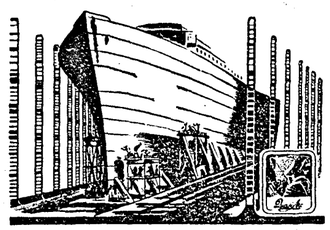
FERROSPEED are made in India and cost less than any comparable imported electrodes.



THE INDIAN OXYGEN & ACETYLENE CO. LTD.

Calcutta Markets

FREIGHT MARKETS FIRM

MORE BUSINESS IN NORTH AMERICAN TRADES

THE past week has shown a consolidation of previous gains and additional business in the North American trades has had the effect of encouraging owners to hold out for higher rates. Further bookings were made from the River Plate at steady figures and 45s was conceded from St. Lawrence to the U.K. for June, an increase of 1s 3d per ton. U.S. Gulf to the U.K. paid 55s and a fixture was made from South Australia to Eire at 105s for barley. In the coal trade Hampton Roads-Japan showed an increase of 15 cents at $10.15 for a May ship and Rotterdam discharge was up 5 cents at $4.55 for June. Calcutta-Korea was arranged at 58s f.i.o. and trimmed and charterers are still open at this rate. Sugar cargoes again featured in the market with Queensland repeating the payment of 102s 6d for August-September whilst Cuba-India was done at rates ranging from $10.75 f.i.o. and stowed to $11 for one port west coast with 25 cents extra for two ports discharge. Fiji-U.K. repeated 83s 9d for September loading. In the time charter section a Liberty size was taken for the trip down to Australia at 19s per ton d.w. with delivery Calcutta in June and a 10,000-ton oilburner at 14s 3d for a West Coast Africa round trip.

SUGAR BUSINESS RESTRICTED

During the week ended 25th May, sugar sales in the Calcutta market averaged 500 bags daily. Arrivals were 1,000 bags per day, and the stocks amounted to 20,000 bags. Rates for ready sugar ex-Kantapukur delivery were Rs. 32-12 for ordinary grain, and Rs. 34-4 for big grain. The ordinary grain on Government account sold at Rs. 30. The ex-mill delivery rate for D28 grain ruled at about Rs. 30-8. Business continued on a small scale despite the improvement in arrival and stock positions and it was reported that the Government was soon going to allot sugar to different parts of India for sale at a price of Rs. 30. Of imported sugar, 15,000 bags only arrived in Calcutta port during the week under review, but a ship with a consignment of 68,500 bags is expected in the next few days.

LINSEED

The market which had displayed a weaker trend throughout the past week ruled slightly better at the close, although prices remained almost unchanged. Crushers showed little interest, and activity was largely confined to the covering of previous commitments. Turnover was rather poor. The oil section which had sagged considerably during the week was somewhat better towards the close with interest mainly confined to forward positions. Buying support was still lacking for nearer deliveries. Latest quotations were as follows: Ready Rs. 18-12 per maund; June-July Rs 19-2 per maund.

HIDES AND SKINS

The market in skins ruled easier and prices showed a downward tendency. Stocks were higher than in the previous week.

Bazar Sales

(Between 18th and 24th May, 1954.)

Cowhides:—Wet salted (Slaughtered) 13,000 pcs. on the basis of Rs. 10-8 to Rs. 26.

Goatskins:—Wet salted (Daisee, Killed) 43,800 pcs. on the basis of Rs. 290 to Rs. 455; Assam-Dinajpur-Murshidabad-Jalpaiguri 18,300 pcs. on the basis of Rs. 305 to Rs. 460; Muzafferpore Darbhanga-Pakur 13,400 pcs. on the basis of Rs. 330 to Rs. 335.

Bazar Stocks

(24th May, 1954.)

Cowhides:—Wet salted 69,700 pcs.

Goatskins:—Wet salted (Daisee, Killed) 44,500 pcs; Assam-Dinajpur-Murshidabad 40,500 pcs; Muzafferpore-Darbhanga-Pakur-Patna-Purneah-Kissenganj 2,20,800 pcs.

SHELLAC MARKET FIRM

During the week ended 25th May, the market ruled firm. The range of quotations was as follows:

Standard Pure Buttonlac		Rs. 134 to Rs. 140 value.
Pure Buttonlac		Rs. 126 to Rs. 135 done and buyers.

Option of Repayment.
(t) 1 months' notice (v) 1 month's notice (w) Any int. day. (x) 3 months notice (y) 3 months notice (z) 12 months notice

(A) Repayable at par between the years 1924 and 1941 in instalments of not less than Rs 1,00,00 per annum by drawings to be held in June of each year

(B) But before 21st December 1956. Also redeemable out of a cumulative sinking fund of 1½ per cent per annum by purchase at any price less than par or by annual drawings at par

(C) Redeemable at par in the event of the undertaking being purchased by the Corporation of Calcutta or Howrah, on 1st January 1945 or every seventh year thereafter

(D) These Bonds are deposited with Imperial Bank of India as security against overdraft

(E) The holders of these Debentures have the right to convert their into shares of Rs 10 each between 1st January 193 and 31st December 1949 on giving 3 months' notice one Bond being exchangeable for 50 Ordinary shares

(F) Redeemable (a) at 102 per cent on 1st October, 1974 or in the event of voluntary liquidation or the undertaking being purchased or in the event of the security being enforceable or (b) out of a sinking fund by drawings at 102 per cent or by purchase at or under 102 per cent.

(G) The holder of each Debenture has the option to apply for Ordinary Shares to the nominal value of Rs or payable in cash and this option expires at the end of 5 months from the date of notice of repayment by the Company.

(H) Up to and including the year 1949 holders may at any time convert into fully paid Ordinary Shares at the rate of Shar. of Rs 10 for every £1 of the stock All Ordinary Shares thus converted will rank for dividend part passu in all respects from the financia year following that in which the option is exercised and the holder will receive interest on the stock converted in respect of the financial year in which the option is exercised

(I) Holders of the fully paid up convertible Debentures may on any interest date up to 1st January 1947 convert into fully paid up Ordinary Shares each £50 debenture, for 20 Ordinary Shares of Rs 10 each on 1 month's notice

(J) If this option is not exercised before 30th September, 1942 the Company will not be entitled to exercise the option before 30th September 1946

(K) Repayable at par by 1966 by annual drawings on 1st July each year

(L) Option of repayment in part out of gross profits every year to a maximum of Rs 1,50,000 Notified to be redeemed at par on 1st November 1945

(M) At par by 17 annual drawings

(N) Option of repayment on 6 months notice after 31st July, 1955 at Rs 2-8 per cent Prem.

(O) At par all or any of this Debenture on 31st December, 1960 or on any subsequent interest date

(P) May be redeemed on

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and the shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. Months against names of companies indicate approximately times of payment of dividends.

BANKS

H indicates that Share capital is half paid. O, C and Dd, indicate Ordinary, Contributory and Deferred Shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

COAL COMPANIES

O. Po. F and Dd. indicate Ordinary, Preferred Ordinary, Founders' and Deferred shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

MR. MOHAMMED ALI'S BOLD DECISION

GOVERNOR'S RULE FOR EAST BENGAL: THE MISTAKES OF MR. HUQ

MR. GHULAM MOHAMMED has dismissed Ministers and ministries before today, but we hope that his decision this week to depose Mr. Fazlul Huq was taken with a heavier sense of responsibility than even his dismissal of Khwaja Nazimuddin. For the representatives of a discredited party to sack a Minister elected by an overwhelming popular vote to the premiership of a remote and disaffected province, and then to issue a defence of their action through a Prime Minister who has himself never been tested at the hustings, obviously required great confidence and courage. Critics will think that it required only cynicism and impertinence. The contrast between Mr. Huq's unlimited popularity and the insecure hold of the Karachi leaders over the electorate's esteem is so glaring that the first and only standard many will apply to the case is that of "democracy"; and they will conclude that Mr. Huq is the certified tribune of the people who has been autocratically deprived of office by opponents entrenched behind an outmoded constitution—a constitution which only continues in force because they have refused to frame a constitution that gives East Bengal the influence it deserves. But democracy supposes something more than popular sanction for a ministry. It supposes the ability to carry on regular government, to maintain law and order, and to guarantee security of life and property to the governed. In its brief and disturbed period of office, Mr. Huq's ministry had not shown the ability to do these things.

That was not entirely Mr. Huq's fault. He has had to contend with vicious forces of one sort or another—Mr. Mohammed Ali has said they were Communists (though he has also implied that they were Indians!) while Mr. Huq has hinted that they were the agents of the Muslim League itself. Whoever they were, they have exploited mass passions with devastating effect and to a degree that would have tried the resources and composure of a more experienced and coherent ministry. But Mr. Huq's ministry was neither experienced nor coherent. The United Front Party represents every shade of opinion in East Pakistan that rejects the Muslim League, and that embraces an extensive spectrum. Mr. Huq assumed the leadership of this political motley not because his policies, so far as they were understood in advance, were a compromise or an average of his colleagues', but only because his seniority and political stature gave him precedence. The task of welding his following into a government still lay before him; to judge from some of his initial fumblings in this direction, even he was not certain of what the result would be. In any event, before he could proceed to this first task, the masses who had provided him with so large a team of supporters had gone on a rampage in two of the province's chief industrial establishments, and political adjustments had to wait on the restoration of civic peace.

*

How the latter assignment should have been tackled depends only in part on who the instigators of the trouble were. If they were indeed Communists or other "enemy agents", as Mr. Mohammed Ali affects to believe, or if they were provincialists, different tactics would have been needed to root them out; but regardless of their motives, once they had begun killing and terrorising, the first need was to subdue them with a vigorous show of force. In this Mr. Huq and his ministry quite failed of their duty. Chandraghona should have been a warning of the trouble in store; the Dacca Jail riot was confirmation. It is alleged that even when these warnings had been disregarded and the Adamjee killing began, members of the Government and senior officials stood by and watched it grow to such terrible proportions. Mr. Mohammed Ali makes a very serious allegation when he says that a riotous leader at the Dacca Jail disturbance, after being arrested in *flagrante delicto* was not only later released but was rewarded with a portfolio in Mr. Huq's Cabinet. This might show that the origin of the troubles lay not in the machinations of any small group of political fanatics, of the right or left, but in the fact that many of the United Front's supporters mistook a crushing electoral victory for a revolution—and proceeded to behave not as men newly entrusted with constitutional power but as men who have quite destroyed all civic power.

The actual collapse of order was bad enough but when Mr. Huq went on to add talkativeness, indecision and bickering, he was comporting himself like a man who has no realisation of the seriousness of his position or the exigencies of the moment. This is perhaps the only importance of Mr. Huq's celebrated "misunderstandings" with the journalists of several countries. His various assertions on the subject of Pakistan's unity, even when we subtract from them the equally forceful retractions that followed, were not of overwhelming importance. Mr. Mohammed Ali can make good polemical use of them, and by recalling the hallowed name of the Quaid-e-Azam can prove by a species of scholasticism that Mr. Huq is a "traitor". But none of them is incapable of being honourably explained away as a loose expression of East Bengal's proper determination to obtain more influence in the state of Pakistan. The real discredit of these episodes for Mr. Huq lies in the fact that he let them become public issues at a time when he should have had much more serious business on hand. A Premier whose state is torn by strife, whose government is not yet installed in office and whose industry is threatened by bloody rioting should not place himself in the position of having to argue about what he did or did not say to the correspondent of the *New York Times*.

*

In these circumstances, the Governor-General and Prime Minister of Pakistan took a bold decision. The temporary institution of Governor's rule might give the province the opportunity to return to quietude and should provide the energy and the instruments to hasten that return if further trouble threatens. It would have been better in appearance if this decision had not also entailed the recall of the Governor, Chaudhuri Khaliquzzaman, for then it would have been plainer that the intention was simply to place the civil and military services under unified leadership. But the previous Governor was an old man and his return to Karachi has not been associated with any personal disgrace; the new incumbent, Major-General Iskander Mirza, has lately been known for his rôle in the negotiations with the United States and Turkey on an unpopular subject, but of more relevance is his previous experience of disturbed provinces in Pakistan. The failure to dissolve the recently elected legislature shows that Karachi's intentions are not as tyrannical as some want to make them appear, for the United Front legislators would constitute a centre of resistance and opposition to an attempt to enforce naked autocracy from Karachi. Tactful management in East Bengal could demonstrate—and it is a pity that Mr. Mohammed Ali missed the opportunity to press this point in his broadcast on Sunday—that the object of Governor's rule is to give the United Front a chance to organise themselves and pacify the province in preparation for the taking over of the administration on a stable basis. The Party tried once to do this and failed; a few weeks of order and they should have fitted themselves for a task they could not accomplish while still under the influence of the heady wine of electoral success.

When the United Front does take over the administration from the Governor, it may choose to do so again under the leadership of Mr. Fazlul Huq. There has been no suggestion from Dacca that his own party do not wish him to resume the premiership, though the more level-headed of his supporters must have realised that he has served them clumsily in the past few months. It is on this point that we quite disagree with the vituperative attack on Mr. Huq made by Mr. Mohammed Ali—an attack that included accusations of treason and of long devotion to "un-Pakistani activities", to amend a phrase that Mr. Ali must have often heard when he was an Ambassador. Mr. Ali went so far in this direction and in fact on so little real evidence, as to make it very difficult ever for him to agree to Mr. Huq taking over the premiership again. This was a mistake. It will not help West Pakistan to make one old man the scapegoat for feelings that are widespread and firmly held in East Bengal. The eastern province does in fact demand something like a greater measure of independence from the West; not independence in the sense it was used during the Indian freedom movement but in the sense children use it of their parents. There is nothing un-Pakistani about this, and if Mr. Ali can read "treason" into some of Mr. Huq's less fortunate phrases he is straining words rather than taking the pulse of East Bengal. Treason presumably means betrayal of the constitution, sale of the country's settled interests—but the whole point about Pakistan's constitution and the interests of the provinces is that they are not yet settled or agreed upon. If Mr. Ali means by treason differing from the reputed views of Quaid-e-Azam Jinnah, he is introducing an undue element of religious veneration into free democratic discussion. Plainly he is charged with the responsibility of maintaining Pakistan's integrity—he was not made Prime Minister to preside over its liquidation—but it remains to be shown that the degree of autonomy that East Bengal demands is inconsistent with the continuance of Pakistan as a nation.

*

We in this country are most interested in the extent to which Mr. Huq's generous though ill-considered assertions of friendship for India played a part in the indictment for treason and his dismissal. There had been fond hopes earlier that the victory of the United Front meant closer relations with India and especially with West Bengal. But the emptiness of those hopes had been realised here long before Mr. Huq's dismissal, for there has been no dismay at his departure beyond the natural support that the East Bengal case finds on the other side of the Radcliffe line. It should become clearer now that, while India can hope to see politicians in power in Pakistan who are not avowedly hostile to her, she cannot reasonably hope for an administration in that country which sets out to pretend that partition never really happened or that the bonds that unite the inhabitants of the sub-continent are stronger than the claims of the new nationalism. Pakistani nationalism stems from the consciousness of contrast with India; it would be too strong to say, from the consciousness of enmity with India, though even that would apply to some individuals. And this will continue to be the case at least until Pakistan has modelled her own peculiar constitution, has achieved her own traditions, and has built up her own economic interests. Until that time comes to be a Pakistani will mean firstly not to be an Indian, and the prudent politician in Dacca as much as in Karachi or elsewhere in West Pakistan will not repeat Mr. Huq's generous mistakes.

CUSTOMS FORMALITIES FOR TOURISTS

INTERNATIONAL MOVE TOWARDS UNIFORMITY

THE rules under which tourists visiting foreign countries may take their cars with them duty free will be made uniform and applied as far as possible on a world-wide basis, if a new convention being studied at an international conference on tourism at United Nations Headquarters is approved by governments. Another draft convention would specify tourists' personal effects, "provisions for the journey", and travel souvenirs which foreign countries would agree to admit duty free, irrespective of the mode of travel. Many countries already offer travellers the facilities proposed under these two conventions. In some countries, customs formalities are even more liberal. But the conventions' aim is to define certain minimum yet liberal facilities and have them accepted in as many countries as possible throughout the world.

This conference—which, in view of its purpose, has the complicated title of the United Nations Conference on Customs Formalities for the Temporary Importation of Private Road Motor Vehicles and for Tourism—is the latest step in efforts to cut out the red tape from international travel. Tourists are now a recognised factor in international trade and, accordingly, governments —particularly in Europe and Latin America—have shown an increasing willingness to relax the rules governing the entry and stay of tourists in their country, even at the slightly higher risk of customs fraud. The two conventions would ease the way, for example, of the tourist who wants to drive his own car through Europe and would speed up the handling of tourist baggage at customs offices.

The first, the Draft Customs Convention on the Temporary Importation of Private Vehicles, is intended to simplify formalities as far as possible for international tourists and at the same time to protect customs regulations from abuse—for instance, from the motorist who might take a new car into a foreign country and try to sell it at a profit. Under this convention, motorists planning to take their cars on a visit to a foreign country would obtain the necessary papers from recognised associations, such as automobile clubs affiliated to an international organisation. The host country would then admit a tourist's car duty free on certain conditions. Most important of these would be that the association would guarantee payment of any import duty and taxes which would become due in the event of failure to re-export the car under the terms of the convention. In such cases, the guaranteeing association would be notified of a tourist's failure to honour his obligation, and would be given time to provide proof that the car had been re-exported in accordance with the convention. If such proof were not forthcoming, the association would then have to pay the duty and taxes, together with interest if required. Customs officers, together with the guaranteeing association, would naturally do their best to recover the duty, taxes and other penalties for which a tourist was liable as a result of fraud, contravention or abuse. On the other hand, a motorist would not have to re-export his car if it were badly damaged as a result of a duly-authenticated accident, so long as he did one of three things: paid the necessary import duties and taxes, abandoned the car free of all expense to the Exchequer of the country he was visiting, or destroyed it at the expense of the parties concerned. The convention also provides that a tourist with a valid excuse could obtain an extension of time needed to get his car out of a foreign country. Several draft texts for a convention will come before the conference. One—on the temporary importation of private road vehicles, aircraft, boats and vessels used for touring purposes—was submitted by the United Kingdom to the sixth session of the Transport and Communications Commission in March, 1953. The Commission decided, however, to recommend that the conference consider a convention only on private road motor vehicles and their equipment. Other similar texts have been prepared by the United Nations Economic Commission for Europe, the World Touring and Automobile Organisation, the United States and France.

* * * *

The second convention to be considered at the world conference relates to customs formalities for tourism. Draft texts already prepared would exempt from duty articles "of an everyday kind in actual use" as well as reasonable quantities of new articles, but note that "there will be suspicion of abuse if the articles do not correspond to the social position of the importer". This reference to the traveller's social position has not found favour in all countries. Australia, for instance, commenting on the text, points out that no differentiation is made by Australia with regard to the tourist's social position. Here are some of the things that a tourist would be able to take with him duty free under one of the proposed drafts: one camera, one miniature cinematograph camera, one musical instrument, one gramophone with 20 records, one radio, one typewriter, perambulators, personal jewellery and sporting and camping equipment for personal use (such as sporting firearms, skis and tennis racquets). Some governments feel that the number of articles should not be specified so rigidly in the convention. Another group that would be admitted duty free includes "provisions of the journey", specified and limited quantities of tobacco, cigars and cigarettes, wine, spirits, toilet water and perfume. The convention would also permit duty free travel souvenirs up to a value yet to be decided. Several drafts for this convention have been prepared, including those of France, the United Kingdom, the Economic Commission for Europe and of two international non-governmental organisations particularly interested in the field—namely, the World Touring and Automobile Organisation and the International Union of Official Travel Organisations. This question of customs formalities has been before the Transport and Communications Commission, the Economic Committee for Europe and ECE's Inland Transport Committee for several years. Indeed, most of the proposals described above have been enforced in many European countries since 1950, when a number of governments decided to apply on a provisional basis the ECE draft covering customs formalities for motor vehicles and tourists.

Invitations to the conference were sent to all member states and to members of the U. N. specialised agencies by the Secretary-General, in accordance with a resolution of the Economic and Social Council in April, 1953. Administering countries were asked to extend the invitation to self-governing territories. Specialised agencies, intergovernmental organisations and international organisations interested were invited to send observers. Forty governments notified the U. N. that they would be represented. European governments have shown a particular interest in the conference.

Already, international travellers have been saved many hours as the result of steps taken in line with United Nations and related bodies' recommendations. Passport and visa requirements have been eased, health inspections speeded up and border formalities on international roads simplified. In addition, U. N. bodies have called on governments to relax customs regulations, make more foreign exchange available for travellers, reduce fees for passports and visas, improve terminal facilities, and publish maps and tourist information. The present conference is expected to make a major contribution to United Nation's work in this field.

CURRENT COIN

P. & O. Assets.—Sir William Currie had some severe criticism to deal with at the P. & O. meeting recently, and the critics are likely to follow up by sending a deputation to wait upon him. The main concern of the critical stockholders was not only for a higher dividend distribution but showed serious concern at the under-valuation of assets in an inflationary period. The attack was led by Mr. Oliver Smedley, a chartered accountant, who felt that the removal of the disparity between the nominal issued capital and the capital employed was highly desirable. The £7 million scrip issue now proposed was only a minute step in the right direction. The writing up of P. & O.'s nominal capital to more realistic values, Mr. Smedley said, would spotlight the meagre returns at present being obtained, strengthen claims for raising depreciation allowance and freight and passenger charges whenever necessary and help to establish a value against possible nationalisation. He estimated the net asset value of the group at well over £200 million (equivalent to about £25 per Def. stock unit) and the return at today's values at less than 1 percent gross. Earlier, Sir William Currie had given a detailed survey of the group's activities. He warned stockholders that prospects were at present poor, but said that profits for the first six months of the current year have been about equal to those of the corresponding period last year. While welcoming the new investment allowance as a much needed tax saving, he saw no reason why the new policy should have any effect on dividends. He expressed the hope that the report of the Royal Commission on Taxation will contain proposals "of lasting benefit to the shipping industry and therefore to shipbuilding." On the subject of putting too much to reserves for ship replacements, Sir William said that in each of the past few years, when criticism had been strongest, there had been a gap between the amount required and the amount retained.

* * * *

Burma Today.—In a recent issue some impressions of conditions in Burma and Indonesia today, as seen by the leader of a British Parliamentary delegation and reported by him to a gathering in London, were mentioned by the Ditcher. An even more useful survey of Burmese conditions is now available in the report of the industrial delegation which recently visited that country at the invitation of the President of the Board of Trade, which has been published by H. M. Stationery Office at the price of 2s. 6d. It will be of particular value to exporters anxious to enter the Burmese market, to whom it offers much useful advice. "It is apparent," the delegation comments, "that there will be enormous demands for capital goods of all kinds" in Burma. But it is not a market that British traders should take lightly. Economic nationalism, as in Ceylon and indeed in all South-East Asian countries, has to be respected. Burma has large long-term plans for developing the country's resources, and she clearly needs both technical help and equipment. Like many other undeveloped areas (a point brought out by most investigations of the World Bank) Burma sadly lacks the technicians to undertake many of the vital jobs. The delegation is also concerned whether there are even enough semi-skilled and unskilled workers to undertake the vast amount of work envisaged under the development programme. Openings for British traders are thought to be good. The report particularly stresses that British consultants would have a good deal of scope under the Burmese plans and that there is need for "civil engineering and building contractors with large resources and experience." One feature of Burmese policy noted by the delegation is the "joint venture" whereby foreign capital and technical knowledge are encouraged, though under certain conditions. It was confirmed that the policy of directing the country's foreign trade into the hands of Burmese nationals was to be continued, but the Burmese Government made the point that branch offices set up by large foreign manufacturers would be regarded favourably, particularly if they could supply an after-sales service. Weighing up general prospects, the report thinks British exporters are in a good position to make competitive offers for most types of equipment, but emphasises the necessity to quote firm prices and to offer quick delivery.

* * * *

The Progress of Anglo-Iranian.—Sir William Fraser, Chairman of the Anglo-Iranian Oil Company, reports a year of increased sales and larger profits in the statement which is to be presented to the 45th annual general meeting in London on 10th June. The gross profit of the company shows an increase of £2,623,244 over last year, after making an increased provision for depreciation amounting to £5,857,297. The problem of the loss of the Abadan refinery is still unsettled, but the Company has shown remarkable flexibility and resilience in the way it has adjusted itself with so little apparent effect on its prosperity. The Persian Government is now willing to negotiate, and a consortium of Anglo-Iranian and seven other major Middle-Eastern oil companies is suggested as the appropriate body to handle distribution of oil from Abadan. In the present state of the markets the question of absorbing Abadan's contribution will present considerable problems. World output has comfortably regained the level ruling prior to the closure and if Abadan is once again to resume production, great care and co-operation will be required. Despite the pessimistic views which have been taken lately about possible over-production of oil the Company is still increasing its output, and investing heavily in new plant. An increase of two million gallons in refinery throughput is reported for 1953, and an increase of almost one half, or 10 million gallons, is expected by the end of next year. This will result from the completion of the new refineries at Aden and at Kwinana in Western Australia.

* * * *

Wool Shortage in World Markets.—The hardening trend in wool prices, both in merino and crossbred varieties, noticed since the end of March this year, reflects the supply and demand position of wool in world markets. Production in the 1953-54 season, which was estimated in October, 1953 to be running ahead of the 1952-53 season, was eventually found by the Commonwealth Economic Committee to be slightly less at 4,350 million lbs. (4,354 million lbs.). As against this, demand was running at a larger and faster rate. According to the estimates of the *World Wool Digest*, sales had been seven percent higher during the first three quarters of the current season than during the same period last season, while the supply for the current season was considerably smaller at 2,331 million lbs. as against 2,669 million lbs. available for the previous season. The March-end stock position was even worse at only 663 million lbs. (792 million lbs.). These explain the position generally. The particular reasons are to be found in the following facts. During the current wool season, which will be over by the end of this month, Australian production showed a fall of 40 million lbs. from the previous season's output of 1,300 million lbs. Australia is the largest producer of wool, accounting for over one-fourth of the world total and more than 50 percent of Commonwealth production. For that matter, Australia is also the biggest exporter supplying nearly half of the world's total trade in wool. Any big change in its production is therefore bound to make a material difference to the market position.

Moreover, the pressure of demand seems to have been particularly felt in the Australian market, where the March-end stock was only 21 percent of the total exportable supply as against 25 percent in the previous year. According to the *Digest*, sales in Australia were unusually heavy during the first three quarters of the current season and disposals were so much in excess of the quantity sold during the same period of 1952-53 that certain selling fixtures had to be cancelled. Unsatisfied overseas demand naturally shifted to other countries of the Commonwealth such as New Zealand and South Africa and it was found by the end of the third quarter that New Zealand had as its exportable stocks only half of what it had during the previous season and South Africa had only short wools to sell. On the other hand, in South American countries, such as Argentina (the second largest wool producer) and Uruguay, stocks remained largely undisposed of and they had more wool in their March-end stocks (speaking in terms of percentages of the overall supply) than during the previous season. Even while the season was advancing towards its close, steps to increase the pace of disposal in these countries were not noticeably evident. This also was another important cause contributing to the shortage.

* * * *

Progress Pattern for Development.—In judging the efficacy of the Community Development Projects and the National Extension Schemes physical achievements must take second place to the results obtained by the efforts to change rural outlooks and to foster new aspirations. This point was made by Mr. V. T. Krishnamachari, Deputy Chairman of the Planning Commission, speaking from the chair at the conference of Development Commissioners of State Governments which held a four-day session in Ootacamund last week. Mr. Krishnamachari undoubtedly emphasised the fundamental motive behind the movements for development when he made his point, but as was brought out in the leading article in the last issue of *Capital*, this emphasis on the importance of intangibles has its dangers when so much public money is being spent. There are four lines of development on which Mr. Krishnamachari would base his judgment of the development schemes. These are: How many families have now got improvement programmes of their own; how many are eligible and have become members of co-operative societies; how many have supplementary occupations beside agriculture; and how many are devoting a specific portion of their time to voluntary work of permanent utility to the community? Judged only on these criteria the development schemes have not been doing too well. The first test is almost impossible to make by any of the statistical methods at present in use. The Evaluation Organisation's reflections on the subject of the second test, in its report on the movement's first year's working, were decidedly pessimistic. Success on the third test may actually involve a net charge on the community because sentimental considerations are undoubtedly being allowed to interfere with the evaluation of such occupations on sound economic lines. On the fourth test the outlook is a little brighter because one of the most encouraging features of the movement to date has been the way in which the ordinary cultivator has freely given his time to help supplement the effects of Central assistance. Mr. Krishnamachari's observations on the need to integrate the various development schemes into one movement were of interest. It is true that the functions of the present schemes tend to overlap and that the cost of their different organisations might therefore involve waste. But it is also true that while there is still room for differences of opinion on whether the emphasis should be on spiritual or material improvements, an organisation which concentrates on one, in the way the Extension Schemes concentrate on improving agricultural output, can be of great value operating separately from those concentrating on the broader issues. Only in this way can some much needed standards of comparison be maintained. The Commissioners agreed that the present distinction between Community Projects and National Extension Blocks should be maintained for the second five year plan period. The chief of the Community Projects Administration, Mr. S. K. Dey, pointed out that the retention of the Community Projects, and the maintenance of the present distinction, was desirable to provide necessary incentive for effort, and to prevent the National Extension Service degenerating into routine administration. Under this service there is already a programme for converting some of the Extension Blocks into intensive development areas. It was proposed that during the second five year plan, nearly half of them should be converted into intensive development areas on the pattern of the present Community Projects.

* * * *

Industrial Disputes.—Provisional statistics of industrial disputes for the month of March show a slight increase in the number of disputes but a decrease in the number of workers involved and man-days lost as compared with the previous month. The total number of disputes during the month was 87 involving 31,563 workers and accounting for a time-loss of 328,698 man-days. The average duration of disputes was 10.4 days as against 8.3 days in February, 1954. Six of the disputes during the month were lock-outs involving 761 workers and accounting for a time-loss of 16,426 man-days. Apart from strikes and lock-outs resulting from industrial disputes, there were 10 work-stoppages not connected with industrial disputes during the month. These affected 20,733 workers and accounted for a time-loss of 20,445 man-days. Sixty-three disputes were settled during the month. Of these, 50 did not last for more than five days each. Four of the disputes lasted for more than 30 days each. Wages, allowances and bonus were the main causes of dispute in 23 cases while grievances relating to personnel accounted for 36 disputes. Fourteen disputes ended in complete or partial success to the workers and in 32 disputes they were unsuccessful. In 17 cases the result was indefinite. Among the States, West Bengal recorded the largest number of disputes, workers involved and time-loss—the figure in each case being higher than that of the previous month. Bombay recorded fewer disputes but higher time-loss. Judged by the time-loss, the States which recorded significant improvement over the previous month were Madhya Pradesh and Madras. The situation in Andhra and Bihar deteriorated. Among the industries, the paper and printing group continued to suffer heavily on account of two work-stoppages in West Bengal.

