "phony" and to give those accused an opportunity to defend themselves. He read the judgment of the Master of the Rolls given on January 18, 1952, in which he stated that the prohibition concerning the sale of goodwill was the only prohibition in the Act, but that prohibition did not have the effect of destroying the goodwill, still less of vesting it in the State or any emanation of the State. The goodwill remained one of the assets of the firm, and for as long as the firm carried on the goodwill must necessarily remain its asset. From the moment he entered into a contract to go into a partnership that goodwill belonged to one or other or both the partners. There was no one, either in the Ministry or in any department, who had the right to say that unless this partnership went on for one year a vacancy might be declared. What was now suggested was that in the case of any partnership that had not existed for twelve months the onus was upon the partners to prove that it was not "phony," and to that principle he strongly objected.

Dr. TALBOT ROGERS said that when there was a definite partnership, if one practitioner died or retired it had been the practice to allow the other partner to choose a new partner to come into the practice, and that seemed a wise and proper course. There had been some cases, however, in which one of the partners was elderly and infirm and immediately before he retired from the practice a partnership agreement had been made with another doctor, and then, almost as soon as the partnership agreement had been signed and sealed, the first doctor had retired. This acted unfairly against those doctors who wanted to be appointed to a vacancy, and it had been the object of his Committee to find some way which would act evenly and justly in all such cases and at the same time not penalize anybody who was genuinely in a partnership practice. This matter

had been discussed on two occasions in the General Medical Services Committee, and on each occasion they had had the advantage of Dr. Gorsky's legal mind, but what he had set out at the beginning and was embodied in the present report had the approval of the Committee.

Dr. W. E. DORNAN said that the Medical Practices Committee had had the greatest difficulty in restraining some executive councils from declaring a vacancy when one partner had given notice of retirement. In the ordinary way the surviving partner should be allowed to choose another partner, but there were cases where the course described was necessary.

Dr. GORSKY, in replying on the discussion, said that this was an attempt by the Ministry to effect a change in the National Health Service by way of an E.C.L. and not by amendment of the Act. There were comparatively few cases, compared with the number of partnerships in this country, which were "phony," yet because they could not settle this business by some other means they were introducing a restrictive E.C.L. which was going to penalize the innocent as well as the guilty. He instanced the case in which in a partnership one doctor, suffering from coronary atheroma, took an assistant into partnership. That assistant in a matter of six months acquired a list of 600 or 700 people. Then the other doctor died of coronary thrombosis and the E.C.L. would give the right to declare a vacancy for the whole of that practice. The practice would be advertised and the 600 or 700 patients would be transferred to another doctor. It was for the Ministry to prove that any partnership was "phony."

The amendment by Dr. Gorsky, which was seconded by Dr. Sutherland, that the reference to this subject be deleted from the report, was lost.

Service Pay

General J. C. A. DOWSE, chairman of the Armed Forces Committee, presented a report on action taken in connexion with Service pay. Representations had been made to the Ministry of Defence stressing the knowledge and experience of the Association in matters of remuneration in all branches of medicine, and requesting that a memorandum from the B.M.A. might be considered. The Ministry warmly welcomed the Association's offer, and with some necessary urgency a memorandum was prepared and submitted in confidence to a working party of the Ministry. The memorandum covered a number of factors likely to affect recruitment to the armed Forces, including clinical opportunities, postgraduate study, employment in civil and Service life after retirement, widows' pensions, and the prestige of the Medical Branches of the armed Forces, but the main emphasis was upon remuneration, and detailed tables incorporating proposals for new scales of remuneration were submitted. He (General Dowse), together with members of the secretariat, had since had the opportunity of meeting members of the Working Party to discuss the Committee's proposals, but the recommendations of the Working Party were not yet known. An assurance had been received that, in the light of any further information which may be forthcoming, the Association retained its right to seek an interview with the Minister of Defence.

The action taken by the Armed Forces Committee was approved, and the CHAIRMAN in the name of the Council thanked the Committee for such prompt action undertaken in an emergency.

International Relations

Dr. J. A. PRIDHAM, chairman of the International Relations Committee, presented a report which set out the arrangements for the first World Conference on Medical Education, to be held at B.M.A. House, London, in August next. The Conference was being held under the joint auspices of the World Medical Association and the World Health Organization, with the collaboration of other international bodies. Sir Lionel Whitby would be president of

the Conference, and the general secretary would be Dr. Louis H. Bauer, the programme secretary Dr. Hugh Clegg, and the local arrangements secretary Dr. E. Grey Turner. The attendance was expected to be in the region of 1,000.

The Council agreed, on the recommendation of the Committee, to authorize the offer of a reception to the Conference at a cost not exceeding £400.

It was also agreed that a subscription dinner be held in honour of the Council of the World Medical Association in August, 1953, no charge to fall on Association funds.

The amount of subscription to the World Medical Association was also considered. The present subscription is based, by a special concession, on the exchange rate prevailing before the pound sterling was devalued. On the recommendation of the International Relations Committee, and with the concurrence of the Finance Committee, it was agreed that for 1953 (without prejudice to the payment in subsequent years) the subscription based on the full current rate of exchange should be paid. This, calculated at the current rate of 12 Swiss francs to the pound, makes the amount of the subscription £833.

At the previous meeting of Council notice had been taken of a statement issued by the World Medical Association on the medical aspects of social security which drew attention to opinions on the medical aspects of social security expressed by an international consultant group set up by I.L.O., and it had been resolved that an approach be made to the Chief Medical Officer of the Ministry of Health in the first instance with a suggestion that the B.M.A. might be consulted when persons were being nominated as representatives of Great Britain to take part in discussions on medical aspects of social security under the auspices of W.H.O. or I.L.O. A reply was now received to the effect that the Council was under a misapprehension in supposing that the British representative on the medical consultant group of I.L.O. was selected and appointed by the Government. The Director-General of W.H.O. was responsible for constituting "consultant groups" and was under no obligation to consult Governments in their selection, although Governments were informed of the choice made. The question had arisen because the consultant group set up by I.L.O. on the advice of W.H.O. had made recommendations on medical aspects of social security, which included a whole-time salaried service, which were contrary to the views of the B.M.A. and the W.M.A.

Other Business

A report was made to the Council on the formation of the College of General Practitioners, and the Council sent forward a unanimous expression of good wishes.

It was decided to present an address to the Royal Photographic Society on its centenary.

The Council unanimously endorsed as a recommendation to the Representative Body the nomination by the Glasgow Division of Professor Sir John McNee as President-elect for 1953-4 and President for 1954-5.

A resolution from the Tower Hamlets Division asking the Council to use its influence with the Government to allow the export of antibiotics to the medical profession in China was passed to the International Relations Committee for its observations.

Correspondence which had taken place between the Financial Secretary to the Treasury and the Civil Service Medical Officers Joint Negotiating Committee concerning the salaries of Civil Service medical officers was reported to the Council. This matter was still in an indeterminate stage and awaiting the result of a meeting shortly to take place. Dr. WAND suggested that they should intimate to the Joint Committee that the Association was behind them in their search for proper machinery which would enable these officers to obtain justice, and this course was agreed to.

The Council approved the award of one ordinary research scholarship of £200 in 1953, in addition to the Ernest Hart and Walter Dixon scholarships, each of £250. Mr. ABEL

urged that the Science Committee be instructed to award scholarships only for work of the highest academic quality. The Council discussed the expenditure by the Association on reception and hospitality, and the availability of the general funds of the Association for this purpose. Legal opinion was that the Association might properly use its general funds for providing hospitality at certain functions centrally arranged, such as receptions to a new Minister of Health or to distinguished visitors from overseas. It was agreed that the cost of such hospitality be defrayed from the general funds, after the present balance in the hospitality fund, amounting to £120, had been exhausted, and that the Office Committee be authorized to arrange functions the cost of which did not exceed £100. This matter is to come forward again on the consideration of the Association's budget.

Appeals Machinery for Northern Ireland

On a recommendation from the Public Health Committee it was agreed that a formal approach be made to the Government of Northern Ireland with a view to the establishment of appropriate appeals machinery for medical practitioners employed in the National Health Service. Dr. J. M. GIBSON, who acted for the chairman of the Committee, said that public health officers had not taken kindly to the machinery as it stood. If the Council approved it was proposed to send a deputation to the Ministry of Health and Local Government.

The Staffing Committee reported that after interviewing three selected candidates it had decided to appoint Mr. M. W. Webb Business Manager to the *British Medical Journal*.

Dr. H. H. D. SUTHERLAND, reporting for the Amending Acts Committee, said that the Committee still had a number of matters under consideration for inclusion in its second report to Council. One of these followed upon the reference to Council by the Representative Body of the question of examining and reporting upon ways and means of procuring the restoration of goodwill in practices for those who wished to reacquire it. It had been decided that a full report of the arguments for and against this proposal should be included in the General Medical Services Committee's report to the Annual Conference in order that the opinion of local medical committees might be ascertained.

The Film Committee through Dr. Liston reported some interesting additions to the Film Library, and stated that it was endeavouring to secure the showing of medical films and of visual aids used in medical education in connexion with the forthcoming World Conference on Medical Education.

The War Memorial

It was mentioned that no promise could be made by the authorities concerned of an early licence for all the work involved in the Association's War Memorial, but the Chief Licensing Officer had undertaken to consider favourably an application for a licence to proceed with the courtyard repairs and the preparation of the memorial foundations.

A letter was read from Sir Henry Cohen acknowledging the honour which the Council had done him in proposing his name to the Representative Body for Vice-Presidency of the Association. "I look back upon my period of office with the Association as one of the happiest and most satisfying, and, as I wrote you some months ago, I learnt to appreciate in the inner Council what a tremendous contribution the Association makes to the welfare of our profession. Not the least satisfaction which the Vice-Presidency will give me is that it perpetuates my connexion with the Association."

Dr. H. Alexander was appointed to a vacancy in the representation of the Association on the Joint Tuberculosis Council. It was reported that Dr. Denis H. Brinton had accepted the Council's invitation to act as the representative of the parent body when he attended the New Zealand Branch Biennial Conference, 1953.

The Council, which had met at 10 a.m., concluded its business at 5.30 p.m.

JOINT CONSULTATION ON HOSPITAL AND CONSULTANT SERVICES

DEPUTATION TO MINISTRY

On January 6 the members of the Joint Consultants Committee met Sir John Hawton and other officers of the Ministry, and had a full and frank discussion on the question of consultation between the Ministry and the Committee on matters relating to the hospital and consultant services.

Profession Disturbed

The Chairman of the Committee, Sir Russell Brain, stated that the profession was extremely disturbed by recent events which seemed to point to an unwillingness on the part of the Ministry to consult the Joint Committee or even to keep it informed on matters in which it was vitally interested, and upon which its advice would be of the greatest help to the Ministry. There also appeared to be a growing belief on the part of the Ministry that the hospital and consultant services should, and could, be controlled in detail from the centre.

Staffing Circular

Referring to the recent circular letter to boards of governors of teaching hospitals concerning medical establishments,¹ Sir Russell Brain reminded the Ministry that an undertaking had been given that the results of the medical staffing survey undertaken by inspecting teams would be discussed with the Joint Committee in general terms before any decisions were taken. Although the matter was one which profoundly affected consultants, that undertaking had not been fulfilled. On the contrary the communication to boards of governors had been followed—again without the knowledge of the Joint Committee—by the recent circular to hospital boards and committees² imposing a 5% reduction in certain categories of hospital staff, freezing the establishment of medical staff, and prohibiting any expansion except with the consent of the Minister. While medical staffs were excluded from the 5% reduction, Sir Russell Brain pointed out that an examination of the recommendations of the inspecting teams revealed that if put into effect they would achieve almost exactly a 5% reduction in the consultant establishment of teaching hospitals. If the inspecting teams' recommendations involved a similar reduction in the case of regional board hospitals it would mean the termination of the contracts of some 300 part-time consultants.

Ministry's Intentions in Doubt

It was true that the matter had not gone beyond the stage of recommendations; nevertheless, it was difficult to avoid the assumption that the recommendations indicated the Ministry's intentions. Moreover, the Ministry's instructions on economy in staffing made no distinction between hospitals which were economically planned and those which were not, and Sir Russell Brain wondered what could be more discouraging to a conscientious hospital authority. The Ministry's attention was also drawn to the damaging effect of the recent instructions on the problem of absorbing the surplus of senior registrars.

Increasing Centralization

Sir Russell Brain pointed out that further evidence of increased centralization was to be found in the recent instructions for statistical recording of the work of pathological and radiodiagnostic departments.³ The measures suggested were open to serious criticism, and there was a very real danger of over-standardization. Apart from the fact that these instructions involved an elaborate recording system which would require additional clerical assistance, they implied a belief that the work of these departments could be assessed in terms of statistics and ignored the human element of its value to the community.

² Ibid., January 3, 1953, pp. 1 and 2.
³ Journal, January 10, 1953, p. 86.

Invidious Position

Sir Russell Brain reminded the Ministry that the Joint Committee had repeatedly urged the need for consultation with the profession at all levels in the Service. The Committee and consultants generally were very willing to help the Ministry, but could not do so unless they felt that they had the Ministry's confidence. Unfortunately, on a number of occasions the Committee had been placed in an invidious position. It has either had to explain to the profession that it had no prior knowledge of the Ministry's intentions in a particular matter, or to remain silent and appear to consent to something it felt it should criticize.

MINISTRY'S REPLY

In reply, Sir John Hawton stated that, although he readily admitted that there had been occasional failures on the part of the Ministry to consult the Joint Committee, these were lapses in performance rather than in intention. The Ministry from the outset of the Service had always been anxious to consult with all the bodies concerned with hospital policy. They had no wish to depart from this position.

Unintentional Error

Dealing with the communication to boards of governors on medical staffing, Sir John Hawton agreed that it would have been better if the Joint Committee had been consulted, but the failure to do so was an error, and not an intentional one. He wished, however, to correct any mistaken impressions on the matter. The proposals that had been sent to the teaching hospitals were simply those of the inspecting teams. They were not the conclusions reached by the Ministry itself, nor was there any intention on the part of the Ministry to impose them on the boards. It was open to each hospital, and particularly to its medical staff committee, to look freely at them and interpret them in the light of their local knowledge. The Ministry was only too anxious to have the views of the hospitals themselves.

Referring to Sir Russell Brain's comment upon a possible reduction of medical staff arising out of the staffing survey, the Permanent Secretary stated that similarity with the 5% reduction called for in the other grades of hospital staff was purely coincidental. There was no intention of imposing a 5% cut on medical staffs, and the Ministry had at the moment reached no conclusions.

No Desire for Centralization

Regarding other lapses in consultation, Sir John Hawton hoped that the Committee would appreciate that on occasion it was necessary for the Department to announce an important item of Government policy without prior consultation with the profession, but fortunately this would be a rare occurrence and did not affect the general position. He added that there was no desire for increasing centralization, and if centralization had increased since the Service began it was due not to any desire for it for its own sake but to the need for an overall control of hospital expenditure, for which the Minister was responsible to Parliament.

Need for Consultation Agreed

Sir John Hawton stated that the Ministry was in full agreement with the Joint Committee on the need for effective consultation. He did not think this need could be formalized; it was rather a matter of the two sides keeping in close touch with one another.

The Permanent Secretary gave an assurance that the Ministry, for its part, would do all in its power to provide effective consultation with the Joint Committee on all matters affecting consultants in the hospital service. The Joint Committee need be in no doubt as to the Ministry's recognition of the Committee as the body speaking for consultants and members of hospital staffs, and of its very real desire to co-operate with the Ministry for the good of the Service.

GENERAL MEDICAL SERVICES COMMITTEE

DISCUSSIONS WITH MINISTRY OF HEALTH

A meeting of the General Medical Services Committee was held on January 15, under the chairmanship of Dr. A. TALBOT ROGERS. The agenda were lighter than usual, but the meeting lasted all day.

On the question of entitlement to initial practice allowances and the amount of payment, the Ministry had been asked to indicate its views on the position of the general practitioner in certain circumstances which did not appear to be fully covered by the terms of the circular issued to executive councils. A reply from the Ministry was now before the Committee and was judged to be satisfactory. The existing circular is to be amplified to meet these points.

The Committee devoted considerable time to the draft model distribution scheme forwarded by the Ministry. The scheme covers payments to be made by executive councils under capitation, loadings, emergency treatment, temporary residents, and other headings. The twenty paragraphs were carefully examined, and certain points were noted for further discussion with the Ministry.

The Inducement Fund

Discussion had also taken place with the Ministry on proposals for the future administration of the inducement fund. The Ministry, however, had intimated that it was not yet ready to discuss the revision of the scheme of payments to doctors or the suggestion that an increase of payments might be made retrospective in the light of the Dankwerts award.

Dr. J. T. BALDWIN said that the discussions with the Department of Health for Scotland had been concluded, and he gave an outline of the proposals as they would affect Scotland. It was agreed that these were very satisfactory, and that they should be brought to the notice of the Ministry of Health when discussions were resumed.

Among other matters discussed with the Ministry was the question of payment for the treatment of dental haemorrhage. The Ministry had pointed out that, although it was true that a doctor could not charge a patient on his list for such treatment following extraction by a private dentist, there was nothing to prevent him from claiming his fee from the dentist, who would, of course, try to come to some arrangement with the patient. The representatives of the Committee had undertaken to discuss the matter again with the British Dental Association.

Mileage

On the question of mileage, which had also been raised in the talks with the Ministry, the Scottish members pointed out that the question was quite different in Scotland from what it was in England, and it had been agreed that an observer from the Department of Health for Scotland and from the General Medical Services Subcommittee (Scotland) should attend meetings of the English Mileage Committee. It was also suggested by a Scottish member that it would be useful if an observer from England were sent to the Scottish discussions on mileage.

The CHAIRMAN thought that a reasonably satisfactory answer had been given by the Ministry on a point raised in connexion with reports of medical service committees. The Ministry had undertaken to consider including in its notes for the guidance of service committees a suggestion that riders dealing with, for example, the methods adopted in a particular practice would be best made in a form which was not sent to the patient or to the Press.

Allegations of excessive prescribing and particularly the delay in investigating them had also been discussed with the Ministry. The Ministry stated that it appreciated the need, in the interests of respondent doctors and of the service, of accelerating the procedure of investigation. Some delay was inevitable with the present appeals machinery if the rights of the appellants and the freedom of the referees

was not to be unduly circumscribed, but the department was constantly searching for ways of shortening the time between the issue of the prescription and the final decision in particular cases.

A hypodermic syringe for diabetic patients, which was recommended by the Ministry, was passed round among members of the Committee. It had been approved by the relevant committee of the British Standards Institution and by the Diabetic Association. The Ministry proposed to publicize the existence of the syringe to secure its wider production. Some suggestions for modifications in detail were made by members of the Committee.

The Defence Trusts

At one point in the meeting the members sat as the National Insurance Defence Trust and the General Medical Service Defence Trust, and Dr. KATHERINE HARROWER, the deputy treasurer, submitted reports. The CHAIRMAN said that in view of the importance of the work of the Committee it was essential that they should maintain the regularity of their meetings notwithstanding the appeal of the Council to committees generally that the number of meetings should be cut down so far as possible. But they were anxious that the whole cost should not fall upon the British Medical Association, and accordingly the executive of the National Insurance Defence Trust recommended that for the year beginning January 1, 1953, the British Medical Association should again be reimbursed from the Trust funds for all expenditure in excess of £1,000 per annum incurred on behalf of the Committee, including the expenses of the conferences of local medical committees. This was agreed to.

Ownership of Goodwill

The Committee next considered in detail a draft statement for inclusion in the Committee's report to the Annual Conference embodying the conclusions arrived at at a previous meeting on a memorandum submitted by the Amending Acts Committee on the optional restoration of the right to buy and sell the goodwill of practices. After certain amendments had been made in the draft the question of attaching a recommendation to the conference on this subject was considered. Dr. F. M. ROSE thought that the Committee should formulate its opinion for transmission to the conference, otherwise if the matter were left in the air it would lead to waste of time in prolonged debate. Other members urged that it was the duty of the Committee to make up its mind and present a clear recommendation.

Dr. S. WAND moved "That the Committee, having heard the evidence from other Association committees, recommends the conference not to press for the optional return of the right of purchase and sale of practices." Dr. I. G. INNES seconded. This proposition was criticized as being too weak, and was lost on a show of hands. Another form of words was moved by Dr. A. BEAUCHAMP: "That this Conference, representing the opinion of general medical practitioners in the National Health Service, is not in favour of optional restoration of the right to buy and sell the goodwill of practices." To this Dr. J. C. ARTHUR moved an amendment that the Amending Acts Committee's proposal for the optional restoration of goodwill was regarded by the General Medical Services Committee as impracticable, and the Committee was not in favour of action being taken along those lines. This amendment was carried, and again as the substantive motion, and it was decided that this recommendation should be included in the annual report to the conference.

Employment of Salaried Assistants

Dr. L. RUSSELL, on behalf of the Assistants and Young Practitioners Subcommittee, brought forward the following recommendation:

"That save for a period of three years no principal in single-handed practice should be permitted to have a list of over 3,500

patients by virtue of the employment of an assistant, and, failing this, that regulations should be introduced governing salaries and terms and conditions of service for assistants."

He hoped that this matter would be considered sympathetically. His subcommittee felt that if a principal went on for three years employing an assistant there was no intention on his part to take a partner. He understood that the number of assistants in the country was 2,500. This was far too high a ratio, and some positive steps should be taken.

Dr. F. M. ROSE hoped that this recommendation would not be passed. Young practitioners were apt to be obsessed with the idea that they were being exploited by principals. The training-ground for the young practitioner must be as an assistant. There were cases in which the limiting period of three years would be most unjust, as, for example, in the case of a practitioner in an isolated area of the country who had a list not big enough to carry a partner. Moreover, there were assistants who desired to remain permanently as such.

Dr. A. B. DAVIES, speaking as an individual member and not as a member of the Assistants Subcommittee, also opposed the resolution. He thought that in view of the new distribution scheme it would be most unwise to pass a resolution of this kind. Dr. J. A. PRIDHAM hoped they would not turn it down flat. He knew the difficulties of some of the younger practitioners in getting into a job "with a view." The CHAIRMAN said that he fully agreed that such a resolution as this should be considered very seriously. It was a matter of sufficient importance to form part of their report to the Annual Conference, whether they agreed with the recommendation or not.

Dr. A. BEAUCHAMP moved the reference back. He said that he did so not unsympathetically but in order that the assistants might have another look at the question and see whether they could not put forward something more concrete. Dr. C. F. R. KILICK objected to the suggestion made by one of the members that many of the proposals of the Assistants Subcommittee had been turned down. On the contrary, many of them had been accepted. He also reminded the Committee that there were assistants who wanted to remain as such and it would be unfair to stop them. They were people who did not care for the responsibility of partnership or principalship and appreciated the steady income of an assistant. Dr. J. T. BALDWIN supported the proposal to refer back. Dr. Russell had said that there were 2,500 assistants in this country. He wondered whether that included trainee assistants, who in the nature of things could not be employed on that particular job for more than one year.

Dr. J. C. ARTHUR said that there was a growing tendency, which he deplored, to consider employment by the State as a commendable thing but employment by a private individual as something to be deprecated. Dr. J. A. GORSKY complained that the recommendation was badly worded, and he objected to the "blackmail" which suggested that if what was now proposed were not done regulations should be introduced governing salaries for assistants. This meant the thin edge of a salaried service. Dr. S. WAND said that he did not think the subcommittee had fully understood either the implications or the mathematics of this problem. The proposal had come along because of certain abuses, but these were not large in number although very annoying to the man who had to put up with them. He thought it would be a better thing to send this recommendation back to the subcommittee in order that they might put forward something more fully considered. He thought they might well wait and see where the Dankwerts award took them. He agreed that there were abuses, but there were also some very good principals indeed, and there were many principals who had been assistants and who would be the first to say that they were grateful for the experience they had gained in that way. Dr. J. A. BROWN pointed out that there were a certain number of assistants who would never in any case be principals, and if this recommendation were carried they would be thrown

out of employment. Dr. RUSSELL, in reply, said that he was prepared to take the matter back to his subcommittee with a view to putting forward constructive proposals. But his subcommittee felt very strongly on this matter. The figure which he had given of 2,500 assistants did include trainees, but only about 400 of them.

It was agreed that the recommendation should be taken back with a view to framing a reasoned statement and that in any case the matter be reported to the Annual Conference.

Inflation of Lists

Following upon the proposals in the Ministry's draft E.C.L. on inflation, which the Committee at its previous meeting had decided would not be effective for the purpose, a long reply from the Ministry was placed before the Committee. The Ministry criticized a new system of numbering propounded by the Executive Councils Association which the Committee had urged should be at least explored. It stated that in its view this scheme was quite impracticable, and that it made certain unwarranted assumptions, such as that people always gave correct particulars of the date of their birth. Moreover, the Ministry urged that to change the system now would involve enormous expense and labour in altering the records relating to some 45 million people.

The Ministry added that it was as much concerned as the Committee with the problem of inflation, to which it had given a considerable amount of attention during the last two years, but it could not agree that, by and large, the present machinery was so far from satisfactory as the Committee had suggested. The scheme in its present form had been in existence for less than a year, and it would be remarkable if no difficulties had arisen during this initial period. The Ministry had in fact been agreeably surprised at the relative success of the scheme. Little fresh inflation had taken place during the last nine months, and the operation of the scheme would be gradually improved as the public became more aware of what was expected of them. In the circumstances the Ministry had to ask the Committee to agree to the issue of the draft E.C.L. as soon as possible.

WHOLE-TIME CONSULTANTS

DISCUSSIONS ON CONDITIONS TO BE REOPENED

The Staff Side of Committee "B" of the Medical Whitley Council at its meeting on December 19, 1952, received a deputation from the Association of Whole-time Salaried Specialists (Supplement, December 20, p. 234) to discuss the position of whole-time consultants and, in particular, their lack of representation on the Staff Side. A report of the discussion has been referred to the Joint Consultants Committee, which is responsible for the nomination of the representatives of the profession on the Staff Side of Committee "B." This question of representation has been raised because of the grievances of whole-time officers regarding their conditions of service and, particularly, the inadequacy of their allowances.

Whole-time Consultants to be Present

The Joint Committee is very conscious of the problems facing whole-time officers. It has already vigorously brought these problems to the notice of the Management Side. To meet the immediate situation the Joint Committee has decided to make a further determined attempt to secure an improvement in the conditions of whole-time service and has obtained the consent of the Management Side to reopen discussions and to invite a number of whole-time consultants to be present and to take part. Arrangements are being made for an early meeting with the Management Side, and it is hoped that whole-time consultants, through their representatives, will seize this opportunity of putting their particular problems to the Management Side.

Representation of Whole-time Consultants on Committee "B"

The Joint Committee has also considered the general position with regard to representation. On this the Joint Committee feels that there are channels already available whereby whole-time officers can secure representation on the Staff Side of Committee "B." For example, the Central Consultants and Specialists Committee of the Association consists mainly of members elected by the various Regional Consultants and Specialists Committees throughout the country. In turn the Central Consultants and Specialists Committee elects six members to serve on the Staff Side of Committee "B."

The Joint Committee has always held it to be impracticable for the Staff Side to include members representing a particular specialty or some sectional interest, and, once the immediate problems have been dealt with on the lines proposed above, it is hoped that whole-time officers will renew their efforts during the coming year to secure representation on the Staff Side through the normal channels open to them.

REMUNERATION OF HOSPITAL MEDICAL STAFF**WHITLEY COMMITTEE "B" DISCUSSIONS**

As announced in the *Supplement* (January 10, p. 7), the Staff Side of Committee "B" of the Medical Whitley Council met the Management Side on Tuesday, January 13, and discussed further its claim for a review of the remuneration of hospital medical staffs. After a general discussion the Management Side put a number of questions arising out of the claim, and the Staff Side undertook to consider them and to submit a written reply. A further meeting will be held with the Management Side within the next few weeks.

MINISTER AT DIVISION DINNER**ENFIELD AND POTTERS BAR**

The Enfield and Potters Bar Division, one of the youngest Divisions of the Association, held its second annual dinner and dance on January 15. The Division's chief guest was Mr. Iain Macleod, Minister of Health, in his capacity as Member of Parliament for the constituency within which the Division lies. An added pleasure was that Mr. Macleod was accompanied by Mrs. Macleod, this being her first public appearance after her long and serious illness.

Special Welcome for Mrs. Macleod

The vice-chairman of the Division, Dr. Gerard Lang, acting in the absence of the chairman, Dr. J. Hutton Chisholm, owing to illness, in welcoming Mr. and Mrs. Macleod, said that it was Mrs. Macleod's courage and gaiety which had carried her through such a difficult time, and that he knew she had expressed the wish that her first public appearance should be on an occasion associated with the medical profession. He expressed the particular delight of the Division that she had been able to accompany her husband.

Praise for General-practitioner Hospitals

Dr. Lang made particular reference to the work of the general practitioner and to the fact that within the Division there were two general-practitioner hospitals which had remained as such in spite of the National Health Service—a fact for which all general practitioners in the area were very grateful. The Minister, in his reply, expressed his pleasure at being able to be present, and stated that he felt he was off-duty for the night and that he did not propose to make any profound statements regarding the National Health Service. His remarks, however, when he said that the preservation of general-practitioner hospitals, and indeed the extension of such hospitals, was a matter very near to his heart, were warmly received.

Scottish News**CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE (SCOTLAND)****ANNUAL REPORT, 1951-2**

The Annual Report of the Central Consultants and Specialists Committee (Scotland) for 1951-2, just published, records a year of activity on all matters pertaining to consultants and specialists in Scotland. The following are a few of the many items covered by the Report.

Legal Responsibilities of Hospital Authorities

The Committee feels that the position steadily being established by English courts, that hospital authorities are responsible in law for the acts and omissions of their medical staffs of all grades whilst they are "acting within the power of the Act," might have unforeseen and undesirable consequences on the relationship of the doctor with both the hospital authority and his patients. In Scotland the responsibility for such acts or omissions is still held by the courts to lie solely with the doctor concerned, but the Committee considers that this satisfactory position would be difficult to maintain in view of the provisions of Section 70 of the National Health Service (Scotland) Act, 1947, relating to the protection of statutory bodies and their officers. The Scottish Joint Committee is to be asked to discuss with the Department of Health the legal implications of Section 70.

Confidentiality of Hospital Records

The Committee reports that it had received complaints that in one region an instruction had been issued to hospital medical staff that any reports upon patients, or ex-patients, of a hospital requested through the medical superintendent by a solicitor must be submitted to the solicitor of the regional hospital board before being sent to the inquirer. The view of the Committee, having obtained legal opinion, is that hospital authorities have no legal right to require that reports on patients examined in hospital under category II of the Terms and Conditions of Service should be submitted to the regional hospital board solicitor before being issued to the inquirer, and that should such a request be received by a member of a hospital staff he should be recommended to notify the medical superintendent that a copy of the report would be submitted if permission to do so were received in writing from the originator of the inquiry.

Consultants' Form of Contract

The report records a protest sent to the Scottish Joint Committee in connexion with its failure to communicate with the constituent bodies before approving amendments to the consultants' form of contract with regional hospital boards. The amendments stated that should a regional hospital board find it necessary to vary the duties attached to an appointment, three months' notice of any change would be given after consultation with the consultant. Similarly, the consultant would be required to give three months' notice of any reduction in his duties that he wished the board to consider. Regional hospital boards would also reserve the right to review their estimate of the time required by a consultant's duties, and three months' notice would be given of any change to be made.

Although the Committee agrees that the intention of the amendments is reasonable, it is considerably perturbed by the implications, and considers that they could in this form be used by the boards gradually to reduce a consultant's sessional work until he was forced out of the hospital service. Legal advice as to the validity of the present contracts has been obtained, and this states that anyone

who receives an annual salary, even if paid in quarterly instalments, is entitled in the absence of any specific provision to a year's notice of any alteration or termination of service. Consultants who have signed the amendments to the contract, however, are now entitled to only three months' notice of alterations—there being, of course, an agreed procedure for appealing against termination of contract.

INCREASE IN INDUCEMENT PAYMENTS IN REMOTE AREAS

The General Medical Services Subcommittee (Scotland) has been negotiating with the Department of Health regarding an increase in inducement payments in the light of the higher level of remuneration to general practitioners following the Danckwerts award.

The matter has now been brought to a satisfactory conclusion. The Department has intimated that the figure of £1,000, which has hitherto been taken as a guide to the level of net professional income normally appropriate to such cases, will be raised to £1,400. Payments current in individual cases will be revised on this basis as from April 1, 1953, regard being had, in determining the precise amounts, to any special circumstance of each case. The Department has also agreed that for the past years covered by the back payments made under the Danckwerts award the same percentage increases as have been added to capitation-fee payments will now be added retrospectively to inducement payments. These percentage arrears are:

For the year to March 31, 1949	..	..	..	13.77%
" " " " " " 1950	..	..	..	11.39%
" " " " " " 1951	..	..	..	22.08%
" " " " " " 1952	..	..	..	22.83%

The percentage figure for the year to March 31, 1953, is at present being ascertained, and it is likely that it will be slightly lower than the figure for the year to March 31, 1952.

Those practitioners concerned can expect to receive payment of their increases from their executive councils, without any need for application on their part, not later than the end of March.

Notes and News

Exchange Visits Between B.M.A. and A.M.A.—An unexpected vacancy has arisen for one doctor to go to the U.S.A. on or before March 31, 1953—i.e., during the present financial year. The doctor may deposit up to £200 with the British Medical Association in London and draw the equivalent in U.S. dollars on his arrival in the U.S.A. For full details apply to the Secretary of the B.M.A. as soon as possible.

Training School for Nurses.—The South-east Metropolitan Regional Hospital Board's first new preliminary nurses' training school to serve both general and mental hospitals was opened by the Parliamentary Secretary to the Ministry of Health at Maidstone on January 14. In her speech the Parliamentary Secretary drew attention to the fact that, although the number of students in all types of hospital had increased by over 20% during the last four years, the total number of students in mental hospitals had decreased by about 14%. She stressed the valuable part that could be played by training schools of this kind covering both general and mental health nursing. The school embraces eight hospitals, and four hospital management committees have combined to run it.

Questions Answered**Car Expenses and Allowance**

Q.—As a part-time consultant my travelling expenses in the past year have exceeded my allowance by a considerable amount owing to a major overhaul (after deducting amounts applicable to personal use). The local tax inspector states that "it is not the policy of the income tax authorities to allow expenses for amounts claimed in excess of the travelling allowance already paid." A certain proportion of this claim only would be allowed for the private side of my practice. Would I be justified in taking my claim for the larger amount before the Tax Commissioners?

A.—The questioner is presumably assessed under Schedule E for his salary as part-time consultant and under Schedule D for the profits of his private practice. If the tax office would agree to assess both sources of income in one sum under Schedule D it would simplify the whole matter. The relevant rule under Schedule E requires allowable expenses to have been expended "wholly, exclusively, and necessarily in the performance of the duties," and the inspector of taxes is apparently willing to admit that such expenditure is allowable up to but not exceeding the amount of the car allowance received from the employing authority. That may be reasonable enough in normal circumstances, but there must be some cases in which, even on a strict application of the statutory rule, the allowable expenses exceed the amount received. This case seems to be of that class, and, provided the questioner can establish the facts, personal appeal to the Commissioners concerned is advisable. The inspector's statement as to "the policy of the income tax authorities" has no merits as a legal argument. It should, however, be borne in mind that abnormal expenditure in one year may result in sub-normal expenditure in the following year, when the car allowance received may possibly exceed the allowable expenditure. If the appeal succeeds it might prove impossible to resist assessment on a following year's "profit" on the car allowance.

Assistant's Purchase of New Car

Q.—As an assistant my salary is £850, plus £150 free of tax for car expenses. In January I bought a secondhand car for £335 and sold it in March for £285 when I received a new car, paying the total cost (£610) in one payment. I do as much mileage as my principal, and think I should be entitled to the initial allowance of 40% of the cost of the car. I have heard nothing since I submitted a car allowance claim in April.

A.—The capital allowances appropriate to the transactions are as follows: *Car No. 1*—balancing allowances £335-£285=£50. *Car No. 2*—initial allowance 40% of £610=£244. Even assuming that some proportion of these amounts should be regarded as applicable to private use of the car it is clear that the capital allowances far exceed the amount of the car allowance which the questioner would receive from his employer for the three months to April 5, 1952, and that without taking running expenses into account. There are, however, two or three factors which should be considered before a claim of this nature is pressed. (1) For 1952-3 and following years the annual allowance must be calculated on the written-down basis—i.e., if £244 initial allowance is claimed for 1951-2 the annual allowance for 1952-3 will be 25% of £610-£244=£366 only. (2) The questioner does not state whether he was in receipt of professional earnings before January 6, 1952. If he was not, or if such earnings were small, he would in the long run lose by concentrating a car allowance into the financial year 1951-2, because presumably his liability for that year would be at only a low rate of tax. (3) Capital allowances cannot be claimed as separate items of deduction: they must be regarded as

part of the total expense of using the car, and presumably if a claim is established for one year that the expense exceeded the allowance received from an employer, the Revenue authorities would claim the right in future years to call for evidence to show that the converse had not given rise to liability to tax on some part of the allowance then received by the employee.

Allowance for New Car

Q.—What is the minimum tax allowance on a new car?

A.—The questioner's inquiry is assumed to relate to the "initial" and "annual" allowances. The initial allowance is 40% of the amount which became legally due in the last practice year, but no allowance is due in respect of payments becoming due after April 5, 1952. The annual allowance is 25%—of the total cost in the first year and of the written-down value in subsequent years. An example may make the matter clearer.

Suppose the practice accounts are made up to December 31 each year and that a car was bought in 1951 for £700, of which £250 was payable by December 31, 1951. Then the allowances to be made in calculating the liability for the financial year commencing April 5, 1953, would be as follows:

	£	£
Cost of car	..	700
Initial allowance on £250 @ 40%	..	100
Annual allowance on £700 @ 25%	..	175
Total allowance		275
Written-down value	..	425
Annual allowance for 1953-4 @ 25%	..	106
		319

(Subject to an additional initial allowance for 1953-4 calculated at 40% on the capital payments due in the period from January 1, 1952, to April 5, 1952.)

Service in the Forces—Expenses

Q.—I am doing national service in the R.A.M.C. Can I claim allowance for subscription to the B.M.A. and to the Medical Defence Union?

A.—Official pay is chargeable to tax under Schedule E, and the rule under that Schedule requires allowable expenses to have been incurred wholly, exclusively, and necessarily in the performance of the duties for which the remuneration is payable. Subscriptions such as those payable to the B.M.A. or to the Medical Defence Union have been held by the High Court not to come within that category, and therefore are not allowable expenses in calculating tax payable on Army pay.

Income-tax Liability of Children's Income

Q.—(a) What is the maximum income a child (minor), unearned, may receive before becoming liable to income tax? (b) If the income should exceed the tax-free limit, is the whole amount liable for tax or only the excess? (c) Is there any option given to the parent, should the excess not exceed the child allowance of £60, either to pay tax on the excess or not to claim the child's allowance, whichever is more advantageous? (d) Does the income, or the excess, have to be included with the parent's income and taxed at his rate?

A.—It is assumed that the child has a legal right to the income, and that it does not fall within the class of income which, though legally that of the child, is nevertheless deemed for income-tax purposes to be that of the parent. On that basis the replies to the questions put are as follows. (a) £120 for 1952-3—i.e., the amount of the personal allowance applicable to an unmarried individual. (b) Only the excess over that sum is taxable. (c) The parent has no such option. (d) No, the income is the income of the child, who ranks as an independent taxpayer, though the parent is normally the individual liable to account for any tax liability there may be.

Correspondence

Appointment Option

SIR.—I note from the *Supplement* (January 10, p. 11) that the Newcastle Regional Hospital Board has agreed to allow future applicants for consultant and specialist posts to have the option of giving whole-time or maximum part-time service, but that psychiatrists are specifically excluded from this benefit.

With one or two notable exceptions, this state of affairs exists in every regional hospital board in the country, and in company with many of my colleagues I am much concerned regarding the principle involved. Whereas some of us might prefer to remain as whole-time consultants and specialists, we feel that an injustice is created, as we have not been allowed any option. I should be interested to learn why this discrimination exists against psychiatrists.—I am, etc.,

Portsmouth.

W. LIDDELL MILLIGAN.

Radiology on Points

SIR.—Dr. J. W. D. Bull (*Supplement*, January 10, p. 11) is quite right. The new obligatory unit system for recording radiological work in its present form makes little sense. The schedule of unit values is incomplete and provides a strait-jacket regulation for the sake of bogus efficiency. It disregards the individual aspect of each x-ray examination, and, to bear out Dr. Bull's example, many post-operative x-ray examinations of the lumbo-sacral spine at my hospital are done in plaster-of-Paris casing, requiring the attendance of two radiographers and one nurse. The length of the examination and the number of films used are dependent on the patient's condition (spine, one area, two units). The present unit system is ill-devised, omits unit values for some important investigations, and makes no allowance for individual radiological work. It is inferior to a unit system which, experimentally, I have been trying out for the South-west Metropolitan Regional Hospital Board since August, 1951.

For those willing to discern the signs of the times, it is another step towards drab uniformity, ultimately reducing the work of hospital departments always to the lowest and cheapest common denominator. Nevertheless, if the present unit system is hastily introduced, it need not be thrown overboard, for the solution is relatively simple. After some alterations, which should include higher unit values for x-ray examinations on in-patients, it can provide basic units for radiological work. However, before the returns are made, the head of each x-ray department should be asked to specify additional units he might require for any particular technique or type of work done in his hospital. One further form would have to be completed, hardly noticeable amongst the spate of others, but it would provide for some individual adjustments for teaching and major non-teaching hospitals throughout the country. It certainly would allow a more reliable analysis of the x-ray work for comparative costing, and at the same time some individuality might still be preserved.—I am, etc.,

Fishers Hill, Surrey.

HENRY W. GILLESPIE.

SIR.—Your annotation (*Journal*, January 10, p. 86) on the above subject and the letters from Dr. J. W. D. Bull and Dr. Hugh W. Davies (*Supplement*, January 10, p. 11) are timely, the first because of the conduct of the Ministry in matters of this sort, and the letters because of the utter futility of the whole business.

There is a mania for statistics. In this region there is believed to be a statistical department equipped with costly calculating machines. This may or may not be true, but this is the only reasonable explanation for the repeated requests for statistical returns from all and sundry. Having got other people to do much of its work the department is

hard put to find justification for the initial expenditure on the machines and must think up more "returns" for others to work out and send in. One particular one is a request for the number of films used in each department. This is regardless of size of film. An x-ray department in a dental hospital where dental films are used in packs with two in each envelope will apparently do twice as much work per patient as the hospital where the single pack is used. I always advise that this particular figure is "not available." I did on one occasion suggest that the group secretary might "multiply the number of attendances by 1.8," and heard no more about it. The figure came out of my head, but I believe I once read something on these lines somewhere. It is comparatively easy to work out the ratio of the number of "points" to attendances or examinations in any one department. If the figure is marked "approximate" one is not being dishonest and the figure would be as valuable as any figure of this sort could be. It would keep calculating machines busy and give the statisticians something to play with, and provide a reason for increasing their staffs and costs.

Is the time not ripe for the appointment of a statistician to study the statistical returns made by the statistical departments in their studies of statistical returns? "Big fleas have little fleas . . . and so *ad infinitum*."—I am, etc.,

Worcester.

ANTHONY A. VICKERS.

SIR.—May I, as a general practitioner far from the inner circle of radiologists, congratulate Dr. J. W. D. Bull on his justifiably indignant letter (*Supplement*, January 10, p. 11), which seems to me to score maximum points—would that be 10?—by hitting the target in the middle? On a point of phraseology, however, may I venture to believe that when Dr. Bull is working at arteriography he does not in practice exercise the ability he mentions to continue in any vein at all—definitely or indefinitely?—I am, etc.,

Sheffield.

G. EDWIN TILSLEY.

Delay in Hospital Reports

SIR.—I am one of the doctors in the area Dr. Harold J. Selby refers to in his letter (*Supplement*, January 10, p. 12), and in fairness I must say that my experience has been a very different one. Letters from the hospital authorities have been prompt, courteous, and satisfactory, and without taking up the cudgels on behalf of the consultant and house officer—they can well look after themselves—I have a feeling that too many cases with too little reason are being sent to the general hospitals, cluttering up the out-patient departments.

It may be that the absence of a fee has something to do with this, or, to a lesser degree, an aversion to the health scheme as a whole, contributing to an attitude that the sum total of the effort required to discharge one's obligations is the writing of a simple prescription. I have no doubt the hospital authorities have an adequate answer to these complaints, and I should be glad to hear their point of view.—I am, etc.,

Blakeney, Glos.

J. ASHTON.

Integration of Medical Practice

SIR.—Dr. J. H. Whittles (*Supplement*, January 17, p. 17) wrongs me when he says that I (*Supplement*, December 27, 1952, p. 237) have attacked our preventive medical services. Preventive and curative medicine are not watertight compartments each to be occupied by different doctors, and in practice local authority doctors seem to have difficulty in confining themselves to preventive work. It is when the "clinic doctor" treats impetigo, a feeding difficulty, or a psychological disturbance, etc., without reference to the a psychological disturbance, etc., without reference to the family doctor that he generates friction and creates confusion. Preventive and curative medicine merge. My paper suggested a division which is absolute, and which should be ever in the minds of local authority doctors. I distinguish between a person submitting himself to a routine examination and anyone personally needing medical

advice. In the latter case I do contend that it is vital to the patient's long-term welfare that his family doctor should be constantly in the picture. The rules which govern the relationship between consultants and general practitioners should also, in our three-part service, control the relationship of the general practitioner and the local authority doctor where the latter's work (and Dr. Whittles cites but a few of many examples) is outside the unaided competence of the general practitioner. Where his work is of a kind which is within the competence of the general practitioner there is a duplication which is indefensible. In a two-part service, doctors doing these special types of work would transfer into the jurisdiction of a hospital authority and do their work as do other specialists. Local authorities would still need their medical officers, but such officers would take no part in personal dealings with individual patients. Doctors whose interest lay in any aspect of the personal care of individuals would find their interest catered for by one or other of the two parts. Education authorities, like industrial concerns, might need medical officers, but these should not look upon themselves as part of the central structure of the country's medical services, but as ancillary thereto. Where they "pick up cases of early deviations from health which otherwise most doctors would never see" it should be their simple duty only to ensure that the patient's family doctor does see it forthwith.

It is not at all obvious to me that in advocating a two-part medical service I am, *ipso facto*, advocating that the general practitioner should attend a child welfare centre. Clearly the details of a two-part service could only be arranged after full discussion between the Whittleses, the Saklatvalas, and many others. But, should it be necessary for the general practitioner to attend clinics, he would reconcile his responsibilities to this fixed-time work with his responsibility for emergencies in the way in which he already does deal with conflicting claims on his time. Every general practitioner has fixed-time surgeries, and does many other parts of his work by appointment, and the consultant, too, has to contrive to cover both appointments and emergencies. We all manage, and to the satisfaction of our patients.—I am, etc.,

West Bromwich.

D. SAKLATVALA.

The Cost of Prescribing

SIR.—I should like to endorse the very important letter written by Mr. F. R. Elkins (*Supplement*, January 3, p. 5). In particular, I support the suggestion of a "counterblast" to the blatant propaganda of some manufacturing chemists. *Prescribers' Notes* has already taken up this idea, and I hope that future publications will endeavour to stimulate sound economy in prescribing to the degree that the "shiny literature" seems to stimulate extravagance.

These notes, although simply presented, should be gracefully accepted by our learned profession, because they are spotlighting waste on a national scale which it is impossible to envisage from the prescribers' end without help.—I am, etc.,

Newport, Mon.

D. N. JOHN.

Civil Service Medical Officers

SIR.—The wheel has turned full circle if one is to judge by the letter from "Old Sweat" (*Supplement*, December 27, 1952, p. 241) regarding remuneration for M.O.s in the Civil Service. The same sentiments were expressed in a less succinct fashion in my own letter (*Supplement*, 1950, 1, 81) some two years before the Danckwerts award. How much worse is our position *vis-à-vis* the G.P.s who are still being encouraged to elbow us out of a proper remuneration.

This is not in any sense an attack on G.P.s, who are my very good friends and occasional employers when financial stringency compels me to forgo leave and do a locum in order to make ends meet; but I feel that a little solidarity in the profession would help the underpaid minority of Civil Service M.O.s a great deal. I suppose it is really too much to ask that G.P.s and retired officers refuse to do

Government work on a part-time basis until the full-time counterpart has been given adequate remuneration.—I am, etc.,

"ANOTHER CIVIL SERVICE M.O."

Doctors' Telephone Accounts

SIR,—There is nothing new about doctors' telephones being charged as "business" (*Supplement*, January 10, p. 13). I have paid this rate ever since I had my own practice. In Middlesex it was compulsory to have a telephone at the branch surgery, and the calls there worked out at about 2s. 6d. each.—I am, etc.,

Lee-on-the-Solent.

BARBARA J. HICK.

Interests of Whole-time Specialists

SIR,—Some of the statements in the report of the December meeting of the Central Consultants and Specialists Committee (*Supplement*, January 3, p. 2) cannot be allowed to go unchallenged. First, we learn with surprise that two members of the Regional Hospital Consultants and Specialists Association were co-opted on the Central Consultants and Specialists Committee. Surely some whole-time staff should have been co-opted instead? Later we read that the "Joint Committee had been careful to brief itself on the problem of full-time officers, and its failure to obtain any improvement was due not to lack of knowledge of the problems but to the unbending attitude of the Management Side of Committee B." How the Joint Committee "briefed itself" is not clear. That it was inadequately briefed is certain from the fact that it did not consult the only representative body, the Association of Whole-time Salaried Specialists, before negotiating the new mileage rates, and that it needed to ask the Association's representatives for concrete instances "of the unsatisfactory mileage arrangements and the anomalies that arise out of them" (*Supplement*, January 10, p. 12).

We realize the unsatisfactory nature of the present Whitley machinery, which gives the Management Side the right to refuse arbitration in any dispute, and urge the B.M.A. to take this matter up in the proper quarters. However, the Staff Side have not, until recently, made very determined efforts to improve the lot of whole-time staff except in response to strong external pressure. We cannot forget that they refused to take up the question of payment of whole-time specialists for domiciliary visiting not so long ago, and that they probably could have secured the implementation of this proposal of the Spens Committee if they had pursued the matter energetically enough in the early days of the scheme when whole-time specialists were in fact paid for these visits.

Before we can believe implicitly in this committee's change of heart and future good intentions we must have more convincing proof of its sincerity than the fulsome and adulatory notices in the *British Medical Journal*. Its first step should be to ensure that whole-time staff, who do at least a third of the hospital work in the National Health Service, have the same proportional representation on the negotiating committee, and the opportunity for this may soon occur, as we believe that the charters of some of the royal colleges do not permit their members as such to sit on the Joint Committee, and so its constitution will have to be amended.—We are, etc.,

LEO GILCHRIST.

Branch and Division Meetings to be Held

BROMLEY DIVISION.—At Royal Bell Hotel, Bromley, Tuesday, January 27, 8.20 for 8.45 p.m., meeting. Address by Mr. A. Lawrence Abel: "Some Common Diseases of the Rectum and Anal Canal." To be followed by coloured cinematograph film of modern operation for carcinoma of the rectum.

CITY DIVISION.—At Burroughs Wellcome's Auditorium, 183, Euston Road, London, N.W., Tuesday, January 27, 8.30 p.m., meeting. Scientific and medical films.

EAST KENT DIVISION.—At Winter Gardens, Margate, Friday, January 30, 8.30 p.m. to 2 a.m., annual supper and ball.

FURNESS DIVISION.—At Orthopaedic Department, North Lonsdale Hospital, Tuesday, January 27, 8 p.m., meeting of Clinical Society. Film show.

MID-HERTS DIVISION.—At Sisters Hospital, St. Albans, Friday, January 30, 8.45 p.m., meeting. Dr. Robert Forbes: "The Legal Hazards of Medical Practice."

OLDHAM DIVISION.—At Oldham Hotel, Monday, January 26, 9 p.m., meeting. Professor R. Platt: "Medical Treatment of Hypertension."

OXFORD DIVISION.—At Radcliffe Infirmary, Oxford, Wednesday, January 28, 8.15 p.m., meeting. Dr. G. A. Ballance: "Infective Hepatitis in a College"; Dr. J. B. M. Davies: "Bornholm Disease."

ROCHESTER, CHATHAM, AND GILLINGHAM DIVISION.—At St. Bartholomew's Hospital, Rochester, Thursday, January 29, 8.30 p.m., clinical meeting. All medical practitioners in the area of the Division are invited.

SOUTH SHIELDS DIVISION.—At Ingham Infirmary, Friday, January 30, 8.30 p.m., clinical meeting. Films: "Malignant Conditions," with commentaries by Mr. C. J. L. Thurgar.

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devon's Road, Bow, E., Friday, January 30, 3 p.m., meeting. Dr. Hume Kendall: "Physical Medicine."

WANDSWORTH DIVISION.—At South London Hospital for Women and Children, South Side, Clapham Common, S.W., Sunday, January 25, 10 for 10.30 a.m., clinical meeting.

WARRINGTON DIVISION.—At Warrington Infirmary, Friday, January 30, 8.15 p.m., clinical meeting. Dr. F. F. Hellier: "Some Dermatological Errors."

WIGAN DIVISION.—At Royal Infirmary, Wigan, Friday, January 30, 3 p.m., clinical demonstration.

WILLESDEN AND WEMBLEY DIVISIONS.—At Abbey Hotel, North Circular Road, N.W., Tuesday, January 27, 8.45 for 9 p.m., combined meeting. B.M.A. lecture by Dr. J. F. Loutit: "Medical Aspects of Atomic Activity."

COLONIAL MEDICAL SERVICE

PROGRESS REPORT

On December 31, 1949, an account was published in the *Supplement* (p. 278) of negotiations which had taken place between the Colonial Office and the British Medical Association on the subject of remuneration in the Colonial Medical Service. It was stated that negotiations were in progress in respect of clinical specialists and senior medical administrative officers, and, further, that discussions were about to be undertaken on remuneration in the smaller territories. From time to time the fruits of these negotiations have been published in announcements of improved remuneration in a number of Colonies, and the Colonial Medical Service in most areas now offers a reasonably well paid and attractive career. The time has come for a further short progress report.

Future Prospects in Thirty-six Colonies

It is difficult to generalize about the Colonial Medical Service, because there are 36 Colonies and the terms and conditions of service are different in each. The "average man" in the service (if the existence of such a person can even be postulated) probably spends about half of his career as a medical officer and the other half as a senior medical officer. The medical officer scale of salary in the large Colonies extends roughly from £900 to £1,600 per annum, and the senior medical officer's salary is roughly £1,700.* Salaries are bigger in Hong Kong, where the cost of living is exceptionally high. In all large Colonies medical officers are rewarded with a holding approved higher qualifications are rewarded with a bonus of four increments in the salary scale (two in Hong Kong). This is designed to attract doctors with higher qualifications into the service, and to encourage junior members of the service to obtain higher qualifications and thus to provide a pool of potential specialists.

Clinical Specialists

The man who wishes to rise higher has two possible avenues of advancement. He can become a clinical specialist, or, alternatively, he may achieve high administrative rank. It has been agreed with the Colonial Office that junior specialists should receive the same salary as senior medical officers, and this agreement has been implemented in all the large Colonies. It has been further agreed that

*Colonial medical officers pay colonial income tax, which is everywhere much lower than income tax in the United Kingdom. It is necessary to add roughly 25% to all the figures in this article (which include expatriation pay) in order to arrive at equivalent salaries under U.K. taxation.

in large Colonies there should be a grade of senior specialists on the same salary level as deputy directors of medical services (roughly £1,800–£2,000). This intention has been broadly carried out in Hong Kong, Malaya, Singapore, Kenya, and Nigeria. The Governments of Tanganyika, Nyasaland, and Northern Rhodesia have each appointed one senior specialist, but the Government of Uganda has so far declined to create any posts in this grade. In all areas specialists are permitted to charge fees when called into consultation by private practitioners.

Some time ago the Association suggested to the Colonial Office that there should be a grade of "super-specialists" or consultants who would be appointed for groups of colonies. They would receive a flat-rate salary (£2,500 was the suggested figure) and they would be debarred from private practice. The Association considered that the creation of a small number of top-class consultant posts in the Colonial Medical Service would be immensely beneficial. This suggestion has been discussed by the Colonial Office with the large Colonies, but has not yet been accepted in any area.

Senior Medical Administrative Officers

Objections can be raised against hierarchical systems of remuneration, but it is difficult to escape from them in Colonies where the official community is small and where the salaries of Government officials are published in the annual estimates for all to see. It has been generally agreed with the Colonial Office that the Director of Medical Services in a large Colony should receive the same remuneration as the Attorney-General and the Financial Secretary. This suggestion has been broadly implemented, except in Colonies where the Attorney-General or the Financial Secretary carries a ministerial portfolio in addition to his responsibilities as a chief official. Directors of Medical Services in the large Colonies now receive salaries in the region of £2,000–£2,500.

From East Africa have come complaints that the starting salary for medical officers has been rendered inadequate by recent steep rises in the cost of living. The remedy for this is to introduce a temporary cost-of-living allowance, and this has been done in most cases. The situation in West Africa is not yet stable. There has been a reorganization of the medical services in Nigeria and new salaries have been introduced which will be published shortly. In the Gold Coast extensive reorganization of the medical department has been recommended by the Maude Commission. The report of this Commission has met with some criticism from members of the medical profession in the Gold Coast, and Mr. Ian Fraser is due to pay a visit to

the territory during March on behalf of the Council of the Association. A salaries commissioner is reviewing the remuneration of the Government medical staff in Sierra Leone.

Smaller Colonies

The small Colonies present a difficult problem, because in many cases they are economically not strong enough to afford the same expenditure on health services and the same salaries for their medical staffs as large Colonies, and they are therefore unable to compete in the attraction of recruits on equal terms with the Colonial Medical Service in other areas and with the National Health Service in the United Kingdom. Some small Colonies have special attractions, however, and financial inducements can be offered in the way of private practice. Unfortunately, the Governments of some small Colonies object to private practice by their medical officers. It is the view of the Association that private practice by Government medical officers should be permitted.

There have been improvements of remuneration in Fiji and the Western Pacific, though the new salaries are lower than those which were proposed by the Association. Negotiations are proceeding with the Colonial Office about the medical services in Borneo and the Seychelles, and it is not possible at present to forecast a satisfactory outcome. Meanwhile, a salaries commissioner has been at work in Mauritius. Satisfactory improvements were introduced some time ago in Aden and British Somaliland.

The condition in Cyprus is unsatisfactory. It may be observed that the Association, for its part, co-operated with the British Council in sending a distinguished surgeon to Cyprus last year on a visit which was of much benefit to the island's medical service.

As regards the Caribbean Colonies, certain proposals for standardized remuneration were worked out by the Caribbean Conference of the B.M.A. at Trinidad in January, 1951, and these have been under prolonged consideration by the Caribbean Governments, whose views are expected shortly.

Changing Status of Colonies

This brief summary of recent progress will show that the interests of the members in the Colonial Medical Service are constantly in mind. The service has many problems other than remuneration. One of the chief is the uncertain future that faces Colonial medical officers as a result of the changing status of many of the Colonies. This is a question which is under careful consideration by the Association and doubtless by the Colonial Office, but, whatever political developments may lie ahead for the Colonies, there is no doubt that they will require the help and advice of British medical men for many years to come. There is in the Colonies an immense and fascinating field of clinical work, in which doctors of all-round capabilities and interests can find a worth-while career.

PRESCRIPTIONS FOR DISINFECTANTS

The General Medical Services Committee has discussed with the Ministry of Health ways and means of lessening the burden which has been placed upon local medical committees in investigating prescriptions for disinfectants. As a result, the Ministry has taken certain steps which should in future avoid unnecessary reference of these prescriptions, and the position will be carefully watched.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

MEDICAL WHITLEY COUNCIL COMMITTEE "C"

CLAIM FOR ASSISTANT MEDICAL OFFICERS TO GO TO ARBITRATION

At a meeting of Committee "C" of the Medical Whitley Council held on January 22 Dr. John Gibson was elected as Chairman of the Committee for the session and Alderman J. Hoy as Vice-Chairman. In the absence of both Chairman and Vice-Chairman, Dr. W. G. Clark was elected chairman for the meeting.

The claim put forward by the Staff Side for an adjustment in the remuneration of assistant medical officers was the main item of business, and after prolonged discussion and negotiation agreement was not reached. The Staff Side then formally requested that the matter should go to arbitration. The Management Side agreed to this course, and the necessary formal action is now being taken.

The Committee discussed certain other matters, including three additional conditions of service for medical officers of health. These conditions were agreed, and the details will be published shortly.

EXCHANGE VISITS WITH CANADA AND THE U.S.A.

The scheme which was initiated two years ago, with the approval of the Bank of England, for exchange visits between members of the American, British, and Canadian Medical Associations will be continued this year.

Procedure

Three doctors from Britain may visit Canada in exchange for three doctors from Canada. Each doctor from Britain will be required to deposit up to £200 with the B.M.A. in London. On arrival in Canada he will be met by a representative of the Canadian Medical Association, who will present him with the equivalent in Canadian dollars. Similarly, each Canadian doctor on arrival in Britain will be met by a representative of the B.M.A., who will present him with the sum deposited in sterling.

Three doctors from Britain may visit the U.S.A. in exchange for three doctors from the U.S.A. Each doctor from Britain will be required to make all his own travel arrangements and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in the U.S.A. he will be met by a representative of the Medical Society of the State of New York, who will present him with the equivalent in U.S. dollars. Similarly, each U.S. doctor on arrival in Britain will be met by a representative of the B.M.A., who will present him with the sum deposited in sterling.

Duration of Visit

The duration of the visits is left to the discretion of the doctors concerned. The American, British, and Canadian Medical Associations cannot accept any responsibility for a doctor who allows his visit to outlast the money placed at his disposal.

Applications are invited from members of the B.M.A. to take part in such exchanges during the next financial year—that is, April 1, 1953, to March 31, 1954. Each applicant must state the object of his visit. Medical practitioners in all branches of the profession, including general practice and public health, are eligible. Applicants should also give approximate dates of the visit desired. Successful applicants will in due course be required to furnish exact dates and details of travel. Applications must be received by the Secretary of the B.M.A. by March 1, 1953.

Correspondence

New B.M.A. Subscription Rates

SIR,—I should like, through the medium of your columns, to be allowed to point out what appears to be one more grave injustice which the whole-time officer has now to suffer. A short time ago I received a statement of the new subscription rates for B.M.A. membership, and noticed that the list was headed by the apparently harmless words, "Ordinary Subscription £6 6s." How many realize that out of all the tens of thousands of members the only ones who will actually pay that six guineas in its entirety are whole-time officers receiving a salary of over £1,500 per annum? Admittedly part-time specialists and general practitioners appear to pay this also, but it is allowed against income tax, and the amount which is paid in practice will be about one-half of this—substantially less, in fact, than the rate for a registrar who has been qualified over five years. Remaining members, apart from hospital officers and general practitioners, nearly all fall into one or other of the groups listed at reduced subscription rates, the highest of which is four guineas.

Whilst I am sure that any whole-time officer will be the first to appreciate the increased expenditure now necessary to produce the *British Medical Journal*, can anyone reasonably claim that it is fair to allow the maximum increase over the old subscription rate to be borne solely by whole-time officers—a group of members who already probably suffer more financial hardship and fewer income-tax concessions than any other group of doctors? Surely these new subscription rates could be altered in some way such that the net amount contributed by the whole-time officer, after income-tax deductions have been taken into consideration, is at least no more than that given by his part-time colleague, instead of, as is the case at present, twice as much. If there is no likelihood of this I am sure that many whole-time officers will be forced, for purely financial reasons, to take what must be to them a most unwelcome and undesirable step, and resign their membership from the Association.—I am, etc.,

Birmingham.

JAMES ACKERLEY.

* * This letter is referred to in a leading article on p. 262. —ED., B.M.J.

Radiology on Points

SIR,—The expansion of radiological services since the end of the war has been in the region of 200% over the whole country, and it shows no sign of diminishing. Practically every new advance in medicine and surgery demands increased effort and increased output from radiological departments, with a corresponding increase in costs. Since a financial limit has of necessity been applied to the National Health Service, it is essential that the funds available for radiological examinations should be used to maximum advantage in the interests of efficiency and economy. It may not be generally appreciated that in many instances the cost of a patient's x-ray investigations may be greater than the combined cost of the whole of his treatment.

It is known by radiologists that the usual methods of assessing the work done in x-ray departments are unreliable and of no comparative statistical value, and there is general agreement on the need for a more reliable system. The Nuffield Provincial Hospitals Trust, in collaboration with a number of radiologists, carried out an experiment in what is now called the unit system of recording. The authors of this report emphasize that the experiment was not conducted "over a sufficiently long period to demonstrate the usefulness of their suggestions."

The Faculty of Radiologists, whose help at one period was sought by the Nuffield Trust, had, in the early days of this experiment, realized the difficulties which would arise in applying the results of a localized survey on a national

scale. The Faculty is aware of the danger in any such system of wrong inferences being drawn as to the quality of the work done in a radiological department. It has, however, been assured by the Ministry of Health that this is not a matter of controlling the way in which medical work is done but only of recording its amount in a form which makes some allowance for the varying complexity of different examinations. There is no intention of seeking uniformity, which in any case is impossible; but study by individual departments of their own problems as compared with others in the light of these statistics might enable them to raise their own standards of efficiency, while at the same time decreasing costs.

Following publication of the Memorandum R.H.B. (52) 130/H.M.C. (52) 118/B.G. (52) 124, the Ministry of Health informed the Faculty that it was recognized that the unit values might be found to need alteration in the light of experience and would be glad to receive any observations on them which the Faculty might wish to make from time to time. The Faculty has therefore appointed a committee composed of:

Sir Harold Graham-Hodgson, Middlesex Hospital (chairman); Dr. Hugh Davies, National Hospital for Nervous Diseases; Professor A. S. Johnstone, Leeds General Infirmary; Dr. J. W. McLaren, St. Thomas's Hospital; Dr. P. H. Whitaker, Liverpool United Hospitals; and the President and Honorary Secretary *ex officio*.

This committee will study at regular intervals the problems arising out of the units system referred to it by the Ministry.

In the light of experience, the Faculty will doubtless have sufficient information to enable it to advise the Ministry on the desirability of retaining the scheme with appropriate modifications or replacing it with a more satisfactory scheme.—We are, etc.,

PETER KERLEY,
President,
ROHAN WILLIAMS,
Hon. Secretary,
The Faculty of Radiologists.

London, W.C.2.

Remuneration of Hospital Medical Staff

SIR,—I read with interest (*Supplement*, January 10, p. 9) that the betterment factor for consultants and specialists stands at 20%. In the *British Medical Journal* dated March 19, 1949, I read on page 487 that "the increase over the Spens figure is 13% at the start and 10% at the finish. If allowance is made for the 8% which is the contribution of the Government to superannuation it is seen that a betterment factor of 22% is applied to the starting salary, and 19% to the salary reached at the age of 40." It seems to me that allowance should not be made for the 8% Government contribution unless it can be regarded as income, and it is clearly not to be so regarded, because (a) it is not subject to income tax, and (b) if a specialist resigns from the Service this 8% contribution is not refunded to him. It therefore does not belong to the specialist, and in my opinion should not be taken into consideration in assessing the betterment factor.

I hope this will be borne in mind in the negotiations about to take place. It appears to me that the true figure of the betterment factor now being received is, as stated in the *Journal* of March 19, 1949, still 13% at the starting salary and 10% at the salary from age 40 onwards.—I am, etc.,

Boston, Lincs.

C. MACLAY.

SIR,—In view of the present negotiations relative to the salaries of specialists, may I stress the following points as a matter of urgency?

Two years ago Lord Moran prophesied that within 10 years private practice would be a thing of the past, and there is no doubt that even now there are a large number of part- and full-time specialists who are unable to augment their income by private practice, or who have no private means available. Such specialists have for the last four

years been struggling to make ends meet in a world where prices are at least 100% over pre-war, on a salary which has been increased 20% over pre-war values. Mr. Micawber's classic quotation is particularly applicable.

The Spens Report, upon which we entered the Service, was accepted in principle by Mr. Bevan, and in that report the quoted figures were to be adjusted by a betterment factor. The Government's cost-of-living index bears no relation whatsoever to the applied betterment factor, and therefore we are entitled to say that the Government's promise upon which we entered the Service has not been implemented. Specialists have as equally a strong moral claim for retrospective adjustment of salary as the general practitioners, and if this is neglected the year 1953 will mark the start of an era in which the status of the specialist is lower than ever before in the history of the profession. The "global sum" involved may seem large, but it must be remembered that half to three-quarters of the amount would immediately be repaid in taxation. When, however, at the age of 65 we are compulsorily retired, and have no means of further income (in contrast to general practitioners, who may work as long as they are able), the difference in pension may mean comfort as opposed to penury.

If negotiations are not proceeding to the entire satisfaction of the Joint Committee adequate time should be allowed to refer the matter to the periphery, where the need is probably greatest, rather than to accept a makeshift offer which might prove to be another tombstone in the history of medical politics.—I am., etc.,

Southampton.

BERNARD SUGDEN.

Delay in Hospital Reports

SIR,—Surely Dr. H. J. Selby (*Supplement*, January 10, p. 12) expects too much from the welfare State. In my part of the world I have yet to be informed of a death occurring in hospital. Kindly consultants write me personal letters about my patients' progress, no doubt in their own time at their own expense. Official letters follow weeks later when they are no longer of value.

Dr. Selby should read *Alice in Wonderland* again: "If it is so it might be, and if it were so it would be, and if it isn't it ain't. That's logic." Lewis Carroll anticipated the Bevan era by nearly 100 years, but the B.M.A. has yet to learn that you reap what you have sown.—I am., etc.,

London, S.E.3.

GUY NEELY.

Branch and Division Meetings to be Held

CHELSEA AND FULHAM DIVISION.—At West London Hospital, Hammersmith Road, W., Friday, February 6, 8.30 p.m., clinical evening. Dr. Geoffrey Konstam: "The Heart"; Dr. E. Hudson: "Modern Treatment of Emphysema and Bronchitis"; Mr. Harold Burge: "Indications for Surgery in Peptic Ulceration and the Imperfections of Partial Gastrectomy"; Dr. Oswald Savage: "Use of Cortisone in Rheumatic Cases." Guests are invited.

COVENTRY DIVISION.—Tuesday, February 3, Medical Films.

EAST NORFOLK DIVISION.—Wednesday, February 4, 2.30 p.m., Tour: Steward and Patteson's Brewery (Pockthorpe), Norwich.

HAMPSTEAD DIVISION.—At Hampstead General Hospital, Haverstock Hill, N.W., Wednesday, February 4, 8.30 p.m., meeting. Sir Zachary Cope: "The Advance of Medicine During the Second World War, 1939-1945."

LEWISHAM DIVISION.—At Lewisham Hospital, S.E., Friday, February 6, 8.30 p.m., meeting. Dr. R. Donald Teare: "Homicide," illustrated by lantern slides.

MARYLEBONE DIVISION.—At Medical Society of London, 11, Chandos Street, W., Thursday, February 5, 8.30 p.m., meeting. B.M.A. Lecture by Sir Horace Evans: "Peripheral Arterial Disease." All members of the Paddington and St. Pancras Divisions are invited.

NUNEATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherstone, Tuesday, February 3, 8 p.m., informal supper; 8.45 p.m., symposium arranged by Dr. A. C. Kendall: "Respiratory Affections of Infants and Young Children."

SALISBURY DIVISION.—At Guildhall, Salisbury, Tuesday, February 3, 7.15 p.m., annual medico-legal dinner. All medical practitioners in the area of the Division are invited.

SOUTH BEDFORDSHIRE DIVISION.—At Luton and Dunstable Hospital, Friday, February 6, 8.30 p.m., clinical meeting.

SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Thursday, February 5, 9.15 p.m., meeting. Sound film: "Some Aspects of Accessible Cancers (Skin and Breast)."

WEST SUSSEX DIVISION.—At Southlands Hospital, Shoreham-by-Sea, Thursday, February 5, 2.30 p.m., clinical session. Members of the Brighton Division and medical friends of members are invited.

Meetings of Branches and Divisions

KENSINGTON AND HAMMERSMITH AND CHELSEA AND FULHAM DIVISIONS

A general meeting was held jointly by the Kensington and Hammersmith and the Chelsea and Fulham Divisions at St. Mary Abbots Hospital, W.8, on January 6, the agenda being: "Further consideration of the Working Party's scheme for distribution of the Danckwerts award." There were 83 members and guests present. The chairman, Dr. C. Watney Roe, said that "further consideration" was somewhat of a misnomer. There was no real study of detail last June, and Divisions were advised to accept the scheme without amendments because delay might lead to loss of the promised money.

Dr. H. D. Sutherland said that he was now sitting on a subcommittee for the purpose of finding a way to help the small-list doctor. Unfortunately it would be a year before they would know the exact amount of surplus money in the pool and so it was impossible to come to a decision at the moment. Dr. Charles Schiff said that the G.M.S. Committee knew all the answers last June, so he failed to understand why it needed now to wait a year for further information. It should be quite easy to alter the loading to the first 1,000 patients. He pointed out the danger of having a core of underpaid doctors with small lists, as these would form a nucleus utilizable by any Government which decided to attack the incomes of those with medium and large lists. Dr. Russell pointed out that those doctors with lists of 700 or less were worse off financially than a year ago. He also quoted figures to show that in 1948 there were 560 full-time assistants, whereas in 1951 the number had risen to 2,000. Dr. A. C. E. Breach stated that he had resigned from the G.M.S. Committee because he objected to the way the scheme was rushed through. He stressed the imperative need for a financial reserve. All business fees would produce £1m. He was against any restriction in the size of lists, but would taper the capitation fee above 3,000 so as to make larger numbers financially unattractive. Dr. Bruce Cardew said that the present method of distribution was unfair because expenses do not increase proportionately with the size of the lists. He therefore advocated loading on the first 2,000 patients scheme as a means of encouraging partnerships was unsatisfactory and would not reduce the number of assistants. Practitioners after taking a partner or to reduce their lists. Many others took part in a general discussion.

Dr. Sutherland explained the difficulties of the G.M.S. Committee, and ended by saying that he would agree that loading motion, "That this meeting records its dissatisfaction with the Working Party's distribution scheme and urges that the loading should begin with the first 1,000 patients in accordance with the Association's unchanged policy," was carried *nemine contradicente*.

British Medical Association

ANNUAL MEETING—CARDIFF, JULY 9-17, 1953

President-Elect: J. W. TUDOR THOMAS, D.Sc., M.D., M.S., F.R.C.S.

PROVISIONAL PROGRAMME

The 121st Annual Meeting of the British Medical Association will be held in Cardiff from Thursday, July 9, to Friday, July 17, 1953, inclusive.

On the evening of Wednesday, July 8, there will be a Sherry Party for Representatives and their Ladies, arranged by the Cardiff Division.

The Annual Representative Meeting will begin on Thursday, July 9, and continue on Friday, Saturday, and Monday, July 10, 11, and 13.

The Representatives' Dinner and Ladies' Dinner take place on Thursday, July 9, followed by a dance.

The Overseas Luncheon is arranged for Friday, July 10.

On Sunday, July 12, a visit has been arranged for Representatives and their Ladies to St. Donat's Castle, and that evening there will be a Welsh Choral Concert.

The adjourned Annual General Meeting and President's Address will take place in the Park Hall Cinema on the evening of Monday, July 13, and the President's Reception, which follows, will be at the National Museum of Wales.

The Annual Scientific Meeting and associated functions occupy the period from Tuesday morning, July 14, to the evening of Friday, July 17.

The Official Religious Service will be held in St. John's Church, Cardiff, on the afternoon of Tuesday, July 14.

Arrangements for a Roman Catholic Service are also being made.

The Annual Dinner of the Association will be held in the City Hall on Thursday, July 16.

A social programme is being arranged, including evening Receptions and Garden Parties, as well as functions especially arranged for the Ladies accompanying members. The usual Golf Competitions will take place.

The Overseas Conference will be held on Wednesday afternoon, July 15, followed by an "At Home" for Overseas Delegates given by the Empire Medical Advisory Bureau.

The Reception Room for registration in the Sophia Gardens Pavilion will be opened on Monday, July 13, at 9 a.m.

Three Plenary Scientific Sessions are arranged as follows: Tuesday morning, July 14, subject "Coronary Disease";

Thursday morning, July 16, subject "Fibrositis"; Friday afternoon, July 17, subject "Overweight."

Seventeen Scientific Sections have been arranged, the meetings to take place on Wednesday morning and Wednesday afternoon, July 15, and Friday morning, July 17. The arrangements so far are as follows:

Medicine	July 15 (a.m. and p.m.)
Surgery	July 15 (a.m. and p.m.)
Obstetrics and Gynaecology	July 15 (a.m. and p.m.)
Anaesthetics	July 15 (a.m.)
Cardiology	July 15 (p.m.)
Child Health	July 15 (p.m.)
Dermatology	July 15 (p.m.)
Diseases of the Chest	July 17 (a.m.)
Neurology	July 17 (a.m.)
Occupational Health	July 17 (a.m.)
Ophthalmology	July 17 (a.m.)
Orthopaedics	July 17 (a.m.)
Oto-rhino-laryngology	July 17 (a.m.)
Pathology	July 15 (a.m.)
Preventive Medicine	July 15 (a.m.)
Psychiatry	July 15 (p.m.)
Radiology	July 15 (a.m.)

Individual programmes for these Sections will be published in a later issue of the *Journal*.

The Ladies' Club will be situated in the University College and will be open throughout the Meeting.

The Annual Trade Exhibition of Surgical Appliances, Foods, Drugs, and Books will be housed in the Sophia Gardens Pavilion. The official opening will take place on Monday, July 13, at 9 a.m., and the Exhibition will remain open on July 14, 15, 16, and 17 from 9 a.m. to 6 p.m.

The Scientific Exhibition will also be held in the Sophia Gardens Pavilion and will be open daily from July 13 to 17. Demonstrations will be given at fixed advertised times. A wide field of medical interests will be covered. A section will be devoted to problems of industrial health, with special local emphasis on coal-mining problems and pneumoconiosis and nystagmus. The medical exhibits will include diagnosis in haematemesis and melaena, electrolyte disturbance, heart disease, and the work of a diabetes unit. Preventive medicine will

* Also Aberdare Hall, Cathays Park, Cardiff, a Students' Hostel with excellent accommodation for 118 guests.
† Also Llandaff House, Penarth, with 36 beds.
Booking arrangements for Aberdare Hall and Llandaff House will be announced shortly.

8.30 a.m.—Annual Medical Missionary Breakfast, New Continental Café.
9.00 a.m.—Reception Room and Trade Exhibition open, Sophia Gardens Pavilion.
9.00 a.m.—Scientific Exhibition open, Sophia Gardens Pavilion.
9.30 a.m.—Ladies' Club open, University College.
10.00 a.m.—*Scientific Sections* at University College.
10.00 a.m.—Notts Ladies' Challenge Cup Golf Competition, Leys Golf Club.
10.00 a.m.—Leinster and Childe Cup Golf Competition, Radway Golf Club.

41

A.—In considering this question one must first have regard to the legal position, and that, undoubtedly, is that the remuneration receivable from the regional board is assessable under Schedule E and the earnings from private practice under Schedule D. There is an advantage in having the whole of the earnings assessed in one sum under Schedule D, because the taxpayer thereby avoids the application to his claim for expenses of the stricter and more restrictive rules applicable to assessments under Schedule E. For many years there has obtained a practice of assessment throughout the country, the essence of which was to avoid the inconvenience, both to the taxpayer and to the Revenue Department, of making assessments under Schedule E on subsidiary items of professional earnings, such as salaries for acting as medical officers at hospitals, for work as coroner, etc. What is now coming up for decision is whether the same course is to be followed in

The General Medical Services Committee wishes to make it clear that no official form exists for this purpose, and that the only action which is necessary on the part of general practitioners is to send a communication to the clerk of the executive council, stating that they wish to take advantage of the notional list arrangement. General practitioners in partnership should apply to the executive council in whose area the majority of the partners in the firm reside. If the doctors in any partnership are equally divided between more than one executive council, application should be made to the executive council where they have the majority of their patients. The executive council which deals with their

Correspondence

Employment of Assistants

SIR,—The rights and wrongs of assistants are one of those problems for which it is very difficult to obtain informed and yet impartial consideration. Those like myself who have never had an assistant—and hope they may never have to take one—are fairly impartial in our approach to the problem, but we cannot claim to be fully informed of its intricacies. For the rest, the assistants themselves and their employers are at an even greater disadvantage in trying to look at the matter objectively.

It is an unfortunate fact that medico-political issues tend to be settled by the "haves," and it is difficult to see how this can be avoided; for it is only those who are well established in practice and who have assistants or compliant junior partners who can afford the time for committee work. Especially is this true of the General Medical Services Committee, whose meetings occupy about 14 whole days a year and whose vast agendas require two complete evenings before each meeting for their digestion. And so it is rare in its discussions to hear the point of view of the single-handed practitioner presented with first-hand knowledge, whilst those of small-list and unestablished practitioners tend to be ignored or misunderstood for sheer lack of representation. This ignorance has been clearly demonstrated in the recent distribution scheme.

The recently appointed Assistants and Young Practitioners Subcommittee, whilst nominally providing for representation of that point of view, tends at present to be dominated by those of its members who are appointed by the G.M.S. Committee from its own members and who are experienced politicians. And so one is not altogether surprised to read in the official account of the last G.M.S. Committee meeting (*Supplement*, January 24, p. 24) of the whole-hearted rejection of the Subcommittee's report; and that at least one of the appointed members of the subcommittee helped to secure the rejection. Yet something must be done to correct the abuses that too often attend the employment of assistants, abuses which bring dishonour to the profession as a whole. Can we not handle this matter in good faith ourselves without invoking the help of Whitehall? There is a certain amount of badly soiled linen here; shall we not wash it at home?—I am, etc.,

Orpington.

A. C. E. BREACH.

Assistantship

SIR,—Permit me space to inform the General Medical Services Committee that I am one assistant, at least, who does not wish to continue as an assistant throughout the rest of his life. If I am going to be employed permanently on my present basis I would welcome the setting up of a State salaried service. I would have a feeling of greater equality and less frustration than I have at the present time. I know of no reason why any normal male practitioner who wishes to marry and settle down should wish to be a permanent whole-time assistant. Female practitioners may prefer permanent assistantships. I think that the money wasted in trainee assistantships could be spent to better advantage, to young doctors and the public, in compensating principals for any loss of income on taking on partners.—I am, etc.,

Rochford, Essex.

W. J. HASTINGS SAYERS.

Trainee Assistants' Remuneration

SIR,—The Department of Health for Scotland has increased inducement payments "in the light of the higher level of remuneration to general practitioners following the Danckwerts award" (*Supplement*, January 24, p. 27). This means that the Department of Health for Scotland has given certain general practitioners a betterment factor (in this case 22%) from moneys outside the central pool.

The main argument against giving trainee assistants an increase in remuneration is that the money for this would

the many cases where under the National Health Service arrangements the Schedule E element in the total earnings is by far the greater—and, if it is to be followed, whether there is any limiting ratio of Schedule E to Schedule D earnings. Where income-tax procedure is concerned it is difficult to secure uniformity of treatment when the rule or practice to be applied is extra-statutory. In the last resort the decision rests with the District Commissioners of Taxes, and it is possible that different bodies of those commissioners may hold differing views as to their responsibilities and to the line that should be followed. It is at least conceivable also that individuals in the service of the Inland Revenue Department may not be of the same opinion as to what should be done in a particular case.

It would be helpful if the Board of Inland Revenue could give some indication as to the ratio of Schedule D to Schedule E earnings which they would regard as justifying an omnibus assessment under Schedule D, though of course that would not be binding on the commissioners, in whose hands rests the ultimate authority. At present all that can be said is that the Schedule D element should be material—a transfer of liability from Schedule E merely on account of the existence of private earnings to the extent of 5% or 10% seems hardly fair to the large number of whole-time salaried employees—and that a ratio of one unit of private earnings to four units of consultant's salary would seem to be sufficient to justify the omnibus Schedule D assessment.

Travelling Expenses Between Places of Practice

Q.—As an ophthalmic medical practitioner I live and practise in Eastbourne, and also have a consulting-room in London where I practise three days a week. Can I claim the cost of a first-class railway season ticket in my expenses? I have always done so, but now this is being queried.

A.—It is stated that the questioner practises in Eastbourne and it is assumed that this implies that he has a consulting-room—or uses accommodation at his flat for consultations—there, and that the liability for the earnings which result are assessed under Schedule D. If so, it should be made clear to the Inspector of Taxes that there is a single practice which is in fact carried on at two places, and that the cost of travelling between them is therefore allowable. The inspector may have in mind a fairly recent case in which the High Court refused expenses of a similar nature in the case of a professional man who practised in London but who did a certain amount of work at home, but not, apparently, to the extent of seeing clients at his residence or holding it out as a place where consultations would be arranged in the normal course. It may be advisable to lay some stress on the difference between such a case and the circumstances in which it is understood that the questioner's practice is conducted.

Notes and News

Higher Pay for Nurses.—Hospital authorities in England and Wales have now received full details of the new scales of pay for nurses and midwives which have been agreed by the Nurses and Midwives Whitley Council. The increases, with arrears as from June 1, 1952, will be paid as soon as possible. Under the new scales a student nurse in her first year will receive £225 as against £200, and a ward sister £425 as against £375. Matrons will get an increase of £60. The extra cost to the hospitals is likely to be about £5,250,000 in a full year.

Visit to the Gold Coast.—Mr. Ian Fraser, president-elect of the Royal College of Surgeons in Ireland and a member of the Council of the British Medical Association, is to spend a fortnight in the Gold Coast. He will arrive at Accra on Thursday, March 5, and will return on Friday, March 20.

FEB. 14, 1953

not come out of the central pool. What now stands in the way of the Department of Health for Scotland increasing the remuneration of trainee assistants? Since a betterment factor of 22% would ensure for the Department an additional expenditure of £15,000 per annum, to give anything less would indeed be paltry.—I am, etc.,

London, N.W.6.

G. GOULD.

Representation of Whole-time Specialists

SIR,—We, and probably many others, were interested to read your comments (*Supplement*, January 24, p. 25) on the representation of whole-time consultants on Committee "B." You state that the Central Consultants and Specialists Committee of the Association consists mainly of members elected by the various regional and specialists committees throughout the country. We have been in our present area for three years and have no knowledge of any election ever having been held. Is this truly representation?—We are, etc.,

R. GRENVILLE-MATHERS.
A. W. ANDERSON.

Harrow.

Cost of Prescribing

SIR,—Mr. G. Smith (*Supplement*, January 17, p. 17) takes Mr. F. R. Elkins to task for his very timely suggestions to reduce prescribing of proprietary medicines to a minimum. We are warned by Mr. Smith that such measures would remove from the industry "all incentive, not only for original research but for development" with "far-reaching and disastrous effects on the health of the nation." This emotionalism, so characteristic of the propaganda brochure, in no way deals with the point at issue. Having worked in a pharmaceutical firm for nearly three years and having friendly contacts with a few more, I find myself unmoved by Mr. Smith's picture of altruism in the industry.

No one can deny the existence of many proprietary remedies which have no B.P. equivalent and which have been brought into use by research financed by individual firms. For these products, the firms concerned have a wide margin of profit and rightly so. And, before long, the firm concerned can make up its outlay and continue to charge the same price so as to acquire more money for research and development. These comprise Mr. Elkins's Group 1. Group 2, the blunderbuss and shotgun mixtures—the 'witches' brews of hormones, of vitamins, of anti-anæmic preparations—these are the proprietaries for which there is neither rhyme nor reason. They are designed purely to catch the gullible—to make easy money either from the authorities or the patient. Do Mr. Smith and the industry defend these? The good firms, including the one I worked for, have eliminated such concoctions, but many are still available and widely advertised. The industry wastes money and time in making these preparations and more money in advertising them. One has only to see chemists carefully calculating the amount of copper, cobalt, and manganese to be added to iron salts for anaemia preparations (trace metals already present in the iron salts) to realize the fatuity and stupidity behind many of the proprietaries in Group 2.

In addition to the unwelcome shoal of half-truths and doctored facts coming through our letter-boxes daily, our intelligence is further insulted when we open our medical journals. There, pre-eminently with the blessing of the B.M.A. and the profession, are full-page advertisements for mixtures which are condemned by the all. Not only should these mixtures be refused by our industry itself, but their advertising should be refused by our medical journals. The journal *Blood*, through its editorial board, proposed this step a few years ago and appears to adhere to these principles. Cannot our British journals help to convince the pharmaceutical industry that shotgun mixtures are bad ethically as well as therapeutically?

Proprietaries, Mr. Smith tells us, account for only 4d. in the pound of the cost of the National Health Service. He was wise to quote the cost in this way. It works out at £6m. was wise to quote the cost in this way. It works out at £6m. Even if only one-sixth to one-seventh of this were wasted in Group 2, it is still something we cannot afford. I believe it to be true that the pharmaceutical industry fully expected more stringent Government control of their activities on the introduction of the National Health Service. Even full nationalization was feared. This latter tragedy was averted, but, if the industry will not clean itself, it will find itself eventually forced to do so. Meanwhile

we in the profession should not prescribe the type of proprietaries referred to above. If no one prescribes them, their sponsors will stop their production. Only then will those firms who refuse to produce these mixtures be given the moral support they have every right to expect from us.—I am, etc.,

London, N.19.

J. G. A. MCSORLEY.

SIR,—The high cost of the pharmaceutical services at the present time is a matter which should cause each general practitioner to ask himself if what he prescribes is the best he can do with regard to the patient who is the consumer, the State which is the payer, and the manufacturing companies who are the producers.

Naturally, the patient is our first concern. In my opinion the *National Formulary* preparation will usually suffice, but it should be noted that in some respects prescribing a proprietary remedy is cheaper than a *National Formulary* equivalent, and therefore represents a small saving to the State. For example, although "benlylin" expectorant by Parke Davis is 5d. an ounce and linctus codeine N.F. is 4d. an ounce, the total cost to the State of a 6-oz. bottle of the former is 3s. 8d., while the cost of the latter is 4s. 3d. owing to the different dispensing fees (1s. 2d. as opposed to 2s. 3d.). A similar state of affairs exists in respect of "tonics" like "syrup minadex" by Glaxo, and certain alkaline mixtures, ear and nose drops, lotions, liniments, gargles, etc. A ½-oz. bottle of auristillae phenolis N.F., which has an ingredient cost of 2½d., costs the State, eventually, over 2s. 6d. A 2-oz. bottle of lotio calaminae N.F. with an ingredient cost of 3d. will cost the State over 2s. 6d. These examples serve to show where much of the money goes. It is not generally known what an expensive substance menthol is, costing 13s. an ounce, and it is in common use as an inhalant, whereas the excellent vapor. benz. N.F. is 4½d. an ounce, although the prescription of an ounce bottle of the latter eventually costs the State about 2s. 9d. I have found tab. ergot. praep. N.F. an efficient preparation. These tablets cost 11d. a dozen. A more refined preparation with a similar action is tab. ergometrin. maleat. These tablets cost 14s. 2d. a dozen, which is their main difference from the former. Many other such examples could be given.

It is essential for all practitioners at least to be able to price their own prescriptions and know just how much of the State's money they are signing away. A knowledge of certain excellent, and cheaper than official equivalent, proprietaries will help to effect a saving. There will, however, always remain some proprietary preparations which are away ahead of the official equivalents and, of course, the excellent preparations which have no equivalent. The supply of these preparations should provide the first-rate and highly ethical drug companies with the necessary trade to maintain their excellent research establishments, which are indispensable to medicine in this country and, indeed, the world.

Briefly, therefore, proprietary preparations are not always the dearer. Official remedies of substantially similar pharmacology often display extreme dissimilarity in cost. The dispensing fee paid to chemists for official liquid medicaments could in many cases probably stand review. Tablets could in many cases replace mixtures and with a gain in efficiency—e.g., tab. ferri. sulph. co.—I am, etc.,

THOMAS M. GLAISTER.

New B.M.A. Subscription Rates

SIR,—On opening this week's *British Medical Journal*, I turned to the *Supplement*, and, after looking at the appointments vacant—I always do—I read Dr. James Ackerley's letter (*Supplement*, January 31, p. 33). This put clearly the injustice suffered by whole-time salaried doctors in relation to the British Medical Association subscription. I turned immediately to your leading article (*Journal*, p. 262) in the hope of finding at any rate some comment on the letter if, as was the case, no reply was possible. Instead I found only that the substance of Dr. Ackerley's letter had been ignored, presumably because it was unanswerable, and that he had only been taken up on two minor points—that six guineas in his view is a large subscription, and that the increase is due to the increased cost of the *Journal*. In both cases he was accused of a misconception. Now, as regards the first, surely this is a matter of opinion rather than a misconception, and I at any rate agree whole-

heartedly with him. The second is admittedly a misconception. I myself am only too well aware of the fact that the cost of providing the *Journal* for the 65,000 members of the Association is covered by the *Journal* subscriptions of the 13,000 non-members, who pay for the *Journal* six times what it costs to produce. But Dr. Ackerley's misconception is easy to understand. After all, like myself, he probably feels that the *Journal* is the only return he gets for his subscription, and imagines that is what his subscription is for.

I believe that, if it were possible for a non-member of the Association to get the *Journal* for a figure representing the cost of production and reasonable profits, the membership of the Association would fall sharply. The subscription to the *Journal* is kept at the same figure as the subscription to the Association, so that doctors who are not paid a full-time salary, and are not liable to income tax on the membership subscription but would be liable to income tax on the *Journal* subscription, can get the *Journal* for not much more than half as much as members as they would do as non-member subscribers. So, whether or not they agree with the policies of the Association, they retain their membership. I maintain that it should be possible to obtain the *Journal* at a figure representing the cost of production plus reasonable profits, without being a member of the Association. At any rate your editorial does not make any reply to Dr. Ackerley's letter. How can you justify the whole-time salaried officer, who is not generally as well paid as doctors who do not come into that category, having to pay, through the peculiarities of the income-tax system, nearly twice as much for Association membership?—I am, etc.,

Andover.

JOHN SLEIGH.

Association Notices

FORMATION OF MIDLANDS BRANCH, SOUTHERN RHODESIA

Notice is hereby given by the Council of the formation of a Midlands Branch in Southern Rhodesia. The area of the Branch will be as follows: districts of Gwelo, Hartley (south of Umsweswe River), Selukwe, Chilimanzi, Gutu, Bikita, Ndanga, Victoria, Chibi, Belingwe, and Nuanetsi.

The areas of the remaining three Branches in Southern Rhodesia will now be as follows:—*Manicaland*: districts of Makoni, Inyanga, Umtali, Melssetter, and Chipinga. *Mashonaland*: districts of Sebungwe, Urungwe, Hartley (north of the Umsweswe River), Lomagundi, Darwin, Mazoe, Salisbury, Marandellas, Charter, Buhera, Mrewa, and Mtoko. *Matabeleland*: districts of Wankie, Shangani, Bubi, Nyamandhlovu, Bulawayo, Bulalima, Mangwe, Matobo, Insiza, and Gwanda.

A. MACRAE,

Secretary.

Diary of Central Meetings

FEBRUARY

- 17 Tues. Organization Committee, 2 p.m.
- 18 Wed. International Conference on Medical Education, Local Arrangements Committee, 11 a.m.
- 18 Wed. Occupational Health Committee, 2 p.m.
- 19 Thurs. G.M.S. Committee, 10.30 a.m.
- 19 Thurs. Joint meeting of representatives of Radiologists Committee and Tuberculosis and Diseases of the Chest Group Committee, 1.45 p.m.
- 19 Thurs. Tuberculosis and Diseases of the Chest Group Committee, 2.30 p.m.
- 20 Fri. Public Health Committee, 2 p.m.
- 24 Tues. Building Committee, 2 p.m.
- 25 Wed. Joint Committee of B.M.A. and British Veterinary Association, 11.30 a.m.
- 25 Wed. Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, W.C.), 12 noon.
- 25 Wed. Joint Formulary Committee, 2.30 p.m.
- 27 Fri. Joint Committee of B.M.A. and the Magistrates' Association, 11 a.m.
- 27 Fri. Library Subcommittee, Science Committee, 12 noon.
- 27 Fri. Science Committee, 2 p.m.

- MARCH
- 2 Mon. Armed Forces Committee, 2 p.m.
 - 4 Wed. Private Practice Committee, 11.30 a.m.
 - 4 Wed. Joint Conference, Occupational Health and Public Health Committees, and Tuberculosis and Diseases of the Chest Group Committee, 2 p.m.
 - 5 Thurs. Subcommittee on Constitution and Procedure of Medical Service Committees, G.M.S. Committee, 2 p.m.
 - 13 Fri. Consulting Pathologists Group Committee, 2.30 p.m.
 - 18 Wed. Council, 10 a.m.
 - 25 Wed. Joint B.M.A. and T.U.C. Committee, 2.30 p.m.

Branch and Division Meetings to be Held

- CHESTERFIELD DIVISION.**—At Walton Sanatorium, Chesterfield, Friday, February 20, 8.45 p.m., Professor G. L. Roberts: "Recent Advances in Dental Surgery."
- COVENTRY DIVISION.**—At Coventry and Warwickshire Hospital, Tuesday, February 17, 8.30 p.m., clinical meeting. Dr. A. C. Kendall: "The Child with the Chronic Cough."
- DARTFORD DIVISION.**—At Joyce Green Hospital, Dartford, Tuesday, February 17, 8.45 p.m., meeting. Scientific film by Mr. James Robertson: "A Two-Year-Old Goes to Hospital."
- ENFIELD AND POTTERS BAR DIVISION.**—At St. Michael's Hospital, Chase Side Crescent, Enfield, Wednesday, February 18, 8.30 p.m., meeting. Clinical papers, Dr. N. S. Levantine: "A Case of Recurrent Haematemesis"; Dr. J. M. Benjamin: "The Chronic Chest"; Dr. G. G. Doel: "Through a Glass Darkly"; Dr. W. E. Hayes: "What, Again? Curse It!"
- GREENWICH AND DEPTFORD DIVISION.**—At Miller General Hospital, Wednesday, February 18, 8.30 p.m., Mr. John E. Buck: "Some Common Orthopaedic Foot Conditions." Members of the Woolwich Division are invited to attend the meeting.
- LAMBETH AND SOUTHWARK DIVISION.**—At Clinical Lecture Theatre, St. Thomas's Hospital, London, S.E., Tuesday, February 17, 8.30 p.m., clinical meeting.
- NORTH STAFFS DIVISION.**—At North Stafford Hotel, Thursday, February 19, 7 for 7.30 p.m., dinner. Annual lecture by Dr. Frangcon Roberts: "Disease and Civilization."
- OLDHAM DIVISION.**—At Oldham Hotel, Monday, February 16, 9 p.m., meeting. Professor W. I. C. Morris: "Management of Breech Presentations."
- SOUTH SHIELDS DIVISION.**—At Ingham Infirmary, Friday, February 20, clinical meeting. Symposium by Consultant Staff of Ingham Infirmary.
- STIRLING BRANCH.**—At Stirling Royal Infirmary, Thursday, February 19, 8.30 p.m., Mr. William Mair: "Legal Pitfalls of the Doctor in General and Hospital Practice."
- STRATFORD DIVISION.**—At Geriatric Unit, Langthorne Hospital, Leytonstone, E., Thursday, February 19, 2.30 p.m., clinical meeting.
- WEST BROMWICH AND SMETHWICK DIVISION.**—At West Bromwich and District Hospital, Tuesday, February 17, 8.30 p.m., therapy. Dr. G. E. Owen Williams: "Some Practical Aspects of Chemotherapy."
- WEST DENBIGH AND FLINT DIVISION.**—At Marine Hydro Hotel, Rhyl, Friday, February 20, 7.45 p.m., dinner; 9 p.m., B.M.A. Lecture by Professor E. J. Wayne: "Problems of Prescribing in the Light of Recent Advances in Pharmacology."
- WEST SOMERSET DIVISION.**—At Musgrove Park Hospital, Taunton, Thursday, February 19, 8.30 p.m., clinical meeting. B.M.A. Lecture by Dr. Francis Camp: "Death and Injury on the Road." Short supporting addresses by Mr. R. F. Winckworth and Mr. F. W. Snell.
- WEST SUFFOLK DIVISION.**—At Everard's Hotel, Bury St. Edmunds, Tuesday, February 17, 8.30 p.m., A.G.M.

Meetings of Branches and Divisions

UGANDA BRANCH

The annual clinical conference was held in Kampala from December 5 to 7. Over 70 members and visitors attended. Dr. A. B. Raper, president, opened the conference with a historical account of the *East African Medical Journal*. The programme included talks on "Modern Advances in Obstetrics and Gynaecology" (Dame Hilda Lloyd), "Some Aspects of the Portal Ulcer" (Mr. I. W. J. McAdam), "The Problem of Old Age in of Tick-borne Relapsing Fever" (Dr. J. K. Cherry), "Pneumonic Plague in Toro, 1952" (Dr. W. H. Timmis), "Therapeutic Problems in African Tuberculosis" (Dr. P. W. Hutton), and a medical administrative survey of the native population in a small district in the Eastern Province (Dr. A. Kagwa). Dr. R. Y. Dunlop led an open discussion on "Housing and Health in Uganda," and a film on cardiac surgery was introduced by Professor Milnes Walker.

The Uganda Branch is a flourishing and active one. The membership now exceeds 150, out of a total of less than 200 doctors in the Protectorate.

OCCASIONAL COMMENT

CONSULTANTS' CONTRACTS

A number of uncomplimentary adjectives were used in the Central Consultants and Specialists Committee on February 12 to describe a series of circulars sent out recently from Savile Row to hospital boards without prior consultation with representatives of the profession. There was considerable disquiet as one member of the committee after another alleged that attempts were being made by the boards, stimulated by the "economy" circular, to save money by apparently unreasonable refusals to replace retiring consultants and to arrange additional sessions for increased work. The committee was anxious lest an actual reduction of sessions should be forced on consultants unfairly.

Appeal Procedure

There is of course a measure of protection in paragraph 16 of the Terms of Service. This paragraph states that, where a consultant considers that his appointment is being unfairly terminated by a board, he shall be entitled to send a full statement of the facts to the Minister, who will then obtain the written views of the board and place the case before a professional committee (consisting of representatives of the Ministry and of the profession) for their advice. The interpretation of paragraph 16 has been discussed with the Ministry by the Joint Committee, which has maintained that a consultant who thinks that he is being treated unfairly is entitled to use the appeal machinery, no matter what the circumstances in which the termination of his appointment is proposed. It is generally agreed, however, that changed contracts, by increase or decrease of sessions, may result inevitably from changed circumstances; and that, although a change may be unfortunate for the consultant concerned, what is unfortunate is not necessarily a consequence of any unfairness. In short, paragraph 16 is by no means a complete safeguard against diminution of work or of income. It is merely, in the words of the old Scots proverb, the "wee bush" that is "better than nae bield."

The Association is advised that a revision of a consultant's contract, except by agreement with the consultant concerned, amounts to a termination of the appointment for the purposes of paragraph 16, since it can be effected only by the board giving formal notice of termination of the existing contract and offering a new contract with a changed assessment of time. The appeal procedure was originally provided only for consultants, but is now available also to senior hospital medical officers.

The Whitley Claims

The Staff Side of Committee "C" is preparing with all possible dispatch the detailed case for the arbitration on the remuneration of assistant medical officers in the public health service, and preliminary discussions have taken place with the solicitors and with counsel. The Staff Side of Committee "B" is trying to arrange an early meeting for further discussion of its claim with the Management Side. There will be no avoidable delay on the part of either Staff Side in these important proceedings.

A Point of Ethics

Dr. A's practice falls vacant and is looked after by a neighbour, Dr. B, until the successor, Dr. C, takes it over. Is it right and proper that Dr. B should then accept any patients of the practice who may choose to apply for admission to his list? Certainly there is nothing in the N.H.S. regulations to prevent his doing so. But what is lawful is not necessarily ethical. May not Dr. B, in the circumstances, be much more likely than the other local doctors to attract patients from Dr. C's practice? Is it fair to Dr. C that he should lose patients, possibly in considerable numbers, who might be content to remain with him had they no opportunity of acceptance by Dr. B? On the other hand, is it fair to Dr. B that he alone among the local doctors should be debarred from accepting patients of Dr. C's practice, merely because he has worked for a short time in that practice? Does experience suggest that a restriction of this kind is necessary to prevent serious harm to the interests of Dr. C? Would the restriction, even if operating only for a limited period, be an unjustifiable interference with the freedom both of Dr. B and of the patients concerned? Might it lead to difficulty in finding a local Dr. B willing to hold a practice together during a vacancy? These questions are being discussed in the Central Ethical and General Medical Services Committees, which have not yet arrived at unanimous answers.

Hardship in the Pre-Registration Year

When the financial position of the provisionally registered ex-Service house-officer was discussed in Parliament it was stated that his income would be much the same as the income he had received as a medical student under the Further Education and Training Scheme of the Ministry of Education. Closer examination of the matter suggests that certain relevant considerations may then have been overlooked. Indeed, it now appears that some married ex-Service students, on becoming house-officers, may suffer a reduction of net income sufficient to cause real hardship

The Association, which has been greatly helped by the British Medical Students' Association in its investigation of the position, has sent a comprehensive memorandum to the Government Departments concerned and has asked for an early opportunity of personal discussion of the problem. The memorandum stresses, in particular, the urgent need for measures to assist the newly qualified practitioner who has no income from any source while awaiting an opportunity of taking up an approved pre-registration post.

Finance

The Association's budget for 1953 will be examined by the Finance Committee early next month. Already there seems reason to believe that there will probably be no great difficulty in carrying out the instruction of the Representative Body that not less than one-half of the increase in revenue from membership subscriptions should be used for debt redemption. The estimates for the *British Medical Journal* and the special journals, including *Abstracts of World Medicine*, show that these publications, considered together, have regained a distinctly healthy financial condition, and in other departments substantial economies have been achieved by changes of organization and methods.

Payment of Subscriptions

For most people the first week in January is perhaps not an exceptionally suitable time for the writing of cheques, but it may be that many of those members of the Association who usually wait for the second subscription reminder could conveniently pay a little earlier. If all such would kindly do this, a useful saving would result through reduction of office expenses and overdraft charges.

Members in various subscription categories have drawn attention to what they regard as anomalies in the new rates, and their observations will receive careful study by the Organization Committee.

CONSULTANTS AND SPECIALISTS

MEETING OF CENTRAL COMMITTEE

A meeting of the Central Consultants and Specialists Committee was held at B.M.A. House, London, on February 12. In the absence of Dr. Rowland Hill on account of illness, the chair was taken by Mr. T. HOLMES SELLORS. A message of sympathy was sent to Dr. Hill.

Consultants' Contracts

This matter was discussed in detail, and is referred to in "Occasional Comment" at page 45 of this issue.

Function of Joint Committee

An alteration in the terms of reference of the Joint Committee was reported, and it was recommended that they should read, "To negotiate with the Ministry of Health on all matters concerning consultants and specialists' practice or affecting members of hospital medical staff, other than those within the scope of Committee 'B' of the Medical Whitley Council." The alteration became necessary because negotiations, so far as they concerned remuneration, would be conducted by Committee "B," and not by the Joint Committee.

Remuneration of Hospital Medical Staff

It was reported that discussions were continuing with the Management Side of Committee "B" on the claim by the Staff Side for a review of remuneration of hospital medical staff. Mr. H. H. LANGSTON recalled that when this matter was raised last year there was full agreement on the need for such a review, and was of opinion that the time had

now come when it was important to press for it with the utmost vigour. This view was strongly supported by the Committee.

The Position of Registrars

The problem of the registrar again exercised the Committee. The CHAIRMAN pointed out that this problem was becoming more acute as time went on. Dr. R. M. FORRESTER, on behalf of the registrars' group, said that there must now be well over one hundred senior registrars in their fourth year liable to dismissal. When the senior registrar came to the end of his four years he should be entitled to apply again for his post or a post in the same specialty. One member suggested that a happy solution would be the employment of the registrar as a part-time general-practitioner specialist, with hospital sessions. It was pointed out, however, that the number of suitable vacancies in general practice was very limited, especially in rural areas. Mr. LANGSTON said that no progress in this question would be possible until the complete figures of the number of impending dismissals were in their possession. The CHAIRMAN said that they would press the Ministry very hard for the figures. He understood that the General Medical Services Committee was also giving the matter consideration.

On the question of the falling off in recruitment at registrar level in non-teaching hospitals, one member suggested that, while many holders of registrar posts would not become senior registrars, they would have the opportunity in their posts of obtaining a higher degree in medicine or surgery. On the other hand, Mr. C. E. KINDERSLEY asked what was the advantage of obtaining a higher degree when the individual found that his chances of entering general practice decreased the longer he stayed in his post.

The view was generally accepted by the Committee that practitioners would be encouraged to seek registrar posts in non-teaching hospitals if the teaching hospitals reversed their present policy and indicated that in appointing senior registrars preference would be given to those who had spent some time in a non-teaching hospital. It felt also that the desirability of a further increment of salary for registrars in their second post might be considered.

Retirement Age

From the younger practitioners the Committee turned its attention to the elder and their superannuation. It was pointed out that the older consultants, while they did not qualify for a pension by reason of their age of entry into the National Health Service superannuation scheme, would in the ordinary way have made provision for their retirement. They were, however, suffering an unexpected hardship on account of the rise in the cost of living and the decrease in private practice, which made such provision barely adequate. The only practical suggestion the Executive Committee could make was that hospital boards should be encouraged to utilize the services of retired consultants as locumtenents.

Some discussion ensued on the period of honorary service in hospital before the "appointed day." This, where it occupied more than half the practitioner's time, is recognized for qualification for superannuation. Professor G. I. STRACHAN brought forward a resolution from the Welsh Regional Committee that, in view of the fact that hospital service prior to the "appointed day" counts as a qualifying period for pension, negotiations should be reopened with a view to securing that a portion of those years be accepted as loading for pension rights. It was promised that this matter should be taken up in the proper quarter.

Reference was also made to the retirement of mental health officers. The normal retirement age of these officers is 60, or five years earlier than for hospital medical staff. It was the view of the Committee that a case for special consideration with regard to their pension should be pressed on behalf of the men who had had to retire at 60 instead of 65.

Full-time Salaried Officers

On the question of the claim of full-time salaried officers for direct representation in the Whitley machinery, it was reported that the Joint Committee felt doubtful about the wisdom of giving direct representation to one section of hospital staff, and, moreover, that there were already channels available, through the constituent bodies of the Joint Committee, for the representation of whole-time medical officers. But it had been agreed with the Management Side that a subcommittee of Committee "B" be set up on which whole-time officers would be invited to serve, to reopen discussions on the subject of their special grievances.

What was described by the Chairman as a satisfactory result on the whole concerning the complicated matter of dual appointments had been achieved. A circular issued by the Ministry to regional boards and committees regarding joint use of medical staff by hospital and by local health authorities provided for the appointment of a small joint advisory committee, consisting of representatives of the employing authorities and the British Medical Association, to deal with cases of difficulty.

An anomaly which it was decided to take up arose out of a complaint of an orthopaedic surgeon that he was called in urgently to attend a newly born baby in a private maternity home, but subsequently his claim for a fee under the domiciliary consultation arrangements was refused by the board on the ground that he was not a paediatrician.

Two matters of legal interest occupied the Committee at the end of its proceedings. One was the introduction of a private Member's Bill into Parliament adding a proviso in the form of two sub-clauses to the appropriate section of the Offences against the Person Act, 1861 (which makes it a felony to administer drugs or use instruments to procure abortion). One sub-clause in the proviso reads: "No person shall be found guilty of an offence under this section unless it is proved that the act charged was not done in good faith for the purpose of preserving the life of the mother. . . ." Professor STRACHAN pointed out the complicated wording of this and the other sub-clause with their double negatives, and in the one case the use of the word "person" and in the other, in the same connexion, of the words "registered medical practitioner." Other members thought it desirable that in any such legislative provision there should be set out the necessity for a second opinion. The other matter concerned the case involving the legal liability of a casualty officer (*British Medical Journal*, January 17, p. 166). Dr. COCHRANE SHANKS gave an account of the case and the legal issues involved as seen by the Medical Defence Union. The Committee expressed its concern that a wrong diagnosis might lead to a penalty even when a most careful examination had been carried out.

G.M.S. SUBCOMMITTEE (SCOTLAND)

The General Medical Services Subcommittee (Scotland) has met twice since the last report (*Supplement*, November 15, 1952, p. 195). The following are some of the matters which have been discussed:

Representation on Assistants and Young Practitioners Subcommittee

The Subcommittee is of the opinion that the most suitable method for appointing Scottish representatives to the Assistants and Young Practitioners Subcommittee is through nomination by the Subcommittee from names submitted by local medical committees. The attention of assistants and unestablished practitioners in Scotland has been drawn to the fact that they are represented, and they have been invited to communicate with their representative through the Scottish Office if they have any questions to

raise. Every local medical committee in Scotland has been asked to consider the desirability of co-opting an assistant from among the assistants in the area.

Group Practice

The possible allocation of £100,000 from the Central Pool for the purpose of stimulating group practice has raised the question of what constitutes "group practice." The Subcommittee feels that some clear definition should be arrived at before a satisfactory method can be devised for utilizing any money available for this purpose. This matter is being considered further in an endeavour to arrive at a suitable definition.

Excessive Prescribing

The Subcommittee has been concerned for some time with the question of extravagant and/or excessive prescribing. Some local medical committees have been experiencing difficulty in dealing with cases referred to them for investigation. Representations have been made to the Subcommittee for guidance on the principles to be observed in order that some degree of uniformity may be obtained in deciding whether or not a practitioner's prescribing is excessive or extravagant and also on the amount of the surcharge, if any, to be imposed. The Subcommittee feels that no hard-and-fast rules can be laid down—since the decision as to whether or not excessive or extravagant prescribing has taken place must lie with the local medical committee according to its detailed knowledge of the case. It is hoped, however, that a memorandum on the subject will be issued to local medical committees in the near future.

An exhibition prepared by the Department of Health to illustrate the cost of certain drugs and dressings has been viewed by members of the Subcommittee. The Subcommittee has recommended to the Scottish Committee that this should be shown to general practitioners and consultants through the divisions of the Association.

Initial Practice Allowances

The Scottish Medical Practices Committee has produced a memorandum on the criteria to be adopted in dealing with applications for initial practice allowances. Local medical committees were given an opportunity of commenting upon it. The Subcommittee thinks that, once the new distribution scheme is brought into operation and applications for initial practice allowances are being considered, difficulties which cannot now be foreseen may arise. It has suggested, therefore, that adequate means of consultation between the various bodies concerned—i.e., the Scottish Medical Practices Committee, executive councils, and local medical committees—should be established for the purpose of solving any problems as and when they occur.

Initial Practice Allowance Appeals

The Subcommittee, at an earlier meeting, had decided that an appeal against the decision of an executive council to grant or continue an initial practice allowance to a particular doctor should be determined by the Secretary of State. The Department of Health, however, has been reconsidering the question and has now proposed that appeals should be determined by the Scottish Medical Practices Committee, with two members of the Subcommittee, without voting powers, sitting with it. The Subcommittee decided to agree to the Department's proposal on the understanding that the two observers would be nominated by the Subcommittee as and when required.

The Subcommittee has agreed that the machinery for determining appeals in connexion with notional lists should be the same as that for the hearing of I.P.A. appeals.

Men Returning from National Service

At the Subcommittee's request the Department undertook to examine the possibility of Servicemen's names being left on their doctors' lists during their period of National

Service, but found this to be impracticable in view of the element of inflation which would be involved. The question of automatic reinstatement was also considered by it to be impracticable, having regard to the large number of Servicemen who did not return to their former address. The Subcommittee is not satisfied with the present position and the problem is to be examined further.

The Subcommittee has agreed with the Department that the names of long-stay patients in mental homes (two years or longer) should be removed from doctors' lists. The same change has been agreed to in England.

CENTRAL ETHICAL COMMITTEE

The Central Ethical Committee of the Association met on February 10 with Dr. R. Forbes in the chair. The Committee had a long agenda, which included an inquiry into an ethical complaint. Certain items of the agenda which the Committee did not have time to consider were referred to the Standing Ethical Subcommittee.

Examination of Patients by Psychiatrists without Reference from General Practitioner

The Committee considered the ethical aspects of the principle raised in a letter received from a psychiatrist who sought advice on the problem which arose when patients applied for an appointment but were unwilling to discuss their belief in their need for psychiatric or psycho-analytical treatment with their general practitioner. The Committee reaffirmed the guiding principle that all forms of consultation should be arranged through the patient's own general practitioner.

Indirect Methods of Advertising

The following resolution was adopted by the Representative Body of the Association in June, 1951: "That, while recognizing that public education on selected health matters is eminently desirable, this Meeting is of opinion that a close liaison should be established between the B.M.A. and the B.B.C. to control the selection of subjects and the scope of material presented to the public, and that practitioners approached to appear in such programmes, whether for 'sound' or 'visual' broadcasting, should insist on anonymity as part of the contract."

The Committee has recently reviewed the whole question of indirect advertising in the light of this resolution of the Representative Body and with special attention to the problems of broadcasting and television. The Committee drew up a draft statement on the subject for the consideration of the Council.

Propriety of Accepting Former Hospital Patients

The Committee considered a request for advice from a general practitioner as to the propriety of his accepting on his medical list patients previously seen by him in a hospital where he held an appointment as resident obstetric officer. The practitioner in question still held a part-time appointment as clinical assistant, and had been informed by the chairman of the local medical committee that he should not accept on his list any patients previously seen by him in hospital until a year had elapsed.

The Committee did not make a definite ruling on the matter, but were of the opinion that, if the practitioner in question did accept on his list patients previously seen by him in hospital at the time when he was resident obstetric officer, he might find himself in conflict with his colleagues and perhaps called upon to answer an ethical complaint. The practitioner was advised to follow the advice of a senior colleague in his locality.

Other Business

Matters left over for consideration by the Standing Ethical Subcommittee at its next meeting included a request for advice on the submission of staff medical reports to a borough treasurer, the association of ophthalmic consultants with contact lens centres, the placing of a doorplate on rooms used also for purposes other than a surgery, the Abortion Act, 1952, and other matters.

EXCHANGE VISITS WITH CANADA AND THE U.S.A.

The scheme which was initiated two years ago, with the approval of the Bank of England, for exchange visits between members of the American, British, and Canadian Medical Associations will be continued this year.

Procedure

Three doctors from Britain may visit Canada in exchange for three doctors from Canada, and three doctors from Britain may visit the U.S.A. in exchange for three doctors from the U.S.A. Each doctor from Britain will be required to make all his own travel arrangements and will also be required to deposit up to £200 with the B.M.A. in London. On arrival in Canada or the U.S.A. he will be met by a representative of the Canadian Medical Association or of the Medical Society of the State of New York, who will present him with the equivalent of his deposit in Canadian or U.S. dollars. Similarly, each Canadian or American doctor on arrival in Britain will be met by a representative of the B.M.A., who will present him with the sum deposited in sterling.

Duration of Visit

The duration of the visits is left to the discretion of the doctors concerned. The American, British, and Canadian Medical Associations cannot accept any responsibility for a doctor who allows his visit to outlast the money placed at his disposal.

Applications are invited from members of the B.M.A. to take part in such exchanges during the next financial year—i.e., April 1, 1953, to March 31, 1954. Each applicant must state the object of his visit. Medical practitioners in all branches of the profession, including general practice and public health, are eligible, but it must be noted that this is not a scheme for the exchange of employment. Applicants should also give approximate dates of the visit desired. (Successful applicants will in due course be required to furnish exact dates and details of travel.) Applications must be received by the Secretary of the B.M.A. by March 1, 1953.

ANNUAL MEETING—CARDIFF, JULY 9-17, 1953

HOSTEL ACCOMMODATION

Accommodation is available for 118 guests in double and single rooms in the Aberdare Hall, Cathays Park, Cardiff. This is a well-equipped, modern students' hostel very conveniently situated to the meeting-places. Its amenities include a bar and ample bathrooms. The charge will be 30s. per person per day, which will include full board, but no reduction can be made for meals not taken. Ration books and towels and soap must be brought by guests. Parking space for cars is available near by.

Members wishing to book at this hostel should write direct to Dr. J. D. Williamson, 175, Newport Road, Cardiff, stating any particular requirements.

NEW SALARY SCALES IN NIGERIA

The following improved salaries in the Government Medical Service in Nigeria can now be announced:

Inspector-General of Medical Services: £2,485, plus £350 expatriation pay.

Deputy Inspector-General of Medical Services: £2,000, plus £350 expatriation pay.

Director of Medical Services (Regional): £2,000, plus £350 expatriation pay.

Deputy Director (Regional); Adviser on Rural Health; Leprosy Adviser; Senior Specialist: £1,835, plus £350 expatriation pay.

Assistant Director (Regional); Assistant Director (Laboratory Services); Assistant Inspector-General: £1,780, plus £350 expatriation pay.

Adviser Maternity and Child Welfare; Dermatologist; Senior Malarialogist; Specialist: £1,675, plus £350 expatriation pay.

Senior Health Officer; Senior Leprosy Officer; Senior Medical Officer; Senior Pathologist; Principal, Medical School: £1,610, plus £350 expatriation pay.

Medical Officer; Medical Officer of Health; Medical Research Officer; Pathologist; Sleeping Sickness Medical Officer; Tuberculosis Officer: £770 by £40 to £1,290 by £60 to £1,350 by £40 to £1,470 by £30 to £1,500, plus expatriation pay of £180 on £770 to £350 on £1,500. (Note: non-specialists remain for three years at £1,290.)

Questions Answered

Methods of Assessment

Q.—(a) My earnings, since I was employed first by a hospital and then by the R.A.F., are taxed under Schedule E, but my wife's earnings as a soloist ballet dancer under contract are taxed under Schedule D. Why the difference? And why is she allowed professional expenses which are not specifically stated on her contract as being required, while I am not allowed expenses because they are not specifically stated on my contract? (b) When I leave the R.A.F., and if I do not seek a hospital post but employ myself with locums, etc., can I claim assessment under Schedule D? (c) If so, will tax relief be granted on the yearly depreciation of a new car, plus the interest payable on a hire-purchase contract?

A.—(a) The correct basis of assessment of the husband is undoubtedly Schedule E; that Schedule may also be appropriate in the case of the wife, but it is believed that unless engagements in the particular profession concerned are for unusually long periods the liability is dealt with under Schedule D. There is normally a difference in the matter of expenses—possibly only one of degree, but nevertheless a substantial difference. (b) If the work undertaken as a locumtenent involves comparatively short periods and frequent changes, the Revenue authorities usually regard the earnings as falling for assessment under Schedule D. If in fact an employer has deducted tax under the P.A.Y.E. system, this does not prevent assessment under Schedule D; the liability on the total earnings is calculated and the tax paid by deduction set off against the amount so calculated. (c) In those circumstances the total expenses incurred in the carrying on of the profession as a locumtenent can be deducted, including the annual allowance of 25% of the cost of the car and the interest on the hire-purchase contract, but subject to an appropriate restriction for private use of the car. The annual depreciation allowance is due on the full cost of the car less the aggregate amount of the hire-purchase interest.

Correspondence

Colonial Medical Service

SIR.—The progress report on the Colonial Medical Service (*Supplement*, January 31, p. 31) is unnecessarily mild in its reference to Cyprus, where representations by the Association have received cavalier treatment by the Government, which also has refused to recognize the local Branch as a body suitable to negotiate on medical matters. It is now over two years since the Association first broached the question of salaries and conditions in the Cyprus Medical Service. Detailed proposals were submitted, but remained unanswered for almost a year, when it was learned that, without consultation with the medical profession either locally or in London, the Cyprus Government had introduced a new and inadequate salary scale in spite of the fact that boom conditions prevail in the Colony. Another unsatisfactory feature of the Colony's medical service is that the terms of service for individual specialists are far from uniform, some enjoying much more favourable conditions than others. The Association has made every effort to bring about improvements, but has encountered an uncooperative spirit at every stage. It is difficult to believe, but it is a fact that the Chairman of the Representative Body, on his recent visit to Cyprus, was unable to obtain an interview with the Governor or the Colonial Secretary.

However, Sir, the prime object of this letter is not to expose the sins of the Cyprus Government but plainly to set out the broad lines of the Association's policy concerning the vexed question of private practice by medical officers of the Colonial Medical Service. Generally speaking, the Association is against private practice by medical officers (exceptions would be where Colonies are too small or too badly off to pay adequate salaries) except those in districts where no other medical help is available and the medical officer is compelled for humanitarian reasons to attend individuals who would normally consult private medical practitioners. In such cases the medical officer should be allowed to retain the fees. The Association is also against the charging of fees to patients in Government hospitals except to those accommodated in annexes or wards specially set aside for the reception of paying patients: such fees should also be retained by the officer concerned, as should fees for consultations asked for by another medical man. The Association is opposed to the "farming out" in any shape of medical officers or the use of their services for revenue purposes.—I am, etc.,

JOHN L. GILKS,
Chairman,
Overseas Committee.

Petersfield.

Whole-time Consultants and Domiciliary Visits

SIR.—Now that the question of the betterment factor as applied to the salaries of full-time consultants is under consideration, it would be appropriate also to reconsider the question of non-payment to full-time consultants for domiciliary visits. If ever an iniquitous decision was agreed to by our representatives, this was one. The British Medical Association, through its *Journal*, is adept at assuring us that full-time consultants' interests are very much to the fore, and that, though there are few, if any, full-timers on various negotiating committees, their interests are adequately looked after by their part-time colleagues. This simply is not so, and the inept handling of the domiciliary-visit question is an example. Domiciliary visits by full-time consultants should be paid for, and I sincerely hope the present opportunity will be taken to reconsider the matter.

At the same time I would like to add my name to the ever-lengthening list of those who consider that the present representation of full-time consultants on negotiating committees is inadequate. There are many of us, and we control many beds throughout the service. It is high time our voices were heard in committee, along with those of our part-time friends and colleagues.—I am, etc.,

Barnet.

G. RIDDELL ROYSTON.

Betterment for Consultants

SIR,—In view of the vital importance of the discussions which are at the moment taking place between the management and staff sides of the Whitley Committee for consultants, it was felt it would be of value to stress that the consultants in the western area of the region administered by the South-west Metropolitan Regional Hospital Board are solidly united in support of a firm line being taken by our negotiators in the Whitley Committee and the Joint Committee. At a recent meeting of the South-west Metropolitan (Western Area) Regional Consultants and Specialists Committee, fully representative of all the consultants in the area, the following resolution was passed:

The South-west Metropolitan (Western Area) Regional Consultants and Specialists Committee urges the Joint Committee to press for full and retrospective implementation of the Spens Report as regards salaries of hospital medical staff, and only to accept a betterment factor which is comparable to that recently decided by arbitration as applicable to general-practitioner remuneration.

This resolution was passed unanimously at a meeting attended by 25 consultants, representing medical advisory committees throughout the area.—I am, etc.,

H. H. LANGSTON,
Hon. Secretary, South-west Metropolitan
(Western Area) Regional Consultants
and Specialists Committee.

Winchester.

New B.M.A. Subscription Rates

SIR,—The new subscription rates were presumably determined with the object of spreading the necessary increase as fairly as possible. As Dr. James Ackerley (*Supplement*, January 31, p. 33) points out, however, the real cost of membership depends both on the rate paid and whether or not the subscription is allowed as a deduction for income-tax purposes. It is highly undesirable that anomalies should occur which might discourage membership in any branch of the profession, and the question raised by this letter certainly requires careful consideration. It was therefore somewhat surprising to find that although the letter was referred to in a leading article (*Journal*, January 31, p. 262) the point of the letter was completely ignored.—I am, etc.,

Tonbridge.

J. W. CRAWFORD.

SIR,—I read with interest Dr. James Ackerley's letter concerning the new B.M.A. subscription rates (*Supplement*, January 31, p. 33) and the leading article (*Journal*, January 31, p. 262).

I cannot find any suggestion in Dr. Ackerley's letter that the new rates are unreasonable, but he did say that the whole-time doctor had to pay more than a just proportion, and with this I most heartily agree. The B.M.A. is rightly concerned to maintain its finances in a sound state, and if the subscription must be increased no exception can be taken. The B.M.A. also realizes that the contributions of its members should bear a relation to their earnings and conditions of work, and this is done by a graduated subscription rate.

The fact remains that, where two doctors receive approximately the same earnings and one is whole-time and one part-time, the former may have to contribute almost double the subscription of the latter, since a whole-time doctor can claim no tax relief on his subscription. This matter, which was the main theme of Dr. Ackerley's letter, receives no comment in your leading article. I cannot believe that the B.M.A. is not aware of the strong feeling amongst whole-time doctors that they receive less than justice at the hands of many official bodies, and I am confident that the B.M.A. would not wish to perpetuate this inequality. The case for allowing salaried doctors to pay a reduced subscription rate seems a strong one.—I am, etc.,

Birmingham.

IAN S. BUCHANAN.

SIR,—The first two sentences in your leading article (January 31, p. 262) are the ones which show grave misconception. Nowhere in Dr. James Ackerley's letter (*Supple-*

ment, January 31, p. 33), to which you refer, is there any mention of the fact that six guineas is a large subscription. The point which appears obvious from the letter is that the only persons paying the full six guineas annual subscription are full-time medical officers of health with salaries from £1,500 per annum. I do not think that this leading article is fair comment on the letter in question, and is merely a reiteration of the report of the Finance Inquiry Committee to the Annual Representative Meeting in 1952 (*Supplement*, July 12, p. 26), when it was decided to raise the annual subscription.—I am, etc.,

Bedlington.

ALEXANDER DONALDSON.

Plight of Provincial Ophthalmic Surgeons

SIR,—The general practitioners have now received the Dankwerts award, and I believe that negotiations are in progress (or about to be) with regard to the consultants. I feel that the provincial consultants, and particularly so the provincial ophthalmic surgeons, have some very just grievances under the Health Service. Unlike the general practitioners, they have no compensation for their practices, which were a very valuable and saleable capital asset. Owing to the lack of preparation of the Health Service, the permanent eye service was not established at the beginning. Under the supplementary service, which was supposed to be a temporary expedient, the patients are able to go to the ophthalmic surgeon's private consulting-rooms, if he were an established ophthalmic surgeon, for one-third of the pre-war private fee, as a State patient. In these circumstances, it has been impossible for ophthalmic surgeons to retain their private practices, as the spectacles were supplied free to the State patient, whilst the private one had to pay for them. Whilst the general practitioner is assessed for pension on the number of State patients on his list, no pension is payable for these supplementary cases which the ophthalmic surgeon sees under the supplementary scheme. The ophthalmic surgeon, having lost his capital asset, can therefore only look forward to a pension on his hospital clinics, which, for a man in the fifties when the Service started, can only amount to £200 or £300 a year when he attains the age of 65.

I would suggest, therefore, that the provincial consultant should (a) be compensated for the loss of his practice in the same way as the general practitioner has been; (b) that the pension for his hospital clinics should be dated from the first time that he held any official post in a hospital; and (c) that ophthalmic surgeons should receive a pension based on the number of State patients seen under the supplementary scheme in their own consulting-rooms to compensate them for the loss of their private practices.

It is a regrettable fact that the supplementary service has practically put an end to private ophthalmic practice, with the result that a considerable number of ophthalmic surgeons are working in dispensing opticians' shops instead of in their private consulting-rooms. Stern necessity has driven these ophthalmic surgeons to seek free professional accommodation and free clerical assistance owing to the small fee paid for refractions by the State. This is a most unfortunate and retrograde step.—I am, etc.,

Camberley, Surrey.

LESLIE HARTLEY.

Payment of Compensation on Taking a Partner

SIR,—It is surprising that the Ministry cannot be persuaded to take a more realistic attitude towards part payment of compensation in respect of partnerships formed after the inception of the Act. The official attitude appears to be that, unless financial hardship can be proved by existing debt, no valid reason exists. This may seem to be justifiable on paper, but in actual fact is far from the case.

My own experience must be similar to that of many other practitioners. In 1949 I entered into a partnership on a 50/50 basis, and, as it was illegal to sell the whole or a part

of a practice, I had in fact given away half of my anticipated income without immediate capital gain. As I had only recently purchased the goodwill and premises in 1947, it appeared reasonable to expect some financial compensation in respect of the loss of right to sell a share to an incoming partner. All attempts to recover any financial compensation have failed because I am unable to demonstrate any debts in respect of the purchase of the practice, which was purchased out of my own capital. It would appear that this comes very close to denying, on grounds which do not appear to be related, an elementary right of the Act—that is, the payment of compensation for the right to sell goodwill.

I submit that the giving away of half of one's income is equivalent to part retirement, and, as such, qualifies for compensation equal to half of the agreed figure with the Ministry without further financial investigation, if we are not to be denied an agreed principle. I was not forced into a partnership because I had a list too large for one man theoretically to handle but because I felt that the increased work and demands on one's patience did not allow sufficient time to do adequate justice to the really ill patients. I was fortunate in meeting a practitioner who shared my views, but I suggest that my appeal for part payment of compensation should have been met.—I am, etc.,

Shipley.

J. A. FRAIS.

Medical Reports

SIR,—The following anomalies exist in fees for medical reports. A solicitor pays a fee of two guineas for a report on a patient. For a similar report, but on its own form, an insurance company, by recent arrangement with the British Medical Association, pays a fee of 15s. For the same report the Ministry of Pensions pays 5s. Leaving out the solicitor's fee, which may entail a full examination of the patient, I think that the Ministry of Pensions fee should be brought into line with the insurance companies. I continue to send these reports to the Ministry of Pensions, as I feel that it might be detrimental to my patients to refuse to do so.—I am, etc.,

Boreham Wood.

A. DE COURCY-WHEELER.

Radiology on Points

SIR,—I am relieved to note (*Supplement*, January 31, p. 33) that the Faculty of Radiologists has now placed the above-mentioned subject in its correct perspective, and before the correspondence closes I hope I may be permitted to amplify the second paragraph of the Faculty's letter.

In 1951 the Radiologists Group Committee of the B.M.A., at the suggestion of the Medical Committee of the B.I.R., drew up independently a unit scheme. When details of the Nuffield scheme were received the two were found to be so remarkably similar that it was decided to use the Nuffield scheme with a few small modifications which were accepted by the Trust, and those facts were reported and discussed at the annual conference of the Radiologists Group of the Association in 1951 and again in 1952. In the circumstances, and particularly in view of your leading article (January 10, p. 86), I suggest that the following points should be made clear: (1) A number of radiologists themselves asked that a standard system of record-keeping in x-ray departments should be devised, in view of the widely different systems in use throughout the service and the desirability that any uniform system of presenting the data required monthly by the Ministry should be one acceptable to radiologists. (2) The radiologists who collaborated in this matter were given to understand that the system would be tried out in the first place as an experiment for at least one year, and that no step would be taken to introduce it officially until all those concerned in its production and trial had had an opportunity to discuss it in its final state.—I am, etc.,

Worthing.

R. BOULTON MYLES,
Chairman,
Radiologists Group Committee.

H.M. Forces Appointments**ARMY**

Colonel G. Anderton, O.B.E., late R.A.M.C., has retired on retired pay.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel A. J. N. Warrack, M.B.E., has retired with a gratuity.

Majors P. D. Stewart, E. D. H. Williams, S. O. Bramwell, M.B.E., and T. A. Pace, O.B.E., to be Lieutenant-Colonels.

Major E. L. Moore, M.C., has retired with a gratuity, and has been granted the honorary rank of Lieutenant-Colonel.

Major I. W. Caldwell has retired with a gratuity.

Short Service Commissions.—Major L. C. F. Chevens has retired with a gratuity, and has been granted the honorary rank of Lieutenant-Colonel. Major A. H. L. Wilson has retired, having received a gratuity. Captains H. T. Jones and P. A. Trafford have retired with gratuities, and have been granted the honorary rank of Major. Captain K. L. Prendergast to be Major.

REGULAR ARMY RESERVE OF OFFICERS**ROYAL ARMY MEDICAL CORPS**

Major D. P. Kearns has ceased to belong to the Reserve of Officers.

ARMY EMERGENCY RESERVE OF OFFICERS**ROYAL ARMY MEDICAL CORPS**

Major (Honorary Lieutenant-Colonel) A. D. Davidson, from T.A.R.O., to be Major, and has been granted the acting rank of Lieutenant-Colonel.

Majors (Honorary Lieutenant-Colonels) G. F. Edwards and M. Kingsley, from R.A.R.O., to be Majors, and have been granted the acting rank of Lieutenant-Colonel.

Major A. McC. Campbell, D.S.O., O.B.E., T.D., has been granted the acting rank of Lieutenant-Colonel.

Captain A. Murphy has been granted the acting rank of Major.

TERRITORIAL ARMY**ROYAL ARMY MEDICAL CORPS**

Major J. D. Finnegan has been granted the acting rank of Lieutenant-Colonel.

Major L. C. Lade has resigned his commission. Captain (Acting Major) G. Gregg has been granted the acting rank of Lieutenant-Colonel.

Captain D. S. Orr to be Major.

Captains K. Greig and W. Brodie have been granted the acting rank of Major.

Captain S. A. Jenkins (now T.A.R.O.), to be Major.

REGULAR ARMY: EMERGENCY COMMISSIONS**ROYAL ARMY MEDICAL CORPS**

Lieutenant (War Substantive Captain) G. Blaine has relinquished his commission, and has been granted the honorary rank of Major.

ROYAL AIR FORCE

Flight Lieutenant S. Gillis has relinquished his temporary commission, retaining the rank of Squadron Leader.

Flight Lieutenant J. C. Rushton has reverted to the Reserve, retaining the rank of Squadron Leader.

COLONIAL MEDICAL SERVICE

The following appointments have been announced: C. W. Davies, M.R.C.S., L.R.C.P., D.P.H., Assistant Director of Medical Services, Tanganyika; B. J. Green, M.B., Ch.B., D.T.M.&H., and D. W. McLaren, M.B., Ch.B., D.T.M., Senior Medical Officers, Nigeria; L. R. Boulger, M.B., Ch.B., Pathologist, Nigeria; E. Rombejko, Med.Dip.M.(Warsaw), Medical Officer, St. Helena; A. A. Akiwumi, M.B., Ch.B., and E. Trinick, M.B., Ch.B., Medical Officers, Gold Coast; K. M. Gottlieb, M.B., Ch.B., Schools Medical Officer, Northern Rhodesia; J. M. H. R. Hardy, L.R.C.P.&S.Ed., Police Medical Officer, Mauritius; D. D. Hilton, M.B., Ch.B., Temporary Medical Officer, Nigeria; A. E. Ward, M.B., Ch.B., District Medical Officer, Windward Islands; S. E. Onwu, M.B., Ch.B., D.T.M.&H., Deputy Director of Medical Services, Eastern Region, Nigeria; G. C. Dansey-Browning, M.R.C.S., L.R.C.P., D.O.M.S., Ophthalmic Specialist, Hong Kong; P. W. Kent, O.B.E., M.B., B.Ch., D.P.H., D.T.M.&H., Special Grade Medical Officer, Kenya; V. O. G. Smyth, M.R.C.S., L.R.C.P., Medical Officer (Alienist), Federation of Malaya; H. I. Williams, M.B., B.Ch., Bacteriologist, Federation of Malaya; L. E. Dasent, M.B., B.Ch., Medical Officer Grade C (late Student), Trinidad; P. R. Das Gupta, M.B., F.R.C.S., Medical Officer (E.N.T.), British Guiana.

Association Notices

SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH

The Council of the British Medical Association is prepared to receive applications for research scholarships as follows:

An Ernest Hart Memorial Scholarship, of the value of £250.
A Walter Dixon Scholarship, of the value of £250.
One or more research scholarships, each of the value of £200.

These scholarships are given to candidates whom the Science Committee of the Association recommends as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease.

In addition, applications are invited for the award of the following research scholarship:

The Insole Scholarship, of the value of £250, for research into the causes and cure of venereal disease.

Each scholarship is tenable for one year, commencing on October 1, 1953. A scholar may be reappointed for not more than two additional terms. A scholar is not necessarily required to devote the whole of his or her time to the work of research, but may be a member of H.M. Forces or may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment will not, in the opinion of the Science Committee, interfere with his or her work as a scholar.

Applications for scholarships must be made not later than March 31, 1953, on the prescribed form, a copy of which will be supplied on application to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

Diary of Central Meetings

FEBRUARY

- 24 Tues. Building Committee, 2 p.m.
- 25 Wed. Joint Committee of B.M.A. and British Veterinary Association, 11.30 a.m.
- 25 Wed. Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, W.C.), 12 noon.
- 25 Wed. Joint Formulary Committee, 2.30 p.m.
- 25 Wed. Joint Conference of Science Committee, Royal College of Nursing, and Pharmaceutical Society, 4 p.m.
- 26 Thurs. Standing Subcommittee, Central Ethical Committee, 12 noon.
- 27 Fri. Joint Committee of B.M.A. and the Magistrates' Association, 11 a.m.
- 27 Fri. Library Subcommittee, Science Committee, 12 noon.
- 27 Fri. Science Committee, 2 p.m.

MARCH

- 2 Mon. Joint Committee of Psychological Medicine Group and R.M.P.A., 11 a.m.
- 2 Mon. Armed Forces Committee, 2 p.m.
- 4 Wed. Private Practice Committee, 11.30 a.m.
- 4 Wed. Joint Conference, Occupational Health and Public Health Committees, and Tuberculosis and Diseases of the Chest Group Committee, 2 p.m.
- 5 Thurs. Subcommittee on Constitution and Procedure of Medical Service Committees, G.M.S. Committee, 2 p.m.
- 11 Wed. General Practice Review Committee (adjourned meeting), 11 a.m.
- 13 Fri. Consulting Pathologists Group Committee, 2.30 p.m.
- 18 Wed. Council, 10 a.m.
- 25 Wed. Joint B.M.A. and T.U.C. Committee, 2.30 p.m.

Branch and Division Meetings to be Held

Bournemouth Division.—At Royal Victoria Hospital, Bournemouth, Friday, February 27, 8.15 p.m., meeting. Film: "The Science and Art of Obstetrics—Normal Labour."

Bromley Division.—At Royal Bell Hotel, Bromley, Tuesday, February 24, 8.20 p.m., meeting. Short papers by Dr. E. C. Warner and Dr. A. C. E. Breach: "The Training of the General Practitioner." General discussion to be opened by Dr. A. Talbot Rogers.

Burnley Division.—At Sparrow Hawk Hotel, Burnley, Friday, February 27, 8.30 p.m., annual general meeting.

City Division.—At Royal National Throat, Nose, and Ear Hospital, Gray's Inn Road, London, W.C., Tuesday, February 24, 8 p.m., clinical evening arranged by Mr. C. Gill-Carey.

Finchley Division.—At Finchley Memorial Hospital, London, N., Friday, February 27, 8.45 p.m., meeting. Dr. Michael Kremer: "Pain in the Upper Limb."

Lewisham Division.—At Lewisham Hospital, S.E., Friday, February 27, 8.30 p.m., meeting. Lecture by Dr. Murdoch MacGregor.

Monmouthshire Division.—At St. Mellons County Club, Thursday, February 26, 7.45 p.m. for 8.15 p.m., dinner. Annual B.M.A. Lecture by Mr. A. Dickson Wright: "The Surgery of Hypertension." Members' wives are also invited.

North Bedfordshire Division.—At South Wing, Bedford General Hospital, Thursday, February 26, 8 p.m., meeting. Dr. J. A. Gorsky: "Alcohol and the Motorist."

North-East Suffolk Division.—At Lowestoft and North Suffolk Hospital, Sunday, February 22, 3 p.m., meeting. Sound films: "Some Aspects of Accessible Cancers."

Oxford Division.—At Maternity Department Lecture Theatre, Radcliffe Infirmary, Oxford, Wednesday, February 25, 8.15 p.m., meeting. Address by Mr. J. A. Stallworthy on his recent visit to Australia and New Zealand.

South Bedfordshire Division.—At Luton and Dunstable Hospital, Thursday, February 26, 9 p.m., meeting. Dr. W. S. C. Copeman: "Rheumatoid Arthritis."

Tyneside Division.—At North Eastern Hotel, Nile Street, North Shields, Tuesday, February 24, 8 p.m., A.G.M.

Warrington Division.—At Warrington Infirmary, Friday, February 27, 8.15 p.m., clinical meeting. Dr. F. H. Brisby: "Crimes and Criminals."

Wembley Division.—At Wembley Hospital, Tuesday, February 24, 9 p.m., meeting. Discussion to be introduced by Dr. H. M. Harris: "The Changing Pattern of Medical Practice." All medical practitioners in the area of the Division are invited.

Woolwich Division.—At St. Nicholas' Hospital, Plumstead, S.E., Tuesday, February 24, 8 p.m., clinical meeting. Members of the Greenwich and Deptford Division are invited.

Meetings of Branches and Divisions

DORSET DIVISION

A meeting was held at the Kings Arms Hotel, Dorchester, on November 7. With Dr. H. G. Harvey in the chair, there were 28 members present. A presentation was made to Dr. E. H. Parkinson in recognition of his work as honorary secretary. The meeting closed with a talk by Dr. A. N. Blades on "Iron Metabolism."

HONG KONG BRANCH

The annual general meeting was held on October 20, 1952, at Hong Kong University Alumni Association premises. With Dr. T. J. Hua in the chair, there were 25 members present. The following officers were elected for 1952-3:

President.—Dr. John Gray.
Secretary.—Dr. A. H. R. Coombes.
Treasurer.—Dr. I. Bergius.

SOUTHAMPTON DIVISION

A ladies' night was held at the Civic Centre, Southampton, on January 21. About 130 members and guests listened to an interesting and amusing lecture by Professor W. T. Williams on "Some of the Medical Problems of Sherlock Holmes."

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

THE CONSTITUTION OF THE B.M.A.

I.—THE LOCAL UNIT

The Annual Representative Meeting to be held at Cardiff in 1953 will be the jubilee meeting of the Representative Body, which first met at Swansea in 1903 under the chairmanship of Sir Victor Horsley. It seems fitting, therefore, in a short series of articles, to describe the history and character of the constitution of the Association—the local unit, the representative structure, the executive council, and the principal committees.

The British Medical Association had its origin at Worcester—in the board-room of the Worcester Infirmary in 1832. There is more significance in this than usually attaches to the choice of locality for a meeting to inaugurate a new movement. The B.M.A. was primarily an organization centred on Worcester, or on the Midlands, and for many years it remained provincial. Its founder and the chairman of its council for more than 30 years, Sir Charles Hastings, was a Worcester man; its two secretaries were resident in Worcester, as were many members of its early councils. In the days when the Association was founded railways were still in their early stages of development, and from most places in England it took as long to get to Worcester as it had done in the time when Charles II was brought to bay by Oliver Cromwell at the gates of the city. The remarkable thing is that the Association should have spread so rapidly to every part of the provinces. Within 10 years its annual meetings were held at places as distant as Manchester, Southampton, and York, and its early council included members from Swansea, Norwich, Exeter, and Sunderland. Even the border was being penetrated at Berwick-on-Tweed.

Beginning in the Provinces

It is important to remember that it was a provincial organization. This fact was conveyed by its title—the Provincial Medical and Surgical Association—for the first 23 years of its history. It was provincial, not by accident, but in intention, designed to counterbalance the concentration of medical authority in London, to sustain the tone of provincial practice, to unite all classes of the profession outside the metropolis, and to ensure that the very considerable status and ability of physicians and surgeons in the provincial hospitals did not go unrecognized. Its provincial character attracted some gibes from the *Lancet* of the period—"a provincial council in the far-off city of Worcester," and again, in view of the fact that

the Association met only once a year and in a different place each time, "a migratory provincial medical club."

Moreover, the Association, to begin with, was mainly a scientific body. In the prospectus setting out its objects only one of the five clauses concerned the "maintenance of the honour and respectability of the profession"; the others had to do with scientific activities. Neither in Hastings's foundation address nor in the official programme of the first meeting was there any reference to medico-political matters. The Association came into medical politics tardily and under the compulsion of events.

As a curious footnote to this history it may be said that there was actually a British Medical Association 20 years before the Provincial Medical and Surgical Association adopted the title and made the initials "B.M.A." universally familiar. This earlier association was founded in London in 1836 and survived for about 10 years. It seems to have had a precarious existence. On one occasion it is reported that the association "met in the person of Dr. George Webster" (its president), "that the secretary was absent, and that the resolutions were moved, seconded, put to the meeting, and carried by the president."

The Creation of Branches

The growth of the Association in the provinces proceeded by the creation of branches. In some cases local societies already existing converted themselves into branches of the Association. This was the case with the first branch to be formed—the East Anglian—which arose out of the Eastern Medical and Surgical Association at Bury St. Edmunds in 1835. A branch at Bath was founded in the following year, and a year later the Lancashire and Cheshire Branch was formed out of the Newton Medical and Surgical Association, Newton being a town half-way between Liverpool and Manchester. Within 10 years eight branches had been formed; within 20 years there were 14, and by the time the Association reached its jubilee in 1882 there were 25, including the first overseas branch (Jamaica). London, or the metropolitan counties, a territory which the Association had hitherto skirted, became a branch in 1853, by which time the Association was ready to drop the name "provincial." Rather oddly there was not for 50 years a branch at Worcester, probably because Sir Charles Hastings had thought of his town as the Association headquarters. At the present time the Association has over 50 branches in the United Kingdom and nearly as many overseas.

Quite early in the Association's history the principles to be followed in its management exercised many minds. There

were those who wanted the representative principle more fully applied than was possible in the patchwork arrangement by which the Association had developed. They felt probably that a good constitution was infinitely better than the best despotism. In its early period the Association was really governed by the members who happened to live in or near Worcester. Arrangements which were adequate for a local society no longer availed for a national organization. The annual meeting was the body of ultimate decision, but it had no representative status and was attended by relatively few of the members, who in the middle of the nineteenth century numbered 1,800. A code of laws had been set up requiring that the council should be elected by the branches, one member for every 20 branch members, resulting in a wholly unwieldy body. In 1873 a committee was set up to prepare a memorandum and articles which turned the Association into a limited liability company, with the members of council as directors. The Association was placed under the control of a general meeting to be held in a different part of the country every year, but the quorum was to be only 25.

Search for a Democratic Basis

It became more and more evident that such constitution as there was was not suited to the new democratic age which was already dawning not only in national government but in the government of the professions. A constitutional committee accordingly was set up and submitted a report which was, in the manner of such reports, referred by the council to the branches and then to a reformed constitution committee for reference to the council again. This delayed matters for some time, and the spell of old custom and tradition was at length broken—as it has been in so many other cases—by the emergence of a “ginger group” and the threat of the establishment of a new body. The ginger group was the Medical Guild of Manchester, which in 1899 called a conference of delegates from societies of general practitioners—not necessarily branches of the Association—from all over the country. The Guild itself was one of a number of local medical societies which sprang up towards the end of the nineteenth century, not, like the earlier local or regional associations, with mainly scientific objects, but for the frank discussion of medico-political matters, which were becoming more and more important with the growth of public responsibilities for the profession. For a time there was a danger of a rival organization to the B.M.A., which would voice more emphatically the views of the profession in relation to medical reform, the Poor Law, public health and State medicine, contract practice, and other subjects.

At a conference summoned on the Manchester initiative delegates from 54 bodies assembled, including seven branches of the Association itself, Sir Victor Horsley taking the chair, with Dr. (afterwards Sir) Smith Whitaker, presently to be medical secretary of the Association, at his right hand. A resolution was brought forward that local associations should elect delegates to meet annually at a conference at which only medico-political and ethical aspects of the doctor's work would be discussed, and at which a central executive committee would be set up, one-third of whose members would retire annually.

The case for a separate body from the Association on the one hand, and on the other for the reform of the Association, was effectively argued, and the decision was in favour of a reformed Association. It was felt that the multiplication of associations was to be deprecated, and it was also generally agreed that the British Medical Association, by now a body of established position, was the most suitable organization for the purpose. It was resolved accordingly that all efforts should be directed to the conversion of the B.M.A. into an energetic body really representative of the profession.

Attempts at reform along these lines had to meet a number of obstacles, the importance of which it is not always easy to understand in retrospect. But at the annual meet-

ing at Ipswich in 1900 a committee of 24 was appointed, half elected at that meeting, and the other half to be appointed by the Council, to report on the best means of meeting the situation. Sir Edmund Owen, one of the small group of London surgeons who took an interest in the affairs of the Association from the 'eighties onwards, and afterwards became chairman of its Council, presided over the committee.

The Division

The first thing which exercised the minds of the Association was the primary unit of the Association. The branches at this period numbered about 80 in this country, but they were not of suitable size and shape in most cases for the real work of the Association. Many of them were too large. For example, one branch comprised Lancashire and Cheshire; another the counties of Kent, Surrey, and Sussex; a third the several counties of eastern England, from Lincolnshire to Essex. Thus it was impossible for members to attend branch meetings regularly, and, moreover, the larger the area the more difficult it was to secure useful discussion on matters of local interest, and the more the discussions tended to be scientific in character.

It was agreed, therefore, that the primary unit should be of such a size that a member would have a reasonable opportunity of attending every meeting. The name “divisions” was given to these primary units, which were grouped within the area of branches. There are, for example, 26 divisions in the Metropolitan Counties Branch, 12 in the North of England Branch, 8 in the Midland Branch. On the other hand, some branches, like East Yorkshire, Leicestershire and Rutland, and, in Scotland, Perth and Fife and Stirling, are not divided. The divisions may comprise a large city like Birmingham, or a town of fair size like Grimsby, or a small county like Buckinghamshire, or a part of a county like South-east Essex. The branches still retain some functions, including the election to the Association of members resident in their areas, the ordination of the divisions, and the allocation of divisional grants. But every member of the Association is deemed to be a member of the division in which he lives, and every member of a division is a member of the Association. There are now about 220 divisions in Great Britain, not including a few branches which, being undivided, are themselves in effect divisions. The Association is thus practically a federation of divisions, each division having its own area, local administration, and rules, subject only to such limitations as are deemed needful for the co-operation of all.

Next Article: The Representative Body.

MEDICAL PRACTICES COMMITTEE

AMENDMENT OF CLASSIFICATION OF AREAS

The following amendments to the classification of areas have been issued by the Medical Practices Committee:

ENGLAND: COUNTIES

Bedfordshire.—Harrold, Sharnbrook, Riseley and Turvey, Intermediate from Restricted.

Cheshire.—Hollingworth and Mottram (sub-area of Hyde, Dukinfield and Stalybridge), Restricted from Intermediate.

Essex.—Urban District of Clacton-on-Sea, Intermediate from *Designated; Harlow New Town Development Area, Designated (rest of Epping Rural District to remain Restricted).

Gloucester County and City.—Filton, Little Stoke and Stoke Gifford, Intermediate from *Designated.

Hertfordshire.—Borough of St. Albans, Intermediate from *Designated; Urban District of Letchworth, Intermediate from *Designated.

Huntingdonshire.—Alconbury Weston, Restricted from Intermediate.

Kent and Canterbury.—Rural District of Dartford, Intermediate from *Designated; Rural Districts of Sevenoaks (except Otford

*Areas where the position is finely balanced and the admission of one or two doctors may result in reclassification.

and Shoreham) and of Swale, Restricted from Intermediate; Urban District of Tonbridge, Intermediate from *Designated.

Lancashire.—Accrington, Colne, Heywood District, Walton-le-Dale, Intermediate from *Designated.

Lincolnshire (Holland).—Boston Municipal Borough and Rural District, East Elloe Rural District, Spalding Urban and Rural Districts, Intermediate from *Designated.

Lincolnshire (Lindsey).—Brigg Area (Barton-on-Humber Urban District), *Designated from Intermediate; Caistor Area (Caistor Rural District), Restricted from Intermediate.

Middlesex.—Boroughs of Hornsey and Wood Green and Urban Districts of Enfield and Harrow have been subdivided and classified as follows. The numerals I, II, or III denote whether the district is designated Doubtful, Intermediate, or Restricted. I: Borough of Hornsey (*South Haringey Ward only); Borough of Wood Green (Noel Park and *Town Hall Wards only); Urban District of Enfield (all wards except Cambridge Road, Green Street, and Town Wards); Urban District of Harrow (*Harrow Weald, *Queensbury, *Roxeth and *Wealdstone North Wards only). II: Borough of Hornsey (Central Crouch End, Finsbury Park, North Haringey, and Stroud Green Wards only); Borough of Wood Green (Alexandra—Bowes Ward only); Urban District of Enfield (Cambridge Road, Green Street, and Town Wards only); Urban District of Harrow (Belmont, Headstone, Kenton, Harrow-on-the-Hill, Pinner North and Hatch End, Pinner South, Stanmore North, and South and West Harrow Wards only). III: Borough of Hornsey (Highgate and Muswell Hill Wards only); Urban District of Harrow (Wealdstone South Ward only).

Northumberland.—Rural District of Glendale, Restricted from Intermediate.

Nottingham County and City.—Carlton-in-Lindrick, Kimberley, Intermediate from *Designated.

Salop.—Shifnal, Intermediate from *Designated.

Somerset.—Rural District of Wellington, Intermediate from Restricted.

Staffordshire.—Urban Districts of Aldridge, Coseley, Stone, Intermediate from *Designated; Urban District of Wednesfield, *Designated from Intermediate.

Suffolk West.—Rural District of Mildenhall, Intermediate from *Designated.

Warwickshire.—Borough and Rural District of Warwick, Intermediate from *Designated.

Worcestershire.—Stourport-on-Severn, Intermediate from *Designated.

Yorkshire (West Riding).—Borough and Rural District of Goole, Borough of Morley, Urban District of Rothwell, Intermediate from *Designated; Rural District of Ripon and Pateley Bridge, Restricted from Intermediate.

COUNTY BOROUGHES

Bolton, Intermediate from Designated; Bradford, classified as one area—Designated (previously subdivided); Carlisle, Intermediate from Designated; Newcastle-upon-Tyne (Central Area—Jesmond Ward), Restricted from Intermediate; Salford (Seedley District), Intermediate from *Designated; Stoke-on-Trent (Hanley, Shelton, Bucknall, Abbey Hulton and Milton), Intermediate from *Designated.

WALES: COUNTIES

Carmarthenshire.—Cwmlllynfell and Brynamman (to be excluded from Pontardawe Rural District, Glamorganshire), combined and classified as Restricted; Drefach, Tumble, Cross Hands and Penygroes, combined and classified as Intermediate; Llandilo, Restricted from Intermediate; Llandovery and Llangadock, combined and classified as Intermediate from Restricted; Pontyberem and Pontyates, combined and classified as Intermediate; St. Clears and Llandboidy, to be combined but to remain Intermediate; Whitland, Restricted from Intermediate. Areas immediately adjacent to Henllan and Lampeter in Cardiganshire to be included with Newcastle Emlyn and classified as Intermediate.

Glamorganshire.—Cwmlllynfell and Brynamman, to be excluded from the Pontardawe Rural District and classified as Restricted in the Carmarthenshire Executive Council's area; Urban District of Aberdare, Intermediate from *Designated.

Monmouthshire and Newport.—Urban District of Nantyglo and Blaena, Intermediate from *Designated.

Pembrokeshire.—Haverfordwest, Intermediate from *Designated.

COUNTY BOROUGH

Swansea.—Swansea East Division, Intermediate from *Designated.

THE REPRESENTATIVE BODY

MEMORANDUM BY THE WINCHESTER DIVISION

The following memorandum on the Representative Body is being circulated by the Winchester Division to other divisions of the Association.

Present Constitution

Total membership, 460. Made up as follows: 425 Representatives from Great Britain and Northern Ireland, 31 overseas, 4 public health (and members of Council, who do not vote).

Functions

(i) The Parliament of the Association. *The only Conference of all sections of the profession, and in which all areas of the country are fully represented.* (ii) The final arbiter of policy. (iii) More attention is paid by the Press to the deliberations of the Representative Body than to those of any other medical organization.

Shortcomings

(i) Most important, its present size—governed by by-laws made over 50 years ago.

(ii) There are 460 Representatives, about 70 members of Council, the Secretariat, and members of the Press, requiring a Hall in which 600 people can move about comfortably. Until such time, therefore, as the size of the R.B. can be reduced, the smaller towns cannot hope to entertain it.

(iii) Its very lengthy Agenda. And resulting from (i), (ii), and (iii):

(iv) The lack of balance in the conduct of business, so that some items of no great importance may be the subject of lengthy debate, while other far more important matters are summarily dealt with, and even subject to guillotine through lack of time; the fate of, and attention paid to, any subject thus largely depends on its position in the Agenda (items on the last day of the meeting, for example, cannot be said to receive equal consideration with those debated on the first day). This position is further exaggerated by the following factors, (v) and (vi):

(v) The Representative Body is *not truly representative of the profession* in that the majority of its members are general practitioners, so that the view expressed by the Representative Body on any subject tends to be the general practitioners' view, and is *unfortunately so regarded by other sections of the profession*. Consequently the decisions of the Representative Body are not always implemented by the appropriate Standing Committees of the Association.

(vi) Large sections of the Agenda are allocated to the major Standing Committees, and this results in matters belonging to smaller committees having scant consideration.

Reorganization

If the above criticisms are valid any constructive proposals must involve three major changes: (i) a substantial reduction in membership; (ii) a balanced representation of all sections of the profession; and (iii) the evolution of a system whereby adequate time can be allocated to the discussion of matters of the first importance, irrespective of the committee of origin.

With the above in mind, therefore, the following constructive proposals are set out:

(1) A Parliament of 300 members should be aimed at. This Division is not entirely satisfied with the view that the activity of a Division increases in direct proportion to its membership, and this view must have been in the minds of those who originally planned the Representative Body. For example, it may well be that a Division of, say, 650 members, at present taking up six seats in the R.B., may yet be unrepresented on the Agenda, whereas a smaller active Division may find itself with only one Representative to speak and reply to half a dozen or more Resolutions.

Furthermore, it is suggested that the view of any division, however active and however large, can be adequately presented by five representatives.

It is with the above in mind that we propose the following Amendments to By-law 40: (a) A Division of 50-249 members to have 1 Representative. (b) A Division of 250-449 members to have 2 Representatives. (c) A Division of 450-749 members to have 3 Representatives. (d) A Division of 750-949 members to have 4 Representatives. (e) A Division of 950 or more members to have 5 Representatives. *Making a total of 279 Representatives.*

(2) And, in addition to the above, to ensure that sectional interests are fully represented, a panel of members to be elected by the undermentioned Committees (following the precedent already set by the Public Health Service): (a) Central Consultants and Specialists Committee to elect 4 members. (b) General Medical Services Committee to elect 4 members. (c) Public Health Committee to elect 4 members (as at present, by-law 44 (1)). (d) Private Practices Committee to elect 2 members. (e) Unestablished Practitioners Committee to elect 2 members. (f) The Registrars Council to elect 1 member. (g) The Armed Forces Committee to elect 2 members. *Making a total of 298 members.*

(3) With (1) and (2) above, 31 overseas members to be appointed as at present. *The Representative Body thus to be made up of a total of 329 members.*

(4) An enlarged Agenda Committee (renamed Steering Committee) should be established with greater powers of arrangement and co-ordination of the Agenda, so as to ensure that important subjects have priority over others. In order to secure this the Chairman of the Representative Body, in consultation with the Steering Committee, should have full powers of grouping and guillotine.

Economy

In view of the recent rise in subscription rate the economies resulting from the above proposals should be borne in mind.

The Rights of Divisions

The above proposals will, of necessity, curtail in some measure the present rights of individual Divisions, but in the view of this Division it is only by these means that the decisions of the Representative Body can carry the whole weight and authority of a united profession behind them.