* * * *

Improving Sugarcane Yields.—In a broadcast on Tuesday, the Agriculture Minister, Dr. P. S. Deshmukh, announced a new campaign to increase the production and improve the yield of sugarcane. He recalled that India is one of the largest cane-producing countries in the world with 4 to 4½ million acres under cultivation, yielding about a million to a million and a half tons of sugar every year and a substantial quantity of other products, such as gur and khandsari. Cane cultivation, he claimed, had received considerable attention from scientists, but the yield per acre was still dismally low, being only about 14 to 15 tons on the average. The promising results obtained last year from the Japanese method of paddy cultivation, said Dr. Deshmukh, had prompted the Government to initiate action in increasing the production of sugarcane, particularly in the three important States of U. P., Bihar and Punjab. It had been decided to provide a heavier dose of fertiliser as top-dressing to the standing crops and to lay out thousands of demonstrations on cultivators' fields, in addition to large-scale top-dressing of crops in big contiguous blocks with ammonium sulphate or similar nitrogenous fertilisers. Nitrogenous manures and fertilisers showed the highest response in sugarcane cultivation; and manurial trials conducted at research stations established that anything up to 120 lbs. of nitrogen per acre could be profitably applied in the northern regions. While the immediate need was to concentrate on the standing crop, the programme of increasing cane production in Northern India or elsewhere through better cultural practices, including the use of improved implements, a proper treatment of the soil, provision of plant protection measures and scientific harvesting would be intensified in the next sowing season. The Food and Agriculture Ministry had already made arrangements for fertilisers for a minimum target area of 2.25 lakh acres, of which one lakh acres each would be in U. P. and Bihar and 20,000 acres in the Punjab. Besides this arrangement for the supply of fertilisers, information on the use of ammonium sulphate in sugarcane and on other improved cultural practices was being prepared and would be distributed free amongst cane-growers. Although the campaign was mainly restricted to the intensive areas in U. P., Bihar and the Punjab, Dr. Deshmukh hoped that the other important sugarcane-growing States would also fall in line and promote their own campaigns to increase cane yields per acre by the same means as were being adopted in the three northern States.

CORRESPONDENCE

NON TUSSORE SED TOSSA

To The Editor of "Capital"

Sir,

A propos of the last paragraph in A Ditcher's Diary last week you will be interested to know that the French were making clothing out of jute more than quarter of a century ago. About that time the representative of a French concern engaged in jute manufacture, accompanied by his wife, visited India. During their visit they were entertained at a jute mill in French territory and the mill manager's wife expressed her admiration for the French lady's "tussore silk" costume. Judge of the astonishment of the mill manager's wife when she was told, truthfully, that the material was not tussore silk but jute.

Yours, etc.,
H. A. L.

Calcutta, 31st May, 1954.

NEW CASH-CUM-CONVERSION LOAN OFFER ANNOUNCED

SHORT-DATEDS DECLINE: SELECTIVE ENQUIRY FOR INDUSTRIALS

London, 2nd June.

RATHER uncertain conditions prevailed in the stock markets under the influence of the international political situation and the strike on British Railways, but a firmer trend developed later following the end of the strike and a slightly more favourable view of the progress of the talks at Geneva. Gilt-edged, after moving uncertainly, improved following the news of the £300 million cash-cum-conversion offer of two percent stock 1958-59 at £99½; the conversion offer is made to holders of National Defence three percent 1954-58. Short-dated stocks were marked down and medium-dated stocks marked up to adjust prices to the terms of the new issue but the rest of the gilt-edged market developed a firm trend on the view that money will get cheaper and not dearer. On balance, however, gilt-edged were lower compared with previous levels. Business in industrials was rather selective but many good features appeared following some more increased dividend statements or in anticipation of higher distributions. Investment buying of leading issues was responsible for some good gains and the general tone of the industrials market was firm, but there was no all-round advance, the buying after the sustained rise of recent months becoming more discriminating. The outstanding feature of the foreign market was the strength of Japanese bonds which went steadily ahead on good demand induced by expectations that dealings in the sterling issues in New York will not be long delayed. Chinese responded to the more hopeful Far Eastern situation while Germans attracted buyers and Greeks went ahead on renewed debt settlement hopes. With the Cape on an extended holiday, gold shares were quiet but selective buying of Free State, and to a lesser extent uranium issues, continued and some useful gains were recorded. Coppers continued their recent advance but tins and other base metals were subdued. Oils recorded little change on balance while rubbers generally held steady. Further good dividend statements announced by a number of tea companies brought a revival of activity in tea shares, which also responded to favourable comment on the industry's prospects. The market was firm and a number of appreciable gains were registered.

The Money Market

Discount houses had a most uncomfortable period last week. Because of an excess of new bills over maturities, a bigger take-up by the market and cessation of the inflow of foreign money, the credit system was strained to the utmost. At times higher rates were conceded for bills whilst last Thursday, in order to avoid paying penal rates, money was borrowed from some quarters at rates of up to 3 percent for loans against bonds. Treasury bill tender applications totalled £426,825,000, of which £270 million was allotted at an average rate of 34s 3.33d percent compared with 34s 3.24d of the previous week. This week £270 million are offered. The Bank of England return for the week ended 26th May shows that notes in circulation rose about £4 million to around £1,613 million, while bankers' deposits were practically unchanged at £267 million. Fine trade bills remained unchanged.

On Wall Street, German bonds were slightly softer last week in moderate trading on an otherwise quiet foreign market. Greek obligations lost ground, while Italian Republic 3 percents were steady. Japanese issues were barely steady. In the South American section, substantial fractions were lost by Chilean 3 percents of 1953, while Brazilian issues generally showed small gains. Peru 3 percents of 1957 were up fractionally on the American Exchange although they lost some of their earlier gains. On the same Exchange, Russian bonds were fractionally firmer in moderate trading. The easy trend in U. S. Government Securities continued in quiet trading. Fractions were lopped off the quoted prices for almost all issues, largely reflecting the recent heavy offerings for refinancing operations. Meanwhile, the Treasury's borrowing cost on its shortest term obligations dipped to the lowest in almost seven years as it sold $1,503 million of 91-day bills at $5 equal to an average yield of only 0.718 percent. Investment in quality corporate obligations continued to ease in light trading.

Inflow of Reserves

In the week ended 26th May, the United States had an inflow of $15 million of reserves and in the previous week an inflow of $18 million. This is the first time since early January that there has been an inflow of reserves to the United States in two successive weeks.

Belgium-Luxemburg Steel Market

The general improvement which was noted earlier on the Belgium-Luxemburg iron and steel market became more pronounced recently. Activity revived in thick plates following an improvement in sales of other types of plates. A further increase in turnover was reported for reinforcing rods with orders being received from West Germany. Orders from outside the Steel Pool came from Scandinavia, the United States, and various Latin-American countries. A limited improvement in prices of all varieties of scrap was noticed at the last monthly auction held by the Belgian State Railways. Trade observers felt, however, that the improvement was the result of special covering purchases by certain factories and did not reflect any general strengthening of the market. Since extensive quantities of foreign scrap are being offered at present, a pronounced price rise would now seem to be out of the question as far as the Belgian market is concerned. There were numerous foreign offers of pig iron.

Fluctuations in Cocoa Market

Cocoa last week achieved a new peak for May delivery position at 570s per cwt. paid, but otherwise the market position remained subject to rapid fluctuation at the enhanced price because of scarcity. The market opened firm with most forward positions about 8s per cwt. above the closing level of last Tuesday, followed by an irregular downward movement because of profit-taking and some stop-loss selling. Total business done amounted to 329 lots of five tons each.

Merchant Shipbuilding Decline

Merchant shipbuilding in the principal countries of the world showed a further decline as on 1st April. New construction in hand or on order dropped to 1,350 vessels of 12,394,497 gross tons, according to the report released by the Shipbuilders' Council of America. These figures compared with 1,423 vessels of 13,052,574 gross tons as on 1st January and with 1,686 ships of 15,195,453 gross tons as on 1st April last year. Great Britain still led all nations with 505 ships of 4,755,329 gross tons or 38.4 percent of the total, followed by Sweden, Germany, Holland, France, Norway and the United States.

Tanker Freights Depressed

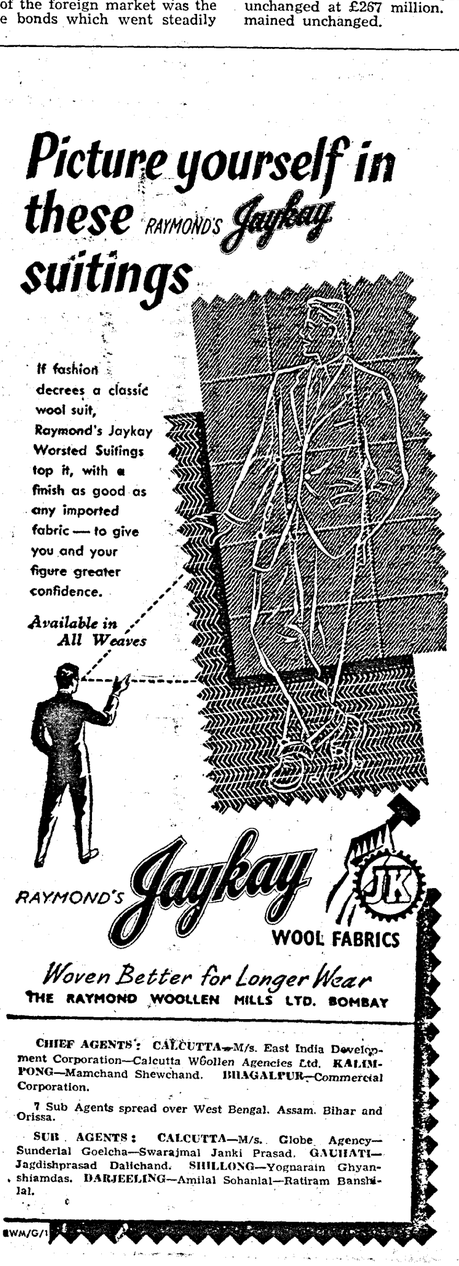
London tanker market operators reported that there was a large increase in laid-up vessels and the estimated total was now nearing the 2½ million-ton mark. The tonnage is remaining, however, still in excess of requirements and rates are at levels where even modern tankers of normal size cannot run at a profit. Moreover, with the American coastal trade entering the slack summer period, traders say that there appears to be little prospect of an early improvement.

Better Outlook for Italian Quicksilver

Italian quicksilver exports are expected to increase substantially this year as a result of increased orders from abroad. According to official statistics, exports in the first quarter of this year amounted to 869 metric tons compared with 325 metric tons in the same period of 1953. It is believed that exports will be maintained at the present rate and that exports for the whole year will reach about double the 1953 figure of 1,901 metric tons. The United States is the largest purchaser of Italian quicksilver and has taken about 60 percent of the total exports. Britain is the second largest buyer, followed by Germany, which this year displaced France from third position.

Linseed Oil Market

A wave of depression struck the London linseed oil market on Tuesday of last week and business was reported to have been done in American oil for August arrival to London and Hull at down to £55½. With more persistent buyers about at this figure, sellers became distinctly more reserved and eventually £58 was realised to Hull for this position. Slow trade has been going on in castor oil and finally there were offers at about £2 below previous levels for Indian B.S.S. at £114 per ton in drums. June shipment and for commercial No. 2 at £106 per ton, cost and freight.



Finance in India & Abroad

THE CALCUTTA MONEY MARKET

CREDIT CONDITIONS UNCHANGED

Wednesday, 2nd June.

MONEY is again slightly easier, but the total supply of funds is still inadequate for the bank's lending needs. Demand from the tea industry is steady, but is now showing signs of strengthening in preparation for the new season. Demand from the jute mills is steady. The "slack season" that should by now be approaching in the money markets may not be as slack as it used to be. The interbank call rate still stands at 2¾ percent.

Business in bills has been very dull again this week. A number of small gunny and tea bills have been reported, but the tea auctions this week produced very few bills. Remittance has been modest to fair. The principal exchange rates are unchanged and quote: sterling T.T. and O.D. 1s 5 31/32d; three months' sight bills 1s 6 7/32d; four months' sight bills 1s 6¼d; the U.S. dollar Rs. 475.

* * * * *

Bullion weakened considerably last week on long liquidation and lack of support from upcountry centres. The price of silver declined from the previous week's level of Rs. 162-4 to Rs. 159-7 quoted today, while the ready rate was about 4 annas higher. The price was unchanged at 72¼d in London and at 35¼ cents in New York.

Gold also moved lower from Rs. 90-12 to Rs. 87-4 in sympathy with silver. The sovereign at Rs. 59-8 showed a loss of 12 annas.

* * * *

There is a further decline of Rs. 12.64 crores in notes in circulation to Rs. 1202.92 crores according to the return of the Reserve Bank of India for the week ended 28th May, 1954, while the total note issue at Rs. 1246.21 crores showed a small rise of Rs. 35 lakhs. Notes held in the Banking Department consequently rose by Rs. 12.97 crores to Rs. 43.28 crores. Deposits of the Government of India rose by Rs. 3.49 crores to Rs. 101.08 crores as did other Government accounts by Rs. 44 lakhs to stand at Rs. 20.55 crores. Balances of commercial banks at Rs. 43.79 crores revealed a fall of Rs. 1.17 crores. Balances held abroad declined by Rs. 2.30 crores to total Rs. 63 crores. Other loans and advances diminished from Rs. 56.22 crores to Rs. 48.02 crores, of which advances to scheduled banks against usance bills amounted to Rs. 21.27 crores against Rs. 25.27 crores. Investments declined fractionally by Rs. 5 lakhs to Rs. 75.65 crores. Ways and means advances were shown at Rs. 87 lakhs (Rs. 1.05 crores).

* * * *

During the week ended 28th May, Government of India treasury bills for Rs. 6,98,25,000 were sold in favour of the Reserve Bank.

* * * *

The statement of the position of the Scheduled Banks for the week ended 21st May, 1954, discloses Demand and Time liabilities at Rs. 541.35 crores (Rs. 8.03 crores on account of borrowings from Banks) and Rs. 328.95 crores (Rs. 1.46 crores) compared with Rs. 536.75 crores (Rs. 8.13 crores) and Rs. 328.60 crores (Rs. 1.55 crores) respectively in the previous week. Cash has declined by Rs. 60 lakhs to aggregate Rs. 33.04 crores, while balances with the Reserve Bank have advanced by Rs. 92 lakhs to stand at Rs. 42.93 crores. There is a rise of Rs. 1.25 crores in investments to Rs. 324.28 crores. Advances and bills discounted at Rs. 579.58 crores reveal a drop of Rs. 7.65 crores. The ratios to total liabilities of cash and balances and of advances and discounts are, in consequence, shown at 8.7 percent and 66.6 percent against 8.7 percent and 67.2 percent.

* * * *

The return of the Imperial Bank of India for the week ended 21st May, 1954, shows a rise of Rs. 32 lakhs in total deposits to Rs. 209.38 crores. Investments in Government Securities and other authorised investments are down by Rs. 5 lakhs and Rs. 25 lakhs to Rs. 82.59 crores and Rs. 10.38 crores, respectively. Loans, cash credits and overdrafts have fallen by Rs. 2.34 crores to aggregate Rs. 94.94 crores, while bills discounted and purchased have risen by Rs. 69 lakhs to stand at Rs. 31.13 crores. Cash and balances are, in consequence, shown at Rs. 17.07 crores or Rs. 73 lakhs higher.

PROSPECTS FOR STERLING CONVERTIBILITY

CHOICE BETWEEN BIG CREDITS AND FLUCTUATING EXCHANGE RATE

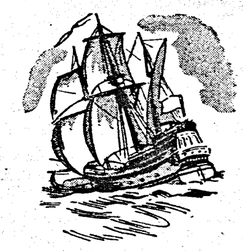
By Air Mail.

INTERNATIONAL opinion took a new turn during May towards convertibility of sterling. The currency has been easier, especially in terms of European currencies, since the denial of rumours that the dealing limits were to be widened beyond 2 cents on either side of $2.80 and since the lowering of Bank rate from 3½ percent to 3 percent. It seems that the speculative element in the funds that had followed into London from New York, Zurich, and other centres, has been mostly withdrawn, though substantial foreign balances remain because they can still earn relatively good rates and because they are needed for genuine commercial transactions. The easing of sterling signifies no weakening of confidence. However, the rumours that arise periodically regarding some major move towards convertibility "within the next few days" do not seem realistic, and they are likely to be disappointed if they persist in the coming months. It is not long since the British authorities were resisting pressure, attributed especially to Germany and Holland, to hasten their progress towards convertibility. If they were unreasonably cautious a few months ago it was because they knew that another mistake like that of 1947 would be disastrous. They will make no hasty move now for the sake of advancing convertibility by a few months. And it can be taken as established that they will make no major move that does not involve the other major European currencies as well.

It is known for certain that convertibility of sterling into dollars and any other currency is the British Government's objective—as it has been, with varying enthusiasm, for years past. It is not known if the British Government has a time-schedule clearly in mind—although it is expected that it anticipates important developments at the meetings of the International Monetary Fund next September. It is certain that the trends of the American economy, and of American foreign economic policy, are being carefully watched in the meantime. These trends may determine when the non-dollar currencies can be safely convertible; for it is not forgotten that the American recession of 1948-49 was largely responsible for the devaluation of sterling in September, 1949. The sterling area's gold and dollar reserve, which dipped below $1,500 million in September, 1949, was nearly back to that level by August, 1952, though it had approached $4,000 million in the intervening "Korean boom". It has since risen almost without interruption almost to $3,000 million; but in relation to prices and to the volume of international transaction this reserve is still much less than would have been considered adequate before the war. It has been suggested that the British authorities would regard a reserve of $5,000 million as a reasonable safeguard for a convertible currency, and that moderate credits from the International Monetary Fund would make good the deficiency of the central reserve. But that figure is probably out of date. Current liabilities—the sterling balances held on external account in London—are twice as large, and, though most of them are of a permanent character, there must be adequate provision against their withdrawal, as well as against fluctuations due to commercial and to speculative transactions.

London is thinking now in terms of substantial standby credits of thousands of millions of dollars. If it were seriously supposed that these credits would be used the idea of making sterling convertible at all would have to be abandoned. The idea is that they shall be there to sustain confidence; and the larger they are the more effective they will be for the purpose. Therefore, the larger they are the less they are likely to be used. It is hoped that such credits—necessarily American—will be negotiated at the IMF meeting in September, if not sooner. It would, of course, be possible to undertake convertibility on a much more slender foundation if exchange rates were flexible. London has been debating for many months past the respective merits of fixed and flexible currencies. Some people regard fixed rates as inconsistent with the British Government's general technique of flexibility in economic policy. The recent rumours, envisaging a margin of variation between, perhaps, $2.70 and $2.90 (instead of $2.78 and $2.82 at present) were associated with a belief not only that the Treasury wished to allow sterling to rise but also that it would approve flexibility as such—whatever the Fund's policy in the matter. The contrary argument is that currencies have been fixed in past periods of flexible economic expansion, and that violent changes in the rates, due to movements of money or to acceleration or withholding of payments, cause disturbance to trade without any counterbalancing advantage.

The possibility that the British Treasury will arrange those wider margins in due course is not to be ruled out; but they will then have a different significance. The Government does not regard flexible currencies as necessary to a flexible economic policy, but it does regard a "realistic" valuation of the currency (naturally, the higher the better) as necessary to convertibility. It might well allow temporary fluctuation—and receive the Fund's blessing for such fluctuation—to enable sterling to find its "natural" level before being made convertible. The present parity of $2.80 is, of course, arbitrary; it was intended in 1949 to represent some degree of undervaluation, so that the currency would become firmer rather than weaker; and the impressive economic recovery since 1952 suggests that a higher value should now be achiev-



Billowing Sails

once carried the world's communications and commerce. Even then Lloyds Bank was providing its clients with information and facilities for overseas trade.
Now, too, as then, Lloyds Bank continues to offer these services to those engaged in foreign business. ed. There are, however, still some serious flaws in the conditions for convertibility. It must be assumed that, if the reserve cannot be consistently built up by normal transactions between the sterling area and the non-sterling world, at least the trend of the reserve will be upward. It is therefore not less necessary now than previously that America's trade policy shall be liberal; and the omens in that respect are not now favourable.

15-YEAR ANNUITY CERTIFICATES

The Government of India have announced the issue of a new type of investment, called the 15-Year Annuity Certificates, as a part of the Small Savings Scheme. The certificates will be available for sale from 1st July, 1954. The annuity scheme is intended to cater to the needs of those who wish to provide for themselves or their dependents a regular monthly payment from a lump-sum investment. An investment of Rs. 3,500, Rs. 7,000, Rs. 14,000 and Rs. 28,000 in these certificates will secure to the holder a monthly payment of Rs. 25, Rs. 50, Rs. 100 and Rs. 200 respectively, for a period of 15 years, the first monthly payment commencing after the expiry of one calendar month from the date of investment. The monthly payment is exempt from Indian income tax and super-tax and will not be taken into account in calculating the total income of the holder for the purpose of income tax.

A DITCHER'S DIARY

THOUGH other annual reunions may show some signs of losing their appeal, the popularity of the Calcutta Dinner appears to be as great as ever. Last week's thirty-fourth annual dinner, which was held at the Connaught Rooms, London, brought together some three hundred and fifty ditchers, both young and old—many of them from distant parts of the British Isles—and the affair went off in the good spirits one associates with the occasion. Sir Anthony Elkins, who already seems to have collected a number of important directorships in the City of London, was in the chair, and Lord Swinton, Secretary of State for Commonwealth Relations, was the principal guest. The speeches, I am informed, were in the traditional vein of affectionate though somewhat critical regard for the City of Calcutta. (In parenthesis, it may be noted that the Bombay Dinner, held a week before the Calcutta gathering, dispensed with all speech making this year.) Lord Swinton, who has been a member of every Conservative Government since 1924, told the Calcutta Dinner that he had never known a time when Commonwealth consultation was closer and more genuinely expressive of that multi-racial and indefinable organisation. Nor, one may add, was there ever a time when a frank exchange of views between honest men was more desirable. But for most of the evening the post-prandial oratory was on a lighter note and it is probable that the diners' greatest enjoyment consisted in meeting old friends and the business and official colleagues of former years. That, after all, is the main purpose of a reunion such as the Calcutta Dinner, the continuing success of which incidentally owes a very great deal to the hard work and organising ability of Mr. G. H. Davis who has been its honorary secretary for the past twelve years.

* * * *

"Like the ancient Turks, who each year were surprised by the coming of spring..." This very dubious but quite unchallengeable opening phrase I found the other day in an article by the famous American economist Samuelson, writing on a subject that had nothing to do with Turks or the springtime. (He was talking in fact about the pleasure business men take in the reappearance of seasonal demand for their goods.) Were the Turks really astonished by the spring? I cannot prove that they were not, and the Professor knows it, so I must let him score a point in one-up-manship. Though, thinking about it again as the monsoon casts its shadow before, I wonder why the cycle of the seasons should surprise only the Turks, ancient or modern. Does the merciful arrival of the rains in Calcutta find a soul unsurprised? There is, I suggest, an enduring sense of wonderment in all of us; and if this be a failing, Nature certainly feeds it prodigiously. She can do the same thing year in and year out without ever evoking the slightest monotony. Who ever got tired of seeing the sun rise or set? I am myself no stranger to the Calcutta monsoon, but something of the first rapture remains. The depressions in the bay, the commerce of moist air and cold air, have been explained to me a dozen times by metereologists, and yet the mystery persists. April *was* the cruellest month, and May not much kinder, but June has already made ample amends; she has brought the monsoon earlier than St. Anthony's Day. If Tuesday's rains were "a false dawn", as I have heard the pessimists suggest, let there be another first monsoon shower—and we shall all be as surprised as the ancient Turks, and as agreeably.

* * * *

Totting up the fees now charged by ten public schools in England, as they were given in an article in the *Financial Times* the other day, I find that the average is no less than £298 a year, and quite a few of them—such as Eton, Charterhouse, Winchester, Rugby, Harrow, Oundle and Stowe—charge well over £300. At this rate the hard-working ditcher who hopes to give his son the luxury of a public school education will have to provide for a capital sum of a good deal more than £1,000 for a four-year period, and this amount will cover fees alone. School fees have risen sharply since the war and there is no promise that they will not rise even further before a boy who is now "down" for one or other of them actually goes into residence. The curious thing is that there is no lack of candidates, and a school like Rugby is receiving applications for as far forward as 1966—and some schools are taking not only the applications but the advance fees too. Naturally the class of people who can budget with any sense of security for such large sums years ahead do not include all the traditional supporters of the public schools; the clergy and servicemen have largely withdrawn from the fee-payers, with professional men and business men taking their place. There are various systems of providing for school fees, by means of insurance and by agreement with the school, but most of them only lighten the financial burden somewhat—and even that is less important, I suspect, than their function of committing parents in advance to a course that seems attractive before the actual difficulty of following it becomes evident. I cannot decide whether this determination on the part of some parents to give their children a public school education in the face of high taxation and reduced savings shows a lack of faith in the improving State system of schooling, or a desire to obtain for their children benefits other than purely educational. Whatever it is, it will ensure the persistence of institutions which it was once feared would not survive an age of egalitarian taxation.

* * * *

Indian undergraduates, a correspondent tells me, are playing an important part this year in some of the less serious activities of both Oxford and Cambridge Universities. Mr. Raghavan Iyer, this year's President of the Oxford Union, and his officers at the recent Eights Week debate, made a brave show in full Indian evening dress, brightly coloured turbans and ornate gold garlands. In accordance with tradition it was a nonsense-debate, but the nonsense was of an extremely high standard. Mr. Iyer evoked the description of a "pocket Nehru" from one of the speakers, and contributed his own piece of humour at the end by substituting "Iyer" for "Aye" and "Nye" for "No" for the division. The motion, it should be mentioned, was that the house preferred the White Rabbit to the Red Queen—"Alice", of course. Another Oxford development has been the revival of the Hermits, motivated by the Maharaja of Dhrangadhra who is now reading philosophy at Christ Church. Meant for undergraduates from the Indian sub-continent, this sports club lapsed during the war. Its scope has now been widened to make its membership international. The Maharaja is its president, and an Oxford tailor has found a sample of the club blazer, which has a lotus flower on the badge. A similar club at Cambridge, the Crocodiles, has been revived by the Maharaja's cousin, K. S. Anirudhsinghji, a nephew of Duleepsinhji.

In judging the work General Templer has done in Malaya in the past twenty-seven months some people seem to confuse two separate facts: that he has done his job exceedingly well, and that it was a job that it would have been better not to have *had* to do. Accusations of personal dictatorship and police state methods can be supported with much evidence, and they are not always made by simply irresponsible men. But surely the idea of putting General Templer in single and total control in February, 1952, with a directive that enjoined upon him ruthless determination, was that he should bring to a divided and terrorised country the measure of peace that dictatorial methods can ensure. That he has done, and since no one can show that he enjoyed doing it or that he imagined that Malaya should always be governed thus, he deserves the gratitude of all communities —though they may be as glad as he no doubt is that the time has now come when different methods can be employed. In India, I know, there was much publicity for the reprisals and collective punishments, the penal curfews and the reduction in rice rations, the burning of hamlets and the firm treatment of suspected collaborators. But there should be recognition too of the decline in insecurity, the sharp drop in civilian deaths after 1952, the extension of the area in which men can live peaceably without fear of victimisation and blackmail by terrorists. As General Templer leaves Malaya this summer, the administration can justly claim that the military situation is in hand, and that is the first requirement for further progress toward pacification and prosperity. Moreover nothing permanently harmful has been done to impede the political development of the country. If the Chinese and Malays are as much in disagreement as ever they were, that is still less than they would have been if a Chinese-managed Communist conspiracy had been allowed to continue to practise coercion and banditry on the other communities.

* * * *

So Mlle Geneviève de Galard-Terraube too is going to venture into authorship with her 25,000-dollar book on her experiences at Dien Bien Phu. This reminds me of J. B. Priestley's recent complaint that too many non-writers are trespassing into the literary pastures these days. Bookshops filled with field-marshals' memoirs, film stars' ghost-written autobiographies, politicians' private papers, and expedition-leaders' adventure stories confirm the grievance. "Strix" of the *Spectator*, who (as Peter Fleming) first made his name as a writer of travel books, did not approve Priestley's disparaging remarks on books of this genre, and said so in his column (as a diarist ever will), but I still think Priestley had a point. Too many recent best-sellers have sold on merits other than literary, and the professional writer may be forgiven for fearing that the readership of today has forgotten the very real distinction between books of information and works of literature. The former do no harm—often they bring a breath of fresh air into the literary hothouse—and I do not care for a "closed shop" policy either in industry or in the arts; but when the amateur who goes to Patagonia to write a book after he gets back, is preferred to the man who has taught himself to write, there is a possibility of topicality assuming the importance of sounder criteria. Just as important, there is the danger of a new species of traveller arising, who will put himself in the way of an improbable experience to make up an interesting chapter in the book he is writing as he goes along—like the gentlemen who threw annas from a Calcutta hotel window the other night to get snapshots of urchins fighting for them. But this sort of thing only becomes a vice with repetition, so Mlle Galard is exempt from Priestley's strictures. Few women have had the chance to display their heroism so brightly to the world, and fewer will have the opportunity to repeat it. She will probably write a very good book.

After a concert given by members of the Liverpool staff of the Clan Line a young man was asked what piece he liked best. His reply was prompt and enthusiastic, for, according to *The Clansman*, he said: "I liked the piece playing the 'cello."

Company Meetings

PENINSULAR AND ORIENTAL STEAM NAVIGATION COMPANY

114th Annual Meeting of the Proprietors held at the Company's Office, 122, Leadenhall Street, London, E.C.3. on Wednesday, 26th May, 1954.

After congratulating Viscount Leathers and Sir Donald Anderson on the honours recently conferred upon them by Her Majesty The Queen, the Chairman, Sir William Crawford Currie, G.B.E., said :—

From the Accounts it will be seen that there was a big contraction in earnings compared with 1952. This was not unexpected, as I forecast when we met here a year ago, and was experienced chiefly in the bulk cargo sections of our business in which cargo liners as well as tramp ships participate. Tramp rates of freight fluctuate more violently than liner rates, and it was the tramp ships which gained most from the 1952 boom and which suffered most in the subsequent recession.

Fortunately part of the reduction of £5¼ millions in net earnings was offset by a reduction in the charge for income tax. In addition, most of the Excess Profits Levy for which we were liable in 1952 is recoverable on the results for 1953, so that the total charge for taxation in the Profit and Loss Account is reduced by £4 millions.

As I have no doubt all Stockholders know, the Shipping Industry for some years has been pressing for recognition by the Government that depreciation on historical cost will not provide for the replacement of fleets. In this inflationary age the depreciation has to be supplemented by accumulations of cash, mainly obtained out of taxed income. A system of initial allowances was introduced some few years ago to give some immediate relief. The system was welcomed, though, as the Chancellor said in his Budget speech last month, the tax relief was no more than an interest-free loan which had to be repaid. This loan to the Group as at 30th September last was over £13¼ millions, and will have to be repaid as increased taxation some years hence.

I am glad to say that the inherent weakness of this system of temporary loans to industry has now been recognised by the Government and that, in general, it is to be replaced by investment allowances on expenditure on new ships and plant. The effect of the new allowances will be that a sum equal to 20 per cent. of the expenditure on all new ships will be allowed as a charge against taxable profits; the resultant tax saving will not have to be refunded at a later date, as is the case with initial allowances. I have seen the investment allowance described as a subsidy. It is not. It is simply a reduction in taxation. Tax relief is not a subsidy.

We are grateful to the Chancellor of the Exchequer for the new allowance; we hope that when the report of the Royal Commission on Taxation is published, it will contain proposals which will be of lasting benefit to the Shipping Industry and therefore to shipbuilding. It is as well, however, not to overestimate the effect of the present investment allowance. The immediate tax relief is precisely what it was with a 20 per cent. initial allowance. The tax saving will still be needed to supplement normal depreciation on historical cost in order to provide the cash required to replace our ships year by year, just as were the cash savings which resulted from initial allowances. For all practical purposes our position is unchanged, although if one goes back three years, when the initial allowance was 40 per cent., we are actually not so well off immediately. I see no reason, therefore, why the new policy adopted by the Chancellor should have any effect upon the level of dividends. In fact, in my view, it would be quite wrong if the relief given to meet inflation were used in that way. It is not until a decade hence, after the time has arrived for the gradual repayment of the interest-free loans received under the initial allowance system, that we shall be thankful that this investment allowance is not repayable. That time is too far ahead for me to forecast how the relief is then likely to operate.