The above represents the thoughts of a small Division on a very important and difficult subject (but one which must be faced at this present time), and this Memorandum is issued to its fellow Divisions as a basis for discussion.

Comments of Divisions would be much appreciated and should be addressed to the Honorary Secretary, Winchester Division, B.M.A., St. Clement's, Winchester.

RONALD GIBSON, *Chairman.*

GEORGE SWIFT, *Hon. Secretary.*

REPORT OF COMPTROLLER AND AUDITOR-GENERAL

PRESCRIPTIONS FOR PROPRIETARY DRUGS

The report of the Comptroller and Auditor-General on the civil appropriation accounts, 1951-2,* shows an increase in the prescribing of proprietary drugs under the N.H.S. In 1950 in England and Wales 18% of the total number of prescriptions (representing 33.5%, or nearly £12,000,000 of the approximate total cost of £35,000,000) were for proprietaries, and in Scotland the percentage was 26%. In 1951 the percentage in England and Wales rose to 23%, and in Scotland to 30%, while a sample analysis in England and Wales for 1952 showed a further rise to 25.6%.

Unnecessary Expense

The cost of prescriptions in 1951 included £400,000 for a proprietary drug. If the standard equivalent had been prescribed instead, the cost would have been £158,000. The Auditor-General considered this to be an unnecessary expense. He asked the Ministry whether it had given doctors any additional information on comparative costs of proprietaries and equivalent standard preparations. Although this had not yet been done, the Ministry stated that it contemplated preparing a price list on these lines for the use of practitioners.

*Civil Appropriation Accounts (Classes I-VIII), 1951-52. H.M. Stationery Office, London.

GENERAL MEDICAL SERVICES COMMITTEE EVIDENCE REGARDING GENERAL PRACTICE

A meeting of the General Medical Services Committee was held on February 19, with Dr. A. TALBOT ROGERS in the chair. The Chairman referred to the death, announced that day, of Sir William Douglas, until lately Permanent Secretary of the Ministry of Health. He said that those of them who had had occasion to meet him held him in high respect as a very able and approachable Civil Servant.

The Committee devoted the whole morning to a consideration, paragraph by paragraph, of the draft memorandum of evidence which the Council of the Association will be invited to submit in due course to the Central Health Services Council's Committee on General Practice, presided over by Sir Henry Cohen. This was a document of some 24 sections and 11 appendices, and the Chairman reminded the Committee that it was based on points of policy already decided by the Conference of Local Medical Committees and the Representative Body. It had been very carefully revised and brought up to date.

In its examination of the draft the Committee made no fundamental alterations, but the phrasing was varied in a number of places. Dr. DAIN drew attention to a statement in the early part of the memorandum to the effect that it was the intention eventually to prepare a still more comprehensive memorandum, embodying the evidence already available and inviting doctors to submit their views on present conditions and future patterns. In his view they had already got together an excellent report, and he hoped they would not recommend the undertaking of any further investigations into general practice for, say, the next four or five years.

After the various revisions had been completed, the Committee adopted a recommendation of the subcommittee which had been preparing the evidence that the Council be invited to appoint not more than seven persons to give oral evidence, the General Medical Services Committee to be represented by four, and the Central Consultants and Specialists Committee, the Public Health Committee, and the General Practice Review Committee by one each.

Applicants for Practices and Surgery Accommodation

Reference was made to what appeared to be a change in policy of the Medical Practices Committee with regard to applicants for inclusion in the medical list. Instead of granting such applications provisionally, subject to confirmation when the actual address of the surgery premises was notified to them, they now returned the application and requested that it be re-submitted when the applicant was in a position to furnish details of his accommodation. Dr. FRANK GRAY said that in the instance cited there might have been a misunderstanding, but it was most important that the Liaison Subcommittee should meet, so that there might be consultation on any changes of policy. Dr. J. A. PRIDHAM, a member of the Medical Practices Committee, said that his committee did not like this procedure with regard to new applicants, but it had arisen owing to the new distribution scheme. A practitioner might wish to start in practice in a designated area, but he had no premises. Afterwards another applicant might appear who had premises, and the classification of the area might be affected. The new procedure had been adopted provisionally. They were going to discuss it with the Executive Councils Association, and they would be very pleased to discuss it with representatives of the Committee.

It was agreed that the Liaison Committee should meet as soon as possible.

Help in the Flood Areas

The Deputy Secretary reported on the inquiries made of Divisions of the Association and local medical committees

in the flood areas, both as to general medical arrangements and as to ways and means by which Headquarters could give assistance. Immediately the flood disaster was reported Headquarters sent out communications to the honorary secretaries of local medical committees in all the areas affected to see whether anything could be done. What they had in mind in particular was that evacuation might place an undue strain upon the reception areas, and it might be possible to enlist the services of additional doctors for those areas. Fortunately, however, the reception areas were able to cope with the situation without extra help. Then an effort was made to discover whether there were individual cases which needed assistance. There were many problems concerned with the effect on the practices of doctors in the flooded districts. There was also the more remote question of the effect on summer resorts and the possible decrease in the number of temporary residents. A certain amount of information had been obtained which showed that, by and large, the immediate problem of coping with the casualties was being overcome. The Secretary of the Association had sent a personal letter to every doctor affected, expressing the Association's concern and inviting them to let the Association know what it could do to help. The Chairman of Council had written a letter in the *Journal* of February 14 (p. 399) asking for donations to the Sir Charles Hastings Fund for this purpose. A number of local medical committees said that they were ready to forward cheques to the General Medical Services Committee or whatever body was organizing funds for this purpose. Already a substantial sum had been received by the Hastings Fund as a result of the Chairman of Council's appeal. Some doctors in the region had been temporarily dispossessed, and there were others whose income would be greatly depreciated this year. The problem divided itself into an immediate one on the lines of the Chairman of Council's letter, and a long-term one, involving possibly compensation for loss of income. Doctors in the reception areas have been reminded that any patients they did accept should not go permanently on their list.

Dr. HUTCHINSON spoke against the setting up of a special fund; he thought it would be better for all subscriptions to go to the Hastings Fund and to be earmarked for flood-relief purposes.

The Chairman agreed that it would be most unwise to have two different funds. The question was whether the Committee as Trustees of the General Medical Services Trust should set aside a sum from that fund to meet the demands.

At a later stage, on the proposal of Dr. KATHERINE HARROWER, it was decided to guarantee a certain amount from the G.M.S. Trust Fund to the Sir Charles Hastings Fund to assist the appeal which the Chairman of Council had launched.

Inflation of Lists

A letter was read from the Ministry regarding persistent inflation of the number of persons on doctors' lists, the areas mainly concerned being Middlesex, London, and Essex. It was stated to be known that in the records of these executive councils some of the medical record cards were without a counterpart in the nominal index. It had been decided that in such cases an inquiry letter should be sent to the person concerned on somewhat similar lines to that sent out during the purge. Under the regulations executive councils must give a practitioner six months' notice of the intention to remove a patient from his list. This would mean that any cases of inflation emerging from the special check could not be removed until October 1, and, because of the new distribution scheme, it was of the utmost importance that the removals should take place by April 1 next. The Committee was asked whether it would agree to giving the practitioner the usual six months' notice, but removing the practitioner the usual six months' notice was issued instead of at the end of the period, the name, of course, being reinstated

and back credit given in any case where the practitioner provided information concerning a person's whereabouts which enabled him to be traced.

Dr. M. SORSBY said that London did not agree that there was any appreciable degree of inflation in 1947, nor did it agree that there were no checks; there were checks all along the line. On January 1 of this year, 97.4% of the population were on doctors' lists. That did not indicate any specific degree of inflation as suggested in this letter. The proportion traced had in fact been 81.7%. He gave reasons indicating the danger of classifying London with Middlesex and Essex. As for the request from the Ministry, London had agreed to accept the principle that the patient's name should be removed from the doctor's list immediately (otherwise there would be some degree of inflation which would not be justified), always provided that the name should be restored in the circumstances stated in the letter. In London they felt it to be of very great importance that either the register should be properly arranged or that there should be a supplementary register to cope with the special difficulties.

The Committee agreed to the suggestion concerned with removal of names as explained in the Ministry's letter.

Other Business

It was agreed to send a message of good will to the newly formed College of General Practitioners, and to invite a delegation from the College to attend a meeting of the Committee at which methods of complementary working might be discussed.

Attention was drawn to the Press statement by the Ministry of National Insurance issued at the peak of the influenza epidemic, reminding patients of the procedure of notification for incapacity for work, having in mind the fact that doctors in affected areas might not be able to see their patients without some delay, and also of the need for making a request for a visit, should this be necessary, if possible before the doctor started his rounds. It was agreed to thank the Ministry for its action in this respect.

The minutes of a meeting of the General Medical Services Subcommittee (Scotland) and of two meetings of the Chairman's Subcommittee were presented, but no matters for discussion arose.

A letter was reported from the Ministry on the formula to be taken for defining the remuneration of general practitioners for superannuation purposes. The formula at present is 50% of mileage payments and 35% of other payments, but in view of the increase in the size of the central pool the formula has to be adjusted to take account of the actual ratio of expenses to earnings. Assuming that the overall figure of 38.7% in 1950-1 was about right, the best estimate that could be made suggested that the present figure might be about 33%. This could be obtained fairly closely by taking 50% of payments for mileage and drugs and 30% of other payments. The Committee's accountants, who had been consulted, considered the formula to be a reasonable one, provided there had been no material increase since 1950-1 in the aggregate value of practice expenses.

On the question of a national code number for all doctors under contract with executive councils, which the Committee had had under discussion with the Ministry, the Society of Clerks of Executive Councils had written that the idea was basically sound, but forty years too late, and gave reasons why any alteration of the present system could not be supported by the Society.

Among the many other matters which came before the Committee were a verbal report by the Deputy Secretary of a meeting with the medical director of the Central Council for Health Education on the Council's pamphlets on diphtheria and measles, an account of discussions with representatives of the Pharmaceutical Society on accidental poisoning of children by medicinal preparations, and various questions relating in particular to prescribing.

Correspondence

Dental Anaesthetics

SIR,—Recently a certain amount of ill-feeling has arisen between myself and doctors in the neighbourhood when patients of theirs have had a general anaesthetic administered to them by a doctor of my own choosing. The executive council, when asked for a ruling, stated that the anaesthetic may be given by any doctor the dentist chooses, which seems rational if one is to regard the routine followed for general surgery in a hospital as a parallel. But the general medical practitioner takes the point of view that the patient is his, that he will be called in if complications occur, and that he is competent to give a dental anaesthetic.

It is this last important point which is questionable. Most practitioners can give a competent intravenous anaesthetic, but from my own experience I believe that very few can administer under all circumstances, as efficiently as is necessary, nitrous oxide and oxygen with or without various adjuncts.

For some years now one doctor has given most of my general anaesthetics. He knows my surgery and staff, we have a mutual knowledge of each other's preferences and habits, and we have achieved the harmony necessary to carry out an efficient and safe operation. Lastly, it is the normal routine in a busy practice to put general anaesthetic cases together in one session in the week. Are we to experience the chaos of having three or four or more doctors, one after the other, giving anaesthetics each in his own way?—I am, etc.,

Leeds.

J. D. MANSON.

* The ethical rules as approved by the Representative Body in 1950 include the following: "Where an anaesthetic is advised by the dentist, it is competent for him to select the anaesthetist, but, if such anaesthetist is not the patient's doctor, no objection should be taken to the patient inviting his doctor to be present. Where the operation proposed is a major one, or if it is known to the dentist that the patient is under medical care, the dentist should consult the patient's doctor upon the operation proposed and should invite him to be present if the patient so desires. Similarly, where the patient is under dental care and the doctor advises operative or other major treatment arising from the patient's dental condition, the dentist should be consulted. On the completion of any dental operation, and especially if there is any reason to think that post-operative complications may ensue, the patient should be advised to consult the dentist immediately if such complications arise, and the dentist should take all reasonable steps to facilitate such consultation."—ED., B.M.J.

Cost of Prescribing

SIR,—May I be allowed as a pharmacist to correct the dispensing charges given by your correspondent Dr. Thomas M. Glaister (*Supplement*, February 14, p. 43)?

For a 6-oz. "benlylin" expectorant or any other proprietary product the dispensing charge is 9d., not 1s. 2d. Aurist. phenol. and lot. calamin. and similar liquid medicaments carry a dispensing fee of 1s., not 2s. 3d. While both tab. ergot. and tab. ergometrin. maleat. have the same action, the latter has a much higher potency and more rapid solubility, which the higher cost may justify according to the physician's preference.—I am, etc.,

Fordingbridge, Hants.

F. E. S. CLARKE.

Whole-time Consultants and Domiciliary Visits

SIR,—Under the present dispensation it would probably be true to say that the majority of general practitioners are loath to call out whole-time hospital staff on domiciliary consultations. The whole-time consultant does undertake,

as part of his duties, the performance of domiciliary consultations—but the fact cannot be altered that his general-practitioner colleagues feel it an imposition to ask him to carry out additional work. In consequence, a useful point of contact between consultant and practitioner is lost. The consultant loses the opportunity of seeing the patient in his home surroundings, which in some specialties at least is a distinct advantage. Quite frequently, in substitution, the patient is admitted to hospital. This often brings psychological upset and, in the case of small children, physical danger. It is also expensive.

The solution to this problem is not necessarily bound up with an increase in the total remuneration of the whole-time consultant. The essence of the problem is that, for reasons beyond his control, the whole-time consultant is frequently debarred from carrying out his work in the most effective manner. Means should be sought for overcoming this impediment.—I am, etc.,

Bebington, Cheshire.

K. R. LLEWELLIN.

Branch and Division Meetings to be Held

DARTFORD DIVISION.—At Embassy Ballrooms, Welling, Kent, Wednesday, March 4, 8 for 8.30 p.m., annual dinner.

EAST HERTS DIVISION.—At County Hospital, Hertford, Thursday, March 5, 8.45 p.m., meeting. Lecture by Professor Alan Moncrieff: "Children in Hospital."

EAST NORFOLK DIVISION.—Wednesday, March 4, 2.45 p.m., tour: Caley's Chocolate Factory, Norwich.

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, March 5, 8.30 p.m., meeting. Lecture by Dr. W. P. H. Sheldon: "Abdominal Distension in Children."

HAMPSTEAD DIVISION.—At Hampstead Town Hall, Haverstock Hill, N.W., Thursday, March 5, 8.30 p.m., discussion: "The Future of the Professions." Members of professions other than medical are invited to attend the meeting.

LANCASTER DIVISION.—At Grosvenor Hotel, Morecambe, Saturday, March 7, 7.30 for 8 p.m., annual dinner.

MID-HERTS DIVISION.—At Red Lion Hotel, St. Albans, Friday, March 6, 8.45 p.m., meeting. Mr. John O'Connell: "Sub-arachnoid Haemorrhage."

NORTH MIDDLESEX DIVISION.—At Friern (Mental) Hospital, 52, Friern Barnet Road, New Southgate, N., Friday, March 6, 8.30 p.m., second meeting of "Brains Trust" on Psychiatric Problems. Panel: Dr. A. C. Dalzell, Dr. Colman Kenton, and Mr. W. H. A. Weston.

NUNEATON AND TAMWORTH DIVISION.—At Gymnasium, Manor Hospital, Nuneaton, Tuesday, March 3, 8.45 p.m., clinical meeting. General practitioners' evening arranged by Dr. H. J. Wright.

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, March 3, 8.30 p.m., meeting. Sir Arthur Porritt: "Surgery and the Peptic Ulcer."

SOUTH ESSEX DIVISION.—(1) At King's Head Hotel, Romford, Thursday, March 5, 7.30 p.m. until 1 a.m., annual supper dance. (2) At Rush Green Hospital, Romford, Sunday, March 8, 10.30 a.m., clinical meeting.

SUNDERLAND DIVISION.—At Royal Infirmary, Sunderland, Friday, March 6, 8 p.m., clinical demonstration by Dr. V. H. Allan, Mr. M. L. Nairac, and Mr. G. Rhys-Evans.

SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Thursday, March 5, 8.30 p.m., annual general meeting.

WIGAN DIVISION.—At Prince of Wales Hotel, Southport, Wednesday, March 4, annual dinner dance.

OCCASIONAL COMMENT

WINCHESTER ON THE R.B.

That the spirit of reform is still alive in the Winchester Division is evident from the memorandum on the Representative Body of the Association published last week (*Supplement*, February 28, p. 55). This will no doubt revive, as it is intended to revive, discussion of certain problems which have received much careful study in recent years. The latest Winchester proposals relate to the size and composition of the R.B. and to matters of procedure, especially the arrangement of the agenda.

The Problem of Size

The original plan for the Representative Body, drawn up in 1902, provided for one representative to be elected by each constituency, the total number of constituencies not to exceed 300. To-day the relevant By-law, which dates from 1911, entitles a constituency in the United Kingdom with not less than 150 members to elect one additional representative for every 100 members in excess of 50. Of necessity, therefore, the R.B. has grown enormously in size with the ever-increasing membership of the Association. The number of representatives actually appointed by the home constituencies was 210 in 1920, 278 in 1938, 360 in 1947, and 425 in 1951. The possible number in 1953 is 448.

Previous Discussions

In the autumn of 1947 the Organization Committee began to discuss the advisability of a reduction in size, and in April of the following year it advised the Council to recommend that the R.B. should approve a reduction to approximately 300 and should instruct the Council to submit proposals for bringing this about. It was argued in the Council that the governing considerations should be the effectiveness of the R.B. as a working body, and the limitation imposed by the size of the Great Hall at B.M.A. House and the halls in provincial cities. Against this it was maintained that it was "a healthy thing that as many representatives as possible should be appointed, for such people, when they went back to their constituencies, were good disciples of Association policy." The Council's decision was to refer the matter back to the Committee; and later in the same year the R.B. itself rejected a motion from Gloucestershire advocating a decrease in its size.

"A Shambles"

In August, 1948, the Winchester Division produced a comprehensive memorandum on the organization of the

Association in which it described Representative Meetings as "a shambles—too many members discussing too many resolutions," and recommended that the membership should be reduced to 200, "based on Branch representation." This led to further discussions at Headquarters, culminating in a report by the Council to the A.R.M. in 1949. This report, referred to below, discussed the size of the agenda, but made no reference to the size of the meetings. The latter problem was re-examined by the Organization Committee during session 1950-1, but the Committee decided against recommending any change, considering that attendance at the meetings was of "great educational value to the members concerned."

The Financial Aspect

Last session the Council, at the suggestion of its Finance Inquiry Committee, asked the Organization Committee to look at the matter again from the point of view of economy. On this occasion the Committee went so far as to recommend to the Council two alternative methods of reducing the number of representatives by altering the qualification for additional representation of constituencies. The first plan was the one proposed by Gloucestershire in 1948—that a constituency with not less than 200 members should have an additional representative for every 150 in excess of 50. This would have reduced the R.B. to 350. The alternative plan was that a constituency with not less than 250 members should have an additional representative for every 150 in excess of 100. This would have brought about a reduction to 304. The Council rejected both proposals and reported to the R.B. at Dublin last July that it was satisfied that the additional representation afforded under the existing By-law "more than compensates for the expenditure involved." Apparently the same satisfaction was felt by the R.B., which rejected motions from Cornwall and Gloucestershire asking for reconsideration of the matter. And now, nothing daunted, Winchester returns to the attack.

The Problem of Procedure

The congestion of business at the Representative Meetings, and particularly at the special Meetings, became a serious problem in the period of unusual medico-political activity when the proposals for the National Health Service were under discussion. In 1945 the Winchester Division proposed that, as a temporary measure "during the present emergency," the bulk of the agenda should be dealt with by committees constituted *ad hoc*, which would sit simultaneously and report to plenary sessions of the R.B. This proposal did not find favour, but in 1946 a Winchester motion that a committee should be appointed to recommend

"such alterations in procedure as would enable the bulk of the agenda to receive adequate consideration" was referred to the Agenda Committee. This Committee, which had no dictatorial ambitions, advised that it should not be empowered to compile "omnibus" resolutions and to exclude motions covered by such resolutions from the agenda. It discussed, but did not advocate, the plan of resolutions from Divisions being filtered through a body composed of representatives of grouped Branch councils. Its only positive recommendation was that its own membership (consisting of the Chairman and Deputy Chairman of the R.B. and the Chairman of Council, with power to co-opt up to four chairmen of standing committees) should be altered by the addition of two members elected by the R.B. This was approved by the A.R.M. in 1946, and two years later the number of members so elected was increased to four.

"Starred" Motions

The 1948 Winchester memorandum recommended discussion and co-ordination of Divisional resolutions at the Branch level, and further co-ordination by a committee elected by the R.B. or by the Branches before transmission of the resolutions to the Agenda Committee. In the following year the Council reported on the problem to the R.B. Its report discussed, among other matters, the plan of "starring" a selected motion in a group of similar motions on the same subject, the other motions in the group being held to be covered by the one "starred." Certain disadvantages of this plan, which had been tried in 1946, were suggested. A representative, for example, might feel that the "starred" motion did not bring out the precise point made by his constituency in a "covered" motion. The Council made no definite recommendation, but the A.R.M. in 1949 approved a motion from Marylebone that representatives whose motions were "grouped" or "held covered" should be given at least 48 hours' notice in writing and be allowed an opportunity of discussion at the meeting to decide on the proposer of the "starred" motion. It also referred to the Council a motion from Mid-Cheshire calling for the early institution of a "steering committee" for the agenda at Representative Meetings.

Recent Changes

At the Southport meeting in 1950 a number of changes were introduced. First, four complete days—instead of three and a half—were made available for the meeting, which now begins on a Thursday morning and need not conclude before the following Monday afternoon. Secondly, the time allowed to movers of motions and amendments was reduced. Thirdly, the procedure of the grouping and "starring" of certain motions by the Agenda Committee was incorporated in the Standing Orders. Despite these changes, the A.R.M. at Southport, owing to exceptional circumstances, was unable to complete its business, and an adjourned meeting was held in London in September, when it was decided, on the recommendation of the Agenda Committee, that representatives whose motions were grouped should be empowered to select a motion for discussion in place of the "starred" motion, or to agree a common form of motion. Other proposals approved were that the Chairman should be empowered to take such steps as he deems necessary to prevent tedious repetition, and that the Agenda Committee should meet at intervals during the meeting to examine the progress made and to make any necessary recommendations. Whether these various measures to facilitate the conduct of business at Representative Meetings go far enough is no doubt debatable. Winchester thinks they do not.

Representation of Sectional Interests

At the A.R.M. last year Winchester failed to secure acceptance of a motion that in any future reorganization of the constitution of the R.B. consideration should be given to providing for "direct election to the R.B. from the regional consultants and specialists committees—for

example, one representative from each region." The present Winchester memorandum asks for four members of the R.B. to be elected by the Central Consultants and Specialists Committee, and varying numbers by certain other committees representing sectional interests. To judge from the discussion at Dublin, this is likely to prove the most controversial of the new proposals, although there is already provision for four public health service members to be elected—not, as Winchester suggests, by the Public Health Committee, but by the general body of the public health service members of the Association. This is the sole exception to the rule of election by Divisions and Branches. Apart from any possible objection in principle (such as was voiced at Dublin) to an extension of sectional representation, there may perhaps be differing views about the particular sections which might properly be included if any such scheme as is now proposed were to be adopted. And it may perhaps be questioned whether the present proposals would either provide the "balanced representation of all sections of the profession" which Winchester desires, or remove the disadvantage—if, as Winchester suggests, it is a disadvantage—of the majority of the representatives being general practitioners.

Whatever decisions may be taken on these matters, this small Division is to be admired for the ceaseless thought which it gives to the improvement of the Association's organization—and surely also for what is either the engaging modesty or the nice sense of humour displayed in its remark that it is "not entirely satisfied with the view that the activity of a Division increases in direct proportion to its membership."

THE CONSTITUTION OF THE B.M.A.

II.—THE REPRESENTATIVE BODY

The first Annual Representative Meeting was held in 1903 at Swansea during the Annual Meeting of the British Medical Association, and it marked the emergence of the Association from a long period of controversy as a truly democratic body. What constitutes a representative assembly is always difficult to define. The line between a representative and a delegate can never be exactly drawn. The representative comes, as do members of the Representative Body year by year, instructed by his constituency concerning the principal items on the agenda or at least the general line of policy which is proposed; and yet he is at liberty, being a representative and not a delegate, so to interpret his duties that if he finds the arguments on the other side so cogent, or if new aspects of the problem come forward or new facts are revealed, and he feels that his decision would be endorsed by the members of his constituency, he may vote contrary to his original instructions. That principle at least has always obtained in the Association, where, unlike Parliaments, there are no parties with conflicting loyalties. The representative is a trusted man, permitted to exercise his discretion with regard to his instructions, not an automaton registering a vote. Even if he is not sure that his change of attitude on a particular question may be endorsed by his constituents, and follows the line of his own convictions, probably no one will reproach him, and what his constituency may lose in one respect they gain in having a representative of independence of mind and judgment. In any event, as representatives hold office only for one year, a constituency can change its representative in time for another Annual Meeting. Unlike Parliamentary constituencies, it has not to await the lifetime of a Parliament.

The Representative Body is the governing organ of the Association. In this assembly policy is determined. The Council is the central executive, charged with carrying out that policy. Only in certain relatively minor, though not unimportant, fields can the Council act on its own. For example, the general and sectional meetings of the Association and many other internal and domestic matters are in its sole charge.

Composition of the Representative Body

The representatives are elected by the constituencies, which are Divisions or groups of Divisions; members of Council also sit in the Representative Body, although their voting rights, unless they are also elected representatives, are limited. There are 201 constituencies in Great Britain and Northern Ireland for the purpose of election to the Representative Body, and in addition each Division of the Association overseas is an independent constituency and entitled to return one representative. Great pains have been taken to ensure a proper geographical representation.

The number of members of the Representative Body from Great Britain and Northern Ireland is 441; of these, 56 represent Scottish constituencies, 21 Welsh, and 13 Northern Ireland. Most of the constituencies consist of single Divisions, but sometimes two, and in one case (Aberdeen and Kincardine counties and the islands of Orkney and Shetland) three, are grouped together to form a constituency. Each constituency elects one member, with an additional member for every 100 members of the Association in excess of 50. With the continual growth of the membership of the Association the result has been that some constituencies return a phalanx of representatives. One Division (Glasgow) is entitled to 11; three (the cities of Birmingham and Edinburgh and the borough of Marylebone, in London) are entitled to 10. But nearly half the constituencies return only one member, and of the remainder more than half return only two. The Branch area with the largest number of representatives is the Metropolitan Counties, with 73, followed by Yorkshire, with 28, and Glasgow and the West of Scotland, with 25. There are also four representatives specially elected by the public health service members of the Association. This special representation was agreed upon a few years ago in order to ensure that the public health service would have its mouthpiece in these assemblies, which might well not have happened had it been left to the accident of the constituency vote. Overseas Divisions, or Branches without Divisions, may return nearly 70 representatives. Thus the total assembly of the Representative Body may be more than 500, one-half constituting a quorum. This forms a real problem in the matter of accommodation in the halls in which the meeting is held, not excepting the Great Hall of the Association in London, for the volume of documents with which each representative is burdened necessitates a table as well as a chair.

The Representative Body at Work

The Annual Representative Meeting is normally held at the time of or just preceding the Annual Meeting of the Association, but there is provision for calling a Special Representative Meeting, either by the chairman of the Representative Body on the requisition of the Council or on the requisition of not less than 20 constituencies. At times of crisis, such as the introduction of National Health Insurance in 1911-12 or of the National Health Service in 1946-8, several Special Representative Meetings were summoned (each of them, by the way, at the cost of something like £1,000 to the Association, for the first-class return fares of representatives are paid centrally) to make specific decisions on policy.

The Representative Body elects its own chairman and deputy chairman, also, on the recommendation of Council, the president of the Association, and it elects 16 members of Council, 10 of them being ordinary members and three Service members, elected by the representatives voting together as a whole, together with two elected by representatives of constituencies in Scotland, and one by representatives of constituencies in Wales. Both the Representative Body and the Council are carefully adjusted on the geographical model so as to ensure the representation of different types of practice so far as these can be linked with varying localities, and in fact, although apart from the public health service there is no specific provision, every branch of medicine can be sure of having a voice.

The first and principal business of the Annual Representative Meeting is to consider the Annual Report of Council, which is published beforehand in ample time for consideration by the Divisions, while a Supplementary Report covers later events. It considers also the Financial Statement of the Association. At least two months' notice is required from Divisions or Branches of any motion they may desire to bring forward at an Annual Representative Meeting, or 14 days' notice in the case of a Special Representative Meeting. The Annual Report is a comprehensive document, recording the work of the many committees, standing and special, which assist the Council, and, although opportunity is given for motions on matters not covered by the report, these are generally few and minor. A time limit is imposed on speakers, but can be extended.

Fifty Years of History

As already stated, the first Annual Representative Meeting was held at Swansea in 1903. Some of those who attended that meeting are happily still with us, notably Alfred Cox, who on that occasion represented Consett and Gateshead, and who was to be Medical Secretary of the Association for 20 years, and R. Langdon-Down, who put in conspicuous service as chairman of the Central Ethical Committee. Many whose names are still familiar in Association memories attended that first meeting—a future Chairman of Council in J. A. Macdonald, then representative of West Somerset; a future Treasurer in N. Bishop Harman, representative of Hampstead; a future Chairman of the Representative Body in T. W. H. Garstang, of Cheshire. The number of representatives attending was 135, much smaller than the number of constituencies, the reverse of the position obtaining to-day.

The first Chairman of the Representative Body was Sir Victor Horsley, a man who had already achieved world-wide fame as a physiologist, neurologist, and surgeon, and who had plunged into the struggle for the reorganization of the Association and the championship of the general practitioner with all the zeal of a youthful enthusiast. It was he who at the meeting of the Association three years earlier at Ipswich brought forward the motion to appoint a committee to consider the constitution of the Association, and when after long discussions it was hammered out in legal form and adopted at meetings in London in 1902 Sir Victor Horsley was the obvious choice of what has now become a long succession of able chairmen. In spite of his radicalism and his strongly held opinions he had a profound respect for constitutional practice, and this proved to be of the greatest value to the Association in the four critical years in which he presided over the Representative Meetings. One curious circumstance marked his election to the chairmanship. After he had been chosen it was discovered that he was not properly a member of the Representative Body at all, because the secretary of his constituency had inadvertently omitted to inform Headquarters of his election. The technical lapse was soon rectified.

Another little circumstance attending the first Representative Meeting is worth noting. On the second day of the meeting—it lasted a day and a half—a timid knock at the door conveyed a request from the Press—not the national but the local Press—for permission to report some of the proceedings. The meeting discussed this matter at length, and decided that the request could not be granted—a very different attitude from that which obtains to-day, when, thanks to the Public Relations Department, every facility is afforded to the 40 or 50 pressmen who usually attend to report the meeting extensively in all the principal journals of the country. On some occasions the meeting has gone into closed session, but on others it has discussed private matters in the presence of the Press, and a word to them has always secured their loyalty and co-operation.

This short account does not pretend to be a history of the work of the Representative Body over the course of 50 years, a period which has included two world wars and two major revolutions in medical practice in this country. But it can be said that the machine has worked well.

During the few days into which the Annual Meeting has had to be compressed no professional or trade union congress has shown such a capacity for hard work. The standing orders have been framed to secure the utmost fairness to all taking part in the debates. If there have been grievances, these have arisen from the size of the meeting and the multiplicity of motions and amendments. Some effort has been made lately to curb the diffuseness of debate which is likely to follow when large numbers of constituencies send forward amendments of similar intention but slightly different phrasing.

There has been much keen debate at Representative Meetings; oratory has often risen to a high level, the clash of opinion has been expected and welcomed. But the writer of these notes has attended every Annual Meeting for more than 40 years, and, except for one or two instances at the beginning of the National Health Insurance controversy, he cannot recall any disagreeable incidents which have left a mark in the mind. Exchanges on a personal level have been very few. In spite of the enormous volume of business which has had to be carried through in a short time, the Representative Body has proved worthy of the profession it represents, a machine well poised and effective for its purpose, and a model which other professional organizations have envied and sometimes imitated.

FLOODS

Arrangements are being made to ensure that for the time being doctors who have suffered as the result of the recent flood disaster will not suffer any loss of income from capitation payments and temporary-resident payments. The position will be reviewed from time to time.

THE ASSOCIATION AND PUBLIC HEALTH

A meeting of the Public Health Committee of the Association was held on February 20, with Dr. H. K. COWAN in the chair. Dr. C. Metcalfe Brown was warmly welcomed back after his illness, and the Committee also welcomed a new member, Dr. J. S. G. Burnett.

It was reported that, with only five exceptions, where appeals are pending, local authorities had accepted the awards Nos. 2285 and 2321 of the Industrial Court.

Appeals Machinery—Northern Ireland

A report was made on the present position regarding the approach already made to the Northern Ireland Government in connexion with the need for an adequate appeals machinery in Northern Ireland, and particular reference was made to the present disagreement regarding certain divisional medical officers. Mr. LEIGH TAYLOR (of Messrs. Hempsons, solicitors to the Association) attended the Committee and explained the variations in the legal position as between Northern Ireland and the rest of the United Kingdom. It was agreed that a further approach be made to the Northern Ireland Government.

Whitley Council

In the wider field of arbitration it was reported that the General Whitley Council, at a meeting during the following week, would be giving further consideration to the establishment of a court of arbitration within the existing machinery. In the event of the Staff Side failing to reach a satisfactory agreement with the Management Side, alternative action would have to be taken.

Assistant Medical Officer Arbitration

The CHAIRMAN gave a full report of the discussions in connexion with the claim for the revision of the salary scale for assistant medical officers. The Staff and Management Sides had failed to reach agreement and it had been

decided by both sides to refer the matter to arbitration. The necessary action was now being taken to report the matter to the Minister of Labour under the Industrial Courts Act. Further, discussions were now going ahead with Counsel regarding the preparation and presentation of the claim.

"Dual Appointments"

The circulars (RHB (53) 11 and Ministry of Health 3/53) which deal with the recent agreement were received. The membership of the Staff Side of the Advisory Committee, which had been the subject of discussion in the Central Consultants and Specialists Committee, was agreed.

Superannuation

Some comments by the Compensation and Superannuation Committee on the Local Government Superannuation Bill were considered. The Bill itself was considered to be satisfactory, but it was emphasized that it would be important to watch any subsequent regulations. An assurance had been given that the Association would be afforded an opportunity of studying draft regulations before they were laid before Parliament.

A summary of the extent to which local health authorities were exercising their discretionary power under the Local Government Superannuation Act, 1937, whereby part-time service may be superannuable, was received. The discretionary power did not appear to be widely used, and the Committee decided to consider the matter further.

Decentralization of Part III Services

The Committee had on a previous occasion received a document prepared by the Society of Medical Officers of Health regarding the decentralization of Part III Services. It was agreed that this document set out the views of the Committee and should be recommended for acceptance by the Council of the Association.

Therapeutic Abortion

It was reported to the Committee that a private Bill had been introduced into the House of Commons to add a proviso to the appropriate section of the Offences Against the Person Act, 1861 (which makes it a felony to administer drugs or use instruments to procure abortion). The proviso is as follows:

(a) No person shall be found guilty of an offence under this section unless it is proved that the act charged was not done in good faith for the purpose of preserving the life of the mother;

(b) no registered medical practitioner who acts with the concurring opinion of a second registered medical practitioner shall be found guilty of an offence under this section unless it is proved that the act charged was not done in good faith for the purpose of preventing injury to the mother in body or health.

Dr. METCALFE BROWN referred to the statement issued to the Press by the British Medical Association on the subject of therapeutic abortion. With regard to the proviso before the Committee, he spoke of the difficulty of proving "good faith." If subclause (a) were passed it might just as well be said that anybody was entitled to carry out therapeutic abortion.

The CHAIRMAN pointed out that the Act of 1861 referred to unlawful abortion, thereby implying that abortion under given conditions might be carried out lawfully. Dr. METCALFE BROWN moved that the Committee inform the Central Ethical Committee that in its view subclause (a) was objectionable. This was agreed.

After considerable discussion on subclause (b) the Committee agreed that its views were fully expressed in the statement already issued by the Association, which reads as follows: "The general question whether it is right to perform therapeutic abortion (that is, abortion carried out for the purpose of saving the life of a mother or of preventing injury to her health) involves important non-medical considerations outside the province of the Association, and on which, therefore, we are not called to comment.

There is considerable uncertainty, however, regarding the present legal position. If, as is sometimes believed, therapeutic abortion is in fact permissible under the existing law, it is highly desirable that the legal position should be made clear. The question whether or not to perform a therapeutic abortion in any particular case—within the limitations imposed by the law—must be left to the decision of the doctor concerned. The Association would always advise that a doctor proposing to carry out therapeutic abortion should seek a second opinion from a professional colleague."

Other Business

A number of other matters, including Home Office Circular No. 258/52 on child care, the resettlement in industry of tuberculous persons, and the care of mothers and babies during the lying-in period, were considered by the Committee.

PUBLIC HEALTH SERVICE DEFENCE TRUST

Purpose of the Trust Fund

The Committee, sitting as the Trustees of the Public Health Service Defence Trust, considered the question of contributing from the Trust Fund towards the legal costs involved in the presentation of cases for arbitration. These cases might involve a single medical officer, a section, or the whole of the public health service.

The view was expressed that the Trust Fund was originally intended to assist members in difficulties or suffering hardship which resulted from their adhesion to B.M.A. policy. It was agreed, however, that under the constitution of the Trust it was clear that the Trustees had wide powers and it was entirely proper to use the funds available for arbitration purposes.

The present position regarding the other Trusts—General Medical Services Defence Trust and Hospital Medical Staffs Defence Trust—was explained. It was agreed that, without prejudice to the future, the Trust should pay the legal costs of the arbitration on the assistant medical officer claim, and also of a pending case of arbitration under the Industrial Courts Act concerning an individual medical officer regarding whose status there is a difference of view between the two sides of Committee C.

OCCUPATIONAL HEALTH COMMITTEE THE FUTURE OF OCCUPATIONAL HEALTH SERVICES

A meeting of the Occupational Health Committee of the Association was held on February 18, with Dr. J. A. L. VAUGHAN JONES in the chair. It was announced that Dr. J. M. Rogan had accepted the Committee's invitation to serve as a co-opted member, and that the Public Health, Central Consultants and Specialists, and Private Practice Committees, and the Dermatologists Group Committee had appointed representatives for the current session.

The Committee devoted itself to the study of a draft memorandum intended for the Ministry of Labour and National Service on the future of occupational health services. It had been learned that the Social Insurance and Industrial Welfare Committee of the Trades Union Congress was anxious to have informal discussion on the development of a comprehensive occupational health service. A joint meeting had been held at which a preliminary exchange of views had taken place.

After the draft memorandum had been discussed for some time in the Occupational Health Committee, and various amendments in the phraseology had been agreed to, it was found necessary for the memorandum to be referred back to the Planning Subcommittee for reconsideration of certain essential points.

Integration of Training for Diplomats

At a previous meeting the Committee appointed a subcommittee to consider the integration of the training for the diplomas in industrial health and in public health and the possibility of a part-time course spread over two or three years in place of the one-year full-time course for the D.I.H. The conclusion reached was that there was no objection to even more integration of the two courses than exists at present, since a necessary proportion of the knowledge is common to both. It was mentioned that the London School of Hygiene and Tropical Medicine had gone some considerable way towards achieving this integration in a teaching experiment with a selected group of students. The evidence, however, was insufficient at present for the subcommittee to recommend a complete amalgamation of the two courses. It was generally agreed that a part-time course for the D.I.H., spread over a period of two or three years, was both desirable and practicable.

The full Committee agreed to submit these views to the Council.

Medical Examination of Public Transport Drivers

Two members of Council, Mr. D. S. Pracy and Dr. R. Forbes, attended during a discussion in the Committee on the medical examination of public transport drivers. The Committee was concerned with the possibility of drivers suffering from diabetic coma or some other condition which impaired their mental state, imperilling the safety of the travelling public.

Dr. FORBES pointed out that there were two matters involved in this subject. One was the policy with regard to more frequent examination of drivers of transport of any kind, and the other was the ethical question of what the doctor should do when he became aware that his patient, a driver of a vehicle, was suffering from some condition which might be a serious danger to the public. The B.M.A. had said that information gained from the patient in confidence must not be disclosed except by consent or by statutory authority.

A subcommittee was set up to prepare, with all urgency, a report on the whole subject. Included on the subcommittee will be medical officers closely concerned with transport questions. The question of the extent of the reference was considered. It was suggested that it might be extended to drivers of motor-cars in general, but it was agreed to limit it in the first place to drivers of passenger transport.

Ethical Rules for Industrial Medical Officers

A document which had been submitted by the Association of Industrial Medical Officers at an earlier meeting, entitled "Notes for the Guidance of Industrial Medical Officers," had been considered by the Central Ethical Committee, which had expressed anxiety regarding the apparent desire of industrial medical officers to undertake the continued treatment in minor or trivial cases without the consent of the general practitioner. At a later meeting they had considered the view of the Association of Industrial Medical Officers that there was no longer any necessity for them to be singled out as a section of the profession requiring special ethical rules. In reply to this the Central Ethical Committee had said that there was no intention to single them out or to suppose that they were more likely than anyone else to transgress the accepted code of ethics, but there were ethical rules for other sections of the profession, and the rules were of great value when questions were raised or complaints lodged. It regarded the retention of the present rules as highly desirable.

The policy of the Association in this respect was reaffirmed at the Annual Representative Meeting last year: "That it is a practitioner's obligation to observe strictly the rule of professional secrecy by refraining from disclosing voluntarily without the consent of the patient (save with statutory sanction) to any third party information which he has learned in his professional relationship with the patient."

A long discussion took place in the Occupational Health Committee on this subject, and various points were made by representatives of the Association of Industrial Medical Officers. One of them pointed out that whereas under the first of the rules an industrial medical officer giving advice or treatment at the place of employment must inform the employee's doctor of the material facts, yet in an establishment in which there was no medical officer but there was a nurse she might carry out some necessary treatment without being under any compulsion immediately to ring up the patient's doctor. The member who raised this point thought the matter was one to be considered on grounds of common sense and convenient practice. Another argument put forward was that the ethical considerations originally advanced did not carry the weight they formerly did, now that the National Health Service was in being. This argument was answered by a statement that ethical considerations between doctors were unaffected by the existence of a National Health Service. Another point made in the discussion was that there were part-time industrial medical officers who might use their position to attract patients on to their lists, and the ethical rules were essential to prevent this from happening. One member expressed the view that if some instructions were given to general practitioners when they took over an industrial appointment a considerable part of the difficulty would be overcome.

It was agreed that the document under consideration should go back to the Association of Industrial Medical Officers for study and revision in the light of the comments made by the Central Ethical and Occupational Health Committees.

APPOINTMENTS TO SCOTTISH HEALTH SERVICES COUNCIL AND STANDING ADVISORY COMMITTEES

The Secretary of State for Scotland has appointed the following eight new members to the Scottish Health Services Council in place of those who retired on December 31, 1952.

Dr. W. Mackie, Group Medical Superintendent, Perth Royal Infirmary Group, until December 31, 1953; Dr. W. Boyd, Medical Superintendent, Stratheden Mental Hospital; Dr. C. W. Clayton, physician-in-charge, Lochmaben Sanatorium; Dr. J. G. M. Hamilton, physician, Edinburgh; Professor J. L. Henderson, Professor of Paediatrics, St. Andrews University; Councillor Mrs. M. S. Ewart, chairman of the Health Committee of Hamilton Town Council; Mr. J. South, ex-chairman, Northern Regional Hospital Board; and Mr. W. R. Tattersall, dental practitioner, Perth, have been appointed members of the Council until December 31, 1955.

Reappointments

The following members have been reappointed until December 31, 1953: Dr. I. D. Grant, general practitioner, Glasgow; Mr. W. W. Galbraith, surgeon, Glasgow; Miss E. W. Himsforth, County Nursing Superintendent, Midlothian and Peebles; and Dr. David McCall, secretary, Pharmaceutical Society (Scottish Department).

Standing Advisory Committees

The Secretary of State has also appointed the following members to the Standing Advisory Committees.

Standing Medical Advisory Committee: Dr. D. P. Cuthbertson, Director, Rowett Research Institute, Aberdeen, has been reappointed. **Standing Dental Advisory Committee:** Mr. J. F. Henderson, dental practitioner, Motherwell, and Mr. D. MacGregor, chairman, Scottish Committee of the British Dental Association. Mr. G. K. MacLennan, dental practitioner, Edinburgh, has been reappointed. **Standing Nursing and Midwifery Advisory Committee:** Miss M. Fraser, Supervisor of Midwives for Lanarkshire; Miss F. E. Kaye, Matron, Aberdeen Royal Infirmary; and Miss C. Macdonald, Matron, Craig Dunain Mental Hospital, Inverness. Professor W. L. Burgess, Department of Public Health and Social Medicine, St. Andrews University, and Miss M. C. N. Lamb, Education Officer, Royal College of Nursing, have been reappointed. **Standing Pharmaceutical**

Advisory Committee: Mr. J. Hall, Western General Hospital, Edinburgh, Dr. I. M. Macleod, general practitioner, Inverness, and Mr. G. D. Stewart, retail pharmacist, Edinburgh, have been reappointed. **Standing Advisory Committee on Hospital and Specialist Services:** Dr. J. T. Curran, Superintendent, Lennox Castle Mental Deficiency Institution. Mr. J. Mackenzie, male mental nurse, Craig Dunain Mental Hospital, Inverness, has been reappointed. **Standing Advisory Committee on Local Authority Services:** Dr. I. B. K. MacGregor, general practitioner, Kilmarnock, and Mr. W. J. M. Kean, chairman, Public Health Committee, Edinburgh. Mr. R. P. Ligertwood, chairman, Public Health Committee, Aberdeen, has been reappointed. **Standing Advisory Committee on General Practitioner Services:** Mr. G. G. C. Bain, chairman, Aberdeen Executive Council, and Mr. M. B. Jackson, ophthalmic optician, Dunfermline, have been reappointed. **Standing Advisory Committee on Health Services in the Highlands and Islands:** Dr. C. S. Sandeman, general practitioner, Durness. Mr. J. S. Banks, chairman, Caithness Executive Council, and Mr. J. McNaughton, Argyll County Council, have been reappointed.

IRISH HEALTH BILL

CHANGES FROM WHITE PAPER

The Government of Eire has recently published the text of its Health Bill. An explanatory memorandum issued with the Bill says that its main object is to give to local health authorities the power and the duty to provide the improved and extended health services outlined in the White Paper published in July, 1952 (*Supplement*, August 9, 1952, p. 92). The explanatory memorandum also states that suggestions made by several bodies particularly interested in the development of health services for modifications of the White Paper proposals have been taken into consideration in drafting the Bill. The White Paper proposals were rejected by the Irish Medical Association as unacceptable (*Supplement*, November 15, 1952, p. 193).

New Features

Important changes from the White Paper are confined to new definitions of the income groups eligible for free treatment. They affect mostly what was described in the White Paper as the "middle income class." It has been decided that only the lower income group (previously known as the public assistance group) should have free general-practitioner, maternity, hospital, and specialist treatment. This proposal does not alter the existing position. The middle income classes are defined in the Bill as (a) persons insured under the Social Welfare Act, 1952, (b) adult persons whose yearly means (including the means of certain members of the family) are less than £600, (c) adult persons whose yearly means (including those of certain members of the family) are derived wholly or mainly from farming and the valuation of whose farms is £50 or less, together with (d) other persons who, in the opinion of the health authority, would be unable without undue hardship to provide institutional and specialist services for themselves or their dependants. These groups, and their dependants, may have free institutional and specialist services (but not general-practitioner or maternity services) as determined by the local health authorities. At the same time, local authorities will have discretion to impose a charge on groups (a)-(c) not exceeding two guineas a week for institutional services. A higher charge may be made for the persons specified in group (d).

Maternity Services

The White Paper proposed that maternity services should be free to all. In the Bill free services are restricted to the lower income groups and those in the middle income group who are unable to pay. Otherwise maternity services of all kinds—specialist and general practitioner—will be obtained by the middle income groups and above by the payment of £1 per annum. These contributions will be payable to the local health authority, and regulations will govern the conditions of their payment.

Schoolchildren

Special arrangements are made in the Bill for free specialist and institutional treatment for all pupils in national schools in respect of defects found at school health examinations. Arrangements are also made for cripples and mental defectives. A service at child welfare clinics and similar institutions will be available, free, for children up to 6 years of age.

The local health authorities will be responsible for the administration of all services. There is no provision in the Bill for any central medical advisory council.

Correspondence

Mau Mau

SIR,—The annual general meeting of the Kenya Branch of the Association was held in Nairobi on January 30, six days after the murder of Dr. Esme Ruck, whose obituary notice appeared in the *Journal* of February 28, p. 513. The meeting expressed the wish that the profession should be acquainted with the wanton attacks which have been made and of the continuing threat to life in Kenya. Although cognizance had been taken of subversive movements for some years, it was only in September, 1952, that it became clear that a considerable section of the Kikuyu tribe had, perhaps largely by coercion, taken an illegal pagan oath which forced dedication to the perpetration of murder and other felonies with the object of expelling British settlers and those loyal leading Africans who held that the improvement of their lot lay in co-operation with the Government. The movement is openly anti-Christian. The causes and controlling forces behind the movement, known as the Mau Mau, are *sub judice*, but it would appear to have taken root because some African "intelligentsia" have been encouraged to believe that their prosperity lay in expelling the British and seizing political power by force.

The Kenya Branch put forward in 1947-8 the case for a Royal Commission to inquire into the population problem. The Kenya representative at the Annual Meeting at Cambridge in 1948 pleaded for support for the proposal and subsequently the Council of the British Medical Association recommended it to the Colonial Office. The Government then in office, however, declined to recommend the appointment of a Commission. It will thus be seen that the Kenya Branch has been actively concerned with the problem of providing sufficient food for an increasing population. On the human level this is the primary need of the Colony. Many members of the Branch are devoting their professional lives to medical work primarily on behalf of Africans, and the present disturbances are a great disappointment to us all. Casualty figures of those murdered by Mau Mau up to January 31, 1953, are Wa-Kikuyu 134, other Africans 37, Europeans 8, Asians 2. These numbers may appear small, but in the affected areas loyal Africans are on the alert against surprise attacks from their neighbours, whilst the murdered include some of the most loyal and progressive chiefs, headmen, teachers, and pastors. Europeans have been attacked at night, those chosen being the apparently vulnerable from their situation. No discrimination in the choice of victims is made unless it is to choose those who are elderly or who are held in especial esteem by Africans whom they have befriended. Dr. Esme Ruck was not the first member of our profession to be attacked. Commander Meiklejohn and his wife, Dr. Meiklejohn, were similarly attacked by a gang using the usual sharp and heavy knives. Both were left for dead, but, although Commander Meiklejohn subsequently died, Dr. Meiklejohn survives after sustaining severe mutilating wounds. Farmers and others in affected areas have been left with no recourse but to arm against all possible assailants, for those propagating the crimes include trusted servants, so little have we correctly understood African psychology. Great strides have been made in the development of the

medical services in the Colony during the last 25 years, in which activities trained Africans have played an increasingly important part. Whilst casual visitors to the Colony are impressed by the disparity between the productive farm lands of European settlements and the soil-eroded areas of certain native reserves, no competent authority has ever advocated that the solution of the food problems of the Africans lay in interfering with the successful farming of the former. The Kenya Branch is anxious that the profession should become acquainted with these facts, lest in a desire to help the Africans of Kenya some of its members might misinterpret events and hinder a return to orderly progress on which alone the health of all communities, but especially that of the African, depends.

It should be recognized that, with possible rare exceptions, Mau Mau has had no support from members of any tribe in Kenya except the Wa-Kikuyu.—I am, etc.,

Nairobi.

R. HOWITT WISEMAN,
Hon. Secretary, Kenya Branch.

Cost of Prescribing

SIR,—If everyone taking a prescription to the chemist's would bring along a clean medicine bottle, Britain would save £1m. a year. At present National Health Service patients lose roughly one-half of the 100,000,000 handed to them each twelve months; and, as householder, pharmacist, and taxpayer, need I say how much I deplore the loss of the £1m. which this wastage means to all of us?—I am, etc.,

Nottingham.

MARY A. BURR.

Admission of Acutely Ill Patients to Hospital

SIR,—Like Dr. A. Harbour (*Supplement*, February 7, p. 37), I am irritated to read week by week that 80% to 90% of applications to the Emergency Bed Service are admitted to hospital. Also, like Dr. Harbour, I have learned long ago the type of case that it is useless to try to get admitted. I entirely agree with his analysis of the situation. A G.P. has to learn to withstand the reproachful looks of the district nurse as she gallantly struggles to prevent pressure sores developing in some elderly, comatose, bronchopneumonic, doubly incontinent, and with perhaps only a senile husband to tend her. I no longer trouble the E.B.S. with such cases.

Dr. Harbour might well have raised a further question. What kind of case does occupy the beds of medical wards? What principle, if any, is used in the selection of such cases? From my own experience, certainly not that of greatest need. My own feeling—and I should be glad to be proved wrong—is that cases have roughly the following priority. First are those cases of medical or therapeutic interest seen on grounds of urgency in the out-patient department; second are similar cases from general practitioners; third, and very much the last, are those pathetic, desperate, all-too-common cases of serious illness in the elderly with inadequate facilities for home care.—I am, etc.,

London, S.W.14.

J. H. S. HOPKINS.

Position of Registrars

SIR,—I should be grateful if you would allow me to correct a serious error in your report of a statement I made at the Central Consultants Committee on February 12 (*Supplement*, February 21, p. 46).

My figures for senior registrars who are now in their fourth or subsequent years referred only to two metropolitan, two provincial, and one Scottish region. In these five regions alone we are aware of about 110 senior registrars in this unenviable position. We believe that when up-to-date figures from all the regions are known there will be at least 300 senior registrars in the same position. It is difficult to see how the Ministry of Health can remain complacent about the future of such a large group of highly trained men.—I am, etc.,

Manchester.

R. M. FORRESTER,
Late Chairman, Registrars' Group.

Association Notices

ELECTION OF MEMBERS OF COUNCIL

Notice is hereby given that nomination of candidates for election as members of Council, 1953-4, (a) by the following Divisions and Branches, (b) by public health service members, and (c) by women members, must be forwarded in writing so as to reach me not later than Saturday, April 4, 1953.

Forty Members by Branches in Great Britain and Northern Ireland

Group	England and Wales	No. of Members of Council to be Elected by Group
1.	North of England Branch; Tees-side Branch	2
2.	East Yorkshire Branch; Yorkshire Branch	3
3.	North Lancashire and Westmorland Branch	1
4.	Divisions in Cheshire: Birkenhead and Wirral; Chester; Crewe; Hyde; Macclesfield and East Cheshire; Mid-Cheshire; Stockport; Wallasey	1
5.	Lancashire Divisions of Merseyside Branch: Liverpool, St. Helens, Southport, Warrington; Isle of Man Branch	1
6.	Lancashire Divisions of South Lancashire and East Cheshire Branch: Ashton-under-Lyne; Bolton; Bury; Leigh; Manchester; Oldham; Rochdale; Salford; Wigan	1
7.	Derbyshire Branch; Nottinghamshire Branch; Lincolnshire Branch; Leicester and Rutland Branch	2
8.	Midland Branch	1
9.	Staffordshire Branch; Worcester and Hereford Branch	1
10.	Berks, Bucks, and Oxford Branch; Northamptonshire Branch	1
11.	Cambs and Hunts Branch; Norfolk Branch; Suffolk Branch	1
12.	Divisions of Metropolitan Counties Branch in Middlesex	2
13.	Marylebone Division	1
14.	Tower Hamlets Division; City Division; Stratford Division; South-west Essex Division	1
15.	Hampstead Division; St. Pancras Division; Westminster and Holborn Division	1
16.	Kensington and Hammersmith Division; Paddington Division; Chelsea and Fulham Division	1
17.	Camberwell Division; Greenwich and Deptford Division; Lambeth and Southwark Division; Lewisham Division; Woolwich Division; Wandsworth Division	1
18.	Hertfordshire Branch; Essex Branch; Bedfordshire Branch	1

20.	Kent Branch	1
21.	Sussex Branch	1
22.	Southern Branch; Dorset and West Hants Branch	1
23.	Bath, Bristol, and Somerset Branch; Gloucestershire Branch; Wiltshire Branch	2
24.	South-western Branch	1
25.	North Wales Branch; Shropshire and Mid-Wales Branch	1
26.	South Wales and Monmouthshire Branch	1
Scotland		
27.	Aberdeen Branch; Dundee Branch; Northern Counties of Scotland Branch; Perth Branch	1
28.	Edinburgh and South-east of Scotland Branch; Fife Branch	1
29.	Glasgow and West of Scotland Branch (Glasgow Division)	1
30.	Glasgow and West of Scotland Branch (County Divisions); Border Counties Branch; Stirling Branch	2
Northern Ireland		
31.	Northern Ireland Branch	2

Public Health Service Members

Two members of Council are nominated and elected by members of the Association employed in the public health service as defined in By-law 1 (3). Candidates must be members of the public health service as so defined.

One Woman Member

One woman member of Council is nominated and elected by women members of the Association.

Nominations

The nominations must be on the prescribed forms, copies of which can be obtained on application to me. In the case of the 40 members to be elected by Divisions and Branches, the nomination may be by a Division or Division-Branch as such, or by not fewer than three members of any Branch in the group. A notice will be published by the Council in the *British Medical Journal Supplement* on April 18, 1953, of the candidates nominated. Where contests occur, voting papers containing the names of all duly nominated candidates will be issued on April 25, 1953, from the Head Office, British Medical Association, Tavistock Square, London, W.C.1, to each member in the Group, or to the public health service members, or to women members. A notice will be published by the Council in the *Supplement* of May 16, 1953, giving the results of the elections where there have been contests.

A. MACRAE,
Secretary.

Diary of Central Meetings

MARCH

11 Wed.	General Practice Review Committee (adjourned meeting), 11 a.m.
13 Fri.	Consulting Pathologists Group Committee; 2.30 p.m.
17 Tues.	Subcommittee re Occupational Dermatitis, Occupational Health Committee, 2 p.m.
18 Wed.	Council, 10 a.m.
18 Wed.	Charities Committee, 1.15 p.m.
19 Thurs.	G.M.S. Committee, 10.30 a.m.
19 Thurs.	Radiologists Group Committee, 2 p.m.

Branch and Division Meetings to be Held

ALDERSHOT AND BASINGSTOKE DIVISION.—At Village Hall, Rotherwick, Wednesday, March 11, 9 p.m., meeting to discuss a proposal to alter the area of the Division.

BURTON-ON-TRENT DIVISION.—At Burton Golf Club, Ashby Road, Tuesday, March 10, 7.45 p.m., dinner, followed by lecture by Dr. Melville D. Mackenzie: "International Medical Work."

CROYDON DIVISION.—At 43, Wellesley Road, W. Croydon, Tuesday, March 10, 8.30 p.m., general meeting. Illustrated address by Dr. Philip Ellman: "Cancer of the Lung—Problems in Diagnosis and Differential Diagnosis."

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, March 12, 7.30 p.m., dinner; 8.45 p.m., meeting. Dr. J. M. Lipscomb: "Heart Trouble."

HENDON DIVISION.—At Hendon Hall Hotel, London, N.W., Tuesday, March 10, 8.45 p.m., clinical meeting. Dr. Donald Teare: "Abortion."

KESTEVEN DIVISION.—At White Hart Hotel, Sleaford, Thursday, March 12, 7.15 for 7.30 p.m., dinner; 9 p.m., address by Dr. C. Worster-Drought: "Recognition of Early Organic Disease of the Nervous System."

LEEDS DIVISION.—At Medical School, Leeds, Wednesday, March 11, 8.15 p.m., meeting. Lecture by Dr. Ffrangcon Roberts: "The Impact of Scientific Medicine on the Struggle for Existence."

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Royal Oak Hotel, Alderley Edge, Cheshire, Monday, March 9, 8.30 p.m., meeting. Discussion on Cohen Report, followed by medical films.

MANCHESTER DIVISION.—At Manchester Royal Infirmary, Oxford Road, Manchester, Thursday, March 12, 5.30 p.m., special meeting. Dr. E. E. Claxton (Assistant Secretary, B.M.A.): "Current Problems in the Hospital Field."

ST. PANCRAS DIVISION.—At Old Library, B.M.A. House, Tavistock Square, W.C., Tuesday, March 10, 8.30 p.m., meeting. Lord Amulree: "Geriatrics."

SALISBURY DIVISION.—At Church House, Crane Street, Salisbury, Tuesday, March 10, 8.15 p.m., meeting. B.M.A. Lecture by Mr. T. Holmes Sellors: "Disorders of the Lower End of the Oesophagus" (illustrated with lantern slides).

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, March 12, 8.30 p.m., meeting. Mr. A. J. Wrigley: "Changes that have Occurred in Obstetrics in the Past 25 Years and the Lessons to be Learned from Them."

TUNBRIDGE WELLS DIVISION.—At Pembury Hospital, Wednesday, March 11, 8.30 p.m., clinical meeting.

THE CONSTITUTION OF THE B.M.A.

BY

Sir ZACHARY COPE, M.D., M.S., F.R.C.S.

The brief but interesting account* of the origin and growth of the British Medical Association does not lay special emphasis on that which must colour any attempt to discuss the merits and demerits of its organization and administration—i.e., the fact that it has achieved a remarkable success. It has brought together and amalgamated into one body many thousands of doctors whose habits of thought and action are intensely individualistic, who by instinct and training object to being made to conform to any one pattern, and whose outlooks vary according to the branch of the profession which they have taken for their life-work. Consultants and general practitioners, those without and those within the National Health Service, civilians and Service members, research workers and public administrators, all are to be found in the one large Association. The fact that there still remain some whose sense of the importance of independence is greater than their appreciation of the value of unity in the profession is not surprising. The remarkable fact is that the minority is so small.

The British Medical Association started from a provincial centre and was "designed to counterbalance the concentration of medical authority in London." This aim has succeeded so well that, though the Headquarters of the Association are in London, a considerable if not a preponderating proportion of the principal officers of the Association have for many years been chosen from parts outside the Metropolitan area, and, to judge from my own observations, there is greater keenness and enthusiasm for the Association outside than within London.

The Association's Scientific Activities

When the Association was started there were few opportunities for developing the scientific aspect of medicine, and it was natural that the Association's activities should be mainly scientific. As time went on other opportunities outside the Association of advancing the scientific part of medicine presented themselves, and, with the simultaneous rise into prominence of many medico-social and medico-political questions, it was natural that greater emphasis was laid on these new problems. There was some danger that the scientific side of the Association might be neglected. Never-

*Three general articles under the above title have already appeared (*Supplement*, February 28, March 7, and March 14). Other signed articles will follow.

theless, the scientific value of the papers and discussions at the Annual Meetings remained very great, and the scholarships granted for research gave many distinguished men their first opportunity to show their worth. This aspect of Association affairs should not be lost sight of. The recent institution of prizes for essays written by nurses and medical students is a step in the right direction, but, if and when funds permit, there are other useful projects of a scientific nature which the Association might well undertake.

Branches and Divisions

The organization of the Association into branches and divisions has been carefully thought out, and for the most part seems to function well, but some of the branches are so large as to be almost unwieldy. If it be granted that one of the functions of a branch is to train those of its members who have special aptitude for administrative work, then it is unlikely that a very large branch will provide sufficient scope for training the number of able men who should be available among several thousand doctors. There is some ground for thinking that this last criticism might be fairly applied to the Metropolitan Counties Branch, which comprises 26 divisions and over 7,000 members. Though this branch is well run and well officered, objections against its size can be raised both on principle and as regards practical working. On the practical side it is difficult to get up enthusiasm for such a large unit as London, for the conditions of one part differ so greatly from those of another. There is reasonable ground for discussing whether it might be wise to split the Metropolitan Counties Branch into either two or four smaller branches. Each smaller branch would contain six or seven divisions, and there might be the additional advantage that there would be a greater community of interests as regards hospital matters which might help to make a more compact unit of the divisions in the branch. On special occasions combined meetings of the branches could easily be arranged.

The Representative Body

The Representative Body is a remarkable institution which gets through an amazing amount of work most expeditiously. It is at present quite large enough, and it would be more easily accommodated and perhaps more easily managed if the number of members were reduced to 400. It seems surprising that the representation of Marylebone should be as great as that of Birmingham or of Edinburgh, but that is no doubt due to the extraordinary number of specialists who congregate round the neighbourhood of Harley Street.

The discussions in the Representative Body are often clever and animated, and any speaker, however unpopular his views, will obtain a fair hearing. The many resolutions which are on the agenda paper of the Representative Body are, before the meeting, grouped and classified so as to diminish the number of arguable propositions, but, even with this sifting, there are too many items, and towards the end of the meeting, when the attendance begins to flag, many matters have to be hurried over which deserve a longer discussion.

The Council

The Council consists of a picked body of men who are experienced in the business of the Association and have a high sense of responsibility. Their debates have a statesmanlike quality. It is a pity that the membership has increased beyond the 50 which the Council Chamber was to seat comfortably. Owing to the great distance between some of the overseas branches and the Mother Country it has been customary to elect distinguished men from overseas who are practising in this country to represent those branches from which they originally came. This method of representation has worked very well and has been the means of bringing many very able men into the Council. Now that the means of communication throughout the world have improved beyond what would have been considered possible when the constitution of the Association was devised, there is something to be said, as and when vacancies should occur, for arranging for the overseas members of Council to be chosen from those actually practising in the country they represent. By this means a very close touch would be kept with the distant branches, and what is now almost an academic discussion on their affairs would become more practical and helpful.

The Committees

Few members of the Association have a full realization of the amount and value of the work done so conscientiously by its numerous committees. Though the constitution of the Association may to some appear rather rigid, yet considerable flexibility is shown by the permission given to Council to appoint special *ad hoc* committees to deal with any particular subject which may be in need of thorough investigation. From the reports of some of these committees have come information and recommendations which have led to very great improvements in the practice of medicine. Flexibility is also shown in the formation of the so-called autonomous committees, though here there is a distinct danger that outside influence may sometimes prevent the Association from pursuing the policy decided upon by the Representative Meeting. On the other hand, these autonomous committees are the means of extending the influence of the Association. It is well represented upon them, and by this means is able to make its views known to the whole profession, to interchange views with other medical bodies, and to reach conclusions which, on due confirmation by the bodies represented on the committees, can be regarded as the considered view of the whole profession. In former days, and before the introduction of the National Health Service, it was often said that the Association was mainly interested in the affairs of general practitioners, and there was some force in the remark. The criticism is no longer just, for of late years consultants have seen the importance of united action and have taken an increasing part in the activities of the Association. Undoubtedly the autonomous committees have formed a valuable link between the Association and outside bodies, but there is still need for closer integration of the whole profession, specialists and general practitioners, and the Association is the only body which provides the opportunity and actively encourages this necessary unification.

The Secretariat

It is strange that in the preceding articles the account of the Council should have omitted an important function—that of appointing the secretariat of the Association. The secretariat of any large association can be compared with

the nervous system of the body, for it is in constant contact with the periphery and knows every shade of opinion among the constituent members. The Secretary and his assistants can, and regularly do, furnish information of the greatest importance to the chief officers and the Council. Everyone will agree that the Association has been extremely fortunate in the choice of its secretaries and deputy and assistant secretaries, much of whose work is done behind the scenes where full credit does not always penetrate.

During the last 20 years there has been a great increase in membership of the Association, and any impartial observer will also have noted that its power and authority have also increased. If the Association shows the same flexibility, alertness, and unity that have characterized it during the last decade it should still further enhance its reputation.

MEDICAL PRACTICES COMMITTEE FOR ENGLAND AND WALES

FOURTH REPORT

The Medical Practices Committee for England and Wales has presented its fourth report to the Minister of Health covering the period of eighteen months. The following is a summary of some of its contents.

Analysis of Movement of Medical Manpower

The report contains an analytical survey illustrating the movement of medical manpower throughout the country since July, 1948. The Committee did not consider itself to be in a position to do this before, because so many imponderable and abnormal circumstances of medical practice were in being at the commencement of the National Health Service. To some extent they are still apparent to-day, and for these reasons it would have been preferable, says the report, that a five-year period, at least, should have elapsed before presenting this material. The inferences to be drawn from a survey extending over the longer period would have been more reliable. The Committee thinks, however, that the introduction of the plan proposed by the Working Party is bound to have rapid effects on the distribution of medical manpower, and therefore the period assessed is the longest over which the results of the operation of the Act and its amendments in this respect, as they were originally planned, can be properly assessed.

Some Figures

The report states that the figures given are substantially accurate, but that in a few instances there are inaccuracies. For example, in a few executive council areas the numbers on doctors' lists are still subject to a degree of inflation. In one instance this may amount to about 10% in excess of the true figure. But in the Committee's opinion this factor does not affect the relative changes that have occurred and allows broad inferences to be drawn. The report says that "in July, 1948, the total number of principals on medical lists in England and Wales was 16,864 and the number of registered patients approximately 41,500,000. The numbers at July, 1952, were 17,383 and 42,250,000 respectively. These figures give an average of 2,461 patients to each principal in 1948 and 2,430 in 1952 throughout the whole country. In 1948 variations in the average list in different parts of the country were wide. In Wales, to quote extreme examples, the average list per principal in Radnorshire Executive Council's area was 1,120, while in a part of Glamorgan it was over 8,000 in that year. In 1952, on the other hand, the averages for the same areas are 1,320 and 2,832 respectively."

Average of Lists

In the areas where the earlier reports of executive councils showed the average lists to be high the following figures taken from the report show the alterations in the position. (Assistants and practitioners on the list for limited purposes

have not been included in the following summaries. Principals have been taken into account only for the areas in which the main portion of each practice is situated.)

	No. of Principals	Average Lists
July, 1948	6,648	3,163
January, 1949	6,758	3,049
" 1950	6,783	3,041
" 1951	7,055	3,009
" 1952	7,397	2,869

The total increase of 749 in the number of principals practising in these areas represents an increase of over 11%. The important point, says the report, is that these additional principals are working where their services are most needed. Further, it is known that in these areas of high average lists most of the 1,560 assistants practising in the Service are employed.

In areas where the executive council's reports showed that the average lists were low the position has altered thus:

	No. of Principals	Average Lists
1948	1,176	1,648
1949	1,157	1,674
1950	1,085	1,868
1951	1,075	1,941
1952	1,062	2,010

Fewer Principals in "Overdoctored" Areas

Nearly 10%, or 114, fewer principals are now practising in these "overdoctored" areas than when the Service started. Included in these areas are many rural districts where one doctor is essential however small his list. It is concluded that the reduction of manpower in the urban areas is therefore mainly responsible for the alteration. For example, Bournemouth in 1948 had 97 principals, with average lists of 1,237, and in 1952 only 72 principals, with average lists of 1,827. Southport, Colwyn Bay and the surrounding district of Denbigh and Flint, Hastings, and Harrogate are given as other examples of substantial urban areas where the average lists of patients, well under 1,400 in 1948, have all risen considerably as the number of principals has fallen. In 1948 these principals numbered about one-third more than they do to-day.

"It appears doubtful," the report continues, "whether the number of doctors practising in these areas will or should be much further reduced. A number of these practitioners have held during their more active years busy practices in other areas, and have preferred to take smaller practices later in life rather than carry on work that had become too heavy for them or to retire completely. It is right that they should still be permitted to do this. Since 1948 some executive councils and local medical committees have, not unnaturally, been reluctant to allow this position to continue, and have dispersed practices which such doctors might have taken. Now that there is no longer a question in this type of vacancy of the practitioner being entitled to claim a fixed annual payment at the expense of the other doctors practising locally, it is probable that the attitude of the local bodies will be more tolerant towards the doctor seeking a semi-retired vacancy in their area."

Classification of Areas

Following upon the Danckwerts award and the Working Party's report, the Committee reports that it formulated proposals which were accepted by the Ministry and by the General Medical Services Committee of the British Medical Association. These proposals fixed the figures of 1,500 and 2,500 as flexible limits, so that any area with an average list of patients for each effective unit of medical manpower between these limits would be termed "doubtful" or "intermediate." With an average above the upper limit an area would become "designated," and beneath the lower limit would be classified as "restricted."

The Committee proposes to defer asking for detailed reports from executive councils about the medical manpower position in their areas until later in the year. The Committee thinks that executive councils will at that time have an opportunity of deciding, in the light of some experience of the working of the most recent amendments to the regulations, whether any rearrangement is desirable.

Admissions to Medical List

The Committee reports that the rate of admission of new partners to the list since July has increased considerably, and appears likely to continue to do so. Experience suggests that the stimulus of the Danckwerts award and the Working Party's plan will lead speedily to an improved service where it is most needed.

The report states that there have been 300 applications made by doctors who have themselves chosen a place in which to commence new practices. Of these 290 were granted and 10 refused. One of two appeals against the Committee's decision to refuse an application was allowed by the Minister. A further appeal against a restriction imposed by the Committee was also allowed by the Minister.

The Committee states that executive councils occasionally forward to it applications which have been made by doctors seeking admission to the list who are desirous of knowing in advance of making definite or even provisional arrangements whether their applications will be granted. Until recently the Committee gave the assurance asked for, but now, in view of the introduction of the scheme for designated areas, it has felt obliged to modify its procedure. Now it insists that the candidate should have made at least provisional arrangements for commencing to practise before being admitted to the list. "It would be manifestly unfair," says the report, "that an applicant to practise in an area which was designated, and who had, in fact, made his arrangements, should be deprived of the initial practice allowance because the 'designation' of the area had just been removed by reason of the admission to the list of applicants who had not made any such arrangements, and some of whom might never do so."

Additional Principals as Partners in Established Practices

The Committee reports that the number of admissions to the list under this heading was 781. Of these 44 were replacements for partners who were about to withdraw or had recently withdrawn from the list, and 737 were additional partners at the time of their admission to the list. In 344 of these cases the new partner had served as assistant in the practice before his admission to the partnership. Since the publication of the Danckwerts award and the report of the Working Party the Committee notes that "it appears not only to be financially practicable but also desirable or even necessary that many new partners will be required in existing practices. Indeed, from the numbers of new partnerships of which we have been notified each week since July last we know that the process of assimilating doctors into general practice in this manner has again been restored to a satisfactory level. During the next few months the number is likely to exceed those hitherto admitted during any similar period."

The Committee expresses concern, as it has done before, regarding attempts to nullify the normal procedure of appointing a doctor to succeed one retiring from the list who had hitherto been in single-handed practice. "Such attempts," it says, "are persisting, and consist of the formation of a 'partnership' which cannot in fact have any reality in substance, since the senior partner clearly contemplates almost immediate retirement and the transfer of the practice property to the new practitioner. Executive councils have themselves noted these devices with great concern." The Committee has suggested to executive councils that in these cases it is proper neither for it nor for the executive councils themselves to appear to condone

the procedure which in such cases has been adopted, and that therefore the usual custom of effecting a block transfer of the patients on the list of the retiring "partner" to that of the new "partner" should not be followed. No satisfactory method, the report continues, of preventing this abuse of the privilege which rightly attaches to genuine partnerships has so far been found.

Advertised Vacancies

During the period 208 vacancies were advertised, of which 28 were for the purpose of commencing new practices from premises situated usually on new housing estates. The remainder were for the vacancies in established practices following the death or resignation of single-handed practitioners. Most executive councils dealt initially with the applications received, and after an interview of short-listed candidates have made a definite recommendation to the Committee. These recommendations were accepted in 206 cases, and in only two was it found necessary to disagree with the executive council and to select another candidate. "These figures," states the report, "show how infrequently any real difference arises between the Medical Practices Committee and the local bodies acting in these matters."

In its third report the Committee referred to the average time taken to fill 32 vacancies. A similar number of recent cases have been examined, and analysis in this, its fourth, report shows that the periods have fallen from eight weeks to just under seven weeks in cases in which no appeal was made, and from eleven weeks to just under nine weeks where there were appeals.

Age of Candidates for Vacancies

In its last report the Committee noted that the average age of candidates selected for advertised vacancies was approximately 38. A further study shows that the average has fallen to 36. The proportion of doctors above and below 40 years of age applying for advertised vacancies appears to have remained fairly constant. The Committee gladly notes a tendency on the part of some executive councils to give consideration to older applicants for vacancies, and particularly to those who have retired from other forms of medical practice at a comparatively early age. Generally, however, the Committee finds that it remains extremely difficult for this class of applicant to make a belated entry into general practice.

Assistants

The report states that the number of full-time assistants, other than trainees, employed by principals in general practice in England and Wales, which had been fairly constant, dropped from the figure of 1,724 noted last year to 1,566 on November 1, 1952. As a result of the Working Party's report, an increasing tendency for assistants in the larger practices to be taken into partnership has been noticed, and the Committee has no doubt that because of this the number of permanent assistants will continue to decrease during the next few months. According to the report, there is little evidence to support the contention that the advent of the National Health Service in 1948 produced a very large increase in the numbers of permanent assistants employed in general practice. There are no reliable figures of the number of whole-time assistants in general practice prior to the appointed day, nor until the end of 1949. The number believed to be so engaged prior to July, 1948, was approximately 2,100 for the United Kingdom and Northern Ireland, as stated in the reports made before the plebiscites of the profession held in 1947-8.

Practice Premises

The Committee thinks that in some areas, at least, the problem of doctors obtaining premises from which to commence a practice has been a little easier during the last 12 months. Joint discussions between the Ministry, the General Medical Services Committee of the B.M.A., and

the Medical Practices Committee have resulted in the agreement of the Association to the issue of regulations which in the Committee's view should to some extent avert the position in which a doctor, selected to succeed to a practice vacancy, finds himself when the premises from which the practice has been conducted are already secured by a competing doctor. (See p. 77 of this Supplement.)

The report concludes with a sincere appreciation of the work done by executive councils and local medical committees. A greater difficulty than was in fact experienced had been anticipated in reconciling views regarding the reclassification of areas. Where initial disagreement was encountered, in nearly every case a decision satisfactory to all the statutory bodies concerned had been arrived at, and where disagreement still persists the Committee is confident that this will be amicably resolved.

The report is signed by W. E. Dornan (Chairman), H. Lesser, J. A. Pridham, A. C. Gillie, J. F. Murphy, J. C. Pearce, D. B. Evans, R. O. Wilberforce, and P. V. Anderson.

British Medical Association

EXTRAORDINARY GENERAL MEETING

In pursuance of a requisition made in writing and signed by more than 100 members of the British Medical Association, notice is hereby given that an Extraordinary General Meeting of the members of the Association will be held at B.M.A. House, Tavistock Square, London, W.C.1, at 2.30 p.m. on Tuesday, May 5, 1953, for the purpose of considering and, if thought fit, passing the following Resolution:

That the Association being concerned by the modification of the present method of remuneration by capitation fees agreed in the Working Party's report requires the Council forthwith to approach the Minister of Health with proposals for the better protection (financial and otherwise) of the small-list doctor and of the doctor newly seeking entry into practice, and requests the Minister of Health not to implement the Working Party's report until the scheme for distribution of remuneration has been considered in the light of such proposals, and meanwhile to continue the present method of payment.

By order of the Council,

A. MACRAE,
Secretary.

THE ASSOCIATION OF WHOLE-TIME SALARIED SPECIALISTS

CHANGE OF NAME

The annual general meeting of the Association of Whole-time Salaried Specialists was held at the Royal College of Surgeons of England on February 20, 1953. It was decided to change the name of the Association to "The Whole-time Consultants Association."

The following officers were elected for 1953: *President*, Dr. E. N. Allott; *Hon. Treasurer*, Dr. J. Duncan White; *Hon. Secretary*, Dr. C. Allan Birch.

It was reported that, as a result of representations made by the Association, Committee "B" of the Medical Whitley Council had decided to set up a subcommittee to reconsider problems affecting whole-time consultants. This subcommittee would consist of the whole of both the Management and Staff sides of Committee "B," together with three representatives of the Whole-time Consultants Association. It was felt that a considerable step forward had been taken, and it was hoped that the first meeting of the subcommittee would take place at an early date.

Dangerous Drugs Act: Withdrawal of Authorities

The Home Office announces that Dr. Alex Forbath (London, S.E.9) and Dr. G. O. Grant (Carlisle) are no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations apply.

GENERAL MEDICAL SERVICES

PARTNERSHIP PREMISES AND NOTIONAL LISTS

The following is a summary of some of the matters dealt with in a letter from executive councils to all doctors on their lists (E.C.N.114). Further details should be obtained by reference to the original document.

Succession to a Vacant Medical Practice by a Partner

Under this heading attention is called to the fact that partnerships have occasionally been formed between an established single-handed doctor who intends or is expected shortly to retire and another doctor, apparently with the main object of enabling the latter to secure the succession to what is essentially a single-handed practice. It is stated that this action, if allowed to be successful, would defeat the intention of the regulations made under the Act, by which the executive council and the Medical Practices Committee in consultation are required to select doctors for single-handed vacant practices. The Medical Practices Committee, therefore, in agreement with the Ministry of Health and the General Medical Services Committee of the B.M.A., will not accept one partner as a logical successor to another partner who has died or resigned if the partners have not been in active practice together for about a year, unless there are good reasons for an exception being made. When a vacancy occurs in a partnership practice of this kind the Ministry of Health considers that it is particularly desirable that the vacancy should be advertised.

Acquisition of Vacant Practice Premises

A doctor selected for a vacant practice is sometimes faced with competition from another doctor who may have been an unsuccessful applicant for the practice and who has secured the premises from which the practice was previously conducted. In order to help the selected doctor to establish himself in the new practice and to purchase the premises, if he so wishes, a new provision is to be inserted in the terms of service which will prohibit a doctor from practising at premises previously used by another doctor whose practice has been declared vacant unless he has the consent of the executive council or, on appeal, of the Medical Practices Committee. The effect of these provisions is, in short, that the selected successor to a vacant practice will have the first offer of the vacant practice premises and will have a month in which to decide whether to accept the offer. The terms of the offer will have to be approved by the Medical Practices Committee.

Payment of Partners on Notional Lists

In order to qualify for the payment of loading fees which is most advantageous to a partnership (notional lists), all the partners must be principals and each of them entitled to a share of the profits of the partnership which is not less than one-third of the share of any other partner.

If a salaried partner is to be entitled to be regarded as a full partner under the allocation scheme, it will be necessary for the executive council to be satisfied that his guaranteed minimum share in the form of a net salary is at least one-third of the net income of any other partner, and that the share of the partner with a guaranteed minimum must increase—proportionately to his share in the practice—above the minimum when the net earnings of the practice exceed the amount necessary to provide his guaranteed income. Where there is an assistant, or a doctor described as a partner who is paid a fixed salary without any provision for a variable share in the profits, the total list under the allocation scheme may be increased only by an additional 2,000 patients, and this allowance will not attract "loadings" or be included in the calculation of notional lists to attract "loadings."

Paragraph 9 of E.C.N.108

This paragraph stated that executive councils will require at least three months' notice of any change which is desired

by a partnership in the basis of payment on notional lists. This statement was intended to apply to any changes requested by a partnership after notional list arrangements for the partnership had been brought into effect, not to suggest that executive councils will require three months' notice when dealing with original applications by partnerships for payment on notional lists.

Scottish News

SCOTTISH COMMITTEE

The Scottish Committee met at B.M.A. House, Edinburgh, on February 24, with Dr. J. G. M. HAMILTON in the chair. The Committee had before it a recommendation of its Hospitality Subcommittee that it should recommend to Council that the occasion of the Committee's Jubilee Year should be marked by holding a dinner in October to which guests prominent in Scottish public life would be invited. The approximate cost to the Association would be £225. After considerable discussion, and reference to the need for economy in the Association, the Committee resolved that a dinner be arranged, but that the cost be borne by the members of the Committee.

Invitation from Denmark

The Committee welcomed an invitation from the Danish Society (the equivalent in Denmark of the British Council) for a small party of doctors in Scotland to visit Denmark for two weeks in September (see page 78). The Scottish Secretary reported that the number suggested was 20, and that an attractive provisional programme had been drawn up by the Society in conjunction with the Danish Medical Association. The Secretary was instructed to undertake the necessary arrangements, including notices to the *Journal* and to Branch and Division secretaries in Scotland.

Dr. Hamilton informed the meeting that he had been invited, as Chairman of the Scottish Committee, to become a Patron of the Scottish Marriage Guidance Council. The Scottish Committee accepted a letter from the council setting out the aims of the work undertaken, and found no objection to the Chairman accepting the invitation, should he wish to do so.

Glasgow Regional Office

Dr. J. T. McCUTCHEON, Assistant Scottish Secretary, submitted his annual report on the work of the Glasgow Regional Office. The Chairman said he felt sure the Committee would wish to congratulate Dr. McCutcheon on the good work which was being done by himself and his staff in the Glasgow office. Dr. I. D. GRANT said the Glasgow office had given great satisfaction in the West of Scotland. In view of this he felt that the Organization Committee of the Association might usefully begin to consider the establishment of similar regional organizations in other parts of the country. There was no doubt that the Glasgow office had enhanced the value of the Association to members in the area.

Public Relations

A report on the work of the past year was submitted by Mr. GEORGE DONALDSON, Press Officer in Scotland, and the hope was expressed that local medical committees and Divisions would avail themselves of Mr. Donaldson's offer to address them on the special needs of public relations in Scotland. It was felt that, if there was a greater appreciation of this need, more could be achieved to foster understanding and good relations between the public and the profession in Scotland.

Resignations

The Committee received with regret the resignation for health reasons of Dr. W. N. Gray, Helmsdale. The

Caithness and Sutherland Division has elected Dr. J. C. McGregor, Thurso, to succeed him.

It was agreed that no action should be taken to fill the vacancy caused by the resignation from the Committee last month of Dr. T. Simson Hall and that Dr. Hall be thanked for his services.

A Happy Ending

At the conclusion of the meeting a cocktail party was held in honour of Dr. I. D. Grant, immediate past chairman of the Committee. In proposing Dr. Grant's health, the Chairman said that it must have been particularly gratifying to Dr. Grant that the project of the Glasgow Regional Office, of which he had been an untiring advocate for many years, should be realized during his term of office. He felt sure that Dr. Grant, no matter to what further heights he should rise in the Association's hierarchy, would always have closely at heart the interests of the Association in Scotland. Dr. GRANT, in reply, said how proud he was to have been Chairman of the Scottish Committee, and thanked the members for the honour they did him, and for their support during his term of office.

PROPOSED TOUR OF DENMARK BY SCOTTISH DOCTORS

The Scottish Committee has welcomed an invitation received from the Danish Society (the Danish organization corresponding to the British Council) for a party of up to 20 Scottish doctors to tour Denmark in September, 1953.

It is proposed that the tour shall extend from September 1 to 14. Organized visits to Danish hospitals, universities, medical institutes, and other places of interest to members of the medical profession, together with sightseeing excursions, will be arranged. The cost of the tour will be approximately £31, including travel (third class) Newcastle-Copenhagen-Newcastle and the stay in Denmark. First-class travel can be arranged for an extra charge of about £7. All expenses of travelling in Denmark will be met by the Danish Society, who will also make full arrangements for the programme in co-operation with the Danish Medical Association. The provisional programme for the visit is as follows:

Date	Time	
Tuesday, September 1	Noon	Departure from Newcastle
Wednesday " 2	1 p.m.	Arrival Esbjerg
	7 "	Departure from Esbjerg
Thursday " 3		Arrival Aarhus
		Programme in Aarhus arranged by the Danish Medical Association and the Danish Society (including visits to University, Town Hall, Central Hospital, Serum Institute, modern housing)
Saturday " 5	Night	Leave by boat for Copenhagen
Sunday " 6	8 a.m.	Arrival Copenhagen
	10 "	Sightseeing in Copenhagen
	1 p.m.	Meet private hosts
Monday " 7		Programme in Copenhagen arranged by the Danish Medical Association and the Danish Society (including visits to the new university town, reception at Domus Medica, visit to "Rigshospitalet" and the Anatomical Institute, excursion to North Zealand with visits to the Central Hospital in Hillerød and to Frederiksborg and Kronberg Castles, further visits in Copenhagen to the Serum Institute, the central tuberculosis station, a tuberculosis sanatorium, to the new institute for infantile paralysis, to the laboratory of the Sick Benefit Clubs and the Finsen Institute)
Saturday " 12		Free in Copenhagen
Sunday " 13	11.45 a.m.	Leave Copenhagen by train for Esbjerg
	5.45 p.m.	Leave Esbjerg by boat for Newcastle
Monday " 14	6 p.m.	Arrive at Newcastle

Depending to some extent on the number of applicants, it may be possible to arrange to include their wives in the party.

Doctors in Scotland who are interested in this tour of Denmark are asked to communicate with the Scottish Secretary, British Medical Association, 7, Drumsheugh Gardens, Edinburgh, 3, without delay.

HOSPITAL ACCOUNTS FOR 1951-2

AVERAGE COST OF MAINTAINING N.H.S. PATIENT

Detailed costing returns* for the year ending March 31, 1952, covering some 2,750 hospitals in the National Health Service in England and Wales, have been published by the Ministry of Health. Each hospital is classified in the returns according to its primary function, for example, wholly general, mainly chronic, maternity, mental, etc. Then three main sets of figures are worked out—(1) the total inclusive net cost per week of maintaining a patient; (2) the same cost after allowing for out-patient expenditure (this is done by assuming that five out-patient attendances equal for costing purposes one in-patient day); and (3) the same cost further adjusted to allow for the "vacant bed factor"—beds staffed but not occupied. An innovation of the present returns is that non-teaching general hospitals have been classified according to the number of beds.

The following Table shows the regional and national average cost of maintaining an in-patient per week in general hospitals (excluding teaching hospitals) according to bed-size, and in maternity, mental, and tuberculosis hospitals.

Region	Wholly General Hospitals				Maternity	Mental	Tuberculosis
	1-50 Beds	51-100 Beds	101-300 Beds	301-900 Beds			
	£ s.	£ s.	£ s.	£ s.	£ s.	£ s.	£ s.
Newcastle-upon-Tyne ..	10 15	11 17	12 18	13 0	15 9	3 17	7 9
Leeds ..	14 2	12 9	14 8	13 10	17 1	3 14	9 5
Sheffield ..	12 0	14 10	12 16	14 4	15 9	4 5	7 19
East Anglian ..	13 4	14 3	13 19	14 2	15 16	3 14	9 16
N.W. Metropolitan ..	15 15	15 17	17 0	19 6	18 4	4 9	12 8
N.E. " ..	14 0	15 2	15 16	14 11	20 5	4 10	9 11
S.E. " ..	13 0	15 13	15 10	15 6	18 2	3 18	10 16
S.W. " ..	11 17	14 9	14 19	15 5	15 12	4 4	8 19
Oxford ..	13 13	18 0	18 11	16 13	19 9	4 4	11 2
South-western ..	12 16	14 4	15 18	17 15	15 5	4 0	9 7
Welsh ..	12 15	14 5	14 17	14 2	14 9	4 4	8 17
Birmingham ..	13 17	12 0	15 9	13 10	19 5	3 16	8 15
Manchester ..	11 0	12 6	12 18	12 14	15 4	3 14	8 2
Liverpool ..	12 9	11 2	13 6	13 8	15 16	3 12	8 12
National averages	12 14	14 7	14 13	14 11	16 19	4 1	9 6

The average patient-week cost in England and Wales in 1951-2 for all non-teaching hospitals in the "wholly general" group was £14 5s. 11d. The corresponding average figure in 1950-1 was £13 10s. 3d.

Teaching Hospitals

For teaching hospitals (irrespective of size) classified as wholly general, the average weekly cost per in-patient in 1951-2, again computed on the same basis, was £23 13s. 8d. in London, and £17 15s. 8d. in the provinces. The figures for the previous year were £23 16s. 10d. and £17 5s. 10d. respectively, but the figures before allowing for out-patient expenditure were: London, 1951-2 £33 2s. 4d., 1950-1 £32 18s. 11d.; Provinces, 1951-2 £23 13s. 6d., 1950-1 £22 17s.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

*National Health Service: *Hospital Costing Returns*, year ending March 31, 1952. H.M. Stationery Office.

THE DANCKWERTS AWARD AND THE SMALL-LIST PRACTITIONER

WORKING PARTY TO MEET

As announced in last week's *Supplement* (p. 69), the General Medical Services Committee has decided to undertake, with the help of the Ministry of Health, local executive councils, and local medical committees, an immediate inquiry with a view to obtaining a precise analysis of the number and categories of practitioners who may suffer injustice under the new distribution scheme which starts on April 1.

If the results of an inquiry of this nature are to be accurate, comprehensive, and above criticism all three sources of information must be used and the inquiry carried out on a uniform basis throughout the country. Again, after the results of the inquiry are known, any further steps which the Committee might wish to take to give effect to the rider passed by the Conference of Local Medical Committees must necessarily be taken through the Working Party, as a means of securing the agreement of the Ministry of Health.

First Meeting Soon

It has been agreed, therefore, to call the Working Party together again to investigate the problem and to obtain the fullest possible information about the number of small-list practitioners likely to be concerned. It is anticipated that the first meeting of the Working Party will take place within the next few weeks.

Distribution Scheme

The Regulations embodying the new distribution scheme will include a provision to enable the Minister to evolve a scheme to provide for payment, if this should prove necessary, to certain practitioners who may suffer a fall in remuneration through the introduction of the new methods of payment.

Notes and News

Resolution of Nottingham Consultants.—Sixty members of the Nottingham Area Consultants and Specialists Committee met recently and passed the following resolution: "That this meeting of consultants and specialists of the Nottingham and Nottinghamshire area is of the opinion that an adequate betterment factor should now be accorded to the consultants and specialists in conformity with the intention of the Spens report, accepted by the Government and by the profession, and already implemented in the case of the general practitioners by the Danckwerts award."

Holiday Exchange.—A German doctor would like his son, aged 16, to stay with the family of a doctor in this country from July 20 to September 10. In return, the British doctor's son could spend a similar period in Germany either before July or after September 10. The German family live in a town between the Ruhr and the Rhineland, and, as a car is available, the British boy would be able to see much of the surrounding countryside. Anyone interested should write to Dr. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Telesuggestion.—A patient, referred to a chest physician, took with him a note from his general practitioner: "This man has a television set. He has been worried as to whether he has tuberculosis or cancer. Please x-ray."

Correspondence

The Representative Body

SIR,—It warmed up my old ex-secretarial heart to read Winchester's memorandum (*Supplement*, February 28, p. 55). Although it was the Divisions who were asked for their opinion, I feel sure Winchester will not object to my butting in. Not only because I largely agree with it, and because I think it a lucid and masterly statement and argument, but also because I naturally take a special interest in the status and reputation of the Representative Body, being the only survivor of the Constitution Committee which in 1900 created it as the very core of the new constitution of the Association.

I cannot improve on the Winchester argument in favour of the reduction in size of the R.B., but I wish to emphasize some of its points. That body was always intended to be the *parliament* of the Association and ultimately that of the whole profession. At present it seems more like a public meeting than a legislative body. We are told that it is good to have a large meeting on account of the educative influence it has on its members and, through them, on their colleagues at home. This argument can easily be pushed too far, and I doubt if any Division, however large and important, would suffer if limited to a maximum of, say, five representatives. The present generosity looks to me extravagant, and a body which has had to increase its subscription cannot afford extravagance.

I like the idea of giving representation to the autonomous bodies which have sprung up recently within the Association. The idea of autonomy inside a parliament is unusual and seems to me potentially dangerous. A parliament represents all sections of the community, and in our profession there is no other body than the B.M.A. and its R.B. capable of doing this.

Finally, a recent personal experience of the hypertrophy of the R.B. disturbed me. Since my retirement from office I have attended as a spectator every Representative Meeting held in London. On the last occasion I found great difficulty in inserting myself into the gallery, because for the first, and I hope for the last, time it was almost entirely taken up by representatives who had overflowed the usual accommodation on the floor. I was sorry for them, for they must have felt it difficult to take an active part in what was going on below. But it would be a great pity if the ordinary member were denied the opportunity to see his representative at work. It looks as if our Great Hall is no longer able to accommodate a Representative Meeting and interested onlookers. This difficulty is likely to be even more acutely felt in some of the towns in which the Annual Meeting may be held.

I earnestly hope that the Winchester document will receive the attention it deserves, first from the Divisions and later from the R.B. itself.—I am, etc.,

London, S.W.7.

ALFRED COX.

Cost of Hospital In-patient Maintenance

SIR.—The Ministry of Health publication about hospital costings makes interesting perusal (see page 78). The discrepancy between the costs for dealing with maternity, general, tuberculosis, and mental-hospital patients clearly requires some explanation. Why should the maintenance of a patient in a mental hospital cost so much less—£4 1s. 1d. per week, compared with £9 6s. 7d. in a sanatorium and about £14 10s. in a non-teaching general hospital?

The explanation may lie partly in the fact that mental hospitals, like sanatoria, work almost to capacity, and this must reduce the cost of patient maintenance. On the other hand, admissions to general hospitals are more sporadic and irregular. This implies a certain measure of bed-

wastage which is inevitable in even the most efficiently managed general hospital. Again, it is possible that the shortage of mental nurses and the overcrowding of mental hospitals (11%) help to keep costs *per caput* low. The above reasons may be partly responsible for the lower running charges in mental institutions. Yet these facts cannot account for the very considerable difference in the maintenance costs for sanatorium and mental-hospital patients.

It is well established that there are a considerable number of factors, such as overcrowding, difficulty in hygienic control of mental-hospital patients, etc., responsible for the extremely high tuberculosis morbidity and mortality rates in mental hospitals (2.8% of the national deaths due to tuberculosis occur in mental hospitals, while this community only constitutes 0.35% of the population of England and Wales). A most important factor in the high incidence of pulmonary tuberculosis in mental institutions may prove to be the failure to maintain an adequate nutritional level among mental-hospital patients. It would be reassuring to learn that the feeding costs *per caput* in these various institutions cited by the Ministry are approximately similar, and that the calorie intake in the mental units compares favourably with that to be found in sanatoria, general, and maternity hospitals.—I am, etc.,

Halifax.

Branch and Division Meetings to be Held

BRIGHTON DIVISION.—At Hotel Metropole, Brighton, Thursday, March 26, 8.30 p.m. Joint meeting with Brighton and Hove Association of Pharmacy.

CHESTERFIELD DIVISION.—At Walton Sanatorium, Chesterfield, Friday, March 27, 8.45 p.m., meeting. Lecture by Dr. R. T. Gaunt: "Some Recent Advances in Medicine." (Date changed from March 20.)

CITY DIVISION.—At Finsbury Health Centre, Pine Street, London, E.C., Tuesday, March 24, 8.30 p.m., meeting. Lantern demonstration by Dr. R. M. B. MacKenna: "Common Problems in Dermatology."

DEWSBURY DIVISION.—At Dewsbury General Infirmary, Friday, March 27, 8.30 p.m., meeting. Annual B.M.A. Lecture by Mr. A. Dickson Wright: "Ulcerative Colitis" (illustrated by lantern slides).

EAST SOMERSET DIVISION.—At The Small Hall, Wells, Sunday, March 22, 3 p.m., general meeting.

FURNESS DIVISION.—At Duke of Edinburgh Hotel, Abbey Road, Barrow-in-Furness, Friday, March 27, 7.15 for 7.45 p.m., annual dinner.

ISLE OF WIGHT DIVISION.—At St. Mary's Hospital, Newport, Sunday, March 29, 2.30 p.m., meeting. Combined lecture-demonstration by Dr. Aitken Ross: "Treatment of Chronic Leg Ulceration." All island medical practitioners and district nurses are invited.

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Mary Abbots Hospital, Marloes Road, Kensington, W., Tuesday, March 24, 8.30 p.m., meeting. B.M.A. Lecture by Dr. Eustace Chesser: "Psychological Factors in the Termination of Pregnancy." Members of the Chelsea and Fulham and the West Middlesex Divisions are invited.

LEWISHAM DIVISION.—At Lewisham Hospital, S.E., Friday, March 27, 8.30 p.m., meeting. Mr. J. V. Broad: "The Discharging Ear. Some Comments on Migraine and Sinus Headaches."

NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital, Silver Street, Edmonton, N., Tuesday, March 24, 8.45 p.m., annual general meeting. Film: "Anaesthesia in the Dental Chair."

OXFORD DIVISION.—At Maternity Department Lecture Theatre, Radcliffe Infirmary, Oxford, Wednesday, March 25, 8.15 p.m., meeting. Dr. W. D. W. Brooks: "Recent Advances in the Treatment of Pulmonary Tuberculosis."

ROCHESTER, CHATHAM AND GILLINGHAM DIVISION.—At St. Bartholomew's Hospital, Rochester, Thursday, March 26, 8.30 p.m., meeting. Lecture by Dr. William Tegner: "Rehabilitation." All medical practitioners in the area of the Division are invited.

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, March 26, 8.30 p.m., annual general meeting. Colour and sound film: "Senile Obliterative Arteritis of the Legs."

SHEFFIELD DIVISION.—At University Medical Library, Sheffield, Friday, March 27, 8.30 p.m., annual general meeting.

SOUTH BEDFORDSHIRE DIVISION.—At Luton and Dunstable Hospital, Friday, March 27, 9 p.m., meeting. Dr. Robert Forbes: "The Legal Hazards of Medical Practice."

SOUTH SHIELDS DIVISION.—At Ingham Infirmary, Friday, March 27, clinical meeting. Address by Dr. W. G. A. Swan: "Mitral Valvotomy."

SOUTH-WEST ESSEX DIVISION.—At Whipps Cross Hospital, Leytonstone, E., Wednesday, March 25, 8.30 p.m., meeting. Address by Dr. M. Gilchrist: "Handicapped Children." All members of Leyton Head Teachers' Association are invited.

SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Tuesday, March 24, 9.30 p.m., meeting. Paper by Mr. A. L. d'Abreu: "The Selection of Patients for Thoracic Surgery." To be followed by annual general meeting.

WANDSWORTH DIVISION.—At St. James' Hospital, Ouseley Road, Balham, S.W., Tuesday, March 24, 8.30 p.m., meeting. Lecture by Mrs. Collis and Dr. W. F. Dunham: "The Neurological Disorders of Infancy."

WARRINGTON DIVISION.—At Warrington Infirmary, Friday, March 27, 8.15 p.m., clinical meeting. Professor Robert Platt: "Hypertension."

WEST NORFOLK DIVISION.—At West Norfolk and King's Lynn Hospital, Thursday, March 26, 3 p.m., meeting. Annual B.M.A. Lecture by Dr. P. M. F. Bishop: "Endocrine Disorders in General Practice."

WEST SUSSEX DIVISION.—At Burlington Hotel, Worthing, Wednesday, March 25, 8.30 p.m. Dr. N. Lloyd Rusby: "Domiciliary Management of Pulmonary Tuberculosis."

WILLESDEN DIVISION.—At Willesden General Hospital, Harlesden Road, N.W., Friday, March 27, 9 p.m., clinical meeting. Address by Dr. J. H. Gould: "The Approach to Psychological Problems in General Practice."

Meetings of Branches and Divisions

GUILDFORD DIVISION

A meeting was held at the Royal Surrey County Hospital on March 5, 1953. With Dr. Gerald Cranston in the chair, there were 30 members present. The following resolution was passed: "The Guildford Division of the British Medical Association is profoundly shocked by the judgment given in the case of *Payne v. St. Helier Group Hospital Management Committee* and *Another*. The Division asks the Council of the Association to examine the implications of the judgment and to include a memorandum on the matter in either the Annual or Supplementary Report of Council."

MOMBASA DIVISION

The annual general meeting was held at the Pandya Memorial Clinic on January 29, 1953. With Dr. S. D. Karve in the chair, there were 10 members present. The following officers were elected for 1953:

President.—Dr. Cochrane.

Vice-president.—Dr. S. D. Karve.

Hon. Secretary and Treasurer.—Dr. A. U. Sheth.

SOUTH STAFFORDSHIRE DIVISION

A meeting was held at the Rendezvous Café, Wolverhampton, on January 28, 1953. With Dr. Eva Pringle in the chair, there were 26 members present, a further 15 attending after supper. Dr. Philip H. Addison gave a lecture on "Legal Pitfalls in Medical Practice," which was followed by a discussion on medico-legal problems.

THE CONSTITUTION OF THE B.M.A.*

BY

C. METCALFE BROWN, M.D., D.P.H.

Barrister-at-Law

"By constitution we mean," wrote Bolingbroke in 1735, "whenever we speak with propriety and exactness, that assemblage of laws, institutions and customs derived from certain fix'd principles of reason . . . that compose the general system, according to which the community hath agreed to be govern'd." What Bolingbroke wrote about the national constitution so long ago applies with equal force to the constitution of the British Medical Association—the community of practitioners of medicine.

A constitution may be autocratic, oligarchical, or democratic. The first and short-lived British Medical Association was an excellent example of autocracy, particularly so when the President, being the only member present, contrived to move, second, and approve the business of the day. In the present century, the work of the Association has been conducted on a basis sometimes oligarchical, sometimes democratic—depending on whether or not a handful of strong men exercised sway. To-day we are truly democratic—there are strong men in leading places, but their strength is directed by the Representative Body.

Earlier articles have shown how the constitution has been constructed and how it has evolved to meet the ever-changing needs of a profession that is making progress with increasing acceleration. Evolution goes on and will go on, and we can only speculate what the effects will be. One thing, however, is clear—it is vital that all the decisions of the Association be measured against the essential and unchanging standard: "The primary objects for which the Association is established are to promote the medical and allied sciences, and to maintain the honour and interests of the medical profession."

The constitution of the Association, like a well-found ship, creaks and groans on occasion in face of stress and strain. But this is a sign of strength and elasticity and purposeful movement. There is nothing quieter than a vessel rotting on the harbour mud. There is no stasis in Tavistock Square. The constitution of the Association has had to be adjusted from time to time to meet its difficulties and, indeed, its

*Articles under this title have appeared in the four preceding issues of the Supplement.

dangers—recent changes and new problems will need further adjustments and most probably an approach different from that of the past.

The prestige of the Association is high and must be maintained and fostered. It is dependent on the prestige of the profession, and that in turn must rest on the unity of the profession—not merely a veneer of unity but rather a stable solidarity. There are unlimited opportunities for discussion, agreement, and disagreement within the Association. There is no room in a healthy co-partnership for subterranean clashes which have a disastrous effect on personal relations and general morale. There is no room either for differences between members of the Association outside the Association on Association business—the Representative Body and the Council have long been generously considerate of the minority view—a civility which I have needed and gratefully received on more than one occasion.

The main potential difficulties of the Association may appear to arise from autonomy, schism, aberration in the medico-political field, and financial interests.

Autonomy

Reference has been made in earlier articles to the autonomous bodies within the Association—namely, the General Medical Services Committee and the Central Consultants and Specialists Committee. Both report to the Representative Body through the Council, yet both have some independence. Autonomy is indeed difficult to define, but it can be defined as Cockram did in 1623—"liberty to live after ones owne law." By that definition the two bodies are not truly autonomous, and neither would claim that they are.

Theoretically, autonomy, utter or mitigated, within the Association is illogical and might be productive of disunity and therefore bad. But in practice few difficulties have so far arisen, and for a very simple reason. Comparison of the lists of members of the Council of the Association, the General Medical Services Committee, and the Central Consultants and Specialists Committee shows how exceedingly well each body is represented on the other. This state of affairs is a reflection of the position in the constituencies—most of the members of a local medical committee, for example, have a remarkable physical resemblance to most of the members of the corresponding Division executive committee of the Association. Danger from autonomy is therefore much less than might appear, but any kind of

autonomy is incompatible with true unity, and therefore autonomy should cease. But any revolutionary attempt to abolish autonomy would almost certainly cause more disunity than autonomy itself. Autonomy should be abolished in time by evolution and by agreement.

"All those autonomies wherewith the world was filled . . . one after another stoop and disappear."

Schism

Schism is a division into mutually opposing factions of a body of persons who have previously acted in concert. As we have seen, the autonomous bodies are clearly not schismatic, but some fear that fission may appear sooner or later. These fears appear to be groundless, and patience, good will, common sense, and mutual forbearance will ensure that they will continue to be so.

Some apprehensions have been expressed about the relations between the Association and the Fellowship for Freedom in Medicine. Most of the members of the latter would probably agree that there are other fellowships for freedom in medicine, not the least of which is the Association itself. Is the Fellowship schismatic? We must judge by what is said by or for the Fellowship and a consideration of what are its objects. The Chairman, Lord Horder, has said, "The B.M.A. is no longer the mouthpiece of the profession." Also: "If, and when, we are confident that the B.M.A. accepts, and carries out, the obligations to the public for which we ourselves stand, we can dissolve into thin air." He added, "But that time is not yet." Lord Horder also said, "The F.F.M. is the B.M.A.'s one eye. It behoves us to keep that eye open." That suggests rather a sleepless vigilance, a declaration of adherence to the body politic and a promise of ocular co-ordination subject to the B.M.A.'s other eye remaining open too—and no doubt it will.

Most of the members of the Fellowship are practitioners with high ideals who feel strongly about the inroads of the State into the practice of medicine and are striving to amend the National Health Service Act with the object of preserving the highest standards of practice and of achieving a reasonable measure of professional freedom. If that be a fair interpretation of the main aims of the Fellowship, it must be remembered that that, too, is the policy of the Association.

May we hope that the Fellowship will continue to stimulate and criticize—within the Fellowship and within the Association. May we hope, too, that they will continue to assist in the education of the public about the defects in the medical service. We also hope that in medico-political matters they will strive for unity within the profession so that we can speak with one voice.

A recent development of much interest is the provisional formation of the College of General Practitioners. Its aims are to supplement the work of the medical educational institutions and to complement the scientific and educational functions of the British Medical Association. One of its functions is "to ensure that the best achievements and traditions of general practice are preserved and that the best of future developments are encouraged." It will not have a political function. There is clearly no schism here.

Medical Politics

No divine right or any right has been conferred on the Association to possess a monopoly in medical politics. But with a membership of some 67,000 the Association does represent the vast majority of doctors—general practitioners, consultants and specialists, public health medical officers, and many others. It is the only medical society that can properly claim to represent the views of the profession as a whole, a claim which has been accepted in practice by a succession of Governments over a long period of years. This unchallenged leadership means that the Association speaks for the profession with power and authority. Power is a great privilege and carries with it great responsibilities. In the exercise of that power the Association does well to give careful attention and every consideration to the opinions

expressed by other medical bodies—some of them small, and some representative of sectional interests only. Their points of view are important. In this respect, an agreement of many years' standing between the Association and the Society of Medical Officers of Health may be regarded as worthy of consideration in that it has helped in the establishment and maintenance of cordial relations and mutual help and has set up a valuable precedent.

The agreement was made between the Association and the Society in 1923 and modified in 1939. Section II of this agreement is as follows:

II (a) If the Society of Medical Officers of Health propose to formulate and urge any medico-political policy which, by reason of affecting the interests of public or private practice, is of mutual concern to both the Society and the Association, the Society shall communicate its opinions or proposals with regard thereto to the Association and shall refrain from taking any further action on such policy. In the event of the Association approving such policy or proposals through its Representative Body or (if within the already declared policy of the Association) through the appropriate machinery of the Association all action consequent thereon shall be taken by the B.M.A.

(b) Where the Association is consulted by a Government Department or by another association on questions of public health or preventive medicine, and where the Society is consulted by a Government Department or another association on a matter which is held to be medico-political—that is, likely to affect the interests of public or private medical practice—the Association and the Society shall forthwith consult together by communication between the offices and if necessary by the calling of a joint standing committee appointed for the purpose. In the event of the Association raising no objection to the proposed reply of the Society, the Society shall be free to express its opinion to the Body by which it has been consulted.

(c) In the event of dissent being expressed by the Association, either under subsection (a) or subsection (b), the Society shall refrain from taking any action in support of a divergent policy or from making any divergent reply to a Government Department or association consulting it until the joint standing committee has reported to the two Councils concerned, and those Councils have had an opportunity of considering the report or, at the request of either Council, conferring together.

Matters of Finance

"The world is too much with us; late and soon,
Getting and spending, we lay waste our powers."

To some extent that is true for many of us. Even so, we are entitled to a just reward for the services we give. But it has been felt by many in recent years that the financial interests of the profession have been too much to the fore. The Association must look after the status and appropriate remuneration of all doctors in all sections of the profession, but it would be most unwise for this to take priority over everything else. The setting up of Whitley machinery has partly dealt with these matters, but this does not mean that the Whitley committees have taken the full responsibility out of the hands of the Association. The Whitley committees have full powers to act according to their own judgment, but are advised in the first place by the appropriate committee of the Association and by Council and must keep in mind the rulings of the Representative Body. The position is still in a state of evolution and should be carefully watched.

Co-ordination of Medical Sections

In the past the various sections and branches of the profession have been inclined to live and think in watertight compartments. It is the duty of the Association to counteract this tendency, and indeed this has been done to a considerable extent. The setting up of joint committees within the Association is an excellent method of achieving co-ordination. A good example of this at the present time is the Joint Committee of representatives of the Public Health, Occupational Health, and Tuberculosis Group Committees dealing with the urgent social problems of the resettlement of tuberculous persons in industry. This is a matter of great importance to the medical profession and even more so to the community.

Inter-professional Relationships

Here is great scope for co-operation between the Association and the allied professions. There is a very large number of subjects of mutual interest, and an example of this co-operation comes readily to mind in the Joint Committee of the B.M.A. and the British Veterinary Association, which has had joint discussions on the question of meat inspection and the Penicillin Bill. A further example is the Joint Committee of the B.M.A. and the Magistrates' Association. This Committee has produced a series of interesting and helpful reports and is now discussing the question of cruelty to children. There are other committees where joint discussions take place, such as the B.M.A. and the Pharmaceutical Society and the B.M.A. and the Royal College of Nursing. These and similar committees should be encouraged to undertake more work in wide fields, bearing in mind that the fact that the two professions are working together will not only enhance the status of both, but, more important, render the work of great value to the community.

Anatomy of the Representative Body

The timely memorandum (*Supplement*, February 28, p. 55) on the Representative Body circulated by the Winchester Division merits close study. Winchester's criticisms of the size of the Representative Body, the very lengthy agenda, and the lack of balance in the conduct of business are well founded, and their proposal to reduce the number of representatives is conservative rather than radical. The Representative Body as at present constituted is so unwieldy that proper consideration of all the business before it is well-nigh impossible. The Division's proposal to ensure that sectional interests are well represented is in line with the existing policy of the Association of freedom of discussion and full facilities for presenting the minority viewpoint.

The suggestions for an enlarged Agenda Committee to ensure priority for important subjects are soundly based.

Less sound, however, is the statement that "the Representative Body is not truly representative of the profession in that the majority of its members are general practitioners." The largest group of members of the Association are the general practitioners, and in any case, if the electorate chooses a majority of representatives whatever they may be, then the result must be true representation.

PRIVATE PRACTICE COMMITTEE

ALL-DAY MEETING

An agenda of more than 60 items awaited the Private Practice Committee of the Association at a meeting on March 4. Dr. I. D. GRANT was in the chair. Dr. T. W. MORGAN was appointed vice-chairman in view of the Chairman's forthcoming temporary absence abroad. Dr. J. H. HUNT, honorary secretary of the College of General Practitioners, had been invited to attend the meeting to discuss possible matters of common interest to the College and the Committee. The good wishes already expressed by Council were endorsed.

Prison Medical Officers

Mr. B. M. TRACEY, of Norwich, had also been invited to attend during a discussion on the salaries of part-time prison medical officers in England and Wales. The Prison Commissioners are proposing to introduce a similar scheme of payment to that which obtains in the Scottish prison service, and which had been accepted by the Scottish Committee and approved by Council in November, 1952.

After discussion the Committee expressed itself satisfied with the scale subject to the approval of Council. It was stated that the revised salaries for part-time medical officers in the Scottish prison and Borstal service were proving satisfactory.

Cremation Certificates

A letter from the Home Office had invited the Association to recommend to its members that £2 2s. would be a suitable maximum for completion of either certificate B or C. It was agreed that, although this fee was suitable, a maximum fee could not be recommended.

Fees for Services to the Coroner

Dr. ROBERT FORBES presented the views of the Coroners Subcommittee on fees payable to medical practitioners under the Coroners Acts. It was noted that the Subcommittee's representations had been sent to the Home Office, and an assurance had been received that the Association would be informed as soon as there was any possibility of introducing necessary amending legislation.

It was reported that the Coroners Society had agreed that the proper salary for a full-time coroner was £2,750 per annum.

Dr. Forbes also reported for the Medical Witnesses Subcommittee. The fees payable to medical witnesses at the Central Criminal Courts were set out, and it was agreed that an endeavour should be made to arrange a meeting with the Home Secretary to secure the adoption of this scale at all criminal courts. In view of certain difficulties experienced by medical witnesses in courts of law, it is to be recommended to Council that it should obtain counsel's opinion on whether a medical witness to fact can refuse to express an opinion on the facts. If he does express such an opinion it is also to be inquired whether he should accordingly be regarded as an expert witness.

Examination of Recruits to the Regular Army

In at least one Command it appears that an anomaly has arisen in the method of payment of civilian medical practitioners examining recruits. The fee is £1 1s. for each man examined; for Territorials this is subject to a weekly maximum of 25 men, but in the case of volunteers for the Regular Army a daily maximum payment of £3 10s. is in operation. It was stated that in one Command it appeared to be the practice to require civilian medical practitioners to examine a relatively large number of recruits on one day of the week, thus reducing the average fee very appreciably. It was decided to press for the application of a weekly maximum for examination of both Regular and Territorial Army recruits.

Mineworkers and Bonus Shift Medical Certificates

A matter of some importance arose on the report of a joint committee (with the Occupational Health Committee) on the National Coal Board Medical Service. In order to stimulate regular attendance a system of payment for miners has been instituted whereby a man is paid for six shifts provided he works five (work on Saturday being voluntary and outside the scope of the agreement), but he is allowed payment for the bonus shift if he is absent for one or more days owing to illness or to certain domestic causes. In sickness a medical certificate or other evidence must be produced during absence or immediately on return. The consequence of this has been that the miner absent even for one day must produce a doctor's certificate, and often the doctor is asked to issue a certificate which can only be a record of the man's statement that he has been ill.

It was decided to seek a meeting with representatives of the National Coal Board to discuss the problems arising from the requirement of such certificates.

It was agreed to recommend to Council that £1 1s. was an appropriate fee for the "counter" medical certificate required by certain areas of the National Union of Mine-workers.

Miscellaneous Business

Advice was asked by a member about the proper fee for a report of inspection of men for a gas board in order to prevent skin complaints due to contact with tar or pitch.

It was considered that an appropriate fee would be 7s. 6d. for each man examined at the works, or 5s. if examined at the surgery.

It was reported that agreement had been reached with the Ministry of Civil Aviation on the fees for attendance at civil airfields.

The question of the unattended telephone again came forward, and particulars were given of a trade device approved by the G.P.O. This records telephone messages in the absence of the subscriber, and plays the messages back to him on his return or on ringing his own number from some other telephone and using a private code.

For the information of the Committee it was stated that all life assurance offices using a short form of medical examination report had now agreed to increase the fee to 15s.

Reference was made to the complicated legal position of utility vehicles used for professional purposes. Attempts have been made and will continue to be made to remove the anomalies affecting doctors.

CARE OF MOTHERS AND BABIES

RESPONSIBILITY OF LOCAL HEALTH AUTHORITIES

The Ministry of Health has sent a memorandum to regional hospital boards, hospital medical committees, and boards of governors (R.H.B. (53) 19, H.M.C. (53) 18, B.G. (53) 20) and circular 5/53 to local hospital authorities, drawing attention to the need for continuity in the care of mothers and babies.

Duties Under the Act

The memorandum points out that the major responsibility for securing adequate postnatal attention for women who have been confined in hospital rests with the local health authority. Under the National Health Service Act, 1946, under Section 23, it has the duty to secure the provision in its area of sufficient certified midwives for "attendance on women in their homes as midwives, or as maternity nurses during childbirth and from time to time thereafter during a period not less than the lying-in period"; under Section 22, to make "arrangements for the care . . . of expectant and nursing mothers and of children who have not attained the age of 5 years and are not attending primary schools"; and under Section 24, to "make provision . . . for the visiting of persons in their homes by . . . health visitors for the purpose of giving advice as to the care of young children . . . and expectant or nursing mothers."

The duty to provide the requisite continuity of care is subject to the clinical responsibility of the family doctor in attendance on the mother or child, and to the general responsibility of the hospital authority for care when the mother or child is a hospital in-patient or attending hospital clinics.

The Lying-in Period

The memorandum calls attention to the definition by the rules of the Central Midwives Board of the lying-in period as "a period being not less than 14 days nor more than 28 days after the end of labour during which the continued attendance of the midwife on the mother and child is requisite." It is clear, the memorandum states, that the lying-in period will vary between 14 and 28 days, and that it is not limited to the time during which the mother needs to remain in bed or indoors, nor necessarily coextensive with the time during which a mother confined in hospital needs to remain an in-patient.

The period during which a mother and child should be kept as in-patients in a hospital or maternity home depends mainly on clinical considerations. In the Minister's view it should not be less than 10 days after the confinement unless there are special reasons for earlier discharge. It will be for the local health authority to decide what, if any,

form of care is necessary after discharge, and at what stage the attendance of a midwife should cease and visiting by a health visitor begin.

Continuity of Care

The memorandum points out that continuity of care depends upon notification (with the knowledge and agreement of the patient) by hospital authorities to the family doctor and the medical officer of health of the local health authority of all impending discharges of maternity patients, if possible not less than 24 hours beforehand; upon visiting of mother and child by the appropriate local authority officer as soon as possible after discharge; upon notification by the hospital to the doctor and, where appropriate, the medical officer of health of any special attention required; and upon consultation between the appropriate authorities and the family doctor where there is any doubt about the advisability of discharge, having regard to home conditions.

The memorandum stresses the importance of ensuring that the nursing, midwifery, and health visiting services of local health authorities work in close collaboration with the family doctors.

TREATMENT OF TEMPORARY RESIDENTS ON BOARD SHIP

The General Medical Services Committee has recently discussed with the Ministry of Health the terms of a new distribution scheme which will give effect to the recommendations of the Working Party on the future distribution of the pool. Advance copies of this scheme have already been sent to executive councils, and it is apparent that some confusion exists about the section dealing with fees for the treatment of temporary residents. This section reads as follows:

"Payment shall be at the rate of 17s. for treatment given to a temporary resident, or 5s. if the temporary resident is residing at a place which the executive council in consultation with the local medical committee has classified as a convalescent home or other institution, being a place at which ten or more persons reside temporarily and where the council concerned is satisfied that the practitioner is in regular attendance. The council may also at its discretion, in consultation with the local medical committee, pay at the lower rate in other cases where a practitioner is known to give treatment to temporary residents who are living temporarily in groups of ten or more, on a ship or at any other place within the council's area."

Discretion Given

It will be seen that this paragraph gives discretion to executive councils in consultation with local medical committees to pay at the lower rate in cases where a practitioner is known to give treatment to temporary residents who are living in groups of ten or more on a ship.

It was in the Committee's mind when this matter was discussed with the Ministry that where a practitioner visits a ship and treats a large number of seamen on the one occasion it would clearly be inappropriate for him to claim the higher temporary-resident payment. On the other hand, a visit paid to a ship where only a few patients are treated should warrant the higher rate. The matter is left entirely to the discretion of the local executive council in consultation with the local medical committee, and it is assumed that applications for payment will be dealt with on general principles outlined above.

REGISTRARS' GROUP—SCOTTISH WESTERN REGION

The annual general meeting of the above group will be held in the Lister Theatre of the Glasgow Royal Infirmary on Monday, March 30, 1953, at 7.30 p.m.

British Medical Association

PROCEEDINGS OF COUNCIL

A meeting of the Council of the British Medical Association was held at Headquarters on March 18, Dr. E. A. GREGG, Chairman of Council, presiding. The Chairman welcomed the return of Dr. John Cottrell, Mr. Logan Dahne, and Dr. T. Rowland Hill after their absences through illness. The Chairman also welcomed Dr. T. C. Routley. He reminded the Council that Dr. Routley had been for many years General Secretary of the Canadian Medical Association. They were also delighted to see with him Dr. Arthur Kelly, deputy General Secretary of that body, who would shortly succeed Dr. Routley as Secretary.

Dr. ROUTLEY said that they were deeply grateful for the warmth and cordiality with which they had been welcomed. They as Canadians did not feel themselves to be strangers in their midst. He was also very grateful to those who had proposed his name for the presidency of the Joint Annual Meeting at Toronto in 1955. He assured members who came to Canada two years hence that the most cordial welcome awaited them.

The Council received a report that the Canadian Medical Association had nominated Dr. Routley for election as President of the British Medical Association for the session 1955-6, and unanimously passed on a recommendation to the Representative Body to that effect.

A letter was also received from the Canadian Medical Association regarding the proposal to hold a joint Annual Meeting of the two Associations in Great Britain at a date after 1955. Dr. Routley said that they would be very happy to come back to this country, not later, he hoped, than five years after the Toronto meeting.

The Council deferred for further consultation the question of the exact year in which the meeting should be held.

The death was reported of Dr. Alfred Tennyson Smith, of Bournemouth, a former member of Council. The Chairman also referred to the death of Mr. A. Twelftree, for many years a very faithful servant of the Association and at the time of his death Chief Clerk.

The members of the Council stood in silence as a tribute. The SECRETARY reported that in accordance with a previous decision of Council a communication had been sent, through the Soviet Embassy, to the President of the Academy of Sciences of the U.S.S.R., inviting the Academy to send six Russian doctors on a friendly visit to Great Britain for a few days as guests of the Association. He had received a reply stating that the Soviet Medical Associations thanked the B.M.A. for its kind invitation and informed it that unfortunately they were unable to send a delegation to this country at the moment.

The Duke of Edinburgh, Honorary Member

The PRESIDENT-ELECT (Mr. Tudor Thomas) proposed that it be a recommendation of the Council to the Representative Body that H.R.H. the Duke of Edinburgh be elected as an Honorary Member of the Association. He said that at the present time they had one Honorary Member in the person of Lord Nuffield. There were two precedents early in this century for royal personages being honorary members of the Association—namely, the future King Edward VII and the future King George V, both of whom laid down their Honorary Membership on ascending the Throne, when they became Patrons of the Association. The interest that the Duke of Edinburgh took in the advancement of science, including medicine, was well known.

The recommendation was approved with acclamation.

Requisition for Extraordinary General Meeting

The SECRETARY stated that a requisition had been received signed by 141 members, and some signatures additional to those in the agenda had also been received, requiring the

Council to convene an Extraordinary General Meeting of the members of the Association for the purpose of considering and, if thought fit, passing the following resolution:

That the Association being concerned by the modification of the present method of remuneration by capitation fees agreed in the Working Party's report requires the Council forthwith to approach the Minister of Health with proposals for the better protection (financial and otherwise) of the small-list doctor and of the doctor newly seeking entry into practice, and requests the Minister of Health not to implement the Working Party's report until the scheme for distribution of remuneration has been considered in the light of such proposals, and meanwhile to continue the present method of payment.

The Secretary reported that he had referred certain questions of procedure to the Solicitor of the Association, and the Solicitor had advised that Counsel's opinion should be taken whether, in view of the terms of Article 37, it was really competent for a General Meeting to pass a resolution on a medico-political matter of this kind and whether the matter was not exclusively one for the Representative Body.

The SOLICITOR, Mr. Leigh Taylor, who attended the meeting, said that the position was that the meeting must be held, but the opinion of Counsel was that the resolution if passed at that meeting would be ineffective. The Representative Body had reserved to it the rights and powers of decision in a matter of this nature.

The CHAIRMAN said the constitutional point was that, if the Council did not carry out the wishes of the requisitionists, then the requisitionists themselves were at liberty within three months to call a meeting.

Constitutional Difficulty

Dr. J. A. GORSKY said that there was obviously some constitutional difficulty here. This requisition might cause a considerable expense to the Association. At the same time the Council must not allow it to be thought that it was trying in any way to override the grievance of a minority. He suggested that it might be possible to ask Mr. Justice Danckwerts for a declaration judgment as to whether his decision and the decision of the Working Party were consistent with one another.

Mr. LEIGH TAYLOR replied that there were two objections to referring the matter to Mr. Justice Danckwerts, one of them the time factor and the other procedural. Before they could go back to Mr. Justice Danckwerts they would have to come to an agreement with the other party to the adjudication and in addition to get the Lord Chancellor's agreement to the proposed reference. Mr. Justice Danckwerts at the inquiry had been concerned with the total sum to be awarded, and he did not think he had applied his mind to the question of distribution at all, which was the task of the Working Party. He was not saying that he would not be competent to do so, but it would be an elaborate procedure, involving another hearing of some kind.

Dr. GORSKY said that this was a requisition asking the Association, under Company Law, to do a certain thing which concerned not only the Working Party but also the Ministry of Health. Supposing they did call this meeting, could the Ministry at any time on behalf of its own membership in the Working Party issue a writ of prohibition?

On the proposition of Mr. H. H. Langston, seconded by Dr. A. V. Russell, it was agreed to call the Extraordinary General Meeting for Tuesday, May 5, at 2.30 p.m., the day preceding the next Council Meeting.

Discussion then turned on the question of whether, and, if so, when, a Special Meeting of the Representative Body should be called.

A report by the Organization Committee presented by Dr. PRIDHAM recommended that, to conform with the system of budgetary control approved by the Council, the financial

year of Divisions and Branches should in future terminate on June 30 instead of on December 31. It was stated that only in this way would it be possible to determine the grants to Branches in time for inclusion in the budget which must be drawn up at the beginning of the session. This recommendation was passed on to the Representative Body, and, if agreed to, will take effect as from next year.

Dr. PRIDHAM reported that the membership of the Association was now 66,823.

Dr. DORNAN reminded the Council that it decided at its last meeting that further consideration should be given to those medical students who had been receiving grants and on taking pre-registration appointments were considerably worse off than before. They had in mind particularly ex-Service students who were married. It was reported that the Ministry had answered promptly, and in many respects adequately, to the representations which had been made on behalf of these men.

Association Finance

The TREASURER (Mr. A. M. A. Moore) presented a detailed financial statement concerning the position of the Association. He said that the position had greatly improved during the year, though he must impress on the Council the importance of stringent economy during the coming year. It was essential to consider very carefully any steps which involved fresh or added expenditure. In going through the various sections of the statement he drew special attention to the considerable improvement in the position of the *British Medical Journal*. When they compared the present position with the state of affairs at this time last year there was occasion for great satisfaction. The financial position of *Family Doctor* was also greatly improved.

The draft Financial Statement for the year ending December 31, 1952, which was submitted subject to audit, was received and approved, and the Treasurer was congratulated upon the great improvement of the position.

The Treasurer then went on to present the draft Revenue and Capital Budgets for the twelve months ending December 31, 1953. These had been prepared in a form which incorporated the recommendations of the firm of management consultants whose services had been retained to advise on the system of budgetary control adopted by the Council. Provision had been made for loan redemption and reserve for contingencies amounting altogether to £50,000. He hoped it would be noted that the instruction of the Representative Body with regard to earmarking for loan redemption at least half of the revenue accruing from the increase in subscription had been more than met.

Dr. CARTER, Chairman of the Journal Committee, said that some fear had been previously expressed that the advertisement revenue from the *Journal* might fall, but in actual fact the advertisement revenue was now higher than at the corresponding period of last year.

The Revenue and Capital Budgets for the year ending December 31 next were approved.

Dr. FRANK GRAY wished it to be referred to the Finance Committee to consider the remuneration appropriate to the chief officers of the Association. Everybody realized, he said, the burden falling upon the Chairman of Council, the Chairman of the Representative Body, and the Treasurer, and it was quite time that this position was looked into, irrespective of the persons who held these offices. This burden was heavy and might very well become heavier, and he hoped that the Council would not continue to rely on members of the Association doing an extraordinary job of work and making them no recompense whatever.

Dr. R. P. LISTON and other members supported this view. The CHAIRMAN OF COUNCIL said that at the present moment the Association was only just getting out of its "financial wood." He begged that this matter might be adjourned to some future occasion. (Cries of "No.") Then he ruled it out of order.

Dr. CARTER gave a brief report on *Family Doctor*, and spoke of progress in the matter of distribution and in other respects. Financially *Family Doctor* was "breaking even."

Public Health

Dr. H. K. COWAN presented the report of the Public Health Committee. He said that the Committee had considered a statement on decentralization by county councils of Part III services under the National Health Service Act, and he moved that the policy already endorsed by the Society of Medical Officers of Health favouring decentralization of such services be accepted.

This was agreed to.

A further recommendation was agreed to defining the term "public health service member" in the By-laws of the Association.

Dr. COWAN also brought forward the report of a Joint Committee of the B.M.A. and the British Veterinary Association (see *Supplement*, March 14, p. 71) which had been considering the Therapeutic Substances (Prevention of Misuse) Bill. This dealt with the relaxation of certain of the restrictions on the sale of penicillin. It was proposed to make representations to the Ministry of Health that any regulations for the preparation of diluted penicillin in the form of a supplement for addition to livestock feeding-stuffs should be confined to such firms as were able adequately to protect their employees from the hazards of penicillin, and that investigations should be carried out in order to determine whether there was a need for precautions to be taken, and, if so, what precautions, by persons who in the course of their employment handled livestock feeding-stuffs supplement containing penicillin.

This recommendation was agreed to.

Dr. Cowan also submitted the report of a conference of representatives of the Occupational Health, Public Health, and Tuberculosis and Diseases of the Chest Group Committees on the resettlement of tuberculous persons. The conference, after detailed consideration of the problems, had decided to ask the Ministry to discuss the matter with a deputation consisting of Dr. Peter Edwards, Dr. J. A. L. Vaughan Jones, and himself.

Miscellaneous

Dr. J. A. MOODY presented a report of the Building Committee concerning certain work at B.M.A. House.

Mr. NICHOLSON-LAILEY brought forward on behalf of the Science Committee a recommendation that the annual grant to the Library for the purchase of books and periodicals and the binding of journals be increased from £2,000 to £2,500, and this was agreed to. He also submitted a number of recommendations concerning the award of B.M.A. prizes.

General J. C. A. DOWSE brought forward a report of the Overseas Committee which dealt with a number of matters concerning overseas branches, and this was approved. He also submitted a report on behalf of the Armed Forces Committee concerning Service pay, and said that he hoped that at the next meeting of Council his committee would have something satisfactory to report.

Dr. VAUGHAN JONES presented the report of the Occupational Health Committee, and the Council agreed to its recommendation that it saw no objection to even more integration of the two courses for the D.P.H. and the D.I.H. than existed at present, since a necessary proportion of the knowledge was common to both. The Council was generally agreed that a part-time course for the D.I.H. spread over a period of two or three years was both desirable and practicable, and recommended that such courses should be arranged.

Dr. PRIDHAM, who was shortly going to Lisbon to attend the Council of the World Medical Association, asked for guidance concerning a question which would arise at those proceedings—namely, the call from the Medical Association of Israel for the denunciation of the trial of the doctors recently arrested in Moscow. After discussion the Chairman of Council said that they could trust Dr. Pridham to handle the matter in a proper way.

The Council rose at 6.45 p.m., after sitting with two short intervals, from 10 a.m.

British Medical Association

ANNUAL MEETING—CARDIFF, JULY 9-17, 1953

President-Elect: J. W. TUDOR THOMAS, D.Sc., M.D., M.S., F.R.C.S.

Local General Secretary: JOHN D. SPILLANE, M.D., F.R.C.P.

Science Secretary: PROFESSOR GILBERT I. STRACHAN, M.D., F.R.C.P., F.R.C.S., F.R.C.O.G.

Executive Officer: G. A. PECK, B.Sc., B.M.A. House, 195, Newport Road, Cardiff.

PROVISIONAL PROGRAMME

SCIENTIFIC MEETING

PLENARY SESSIONS

Tuesday, July 14, 10 a.m.: "Coronary Disease"

Chairman: Professor H. SCARBOROUGH (Cardiff).
Speakers: Dr. D. EVAN BEDFORD (London), Dr. WILLIAM PHILLIPS (Cardiff), Professor G. W. PICKERING (London), Dr. CLIFFORD G. PARSONS (Birmingham), Dr. A. RAE GILCHRIST (Edinburgh), Dr. JOHN H. HUNT (London).

Thursday, July 16, 10 a.m.: "Fibrositis"

Chairman: Mr. A. LAWRENCE ABEL (London).
Speakers: Dr. A. TALBOT ROGERS (Bromley), Dr. A. H. DOUTHWAITE (London), Dr. J. P. SPILLANE (Cardiff), Orthopaedic Surgeon (name to be announced later), Mr. LESLIE H. W. WILLIAMS (London), Dr. J. H. CYRIAX (London), Dr. G. D. KERSLEY (Bath).

Friday, July 17, 2.15 p.m.: "Overweight"

Chairman: Right Hon. LORD HORDER (London).
Speakers: Dr. J. H. SHELDON (Wolverhampton), Professor R. A. McCANCE, F.R.S. (Cambridge), Dr. ARNOLD P. MEIKLEJOHN (Edinburgh), Dr. H. M. SINCLAIR (Oxford), Dr. LEONARD H. HOWELLS (Cardiff), Dr. EMRYS WILLIAMS (Cardiff).

SCIENTIFIC SECTIONS

MEDICINE

President: Professor A. M. KENNEDY, M.D., F.R.C.P. (Cardiff).

Vice-Presidents: Professor W. MELVILLE ARNOTT, B.Sc., M.D., F.R.C.P. (Birmingham); Sir DANIEL DAVIES, M.D., F.R.C.P. (London); LEONARD H. HOWELLS, K.C.V.O., M.D., F.R.C.P. (London); and Professor W. J. E. JESSOP, M.D., F.R.C.P. (Cardiff); and Professor W. J. E. JESSOP, M.Sc., M.D., F.R.C.P.I., D.P.H., F.R.I.C. (Dublin).

Hon. Secretaries: BYRON EVANS, M.D., M.R.C.P., 59, Cathedral Road, Cardiff; JOHN RICHARDSON, M.V.O., M.D., F.R.C.P., 33, Devonshire Place, London, W.1.

The following programme has been arranged:

Wednesday, July 15—morning and afternoon. A.m., Subject: The Use and Abuse of Antibiotics. (The names of the openers and the invited speakers will be announced later.) P.m., Subject: The Early Diagnosis of Intrathoracic New Growths. To be opened by Sir GEOFFREY MARSHALL (London), Mr. VERNON THOMPSON (London), and Dr. PETER KERLEY (London), followed by Dr. BRIAN TAYLOR (Birmingham) and Mr. DILLWYN THOMAS (Cardiff).

SURGERY

President: Professor LAMBERT C. ROGERS, V.R.D., M.Sc., M.D., F.R.C.S., F.A.C.S., F.R.A.C.S. (Cardiff).
Vice-Presidents: D. J. HARRIES, M.D., F.R.C.S. (Cardiff); J. B. HAYCRAFT, M.C., M.B., F.R.C.S. (Cardiff); D. IOAN JONES, M.B., F.R.C.S. (Cardiff); C. JENNINGS MARSHALL, M.D., M.S., F.R.C.S. (London); A. DICKSON WRIGHT, M.S., F.R.C.S. (London).

Hon. Secretaries: STANLEY AYLETT, M.B.E., M.B., F.R.C.S., 114, Harley Street, London, W.1; D. B. E. FOSTER, M.B., F.R.C.S.Ed., Hillboro, Llandough, Penarth, Glamorgan.

The following programme has been arranged.

Wednesday, July 15—morning and afternoon. A.m., Subjects: The Relief of Pain of Vascular Disease in the Lower Limb. To be opened by Sir JAMES PATERSON ROSS (London) and Mr. J. B. OLDHAM (Liverpool), followed by Mr. HAROLD DODD (London) and Professor C. G. ROB (London). P.m., Subject: (1) The Treatment and Diagnosis of Toxic Goitre. To be opened by Mr. R. V. COOKE (Bristol). (2) The Treatment of Diseases of the Gall-bladder and Bile Ducts. To be opened by Mr. McNEILL LOVE (London).

OBSTETRICS AND GYNAECOLOGY

President: Professor G. I. STRACHAN, M.D., F.R.C.P., F.R.C.S., F.R.C.O.G. (Cardiff).

Vice-Presidents: M. D. ARWYN EVANS, M.D., F.R.C.S.Ed., F.R.C.O.G. (Cardiff); Professor H. HARVEY EVERS, M.B., M.S., F.R.C.S., F.R.C.O.G. (Newcastle-upon-Tyne); R. G. MALIPHANT, M.D., M.R.C.P., F.R.C.S., F.R.C.O.G. (Cardiff); H. K. PACEY, M.D., F.R.C.S., F.R.A.C.S., F.R.C.O.G. (Wellington, New Zealand); LESLIE H. W. WILLIAMS, M.D., M.S., F.R.C.S., F.R.C.O.G. (London).

Hon. Secretaries: J. M. BOWEN, M.B., M.R.C.O.G., 9, Edward VII Avenue, Newport, Mon; ALISTAIR L. GUNN, M.D., F.R.C.S.Ed., F.R.C.O.G., 51, Harley Street, London, W.1.

The following programme has been arranged:

Wednesday, July 15—morning and afternoon. A.m., Subjects: The Place of the Forceps in Present-day Obstetrics. To be opened by Professor T. N. A. JEFFCOATE (Liverpool), followed by Mr. GAVIN BOYD (Belfast), Mr. WILLIAM HUNTER (Newcastle-upon-Tyne), and Mr. E. PARRY JONES (St. Asaph, Flint). Short Paper: Professor J. C. McCLURE BROWNE (London), Placental Circulation in Pre-eclamptic Toxaemia. P.m., Subjects: The Climacteric. To be opened by Mr. ALECK W. BOURNE (London), followed by Mr. T. N. MACGREGOR (Edinburgh), Professor H. C. McLAREN (Birmingham), and Mr. M. D. ARWYN EVANS (Cardiff). Short Paper: Dr. D. McKAY HART (Glasgow), Dysmenorrhoea.

ANAESTHETICS

President: C. LANGTON HEWER, M.B., B.S., M.R.C.P., D.A., F.F.A.R.C.S. (London).

Vice-Presidents: RONALD JARMAN, D.S.C., M.R.C.S., L.R.C.P., D.A., F.F.A.R.C.S. (London); A. HUGH MUSGROVE, M.R.C.S., L.R.C.P., D.A., F.F.A.R.C.S. (Cardiff); WILLIAM W. MUSHIN, M.A., M.B., B.S., D.A., F.F.A.R.C.S. (Cardiff).

Hon. Secretaries: J. G. BOURNE, M.B., B.Ch., D.A., 37, Marsham Court, Westminster, S.W.1; I. RHYS JONES, M.R.C.S., L.R.C.P., D.A., Cliff Cottage, Radyr, Glamorgan.

The following programme has been arranged:

Wednesday, July 15—morning and afternoon. A.m., Subject: A Return to Simplicity. To be opened by Dr. M. D. NOSWORTHY (London), followed by Dr. W. W. MUSHIN (Cardiff). P.m., Subjects and speakers will be announced later.

CARDIOLOGY

President: MAURICE CAMPBELL, O.B.E., D.M., F.R.C.P. (London).

Vice-Presidents: A. RAE GILCHRIST, M.D., F.R.C.P. (Edinburgh); Professor C. BRUCE PERRY, M.D., F.R.C.P. (Bristol); WILLIAM PHILLIPS, M.D., F.R.C.P. (Cardiff).

Hon. Secretaries: SHEILA HOWARTH, M.B., B.S., Institute of Cardiology, 35, Wimpole Street, London, W.1; ARTHUR J. THOMAS, M.D., M.R.C.P., D.P.H., Tanooma, Llandough, near Penarth, Glamorgan.

The following programme has been arranged:

Wednesday, July 15—afternoon. Subject: Pulmonary Heart Disease. To be opened by Dr. A. J. THOMAS (Cardiff) and Professor JETHRO GOUGH (Cardiff), followed by Dr. WILLIAM EVANS (London).

DISEASES OF THE CHEST

President: SIR CLEMENT PRICE THOMAS, K.C.V.O., F.R.C.S. (London).

Vice-Presidents: A. L. D'ABREU, O.B.E., M.D., Ch.M., F.R.C.S. (Birmingham); Professor FREDERICK HEAF, M.D., F.R.C.P. (Cardiff); DILLWYN M. E. THOMAS, M.R.C.S., L.R.C.P. (Sully, Glam).

Hon. Secretaries: H. R. S. HARLEY, M.S., F.R.C.S., 93, Station Road, Llanishen, Cardiff; M. MEREDITH BROWN, B.M., F.R.C.S.Ed., 17, Priory Mansions, Drayton Gardens, London, S.W.10.

The following programme has been arranged:

Friday, July 17—morning. Subjects: The Value of Artificial Pneumothorax in the Treatment of Pulmonary Tuberculosis. To be opened by Dr. HOWARD NICHOLSON (London) and Dr. C. H. C. TOUSSAINT (London), followed by Mr. R. S. BARCLAY (Newton Mearns, Renfrewshire), Dr. C. S. DARKE (Sheffield), and Dr. PETER EDWARDS (Cheshire Joint Sanatorium). *Short Papers:* (1) Mr. O. S. TUBBS (London), Constrictive Pericarditis. (2) Mr. R. H. FRANKLIN (London), Congenital Atresia of the Oesophagus. (3) Dr. ARCHIE COCHRANE (Cardiff), Radiological Diagnosis of Pneumoconiosis.

CHILD HEALTH

President: Professor A. G. WATKINS, M.D., F.R.C.P. (Cardiff).

Vice-Presidents: V. MARY CROSSE, O.B.E., M.D., D.P.H., D.R.C.O.G. (Birmingham); Professor A. V. NEALE, M.D., F.R.C.P., D.P.H. (Bristol); J. N. O'REILLY, D.M., M.R.C.P. (London).

Hon. Secretaries: P. T. BRAY, M.R.C.P., D.C.H., 28, Park Place, Cardiff; I. A. B. CATHIE, M.D., M.R.C.P., Pathological Department, The Hospital for Sick Children, Great Ormond Street, W.C.1.

The following programme has been arranged:

Wednesday, July 15—afternoon. Subject: Care of the Newborn. To be conducted on a basis of "Any Questions?" The names of the panel will be announced later. Poisoning in Childhood. To be opened by Dr. D. SWINSCOW (London) and Dr. J. O. CRAIG (Edinburgh).

DERMATOLOGY

President: R. M. B. MACKENNA, M.D., F.R.C.P. (London).

Vice-Presidents: LOUIS FORMAN, M.D., F.R.C.P. (London); GEOFFREY HODGSON, M.B.E., D.M. (Cardiff); BERNARD A. THOMAS, M.D., D.P.H. (Newport, Mon).

Hon. Secretaries: A. J. ROOK, M.D., M.R.C.P., 23, Park Place, Cardiff; D. S. WILKINSON, M.D., M.R.C.P., Whitecroft, Hervines Road, Amersham, Bucks.

The following programme has been arranged:

Wednesday, July 15—morning. Subject: Symposium on Practical Problems in the Management of Disorders of the Skin in General Practice. (1) Dr. LOUIS FORMAN (London), The Management of Pruritus. (2) Professor ARTHUR W. GRACE (New York), The Differential Diagnosis and the Treatment of Ringworm of the Feet. (3) Dr. C. H. WHITTLE

(Cambridge), The Problem of Nummular Eczema. (4) Dr. C. S. NICOL (London), Difficulties in the Interpretation of the Serological Tests for Syphilis. (5) Dr. MARTIN BEARE (Belfast), Difficulties in the Diagnosis and Treatment of Scalp Ringworm. (6) Dr. D. S. WILKINSON (Amersham), Management of Hypostatic Conditions of the Lower Leg. (7) Dr. IAN SNEDDON (Sheffield), Overtreatment. (8) Dr. GEOFFREY HODGSON (Cardiff), The Influence of Home Conditions on Skin Diseases.

In connexion with this Section a clinical demonstration will be held on the afternoon of Wednesday, July 15, in Cardiff Royal Infirmary. Further details of this will be available at a later date.

NEUROLOGY

President: W. RITCHIE RUSSELL, C.B.E., M.D., F.R.C.P. (Oxford).

Vice-Presidents: Professor PHILIP C. P. CLOAKE, M.D., F.R.C.P., D.P.M. (Birmingham); T. ROWLAND HILL, M.D., F.R.C.P. (London); W. ESMOND REES, M.D., F.R.C.P. (Swansea).

Hon. Secretaries: CHARLES LANGMAID, M.B., F.R.C.S., 174, Lake Road East, Roath Park, Cardiff; C. W. M. WHITTY, D.M., M.R.C.P., Department of Neurology, The Radcliffe Infirmary, Oxford.

The following programme has been arranged:

Friday, July 17—morning. Short Papers: (1) Dr. HONOR SMITH (Oxford), Diagnosis and Treatment of Meningitis. (2) Dr. A. B. KINNIER WILSON (Oxford), Dangers of Bulbar Poliomyelitis. (3) Dr. RICHARD JOHNSON (Manchester), Surgical Treatment of Intracranial Haemorrhage. (4) Dr. MURRAY FALCONER (London), New Trends in the Diagnosis of Spastic Paraplegia.

OCCUPATIONAL HEALTH

President: J. A. L. VAUGHAN JONES, M.B., Ch.B. (Leeds).

Vice-Presidents: Professor R. C. BROWNE, M.A., D.M., M.R.C.P. (Newcastle-upon-Tyne); ANDREW MEIKLEJOHN, M.D., M.R.C.P., F.R.F.P.S. (Glasgow); J. M. ROGAN, M.D., F.R.C.P.Ed., D.P.H. (London); J. S. SPICKETT, M.R.C.S., L.R.C.P. (Bridgend, Glam).

Hon. Secretaries: J. G. BILLINGTON, M.R.C.S., L.R.C.P., 7, Westfield Hall, Hagley Road, Edgbaston, Birmingham, 16; H. L. COULTHARD, M.D., M.R.C.P., D.P.H., 149, Heathwood Road, Cardiff.

The following programme has been arranged:

Friday, July 17—morning. Symposium: Work and Age. Dr. N. T. WELFORD (Cambridge), Dr. W. P. D. LOGAN (London), Dr. D. D. REID (London), and Dr. I. M. RICHARDSON (Aberdeen). *Film:* Date of Birth. *Occasional Papers:* (1) Carcinoma of the Lung Associated with Certain Industries, Dr. J. GWYNNE MORGAN (Clydach). (2) Method of Demonstrating Porphyrin in the Urine of Lead Workers, Dr. J. GWYNNE MORGAN (Clydach).

OPHTHALMOLOGY

President: J. H. DOGGART, M.D., F.R.C.S. (London).

Vice-Presidents: RUPERT J. PARRY, M.B., F.R.C.S.Ed. (Cardiff); ROY THOMAS, M.B., F.R.C.S.Ed., D.O.M.S. (Swansea); EUGENE WOLFF, M.B., F.R.C.S. (London).

Hon. Secretaries: BERNARD GLUCK, M.Ch., F.R.C.S.Ed., D.O.M.S., 76, Cathedral Road, Cardiff; A. J. B. GOLDSMITH, M.B., F.R.C.S., 63, Harley Street, London, W.1.

The following programme has been arranged:

Friday, July 17—morning. Subject: (1) The Ocular Complications of Diabetes. To be opened by Mr. G. I. SCOTT (Edinburgh) and Dr. LEONARD HOWELLS (Cardiff), followed by Mr. A. B. NUTT (Sheffield). (2) The Scope of Corneal Graft Surgery. To be opened by Mr. B. W. RYCROFT (London) and Mr. E. C. ZORAB (Southampton), followed by Mr. J. AYUB (London) and Mr. A. G. LEIGH (London).

ORTHOPAEDICS

President: A. O. PARKER, M.D., C.M., M.C.P.S., F.R.C.S. (Monmouth).

Vice-Presidents: IAN LAWSON DICK, M.D., Ch.M., F.R.C.S.Ed. (Edinburgh); A. M. HENDRY, M.B., F.R.C.S.Ed. (Birmingham); D. N. ROCYN-JONES, M.D., F.R.C.S.Ed. (Cardiff).

Hon. Secretaries: J. M. P. CLARK, M.B.E., M.B., F.R.C.S., 29, Park Square, Leeds, 1; DILLWYN EVANS, M.B., F.R.C.S.Ed., 25, Cathedral Road, Cardiff.

The following programme has been arranged:

Friday, July 17—morning. Subject: The Injured Hand. *Opening Speakers:* Mr. WILLIAM GISSANE (Birmingham) Major Injuries of the Hand. Mr. R. J. FURLONG (London), The Cut Tendon. Mr. EMLYN LEWIS (Cardiff), Major Skin Loss and the Vascular Effect of Crush Injuries of the Hand. Mr. L. W. PLEWES (Luton), The Rehabilitation of the Hand.

OTO-RHINO-LARYNGOLOGY

President: R. D. OWEN, F.R.C.S. (Cardiff).

Vice-Presidents: C. GILL-CAREY, F.R.C.S. (London); R. R. SIMPSON, M.B., F.R.C.S.Ed. (Hull); HECTOR A. THOMAS, M.B., F.R.C.S.Ed. (Cardiff).

Hon. Secretaries: ALUN BEYNON THOMAS, M.B., F.R.C.S., D.L.O., 23, Park Place, Cardiff; JOAN WADGE, M.B., F.R.C.S., 15, Devonshire Place, London, W.1.

The following programme has been arranged:

Friday, July 17—morning. Subject: (1) The Diagnosis and Treatment of Upper Respiratory Tract Infections in Allergic Children. To be opened by Mr. ANGELL JAMES (Bristol), followed by Dr. JOSEPH JACOBS (Cardiff) and Dr. J. PEPYS (London). (2) The Management of Otitis Media. (The speakers on this subject will be announced later.)

PATHOLOGY

President: Professor J. B. DUGUID, M.D. (Newcastle-upon-Tyne).

Vice-Presidents: E. N. ALLOTT, D.M., F.R.C.P. (Beckenham); Professor J. GOUGH, M.D. (Cardiff); Professor R. A. Q. O'MEARA, D.Sc., M.D., D.P.H., F.R.C.P.I., F.T.C.D. (Dublin).

Hon. Secretaries: I. H. O. EARLE, M.D., 12, Hillside, Wimbledon, London, S.W.19; SCOTT THOMSON, M.D., M.R.C.P.Ed., D.P.H., Public Health Laboratory Service, Institute of Pathology, Third Floor, Royal Infirmary, Cardiff.

The following programme has been arranged:

Wednesday, July 15—morning. Subject: Gastro-enteritis in Babies. To be opened by Professor ROBERT CRUICKSHANK (London), followed by Dr. M. T. PARKER (Manchester), Dr. K. B. ROGERS (Birmingham), and Dr. JOAN TAYLOR (London).

PREVENTIVE MEDICINE

President: J. GREENWOOD WILSON, M.D., F.R.C.P., D.P.H. (Cardiff).

Vice-Presidents: A. R. CULLEY, M.D., D.P.H. (Cardiff); Professor I. G. DAVIES, M.D., M.R.C.P., D.P.H. (Leeds); Professor T. FERGUSON, D.Sc., M.D., F.R.C.P.Ed., F.R.F.P.S., D.P.H. (Glasgow).

Hon. Secretaries: R. T. BEVAN, M.B., Ch.B., D.P.H., West Winds, 14, Rhiwbina Hill, Rhiwbina, Cardiff; J. A. STIRLING, D.S.C., M.B., Ch.B., D.P.H., Public Health Department, Town Hall, Chesterfield.

The following programme has been arranged:

Wednesday, July 15—morning and afternoon. A.m., Subject: The Health Visitor and the Family Doctor. To be opened by Dr. LLYWELYN ROBERTS (Sheffield) and Dr. STANLEY THOMAS (London). *P.m., Subject:* Cancer and the Community. To be opened by Dr. PERCY STOCKS (Rhodes-on-Sea) and Mr. RONALD W. RAVEN (London), followed by Dr. E. K. MACDONALD (Leicester).

PSYCHIATRY

President: T. J. HENNELLY, M.D., D.P.M. (Cardiff).

Vice-Presidents: Professor D. R. MACCALMAN M.D., M.R.C.P.Ed. (Leeds); DORIS M. ODLUM, M.R.C.S., L.R.C.P.

D.P.M. (London); HENRY V. DICKS, M.A., M.D., F.R.C.P. (London).

Hon. Secretaries: KENNETH SODDY, M.D., D.P.M., World Federation for Mental Health, 19, Manchester Street, London, W.1; JOSEPH P. SPILLANE, M.D., D.P.M., Whitchurch Hospital, Cardiff, Glam.

The following programme has been arranged:

Wednesday, July 15—afternoon. Subject: Interpersonal Relationships and Stresses within the Family. To be opened by Dr. H. V. DICKS (London) and Dr. W. S. MACDONALD (Leeds).

RADIOLOGY

President: PETER KERLEY, C.V.O., C.B.E., M.D., F.R.C.P., D.M.R.E., F.F.R. (London).

Vice-Presidents: J. A. C. FLEMING, M.B., F.R.C.S.Ed., D.M.R.E., F.F.R. (London); ERNEST HANSON, M.B., B.S., D.M.R. (Cardiff); E. ROHAN WILLIAMS, M.D., F.R.C.P., D.M.R.E., F.F.R. (London).

Hon. Secretaries: MARGARET D. SNELLING, M.B., M.R.C.P., F.R.C.S., D.M.R., Meyerstein Institute of Radiotherapy, The Middlesex Hospital, London, W.1; BRYAN WILLIAMS, M.R.C.P., D.M.R.D., 119, Cathedral Road, Cardiff.

The following programme has been arranged:

Wednesday, July 15—morning. Subject: Radiology of Congenital Heart Disease. To be opened by Dr. THOMAS LODGE (Sheffield), Dr. ROBERT STEINER (London), and Dr. THOMAS HILLS (London). (Names of any other speakers to be announced later.)

SCIENTIFIC EXHIBITION

All the stands (32) have now been allocated, and details will be given in a later issue of the *Journal*.

TIME-TABLE AND HOTEL ACCOMMODATION

An up-to-date time-table giving details of the social functions and excursions arranged during the Annual Meeting, and a further list of hotel accommodation available in and around Cardiff, will be published shortly (see *Supplement*, February 14, p. 39, and 21, p. 48, for previous notices).

IRISH HEALTH BILL REJECTED

I.M.A. SPECIAL GENERAL MEETING

The Irish Medical Association on March 18 unanimously rejected the Health Bill now before the Dail. The association would refuse to co-operate if it became law, and a defence committee was set up to devise ways and means of defeating the Government's proposals. The decision was announced after a special general meeting, at the opening of which Dr. A. McCarthy, chairman of the central council, said that reports from branches and groups were unanimously against the Bill.

Declaring that the association had a membership of 2,200, representing over 90% of the doctors of Ireland, he said that whatever scheme was brought in would have to be worked by the doctors. They had the power in their hands, and what was needed was the determination and courage to use it.

Objections Summarized

The I.M.A. summarized the objections to the Bill under five points: (1) that it contained in essence State control of the medical profession; (2) that under it the State must enter unduly and very intimately into the lives of patients and of doctors; (3) that to implement it the whole community must be heavily taxed independently of the necessity or desire of the citizens to use the facilities that might be provided; (4) that its implementation by taxation direct or indirect would morally compel the citizens to avail themselves of the services; and (5) that under it, the State must have recourse in great part to ministerial regulations as distinct from enactments of Parliament.

British Medical Association

EXTRAORDINARY GENERAL MEETING,
MAY 5, 1953

The names of the signatories to the requisition for an Extraordinary General Meeting which the Council has convened for Tuesday, May 5, 1953, at 2.30 p.m. (see *Supplement*, March 21, p. 70), are as follows:

Alken, C. F. S., Padstow
Allison, S., Liverpool
Andrew, Katharine M., Parkstone
Arazi, E. C., Mitcham
Armstrong, T. V., Manchester
Barber, C. H., Thame
Beattie, T. M., Manchester

GENERAL MEDICAL SERVICES
COMMITTEE

THE FATE OF THE DISTRIBUTION SCHEME

An all-day meeting of the General Medical Services Committee was held at Headquarters on March 19, with Dr. A. TALBOT ROGERS in the chair. Dr. A. Kelly, Deputy General Secretary of the Canadian Medical Association, attended the meeting and was given a hearty welcome.

It was reported that the evidence on general practice proposed to be given to the Cohen Committee had been approved by the Council at its meeting on the previous day, subject to certain suggested revisions made in the course of the debate.

College of General Practitioners

In response to an invitation given at the previous meeting, Dr. G. F. Abercrombie, Chairman of Council of the College of General Practitioners, and Dr. J. H. Hunt, Honorary Secretary, attended the meeting to discuss matters of mutual interest. The Chairman welcomed the visitors and said that in the General Medical Services Committee they were, of course, concerned with the affairs of general practitioners, and it was desired to make certain that the work of the two organizations would be complementary.

Dr. ABERCROMBIE said that he could speak for the whole of his council when he stated that they were not interested as a College in medical politics. Their sole object was the education of the general practitioner and the improvement of general practice.

Dr. HUNT thanked the Committee for the congratulations which it had extended to the College and which had been very encouraging and helpful. He repeated also that they were interested only in the academic side of general practice. In order to underline this, they felt that their regional faculties should be situated in universities which had medical schools. He himself had feared there might be a certain overlapping between the work of the British Medical Association and the College, but in his view there was plenty of room for both. He asked whether the Committee discussed subjects of academic interest and what liaison it might have with the Postgraduate Medical Federation of the University of London and with the 19 universities in Great Britain and Eire which had medical schools.

Postgraduate Training

Dr. TALBOT ROGERS said that they were concerned with the postgraduate training of the general practitioner and had looked into that matter very carefully. He referred to one of the aims of the College—namely, an open door for the general practitioner to the pathological and x-ray and like facilities in hospitals—and inquired how this objective could be achieved outside medical politics.

Dr. HUNT said that they had collected a great deal of evidence on this and similar matters which would be at the Committee's disposal if it wished. It would be their aim to refer all matters to do with medical politics to the B.M.A.

Dr. BEAUCHAMP asked what would be the relationship between the regional faculties and the kindred organizations already existing in the area.

Dr. HUNT replied that it would be the same as the arrangements already existing in London. His College and the General Practitioner Section of the Royal Society of Medicine and other like bodies would be complementary.

The CHAIRMAN pointed out that they had in the Association a Central Consultants and Specialists Committee which dealt with the Ministry through a Joint Committee with the Royal Colleges. In the General Medical Services Committee they would not be in favour of such a joint arrangement with the College of General Practitioners.

Dr. FRANK GRAY said that, while accepting the view that the spheres of the Committee and the College would in general be separate, he wondered whether their visitors had any ideas as to how the problem of overlapping when it occurred could be solved.

Close Liaison

Dr. HUNT said that what he would like to see was a very close liaison between the two bodies, and he hoped that a member or more than one member of the Committee might be on his College council.

Dr. H. G. DAIN said that they were all convinced of the sincerity of the present representatives of the College in saying that there was no intention on the part of the College to enter the medico-political field. But there could be no assurance that their successors would be of a like mind. He was very anxious that nothing should happen to destroy or harm the work of the committee of the British Medical Association in its approach to the Ministry. The General Medical Services Committee could claim to go to the Ministry as representative of the whole body of general practitioners. It would be seen, therefore, that he regarded the starting of the College of General Practitioners with some misgiving.

Dr. F. M. ROSE said that it all depended on the College and the methods by which it was run.

Dr. W. WOOLLEY said that in his view the College would be up against medical politics right from the beginning if they wanted to do anything with hospitals. He admired their intention to keep out of medical politics, but he was not at all sure how they were going to do it.

Dr. ABERCROMBIE said that he thought that if the College found itself faced with a problem the solution of which was not its business it would transfer the whole matter to the proper quarter.

Dr. Abercrombie and Dr. Hunt were thanked for their attendance and then retired.

Dr. FRANK GRAY said that it was important to have a co-operative basis from the beginning. In his view a Liaison Committee would not be adequate as a permanent arrangement.

It was agreed that a small number from the College and the General Medical Services Committee should continue the discussions and report back in due course.

The Conference Rider

A report by the Working Party Subcommittee was submitted and led to long discussions. Dr. TALBOT ROGERS, who had been in the chair of the subcommittee, said that it had been proposed to take immediate steps, in view of the Conference rider, to find out the number of groups of general practitioners who might be adversely affected by the new distribution scheme. The subcommittee felt that inquiries must be carried out on a uniform basis throughout the country, and information sought from the Ministry, executive councils, and local medical committees. It had been decided, in view of the sense of urgency, to invite the Ministry to call the full Working Party together again to investigate the problem. An official inquiry would safeguard both the accuracy of the information sought and the form in which it was given. He proposed that the action of the subcommittee in taking steps to call the Working Party together again for the investigation of the problem of the future remuneration of the small-list practitioner be approved.

This was agreed to.

Requisition for Extraordinary Meeting

The Committee then turned to the requisition signed by more than 100 members for an Extraordinary General Meeting to be convened to consider a resolution which was set out in the notice of the meeting, published in the *Journal* of March 21, and in the report of the proceedings of Council (see p. 85 of this *Supplement*).

Dr. MACRAE (Secretary of the Association's Solicitor at the legal position as stated by the Association's Solicitor at the Council on the previous day.

Dr. KNOX, Chairman of the Conference, proposed the acceptance of a recommendation of the Working Party Subcommittee that a Special Conference of Representatives of Local Medical Committees be convened on the issue

which had been raised, and to decide what action was necessary in view of the resolution to be brought forward at the Extraordinary General Meeting.

Dr. HOWIE WOOD seconded, and other members supported the calling of a Special Conference.

Dr. BRUCE CARDEW said that his organization, the Medical Practitioners Union, had had, of course, no opportunity of expressing its opinion on this matter, but he had little doubt about the view they would hold when they learnt of the new position. He was one who had moved certain modifications in the Working Party's proposals, but in no sense of the word was his organization behind this move on the part of the requisitionists to delay the implementation of the report of the Working Party, nor, he thought, would his council be likely to be in sympathy with it. After the acceptance of the Working Party's proposals he had always said that he believed the scheme should go forward. Certain modifications had been made, and he was entirely satisfied with the undertaking by the Committee to ask the Working Party to investigate further the problem of the future remuneration of the small-list practitioner. When his Union met to consider this matter he was convinced that it would disapprove of any attempt whatsoever to upset the scheme in the way proposed, though they would continue to seek certain modifications through the proper channels. Dr. MACALISTER, the President of the M.P.U. (a member of the Committee), indicated his assent.

Dr. F. M. ROSE thought it essential that the Conference should again in present circumstances reaffirm its decision taken in the early part of last year.

A motion to hold a Special Conference before the Extraordinary General Meeting was agreed to with two dissentients, and discussion then turned upon the appropriate date. Dr. DAIN suggested that the Conference be held on the morning of the day fixed for the Extraordinary General Meeting—namely, May 5.

Dr. HOWIE WOOD seconded Dr. Dain's proposal. Dr. CARDEW moved as an amendment that the Special Conference take place at a date well in advance of the Extraordinary General Meeting. This would give an opportunity for a full report of the Conference in the *Journal* and a better understanding of the issues by all concerned before the Extraordinary General Meeting took place. Dr. FRANK GRAY seconded.

A proposal to hold the meeting at an earlier date was lost, and the motion that the Special Conference be held on the morning of May 5 was carried.

The Committee then turned to the consideration of a draft report to the Special Conference and approved it subject to certain alterations. It also approved a letter, to be signed by the Chairman of the Conference, to go out to chairmen of local medical committees.

Flood Relief

Sitting as trustees of the General Medical Services Defence Trust, the members of the Committee received a statement from Dr. KELYNACK (Assistant Secretary) on the measures taken to assist doctors who had suffered as a result of the recent flood disaster. She said that there had been an extraordinarily good response to the appeal, and altogether some £3,670 had been received, including £1,500 (out of £5,000 set aside for the purpose) from Trust funds. Twenty-one doctors had already received help from the fund.

It was agreed by the Trustees that inquiries should be made as to whether there were any means of giving help to doctors in the Netherlands and that a report on this subject be made at the next meeting.

Provisional Inclusion in Medical List

The CHAIRMAN reported that a meeting of the Liaison Subcommittee with the Medical Practices Committee had been held to discuss the position arising from the decision of the Medical Practices Committee to discontinue the granting of applications for inclusion in the medical list provisionally. The reason for this change was that it did not seem

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

justifiable to alter the classification of an area as a result of a provisional application which might not mature. It was pointed out in discussion that whatever course was taken difficulties were bound to arise. The representatives of the General Medical Services Committee suggested that the position could best be met by enforcing safeguards that in such cases provisional admission should be granted only for a short period and only in one area at a time. The Medical Practices Committee had agreed that this appeared to be an equitable solution and undertook to discuss it with the Executive Councils Association. Dr. ROGERS said that what it came to was that where a practitioner applied to go provisionally on the list his application would be granted for at least one month, but if at the end of that time there was another practitioner who was in possession of premises and waiting to go on the list the period would not be extended.

Various

The Committee had spent a very large part of its session in discussing the requisition for an Extraordinary General Meeting in connexion with the Working Party's report, and other items on what had appeared to be a light agenda had to be dealt with quickly or in some cases held over until the next meeting on April 16. Dr. J. D. R. MURRAY reported on his discussion with the Central Ethical Committee on the circumstances in which patients of vacant practices should be accepted by other doctors in the vicinity. Certain suggestions were put forward by the Central Ethical Committee, but Dr. ROGERS from the Chair said that in his view the suggestions were too far-reaching, and might make it difficult to obtain locums. It was agreed to consult further with the Central Ethical Committee.

The Committee also considered, among other documents, a draft E.C.L. on "hardship payments" to elderly doctors, the last of the documents in the present series required to give effect to the recommendations of the Working Party.

It was also reported that local medical committees had been asked for their observations on the relationship between the general practitioner and the school medical service in the light of the agreement reached between the Association and the Society of Medical Officers of Health in 1950. Seven out of eight replies received reported good liaison.

The Assistants and Young Practitioners Subcommittee submitted to the Committee a procedure for compiling electoral rolls and the criteria for inclusion in the rolls. The subcommittee had also under consideration the compilation of a register of unestablished practitioners. Its proposal was that in future principals, including partners, predominantly engaged in general practice, whose lists do not exceed 1,500, should be eligible for inclusion on the roll of unestablished principals. This proposal was referred back to the subcommittee.

On the question of the possibility of issuing national code numbers to doctors instead of the present numbers on a local basis, which the Committee had requested the Ministry of Health to examine, the Ministry stated that it had looked into the matter, but thought that the balance of advantage was in favour of maintaining the present arrangements.

ABERDEEN APPRENTICE SCHEME FOR MEDICAL STUDENTS

The Aberdeen Executive Council has approved a scheme for practical instruction in general practice for medical students put forward by the City of Aberdeen Division of the B.M.A. Under the scheme students in their fifth or final year can be apprenticed to a general practitioner for about a month during vacation.

A circular sent by the Division to general practitioners in Banff, Moray, Nairn, Aberdeenshire, Kincardineshire, and the City of Aberdeen has brought an extremely favourable response. Nearly 90% of the general practitioners have expressed their willingness to participate. The scheme is a voluntary one for both practitioners and students.

SENIOR REGISTRARS

The Joint Consultants Committee has made fresh representations to the Ministry of Health on behalf of those senior registrars whose appointments are being terminated and for whom suitable opportunities are not available in the hospital services or elsewhere. The Ministry is collecting figures from the regions with a view to ascertaining the exact extent of the problem, but the information received is not yet complete. The Joint Consultants Committee has protested at the delay and has received an assurance that the figures will be passed on to it as soon as they are available. It is hoped that the Committee will be in a position to resume the discussions with the Ministry in the near future.

PRIVATE HOSPITAL TREATMENT

NEW PAY-BED REGULATIONS

The Minister of Health has now laid before Parliament new Pay-bed Regulations—the National Health Service (Pay-bed Accommodation in Hospitals, etc.) Regulations, 1953—under Sections 4 and 5 of the National Health Service Act, 1946. These regulations are designed to come into operation on April 1 next, when they will supersede the existing regulations.

The new regulations, which have been the subject of lengthy discussions between the Joint Consultants Committee and the Ministry (and with the Minister himself), deal broadly with two matters: (a) the manner in which the charges for private hospital beds shall be assessed, and (b) the maximum professional fees to be charged to patients desiring private treatment in hospital.

Private-bed Charges

Under Section 5 of the 1946 Act, patients seeking treatment in private hospital beds are required to pay the whole cost of the accommodation and services provided. Since 1948 the charges for private beds have risen to an alarming degree—in some hospitals being more than £25 per week—and during the discussions on the new regulations the Joint Committee sought a personal interview with the Minister of Health and impressed upon him that unless some action was taken to reduce the charges private practice would steadily diminish. The Committee reminded the Minister of the promises of previous Governments that facilities for private practice would be retained under the new Service. It pointed out that it was the experience of consultants in many parts of the country that there was a falling off in demand for private treatment—due largely in their opinion to the high maintenance charges—and that this was bound also to affect hospital revenue. The Committee therefore urged the reintroduction of a moderately priced private bed.

New Legislation Unlikely

In reply the Minister stated that he thought the possibility of introducing the necessary legislation during the next two or three years was extremely remote in view of the heavy parliamentary programme. The Minister added that, while he was anxious not to place any obstacle in the way of private practice, he doubted whether the falling-off in private hospital treatment was primarily due to the high charges. He agreed, however, that if this could be substantiated the position would warrant further consideration, because the provisions of Section 5 were intended to implement the promise given that private practice facilities should continue.

Calculation of Charges

The new regulations are still designed to secure that the charges for private beds shall represent the whole cost, but there are certain changes in the method of calculating the charges that will in many cases result in a reduction of the charge. Thus in hospitals where the total cost of the pay

block cannot be determined separately from the cost of the public wards, the percentage increases which are added to the average daily in-patient cost to arrive at the private-bed charge are reduced from 25% (single room), 15% (double room), or 5% (multiple-bedded room) to 15%, 10%, and 5% respectively. Furthermore, these percentage increases are to be added to the net daily in-patient cost before the addition of the salaries of medical and dental staff instead of after the addition of these salaries as hitherto; and the cost of any service from which the private patient receives no benefit—such as the almoner's and medical records departments—is excluded from the maintenance charge.

Maximum Professional Charges

The main criticism which is likely to be levelled by the profession against the new regulations so far as they concern the professional fees to be charged to private hospital patients is that the detailed classification of operations is retained.

The Joint Committee made strenuous efforts to persuade the Ministry—and even the Minister himself—that the attempt arbitrarily to divide operations into categories of major, intermediate, and minor without reference to the condition of the individual patient was unrealistic and unlikely to work satisfactorily. Unfortunately the Minister has adhered to the view that the classification is necessary as a protection to the patient, despite the repeatedly expressed view of the Committee that the classification affords no protection at all and that on the contrary the maximum fee for each category of operation was likely to become the standard charge, whereas in the past consultants normally related their fee to the particular requirements of the case and to the patient's circumstances.

The Ministry sought the assistance of the Joint Committee in improving the detailed classification of operations, but, because of its view that any classification was impracticable, the Committee declined to accept any responsibility for it.

Some Increase in Professional Fees

Apart from this point of major principle on which the Ministry and the Joint Committee were unable to reach any agreement there are certain improvements in the 2nd Schedule, setting out the maximum professional fees. The maximum fee that may be charged by a physician is increased from 25 to 40 guineas, with a similar increase for a surgeon in cases not involving an operation. There are also changes in the maximum fees in other specialties and the scale for radiotherapists has been completely revised. The maximum fee payable to a general practitioner attending a patient privately in hospital has been increased from 15 to 20 guineas.

The overall fee of 75 guineas to be charged by all the practitioners concerned in the patient's treatment is retained as the normal maximum, but provision is now made for this maximum to be increased to not more than 125 guineas (at the discretion of the hospital board or committee) in the following circumstances.

(a) When the treatment of the patient in accommodation provided under Section 5 of the Act has lasted four months; or
(b) when the patient needs at least two major operations or at least three major or intermediate operations as part of the same course of treatment during the same stay in such accommodation as aforesaid; or

(c) when the patient requires excision of lung, an operation on the heart or oesophagus, or the excision of a tumour of the brain or spinal cord, or otherwise requires specialized operative techniques involving complicated team-work.

Provision is retained for the maximum charges laid down in the regulations to be exceeded in cases where the patient so agrees, provided not more than 15% of the pay-beds are occupied at any one time by patients who have made such an agreement with their doctors.

In a circular to hospital authorities (R.H.B. (53) 26) the Minister of Health has given guidance on the new regulations. He states that the majority of complaints by patients

about pay-bed questions have been caused by lack of explanation before admission, and "many members of the public have . . . been left with a feeling that they have been unfairly treated." Though such complaints have become less the Minister asks hospitals to make sure that patients know (a) about amenity beds as well as about pay-beds; (b) about their right to be admitted as general patients on urgent medical grounds; and (c) about the nature and amount of the medical fees which their doctors may charge.

Notes and News

Holiday Exchanges.—A few French doctors would like to arrange holiday exchanges for their sons with the children of doctors in this country. A French business man with whose family a British doctor's daughter stayed last summer would like to make an *au pair* arrangement for one of his daughters with a family in this country. Anyone interested should communicate with Dr. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Correspondence

The Trainee Assistant Scheme

SIR,—Perusing your vacancy advertisements, I note a disquieting number of vacancies for "assistant or trainee assistant." This type of advertisement suggests a fundamental misunderstanding of the theoretically admirable trainee assistant scheme. The advertiser implies that assistant and trainee assistant are synonymous as regards the duties they are supposed to do. Surely the positions are no more synonymous than assistant surgeon and house-surgeon? A trainee assistant should be a recently qualified practitioner, taken on as a supernumerary to the practice staff, a bounty of £100 per annum being payable to the principal concerned for the trouble taken in training the young man who is not yet ready for the full responsibilities of practice.

In practice, however, some trainer principals seem to see in the trainee scheme an endless procession of not only cheap, but actually profitable, assistants, upon whom (in the name of giving experience) is thrust all the midwifery, most of the night work, and most of the chronic sick, the responsibility for whom the principal is paid to accept. The trainee is also called upon to replace the rather expensive holiday locum—an advantage to the principal which far overshadows the loss of the few-score disgruntled patients who do not like the constant change. I have computed that it would require the loss of over a thousand such patients to equal the financial loss of swapping a succession of trainees for a permanent assistant or, even less likely, a partner. Only too often the trainee scheme furnishes an excuse for the principal concerned to concentrate in his pocket the whole of the profits from a practice which it requires two to run.

The trainee cannot effectively object to this state of affairs. The threat of an unsatisfactory testimonial at the end of the trainee period is a nasty sword of Damocles hanging over a young doctor about to embark upon the search for a practice. He cannot afford to complain until he is himself established, by which time he has usually forgotten the abuses of the system. A simple and effective remedy for this state of affairs would be to limit each trainer principal to one trainee per five years. This would not be contrary either to the spirit or to the letter of the Spens report (an argument used previously for the retention of the trainee scheme as it is), and would have the advantage of multiplying by five the number of principals given the opportunity of training young practitioners.—I am, etc.,

Hayes, Middx.

TOM RUSSELL.

The General Practitioner and Midwifery

SIR,—I have recently had returned by the executive council some midwifery forms (E.C.24) for patients who have had their babies in hospital, on the grounds that the hospital would take full responsibility for the patient during pregnancy and labour. This appears the thin edge of the wedge to exclude the G.P. from midwifery. The next move could be that patients who have their babies at home will be the sole responsibility of the antenatal clinics. The reason given would be to avoid duplication in the midwifery services. The duplication is very evident, but this is not the solution.

The G.P. bears full clinical responsibility for all pregnant women until they enter hospital. In any emergency patients will always send for their own doctor. According to the above ideas, he would not even know if they were pregnant.

Why not follow normal medical practice? The G.P. should do all routine antenatal and postnatal work, and the hospital should hold a consultant clinic to which patients can be referred by their own doctors when necessary. The hospital could also see their own booked patients once or twice as required. There seems now no place for the local authority antenatal clinic.

I feel that the profession should act very sharply to stop this tendency. If it is allowed to pass by default, general practice will lose its midwifery, and medicine will degenerate one step further.—I am, etc.,

Kisca, Mon.

P. M. VASEY.

E.C.N. 113

SIR,—In 1948 we entered the N.H.S. lured on by various specious promises, amongst them the promise of secretarial help. Although that came to nothing, general practitioners have kept their records, nor am I aware that there have been any grounds for complaint—on the contrary. In any case, the Ministry knows well enough that we cannot conduct our practices without constant use of records.

None the less, a circular directive (E.C.N. 113) is sent out to tell us that "clinical records should contain all information that would normally be considered by general practitioners as necessary . . ." and so on. That is silly enough, but I am amazed to find the G.M.S. Committee a party to the business, and I hasten to assure the G.M.S. Committee that in this matter it represents only itself. It certainly does not represent me. On whose side is it battling?—I am, etc.,

Gateshead.

K. T. BROWN.

Memorandum on General Practice

SIR,—I would strongly suggest that the final draft memorandum on general practice which is to be submitted to the Central Health Service Council's Committee, presided over by Sir Henry Cohen, appears before all Divisions and general practitioners for discussion prior to its submission to the above-mentioned committee. Members will bear in mind that on more than one occasion evidence which was not representative of the medical profession as a whole has been submitted to outside bodies by the Association.—I am, etc.,

Meols, Cheshire.

E. S. A. ASHE.

Dental Anaesthetics

SIR,—In answer to the letter by Mr. J. D. Manson (*Supplement*, February 28, p. 58), I am afraid that neither the ethical rules quoted by the Editor nor the specious arguments of the dental surgeon enter into it. The only thing that matters here is that if the doctor concerned persists in giving dental anaesthetics to patients other than his own, and he knows that the doctors of those patients are willing to give the anaesthetic, then he is reducing medical ethics to a new low level. Having behaved in this rather cut-throat manner, he cannot then be surprised if there is ill feeling between him and his colleagues.

The ethical rules state, "No objection should be taken to the patient inviting his doctor to be present." This is surely one of the most ludicrous things ever written. I cannot imagine any doctor standing by and watching a colleague,

whether he be a specialist anaesthetist or a general practitioner, giving someone gas to have a few teeth extracted when, in spite of what the dentist says, he could do the job equally well himself. There must be many other very busy dentists in the district who get along quite well with the patients having gas from their own doctors.—I am, etc.,

Littlehampton.

HUGH STEWART.

S.H.M.O. Groups

SIR,—The S.H.M.O.s of the Leicester area have formed a Group for the following purposes: (1) Ensuring that full justice be done in the interests of its members; (2) representation of S.H.M.O.s on various committees; (3) assisting, wherever possible, the smooth running and efficiency of the Health Service.

In view of the extreme dissatisfaction expressed by S.H.M.O.s in many letters from various regions, it is hoped that groups will be started in other areas, and eventually an organization formed to cover the whole country. This Committee will willingly help in any way, either to assist individuals or to help with the formation of other groups. Correspondence will therefore be welcomed from anyone interested.—I am, etc.,

53, Stoneygate Road,
Leicester.

G. WARING ROBINSON.

Branch and Division Meetings to be Held

BROMLEY DIVISION.—At Royal Bell Hotel, Bromley, Tuesday, March 31, 8.20 for 8.45 p.m., meeting. Cinematograph films of medical and scientific interest.

CORNWALL DIVISION.—At Royal Cornwall Infirmary, Truro, Tuesday, March 31, 8.30 p.m., clinical meeting. Address by Professor W. Melville Arnott: "The Changing Aetiology of Heart Disease."

DONCASTER DIVISION.—At Messrs. Parkinson's Café, High Street, Doncaster, Tuesday, March 31, 7.30 p.m., meeting. Annual B.M.A. Lecture by Mr. H. S. Shucksmith: "A General Surgical Ramble."

DORSET DIVISION.—At the Clinic, Glyde Path Road, Dorchester, Friday, April 10, 8.30 p.m., meeting. Consideration of Cohen Report: "General Practice and the Training of the General Practitioner." Lecture by Dr. Vera B. Walker: "Allergy in General Medicine."

GLASGOW DIVISION.—At B.M.A. Glasgow Regional Office, 234, St. Vincent Street, Glasgow, Thursday, April 2, 8.30 p.m., A.G.M.

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, April 2, 8.30 p.m., meeting. Address by Dr. W. J. O'Donovan: "Drug Eruptions, New and Old."

HAMPSTEAD DIVISION.—At New End Hospital, Hampstead, N.W., Wednesday, April 1, 8.30 p.m., meeting. Talk by Mr. J. E. Piercy: "Recent Advances in the Treatment of Thyroid Disease."

MONMOUTHSHIRE DIVISION.—At St. Mellons County Club, Tuesday, March 31, 7.45 for 8.15 p.m., dinner. Address by Mr. G. M. Schwartz (Kemsley Newspapers, Ltd.): "We Can't Afford It." Members, their wives, and friends are invited.

NORTH BEDFORDSHIRE DIVISION.—At Bedford General Hospital, South Wing, Tuesday, March 31, 8.30 p.m., joint clinical meeting with Bedford Medical Society.

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, March 31, 8.30 p.m., meeting. Dr. J. Franklin: "The Modern Approach to Some Dermatological Problems."

WEMBLEY DIVISION.—At Wembley Hospital, Fairview Avenue, High Road, Wembley, Tuesday, March 31, 9 p.m., clinical meeting. Address by Dr. O. L. S. Scott: "Dermatology with Special Reference to the Problems Encountered in General Practice" (illustrated by lantern slides).

PRELIMINARY**The Queen's Patronage**

1. It is with the greatest pleasure that the Council records the fact that Her Majesty the Queen has been graciously pleased to grant Her Patronage to the Association.

Election of Honorary Member

2. On more than one occasion in the past a member of the Royal Family has honoured the Association by accepting Honorary Membership. In the year 1900 His Royal Highness the Prince of Wales (later His Majesty King Edward VII) was elected as an Honorary Member, and His Majesty King George V also had been an Honorary Member before his accession to the Throne.

The interest taken by His Royal Highness the Duke of Edinburgh in scientific advances, including those in the medical field, is well known, and the Council is sure that the Representative Body will give enthusiastic approval to the following recommendation:

Recommendation: That His Royal Highness the Duke of Edinburgh be elected, as an Honorary Member of the Association.

Election of a Vice-President

3. The Council has much pleasure in recommending:

Recommendation: That Professor Sir Henry Cohen, J.P., LL.D., M.D., F.R.C.P., F.F.R., be elected a Vice-President of the Association in recognition of his outstanding services to the Association.

Annual Meeting, 1953

4. The Annual Meeting of the Association will be held in Cardiff from July 9 to 17, 1953. The Adjourned Annual General Meeting, at which the President's Address is delivered, will be held on the evening of Monday, July 13.

As in 1952, there will be two types of scientific meetings: (i) Plenary Sessions, (ii) Meetings of Scientific Sections. The plenary sessions will be on "Coronary Disease," "Fibrosis," and "Overweight." The Popular Lecture on Friday, July 17, will be given by Sir Russell Brain, P.R.C.P.

There will also be a Scientific Exhibition covering a wide field of medical interests. Provisional programmes of the Meeting appeared in the *Supplement to the British Medical Journal* of February 14 and of March 28, and further details will be published when available.

Annual Meeting, Glasgow, 1954

5. The Annual Meeting at Glasgow will be held from July 1 to 9, both dates inclusive.

The Council recommends:

Recommendation: That Professor Sir John McNee, D.S.O., D.Sc., M.D., F.R.C.P., Glasgow, be elected as President of the Association for 1954-5.

Joint Annual Meeting, Toronto, 1955

6. A Joint Annual Meeting of the British Medical Association and the Canadian Medical Association will be held in Toronto in 1955, beginning on June 20.

The Council recommends:

Recommendation: That Thomas Clarence Routley, C.B.E., LL.D., M.D., F.R.C.P.(C.), Toronto, be elected as President of the Association for 1955-6.

Arrangements for Future Annual Meetings

7. The Council has accepted an invitation from the Brighton Division to hold the Annual Meeting in Brighton in 1956 from July 5 to 13.

The Canadian Medical Association has accepted the Council's invitation to hold a joint meeting of the two Associations in the British Isles at a date after 1955. The precise date has not yet been determined.

The Annual Representative Meeting, 1952, decided that the election of the President of the Association should in future be on a national basis except when the Annual Meeting is held overseas, when the selection would be a matter for consultation with the "host organization." The Council has decided to bring the new procedure into operation in 1956, when the President for 1957-8 will be elected.

The Council has arranged for a member of the central secretariat of the Association to take a special interest in the details of procedure of the Annual Scientific Meeting in order that he may advise science secretaries and officers of Sections in the light of past experience.

The Council has decided to pay the travelling expenses within the United Kingdom of non-members, including foreign speakers, invited to speak at the Annual Scientific Meeting.

A lantern projector with portable screen has been purchased for use at Annual and other meetings.

The Council has decided to provide overseas representatives, delegates, and speakers, and ladies accompanying them, with free tickets for all functions at the Annual Meeting.

Extraordinary General Meeting

8. A requisition, signed by more than 100 members of the Association, has been addressed to the Council in the following terms:

Pursuant to Articles 24 and 25 of the Articles of Association of the British Medical Association the undersigned members of the Association require the Council to convene an Extraordinary General meeting of the members of the Association in accordance with Article 27 of the said Articles of Association for the purpose of considering, and if thought fit passing, the following Resolution:

That the Association, being concerned by the modification of the present method of remuneration by capitation fees agreed in the Working Party's report, requires the Council forthwith to approach the Minister of Health with proposals for the better protection (financial and otherwise) of the small-list doctor and of the doctor newly seeking entry into practice, and requests the Minister of Health not to implement the Working Party's report until the scheme for distribution of remuneration has been considered in the light of such proposals, and meanwhile to continue the present method of payment.

The Council has convened an Extraordinary General Meeting, to be held on May 5, for consideration of the above resolution, but it is advised that the resolution, if passed, will not be effective, since "the general control and direction of the policy and affairs of the Association" are vested in the Representative Body by Article 37. (See also paragraph 27 of this Report.)

Representative of the Medical Branch of the Royal Navy on the Council

9. In 1951 the Representative Body elected Surgeon Rear-Admiral O. D. Brownfield to represent the Medical Branch of the Royal Navy on the Council for the remainder of the period of office of his predecessor—that is, until the A.R.M., 1952. Owing to an oversight, the expiry of Admiral Brownfield's term of office was not reported to the Council, and consequently no recommendation was made to the Representative Body in 1952 for the filling of the vacancy.

On behalf of the Council the Chairman nominated Admiral Brownfield for re-election for the period 1952-5, and the Chairman of the Representative Body accepted the nomination on behalf of the Representative Body, which is now asked to confirm the decision of its Chairman.

The Council recommends:

Recommendation: That Surgeon Rear-Admiral O. D. Brownfield, C.B., O.B.E., be elected as the representative of the Medical Branch, Royal Navy, on the Council for the period 1952-5.

Representatives at Conferences of Other Bodies

10. The Council appointed the following to represent the Association at the Conferences named:

West German Medical Association, Annual Meeting, Berlin, September, 1952	Dr. S. Wand
New Zealand Branch Biennial Conference, February, 1953	Dr. Denis H. Brinton
British Council for Rehabilitation Conference, London, February, 1953	Dr. J. A. L. Vaughan Jones Mr. H. H. Langston
The Pedestrians' Association—Conference on the safety of old people on the roads, March 7, 1953	Dr. E. B. Brooke
Eighth International Hospital Congress, London, May, 1953	Dr. J. M. Gibson Dr. T. Rowland Hill
National Association for Maternity and Child Welfare—Annual Conference, London, June, 1953	Mary Esslemont Annis Gillie
American Medical Association Annual Meeting, New York, June, 1953	Mr. Albert Sharman
Annual Conference of the Cremation Society, Llandudno, June 29 to July 1, 1953	Lord Horder
Seventh International Congress of Radiology, Copenhagen, July, 1953	Professor B. W. Windeyer
First World Conference on Medical Education, London, August, 1953	The Chairman of Council Sir Henry Cohen Dr. R. P. Liston Mr. J. R. Nicholson-Lailey Dr. A. T. Rogers Dr. F. M. Rose

Centenary of the Metropolitan Counties Branch

11. The Council has sent congratulations to the Metropolitan Counties Branch on attaining its Centenary. To mark the occasion the Branch organized a very successful ball in aid of medical charities.

Gifts to the Association

12. The Council has pleasure in reporting the following gifts to the Association:

- (1) Mounted head of a waterbuck, presented by Mr. N. E. Waterfield, a member of Council from 1934 to 1950.
- (2) Large walnut table, presented by Mrs. Radcliffe, in memory of the late Dr. Frank Radcliffe, a member of Council from 1920 to 1934.
- (3) Original manuscript of a letter written to a patient in 1817 by Dr. J. Gregory, presented by Captain Sir James Paget, Bt. R.N.

War Memorial

13. A further application was made recently for a licence to proceed with the erection of the Association's war memorial. The application was supported by influential members of the Association, and it was pointed out that many of the older subscribers to the memorial would wish to see it completed in their lifetime. A reply was received that a licence for the erection of the memorial itself could not be granted, but permission has since been given to proceed with repair and drainage work on the courtyard, which will be a necessary preliminary to the erection of the memorial.

An unforeseen effect of the delay in securing a licence to proceed with the memorial itself is that a rise in the cost of materials, wage rates, and transport charges will increase the cost of the memorial.

The Flood Disaster

14. In response to an appeal by the Chairman of Council, published in the *British Medical Journal* of February 14, many contributions from local medical committees and from individual members of the profession have been received by the Sir Charles Hastings Fund for the assistance of the doctors who suffered in the recent flood disaster. The Canadian Medical Association sent a most kind donation of a thousand dollars, and the General Medical Services Defence Trust generously guaranteed moneys for immediate assistance up to £5,000. The Council is grateful for the kindness of all concerned, and is glad to report that it has been possible to provide substantial relief in all the known cases of hardship. (See also paragraph 38 of this Report.)

Co-opted Member of Council of Royal College of Surgeons of England

15. The Council of the Royal College of Surgeons of England, after considering nominations which it had invited from the Council of the Association, has co-opted Dr. O. C. Carter (Bournemouth) to its membership for 1952-3.

College of General Practitioners

16. The Council has conveyed to the founders of the College of General Practitioners its best wishes for the success of the College.

The University of Southampton

17. The Association has been invited to appoint two representatives on the Court of the newly established University of Southampton, one nominated by the local Division and one by the Central Council. The Southampton Division has nominated Dr. J. G. McDowell and the Council has nominated Mr. H. H. Langston (Winchester).

Centenary of the Royal Photographic Society

18. The Council, on behalf of the Association, sent an Address to the Royal Photographic Society on the occasion of its Centenary on January 20.

Deaths

19. The Council regrets to record the death of 597 members during the year 1952.

Staff

20. The adoption of proposals made by the management consultants whose advice was sought in regard to the Association's financial structure and organization has involved changes in the designation and responsibilities of certain officials. The Finance and Business Officer (Mr. W. S. Giles) has been given the title of "Financial Comptroller," and Mr. D. C. Turnbull is now designated "Accountant and Assistant to the Financial Comptroller."

On the advice of the management consultants, a Business Manager to the *British Medical Journal* (Mr. M. W. Webb) has been appointed.

A vacancy on the editorial staff has been filled by the appointment of Dr. J. G. Thwaites as Assistant Editor.

Dr. Cormac Swan has resigned his appointment as Assistant Medical Editor of *Family Doctor*.

GENERAL MEDICAL SERVICES**Remuneration**

21. During the earlier part of the session a good deal of the General Medical Services Committee's time was taken up with discussions with the Ministry on the detailed application of the Danckwerts award and the recommendations of the Working Party on the future distribution of the Pool.

Payment of Arrears

22. The Committee, in consultation with its accountants, was able to reach agreement with the Ministry on the detailed calculation of the arrears due under the Danckwerts award and to secure their prompt distribution to the profession. This task was completed by November 28, 1952.

Income Tax

23. The Committee, assisted by Counsel, had discussions with the Board of Inland Revenue on the assessment of income tax and surtax on the arrears paid to general practitioners. The Committee wishes to acknowledge the co-operation of the Board and to report that the discussions enabled agreement to be reached on an equitable method of assessment.

Size of the Pool

24. It will be remembered that the size of the Pool each year depends upon a number of variable factors, in particular the number of doctors in the Service and the amount of practice expenses. At the Committee's request, Messrs. Price, Waterhouse & Co., the Association's auditors, carried out a detailed check of the Ministry's records and of the records maintained by a number of executive councils, and have been able to agree upon the precise number of doctors in the Service and thus to calculate the exact size of the Pool.

The Committee is in consultation with the Ministry about a further inquiry into practice expenses which will in future be undertaken at regular intervals.

The New Distribution

25. The new distribution scheme commenced on April 1, and, after consultation with the Committee, the Ministry issued detailed instructions in advance to executive councils outlining the arrangements to be made for the reduction of lists to the new maxima, the payment of partners on the basis of notional lists, and the procedure to be adopted in dealing with applications for initial practice allowance.

Reclassification of Areas

26. The revised report of the Medical Practices Committee, setting out the classification of areas throughout the country in accordance with the Working Party's proposals, was published in good time before the new distribution scheme started.

The report and subsequent amendments were published in the *British Medical Journal* (Supplement, October 18, 1952).

The Danckwerts Award and the Small-list Practitioner

27. Shortly after the Special Conference of Local Medical Committees, 1952, the Committee set up a special sub-committee to consider a rider passed by the Conference to the effect that if, in the light of experience of the new distribution scheme, it was found that certain groups of practitioners had not benefited to the extent which might have been expected, it should be left to the Working Party provisionally to allocate an appropriate proportion of the final settlement moneys for the purpose of remedying any obvious defects in the scheme.

The Committee has given very careful consideration to the report of its subcommittee and agrees with the view expressed that it would not be possible in the time available before April 1 to obtain information sufficiently exact for the Committee to be able to formulate any reliable estimate either of the extent of the problem or of the funds likely to be available for its solution.

It has therefore decided to undertake an immediate inquiry, with the help of the Ministry of Health, local executive councils, and local medical committees, with a view to obtaining a precise analysis of the number and categories of practitioners who might suffer injustice under the new distribution scheme which started on April 1. If the results of an inquiry of this nature are to be accurate, comprehensive, and above criticism, all three sources of information must be used and the inquiry carried out on a uniform basis throughout the country. Again, after the results of the inquiry are known, any further steps which the Committee might wish to take to give effect to the rider passed by the Conference must necessarily be taken through the Working Party as a means of securing the agreement of the Ministry of Health. It has been agreed, therefore, that the Working Party should be called together again to investigate the problem and to obtain the fullest possible information about the number of small-list practitioners likely to be concerned, and arrangements have been made for an early meeting.

The Ministry, at the Committee's request, has included in the regulations embodying the new distribution scheme a provision to enable the Ministry to evolve a scheme to provide for payment if this should prove necessary in the light of the results of the inquiry. In this way the final settlement fund can be used to adjust retrospectively the remuneration of any small-list practitioner who can show that his financial position has been prejudiced by the new distribution scheme.

Assistance for Elderly Practitioners

28. Paragraph 19 of the Working Party's Report provides that a small sum of money should be set aside from the Central Pool to deal with cases of hardship which might arise, particularly where under the new arrangements an elderly practitioner might lose his fixed annual payment and after receiving the initial practice allowance for a year find himself less well off than he was before the new scheme of distribution came into operation. Discussions are now being held with the Ministry as to the detailed arrangements to be made for implementing this recommendation.

Payments from the Inducement Fund

29. The Ministry has agreed that the percentage increase in the size of the Central Pool made under the Danckwerts award shall be applied to payments which have been made in the past from the Inducement Fund to assist doctors in "inducement areas." Percentage additions ranging from 11% to 22% are accordingly being made in respect of the years 1948-9 to 1952-3.

Group Practice

30. It will be remembered that the Report of the Working Party (paragraph 29) provisionally allocated the sum of £100,000 to encourage the formation of partnerships working as a group practice. The Committee has been informed that the Committee on General Practice of the Central Health Services Council has been asked by the Minister to define "group practice," and when this definition is available discussions will be held with the Ministry to consider both the advice tendered by Sir Henry Cohen's Committee and the measures necessary to give effect to paragraph 29 of the Working Party's Report.

Provisional Applications for Inclusion in the Medical List

31. It has been the practice of the Medical Practices Committee in the past to permit the provisional inclusion of a practitioner in the medical list on the understanding

that the application would require confirmation when satisfactory practice premises had been obtained. The Medical Practices Committee has discontinued this practice on the ground that the addition of one more doctor to the list might result in the reclassification of the area and in the exclusion of another practitioner who had earmarked suitable practice premises.

The Committee appreciates the intention of the Medical Practices Committee, but feels that some hardship may be caused by the new arrangement. It is proposing to hold an early meeting with members of the Medical Practices Committee to discuss the matter more fully.

Filling of Vacancies

32. (a) The Committee has reviewed the present arrangements for filling practice vacancies and has sought the views of local medical committees on this important subject. Replies received show that there is a good deal of dissatisfaction with the arrangements in England and Wales, and a preference has been expressed for the methods already in force in Scotland.

The Committee considers that the problem could best be met by combining the most satisfactory features of the English and Scottish systems, and is recommending to the Annual Conference of Local Medical Committees that:

- (i) the executive council should be responsible for appointing a successor;
- (ii) the decision as to whether a practice is to be dispersed or a vacancy is to be declared and advertised should rest with the executive council;
- (iii) the Medical Practices Committee should act as an appeals body, and in hearing an appeal should be required to review all the applications originally submitted and not merely that of the appellant.

(b) Proposals were approved by the last Annual Conference of Local Medical Committees for the amendment of the terms of service to protect the position of a successful applicant to a practice vacancy who finds that the practice premises have been secured by another doctor. Following discussions with the Ministry, the necessary amendment to the regulations and a circular letter to executive councils have been drafted, and will shortly be issued.

(c) The Committee's attention has been particularly drawn to partnerships which have been formed between an established single-handed doctor who intends shortly to retire and a doctor who is new both to the practice and to the district, the intention being to enable the latter to secure the succession to what is essentially a single-handed practice. The Committee feels that this practice is against the best interests of the Service and has therefore agreed with the Ministry that in future the Medical Practices Committee will not, unless there are special circumstances, accept one partner as a logical successor to another partner who has died or resigned unless the partners have been in active practice together for about a year. The Medical Practices Committee will retain full discretion if the circumstances of any particular case merit special consideration.

Committee on General Practice of the Central Health Services Council

33. At the invitation of the Council, the Committee has prepared a memorandum of evidence for submission to the Committee on General Practice of the Central Health Services Council. The evidence to be submitted is confined to recommendations and observations of a general character based upon policy which has already been determined by the Representative Body and the Conference of Local Medical Committees.

The Committee was assisted in its task by representatives of the Central Consultants and Specialists, Public Health, and General Practice Review Committees, whose experience and viewpoints in their own fields were of the greatest value in compiling the memorandum.

Mileage

34. The Interdepartmental Mileage Committee, which is examining the whole question of the distribution of the mileage fund and upon which the Committee is represented, has continued its work. The Committee's task was at first hampered by lack of information about the net earnings of rural practitioners, but, as a result of the evidence collected in connexion with the Danckwerts award, full information is now available and it should soon be possible for the Committee to formulate its views. Apart from the Committee's direct representation on the Interdepartmental Committee, a very close liaison has been established between the two bodies.

Inflation of Lists

35. The virtual completion of the "purge" of doctors' lists has on the whole produced satisfactory results, and a substantial amount of inflation has been eliminated. In view of the guaranteed capitation fee which will be paid from April, 1953, it is more than ever essential that lists should be accurate, and the Ministry has launched a further campaign to keep inflation at a low level, based on sustained local publicity through executive councils and various social organizations. It is hoped that in this way the resistance to the use of a numbering system which followed the abolition of national registration will be reduced, and that the public will appreciate that the continued use of national registration numbers purely for the purpose of identifying individuals using the National Health Service is essential to the proper administration of the Service. The Committee concurs in the arrangements which the Ministry has made, although it feels that further steps may be required at a later stage.

The Ministry has also decided to undertake a further "purge" in a few remaining counties where there is still a substantial degree of inflation. In view of the urgency of the task, the Committee has agreed that where under the regulations six months' notice is normally given to a practitioner of intention to remove a patient from his list, in these particular cases the removals should be effective as from the date of service of the notice. It is anticipated that this further check in these areas will be completed by April 1, and that any necessary adjustments in the lists of the doctors concerned will be effected on that date. Should the practitioner subsequently provide information which enables the patient's whereabouts to be traced, the patient would be reinstated and a back credit given.

Limited Lists

36. The Committee has discussed with the Ministry the procedure to be followed when the inmate of an institution, such as a residential day nursery, who during his or her period of residence has been transferred to the list of the medical officer in charge, leaves the institution. There are practical difficulties in the way of applying any standard procedure for automatic reinstatement on the list of the patient's own family doctor. The Ministry and the Home Office, who are responsible for the majority of these institutions, have, however, agreed to prepare a standard letter which will be sent to the children's parents, and this should go a long way towards overcoming the problem.

Allocation of Patients to General Practitioners

37. Further discussions have taken place on the powers which the Act vests in the Ministry, acting through an executive council, to compel a practitioner providing general medical services to take on his list as a patient a person who is already receiving treatment from an unqualified practitioner. It appears that the only completely satisfactory solution lies in an amendment of the National Health Service Act, 1946, and unfortunately there is little hope of early amending legislation in the health field. As a temporary measure, the Ministry has agreed to include in its *Notes for Service Committees* a reference which will ensure that if a doctor is alleged to have broken his terms

of service by refusing to take on his list a patient who at the same time is receiving treatment from an unregistered practitioner, the attitude of the General Medical Council regarding "covering" should be fully taken into account by the Service Committee.

Flood Areas

38. Immediately news was received of the serious floods along the East Coast, telegrams were sent on behalf of the Committee to the secretaries of local medical committees in the areas affected expressing the Committee's sympathy and seeking information as to how best assistance might be given. It was anticipated originally that additional doctors might be required in the reception areas to cope with the sudden influx of population, but reports received subsequently indicated that in general the normal medical services were able to meet the demands placed upon them.

The Committee has given careful consideration to the steps which might be necessary to prevent hardship among individual practitioners whose practices were in the flood areas. It was felt that the problem would best be met by:

- (a) providing immediate financial assistance to doctors whose property had been lost or damaged, and
- (b) the introduction of long-term measures to protect the practices of doctors in the flood areas and to compensate them for any loss of income.

It has welcomed, therefore, the appeal made by the Chairman of Council for contributions to the Sir Charles Hastings Fund which would be earmarked for the relief of doctors in the flood areas, and has decided to recommend to the Trustees of the General Medical Services Defence Trust that a sum of money should be guaranteed to the Hastings Fund in the event of heavy demands exhausting the resources available to that Fund. This recommendation has been accepted by the Trustees.

The Committee has discussed with the Ministry the steps to be taken to compensate doctors for loss of income due to the evacuation of many of the coastal areas and the likelihood that many seaside resorts will not this year receive their usual number of holiday visitors. It has been agreed that this may most appropriately be done by guaranteeing the doctor (from the final settlement) a minimum income based on the number of patients on his list as at January 1, 1953, together with a payment by way of temporary resident fees equivalent to the amount which he received from that source during the previous year.

It is hoped that by the end of the year conditions will have returned to normal, but, if it appears necessary, further discussions will then be held so that these emergency arrangements may be extended for a longer period.

Fees for Temporary Residents

39. The Ministry, after consultation with the Committee, has raised the maximum standard fee for the treatment of a temporary resident from 15s. to 17s. The lower rate of payment has also been raised from 2s. 6d. to 5s. The new lower rate will be applied not only to convalescent homes but other institutions—for example, holiday camps—where special arrangements for medical services are made. For this purpose an institution has been defined as "a place of residence at which 10 or more persons reside temporarily, and where a surgery is held at which a practitioner regularly attends." It does not include hotels or boarding-houses. Lists of such institutions are being kept locally by executive councils in consultation with local medical committees. The new rates will be paid to practitioners on June 30, 1953, in respect of cases treated in the quarter ending on March 31.

Treatment of Services Personnel on Leave

40. Although the Committee was in general agreement with a proposal made by the Ministry that Services personnel on leave should be treated as temporary residents under the National Health Service, the arrangements which

the Ministry suggested carry with them certain implications which are not altogether acceptable to the Committee. In particular, the Committee is concerned to protect the positions of private practitioners, who appear to be excluded by the Ministry's proposals. Similarly, the position of Admiralty surgeons, whose responsibilities go beyond those of a practitioner providing temporary resident treatment under the N.H.S., requires careful consideration.

The Committee has therefore discussed these questions with the Ministry of Health, and its observations have been forwarded to the Service departments.

Treatment of Merchant Seamen

41. The Shipping Federation has sought from the Ministry of Health an increase, as from April 1, 1951, in the annual payment made to the Federation from the Pool for the services of their whole-time medical officers. The Committee has informed the Ministry that it raises no objection to the small increase proposed.

Emergency Fees—Anaesthetics

42. The Committee has agreed with the Ministry that emergency and anaesthetic fees shall be a first charge on the local final settlement money, and funds will be made available for the distribution of fees quarter by quarter. Where there is a local arrangement that no emergency fees are claimed, that amount of money will be used to supplement the final settlement for the area.

Medical Service Committee Procedure

43. The special subcommittee which was appointed to carry out a full investigation of the status, composition, procedure, and functioning of the Tribunal and Medical Service Committees has now completed its task and a detailed report is being prepared for submission to the Annual Conference. The report will be issued as an appendix to the Supplementary Annual Report of Council.

Representation of General Practitioners in Hospital Administration

44. The Ministry's attention has been drawn on a number of occasions to the importance which the Annual Conference and the Representative Body attach to the adequate representation of general practitioners at all levels of hospital administration.

The Committee is happy to report that some progress has been made in this matter, and it will continue to press for greater representation whenever the opportunity occurs.

Sale of Goodwill

45. The A.R.M. last year referred to the Council a motion that the Council be instructed to examine and report upon ways and means of procuring the restoration of goodwill to those who wish to reacquire it.

As indicated in paragraph 88 of this Report, the Amending Acts Committee has prepared a memorandum on the optional return of goodwill which has as its object the repeal of section 35 of the National Health Service Act, 1946. This memorandum, together with the comments of the Compensation and Superannuation Committee, has been considered by the Committee, and representatives of the Amending Acts Committee took part in the discussions on the optional restoration of goodwill.

After most careful consideration the Committee has reached the conclusion that the proposals put forward by the Amending Acts Committee in regard to goodwill are impracticable, but, bearing in mind the very strong views expressed by the profession on the subject before the "appointed day," has decided that a full report setting out the arguments for and against the proposal should be included in the Committee's Annual Report to the Conference of Local Medical Committees in June.

Employment of General Practitioners in Hospitals

46. The Committee was asked to consider the draft of a circular letter which the Ministry proposed to issue to hospital authorities giving guidance on the employment of general practitioners in hospitals. The terms of the circular were not entirely satisfactory, and the Committee has put forward to the Joint Consultants Committee certain amendments which it feels should be made. The Committee's objections are at present under discussion between the Joint Committee and the Ministry, and a representative of the Committee has been invited to be present and to take part in the discussion.

Dispensing Capitation Fee

47. Following representations by the Committee, the Ministry accepted a proposal that an increase of 50% should be made in the dispensing capitation fee as from April 1, 1952. Payment was made when the Danckwerts award was implemented, and the Committee has good reason to believe that the revised figure is equitable, having regard to the heavy increase which has taken place in the cost of drugs.

Charges for Prescriptions

48. Following the decision of the Government to introduce charges for prescriptions issued under the National Health Service, the Committee asked the Ministry to discuss not only the detailed application of the scheme but also the measures it proposed to adopt to safeguard the interests of the dispensing doctor.

As a result of the Committee's intervention, the original proposal that an arbitrary deduction should be made from the dispensing capitation fee was replaced by the present system whereby a dispensing doctor is called upon to account for only the number of shillings which he is actually able to collect. In order to safeguard the Ministry's position, draft regulations have been prepared which extend the existing disciplinary machinery to cover possible cases of abuse of the arrangements made for collecting the charges. These regulations have been approved by the Committee and will shortly be issued by the Department.

Economy in Prescribing

49. The Committee has considered whether it is practicable or desirable to impose by regulation a requirement that the dispensing costs of proprietary articles should be shown in the advertising material issued by pharmaceutical firms.

A meeting was held with representatives of the Association of British Pharmaceutical Industry, when a most helpful exchange of views took place. It was agreed on both sides that it was desirable that doctors should know the costs of the articles which they were prescribing, and that anything which could be done to achieve this should be encouraged. There are, however, many technical difficulties in printing prices on promotion material which has to cater for different markets at varying prices, and the Committee has recommended the Conference of Local Medical Committees not to press at this juncture for the introduction of any measure of compulsion.

The Committee has also discussed a motion proposed at the Annual Representative Meeting in 1952 to the effect that in the interests of national economy patients who are attending hospital regularly should have their medicines dispensed by the hospital and not by the family doctor. In the Committee's view, the sole criterion should be the interests of the patient, and the Committee is in agreement with the proposal in those cases where it is in the interests of the patient that the hospital should do the dispensing.

Investigation of Prescribing

50. The attention of the Committee has been drawn to cases in which charges of over-prescribing brought against general practitioners were not finally resolved until many months after the issue of the prescription in question. This

is obviously an unsatisfactory state of affairs from the point of view both of the efficient working of the Service and of the individual doctor concerned. The Committee has discussed with the Ministry ways and means by which this procedure might be speeded up without infringing the doctor's legal rights. The main difficulty has been the time lag between the issue of a prescription and its pricing by the Pricing Bureau, but the Committee understands that Pricing Bureaux are working through these arrears at a steady rate and that it should shortly be possible for an investigation to be completed within three months from the issue of the prescription.

Medicines and Appliances for Doctors' Surgeries

51. The Committee has again discussed with the Ministry the urgent necessity for introducing arrangements for stock orders for doctors' surgeries. The Ministry is in favour of such a scheme on the grounds of both convenience and economy, but, unfortunately, the pharmacists have declined to proceed any further at the present time. The Committee appreciates that the pharmacists cannot be compelled to take part in the proposed arrangements, but every effort will be made to reach agreement on this important aspect of the pharmaceutical service.

Maternity Medical Services

52. The National Health Service (General Medical and Pharmaceutical Services) Regulations lay down that a doctor providing maternity services shall carry out a post-natal examination of the mother at or about six weeks after pregnancy. In the past, the Ministry has advised executive councils that a doctor may be held to have complied with his obligations if the examination is undertaken within 10 weeks. Following discussions with the Committee's representatives, the Ministry has now agreed to extend this period to twelve weeks from the date of confinement.

The Ministry has also agreed to bring to the notice of local authorities the desirability of supplying self-contained maternity outfits so that general practitioners do not receive requests from patients for additional supplies. It has been pointed out that antiseptics and surgical spirit not normally included in the maternity pack should, if required, be supplied by the midwife, and that where crêpe bandages are considered necessary these should be obtained from the local health authority and not prescribed on Form E.C.10.

Arrangements were made by the Committee for a copy of the Ministry's letter to be sent to all local medical committees with a suggestion that if adequate provision was not made in any particular area the local medical committee should approach the local authority on the subject.

Criteria for Admission to the Obstetric List

53. Discussions have taken place with the Ministry of Health concerning the publication of advice which the Minister received from the Central Health Services Council about the procedure for the admission of doctors to the special obstetric list.

In the Committee's view, it was undesirable that a circular embodying any advice on this subject should be sent to executive councils at the present time when the whole question is under review in the light of the decisions taken by the Representative Body and when another committee of the Central Council, that on general practice, will also have the matter under consideration.

The Ministry has pointed out that the Minister has an obligation to publish advice which he receives from the Central Health Services Council. It has been agreed, however, that, instead of an official letter being sent to executive councils, the advice shall be transmitted only to the chairmen of these councils by means of a personal letter, which will include a paragraph making it clear that the Minister has no wish to disturb existing arrangements by laying down any rigid criteria to be applied to applications for admission to the special obstetric list.

Liaison between the General Medical Services and Public Health Committees

54. It has been the practice for the representative of the public health service on the General Medical Services Committee to be appointed by the Society of Medical Officers of Health. There has been no direct representative of the General Medical Services Committee appointed to the Public Health Committee.

The Council has considered a proposal that the public health service representative should be jointly nominated by the Public Health Committee and the Society, with a view to establishing a closer liaison between the two committees. This proposal has been accepted by the Society, and it has been agreed that the representative appointed should be a medical officer of a local health authority who is a member both of the Public Health Committee and of the Council of the Society.

The Council is also of opinion that there should be a direct representative of the General Medical Services Committee on the Public Health Committee. The recommendation for amendment of the Schedule to the Bylaws to cover these decisions is contained in Appendix III.

Admission of Students to Medical Schools

55. From time to time the Council has received requests for information about the number of students admitted to medical schools in relation to the probable future need for doctors. The Committee considers that an early inquiry should be made into this important problem, and, as a start, proposes to investigate:

- The number of students in medical schools;
- the number qualifying from the schools; and
- the number of newly registered practitioners absorbed into the various branches of the medical profession.

The inquiry will, inevitably, take some time, but a full report will be made as soon as possible.

Medical Records

56. Under the National Health Insurance Scheme a fairly elaborate memorandum of guidance was issued to medical practitioners as to the form in which their medical records should be kept. The Ministry of Health has drawn attention to the fact that nothing comparable has been issued under the National Health Service, and that difficulties are arising in determining whether particular practitioners have complied with their obligations under their terms of service. The Ministry has accordingly prepared for issue to general practitioners a short note of guidance in general terms which has, with minor alterations, been agreed by the Committee.

Certification for Surgical Corsets

57. The Committee has long held the view that the practice of requiring a medical certificate for the remission of tax on a made-to-measure corset of the non-surgical type should be abolished. The Ministry has been reluctant to withdraw this form of certification in case it should increase the call for free corsets from the hospitals. The Board of Customs and Excise has, however, amended the list of conditions in respect of which a certificate from a doctor entitles the patient to a tax-free appliance. It is hoped that this will have the effect of reducing the demand made upon the doctor for certificates, but at the same time the Committee feels that the complete abolition of the concession is the only satisfactory method of solving the problem. It will keep the problem under review.

COMPENSATION AND SUPERANNUATION

Assignment of Compensation

58. The Council, in collaboration with the Medical Insurance Agency, investigated ways of assisting, by means of loans on security of compensation, practitioners suffer-

ing financial hardship who were unable to obtain an advance payment of compensation. The results were successful and it is now possible for a practitioner to secure an advance of a proportion of the capital eventually payable by assigning the compensation and interest thereon to the lender under a form of mortgage.

Payment of Compensation

59. The Council has considered Minutes 243 and 244 of the A.R.M., 1952, and has reconsidered Minutes 165 and 167 of the A.R.M., 1951, on which action had previously been deferred pending the outcome of the arbitration on remuneration. The Council thinks that the time is now opportune to reopen the question of the payment of the whole or part of the compensation due in the following circumstances:

- (a) When a partner is taken into a practice.
- (b) When a doctor moves from one area to another.
- (c) Where hardship arises because of a debt on a practice house.

Representations have been made to the Ministry on these points and the Council will also endeavour to reach agreement as to the circumstances which constitute "hardship" within the meaning of the Compensation Regulations.

Superannuation

60. The Council regrets to report that the decision of the Income Tax Commissioners, that tax is payable under Case III of Schedule D on the 8% contribution paid by the Minister to those practitioners who opted out under Regulation 38 (3) (m), was upheld when an appeal was heard in the High Court. Counsel has advised against any further appeal.

REVIEW OF GENERAL PRACTICE

61. The General Practice Review Committee, appointed by the Council in 1950, has completed its report, which contains an illuminating account of general practice in the early years of the National Health Service, based partly on systematic personal observation of a random sample of practitioners at work and partly on replies to a postal inquiry. The Council has decided to publish the report in the *British Medical Journal*, and the document is now being edited by the Committee for publication.

"GENERAL PRACTICE AND THE TRAINING OF THE GENERAL PRACTITIONER"

62. The Council summarized in its last Annual and Supplementary Reports the replies of 39 Divisions to its request for observations on the report on *General Practice and the Training of the General Practitioner* prepared by a special committee under the chairmanship of Sir Henry Cohen. Soon after the issue of the Supplementary Report six more replies were received. The Representative Body (A.R.M., 1952) "deplored the apparent apathy of the Divisions in that few of them had submitted a considered opinion of the important Cohen Report, and urged all Divisions to give this subject adequate and urgent consideration so that an agreed Association policy on general practice and the training of the general practitioner might be formulated." The Council, accordingly, circulated a further request to the remaining 175 Divisions for a definite statement of what action, if any, had been taken in their areas to study the Report. As a result, 15 more Divisions have sent comments or recommendations and 28 have stated that they have considered the Report and have no observations to make. Of the remainder, 36 Divisions are to consider it at future meetings.

The Council is grateful to the Divisions and study groups which have submitted their views. Many of them have obviously given much time and thought to the subject. All their observations will be collated and carefully studied by the Council.

HOSPITAL AND CONSULTANT SERVICES

63. During the past year the Central Consultants and Specialists Committee has maintained its contact with hospital staffs throughout the country through its regional organization; and at the same time has taken an active part in the work of the Joint Consultants Committee and the Staff Side of Committee "B" of the Medical Whitley Council. It has also had the benefit of the advice of the special groups of the Association, including the Registrars Group, and has thus secured that the views of consultants and specialists generally, and those with special problems, have been fully represented in discussions with the Ministry and in the Whitley Council.

The guiding principle of the Committee has been that there should be regular joint consultation with the Ministry in the shaping of the service so that the profession may take its full part in providing the type of service that it knows from its own experience is likely to prove successful. For this reason it has consistently urged that the professional advisory machinery should be overhauled to provide at all levels of the service democratically elected committees representative of the profession. It has been a disappointment to the Committee to find a tendency on the part of the Ministry to reach somewhat hasty decisions without consultation with the profession.

Hospital Medical Staffing

64. Some two years ago the Ministry appointed a number of inspecting teams to carry out a survey of hospital medical staffing, and in June, 1951, the Joint Committee obtained from the Ministry an undertaking that it would discuss the results of the survey in general terms with the Committee before any final decisions were taken. The Committee was therefore extremely disturbed in November last to find that the recommendations of the inspecting teams regarding alterations in medical staffing had been sent by the Ministry to boards of governors without prior consultation with, or indeed the knowledge of, the Joint Committee.

At about the same time instructions were issued to all hospital authorities calling for a 5% reduction in certain categories of hospital staff over the next twelve months, and "freezing" medical staffs at their present level.

The Joint Committee immediately sought an opportunity of discussing with the Permanent Secretary of the Ministry the apparent unwillingness of the Department to take the profession's representatives into its confidence and to discuss with them matters affecting medical staffs in hospitals before issuing instructions to the hospital authorities. The Permanent Secretary freely admitted that on occasions the Ministry had omitted to consult the Joint Committee—as for instance in the matter of the staffing survey—but he assured the Committee that for the most part these were unintentional rather than deliberate lapses and that his Department wished to have the benefit of the Committee's advice on all appropriate subjects. He hoped the Committee would recognize, however, that there must be occasions when it was impracticable to consult with the profession before announcing decisions involving Government policy.

The Joint Committee is continuing to discuss the question of medical staffing with the Ministry in the light of the staffing survey and the instructions on economy measures.

Review of Remuneration of Hospital Medical Staff

65. In June, 1952, the Staff Side of Committee "B" of the Medical Whitley Council notified the Management Side of its intention to submit a claim for a review of the remuneration of hospital medical staff in order that the intention of the Consultant Spens Committee might be fulfilled that the salary scales recommended by the Committee and based on the 1939 value of money should be adjusted to meet post-war conditions.

After the advice of leading counsel had been taken the claim was duly submitted in the autumn and is now under discussion with the Management Side.

Security of Tenure

66. The Committee has had before it the following resolution adopted by the Representative Body in 1952:

That this meeting considers that when a permanent contract has been issued no revision of that contract should take place within a period of three years, unless the work should substantially alter.

The Committee shares the anxiety of the Representative Body at the lack of security of senior members of hospital medical staffs, and particularly of part-time consultants and S.H.M.O.s, in view of recent instructions of the Ministry that part-time contracts should be kept under "continuing" review. The Committee agrees that a permanent contract once entered into should not be lightly set aside or altered, though it feels that the possibility of adjustment either way in an individual officer's contract must be accepted. Nevertheless, the Committee is strongly of the opinion that part-time consultants and S.H.M.O.s should be reasonably protected against sudden and unjustified reductions of sessions, since with the falling off in private practice they are becoming dependent to an increasing degree upon the income from their hospital appointments. The Committee feels that the absence of such safeguards will create a preference for whole-time appointments and encourage the development of a whole-time hospital service.

In recent discussions on the subject the Ministry suggested to the Joint Committee that the appeal machinery provided under paragraph 16 of the Terms and Conditions of Service did not apply in a case where a consultant's (or S.H.M.O.'s) contract was being altered or determined as a result of redundancy or hospital reorganization. The Ministry's attitude was the more disturbing because, if there were any widespread attempt to reduce consultants' sessions as a result of the hospital medical staffing survey, the "moral obligation" placed upon boards to try to find alternative employment would be virtually impossible to discharge. The Central Consultants and Specialists Committee and the Joint Committee did not, however, accept the Ministry's view, and they were firm in their opinion that the wording of paragraph 16 of the Terms and Conditions of Service clearly gave a consultant or S.H.M.O. the right to appeal to a professional committee against the termination of his employment wherever he considered the Board's action to be unfair. Moreover, the Committee was advised that this right extended to consultants and S.H.M.O.s who were threatened with a reduction of sessions, since the reduction could only be effected—apart from agreement—by the termination of the existing contract and the offer of a new one. The Ministry has now accepted this view. Discussions on the subject are continuing with the Ministry, with particular reference to the manner of reviewing part-time contracts.

Reduction in Senior Registrar Establishment

67. In November, 1950, the Ministry issued instructions for a reduction in the number of registrar and senior registrar appointments from approximately 1,400 in each grade to 1,100 and 600 respectively. The Joint Committee, with the support of the Central Consultants and Specialists Committee, at once protested against the Ministry's proposals, and after lengthy discussions it was agreed in the summer of 1951 that the future establishment of senior registrars should be 960 instead of the 600 previously proposed, and that there should be no fixed establishment of registrars, the posts in this grade to be determined by the needs of the service.

The number of medical staff who were likely to be dismissed from the hospital service as a result of the Ministry's action had thus been substantially reduced. Nevertheless it still seemed inevitable that a considerable number of practitioners who had been attracted to the hospital service by the prospect of a consultant career, and had spent many years in training for the practice of a specialty, would be dismissed without any real prospect of obtaining consultant posts, and at a time when entry into general practice had

become difficult. The anxiety of the profession regarding the hardship in which senior registrars were likely to be involved was expressed in the following resolution adopted by the Representative Body in 1952:

That this Representative Body considers that the impending dismissal of senior registrars is unjust, and that, in view of the grave difficulties most of these registrars will have in finding alternative employment, this meeting considers it is the responsibility of the Ministry of Health to provide suitable alternative employment for these doctors in view of their age and experience.

The Central Consultants and Specialists Committee and the Joint Committee were fully alive to the problem. They calculated that, even after allowance was made for those senior registrars who might be expected to obtain consultant posts and for those temporarily retained for the needs of the service, a rapid reduction to the agreed establishment of 960 posts would involve the displacement of some 300 senior registrars before or after completion of their training. The Joint Committee continued to impress upon the Ministry the urgency of taking appropriate action to prevent hardship falling upon these senior registrars, and to secure that they were not lost to the hospital service.

In the latter half of 1952 the Joint Committee learnt that the number of actual consultant vacancies had for some time substantially exceeded the estimated number of vacancies on which the senior registrar establishment had been based. Although it was not known whether, or for how long, this trend would continue, the Ministry thought it likely that as a result the number of senior registrars who at the end of their training would find difficulty in obtaining consultant posts would not be nearly so high as was at one time feared. The Ministry asked to be informed if future events proved this assumption to be false. The Joint Committee accepted the Ministry's contention with some reserve because it thought it likely that the bulk of the displaced senior registrars would be general physicians or surgeons, whereas most of the consultant vacancies would probably be in other specialties. It was still discussing the problem with the Ministry when instructions were issued "freezing" hospital medical establishments at their present level, and virtually putting an end to any consultant expansion (see paragraph 64).

There is little doubt that the efforts of the Joint Committee have been seriously undermined by these instructions, but the Committee is still pursuing the matter vigorously with the Ministry. It is clear that the present situation has arisen from the Government's policy of hospital expansion at the end of the war and the promise of an expansion in the consultant service which it has been unable to fulfil. The Committee strongly feels, therefore, that the Ministry has a definite responsibility towards the present body of senior registrars.

The Central Consultants and Specialists Committee has also noted the following resolution of the Representative Body:

That as far as possible there should be an interchange of senior registrars and registrars between teaching and non-teaching hospitals.

The principle that there should be an interchange of senior registrars between teaching and non-teaching hospitals has already been accepted by the Ministry, and regional boards and boards of governors are putting it into effect.

The Committee has considered the desirability of urging that the principle should be extended to registrars, but feels that this would be impracticable within the short period of a registrar appointment.

Junior Hospital Staffing Difficulties

68. Reports received from various parts of the country during the year indicate that the shortage of junior hospital staff is creating increasing difficulty, particularly in some

of the non-teaching hospitals. It is hoped that the provisions of the Medical Act, 1950, requiring practitioners qualifying after January 1, 1953, to undertake a period of 12 months' pre-registration service in approved hospital posts, will go a long way towards meeting the difficulty at house-officer level. Unfortunately, however, the problem is no less acute at registrar level, and there is little doubt that the recruitment difficulties at this level are related to promotion prospects and facilities for entry into general practice.

The Committee is giving the matter its urgent consideration.

Employment of General Practitioners in Hospitals

69. The Joint Committee, in consultation with representatives of the General Medical Services Committee, is now discussing with the Ministry the question of the employment of general practitioners in hospitals in the light of the resolutions adopted by the Representative Body in 1952.

It is hoped that it will be possible to make a further report in the Supplementary Annual Report of Council.

Medical Advisory Machinery

70. Discussions have taken place during the past year on the question of the establishment of satisfactory medical advisory machinery at all levels in the hospital service, and a large measure of agreement has been reached on the constitution and functions of advisory committees to boards of governors and hospital management committees. The Ministry has accepted the principle that the composition of the advisory committee should be left to the medical staff to decide according to the needs of the hospital or hospital group. It is envisaged that in some hospitals (or hospital groups) the whole of the consultant staff might constitute the advisory committee, meeting regularly to discuss matters of policy, and that in other cases it might be more appropriate for the staff to elect a representative committee. It is anticipated that a circular for the guidance of boards of governors and hospital management committees will be issued shortly.

So far the Ministry has been reluctant to discuss advisory machinery at regional board level, being of the opinion that the boards should be left to seek advice where they think fit. The Ministry has been informed, however, that the profession is extremely disturbed at the way in which some boards are obtaining professional advice, and that it considers it to be fundamental to the development of the service, and to the development of a spirit of co-operation between the profession and the boards, that the advisory machinery at regional board level should be placed on a satisfactory basis. Discussions on this aspect of the matter are being continued.

Review of S.H.M.O.s

71. The Committee has had before it the following resolutions adopted by the Representative Body in 1952:

1(a). That this meeting deplores the fact that the constitution of the Grading Committee was not as recommended in the A.R.M. of 1951, namely:

"That immediate arrangements be made for reviewing the grading of S.H.M.O., J.H.M.O., and others in the 10B group, and that, as many of these are working as part-time general practitioners, the reviewing committee should contain not less than 20% of general practitioners." (Minute 36, A.R.M., 1951.)

1(b). That this meeting deplores the fact that the Grading Committee in the South-west Region, in reviewing the status of individual practitioners, took into consideration whether or not the person under review was in general practice.

1(c). That this meeting considers that there should be a periodic review of the grading of specialists not graded as consultants.

2. That as distinct from the grading of the holder of a post, the grading of all hospital posts be reviewed and published.

3. That this meeting considers that all senior hospital medical officer posts in the hospital establishment should be reviewed as a matter of urgency.

4. That there should be the right of appeal from the decision of the review committees to some suitable central body.

As reported last year, the composition of the professional grading committees appointed to carry out a review of S.H.M.O.s at the end of 1951 had largely been determined by the Ministry at the time when the Representative Body's resolution on the subject was adopted. The Central Consultants and Specialists Committee and Joint Committee went as far as they could in obtaining the inclusion in the review committee of outside assessors nominated by the Royal Colleges (in consultation with the chairman of the Central Consultants and Specialists Committee).

The implication of the second resolution of the Representative Body is that the professional review committee in the South-western Region was biased, in reaching a decision as to grading, in cases where the practitioner under review was also engaged in general practice. The Committee doubts whether it would be possible to obtain sufficient evidence to make it practicable to pursue the matter.

Although the Committee recognizes that there are a number of practitioners who are still dissatisfied with their grading after the last review, it feels that it is impracticable to press for a right of appeal to a central review committee or for further reviews at periodic intervals. A right of appeal to a central body has already been refused by the Government and the Committee does not consider that any useful purpose would be served by pursuing the matter. In the future practitioners will acquire the status of the appointments they obtain in open competition, as they did before 1948, and it is preferable to revert to this principle rather than to perpetuate a system of grading by review committees.

So far as any injustices still exist, the Committee feels that the only course is to raise them on an individual basis direct with the Ministry. The Committee is therefore exploring the position of those S.H.M.O.s who have expressed their dissatisfaction with their grading with a view to raising appropriate cases with the Ministry.

In some cases it is alleged that an S.H.M.O. post is wrongly designated, and presumably the Representative Body had this in mind when it proposed that all S.H.M.O. posts should be reviewed. The Ministry has assured the Joint Committee, however, that hospital boards have been advised that S.H.M.O. posts should only be so designated in accordance with the terms of the agreement reached between the Ministry and the Joint Committee, and set out in Circular RHB (50) 96. The Committee does not consider that there is any evidence that would justify a demand for a general review of S.H.M.O. posts, though it recognizes that there may be individual cases where a post has been wrongly graded. The Committee would be quite prepared, however, where this can be substantiated, to take the matter up through the regional Whitley appeals machinery.

Those S.H.M.O.s holding consultant posts who were upgraded to consultant status as a result of the last review have been placed at the minimum point in the consultant salary scale, despite the fact that a number of them are practitioners of upwards of 40 years of age who have held the same appointment for many years. Hospital boards have declined to exercise their discretionary power to advance the starting salary because the Ministry has advised them that it would be "inappropriate" to do so. The matter has been raised with the Ministry.

Whole-time Officers

72. During the year there has been growing pressure from whole-time officers for direct representation upon the Committee, and upon the Joint Committee and the Staff Side of Committee "B" of the Medical Whitley Council.

It is true that at the present time the number of whole-time consultants on the Central Consultants and Specialists Committee is very small, and that there is only one whole-time member (a university professor) on the Joint Committee and the Staff Side of Committee "B." Nevertheless, there is little doubt that one of the real causes of the unrest among whole-time officers is a lack of information regarding the efforts made on their behalf, particularly by the Staff Side. This, coupled with the fact that there has been no improvement but rather a deterioration in the conditions of service of whole-time officers during the year, has not unnaturally given rise to a growing feeling that they would be better served if directly represented in the negotiating machinery. The Committee is confident, however, that an examination of the work of the Staff Side would show conclusively that nothing more could have been done in negotiation to advance the interests of whole-time officers, and that failure to achieve any material improvements in the conditions of whole-time employment is not due to any lack of sympathy or knowledge on the part of the Staff Side.

At the same time the most careful consideration has been given to the claim for direct representation. So far as the Central Consultants and Specialists Committee is concerned, its membership derives largely from the Regional Consultants and Specialists Committees, which in turn are representative of consultants and specialists (whole- as well as part-time) throughout the country. In some areas whole-time consultants outnumber part-time consultants, but at the moment part-time representatives are often appointed to the Central Committee even in these areas. Nevertheless, there would appear to be adequate opportunity already available for whole-time consultants to find their way to the central committee. Moreover the Committee is composed of some 70-80 members, and it feels that there is room in a body of this size for all sectional interests to be represented without difficulty. In the case of the Joint Committee and the Staff Side of Committee "B," which are much smaller bodies, the Committee considers that it would be impracticable to place representation on the basis of sectional interest, and that it is much more in the interests of all sections of hospital medical staff that the profession's negotiators should be chosen for their personal merits.

The Committee is, however, seeking the views of consultants and specialists generally on the matter through its regional organization, and will be guided as to its future policy by them.

In the meantime, in order to deal with the immediate grievances of whole-time officers over the matter of their professional expenses, the Staff Side of Committee "B" has sought and obtained the agreement of the Management Side to reopen the discussions on the subject, which reached a deadlock last year, and to invite representatives of whole-time officers to take part in the negotiations.

Private Hospital Beds

73. In July, 1952, the Joint Committee sought a personal interview with the Minister of Health, and impressed upon him that, unless some action was taken to reduce the maintenance charges for private hospital beds, private practice would steadily diminish. The Committee reminded the Minister of the promises of previous Governments that facilities for private practice would be retained under the new service. It drew his attention to the reduction since 1948 in the number of hospital beds set aside for private patients, and to the substantial increases which in the same period had taken place in the hospital charges for private beds. The Committee stated that it was the experience of consultants in many parts of the country that the demand for private hospital treatment was falling off, largely owing to the high maintenance priced private bed. In reply, the Minister stated that any such modification would require amending legislation in view of the fact that Section 5 of the 1946 Act required private hospital patients

to pay the whole cost of maintenance. He thought that the possibility of introducing such legislation during the next two or three years was extremely remote, having regard to the heavy Parliamentary programme. The Minister added that, while he was anxious not to put any obstacle in the way of private practice, he thought it was open to argument whether the falling off in private hospital treatment was primarily due to the high charges. He agreed, however, that if this could be substantiated, the position would warrant further consideration, because the provisions of Section 5 were intended to implement the promise given that private practice facilities would continue.

The Committee is now endeavouring to obtain evidence to put before the Minister.

Pay-bed Regulations

74. Discussions have continued during the past year between the Joint Committee and the Ministry upon the question of the revision of the pay-bed regulations, which prescribe the maximum professional fees chargeable to private hospital patients and the method of calculating the maintenance charges.

The Minister has refused to abolish the detailed classification of operations upon which surgeons' professional charges are based, but the new regulations which the Minister has laid before Parliament are, in many respects, an improvement on the existing regulations. Thus provision has been made for the overall maximum of 75 guineas for all professional charges to be increased up to 125 guineas in certain circumstances, and in some specialties the maximum professional fees have also been increased. Moreover the method of calculating the private-bed charges has been amended and should lead to a reduction in the charges.

The new regulations came into operation on April 1, 1953.

Legal Actions Involving Hospital Staffs

75. During recent years there have been an increasing number of actions for alleged negligence brought by patients against hospital authorities and members of their medical staffs. In addition to the general uneasiness caused by this tendency, it is damaging to the spirit of co-operation which has existed hitherto between medical staffs and their employing authorities. The authority is not helped at the moment by the policy of the Ministry that, where it is sought to make a hospital board or committee liable for the alleged negligence of a member of its medical staff, it should endeavour to obtain a contribution from the practitioner concerned in respect of any damages awarded. This makes it difficult for hospital medical staffs to co-operate with their authorities as fully as they would wish, since by so doing they may furnish the authority with information that will subsequently be used against them in pursuance of the Ministry's policy.

Discussions are now proceeding with the Ministry in an endeavour to meet the difficulties both of hospital authorities and of their medical staffs, and it is hoped that a satisfactory arrangement will soon be reached.

The Committee is examining the implications of the judgment given in the recent case of *Payne v. St. Helier Group Hospital Management Committee and Another*. It is hoped to include a statement on this subject in the Supplementary Annual Report of Council.

Mileage Allowances for Hospital Medical Staff

76. The Management Side of Committee "B" of the Medical Whitley Council has consistently taken the view that mileage allowances are a matter of general application to all sections of hospital staff, and for this reason it has proved impracticable to reach separate arrangements for medical staff.

Early in 1952 the General Whitley Council introduced the following revised rates of mileage payments:

New Rates	Old Rates
<i>Cars up to and including 10 h.p.</i>	<i>Regular User*</i>
7½d. per mile for the first 2,000 miles per year.	Annual allowance of £52 per annum, plus 3½d. per mile (irrespective of horse-power)
5½d. per mile from 2,001 to 7,000 miles per year.	*A regular user was one whose annual mileage was estimated to exceed 2,000 miles per annum.
4½d. per mile thereafter.	
<i>Cars over 10 h.p.</i>	<i>Casual User</i>
9d. per mile for the first 2,000 miles per year.	7½d. per mile for the first 3,120 miles and thereafter 3½d. per mile (irrespective of horse-power).
7½d. per mile from 2,001 to 7,000 miles per year.	
6d. per mile thereafter.	

When these new rates were referred in due course to Committee "B" of the Medical Whitley Council for consideration of their adoption for hospital medical staff, the Staff Side was particularly concerned to note that acceptance of the new rates was subject to a proviso that the payment of mileage in respect of the home-hospital part of the journey to a whole-time officer using his car in the performance of his duties would be discontinued in cases where the officer normally travelled between his home and main hospital by car on the days when he did not require it for his official duties.

The Staff Side recognized that this proviso would probably mean that the revised rates would bring little improvement to whole-time officers, and that some of them might even be worse off under the new rates than under the old. It also felt that it was inequitable that a whole-time officer who might require to have his car available at all times should be penalized in this way. The Staff Side, therefore, vigorously resisted the application of the condition to medical staff, but the Management Side was not prepared to vary the terms of the General Council agreement for medical staff alone. The Staff Side was accordingly faced with the choice of accepting the revised rates and conditions *in toto* or of retaining the existing rates. It did not feel that any advantage would be gained for those officers adversely affected by the home-hospital mileage condition by denying hospital medical staffs generally the benefit of the new mileage rates. The Staff Side therefore accepted the revised rates under protest, at the same time making it clear that the question of home-hospital mileage would be taken up in the General Whitley Council.

Objections to the new restriction were also raised in the General Whitley Council by other sections of hospital staff, and after further discussions the following agreement was reached and accepted on behalf of hospital medical staff:

An officer whose normal practice is to travel to his headquarters by car but who satisfies both of the following requirements may, if the employing authority by resolution so decide, be paid mileage allowance in respect of the home-hospital journey calculated in accordance with the terms of service as hitherto in respect of the days on which he actually uses the car to make an official journey which attracts mileage allowance at other than the public transport rate. The officer to whom this arrangement applies is one who has a claim to special consideration because:

(i) He has a definite commitment to make an official journey every day for which the use of his car is justified, or alternatively his duties are such that he is liable to be called upon to make official journeys by car which cannot be arranged in advance, and that liability is so extensive and the journeys in practice so frequent as to make it desirable that his car should always be available at his headquarters.

(ii) He would not otherwise require to travel to his headquarters by car.

If the officer is unable to satisfy these conditions and it is his normal practice to travel to his headquarters by car, then on the days when he uses it for an official journey he will be paid mileage allowance by reference to the excess, if any, of the total distance travelled over his normal return journey between home and headquarters.

If, on the other hand, the officer only travels by car on the days when he requires it for an official journey, mileage will be paid as hitherto in accordance with the terms of service.

The revised mileage rates apply to hospital medical staff with effect from April 1, 1952, with a further increase of ½d. per mile as from October 1, 1952.

Practitioners in Whole-time Salaried Employment: Income Tax

77. The Committee has given consideration to the following resolution adopted by the Representative Body in July, 1952:

That pressure be brought to bear on the Treasury to allow rebate of income tax on the annual subscription to practitioners paid by annual salary.

The rules governing the assessment of income tax under Schedule E allow tax relief only in respect of expenses which the taxpayer is necessarily obliged to incur and defray out of the emoluments of the employment, being money expended "wholly, exclusively, and necessarily" in the performance of the duties of the appointment. Thus income-tax relief in respect of the payment of membership subscriptions to the Association could only be allowed to a practitioner in whole-time salaried employment if membership of the Association were a condition of his employment. To press that membership of the Association should be made a condition of employment would be inconsistent with its policy on the "closed shop" question.

Provision of Diagnostic and Ancillary Facilities

78. The Committee has had before it the following resolutions of the Representative Body:

That this meeting, while appreciating the increasing provision of diagnostic and ancillary services, feels that the present difficulties are as much due to the shortage of staff as to the restriction of capital development, and calls on the Ministry to take steps to overcome this shortage.

That the Ministry be pressed to insist via regional hospital boards and hospital management committees that local hospitals make greater efforts to furnish facilities for pathological investigations for general practitioners in their areas.

That it be an instruction to the Council to make all possible efforts to achieve direct access to pathology and x-ray departments for all general practitioners.

The Central Consultants and Specialists Committee and the Joint Committee both support the principle that wherever practicable general practitioners should have direct access to hospital ancillary departments. The principle is also accepted by the Ministry, and is being implemented as conditions allow.

As the Representative Body itself suggests, the application of the principle is dependent upon the provision of adequate hospital staff as well as apparatus and other facilities, and during the past year a great deal of attention has been devoted in the discussions between the Joint Committee and the Ministry to staffing problems.

Admission of Urgent Cases to Hospital

79. The Committee has noted the resolution of the Representative Body to the effect that hospitals should make the arrangements for an ambulance in emergency cases if so requested by the general practitioner.

The Committee does not consider that this should present any difficulty, but feels that it is essentially a matter for local arrangement.

Early Discharge of Patients from Hospital

80. The Committee endorses the view expressed by the Representative Body in the following resolution, and, as opportunity occurs, will discuss the matter with the Ministry:

That in the view of this Representative Body the early discharge of patients from hospital should be encouraged to enable a quicker turnover of waiting-list.

Fees for Lectures to Nurses

81. The following resolutions of the Representative Body were referred to the Committee for its consideration:

That this A.R.M. deplores the attitude of the Management Side of the Whitley Council in maintaining differentiation in the fees payable for lectures to nurses, and is of the opinion that a uniform fee for all should be the accepted principle.

That the apparently agreed fees for lectures to nurses be restricted to new appointments; the holders of pre-existing appointments to be awarded a fee of two guineas per lecture.

The fees recently agreed for lectures given by members of hospital medical staff to student nurses and midwives were the result of prolonged negotiation in Committee "B" of the Medical Whitley Council. Both the Central Consultants and Specialists Committee and the Staff Side would have preferred a single fee, but the agreed rates represent the best compromise that could be reached.

The Committee feels that the second resolution of the Representative Body on this subject is impracticable. It should be appreciated that in some cases the new rates are an improvement on the pre-existing rates, and it would be impossible to secure the benefit of the new rates for some hospital staff without accepting the reverse for others.

The Committee considers that the best course is to leave matters where they are until experience can be gained of the operation of the new area nurse-training arrangements.

Retiring Age

82. The Committee has considered the following resolution of the Representative Body:

That this Representative Body considers that the difference between the retiring age of consultants and general practitioners is contrary to national policy, which maintains that those over 65 should remain at work as long as they continue to carry out their duties efficiently.

The present policy that members of hospital medical staff should normally retire from their appointments at 65 does not represent any change in the practice which obtained generally in the hospital service before the inception of the National Health Service. The Committee suggests that different considerations may well apply in general practice and in the hospital service, and it would point out that any general departure from the present agreed policy would be bound to have serious repercussions upon the prospects of promotion for junior members of hospital staffs, and in particular for the present body of senior registrars.

Domiciliary Consultation Arrangements

83. The Committee has noted the objection raised by the Representative Body to the inclusion of the diagnosis in the model form of domiciliary consultation certificate agreed between the Joint Committee and the Ministry.

This point was thoroughly discussed with the Ministry, but the Department was strongly of the opinion that the information would be of value for the purpose of hospital statistics. The Ministry agreed, however, to review the model form in consultation with the Joint Committee in 12 months' time and the Committee will bear the Representative Body's view in mind when the matter is reopened.

Deductions for Board and Lodging During Leave

84. Following representations by the Staff Side of Committee "B" of the Medical Whitley Council, the Management Side has agreed that hospital authorities should be

advised that, except in the case of house officers, the charge for board and lodging should not be made in respect of periods when a resident officer is absent from the hospital on annual leave. If the leave entitlement is taken into account in assessing the annual charge, no actual deduction would be made during absence on annual leave, but where the charge is assessed on the full cost of 52 weeks' board and lodging the charge should not be deducted from the officer's remuneration when absent on holiday.

Hospital Capital Expenditure

85. The Committee has noted the following motion, referred by the Representative Body to Council:

That the British Medical Association through its appropriate Committee brings pressure to bear on the Ministry of Health to ensure that, in areas where hospitals are not yet fully developed, central funds on a priority basis will be available for hospital capital expenditure.

The Committee has already recommended, in the evidence submitted to the Select Committee on Estimates, that a block grant system of hospital finance should be introduced. This would go some way towards meeting the difficulties of hospital development to which the Representative Body's resolution draws attention.

The Committee will bear the matter in mind for further discussion with the Ministry at the appropriate time.

Appointment of Members of Regional Hospital Boards

86. The term of office of one-third of the members of regional hospital boards expired in March, 1953, and, as in previous years, the Association received an invitation from the Minister to submit names for his consideration in filling the resultant vacancies. Regional consultants and specialists committees, local medical committees, and Branches and Divisions of the Association, were accordingly asked to consider the matter and to recommend the names of consultants and general practitioners respectively, and the nominations received were transmitted to the Minister at the beginning of the year.

Subsistence Allowances

87. The following new rates of subsistence allowance were introduced by the General Whitley Council in November, 1952, and accepted for application to hospital medical staff:

Night subsistence:

	£810 per annum or over			
	From	To	s. d.	s. d.
(a) Officers in receipt of salary of				
First seven nights	30	0	37	6
From 8-28 nights	25	6	30	0
(b) Officers in receipt of salary of less than £810 per annum				
First seven nights	24	0	30	0
From 8-28 nights	18	0	24	0

Day subsistence:

	£810 or over			
	From	To	s. d.	s. d.
(a) Officers in receipt of salary of				
5-8 hours	3	6	4	0
Over 8 hours	8	4	9	6
(b) Officers in receipt of salary of less than £810 per annum				
5-8 hours	2	6	3	0
Over 8 hours	6	0	7	6

Provided that, where an officer has lunch and/or dinner on a train or boat during the absence, the following allowances shall be substituted for those above:

	s. d.
5-8 hours	6 6
Over 8 hours	
Lunch or dinner	12 0
Lunch and dinner	13 0

(Junior staff 10s. 6d.)

REFORM OF THE NATIONAL HEALTH SERVICE

88. It had been the intention of the Council to present to the A.R.M., 1953, its second report to cover the following items:

- (1) The principle of "contracting out" of the Service;
- (2) the restoration of the optional ownership of goodwill; and
- (3) the structure and functions of regional hospital boards and hospital management committees.

In view of the Government's heavy legislative programme, any amending legislation in the health field seems unlikely in the immediate future. The Council intends in the interval to complete the consideration of the items named, which are still the subject of discussion by the various Association committees concerned, and thereafter to determine the further programme. Further developments in respect of the item on the restoration of goodwill are reported in para. 45 of this report.

The Scottish and Northern Ireland Acts are at the present time under review by committees in those two countries.

Arbitration

89. The question of establishing a Whitley court of arbitration for the National Health Service has been the subject of discussion in the General Whitley Council for the Health Services, but at the present time no final agreement has been concluded. The Staff Side of the General Whitley Council is pressing urgently for further consideration of this matter.

OCCUPATIONAL HEALTH**Future of Occupational Health Services**

90. The Council has continued to consider plans for the future of occupational health services. Discussions with representatives of the Society of Medical Officers of Health have resulted in surveys being undertaken by medical officers of health in different types of area: (a) part of a big city, (b) part of a medium-sized town containing mixed industries, (c) a rural area, and (d) a port. The purpose of these surveys is to ascertain the kind of occupational health services, if any, at present available and to determine future requirements. It is hoped that these surveys will be completed this summer. In addition, surveys are being carried out in two specific industries in a large city, and also in a large industrial organization covering many types of factories and industrial establishments.

An informal discussion has taken place with the Social Insurance and Industrial Welfare Committee of the T.U.C., at which there was a preliminary exchange of views on future occupational health services. A further discussion on this subject will take place when the results of the above-mentioned surveys are available.

Training for the Occupational Health Field

91. In order to ascertain the opportunities for occupational health training at present available, information has been sought from the deans of medical schools on the amount and type of occupational health training given to undergraduate students, and facilities available for postgraduate students.

Although it is appreciated that some training in this subject may be given even where there is no set course in the undergraduate curriculum, the results of the investigation show that the position is not very satisfactory. With few exceptions only a very limited amount of training appears to be given. A greater emphasis on the principles underlying a man's relation to his working environment and his occupation is required. Assessment of a man's fitness for a particular job and for work in general is an important function of a general practitioner, and it is important that medical students should be taught how to undertake such

assessments. In addition, the final examinations might well include a proportion of questions with an occupational health bias.

In so far as postgraduate training is concerned, the number of students undertaking courses for the Diploma in Industrial Health has gradually decreased during the past few years, and at some universities courses are no longer held. As a possible solution of this difficulty, the Council has considered whether integration of the courses of training for the Diploma in Industrial Health and the Diploma in Public Health would be possible. Part I of the course is already common to both. The London School of Hygiene and Tropical Medicine has a D.P.H. elective course, and in the industrial elective course a teaching experiment with a selected group of students has been carried out by which it has been possible to achieve some integration of the D.I.H. and D.P.H. courses. There is not, however, sufficient evidence available at present to show that there could be complete amalgamation of the two courses, leading to either diploma or both diplomas. It has been suggested that a part-time course for the D.I.H. spread over a period of two or three years in place of the present full-time course would be practicable and might well increase the number of postgraduate students wishing to take the D.I.H.

The Council has brought this suggestion to the notice of all teaching authorities in Great Britain.

Occupational Dermatitis

92. Representations have been made to the Ministry of National Insurance that, in all cases of occupational dermatitis where benefit is claimed under the National Insurance (Industrial Injuries) Act and the claimant has been referred to a dermatologist, a copy of the dermatologist's report should be sent to the examining medical practitioner. The Ministry is not prepared to agree to this arrangement, but is willing to provide copies of the dermatologist's report in individual cases where a specific request is received from the examining medical practitioner. The Council has been asked to advise the Ministry on the best method of bringing this decision to the notice of examining medical practitioners, and this matter is now under consideration.

Duties of and Ethical Rules for Industrial Medical Officers

93. The Association of Industrial Medical Officers submitted a document entitled "Notes for the Guidance of Industrial Medical Officers" which it recommended should replace the "Duties of and Ethical Rules for Industrial Medical Officers" approved by the Representative Body in 1949. The Association of Industrial Medical Officers was of the opinion that it was no longer necessary to single out industrial medical officers by the continued use of special ethical rules for this section of the profession. In addition, the Association of Industrial Medical Officers sought to secure that industrial medical officers may undertake continued treatment in connexion with minor or trivial conditions without consultation with the employee's family doctor. The Council is not prepared to agree to abolition of the present ethical rules nor can it accept the view that continued treatment, even for minor or trivial conditions, should be permitted without consultation with the family doctor. The rules act as a guide to new entrants to the occupational health field, particularly to part-time industrial medical officers who may also be general practitioners in the same area. They also assist the Association in advising individual medical practitioners or in dealing with rare complaints which may be lodged. The document has been referred back to the Association of Industrial Medical Officers.

PUBLIC HEALTH**Salaries in the Public Health Service**

94. All authorities, with the exception of six, have now accepted and implemented the awards of the Industrial Court for public health medical officers. The scale

awarded for assistant medical officers has caused considerable anxiety, and negotiations on a revision of the scale have taken place in Committee "C" of the Medical Whitley Council. Following the breakdown of these negotiations, steps have been taken to report the matter to the Minister of Labour for settlement under the Industrial Courts Act.

The Council has under consideration the conditions of service of medical officers employed by local authorities on a part-time basis, including both those remunerated by means of an annual salary and those receiving sessional payment.

Appeals Machinery

95. The Whitley appeals machinery is functioning satisfactorily apart from the failure to establish a Whitley court of arbitration.

Forty-one local authorities have been involved in appeals and in fifteen cases regional appeals were notified by the Association, acting on behalf of the individual medical officers, after failure to secure a settlement at the local level. With one exception, which is now to be the subject of arbitration, the rulings of the regional appeals committees were in favour of the Association. Only in one case has the local authority refused to accept the agreed ruling, and representations on this matter have been made to the Ministry of Health.

Three appeals against non-implementation of the awards are pending, and in another case the status of the medical officers concerned is being taken up with the appropriate Government department. Advice has been given to certain medical officers of health with regard to the manner in which the employing authority had exercised its discretion in selecting the scale of remuneration.

Representations have been made to the Minister of Health and Local Government in Northern Ireland with a view to the establishment of appropriate appeals machinery for all medical officers employed in the National Health Service in Northern Ireland.

Arbitration Machinery

96. The absence of a Whitley court of arbitration gives rise to difficulties when a regional appeals committee fails to reach an agreed decision or when an employing authority does not accept the decision of a regional appeals committee.

The Council is strongly in favour of the establishment of such a court of arbitration and is fully supporting the Staff Side of the General Whitley Council on this matter. The decision to participate in the Medical Whitley Council and to be associated with the General Whitley Council was taken on the understanding that there would be adequate provision for arbitration. The Council is also pressing for the amendment of the Industrial Disputes Order to enable disputes such as those which have not been settled through the present incomplete Whitley machinery to be reported by the Association to the Minister of Labour under that Order.

"Dual Appointments"

97. The protracted negotiations on matters affecting medical officers employed by both hospital authorities and local authorities have been concluded. Details of the agreement are set out in Ministry of Health Circular 3/53 (issued to local health authorities) and RHB (53) 11. The suggestions contained in Ministry of Health Circular 118/47 and RHB (48) 15 for the employment of such officers on an agreed part-time basis by both authorities has now been withdrawn in view of the practical difficulties which had arisen. Under the new arrangements the medical officer will have a full-time contract with the body which requires the greater use of his services, and will receive a full-time salary appropriate to that employment. Provision has been made to safeguard, as far as possible, the position of existing officers. The agreement provides for the establishment of a joint advisory committee which will give advice to officers and employing authorities in cases of doubt. The Staff Side of the advisory committee is composed of representatives nominated by the Association.

Superannuation

98. The Council has examined the Local Government Superannuation Bill, the main purpose of which is to bring the superannuation benefits payable by local authorities into line with those provided by the National Health Service superannuation scheme. The major changes will be embodied in regulations made by the Minister of Housing and Local Government, and these will receive careful consideration by the Council whilst still in draft form. The Council has welcomed the clause under which provision may be made to enable a contributing employee possessing special qualifications to be allowed to reckon additional service on payment of appropriate contributions.

Definition of "Public Health Service Member"

99. The Council has reviewed the current definition of the expression "Public Health Service Member" in By-law 1 (3) of the Association, and is of the opinion that the definition requires amendment as a result of recent enactments and agreements. The Council's proposal for a new definition is given in Appendix III.

"Closed Shop"

100. The "closed shop" dispute with the Durham County Council has been successfully concluded. The board of arbitration, appointed by the Minister of Labour to determine the difference which had arisen in regard to applications for extended sick pay, made an award in favour of the Joint Emergency Committee of the Professions, which was the party in dispute with the county council.

The requirement of certain authorities that their staff, as a condition of employment, should be members of a trade union or professional organization is now virtually nonexistent so far as the medical profession is concerned. Four authorities are still believed to require such membership in accordance with a resolution passed several years ago, but it is known that no pressure has been brought to bear on the medical officers concerned with a view to enforcing this requirement.

Decentralization by County Councils of Part III Services

101. The Council is in agreement with the policy of the Society of Medical Officers of Health favouring, wherever practicable, decentralization by county councils of Part III services under the National Health Service Act. The Council concurs in the view of the Society that there is much to be gained by fostering local interest in child welfare and other Part III services, all of which are of a personal nature and are most appropriately handled by the authorities in closest touch with the persons who are to benefit from the services provided. It is envisaged that the decentralization to subcommittees of the functions of the county health committee would relate to the day-to-day administration of the services in question, matters such as policy and finance being retained by the Central Committee.

Child Care

102. General approval has been given by the Council to the memorandum of guidance prepared by the Ministry of Health on the subject of the responsibilities of hospital authorities, local health authorities, and executive councils for the care of women who are confined in hospital and for their babies during the lying-in period. This general approval has been given subject to the acceptance by the Ministry of the views of the Council regarding the need for adequate administrative procedure within the hospital to ensure the prompt sending of the requisite information to medical officers of health and general practitioners.

The Council is anxious to secure the widest possible co-operation between school medical officers and general practitioners, and is keeping under review the operation of the agreement reached between the Association and the Society

of Medical Officers of Health in 1950 relating to the principles governing the reference of children to specialists.

The attendance at school medical inspections of ophthalmic opticians to undertake sight-testing is regarded by the Council as not being in the public interest. The Council is of the opinion that children whose visual acuity is below normal should in all cases be referred to the school eye clinic for a full ophthalmic examination.

Detailed consideration has been given to draft regulations which the Ministry of Education proposes to introduce to replace the Handicapped Pupils and School Health Regulations, 1945. The comments of the Council have been submitted to the Ministry.

The Council has received with interest Home Office Circular No. 258/52, which deals, among other matters, with the need for foster homes, the desirability of boarding-out children in the care of local authorities, and consultation with the local authority associations about the organization of regular exchanges of information between areas where boarding-out is difficult and the more fortunately placed areas.

Tuberculosis

103. As a result of an approach by the Council to the Ministers of Housing and Local Government and Health, stressing the need for priority in the rehousing of persons suffering from active pulmonary tuberculosis, it has been ascertained that most local authorities take steps to ensure early rehousing in cases where pulmonary tuberculosis occurs in a family which is overcrowded or has no separate home. In these circumstances the Ministries concerned felt that no useful purpose would be served by issuing a further circular on this subject at the present time.

Discussions are proceeding on the general question of the occupational resettlement of tuberculous persons with particular regard to the effect of the new arrangements contained in Ministry of Health Circular 7/52. The problems of placing positive sputum cases in industry, the risks involved, the necessary safeguards which should be taken, and the extent of the responsibility of the various authorities who would be concerned with the operation of the proposed arrangements are matters of the greatest concern both to the individual patient and to the community. Any agreement reached will be dealt with in the Council's Supplementary Report.

Infectious Diseases

104. It is believed that in certain areas there has been an increase in the number of primary vaccinations of infants, and current trends are being kept under review. The Council adheres to its view regarding the desirability of increased propaganda for infant vaccination.

MEDICAL ETHICS

Indirect Methods of Advertising

105. Numerous requests for advice have been submitted by members in regard to such matters as undesirable publicity arising out of the publication of articles, the delivery of lectures, or the granting of press interviews, and the practical application of the Association's policy of anonymity for medical practitioners in sound broadcasting and television. The Council considers that it is desirable for the Association to publish an up-to-date pronouncement on the subject of indirect methods of advertising, the original statement on this matter having been approved by the Representative Body in 1925. The Council submits in Appendix II a revised version of this statement.

Recommendation: That the revised statement on indirect methods of advertising be approved.

Loan of Hospital Records to Government Departments

106. Following a request made by the Representative Body last year, the Council has examined further the possibility of introducing additional safeguards into the procedure for the loan of case papers by hospitals to the Ministry of

Pensions and the Ministry of National Insurance. The Council has proposed a general statement on the question of the loan of hospital records to Government departments and recommends:

Recommendation: That the following amplified statement on the loan of hospital records to Government departments be approved:

(a) Medical records may be lent to Government departments only when written consent has been given by or on behalf of the patient. (b) The form of consent signed by or on behalf of the patient should include a statement that the disclosure of the information contained in the records will not necessarily be to the advantage of the claimant. (c) Wherever practicable, and particularly where disclosure of information may have an adverse psychological effect upon the patient, the practitioner who compiled the record, or, if he is not available, one nominated by the hospital authority for the purpose, should be consulted on the wisdom of disclosing to the patient all of the confidential information contained therein.

Use of Reminders by Ophthalmic Medical Practitioners

107. The Council has considered the propriety of the issue by ophthalmic medical practitioners of reminder letters to patients, inviting them to attend for re-examination. The Council has expressed the opinion, which has been conveyed to the Ministry of Health, that such reminders should not be issued by ophthalmic medical practitioners or ophthalmic opticians.

Work of the Central Ethical Committee

108. Apart from the investigation of complaints regarding professional conduct, the Central Ethical Committee has given advice on many problems relating to professional secrecy, intraprofessional relationships, and other ethical matters.

PRIVATE PRACTICE

Fees for Police Calls

109. The revised scale of fees for payment to practitioners called in by the police, which was approved by the A.R.M., 1951, has been adopted by many police authorities throughout England and Wales. In some areas, however, other methods of payment exist, many of which are considered to be satisfactory by the profession locally. Where this is not the case, it has been suggested to the Division concerned that suitable representations be made to the police authority, the full support of the central organization being available if any difficulty is met.

Hire Purchase: Doctors' Cars

110. The Council has continued to support applications made to the Board of Trade for licences under the Hire Purchase Control Order whereby the period of repayment of the purchase price of a car may be extended over a period of three years. Until December, 1952, the Board of Trade was prepared to issue licences only to general practitioners, or to those about to enter general practice. Since January, however, the Board has agreed to consider similar applications from doctors in the hospital, consultant, or public health services who are able to show that relief from the standard maximum period of 18 months is necessary on financial grounds and also that there is professional need, comparable with that of the general practitioner, for a car in the interest of service to the public.

Mortuary Accommodation

111. Discussions have taken place with the Ministry of Housing and Local Government with a view to the implementation of the recommendations on mortuary accommodation contained in the 1949 report by Council on the working of the Coroners Acts. Further meetings are being arranged which, it is hoped, will enable the Ministry to prepare a scheme for the improvement of mortuary accommodation generally.

The Unattended Telephone

112. The Council has considered the following Minute 254 of the A.R.M., 1952, together with a memorandum from the General Post Office detailing the various methods of dealing with this problem.

Resolved: That this meeting regrets that no progress has been made in meeting the difficulty of the unattended telephone, and urges the Council to press at the highest level for a satisfactory solution.

It is apparent from the memorandum that the G.P.O. is fully aware of the difficulties of the profession and that it is doing all it can to provide a satisfactory solution, having regard to the acute shortage of equipment and the Government's policy of restricting capital outlay. Facilities for the transfer of telephone calls to other numbers are available to a certain extent, and it is the policy of the Post Office to increase these facilities whenever conditions allow. In the meantime the Post Office is prepared to publish in the telephone directories an alternative number which can be used by a patient when the doctor's telephone is unattended. Telephone message centres and agencies, another means of overcoming the problem, have been established in London and in certain provincial centres.

The Post Office has approved, for use in connexion with its lines, a device manufactured commercially which will record a telephone message received in the absence of the subscriber. The recorded message can be played back to the subscriber either on his return or from some other telephone by using a private code.

Remuneration of Part-time Medical Officers at Civil Airfields

113. Discussions have taken place with the Ministry of Civil Aviation on the remuneration of part-time medical officers of civil airfields, and the Council regards as satisfactory the fees now offered.

Remuneration of Medical Witnesses under the Coroners Acts

114. The A.R.M., 1952, deplored the failure of the present and past Governments to give consideration to the implementation of the recommendations of the Representative Body with regard to the working of the Coroners Acts, and called upon the Secretary of State for Home Affairs to introduce an Amending Bill. The Council has since been informed that while the Secretary of State sympathizes with the suggestion that the existing scale of allowances to medical witnesses at coroners' courts should be improved, he is not yet in a position to say when it will be possible to introduce the amending legislation required. The Council will continue to press for action in this matter.

Appointment of Medical Practitioners as Coroners

115. The A.R.M., 1952, reaffirmed a previous decision that the most suitable persons for appointment to coronerships are registered medical practitioners who possess, in addition, a legal qualification. The Council will take appropriate action whenever a local authority seeks to avoid or exclude the appointment of medical men as coroners.

The A.R.M., 1952, also approved the Report by Council that £2,750 per annum, exclusive of expenses, should be the minimum salary of a coroner employed on a full-time basis. The Council has considered what action should be taken in the event of an advertisement being submitted for publication in the *British Medical Journal* which offers a salary of less than £2,750. Bearing in mind the fact that if such an advertisement is refused the effect may be to restrict, or even exclude, the appointment of a qualified medical practitioner, the Council has decided that an advertisement of this nature, if otherwise acceptable, will be accepted for publication.

Life Assurance Short Forms

116. Following representations made by the Council to the Life Offices Association, the fee for the short form of medical report was increased from 10s. 6d. to 15s. as from November 1, 1952.

A similar increase has been agreed by the Co-operative Wholesale Society in the fee for the examination of prospective employees and for a report on the approved short form.

Furnishing Copy of Medical Report to the Defence

117. A suggestion was made by the Law Society that a copy of a police doctor's report should, on application, be made available to the defence. The chief constables, while in favour of a short report being handed to the defence, considered that this procedure might make it more difficult for the police to obtain the services of doctors. The Council, which was asked for its observations by the Home Office, has replied as follows:

(a) that objection would not be raised to a brief report of the doctor's findings being made available to the defence, but that the Council does not favour the issue of a detailed report;

(b) that the difficulties described by the chief constable might be circumvented by other methods, such as the payment of adequate fees, and saving of the doctor's time when he is required to attend court to give evidence on behalf of the police.

Hearts of Oak Benefit Society

118. The Hearts of Oak Benefit Society has agreed that, where its members are of pensionable age and are certified as permanently incapacitated, medical certificates will be required only at yearly intervals.

Car Priorities

119. Up to the late summer of 1952 the delay in obtaining new cars on priority was still causing great anxiety. A pilot survey showed that there were about 1,000 doctors who had not received their first post-war model and whose orders had been outstanding for more than six months. Hitherto, the trade had been unwilling to repeat the emergency measures taken in 1949, but following a renewed appeal agreed to a second special clearance, which, it was hoped, would be completed by the end of the year.

It had been apparent for some time that second-hand prices were falling and that once the price of used post-war cars (of reasonably low mileage) was equal to or fell below the list price of the equivalent new model, the whole position would change. What was not foreseen was the speed at which the final stages of this gradual decline in prices took place. The result was dramatic; the whole situation changing, as it were, overnight, and the special lists prepared for the manufacturers were largely out of date before they were submitted.

Correspondence on car problems is now negligible compared with the volume at which it was maintained during the past five years. This reached its peak in 1950, when 25,000 letters were received, nearly 80 daily, and 6,000 recommendations for priority issued. The Association's Car Department, which employed a whole-time clerical staff of four, has been virtually closed, but the priority scheme remains in being. The Council will continue to watch the position.

Salaries of Part-time Medical Officers of Prisons and Borstal Institutions in England and Wales

120. Proposals for the remuneration of part-time prison and borstal medical officers in England and Wales, submitted by the Prison Commission, have been approved by Council. In future, these medical officers will be paid a salary based on the number of hours spent at the prison during each week, with additional allowances based on the annual turnover of prisoners and the varying responsibilities of the different posts.

National Union of Mineworkers

121. The attention of Council has been drawn to the "counter" certificates required by some branches of the National Union of Mineworkers in cases where the percent-

age disability sustained by a miner has been assessed by an industrial injuries tribunal. The "counter" certificate is a medical report, usually obtained from the patient's family doctor, on which the Union decides whether it should contest the decision of the tribunal. The Union has declined to enter into a national agreement on the ground that these reports are required only in certain areas. Therefore it will be necessary to make arrangements locally for the payment of an adequate fee. In the opinion of the Council a fee of not less than one guinea should be paid for each report.

Cremation

122. The Secretary of State has decided not to make any substantial alterations in the existing procedure for medical certification for cremation when revised regulations are issued under the Cremation Act, 1902, as amended by the Act of 1952. There will, however, be certain alterations in the form of Certificate C, designed to emphasize its importance, and the Council has approved a draft of the revised certificate.

The Cremation Act, 1952, gives the Secretary of State the power to make regulations prescribing the fees which may be charged for Certificates B and C. It was announced in the House of Commons, however, that the Secretary of State would prefer to settle the matter by agreement with the profession without the exercise of his statutory power.

In reply to an official request the Council has informed the Home Office that, although it would be prepared to recommend that two guineas is a suitable fee for the completion of Certificate B or C, it is not prepared to recommend that the fee should not exceed two guineas.

Bonus Shift Certificates

123. In order to stimulate regular attendance at work the National Coal Board, in agreement with the National Union of Mineworkers, instituted a system of payment whereby a man is paid for six shifts provided he works five. Payment for the bonus shift may also be made if the miner is absent on one or more days owing to injury received in the course of his work. In November, 1952, however, the agreement was extended to allow the payment of proportionate bonus in the case of absence due to certified sickness and absence due to the death or sudden illness of a near relative or another person upon whom the worker relies for the management of his home.

In the case of sickness a medical certificate must be produced either during the absence from work or immediately on return to work, unless evidence is produced to show that the worker concerned was in receipt of National Insurance sickness benefit while absent. This has resulted in a considerable increase in the demand for medical certificates for a period of absence of one or two days, and often the certificate can only be based on the miner's own statements.

The Board has been asked to discuss with the Association the problems arising from the need for these bonus shift certificates.

Allowances at Criminal Courts

124. The Council regards as satisfactory the following scale of allowances to medical witnesses to fact which is now in operation at the Central Criminal Court:

	Minimum		
	£	s.	d.
Hospital doctor paid by salary only	1	11	6 a day
Same if coming from over 10 miles away	2	2	0, " "
Doctor in private practice under 10 miles away	3	3	0, " "
Same over 10 miles away	4	4	0, " "
Doctor in private practice coming from long distance—e.g., Reading	5	0	0, " "

The Council proposes to press for the adoption of this scale by all criminal courts in England and Wales.

The Council is also making further inquiries into the position of the medical practitioner who attends court as a witness to fact and who is then asked for his opinion on the

matters in issue. It is the view of the Council that in such circumstances the practitioner should be granted an allowance as an expert witness. The opinion of Counsel is being sought.

"BRITISH MEDICAL JOURNAL"

125. In the report to Council last year reference was made to the high cost of paper and its effect upon the financial position of the *Journal* and other publications. It was stated that "a fall in the cost of paper would go a long way to ease the anxieties of those responsible for the Association's publications." During the past year the price has fallen and the financial position is correspondingly better than it was. At the end of 1951 the Council appointed a firm of business consultants, Messrs. Harold Whitehead and Partners, to investigate the organization of the *Journal* department, with a view to improving efficiency and effecting economy. The consultants made a thorough investigation of the activities of the staff and of the methods employed, and set forth the results of this in a document presented to the Council early in 1952. Among other things, they recommended the Council to appoint a business manager, a recommendation acted on at the end of the year. A number of economies were brought into force, the major one being the purchase of a cheaper type of paper found to be satisfactory for the *B.M.J.*

One of the economies was brought in at the beginning of 1952, when the Council instructed the Editor to reduce the number of literary pages in 1952 by an average of 4 a week, or 208 a year, as compared with 1951. Unfortunately in 1952 the *Journal* received for publication a record number of original articles, with less space in which to print them than formerly. This meant that many more authors than usual had to be disappointed, and, along with other factors operating caused a regrettable delay in publication of papers and in the return of those rejected. The fact that a growing number of members of the Association are seeking to publish their articles in the *B.M.J.* may be taken as an encouraging sign, and as a recognition of the value of publication in the *Journal*. With the increase in the membership of the B.M.A. pressure on space in all parts of the *Journal* increases, especially in the correspondence columns. The imposed restriction on space leads to delay in publication of letters, and at times makes it difficult to preserve a balanced journal.

The "Any Questions?" section and the "Refresher Course" series continue to be popular with general practitioners. About 10,000 copies of the book containing a first selection of questions and answers have been sold, and about 5,000 copies of the *Refresher Course* book, these sales making a useful contribution to the *Journal's* balance sheet. Between 30 and 40 questions are received each week, most of these being answered from the stock-pot of answers to previous questions.

An attempt is being made to produce a more informative *Supplement*, though here again limitation of space is a drawback.

The quarterly journals as a group continue to show satisfactory progress in circulation, and the cost to the Association of these was much less in 1952 than in 1951. The editors of these journals have co-operated to the full in easing the financial situation. But most of them are sharing the same experience as the *B.M.J.* in receiving far more papers than they can find space for. It seems clear that the quantity of work being done by British doctors is increasing, and that this is being accompanied by no falling off in quality. The reputation of the special journals stands high both in this country and abroad, and their publication enhances the prestige both of British medicine and of the B.M.A.

Abstracts of World Surgery ceased publication last June, and *Abstracts of World Medicine* now contains abstracts of surgical as well as of medical literature. Its publication is a service to medicine and represents another attempt to

fulfil the first object of association of the B.M.A.—"to promote the medical and allied sciences." An abstracting service is all the more needed at a time when such rapid advances are being made in the science and so in the practice of medicine, and in financing such a service the B.M.A. shows its awareness of this. The abstracting department receives some 1,500 periodicals a year, and they are eventually made available to members in the library of the B.M.A.

"FAMILY DOCTOR"

126. It should be recalled that *Family Doctor* was launched in April, 1951. By the end of the year, ten monthly issues had appeared, and there had been considerable financial and other difficulties. In order to grapple with these problems the Council appointed a special *Family Doctor* Committee with wide powers; separated *Family Doctor* from the other B.M.A. publications; and accepted and approved a number of staffing changes and a complete plan for reorganization.

At the Annual Representative Meeting in Dublin, 1952, the Chairman of the *Family Doctor* Committee gave an estimate of its likely loss on the year's working, which he hoped would be not more than £6,500. The Committee has been able to keep to this. The trading loss on the eleven issues for which the Committee was responsible (the February issue was in the process of publication before the Committee took over, and appeared on January 28, 1952) is below this figure, and is of the order of £6,200.

For the year 1953 it is the Committee's aim to conduct the affairs of *Family Doctor* at no cost to the general funds of the Association. Already it can be reported that this aim has been achieved on the first three issues of this year, on each of which there is a small surplus. During the whole of the year *Family Doctor* will have a minimum circulation of 100,000 copies per issue, and an advertising revenue which it is estimated will be half as much again as that achieved in 1952. Targets have been set for each month, and money spent on development and promotion will come out of *Family Doctor's* earnings. The standing of *Family Doctor* has been consolidated in the course of the year, and its financial position has been greatly improved.

Obviously the financing of *Family Doctor*, which is being sold from the bookstalls in a highly competitive market, has remained the consideration governing all policies and proposals for 1953. At the end of the year *Family Doctor* should "break even," or perhaps even show a small surplus.

FINANCE

(As the auditing of the Association's accounts has not yet been completed, the Annual Financial Statement will be published with the Council's Supplementary Report.)

127. Throughout the past year the financial position of the Association has been under constant review by the Council. The aim has been to effect an early redemption of the indebtedness which resulted from the losses of the previous year, and to introduce methods which will ensure a more efficient financial control.

Income

128. The income in 1952 from subscriptions, rents, and investments amounted to £239,000, which exceeded the budget figure. In addition, the Association received £20,000, largely in the form of income-tax recoveries in respect of the previous year's losses. The payment by H.M. Government in respect of expenses of the Central and Area Recruitment Committees was increased from £7,000 to £13,000 in accordance with the arrangement that the Association recovers 75% of the total costs incurred in this work.

Expenditure

129. When the budget for 1952 was prepared it was anticipated that the expenditure for the year, excluding the publications, would reach a level of £240,000, and that there would be a small surplus of £3,000 on the general Association account to offset the anticipated deficit of £30,000 on the publications account. That the decisions of Council in regard to economies were effective to a marked degree is shown by the accounts for the past year; for not only was this deficit avoided, but a surplus on both the publications account and the general account, amounting in all to £18,000, was realized. This credit balance, together with the surplus which has accrued from the tax recoveries, has reduced the Association's indebtedness by over £30,000. Against this indebtedness the Association still holds investments in Government and other first-class securities, the market value of which at December 31, 1952, was £133,000.

The economy measures introduced by the Council during the year have had a marked effect on many of the items of Association expenditure. In the case of central meetings the net cost fell from £22,400 to £17,300. Most of the committees were asked at the beginning of the new session to reduce their meetings to two a year unless circumstances warranted additional meetings. Documents were stencilled wherever possible instead of being produced in the more expensive printed form. The stencilling of the Council documents resulted in a saving of £1,300 in the 12 months. The Council gratefully acknowledges the help given by the trustees of the National Insurance Defence Trust, who considerably increased their contribution towards the expenses of the General Medical Services Committee.

The cost of operating the bank overdraft was less than had been anticipated, as the overdraft at its highest figure did not exceed £156,000 in 1952. The Association has been able to make arrangements with the bank for 1953 on the same favourable terms as those for last year's accommodation.

Expenditure on the Empire Medical Advisory Bureau and the International Medical Visitors' Bureau was well inside the amount set aside by the Council for this purpose. Although the anticipated cost of the Bureaux for 1953 is slightly higher than in 1952 the committee of management has accepted a budget which provides for a saving of £500 on the figure originally earmarked.

Economy has been exercised in regard to the premises, and there has been little capital expenditure on alterations or on repairs and redecorations. It will, however, be necessary to meet increased expenditure during 1953 in order to maintain the buildings in a good state of repair, and provision for this has been made in the budget.

The amount paid as capitation grants to Branches and Divisions is considerably less than was provided in the 1952 estimates. By ensuring that all unused balances in the hands of Branches and Divisions were withdrawn it was possible to effect a substantial scaling down of the normal grants, and the Council acknowledges the co-operation given by Branch officers in making this economy possible.

In the case of the library expenses the Council's decision to ask borrowers of library books to pay the postage incurred reduced the cost of this service by over £600. On printings, postage, and stationery there has been an overall reduction in cost of nearly £5,000. This substantial reduction resulted partly from the receipt of certain non-recurring credits and from a fall in the price of paper, and partly from the steps taken in all departments of the Association to effect economies wherever possible.

Publications Account

130. From an estimate prepared in the early months of 1952 the Council had been led to anticipate an adverse balance of £20,000 on the accounts of the *British Medical Journal*, special journals, and abstracts. Two main factors

have contributed to the highly satisfactory position disclosed by the accounts for the past year. First, the adoption of recommendations made by the firm of management consultants retained to investigate the Association's organization and methods resulted in reductions in the cost of paper, wrappers, and reprints. During the period in which these economies operated in 1952 the saving effected was approximately £6,850, or £11,500 when calculated at an annual rate. Secondly, paper prices commenced to fall in May, 1952, and this trend has continued. The result of these and other factors has been that the cost of production of the *British Medical Journal* fell by over £20,000.

"Family Doctor"

131. In the early months of 1952 the Council allowed for a maximum deficit of £10,000 on the working of *Family Doctor*. The results of the year's trading are well within this figure. The present financial position of *Family Doctor* is regarded as satisfactory. On each of the first few issues published in this year (1953) a small surplus is being shown. The aim for the year is that *Family Doctor* will "break even," and will involve no charge upon the funds of the Association.

Trust Funds

132. Although the market value of investments held by the Trust Funds was still relatively low at the close of 1952, they are in a sound position, and in the case of the Prize Funds the income has been sufficient to meet the cost of the normal awards. The Council is pleased to report an increase in the support given to the Medical Charities.

Revenue Budget for Twelve Months ending December 31, 1953

133. A summary of the Budget for the year to December 31, 1953, is set out below. It makes provision for all normal expenditure and for increases which will be met during the year as a result of recent decisions of Council. It is prepared in a form recommended by the firm of management consultants retained by the Council.

Hitherto the budget has shown the total expenditure anticipated under headings such as, for example, salaries and wages, printings and stationery, etc. In future the budget will be set out so as to show the estimated cost during the coming year of each major service or department for which a Committee is responsible. These committees will prepare their internal budgets and submit them for incorporation in the master budget.

The Council has appointed a small Financial Advisory Committee, which will not only scrutinize the annual budget before its submission to the Finance Committee and the Council but will also hold regular monthly meetings to keep a constant watch on expenditure. Any major deviation from the budgeted expenditure of any department will come promptly to the notice of this committee, which will consider how increased costs, if necessary in one department, may be balanced by reduced costs in another. The Council is confident that this new system will provide more effective co-ordination and control of the Association's finances than have existed in the past. The members of the Financial Advisory Committee are the Chairman of Council, the Chairman of the Representative Body, the Treasurer, the Deputy Chairman of the Representative Body, and Dr. H. Guy Dain, and the terms of reference of the Committee are "to review monthly budget and other statements showing the financial position of the Association and to co-ordinate for the Treasurer information and advice on all the Association's financial affairs."

The Committee has no authority to make executive decisions, but its close and constant scrutiny of income and expenditure in all departments will make it possible for timely warning to be given to the Finance Committee of the need for executive decisions.

Summary of Budget for 1953

INCOME		£	£
Membership subscriptions		244,485*	
Rents		33,970	
Investments and sundries		19,819	
Total income			298,274
* The additional revenue from subscriptions as a result of the increased rates which operated from January 1, 1953, is expected to be approximately £49,500, and the greater part of this sum has been earmarked for loan redemption.			
EXPENDITURE		£	£
Secretary's budget		81,106	110,675
Medical Practices Advisory Bureau		6,994	10,594
Regional offices		—	9,840
Central and representative meetings		—	18,600
Scottish offices		—	14,558
Empire Medical Advisory Bureau and International Medical Visitors, Bureau		—	6,074
Organization Committee (grants, etc.)		—	16,895
Science Committee (including library)		5,633	6,483
Public relations (net cost)		4,086	1,551
Film Committee		701	251
Financial charges (including building)		—	41,668
International Relations and Overseas Committees		—	2,220
General services (including catering)		—	6,150
Total secretarial expenses			255,979
Secretarial budget—surplus			42,295
British Medical Journal, medical abstracts, and special journals—surplus			11,594
Family Doctor—estimated to "break even"			—
Total estimated surplus			53,889
Less: Amount appropriated for loan redemption			35,000
Reserve against contingencies			15,000
			50,000
Estimated net surplus to be transferred to Accumulated Fund			£3,889

Membership Subscription

134. The Representative Body authorized the Council "to investigate the position of whole-time salaried members of the B.M.A. in the lower-income group" and, at its discretion, to introduce lower subscription rates for these members.

After reviewing the position of these members, the Council finally decided that a reduced subscription of four guineas for those in receipt of a whole-time salary of not more than £1,500 per annum would be equitable. The new rate of subscription has been applied as from January 1, 1953.

It is considered that the salary limit used to define "lower-income group" should be capable of variation by the Council in the light of experience, and the proposed addition to the by-law makes provision for this.

The recommendation of the Council for amendment of By-law 16(1)B is contained in Appendix III.

Subscription Payable by Associates

135. The annual subscription of £1 5s. paid by associates of overseas Branches has been varied to £1 15s., in order to relate it to the increase in subscription paid by overseas members as from January 1, 1953. No increase has been made in the subscription of £4 4s. paid by associates of home Branches. These latter are a small and diminishing group, comprised mainly of mid-European practitioners engaged in prolonged postgraduate courses.

Income-tax Rebate on Annual Subscription of Salaried Practitioners

136. When asking the Council to review the subscription of whole-time salaried members in the lower-income group, the Representative Body was influenced to some extent by the anomaly which exists in the charging for income-tax purposes of subscriptions to professional bodies.

The A.R.M., 1952, asked that pressure be brought to bear on the Treasury to allow rebate of tax on the subscriptions of practitioners paid by annual salary. The Council has considered this very carefully, but has decided that it would

be impolitic to take the action suggested. The question is closely linked with the "closed shop" issue, as it would be necessary to show that membership of the Association was a condition of employment.

BUILDING

137. Although capital expenditure has been reduced to a minimum, the Council has continued its efforts to improve the amenities at B.M.A. House. In early January, the new Hastings Room was opened to members and their guests. The furnishing of this room has been carried out in a scheme which provides adequate and comfortable seating, and visitors to Tavistock Square now have available a lounge which is in keeping with the dignity and character of the Association's headquarters. The portrait of Sir Charles Hastings, the Founder of the Association, which was painted by a member of his family from the original by Faulkner, and that of Dr. Guy Dain, by David Jagger, are hung in the Hastings Room.

A licence has now been granted by the Ministry of Works for the repaving of the Court of Honour and fountain, and it is hoped that this work will be completed before the summer recess. The licensing officer has not given his approval to the completion of the memorial itself, but it is hoped that by the time the sculptor is ready to prepare the symbolic figures which form a part of the memorial the necessary licence will have been secured. It is interesting to note that Mr. James Woodford, R.A., who was selected by the Council to execute the war memorial, has been commissioned to design and execute the "Queen's Beasts," the heraldic animals which will ornament the Coronation pavilion in Westminster Abbey.

The Council has also directed its attention to the probable future needs of the various departments and services, and in particular the library, by accepting the opportunity which was presented of securing a lease of land and property in Burton Street at the rear of B.M.A. House. Agreement has now been reached with the Bedford Estate Office on the question of ground rent, and negotiations are proceeding in regard to the terms of a lease which will secure the site for the Association until the year 2125, when the existing lease terminates. By the acquisition of this new site, the Association in its own time will be able to extend the building by some 5,000-6,000 square feet, and also improve the facilities available to members for garaging and servicing their cars.

The Association continues to enjoy a rental income of approximately £34,000 from the accommodation occupied by the medical and professional organizations in Tavistock House North and South. All the available space is let on leases with a seven-year term, with the exception of two which are for a longer period.

SCIENCE

Association Prizes

Sir Charles Hastings and Charles Oliver Hawthorne Clinical Prizes, 1953

138. The Sir Charles Hastings Clinical Prize, established to stimulate observation, research, and record in general practice, has been awarded for 1953 to M. I. Cookson, of Gloucester, for his essay on "A Survey and a Commentary on Certain Aspects of Obstetrics of Importance to the General-practitioner Obstetrician." The award consists of a certificate and a cheque for 50 guineas.

The Charles Oliver Hawthorne Clinical Prize, awarded to the writer of the essay ranking second best in the Sir Charles Hastings Clinical Prize Competition, has been awarded for 1953 to G. A. Ballance, of Oxford, for his essay on "An Epidemic of Infective Hepatitis in an Oxford College, 1950." The award consists of a certificate and a cheque for 40 guineas.

Katherine Bishop Harman Prize

139. The Katherine Bishop Harman Prize, established for the encouragement of study and research connected with the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child-bearing, has been awarded for 1953 to T. G. E. White, of Croydon, for his essay on "Deflexion Attitudes of the Foetus *in utero*, with special reference to the Aetiology and Diagnosis of Face and Brow Presentation." This prize consists of a certificate and a cheque for £75.

Occupational Health Prize

140. The Occupational Health Prize, established for the purpose of encouraging interest and research in the field of occupational health, has been awarded for 1953 to R. McL. Archibald, of Northwich, Cheshire, for his essay on "Perforation of the Nasal Septum due to Soda Ash." The award consists of a certificate and a cheque for £50.

Prizes for Medical Students

141. The Students' Prize Essay Competition has again been held. The subject set for the 1953 competition was "A Good General Education is a Necessary Preliminary to a Medical Career." A list of the prizewinners will be published in the Supplementary Annual Report of Council.

Prizes for Nurses

142. A number of entries have been received in connexion with the 1953 Nurses' Prize Essay Competition, which has again been organized in four classes. The subjects set were:

- Student Nurses*.—"Is Nursing a Vocation?"
- State Registered Nurses working in a hospital*.—"The Role of the Married Nurse in the Hospital Service."
- State Registered Nurses not working in a hospital, i.e., District Nurses, Private Nurses, etc.*.—"The Psychological Approach to the Patient."
- State-enrolled Assistant Nurses*.—"The Nursing Care of the Paralytic Patient."

A list of the prizewinners will be published in the Supplementary Annual Report of Council.

B.M.A. Lectures

143. At the invitation of the Council, experts in various fields of medicine have continued to give "B.M.A. Lectures" to Branches and Divisions. The number of lectures arranged during the year was 73. The Council wishes to record its appreciation of the services of the lecturers.

The Library

144. The number of individual members using the Library during the past year has increased, although the number of books borrowed is slightly less than in 1951. Over 200 books and journals have been presented to the Library by members of the Association. In order to meet the heavy demand for periodicals from all parts of the British Isles, a number of journals have been added to the Library to make up previously incomplete sets.

Since November, 1951, the cost of postage has been borne by individual borrowers, and this has resulted in a saving to the Association of approximately £900.

The Council has decided not to renew its membership of the National Central Library Inter-Library Loan Scheme. The demands made upon the Association by this Library have been steadily increasing, whereas the Association borrows only a very limited number of books from this source. By virtue of the Association's mutual loan arrangements established with all the main medical and scientific libraries, the loss of the facilities of the National Central Library can be replaced.

Research Scholarships

145. The following Research Scholarships, ténable for 12 months from October 1, 1952, have been awarded:

Ernest Hart Memorial Scholarship (£250).—F. Prime, B.A. (Hon.), M.B., B.Ch.—for research on the therapy of CO₂ narcosis in emphysema.

Walter Dixon Memorial Scholarship (£250).—J. D. K. North, M.B., Ch.B.(N.Z.)—for research into the experimental production of polyneuropathy in the rat.

Ordinary Research Scholarships (£200 each).—(i) I. S. Hodgson-Jones, M.A., M.B., M.R.C.P. (renewal)—for research into the physiological and pathological variations of sebaceous activity. (ii) J. G. P. Hutchison, M.B., B.S.—for research on the nasal carriage of staphylococci. (iii) A. F. Ross, M.B., Ch.B., B.Sc.—for research into the cavernous tissue associated with the posterior parts of the superior sagittal sinus. (iv) P. Macdonald Tow, Ph.D., M.B., B.S.—for research into a severe psychoneurosis.

The Council wishes to thank those who visited and reported on the work of the 1951-2 scholars.

Children's Sand-pits

146. The National Playing Fields Association sought the advice of the Association on the possible danger to the health of the community, and, in particular, to children, arising from the provision of sand-pits. Information was obtained from a number of experts on the subject, including detailed recommendations for the construction and maintenance of sand-pits in operation at day nurseries with sand-pits in the London County Council area, and these have been conveyed to the National Playing Fields Association.

PUBLIC RELATIONS

147. The Public Relations Committee, reconstituted in accordance with the decision of last year's Annual Representative Meeting, now includes representatives of the Central Consultants and Specialists, Public Health, and Journal Committees. At its first meeting it decided to co-opt to its membership someone representing industrial medicine, and the Occupational Health Committee was asked to nominate a representative.

Hitherto the expenses of the Association's Public Relations activity have been borne in equal parts by the Council of the Association and by the National Insurance Defence Trust. In view of its altered constitution, the Committee has suggested that the Central Consultants and Specialists and Public Health Committees might consider making a contribution towards the cost. The Central Consultants and Specialists Committee has agreed to contribute £500 for the current year. The Trustees of the Public Health Services Defence Trust have decided that, in view of the present calls on their Trust Fund, they are unable to contribute at the present time, but will consider the matter again during next session.

Information Service

148. The Public Relations Department has continued and extended its many-sided activities for the profession. The close and friendly relations built up between the Department and the Press have been further strengthened. The Information Service in particular is now widely used not only by the Press but also by many public bodies. During the year there has been an increase of nearly 40% in the number of telephone inquiries—many of them involving considerable research—dealt with by the service. The number of personal visitors, chiefly journalists, has also shown a steady increase. For their willing co-operation the Department is much indebted to the B.M.A. Librarian and his staff.

Central Register of Medical Conferences

149. The Department has steadily built up a Register of Conferences in the medical and allied fields, which is now recognized to be the most comprehensive calendar of its kind maintained anywhere in the country. A selected list

of conferences—national and international—is regularly issued by the Department to the Press and other interested organizations. This is a service which is widely appreciated and has helped to strengthen the good will felt for the Association. During the year certain medical societies pressed the Department to extend this service within the medical field itself, and to set up a Central Register of Conference Dates which would prevent the clashing of conference dates, which in the past has frequently occurred. With the approval of the Council, such a Central Register has now been established. Every participating society has agreed to keep the Register informed of forthcoming conferences and to consult with it before finally fixing a date. The establishment of the Register has been warmly welcomed.

ARMED FORCES**Service Pay**

150. At the request of the Ministry of Defence the Council has submitted a memorandum to a Working Party set up to consider all aspects of the Service medical officer's career, including remuneration. This memorandum covered a number of factors likely to affect recruitment of medical officers to the Armed Forces, including clinical opportunities, postgraduate study, employment in civil or Service life after retirement, widows' pensions, and the prestige of the medical branches of the Armed Forces. Its main emphasis, however, was on remuneration, particularly the necessity for Service pay of medical officers to be comparable with that of civilian practitioners. The views of the Ministry of Defence are now awaited.

Entertainment Allowances

151. Each Service has its own criteria governing the payment of entertainment allowances, but in regard to all three Services the Council considered that the entitlement to payment of entertainment allowances required investigation, and representations were accordingly made to the Ministry of Defence. Individual medical officers are permitted to submit complaints through Service channels, but the Council feels that in many instances they are reluctant to take such action.

Rank and Pay

152. It was reported to the Council that isolated cases have occurred where Service medical officers had been forced to seek legal aid before attaining the rank and pay attached to the appointment they held. Although these cases had been settled successfully it was decided to draw the attention of the Service department to the need for safeguarding the rights of medical officers as laid down in the regulations. Assurances that such action is taken have been received.

Forces Family Pensions

153. The recent increases granted in ordinary pensions payable to widows and children of Service personnel, and the amendment of the conditions attached to the payment of these pensions, have been noted with interest. The inadequacy of widows' pensions was a point dealt with in the Association's Memorandum to the Working Party of the Ministry of Defence.

Retired Service Specialists

154. In order to assist specialists on retirement from the Services to obtain civilian appointments, it has been suggested that Service medical officers should on retirement inform the Medical Practices Advisory Bureau of their availability for civilian appointments, and that regional hospital boards and hospital management committees should be encouraged to communicate with the Bureau when they are in need of a specialist locum. It is considered that this interchange of information may result in more Service medical officers securing adequate civilian appointments.

ORGANIZATION**Association Membership**

155. The Council submits the following report upon the membership of the Association for 1952:

New members	4,050	
Resignations withdrawn	104	4,160
Reinstated	6	
Removed in arrears	2,105	
Less paid arrears	1,193	912
Deaths		597
Resignations		809
Erased from Register		1
		2,319
		Increase 1,841
Membership, December 31, 1951	66,064	
Membership, December 31, 1952	67,905	

The membership of the Association in the United Kingdom represents 74% of the total profession and 84% of the working profession. The membership on March 17, 1953, was 65,823.

Although it is not possible at this stage to make an accurate forecast, the indications are that, notwithstanding the increase in the Association subscription as from January 1, 1953, the membership position will remain satisfactory. An analysis of resignations received up to January 31, 1953, shows that a great many of these are due to lack of knowledge of the Association's activities. In order to meet the criticisms disclosed, arrangements are being made for greater publicity in the *B.M.J. Supplement* for Headquarters activities, with particular reference to the meetings of sub-committees which are not ordinarily reported. Articles have also appeared in the *Supplement* on the constitution of the Association and the work of the Council and its Committees.

The Council is pleased to report that in a large number of Divisions steps have been taken to implement Minute 33 of the A.R.M., 1952, which expressed the view that the Danckwerts award provided an ideal opportunity for a concerted drive for new members.

Honorary Secretaries

156. The Council, on behalf of the general body of members of the Association, desires to express its grateful thanks to Honorary Secretaries of the Divisions and Branches, without whose loyal co-operation the Association could not function as an efficient organization.

Annual Conference of Secretaries

157. The Secretaries Conference at its 1952 meeting in Dublin discussed the place and duration of future annual Conferences, and the majority view was in favour of a whole-day session during the Annual Meeting of the Association. Unfortunately, the programme of the Annual Meeting at Cardiff will not permit of this without conflict with other important functions. The Conference will therefore be held at B.M.A. House, London, on Wednesday, May 20, 1953, commencing at 10.45 a.m. The Conference will be followed by a dinner in the evening, to which ladies are invited.

Financial Year of Divisions and Branches

158. Under the system of budgetary control approved by the Council, each of the "spending committees" of the Association has the duty, at the beginning of the session in the autumn, of drawing up its annual budget for the following calendar year. The expenditure on capitation grants to Branches forms one of the main items of the Organization Committee's budget. The new procedure necessitates a change in the financial year of the Divisions and Branches, which at present ends on December 31. To ensure a correct estimate for expenditure on capitation grants, the Branch and Division financial year in future must be related to the

Association session instead of the calendar year. Only in this way will it be possible to determine the grants to Branches in time for inclusion in the budget.

The Recommendation of the Council for the necessary amendment of By-law 36 is contained in Appendix III.

Financial Position of Home Divisions and Branches

159. In its Supplementary Annual Report for 1952 the Council reported that considerable economy had been effected in the allocation of grants to home Branches for 1952, and that it was hoped by this means to utilize substantial balances which had accumulated in the funds of some home Divisions and Branches. It was also hoped that it might be possible for a number of Branches to return to central funds a portion of the balances in their local accounts. The Council is pleased to report that the Branches concerned have responded generously to its appeal, with the result that approximately 80% of the amount asked for has been refunded.

Areas of Branches and Divisions

160. Approval has been given, after due notice in the *British Medical Journal Supplement*, to the formation of a new Midlands Branch in Southern Rhodesia. Other changes in home Division areas are under consideration.

Resolutions of Representative Body requiring Two Months' Notice

161. The Council has considered Minute 316 of the A.R.M., 1952, namely:

316. **Resolved:** That the Representative Body instructs the Council to examine Article 39(2) with a view to recommending to the 1953 Annual Representative Meeting amendment of the Article to provide that the words "two months" and "one month" shall be changed to "six weeks" and "three weeks" respectively.

Article 39 (2) provides that "no resolution of the Representative Body to make any addition to or any amendment, alteration, or repeal of any Regulation or By-law, or to make any new Regulation or By-law, shall have any operation unless a proposal to make the same shall have been previously approved and submitted to the Representative Body, either by the Council, or by a Branch, or by a Division, and shall have been published in the *Journal* not less than two months before the Annual Representative Meeting, or one month before the Special Representative Meeting at which such resolution is passed."

By-law 47 provides that any resolution submitted by a Division or Branch to the Representative Body which "proposes material alteration of, or addition to, the constitution or policy of the Association" shall receive two months' notice in the *Journal*.

Article 39 came into operation in 1910, when new Articles and By-laws of the Association were adopted. Conditions have changed considerably in the 40 years which have since elapsed, and little time is allowed under present arrangements for Divisions to consider the Annual Report of Council and to submit any Motions requiring notice under the Article or the By-law. The Council accordingly supports the proposal made in Minute 316 of the A.R.M., and its recommendation for amendment of the Article and the consequential amendment of By-law 47 is contained in Appendix III.

Overseas Representation in the Representative Body

162. At present each Division of the Association outside Great Britain and Northern Ireland is an independent constituency in the Representative Body and is entitled to elect one Representative. With few exceptions, the essential unit of organization overseas, in contrast to the United Kingdom, is the Branch and not the Division. The present system of representation, therefore, gives rise to anomalies in that a Branch composed of several Divisions may have a corresponding number of Representatives—for example, the

New Zealand Branch (16)—while another large and important Branch—for example, New South Wales (1)—may send only one Representative to the Annual Representative Meeting. In order to remedy this situation, it is proposed, in the case of the overseas Branches, that the Branch should form the constituency, and that the representation should be on the numerical basis which applies to the United Kingdom constituencies, subject to a maximum of three Representatives for any one Branch. The overseas Branches have been consulted and those who have replied, including the Branch most affected by the change—namely, New Zealand—unanimously approve the proposal. This proposal would not apply to the group of Branches in the Republic of Ireland, which at present forms one constituency.

Provision for the appointment of Deputy Representatives by overseas Branches is not appropriate, as their invariable practice is to appoint as Representative a member who proposes to attend the Annual Meeting of the Association.

The Council recommends:

Recommendation: That the representation of the overseas Branches in the Representative Body be modified to provide:

(a) That every Branch not in Great Britain or Northern Ireland shall form a constituency, except that the Branches in the Republic of Ireland shall together form one constituency.

(b) That each constituency thus formed shall be entitled to elect one Representative, together with an additional Representative for each complete number of 100 members in excess of 50 members, subject to a maximum of three Representatives.

(c) That provision be not made for the appointment of Deputy Representatives.

The amendments to the By-laws entailed by this recommendation are contained in Appendix III.

Amendments of Articles and By-laws

163. Proposals are made in various paragraphs of this report which necessitate alteration of the Articles and By-laws. Amendments of the Schedule to the By-laws in respect of certain Standing Committees are also necessary to give effect to decisions of the Council relating to the constitution of these Committees. The object of these amendments of the Schedule is to improve liaison with other Committees of the Council or to provide for the filling of vacancies for which no provision is at present made.

The Council recommends:

Recommendation: That the Articles and By-laws of the Association be altered in the manner shown in Appendix III and that the Council be instructed to submit the amendment of Article 39 (2) to an Extraordinary General Meeting of the Association.

Autonomous Bodies

164. Under Minute 27 of the A.R.M., 1950, the autonomous powers of the General Medical Services and Central Consultants and Specialists Committees, "in so far as they derive from the Representative Body," require to be specifically renewed by successive Annual Representative Meetings.

The Council recommends:

Recommendation: That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1953-4.

That the Representative Body looks to these Committees to ensure (1) that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and (2) that their autonomous powers will be used so as to expedite and not to delay the work of the Association.

Resolutions on Policy

165. The A.R.M., 1952, passed the following resolution:

267.—**Resolved:** That this meeting calls upon Council to state whether in its opinion all resolutions on policy passed by the Representative Body before July 5, 1948, and never rescinded still represent the policy of the Association.

In consultation with the Solicitor, a scrutiny has been made of the resolutions referred to in the above minute, together with the resolutions of the S.R.M. of May, 1948, which relate to the acceptance of service under the National Health Service.

In the view of the Council the decision as to those resolutions of the Representative Body adopted before July 5, 1948, which still represent the policy of the Association is governed by Minute 28 of the S.R.M. of May, 1948—namely:

That, despite the insufficiency of the safeguards to the profession's freedoms and the misgivings of a substantial section of the profession, the Representative Body, anxious as ever that in the public interest a comprehensive health service should be made available to the community, is prepared to advise the profession to co-operate in the new service on the understanding that the Minister will continue negotiations on outstanding matters, including terms and conditions of service for consultants and specialists, general practitioners, public health medical officers, and others.

This minute provides for the profession joining the National Health Service on the understanding that the Minister will continue negotiations on outstanding matters. The resolutions in question fall into four main groups:

(a) Those which express policy in general terms without reference to particular sections of the National Health Service Acts. These resolutions clearly remain operative.

(b) Those which express opinions or policy contrary to definite provisions of the Act (or of regulations made at a later date in agreement with the profession) and which were not "outstanding" at the time of acceptance of service. This group (which includes the various resolutions on goodwill and contracting out) must be regarded as covered by Minute 28 of the S.R.M. of 1948, and therefore as no longer operative.

(c) Those relating to matters of policy under discussion with the Government at the time of acceptance of service—e.g., terms and conditions of service—or matters which could only be assessed subsequently in the light of experience. This group remain operative.

(d) Resolutions which have been superseded by subsequent resolutions of the Representative Body but the underlying principle of which still remains—e.g., those relating to arbitration, the power of the Minister in respect of changes in conditions of service, and appointment in agreement with the profession of medical representatives on administrative bodies.

Medical Act, 1950, in its Relation to Provisionally Registered Practitioners

166. Allowances to married ex-Service men holding hospital appointments during the pre-registration year.—Sections 1 and 2 of the Medical Act, 1950, make compulsory a period of employment in a resident medical capacity in an approved hospital or institution before full registration in the Medical Register can be obtained. Regulations made under the Act specify this employment as a period of 12 months as a house-officer. After consultation with the Association and other professional organizations, a memorandum has been issued by the Ministry of Health to hospital authorities explaining the implications of these provisions, and announcing the "appointed day"—namely, January 1, 1953. The Council raised no objection to the date fixed for the appointed day. It recommended to the Ministry of Health, however, that special provision should be made to relieve the hardships which would be experienced by married ex-Service men, and the Ministry replied that such provision was being made for those formerly in receipt of grants from the Ministry of Education under the Further Education and Training Scheme. Representations have recently been made by the British Medical Students Association to the effect that the financial assistance which a provisionally registered practitioner may so receive during the pre-registration year may leave him with an income considerably less than he received as a student in receipt of F.E.T.S. or other grant.

The Council was satisfied as to the justice of the case presented by the B.M.S.A., and considered that immediate action was called for if the severe hardship which a number

of ex-Service provisionally registered practitioners are suffering was to be relieved. Accordingly, negotiations have been proceeding with the Ministry of Health, and substantial improvement has been made in the original proposals. The provement has been accepted by the Council subject to further discussion on a number of administrative matters and without prejudice to the right of the Council to re-examine the position in the light of experience.

Right of appeal by the provisionally registered practitioner.—Full registration in the Medical Register is dependent upon a certificate of sufficient and satisfactory service during the pre-registration year. This certificate is furnished by the licensing body after receipt of reports from the hospital authorities that the practitioner has completed such service. As the Act contains no specific appeal provision, steps have been taken to clarify the position. The Council is advised that no such provision is necessary. The licensing body is not bound by the report from the hospital authority, and it would be open to the house-officer, where a certificate of satisfactory service was not forthcoming from the hospital authority, to make representations to the licensing body; similarly, the licensing body could hear the practitioner and arrive, on the evidence before it, at a decision regarding the nature of the certificate provided and its attitude thereto.

Employment in general practice during period of provisional registration.—The Council has considered the following Minute 24 of the A.R.M., 1952:

Resolved: That the following Motion be referred to the Council:

That in view of the fact that the majority of newly qualified practitioners will be entering general practice and will be rendering general medical services under the N.H.S. Acts, this Representative Body strongly recommends that it would be in the interests of both the public and the profession that a period of employment of six months in general practice shall be considered as one of the required appointments needed to qualify for full registration.

The Council does not consider that the proposal made in the motion is in keeping with the spirit or purpose of the Act, which is to secure a period of post-qualification experience in hospitals under supervision. The pre-registration year is essentially part of the training of the young practitioner, and in hospital the close supervision of senior members of the staff can be ensured. The organization and administration of present-day general practice do not permit of this close supervision, and difficulties might arise with regard to the signing of death certificates, etc.

It is not clear whether the motion contemplates that the six months' period in general practice would be in addition to or in substitution for part of the 12 months' hospital experience. If the former, the Council feels that it would be undesirable to add to the burden of the practitioner during the pre-registration period. Moreover, the trainee-practitioner scheme would appear to meet the purpose of the motion.

Recognition of Provisionally Registered Appointments for Higher Qualifications

167. Inquiries made of the licensing bodies indicate that the majority of these bodies are prepared to recognize for the purpose of their higher degrees and diplomas pre-registration hospital appointments under the Medical Act, 1950, which conform to their requirements.

Group of Medical Hypnotists

168. The Council has received, over the signature of 15 members engaged in the practice of hypnotherapy, a petition for the formation of a group of medical hypnotists, the group to include medical practitioners who use hypnosis for medical purposes.

Opportunity is already provided to members making use of this form of treatment in their medical practices to express

their opinions through the medium of existing groups. The petition for the formation of a special group has therefore been rejected.

SCOTLAND

Chairman and Deputy Chairman of Scottish Committee

169. Dr. J. G. M. Hamilton and Dr. W. M. Knox were appointed Chairman and Deputy Chairman respectively of the Scottish Committee for the session 1952-3.

Jubilee Year

170. This is the Jubilee Year of the Scottish Committee, which intends to mark the occasion by holding a formal dinner in the autumn.

Glasgow Regional Office

171. The facilities available at the Glasgow Regional Office are being increasingly used by the profession in the West of Scotland.

Salaries of Part-time Medical Officers for Prisons and Borstals in Scotland

172. The Scottish Committee has recently negotiated with the Scottish Home Department the following scale of salaries for part-time medical officers of prisons and borstals in Scotland:

A. Up to 3 hours per week	£75-155 per annum
B. 3 " 5 " " "	155-235 " "
C. 5 " 8 " " "	235-355 " "
D. 8 " 11 " " "	355-475 " "
E. 11 " 14 " " "	475-595 " "
F. Above 14 " " "	By calculation in individual cases

with additional weighting as follows:

(a) Part-time doctors in medical charge of an institution to receive "charge pay" fixed on a U.K. basis on the annual turnover of inmates, as follows:

Annual Turnover	Charge Pay
50-150	£ 50
150-350	75
350-750	100
over 750	125

(b) A further flat rate allowance of £50 to be paid if the prison is one which deals with a large number of trial and remand cases. (This is only likely to apply in one case at the moment.)

(c) An allowance of £100 per annum where the doctor is liable to perform court work regularly.

Press Officer to the Scottish Office

173. Mr. George Donaldson has been reappointed part-time Press Officer to the Scottish Office for a further period of one year ending June, 1953. Steps are being taken to publicize to a greater extent the type of service which Mr. Donaldson can offer to the profession in Scotland.

General Medical Council

174. The Association in Scotland was asked by the General Medical Council to nominate a candidate to fill the vacancy caused by the death of Dr. R. W. Craig. The procedure for direct elections to the General Medical Council was carried out and Dr. G. W. Ireland was nominated as the candidate to be supported by the Association and has now been appointed to the General Medical Council.

Reconstitution of Central Midwives Board for Scotland

175. As a result of further negotiations with the Department of Health for Scotland provision has now been made under the Central Midwives Board for Scotland (Reconstitution) Order, 1952, for the appointment of a deputy to the "1 duly qualified medical practitioner" appointed by the Scottish Committee on the Board.

Training of Health Visitors in Scotland

176. The Scottish Committee has accepted an invitation from a Joint Committee of the Standing Nursing and Midwifery Advisory Committee and the Standing Advisory Committee on Local Authority Services of the Scottish Health Services Council to submit views on the training of the health visitor and to submit proposals for the revision of the present training syllabus in the light of the requirements of the present-day health visitor service. The Scottish Committee accordingly appointed a subcommittee to draw up a report on the training of health visitors. This report has been approved by the Scottish Committee and has been submitted to a special joint committee of the Scottish Health Services Council. The Scottish Committee has also been invited to give oral evidence before the special subcommittee.

Visit to Denmark

177. The Scottish Committee has accepted an invitation from the Danish society for a small group of Scottish doctors to visit Denmark during September, 1953. The tour, which will last for 14 days, will include visits to Danish hospitals, universities, and medical institutions, together with sight-seeing excursions. Hospitality will be extended to the visitors by the medical profession in Denmark.

Scottish Marriage Guidance Council

178. The Scottish Committee has agreed that the Chairman should accept an invitation from the Scottish Marriage Guidance Council to become one of its patrons.

Maternity Services Subcommittee

179. Action has been taken by the Subcommittee in connexion with various administrative matters concerning the maternity services in Scotland under the National Health Service. The Subcommittee intends to discuss with the Department of Health for Scotland the possibility of arranging for maternity record cards, in respect of patients confined in hospital, to be completed by the hospital authorities, the cards being returned to the patients' own doctors on the completion of hospital attendance.

Public Health Subcommittee

180. The Public Health Subcommittee has under consideration the problem of remuneration of medical officers of health holding "dual appointments." The question of car allowances for public health medical officers in Scotland is also being investigated.

Partnership Advisory Committee

181. The Partnership Advisory Committee is receiving an increasing number of requests for advice on proposed partnership agreements.

Committees which Report to the Scottish Committee

182. (a) *General Medical Services Subcommittee (Scotland)*.—In order to maintain liaison between the British Dental Association and the B.M.A., cross representation on the Scottish General Dental Services Committee and the G.M.S. Subcommittee (Scotland) has been established.

As an interim measure, pending the result of the United Kingdom inquiry into the drug costs of dispensing doctors paid on the capitation fee basis, the dispensing capitation fee in Scotland has been increased from 6s. 6d. to 9s. 9d. per annum as from April 1, 1952.

The criteria to be adopted in dealing with applications for initial practice allowances have been approved by the Subcommittee and the Subcommittee has made suggestions for securing adequate means of consultation between the various bodies concerned.

The Subcommittee has recommended, and it has been agreed, that the Interdepartmental Mileage Committee in London and the Mileage Subcommittee of the Scottish

Advisory Distribution Committee should continue independently to consider the mileage distribution scheme. Joint meetings will be held at a later date to consider the inter-national division of the Fund.

As a result of negotiations with the Department of Health for Scotland the figure taken as a guide to the level of net professional income in cases in which inducement payment are made has been raised to £1,400 as from April 1. The percentage increases applied to capitation fee payment under the Danckwerts award will be added retrospectively to inducement payments.

(b) *Central Consultants and Specialists Committee (Scotland)*.—A questionnaire was issued to all consultants S.H.M.O.s, and senior registrars in Scotland in order to ascertain their views on proposals put forward by the Department of Health for alteration of the structure of hospital medical staffing in Scottish hospitals. The number of questionnaires issued was 1,278, and of the 838 replies received 315 were in favour and 523 were against the proposals. In view of this result further consideration is being given to the problem of medical staffing in Scottish hospitals. At the same time, the Scottish Joint Committee, at the instigation of the Central Consultants and Specialists Committee (Scotland), has asked the Department of Health to carry out an immediate review of S.H.M.O.s in Scotland.

Following representations from the Ophthalmic Services Subcommittee, the Department of Health has instructed the clerks of joint ophthalmic services committees that hospital ophthalmic prescriptions about which there may be some doubt should not be scrutinized by the joint ophthalmic services committees, but referred back to the hospital or consultant concerned.

The Committee has accepted a proposal from the Department of Health that mileage allowances might be commuted, provided that (a) commutation is optional, and (b) the commutation excludes domiciliary and emergency consultations.

The Committee's third annual report (1951-2) has now been issued to all consultants, S.H.M.O.s, and senior registrars in Scotland.

WALES

183. The Welsh Committee, which includes representatives of all the Divisions and Branches in Wales and Monmouthshire, has met in Shrewsbury under the chairmanship of Dr. Graham P. Williams. It provides opportunities for discussion of all matters affecting Welsh members.

The Committee is making a presentation to Dr. H. R. Frederick in appreciation of his services as chairman of the Committee for the past seven years.

The Annual Welsh Dinner is to be held in Cardiff on Saturday, July 11.

OVERSEAS**Cyprus**

184. The Council regrets that it is unable to report any settlement of the protracted dispute with the Government of Cyprus over the remuneration of Government medical officers, although some progress has been made on the question of the position of the Cyprus Branch as a negotiating body, which was also in dispute. Meetings have been held on two occasions with officials of the Colonial Office, and local representations have also been made.

New salary scales were introduced in June, 1952, which were considered unsatisfactory, particularly in the senior specialist grade, and it was decided that no advertisements issued by the Cyprus Government could be accepted for publication in the *Journal*.

The Chief Medical Officer to the Colonial Office has recently visited Cyprus. The Council is anxious not to prejudice any chance of reaching an amicable agreement, but it is strongly of opinion that negotiations have already dragged on too long and that they cannot continue indefinitely without any prospect of a settlement of the dispute. It has therefore informed the Colonial Office that unless

evidence of a desire on the part of the Cyprus Government to reach a settlement on the lines of the proposals made by the Association in August, 1951, is received within three months (from February, 1953) it will have no alternative but to include all medical appointments under the Government of Cyprus in the "Important Notice."

Jamaica

185. The Council is pleased to learn that the Government of Jamaica has officially recognized the Jamaica Branch as the proper negotiating body for salaries and conditions of service of Government medical officers.

Gold Coast

186. The Council has considered the report of a Commission on the Civil Service of the Gold Coast, 1950-1 (the Lidbury Commission), and the report of the Commission of Inquiry into the Health Needs of the Gold Coast, 1952 (the Maude Commission), in relation to the medical services of the Gold Coast. The first of these Commissions reported critically upon certain aspects of the administration of the medical department. The second recommended a reorganization of the department, which has now been carried out by the Gold Coast Government.

Recent events in the Gold Coast, such as the publication of the Lidbury and Maude reports, and the rapid constitutional developments in the territory, have emphasized the need for a strong local representative organization for the medical profession. A number of members of the Association accordingly met in January, 1953, in Accra, for the purpose of forming a Gold Coast Branch, and appointed a Steering Committee to arrange a further meeting on February 26 at which rules were adopted and officers elected. Further arrangements were made for Mr. Ian Fraser, a member of the B.M.A. Council and President-elect of the Royal College of Surgeons in Ireland, to visit the Gold Coast from March 4 to 21, 1953, on behalf of the Council.

East Africa—Royal Commission

187. The Council has noted with pleasure the appointment of a Royal Commission to inquire into the wider aspects of land utilization in relation to the economic, industrial, social, and demographic problems of the East African region as a whole. It regrets, however, that there is no medical member of the Commission. The appointment of a Royal Commission on Health and Population was suggested by the Kenya Branch of the Association as long ago as March, 1947, when a detailed memorandum by the Branch on the subject was sent to a number of members of both Houses of Parliament and to the Secretary of State for the Colonies. Copies of a précis of this memorandum have been sent to members of the Royal Commission.

Colonial Medical Service

188. The Council has continued to negotiate with the Colonial Office on salary scales. New scales have been introduced in Nigeria, and senior specialist posts have now been established in Tanganyika and Northern Rhodesia. Salaries in British Borneo and the Seychelles are still under discussion, particularly in relation to the position regarding private practice.

The Council has taken note of the agreed scheme for the unification of the health services in the Federation of Malaya and in Singapore.

The Council has received with satisfaction the announcement by the Ministry of Health that consultants or S.H.M.O.s in the National Health Service can be granted leave without pay in order to take up overseas appointments for a period not exceeding three years, with automatic reinstatement on returning to this country. This will go some way towards removing one of the major obstacles to short-term recruitment from the United Kingdom for overseas appointments.

EMPIRE MEDICAL ADVISORY BUREAU

189. The Empire Medical Advisory Bureau was opened in July, 1948, to welcome and provide a personal advisory service to medical practitioners visiting this country, particularly from the Dominions and Colonies.

The Committee of Management has met regularly during 1952 and the Advisory Committee held its fifth annual meeting on May 29, 1952. The attendance of members and their help throughout the year in the solution of individual problems of visitors is much appreciated.

The Bureau is now well established and becoming more well known abroad, and the number of new inquirers seeking the aid of the Bureau during 1952 shows an increase over last year of nearly 30%. In addition to new inquirers, many overseas doctors keep in touch with the Bureau during their stay in the country and are encouraged to turn to the Bureau for any help needed.

More than half the inquirers sought information about the various aspects of postgraduate education and experience, including information on courses of instruction, examinations, appointments in and visits to hospitals, and medical registration.

The *Summary of Regulations for Postgraduate Diplomas and of Courses of Instruction in Postgraduate Medicine* compiled and published by the Bureau has been revised, reprinted, and dispatched overseas to all Branches of the Association, affiliated associations, deans of medical faculties, postgraduate committees, and editors of medical journals. Many tributes to its usefulness for reference purposes have been received.

More than 200 doctors requested help in obtaining or advice about hospital appointments, and a "follow-up" of visitors who called at the Bureau during the first half of the year showed that the majority obtained the appointments desired within a reasonable period.

The Medical Practices Advisory Bureau has most helpfully co-operated with the Empire Medical Advisory Bureau by finding locum appointments for those overseas visitors desiring such appointments.

Many of the more senior visitors, who may combine a holiday visit to this country with an intention to see something of the latest techniques in various fields of medicine, have requested the Bureau to arrange such visits for them. Through the kindly co-operation of hospital authorities and consultants all such requests have been met.

Port health medical officers throughout the country have kindly continued to help the Bureau by meeting in person, where possible, overseas visitors on their first arrival in the country. Where a visitor cannot be met personally a letter of welcome from the Bureau is sent to him, and such letters have been much appreciated.

The Bureau has found accommodation for visitors in readiness for their arrival, and all requests for this have been met. In addition, many have been found furnished flats and houses after arrival in the country. Nearly 300 doctors and families have been assisted with the difficult problem of accommodation—the satisfactory solution of which is essential to a successful visit.

Social functions arranged by the Bureau, at which overseas visitors have the opportunity of meeting fellow practitioners from all parts of the Commonwealth, including senior members of the profession in this country, have continued to be held and are much appreciated. "At Homes" were arranged during the year in London, Edinburgh, and Cardiff, and nearly 1,100 overseas doctors and wives attended these social functions.

Inquiries coming under the heading of "General Information" were very numerous during the year, and nearly all inquirers had some query in this wide field.

Expressions of appreciation were received from many overseas visitors for the help given by the Bureau, and the demand on its services is a reflection of the needs of the newcomer, his wife, and family, especially when visiting Great Britain for the first time.

The Council is glad to feel that our overseas medical visitors from other parts of the British Commonwealth can obtain the assistance they need to make the most of their visits to this country.

International Medical Visitors Bureau

190. The International Medical Visitors Bureau was opened in January, 1950, to provide a personal advisory service for medical practitioners desiring to visit the United Kingdom from countries outside the British Commonwealth.

The Committee of Management has met four times during 1952.

Inquirers and visitors from 38 countries consulted the Bureau, and the number of inquiries was about one-sixth more than in 1951. Many inquirers required information about postgraduate courses of instruction, diplomas and examinations, and facilities for visits to hospitals, clinics, and other centres during their stay in the country. Inquiries were also received about temporary hospital appointments for the purpose of acquiring further experience, and information was given in all cases with the result that in a few cases such appointments were secured.

The arrangements for visits to hospitals and clinics often involve a good deal of planning, and in some cases where time is short many telephone calls are required. All this is very worth while, however, and visitors have been very appreciative of the arrangements made. The Bureau is much indebted for the whole-hearted co-operation received from consultants and hospital authorities in this connexion. Suitable accommodation has been found for all visitors requesting this, and help has been given to visitors to London and other centres.

Inquiries in the field of "General Information" have been dealt with, and visitors are encouraged to make requests with a view to making their stay pleasant and profitable.

With the co-operation of overseas medical associations, the Bureau has continued to facilitate holiday exchanges of United Kingdom doctors' children with children of doctors in Europe, and several exchanges have been arranged.

Visitors have been very appreciative of the help they have received, and the Council is glad to know that international medical relations are being strengthened by the services given by the Bureau.

MEDICAL FILMS

191. The Council is glad to report that increasing use has been made of the Association's Film Library during the past year. Thirteen films have been added to the Library. A page of addenda to the film catalogue has been issued.

Appraisal panels have met from time to time to view medical films which have been brought to the notice of the Association, and the Council wishes to express its thanks to the members of the profession who have served on these panels.

The Council is greatly indebted to the following, who have kindly presented films to the Association in the past year or have placed copies of their films in the Library on indefinite loan: American Medical Association, Imperial Chemical Industries Ltd., Ortho Pharmaceutical Ltd., Roche Products Ltd., Royal National Hospital for Rheumatic Diseases, Bath, Dr. J. G. Billington, and May and Baker Ltd.

WORLD RELATIONS

First World Conference on Medical Education

192. Preparations are being made for the First World Conference on Medical Education, which is to be held in London on August 24-29, 1953, under the joint auspices of the World Medical Association and the World Health Organization, with the collaboration of the Council of International Organizations of the Medical Sciences and the International Association of Universities, and under the patronage of the Secretary of State for Scotland, the Ministers of Education and Health, and the Chancellor of the University

of London. The President will be Sir Lionel Whitby and the Deputy President Professor W. Melville Arnott. The local arrangements are in the charge of a committee under the chairmanship of Dr. T. Rowland Hill, and the Council is giving a reception to inaugurate the Conference.