From time to time I receive criticism that as a Group we place too much to reserves for the replacement of our fleets. I must again emphasise, however, that in each of the past few years, when criticism has been strongest, there has been a gap between the amount required for replacement and the amount retained by the Group. The graphs in the Directors' Report show the progress made and how far our efforts have fallen short of filling the gap.

Stockholders will have noticed that for the first three years covered by the graphs, the tonnage of the Group fleets increased. The actual figure at the end of 1951 was 312,951 tons more than at the end of 1948. You may wonder how this was achieved despite inadequate provisions for replacement. The answer is to be found partly in the fact that the Group liquid resources were run down by some £10½ millions during the three years, but that is not the whole explanation. At the end of the war most of our large passenger ships were reconditioned and some re-engined. Their useful life was thereby extended beyond the normal twenty years and some are still giving useful service. Postponement of the replacement of these ships has been a big help. We have thereby been able to devote a larger proportion of our resources to the relatively cheaper cargo tonnage.

With the advent of large scale air transport it was thought unwise to replace all the passenger ships that we had before the war and events have proved that decision to be correct. Whereas before the war the Group fleets consisted of passenger ships and cargo ships in roughly equal proportions, today only about one-third of the fleets consists of passenger tonnage.

If these fleets are to remain progressively competitive, we must continue to do all in our power to ensure the replacement of obsolescent ships. There are no signs of a reduction in building costs for the type of tonnage which the Group requires. It may be asked why we continue in business on what would appear to be an uneconomic basis.

The answer is quite simple. Your Board takes the view that the world will need shipping for as far ahead as any of us can see. Nothing has yet taken the place of sea transport as the most economical form of transport for general world trade. If this is true, it must be assumed that over a period shipping will be able to charge what is necessary to make it pay. There will be periods in the future, as in the past, when shipping does not pay, but unless it can recover its costs over a period it will disappear. In our view, the world cannot afford to let it disappear. Thus, whilst we, in common with other shipping men, say that prospects are at present poor, we are not suggesting that this is a permanent state of affairs. In these troubled times no one can safely predict the level of demand for shipping even 12 months ahead, let alone for the 20 years we must have in view when building a new ship. But if world shipping is to pay its way over a period, there is every reason to suppose that we, as part of it, can do the same, so long as we progress and do not fall behind. Old trades will fade away and new trades will emerge. We do not blindly pursue the old trades or ignore the new. We do not replace like for like. We do not set up a target of tonnage which we try to maintain. We try always to carry more cargo in fewer ships. We are always modifying, switching, altering to conform to the changing demand. But we must continue to build and to build the right type and quality of ship. Every new ship must always be an act of faith, but we consider this faith fully justified despite present difficulties.

British Shipping has been built up by husbanding its resources over a long period. This Company has been built up in the same way and by not losing heart when things look bad, but by driving on through bad times to better. The Balance Sheet before you today is a better testimonial to the results of such a policy than any other arguments I can use.

At the end of this Meeting stockholders will be asked to approve the two Resolutions printed in the notice calling the Meeting, one to increase the capital to £25 million and the second to capitalise £6,888,777 of the Reserve Account and allot to Deferred Stockholders a 100 per cent. scrip issue. This does not, of course, mean that future dividends will be at the same rate on the increased capital. The rate must depend upon trading results and be governed by the need to maintain the fleets in a condition of competitive efficiency. On the assumption that this Meeting will pass the Resolutions already referred to, the Board has decided that an ad interim dividend of 3 per cent. will be declared in the autumn for payment in November on the capital as increased. I can now say that the profits of the first half of the current year have been about equal to those of the corresponding period last year, but I am unable to venture a forecast for the remainder of the year.

India and Pakistan

Trade to and from India and Pakistan has shown some recession since we last met, but we were fortunate in being able to make good some of the lack of cargo offering for India and Pakistan ports by a sustained demand to and from Red Sea ports.

Despite more intensive competition for India and Pakistan markets, Britain seems to be holding her own in many fields of industry although Continental and Japanese suppliers have made inroads into the trade in some of the bulk commodities.

There is an increasing demand for oil cargoes to be shipped in bulk and with most of our ships fitted with bulk oil tanks we are in a good position to benefit from this development.

We still have to contend with very serious delays at the East Pakistan ports of Chittagong and Chalna to obtain a worth-while loading. Developments are taking place at these ports, however, which, it is hoped, will ease the position.

INDIAN TRADE & GENERAL INSURANCE COMPANY LTD.

TENTH ANNUAL REPORT

PREMIUMS EXCEED Rs. 50 LAKHS

The Annual General Meeting of the Indian Trade & General Insurance Co., Ltd. (General Manager, Mr. T. M. Sturgess) will be held in Calcutta on June 15th.

The following are points taken from the Statement circulated to Shareholders on the Report, Accounts and Balance Sheet by the Chairman and Managing Director, Mr. Karam Chand Thapar :—

It is a happy coincidence that our Nett Premium Income in all Departments should at the end of this first decade exceed the Rs. 50 lakh mark, I think you will agree that this is sure evidence that we have developed our business along the right lines.

Market conditions are still far from satisfactory, this is borne out by the large number of Companies that operated at an expense ratio well above that permitted under the Insurance Rules in 1952 as published in the 1953 Insurance Year Book; it is obvious therefore that if we are to continue to operate within the specified limit of expenses we must be satisfied with such increase in our Indian business as is attracted by the services we are able to render, the security we offer and the enviable reputation we have acquired for prompt and fair settlement of claims.

Our total Nett Premium Income amounted to Rs. 51,58,146 as against Rs. 40,53,261 in 1952.

To the Nett Premium Income of Rs. 51,58,146 must be added Interest and Dividends (less Income Tax) amounting to Rs. 1,44,068 and Miscellaneous Receipts of Rs. 1,533; the total income of the Company thus amounted to Rs. 53,03,747 : Claims Paid and Outstanding take Rs. 25,01,250; Commissions, Expenses of Management and Foreign Taxes Rs. 18,00,951; Company's contribution to Provident and Pension Fund and Bonus to Staff total Rs. 66,500, and Depreciation, Bad Debts and other debits account for a further Rs. 1,61,563, leaving a balance of Rs. 7,73,483, to which must be added the balance carried forward from the previous year amounting to Rs. 10,886, making a total credit balance of Rs 7,84,369. Out of this balance an amount of Rs. 6,71,706 (equal to 13% of our total premium) is placed to Reserves for Unexpired Liabilities in all Departments, and after reserving Rs. 13,000 for Bad and Doubtful Debts, there is an available balance at the end of the year of Rs. 99,663.

It is proposed to maintain the same Dividend as last year of Rs. 1/8/- per share (tax-free) which will absorb Rs. 90,000, and to carry forward the balance to the next account.

Management Expenses, Commissions, Depreciation and Foreign Taxes work out at 37.7% of our Nett Premium Income, a further improvement on the figure of 37.9% in 1952, and I can say without fear of contradiction that at this level our expenses compare most favourably with those of almost any Company of whatever size or age, Indian or Foreign; the importance of this aspect of the management of our business cannot be sufficiently emphasised.

Fire

Nett Premiums totalled Rs. 25,97,027 as against Rs. 22,61,308 in the previous year. Claims paid and outstanding were higher at 46.4%, due to the preponderance of foreign business but Commissions and Management Expenses at 40.5% of the income showed a welcome reduction on the figure of 46% in 1952.

Rs. 2,47,346 is transferred to Profit and Loss Account.

Marine

Nett Premiums were Rs. 16,57,459 as against Rs. 9,90,309. This increase is mainly due to a change in our method of Reinsuring. Whilst commissions and expenses of management show an increase at 29.4% of the premium income due to the reduced commissions earned on reinsurances ceded under the new system of reinsurance, this is more than offset by the substantial reduction in the claims ratio at 53.6% as against 70.4% in 1952.

The rapid increase in premium brings with it a heavy financing charge and we have transferred Rs. 2,09,544 to the Profit and Loss Account as a result the Reserve for unexpired liabilities is strengthened and now stands at Rs. 13,25,967 an increase of over Rs. 5 lakhs.

Miscellaneous

Premiums at Rs. 9,03,662 show an increase of a little over one lakh on the previous year. Commission and Expenses at 42.8% are 1.5% higher due to the initial cost of procuring business in certain overseas territories.

Claims have improved to 45.3% of the premium as against 51.4% in 1952.

An amount of Rs. 36,013 has been transferred to the Profit and Loss Account.

Balance Sheet

The position is greatly strengthened as a result of the year's operations.

Investments exceed Rs. 41 lakhs. Underwriting and Contingency Reserves are over Rs 35 lakhs and our Total Assets now stand at the substantial figure of Rs. 82,32,441.

We can look to the future with every confidence and I must thank our General Manager Mr. T. M. Sturgess, the senior Executives and Staff both in India and abroad as well as our many friends and Agents who have all contributed to the success of our operations.

BRITISH INSULATED CALLENDER'S CABLES, LTD.

SIR ALEXANDER ROGER ON THE SATISFACTORY RESULTS

The 9th annual general meeting of British Insulated Callender's Cables Ltd., will be held on June 10 in Liverpool, England.

The following is an extract from the circulated Statement of the Chairman, Sir Alexander Roger, K. C. I. E.:

The Directors deeply regret to record the loss, through death last July of Sir Johnstone Wright who, after a lifetime of service in the electricity supply industry, joined the Board of this Company in 1948. His friendship and wise counsel are greatly missed by us all.

The resignation from the Board has just been received, on account of impaired health, of The Rt. Hon. Lord Ramsden to take effect from the forthcoming Annual General Meeting. No words of mine can adequately describe the outstanding services Lord Ramsden has rendered since 1942.

We had much pleasure in appointing Sir Rex Hodges to our Board on 31st March last. He is a man of wide experience with an outstanding reputation in the Merseyside area in which so many of our main factories are located.

In my Statement last year I expressed the opinion that trading conditions in 1952 had been exceptionally favourable and the drop in 1953 Trading Profit of £1,178,002 to £8,344,074 was not unexpected by us.

Production

1953 has not been an easy year for our Production people. In certain of our activities the Group has enjoyed a good load factor with all its benefits, but in others the load has been erratic with all its consequent problems. This latter position has applied particularly where copper is mainly involved.

In addition we have had such abnormal experiences as the flooding of our Erith Works and an explosion last August in our copper refinery after 22 years of trouble-free operation. Fortunately no loss of life occurred in either case.

We have, however, made excellent progress on several large schemes of improvement which have left us with manufacturing units of which we can be justly proud.

In some of our activities turnover was increased and in others well maintained, but in our Copper Wire Mill products and in Power Cables substantial reductions were experienced. Admittedly some falling away from previous levels was to be expected, but in the summer of last year there was an abnormal shortage of orders in copper products when it became known that the London Metal Exchange was re-opening in August.

The other main factor affecting business in 1953 was the growth of competition particularly from European and Japanese manufacturers in overseas markets.

In the all-important matter of exports one of the many strong points of the BICC Group is in having operating Subsidiaries in several overseas countries.

In my Statement last year I dealt at length with our new investment in Canada and our new Subsidiary in Australia. The former has had a satisfactory first period of operation and, as regards Australia, I have just returned from an extended tour of that country and of New Zealand. I was amazed at the developments in both these countries.

We have since the close of the year received an order in face of international competition, valued over $3,000,000 from the British Columbia Electric Company for the supply and installation of some 77 miles of 138,000-volt gas pressure type cable.

In Uganda good progress has been made with the erection of 132,000-volt transmission lines to carry power from the Owen Falls Hydro Electric Station recently opened by H. M. the Queen. In Portugal a 130,000-volt transmission line from Lindoso to Oporto was commissioned last June.

The contract for the supply and erection of the overhead equipment, together with underground feeder cables and pillars, for the first trolley-bus system in Ceylon was completed during the year.

Included in the BICC Group is the Indian Cable Company Limited in which your Company holds a substantial interest, with the great bulk of the balance owned by Indian Nationals. Early in 1923 the Company commenced production of the first Indian-made copper conductors and rubber insulated cables. From small beginnings it has grown considerably and the factory at Tatanagar now stands in an area of 170 acres with well designed workers' housing and medical, recreational and educational facilities for its 1300 employees. Far-seeing post-war plans for expansion are now coming to fruition. The new non-ferrous rod rolling mill went into production early in 1953, while nearby, a spacious building has been erected to house plant and equipment for the manufacture in India for the first time of paper insulated power cable. These developments represent a major contribution to India's Five Year Plan and a consolidation of our long and happy association with that great country.

Standard parts for our Callender-Hamilton bridges and hangars have been shipped to New Zealand, Trinidad, British Guiana, Malaya and Sudan.

On the marine side, we were particularly happy to be associated with the cabling of the Royal Yacht, and with many other new ships.

Although there has been a welcome increase in the intake of orders since last Autumn, there is no doubt that the days of having long order books are over, and that we are back to the pre-war position in many of our products with delivery and price becoming of increasing importance. This applies particularly to our overseas business where, for reasons I have already given, competition is becoming more and more intense.

The relinquishment, however, of Government controls over most of our raw materials, and the growing freedom we therefore enjoy, are a help and challenge to us all in the Group to achieve greater productivity, even higher efficiency and lower costs. They must remain our foremost objectives.

Conditions from the short-term aspect may not be easy—they rarely are! But I have confidence in the future of this Group with its wide spread of interests both in products and in territories; with its active research and technical activities; with its fine factories constantly being improved; and above all with its enthusiastic, competent and loyal team of men and women.

The Chairmanship

In concluding this review of the 1953 results I also virtually conclude my active service as a Director and as your Chairman, for it is my intention immediately after the forthcoming General Meeting to resign both these Offices.

I get particular pleasure and comfort from the proposed appointment of Mr. W. H. McFadzean as my successor in the Chair. He and I have worked together closely and happily for over 20 years, and since the amalgamation he has been my right-hand man.

I commend him to you with complete confidence, and my final wish is that he will receive from all Stockholders and all the BICC Team, the understanding and support and trust which I have enjoyed and have so deeply appreciated, and which will always remain one of my most treasured memories.

Also issued with the Accounts was a tribute from the Board of Directors to Sir Alexander Roger on the occasion of his retirement as Chairman and Director of the Company.

THE ANDHRA CEMENT COMPANY, LIMITED

Speech delivered by Sri V. Ramakrishna, M.A., CIE, I.C.S. (Retd.) Chairman, The Andhra Cement Co., Ltd., at the annual general body meeting held on 22nd May, 1954, at the registered office of the Company, (55, Peters Road, Madras-6.).

Gentlemen,

I have very great pleasure in extending to you a very hearty and warm welcome to the 16th Annual General Meeting of our Company, this evening.

The Directors' Report, the audited Statement of Accounts together with the Profit and Loss Account for the year ended on 31st December, 1953, have already been in your hands for sometime, and I therefore, with your kind permission, will take them as read.

1953 has been a year of notable improvement with regard to both agricultural and industrial production. On the food front the production has substantially increased during the past two years leading to gradual decontrol of foodgrains all over the country. The industrial production in 1953 has been the highest since Independence. The general index of industrial production has gone up from 117.2 in 1951 to 135.1 in 1953. Though the targets fixed by the Planning Commission exceeded in certain cases like cotton textiles, and salt, some industries like steel, suffered a small set back due to labour troubles. In the case of cement the production was 3.78 million tons as against installed capacity of 3.96 tons. Tea and paper have also recorded increased production.

India completed three years out of the Five Years Plan Programme, and spent about Rs. 1,000 crores. The Planning Commission recommended an increase in the total expenditure under 5 Year Plan by Rs. 175 crores to Rs. 2,244 crores. The Government will have therefore to spend about Rs. 1,250 crores during the next two years. This increase in expenditure in Public sector may create greater opportunities for employment, but unless this is accompanied by a corresponding increase in expenditure in private sector, it will not be conducive to the creation of proper opportunities for full employment. I hope the Committee appointed by the Reserve Bank under the chairmanship of Sri A. D. Shroff, must have recommended appropriate measures of assistance to private sector. The initiative taken by the Government to start two development corporations for providing financial assistance to private sector is really to be welcomed. One will be started directly by the Government of India, and the other will be by the Indian Industrialists with the assistance of the Government of India and the World Bank. I hope that with the increased expenditure in the public sector, and with the availability of adequate financial facilities in Private sector, there will be greater activity in our country leading to greater economic prosperity.

I referred in my speech last year to the enquiry undertaken by the Tariff Commission and the representations made by our Company. The Tariff Commission among other things, recommended the fixation of a basic price of Rs. 72/- per ton F.O.R. destination as against the existing price of Rs. 71/- per ton for all Companies other than the five high-cost units and also an extra price ranging from Rs. 5/- to Rs. 8/- per ton for all the high-cost units. The Tariff Commission while recommending the price of Rs. 72/- per ton, have made provision for a return of 10% on the gross block and 4½% return on the capital employed, and about Rs. 3.9 per ton for rehabilitation and expansion.

Apart from the question whether the recommendation of a return of a 10% on gross block is fair or not, in view of certain items of expenditure such as Managing Agents' Allowance and Bonus, are not taken into account while computing the various elements of cost of production, the Government of India have considered it adequate to allow a return of only 8% on gross block. This would mean a reduction of about Rs. 1½ per ton in the price recommended by the Tariff Commission. The Government also felt that there was no justification for allowing Rs. 3.9 per ton in the cost, towards rehabilitation and expansion in the case of high cost units. They have therefore decided to treat Rs. 67/- per ton F.O.R. destination as the standard ceiling price of cement. In order to assist the old units to carry out their rehabilitation and expansion programmes, the Government of India allowed these units to add a sum of Rs. 4/- per ton to the standard cost, to make the total cost as Rs. 71/- per ton as before. After deduction of taxes, the amount of Rs. 4/- per ton allowed for rehabilitation and expansion, will yield a little over Rs. 2/-. As it is the intention of the Government that this sum of Rs. 2/- per ton should be exclusively utilised for rehabilitation and expansion, they have ordered that all the companies concerned should credit this amount in a separate account which should be operated with the consent of the Government. As the Government felt that there was no necessity for any rehabilitation in the case of high cost units, but at the same time these units cannot economically work on returns on the same scale as other units, they allowed an increase in the price ranging from Rs. 5/- to Rs. 12/- over the standard ceiling price of Rs. 67/- in the case of five high-cost units.

While it is gratifying to note that the Government of India have given a high degree of priority to the expansion and development of cement industry along with other basic industries, it is somewhat disappointing to notice the discouraging attitude on the part of the Government in not allowing a fair increase in the selling price. This decision of the Government of India, is likely to prove to be a great hardship to the industry in general, and particularly to our unit which is a small and single unit, and which is partly old and partly new by treating it on the same basis as the A.C.C. Ltd.

The Cement industry has made a fairly satisfactory progress during the past few years, with the production increasing from about 1.55 million tons in 1948 to 3.78 million tons in 1953. The total demand for cement inclusive of the requirements of multi-purpose projects and roads, is expected to be around 3.8 million tons by 1955/56. The requirements of cement for multi-purpose projects and roads are estimated at about 7 lakhs tons during the first Five Year Plan period. As against the anticipated demand of 4.5 million tons by 1955/56, the Planning Commission have fixed the target for increasing the rated capacity of this industry, as 5.01 million tons in 1955/56.

At a time when the need for expansion of this industry so great, it would have been fair for the Government of India to offer enough incentives to the industry, especially taking into account the very satisfactory part played by this industry in fulfilling the expectations of all the interests concerned.

It may be mentioned that the potentialities for the development of cement industry in the Andhra State are very great, not only on account of the existance of huge high quality deposits of limestone but also on account of a growing demand for cement as a result of coming into existance of two big hydro-electric projects and construction of a very big river valley project on Krishna River, in addition to a large number of minor irrigation schemes. With the development of various river valley and irrigation projects and with the growth of electricity and the construction of State Capital, the demand for cement in the Andhra State alone may be expected to be doubled in the next few years.

Coming to our own affairs, I hope the shareholders will regard with satisfaction the results of the working of our Company during the year 1953. You will observe from the accounts placed before you that the Profits of the Company amounted to Rs. 10,73,622/- after providing a sum of Rs. 10.0 lakhs towards depreciation, as against the profit of Rs. 7,07,918/- in the previous year after providing the same amount of Rs. 10.0 lakhs for depreciation. Production as well as despatches were, of course, higher during the year under review. Cement despatches amounted to 1,20,231 tons during 1953, as against 76,861 tons in 1952. This increase in production and despatches could not find a corresponding reflection in the trading results during the year under review on account of a reduction in the price of packed cement and an increase in production costs. The packing charges are fixed by the Government and they have been reduced every quarter in 1953. Ourselves being a small unit, it is not possible for us to buy huge quantity of packing materials at advantageous rates. The prices of various raw materials as well as of packing materials continued to rule high. The labour costs also have been on the increase. The increase in profits in 1953 was, therefore due to higher turnover and not improved margin of profit.

I would like to draw your attention to the provision made for Taxes at Rs. 5.45 lakhs as against Rs. 75,000 last year. Provision under this head will be on the increase hereafter.

Last year I referred to the question of providing additional railway siding facilities at our factory to cope up with increased despatches. We have finalised the programmes regarding the provision of additional siding facilities at the factory and also to lay a special line for about six furlongs at the limestone quarries in Nadikude to ensure increased supplies of good quality limestone. In this connection I wish to point out that we are not able to get adequate supplies of wagons for transporting our cement and this is proving to be a limiting factor over our sales, on many occasions, apart from the great inconvenience caused to our constituents.

Your Directors have been always striving their level best to maintain cordial relationship with labour, and you may be glad to note that our relations with the labour have been on the whole, quite satisfactory, despite occasional manifestation of a few discordant notes now and then.

The construction of the first set of 50 quarters allotted to us under the Industrial Subsidized Housing Scheme is almost completed, and arrangements are now being made for undertaking the remaining quarters contemplated under the Subsidized Scheme. It is proposed to build these quarters in two patterns suitable for the lower income and higher income groups respectively.

In January 1954, we have floated a subsidiary Company under the name and Style "ANDHRA CEMENT CONSTRUCTION CO. LTD." for the purpose of undertaking various kinds of construction works and also to carry on any other business which will be conducive to the interests of this Company and we hope this institution will prove to be of great assistance to us.

With these few remarks I now commend the Directors' Report and the audited statement of accounts for your adoption.

ANGLO-IRANIAN OIL COMPANY, LIMITED

FORMATION OF CONSORTIUM TO NEGOTIATE SETTLEMENT OF IRANIAN DISPUTE

Total sales in 1953 increased by 14% to 37,000,000 Tons

Sir William Fraser's Statement

The 45th annual general meeting of the Anglo-Iranian Oil Company, Ltd., will be held on June 10 in London, England.

The following is an extract from the statement to stockholders by the Chairman, Sir William Fraser, C.B.E., LL.D., circulated with the report and accounts:

Consolidated trading profit and other income for 1953 was £43,827,585 after provision of £20,056,243 for Depreciation. The gross consolidated profit thus totalled £63,883,828, comparing with £61,260,584 for 1952 when depreciation and other write-offs totalling £14,198,946 were provided.

Total Capital Expenditure during 1953 was just under £75,000,000, financed by the proceeds of the Debenture Issue in January 1953, retained profits and reduction of net current assets. This capital expenditure included the following main items:—Aden Refinery £26,500,000; Kent Refinery £14,600,000; Kwinana (W. Australia) Refinery £10,700,000; other U. K. Refineries £4,300,000; Tankers £8,500,000; Oil Exploration Interests £4,500,000 and Marketing Interests £4,000,000—a total of £73,100,000.

Capital expenditure in 1954 continues to be heavy, being of the order of £60,000,000.

After providing £19,342,232 for taxation on profits, the amount available for reserves and dividends is £24,382,850 compared with £25,165,966 for 1952. Your directors have placed £14,000,000 to General Reserve and have recommended a final dividend on the Ordinary Stock of 25 per cent., and in addition a cash bonus of 2s. 6d. per £1 Stock Unit, both less income tax. The total distribution for the year approximates 7 per cent. on the Ordinary Stock plus General Reserve.

The Company's Interests in Iran

The Statement describes the latest events relating to the Company's interests in Iran including the resumption of diplomatic relations between Her Majesty's Government and the Iranian Government. Following inter-Government negotiations and inter-Company discussion of the problem of restoring Iranian oil to the world market it has been agreed that the best chance of reaching a solution lies in the formation of a Consortium of Anglo-Iranian and seven other major oil companies concerned with the production and marketing of Middle East oil.

The Consortium of Companies would be as follows: Anglo-Iranian Oil Company, with a 40 per cent. share; the five United States Companies, Standard Oil (New Jersey), Socony-Vacuum Oil, Standard Oil of California, Gulf Oil and Texas with an interests aggregating 40 per cent; Royal Dutch-Shell with 14 per cent. and the Compagnie Francaise des Pétroles with 6 per cent. The Consortium would not be established until there is an agreement with the Iranian Government which is acceptable to all the Companies participating.

At the invitation of the Iranian Government a delegation of three negotiators left London for Tehran on 10th April.

Parallel with the negotiations between the Consortium delegation and the Iranian Government, negotiations with regard to the compensation to be paid to the Anglo-Iranian Oil Company by the Iranian Government are being conducted by Her Majesty's Ambassador, who arrived at Tehran in March. It had been agreed that this question, with which the other members of the Consortium are not directly concerned, should be dealt with separately.

The two sets of negotiations are in progress and developments between now and the Annual General Meeting will be reported then.

Production, Exploration and Refining

Crude oil production in Kuwait, Iraq and Qatar was again substantially increased during 1953, when our off-take from those sources totalled some 32,200,000 tons compared with 25,600,000 tons in 1952. Our range of exploration activities (including Australia, Papua, Canada, East and West Africa, Trinidad, Sicily and the Persian Gulf) has been further extended.

Our total refinery throughput during 1953, at 20,000,000 tons was 2,000,000 tons greater than in 1952. With the new Aden refinery coming into commission this summer, and Kwinana (W. Australia) refinery early next year, as well as expected increases in capacity of some of our existing refineries, our total refining capacity by the end of next year should be some 30,000,000 tons. Parallel with this expansion in refining capacity, our refining operations and the quality of products are being continuously improved by the installation of new plant, in a constant effort to achieve the most efficient and competitive production.

In Great Britain, our refinery throughput in 1953 was 9,327,000 tons against 6,788,000 tons in 1952.

The statement details the Company's refinery operations in Belgium, France, Germany, Italy, Israel, Kuwait, Australia and Aden.

World demand for petroleum products (excluding the Iron Curtain countries) increased by about 5% in 1953, a similar rate to that experienced in the preceding year. In the Eastern Hemisphere the increase in consumption was about 6%, only fractionally less than in the preceding year.

1953 was our second full year without supplies from Iran. As reported last year, although the Anglo-Iranian Group's sales of over 32 million tons of crude oil and products in 1952 were 3 million tons below those for 1951, our position had been improving. This improvement continued, with the result that the Group's sales of crude oil and products in 1953 increased by 4¼ million tons, or just over 14%, compared with 1952, and totalled just under 37 million tons. This increase occurred mainly in crude oil sales; sales of refined products increased by rather over one million tons and were supplied to a greater extent from our own resources.

In India, Pakistan, and in our other outlets in East and South Africa, the Rhodesias, Egypt and the Sudan, etc., our trading position has been maintained or improved upon.

Without Prejudice

COMPENSATION FOR LOSS OF BUSINESS

ATTEMPT TO COLLECT TAX FAILS

(BY OUR LEGAL CORRESPONDENT)

1. THE business premises of an assessee are requisitioned by Government.

2. On account of the requisitioning he suffers loss of business.

3. He claims and is awarded compensation in respect of the loss.

Is the sum so received revenue or a capital receipt, for purposes of income tax? Alternatively, is it an income of a casual and non-recurring nature?

This was the question which fell for decision in a recent Bombay case. The assessee was a registered firm, the Shamsher Printing Press, whose business was that of purchasing and selling paper, stationery, etc. and that of manufacturers of books, exercise books, diaries, and the like. The assessment year was 1945-46, the relevant accounting year corresponding to it being Samvat Year 2000. The premises in which the assessee carried on business were requisitioned by the Collector of Bombay on 11th September 1943 under the Defence of India Rules. The assessee filed a claim before the requisitioning authorities claiming a sum of Rs. 8,10,300 as compensation. He did not obtain this amount. What he did obtain was Rs. 93,106. The Income Tax Officer treated a sum of Rs. 61,129 out of this amount as a revenue receipt and the particular reference with which Chagla C. J., and his colleague, were concerned was in regard to an item of Rs. 57,435, part of the compensation received.

In the claim that the assessee made in respect of this item he claimed a sum of Rs. 4,58,900, "on account of the compulsory vacation of the premises, disturbance and loss of business on the basis of two years at Rs. 2,29,450 per annum," and in the order awarding compensation the description of the item is the same with the exception of "loss in business" being substituted for "loss of business" and against the claim of Rs. 4,58,900, a sum of Rs. 57,435 was actually awarded.

The contention of Sir Nusserwanji Engineer, counsel for the Commissioner of Income Tax, was that this represented loss of profits and that therefore it was a revenue receipt and taxable as profits arising out of the business of the assessee. The contention of the assessee, represented by Sir Jamshedji Kanga on the other hand, was that this amount was awarded to him for damage done to his business and when a business man receives compensation for damages that compensation can never constitute a revenue receipt. "It is important to note", said the learned Chief Justice, "that in awarding compensation under the Defence of India Rules, the measure of damages that has to be adopted is the same as laid down in Sec. 23 of the Land Acquisition Act, and one of the factors that the Court has to take into consideration is the damage, if any, sustained by the person interested at the time of the Collector's taking possession of the land by reason of the acquisition injuriously affecting his other property, moveable or immoveable, in any other manner, or his earnings. Therefore, if by reason of the premises of the assessee being requisitioned, his business was prejudicially or injuriously affected, or even if his earnings were prejudicially or injuriously affected, the assessee would be entitled to compensation for the damages so caused and it seems to us clear that, if the assessee can successfully bring his case under this head the compensation cannot constitute a revenue receipt."

* * * *

The claim of the Income Tax Department was that it was entitled to tax the amount of compensation as income falling under S.10 of the Income Tax Act, from which it followed that the Department had to satisfy the Court that the compensation received was in the nature of the profits or gains of the assessee's business.

In support of his contention Sir Nusserwanji, on behalf of the Commissioner, relied on an English decision, *Ensign Shipping Co., Ltd. v Commissioner of Inland Revenue*.[1] In that case two ships of a company which were ready to proceed to sea were detained in port for a certain number of days. The Government having received a claim from the assessee company for compensation for the loss of use of the ships and for wages, paid a lump sum as such compensation. Rowlatt J., held that the amount paid was a receipt on trading account in lieu of the loss of income during the period of the interruption. It was a trading receipt and not a capital receipt. On appeal, the Court of Appeal upheld Rowlatt J's decision.

Chagla C. J. pointed out a vital distinction between that case and the one before him and his colleague:—"In the case before the Court of Appeal the Government actually had the use of the two ships and what was received by the assessee company was in the nature of hire for the two ships. Therefore the amount that the assessee company received was in the course of its business. Instead of a private party hiring the two ships the Government hired them and had the use of them, and the Government paid for the hire and therefore it was on those facts that the Court of Appeal held that the amount received was a revenue receipt and not a capital receipt, and at p.1177 Lord Henworth M.R., makes the position celar: 'Their business (i.e. the business of the assessee) is to make use of the vessels that they own, to hire out the vessels to charterers, and to make profits from the earnings of the ships. If one treats the ships as being capable of being hired out under freight for every day of the year, it is, then, I think plain that if you hold up a ship for 15 days, as in the case of the *Charlus*, or 19 days, as in the case of the *Webburn*, you have prevented the vessel from earning money.' Now (Chagla C. J., proceeded), in this case it is not as if the Government took over the business of the assessee, ran it and paid to the assessee a certain amount for the use of the business or for the profits of the business. The assessee continued to carry on its own business and its claim was based on the injury done to that business, and, however that injury might have been assessed and whatever test might have been applied to determine what the damages were, the payment which was actually received was damages and not income arising out of the business or in the course of the business. Therefore the Tribunal was right in taking the view that the assessee was not liable to pay tax on this sum as constituting profits or gains from the assessee's business. The payment would either constitute a capital receipt, or, if one takes the view that the payment was entirely independent of the business of the assessee, a casual and non-recurring receipt."

* * * *

The main question, which was whether the receipt was a capital receipt, having been decided in favour of the assessee, the Court next turned its attention to the alternative question. It was this, "Whether in any event the receipt of Rs. 57,435 is of a casual and non-recurring nature and therefore exempt from taxation under S.4 (3)(vii) of the Income Tax Act?"

Now there is no difficulty in this case about the application of the word "non-recurring". The payment was clearly of a non-recurring nature. Where the reader non-expert in income tax law may find considerable difficulty is in the application of the word "casual". The word is not defined in the Act. One is therefore thrown back on the ordinary, everyday meaning of a very common English word. The dictionary meaning is:—"Happening by chance; accidental; occasional; fortuitous." One expects there to be something haphazard, and indeed it has been held that a receipt which is foreseen, known, anticipated and provided for by agreement cannot be regarded as casual.

In a case such as this you may think that the moment the Requisition Order was served the receipt of compensation was by the assessee "foreseen, known, anticipated and provided for", if not by agreement then even more certainly by statute. It was only the amount of compensation and not the payment of it which was unsettled and indefinite; and as there are specific statutory provisions as to how the amount is to be calculated and ascertained it is difficult to see anything casual about that either. In short you may think that there was nothing casual about the receipt of this compensation at all. If so you would be wrong. Over a long period of years case law has steadily widened the meaning of the word in favour of the taxpayer. For example a regular annual allowance made voluntarily as a free gift may be a casual payment and Sir Jamshedji Kanga who was leading counsel for the assessee in this case supplies us in his well-known work on the subject with a great number of other cases in which it is difficult to reconcile the judicial meaning of the word with its plain and ordinary sense.[2]

The receipt in this case was held to be of a casual and non-recurring nature and, the answers to both questions referred to the High Court being in favour of the assessee, the Commissioner had to pay the costs of the reference.

[2]Ibid p.190 et seq.

[*I. T. Commissioner v Shamsher Printing Works* A.I.R. 1954 Bombay 137]

Stocks and Shares

SELECTIVE SUPPORT FOR SHARES IN RESTRICTED TRADING

TEA SECTION LEADS MARKET: FURTHER RISES IN OIL ISSUES: IRONS DULL

Wednesday Evening.

THE share market presents an irregular appearance, with little interest being taken in the main speculative counter, Indian Irons, but strong selective enquiry for a variety of other shares. The amount of business put through in the past week has not been large, although there has been an increase in the turnover in the tea section. The undertone is firm and prices are generally steady.

Jute shares are almost completely neglected and brokers report that many issues in this section are virtually unsaleable. There has been a little more interest shown in coal shares but prices have not changed much; Central India are quoted today at Rs. 6-6 and Burrakurs at Rs. 10. In the engineering section, apart from the dullness in Irons which today are priced at Rs. 30-6, prices are fully steady. Angelo Brothers are a feature in the miscellaneous section, buyers offering Rs. 22-8. National Tobacco have gained another 14 annas this week to Rs. 11-2.

Paper shares are once again well supported, with special interest in Orient Paper since it was learned that they were to go on to the forward list. Titaghur Paper have improved to Rs. 42 and Indian Paper and Pulp have gained over the week.

Oil shares have staged a further advance and Indo Burma Petroleum are being dealt in Rs. 139-8, with British Burma Petroleum at Rs. 4-5. Support from Bombay for Indian Coppers has taken the price to Rs. 3-3.

Government securities have been much steadier with the onset of somewhat easier conditions in the money markets, and several loans have gained two annas or more in the past week.

Details of the week's trading follow.

* * * *

There was a distinct improvement in sentiment in the Government securities section. Buyers appeared throughout the entire list with few sellers in evidence. Steady conditions were attributed to easier money, and the revival of fresh rumours of a change in the Reserve Bank rate also helped sentiment. After declining to Rs. 81-11, three percent Conversion Loan 1986 spurted to Rs. 82-3 on strong support; three percent Non-Terminable Paper improved by four annas to Rs. 81 without any business passing. Among short-dated securities 2½ percent 1954 loan was marked higher to Rs. 99-9 with buyers over, as was 2½ percent 1955 to Rs. 99-10 with few declared sellers. Three percent 1957 loan was better at Rs. 98-2 and three percent 1958 at Rs. 98-1. In the medium-dated group 3½ percent National Plan Loan 1961 rose to Rs. 93-14 to react thereafter to Rs. 98-11 on the payment of half-yearly interest. Three percent 1959-61 was taken at Rs. 96-2; 3 percents 1963-65 and 1964 were both marked up to Rs. 92-14 but 3 percent 1963-65 loan were later indicated at Rs. 92-12 ex-voucher; 4 percent 1960-70 improved from Rs. 101-7 to Rs. 111-11 because of sustained enquiry; 2½ percent 1961 advanced to Rs. 91-2; 2¾ percents 1960 and 1962 were lifted higher to Rs. 94-2 and Rs. 92-2 respectively. Long-dated loans were in strong demand with 3 percent 1966-68 rising to Rs. 90-2; 3 percent 1970-75 improved by 3 annas to Rs. 86-4.

Provincial loans also attracted scattered enquiry. 4 percents Madras 1963 and 1964 rose to Rs. 99-12; 4 percent, U. P. 1963 and 1964 were higher at Rs. 99-11 while there were buyers of 4 percent West Bengal 1963 at Rs. 100-3½ but sellers were asking one anna more; 2¾ percent U. P. 1961 and 3 percent U. P. 1960 were enquired for without attracting sellers.

Business was limited in preference shares, though good demand continued in selected miscellaneous scrip. Jutes were neglected with Anglo-India coming to hand at Rs. 118-8, Clive 6 percent at Rs. 84 and Howrah "A" at Rs. 114. Among miscellaneous issues Associated Hotel were done at Rs. 62-8, Basanti at Rs. 8, British India Corporation at Rs. 145 and Calcutta Electric at Rs. 12-5; Bharat Collieries improved to Rs. 53-8 and Rohtas "B" were crossed at Rs. 58-8; Carew were taken at Rs. 96, F. & C. Osler at Rs. 63, Indo-Burma Petroleum at Rs. 100 and Indian Iron and Steel at Rs. 108-8.

* * * *

There was slightly better enquiry in selected coal shares. Burrakur moved between Rs. 10-3 and Rs. 9-12 to close at Rs. 10. Central India were a shade higher at Rs. 6-6 while Raneegunge improved by more than a rupee to Rs. 14.

Interest in jutes was restricted and routine turnover was transacted. National at Rs. 26-3 showed little change but Howrah gained six annas at Rs. 24-6 on short covering. Champdany gained three points at Rs. 151 and Presidency were 4 annas better at Rs. 6-4.

In the engineering section Indian Iron moved between Rs. 30-7 and Rs. 29-13 to close around Rs. 30-6. Other engineering shares showed little variation with Braithwaite quoted at Rs. 16-4 and Kumardhubi at Rs. 10-2.

In spite of restricted turnover the miscellaneous group was marked by a few bright features. Indo-Burma Petroleum shot up from Rs. 114-8 to Rs. 139-8 on sustained support as did British Burma Petrol from Rs. 3-12 to Rs. 4-5. Investment support lifted Martin Burn from Rs. 20-9 to Rs. 22-1 and National Tobacco improved to Rs. 11-2 on renewed enquiry. Angelo Brothers rose by about a rupee and a half to Rs. 22-6 on fresh support; Titaghur Paper were a shade better at Rs. 42 but Orient reacted to Rs. 19-10 after Rs. 20-10 because of profit-taking. Ramnugger Cane were steady at Rs. 24-9 and Indian Wood Products at Rs. 34-12 on a satisfactory distribution. Notable declines included F. & C. Osler at Rs. 17-5, Orissa Minerals at Rs. 41-2 and Rallis India at Rs. 55-8. Alkali and Chemical were about a rupee higher at Rs. 16-12. British India Corporation at Rs. 8-2 and India Steamship at Rs. 8-7 showed little variation.

Tea shares met with broadening enquiry because of steady prices realised at Calcutta auctions this week and selected scrip showed smart rises. In the Assam group Bhatkhawa improved to Rs. 33-4, Teloijan to Rs. 19-6 and Dhunseri to Rs. 16-8. Among Dooars gardens Hantapara rose to Rs. 273, Hasimara to Rs. 37-4 and Killcott to Rs. 22-6. In the Terai group Gungaram were about 50 points higher at Rs. 350. Among Cachar estates Hattikhira were steady at Rs. 17-10 and Eastern Cachar at Rs. 6-2.

SISTA'S 8-9

amounted to Rs. 51.58 lakhs against Rs. 40.53 lakhs in 1952. Bringing other miscellaneous receipts there remains a balance of Rs. 53,03,747. Of this, claims absorb Rs. 25.01 lakhs, expenses, etc. Rs. 18.01 lakhs and depreciation and bad debts Rs. 1.61 lakhs, leaving Rs. 7,73,567. Bringing in Rs. 10,886, there is an available balance of Rs. 7,84,453. A sum of Rs. 6,71,706 is placed to reserves for unexpired liabilities. The dividend is the same at Rs. 1-8 per share. After making all adjustments Rs. 2,47,346 has been transferred to the profit and loss account from the fire account. Referring to the working of this department, Mr. Karam Chand Thapar, the Managing Director and Chairman, stated: "As at first sight it might appear that we have reinsured too heavily abroad I would say at once that there is a balance in our favour of nearly Rs. 6 lakhs as a result of our exchange of reinsurance business with overseas companies in the fire department." The miscellaneous department also gave a surplus of Rs. 36,104 to the profit and loss account. After transferring Rs. 2,09,544 from the profit and loss account, the reserve for unexpired liabilities in the marine department is increased by Rs. 5.04,003 and now stands at Rs. 13,25,967 equivalent to 80 percent of the premium income for the year. Mr. Thapar pointed out that "the balance sheet position is greatly strengthened as a result of the year's operations. Investments exceed Rs. 41 lakhs, underwriting and contingency reserves are over Rs. 35 lakhs, and total assets now stand at the substantial figure of Rs. 82,32,441".

* * * *

The statement of Sir Alexander Roger, Chairman of BRITISH INSULATED CALLENDER'S CABLES LTD., shows a drop in the trading profit for 1953 of £1 178,002 from the figure of £8,344,074 in 1952. This has been due largely to production difficulties, increased competition, and the unfavourable contrast with the unusually good figures of the previous year. The post-war expansion plans of the Indian Cable Company Ltd., in which the BICC group holds a substantial interest, are beginning to yield results. The new non-ferrous rod rolling mill began production early last year, and equipment is now being installed for the manufacture of paper insulated power cables for the first time in India. Sir Alexander gives a warning for the future. The days of the long order book are over, and they have been replaced by the pre-war conditions where price and delivery dates are of supreme importance. This applies specially to the business of the company outside the United Kingdom where increased competition from Japanese and German suppliers is being encountered.

* * * *

In his address from the chair at the recent annual general meeting of ANDHRA CEMENT LTD., Mr. V. Ramakrishna said that the Government had not allowed a fair increase in the selling price of cement. Its decision was likely "to prove to be a great hardship to the industry in general, and particularly to our unit which is a small and single unit." Reviewing prospects, he stated that the cement industry had made fairly satisfactory progress duding the past few years, with production increasing from about 1.55 million tons in 1948 to 3.78 million tons in 1953. The total demand for cement, exclusive of the requirements of multipurpose projects and roads, was expected to be around 3.8 million tons by 1955-56. "At a time when the need for expansion of this industry is so great, it would have been fair for the Government of India to offer enough incentive to the industry especially taking into account the very satisfactory part played by this industry in fulfilling the expectations of all the interests concerned." Mr. Ramakrishna thought that the potentialities for the development of the cement industry in Andhra State were very great, not only on account of the existence of huge high-quality deposits of limestone but also on account of a growing demand for cement from two big hydro-electric projects and a very big river valley project on Krishna River, in addition to a large number of minor irrigation schemes. With the development of various river valley and irrigation projects and with the growth of electricity and the construction of the State capital, he thought the demand for cement in Andhra State alone may be expected to be doubled in the next few years. The working of the Andhra Cement Company for the year ended December 1953 has produced satisfactory results. Progress was made in production and sales, though costs remained high because of increased wages. Allowing Rs. 10 lakhs for depreciation there is a profit of Rs. 10,73,621, which, added to Rs. 6,33,039 brought in, makes an available balance of Rs. 17,06,661. The usual preference dividends have been paid but the ordinary dividend has been raised by a bonus of 2½ percent to 10 percent. Amenities reserve is allocated Rs. 2 lakhs and gratuity reserve Rs. 15,000. Taxation absorbs Rs. 5.45 lakhs, leaving a carry-forward of Rs. 4,636. It is stated that a compromise decree has been obtained in the litigation between the directors and the managing agents.

* * * *

The INDIAN WOOD PRODUCTS COMPANY has made a profit of Rs. 12.51 lakhs for the year ended September, 1953 against Rs. 15.49 lakhs in the previous year because of increased costs. Sales were almost the same at Rs. 35.24 lakhs. Allowing Rs. 5.58 lakhs (Rs. 6.27 lakhs) for taxation, there remains a balance of Rs. 6,92,961, which together with Rs. 1,70,440 leaves a balance of Rs. 8,63,401. An interim dividend of 10 percent (15 percent) was paid on the increased capital. The final dividend is the same at 15 percent. General reserve receives Rs. 2 lakhs (Rs. 3 lakhs), leaving a carry-forward of Rs. 1,63,401.

The profit of the KHARDAH JUTE COMPANY fell from Rs. 10.22 lakhs to Rs. 8.60 lakhs for the half-year ended September, 1953. Bringing forward Rs. 3,07,185 there is Rs. 11,164. Taxation absorbs Rs. 3.25 lakhs (Rs. 3.80 lakhs) and depreciation Rs. 1.50 lakhs (same). The ordinary dividend has been reduced by Rs. 2-8 to Rs. 7-8 per share, leaving a carry-forward of Rs. 2,60,164.

* * * *

There is a rise of Rs. 3.93 lakhs in the profit of the METTUR INDUSTRIES to Rs. 29.24 lakhs for the year ended March, 1954 because of higher sales of cloth at Rs. 1.33 crores against Rs. 1.24 crores. Depreciation absorbs Rs. 1.66 lakhs (Rs. 1.45 lakhs). Replacement reserve is allocated Rs. 6 lakhs (Rs. 5 lakhs) and dividend equalisation reserve Rs. 50,000. The dividend has been maintained at 12½ percent, but a special bonus of 10 percent has also been paid because of a refund of Rs. 6.81,214 on account of E.P.T. The carry-forward is Rs. 50,153 (Rs. 77,483).

* * * *

The profit of the METHONI TEA COMPANY has risen sharply from Rs. 35,973 in 1952 to Rs. 4,95,432 in 1953 because of the higher average selling price of Rs. 2-0-9 against Rs. 1-7-10 per lb. The crop was lower at 10,037 maunds (10,588 maunds). After providing Rs. 1.17 lakhs for taxation, Rs. 81,264 for depreciation, transferring Rs. 1 lakh to reserve the dividend has been declared at 15 percent (nil). The carry-forward is Rs. 45,435 (Rs. 7,778). Estimates for 1954 have been made for a crop of 9,800 maunds at a cost of Rs. 12.28 lakhs.

* * * *

The NAGAISUREE TEA COMPANY earned a profit of Rs. 9.05 lakhs for the year ended December, 1953, compared with the previous year's loss of Rs. 1.29 lakhs. This is due to a larger crop at 13,169 maunds (11,836 maunds) and an average selling price of Rs. 21-1-10 against Rs. 1-5-8 per lb. After making all adjustments there is Rs. 6,99,278 of which revenue reserve is allocated Rs. 1.79 lakhs and buildings reserve Rs. 2 lakhs. The dividend has been declared at 25 percent against nil, leaving a carry-forward of Rs. 80,278. Estimates for 1954 provide for a crop of 12,000 maunds at a cost of Rs. 13.07 lakhs.

* * * *

There is a profit of Rs. 1.05 lakhs of the PUTINBAREE TEA ASSOCIATION, LTD. for the year ended last December against a loss of Rs. 95,638 in the previous year. The dividend has been declared at 10 percent (Nil). Revenue reserve is allocated Rs. 67,500 and buildings reserves Rs. 20,000, leaving a carry-forward of Rs. 8,942. The crop was 2,573 maunds (2,844 maunds) and the average selling price rose from Rs. 0-15-0 to Rs. 1-12-0 per lb. Estimates for 1954 are for a crop of 2,500 maunds at a cost of Rs. 2.54 lakhs.

* * * *

The NEW CINATOLLIAH TEA COMPANY made a profit of Rs. 2.01 lakhs for the year ended December 1953 and this compares with the previous year's loss of Rs. 2.10 lakhs. The dividend has been declared at 5 percent (Nil). Revenue reserve gets Rs. 75,000 and buildings reserve Rs. 40,000, leaving Rs. 21,164 to be carried forward. The crop totalled 4,707 maunds (5,206 maunds) and the average selling price improved from Rs. 1-9-10 to Rs. 2-3-3 per lb. Crop estimates for 1954 have been made for a crop of 5,300 maunds at a cost of Rs. 6.81 lakhs.

* * * *

The SEEVOK TEA COMPANY shows a profit of Rs. 48,216 for the year ended December, 1953 against a loss of Rs. 1.25 lakhs in the preceding year. The dividend has been declared at 2½ percent (Nil). Revenue reserve receives Rs. 20,000 and buildings reserve Rs. 10,000, leaving a carry-forward of Rs. 18,571. The crop was 2,056 maunds (1,779 maunds) and the average selling price rose from Rs. 1-12-7 to Rs. 2-7-1 per lb. Estimates for 1954 have been framed for a crop of 2,000 maunds at a cost of Rs. 3.37 lakhs.

New Delhi

ROLLS ROYCE TEAM REPORTS ON AERO-ENGINE PROJECT

GOVERNMENT EXPECTED TO SIGN PACT SOON

(FROM OUR NEW DELHI CORRESPONDENT.)

THE Rolls Royce technical team has submitted its project report to the Government of India on the establishment of an aero-engine factory in this country. It has suggested Bangalore as the site and thinks the factory will take two years to establish. The factory will manufacture both piston and jet engines. The Government of India is expected to conclude an agreement with Rolls Royce at an early date. Last year, it was decided to establish an aero-engine factory in India. An Indian mission sounded Rolls Royce about undertaking the project, so the Company sent out a team. It has been here for some weeks and has visited various industrial centres, including the Hindustan aircraft factory at Bangalore and the machine tool factory at Poona. In the event of an agreement being reached, Rolls Royce is expected soon to send to India one of its directors to undertake the preliminary work.

Trade Mission to Russia

In response to an invitation from Moscow, a goodwill trade mission including agriculturalists and industrialists is expected to visit Russia shortly. Trade between the two countries, even after last year's agreement, has not been on a large scale. Its total volume in the first three months, ended January 1954, was Rs. 17 lakhs, including Rs. 4 lakhs worth of exports from India which mostly consisted of shellac.

Policy on Dyestuff Manufacture

The Ministry of Commerce and Industry has lately been working in accordance with a policy intended to stimulate industrialisation without hampering the development of existing units and without creating monopolies. The Indian Dyestuff Company, for instance, has been manufacturing some categories of dyes without any foreign aid or collaboration. Now, Atul Products Ltd., as reported last week, will produce dyes in collaboration with Imperial Chemical Industries Ltd. Its proposed range of production is similar to that of the Indian Dyestuff Company. Before granting the licence to Atul Products, the Government studied the demand for various dyestuffs. The licence assures the fullest development of the project as an economic unit without enabling it to squeeze out the Indian Dyestuff Company from the market.

Indian Research Laboratories is another unit which has been manufacturing a certain range of dyestuffs. In granting licences to its competitors its legitimate interests have been suitably safeguarded. Then again, the Amritlal Company has a tie-up with an American firm of dye manufacturers, Hilton Davis. Atul Products Ltd., working in the same field, have a tie-up with another American firm of dye manufacturers, Cymadie. Licences have been granted to both the Indian companies in order to encourage competition and secure maximum production without one trying to squeeze out the other. Another feature of the plan is that the foreign collaborator is expected to produce results. The royalty to Hilton Davis depends on sales and not on production. In other words, the foreign partner is made to interest himself not only in the production but also in the marketing of the finished goods.

The phased programme of production is another feature of the plan In the case of dyestuffs, for certain groups the entire production from the raw material stage within a specified period has been ensured. In certain other groups, intermediate products will be permitted to be imported so as to enable the manufacture of certain stages of dyestuffs till the entire manufacture is undertaken in India.

Further details are now available of the terms of Imperial Chemical Industries' collaboration with Atul Products. Imperial Chemical Industries under the agreement will receive neither a royalty nor a technical fee. Mr. Kasturbhai Lalbhai will be the first chairman of the company for a period of five years, after which the chairmanship will be held in rotation by the two partners for a period of three years each.

Heavy Electrical Equipment Project

The two project reports for the heavy electrical equipment industry are being examined by experts here. The Government has asked Indian industrialists what articles of heavy electrical equipment are already being manufactured in India and what articles are likely to be manufactured during the next five years. By doing so, it has been able to get a complete picture of the potentialities of the private sector. This was considered necessary in order to avoid the sort of controversy which arose over the machine tool factory. Private manufacturers of machine tools, it will be recalled, objected to a State enterprise on the ground that it would compete with them. A policy decision will soon be reached under which proposed State undertaking will manufacture only those items of heavy electrical equipment which private industry is unwilling to manufacture. Government aid to private enterprise is also envisaged.

State Participation in Road Transport

The Planning Commission has re-orientated its road transport policy. It has asked State Governments to define clearly the areas in which increased Government participation in road transport is contemplated. Permits, it is urged, should be freely granted to operators outside such areas and should be for a period of not less than three years. Within the defined areas the validity of the permits should be for the longest period permissible under the "expansion schedule". In the areas left to private operators, special encouragement should be given to viable units. Government participation in road transport, it is stated, should be on a tripartite basis, the three parties being State Governments, the railways and private operators; failing this, it should be on a bipartite basis, namely State Governments and the railways. The Central Government has said that it will be prepared to give financial assistance if the framework of the plan outlined is accepted by State Governments.

Another Major Port for West Coast

Experts are examining whether Mangalore or Malp should be developed into a major port, it is learned. The first point to be determined is whether a major port between Bombay and Cochin is necessary and, if so, which of the two ports should be developed. Data for the development of Chandbali, in Orissa, into a major port is also being collected.

Postal and Telephone Finances

The Federation of Indian Chambers of Commerce and Industry, in a communication to the Government of India, has raised an important issue, namely the subsidising of the Posts and Telegraphs Department with the profits of the Telephone Department. At the end of the financial year 1951-52, the capital outlay on telephones was approximately Rs. 25.6 crores: income during the year was Rs. 9.66 crores and the net expenditure was Rs. 5.04 crores. This indicated a net return of 16 percent on the capital outlay. For the year 1950-51 the net return on capital was 20 percent. This, the Federation holds, is a high return for a State undertaking. "It would appear that the surplus from the telephone section is being utilised not only to set off the loss in the other activities of the Postal Department but also as the contribution of the Postal Department to the general revenues. In this connection, the Committee wish the Government to clarify the reason and purpose for continuing the 'own your telephone' scheme which was introduced in 1949. Is it for raising revenues or for curtailing applications for new telephone connections?"

Decision on Bank Award Delayed

An ordinance was issued last week amending the Industrial Disputes (Appellate Tribunal) Act so as to extend the stipulated period of 30 days by a further period of three months for the proper consideration of the Labour Appellate Tribunal's award in the bank dispute. This followed a representation from bankers who urged the Government that industrial legislation should not be applied to banks, where the worth of personnel depended on the experience they had gained from days of clerkship upwards through actual work.

FINEST SCOTCH WHISKY

Limited quantities available now

Sole Distributors:
MACKINNON, MACKENZIE & CO. LTD.

ORIENTAL

OFFERS 3 PLANS

TO ENSURE RELIEF FROM ESTATE DUTY

1. ESTATE DUTY POLICIES for the specific payment of Estate Duty, issued from age 18 to 60 nearer birthday. The proceeds of these Policies to the extent of the Duty payable but not exceeding Rs. 50,000 are exempted from Duty.
2. GIFT POLICIES: Issued from age 18 to 65 nearer birthday, our Two-Year Temporary Policies provide for payment of Duty on property transferred as absolute gifts, which for two years from the date of the gift, attract Duty.
3. MARRIED WOMEN'S PROPERTY ACT POLICIES: Issued from age 18 to 60 nearer birthday for the sole benefit of the wife and/or children, the proceeds of these Policies, under section 34 of the ESTATE DUTY ACT are not aggregated with the rest of the property, thus substantially reducing the incidence of Duty

Premiums under all our schemes have now been greatly reduced.

For the benefit of those with property which may attract Duty on death, ORIENTAL offers confidential advice on the best method of conserving their estates for their heirs. This advice is absolutely free and tendered solely in the interest of estate owners.

First name in Insurance — Last word in Security

ORIENTAL GOVT. SECURITY LIFE ASSURANCE CO., LTD.
Transacting all classes of life assurance and annuities
ORIENTAL FIRE & GENERAL INSURANCE COMPANY LTD.
Transacting Fire, Marine, Motor, Accident, also specializing in Machinery Erection and Breakdown Insurance.
Office: Oriental Buildings, Bombay 1.

INDIA'S LEADING INSURANCE COMBINE

"This process of building up competent bankers with a sense of responsibility is completely frustrated by application of labour legislation to banks." The bankers said that the award would raise establishment charges by 15 percent. The net profits of banks had declined from Rs. 13 crores in 1948 to Rs. 8 crores in 1954, and this would reduce the income tax receipts of the Government. They would be compelled to raise the charges for their services, which in turn would affect the export trade. Furthermore, they would be forced to close some branches, thereby throwing at least 4,000 people out of employment.

The bank award is another instance where a tribunal has ignored the broader economic consequences of its decision. The country urgently needs to expand banking facilities and a committee is trying to work out a plan to extend such facilities to the rural areas. But the bank award will, in effect, curtail the existing facilities.

Labour Studies

There is growing consciousness in India of the need for an agency designed to afford facilities for a continuing and expanding programme of education in all aspects of industrial development relating to the human factor and the needs of a developing economy. In the Five Year Plan it is suggested that a Museum of Industrial Health, Welfare and Safety should be established soon in a centrally situated industrial area. It is further suggested that the Museum, as a centre of demonstration, with exhibits covering all aspects of working conditions, including health, and with its Information Section and Library, could be the nucleus around which any specialised courses of training and education could be evolved. The scheme envisaged is, therefore, a composite one, comprising the Museum of Industrial Safety, Health and Welfare, an Industrial Hygiene Laboratory, a Training Centre and a Library-cum-Information Centre.

(1) A Museum of Industrial Safety Health and Welfare would, briefly, fulfil the following purposes:

(a) explain and illustrate the dangers to life and limb and health incidental to industrial processes and demonstrate the most effective ways and means of avoiding them;

(b) act as a centre of information for Factory Inspectors and Labour Inspectors on problems connected with their work;

(c) educate employers, supervisors, foremen, workers and all those connected with the promotion of the well-being of the workers in the application of the principles of industrial safety and health; and

(d) stimulate improvement in appliances and methods to ensure safety and health, to promote welfare, and to carry on research and education in the improvement of all aspects of working conditions in factories (such as machine-guarding, industrial hazards, occupational diseases, ventilation, lighting, sanitary arrangements, washing facilities, protective equipment, first-aid, fire-fighting, etc.).

Industrial Hygiene Laboratory

(2) An Industrial Hygiene Laboratory would provide facilities for field investigations:

(a) for the detection of health hazards;

(b) for the determination of environmental conditions involving exposures to various hazards and toxic substances used in industrial processes; and

(c) for the development of new techniques and preventive measures for counteracting and eliminating such hazards.

(3) A Training Centre would provide facilities:

(a) for the training of labour administrators and other personnel;

(b) for the training of trade unionists by assisting in organising periodical courses in the techniques of management of trade unions, collective bargaining methods, and other aspects affecting the well-being of workers such as working conditions and measures for promoting the health, welfare and safety of workers;

(c) as a common meeting ground for Government, management and labour groups for purposes of discussion relating to their respective rôles in an atmosphere free from the usual stress and conflict.

(4) A Library-cum-Information Centre providing facilities for study and research and for the supply of authentic information on all labour problems.

National Productivity Centre

(5) A National Productivity Centre would:

(a) conduct productivity studies in selected plants in the most important Indian industries, and more particularly in those whose output is expected to expand substantially, in co-operation with the employers and workers concerned;

(b) organise practical training courses for Government officials and/or management and worker personnel from those and other plants in all phases of modern industrial engineering techniques which have proved effective in raising productivity;

(c) organise training in job evaluation and in the scientific assessment of work-loads; and

(d) assist in applying modern industrial engineering techniques in selected plants with a view to raising productivity and workers' earnings and improving conditions of work in these plants, and to demonstrating to Governments, employers and workers the benefits which follow from the application of such techniques.

(6) A T.W.I. Centre would conduct training-within-industry courses in job instruction, job relations, job methods and job safety.

(1) Museum of Industrial Safety, Health and Welfare: It is proposed to obtain the machinery and most of the exhibition on loan or as gifts from manufacturers, as is done in the British Museum of Industrial Health, Welfare and Safety. In fact, to ensure that the exhibits represent the best modern practice, some arrangement such as this is considered most essential, so that when any improvements are effected in the appliances or machines on exhibit, the manufacturers would themselves arrange to replace the obsolete exhibits by newer ones.

(2) Industrial Hygiene Laboratory: In India, while all measures relating to health, welfare and safety of industrial labour can be considered to be on a level with those in the other industrially-advanced countries hardly any progress has been made with regard to the problem of industrial hygiene and occupational diseases. One method of making an overall appraisal of the industrial health problems would be through the medium of reliable statistics on industrial morbidity and mortality and accurate information on occupational diseases and accidents. While reliable information on industrial accidents is available, there are no data on occupational diseases. This is mainly because there is a shortage of personnel trained in industrial hygiene and industrial medicine, both in the Inspection Services and in the Public Health Departments. In view of these difficulties, the best method of attacking the problem of occupational diseases would be through a scientific study of industrial health problems.

Training Centre

(3) Training Centre: Representatives of employers and labour have for some time been suggesting that the Government of India should set up a centre for the training of personnel of Labour Departments of the Central and State Governments. In urging the establishment of such a centre it has been stated that, as in progressive countries specialised training should be imparted in labour laws and administration, industrial relations, wage fixation, labour and factory inspection, labour welfare and other social problems affecting labour. It has further been suggested that refresher courses should be instituted to provide an opportunity to personnel employed in Government labour departments and in the labour departments of industry to come in closer contact. Suggestions have also been made by representatives of labour that such training facilities should also be extended to trade unions.

(4) Library-cum-Information Centre: It is proposed to equip the Information Centre with literature on all labour matters. Arrangements will be made with some of the industrially-advanced countries for the supply of technical literature covering all aspects of labour problems. It is also proposed to make arrangements with leading trade and labour associations in the United Kingdom and the U.S.A. to supply all available literature concerning trade agreements, labour problems, etc. The Centre would also provide facilities for study and research and, at the same time, supply authentic information on all problems connected with labour.