A leaflet of information about the Conference may be obtained on application to the Local Arrangements Secretary at B.M.A. House.

World Medical Association

193. The Sixth General Assembly of the World Medical Association took place in Athens in October, 1952, the British delegates being the Chairman of Council and Dr. T. Rowland Hill, with Dr. S. Wand and the Secretary as alternate delegates. The subjects discussed included the arrangements for the Conference on Medical Education, the medical aspects of social security, a report on social security schemes in Europe, and the principles of medical certification. The next General Assembly will be held in September, 1953, at The Hague, under the Presidency of Dr. A. L. Hulst, and the British delegates will be those who attended the meeting in Athens. Dr. J. A. Pridham has been re-elected to the Council of the W.M.A.

During the past year the Council has sent factual replies to questionnaires circulated to member-associations by the W.M.A. on the liaison between national medical associations and medical student organizations, subscriptions and benefits of membership of the B.M.A., co-operation between doctors and clergy, the provision of medical aid for foreign visitors, and practice by immigrant displaced doctors.

Anglo-American and Anglo-Canadian Exchange Scheme

194. The scheme for the exchange of members of the American, British, and Canadian Medical Associations, which was inaugurated in 1951 with the approval of the Bank of England, has been continued. During 1952-3 five British doctors have visited Canada and the U.S.A. under the scheme.

Fourth International Congress of Haematology

195. The Council co-operated with certain pharmaceutical firms in enabling two British haematologists to attend the Fourth International Congress of Haematology in Argentina in September, 1952.

Invitation to Soviet Doctors

196. The Council in September, 1952, sent an invitation to the President of the Academy of Sciences of the U.S.S.R. for six Soviet doctors to pay a good-will visit to Great Britain. The reply received expresses thanks for the invitation and states that unfortunately it is not possible to send a delegation to this country at the present time.

OTHER ASSOCIATION ACTIVITIES

Alcohol and Road Accidents

197. The Committee appointed by the Council in June, 1951, to revise the Association's two publications *Tests for Drunkenness* (1927) and *Alcohol in Relation to Road Accidents* (1935) has continued its work. A revised edition of the first-named publication is likely to be completed before the end of the year, but the revision of the second has been deferred until the results of certain current research are available.

Joint Committee of B.M.A. and the Magistrates' Association

198. The problem of cruelty to children is now being studied by this Committee with a view to the preparation and publication of a report. A considerable amount of information and many varied opinions on the methods of dealing with this problem are under discussion.

National Formulary

199. The revision of the *National Formulary* is a time-consuming task. Although a new edition came into operation as recently as June 1, 1952, the committee responsible for it is already engaged in the work of revision, which will result in a further edition in 1954.

Medical Practices Advisory Bureau

200. The agency work of the Medical Practices Advisory Bureau continues to increase, and there is evidence that its services are widely used and appreciated by members. In 1952, nearly 2,400 locums were arranged. Advice continues to be sought on a wide variety of problems associated with entry into and conduct of medical practice, including contracts and agreements between practitioners and problems arising from the relations between partners, principals, and assistants.

Control of Therapeutic Substances

201. The Penicillin Act, 1947, places restrictions on penicillin, and such other antimicrobial organic substances produced by living organisms as may be prescribed in regulations, by specifying the classes of persons who may supply them.

A Bill has recently been introduced—the Therapeutic Substances (Prevention of Misuse) Bill—which seeks (a) by regulation to add to the substances referred to in the Penicillin Act any therapeutic agent which appears to be capable of causing danger to the health of the community if used without proper safeguards; and (b) to relax, again by regulation, the restrictions imposed by the Act. The immediate object of such relaxation would be to enable penicillin to be added in small quantities to animal feeding-stuffs, the evidence being that such an addition accelerates the fattening of livestock. The Medical Research Council and the Agricultural Research Council have advised the Minister of Health that there would be little risk to the consumer.

The Council, in co-operation with the British Veterinary Association, has considered the Bill, and an outline of the regulations which it is proposed to make once the Bill has passed into law. It has recommended, as a safeguard against penicillin falling into the hands of members of the public and being wrongly used, that the regulations should restrict the preparation of the penicillin addition (which is to be penicillin mixed in a suitable proportion with a diluent from which it will be impossible to extract it) to such firms as are able to protect their employees adequately against the hazards of penicillin.

The Council has also drawn the attention of the appropriate Government departments to possible dangers to those who handle the diluted penicillin for the purpose of mixing it with feeding-stuffs, and has recommended that steps be taken to investigate whether safeguards are necessary.

The Council is taking the opportunity of considering with the British Veterinary Association and the Pharmaceutical Society the need for some form of control for sexual hormones. Such control could be brought within the scope of the regulations foreshadowed in the Therapeutic Substances (Prevention of Misuse) Bill.

Control of Medical Manpower

202. The new committees set up by the Government in consultation with the medical profession for the control of medical manpower in peace and war have come into operation during the past year. The Council has continued to provide the secretarial and clerical staff and other facilities for these committees and to assist the local, regional, and area medical recruitment committees which have been set up throughout the country. The expenses of all these committees for the control of medical manpower are borne by the British Medical Association, which then recovers three-quarters of the cost from H.M. Government. Steady progress has been made with the compilation of the Emergency Register of the medical profession.

The Council cannot allow the Central Medical War Committee and the Scottish Central Medical War Committee to

pass away without some mention of their history and of their magnificent service to the country in two world wars. In August, 1914, the British Medical Association placed its whole machinery at the disposal of the Government for the war effort. The Scottish War Emergency Committee was established in 1914 and the Irish Medical War Committee in 1915. By 1915 it was clear that the national emergency called for something more than adaptation of the Association's normal organization to the requirements of war, and the Representative Body established the first Central Medical War Committee. It was a committee of the Association with co-opted representatives from other bodies such as the Royal Colleges. The Military Service Act of 1916 gave statutory recognition to the Central Medical War Committee and to its functions, which came to an end in 1919, when the Committee was dissolved.

Between the two wars the Council maintained a shadow organization for the control of medical manpower in war. In November, 1938, alarmed by the deteriorating international situation, the Council reconstituted the Central Medical War Committee under the title "Central Emergency Committee." It was again a committee of the Association with co-opted representatives from other bodies, but the committee was larger than its predecessor and representation was made wider in scope. In September, 1939, the Central Emergency Committee became the second Central Medical War Committee, and both this Committee and the Scottish Central Medical War Committee functioned without interruption until 1952. The Northern Ireland Medical War Committee functioned throughout the second world war and gave most valuable service.

The Central Medical War Committee, the Scottish Central and Northern Ireland Medical War Committees, and all the Local Medical War Committees (which were established in both wars in the areas of B.M.A. Divisions) shouldered an enormous burden of voluntary work, to which the Council takes this opportunity of paying a final tribute.

Remuneration of Civil Service Medical Officers

203. The 1952 A.R.M. passed a resolution (Minute 283) supporting the action of the Council in connexion with the dispute between the Treasury and the Civil Service Medical Officers' Joint Committee about the salaries of Civil Service medical officers. Briefly, the position at that time was that the Treasury was asked either to reopen negotiations on the recommendations of the Howitt Committee in the light of the Danckwerts award, and other relevant factors, or to refer the whole matter to arbitration. The Treasury declined arbitration and was willing to review the existing scale of salaries only after they had been given a trial. The Council therefore decided not to accept further advertisements in the *British Medical Journal* for medical officer appointments in the Civil Service until such time as the matter was referred to arbitration or until further discussions resulted in better opportunities for Civil Service medical officers.

After further correspondence the Financial Secretary to the Treasury offered to invite such members of the Howitt Committee as were still available to review their recommendations. The Joint Committee did not feel able to accept this suggestion, though they indicated their willingness to have the existing scales reviewed by a new committee or arbitrating body whose composition and terms of reference could be agreed between the Treasury and the Joint Committee.

The Financial Secretary stated his willingness to agree to the reviewing body being asked to "have regard to any changes since August 31, 1951, in medical remuneration and to any other relevant circumstances" (including the level of remuneration amongst general practitioners resulting from the Danckwerts award). He was not, however, prepared to accede to the original request for arbitration, and was unwilling to invite any body except the Howitt Committee to undertake a further review of Civil Service medical officers' salaries.

A deputation from the Joint Committee is having further discussions with the Financial Secretary to the Treasury.

The Law in Relation to the Adoption of Children

204. The Home Secretary and the Secretary of State for Scotland have appointed a Committee under the chairmanship of His Honour Sir Gerald Hurst, Q.C., "to consider the present law relating to the adoption of children and to report whether any and, if so, what changes in policy of procedure are desirable in the interests of the welfare of children." The Association having been invited to submit evidence, the Council has formed a small Committee to prepare a memorandum for submission to the Interdepartmental Committee.

E. A. GREGG,
Chairman of Council.

APPENDIX I
RETURN OF ATTENDANCES OF COUNCIL

Name	Attendances	
	Actual	Possible
E. A. Gregg, London (Chairman of Council)	5	5
P. T. O'Farrell, Dublin (President)	4	5
S. Wand, Birmingham (Chairman of Representative Body)	5	5
A. M. A. Moore, London (Treasurer)	4	5
A. W. S. Sichel, Capetown (Immediate Past President)	1	1

APPENDIX II

REPORT OF COUNCIL ON INDIRECT METHODS
OF ADVERTISING

N.B.—Final decision in all these matters must rest with the individual concerned, but practitioners finding themselves in any difficulty in deciding upon their course of action or in doubt as to the safeguards necessary are advised to seek guidance from the Secretary of the Association.

1. Paragraph 6 of the Warning Notice of the Medical Disciplinary Committee of the General Medical Council reads as follows:

Advertising and Canvassing

The practices by a registered medical practitioner

(a) Of advertising whether directly or indirectly for the purpose of obtaining patients or promoting his own professional advantage; or, for any such purpose, of procuring or sanctioning or acquiescing in, the publication of notices commending or directing attention to the practitioner's professional skill, knowledge, services, or qualifications, or depreciating those of others; or of being associated with, or employed by, those who procure or sanction such advertising or publication; and

(b) Of canvassing or employing any agent or canvasser for the purpose of obtaining patients; or of sanctioning, or of being associated with or employed by those who sanction, such employment,

are in the opinion of the Committee contrary to the public interest and discreditable to the profession of medicine, and any registered medical practitioner who resorts to any such practice renders himself liable, on proof of the facts to the satisfaction of the Committee, to have his name erased from the Medical Register.

2. *Definition of Advertising.*—In the opinion of the Council of the Association the word "advertising" in connexion with the medical profession must be taken in its broadest sense, to include all those ways by which a person is made publicly known, either by himself or by others without objection on his part, in a manner which can fairly be regarded as for the purpose of obtaining patients or promoting his own professional advantage, or as appearing to be for these purposes.

3. *Accepted Customs.*—It is generally accepted by the profession that certain customs are so universally practised that it cannot be said that they are for the person's own advantage, as, for instance, a door plate with the simple announcement of the doctor's name and qualifications. Even this, however, may be abused by undue particularity or elaboration.

4. *Public Health Medical Officers.*—Publicity is necessary in carrying out the duties of medical officers of health and other medical men who hold posts in the public health or other public services. Provided that this is not used for the individual's advancement in his profession, this may be rightly allowed.

5. *Holding of Public Office.*—It is the recognized duty of a medical man to take his share as a citizen in public life and his right to hold public office should be so desired, but it is essential that the holding of public office is not used as a means of advertising himself as a doctor.

6. *Statements and Publications.*—Members of the profession are advised to exercise the greatest care with regard to public utterances and writings. There are many things innocent in themselves which may, by the manner or frequency of their doing, gravely contravene the principle that medical practitioners should not advertise.

7. *Public Activities.*—Practitioners may speak or write on topics which are of general public interest and which require medical knowledge for their proper presentation. Such activities when undertaken with propriety are recognized as legitimate and indeed form a useful public service, but, if abused, may be an avenue for promoting professional advantage. Such activities as lectures and discussions, writing in books and magazines and the like

and appearances in radio and television are those in which medical men are most commonly asked to take part.

8. *Dangers.*—The particular dangers in each of these fields of activity are referred to in the succeeding paragraphs. But, in every case, the guiding principles should be those of the Warning Notice of the General Medical Council which lays down that a practitioner should not sanction or acquiesce in anything which commends or directs attention to his professional skill, knowledge, services, or qualifications or depreciates those of others, or be associated with those who procure or sanction such advertising or publicity.

9. *Books, Articles, and Lectures.*—The publication of books and articles and the delivery of lectures on medical or semi-medical topics which are of general public interest and require medical knowledge for their proper presentation are recognized as legitimate, subject to the avoidance of methods which tend to promote the professional advantage of their authors. It is a wise precaution for a practitioner who proposes to deliver a lecture to request the chairman beforehand to be circumspect in any introductory remarks concerning his status as a speaker. Special precautions are necessary when it is known in advance that a press reporter will be present.

10. *Discussions in Lay Press.*—From time to time there are discussions in the lay press topics which have relation both to medical science and policy and to the health and welfare of the public, and it may be legitimate or even advisable that medical practitioners who can speak with authority on the question at issue should contribute to such discussions. But practitioners who take this action must make it a condition of publication that laudatory editorial comments or headlines relating to the contributor's professional status or experience shall not appear. Discussions in the lay press on controversial points of medical science and treatment should be avoided by practitioners; such matters are more appropriate to medical journals and discussion in professional societies. In particular, medical contributors to the lay press should avoid all references to the diagnosis and treatment of illness which may have the effect of embarrassing their colleagues in the field of active practice and which may lead the public to expect or demand a specific line of treatment.

11. *Press Interviews.*—A practitioner should exercise the greatest caution in granting interviews to the press, and the same conditions as are applicable to the publication of written articles should be scrupulously observed. A seemingly innocuous remark or casual aside is always open to misinterpretation and may easily form the subject of a damaging headline. This may place the practitioner in a position of embarrassment and danger. It is a wise precaution for a practitioner to insist upon seeing a draft of any material prior to publication.

12. *Photographs.*—A practitioner's photograph appearing in connexion with an interview or an article published in the lay press is a most undesirable form of publicity, and every reasonable precaution should be taken to ensure that, wherever practicable, such photographs are not published.

13. *Broadcasting and Television.*

(i) The Association accepts the view held by many in the profession that medical practitioners who possess the necessary knowledge and talent should be permitted to participate in radio and television programmes, provided they ensure the observance of appropriate ethical safeguards.

(ii) To an increasing extent in recent years, medical themes have been included in the programmes broadcast by the British Broadcasting Corporation (including television); for example, such subjects as diabetes, tuberculosis, peptic ulcers, cancer, deafness, diseases of the eye, heart diseases, and alcoholism.

(iii) The public has a legitimate interest in the advances made in the science and art of medicine, and it is of advantage that medical information, discreetly presented, should reach the public through the medium of broadcasting, both for the general instruction of the inquiring layman and for the particular purpose of "health education."

(iv) In November, 1934, the General Medical Council adopted the following resolutions:

1. That the British Broadcasting Corporation be informed that the Council can take no responsibility for the policy of the British Broadcasting Corporation with regard to broadcasting on medical or public health subjects, or broadcasting by registered medical practitioners, but are of the opinion that it is desirable, in the public interest, that registered medical practitioners should broadcast anonymously.

2. That the British Broadcasting Corporation be informed that the Council approved the suggestions numbered 2 and 3 in the letter of June 22, 1934, from the Director-General of the Corporation—namely, that correspondence addressed to broadcasters who are medical practitioners should not be forwarded to them, and that the anonymity of speakers should be strictly observed in connexion with any inquiries relevant to them or to their broadcast talks.

(v) The following resolution was adopted by the Representative Body of the British Medical Association in June, 1951:

That while recognizing that public education on selected health matters is eminently desirable, this meeting is of opinion that a close liaison should be established between the B.M.A. and the B.B.C. to control the selection of subjects and the scope of material presented to the public, and that practitioners approached to appear in such programmes, whether for "sound" or "visual" broadcasting, should insist on anonymity as part of the contract.

(vi) Anonymity may be defined for this purpose as withholding the publication or announcement of the practitioner's name, or any information, such as particulars of the appointments he holds, which might enable the public to identify him. Identification cannot be completely excluded, but it is incumbent upon medical practitioners who take part in sound or television programmes to ensure that the possibility of identification and publicity is reduced to a minimum. Unless a practitioner insists on anonymity he is not only offending against the ethical principles of the profession but is placing himself in danger of being accused of violating the Warning Notice of the General Medical Council. Should a practitioner, while carefully observing these precautions, be recognized by a section of the public, that fact should not of itself be regarded as evidence of an infringement of the rule of anonymity.

(vii) In 1937 the Central Ethical Committee passed the following resolution regarding the association of medical practitioners with commercial enterprises:

The Central Ethical Committee disapproves of the direct association of a medical practitioner with any commercial enterprise engaged in the manufacture or sale of any substance which is claimed to be of value in the prevention or treatment of disease and which is recommended to the public in such a fashion as to be calculated to encourage the practice of self-diagnosis and of self-medication or is of undisclosed nature or composition.

The Central Ethical Committee takes a similar view of the association of a medical practitioner with any system or method of treatment which is not under medical control and which is advertised in the public press.

In neither of the above findings does the Central Ethical Committee pretend to interfere with the right of a medical practitioner to be associated (save as above) with any legitimate business enterprise, but if such enterprise concerns the sale of a medicine or food the practitioner should not allow his professional status or qualifications to be used for advertising purposes outside the medical press.

This remains the policy of the Association; consequently it is unethical for a practitioner to participate in sound or television programmes which are being presented for, or on behalf of, firms using sponsored radio as a means of advertising.

(viii) There is a wide range of subjects unrelated, or only remotely related, to the practice of medicine where there may well be no objection to the announcement of the name and usual designation of a doctor who is an authority on the particular subject. There should be nothing in the announcement or presentation of the subject which could be regarded as promoting his professional advantage.

14. There is a special duty upon practitioners of established position and authority to observe these conditions, for their example must necessarily influence the action of their less-recognized colleagues.

15. After making all allowances for all those modes of publicity for which there may be some justification, there remain many instances which can be regarded as contravening the spirit of the Warning Notice of the General Medical Council. The Association is convinced that in taking up the attitude of determined opposition to undesirable methods of publicity it is acting in the best interests of the public as well as of the medical profession. Advertising by the profession in general would certainly destroy those traditions of dignity and self-respect which have helped to give the British medical profession its high status. The Association therefore draws the attention of the profession to the danger of these objectionable methods, and stresses the urgent need that every member of the profession should offer a firm resistance to them.

APPENDIX III

AMENDMENT OF ARTICLES AND BY-LAWS

Amendment of Article

1. By altering Article 39(2) as follows: By the substitution of "six weeks" for "two months" in line 8, and "three weeks" for "one month" in line 9.

Amendment of By-laws

1. By deleting By-law 1(3) and substituting therefor the following:

(3) The expression "Public Health Service Member" means a Member of the Association who is wholly or mainly employed in the medical service of the Council or Education Authority of any County, County of City, County Borough, Municipal Borough, Metropolitan Borough, Burgh, Urban District, Rural District, or Port Health Authority in Great Britain or Northern Ireland, or a combination of such authorities, or who has been for a period of not less than 10 years so employed and is a whole-time teacher of public health at a University or Medical School in Great Britain or Northern Ireland and whose name is in either case distinguished in the Register of Members of the Association as a Public Health Service Member.

2. By inserting in By-law 16(1)B the following new subparagraph:

(viii) Any Member who is engaged in full-time salaried employment the salary of which is not more than £1,500 per annum (or such other sum as the Council may from time to time determine) and who has signed and transmitted to the Treasurer a declaration in specified form that he comes within this group in relation to the year for which the subscription is due.

Four guineas

The Council have the power to decide in case of doubt whether the Member comes within the group.

3. By substituting in By-law 36 for the words "During the month of January" the words "Not later than the 22nd July"; for the words "during the previous year" the words "during the year ended on the previous 30th day of June"; and for the word "March" the word "August."

4. By inserting in By-law 38 after the word "Divisions" in line 4 the words "or Branches."

5. (i) By inserting in para. (2) of By-law 39 after the words "Any Division" the words "in Great Britain and Northern Ireland."

(ii) By inserting in para. (3) after the word "Division" the words "in Great Britain and Northern Ireland."

(iii) By inserting a new para. (4) reading as follows:

"(4) Every Branch not in Great Britain and Northern Ireland may form a Constituency provided that the Branches in the Republic of Ireland may be grouped together to form one Constituency."

(iv) By altering the number of the existing paras. (4) and (5) to (5) and (6) respectively.

6. By deleting in By-law 40 from para. (2) the words "in Great Britain and Northern Ireland" and by adding at the end of this para. the words "Provided always that no Constituency not in Great Britain or Ireland shall be entitled to elect more than 3 Representatives in all."

7. (i) By adding in para. (2) of By-law 42 after the word "Division" the words "or Branch" and after the word "Divisions" the words "or Branches."

(ii) By making the like alteration in para. (3) of the By-law.

8. By adding in By-law 43 after the word "Constituency" where it first appears in para. (1) the words "in Great Britain and Northern Ireland."

9. By substituting in the last line but one of By-law 47 "six weeks" for "two months."

Amendment of Schedule to By-laws

1. In the Schedule to the By-laws relating to the Amending Acts Committee insert at the end of the present words in the second column ("Additional Members *ex officio*") the words "or at the discretion of each such Committee one other Member appointed by such Committee."

2. In the Schedule to the By-laws relating to the General Medical Services Committee substitute in the fifth column ("Otherwise Appointed") the words "one to be nominated by the Public Health Committee in consultation with the Society of Medical Officers of Health" for the words "one Health."

3. In the Schedule to the By-laws relating to the Public Health Committee add in the fifth column ("Otherwise Appointed") the words "one to be appointed by the General Medical Services Committee."

4. In the Schedule to the By-laws relating to the Armed Forces Committee insert at the end of the existing entry in the sixth column the words "and to appoint one member arising from the failure by members of the Association on the active list of the medical branch of any of the Armed Forces to elect a member of the Committee."

5. Add as a footnote to the By-laws:

Standing Committees appointing representatives on other Committees are entitled to appoint a deputy to attend meetings in the event of the appointed representative being unable to do so.

GENERAL MEDICAL SERVICES COMMITTEE REPORT TO SPECIAL CONFERENCE OF LOCAL MEDICAL COMMITTEES

A special Conference of Local Medical Committees has been called for May 5, 1953, at 10.30 a.m. at B.M.A. House, Services Committee.

1. The Committee has learned that, following a requisition by some 159 members of the British Medical Association, an Extraordinary General Meeting of the British Medical Association will be held on May 5, 1953, "for the purpose of considering and, if thought fit, passing the following resolution":

"That the Association, being concerned by the modification of the present method of remuneration by capitation fees agreed in the Working Party's Report, requires the Council forthwith to approach the Minister of Health with proposals for protection (financial and otherwise) of the small-list doctor and the Minister of Health not to implement the Working Party's Report until the new scheme for distribution of remuneration has been considered in the light of such proposals, and meanwhile to continue the present method of payment."

2. The Committee can only interpret the requisitioning of this Extraordinary General Meeting as an attempt by a small minority group of the profession to overturn the decisions

overwhelmingly approving the Working Party scheme taken by a Special Conference of Local Medical Committees in June, 1952, and by the Representative Body of the British Medical Association in July, 1952.

3. Under Article 37 of the Articles of Association of the B.M.A. the general control and direction of the policy and affairs of the Association are vested in the Representative Body, and it is disturbing to think that it could be open to any small group of practitioners to attempt by the device of an Extraordinary General Meeting to impose their will against the declared wishes of the majority of the profession. It understands that learned Counsel has given his opinion that a resolution on a major medico-political issue, if carried at such a meeting, would have no effect. Notwithstanding this opinion the Committee believes that local medical committees should be made fully aware of the situation and of the steps that have been taken by the Committee since the Special Conference in June, 1952, to give effect to the Conference wishes. It considers it essential that before the Extraordinary General Meeting it shall know the current views of local medical committees on these important matters.

4. The Committee wishes to remind local medical committees that the implementation of the Danckwerts award and the subsequent increases which have been made in the Central Pool, retrospectively to July, 1948, were dependent upon agreement being reached in the Working Party (composed equally of members of the G.M.S. Committee and the Ministry of Health) on a new method of distribution. Every N.H.S. general practitioner was sent a copy of the Working Party's Report, and the recommendations were discussed by local medical committees and at open meetings of the profession held throughout the country. Only after this were the recommendations submitted to and approved with almost complete unanimity by the Conference of Local Medical Committees and the Representative Body of the Association.

5. During the discussions that took place before the approval of the scheme it was suggested that there might be certain groups of practitioners for whom the new distribution might not make adequate provision. To safeguard these practitioners the following rider was put on behalf of the G.M.S. Committee to the Special Conference, by whom it was approved:

Resolved: That if, when the new scheme of distribution has been endorsed by both parties, it is found in the light of experience that certain groups of practitioners who under the terms of reference of the Working Party might have expected to have benefited have, in fact, not done so, it be left to the Working Party provisionally to allocate an appropriate proportion of the final settlement moneys for the purpose of remedying any obvious defects in the distribution scheme, such allocation to be subject to confirmation by the next Conference before it becomes a permanent feature of the scheme.

6. The Committee is satisfied that every doctor concerned, be he a member of the B.M.A. or not, has had an opportunity of making his views known before and since July, 1952, through the democratic machinery open to him. During the months that have elapsed since the Special Conference the Committee has heard of no new arguments against the scheme such as might have influenced the Conference to make any different recommendation. It has received no communication from any local medical committee indicating dissatisfaction with the decisions taken by the Conference. Nor has any such indication been received by the Council of the British Medical Association from any Division of the Association. The Committee is therefore surprised that, at this late hour, an attempt should be made to prevent the introduction of the new distribution scheme due to come into effect on April 1.

7. The sponsors of the resolution to be considered by the Extraordinary General Meeting propose the rejection of the whole of the Working Party's Report and claim to do so in the interests of the small-list practitioner and of the doctor newly seeking entry into practice. The Com-

mittee is convinced, however, that any delay in introducing the new scheme of distribution cannot ultimately be in the best interests of these practitioners.

8. The Working Party in framing its recommendations had many points in mind, but not least among its objectives was to help the new entrant to general practice and the general practitioner in full active N.H.S. practice who had only a small list. Delay in introducing the Working Party scheme would mean denying to these practitioners the benefits of the initial practice allowances, the special provisions made for elderly practitioners, the notional-list arrangements to encourage partnerships, and redistribution of patients expected from the reduction in the size of maximum permitted lists. Some practitioners may believe that the scheme does not offer them, as individuals, the help that they expected to receive, but this is hardly a good reason for vetoing the whole scheme, particularly as it has been agreed by the Conference and by the Working Party that, if experience shows that their fears are justified, an appropriate proportion of the final settlement moneys can be used for the purpose of remedying any obvious defects in the new scheme.

9. Immediately following the Special Conference the Committee set up an *ad hoc* subcommittee, consisting of the medical members of the Working Party and also members of the Assistants and Young Practitioners Subcommittee, the Medical Practitioners' Union, and the Amending Acts Committee of the Association, to examine possible ways and means of giving effect to the wishes of the Conference as set out in the rider quoted above. The Subcommittee held several meetings, but its preliminary work was hampered by lack of reliable information as to the extent of the problem. Although figures are known of the number of doctors whose present lists of patients are small, it is not possible to tell from these figures alone how the introduction of the reduced maxima of lists will affect the situation and whether there will be a proportion of those doctors who can genuinely claim to be in active general practice who will suffer injustice under the new arrangements. Many of the small-list doctors are, or will become, junior partners taking advantage of notional lists for loading; others will be eligible for I.P.A. or for the year's "buffer" allowance: some rely, and will continue to rely, on earnings from sources other than capitation fees for the major proportion of their incomes. There is no case for altering the scheme to give additional help to these groups, but there may remain a proportion of small-list practitioners devoting their whole professional time and ability to the running and the building up of their practices for whom modifications may need to be sought. So far the Committee has not been able to make any reliable estimate of the likely numbers of this last group. Indeed, to do so with any pretence of accuracy would entail the preparation of a nominal roll of all small-list practitioners and a precise prediction of their position after April 1, 1953, on which date the new arrangements came into force. This is obviously impossible at present.

10. The Committee has considered how best this essential information may be obtained. As a first step, it will be necessary to prepare a precise analysis of the number and categories of practitioners concerned, and, if the results of such inquiry are to be accurate, comprehensive, and above criticism, it must be undertaken with the help of the Ministry of Health, local executive councils, and local medical committees and carried out on a uniform basis throughout the country. Whilst the Ministry and executive councils can supply certain data, only local medical committees can provide the full picture of the doctors' other commitments and general practice arrangements. For these reasons the Committee, in consultation with the Ministry, decided to call the Working Party together again to investigate the problem and to initiate an official inquiry designed to reveal both the number and groups of general practitioners who may, in the light of experience, be found to be adversely affected by the new distribution scheme. At the same time the

Working Party can determine more precisely the size of the final settlement in the light of the number of new principals who enter practice under the new arrangements and the number of partnerships who avail themselves of the advantages of notional lists. The Committee felt that not only would such a step safeguard the accuracy of the information which is being sought, but it has the advantage that the Ministry would be aware of the Committee's intention to examine the situation and would be prepared in advance for any adjustments in the Working Party's scheme which might in the light of experience prove necessary. The Ministry has readily accepted the suggestion and an early meeting of the Working Party is being held to determine the machinery for the proposed inquiry. The Committee is, therefore, quite satisfied that if defects are shown to exist in the new distribution scheme the steps it has taken to provide in the regulations for retrospective payments adequately safeguard the position of any practitioner who in the light of experience is found to be covered by the Conference rider.

11. The Committee believes that it has taken every possible step to carry out the intentions of the Conference in regard to cases of hardship which may arise under the new distribution scheme.

12. It first set up a subcommittee specially chosen to ensure proper consideration of all constructive suggestions which have been put forward in the Committee. This subcommittee was set up in September and has met on a number of occasions and carried out a detailed examination of the problem and of possible ways of overcoming it.

13. Realizing that no progress would be made without accurate information of the size of the problem, it made arrangements for the full Working Party to be called together so that an official inquiry could be undertaken designed to show whether, and, if so, how many and what type of, practitioners will suffer under the new distribution scheme.

14. It has asked the Ministry, and the Ministry has agreed, to include in the regulations embodying the new distribution scheme a provision to enable the Minister to evolve a scheme to provide for any necessary additional payment should this prove necessary and to make such payments retrospective for practitioners who may be found to merit special consideration.

15. To go further than this now would create new and almost insurmountable difficulties.

16. The Minister himself has stated in Parliament that the new distribution scheme must be given a fair trial, and, indeed, as from April 1 it will have full legal force as the result of regulations now before the House.

17. Again, many practitioners will have decided, and made arrangements, to take in new partners under the notional-list arrangements.

18. Others will have decided to enter practice for the first time in designated areas in the expectation of receiving initial practice allowances.

19. Indeed, there can be few practitioners who have not entered into commitments of one sort or another in the expectation of the benefits to be conferred by the new distribution scheme on April 1.

20. For all these reasons, the Committee is satisfied that it would be impracticable, and most undesirable, for any approach to be made to the Minister in the terms of the resolution to be considered by the Extraordinary General Meeting, and invites local medical committees to endorse the steps already taken by the Committee to safeguard the position of the small-list practitioner and the doctor newly seeking entry into practice. It therefore recommends:

Recommendation: That this Conference, representing National Health Service general practitioners throughout the country, fully endorses the steps already taken by the General Medical Services Committee to implement the rider passed by the Special Conference of Local Medical Committees on June 26, 1952.

British Medical Association

MEDICAL PRACTICES ADVISORY BUREAU

The following annual report of the Association's Medical Practices Advisory Bureau was presented by the Medical Director (Dr. L. S. Potter) to the Council on March 18. The report deals with the year ending December 31, 1952.

AGENCY SERVICES

Entry into Practice

The records of work in the three principal offices of the Bureau, in London, Manchester, and Scotland (Edinburgh and Glasgow), show a slight increase over 1951. Other regional or B.M.A. Branch activities are mainly concerned with locum arrangements, which can be undertaken satisfactorily in a medical school centre. For other appointments their scope is limited and they act as clearing-house for the main Branches.

The following Table shows the number of assistants with or without view to partnership introduced by the Bureau during 1951 and 1952:

	1951	1952
Assistants with view	211	213
Assistants without view and trainees	435	450

The New Distribution Scheme

The last annual report called attention to the decline in vacancies for partners (assistants with view) and the relative increase in requests for so-called "permanent" assistants. Though seasonal fluctuations in both fields make it difficult to be dogmatic the records indicate that this trend has been reversed, although stability has probably not been reached. For example, requests for the introduction of prospective partners reach their peak in the first quarter of the year and are fewest in the third quarter. In 1952, however, the number introduced in the third quarter showed for the first time a marked increase over both the preceding quarter and the corresponding quarter in 1951. This is emphasized by the fact that the number in the second quarter of 1952 was the lowest since the formation of the Bureau.

It is too early to assess the effect of the new distribution scheme on entry into general practice, but there is strong presumptive evidence that the number of new partnerships formed is very much greater than the number of new engagements of assistants with view. In other words, "permanent" assistants are being taken into partnership in far greater numbers than the above figures suggest, and therefore the comparison between assistants with view introduced in 1951 and 1952 does not give a true picture. Requests for advice on the procedure for entering partnership, the allocation of shares, the content of the agreement, etc., have shown a very marked increase in the last six months, and it is reasonable to relate this increase to the Danckwerts award and the Working Party's report. It is impossible to give figures, but this experience is confirmed by local medical committees.

The last report of the Bureau suggested that an important cause of the reluctance of established practitioners to take partners was the absence of a capital sum to offset the initial loss of income when a share is transferred. This factor will continue to affect adversely entry into general practice. The loss is not fully compensated by payment on notional lists, and seems to give rise to a tendency to carry over into partnerships the relation of employer and employee, which is the normal relationship of principal and assistant. Entry into partnership practice would be made much easier if the appropriate proportion of compensation were paid to a practitioner giving a share to a partner.

Demand for Openings in General Practice

Among the great number of doctors registered with the Bureau as seeking openings in general practice there is a

group which, because of advancing age or other reasons, will only succeed with great difficulty in obtaining other than temporary appointments. Apart from this group the majority are in posts in general or hospital practice and are seeking vacancies which offer more security and long-term prospects. The amount of actual unemployment among doctors is thought to be small, and has certainly been exaggerated.

Much has been said in committee and in the medical and lay press about the difficulty of obtaining posts with reasonable prospects in general practice. Undoubtedly the demand exceeds the supply of vacancies, but it is surprising how many attractive openings are difficult to fill. Making allowances for housing problems, domestic factors, and the fact that many are in posts which cannot be relinquished at short notice, there are inexplicable anomalies.

(i) A practitioner in a large country town, with a maximum list, offered a third share increasing by stages mutually agreeable, after an assistantship of twelve months. Salary £800 with £150 car allowance and *rent-free furnished flat*. This was sent to nearly 200 eligible applicants—very few replied, and none could take up the appointment for three months.

(ii) A large firm in a Home Counties town offered a salaried partnership to be followed by full status on an eighth share rising to parity in three years. Initial salary £750 with £150 car allowance and furnished rooms (suitable for married man without children) and *full board*. Sent to nearly 200—less than six applicants, all unsuitable.

(iii) A firm of three in a London suburb offered a fifth share (£1,800 per annum approximately) after six months—parity in due course—obstetric experience desirable—detached four-bedroomed house available at valuation on completion of partnership. Sent to 300—less than 20 applicants.

The same reluctance to apply for what seem to be very satisfactory posts is apparent in assistantships without view and traineeships.

Locum Engagements

The number of locums introduced during 1952 compared with previous years shows a fairly constant pattern. The highest seasonal peak was reached in the third quarter of 1952, when approximately 800 locums were arranged.

1949	1950	1951	1952
1,662	2,374	2,452	2,395

During the peak periods in the first quarter and during the holiday months it is usually quite impossible to meet demands.

Other Appointments

During the year the Bureau has been asked to help in filling a large variety of miscellaneous appointments, often when advertisement has been unsuccessful. Many of these have been specialist posts abroad, usually for periods of from one to three years, renewable. There is an understandable reluctance among young specialists to apply for these posts, however attractive the experience and remuneration, because they feel that absence may make it impossible for them to catch up with the keen competition for hospital appointments on their return.

Perhaps the greatest problem facing the Bureau is to find suitable part- or whole-time appointments for practitioners who have reached retiring age and whose private practices have been affected by the changes since 1948. Circumstances are forcing many of these to seek remunerative work, but they face competition from younger men, and many have no aptitude for, or experience of, general practice, where temporary work is usually available.

ADVISORY SERVICES

The demand for advice on a wide variety of personal problems associated with medical practice continues to increase. There is much evidence that this service is appreciated, and the number of complaints is negligible. The

need for an advisory service which only a disinterested body such as the B.M.A. can give is emphasized by the number of instances in which, had advice been sought in time, serious consequences might have been averted. For example, an assistantship with view to succession in one of the Dominions was recently advertised in the *British Medical Journal*. An assistant in England wrote for particulars, on receipt of which he assumed that he had been offered the vacancy and forthwith gave notice to his principal, sold his house, and booked passages. Only on the eve of departure did he learn that the post had been filled. There is of course no excuse for such impulsive action, but his present unenviable predicament and anxiety could have been avoided had he sought advice in time. Fortunately the Bureau, through its contact with B.M.A. Branches and agencies abroad, may still be able to help. There are other instances where practitioners have accepted posts overseas on mere verbal assurances and have sailed without written contracts, only to find that conditions are very different from what they have been led to expect.

The Council approved the Report and placed on record its appreciation of the services of Dr. Potter and of the loyalty and efficiency of the staff of all the offices of the Bureau.

PUBLIC HEALTH SERVICE

MEDICAL WHITLEY COUNCIL, COMMITTEE "C"

Arbitration Regarding Remuneration of Assistant Medical Officers

As previously reported (*Supplement*, January 31, p. 32) the two sides of Committee "C" of the Medical Whitley Council agreed that the Staff Side's claim for an adjustment in the remuneration of assistant medical officers should go to arbitration. The matter was referred to the Minister of Labour under the Industrial Courts Act. Notification has now been received by the joint secretaries of Committee "C" that the Minister of Labour has referred the difference to the Industrial Court. Information with regard to the date of the hearing before the Industrial Court is now awaited.

Additional Conditions of Service for Medical Officers of Health

The following circular (M.D.C. No. 16) signed by the joint secretaries of Committee "C," Medical Whitley Council, has been sent to all local authorities in England and Wales and Scotland:

"We have to advise you that Committee 'C' of the Medical Whitley Council have had under consideration a proposal that certain of the conditions of service applicable to chief officers of local authorities should be embodied in the conditions of service of medical officers of health. They have agreed that the following conditions of service should apply to medical officers of health:

"(1) *Whole-time Service*.—A whole-time medical officer of health shall devote his whole-time service to the work of the council(s), and shall not engage in any other business or take up any other additional appointment without the express consent of the council(s).

"(2) *Advice to Political Groups*.—A medical officer of health shall not be called upon to advise any political group of the council either as to the work of the group or as to the work of the council, neither shall he be required to attend any meeting of any political group.

"(3) *Inclusive Salaries*.—Salary scales within the ranges adopted by the Whitley Council shall be deemed to be inclusive salary scales, and all fees and emoluments except those for which other provision is made by or as a result of the conditions of service agreed upon by the Whitley Council shall be paid by the medical officer of health into the rate funds."

H.M. Forces Appointments

ROYAL NAVY

Acting Interim Surgeon Commander J. P. Corcoran has retired.

ROYAL NAVAL VOLUNTEER RESERVE

Temporary Surgeon Lieutenant-Commander J. H. Simpson has terminated his temporary commission on transfer to the R.A.N. (Reserve Forces).

ARMY

Major-General T. Menzies, C.B., O.B.E., Q.H.P., late R.A.M.C., having reached the age for retirement, has retired on retired pay.

Major-General R. D. Cameron, C.B., C.B.E., M.C., Q.H.S., late R.A.M.C., has retired on retired pay.

Brigadiers (Temporary Major-Generals) E. P. N. Creagh and R. Murphy, C.B.E., Q.H.S., late R.A.M.C., to be Major-Generals.

Brigadier (Temporary Major-General) E. P. N. Creagh, late R.A.M.C., to be Major-General.

Brigadier W. R. D. Hamilton, O.B.E., Q.H.P., late R.A.M.C., to be Major-General (supernumerary).

Colonel (Temporary Brigadier) F. J. O'Meara, late R.A.M.C., to be Brigadier.

Colonel K. Fletcher-Barrett, O.B.E., late R.A.M.C., to be Brigadier.

Lieutenant-Colonels P. J. Richards, D.S.O., O.B.E., and W. A. Robinson, O.B.E., from R.A.M.C., to be Colonels.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel B. Blewitt has retired on retired pay, and has been granted the honorary rank of Colonel.

Major R. A. Bond to be Lieutenant-Colonel.

Captain G. M. McEwan to be Major.

Major G. P. Crean, from Short Service Commission, has been appointed to a permanent commission in the rank of Captain. (Substituted for the notification in a *Supplement* to the *London Gazette* dated November 5, 1948.)

Short Service Commissions.—Majors A. S. Cox and G. P. Stille have retired, having received gratuities. Captain D. Ollivier to be Major.

Short Service Commission (Type "B").—Major H. Shield, M.C., T.D., has retired on retired pay.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major (Honorary Lieutenant-Colonel) F. W. A. Warren, O.B.E., T.D., from T.A.R.O., to be Major, and has been granted the acting rank of Colonel.

Major (Honorary Lieutenant-Colonel) G. S. Adams, T.D., from T.A.R.O., to be Major, and has been granted the acting rank of Lieutenant-Colonel.

Captain P. W. Ingram, from T.A.R.O., to be Captain, and has been granted the acting rank of Lieutenant-Colonel.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Colonels I. G. W. Hill, C.B.E., T.D., and A. H. Whyte, D.S.O., T.D., whose tenures have expired, have relinquished their appointments as Honorary Colonels of T.A. units.

Lieutenant-Colonel (Acting Colonel) S. G. de Clive-Lowe, T.D., to be Colonel.

Lieutenant-Colonel O. G. Prosser, M.C., to be Brevet Colonel.

Major (Honorary Lieutenant-Colonel) E. Shipman, from T.A.R.O., to the Active List, to be Major. (Substituted for the notification in a *Supplement* to the *London Gazette* dated April 14, 1950.)

Captains D. Macartney, J. H. Challenger, J. S. Lancaster, M.C., N. D. Cousins, W. G. Daynes, J. H. Orr, and I. D. Henderson to be Majors.

Captain B. J. Harries and D. L. Nicholls to be acting Majors.

Lieutenant (War Substantive Captain) P. Walsh, now T.A.R.O., to be Major.

Lieutenant J. E. Grey to be Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Colonel L. J. Haydon, T.D., from Active List, to be Colonel.

Brevet Colonel O. G. Prosser, M.C., from Active List, to be Brevet Colonel.

Lieutenant-Colonel S. W. Barber, M.B.E., T.D., from Active List, to be Lieutenant-Colonel.

Majors (Honorary Lieutenant-Colonels) W. R. P. Templeton, T.D., J. H. Dunn, O.B.E., T.D., and R. Armstrong, having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O.

Major (Honorary Lieutenant-Colonel) J. W. E. Webster has relinquished his commission, retaining the honorary rank of Lieutenant-Colonel.

Major W. D. Jackson, O.B.E., M.C., T.D., has relinquished his commission, and has been granted the honorary rank of Lieutenant-Colonel.

Majors R. E. Haswell and A. Murray, from Active List, to be Majors.

Majors E. C. Murphy, T.D., E. G. Recordon, and J. E. Wells, T.D., have relinquished their commissions, retaining the rank of Major.

War Substantive Major G. N. Bailey has relinquished his commission, and has been granted the honorary rank of Lieutenant-Colonel.

Captain (Honorary Major) G. B. Morton has relinquished his commission, retaining the honorary rank of Major.

Captains L. K. Wills and J. D. A. Gray, T.D., have relinquished their commissions, and have been granted the honorary rank of Major.

Correspondence

Extraordinary General Meeting

SIR,—I read with amazement the announcement of an Extraordinary General Meeting (*Supplement*, March 21, p. 76). It is the deliberate policy of the Association to confine general meetings to essential matters of business which, in company law, can be transacted only by a General Meeting. Such business is specified in the handbook of the Association and excludes subjects of a medico-political nature, which are left to the democratically elected Representative Body.

As recently as July, 1952, the Representative Body, comprising representatives from all the 300 constituencies, approved the policy of the G.M.S. Committee in relation to the Working Party's Report, with only one dissident. Can there be any doubts that such an overwhelming vote indicates the view of the vast majority of the profession? Yet, despite this vote, and despite the assurances given at the time, and since, by Dr. Wand and Dr. Talbot Rogers, and despite the inquiry already initiated by the G.M.S. Committee and the Working Party with a view of ensuring justice for the small-list practitioner, this Extraordinary General Meeting has been forced upon us by a small group of disgruntled people. The action appears to me to be an effort by a particular group to thwart the expressed wish of the majority of the profession by the summary calling of a meeting in London, attendance at which presents serious difficulties for all who reside outside London and the counties immediately adjacent.

I would therefore urge all Divisions to do everything in their power to prevent a totally unrepresentative opinion prevailing on May 5 by sending representatives with specific instructions to vote on the resolution which is to be placed before the assembly.—I am, etc.,

East Herrington, Sunderland.

IVOR JONES.

SIR,—As your readers know, the Council of the British Medical Association has called an Extraordinary General Meeting of the Association on the requisition of more than 100 members to consider a resolution concerning small-list practitioners. This meeting is to be held on the afternoon of May 5.

We now learn to our astonishment that the General Medical Services Committee, "disturbed" at this threat to upset its plan for distribution, has called a Special Conference of Local Medical Committees for the sole purpose of reaffirming its approval of the plan; this Conference is to be held on the very morning of the Extraordinary General Meeting, and so influencing its debate.

It is to be noted that the expenses of delegates to the Conference are paid from Trust Funds, while British Medical Association members attending the Extraordinary General Meeting will have to pay their own expenses. It is difficult not to regard this decision of the General Medical Services Committee as a deliberate attempt to devise a majority at the Extraordinary General Meeting by subsidizing the attendance of members whose views are known to favour the Working Party's plan.—We are, etc.,

Shrewsbury.
East Horsley, Surrey.
Edgware.
London.

W. J. GRANT.
BASIL GRANT.
A. D. MANNING.
CHARLES I. SCHIFF.

The Small-list Doctor

SIR,—I am a senior member of our profession (being now aged 68) and have only a small panel list which it is virtually impossible for me to increase. Because of these factors those who found themselves in the same position as myself were, prior to the Danckwerts award, allowed certain extra

sums out of the general sums available for the payment of doctors. Following this award, these sums are all to be reduced, and in my own case this will mean that I am likely to lose not less than £100 per annum. The loss may be greater, for the precise figures are not yet worked out. The sums which we lose are to find their way into the pockets of younger men with larger lists, most of whom have never been called upon to do the vast amount of unpaid work which was our lot when we entered the profession.

It will probably be agreed by everyone that this state of affairs involves a flagrant injustice which should be corrected by Parliament itself. I shall be grateful if I may have the hospitality of your columns to recommend all those in the same position as myself to write forthwith to their Member of Parliament, and to their local representatives on any professional committees, asking that this matter may be given urgent attention.—I am, etc.,

Sevenoaks.

GORDON WARD.

** As Dr. Ward is over the age of 65, he may become eligible for a special grant under the terms of paragraph 19 of the Working Party's report. This paragraph states: "A small sum of money should be set aside from the central pool to deal with cases of hardship which might arise, particularly where, under the new arrangements, an elderly practitioner might lose his fixed annual payment, and, after receiving an initial practice allowance for a year, find himself less well off than he was before the new scheme came into operation." A circular will shortly be issued notifying practitioners how they may claim a grant under this heading.—Ed., B.M.J.

Salaries of Whole-time Specialists

SIR,—We are pleased to see that publicity is now being given by the Association to the grievances of whole-time specialists. It is to be hoped that this will be followed by concrete results. It is certainly a very peculiar situation when a consultant, by taking up an appointment part-time under the National Health Service, is likely to receive (at least in the case of a clinician) a larger remuneration from the Service than if he were to take up the same appointment whole-time. The reason for this, of course, is that his allowances and domiciliary visits can easily make up more than the difference between whole-time and eight or nine sessions part-time salary.

Several suggestions have been made in the *Journal* and elsewhere that whole-time specialists should receive payment for domiciliary visits. This alone, however, would not solve the problem. Whole-time clinicians would, no doubt, benefit considerably, but certain specialties (e.g., radiology and pathology) would scarcely benefit at all, since in these there is seldom scope for much useful domiciliary work. Indeed, it appears to be for this very reason that so many purely whole-time appointments are made to these specialties. The only real solution to the present inequality between whole- and part-time specialists under the National Health Service is to increase considerably the difference between their basic salaries.—We are, etc.,

W. H. J. BAKER.
D. R. CHRISTIE.
P. CLIFF.

Hereford.

Cost of Prescribing

SIR,—My letter on the cost of prescribing (*Supplement*, February 14, p. 43) appears to have caused some irritation among English members of the pharmaceutical profession, as seen by the recent letters in the *Supplement* drawing attention to the "wild inaccuracy" of my figures. Let me say that my figures are dead accurate—that is, 1s. 2d. for dispensing a proprietary liquid medicament, and 2s. 3d. for dispensing an official liquid medicament. These figures are taken from the *Drug Tariff* supplied by the Department of Health for Scotland, and are in fact the figures payable in Scotland at the present time in my area. There are no doubt

complicated reasons for the different dispensing fees payable in Scotland on the one hand and England on the other, but such factors as population density and different prescribing habits in Scottish doctors are probably two of the main reasons. I would point out to Mr. F. C. Wilson (*Supplement*, March 14, p. 71) that proprietary medicines can be supplied in dispensing packs purchase-tax free—for example, "benylin" at 5d. an ounce in Scotland. Prescriptions are then made up by chemists from "broken bulk."

I am not campaigning for a reduction in chemists' remuneration, but probably I was struck with the ease with which the chemist could make 2s. 3d. simply by putting three-halfpennyworth of *lotio calaminae* into a bottle, while I, in order to make 5s., might be obliged to make three journeys into the country, give three injections, and fill in a form to immunize a child against diphtheria and pertussis. In spite of that slight intrusion of envy, I have great confidence in the chemists I deal with, and would be lost without them. At all times they are the very soul of discretion, and far be it from me to grudge them some "easy money."—I am, etc.,

Lanark.

THOMAS M. GLAISTER.

Medical Practices Committee Report

SIR,—I should like to draw attention to some of the statements in the fourth report of the Medical Practices Committee (summarized in the *Supplement*, March 21, p. 74). The report states that in the United Kingdom and Northern Ireland prior to July, 1948, there were believed to be approximately 2,100 whole-time assistants. In its first report (*Supplement*, 1949, 2, 128), the Medical Practices Committee stated that the number of assistants on July 5, 1948, was 562.

The latest report states that the number of assistants on November 1, 1952, was 1,566. This was the number of whole-time assistants, other than trainees, in England and Wales only. The total of whole-time assistants in the United Kingdom and Northern Ireland is approximately 2,400.

The report states that in the past eighteen months 344 assistants were taken into partnership. This shows that less than 15% of assistants are taken into partnership annually and bears out the contention that assistants are encountering very serious delay before becoming established as principals. The Unestablished Practitioners Group considers that this delay is one of the most serious problems facing those seeking entry into practice. It is a problem which the Medical Practices Committee has obviously failed to comprehend and for which a solution has yet to be found.—I am, etc.,

B. LANGLEY,
Secretary,

London, N.W.6. Unestablished Practitioners Group.

POINTS FROM LETTERS

Saturday Night Surgery

Dr. G. J. GRAINGER (London, S.W.4.) writes: I can answer Dr. R. S. Thubron's letter (*Supplement*, March 14, p. 72) from my own experiences. I gave up my Saturday evening surgery in April, 1950, because I grew tired of doing little other than signing final "panel" certificates for patients who should have attended on Saturday morning anyway. Very few patients have been inconvenienced by this, and to those who have I stress the fact that this is not an extra half-day for me, and that I am available for emergencies of any kind, if required.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

Branch and Division Meetings to be Held

CITY DIVISION.—At Hackney Hospital, London, E., Tuesday, April 7, 8 p.m., clinical evening.

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, April 9, 7.30 p.m., dinner: 8.45 p.m., meeting, address by the Reverend Leslie D. Weatherhead (Minister of the City Temple, London): "Faith Healing." Members are invited to bring along, as their personal guests, members of the clergy.

HARROW DIVISION.—At Rayners Hotel, Rayners Lane, Tuesday, April 7, 8.30 p.m., clinical meeting. Address by (1) Dr. C. G. Barnes and Mr. K. S. Mullard: "Mitral Valvulotomy"; (2) Dr. H. J. V. Morton: "Recent Advances in Anaesthesia."

LEWISHAM DIVISION.—At Lewisham Hospital, S.E., Sunday, April 12, 10.30 a.m., clinical meeting.

MID-HERTS DIVISION.—At Ashwell House, Verulam Road, St. Albans, Wednesday, April 8, 8.30 p.m., meeting. Annual B.M.A. Lecture by Dr. Charles Hill, M.P. Members' wives and dental practitioners and their wives are invited.

SALISBURY DIVISION.—At Salisbury General Infirmary, Tuesday, April 7, 8.15 p.m., meeting. Mr. E. J. Dalling: "The Dental Aspects of Plastic Surgery." All dental practitioners in the area of the Division are invited.

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Shrewsbury, Tuesday, April 7, 8.30 p.m., meeting of clinical and pathological section of Branch. Lecture by Dr. A. T. M. Myres and his colleagues, and Mr. E. G. Dolton: "Some Aspects of the Treatment of Tuberculosis."

SOUTH-EAST ESSEX DIVISION.—Wednesday afternoon, April 8, visit to Messrs. May and Baker, Dagenham

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Bow, E., Friday and Saturday, April 10 and 11, week-end postgraduate course. Friday, 8 to 10 p.m., Mr. D. F. Ellison Nash: "Diseases of the Thyroid"; Dr. D. W. G. Smith: "Medical Cases. Saturday, 2 to 5 p.m., Mr. J. H. Carver: "Urological Problems in General Practice"; Dr. J. A. Scott: "Public Health and the General Practitioner"; 8 to 10 p.m., Dr. W. R. Bett: "Medical Bibliography and Writing of Scientific Articles"; Dr. J. A. Robertson: "Coronary Thrombosis."

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Wednesday, April 8, 8.30 p.m., meeting. Dr. John Freeman: "The Place of the Laboratory in Clinical Medicine."

WEST BROMWICH AND SMETHWICK DIVISION.—At "The Red Cow," High Street, Smethwick, Friday, April 10, 8 p.m., dinner and dance.

WESTMINSTER AND HOLBORN DIVISION.—Thursday, April 9, (1) at Westminster Arms Hotel, Page Street, S.W., 7 for 7.30 p.m., dinner meeting; (2) at Meyerstein Lecture Theatre, Westminster Medical School, Horseferry Road, S.W., 8.45 p.m., lecture: "Facilities Available for Early Diagnosis and Treatment of Cancer"; film: "Early Diagnosis of Carcinoma of the Larynx." Speakers, Mr. A. J. Gardham and Professor B. W. Windeyer. Guests and members from neighbouring Divisions are invited.

WINCHESTER DIVISION.—At Abbey House, Winchester, Saturday, April 11, 3 p.m., meeting. Winchester Address for 1953 by Dr. H. Guy Dain: "John Citizen and His Doctor. Where do we go from here?" To be delivered before an invited audience.

THE EXTRAORDINARY GENERAL MEETING

THE CONSTITUTIONAL POSITION

At its last meeting on March 18 the Council of the B.M.A. had on its agenda a requisition signed by more than 100 members of the Association to convene an Extraordinary General Meeting for the purpose of considering and, if thought fit, passing the following resolution:

That the Association being concerned by the modification of the present method of remuneration by capitation fees agreed in the Working Party's Report requires the Council forthwith to approach the Minister of Health with proposals for the better protection (financial and otherwise) of the small-list doctor and of the doctor newly seeking entry into practice, and requests the Minister of Health not to implement the Working Party's report until the scheme for distribution of remuneration has been considered in the light of such proposals, and meanwhile to continue the present method of payment.

The requisition was deposited at the head office of the Association on March 6. Under the terms of Article 24 of the *Memorandum and Articles of Association and By-Laws of the British Medical Association* the Council has called an Extraordinary General Meeting of the Association for May 5 (*Supplement*, March 21, p. 76). The names of 159 signatories to the requisition are set out in the *Supplement to the Journal* of March 28, at page 92.

B.M.A. a Company

Article 24 in the *Memorandum and Articles of Association and By-Laws of the British Medical Association* is as follows: "The Council may whenever it thinks fit and (without prejudice to the provisions of the Companies Act, 1948) it shall upon a requisition made in writing as herein-after provided by any one hundred or more Members convene an Extraordinary General Meeting."

The British Medical Association is a limited company (allowed to dispense with the description "limited" in its title), and must fulfil the requirements of the Companies Act of 1948.

The Business of a General Meeting

The *B.M.A. Year Book*, 1952-3 (p. 77), contains the following: "Certain business of the Association must, in accordance with company law, be performed by the General Meeting, but it is the deliberate policy of the Association to reduce the duties of the General Meeting to the least amount compatible with the law, and to place as much as possible of the responsible deliberative work of the Association on the Representative Body. The business transacted by

General Meeting is: (1) Alteration of Memorandum or of Articles, when necessary. (2) Consideration of the income and expenditure account and of the balance-sheet. (3) Appointment of auditors and fixing their remuneration. (4) Reception and discussion of scientific matters. General Meetings are open to every member of the Association.

"An Annual General Meeting is held once in every year, usually at the time of the Annual Representative Meeting. Extraordinary General Meetings may be convened at any time by the Council, or on the requisition of 100 or more members, but only for the transaction of the above-mentioned business."

Revision of Articles

The restriction placed on the business that can be considered at an Extraordinary General Meeting, as recorded in the *Year Book*, is based upon Articles and By-laws which are now out of date, and the *Year Book* has not yet been revised. In 1949 the Council reviewed the Articles and By-laws to bring them into conformity with the provisions of the Companies Act of 1948. This Act does not restrict the objects for which an Extraordinary General Meeting may be held. Therefore in the revised Articles of the Association published in 1951 the restriction formerly included in Article 24 that the business of an Extraordinary General Meeting shall be confined to "any such business as . . . is required to be transacted at a General Meeting" is removed. However, provided that it fulfils the requirements of company law and holds general meetings for the purpose of conducting such company business as the Companies Act requires, the Association may arrange the conduct of its other affairs as it sees fit. It sees fit to vest the general control and direction of its policy and affairs in the Representative Body.

Article 37

This vesting of the general control and direction of policy and affairs in the Representative Body is governed by Article 37, which is as follows: "Subject to the provisions of any Statute, the general control and direction of the policy and affairs of the Association shall be vested in a body of representatives styled 'the Representative Body' and composed of (1) the Chairman and the immediate Past-Chairman of the Representative Body *ex officio*, (2) the Members of the Council for the time being in office or elected to take office, and (3) Members of the Association elected in the manner prescribed by the By-laws by the Divisions and by such other groups or classes of Members (if any) as may from time to time be so prescribed."

R.B. versus General Meeting

The reasons which earlier on made the Association decide the way in which it should apportion its business between the General and Representative Meetings are clearly indicated in the older *Annual Handbooks* of the Association, which, under the heading "General Meetings," contained the following paragraph: "Certain business of the Association must, in accordance with company law, be performed by the General Meeting, but it has been the deliberate policy of the Association, ever since its reorganization in 1902, to reduce the duties of the General Meeting to the least amount compatible with the law, and to place as much as possible of the responsible deliberative work of the Association on the Representative Body. The reasons for this are that the General Meeting, in the nature of the case, is an unrepresentative body, composed to a large extent of members of the Association resident in the district in which the Meeting is held, and that there can be no continuity of policy in such a body, as it cannot be governed by the same sense of homogeneity and of responsibility as has grown up in the Representative Body."

Counsel's Opinion

The object of calling the Extraordinary General Meeting on May 5 next as stated by the signatories to the requisition is to consider a resolution which relates to the general control and direction of the policy and affairs of the Association—control of which, under Article 37, is vested in the Representative Body. Furthermore, the resolution to be placed before the Extraordinary General Meeting seeks to reverse a decision of the Representative Body at Dublin in 1952. The question arises, therefore, whether a decision of a general meeting of the Association can override and reverse a decision of the Representative Body.

On the advice of the solicitors to the Association, counsel's opinion was obtained whether, in view of the terms of Article 37, it would be competent for a General Meeting to pass a resolution on a medico-political matter of the kind set out in the object for requisitioning the Extraordinary General Meeting, and whether such a matter was not one exclusively for the Representative Body. The opinion given was that under the terms of Article 24 the requisitioned Extraordinary General Meeting must be held, but that the resolution if passed at that meeting would be ineffective on the policy of the Association as decided by the Representative Body. Under Article 37 the Representative Body, said counsel, had reserved to it the rights and powers of decision in a matter of this nature.

To sum up: Under the Companies Act and the Articles of the Association an Extraordinary General Meeting can be called for any object by the Council or by requisition of more than 100 members of the B.M.A. But the Articles of the Association confer upon the Representative Body the rights and powers to decide matters concerned with the general control and direction of the policy and affairs of the Association. Therefore, although it is constitutionally in order to call an Extraordinary General Meeting, if the object of calling the meeting is to do with a matter which encroaches upon the jurisdiction of the Representative Body any resolution passed in connexion with this object would be ineffective and would not become a decision of the Association.

Conduct of Meeting

A General Meeting of the Association is open to all members to attend. The President of the Association, if present, shall preside as chairman at the opening of every General Meeting. In the absence of the President, the Chairman of the Council shall preside, and in his absence a chairman shall be appointed by the Meeting.

Article 33 states: "Except as hereinafter provided, no business shall be transacted in any General Meeting unless there be present a quorum of not less than 100 Members. If within one hour from the time appointed for the Meeting such quorum be not present, the Meeting, if convened upon

the requisition of Members, shall be dissolved. In any other case it shall stand adjourned to the same day in the following week, at the same time and place, and if at such adjourned Meeting a quorum be not present, those present shall be deemed to be a quorum."

The chairman of any General Meeting may, with the consent of the meeting, adjourn any business from time to time and from place to place, but no business shall be transacted at any adjourned meeting other than the business left unfinished at the meeting from which the adjournment took place.

Unless a poll is demanded by at least five members the chairman has power to decide whether a motion has been lost or carried. All resolutions of a General Meeting of the Association and of the Representative Body must be considered by the Council within one month after the date on which the resolution is passed. The Council has its next meeting on May 6.

Additional Information

No expense, other than incidental administrative costs, falls upon the Association in connexion with the holding of an Extraordinary General Meeting. Members attending pay their own expenses.

The last Extraordinary General Meeting which was requisitioned was in 1897. This was before the present constitution—including the Representative Body—became effective in 1903. The meeting in 1897 was called for the purpose of making an alteration in the Articles. The alteration was not made.

CHARGES AGAINST RUSSIAN DOCTORS

The following statement was issued by the Council of the World Medical Association in Lisbon on March 27 and is commented on in a leading article on page 824.

Because of requests from various sources, because of the nature and form of the accusations recently levelled against certain Russian doctors, and because of the international publicity given to them by Soviet news agencies and radio broadcasts, the World Medical Association, representing 700,000 doctors throughout the world, feels compelled to issue a statement.

The charges include accusations of attempts by doctors against the lives of their patients, and of other actions which violate the traditions and ethics of medicine.

These charges may have the effect of shaking the faith of patients in their doctors, who for centuries have adhered to the principles of the Hippocratic oath, recently reformulated in the Declaration of Geneva and the Code of Ethics drawn up by the World Medical Association. The normal practice of medicine would become impossible if doctors were to be too easily accused or condemned in the event of diagnostic or therapeutic failure or the death of their patients.

Accordingly the World Medical Association, on behalf of practising doctors throughout the world, urges that in this or any similar future case the matter should be investigated with the sole purpose of establishing the truth and of preventing the condemnation of any doctor without recourse to proper judicial procedure.

**GENERAL MEDICAL SERVICES
AMENDMENT REGULATIONS TO IMPLEMENT
WORKING PARTY'S REPORT**

Amendment Regulations to implement the recommendations of the Report of the Working Party on the remuneration of General Practitioners and the new Distribution Scheme came into operation on April 1. A copy of the regulations with an explanatory note (E.C.L. 16/53) has been sent to all executive councils.

**PROPOSED TOUR OF DENMARK BY
SCOTTISH DOCTORS**

The invitation received by the Scottish Committee from the Danish Society for a party of Scottish doctors to tour Denmark in September, 1953, has brought a good response. Full details of the provisional programme for the visit were given in the *Supplement* (March 21, p. 78).

It is proposed that the tour shall extend from September 1 to 14, and the programme arranged by the Danish Society in co-operation with the Danish Medical Association will include visits to hospitals, universities, medical institutes, etc., as well as sightseeing excursions. The cost of the tour will be approximately £31, including third-class travel Newcastle-Copenhagen-Newcastle and the stay in Denmark. All travelling expenses in Denmark will be met by the Danish Society.

Doctors in Scotland who are interested in this tour of Denmark are asked to communicate with the Scottish Secretary, British Medical Association, 7, Drumsheugh Gardens, Edinburgh, 3, without delay.

Notes and News

Carlisle Medical Bureau.—A telephone message centre, similar to the one in operation in Glasgow, opened in Carlisle on April 1. The scheme has been made possible by the City Fire Service and Ambulance Committee allowing the medical bureau the use of the fire and ambulance control. The local medical committee describes the bureau as a practical example of an improvement in the National Health Service made possible by the co-operation of the local health authority and general practitioners. The small administrative cost will be borne by the two specialists and 27 general practitioners resident in Carlisle who have joined the scheme.

A Question of Preference.—Our attention has been called to a newspaper advertisement which offers for sale a residence in North Wales with "4 acres of land and hay optional. Suit sheep, poultry, pigs, or surgery."

The Heart of the Matter.—A doctor recently received a telephone call from a young man who explained that three days previously he had given a lift as far as the surgery to a girl called "June" with a sprained ankle. Unfortunately, in the excitement of the first meeting he had forgotten to ask her name and address, and as he wanted to make a date with her could the doctor please let him have these very necessary details?

Correspondence**Hospital Costing Returns**

SIR,—The recently published *Hospital Costing Returns* (*Supplement*, March 21, p. 78) show a somewhat striking disparity in the cost per week of maintaining a patient in different regions. That this should be so is not surprising when it is realized that no arrangement has yet been made to distribute the money available for hospitals on a *per capita* basis. This would presumably entail the definition of catchment areas for each group of hospitals, which would receive an annual allocation of money related to the population served, with the necessary adjustments to meet the particular circumstances of teaching hospitals, regional special centres, and so on.

It is perhaps too early since the inception of the National Health Service to expect that markedly different standards amongst provincial hospitals, in buildings, equipment, and staffing, have yet been evened out to allow distribution of money on a *per capita* basis at this stage. But, as the figures given in the costing returns are average figures for

entire regions, there is some justification for the assumption that the national resources are not being equally distributed. It would therefore appear reasonable that some active steps should be taken to ensure a more even distribution of the money available. Early consideration of the possibility of there being ultimately distribution on a *per capita* basis might at least prevent further hospital development in areas already receiving an unfair share of the national resources.—I am, etc.,

Eastbourne.

I. M. BROWN.

Prescribing in the N.H.S.

SIR,—The size of the national drug bill should concern us all as taxpayers, apart from the fact that we might prefer to see the money spent on other aspects of the Service. Is it possible that the lower cost in Scotland is due to the Scottish doctor being allowed a stock of drugs and dressings, while the English one has to prescribe separately for each case? For example, a patient needs 10 gr. of sodium barbitone at night. If a prescription is written, there is the dispensing fee, the "urgent" fee, and the cost of the container, besides the retailer's profit, so that the cost is a couple of shillings. The Scottish doctor, I presume, hands over the tablets, and the cost is a few pence.

Is there any reason why drugs normally used personally by a doctor should not be supplied direct to him at wholesale cost? This is already done in the case of diphtheria prophylactic and calf lymph, and it might be interesting to have the comparative cost of supplying these and other vaccines. I imagine it works out much more cheaply, and that there would be a great saving if things like penicillin were also supplied direct.

Most important of all, something really must be done about the *National Formulary*, which could be a time- and money-saving tool instead of a cause of intense irritation. For some amazing reason the titles are in pseudo-Latin and the alphabetical order in English. E (enema) is followed by G (guttae), then C (collyrium) and O (oculenta). It might have been arranged by Lewis Carroll, and minutes are wasted finding what one wants. In fact, Lewis Carroll might have considered it mildly funny that this latinity makes sulphaguanidine feminine, while sulphathiazole is neuter. Is it their glands perhaps? One has to be both an organic chemist and a classical scholar to appreciate the beauty of many of the new names for drugs. But as one is only a rather busy doctor, is it quite impossible for most things to be prescribed by short titles which can be remembered? Why cannot I prescribe tab. SG instead of sulphaguanidine; tab. K instead of acetonephenone (which I cannot even spell)? Give me a short title for each drug and I will happily abandon proprietaries.

Prescribing is a time-consuming part of our work. Could it not be someone's job to make it as simple as possible?—I am, etc.,

Ashted, Surrey.

W. EDWARDS.

Dental Anaesthetics

SIR,—As a general practitioner whose main interest is, and always has been, in anaesthetics, I have read with considerable care the letters of Mr. J. D. Manson (*Supplement*, February 28, p. 58) and Dr. Hugh Stewart (*Supplement*, March 28, p. 96).

There are, surely, two factors to be considered—the skill of the anaesthetist, and the personalities of the dental surgeon and the doctor. Of the first, the dentist must be the best judge, and the interests of his patient and himself are identical in this matter. The occasional anaesthetist is to be deprecated, as much in dentistry as in general surgery. Dr. Stewart's letter implies (or so I read him) that the only function of the dental anaesthetist is to render the patient unconscious. Nothing could be farther from the truth. One anaesthetist working with one dentist becomes a really competent team, complete understanding soon develops, and no word need be spoken even during extensive or difficult operations. Secondly, the personalities of

2517

even in the big cities, such as Glasgow and Birmingham, types of practice vary considerably. There should be no difficulty in splitting up the Divisions in such a way that each new Division contained some or all types of practice.

The Power of the R.B.

The power and efficiency of the Representative Body to govern the Association have been much impaired by the creation of the autonomous bodies, the heavy agenda of its meetings, its size, and lastly, but less important, the reduction in numbers of members of Council which it elects.

The G.M.S. Committee, the autonomous body with which I am concerned, stemmed from the former Insurance Acts Committee, and the success of the latter in the days of National Health Insurance encouraged the belief that autonomy, however paradoxical it might seem, would be equally successful under the conditions of the National Health Service. It was expected, and it certainly has happened, that on occasions decisions which could not wait for the Annual Representative Meeting would have to be taken quickly, and that the Conference of Local Medical Committees could act as satisfactorily as the Representative Body. In my opinion the analogy of the Insurance Acts Committee and the G.M.S. Committee is false, because practically all general practitioners, and 95% of the patients, are now in the N.H.S., whereas before the appointed day many doctors had no panel and less than 40% of the patients were insured.

The Representative Body has very little influence upon the composition of the G.M.S. Committee. Out of 56 members the Representative Body appoints only 10, including those who are *ex officio*. The rest are elected by grouped local medical committees, and the Committee has powers to co-opt. The G.M.S. Committee is, as mentioned before, the executive of the Conference of Local Medical Committees.

The Efficiency of the R.B.

Under present conditions one annual meeting of the Representative Body is not sufficient. The volume of business is too great for the agenda to be completed properly; frequently the end of these meetings is almost farcical, quite important matters being referred to Council after a most perfunctory debate with speeches limited to two or three minutes, or even after no debate at all. Motions are frequently withdrawn because movers think that a proper hearing is impossible. At least two meetings a year should be held, preferably three. Then the need for autonomous bodies would largely disappear, the usefulness of the representatives in the periphery would be enhanced, and Headquarters would be less remote. It should be noted that, unless there is a Special Representative Meeting or the Annual Meeting is held in the Dominions and the Representative Meeting in London, the vast majority of representatives never go near B.M.A. House in an official capacity.

The Representative Meetings are now very large, and, with the increasing membership of the Association, likely to become still larger. A reduction in size and, I believe, an increase in efficiency could be achieved in two ways. First, the present basis of one representative for each constituency and an additional one for each 100 members over 50 should be modified. This should be carried out *pari passu* with the splitting of the larger Divisions. In order to produce an effective reduction in numbers it would probably mean that there would have to be a bigger member-representative ratio for the Divisions in the big towns and cities than for those in the more sparsely populated areas in order that the present balance of the Representative Body should not be disturbed.

There is nothing undemocratic in this procedure; both Parliamentary and local government constituencies vary considerably in size, and those of towns and cities are usually larger than those of country districts. The same state of affairs exists in constituencies electing members of our own Council. The second suggestion is that, with the exception of the president, the president-elect, and the immediate past

president, only representatives should be eligible for election to the Council. This method would add an additional qualification, but would not interfere with the present method of distribution of seats.

Summary

To summarize—the prime task facing the Association is still the education and the creation of interest and enthusiasm in the periphery. The representatives are the people to do this. Their work will be much more effective if the Division is a comparatively small unit. At present the influence and prestige of Divisions are lessened because the Representative Body is no longer in complete control; it is too large and meets too infrequently for its all-important function of “governing” to be carried out. Rightly or wrongly, many members do not like the idea of autonomous bodies. The necessity for this autonomy would largely disappear if the Representative Body met more frequently. The basic organization of the Association is still perfectly sound and democratic; only minor adjustments are necessary or desirable.

In conclusion, I suggest that consolidation of our forces, whatever method be chosen, is not only of paramount importance but of considerable urgency. There is still a stern struggle in front of our profession, a struggle which will last a long time and the opening moves of which may not be far distant.

FLOOD RELIEF FUND

The Trustees of the Sir Charles Hastings Fund, who have been responsible for the administration of the Flood Relief Fund, feel that the many donors to the Fund will wish to know details of the assistance which has been given to those doctors who have suffered.

In response to the Chairman of Council's appeal the Trustees received gifts from individual doctors, grants from local medical committees, and a splendid donation of \$1,000 from the Canadian Medical Association. The total was £2,780. In addition the General Medical Services Defence Trust guaranteed £5,000, of which £1,500 was made available at once. The Trustees made initial and immediate grants to a number of doctors in the flood areas, and this prompt help was much appreciated. On the receipt of additional and detailed information, and as a result of the visits of two of the regional secretaries to the flood areas, the Trustees have reviewed every case and have given additional grants where necessary.

Twenty-two doctors have been helped. They include fifteen general-practitioner principals, two assistants in general practice, three consultants, one medical officer serving with the R.A.M.C., and one retired practitioner. The total amount spent is £4,070.

The Trustees wish to thank most sincerely all those who have assisted with gifts and offers of practical help, and also the honorary secretaries of Divisions and local medical committees for the information and advice given by them.

ASSESSMENT OF PART-TIME CONSULTANT SERVICES CLINICAL RESEARCH

In paragraph 5 of the *Terms and Conditions of Service of Hospital Medical Staff*, which describes the manner in which part-time consultant services shall be assessed and illustrates the kind of duties to be taken into account, there is no mention of clinical research.

The Management Side of Committee “B” of the Medical Whitley Council, however, has assured the Staff Side that where clinical research is included in the “duties attached to the post”—as distinct from research undertaken on the consultant's own initiative—the time involved should be taken into account in computing the consultant's services.

CORONATION DAY

ROAD TRAFFIC ARRANGEMENTS IN THE LONDON AREA

The attention of medical practitioners living or practising in London is drawn to the special arrangements which it is understood will operate on June 2.

The following area will be “restricted” from midnight on June 1 to approximately 7 p.m. on June 2:

North boundary: From Notting Hill Gate by Bayswater Road, Sussex Gardens, Marylebone Road, and Euston Road to St. Pancras Church.

East boundary: By Woburn Place, Southampton Row, Kingsway, Aldwych, Waterloo Bridge, Waterloo Road, and London Road to Elephant and Castle.

South boundary: By Newington Butts, Kennington Lane, Vauxhall Bridge, Grosvenor Road to Chelsea Bridge.

West boundary: By Chelsea Bridge Road, Sloane Street, King's Road, Sloane Avenue, Onslow Square, Exhibition Road, Kensington Road, Kensington Church Street to Notting Hill Gate.

Entry or return to this area, or circulation within it, will be limited to vehicles displaying one of the special wind-screen labels. Medical practitioners who may require during this period to enter, or circulate in, the area for professional purposes should apply for an “exempted services” wind-screen label as soon as possible to the Commissioner of screen label as soon as possible to the Commissioner of screen label of the Metropolis (Coronation Traffic Department), New Scotland Yard, London, S.W.1. Envelopes with applications should be marked “Windscreen Labels” in the top left-hand corner, and for reply should enclose a stamped addressed envelope at least 7½ in. by 5 in. It has been requested that applications should not be made by telephone or personal call.

Professional Business Only

In applying it is necessary to state clearly the professional purposes for which access to the restricted area is required. An “exempted services” windscreen label is unsuitable for those wishing to enter the area by car to view the procession. For this latter purpose a “spectator” label is essential. With the appropriate label there is also issued a detailed map of the arrangements. Those with “exempted services” labels will be able to cross the processional route at fixed places at certain periods. No vehicular traffic will be allowed on the route.

EXTRAORDINARY GENERAL MEETING

The Extraordinary General Meeting on May 5 will be concerned only with the resolution submitted by the requisitionists (*Supplement*, March 21, p. 76) and any amendments to this resolution which may be proposed.

Any individual member of the Association intending to be present at the meeting and wishing to move an amendment may send his amendment, if he so desires, to the Secretary of the Association before the date of the meeting. The amendment must be signed by himself as proposer and by another member (who will attend the meeting) as seconder. Any amendments received before May 5 will be included in the agenda paper which will be issued to those present at the meeting. It would be convenient if amendments were received by the Secretary not later than the morning of Saturday, April 25, so that they might be published in the *Supplement* of May 2 for the information of all concerned. These arrangements do not preclude the handing in of amendments during the course of the meeting.

Dangerous Drugs Act: Withdrawal of Authority

The Home Office announces that Dr. Conrad Hunter-Smith (Canterbury) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations apply.

CIVIL SERVICE MEDICAL OFFICERS

The Civil Service Medical Officers' Joint Committee is continuing to press for a review of the remuneration of Civil Service Medical Officers, but no agreement has yet been reached with the Treasury as to the method of any such review.

Meantime it remains the policy of the Association to refuse advertisements, if offered, of vacant medical appointments in the Civil Service except those which are outside the scope of the report of the Howitt Committee and which carry remuneration at rates agreed with the Association.

MEDICAL WHITLEY COUNCIL COMMITTEE “C”

ASSISTANT MEDICAL OFFICER ARBITRATION

The claim put forward by the Staff Side of the Medical Whitley Council Committee “C” for an adjustment in the remuneration of assistant medical officers (*Supplement*, January 31, p. 32) will come before the Industrial Court for arbitration on Wednesday, May 13, at 10.30 a.m.

Correspondence

Extraordinary General Meeting

SIR,—On May 5 there will be held at B.M.A. House a meeting open to all members of the Association. What are the steps that have led to this unusual event? The B.M.A. is a company and is subject to the provisions of the Companies Act, and this meeting has been summoned formally on the requisition of more than 100 of its members who believe that a minority will be wronged by the new Distribution Scheme. It is pleasant to note that many of the signatories are not personally interested in the issue and are rather concerned to prevent an injustice for others.

It has been argued that such questions should be, and have been, settled by the Representative Meeting; but the R.M. is composed of doctors who represent, or purport to represent, the interests of majorities in the Divisions. As we all know, it is rare indeed for a majority of any Division to be present when its representatives are instructed. Thus the “representative” can usually do little more than make an intelligent guess at his constituents' wishes and may even give up the attempt and express his own views only. Now, if it is difficult for him correctly to express the wishes of the majority of those whom he represents, it is virtually impossible for him to voice the needs of minorities, and so at Representative Meetings their case is seldom heard.

The 1952 Meeting was no exception. A completely new and complex Distribution Scheme had been prepared in secret by the Working Party and approved by a conference of delegates from local medical committees, who had themselves a bare fortnight from the date of publication in which to consider the Scheme and ascertain the views of their constituents. This approval the representatives at Dublin were called upon to endorse. Both the Conference and the Dublin Meeting were warned incorrectly that alteration of the Scheme would jeopardize the implementation of the Danckwerts award. The Minister made it clear, too late, that this threat was false and at once a torrent of criticism of the Scheme was released, much of it well informed and constructive.

The astonishing fact emerged that the General Medical Services Committee, which had predigested the Scheme before the Conference, had no reliable figures from which to estimate its impact upon the earnings of the various groups of doctors. It appointed a subcommittee to investigate the criticisms; but the subcommittee consisted essentially of the same team which had helped to compose the

Scheme (the medical members of the Working Party), and it is not surprising that after five months it reported that it could find no evidence of imperfection, but that it still had no dependable figures. Only then, it appears, did Dr. W. J. Grant and others (*Supplement*, April 4, p. 133), convinced that minority interests were being trifled with, decide to avail themselves of the provisions of the Companies Act—provisions wisely created by Parliament for the protection of minorities in just such a case as this. They drew up a requisition and invited signatures to a resolution asking that the introduction of the new plan might be delayed and the present method of remuneration continued until there had been time to re-examine the minority interest in the light of actual figures. Within a few days the G.M.S. Committee announced its intention to begin a full investigation of the whole problem.

Upon the announcement of the Extraordinary General Meeting, the G.M.S. Committee called a Special Conference for the morning of the same day to reaffirm the approval of the Scheme which it had already given last summer and to receive a report in the general sense that an investigation is being held and that no action is needed in the meantime.

The normal Annual Meeting of the Conference will take place on June 17, and it is therefore impossible to justify the expenditure of more than £1,000 from trust funds in order to hold this Special Conference on May 5. Yet it is to be noted that the 300 delegates who approved the Scheme last summer will have their expenses paid for coming to London on the same day as the Extraordinary Meeting of the Association which has been summoned to criticize the plan.

Whatever may be the intrinsic rights and wrongs of the case, it is clear that this decision of the General Medical Services Committee to overshadow the Extraordinary General Meeting by holding a Special Conference on the same day has put the Committee completely in the wrong in the eyes of all impartial observers. It would, perhaps, be charitable to regard this ill-judged decision as a reaction of panic. In my view it is of a piece with the actions which led me to resign from the Committee last summer, and I regard it as the simple duty of every open-minded member of the Association to do his utmost to attend the Extraordinary General Meeting and see that the interests of minorities receive full and fair consideration.—I am, etc.,

Orpington.

A. C. E. BREACH.

SIR,—Although not connected in any way with the requisition for an Extraordinary General Meeting, I have considerable sympathy with the small-list practitioner. As a member of the Association's Finance Committee, however, I view with concern the unnecessary expenditure involved in calling such a meeting. Those who have read the Proceedings of Council (*Supplement*, March 28, p. 85) will have noted the statement by the solicitor to the effect that learned counsel have expressed the opinion that the resolution, if passed, would be ineffective for the reason that the Representative Body has reserved to itself the right of decision on matters of this nature. In such circumstances it would be a sheer waste of time and money to hold an extraordinary meeting.

A Special Conference of Local Medical Committees has been fixed for the morning of May 5, on the afternoon of which the Extraordinary General Meeting is scheduled to be held. The result of this will be that the latter meeting is likely to be attended *en masse* by the same delegates who endorsed the Working Party's Report, and the resolution will have as much chance of being carried as if it had been brought before the Conference itself. It is obvious, therefore, that the time, energy, and money of everybody concerned in these two meetings, as well as the funds of the Association, with which I am more particularly concerned at the moment, are about to be dissipated to no effectual purpose. I therefore appeal most strongly to the requisitionists to withdraw their requisition as quickly as possible.

Any practitioner presumably still retains the prerogative of making direct representations to the source of his remun-

eration, and if the small-list practitioners still consider, as I do, that they have an inherent and intrinsic legal right to as equally proportionate a share in the public moneys of the Central Pool as have their larger-list colleagues, without dependence on the charity of their brethren implicit in para. 19 of the Working Party's Report, the only thing to do is to go direct to the paymaster himself. The small-list practitioner is not likely to succeed in obtaining what he considers to be his rights until he explains his case, with facts and figures, to the Minister himself, and dispels any misconceptions which may be operating against him. It is plain that there is a difference of opinion between the small- and the large-list practitioner, and, as the matter is a financial one, independent arbitration ought to be sought.—I am, etc.,

Harrow.

J. B. WRATHALL ROWE.

SIR,—It is illogical for Dr. C. I. Schiff and three others (*Supplement*, April 4, p. 133) to object to a Conference of Local Medical Committees to be held on the same day as the Extraordinary General Meeting of the B.M.A. However well-named we may consider this meeting, it does, nevertheless, constitute an attempt by a minority to sabotage at the eleventh hour the Working Party's distribution scheme accepted so recently by the profession, and as such must be taken seriously. If the attempt should succeed the confusion and disruption which would ensue need no emphasis.

Partnerships made possible by the notional list are daily being arranged, and there can be few whose future plans are not based on the new distribution scheme. That the small-list practitioners are being badly advised is obvious. An essential first step in gaining support for their cause would have been to supply facts and figures as to the number of practitioners adversely affected and the degree to which they are suffering loss of income.

How many doctors are suffering *unavoidable* hardship? Alongside vague allegations of distress, the report of the Medical Practices Advisory Bureau in the same issue of the *Supplement* (p. 130) makes strange reading. Accounts are given of profitable partnerships going begging for lack of interested applicants. Can it be that it is now considered "degrading" even to be a junior partner, or is the prospect of hard work a deterrent? It appears likely that in many cases a small list with free time for other activities would be considered desirable, provided the loading of fees be adjusted to make it practicable.—I am, etc.,

London, E.2.

D. E. PEAKE.

SIR,—Although I am not in general practice I cannot refrain from commenting on the letter from Dr. Ivor Jones (*Supplement*, April 4, p. 133). Contrary to your correspondent's remark about an "overwhelming vote," I seem to have read a great number of highly critical letters from small-list men. Surely Dr. Jones does not believe that a minority should be ignored, and are there not two interpretations of the "unrepresentative opinion" which he seems to fear? That the alleged opinion of the majority is not representative of that of the minority appears to be shown by the calling of this Extraordinary General Meeting.—I am, etc.,

Radlett, Herts.

R. S. MURLEY.

SIR,—I am disturbed by a letter which I have received from Dr. W. M. Knox, writing as Chairman of the Conference of Local Medical Committees. I fear that he has rather let his enthusiasm run away with him, for it amounts to a special plea to local medical committees and their constituents to pack the Extraordinary General Meeting called for the afternoon of May 5 in order to defeat the object of those who called it.

I know nothing of those who requisitioned the Extraordinary General Meeting, except that they are B.M.A. members, and nothing about the rights or wrongs of their case. On the face of things, however, it appears that, hearing nothing of any efforts on their behalf on the part of the rider committee of the G.M.S. Committee, and fearing

that after April 1 they would be even worse off financially than they already were, they exercised their democratic rights as members of the B.M.A. in order to bring their plight to the notice of the Association.

At the Special Conference of June 26, 1952, the Working Party's report was approved almost unanimously after the addition of an important rider. The rider dealt with the case of the small-list men, and the report, with this addition, was approved, I think, because we all understood that nobody would be worse off because of it. This was what I understood at least. It is as certain as anything can be, I suppose, that on May 5 the Special Conference will reaffirm its approval of the Working Party's report and its rider, and if it is true that counsel has said that no resolution at the Extraordinary General Meeting on the same day can have any effect—why all these efforts to crush the minority who have called it? It is rather like employing a steam hammer to crush a gnat, and offends against one's sense of fair play.

If our position is a just one, then we have nothing to fear, and should be willing to do justice to this group and to those—if any—they represent. What is more important, it should be apparent to all that justice is being done, and that we are playing fair.

Therefore I think it is singularly unfortunate that the G.M.S. Committee should have called its Conference for the morning of May 5, and even more unfortunate that Dr. Knox—who as Chairman of the Conference ought to remain impartial—should have written his letter to the chairmen of local medical committees, for those two things will almost certainly be construed as an attempt on the part of the G.M.S. Committee to pack a General Meeting of the Association and prevent their case from being put by those who requisitioned it.—I am, etc.,

A. VICTOR RUSSELL,

Chairman,

Wolverhampton Local Medical Committee.

SIR,—As secretary of the Unestablished Practitioners Group Committee I am authorized by my committee to make known its views on the recent developments which closely affect unestablished practitioners. These views may be summarized as follows.

(1) The Working Party's recommendations will not solve the related problems of remuneration of general practitioners, entry into practice, and the assistantship system. We think that this view will be proved correct in the course of time. (2) Unorthodox methods, such as the calling of an Extraordinary General Meeting of the British Medical Association, should not be necessary to change the Working Party's recommendations. Changes should be brought about through the recognized machinery. (3) Nevertheless, it is justifiable to use any legal method in an attempt to correct the unfortunate error arising from the Working Party's recommendations—that some single-handed practitioners receive a smaller average capitation fee (and hence income) under the new distribution scheme than under the old one. This contradicts the terms of reference, and presumably the intention, of the Working Party. (4) The antagonisms in the profession should be reduced by immediately correcting this error so that no single-handed practitioner would receive an average capitation fee smaller than the present one—i.e., 20s. 3d. (5) If the Extraordinary General Meeting should lead to the continuation for all single-handed practitioners of an average capitation fee of not less than 20s. 3d. the "requisitionists" would have rendered the profession a great service. But changes in the Working Party's recommendations (as distinct from correcting the unfortunate error) should be brought about through the recognized machinery after the findings of the Ministerial investigation into the earnings of small-list of the General Medical Services Committee are known. (6) The General Medical Services Committee should not have called a Special Conference of Local Medical Committees for the morning of May 5, since the Extraordinary General Meeting of the British Medical Association is to be held in the afternoon of the same day. Supporters of the G.M.S. Committee (with expenses paid) present at the morning meeting will thus be available to attend the afternoon meeting. This will thus be available to attend the Extraordinary General Meeting and so increase the strength of the extremists on both sides, to the detriment of reason and compromise. (7) The partial autonomy of the G.M.S. Committee is a cause of recurrent disharmony; yet complete control by the B.M.A. is clearly not a

satisfactory solution for general practitioners who are not members of the B.M.A. The only satisfactory solution for all is for the G.M.S. Committee to become fully autonomous so that it can be free to represent all general practitioners not only officially and democratically, but also harmoniously.

As regards the immediate disharmony, the Unestablished Practitioners Group Committee hopes that the supporters of the G.M.S. Committee and the "requisitionists" will agree to a compromise. This should be the continuation of an average capitation fee of not less than 20s. 3d. for all single-handed practitioners; no delay in starting the new scheme; and reconsideration of the latter after the findings of the Ministerial inquiry are known.—I am, etc.,

London, N.W.6.

B. LANGLEY.

The Constitution of the B.M.A.

SIR,—The Winchester Division of the B.M.A. is to be congratulated on its enterprise in having circulated its memorandum on the Representative Body of the Association. It is to be hoped that this will stimulate a critical examination of our present organization, which to many doctors, I am sure, appears to be failing to deal with the many urgent problems which have arisen since 1948. It does seem that the Winchester Division's suggestions for reorganization perpetuate the fundamental weakness of the present body, in that the Division fails to allow for the fact that representation of sectional interests will continue to promote conflicts which have been, and still are, against the best interests of everybody concerned. The majority of doctors are members of a team in a National Health organization, their interests are mutually interdependent, and from the financial aspect are governed by limits strictly imposed by the Treasury.

Failure to recognize this fact is only too evident in the report of the proceedings of the Council Meeting of March 18 (*Supplement*, March 28, p. 85). The requisition for an Extraordinary General Meeting is a symptom of a problem which is of the utmost importance to every doctor. The teaching hospitals are full, and every year 1,000 extra doctors are registered. The country is, in fact, over-doctored. The present interests of small-list doctors can only be satisfied by an increase in payment, which means that established practitioners' incomes must be reduced. In a few years' time there will be a further accumulation of under-privileged doctors, to whom the same remedy will, no doubt, be applied. Mr. Lawrence Abel, speaking in the Council, presumably had this solution in mind. The 600 registrars due to be "on the market" very soon will, when added to the small-list doctors, also receive his sympathetic blessing. Later in the meeting, speaking for the consultants, he did not suggest that these registrars might be given consultant status, if established consultants would agree to a reduction in income.

Surely, if sacrifices are to be made, then they should be made by everybody. This current example of procrastination by the Council is due to a failure to recognize and tackle basic problems, and, because of the system of sectional representation, to offer the now familiar solution of blatantly playing off the interests of one section of the profession against another.—I am, etc.,

Sittingbourne, Kent.

K. W. HARDY.

The Small-list Doctor

SIR,—Poor Dr. Gordon Ward (*Supplement*, April 4, p. 133)—he never had a private patient to subsidize the vast amount of "unpaid work." Sevenoaks is or was, I believe, a salubrious area. Now, at 68, he might suffer a loss of £100 a year. He could of course retire, draw his compensation, and make way for a young man who would have the health and strength to increase the list by hard work, much as I imagine Dr. Ward did many years ago.—I am, etc.,

Writtle, Essex.

J. TUDOR PEMBLETON.

Association Notices

COUNCIL OF THE B.M.A.

Election of 40 Members by Grouped Branches in the British Isles, of 2 Public Health Service Members, and of 1 Woman Member

The following have been elected unopposed for the session 1953-4:

North of England and Tees-side Branches:

J. C. Arthur, Gateshead.
Weldon P. T. Watts, Newcastle-upon-Tyne.
L. Dougal Callander, Doncaster.
W. E. Dornan, Sheffield.
Ian G. Innes, Hull.
F. M. Rose, Preston.

East Yorkshire and Yorkshire Branches:

North Lancashire and Westmorland Branch:

Divisions in Cheshire—Birkenhead and Wirral; Chester; Crewe; Hyde; Macclesfield and East Cheshire; Mid-Cheshire; Stockport; Wallasey:

Lancashire Divisions of Merseyside Branch—Liverpool; St. Helens; Southport; Warrington; Isle of Man Branch:

Lancashire Divisions of South Lancashire and East Cheshire Branch—Ashton-under-Lyne; Bolton; Bury; Leigh; Manchester; Oldham; Rochdale; Salford; Wigan:

Derbyshire, Nottinghamshire, Lincolnshire, and Leicester and Rutland Branches:

Midland Branch:

Staffordshire and Worcester and Hereford Branches:

Berks, Bucks, and Oxford and Northamptonshire Branches:

Cambs and Hunts, Norfolk, and Suffolk Branches:

Divisions of Metropolitan Counties Branch in Middlesex:

Marble Division:

Tower Hamlets, City, Stratford, and South-West Essex Divisions:

Kensington and Hammer-smith, Paddington, and Chelsea and Fulham Divisions:

Camberwell, Greenwich and Deptford, Lambeth and Southwark, Lewisham, Woolwich, and Wandsworth Divisions:

Hertfordshire, Essex, and Bedfordshire Branches:

Kent Branch:

Sussex Branch:

Southern and Dorset and West Hants Branches:

South-Western Branch:

North Wales and Shropshire and Mid-Wales Branches:

Aberdeen, Dundee, Northern Counties of Scotland, and Perth Branches:

Edinburgh and South-East of Scotland and Fife Branches:

Glasgow and West of Scotland Branch (Glasgow Division):

Glasgow and West of Scotland Branch (County Divisions):

Border Counties, and Stirling Branches:

Northern Ireland Branch:

The following candidates have been nominated:

Hampstead, St. Pancras, and Westminster and Holborn Divisions (one seat):
Surrey Branch (two seats):

J. A. Gorsky, S.W.1.
F. Gray, W.C.1.
L. A. Gibbons, Reigate.
T. W. Morgan, New Malden.
J. O. M. Rees, Guildford.
H. G. Dowler, Churchdown, Glos.

Bath, Bristol, and Somerset, Gloucestershire, and Wiltshire Branches (two seats):

H. M. Golding, Westbury-on-Trym.
J. R. Nicholson-Lailey, Taunton.
T. W. Davies, Swansea.
J. T. Rice Edwards, Newport, Mon.

South Wales and Monmouthshire Branch (one seat):

Voting papers will be issued to the members of these Groups on April 25, 1953.

Public Health Service

The following have been elected unopposed:
Kenneth Cowan (Chelmsford), *J. M. Gibson (Huddersfield). (*Since the last date for the receipt of nominations Dr. Gibson has resigned, and the vacancy thus created will be filled by the Chairman of the Representative Body under By-law 63(2). A further announcement will be made in due course.)

Woman Member

Annis Gillie, London, W.2, has been elected unopposed.
A. MACRAE, Secretary.

Diary of Central Meetings

APRIL

20 Mon. Adoption Committee, 10 a.m.
20 Mon. Armed Forces Committee, 2 p.m.
21 Tues. Grants Subcommittee, Organization Committee, 2 p.m.
22 Wed. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
22 Wed. Compensation and Superannuation Committee, 2 p.m.
23 Thurs. Journal Committee, 11 a.m.
23 Thurs. Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, London, W.C.1), 2 p.m.
29 Wed. General Practice Review Committee, 11 a.m.

Branch and Division Meetings to be Held

BIRMINGHAM BRANCH.—At 154, Great Charles Street, Birmingham, Tuesday, April 21, 8.30 p.m., meeting. B.M.A. Lecture by Mr. Denis J. Browne: "The Early Diagnosis and Treatment of Congenital Deformities."
BROMLEY DIVISION.—At Royal Bell Hotel, Bromley, Tuesday, April 21, 8.45 p.m., meeting. Consideration of Annual Report of Council and election and instruction of representatives for A.R.M.
BURTON-ON-TRENT DIVISION.—At the General Infirmary, Burton, Tuesday, April 21, 8 p.m., meeting. Dr. G. Ramage: "The Atom Bomb and its Effects."
CITY DIVISION.—At B.M.A. House, Tavistock Square, W.C., Tuesday, April 21, 8.30 p.m., meeting. Scientific and medical films.
CROYDON DIVISION.—At Greyhound Hotel, High St., Croydon, Thursday, April 23, 7.30 for 8 p.m., jubilee dinner and dance.
EAST HERTS DIVISION.—At Haymeads Hospital, Bishop's Stortford, Thursday, April 23, 8 p.m., clinical meeting.
LINCOLN DIVISION.—At the Saracen's Head Hotel, Lincoln, Thursday, April 23, 7.30 for 8 p.m., seventh annual dinner.
MARLBOROUGH DIVISION.—At Medical Society of London, 11, Chandos Street, W., Thursday, April 23, 8.30 p.m., A.G.M.
NORTH WALES BRANCH.—At Wynnstay Hotel, Wrexham, Saturday, April 25, 3.30 p.m., meeting. Short papers by Dr. D. E. Meredith: "Constrictive Pericarditis"; Mr. O. V. Jones: "Current Trends in Obstetrics and Gynaecology"; Mr. J. Rowland Hughes: "Sprained Ankle."
OLDHAM DIVISION.—At Oldham Hotel, Monday, April 20, 9 p.m., meeting. Mr. D. Lloyd Griffiths: "Sciatica."
ROCHESTER, CHATHAM, AND GILLINGHAM DIVISION.—At St. Bartholomew's Hospital, Rochester, Thursday, April 23, 8.30 p.m., meeting. Film show. All medical practitioners in the area of the Division are invited.
SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Tuesday, April 21, 8.30 p.m., meeting of all medical practitioners in the area of the Division, followed by A.G.M.
SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Friday, April 24, 9 p.m., clinical meeting. Symposium: "Some Aspects of Renal Failure."
STRAFORD DIVISION.—Thursday, April 23, 1.45 p.m., combined meeting of the Stratford Division and Ilford Medical Society. Visit to Ford Motor Works, Dagenham.
TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Wednesday, April 22, 8.30 p.m., annual general meeting.

THE JUBILEE OF THE REPRESENTATIVE MEETING

BY

ALFRED COX, O.B.E., Hon. M.A. Durham
Hon. LL.D. Manitoba, M.B., B.S.

Fifty years ago there was a revolution in the constitution of the B.M.A. It was on July 9, 1902, that the new Articles which embodied the result of the revolution came into force. But the most striking manifestation of the change was not seen until July 28, 1903, when the first Annual Representative Meeting was held at Swansea. This seems to me an obvious event for celebration, and I propose to try to recall the memory of what to my generation was a very stirring time and an epoch in the Association's history.

Growing Despair

To appreciate fully its significance it is necessary to recall the history of the Association during the closing years of the century. Anyone reading our *Journal* of those years could not fail to be struck by the growing despair, resentment, and even desperation of a large section of our profession caused by the shocking abuses of contract medical practice, and the indifference or helplessness of the ruling body of the Association—its Council. It must seem almost incredible to those only knowing the Association as it now is, but I have no hesitation in saying that few of those suffering these grievances believed that any help could come from the Association. Anybody having any doubt as to the reality of the grievances should read the classic Report on Contract Practice in the *Journal* of July 22, 1905. There were few numbers of the *Journal* in the years 1895 to 1900 which did not contain some protests in the correspondence columns against official inaction.

The *Lancet*, more alive to the situation, employed a special commissioner, who visited many parts of the country in which the abuse was most acute, and his reports were reprinted in two volumes entitled *The Battle of the Clubs*.

Why did the Association take no action? The real reason was that it was unable to do anything effective because under its constitution it had no means of voicing the opinion either of the profession as a whole or even of its own members, and no machinery by which it could have organized effective resistance.

At this period it was possible to be a member of the Association without being a member of a Branch, and Divisions had not been thought of. The subscription to the Association was a guinea a year, and to become a member

of a Branch involved special election and an annual payment of 5s. The Branches elected the members of Council, which was the Association's only policy-making and executive organ. Forty per cent. of the members of the Association were unattached to any Branch. It was true that the unattached member could attend the Annual General Meeting and could raise any question relevant to the Report of Council, but the Council held that it was not bound by any resolution of such a meeting, and indeed it would have been absurd if it had been so bound by a meeting the composition of which largely depended on the area in which it was held. In these circumstances it was not surprising that the men suffering from grievances and seeing no prospect of help from the B.M.A. began to look elsewhere. Local societies devoted to medical politics and ethics sprang up in many areas, chiefly industrial, and in the *British Medical Journal* of September 16, 1899, there appeared a letter which became of historical importance. It was signed by Samuel Crawshaw, of Ashton-under-Lyne, acting on behalf of the Manchester Medical Guild. It announced the holding of a Conference of "delegates from all associations of general practitioners in England and Wales." It proposed that this Conference should elect an executive to carry out its wishes, and went on, "The various medical papers contain abundant evidence of the evils under which the general practitioner suffers. It is absolutely necessary that we stand together to resist aggression effectually." There was no suggestion that the B.M.A. would serve the purpose, and in reply to a suggestion that it was a mistake to multiply organizations Dr. Crawshaw said that the Guild had discussed this point and "came to the conclusion that it would be a very long business, if it ever succeeded, to get the B.M.A. to take up these questions. They wanted something complementary to the B.M.A."

The Conference of 1900

The Conference was held in Manchester on May 1-3, 1900. There were present 35 delegates from local associations, 5 from Branches of the B.M.A., and Dr. Samuel Woodcock from the Council of the Association. Papers on various medico-political and ethical subjects were read and discussed on the first two days, but the vital issue of organization came up on the third day and was hotly debated. Dr. Crawshaw proposed that a confederation of local medical societies formed for medico-political and ethical purposes should be set up "with an executive council elected by an annual meeting of delegates." In the discussion that followed there was much criticism of the B.M.A. even by prominent members of it, including Mr. (later Sir) Victor Horsley. It

is a source of pride to me that on behalf of the Gateshead Medical Society, of which I was a founder and honorary secretary, I succeeded in carrying an amendment to the effect that, for reasons given, "an attempt should be made to capture the B.M.A." This was carried eventually by a good majority. It is not without its ironic aspect that Smith Whitaker, of Great Yarmouth, who became the first Medical Secretary of the B.M.A., opposed me, saying that "he could not hope that the Association would ever reform itself." The minority did not conceal their belief that the appeal to the B.M.A. would fail, and in appointing a committee to approach the Council it was agreed that we might approach other bodies and the *Lancet* if the B.M.A. failed to respond. It is, I think, due to the *Lancet* to put on record a fact that I believe has never been published before. A few of us did unofficially sound Dr. (later Sir) Squire Sprigge, then Editor, who strongly advised us to concentrate on converting the B.M.A., which already had a national organization, whereas the *Lancet*, though very sympathetic, had none. We could come back again, he said, if we failed with the B.M.A.

But we did not fail. On the contrary, when our committee met the Council at the Ipswich Annual Meeting in July, 1900, we were received with cordiality. Our case was put by Victor Horsley, who, though never a general practitioner, had been chosen by the Manchester Conference to lead our deputation, composed, with the exception of himself, entirely of general practitioners. The way had been made easier for him because since the Conference the Council, feeling that something must be done, had brought forward a scheme of reform which strengthened the influence of the Branches but did nothing to enfranchise the "unattached" members or to make the voice of the members effective in the Annual General Meeting. This scheme had been very decisively turned down at a Special General Meeting on July 18, 1900, and the Council was in a chastened mood. It welcomed Horsley's proposal that the Council should appoint a Committee to report on the best means of reorganizing the Association, to report not later than March 1, 1901. The Constitution Committee of 24 was thoroughly representative, half being appointed by the Council and half by the Annual General Meeting, in which on this occasion we took pains to secure that there should be a considerable number of our supporters. I shall not enter into much detail about either the personnel or the findings of the Constitution Committee, for this was most thoroughly done by Dr. J. C. McVail, a member of it, in articles which appeared in the *booklet* now not easy to come by, but which is in the B.M.A. Library. To my memory is greatly indebted. It is, however, due to the memory of several fine characters them briefly. There were Mr. (later Sir) Henry Butlin, later Treasurer of the Association and President in 1910; Professor Robert Saundby, of Birmingham, later Chairman of Council and President in 1911; T. Jenner Verrall, first chair-Representative Body, 1913-15, also chairman of the Medical War Committee, 1914-18, and knighted for his service; a high official in the National Health Insurance Commission, partly because he was a very popular man and partly because he confessed he was totally ignorant both of medical politics and of the constitution of the B.M.A., but "was willing to learn." There is no doubt he had a great deal to do with the enthusiastic reception of our Report at Cheltenham in 1901.

I have had a long experience of committees in my time, but I remember none which worked more rapidly, more efficiently, or more pleasantly. We had on the Committee several senior members of the Council with conservative views, but to a man we worked together, ready to compromise when it was really necessary, but determined to produce a constitution which would put new life into the Association. In the event its report was adopted almost

without alteration, and the suggested constitution still stands unaltered in its main principles. Moreover, it was so framed that it has been found easy to incorporate in it the changes inevitable in a steadily growing and increasingly active body.

Horsley and Smith Whitaker

The main reason which has impelled me—the only survivor of the Committee—to write this account is to do what I can to honour the memory of the two men who took by far the lion's share in making our constitution what it is. They were Horsley and Smith Whitaker. Smith Whitaker was the man who came to the Committee with carefully thought out principles and the ability to state and uphold them. Horsley was the great motive force behind Smith Whitaker. The pair were irresistible. Horsley had an inter-axe to grind, and, though unpopular in certain quarters for his radicalism, his leadership was spontaneously accepted. Smith Whitaker was unknown outside Great Yarmouth, where he practised until he came to Manchester. There he made an instant impression as a thoughtful and constructive speaker. On the Constitution Committee he showed a positive genius as a draughtsman, and, as Mr. Owen said at the Cheltenham Annual Meeting, "Whitaker penned every line of the report." He had not been easy to persuade that the B.M.A. could be captured, but the appointment of the Constitution Committee convinced him that the way was open, and he threw himself heart and soul into the constructive work required. He was so obviously the man to first as Organizing Secretary, later as Medical Secretary, was inevitable.

My own opinion, looking back on this episode and linking it up with the history of the Association before and since, is that the work of Horsley and Smith Whitaker was of such importance that the Association owes them a debt of gratitude second only to that due to our Founder. This is a bold claim, but to show that I am not alone in my estimate of the outstanding importance of these men let me quote what Owen said of them in his brilliant speech when he presented the Report of the Committee at Cheltenham. Of Smith Whitaker he said, "In him we found an extraordinary man. He was splendid in debate; he knew the Articles and By-laws and Company Law, but he did not thrust his knowledge on the Committee. Whitaker was the sort of man of whom martyrs are made—he would willingly have gone to the stake for his principles. But Horsley would not have gone to the stake: with his extraordinary ability and dialectical skill he would have turned the tables on his accusers and would have had the mournful satisfaction of fixing them to the stake they had prepared for him." It is a pleasure to me to report that Dr. Donald Whitaker, a son of my old friend and chief, has been an active worker in the Guildford Division for many years and was for nine years a member of the Representative Body. He may well feel proud of his father's record.

Report of the Constitution Committee

Before our Report came before the Annual Meeting it had to run the gauntlet of the Branches, where it was generally approved. My readers will not be surprised to hear that so far as can be gathered from the reports of local meetings this epoch-making document did not succeed in attracting large audiences. But the Cheltenham Annual Meeting of 1901 gave it a hearty send-off and appointed a committee of 13 (of which I am again the only survivor) to translate the Report into Articles and By-laws—a stiff job in the *Journal* of May 24, 1902, and at an Extraordinary General Meeting held in the Exeter Hall, London, on June 18, 1902, the scheme was formally approved. But it was a near thing, for at the first of the two meetings required by a by-law a two-thirds majority was needed and the voting was 96 to 28. If the minority had been 33 . . . !

The scene once more returns to the periphery, where the Branches had to be split up into Divisions and, what was

of equal importance, men had to be found to act as secretaries for the new bodies. This was a very strenuous business, but enthusiasm for the new constitution was growing, as was the membership of the Association. A cheering sign came from the sceptical Crawshaw, who wrote to the *Journal*: "If the constitution is adopted I am convinced that the Association will enter upon a period of prosperity and usefulness such as it has never before enjoyed." The work at the periphery was greatly stimulated by the appointment of Smith Whitaker as Organizing Secretary in charge of the new Organization, Medico-Political, and Ethical Committees; and a significant sign of the times was the appearance of the first *Supplement* to the *Journal* of February 7, 1903, devoted to medico-political and cognate subjects.

In the *Supplement* of April 25, 1903, appeared the first notices of motions for the new Representative Meeting. There were two from the Council proposing small changes in the new By-laws; one from the Southern Branch proposing a new method of election of members; one from Edinburgh supported by Dundee for the establishment of a Scottish Committee. The Leinster Branch asked for improvements in the Irish Poor Law Medical Service. The Gateshead Division proposed (1) that the Medico-Political and Ethical Committees be instructed to prepare a report on contract practice, and (2) that the services of the Organizing Secretary be placed at the disposal of any Division needing help in local negotiations.

The Great Day

So we come to the great day when the new constitution was to be put to a crucial test, for both friends and opponents of the new order of things felt that it stood or fell by the success or failure of the new "Parliament of the profession." Would it spend its time in futile discussions leading nowhere? Would it get the Association to do something to satisfy the sorely tried and still sceptical industrial practitioners?

The great day was Tuesday, July 28, 1903, and the place was the King's Hall, Swansea. It is interesting to note that the date was a jubilee for Swansea, for the only previous Annual Meeting held there was in 1853. There were no indications that anything revolutionary was happening. The new Representative Meeting was not the "cynosure of all eyes." As a matter of fact it had to fit its sessions rather uncomfortably into the time-honoured Annual Meeting arrangements. But we were on the whole a young and enthusiastic body which felt it was taking part in a historic occasion. There were 133 of us. Mr. Andrew Clark, Chairman of Council, always a firm believer in the new era, took the chair temporarily. Dr. William Douglas, a handsome and eloquent Ulsterman representing Maidstone, Rochester, and Chatham, moved that Sir Victor Horsley be appointed Chairman, and I seconded. Horsley, always a stickler for strict order, said the meeting must first decide if he was eligible. The secretary of his Division (Marylebone) had informed him that he had been elected as one of its representatives but had failed to notify headquarters, so that his election could be valid only if carried by a two-thirds majority. A unanimous vote convinced him, and in taking the chair he said it was no exaggeration to say that his election was the highest honour the profession, most kind to him on many an occasion, had ever conferred on him. This was no exaggeration, as it came from a man not given to superlatives, and who always regarded the piloting of the new constitution as one of the great achievements of his life.

So far as I can ascertain there are only two or three surviving members beside myself who were present at that meeting. One of them is R. L. Langdon-Down, who represented Richmond. A. E. Larking, representing Folkestone, Dover, and Ashford, died last year. Larking was an enthusiastic worker for the Association before and after the change, first in Buckingham and later in Kent. Langdon-Down's record in the Association is a long and brilliant one, in the Representative Meeting, the Council, and on

many committees. I feel sure the Jubilee Meeting will wish to assure him that his pioneer work has not been forgotten.

We spent much time on the Standing Orders, over which the Organization Committee, under the chairmanship of Mr. Jenner Verrall, had worked very hard. The proposals for a Scottish Committee and for a Report on Contract Practice were carried with no opposition. A proposal of mine that the Association should sponsor candidates for the General Medical Council was opposed by Manchester, who thought it "might lead to cliquism and practically to holding an amateur election beforehand." It was eventually referred to the Medico-Political Committee for report. We turned down a request that the Press should be admitted (the modern craving for publicity had hardly begun). I suppose it was because of this that no report of our proceedings appeared in the *Lancet*, though it gave generous space to other sections of the Annual Meeting. Our *Journal*, of course, gave us a good report, and in its editorial comment said, "The first Representative Meeting may be pronounced a distinct success owing to the manner in which the members devoted themselves to business, and owing in a very large degree to the conspicuous ability with which Sir Victor Horsley conducted its proceedings." And in a later comment said, "All the representatives appeared to be fully conscious of the responsible nature of the duties they had undertaken; the attendance was good, the speeches for the most part short, and the whole tone businesslike." Referring to the long time taken over the Standing Orders the *Journal* said, "These seemed to work very well, and future meetings will probably be disposed to adopt them as they now stand." They seem to me to be remarkably little altered.

One of these Standing Orders in 1905 produced a humorous situation. It lays down that there shall be no smoking during the meeting. This was introduced by Blackburn and was carried by only a small majority after a heated discussion. Within an hour or so the suspension of this Standing Order was carried with great enthusiasm. I believe it still stands, but very insecurely.

These comments by our then editor, Dawson Williams, have all the more value as they came from one who had been doubtful about the new regime. His conversion was heartily welcomed by the "reformers," for Williams was a great force in the Association.

Creating a Precedent

The emphasis on the importance of a narrow time limit for speeches was largely due to Horsley, who, always with an eye on Parliamentary procedure, insisted that in this respect we should create our own precedent. I believe that nothing has more forcibly struck the Press and the occasional lay observer than the way in which speakers have shown that it is possible to combine information and brevity. The meeting has always been indulgent to speakers dealing with a subject of such importance that the time limit was obviously a hindrance to a proper discussion. But it has never had any use for the speaker who doesn't know his brief or who has nothing particular to say but feels he must say it.

I cannot find any record of a speech by Dr. Langdon-Down at that first meeting, but he tells me that, though somewhat awed by the atmosphere of the meeting, he did eventually venture timidly to say something. Dr. Larking made a vigorous speech supporting the action of the Council in making a grant to the Imperial Vaccination League, and he had the satisfaction of seeing the objectors heavily defeated.

Among the Representatives and Members of Council were several who afterwards held prominent positions in the Association. For example, Sir Hamilton Ballance, of Norwich, later Chairman of the meeting; T. W. H. Garstang, of Altrincham, later Chairman of the meeting; N. Bishop Harman, later Treasurer, Benefactor, and Gold Medallist; William Collier, President at Oxford in 1904; J. A. Mac-

donald, of Taunton, later Chairman of the meeting and of the Council, and a Gold Medallist; Jenner Verrall, of Brighton, later Chairman of the meeting and Gold Medallist; and Professor Robert Saundby, President at Birmingham in 1911.

I am not writing a history of the Representative Body. That, up to the year 1931, is succinctly dealt with in the *History of the British Medical Association*, published in 1932—a book which I am afraid is little known to the present generation but is invaluable to anyone interested in the evolution of the Association. We owe a great debt of gratitude to Mr. Muirhead Little, F.R.C.S., the author of it. Those who are interested in these reminiscences will find in the *History* the portraits of many of the eminent men I have mentioned. It is, however, useful to put on record what informed critics have said about the new constitution and the part played in it by the Representative Meeting. The *Lancet* in reporting the Annual Meeting at Leicester in 1905 said, "A glance at the meeting of representatives in the hall, the floor of which was covered with small tables at which were seated some 150 representatives—all apparently fully absorbed in the business in hand—furnished a striking contrast between the present-day method of conducting the business of the Association and that which formerly prevailed. The new constitution has evolved order out of chaos, and it is no longer possible for the clamorous minority to vote over the heads of the less assertive majority."

Tributes

The following extract from a report made to the Shropshire and Mid-Wales Branch by its representative in 1905 is a striking testimony to the value of the meeting by a highly respected senior member of the profession, Dr. H. Willoughby Gardner. He wrote: "I must confess I went to my first meeting feeling but a lukewarm interest in it all and very doubtful whether any practical good would come out of it. To my surprise I found myself among a set of men who were all keen, all enthusiastic, all evidently believing in their mission, and all intent to do their work to the utmost of their ability. Soon I found that I too was becoming infected with the same spirit. You may ask me what will be its future? Will it be helpful to us as a profession? Will it ever have any real power? Much will depend on the class of men sent up as representatives. Much, too, will depend on future chairmen and officials. . . . In time, such a meeting must attain great influence."

But the most striking tribute to the new constitution and its legislative organ the Representative Meeting appeared in an article on "Professional Organization" in the special Supplement of *The New Statesman* of April 21, 1917. It was written by Mrs. Sidney Webb. By common consent Mrs. Webb and her husband were the greatest authorities on Labour and Professional Organization in this or perhaps in any country. Praise from this quarter was praise indeed. "The B.M.A. is, alike in its constitution and in its functions, one of the most highly developed and the most efficient of all the British Professional Organizations. . . . The oldest part of the constitution, the Annual General Meeting, was until 1902 the supreme organ of government. But in that year a complicated constitution was adopted including all the devices of advanced Democracy. . . . The strength of the B.M.A., compared with all other voluntary associations of medical men, lies not only in its great traditions, but also in its status as a scientific and technical Society controlling a powerful journal and organizing a popular Annual Conference, at which science and social intercourse are happily combined."

I well remember that when I was Medical Secretary of the Association I was invited by the Webbs to their home on the Embankment to meet a group of Labour leaders. I was introduced to them by Mrs. Webb as "the Secretary of the strongest Trade Union in the country." I tried to explain that, while I had no objection to the reference to our strength, there were important ways in which we

differed from trade unions. But Mrs. Webb brushed this aside and told the Labour men that the advantage we had over them was that we had been clever enough to see the great benefit of combining in one body our scientific activities and our duties to the public with our duty to protect the legitimate interest of our profession.

Impressions of Early Meetings

Among my sharpest impressions of early meetings are those connected with Horsley and the Chair. At the end of his second year he was induced with great difficulty to stand again. He was strongly in favour of a fixed term of office for all high offices. When he did retire in 1906 he said: "It was the custom of our fathers to date everything from Waterloo—Cheltenham was our Waterloo. Before Cheltenham the Association presented to the State its scientific side. Since, they had proved their right to take a part in the socio-political life of the Empire." The episode of the proposed presentation to him when he left the Chair throws a light on his character which shows a man whose actions were difficult at times to predict and whom it was impossible to move when he had made up his mind.

A considerable sum of money had been collected by Dr. W. Douglas and a handsome piece of plate bought before Horsley heard of it. He at once informed Douglas that he could not accept a presentation, much as he valued the feeling which inspired it. First, he said, he had already been thanked very generously, and secondly he had all his life held the view that personal presentations should not be made for public work, except by the State. "Work, whether political or scientific, if done in the interests of the profession, brings with it not only the satisfaction of having contributed to social progress but also earns constantly recurring grateful acknowledgment from those who happen more directly to benefit by what has been attained."

This attitude, which no amount of pressure could alter, was very disconcerting to Douglas and his colleagues, and I happen to know that he was personally out of pocket over the transaction with the makers of the plate.

Looking Backward

Looking back over nearly 50 years of the Representative Meeting (from the gallery since 1932), it seems to me that "plus ça change, plus c'est la même chose." I fancy that if I came back in another 50 years (when I should certainly want to see how it was getting on) I should still find it discussing capitation fees—or probably by that time Civil Service salaries—for it is an axiom that these are not, never were, nor ever will be adequate. I should expect to find that the voice of the rural practitioner was still loud in the land. And that will-o'-the-wisp trade union powers would, I feel sure, duly turn up. I have seen it debated and scotched (and I had hoped killed) at least three times.

A memorable incident in the history of the Representative Meeting was the visit paid to it by the Chancellor of the Exchequer, Mr. Lloyd George, on Thursday, June 1, 1911, when a special meeting was held in the Examination Hall of the Royal Colleges to discuss the National Health Insurance Bill, of which the Chancellor was in charge.

On the previous day it had been proposed to send a deputation to the Minister with a series of questions, but he said he would prefer to come to us—"not to make a speech but to hear what we had to say." It took him two and a half columns of the *British Medical Journal* to tell us this, but it was very good listening, as were his answers to the questions read out to him by the Chairman, Dr. (now Sir) Ewen Maclean. The proceedings were quite cordial, but the *Journal* in commenting on them said, "The self-restraint which the meeting imposed on itself even when it most strongly dissented from the Chancellor's remarks was a proof of its politeness but not of its being 'nobbled,' as some had suggested it would be." Following this meeting the Association issued its national

One of the most exciting things I remember in connexion with the Representative Meeting occurred at the Edinburgh meeting of 1927. Incidentally Dr. Ewen Maclean, who was there installed as President Elect, in returning thanks said it was the first time this honour had fallen to the lot of a former Chairman of the R.M. The same distinction has since fallen to Sir Henry Souttar, who was President in 1944-5.

The exciting event was the presentation by Dr. (later Sir) Robert Bolam, Chairman of Council, of the costly and ambitious scheme for the extension of B.M.A. House. The House had been opened by King George V in 1925, and many people thought the new scheme was very rash, financially speaking. However, Bolam, a very astute business man, with the cordial support of Bishop Harman, the Treasurer, and Brackenbury, Chairman of the meeting, managed to persuade a somewhat reluctant Council to advocate a scheme calculated to occupy some years to complete and to need a great deal of borrowed money. Many prophesied that the R.M. would turn it down, and there was a certain amount of betting on the prospect. Bolam arrived equipped with lantern slides of the existing building and sketches of the proposed extension and completely swept the meeting off its feet. The scheme was adopted in a scene of enthusiasm that I have never seen surpassed in my experience of the Representative Meeting. If the orator of the day could come back to the scene of his planning he would find that his prophecies about the financial side of the scheme had been amply fulfilled.

Outstanding Men

I think this sketch of the inception and influence of the R.M. might fittingly end with an annotated list of its Chairmen. It contains the names of many men outstanding for service inside the Association and some known far outside it. Of the first, Sir Victor Horsley, it only remains to say that he was a member of the meeting until 1912; on July 16, 1916, he died on active service in Mesopotamia. His successor, J. A. Macdonald, was a general practitioner in Taunton. He with Ewen Maclean led the Association side in the National Health Insurance struggle, 1910-13, became Chairman of Council, and was awarded our Gold Medal. Hamilton Ballance, who followed, was a surgeon of Northwich, played a conspicuous part in the 1914-18 war, and was knighted. Next came Ewen Maclean, a gynaecologist of Cardiff, President of the Association in 1928. Jenner Verrall, a surgeon of Brighton, was chairman of the first mittee work in the Association, 1914-18, and was Central Medical War Committee, 1914-18, and was knighted. He was awarded the Gold Medal of the Association. E. B. Turner was a general practitioner in London, and his many years of service to the Association are commemorated by the clock which faces our courtyard.

T. W. H. Garstang, of Altrincham, was the only whole-time M.O.H. who has filled the chair. R. W. Wallace Henry, of Leicester, an ophthalmic surgeon, served the Association in many ways and was a pioneer in the Public Medical Service movement. Henry Brackenbury was a general practitioner of Hornsey. He made a great reputation as a citizen and in the educational world, was also Chairman of Council, was knighted, and awarded our Gold Medal. Charles Oliver Hawthorne was a London physician, a highly appreciated orator; he served on many committees, and was awarded the Gold Medal. E. Kaye Le Fleming was a general practitioner of Wimborne; he became Chairman of Council, was knighted, and awarded the Gold Medal. He was succeeded by Henry S. Souttar, a surgeon of London Hospital, who became Chairman of Council, and was President of the Association in 1944-5, and was knighted. His successor was Harry Guy Dain, a general practitioner of Birmingham, who was later Chairman of Council and was awarded the Gold Medal.

Peter Macdonald is an ophthalmic surgeon of York, and in addition to service on many committees was Chairman of

the Services Committee, which was the 1939-45 lineal successor to the Medical War Committee of the 1914-18 war.

He was followed by J. B. Miller—a general practitioner of Bishopbriggs, Lanark, and the only Scot who has held the office and whose residence is still in Scotland. E. A. Gregg, the next Chairman, is a London general practitioner who held office for only one year, having been appointed Chairman of Council, and has been awarded the Gold Medal. J. A. Brown and S. Wand, both general practitioners in Birmingham, are the two most recent holders of the post.

What the R.M. has Done

If I am asked, "Has the R.M. done what you reformers of 1900 expected of it?" my answer is emphatically, "Yes." Not only has it nobly performed its function as the policy-making body of the B.M.A., but it has made itself into the nearest possible approach to a Parliament of the medical profession. Not only is it so regarded by our profession, but our Association, of which it is such a conspicuous element, has been accepted by successive Governments as the body to be consulted in all matters in which doctors are concerned. The meeting has, of course, made mistakes—a bad one in 1912 when on the eve of the beginning of National Health Insurance it declared the scheme to be "derogatory" and said that the profession would not work it. Within a month it had to eat its own words. On that occasion I think it was misled by demagogue speeches and obstinate refusal to face facts. I remember no other similar episode. There have been times when it looked as if encroachments were being made on its claim to be the sole legislative body of the Association. One such occasion was when the National Health Insurance Committee was set up with apparently autonomous powers and with an Annual Conference to which its policy and actions had to be submitted. Many feared that this would undermine the supremacy of the R.M. I did not think so, and held that, the composition of the Committee being what it was—dominated by loyal B.M.A. members, many of whom were Representatives and with no other body in sight with a membership and prestige comparable to that of the B.M.A.—the Association could safely take what risk there was. As a matter of fact, there was never any clash between the Panel Conference and the R.M.

The same problem arises at the present time with the creation of the General Medical Services Committee and the Central Consultants and Specialists Committee. Theoretically they are autonomous and their relation to the R.M. is as indefinite as was that of the N.H.I. Committee. The situation needs and no doubt will receive careful watching, but I see no reason why these bodies should want to run counter to the policy of the Association which created and finances them. Just as the old N.H.I. Committee realized that its influence depended very largely on the fact that it was part of the machinery of the Association, so I believe will its successors increasingly realize. I speak with reserve, of course, as I have no responsibility now and no intimate contact, but the situation seems to me to be no more dangerous than it was in 1914—in fact, less so, because the numbers of consultants and specialists who are taking an active part in the administration of the Association steadily increases.

As an interested onlooker I cannot help feeling that the R.M. is becoming rather unwieldy. In a recent view of it from the gallery at B.M.A. House I found myself to be the only non-Representative among some thirty Representatives, who from their remote position were unable to take their full share in the proceedings. One way in which this could be remedied and at the same time save the funds of the Association would be to curtail the number of Representatives. I know I am treading on delicate ground, but this seems to me the obvious solution. It would be a pity if it were found necessary to seek accommodation elsewhere when meetings were to be held in

The subject was referred for more considered discussion at the next meeting.

HARDSHIP PAYMENTS TO GENERAL PRACTITIONERS

IMPLEMENTATION OF WORKING PARTY'S RECOMMENDATION

A letter (E.C.L. 27/53) has been sent from the Ministry to all executive councils setting out the arrangements for putting into effect paragraph 19 of the report of the Working Party. This paragraph recommends that a sum of money should be set aside to deal with cases of hardship which might arise under the new distribution scheme, particularly among elderly practitioners who previously received fixed annual payments.

Payments to Elderly Practitioners

It is recognized that elderly single-handed practitioners with small lists are less likely than younger doctors to be in a position to benefit from the incentive now to be given to the formation of partnerships, or to be able to expand their own practices. To prevent possible hardship, supplementary payments will be available to doctors in single-handed practice. Doctors who are eligible for these payments are (a) those who were aged 65 or over on April 1, 1953, and (b) those who subsequently reach the age of 65, from the beginning of the next quarter of the year—i.e., January 1, April 1, July 1, or October 1—after they reach that age. These proposals are similar to the arrangements which were previously made for elderly practitioners to claim a fixed annual payment. Supplementary payments under the new scheme may, however, be claimed by an elderly doctor irrespective of whether he was or was not in receipt of a fixed annual payment. The doctor must continue to be actively engaged in single-handed practice, and it is suggested that a list of at least 500 persons should be taken as an indication that the doctor continues to be so engaged. But, particularly in rural areas, claims from doctors with smaller lists might be accepted.

Rates of Payment

The maximum rate of payment will be £350 per annum, payable where the doctor has a list of 500 patients under the National Health Service, or a smaller list if, in an exceptional case, he is accepted as being actively engaged in practice. This rate of payment will be decreased by 9s. (one-third of the loaded capitation fee) for each person on the doctor's list over 500. The payment for any year will be limited to the amount needed to bring the doctor's income from all professional sources to £1,250.

A claim for payment from April 1, 1953, should be sent to the executive council by June 30, 1953, or in exceptional cases by December 31, 1953. Claims will not be entertained after that date. Doctors who are in doubt about their eligibility should consult the clerk to their executive council, who will be willing to assist in making a claim or advise whether a claim is likely to succeed.

Claims from Others with Small Lists

The Ministry expects that most doctors with small lists, other than those who are elderly, will benefit from the assistance given under the new arrangements to forming partnerships or to setting up practices in under-doctored areas, or in many areas will be able to build up their lists of National Health Service patients as a result of the reduction of the maximum size of lists which is to be brought about during 1953-4. Nevertheless, the Ministry thinks it is possible that some doctors with small lists may not secure any direct or indirect benefit from the new arrangements, and may suffer a loss of income amounting to hardship. The existence or extent of hardship among such doctors can be determined only in the light of actual experience after the new arrangements have been in operation for some time. Any evidence of the need to provide special assistance to doctors under the age of 65 will therefore be considered,

and, if such assistance seems to be necessary, consultations will take place with the representatives of the medical profession with a view to making further arrangements, as envisaged in the resolution of the Conference of Local Medical Committees. The problem of these practitioners is to be considered by the Working Party in the near future.

CHESTER-LE-STREET URBAN AND RURAL DISTRICT COUNCILS

APPOINTMENT OF M.O.H.

In September, 1951, the appointment of medical officer of health to the combined urban and rural districts of Chester-le-Street was advertised in the *Journal*. The temporary medical officer of health of the rural district applied for the combined appointment and was interviewed by a joint committee of the two authorities, which unanimously recommended his appointment. This recommendation was accepted by the urban district council, but was rejected by the rural district council on the grounds that the selected candidate had declined to answer questions about trade union membership.

Illogical Attitude

The attitude of the rural district council to the selected candidate was illogical, because, although he had publicly stated that he was not a member of any trade union and had no intention of joining one under any form of duress, the rural district council had employed him as their temporary medical officer of health since 1948.

The Association took up the case of the selected candidate, and it can now be announced that he has been appointed to a new post (mixed appointment) shared by the county council and the Chester-le-Street rural and urban district councils.

NORTHERN IRELAND GENERAL PRACTITIONERS

INCREASE IN REMUNERATION

The Government of Northern Ireland has made regulations which will improve the remuneration of general practitioners in the Health Service in Northern Ireland to the same amount as in England, Scotland, and Wales under the Danckwerts award, with back pay to 1948. A distribution scheme on precisely the same lines as the Working Party's scheme which started in this country on April 1 has also been introduced in Northern Ireland.

EXTRAORDINARY GENERAL MEETING

AMENDMENT TO RESOLUTION

The following amendment to the resolution proposed by the requisitionists has been received by the Secretary of the Association:

"To delete all the words following the words, 'entry into practice.'"

The amendment is proposed by Lord Horder and seconded by Dr. F. G. Tomlins.

Each member of the Association who proposes to attend the Extraordinary General Meeting on May 5 is asked to bring, and to hand to one of the attendants on entering the hall, a card or slip of paper on which are legibly written his or her name and the name of the Division of which he or she is a member. The co-operation of members in this way will greatly facilitate the recording of the attendance at the meeting.

British Medical Association

ANNUAL MEETING, CARDIFF

JULY 9-17, 1953

SECOND LIST OF HOTEL AND GUEST HOUSE ACCOMMODATION

Name of Hotel or Guest House	Tel. No.	Beds Available for	Bed and Breakfast per Day From	Special Remarks
CARDIFF				
Aberdare Hall, Cathays Park (See note below re booking arrangements)	—	80 guests	—	30/- per day full board. Minimum period 5 days. Students' residential hall
Central Hotel	25749	Unspecified	17/6	—
*Grand Hotel, Westgate St.	26626	13 guests	19/6	—
*Philharmonic Hotel, St. Mary St.	30678	12 "	18/6	Double rooms only
*Sandringham Hotel, St. Mary St.	321611	15 "	19/6	—
Glenmor Private Hotel, 154, Newport Rd.	248371	10 "	14/6	—
Kingswood Guest House, 5, Highfield Rd., Heath Linden Court Hotel, 191, Newport Rd.	Llanishen 1087 246361	7 "	15/-	—
Monkstone Club and Guest House, Newport Rd., Rumney	St. Mellons 34	6 "	14/6	—
Parklands Guest House, 49, Ninian Rd., Roath Park	46551	10 "	14/6	Double rooms only
Philips' Commercial Hotel, 154, Colum Rd., Cathays Park	25972	8 "	16/6	—
St. David's Guest House, 103, Newport Rd.	239531	6 "	12/6	Double rooms only
NEWPORT (20 minutes by car from Cardiff)				
*King's Head Hotel	3340	60 guests	19/6	—
*Queen's Hotel	2171	38 "	17/6	—
*Tredegar Arms Hotel	428011	16 "	17/-	—
PORTHCAWL (40 minutes by car from Cardiff; seaside resort with excellent golf course)				
*Esplanade Hotel	1	42 guests	22/6-27/6	—
*Marine Hotel	292	26 "	20/-	—
*Porthcawl Hotel	57	24 "	19/6	—

Name of Hotel or Guest House	Tel. No.	Beds Available for	Bed and Breakfast per Day From	Special Remarks
PONTYPRIDD (20 minutes by car from Cardiff)				
*New Inn Hotel	Pontypridd 2201	6 guests	20/-	—
BRIDGEND (30 minutes by car from Cardiff; country town)				
*York Hotel	Bridgend 224	6 guests	13/6	—

* Licensed hotel.

When writing to hotels regarding reservations members should mention that they are attending the B.M.A. Meeting.

Members who have difficulty in making arrangements for their accommodation are advised to write direct to the Executive Officer, B.M.A. House, 195, Newport Road, Cardiff, stating their exact requirements. A further list of private guest houses which have been approved by the local hospitality committee is available at this office, and every effort will be made to suit all applicants.

Aberdare Hall.—Accommodation is available in double and single rooms in the Aberdare Hall, Cathays Park, Cardiff. This is a well-equipped modern students' residential hall very conveniently situated to the meeting-places. Its amenities include a bar and ample bathrooms. The charge will be 30s. per person per day, which will include full board, but no reduction can be made for meals not taken. It is requested that guests should book for a minimum of five days. Ration books and towels and soap must be brought by guests. Parking space for cars is available near by. Members wishing to book at Aberdare Hall should write direct to Dr. J. D. Williamson, 175, Newport Road, Cardiff, stating any particular requirements.

The provisional programme of the scientific meetings was published in the *Supplement* of March 28 (p. 89). It is hoped to publish the full programme in the *Supplement* of May 9.

GENERAL MEDICAL SERVICES COMMITTEE

The usual monthly meeting of the General Medical Services Committee was held on April 16, with Dr. A. TALBOT ROGERS in the chair.

Further consideration was given to the question of co-option of members of the Assistants and Young Practitioners Subcommittee to the General Medical Services Committee. At present Dr. A. Joffe and Dr. L. Russell represent the subcommittee, and it was agreed that the present arrangement should continue.

Concerning the forthcoming Special Conference, Dr. D. F. HUTCHINSON brought forward a resolution which had been passed *nem. con.* by the Middlesex Local Medical Committee strongly approving the recommendation which the General Medical Services Committee is to place before the Special Conference on May 5.

Dr. RUSSELL raised the question of the size of the final settlement. Some impression appeared to have been given that there might be no surplus at the end of the financial year but a deficit.

In reply it was pointed out that they would shortly be in a position to know, in round figures, the amount available for the final settlement. Dr. WAND explained how the Working Party proposed to deal with the question of the small-list practitioner. It was necessary first to find out the extent of the problem and the cost of solving it. The G.M.S. Committee had said over and over again that it would face up to this matter as soon as the information became available.

Dr. RUSSELL said that the Working Party subcommittee failed to make recommendations because it was not known

whether there would be any surplus available, and among assistants and young practitioners there was a strong feeling that the new Working Party might be under a similar limitation.

Dr. FRANK GRAY said that if they were convinced in the light of the information about to be sought that any group had a claim on the grounds of justice that claim had to be met.

Medical Service Committees

Dr. DAIN, the Chairman of the Special Subcommittee which had been considering Medical Service Committee procedure, mentioned the desirability, arising out of what is known as the Glasgow case, that a practitioner's obligations under his terms of service should be demarcated from professional misbehaviour or unethical conduct. He said that in the Glasgow case a doctor had been removed from the list, although not found guilty of any breach of regulations, because his behaviour was judged to be detrimental to the Service. This seemed to open up the possibility of the removal of doctors on account of conduct not really connected with the Service at all.

It was agreed that further consideration of this problem be deferred until a later meeting.

Domiciliary Nursing of Tuberculosis

Discussion arose on a memorandum on domiciliary nursing of tuberculosis proposed to be issued under the auspices of the Ministry and prepared by the Standing Nursing Advisory Committee in consultation with other standing advisory committees of the Central Health Services Council.

Strong exception was taken by the Committee to certain paragraphs in the memorandum which were regarded as likely to create unnecessary alarm to the patient. One member said that it would be inadvisable for such a document to get into the hands of the general public, and, while its detailed instructions might be admirable under ideal conditions, they would prove difficult to fulfil in practice.

The CHAIRMAN commented on the fact that there appeared to be no general practitioner on either the Nursing or the Tuberculosis Standing Advisory Committees.

The Committee expressed the view that the document was unsuitable for distribution in its present form and should be subject to revision. The comment of the Society of Medical Officers of Health was that, although the memorandum as such could not be criticized, the advice given was impracticable in many households. The recommendations were too detailed and the essential information was already available in several handbooks for nurses.¹ It was agreed that the Committee's comments should be forwarded to the Public Health Committee.

A memorandum by the British Dental Association on fees for the arrest of dental haemorrhage was considered by the Committee. It was agreed that an early opportunity be taken of discussing it, in company with representatives of the British Dental Association, at the Ministry.

Rural Mileage

A lengthy report from the Rural Practices Subcommittee on mileage was presented by Dr. C. F. R. Killick. The Subcommittee held the view that the figures of average remuneration submitted by the Mileage Committee set up by the Minister in 1950 were open to certain criticisms which rendered it impossible to make a realistic comparison of the remuneration levels of the urban and rural practitioner, and also ignored a number of other important factors which in equity should be taken into account. It felt that no case had been made for any reduction in the size of the mileage fund, and recommended that the matter be kept under review.

The CHAIRMAN said that there had been a feeling among rural practitioners that the mileage fund was not providing sufficient extra money to finance rural practice. Their

¹The memorandum was also discussed by the Public Health Committee of the Association on the following day, and it was proposed that the chairman of that committee and the chairman of the General Medical Services Committee should meet and endeavour to arrive at an agreed statement.

expenses had gone up out of all knowledge, and they looked to some increase in the mileage fund. Examination of the position by the Ministry of Health seemed to show that the rural practitioner was not as badly off as had been thought, a conclusion with which the subcommittee did not completely agree. What the rural practitioners said in effect was that, the statistics notwithstanding, it would not be unfair to continue the same allocation of money to the mileage fund as at present.

It was agreed, on the proposition of Dr. WAND, seconded by Dr. KILLICK, to recommend that no steps be taken to alter the allocation of £2m. to the mileage fund, at which figure it had stood for the last four years.

The National Formulary

It was reported to the Committee that the Joint Formulary Committee was now revising the *National Formulary*, 1952, with a view to the publication of a further edition in the summer of 1954. It had been suggested to the Committee that in a special edition for use by prescribers the preparations be listed in pharmacological classifications, instead of under the various sections such as mixtures and injections as at present. Another suggestion from one local medical committee was that prices of preparations be included in the *Formulary*, but the National Formulary Committee had decided against this on the ground that there should be no suggestion that the practitioner's choice of appropriate preparations should be guided by considerations of cost. It was stated that in Scotland practitioners were informed of the prices of the drugs.

The view of the General Medical Services Committee after a long discussion was against pharmacological classification or classification under diseases, one member voicing strong objections to the introduction of any new system which would suggest that a particular drug was good for such and such a condition. The Committee wanted the classification retained as in the present edition. Discussion also took place on a proposal to use English titles and Latin translations, but Dr. SORSBY drew attention to the international repercussions of such an alteration, and said that any proposal of this kind ought to be considered by an international pharmacopoeial body.

It was agreed, on the suggestion of the Wiltshire Local Medical Committee, to make representations to the Ministry in favour of 2 in. by 2 in. squares of "vaseline" gauze being included in the drug tariff. The larger size at present included was said to result in considerable waste.

The Committee devoted a great deal of time to considering and amending its draft report to the forthcoming Annual Conference.

REMUNERATION OF HOSPITAL MEDICAL STAFF

Junior members of hospital medical staff are asking if they will be affected by the discussions now taking place in Committee "B" of the Medical Whitley Council on what is often referred to as "consultants' betterment." The claim for increased remuneration submitted to the Management Side of Committee "B" embraces all grades of hospital medical staff, although it is based on the Spens Report, which dealt only with the salaries of consultants and registrars.

THE BUDGET AND DOCTORS' CARS

The Budget proposal to reinstate the system of initial allowances for capital expenditure on "plant and machinery" will be welcomed by many practitioners. A similar allowance was in operation until April 5, 1952, except that the allowance then amounted to 40% of the capital cost and practitioners were able in certain circumstances to obtain this relief on the purchase of a car for professional purposes. The new rate of initial allowance is 20% and operates as from April 15, 1953. This allowance is, of course, in addition to the annual depreciation allowance.

Scottish News

S.H.M.O. REVIEW IN SCOTLAND

Arrangements are now nearly complete for an S.H.M.O. review in Scotland similar to that which was recently undertaken in England and Wales (*Supplement*, 1952, 2, 164). The review will be in two parts: (a) a final review of the professional status of senior hospital medical officers, and (b) to determine whether in fact posts designated as S.H.M.O. are properly graded as such, having regard to the duties devolving on them and the facilities associated with them.

SCOTTISH REGIONAL HOSPITAL BOARDS

New appointments to fill vacancies in the five Scottish regional hospital boards have been made by the Secretary of State for Scotland. The vacancies arise from the statutory requirements that one-third of the members should retire annually. Eighteen are reappointments of retiring members. The tenure of office will be for three years, until March 31, 1956. The Secretary of State has made a slight reduction in the size of the boards, the number of members (excluding the chairman) being now as follows: Northern Region, 16; North-eastern Region, 18; Eastern Region, 18; South-eastern Region, 23; Western Region, 29. There are two current vacancies in the South-eastern Region still to be filled. The members reappointed or newly appointed are:

Northern Regional Hospital Board.—Reappointed: Miss M. B. Clyne, Rev. Father Neil MacKellaig, Mr. G. Ralph, Mr. J. South. New member: Rev. A. Gemmell.

North-eastern Regional Hospital Board.—Reappointed: Mr. D. Cochran, Provost H. J. Milne, M.C., Mr. R. Ollason, Mrs. J. Wolrige-Gordon. New Member: Mr. R. Esslemont.

Eastern Regional Hospital Board.—Reappointed: Mr. W. I. Brown, Professor W. L. BURGESS, Miss M. C. Cameron, Councillor J. R. Christie. New member: Dr. J. C. ANDERSON.

South-eastern Regional Hospital Board.—Reappointed: Dr. W. Boyd, Councillor R. Burnside, Bailie D. R. Matheson. New member: Dr. G. J. SUMMERS.

Western Regional Hospital Board.—Reappointed: Dr. T. ANDERSON, Dr. P. K. McCOWAN, Mr. J. Stewart. New members: Mr. R. S. BARCLAY, Mr. D. Burns, Mr. W. H. Dunlop, Mr. P. R. Jacobs, Mr. A. M. Robertson.

The Secretary of State has also made the following appointments to fill casual vacancies:

North-eastern Regional Hospital Board.—Miss Bell Jobson (to March 31, 1955).

Western Regional Hospital Board.—Mr. J. BRUCE DEWAR (to March 31, 1954).

Questions Answered

Purchase of Car

Q.—As a medical officer of health I purchased a new car in February, 1951. I am paid a fixed allowance per year and also a mileage allowance. Can I claim a 40% capital allowance, less any difference between the travelling allowance and actual expenditure incurred over the year?

A.—The questioner's remuneration is assessable under Schedule E, and the statutory rule with regard to expenses restricts the allowance to expenses incurred wholly, exclusively, and necessarily in the performance of the duties of the office held. The expenses of using a car can include the capital allowances provided in the Income Tax Act—i.e., 40% of the cost of purchase (so far as incurred before

April 6, 1952) and 25% of the written-down value of the car as an annual allowance. But if the car is used partly for private purposes—including travelling between the residence and the main place of employment—then only a proportion—e.g., on a mileage basis—of such allowances and of the cost of licence, insurance, petrol, repairs, etc., can be claimed for income-tax purposes. In other words the 40% allowance cannot be treated as a separate subject of claim, but, so far as it is appropriate, only as part of the total cost of using the car. If the cost of travelling in the performance of the duties calculated on the above basis is found to exceed the car allowance received from the employing authority, a claim can be made for the deduction of the excess from the amount of the remuneration. Experience suggests, however, that it is usually very difficult to persuade one authority—i.e., the Commissioners of Taxes—that an allowance given by another authority is in fact inadequate to cover the "necessary" expense.

Income-tax Allowance on New Car

Q.—By 25% annual depreciation, the value of my car has been written down to £200. I could sell it for £400. If I buy a new car for £800 can I deduct 40% initial allowance plus 25% depreciation allowance for the year of purchase?

A.—The initial allowance ceased to apply to expenditure incurred after April 5, 1952, and consequently the only allowance applicable to a car bought now is the annual allowance calculated at 25% per annum. The figures mentioned in respect of the present car suggest that when sold part of the amount received will be liable to assessment as a "balancing charge."

Correspondence

The National Formulary

SIR,—It is common knowledge that a revision of the *National Formulary* is in progress, and the very interesting account by Professor Dunlop *et al.* of prescribing in Scotland (*Journal*, March 28, p. 694) suggests the importance of this work. The fact that the Budget estimates that next year £52,000,000 will be spent on pharmaceutical services (not, of course, only on drugs) emphasizes the financial implications of prescribing habits, on which the *National Formulary* has a considerable bearing.

The revision can be considered under two heads—content and format. I want in this letter to confine myself to format, for it has some bearing on the content and still more on the usefulness of the *Formulary*. If it is convenient to use, it probably will be used more and more extensively and intelligently; and now is the time when doctors can—and I hope will—make their views known. I give my own opinions in the hope that they will stimulate others to contradict or confirm them.

People are getting more familiar with the present layout and may not take kindly to any drastic alteration. But against this is the fact, which Professor Dunlop mentions, that proprietary preparations are rapidly displacing the more official ones. This means either that the *Formulary* does not contain the preparations that doctors find their patients need, or that the presentation of the *Formulary* is not so attractive or so easy to remember as the advertisements of the drug firms. I believe that both are true, but perhaps the second is the more important.

G.P.s are not the only people involved; students, teachers, and consultants also have their points of view and must use the *National Formulary*. There is the trouble about metric and English measures to be considered, also the fact that to-day many medical students do not know Latin and the new B.P. uses English throughout. This introduces great difficulties. Taking these and other factors in mind, I think that a therapeutic classification would prove an immense improvement on the

present layout—that is, putting all the cough medicines together, those for gastro-intestinal, genito-urinary troubles, and so on. There is such a classification on pages 42-55 of the present *Formulary*. This could then be omitted. I would displace and modify the present monographs and place them at the head of each section, giving us the latest authoritative views on therapy—or at least of pharmacology—in these sections. I know that a *Formulary* is not a potted *materia medica*, but it seems reasonable to ask the compilers of a *formulary* that they should give some indications of what was in their minds. This arrangement would have great advantages, particularly in that it would largely overcome the language difficulty; for if in every section one had first the liquids, mixtures, etc., followed by the solids, tablets, pills, etc., none of the subsections would actually contain many items, so that it would not take long for anyone to see all that were available. Furthermore, grouping them in this way should lead to greater variety and exactness in prescribing, for one would constantly have brought to notice the wealth of preparations available for related conditions. The monographs at the head of the sections will help those of us who are getting on to use the newer drugs more effectively, and all of us will find having the theoretical and practical brought together in this succinct way stimulating or refreshing. Students and housemen will, I think, share these feelings, while even teachers may find them useful.

Besides the sections based on therapeutic usage there would have to be others based on pharmacology—for example, antibiotics, vitamins, sulphonamides. As many of these would occur in several sections, in each section the most suitable ones would just be mentioned with a reference to the fuller information elsewhere. In a therapeutic classification some duplication is unavoidable, but I think it is justifiable. One more advantage of a clinical classification is that it would make it possible to put formulae for children at the end of each adult section instead of putting them all together at the end of the book, particularly as for older children the adult formulae in smaller doses are often more suitable than those *pro infantibus*.

This matter is one of the greatest importance, and I sincerely hope that other readers will make their views known. Now is the time that they can have an effect, for the format of the book may considerably modify its content and its usefulness.—I am, etc.,

Winsford, Cheshire.

W. N. LEAK.

SIR,—May I add my testimony to Dr. W. Edwards's sound letter (*Supplement*, April 11, p. 137), which points out the difficulty, almost the hopelessness, of finding one's way about the *National Formulary*? The whole book needs completely re-editing, and, above all, the simplification of names. I agree with him that this measure alone will save thousands of pounds. Who on earth can be expected to write out inj. procain. benzylpenicil. confirm. B.P.C., or ung. iod. denig. c. methyl. salicyl. B.P.C. (which are the recognized abbreviations of preparations) when there are well-known proprietary equivalents of a few letters?

A last point, and an important one, why is not more trouble taken to render many of the mixtures more palatable? Chloroform water and similar flavours can be most nauseating. Palatability does matter.—I am, etc.,

Thornton Heath, Surrey

S. G. HAMILTON.

The Registrar Problem

SIR,—At this critical period in the affairs of many senior registrars we should appreciate an opportunity to state the views of the Registrars Group. In April, 1952, we put to the Joint Committee our opinion that within a year there would be a serious crisis because, for the first time since the start of the National Health Service, large numbers of senior registrars would reach the end of their four-year tenure. A review carried out by us this month reveals the following facts.

In 19 of the 20 regions there are at least 326 senior registrars whose appointments are shortly due to be terminated as they are in their fourth or subsequent years. Figures for the remaining region, and for a considerable number of teaching hospitals, are not yet available, nor does this total include university officers of registrar grade who are likely to compete for consultant vacancies. The great majority of these senior registrars are employed in general medicine or surgery.

A survey of the advertisement columns of the medical journals has shown that during 1952 only 25 consultant posts in general medicine and 28 in general surgery were advertised; these figures do not include the six posts in medicine and five in surgery created in late 1952 by the North-west Metropolitan Regional Hospital Board in an endeavour to solve the senior registrar problem in their region.

We have never held the view that all senior registrars should eventually obtain consultant posts; on the contrary, in all discussions we have agreed that competition is essential to ensure a high-quality consultant service. On the other hand, it is surely reasonable to suggest that the wastage at senior registrar level should be no more than about 25%, an ideal which should be fulfilled when the senior registrar establishment is eventually scaled down to the agreed level so as to be related to future consultant vacancies. Last year, however, between 50 and 70 well-qualified surgeons applied for each general surgical post advertised in one region. This situation bears no relation to the fair competition we have envisaged; it is the direct outcome of post-war expansion, for which the Ministry must bear responsibility. It is the present generation of senior registrars for whose welfare we are particularly concerned; this is a special, non-recurring problem which needs special and immediate measures for its solution.

The following suggestions of the Registrars Group Council have been received sympathetically by the Joint Committee.

(1) The consultant service can still be expanded to the benefit of the National Health Service. Although the Ministry of Health have admitted their error in announcing abruptly a "freezing" of hospital establishments (*Supplement*, January 24, p. 23) it is clear that they would not welcome a general expansion of the consultant service. However, senior registrars are at present doing important work; they are not just supernumerary trainees, and when establishments are cut their work will have to be done. Consultants will be needed to replace them, and it is surely better to foresee the need and to create additional posts while the present senior registrars are available to fill them. We must point again to the action of the North-west Metropolitan Regional Hospital Board, which appears to us to be an important contribution to the problem.

(2) The run-down to the agreed senior registrar establishment should be slow. This would allow a gradual but parallel increase in the consultant service as suggested above. We have agreed that a reduction in establishment is necessary to prevent the present problem from continuing indefinitely, but we feel that no senior registrar appointment should be terminated before the end of the normal four-year term. It will still be possible to reduce the establishment when posts are vacated voluntarily or when the holders of posts no longer "established" reach the end of their fourth year. It is hoped that the suggestions in the next paragraph will enable suitable individuals in the latter category to continue a specialist career in another post.

(3) Any senior registrar reaching the end of his normal tenure should be allowed and encouraged to apply in open competition for his own post or for other posts in the same grade and specialty, either in his own region or elsewhere. It has been suggested that any senior registrar who fails to obtain a consultant post before the end of his four years in office is unlikely to be successful and that prolongation of tenure would only postpone the final disappointment. With this we would agree far from being normal. It is also admitted that there may be some senior registrars who for one reason or another are unlikely to attain consultant status. We believe that the method outlined above is the most equitable way of solving the present dilemma. A full selection committee is given the onus of deciding whether a man is likely to become a consultant; if so, they will reappoint him, and if he is not reappointed it will be clear that he would be unwise to continue further. A senior registrar whose post is discontinued owing to a reduction in establishment would be able to apply for posts in the same specialty elsewhere. This plan would ensure that good potential consultants are not lost to the Service purely owing to passage of time. Registrars (intermediate grade) might criticize this plan as lessening their chances of promotion. They would of course be eligible to compete with senior registrars for the vacant posts; furthermore, it has been agreed that there need be no limit on the duration of registrar (intermediate grade) appointments. This objection also loses

substance as the shortage of registrars in the intermediate grade increases, and it is becoming difficult even to fill certain senior registrar posts. Indeed, we would suggest that unless the Ministry encourages reapplication by senior registrars the shortage of suitable applicants will increase. We appreciate that it may be necessary to place some time limit (say two years) on the duration of tenure when a man is reappointed to his own post.

(4) Entry into general practice should be made a more practicable proposition for the ex-registrar. This is an immensely complicated subject. We have been pressing its importance for over three years, as there is no doubt that registrar experience is usually a positive disadvantage when application is made for a position in general practice. It is now clear that this is the main reason for the increasing shortage of junior medical staff in many hospitals. It seems to us that the manifold problems involved remain unsolved because of the sharp division which has been created between the hospital and general-practitioner services; there appears to be no mechanism within the Ministry or even within the B.M.A. for discussing it, let alone for taking action.

The Joint Committee have been negotiating registrar affairs with the Ministry of Health for a long time, but, although the Ministry have said that they are considering the problem sympathetically, there is no indication that they realize its urgency or that they are taking steps to solve it. The figures given in this letter have been forwarded to the Joint Committee in the hope that they will be able to persuade the Ministry not only that the problem is a serious one, but also that it is capable of solution.—We are, etc.,

R. M. FORRESTER,
Late Chairman, Registrars Group, B.M.A.
JOHN N. WALTON,
Chairman, Registrars Group, B.M.A.

Newcastle-upon-Tyne.

SIR,—There are many areas throughout the country to-day which comprise populations of well over 100,000 persons, and which are served by only one part-time consultant in gynaecology and obstetrics. This individual works at a maximum nine sessions a week and is only on call for cases of emergency. Such an arrangement in an extensive district necessitates that he is frequently not available, and so the hospital work falls upon the senior registrar or his deputy—in other words, the majority of the hospital work is being done, or is likely to be done, by cheap registrar labour. Surely this state of affairs demands instant revision of hospital staffing in order to ensure that the public has available to it a worth-while consultant service at all times.

At the moment there are a large number of senior registrars amply trained for consultant practice who have become redundant owing to the fact that few such appointments are vacant or available. It is for this reason that I would suggest that senior registrars of tried experience and skill be employed as junior consultants on a sessional basis—e.g., five sessions a week. Financially this would be equivalent to, or less than, their present salaries. After four years of satisfactory service such an officer would be eligible for consultant status on a full or part-time basis.

To my mind it is certain that the type of man envisaged and so enrolled as an assistant consultant in a populous and scattered area would not scamp his work any more than he would dream of so doing as a senior registrar. There is no question whatever that thereby the public would greatly be the gainers.

Such a scheme would adequately fulfil an urgent demand in many county areas to-day, and would permit the executive of the National Health Service to build up a graded scale of hospital officers. Moreover, this plan would encourage juniors in our specialty to apply for hospital appointments, realizing that there was some reasonable prospect of advancement; for is it not a matter of common experience to-day to find that recently qualified doctors in sufficient numbers are unwilling to undertake specialist training, because many of their seniors with years of experience and consultant qualifications are being forced to embark upon general practice or quit the profession?—I am, etc.,

London, W.1.

V. B. GREEN-ARMYtage.

Whole-time Consultants

SIR,—In the part of the Annual Report of Council which deals with Hospital and Consultant Services, the first sentence of the second paragraph of the section headed "Whole-time Officers" (*Supplement*, April 4, p. 106) is not clear. I understand it to mean that the Council regards a university professor as representing the point of view of whole-time consultants in the N.H.S. No doubt professors have problems in common with whole-time consultants, but because a professor is not paid by the National Health Service he cannot be regarded as an adequate spokesman for whole-time consultants.

The report suggests that one of the causes of unrest amongst whole-time officers is ignorance of the efforts made on their behalf. The efforts are undoubted; it is harder to know with how much determination these efforts are made. In part, at least, the increasing disquiet of the whole-time consultants results from the growing differences between the conditions of service of whole-time and part-time consultants, added to the knowledge that, with the solitary exception of the university professor, all the consultants on the Joint Committee and the Staff Side of Committee "B" are part-time.

The whole tenor of the section of the Annual Report dealing with whole-time officers suggests that the Council is still unwilling to allow whole-time officers any share in negotiations affecting them.—I am, etc.,

Sheffield, 11.

ARTHUR JORDAN.

Extraordinary General Meeting

SIR,—I note that, following the requisition for an Extraordinary General Meeting of the Association, the Working Party has been called together in order to take effective steps to investigate and relieve any injustices inherent in the Distribution Scheme. This belated action does, in fact, secure the main purpose of the requisitionists, for it is accompanied by an assurance that any injustices which are found to exist will be made good retrospectively to April 1, 1953. It therefore appears to me that it is no longer necessary to ask that the implementation of the scheme should be postponed pending a proper inquiry, and I have accordingly submitted an amendment, which I trust will be acceptable to the requisitionists, that the last four lines of the resolution commencing "and requests the Minister..." should be deleted.

May I trespass on your space to add a personal reflection? The Working Party should have taken effective action to inform itself of the nature and size of the problem and to devise a suitable solution not later than last October. Had it done so, small-list practitioners and others would have been spared much anxiety and distress and there would not now be this need for the requisitioning of an extraordinary meeting.—I am, etc.,

London, W.1.

HORDER.

SIR,—It has been suggested that those who have requisitioned the Extraordinary General Meeting (and their supporters) might agree to the deletion from the Resolution proposed for consideration by the meeting of those words asking the Minister of Health to continue the method of remuneration in force up to March 31 and to postpone the implementation of the Working Party's scheme of distribution until fresh agreements were agreed.

In my opinion such a course could be readily agreed if the Council and the G.M.S. Committee would signify their unqualified acceptance of the principle that all practitioners, regardless of size of list, should participate as of inherent and equitable right in a substantial increase of capitation rate for persons on their lists, such as is made possible by the Danckwerts award, and that, particularly, no practitioner should find his remuneration less (relative to numbers on his list) after the award than before it.

or be submitted to any kind of means test before participating in the increase of remuneration. Remuneration should be on the basis of work done and expenses incurred in its doing.

In making his award, Mr. Justice Danckwerts found the profession had been underpaid since the inception of the Service. He found a "betterment" figure, and increased the central pool by some £10,000,000 on 1951-2 figures, declaring he had adjusted his figure "to the number of practitioners in the Service and not the population." No one asks that this sum, capable of allowing a yearly increase of payment to every practitioner of over £500, should be divided equally to all. But clearly it makes available a substantial increase of remuneration to every practitioner; and it would be an act of injustice to exclude any practitioner from a substantial share in the Danckwerts award, or to submit him to any means test before according it.

If the Council and the G.M.S. Committee at any date before the Extraordinary General Meeting would signify acceptance of the above general principles for distribution of the central pool and agree that they should become B.M.A. policy in fresh negotiations to be initiated immediately with the Minister, complete unanimity could be attained at the meeting. Had such a principle been accepted earlier, our Association would have been saved this otherwise unnecessary, undignified, regrettable, and artificially created seeming dispute between small-list and big-list practitioners and the Extraordinary General Meeting would never have been requisitioned. One act of vision and statesmanship now would immediately resolve the unnatural situation.

—I am, etc.,
Shrewsbury.

W. J. GRANT.

SIR,—The honorary secretary of my Division has shown me a letter sent to him—and, indeed, to all honorary secretaries of B.M.A. Divisions in London—by Dr. Frank Gray in his capacity as secretary of the Local Medical Committee for the County of London, which is a statutory body constituted by the National Health Service Act, using funds deducted from practitioners' pay.

In this letter Dr. Gray requests each honorary secretary to call a meeting of the executive committee of his Division for the express purpose of endeavouring to see that as many members of the Division as possible attend the Extraordinary General Meeting on May 5, the letter being so worded as to suggest that those requisitioning the Extraordinary General Meeting are attempting to bring serious discredit on the Association.