(5) National Productivity Centre: It is proposed that the Centre should start functioning in Bombay this year. The I.L.O. have been requested to make available the services of one Director and four other experts for a period of two years. The I.L.O. will also provide any equipment, etc., required for the setting up of the Centre. Two Indian experts will be on the staff of the Centre.

Training Within Industry

(6) T.W.I. Centre: This will form part of the National Productivity Centre, and the five experts whose services India has asked for from the I.L.O. are expected to be qualified by experience and professional training to provide expert assistance in T.W.I. also.

It has been decided to locate the Institute in Bombay. The Bombay Government has made available, free of cost, 13 acres of land for the project. The Institute will start functioning by the beginning of 1955. The equipping of the Museum will, of course, have to be phased over a longer period, say three to four years. A capital grant of Rs. 9.5 lakhs has been sanctioned for the construction of the Institute building. An operational agreement has also been signed between the U.S. Government and the Indian Government, under the Supplementary Indo-U.S. Technical Co-operation Agreement: the U.S. Government has agreed to contribute $ 100,000 for the purchase of plant, equipment, exhibits, technical books, publications, etc., for the Institute.

Minerals Policy

The Minerals Advisory Board will hold its next meeting at Ranchi from 3rd June. It will consider the draft of the Mineral Conservation and Development Rules and the advisability of developing non-ferrous mineral resources. It will also discuss the necessity for the establishment of beneficiation plants in certain areas. At the instance of the Indian Colliery Owners' Association, the Board will consider whether provision for additional rail facilities for the movement of coal is necessary and what steps should be taken to re-capture the lost market for coal in Australia.

The present position of some non-ferrous metals is as follows:

	Production.		Imports.	
	Quantity (Tons)	Value (Rs.)	Quantity (Tons)	Value (Rs.)
Copper	6,079	1,95,50,850	20,610	7,62,45,579
Lead	1,132	17,38,000	3,350	65,56,350
Zinc	3,867 (concentrates)	—	23,000	2,54,19,140
Aluminium	3,566	1,05,19,700 (estimated)	6,035	2,40,33,300
Tin	—	—	2,030	2,48,90,661
				17,71,45,050

India has vast deposits of high-grade bauxite ore and the deficiency in aluminium is mainly because there are too few electrolytic plants for the manufacture of the metal.

Mosaboni Copper Mines

Regarding copper, the Indian Copper Corporation Ltd. is working the Mosaboni mines in Singhbhum district, Bihar, and the production is about 3,24,634 tons or ore containing 2.17 percent of copper. The amount of metal produced varies from 6,000 to 7,000 tons of "fire-refined" copper per year. This is used principally for the manufacture of brass. Though mineral concessions have been granted in Rakha mines, Bihar, Bhabbar Kali, Koi and Zari, Panchmahal district, Bombay, Karamsara in Balaghat district, Madhya Pradesh, Khetri and Daribo mines, Rajasthan, and Padhan Mines, P.E.P.S.U., there is no production from these mines. The concessions are confined mostly to the old and abandoned workings. There are numerous other old workings in Sikkim, Almora and Tehri Garhwal district, Uttar Pradesh; Hazaribagh district, Bihar; Kurnool district, Andhra; Jubbulpore district, Madhya Pradesh; Mysore and Chitaldrug districts, Mysore; and Riasi, Ramban, Anantnag and Baramula districts in Kashmir. Most of these abandoned mines have been exploited during the past, as is evident from the extensive workings and the voluminous slag heaps. With the present improved metallurgical practices it is now possible to work copper ores containing as little as 0.2 percent of copper as compared to the previous requirement of 2.5 percent. No information is, however, available about the reserves and qualities of copper ore in different areas; unless this is obtained it will not be possible to plan the development of the copper industry.

As for lead and zinc, only the Zawar mines in Rajasthan are being worked. Even though they were worked extensively in the past and were explored and developed by the Utilisation Branch of the Geological Survey of India during the last war as an emergency source of lead and zinc and were taken over by the Metal Corporation of India on lease in 1945, the present production of the Corporation is about 200 tons of run-of-mine ore per day. To make the operations really economic and to be able to smelt zinc within this country the daily production ought to be increased to about 1 000 tons of ore a day. In order to attain this target it is necessary to prove at least 8 to 10 million tons of ore in the deposits. As a result of the development work so far carried out by the Corporation at Zawar the reserves have been roughly estimated at 1.6 million tons, containing 2.5 percent of lead and 4.6 percent of zinc (7.1 percent of total metal). The total quantities of both metals that are recoverable are estimated at about 90,000 tons.

Zinc Smelter

The Zinc Smelter Committee has gone into the question of setting up a zinc smelter in India but has not been able to draw up plans because indigenous resources have not been developed and the extent of reserves remains to be estimated precisely. Besides Zawar, lead and zinc ore is found in Riasi, Baramula Kishtwar, Kashmir, Kulu Valley, P.E.P.S.U., Bhagalpur, Monghyr, Santhal Parganas, Ranchi, and Singhbhum districts of Bihar; Piparia in Hoshangabad district of Madhya Pradesh and Panchmahal district of Bombay. To achieve self-sufficiency in lead and zinc it is necessary to develop the Zawar lead-zinc mines and to assess the reserves in some of the old mines like Nigote and Riasi which are stated to be over half a mile in length. All these deposits will have to be examined in greater detail to find out their exact potentialities. With modern techniques of exploring and smelting the metals, it is very likely that these deposits may prove to be economically workable in present conditions. The following are the important prospective sources of metals, according to the information available at the moment:

Copper ore—(1) Khetri, Rajasthan. (2) Daribo. (3) Singhbhum district, Bihar. (4) Rangpo, Sikkim. (5) Gani, Nellore district, Andhra. (6) Baraganda, Hazaribagh district, Bihar. (7) Kalimpong, West Bengal. (8) Chhota Udaipur, Panchmahal district, Bombay. (9) Khasi Hills, Assam. (10) Baihar, Balaghat district, Madhya Pradesh. (11) Jammu and Kashmir.

Lead zinc—(1) Zawar, Rajasthan. (2) Jodawai, Rajasthan. (3) Bhagalpur and Hazaribagh districts, Bihar. (4) Manbhum district, Bihar. (5) Rewa, Vindhya Pradesh. (6) Cuddapah district, Madras. (7) Parvati Valley, Punjab. (8) Sabathu, Solan, Punjab. (9) Riasi, Kashmir.

Bombay

MR. C.D. DESHMUKH DISCUSSES FOREIGN AID PROSPECTS

ADDRESS TO CONGRESS WORKERS

(FROM OUR BOMBAY CORRESPONDENT)

MR. C. D. DESHMUKH, Central Finance Minister, told Congress party members at Thana near Bombay that to make an ambitious second Five Year Plan successful, it would be absolutely necessary to harness national resources to the fullest extent. He was in a mood, under the present unstable international conditions, to write off at least a good part of the financial aid from friendly nations from the amount expected earlier. He did not consider the sterling balances could serve as a prop for the second Plan, as they were likely to be wiped out during the next two years. He said that it would be unscientific to rely entirely on additional note issue to finance the plan. Directing his remarks specifically to party workers, Mr. Deshmukh observed that in order to make the Five Year Plan successful, Congressmen would have to strengthen their organisation and get in more intimate touch with the people than at present. He also issued a warning that unless Congressmen revived their contact with the masses, other political groups were likely to fill the vaccum.

Bombay has not taken kindly to Mrs. Durgabai Deshmukh's suggestion, approved by the authorities at the Centre, to the people and especially to women, to subscribe jewellery for the National Plan Loan through approved banks. The money market is inclined to view this proposal as almost fantastic, because the bullion trade is so well organised that there will be no need for the banks to intervene. Besides the branch offices of banks are not equipped to appraise the value of jewellery either in the form of gold or precious stones.

Export of Cotton

Two moves are reported from the cotton trade to improve the conditions of gloom into which it fell during May. While the forward price of cotton has come down during the course of last two or three weeks from Rs. 705 per candy to Rs. 665 in spite of the strong statistical position of Indian cotton for the rest of the year, the spot trade has also suffered in the matter of turnover, as buyers have become scarce with the persistent falls in the future section. The spot trade has, therefore, made a strong representation to the Government to allow an extra quota of 30,000 bales of Bengal Deshi cotton for export, as this cotton is no longer required by Indian mills and unwanted stocks are pressing heavily on the spot market. In fact, there is a good demand from the U.S.A. and the Continent for this quality. Last October, the Government allowed an export quota of 75,000 bales which was completed long ago. The authorities also hinted, while making the announcement of that quota, that the question of further release would be considered as soon as the crop position was known more clearly. There is no reason now, therefore, for any delay in allowing additional exports of surplus stocks of this variety. There are unused quotas of other varieties of short staple cotton for which there is no demand from abroad, because of the high rate of export duty on them. The trade would, therefore, desire that either the export duty on this otherwise unsaleable cotton be reduced or at least the unused part of the quota converted into Bengals of which there is a surplus and for which there is a demand. The second move is to persuade the Government to allow exchange facilities for hedging imported cotton in the newly opened Liverpool cotton market. A large quantity of cotton amounting to 6 to 7 lakhs of bales is imported. It is difficult to hedge it in the Jarilla contract in the forward market here. While there could be some objection to allowing hedging in the New York market because of the shortage of hard currency, there should be no such difficulty in the case of the Liverpool exchange with proper precautions to ensure that any demand for sterling is for *bona fide* trade purposes and not to remove capital outside the country. Such a link would also provide a corrective to the forward market in India, which is often apt to get into the grip of speculators. It may be recalled that in the pre-war years there used to be a good volume of straddle trade between Bombay and Liverpool in cotton and there is every reason why such a facility should now be provided when it has become feasible for an important commodity involving hundreds of crores of rupees. In the meantime, the Committee of the E.I.C.A. is actively engaged in considering some important changes in the machinery of forward trading carried on under its auspices so as to render it more realistic *vis-a-vis* the conditions in the spot market than at present.

Rationalisation in Cotton Textiles

Mr. G. D. Somani, a prominent millowner and former President of the Bombay Millowners' Association, speaking at the annual general meeting of the Shree Niwas Cotton Mills as Chairman, pleaded for a scientific formula on a long-term basis which would ensure adoption of rationalisation without unduly disturbing the present employment position. While fully alive to the fact that the country in its present position could not afford to aggravate the unemployment problem by large-scale retrenchment through a hasty and drastic programme of installing automatic machinery in the textile mills, he pleaded that it should also not lose sight of the growing competition in world textile trade. Mr. Somani warned that any severe ban on the installation of modern equipment and introduction of rationalised working would prove disastrous to the very cause of maintaining maximum employment and pointed out that introduction of rationalisation measures everywhere had resulted in substantial improvement of working conditions and created better and more employment in industry. Unless some satisfactory arrangement with regard to this problem is made, the working of the textile industry would be so adversely affected by economic factors as to lead to an enforced curtailment of production and widespread unemployment. He also pleaded for the removal of the export duty on coarse cloth, to remove the difficulties which the industry faced in the overseas markets, as unless this was done it would not be possible to reach the target laid down by the Government. To his fellow millowners Mr. Somani appealed fully to appreciate the spirit of the changing times and to make every endeavour to conform to the highest standard of managerial efficiency and integrity, so that the industry could make its contribution to the economic rebuilding of the country.

Future of Film Industry

In connection with the statement presented to the House of the People last week by Mr. B. V. Keskar, the Central Minister for Information and Broadcasting, regarding the belated Government decision on the recommendations of the Film Enquiry Committee, Mr. S. K. Patil, who was Chairman of this Committee, stated that the most important recommendation of his Committee had not found favour with the authorities. He, therefore, believed that the problems of the film industry which had assumed important proportions remained unsolved and the industry still faced a severe crisis. Mr. Patil's main criticism was directed towards the unwillingness on the part of the Government to establish a Film Finance Corporation, on the ground of giving priority to urgent projects of development in the Five Year Plan. He claimed priority for this industry also as it was the greatest instrument both of public entertainment and education. Though India ranked high quantitatively in the world as a film producing country, Mr. Patil said industry was the worst organised in the world in the matter of finance and unless this basic question of financing was put on a satisfactory basis, there would be no chance for the industry to show any progress. He regretted that the Government had also rejected the Committee's recommendation to create a Statutory Film Council of India to guide and advise the industry and feared that with the rejection of this recommendation, the whole structure of the report had really fallen to pieces.

Reserve Bank's Housing Colony

An important contribution which might serve as a model for various industries for the solution of the problem of housing their employees has been made by the Reserve Bank of India with the building of a vast housing colony for its clerical employees in the heart of the city, at a cost of about Rs. 2 crores. It consists of 11 big buildings with the provision of all the necessities for community life, such as a club house, water supply, dispensary and a co-operative store, with concrete roads and well laid out gardens. There are 565 flats calculated to house about 2,800 people. The flats are to be let out on a very low rent which would not cover even the annual maintenance cost of the buildings and the Reserve Bank of India is expected to subsidise about two-thirds of the entire expenses annually. The colony was declared open last week by Mr. C. D. Deshmukh, Central Finance Minister, who gave a hint that the second Five Year Plan would make more provision for housing than it was possible to do in the first Plan. He, however, deplored that our engineers had failed to find a key to low cost housing and feared that unless this was done, it would not be possible for the Government to increase housing facilities for the masses. He also appealed to the employers in the private sector to follow the Reserve Bank's example and to provide housing facilities for all their employees in the industrial towns and cities.

Give your ware
P.L.M.
PACK LABEL MARK
care..

Our shocked knowledge that crores of rupees are annually paid by the railways in Claims must need be balanced by the conviction that Claims are mostly man-made and can, therefore, be almost wholly prevented.
You, as a consignor, can help the railways by ensuring every time that your consignment is securely packed, properly labelled and correctly marked.
P. L. M. WEEK
JUNE 1-7, 1954

THIS IS HOW YOU CAN HELP
- Pack the goods in strong cases. Nail properly and securely.
- Line the case with shock-absorbing and waterproof material.
- Enclose a spare label.
- Remove all traces of old markings.
- Address neatly, boldly and indelibly.
- Mark correctly.
- Indicate the nature of goods consigned.

IMPLICATIONS OF INCREASE IN M.P.S.' SALARY

BENTHALL MISSION'S REPORT ON MIDDLE EASTERN MARKETS

(FROM OUR LONDON CORRESPONDENT)

PENURY, politics and personalities clashed in the House of Commons debate on the motion for increasing the salary of members from the present sum of £1,000 to £1,500 per annum. The free vote produced an unexpectedly large majority of 114 in favour, including 33 Conservatives, and an almost equally convincing rejection of the alternative proposal, supported by the Chancellor of the Exchequer, in favour of an expense allowance with a similar limit. In the circumstances, it is difficult to see how the Government can avoid taking the necessary steps to implement the vote, even though the majority of its supporters are seeking every means to delay such action and although it is already apparent that other sections of the community are regarding this as more than justifying, if not indeed encouraging, a general scramble for higher wages. In itself the increase to M.P.s will not cost much more than about £270,000 a year, and perhaps not that if some Members prefer to retain their "amateur" status and refuse to take it, but it is a rise of 50 percent, which sounds a lot compared with the recent 6 percent increase awarded in a number of industrial disputes, even though the cost of the latter ran into millions of pounds. Mr. Butler must be congratulating himself on his cautious Budget policy, which allowed him room for these minor manœuvres—increases for M.P.s, and inevitably for junior Ministers and Ministers of State; more for pensioners, and a start with equal pay for women in the Civil Service—but the ultimate consequences on the country's economy as a whole if the movement cannot be kept within bounds must be giving him much food for serious thought.

"Unofficial" Strikes

There can be no doubt about the sincerity of the views expressed by Members during the debate, but it is open to question whether in fact all of them had fully examined the implications of their final action. Suggestions that it was all part of a subtle Opposition plot are nonsense, but there can be little doubt that the Socialists must be pleased to see the Government faced with an additional embarrassment to add to the many headaches it is already experiencing over the deterioration in industrial relations. By and large, the Conservative Government has done a lot better than was expected, particularly in the economic sphere, and despite the smallness of its majority in the House has confidently gone ahead with any "unpopular" policies which were considered necessary without, as the Socialists expected, risking the need for a fresh appeal to the country. Sir Winston Churchill apparently expects a full term, and Labour (in the rank and file, at all events) is disappointed. How, otherwise, is one to explain the fact that "unofficial" strikes are the order of the day, negotiated agreements are being thrown overboard, new strike techniques are being developed and all the resources of the unions are being pledged to giving them effect—and the ultimate purpose, often expressed quite unequivocally, is to secure the return of a Labour Government "by every means in our power." It is only fair to say that the union leaders, with only a few exceptions, take a realistic view of their responsibilities, but it is also clear that their control of union membership—as the railway footplate strike and the disappointing coal output this year have amply demonstrated—leaves much to be desired.

Raw Cotton Commission's Report

The life of the Raw Cotton Commission is drawing to a close, and its report for the twelve months ended 31st August, 1953, showing that it sustained a loss of £22,701,799—to create a deficit of £12,821,548 in the reserve fund established under the Cotton (Centralised Buying) Act of 1947, and leave the Commission with a net deficit of £11,097,817, against a net surplus of £11,269,384 a year previously—suggests that the time for the return of trading in this commodity to private hands was just about overdue. The cotton department of the Commission actually showed a gross profit of £2,315,252 on its own trading, but the provision of cover for this department showed a deficit of £17,056,258 and for contractors out a deficit of £3,755,554. The carrying of excess stocks of 37,000 bales previously ordered for mills who contracted out cost about £111,000, but the main difficulty was that the bulk of the stock of 1,144,830 bales with which the year started had to be carried through at a time when cotton prices were declining. Imports during the year totalled 902,542 bales, about half the amount in the previous year, deliveries to consumers were 1,244,000 bales (against 1,810,000 in the previous thirteen months) and stocks at the end of the year were 683,341 bales. During the present year 56 percent of imports are likely to be handled by private trade, against nearly one-third of the total in the year under report.

Tea and Coffee Prices May Rise

Increased demand and the inadequacy of supplies are expected to affect the prices of coffee and tea in this country shortly. Brazil's coffee crop has run into difficulties, and East African supplies, though they are increasing, cannot yet make up any shortfall in the production of the world's main producer. It is estimated a price of 10s per pound may be expected. The price of tea, already raised three times this year, is also expected to go up again within the next six weeks. The extra charge is likely to be 4d a pound, adding a total of 1s 4d to 1953 prices. Market prices have continued to harden, and the amount of tea used in England and America is outstripping supplies. Consumption last year was about 9½ pounds per head of Britain's population, and increase of 11 percent on 1952 and slightly higher than the average for the five years before the war. An official of the Tea Bureau commented: "The trade does not want to put up the price if it can be helped. Much depends on the North Indian crop and whether consumption continues to rise."

Cotton Cloth from India

The detailed trade figures in recent months have shown one interesting feature. India has supplanted Japan as the leading supplier of cotton cloth to British finishers. These imports have shown a steadily rising tendency since early this year, and although in March—the latest figures available—India sent less than in February whereas the other main suppliers sent more, she is still responsible for about half the total. What is more, although virtually all the 9,490,000 square yards which arrived from India consisted of grey cloth, none of it was for re-export. The contrast with Japan is striking. Japan, from being the most important supplier, only sent in March 1,109,000 square yards, all of which was for re-export. It has been suggested that the low level of Japanese imports into this country results from the dullness of some of the more important markets to which the re-export of these goods is permitted. Belgium, Western Germany, and France all sent more cotton cloth to this country in March than did Japan, and only in the first case was the percentage for re-export small. In the main, however, and almost entirely because of the special nature of the trade with India, cloth imports are used to supplement supplies for home consumption: out of the still large total imports of eighteen million square yards in March, only one-quarter was for re-export.

Middle Eastern Markets

The markets of the Middle East have always attracted the attention of Indian exporters, but their impact can hardly be said to have created much impression yet. Britain, on the other hand, has usually enjoyed some success with her products, and since the war, with the increasing prosperity of the Middle East, the volume of U. K. exports to the area has risen from £3.2 million in 1938 to some £71 million in 1953, though much of the increase has been with the oilfields. Recently, however, there have been signs of keen competition, so a Board of Trade mission, led by Sir Edward Benthall of Bird and Co., with eight other British business men as members, visited the area in November and December and has just issued its report (H.M. Stationery Office, 5s). The countries visited were Iraq, Kuwait, Saudi Arabia, Syria and Lebanon. The mission reports that there is a large and growing market for a wide range of exports, but offers some criticisms and makes several useful suggestions on how the best advantage could be taken of the goodwill towards Britain which both the Governments and the commercial communities showed. British reputation for fair dealing, it feels, is the most valuable asset we have in the Middle East but the team was clearly disturbed about British prices. It considers that Britain must exercise greater drive than hitherto if exports to these markets are to be maintained and recommends frequent visits by directors and senior executives, the employment of British staff with a knowledge of Arabic, intensive salesmanship, and greater caution in the selection of agents. On the question of extended credit terms and the waiving of down payments by Continental competitors, the mission found it very hard to establish concrete cases but says that as reports are so persistent there must be "some substance in them." On the other hand it did find "strong evidence" that buyers in Middle Eastern countries were arranging medium or long term credit terms from some local banks on the ultimate guarantee of the home bank of the Continental exporter. It also found "circumstantial evidence" that in one or two cases foreign competitors were receiving "abnormal financial facilities and subsidies from their Government." It suggests "a further examination" of the problem of extended credit and recommends that we should take steps now to meet export subsidies in case an international truce cannot be achieved.

Brevities

Sir Donald Anderson, Deputy Chairman and Managing Director of P. & O. Steam Navigation, and Sir Edward Wilshaw, Governor of Cable and Wireless (Holding), have joined the board of Britavia Ltd., the British airline group which controls Silver City Airways and Aquila Airways.

A total of 5,907,000 workers received pay increases in the first four months of this year, according to the Ministry of Labour Gazette. The increase totalled £1,651,000 a week. In the corresponding period last year 3,714,000 workers were given increases amounting to £1,020,000 a week. There were 711 strikes during the first four months of this year, involving 154,600 workers, and a loss of 506,000 working days. In the first four months of last year there were 585 stoppages, involving 103,500 workers and the loss of 555,000 working days.

Madras

NATIONAL EXTENSION SERVICE FOR TWO TANJORE DIVISIONS

COMMUNISTS EXPLOITING AGRARIAN DISCONTENT IN DISTRICTS

(FROM OUR MADRAS CORRESPONDENT)

THE Government of Madras has decided to introduce the National Extension Service scheme in two of the six divisions of the canal-irrigated Tanjore district. This is the first project of its kind in Madras. The chief aim of the project is to increase agricultural production by intensive cultivation. The scheme provides for the formation in every village, by the people themselves, of village development panchayats. Each such panchayat will draw up a village development plan which will make provision for a three-year programme of intensive cultivation and village works. Government departments will give all technical advice and assistance needed by the panchayats. The aims of the project are comparatively modest, and hence feasible. The target for intensive cultivation is an average increase of two bags of paddy per acre (about 250 lb. of unhusked grain), representing only 15 percent of the present average yield in Tanjore. As regards village works, the money value of additional employment should not fall short of a third of a crore of rupees. The cost, about Rs. 80 lakhs, is to be borne equally by the village people and the Government. The Government's share does not include the usual takkavi loans. For improving cultivation, the scheme plans efficient distribution of fertilisers, seeds and pesticides.

The success of the scheme will depend as much on the enthusiasm of the district landowners as on harmonious relations between them and the tillers of their lands. Landlord-tenant relations in the district are strained, in spite of the Tenancy Reform Act of 1952, and this is largely due to the unceasing activity of the Communists whose influence is believed to have increased of late. Agitation among the kisans is rising with every month that passes, and kisan conferences are being held at village, taluk and district levels.

Agrarian Tension

Agrarian tension is not confined to the Tanjore district whose entire cultivated area of about 1.2 million acres is under canal irrigation; as land hunger and high competitive rents are a general feature in all canal-irrigated tracts of the State, kisan agitation and consequent tension are spreading to other districts where the Communists were not quite so active until recently. There is a mood of defeatism in Congress circles as far as Tanjore is concerned; but there is at the same time a feeling that the situation can yet be saved in other districts by early action. This recognition has led to the formation by the Tamil Nad Congress Committee of a sub-committee to frame concrete proposals of land reform for immediate implementation. This sub-committee of experts and kisan leaders appears to have been set up on the advise of Mr. Kamaraj, the Chief Minister, who has been repeatedly saying that the land problem would have to be solved at the very earliest, however complicated it might be. As the agrarian situation varies from district to district, the Committee plans a study tour of the eleven Tamil districts from 15th June to sound representative landlord and kisan opinion in the different trouble-spots, and to frame realistic and generally acceptable proposals of reform before the end of August. The Committee's proposals are likely to form the basis of land reform legislation covering the entire State. It is, however, faced with the difficult problem of how best to strengthen the position of the tenant-cultivator without weakening the position of the small-holder and to prevent them both from being enticed by the Communists, who, now command the allegiance of customary farm labourers only. The impending elections to the district boards, on the basis of adult franchise, in August are expected to spotlight the land problem. But the Government's decision to drop the unpopular Rajaji scheme of elementary education may better the prospects of the Congress in the local elections.

Carry-Over Reservoirs Needed

While intensive cultivation in irrigated areas and land reforms are closely related, and have their political aspects, there is very little of politics in the Madras Government's proposals for carry-over reservoirs to cater for new areas. The division of the former composite Madras State has left the present residuary State deficient in water resources. Madras now has only the Cauvery, a comparatively small river, much of whose waters has been used already. There are several smaller rivers, also partially developed. There are nearly 24,000 tanks irrigating about 1.6 million acres in the State. While the picture is a dismal one so far as potentialities for normal irrigation are concerned, it is not correct to say that the available resources are exhausted and that no more development is possible. Only the conventional approach to the problem has to be changed. An indication of this is available in the Krishnagiri Project on the Pennar in Salem, where proposals have been made for a carry-over reservoir. A study of the recorded flows of various rivers shows that usually in two to three years, out of a cycle of five, there was considerable surplus water in rivers which were not utilised because they were not dependable for continuous yearly irrigation. The obvious way to use them would be to construct big reservoirs to store the flows of the rivers over a period of three years as a minimum and, possibly, about five years as a maximum and make the water available for irrigation by distributing the stored waters not on a yearly basis but on the basis of storage for three to five years. Carry-over reservoirs being costly, their extra cost would naturally have to be borne by the owners of the areas benefited, by way of subscription to relevant public loan, betterment levies and water rates. All this applies to such smaller rivers as the Palar, the South Pennar, the Periyar, the Vaigai and the Tambraparni which are now almost fully developed for continuous irrigation on a yearly basis. An increase in the area irrigated by these rivers can be brought about only by large carry-over reservoirs. The first five year plan involves an expenditure of Rs. 35 crores on irrigation projects in the residuary State, but the second five year plan expenditure on new irrigation projects is estimated at only Rs. 14 crores. Even after completing all these schemes by 1960, the State may be faced with the problem of finding and conserving water for still newer developments.

Although the water resources of the State are very limited they have to be spread out to new areas, at least to relieve the acute land hunger in the few irrigated tracts where cultivated and cultivable lands are scarce in relation to the competing demands of the landless peasantry. Land reform may solve a part of the agrarian problem; the other part will have to be solved by the Planning Commission by sanctioning bold schemes of irrigation.

LAND FOR INDIA'S LANDLESS

THE BHOODAN SOLUTION TO THE COUNTRY'S PROBLEMS

(By Taya Zinkin)

BHOODAN is the voluntary gift of land by the landed to the landless. The movement was started three years ago by Acharya Vinoba Bhave, Gandhi's favourite disciple, in an attempt to counteract Communism in Hyderabad. Over the past three years Mr. Bhave has received over 3,300,000 acres of land. Bhoodan cannot be dismissed. The procedure followed for gifts of land is that Bhoodan workers go to villages, stay there if necessary, explain to the villagers what the idea behind Bhoodan is, namely that land is just another element like air and that every man is entitled to his share. They praise the virtues of love and charity, they talk of enlightened self-interest, they quote the precedent in Telengana where the Communists distributed land by forcibly seizing it and often killing the owner in the process. They contrast the Bhoodan method by which relations between giver and given are improved and Communism is defeated. They circulate danpatras, which are printed forms on which the owner describes the land he wishes to give according to its survey number, and he signs it in front of two witnesses. This is enough to freeze the land, of which only Mr. Bhave—the beneficiary of the gift deed—can then dispose. The land is of course not really Mr. Bhave's; it becomes Bhoodan land and is disposed of through the Bhoodan machinery for distribution. States where the movement has been very successful, like Bihar and the U.P. have enacted laws to expedite the transfer of land after the danpatra is signed. After the land gift has been surveyed, it is announced in the area concerned that it will be distributed on a given date. The Bhoodan workers come back and the villagers themselves decide who is to get the land. The revenue official simply enters the names of the new owners against the survey number and mentions that this is Bhoodan land. The workers only come into the picture if there is not enough land to distribute at the rate of five acres to each landless family. They then persuade the villagers to draw lots and they promise those whom fate has left out that their turn will come as soon as there is more Bhoodan land. Bhoodan land is only in trust with the new owners; it cannot be sold, rented mortgaged or left fallow. If it is misused, it is resumed by the village for its Bhoodan pool for the next distribution.

Mr. Bhave has announced that he hopes to get 50 million acres of land for India's 10 million landless families by the end of 1957. This amount represents one-sixth of the cultivable land of the Indian Union. Whether he will succeed or not it is too soon to tell, but the facts are impressive. One year ago he was getting land at the rate of 200 acres a day; today, excluding the large estates of Rajas like Darbhanga or Ramghar, he gets between 3,000 and 4,000 acres a day. Tomorrow he may get 10,000 acres a day, who knows. But without wanting to enter into the merits of a moral crusade of the type he has started one can analyse factually the chances of Bhoodan's solving India's ills. These ills are real and the Government will have to solve them, whether Bhoodan succeeds or fails. The troubles are well known:—India is overpopulated; India does not have enough land to go round. Bhoodan cannot distribute non-existent land. At best Bhoodan can only equalise holdings —in other words distribute poverty—unless agriculture becomes efficient enough not only for the peasant with his five acres to make enough to eat, but to leave him something to save so that he can invest. This brings one to fundamental problems which are far more important than the merits or demerits of Bhoodan. Can agriculture improve, and to what extent? It certainly can improve. If it were to improve by 100 percent it would automatically provide subsidiary employment as well as more food. But this is not likely in the end to do more than keep up with the increase in population. In 50 years' time India's population will be over 700 million and whether the land produces twice as much more, it will not be enough, to provide for the needs of such large numbers.

The Choices

India has to decide whether she will rely on the old Malthusian ways, or on birth control to keep her population in check. It is obvious that no democratic Government can rely on the first and remain in power. Therefore it is in birth control, not in Bhoodan that the cure to India's ills lies. But this does not mean that Bhoodan has no part to play. The land hunger is already there. Bhoodan has not created it; all it does is to try and satisfy it as far as possible and as peacefully and freely as possible. There is no compensation to be paid to the landlord, as has to be done with the Government's own method of zemindari abolition. Bhoodan, where it succeeds, brings stability to the villages; it even makes it easier to get on with the next steps: consolidation, co-operatives, more panchayat initiative etc. This is achieved in two ways. Firstly it creates a climate in which the ownership of land seems to become less important so that the redrafting of boundaries is easier; secondly it makes the various elements of a village conscious of their interdependence. It develops the authority of the panchayat, and improves relations between classes so that co-operatives and collective enterprises will be the next natural step.