As chairman of my Division, I have not agreed to such a meeting being summoned at the behest of the secretary of an outside, statutory committee attempting to intervene and to prejudice members of the British Medical Association against fellow-members.—I am, etc.,

London, E.8.

CHARLES SCHIFF,
Chairman, City Division.

Dental Anaesthetics

SIR,—There is, unfortunately, some feeling among medical men about not being asked to act as dental anaesthetist for their own patients. In an experience of over seventeen years I find the most important factor for a successful administration is practice together as a team, which includes the dental surgery assistant(s). Questions of premedication, throat packing, manipulation of mouth gags, adjuncts to nitrous oxide, maintaining adequate airway, maintaining adequate oxygenation and depth of anaesthesia, maintaining access to and sight of the teeth, control and prevention of trugging, etc., demand the fullest possible degree of understanding and co-operation between administrator, operator, and assistants. A predetermined system is essential if difficulties are to be forestalled and a high level of success maintained.

The advantages of a practised team over the occasional coming together of the patient's own doctor and the dentist would be obvious. This correspondence, however, shows that they are not.—I am, etc.,

Birmingham.

Branch and Division Meetings to be Held

BERKS, BUCKS, AND OXFORD BRANCH.—At Forum Restaurant, High Street, Oxford, Tuesday, April 28, 2.45 p.m., council meeting; 3.30 p.m., annual general meeting.

BIRKENHEAD AND WIRRAL DIVISION.—At Arrowe Park Hotel, Birkenhead, Saturday, May 2, 7.30 for 8 p.m., dinner; 9 p.m., address by Dr. Ffrangcon Roberts: "Medical Progress: A Centenarian Looks Back from the Year 2053."

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Thursday, April 30, 3 p.m., annual meeting.

BLACKBURN DIVISION.—At Royal Infirmary, Blackburn, Sunday, April 26, 11 a.m., annual general meeting.

CHELSEA AND FULHAM DIVISION.—At Fulham Town Hall, S.W., Friday, April 24, 9 p.m., annual general meeting.

COVENTRY DIVISION.—Tuesday, April 28, general practitioners' evening.

DERBY DIVISION.—At Derbyshire Royal Infirmary, Friday, May 1, 8.30 p.m., annual meeting.

DUDLEY DIVISION.—At Educational Offices, St. James's Road, Dudley, Tuesday, April 28, 9 p.m., meeting. Consideration of Annual Report of Council, etc.

FINCHLEY DIVISION.—At Finchley Memorial Hospital, London, N., Friday, May 1, 7.45 p.m., annual general meeting.

HOLLAND DIVISION.—At Bridge Hotel, Sutton Bridge, Saturday, May 2, 7.30 for 8 p.m., dinner. Dr. C. C. Bowley: "The Rhesus Factor in General Practice."

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Mary Abbots Hospital, Marloes Road, Kensington, W., Tuesday, April 28, 8.30 p.m., annual general meeting.

MANCHESTER DIVISION.—At The Library, Midland Hotel, Manchester, Thursday, April 30, 8.30 p.m., medical brains trust.

NORTH-WEST WALES DIVISION.—At Royal Hotel, Capel Cerrig, Sunday, April 26, 2.30 p.m., annual general meeting.

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, April 28, 8.30 p.m., special Divisional meeting. Discussion: "The Care of the Elderly Sick."

ST. PANCRAS DIVISION.—At B.M.A. House, Tavistock Square, London, W.C., Wednesday, April 29, 8.30 p.m., meeting. Mr. W. B. Purchase: "Coroners' Procedure During the Last Thirty Years in London."

SOUTHAMPTON DIVISION.—At Stoneham Golf Club, Sunday, May 3, 2.45 p.m., Divisional qualifying round for Treasurer's Cup Golf Competition.

SOUTH-WEST ESSEX DIVISION.—At Thorpe Coombe Maternity Hospital, Forest Road, Walthamstow, E., Wednesday, April 29, 8.30 p.m., (1) meeting. B.M.A. Lecture by Dr. B. F. Russell: "Some Dermatological Problems in General Practice." (2) Special meeting of all medical practitioners in the area of the Division to follow.

STRATFORD DIVISION.—At Minor Hall, East Ham Town Hall, Wednesday, April 29, 9 p.m., meeting of all medical practitioners in Barking, East Ham, West Ham, and Ilford.

WEMBLEY DIVISION.—At Wembley Hospital, Tuesday, April 28, 9 p.m., annual general meeting.

WEST NORFOLK DIVISION.—At West Norfolk and King's Lynn Hospital, Thursday, April 30, 3 p.m., meeting. Talk by Sir Alan Rook: "Our Aims in Human Ecology."

GENERAL MEDICAL SERVICES COMMITTEE

REPORT OF THE GENERAL MEDICAL SERVICES COMMITTEE TO THE ANNUAL CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL COMMITTEES, 1953

PERSONNEL OF GENERAL MEDICAL SERVICES COMMITTEE, 1952-3

Ex-officio: Dr. P. T. J. O'Farrell, Dublin (President); Dr. S. Wand, Birmingham (Chairman of Representative Body); Dr. E. A. Gregg, London (Chairman of Council); Mr. A. M. A. Moore, Upminster, Essex (Treasurer); Dr. W. M. Knox, Glasgow (Chairman of Conference of Local Medical Committees).

Elected by A.R.M. of B.M.A. (1952): England and Wales: Dr. J. A. Brown, Birmingham; Dr. H. Guy Dain, Birmingham; Dr. J. A. Gorsky, London; Dr. F. Gray, London; Dr. J. T. Baldwin, Milton Bridge, Midlothian; *Scotland*: Dr. J. T. Baldwin, Milton Bridge, Midlothian; *Northern Ireland*: Dr. J. Bleakley, Belfast (deputy: Dr. J. H. Cronhelm).

Direct Representatives of Local Medical Committees: Dr. W. Neil Darling, Edinburgh (Group A1); Dr. C. J. Swanson, Aberfeldy, Perthshire (Group A2); Dr. J. R. Langmuir, Glasgow (Group A3); Dr. R. C. Hamilton, Kilmarnock (Group A4); Dr. F. Lishman, Bishop Auckland, and Dr. D. T. MacDonald, Belford (Group B); Dr. H. F. Hollis, Leeds, and Dr. H. Thorp, Todmorden, Yorks (Group C); Dr. A. Campbell, Accrington, Lancs, Dr. F. S. Catto, Manchester, and Dr. P. J. Gibbons, Liverpool (Group D); Dr. Chester, and Dr. P. J. Gibbons, Liverpool (Group D); Dr. Miles Parkes, Crewe (Group E); Dr. D. B. Evans, Wrexham, and Dr. T. J. Hargest, Swansea (Group F); Dr. E. W. Goodwin, Leicester, and Dr. A. S. Wilson, Gosberton, Lincs (Group G); Dr. A. B. Davies, Walsall (Group H); Dr. F. A. Smorffitt, Southam, Warwickshire (Group I); Dr. C. F. R. Killick, Williton, Somerset (Group J); Dr. R. W. McConnel, Wendover, Bucks (Group K); Dr. J. D. R. Murray, Exmouth, Devon (Group L); Dr. K. S. Maurice-Smith, Ely, Cambs (Group M); Dr. H. S. Howie Wood, Isle of Wight (Group N); Dr. D. F. Whitaker, Guildford (Group O); Dr. A. W. Gardner, Lewes (Group P); Dr. A. T. Rogers,

Bromley, Kent (Group Q); Dr. D. F. Hutchinson, Middlesex, and Dr. A. N. Mathias, Cricklewood, N.W.2 (Group R); Dr. J. L. McKenzie Brown, London, and Dr. C. M. Scott, New Barnet, Herts (Group S); Dr. H. H. D. Sutherland, London, and Dr. Max Sorsby, London (Group T); Dr. J. B. Young, Belfast (Group U).

Elected by Annual Conference of Local Medical Committees, 1952: Dr. J. C. Arthur, Gateshead; Dr. A. Beauchamp, Birmingham; Dr. I. G. Innes, Hull; Dr. J. A. Pridham, Weymouth; Dr. F. M. Rose, Preston; Dr. W. Woolley, Bristol.

Nominees of Other Bodies: Dr. T. Rowland Hill, London, W.1, and Mr. H. H. Langston, Winchester, Hants (Central Consultants and Specialists Committee); Dr. Catherine Harrower, Glasgow (Medical Women's Federation); Dr. H. D. Chalke, London, N.W.3 (Society of Medical Officers of Health); Dr. Bruce Cardew, London, W.C.1, and Dr. I. M. MacAlister, Wallasey, Cheshire (Medical Practitioners' Union).

Co-opted Members: Dr. O. C. Carter, Bournemouth; Dr. A. Joffe, London, W.1, and Dr. L. Russell, London, N.W.10 (Assistants and Young Practitioners Subcommittee); Mr. D. C. Bowie, London, W.C.1.

Observer from the British Dental Association: Mr. G. M. Hickley, London, S.W.9.

CHAIRMAN

1. Dr. A. Talbot Rogers was appointed Chairman for the session 1952-3.

THE WORK OF THE COMMITTEE

2. The past session has proved a busy period for the Committee, and inevitably a considerable amount of its time has been taken up with matters arising out of the

Danckwerts adjudication and the Report of the Working Party on the future distribution of the Central Pool. A good deal of preparatory work had to be undertaken in co-operation with officers of the Ministry of Health in order that the new scheme of distribution could be brought into operation on April 1, 1953, and in addition the Committee has had to deal with a number of consequential problems arising from the Working Party's Report.

3. Other major tasks which the Committee has undertaken during the year include the preparation of a memorandum of evidence for submission to the Central Health Services Council's Committee on General Practice, an examination of proposals it has received for the optional return of the right to buy and sell the goodwill of medical practices, and an exhaustive survey of the Medical Service Committee and Tribunal Regulations.

4. Throughout the year representatives of the Committee have met officers of the Ministry at regular intervals to discuss the many detailed points of day-to-day administration of the Service which continue to arise. These discussions have been of great value and have enabled the Committee to take immediate action upon points brought to its notice by local medical committees.

5. The Committee has maintained a close liaison with the Medical Practices Committee and wishes to pay tribute to the way in which it speedily undertook the task of re-classifying the country in the light of the Working Party's recommendations.

6. The close contact which has also been made with the organizations representing other professions engaged in the Health Service has been of particular value in considering administrative problems where more than one profession is affected.

7. A list of attendances at various meetings and the membership of the various Subcommittees set up is given in Appendix A. This does not include attendances of members at meetings of other Association Committees upon which they serve as representatives of the G.M.S. Committee.

REPRESENTATION ON B.M.A. COMMITTEES

8. The G.M.S. Committee is represented on the following B.M.A. Committees: Private Practice (Dr. A. N. Mathias—Deputy: Dr. C. M. Scott); Central Consultants and Specialists (Dr. A. Talbot Rogers and Dr. D. F. Hutchinson—Deputies: Dr. A. W. Gardner and Dr. J. D. R. Murray); Ophthalmic Group (Dr. M. Sorsby); Occupational Health (Dr. H. F. Hollis—Deputy: Dr. F. Lishman); Public Relations (Dr. A. Talbot Rogers, Dr. D. F. Hutchinson, Dr. F. M. Rose, and Dr. W. Woolley—Deputies: Dr. J. T. Baldwin, Dr. P. J. Gibbons, Dr. R. W. McConnel, and Dr. H. H. D. Sutherland); Compensation and Superannuation (Dr. A. N. Mathias, Dr. A. Campbell, and Dr. S. Wand); Joint Committee of B.M.A. and Pharmaceutical Society (Dr. A. Talbot Rogers, Dr. F. Gray, and Dr. E. W. Goodwin); Consultants and General Practitioners Liaison Committee (Dr. A. Talbot Rogers, Dr. H. S. Howie Wood, Dr. D. F. Hutchinson, Dr. A. W. Gardner, Dr. J. D. R. Murray, Dr. S. Wand, and Dr. D. F. Whitaker); Joint Formulary Committee of B.M.A. and Pharmaceutical Society (Dr. S. A. Forbes, Dr. A. Smith Pool, Dr. D. F. Whitaker, and Dr. A. B. Davies); Arrangements Committee (Dr. A. Talbot Rogers, Dr. I. G. Innes, and Dr. F. M. Rose—Deputy: Dr. A. W. Gardner); Pharmacopoeia Subcommittee of Science Committee (Dr. S. A. Forbes); Committee on the Relation of Drunkenness and Alcohol to Road Accidents (Dr. A. B. Davies).

CENTRAL HEALTH SERVICES COUNCIL

9. Dr. S. Wand has served for a further year on the Standing Medical Advisory Committee of the Central Health Services Council, to which he was appointed after nomination by the Association.

NOMINEES ON MINISTRY OF HEALTH DISTRIBUTION COMMITTEES

10. The following nominees were accepted by the Ministry for appointment on Central Distribution Committees for 1952-3:

International Distribution Committee: Dr. F. Gray (London), Dr. J. D. Wells (Billericay, Essex), Dr. D. B. Evans (Wrexham), and Dr. A. C. Blair (Kilsyth).

Distribution Committee for England and Wales: Dr. A. Talbot Rogers (Bromley, Kent), Dr. F. Gray (London); Dr. W. Woolley (Bristol), Dr. D. B. Evans (Wrexham), and Dr. D. P. Stevenson (Deputy Secretary of the B.M.A.); together with Dr. J. C. Pearce (Diss, Norfolk), Dr. J. D. Wells (Billericay, Essex), and Dr. C. F. R. Killick (Williton, Somerset) when questions concerning mileage are under consideration.

BRITISH DENTAL ASSOCIATION'S GENERAL DENTAL SERVICES COMMITTEE

11. A close liaison has been maintained with the General Dental Services Committee of the British Dental Association by the attendance of an observer from the B.D.A. (Mr. G. M. Hickley, of London) at meetings of the Committee, and the appointment of Dr. F. Gray (London) to the General Dental Services Committee of the B.D.A.

12. This cross-representation has been of great value and enabled the two bodies to reach agreement on a number of matters of mutual interest.

GROUPING OF AREAS FOR REPRESENTATION ON THE GENERAL MEDICAL SERVICES COMMITTEE

13. Representations have been made by the Cumberland Local Medical Committee that the special interests of that isolated area were not adequately represented on the General Medical Services Committee. The local medical committee felt that one additional representative of Group B should be allocated to the Cumberland area, which it was claimed had little geographical affinity to the other areas of the Group.

14. The Committee has considered this matter on previous occasions, and, whilst not unsympathetic to the views expressed by the local medical committee, it does feel that any proposal to constitute Cumberland and Westmorland as a separate group would disturb the balance of representation on the Committee. The Committee therefore felt that, as any problems which would arise in Cumberland would be mainly of a rural nature, the position could best be met by offering facilities for direct representation to Cumberland and Westmorland on the Rural Practices Subcommittee, and, at the same time, to grant direct access to a representative from the area to the G.M.S. Committee on an *ad hoc* basis should the need arise. This proposal was accepted by the local medical committees concerned.

LIAISON BETWEEN THE GENERAL MEDICAL SERVICES AND PUBLIC HEALTH COMMITTEES

15. It has hitherto been the practice for the representative of the Public Health Service on the General Medical Services Committee to be appointed by the Society of Medical Officers of Health, and there has been no direct representative of the G.M.S. Committee on the Public Health Committee of the Association. The Committee has therefore welcomed a proposal that the Public Health Service representative should be jointly nominated by the Public Health Committee and the Society and that a direct representative of the G.M.S. Committee should be appointed to the Public Health Committee. The necessary arrangements are being made to give effect to this proposal, and it is understood that the Public Health representative will be a medical officer of a local health authority who is a member both of the Public Health

Committee and of the council of the Society. This new procedure will promote an even closer liaison between these two branches of the profession.

COMMITTEE ON GENERAL PRACTICE OF THE CENTRAL HEALTH SERVICES COUNCIL

16. The Committee has prepared a memorandum of evidence for submission to the Committee on General Practice of the Central Health Services Council. The evidence is confined to recommendations and observations of a general character based upon policy which has already been determined either by the Representative Body or the Conference of Local Medical Committees.

17. In addition to the very considerable help which it received from local medical committees, the Committee was assisted in its task by representatives of the Central Consultants and Specialists, the Public Health, and General Practice Review Committees, whose experience and viewpoints in their own fields were of the greatest value in compiling the memorandum. The memorandum of evidence is set out in Appendix B.

FLOOD AREAS

18. Immediately news was received of the serious floods along the East Coast, telegrams were sent on behalf of the Committee to the secretaries of local medical committees in the areas affected expressing the Committee's sympathy and seeking information as to how best assistance might be given. It was anticipated originally that additional doctors might be required in the reception areas to cope with the sudden influx of population, but reports received subsequently indicated that the normal medical services were able to meet the extra demands placed upon them.

19. The Committee decided to take immediate action to prevent hardship among individual practitioners whose practices were in the flood areas, and, on consideration, it appeared that this could best be achieved by—

- (a) providing immediate financial assistance to doctors whose property had been lost or damaged, and
- (b) the introduction of long-term measures to protect the practices of doctors in the flood areas and to compensate them for any loss of income.

20. In the meantime the Committee learned that an appeal had been made by the Chairman of Council for contributions to the Sir Charles Hastings Fund for the relief of doctors in the flood areas, and decided to recommend to the Trustees of the General Medical Services Defence Trust that a sum of money should be made available to the Hastings Fund. This recommendation was accepted by the Trustees, and a donation of up to £5,000 has been guaranteed to the Hastings Fund.

21. The Committee has also discussed with the Ministry the steps to be taken to compensate doctors for loss of income due to the evacuation of many of the coastal areas and the likelihood that many seaside resorts would not this year receive their usual quota of holiday visitors. Arrangements have been made to ensure that, for the time being, doctors who have suffered as a result of the recent flood disaster will not suffer any loss of income from capitation payments and temporary resident fees.

22. It is hoped that by the end of the year conditions will have returned to normal, but the position will be reviewed from time to time, and, if it appears necessary, further discussions will be held so that these emergency arrangements may be extended for a longer period.

COLLEGE OF GENERAL PRACTITIONERS

23. The Committee has learned with interest of the formation of the College of General Practitioners and has conveyed to the College its congratulations and best wishes for its success. Representatives of the Council of the College attended a meeting of the Committee to discuss the

relationship between the two bodies, and points of detail are now under examination by a small subcommittee upon which both organizations are represented. The results of this detailed examination will be reported to the Committee in due course.

REMUNERATION

24. Following the Danckwerts award and the acceptance of the Working Party's Report on the future distribution of the Central Pool, much of the Committee's time during the earlier part of the session was taken up in discussions with the Ministry of Health on the application of the principles established by the award, to the calculation of the size of the Pool, and in considering again in consultation with the Ministry the detailed administrative machinery necessary to give effect to the Working Party's proposals.

Payment of Arrears

25. First, it fell to the Committee, in consultation with its accountants, to reach agreement with the Ministry on the detailed calculation of the arrears due under the Danckwerts award and to secure their prompt distribution to the profession. This was accomplished by November 28, 1952, and the Committee wishes to place on record its appreciation of the whole-hearted co-operation on the part of the Ministry and executive councils which enabled this big administrative task to be completed by that date.

Income Tax

26. The Committee, assisted by Counsel, had discussions with the Board of Inland Revenue on the assessment of income tax and surtax on the arrears paid to general practitioners. The Committee wishes to acknowledge the co-operation of the Board and to report that the discussions enabled agreement to be reached on an equitable method of assessing the arrears for tax purposes.

Size of the Pool

27. It will be remembered that the size of the Pool each year depends upon a number of variable factors, in particular the number of doctors in the Service and the level of practice expenses. Hence, it was of first importance to see that proper arrangements were made to enable a reliable and accurate assessment to be made each year of the number of doctors in the Service. The Committee is glad to report that agreement has now been reached with the Ministry as to the method to be used for making this calculation. At the Committee's request, its accountants, Messrs. Price, Waterhouse & Co., have agreed to carry out each year a detailed check of the Ministry's records and of the records maintained by a number of executive councils.

28. The Special Conference last year asked the Committee to consider the preparation, on a permanent basis, of lists of practitioners providing general medical services, as a check against the records maintained by the Ministry. The great difficulty in maintaining separate records is that inevitably, if they are to be accurate, the information must be supplied by executive councils, whose information forms the source of the Ministry's own figures. Apart from the difficulties which would be experienced in reconciling the two separate sets of records, such machinery would not necessarily be accepted as a reliable check, and the Committee felt that the situation could best be met by making both Departmental and executive council records available for examination by independent auditors acting on its behalf. The Ministry has offered its full co-operation to enable such a check to be carried out, and the Committee is satisfied that this method amply safeguards the situation and at the same time overcomes the disadvantages inherent in the maintenance of a second set of records by the Committee.

29. The Committee is in consultation with the Ministry about a further inquiry into practice expenses, which in future will be undertaken at regular intervals.

Reduction of the Maximum Number of Patients whom a General Practitioner may accept under the Service

30. With the introduction of the new distribution scheme in April this year, the new and reduced maxima envisaged in the Working Party's Report came into effect. It will be remembered that the new maxima are:

- 3,500 for a single-handed practitioner;
- 4,500 for a member of a partnership, provided the average for the partnership is not above 3,500;
- 2,000 in respect of the employment of a permanent assistant.

31. Since it was felt that the reduction of the permitted maximum lists must lead to a substantial redistribution of patients, in order to avoid inconvenience to patients and doctors alike it has been agreed that the new maxima will not come into full effect until April 1, 1954. Thus practitioners who, under the new Regulations, are required to bring their lists within the new limits will do so by stages. At the end of the second quarter of the new distribution scheme, lists should be brought within 300 of the new maxima, at the end of the third quarter to within 200, and at the end of the fourth quarter to within 100. The tolerance of 100 allowed for the last quarter of the present year will continue after April, 1954. The operation of these new maxima means that, apart from the tolerance of 100 mentioned above, a practitioner will not be paid capitation fees for any patients in excess of the number permitted.

32. In the case of partnership lists, any partner whose share in the practice is less than one-third of the share of the partner with the greatest share will, for the purposes of the new maxima, be regarded as an assistant. This is in line with the criteria which existed under the old distribution scheme.

33. The problem of the "salaried" partner who is guaranteed a minimum income has been met by providing that such a practitioner will be regarded as a full partner so long as his share is not below the level of one-third mentioned above and that he will participate in any balance of income which is available to the partnership over and above the amount needed to provide the guaranteed minimum.

Payment on the Basis of Notional Lists

34. One major feature of the Working Party's scheme which the Committee is confident will do much to stimulate the formation of partnerships is the arrangement whereby members of a partnership can apply to be paid on the basis of "notional lists." In order that practitioners would have as much time as possible to make any necessary arrangements before the advent of the new distribution scheme, the Committee had early discussions with the Ministry on the administrative machinery necessary to give effect to the new proposals, and detailed instructions have now been issued to executive councils.

35. Any partnership which wishes to take advantage of these arrangements is required to notify the executive council of its intentions. No special form of application is needed, and notifications must be sent either to the executive council in whose area the majority of the partners reside or, if there is no clear majority, to the executive council in whose area the majority of the partnership's patients reside. There has been a good deal of confusion in the minds of some practitioners about the notional-list arrangements, and the Committee would like to emphasize that no physical transfer of patients between the partners is necessary for this purpose—it is an arrangement purely in connexion with remuneration, to enable partnerships to take the maximum advantage of the system of loaded capitation fees.

36. To avoid any possibility of abuse and to safeguard the Central Pool, the Committee has agreed that only applications from bona fide partnerships should be granted. For this reason executive councils, in consultation with local medical committees, have been given full discretion in dealing with requests for payments on the basis of notional lists.

37. Initially, applications from partnerships which were in existence when the new scheme was announced are granted without question. In the case of new partnerships, executive councils are required to satisfy themselves generally that all the partners are taking an active part in the practice and, in particular, that no partner's share in the practice is less than one-third of the share of the partner with the greatest share. If a member of a partnership does not conform to these criteria, he will be regarded as an assistant, the notional-lists arrangement will not apply, and no loaded capitation fees will be payable for any of the additional 2,000 patients allowed in respect of such a practitioner. These provisions, which are in line with the regulation governing the size of lists, should adequately safeguard the position so far as the problem of "sleeping partners" is concerned. In addition, executive councils have discretion to withdraw consent by giving at least one month's notice if they have good reasons to doubt the bona fides of any particular partnership.

38. In the case of consent being either withheld or withdrawn, a right of appeal to the Minister has been established. In deciding such appeals, the Minister will be advised by a panel consisting equally of nominees of the Department and of the Committee.

39. The position of "salaried" partners who receive a guaranteed minimum under their partnership agreement has also been considered, and, provided that such a partner qualifies under the one-third share criterion mentioned above and that his share in the partnership rises in proportion to any increase in the firm's income over the amount needed to secure the guaranteed minimum, any application for payment on the basis of notional lists will be granted.

Initial Practice Allowances

40. One other important feature of the Working Party's Report came into operation on April 1 this year. From that date, initial practice allowances became payable in areas classified as "designated" by the Medical Practices Committee, and detailed instructions were issued to executive councils on the subject in November, 1952, following discussions between the Committee and the Ministry of Health. The Committee feels that these arrangements will do much to ease the problem of the new entrant, who, provided he commences practice in an area which is in need of further doctors, will be assured of a minimum income for three years.

41. For this period of three years initial practice allowances are payable at maximum rates of £600 in the first year, £450 in the second year, and £200 in the third year, subject in the second and third years to the conditions:

- (i) that the practitioner had obtained 150 patients by the end of the first year and 500 patients by the end of the second year; and
- (ii) that the payment in the second year is not greater than the amount necessary to make up to £1,000 the practitioner's gross income from professional sources (excluding his initial practice allowance) during the first year, and in the third year that it is not greater than the amount necessary to make up to £1,100 the gross income of the second year, again excluding his initial practice allowance.

42. In designated areas doctors genuinely setting up in single-handed practice in a practice area new to them otherwise than as a successor to a vacant practice qualify for these allowances. Doctors filling single-handed vacancies in designated areas are also eligible for an initial practice allowance for three years. The allowance in the first year will be such sum as is required to raise the income calculated on the size of the list, when taking over, to a gross total of £1,000, subject to a maximum payment of £600. Allowances in the second and third years are subject to the same conditions of income level as for doctors setting up new single-handed practices, and the same conditions as to the minimum number of the list to be reached apply to the second and third years' payments. Practitioners in receipt

of initial practice allowances are paid, in addition, normal capitation fees without any deductions.

43. Payment of initial practice allowances begins from the date on which the doctor starts his practice following his admission to the medical list. A doctor whose application to be included in the medical list is received whilst an area is classified as designated has a right to be included in the list, and his application is granted automatically by the Medical Practices Committee.

44. Executive councils are required to consult local medical committees in considering applications for initial practice allowances, and a right of appeal to the Minister exists in those cases where the application is refused. The Minister will be advised by a committee consisting of equal numbers of representatives of the Department and of general practitioners from a panel nominated by the Committee.

Qualification for Initial Practice Allowances

45. The Committee has examined a motion which was referred to it by the Special Conference to the effect that practitioners who had completed their military service before qualifying should be eligible for an initial practice allowance after two years' qualification as a medical practitioner. After careful consideration, however, it has concluded that no case exists for relaxing the criteria laid down by the Working Party.

Doctors Previously Receiving Fixed Annual Payments

46. Doctors in all areas who, when the scheme began on April 1 this year, had been in receipt of a fixed annual payment for less than three years, and whose applications for payment were received before November 24, 1952, receive a special payment on the appropriate initial practice allowance rates for the balance of the three-year period or for one year, whichever is the longer. Payment is subject to the appropriate maxima on professional earnings during the preceding year (excluding any fixed annual payment and the percentage increase in respect of it paid as a result of the Danckwerts award). If payment is due for more than one year its continuance is subject to the standard conditions relating to the size of list to be secured at the end of each year.

47. A doctor who, on April 1, 1953, was in receipt of a fixed annual payment which had continued for three years or more receives a special payment for one year. The payment is restricted to the amount by which his gross professional earnings due for the preceding year (excluding a fixed annual payment and percentage increase) fell short of £1,100, subject to a maximum of £200.

Classification of Areas

48. Shortly after the acceptance by the Conference of the Working Party's Report, the Medical Practices Committee circularized local medical committees seeking information as to the medical manpower position in each individual area. Subsequently, the Medical Practices Committee published a report containing the classification of areas as envisaged by the Working Party. It will be remembered that the country has been divided into three areas:

- (i) "designated" areas—where an application for admission to the medical list will be granted automatically by the Medical Practices Committee, and where, on admission, a doctor not proposing to practise in a partnership will be entitled to receive an initial practice allowance;
- (ii) "intermediate" areas—where an application for admission will be considered in the light of the particular circumstances and where, if granted, a doctor would not be entitled to an initial practice allowance;
- (iii) "restricted" areas—where there are generally already a sufficient number of doctors practising in the area and the admission of new doctors not already engaged in National Health Service practice in the vicinity will therefore be exceptional.

49. Average lists of 1,500 and 2,500 have been adopted as the datum lines demarcating the new types of area. The application of these figures is essentially flexible and dependent upon the type of area, the number of principals practising there, local geographical conditions, housing development, slum clearance, and possible future shifts of population, whilst the scope for professional work outside the provision of general medical services is also taken into account.

50. Although the new distribution scheme did not come into effect until April 1, 1953, the Committee felt it most desirable that doctors should be well aware in advance of the future classification of areas so that those who were proposing to set up in practice or to change their practices would be fully apprised at the earliest possible date of the position in any particular part of the country. It was therefore decided, in consultation with the Medical Practices Committee and the Ministry, that local executive councils and local medical committees should, on this occasion, be asked to content themselves with making written representations and that the classifications made in the first instance by the M.P.C. would be provisional. Now that the new schedules have been published, it will be open to executive councils, should they wish, to make any oral representations which they may deem necessary in the light of any change which may have taken place in the circumstances of their own particular areas.

51. Arrangements have also been made for the prompt publication in the medical press of any changes in the classification of an area. The M.P.C. has also undertaken to provide individual doctors with general information about the classification of any particular area, but practitioners will be well advised to get in touch with a particular executive council or local medical committee before making any final decision to set up in practice.

Group Practice

52. The Committee has considered what further steps may be necessary to stimulate the formation of partnerships working as a group practice. It will be recalled that the Working Party recommended that a sum of money (provisionally £100,000) should be set aside for this purpose. One of the major difficulties in the way of implementing this recommendation has been the absence of any clear definition of what is meant by "group practice."

53. The Committee noted with interest that the Minister of Health had announced in the House of Commons that he was asking the Committee on General Practice of the Central Health Services Council to define the term "group practice," and the Committee has been assured that any definition suggested will be submitted to it for consideration. At this stage the Committee intends to discuss with the Ministry the measures which may be found necessary to give effect to paragraph 29 of the Working Party's Report.

Additional Remuneration for Special Qualifications and Experience

54. The Committee was asked by the Special Conference last year to consider the possibility of preparing a scheme to make available from the Central Pool an agreed sum for distribution to general practitioners by way of recognition for seniority in the Service, special qualifications, and experience. This proposal was, of course, one of the matters to which the Working Party itself gave careful consideration before framing its recommendations.

55. There are many obvious difficulties in devising a practical scheme, and the Committee feels that, particularly in view of the consideration which has already been given to the proposal by the Working Party, it would be inadvisable to take the matter any further at the present time.

Inducement Payments

56. The Adjudicator, in determining the size of the Central Pool, decided that no account should be taken of the special

Inducement Fund. In consequence, the Ministry put forward the view that this Fund could not, in the light of the award, in future be regarded as a fixed percentage of the Central Pool, and that the Inducement Fund, as such, would no longer exist. Nevertheless, the Ministry agreed that in appropriate cases inducement grants would still be forthcoming from public moneys outside the Central Pool. In view of the Adjudicator's decision, the Committee could not contest this point of view. So far as the past is concerned, the Ministry has agreed that the percentage increase made under the Danckwerts award should be applied to payments which have been made since the inception of the Service from the Inducement Fund to assist doctors in these unattractive areas. Percentage additions ranging from 11% to 22% have accordingly been made in respect of the years 1949-53. They do not apply to "hardship" payments which have in the past been made from the Inducement Fund.

57. Discussions are proceeding with the Ministry on the new levels of income which should be taken into account in deciding upon future *ad hoc* payments in inducement areas.

The Danckwerts Award and the Small-list Practitioner

58. A full report of the Committee's efforts to inquire into and, where necessary, to provide assistance for certain practitioners who may suffer injustice under the new distribution scheme will be considered by the Special Conference of Local Medical Committees on May 5. A further report of the decisions taken at the Special Conference and the outcome of the Extraordinary General Meeting of the Association will be made to the Annual Conference.

Assistance for Elderly Practitioners

39. Paragraph 19 of the Working Party's Report provided for a small sum of money to be set aside from the Central Pool to deal with cases of hardship which might arise, particularly where, under the new arrangements, an elderly practitioner might lose his fixed annual payment and, after receiving an initial practice allowance for a year, finds himself less well off than he was before the new scheme of distribution came into operation.

60. Discussions were therefore held with the Ministry on the arrangements to be made for implementing this recommendation, and detailed instructions have now been issued to executive councils setting out the method and manner of the assistance which is to be given in these cases. Generally, financial help will be given to doctors who were aged 65 or over when the new distribution scheme came into effect or who subsequently attain that age and who are actively engaged in single-handed practice under the National Health Service. For this purpose, a list of at least 500 persons will normally be taken as an indication that the doctor is so engaged, but, particularly in rural areas, executive councils have discretion to accept claims from doctors with smaller lists if they are satisfied that it is reasonable to do so.

61. For the year 1953-4 the rates of payments are as follows :

(a) The maximum rate of payment is £350 per annum, payable where the doctor has a list of 500 patients under the National Health Service, or a smaller list if, in an exceptional case, he is accepted as being actively engaged in practice.

(b) This rate of payment will be decreased by 9s. (one-third of the loaded capitation fee) for each person on the doctor's list over 500.

(c) The payment for the year, subject to the overriding maximum of £350 per annum mentioned above, is limited to the amount needed to bring the doctor's income from all professional sources to £1,250.

(d) The payment for 1953-4 will be reduced by the amount of any payment to be made for this year under the arrangement to make a special allowance to practitioners who have been in receipt of a fixed annual payment for three years or more.

MODEL DISTRIBUTION SCHEME

62. With the introduction of the new proposals for the distribution of the Central Pool, it became necessary to prepare a model distribution scheme which came into effect on April 1, 1953. The scheme covers the payments to be made by executive councils under the following headings :

- (a) capitation payments ;
(b) loadings ;
(c) payments for emergency treatment ;
(d) payments for the administration of anaesthetics ;
(e) payments for the treatment of temporary residents ;
(f) the supplementary distribution to be made by executive councils after the end of each year.

63. Executive councils are normally given discretion, subject to the approval of the Minister, to vary their local distribution schemes to take account of the wishes of the doctors in their areas. Unfortunately, through pressure of work in connexion with other aspects of the Working Party's Report, it was not found possible to prepare and issue the new model scheme until the middle of March, and by then there was insufficient time for local executive councils and local medical committees to consider and to secure the approval of the Minister to any local variations which they wished to introduce. Again, the Committee is informed that, for constitutional reasons, it is not possible to present to Parliament a model scheme which provides for variation in fees not specifically included in the model. In consequence, the Regulations provided that the terms of the model distribution scheme would operate, without modification, for the year beginning April 1, 1953. In order that local variations might be introduced after April 1, 1954, executive councils were instructed to consult local medical committees and consider whether they wished to suggest any modifications in the model scheme for subsequent years.

64. In the case of fees for emergency treatment the Committee is convinced that the "knock for knock" system, which is one of the alternatives available under the model scheme, is a very satisfactory method of dealing with these payments, and a circular letter has been sent by the Committee to local medical committees advocating the adoption of this system.

**DATE OF INCLUSION OF A GENERAL
PRACTITIONER'S NAME IN THE
MEDICAL LIST**

65. The importance of assessing accurately the number of doctors in the Service has been mentioned elsewhere in this Report. Equally, it is important to ensure that uniformity of treatment is achieved so far as the date of inclusion of a doctor in the medical list is concerned. In consequence, at the Committee's request the Ministry has now issued a circular letter to executive councils, pointing out that, if a practitioner applies to have his name included in the medical list (either to succeed to a practice declared vacant or otherwise) and there is only one applicant for the vacancy, he is entitled to be placed on the medical list as from the date he was informed of his selection by the Medical Practices Committee.

66. In the case of vacancies where there are several applicants the doctor's name in the absence of an appeal is to be included in the list as from the eighth day from the Medical Practices Committee's decision. If there is an appeal the council must await the outcome of that appeal in accordance with Section 34(7) of the Act.

**PROVISIONAL APPLICATION FOR INCLUSION IN
THE MEDICAL LIST**

67. It has been the practice in the past for an applicant for inclusion in the medical list to be provisionally accepted on the understanding that the application would be confirmed when satisfactory practice premises had been obtained. With the introduction of the new distribution

scheme, the Medical Practices Committee felt that this practice should be discontinued on the grounds that the addition of one more doctor to the list might result in the reclassification of the area and have the effect of excluding another practitioner who was about to seek admission to the list and who had earmarked suitable practice premises.

68. Following discussions between the Committee and the Medical Practices Committee, it has been agreed that the practice of granting provisional admission to the medical list should be continued, and full admission to the list will be subject to the new entrant starting his practice within one month after provisional admission. This period will be renewable month by month for up to a further two months at the discretion of the council. In those cases where another practitioner is in the field who has already taken steps to secure practice premises, no extension of the original period of one month will be granted.

**REMOVAL OF PRACTITIONER'S NAME FROM THE
MEDICAL LIST**

69. The Committee received from the Ministry the draft of a new Regulation made under Subsection (2) of Section 33 of the N.H.S. Act and Section 14 of the N.H.S. (Amendment) Act, 1949. The purpose of the Regulation is to lay down the procedure to be adopted by executive councils in giving notice to a medical practitioner that it is proposed to remove his name from the medical list in cases where it is apparent that he has never undertaken the provision of general medical services, or where, having done so, he has ceased to provide such services for some considerable time. It is satisfied that adequate safeguards

70. The Committee is satisfied that adequate arrangements were provided in the draft Regulations, and that the local bodies concerned are given a large measure of discretion in dealing with these cases. It therefore accepted the new arrangements, and a circular has now been sent to executive councils on the subject.

CODE NUMBER FOR GENERAL PRACTITIONERS

71. The Committee has considered a suggestion that all general practitioners in contract with executive councils should be provided with a national code number in lieu of the present local code number which is allocated to a doctor by individual executive councils. Although the Ministry accepts the Committee's point of view that it may be inconvenient and at times confusing for doctors on the lists of several councils to have more than one number, the introduction of the Committee's proposal would require the maintenance of a central register of doctors, and the Department feels that, on the grounds of expense, such a scheme could not at present be justified. The Committee proposes to keep the suggestion under review.

FILLING OF VACANCIES

Acquisition of Vacant Practice Premises

72. The Annual Conference last year agreed that an amendment should be made to the Regulations to add a condition to the terms of service that a doctor would not, without the consent of the executive council or, on appeal, of the Medical Practices Committee, provide general medical services from the premises of an outgoing doctor for a period of not more than one year from the date of confirmation of the appointment of the successor, with a proviso that, where the owner had previously agreed with the executive council to give the successful applicant an option on the premises, if that option were not taken up within the first month the restriction on practice from the premises would lapse.

73. The Committee has now discussed with the Ministry the necessary amendment to the Regulations to give effect to this decision and the safeguards necessary to prevent any hardship arising as a result of its application. Briefly, the effect of the new regulation is that the successor to a vacant practice will have one month in which to decide whether to accept an offer of the practice premises. The terms of the

offer will have to be approved by the Medical Practices Committee, which, following the necessary inquiries, will act as expeditiously as possible. If the successor does not want the premises, or if he fails to accept the offer in a month, the premises can then be used by another doctor. If no offer of the premises is made, they cannot be used by any other doctor for a Health Service practice for a period of 12 months from the successor's appointment, except with the consent of the executive council, or, on appeal, of the Medical Practices Committee. The successor, if he is prepared to accept the offer, will be expected to complete the purchase with reasonable expedition. In certain circumstances the council, or, on appeal, the Medical Practices Committee, has power to consent to the use of the practice premises by a doctor other than the successor to the vacant practice even though their use is otherwise prohibited under the new regulation.

74. The Committee hopes that the action which has been taken will in a large measure solve the problem which has arisen when the appointed successor to a practice vacancy has found that the practice premises of the outgoing doctor have been secured by another general practitioner.

Succession to Vacant Medical Practice by a Partner

75. The Committee's attention has been drawn to the increasing practice whereby partnerships have been formed between an established single-handed doctor who intended shortly to retire and a doctor who was new both to the practice and to the district, with the intention of enabling the latter to secure the succession to what was essentially a single-handed practice. The Committee felt that this practice was against the best interests of the Service, and it has therefore agreed with the Ministry and the Medical Practices Committee that in future that Committee will not, unless there are special circumstances, accept one partner as a logical successor to another partner who has died or resigned, unless the partners have been in active practice together for about a year. The Medical Practices Committee will, of course, retain full discretion if the circumstances of any particular case merit special consideration, and the Committee appreciates that there will often be good reasons for an exception to be made. A genuine partnership might, for instance, have been formed and then terminated soon afterwards by the sudden death of the original partner or his resignation because of unexpected illness. Similarly, there might be special reasons for making an exception when the partnership had existed for less than a year but the two partners are related. Sympathetic consideration will and must be given to such cases, but the Committee is satisfied that the action it has taken is necessary in the best interests of the Service.

Transfer of Patients in Cases of Partnership

76. The Ministry, in consultation with the Committee, has advised executive councils that where a single-handed practitioner or a practitioner working with an assistant forms a new partnership there will not normally be any need for the transfer of patients *en bloc* from one list to the other, since the provisions for partners to be paid on the most advantageous division of patients between them (notional lists) will operate. Executive councils in future will not therefore be required to make block transfers of patients between lists where new partnerships are formed, except where one of the partners has a list in excess of the prescribed maxima.

Certificates Granted by the Medical Practices Committee

77. It is a common practice for doctors proposing to establish a partnership to apply to the Medical Practices Committee for a certificate under Section 35 (9) of the National Health Service Act, 1946, as proof that nothing in the proposed partnership deed involves the sale of goodwill.

78. The Ministry has advised executive councils that a certificate granted by the Medical Practices Committee for

105. During the course of its deliberations the Mileage Committee has discovered a number of anomalies in the present mileage distribution scheme, and, as a first step, a number of urban areas hitherto included in the mileage scheme have now been excluded, following consultation with the local executive councils and local medical committees concerned.

106. As the information collected for the purpose of the adjudication became available, the Mileage Committee also took the opportunity of examining the adequacy of the total amount of the Mileage Fund—namely, £2m. As a result of its deliberations, the views of the G.M.S. Committee were sought, and, in the light of the data which were made available to it, the Committee is satisfied that the overall size of the fund should not be altered, and has informed the Mileage Committee to that effect.

Classification of Practices for Mileage Purposes

107. The Committee's attention has been drawn to cases where, as a result of the operation to eliminate inflation from doctors' lists, the application of the formula which is used to classify a doctor's practice for mileage purposes results in a new classification of the practice. The Ministry has agreed that, as soon as it is practicable, executive councils should give effect to any amended classifications which emerge as a result of the pruning of lists, and make the necessary adjustments to the mileage payments.

MEDICAL SERVICE COMMITTEE PROCEDURE

108. The special subcommittee appointed to carry out a full investigation of the status, composition, procedure, and functioning of the Tribunal and Medical Service Committees has now completed its task, and its report is set out in full in Appendix C. In reaching the conclusions set out in its report, the subcommittee took full note of the views expressed by local medical committees in England and Wales, who were asked to examine the existing machinery and suggest any modifications which they felt might be necessary. Representatives of the dentists and of the pharmacists were present throughout the subcommittee's deliberations and its report expresses the views of the representatives of all three professions.

109. Subject to any views which may be expressed by the Conference, the recommendations contained in the report will be discussed with the Ministry of Health.

110. The Committee's attention was drawn to a case in which a service committee, although acquitting a practitioner of the charge brought against him, passed a rider which was, in effect, critical of his methods of conducting his practice. The Committee held that the publication of such comments was clearly undesirable, and the matter was raised with the Ministry of Health, which has now agreed that, when a service committee desires to draw the attention of a doctor to a particular point in connexion with the administration of the services, it should do so by means of a private communication and not by way of a reference in any part of its report.

111. The Committee has also considered a case which arose in Scotland in which the Tribunal had pronounced judgment on a doctor whose name was removed from the medical list although no breach of the terms of service had been committed. Counsel's opinion was obtained on the principles involved in this case, and there is no doubt that the action taken was in accord with the Act and existing regulations. Further consideration is being given to ways and means of overcoming this problem.

112. Another problem which the Committee has examined during the past session is the position of a member of a partnership *vis-à-vis* his responsibility for the acts or omissions of a second practitioner acting as his deputy or assistant.

113. Under his terms of service a practitioner is held responsible for his deputy's acts or omissions, and whilst the Committee appreciates that this provision may be equitable in the case of assistants and locums, it holds that where a

partnership exists each partner should be held fully responsible for his own actions. Moreover, in this respect, the terms of service appear to be at variance with the provisions of the Partnership Act. The Committee is therefore initiating discussions with the Ministry with a view to securing an appropriate amendment of the terms of service.

DISPENSING CAPITATION FEE

114. Following discussions between the Ministry of Health and the Rural Practices Subcommittee, the Committee agreed that a provisional increase of 50% should be made in the dispensing capitation fee from April 1, 1952. Payment was made when the Danckwerts award was implemented, and the increase has been allowed for in future calculations of the size of the Central Pool.

DISCOUNT ON DRUGS

115. The Committee has again received complaints from individual practitioners and local medical committees about the loss sustained by dispensing doctors paid on the basis of the Drug Tariff when supplying a number of proprietary preparations. This loss arises as a result of the lower rate of discount which dispensing doctors receive from wholesale drug houses, combined with the fact that the prices in the Drug Tariff are based on the wholesale price of the article to the chemist.

116. Although representations have been made on a number of occasions in the past both to the Association of the British Pharmaceutical Industry and the Ministry of Health, it has not been found possible to overcome the problem. The Committee feels it most inequitable that a doctor should suffer financial loss when dispensing for his patients, and will pursue its efforts to find a solution.

ECONOMY IN PRESCRIBING

117. The Committee has considered whether it would be practicable or desirable to impose a requirement that the dispensing costs of proprietary articles should be shown in the advertising material issued by the drug houses. A meeting was held with representatives of the Association of the British Pharmaceutical Industry, and a most helpful exchange of views took place. Both sides were agreed that doctors should be informed of the cost of the articles which they were prescribing, and that any steps which could be taken to achieve this end should be encouraged. There are, however, a number of technical difficulties in printing the price of a particular article on promotion material which is designed to cater for different markets with consequent variations in price, and the Committee feels that it would not be wise at this juncture to press for any measure of compulsion. At the same time, the Association of the British Pharmaceutical Industry was asked to use its influence with the drug houses to ensure that doctors were kept informed of the prices of drugs, particularly the more recently introduced preparations. Similarly, the Committee felt that representatives calling on general practitioners should always be prepared to provide prices of the drugs supplied by their houses, and that general practitioners should be encouraged to ask or write for this information.

118. The Committee has also considered a proposal that in the interests of national economy patients who are attending hospital regularly should have their medicines dispensed by the hospital and not by the family doctor. In the Committee's view, the sole criterion should be the interests of the patient, and the Committee takes no exception to the proposal in those cases where it is in the interests of the patient that the hospital shall undertake the dispensing.

119. Under National Health Insurance one of the greatest aids to economy lay in the doctor's ability to check his prescribing costs against an areal average. The Committee has constantly advocated the reintroduction of this system, but the arrears of work in the Pricing Bureaux, and the fact that not all prescriptions are costed, have prevented its re-establishment. Nevertheless, the Committee is discussing

with the Ministry the possibility of instituting the system of areal averages determined for the time being on a sampling basis.

MEDICINES AND APPLIANCES FOR DOCTORS' SURGERIES

120. The Committee has again pressed the Ministry to introduce arrangements for stock orders for doctors' surgeries. The Ministry itself is in favour of such a scheme on the grounds of convenience and economy, but unfortunately, because of complications arising out of the charge for prescriptions, the pharmacists have declined to proceed any further at the present time. The Committee appreciates that the pharmacists cannot be compelled to take part in the proposed arrangements, but every effort will be made to reach early agreement on this important aspect of the Pharmaceutical Service.

INVESTIGATION OF PRESCRIBING

121. The attention of the Committee has been drawn, on a number of occasions, to cases in which charges of over-prescribing brought against general practitioners and investigations into whether a particular substance is a food or a drug were not finally resolved until very many months after the issue of the prescription in question. This is obviously an unsatisfactory state of affairs both from the point of view of the individual doctor concerned and of the efficient working of the Service. The Committee therefore discussed with the Ministry ways and means by which this procedure might be speeded up without in any way infringing upon the doctor's legal rights. The main difficulty has been the time lag between the issue of a prescription and its pricing by the Pricing Bureau, but the Committee understands that Pricing Bureaux are diminishing arrears at a steady rate and that it should shortly be possible for an investigation to be initiated within three months from the issue of the prescription.

122. During the course of its discussions the Committee suggested to the Department that the time after which a prescription might be referred for investigation should be limited to a reasonable period, and this particular aspect is dealt with more fully in the report of the special subcommittee which has been reviewing the disciplinary machinery. The proposal is still under discussion.

DETERMINATION OF WHETHER A SUBSTANCE IS A DRUG

123. On several occasions during the past session the Committee's advice has been sought by local medical committees on whether a particular substance which has been prescribed by a practitioner is to be regarded as a food or a drug. Although prescriptions for these substances are referred for investigation by the Pricing Bureaux, the Committee wishes to emphasize that the reports of the Committee to the Joint Subcommittee of the Central Definition of Drugs are no more than a guide, and that every case must be dealt with on its merits.

124. The Committee recognizes that these investigations have thrown a heavy burden of work on local medical committees, but this is inevitable if the profession is to sustain its contention that an individual practitioner is quite free to prescribe whatever he considers to be in the best interests of his patient, provided always that if subsequently challenged he can justify his action before his colleagues on the local medical committee. The Committee regards this task as one of the most important of those falling on local medical committees and wishes to express its appreciation of the painstaking manner in which it has been discharged.

PRESCRIBING OF COD-LIVER OIL AND MALT AND GLUCOSE

125. The Committee received a number of complaints from general practitioners about the surcharges which were being levied in respect of prescriptions for cod-liver

oil and malt and glucose. It was felt that the increasing number of references were largely due to the result of the publication of a Report of the Joint Subcommittee on the Definition of Drugs. In consequence, the matter was discussed with the Ministry of Health, and a circular letter was issued to executive councils reminding them of the conclusions reached by the Joint Subcommittee that, as a general principle, these preparations, whose primary purpose was to provide nourishment in established diseases, should be classed as drugs.

126. Although the principles set out in the Joint Subcommittee's Report are by no means mandatory, and the individual doctor must continue to accept full responsibility for prescribing for the needs of his patients, the Committee felt that local medical committees should consider prescriptions for these substances in the light of the broad policy laid down by the Joint Subcommittee. This advice was therefore incorporated in a circular letter which the Committee sent to all local medical committees.

PRESCRIBING OF DISINFECTANTS

127. The Ministry has informed the Pricing Bureaux that, in the case of disinfectants, only prescriptions ordering more than 16 fluid ounces should be referred to executive councils for subsequent investigation by local medical committees. The Committee feels that this step will greatly diminish the number of prescriptions referred.

CHARGES FOR PRESCRIPTIONS

128. In its last Report the Committee referred to the discussions which were then taking place with the Ministry of Health as a result of the Government's decision to impose charges for prescriptions issued under the National Health Service. As a result of the Committee's intervention the original proposal that an arbitrary deduction should be made from the dispensing capitation fee was replaced by the present system whereby a dispensing doctor is called upon to account for only the number of shillings which he is actually able to collect. The Committee feels that not only does the method now adopted for the collection of these charges adequately safeguard the interests of the dispensing doctor but that the system which involves the use of postage stamps is a clear indication to the patient as to the ultimate destination of the money which is collected.

129. When the scheme was under discussion the Committee agreed that, to protect the Treasury, the existing disciplinary machinery should be extended to cover possible cases of abuse. Draft Regulations have now been approved by the Committee and will shortly be issued by the Department.

USE OF FORM E.C.10 FOR PRESCRIBING FOR MORE THAN ONE PATIENT

130. The National Pharmaceutical Union has drawn the attention of the Committee to difficulties and dangers which arise as a result of prescriptions being issued on Form E.C.10 for more than one person. Cases have occurred where a script has been issued containing prescriptions for different members of a family—some of whom may be adults and some children—with insufficient means of identification. Although the Committee is informed that this practice is not widespread, there are indications that it has increased recently, particularly since the adoption of the shilling charge on prescriptions. Apart from the fact that it is a breach of the practitioner's terms of service and renders him liable to disciplinary action, there are obvious dangers if the chemist is unaware of the doctor's intentions, and in the event of a mishap responsibility would fall mainly upon the chemist. The Committee has asked local medical committees to do all in their power to make general practitioners in their areas alive to the potential dangers involved and to co-operate to this end with local pharmaceutical committees.

AUREOMYCIN

131. The Committee has suggested to the Ministry that aureomycin should be made freely available to general practitioners. At present it can be obtained only through a hospital.

LIST OF SPECIALLY EXPENSIVE DRUGS

132. The Ministry, in agreement with the Committee, has added methyltestosterone to the list of specially expensive drugs, for the supply of which dispensing doctors paid by capitation fee receive payment over and above such fee.

133. The Committee received a number of requests that penicillin tulle should be added to the specially expensive list, in common with the sulphonamide preparations. It is at present excluded, as it is held by the Department to be an appliance and therefore not within the term "penicillin and preparations of penicillin" in the Drug Tariff. Appropriate representations are being made to the Ministry. Representations are also being made for the inclusion of "sulphex" nasal drops and "clintest" and similar types of apparatus (with the accompanying tablets).

LIST OF APPLIANCES

134. The Ministry has agreed to the inclusion of 2-in. and 3-in. stockinette bandages in the list of appliances prescribable by general practitioners in the National Health Service. It has accepted in principle the inclusion of waterproof dressings, and discussions are proceeding with the manufacturers as to a suitable specification.

135. Requests for the inclusion of the following items are under consideration by the Ministry:

Hypodermic insulin syringe calibrated at 40 units per ml.; catheter lubricant; "vaseline" gauze in 2 in. x 2 in. squares.

NATIONAL FORMULARY

136. The Committee's views were sought by the Joint Formulary Committee on the "lay-out" which would be most useful to prescribers should it be necessary to publish two editions of the *Formulary*, preserving the alphabetical classification in the edition which is predominantly in Latin. It had been suggested that with a gradual change in the use of English nomenclature there should also be a change to a pharmacological rather than an alphabetical classification.

137. After careful consideration, the Committee feels that the majority of subscribers would not welcome a formulary compiled in this way, and the Joint Formulary Committee has been so informed. The Committee, for its part, also holds that there are many advantages in reverting to the use of Latin throughout.

THE OBSTETRIC LIST

138. The Committee has given very careful consideration to a proposal put forward at the Annual Representative Meeting that the special obstetric list should be abolished. The Committee takes the view that every general practitioner is qualified in law to practise midwifery, and the artificial distinction imposed by the present Regulations is unwarranted.

Again, standards imposed by local obstetric committees for admission to the obstetric list are by no means uniform, and it is not uncommon to find that a practitioner has been included in the list of one executive council but been unsuccessful in a neighbouring council into which his practice overlaps. The Committee holds that what the general practitioner requires is the opportunity and experience to further his skill in obstetrics both domiciliary and institutional, and that this end will never be achieved by the purely administrative and artificial device of an obstetric list.

139. In Scotland and Northern Ireland every registered medical practitioner is eligible to have his name included in a list of practitioners undertaking to provide maternity services, and admission is automatic upon application.

140. The Committee believes that this procedure is much to the advantage of both the patient and the maternity

services as a whole, and an appropriate recommendation has been made to the Committee on General Practice of the Central Health Services Council.

141. The Committee was, in the meantime, asked to comment by the Ministry on the draft of a circular letter which it was proposed to send to executive councils containing advice tendered to the Ministry by the Central Health Services Council upon the procedure for the admission of doctors to local obstetric lists. Briefly, the circular stated that the existing machinery for dealing with applications passed to local obstetric committees should be continued, but that in future those committees should be recommended to insist that the applicant should have held a six months' resident appointment in an obstetric unit.

142. The Committee pointed out that, apart from the impracticability of some of the suggestions made, it was undesirable and premature that a circular embodying the advice should be sent to executive councils at the present stage when the whole question of the future of the obstetric list would shortly be under discussion. Again, many executive councils would consider the advice given in this manner as being mandatory. The Ministry was not unappreciative of the Committee's difficulties, but pointed out that the Minister was bound to publish any advice which he received from his statutory advisers. Indeed, the profession itself had attached great importance to this principle before the appointed day.

143. It was therefore agreed that, in order to meet both points of view, instead of sending an official circular to executive councils the advice would be transmitted on a personal basis to the chairmen of executive councils. It was agreed that the letter would include a paragraph which would make it clear that, although wishing to commend the advice of the C.H.S.C. to local obstetric committees, the Minister had not in the past prescribed any rigid criteria to be applied for applications to the obstetric list and he did not now propose to do so.

**ASSISTANTS AND YOUNG PRACTITIONERS
SUBCOMMITTEE**

144. The special subcommittee which was established to represent the views of assistants and unestablished principals has continued its work during the past session, and its views have been sought by the parent Committee on a number of occasions. The subcommittee has, of course, been particularly concerned with the general problem of entry into practice and of the effects of the Working Party's recommendations on the small-list practitioner. The Committee feels that the opportunity which it has, through the subcommittee, of ascertaining the views of the assistant and the unestablished principal is most valuable.

145. Particularly in the case of assistants the Committee considers it important that local medical committees should be aware of the views of this section of the profession, and hopes, wherever possible, that assistants will find representation on the local medical committee. This procedure has been adopted in a number of areas and has proved of considerable advantage both to the established practitioners and to the assistants, and the Committee therefore recommends:

Recommendation: That local medical committees be asked to take such steps as will ensure that assistants in their areas are, wherever possible, represented on each local medical committee by at least one assistant.

146. The subcommittee itself is considering further methods of facilitating the entry of assistants into practice as principals.

**MATERNITY MEDICAL SERVICES—POST-NATAL
EXAMINATIONS**

147. The National Health Service (General Medical and Pharmaceutical Services) Regulations lay down that a doctor providing maternity services shall carry out a post-natal

examination of the mother at or about six weeks after pregnancy. In the past, the Minister of Health has advised executive councils that a doctor may be taken as having complied with his obligations if the examination is undertaken within 10 weeks. In view of the importance attached to the examination, and after discussion with the Committee's representatives, the Minister has advised executive councils to accept an examination given up to 12 weeks from the date of confinement as complying with the regulations.

**DRUGS AND DRESSINGS FOR MATERNITY
PATIENTS**

148. The Ministry has been asked to examine the arrangements for providing drugs and dressings for maternity patients supplementary to those included in the maternity outfits supplied by local health authorities. It is the Ministry's policy that the outfits should be self-contained and that midwives should not encourage patients to ask their own doctors for additional supplies. Similarly, if anaesthetics, surgical spirit, and requirements such as crêpe bandages not normally included in the maternity pack are obtained from the local health authority, and not prescribed on Form E.C.10.

149. The Committee has reason to believe that there may be difficulty in some areas in obtaining supplies from the local authority, and a copy of the Ministry's letter on the subject was sent to local medical committees with a suggestion that, if necessary, those committees should approach the local authority to ensure that adequate provision for the supply of maternity outfits is made in the next year's financial estimates.

**GENERAL PRACTITIONERS AND INSTITUTIONAL
MIDWIFERY**

150. The Committee has again drawn the attention of the Ministry to its view that no maternity case should be admitted to hospital without consultation with the patient's own doctor, and that the selection of patients for maternity beds on account of home conditions should be made only after consultation between the general practitioner and the staff of the hospital concerned.

151. The Ministry is in general agreement with this policy, subject to the proviso that when the question of home conditions is under consideration the hospital should be advised through the local authority. The Ministry is prepared to say that consultations with the general practitioner should always take place, and the Department has undertaken to bring to the notice of both hospital authorities and medical officers of health the importance of such consultation, especially in those cases where the patient had originally booked a general practitioner for maternity medical services.

**CARE OF MOTHERS AND BABIES DURING THE
LYING-IN PERIOD**

152. A memorandum prepared by the Ministry for the guidance of hospital authorities, local authorities, and executive councils as to their respective responsibilities for the care of women confined in hospital and for their babies during the lying-in period was received in September, 1952. The Committee, in consultation with the Central Consultants and Specialists and Public Health Committees, welcomed the issue of the memorandum, with which it was generally in agreement, and at the same time informed the Ministry that it was desirable that the hospital authority should always ensure that not only the medical officer of health but also the general practitioner is advised of the discharge of a maternity patient from hospital.

NATIONAL INSURANCE BILL

153. Under the terms of a Bill which has now been published to amend the National Insurance Acts, the maternity

grant will be increased from £4 to £9, and the former condition of payment of the grant, that the woman should obtain a medical certificate that the confinement had taken place, has been replaced merely by a requirement that the woman has been confined. Similarly, the need for a medical certificate in connexion with applications for maternity allowances has been abolished.

154. The Committee welcomes the payment of an additional grant of £3 in the case of home confinements, which it hopes will do something to encourage domiciliary midwifery.

SALE OF GOODWILL**Preamble**

155. The Annual Representative Meeting in 1952 referred to the Council a resolution calling for an examination and report upon ways and means of procuring the restoration of the right to buy and sell the goodwill of medical practices to those general practitioners who wished to reacquire it. Subsequently, the Amending Acts Committee of the Association, after a detailed investigation of the problem, prepared a memorandum which has been submitted to the Committee for its comments and which is set out in Part I of Appendix D to this report.

Measure of Support for the Proposal

156. In the Committee's view, it is fundamental that if negotiations are to be opened with the Government it should first be firmly established whether there is any strong desire among general practitioners to return to the custom of the sale of goodwill and particularly whether the volume of support is sufficient to justify an attempt to amend Section 35 of the National Health Service Act. Consideration has been given to the possibility of instituting an inquiry throughout the profession to discover, once and for all, the views which are held on this controversial subject. Such an inquiry would, however, need to be accompanied by a very full account of the considerations involved, and even then, so complicated are the details affecting individual practices, it is by no means certain that a plebiscite would give an accurate picture of the measure of support upon which the profession's representatives could count. The Committee therefore feels that local medical committees should be given an opportunity of full discussion on the subject and that the inclusion of a reasoned statement in the Committee's Annual Report to the Conference will best achieve this end.

Practical and Economic Aspects of the Proposal

157. The principle behind the right to buy and sell goodwill, so forcibly expounded by the profession before the "appointed day," is no less a principle at the present time. Indeed, many of the difficulties in connexion with succession to practice which were prophesied by the profession in 1946 have come to pass through the insistence of the Government in abolishing the right to buy and sell goodwill. Nevertheless to-day, after four years of National Health Service practice, conditions are very different, and, apart from the question of whether the profession itself is in favour of the proposal, the Committee has had to consider the practical and economic aspects of an optional return to the sale of goodwill, on the lines suggested by the Amending Acts Committee. In this connexion it has had the benefit of the views of the Association's Compensation and Superannuation Committee (Part II of Appendix D), with which it is in full agreement.

158. In its memorandum the Amending Acts Committee suggests that, if a majority of practitioners were able to exercise the option, the value of goodwill could be stabilized at 1.5 or 1.6 years' purchase. Apart from the fact that this suggestion might be regarded as incompatible with freedom to sell in the open market, it does not take into account that the value of goodwill always varies with the type of practice, the introduction to the practice, whether it is a single-handed or partnership practice, and other factors.

Such artificial control would therefore be quite impracticable. Even if a standard rate of 1.5 or 1.6 years' purchase were established at the outset, there is no guarantee that such a rate would be maintained, and it would therefore lack the security which compensation affords. Even in a free market there is no certainty, under present circumstances, and in competition with a system of appointments to practices, that a doctor could obtain a price equal to the amount of compensation which he would be renouncing.

159. Private practices have sold, since the inception of the Act, on the average at considerably less than 1½ years' purchase price, and in the Committee's view it cannot be assumed that the return of a free market in goodwill would result in a return to the values existing in pre-Act or pre-war days. Thus, a doctor renouncing his compensation in the hope that he could enhance the goodwill of his practice would inevitably be taking a serious risk.

160. The Committee is certain that the optional return of the right to buy and sell goodwill would inevitably over the course of time lead to a universal restoration of the right. As the years go by more and more practitioners will take the compensation moneys due to them, whereas many new entrants to the Service are likely to exercise their option because they have little to lose and everything to gain. Thus the Government would have to justify the expenditure of a large sum of public money designed to compensate practitioners for the loss of the right to sell goodwill when at the same time they were parties to a proposal which would restore the very thing which the Compensation Fund was designed to prevent. The failure of any political party to support the system of sale and purchase of goodwill in a public service was a significant factor in 1946. There is no reason to believe that the position is different to-day. Indeed, it must be faced that the natural corollary to granting such an option might inevitably be a refusal on the part of the Government to pay any further compensation, a risk which would bear hard on those not exercising their option.

161. Medical practices are not static, and the complications which would ensue as a result of attempting to restore the goodwill of practices which had been dispersed or altered in any way to their detriment are obvious. Serious complications would inevitably arise in partnership practices where one partner who had entered the practice since the "appointed day" without purchasing a share might wish to exercise the option. For those in health centre practice even greater difficulties would arise. Another practical difficulty is that any area scheduled as "open" can at any time in the future be declared "closed," with the result that the practitioner who relinquishes his compensation in favour of the right to dispose of his practice may, when the time comes, find that he has what is, in effect, an unsaleable asset.

162. The Committee has also considered the probable effects of the return of goodwill upon the problem of entry into practice. Of first importance is the fact that conditions to-day are very different from those which existed before the "appointed day." The substantial increase in the capital necessary to start a practice, even without the purchase of goodwill, is already creating a serious problem for the young doctor wishing to establish himself in general practice. Moreover, the measures taken by the Government to restrict credit, the rates of interest charged by banks and financial houses, and current rates of income tax have aggravated the problem, and even if the additional money required for the purchase of a practice could be obtained it is very doubtful if the newly established doctor could meet, in his early years of practice, the very heavy commitments he would have incurred.

163. To meet this aspect of the problem it has been suggested by the Amending Acts Committee that that proportion of the £66m. renounced or repaid by those wishing to sell their practices should be used to finance purchasers if banks or finance houses refuse to accept the practice as security. (The Committee does not regard this as a likely

or practicable possibility even if the principle of sale and purchase were conceded.) For example, the suggestion would still not obviate the need for some form of selection machinery—in this case to select the applicants who would be granted loans from the Fund—and new difficulties would arise similar to those the Medical Practices Committee now experiences in selecting the successor to a vacancy.

164. The Committee is of the opinion that a universal restoration of the right to buy and sell goodwill is impracticable, since certain practitioners have already received compensation and many have received substantial sums on account. It would be unrealistic to expect that these sums could be returned to the Government. Moreover, the Committee can see no possibility of the Ministry accepting the proposal to repeal Section 35 of the Act, as by so doing the Minister would cease to retain such control over the distribution of doctors as will enable him to discharge the duties laid upon him by Parliament to provide an adequate and comprehensive Service.

165. Again, it is suggested that, where a doctor has been appointed to a vacancy, he should have the right to decide whether he should regain his right to sell by refunding to the Treasury the compensation paid to his predecessor. It seems to the Committee that this proposal again ignores the fact that the value of a practice may well have increased by the endeavours of the appointed doctor's predecessor rather than by the successor himself. Yet the latter is to benefit without any apparent exertion on his part.

166. Nevertheless, the Committee would not wish administrative difficulties or political expediency to stand in the way if the change sought is in the interest of the profession itself. On this the Committee has grave doubts. The lack of any unified call for the return of goodwill, the possible hazards facing the doctor who exercises the option, and the increased financial burden which will be placed upon the new entrant are factors which cannot be ignored. Above all, the Committee is concerned to ease the position of those wishing to enter practice. The return of the right to buy and sell goodwill, even on an optional basis, can, in the absence of such a fund as is referred to in paragraph 9, lead only to a situation where the most desirable vacancies will, in course of time, become available to those who can afford to buy. This will inevitably result in a form of discrimination in the case of new entrants which many would regard as undesirable.

Summary

167. The Committee has carefully considered the proposals put forward by the Amending Acts Committee. It has studied the practicability of these proposals in the light of the comments submitted by the Compensation and Superannuation Committee of the Association. It has had in mind the very strong views expressed by the profession on the subject before the "appointed day," and has balanced them against the very real practical and economic difficulties which would arise if an attempt were made to repeal Section 35 of the National Health Service Act. The Committee believes that under the totally different circumstances which prevail to-day many of the advantages claimed for its restoration, even if practicable, would impose a serious financial hardship upon the young man entering practice. The Committee is anxious to ensure that those who might otherwise be in favour of the principle of the right to buy and sell goodwill are fully alive to all the considerations set out above, and recommends:

Recommendation: That the Conference of Local Medical Committees, representing National Health Service practitioners throughout the country, having considered the memorandum prepared by the Amending Acts Committee and the comments of the General Medical Services Committee and the Compensation and Superannuation Committee upon it, is not in favour of the optional return of the right to buy and sell goodwill of practices, which it believes to be impracticable.

EMPLOYMENT OF GENERAL PRACTITIONERS IN HOSPITALS

168. In June, 1952, the Committee appointed a special subcommittee to consider the status and remuneration of general practitioners working in hospitals, and in particular to examine certain suggestions made by the Ministry of Health about the position of junior hospital medical staffs generally. These proposals provided for the classification of general practitioners working in hospitals into several categories according to the work undertaken and the responsibility involved.

169. In the Committee's view this subdivision was unnecessary, as it was considered that, with the exception of a small number of posts of a purely training nature, in the vast majority of general practitioners working in hospitals, although their duties might be of a diverse character, carried a comparable degree of responsibility. In character, the Committee's opinion the general practitioner, because of his knowledge of general practice and the environment of his patients, brought to the hospital a fresh outlook which would otherwise be missing, and if the right type of general practitioner was to be attracted to hospital posts proper recognition should be given to that fact. The Committee therefore recommended that all general-practitioner posts in hospitals, with the exception of a few which are more of a postgraduate educational nature, should be remunerated at the rate of £175 per annum per weekly half-day as laid down in paragraph 10 (b) of the Terms and Conditions of Service of Hospital Staffs. It was recognized, however, that the usefulness of the general practitioner might vary with the number of years which he had spent in general practice, and the Committee was therefore prepared if necessary to accept a sliding scale based on age and/or seniority within the range of £160-£190 per annum per weekly half-day.

170. The Committee agreed that the type of post which might be held to be of a training nature was that described by the Ministry in the following terms:

"The out-patient clinical assistant, often in such special departments as dermatology, paediatrics, etc. These appointments are often temporary, one or more years, and may be of a training character. The G.P. sees interesting new cases with the consultant and may see selected old ones or take histories. Responsibility is very limited."

Whilst the Committee was in agreement that these posts should not carry a salary, it felt that, if in fact they involved work over and above that which could normally be expected of a post of a training nature, an honorarium of, say, £50 should be paid. Equally, it was felt to be important that such posts should be well defined so that hospital boards would have no opportunity to set them up in place of posts which would normally be remunerated under the paragraph 10 (b) arrangements outlined above. With this in mind, it was suggested that local medical committees should be consulted before such posts were designated.

171. The Committee has made its views known to the Joint Consultants Committee, which is in negotiation with the Ministry on the subject, and representatives of the General Medical Services Committee have taken part in the discussions.

172. The Ministry was in general agreement with the Committee's contention that all non-specialist general practitioners working in hospitals other than those holding honorary posts of a training nature should be remunerated at the rate of £175 per annum per weekly half-day. Indeed, during the course of the discussions, the impression was gained that the Ministry intended to put forward proposals through the Management Side of Committee "B" of the Medical Whitley Council for alternative rates of remuneration for certain types of post.

173. The Joint Consultants Committee therefore made it quite clear to the Ministry that it could not agree upon any

points of principle regarding the classification of hospital posts to be held by general practitioners, if such agreement would prejudice the position of the Staff Side of Committee "B" in any subsequent discussions on remuneration. The Ministry has accepted this position, and it now remains to be seen whether and, if so, what proposals regarding remuneration are submitted in Whitley Council.

CO-OPERATION BETWEEN HOSPITAL, LOCAL AUTHORITY, AND GENERAL-PRACTITIONER SERVICES

174. The Committee's attention was drawn to a circular letter which was issued by the Ministry of Health to executive councils accompanying a report by a subcommittee of the Central Health Services Council on co-operation in the National Health Service between hospital, local authority, and general-practitioner services. Whilst the Committee accepts the position that any advice which the Minister receives from his statutory advisers must be published, it made a strong protest against the departure from a previous undertaking that the Ministry would always consult the Committee before proceeding with the implementation of any advice which affected general practitioners as a whole. An assurance was given by the Ministry that it had no intention of departing from the undertaking which had been given, but that in this instance it was felt that the circular letter contained nothing but a factual statement of the report and in no way constituted an acceptance of the report.

175. The Committee accepted this position, but at the same time it made a number of suggestions which it felt would facilitate the arrangements referred to in the circular and in particular ensure that general practitioners were brought into the discussions.

REPRESENTATION OF GENERAL PRACTITIONERS IN HOSPITAL ADMINISTRATION

176. The Ministry's attention has again been drawn to the importance attached both by the Annual Conference and by the Representative Body to the adequacy of general-practitioner representation at all levels of hospital administration.

177. The Committee has been in close touch with the Ministry, and is happy to report that some progress is being made in this matter. The Committee will continue to press for greater representation whenever the opportunity occurs.

DOMICILIARY CONSULTATIONS

178. The Committee's attention was drawn to the domiciliary consultation form which the South-west Regional Hospital Board proposed to issue in place of the form already agreed by the profession. The Committee felt that the certificate proposed by the regional hospital board was undesirable in a number of respects, and that no departure should be made from the model form which had previously been agreed between the Ministry of Health and the Joint Consultants Committee. Strong representations were made both centrally and locally, and the Committee now understands that the board has dropped its original proposals.

PROVISION OF DIAGNOSTIC AND ANCILLARY FACILITIES

179. The Committee continues to urge on the Ministry its firm policy that general practitioners should have direct access to diagnostic and similar hospital facilities. In particular, it made strong representations against the attempt to deny to general practitioners the direct use of the x-ray department at the Boston General Hospital. Subsequently, instructions were given by the regional hospital board that practitioners who wished might send patients directly to the x-ray department, but that the radiologist should have a right to refer the patient back without undertaking the examination, or to refer the patient first for an examination by a clinical colleague. The Committee has accepted this

arrangement, and it is hoped that general practitioners and radiologists will co-operate to secure the minimum of friction in working the scheme.

PREGNANCY TESTS AT SHEFFIELD

180. Complaints were received by the Committee that general practitioners who had formerly had direct access to the pregnancy diagnosis station at Sheffield would no longer be allowed to use the facilities provided unless the patient was referred to the centre through one of the regular clinics and examined by an obstetric specialist.

181. The Committee took the matter up with the Ministry, which pointed out that there had been some misunderstanding, as it was not its intention to restrict the use of the facilities provided in this way. It was, however, more convenient from an administrative point of view if the material was sent via the hospital laboratory normally used by the practitioner. Further, the practitioner was asked to state the reason for requiring the test, as it was intended to limit the testing to those cases where, for medical reasons, it was vital to know at once if pregnancy existed or continued. The facilities available would break down if a test was demanded in every case where a patient as a matter of convenience wished to know at an early date whether she was or remained pregnant.

182. The Committee has accepted the Ministry's explanation and is seeking an assurance that the position is fully understood by the officers of the Leeds and Sheffield Regional Hospital Boards.

NOTIFICATION OF DISCHARGE FROM HOSPITAL

183. The Committee has, on a number of occasions, referred to the failure of hospital authorities to notify the general practitioner about patients discharged from hospital. The Committee originally suggested that each hospital patient should, on discharge, be given a note to be handed to his family doctor. The Committee, however, understands that the additional clerical work involved if such a suggestion were to be universally adopted is too great an obstacle, and it has, for the time being, dropped this proposal. In return, the Ministry has given an undertaking that it will do all it can to expedite the transmission of information to general practitioners. The Committee intends to watch the position closely.

184. The Committee has also discussed with the Ministry a resolution of the Annual Conference that all hospitals should be asked to issue letters and reports to general practitioners regarding patients on stationery of a standard size. The Ministry supports this suggestion, and has agreed to bring it to the notice of hospital management committees.

RELATIONSHIP BETWEEN GENERAL PRACTITIONERS AND THE SCHOOL HEALTH SERVICE

185. Following a conference between representatives of the Association and of the Society of Medical Officers of Health to discuss the relationship between general practitioners and the School Health Service, the Committee has sought further information from local medical committees on how the agreed scheme of notification works in individual areas. The agreed scheme provides that:

(i) Where in the opinion of a medical officer employed by a local authority a child needs special investigation, other than ophthalmic examination or treatment, he should send the child to a specialist only after prior consultation with the child's own doctor, upon whom rests the responsibility for general medical care;

(ii) In consulting the general practitioner, the medical officer should give him the opportunity to make the arrangements for the consultation or to agree—by replying or in the absence of a reply—that the arrangements should be made by the medical officer;

(iii) A copy of any special report on the child received by the medical officer should be sent to the child's own doctor.

186. The Committee is satisfied from the replies received that no further action on its part is required.

VACCINATION AND IMMUNIZATION

187. Following the agreement which was reached some years ago with local authorities on the payment of a notification fee for vaccination and immunization, the Committee was surprised to learn that a local authority had refused payment of fees which were due in respect of records of a hospital staff which had been submitted by the medical officer responsible for the health of the hospital personnel. The Ministry, however, takes the view that vaccination of hospital staffs is essentially a hospital function, and that records of the vaccinal state of such staffs is a hospital responsibility. If, therefore, the local authority preferred to make use of hospital records and chose not to accept notifications in respect of individual members of the hospital service it was perfectly free to do so.

188. The Ministry, however, accepted the Committee's view that in these cases the local authority would be justified in paying the usual notification fee if it required records submitted by a hospital medical officer for individual members of the hospital staff for whom he was providing general medical services under Part IV of the Act.

HEALTH CENTRES

189. Further discussions have taken place with the Ministry of Health and with the London County Council on the draft model contract for the use of general practitioners who consent to practise from health centres. Although the negotiations have taken some time, the Committee has been mindful of the very great care which was required in drafting a form of contract which would ultimately serve as a model for other general practitioners who provided general medical services in this experimental form of practice. Nevertheless, considerable progress has been made, and it is hoped that the model contract will shortly be available to local medical committees.

SUPERANNUATION—GENERAL MEDICAL PRACTITIONERS

190. "Net remuneration" for superannuation purposes has in the past been calculated as 50% of mileage payments and 65% of all other payments. The deduction of 35% from other payments is in respect of practice expenses, and was fixed in the early days of the National Health Service. Subsequently it was established during the course of the Adjudication that practice expenses for the year 1950-1 amounted to 38.7%. With the increase in the size of the Central Pool as a result of the Danckwerts award, the formula requires adjustment, and, on the assumption that the ratio of expenses to remuneration since the award has not varied, the appropriate figure would now be 33%. The formula now put forward by the Ministry to calculate remuneration for superannuation purposes is to take 50% of payments for mileage and drugs and 70% of all other payments. The Committee, on the advice of its accountants, has accepted this proposal as reasonable but without prejudice to the result of any further inquiry into the present actual level of practice expenses.

RETIREMENT OF GENERAL PRACTITIONERS

191. Some confusion has arisen in the public mind that, when a doctor retires from his National Health Service practice, he also automatically relinquishes his private practice. At the request of the Committee, the Ministry has issued a short circular to executive councils asking them to make it clear in the notice which is sent to patients that it relates exclusively to the retirement of the doctor from his National Health Service practice.

CERTIFICATION

Certification in Times of Epidemic

192. During the influenza epidemic in the New Year the Committee asked the Ministry of National Insurance to take steps to ease the certification burden borne by general practitioners. The Ministry subsequently issued a Press statement that a note sent within three days by a patient (or a relative or friend), bearing his particulars and the date on which the illness began, would be accepted in lieu of a first medical certificate, the certificate to follow when the doctor had seen the patient at any time within the next 10 days. The Committee wishes to record its appreciation of the prompt and practical assistance given by the Ministry in this way.

Stocks of Certificate Forms

193. At the request of the Committee the Ministry of Health has arranged that, in addition to the usual sources of supply, a stock of the forms for certificates most commonly in use should also be kept by executive councils. Certain certificates, such as death and stillbirth certificates, must necessarily be excluded from such a scheme, but generally it is felt that it will be of assistance to the general practitioner to be able to obtain supplies from a common source.

Certification for Surgical Corsets

194. The Committee has again discussed with the Ministry the burden of certification falling upon general practitioners as a result of the purchase-tax concession which may be obtained on the production of a doctor's certificate for a surgical corset. The Committee felt that the time had come when the practice of requiring such a certificate for the remission of tax on a made-to-measure corset of the non-surgical type should be discontinued. The Ministry, however, has been reluctant to withdraw this form of certification in case it should increase the call for free corsets from the hospitals, but, following the Committee's representations, the Board of Customs and Excise has amended the list of conditions in respect of which a certificate from a doctor entitles the patient to a tax-free appliance.

195. It is hoped that this will have the effect of reducing the demand for certificates made upon the doctor, but, at the same time, the Committee feels that the complete abolition of the concession is the only satisfactory method of solving the problem.

REMUNERATION OF TRAINEE GENERAL PRACTITIONERS

196. The Committee is proposing to discuss with the Ministry the remuneration of trainee general practitioners in the light of the standards of remuneration established by the Danckwerts award. When the scheme was originally launched the amounts then agreed were based generally upon rates of assistants' remuneration then prevailing. The Ministry is prepared to review the present rates of payment for trainee assistants and as a preliminary step is seeking information as to the extent to which the scheme is being used. At the same time the Committee has undertaken to collect evidence as to the effect of the Danckwerts award on salaries paid to ordinary assistants.

197. The Committee has taken the opportunity to bring to the notice of the Ministry the report of its subcommittee on the whole question of the trainee general practitioner scheme.

REMUNERATION FOR ATTENDING A CASE OF DENTAL HAEMORRHAGE

198. It will be remembered that it was only after protracted negotiations that agreement was reached with the Ministry of Health that a fee should be payable to a general practitioner for attending a case of haemorrhage following a dental operation. Although local authorities were also

authorized to pay a similar fee for cases of haemorrhage which arose following dental treatment in a local authority clinic, the problem remains unresolved so far as extractions undertaken at hospital are concerned. Whilst the Committee appreciates that such cases may be few it is felt that, having conceded the principle that a general practitioner should receive a fee for this service, no discrimination can be drawn between cases which occur following treatment by a dentist and those following extraction in a hospital. Discussions on this point are proceeding with the B.D.A. and the Ministry.

199. The Committee is also considering, in consultation with the B.D.A., methods by which a general practitioner who treats a case of dental haemorrhage may secure the payment of the appropriate fee in the following circumstances:

- (i) where the haemorrhage follows an extraction by a dentist who is not in the National Health Service, and
- (ii) where the dental treatment was originally given privately, although by a dentist who undertakes National Health Service work.

THE MEDICAL ACT, 1950

200. The Committee has examined a motion referred to the Council at the Annual Representative Meeting to the effect that it would be in the interests of both the public and the profession that a period of employment of six months in general practice should be considered as one of the required appointments needed to qualify for full registration.

201. The Committee has considered the implications of this motion very carefully, and wishes to point out that the Act at present requires the provisionally qualified practitioner, in order to obtain full status, to take a post where his activities are under constant supervision. The organization and administration of present-day general practice do not permit of such detailed supervision, and the Committee is strongly opposed to the suggestion that the Medical Act should be amended in this way.

DISCLOSURE OF INFORMATION REGARDING TUBERCULOUS PERSONS TO THE MINISTRY OF HEALTH

202. The Committee's attention was drawn to a circular issued by the Ministry of Health which requested hospital management committees to send to the local offices of the Ministry of Labour particulars of all men born in 1935 who were shown by chest clinic registers to have a tuberculous history.

203. The Committee has given its support to the views expressed by the Central Ethical Committee, and agrees that a strong protest should be made to the Ministry of Health.

ADMISSION OF STUDENTS TO MEDICAL SCHOOLS

204. In his judgment Mr. Justice Danckwerts expressed the view that it might be necessary to reconsider his decision that the Central Pool should be based on the number of doctors in the Service if the number of new entrants to general practice subsequently proved to be disproportionately high. The Committee, wishing to take a long view of this problem, has decided to seek information about the numbers of students admitted to medical schools in relation to the probable future need for doctors.

205. A special subcommittee has been established with the object of investigating—

- (a) the number of students entering medical schools;
- (b) the number qualifying from the schools; and
- (c) the number of newly qualified practitioners absorbed into various branches of the profession.

206. During the course of its investigations, which will necessarily be lengthy, the special subcommittee proposes to seek the advice of an expert statistician.

MEDICAL CARDS

207. The Committee has suggested to the Ministry that a patient who wishes to take advantage of the supplementary dental and ophthalmic services although electing to remain a private patient should not be given an ordinary medical card but should be provided with a plain card which merely shows his name, address, and National Health Service number.

208. The window envelopes used by executive councils for the transmission of medical cards carry the following advice:

"If a home visit is necessary, please help your doctor by telling him before 10 a.m. (unless the case is urgent)."

209. It was suggested that it would assist doctors if this wording was expanded, and the Ministry, in agreement with the Committee, has amended the form of words to read:

"If a home visit is necessary, please help your doctor by telling him before 10 a.m. (unless the case is urgent), and giving details of symptoms."

MEDICAL RECORDS

210. Under the National Health Insurance scheme a fairly elaborate document of guidance was issued to practitioners as to the form in which their records should be kept. Until recently nothing comparable was issued under the National Health Service, and it was represented to the Committee by the Ministry that difficulties were arising in determining whether particular practitioners had complied with their obligations under the relevant paragraph of the terms of service.

211. The Ministry felt that it was desirable that clinical records should contain all information that would normally be considered by a general practitioner as necessary both to the doctor and to other practitioners who might subsequently be responsible for the care of a patient to enable proper and necessary treatment to be given. In consequence, the Ministry has, in consultation with the Committee, now issued a circular for the guidance of general practitioners indicating the form in which it is considered that medical records should be kept.

MEDICAL EXAMINATION OF STUDENT NURSES

212. For some time past the Committee has urged the Ministry to reconsider the arrangement whereby the fee for the medical examination of student nurse candidates is paid by the candidate to the doctor, the candidate being reimbursed by the hospital. The Ministry considers that the alternative put forward by the Committee, that the fee should be paid direct to the doctor by the hospital authority concerned, is not workable and that it is inadvisable to impose a uniform procedure, as the practice in different hospitals varies widely with the type of certificate they require. The Committee is not satisfied with the position and will hold further discussions with the Ministry.

CIVIL DEFENCE

213. The Ministry of Health has asked the Association to encourage general practitioners to co-operate in the Civil Defence Scheme by giving their services voluntarily in training the personnel of first-aid teams. The Ministry has asked regional hospital boards to invite local medical committees to nominate general practitioners for this purpose. Voluntary service in this capacity does not involve any commitment for service in any national emergency, nor does it release any reservist from his Service commitments.

214. The Committee has given its support to the Ministry in seeking the participation of general practitioners in this work.

PROPRIETY OF DISCLOSING CLINICAL DETAILS TO LOCAL MEDICAL COMMITTEES OR EXECUTIVE COUNCILS

215. The Annual Representative Meeting in 1952 drew to the notice of the Council the plight of practitioners who, having been asked by the executive council for clinical details of a patient prior to the council deciding whether a preparation prescribed on E.C.10 was a food or a drug, failed to get the patient's consent to such disclosure and were consequently surcharged.

216. The Committee is discussing with the Ministry a suggestion which appears to be a practical solution of the problem—namely, that clinical records of these cases should be made available only to the medical secretary of a local medical committee and not to a lay official. The local medical committee would thus be in possession of the clinical details, but it would not be informed of the name of the patient. When the committee finally reports to the executive council the clinical details would be suppressed, but the council would be advised by the clerk of the name of the patient. Thus, the medical secretary would be the only person who could connect the patient by name with the clinical details.

CENTRAL COUNCIL FOR HEALTH EDUCATION

217. The Committee has, for some time, been disturbed about the nature of various educational pamphlets which have been issued by the Central Council for Health Education warning parents against the dangers of diphtheria, measles, whooping-cough, and other diseases to which children are particularly susceptible. The Committee felt that the wording used in the pamphlets was likely to cause unnecessary alarm and that insufficient regard had been paid to the special position of the general practitioner in the field of preventive medicine.

218. Discussions have taken place with the Central Council for Health Education, and arrangements are being made to secure a closer liaison between the Central Council and the Committee on all matters affecting the general practitioner. It is hoped that, in the future, the Committee will see reprints of existing pamphlets and all new pamphlets in draft before they are issued.

NATIONAL MARRIAGE GUIDANCE COUNCIL

219. The Committee has discussed with representatives of the National Marriage Guidance Council the wording of a memorandum which that council wished to issue to Divisions of the British Medical Association, setting out ways in which it was considered that marriage counsellors and general practitioners might co-operate in this field.

220. General agreement was reached on the terms of the memorandum, except that the Committee was unable to accept a paragraph which the National Marriage Guidance Council wished to include suggesting that it would be desirable for those contemplating marriage to undergo a medical examination by their own doctor as a routine procedure. The council amended the memorandum to meet the Committee's wishes, and it has now been issued.

ACCIDENTAL POISONING OF CHILDREN BY MEDICINAL PREPARATIONS

221. The Committee, in consultation with the Pharmaceutical Society, has considered what measures can be taken to protect children against accidental poisoning by medicinal preparations. A number of meetings have been held with representatives of the Pharmaceutical Society, and various possibilities have been explored. In particular, the Committee has examined any possible legal and practical implications which might ensue from some of the suggestions which have been made, and, after careful deliberation, both

bodies have agreed that, whatever precautions the professions may jointly suggest, the main duty of protection must always rest with the parents or guardians of the children.

222. Consideration has been given to the desirability of using a standard container and of printing on the container details of a patient prior to the council deciding whether a preparation prescribed on E.C.10 was a food or a drug, failed to get the patient's consent to such disclosure and were consequently surcharged.

223. A further meeting between the representatives of the Committee and the Society will be held to consider the publication of a joint statement on these points.

THE DEFENCE TRUSTS

224. The balance sheets and statements of income and expenditure of the National Insurance Defence Trust and the General Medical Services Defence Trust for the year ended December 31, 1952, are being sent to local medical committees.

225. A statement showing the contributions so far received from each area is also being circulated to local medical committees.

A. TALBOT ROGERS,

Chairman, General Medical Services Committee.

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

Chairman and Vice-chairman

226. Dr. J. T. Baldwin and Dr. C. J. Swanson were re-appointed Chairman and Vice-Chairman respectively for the session 1952-3.

Subcommittees

227. The following subcommittees were appointed for the session: Chairman's, Rural Practitioners, Colliery Practitioners, Dispensing Capitation, Fee, and Joint Subcommittee with the Central Consultants and Specialists Committee (Scotland) on Relation of General Practitioners to Hospitals. A special subcommittee was also appointed to consider the effect of the Working Party's proposals on general practitioner remuneration in Scotland.

Representation

229. Representatives of the Subcommittee were appointed to the following Committees: Central Consultants and Specialists Committee (Scotland) and their Anaesthetic Services, Ophthalmic Services, and Radiological Services Subcommittees; Maternity Services, Public Health, Partnership Advisory, and N.H.S. (Scotland) Review Subcommittee of Scottish Committee; Staff Side of Medical Subcommittee of Scottish Advisory Committee (Whitley); Liaison Committee with Scottish Association of Executive Councils; International and Scottish Advisory Distribution Committee; Editorial Subcommittee of Prescribers' Bulletin; Medical Scottish Central Medical Recruitment Committee; Medical Advisory Committee under Regulation II of the Medical and Pharmaceutical Committees and Tribunal Regulations; Scottish General Dental Services Committee of the British Dental Services Committee of the British Dental Association. The Subcommittee has also nominated an assistant and an unestablished practitioner to represent Scotland on the Assistants and Young Practitioners Subcommittee of the G.M.S. Committee.

Training of Assistants Scheme in Scotland

231. Local medical committees were invited to nominate representatives for appointment to the regional selection committees, and each regional consultants and specialists

committee was asked to appoint a panel of consultants from which up to three would be selected by the Secretary of State to serve *ad hoc* on the selection committee.

Liaison with British Dental Association

232. Cross-representation on the Scottish General Dental Services Committee and the G.M.S. Subcommittee has been established in view of the desirability of maintaining liaison between the two professions.

Assistants and Young Practitioners Subcommittee of the G.M.S. Committee

233. Considerable discussion has taken place regarding the representation of Scotland on the above subcommittee and the means by which the interests of unestablished principals and assistants in general practice would receive adequate consideration. The Subcommittee unanimously decided that, whilst in England the representatives on the Assistants and Young Practitioners Subcommittee were elected, similar procedure would not be realistic so far as Scotland was concerned and that Scotland's representation would best be obtained by the Subcommittee appointing suitable nominees.

234. The Subcommittee has recommended that local medical committees, where possible, should co-opt an assistant, and has asked them to submit the name of a suitable assistant and/or unestablished practitioner willing to undertake the representation of his respective class of practitioner on the above subcommittee. On receipt of these names the General Medical Services Subcommittee will nominate the representatives to serve on the subcommittee for the ensuing year.

235. The attention of assistants and unestablished practitioners in Scotland has been drawn to the fact that they are represented on the above subcommittee, and they have been invited to communicate with their representative through the Scottish Office if they have any questions to raise.

Model Distribution Scheme

236. The Subcommittee has approved in general the model distribution scheme prepared by the Department giving effect to the changes introduced as a result of the Working Party's report for the distribution of the remuneration pool. Since it has not been found practicable, in the time available, to consider individual schemes, the Subcommittee has agreed to the model scheme being operated throughout Scotland for one year as from April 1, 1953, and that any variations which executive councils may wish to make as regards their own areas, after consultation with the local medical committee, and with the approval of the Secretary of State, will be given effect to on April 1, 1954.

Initial Practice Allowances

237. The Subcommittee, after consulting local medical committees, approved the criteria proposed by the Scottish Medical Practices Committee for dealing with applications for initial practice allowances. It felt, however, that difficulties in this connexion might arise once the new distribution scheme was in operation, and has suggested that adequate means of consultation between the Scottish Medical Practices Committee, executive councils, and local medical committees should be established for the purpose of dealing with any such problems.

Appeals Machinery

238. The Department of Health has proposed that an appeal by a practitioner against the decision of an executive council to grant or continue an initial practice allowance should be determined by the Scottish Medical Practices Committee with two members nominated by the Subcommittee, but without voting powers, sitting with it. The Subcommittee, after giving the question careful consideration, agreed to this procedure.

239. The Subcommittee has agreed to the same machinery for determining an appeal against the refusal of an executive council to agree to the payment of a partnership on the basis of notional lists.

Inducement Payments in Remote Areas

240. The Subcommittee's negotiations with the Department of Health for increased inducement payments resulted in the figure, taken as a guide to the level of net professional income normally appropriate to such cases, being raised to £1,400 as from April 1, 1953. The same percentage increases as applied to capitation fee payments under the Danckwerts award are to be added retrospectively to inducement payments.

Back Payments to Locumtenents

241. The Subcommittee was in agreement with the suggestions put forward by the Department (1) that a locum who had acted in a practice vacancy and who had received as remuneration the earnings of the practice should be entitled to the back money due to the practice under the award for the period of the vacancy; and (2) that a locum who had been paid on a salary basis should not receive any additional remuneration, it being assumed that the salary was in proportion to the current cost-of-living index.

Removal of Long-stay Patients from General Practitioners' Lists

242. The Subcommittee has agreed to the Department's proposal to remove from practitioners' lists the names of National Health Service patients who have been inmates of mental hospitals for two years or longer. This measure will be brought into effect along with the new distribution arrangements.

Keeping of Medical Records

243. Local medical committees have been asked to draw the attention of their constituents to the need for keeping adequate medical records, not simply for statistical purposes but also to ensure continuity of treatment, and to suggest as a guide that a practitioner should record such information as he himself would hope to receive when a patient comes to him from another area.

Excessive Prescribing

244. Considerable discussion has taken place on the question of excessive prescribing. Some local medical committees have been experiencing difficulty in deciding in certain cases referred to them for investigation whether or not a practitioner's prescribing is excessive or extravagant, and in assessing any surcharge to be imposed. The Subcommittee felt that no hard-and-fast rules could be laid down, since the decision must lie with the local medical committee according to the particular details concerning each case. It has, however, issued to local medical committees a memorandum of guidance on the general principles to be observed with a view to some degree of uniformity being obtained.

245. Another aspect of this question is the difficulty caused to practitioners by some specialists and consultants in hospitals recommending, at times, the administration of preparations which cannot properly be prescribed by practitioners under the National Health Service and the prescribing of which may result in their being asked to justify their action. Local medical committees have been asked to consider the arrangement adopted in one area for dealing with difficulties of this nature whereby it is open to a practitioner, on receiving a prescribing recommendation of the type referred to, to contact the medical superintendent of the hospital to which the specialist or consultant is attached, so that the latter may be advised of the difficulty. In this way also the undesirability of any recommendation regarding treatment being

forwarded to a practitioner via the patient in an open letter may be brought to the notice of the consultant or specialist concerned.

246. Local medical committees have also been asked to remind their constituents of the conditions under which stock order forms should be used, since it has been alleged by certain chemists that some practitioners are using Form E.C.10A for purposes other than those laid down in the Regulations.

247. An exhibition prepared by the Department of Health to illustrate the cost of certain drugs and dressings is to be shown to general practitioners and consultants through the Divisions of the Association.

Automatic Reinstatement of Servicemen's Names on Doctors' Lists

248. A solution to this question has been difficult to find, and considerable discussion has taken place with the Department. The automatic reinstatement of names on completion of national service was found to be impracticable in view of the percentage, said to be in the region of 20%, of men who do not return to their former addresses. The possibility of names being left on doctors' lists during the period of national service was also ruled out because of the element of inflation which would be involved. The Subcommittee felt, however, that since many demobilized Servicemen are under the impression that their names remain on the doctor's list the need to re-register should be stressed on Form E.C.13, and it has asked the Department to submit a draft of the revised form before it is issued to Service Departments.

Future Arrangements for Fees for Treating Temporary Residents

249. As from April 1, 1953, a fee of 5s. will be paid to practitioners for treating persons temporarily resident in convalescent homes and any other similar institutions where special arrangements for medical services are made—that is, a place of residence at which ten or more persons reside temporarily and where the executive council is satisfied that the practitioner is in regular attendance. A fee of 17s. will be paid for treating persons in private residences and institutions which do not come within that category. Executive councils are being asked to classify, in consultation with local medical committees, homes and institutions in their area to which the 5s. rate will apply. Executive councils will have discretion to vary the ratio in consultation with local medical committees. Any additional money required to operate a local scheme will be payable only in the following year and will be treated as a first charge on the final settlement money due to the council, thus reducing the amount for distribution locally to individual doctors by way of final settlement.

Future Arrangements for Payments of Fees for Emergency Treatment and Anaesthetics

250. The following scale of fees for emergency treatment has been agreed with the Department for the year 1953-4, and thereafter may be varied locally with the approval of the Secretary of State:

	£	s.	d.
(1) Emergency consultation (at any place or time)	8	6	
(2) Emergency consultation involving minor surgical operation requiring:			
Local or general anaesthetic			
Treatment of fractures		15	0
Reduction of dislocation			
(3) Administration of general anaesthetic	1	15	0

Mileage

251. The question of the division and distribution of the mileage fund has been under consideration. The Subcommittee suggested that the Interdepartmental Mileage Committee in England and the Mileage Subcommittee of

the Scottish Advisory Distribution Committee should each formulate its own distribution scheme, and that a joint committee should be set up at an appropriate stage to consider the international division of the fund. Both mileage committees have agreed to this suggestion and are examining the problem carefully before coming to any conclusion.

Dispensing Capitation Fee

252. Pending the results of the U.K. inquiry into the drug costs of dispensing doctors paid on the capitation fee basis, it would appear that prospective partners have found the information contained therein helpful in drawing up their agreements. The Partnership Advisory Subcommittee of the Scottish Committee frequently receives requests to advise and comment upon draft agreements. It will be necessary shortly to have the memorandum reprinted, as present supplies are diminishing, and this will afford an opportunity of revising the memorandum and bringing it up to date.

Partnership Arrangements

253. The memorandum on medical partnerships prepared by the Subcommittee has been in considerable demand, and it would appear that prospective partners have found the information contained therein helpful in drawing up their agreements. The Partnership Advisory Subcommittee of the Scottish Committee frequently receives requests to advise and comment upon draft agreements. It will be necessary shortly to have the memorandum reprinted, as present supplies are diminishing, and this will afford an opportunity of revising the memorandum and bringing it up to date.

Scottish Health Services Council's Report on the General Practitioner and Hospital Service

254. The Joint Subcommittee of the General Medical Services Subcommittee and the Consultants and Specialists Committee on the relation of general practitioners to hospitals has undertaken to ascertain what steps have been taken by local medical committees and regional consultants and specialists committees to consider the proposals contained in the report of the Scottish Health Services Council and what action, if any, has been taken towards implementing any of them. When this information is available the Joint Subcommittee will discuss the report further.

Mass Vaccination

255. The remuneration of practitioners for services to local authorities in the event of an outbreak of smallpox in Scotland has now been agreed. Sessional fees for vaccination etc., at clinics arranged by local authorities will be 45s. for sessions lasting from 1½ to 2½ hours and 30s. for sessions not exceeding 1 hour. A fee of 2s. 6d. for each vaccination notified will be paid to a practitioner conducting "mass vaccination" in his own surgery.

Bonus Shift Certificates

256. The Subcommittee's attention has been drawn to the frequent requests made to practitioners in colliery areas for certificates in respect of one day's absence to enable miners to claim bonus shift money. On investigation it appeared that the problem was fairly widespread, and the Private Practice Committee of the Association has taken the matter up with a view to reporting on the position in colliery areas in England and Wales. The Colliery Practitioners Subcommittee is to consider the position in Scotland when the Private Practice Committee's report is available.

Attendance at Accidents at Privately Owned Mines

257. As a result of representations, the Federation of Small Mines in Great Britain has recommended to its members that practitioners who attend at their collieries in the event of serious accidents should be granted *ex gratia* payments on a scale similar to that agreed in Scotland with the National Coal Board.

J. T. BALDWIN,

Chairman, G.M.S. Subcommittee (Scotland).

APPENDIX B

MEMORANDUM OF EVIDENCE TO THE
CENTRAL HEALTH SERVICES COUNCIL'S
COMMITTEE ON GENERAL PRACTICE

I. INTRODUCTION

1. The British Medical Association is a voluntary association of over 67,000 registered medical practitioners resident in Great Britain and overseas, and practising all branches of medicine. Of its total membership approximately 21,000 are engaged in general practice in the United Kingdom, the great majority under the National Health Service. It may therefore be claimed that the Association is in an advantageous, if not unique, position to express the views of general practitioners and to gather together the opinions of its members in other branches of medicine where they impinge upon the field of general practice.

2. The Council of the Association is conscious of the long delay in responding to the invitation to submit evidence, and wishes to express its appreciation of the patience shown in awaiting its observations.

3. The delay has been due to a number of factors, not the least being the preoccupation of the Association's Standing

Committee on National Health Service general practice with matters concerning the administration of the Service and the day-to-day problems which have arisen since the appointed day. The demands which have been made upon the time of members of this Committee, the great majority of whom are engaged in active general practice, have been heavy. In particular the long discussions which culminated in the Danckwerts award and the Report of the Working Party on the future distribution of the Central Professional Pool have, until now, made it difficult for the Committee to devote the necessary time to gather together all the information and experience it has obtained about conditions of National Health Service general practice.

4. Even now the Council does not feel that with the Service in its present stage of development it is possible to prepare a fully comprehensive memorandum embodying final recommendations on the ultimate future of general practice. The Service is less than five years old and the process of change is continuous. The Council would justifiably be open to criticism if, in the light of this comparatively short experience, it attempted to recommend far-reaching reforms in National Health Service general practice which it has not had the opportunity of submitting to the profession for discussion and approval. *Moreover, the Danckwerts award and the recommendations of the Working Party on the future distribution of the Pool must inevitably have a bearing upon the future of general practice, but the effects will not become apparent for some time to come.*

5. The Association is constantly aiming to effect improvements in the National Health Service, and has already formulated its views on a number of facets of general practice. For example, it has issued reports on "Health Centres" and "General Practice and the Training of the General Practitioner," and it is in a position to make known its views on these and many other matters on which the profession has already determined its policy.

6. The Association holds the view that the standard of service given to the public by general practitioners is of a high order, but the general medical services are kept (as are other parts of the Service) constantly under review, and the Association is ever seeking to consider and to make constructive suggestions for their improvement.

7. The future of general practice, its trends and development, is a matter of the greatest concern to all, for the service of the general practitioner to the community must necessarily be influenced by the conditions under which he works.

8. It will not be disputed that the general practitioner, in common with his professional colleagues, must have a voice in the development of the Service, and it is vital that any far-reaching modifications should be made only after the fullest possible consultation and agreement with the profession.

9. The Association has, during the course of the last four years, through the Representative Body of the Association and the Conference of Local Medical Committees, formulated a substantial number of recommendations designed to improve conditions in general practice.

10. Some of these recommendations have, after discussion with the Ministry of Health, already been implemented. Others have received partial acknowledgment, and their full implementation could be profitably pursued. Not a few have fallen by the way, and the Service has sometimes suffered as a result.

11. The Council is grateful, therefore, for the opportunity to submit this memorandum of evidence embodying existing Association policy on many matters relevant to the future of general practice. It is anxious to give all the help it can to the Committee on General Practice of the Central Health Services Council.

II. SOME GENERAL OBSERVATIONS

12. It is not always sufficiently appreciated that, so far as general medical services are concerned, the National Health Service is an extension of the facilities which were available under National Health Insurance and the Public Medical Services before July, 1948. Prior to the National Health

Service only a limited section of the community qualified for free treatment, and the right to benefit did not extend to their dependants.

13. It has been the policy of the Association since 1930 to extend the facilities provided under National Health Insurance to include dependants, and the heavy demands made upon the Service by those brought within its scope for the first time were therefore anticipated by the profession. The general practitioner has done his utmost to meet the calls made upon him, though inevitably, in so doing, he has laid himself open to certain criticisms brought about largely by the magnitude of the task devolving upon him. Indeed, there is no doubt that the general practitioner, by his full co-operation, has provided so good a Service that the public has sought to use it to capacity. That this has led to long hours of consultation in surgeries and sometimes to overcrowded waiting-rooms is not the fault of the doctor. Rather it is a measure of the public's confidence in and appreciation of the family doctor.

14. The large and increasing proportion of the public availing themselves of general medical services under the Act and the small and diminishing amount of private practice does indicate that, even allowing for changed economic conditions, the public is, by and large, well satisfied with the service given. Yet medical practice can never remain static, and general practitioners are anxious to play their full part in securing improvements in the Service. The Association is constantly in touch with the Ministry with this aim in view, and a number of recommendations which have been put forward over the past few years have already been acted upon and have become a permanent feature of the Service.

15. An obvious defect in the present Service is the tendency for the general practitioner in some areas to become isolated. In a comprehensive Health Service it was anticipated that there would be the closest possible co-operation between the three main branches of the Service at administrative level, and that this of itself would encourage the fullest co-operation between individual consultants, general practitioners, and those engaged in the field of public health. This hope has not been fulfilled, and it should be the continuous aim of those responsible for its administration to secure the complete integration of the Service both at administrative and at individual levels.

16. It is becoming more and more the policy of regional hospital boards to regard cottage and other small hospitals as annexes to the main group hospitals, and to employ consultants to the exclusion of the general practitioner. The resulting divorce of the general practitioner from his local hospital is to the detriment of both and is not in the best interests of the patient.

17. Bad housing conditions, changed economic and social circumstances, particularly the wider employment of women, and the provision of free hospital treatment are factors which have made it increasingly difficult for patients to be cared for at home. Since the introduction of the National Health Service there has been an increasing tendency on the part of the family to shift on to the State their responsibility for the care of aged and sick relatives. This is to a certain extent inevitable when so many members of the family have to be employed outside the home. Advances in methods of investigation and treatment in the specialist field have also led to an increased demand for hospital beds.

18. At the same time, modern research, the development of antibiotics, and ancillary diagnostic facilities have greatly extended the range of cases suitable for domiciliary treatment, and it is discouraging to the general practitioner when he finds that, because of the factors mentioned above, many of the most clinically satisfying of his cases must be transferred to hospital.

19. The cumulative effect of all this is reflected in the long waiting-lists for hospital beds.

20. The Association believes that, not only should the general practitioner be given every opportunity to treat his patients at home—*inter alia*, by the development of improved nursing facilities—but he should also be able, whenever appropriate, to continue the treatment of his

patients in hospital. Only in such a manner will patients be able to obtain the fullest benefit from the family doctor and hospital services.

21. The general practitioner has a particular interest in those matters of hospital policy and administration which affect the general-practitioner service, and it is important that he should be afforded an opportunity of making his point of view known. The most practicable way of achieving this is for at least one general practitioner who enjoys the confidence of his colleagues to sit on every board of governors, regional hospital board, and hospital management committee, and on medical advisory committees at all levels. He is then in a position to make known in the hospitals the views of the general practitioners in the area, and, at the same time, to keep his fellow practitioners informed on hospital matters.

22. In the past four years the general practitioner has at times felt that his work, so often referred to as the "essential link" in the whole Service, has not been properly recognized. The long delay in fully implementing the Spens Report (Appendix A), with the resulting inadequate level of general-practitioner remuneration, led to bitter controversy, anxiety, and frustration. Happily, this long and contentious chapter has now closed, for the significance of the Danckwerts award lies not only in the material benefits which it confers but in the public acknowledgment of the justice of the general practitioner's claim. The award has justified the profession's faith in itself, and the new distribution scheme which followed should go far to remedy many of the present difficulties in general practice. The methods adopted include the reduction of the maximum number of patients any individual doctor may accept under the Service; a fresh classification of the country by the Medical Practices Committee into "restricted," "designated," and "intermediate" areas (instead of the four categories previously in use), and the constant revision of individual areal classifications in the light of changing circumstances; the introduction of initial practice allowances in designated areas; the maintenance of a standard capitation fee; and a special loading in favour of the doctor with a medium-sized list. These measures should stimulate the formation of partnerships and materially ease the problems of new entrants to practice. This scheme is set out in full in Appendix B ("The Danckwerts Award and the Working Party's Findings on the Future Distribution of the Central Pool").

23. Another defect of the National Health Service which has a direct bearing upon general practice is the failure to co-ordinate at local levels the three main branches of the Service.

24. It has been said that, without sweeping changes in the whole administration of the Service, it is difficult to see what more can be done to remedy this defect other than the encouragement of a close liaison between the existing committees, councils, and boards.

25. The Association is watching with interest the progress of the liaison committees which are at present being established in some regions. Although there is much to be said for a system of cross-representation, there are obvious difficulties in advocating any one method which would give universal satisfaction. The Association is, however, firmly convinced that the local medical committee, as a statutory committee, must remain an integral part of any liaison machinery, and must continue to be regarded as the authoritative voice of general practitioners in the area. It should be recognized as the body from which advice should be sought on every occasion on matters affecting general practice. In the areas of some regional hospital boards local medical committees have formed a joint committee which has been able to make useful and practical liaison with the board on matters affecting both hospital and general practice.

26. Ultimately, it is felt that radical changes in the administrative machinery will be necessary, but the Association believes that it is still too early to decide what form these should take.

27. The problem of entry into practice is referred to elsewhere in this memorandum, and it is sufficient here to indicate that, apart from administrative modifications, no important changes are suggested at present.

28. The Association is in favour of the Trainee General Practitioner Scheme, which provides a valuable introduction to the problems of general practice. A number of modifications to the existing scheme have been suggested in a later section of this memorandum.

29. The Association is anxious to do all in its power to encourage partnership practice, and considers that assistantship "with a view" is an ideal mode of entry into general practice. Various suggestions are made elsewhere in the memorandum, particularly in Appendix D, as to the relationship between principal and assistant.

30. The Association favours, in certain areas, experiments in the development of health centres and group practice, where general practitioners may share the pooled provision of ancillary help and diagnostic aids.

31. In the past the exigencies of general practice have permitted little time for leisure. The general practitioner needs greater opportunity for postgraduate study and for reading and reflection. It is hoped that the recommendations contained in the section of the report dealing with postgraduate education, coupled with the benefits conferred by the Dankwerts award, particularly the spread of the numbers of patients, will make this possible.

32. It is believed that the widespread adoption of the recommendations which follow would go far towards providing the improvements that are needed in the conditions of general practice.

III. THE TRAINING OF THE GENERAL PRACTITIONER AND POSTGRADUATE FACILITIES

33. The training of the general practitioner has already been the subject of a report by a special committee of the Association under the chairmanship of Sir Henry Cohen. This report (see Appendix C) has been discussed by the Representative Body, and comments on its recommendations are now being sought from local Divisions of the Association in order that those most intimately concerned may have an opportunity of voicing their opinions before the Association's policy is finally determined.

34. Facilities for postgraduate training should play an important part in the general-practitioner service, and, in the Association's view, these fall into two main categories: first, those required in the period of training after registration for the special work of general practice; and, secondly, those needed in the subsequent continuous education of the general practitioner throughout his professional life.

35. In the first category, reference is made elsewhere in this memorandum to the Trainee General Practitioner Scheme, which the Association maintains is one of the valuable new features of the service in that the trainee is required under the terms of his grant to instruct his trainee in the specialty of general practice.

36. It is equally important that those practitioners who receive their first introduction to general practice as ordinary assistants should derive as much experience as possible during the tenure of their post. The principal should make it his responsibility to pass on to the young doctor his knowledge and experience. This will include not only a wide understanding of clinical medicine but also experience in the general management of patients and their relatives, the detailed administration of a practice, and the application of the law to medicine. To absorb all this will require of the assistant a different approach from that adopted towards other specialties with which he has become acquainted in hospital, but it is a valuable and indeed an essential introduction to the problems which he will have to face in general practice.

37. In the second category, it is contended that specially designed postgraduate training for general practice should go far beyond the old conception of the occasional refresher course or occasional lecture. It should take several shapes—

organized courses, ward-rounds, participation in clinical conferences, hospital work, and consultation with specialists on individual cases. In the past too little study has been made of the mechanics of the postgraduate education of the general practitioner. This, including the selection of instructors, is a matter requiring urgent consideration.

38. The association of the general practitioner with the hospital is one form of postgraduate medical education which should particularly be encouraged, and it is hoped that the good will and co-operation of boards of governors of teaching hospitals and regional hospital boards will make this increasingly possible. Reference is made to this in more detail in a later section of the memorandum dealing with the association of the general practitioner with hospital work.

39. Apart from his formal education, it is again stressed that the general practitioner must have leisure for the valuable self-education which is derived from reading and reflection.

40. The general practitioner should be given ample opportunity through postgraduate lectures and courses, including the extended use of visual methods, to keep himself up to date on modern methods of treatment and of relating them to the social conditions and types of occupation and illness which he will find in his own practice. This should be achieved with the minimum of disturbance of his practice.

41. Every regard should be had by the authorities responsible for the postgraduate education of the general practitioner, whatever form it may take, to the wishes and particular requirements of those concerned. The local medical committee can offer valuable advice on this and should always be consulted before definite arrangements are made.

42. Postgraduate facilities for principals must also be open equally to assistants in general practice.

43. Insufficient stress is laid in the education of both student and general practitioner upon preventive and social medicine and upon health education. It is essential that the general practitioner should make himself acquainted with the latest advances in preventive medicine, and he should be given every opportunity of extending his knowledge in this field. Health education should form a recognized part of his postgraduate training.

44. The late Sir Henry Brackenbury held that medicine had three main aspects—constructive, preventive, and curative. It is constructive in that the general practitioner is called upon to instruct the individual patient and the family as to the best methods of maintaining sound health; preventive in that the doctor advises each patient on the measures to be taken to avoid disease and ill-health; and curative because the practitioner is called upon to advise and treat those patients who are ill. What was true then is true to-day, and the Association holds that the general practitioner's responsibility is the attainment, maintenance, and enhancement of the physical and mental health of his patient.

45. The general practitioner is in a specially favourable position to undertake constructive and preventive work, because the patient is consulting a person whom he already knows and trusts and whose advice therefore he will more readily accept; because he is going at a time when he is not well, and will therefore be more interested in how to keep in his future; and because he is likely to be going at a stage in his complaint where preventive measures can be effectively applied.

46. It is encouraging that the present Minister of Health has recognized the unique position of the general practitioner in this field, for in a recent speech he used these words: "The general practitioner could now be the clinical leader of a team comprising all services provided by the local authority."

IV. ENTRY INTO PRACTICE

(a) General

47. The problem of entry into general practice has been under constant review since the inception of the National Health Service, and the Association is confident that many of the difficulties which have been

will largely disappear when the recommendations of the Working Party on the future distribution of the Pool have had time to take their full effect. New partnerships will be encouraged by the "notional lists" arrangement, which entitles those in partnership to claim the maximum number of "loaded" capitation fees in respect of each partner. The reduction in the maximum number of patients whom a practitioner may accept on his list and the provision of a sum of money to stimulate the formation of partnerships working as group practices are other factors which should ease the problems of the new entrant. In future, the new entrant will have accurate information about the areas which are in need of new doctors, and, provided that he chooses such an area, he can be assured of receiving substantial help.

48. The Association is alive to the fact that the problem of entry into general practice has been accentuated by the decision to reduce the hospital establishment of registrars. Although it is hoped that this will prove to be a short-term problem the Association is anxious to ensure that registrars are displaced as a result of hospital reorganization should be absorbed into general practice, while yet being afforded real opportunities of maintaining a link with the hospital service.

(b) The Machinery for Filling Practice Vacancies

49. The general arrangements for filling practice vacancies are still under consideration, and the Association is anxious to speed up the procedure, wherever possible, and to afford a greater measure of responsibility to executive councils. No final decision as to the best procedure has yet been reached, and the Association will later be discussing the matter with the Ministry of Health. The problem is one which has only arisen since the introduction of the National Health Service. Discussions have taken place with the Medical Practices Committee upon defects which have become apparent during the four years that the system has been in operation, and this has proved to be a most fruitful form of liaison.

(c) Assistantships

50. The role of the assistant in general practice is a valuable one, and, in the Association's view, provides the newly qualified practitioner with the best introduction to general practice. It is the Association's aim to encourage principals to take their assistants into partnership, and the recommendations of the Working Party were designed with that object in view. Only time and experience can show whether the further measures are likely to be required. As always, the process of achieving modifications in the Service is continuous, and the position will be carefully watched.

51. Generally the principal-assistant relationship is good, and the Association is anxious to preserve it and to give the assistant every help in making his way. One positive step which the Association has taken in this field has been the inclusion in its *Handbook* of detailed guidance on conditions of service which should be observed by both parties. A model contract has also been prepared. Extracts from the *Handbook* are set out in Appendix D. It is emphasized that terms of service for assistants should remain on a personal basis and not be governed by official regulations.

(d) Partnerships

52. The Association holds the view that partnership is a most satisfactory form of medical practice, which should be given all possible encouragement. This view was also held by the Working Party, who provided in the new distribution scheme that partners might apply to their executive councils to be paid on what the partners consider will be the most financially advantageous division of the patients between them—i.e., on the basis of notional lists.

53. Nevertheless, it must be recognized that the abolition of the sale of goodwill will continue to have a deterrent effect on partnerships. Before the introduction of the Act a practitioner taking a partner could rely upon receiving a capital sum to tide him over the difficulties of the subsequent period of reduced income whilst the practice was building

up to a level which would in some measure redress his loss of income. The abolition of this financial inducement is a deterrent which it is difficult to overcome, but, as a short-term remedy, it is suggested that a general practitioner taking another into partnership should be allowed the option of receiving forthwith a percentage of the compensation moneys due to him in proportion to the share of the practice which he surrenders. A precedent for this exists in the National Health Service (Amendment) Act, 1949, which provides that, where there is an agreement in force between members of a partnership to purchase the share of one of the partners, there shall be paid to the partner from whom the share is transferred the appropriate compensation for his share in the goodwill of the practice.

54. The Association is convinced that this one recommendation would stimulate the formation of partnerships and go a long way towards solving the immediate problem of entry into practice and diminish the number of permanent assistantships.

(e) Trainee General Practitioners

55. A detailed examination has been made of the Trainee General Practitioner Scheme, and the Association is convinced of the value of this scheme, both to the profession and to the National Health Service. The Association is aware that there are certain difficulties in the administration of the scheme which it believes can be rectified if the measures advocated in a detailed report by the General Medical Services Committee are adopted (see Appendix E). Generally, it is satisfied that the scheme should continue and that executive councils should, to demonstrate the value of these assistantships, give special consideration, other things being equal, to applications to fill vacancies in general practice which are submitted by former trainee general practitioners.

V. HEALTH CENTRES

56. The Association holds the view that the provision of health centres should be on an experimental basis, and that no large-scale building programme should be undertaken until experience has been gained in experimental centres and considerably more information is available. It is considered that new towns and large housing estates still in the planning stage would be the most appropriate places for the construction of health centres on an experimental basis. Conditions here are specially favourable in that the demand for medical services is newly created and not as yet met, and there is greater freedom in the choice of sites. It may actually be more economical to build health centres under these circumstances than to provide separate premises for local authority services and individual doctors' surgeries. Nevertheless, the Association does not consider that any one method should be adopted to the exclusion of others, and it consequently dissents from the invariable application of the view previously expressed by the Central Health Services Council that new communities should be provided with health centres from the start concurrently with schools and other public services.

57. It is difficult to see how health centres can ever be a practical proposition in rural areas; patients are not likely to take kindly to the distances which they have to travel to a centre covering a large area with a scattered population. In such areas some less formal type of group practice is likely to develop, and this could with advantage be centred upon an existing cottage hospital.

58. It must be remembered that health centres will prove to be a costly venture, and a good deal of experience will be necessary before any attempt can be made to assess their value and the enthusiasm of doctors and the public for this experimental form of practice. The views of doctors and patients at such recently opened health centres as Bristol and Woodberry Down are therefore awaited with interest. Traditionally, the patient has grown accustomed to attending for consultation at the doctor's house, where the ease of access and the more intimate environment are factors which

cannot be ignored in assessing the need and demand for health centres. During the time that health centres are being provided on an experimental basis, and under conditions which are by no means uniform, it is important to ensure that the centre has a reasonable chance of establishing itself. This could be effectively assisted by promulgating regulations that no doctor (other than a principal in the health centre or a doctor who, at the commencement of a specified period, had premises in the area in which he practised and was at that time on the executive council list) should be allowed to open a surgery (including a surgery at his residence) within an agreed area round the centre for a specified period before and after the opening of the centre. Only by the introduction of safeguards of this nature will it be possible to induce doctors to take part in what must still be regarded as an experimental form of practice with an unpredictable future.

59. It is important that, before any plans for a health centre in an area are formed, there must be the fullest consultation between the local authority, the executive council, and the local medical committee. There should also be early consultation on the choice of a site. Not only must the doctor's position in practice be safeguarded, but the financial arrangements at the centre must be discussed and agreed with the profession in advance.

60. The Report of the Association on Health Centres and a report by the General Medical Services Committee on certain administrative considerations, including a model contract, are attached (see Appendices F and G).

VI. THE DOCTOR-PATIENT RELATIONSHIP

61. In his book, *Patient and Doctor*, published in 1935, the late Sir Henry Brackenbury regarded it as fundamental that the doctor-patient relationship should be one existing between a person who is a patient and a person who is a doctor, and not between healer and disease. Sir Henry Brackenbury pointed out that: "No doctor can be, or should be, a cool, detached scientific observer dealing quite objectively with some morbid condition or process." "The attitude of the patient should not be that indicated by the question, 'What disease have I got, and will you cure it?' but that shown by such a question as, 'Will you try to discover how and why I am ill, and help me to restore my health and keep it?'" Sir Henry went on to add that "the doctor should be regarded primarily as an expert helper and health adviser rather than as a disease curer," and that "mutual confidence between patient and doctor is of the first importance for successful medical relationship, advice, and treatment."

62. No one is likely to dispute the wisdom of these views on the doctor-patient relationship, and those responsible for the administration of general medical services under the National Health Service have a responsibility to ensure that they are put into effect under conditions prevailing to-day. Has the National Health Service in any way changed the relationship between patient and doctor? There is no doubt that the inauguration of the Service has led to a generally increased demand both on the general practitioner's time and for drugs, dressings, and appliances. Some part of this demand was a natural and foreseeable result of the removal of any financial barrier between doctor and patient. Unfortunately, the publicity with which the Service was launched, and the emphasis which was laid on this very absence of financial restraint, also led a small but irresponsible section of the public to make unnecessary demands upon the profession and to fail to observe those elementary courtesies customary between doctor and patient, and so essential to the maintenance of a proper relationship between them.

63. Generally, the doctor-patient relationship has remained at a high level, and many doctors have not been slow in pointing out that the freedom from financial anxiety, if it has led to an increased demand on the doctor's time, has also improved the relationship between patient and doctor. The doctor has certainly continued to retain complete freedom in clinical judgment and treatment, and it is essential that this should continue.

64. Nevertheless, a small minority of the public have undoubtedly abused their privileges, and it may be necessary to strengthen the doctor's hand if they continue to make exorbitant demands upon the Service and fail to recognize that the doctor, though now in contract with an executive council, is still in contract also with the patient and entitled to as much consideration as he was before. During the existence of the National Health Insurance Scheme any flagrant breach of normal courtesy could adequately be dealt with by a reference by the general practitioner to the rules of conduct for patients which appeared on the medical card. Such a set of rules, even if not enforceable by penalties, would lend authority to the doctor's refusal to accede to unreasonable requests for either services or drugs. The Association strongly urges that the Minister, in consultation with the Association, should draw up a new code of conduct for patients, and that the Minister should take determined steps to bring it to the notice of every patient.

VII. RANGE OF SERVICE

65. The Association is of the opinion that general practitioners should be given every encouragement to develop special interests within the scope of general practice. This is most easily arranged in a group practice, and has been one of the arguments used in favour of health centres. The fulfilment of this need raises again the importance attached to a close association of general practitioners with hospital work, and the provision of an adequate number of clinical assistantship posts.

66. It should be emphasized that the development of a special interest should not normally be a step towards transferring to a specialty, but it would add variety to general practice and enable the practitioner to provide a fuller service for his patients. In some areas, general practitioners have found it an advantage to have among their number one who has made a special study of a particular aspect of practice and can help with difficult cases.

VIII. ACCOMMODATION

67. It is important to the future of general practice that doctors should provide clean, pleasant, and adequately equipped surgery and waiting-room accommodation compatible with the size and circumstances of the practice.

68. The Danckwerts award and the improved rates of remuneration present a new opportunity for general practitioners to review the surgery and accommodation facilities provided for the public and, where necessary, to effect improvement.

69. Unfortunately, the shortage of houses will inevitably retard progress in this direction for some time to come. While most war damage has now been made good, many property owners find themselves faced with a backlog of repairs and dilapidations which it was impossible to deal with during the war period and which, by reason of the high cost of labour and materials and of licensing restrictions, cannot all be made good at once.

70. The general practitioner himself has certain obligations under his terms of service, and representatives of executive councils already have power to inspect surgery premises. The Association thinks that this provides adequate safeguards and is opposed to any suggestion that minimum standards should be laid down.

IX. CERTIFICATION

71. The position of the State as an interested third party, the continued shortage of essential commodities, food rationing, and the growth of various forms of industrial insurance resulted at the commencement of the National Health Service in an increase in the number of certificates required. These certificates vary slightly in form according to the purpose for which they are needed or the stage which the patient's illness has reached, and it is the doctor's task to be familiar with the different types of certificate and their uses. Certification must never be more than a subsidiary

function of a general practitioner, but it has at times proved unnecessarily irksome, and the Association welcomed the helpful suggestions made by the Safford Committee for reducing the number of certificates in use. This report is annexed (Appendix H).

72. It would be of great help to the general practitioner if he could obtain the more usual forms of certificates required by the various Ministries, the local health authority, the public health laboratory, and the hospital authority from his local executive council as well as from normal sources. This may well be a matter for arrangement at local level, and while it would not be possible to extend it to all certificates—the death and stillbirth certificate forms issued by the registrar of births and deaths, for instance, could hardly be supplied in this way—nevertheless it would be a great convenience to the busy general practitioner.

73. It is also strongly recommended that, when any trade, industrial, or professional agreement is being negotiated which will necessitate the presentation of medical certificates or a medical opinion, the profession should be represented in order that it may have an early opportunity of making known its views on the kind of information which its members will subsequently be called on to provide.

X. PRESCRIBING AND DISPENSING

74. The Association has been seriously concerned at the steadily mounting cost of the pharmaceutical services, and has been active in suggesting to the Ministry ways and means by which the expenditure can be reduced without detriment to the patient.

75. A number of proposals have been made by the Association, and discussed with the Ministry. These included the issue of the *Prescribers' Notes*, now an established and successful feature of the Service, the reintroduction of the system of notifying areal averages of prescribing costs, and the issue of a comprehensive list of proprietary preparations with their reputed therapeutic equivalents.

76. The Association has on all possible occasions emphasized the need to bring home to the public the heavy cost of drugs and appliances. It has also suggested that those responsible for teaching medical students should draw attention to the cost of drugs, particularly those in the more expensive ranges, and emphasize the need for reasonable economy at all times.

77. As another step towards economy, it is hoped that, wherever possible, promotion material distributed by the drug houses will show the price of the drugs being advertised. Discussions have been held with the Association of the British Pharmaceutical Industry, which, whilst for practical reasons opposed to any legal requirements, has expressed its willingness to co-operate in this way. The practitioner should also be kept advised of the cost of analogous *National Formulary* preparations so that he may be in a position to make comparisons of cost. The Association recognizes that this may prove difficult, but it is important that all practitioners should be made aware of the cost of the more expensive preparations they prescribe.

78. One major practical proposition put to the Ministry by the Association was that doctors should be allowed to order on official prescription forms stocks of medicines and dressings for emergency use in their surgeries. Apart from the inconvenience to the public, there is no doubt that the introduction of such an arrangement would lead to considerable economies in the drug field. Discussions have taken place on a number of occasions between the Association, the Ministry of Health, and the National Pharmaceutical Union. Indeed, at one time the two professional bodies had prepared an agreed list of preparations and appliances which it was intended a doctor should order in bulk on a special form E.C.10A. An outline of the scheme is shown in Appendix I. Unfortunately, shortly after this agreement had been concluded, the introduction of the shilling levy on prescriptions brought new problems to light, and the National Pharmaceutical Union felt unable to proceed with the scheme. The arrangements set out above have been working well in Scotland since 1914, and the Association recommends that

they should be extended to England and Wales without further delay in the interests of the patient and as a means of reducing the costs of the pharmaceutical service.

79. The general practitioner must always be free to prescribe whatever drugs he considers necessary for the proper treatment of his patients. The Association is glad to note that the policy of the Definition of Drugs Joint Subcommittee supports this view, though the Association recognizes that a general practitioner must always be prepared to justify his action should a case of alleged extravagant prescribing be brought against him.

80. The general practitioner has full control over what he prescribes, but he is sometimes placed in an embarrassing position when, for good and sufficient reasons, he considers it necessary to order some drug in a form other than that recommended by the consultant to whom the patient has been referred for advice. It is felt that hospital medical staffs should be notified of the measures which are being designed to effect economy in prescribing and that, when patients are referred back to their general practitioners with advice, due regard should be paid to economy.

81. The Association considers that the normal practice of the consultant informing the general practitioner of his findings by letter is the best way of passing on information about the treatment he has ordered. In this way the complete confidence of the communication is ensured, and the consultant has an opportunity of informing the general practitioner why he may have considered it necessary to order some particularly expensive preparation.

82. One continuing source of irritation is that a doctor is frequently required to justify his prescribing many months after the incident which gave rise to the issue of the prescription. Many of these cases do not relate to over-prescribing at all, but to the prescription of articles not strictly defined as drugs. This delay is understood to be entirely due to the fact that pricing offices are many months behind in their work and are unable promptly to inform executive councils of cases in which they consider a surcharge might be levied. Some reasonable restriction should therefore be placed upon the period after which a pricing committee can refer a prescription for investigation.

83. Under National Health Insurance one of the greatest aids to economy lay in the doctor's ability to check his prescribing costs against an areal average. While it is unlikely that full costing can be achieved for some time to come, it is understood that pricing bureaux are now reducing their arrears of work and that in the near future it may be expected that any prescription challenged will be investigated within a period of three months from issue. Every effort should be made to establish the system of areal averages, if only on a sampling basis, as this is considered to be far and away the most effective method of drawing attention to and so controlling excessive prescribing.

XI. MATERNITY MEDICAL SERVICES

84. On the whole, the arrangements for maternity medical services have worked satisfactorily, but experience has brought to light a number of difficulties which, in the interests of doctor and patient alike, should speedily be removed.

85. The family doctor has always regarded midwifery as a most important—and indeed essential—part of his work. It is recognized to-day that the number of domiciliary confinements is determined largely by social conditions. It should be the rule, however, that hospital maternity beds should be occupied by patients requiring them on medical grounds or where admission is necessary for social reasons.

86. They should not otherwise be used for normal confinements. For a normal maternity case to occupy a hospital bed solely to suit the convenience of the patient may be to deprive another patient of a bed at a time when the services of a consultant may urgently be required. The position has been worsened by the Maternity Benefit Regulations, which at present take no cognizance of the fact that confinement in hospital carries with it free board and maintenance.

87. The decline in the number of confinements undertaken by the general practitioner alone, or in conjunction with the domiciliary midwife, is depriving him not only of necessary experience in dealing with deviations from the normal but also of a most interesting and satisfying part of his work. The Association considers that immediate steps should be taken, wherever possible, to reduce the increasing number of institutional confinements, and recommends that maternity cases should be accepted at clinics or hospitals only on the recommendation of the general practitioner. Normally, such a recommendation would be made on grounds of medical need or where confinement at home is not possible for social reasons.

88. Finally, the inability of the general-practitioner obstetrician to follow his patients into hospital is one of the most unfortunate aspects of the service. The provision of an adequate number of beds in hospital maternity units for general-practitioner obstetricians would give great encouragement to the general practitioner. A logical development would be the establishment of maternity units fully staffed by general practitioners, to which consultant services would always be available when required.

The Obstetric List

89. Every general practitioner is qualified, in law, to practise midwifery, and the artificial distinction imposed by the present regulations has, in practice, done nothing to raise the standard of midwifery.

90. The standards imposed by local obstetric committees for admission to the obstetric list are by no means uniform, and in not a few instances a practitioner has been included in the list of one executive council and has been unsuccessful in a neighbouring council in which his practice overlaps.

91. It is submitted that what the general practitioner requires is opportunity and experience to further his skill in obstetrics, both domiciliary and institutional, and this will never be achieved by the purely administrative and artificial device of an obstetric list.

92. The Association believes that the procedure followed in Scotland is much to the advantage both of the patient and of the maternity services as a whole. In Scotland and Northern Ireland every registered medical practitioner is eligible to have his name included in a list of practitioners undertaking to provide maternity services. Indeed, unless the practitioner expresses a wish not to be so included, admission is automatic upon his inclusion in the medical list.

93. This policy has been fully vindicated by the lack of any differentiation in the maternity morbidity and mortality rates for the two countries. The Association recommends that the Scottish procedure should be extended to England and Wales.

XII. THE GENERAL PRACTITIONER AND HOSPITAL WORK

94. Reference has already been made in the introduction to this document to the isolation of the general practitioner and his exclusion from hospital work. Opportunities for co-operation with consultant members of hospital staffs should be increased.

95. This problem has two main aspects. First, the need to provide an adequate number of general-practitioner beds where the general practitioner can accept full clinical responsibility for the care of his own patients whose treatment is within his competence. Modern social conditions often prevent the general practitioner from continuing domiciliary treatment although medical considerations alone would not always necessitate the removal of the patient to hospital. Because of the lack of general-practitioner beds these patients are obliged to occupy beds under the care of specialists to the exclusion of more serious cases which require consultant attention. The Association holds that, as a first step, the smaller general-practitioner and cottage hospitals should be returned to and retained by the general practitioner, and that, as a long-term policy, beds

should be set aside in every general hospital, of whatever size, for the treatment of patients by their own general practitioners. These general-practitioner hospitals should be closely linked with a "parent" hospital for the purpose of regular consultant visiting arrangements. It is important that they should not become isolated units and that the general practitioner and the visiting consultant should work in harmony. Consultants should not merely be on call for emergency work or consultations, but should attend at regular intervals. Their visits should be made in an advisory rather than a supervisory capacity.

96. Secondly, it is essential that the general practitioner should be given every opportunity of taking part in the life of his local hospital. This has been achieved to some extent in the smaller hospitals in rural areas where personal contact is more readily maintained, but it is essential to the future of general practice that the general practitioner should ultimately have a recognized place in the larger provincial and teaching hospitals. It was confidently expected that the introduction of a comprehensive health service would achieve this end, but unfortunately the opportunity has not been seized, and the integration of the general practitioner with the hospital service has been the exception rather than the rule. The situation can, however, quickly be remedied by the appointment of such general practitioners as are appropriately qualified and experienced to all grades of hospital appointments, as part-time consultants, senior hospital medical officers, junior hospital medical officers, registrars, or clinical assistants. Such a step would ensure a closer integration between the two branches of the Service and bring lasting benefit to the patient. It is clear from his address to the annual meeting of the Executive Councils' Association that the Minister himself attaches great importance to the integration of the hospital and family doctor service. The Minister said:

"General practitioners in the smaller towns and rural areas should be able to have charge of their own patients not needing specialist care although needing admission to hospital; selected general practitioners should hold part-time hospital posts of a general or specialized character." The creation of non-specialist posts for the general practitioner in hospitals is a policy which has the full support of the Association, and the Minister's pronouncement on the subject has been widely welcomed.

97. Particular importance is attached to clinical assistantships, and it is anticipated that many of these posts, although in themselves permanent, would be held by a number of general practitioners in rotation. Where they are not purely educational, the holders would have certain definite responsibilities. The Association is of the opinion that the general practitioner, because of his knowledge gained in general practice of the environment and the social and occupational problems of his patient, brings to the hospital a fresh outlook which would otherwise be difficult to obtain. Proper recognition should be given to this fact, as it affects the general practitioner's usefulness in whatever role he enters the hospital.

98. To-day the great majority of consultants have obtained their hospital appointments with no experience of general practice and have spent their period of training entirely within the precincts of the hospital, whereas in the past a number of them undertook a period in general practice before securing a hospital appointment. It should be entirely a matter for the individual concerned to decide whether he will personally benefit from experience gained in this way, and it should in no way jeopardize his consultant career if he decides to work temporarily in general practice. The normal "hospital ladder" of promotion has, however, become so rigidly established that it is now virtually impossible to obtain a hospital appointment of senior status through any other channel, and this necessarily influences the potential consultant. The Association believes that this is wrong and that the future consultants should have a free choice, and that equally there should be no bar against the general practitioner as such who seeks consultant status.

99. The Association's policy on this whole question is set out fully in a report entitled "The Association of the General Practitioner with Hospital Work." (Appendix J.)

Diagnostic Facilities

100. One of the faults of the Service still persisting in many areas has been that hospital authorities tended to require that requests from a general practitioner for some diagnostic procedure—an x-ray examination or a pathological report—should first be referred to the appropriate department, where the consultant in charge would decide whether the request should be met. This procedure is wasteful both of out-patient facilities at the hospital and of the time of the consultant concerned, for the point at which the consultant's opinion may be of greatest value is when the necessary preliminary investigations have been made. In many cases the results of the investigations are satisfactory, and it is not necessary to seek consultant advice at all. This "closed door" policy has resulted in a good deal of annoyance and justifiable criticism, and promotes misunderstanding between general practitioner and consultant.

101. The Association holds strongly to the view that general practitioners should have direct access to the consultants in charge of pathological and radiological departments in all areas. In areas where this policy has been adopted, great care has been exercised by general practitioners not to abuse the facilities available.

Physiotherapy

102. The Association believes that physiotherapy is a valuable adjunct to the rehabilitation of the patient, but the more extensive facilities provided in the last few years have sometimes been used improvidently, and unnecessarily heavy demands have been made upon the departments themselves and upon ambulance and other hospital transport. The present long waiting period for treatment might well be reduced if patients could be sent by the general practitioner direct to the medical officer in charge of the department without having first to go through other clinics in the hospital out-patient department. In country districts mobile physiotherapy units have proved to be of considerable value.

103. It is desirable that the physiotherapy department should work in close co-operation with the family doctor. In smaller hospitals the day-to-day supervision of such a department might well be placed under the care of a general practitioner who has acquired special experience of the work and who would work in co-operation with a consultant charged with the supervision of a number of physiotherapy departments in the region. At present, as a general rule, a general practitioner who sends a patient to hospital for physiotherapy loses contact with the case, and has no control over and little information about his patient's progress.

104. The initial treatment of a patient by a general practitioner and his subsequent rehabilitation often involving physiotherapy are parts of one and the same process, and it is essential that the general practitioner and medical officer in charge of the department should work together with the object of returning the patient to suitable work at the earliest possible moment. For the convenience of the patient who is fit to return to work but still requiring some treatment, the Association favours the provision of evening clinics whenever possible.

Hospital Admission and Discharge, Including the Role of Almoner and Out-patient Department: Ambulance Arrangements

105. Experience has shown that a number of improvements could readily be made in hospital administration which would free the general practitioner from a number of tasks which at present unnecessarily take up a good deal of his time.

106. It is the policy of the Ministry, in which the Association concurs, that every hospital should have a reasonable appointments system. The Association also considers it essential that a proportion of the time available for out-patient consultations should be kept free for urgent cases.

107. Every effort should be made to restrict hospital out-patient departments to cases on which the general practitioner requires a second opinion, and the departments should not be used for the continued treatment of cases which can properly be treated by the general practitioner. Patients should be returned to the general practitioner at the earliest opportunity, except where essential treatment can be given only at hospital. There will, of course, be cases where for good and proper reasons the consultant himself will wish to maintain direct supervision over a particular patient. If these measures are adopted it should be possible to effect a quicker turnover of out-patient waiting-lists.

108. It is considered that, as a general rule, once a hospital has agreed to accept a patient for consultation or admission the responsibility for providing transport should fall upon the hospital authorities. It is not suggested that the ambulance service should be administered by the hospital, but rather that the requisition of an ambulance should be the responsibility of the hospital at the request of the general practitioner. In country areas, general practitioners have found that requests for ambulance transport, usually by telephone, are time-consuming. The general practitioner's time is thus wastefully employed, and proper attention to these points of detail would enable him to give greater individual attention to his patients.

109. Another matter of concern to general practitioners is the time lag between the discharge from hospital or death of a patient and the receipt of information by the family doctor. In general, it has been the experience of general practitioners that, although reports on patients are full and helpful, they do not reach him until the patient has been discharged for some time. One remedy would be for arrangements to be made for a note to be given to each patient on discharge, setting out the position regarding treatment and certification, with instructions to hand it immediately to the patient's own doctor. In certain cases, it might be found preferable to send the note through the post. It is suggested that the normal procedure might be for the initial notification to take the form of a brief note by the house-officer, which would serve to keep the general practitioner informed of the patient's discharge, followed at the earliest opportunity by a more detailed report from the consultant in charge of the case. The exact method to be adopted would in any case be a matter of administrative procedure to be settled locally between the two branches of the profession.

110. The Association is concerned with the difficulties experienced by general practitioners and the time involved in obtaining speedy admission of patients to hospital, and has considered, in conjunction with the Ministry, ways and means of relieving the present shortage of beds and improving the existing machinery for the admission of emergency cases.

111. It is considered that, once the initial request for a bed has been made by a general practitioner, all subsequent arrangements should normally be made through the hospital administrative machinery, as was the case prior to the Act, when the public assistance department accepted responsibility for making any necessary arrangements. The Ministry has brought a number of the suggestions made by the Association to the attention of regional hospital boards—particularly a proposal to establish closer liaison between regional hospital boards and local medical committees, so that the general practitioner's difficulties in hospital matters may more readily be made known.

112. Every endeavour is being made to improve the emergency admissions machinery, and, while it is not possible at present to establish a uniform method throughout the country, it is important that at least in the more popu-

lated parts admission should be on a group basis. In a number of areas it appears to be the normal practice for the general practitioner to make a direct approach to the hospital he considers appropriate, and it is not proposed to interfere with this practice. He often has difficulty, however, in making contact with the appropriate resident at the hospital, and a great deal of time can be wasted in this way. A modern telephone and "call" system is of the greatest assistance to all concerned, and the efficiency of the Service would be much increased if all hospitals were equipped with up-to-date internal communications. Generally the aim is to establish machinery at each level—small hospital, large hospital, hospital management committee, emergency bed service, or regional headquarters—whereby there will be an officer who will be responsible for allocating beds in the area, so that once the general practitioner has made his request for a bed he will have done all that is required of him to secure the admission of the patient.

113. It is hoped that additional facilities for general practitioners on these lines, so essential in times of epidemic, will be extended through the country.

114. The Association is also concerned with the problem of finding suitable accommodation for elderly people who require nursing or whose home conditions are unsuitable. At present, a great deal of the general practitioner's time is taken up in abortive efforts to find suitable institutional accommodation for the elderly sick. It would be of assistance if financial help could be given more extensively to provide night-attendant care and similar services and so enable these people to be cared for in their own homes.

115. The Association is well aware that the present pressure on hospital accommodation leaves little margin, and it has made several suggestions to the Ministry for alleviating the present shortage of beds, which could be of serious consequence should an epidemic arise. Amongst these are proposals that special accommodation should be provided for elderly people who do not require skilled nursing, and that the practicability of extending the district night-attendant service (already in operation in certain areas) and the daytime home nursing and home help services should be explored.

XIII. RELATIONS BETWEEN GENERAL PRACTITIONERS AND CONSULTANTS

Representation of the General Practitioner in Hospital Administration

116. It is the Association's policy that there should be adequate representation of the general practitioner at all levels of hospital administration. Especially is this important at hospital management committee level, where the general practitioner, particularly if he finds a place on the group medical advisory committee, can ensure that the day-by-day problems of general practice are brought to the notice of those who shape and are responsible for hospital policy and administration. Where representation has been secured, there is no doubt that a closer integration of the hospital and general-practitioner services has resulted, to the benefit of the patient. It is to be hoped that in future the Ministry of Health will set an example by ensuring that there is a general-practitioner representative enjoying the confidence of his colleagues on every regional hospital board or board of governors. This step alone would give an impetus to general-practitioner representation at lower levels of hospital administration.

XIV. LIAISON WITH LOCAL AUTHORITY SERVICES

117. Section 19 (3) of the National Health Service Act and Part II of the Fourth Schedule provide that every local health authority shall establish a health committee, to whom shall stand referred all matters relating to the discharge of its functions as a local health authority. It is laid down that the majority of the members of the health committee shall

be members of the local authority, but no directions are given as to the exercise of its powers of co-option. The Association considers that there should be an amendment of the Act requiring local authorities to exercise their powers of co-option to secure the inclusion in the statutory health committees of not fewer than two medical practitioners representative of the local medical profession, selected from among those nominated by the appropriate local medical committees, part-time employment by the local authority not being a bar to co-option.

118. In fairness, it should be said that the majority of local authorities have secured general-practitioner representation on their health committees, but an amendment of the Act, as recommended, would ensure universal application of this essential liaison between the two fields.

119. The closest possible liaison should exist between the general practitioner and the medical officer of health. Their problems overlap to a large extent, and there is much to be said for a medical officer of health spending a period in general practice before embarking upon his permanent career. Certainly more stress should be laid on preventive and social medicine in the training of the general practitioner.

XV. LOCAL AUTHORITY CLINICS

120. In the past relations between local authority clinics and the general practitioner have not always been good. Indeed, it was common experience to find that instructions had been given without the knowledge of the patient's family doctor to the embarrassment of both doctor and patient. The position has improved in some areas in the last few years, but the only certain way to obviate difficulties of this kind is to ensure an effective liaison between the various branches of the Service as advocated elsewhere in this report.

121. It is hoped that general practitioners will in the future be given every encouragement to play a full part in the type of work at present undertaken by local authority clinics. Indeed, it would be difficult to give effect to the Minister's view that the general practitioner should be the "leader of the team" unless this were the case.

XVI. SCHOOL HEALTH SERVICE

122. Considerable thought has been given to the position of the School Health Service and the desirability of maintaining the closest possible liaison between the general practitioner and the school medical officer. The general practitioner's role is one of continuous responsibility, and the closer the liaison between the School Health Service and the general practitioner the greater the benefit to the child. Some of the difficulties which have been experienced may well be due to the fact that the School Health Service was established before the National Health Service Act, and still is independent of the National Health Service.

123. The Association believes that the following principles should govern the relationship between the general practitioner and the school medical officer:

(1) Where, in the opinion of a medical officer employed by a local authority, a child needs special investigation (other than an ophthalmic examination) or treatment, he should send the child to a specialist only after prior consultation with the child's own doctor, upon whom rests the responsibility for general medical care.

(2) In consulting the general practitioner, the medical officer should give him the opportunity to make the arrangements for the consultation or to agree—by reply or in the absence of a reply—that the arrangements should be made by the medical officer.

(3) A copy of any special report on the child received by the medical officer should be sent to the child's own doctor.

124. These views are shared jointly by the Association and the Society of Medical Officers of Health, and every effort is being made to introduce them throughout the country.

XVII. AFTERCARE AND DUTIES OF HEALTH VISITORS

125. The Association welcomes the view of the Ministry of Health that there should be the closest co-operation between the medical officers of health and general practitioners on the provision of aftercare. When a patient is discharged from hospital there will in certain circumstances be a statutory requirement that details of aftercare requirements should immediately be transmitted by the hospital to the medical officer of health. It is of even greater importance that they should at all times be sent to the patient's family doctor.

126. Complaints are sometimes received of the attitude adopted by certain health visitors which suggest that there is need for a review of the functions and activities of these officers. Hitherto, health visitors were mainly concerned with maternity and child welfare, but now they have tended to become general social workers, visiting the home for a variety of purposes. Some reorientation of training and attitude is required to meet the new type of duty, and in the present transitional stage a number of health visitors, failing to appreciate the change, are causing difficulty between doctors and patients. The training of the health visitor should consist of a basic training in nursing and a general training in social work specially related to the environment of the patient, and it should emphasize the need for close co-operation with the family doctor. It should not be, as has sometimes happened in the past, that independent advice contrary to that given by the family doctor is given by the health visitor. It is advisable for the medical officer of health to make such administrative arrangements in consultation with local medical committees as will ensure proper co-ordination.

127. The patient will derive the maximum benefit only when the general practitioner, the health visitor, the home nurse, and the midwife work together as a team, and the Association is strongly of the opinion that all possible steps should be taken by those responsible to achieve this desirable end.

XVIII. CONVALESCENT FACILITIES

128. At present, patients who require a period of rehabilitation under medical supervision may be accommodated in convalescent homes by arrangement with the hospital authority. The local authority is enabled to provide suitable persons with recuperative holidays when no medical attention is required. The Association would like to see a return to the simpler procedure in existence before the war, when a general practitioner was able to arrange convalescent care for his patient on the strength of his personally signed note, and was not required to refer his patient first to the hospital or to the local authority.

XIX. ANCILLARY HELP

129. There is no doubt that the provision of efficient secretarial assistance is an important factor in the administration of a busy practice, and enables the general practitioner to devote more time to his clinical work.

130. The Danckwerts award will, it is hoped, enable doctors to review their practice arrangements and make it easier for them to provide the necessary ancillary help. Moreover, the recommendations of the Working Party are designed to promote partnership practice, and this of itself will enable the expenses of a secretary to be shared by the various members of the firm.

131. The Association is, however, firmly of the view that the provision of ancillary help is a matter which every general practitioner must decide for himself in the light of his own particular circumstances and wishes.

XX. DISCIPLINARY PROCEDURE

132. Generally, the Association is satisfied that the present disciplinary machinery of a quasi-legal character is effective and best suited for dealing with alleged breaches of the

terms of service by professional men and women. Inevitably, however, experience has brought to light a good many faults which should be remedied. The Association is now in the course of investigating the whole Service Committee and Tribunal procedure. The results will be submitted to the profession in the near future, and such changes as are recommended will be referred to the Ministry of Health.

XXI. ARBITRATION

133. The Association, in surveying the progress made by the profession in negotiating improvements in the terms and conditions of service for general practitioners, is convinced that the absence, after nearly five years, of any agreed arbitration machinery has had a stultifying effect on negotiations. It is admitted at once that the Ministry gave its consent to the appointment of an adjudicator to settle the dispute on the size of the Central Pool. Nevertheless, this consent was obtained only after four years' difficult negotiation, and in future it is desirable that such delays should be avoided. There is good reason to believe that we have entered a new era of co-operation between the profession and the Ministry, but, with the best of good will on both sides, it is difficult to envisage negotiation in the proper sense if one side can decline to concede a point and then proceed to refuse the other side the right to have the point settled by arbitration.

134. The Association therefore considers that any amendment of the National Health Service Acts should provide for the establishment of a National Health Service court of arbitration, to which could be referred by the Ministers, or representatives of the profession, disputes on the terms of service, including remuneration, without the consent of the other party, whether existing terms or new terms affecting any section or individual member of the profession.

135. The essential features, composition, and terms of reference of such a court have been approved by the Representative Body of the Association and are fully set out in Appendix K together with, in Appendix L, Counsel's opinion on arbitration. This scheme has, of necessity, been designed for the medical profession as a whole, and has as its basis the negotiating machinery set up under the Whitley Council for the Health Services.

136. It is therefore important to point out that traditionally and over a period of 30 years negotiations on the terms and conditions of service for general practitioners have been carried out direct between the Minister and his officers on the one hand, and the Insurance Acts Committee and its successor the General Medical Services Committee on the other.

137. By and large these arrangements have proved to be the most suitable for dealing with the day-to-day problems of general practice, and the Association would not wish to make any fundamental changes in them.

138. Nevertheless, the right to arbitration, at present absent, is as much the concern of general practitioners as those in other fields, and it should not be difficult to adapt the model scheme set out in Appendix K to meet the particular requirements of general practitioners.

139. It would be implicit that every effort would be made on both sides to reach agreement by direct negotiation. Recourse to arbitration in the general-practitioner field would no doubt be rarely used, but the existence of a court to which either side can apply would, it is submitted, bring a spirit of reality to negotiations in the future.

XXII. PRIVATE PRACTICE

140. The profession has always understood it to be the policy of the Ministry of Health that facilities for private practice should be available, that the public should not be compelled to obtain their treatment through the National Health Service, but should be able to elect to receive private treatment, and that a doctor should be permitted to undertake both forms of practice. It would be true to say, however, that the Ministry has done little to enable the public

to exercise this freedom of choice. It frequently happens that patients who would otherwise elect to receive their medical treatment privately are discouraged from doing so by the high cost of drugs, medicines, and appliances obtained at the patient's personal expense.

141. An amendment of Section 38 of the National Health Service Act, 1946, to enable private patients to obtain drugs and appliances at the public expense, on the prescription of the attending practitioner on Form E.C.10, on the same terms as patients registered in the National Health Service would be a welcome indication of the Ministry's intentions towards private practice, and the Association urges that this step be taken at an early date.

APPENDICES

The following are the documents to which reference is made in the Memorandum:

- "A."—The Spens Report on the Remuneration of General Practitioners.
- "B."—The Danckwerts Award and the Working Party's Findings on the Future Distribution of the Central Pool.

- "K."—Extract from Report of Special Representative Meeting, December 13, 1951 (Arbitration machinery).
- "L."—Counsel's Opinion on Arbitration.

APPENDIX C

REPORT OF SUBCOMMITTEE ON SERVICE COMMITTEES AND TRIBUNAL REGULATIONS

PRELIMINARY

1. The Subcommittee was appointed in November, 1951, with the following reference and personnel:

Reference: That a Subcommittee be appointed to carry out a full investigation of the status, composition, procedure, and functioning of the Tribunal and Medical Service Committees, to hear evidence, to take legal advice, and to prepare a full report with recommendations as a preliminary step to securing amending legislation.

Personnel: S. Wand, A. C. E. Breach, A. Campbell, H. Guy Dain, F. Gray, Kate Harrower, D. F. Hutchinson, C. F. R. Killick, W. M. Knox, F. Lishman, A. N. Mathias, A. T. Rogers, and H. H. D. Sutherland, together with three representatives of the dentists and one representative of the pharmacists when matters of common interest are under discussion.

2. Subsequently, when reappointing the Subcommittee for the session 1952-3, the parent Committee modified both the terms of reference and the personnel of the Subcommittee in the following manner:

Reference: That a Subcommittee be appointed to review the constitution and procedure of Medical Service Committees and to report with recommendations to the parent Committee.

Personnel: A. Talbot Rogers, B. Cardew, H. Guy Dain, J. A. Gorsky, F. Gray, R. C. Hamilton, Kate Harrower,

D. F. Hutchinson, W. M. Knox, A. N. Mathias, F. A. Smorfit, and H. H. D. Sutherland, together with three representatives of the dentists and one representative of the pharmacists when matters of common interest are under discussion.

3. At the outset it was agreed that, as most of the provisions of the Service Committees and Tribunal Regulations affected general practitioners, dentists, and pharmacists alike, it would be to the mutual advantage of the three professions if the representatives of the dentists and pharmacists were present throughout the Subcommittee's deliberations. The British Dental Association and the National Pharmaceutical Union accepted the Subcommittee's invitation to send representatives, and the following were appointed:

British Dental Association:

Mr. L. E. Balding (Hove).

Mr. A. Smith (Hull).

Mr. C. W. Spendelow (Grimsby).

Mr. G. M. Hickley (London) (in place of Mr. Spendelow, who subsequently resigned).

National Pharmaceutical Union:

Mr. H. Noble (London).

CHAIRMAN

4. H. Guy Dain was appointed Chairman of the Subcommittee.

EARLIER DISCUSSIONS

5. The Subcommittee wishes to point out that the review of the Service Committees and Tribunal Regulations procedure dealt with in this report is not the first which has taken place since the introduction of the National Health Service. In 1949 the General Medical Services Committee appointed a similar subcommittee which carried out an extensive review of the regulations and recommended changes where it was considered that the existing machinery was defective or was not working smoothly. A statement containing a number of proposals requiring amendment of the regulations was prepared and discussed with the Ministry of Health. The Ministry made it clear at that time that, whilst it was necessary to set out the framework and general procedure in regulations, it was the Department's policy to discourage the promulgation of additional regulations except where the need for them was clearly established. The Department held the view that the present and future improvements in the machinery for considering complaints could best be secured by issuing a handbook of guidance to all concerned. Much of the Subcommittee's time was occupied subsequently in discussions with the Ministry on the text of the handbook, which was issued to executive councils and Service Committees in April, 1952. The Subcommittee is, however, by no means satisfied that this handbook goes far enough, and holds strongly to the view that changes in the Act and its regulations will be necessary to eliminate a number of faults in the present arrangements which experience has brought to light.

CONSULTATION WITH LOCAL MEDICAL COMMITTEES

6. Although local medical committees had previously been asked to review the present Medical Service Committee procedure, it was again decided to invite them to consider the subject and to submit their views. This was done in the early autumn of 1951, when local medical committees were sent a memorandum setting out in detail the provisions of the Service Committees and Tribunal Regulations.

7. Previously the Kent and Canterbury Local Medical Committee had issued to every local medical committee a

memorandum containing recommendations for a more "legal" procedure for the hearing of complaints. The changes proposed were:

(1) That the Medical Service Committee should be abolished.

(2) That "local courts" should be set up in each county.

(3) That local medical committees should continue to hear complaints of alleged over-prescribing, failure to keep records, and faulty certification.

(4) That England and Wales should be divided into three judicial regions, each region being served by a "regional circuit" court holding sessions in the county towns of its Region as may be convenient.

(5) That there should be no other special courts, committees, or tribunals.

(6) That the Minister and the executive council, being interested parties, should have no right of intervention at any stage except as complainant or respondent.

8. The General Medical Services Committee accordingly invited local medical committees, when sending in suggestions for any modifications of the present procedure, to indicate whether they wished to have substituted for the present informal procedure any other scheme providing, for example, for the appointment of a lawyer as chairman of the Medical Service Committee, legal representation of the parties, the giving of evidence on oath, and, generally speaking, a more legal procedure than obtains at present.

9. The following is a summary of the replies that have been received:

Total No. of Committees in England and Wales	138
circularized	101
Total No. of replies received	101

23 Committees specifically stated that they did not wish to have the general framework of Service Committee and Tribunal procedure superseded by a more formal judicial machinery.

30 Committees, without commenting generally on the present procedure, put forward small but important suggestions for its revision.

17 Committees were satisfied with the present Regulations and did not wish to put forward any suggestions for their modification.

1 Committee was not satisfied with the present Regulations, but made no suggestions for their modification.

15 Committees supported the Kent proposals without modification.

15 Committees supported the Kent proposals with some modification.

10. The above analysis of the replies received shows that there is a substantial majority among local medical committees in favour of the present Service Committee procedure, modified in the light of experience gained since the appointed day. Although only a minority of local medical committees supported the Kent proposals for a more formal procedure, representatives of the Kent Local Medical Committee were invited to meet the Subcommittee to put their point of view. The Subcommittee, in view of the lack of support among local medical committees, and having heard the Kent representatives, is satisfied that it would not be in the profession's interest to press for an entirely new and more legal set-up. It is convinced that the General Medical Services Committee's efforts would most usefully be concentrated on securing such modifications of the present machinery as will ensure an improvement in its efficiency.

It is of interest to record that the dental and pharmaceutical representatives on the Subcommittee report that among their constituents there has been no demand for a radical alteration of Service Committee procedure on the lines suggested by Kent and Canterbury.

REVIEW OF SERVICE COMMITTEES PROCEDURE

11. The Service Committees and Tribunal Regulations have been examined section by section in the light of the observations from local medical committees, and the conclusions reached by the Subcommittee are given below.

Constitution of Service Committees

12. Absence of criticism of the present constitution of the Service Committees, as laid down in the regulations, leads to the conclusion that there is general satisfaction under this heading, and no change is recommended.

Appointment of Chairman and Deputy Chairman

13. At present, Regulation 3 (3) stipulates that only the lay members of the executive council are eligible for appointment as chairman or deputy chairman of a Service Committee in the first instance. It is felt that this unnecessarily restricts the field of selection, and the Subcommittee recommends:

Recommendation A: That Regulation 3 (3) should be modified so as to leave the field open to non-members of the executive council, it being understood that, notwithstanding the wider field of selection envisaged, the person appointed should be acceptable to both parties represented on the Service Committee.

14. A number of local medical committees have suggested that the chairman should hold a legal qualification. Among the reasons given were that such a chairman would be able to advise the committee upon the legal aspects of the matter under inquiry and that the presence of a trained legal mind at the Service Committee stage of any investigation would provide some safeguard against the possibility of a serious miscarriage of justice.

15. The Subcommittee recognizes that there are advantages in having a lawyer in the chair, but feels that such an appointment should not be an obligation on the committee, which should be free to exercise discretion upon the point.

Position of an Interested Person who is a Member of the Service Committee

16. The Subcommittee considers that it is of vital importance that every member of a Service Committee should be uninfluenced in his judgment of the case under consideration by any personal association with either party. For this reason the Subcommittee recommends:

Recommendation B: That provision should be made in the Regulations for a requirement that a member of a Service Committee who is an interested party in the matter under consideration shall be required to disclose his interest either to the chairman before the meeting or at the commencement of the proceedings.

17. The Subcommittee is satisfied with the present arrangements for appointing the deputy chairman, but recommends:

Recommendation C: That consideration be given to the practicability of appointing a deputy chairman for a defined group of executive council areas adjacent to each other.

Investigation by Service Committee

18. At present Regulation 4 requires the Service Committee to investigate "any complaint made by a person against a medical practitioner in respect of an alleged failure to comply with the terms of service." This regulation is so wide as to give complete freedom to anyone who feels disposed to lodge a complaint against a doctor. Although there are certain safeguards against frivolous or vexatious complaints, it is felt that the right to lodge a complaint should be restricted (i) to a patient of the doctor concerned or someone who is acting on his or her behalf because of the inability of the patient to make the complaint, and (ii) in appropriate cases to a representative of the Ministry of National Insurance. It is therefore recommended:

Recommendation D: (1) That the following proviso be inserted after Regulation 4 (1):

Provided that no such complaint shall be investigated as aforesaid unless made by a person for whose treatment the medical practitioner is responsible in respect of treatment afforded to him by such medical practitioner or person authorized by him in writing to make such complaint or

his spouse or in the case of an infant his parent or guardian or in the case of a person unable to make such complaint owing to mental infirmity a close relative or in the case of a deceased person his personal representative(s), or in the case of the Ministry of National Insurance a responsible official of that Department.

(2) That the following be inserted in place of Regulation 4 (3):

Subject as hereinafter provided the Dental Service Committee shall investigate any complaint that a dental practitioner has failed to comply with the terms of service made by a person for whom the dental practitioner has undertaken or agreed to undertake treatment.

Any complaint made under this regulation shall be made by the person for whom the dental practitioner has undertaken or agreed to undertake treatment provided that on being satisfied that any such person is deceased or that he is unable through age, infirmity, or other reasonable cause himself to make the complaint the committee may investigate a complaint made by some other person on his behalf.

Time Limit for Making Complaints

19. As a general rule complaints against a medical practitioner or pharmacist are required to be lodged with the clerk to the executive council within six weeks of the event giving rise to the complaint. This is considered to be an unnecessarily long period. In addition, in the event of an application being made to the Minister for permission to investigate a complaint, the application need not at present be supported by a majority vote of the members of the Service Committee. Indeed, in the Minister's view, it may be made on the decision of the chairman alone. Similar considerations apply to the dental profession.

The Subcommittee recommends:

Recommendation E:

- (i) That the period of six weeks referred to in Regulation 4 (4) (a) be reduced to four weeks;
- (ii) That the period of two months referred to in 4 (4) (c) (i) be reduced to six weeks;
- (iii) That any application to the Minister for permission to investigate a complaint, notice of which is received more than six weeks after the event, should be supported by a majority vote of the members of the Service Committee;
- (iv) That the following be substituted for Regulation 4 (4) (b):

The person desiring to make a complaint under this Regulation against a dental practitioner shall within six months after the completion of treatment, or within four weeks after the event which gave rise to the complaint, whichever is the sooner, give written notice to the clerk of the council stating the substance of the matter which it is desired to have investigated.

- (v) That the following be substituted for Regulation 4 (4) (c) (ii):

(ii) in the case of a complaint against a dental practitioner the complaint is made within six months after the completion of the treatment or within six weeks after the said event, whichever is the sooner, or

- (vi) That Regulation 4 (4) (c) (iv) be modified so as to make it clear that the practitioner's representations relate solely to the question of the departure from the time limit for making the complaint.

20. The Subcommittee also agrees with the views of its dental members that there should be an overall time limit outside which the Minister should have no power to authorize the hearing of a complaint in those cases which relate to the fit and efficiency of dentures. Under the new and simplified procedure which is shortly to be introduced, the executive council will deal with such complaints, and it is felt that the Minister should have no power to authorize a hearing of a complaint of this nature if more than twelve months have elapsed since the completion of treatment. Any evidence relating to the adequacy of treatment which consists in the provision of dentures necessarily deteriorates

rapidly in value as time passes, and it can reasonably be said that after twelve months have elapsed from the original provision of a denture it is extremely difficult, and in many cases impossible, to decide whether the treatment provided was in fact satisfactory. For these reasons the Subcommittee supports its dental colleagues in seeking the early introduction of an overall time limit of twelve months.

21. The Subcommittee recommends:

Recommendation F: That the substance of the following paragraph of the Handbook on Service Committee Procedure should be incorporated in the Regulations:

7. Similarly if a practitioner's observations on alleged acts of omission or commission are sought by the executive council prior to possible reference of a case to a Service Committee under Regulation 4 (5) the source from which the information has come should be indicated and also any provisions in the terms of service alleged to have been broken. If no term of service is affected the reason why the conduct of the practitioner is being investigated should be clearly set out.

Procedure of Service Committee

22. Several local medical committees have suggested that the chairman of the Medical Service Committee should not be the sole judge as to whether the statement made by a complainant discloses prima facie ground of complaint. The Subcommittee is in general agreement with this view, and recommends:

Recommendation G: That the chairman of a Service Committee should confer with a professional adviser who is not a member or a deputy member of the Service Committee but selected by the Service Committee from a panel nominated by the local professional committee, when deciding whether a statement made by a complainant discloses prima facie ground of complaint.

Rules of Procedure for Service Committees under Regulation 5

23. Rule 1 (1) (a) requires the clerk of the executive council, when informing the complainant that his statement discloses no prima facie ground of complaint or is frivolous or vexatious, to invite the complainant to submit a further statement within seven days. The Subcommittee is of opinion that the rule goes unnecessarily far, and recommends:

Recommendation H: That the clerk should be required only to inform the complainant of the procedure which will be followed if a further statement is not received within seven days—namely, that the case will be brought before the Service Committee, which has power to dispense with the hearing.

24. Under Rule 1 (1) (e) the documents of a case must be sent to each member of the Service Committee three clear days before the meeting of the Service Committee. This period is thought to be too short, and it is recommended:

Recommendation I: That the period of three days referred to in Rule 1 (1) (e) be extended to seven days and a further requirement of the clerk be added to ensure that copies of the documents are sent to the secretary of the local professional committee.

25. Rule 1 (1) (f) states that "either party shall be entitled to be present at the hearing and to give or call such evidence as the committee may think relevant to the matters at issue." The Subcommittee feels this rule is unnecessarily all-embracing, as the issue of relevancy should be one of fact. It therefore recommends:

Recommendation J: That the words "such" and "as the committee may think" be deleted from Rule 1 (1) (f) so that it reads:

Either party shall be entitled to be present at the hearing and to give and call evidence relevant to the matters at issue, and may put questions relevant to the matter in dispute to the other party or to any witness called by him, either

directly, or, if the committee so direct, through the chairman of the committee. Subject as aforesaid, the procedure at the hearing shall be such as the committee may determine.

26. Rule 1 (1) (h) provides that, if in the course of a hearing any new issue is introduced by the complainant, the chairman has discretion to admit or exclude such issues as he thinks fit, but if it is admitted the respondent may ask for an adjournment, which shall be granted. The Subcommittee feels that this is unsatisfactory, and recommends:

Recommendation K: That Rule 1 (1) (h) be amended so as to make it obligatory to adjourn the committee if a new issue is admitted.

Report of Service Committee

27. At present, a Service Committee is required to report on every case brought before it, including cases in which the chairman has decided that there is no prima facie ground of complaint. It is felt that it should not be necessary to report in detail to the executive council on this type of case, and the Subcommittee recommends:

Recommendation L: That the rules of procedure should be amended so that a Service Committee is not required to report in detail on those cases where there is no prima facie ground of complaint.

28. In giving the Service Committee discretion in its report to draw the attention of the executive council to any previous reports made by the committee in connexion with the practitioner whose conduct has been under consideration, no distinction is made between cases in which the complaint has been proved and cases in which it is not proved. The Subcommittee therefore recommends:

Recommendation M: That an amendment be sought to Regulation 5 (4) so as to ensure that reference to previous cases should be made only when failure to comply with the terms of service was found in those cases and is also found in the present case.

Representation of Executive Council to Tribunal

29. Regulation 8 states that if an executive council decides to make representations to the Tribunal with regard to the continued inclusion in any list of the name of any practitioner, and an appeal is made to the Minister against the executive council's decision on other matters, the Minister may treat as conclusive for the purpose of the appeal any relevant findings of the Tribunal. The Subcommittee recommends:

Recommendation N: That the words "any relevant findings" in Regulation 8 be amended to read "any relevant findings of fact."

Procedure on Appeal

30. Regulation 9 (5) provides that, in the event of an oral hearing following an appeal, and where one of the parties is a medical or dental practitioner and the decision of the executive council involves the finding that he has been guilty of a breach of certain of the terms of service, the persons appointed to hear the oral representations shall include a medical or dental practitioner, as the case may be, selected from the panel of practitioners referred to in Regulation 11. There is no similar provision, however, when the practitioner has been found not guilty of a breach of those terms of service and the patient then appeals against the decision of the executive council. The Subcommittee feels that proper provision should be made for this contingency, and recommends:

Recommendation O: That, in cases where the practitioner has been found not guilty of a breach of the terms of service and a patient then appeals against the decision of the executive council, the persons appointed to hear the oral representations shall include a medical or dental practitioner, as the case may be, selected from the panel of practitioners referred to in Regulation 11.

Appeal to the Court

31. Eighteen local medical committees have recommended that there should be a right of appeal to the courts, or some other judicial body, against decisions of the Minister and/or the Tribunal.

32. The Subcommittee, bearing in mind the original controversy on this point, has given very careful consideration to the issues involved and has reached the following conclusions:

(a) That the Minister's responsibility to Parliament "to provide or secure the effective provision of services" in accordance with the National Health Service Act and its Regulations is indisputable and in accord with democratic procedure.

(b) That there are advantages in having a right of appeal to the Minister of Health and not to the Courts, in that—

(i) the Minister has power to reinstate a practitioner's name in the appropriate list at any time after the decision to remove the name from the list; no such power rests with the Court, and it would be a more difficult procedure to reinstate the practitioner.

(ii) an appeal to the courts if granted would normally be held in public. This applies at present to hearings by the Tribunal if the respondent wishes it, but not otherwise.

(iii) if the Minister is not satisfied on appeal that a practitioner's name should be deleted from the list he has the option of imposing the lesser penalty of a fine. If the appeal lies to the Court, the Court has not that alternative.

(c) If representations are made to the Court against a decision of the Tribunal, it follows that the Minister and also the patient would have the right to be heard. Under the present system only the defendant has the right of appeal to the Minister, and any change might therefore not be in the defendant's best interests, as it would mean that the present one-way channel of appeal would be capable of being used in the opposite direction. At the same time, while the Minister is limited to revoking the direction of the Tribunal in favour of the doctor, dentist, or pharmacist, the Court would not be so limited and might, in fact, impose a heavier sentence.

33. The Subcommittee feels that, on balance, it would not be to the advantage of the profession to press for a right of appeal to the Courts, but believes that some modification of the present procedure is desirable. It therefore recommends:

Recommendation P: That the present appeals machinery be amended so as to provide that the person appointed under Section 42 of S.I. 507 (1948) to hear the appeal should be appointed by the Lord Chancellor, and should be a practising barrister or solicitor of not less than ten years' standing, not being a member of the staff of the Ministry of Health.

Procedure on Withholding Money

34. The Subcommittee has sought legal advice on the powers of the Minister under Regulation 11 (1) to impose a fine following a hearing which results in a verdict favourable to a practitioner. It appears that the present Regulations do permit the imposition of a monetary penalty in such circumstances, and, whilst the Subcommittee appreciates that such a power may be equitable in the case of the Tribunal, it is certainly not in the case of Service Committee proceedings. The Tribunal is concerned only with whether a practitioner should be removed from the list following representations by an executive council. To prevent the Minister imposing a fine would mean that a practitioner who was guilty of misconduct, which although not serious enough to justify his removal from the list had nevertheless resulted in a breach of his terms of service, would suffer no penalty at all, whereas another practitioner found guilty of a lesser

offence by a Service Committee could have money withheld from his remuneration. A verdict favourable to the practitioner having been reached by the Service Committee, or on appeal by the appeals body, however, clearly vindicates the practitioner against the charges which have been brought against him, and the Minister should certainly have no power to impose a fine in such circumstances. The Subcommittee therefore recommends:

Recommendation Q: That Regulation 11 (1) be amended to provide that the Minister should not be empowered to impose a fine following either a hearing by a Service Committee, or an appeal against the findings of a Service Committee, which results in a verdict favourable to a practitioner.

35. Similarly, the Subcommittee is strongly of the opinion that the Minister should not be empowered to impose a fine following consideration of the report of either a medical or dental officer under Regulation 14, which deals with the investigation of record-keeping, nor should the power to impose a monetary penalty exist where a case of this nature is referred to the local medical committee or local dental committee for consideration and a verdict favourable to the practitioner is reached either by the local committee concerned or, on appeal, by the appeals body. The amendment to Regulation 11 (1) recommended in Recommendation Q above should make specific provision to this end.

36. Regulation 11 also provides for the constitution of advisory committees to assist the Minister in discharging his duties under the Regulation when he decides that a sum of money shall be recovered from the remuneration of the practitioner whose conduct has been the subject of an investigation. In the case of the medical advisory committee, the selection of medical practitioners to serve on it is required to be made in rotation from the panel of practitioners nominated for this purpose, but in the case of the dental advisory committee no mention is made of the selection being made in rotation. The Subcommittee recommends:

Recommendation R: That Regulation 11 (6) be amended by:

- the addition of the words "so far as may be in rotation" after the word "Minister" in line 4;
- the insertion of the words "for that purpose" after the word "nominated" in line 6.

Appeals from Dental Estimates Board

37. It is recommended:

Recommendation S:

(i) That Regulation 18 (2) be amended by the addition of the following:

"The Minister may on the application of any person desiring to appeal, extend the time for giving notice of appeal and may do so although the application is not made until after the expiration of one month from the date on which notice of the Board's decision was received."

(ii) That the following be substituted for Regulation 18 (3):

"The Minister shall appoint two dental practitioners, of whom one shall be selected from a panel of dental practitioners who are or have been engaged in the provision of general dental services nominated for that purpose by organizations which are, in the Minister's opinion, representative of the dental profession. The practitioners so appointed shall hear the representations of the appellant and the Dental Estimates Board and determine the appeal."

Investigation of Alleged Excessive Prescribing

38. It is not clear from the Regulations whether, at the investigation by the local medical committee, a practitioner

may be represented by counsel or other paid advocate, or may call witnesses. The Subcommittee recommends:

Recommendation T: That Regulations 12, 13, 14, 15, and 16 be amended so as to make it clear that the decision as to whether a practitioner may be represented by counsel or other paid advocate, or may call witnesses, rests with the local medical committee.

Determination of Question Whether a Substance was a Drug

39. At present there is no time limit within which a question as to whether a substance ordered by a practitioner was a drug or not may be raised. In practice, the absence of any time limit has led to considerable inconvenience, and busy practitioners cannot be expected to remember the clinical details of a case for which a prescription was ordered and which is the subject of investigation often eighteen months or more later. Similarly, the Subcommittee feels that there are good grounds for imposing a time limit within which a practitioner must be informed of the result of any appeal. Experience has shown that in a number of cases even after the appeal has been heard a considerable time elapses before the practitioner is informed of the outcome of his appeal. It is manifestly unfair that, even when a decision has been reached, there should be a long delay before it is communicated to the respondent. The Subcommittee therefore recommends:

Recommendation U: That any question under Regulations 16 and 17 as to whether a substance ordered by a practitioner was a drug or not may only be investigated within a period of six months subsequent to the date of issue of the prescription, and that in the event of the practitioner appealing against the decision of the local medical committee the results of such appeal shall be notified to the practitioner within one month from the date of the appeal.

The Tribunal

40. The Subcommittee has no suggestions to make for the amendment of the Regulations relating to inquiries by the Tribunal. It is felt that, having regard to the safeguards laid down in the Regulations, it would be undesirable to interfere with the right of any person or executive council who believes that a practitioner's name should be removed from the appropriate list, to make representations to that effect direct to the Tribunal.

41. One local medical committee suggests that the period of fourteen days within which an appeal against the decision of the Tribunal must be lodged should be extended. The position is safeguarded, however, by the Ministry being given discretion to extend this period.

Notices to be Given under the Regulations

42. The Subcommittee recommends:

Recommendation V: That all documents required or authorized by the Regulations to be sent to persons concerned with the hearing should be sent by registered post.

Complaints Against Patients

43. The Subcommittee endorses the policy of the General Medical Services Committee that there should be provision for the investigation of a complaint by a doctor against a patient on account of frivolous and unreasonable demands on the doctor's services.

"Code of Behaviour" for Patients

44. At the request of the Annual Conference, the Ministry of Health is being pressed to draw up a "code of behaviour" for patients which would be brought to their notice on appropriate occasions. It is recognized that such a code would not necessarily be enforceable, but it is believed that it would be helpful to medical practitioners in the National Health Service.

APPENDIX D

SALE OF GOODWILL

PART I—MEMORANDUM BY THE AMENDING ACTS COMMITTEE

1. The Committee has decided that for the purpose of discussion and consideration by the Council detailed reasons should be set out for the desirability of restoring to general practitioners the option to buy and sell the goodwill of their practices and of the premises from which they practise.

2. Notwithstanding arguments adduced by the General Medical Services and Superannuation and Compensation Committees, the Committee adheres to the view that Section 35 of the National Health Service Act, 1946, should be repealed. It believes that a substantial number of the profession share this view.

3. It believes also that a mistake of judgment was made in 1948 in entering the Service without retaining the right to buy and sell goodwill of practices. This was done in the belief that the younger practitioner could not raise sufficient capital to buy a share in the practice. This view is apparently still held by the Compensation and Superannuation Committee. They forget that the most important thing in the right to buy and sell goodwill is that it maintains the ability of the doctor to disagree with the Government Service if the regulations issued by the Government interfere with his liberty.

4. We know that many of the people concerned with lay administration of the National Health Scheme had for a long time been averse to the idea of buying and selling practices, and we know that the Socialist Medical Association, in particular, agreed with the idea of a salaried service with powers of direction by a Minister and entry by selection.

5. Entry by selection since 1948 has been tried and found wanting by young practitioners seeking to enter practice. Unfortunately the situation has now arisen whereby, having lost the cover of ownership of practice and in its place instead relying on selection committee procedure as the main method of entry into the profession, we have seen after four years a tendency towards a hardening of the regulations governing this form of entry into general practice.

6. We have created in the lay mind the idea that general practices are now publicly owned.

Definition

7. Goodwill is that attachment to a person or persons engaged in a profession, trade, or business which results from appreciation of services rendered in that said profession, trade, or business.

8. By "ownership of goodwill" is meant the right of the said person or persons engaged in a profession, trade, or business to sell, or otherwise dispose of, by deed, gift, or inheritance, the goodwill of their patients, clients, or customers.

Preamble

9. As will be seen in Sub-Appendix I, goodwill is a legal entity and a form of property, and as such is a saleable and inheritable entity and a capital asset.

10. The ownership of goodwill has, up to the present, been a right enjoyed by all engaged in forms of trade, business, or professional activities not controlled by bodies such as local and central authorities or corporate boards. Those employed by these latter bodies have the right to resign, to start an undertaking of their own, and so to acquire goodwill. Thus there exists an inherent right for all citizens to own goodwill if they so wish, and to be able to exercise it without penalty.

11. It is unjust and inequitable that, by sudden legislation (compulsory purchase), one section of the community should be deprived of the right exercised by their fellow citizens as individuals, partners, or companies.

12. Goodwill and all it entails has, by arbitrary action, been transferred from the Chancery Division of the High Court to an inferior criminal court. This is against natural law and the basic principle of criminal law, in that a person committed to a criminal court is presumed to possess *mens rea* or "guilty mind." The doctor's position is so complicated by regulation and statute that he may offend quite unwittingly.

13. What is needed for a medical practitioner is, therefore, at least the right to choose whether or not he wishes to exercise his right to the goodwill of his practice and the freehold (or "restricted leasehold") of his premises.

14. Better still would be the absolute return of this right to the whole profession.

15. It has been contended that the restoration of goodwill is not practicable. The Committee does not hold this view. Indeed, precedent is being established in the proposed legislation to restore the freehold ownership of goodwill to certain sections of Road Transport. No Act is sacrosanct, but is capable, as experience has shown, of amendment or annulment.

16. The present situation is really intolerable, since, having removed the power from the doctors to realize the capital value of the hard work they have put in, the Government itself is building up valuable capital assets, both in new practices and by the improvement of old ones, using the doctors' hard work without repayment.

17. It will not take long for the younger doctors to realize this, and they will then demand suitable salaries from the start. After all, why should they start from nothing (or even from £600 per year I.P.A.) building up something which they will never be able to realize but which the Government will be able to use as an attraction for other new entrants to the Government Service in the future?

18. At the moment the new entrant is getting the worst of both worlds. He has to build up a practice which he can never own and is getting no pay whilst doing this.

19. The question of compensation is no cure, as the new entrant is not entitled to it, and, indeed, unless compensation were given to each G.P. at his retirement, irrespective of when he entered the Service, it can act as no incentive to the new doctor entering practice for the first time.

Practical Reasons

20. Fundamentally there exist three main reasons for the restoration of goodwill to the medical profession:

(1) The Moral Right

This is incontrovertible. Article 17 of the "Universal Declaration of Human Rights," passed and proclaimed by the General Assembly of the United Nations (to which Great Britain subscribed) on December 10, 1948, states:

(i) Everyone has the right to own property alone as well as in association with others.

(ii) No one shall be arbitrarily deprived of his property.

(2) The Legal Right

This is fully outlined in the preamble, and substantiated in the Appendix.

The right of purchase and sale of goodwill was abolished by decision of the Government itself, and not at the request of the profession. The great majority of general practitioners who entered the Service in 1948 (under the financial duress of the Minister) were at that time established in practice and had taken up this mode of medical life as *free men*, believing their goodwill to be unassailable.

(3) The Practical Right

Here it may be as well to consider some of the arguments for and against the restoration of the right of general practitioners to own the goodwill of their practices and premises.

(i) AGAINST:

(a) The initial outlay for incoming partners is said to have constituted a millstone round their necks for many years; or that practitioners who commenced practice in an area without purchasing a share in an existing practice often received an inadequate income for many years.

The first of these is dealt with below; the second is well covered under the National Health Service Act.

(b) Disapproval of the policy of a practitioner selling a "block of patients" to an incoming partner, leading to a suggestion that the patients were "sold" and thereby lost the freedom of choice of doctors.

"Sale of patients" has never existed, but there has been allocation of patients between partners on an agreed share basis. A similar situation exists under the National Health Service, and patients retain the right they have always possessed to change their doctors if they so wish. The unsatisfactory nature of the remuneration received by the practitioner under the Service may, however, deter him from taking in a partner as he would otherwise have done, with the risk that through overwork his service to his patients may deteriorate.

(ii) FOR:

(a) Prior to the Act the increase in the value of goodwill which accompanied increase in practice provided an incentive to personal effort which does not now exist to the same extent. It is true that the amount of superannuation which a practitioner receives under the provisions of the Act is related to the income he makes in practice, but the stimulus to effort is lacking. There is also less incentive to retire.

(b) The lack of compensation offered to principals when taking on new partners leads to a diminished number of vacancies for "assistants with a view" and encourages unemployment. At present those taking on new partners have to face an immediate loss of income with no capital reimbursement; they have to bear in mind also the falling value of money and its effect on their eventual compensation.

(c) Dentists and practitioners engaged in certain types of specialist practice such as ophthalmology and radiology retain the right to dispose of their goodwill. It is inequitable that this right should be enjoyed by certain classes of practitioner engaged in the National Health Service and denied to others.

(d) A practitioner under existing circumstances may be appointed to a practice after some considerable delay, only to find that some or all of his predecessor's practice has been taken from him by a new entrant to practice in the area, who meantime has purchased the "practice house" from the widow. In the matter of practice premises, the present regulations make what amounts to a criminal waste of the country's money and resources, as in many cases they are not handed on because their true value might be considered as containing an element of payment for goodwill which would not be allowed. Now we find a succession of new doctors starting new premises from scratch, and in course of time there will be complete duplication of medical premises over the country.

(e) It is admitted that in present-day conditions the borrowing of capital for the purpose of acquiring a practice or partnership entails a heavy financial burden. To offset this, however, the practitioner would acquire a capital asset, and the financial burden might be eased by a scheme of long-term Government loans at a low rate of interest and capital return, as indicated in para. 23 (b) below. For existing doctors who are due to receive compensation on retirement the position is not much better. When they retire after 30 years the value of their compensation in terms of real money, which has already dropped by approximately one-third, will mean absolutely nothing to them.

(f) The return of the right to buy and sell goodwill, or at least the option to do so, would at once promote the regrowth of flourishing partnerships and group practices. This is the surest way to safeguard the interests of the patients, by efficient practice and full cover, and also the health and happiness, at work, of the members of the partnership.

Method

21. The profession may be divided into two groups:

- (1) *Those doctors who have retired*
These are automatically dealt with, since they have received or are about to receive their compensation.
- (2) *Those who have not retired*
Of these:

(i) Those who do not wish to resume ownership present no problem.

(ii) Those who do wish to resume ownership must be considered in three groups:

(a) *Those who were in practice before the appointed day.*
These would give formal notice of their intention to resume ownership, would refund any capital they have received; and resign any claim to capital compensation not yet received.

(b) *Those who have started new practices since the appointed day, either by "squatting" or by selection.*

These are not entitled to compensation and have none to relinquish. They would give formal notice to assume ownership.

(c) *Those who have entered existing practices since the appointed day through the selection machinery.*

These have received a valuable asset. They should be entitled to assume ownership upon refunding to the Treasury any capital compensation which has been paid out or credited to the previous owner or owners of that asset.

Summary

22. Summing up the above, it may be said, therefore, that if only a few doctors avail themselves of the right to own the goodwill of their practices substantial progress will have been made in the following directions:

(a) Towards solving the problem of the unestablished practitioner.

(b) Returning partnerships to a normal and logical basis.

(c) Separating the ownership of all doctors' premises from the goodwill they may or may not have reclaimed from the Government. This will abolish the injustices of the penal clauses relating to the sale of goodwill affecting doctors' premises, and incidentally would free these premises to the ultimate benefit of new entrants.

23. It may be said that the restoration of goodwill would divide practitioners into those who could and those who could not afford to buy, and thus result in ill-feeling (even a black market atmosphere) or violent competition for the "free" practices. In reply it is again emphasized:

(a) That the goodwill of a practice bought at once gives the owner a saleable capital asset, which, by skill and hard work, he can enhance.

(b) That for those not able to raise the capital the Government could well lend the practitioner the required sum from the fund at present used for payment of compensation. Both the Government and the practitioner would gain.

24. If only a proportion of doctors elected to own their goodwill then the number of years' purchase must be left to the natural operation of the market, but if all or the majority should do so it would be equitable legally to fix the years' purchase at an agreed figure, say 1.5 or 1.6.

25. The views of the Compensation and Superannuation Committee cannot be accepted, particularly when they refer to the fact that the doctor makes up in pension what he loses by loss of the right to buy and sell goodwill. Under the superannuation regulations agreed by this committee the doctor who employs an assistant cuts his pension by approximately one-half in some cases, as he is not allowed to pay into the superannuation fund on his total earnings but only on his earnings after he has deducted the earnings of his assistant.

Medical Practices Committee

26. The return to the principle of the purchase and sale of goodwill, even on an optional basis, would considerably affect the work of the Medical Practices Committee, and would necessitate review of its existing powers in reference to the filling of vacancies in and entry to practice.

27. Finally, by the present recent judgment of the Master of the Rolls (in *Whitehill v. Bradford*) (1) Times Law Reports, 1952, 73) the goodwill of all practices still belongs to the doctor, or his heirs, although the right to buy and sell is denied by the Act of 1946. Since the goodwill belongs to the doctor (or his heirs), he has a legal right to choose his successor. It would appear that the judgment referred to above completely nullifies the present method of filling vacancies.

28. There is no regulation which permits of a vacancy being declared either by the executive council or by the Medical Practices Committee.

29. It would appear, therefore, that the Amending Acts Committee is expressing the will of the profession and reasserting the profession's legal rights in asking for a repeal of Section 35 of the Act and all its co-related sections in other parts of the Act.

SUB-APPENDIX I

1. The Bankruptcy Act, 1914, the Landlord Act, 1937, the Trademark Act, 1938, and the Copyright Act, 1911, all specifically recognize the right of citizens, in partnership or otherwise, to own, buy, sell, or inherit goodwill, and the old National Insurance Act of 1911-12 does so by the fact that ownership of goodwill was confirmed.

2. In addition, there is a wealth of evidence in Common Law recognizing an individual's rights to the ownership of goodwill.

3. In Halsbury's *Laws of England*, second edition, vol. 32, pages 445-8, goodwill is defined, and is separated into two parts: that associated with the name and recommendation of the person who owns the business, and that associated with the premises in which the business was carried on. Both these must be taken into account either separately or together. In this section doctors, surgeons, separately or together. In this section doctors, surgeons, and dentists are amongst others specified. Further, Halsbury states that goodwill is property within the meaning of the Stamp Act, 1891.

Transfer of goodwill can be affected without writing, except in so far as writing may be required by the Statute of Frauds, 1677, and the Law of Property, 1925.

Such transfer confers on the transferee the exclusive right to carry on the business transferred, the exclusive right to REPRESENT himself as carrying on such business, and as against the transferor, the exclusive right to use the name under which this business has been carried on, but such a name must not be used to expose the transferor to risk of personal liability.

4. Roland Burroughs, K.C., in *Words and Phrases Judicially Defined*, vol. 2, pages 425-7, quotes Case Law to the effect that if a person continues to practise from, or to the effect that if a person continues to practise from, or to own and occupy, the premises from which he has practised heretofore, that goodwill is attached to him as well as by and through the premises.

5. Further, the general practitioner under his terms of service is now in "contract for services" not "contract of service," and, in addition, pays his insurance contribution at the higher rate as a self-employed person, and under Regulation S.I. 1376 is not considered to be a "workman"—that is, he "gives service to" and is not in "the service of." Therefore he is, as a citizen, entitled to the same rights of ownership of goodwill as, say, an author who, under contract for services, undertakes to write a book for a publisher as an independent contractor, continuing to own his goodwill for the said book—that is, his copyright.

(It might be argued that, because the Minister of Health to a large extent controls practitioners' salaries and conditions of service, they are therefore his servants. But—using the above comparison again—because a publisher may decide the payment an author is to receive for his book, and other conditions of publication, it cannot be said that these powers make the author the servant of the publisher.)

PART II—MEMORANDUM ON THE PRACTICAL ASPECTS OF THE SALE AND PURCHASE OF GOODWILL PREPARED BY THE COMPENSATION AND SUPERANNUATION COMMITTEE

At the request of the Amending Acts Committee, the Compensation and Superannuation Committee considered a proposal that the Association should press for the amendment of the N.H.S. Act, 1946, to restore to general practitioners the right to buy and sell goodwill.

The Committee informed the Amending Acts Committee, first, that it had no evidence of strong desire among general practitioners to return to the custom of the sale of goodwill, or of a united opinion in the profession sufficient to justify an attempt to annul Section 35 of the N.H.S. Act; and, secondly, that it was of the opinion that a proposal to give an option was impracticable.

The Amending Acts Committee has challenged the Committee to give the reasons for its opinion, and has submitted for consideration a case for the repeal of Section 35 of the Act or for an option to renounce compensation rights.

General Considerations

The Committee is asked to consider whether a resumption of the sale and purchase of goodwill is practicable. It is not asked whether such a step would be desirable. After three years of the operation of the Act the Committee lacks evidence of a strong desire or of united opinion among general practitioners, and the following notes are directed solely to the question of the practicability of amendment or repeal of Section 35 of the Act.

Economic Considerations

(1) The Amending Acts Committee suggests that if a majority of practitioners were able to exercise the option the value of goodwill could be stabilized at 1.5 or 1.6 years' purchase.

Apart from the fact that this suggestion might be regarded as incompatible with freedom to sell in the open market, it does not take into account that the value of goodwill has always varied with the security offered or, in other words, the introduction to the practice. For this reason the Compensation Committee would regard artificial control, or pegging of the value of goodwill, as impracticable and undesirable. In any case, a rate of 1.5 or 1.6 years' purchase does not give to an established practitioner a higher rate than he will receive in compensation, and lacks the security which compensation affords. It does, of course, enable him to increase the capital value of the goodwill by increasing the practice.

Even if the market were free, there is no certainty that under present circumstances (in a publicly organized service available to the whole population), and in competition with a system of appointments to practices, a doctor could obtain a price equal to the amount of compensation he is renouncing.

Experience shows that private practices sold since the appointed day realize 1.5 years' purchase only in ideal conditions, and the average is very much less. Too much should not be made of this argument, because circumstances are different, but it should not be assumed that to return to a free market would mean a return to the values existing in pre-Act or pre-war days.

A doctor who renounces his compensation in the hope that he could enhance "by skill and hard labour" a saleable asset would be taking a serious risk. Let us assume that a doctor in practice on the appointed day forgoes his compensation at 1.58 years' purchase. Two years later, unexpectedly, he dies or has to retire permanently on health grounds. He, or his executors, would be unlikely to obtain even one year's purchase, and those dependent on him would lose heavily.

(2) In answering the suggestion that to have two systems side by side would divide the profession, the Amending Acts Committee stresses the fact that purchase gives the owner a saleable asset which he can enhance. This is of course true, but no mention is made of the financial barrier, which is immeasurably greater now than formerly.

The amount that a practitioner who has no capital resources has to borrow in order to establish himself in practice is now so great that repayment of capital and interest out of income is often nearly impossible, even when there is no payment for the goodwill which the income represents.

What was possible in pre-war days is now no longer possible. For example:

A practitioner purchases

(a) a share calculated to bring in £1,200 net income. Even at 1.5 years' purchase, which is much lower than the rate formerly paid for a share in a partnership, this represents £2,700 (1½ times a gross income of approximately £1,800).

(b) a house at, say, £3,500 (a very moderate estimate).

(c) a car and equipment for, say, £600 (probably an underestimate).

He therefore faces a total loan of nearly £7,000 for which he may have to find some collateral security. On a

modest estimate, and if repayable over a maximum period of 20 years at 4%, he will have to face annual repayments of capital and interest amounting to approximately £685. If these are repayable over a shorter period the annual instalments would be proportionately greater. There would be little or no margin out of a net taxable income of £1,200 a year.

If he were able to borrow the whole amount on overdraft without the necessity for regular repayments of capital, the interest would amount to £300/£350 per annum. These figures do not take into account (a) allowances which can be claimed against income tax, (b) the cost of premiums for insurance policies required as collateral security (at least £50 per annum), and (c) reduction of income through superannuation deductions (at least £70 per annum).

It would be very difficult for this doctor to contemplate the purchase of a further share in order to improve his prospects, within a reasonable time. If he were purchasing a single-handed practice giving an annual gross income of between £2,000 and £3,000 per annum, then his initial capital outlay and burden of debt would be very much greater.

The value of goodwill in a free market might well be adversely affected by economic factors of this kind.

(3) The Amending Acts Committee suggests that that proportion of the £66m. renounced or repaid by those wishing to sell their practices should be used to finance purchases if banks or finance houses refuse to accept the practice as security. The Compensation Committee does not regard this as a likely possibility even if the principle of sale and purchase were conceded.

Administrative Difficulties

If an option were granted it could only be a matter of time before sale and purchase became general. It can be assumed that all practitioners who have started new practices since the appointed day would give formal notice to assume ownership. They have nothing to lose and everything to gain. If to these be added those who would resume ownership with voluntary surrender of compensation rights, the result would be a gradual return to the *status quo* which in an early draft of its interim report the Amending Acts Committee did not regard "as right or practicable."

The Compensation and Superannuation Committee agrees with the view that total repeal is impracticable, since certain practitioners have already received compensation and many have received large sums on account which could not now be repaid. It submits that the existence of a dual system would present even greater administrative difficulties than total repeal. For instance, for an indefinite period practices, as distinct from practitioners, would have to be considered and records of both maintained.

The Amending Acts Committee suggests that where a doctor has been appointed to a vacancy he shall have the right to decide whether he shall regain his right to sell by refunding to the Treasury the compensation paid to his predecessor. If he does not exercise this right but after some years leaves the practice, his successor will, presumably, still have this option, but might have to buy back the right to sell for a sum which no longer represents the value of the goodwill.

Compensation has already been paid in respect of a large number of practices rendered vacant by death or retirement. In the case of practices which have been dispersed, neighbouring practitioners who, in consequence, have increased their lists would presumably be able to regain the right to sell goodwill for which compensation had already been paid, but it would be quite impossible to assess the proportion to be refunded. Alternatively, they would be denied the exercise of the option.

Again, where an appointment is made to a vacancy there is often a fall in value, and a practitioner who wished to exercise the option would have to buy back his right to sell at a figure which might be considerably higher than the value of the goodwill he may eventually acquire.

Great difficulties would arise in partnership practice. Some partners holding options in force on the appointed day would no doubt complete purchase, though amendment

of the N.H.S. (Amendment) Act, 1949, would be necessary. In cases where partnerships have been formed since the appointed day without payment, there might well be disagreement which would be detrimental to the partnership and would cause severe hardship. In order to continue in practice a junior partner might be forced to purchase a share which he could not afford. In group practices, or in health centres, the difficulties would be enormously increased and there would be a risk of abuses which would be difficult, if not impossible, to control. At present partners have a right to determine with whom they shall work and how the practice shall be conducted, but the need for adequate safeguards against abuses in a dual system might well lead to controls and restrictions which would affect this right.

Entry into Practice

These notes are concerned with the practicability of a gradual return to sale and purchase through the exercise of an option, but the Compensation and Superannuation Committee has considered the reasons given in the Amending Acts Committee's Memorandum for the statement that "a return to sale and purchase of goodwill will go a long way to solving the problem of the unestablished practitioner." In the opinion of the Committee the lack of incentive to maintain goodwill, or, in other words, to increase income, and the lack of incentive to retire, which may result from the inability to sell goodwill, are more than offset by the opportunity of increasing the pension, which is related to total net income. Further, though the lack of compensation offered to principals taking on new partners may lead to a diminished number of vacancies, this difficulty could be removed at once if the Ministry concedes the principle for which the Compensation and Superannuation Committee has been pressing for nine months and for which no amendment of the Act is necessary. Any increase in vacancies following an option to sell goodwill could only be spread out over a number of years.

The Committee submits that, following the exercise of an option, the most desirable vacancies will in course of time become available only to those who can afford to buy, and an increasing number of areas will be effectively closed to many wishing to enter general practice. This must surely increase, rather than decrease, the difficulties facing assistants and unestablished practitioners.

Political Considerations

The legal and moral rights to buy and sell goodwill are ably set out in the Amending Acts Committee's Memorandum, but the fact remains that the Act of 1946 abolished the right to sell goodwill.

It is relevant to recall that, in the negotiations in 1947, the question of the abolition of sale and purchase of goodwill was closely linked with the proposals for securing a better distribution of general practitioners. The Negotiating Committee pressed for, but failed to secure, amendments of the Act in both these fields.

A return to sale and purchase, even on an optional basis, would have repercussions on Section 34, and sooner or later, for the reasons suggested above, amendment or repeal of Section 34 would be necessary, since the Medical Practices Committee and executive councils would lose control over those practices where options had been exercised. What, for instance, would be the position in an over-doctored area which had been declared closed by the Medical Practices Committee? If practitioners retained the right to sell goodwill, then the power of the executive council to control the distribution of doctors in the area would be reduced and eventually abolished. If, on the other hand, when a doctor retired in a closed area the executive council retained the right to recommend, and the Medical Practices Committee to rule, that the practice should be dispersed or that there should be no vacancy, the practitioner who had opted for or repurchased the right to sell would be in an impossible position. Further, in all areas there would be a risk, since no doctor could be certain from year to year that the area would not be closed.

There is little or no evidence that a change of Government has caused a change in the attitude of Parliament on this question. One of the factors which undoubtedly had some weight with the profession in 1948 was the discovery that for the party then in opposition was not prepared to press for the continuance of sale and purchase. Even if a majority in Parliament were convinced of the advantages of a free market in goodwill, they would be likely to resist on political grounds any proposal which would seriously affect the administrative structure of Part IV of the Act.

Within the profession such a step might have a serious effect on the unity of general practitioners, since there must be a large number who would not be in a position to exercise the option, and practitioners would be divided into those who can and those who cannot afford to buy. The Committee considers that strong, forceful, and concerted action by a very substantial majority of general practitioners in the Service would be required before any Government would be likely to concede the principle. It is pertinent to ask whether, assuming that 25% of general practitioners would wish to exercise an option, as suggested by the Amending Acts Committee, the rest of the profession would give sufficient support.

Lastly, as a matter of practical politics, there is the question whether the time is opportune to raise a matter with such serious implications in the field of general practice at a time when a Working Party is seeking a form of distribution of general practitioners' remuneration which may well have a marked effect on incomes and which may well result, through incentives to take partners, in an improved prospect to those wishing to enter practice. In the view of the Committee, it would be unwise to come to a decision on this subject before the findings of the Working Party are received.

To sum up, the Compensation and Superannuation Committee regards an option to buy and sell goodwill as impracticable because:

- (1) Under present economic circumstances it is virtually impossible for a practitioner without substantial private means to buy a sufficient amount of goodwill at a rate which would recompense a principal for the loss of the security afforded by compensation.
- (2) The administrative difficulties associated with a dual system would be very great, if not insuperable.
- (3) There is no evidence of even a hard core of opinion in Parliament which would press for the virtual recasting of the N.H.S. Act, 1946.
- (4) There is no evidence of a united front among general practitioners on this question. The hardship to many of a choice forced upon them by a majority opinion might cause dangerous friction in that section of the profession where unity is of paramount importance.
- (5) It would be unwise to reach a decision on this subject before the findings of the Working Party are received.

EXTRAORDINARY GENERAL MEETING

The following additional amendment to the resolution to be presented to the Extraordinary General Meeting on May 5 has been received:

"That after the words, 'approach the Minister of Health,' and before the words, 'with proposals for the better protection,' the words, 'through appropriate channels,' should be inserted."

The amendment is proposed by Dr. H. C. Faulkner and seconded by Dr. G. M. Gould.

Each member of the Association who proposes to attend the Extraordinary General Meeting on May 5 is asked to bring, and to hand to one of the attendants on entering the hall, a card or slip of paper on which are legibly written his or her name and the name of the Division of which he or she is a member. The co-operation of members in this way will greatly facilitate the recording of the attendance at the meeting.

PRE-REGISTRATION-YEAR HOSPITAL APPOINTMENTS

ALLOWANCES TO EX-WAR-SERVICE MEN

A brief reference is made in the Annual Report of Council (*Supplement*, April 4, p. 120) to the action taken by the Association to relieve financial difficulties facing married ex-war-service men holding hospital appointments during the pre-registration year. The following is a more detailed factual statement for the information of members of the Association particularly concerned.

Unforeseen Hardship

Long before the announcement of the day appointed for the Medical Act (1950) to come into operation, after which all those qualifying would have to spend 12 months as house officers, it was apparent that some students, particularly ex-Service men who had been receiving special grants, might suffer financial hardship. Their remuneration as house officers was likely to be substantially less than the income they had derived from their grants during the student period and which ceased abruptly on qualification. In addition they would be prevented from seeking more remunerative work—for example, as trainee practitioners—on the expectation of which they had based their family budgets.

Approach to Ministries

The British Medical Students Association had been concerned for some time with the position. When postponement of the appointed day of the Act proved to be impossible, it approached the two departments concerned—the Ministries of Health and Education—on behalf of the group of students who would qualify after January 1, 1953. During the discussion in Parliament on the Order of Council approving the Regulations, the Minister of Health announced measures which it was hoped would meet the situation. On examination, however, it appeared that, notwithstanding some help, the house officer would still receive substantially less than the income he had received from special grants. The main cause of the difference was that the student's marriage allowance of £121 would no longer be forthcoming. In addition, the house officer would be liable for superannuation and national insurance contributions, from which as a student he was exempt. These amount to £86 in the year, making a difference of approximately £150 between his total receipts as a student and his net income as a house officer.

B.M.A. Council's Action

The provisionally registered practitioner is eligible for membership of the B.M.A., and the Council of the Association, after consultation with representatives of the British Medical Students Association, requested the departments concerned to review the position urgently. The Council asked first that the income of the house officer should be brought into line with his former income as a student by restoration of the marriage allowance, or by some other form of subsidy; secondly, that where there was unavoidable delay in obtaining an approved appointment (or between two appointments), the practitioner should receive an adequate weekly payment; and thirdly, that financial assistance should be available to all ex-war-service house officers on evidence of need whether or not they were formerly in receipt of grants from the State or from local education authorities.

Modifications Proposed

The Ministry announced that for those who had received Further Education and Training Scheme grants, in addition to the grants already announced, there would be a special hardship allowance of £25 per annum included automatically in the assessment made of each individual applicant, as well as the £25 "two homes" allowance payable where the house officer has to maintain his family in a separate home set up by him.

The Ministry of Education has discretion in individual cases to increase this hardship grant. Practitioners formerly in receipt of grants under the Ministry's Further Education and Training Scheme (F.E.T.S.) who feel that their circumstances justify an exceptional addition should apply in writing to the Ministry of Education (Awards Branch), Curzon Street, W.1. The hardship allowance is also available from January 1, 1953, to those who qualified before that date and are serving in hospital posts.

Allowance Pending Appointment

The Ministry will also pay for a limited period a vacation allowance of 30s. a week, together with dependants' allowance at the usual rates, to a qualified practitioner who is awaiting appointment to an approved post. This allowance will be available for two months, but it may be extended if the Ministry of Education is satisfied that further delay in obtaining the post is unavoidable. The Ministry stated that payment would normally be made on taking up the appointment, but has agreed, following further inquiry by the Council, that the allowances shall be payable forthwith on evidence of appointment to an approved post and on proof of need. The Ministry emphasized that, as hitherto, these grants would be available only to married ex-war-service men with dependent children who held awards under the Further Education and Training Scheme. It has now agreed to consider sympathetically individual cases where there are no dependent children, but where special circumstances make it impossible for a wife to undertake remunerative employment.

Local Education Authority Grants

The Minister of Education will not accept responsibility for those who were receiving grants paid by local education authorities. It has no power to make grants to those outside the F.E.T.S., but any individual may apply for a grant to his local education authority. This applies both to those who were formerly in receipt of grants from local authorities and to those who received grants from other sources, or no special subsidy.

Inquiries Welcomed

The Council feels that the proposals, while not completely filling the gap, go some way towards it—taking into account the saving in the family budget due to the fact that the house officer holds a resident post. After consultation with the British Medical Students Association, the Council has accepted the Ministry's proposals, reserving the right to re-examine the position in the light of experience. It will continue to watch the interests of those who may find it necessary to approach local authorities, and individual practitioners or students seeking provisional registration are invited, in case of difficulty, to seek advice from either the B.M.A. or the B.M.S.A.

OCCUPATIONAL HEALTH COMMITTEE

FUTURE OF OCCUPATIONAL HEALTH SERVICES

An all-day meeting of the Occupational Health Committee was held at B.M.A. House on April 15, with Dr. J. A. L. VAUGHAN JONES in the chair. The whole of the morning was occupied with a detailed study of the draft memorandum on the future of occupational health services, prepared by the Planning Subcommittee for submission to the Ministry of Labour. The memorandum received a careful examination, and amendments were made at various points. It was passed for comment to the Public Health Committee, which met later in the week.

Dr. L. G. NORMAN, for the Remuneration Subcommittee, reported that the National Coal Board's proposed injury benefits scheme for its whole-time medical officers had been discussed and found acceptable in principle. Before

a final decision, however, it had been thought desirable to refer it to the whole-time medical officers of the Board for their comments.

Occupational Dermatitis

Dr. H. ALEXANDER, for the Occupational Dermatitis Subcommittee, reported further stages in the correspondence which has taken place on dermatitis in relation to the National Insurance (Industrial Injuries) Act. The Ministry of National Insurance, in reply to representations that examining medical practitioners should in all referred cases be provided with a copy of the dermatologist's report, had suggested that copies should be provided only in individual cases where the practitioner had made a specific request. This was not regarded as satisfactory, as the examining medical practitioner was not aware which cases had been referred. It had been stated that there were 20,000 claimants a year in respect of occupational dermatitis, but the proportion of these claims which were referred to dermatologists was in doubt. One figure mentioned was 14,000, which, if valid, was a very high proportion (two out of three).

It was agreed that the possibility of circularizing a group of examining medical practitioners to secure facts from their records should be considered; also that further representations be made to the Ministry to secure that general practitioners, in addition to examining medical practitioners, be supplied with a copy of the dermatologist's report.

Dr. Alexander said that there was now a tendency to send cases to dermatologists in the out-patient departments of hospitals instead of to their private consulting-rooms. This meant that the normal work of hospital departments was interfered with, and, moreover, that the dermatologist did not receive a fee. The question turned on whether this service, which was concerned with prognosis, came under the National Health Service Act. Discussions are proceeding between the Joint Committee and the Ministry.

Liaison

A point which the Committee desired to be emphasized was that dermatologists should be encouraged to have Appointed Factory Doctors as their clinical assistants or, where no opportunity existed for such appointment, the Appointed Factory Doctor should be invited to attend the dermatological department of a suitable hospital as post-graduate student. This would mean better liaison between industrial medicine and hospital dermatology.

It was also agreed that representatives from the Ministry of National Insurance and the Factory Department of the Ministry of Labour should be invited to attend a joint conference on the subject of dermatitis as a notifiable disease, in particular on the question of making available to the Ministry of Labour for its preventive work any information in possession of the Ministry of National Insurance. It was felt that the latter Ministry should notify the Factory Department of all cases accepted as occupational dermatitis, and that both the examining medical practitioner and the patient's general practitioner should be informed of the notification.

Yet another matter in connexion with dermatitis arose out of the disapproval expressed by the Central Ethical Committee of the disclosure of the names of employees qualifying for industrial injuries benefit. It was the view of the Occupational Health Committee that the information sought was not a disclosure of medical matters by a medical practitioner and did not contravene medical ethics. The Central Ethical Committee was asked to give the matter further consideration.

Medical Standards of Public Transport Operators

On behalf of the subcommittee appointed at the previous meeting to examine the medical standards required for drivers of public transport, it was stated that the sub-

MAY 2, 1953

committee had got down to its work under the chairmanship of Dr. L. G. NORMAN. It asked for a widening of its reference in two respects—the first that it should not be limited to passenger-carrying transport, and the second that not only drivers but other persons concerned with the operation of transport should be included. This widening of reference was agreed to. The scope of the subcommittee covers all road, rail, and air transport. A member suggested that navigation by water should be included.

Ethical Rules

Further discussion took place on the action taken by the Central Ethical Committee in connexion with the *Notes for the Guidance of Industrial Medical Officers*, submitted by the Association of Industrial Medical Officers as a suggested replacement of the *Duties and Ethical Rules of Industrial Medical Officers*. The chief point turned on the requirement or otherwise that, except in an emergency, the industrial medical officer should consult the employee's family doctor before undertaking treatment for trivial and minor complaints. One industrial medical officer on the Committee stated that he had sent as many as 280 letters to general practitioners in cases of this kind. It was true that the letters were so worded that they did not call for a reply unless the practitioner objected, but in not one of these cases had he received any acknowledgment.

At a previous meeting the Association of Industrial Medical Officers had been asked to consider its document again in the light of comments from the Central Ethical Committee. The question was now again argued, particularly the aspect of continued treatment at the factory without consultation with the family doctor.

It was agreed eventually to call a joint conference of representatives of the General Medical Services, Central Ethical, and Occupational Health Committees to discuss this whole matter, the Occupational Health Committee's representation to consist of three whole-time industrial medical officers, two part-time, and one public health medical officer.

PUBLIC HEALTH SERVICES

MEETING OF ASSOCIATION COMMITTEE

A meeting of the Public Health Committee of the Association was held on April 17, with Dr. K. COWAN in the chair. A report was made by the Secretary of the Committee (Dr. Kelynnack) on the implementation of the Industrial Court awards Nos. 2285 and 2321, and the result of appeals against certain authorities. Three regional appeals have been won recently by the Association acting on behalf of the medical officers. The position was judged by the Committee to be satisfactory.

On the question of the Whitley arbitration machinery, it was reported that the Management Side of the General Whitley Council at a recent meeting had agreed to look at the matter again, and it is to be the subject of further discussion by the General Council on May 11.

Conditions of Service for Part-time Medical Officers

The Committee again devoted attention to the question of certain conditions of service for medical officers who are remunerated on a proportional basis related to the National Award scale for whole-time medical officers. It was decided to refer the matter to the Staff Side of Committee "C" for advice, and, if thought fit, appropriate action.

Domiciliary Nursing of Tuberculous Patients

The Committee turned its attention to a draft circular on the domiciliary nursing of cases of tuberculosis to be issued by the Ministry of Health. At its meeting on the previous day the General Medical Services Committee had commented on certain of the advice given in the memorandum. Dr. COWAN thought that the memorandum was

a straightforward document, embodying useful guidance, although some of the items were of a controversial nature.

It was agreed that the chairman of the two Committees be asked to agree a joint statement with comments, to be forwarded to the Ministry.

Future of Occupational Health Services

A draft memorandum on the future of occupational health services, prepared by the Planning Subcommittee of the Occupational Health Committee, came forward for consideration. Certain paragraphs of the memorandum, however, had been considerably revised by the Occupational Health Committee at its meeting two days previously. Disagreement was expressed mainly on two points in the scheme recommended—namely, (1) that the new occupational health scheme should be developed independently of the National Health Service although co-ordinated with it, and (2) the uncertain role of the medical officer of health, which appeared to mean the possible exclusion of the Public Health Service in the recommended scheme.

The Chairman of the Committee was instructed to state these points of view to the Council of the Association.

Resettlement of Tuberculous Persons

A report on the occupational resettlement of tuberculous persons, the result of a conference between representatives of the Public Health, Occupational Health, and Tuberculosis and Diseases of the Chest Group Committees, was received, but detailed consideration was deferred until after a meeting with the Ministry, fixed for April 21.

Ministry of Health circulars on the need for continuity in the care of mothers and babies, on the Public Health (Infectious Diseases) Regulations, and on local publicity campaigns for diphtheria prophylaxis were laid before the Committee. A report from the Central Consultants and Specialists Committee on the organization of the obstetric service, and a report of the Joint B.M.A. and Royal College of Nursing Committee dealing particularly with the special register for fever nurses, were received.

The Public Health Service Defence Trust

A formal meeting of the trustees of the Public Health Service Defence Trust was held at the conclusion of the meeting of the Public Health Committee.

MISUSE OF HORMONE PREPARATIONS BY THE PUBLIC

It has recently been suggested that there may be serious misuse of hormone preparations by the public, especially sex hormones. Self-treatment with ovarian type hormones is said to be a cause of dangerous delay in seeking medical advice in potential cases of cancer of the uterus. It has also been suggested that the efforts of nurses and midwives to encourage breast-feeding are often in vain, as young mothers can so readily obtain these substances in order to suppress lactation.

The Science Committee of the Association wishes to discover whether abuse of hormones by the public does indeed exist, and any member of the Association who can provide information on this problem is invited to communicate with the Secretary, B.M.A. House, Tavistock Square, W.C.1.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

I believe that serious doubts of the nature I have stated exist in the minds of many of us. Anything which will tend to increase the loss of contact and co-operation between the various branches of the profession is to be gravely deplored, and we should all strive to encourage and bring back the consultative method of dealing with our patients. Only in

this way can we justify our claim that we are treating patients and not cases and have that respect for each other which should exist in a wise and intelligent profession.—I am, etc.,

Braintree, Essex.

B. A. J. MAYO.

POINTS FROM LETTERS

Splitting the Profession

Dr. R. E. CLARKE (St. Osyth, Essex) writes: The medical profession is once more in the throes of controversy. Having been corralled into a State service we are now split asunder; the consultants are divided into whole-time and part-time, and the G.P.s into small-list, large-list, and new entrants. Divide and defeat is still good pragmatics. G.P.s are suffering from the inequitable decisions of a Ministry-dominated Working Party handing out absurd directions on how to distribute a sum of money in wages to men doing the same kind of work. The results of the Working Party's decisions are what they obviously would be—unfair to both small-list and big-list men. The small-list doctor is worse off and the new entrant G.P. is thoroughly hamstrung. If he is without private means he will not get a living from his profession for years and years, if ever.

Entry Into Practice

Dr. C. J. DE VERE SHORTT (London, S.W.18) writes: In the *Supplement* (April 4, p. 130) you publish the report of the B.M.A. Medical Practices Advisory Bureau. In this report it is stated that the cause of "the reluctance of general practitioners to take partners was the absence of a capital sum to offset the initial loss of income when a share is transferred. This factor will continue to affect adversely entry into general practice. . . ." The future of the young doctor should be the concern of the profession, and a select committee (in more senses than one) should be appointed to formulate some means whereby the above part of the Bureau's report could read very differently and give the young doctor a more rosy outlook in the future.

Standard Size for Communications

Dr. W. F. BENSTED-SMITH (Newton Ferrers, Devon) writes: For a long time I have urged upon manufacturers' representatives that what we want is not a reproduction of the works of eminent or obscure artists but a concise statement on the drug concerned printed on a thin card the size of an N.H.S. record envelope. These could then be filed in standard cabinets at the doctor's discretion for reference. . . . Hospital (and consultant) reports if typed on paper of a size which, plain or folded, would equal an N.H.S. continuation card (7 in. by 4½ in.) would be an immense advance too.

H.M. Forces Appointments

COLONIAL MEDICAL SERVICE

The following appointments have been announced: C. P. Allen, Ch.M., F.R.C.S., D.T.M.&H., M. A. X. Cocheme, M.B., B.Ch., D.T.M.&H., D.P.M., R. T. B. Green, M.D., D.T.M., B. D. Molesworth, M.B., B.Ch., and R. A. Pallister, O.B.E., M.D., M.R.C.P., D.T.M.&H., Specialist Officers, Grade "A," Federation of Malaya; G. Drury, M.R.C.S., L.R.C.P., D.T.M.&H., Assistant Director of Medical Services, Kenya; L. G. Eddey, M.B., Ch.B., D.T.M.&H., Director of Medical Services, Gold Coast; G. C. Franklin, M.B., B.Ch., Medical Officer, Hong Kong; R. E. Shaw, M.B., F.R.C.S., Medical Officer, Kenya; P. J. Ndow, M.B., B.Ch., Medical Officer, Gambia; J. C. Ryan, M.B., B.Ch., Medical Officer, British Guiana; W. Sinclair, M.B., B.Ch., J. A. D. Bradfield, M.B., B.Ch., G. A. Jeffery, M.B., Ch.B., and R. N. Weir, M.B., Ch.B., Medical Officers, Nyasaland; J. A. Attard, M.D., Medical Officer, Gold Coast; H. J. Barclay, M.B., Ch.B., Resident Medical Officer (Intern), Northern Rhodesia; T. D. Brick, M.B., B.Ch., D.M.R.D., Radiologist, Federation of Malaya; A. M. G. Kissaun, M.D., Medical Officer, Nigeria; H. N. Davies, O.B.E., M.B., Ch.B., D.T.M., Senior Specialist, Tanganyika; E. O'D. C. Grattan, M.B., F.R.C.S., D.T.M.&H., Surgeon Specialist, Kenya; J. F. Jarvis, M.B., F.R.C.S., D.L.O., D.T.M.&H., Ear, Nose, and Throat Specialist, Kenya; W. E. S. Merrett, O.B.E., M.B., B.Ch., Principal, Medical School, Nigeria; S. P. W. Street, F.R.C.S., and M. R. Thompson, F.R.C.S., Surgeon Specialists, Jamaica; W. H. K. Willis, M.B., F.R.C.S., Orthopaedic Specialist, Kenya; Lieutenant-Colonel A. C. S. Hobson, M.B., B.S., M.R.C.P., and J. C. G. Stewart, M.R.C.S., L.R.C.P., Medical Officers, Federation of Malaya; D. E. Evison, M.B., B.Ch., Medical Officer of Health, Northern Rhodesia; A. W. H. Thomson, M.B., Ch.B., Medical Officer, Uganda.

Association Notices

ASSAM BRANCH

Notice is hereby given by the Council to all concerned that it is proposed to dissolve the Assam Valley and Surma Valley Divisions of the Assam Branch, and to reconstitute the Branch into one without Divisions. Any member affected by this proposal and objecting thereto should write to the Secretary of the Association by May 30.

A. MACRAE,
Secretary.

British Medical Association

EXTRAORDINARY GENERAL MEETING

The Extraordinary General Meeting of the British Medical Association, summoned on a requisition signed by more than 100 members, took place in the Great Hall of B.M.A. House, London, on Tuesday afternoon, May 5, following the Special Conference of Local Medical Committees, which was held in the morning. The meeting was attended by about 850 members. The chair was taken by Dr. E. A. GREGG, Chairman of Council, in the absence of the President of the Association.

The CHAIRMAN said that they found themselves in a somewhat peculiar position. The Council had been advised by the learned counsel to convene the meeting in answer to the requisition, but also it had been advised that the resolution proposed by the requisitionists, if carried, might be ignored by the Council, since it dealt with matters within the province of the Representative Body, in which was vested by Article 37 the general control and direction of the policy of the Association. He confessed that this was a somewhat untidy way of ordering their affairs and called for some consideration in the future. He then proposed certain rules for the conduct of the meeting, and these were generally approved.

The Resolution

The resolution which the meeting was called to consider was as follows:

"That the Association being concerned by the modification of the present method of remuneration by capitation fees agreed in the Working Party's report requires the Council forthwith to approach the Minister of Health with proposals for the better protection (financial and otherwise) of the small-list doctor and requests of the doctor newly seeking entry into practice, and requests the Minister of Health not to implement the Working Party's report until the scheme for distribution of remuneration has been considered in the light of such proposals, and meanwhile to continue the present method of payment."

Dr. W. J. GRANT (Shrewsbury), in moving the resolution, said that for years general practitioners had been underpaid. The General Medical Services Committee said that the Danckwerts award made it clear that remuneration had been inadequate since the National Health Service began. The necessity for increased remuneration was universally recognized. But the method of distribution of the money rendered available created grave injustice for those with small lists. There was severe discrimination against the less fortunate of their fellows. There should, said Dr. Grant, be equal pay for equal work. Why, he asked, should the small-list practitioner's capitation fee be less because he

received payments from outside the Service? If this principle was to apply it should apply to lists of all sizes. It had been suggested in some quarters that the intention behind this distribution was direction of labour by economic pressure. The smaller the practice the relatively less the rate of remuneration *per caput*. "We do ask that, in accordance with every canon of justice, and with the statements made by the General Medical Services Committee, every practitioner should receive, without any tinge of charity, his due share of remuneration from the central pool in respect of the work he does for the patient."

Dr. Grant concluded by saying that he had in his possession letters from hundreds of practitioners which revealed a sad picture of urgency, distress, and almost despair. For five years men with good qualifications had been carrying on with great difficulty. He asked that such men should not be condemned to a further delaying period, like guinea-pigs awaiting experiment in a laboratory. Some 1,500 to 2,000 of their colleagues were in need through no fault of their own.

Dr. CHARLES I. SCHIFF (City of London), in seconding, said it was encouraging to see such a packed meeting. (Laughter.) This meeting was not hurriedly requisitioned. There was no question here of throwing spanners into works. The small man was being regarded as a helot. He was going to be remunerated at the rate of 17s. It was said that he had other sources of income, and this would mean that other corporations and services were expected to exploit him in his Health Service work.

The Negotiators' Work

Dr. TALBOT ROGERS pleaded "Not guilty" to the charge of negligence concerning the interests of the small-list man. "We believe in our Committee that, had we been able to keep the periphery fully and properly informed of what we were doing month by month during the course of our preparations for negotiation on this matter, this Extraordinary General Meeting would not have been summoned." He then recounted certain of the events of the last four years, from the negotiations with a very obdurate Minister in 1949 and the two years that followed.

Dr. Rogers went on to quote resolutions of the Special Conference in June, 1952, and the Annual Representative Meeting in that year. These were the answer to the representation that the Working Party, by considering and acceding to a form of distribution which did not load the first thousand, was doing what it had no right to do.

British Medical Association

ANNUAL MEETING—CARDIFF, JULY 9-17, 1953

President-Elect: J. W. TUDOR THOMAS, D.Sc., M.D., M.S., F.R.C.S.

General Secretary: JOHN D. SPILLANE, M.D., F.R.C.P.

Science Secretary: PROFESSOR GILBERT I. STRACHAN, M.D., F.R.C.P., F.R.C.S., F.R.C.O.G.

Executive Officer: G. A. PECK, B.Sc., B.M.A. House, 195, Newport Road, Cardiff.

PROGRAMME

The 121st Annual Meeting of the British Medical Association will be held in Cardiff from Thursday, July 9, to Friday, July 17, 1953, inclusive.

On the evening of Wednesday, July 8, there will be a Sherry Party for Representatives and their Ladies, arranged by the Cardiff Division.

The first part of the Meeting—the Annual Representative Meeting—will begin on Thursday, July 9, and continue on Friday, Saturday, and Monday, July 10, 11, and 13.

In view of the visit of Her Majesty the Queen to Cardiff on July 9, the Representative Meeting will be held that day in the Cory Hall, Station Terrace, with the A.R.M. Inquiry Office in the adjoining Y.M.C.A. centre. On the following day, Friday, July 10, the Annual Representative Meeting will transfer to the City Hall, where it will remain until the conclusion of the meeting on July 13.

The Representatives' Dinner and Ladies' Dinner take place on Thursday, July 9, followed by a dance.

The Overseas Luncheon is arranged for Friday, July 10.

On Sunday, July 12, a visit has been arranged for Representatives and their Ladies to St. Donat's Castle, and that evening there will be a Welsh Choral Concert.

The second part of the Meeting—the Annual Meeting proper—occupies the period from the conclusion of the A.R.M. on Monday, July 13, to the evening of Friday, July 17.

The adjourned Annual General Meeting and President's Address will take place in the Park Hall Cinema on the evening of Monday, July 13, and the President's Reception which follows will be at the National Museum of Wales.

Three Plenary Scientific Sessions are arranged as follows: Tuesday morning, July 14, "Coronary Disease"; Thursday morning, July 16, "Fibrositis"; Friday afternoon, July 17, "Overweight."

Seventeen Scientific Sections have been arranged, the meetings to take place on Wednesday morning and Wednesday afternoon, July 15, and Friday morning, July 17 (details are given below).

The Official Religious Service will be held in St. John's Church, Cardiff, on the afternoon of Tuesday, July 14.

A Roman Catholic Service will be held in St. Peter's Church, Cardiff, on the morning of July 14.

The Popular Lecture will be given by Sir Russell Brain, F.R.C.P., on the evening of Friday, July 17.

There will be a Joint Reception by the University College of South Wales and Monmouthshire and the Welsh National School of Medicine on Tuesday evening, July 14, and a Civic Reception on the following evening.

The Annual Dinner of the Association will be held in the City Hall on Thursday, July 16.

Two large Garden Parties have been arranged—on Thursday, July 16, at Margam, by invitation of Mr. Evans Bevan, and on Friday, July 17, at Duffryn House, by invitation of the Board of Governors of the United Cardiff Hospitals.

The Monmouthshire Division is giving a Sherry Party on Tuesday, July 14.

An attractive social programme has been drawn up, including many functions specially arranged for the ladies accompanying members. There are also a number of visits to Welsh industrial concerns, including one to the Abbey Steel Works, Margam, the largest of its kind in the world.

The South Wales Association of the Medical Women's Federation is giving a Sherry Party on July 10 for medical women visitors.

The usual golf competitions will take place, and there will also be facilities for bridge, bowls, and tennis. Various sports and social clubs have offered honorary membership to B.M.A. Members throughout the Meeting.

The Overseas Conference will be held on Wednesday afternoon, July 15, followed by an "At Home" for Overseas Delegates given by the Empire Medical Advisory Bureau.

The Christian Medical Fellowship is holding its Annual Breakfast (formerly known as the Medical Missionary Breakfast) on July 15, and the usual graduate luncheons and dinners have been arranged.

The Reception Room for registration in the Sophia Gardens Pavilion will be opened on Monday, July 13, at 9 a.m.

The Ladies' Club will be situated in the University College and will be open throughout the Meeting.

The Annual Trade Exhibition of Surgical Appliances, Foods, Drugs, and Books will be housed in the Sophia Gardens Pavilion. The official opening will take place on Monday, July 13, at 9 a.m., and the Exhibition will remain open on July 14, 15, 16, and 17 from 9 a.m. to 6 p.m.

The Scientific Exhibition will also be held in the Sophia Gardens Pavilion and will be open daily from July 13 to 17. Demonstrations will be given at fixed advertised times (details are given below).

HOTEL ACCOMMODATION

A list of hotels and guest houses in and around Cardiff was published in the *Supplement* of April 25 (p. 153), and members who have not already made their arrangements for accommodation at the Meeting are advised to do so without further delay. Those who have difficulty in making arrangements are advised to write direct to the *Executive Officer*, B.M.A. House, 195, Newport Road, Cardiff, stating their exact requirements.

REGULATIONS REGARDING DRESS

Academic Dress is to be worn at the President's Address, the President's Reception, the Official Religious Service, the Roman Catholic Service, the University Reception, and the Civic Reception.

Robes may be hired from Messrs. Ede and Ravenscroft, Ltd., 93, Chancery Lane, London, W.C.2, who request that the gowns be sent to the home address of the individual concerned. Early application is advised, as the supply of gowns is limited.

Evening Dress (Tails or Dinner Jacket), with Decorations, is to be worn at the President's Reception, University Reception, Civic Reception, and Annual Dinner. Evening Dress without Decorations should be worn at the Representatives' Dinner and the Representatives' Dance.

REGISTRATION FEE

Members attending the Annual Meeting (other than members of the Representative Body and overseas visitors) are required to pay a fee of one guinea towards the expenses of the Meeting. The fee will be payable when members register at the Reception Office.

TICKETS

No tickets for functions or excursions can be issued in advance.

All tickets for functions up to Sunday, July 12, will be available at the A.R.M. Inquiry Office at the Y.M.C.A. on July 9 and at the City Hall on July 10 and 11, or at the Ladies' Club, University College.

Tickets for all other functions will be available from Monday, July 13, at the Reception Office, Sophia Gardens Pavilion, or at the Ladies' Club.

BADGES

Members will not be admitted to the Plenary Sessions or Scientific Sections unless wearing badges. They should therefore make a point of visiting the Reception Office, Sophia Gardens Pavilion, on the first day of their attendance at the Annual Meeting to obtain their handbook, badge, registration card, and tickets.

Officers of Scientific Sections and other office-holders should inquire for special badges at the Reception Office.

CAR-PARKING

Windscreen labels may be obtained at the Reception Offices, and members bringing their own cars are advised to use these labels to facilitate car-parking.

Only limited covered accommodation is available for cars in Cardiff, but open-air accommodation is available at Messrs. E. R. Forse & Co., Kingsway, and The Friary, Cardiff.

ABERDEEN GRADUATES' DINNER

A dinner arranged by the South Wales and West of England Branch of the Aberdeen University Graduates' Association will be held in the Royal Hotel, Cardiff, on Friday, July 10, at 7.30 p.m. Tickets will be one guinea each, excluding wine.

This dinner is open to all Aberdeen graduates and their wives attending the Annual Meeting, and those intending to attend the A.R.M. or resident in the area. Those attending the A.R.M. or resident in the area, Mrs. Scott be present are asked to notify the local secretary, Mrs. Thomson, Glasfryn, Lower Cwrt-y-vil Road, Penarth, Glam. Tickets will be available at the A.R.M. Inquiry Office, Y.M.C.A. (opposite Queen Street Station), on July 9.

GLASGOW GRADUATES' DINNER

The Glasgow Graduates' dinner will be held in the Royal Hotel, Cardiff, on Saturday, July 11, at 7 for 7.30 p.m. This dinner is open to all Glasgow graduates and their ladies attending the A.R.M. or resident in the area.

Tickets, at a cost of 25s., including aperitifs, are obtainable from Dr. Robert Forbes, Tavistock House South, Tavistock Square, London, W.C.1.

WELSH DINNER

A dinner open to all doctors with Welsh associations and their wives attending the Annual Meeting will be held in the New Continental Café, Cardiff, on Saturday, July 11, at 7.30 p.m. Tickets will be one guinea each, and those wishing to attend are asked to apply for tickets, with remittances, to the Hon. Secretary, Welsh Dinner, B.M.A. House, 195, Newport Road, Cardiff.

CHRISTIAN MEDICAL FELLOWSHIP ANNUAL BREAKFAST

The Annual Breakfast of the Christian Medical Fellowship (formerly known as the Medical Missionary Breakfast) will be held at the New Continental Café, Cardiff, on Wednesday, July 15, at 8.30 a.m. The chairman will be Mr. J. W. Tudor Thomas, and the speaker Dr. D. Martin Lloyd-Jones. The proceedings will terminate at 9.40 a.m. Those intending to be present are asked to notify the local secretary: Mr. A. S. Aldis, F.R.C.S., 3, Heol Don, Whitchurch, Cardiff.

SCIENTIFIC MEETING

PLENARY SESSIONS

All sessions will be held in the Reardon Smith Theatre, Park Place.

Tuesday, July 14, 10 a.m.: "Coronary Disease"

Chairman: Professor H. SCARBOROUGH (Cardiff).

Speakers: Dr. D. EVAN BEDFORD (London), Dr. WILLIAM PHILLIPS (Cardiff), Professor G. W. PICKERING (London), Dr. CLIFFORD G. PARSONS (Birmingham), Dr. A. RAE GILCHRIST (Edinburgh), Dr. JOHN H. HUNT (London).

Thursday, July 16, 10 a.m.: "Fibrositis"

Chairman: Mr. A. LAWRENCE ABEL (London).

Speakers: Dr. A. TALBOT ROGERS (Bromley), Dr. A. H. DOUTHWAITE (London), Dr. J. P. SPILLANE (Cardiff), Mr. J. S. BATCHELOR (London), Mr. LESLIE H. W. WILLIAMS (London), Dr. J. H. CYRIAX (London), Dr. G. D. KERSLEY (Bath).

Friday, July 17, 2.15 p.m.: "Overweight"

Chairman: Right Hon. LORD HORDER (London).

Speakers: Dr. J. H. SHELDON (Wolverhampton), Professor R. A. McCANCE, F.R.S. (Cambridge), Dr. ARNOLD P. MEIKLEJOHN (Edinburgh), Dr. H. M. SINCLAIR (Oxford), Dr. LEONARD H. HOWELLS (Cardiff), Dr. EMRYS WILLIAMS (Cardiff).

SCIENTIFIC SECTIONS

All sessions will be held in University College, Cathays Park.

MEDICINE

President: Professor A. M. KENNEDY, M.D., F.R.C.P. (Cardiff).

Vice-Presidents: Professor W. MELVILLE ARNOTT, B.Sc., M.D., F.R.C.P. (Birmingham); Sir DANIEL DAVIES, K.C.V.O., M.D., F.R.C.P. (London); LEONARD H. HOWELLS, M.D., F.R.C.P. (Cardiff); and Professor W. J. E. JESSOP, M.Sc., M.D., F.R.C.P.I., D.P.H., F.R.I.C. (Dublin).

Hon. Secretaries: BYRON EVANS, M.D., M.R.C.P., 59, Cathedral Road, Cardiff; JOHN RICHARDSON, M.V.O., M.D., F.R.C.P., 33, Devonshire Place, London, W.1.

The following programme has been arranged:

Wednesday, July 15 (Room 103).—10 a.m., The Use and Abuse of Antibiotics. To be opened by Dr. R. W. FAIRBROTHER (Manchester), Dr. THOMAS ANDERSON (Glasgow), and Mr. J. S. JEFFREY (Edinburgh); followed by Dr. KENNETH S. MACLEAN (London), Dr. H. M. FOREMAN (Sully, Glam), and Dr. F. A. WHITLOCK (Truro). 2 p.m., The Early Diagnosis of Intrathoracic New Growths. To be opened by Sir GEOFFREY MARSHALL (London), Mr. VERNON THOMPSON (London), and Dr. PETER KERLEY (London); followed by Dr. BRIAN TAYLOR (Birmingham) and Mr. DILLWYN THOMAS (Cardiff).

SURGERY

President: Professor LAMBERT C. ROGERS, V.R.D., M.Sc., M.D., F.R.C.S., F.A.C.S., F.R.A.C.S. (Cardiff).

Vice-Presidents: D. J. HARRIES, M.D., F.R.C.S. (Cardiff); J. B. HAYCRAFT, M.C., M.B., F.R.C.S. (Cardiff); D. IOAN-JONES, M.B., F.R.C.S. (Cardiff); C. JENNINGS MARSHALL, M.D., M.S., F.R.C.S. (London); A. DICKSON WRIGHT, M.S., F.R.C.S. (London).

Hon. Secretaries: STANLEY AYLETT, M.B.E., M.B., F.R.C.S., 114, Harley Street, London, W.1; D. B. E. FOSTER, M.B., F.R.C.S.Ed., Hillboro, Llandough, Penarth, Glamorgan.

The following programme has been arranged:

Wednesday, July 15 (Room 129).—10 a.m., The Treatment of Toxic Goitre. To be opened by Mr. R. V. COOKE (Bristol). The Treatment of Diseases of the Gall-bladder and Bile Ducts. To be opened by Mr. R. J. McNEILL LOVE (London). 2 p.m., The Relief of Pain of Vascular Disease in the Lower Limb. To be opened by Sir JAMES PATERSON

ROSS (London) and Mr. J. B. OLDHAM (Liverpool); followed by Mr. HAROLD DODD (London), Professor C. G. ROB (London), and Mr. S. M. COHEN (London).

OBSTETRICS AND GYNAECOLOGY

President: Professor G. I. STRACHAN, M.D., F.R.C.P., F.R.C.S., F.R.C.O.G. (Cardiff).

Vice-Presidents: M. D. ARWYN EVANS, M.D., F.R.C.S.Ed., F.R.C.O.G. (Cardiff); Professor H. HARVEY EVERS, M.B., M.S., F.R.C.S., F.R.C.O.G. (Newcastle-upon-Tyne); R. G. MALIPHANT, M.D., M.R.C.P., F.R.C.S., F.R.C.O.G. (Cardiff); H. K. PACEY, M.D., F.R.C.S., F.R.A.C.S., F.R.C.O.G. (Wellington, New Zealand); LESLIE H. W. WILLIAMS, M.D., M.S., F.R.C.S., F.R.C.O.G. (London).

Hon. Secretaries: J. M. BOWEN, M.B., M.R.C.O.G., 9, Edward VII Avenue, Newport, Mon; ALISTAIR L. GUNN, M.D., F.R.C.S.Ed., F.R.C.O.G., 51, Harley Street, London, W.1.

The following programme has been arranged:

Wednesday, July 15 (Room 56).—10 a.m., The Place of the Forceps in Present-day Obstetrics. To be opened by Professor T. N. A. JEFFCOATE (Liverpool); followed by Mr. GAVIN BOYD (Belfast), Mr. WILLIAM HUNTER (Newcastle-upon-Tyne), and Mr. E. PARRY JONES (St. Asaph, Flint). *Short Paper:* Professor J. C. MCCLURE BROWNE (London), Placental Circulation in Pre-eclamptic Toxaemia. 2 p.m., The Climacteric. To be opened by Mr. ALECK W. BOURNE (London); followed by Mr. T. N. MACGREGOR (Edinburgh), Professor H. C. McLAREN (Birmingham), and Mr. M. D. ARWYN EVANS (Cardiff). *Short Paper:* Dr. D. MCKAY HART (Glasgow), Dysmenorrhoea.

ANAESTHETICS

President: C. LANGTON HEWER, M.B., B.S., M.R.C.P., D.A., F.F.A.R.C.S. (London).

Vice-Presidents: RONALD JARMAN, D.S.C., M.R.C.S., L.R.C.P., D.A., F.F.A.R.C.S. (London); A. HUGH MUSGROVE, M.R.C.S., L.R.C.P., D.A., F.F.A.R.C.S. (Cardiff); WILLIAM W. MUSHIN, M.A., M.B., B.S., D.A., F.F.A.R.C.S. (Cardiff).

Hon. Secretaries: J. G. BOURNE, M.B., B.Ch., D.A., 37, Marsham Court, Westminster, S.W.1; I. RHYS JONES, M.R.C.S., L.R.C.P., D.A., Cliff Cottage, Radyr, Glamorgan. The following programme has been arranged:

Wednesday, July 15 (Room 116).—10 a.m., A Return to Simplicity? To be opened by Dr. M. D. NOSWORTHY (London); followed by Dr. W. W. MUSHIN (Cardiff). 2 p.m., *Short Paper:* Dr. E. J. DELORME (Edinburgh), Hypothermia and Anaesthesia. The Case Against Hypotension. To be opened by Dr. M. H. ARMSTRONG DAVISON (Newcastle-upon-Tyne); followed by Dr. R. F. WOOLMER (Bristol).

CARDIOLOGY

President: MAURICE CAMPBELL, O.B.E., D.M., F.R.C.P. (London).

Vice-Presidents: A. RAE GILCHRIST, M.D., F.R.C.P. (Edinburgh); Professor C. BRUCE PERRY, M.D., F.R.C.P. (Bristol); WILLIAM PHILLIPS, M.D., F.R.C.P. (Cardiff).

Hon. Secretaries: SHEILA HOWARTH, M.B., B.S., Institute of Cardiology, 35, Wimpole Street, London, W.1; ARTHUR J. THOMAS, M.D., M.R.C.P., D.P.H., Tanoama, Llandough, near Penarth, Glamorgan.

The following programme has been arranged:

Wednesday, July 15 (Room 202).—2 p.m., Pulmonary Heart Disease. To be opened by Dr. A. J. THOMAS (Cardiff) and Professor JETHRO GOUGH (Cardiff); followed by Dr. WILLIAM EVANS (London) and Dr. MAURICE CAMPBELL (London). *Film Demonstration* by Dr. I. McMILLAN (London), The Action of the Aortic Valves.

DISEASES OF THE CHEST

President: Sir CLEMENT PRICE THOMAS, K.C.V.O., F.R.C.S. (London).

Vice-Presidents: A. L. D'ABREU, O.B.E., M.D., Ch.M., F.R.C.S. (Birmingham); Professor FREDERICK HEAF, M.D.,

F.R.C.P. (Cardiff); DILLWYN M. E. THOMAS, M.R.C.S., L.R.C.P. (Sully, Glam).

Hon. Secretaries: H. R. S. HARLEY, M.S., F.R.C.S., 93, Station Road, Llanishen, Cardiff; M. MEREDITH BROWN, B.M., F.R.C.S.Ed., 17, Priory Mansions, Drayton Gardens, London, S.W.10.

The following programme has been arranged:

Friday, July 17 (Room 28).—10 a.m., The Value of Artificial Pneumothorax in the Treatment of Pulmonary Tuberculosis. To be opened by Dr. HOWARD NICHOLSON (London) and Dr. C. H. C. TOUSSAINT (London); followed by Mr. R. S. BARCLAY (Newton Mearns, Renfrewshire), Dr. C. S. DARKE (Sheffield), and Dr. PETER EDWARDS (Cheshire Joint Sanatorium). *Short Papers:* Mr. O. S. TUBBS (London), Constrictive Pericarditis; Mr. R. H. FRANKLIN (London), Congenital Atresia of the Oesophagus; Dr. ARCHIE COCHRANE (Cardiff), Radiological Diagnosis of Pneumoconiosis.

CHILD HEALTH

President: Professor A. G. WATKINS, M.D., F.R.C.P. (Cardiff).

Vice-Presidents: V. MARY CROSSE, O.B.E., M.D., D.P.H., D.R.C.O.G. (Birmingham); Professor A. V. NEALE, M.D., F.R.C.P., D.P.H. (Bristol); J. N. O'REILLY, D.M., M.R.C.P. (London).

Hon. Secretaries: P. T. BRAY, M.R.C.P., D.C.H., 28, Park Place, Cardiff; I. A. B. CATHIE, M.D., M.R.C.P., Pathological Department, The Hospital for Sick Children, Great Ormond Street, London, W.C.1.

INVITATION FROM MONTECATINI

The authorities of Montecatini (Italy) have invited a party of 25 doctors, who may be accompanied by their wives, to spend a week at Montecatini as their guests. Montecatini is about 25 miles north-west of Florence, and is a spa specializing in diseases of the gastro-intestinal tract. The party will be given accommodation and full board for one week, but will be responsible for their own travel to and from Montecatini. Some lectures will be offered by Italian doctors, and there will be excursions to various centres in Tuscany. The date suggested is the week June 28-July 4.

Applications are invited from members interested in the treatment of gastro-intestinal diseases, and should be sent to the Secretary of the Association as soon as possible.

N.O.T.B. ASSOCIATION

The N.O.T.B. Association held its twenty-seventh committee meeting on April 24. It received and welcomed the views of the Ophthalmic Group Committee of the British Medical Association on the future developments in public relations for ophthalmology. A meeting of the appropriate N.O.T.B.A. subcommittee will be held in the near future.

The committee learned with pleasure of the support given by the Ophthalmic Group Committee of the B.M.A. to the recommendations in the N.O.T.B. Association's report concerning the status of the ophthalmic medical practitioner in the supplementary ophthalmic service.

Medical Eye Centres

After a full discussion on the minutes of the last two meetings of the Medical Appointments Subcommittee the committee decided to remind all members of the particular importance of the following rules concerning medical eye centres:

(a) No N.O.T.B. medical eye centre shall be opened, nor shall the medical staff of any existing centre be increased, without the approval of the association.

(c) All appointments to the medical staff of N.O.T.B. medical eye centres shall be subject to the approval of the association, and where there are more applications for any appointments than vacancies the selection shall be made by the association.

Representation on B.M.A. Ophthalmic Group Committee

Dr. R. U. Gillan, the annual retiring member for 1953, was unanimously re-elected to represent the association on the Ophthalmic Group Committee of the B.M.A. for 1953-4.

DINNER TO DR. S. WAND AND
DR. D. P. STEVENSON

Sets of Royal Crown Derby china were presented to Dr. S. Wand and Dr. D. P. Stevenson at a dinner held at the Midland Hotel, Derby, on Sunday, April 12, 1953, by the Derbyshire Local Medical Committee and the Derby Local Medical Committee.

In making the presentations Dr. E. J. Allan (Glossop) and Dr. E. C. Dawson (Derby) stressed the debt owed to Drs. Wand and Stevenson by the profession for their work towards obtaining the Danckwerts award.

In their replies both guests, in thanking the committees for their gifts, drew attention to the continuing need for unity within the profession, which to-day was as great as, if not greater than, during the period leading up to the events which the presentations recognized.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

The Constitution of the B.M.A.

SIR,—Members should be greatly indebted to you for your series of articles on the constitution of the B.M.A., and particularly for the leading article on the Representative Body (*Journal*, April 25, p. 923). Many members who recognize the importance of a strong and active B.M.A. organized on lines so that it can cope effectively with modern medico-political problems, many indeed who realize that in the B.M.A. there stands the final hope of our survival as one profession, have during the last few years been conscious of an increasing sense of uneasiness. In any truly democratic body reform of its constitution must inevitably follow after the events which lead to the need for reform, and there is, therefore, bound to be a period when the organization is not working at its maximum efficiency (no matter how capably directed), and this danger period is one through which we have been passing during the last five years. An organization that was deemed adequate fifty years ago cannot be expected to keep up with the amount of work required of it to-day in this rapidly changing medical world. This work has doubled and trebled itself even in the last few years, and the speed of events is such that only an up-to-date machine can be expected to deal with it. To resist this modernization is a short-sighted policy. To leave it only partly complete would be disastrous.

It was with these thoughts in mind that the Winchester Division set out on its series of memoranda four years ago. It seemed rational at the start to concentrate on the main executive body—the Council of the Association. To our minds its efficiency was impaired primarily because it was out of touch with the opinions of the individual members of the Association. It will be remembered that there was sufficient support forthcoming for this view for us to be able to put the case to a Special Representative Meeting, and for reform to follow.

What was not seen so clearly at this time, and where we may be considered to have failed in our initial efforts, was the ever-increasing power of those offspring of the Council known then as autonomous bodies, but now as standing committees. The work of reform so successfully carried out by the R.B. has been to a dangerous extent neutralized by these autonomous committees, so that we see an otherwise active parent body held down and, at any rate in part of its work, virtually strangled by the offspring it so wittingly created. Steps so far taken to prevent this slow but steady delegation of power from central control to control by autonomy have amounted to a resolution by the Representative Body that the autonomous powers should be renewed each year, a mere paper transaction of no significance; and an accepted placebo in the Council that "standing committee" sounds better than "autonomous body" (no one has heard of the arrest of malignant disease by changing its name from "carcinoma" to "growth"). Both of these were face-saving and have merely evaded the better. For the rest, we have warning articles and letters in the *Journal*, backed up by the opinions of such men as Dr. Alfred Cox (*Supplement*, April 25, p. 145) and Dr. F. B. Winfield (*Supplement*, April 18, p. 139), but no constructive suggestions or strong, effective action to eradicate the danger.

Continuing this review of the modernization of the machine, it next seemed reasonable that the information service (I think its modern name is "Inter-professional Relations," to distinguish it from "Public Relations")

should be streamlined—and anything smacking of propaganda is a nauseating subject at the best of times to a conservative profession. Having a more active and well-informed Council and, we hoped, a more interested periphery (more must be said about this later), it was essential for efficiency that these two should be more closely knit and better informed of each other's day-to-day activities. This could be done along two lines: To individual members and by means of reports and notices in the *Journal*, and back again via the same medium in the shape of articles and letters from the members themselves; and to the Branches and Divisions through the Secretariat and the Public Relations Officer. The *Supplement* is now full of comprehensive information each week, and there can no longer be any excuse for suggestions that the ordinary member has little or no knowledge of what is going on at Headquarters in the running of his affairs, and the recent articles on the constitution of the Association must have done a great deal of good in rousing and maintaining the interest of members in their own Association. Similarly, the information services available for individual members at B.M.A. House, vices available for individual members at B.M.A. House, together with the increased club facilities, are worthy of high praise.

May we be forgiven if we point to one aspect of this subject in which no progress appears to have been made? I refer to the lamentable lack of interest shown by Headquarters in Divisional activities. It is now no exaggeration to say that until the Annual Report of Council appears in the *Journal* each year these important cogs in the machine are left virtually untended to fend for themselves and to rotate at their own speed, if at all. I say "if at all" advisedly, because even in an active Division such as Winchester attendances at meetings are falling off, so that well-advised meetings, with first-rate and well-known speakers, advertised meetings, with first-rate and well-known speakers, fail to attract more than a handful of members. Very few of the regular attenders at Divisional meetings can any longer be deceived that their views are of any interest centrally, since the number of times they—as Divisions—are asked to express their views during any one year can be counted on fingerless hands. The answers given centrally are that Divisions should be able to find their own means of keeping up the interest of members and not rely on Headquarters to do it for them; that the speed of events is such that there is not time to ask for the opinion of Divisions; that the Annual Report of Council gives Divisions ample material for debate. None of these is acceptable when we are engaged in modernizing the machine, for it primarily depends for its efficiency (indeed for its very existence) on the creation and maintenance of a membership actively interested in its own affairs.

No one doubts the amount of work being done by the committees of the Association and the Secretariat, but they exist to interpret the will of the members by close and to serve, and this they can only do effectively by close and continued contact with the Divisions. If for ten months of the year these latter are left to their own devices, active or inactive according to the whims of the local secretaries, the machine is useless. (Would it be too much to ask, for example, that a bulletin, containing notes by individual members of the Secretariat, the Public Relations Officer, and chairmen of committees, should be circulated to Divisions each month? This small step alone would be of immense help to the hard-working and oft-despairing secretaries of Divisions.)

Weighing up what has been said so far, we find ourselves facing two major weaknesses in our reorganization: an active Council rendered increasingly impotent by its own standing committees—this might fairly be described, I think, as a weakness that has grown up in recent years, and hardly existed when the work of modernization began; and Divisions rendered increasingly impotent through lack of an efficient liaison service with Headquarters—an old weakness which has become more obvious in recent years and has, so far, resisted change.

But one part of the machine has not yet been touched—the Representative Body—and it may well be that in

remodelling this we could succeed also in eliminating the two potentially dangerous elements we have discussed in the last paragraph. Even the most superficial glance at the constitution and activities of the Representative Body reveals that this parliament of the Association is itself being influenced by these same autonomous bodies, and being weakened in its debates by the knowledge that the Divisional meetings, upon whose deliberations it depends in the shaping of the policy of the Association, are more sparsely attended than ever before in their history.

How, then, to modernize the parliament? From the first it is obvious that the Representative Body in future, to be effective, must not only represent active Divisions but each separate section of the profession. We may regret that these sections have developed, but it would be foolish not to recognize their existence (the National Health Service Act, as Dr. H. G. Dain explained to us in his recent Winchester address, divided the profession into three. It is not for us to perpetuate this fragmentation but to eliminate it). Building on this foundation, what changes are necessary in the creation of a new parliament?

(1) To reduce its numbers so that it is of such a size that it can do its work with maximum efficiency.

(2) To cut down its agenda so that each item receives the attention it deserves, from the first page to the last.

(3) To increase its sectional representation so that the major standing committees have a personal interest in its deliberations and decisions. This will encourage them to take more than a superficial glance at motions passed to them from the R.B., and to carry into effect the intentions of their Parliament, not just note them and decide that "no action is necessary at present"—so completely nullifying the activities of the ordinary members in Divisional meetings and the Representatives who successfully present their resolutions.

(4) To ensure that among the elected Representatives such an arrangement exists that no section—for example, the general practitioners—can be accused of swamping the resolutions of interest to its colleagues (the argument against this latter view is that if representatives are elected by Divisions and sent to the R.B. to represent them the R.B. must, verily, be truly representative. Against this is the obvious fact that one section of the profession—the general practitioners—greatly outnumber the other two and must inevitably have a greater number of representatives, irrespective of whether the G.P.s take a more active interest in Divisional affairs than their colleagues or not).

Following on the above, it is common sense to suggest that reform must not be weakened by inadequate consideration, must not be incomplete in any detail, and must not be sterilized by a lack of determination to face and eliminate every existing fault. Old concepts of adequate representation will inevitably have to be discarded, as will also old ideas of representing one profession by one man. None of this can be done in a day, or even in the course of one Annual Representative Meeting, and it would be disastrous if the new parliament were to be built up piecemeal by means of isolated motions designed merely to patch up the present constitution. In reorganizing the Council the R.B. was able to take a comparatively detached and unselfish view of the reforms needed. A different situation arises when the most important body of the Association undertakes to reform itself. Before this can be done it must have a clear view of its own weaknesses and must be prepared to act unselfishly and ruthlessly to eradicate them. A new parliament must be built on firm foundations and not on the ruins of the old.

It is to be hoped, therefore, that the R.B. will, as you have suggested, instruct Council to form a constitution committee of the Association which can devote its time solely to this problem (for no existing committee has the time to deal with this together with all its other business). To do this the committee will have to take evidence from all sources—Branches and Divisions; Council; standing committees; prominent and well-informed individual members of the Association (and we must name Dr. Alfred Cox in this group); and any outside source which may be deemed to have sufficient knowledge of such an organization that it can help usefully the Committee in its work. In

this connexion it will no doubt be noted that Council is already employing a team of experts to reorganize the "office" side of the Association. Such people could undoubtedly give good advice also in the reorganization of the R.B. The Winchester Division hopes to collect reports from as many Divisions as possible by July, to spend some weeks in analysing and grouping them, and then to produce a concise memorandum based on the majority view which, it is hoped, may be accepted as useful evidence.

When the R.B. is reconstituted so that it can regain its lost power, has become truly representative of all Divisions and sections of the profession, and can properly bring to action the wishes of the ordinary member in Divisional meetings, the danger period through which we are passing will be over and we shall be able to go ahead in this jet-propelled age with a machine which is second to none. For the future, many will support Dr. Dain's view that the Association must work for a reorganization at the periphery so that one body in each geographical area represents the interests of all sections of the profession. The increased strength this would give to the framework of the Association is immeasurable, but it will be impossible to achieve until our own reorganization is completed.—I am, etc.,

Winchester.

RONALD GIBSON.

The Cost of Prescribing

SIR,—If your special correspondent (*Journal*, March 28, p. 723) or the writer of your leading article on the Health Service estimates (p. 716) had listened to my remarks at the last A.R.M. on the 1s. charge for prescriptions they would not have expressed the surprise they did at certain figures for pharmaceutical services.

I suggested that so far from acting as a deterrent the prescription charge was quite likely to lead to extravagance and waste—for the following reasons. (1) There would be an inevitable tendency to prescribe larger bottles of medicine or more tablets, etc., for many perfectly good reasons, yet much of the extra medicine would not, in fact, prove necessary or be used. (2) There is a natural human tendency in the circumstances for patients to anticipate their needs, and when coming for a repeat prescription to ask for something which they do not actually need at the time and may never need at all. (3) It was also almost certain—as has happened—that prescriptions for more than one member of the family would be prescribed on one form, and finally that the charge actually weakened the doctor's position, as the patient would reply, "But, Doctor, I'm paying for it now."

For these reasons—and there may be others—it is no surprise to find that the cost of drugs has not diminished or that "the reduction in the estimated yield from the charges in the coming year is not greater than it is." To prevent these evasions of charges extremely heavy penalties are authorized, but I think I also mentioned that the very severity of the penalties would prevent them ever being imposed except in most outrageous cases, and that as both patient and doctor would be equally liable it would be practically impossible to get the necessary evidence to convict either.

Hope for diminution of the drug bill should come, as I suggested in *The Times* of March 10, from a thorough and acceptable revision of the *National Formulary*. I think this might bring it down by five or perhaps even seven or eight million pounds, with actually increased satisfaction to patients as well as doctors. The other, and more immediate, prospect of relief is suggested by the anomalous Scottish figures, which show a reduction of £500,000. This is not, I fear, due to improved prescribing in Scotland, where appreciably more proprietary drugs are ordered than in England. I think it is most probably due to the use in Scotland of E.C.10A so that doctors there are encouraged to keep stocks of some drugs and can give on the spot, say, one pil. col. co. instead of ordering a dozen, of which 11 may not be required. They can also, for example, give a patient with an influenza cold a few febrifuge tablets, one or two sleeping tablets, and prescribe one item instead of three.

If the Minister of Health would sanction the use of E.C.10A in England, and encourage doctors to carry round small supplies of drugs for immediate use, the Scottish

figures suggest that he could immediately cut a million or two off his estimates and make everyone—except the chemists and some manufacturers—much happier in the process, and do something to diminish sickness absence. These two measures I have outlined might well reduce the cost of pharmaceutical services by 10–15% and are vastly preferable to any attempt to interfere with prescribing in the interests of economy.—I am, etc.,

Winsford, Cheshire.

W. N. LEAK.

The Malayan Medical Service

SIR,—In view of the specious and superficially attractive advertisements of appointments in the Colonial Medical Service which appear weekly in the *Journal*, I think it is necessary that prospective applicants should be informed of certain facts concerning the Service which are not advertised and which the Colonial Office will certainly not pass on to them. I was a member of the Colonial Medical Service for 9½ years, serving in the Gold Coast, Borneo, and Malaya; I resigned a year ago, and the circumstances which led to my resignation are, I think, an example of what any candidate for appointment to the Service should know.

Pre-war, the Malayan Medical Service was almost entirely a European service, local graduates from the medical college in Singapore being appointed to the Assistant Medical Service, although promotion to the Malayan Medical Service was given to a few outstanding Asians. In 1946 a Socialist Government, determined to give self-government to Malaya, announced its intention of combining the Malayan Medical Service and the Assistant Medical Service into a single entity. It was implied that the position of the European medical officers would be safeguarded in some way acceptable to them. After this, however, discussion went on for five years, and it finally became apparent that for any scheme to be acceptable to the European medical officers it must contain an escape clause permitting anyone to whom the new service was not acceptable to retire without financial loss—that is, he would receive a pension or gratuity in recognition of the service he had already given. This the Government refused to accept, for the obvious reason that it feared the collapse of the service if the leavening and stiffening influence of its European members disappeared. Accordingly, early in 1952, the Government announced the nature of the scheme it intended to introduce and make retroactive to January 1, 1947. The European medical officers were given the option of entering the new service or resigning their appointments, but it was made clear that anyone who did resign would forfeit his pension, and no claim to compensation would be considered. With this decision the Secretary of State has declined to interfere.

I was one of the fortunate ones. Being still young, and without dependants, I was able to cut my losses and make a fresh start elsewhere. (Lest it should be thought that this letter is prompted by "sour grapes," may I state that I am now infinitely better off in every way than I ever was in the Colonial Service.) Many of the older men, however, were not so fortunate. A man in the middle or early forties, with children at school in England, and who had already given 15 or 20 years' service, would jeopardize the financial security of his dependants if he resigned. Few were prepared to do this, and consequently most have remained in the service, embittered and resentful, for I have reason to believe that the new proposals are unacceptable to 90% of the European medical officers. The Government obtained what it wanted, and compelled its European medical officers to enter the new service by the familiar application of economic sanction.

Any recent graduate who is considering joining the Colonial Medical Service as a permanent career should think well before putting his head into the noose. The appointments are superficially attractive—good rates of pay, at any rate in the Far East, long periods of home leave on full pay, a pension at 50, etc. But the apparent security is based upon sand. An officer's terms of service can and will be altered if at any time it becomes politically expedient to alter them, and he will have no redress whatsoever. Furthermore, it now seems that promotion to the most senior posts depends not on ability but on politics. A single short contract is to some extent free from these objections. For a recently qualified man a short contract of 2–3 years provides an opportunity to see the world and to gain

experience, professional and otherwise, and he will receive a gratuity at the end. Having seen conditions, it is highly unlikely that he will renew his contract. But I seriously warn any man thinking of joining the permanent service to think hard first.—I am, etc.,

Alberta, Canada.

G. A. MOTT.

The National Formulary

SIR,—I am delighted to have the support of Dr. W. N. Leak and Dr. S. G. Hamilton (*Supplement*, April 25, pp. 155 and 156) in my campaign against the *National Formulary*, but distressed at the reactionary attitude of the General Medical Services Committee, who seem all in favour of Latin and against the idea that any drug could be used for any special condition. This is surely a book for the use of British doctors, so what are these dreadful inter-national repercussions which will happen if we use our own language? I used, too, to be under the illusion that Latin was international, till I tried to get a Latin prescription made up in Italy, and was informed that there they were always written in Italian. Must we all be sacrificed to the very rare foreign doctor who wants to get a prescription dispensed here? It is on all fours with the campaign for the adoption of the metric system, a system designed for those who can only count on their fingers. If the G.M.S. Committee is so very keen to avoid all therapeutic suggestion, why do drops have to have different names according to whether they are poured into the eye, the ear, or the nose? This book must be designed for the person who uses it—the prescriber—and not for academic people who want to air pet theories.

There are, I believe, people who have actually been trained and had long experience at classifying and indexing—librarians, for example. Could not the advice of one such expert be taken on making this book reasonable?—I am, etc.,

W. EDWARDS.

Ashhead, Surrey.

SIR,—The chief weakness of the *National Formulary* is that one cannot rapidly turn up any particular group of preparations. I would suggest, therefore, that consideration be given to the "thumb-nail" method of indexing for easy and rapid reference. One glance down the right-hand side of the volume would be sufficient to locate the group required—e.g., mist., tabs., linct., etc.—and the preparation of choice would then be readily selected.—I am, etc.,

R. DAWSON.

Middleton-in-Teesdale.

The Registrar Problem

SIR,—In our sympathy for the displaced registrar we are in danger of forgetting that there are two distinct problems to be faced; both of these have been created by forces outside the profession, but their solution must concern us all closely. In the great majority of non-teaching hospitals registrars are a fairly new creation, and, viewed merely as pairs of hands, were an addition to those already present. Their presence had many advantages and they had much to offer the various departments, but this does not alter the fact that, to the official eye, there was a certain amount of overstaffing, and this enabled the regional boards to rid themselves in various ways of elements in their hospital staffs which they thought to be unsatisfactory. There followed the dismissal or forced resignation of many who had given years to the hospital service but who were tainted by general practice.

The resignation of the general-practitioner specialists redressed for a time the overstaffing situation. The work they did was taken over by registrars, even more of whom were created, and all might have gone well had it not become necessary to assure a future to the registrars themselves. The failure of this assurance and the forced reduction in the number of registrars have suddenly so reduced the numbers in all departments that we are faced with a breakdown in some of them. General surgical departments are probably the worst hit for obvious reasons, and I know of some

in which list-work is coming to a standstill. If the ranks of the G.P. specialist had not been decimated by official action, the removal of the registrars would have done little more than return us to the situation of a few years ago, but the absence of the former has exposed the bare bones of the Service, and things are little short of desperate. It does appear to me that a little wisdom would have foreseen the present situation, and it is tragic that those thrown up into positions in which they could influence the growth of the new Service should have been proved to be so lacking in sagacity.

It is generally admitted, except amongst the diehards, that there must be a return of the part-time G.P. specialist. We should admit at once that the plan to staff the hospital service from within itself has not been very successful, and the sooner we start to work out the details and get these men back the better. Recent experience has convinced me that the regional boards think this is going to be easy, but I have never known of any process of turning back the clock that was, and I am sure that this is no exception. There are very real problems to be solved.

Many of us have directed the accusation of cheap labour against the registrar system, and Mr. Green-Armytage has recently renewed this charge (*Supplement*, April 25, p. 156). The part-time G.P. specialist cannot hope to take on more than six sessions, and these represent a very large proportion of his working week, and for this he will get about £1,000 a year. The accusation of cheap labour is not going to be met merely by changing the operative's title.—I am, etc.,

Swindon.

GUY ROWORTH.

SIR,—Mr. V. B. Green-Armytage's letter (*Supplement* April 25, p. 157) is timely. His proposals for the utilization of the gynaecological and obstetric registrars might well be applied to registrars in other fields.

In the light of present conditions, however, the majority of registrars can never hope to achieve full consultant status, and will inevitably turn to general practice. They are more likely to obtain openings in their own localities than elsewhere. As general practitioners they could usefully continue some of the work they did as registrars by means of some such appointment as part-time clinical assistant on a sessional (and regular) basis.

The retention of highly trained registrar personnel in this capacity would be of advantage, both on the grounds of common humanity and of expediency. Men who had sacrificed everything for a specialist career would not feel that all was lost nor experience the sense of bitter disappointment and frustration which would otherwise inevitably follow, while at the same time they would be performing a useful service to the community by helping to solve the critical shortage of efficient junior specialist staff which exists in many hospitals to-day.—I am, etc.,

Wolverhampton.

H. W. CHADFIELD.

The Trainee Assistant Scheme

SIR,—I would like to disagree with the impression created by Dr. Tom Russell (*Supplement*, March 28, p. 95) that the trainee assistant merely eases the work of his principal and receives little training in return. We must not forget that the principal takes full responsibility for all the deeds and misdeeds of his trainee, a matter of some importance in these days when patients are all too ready to go to law.

My traineeship started in November and as yet I have done no night work. I have had ample time off to attend clinics, visit hospitals, and study for a postgraduate examination, in spite of its being one of the heaviest winters for the G.P. for many years. My principal informs me that, so far as London is concerned, mine is the usual lot.

Finally, what does Dr. Russell recommend for holidays? Should someone who does not know the patients, and who has probably had less experience in general practice than I have, take my place?—I am, etc.,

London, S.W.10.

ANGELA MANNING.

Association Notices

ANNUAL REPRESENTATIVE MEETING,
CARDIFF, 1953Resolutions by Divisions of which Two Months' Notice
is Given*The Membership Subscription*

Motion by Tunbridge Wells Division: That the membership subscription be modified for members who are assessed under Schedule E so that the net cost of membership may be equitable throughout the profession.

Membership of Divisions and Branches

Motion by Rugby Division: That members of the Association shall ordinarily be allocated, as hitherto, to the various Divisions (and Branches) purely on an address basis, but where by reason of ease of access, professional association, or for any other reason, a member finds it more convenient to attend the meetings of some other Division (or Branch) that member may, on application to Head Office, be transferred to the Division (or Branch) of his choice.

DIVISIONS OF NEW ZEALAND BRANCH

Notice is hereby given by the Council of the formation of a Marlborough Division of the New Zealand Branch, and of the change of name of the North Auckland Division to Northland Division and of the Palmerston North Division to Manawatu Division.

A. MACRAE,
Secretary.

Diary of Central Meetings

MAY

- 13 Wed. Transport Medical Standards Subcommittee, Occupational Health Committee, 2.30 p.m. (*date changed from May 12*).
- 14 Thurs. Central Consultants and Specialists Committee, 12 noon.
- 15 Fri. Glasgow Arrangements Committee, 11 a.m.
- 20 Wed. **Conference of Honorary Secretaries**, 10.45 a.m.
- 21 Thurs. G.M.S. Committee, 10.30 a.m.
- 27 Wed. Alcohol and Road Accidents Committee, 2 p.m.
- 27 Wed. Consultants and G.P.s Liaison Executive Committee, 2 p.m.
- 27 Wed. Film Committee, 2 p.m.
- 28 Thurs. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
- 28 Thurs. Central Ethical Committee, 2 p.m.
- 28 Thurs. Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, W.C.), 2 p.m.
- 29 Fri. Joint Committee of B.M.A. and the Magistrates' Association, 11 a.m.

JUNE

- 5 Fri. Library Subcommittee, Science Committee, 12 noon.
- 9 Tues. Joint Conference between Representatives of the Occupational Health, G.M.S., and Central Ethical Committees on Continued Treatment by Industrial Medical Officers, 2.30 p.m.
- 17 Wed. **Annual Conference of Representatives of Local Medical Committees**, 10 a.m.

Branch and Division Meetings to be Held

BATH, BRISTOL, AND SOMERSET BRANCH.—At Bridgwater and District Arts Centre, 11, Castle Street, Bridgwater, Thursday, May 14, 8.30 p.m., meeting. B.M.A. Lecture by Professor E. J. Wayne: "Uses and Abuses of Antibiotics."

BROMLEY DIVISION.—At Wellcome Research Laboratories, Langley Court, Beckenham, Saturday, May 16, 3 p.m. to 6 p.m., garden party. All medical practitioners and their friends in the area of the Division are invited.

BURTON-ON-TRENT DIVISION.—At Burton Golf Club, Ashby Road, Tuesday, May 12, 7.45 p.m., dinner, followed by A.G.M.

CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, May 12, 8.30 p.m., annual general meeting. Film show to follow: (1) Some Aspects of Accessible Cancers: (a) Lip, Tongue, and Mouth; (b) Cervix and Uterus; (2) Endocrinology of the Menstrual Cycle.

DORSET DIVISION.—At The Clinic, Glyde Path Road, Dorchester, Friday, May 15, 8.30 p.m., meeting. Annual B.M.A. Lecture by Dr. W. W. Bridgen: "Recent Advances in the Treatment of Cardiovascular Disease."

EAST HERTS DIVISION.—At Gilston Park Hotel, Friday, May 15, 9 p.m. to 1.30 a.m., supper dance.

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, May 14, 7.30 p.m., dinner; 8.45 p.m., special general meeting.

ENFIELD AND POTTERS BAR DIVISION.—At St. Michael's Hospital, Chase Side Crescent, Enfield, Friday, May 15, 8.30 p.m., third annual meeting.

LANCASTER DIVISION.—At Alexandra Hotel, Lancaster, Friday, May 15, annual general meeting.

LEEDS DIVISION.—At Queen's Hotel, Leeds, Wednesday, May 13, Jubilee dinner.

LEWISHAM DIVISION.—At Lewisham Hospital, High Street, S.E., Friday, May 8, 8.30 p.m., annual general meeting.

METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Tuesday, June 9, 2.30 p.m., annual general meeting. President's address by Dr. J. Arthur Moody: "Founders of the Branch and their Problems."

SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Friday, May 8, 9 p.m., meeting. Dr. J. C. Sawle Thomas will address the Division and invite questions about local difficulties in disposing of and treating cases of mental ill-health.

SOUTH-WEST ESSEX DIVISION.—At Connaught Hospital, Orford Road, Walthamstow, E., Wednesday, May 13, 8.30 p.m., A.G.M.

STIRLING BRANCH.—At Golden Lion Hotel, Stirling, Sunday, May 17, 7 p.m., annual general meeting; 8 p.m., dinner.

SWANSEA DIVISION.—At Pennard Golf Club, Saturday, May 16, annual competition for the Cellan-Jones Golf Trophy.

WANDSWORTH DIVISION.—At St. James' Hospital, Ouseley Road, S.W., Friday, May 15, 8.45 p.m., annual general meeting.

WEST DENBIGH AND FLINT DIVISION.—At Marine Hydro Hotel, Rhyl, Wednesday, May 13, 8 p.m., annual meeting.

WIGAN DIVISION.—At Wrightington Hospital, Thursday, May 14, 2.30 p.m., clinical meeting.

B.M.A. LIBRARY

The following books have been added to the Library:

- Alberti, G.: *Per una Nuova Fisiologia Sociale dell'Alimentazione*. 1952.
- Anderson, W. A. D.: *Synopsis of Pathology*. Third edition. 1952.
- Bailey, P., and von Bonin, G.: *Isocortex of Man*. 1951.
- Barton, E. A.: *A Doctor Remembers*. Second edition. 1950.
- Bett, W. R.: *Infirmities of Genius*. 1952.

PRELIMINARY

Death of Her Majesty Queen Mary

205. On behalf of the members of the Association an Address signed by the Officers of the Association was submitted through the Home Secretary to Her Majesty the Queen on the occasion of the death of Her Majesty Queen Mary.

Arrangements for Future Annual Meetings
(Continuation of para. 7 of Annual Report)

206. The Council is suggesting to the Canadian Medical Association that the proposed Joint Meeting of the two Associations in the British Isles should take place in 1959.

Extraordinary General Meeting
(Continuation of para. 8 of Annual Report)

207. The Extraordinary General Meeting referred to in para. 8 of the Annual Report was held on May 5, when some 800 members were present. A report of the meeting was published in the *Supplement to the British Medical Journal* of May 9 (p. 205).

Delegate to Annual Meeting of the Canadian Medical Association

208. Dr. Robert Forbes (London), who will be visiting Canada at the time, has been appointed as the Association's delegate to the Annual Meeting of the Canadian Medical Association, to be held in Winnipeg in June, 1953.

Purchase of Silver Tray which belonged to Sir Charles Hastings

209. The Association has acquired by purchase a large silver tray which was presented to Sir Charles Hastings on his retirement from the staff of the Worcester Infirmary. The tray bears the following inscription:

"Presented to Sir Charles Hastings, M.D., D.C.L., F.G.S., on his retirement from the office of Honorary Physician to the Worcester Infirmary in acknowledgment of his unwearied and important services to that Institution for a period of forty-nine years, of his unceasing efforts to promote the scientific and social interests of his native City and County, and to unite in cordial co-operation the feelings and energies of the Provincial Medical Practitioners.

"Jan. 9th, 1862."

Cricket Match against the Law Society

210. In response to a challenge from the Law Society Cricket Club, arrangements are being made for a team representing the Association to play against this club. According to present arrangements the match will be played at Hurlingham on Sunday, July 5.

GENERAL MEDICAL SERVICES**Model Distribution Scheme**

(Continuation of para. 25 of Annual Report)

211. Regulations have now been made to give effect to the Working Party's proposals. They include a model distribution scheme which covers payments to be made by executive councils by way of capitation payments, loadings, fees for emergency treatment, anaesthetics, and temporary residents, and the supplementary distribution to be made by executive councils after the end of each year. Unfortunately, there has been insufficient time for local executive councils and local medical committees to consider and secure the approval of the Minister to any local variations which they wish to introduce, and, in consequence, the model scheme will operate without modification for the year beginning April 1, 1953. It is open to local medical committees to consider whether they wish to suggest any modifications in the model scheme for subsequent years.

The Danckwerts Award and the Small-list Practitioner

(Continuation of para. 27 of Annual Report)

212. Following the Committee's decision to invite the full Working Party to carry out an investigation into the number and categories of practitioners who might suffer injustice under the new distribution scheme, a meeting of the Working Party has now been held. Arrangements have been made to proceed immediately with the investigation.

Assistance for Elderly Practitioners

(Continuation of para. 28 of Annual Report)

213. Following discussions with the Committee, the Ministry has now issued instructions to executive councils which implement the recommendation of the Working Party for the relief of any cases of hardship among elderly practitioners resulting from the new distribution scheme. Generally, financial help will be given to doctors who were aged 65 or over when the scheme came into operation, or who subsequently attain that age, and are actively engaged in single-handed practice in the National Health Service. For this purpose, a list of 500 persons will normally be taken as an indication that a doctor is so engaged, but, particularly in rural areas, executive councils have discretion to accept claims from doctors with smaller lists if they are satisfied that it is reasonable to do so.

For the year 1953-4 the maximum rate of payment will be £350 per annum, decreasing in proportion to the number of patients on the doctor's list in excess of 500. Subject to the maximum of £350, the payment will be sufficient to bring the doctor's income from all professional sources to £1,250, and it will be subject to reduction by the amount of any special payment made in accordance with the Working Party's Report to a practitioner who had previously been in receipt of a fixed annual payment for three years or more.

Payment of Partners on the Basis of Notional Lists

214. The Ministry has agreed that new partnerships which were entered into on April 1, 1953, would be effective for the purpose of payment on the basis of notional lists as from that date, although confirmation of the inclusion of the new partner in the medical list might not have been received from the Medical Practices Committee until a somewhat later date.

Provisional Inclusion in the Medical List

(Continuation of para. 31 of Annual Report)

215. Following discussions with the Medical Practices Committee, it has now been agreed that, where a practitioner applies for provisional inclusion in the list, such an application will be granted for a period of at least one month, without the applicant having to show that he has acquired practice premises. If at the end of that time another practitioner, who is already in possession of premises, is seeking inclusion in the list, then the period of provisional inclusion will not be extended. If, however, no other applications have been received from practitioners who have premises available, then the period of provisional inclusion may be extended by a further period not exceeding two months.

Committee on General Practice of the Central Health Services Council

(Continuation of para. 33 of Annual Report)

216. The Council's memorandum of evidence has now been completed and submitted to the Committee on General Practice of the Central Health Services Council. The memorandum appears as Appendix B to the Report of the General Medical Services Committee to the Annual Conference of Local Medical Committees, published in the Supplement to the *British Medical Journal* of May 2, 1953 (p. 180). A reprint of the memorandum will be issued to Representatives with the agenda of the A.R.M.

Medical Services Committee Procedure

(Continuation of para. 43 of Annual Report)

217. The Report of the Special Subcommittee which has been reviewing the functions of the Tribunal and Service Committees has now been completed, and its conclusions, which have been approved by the parent Committee, are set out in Appendix IV.

Throughout its deliberations the Subcommittee was assisted in its task by representatives of the British Dental Association and the National Pharmaceutical Union, and its conclusions represent the views of the representatives of all three professions.

Responsibility of a Partner for the Acts or Omissions of his Deputy or Assistant

218. The Committee has considered carefully the position of a member of a partnership in relation to his responsibility for the acts or omissions of a second practitioner acting as his deputy or assistant.

Under his terms of service, a practitioner is held responsible for his deputy's acts or omissions, and, while the Committee

appreciates that this provision may be equitable in the case of assistants and locums, it holds that where a partnership exists each partner should be held fully responsible for his own actions. Moreover, in this respect the terms of service appear to be at variance with the provisions of the Partnership Act. The Committee is therefore initiating discussions with the Ministry with a view to securing an appropriate amendment of the terms of service.

National Formulary

219. The Committee's views were sought by the Joint Formulary Committee on the "lay-out" which would be most useful to prescribers should it be necessary to publish two editions of the *Formulary*, preserving the alphabetical classification in the edition used mainly by pharmacists, which may be predominantly in Latin. It had been suggested that with a gradual change in the use of English nomenclature there should also be a change to a pharmacological rather than an alphabetical classification.

After careful consideration, the Committee feels that the majority of prescribers would not welcome a *Formulary* compiled in this way, and the Joint Formulary Committee has been so informed. The Committee, for its part, also holds that there are many advantages in reverting to the use of Latin throughout.

COMPENSATION AND SUPERANNUATION
Superannuation Contributions on Notional Lists

220. Following the introduction of the revised Distribution Scheme, which gives practitioners the option to be paid on notional lists, the Council has asked the Ministry of Health to reverse the procedure laid down in Regulation 46 (2) (b) of the National Health Service (Superannuation) Regulations, 1952, for assessing superannuation contributions.

Under the present regulations partners pay contributions based on the numbers on their respective lists unless they notify the executive council that they wish their deductions to be made in proportion to their partnership shares. The suggested amendment will provide that, ordinarily, contributions will be based on the partnership shares and that only if all partners assent by notice in writing to the executive council will payment be made in accordance with individual lists. Thus, before contributions can be related to lists, a positive step, agreed by all partners, will have to be taken. This, in the opinion of Council, will safeguard the superannuation position of all members of a partnership.

REVIEW OF GENERAL PRACTICE

(Continuation of para. 61 of Annual Report)

221. The editing of the report of the General Practice Review Committee has now been completed and the Council has decided to publish the report as a special number of the *British Medical Journal* in September.

HOSPITAL AND CONSULTANT SERVICES
Hospital Medical Staffing

(Continuation of para. 64 of Annual Report)

222. Although the recent instructions issued by the Ministry on hospital staffing economies do not involve any reduction in medical staffs, the Joint Committee has called the attention of the Ministry to the possible effect of a reduction in technical staff on the efficiency of the medical services. In reply, the Ministry has stated that the 5% reduction of staff called for applies to a wide category of posts of which medical auxiliaries form only a small part, and that the reduction would not necessarily involve technical staff. In any event, the 5% reduction was a target figure and boards were not expected to reduce staff to an extent that would interfere with efficiency.

The Ministry has again assured the Joint Committee that it will discuss with it the results of the hospital medical staffing survey as soon as the survey is complete and before any final steps are taken by the Department.

Review of Remuneration of Hospital Medical Staff

(Continuation of para. 65 of Annual Report)

223. It is regretted that the Council is unable to report any developments in connexion with the claim for a review of the remuneration of hospital medical staff, as the Staff Side of Committee "B" of the Medical Whitley Council is still awaiting the answer of the Management Side.

Security of Tenure

(Continuation of para. 66 of Annual Report)

224. As stated in paragraph 66 of the Annual Report, the Ministry has now agreed that paragraph 16 of the Terms and Conditions of Service gives consultants and S.H.M.O.s a right of appeal where hospital boards threaten to terminate their contracts in order to offer new contracts for a reduced number of sessions.

The Joint Committee has impressed upon the Ministry the desirability of securing that any review of part-time contracts is carried out in full consultation with the consultant or S.H.M.O. concerned, and that the views of the hospital medical committee are sought. The Ministry understands that this is the normal practice, and has asked the Joint Committee for instances where the review is not carried out in this manner.

At the request of the Staff Side of Committee "B" of the Medical Whitley Council, the Management Side recently agreed that paragraph 16 of the Terms and Conditions of Service should be amended in order to extend the right of appeal against dismissal to S.H.M.O.s. The Committee has now asked the Staff Side to urge that the moral obligation placed upon hospital boards by paragraph 16 to try to find alternative employment for a consultant whose appointment is terminated or whose sessions are reduced as a result of a hospital reorganization should similarly be extended to cover S.H.M.O.s.

Senior Registrars

(Continuation of para. 67 of Annual Report)

225. It appears from figures recently supplied by the Ministry that the number of senior registrars has now been reduced to a figure not greatly in excess of the agreed establishment of 960, but unfortunately this does not mean that the problem of displacement has been resolved. A high proportion of the senior registrars in their fourth or subsequent year, who may expect their appointments to be terminated during the course of the present year, are in general medicine or surgery, and it is in these specialties that there are the fewest consultant vacancies. Moreover, it is undoubtedly true that many of these senior registrars are engaged for a large part of their time in consultant work, and their dismissal will be likely to create a serious staffing problem, since, even where their posts are not to be abolished, it is unlikely that newly appointed senior registrars will be able satisfactorily to replace them.

These facts have been presented to the Ministry, and it has again been urged that the ultimate solution of the problem lies in an expansion of the consultant establishment, particularly in medicine and surgery. In order to meet the immediate difficulties of the existing senior registrars it has also been urged that they should be allowed, on completion of their appointments, to reapply in open competition for their own posts, and to be reappointed for a further period of two years, or to apply for other posts in the same specialty. The Ministry has now agreed to this proposal.

Junior Hospital Staffing Difficulties*(Continuation of para. 68 of Annual Report)*

226. Owing to the shortage of junior medical staff in many hospitals, house officers are not infrequently asked to undertake the burden of additional duties, and staffing difficulties are often aggravated because house officers are required to take their leave during their six months' appointment.

These problems are now under discussion in Committee "B" of the Medical Whitley Council.

Employment of General Practitioners in Hospitals*(Continuation of para. 69 of Annual Report)*

227. In consultation with representatives of the General Medical Services Committee, the Joint Committee has continued its discussions with the Ministry on the question of the employment of general practitioners in hospitals. The terms of a draft circular advising hospital authorities on the subject have been agreed with the Ministry, and the only question now outstanding is that of remuneration. Under the Terms and Conditions of Service the rate of remuneration for a general practitioner employed part-time on the staff of a hospital, where no other rate is appropriate, is £175 per annum per weekly half-day (paragraph 10(b)). In agreement with the General Medical Services Committee, the Joint Committee has urged that except for honorary clinical assistantships, purely educational in character, all general practitioners employed in hospitals (other than those graded as consultants or S.H.M.O.s) should continue to be remunerated at this rate. It is possible that proposals for an alternative rate of remuneration for certain posts will be put forward by the Management Side of Committee "B" of the Medical Whitley Council. The Joint Committee has therefore made it clear to the Ministry that its agreement on points of general policy is without prejudice to any subsequent discussions on remuneration in Committee "B," and cannot be taken as implying that the Joint Committee or the Staff Side agrees that any group of general practitioners employed in hospitals should be remunerated at less than £175 per annum per session.

Review of S.H.M.O.s*(Continuation of para. 71 of Annual Report)*

228. The Committee has made a careful examination of the claims to consultant status of those S.H.M.O.s who, following the last review, have expressed their dissatisfaction with their grading, and it is satisfied that in some cases there is prima facie evidence for suggesting that an injustice has been done and that practitioners have been wrongly graded. The Committee has accordingly brought these cases to the notice of the Ministry, urging the need for a re-examination of the grading of these S.H.M.O.s.

Reference was made in the Annual Report to the fact that those S.H.M.O.s holding consultant posts who were upgraded to consultant status at the last review had been placed at the minimum point in the consultant salary scale. Some of these practitioners have occupied the same posts and have carried out the same duties for many years, and it would have appeared reasonable that hospital boards should have exercised their discretionary power to advance the starting salary. Acting on the advice of the Ministry, however, they have not done so, and approaches to the Ministry have proved unsuccessful. The Committee has decided, therefore, to advise certain of these practitioners—where the non-exercise of the Board's discretionary power appears particularly harsh and unreasonable—to appeal against the Board's decision under the Whitley regional appeals machinery.

Whole-time Officers' Allowances*(Continuation of para. 72 of Annual Report)*

229. Discussions have now been reopened in Committee "B" of the Medical Whitley Council on the question of

whole-time officers' allowances, and representatives of whole-time officers have been invited to take part in the negotiations.

Private Hospital Beds and Pay-bed Regulations*(Continuation of paras. 73 and 74 of Annual Report)*

230. Following protracted discussions between the Joint Committee and the Ministry, revised Pay-bed Regulations have now been introduced with effect from April 1. The new regulations, which follow the same pattern as the previous regulations, deal broadly with two matters: (a) the manner in which the charges for private beds shall be assessed, and (b) the maximum professional fees to be charged to patients electing to receive hospital treatment privately.

In accordance with the provisions of Section 5 of the National Health Service Act, 1946, the new regulations are still designed to secure that the charges for private beds shall represent the whole cost of the accommodation and services provided, but there are certain changes in the method of calculating the charges that will in many cases result in a reduction. Thus, in hospitals where the total cost of the pay block cannot be determined separately from the cost of the public wards, the percentage increases which are added to the average daily in-patient cost to arrive at the private-bed charge are reduced from 25% (single room), 15% (double room), or 5% (multiple-bedded room) to 15%, 10%, and 5% respectively. Furthermore, these percentage increases are to be added to the net daily in-patient cost before the addition of the salaries of the medical and dental staff instead of after the addition of these salaries as hitherto; and the cost of any service from which the private patient receives no benefit—such as the almoner's and medical records departments—is excluded from the maintenance charge.

There are also certain improvements in the Schedules to the Regulations, setting out the maximum professional fees, although, as previously reported, the Minister has insisted on retaining the detailed classification of operations. The maximum fee that may be charged by a physician is increased from 25 to 40 guineas, with a similar increase for a surgeon in cases not involving an operation. There are also changes in the maximum fees in other specialties, and the scale for radiotherapists has been completely revised. The maximum fee payable to a general practitioner attending a patient privately in hospital has been increased from 15 to 20 guineas.

The overall fee of 75 guineas to be charged by all the practitioners concerned in the patient's treatment is retained as the normal maximum, but provision is now made for this maximum to be increased to not more than 125 guineas (at the discretion of the hospital board or committee) in the following circumstances:

(a) When the treatment of the patient in accommodation provided under Section 5 of the Act has lasted four months; or

(b) when the patient needs at least two major operations or at least three major or intermediate operations as part of the same course of treatment during the same stay in hospital; or

(c) when the patient requires excision of the lung, an operation on the heart or oesophagus, or the excision of a tumour of the brain or spinal cord, or otherwise requires specialized operative technique involving complicated team-work.

Provision is retained for the maximum charges laid down in the regulations to be exceeded in cases where the patient so agrees, provided that not more than 15% of the pay-beds are occupied at any one time by patients who have made such an agreement with the consultants concerned.

The Ministry has sent an explanatory circular on the new regulations to hospital boards and committees, and this also was discussed beforehand with the Joint Committee.

The Committee has been endeavouring to obtain evidence to place before the Minister to show that the high level of

private-bed charges is deterring patients from seeking hospital treatment as private patients, and that this is leading to a loss of hospital revenue. The Committee is therefore waiting with interest to see whether the reduction in charges anticipated as a result of the new regulations has the effect of increasing the demand for private treatment.

Legal Actions*(Continuation of para. 75 of Annual Report)*

231. The profession has become increasingly disturbed over the number of actions for alleged negligence brought by patients against hospital authorities and members of their medical staffs. There is no doubt that since the inception of the National Health Service these cases have increased considerably in number. The public is apparently becoming more litigious. This may be due, among a number of causes, to the ownership of the hospitals by the State and a lessening of local regard for the hospital and its staff, to the extension of legal aid, and to the present tendency of the public to expect compensation wherever damage is suffered, whether there is negligence or not. Whatever the causes, the frequency with which cases are brought is most disturbing, particularly as it is recognized that a far larger number are settled out of court.

It should be emphasized, however, that although the present tendency towards litigation may have serious implications for hospital medical staffs, the law of negligence has not changed. The principle still holds that a medical practitioner owes to his patient the duty of exercising reasonable care and skill, and it is a breach of this duty which usually supports an action for negligence. The words "reasonable care and skill" have to be interpreted in the light of the circumstances of each case, and a house-officer, for example, is not *ipso facto* negligent because someone of greater knowledge and skill would have acted differently.

Neither is the risk of litigation a new one. It is, and always has been, open to a patient to sue a hospital authority and/or members of the medical staff concerned. Although it is well established in English law (Scottish law differs from that of England and Wales in this matter) that a hospital authority is liable for the acts or omissions of medical staff at least up to the level of registrar, this does not mean that the hospital is prevented from asking the Court to apportion the blame. This, indeed, is where a change has taken place, for it is the present policy of the Ministry that, where it is sought to make a hospital authority liable for the alleged negligence of one of its medical staff, the authority should seek a contribution or indemnity from the member of its staff concerned in respect of any damages awarded against it. This means that where a hospital and a member of its medical staff are joined in an action for alleged negligence the hospital authority asks the Court to apportion the damages between the co-defendants. As stated in the Annual Report, paragraph 75, this aspect of the matter is already under discussion between the Ministry of Health and the Joint Consultants Committee, and early agreement is expected which will mitigate possible dangers to members of hospital staffs.

Many members of the profession have been particularly disturbed by the judgments given in recent cases, notably that of "Payne v. St. Helier Group Hospital Management Committee and Another." It is extremely difficult, however, to assess the merits of a case without all the available evidence, and reports published in the medical and lay press are at best incomplete. The Council is advised that this case has not established any new principles. For example, it does not follow from the judgment that an error in diagnosis necessarily amounts to negligence. When conflicting evidence is given by expert witnesses the Judge is at liberty to decide which witness is the more acceptable. Even when the judgment appears harsh there is nothing to be gained by taking a case of this kind to the Court of Appeal, since that court, having had no opportunity of hearing the evidence and observing the witnesses, would be bound to uphold the judgment unless it were clearly one at which

no reasonable person could possibly have arrived in the light of the evidence.

It was held in Payne's case that a patient with an abdominal injury who had been examined by a casualty officer should have been referred by him to a consultant. In this respect also the judgment is not to be regarded as of general application. It has reference only to the "facts" of this particular case as found by the Judge. It is clear, however, that consultants must give the junior members of their staffs ample guidance as to the type of case that should always be referred to them, and must hold themselves ready at all times to give advice and assistance. Junior staffs should exercise the greatest care in seeking the assistance of their chiefs in any puzzling or unusual cases.

The foregoing statement has the full support of the Joint Consultants Committee.

Mileage Allowances for Hospital Medical Staff*(Continuation of para. 76 of Annual Report)*

232. The Committee is suggesting to the Staff Side of Committee "B" of the Medical Whitley Council that in the interests of economy it should consider the possibility of compounding mileage allowance as a lump sum payment based on the officer's average mileage, in order to save the administrative expense associated with individual and detailed claims.

Domiciliary Consultation Arrangements*(Continuation of para. 83 of Annual Report)*

233. The Joint Committee has taken note of the Representative Body's objection to the inclusion of the diagnosis in the model form of domiciliary consultation certificate, and has decided to reopen the matter with the Ministry.

The Committee has asked the Joint Committee to reopen with the Ministry the desirability of extending the domiciliary consultation arrangements to permit the attendance of a consultant in any specialty in an emergency upon a baby born in a private maternity home.

The Committee has also given further consideration to the claim of whole-time consultants to receive additional payment for domiciliary consultations. It will be remembered that when the Terms and Conditions of Service were introduced it was agreed with the Ministry that whole-time consultants should be free to delete from their contracts the obligation to undertake domiciliary consultations, except that where it was the only way of providing a service the board might insist on a whole-time officer undertaking this work. Boards were also advised by the Ministry that, where a whole-time consultant was required to accept a liability for domiciliary consultations, his whole-time duties should be suitably adjusted so that no extra burden was placed upon him by the domiciliary work.

Bearing these facts in mind, the Committee does not consider that it is practicable to press for additional payment to whole-time consultants in respect of domiciliary consultations where the board has followed the Ministry's instructions and set aside time in the officer's hours of duty for the performance of this work. Where, however, a whole-time consultant is required to undertake domiciliary consultations as an additional commitment over and above the normal duties of a whole-time appointment, the committee feels that there is a case for additional payment.

The Committee has passed the foregoing views to the Staff Side of Committee "B."

Disclosure of Information Regarding Tuberculous Persons to the Ministry of Labour

234. The Committee has asked the Joint Committee to protest to the Ministry at the Department's request to hospital authorities to furnish to the Ministry of Labour and National Service information from the records of chest clinics regarding tuberculous patients called up for military service, in the absence of statutory authority and without the patient's consent.

on February 26 the members of the Association in the Gold Coast formed themselves into a Branch. Rules were adopted and officers elected, and a Branch Council was set up which met on March 5. Consideration was given by the Branch Council to various matters, and in particular a resolution was passed deprecating the apparent intention of the Government that the work of the Chief Medical Officer and other professional officers should be subject to the supervision of the Permanent Secretary to the Ministry of Health. This is a reversal of the policy so far followed, which was founded on the accepted recommendations of the "Maude" Commission. The Branch Council is also endeavouring to initiate action to restrain persons who are not qualified registered medical practitioners from using the title of "Doctor." A General Meeting of the Branch was addressed by Mr. Fraser on March 6.

Arrangements have been made for future meetings of the Branch biennially and of the Branch Council at monthly intervals, and for regular clinical meetings, and it is hoped that the Branch will consolidate its position in spite of the many difficulties which hindered its inception.

Colonial Research Service

251. Many projects on which the Colonial Research Service is engaged are dependent on funds provided by the United Kingdom Government under the Colonial Development and Welfare Acts of 1945 and 1950, which expire in 1956, and some concern has been felt as to the prospects of officers engaged in this service.

It appears from discussions with Colonial Office officials that, so far as can be ascertained, funds will be made available after 1956 for the continuation of research projects, and there is every prospect of employment for existing Colonial research officers for many years to come. The Colonial Office has stated that confirmed appointments will be terminated only for specific reasons, and in such cases six months' notice will be given. If the officer has qualified for a pension he will be entitled to one proportionate to his years of service or, if he has not so qualified, he will be entitled to the return of his superannuation contributions with interest. There is reciprocity between the Colonial superannuation scheme and the various Colonial pension schemes.

MEDICAL BENEVOLENCE

252. The sum of £10,966 was received during 1952 by the Charities Trust Fund of the Association for medical charities, which is £1,516 more than that received during 1951. The following statement shows the amounts collected and distributed during the twelve months:

To subscriptions and donations collected for:	1952	£
(a) Distribution at the discretion of B.M.A. Charities Trust Fund	4,513	
(b) Royal Medical Benevolent Fund	4,254	
(c) Royal Medical Foundation of Epsom College	899	
(d) Royal Medical Benevolent Fund Society of Ireland	103	
Bequests received and allocated to existing medical charities	350	
Subscriptions and donations in respect of 1953, paid in advance	847	
	£10,966	
By amounts distributed to:	1952	£
(a) Royal Medical Benevolent Fund:		
(i) Allocation from B.M.A. Charities Trust Fund for General Fund	£2,123	
(ii) Earmarked for Fund	4,254	
(b) Royal Medical Foundation of Epsom College:		
(i) Allocated from B.M.A. Charities Trust Fund for General Fund	£2,123	
(ii) Allocated from bequests for General Fund	350	
(iii) Earmarked for General Fund	866	
(iv) Earmarked for Sherman Bigg Fund	34	
(c) Royal Medical Benevolent Fund Society of Ireland:		
Earmarked for Fund	3,373	
(d) Dain Fund:		
Allocated from B.M.A. Charities Trust Fund	103	
Payments in advance carried forward	266	
	£10,966	

Other Benevolent Funds

253. The Council has received with interest reports of the work of the Dain Fund and the Sir Charles Hastings Fund. It is clear that these funds are giving much needed assistance in many cases, and the Council would urge members to give their continued support. The Dain Fund is devoted solely to giving financial assistance for educational purposes to the sons and daughters of medical practitioners. The Sir Charles Hastings Fund assists doctors who, through no fault of their own, are in financial difficulty of a purely temporary nature.

Flood Relief Fund

254. Since the publication of paragraph 14 of the Council's Annual Report, additional help has been given to victims of the flood disaster. The total amount spent is £4,070. In all, twenty-two doctors have been helped, including fifteen general-practitioner principals, two assistants in general practice, three consultants, one medical officer serving with the R.A.M.C., and one retired practitioner.

OTHER ASSOCIATION ACTIVITIES

Remuneration of Civil Service Medical Officers

(Continuation of para. 203 of Annual Report)

255. Further correspondence has taken place between the Civil Service Medical Officers' Joint Committee and the Financial Secretary to the Treasury, and a deputation had further discussions with the Financial Secretary on March 25.

The Financial Secretary is prepared to agree to the question of the salaries of Civil Service medical officers being a matter for direct negotiation between the Treasury and the Joint Committee. He insists, however, that before such negotiations take place there shall be a trial period during which vacancies in the service will be advertised freely at salaries recommended in the Howitt Report. The Joint Committee is opposed to this suggestion and the Council supports the Joint Committee's attitude. The Council is therefore continuing to refuse to publish advertisements in the *British Medical Journal* for medical appointments in the Civil Service.

The Law in Relation to the Adoption of Children

(Continuation of para. 204 of Annual Report)

256. As reported in paragraph 204 of the Annual Report, the Council formed a small committee to prepare a memorandum of evidence for submission to the Interdepartmental Committee on the Adoption of Children. The memorandum has now been submitted to the Committee and is reproduced in Appendix VI.

Joint B.M.A. and T.U.C. Committee

257. Matters connected with industrial chest diseases and the National Insurance (Industrial Injuries) Act are under discussion in the Association's Joint Committee with the Trades Union Congress.

Fever Nursing Register

258. The Society of Medical Officers of Health has called the Council's attention to a serious shortage of nursing recruits to infectious diseases hospitals, which the Society suggests is the result of a proposal by the General Nursing Council to close the fever nursing register—i.e., a supplementary register of nurses recruited and specially trained at infectious diseases hospitals. The Society has asked for the Council's support in its representations that the closing of the register is not at present practicable.

It is understood to be the policy of the General Nursing Council, that, in the interests of those entering the nursing profession, supplementary registers should be abolished so that all recruits receive their basic general training before specializing.

The Council has considered the matter in consultation with the Royal College of Nursing through the standing liaison arrangements with the Royal College, but it is not clear whether the problem is caused by the proposal to close the register or, as has also been suggested, by a preference on the part of nursing recruits to enter a general hospital and receive their basic training as soon as possible so as to be in a more favourable position for advancement in the profession.

The Council is endeavouring to obtain evidence to show whether or not the closing of the register is likely materially to affect the nursing position at infectious diseases hospitals, and has asked the Ministry in the meantime not to confirm any proposal which may have been made for closing the register.

Committee to Review Cost of National Health Service

259. The Minister of Health announced in the House of Commons on April 1 the appointment of a small independent committee, under the chairmanship of Mr. C. W. Guillebaud, with the following terms of reference:

To review the present and prospective cost of the National Health Service; to suggest means, whether by modifications in organization or otherwise, of ensuring the most effective control and efficient use of such Exchequer funds as may be made available; to advise how, in view of the burdens on Exchequer, a rising charge upon it can be avoided, while providing for the maintenance of an adequate Service; and to make recommendations.

The Ministry of Health has been informed that the Association is willing to assist this committee and has been asked for guidance as to the kind of help that would be welcomed.

E. A. GREGG,
Chairman of Council.

APPENDIX IV REPORT OF SUBCOMMITTEE ON SERVICE COMMITTEES AND TRIBUNAL REGULATIONS PRELIMINARY

1. The Subcommittee was appointed in November, 1951, with the following reference and personnel:

Reference: That a Subcommittee be appointed to carry out a full investigation of the status, composition, procedure, and functioning of the Tribunal and Medical Service Committees, to hear evidence, to take legal advice, and to prepare a full report with recommendations as a preliminary step to securing amending legislation.

Personnel: S. Wand, A. C. E. Breach, A. Campbell, H. Guy Dain, F. Gray, Kate Harrower, D. F. Hutchinson, C. F. R. Killick, W. M. Knox, F. Lishman, A. N. Mathias, A. T. Rogers, and H. H. D. Sutherland, together with three representatives of the dentists and one representative of the pharmacists when matters of common interest are under discussion.

2. Subsequently, when reappointing the Subcommittee for the session 1952-3, the parent Committee modified both the terms of reference and the personnel of the Subcommittee in the following manner:

Reference: That a Subcommittee be appointed to review the constitution and procedure of Medical Service Committees and to report with recommendations to the parent Committee.

Personnel: A. Talbot Rogers, B. Cardew, H. Guy Dain, J. A. Gorsky, F. Gray, R. C. Hamilton, Kate Harrower, D. F. Hutchinson, W. M. Knox, A. N. Mathias, F. A. Smorffitt, and H. H. D. Sutherland, together with three representatives of the dentists and one representative of the pharmacists when matters of common interest are under discussion.

3. At the outset it was agreed that, as most of the provisions of the Service Committees and Tribunal Regulations affected general practitioners, dentists, and pharmacists alike, it would be to the mutual advantage of the three professions if the representatives of the dentists and pharmacists were present throughout the Subcommittee's deliberations. The British Dental Association and the National Pharmaceutical Union accepted the Subcommittee's invitation to send representatives, and the following were appointed:

British Dental Association:

Mr. L. E. Balding (Hove).

Mr. A. Smith (Hull).

Mr. C. W. Spendelow (Grimsby).

Mr. G. M. Hickley (London) (in place of Mr. Spendelow, who subsequently resigned).

National Pharmaceutical Union:

Mr. H. Noble (London).

CHAIRMAN

4. H. Guy Dain was appointed Chairman of the Subcommittee.

EARLIER DISCUSSIONS

5. The Subcommittee wishes to point out that the review of the Service Committees and Tribunal Regulations procedure dealt with in this report is not the first which has taken place since the introduction of the National Health Service. In 1949 the General Medical Services Committee appointed a similar subcommittee which carried out an extensive review of the regulations and recommended changes where it was considered that the existing machinery was defective or was not working smoothly. A statement containing a number of proposals requiring amendment of the regulations was prepared and discussed with the Ministry of Health. The Ministry made it clear at that time that, whilst it was necessary to set out the framework and general procedure in regulations, it was the Ministry's policy to discourage the promulgation of additional regulations except where the need for them was clearly established. The Ministry held the view that present and future improvements in the machinery for considering complaints could best be secured by issuing a handbook of guidance to all concerned. Much of the Subcommittee's time was occupied subsequently in discussions with the Ministry on the text of the handbook, which was issued to executive councils and Service Committees in April, 1952. The Subcommittee is, however, by no means satisfied that this handbook goes far enough, and holds strongly to the view that changes in the Act and its regulations will be necessary to eliminate a number of faults in the present arrangements which experience has brought to light.

CONSULTATION WITH LOCAL MEDICAL COMMITTEES

6. Although local medical committees had previously been asked to review the present Medical Service Committee procedure, it was again decided to invite them to consider the subject and to submit their views. This was done in the early autumn of 1951, when local medical committees were sent a memorandum setting out in detail the provisions of the Service Committees and Tribunal Regulations.

7. Previously the Kent and Canterbury Local Medical Committee had issued to every local medical committee a

memorandum containing recommendations for a more "legal" procedure for the hearing of complaints. The changes proposed were:

- (1) That the Medical Service Committee should be abolished.
- (2) That "local courts" should be set up in each county.
- (3) That local medical committees should continue to hear complaints of alleged over-prescribing, failure to keep records, and faulty certification.
- (4) That England and Wales should be divided into three judicial regions, each region being served by a "regional circuit" court holding sessions in the county towns of its region as may be convenient.
- (5) That there should be no other special courts, committees, or tribunals.
- (6) That the Minister and the executive council, being interested parties, should have no right of intervention at any stage except as complainant or respondent.

8. The General Medical Services Committee accordingly invited local medical committees, when sending in suggestions for any modifications of the present procedure, to indicate whether they wished to have substituted for the present informal procedure any other scheme providing, for example, for the appointment of a lawyer as chairman of the Medical Service Committee, legal representation of parties, the giving of evidence on oath, and, generally speaking, a more legal procedure than obtains at present.

9. The following is a summary of the replies received:

Total No. of Committees in England and Wales	
circularized	138
Total No. of replies received	101
23 Committees specifically stated that they did not wish to have the general framework of Service Committee and Tribunal procedure superseded by a more formal judicial machinery.	

30 Committees, without commenting generally on the present procedure, put forward small but important suggestions for its revision.

17 Committees were satisfied with the present Regulations and did not wish to put forward any suggestions for their modification.

1 Committee was not satisfied with the present Regulations, but made no suggestions for their modification.

15 Committees supported the Kent proposals without modification.

15 Committees supported the Kent proposals with some modification.

10. The above analysis of the replies received shows that there is a substantial majority among local medical committees in favour of the present Service Committee procedure, modified in the light of experience gained since the appointed day. Although only a minority of local medical committees supported the Kent proposals for a more formal procedure, representatives of the Kent Local Medical Committee were invited to meet the Subcommittee to put their point of view. *The Subcommittee, in view of the lack of support among local medical committees, and having heard the Kent representatives, is satisfied that it would not be in the profession's interest to press for an entirely new and more legal set-up.* It is convinced that the General Medical Services Committee's efforts would most usefully be concentrated on securing such modifications of the present machinery as will ensure an improvement in its efficiency.

It is of interest to record that the dental and pharmaceutical representatives on the Subcommittee report that among their constituents there has been no demand for a radical alteration of Service Committee procedure on the lines suggested by Kent and Canterbury.

REVIEW OF SERVICE COMMITTEES PROCEDURE

11. The Service Committees and Tribunal Regulations have been examined section by section in the light of the observations from local medical committees, and the conclusions reached by the Subcommittee are given below.

Constitution of Service Committees

12. Absence of criticism of the present constitution of the Service Committees, as laid down in the regulations, leads to the conclusion that there is general satisfaction under this heading, and no change is recommended.

Appointment of Chairman and Deputy Chairman

13. At present, Regulation 3 (3) stipulates that only the lay members of the executive council are eligible for appointment as chairman or deputy chairman of a Service Committee in the first instance. It is felt that this unnecessarily restricts the field of selection, and the Subcommittee recommends:

Recommendation A: That Regulation 3 (3) should be modified so as to leave the field open to non-members of the executive council, it being understood that, notwithstanding the wider field of selection envisaged, the person appointed should be acceptable to both parties represented on the Service Committee.

14. A number of local medical committees have suggested that the chairman should hold a legal qualification. Among the reasons given were that such a chairman would be able to advise the committee upon the legal aspects of the matter under inquiry and that the presence of a trained legal mind at the Service Committee stage of any investigation would provide some safeguard against the possibility of a serious miscarriage of justice.

15. The Subcommittee recognizes that there are advantages in having a lawyer in the chair, but feels that such an appointment should not be an obligation on the committee, which should be free to exercise discretion upon the point.

Position of an Interested Person who is a Member of the Service Committee

16. The Subcommittee considers that it is of vital importance that every member of a Service Committee should be uninfluenced in his judgment of the case under consideration by any personal association with either party. For this reason the Subcommittee recommends:

Recommendation B: That provision should be made in the Regulations for a requirement that a member of a Service Committee who is an interested party in the matter under consideration shall be required to disclose his interest either to the chairman before the meeting or at the commencement of the proceedings.

17. The Subcommittee is satisfied with the present arrangements for appointing the deputy chairman, but recommends:

Recommendation C: That consideration be given to the practicability of appointing a deputy chairman for a defined group of executive council areas adjacent to each other.

Investigation by Service Committee

18. At present, Regulation 4 requires the Service Committee to investigate "any complaint made by a person against a medical practitioner in respect of an alleged failure to comply with the terms of service." This regulation is so wide as to give complete freedom to anyone who feels disposed to lodge a complaint against a doctor. Although there are certain safeguards against frivolous or vexatious complaints, it is felt that the right to lodge a complaint should be restricted (i) to a patient of the doctor concerned or someone who is acting on his or her behalf because of the inability of the patient to make the complaint, and (ii) in appropriate cases to a representative of the Ministry of National Insurance. It is therefore recommended:

Recommendation D: (1) That the following proviso be inserted after Regulation 4 (1):

Provided that no such complaint shall be investigated as aforesaid unless made by a person for whose treatment the

medical practitioner is responsible in respect of treatment afforded to him by such medical practitioner or person authorized by him in writing to make such complaint or his spouse or in the case of an infant his parent or guardian or in the case of a person unable to make such complaint owing to mental infirmity a close relative or in the case of a deceased person his personal representative(s), or in the case of the Ministry of National Insurance a responsible official of that Department.

(2) that the following be inserted in place of Regulation 4 (3):

Subject as hereinafter provided the Dental Service Committee shall investigate any complaint that a dental practitioner has failed to comply with the terms of service made by a person for whom the dental practitioner has undertaken or agreed to undertake treatment.

Any complaint made under this regulation shall be made by the person for whom the dental practitioner has undertaken or agreed to undertake treatment: provided that he being satisfied that any such person is deceased or that he is unable through age, infirmity, or other reasonable cause himself to make the complaint the committee may investigate a complaint made by some other person on his behalf.

Time Limit for Making Complaints

19. As a general rule complaints against a medical practitioner or pharmacist are required to be lodged with the clerk to the executive council within six weeks of the event giving rise to the complaint. This is considered to be an unnecessarily long period. In addition, in the event of an application being made to the Minister for permission to investigate a complaint, the application need not at present be supported by a majority vote of the members of the Service Committee. Indeed, in the Minister's view, it may be made on the decision of the chairman alone. Similar considerations apply to the dental profession.

The Subcommittee recommends:

Recommendation E:

- (i) That the period of six weeks referred to in Regulation 4 (4) (a) be reduced to four weeks;
- (ii) that the period of two months referred to in 4 (4) (c) (i) be reduced to six weeks;
- (iii) That any application to the Minister for permission to investigate a complaint, notice of which is received more than six weeks after the event, should be supported by a majority vote of the members of the Service Committee;
- (iv) That the following be substituted for Regulation 4 (4) (b):

The person desiring to make a complaint under this Regulation against a dental practitioner shall within six months after the completion of treatment, or within four weeks after the event which gave rise to the complaint, whichever is the sooner, give written notice to the clerk of the council stating the substance of the matter which it is desired to have investigated.

(v) That the following be substituted for Regulation 4 (4) (c) (ii):

(ii) in the case of a complaint against a dental practitioner the complaint is made within six months after the completion of the treatment or within six weeks after the said event, whichever is the sooner, or

(vi) That Regulation 4 (4) (c) (iv) be modified so as to make it clear that the practitioner's representations relate solely to the question of the departure from the time limit for making the complaint.

20. The Subcommittee also agrees with the views of its dental members that there should be an overall time limit outside which the Minister should have no power to authorize the hearing of a complaint in those cases which relate to the fit and efficiency of dentures. Under the new and simplified procedure which is shortly to be introduced, the executive council will deal with such complaints, and it is felt that the Minister should have no power to authorize a hearing of a complaint of this nature if more than twelve

months have elapsed since the completion of treatment. Any evidence relating to the adequacy of treatment which consists in the provision of dentures necessarily deteriorates rapidly in value as time passes, and it can reasonably be said that after twelve months have elapsed from the original provision of a denture it is extremely difficult, and in many cases impossible, to decide whether the treatment provided was in fact satisfactory. For these reasons the Subcommittee supports its dental colleagues in seeking the early introduction of an overall time limit of twelve months.

21. The Subcommittee recommends:

Recommendation F: That the substance of the following paragraph of the Handbook on Service Committee Procedure should be incorporated in the Regulations:

7. Similarly if a practitioner's observations on alleged acts of omission or commission are sought by the executive council prior to possible reference of a case to a Service Committee under Regulation 4 (5) the source from which the information has come should be indicated and also any provisions in the terms of service alleged to have been broken. If no term of service is affected the reason why the conduct of the practitioner is being investigated should be clearly set out.

Procedure of Service Committee

22. Several local medical committees have suggested that the chairman of the Medical Service Committee should not be the sole judge as to whether the statement made by a complainant discloses prima facie ground of complaint. The Subcommittee is in general agreement with this view, and recommends:

Recommendation G: That the chairman of a Service Committee should confer with a professional adviser who is not a member or a deputy member of the Service Committee but selected by the Service Committee from a panel nominated by the local professional committee, when deciding whether a statement made by a complainant discloses prima facie ground of complaint.

Rules of Procedure for Service Committees under Regulation 5

23. Rule 1 (1) (a) requires the clerk of the executive council, when informing the complainant that his statement discloses no prima facie ground of complaint or is frivolous or vexatious, to invite the complainant to submit a further statement within seven days. The Subcommittee is of opinion that the rule goes unnecessarily far, and recommends:

Recommendation H: That the clerk should be required only to inform the complainant of the procedure which will be followed if a further statement is not received within seven days—namely, that the case will be brought before the Service Committee, which has power to dispense with the hearing.

24. Under Rule 1 (1) (e) the documents of a case must be sent to each member of the Service Committee three clear days before the meeting of the Service Committee. This period is thought to be too short, and it is recommended:

Recommendation I: That the period of three days referred to in Rule 1 (1) (e) be extended to seven days and a further requirement of the clerk be added to ensure that copies of the documents are sent to the secretary of the local professional committee.

25. Rule 1 (1) (f) states that "either party shall be entitled to be present at the hearing and to give or call such evidence as the committee may think relevant to the matters at issue." The Subcommittee feels this rule is unnecessarily all-embracing, as the issue of relevancy should be one of fact. It therefore recommends:

Recommendation J: That the words "such" and "as the committee may think" be deleted from Rule 1 (1) (f) so that it reads:

Either party shall be entitled to be present at the hearing and to give and call evidence relevant to the matters at issue.

and may put questions relevant to the matter in dispute to the other party or to any witness called by him, either directly, or, if the committee so direct, through the chairman of the committee. Subject as aforesaid, the procedure at the hearing shall be such as the committee may determine.

26. Rule 1 (1) (h) provides that, if in the course of a hearing any new issue is introduced by the complainant, the chairman has discretion to admit or exclude such issues as he thinks fit, but if it is admitted the respondent may ask for an adjournment, which shall be granted. The Subcommittee feels that this is unsatisfactory, and recommends:

Recommendation K: That Rule 1 (1) (h) be amended so as to make it obligatory to adjourn the committee if a new issue is admitted.

Report of Service Committee

27. At present, a Service Committee is required to report on every case brought before it, including cases in which the chairman has decided that there is no prima facie ground of complaint. It is felt that it should not be necessary to report in detail to the executive council on this type of case, and the Subcommittee recommends:

Recommendation L: That the rules of procedure should be amended so that a Service Committee is not required to report in detail on those cases where there is no prima facie ground of complaint.

28. In giving the Service Committee discretion in its report to draw the attention of the executive council to any previous reports made by the committee in connexion with the practitioner whose conduct has been under consideration, no distinction is made between cases in which the complaint has been proved and cases in which it is not proved. The Subcommittee therefore recommends:

Recommendation M: That an amendment be sought to Regulation 5 (4) so as to ensure that reference to previous cases should be made only when failure to comply with the terms of service was found in those cases and is also found in the present case.

Representation of Executive Council to Tribunal

29. Regulation 8 states that if an executive council decides to make representations to the Tribunal with regard to the continued inclusion in any list of the name of any practitioner, and an appeal is made to the Minister against the executive council's decision on other matters, the Minister may treat as conclusive for the purpose of the appeal any relevant findings of the Tribunal. The Subcommittee recommends:

Recommendation N: That the words "any relevant findings" in Regulation 8 be amended to read "any relevant findings of fact."

Procedure on Appeal

30. Regulation 9 (5) provides that, in the event of an oral hearing following an appeal, and where one of the parties is a medical or dental practitioner and the decision of the executive council involves the finding that he has been guilty of a breach of certain of the terms of service, the persons appointed to hear the oral representations shall include a medical or dental practitioner, as the case may be, selected from the panel of practitioners referred to in Regulation 11. There is no similar provision, however, when the practitioner has been found not guilty of a breach of those terms of service and the patient then appeals against the decision of the executive council. The Subcommittee feels that proper provision should be made for this contingency, and recommends:

Recommendation O: That, in cases where the practitioner has been found not guilty of a breach of the terms of service and a patient then appeals against the decision of the executive council, the persons appointed to hear

the oral representations shall include a medical or dental practitioner, as the case may be, selected from the panel of practitioners referred to in Regulation 11.

Appeal to the Courts

31. Eighteen local medical committees have recommended that there should be a right of appeal to the courts, or some other judicial body, against decisions of the Minister and/or the Tribunal.

32. The Subcommittee, bearing in mind the original controversy on this point, has given very careful consideration to the issues involved and has reached the following conclusions:

(a) That the Minister's responsibility to Parliament "to provide or secure the effective provision of services" in accordance with the National Health Service Act and its Regulations is indisputable and in accord with democratic procedure.

(b) That there are advantages in having a right of appeal to the Minister of Health and not to the Courts, in that—

(i) the Minister has power to reinstate a practitioner's name in the appropriate list at any time after the decision to remove the name from the list; no such power rests with the Court, and it would be a more difficult procedure to reinstate the practitioner.

(ii) an appeal to the Courts if granted would normally be held in public. This applies at present to hearings by the Tribunal if the respondent wishes it, but not otherwise.

(iii) if the Minister is not satisfied on appeal that a practitioner's name should be deleted from the list he has the option of imposing the lesser penalty of a fine. If the appeal lies to the Court, the Court has not that alternative.

(c) If representations are made to the Court against a decision of the Tribunal, it follows that the Minister and also the patient would have the right to be heard. Under the present system only the defendant has the right of appeal to the Minister, and any change might therefore not be in the defendant's best interests, as it would mean that the present one-way channel of appeal would be capable of being used in the opposite direction. At the same time, while the Minister is limited to revoking the direction of the Tribunal in favour of the doctor, dentist, or pharmacist, the Court would not be so limited and might, in fact, impose a heavier sentence.

33. The Subcommittee feels that, on balance, it would not be to the advantage of the profession to press for a right of appeal to the Courts, but believes that some modification of the present procedure is desirable. It therefore recommends:

Recommendation P: That the present appeals machinery be amended so as to provide that the person appointed under Section 42 of S.I. 507 (1948) to hear the appeal should be appointed by the Lord Chancellor, and should be a practising barrister or solicitor of not less than ten years' standing, not being a member of the staff of the Ministry of Health.

Procedure on Withholding Money

34. The Subcommittee has sought legal advice on the powers of the Minister under Regulation 11 (1) to impose a fine following a hearing which results in a verdict favourable to a practitioner. It appears that the present Regulations do permit the imposition of a monetary penalty in such circumstances, and, whilst the Subcommittee appreciates that such a power may be equitable in the case of the Tribunal, it is certainly not in the case of Service Committee proceedings. The Tribunal is concerned only with whether a practitioner should be removed from the list following representations by an executive council. To prevent the Minister imposing a fine would mean that a practitioner who was

guilty of misconduct which, although not serious enough to justify his removal from the list, had nevertheless resulted in a breach of his terms of service would suffer no penalty at all, whereas another practitioner found guilty of a lesser offence by a Service Committee could have money withheld from his remuneration. A verdict favourable to the practitioner having been reached by the Service Committee, the appeals body, however, clearly vindicates the practitioner against the charges which have been brought against him, and the Minister should certainly have no power to impose a fine in such circumstances. The Subcommittee therefore recommends:

Recommendation Q: That Regulation 11 (1) be amended to provide that the Minister should not be empowered to impose a fine following either a hearing by a Service Committee, or an appeal against the findings of a Service Committee, which results in a verdict favourable to a practitioner.

35. Similarly, the Subcommittee is strongly of the opinion that the Minister should not be empowered to impose a fine following consideration of the report of either a medical or dental officer under Regulation 14, which deals with the investigation of record-keeping, nor should the power to impose a monetary penalty exist where a case of this nature is referred to the local medical committee or local dental committee for consideration and a verdict favourable to the practitioner is reached either by the local committee concerned or, on appeal, by the appeals body. The amendment to Regulation 11 (1) recommended in Recommendation Q above should make specific provision to this end.