Much criticism of Bhoodan is based on the fact that much of the land given away is either bad or under litigation. In cases where the land is under litigation it is doubtful whether the parties who eventually win the land will have the courage to take it back for themselves. They will have to live amongst the people who had already looked upon it as theirs, and the landowning villagers who have given will be the first to side with the landless in bringing "moral" pressure to bear. As far as bad land is concerned there are three considerations to keep in mind. Firstly, even if only 25 percent of the land given is cultivable, that is a lot of land, in fact practically one million acres. Secondly, in the case of lands belonging to large zemindars, that land is by definition new land to be brought under cultivation since the zemindar cannot expel his tenant and can only give land hitherto fallow, or under grazing, or forested. In some cases the compensation which the Government had to pay for the zamin is also handed over to the Bhoodan movement for the reclamation of the land which has been given. This means that the compensation money will reclaim that land in part, whereas without Bhoodan the Government would have had to find both the money to compensate the zemindar, and then the money to reclaim the land. There is a net saving to the Exchequer. The Government of India will have to reclaim indifferent lands in any case if it is to keep up with the increase in population before birth control has taken effect—in other words for perhaps the next 20 to 30 years. Bhoodan adds no problems to the Government's programme, except perhaps in that it may change the order of priority which would have to be given to reclamation. The rest of the land which is unreclamable can always be used for grazing or forest.

The Advantages of Bhoodan

To condemn Bhoodan is easy and fashionable. To praise the Ministry of Refugee Rehabilitation is both, and deserved, although it may be unfair to contrast the record of one with that of the other. Millions of refugees have been rehabilitated, admirably so, but at some considerable cost to the tax-payer. Bhoodan rehabilitation is done free. But this does not mean that the Bhoodan way is the easy way; far from it. There are many difficulties to be overcome in the way in which Bhoodan works; perhaps the most serious of all is that the landless labourers are, quite often through no fault of their own but through the improvidence of a grandfather, not the most skilled of agriculturalists. Moreover they are certainly the least educated and often lack savings and implements. The second stumbling block in Bhoodan's way is the lack of professional efficiency in its secretariat which is manned by men and women of goodwill, but with no training in administration. Finally there is the fact that so far Bhoodan is a one-man show. But even to these three serious problems there are answers. The landless who get the land are quite often bad agriculturalists and they will no doubt have to be trained if India is to be self-sufficient in food. A man with a direct stake in better yields will be twice as willing to learn as a wage-earner. For example, one of the difficulties in the Japanese rice growing method is that if one employs labourers, they do not in fact plant only two seedlings, because it is a more skilled operation than planting a handful and they have no stake in the crop. The more people that have land, the easier it will be for the Government of India's Extension schemes and Community Projects under the five year plans to succeed. But, if the landless of yesterday make bad agriculturalists of tomorrow, the terms under which they get Bhoodan land ensure that the land will not be misused, because they have to surrender it to more efficient peasants. The poor efficiency of the Bhoodan secretariat is not so important although it is more difficult to cure. The Government and Mr. Bhave are now thinking of having six-week training camps for the workers, and a Board for the distribution of land has been sanctioned. The receiving, and even the giving away, of land are easy administrative jobs. The revenue officer does all the legal part of it and the villagers do the moral part. The workers are only there in a symbolic fashion. Where the trouble will start is when it comes to the workers running the sampatti-dan —the giving of wealth—by which money is periodically collected and converted into implements or bullocks for the newly settled. Even here, as the agricultural Extension and Community Project networks extend, it is going to be more and more a regular administrative routine and less and less left to goodwill. Finally Mr. Bhave is mortal, indeed he is probably under short reprieve, but this too is immaterial. There is Mr. J. P. Narain, the Socialist leader, to provide Bhoodan workers with a focus and to prevent Bhoodan falling into unscrupulous revolutionary hands, and the actual collection of land may soon require no one to ensure its survival, for as Mr. Bhave explains, the landless themselves will see to it that Bhoodan continues.

Bhoodan has achieved two very important moral aims as well: it has provided the disorientated Gandhian constructive workers with a purpose, a good thing when so far the only people who have claimed to be selfless—since Independence—are the Communists. It has brought Gandhians back into contact with villages, and that is a stabilising political fact. It has also removed venom from the poorer classes and stolen the Communst fire. If Bhoodan succeeds, the Communists will be driven out of the rural areas into the urban proletariat which, as China has shown, is the wrong base from which to capture power. Even in areas such as the coast of Malabar where special problems obtain, a modified Bhoodan, industrialised perhaps, could do a lot to reduce the frustration of the have-nots by showing that the haves are not indifferent to their fate. But of course the concept of a revolution of love is one which is so unorthodox as to be repugnant to economists and historians alike. Indeed Bhoodan is so new that it takes a lot of rethinking before one casts the first stone.

THE PATTERN OF WORLD TRADE

About 50 per cent. of the total world trade in 1952 was between the primary producers on the one hand and the manufacturing countries on the other. Trade between manufacturing countries was 36 per cent., and between primary producers 9 per cent., of the total.

These figures are contained in an article in the current issue of the British Board of Trade Journal on the Network of World Trade.

Exports to primary producers in 1952 formed a particularly high proportion for the U. K. at two-thirds of her total exports. About a quarter of primary producers' total exports were sent to North America.

Not all of the trade between manufacturing countries was in manufactures, for two-fifths of intra-European and one-third of U. S.-Canadian trade consisted of primary products.

The pattern of trade between primary producers and the manufacturing countries closely followed the variations in raw material prices since the Korean war, and the effect of these variations on the primary producers' export incomes. Raw material exporters' earnings fell rapidly in 1951, and following the enforced reduction of their own imports, production in the U. S. and Europe stagnated in 1952.

Industrial Output

Industrial output recovered in late 1952, however and, the consequent recovery in primary producers' earnings led to their imports from manufacturing countries in the second half of 1953 being 7 per cent. higher than a year earlier.

A review of developments in 1953 shows that although there was a marked fall in the volume of U. S. imports—in the last quarter of 1953 7 per cent. lower than a year earlier—world commodity prices remained buoyant, due to an increase in industrial activity of 4 per cent. in Europe, with a maintained demand there for primary products. The export incomes of primary producers were therefore maintained throughout 1953 and the total value of world trade increased slightly in spite of a recession in North America.

The possible effects of reduced commercial imports by the U. S. were offset by the military aid and offshore purchase programmes. As a result, there was no general dollar shortage and at the end of 1953 the U. S. was still in deficit with the rest of the world.

RAW MATERIALS FOR PAINT

A new family of raw materials for the paint industry recently introduced to the U. S. market threatens to affect the traditional business of producers of linseed oil, soya-bean and castor oil, and their fatty acids. The new products are safflower fatty acids, and they are being sold by the California firm of Pacific Vegetable Oils.

The dictionary defines safflower as "a thistle-like plant with large orange-coloured heads." It yields a drying oil similar to oils from linseed, soya-bean and castor beans, and fatty acids derived from this are now being incorporated in high-quality American paints, varnishes and synthetic resins.

The chief quality of the raw material, apart from its exceptionally fast-drying property, is said to be its improved non-yellowing characteristics. A more refined form, conjugated safflower fatty acid, is credited with qualities similar to those of dehydrated castor oil. It is described as having still superior non-yellowing and quick-drying properties.

So far the new materials, produced since last year by the one firm, have made only a slight impact on the paint and allied industries. In 1953, 320 tank cars (61,000 lbs each) of safflower were produced on 46,000 acres in the U. S. The 1954 crop is expected to be rather smaller, the product of only 40,000 acres.

Plantation Topics

LONDON TEA SALES

AT last week's London tea sales the 22,485 packages on offer realised an average price of 4s 10.80d a lb. against 4s 10.38d the previous week and 3s 8.87d in the corresponding week of 1953. Results obtained by some of the companies are given below:

	No. of packages	Aver. per lb.
Alliance	180	5/2¼
Anglo-Ceylon	708	5/0½
Assam Frontier	50	5/1¼
Blantyre and E. A.	492	4/8
Bogawantalawa	348	5/2
Central Province	636	5/
Ceylon Amalgamated	276	4/10¼
Cons. Estates	468	4/11¾
Demodera	488	4/10½
Eastern Assam	263	5/0¼
Eastern Produce	1,334	5/1½
Hanipha	90	4/11
Hunasgeria	204	4/10½
Imperial Ceylon	264	4/10¾
Lanka Plantns.	318	5/2
Lunuva	534	4/11¼
Mini Mini	120	4/9
Namunakula	192	5/1
Ouvah	354	4/11½
Panawatte	132	4/9¾
Pundaloya	252	5/2¼
Scot. Assam	144	4/11
Scot. Ceylon	144	4/11½
Scot. Tea and Lands	388	5/0½
Spring Valley	216	4/11½
Standard	1,020	5/1½
United Planters	294	5/1½
Yataderia	126	4/10½

Tea Stocks Lower

Tea stocks in London and provincial warehouses on 21st May totalled 99,884,016 lbs. compared with 104,381,568 lbs. in the previous week. Landings during the period totalled 4,813,884 lbs. and deliveries 9,311,436 lbs.

INCREASE IN TOBACCO ACREAGE

According to the Directorate of Economics and Statistics, Union Ministry of Food and Agriculture, the all-India second estimate of tobacco for 1953-54 puts the current year's area at 822,000 acres, as against the adjusted second estimate of 731,000 acres for 1952-53. The current year's estimate thus shows an increase of 91,000 acres or 12.4 percent in area. The second estimate generally covers about 95 percent of the final area under the crop. The increase in acreage during the current year has occurred mainly in Bombay and is due to timely and favourable rainfall and better prices of the crop. This increase has, however, been offset, to some extent, by the decrease reported mainly by Andhra State because of heavy rains during the planting season. The information given in this estimate generally relates to the period up to the end of February 1954. Till then, the condition of the crop was reported to be generally satisfactory except in Andhra, where in some districts, it was attacked by leaf-eating caterpillar. This estimate does not cover the entire area sown to tobacco during 1953-54. Past experience has shown that the area at the second estimate stage forms roughly 95 percent of the area under the crop finally reported. This estimate includes, for the first time, information on Himachal Pradesh and Bhopal which account for an area of 1,000 acres.

COCHIN TEA SALES

At Sale J held on 25th May, approximately 302,000 lbs. were on offer. There was only a fair demand at prices which were an irregular 2 annas easier, and withdrawals were appreciable. There was however a good enquiry for Clean Black leafy sorts and Nilgiri B.O.P. Dusts, which sold at fully firm rates.

No transactions were reported in 1953-54 Export Quota Special Licences, which expired on 31st May, and which were quoted nominally at 50 pies. The market has however hardened further to 56 pies buyers in 1954-55 Quota Licences, with sellers scarce. Internal Sale K will be held on 8th June.

Jute

THE JUTE ENQUIRY COMMISSION ON EXPORT DUTIES

PERHAPS the most surprising of all the findings of the Jute Enquiry Commission is that the high rate of export duties on jute manufactures did not adversely affect the position of the Indian industry in foreign markets. On page 119 the Commission states that "if the Government tax policy has affected the market for Indian jute goods, it was not on account of the fact that the duties at the level they were in force were excessive and had engendered justifiable opposition in buying countries, but it was for the reason that the purchasing policy of overseas buyers is influenced by their constant expectation of the inevitable reduction in the rates of duty, particularly in a falling market".

No one will question the fact that the expectations of prices being lowered because of reductions in the export duty caused buyers to delay their purchases as long as possible. That delay would not, however, explain the sudden increase in U.S. purchases of Continental hessian. Other aspects of the position were brought to the notice of the Commission without convincing it, but the Commission itself has provided the refutation of its own finding by the publication of figures showing that India's share in the U.S. market fell from 97.3 percent in 1946 to 76.1 percent in 1953. If the Commission's contention that the decline in the purchase of burlap in the U.S.A.—from 900 million yards in 1946 to 800 million yards in 1953—resulted from the expectation of an inevitable reduction in the Indian export duties one would have expected the share of other producing countries to have declined *pari passu* with that of India. That was not the case. Out of the 900 million yards bought by the U.S.A. in 1946, 97.3 percent was manufactured in India while, out of the 800 million yards bought in 1953, only 76.1 percent was of Indian manufacture. The drop in India's sales to the U.S.A. in the period was, therefore, 266.9 million yards and Continental manufacturers gained by that amount.

Pakistan's Raw Jute Policy

The real facts of the matter are that Continental manufacturers could buy jute in Pakistan with an advantage over India because of Pakistan's discriminatory export duty on raw jute and their manufactured goods did not bear any export duty while the Indian export duties, at their maxima, placed Indian hessian at a disadvantage of over £100 per ton. This enabled the Continental manufacturers to overbid India in the Pakistani market for raw jute, if they felt inclined to do so and, at the same time, to underquote India in the U.S. burlap market. The report states that foreign manufacturers had newer and more efficient machinery and were thus able to produce more cheaply. That was only partly true at the time of the enormous increase in the export duties but the large profits which the duties enabled the Continental mills to earn put them in a position to modernise their machinery and expand their manufacturing capacity. The export duties thus acted as an indirect subsidy to Continental mills to the detriment of the Indian industry.

It is difficult to understand how the Commission reached its conclusion on this subject and it is now largely only of academic interest but it seems that the Commission may have been tempted to do a bit of white-washing.

Pucca Delivery Orders

In its remarks on futures markets the Commission had a good deal to say about abuse of the system of issuing Pucca Delivery Orders for goods sold. The subject is taken up again in connection with the method of marketing the mills' production. In discussing the matter, the Commission agrees that the system enables the sale of the goods to be negotiated by dealers even if the goods are still in the custody of the mills. It gives a flexibility which has advantages for the trade and for the mills "as it permits the maximum turnover to take place." The Commission does not say so but, in reality, this means that it facilitates speculation. It also states, correctly, that the P.D.O. has so far been regarded as a document of title on the basis of which banks have given discounting facilities. It states that it is generally agreed that the drawback is the absence of any provision limiting the period in which delivery should be effected by mills. The I.J.M.A. opposed this but the Commission was inclined to accept the view that there should be a limit and that there should be an endorsement on the P.D.O. that the goods were ready and would be available for inspection within a specified period.

The Commission had the records of a random sample of 17 mills examined. A wide variation in practice was found. Some mills had no proper records of sales of P.D.O's but, in the majority of cases, there were only small differences between the current monthly production and the P.D.O.'s issued. In some cases mills were found to have repurchased their own P.D.O.'s or P.D.O.'s of other mills in their group while in several cases it was found that mills had made extensive purchases of P.D.O.'s of other mills to cover their own sales and in some cases contracts were settled without the issue of P.D.O.'s. In other words the mills which indulged in this practice were engaging in speculative operations. One mill was found to make a habit of over-issuing P.D.O.'s for B Twills which seems to savour of dealings in the phatka market.

The Commission found that P.D.O.'s are often issued in excess of production and in anticipation of production and that there was a feeling that this could be done legally as long as there was no ultimate default. The Commission was told, in connection with a case in which a mill had issued P.D.O.'s greatly in excess of its holdings and was unable to deliver the goods on presentation of the P.D.O.'s, that there had been no other such instance within the last 20 years. Human memories, unlike those of elephants, are proverbially short, but it must be just about 20 years since there was such a case which was one of the causes of the transfer of the managing agency of the mill.

THE JUTE MARKETS

FIBRE PRICES LOWER

Early in the week selling pressure in the phatka market brought about easier conditions though there was no material change in the actual position so far as enquiry from overseas markets was concerned. The main business during the week was covering in heavy sacking for early shipments and substantial premiums were paid for certain kinds of bags. This continued to give an artificial appearance of strength to the market. With the lowering of the phatka quotations for B Twills jute sellers dropped their prices and raw jute is quoted at from one rupee to Rs 1-8 lower than the prices of a week ago. The quantity on offer is, however, small and, though buyers have shown some interest at the decline they have not been able to buy very much.

Manufactured Goods: There has not been much enquiry from abroad. Some enquiry was reported from the U.S.A. but it is said to be difficult to conclude business because spot and afloat goods are being offered at below the Calcutta export quotations. There were rumours of further enquiries from Burma but the main feature of the market was again local covering of heavy sacking for early shipment. Certain constructions are still in short supply and high premiums were paid for spot goods such as A Twills and green Cees. Conditions have, in fact, been topsy-turvy for these high prices were being paid when the quotations for B Twills in the phatka market were falling. It is interesting to note that, while B Twills were quoted on 25th May for May shipment at Rs 112-14 and for Oct.-Dec. at Rs. 108, on 1st June B Twills for ready were quoted at Rs 111-12 and for Oct.-Dec. at Rs 108-8. In the same period A Twills had jumped from Rs 144-8 to Rs 160. It is thought that this shortage of certain classes of heavy goods will continue into July but it will gradually be relieved because of the transfer of machinery from hessian to sacking and the manufacture of other heavy sacking in place of B Twills. Shipments of heavy goods in May are reported to have been in excess of production and a substantial drop in stocks of heavy sacking is expected. In spite of the lack of orders for hessian from the U.S.A. the tone in this section is confident and prices are higher than they were a week ago.

Quotations on Wednesday morning were as under:

	Ready	June	July-Sept.	Oct.-Dec.
40" 8 oz.	Rs. 37-4	36-14	36-0	35-6
40" 10 oz.	Rs. 44-6	44-8	44-10	43-12
B. Twills	Rs 111-14	111-6	110-2	108-8
Heavy Cees	Rs. 114-0	113-8	111-0	109-0
Cornsacks	Rs. 127-8	123-8	113-4	109-8

Heavy goods quotations dropped about one rupee immediately after the opening.

Raw Jute: In the early part of the week there was very little activity and, in sympathy with a drop in gunny phatka quotations, jute prices were lowered. At the decline mills took a mild interest and small business was done in Upper Assam at Rs 25-8 basis Bottoms for Old Crop and Rs 26 basis Bottoms for New Crop. Dhubri and Northern were done at Rs 26-8 basis Bottoms. During the week-end moderate business was done in New Crop with Marwari mills at Rs 25-8 basis Bottoms for Upper Assam and Rs 26 basis Bottoms for Dhubri and Northern. On Monday and Tuesday mills continued to take interest in Upper Assam on the basis of Rs 25 for Bottoms for Old Crop and Rs 25-8 for New Crop but, at these prices, it was difficult to find sellers. Business was done also in Daissee at Rs 28 basis Bottoms for Assortment and Rs 29 for Bottoms alone ex Sheoraphuli and other good agencies.

Pakistani jat X was reported done at Rs 22 ex Calcutta and District at Rs 20-8 while Pakistani H. J. ex Calcutta was sold at Rs 105 per bale. There was also an unconfirmed report of business in New Crop Selected Weedings at Rs 36 and Middle Weedings at Rs 33 for July-August shipment. At the time of writing on Tuesday there are buyers of Old Crop at Rs 25 basis Bottoms for Upper Assam and Rs 25-8 for Lower Assam and Northern with New Crop at eight annas higher but sellers at these prices are scarce.

On Wednesday morning quotations were as under:

Indian Jute (1953 Crop):	Landed at Mills. Rs. per md. basis Bots.	Shipment.
Lower Assam	25-8 Buyers	June-July
Upper Assam	25-0 "	"
Northern	25-8 "	"
Purnea	25-0 "	"
Murshidabad Tossa	26-8 Sellers	"
Daissee ex Sheoraphuli	29-0 "	"
Daissee ex Calcutta	28-8 "	"
Daissee Mesta ex Calcutta	24-8 "	"
Bihar Mesta	23-8 "	"
Northern ex Calcutta	25-0 "	"
Local Packing	24-0 "	"
Bimli	23-0 F.A.Q. "	"

Tossa prices are Rs. 2 per md. above the prices of white jute.

Pucca Bales:	Rs. per bale	Shipment.
Mill Firsts	175-0	June-July
Mill Lightnings	160-0	"
Dundee Daissee 2/3 S.G.	175-0	"
2/3 L.G.	160-0	"

Pakistani Jute ex Pakistan:	Rs. per md. basis Bots.	Shipment
Jat	27-8 "	"
District	26-8 "	"
Northern	25-0 "	"

New Crop (1954) is quoted at eight annas per maund above the price of Old Crop though, in some cases, business could be done at the same price as for old.

Imports into Cossipur from Indian districts are negligible but there has been an increase in arrivals of Pakistani jute. The increase in imports of Pakistani jute is said to be the result of pressure put on holders of Jute Board jute to clear their stocks and instructions from the State Bank of Pakistan that all overdrafts secured on jute must be liquidated by 30th June. There has been little activity and prices have sagged in sympathy with Calcutta but in the past day or two the decline has been arrested on reports of mill business in local packing.

Mofussil: In Indian markets there is no business worth mentioning and it would appear that the Indian crop is practically exhausted.

In both Upper and Lower Assam there has been too much rain and, in places, flooding has been reported. In central West Bengal more rain is needed. Hot and dry weather has impeded sowings. Conditions have been satisfactory in the daissee districts but less rain and more sunshine would be beneficial.

In Pakistan, dull conditions continue. Demand from overseas is negligible and Calcutta buyers are not taking much interest. The disturbed political conditions have also affected markets in the main centres. Prices have declined further.

In southern and eastern districts conditions have been favourable for the crop. In north-east Mymensingh rainfall has been excessive and fields are water-logged in many places. In the western parts of the Rajshahi division the weather has continued hot and dry and the young plants from previous sowings are reported to be stunted. In Faridpur and Pabna flowering is reported. The Jumna has fallen and premature cutting of the low land crop in that area has been stopped.

In Narayanganj quotations are as under, f.o.b. Narayanganj, in Pakistani currency:

Pucca Bales:	Rs.	Kutcha Bales:	Rs.
Mill Firsts	131-0	Jat	20-8
Export Firsts	111-0	District	19-8
Export Lightnings	98-0	Northern	17-8
Dacca Tossa 4's	164-0		
Dundee Tossa 4's	134-0		
Outport Tossa 4's	124-0		
N. C. Cuttings	32-0		

INCREASED PRODUCTION OF JUTE GOODS URGED

MR. N. KANORIA'S ADDRESS TO GUNNY TRADES ASSOCIATION

ADDRESSING the annual general meeting of the Gunny Trades Association in Calcutta last Tuesday, the President, Mr. Nandalal Kanoria, said that the Jute Enquiry Commission's recommendation about increasing the working hours of mills, "when implemented, will bring in a revolutionary change in the working policy of the industry. In the past the industry always planned or adjusted its working on the basis of profitable manufacturing conditions based on the immediate demand for its production. It is not difficult to assess the harm done by this policy. The most obvious result has been the establishment and expansion of jute industry in foreign countries at our cost. You will be surprised to learn that the present yearly production of the Indian jute mill is less than the average yearly production during the years 1920-30 and so are its exports, in spite of a 12 percent increase in loomage since 1930. This shrinkage in the production of this most useful packaging material seems strange against the background of tremendous rise in the industrial and agricultural production all over the world. I strongly feel in favour of a gradual increase in working hours by the industry. The policy of increasing the working hours, when acted upon, will go a long way to help the Indian industry to regain its supremacy in world markets.

Futures Market

"Besides the growing of pro[illegible] quality of jute and increasing working hours, there is another importa[illegible]

point which has to be given attention to if we are to compete successfully in foreign markets. The cost of production should be brought down and this can be achieved only by modernisation and rationalisation of the industry. Although not much has been done in this direction so far but I am glad that now it is engaging the attention of the industry and the Government. When these measures are accomplished, India will once again occupy its unique position in jute goods trade.

"The Commission also accepted the view expressed by your Association that a well-regulated futures market in jute goods would fulfil the most useful function for providing hedging facilities to those engaged in the trade. Your Association had represented that the organisation controlling the futures market should be representative of important trade organisations. It had also suggested certain measures which would stop over-trading, cornering and delivery of fake P.D.Os. These suggestions have been taken into account and the Commission has recommended the establishment of a well-organised futures market which will take all these precautions. I hope that a futures market will soon be established for jute and jute goods and its rules and by-laws will be framed *in such a way* that the defects which have been experienced in the operations of the futures market in the past will not be allowed to be repeated. I am glad that the Indian Jute Mills Association, which was at one time opposed to the futures market in any shape, has also now expressed an opinion in its favour.

"The Commission has very rightly advocated abolition of sales tax and similar taxes on raw jute and reduction in the freight rates—which are undoubtedly high—by railways and steamer companies for carrying raw jute from the mofussil to Calcutta. It has also wisely advised labour not to press for wage-increment and the shareholders to limit voluntarily dividends in the long-term interest of the industry. The Commission has further recommended the appointment of a Jute Commissioner and the establishment of a Jute Board and a Development Council. I do not think the appointment of these bodies can make any new contribution. Too much interference or control by the Government is likely to create new problems rather than solve them.

Classification of Sacking

"During the period under review your Association undertook to fulfil a long-felt need of the trade. Although so far as hessian was concerned, there was Bemis grouping of jute mills, which was relied on by the sellers and buyers, yet there was no such grouping or classification of mills for guidance in making contracts for the sale and purchase of sacking goods. In the absence of classification such discriminatory terms as 'European mill-make'. 'Indian mill-make'. 'Any bar Indian mill-make' etc. were current in the trade. The use of such terms in the contract was objected to by the Government of India and it was pointed out by them that the same should be eliminated from the trade as soon as possible. A meeting was held between the Presidents of the Indian Jute Mills Association, Calcutta Jute Fabrics Shippers Association and your Association and, in the course of discussions at this meeting, a proposal was made on behalf of your Association to undertake the preparation of an approved list of jute mills for general transactions of sacking goods.

The I.J.M.A. could not associate itself with this scheme as it could not make discrimination among its members. However, it is a matter of great satisfaction that, with the co-operation of the members of this Association, your Committee has been able to draw up an approved list of 58 jute mills out of the 74 mills in and around Calcutta, which is subject to revision every year. This list has been made effective in the market from the beginning of 1954 and has worked satisfactorily for the last five months. The Government of Burma has given recognition to this list and we have received many encouraging letters from foreign consumers complimenting us on our scheme as well as assuring us of their co-operation. Copies of the list have now been supplied to important foreign buyers for their guidance in the purchase of selected sacking goods. Although at present this classification has been made on the basis of opinions collected from the members of the Association and some important shippers and consumers, the Association is contemplating the introduction of other tests for this purpose and arrange for scientific equipment for the same as soon as possible.

Arbitration Procedure

"The existing system of arbitration as provided for in the contract for jute and jute goods has recently come in for unfavourable comment and it has been felt that the present system of forming panels of arbitrators by the Bengal Chamber of Commerce and Industry is not entirely satisfactory. It does not accord adequate representation to the dealers who are so vitally concerned in the disputes. It goes without saying that in a satisfactory system of arbitration the appointment of arbitrators should be made from panels which enjoy the fullest confidence of both the parties to the disputes. Your Association has made representations to the Indian Jute Mills Association to advise the Bengal Chamber of Commerce and Industry so to change the system of forming the panels of arbitrators as to allow inclusion of nominees of this Association which is the most representative organisation of dealers in jute goods. I am glad that the Jute Enquiry Commission has also taken note of the present unsatisfactory state of affairs with regard to the arbitration as provided for in the jute and jute goods contracts and has advised that the deficiency in the present procedure should be removed as early as possible. I am given to understand that the Tribunal of Arbitration of the Bengal Chamber of Commerce and Industry are contemplating introducing certain changes in the method of constitution of the panels whereby the same would be made more representative by including nominees of all sections of the trade.

Complaints from U.S. Buyers

"Some unsavoury remarks had been made in an American trade journal towards the early part of this year alleging a fall of commercial morality among the Indian shippers and your Association made thorough enquiry into the matter, as a result of which it was revealed that barring a few individual cases of contractual breaches, the business morality among the established and regular shippers was as high as ever and in most of the cases where the American buyers had any complaints against the shippers for having not fulfilled the contractual obligations it was found that they had made purchases from cheap and unknown sellers without ascertaining beforehand their financial position as well as business integrity.

"Gentlemen, I would now like to refer to a matter which vitally concerns the members of this Association. Growing dissatisfaction has been felt among gunny dealers and shippers in the market on account of the increasing tendency on the part of some of the mills to open and expand their own export houses. Before the war and even after World War II, the major portion of the mills' production was sold to the traders and shippers and direct exports by the mills or their subsidiary firms were small, since mill houses seldom found it economically advantageous to sell their products direct in the foreign markets. But during the Control period from October, 1949 to March, 1951, the Government allowed shippers to charge a handsome commission of 5 percent over the controlled prices. Possibly, this inducement led many mills to expand their exports and set up new export departments. The total effect of this has been that there has been a serious contraction in the business of the bazar people as a result of which many dealers, brokers and their dependents have been thrown out of employment. This is a very serious situation especially under the present hard times. This trade has always given unlimited opportunities to the competent and deserving people as is borne out by the fact that quite a number of brokers and traders of the past are today owners of and partners in several mills. I have high regard for their business acumen and perseverance and I sincerely appeal to all that the opportunities which were available in the past should not be denied now. We had brought this fact to the notice of the I.J.M.A. but they had expressed their inability to do anything in the matter owing to their unwillingness to interfere in the selling policy of the mills.

"The attention of the Jute Enquiry Commission was also drawn to this matter. In their report, they have quoted a letter from the I.J.M.A. wherein it writes that 'the Indian export trade in jute manufactures is conducted through an extremely intricate network which has been built up by the regular jute fabrics shippers over the past 50 years. If the manufacturers were now to export direct, the overseas contacts which have been built up by the shippers and which are vital to the maintenance of export markets would be irretrievably lost. From the practical point of view, too, direct export by manufacturers would be impossible because individual mills have not the necessary finance and any system of joint export would immediately antagonise overseas buyers and particularly those in the U.S.A. where any form of cartel is anathema. The result would almost certainly be the establishment of a central buying organisation as a means of retaliation and the consequences of this in a buyers' market would be disastrous'. From the above it would appear that the Indian Jute Mills Association is not oblivious of the services which the shippers and dealers have rendered and continue to render to the advantages and benefits of the industry on the one hand and of the dangers which would result to the industry if shippers and dealers who have been helping the industry with their experience and financial resources are deprived of their legitimate business. I once again earnestly appeal that the industry should continue to patronise the brokers who perform a very useful function."

SOWINGS COMPLETED IN ASSAM: GOOD WEATHER CONDITIONS

In their tenth crop report for the current Indian season, covering the week ended 29th May, Messrs Sinclair Murray & Co. Ltd. say that in all districts, with the exception of Murshidabad, crop progress has been satisfactory with a continuation of favourable weather conditions. In Assam sowings have been completed and elsewhere sowings are progressing.

DANPUR: Favourable weather has been experienced and considerable progrss has been made in sowings which are estimated to be -/14/- as against -/2/3 on the corresponding date last year. Seed germination and the condition of young plants is satisfactory, and plants range in height up to 1ft. The river is normal for this time of the year.

JAJPUR ROAD: The continuation of favourable weather has been beneficial for sowings and the growth of young plants. Sowings to date amount to -/18/- as against -/3/- on the same date last year. *Plant condition is considered to be very satisfactory* and they range in height up to 6 in. The river level is normal for this time of the year.

RANAGHAT: Favourable weather has been experienced and sowing now amount to -/14/- as against -/9/- as on the same date last year. Earlier in the week, weeding operations were suspended, but with the continuation of favourable weather, have been carried on where necessary. Plant condition is satisfactory and they range in height up to 1' 6". The river level is slightly higher than the normal for this time of the year.

COSSIMBAZAR: Weather conditions continue to be extremely hot and dry and heavy showers, are required to enable cultivators to carry on with sowings. We estimate this year's sowings to date as -/6/- as against -/4/- on the same date last year. The condition of plants is not very satisfactory, and growth has been hampered because of excessive heat. The river level is below normal for this time of the year.

FORBESGANJ: Weather conditions have been very favourable with alternate rain and sunshine. Sowings have progressed and now amount to -/9/- as against -/14/6 as at this time last year; condition of plants is satisfactory and they range in height up to 2' 3" in the low lands.