36. Regulation 11 also provides for the constitution of advisory committees to assist the Minister in discharging his duties under the Regulation when he decides that a sum of money shall be recovered from the remuneration of the practitioner whose conduct has been the subject of an investigation. In the case of the medical advisory committee, the selection of medical practitioners to serve on it is required to be made in rotation from the panel of practitioners nominated for this purpose, but in the case of the dental advisory committee no mention is made of the selection being made in rotation. The Subcommittee recommends:

Recommendation R: That Regulation 11 (6) be amended by:

- the addition of the words "so far as may be in rotation" after the word "Minister" in line 4;
- the insertion of the words "for that purpose" after the word "nominated" in line 6.

Appeals from Dental Estimates Board

37. It is recommended:

Recommendation S:

- That Regulation 18 (2) be amended by the addition of the following:

The Minister may, on the application of any person desiring to appeal, extend the time for giving notice of appeal and may do so although the application is not made until after the expiration of one month from the date on which notice of the Board's decision was received.

- That the following be substituted for Regulation 18 (3):

The Minister shall appoint two dental practitioners, of whom one shall be selected from a panel of dental practitioners who are or have been engaged in the provision of general dental services nominated for that purpose by organizations which are, in the Minister's opinion, representative of the dental profession. The practitioners so appointed shall hear the representations of the appellant and the Dental Estimates Board and determine the appeal.

Investigation of Alleged Excessive Prescribing

38. It is not clear from the Regulations whether, at the investigation by the local medical committee, a practitioner

may be represented by counsel or other paid advocate, or may call witnesses. The Subcommittee recommends:

Recommendation T: That Regulations 12, 13, 14, 15, and 16 be amended so as to make it clear that the decision as to whether a practitioner may be represented by counsel or other paid advocate, or may call witnesses, rests with the local medical committee.

Determination of Question Whether a Substance was a Drug

39. At present there is no time limit within which a question as to whether a substance ordered by a practitioner was a drug or not may be raised. In practice, the absence of any time limit has led to considerable inconvenience, and busy practitioners cannot be expected to remember the clinical details of a case for which a prescription was ordered and which is the subject of investigation often eighteen months or more later. Similarly, the Subcommittee feels that there are good grounds for imposing a time limit within which a practitioner must be informed of the result of any appeal. Experience has shown that in a number of cases even after the appeal has been heard a considerable time elapses before the practitioner is informed of the outcome of his appeal. It is manifestly unfair that, even when a decision has been reached, there should be a long delay before it is communicated to the respondent. The Subcommittee therefore recommends:

Recommendation U: That any question under Regulations 16 and 17 as to whether a substance ordered by a practitioner was a drug or not may only be investigated within a period of six months subsequent to the date of issue of the prescription, and that in the event of the practitioner appealing against the decision of the local medical committee the results of such appeal shall be notified to the practitioner within one month from the date of the appeal.

The Tribunal

40. The Subcommittee has no suggestions to make for the amendment of the Regulations relating to inquiries by the Tribunal. It is felt that, having regard to the safeguards laid down in the Regulations, it would be undesirable to interfere with the right of any person or executive council who believes that a practitioner's name should be removed from the appropriate list, to make representations to that effect direct to the Tribunal.

41. One local medical committee suggests that the period of fourteen days within which an appeal against the decision of the Tribunal must be lodged should be extended. The position is safeguarded, however, by the Ministry being given discretion to extend this period.

Notices to be Given under the Regulations

42. The Subcommittee recommends:

Recommendation V: That all documents required or authorized by the Regulations to be sent to persons concerned with the hearing should be sent by registered post.

Complaints Against Patients

43. The Subcommittee endorses the policy of the General Medical Services Committee that there should be provision for the investigation of a complaint by a doctor against a patient on account of frivolous and unreasonable demands on the doctor's services.

"Code of Behaviour" for Patients

44. At the request of the Annual Conference, the Ministry of Health is being pressed to draw up a "code of behaviour" for patients which would be brought to their notice on appropriate occasions. It is recognized that such a code would not necessarily be enforceable, but it is believed that it would be helpful to medical practitioners in the National Health Service.

Appendix V—Financial Statement
Balance Sheet—December 31, 1952

	1952 £	1951 £
Accumulated Fund (formerly Surplus Account)—(See account annexed) Balance at December 31, 1952	406,458	379,479
Reserve for Development of Regional Offices (after charging £1,743 costs of development during year)	29,737	31,480
	<u>436,195</u>	<u>410,959</u>
Liabilities and Provisions:		
Loans	32,100	97,100
Bank Overdraft	118,588	99,948
Creditors and accruing expenses	65,547	113,601
Amounts received in advance (including subscriptions)	68,581	23,431
Current Taxation	7,639	3,989
Provisions for:		
Dilapidations and redecoration of premises	43,201	43,535
Pensions	6,904	5,764
	<u>310,460</u>	<u>290,268</u>

Note.—The Association is a company limited by guarantee, the liability of members being limited (except as provided in paragraph 6 of the Memorandum of Association) to 1 guinea each.

Fixed Assets at net book amount at January 1, 1947, of assets acquired before that date, with additions since at cost, less Sales, Depreciation, and Sinking Fund instalments—

AUDITORS' REPORT TO THE MEMBERS OF THE BRITISH MEDICAL ASSOCIATION

In our opinion and to the best of our information and according to the explanations given to us the above balance sheet and the annexed income and expenditure account give a true and fair view of the state of the Association's affairs as at 31st December, 1952, and of its income and expenditure for the year ended on that date. We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for our audit. In our opinion the Association has kept proper books of account and received proper branch returns, and the above-mentioned accounts, which are in agreement with them, give in the prescribed manner the information required by the Companies Act, 1948.

3, Frederick's Place, Old Jewry, London, E.C.4.

15th May, 1953.

PRICE WATERHOUSE & Co.,
Chartered Accountants.

Income and Expenditure Account for the Year ended December 31, 1952

	1952 £	1951 £
Central Meetings Expenses	17,158	22,459
General Expenses, including Auditors' Remuneration £735 (1951-£735) and Interest on Loans £1,168 (1951-£909)	46,191	45,090
Premises Expenses	34,179	37,266
Capitation Grants, Regional Offices and Direct Expenditure on Local Organization	81,892	37,192
Library Expenses	6,902	7,129

Balance brought forward—January 1, 1952		379,479
Income Tax recovered in respect of previous years		13,471
Further grant towards cost of Central Medical Recruitment Committee in respect of 1951		2,333
Surplus for 1952 brought down from Income and Expenditure Account		18,289
		<u>£413,572</u>

APPENDIX VI

MEMORANDUM OF EVIDENCE SUBMITTED
TO INTERDEPARTMENTAL COMMITTEE
ON THE ADOPTION OF CHILDREN

I. PREFACE

1. The British Medical Association is a voluntary organization representing over 65,000 medical practitioners resident in the United Kingdom and overseas and engaged in all branches of medicine. For the purpose of preparing evidence in response to the invitation from the Interdepartmental Committee on Child Adoption, the Council appointed a special committee composed of the following persons:

Annis Gillie, M.B., B.S., M.R.C.P., General Practitioner, London (Chairman).

T. Y. Finlay, M.D., F.R.C.P.Ed., Honorary Treasurer, Scottish Association for the Adoption of Children.

Miriam Florentin, M.B., Ch.B., D.P.H., Senior Medical Officer, Maternity and Child Welfare, County Borough of West Ham.

J. B. S. Morgan, B.Sc., M.B., B.Ch., D.P.H., County Medical Officer of Health and School Medical Officer, Derbyshire County Council.

T. W. Morgan, M.B., B.S., General Practitioner, New Malden, Surrey.

Kenneth Soddy, M.D., D.P.M., Physician, Department of Psychological Medicine, University College Hospital, and Assistant Director, World Federation for Mental Health.

H. P. Tait, M.D., F.R.C.P.Ed., D.P.H., Maternity and Child Welfare Medical Officer, City of Edinburgh.

2. The Council is grateful for the opportunity to make a contribution to the present inquiry, for medical practitioners, especially those in general practice, often have close personal experience of the circumstances which necessitate adoption and of the difficulties and anxieties of parents and adopters. This memorandum of evidence is based on the views of medical practitioners who have given much thought to the subject. It is believed that the recommendations, if put into effect, could result in a still higher proportion of successful adoptions, success being measured by the achievement of happy family life and eventually by well-balanced adult personalities in the adopted children.

II. THE IMPORTANCE OF PERSONALITY

3. Child adoption, regarded as a special aspect of child care, gives an opportunity for providing integrated family life for both the child and the adopting parents. Investigation and formal process are essential, but they need to be conducted with a higher degree of sympathy and human understanding than is usual in the majority of legal procedures. The Council wishes to emphasize the importance of recognizing the human attributes and needs of all concerned, and it will be seen that most of its recommendations for the improvement of the present system are based on this.

4. This method of approach may be summarized here before the Council proceeds to more detailed recommendations. The mode of investigation and legal procedure should be kept as flexible as possible in order to meet varying circumstances, and to balance the flexibility there should be corresponding protection against abuse and failure. All investigation and assessment of those concerned should be carried out only by persons specially selected for their possession of suitable qualities and experience. The situation of the natural parents and their emotional conflict in deciding whether to give up the child need wise and sympathetic handling by experienced advisers. It should not be forgotten that the adopters, too, are undergoing emotional stress and may be feeling very uncertain of their capacity to act as adopting parents. The matching of child and adopters should be carried out with a full sense of the seriousness of the step and its effect upon their future lives.

5. Adoption can be successful whatever the age of the child at the time of the placing, but the Council believes that the earlier the arrangements for adoption are proposed the better will be the emotional adjustment of all concerned.

It is known that some of the most successful adoptions have been initiated before the birth of the baby. It may be difficult, when placing a child in the early weeks of life, to provide for the adopters an adequate forecast of his physical and mental development, but the risk is no greater than that which must be accepted by natural parents.

6. When the adoption is arranged for before the birth of the child the natural mother is relieved of that part of her emotional conflict which is concerned with parting from her living baby, a conflict which increases the longer the baby remains with her. Anticipation of the birth also stirs the parental feelings of the adopters, and the eagerness with which the baby is awaited is a powerful factor in promoting family unity.

7. The responsibility of all concerned with prenatal adoptions or with the placing of a child in the early weeks or months of his life is very great. This difficulty could be met by giving the court power to require a longer period of probation without the need of an interim order.

8. The Council believes that adequate preliminary investigation, based in all cases as much on personal qualities as on material considerations, could reduce the number of unsuccessful adoptions and remove the desire occasionally expressed for power to rescind an adoption order. Such power would, indeed, undermine the very spirit of the system, which aims at giving the adopted child as full status in his family as any other child. Adopters, if they are to succeed as parents, have to accept the risks of disappointment in the development of their child in the same way that natural parents accept them. Medical practitioners are well aware that, in spite of very careful examination of the child before adoption, physical or mental defect may later emerge, and they know the acute unhappiness and disappointment this may cause the adopters. This element of risk should be fully explained to the adopters both at the time of the placing of the child and when the adoption order is made.

9. The reception of the child by the adopters is an important event in their lives. The Council would like to see more appreciation of the sense of the occasion by those concerned with the arrangements. Efforts should be made to arrange that the physical transfer of the child to the adopters shall take place in suitable surroundings and without undue haste. The court also, when hearing the case at a later date, has a great opportunity for impressing on the adopters the importance of the step they are taking.

III. THE METHODS OF ADOPTION

10. Adoptions arranged through a local authority or a registered adoption society are controlled by statute and, with certain reservations to be mentioned later, are considered reasonably satisfactory. Direct and third-party adoptions are open to most abuse, and it is towards them that general criticism is directed.

11. Although the Council is aware that with the direct method there is a greater chance of commercial exploitation, it considers that direct adoption should remain available.

12. It has been suggested that all third-party adoptions should be prohibited and that the local authority and the registered adoption society should be the only channels permitted. The Council admits that there is a greater risk of failure in third-party adoptions. This may often be due either to the short time left for the investigation of all concerned or to the lack of such supervision, during the probationary period, as is required in local authority adoptions. On the other hand, many third-party adoptions are successful for the very reason that they are informal. For example, when a general practitioner who arranges for an adoption knows both the parents and the adopters he is in a specially favourable position to estimate the chances of success. Many similar arrangements have been made with the agreement of all concerned, including notification to the local authority. It must be admitted, however, that on occasion the information is received too late for any effective action to be taken if the circumstances are found to be unsuitable.

The Unmarried Mother

20. One of the most difficult tasks in the investigations may lie in the handling of an unmarried mother. At present too little sympathy or understanding may be shown towards her while she is endeavouring to decide upon her child's future. It is true that some of these mothers have little conscious intention of keeping their babies and would experience small sense of loss, but many undergo a severe emotional ordeal during which they deserve every possible consideration. A woman faced with this problem should not be unduly pressed to make an early decision on whether to offer her baby for adoption. The Council recommends that the medical officer of health should select some person to be available to give advice to any unmarried mother who is contemplating offering her child for adoption. It appears that there are cases where adoption of the child at a very early age is the best solution, and it is here that the responsibility of the adviser is greatest. The adequate provision of homes for mothers and babies would help to solve some of the difficulties encountered. As previously suggested, an obligation on the mother to make a request to the local authority for permission to place the child for adoption would be some safeguard against making a decision that she might later regret.

Period of Probation

21. The Adoption Act, 1950, provides that the consent of the mother to adoption of her child shall not be admissible until he is at least 6 weeks old, and an adoption order shall not be made unless the child has been with the prospective adopters for at least three consecutive months. As has already been stated, the Council favours the placing of the child at a very early age in certain suitable cases, but it suggests that the courts should be empowered to make a probationary period of more than the statutory three months, according to the problems of the particular case, and that this period should not begin until the child has reached the age of 6 weeks. This would give a fuller opportunity for the settlement of any doubts about the child's future health or capacity for development, or about the suitability of the adopters.

Medical Examination of the Child

22. A medical examination of the child to be adopted is already included in the procedure of both local authorities and registered societies. The Council is of the opinion that two medical examinations are desirable in every case. The first should be undertaken at the time of the placement and the second at the time of the adoption order. The second should be carried out by a medical practitioner with special experience of child health and development.

Medical Examination of Adopters

23. The guardian *ad litem* is required under the Summary Jurisdiction Rules to collect information about the material circumstances of the adopters, but there is no requirement for the medical examination of the adopters. The Council considers that there should be a standard comprehensive medical examination of the adopters, together with an opinion on their personality, probable adaptability to family life, and reasonable expectation of survival. This examination and report should be made by the family doctor of the adopters, where desired, and submitted to a medical referee appointed for each area. If necessary, the referee should obtain information from suitable official sources, such as child guidance clinics and local health authorities, with prior consent of the persons involved. Only the decision of the referee would be communicated to the case committee. It is important that all investigations should be completed, whenever possible, before the child is placed with the prospective adopters.

Registered Societies

24. Registered societies will make their own arrangements for medical examinations, but the Council recommends that the forms of report used should be adequate. It is also

13. There is something of such great personal value in the best type of third-party placing that the Council would wish this method to be preserved, but more safeguards against the risk of hasty uninformed placing need to be introduced. These should include notification to the local authority, and full investigation before the placing of the child with the prospective adopters. It will be obvious that adequate time must be allowed to elapse between the notification and the placing to permit of satisfactory investigation.

IV. ADMINISTRATIVE AND LEGAL PROCEDURE

14. The Council considers that, while a choice of methods of adoption should remain, it is desirable that a substantial degree of uniformity in procedure and standards should be required by statute and regulation in all cases, however responsible may have been the introduction by third-party or the personal direct transfer. The recommendations below are intended to apply to local authority, third-party, and direct procedures, and a paragraph on registered societies is included.

Adoption Authorities

15. The Council has given careful consideration to the suitability of the present administrative arrangements, which fall within the sphere of the Home Office. It is of the opinion that there are so many medical aspects in successful adoption that the subject falls more naturally within the range of activities of the Ministry of Health than of the Ministry of Home Affairs. If control were transferred to the Ministry of Health the responsibility for the care of mothers and of children in connexion with adoption would fall within the powers of local health authorities under Sections 22 and 28 of the National Health Service Act for England and Wales, of the National Health Service Act for Scotland. It is realized with corresponding arrangements for Scotland. It is realized that active co-operation with the local children's committee would still be essential.

16. The Council suggests that the Health Committee of the local health authority should appoint a special Adoption Subcommittee to which it would delegate the responsibility for investigating cases. It is thought that this subcommittee would function most effectively if its membership were limited to four to six experts representing public health officers, the Children's Committee, the local medical profession, and local voluntary associations. The local health authority in a small area might co-operate with its neighbours in order to make a wider selection of personnel available.

Applications

17. An obligation should be laid upon the natural parents or the guardian to request permission from the local authority to place a child for adoption. It is essential that the giving up of a child for adoption should be an active decision and not a matter of indifference or resignation.

Investigation of Cases

18. The success of an adoption depends to a large extent upon the completeness of the investigation of all factors concerned. Failure to make a satisfactory investigation may result in bad matching of child with adopters or hardship to the natural parents. It is therefore important that the investigation should be carried out with a full sense of the importance of the task. The Council recommends that when an application is received for the placing of a child it should be referred to the Adoption Committee already mentioned, which would be responsible for investigating the case and reporting to its parent committee or authority. It would also organize the collection of the information detailed in the Adoption of Children (Summary Jurisdiction) Rules, 1949-52. Such a committee would not supersede the guardian *ad litem* in representing the infant in court, but would be a source of information in protecting the child's interests.

19. The investigation should be begun at the earliest opportunity, if necessary before the birth of the child. All medical reports must be regarded as confidential.

essential that societies should avail themselves, to a greater degree than is usually the case at the present time, of the sources of medical information about the individual which are available under the National Health Service, with the prior consent of those concerned. The Council suggests that they should also set up their own machinery, parallel to that recommended above for local authority adoptions, for the investigation of individual cases. The smaller societies could no doubt take advantage of the adoption machinery available in their areas under the appropriate authority.

The Court

25. If all the circumstances were properly and fully investigated by the Adoption Committee as suggested above, the main function of the court would be to ensure that the legal procedure had been duly followed, and the need for interviewing in court with regard to medical matters would be small.

26. When an adoption case is heard in a juvenile court there are advantages, from a psychological standpoint, in ensuring that children brought for adoption are kept separate from those attending for other reasons. Similarly, the need for a different mode of approach will be recognized by the magistrates, and it may be that separate sessions will be thought preferable. As suggested in paragraph 9, the proceedings will provide an occasion for the magistrates to impress upon the adopters the importance of the responsibility they are accepting.

Identities

27. Although the problem of the disclosure of identities might appear to be outside the medical aspects of adoption, it has some psychological implications. The Council considers that, in the adoption procedure, there are advantages in giving each child a serial number which is linked with the confidential information kept by the court. For example, subject to suitable and adequate safeguards, a child who wished in adult life to ascertain the identity of his parents, whether to satisfy legitimate curiosity about his origin or to protect his legal rights in respect of inheritance and title, could apply to the court which made the original adoption order.

28. The problem of whether the adopters should know the identity of the natural parents is more complex. On the whole, the Council is of the opinion that, while the name and address of the natural parents should usually be concealed, the adopters would be helped later in answering the child's questions if they knew something of the personality and social and economic status of his parents. For practical reasons the identity of the adopters should not, in the majority of cases, be revealed to the natural parents.

SUMMARY OF RECOMMENDATIONS

1. In the arrangement of adoptions full recognition should be given to the human attributes and needs of all concerned (paras. 3-8).
2. Fuller appreciation should be shown of the sense of the occasion when the child is transferred to the adopters (paras. 9 and 26).
3. The system of third-party adoptions and direct transfers should be preserved, with additional protection of the interests of all concerned (paras. 10-13).
4. These safeguards should include:
 - (i) notification to the local authority of a proposed placing (para. 13);
 - (ii) full investigation before the placing of the child with the prospective adopters (para. 13);
 - (iii) a requirement that the natural parents or the guardian should seek from the local authority permission to place the child with a view to adoption (para. 17);
 - (iv) the provision of advisers to the natural parents (para. 20).
5. A substantial degree of uniformity in the standards and procedure should be required by statute and regulations in all cases of adoption (para. 14).

6. In view of the many medical aspects in successful adoption, it is considered that the subject falls more naturally within the range of the Ministry of Health than of the Home Office (para. 15).

7. The Health Committee of a local health authority should delegate to a special Adoption Subcommittee the responsibility of investigating cases (para. 16).

8. All applications for placing should be referred for investigation to the Adoption Committee (para. 18).

9. The investigation should be begun at the earliest possible opportunity (para. 19).

10. All medical reports must be regarded as confidential (para. 19).

11. More consideration should be shown to the unmarried mother in her difficulties (para. 20).

12. The placing of the child should take place at the age most suitable for each case, but the courts should be empowered to make a probationary period of more than the statutory three months, according to the problems of the particular case; this period should not begin until the child has reached the age of 6 weeks (para. 21).

13. Two medical examinations of the child should be required, one at the time of placement and the other at the time of the adoption order (para. 22).

14. A comprehensive medical examination of the adopters should be required in all cases, subject to the final decision of a medical referee (para. 23).

15. The forms of medical certificate and report used by registered adoption societies should be adequate (para. 24).

16. Registered societies should set up machinery parallel to that recommended for local authority adoptions (para. 24).

17. Care should be taken in the procedure of juvenile courts to ensure that children brought for adoption are kept separate from those attending for other reasons (para. 26).

18. Consideration should be given to the suggestion that each child should be given a serial number which is linked with the confidential information kept by the court (para. 27).

PRESCRIBING APPEAL

The following is a report of an appeal to the Ministry by a doctor against the decision of a local medical committee upholding an executive council's decision that gin contained in a mixture was not a drug which it was bound to supply.

The Doctor's Case

The doctor had prescribed for his patient, who was suffering from secondary carcinomatosis, a mixture containing in each ½ oz. (15 ml.): morphine 1 gr. (65 mg.), cocaine ½ gr. (32 mg.), honey 1 dr. (4 g.), and gin 2 dr. (8 ml.). The patient had had this mixture in hospital and the doctor continued to prescribe it. He stopped the mixture for one week, and the result convinced him that without it the patient's life was unbearable. The executive council decided after six months that the gin in the mixture was not a drug, and thereafter he prescribed the mixture without the gin. The doctor considered that rectified spirit would not have the same effect in counteracting depression caused by pain and opiates.

No argument was offered for the executive council.

Findings of the Referees

The referees appointed by the Ministry to hear the case were divided in their views. The majority were satisfied that the gin was included in the mixture for a pharmacological purpose, and that it was a doctor's duty to alleviate physical and mental distress. The doctor disregarded the advice of the Joint Subcommittee of the Standing Medical, Pharmaceutical, and General Practitioner Committees, who recommended that alcoholic beverages should never be classed as drugs and that the place of gin should be taken by spirit can be a drug, so can gin, and they could not say that the doctor's view that rectified spirit did not produce the same effect as gin was unreasonable. The referees decided by a majority that gin was a drug.

MINISTER OF HEALTH TO ADDRESS ANNUAL CONFERENCE OF LOCAL MEDICAL COMMITTEES

The Minister of Health, the Rt. Hon. Iain Macleod, M.P., P.C., has accepted an invitation from the General Medical Services Committee to address the Annual Conference of Local Medical Committees on Wednesday, June 17. The Minister will address the Conference at 12.30 p.m., and it is understood that he intends to make his views known on a number of important matters of policy.

The Minister will afterwards be the guest of the Committee at a fork luncheon.

SURPLUS SENIOR REGISTRARS

MINISTER'S PROPOSALS

The Joint Consultants Committee has been pressing the Minister of Health to take action to avert the crisis which threatened with the expiry shortly of the appointments of many senior registrars. As a result the following statement has been issued by the Minister and the Joint Committee.

The Minister of Health and the Joint Committee for Consultants and Specialists as representing the medical profession have been discussing the position of those senior registrars in England and Wales whose appointments will soon be ending in accordance with the arrangements made in 1951 for reducing the number of senior registrar posts to bring it more into line with the estimated number of vacancies for consultants and senior hospital medical officers in the various specialties. The Joint Committee has represented to the Minister that to avoid undue hardship a longer time should be allowed for this adjustment to be brought about so that in suitable cases these senior registrars and about so that in suitable cases these senior registrars and former senior registrars may have longer to seek the higher hospital appointments for which they have been training or to obtain other medical posts outside the hospital service. The Minister has come to the conclusion that transition to the senior registrar complement envisaged by the plan of 1951 may be smoothed in that way without detriment to the hospital service.

Accordingly the Minister has authorized hospital boards to retain senior registrar posts in excess of those covered by the plan of 1951 for a period not extending beyond the end of 1955 at the latest where this will avoid extra staff having to be employed in other grades and fully suitable candidates are forthcoming for the retained posts. As the engagements of the present holders will be advertised, applications will be entertained from the present holders, from other senior registrars whose appointments will end in the near future, and, in certain circumstances, from former senior registrars. The term of these posts will be one year, but boards will be free to allow a second year where other employment has not been obtained by the end of the first year.

Though the holders of these posts will continue to be free to compete for higher hospital appointments they will do so in competition with other candidates, and their retention as senior registrars will not give them any special claim or constitute any guarantee that they will be successful in the competition.

In addition, there will still, of course, be nothing to prevent a retiring senior registrar from applying for and being appointed to a post within the training establishment. If, however, he is reappointed to the same post, the term of his reappointment will be limited to two years. The Joint Committee has expressed its agreement with these arrangements.

The above announcement relates only to England and Wales. Discussions on the Scottish position are still in progress between the Department of Health and the medical profession in Scotland.

SCOTTISH MEDICAL PRACTICES COMMITTEE

REVISED LIST OF UNDER-DOCTORED AREAS

The following revision to the list of areas needing more family doctors (*Supplement*, November 1, 1952, p. 177) has been prepared by the Scottish Medical Practices Committee, and is being issued to executive councils through Scotland.

County of Ayr: Kilmarnock; County of Caithness: Wick; County of Dunbarton: Dumbarton, Vale of Leven, Clydebank, Kirkintilloch; County of Fife: Lochgelly, Cardenden and Crossgates, Burntisland, Dunfermline, Rosyth and Inverkeithing; County of Lanark: Airdrie, Bellshill, Larkhall, Motherwell, Shotts, Coatbridge; Lothians and Peebles: Bathgate, Linlithgow and Bo'ness, Gorebridge and Newtongrange, West Calder; County of Orkney: Kirkwall; County of Renfrew: Johnstone, Renfrew; Stirling and Clackmannan: Falkirk, Polmont, Grange-mouth, Alloa.

In an accompanying circular the Department of Health for Scotland states that in areas included in the revised list it can be assumed that an initial practice allowance will be payable for a doctor setting up in single-handed practice, so long as conditions remained unchanged. Applications for initial practice allowances in areas not appearing on the list will be considered by the Medical Practices Committee in the light of circumstances in the area. Initial practice allowances, which were among the changes recommended by the Working Party on remuneration of doctors, range up to £600 and took effect from April 1 of this year. They are designed to produce an income in the range of £600 to £1,100 over a period of three years for a doctor genuinely building up a practice in an area where it is needed.

REGIONAL CONSULTANTS AND SPECIALISTS COMMITTEES

CONFERENCE OF HONORARY SECRETARIES

Fifteen honorary secretaries of regional consultants and specialists committees attended a conference held at B.M.A. House on April 23. After a welcome by the Secretary of the Association, Dr. T. ROWLAND HILL, Chairman of the Central Consultants and Specialists Committee, who took the chair in the morning, reported on the present medico-political position in the hospital field.

Organization Discussed

In the afternoon Dr. A. H. IMRIE presided over a discussion on the work of the Consultants and Specialists Organization. The discussion covered the present structure of the organization, the need for possible modifications and improvements, and the question of increased secretarial and clerical assistance. Particular attention was paid to the links between B.M.A. Headquarters and the regional committees and between these committees and hospital groups and individual consultants. Relationships between the central organization of consultants and specialists and the Ministry were examined, together with those between the peripheral organization and hospital boards, with reference to the principle of joint consultation. The relationship between the Consultants and Specialists Organization and the rest of the British Medical Association was also discussed, together with its problems and possibilities. The desirability of increased liaison and co-operation with general practitioners and the public health organizations was stressed.

Refreshing Contact

The small conference provided an excellent opportunity for informal exchanges of opinion and for presenting information about prevailing conditions. The members departed refreshed by contact with their opposite numbers and perhaps feeling that, though the lot of regional honorary secretaries is not always a happy one, the work is nevertheless worth while. It is hoped that there will be more of these conferences.

NATIONAL HEALTH SERVICE

APPOINTMENTS TO REGIONAL HOSPITAL BOARDS

Appointments, mainly to fill vacancies caused by the retirement in rotation of one-third of the members of the 14 regional hospital boards set up under the National Health Service Act in England and Wales, have been made by the Minister of Health, Mr. Iain Macleod. Out of a total of 124 appointments, 89 are reappointments of retiring members; 6 appointments are still outstanding. Among those reappointed 13 are women, and of the new appointments 4 are women.

Tenure of office will be for three years—until March 31, 1956. Another one-third of the members will retire on March 31, 1954. Total membership of the boards, excluding chairmen, is 364.

Those reappointed or newly appointed for each board are as follows:

Newcastle.—Reappointed: Mr. Edward Crowther; Dr. S. WHATELEY DAVIDSON; Professor R. BRAMBLE GREEN; Mr. Arthur Kay; Dr. JOHN RAYMOND MURRAY; Mr. John Lisle; Viscountess Ridley; Dr. R. GORDON RUSSELL. New Members: Mr. James Thomas Fletcher (Redcar); Miss Barbara Carmichael (South Shields).

Leeds.—Reappointed: Alderman D. Beevers; Mr. H. J. Edwards; Mr. B. Hazell; Mr. W. Louis Lawton; Mr. C. R. Morris; Mr. F. Watkinson. New Member: Dr. R. WATSON (Beverley, Yorks). One appointment outstanding.

Sheffield.—Reappointed: Dr. H. BARBER; Mr. A. R. Martin; Alderman A. E. McVie; Mr. T. Pearson; Professor G. L. ROBERTS; Mr. E. W. Scorer; Councillor J. S. Worrall. New Members: Mr. R. LODGE (Leicester); Dr. D. MACMILLAN (Nottingham); Mr. A. H. Whiteley (Mansfield).

Oxford.—Reappointed: Mr. A. R. BANHAM; Mr. J. W. W. Cripps; Captain F. Gardiner; Colonel C. B. Krabbe; Professor T. POMFRET KILNER; Miss Rosemary Spooner; Professor J. A. STALLWORTHY. One appointment outstanding.

South-western.—Reappointed: Mrs. Margaret Ball; Mrs. K. A. Goddard; Alderman V. J. Ross; Colonel H. Bland Stokes. New Members: Mr. E. C. F. Bird (Lyme Regis); Professor J. A. Coutts (Bristol); Mr. H. M. Scott (Frome); Mr. P. N. Washbourn (Plymouth); Dr. L. W. HALE (Camborne). Miss M. H. Cordiner (Bristol) has been appointed until March 31, 1955.

East Anglian.—Reappointed: Mr. M. W. B. BULMAN; Mr. J. Grantham; Mr. H. S. Matthes; Mr. G. T. Vawser. New Members: Sir Stephen Green, Bt. (Snettisham, King's Lynn); Dr. STEPHEN MACKEITH (Norwich); Captain E. Murray-Harvey (Old Hunstanton). One appointment outstanding.

North-west Metropolitan.—Reappointed: Professor S. J. COWELL; Alderman Lieutenant-Colonel G. B. Goad; Mr. A. STAVELEY GOUGH; Dr. D. F. HUTCHINSON; Mr. H. Lesser; Miss M. Marriott; Mr. J. M. Oakey; Miss E. RICKARDS. New Members: Lord Hacking (London); Professor A. Bradford Hill (Great Missenden, Bucks).

North-east Metropolitan.—Reappointed: Dr. LOUIS COMYNS; Lieutenant Commander H. Denton; Professor V. W. DIX; Mr. Thomas R. Haggerty; Mrs. Ruth Rees-Thomas; Major R. P. Woodhouse.

South-east Metropolitan.—Reappointed: Mr. E. R. Bolland; Rt. Hon. Lord Cunliffe; Mr. R. J. Mellish, M.P.; Dr. A. TALBOT ROGERS. New Members: Miss D. M. Smith (London); Mr. H. J. Lester (Orpington). One appointment outstanding.

South-west Metropolitan.—Reappointed: Mrs. E. Hailstone; Dr. LOUIS MINSKI; Mr. M. F. NICHOLLS; Mr. S. R. Thorowgood; Mrs. H. Feiling. New Members: Dr. CHARLES GROSCHE (London); Mr. H. H. LANGSTON (near Winchester); Miss D. Morris (London); Mr. H. T. Townsend (Salisbury). Surgeon Lieutenant-Commander REGINALD BENNETT (London) has been appointed until March 31, 1955.

Wales.—Reappointed: Mr. William Berriman; Alderman William Casey; Alderman Thomas P. Davies; Alderman Walter C. Davies; Councillor Eddie Jones; Alderman James J. Panes; Dr. DYFRIG H. PENNANT; Sir Ivor Broadbent Thomas; Professor Owen H. Williams. New Member: Alderman Robert Dyson Briercliffe (Anglesey) has been appointed until March 31, 1954.

Birmingham.—Reappointed: Mr. J. E. Roberts; Mrs. V. Evershed; Alderman H. Barber; Professor C. F. V. SMOUT; Alderman P. Williams; Alderman L. Whitehouse; Mrs. S. A.

Ward; Mr. Everard P. Major. New Member: Mr. David Rhydderch (Worcs). One appointment outstanding.

Manchester.—Reappointed: Mr. Walter Barnes; Alderman G. D. Hastwell; Professor A. D. MACDONALD; Alderman W. Onions; Sir JOHN STOPFORD, F.R.S.; Mr. J. T. Waite; Mrs. E. A. Watson. New Members: Dr. H. PIGOTT (Manchester); Dr. A. POOLE (Oldham). One appointment outstanding.

Liverpool.—Reappointed: Miss A. L. Bulley; Professor Sir HENRY COHEN; Mr. G. N. Fullagar; Mr. A. A. GEMMELL; Mr. T. W. Harley; Alderman H. Platt. New Member: Dr. STEPHEN BARTON HALL (Liverpool).

TEACHING HOSPITAL APPOINTMENTS

Appointments, mainly to fill vacancies caused by the retirement in rotation of one-third of the members, have been made to the boards of governors of the 10 provincial teaching hospitals in England and Wales by the Minister of Health, Mr. Iain Macleod. Out of a total of 92 appointments 61 are reappointments of retiring members; two appointments are still outstanding. There are two new women members and nine have been reappointed.

Members of these boards serve in a voluntary capacity. Tenure of office will be for three years—until March 31, 1956. Another one-third of the members will retire on March 31, 1954. Total membership of the 10 boards, excluding chairmen, is 280.

Those reappointed or newly appointed for each board are as follows:

United Newcastle-upon-Tyne Hospitals.—Reappointed: Professor ROBERT VIVIAN BRADLAW; Mr. Edward Foyle Collingwood; Professor R. BRAMBLE GREEN; Professor F. JOHN NATTRASS; Mr. Edward Colgan. New Members: Mr. NORMAN HODGAM (Newcastle-upon-Tyne); Rev. R. E. Robson (Prudhoe, Northumberland); Miss A. M. Truesdale (Forest Hall, Northumberland); Mr. G. Hodnett (Newcastle-upon-Tyne); Dr. JAMES HENDRY, L.R.C.P. (Jarrow).

United Leeds Hospitals.—Reappointed: Alderman D. Beevers; Professor A. M. CLAYE; Councillor W. Maldwyn Jones; Mr. J. E. Rusby; Miss E. G. Lupton; Professor T. TALMAGE READ; Mr. D. WATSON. New Member: Professor P. J. MOIR (Leeds).

United Sheffield Hospitals.—Reappointed: Mr. A. R. Martin; Mr. T. Pearson; Dr. H. R. VICKERS; Professor E. J. WAYNE; Mr. J. M. Whittaker, F.R.S.; Mr. J. Madin; Mr. P. Malby; Councillor A. Wilde; Mr. A. O'Connor Fenton. New Member: Dr. C. S. O'FLYNN (Sheffield).

United Cambridge Hospitals.—Reappointed: Professor A. LESLIE BANKS; Lady Elizabeth Rook; Mr. T. C. Wyatt; Lady Bragg; Mrs. E. Hepner; Mr. E. C. Webb. New Member: Mr. T. J. FAIRBANK (Cambridge).

United Oxford Hospitals.—Reappointed: Dr. C. W. CARTER; Colonel C. B. Krabbe; Mr. J. G. Robinson; Miss Rosemary Spooner; Mr. R. E. Warrell. New Members: Mr. A. W. Dent (Oxford); Mr. A. S. TILL (Eynsham); Dr. W. RITCHIE RUSSELL (Oxford). One vacancy to be filled.

United Bristol Hospitals.—Reappointed: Mrs. Helen Bloom; Mr. H. K. Campbell; Professor A. I. DARLING; Miss Iris M. Lobb; Alderman J. J. Milton; Sir Philip Morris; Lady Mary Sinclair; Colonel H. Bland Stokes. New Member: Dr. G. K. MCGOWAN (Bristol).

United Cardiff Hospitals.—Reappointed: Mr. Alec Johnson; Mr. Edward E. Tompkins; Dr. JAMES WALKER. New Members: Professor LAMBERT C. ROGERS (Cardiff); Mr. JAMES TUDOR THOMAS (Cardiff); Professor FRED GRUNDY (Radyr, Glam.); Mr. Eddi Jones (Tredegar); Mr. Harold M. Meredith (Penarth); Mr. W. J. Canton (Merthyr Tydfil).

United Birmingham Hospitals.—Reappointed: Alderman A. F. Bradbeer; Dr. E. BULMER; Mr. W. J. G. Sperry; Mr. D. Bulgin; Mr. J. F. Crowder. New Members: Mr. W. L. Barrows Humphrey Humphreys (Birmingham); Vice Chancellor, Birmingham University (until September 30, 1953). One vacancy to be filled.

United Manchester Hospitals.—Reappointed: Mr. L. G. M. Crick; Mr. OGILVIE M. DUTHIE; Mr. Graham Halbert; Professor Mansfield Cooper; Mr. H. E. Newbold; Sir JOHN STOPFORD, F.R.S.; Mr. G. C. Sumner. New Members: Professor Horace Gray Radden (Manchester); Colonel F. J. Gidlow Jackson (Bowdon, Cheshire); Lady Stopford (Manchester) (until

March 31, 1954); Mr. Charles A. Miller (Knutsford) (until March 31, 1954); Professor WALTER SCHLAPP (Cheadle) (until March 31, 1955).

United Liverpool Hospitals.—Reappointed: Mr. J. H. Bromfield; Professor Sir HENRY COHEN; Mr. Richard Davies; Councillor H. S. Dickson; Miss Mary Jones; Mr. George Leather. New Members: Dr. P. E. GORST (Liverpool); Mr. R. R. P. Roberts (Heswall); Dr. P. H. WHITAKER (Liverpool).

MEDICAL PRACTICES COMMITTEE

AMENDMENTS OF CLASSIFICATION OF AREAS

The following amendments to the classification of areas have been issued by the Medical Practices Committee:

ENGLAND: COUNTIES

Bedfordshire.—Barford, Eaton Socon, Sandy and Potton, Intermediate from *Designated.

Berkshire.—Rural District of Hungerford, Restricted from Intermediate.

Buckinghamshire.—Burnham and Taplow, Chesham, Slough and Cippenham, Intermediate from *Designated.

Cheshire.—Chester District (sub-area of Ellesmere Port and Whitby), Intermediate from *Designated; Mid-Cheshire District (sub-area of Great Budworth), Restricted from Intermediate.

Cumberland.—Egremont District, Intermediate from *Designated.

Durham.—Urban District of Shildon, Intermediate from *Designated.

Essex.—Urban District of Waltham Holy Cross, Intermediate from *Designated.

Kent and Canterbury.—Borough of Gillingham, Urban District of Sittingbourne and Milton Regis, Intermediate from *Designated; Rural District of Bridge Blean (except Sturry), Restricted from Intermediate.

Lancashire.—Huyton-with-Roby, Ince-in-Makerfield, Lancaster, Padiham, Intermediate from *Designated.

London.—Borough of Battersea: Nine Elms and Park Ward (South of Battersea Park Road), Shaftesbury Ward, Intermediate from *Designated. Borough of Greenwich: Charlton and Kidbrooke Ward, Intermediate from *Designated.

Middlesex.—Borough of Acton, Borough of Brentford and Chiswick, Borough of Hornsey (South Haringey Ward), Borough of Willesden (Church End Ward), Urban District of Yiewsley and West Drayton, Intermediate from *Designated.

Nottingham County and City.—Mansfield Woodhouse, Nottingham City District No. 1, Intermediate from *Designated.

Oxford County and City.—Dorchester-on-Thames, Restricted from Intermediate.

Staffordshire.—Borough of Newcastle, Intermediate from *Designated.

Surrey.—Urban District of Haslemere, Restricted from Intermediate.

Warwickshire.—Urban District of Bedworth, Rural District of Atherstone, Rural District of Stratford-on-Avon, Restricted from Intermediate.

Worcestershire.—Bewdley, Restricted from Intermediate.

Yorkshire (East Riding).—Haltemprice, Intermediate from *Designated.

Yorkshire (North Riding).—Borough of Thornaby-on-Tees, Urban District of Skelton and Brotton, Intermediate from *Designated.

Yorkshire (West Riding).—Urban Districts of Normanton, Rawmarsh, Stocksbridge, Wombwell, Intermediate from *Designated.

COUNTY BOROUGHES

Birmingham.—Erdington Ward, Northfield Ward, Sheldon Ward, Stechford Ward, Weoley Ward, Intermediate from *Designated.

Bristol.—District No. 1 St. George, District No. 3 Bedminster, Intermediate from *Designated.

Darlington.—Whole of County Borough, Intermediate from *Designated.

*Areas in which the position is finely balanced and the admission of only one or two doctors may result in reclassification.

Huddersfield.—District of Fartown and Sheepridge, District of Moldgreen, Dalton and Almondbury, Intermediate from *Designated.

Ipswich.—Whole of County Borough, Intermediate from *Designated.

Liverpool.—Postal District No. 19, Intermediate from *Designated.

Newcastle-upon-Tyne.—West Area, Intermediate from *Designated.

Plymouth.—Northern Section, Intermediate from *Designated.

Stoke-on-Trent.—Fenton and Blorton, Stoke and Hanford, Intermediate from *Designated.

York.—Whole of County Borough, Intermediate from *Designated.

WALES: COUNTIES

Cardiganshire.—Aberystwyth, Restricted from Intermediate; St. Dogmaels (classified with Cardigan), Restricted.

Denbighshire and Flintshire.—Ffynnongroew, Intermediate from Restricted; Hawarden Rural District (practice area already restricted), Restricted from Intermediate.

Glamorganshire.—Taffs Well Ward (Caerphilly U.D.), Intermediate; Llantrisant and Llantwit Fardre, Intermediate from *Designated.

Monmouthshire and Newport.—Urban District of Abercarn, Intermediate from *Designated; Municipal Borough and Rural District of Monmouth, Restricted from Intermediate.

Pembrokeshire.—St. Dogmaels (classified with Cardigan), Restricted.

NEW AMERICAN DEPARTMENT OF HEALTH

Mrs. Oveta Culp Hobby has been appointed Secretary of the United States Federal Government's new Department of Health, Education, and Welfare. The post carries cabinet rank. According to the *New York Times*, Mrs. Hobby has said it is her "personal philosophy" that adequate medical care for all Americans could be achieved by "expanding and perfecting the system of voluntary, non-profit, privately operated health insurance programmes." Her views, which are in full agreement with those of the President, are opposed to socialized medicine and the compulsory health insurance policy suggested during the Roosevelt and Truman administrations.

The reorganization will include a new post—that of special Assistant for Health and Medical Affairs. This official will represent private medical practice and will "review the health and medical programmes of the Department and advise the Secretary with respect to necessary legislation." It would seem that the occupier of the post will be an adviser to the Secretary additional to the Surgeon-General of the Public Health Service.

COST OF PRESCRIBING

The Minister of Health, when asked in Parliament the number and cost of prescriptions issued for which charges were imposed under the National Health Service Act, 1952, for the months of January, February, and March, 1953, as compared with the figures for the same months in 1952, gave the following figures for England and Wales:

	No. of Prescriptions	Average Cost per Prescription	Total Cost
January, 1952 ..	21,115,577	46.51d.	£4,092,083
February, 1952 ..	21,189,421	47.27d.	£4,173,386
March, 1952 ..	20,758,051	47.12d.	£4,075,277
January, 1953 ..	23,764,000	Declared by chemists } Not yet available	
February, 1953 ..	21,635,000		
March, 1953 ..	21,131,000		

These figures include prescriptions for appliances ordered by general practitioners and dispensed by chemists and prescriptions given by hospital out-patient departments and dispensed by chemists. No figures are available to show the number of prescriptions dispensed at hospitals to out-patients.

ADMISSIONS TO THE MEDICAL LIST
COMPARATIVE FIGURES

The following Table, supplied by the Medical Practices Committee, gives comparative totals of admissions to the medical lists of executive councils during March and April, 1952, with those during March and April, 1953. Cases where new entrants joined the list of two executive councils are counted as only one admission in the figures given. The main practice area is taken in each case, and therefore there is no inflation by duplication.

Date	Partnerships		New Practices	Advertised Vacancies	Limited List	Maternity Medical Services Only	Total
	New Partner	With Former Principal					
1952: March	10	5	9	11	10	—	45
April	60	29	23	17	20	1	150
Total	70	34	32	28	30	1	195
1953: March	87	133	26	20	28	4	298
April	67	105	11	4	12	—	199
Total	154	238	37	24	40	4	497

MEDICAL WHITLEY COUNCIL
COMMITTEE "C"

ASSISTANT MEDICAL OFFICER ARBITRATION

The hearing of the claim put forward by the Staff Side of the Medical Whitley Council Committee "C" for an adjustment in the remuneration of assistant medical officers came before the Industrial Court on Wednesday, May 13. The Staff Side claim was presented by Mr. H. B. H. Hylton-Foster, Q.C., accompanied by Mr. S. B. R. Cooke. The case for the Management Side was presented by Mr. H. B. Williams, Q.C., accompanied by Mr. E. H. Blain. The hearing took the whole day, and the finding of the Court will be announced in due course.

Notes and News

A Refreshing Occasion.—Much has been said about the need for co-operation between the various health agencies which deal with patients in their homes. There is news from a Lancastrian and an East Anglian borough of pleasant efforts to translate words into deeds. In Cambridge a general practitioner entertained his colleagues and public health medical officers, nurses, midwives, and health visitors to sherry. In Preston, the local branch of the Association of Public Health Nurses, independently inspired with the same thought, regaled the local practitioners with a similar beverage. In both cases short talks and exchanges of ideas were added to the business of the evening. From both places it is reported that a greater feeling of partnership has developed between those present and that they are no longer strangers in a common field.

Excluded Hospital's Finances.—The *Daily Herald* reports that the finances and administration of the Industrial Orthopaedic Society and Manor House Hospital are to be considered by a committee appointed by the Society, most of whose 330,000 members are trade unionists. The Society and its hospital had deficits of £18,449 in 1952, £12,000 in 1951, and £23,000 in 1950. Increased costs are blamed for the loss.

Essex County Health Handbook.—A third edition of the *Essex County Health Handbook* has now appeared. Although primarily for the information of the public, it should

prove as useful to the doctors and nurses concerned as its predecessors. First there is a ready reference summary in alphabetical order of all the Health Service facilities available in the county. This is followed by a more detailed description of the preventive and curative services, what they are and how they work. Concise information about various matters of administration together with helpful lists of names and addresses is given in the appendices. A good index rounds off a good booklet.

Correspondence

Tuberculosis and Diseases of the Chest Group
Committee

SIR,—We, the undersigned, whilst acknowledging that this Committee has done good work, deplore its unrepresentative nature. If the present method of election is continued it is almost inevitable that the Committee will consist of its present members, or others living in the South and Midlands, and the large number of members living in the North of England will continue to be inadequately represented.

We therefore suggest that the country be divided up into areas, and that each area votes separately for its representative. If the areas are made large enough the Committee thus elected would be a little bigger than at present, but would be representative of the whole country. We suggest that the following divisions based on regional hospital board areas would be suitable, and hope that the annual meeting of the Group will agree to recommend this change to the Council of the British Medical Association: (1) Newcastle and Leeds Regions. (2) Sheffield and East Anglia Regions. (3) North-west and North-east Metropolitan Regions. (4) South-east and South-west Metropolitan Regions. (5) South-western Region. (6) Birmingham and Oxford Regions. (7) Manchester and Liverpool Regions. (8) Wales. (9) Scotland. (10) Northern Ireland. It is appreciated that the population of the South-western Region is less than that of the other regional groups, but it is geographically large, relatively isolated, rural in nature, and so has a case for its own representative.—We are, etc.,

The Constitution of the B.M.A.

SIR,—The place of origin, "Winchester," and the name, "Ronald Gibson," encouraged me to read the long letter in the *Supplement* of May 9 (p. 214) headed "The Constitution of the B.M.A." As I read I found that, considering the ground covered and the number of nails hit truly on the head, the letter was actually very short.

Before the Representative Body can be persuaded to call for an investigation into the best way of achieving its own reform it must be established that such reform is necessary, and this Dr. Gibson has done. I have attended the last dozen Representative Meetings and my personal view is that, though the agenda gets longer and longer, the actual achievement of each meeting is less and less. It is a most regrettable fact that the R.B. is no longer the parliament of the Association, and no good will come out of pretend-

MAY 23, 1953

CORRESPONDENCE

BRITISH MEDICAL JOURNAL

ing that it is. Even when it refers a matter to Council, believing that that body, acting as the executive of the R.B., will put its wishes into operation, it merely refers something to another body as hamstrung as itself. Both the R.B. and the Council still do some useful work, but all their efforts produce only a fraction of the good to the profession that they would if they were unfettered by the autonomous bodies.

Dr. Gibson says: "A new parliament must be built on firm foundations and not on the ruins of the old." The keystone of those foundations must be unity. Autonomous bodies and unity cannot exist together. The first step therefore will be to devise a form of Representative Body that will render autonomy of committees as unnecessary as it is undesirable.—I am, etc.,

R. HALE-WHITE.

London, N.W.1.

Temporary Residents

SIR,—Whilst agreeing that in the past it was quite absurd to pay 15s. for the hundreds of cases that only required a single consultation each for some trivial complaint, and that the new rate of 5s. is a just and fair one, it is far from adequate for cases requiring more attention than this—for example, suturing lacerations, night visits, and cases that require constant attention. Surely the profession cannot contemplate allowing some of its members to work for such inadequate remuneration.

In my own town the population is about 9,000 in the winter, growing to about 18,000 in the summer. Most of the visitors stay at organized holiday camps, and, unlike one's regular patients, have no hesitation in calling one out at all hours of the day and night, thus creating chaos in the organization of one's practice. It is essential for me to have an assistant to cope with the extra work in the summer, and, quite naturally, I have to maintain him all the year round. The reduction from 15s. per patient to 5s. has therefore placed me in a very difficult position. I have written to the clerk of the local executive council. This I did, and he was most sympathetic, but said that the matter was one for the doctors to settle amongst themselves, suggesting that I wrote to the hon. secretary of the local medical committee, as it would have powers to see that I was fairly treated. The committee's reaction appears to be that holiday camps are exactly what the new regulation was aimed at, and that it could not alter the new scale. It felt that cases where a fee of more than 5s. was justified should be sent to hospital, which I think indicates the complete lack of appreciation of the problems facing seaside doctors, most of the committee having practices in inland or industrial areas. This fee of 5s. does not bear comparison with fees paid for emergency work, or the same work done in private practice prior to the National Health Act. Is it not therefore possible for practitioners in seaside resorts—who are very much in the minority, taking the profession as a whole—to have this problem adequately investigated and fairly dealt with? I should be interested to learn if other seaside practitioners feel as I do about this and whether they think that some method should be found by the B.M.A. of giving due consideration and weight to our peculiar problems.—I am, etc.,

JOHN GRIFFITHS.

Prestatyn.

Specialization and General Practice

SIR,—Two of the many problems awaiting solution since the inception of the N.H.S. are, first, a method of bridging the gap between the hospital service and general practice, and, secondly, the evolution of a satisfactory training-scheme for aspiring specialists and general practitioners. Though the first may only be solved by clinical appointments and/or general-practice hospitals or wards and the second by the wider and so far unfaced issue of a realistic revision of undergraduate and postgraduate training, a partial solution might be sought along the following lines.

The first-year registrar post and the trainee assistant scheme could be abolished and replaced by a joint hospital/general practice appointment of S.H.O. status, the post being part-time, half-day in hospital, half-day with a selected general practitioner (or day about). In hospital the appointee would hold a series of posts—e.g., three months each in surgery (including anaesthesia), medicine (including fevers), midwifery and gynaecology (including paediatrics), and the remaining three months in special departments. In general practice he would sit in on consultations and accompany the general practitioner on his rounds, later undertaking some of the duties on his own. This appointment would be held after the period of National Service, when maximum benefit would be derived.

Such an appointment would give a broad basic training useful in either general practice or specialization, and give time for appraisal of several possible candidates for training as specialists by several members of the staff, so reducing the chance of discard when fully embarked on specialist training. Conversely the "holder," who is at the stage when he has to decide his future, would have an opportunity to view the various fields of medical endeavour. The appointment would not add to the already lengthy training in medicine, and would form a link between general practice and the hospital service. The holder would keep the particular problems of general practice before the hospital staff and at the same time help the general practitioner to keep abreast of hospital practice. He would also avoid the stigma of being a "failed" registrar if from choice or necessity he decided to enter general practice, and avoid the sisyphus task of specialization without experience of general practice. The arrangement would abolish the trainee assistant scheme.

Direct entry to general practice need not be barred. The posts could be largely financed by pooling the moneys expended on first-year registrars and trainees (the latter alone in Scotland cost £83,000 per annum).—I am, etc.,

NORMAN J. LOGIE.

Aberdeen.

The Trainee Assistant Scheme.

SIR,—I was interested to read the views of Dr. Angela Manning (*Supplement*, May 9, p. 217) concerning my letter on the trainee assistant scheme (*Supplement*, March 28, p. 95). Unhappily she has misconstrued my comments as an attack upon the scheme itself, whereas it was, in reality, an attempt to provide destructive criticism of its abuses, and constructive advice on its remedy.

I must reiterate that I am in support of the proposals for a trainee scheme on the lines approved by the G.M.S. Committee of the B.M.A. last year. Theoretically, the whole idea is admirable; but it is one which, I fear, is open to exploitation and abuse by those few trainers who take advantage of a procession of trainees to fill the gap which would normally be filled by a permanent assistant or a junior partner. Further, I would add (for her edification) that, while I myself am a junior partner (and have no axe to grind in the matter whatever), I have served for a year as a trainee, as have no fewer than seven of my personal friends and contemporaries. It was the result of many long and enjoyable (and often unanimous) conversations about the scheme over the past two years that led me to put pen to paper to suggest so simple, so obvious, and so effective a solution for the more obvious disadvantages of the scheme.—I am, etc.,

TOM RUSSELL.

Hayes, Middlesex.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

B.M.A. LIBRARY

The following books have been added to the Library:

- Macdonald, O. J. S.: Small Sewage Disposal Systems. 1952.
Maingot, R. (Editor): Management of Abdominal Operations. 1953.
Mozley, A.: Molluscicides. 1952.
Parry, S. C.: Polyglot Medical Questionnaire. 1953.
Scott, J. A.: Allergy and Seborrhoea. 1952.
Semon, H. C. G.: Atlas of the Commoner Skin Diseases. Fourth edition. 1953.
Stern, D. M., and Burnett, C. W. F.: Modern Practice of Obstetrics. 1952.
Stewart, H. J.: Cardiac Therapy. 1952.
Stuart-Harris, C. H.: Influenza and Other Virus Infections of the Respiratory Tract. 1953.
Tintometer Ltd.: Handbook of Colorimetric Chemical Analytical Methods for Industrial Research. 1953.
Victor, F.: Handwriting: A Personality Projection. 1952.
Vogt, H., and Amelung, W.: Einführung in die Balneologie und medizinische Klimatologie. Zweite Auflage. 1952.
Weber, F. P.: On Naevi and Miscellaneous Subjects. 1952.
Wolff, C.: The Hand in Psychological Diagnosis. 1951.
Worster-Drought, C. (Editor): Residential Speech Therapy. 1952.

H.M. Forces Appointments

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel J. L. O'Neill has retired on retired pay on account of disability, and has been granted the honorary rank of Colonel. (Substituted for the notification in a Supplement to the *London Gazette* dated June 22, 1951.)

Lieutenant-Colonel C. A. de Candole has retired on retired pay.
Lieutenant-Colonel G. C. Dansey-Browning has retired with a gratuity.

Major H. R. Hartnell, M.B.E., has retired with a gratuity.
Captain J. K. Sugden, T.D., to be Major.

Short Service Commissions.—Captains (War Substantive Majors) T. Griffiths, A. W. O. Taylor, and A. MacD. Maiden have relinquished their commissions, and have been granted the honorary rank of Lieutenant-Colonel. Captain S. J. T. Merryfield to be Major. Captain F. J. Brown-Douglas has retired with a gratuity, and has been granted the honorary rank of Major.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major (Honorary Lieutenant-Colonel) J. M. Lockie, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

Major A. W. Davidson, M.C., having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers, and has been granted the honorary rank of Lieutenant-Colonel.

TERRITORIAL ARMY

Lieutenant-Colonels (acting Colonels) A. G. Flemming, O.B.E., T.D., and R. Mowbray, from R.A.M.C., to be Colonels.

REGULAR ARMY: EMERGENCY COMMISSIONS

ROYAL ARMY MEDICAL CORPS

Lieutenants (War Substantive Majors) H. G. H. Houghton, B. H. Smith, and H. I. Maister have relinquished their commissions, and have been granted the honorary rank of Lieutenant-Colonel.

Lieutenant (Acting Lieutenant-Colonel) D. N. Parfitt has relinquished his commission (without pay and allowances), and has been granted the honorary rank of Lieutenant-Colonel.

ROYAL AIR FORCE

Group Captain A. Dickson has retired.
Wing Commander B. F. Haythornthwaite has retired.
Flight Lieutenant T. A. Evershed to be Squadron Leader.
Flight Lieutenants W. R. Lee and D. A. Good have reverted to the Reserve of Officers, retaining the rank of Squadron Leader.
Flight Lieutenant C. W. J. Usher has retired at his own request, retaining the rank of Squadron Leader.

Woman Officer Employed with the Medical Branch of the R.A.F.—Flight Lieutenant E. M. McKechnie to be Squadron Leader.

ROYAL AIR FORCE RESERVE OF OFFICERS

Flight Lieutenant J. G. Field to be Squadron Leader.
Flight Lieutenant A. V. Price has relinquished his commission on account of medical unfitness for Air Force service, retaining the rank of Squadron Leader.

ROYAL AUXILIARY AIR FORCE

Flight Lieutenants R. J. S. Wilson and D. Turner to be Squadron Leaders

Association Notices

FORMATION OF A GOLD COAST BRANCH

Notice is hereby given that the Council has formed a Gold Coast Branch comprising the Gold Coast Colony, Ashanti, the Protectorate of the Northern Territories of the Gold Coast, and Togoland under United Kingdom Trusteeship.

A. MACRAE,
Secretary.

Diary of Central Meetings

MAY

- 27 Wed. Local Arrangements Committee, First World Conference on Medical Education, 11 a.m.
27 Wed. Alcohol and Road Accidents Committee, 2 p.m.
27 Wed. Consultants and G.P.s Liaison Executive Committee, 2 p.m.
27 Wed. Film Committee, 2 p.m.
28 Thurs. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
28 Thurs. Central Ethical Committee, 2 p.m.
28 Thurs. Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, W.C.), 2 p.m.
29 Fri. Joint Committee of B.M.A. and the Magistrates' Association, 11 a.m.

JUNE

- 5 Fri. Library Subcommittee, Science Committee, 12 noon.
9 Tues. Joint Conference between Representatives of the Occupational Health, G.M.S., and Central Ethical Committees on Continued Treatment by Industrial Medical Officers, 2.30 p.m.
10 Wed. Compensation and Superannuation Committee, 2 p.m.
10 Wed. Public Relations Committee, 2 p.m.
17 Wed. Annual Conference of Representatives of Local Medical Committees, 10 a.m.

Branch and Division Meetings to be Held

CHELSEA AND FULHAM DIVISION.—At Fulham Town Hall, S.W., Friday, May 29, 8.30 p.m., general meeting.

EAST NORFOLK DIVISION.—At Norfolk and Norwich Hospital, Wednesday, May 27, 2.30 p.m., annual general meeting.

FURNESS DIVISION.—At Duke of Edinburgh Hotel, Barrow, Tuesday, May 26, 8 p.m., annual general meeting.

GLASGOW DIVISION.—At Glasgow Regional Office, 234, St. Vincent Street, Glasgow, Friday, May 29, 8.30 p.m., meeting.

HARROW DIVISION.—At Rayners Hotel, Rayners Lane, Tuesday, May 26, 8.30 p.m., annual general meeting.

KINGSTON-ON-THAMES DIVISION.—At Kingston Hospital, Wolverton Avenue, Kingston, Tuesday, May 26, 8.30 p.m., annual general meeting.

LEICESTERSHIRE AND RUTLAND BRANCH.—At Leicester Royal Infirmary, Thursday, May 28, 8.45 p.m., annual general meeting.

METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Tuesday, June 9, 2.30 p.m., annual general meeting. President's address by Dr. J. Arthur Moody: "Founders of the Branch and their Problems."

MIDLAND BRANCH.—At Nuffield House, Queen Elizabeth Hospital, Birmingham, Thursday, May 28, 8 p.m., address by Dr. E. E. Claxton to consultants and specialists of the Birmingham Region. General practitioners are welcome.

OXFORD DIVISION.—At Maternity Department Lecture Theatre, Radcliffe Infirmary, Oxford, Wednesday, May 27, 8.15 p.m., meeting. Dr. W. R. Bett: "Medical Aspects of the Tudor Period."

WEMBLEY DIVISION.—At Wembley Hospital, Tuesday, May 26, 8.30 p.m., clinical meeting.

WEST HERTS DIVISION.—At Ashridge Golf Club, Little Gaddesden, Herts, Wednesday, May 27, Treasurer's Cup Golf Competition.

WEST SUFFOLK DIVISION.—At Everards Hotel, Bury St. Edmunds, Tuesday, May 26, 8.30 p.m., meeting.

WIGAN DIVISION.—At Wrightington Hospital, Appley Bridge, near Wigan, Thursday, May 28, 2.30 p.m., clinical meeting. Clinical demonstration by Mr. J. Dobson and Dr. E. H. W. Deane.

WILLESDEN DIVISION.—At Physical Medicine Department, Willesden General Hospital, Harlesden Road, N.W., Tuesday, May 26, 9 p.m., annual general meeting.

ANNUAL MEETING: CARDIFF, JULY 9-17

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL

LONDON SATURDAY JUNE 6 1953

The B.M.A. in Committee

GENERAL MEDICAL SERVICES

The General Medical Services Committee, which consists of 61 members, is not in itself a statutory body, but it is a recognized one—that is to say, it is recognized by the Ministry of Health as the mouthpiece of all practitioners, whether members of the British Medical Association or not, who are providing general medical services under the National Health Service Acts. Moreover, it is the executive of the Conference of Local Medical Committees. Local medical committees, again, are recognized bodies as representing the doctors in their areas, and each of them in Great Britain and Northern Ireland has a voice at the conference.

The majority of the members of the G.M.S. Committee are elected from 24 groups of local medical committees in such a way as to secure geographical cover all over the kingdom. The rest of the membership is made up in various ways. Six members are sent to the Committee by the "informed electorate" of the Annual Conference, a further six by the Representative Body. The sister committees representing consultants and specialists and public health medical officers nominate members, as do the Society of Medical Officers of Health, the Medical Women's Federation, and the Medical Practitioners' Union. Pains have been taken to ensure that every kind of practice is represented—the dispensing doctor, the general practitioner not in the service, the general practitioner employed also in a part-time capacity, and so on.

The amount of travel which a single meeting of the Committee entails is, in total, enormous. If every member of the Committee attends the meeting (and there are very few absentees), the distances travelled, outward and return, must amount to something like 8,000 miles, or an average of 130 miles for each member. The willingness of the members to give journeying time, which in many cases is longer than the time spent in the Committee, is one of the best tributes to their enthusiasm. On one wintry day when trains in some parts of the country were snowbound, a member from the North of Scotland arrived at four o'clock in the afternoon for the last 10 minutes of the meeting, having travelled for 18 hours—but that was exceptional.

The Minister of Health, the Rt. Hon. Iain Macleod, M.P., P.C., has accepted an invitation extended to him by the General Medical Services Committee to address the Annual Conference. The Minister's address will commence at 12.30 p.m.

Wide Experience

In the forefront of the Committee at every meeting are half a dozen strong and (mostly) silent Scots, the first to come and the last to go, for two nights in a sleeper is part of the routine of their attendance. Scotland, by the way, has its own subcommittee, which works very hard up in the North. The back row has about the same number of the North. There are emphatic Lancastrians and other Northerners. There are seven from the Midlands, four from Yorkshire and Durham, three from Wales, and two from Northern Ireland. There are rural, semi-rural, suburban, and urban practitioners. The rural practitioners also have their own subcommittee. The Committee includes the veteran whose experience goes back to the early days of National Health Insurance, and the assistant and young practitioner is also there, with the certainty of being heard on any subject which concerns him. There are men from industrial practices and from practices in genteel watering-places. In-town practice in London is represented, and so are the various outer fringes.

The Committee normally sits from half-past ten until about six, but the actual sitting is only part of the labours of the Committee man. A week or a fortnight before the meeting a pile of documents reaches him, sometimes an inch thickness of foolscap. Other documents arrive by later posts, and when he gets to the meeting still others will be distributed. Agenda have been known to run to 90 items, with reports from half a dozen subcommittees or other sources. Here is no neat programme of business, beginning with the minutes of the last meeting, and ending six lines down with, "Any other relevant matter." The agenda means for the conscientious member a discipline of hours of reading if he is to take an intelligent part in the discussions. There are no preliminaries wasted in explaining what it is all about. Agenda of public bodies can rarely make such demands on the intelligence and understanding of their members.

The outside observer would probably vote the meeting confused. So it is, but it is not the confusion of the ill-informed; it is the confusion of a body in which every member is an expert on the details of general practice, to which every member can bring his own experience. Every member assumes in his neighbour the same acquaintance with detail as he himself possesses. In the result, without any pedantic regard for rules of debate, resolutions are taken, recommendations are framed for the conference, a whole tangle of matters are noted for discussion with the Ministry, replies are decided on points raised by local medical committees and others, subcommittee reports are dissected, and sometimes amended or referred back. And all this takes place normally every month, and even, in times of exigency, at shorter intervals.

No Mean Heritage

The G.M.S. Committee, which held its first meeting in December, 1948, is the successor of the Insurance Acts Committee, inheriting its constitution, its responsibilities, and its reputation—the last no mean heritage. The Insurance Acts Committee, in the 35 years or so of its existence, made a great name for itself. It was fortunate in its successive chairmen—Sir Henry Brackenbury, who brought to its work his incisive logic and skilled advocacy; Dr. Guy Dain, a persuasive and adroit leader, as able to keep his own side in rein as to lash the "enemy"; Dr. H. C. Jonas, who was unfortunately prevented by ill-health from continuing; and Dr. E. A. Gregg, with his unrivalled capacity for "cutting the cackle and getting to the 'osses." Three times has the chair of the Insurance Acts Committee been a stepping-stone to the chair of the Council.

When the title of the Committee was changed and its scope enlarged in 1948 the first chairman was Dr. Wand. He brought to the office the qualities exactly needed at a time of transition and controversy. Perhaps his greatest quality was his pertinacity. The Ministry has more than once found it difficult to maintain its "No" in the face of his persistence. His able successor, Dr. A. Talbot Rogers, has just completed his first year of office. To conduct an orderly meeting is the least of the jobs for the chairman. It is for him to lead the Committee, to give it voice, to interpret its decisions, sometimes to forecast them, at any time to influence them. The Committee's labours in connexion with the recent adjudication are fresh in the memory, but in many other fields its work has been of immense benefit.

Variety of Problems

It is not the purpose of these articles to catalogue the past achievements of committees, but to describe their present constitution and activities. The matters which in various forms and relationships come continually before the G.M.S. Committee include questions concerning assistants and partners and locumtenents, certification, mileage payments, emergency fees, protection of practices, temporary residents, inflation of lists, refresher courses, the general-practitioner specialist, health centres, the doctor in hospital, medical service committee inquiries—the list could be indefinitely extended. A valuable feature of the Committee is its liaison with dentists and pharmacists. A representative of the British Dental Association attends its meetings.

So impersonal is a committee that it can hardly be expected to evoke affection, yet its members often speak of it in affectionate terms, and a former secretary of the Association, the late Dr. G. C. Anderson, retained the secretaryship of the Insurance Acts Committee after his promotion to full office because, he said, he loved it. The writer of these paragraphs happens to have attended almost every meeting of the successive committees for 20 years, and in all that time, while there have been sharp divisions of opinion, he cannot recall one single disagreeable incident; which is a great thing to say.

GENERAL MEDICAL SERVICES COMMITTEE

A meeting of the General Medical Services Committee was held on May 21, with Dr. A. TALBOT ROGERS in the chair.

A report was made to the Committee of the proceedings of the recent Special Conference and of the Extraordinary General Meeting, and the chairman was congratulated on his speeches on those occasions. The Committee had before it an office note of a previous meeting of the Working Party at which a general discussion took place on the scope, methods, and intentions of the promised inquiry into the problems of the small-list practitioners. It was agreed that the Ministry should go ahead as quickly as possible, and that the chairman should include an account of the progress made in his address to the Annual Conference on June 17.

Future of Occupational Health Services

Dr. J. A. L. VAUGHAN JONES, chairman of the Occupational Health Committee, attended for a discussion on the memorandum on the future of occupational health services which his committee has prepared for submission to the Minister of Labour and National Service. Dr. Vaughan Jones said that the memorandum was really a compromise document, as his committee included members with somewhat sharply differing points of view. But the committee had had very real regard for the position of the general practitioner, and he thought the document as a whole was in line with Association policy. He answered various points of question or objection.

Dr. H. D. CHALKE said that in his view the whole of occupational health should be part and parcel of the National Health Service, not independent of the Service (though co-ordinated with it) as the document proposed.

One member gave instances of interference with his own practice by factory doctors.

One point mentioned in a detailed discussion was that managements did not seem to realize that early passes-out were not necessary in order that a man might see his doctor. All doctors in industrial areas kept their surgeries open late. Dr. GRAY thought it important that every industrial medical officer should make contact with the general practitioners in his neighbourhood; the medical officer of health also should be brought in. That should be a cardinal principle of any service.

The CHAIRMAN said that those of them who were members of the Council would, after this discussion, be better able to take part in the final discussions when the memorandum, after its reference to the interested committees, came forward. Dr. Vaughan Jones was thanked for coming.

Appeals Procedure

The agreed arrangements for the payment of partners on the basis of notional lists, the payment of initial practice allowances, and the granting of "hardship" payments include provision for an appeal by a dissatisfied practitioner to the Minister. The advisory body to the Minister is differently constituted in the first two of these classes from what it is in the third, and the Ministry now suggests that the same procedure should be adopted for all three classes of appeals—a committee of, perhaps, three representatives of the department and of three practitioners selected from a panel nominated by the General Medical Services Committee. The Ministry also suggested that when Welsh cases were concerned a representative from the Welsh Board of Health should be brought in, together with a representative of the practitioners in Wales.

The proposal was in general agreed to by the Committee. Another communication from the Ministry stated that it had recently been criticized for supplying regulations to individual medical practitioners, and asked whether the circulation of regulations could be restricted. If new regulations contained no substantial amendment would it be sufficient to make them known by E.C.N.? Dr. WAND insisted

that all regulations should be supplied automatically to every doctor. An E.C.N. was not at all the same thing. This appeared to be the general view of the Committee.

Various Matters

A draft circular on cancer education proposed to be sent by the Ministry to local health authorities was considered. Some concern was expressed lest it should encourage cancerphobia. The view of the Committee was that if the scheme did go forward general practitioners should be represented on any local committees set up for the purpose, and the scheme should be exploratory and reviewed after a time.

The Committee agreed to a request from the Middlesex Local Medical Committee that the Minister be approached for authority for the supply of the combined diphtheria and whooping-cough vaccine to practitioners by local health authorities on request. The combined vaccine has been used by local authority clinics following the completion of an experimental survey initiated by the Medical Research Council.

Dr. A. BEAUCHAMP submitted a memorandum in connexion with the proposed scheme for combined date and place of birth registration numbers relating to identification of general-practitioner patients. The advantages and disadvantages of the scheme were fully set out. It was agreed to discuss the matter with representatives of the clerks of executive councils.

The Committee agreed to a recommendation from the Assistants and Young Practitioners Subcommittee that, in future, principals, including partners, predominantly engaged in general practice, in receipt of a total gross professional income not exceeding £1,500 should be eligible for inclusion on the electoral roll of unestablished principals.

It was agreed, on the suggestion of the Northamptonshire Local Medical Committee, to take up a request to the Ministry for "butazolidin" to be added to the list of specially expensive drugs.

The Committee began its sitting at 10.30 a.m., and did not complete its business until 6 p.m. It was agreed to hold a further meeting on the day after the forthcoming Annual Conference.

GENERAL MEDICAL COUNCIL MEDICAL DISCIPLINARY COMMITTEE

The Medical Disciplinary Committee of the General Medical Council sat from May 20 to 23 and considered 16 penal cases. Professor David Campbell presided.

Restorations

The Committee heard six applications from practitioners for restoration of their names under Section 21 of the Medical Act, 1950. The names of Brendan O'Carroll and James A. Seavers were restored to the Register. In the case of another application, the Solicitor to the Council reported that several of the testimonials sent in were from persons whose identity was unverifiable, and apparently they were spurious. The Committee refused the application and considered *in camera* what further action should be taken. Three other applications were not granted.

Alleged Improper Behaviour and Adultery

The Committee considered a charge against Sidney Linton, registered as of Meanwood, Leeds, M.R.C.S.Eng., 1945; L.R.C.P.Lond., 1945, that he had been guilty of infamous conduct in a professional respect in that on numerous occasions beginning in or about April, 1949, and ending in November or December, 1951, he had behaved improperly to and committed adultery with Miss Myra Metcalfe, with whom he stood in professional relationship at the material times. Dr. Linton, who attended, was represented by Mr. Norman Richards, counsel, instructed by Messrs. Le Brasseur

and Oakley, solicitors to the Medical Protection Society, and Miss Metcalfe was represented by Mr. J. D. Walker, solicitor.

At the outset of the hearing it was submitted on behalf of Dr. Linton that as the allegation involved a charge of felony at law, in respect of which no action had been taken against the doctor in the courts, the Committee had no jurisdiction. After a legal argument, this submission, together with one by complainant's counsel that the case be heard *in camera*, was rejected.

Miss Metcalfe, of Tong Lane, Bradford, testified that she first got to know Dr. Linton in April, 1949, when she consulted him about her daughter, aged 5. Some time later she herself became Dr. Linton's patient, and at about the fifth visit he recommended hypnosis. She was hypnotized on four occasions, and on each occasion except the first the doctor behaved improperly to her. After the course had ceased she was accustomed to meet him, and go out with him in his car, which she did practically every Friday evening for two and a half years. They went to a spot near a disused airfield seven miles from Leeds, and on each occasion intimacy took place in the back of the car. She was never a willing party; though not under hypnosis she was very much under the doctor's influence, and he more or less made her continue the association. On each occasion when they got to the place he would cover over the B.M.A. badge on his car radiator. Finally she broke off the association in 1951, when she learned that his wife was pregnant. Evidence was also given by Miss Metcalfe's fiancé, who said that in April, 1952, when Miss Metcalfe appeared unhappy and depressed, he saw Dr. Linton, who admitted that he had given her hypnotic treatment, and said that he was pleased that marriage between the two was contemplated as it would be a very good thing for her.

At the close of complainant's case Mr. Norman Richards submitted that in the absence of corroboration there was nothing to answer, but the Committee rejected that submission.

The first witness for the respondent was a night sister at St. James's Hospital, Leeds, who testified that on a particular date and hour, when it had been alleged that Dr. Linton was with a lady in his car seven miles from Leeds, he was in fact at the hospital attending a patient who had had an operation the previous day. Another witness stated that at the time mentioned Dr. Linton's car was in his garage for repairs.

Dr. Linton, in evidence, said that he had a National Health list of 2,100 and many private patients. He lived happily with his wife, and had two children. He strongly denied that he had ever hypnotized Miss Metcalfe or had sexual relations with her. It was true that he had on a few occasions practised hypnosis, chiefly for anxiety neurosis, and this fact was known locally. He also strongly denied that he had taken Miss Metcalfe out in his car. Friday evenings, when it was alleged that these excursions took place, were invariably social occasions at home, except for an emergency call. The allegations in the complaint were completely malicious and a lie.

Mr. Walker, on behalf of Miss Metcalfe, called Dr. Linton's attention to three medical certificates which he said had been issued by him to her, and asked why he had instructed his solicitor that Miss Metcalfe had never been a patient of his. Dr. Linton replied that he had no record card for Miss Metcalfe; the only card he had was for the child.

Corroborative evidence was given by Mrs. Linton, who testified to a happy married relationship. It was ridiculous to suggest that Dr. Linton was out every Friday evening during the long period mentioned in the charge. He was at home on Friday evenings except for an occasional brief call on a patient.

After other evidence had been given, the Legal Assessor (Mr. C. P. Harvey, Q.C.) pointed out to the Committee that there was no evidence that Miss Metcalfe made any complaint of Dr. Linton's behaviour to any person close to her. She was a woman of 23 and she had a mother,

and one might have expected that if she had been hypnotized in the doctor's surgery and raped she would have gone home and complained to her mother about it, but she had not done so.

The Committee deliberated in private for 15 minutes, and the President then announced that the charge against Dr. Linton had not been proved, and the case was dismissed.

Drug Offences

The Committee considered the case of Joseph Henry Bentley, registered as of Limsfield, Surrey, L.M.S.S.A.Lond., 1935, who appeared on the charge that he had been convicted at Portsmouth, after pleading guilty, of procuring for himself, when not duly authorized or otherwise than in accordance with the terms and conditions of his authority, on four occasions in September, 1952, of 20 one-quarter grains of morphine, contrary to the provisions of the Dangerous Drugs Regulations. He had also been convicted of not keeping a register in the form set out in the second schedule of the regulations. In respect of each of the convictions he had been fined £50, and in respect of the first conviction ordered to pay £5 5s. costs.

Mr. F. P. Winterbotham, solicitor to the Committee, said that Dr. Bentley first came under the notice of the Home Office in 1946-7, when he was acting as a locumtenent and his use of morphine appeared to be excessive. In June, 1950, when acting as an assistant, he was admitted to hospital with morphine poisoning. There was a long history of morphine addiction.

Dr. Bentley, when asked by the President what he had been doing since his conviction in November, 1952, said that he had been rehabilitating himself. He had not taken any morphine for seven months. He had now no desire to take morphine. Certain testimonials were put in stating that he had made a gallant fight to overcome his addiction.

The Committee, in order to assist Dr. Bentley to overcome his tendency to take drugs, postponed judgment for one year.

The Committee considered a charge against Thomas Leven, registered as of Irvine, Ayrshire, L.R.C.P.Ed., 1945; L.R.C.S.Ed., 1945; L.R.F.P.S.Glas., 1945, that in June, 1952, he was convicted, at the Sheriff Court of Ayr and Bute, after pleading guilty, of contravening the regulations by procuring for himself in *cumulo* 567 grains of morphine sulphate by presenting, in the name of his patients, prescriptions therefor to chemists. He had been "admonished" by the Court, which, the Committee's solicitor said, was equivalent to conviction.

It was stated that the prescriptions had been made out in the names of nine patients, seven of whom strongly denied ever having had morphine; the other two had had four injections which might have been morphine, and a total of 125 grains had been prescribed on their behalf. In April, 1952, a rapid increase in the practitioner's prescribing of morphine was noted. One chemist supplied him with 95 grains of morphine sulphate, and similar supplies were probably made by other chemists.

Dr. Leven said that he had had hospital treatment for a month or six weeks. It was four or five months since he came out of hospital, and he had entirely given up drugs.

In this case also judgment was postponed for a year in order to give the practitioner an opportunity of completely overcoming his tendency.

Drunkenness and Cognate Offences

The Committee considered the case of Florence Joseph O'Driscoll, registered as of Orrell Park, Liverpool, against whom convictions were proved, at Liverpool in February, 1949, of being guilty, while drunk, of disorderly behaviour, and twice in March, 1953, of being found drunk. Mr. C. Leigh Taylor, of Messrs. Hempsons, solicitors to the Medical Defence Union, agreed that Dr. O'Driscoll's record was a bad one. He had previously been before the General Medical Council following similar offences, but in the ten years

from 1939, when he previously appeared, to 1949 he was in no trouble whatever, and he had built up a practice and had now about 1,200 patients on his list. These were isolated occasions and not part of a general habit. Dr. O'Driscoll gave an undertaking never again to take alcohol.

The Committee warned Dr. O'Driscoll, but, in order to give him one further opportunity, postponed judgment for one year.

The case of Patrick Aloysius Gallen, registered as of Garscube Road, Glasgow, was next heard. He had been convicted in 1940 at Glasgow of being in charge of a motor vehicle whilst under the influence of drink; in 1946 of a similar offence; in February, 1952, of driving a car without due care and attention, and in October, 1952, of driving a motor vehicle recklessly and of driving and being in charge of a motor vehicle while under the influence of drink.

It was pleaded on behalf of Dr. Gallen that he had a good record in general practice in Glasgow for 24 years, and that on each of these occasions he was not seeing patients or engaged in medical work of any kind. As a result of medical treatment he had not touched alcohol for the last two months.

Judgment was postponed for one year.

Roger Keith Hayden, registered as of Graham Road, Hendon, appeared on the charge that in November, 1952, at Chelmsford, he had been convicted of driving a motor vehicle when under the influence of drink, also of driving a motor vehicle in a manner dangerous to the public, of assaulting two police constables, and of committing wilful damage to cell windows. In December, 1952, again at Chelmsford, he had been convicted of 13 offences in September and October of obtaining certain drugs by false pretences. The offences related to obtaining in all some hundreds of tablets of cyclobarbitone, amphetamine, and codeine.

Mr. Norman Richards, counsel, read a number of testimonials on Dr. Hayden's behalf. He had been under unusual anxiety and stress in building up a practice, and had now succeeded in building up a small one, but with the opening of a new estate at the end of this year it was hoped that it might be enlarged. It was in his anxiety state that he had yielded to temptation and taken the drugs. It was apparent that he was being cured. Mr. Richards pointed out that he had not only been on trial before the court of summary jurisdiction but had also had to appear before the National Health Service tribunal, and these proceedings before the Disciplinary Committee had been hanging over him for many months.

In this case also judgment was postponed for one year.

The next case was that of Patrick Laurence Lyons, registered as of Kilkelly, Co. Mayo, who appeared following convictions in 1951 at Loughborough of driving or attempting to drive or being in charge of a motor vehicle while under the influence of drink; and in December, 1952, at Manchester, of driving a motor vehicle when under the influence of drink, and driving in a manner dangerous to the public, and, on the same date, of being found drunk in a highway.

Mr. Norman Richards, counsel, on behalf of Messrs. Le Brasseur and Oakley, solicitors to the Medical Protection Society, said that this was a young man aged 34. He had now given up alcohol. Testimonials were read on his behalf.

The Committee postponed judgment for a period of one year.

Cases Adjourned from Previous Sessions

The following practitioners, against whom convictions for misdemeanours had been found proved at previous sessions, when judgment had been postponed, came before the Committee and produced testimonials as to their satisfactory conduct in the interval:

Daniel Topping Gemmell, registered as of Ward End, Birmingham; Thomas Patrick Smyth, registered as of Atherton, Manchester; Alan McKerlie, registered as of Upper Chorlton Road, Manchester.

In each of these cases the Committee accepted the testimonials, resolved not to direct the Registrar to erase the name, and closed the proceedings.

In the case of Patrick Kennedy, registered as of East Dulwich Road, London, the testimonials produced covered a period of only ten weeks, during which he had been acting as locumtenent, and the Council postponed judgment for a further six months, and impressed on Dr. Kennedy the importance of satisfying the Committee by the production of adequate testimonials.

[The conclusion of the business of the General Medical Council will be reported in next week's Supplement.]

AGENDA OF ANNUAL CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL COMMITTEES, JUNE 17, 1953, 10 A.M., AT B.M.A. HOUSE, LONDON

Chairman: Dr. W. M. KNOX (Glasgow)

In this Agenda are printed all Notices of Motion received up to and including May 27, 1953. The printing of these does not affect the position of relevant Amendments or Motions subsequently received, which, must, however, in order to secure consideration, be sent to the Secretary prior to the Conference, or handed in *in writing* at as early a stage of the Conference as possible.

PRELIMINARY BUSINESS

Items 1 to 6 relate to preliminary business.

ANNUAL REPORT OF GENERAL MEDICAL SERVICES COMMITTEE

7. Motion by the Chairman of the General Medical Services Committee: That the Annual Report of the General Medical Services Committee (M.9) be received.

Remuneration: Reduction of the Maximum Number of Patients whom a General Practitioner may Accept under the Service
(Paras. 30-3 of Report)

8. Motion by the Chairman of the General Medical Services Committee: That paragraphs 30-3 of the Report of the General Medical Services Committee be approved.

9. Motion by GATESHEAD: That the attention of local medical committees be drawn to the fact that most Allocation Schemes as at present adopted do not truly represent the Working Party's Report in that they do not permit of an unremunerative excess beyond the nominal remunerative maxima.

Model Distribution Scheme
(Paras. 62-4 of Report)

10. Motion by the Chairman of the General Medical Services Committee: That paragraphs 62-4 of the Report of the General Medical Services Committee be approved.

11. Motion by NEWCASTLE-UPON-TYNE: That the Distribution Scheme should provide for a monthly payment to all general medical practitioners without individual application.

Removal of a Practitioner's Name from the Medical List
(Paras. 69 and 70 of Report)

12. Motion by the Chairman of the General Medical Services Committee: That paragraphs 69 and 70 of the Report of the General Medical Services Committee be approved.

13. Amendment by BIRKENHEAD: That this Conference strongly deprecates the Minister's interpretation in E.C.L. 93/52, of the National Health Service (General Medical and Pharmaceutical Services) Amendment (No. 2) Regulations, 1952 (S.R. & O., 1952, No. 2135), regarding the removal of medical practitioners from a Council's list in

certain circumstances. (Such circumstances for the removal of a practitioner from a Council's list include, according to Paragraph 3 (c) of E.C.L. 93/52: "Where the practitioner has absented himself from his practice for a period of 12 months or more, even if he has informed the Council and made adequate deputizing arrangements, but where there is no apparent likelihood of his returning within the immediate future.")

Succession to Vacant Medical Practice by a Partner
(Para. 75 of Report)

14. Motion by the Chairman of the General Medical Services Committee: That paragraph 75 of the Report of the General Medical Services Committee be approved.

15. Amendment by WOLVERHAMPTON: That as Local Medical Committees may render themselves liable to be mulcted by legal damages on the suit of an aggrieved doctor if they advised Local Executive Councils in the conditions envisaged in para. 75 of the report, para. 75 be not approved.

Machinery for Filling Practice Vacancies
(Para. 79 of Report)

16. Motion by the Chairman of the General Medical Services Committee: That steps be taken to secure that:

- (i) the Executive Council should be responsible for appointing a successor;
- (ii) the decision as to whether a practice should be dispersed or a vacancy is to be declared and advertised should remain with the Executive Council-in consultation with the Local Medical Committee;
- (iii) the Medical Practices Committee should act as an appeals body, and in hearing an appeal should be required to review all the applications originally submitted and not merely that of the appellant.

17. Amendment by BERKSHIRE: That Recommendation (i) should be amended to read "the Executive Council after consultation with the Local Medical Committee should be responsible for appointing a successor."

18. Amendment by BERKSHIRE: That Recommendation (iii) be amended by the addition of the words "when an appeal is being heard representatives of the Executive Council concerned should be in attendance."

19. Amendment by WESTMORLAND: That, if an appeal is heard, the Local Executive Council of the area concerned should be entitled to be represented at the meeting of the Medical Practices Committee.

Elimination of Inflation from Doctors' Lists
(Paras. 81-87 of Report)

20. Motion by the Chairman of the General Medical Services Committee: That paragraphs 81 to 87 of the Report of the General Medical Services Committee be approved.

21. Motion by CITY OF WORCESTER: That, in order to assist in avoiding a recurrence of the recent inflation in doctors' lists, instructions be printed on the medical card stating that patients must notify to the Executive Council any change of address even within the same Council area.

Reinstatement of Demobilized Services Personnel on Doctors' Lists
(Paras. 89 and 90 of Report)

22. Motion by the Chairman of the General Medical Services Committee: That paragraphs 89 and 90 of the Report of the General Medical Services Committee be approved.

23. Amendment by NORFOLK: That demobilized National Service men should automatically be replaced on their former doctor's list and issued with a medical card with the original doctor's name, as it is the experience of the members of this Conference that demobilized men do not trouble to reregister.

Allocation of Patients to General Practitioners

(Para. 92 of Report)

24. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 92 of the Report of the General Medical Services Committee be approved.

25. **Motion** by CITY OF WORCESTER: That a practitioner under contract with an Executive Council should not, by reason of his terms of service, be compelled to take or to retain on his list a patient who is accepting treatment from an unregistered practitioner or from another registered practitioner with whom he is not acting in consultation.

Treatment of Services Personnel on Leave

(Paras. 101-3 of Report)

26. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 101-3 of the Report of the General Medical Services Committee be approved.

27. **Amendment** by OXFORD COUNTY AND CITY: That all Services personnel on leave should come on the lists of National Health Service doctors as temporary residents.

28. **Amendment** by NORTHAMPTON: That Services personnel on leave should be treated as temporary residents, and that Service Departments make contribution of a round sum to the Central Pool to cover such cases.

Mileage

(Paras. 104-6 of Report)

29. **Motion** by the Chairman of the General Medical Services Committee: that paragraphs 104-6 of the Report of the General Medical Services Committee be approved.

30. **Motion** by GATESHEAD: That mileage payments be based on the difficulty of access of the individual patient rather than upon any broad classification of types of practice.

Service Committees Procedure

(Paras. 108, 109, and 113 of Report)

31. **Motion** by the Chairman of the General Medical Services Committee: That the Report of the Subcommittee on Service Committees and Tribunal Regulations (Appendix "C") be received.

32. **Motion** by the Chairman of the General Medical Services Committee: That the following Recommendation be approved:

Recommendation A: That Regulation 3(3) should be modified so as to leave the field open to non-members of the Executive Council, it being understood that, notwithstanding the wider field of selection envisaged, the person appointed should be acceptable to both parties represented on the Service Committee.

33. **Amendment** by HASTINGS: That Regulation 3(3) be amended to provide for the chairman to be a barrister or solicitor of not less than seven years' standing, and that he need not be a member of the Executive Council, but should be acceptable to both the lay and medical parties on the Service Committee.

34. **Motion** by the Chairman of the General Medical Services Committee: That the following Recommendation be approved:

Recommendation B: That provision should be made in the Regulations for a requirement that a member of a Service Committee who is an interested party in the matter under consideration shall be required to disclose his interest either to the Chairman before the meeting or at the commencement of the proceedings.

35. **Amendment** by HASTINGS: That the words "and shall, if the majority of the Committee require it, withdraw" be added to Recommendation B.

36. **Motion** by the Chairman of the General Medical Services Committee: That the following Recommendation be approved:

Recommendation E:

(i) That the period of six weeks referred to in Regulation 4(4)(a) be reduced to four weeks.

(ii) That the period of two months referred to in 4(4)(c)(i) be reduced to six weeks.

(iii) That any application to the Minister for permission to investigate a complaint, notice of which is received more than six weeks after the event, should be supported by a majority vote of the members of the Service Committee.

(iv) That the following be substituted for Regulation 4(4)(b):

"The person desiring to make a complaint under this Regulation against a dental practitioner shall within six months after the completion of treatment, or within four weeks after the event which gave rise to the complaint, whichever is the sooner, give written notice to the Clerk of the Council stating the substance of the matter which it is desired to have investigated."

(v) That the following be substituted for Regulation 4(4)(c)(ii):

"(ii) In the case of a complaint against a dental practitioner the complaint is made within six months after the completion of the treatment or within six weeks after the said event, whichever is the sooner, or".

(vi) That Regulation 4(4)(c)(iv) be modified so as to make it clear that the practitioner's representations relate solely to the question of the departure from the time limit for making the complaint.

37. **Amendment** by KENT AND CANTERBURY: That the following words be added to paragraph (iii) of Recommendation E:

"and that in the event of a decision to refer the case the Minister should be advised by a committee having a similar constitution to that of the medical advisory committee constituted under Regulation 11(4).

38. **Motion** by the Chairman of the General Medical Services Committee: That the following Recommendation be approved:

Recommendation G: That the Chairman of a Service Committee should confer with a professional adviser who is not a member or a deputy member of the Service Committee but selected by the Service Committee from a panel nominated by the local professional committee, when deciding whether a statement made by a complainant discloses prima facie ground of complaint.

39. **Amendment** by OXFORD COUNTY AND CITY: That Recommendation G be deleted altogether.

40. **Motion** by the Chairman of the General Medical Services Committee: That the following Recommendation be approved:

Recommendation I: That the period of three days referred to in Rule 1(1)(e) be extended to seven days and that copies of the documents are sent to the secretary of the local professional committee.

41. **Amendment** by OXFORD COUNTY AND CITY: That all words after "seven days" in Recommendation I should be deleted, so that Recommendation I should read:

"That the period of three days referred to in Rule 1(1)(e) be extended to seven days."

42. **Motion** by the Chairman of the General Medical Services Committee: That the following Recommendation be approved:

Recommendation T: That Regulations 12, 13, 14, 15, and 16 be amended so as to make it clear that the decision as to whether a practitioner may be represented by counsel or other paid advocate, or may call witnesses, rests with the Local Medical Committee.

43. **Amendment** by HASTINGS: That the words "decision as to whether a" and the words "rests with the Local Medical Committee" be deleted from Recommendation T.

44. **Motion** by the Chairman of the General Medical Services Committee: That the remainder of the Report and Recommendations C, D, F, H, J, K, L, M, N, O, P, Q, R, S, U, and V of the Subcommittee on Service Committees and Tribunal Regulations be approved.

45. **Motion** by WEST BROMWICH: That any communication from an Executive Council to a doctor informing him that a complaint has been lodged against him by or on behalf of a patient, and inviting his comments thereon, should embody a clear warning that his reply will be produced at any inquiry which might follow, and that its contents might there be used to his disadvantage.

46. **Motion** by HASTINGS: That Regulation 37 of Statutory Instrument 507 of 1948 (which gives the tribunal, *inter alia*, the power of subpoena and imposing penalties for non-compliance therewith) be amended to apply it to proceedings before the Service Committee except in so far as it relates to costs.

47. **Motion** by KENT AND CANTERBURY: That provision be made in the Regulations whereby a complaint from a person or body shall not be considered by the Medical Service Committee unless and until it is presented in the form of a statutory declaration sworn before a Commissioner of Oaths.

48. **Motion** by KENT AND CANTERBURY: That under the Rules of Procedure it be made clear that a copy of the question or matter with which the complaint is concerned should be sent to the practitioner at the same time as it is sent to the Chairman, with an appropriate explanatory letter.

49. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 113 of the Report of the General Medical Services Committee be approved.

50. **Amendment** by HASTINGS: That the terms of service be amended so that a practitioner who has arranged for the temporary treatment of a patient or patients by partner, deputy, assistant, or locum shall not be responsible for the default of his partner, deputy, assistant, or locum.

Discount on Drugs

(Paras. 115 and 116 of Report)

51. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 115 and 116 of the Report of the General Medical Services Committee be approved.

52. **Motion** by EAST SUSSEX: That this Conference expresses concern that, despite the representations of the General Medical Services Committee, dispensing doctors paid on the basis of the Drug Tariff should continue to sustain financial loss when supplying a number of proprietary preparations, and requests the General Medical Services Committee to take the strongest possible action without delay to remedy the present inequitable position.

Economy in Prescribing

(Paras. 117-119 of Report)

53. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 117-19 of the Report of the General Medical Services Committee be approved.

54. **Motion** by BIRMINGHAM: That this Conference of Local Medical Committees is anxious to co-operate in reducing the cost of pharmaceutical services consistent with the right of the doctor to prescribe whatever is necessary for the proper treatment of the patient, and urges that: (1) Economical prescribing be taught to students at all appropriate stages in the curriculum. (2) All house officers shall be similarly instructed. (3) Investigation of excessive and extravagant prescribing be accelerated so that at the

earliest moment individual doctors may be notified and the usual steps taken. (4) All consultants be kept fully informed on this subject and the actions to be taken.

55. **Motion** by LINES (LINDSEY): That, in view of the high cost of prescribing within the National Health Service, this Conference agrees that the Minister should make full use of his powers to impose financial penalties on doctors who persistently prescribe at a cost grossly above the area average.

Investigation of Prescribing

(Paras. 121 and 122 of Report)

56. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 121 and 122 of the Report of the General Medical Services Committee be approved.

57. **Motion** by BERKSHIRE: That in future all investigations into the prescribing of food and drugs should cease forthwith.

58. **Motion** by BUCKINGHAMSHIRE: That this Conference considers the present extensive use of investigations on irregular prescribing under Regulations 16 and 17 (Service Committee and Tribunal Regulations) 1948 is wasteful and undesirable, and since it does not effect any material economy in prescribing should be abandoned.

59. **Motion** by BUCKINGHAMSHIRE: That it is considered that real economy in prescribing would result from investigations by the Local Medical Committee into the prescribing of those practitioners whose prescribing costs have been reported to the Committee to be consistently above the average for their area.

60. **Motion** by BERKSHIRE: That practitioners whose prescribing costs were found to be above the local average should be investigated by the Local Medical Committee.

Prescribing of Cod-liver Oil and Malt and Glucose

(Paras. 125 and 126 of Report)

61. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 125 and 126 of the Report of the General Medical Services Committee be approved.

62. **Amendment** by GATESHEAD: That the necessary steps be taken to secure that in prescriptions for cod-liver oil and malt only quantities in excess of 4 lb. be liable to investigation and possible surcharge.

Prescribing of Disinfectants

(Para. 127 of Report)

63. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 127 of the Report of the General Medical Services Committee be approved.

64. **Motion** by SUNDERLAND: That this Conference protests against the inference which appears to be drawn by the Newcastle-upon-Tyne Pricing Bureau that "dettol" and other antiseptics are being used by patients as disinfectants for general hygienic purposes with the knowledge of the prescriber, and considers that the onus of proving that such antiseptics are being so used should not rest with the prescriber, as would appear to be the case at present, by reason of his being called upon to justify the quantities prescribed.

Charges for Prescriptions

(Paras. 128 and 129 of Report)

65. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 128 and 129 of the Report of the General Medical Services Committee be approved.

66. **Motion** by LEICESTERSHIRE AND RUTLAND: That this Conference is of the opinion that the 1s. charge on prescriptions should be abolished.

67. **Motion** by LEICESTERSHIRE AND RUTLAND: That the 1s. charge on prescriptions be limited to proprietary preparations.

68. **Motion** by GATESHEAD: That the prescription fee be greater for proprietary than for non-proprietary drugs.

National Formulary

(Paras. 136 and 137 of Report)

69. **Motion** by the Chairman of the General Medical Services Committee: that paragraphs 136 and 137 of the Report of the General Medical Services Committee be approved.

70. **Motion** by BUCKINGHAMSHIRE: That a return to the Latin system of headings of the editions of the *National Formulary* prior to 1952 should be made at an early date, and that it is unnecessary and undesirable that an alternative edition with English headings be published.

71. **Motion** by BRISTOL: That this Conference welcomes wholeheartedly the decision of the General Medical Services Committee to press for a return to Latin throughout future editions of the *National Formulary*.

72. **Motion** by BERKSHIRE: That the *National Formulary* should revert to the original Latin headings.

73. **Motion** by BRISTOL: That this Conference emphasizes the need for more consideration and imagination to be given to the flavouring of *National Formulary* mixtures.

The Obstetric List

(Paras. 138-40 of Report)

74. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 138-40 of the Report of the General Medical Services Committee be approved.

75. **Motion** by DORSET: That in the opinion of this Conference the official list of general-practitioner obstetricians should be abolished.

Assistants and Young Practitioners Subcommittee

(Paras. 144-46 of Report)

76. **Motion** by the Chairman of the General Medical Services Committee: That Local Medical Committees be asked to take such steps as will ensure that assistants in their areas are, wherever possible, represented on each Local Medical Committee by at least one assistant.

Maternity Medical Services

(Para. 147 of Report)

77. **Motion** by the Chairman of the General Medical Services Committee: That paragraph 147 of the Report of the General Medical Services Committee be approved.

78. **Motion** by MIDDLESEX: That this Conference instructs the General Medical Services Committee to review the whole question of the Maternity Medical Service with particular reference to the relation of fees to the work done.

Sale of Goodwill

(Paras. 155-67 of Report)

79. **Motion** by the Chairman of the General Medical Services Committee: That the Conference of Local Medical Committees, representing National Health Service practitioners throughout the country, having considered the memorandum prepared by the Amending Acts Committee and the comments of the General Medical Services Committee and the Compensation and Superannuation Committee upon it, is not in favour of the optional return of the right to buy and sell goodwill of practices, which it believes to be impracticable.

80. **Amendment** by NORFOLK: That, in view of the damage done to the tone and keenness of general medical services, and the increasing difficulties of entering and changing practices caused by the loss of goodwill, the so-called impracticability of its retention should be overcome for the sake of a certain gain in the efficiency of the Health Service.

81. **Amendment** by SURREY: That the following words be added to the Recommendation contained in Paragraph 167 of the Report of the G.M.S. Committee dealing with goodwill: "but desires the subject to be reviewed from time to time."

Co-operation between Hospital, Local Authority, and General-practitioner Services

(Paras. 174-7 and 179 of Report)

82. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 174 to 177 and 179 of the Report of the General Medical Services Committee be approved.

83. **Motion** by HERTFORDSHIRE: That this Conference, believing that the preservation of the status of general practice is of supreme importance, to this end instructs the General Medical Services Committee more vigorously to pursue the full implementation of its policy in respect of: (1) General-practitioner hospital beds. (2) Direct access to special investigations. (3) Association of general practitioners with hospital administration.

Notification of Discharge from Hospital

(Paras. 183 and 184 of Report)

84. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 183 and 184 of the Report of the General Medical Services Committee be approved.

85. **Motion** by DERBYSHIRE: That a standard size and form of hospital report sheet be adopted by all Regional Hospital Boards to fit the standard medical record envelope.

86. **Motion** by CITY OF WORCESTER: That hospitals be requested to issue reports, letters, etc., to general practitioners regarding patients on paper of a standard size which can be inserted into the medical card (Form E.C.5 and E.C.6) without folding.

Vaccination and Immunization

(Paras. 187 and 188 of Report)

87. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 187 and 188 of the Report of the General Medical Services Committee be approved.

88. **Motion** by BRISTOL: That this Conference deplores the apparent breach of the vaccination arrangements by some local authorities in that they have notified general practitioners that they will no longer pay for reports on successful vaccination of certain adults.

Civil Defence

(Para. 213-14 of Report)

89. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 213-14 of the Report of the General Medical Services Committee be approved.

90. **Amendment** by CITY OF WORCESTER: That the stand-by duties which are to be expected from general practitioners at static first aid posts while there is no local emergency are unacceptable and are uneconomic to the general medical necessities of the community and to the acute civilian sick.

Propriety of Disclosing Clinical Details to Local Medical Committees or Executive Councils

(Paras. 215 and 216 of Report)

91. **Motion** by the Chairman of the General Medical Services Committee: That paragraphs 215 and 216 of the Report of the General Medical Services Committee be approved.

92. **Motion** by DEVON AND EXETER: That the words "or Chairman" be inserted immediately following the words "Medical Secretary" where they occur in paragraph 216 of the Report.

Remainder of Report of General Medical Services Committee

93. **Motion** by the Chairman of the General Medical Services Committee: That the remainder of the Report of the General Medical Services Committee be approved.

MATTERS NOT REFERRED TO IN THE ANNUAL REPORT**Classification of Areas**

94. **Motion** by WOLVERHAMPTON: That as the Medical Practices Committee has no statutory right to ask for particulars of any medical work a doctor "on the list" performs outside his general medical service duties, this Conference objects to any such inquiry.

Nursing Service

95. **Motion** by IPSWICH: That, as some of the work at present done by fully trained district nurses could be done by assistant nurses, the General Medical Services Committee be instructed to explore the possibility of employing assistant nurses to alleviate the present shortage of home nursing facilities.

Income Tax

96. **Motion** by READING: That the General Medical Services Committee be instructed to explore the possibilities of general practitioners who opt to do so paying their income tax assessments on the basis of P.A.Y.E.

Bulk Prescribing

97. **Motion** by EASTBOURNE: That bulk prescribing of other than *National Formulary* prescriptions should be permitted in schools and other similar institutions.

Compensation

98. **Motion** by NEWCASTLE-UPON-TYNE: That the General Medical Services Committee press for repayment of compensation at an early date.

THE DEFENCE TRUSTS

99. **Motion** by the Chairman of the Trustees: That the Report of the Trustees of the National Insurance Defence Trust and G.M.S. Defence Trust, as to action taken since the last report to the Conference (paragraph 224 of Report), be received and approved.

100. **Motion** by the Chairman of the Trustees: That the report of contributions received from Local Medical Committees up to April 10, 1953 (Doc. M.7), be received and approved.

CHAIRMAN OF CONFERENCE

101. **Elect:** Chairman of Conference for Session 1953-4 (see *Standing Order 14—Nominations to be handed in not later than 11 a.m. on the day of the Conference*).

CONFERENCE AGENDA COMMITTEE

102. **Elect:** Three members of the Conference Agenda Committee (see *Standing Order 17—Nominations to be handed in not later than 1 p.m. on the day of the Conference*).

ELECTION OF SIX MEMBERS OF GENERAL MEDICAL SERVICES COMMITTEE

103. **Elect:** Six members of the General Medical Services Committee (see *Standing Order 15—Nominations to be handed in not later than 1 p.m. on the day of the Conference*).

THE CLAIRE WAND FUND

104. **Receive:** Report by the Chairman of Conference on the progress of the Claire Wand Fund.

THE DAIN FUND

105. **Receive:** Annual Report of the Trustees of the Dain Fund.

DINNER COMMITTEE

106. **Motion** by the Chairman: That five members of the Conference be appointed the Dinner Committee under *Standing Order 18*.

GENERAL MEDICAL SERVICES COMMITTEE**ELECTION OF DIRECT REPRESENTATIVES, 1953-4**

The following direct representatives upon the General Medical Services Committee have been elected unopposed for the Groups mentioned:

Group A1

Dr. W. Neil Darling (Edinburgh).

Group A2

Dr. C. J. Swanson (Aberfeldy, Perthshire).

Group A3

Dr. J. R. Langmuir (Glasgow).

Group A4

Dr. R. C. Hamilton (Kilmarnock).

Group C

Dr. H. F. Hollis (Leeds).

Dr. H. Thorp (Todmorden).

Group D

Dr. A. Campbell (Accrington).

Dr. F. S. Catto (Manchester).

Dr. P. J. Gibbons (Liverpool).

Group E

Dr. Miles Parkes (Crewe).

Group F

Dr. T. J. Hargest (Clydach, Swansea).

Dr. G. P. Williams (Holyhead).

Group H

Dr. A. B. Davies (Walsall).

Group I

Dr. F. A. Smoritt (Southam, Warwick).

Group J

Dr. C. F. R. Killick (Williton, Somerset).

Group K

Dr. R. W. McConnel (Aylesbury, Bucks).

Group L

Dr. J. D. R. Murray (Exmouth).

Group M

Dr. K. S. Maurice-Smith (Ely).

Group N

Dr. H. S. Howie Wood (Shanklin, Isle of Wight).

Group O

Dr. D. F. Whitaker (Guildford).

Group P

Dr. A. W. Gardner (Lewes, Sussex).

Group Q

Dr. A. T. Rogers (Bromley, Kent).

Group R

Dr. D. F. Hutchinson (Middlesex).

Dr. A. N. Mathias (London, N.W.2).

Group S

Dr. C. M. Scott (New Barnet).

Dr. J. L. McK. Brown (London, E.18).

Group T

Dr. H. H. D. Sutherland (London, W.10).

Dr. M. Sorsby (London, E.5).

Group U

Dr. J. B. Young (Belfast).

In the contested Groups—namely, B and G—the results were as follows:

Group BDr. D. T. MacDonald (Belford). *Elected.*Dr. F. Lishman (Bishop Auckland). *Elected.*

Dr. F. J. Stevenson (Carlisle).

Group GDr. E. W. Goodwin (Leicester). *Elected.*Dr. A. S. Wilson (Gosberton, Lincolnshire). *Elected.*

Dr. A. D. Stoker (Winstar, Derbyshire).

Dr. D. F. Menzies (Skegness).

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

without delay so that the stones comprising the base may be inscribed before they are placed in position.

The following have already been considered by the War Memorial Committee:

"They died that others might be healed."
"Greater love hath no man than this . . ."
"They died in the service of others."
"There need be no war were all lives so dedicated."
"They fought with Death. Themselves they could not save."
"They chose rather to suffer the utmost than to win life by weakness." (From Pericles' funeral oration.)
"My sword I give to him that shall succeed me, . . . my courage and skill to him that can get it." (Bunyan, *Pilgrim's Progress*.)
"Courage, Loyalty, Skill, Selflessness, Faithfulness, Duty."
"Peace to their ashes, honour to their memory, long may the cause of freedom shine."

Anyone wishing to make suggestions should communicate with me at B.M.A. House, Tavistock Square, W.C.1.—I am, etc.,

H. GUY DAIN,
Chairman,
War Memorial Committee.

POINTS FROM LETTERS

Temporary Residents

Dr. J. D. CONDON (Blackburn) writes: I entirely agree with Dr. John Griffiths (*Supplement*, May 23, p. 247) that it was quite absurd to pay 15s. for the hundreds of cases that only required a single consultation, each for some trivial complaint, and that the new rate of 5s. is a just and fair one. . . . It is in holiday camps and such establishments that one mainly gets these single trivial consultations, as those who are really ill are sent either to hospital or back to their own homes, whichever is deemed best in the patient's own interests. The local medical committee is, no doubt, fully aware of this and in my opinion has dealt with the matter in a fair and just manner.

B.M.A. LIBRARY

The following books have been added to the Library:

CARDIFF AND ITS ENVIRONS

BY
ROBERT D. OWEN, F.R.C.S.

The last Annual Meeting of the British Medical Association held in Cardiff was in 1928, under the presidency of Sir Ewen Maclean; the first was in 1885. It is fitting that this year's annual meeting should be held in Wales, as the Association is celebrating the jubilee of the representative meeting. The first was held in Swansea on July 28, 1903, and, as all members know, the occasion marked a revolution in the history of the B.M.A. It is a pity that Swansea found it difficult to extend an invitation this summer, the sole reason being the impossibility of acquiring the necessary hotel accommodation. Swansea suffered severely from air raids during the war, and many hotels were destroyed.

The 1928 meeting in Cardiff was a great success. Hospitality was offered freely. The great houses that sprang up in the nineteenth century—the hall-mark of prosperity that oozed out of the coalfields and Cardiff docks—are no longer available to extend a welcome, yet warm hearts continue to beat in Cardiff.

Early Cardiff

The origin of Cardiff, like that of most mediaeval towns, is wrapped in obscurity. There is no doubt about the ruins of a Roman fortress on the left bank of the River Taff. This is the site on which Cardiff Castle has been built. It was, however, in Norman times that the name Caer-dyf first came into the light of day, when the Norman Robert Fitzhamon seized Glamorgan in 1081. He made Cardiff the caput or head of his lordship, and in 1106 it was referred to as a borough.

The Welsh name for Cardiff as used in Wales is Caerdydd. Early Welsh writers always used Caer Dyf, but Welsh scholars are agreed that the ending "dydd" is due to sounds like "dd" and "f" being confused as the result of everyday use. The modern name of Cardiff is really a hybrid of Welsh and Scandinavian elements, and simply means "the fort mound." The imposing proportions of this mound or keep are to be seen to this day within the Cardiff Castle grounds. This powerful stone keep was raised about 1081 when the Normans came to Glamorgan and entered into occupation of the ruined Roman defences and then remodelled them to meet their own requirements.

The Development of Cardiff

The centuries passed, and even in 1801 the population of Cardiff was under two thousand. Then came the industrial development of South Wales, with the city showing an abnormally rapid growth. By 1940 the population had reached a quarter of a million, with two million within a radius of 30 miles.

The eighteenth century saw a large-scale immigration which was to change the face of the county of Glamorgan. It began by arrivals from the English midlands to exploit the mineral wealth of the surrounding hills and valleys. The discovery of the previous century that iron ore could be smelted by mineral fuel gave an impetus to the iron industry. Works were established along the northern boundary of the county, such as at Merthyr Tydfil, where coal and ironstone and carboniferous limestone were abundant. The iron trade became for a time the important industry of the district. The iron was at first carried down on the backs of mules to be shipped from the mouth of the Taff, and later the Glamorgan Canal was constructed to replace this primitive form of transport. With the increased demand for coal for steam-raising purposes,

The B.M.A. in Committee

ORGANIZATION FOR CONSULTANTS

The two autonomous bodies within the ambit of the Association are the General Medical Services Committee and the Central Consultants and Specialists Committee. The latter is empowered to consider and act upon all matters affecting those engaged in consultant and specialist and hospital practice, including terms and conditions under Part II of the National Health Service Acts.

This is a very large committee, larger even than the Council. It is inevitably large because of the requirement to make it representative not only territorially but professionally. Rather more than half the members are representative of regions, but nearly one-quarter are on the Committee because they are engaged in a particular branch of specialist work or type of practice. No representative body can be exactly adjusted to its constituency, but it is difficult to think of a more completely balanced representation, including every type of experience and viewpoint, than the constitution of the Central Consultants and Specialists Committee.

Representative Membership

The largest group in its membership consists of two members from each of the 16 Regional Consultant and Specialist Committees in England, Wales, and Northern Ireland, to which are added up to 10 appointed by the Central Consultants and Specialists Committee (Scotland). Then four members are elected by the Representative Body, two by English and Welsh representatives, one by Scottish, and one by Northern Irish. Two others are appointed by the Council.

The registrars, too, have their representation—two members, who are full members of the Committee, and contribute very usefully to its discussions. Certain of the other standing committees of the Association are represented, occupying five seats, and each of the 13 Group Committees is assigned one seat. These Group Committees represent distinctive professional interests which, either because of paucity of numbers or their local distribution, could not depend upon adequate representation through the normal machinery. The Group Committees are the following:

Anaesthetists, consulting pathologists, dermatologists, ophthalmologists, orthopaedists, otolaryngologists, practitioners of physical medicine, practitioners of psychological medicine, radiologists, spa practitioners, those engaged predominantly in the field of tuberculosis and diseases of the chest, and venereologists.

Finally, the membership is reinforced by four *ex-officio* members—namely, the chief officers of the Association—and there is a limited power of co-optation.

For many years a Hospitals Committee of the Association worked out a hospitals policy. Later there was a Special Practice Committee. These have been replaced by this large body which takes all hospital medical service as its province. It was formed on the coming into force of the National Health Service Acts, and its first meeting was held towards the end of 1948. It arose out of the necessity that hospital staffs should have their views represented to the Ministry and other authorities and should have a planned policy of national extent. In each region Consultants and Specialists Committees were set up, their members being elected from the hospitals and hospital groups in the region, and from each of these regional bodies two representatives, usually one on the teaching and the other on the non-teaching side, go to the Central Committee.

This is a standing committee of the Association, and its chairman is *ex officio* a member of the Council; but its membership is not limited to the B.M.A., and in its own field it is autonomous. In practice this arrangement has so far worked without difficulty, as it has also done in the field of general medical services.

Relation with Joint Consultants Committee

A matter which gave rise to some questioning at first, even in the Committee itself, was the apparent subordination of this body, representing consultants as a whole, to what is known as the Joint Consultants Committee, comprising representatives of the Royal Colleges and Scottish Royal Corporations as well as the B.M.A. members. Six members of the Central Consultants and Specialists Committee are on the Joint Committee, with 11 representatives of the Colleges and Corporations. The Joint Committee represents hospital medical staffs in discussions with the Ministry of Health and also appoints the staff side of Committee "B" of the Medical Whitley Council. It is the only official negotiating body in the hospital medical service.

The success of the Joint Committee has been due in no small measure to the able chairmanship, in the early years, of Sir Lionel Whitby and, more recently, of Sir Russell Brain, P.R.C.P., the present chairman. Experience has shown that there is never any serious conflict of opinion between the B.M.A. representatives and the others. It is not a question of counting numbers as if it were a lobby of the House of Commons. Here there is neither left nor right, or, if there is, the demarcation does not follow the lines of representation. The whole committee works harmoniously as a team, working out policy, negotiating at the highest level, and dealing with matters in the Service as they arise. But should a conflict arise—an unlikely event—any of the bodies represented on the Joint Committee is entitled to have its views represented to the Government.

The consultants' organization within the B.M.A. owed much during the transitional period to Mr. A. M. A. Moore, the present Treasurer of the Association, who was the "mid-wife" at the birth of the Committee, and to Mr. R. L. Newell, of Manchester, during the early period of its existence. It is now led by Dr. T. Rowland Hill, whose quiet mastery of its huge agenda and complicated business is always a pleasure to watch. The meetings generally last from midday until early evening, and the documentary assimilation preparatory to each of them is no mean task for the conscientious member.

It is not the purpose of this article to recite the achievements of the Committee during the first five years of its existence. These are recorded in the reports of its meetings, the successive Annual Reports of Council, and the debates in the Representative Body. It has already much good work to its credit, and will achieve much more, with its unrivalled opportunity for focusing consultant opinion and making it effective through the Joint Consultants Committee and in other ways.

Is Specialist Necessary?

Perhaps the one drawback to the Committee is its cumbersome name. One wonders whether the word "specialists" need be retained in its title. After all, a consultant may or may not specialize, but a specialist is surely one to be consulted on matters within his specialty, and thus the word "consultants" might stand for both. "Consultant" is a word of tradition and dignity, well understood and accepted in medicine.

The B.M.A. has sometimes been regarded as a body of general practitioners, with a few consultants thrown in as a make-weight. A glance at the Association's history would dispel any such notion. From the very beginning, in the days of the Provincial Medical and Surgical Association, it represented, in the provinces at least, all physicians and surgeons, who were as much consultants as any in London. In all its 120 years it has enlisted distinguished consultants on its Council and in its chief offices. Some of them, like Victor Horsley for example, have had marked influence on Association affairs. Bishop Harman guided the Hospitals Committee for many years. Through the Central Consultants and Specialists Committee the Association is enabled to do for consultants what it endeavours to do for every other branch in a profession united under its leadership.

Reference will be made in a future article to the organization for consultants in Scotland.

THE WINCHESTER ADDRESS

DR. DAIN SPEAKS

The Winchester Address was given this year by Dr. H. Guy Dain. Dr. Ronald Gibson, chairman of the Winchester Division of the B.M.A., presided over an invited audience which included lay people. The subject of the address was "John Citizen and his doctor—where do we go from here?"

Development of General Medical Services

Tracing the development of provided medical services, Dr. Dain called attention to the acceptance by the medical profession of the insurance method of payment from the early days of clubs and friendly societies to the capitation fee method of to-day. At the inauguration of the National Health Insurance Service in 1911 the profession's experiences with friendly societies and the development of local authority clinics led to the establishment of insurance committees to which doctors taking part in the service were elected by doctors. For a person employed in a public service to take a full part in its administration established a precedent, said Dr. Dain. This position had been further improved in the executive councils of the National Health Service, where the professional members outnumbered the lay. The executive councils, like the insurance committees before them, took their professional advice from the members actually doing the work and not from a paid whole-time officer of the council. In Dr. Dain's view a great measure of the success of these bodies could be attributed to this factor.

Birth of Specialization

In a little more than half a century the hospital service had evolved from a position in which all the members of a teaching hospital staff were general practitioners as well as physicians and surgeons. Then the G.P. began to disappear from the hospital, the places being occupied by physicians and surgeons. With the great increase in specialization the general surgeon and physician were now being eliminated by the fragmentation going on into what the speaker called "the modern 'ology' and 'ologist'." In the public health field similar specialization had taken place. The G.P. medical officer of health was almost gone in favour of the whole-time medical officer of health.

All this, Dr. Dain observed, had meant progress in every department of medicine, but it had given rise to a major problem to-day. Fifty years or so ago all medical practitioners were "doctors." Gradually they had been separated into groups with different problems and interests.

Different Administrations

When the N.H.S. proposals came forward it was hoped that the groups would be brought together in one service, but in fact the groups were made more isolated by setting up three services all differently administered.

The State ownership of all hospitals, with direction from above and the appointment to various administrative bodies by the Minister, practically took away the local interest which had been the great factor in the hospital service. After five years' experience numbers of attempts were being made to co-ordinate the three services without great success but with much multiplication of committees.

Suggested Reform

Coming to the point "Where do we go from here?" Dr. Dain held the view that the first and most important step would be to make the administrative area of all three services the same, possibly a revised local authority area, where a real health administration could be set up. The hospital service of this area could be administered by a body constituted and elected similarly to the present executive council, which would continue to administer the G.P. service. If the hospitals were administered by locally

elected people many economies would be effected. Regional hospital boards could continue with a supervising function, and with the distribution of centrally provided moneys.

The Position of the B.M.A.

When the N.H.S. was reorganized as a single service the important position of the British Medical Association as the mouthpiece of the profession would be enhanced, said Dr. Dain. It was the only body able to speak for the whole profession, with all its groups and differing interests, and it seemed to him that the Association must give some thought to bringing the problems of each section to the consideration of the rest. Each group must learn to consider its own difficulties in relation to those who practise in a different way, and be prepared to act as an association of doctors. Fifty years ago the B.M.A. did this easily. To-day the subdivisions of medicine are making it more difficult, but a unified service working with, and advised by, a strong B.M.A. should, Dr. Dain thought, be able to ensure that John Citizen had the best health service in the world.

GENERAL MEDICAL COUNCIL

THE PUBLIC HEALTH DIPLOMA

The Council had before it the annual returns of examinations for the certificate and the diploma in public health and a summary of information from licensing bodies concerning the extent to which persons who have obtained a certificate proceed to a diploma. The President remarked that a number of licensing bodies held no examinations last year. Except at University College, Dublin, it appeared that in general those who had taken the certificate did go on to take the diploma.

Professor WALTER SCHLAPP said that discussions with his colleagues had suggested to him that the rules for the examinations were not fulfilling the purpose for which they had been drawn up. He wondered whether the division into certificate and diploma courses was in the best educational interest. The rules were somewhat too precise in the way they laid down methods of teaching.

Sir ANDREW DAVIDSON reminded the Council that the D.P.H. rules came into force in 1944. They followed upon the Goodenough report and upon a report of the Society of Medical Officers of Health, which was of great value to the committee drafting the rules. He was anxious to know whether the certificate was fulfilling the intentions of its advocates. It seemed that the certificate was no better than the old Part I of the D.P.H. rules. The medical officer of health had been caught up in the changes which had taken place since the introduction of the National Health Service, and was anxious to find out what functions he was to undertake in the future. A case could be made out for another revision of the rules. The setting up of a committee for the purpose might seem at the moment a little premature; on the other hand it might act as a stimulus towards bringing the rules into line with present-day trends.

Professor F. M. R. PICKEN agreed that the case for setting up a committee was a strong one. He himself had been teaching for the D.P.H. for many years, but had never been satisfied with any of the numerous courses prescribed by the Council. The course was a mixture of incompatibles. A number of people were taking the course who would never need it statutorily. That, indeed, was one of the reasons why the certificate was introduced, and in Wales there were always far more C.P.H. than D.P.H. students. In Wales it was made clear to an intending student that if he would not need the diploma statutorily it would be better if he took something else—the Diploma in Child Health or in Obstetrics, for example.

After some further discussion the President said that the Council was charged with the supervision of the diploma and must carry out its duty. In view of the difficulties, a change in the law was unlikely. The course in public health

varied considerably in different universities, and in some could hardly be considered to exist.

The Council agreed to set up a special committee on the lines indicated by Sir Andrew Davidson, the committee to consist of Dr. Clark, Dr. Morley, Professor Picken, Professor Schlapp, Mr. Ireland, Dr. Tulloch, Dr. Boyd, Dr. Biggart, and Sir Andrew Davidson, with power to co-opt and to consult any other members or bodies.

Provisional Registration

The Council considered a report from its special committee on provisional and full registration. This included a letter from the British Medical Association which raised the question of what appeal there was in the case of an individual who during or at the end of his period of service did not get a certificate of satisfactory service from the authority with which he had been working. The PRESIDENT said that this was a matter for the licensing bodies rather than for the Council. The letter had been circulated to the deans, and a number of them were not sure how to answer it. It would be difficult to go behind an unsatisfactory certificate and impossible to hold anything like a legal inquiry.

Dr. BIGGART suggested that, although dissatisfaction might be expressed by an authority, if the dissatisfaction was not such as to have led the authority to dispense with the services of the individual the licensing body might disregard an "unsatisfactory" certificate. The PRESIDENT replied that that would be a matter for the licensing body.

A revised form of certificate of satisfactory service, bearing the name of a member of the consultant or specialist staff under whom the individual had worked, was approved by the Council, which authorized the President to sign the necessary order.

Reciprocal registration arrangements with the Province of Alberta under sect. 1 (b) of the Medical Act, 1950, were approved.

Election of Medical Disciplinary Committee

The Council re-elected the Medical Disciplinary Committee with the same personnel for a further year. It consists of 16 members, with the President of the Council as Chairman.

MEDICAL DISCIPLINARY COMMITTEE

Directions to Erase

The Committee on May 21 considered the case of Charles Kingsley Colwill, registered as of Aldenham Road, Bushey, Herts, who appeared on the charge that he had committed adultery with Violet Elizabeth Alabaster, a married woman, of which adultery he had been found guilty by the decree of the Divorce Court dated April 4, 1952, and made absolute on June 3, 1952, in the case of Alabaster v. Alabaster and Colwill, in which he was the co-respondent, and that he had stood in professional relationship with the said Mrs. Alabaster at all material times.

Dr. Colwill was present, and admitted the charge, which the Committee found proved. In a letter he stated that at the time he had been suffering from financial and domestic strain. He threw himself on the mercy of the Committee, and asked that judgment be postponed rather than that the penalty of erasure should be imposed.

The Committee directed the Registrar to erase the name of Charles Kingsley Colwill.

The next case was that of Nicholas Lupkovics, registered as of Higher Compton, Plymouth, M.D. U.Chile, 1938, who was summoned on the charge of having been convicted at Bow Street on November 19, 1952, of unlawfully making an untrue statement to procure a passport. He was also charged with having committed adultery with a married woman, of which adultery he had been found guilty by decree of the Divorce Court, November 26, 1952, in the case of Paterson v. Paterson and Lupkovics, and that he had stood in professional relationship to the woman in question.

Dr. Lupkovics did not appear, and it was stated that he could not be traced and was believed to be abroad.

Evidence was given by Mr. Paterson, who said that his wife had consulted Dr. Lupkovics about her asthma, and subsequently told him (the husband) that she was leaving him.

In this case also the Registrar was directed to erase the name.

The decisions in both these cases leave it open to the respondents to appeal to the Privy Council within 28 days.

In the case of John Howard Crawford, registered as of Wimborne Road, Bournemouth, against whom at a previous session certain irregularities regarding forms for temporary residents under the N.H.S. had been found proved, the Committee, after consideration of testimonials now produced, decided not to instruct the Registrar to erase the name, and closed the case.

ANNUAL MEETING

IRISH GRADUATES' LUNCHEON

The Irish Graduates' Luncheon will be held on Wednesday, July 15, at 12.30 for 1 p.m. at the Royal Hotel, Cardiff, at a cost of 10s. per person (excluding wine). This luncheon is open to all Irish graduates and their ladies attending the Annual Meeting, and those intending to be present are asked to notify in advance the Honorary Secretary, Irish Graduates' Luncheon, B.M.A. House, 195, Newport Road, Cardiff, or to give in their names at the Registration Office, Sophia Gardens Pavilion, Cardiff, on arrival at the meeting. No tickets will be issued, and payment will be made at the Royal Hotel.

PUBLIC HEALTH AWARD

SALARY INCREASES FOR A.M.O.s

Assistant medical officers or medical officers in departments have their salary scales increased by an award of the Industrial Court. It takes effect from June 1. (See annotation in *Journal* at p. 1323.) The award is as follows:

(a) The salary scale of assistant medical officers or medical officers in departments shall be £950 by £50 to £1,300.

(b) Paragraph 13c of Award No. 2321 shall apply as before, the scale for assistant medical officers being adjusted to £950 by £50 to £1,300.*

(c) The new scale shall be applied to the present holders of such appointments, assimilation being at the point on the new scale corresponding with the medical officer's position on the old scale. A medical officer now at the maximum (£1,150) of the old scale shall be placed at the sixth point (£1,250) of the new scale and shall thereafter proceed to the new maximum (£1,300).

(d) The operation of the new scale shall not in any circumstances result in reducing the salary of any medical officer in post.

The following Table compares old and new salaries:

	Minimum £	Increments £	Maximum £
Under earlier award	850	50 (6)	1,150
Claimed by Staff Side	1,000	50 (8)	1,400
Offered by Management Side	875	50 (3)+45 (1)	1,150
Under new award	950	+40 (2) 50 (5)	1,300

*Paragraph 13c reads: Medical officers, being assistant medical officers or divisional or area medical officers under a county council, acting as district medical officers of health (either for single or combined districts) for a definite proportion of their time shall receive as regards the salary relating to county council work the appropriate proportion (calculated in accordance with the Spens formula in respect of the consultants) of their salary as assistant medical officers, divisional or area medical officers, as the case may be, plus the appropriate proportion of the salary fixed for county district medical officers of health under Award No. 2285, and a similar proportion of £100.

LIAISON BETWEEN CONSULTANTS AND GENERAL PRACTITIONERS

The Consultants and General Practitioners Committee is a liaison committee between the Central Consultants and Specialists and General Medical Services Committees, and it met on May 27 under the chairmanship of Dr. A. TALBOT ROGERS to consider problems common to the two parent committees.

The main topics discussed were the junior staffing of hospitals and entry into general practice. Representatives of the Registrars Group attended, and with their lively appreciation of the young doctor's difficulties they brought a fresh and realistic approach to the problem.

In the old days a young doctor was well aware that not only were a few years spent in hospital posts of great benefit to him clinically in whatever sphere of medicine he intended to practise, but that they often helped him to find a good opening in general practice, particularly one which he might combine with a medical or surgical appointment on the staff of the local hospital. Things are different now. Competition for the higher hospital appointment is extremely keen and "wastage" is high, while the doctor who continues in hospital after his house appointments finds that he has been left behind in the race for general-practice vacancies. Moreover, he is beginning to doubt whether the extra years in hospital are of any advantage if he seeks employment outside the hospital service. The difficulties in recruiting junior hospital staff and entry into general practice are therefore closely related, and it is more than likely that the failure so far to implement the Consultants Spens Report (following the Danckwerts award) is increasing the hospital staffing problem. This was discussed by the Liaison Committee, and suggestions were made for integrating the general-practitioner and hospital services to a far greater degree.

The Committee also discussed the domiciliary consultation arrangements, out-patient appointment forms, and other matters of interest to both general practitioners and consultants.

THE SMALL-LIST PRACTITIONER

A meeting of the full Working Party has been held, and it discussed the scope, methods, and intentions of the promised inquiry into the problem of the small-list practitioner. It was agreed that the inquiry should proceed with all possible speed, and details will be published in the *Supplement* from time to time. The chairman of the G.M.S. Committee also hopes to make a statement on the inquiry when the Annual Conference of Local Medical Committees takes place on June 17.

Correspondence

The Registrar Problem

SIR,—We have been glad to note in your columns (*Supplement*, May 23, p. 243) that the Ministry of Health has now taken action in an attempt to alleviate the present senior registrar problem. We would like, however, to emphasize the point made by the Ministry that, while the new regulations may offer a breathing-space to many whose future appeared uncertain, the likelihood of any individual reaching specialist status will only be increased if the consultant service is expanded. No one can predict the probable extent of such expansion, and each doctor who now seeks to prolong his registrarship must do so with this situation in mind.

Apart from the effect on the immediate personal problems of senior registrars, the most important implication of the Ministry's action is the final rejection of the rigid

training programme imposed in 1949. Now registrars of whatever status may apply for further posts in the same grade and specialty. The duration of a specialist's training has thus come to depend, as it did in the past, upon the ability of the individual and upon the needs of his particular specialty. The flexibility of the new arrangements will benefit both the individual doctors and the hospital service, since the best of the registrars will be allowed to continue to work in their specialties until consultant posts are available for them.—We are, etc.,

R. M. FORRESTER, J. N. WALTON,
Late Chairman, Chairman,
Registrars' Group, B.M.A.

Newcastle-upon-Tyne.

The Extraordinary General Meeting

SIR,—The Extraordinary General Meeting was instructive and should be studied carefully by all who care for the freedom of medicine.

If I heard aright, the signatories made three major points: no one must be worse off as a result of the Working Party's plan than he was before; no one must be forced by economic necessity to move from his present address; and any special treatment of the small-list man is his natural right and not charity. The first two propositions mean in effect that the basic salary or its equivalent must be carried on in perpetuity. In other words, everyone with a medical qualification is automatically entitled to a living at the expense of the State (or his fellows) irrespective of the number of patients he may attract. Even if work exists elsewhere he must be free to stay where he is and draw his pay.

It would be interesting to know the philosophical—or political—basis for this astonishing claim. Nothing in the revolutionary writings of the last 150 years has approached it. A section of a particular profession is to be held aloof, unique in the sweating, toiling millions of the world, from hardship, competition, and all the material difficulties in life, and moreover demands it as a right, as a "liberty."

The whole situation was perfectly put by one of the complainants, a young man. He explained that the coming of the N.H.S. had necessitated his application for the basic salary, which had been granted. Even so, he had found it necessary to work for other doctors to make ends meet. This, we were told, was the monstrous state of affairs which must be remedied at once. It must no longer be necessary for him to do outside work. A sufficient slice of the award must be allotted to enable him to exist without doing anything in his ample spare time. We have heard of equality of opportunity. A new phrase will have to be coined for this claim. I hope these views are not widely held.

There is one way in which for a time all could be secure, and that is in a salaried service, but in that case a man would go where he was told, like a soldier. The present scheme with its loading has moved in that direction. The loading of the first 1,000 would be a step, probably decisive, in the same direction. The advocates of a salaried service are not idle. They will never admit defeat. The correspondence columns of the *Journal* are filled with their disguised propaganda. Their organization appears to be first-class. They are a menace to the profession.

Finally, the calling of the meeting itself. Readers of Mr. Bullock's book on Hitler will fully understand the technique of revolution by legality. Here was an example of it. The signatories, some of whom were not even members of the Association, called a meeting of 67,905 people in a hall capable of holding 775, by a dubious use of the rules, in an attempt to upset the policy of the Association, and then complained that the meeting had been packed against them. They were entitled to use the rules—the G.M.S. Committee evidently was not. Thank heaven the G.M.S. Committee had the courage to do it. Not often does true democracy find itself with a ready weapon against the legal revolutionaries. The rights of minorities are sacred. Dr. Grant seemed to think that they extended to the right to govern. Here then, Sir, I say that there is food for serious thought.

Nothing in this letter must be taken as meaning that the older men who find themselves in difficulties owing to the advent of the health service must be left to their fate. On the contrary they must, and, I am sure, they will, be looked after. That is only a temporary and passing problem, and has nothing to do with the deadly implications of the resolution presented to the Extraordinary General Meeting.—I am, etc.,

London, N.W.4.

R. W. COCKSHUT.

The G.P. and the Industrial Medical Officer

SIR,—My Division has had under consideration for many months the question of proper liaison between the general practitioner and the industrial medical officer. It has felt well qualified to examine this problem, as the area, covering four suburban boroughs, is densely populated and a very considerable proportion of the patients are employed in industrial undertakings of varying size and type.

A number of examples of lack of proper liaison have come to light, some of which could well have been made the subject of complaint on ethical grounds, but my executive committee takes the view that the situation is unlikely to be purely a local one or that its experience is unique. We are well aware of the good services that the industrial medical officer is providing, and fully appreciate that this work is in the interest of the patient, his employer, and the general practitioner; but at the same time we feel that a closer contact between the two branches of the profession would be beneficial to all concerned, and on occasion avoid misunderstanding and sometimes ill-feeling or embarrassment. We feel, however, that a situation has arisen which seriously endangers the integration of the two groups and is causing a developing antagonism between them. At the same time, this can interfere with continuity of treatment, confuse the patient, reduce his confidence in his medical advisers, and involve unnecessary or duplicated investigations at hospital.

It had not passed unnoticed that during the time that this matter was under examination there was a move to modify the Association's Ethical Rules for Industrial Medical Officers, approved by the Annual Representative Meeting as recently as 1949. The Stratford Division felt, therefore, that the problem warranted discussion on a high level and in general terms, and to this end a meeting has recently been held at which the Occupational Health Committee of the Council, the Association of Industrial Medical Officers, and the Division were represented. We feel this question to be an important one which warrants a full and early examination, as the situation would appear to be deteriorating since the advent of the National Health Service.

It would be interesting to know whether other areas are faced with a similar problem.—I am, etc.,

Ilford, Essex.

RONALD PETERS,
Secretary, Stratford Division.**Association Notices****ANNUAL GENERAL MEETING**

Notice is hereby given that the Annual General Meeting of the Association will be held in the City Hall, Cardiff, on Monday, July 13, 1953, at 12.30 p.m. Business: (1) Minutes of the last meeting, held on July 7, 1952. (2) Induction of President, 1953-4. (3) Balance-sheet and income and expenditure account for the year ending December 31, 1952. (4) Appointment of auditors.

A. MACRAE,
Secretary.**EXTRAORDINARY GENERAL MEETING**

Notice is hereby given that an Extraordinary General Meeting of the British Medical Association will be held in the City Hall, Cardiff, at 12.30 in the afternoon of Monday, July 13, 1953, or as soon thereafter as the Annual General

Meeting of the Association shall be terminated, when the following resolution will be proposed as a Special Resolution:

RESOLUTION

That Article 39(2) be altered in the following manner:
By the substitution of "six weeks" for "two months" in line 8, and "three weeks" for "one month" in line 9.

By order of the Council.

Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Aldershot Civil Infectious Diseases Hospital, Tuesday, June 16, 8.30 p.m., inaugural meeting of Division followed by special meeting.

DORSET DIVISION.—At Langleat House, near Warminster, Sunday, June 21, 3.30 p.m., social meeting.

LINCOLNSHIRE BRANCH.—At George Hotel, Grantham, Thursday, June 18, 12.15 for 12.45 p.m., lunch; 2 p.m., annual meeting.

NORTH MIDDLESEX DIVISION.—At Hornsey Central Hospital, Park Road, Crouch End, N., Tuesday, June 16, 8.45 p.m., meeting. Short papers.

NORTH OF ENGLAND BRANCH.—At Holy Island, Thursday, June 18, 12 noon, annual meeting.

PADDINGTON DIVISION.—At Paddington Hospital, Harrow Road, W., Wednesday, June 17, 2.30 p.m., clinical meeting in conjunction with London County Medical Society.

SUFFOLK BRANCH.—At Everard's Hotel, Bury St. Edmunds, Thursday, June 18, 12.30 p.m., annual general meeting.

SURREY BRANCH.—At The Star and Garter Home, Richmond, Wednesday, June 17, 2.30 p.m., annual meeting.

WEMBLEY DIVISION.—Thursday, June 18, 2.30 p.m., tour of Messrs. Glaxo Ltd., Greenford.

Meetings of Branches and Divisions**GLASGOW DIVISION**

A meeting was held in the Glasgow Regional Office, on April 2, 1953. With Dr. James R. Langmuir in the chair, there were 24 members present. The following officers were elected for 1953-4: Chairman.—Dr. W. D. Anderson.

Vice-chairman.—Mr. John Dunbar, Dr. J. S. McL. Ord, and Dr. Wm. Gardner.

Honorary Secretary.—Dr. J. Inglis Cameron.

Honorary Treasurer.—Dr. J. Baird Forrester.

DORSET DIVISION

A meeting was held at the Clinic, Dorchester, on April 10, 1953. There were 23 members present. Dr. Vera Walker gave a lecture on allergy in general medicine.

DRUG BILL IN GENERAL PRACTICE MINISTER'S APPEAL TO CONFERENCE

Addressing the Annual Conference of Local Medical Committees on June 17, the Minister of Health, Mr. IAN MACLEOD, said that the rising cost of the drug bill was one of the gravest and most urgent problems which confronted the National Health Service. He therefore made an urgent appeal to general practitioners to ponder on the figures and to pause to consider each time they prescribed what and how much was justified on clinical grounds. We could not afford to ask the Exchequer to go on paying an annual bill of something like £40m. for drugs prescribed by general practitioners unless they were in fact all essential for the proper treatment of patients—a point on which as a general proposition he believed medical opinion to be more than doubtful. In addition, the 1s. charge paid by patients was expected to contribute about £6½m.

Reasons for Higher Costs

Apart from the effects of the influenza in 1950-1 and 1952-3, and the fog of last December, the Minister thought there were some important reasons for the increase in the drug bill (from £31½m. in 1949-50 to an estimated figure of £46½m. in 1953-4). First there had been some increase in the total number of prescriptions dispensed (the total was still over 200 million a year). Secondly, the average cost of prescriptions had risen from 2s. 9d. in 1948-9 to an estimated 4s. 3d. in 1953-4. This was because of the introduction of useful but expensive drugs, and the rise in ingredient prices until this year (though some drugs were cheaper—for example, some of the antibiotics). In addition an increased proportion of proprietary drugs had been prescribed. (In 1952 proprietaries represented 26% of the total number of prescriptions, 52% of their total ingredient costs, and 44.5% of their total cost.)

Quoting from "Prescribers' Notes" examples of the savings that might have resulted from the use of standard preparations, the Minister mentioned a proprietary slimming preparation which, if prescribed by its standard name, would have produced a saving of about £242,000 in 1951. Then there were proprietary tablets containing as their main ingredients aspirin, phenacetin, and codeine (with some additional ingredients) which cost 6s. 3½d. for 50. The same number of tablets of their comparable standard preparation cost 2s. 11d., and their use would have meant a saving of more than 50%. Again, proprietary asthma inhalants might cost four to nearly six times as much as a standard inhalant, yet the *British Medical Journal* had reported an investigation of some of these which found little to choose between them and the standard preparation. The indications were that savings of £48,000 and £54,000 respectively might re-

sult from the use of comparable standard preparations for certain proprietary prescriptions for the treatment of peptic ulcer and heart trouble.

How Doctors Could Help

It was necessary and only fair to say that many preparations had, of course, no exact official equivalents, and that some important preparations—such as many of the antibiotics—were in fact made up only in proprietary form. But, having acknowledged this, there were many ways in which doctors could help, and the Minister felt confident that he would not appeal to them in vain. For instance, doctors could make careful use of *National Formulary* preparations. They could refer to the two tables of proprietary preparations in the *Formulary* which showed those for which an identical preparation in the *Formulary* was available and those for which there was a *Formulary* preparation substantially the same or reputed to have an analogous therapeutic effect, and they could prescribe the *Formulary* preparation in both these cases unless there was a special reason to do otherwise.

In this connexion the Minister particularly wished to emphasize that, while *Formulary* preparations might be cheaper, there was no reason on this account to regard them as being inferior. They were recommended by the experts of the medical and pharmaceutical profession (quite independently of the Ministry of Health), and the great majority of them or their ingredients conformed to standards laid down by the *British Pharmacopoeia* or the *British Pharmaceutical Codex*. These standards were generally accepted as standards of quality, purity, and potency.

Doctors could also satisfy themselves, before prescribing a proprietary preparation not included in the two *Formulary* lists, that there were adequate grounds for accepting its therapeutic value in treating the particular condition for which it was proposed to prescribe it. And they could help by resisting pressure from patients to prescribe particular preparations which they had had recommended to them or which they had seen advertised.

Other ways in which doctors could help were by refraining from prescribing unreasonably large quantities of a drug or dressing, and by not prescribing anything unless they were fully satisfied that it was required at the time for the patient's treatment.

There was nothing in these suggestions, the Minister continued, with which he believed doctors would not agree—in general. The difficulty was of course to apply the suggestions in practice. But difficult as it was, he felt sure he could rely on their help.

Guidance from Ministry

For their part the Ministry would do all they could to assist and guide doctors in these matters. A prescribing investigation unit had been established and had for three years been examining prescriptions in cases where there was reason to believe that there was extravagant prescribing. The Department's regional medical officers were ready to help with advice in these matters, and if necessary local medical committees must be brought in.

Useful advice and information was also available to general practitioners in "Prescribers' Notes," copies of which were distributed to all general practitioners on executive council lists. To assist doctors, the Ministry also proposed to issue a "price list" of *Formulary* preparations and proprietary preparations listed in the *Formulary* or occupying a high place on the basis of frequency of prescribing. Doctors should thus be made fully aware of the cost of what they were prescribing.

Finally, the recommendations of the Cohen Committee had already given a clear lead. The Committee would shortly have completed its initial classification of proprietary preparations. This would enable doctors to be told the names of preparations in the two "doubtful" categories covering drugs which were not of proved therapeutic value and ought not to be prescribed. Simultaneously the Department was proceeding in consultation with the manufacturers to investigate the production costs of selected proprietary preparations in the categories which the Cohen Committee considered prescribable subject to satisfactory price arrangements; those initially selected were naturally preparations which were frequently prescribed or at first sight seemed unduly expensive.

HELP IN STABILIZING COSTS

Dr. Rogers's Reply to Minister's Address

Dr. TALBOT ROGERS, Chairman of the General Medical Services Committee, thanked the Minister for sparing the time to address the Conference. He felt that the Minister's words would be carefully studied by every general practitioner present and through the *British Medical Journal* by general practitioners throughout the country. He said that he would not like the Minister to think that the G.M.S. Committee had been unmindful of the mounting costs of the drug bill. Indeed there had been constant discussions with the Ministry over the past few years on this subject. As long ago as 1948 his Committee had asked the Ministry to institute a system of stock order forms for general practitioners in line with the procedure which had been adopted so successfully in Scotland. It was not the Committee's fault that this scheme had not been introduced, and he was certain that this one single step would have materially reduced present costs. Again, the Committee had urged the Ministry to reintroduce the system of "area averages" whereby the prescribing costs of a doctor can be compared with the average for the area. This system had worked well under the National Health Insurance Act and he hoped that everything possible would be done to reintroduce it in the present Service.

Dr. Rogers assured the Minister that his Committee during the coming season would do all it could, in co-operation with his officers, to assist in stabilizing the cost of the pharmaceutical service, provided this was not incompatible with the essential needs of the patient.

[See leading article at p. 1380. A report of the meeting will be published next week.]

British Medical Association

ANNUAL MEETING—CARDIFF, JULY 9-17, 1953

President-Elect: J. W. TUDOR THOMAS, D.Sc., M.D., M.S., F.R.C.S.

General Secretary: JOHN D. SPILLANE, M.D., F.R.C.P.

Science Secretary: PROFESSOR GILBERT I. STRACHAN, M.D., F.R.C.P., F.R.C.S., F.R.C.O.G.

Executive Officer: G. A. PECK, B.Sc., B.M.A. House, 195, Newport Road, Cardiff.

PROGRAMME

The 121st Annual Meeting of the British Medical Association will be held in Cardiff from Thursday, July 9, to Friday, July 17, 1953, inclusive.

On the evening of Wednesday, July 8, there will be a Sherry Party for Representatives and their Ladies, arranged by the Cardiff Division.

The first part of the Meeting—the Annual Representative Meeting—will begin on Thursday, July 9, and continue on Friday, Saturday, and Monday, July 10, 11, and 13.

In view of the visit of Her Majesty the Queen to Cardiff on July 9, the Representative Meeting will be held that day in the Cory Hall, Station Terrace, with the A.R.M. Inquiry Office in the adjoining Y.M.C.A. centre. On the following day, Friday, July 10, the Annual Representative Meeting will transfer to the City Hall, where it will remain until the conclusion of the meeting on July 13.

The Representatives' Dinner and Ladies' Dinner take place on Thursday, July 9, followed by a dance.

The Overseas Luncheon is arranged for Friday, July 10. On Sunday, July 12, a visit has been arranged for Representatives and their Ladies to St. Donat's Castle, and that evening there will be a Welsh Choral Concert.

The second part of the Meeting—the Annual Meeting proper—occupies the period from the conclusion of the A.R.M. on Monday, July 13, to the evening of Friday, July 17.

The adjourned Annual General Meeting and President's Address will take place in the Park Hall Cinema on the evening of Monday, July 13, and the President's Reception which follows will be at the National Museum of Wales.

Three Plenary Scientific Sessions are arranged as follows: Tuesday morning, July 14, "Coronary Disease"; Thursday morning, July 16, "Fibrositis"; Friday afternoon, July 17, "Overweight."

Seventeen Scientific Sections have been arranged, the meetings to take place on Wednesday morning and Wednesday afternoon, July 15, and Friday morning, July 17 (details are given below).

The Official Religious Service will be held in St. John's Church, Cardiff, on the afternoon of Tuesday, July 14.

A Roman Catholic Service will be held in St. Peter's Church, Cardiff, on the morning of July 14.

The Popular Lecture will be given by Sir Russell Brain, P.R.C.P., on the evening of Friday, July 17.

There will be a Joint Reception by the University College of South Wales and Monmouthshire and the Welsh National School of Medicine on Tuesday evening, July 14, and a Civic Reception on the following evening.

The Annual Dinner of the Association will be held in the City Hall on Thursday, July 16.

Two large Garden Parties have been arranged—on Thursday, July 16, at Margam, by invitation of Mr. Evans Bevan, and on Friday, July 17, at Duffryn House, by invitation of the Board of Governors of the United Cardiff Hospitals.

The Monmouthshire Division is giving a Sherry Party on Tuesday, July 14.

An attractive social programme has been drawn up, including many functions specially arranged for the ladies accompanying members. There are also a number of visits to Welsh industrial concerns, including one to the Abbey Steel Works, Margam, the largest of its kind in the world.

JUNE 20, 1953

The South Wales Association of the Medical Women's Federation is giving a Sherry Party on July 10 for medical women visitors.

The usual golf competitions will take place, and there will also be facilities for bridge, bowls, and tennis. Various sports and social clubs have offered honorary membership to B.M.A. Members throughout the Meeting.

The Overseas Conference will be held on Wednesday afternoon, July 15, followed by an "At Home" for Overseas Delegates given by the Empire Medical Advisory Bureau. The Overseas League is giving a reception for Overseas Delegates on Tuesday afternoon, July 14.

The Christian Medical Fellowship is holding its Annual Breakfast (formerly known as the Medical Missionary Breakfast) on July 15, and the usual graduate luncheons and dinners have been arranged.

The Reception Room for registration in the Sophia Gardens Pavilion will be opened on Monday, July 13, at 9 a.m. The Ladies' Club will be situated in the University College and will be open throughout the Meeting.

The Annual Trade Exhibition of Surgical Appliances, Foods, Drugs, and Books will be housed in the Sophia Gardens Pavilion. The official opening will take place on Monday, July 13, at 9 a.m., and the Exhibition will remain open on July 14, 15, 16, and 17 from 9 a.m. to 6 p.m.

The Scientific Exhibition will also be held in the Sophia Gardens Pavilion and will be open daily from July 13 to 17. Demonstrations will be given at fixed times. There will be a showing of the three-dimensional colour film "Mediastinal Tumours," by Ethicon Suture Laboratories Ltd., on July 13, 14, 15, and 17, at 5 p.m.

HOTEL ACCOMMODATION

Hotel accommodation in and around Cardiff is now very fully booked up. Those who have difficulty in making arrangements are advised to write direct to *The Executive Officer, B.M.A. House, 195, Newport Road, Cardiff*, stating their exact requirements.

It is regretted that, owing to a wages agreement applicable to all the hotels in the Cardiff area, an increase has been made in charges for accommodation. A single room formerly 22s. 6d. for bed and breakfast is now 25s., and similar increases apply for other charges.

REGULATIONS REGARDING DRESS

Academic Dress should be worn at the President's Address, the President's Reception, the Official Religious Service, the Roman Catholic Service, the University Reception, and the Civic Reception.

Robes may be hired from Messrs. Ede and Ravenscroft, Ltd., 93, Chancery Lane, London, W.C.2, who request that the gowns be sent to the home address of the individual concerned. Early application is advised, as the supply of gowns is limited.

Evening Dress (Tails or Dinner Jacket), with Decorations, is to be worn at the President's Reception, University Reception, Civic Reception, and Annual Dinner. Evening Dress without Decorations should be worn at the Representatives' Dinner and the Representatives' Dance.

REGISTRATION FEE

Members attending the Annual Meeting (other than members of the Representative Body and overseas visitors) are required to pay a fee of one guinea towards the expenses of the Meeting. The fee will be payable when members register at the Reception Office.

TICKETS

No tickets for functions or excursions can be issued in advance.

All tickets for functions up to Sunday, July 12, will be available at the A.R.M. Inquiry Office at the Y.M.C.A. on July 9 and at the City Hall on July 10 and 11, or at the Ladies' Club, University College.

Tickets for all other functions will be available from Monday, July 13, at the Reception Office, Sophia Gardens Pavilion, or at the Ladies' Club.

BADGES

Members will not be admitted to the Plenary Sessions, Scientific Sections, or Scientific Exhibition unless wearing badges. They should therefore make a point of visiting the Reception Office, Sophia Gardens Pavilion, on the first day of their attendance at the Annual Meeting to obtain their handbook, badge, registration card, and tickets.

Officers of Scientific Sections and other office-holders should inquire for special badges at the Reception Office.

CAR-PARKING

Windscreen labels may be obtained at the Reception Offices, and members bringing their own cars are advised to use these labels to facilitate car-parking.

Only limited covered accommodation is available for cars in Cardiff, but open-air accommodation is available at Messrs. E. R. Forse & Co., Kingsway, and The Friary, Cardiff.

REPRESENTATIVES' EXCURSION

There will be an all-day excursion for Representatives and their Ladies to St. Donat's Castle on Sunday, July 12. Lunch and tea will be provided, and there will be facilities for bathing in the swimming pool in the grounds.

The inclusive price for lunch, wines, tea, and admission to the grounds is 30s., with transport by bus 4s. extra.

ABERDEEN GRADUATES' DINNER

A dinner arranged by the South Wales and West of England Branch of the Aberdeen University Graduates' Association will be held in the Royal Hotel, Cardiff, on Friday, July 10, at 7.30 p.m. Tickets will be one guinea each, excluding wine.

This dinner is open to all Aberdeen graduates and their wives attending the Annual Meeting, and those intending to be present are asked to notify the local secretary, Mrs. Scott Thomson, Glasfryn, Lower Cwrt-y-vil Road, Penarth, Glam. Tickets will be available at the A.R.M. Inquiry Office, Y.M.C.A. (opposite Queen Street Station), on July 9.

EDINBURGH GRADUATES' DINNER

The Edinburgh Graduates' Dinner will be held in the Park Hotel, Cardiff, on Friday, July 10, at 7.30 p.m. The dinner is open to all Edinburgh graduates and their ladies attending the A.R.M. or resident in the area.

Those intending to be present are asked to notify Dr. Angus Weston, Edinburgh House, Greenford, Middlesex, as soon as possible, enclosing remittances for tickets, the cost of which is 25s. each, including aperitifs.

GLASGOW GRADUATES' DINNER

The Glasgow Graduates' Dinner will be held in the Royal Hotel, Cardiff, on Saturday, July 11, at 7 for 7.30 p.m. This dinner is open to all Glasgow graduates and their ladies attending the A.R.M. or resident in the area.

Tickets, at a cost of 25s. including aperitifs, are obtainable from Dr. Robert Forbes, Tavistock House South, Tavistock Square, London, W.C.1.

IRISH GRADUATES' LUNCHEON

The Irish Graduates' Luncheon will be held on Wednesday, July 15, at 12.30 for 1 p.m. at the Royal Hotel, Cardiff, at a cost of 10s. per person (excluding wine). This luncheon is open to all Irish graduates and their ladies attending the Annual Meeting, and those intending to be present are asked to notify in advance the Honorary Secretary, Irish Graduates' Luncheon, B.M.A. House, 195, Newport Road, Cardiff, or to give in their names at the Registration Office, Sophia Gardens Pavilion, Cardiff, on arrival at the meeting. No tickets will be issued, and payment will be made at the Royal Hotel.

WELSH DINNER

A dinner open to all doctors with Welsh associations and their wives attending the Annual Meeting will be held in the New Continental Café, Cardiff, on Saturday, July 11, at 7.30 p.m. Tickets will be one guinea each, and those wishing to attend are asked to apply for tickets, with remittances, to the Hon. Secretary, Welsh Dinner, B.M.A. House, 195, Newport Road, Cardiff.

CHRISTIAN MEDICAL FELLOWSHIP ANNUAL BREAKFAST

The Annual Breakfast of the Christian Medical Fellowship (formerly known as the Medical Missionary Breakfast) will be held at the New Continental Café, Cardiff, on Wednesday, July 15, at 8.30 a.m. The chairman will be Mr. J. W. Tudor Thomas, and the speaker Dr. D. Martin Lloyd-Jones. The proceedings will terminate at 9.40 a.m. Those intending to be present are asked to notify the local secretary: Mr. A. S. Aldis, F.R.C.S., 3, Heol Don, Whitchurch, Cardiff.

SCIENTIFIC MEETING

PLENARY SESSIONS

All sessions will be held in the Reardon Smith Theatre, Park Place.

Tuesday, July 14, 10 a.m.: "Coronary Disease"

Chairman: Professor H. SCARBOROUGH (Cardiff).
Speakers: Dr. D. EVAN BEDFORD (London), Dr. WILLIAM PHILLIPS (Cardiff), Professor G. W. PICKERING (London), Dr. CLIFFORD G. PARSONS (Birmingham), Dr. A. RAE GILCHRIST (Edinburgh), Dr. JOHN H. HUNT (London).

Thursday, July 16, 10 a.m.: "Fibrositis"

Chairman: Mr. A. LAWRENCE ABEL (London).
Speakers: Dr. A. TALBOT ROGERS (Bromley), Dr. A. H. DOUTHWAITE (London), Dr. JOSEPH P. SPILLANE (Cardiff), Mr. J. S. BATCHELOR (London), Mr. LESLIE H. W. WILLIAMS (London), Dr. J. H. CYRIAX (London), Dr. G. D. KERSLEY (Bath).

Friday, July 17, 2.15 p.m.: "Overweight"

Chairman: Right Hon. LORD HORDER (London).
Speakers: Dr. J. H. SHELDON (Wolverhampton), Professor R. A. MCCANCE, F.R.S. (Cambridge), Dr. ARNOLD P. MEIKLEJOHN (Edinburgh), Dr. H. M. SINCLAIR (Oxford), Dr. LEONARD H. HOWELLS (Cardiff), Dr. EMRYS WILLIAMS (Cardiff).

SCIENTIFIC SECTIONS

All sessions will be held in University College, Cathays Park.

MEDICINE

President: Professor A. M. KENNEDY, M.D., F.R.C.P. (Cardiff).

Vice-Presidents: Professor W. MELVILLE ARNOTT, B.Sc., M.D., F.R.C.P. (Birmingham); Sir DANIEL DAVIES, K.C.V.O., M.D., F.R.C.P. (London); LEONARD H. HOWELLS, M.D., F.R.C.P. (Cardiff); and Professor W. J. E. JESSOP, M.Sc., M.D., F.R.C.P.I., D.P.H., F.R.I.C. (Dublin).

Hon. Secretaries: BYRON EVANS, M.D., M.R.C.P., 59, Cathedral Road, Cardiff; JOHN RICHARDSON, M.V.O., M.D., F.R.C.P., 33, Devonshire Place, London, W.1.

The following programme has been arranged:

Wednesday, July 15 (Room 103).—10 a.m., The Use and Abuse of Antibiotics. To be opened by Dr. R. W. FAIRBROTHER (Manchester), Dr. THOMAS ANDERSON (Glasgow), and Mr. J. S. JEFFREY (Edinburgh); followed by Dr. KENNETH S. MACLEAN (London), Dr. H. M. FOREMAN (Sully, Glam), and Dr. F. A. WHITLOCK (Truro). 2 p.m., The Early

Diagnosis of Intrathoracic New Growths. To be opened by Sir GEOFFREY MARSHALL (London), Mr. VERNON THOMPSON (London), and Dr. PETER KERLEY (London); followed by Dr. BRIAN TAYLOR (Birmingham) and Mr. DILLWYN THOMAS (Cardiff).

Official Reporter: Dr. THOMAS PARKINSON.

SURGERY

President: Professor LAMBERT C. ROGERS, V.R.D., M.Sc., M.D., F.R.C.S., F.A.C.S., F.R.A.C.S. (Cardiff).

Vice-Presidents: D. J. HARRIES, M.D., F.R.C.S. (Cardiff); J. B. HAYCRAFT, M.C., M.B., F.R.C.S. (Cardiff); D. IOAN-JONES, M.B., F.R.C.S. (Cardiff); C. JENNINGS MARSHALL, M.D., M.S., F.R.C.S. (London); A. DICKSON WRIGHT, M.S., F.R.C.S. (London).

Hon. Secretaries: STANLEY AYLETT, M.B.E., M.B., F.R.C.S., 114, Harley Street, London, W.1; D. B. E. FOSTER, M.B., F.R.C.S.Ed., Hillboro, Llandough, Penarth, Glamorgan.

The following programme has been arranged:

Wednesday, July 15 (Room 129).—10 a.m., The Treatment of Toxic Goitre. To be opened by Mr. R. V. COOKE (Bristol). The Treatment of Diseases of the Gall-bladder and Bile Ducts. To be opened by Mr. R. J. MCNEILL LOVE (London). 2 p.m., The Relief of Pain of Vascular Disease in the Lower Limb. To be opened by Sir JAMES PATERSON ROSS (London) and Mr. J. B. OLDHAM (Liverpool); followed by Mr. HAROLD DODD (London), Professor C. G. ROB (London), and Mr. S. M. COHEN (London).
Official Reporter: Mr. R. S. MURLEY.

OBSTETRICS AND GYNAECOLOGY

President: Professor G. I. STRACHAN, M.D., F.R.C.P., F.R.C.S., F.R.C.O.G. (Cardiff).

Vice-Presidents: M. D. ARWYN EVANS, M.D., F.R.C.S.Ed., F.R.C.O.G. (Cardiff); Professor H. HARVEY EVERS, M.B., M.S., F.R.C.S., F.R.C.O.G. (Newcastle-upon-Tyne); R. G. MALIPHANT, M.D., M.R.C.P., F.R.C.S., F.R.C.O.G. (Cardiff); H. K. PACEY, M.D., F.R.C.S., F.R.A.C.S., F.R.C.O.G. (Wellington, New Zealand); LESLIE H. W. WILLIAMS, M.D., M.S., F.R.C.S., F.R.C.O.G. (London).

Hon. Secretaries: J. M. BOWEN, M.B., M.R.C.O.G., 9, Edward VII Avenue, Newport, Mon; ALISTAIR L. GUNN, M.D., F.R.C.S.Ed., F.R.C.O.G., 51, Harley Street, London, W.1.

The following programme has been arranged:

Wednesday, July 15 (Room 56).—10 a.m., The Place of the Forceps in Present-day Obstetrics. To be opened by Professor T. N. A. JEFFCOATE (Liverpool); followed by Mr. GAVIN BOYD (Belfast), Mr. WILLIAM HUNTER (Newcastle-upon-Tyne), and Mr. E. PARRY JONES (St. Asaph, Flint). *Short Paper:* Professor J. C. MCCLURE BROWNE (London). Placental Circulation in Pre-eclamptic Toxaemia. 2 p.m., The Climacteric. To be opened by Mr. ALECK W. BOURNE (London); followed by Mr. T. N. MACGREGOR (Edinburgh), Professor H. C. McLAREN (Birmingham), and Mr. M. D. ARWYN EVANS (Cardiff). *Short Paper:* Dr. D. MCKAY HART (Glasgow), Dysmenorrhoea.
Official Reporter: Mr. S. BENDER.

ANAESTHETICS

President: C. LANGTON HEWER, M.B., B.S., M.R.C.P., D.A., F.F.A.R.C.S. (London).

Vice-Presidents: RONALD JARMAN, D.S.C., M.R.C.S., L.R.C.P., D.A., F.F.A.R.C.S. (London); A. HUGH MUSGROVE, M.R.C.S., L.R.C.P., D.A., F.F.A.R.C.S. (Cardiff); WILLIAM W. MUSHIN, M.A., M.B., B.S., D.A., F.F.A.R.C.S. (Cardiff).

Hon. Secretaries: J. G. BOURNE, M.B., B.Ch., D.A., 37, Marsham Court, Westminster, S.W.1; I. RHYS JONES, M.R.C.S., L.R.C.P., D.A., Cliff Cottage, Radyr, Glamorgan.

The following programme has been arranged:

Wednesday, July 15 (Room 116).—10 a.m., A Return to Simplicity? To be opened by Dr. M. D. NOSWORTHY

(London); followed by Dr. W. W. MUSHIN (Cardiff). 2 p.m., *Short Paper:* Dr. E. J. DELORME (Edinburgh), Hypothermia and Anaesthesia. The Case Against Hypotension. To be opened by Dr. M. H. ARMSTRONG DAVISON (Newcastle-upon-Tyne); followed by Dr. R. F. WOOLMER (Bristol).
Official Reporter: Dr. MARY OSTLER.

CARDIOLOGY

President: MAURICE CAMPBELL, O.B.E., D.M., F.R.C.P. (London).

Vice-Presidents: A. RAE GILCHRIST, M.D., F.R.C.P. (Edinburgh); Professor C. BRUCE PERRY, M.D., F.R.C.P. (Cardiff); WILLIAM PHILLIPS, M.D., F.R.C.P. (Cardiff).

Hon. Secretaries: SHEILA HOWARTH, M.B., B.S., Institute of Cardiology, 35, Wimpole Street, London, W.1; ARTHUR J. THOMAS, M.D., M.R.C.P., D.P.H., Tanooma, Llandough, near Penarth, Glamorgan.

The following programme has been arranged:

Wednesday, July 15 (Room 202).—2 p.m., Pulmonary Heart Disease. To be opened by Dr. A. J. THOMAS (Cardiff) and Professor JETHRO GOUGH (Cardiff); followed by Dr. WILLIAM EVANS (London) and Dr. MAURICE CAMPBELL (London). *Film Demonstration* by Dr. I. McMILLAN (London), The Action of the Aortic Valves.
Official Reporter: Dr. G. W. HAYWARD.

DISEASES OF THE CHEST

President: Sir CLEMENT PRICE THOMAS, K.C.V.O., F.R.C.S. (London).

Vice-Presidents: A. L. D'ABREU, O.B.E., M.D., Ch.M., F.R.C.S. (Birmingham); Professor FREDERICK HEAF, M.D., F.R.C.P. (Cardiff); DILLWYN M. E. THOMAS, M.R.C.S., L.R.C.P. (Sully, Glam).

Hon. Secretaries: H. R. S. HARLEY, M.S., F.R.C.S., 93, Station Road, Llanishen, Cardiff; M. MEREDITH BROWN, B.M., F.R.C.S.Ed., 17, Priory Mansions, Drayton Gardens, London S.W.10.

The following programme has been arranged:

Friday, July 17 (Room 28).—10 a.m., The Value of Artificial Pneumothorax in the Treatment of Pulmonary Tuberculosis. To be opened by Dr. HOWARD NICHOLSON (London) and Dr. C. H. C. TOUSSAINT (London); followed by Mr. R. S. BARCLAY (Newton Mearns, Renfrewshire), Dr. C. S. DARKE (Sheffield), and Dr. PETER EDWARDS (Cheshire Joint Sanatorium). *Short Papers:* Mr. O. S. TUBBS (London), Constrictive Pericarditis; Mr. R. H. FRANKLIN (London), Congenital Atresia of the Oesophagus; Dr. ARCHIE COCHRANE (Cardiff), Radiological Diagnosis of Pneumoconiosis.
Official Reporter: Dr. THOMAS PARKINSON.

CHILD HEALTH

President: Professor A. G. WATKINS, M.D., F.R.C.P. (Cardiff).

Vice-Presidents: V. MARY CROSSE, O.B.E., M.D., D.P.H., D.Obst.R.C.O.G. (Birmingham); Professor A. V. NEALE, M.D., F.R.C.P., D.P.H. (Bristol); J. N. O'REILLY, D.M., M.R.C.P. (London).

Hon. Secretaries: P. T. BRAY, M.R.C.P., D.C.H., 28, Park Place, Cardiff; I. A. B. CATHIE, M.D., M.R.C.P., Pathological Department, The Hospital for Sick Children, Great Ormond Street, London, W.C.1.

The following programme has been arranged:

Wednesday, July 15 (Room 28).—2 p.m., Care of the Newborn. To be conducted on a basis of "Any Questions?" The panel consists of Professor W. C. W. NIXON (London), Professor WILFRED GAISFORD (Manchester), Dr. E. NOEL REES (Llanelly), and Dr. DOROTHY H. ALDIS (Cardiff). Poisoning in Childhood. To be opened by Dr. D. SWINSCOW (London) and Dr. J. O. CRAIG (Edinburgh).
Official Reporter: Dr. I. A. B. CATHIE.

DERMATOLOGY

President: R. M. B. MCKENNA, M.D., F.R.C.P. (London).
Vice-Presidents: LOUIS FORMAN, M.D., F.R.C.P. (London); GEOFFREY HODGSON, M.B.E., D.M. (Cardiff); BERNARD A. THOMAS, M.D., D.P.H. (Newport, Mon).

Hon. Secretaries: A. J. ROOK, M.D., M.R.C.P., 23, Park Place, Cardiff; D. S. WILKINSON, M.D., M.R.C.P., Whitecroft, Hervines Road, Amersham, Bucks.

The following programme has been arranged:

Wednesday, July 15 (Room 121).—10 a.m., Symposium on Practical Problems in the Management of Disorders of the Skin in General Practice: Dr. LOUIS FORMAN (London), The Management of Pruritus; Professor ARTHUR W. GRACE (New York), The Differential Diagnosis and the Treatment of Ringworm of the Feet; Dr. C. H. WHITTLE (Cambridge), The Problem of Nummular Eczema; Dr. C. S. NICOL (London), Difficulties in the Interpretation of the Serological Tests for Syphilis; Dr. MARTIN BEARE (Belfast), Difficulties in the Diagnosis and Treatment of Scalp Ringworm; Dr. D. S. WILKINSON (Amersham), Management of Hypostatic Conditions of the Lower Leg; Dr. IAN SNEDDON (Sheffield), Over-treatment; Dr. GEOFFREY HODGSON (Cardiff), The Influence of Home Conditions on Skin Diseases.

In connexion with this Section a Clinical Demonstration will be held on the afternoon of Wednesday, July 15, in Cardiff Royal Infirmary. Further details will be available later.

Official Reporter: Dr. J. T. INGRAM.

NEUROLOGY

President: W. RITCHIE RUSSELL, C.B.E., M.D., F.R.C.P. (Oxford).

Vice-Presidents: Professor PHILIP C. P. CLOAKE, M.D., F.R.C.P., D.P.M. (Birmingham); T. ROWLAND HILL, M.D., F.R.C.P. (London); W. ESMOND REES, M.D., F.R.C.P. (Swansea).

Hon. Secretaries: CHARLES LANGMAID, M.B., F.R.C.S., 174, Lake Road East, Roath Park, Cardiff; C. W. M. WHITTY, D.M., M.R.C.P., Department of Neurology, The Radcliffe Infirmary, Oxford.

The following programme has been arranged:

Friday, July 17 (Room 56).—10 a.m., Short Papers: Dr. HONOR SMITH (Oxford), Diagnosis and Treatment of Meningitis; Dr. A. B. KINNIER WILSON (Oxford), Dangers of Bulbar Poliomyelitis; Mr. RICHARD JOHNSON (Manchester), Surgical Treatment of Intracranial Haemorrhage; Mr. MURRAY FALCONER (London), New Trends in the Diagnosis of Spastic Paraplegia.
Official Reporter: Dr. C. W. M. WHITTY.

OCCUPATIONAL HEALTH

President: J. A. L. VAUGHAN JONES, M.B., Ch.B. (Leeds).

Vice-Presidents: Professor R. C. BROWNE, M.A., D.M., M.R.C.P. (Newcastle-upon-Tyne); ANDREW MEIKLEJOHN, M.D., M.R.C.P., F.R.F.P.S. (Glasgow); J. M. ROGAN, M.D., F.R.C.P.Ed., D.P.H. (London); J. S. SPICKETT, M.R.C.S., L.R.C.P. (Bridgend, Glam).

Hon. Secretaries: J. G. BILLINGTON, M.R.C.S., L.R.C.P., 7, Westfield Hall, Hagley Road, Edgbaston, Birmingham, 16; H. L. COULTHARD, M.D., M.R.C.P., D.P.H., 149, Heathwood Road, Cardiff.

The following programme has been arranged:

Friday, July 17 (Room 116).—10 a.m., Symposium on Work and Age. Speakers: Dr. N. T. WELFORD (Cambridge), Dr. W. P. D. LOGAN (London), Dr. D. D. REID (London), and Dr. I. M. RICHARDSON (Aberdeen). *Film:* (London), and Dr. I. M. RICHARDSON (Aberdeen). *Film:* Date of Birth. *Occasional Papers:* Dr. J. GWYNNE MORGAN (Clydach), (1) Carcinoma of the Lung Associated with Certain Industries; (2) Method of Demonstrating Porphyrin in the Urine of Lead Workers.

Official Reporter: Dr. ANDREW MEIKLEJOHN.

OPHTHALMOLOGY

President: J. H. DOGGART, M.D., F.R.C.S. (London).
Vice-Presidents: RUPERT J. PARRY, M.B., F.R.C.S.Ed. (Cardiff); ROY THOMAS, M.B., F.R.C.S.Ed., D.O.M.S. (Swansea); EUGENE WOLFF, M.B., F.R.C.S. (London).

Hon. Secretaries: BERNARD GLUCK, M.Ch., F.R.C.S.Ed., D.O.M.S., 76, Cathedral Road, Cardiff; A. J. B. GOLDSMITH, M.B., F.R.C.S., 63, Harley Street, London, W.1.

The following programme has been arranged:

Friday, July 17 (Room 103).—10 a.m., The Ocular Complications of Diabetes. To be opened by Mr. G. I. SCOTT (Edinburgh) and Dr. LEONARD HOWELLS (Cardiff); followed by Mr. A. B. NUTT (Sheffield). The Scope of Corneal Graft Surgery. To be opened by Mr. W. B. RYCROFT (London) and Mr. E. C. ZORAB (Southampton); followed by Mr. J. AYOUB (London) and Mr. A. G. LEIGH (London).

Official Reporter: Mr. A. J. B. GOLDSMITH.

ORTHOPAEDICS

President: A. O. PARKER, M.D., C.M., M.C.P.S., F.R.C.S. (Monmouth).

Vice-Presidents: IAN LAWSON DICK, M.D., Ch.M., F.R.C.S.Ed. (Edinburgh); A. M. HENDRY, M.B., F.R.C.S.Ed. (Birmingham); D. N. ROCYN-JONES, M.D., F.R.C.S.Ed. (Cardiff).

Hon. Secretaries: J. M. P. CLARK, M.B.E., M.B., F.R.C.S., 29, Park Square, Leeds, 1; DILLWYN EVANS, M.B., F.R.C.S.Ed., 25, Cathedral Road, Cardiff.

The following programme has been arranged:

Friday, July 17 (Room 127).—10 a.m., The Injured Hand. To be opened by Mr. WILLIAM GISSANE (Birmingham), Major Injuries of the Hand; Mr. R. J. FURLONG (London), The Cut Tendon; Mr. EMLYN LEWIS (Cardiff), Major Skin Loss and the Vascular Effect of Crush Injuries of the Hand; Mr. L. W. PLEWES (Luton), The Rehabilitation of the Hand; followed by Mr. R. G. PULVERTAFT (Derby), Mr. A. L. EYRE-BROOK (Bristol), Mr. F. C. DURBIN (Exeter), and Mr. MERVYN EVANS (Swansea).

Official Reporter: Mr. W. D. COLTART.

OTO-RHINO-LARYNGOLOGY

President: R. D. OWEN, F.R.C.S. (Cardiff).
Vice-Presidents: C. GILL-CAREY, F.R.C.S. (London); R. R. SIMPSON, M.B., F.R.C.S.Ed. (Hull); HECTOR A. THOMAS, M.B., F.R.C.S.Ed. (Cardiff).

Hon. Secretaries: ALUN BEYNON THOMAS, M.B., F.R.C.S., D.L.O., 23, Park Place, Cardiff; JOAN WADGE, M.B., F.R.C.S., 15, Devonshire Place, London W.1.

The following programme has been arranged:

Friday, July 17 (Room 121).—10 a.m., The Management of Otitis Media. To be opened by Mr. I. SIMSON HALL (Edinburgh); followed by Mr. J. I. MUNRO BLACK (Newcastle-upon-Tyne) and Mr. GEOFFREY H. BATEMAN (London). The Diagnosis and Treatment of Upper Respiratory Tract Infection in Allergic Children. To be opened by Mr. ANGELL JAMES (Bristol); followed by Dr. T. A. BRAND (Newport, Mon) and Dr. J. PEPYS (London).

Official Reporter: Mr. N. A. JORY.

PATHOLOGY

President: Professor J. B. DUGUID, M.D. (Newcastle-upon-Tyne).

Vice-Presidents: E. N. ALLOTT, D.M., F.R.C.P. (Beckenham); Professor J. GOUGH, M.D. (Cardiff); Professor R. A. Q. O'MEARA, D.Sc., M.D., D.P.H., F.R.C.P.I., F.T.C.D. (Dublin).

Hon. Secretaries: J. H. O. EARLE, M.D., 12, Hillside, Wimbledon, London, S.W.19; SCOTT THOMSON, M.D.,

M.R.C.P.Ed., D.P.H., Public Health Laboratory Service, Institute of Pathology, Third Floor, Royal Infirmary, Cardiff. The following programme has been arranged:

Wednesday, July 15 (Room 127).—10 a.m., Gastro-enteritis in Babies. To be opened by Professor ROBERT CRUKSHANK (London); followed by Dr. M. T. PARKER (Manchester), Dr. K. B. ROGERS (Birmingham), Dr. JOAN TAYLOR (London), Dr. JOHN SMITH (Aberdeen), and Dr. A. T. RODEN (Salisbury).

Official Reporter: Dr. JOYCE WRIGHT.

PREVENTIVE MEDICINE

President: J. GREENWOOD WILSON, M.D., F.R.C.P., D.P.H. (Cardiff).

Vice-Presidents: A. R. CULLEY, M.D., D.P.H. (Cardiff); Professor I. G. DAVIES, M.D., M.R.C.P., D.P.H. (Leeds); Professor T. FERGUSON, D.Sc., M.D., F.R.C.P.Ed., F.R.F.P.S., D.P.H. (Glasgow).

Hon. Secretaries: R. T. BEVAN, M.B., Ch.B., D.P.H., West Winds, 14, Rhiwbina Hill, Rhiwbina, Cardiff; J. A. STIRLING, D.Sc., M.B., Ch.B., D.P.H., Public Health Department, Town Hall, Chesterfield.

The following programme has been arranged:

Wednesday, July 15 (Room 122).—10 a.m., The Health Visitor and the Family Doctor. To be opened by Dr. LLYWELYN ROBERTS (Sheffield), Dr. STANLEY THOMAS (London), and Dr. D. A. WILLIAMS (Cardiff). 2 p.m., Cancer and the Community. To be opened by Dr. PERCY STOCKS (Rhos-on-Sea) and Mr. RONALD W. RAVEN (London); followed by Dr. E. K. MACDONALD (Leicester).

Official Reporter: Dr. J. F. WARIN.

PSYCHIATRY

President: T. J. HENNELLY, M.D., D.P.M. (Cardiff).

Vice-Presidents: Professor D. R. MACCALMAN, M.D., M.R.C.P.Ed. (Leeds); DORIS M. ODLUM, M.A., M.R.C.S., L.R.C.P., D.P.M. (London); HENRY V. DICKS, M.A., M.D., F.R.C.P. (London).

Hon. Secretaries: KENNETH SODDY, M.D., D.P.M., World Federation for Mental Health, 19, Manchester Street, London, W.1; JOSEPH P. SPILLANE, M.D., D.P.M., Whitchurch Hospital, Cardiff, Glam.

The following programme has been arranged:

Wednesday, July 15 (Room 110).—2 p.m., Interpersonal Relationships and Stresses within the Family. To be opened by Dr. H. V. DICKS (London) and Dr. W. S. MACDONALD (Leeds).

Official Reporter: Dr. KENNETH SODDY.

RADIOLOGY

President: PETER KERLEY, C.V.O., C.B.E., M.D., F.R.C.P., D.M.R.E., F.F.R. (London).

Vice-Presidents: J. A. C. FLEMING, M.B., F.R.C.S.Ed., D.M.R.E., F.F.R. (London); ERNEST HANSON, M.B., B.S., D.M.R. (Cardiff); E. ROHAN WILLIAMS, M.D., F.R.C.P., D.M.R.E., F.F.R. (London).

Hon. Secretaries: MARGARET D. SNELLING, M.B., M.R.C.P., F.R.C.S., D.M.R., Meyerstein Institute of Radiotherapy, The Middlesex Hospital, London, W.1; BRYAN WILLIAMS, M.R.C.P., D.M.R.D., 119, Cathedral Road, Cardiff.

The following programme has been arranged:

Wednesday, July 15 (Room 28).—10 a.m., Radiology of Congenital Heart Disease. To be opened by Dr. ROBERT STEINER (London), Angiocardiography in the Non-cyanotic Congenital Heart Diseases; Dr. THOMAS H. HILLS (London), Angiocardiography in the Cyanotic Congenital Heart Diseases.

Official Reporter: Dr. BRYAN WILLIAMS.

SCIENTIFIC EXHIBITION

Sophia Gardens Pavilion, July 13-17, 1953

The Exhibition will be open each day from 9 a.m. to 6 p.m., and the following list gives brief details of the exhibits.

Stand No.

- 1.—Welsh National School of Medicine, Department of Pathology and Bacteriology. Professor J. Gough and Mr. J. E. Wentworth. A new method of mounting permanent sections of whole organs on paper. This is of particular value in pulmonary conditions, as comparison is possible of the pathological changes with the radiological findings present during life.
- 2.—Medical Research Council Pneumoconiosis Research Unit, Llandough Hospital, Cardiff. Dr. J. C. Gilson. Coal workers' pneumoconiosis.
- 3.—National Coal Board. Outline of the Board's medical research programme.
- 4.—Leeds University Medical School and General Infirmary. Departments of Bacteriology and Dermatology. Dr. C. J. La Touche. The role of domestic and farm animals in the epidemiology of human ringworm.
- 5.—St. David's Hospital, Cardiff, Departments of Obstetrics and Child Health. Professor A. G. Watkins. A breast-milk bank.
- 6.—Cardiff Royal Infirmary, Departments of Surgery and Radiology. Mr. L. P. Thomas, Mr. R. J. Williams, and Dr. Bryan Williams. Abdominal radiography in the differential diagnosis of atypical appendicitis.
- 7.—Section of Preventive Medicine, Cardiff City Health Department. Dr. J. Greenwood Wilson. Care and Aftercare: hospital follow-up through health visitors.
- 8.—Welsh National School of Medicine, Department of Tuberculosis, Professor F. Heat; and the City of Cardiff Public Health Department. Dr. J. Greenwood Wilson. Medical Officer of Health. Tuberculosis: prevention, treatment, aftercare, results.
- 9.—University of Wales Student Health Service. Dr. Graham Grant, Senior Health Officer. Student health.
- 10.—University of Durham, Nuffield Department of Industrial Health, Professor R. C. Browne and Dr. R. I. MacCallum. (1) Acid Decalcification of Human Teeth. (2) Designing the machine to fit the man. (3) Miners' nystagmus.
- 11.—Liverpool School of Tropical Medicine, Department of Tropical Medicine. Professor B. G. Macgregor. Liver circulation—pathogenesis of hepatic centrilobular lesions in malaria and other diseases. Respiration of the malaria parasite. The effect of milk diet on malaria.
- 12.—Royal Army Medical College, Millbank. Methods of prevention, diagnosis, and treatment of the enteric group of fevers in the Army.
- 13.—Medical Department of the Navy—Royal Naval Physiological Laboratory. Under-water blast. Oxygen poisoning. Diving problems.
- 14.—Medical Branch of the Royal Air Force. Aviation medicine and applied physiology. Exposure suits; rations for extreme cold. Casualty air evacuation.
- 15.—National Association for the Prevention of Tuberculosis. Statistics, treatment, and pathology of tuberculosis.
- 16.—Welsh National School of Medicine, Medical Unit, and Department of Radiology, United Cardiff Hospitals. Early radiological diagnosis in haematemesis and melaena.
- 17.—United Cardiff Hospitals, Department of Urology. Mr. D. G. Morris and Mr. R. A. Mogg. Significance of congenital abnormalities in infection of the urinary tract.
- 18.—The Medical Group of the Royal Photographic Society. genital abnormalities in infection of the urinary tract.
- 19.—The Medical Group of the Royal Photographic Society. London. Medical illustration techniques and examples of records obtainable.
- 20.—Guy's Hospital, London, Department of Surgery. Mr. Rex hydrocephalus.
- 21.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 22.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 23.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 24.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 25.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 26.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 27.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 28.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 29.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 30.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 31.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.
- 32.—The Welsh National School of Medicine, Surgical Unit, material, and museum specimens.

- 23.—Royal Cancer Hospital, London. Mr. Lawrence Abel, Dr. J. H. O. Earle, Mr. W. P. Greening, and Mr. Michael Harmer. The early diagnosis of malignant disease.
- 24.—The Ministry of Health and Public Health Laboratory Service. Dr. W. H. Bradley, Dr. W. C. Cockburn, Dr. A. P. Goffe, Dr. F. O. MacCallum, and Dr. D. Thomson. Poliomyelitis in England and Wales.
- 25.—The Empire Rheumatism Council, London. Common types of arthritis and their treatment.
- 26.—United Cardiff Hospitals, Department of Physical Medicine. Dr. Kenneth Lloyd. Rehabilitation of the Hemiplegic.
- 27.—St. Thomas's Hospital, London. Department of Physical Medicine. Dr. P. Bauwens. Electrodiagnosis.
- 28.—United Cardiff Hospitals. Dr. John D. Spillane. Heart models. A series of life-size coloured models illustrating the common congenital and acquired forms of heart disease.
- 29.—The National Maternity Hospital, Dublin. Dr. A. P. Barry. Accidental antepartum haemorrhage.
- 30.—Royal College of Surgeons of England. Professor Kenelm H. Digby. Methods of investigating the function of the sub-epithelial lymphatic glands.
- 31.—Hospital for Sick Children, Great Ormond Street, London. Mr. Denis Browne. Various forms of apparatus for orthopaedic treatment by controlled movement.
- 32.—Rooksdown House, Basingstoke. Plastic and Oral Surgery Unit. Mr. A. J. Evans and Mr. H. C. Killely. (1) Treatment of severe burns. (2) Treatment of fractures of the facial skeleton.

Pharmaceutical Society of Great Britain

Exhibition in Entrance Hall of University College, Cathays Park: "Aspects of Pharmaceutical History in Relation to Medicine." July 15-17.

TIME-TABLE OF MEETINGS

R.—Events available for members of Representative Body and Ladies accompanying them.
L.—Events primarily arranged for Ladies.
U.—Events for all Members and Ladies accompanying them.
*Academic Robes should be worn.

Wednesday, July 8

8.30 to 10.30 p.m.—R. Sherry Party (by invitation of Cardiff Division), University College, Cathays Park.

Thursday, July 9

9.00 a.m.—A.R.M. Inquiry Office opens at Y.M.C.A. (opposite Queen Street Station).
9.00 a.m.—Ladies' Club opens, University College, Cathays Park.
9.30 a.m.—Annual Representative Meeting, Cory Hall (opposite Queen Street Station).
1.30 p.m.—L. "At Home," with Bridge, at Ladies' Club, University College.
7.30 p.m.—R. Representatives' Dinner, New Continental Café, Queen Street. Ticket 20s., including wines, but including Dance.
8.00 p.m.—L. Representatives' Ladies' Dinner, Whitehall Rooms, Park Hotel. Ticket 25s., including wines.
9.30 p.m.—R. Representatives' Dance, New Continental Café, Queen Street. Ticket 5s. 6d., including buffet (for all ladies and for Representatives not attending their Dinner).

Friday, July 10

9.00 a.m.—A.R.M. Inquiry Office open, Marble Hall, City Hall.
9.30 a.m.—Ladies' Club open, University College.
9.30 a.m.—Annual Representative Meeting, Assembly Rooms, City Hall.
9.30 a.m.—L. All-day excursion to the Wye Valley. Coffee at Usk, lunch at Symonds Yat, tea at Tintern. Transport ticket 7s. (for 40).
10.30 a.m.—L. Visit to the Dingle, Cefn On, with coffee by kind invitation of Mrs. A. G. Watkins (for 30). Transport 1s. 9d.
11.00 a.m.—Welcome by Lord Mayor of Cardiff to A.R.M.
1.00 p.m.—Overseas Luncheon, Angel Hotel.
1.00 p.m.—Luncheon by Mr. R. G. M. Street (for 30) (by invitation only).
2.30 p.m.—L. Visit to Caerphilly and Castell Coch. Tea by invitation of Mrs. D. G. Williams. Transport 2s. 6d. (for 30).

- 5.30 p.m.—Sherry Party for Women Representatives and medical women accompanying Representatives, B.M.A. House, 195, Newport Road (by invitation of the South Wales Association of the Medical Women's Federation).
- 7.30 p.m.—Edinburgh Graduates' Dinner, Park Hotel. Ticket 25s., including aperitifs.
- 7.30 p.m.—Aberdeen Graduates' Dinner, Royal Hotel. Ticket 21s., excluding wines.
- 8.30 p.m.—Evening visit to Porthkerry House, by kind invitation of Mrs. M. V. Roberts (for 40). Transport 2s. 6d.
- 8.30 p.m.—R. Dinner-Dance at St. Mellon's County Club for 150. Coaches call at Park, Royal, and Angel Hotels, leaving at 8 p.m. and returning at midnight. Ticket 16s., including transport.
- p.m.—Short evening coach tours to be arranged, if required.

Saturday, July 11

- 9.00 a.m.—Council Meeting, Council Chamber, City Hall.
- 9.00 a.m.—A.R.M. Inquiry Office open, City Hall.
- 9.30 a.m.—Ladies' Club open, University College.
- 10.00 a.m.—Annual Representative Meeting, City Hall.
- 10.30 a.m.—L. Visit to St. Fagan's Castle, with coffee (for 80). Ticket, including transport and coffee, 2s. 6d.
- 2.30 p.m.—L. Visit to Coedardhyglyn, with tea by kind invitation of Mrs. C. G. Traherne (for 35). Transport 1s. 6d.
- 2.30 p.m.—L. Visit to the Manor House, St. Nicholas, with tea by kind invitation of Mrs. John Davies (for 35). Transport 1s. 6d.
- 7.30 p.m.—Welsh Dinner, New Continental Café. Ticket 21s., excluding wines.
- 7.30 p.m.—Glasgow Graduates' Dinner, Royal Hotel. Ticket 25s., including aperitifs.
- 7.30 p.m.—R. Evening visit to Seabank Hotel, Porthcawl. (Dinner-Dance for 30). Ticket, including transport, 20s.

Sunday, July 12

- 10.30 a.m.—R. All-day excursion to St. Donat's Castle, with lunch and tea. Coaches leave University College from 10.30 to 11 a.m., returning 5.15 to 5.45 p.m. Short religious service in Castle grounds at 12.15 p.m. Ticket 30s., inclusive of lunch, wine, tea, and admission to Castle grounds. (Transport 4s. extra.)
- 8.30 p.m.—R. Welsh Choral Concert, New Theatre, Park Place.

Monday, July 13

- 9.00 a.m.—A.R.M. Inquiry Office open, City Hall.
- 9.00 a.m.—Opening of Scientific and Trade Exhibitions by President-Elect, Sophia Gardens Pavilion.
- 9.00 a.m.—Reception Room opens at Sophia Gardens Pavilion for registration.
- 9.30 a.m.—Ladies' Club open, University College.
- 10.00 a.m.—Annual Representative Meeting, City Hall.
- 10.00 a.m.—L. All-day excursion to Brecon. Coffee at Treforest Estate. Lunch at Brecon and tea at Llantrissant. Transport ticket 7s. (for 40).
- 10.30 a.m.—L. Visit to Caerleon. Transport ticket 2s. 6d. (for 40).
- 12.30 p.m.—Annual General Meeting, City Hall, followed by an Extraordinary General Meeting.
- p.m.—Council Meeting, Council Chamber, City Hall (at conclusion of A.R.M.).
- 2.00 p.m.—L. Golf at Radyr Golf Club (by kind invitation of Mrs. D. G. Williams—Ladies' captain).
- 2.00 p.m.—L. Visit to Crickhowell, with tea by kind invitation of Lady Glanusk (for 30). Transport 6s.
- 2.15 p.m.—U. Visit to Guest, Keen, and Nettlefolds Steelworks (for 30-40). Transport ticket 2s.
- 2.15 p.m.—U. Visit to Guest, Keen, and Baldwins Steelworks (for 30-40). Transport ticket 2s.
- 5.00 p.m.—Three-dimensional Colour Film "Mediastinal Tumours," at the Reardon Smith Theatre, Park Place.
- 8.15 p.m.—U*. Adjourned Annual General Meeting and President's Address, Park Hall Cinema.
- 9.30 p.m.—U*. President's Reception, National Museum of Wales, Cathays Park (for 1,250).

Tuesday, July 14

- 8.30 a.m.—Members will robe in the Mansion House for Roman Catholic Service.
- 9.00 a.m.—U*. Roman Catholic Service in St. Peter's Church, followed by Reception at Mansion House.

- 9.00 a.m.—Reception Room and Trade Exhibition open, Sophia Gardens Pavilion.
- 9.00 a.m.—Scientific Exhibition open, Sophia Gardens Pavilion.
- 9.30 a.m.—Ladies' Club open, University College.
- 10.00 a.m. to 12.30 p.m.—Scientific Plenary Session ("Coronary Disease") at the Reardon Smith Theatre, Park Place.
- 10.30 a.m.—L. Visit to Coedardhyglyn, with coffee by kind invitation of Mrs. C. G. Traherne (for 35). Transport 1s. 6d.
- 10.30 a.m.—L. Mannequin Parade, St. Mellon's County Club (for 200). Coffee by invitation of Mrs. J. Lewis Walters. Transport 2s. 6d.
- 12.45 p.m.—Luncheon, Park Hotel. Sir Robert Webber (by invitation only) (for 120).
- 2.30 p.m.—Robing for Religious Service, City Hall.
- 2.45 p.m.—Procession leaves City Hall for St. John's Church.
- 3.15 p.m.—U*. Official Religious Service, St. John's Church.

- 5.30 to 7.00 p.m.—Monmouthshire Division Sherry Party, St. Mellon's County Club (by invitation only).
- 6.00 p.m.—Cocktail Party, Sir Herbert Merrett, Cwrt-yr-ala, Dinas Powis (for 35).
- 8.30 p.m.—U*. Joint Reception by University College of South Wales and Monmouthshire and Welsh National School of Medicine, University College, Cathays Park (for 1,000).

Wednesday, July 15

- 8.30 a.m.—U. Annual Breakfast of the Christian Medical Fellowship, New Continental Café.
- 9.00 a.m.—Reception Room and Trade Exhibition open, Sophia Gardens Pavilion.
- 9.00 a.m.—Scientific Exhibition open, Sophia Gardens Pavilion.
- 9.30 a.m.—Ladies' Club open, University College.
- 10.00 a.m.—Scientific Sections, University College.
- 10.00 a.m.—L. Notts Ladies Challenge Cup Golf Competition, Barry Golf Club (The Leys).
- 10.00 a.m.—U. Leinster and Childe Cup Golf Competition, Southerndown Golf Club.
- 10.30 a.m.—L. Visit to Nash Manor, with coffee by invitation of Mrs. Charles Llewellyn (for 30). Transport 3s.
- 10.30 a.m.—L. Visit to Duffryn Gardens, St. Nicholas, with coffee (for 60). Inclusive ticket 2s. 6d.
- 10.30 a.m.—Mannequin Parade, St. Mellon's County Club, for 200. Transport 2s. 6d.
- 1.00 p.m.—Irish Graduates' Luncheon, Royal Hotel. Ticket 10s., excluding wines.
- 2.00 p.m.—Scientific Sections, University College.
- 2.00 p.m.—U. Visit to the Abbey Steelworks, Margam (limited to 90). Transport ticket 5s. 6d. (Admission by coach only.)
- 2.15 p.m.—Visit to N.C.B. Nantgarw Colliery (for 20 men). Transport ticket 2s. 6d.
- 2.15 p.m.—U. Visit to N.C.B. Coke Ovens, Nantgarw (for 30). Transport ticket 2s. 6d.
- 2.30 p.m.—Overseas Conference, Council Chamber, City Hall. (for 40). Inclusive ticket 6s.
- 2.30 p.m.—L. Visit to Southerndown, with tea at Quaintways.
- 5.00 p.m.—"At Home" for Overseas Delegates given by the Empire Medical Advisory Bureau, Cardiff Castle.
- 5.00 p.m.—Three-dimensional Colour Film "Mediastinal Tumours," Reardon Smith Theatre.
- 8.30 p.m.—U*. Civic Reception and Dance, City Hall (for 1,000).

Thursday, July 16

- 9.00 a.m.—Reception Room and Trade Exhibition open, Sophia Gardens Pavilion.
- 9.00 a.m.—Scientific Exhibition open, Sophia Gardens Pavilion.
- 9.30 a.m.—Ladies' Club open, University College.
- 10.00 a.m. to 12.30 p.m.—Scientific Plenary Session ("Fibrositis") at the Reardon Smith Theatre.
- 10.00 a.m.—Treasurers' Cup Golf Competition, Royal Porthcawl Golf Club (transport leaves University College 9 a.m.).
- 10.30 a.m.—L. Conducted Tours—Cardiff Castle and Museum.
- 10.30 a.m.—L. Visit to Peterston, by kind invitation of Elizabeth Lady Reardon Smith. Coffee (for 30). Transport 2s. 6d.

- 10.30 a.m.—L. Conducted Tour of Llandaff Cathedral, with coffee, by invitation of Mrs. F. Campbell (for 30). Transport 1s. 9d.
- 12.00 noon to 2.00 p.m.—Visit to Brains Brewery, including lunch (for 30). Men only. (By invitation only.)
- 2.15 p.m.—U. Garden Party at Margam (by kind invitation of Mr. and Mrs. Evans Bevan) (for 750). Transport 4s. 6d.
- 6.30 p.m.—U. Coach Tour to Tintern, with dinner at Beaufort Arms (for 30). Ticket 15s., including dinner and transport.
- 7.30 p.m.—Annual Dinner, Assembly Room, City Hall (for 500). Ticket £2 5s., including wines.
- 8.30 p.m.—U. Dance at St. Mellon's County Club (for 150). Coaches leave University College, Cathays Park, at 8 p.m., calling at Park, Royal, and Angel Hotels, and returning at 12 midnight. Ticket, including dinner, dance, and transport, 16s.

Friday, July 17

- 9.00 a.m.—Reception Room and Trade Exhibition open, Sophia Gardens Pavilion.
- 9.00 a.m.—Scientific Exhibition open, Sophia Gardens Pavilion.
- 9.30 a.m.—Ladies' Club open, University College.
- 10.00 a.m.—Scientific Sections, University College.
- 10.30 a.m.—L. Visit to St. Fagan's Castle. Transport 1s. 6d. (for 30).
- 10.30 a.m.—L. Visit to Barry, with coffee at Llantwit Major (for 40). Inclusive ticket 4s.
- 2.15 to 4 p.m.—Scientific Plenary Session ("Overweight") at the Reardon Smith Theatre.
- 3.15 p.m.—Congregation of University to award Honorary Degrees, City Hall.
- 4.00 p.m.—U. Garden Party at Duffryn House (by kind invitation of the Board of Governors of the United Cardiff Hospitals) (for 500). Transport 2s. Leaving at 6 p.m.
- 5.00 p.m.—Three-dimensional Colour Film "Mediastinal Tumours," at Reardon Smith Lecture Theatre.
- 8.15 p.m.—U. Popular Lecture by Sir Russell Brain, P.R.C.P., at Reardon Smith Theatre. "Dr. Johnson as Scientist and Patient."
- 9.00 p.m. to 2 a.m.—U. B.M.A. Summer Ball, in aid of the Ladies' Guild of the Royal Medical Benevolent Fund, Cardiff Castle. Ticket 20s., including buffet.

The B.M.A. in Committee

PUBLIC HEALTH

Many have supposed that the British Medical Association is devoted almost entirely to the interests of the private practitioner. A study of the history of the Association from the very beginning, even before any medical officer of health was appointed in this country, would dispose of that notion. It would show what an astonishing amount of constructive work the Association has done in the field of public health. Many of the developments which have been embodied in legislation during the last hundred years have been no time initiative. This is not to say that there has been no time lag between the original proposals put forward by the Association and the acceptance of them by the Government and the legislature. In all its work, in fact, the Association has been in advance of public opinion, and its proposals have received the sanction of legislation usually only after the lapse of years. But it can be said that all the general public health measures which have been put forward since the charter of public health administration, the Public Health Act of 1875, owe something, and often a great deal, to the constructive criticism of the Association, based as it has been upon a considered public health policy.

Thus the Association quite early—in the middle of the last century—was occupied with the problem of the notification of infectious diseases. It joined with the Poor Law Reform Medical Officers Association in promoting the reform of the Poor Law—a co-operation which existed for about half a century. From the early 'seventies onwards it

interested itself in the qualifications and conditions of service of public health medical officers. The gradual improvement in the powers and status of such officers and in their consequent usefulness to the public was a matter of careful consideration from the very first, and it was through the Association that minimum scales of salaries came to be established and generally accepted. The movement for the registration of midwives was largely promoted by the Association. A great contribution was made towards the present organization for the care of maternity, infancy, and childhood. It was the Association, for example, which secured effective action leading to the elimination of ophthalmia neonatorum. It devoted itself to the problem of the supply of qualified midwives and the elimination of the shadows of domiciliary midwifery. In the early part of this century the Act which prohibited unqualified practice owed most of its amendments—which were its principal good points—to the intervention of the Association, and the Association exerted a similar influence on the subsequent Acts which eventually resulted in the existing system of maternity and infant welfare clinics.

Even more remarkable was the work of the Association in the development of the school medical service. Forty years ago it presented to the Government of the day a complete scheme for school clinics in the metropolitan area. It ensured that the officers employed in this service were suitably qualified for their work and had adequate status and remuneration, and with every expansion of the service it kept closely in touch. The Association insisted from the very beginning that the local education authority should not establish a general domiciliary scheme of treatment by medical practitioners for children or young persons, but should consider how far it could avail itself of the services of private medical practitioners.

Many of the achievements of the Association in the public health field have been brought about as a result of the reports of special committees set up by the Council for a specific purpose, or have emerged as a result of representations from the Section of Public Health and State Medicine at Annual Meetings. Public health matters for many years were the sphere of the Parliamentary Bills Committee of the Association, and afterwards of the old Medico-Political Committee, which took all proposed legislation as its province.

The Public Health Committee, which is now a standing committee, has a more continuous and specific reference. Its duty is to consider and report upon questions relating to the Public Health Service. It deals with the problems, however local and individual, of those engaged in that service, and does its best to ensure that their remuneration and conditions are in line with those of practitioners engaged in other branches of the National Health Service. With the Society of Medical Officers of Health it has for many years worked in closest co-operation. The object of that society is to promote the advancement of preventive medicine and efficient health administration. By a long-standing agreement medico-political activities in this field are undertaken by the Association, and the agreement has worked extremely well.

The Committee consists, in addition to the Association's principal officers, of the two members of Council who are elected by the Public Health Service members of the Association, five others elected by the Council itself, five elected by the Representative Body, two nominated by the Society of Medical Officers of Health, one appointed by the Private Practice Committee, and another by the Central Consultants and Specialists Committee. In addition, the Committee itself has power to co-opt three members "to secure representation of a particular class of experience not otherwise represented on the Committee." The Committee sends representatives to the Central Consultants and Specialists Committee, the Private Practice, and the Occupational Health Committees, and to complete the liaison with the General Medical Services Committee is nominated by the Public Health Committee and the Society to represent the Public

Health Service interests. A further link is the nomination by the Council of the Association of two members who sit on the Council of the Society of Medical Officers of Health.

The result is a committee which, although relatively small as compared with the two others representing those working in the National Health Service (for it comprises not more than 23 members, including those who are members *ex officio*), nevertheless covers the field very thoroughly. It is able to bring to bear upon the many matters submitted to it the experience of men engaged all the time in the public health services in their various functions and grades, and also that of those who touch the services at various points from outside. It includes the whole-time and the part-time officer, the officer whose work is mainly clinical and he whose work is mainly administrative, and the general practitioner whose association with the public health services is sessional or occasional. All types of experience are pooled in an excellent working arrangement.

Like other committees of the Association, it has been very fortunate in securing a succession of able chairmen, who have brought to their task the experience and judgment which they are daily accustomed to exercise in their own important authorities. In the most recent years the Committee has had the great advantage of the leadership of H. K. Cowan, the present Chairman, and C. Metcalfe Brown, of Manchester, and preceding them, James Fenton, of Kensington, and R. M. F. Picken, of Cardiff. The recollections of some of us go back to earlier chairmen, such as that able Welshman E. Lewys-Lloyd. Many distinguished public health officers have given their services to the Committee—E. H. T. Nash, of Heston and Isleworth; G. Clark Trotter, of Islington; George Buchan, of Willesden; E. H. Snell, of Coventry; W. G. Willoughby, of Eastbourne, the last-named the only public health medical officer to be President of the Association, to name only a few. Many others not themselves associated with public health work have contributed their point of view.

It is not the purpose of these articles to record the achievements of committees, but only their set-up and functions. The achievements can be read in successive annual reports of Council. But mention may be made of the part which the Committee and particularly its two Chairmen, Dr. K. Cowan and Dr. Metcalfe Brown, have taken in recent years in the leadership of the Staff Side of Committee "C" of the Medical Whitley Council, the reference to arbitration of the disputes concerning remuneration and conditions of service of medical practitioners employed by local authorities, and the proceedings in 1950 and 1951 before the Industrial Court. The awards were accepted by Committee "C," and local authorities were recommended to put them into operation. Then came the long and patient task of ensuring that the local authorities implemented the awards, and now this has been done, leaving only a very small residuum of cases. The awards were disappointing in some respects, but they have meant that many medical officers of health have received a long overdue increase of salary. In recent weeks a further dispute regarding the remuneration of Assistant Medical Officers has been before the Industrial Court, and its ruling was published in our last issue.

The prompt action of the Committee and particularly the part played by its present Chairman, as Chairman of the Joint Emergency Committee of the Professions, in what has come to be known as the Durham "closed shop" is within everyone's recollection. The question of dual appointments—both under local authorities and hospital authorities—is another matter which has lately received much consideration. The securing of harmonious relations between the school medical service and general practitioners has exercised the Committee, which has called conferences with that objective in view. Various questions in connexion with the notification of infectious diseases and with propaganda for vaccination and immunization have come for-

ward. The position with regard to equality of status and salary for medical men and women in the Public Health Service is now fully accepted, but it should be remembered that it is a result of the direct action of this Committee of the Association that this battle, which lasted for many years, can now be considered won for all time. The Committee has plenty of work to do even though the National Health Service has shorn local authorities of certain of their health functions. It should be remembered, however, that the same Act has added other duties, particularly in the fields of welfare, care, and aftercare.

Scottish News

CENTRAL CONSULTANTS COMMITTEE

The Central Consultants and Specialists Committee (Scotland) met on May 11 at B.M.A. House, Edinburgh, under the chairmanship of Dr. J. G. M. HAMILTON.

In connexion with the Finance Subcommittee's report it was intimated that about 70% of the consultants and specialists in Scotland were now contributing to the Central Committee's fund. Owing to this satisfactory response it had been possible to extend the use of the fund considerably from its original purpose, which had been to defray the travelling expenses of members attending meetings of Regional Consultants and Specialists Committees. Modest subsistence allowances were added where appropriate, and the fund now covers the following: Regional Committee travelling and subsistence; Regional Committee office costs (stationery, postage, etc.); travelling and subsistence expenses of members attending meetings of the Central Committee and its subcommittees; and a substantial proportion of the central office costs, including stationery, postage, and printing of the annual report.

The present annual income was between £800 and £900, and the fund had a balance of over £1,500. The Committee unanimously approved a recommendation of the Finance Subcommittee that the fund should be maintained on its present basis and be the medium for contribution to any United Kingdom fund which might be instituted. It was also agreed that those not now contributing should be invited to do so, including whole-time members of university staffs who, holding honorary appointments with regional boards, could not make use of the method of mandatory deduction from regional hospital board remuneration.

Review of S.H.M.O.s

The Committee gave further consideration to the arrangements for the review of S.H.M.O.s in Scotland contained in the Department of Health's memorandum R.H.B. (53) 10. The CHAIRMAN undertook that at the next meeting of the Joint Committee he would put forward the proposal that one of the three members of the Review Committee, who are to be appointed by the Secretary of State, should be the holder of a whole-time appointment.

A proposal that the Scottish Joint Committee should be asked to reopen the question of the date from which remuneration would apply was rejected on a vote by a substantial majority.

The Committee unanimously approved a recommendation of the Radiological Services Subcommittee for amendment of the Subcommittee's constitution, designed to secure more or less equal representation of radiodiagnosis and radiotherapy.

A proposal from the N.E. Regional Committee was also accepted which will allow of the three northern regions, which have only two representatives on the Central Committee, to appoint deputies for these representatives.

Specimen samples of the domiciliary visit claim forms in use in the five regions were considered by the Committee. These showed considerable variation in the amount of information required. Some required signature by the

family doctor, others did not. After discussion it was decided not to press for a uniform national form.

The Committee accepted a recommendation from the Chairman's Subcommittee that a Subcommittee representing the Diseases of the Chest and Tuberculosis physicians in Scotland be set up. It was remitted to the Chairman's Subcommittee, in consultation with the physicians concerned, to make the necessary arrangements.

METROPOLITAN COUNTIES BRANCH 95th ANNUAL GENERAL MEETING

The Metropolitan Counties Branch, which has just passed its centenary, held its 95th annual general meeting at B.M.A. House, London, on June 9. In the absence of the retiring President, Dr. R. Forbes, who was attending the meeting of the Canadian Medical Association, the chair was taken by Mr. LAWRENCE ABEL.

The report of the Branch Council, which was adopted, showed the membership of the Branch to be 7,162. The financial position was said to be extremely satisfactory, and the Divisions to be holding regular meetings. A series of addresses to senior medical students had been organized during the year. A centenary ball on January 8 resulted in £300 for medical charities.

For the session 1953-4 the following officers were elected: president-elect, Dr. D. F. Hutchinson; vice-presidents, Drs. H. Alexander, J. W. McCarthy, H. Vickers, and C. Leonard Williams; hon. treasurer, Dr. Angus Weston; hon. secretaries, Drs. H. Barbara Woodhouse and Annis Gillie.

Mr. Abel then inducted Dr. J. ARTHUR MOODY as President of the Branch for the session 1953-4, and Dr. Moody delivered an address on "Founders of the Branch and their Problems." We hope to publish it in a future issue. Finally, a vote of thanks was accorded to Dr. Moody on the proposition of Dr. H. H. D. SUTHERLAND, seconded by Dr. J. W. MCCARTHY.

G.M.S. COMMITTEE

ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE

Elections will be held in July to appoint representatives of assistants and unestablished principals to the Assistants and Young Practitioners Subcommittee of the General Medical Services Committee for the session 1953-4. The newly appointed Subcommittee will come into office on September 1, 1953.

For the purposes of election, England and Wales is divided into five regions: (1) South-west and Wales, (2) South-east, (3) North-west and Midlands, (4) North-east, and (5) London and Home Counties. The General Medical Services Subcommittee (Scotland) appoints two representatives for that country as a whole.

Each region is based upon a regional office of the Association and elects two direct representatives to the Subcommittee—one assistant and one unestablished principal. The G.M.S. Subcommittee appoints six of its members to serve on the Subcommittee. One assistant and one unestablished principal from the Subcommittee are co-opted to the G.M.S. Committee.

The electorate and membership of the Subcommittee, apart from the representatives of the G.M.S. Committee, are restricted to the following classes of practitioner:

- Assistants in general practice.
- Practitioners engaged predominantly in general practice as principals (including those in partnership) whose total gross professional income does not exceed £1,500 per annum.

Assistants

The electoral roll for assistants is compiled from the Association's records, and each eligible assistant should by now have received a letter from the secretary of the Committee advising him that unless he signifies to the contrary

his name will automatically be included in the new roll. Any assistant who has not received such a letter but believes himself to be eligible for inclusion in the roll should communicate with the Secretary, B.M.A. House, Tavistock Square, London, W.C.1, not later than Monday, June 29.

Unestablished Principals

The income limit for inclusion in the roll of unestablished principals has been increased from £1,250 per annum to £1,500 per annum in the light of changed circumstances since the roll was first compiled. This will necessarily admit a number of principals previously excluded, and application for inclusion should be made not later than Monday, June 29, on the form set out below by any practitioner who considers himself to be eligible but who is not already included in the roll.

Nominations

Electoral rolls will, as indicated above, be closed on June 29. On July 3 a copy of the revised roll for his area will be sent to each eligible assistant or unestablished principal, asking for the submission of nominations not later than July 20. If there is a contest in any particular area voting papers will then be issued.

For the use of unestablished principals only

General Medical Services Committee Assistants and Young Practitioners Subcommittee UNESTABLISHED PRINCIPALS

I
(Block letters, please)

of
hereby apply for inclusion in the electoral roll of unestablished principals.

I declare that I am engaged predominantly in general practice as a principal with a total gross professional income not exceeding £1,500 per annum,

and I undertake to inform the Secretary of the Committee, at B.M.A. House, of any change in my status which affects my eligibility for membership of the electorate.

Signed

Date

To be returned not later than first post on June 29, 1953.

Correspondence

The Extraordinary General Meeting

SIR,—As I was the speaker at the Extraordinary General Meeting who gave the main pleading on behalf of the small-list practitioner, and as Dr. R. W. Cockshut (*Supplement*, June 13, p. 279) does me the dubious honour of mentioning me by name, I would deal with the three points which Dr. Cockshut wrongly imagines were the major points.

(1) I nowhere contended that "no one should be worse off after the Working Party's plan than before it." It is obvious that if a practitioner's list falls under a capitation method of payment his income also falls. What I did say was that "100 persons on anyone's list will require the same average yearly attendance," and asked that, "with consideration to the number on his list and the legitimate expense he incurs in giving them yearly attendance, he (the small-list practitioner) receive an increase of remuneration in some way proportionate to that accorded his better-placed colleagues." Will Dr. Cockshut deny the justice of this?

(2) I did not say no one must be forced by "economic necessity" to move from his present address. I said that the discriminatory withholding of increased remuneration applied to some practitioners has been applied in order to force them to

Diary of Central Meetings

JUNE

- 24 Wed. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
24 Wed. Executive Subcommittee, Joint Formulary Committee (at Pharmaceutical Society, 17, Bloomsbury Square, London, W.C.), 2 p.m.
30 Tues. Joint Committee of Psychological Medicine Group and R.M.P.A., 2 p.m.

JULY

- 1 Wed. Local Arrangements Committee, First World Conference on Medical Education, 11 a.m.
2 Thurs. Radiologists Group Committee, 2 p.m.
3 Fri. Ophthalmic Qualifications Committee, 1.45 p.m.
6 Mon. Ophthalmic Group Committee, 2 p.m.
9 Thurs. Registrars Group Executive Committee, 2 p.m.
10 Fri. Annual Representative Meeting (at Cardiff), 10 a.m.
11 Sat. Annual Representative Meeting (at Cardiff), 9.30 a.m.
11 Sat. Council (at Cardiff), 9 a.m.
13 Mon. Annual Representative Meeting (at Cardiff), 10 a.m.
13 Mon. Annual General Meeting (at Cardiff), 12.30 p.m.
13 Mon. Extraordinary General Meeting (at Cardiff), at conclusion of A.G.M.
13 Mon. Council (at Cardiff) at conclusion of A.R.M.
13 Mon. Adjourned Annual General Meeting and President's Address (at Cardiff), 8.30 p.m.
22 Wed. Transport Medical Standards Subcommittee, Occupational Health Committee, 2.30 p.m.

OCTOBER

- 2 Fri. Joint Committee of B.M.A. and the Magistrates' Association, 11 a.m.

Branch and Division Meetings to be Held

- CAMBRIDGE AND HUNTINGDON BRANCH.—At Dujon Restaurant, Market Place, Peterborough, Thursday, June 25, 12.15 p.m., annual general meeting; 1 p.m., lunch; address by Dr. W. Marshall: "A Medical Paradox."
DORSET AND WEST HANTS BRANCH.—At Linden Hall, Boscombe, Tuesday, June 23, 3 p.m., annual general meeting. Presidential address by Dr. W. B. McQueen: "Medicine East of Suez."
HEREFORD DIVISION.—At General Hospital, Hereford, Friday, June 26, 3.45 p.m., annual meeting.
KENT BRANCH.—At Bearsted, Thursday, June 25, 12 noon, annual general meeting.
LEICESTERSHIRE AND RUTLAND BRANCH.—At Nurses Home, Leicester Royal Infirmary, Wednesday, June 24, 8.45 p.m., meeting and its Hospitals.
NORTH WALES BRANCH.—At Grand Hotel, Penmaenmawr, Thursday, June 25, 3 p.m., annual meeting. Address by Dr. J. Glyn Jones: "The Chemotherapy of Pulmonary Tuberculosis."
OXFORD DIVISION.—At Horton General Hospital, Banbury, Wednesday, June 24, 8.15 p.m., clinical meeting.
SOUTH WALES AND MONMOUTHSHIRE BRANCH.—At The Priory, Caerleon, Mon., Thursday, June 25, 3.30 to 5.30 p.m., Garden Party.
WEST HERTS DIVISION.—At Peace Memorial Hospital, Watford, Wednesday, June 24, 9 p.m., annual general meeting.

Meetings of Branches and Divisions

SOUTH-EASTERN COUNTIES DIVISION
The annual meeting was held at the Buccleuch Arms Hotel, St. Boswells, on April 19. With Dr. Davidson in the chair, there were 22 members present. The following officers were elected for the ensuing year:

Chairman.—Dr. H. J. C. C. Smith.
Vice-chairman.—Dr. E. Clark.
Secretary and Treasurer.—Dr. E. H. Duff.

abandon their present practices and move to other areas. It is one thing for a man to move voluntarily to another area, if there be prospect of bettering his position. But the distribution scheme nowhere makes this possible. But by departing from the principle of "equal pay for equal work," and by giving to some practices an increase of remuneration of £35 per annum per hundred patients and a paltry increase of only £2 to other practices, it has continued the small-list man on an uneconomic rate of payment with the deliberate intention of forcing him to move. That is *direction by economic discrimination*. Does Dr. Cockshut agree with this monstrous plot?

(3) I nowhere advocated "special treatment for the small-list man." My whole speech was a protest that he had been singled out for "special treatment" of a most unjust and inequitable nature. If 1,500 patients are to draw a "bonus" of £500 per year to their practitioner, why not at least £250 "bonus" for the practitioner with a 750 list? If not, will Dr. Cockshut tell us why? And, if remuneration of a bare 17s. per caput is an uneconomic rate of payment for a 3,000 list without the £500 "load" accorded it, is not a bare 17s. capitation rate (with no "load") the more uneconomic and insufficient for a 500 list? If not, again will Dr. Cockshut resolve the economic conundrum?

These, however, are not, as Dr. Cockshut imagines, the "major points" in the argument for the small-list man. The basic point is that he has shamefully been denied his due share in the £10m. increase placed in the central pool by the Danckwerts award. He has been given little or no increase of remuneration under the award, despite the fact that the present Health Minister asserted in the House of Commons "that the doctors had an unanswerable case for increased remuneration" and despite the declaration of the G.M.S. Committee that "the Danckwerts award made it clear that general practitioners had been substantially underpaid since the Health Service began." Moreover, the some 3,000 small-list men each attract to the central pool the sum of £2,500 by their very presence in the Service. Yet they have been denied any increase of remuneration in proportion to numbers on their lists proportionate to the increase given their "more-favourably placed colleagues," in direct contravention of the terms of reference given the Working Party. Denied their rightful increase of remuneration and after a "means test," they are offered "charity" scheme, yet Dr. Cockshut has the temerity to defend it.

I will not follow Dr. Cockshut in the paths of bemused philosophical platitudes. His assumption that I think either a minority or majority should override the canons of right and equity and right morals is as false as are his "three points" dealt with above. It is, I believe, the tactic of dictators of right and left to accuse their victims of evils they are themselves in the course of perpetrating and defending. I trust Dr. Cockshut is not following this technique in defending the distribution scheme.—I am, etc.,

Shrewsbury.

W. J. GRANT.

Absence from Work

SIR,—I have found from personal experience one reason why patients rarely "sign on" for work at the end of a short illness; this seems to be a likely contributory cause for an increase in absence from work. A person taken ill on Tuesday who resumes work on the Wednesday a week later draws a full week's sickness benefit, but has to contribute for stamps on his insurance card for both weeks—that is, he receives no credit for a full week off work—due to the complicated working of the Insurance Acts. Surely it is logical and right that seven days off work should excuse one stamp, whether the illness starts on a Monday or not.

So long as this sort of thing persists our patients will continue to see the week out "on the club."—I am, etc.,

Brixham, Devon.

KENNETH INMAN.

Registrars' Meeting.—A general meeting of the North-east Region Registrars Group will be held in the New Lecture Theatre, Royal Victoria Infirmary, Newcastle-upon-Tyne, on Wednesday, June 24, at 6 p.m.

ANNUAL CONFERENCE OF LOCAL
MEDICAL COMMITTEES

A YEAR OF VARIED ACTIVITY

The Annual Conference of Representatives of Local Medical Committees was held in the Great Hall of B.M.A. House, London, on Wednesday, June 17. Dr. W. M. KNOX (Glasgow) was in the Chair, supported by Dr. A. Talbot Rogers, chairman of the General Medical Services Committee. Nearly all the 100 motions and amendments on the agenda related to the report of the Committee, published in the *Supplement* of May 2. As already reported in last week's *Supplement* (p. 281), the Minister of Health (Rt. Hon. Iain Macleod, M.P.) attended by invitation and delivered an address, further details of which are given on another page of this issue.

Chairman's Progress Report

Dr. TALBOT ROGERS, in moving the reception of the Annual Report, said that some of them might be surprised at its length and the variety of subjects it covered. Many had anticipated a lull after the successful termination of the adjudication, but, on the contrary, this had been one of their busiest years. He proceeded to review the more important matters which had been taken up in discussions with the Ministry on the application of the principles established by the Danckwerts award. These covered questions of payment of arrears, assessment of tax on arrears, size of pool, etc. The tasks of the Working Party had involved complicated discussions. They had taken the opportunity of dealing with two problems which were giving rise to some difficulties in certain areas—one the question of the premises of a deceased doctor and the rights of his successor, and the other the succession by a partner to a small-list practice. Then there was the question of the small-list doctor. There was no need for him to enlarge upon the steps they had taken to facilitate the rider passed at last year's Conference. Although the profession seemed to be satisfied with the action taken by the Committee and were willing to await the result of the Working Party inquiry, there were some who were still dissatisfied. What he had said at the Special Conference was that they would, through inquiry of the Ministry, the executive councils, and the local medical committees, find the number of doctors concerned and their categories, and in the case of doctors whom they found suffering from injustice they would set themselves to discover means of meeting their

grievance. It was known that some small-list practitioners had enjoyed a much higher capitation rate than normally—a capitation rate which they could not justly allow to continue. What they had to do was to find whether there were single-handed practitioners actively engaged whose lists through no fault of their own remained too small to meet the benefits of the loading enjoyed by their colleagues with larger lists. It was for this group that the Working Party was looking. They would have to eliminate those consideration doctors in partnership, doctors with lists of over 1,200, those in practices recently established (who should be helped in other ways), and practitioners who held other remunerative and time-consuming appointments. When these were eliminated they would be able to consider those that remained and to devise ways of helping them to remedy any injustices from which they suffered. At the proper time the Working Party's suggestions would be submitted for approval.

Among other matters which figured in the Report was the question of medical service committee and tribunal procedure. This had been reported on by a subcommittee ably led by Dr. H. Guy Dain. A committee also had been set up by the Council to review general practice, and the Report of that committee had now been edited and would be published in the early autumn. Another committee on general practice (the Cohen Committee) had been set up by the Central Health Services Council, and his Committee had prepared a memorandum for that body. The memorandum covered a considerable field, including, he believed, all the controversial points about general practice on which the Cohen Committee wanted to have advice, and the memorandum had been supported by oral evidence.

On the question of restoration of goodwill, his Committee had given consideration to the matter, but had eventually decided that the scheme put forward was not practicable; nevertheless it had sent the scheme with its comments to local medical committees for their examination.

There had been considerable co-operation between the G.M.S. Committee and the other committees of the Association and outside bodies, such as the Medical Practices Commission and the British Dental Association. In all their negotiations this year they had found the Ministries most co-operative. They had never known a time when Government departments had listened more attentively to the arguments put forward. That there was a better atmosphere was shown by the fact that the Committee had been able to invite the Minister of Health to address the Conference that day; there had been times when they would not have thought

of doing so. The Minister himself had shown considerable understanding of the position of the general practitioner.

With reference to the question of hospitals, Dr. Talbot Rogers mentioned that in the 14 regional boards in England and Wales there was now only one which had not got a general practitioner as a member of the board. They had had conversations with representatives of the new College of General Practitioners, and the conversations showed a full understanding of the position, and there was no wish on the part of the College to take away from that Conference or the Committee the full rights of negotiation on behalf of general practitioners.

He looked forward to a still busier year. There would have to be further agreements about the Mileage Fund and its method of distribution. They had been asked to discuss with the Ministry the one remaining topic in the Working Party Report not yet tackled—namely, the use of the money set aside for the encouragement of group practice. Long-term policy concerned the proper number of practitioners in the community and the number of medical students being trained. He also referred to the Guillebaud Committee set up by the Government to inquire into the cost of the health services. The last thing they wanted to do as an association was to have any sectional presentation of findings to a committee like that.

In conclusion Dr. Talbot Rogers said that in recent months voices had been raised in some quarters criticizing the powers and actions of the G.M.S. Committee. He knew that the Committee enjoyed the confidence of the Conference, but they had to take notice of those critical voices. If they did not do so it might interfere eventually with their strength in negotiation. He thought he had said enough to show the need for a well-chosen, well-informed, and hard-working Committee with power to act when new problems demanded attention. It would work to the best of its ability to carry out the policies laid down by the Conference and the Association. (Applause.)

Remuneration

Dr. J. C. ARTHUR (Gateshead) moved to draw the attention of local medical committees to the fact that most allocation schemes as at present adopted did not truly represent the Working Party's report in that they did not permit of an unremunerative excess beyond the normal remunerative maxima. This motion was an attempt to clear up an ambiguity as between the Working Party position and the position as stated in the allocation scheme. This ambiguity had existed for some considerable time. Gateshead preferred the Working Party position. They suggested that the practitioner should be allowed to take these patients on his list, but not in any circumstances to be paid for more patients than his accepted maximum.

Dr. TALBOT ROGERS said that the Working Party had tried to make it easier for young practitioners to come into areas where they were most needed and where the lists were biggest. It was for that reason that it had established the initial practice allowance. If they were going to send young men into areas like that it was going to make it very difficult for them to build up a practice in the way they would expect if practitioners who were in excess of the maximum were told that there was no need for any alteration. He hoped the Conference would not accept the resolution of Gateshead.

The Gateshead resolution was lost.

Economy in Prescribing

Dr. F. E. GOULD (Birmingham) moved:

That this Conference is anxious to co-operate in reducing the cost of pharmaceutical services consistent with the right of the doctor to prescribe whatever is necessary for the proper treatment of the patient, and urges that: (1) economical prescribing be taught to students at all appropriate stages in the curriculum; (2) all house officers shall be similarly instructed; (3) investigation of excessive and extravagant prescribing be accelerated so that at the earliest moment individual doctors may be notified and the usual steps taken; and (4) all consultants be kept fully informed on this subject and the actions to be taken.

The trouble came from young practitioners who had not yet learned what prescribing meant in the N.H.S. The tendency in teaching was to teach students about the more complicated drugs, and in their medical schools they often heard little or nothing of the simple drugs on which older practitioners had been brought up and which were frequently the basis of proper prescribing.

Dr. J. A. BROWN and Dr. A. BEAUCHAMP (Birmingham) supported the motion, the latter remarking that it would go a long way towards teaching consultants the art of prescribing.

Dr. TALBOT ROGERS said that his Committee would be very pleased if this motion were passed. It represented the type of argument they would like to use when they went to the Ministry.

The motion was agreed to.

Dr. A. M. MAIDEN (Lindsey) asked the Conference to agree, in view of the high cost of prescribing, that the Minister should make use of his powers to impose financial penalties on doctors who persistently prescribe at a cost grossly above the area average. He said that they were all concerned with the rising costs of the Service, and a resolution like this would show the Ministry that a responsible body of general practitioners was not disinterested in this matter.

Dr. F. GRAY (G.M.S. Committee) said that the Conference had shown most emphatically that it realized its responsibilities in the matter of economy in prescribing. None of them wanted excessive prescribing. But this Lindsey motion was not the way to do it. The motion referred to the Minister's powers. These were not the Minister's powers, they were their own powers. Lindsey was really asking that they should give away one of the most valuable safeguards they possessed, that professional matters should be dealt with by a professional body.

Dr. TALBOT ROGERS said that one of the things that had handicapped them in exercising any control was that they had not been able to have a comparison between areal and individual averages. Areal averages would soon be available, and he believed that this information would have a salutary effect and prevent in many instances the bringing in of sanctions.

After further discussion, Dr. MAIDEN said that there was no desire to short-circuit the present regulations. He thought it was implicit in his motion that any investigation would go through the routine procedure before coming to a Minister.

The motion was lost.

Dr. D. C. S. RENDALL (Berkshire) moved that all investigations into the prescribing of food and drugs should cease forthwith.

Dr. TALBOT ROGERS said that this was a most attractive proposition, but unfortunately it was not one that could be acceptable to the Ministry. He knew that none of them liked these inquiries, but if they did not have them some official would carry them out on a rule-of-thumb basis.

Dr. RENDALL said that the majority of the investigations were upon very controversial foods and drugs. These should be put into a hard and firm class. What they did want was more guidance as to what was a food and not a drug.

The motion was lost.

Dr. J. E. ELLIOTT (Buckinghamshire) asked the Conference to declare that the present extensive use of investigations into irregular prescribing under the Service Committee and Tribunal regulations was wasteful and undesirable.

Dr. TALBOT ROGERS said that they would all agree that the investigations were far from ideal. His Committee had taken what action it could to limit the time-lag, and was hoping to get the position much more to their satisfaction.

Dr. FRANK GRAY said that this was something they could not ask for. They knew in London particularly how much time was taken up with these investigations. They had had to deal with as many as fifty of these cases in a month, but that was one of the necessary results of keeping this matter in their own hands. While the work was considerable, it was a great safeguard.

Dr. ELLIOTT said that what they were pleading for was not that the investigations themselves should be abandoned, but only their extensive use.

The motion was lost.

Dr. ELLIOTT then further moved:

That real economy in prescribing would result from investigations by the local medical committee into the prescribing of those practitioners whose prescribing costs had been reported to the Committee to be consistently and appreciably above the average for their area.

Dr. A. BEAUCHAMP (Birmingham) said that a good deal of work had been done in his area by means of occasional letters in persuading doctors to prescribe economically and sensibly. That method was well worth trying. The next stage would be to provide doctors with their areal figures, and the third stage investigation by the local medical committee.

Dr. TALBOT ROGERS said that this was a resolution which the Committee would welcome. It was in line with the policy they wanted to carry out.

The motion was carried.

The Model Distribution Scheme

Dr. F. J. ROBERTSON (Newcastle-upon-Tyne) moved that the distribution scheme should provide for a monthly payment to all general medical practitioners without individual application. He said that the officials of all Government departments were paid on a monthly basis. General practitioners in the National Health Service stood alone as the only section not receiving a monthly cheque. This was not because they were considered to be self-employed. Their dental colleagues were paid monthly, and he thought that doctors should receive automatic monthly cheques.

Dr. C. O'DONOVAN (Leicester and Rutland) said that this motion as it stood would involve an immense amount of additional work at executive council offices. He thought people who wished to have monthly rather than quarterly payments should have them on application.

Dr. S. R. FEE (Stoke-on-Trent) said that ever since 1912 they had a monthly payment of accounts and there had never been any administrative difficulty. He certainly felt they should be paid monthly.

Dr. W. WOOLLEY (Bristol) considered that this was a matter for local action, and suggested that it be referred to the G.M.S. Committee.

The discussion was continued by Dr. N. NELSON (Dundee) and Dr. C. S. O'FLYNN (Sheffield).

It was agreed to refer the matter to the Committee.

Removal from List

Dr. E. G. WATSON (Birkenhead) asked the Conference strongly to deprecate the Minister's interpretation in E.C.L. 93/52 of the regulations regarding the removal of practitioners from a council list in certain circumstances, to wit:

"Where the practitioner has absented himself from his practice for a period of 12 months or more, even if he has informed the Council and made adequate deputizing arrangements, but where there is no apparent likelihood of his returning within the immediate future."

Dr. Watson said that his committee thought the word "immediate" was far too strong. Obviously the main reason for such absence on the part of the doctor would be a long illness. The phrase "immediate future" was unfortunate. Some conditions such as tuberculosis might incapacitate a man for longer than twelve months. He pleaded for a more generous phrasing.

Dr. TALBOT ROGERS said that he thought the representative of Birkenhead was being over-anxious about this matter. There was no intention on the part of the Ministry to act in the way suggested if a doctor had a reasonable chance of returning to his practice. If he was ill and had provided adequate deputizing arrangements he was quite certain that executive councils would accept the view that no action should be taken.

Dr. BEAUCHAMP pointed out that there were adequate safeguards in the local medical committee. He thought Birkenhead was over-sensitive about the word "immediate." The motion was lost.

Practice Vacancies

Dr. A. V. RUSSELL (Wolverhampton) moved that para. 75 of the Committee's report be referred back for consideration on the ground that local medical committees might render themselves liable to be mulcted of legal damages on the suit of an aggrieved doctor if they advised executive councils in of an conditions envisaged in the paragraph. This related to the increasing practice whereby partnerships have been formed between an established single-handed doctor who intended shortly to retire and a doctor who was new to both the practice and the district, with the intention of enabling the latter to secure the succession to what was essentially a single-handed practice. The Committee had felt that this was against the best interests of the Service, and that, apart from special circumstances, the Medical Practices Committee should not accept one partner as the logical successor to another who had died or resigned, unless the partners had been in active practice together for about a year. The mover described a case in support of his view that the position required clarifying. It should be placed beyond all shadow of doubt as to what the position of the local medical committee might be in these circumstances.

Dr. F. M. ROSE (G.M.S. Committee) said that there were a minority of doctors who for one reason or another attempted to defeat the machinery set up for the filling of practice vacancies. If the Medical Practices Committee acted properly there would be no trouble at all, and when something unexpected happened he was quite sure that imagination and humanity would be applied. But there was a minority of cases in which an attempt was made to get round the regulations, and para. 75 was so designed as to meet particular cases.

Dr. J. A. GORSKY (G.M.S. Committee) said that there was some disquiet over this matter. They were still waiting to learn whether an E.C.L. had any statutory authority. Until now neither an executive council nor the Medical Practices Committee had the power to declare a vacancy. This E.C.L. was not based upon any statutory instrument whatsoever. If this went through there would come a time when a vacancy would be declared in a case where a partnership deed had been entered into by two doctors, and there would possibly arise a conflict on this question of the deed. He intended to bring this matter up at the Cardiff meeting. If they allowed this to go through without second thoughts, they would be merely government by decree. He asked then it would be merely government by decree. He asked the Committee to take back para. 75 and reconsider it, and that they should await a decision as to whether an E.C.L. had statutory force or not.

The reference back was agreed to.

Machinery for Filling Vacancies

Dr. TALBOT ROGERS moved on behalf of the General Medical Services Committee:

That steps be taken to secure that:

- (i) The executive council should be responsible for appointing a successor;
- (ii) The decision as to whether a practice is to be dispersed or a vacancy is to be declared and advertised should remain with the executive council in consultation with the local medical committee;
- (iii) The Medical Practices Committee should act as an appeals body, and in hearing an appeal should be required to review all the applications originally submitted and not merely that of the appellant.

Dr. A. CAMPBELL (G.M.S. Committee) moved non-approval. He considered that this motion, which was passed by the Committee at a very thin meeting, put them in a very difficult and dangerous position. If para. (iii) were passed and the Minister agreed, he felt that lay members of executive councils would not dream of sitting in committees selecting a short list, because they would know

that they might be overruled by other people at a distance. The Minister, as was evident from his speech to the Conference, was worried about centralization, but this proposal meant more centralization.

Dr. P. J. GIBBONS (G.M.S. Committee) said that they could all agree that they were very fortunate in the present members of the Medical Practices Committee, but the same state of affairs might not obtain in ten years' time. The Committee's motion would also mean the centralization of power in London, which none of them liked.

Dr. D. F. HUTCHINSON (G.M.S. Committee) said that he thought the Conference would know that under the present system a great deal of trouble had arisen. The reason why it was suggested that the Medical Practices Committee should be an appeal body was very simple. The committee was composed very largely of general practitioners, who would have an understanding of the position which officials of the Ministry could not be expected to possess. He thought what was now proposed would be a real improvement on the position, which had caused so much trouble in the past.

Dr. D. C. S. RENDALL (Berkshire) felt that all these appointments must be made locally by people who knew what they were talking about.

Dr. TALBOT ROGERS pointed out that what they were asking here was that the local body should have the dominant say, in fact the only say unless there was an appeal. Then, and then only, would the Medical Practices Committee come in. At present the Medical Practices Committee decided the original application, and it decided it with an eye to a possible appeal.

The amendment moved by Dr. Campbell to withhold approval from the Committee's proposal was lost.

Dr. RENDALL (Berkshire) moved to amend para. (i) of the recommendation by inserting the words after "executive council," "after consultation with the local medical committee," and para. (iii) by the addition of the words "when an appeal is being heard representatives of the executive council concerned should be in attendance." This was just to make it certain that the local medical committee had its say as to who did the job.

The amendment was accepted on behalf of the Committee and by the Conference, and the recommendation of the Committee as thus amended was agreed to.

Service Committee Procedure

Dr. H. GUY DAIN, as chairman of the subcommittee which has been engaged on the study and proposed improvement of Service Committee and Tribunal Regulations, presented the report which was published in the *Supplement* of May 2 (p. 190). The report contained some 22 recommendations on modifications of procedure, but only those were separately moved to which amendments had been sent in by local medical committees. Dr. Dain said that the great value of the complaints procedure was that it presented an opportunity of airing complaints and getting rid of them, and in that way it was more frequently protective of the doctor—the person complained against—than punitive. An endeavour had been made to strengthen some weak places in the scheme and make it more satisfactory to everybody all round. He then moved the first of the recommendations, concerning the appointment of chairman and deputy chairman, so to modify the regulation as to leave the field open to non-members of the executive council, provided the person appointed was acceptable to both parties represented on the committee.

Dr. MICHAEL CUTLER (Hastings) desired the regulations to be amended to provide for the chairman of the committee to be a barrister or solicitor of not less than seven years' standing. The advantages would be the complete impartiality of such a person and his ability to give a lead to the committee.

Dr. W. WOOLLEY (G.M.S. Committee) pointed out that if Hastings wanted a barrister or solicitor they could have one, even if the recommendation was carried. But if it

was carried it would mean that service committees which did not wish to have a member of the legal profession as chairman must have one.

Dr. DAIN said that a number of local medical committees held the same view as Hastings had expressed, but still more desired a more flexible method of selecting their chairmen.

Dr. E. A. GREGG (Chairman of Council) said that experience in London in past years had shown that a chairman who was a member of the legal profession was not necessarily the best choice.

The amendment that the chairman must be a member of the legal profession was lost.

Dr. A. M. MAIDEN (Lindsey) spoke against the subcommittee's recommendation, his reason being that there might be constitutional difficulties if the chairman came from outside the membership of the executive council.

Dr. FRANK GRAY said that in London they had a chairman and deputy chairman neither of whom was a member of the executive council, and there had not been the slightest constitutional difficulty. He hoped the meeting would feel that the proposal was practical and wise.

The recommendation was adopted.

Dr. DAIN proceeded to move the second recommendation, that provision should be made in the Regulations that a member of the service committee who was an interested party should be required to disclose his interest.

Dr. MICHAEL CUTLER (Hastings) moved as an amendment to add the words that the interested party "shall, if either the complainant or respondent requires it, withdraw." He said that this brought the procedure into line with that of a court-martial.

Dr. DAIN considered the amendment entirely unnecessary. The amendment was lost, and the recommendation agreed to.

Dr. G. D. STILWELL (Kent and Canterbury) moved an amendment with regard to the bringing of complaints, that in the event of a decision to refer a case the Minister should be advised by a committee having a similar constitution to that of the medical advisory committee constituted under Regulation 11 (4).

Dr. DAIN said that he would like this amendment to be referred back for consideration. Without knowing all its implications, he could not say "Yes" or "No."

It was agreed to refer this back to the Committee.

The next recommendation moved by Dr. DAIN proposed that the chairman of a service committee should confer with a professional adviser who was not a member or deputy member of the committee, but selected from a panel nominated by the local professional committee.

Dr. W. F. HUDSON (Oxford) moved the omission of this recommendation. He thought it complicated the situation somewhat. The procedure it set out should either be deleted or remain permissive. The Oxford amendment was lost.

Dr. A. P. DAVIES (Walsall) moved to substitute the word "must" for "should" ("the chairman of a service committee must confer with a professional adviser"). There would still be some chairmen who would ignore the Regulation if it were merely permissive.

The Walsall amendment was carried, and the recommendation as thus amended was adopted.

Dr. DAIN next moved that the documents in the case should be sent out seven days (instead of three days) before the hearing and that they be sent also to the secretary of the local professional committee. This was designed to give deputies who were called upon to act in a case time to study the documents before the case came forward. It was another instance of making the machinery a little more efficient.

Dr. HUDSON (Oxford) moved an amendment whereby this provision would not apply to the secretary of the local professional committee. As it stood it meant that the circle of people who knew what was going on in the service committee was widened.

Dr. FRANK GRAY pointed out that it was already provided in the Regulations that the secretary of the local profes-

sional committee should have a statutory right to be present at the hearing. There was also a very strong moral obligation that he should be present. But if what Oxford wanted was done he might be forced to go to the meeting without the documents and knowing nothing of the case.

Dr. F. E. GOULD said that in Birmingham they had repeatedly asked practitioners who might receive a complaint to get in touch at once with the secretary of the local medical committee. From his experience of these cases he was quite certain that doctors only too often acted on their own account without consulting the secretary of their professional committee, and this might be a very unwise step.

Dr. HUDSON said that his only object in moving the amendment was to narrow so far as possible the number of persons concerned in the inquiry.

The Oxford amendment was lost.

Question of Legal Representation

Dr. DAIN then moved that the series of regulations relating to procedure before a local medical committee hearing complaints about prescribing or certification be amended so as to make it clear that the decision as to whether a practitioner might be represented by counsel or other paid advocate, or might call witnesses, rested with the local medical committee. The Regulations did not make any provision for counsel or solicitor.

Dr. CUTLER (Hastings) moved an amendment to the effect that a petitioner, independently of any reference to the committee, might be legally represented or call witnesses. He considered that the committee might make arbitrary decisions which led to injustice.

Dr. DAIN said that if the Conference felt that this amendment improved the recommendation he had nothing to urge against it.

Dr. W. WOOLLEY (G.M.S. Committee) asked whether it was not preferable for these inquiries to take place in as friendly an atmosphere as possible. In addition, how could a lawyer know whether a prescription indicated excessive quantities of a drug? That was a matter for doctors and doctors only. The other professions were very useful in their place, but this was not one of them.

Dr. CUTLER said that all he asked was that the doctor should have a right to call a lawyer, not that he was obliged to do so.

The Hastings amendment was carried.

Dr. DAIN then moved the approval of the remaining 15 recommendations. One of the recommendations provided for the amendment of the rule that if, in the course of a hearing, any new issue was introduced by the complainant the chairman had discretion to admit or exclude such issue as he thought fit, but if it was admitted the respondent might ask for an adjournment. It was proposed to amend this rule so as to make it obligatory to adjourn the committee if a new issue was admitted. The reason for this proposal was that the doctor was under a grave disadvantage if when the new issue came forward he himself was compelled to ask for an adjournment. This amendment would leave the service committee no option but adjournment if any new issue were brought forward.

Dr. A. D. STOKER (Derbyshire) moved to add to the recommendation the words "if the respondent so desires." It seemed to him very unfair that the whole proceedings should necessarily be adjourned and the practitioner be subjected to another month of suspense.

Dr. J. A. GORSKY supported the Committee's recommendation. The anxiety to which the previous speaker had referred would be much greater if the verdict went against him on the issues newly introduced and determined forthwith. The procedure proposed by the Committee was the one invariably followed at inquests.

Dr. FRANK GRAY supported the last speaker. He had seen several cases where a responsible doctor had been placed in a very difficult and embarrassing position by the ringing up of a new issue. If the doctor said that he

was not willing that the new issue should be considered at that hearing he knew that the committee would have it in their minds that he was compelling them to come back again on a later occasion. The present proposal transferred the embarrassment to the right quarter.

The Derbyshire amendment was lost and the recommendation agreed to.

Lodging of Complaints

Dr. D. SARLATVALA (West Bromwich) moved that any communication from an executive council to a doctor informing him that a complaint had been lodged against him by or on behalf of a patient, and inviting his comments thereon, should embody a clear warning that his reply would be produced at any inquiry which might follow, and might there be used as evidence.

This was immediately adopted without discussion.

Dr. A. D. DAVIES (Walsall) moved:

That the chairman of a service committee, before deciding that a prima facie ground of complaint is disclosed, must submit a statement of complaint to the practitioner concerned, giving him the opportunity of making observations at an early stage.

He said that now that the Conference had passed all the recommendations brought forward by Dr. Dain the position as regards the defendant practitioner had been very greatly improved and safeguarded, but it did seem common justice that at the first opportunity the defendant should be granted the courtesy of making any essential observations. It might prove that the case was obviously frivolous from the beginning.

Dr. DAIN drew attention to the First Schedule of the Rules of Procedure, which laid it down that the clerk of the council should as soon as practicable send to the chairman of the appropriate committee and to the practitioner concerned a copy of the complainant's statement and any ensuing correspondence on the matter. The doctor must be informed at the same time as the chairman of the committee was informed.

Dr. GORSKY pointed out that the Regulation did not say whether the clerk of the executive council should invite the comments of the doctor, or whether the letter be sent to the doctor before the prima facie case had been decided or not. The Walsall amendment was important, because it was necessary for the Minister to clarify this particular Regulation.

Dr. DAIN said that his Committee thought that the position was properly protected by the Rules of Procedure. The Walsall motion was carried.

Dr. CUTLER (Hastings) moved that the power of subpoena and the imposition of penalties for non-compliance therewith should be applied to proceedings before the service committees except so far as it related to costs.

Dr. DAIN said that the great majority of local medical committees were opposed to the power of subpoena in medical service committees. They agreed to the need for it at tribunal level.

The Hastings motion was lost.

Dr. M. CUTLER (Hastings) moved that the terms of service be amended so that a practitioner who had arranged for the temporary treatment of a patient by partner, deputy, assistant, or locum tenens should not be responsible for the default of such substitute. A breach of the terms of service should not result in a vicarious liability. It might be said that there were administrative difficulties, particularly so far as locum tenens were concerned, but surely such a matter could be under the control of the executive council.

Dr. J. A. GORSKY urged that this be referred to the Committee, which was well aware of these difficulties.

The motion was agreed to as a reference to the Committee.

Dr. B. HALFPENNY (Kent and Canterbury) moved that an amendment should be sought in the Regulations whereby a complaint should not be considered by the medical service committee unless and until it had been presented in the form of a statutory declaration.

Dr. DAIN said there were sound arguments against putting so severe a deterrent on the complainant. To confront him

with the need to consult solicitors and swear before a commissioner of oaths would not be advisable. Local medical committees were not in favour of appearing to stand so much in the way of making a complaint.

The motion was lost.

Suggested Penalties on Patients

Dr. A. J. JOHNSON (Norfolk) moved that the Ministry be urged to introduce legislation whereby patients who had been found by the appropriate service committee to have grossly abused the National Health Service should be subject to a fine or other penalty. This had been brought up before, but he hoped the Conference would reconsider it. It had been suggested that it should be possible to teach the public not to abuse the Service. But surely those people who were likely to be guided by propaganda were not the kind likely to abuse the Service, and it was necessary to have some remedy against gross abuse.

Dr. DAIN pointed out that this would require a new Act of Parliament. There was no provision in the present Acts for penalizing a patient. He hoped the Committee would not be asked to do something which was really impossible.

The motion was carried.

Elections

At this point it was announced that Dr. W. M. Knox had been re-elected Chairman of the Conference without a contest, and that the following had been elected by the Conference as members of the General Medical Services Committee: Dr. A. Beauchamp, Dr. J. A. Gorsky, Dr. I. G. Innes, Dr. J. A. Pridham, Dr. F. M. Rose, and Dr. W. Woolley.

The death was announced of a former member of the Committee, Dr. A. S. Winstanley, and the Chairman paid a warm tribute to Dr. Winstanley's services.

Inflation

Dr. A. B. MILLIGAN (Worcester) moved that, in order to assist in avoiding a recurrence of the recent inflation in doctor's lists, instructions be printed on the medical card stating that patients must notify to the executive council any change of address even within the same council area.

Dr. TALBOT ROGERS thought this a helpful suggestion. The original motion as amended was referred to the Committee.

A motion by Middlesex was also accepted that the words "change of name and/or address" be substituted for the words "change of address."

Demobilized Service Men

Dr. A. J. JOHNSON (Norfolk) moved that demobilized National Service men should automatically be replaced on their former doctor's list and issued with a medical card with the original doctor's name. He said that it was a very common experience that demobilized men did not trouble to re-register. The motion was supported by Dr. W. H. HAYES (Bristol), who said that it was not the Ministry of Health but other Ministries which were obstructive.

Dr. TALBOT ROGERS said that this might well be referred to the Committee. He could not promise too much, because there was a real fear of inflation at the Ministry.

The motion was referred.

Allocation of Patients

Dr. A. B. MILLIGAN (Worcester) moved that a practitioner should not, by reason of his terms of service, be compelled to take or retain on his list a patient accepting treatment from an unregistered practitioner or from another registered practitioner with whom he was not acting in consultation. This was in reference to the statement made in para. 92 of the report. In Worcester they felt that this matter should be given more attention.

Dr. TALBOT ROGERS said that, so far as the unregistered practitioner was concerned, this was the policy they had always followed, but the Act as it stood at present made it necessary for someone to accept National Health Service responsibility for such a patient. The Ministry had heard their views and received them sympathetically. With regard to treatment by another registered practitioner, here he was afraid they could take no action. It was surely a matter for ethical consideration by the local doctors.

The motion was carried.

Treatment of Service Men on Leave

Amendments in the name of Oxford and Northampton called for the placing of all Service personnel on leave on the lists of N.H.S. doctors as temporary residents, Northampton adding that Service departments should make a round sum contribution to the central pool to cover such cases.

Dr. TALBOT ROGERS said that they had had a message from the Ministry that in consultation with the Service departments they had been able to find a solution which overcame the difficulties in this respect. How exactly the difficulties were being overcome and to what extent he did not know.

The motions were withdrawn.

Mileage Payments

Dr. J. C. ARTHUR (Gateshead) moved that mileage payments be based on difficulty of access of the individual patient rather than upon any broad classification of types of practice. What they wanted to ensure was that there was no departure from the fundamental principle of mileage. He reminded the Conference that in the North of England, not to speak of Scotland or Wales, there were many practices in large industrial centres which had, closely adjacent, some of the bleakest and wildest country. The primary factor should still be difficulty of access to the patient.

Dr. C. F. R. KILLICK (G.M.S. Committee) said that a Government inquiry was taking place into the whole effect of mileage, and there might be a complete reclassification. The term "mileage fund," of course, was wrong; they had asked the Minister that the term should be "rural practices fund," but he could hardly think that practices in Gateshead would be looked upon as truly rural practices.

Dr. ARTHUR said that he was not suggesting that they should go into the individual requirements of every single patient. All he asked was that the fundamental principles should be maintained.

The motion was lost.

Dispensing and Prescribing

Dr. R. GREEN (East Sussex) moved to express concern that dispensing doctors, paid on the basis of the drug tariff, should continue to sustain financial loss when supplying a number of proprietary preparations, and to request the Committee to take action. The real object of the motion, he said, was to strengthen the Committee by a firm reminder that in some quarters there was resentment over arrangements about doctors who were compelled to dispense. The grievance was that the doctor who was paid on the drug tariff was relatively much worse off than the chemist, because he was unable to buy most of his drugs at the same advantageous price. But a large proportion of drugs were described as "medical products" or "specialties," and here the discount was 33½% to the chemist and 10% to the doctor. He gave examples of how this matter worked out to the doctor's disadvantage. One way in which the condition could be remedied was by persuading the drug houses to sell drugs for dispensing at the same rate to the doctor as to the chemist.

Dr. KILLICK said that this matter had been taken to the Ministry and discussed most fully. The Ministry had already agreed to the necessity for some action.

The motion was carried.

The Obstetric List

Dr. A. G. CHAMBERLAIN (Dorset) called for the abolition of the official list of general-practitioner obstetricians. They did not like the restrictive list at all. They were very disturbed when they heard it mooted that a circular should be sent to all executive councils recommending that one of the criteria for admission to the obstetric list should be a six months' course in obstetrics. It was unnecessary to have any list. England should be placed in the same position in this respect as Scotland and Northern Ireland. The only list should be that of people willing to do midwifery.

Dr. TALBOT ROGERS replied that there was a list in Scotland; it consisted of those who had not opted out. It must be remembered that there were some people who would not want to do this work or to be included in any list.

It was agreed to pass to the next business.

Representation of Assistants

Dr. TALBOT ROGERS moved on behalf of the Committee that local medical committees be asked to take such steps as would ensure that assistants in their areas were, wherever possible, represented on each local medical committee by at least one assistant.

This was agreed to.

Maternity Medical Services

Dr. R. B. L. RIDGE (Middlesex) moved to instruct the Committee to review the whole question of the maternity medical service, with particular reference to the relation of fees to the work done. Revision was required on the question of maximum requirements. These were quite unrealistic and far below the standard of obstetric practice which general practitioners considered satisfactory. Furthermore a practice was permitted, though not encouraged, which could only be described as "postal midwifery," the doctor having done his two antenatal examinations. The very low standard of minimum requirements was not without its effect on the fee payable.

Dr. TALBOT ROGERS said that a sufficiently good case had been made out for the acceptance of this motion, and the G.M.S. Committee would look into the matter.

The motion was agreed to.

Sale of Goodwill

Dr. TALBOT ROGERS moved on behalf of the Committee:

That the Conference, representing N.H.S. practitioners throughout the country, having considered the memorandum prepared by the Amending Acts Committee and the comments of the General Medical Services Committee and the Compensation and Superannuation Committee upon it, is not in favour of the optional return of the right to buy and sell goodwill of practices, which it believes to be impracticable.

He said that this did not mean that the Committee thought that the ownership of goodwill was necessarily a bad thing. But the optional scheme of restoration did not seem to be practicable. One of the amendments to his motion asked that the matter be deferred and reviewed from time to time. This would mean a good deal of extra work.

Dr. A. J. JOHNSON (Norfolk) moved an amendment "That, in view of the damage done to the tone and keenness of general medical services and the increasing difficulties of entering and changing practices caused by the loss of goodwill, the so-called impracticability of its retention should be overcome for the sake of a certain gain in the efficiency of the service." He said they felt in Norfolk that the Committee's recommendation closed the door finally.

Dr. H. H. D. SUTHERLAND (G.M.S. Committee) said that by instruction of the Representative Body the Amending Acts Committee had set out in a document the general principles of the whole matter of goodwill in its practical and theoretical aspects. This memorandum had not yet been submitted to the Council. It would be far better at

Dr. C. O'DONOVAN (Leicestershire) asked the Conference to declare that the shilling charge on prescriptions should be abolished. This charge, he said, had not been a success, and results had not justified the hopes entertained with regard to it. The Government should be asked to think again. There must be several other methods of keeping down this colossal expenditure. The public must be educated as to the uselessness of many of the drugs—tonics, older ones, must also be educated. A service of essential drugs should be substituted in place of the present scheme, and only such essential drugs should be free on prescription to the patients. That would help the public to see how few essential drugs, comparatively speaking, there were; it would also help pricing bureaux, because they would have fewer prescriptions to deal with. The poorer members of the public would gain, as the shilling charge was a drain on them, and they often neglected going to the doctor on account of it.

Dr. TALBOT ROGERS asked the Conference not to pass this motion in its present form. They would discuss with the Ministry how to check rising prices, giving information to which they would receive from their representatives as to how the shilling charge was working out. It might even be that the larger average quantities that were being prescribed during the past year were costing more than the total of shillings brought in. The Committee would take the matter up with the Ministry, and if the Ministry felt it wanted to make a change it must be left to it to do so. Political questions were involved, and they should not tie themselves to one particular policy at the Conference.

It was agreed to pass to the next business.

Dr. ARTHUR (Gateshead) moved that the prescription fee be greater for proprietary than for non-proprietary drugs. He thought that a little of the demand for the proprietaries might be curbed by this motion.

Dr. TALBOT ROGERS could not agree. Patients would still choose the proprietary drug if they had the choice.

The motion was lost.

The "National Formulary"

Motions by Buckinghamshire, Bristol, and Berkshire supported the Committee's view that there should be a return to the Latin system of headings in future editions of the *National Formulary*. Dr. J. E. ELLIOTT, in moving for Buckinghamshire, said that there were three good things about Latin headings: they were international; and the bulk of liked them (they had said so officially); and the bulk of general practitioners and consultants found them most convenient. There was about them a certain classical dignity which was not unbecoming to a profession such as theirs. He quoted: "He who uses the winning fan too strongly loses good grain as well as chaff."

Dr. D. F. WHITTAKER (G.M.S. Committee) said that pharmacology was taught in English, and the *British Pharmacopoeia* was published with English titles. There was an increasing population who had no Latin.

Dr. W. WOOLLEY (Bristol) supported the motion. He considered that Latin should be one of the things that young doctors had to know.

The motion was carried.

Dr. W. H. HAYES (Bristol) asked for more consideration and imagination to be given to the flavouring of *National Formulary* mixtures.

Dr. A. B. DAVIES said that a great deal of work was done on the improvement of flavours. Keeping properties and compatibility had to be considered. Every mixture in the *Formulary* at present had some flavouring agent or other which had been found by patient trial and experiment to be the best for that particular medicine.

Dr. WOOLLEY asked whether the synthetic flavouring agents now available had been tried out. Dr. DAVIES said that all had been tried. Many samples of these had been received from America.

The motion was lost.

The Minister said he would like also to refer to more general matters, and to consider what still lay ahead of them. One of the things they wanted to achieve was that more patients were treated in their own homes and, on the

whole, fewer in hospital. He did not put that forward on economic grounds, though these were a factor, but many patients would in fact benefit greatly if they could be treated in their own familiar surroundings and without the disturbance, stress, and anxiety of removal to hospital. If the cost of the hospital service continued to grow it would inevitably absorb more and more of the money set aside for the Health Service. They must strive to lighten the load on the hospital, provided this could be done without any detriment to the patient. The treatment of a greater variety of patients at home should add enormously to the value and interest of the work of the general practitioner. He believed that direct consultation with the consultant was of first importance, and he had no doubt that the vast majority of those present took full advantage of the opportunities which existed.

"One thing I regard as of vast importance, that a general practitioner should have direct access, not of charity but of right, to x-ray and pathological services. He should be told, and at once, when his patient leaves hospital, and when he refers the patient for consultation he should receive a considered opinion always from a senior member of the staff. He should be made always welcome in the hospital, and be considered part of the hospital service of his area in the fullest sense of the word. That is common practice in many places, but in too few, and that sort of welcome is not always extended to the general practitioner.

Liaison with Local Authority

"Let me turn to the liaison between the general practitioner and the local health authority, particularly in preventive work. I have been struck with the difference here as I go about the country. I find that in many areas there is close touch between health visitors and general practitioners, and usually in such places there is an able and energetic medical officer of health, but that is not true in other areas. Many feel that there are too many people concerned with the welfare of the patient, and that there is danger of the practitioner being crowded out. There is no danger of that, provided the general practitioner is recognized to be the clinical head of the whole team. If we can achieve that we shall have achieved the partnership we wish.

"We are engaged in a great experiment in social medicine, but it must not be strangled by too much administration or too much central direction. I know you feel that there is too much, and, believe me, I sympathize. It is because of circumstances and the financial position of the moment that I am forced to keep the reins as firmly in my hands as I do, but all my instincts are towards giving greater freedom, and all my efforts will be directed to that end, however crabwise you may think my movements may be.

Appeal for Co-operation

"It has been a very good thing for me to get to know you. The Minister of Health should be something more to this profession than just a name at the foot of one of those incomprehensible circulars you receive from time to time. I can at least say one thing in self-defence. I do not assume that when proposals are put to me by the medical profession they are either necessarily biased or necessarily wrong. I do not work on the assumption either that our own proposals are necessarily always right. I want to seek your help and the help of all the other professions engaged in the Service. This is not a job that Ministers or Departments can do alone. It is essentially something in which we must work together. I need your help, and I hope you too will feel that any help I can give is most willingly at your disposal. It is only in partnership that we are going to solve these problems and achieve the true potentiality of the National Health Service." (Loud applause.)

Dr. TALBOT ROGERS, in thanking the Minister, said that what he had put forward as the rights of the general practitioner were just the things that the profession had been working towards for many years.

CONFERENCE DINNER

At the conclusion of the Conference the representatives dined together at the Dorchester Hotel, Dr. W. M. KNOX presiding. In proposing the health of the General Medical Services Committee, who were the guests of the evening, Dr. F. E. GOULD (Birmingham) remarked that the *Journal* had stolen his ammunition by publishing in the preceding week an article on the functions and activities of the Committee. The Committee put in a great deal of work, for which it received no material reward. Its members had an inordinate number of documents to study, and they did study them to some purpose. To control such an expert, informed, and energetic body was no small task, and they were to be congratulated on having Dr. Talbot Rogers in the chair. He felt that the speeches he had made at the Special Conference and the Extraordinary General Meeting, as well as at the Annual Conference that day, were such as to rank him worthily with his predecessors in office.

Dr. TALBOT ROGERS, in responding, declared himself to be proud of his Committee—a good and a very necessary Committee. Had there been no General Medical Services Committee and no Insurance Acts Committee before it, the position of general practitioners under the present Service would be very different from what it was. Dr. Rogers further said how pleased they all were to have with them that evening the President of the Association, Dr. P. T. O'Farrell, who had come all the way from Dublin to attend; also certain members of the Medical Practices Committee.

As proof of what the "periphery" thought about the body representing it, it was significant that as a result of one change, and that was on account of the retirement of Dr. D. B. Evans, who had helped the Committee and its predecessor in the most valuable way during the last eleven years and would be greatly missed. It was sometimes said that the Committee was not interested in anything except remuneration, and that then it was on the side of the "big battalions." On the evidence presented to the Conference that day it would be difficult to believe that that was all it did. It was a committee of manifold duties and responsibilities, and he himself was very proud—and not a little surprised—to be its Chairman. He paid a tribute to its only treasurer of the Defence Trust. He thanked also the Scottish members who had presented the Chair with a handsome gavel on which were inscribed the names of the Chairmen of the Committee since its inception. Although the Insurance Acts Committee started in 1913, there had only been, including himself, seven Chairmen of the two Committees, and one of them, still happily vigorous, entered on his chairmanship thirty years ago—namely, Dr. Guy Dain.

Dr. A. S. WILSON proposed the toast of the Chairman of the Conference, and commented on his pleasant manner towards all who made their way to the rostrum. Dr. KNOX paid a tribute to the Association staff, who had made the Conference such a success by the amount of work they had put in behind the scenes, and he spoke particularly of the valuable services of the secretary of the Committee, Dr. D. P. Stevenson.

The collection for the Dain Fund brought in the handsome sum of £200.

UNIVERSITY DEGREE CEREMONY, CARDIFF

There is to be a congregation of the University of Wales from 3.15 to 4.45 p.m. on Friday, July 17, in the City Hall, Cardiff, for the conferment of degrees. It is understood that there will be a number of distinguished medical men receiving degrees, and the University invites the presence at the ceremony of members of the B.M.A. and their ladies. Any members wishing to be present are asked to apply for tickets to the Registrar, University Registry, Cathays Park, Cardiff, by June 30.

British Medical Association

AGENDA OF ANNUAL REPRESENTATIVE MEETING, JULY 9, 1953, IN THE CORY HALL, CARDIFF, AND JULY 10, 11, AND 13 IN THE CITY HALL, CARDIFF

CHAIRMAN: DR. S. WAND, Birmingham

PRELIMINARY BUSINESS

Items 1 to 7 relate to preliminary business.

REPORT OF AGENDA COMMITTEE

Grouping of Motions and Amendments

8. The Committee has arranged certain Motions and Amendments which cover substantially the same ground in groups and has selected in each group one Motion or Amendment (marked with an asterisk) on which it proposes that discussion should take place. The Representatives of the constituencies concerned have been informed of these proposals in accordance with Standing Order 21 (iii).

Order of Business

9. The Committee Recommends:

Recommendation: (1) That the first business on Friday, July 10, be the business under "Public Health," if not previously dealt with;

(2) That the business under "Overseas" be taken at 11 a.m. on Saturday, July 11;

(3) That "Other Motions by Divisions and Branches," if not previously dealt with, be considered as the first business on Monday, July 13, after the Official Vote of Thanks;

(4) That, with these exceptions, the order of the business be as set out in the Agenda.

STANDING ORDERS

10. Motion by the Chairman: That the Standing Orders (Doc. A.R.M. 5) as circulated with this Agenda be adopted as the Standing Orders of the Meeting.

PRELIMINARY

11. Motion by the Chairman of Council on behalf of the Council: That the Annual and Supplementary Reports of Council under "Preliminary" (Doc. A.R.M. 2, paras. 1-20 and Doc. A.R.M. 3, paras. 205-10) be received.

Election of Honorary Member

12. Motion by the Chairman of Council: That His Royal Highness the Duke of Edinburgh, K.G., K.T., be elected as an Honorary Member of the Association.

Election of a Vice-President

13. Motion by the Chairman of Council: That Professor Sir Henry Cohen, J.P., LL.D., M.D., F.R.C.P., F.F.R., be elected a Vice-President of the Association in recognition of his outstanding services to the Association.

President, 1954-5

14. Motion by the Chairman of Council: That Professor Sir John McNee, D.S.O., M.D., D.Sc., F.R.C.P., Glasgow, be elected as President of the Association for 1954-5.

Joint Annual Meeting, Toronto, 1955:

President, 1955-6

15. Motion by the Chairman of Council: That Thomas Clarence Routley, C.B.E., LL.D., M.D., F.R.C.P.(C.), Toronto, be elected as President of the Association for 1955-6.

Representative of the Medical Branch of the Royal Navy on the Council

16. Motion by the Chairman of Council: That Surgeon Rear-Admiral O. D. Brownfield, C.B., O.B.E., be elected as the representative of the Medical Branch, Royal Navy, on the Council for the period 1952-5.

Remainder of Report under "Preliminary"

17. Motion by the Chairman of Council: That the remainder of the Annual and Supplementary Reports of Council under "Preliminary" be approved.

WALES

18. Motion by the Chairman of the Welsh Committee on behalf of the Council: That the Annual Report of Council under "Wales" (Doc. A.R.M. 2, para. 183) be received.

19. Motion by the Chairman of the Welsh Committee: That the Annual Report of Council under "Wales" be approved.

SCOTLAND

20. Motion by the Chairman of the Scottish Committee on behalf of the Council: That the Annual Report of Council under "Scotland" (Doc. A.R.M. 2, paras. 169-82) be received.

21. Motion by the Chairman of the Scottish Committee: That the Annual Report of Council under "Scotland" be approved.

BUILDING

22. Motion by the Chairman of the Building Committee on behalf of the Council: That the Annual Report of Council under "Building" (Doc. A.R.M. 2, para. 137) be received.

23. Motion by the Chairman of the Building Committee: That the Annual Report of Council under "Building" be approved.

ARMED FORCES

24. Motion by the Chairman of the Armed Forces Committee on behalf of the Council: That the Annual Report of Council under "Armed Forces" (Doc. A.R.M. 2, paras. 150-4) be received.

25. Motion by the Chairman of the Armed Forces Committee: That the Annual Report of Council under "Armed Forces" be approved.

MEDICAL FILMS

26. Motion by the Chairman of the Film Committee on behalf of the Council: That the Annual Report of Council under "Empire Medical Advisory Bureau" (Doc. A.R.M. 2, paras. 189 and 190) be received.

27. Motion by the Chairman of the Film Committee: That the Annual Report of Council under "Medical Films" be approved.

MEDICAL BENEVOLENCE

28. Motion by the Chairman of the Charities Committee on behalf of the Council: That the Supplementary Report of Council under "Medical Benevolence" (Doc. A.R.M. 3, paras. 252-4) be received.

29. **Motion** by the Chairman of the Charities Committee: That the Supplementary Report of Council under "Medical Benevolence" be approved.

WORLD RELATIONS

30. **Motion** by the Chairman of the International Relations Committee on behalf of the Council: That the Annual Report of Council under "World Relations" (Doc. A.R.M. 2, paras. 192-6) be received.

31. **Motion** by the Chairman of the International Relations Committee: That the Annual Report of Council under "World Relations" be approved.

Export of Antibiotics to China

32. **Motion** by TOWER HAMLETS: That this Representative Body requests the Council of the B.M.A. to use its influence with Her Majesty's Government so as to allow the export of antibiotics to the medical profession of China.

OCCUPATIONAL HEALTH

33. **Motion** by the Chairman of the Occupational Health Committee on behalf of the Council: That the Annual and Supplementary Reports of the Council under "Occupational Health" (Doc. A.R.M. 2, paras. 90-3, and A.R.M. 3, paras. 236-9) be received.

Duties of and Ethical Rules for Industrial Medical Officers

34. **Motion** by HENDON: That the Representative Body cannot agree that industrial medical officers should be permitted to undertake continued treatment of workpeople, and instructs the Council not to depart from the rules at present in operation.

35. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting, while it wholeheartedly supports the Council's view that the continued treatment, even of minor conditions, by industrial medical officers *without consultation with the family doctor* is unethical, is of opinion that a letter sent to the family doctor shall be deemed adequate consultation in this connexion.

36. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That this Meeting, while it wholeheartedly supports the Council's view that no case has been made out for the abolition of the existing ethical rules for industrial medical officers, urges that these rules should be specifically brought to the notice of all industrial medical officers, whether members of the Association or not, and hopes that these rules will be scrupulously observed.

Remainder of Report under "Occupational Health"

37. **Motion** by the Chairman of the Occupational Health Committee: That the remainder of the Annual and Supplementary Reports of Council under "Occupational Health" be approved.

FINANCE

38. **Motion** by the Treasurer on behalf of the Council: That the Annual and Supplementary Reports of Council under "Finance" (Doc. A.R.M. 2, paras. 127-36, and A.R.M. 3, para. 246) and Appendix V and the Financial Statement for the year ending December 31, 1952 (Doc. A.R.M. 3A), be received.

Membership Subscription

39. **Motion** by the Treasurer: That para. 134 of the Annual Report of Council be approved.

40. **Amendment** by TUNBRIDGE WELLS: That the membership subscription be modified for members who are assessed under Schedule E, so that the net cost of membership may be equitable throughout the profession.

41. **Amendment** by MID-CHESHIRE: That this Meeting considers that the reduced subscription of £4 4s. should be granted to all whole-time salaried members of the Association.

Remainder of Report under "Finance"

42. **Motion** by the Treasurer: That the remainder of the Annual and Supplementary Reports of Council under "Finance" be approved.

"BRITISH MEDICAL JOURNAL"

43. **Motion** by the Chairman of the Journal Committee on behalf of the Council: That the Annual Report of Council under "British Medical Journal" (Doc. A.R.M. 2, para. 125) be received.

44. **Motion** by the Chairman of the Journal Committee: That the Annual Report of Council under "British Medical Journal" be approved.

Composition of "Journal"

45. **Motion** by EASTBOURNE: That the composition of the Journal be altered so that at least one-third of the matter be devoted to clinical subjects of interest to general practitioners.

Reports of Divisional Meetings in "Supplement"

46. **Motion** by CHELSEA AND FULHAM: That the Representative Body considers that reports of Divisional meetings on subjects of general interest should be given more prominence in the *British Medical Journal Supplement* and be printed in whole or in part in large type.

"FAMILY DOCTOR"

47. **Motion** by the Chairman of the Family Doctor Committee on behalf of the Council: That the Annual Report of Council under "Family Doctor" (Doc. A.R.M. 2, para. 126) be received.

48. **Motion** by the Chairman of the Family Doctor Committee: That the Annual Report of Council under "Family Doctor" be approved.

49. **Amendment** by SWANSEA: That the *Family Doctor*, with the name of the British Medical Association on its cover, is advertising drugs of doubtful value for the purpose of swelling its income. This is an unethical practice, and, although it is stated that *Family Doctor* depends largely on its advertisement income for its existence, this meeting nevertheless calls for the cessation of this practice.

50. **Motion** by WINCHESTER: That this Meeting congratulates the editorial staff on the increased success of *Family Doctor* during the past year.

PUBLIC HEALTH

51. **Motion** by the Chairman of the Public Health Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Public Health" (Doc. A.R.M. 2, paras. 94-104, and A.R.M. 3, paras. 240-5) be received.

Arbitration Machinery

52. **Motion** by MID-HERTS: That this Meeting deplores the lack of a Whitley Court of Arbitration to which there should be a right of appeal by unilateral reference and instructs Council to take immediate and urgent action to obtain the necessary amendments of the Industrial Disputes Order to enable disputes to be reported by the Association to the Minister of Labour under that Order.

53. **Motion** by WESTMINSTER AND HOLBORN: That this Representative Body expresses its resentment and grave anxiety that there is still no agreement on arbitration. As amended and the B.M.A. is still excluded from this Order, thus precluding the Association from submitting any dispute to the Ministry of Labour, this Meeting therefore demands urgency, to ensure that arbitration machinery be set up. It further asserts that the requests for arbitration shall not be subject to the Minister's veto. It is imperative that

S.I. 1376 be amended in order to terminate the Association's present disability to refer a dispute to the Ministry of Labour. That this Representative Body pleads for the active support of all other professional bodies engaged in the N.H.S. whose position is likewise prejudiced by exclusion from the Order.

Infectious Diseases

54. **Motion** by CITY: That, since the frequency and rapidity of travel often makes vaccination against smallpox unnecessary in adult life, when there is a possibility of undesirable complications if the vaccination is then done for the first time, the Association do declare its continued belief that it is in the interest of every individual to be vaccinated in infancy, the Association take immediate measures centrally and through the Divisions to secure the vaccination of every person at least once during infancy and urge the Government to act for the same purpose.

Remainder of Report under "Public Health"

55. **Motion** by the Chairman of the Public Health Committee: That the remainder of the Annual and Supplementary Reports of Council under "Public Health" be approved.

Health Visitors

56. **Motion** by CITY: That the Association welcomes health visitors as a means by which general practitioners may increase the help they may give to their patients, and encourages health authorities to increase the number of health visitors, where necessary.

HOSPITAL AND CONSULTANT SERVICES

57. **Motion** by the Chairman of the Central Consultants and Specialists Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Hospital and Consultant Services" (Doc. A.R.M. 2, paras. 63-87, and A.R.M. 3, paras. 222-35) be received.

Review of Remuneration of Hospital Medical Staff

*58. **Motion** by NOTTINGHAMSHIRE: That this Meeting is of the opinion that an adequate betterment factor should be accorded to the consultants and specialists, in conformity with the intention of the Spens report accepted by the Government and profession and already implemented in the case of the general practitioners by the Danckwerts award.

59. **Motion** by KESTIVEN: That this Meeting recommends that the Spens report on remuneration for consultants be implemented so that the betterment factor be apportioned at an appropriate figure and awarded at an early date.

60. **Motion** by OXFORD: That the A.R.M. wishes to emphasize its support for the action taken as embodied in para. 65 of the Annual Report of Council.

61. **Motion** by SOUTHAMPTON: That in view of the consultants' and specialists' dissatisfaction with the implementation of the intention of the Spens report, this Representative Body appreciates the action which has been taken and expresses the hope for an early settlement.

62. **Motion** by MARYLEBONE: That this Meeting supports the Staff Side of Committee "B" of the Medical Whitley Council in their "betterment" claim.

The Whitley Machinery

63. **Motion** by MARYLEBONE: That in view of the frustration experienced in the Whitley machinery, this Meeting advises the Central Consultants and Specialists Committee and the Joint Consultants Committee to withdraw from Whitley, and to arrange a direct approach to the Minister.

Security of Tenure

64. **Motion** by SOUTH MIDDLESEX: (1) That no contracts made by the hospital regional board with its consultant

staff should be varied without prior consultation with the individual and medical committees of the establishments concerned.

(2) That all advertisements for consultant posts should contain full details of the appointments and duties of the individual concerned.

Reduction in Senior Registrar Establishment and Expansion of Consultant Services

65. **Motion** by MARYLEBONE: That this Meeting is of the opinion that the Minister should increase the number of part-time consultant posts in general medicine and general surgery.

Junior Hospital Staffing Difficulties

66. **Motion** by WEST BROMWICH AND SMETHWICK: That the Representative Body observes with concern that preference is being given to teaching hospital registrars in appointment of consultants and senior registrars. This policy has seriously affected the recruitment of registrars to the non-teaching hospitals, with an ultimate threat to their efficiency and the comprehensive training of registrars, and Council is asked to seek a remedy.

Senior Hospital Medical Officers

67. **Motion** by DARTFORD: That this Meeting is of opinion that senior hospital medical officers are not adequately represented at all discussions concerning their terms and conditions of service.

Whole-time Officers

68. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That para. 72 of the Annual Report of Council and para. 229 of the Supplementary Report be approved.

*69. **Amendment** by STIRLING: That this Meeting calls upon Council to promote the interests of whole-time hospital officers by endeavouring to secure for these officers full and direct representation on Whitley Committee "B."

70. **Amendment** by DORSET: That whole-time specialists should have reasonable representation on the Whitley Committee "B."

Legal Actions

71. **Motion** by EAST NORFOLK: That this Meeting requests Council to set up a committee to inquire at the highest levels into the increasing litigation against doctors.

72. **Motion** by WEMBLEY: That the Council of the B.M.A. be invited to consider the recent unfavourable legal decisions against medical practitioners and to examine the present legal procedure with a view to recommending some other method of determining cases imputing professional negligence.

73. **Motion** by REIGATE: That the B.M.A. should strengthen its organization in the medico-legal field.

74. **Motion** by BRISTOL: That Council be instructed to investigate the merits of the various ways in which medical evidence may be given and assessed in courts of law.

75. **Motion** by NEWCASTLE-UPON-TYNE: That this Division feels that the B.M.A. should give more support to their members in court cases and other cases where they are in trouble.

76. **Motion** by SOUTHAMPTON: That this Meeting is concerned with the position of casualty officers as the result of recent legal actions, and the effect that it will have on the future staffing of casualty departments of hospitals, and urges Council to continue its efforts to seek a solution to the problem.

77. **Motion** by SOUTH WARWICKSHIRE: That this Meeting, bearing ever in mind that medicine is not an exact science and that clinical phenomena never follow rigid laws, (i) asserts that medical practitioners should not be held responsible (and liable for damages) on account of an incorrect diagnosis, provided that reasonable care and attention have been given and no negligence has been proved, and (iii) urges that steps should be taken to re-establish this principle.

Provision of Diagnostic and Ancillary Facilities

78. **Motion** by CITY: That the Ministry of Health be urged to supply the means for pathological laboratories and radiological departments in hospitals to give direct service to general practitioners.

79. **Motion** by NORTH GLAMORGAN AND BRECKNOCK: That general practitioners have direct access to hospital physiotherapy departments where such arrangements existed prior to the National Health Service Act.

Fees for Lectures to Nurses

80. **Motion** by CITY: That the Ministry of Health be requested to order that fees for lectures by doctors to hospital nurses should be paid on the scale agreed retrospectively to July, 1948.

Domiciliary Consultation Arrangements

81. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That paras. 83 and 233 of the Annual and Supplementary Reports of Council be approved.

82. **Amendment** by SOUTHAMPTON: That Council be instructed to take urgent and strong action to implement Minute 218 of the A.R.M., 1952.

83. **Amendment** by ENFIELD AND POTTERS BAR: That this Meeting feels most strongly that fees should be payable to whole-time consultants and specialists for domiciliary visits.

Remainder of Report under "Hospital and Consultant Services"

84. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That the remainder of the Annual and Supplementary Reports of Council under "Hospital and Consultant Services" be approved.

Constitution of Central Consultants and Specialists Committee

85. **Motion** by SHEFFIELD and DERBY: That the following proposal be referred to the Council for consideration: "That the Central Consultants and Specialists Committee be composed of part-time and whole-time consultants in the same proportion as they exist in the National Health Service."

Appointment to Part-time Consultant Posts

86. **Motion** by WEST BROMWICH AND SMETHWICK: That the Representative Body of the B.M.A. observes with concern that vacant part-time consultant appointments are not being advertised, and are filled by seconding existing whole-time consultants to them, and asks the Council to consider the propriety of such policy and its ultimate consequences.

Dependants of Services Personnel and Hospital Waiting-lists

87. **Motion** by RUGBY: That a recommendation (not a "directive") be issued by each regional hospital board to the effect that the dependants of Services personnel (and possibly of others) who are posted from area to area when on civil hospital waiting-lists be sympathetically reviewed on arrival in the new area, and the time already on a waiting-list be taken into consideration.

Delays in Hospital Out-patient Departments

88. **Motion** by BIRMINGHAM: That the Council be requested to investigate (a) the long wait for appointments at hospital out-patient departments, (b) the long wait by general practitioners for reports on patients, and to make recommendations to remove the difficulties.

GENERAL MEDICAL SERVICES

89. **Motion** by the Chairman of the General Medical Services Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "General Medical Services" (Doc. A.R.M. 2, paras. 21-57, and Doc. A.R.M. 3, paras. 211-19), the Memorandum of Evidence submitted by the Council to the Committee on General Practice of the Central Health Services Council

(Doc. A.R.M. 7), and the Report of the Subcommittee on Service Committees and Tribunal Regulations (Appendix IV) be received.

The Dankwerts Award and the Small-list Practitioner

90. **Motion** by the Chairman of the General Medical Services Committee: That paras. 27 and 212 of the Annual and Supplementary Report of Council be approved.

91. **Amendment** by KENSINGTON AND HAMMERSMITH: That the extra loading should be placed on the first 1,000 as originally intended so as not to penalize the small-list practitioner and the new entrant to practice.

Filling of Vacancies

92. **Motion** by the Chairman of the General Medical Services Committee: That para. 32 of the Annual Report of Council be approved.

93. **Amendment** by CLEVELAND: That sections (a) (i) and (ii) of the paragraph be amended by the addition of the words "in consultation with the local medical committee."

*94. **Amendment** by SOUTH STAFFORDSHIRE: That Section (c) of the paragraph be referred back to Council.

95. **Amendment** by WESTMINSTER AND HOLBORN: That this Meeting expresses concern regarding para. 32(c) of Council's Report and requests Council to reconsider this matter. It encroaches considerably upon professional freedom and is liable to cause serious conflict between the liberties of individuals, for example, the right of two doctors to enter into partnership agreement based upon a contract governed by the provisions of the Partnership Act, and a "directive" of the Minister.

96. **Motion** by KESTIVEN: That when filling a vacancy in a partnership a partner(s) shall select a new partner for approval of the local executive council.

97. **Motion** by NEWCASTLE-UPON-TYNE: That the Minister be asked to advise that executive councils should give equal consideration to practitioners who have spent several years in hospital as to other applicants for practice vacancies.

Mileage

98. **Motion** by GATESHEAD: That mileage payments be assessed with regard to actual accessibility of patients rather than to broad classifications of types of practice.

99. **Motion** by WEST DENBIGH AND FLINTS: That the standard rate of payment in respect of mileage should apply to all practitioners who at present can claim for mileage allowance.

Inflation of Lists

100. **Motion** by the Chairman of the General Medical Services Committee: That para. 35 of the Annual Report of Council be approved.

101. **Amendment** by PADDINGTON: That persons removed in error from a doctor's list, whether by the "purge" or not, shall be reinstated when the error is discovered, and as from the date of their removal. They shall not be debarred from this by six months or any other limit.

Treatment of Services Personnel on Leave

102. **Motion** by the Chairman of the General Medical Services Committee: That para. 40 of the Annual Report of Council be approved.

103. **Amendment** by TUNBRIDGE WELLS: That this Meeting disagrees with the proposal to treat Service personnel as temporary residents.

Representation of General Practitioners in Hospital Administration

104. **Motion** by BATH: That this Meeting feels that general practitioners are not sufficiently represented on hospital management committees, and asks that the Council will approach the Minister and urge that he will allow at least two representatives from general practitioners to serve on all hospital management committees.

Sale of Goodwill

105. **Motion** by the Chairman: That para. 45 of the Annual Report of Council be approved.

*106. **Amendment** by MARYLEBONE: That, the Amending Acts Committee having recommended the restoration of the right to sell goodwill, this Representative Meeting requests the Council of the Association to consider the matter further and report to the Representative Body in 1954.

107. **Amendment** by WESTMINSTER AND HOLBORN: That as this question is one which concerns all other branches of the profession, as well as those doctors in practice under the N.H.S., this Representative Body, reaffirming its belief that ultimately the freedom of the profession rests on the restoration of the right to buy and sell the goodwill of practices, calls upon Council to reconsider the recommendations of the Amending Acts Committee and the G.M.S. Committee and to report on a practicable method of achieving the restoration of this right to the next A.R.M.

108. **Amendment** by SOUTH STAFFORDSHIRE: That it be an instruction to the Council to produce a scheme for the return of goodwill.

Charges for Prescriptions

109. **Motion** by GATESHEAD: That the prescription charge be greater for proprietary than for non-proprietary drugs.

Economy in Prescribing

110. **Motion** by the Chairman of the General Medical Services Committee: That para. 49 of the Annual Report of Council be approved.

111. **Amendment** by REIGATE: That this Representative Body deplores the attitude under para. 49 (iii) of the Annual Report of Council. That in the interests of national economy patients attending hospital regularly should have their medicines dispensed by the hospital and not by the family doctor.

Investigation of Prescribing

112. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That in view of the long interval that elapses between the issuing of Form E.C.10, and the raising of any objection thereto by the Pricing Bureau, a practitioner should not be liable to a fine for any further Forms E.C.10 issued for the same preparation during this latent interval.

113. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That Council be requested to consider forthwith the plight of practitioners who, having been asked by the Executive Council for clinical details of a patient (prior to the Council's decision whether a preparation prescribed on Form E.C.10 was a food or a drug) failed to get the patient's consent to such disclosure, and were consequently surcharged.

Medicines and Appliances for Doctors' Surgeries

*114. **Motion** by SWANSEA: That Form E.C.10A for the supply of stock orders for doctors' surgeries should be introduced in England and Wales in the same way as it is at present used in Scotland.

115. **Motion** by BUCKINGHAMSHIRE: That doctors in England and Wales should be permitted to prescribe drugs for use in the surgery on Form E.C.10A as in Scotland.

116. **Motion** by EAST KENT: That efforts be made to introduce Form E.C.10A for use in England as well as in Scotland.

Maternity Medical Services

117. **Motion** by DARTFORD: That the medical practitioner providing maternity medical services as laid down by the regulations should receive the full fees irrespective of whether the patient has attended for that pregnancy a previous practitioner.

*118. **Motion** by WORCESTER AND BROMSGROVE: That all women should be entitled to receive a maternity outfit wherever they are being delivered.

119. **Motion** by DUNDEE: That the maternity pack supplied by the local authority for use in domiciliary confinements be also supplied for confinements in nursing-homes.

Obstetric List

120. **Motion** by SOUTH STAFFORDSHIRE: That Council be asked to report the steps that have been taken to secure the abolition of the obstetric list.

Certification for Surgical Corsets

121. **Motion** by the Chairman of the General Medical Services Committee: That para. 57 of the Annual Report of Council be approved.

122. **Amendment** by SOUTHAMPTON: That evidence is already available that the demand for certificates on practitioners has increased and not decreased since the amended list of complaints which carry exemption from purchase tax was published; that this Meeting regards the change of name of splanchnoptosis for visceroptosis as absurd and misleading, and recommends that certificates should not be required from any medical practitioner for exemption of purchase tax.

National Formulary

123. **Motion** by the Chairman of the General Medical Services Committee: That para. 219 of the Supplementary Report under General Medical Services be approved.

124. **Amendment** by MID-CHESHIRE: That this Meeting considers that the revised *National Formulary* should adopt a clinical rather than an alphabetical classification.

125. **Motion** by STIRLING: That in future editions of the *National Formulary* preparations be listed alphabetically according to their Latin names.

126. **Motion** by WORCESTER AND BROMSGROVE: That when the *National Formulary* is next revised formulae should be listed in alphabetical order in Latin as in the editions previous to the present one, and that the metric system equivalents should be printed in parentheses.

Committee on General Practice of the Central Health Services Council

127. **Motion** by the Chairman of the General Medical Services Committee: That paras. 33 and 216 of the Annual and Supplementary Reports of Council and the Memorandum of Evidence submitted by the Council to the Committee on General Practice of the Central Health Services Council (Doc. A.R.M. 7) be approved.

128. **Amendment** by MARYLEBONE: That para. 14 of the memorandum of evidence be amended by the deletion of the words "and the small and diminishing amount of private practice" and the word "even."

(The first sentence of this paragraph of the memorandum would then read:

"The large and increasing proportion of the public availing themselves of general medical services under the Act does indicate that, allowing for changed economic conditions, the public is, by and large, well satisfied with the services given.")

Remainder of Report under "General Medical Services"

129. **Motion** by the Chairman of the General Medical Services Committee: That the remainder of the Annual and Supplementary Reports of Council under "General Medical Services" be approved.

Supply of Medicines to Private Patients

130. **Motion** by GLASGOW: That this Representative Body requests that further representations be made to the Ministry of Health to take immediate steps to allow the issue of medicines on Form E.C.10 to private patients.

131. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That action should again be taken to try to secure for private patients the right to obtain medicines, etc., on Form E.C.10, subject to the same conditions as those in force for National

Health Service patients, and to retention by the Minister of the same degree of control over the prescribing practitioners.

132. **Motion** by RUGBY and SOUTH WARWICKSHIRE: That registered medical practitioners, although not in general practice under the National Health Service, should nevertheless be at liberty to prescribe medicines, etc., on Form E.C.10, provided that they agree to accept the current National Health Service terms of service and obligations in respect to prescribing so far as these be applicable.

Ophthalmic Services

133. **Motion** by DARTFORD: That Form O.S.C.1 should be abolished.

Period of Employment of Permanent Assistants

134. **Motion** by LEWISHAM: That this Representative Body do instruct Council to consider possible methods whereby a principal may not employ a permanent assistant for a greater period than, say, two years.

Private Certificates for Fitness for Employment

135. **Motion** by CARDIFF: That medical certificates required for fitness to undertake employment should be obtained from an independent medical referee at the expense of the prospective employers.

Notification to Executive Councils of Changes of Name

136. **Motion** by LEWISHAM: That Registrars of Births, Marriages, and Deaths be asked to notify executive councils of changes of name due to marriage in females in addition to their present actions on death.

Hours of Dispensing Pharmacists

137. **Motion** by LEWISHAM: That the Representative Body considers the hours of dispensing pharmacists in most cases inadequate—that they should be pressed to give more effective service during the evening, on early closing days, and at week-ends.

Payments to General Practitioners

138. **Motion** by MORPETH: That practitioners in the National Health Service be paid half quarterly as in the past.

Change of Practice

139. **Motion** by NORTH GLAMORGAN AND BRECKNOCK: That ways and means be explored to make it easier for general practitioners to change practice.

Employment of General Practitioners in Hospitals

140. **Motion** by TORQUAY: That it should be the policy of the British Medical Association to strive for the early establishment of general-practitioner hospitals; this objective taking precedence over the development of health centres.

Supply of Drugs to Doctors

141. **Motion** by BURTON-ON-TRENT: That this Meeting expresses the opinion that the supply of drugs to doctors should be on the same terms as the supply of drugs to chemists.

Trainers of Trainee Assistants

142. **Motion** by NEWCASTLE-UPON-TYNE: That a trainer of trainee assistants should only be allowed to function as such in alternate years.

Records of Institutional Midwifery Cases

143. **Motion** by NEWCASTLE-UPON-TYNE: That, following the Scottish suggestion, the appropriate Committee might discuss with the Minister of Health a similar suggestion for England—i.e., that maternity record cards in respect of patients confined in hospital be completed by hospital authorities and sent to the patient's own doctor immediately after the patient's discharge from hospital.

COMPENSATION AND SUPERANNUATION

144. **Motion** by the Chairman of the Compensation and Superannuation Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Compensation and Superannuation" (Doc. A.R.M. 2, paras. 58-60, and Doc. A.R.M. 3, para. 220) be received.

Payment of Compensation

145. **Motion** by the Chairman of the Compensation and Superannuation Committee: That para. 59 of the Annual Report of Council be approved.

146. **Amendment** by SOUTH MIDDLESEX: That compensation should be payable on demand.

147. **Amendment** by CITY OF EDINBURGH: That the Council be asked to open negotiations with the appropriate Government department for payment to be authorized from compensation due, when considerable improvements are made to surgery accommodation involving capital outlay.

148. **Motion** by MORPETH: That principals in general practice in the National Health Service, when taking a partner, be allowed to realize their practice compensation moneys relative to the share of the partnership given to the new partner.

Remainder of Report under "Compensation and Superannuation"

149. **Motion** by the Chairman of the Compensation and Superannuation Committee: That the remainder of the Annual and Supplementary Reports of Council under "Compensation and Superannuation" be approved.

Financial Position of Practitioners Retiring

150. **Motion** by GUILDFORD: That the Council be instructed to inquire into the financial position of members of the profession who retire at the age of 60 or later, with special reference to the position of those who were over 45 years of age on the introduction of the N.H.S.

General Practitioners with Hospital Contracts, and Superannuation

151. **Motion** by WORCESTER AND BROMSGROVE: That where one or more partners in contract with an executive council to provide general medical services also have hospital authorities be requested to credit the gross remuneration to the executive council concerned, who would then deduct superannuation from the partnership shares.

ORGANIZATION

152. **Motion** by the Chairman of the Organization Committee on behalf of the Council: That the Annual Report of Council under "Organization" (Doc. A.R.M. 2, paras. 155-68) be received.

Annual Conference of Secretaries

153. **Motion** by MORPETH: That the Secretaries' Conference be held in conjunction with the A.R.M.

Overseas Representation in the Representative Body

154. **Motion** by the Chairman of the Organization Committee: That the following recommendation of the Council be adopted:

Recommendation: That the representation of the overseas Branches in the Representative Body be modified to provide:

(a) That every Branch not in Great Britain or Northern Ireland shall form a constituency, except that the Branches in the Republic of Ireland shall together form one constituency.

(b) That each constituency thus formed shall be entitled to elect one Representative, together with an additional Representative for each complete number of 100 members in excess of 50 members, subject to a maximum of three Representatives.

(c) That provision be not made for the appointment of Deputy Representatives.

Amendments of Articles and By-laws

155. **Motion** by the Chairman of the Organization Committee: That the following recommendation of the Council be adopted:

Recommendation: That the Articles and By-laws of the Association be altered in the manner shown in Appendix III and that the Council be instructed to submit the amendment of Article 39 (2) to an Extraordinary General Meeting of the Association.

Autonomous Bodies

156. **Motion** by the Chairman of the Organization Committee: That the following recommendation of the Council be adopted:

Recommendation: That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1953-4.

That the Representative Body looks to these Committees to ensure (1) that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and (2) that their autonomous powers will be used so as to expedite and not delay the work of the Association.

Remainder of Report under "Organization"

157. **Motion** by the Chairman of the Organization Committee: That the remainder of the Annual Report of Council under "Organization" be approved.

Appointment of Constitution Committee

158. **Motion** by WINCHESTER and MARYLEBONE: That an *ad hoc* Constitution Committee be formed to take evidence, consider, and report on a reorganization of the Representative Body.

159. **Motion** by WINCHESTER: That the Committee to be formed to consider the reconstitution of the Representative Body shall consist of twenty members, elected by this Meeting of the Representative Body, of which up to 50% may be members of Council. Members of the Committee shall be elected for their knowledge of the subject and not for any sectional interest.

160. **Motion** by WINCHESTER: That the Constitution Committee shall report its findings to a Special Representative Meeting within the next eighteen months.

Membership of Divisions and Branches

161. **Motion** by RUGBY: That members of the Association shall ordinarily be allocated, as hitherto, to the various Divisions (and Branches) purely on an address basis, but where by reason of ease of access, professional association, or for any other reason, a member finds it more convenient to attend the meetings of some other Division (or Branch) that member may, on application to Head Office, be transferred to the Division (or Branch) of his choice.

Branches of the Association

162. **Motion** by EAST KENT: That Council be requested to inquire into the position of Branches in the United Kingdom as intermediary between Headquarters and the Divisions, having particular regard to the increased efficiency and economy that might result from their abolition.

MEDICAL ETHICS

163. **Motion** by the Chairman of the Central Ethical Committee on behalf of the Council: That the Annual Report of Council under "Medical Ethics" (Doc. A.R.M. 2, paras. 105-8) and the Report of Council on Indirect Methods of Advertising (Appendix II) be received.

Indirect Methods of Advertising

164. **Motion** by the Chairman of the Central Ethical Committee: That the following recommendation to the Council be adopted:

Recommendation: That the revised statement on indirect methods of advertising be approved.

165. **Motion** by EAST YORKSHIRE: That this Meeting views with grave disquiet the tendency amongst certain members of the profession to allow their names to appear directly or the public notice in T.V. and sound radio programmes and in press accounts regarding illness in prominent national figures (other than the Royal Family), and considers that such actions are not in accordance with the ethical rules of the Association and urges the central Council to take action in accordance with these accepted rules.

166. **Motion** by HENDON: That the Representative Body deplores the paragraphs which frequently appear in the gossip columns of the Press giving estimates and details of the incomes of medical men, and requests that the matter be brought before the new Press Council as soon as possible.

Loan of Hospital Records to Government Departments

167. **Motion** by the Chairman of the Central Ethical Committee: That the following recommendation of the Council be adopted:

Recommendation: That the following amplified statement on the loan of hospital records to Government departments be approved:

(a) Medical records may be lent to Government departments only when written consent has been given by or on behalf of the patient. (b) The form of consent signed by or on behalf of the patient should include a statement that the disclosure of the information contained in the records will not necessarily be to the advantage of the claimant. (c) Wherever practicable, and particularly where disclosure of information may have an adverse psychological effect upon the patient, the practitioner who compiled the record, or, if he is not available, one nominated by the hospital authority for the purpose, should be consulted on the wisdom of disclosing to the patient all of the confidential information contained therein.

168. **Amendment** by CITY OF EDINBURGH: That the words "the medical officers employed by" be inserted after the words "lent to" in line 1 of Recommendation (a).

The first sentence of recommendation therefore to read "(a) Medical records may be lent to the medical officers employed by Government departments only when written consent has given given by or on behalf of the patient."

Remainder of Report under "Medical Ethics"

169. **Motion** by the Chairman of the Central Ethical Committee: That the remainder of the Annual Report of Council under "Medical Ethics" be approved.

PUBLIC RELATIONS

170. **Motion** by the Chairman of the Public Relations Committee on behalf of the Council: That the Annual Report of Council under "Public Relations" (Doc. A.R.M. 2, paras. 147-9) be received.

171. **Motion** by the Chairman of the Public Relations Committee: That the Annual Report of Council under "Public Relations" be approved.

Relationship of Public Relations Committee to B.M.J. Supplement

172. **Motion** by EAST HERTS: That with a view to improving the relations between the B.M.A. Central Organization and the periphery, the Public Relations Committee should co-operate in the publication of the Supplement of the British Medical Journal.

Annual Meeting of Public Relations Secretaries

173. **Motion** by EAST HERTS: That with a view to keeping the Public Relations machinery of the B.M.A. in readiness for an emergency, a meeting of the Divisional Public Relations Officers be held once a year.

PRIVATE PRACTICE

174. **Motion** by the Chairman of the Private Practice Committee on behalf of the Council: That the Annual Report of Council under "Private Practice" (Doc. A.R.M. 2, paras. 109-24) be received.

The Unattended Telephone

175. **Motion** by WORCESTER AND BROMSGROVE: That even stronger pressure be brought to bear on the G.P.O. in order that a satisfactory solution may be found speedily for the problem of the unattended telephone.

Life Assurance Forms

176. **Motion** by SWANSEA: That the fee for the long form of medical report for life assurance should be increased from £1 11s. 6d. to £2 2s.

Bonus-shift Certificates

177. **Motion** by LOTHIAN: That the Representative Body disapproves of the issuing of bonus-shift certificates to a miner, unless he has been actually attended by the doctor during his illness, and that the Council be asked to consider reopening the question with the National Coal Board.

Remainder of Report under "Private Practice"

178. **Motion** by the Chairman of the Private Practice Committee: That the remainder of the Annual Report of Council under "Private Practice" be approved.

Duration Certificates

179. **Motion** by RUGBY: That a practitioner should never comply with a request to issue a "Duration Certificate" (i.e., a medical report about the previous health and medical history of a person who has died shortly after having been accepted for life assurance (without prior medical examination)). Such a certificate could jeopardize, but could never be essential to establish the claim to, the assurance.

Road Traffic Act

180. **Motion** by PERTH: That the fee and mileage allowance under the Road Traffic Act, 1934, should now be reviewed.

Private Practice

181. **Motion** by GUILDFORD: That this Meeting deplores the absence again this year from the Annual Report of Council of any constructive step directed towards the encouragement of private practice, which still remains part of the stated policy of the B.M.A.

SCIENCE

182. **Motion** by the Chairman of the Science Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Science" (Doc. A.R.M. 2, paras. 138-46, and A.R.M. 3, paras. 247-9) be received.

183. **Motion** by the Chairman of the Science Committee: That the Annual and Supplementary Reports of Council under "Science" be approved.

Control of Therapeutic Substances

184. **Motion** by ISLE OF ELY: That this Meeting requests the British Medical Association to consider the advisability of seeking restrictions on the free sale of stilboestrol in view of the known dangers of this preparation and also in view of the known abuse of its present unrestricted sale to members of the public.

Press Announcements of New Drugs

185. **Motion** by PERTH: That this Meeting is concerned about the effect of premature and exaggerated reports in the public press about new drugs still on trial.

186. **Motion** by CONSETT: That this Meeting deplores the publication in the popular press of extracts from medical articles and newspaper articles of an irresponsible character praising new drugs without illustrating any potential dangers.

REFORM OF THE NATIONAL HEALTH SERVICE

187. **Motion** by the Chairman of the Amending Acts Committee on behalf of the Council: That the Annual Report of Council under "Reform of the National Health Service" (Doc. A.R.M. 2, paras. 88-9) be received.

188. **Motion** by the Chairman of the Amending Acts Committee: That the Annual Report of Council under "Reform of the National Health Service" be approved.

Co-operation Between the Four Divisions of the National Health Service

189. **Motion** by GREENWICH AND DEPTFORD: That this A.R.M. believes that greater co-operation between the four divisions of the Health Service—namely, local health authorities, regional hospital boards, teaching hospitals, and executive councils—is urgently necessary in the interests of (a) patients, (b) economy of man-power.

REVIEW OF GENERAL PRACTICE

190. **Motion** by the Chairman of the General Practices Review Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Review of General Practice" (Doc. A.R.M. 2, para. 61, and A.R.M. 3, para. 221) be received.

191. **Motion** by the Chairman of the General Practice Review Committee: That the Annual and Supplementary Reports of Council under "Review of General Practice" be approved.

GENERAL PRACTICE AND THE TRAINING OF THE GENERAL PRACTITIONER

192. **Motion** by the Chairman of Council on behalf of the Council: That the Annual Report of Council under "General Practice and the Training of the General Practitioner" (Doc. A.R.M. 2, para. 62) be received.

193. **Motion** by the Chairman of Council: That the Annual Report of Council under "General Practice and the Training of the General Practitioner" be approved.

OVERSEAS

194. **Motion** by the Chairman of the Overseas Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Overseas" (Doc. A.R.M. 2, paras. 184-8, and A.R.M. 3, paras. 250-1) be received.

195. **Motion** by the Chairman of the Overseas Committee: That the Annual and Supplementary Reports of Council under "Overseas" be approved.

EMPIRE MEDICAL ADVISORY BUREAU

196. **Motion** by the Chairman of the Committee of Management of the Empire Medical Advisory Bureau on behalf of the Council: That the Annual Report of Council under "Empire Medical Advisory Bureau" (Doc. A.R.M. 2, paras. 189 and 190) be received.

197. **Motion** by the Chairman of the Committee of Management of the Empire Medical Advisory Bureau: That the Annual Report of Council under "Empire Medical Advisory Bureau" be approved.

OTHER ASSOCIATION ACTIVITIES

198. **Motion** by the Chairman of Council: That the Annual and Supplementary Reports of Council "Other Association Activities" (Doc. A.R.M. 2, paras. 197-204, and A.R.M. 3, paras. 255-9) and the Memorandum of Evidence submitted to the Interdepartmental Committee on the Adoption of Children (Appendix VI) be received.

Remuneration of Civil Service Medical Officers

199. **Motion** by CARDIFF: That this meeting is concerned at the continued failure to adjust the salaries of our medical colleagues in the Civil Service, and recommends the Council to consider further action to be taken to resolve the dispute.

Committee to Examine the Problem of the Drug Bill

200. **Motion** by ST. HELENS: That in view of the failure of successive Governments effectively to assist the profession to reduce the Drug Bill, this Representative Body is called upon to appoint a committee to examine the problem and to make recommendations to the Ministry of Health.

Remainder of Report under "Other Association Activities"

201. **Motion** by the Chairman of Council: That the remainder of the Annual and Supplementary Reports of Council under "Other Association Activities" be approved.

OTHER MOTIONS BY DIVISIONS AND BRANCHES

Geriatric Units

202. **Motion** by LINCOLN: That this Meeting, realizing the pressing need for co-ordination of the various authorities caring for the aged, recommends the Minister to consider the establishment of geriatric units for that purpose, under the guidance of an experienced physician.

Whole-time State Salaried Service

203. **Motion** by MARYLEBONE: That this Meeting, representative of all branches of the profession, expresses its strong opposition to full-time salaried service, and reaffirms the resolution passed in May, 1946—"The medical profession is, in the public interest, opposed to any form of service which leads directly or indirectly to the profession as a whole becoming full-time salaried servants of the State or local authorities."

ELECTIONS

204. **Elect**: Chairman; Deputy Chairman; 10 Members of Council by R.B. as a whole; 2 Members of Council by Representatives of Scottish Constituencies; 1 Member of Council by Representatives of Constituencies in Wales (including Monmouthshire); and Members of Standing Committees and of Agenda Committee.

MINUTES

205. **Motion**: That the Chairman be empowered, on behalf of the Meeting, provisionally to approve the minutes of this Meeting.

206. Any other business.

COST OF AMBULANCE SERVICES

The second annual *Ambulance Services Costing Return*¹ for the year ending March 31, 1952, has been compiled by the Ministry of Health from information supplied by local health authorities. The return shows that, although authorities have tried to ensure that only patients who really needed ambulance transport were carried, the numbers of patients and of miles covered have increased.

	Patients	Mileage
1950-1	9,000,000	89,000,000
1951-2	11,000,000	92,000,000

To some extent the increase in the total number of patients carried is accounted for by the adoption by more authorities of the standard method of computation, defining a patient as "one patient carried once in one direction." Despite these increases the average number of miles run per patient has fallen from 9 to 8.3 and the average cost per patient has fallen from 15s. 6d. to 15s. 2d.

Voluntary Reinforcements

At the end of the year under review the ambulance services made available by local authorities and their agents comprised 4,411 ambulances and cars. A large number of

¹ *Ambulance Services Costing Return, 1951-2, H.M. Stationery Office, London.*

private cars provided voluntary reinforcements through the hospital car service, and many patients travelled by rail under arrangements by local health authorities. Of the total cost of £8,608,828 of the ambulance services in 1951-2, directly provided services cost £7,023,326 and agency services £766,432. The hospital car service cost £785,625 and rail journeys £23,445.

Analysis of Expenditure

Analysis of the expenditure is available only for the directly provided services. Of the total cost, 56.4% represented operational staff, 20.3% fuelling and vehicle maintenance, 6% provision of vehicles, 2.8% maintenance of buildings, furniture, etc., 1.2% provision of land and buildings, and 13.3% other expenditure, including administrative expenses. These percentages are roughly the same as for the previous year.

CENTRAL ETHICAL COMMITTEE

When the Central Ethical Committee met recently, under the chairmanship of Dr. R. FORBES, it had before it the memorandum on the future of the occupational health service which had been referred to it by the Council for comment. The Committee emphasized that the document ought to make clear that an industrial medical officer should undertake continued treatment of a patient only with the agreement of the patient's general practitioner. And the Committee discussed with representatives of the Occupational Health Committee the desirability of automatic notification of employers when an employee was receiving benefit under the National Insurance (*Industrial Injuries*) Act, 1946.

Undesirable Publicity

A statement drawn up after discussions with the Association of British Pharmaceutical Industry was before the Committee. It was about the undesirability of medical practitioners' names being associated in a prominent fashion with advertising material issued by pharmaceutical houses, and the Committee approved it. The Committee was glad to hear that substantial agreement had been reached in this matter and expressed gratitude to the A.B.P.I. for its consideration and help. It was generally agreed that in this country it was undesirable for the name of a practitioner to be displayed (as, for example, at the head of a reprint or abstract sent out with advertising material) in such a way as might suggest that some professional advantage might accrue to the practitioner.

Further discussions took place with a representative of the General Medical Services Committee on the ethical aspect of acceptance of the patients of a vacant practice by one who had acted as locum tenens.

The Committee learned that the proposals of the Council about an agreed statement on the loan of hospital records to Government departments had met with only partial acceptance in the Ministries of Health, National Insurance, and Pensions. Certain modifications were suggested, and discussions are continuing.

In addition, the Committee considered a number of requests for guidance from members.

THE DAIN FUND

REPORT OF THE TRUSTEES, 1952-3

During the year under review the Dain Fund has been able to give financial assistance to many most deserving cases. Certain of these have been helped in previous years, but in addition new applications have been considered and accepted.

Continuing grants ranging from £20 to £100 have been given in seven cases. When renewing such grants the Trustees have full details of the progress made by the

individual child together with a report from the appropriate responsible person—dean, headmaster, or headmistress. The expenditure on this group amounted to £404.

The Trustees received a number of new applications, two being for temporary help owing to a sudden and unexpected emergency. Both these applications were met, one case being a medical student, the other a schoolgirl. In addition, three other new cases were also accepted. Grants ranged from £24 to £100, and an amount of £272 was expended on the new cases. The total amount paid out by the Fund during the year was £676.

It is most gratifying to the Trustees to hear of the successes of the children to whom help has been given. During the year a boy has completed his medical studies, a girl has qualified as a physiotherapist, another girl has successfully passed a secretarial course, and a boy, having completed his school education, has been accepted by a London medical school. Two other children who have received grants during the past five years are now no longer needing help from the Fund, as under certain trust funds money has now become available which will ensure that their education at school and university can be completed. This case of two orphan children shows how the Dain Fund was able to provide very necessary financial assistance for an important period of their lives.

The Trustees wish to acknowledge the advice and assistance which they have received from other benevolent funds and from individuals. In addition, the continued interest shown by the gifts from local medical committees and individual doctors has made it possible for the Trustees to continue to assist many needy cases. It must be stressed, however, that the Fund in its present financial state cannot help all the applicants, and the Trustees appeal most earnestly for continued and new support.

H. GUY DAIN,
Chairman of the Trustees.

Notes and News

Hospitality for Foreign Children.—We have received several offers from French doctors who would like to arrange holiday exchanges for their children with children in this country. We have also received several requests from French doctors wishing to place their children as paying guests in British medical families, and several older girls would like to stay in this country *au pair* with British families.

Three Norwegian doctors would like their daughters, aged 15, 16, and 17, to exchange hospitality with the daughters of doctors in the United Kingdom.

Anyone interested in these inquiries should communicate with Dr. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Reciprocal Agreement with Italy on Social Insurance.—An Order-in-Council was published on June 3 bringing into operation a reciprocal agreement on social insurance between the United Kingdom and Italy. The agreement covers retirement pensions; widows' benefits and guardian allowances; unemployment, sickness, and maternity benefits; and all industrial injuries benefits. As a result of the agreement people who have qualified for National Insurance retirement pension, widows' benefits, or industrial injuries benefits will now be able to receive these benefits in Italy. Corresponding benefits under the Italian social insurance schemes will be paid to beneficiaries in Great Britain. The agreement also provides for each country to take account of insurance contributions paid in the other country so that people who go from one country to the other will not lose their benefit rights. The agreement affects only people who are either Italian citizens or citizens of the United Kingdom and Colonies.

SUCCESS IN CENTRAL WHITLEY APPEALS

The first central appeals made by the Association under the Whitley appeals machinery were heard at the Medical Whitley Council offices on June 18. In both cases the appellants had first appealed to their regional boards and then, under the Regional Whitley Appeals machinery, to the special Regional Whitley Appeals Committee. In neither case had the Regional Appeals Committee been able to agree; both, therefore, were referred centrally to Committee "B" of the Medical Whitley Council, which in such circumstances sets up a special appeals subcommittee. The Association was successful in both appeals.

Mileage Allowance

The first case was that of a part-time consultant pathologist, practising in a country district, whose laboratory was regarded as his private consulting-room. He was therefore not entitled to receive mileage for home-hospital journeys. He visits outlying hospitals and makes his journeys to them from his main hospital. The regional hospital board would not allow mileage between the hospitals, but allowed it for the shorter distance between his home and the subsidiary hospitals, on the grounds that the terms and conditions of service did not permit payment in any other way because his private consulting-room was at his main hospital. This strict application of the terms and conditions of service was disputed on the grounds that the journeys undertaken were essentially journeys in the service of the board and unconnected with any private practice.

The pathologist was in fact being penalized for carrying out his work efficiently. Had he travelled direct from his home to his subsidiary hospitals, the main hospital would have had to provide transport for his apparatus and materials kept there. This would have been far more expensive than paying the pathologist for his inter-hospital journeys. It was pointed out at the appeal that this was an example of administrative inflexibility and failure to interpret the terms and conditions of service with reason and common sense. The appeal was allowed.

Grading of Administrative Officer

The second case concerned an administrative medical officer who was previously assistant administrative medical officer to the Eastern Regional Hospital Board (Scotland). The Eastern, North-eastern, and Northern Regional Boards in Scotland are the only boards in the United Kingdom with only two administrative medical officers. The original appointments were made just before the commencement of the National Health Service, and before the final salary scales for administrative officers had been agreed, and were therefore provisional in nature. Following the announcement of the Medical Whitley Council ("B") with regard to revised salary scales of administrative medical officers, both the North-eastern and Northern Boards redesignated their assistant officers as assistant senior administrative medical officer. The Eastern Board did not do so, in spite of the fact that it is analogous to the other boards except that it administers a larger number of hospital beds. In view of the fact that the assistant from time to time has to deputize for his senior and take a measure of individual responsibility, the Association considered that the post warranted classification higher than the most junior type of appointment.

Furthermore, on account of the failure of the board to upgrade him, the officer concerned, who had resigned his post and obtained a new appointment in another region as an assistant senior administrative medical officer, automatically lost the seniority which he should have carried with him from his first appointment.

The appeal was allowed, and the officer concerned will therefore receive retrospective payment for his services with the Eastern Board, and his seniority will be adjusted in his present appointment.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Public Health Salaries

SIR,—The B.M.A. is to be heartily congratulated on having obtained for assistant medical officers in the public health service a revision of the 1950 salary award, a revision which, partially at any rate, rights an injustice to them. I hope the B.M.A. will now turn its attention to the case of senior members of the service.

The significant fact about the 1950 award was that it linked medical officers of health and their deputies much more closely with other local government officers than with the rest of the medical profession. If the B.M.A. is serious about the unity of the profession, it must endeavour to reverse this conclusion. Particularly important from the point of view of present injustice are the medical officers of health and deputies of the smaller county boroughs, the all-purpose authorities whose population size greatly limits the maximum salaries of the senior medical staff, but whose responsibilities are of the widest. The medical officers of health of some county districts, too, having joint county council appointments, are believed to be worse off than if they had remained simply medical officers of health of the district, a curious and illogical situation. It should be the aim of the B.M.A. to secure a broad measure of social equality within the profession for more or less comparable effort, responsibility, and seniority of service in the different spheres of medical practice, but this is far from being the case at present so far as the public health service is concerned. Unity within the profession cannot be maintained if this principle is not accepted. Acceptance involves a demand for further upward revision of the 1950 award.—I am, etc.,

J. H. WHITTLES.

Exeter.

Assistant Medical Officer Award

SIR,—I protest most strongly at the inequity of the revised award of the Industrial Court to assistant medical officers or medical officers in departments (*Supplement*, June 13, p. 278) on the following grounds.

The award is inadequate. It gives an increase at maximum of 85.7% over pre-war maximum compared with 100% increase to general practitioners under the Danckwerts award. The original award was from October 1, 1950, and any revision should have been retrospective to that date. Those officers now about to retire do not benefit as regards pension rights.

The maximum claimed by the Association at the Industrial Court in 1950 for assistant medical officers was £1,680 per annum. Under the revision the maximum claimed was £1,400 per annum, despite a substantial rise in the cost of living during the interval. Surely the Association has learned by now to claim for more than it expects to receive? One is forced to the conclusion that again our claim has been incompetently presented.—I am, etc.,

MAURICE B. GRIFFITH.

Darlington.

Temporary Residents

SIR,—In the last few months the fee for attending a temporary resident living at a camp at the coast has been reduced from 17s. to 5s.—not for each visit at the surgery, but for the total attention and service given by a doctor throughout the patient's stay. If he is staying at a hotel or at a house the full fee of 17s. is paid.

Many seaside resorts have a population made up of old retired people, landladies, and a few tradespeople. This means that the local general practitioner has a higher percentage of old people on his list than his town colleague.

Many of these elderly people can be classed as chronic sick, and require constant medical attention. They can come to the surgery in the summer, but in the winter they need to be visited regularly. In the summer many doctors attend holiday camps. Because of this and the large visiting lists in the winter, they require assistants or partners, although the nominal lists would not suggest this. As a result of the recent increase in the capitation fee these doctors hoped to take their assistants into partnership, but now this sudden reduction of remuneration has made them think again, and their assistants are again "on the look out"—with all its implications.

It seems to me somewhat unfair that if a patient is seen at a holiday camp the professional work done is worth 5s., but if seen in a town it is worth 17s. This incongruity has been decided not by the Government but by our colleagues. All will admit that we see many trivial cases where one visit at 17s. is very generous, but in others, where several visits are required, it is rather the opposite, and one usually cancels out the other. If there is any ill feeling about these fees—let the remuneration be on a graded scale, as in emergency treatment, and let it apply equally in town and country. Let us be fair. What the town general practitioner gets in larger nominal lists the seaside practitioner gets in temporary residents. In the past we asked the Government for fair play, now we ask our colleagues. Give us the same scale of fees you give yourselves and help the establishment of practitioners as principals, don't hinder it.—I am, etc.,

DOUGLAS MACLEOD.

Prestatyn.

Workmen's Compensation

SIR,—I was delighted to read the report on occupational dermatitis (*Supplement*, May 23, p. 230). The problem of P.D.24.B is very difficult, and I see both sides of this as a consultant in a large dermatological out-patient department in an industrial city and as a member of a medical appeals tribunal.

One great weakness, in my opinion, in the Act is that the claimant receives injury benefit on the certificate of the examining medical practitioner, and in many cases such injury benefit should not be paid. By the time the claimant is examined by a dermatologist the man will have received compensation, and it is much more difficult after a lapse of time to be quite certain of the cause of the trouble. If the payment is stopped because he has in fact some constitutional condition, the workman has a very real grievance, which would not be so acute if payment had never been made. That this is true was seen under the Workmen's Compensation Act of 1925 when often the decision of the certifying surgeon was reversed by the medical referee, but since no payment had been made pending the referee's decision there was no feeling of injustice.

Notification of cases is only of assistance if one can be quite sure that the cases are correctly diagnosed.—I am, etc.,

H. R. VICKERS.

Sheffield.

Remuneration of Hospital Staffs

SIR,—Having read Dr. A. Arnaud Reid's letter (*Supplement*, May 30, p. 258), I can only hope that "The Others" to whom his letter is dedicated will express their views on similar lines as an encouragement and stimulus to the negotiating committee. One cannot help feeling that the minority to whom Dr. Reid refers have successfully pulled a fast one by being allowed to present their claim alone, when the obvious course was to let a more competent unbiased authority adjudicate upon Spens's figures and the betterment factor as they affect the whole profession.

I agree with Dr. Reid that a majority of the public, and even of Members of Parliament, are of the opinion that specialists were either included in the Danckwerts award or else are able, by virtue of private practice, to exist on a 1939 salary plus 20%.—I am, etc.,

SOUTHAMPTON.

Demands of Whole-time Specialists

SIR.—Specialists generally are becoming exasperated at the delaying tactics of the Management Side of Whitley "B" and its failure to agree to the proper implementation of the Spens Report. Whole-time officers in particular are disgruntled to learn that the Management Side refuses to grant them any satisfaction in the matter of car and telephone expenses and has only promised to look into the question of income-tax relief on the expense of keeping up to date. The Government policy of charging the whole-time specialist 50% purchase tax (until recently 66½% purchase tax) on the cost of a new car which he requires for his work, paying him less than one-tenth of the cost of using it on official business, and then refusing him any income-tax relief is one of the greatest social injustices ever inflicted on any professional class. This treatment is causing bitter resentment and a sense of frustration which augur no good for the future of the Service among whole-time officers, who do one-third of the consultant work in it.

General practitioners secured the Danckwerts award because they threatened to withdraw from the Service. Whole-time officers should now consider not using their cars and telephones on official business unless they are adequately paid for this service.

It would be an act of wise statesmanship for the B.M.A. to form a section of whole-time specialists (as they have done for whole-time research workers and non-professional teachers, who number only 1,000), so that specialists could present a united front to the Minister and take effective action if he does not agree to their just demands.—I am, etc.,

Farnborough, Kent.

LEO GILCHRIST.

The G.P. and the Industrial Medical Officer

SIR.—Dr. R. P. Liston (*Supplement*, June 6, p. 270) and Dr. Ronald Peters (*Supplement*, June 13, p. 280) both refer to the wish of industrial medical officers to modify the Ethical Rules for industrial medical officers. That these were approved by the Association in 1949 is surely not, at Dr. Peters implies, a reason why such a change should not be sought by those most closely concerned.

I speak only for myself, but I think the chief reason industrial medical officers feel the present Rules to be unsatisfactory is precisely that stated by Dr. Liston: "We are all qualified doctors, qualified to practise medicine in all its aspects." A patient with a septic finger, consulting his works doctor in a well-equipped surgery, will not consider it reasonable that the penicillin he requires, and could easily be given immediately, should be withheld until he has spent an evening sitting in his general practitioner's waiting-room, or until his doctor has found time to reply to a letter asking his permission for the treatment to be given.

To my mind the convenience of the patient is far too often overlooked when this subject is discussed. It is the good fortune of the industrial medical officer that he usually has at his disposal staff and equipment of a high standard, and that he is easily accessible to his patients with a minimum of waiting and has more time to listen to and advise them than his colleague in general practice. Rigid adherence to the Ethical Rules in their present form would go far to deprive the patient of these benefits, whose extent perhaps can only be appreciated to the full by those who have themselves been working-class N.H.S. patients. Do general practitioners, many of whom complain with justice that in present conditions of practice they often cannot devote to consultation and examination the time they feel they should, realize how many patients are discouraged from consulting them by their crowded waiting-rooms, and gladly avail themselves of alternative facilities?

It is, I repeat, the good luck, not the merit, of the industrial medical officer that he is in a position to help. He is glad to do so and the normal rules of professional courtesy will ensure that he keeps the patient's doctor fully informed, and does not act unilaterally and without consultation interfere in treatment which the latter has begun. But a situation calling for good will and voluntary co-operation cannot be dealt with by any printed code—least of all one which

seems to be inspired by the notion that the industrial medical officer is some inferior kind of doctor who must be restrained from taking unfair advantage of his position. The wording of some of the Rules can only be described as insulting.

I am with Dr. Liston in deploring the fragmentation of the profession, and agree that general practitioners who are sufficiently interested can make valuable contributions to industry. I agree with Dr. Peters on the need for close co-operation, and in my own work have done all I can to achieve this. But co-operation implies concessions from both sides, and, although most industrial medical officers have the friendliest relations with individual general practitioners, it is a matter for regret that their spokesmen on the various committees concerned are not disposed to make concessions. If it is necessary at all to control the action of the industrial medical officer by a printed code, should there not be a similar set of rules governing the general practitioner in his relations with the industrial medical officer? And would it not be greatly preferable to recognize that one cannot produce good manners by legislation.—I am, etc.,

Birmingham.

F. H. TYRER.