NOWGONG: Sowings completed at -/18/-. Weather has been favourable and the condition of young plants is satisfactory, ranging in height up to 3' 6" in the low lands. Weedings are going on as required and the river is rising slowly, being at about the same level as at this time last year.

GAUHATI: Sowings completed at -/18/-. Weather conditions have been variable but cultivators have managed to complete sowings at -/18/- as against -/16/- completed sowings of last season. Weeding operations have been curtailed during this week, however, but the condition of plants is still healthy and they range in height up to 4' 6". The river is rising slowly and is about 1' higher than this time last year.

DHUBRI: Sowings completed at -/17/-. The weather has been very wet with excessive rainfall and this has not been favourable for the high land crop. However, condition of the low land and mid-land crop is satisfactory and plants range up to a height of 4' 3". The river level is steady at a slightly lower level than at the same date last year.

DAISEE DISTRICTS: Dry weather has proved beneficial to plants and sowings are estimated at -/24/- as against completed sowings at the same time last year. Weeding operations have been carried on where required and the condition of crop is satisfactory with plants ranging in height up to 2'.

SOWINGS COMPLETED IN PAKISTAN JUTE DISTRICTS

In their twelfth crop report on the current Pakistani season covering the week ended 29th May, Messrs Sinclair Murray (Pakistan) Ltd. say that weather conditions have been favourable and the standing crop continues to make progress. River levels are irregular but they do not show much variance from last year's at this time.

NARAYANGANJ: Sowings completed -/20/-. Favourable weather conditions have been experienced and the crop continues to make satisfactory progress. Plants in the mid and highland area are in a healthy condition and range in height up to 4½ft. The river is about 6in. lower than last year at this time.

DACCA: Sowings completed -/20/-. Favourable weather conditions have been experienced and plants range in height up to 3ft. 9in. The river is higher by about 1ft. from last year at this time.

CHANDPUR: Sowings completed -/18/-. Weather conditions have been favourable and plants range in height up to 5½ ft. The river is the same as last year at this time.

ASHUGANJ: Sowings completed -/20/-. Favourable weather conditions have been experienced and the crop continues to make satisfactory progress. The river is about 1½ ft. higher than at this time last year.

NIKLIDAMPARA: Sowings completed -/21/-. Favourable weather conditions have been experienced and the crop continues to make satisfactory progress with plants ranging in height up to 5 ft. The river is about 1½ ft. higher than last year at this time.

SARISHABARI: Sowing completed -/22/-. Weather conditions have been favourable and the crop continues to make satisfactory progress. Plants range in height up to 4 ft. 6 in. The river is now about 3 ft. lower than at this time last year.

SIRAJGANJ: Sowings completed -/15/-. Favourable weather conditions have been experienced and the crop continues to make satisfactory progress with plants ranging in height up to 5ft. The river is about 2 ft. 9 in. lower than at this time last year.

NAKALIA: Sowings completed -/17/-. Favourable weather conditions have been experienced and *the crop continues to make satisfactory progress.* The river is about 4 ft. lower than last year at this time.

BHANGOORA: Sowings completed -/16/-. Weather has been favourable and plants range in height up to 3½ ft. The river is about 3 ft. lower than at this time last year.

THE FOREIGN JUTE MARKETS

U.K. JUTE GOODS ASSOCIATION'S ANNUAL CONFERENCE

(FROM OUR DUNDEE CORRESPONDENT).

At the annual conference of the U. K. Jute Goods Association at Eastbourne, speeches were made by Mr. Samuel Noble of Liverpool, the retiring president, Mr. James Strachan, chairman of the British Jute Trade Federal Council, and Mr. Harry K. Price, the new president. Mr. Noble stressed three points: adequacy of supply and cheapness of prices, quality of material and quality of service. He said that consumption of new goods in Britain at the present time was as high as it had been for many years. They were naturally gratified about this, but they realised only too well the many influences that could play havoc with their markets and outlets for goods and they had periodically to look over their shoulder to make certain that they were not losing ground to any competitor or to a substitute. The two main sources of supply were Dundee and India and there supply was plentiful at present; but that is not the whole picture. Quality is of the highest importance. It is up to those who manufacture and merchant bags and cloth to press for the highest quality, especially since the deliveries of imported cloth for some considerable time have not been up to prewar standard. They as merchants will watch the efforts that spinners in this country will be making in the near future to maintain and improve the quality of yarn and cloth when they are free to purchase raw jute in the open market. Since the price that is paid for raw jute governs the price of goods, it will be in the best interests of everyone concerned at the producing end to exercise as much influence as possible to keep down costs, so that in the long run the consumer will get his goods at the lowest prices. Every effort should be made to keep jute as cheap as possible. There is always a market for jute goods at the right price. Mr. Noble said the used bag trade exports were the life-blood of the second-hand bag trade in this country before the war. In view of present day trends they had to be careful not to pass on to foreign sack merchants their heritage of being the world's greatest centre in second-hand bags.

Mr. Strachan said he was certain that the momentous announcement made by the Government on 16th February "to safeguard the U. K. jute industry" would never have been made had it not been for the representations made by the Federal Council during the past three or four years on behalf of every section of the industry. This had given them satisfaction, though not complacency, and they had good reason to feel that they had moved from the "Bleak House" of the inter-war years, but what sort of "Great Expectations" could be entertained in the coming years depended on *various imponderables. In reply,* Mr. Harry Price, the new president, declared his own particular credo to be "I believe in the United Kingdom Jute Goods Association". He had known it in bad times and in good, when its membership was 71 and when it was as now, 260.

Raw jute has gone rather easier lately, though not weak, and only about 20s lower. Mill First are more easily obtainable at £100 per ton and Mill Lightnings at £90. Calcutta goods show little or no change and they have maintained a very steady tone. Business in Dundee yarns and cloth has ruled quiet, and few fresh orders have been placed. Prices remain very firm and unchanged all round.

AUSTRALIA TESTS NEW WOOL BALING METHOD: MAY SAVE JUTE

A new method of pressing wool into bales has been field-tested by the Materials Handling Branch of the Inter-departmental Committee on Wool Research in Australia, according to a report in the *World Wool Digest.* The method eliminates the loose wool pack cap and will thus save about 2,400 tons of jute annually (£A400,000), equivalent to one-eighth of the total jute content of the 3½ to 4 million wool packs used in Australia each season. This new method allows the bale to be kept under pressure until it is closed off with a 5-inch flap overlap. It also controls the length and density of the bale. The essential feature of this invention is the use of four long half-inch steel skewers which are passed through the pressed pack under the monkey and over the wool before the pressure is released. When ready, the skewers are withdrawn.

Australia has also been experimenting with substitutes for jute. Woolpacks woven in Australia from kenaf fibre grown in New Guinea are being tried out in a number of wool sheds this season. About 200 woolpacks were made last season from the first experimental kenaf crop. This season the crop has been of better quality and about 1,200 packs have made available to the trade for practical tests in the sheds, through the brokers' stores and into the ships' slings. In addition, wool trade representatives have attended a demonstration in Sydney to watch the pressing and dumping of the packs, which are giving promise of satisfactory service. The kenaf plantation at Oro Bay, New Guinea, *is being* assisted by the Commonwealth Government under a project for the development of the Oro Bay area. Eriama Estates, which has a lease of 15,000 acres for the growing of kenaf, is backed by a strong group of Australian industrial and pastoral companies.

KENYA TO SUSPEND JUTE BAGS CONTROL

Control on all types of jute and sisal bags imported into Kenya will be suspended from 1st August, 1954, according to an announcement by the Jute Controller, Kenya. This decision follows the Government's policy of freeing goods in ample supply and similar action is proposed to be taken by other East African territories. Hessian cloth and jute twine were decontrolled last July. Explaining why control on jute and sisal bags has been suspended rather than removed completely, the Jute Controller said the present shipping conditions made it incumbent on the Government to take every precaution to avoid the possibility of the Colony being without its essential agricultural bags. If nesessary, control would be reimposed. Kenya's annual imports vary from 10,000 to 15,000 bales of jute goods and the Government proposes to hold sufficient stocks to facilitate private trading as early as possible.

Engineering and Transport

DEVELOPMENT OF ASIA'S WATER RESOURCES

VALUE OF MULTI-PURPOSE RIVER SCHEMES STRESSED

Development of Asia's water resources is a basic and essential need for the general economic progress of the region, it was stressed in the conclusions of the six-day U. N. Regional Technical Conference on Water Resources in Tokyo, recently. To provide more arable land and food for the rapidly increasing population and to generate more electric power for industry one of Asia's richest and, to a large extent, still untapped natural resources, that of her mighty rivers, should be utilised to the fullest possible measure, the conference urged.

Some 110 delegates and observers from Asian and non-Asian countries as well as from various U. N. specialised agencies and non-governmental and international technical organisations agreed that, economically and technically, multi-purpose river basin development offered the best suitable method to achieve that purpose. The delegates dealt with most of the technical questions. Eighty-nine information papers were prepared for the conference by experts and organisations from countries throughout the world.

Large Indirect Benefits

In dealing with the economic and social aspects of river basin development, delegates pointed out that water resources projects produced for the community large indirect benefits, and that projects should therefore be selected not only on the basis of engineering feasibility and financial consideration but that the broader interest of national economies should also be considered. Governments were urged to provide sufficient funds for hydrological observations and to embark on comprehensive plans for water measurement and the training of hydrologists.

Defects in existing projects, it was stated, were often because of lack of water measurement records. Such records should be spread over as long a period as possible, the experts suggested. The Conference recommended the adoption by governments of a water measurements standard and records prepared by the E.C.A.F.E. Bureau of Flood Control. The Conference also callled for further studies and the exchange of information concerning selection of hydraulic structures and sediment control works.

INLAND WATERWAY CRAFT MEASUREMENT

E.C.A.F.E. BODY CONSIDERS DRAFT CONVENTION

The E.C.A.F.E. Inland Waterway Sub-Committee considered recently a draft convention prepared by a working party convened earlier this year, the purpose of which was to bring the methods of craft measurement in the region on a uniform basis in order to facilitate the comparison of fleet strengths and studies for improvement of transport performance. Even more important, the convention would provide for uniform registration certificates which should simplify formalities and reduce frontier delays and thus have an immediate effect on the turn-round of vessels and therefore on transport costs. The Sub-Committee accepted the draft after some minor alterations and subject to final amendments which will be made in the course of this year. The convention is expected to be opened for signature on 1st February, 1955.

The Sub-Committee also discussed a comparative study on marine engines prepared by the E.C.A.F.E. Secretariat. This document is intended to serve as a guide for inland waterway transport officials in determining the best policy to be adopted in the expansion of the powered fleets. In most countries, a rapid mechanisation of inland waterway transport is taking place and proper guidance as regards the type of engines to be purchased will save considerable amounts of foreign exchange which will then become available for other purposes. The study in question gives all the basic data and figures required for determination of relative operational efficiencies taking into account purchasing price, repair and maintenance costs, running expenses and performance. The Sub-Committee praised the practical value of the report and made certain suggestions for additions. It was requested that after editing, the report be printed before the end of the year.

Training of Diesel Marine Mechanics

Most countries in the Far East are rapidly replacing steam propulsion by diesel propulsion. A typical example is Burma where before the last war about 90 percent of the inland waterway transport fleet was steam driven whereas now the position is exactly the reverse. This conversion created a serious problem because of lack of expert maintenance and repairs and many engines were out of commission for a long period of time. The Sub-Committee therefore gave serious attention to a plan for establishing a training centre for diesel marine mechanics, the preliminary work on which had already progressed considerably. It was agreed that Rangoon, Burma, would be the most suitable site for the centre. The representative of Burma made the concession that trainees would be admitted to work in existing repair shops to obtain practical experience and also that the fleet of the Inland Water Transport Board of Burma could be used for giving practical training afloat. The Sub-Committee approved a plan for a hostel for students from outside Burma, drew up a list of equipment needed, discussed the matter of financing, received offers from five member countries for possible provision of equipment and instructors, gave an estimate of the number of trainees who attend the first course and set a line of action for establishment of the centre in the course of 1955.

Uniform System of Buoyage

In several countries of the world, difficulty is encountered in international inland waterway transport by differences in the systems of buoyage. It may happen that a master of a vessel has to keep the red buoys on the starboard hand side in one country and, after crossing a border, he finds the reverse happens to be the case. On wide waterways, the banks do not always provide sufficient guidance and consequently accidents have occurred. In the E.C.A.F.E. region, the marking of waterways is mostly still in the initial stages and therefore the cost of converting to a uniform system would be small. Early action is desirable because in future when international traffic will have developed much further and when new canals will have linked various countries, the position would be less favourable. The Sub-Committee considered a proposal for a simple and practical uniform system. It suggested a number of minor amendments and requested that on the basis of this a complete agreement with descriptive part and illustrations be prepared and submitted to the next session for final approval. In addition, the Sub-Committee asked that a study be prepared along similar lines for shore marks as well.

The many other items discussed included: (1) Demonstration and pilot project on improved design of craft, including use of pusher craft and towing methods; (2) Influence of "channel depth/fleet draft ratio" on resistance; (3) Report on the trials of the Joint Steamer Companies in East Pakistan; (4) Current inland waterway developments in Asia and the Far East; (5) Recommendations and conclusions of the 18th International Navigation Congress. During these discussions, the delegations considered the latest views on and accounts of modern practices, many of which are still in the experimental stage, as described in the reports placed before the Sub-Committee. They also gave each other information about their own experiences in the inland waterway transport field and heard opinions of world authorities from countries outside the region who had come to attend the session as advisers to the delegations concerned.

Work Programme

In drawing up the programme of work and priorities, the Sub-Committee set a bold course for action for the next one or two years. As in the past, the emphasis will be on practical work, not only that which is likely to yield immediate results but also work which is of basic importance for development of proper inland waterway transport organisation and administration in the future. Examples of work which will yield immediate results are:—(1) Study on inland ports, their technical installations, services, control, administration and financing; to serve as a guide in organising the many inland ports now required because of developing inland waterway transport; (2) Study of siltation in small ports to find the best means of reducing the very substantial expenses incurred annually in dredging works.

Example of work of basic importance for future development are:—(1) Study of model government organisation to deal with inland waterway transport and river and canal conservancy; (2) Study of model inland waterway transport legislation; (3) Classification of inland waterway; determination of desirable standard dimensions of waterways, structures and crafts.

CANADA'S GIFT OF LOCOMOTIVE BOILERS

The first consignment of locomotive boilers being given by Canada to India under the Colombo Plan has just arrived at the Chittaranjan Locomotive Works. The boilers will be fitted to locomotives manufactured at Chittaranjan. Canada is making a gift to India of 50 W. G. boilers and 120 W. P. locomotives under the Colombo Plan. The approximate value of these is Rs. 8,44,00,000. An Indian railway officer is now in Canada in connection with the inspection of these boilers and locomotives.

The Executive Committee of the Association of Commerce Graduates elected the following to the offices mentioned against their names at its meeting on 28th May: Sir B. P. Singh Roy, President; Mr. G. Basu, Dr. B. B. Ghosh and Mr. J. K. Chatterjee, Vice-Presidents; Mr. Ramesh Chandra Chakravarti, General Secretary; Mr. D. K. Shome, Office Secretary; Mr. A. K. Rakshit and Mr. K. G. Goswami, Joint Secretaries; and Mr. Chinta Haran Banerjee, Honorary Treasurer.

Calcutta Markets

CALCUTTA TEA AUCTIONS

AT Sale No. 2 held on 31st May, 1954, the offerings consisted of approximately 13,866 packages. These generally showed a decline in quality as compared with sale No. 1. Commonest sorts and Plain Liquoring Dooars were up to 1 anna easier; all other descriptions met with a strong demand with discrimination being shown for quality teas. Stylish and flavoury Darjeelings and a few Assam tippy teas on offer met a keen enquiry and sold at high rates. Leaf grades were also well supported and were 1 to 2 annas dearer. Clean common B.P. is quoted at Rs. 2-10 per lb.

Internal Market

The offerings consisted of 3,480 chests only. The market opened generally 2 annas below brokers' ideas and common descriptions were selling between Rs. 2-1-6 to Rs. 2-2 per lb. These rates were similar to those in the closing sale of old season's teas. Small powdery types were more in demand than the larger Dusts except for black exportable types which sold well. There was keen competition for flavoury Darjeelings which sold at about Rs. 2-13 per lb.

Quotation	1954	1953
Medium Dooars Dust	2-1-6	1-6-6 to 1-7-0
Others not quotable.		

Offerings of other grades consisted of 821 packages, which met with a rather limited demand, and although the teas represented good selection, there were a number of withdrawals.

GRAIN & SUGAR CARGOES DOMINATE WEEK'S FREIGHT MARKETS

FOR the past week grain and sugar cargoes have again dominated markets, although there has been some interest in coal movements also. The River Plate maintained steady rates for positions up to August with 77s 6d freely conceded to the U.K. Australian charterers fixed a number of ships to the U.K. on the basis of 80s for bulk wheat ex-Silo from Victoria-New South Wales and a further gain was recorded in the payment of 47s 6d for barley from St. Lawrence to Belfast.

Sugar from Cuba to Calcutta was done at $17.40 with free discharge and Havana-Madras was fixed at $11. f.i.o. and stowed with taxes for charterers account, whilst London-Madras repeated 62s 6d and Queensland-U.K. again conceded 102s 6d. Three vessels were fixed for coal from Calcutta to Korea at 57s and the higher rate of $10.60 was obtained from Hampton Roads to Japan for June loading and October tonnage was fixed at $9.90. The satisfactory rate of 24s per ton deadweight was obtained by a 9,323-ton motor ship for the trip out to Calcutta with delivery London. A Japanese coal burner of 8,400 deadweight capacity was chartered at 13s 4d per ton deadweight for six months Indian trading with delivery Calcutta in June.

SUGAR SALES IMPROVE

During the week ended 31st May, sugar sales in the Calcutta market averaged 3,000 bags daily. Arrivals were 2,000 bags a day, and stocks amounted to 75,000 bags. Rates for ready sugar ex-Kantapukur delivery were Rs. 32-12 for ordinary grain and Rs. 34-12 for big grain. The coming ordinary grain on Government account sold at Rs. 30. Foreign sugar arrivals during the week were nil, but two steamers together carrying 13,250 tons are expected to reach the port shortly. No business in mill delivery sugar has been reported because of the Government's scheme to supply sugar on tender at the rate of Rs. 30 a maund, f.o.r. destination.

LINSEED

A quieter tendency developed in the market owing to somewhat better arrivals from the centres, and a small decline in prices was noted whilst trading was on the whole rather poor. Crushers showed little interest except at lower prices, and activity was largely confined to purchasing against former sales. The oil section appeared slightly more active, chiefly for forward delivery, although owing to the quieter tone now prevailing buyers appeared hesitant. Latest quotations were as follows: Ready Rs. 18-6 per maund; June-July Rs. 18-8 per maund.

HIDES AND SKINS

The market continued easier. Stocks were higher than in the previous week.

Bazar Sales.

(Between 25th May and 31st May, 1954)

Cowhides :—Wet salted (Ord.) 7,000 pcs. on the basis of annas 8 to annas 8-9; wet salted (Ord.) 20,000 pcs. on the basis of Rs. 7-12 to Rs. 8; wet salted (slaughtered) 16,500 pcs. on the basis of Rs. 10 to Rs. 25.

Goatskins :—Wet salted (Daisee, killed) 61,060 pcs. on the basis of Rs. 265 to Rs. 455; Assam-Dinajpur-Murshidabad-Jalpaiguri 36,100 pcs. on the basis of Rs. 345 to Rs. 410; Purneah-Kissenganj 340 pcs. on the basis of Rs. 355; Muzafferpore-Darbhanga-Pakur 27,400 pcs. on the basis of Rs. 345 to Rs. 350.

Bazar Stocks

(31st May, 1954)

Cowhides :—Wet salted (Ord.) 67,100 pcs.

Goatskins :—Wet salted (Daisee, killed) 25,500 pcs.; Assam-Dinajpur-Murshidabad 53,500 pcs.; Muzafferpore-Patna-Pakur-Purneah-Kissenganj 2,30,000 pcs.

SHELLAC MARKET STEADY BUT INACTIVE

During the week ended 1st June, the market was quiet at the beginning, ruled firm mid-week and became steady but inactive at the end. The range of quotations was as follows:

Standard Pure Buttonlac	Rs. 135 value; 140 buyers.
Pure Buttonlac	Rs 129-8 buyers; 136 done and buyers; 134-8 buyers.
Lemon No 1 Shellac	Rs. 130 buyers: 140 done; 135-8 buyers.
Lemon No. 2 Shellac	Rs. 128-8 to 132-8 buyers.
F.O. Std. I. Shellac	Rs. 126 to 130-8 done and buyers.
Pure TN Shellac	Rs. 122 to 128 basis done and buyers.
4% I.T.N. Shellac	Rs. 115 to 123-8 buyers.
No. 1 Kusmi Seedlac 3%	Rs. 123 value; Rs. 127-8 buyers.
No. 2 Kusmi Seedlac 3%	Rs. 114-8 buyers; Rs. 120 done; Rs. 118 buyers.
Fine Bysaky Seedlac (Manbhum) 3%	Rs. 113 buyers; Rs. 116 done and buyers; 115-8 buyers.
Fine Bysaky Seedlac (C.P.) 3%	Rs. 110 to 112-8 buyers.
Ordinary Fine Bysaky Seedlac (C.P.) Under 5%	Rs 104-8 to 108-8 buyers; Rs. 110 done and buyers.
Ordinary Fine Bysaky Seedlac (C.P.) 5%	Rs 102 done and buyers; Rs. 103 to 104-8 buyers.
Kirceiac	Rs 54 to 56-8 buyers.

Shipments during May, until the 29th were 24,219 packages.

Commodity Markets

THE GROWING IMPORTANCE OF VEGETABLE OILS

INCREASING USE IN MARGARINE AND CHOCOLATE MAKING

FATS—butter, margarine, and cooking fat—have come off the ration in Britain this month, and in the same month the price of cocoa has reached new heights. The two events are not automatically connected, but both imply an increase in consumption of vegetable oils. This development can have important effects on the economies of the countries that produce butter, cocoa beans, or vegetable oils, and on the international trade in all of those commodities. Vegetable oils have become in the present generation, and particularly in the past few years, an important element in the technology of food-production. It was as long ago as 1867 that the Emperor Napoleon III of France offered a big prize for an artificial substitute for butter, but it is only since 10th May, 1954 that the British housewife has had the opportunity to taste margarine that is really a substitute for butter, and at approximately half the price that she has to pay for butter. The whole history of chocolate substitutes is more recent, but its implications are similar: processed vegetable oils are being used increasingly to replace both butter and cocoa-butter.

The story of fats in the modern era is the story of a quest for cheaper substitutes; first of animal fats for butter, then of vegetable oils for animal fats, recently of vegetable oils also for cocoa-butter. The first margarine factory set up by the Jurgens in 1871, and those of Van den Bergh and other rivals that followed, converted animal fats into a substitute for butter. The success of the new product outran supplies of the materials, which had become too expensive by the early years of the present century. It was an Englishman, Crosfield, who introduced the process of hydrogenation to the margarine industry in Holland, in 1909, and thereafter vegetable oils could be used as well as animal fats, as they could be converted into solids at normal temperatures. It is this principle of hydrogenation that is applied, especially in America, to the substitution of vegetable oils for cocoa-butter in confectionery. Van den Berghs and Jurgens Ltd. is now a subsidiary of the Unilever combine, which makes about two-thirds of the margarine consumed in Britain. There is strong competition in this reopened market, however, with nearly 20 firms operating, and powerful American capital involved. With prices varying on either side of 2s. a pound, compared with approximately 4s. a pound for butter, the margarine trade's competition is in quality rather than in price. The firm that can claim to make a product equal to butter—or better than butter—and can substantiate that claim, is assured of big sales.

Declining Butter Consumption

Consumption of margarine expanded naturally with the expansion of urban populations. Margarine has, however, encroached so far on the territory of butter that consumption of butter is absolutely less in some countries than a generation ago and much less per head of the population. The 12 principal countries of western Europe have slightly increased their consumption of butter from the 1913 level of one million tons; but at the same time they have tripled their consumption of margarine to more than 1½ million tons. In America the trend towards margarine in the same period has been much more pronounced. Rationing reduced Britain's consumption of butter from 25 pounds a head in 1938 to about 17 pounds in recent years, while allowing an increase in consumption of margarine from less than 9 pounds also to about 17 pounds. The butter-producing countries are anxious now about the future of their trade, and in the unrationed era in Britain they have been publicising their claim that no margarine is really equal to butter. But they cannot hope in present circumstances to compete on price. The drought in New Zealand which is restricting deliveries to Britain is inopportune for the butter interests, and the emergence of the Soviet Union as an important buyer is also keeping up the price of butter. But a deeper reason for the relative scarcity of butter is the increase in consumption of liquid milk, while cheese has priority as a solid product, because it has no substitute comparable with margarine in relation to butter.

The problem of cocoa is similar in some respects, basically in the fact that consumption is outrunning supplies—especially since the big and sustained increase in sales that followed deration of chocolate in Britain early last year. This problem is aggravated by the curiously perverse policy of the marketing boards in the main producing countries, the Gold Coast and Nigeria. This season, when market prices of cocoa have soared, the marketing boards which buy the main crops from the native producers have allowed almost no increase in prices paid to the producers who have therefore no obvious incentive to increase their plantings. This is a particularly serious matter when producing capacity has been severely curtailed by cutting out infected trees in an effort to defeat the swollen-shoot disease. The current world crop, about 710,000 tons, is some 30,000 tons less than last season's, when consumption has expanded so much that it is perhaps 70,000 tons in excess of the current crop. The solution of this problem of deficiency, as of the similar problem of milk, may be the substitution of vegetable oils for cocoa-butter; and the blending of these oils with the cocoa solids that are normally a by-product of the early processes of chocolate-making. The Americans have proved that chocolate suitable for various confectionery can be made by this process of substitution, with a big increase in the yield of chocolate from a given quantity of cocoa beans. The British industry is now showing interest. These new demands will strengthen the values of vegetable oils and may have important implications for the tropical economies—especially for those which have hitherto relied on rubber. That the temperate countries are becoming more dependent on distant supplies of foodstuffs is not, however, an unqualified advantage.

WHOLESALE PRICE INDEX FALLS FURTHER

THE official wholesale price index (base: year ended August, 1939=100) declined further by 0.6 percent to 396.9 during the week ended 15th May, as compared with 399.1 (revised) for the previous week. Relative to the corresponding weeks of the last month and a year ago, the index was lower by 1.8 percent and 0.2 percent respectively. Foodstuffs stood at 370.3 as against 370.5 for the previous week. Items recording noticeable variations were wheat at Amritsar (−11%), tea (−3%), gram (−2%), bajra and coffee (+4% each), rice at Patna (+3%), wheat at Jabalpore and gur (+1% each). The index for Industrial Raw Materials moved down by 1.3 percent to 463.5 because of lower prices of manganese ore (−16%), rapeseed (−8%), gingellyseed (−4%), groundnuts in Bombay, cottonseed at Amravati and copra (−2% each), raw jute, raw silk, linseed and raw hides (−1% each) although the prices of groundnuts at Cuddalore and lac (+4% each), raw wool (+3%), cottonseed in Bombay (+2%) and castorseed (+1%) moved up. The Semi-Manufactures group index showed a fall of 0.4 percent to 362.4 as a result of decreases in the prices of mustard oil at Patna (−7%), linseed oil and mustard oil in Calcutta (−4% each), groundnut cake and coconut cake (−3% each), coconut oil at Cochin, groundnut oil and brass (−2% each), castor oil and gingelly oil (−1% each). The prices of zinc (+3%), mustard oil at Kanpur (+2%) and buffalo hides (+1%), however, recorded an advance. A decline in the prices of rayon and silk manufactures (−7%) and jute manufactures (−2%) brought down the index for Manufactures by 0.7 percent to 380.0 from 382.6 (revised) for the previous week. The prices of glass, however, appreciated by 5 cent. Lower prices of cashewnuts at Mangalore (−5%) and black pepper (−2%) caused a fall of 0.1 percent to 690.4 in the index for Miscellaneous despite an increase in the prices of cashewnuts at Quilon, turmeric and betelnuts (+1% each).

INDEX NUMBERS BY GROUPS AND SUB-GROUPS

(Base: Year ended August 1939=100)

* = Estimated. R = Revised.

American tourists and business travellers spend more than $1000 million abroad every year, according to Trans World Airlines statisticians. The average expenditure abroad by every American traveller is about $721, according to Mr. N. C. Thompson, TWA's chief in India. "Coffee is the only commodity sold to America and imported in greater value than the $1000 million worth of vacations bought by Americans on trips abroad. "When coffee is sold in the United States it must be delivered there" Mr. Thompson said. "But, in the case of tourism, the buyer pays his own travelling expenses, comes to your country to take delivery of his vacation there pays his dollars and goes home. Tourism has become a gigantic industry and a major source of revenue for many countries".

COMPANY AND PUBLIC NOTICES

SHAW WALLACE & COMPANY LIMITED.

NOTICE is hereby given that the Eighth Ordinary General Meeting of the Members will be held at the Registered Office of the Company, 4, Bankshall Street, Calcutta, on Tuesday the 29th June, 1954, at 3 p.m. for the following purposes:

(1) To receive and adopt the Directors' Report and Audited Accounts for the year ended 31st December, 1953.

(2) To confirm the Dividends already paid on the Preference Shares and to declare a Dividend on the Ordinary Shares.

(3) To elect Directors.

(4) To appoint Auditors and to fix their remuneration.

(5) As special business, to pass the following special Resolution:—

"That the Articles of Association of the Company be altered in the manner following:—

(1) In Article 147 line 2 the words "for such period" shall be deleted and the following words substituted therefor:

'for a term not exceeding five years at a time.'

(2) Article 149 shall be deleted and the following new Article substituted therefor:

'The Directors may from time to time entrust to and confer upon a Managing Director for the time being such of the powers exercisable under these presents by the Directors as they may think fit save and except the power to:—

(a) Make calls on Shareholders in respect of moneys unpaid on shares in the Company.

(b) Borrow moneys except within limits previously fixed by the Directors at a Board Meeting.

(c) Invest the funds of the Company and

(d) Make loans except within the limits previously fixed by the Directors at a Board Meeting.

The powers to be exercised by a Managing Director may be conferred upon him for such time, and to be exercised for such objects and purposes, and upon such terms and condition, and with such restrictions as the Directors may think expedient, and they may confer such powers either collaterally with or to the exclusion of, and in substitution for all or any of the powers of the Directors in that behalf; and may from time to time revoke, withdraw, alter or vary all or any of such powers.'"

The Transfer Register of the Company's Ordinary Shares will be closed from 21st June to 29th June, 1954, both days inclusive.

By Order of the Board,

Sd/- R. H. D. CAMPBELL,
Managing Director.

"CAPITAL" STOCKS AND SHARES INDEX*

The *Capital* Stocks and Shares Index (Base: 1939) has now been brought up to March, 1954. Compared with February, the March Indices for Government Securities and Preference Shares reveal rises of 0.1 point and 0.3 points, respectively.

There were increases in Cement (1.3 points), Engineering (2.3 points), Tea (15.7 points), and Paper (40.4 points), while decreases occurred in Bank (2.6 points), Cotton (5.0 points), Coal (5.1 points), Jute (7.9 points), Mining and Oil (8.0 points), Sugar (2.7 points) and Miscellaneous (6.2 points).

Correlating all the factors the *Capital* variable yield securities index shows that the index for stock prices in the above classes of shares declined by 0.8 points during March, 1954.

	Index of Govt. Securities.	Index of Preference Shares.	Variable-Yield Securities. Banks.	Cotton Mills.	Coals.	Jute Mills.	Mining and Oil.	Cement, Lime etc.	Eng. and Metal Works.	Tea Shares.	Paper Mills.	Sugar Shares	Others.	Combined Index.

FACTORS INHIBITING INDUSTRIAL INVESTMENT IN INDIA

THE SHROFF COMMITTEE ON THE "ECONOMIC CLIMATE": CONDITIONS OF ENTERPRISE

THE Report of the Committee on Finance for the Private Sector is a model for future teams of investigators. It has been produced promptly, and this alone sets it apart from so many other official reports which only see the light of day when the problems they were supposed to deal with have resolved themselves, as the doctors say, either by crisis or lysis. It is expertly drafted and clearly written, and it maintains the balance between purely financial and general economic factors in the growth of private enterprise. It is full of ideas. Some of them will not be acceptable to all bankers and business men, but this is not important. An enquiry committee's report—especially when it is written for the Reserve Bank rather than the Government of India—is not a statement of policy but a practical study. In it there is room for proposals that need not be translated into law at once but which are worth further close examination by officials and business men alike. When the Shroff Committee was appointed last year there was reason to fear that the Government was sending public opinion off on a false trail. It will be remembered that the whole discussion of finance for industry was started by the belief that unemployment was increasing, and this in turn brought out the view that unemployment was increasing because business was short of money. It was then that the Reserve Bank appointed the team of bankers under Mr. Shroff to see how business could be provided with more money. This looked to be a false trail because it was known in banking and business circles that the main trouble with Indian enterprise was not that it was short of money but that it was required to work under constricting and discouraging conditions, largely on account of labour legislation and economic controls.

The chief virtue of the Shroff Report is that it brings this point out very clearly. Even while studying the purely financial angle of private enterprise, the bankers have declined to be misled into believing that this is the most important aspect of Indian industry's difficulties. It has prefaced all its recommendations on financial matters with the forthright assertion that it is no use giving an entrepreneur money if you do not also allow him conditions in which he can make his investment pay. This brings the Indian Government back where it was last year: it has explored all the short-cuts and found that none of them leads out of its quandary. There remains only the direct route, which has been commended to it in season and out by all the industrial organisations and financial newspapers in the country. If the Government wishes to provide more employment for a growing population by promoting an expansion of private industry, then it must leave investors the opportunity to make a fair return on their outlay—and it cannot do that if profits are regarded as sinful, and as the rightful prey of labour unions and tax collectors.

*

The Committee's views on the general economic climate in which enterprise must function are especially valuable because this was not the subject they were set to study. They were forced to take it into account when they found that it lay behind all the particular troubles mentioned to them by business men. Furthermore, their views on this question are valuable because as bankers they are not directly involved in the problems of industry in their everyday work; they are concerned with the criteria that distinguish a good investment from a poor one. As bankers they know that in their daily work they do not have to receive large numbers of industrialists with brilliant and profitable schemes to which they must refuse support for want of lendable funds; they know that, on the contrary, they have funds which cannot be safely placed in many enterprises because the entrepreneur has no guarantee that he will be allowed to earn and retain profits large enough to pay the interest charges and principal of which the bank must be assured. So the most important part of the Report is not what the bankers say about banking, but what they say of the difficulties of their clients, actual and aspirant. If the Government reads the Report in this light, it will find it hard to resist the conclusion that the time has come to take active steps toward improving the climate for investment in private, productive enterprise.

The section of the Report that underlines this point is so plainly put that it deserves to be quoted at length: "It is a truism that while lack of finance might inhibit investment, an increase in the supply of finance will not by itself bring about an increase in investment. Cheap or plentiful credit cannot *per se* be an incentive. Private investment will come forth only if there is an expectation of reasonable compensation for the risks it has to undertake. The investor's expectations of the returns he is likely to get on his investment are coloured not only by the purely economic factors of demand and costs but also by various political, social and psychological elements that make up the environment in which he has to function. These semi- or non-economic factors could well limit his willingness to invest and undertake risks, even when a proposition seems worthwhile on purely economic considerations. The Committee feels that in the past few years several changes have occurred in the socio-economic climate of this country which tend to discourage and discredit private enterprise. Unless these inhibiting factors are remedied, mere multiplication or strengthening of agencies supplying finance will not add much to industrial development". This deserves to be written in letters of cupro-nickel over the portals of several Ministries in Delhi.

*

The Committee's review of these "factors inhibiting investment in the private sector" is not exhaustive but it does cover the main points. It refers first to the general questions of changing attitudes to capitalism and the State, and to inevitable political uncertainties. There is perhaps nothing that the Government can do about these things, and indeed there is no reason to believe that anything should be done about them; they are part of the circumstances that investors have to accept. But there are other matters on which the Government can be helpful and of these the Committee mentions the fear of nationalisation, delays and uncertainties in licensing procedure, labour policy, controls and Government borrowing. Nationalisation has by now become such a confused subject that it would probably not help for the Government to offer any renewed general assurance. In any case, there always seems to be some member of the governing party who is ready to contradict his leaders the week after a categorical statement has been issued. It would be better to deal with this fear by writing into a licence or agreement in regard to any major new industry a particular guarantee about no nationalisation within a set period; this has been done with the oil companies and it could be repeated with major undertakings proposed by Indian industrialists. The delays in issuing licences and approving new ventures seem totally unnecessary, and could surely be obviated by better organisation in Delhi—and a reminder to officials that in competitive enterprise, affairs cannot proceed with the magnificent timelessness of Government projects.

On labour legislation and labour awards the Committee naturally refers to some of the more surprising judgements handed down in recent years, such as the Madras Electric Tramways case. It is not suggested that all labour awards are so reckless, but the point is that for the industrialist who is considering making a new investment it is the danger represented by unpredictable and unjust awards that acts as a deterrent. Many and perhaps most labour tribunal awards are fair and reasonable, but the too frequent refusal to accept company balance sheets as reflecting the true profits, and the enforced distribution of carefully husbanded reserves, exercise an influence over investment policy that is out of all proportion to their immediate effects. It is not so much the total burden that private enterprise has to bear in any one year on account of unfavourable judgements, as the whole atmosphere of confusion, uncertainty and disregard of investors' interests that discourages potential investors. Once an investment is made, an unfair tribunal judgement is accepted and the business carries on as best it can; but what is not so obvious is that a dozen other enterprises that might have come into existence, do not.

On the inhibiting effects of controls, there is now much less to be said than there was two years ago. The beneficial effect of decontrol has been demonstrated so clearly throughout the economy, that the presumption must be in favour of removal of such controls as still persist. Two of these are extremely important as affecting investment, the controls over returns in electricity and steel, and the Shroff Committee has singled these out as two spheres in which new investment is being retarded by rigid and outmoded controls. The last general factor inhibiting investment referred to in the Report is the change in the distribution of incomes in an egalitarian age. No one suggests that this should be reversed, but it has gone far enough to make it unnecessary and ill-advised to retain equalisation of incomes as one of the Government's permanent objectives. The strongest force now making for income equalisation is the tax system, and since this lies outside the Shroff Committee's province it is not to be dealt with here. Granted that incomes are now spread more evenly, and that more wealth is now held by people who cannot afford to risk it but must seek the security of investment in some form of Government obligation, it follows that the Government must continue its efforts to mop up small savings. Very little of this money will ever become available for investment in trade and industry, so there is a case for experimenting with ways of attracting small sums of capital to productive enterprise. On this, the Committee suggests unit trusts and the extension of branch banking, if necessary with the assistance of subsidies.

*

We have dealt only with the preface, as it were, to the Shroff Committee's Report, and will leave discussion of its particular recommendations on financial matters to next week. This is because the preface is the most important part of the book, and the detail of the later chapters should not be permitted to obscure this fact. These general matters are not new, and they have been urged on Government in different words from many quarters; the later sections of the report contain some proposals that have an attractive air of novelty and some that have the added attraction of being borrowed from more "advanced" capital markets abroad—such as deposit insurance and investment underwriters. These have their value, no doubt, but the Indian economy now has less need of financial novelties than of the sure and tried methods of encouraging productive investment, of which the chief, as the Shroff Committee itself has shown, is an atmosphere in which enterprise can flourish because it is respectable and profitable.

THE PLACE OF FORESTS IN ECONOMIC DEVELOPMENT

THEME FOR FOURTH WORLD CONGRESS AT DEHRA DUN

THE Indian Forest Research station at Dehra Dun has earned a deservedly high reputation in world forestry circles for its valuable work over a long period of years. It is most fitting, therefore, that it should have been selected as the venue for the fourth World Forestry Congress and the first to be held outside Europe. From 11th to 22nd December this year more than three hundred delegates from all parts of the world will be pooling their knowledge and experience in the heart of that most impressive of all forest areas, the Siwaliks at the foot of the Himalayas. Organised by the Government of India, with the Inspector General of Forests heading the committee, in co-operation with the Food and Agriculture Organisation of the United Nations, this Congress will differ in many ways from the earlier meetings held at Rome in 1926, at Budapest in 1936, and at Helsinki in 1949. Most important of these is that it will be the first occasion on which special emphasis has been laid on tropical forestry. For this reason, more importance than usual is attached to the tours which are being held in conjunction with the Congress. These tours, besides covering many of the finest forest areas in India, will take delegates into neighbouring Pakistan, whose Government has offered full co-operation in enabling delegates to see her own famous forests. The biggest difference, however, is that whereas previous meetings have been concerned mainly with subjects of particular interest to the forestry expert, this one is being linked with a world-wide drive to bring home to people in every corner of the globe the part that forests play in their own lives. The theme of the Congress has already been summed up as "the place of forests in the general land economy and economic development of a country". Forests, besides providing the world's most widely used raw material, have functions in regard to the protection of the soil, the conservation of natural resources, and the general social and spiritual well-being of man which are so universal as to be taken for granted almost everywhere. While the attention of the foresters themselves, therefore, is focussed on the economic importance of their trade, that of the general public can be drawn to the ways in which forests and their products affect the lives of everyone today.

The aim of the Organising Committee in preparing a programme for a meeting such as this is to afford material for deliberation which will subsequently help countries design and co-ordinate their forest policies. The field is a broad one and the session will open with a general review of progress made since the Third World Forestry Congress, based on "the rôle and place of forests in the general economy of a country". The development of modern civilisation, coupled as it is to a rapid increase in world population, depends to some extent on increasing production of everything necessary to man's existence and general welfare. This entails increased competition between various forms of land use, and one of the questions to be resolved is to determine how much of a national territory is to be permanently dedicated to natural cover, and how this area can most advantageously be used in the development of the country's economy. Two factors must be taken into account in defining this area: the protective functions of the forest, and its socio-economic rôle. Linked with these is forest productivity and its effect on the development of efficient forest industries. These three aspects of the rôle of forests cover the bulk of the Congress programme.

* * * *

In considering the protective functions as a basis for determining what land should be kept under forest, emphasis will no doubt be given to the results of recent research on the action of natural cover, and of plantations. Their effects on soil and water conservation, and on production from areas where forestry and agriculture are in close harmony, as in the case of shelter-belts on arable land, will be studied. Education of public opinion in conservation—which is "the rational utilisation for the benefit of the largest possible number of people and for the longest possible time"—and in the broad principles of land use, will also be given prominence. Scientific, technical, economic, legal and social considerations will be even more closely considered in sessions where the productive functions of the forest are discussed. Here again, the basis of the discussions will be the determination of how much land can properly be kept under forest as a basis for industrialisation and other economic or social progress. Good silviculture is the primary requirement for obtaining high yield in quality and quantity but its application is often affected by economic and social conditions, including forms of ownership and the existence of various rights of usage of the land. Under the same general heading will be considered the management of forest land for grazing, as a wild life habitat and for recreation; here, too, come the problems of plantation management outside the forest. The "multiple use of forest zones" is becoming more and more important as pressure on land increases and the highest sustained yield consistent with soil and water conservation becomes essential. The economic value of plantations outside the forest will also be considered, especially in poorly forested countries whose requirements can largely be met by plantations combined with agricultural use of the land. It is hoped that the Congress will contribute usefully to the balanced integration of land use.

Although the integration of the forest with the industries of a country depends largely on the utilisation of forest products, the subject is too vast to be considered in all its aspects. At this Congress, attention is to be concentrated on the development of forests whose economic value has so far remained lower than it need be; and the problems of making such forests more accessible and of making more use of hitherto little used species. There are three main ways of raising the economic value of such forests. They may be made more accessible; more use may be made of species hitherto largely ignored; and the introduction of new industries and new methods of utilisation, adapted to local conditions. In the countries whose forests are under-developed they may become, by application of those methods, and under wise management, a virtually inexhaustible resource. This topic is in fact already linked with current schemes for a wider geographical distribution of new pulp and paper industries, and for the utilisation of timber instead of iron and steel where these have to be imported. Finally, the Congress will discuss the development of industries based on the secondary products of the forest, which are especially important where inaccessibility makes larger scale exploitation impossible at the present time. A special section of the programme will be devoted to tropical forestry. Despite recent progress, the economic yield of tropical forests is small compared with that from those in temperate zones. In the near future this situation must be so changed that tropical forests play the important part they should in the economy of the countries concerned. The Congress programme for discussion of tropical forestry covers only the most important problems and the presently recognised most important species. It also includes discussions on the control of desert areas, and on problems arising from shifting cultivation in various parts of the tropics. It is obvious that this gathering could provide an invaluable guide to the framing of policies of great material value to the economies of under-developed countries everywhere.

It has recently been announced from New Delhi that additional equipment and supplies are to be provided for the Forest Research Institute for augmenting the present facilities for research on forest products, under a supplementary Indo-U.S. Agreement signed some days ago under the *Technical Co-operation Programme*. It is proposed, under this agreement, to acquire equipment and supplies for laboratory research purposes, pilot-plant studies and field studies and for reproduction and dissemination of scientific findings at the Institute. The estimated additional joint cost of the project is $ 85,000 and Rs. 150,000. The agreement was signed by Mr. L. Wade Lathram, Acting Director of the U.S. Technical Co-operation Mission to India, on behalf of the U.S. Government, and Mr. C. V. Narasimhan, Joint Secretary, Ministry of Finance, for the Government of India.

STERLING AREA'S GOLD AND DOLLAR RESERVES

THE FACTORS AFFECTING SIZE AND GROWTH

THE rise in the sterling area's gold and dollar reserves, which has been in progress with only minor interruptions since the late-summer of 1952, has been markedly accelerated in the past three months for which figures have been published—March to May. There are abnormal elements in the increase, which suggest that the rate of progress will not be maintained; but the recent increase itself is not on that account necessarily temporary; and it has brought the reserve almost to $3,000 million. This figure is well below the peak around $3,800 million reached in mid-1951, but it is more solidly based. The rise to that peak was spectacularly rapid and most of it was lost. The rise to the current level has been much slower, and, in the opinion of most observers it should at least be held. It is important now to estimate approximately (precise calculation is, of course, impossible) the likely effects on this reserve of international trends in trade and payments; for on these trends depend the timing of convertibility of currencies.

The London and Cambridge Economic Service, which prepared a quarterly bulletin for "The Times Review of Industry", has this month emphasised the distinction between business conditions and policy as affecting the flow of dollars. Generally, it points out, America's recession has not caused difficulties in other countries' foreign exchange; on the contrary their gold and dollar reserves have tended upward. Generally, world commodity prices are rising rather than falling. The increase in the outside world's reserves of gold and dollars last year means that the United States had no surplus on its ordinary balance of payments to cover its outgoings for foreign aid and investment. Therefore if U.S. imports fell substantially, the effect could be only to check the rise in other countries' reserves, not to cause them to fall. America's foreign aid will be smaller this year than last, but military expenditure abroad will probably be much larger. And "this large element of dollar outflow is not vulnerable to business conditions in the same way as (say) imports of materials". The volume of U.S. imports has, indeed, been sharply reduced by the recession. A recent issue of the United Kingdom "Board of Trade Journal" mentions, in an analysis of trade, that these imports were 7 percent less in the last quarter of 1953 than in the same quarter of 1952. But commodity prices remained buoyant, because an increase of 4 percent in Europe's industrial activity sustained demand for primary products. The export incomes of primary producers were thus maintained in 1953, and the total value of world trade increased slightly despite the North American recession. The London and Cambridge economists have added that, because the recession was foreseen, American business had not made heavy purchases of materials before it began; therefore, their purchases were not afterwards curtailed as drastically as in the recession of 1948-9.

* * * *

On the sterling area's reserve the influences of these trends in primary goods are conflicting. The reserve cannot be fundamentally healthy unless the primary producers of the sterling area are selling to the non-sterling world in satisfactory volume and at satisfactory prices. On the other hand, Britain's own balance of payments tends to deteriorate when primary prices are rising, because the cost of imports tends to rise more than the yield from exports. The sterling area's trade account with the dollar area has still been showing a moderate surplus—say $35 million a month—after deducting the exceptional inflow of foreign currency (some speculative but most to build up balances in London) in April and May. The surplus with the European Payments Union in recent months has averaged about $20 million a month, in terms of the effective addition to the gold and dollar reserve. An important factor in this generally favourable showing is the outside sterling area's sales of primary goods in the European market; whereby the whole area's deficit with the Payments Union late last year has been corrected. If the American recession is, indeed, ending, the outside sterling area's exports to North America may increase sharply; for stocks will need to be rebuilt at the same time as consumption will be increasing. An upturn in America would also stimulate stockbuilding, and also, probably, consumption, in Europe.

The United Kingdom, on the other hand, will probably drain away some of the foreign currency flowing in on account of the rest of the sterling area. The tourist season has well begun, and Britons travelling in Europe will be, as usual, much more numerous than Europeans travelling in Britain. It is not unlikely, though less certain, that the UK's earnings from the export of manufactures will fall far enough behind the UK's expenditure on imports to revive doubts about the balance of payments; though "invisible" earnings are now more diverse, and probably larger, than could have been expected, since the financial and commodity markets have been restored. The factors may aggravate the United Kingdom's position. Output of many commodities was restricted so severely in the post-Korean slump that a manufacturing country dependent on imports may be "squeezed" if demand gains strength and prices rise. And the expansion of demand at home may outstrip the growth of production, which, though 6-7 percent higher than a year ago, is not now quite so strong as in the first quarter of the year; exports may therefore be impeded by inflation at home, especially as home prices for coal and steel are now less favourable to industry. The health of the monetary reserve requires that the UK shall provide plenty of exports on which the prospering primary producers can spend their earnings.

CURRENT COIN

The Needs of Bihar.—The price of steel in Bihar is Rs. 40 a ton higher than in Calcutta, Bombay and Madras, in spite of the fact that the State contains the biggest steel plant in the country. This point was made by Mr. Shanti Prasad Jain, President of the Bihar Chamber of Commerce, at the 27th annual session of the Chamber in Patna last week-end. The reason for this anomaly was the price-fixing formula, designed to meet competition from imports, and it meant that Bihar was receiving no advantage from being a producing centre. Mr. Jain urged that the problem be discussed between the producers and the Central and State Governments as one contribution towards the development of Bihar. The existence of coal deposits and an established steel industry would promote the emergence of a prosperous engineering industry in Bihar but for the difficulty over the price of steel. For the future development of industry cheap power was necessary, yet the price charged for electricity in Bihar was higher than the prevailing rates in West Bengal and Orissa and the State was getting no advantage, other than the mere availability of power, from the fact that most of the D.V.C. dams were located within its boundaries. Mr. Jain mentioned other matters which he considered required adjustment before Bihar could develop in the way she wished. The present structure of railway freight rates tended to favour the movement of coal rather than that of raw materials, and this was affecting the growth of chemical industries in the State. The lack of adequate rail links was holding up the development of forest and mineral resources. Sales tax was a matter on which Mr. Jain pleaded for greater imagination on the part of the State Government. The heavy sales tax on raw materials in Bihar was without parallel in any other State. It was killing the oil industry and drying up the sources of revenue. Diversification of production through small-scale industries was being prevented by a system which involved taxing each transaction at the various stages of production. Mr. Jain mentioned the wealth which the State possessed in the form of coal, iron ore, mica, manganese and limestone, and in such commodities as bamboo, sugarcane and oil seeds. This wealth was extensive, and available for development when the necessary action was taken. This would include starting work on the projects on the Gandak and Kosi rivers, at a cost of about Rs. 75 crores. Mr. Jain gave a timely warning on the subject of the land-gift movement and emphasised that, sentiment apart, the economics of the whole idea should be closely investigated. It appeared commendable that the landless should be given land, but this left unsolved the problem of the land's most economic use, the question of whether the fragments which resulted from voluntary redistribution were worth exploitation, and whether the yields would be commensurate with the amount of money and effort which would have to be spent on them.

* * * *

1757 And All That.—*An Indian correspondent writes:* The public "sympathy and support," for which Dr. S. N. Sen appealed at his press conference in Calcutta on Friday, may not solve all the problems which will confront him and his colleagues in writing the officially sponsored history of India's freedom movement. Indeed, sympathy and support may be embarrassing for, as Dr. Sen said at the conference, non-official sources of information are already proving unreliable because they lack "objectivity and accuracy" which are the first two essentials of any historical work of value. But there is an abundance of other material. The transfer of power in 1947 was so smooth that no large-scale destruction of documents took place, and a large measure of accuracy should not therefore be too difficult to attain. It is objectivity which may still remain beyond the reach of the editorial board, and that is not merely because it includes a number of politicians. At least half the members, Dr. Sen said, are "professional students of history"; which is good as far as it goes, although it leaves unexplained the precise contribution the avowed non-historians on the board are expected to make.

There are other factors which will militate against even such objectivity as the scholars may be able to persuade the politicians to accept. Absolute objectivity, of course, is beyond the achievement of man. Serious historians no longer claim it for their work. They know that all history is selective and when it is, in addition, interpretative, they often give the reader prefatory warnings about their political persuasions so that due allowance may be made for what is known as the personal equation. Collective authorship, such as that of the proposed history of India's freedom movement, does not necessarily obviate the difficulties; it may in fact multiply them. But, there seems to be something amiss in the very approach of the editorial board. With the regional committees reporting to the central board there is the very real risk of local incidents being invested with exaggerated significance and, in any event, no region in India can be described as what Toynbee calls an "intelligible field of historical study." To take an obvious instance or two, are the respective regional committees going to study terrorism in Bengal and the Punjab in isolation, or the salt tax campaigns in Noakhali and Bombay separately? In fact, it is arguable whether India herself, as she is constituted today, is an intelligible field of historical study. To say nothing of Pakistan, whose Government is said to have been requested to assist the Indian chroniclers, are the final years of British rule in India historically explicable without full references to World War II and the general elections in the U.K. in 1945, neither of which strictly belong to Indian history?

It seems probable that the value of the expensive work in hand is going to be exceedingly limited. On the question of the scope of the proposed history, Dr. Sen's reasons for the exclusion of Muslim rule from the phase of India's alien domination will leave unconvinced at least one eminent interpreter of Indian history, Mr. Nirad C. Chaudhuri, who has argued with force in his autobiography that the Muslim rule was as much a part of the larger Islamic polity of the time and as external in character as the British rule in India was a part of Western expansion. The creation of Pakistan in 1947 is evidence that there is exaggeration in Dr. Sen's statement about the Muslim conquerors being "Indianised" in the course of time. Is it possible that the current needs of Indian secularism have impinged upon the editors' view of the past? Professor E. H. Carr has said that one's writing of history is governed more by one's vision of the future than by any other single factor. As it happens, one's vision of the future is largely shaped by one's view of the past. The interplay of these two forces has in our own time resulted not only in the writing of a great deal of false history but also in some examples of suicidal nationalist extremism, of which Germany and Japan are two cases in point. If the inspiration of the planned history of India's freedom movement is purely academic, and not nationalist, Dr. Sen certainly did not make it very clear at his press conference. His rather irrelevant reference to Bengal's "splendid record of patriotism," though historically correct, was indicative of an approach not wholly academic. When individual historians are partisan, their opponents are there to present the contrary point of view. When one history out of the many possible receives the imprimatur of the State, it imperceptibly acts as a check on further research and criticism.

* * * *

U.P.'s Textile Industry.—Mr. Sitaram Jaipuria, of the Swadeshi Cotton Mills Co. Ltd., Kanpur, has issued an informative pamphlet on the progress and problems of the textile industry in Uttar Pradesh. In it, he recalls that the factors which led to the establishment of the industry were low wages, easily accessible markets, cheap power, the availability of cotton in U.P. and from Punjab, and its low cost of transport. As a result, today Kanpur mills alone have over 550,000 spindles and more than 10,000 looms, produce an average of 16,000 bales of cloth every month and employ about 45,000 workers. Conditions have however been changing in recent years. According to Mr. Jaipuria, not only has the industry been deprived of most of its former advantages, but it now suffers from several handicaps compared with units situated in other parts of the country. Wages have risen so much since 1944 that in Kanpur they are now higher than in most other centres. The minimum wage is highest in Kanpur and Bombay, but the former has the additional disadvantage that it is being "forced to employ about 50 percent more workers per unit of production than the workers employed by the mills in Bombay." The majority of the latter, claims Mr. Jaipuria rather doubtfully, "work on a rationalised basis." The actual wages paid by mills in Kanpur per pound of yarn or per yard of cloth "are very much higher than in Bombay or Ahmedabad, in spite of the same basic wage." The Bombay mills "have been carrying out intensification and rationalisation for the last several years" while the efforts made in this direction by mills in Kanpur have not been allowed, on the ground that they would lead to retrenchment and increase unemployment. Mr. Jaipuria says it is high time that those in authority realised that the industry cannot continue to pay the present high emoluments unless workers respond effectively and appreciate their obligations to improve production. If the industry is to be run properly it is essential that it should not only be freed from the heavy burdens entailed by the surplus labour now employed but also enabled to develop on an efficient scientific basis.

* * * *

Employment in April.—During April 111,311 unemployed persons registered themselves with Employment Exchanges for employment assistance, against 106,573 during the previous month; and 12,965 were placed in employment against 13,802 during the previous month. The number of registrants still requiring employment assistance at the end of April was 526,290, which was 529 greater than the figure at the end of the previous month.

Survey of India's New Industries

CAPITAL's mid-year supplement for 1954 will deal with new Indian industries. The growing points of the Indian industrial economy, the new shoots that have been thrown out in the last few years—these are the subjects covered in the Survey which will be published on 24th June, 1954, in the form of a SURVEY OF INDIA's NEW INDUSTRIES. This special issue will be supplied free to registered subscribers and will be available to others at Rs. 5 per copy. Enquiries may be addresssed to the Manager, CAPITAL, 5 Mission Row, Calcutta 1.

STOCK MARKETS QUIETLY STEADY

READJUSTMENT OF GILT-EDGED RATES: TEAS IMPROVE

London, 9th June.

RATHER quiet conditions prevailed in the stock markets during the past week in view of the holiday and the approaching end of the account. The general trend, however, was firm under the lead of the gilt-edged market. A very large amount of business developed in Funds following the announcement of the issue of the new two percent Conversion stock and the market spent the week adjusting prices to the new conditions created by the issue terms of the new loan. Short-dated stocks were mostly marked down but medium and long-dated stocks moved steadily higher because the new loan was taken as an indication of the Government's intention to keep money cheap. Irredeemable stocks, in contrast, attracted little attention and recorded no noteworthy alteration. Leading industrial equities were supported, the buying being encouraged by the firmness of gilt-edged, while many other industrials moved up either in response to good company news or in anticipation of higher dividend announcements. In foreign bonds, Japanese were irregular but Chinese responded to the trade talks and the rather better international political situation, while Germans and Greeks made a firm showing. Gold shares were erratic, with interest centred on Free State and, to a lesser extent, on selected uranium issues. Profit-taking before the end of the acount however brought losses in recent favourites. Coppers continued to advance but other base metals were subdued. Oils made a mixed showing but rubbers held fairly steady. Recent good company news and the generally favourable outlook for the industry brought in fresh buyers of tea shares, which scored some appreciable gains. The demand however was selective.

The Money Market

Stringent credit conditions were again experienced in the past week and the market relied mostly on the authorities to see them through in financing Government borrowing. The main talking point of the week was the big new Government loan operation, with its implication of a 2-1/8 percent basis for five year loans. This resulted in a readjustment by discount houses of their holdings of short-dated bonds to bring interest rates into line. The result of the operations was that the Government was able to borrow on cheaper terms from the market at last week's treasury bill offer. Treasury bill applications for £414,325,000 were allotted £250 million at an average rate of 32s 11.61d compared with 34s 3.33d in the previous week. This week, £260 million is being offered. The Bank of England return for the week ended 2nd June, show notes in circulation about £1 million up at around £1,624 million, while bankers' deposits were about £13 million up at £280 million.

Activity on Wall Street

German issues turned firmer on the New York bond market in a slow foreign section, the 5 percent 1980 gaining more than two points, while Green issues advanced by over one point. Tokyo Electric 6 percent declined, but later rallied to recover their loss. Brazilian bonds were mixed in a narrow range. Chile 3 percent 1993 closed fractionally higher. Early gains in U.S. Government securities were generally erased by later selling. Best grade corporates turned firm and some fractional and bigger past-holiday gains were registered. Rails were mixed in quiet trading while World Bank bonds were neglected and unchanged.

U.S. Federal Reserve Return

The U.S. Federal Reserve return for the week ended 2nd June, shows gold stock down by $49 million. Foreign deposits increased by $18 million, while foreign investments fell by $8 million. The Federal portfolio of Government securities increased by $74 million as it bought $75 million worth of bills and sold $1 million worth of bonds. Member banks' borrowings fell by $27 million to $175 million and their excess reserves fell by $71 million to $609 million. The reserve ratio fell by 0.1 percent to 45.8 percent. Business loans of the New York City banks fell by $207 million to $7,574 million, against a fall of $29 million to $8,383 million a year ago.

Outflow of U.S. Reserves

The outflow of reserves from the U.S.A. was resumed in the week ended last Wednesday at the large figure of $59 million, and this notably included a U.S. loss of $49 million in gold. The previous reversal of the tide of dollars to non-dollars countries lasted only two weeks.

Gold and Dollar Reserves

The Sterling Area's gold and dollar reserves during May rose by $165 million, bringing the total reserves on 31st May to $2,985 million. In April, the reserves rose by $135 million. The U.K.'s provisional surplus with the European Payments Union in May was £10.8 million compared with the surplus of £28.2 million in April. Defence aid from the U.S.A. during May amounted to $6 million and $39 million were received in gold or dollars from the European Payments Union. The end-May 1954 reserves of $2,985 million compare with $2,321 million at the end of May last year.

Exchange Control Relaxation

Another small step in easing the Exchange Control is announced by the Bank of England. The field of "prescribed" securities is being narrowed to include only Canadian and U. S. dollar stocks. Further, formalities are reduced for dealing in blocked sterling which allows banks and stockbrokers to transact business more simply. The effect should be to increase market possibilities in securities expressed in foreign currencies.

Argentina's Composite Exchange Rates

The Argentine Central Bank has fixed composite exchange rates for several export items. The new rates for exports of classified and unclassified cow hair and horse hair is to be 50 percent at the basic rate of five pesos to the U.S. dollar or its equivalent and the other 50 percent at the free market value of 14 pesos to the U.S. dollar. New rates for processed bristles are 20 percent basic and 80 percent free market value. Previously, these items were subject to the simple basic rate of five pesos to the U.S. dollar.

Hongkong Gold Easier

The Hongkong gold market was bearish last week. After touching $(HK)254¾, the price sagged to $(HK)253⅞ in the closing period. Bullion circles attributed the down-trend firstly, to heavier forward contracts, secondly, to diminished demand for export, and thirdly, to daily interest rates easing. It was contended that a further fall would be averted by the bullish influence of American dollars. An unspecified amount of forward contracts were reported fixed at $(U.S.)37.37. Official offtake totalled 12,000 taels and unofficial offtake 4,570 taels. No arrivals were reported from Macao.

Mercury Exports from U.S.A.

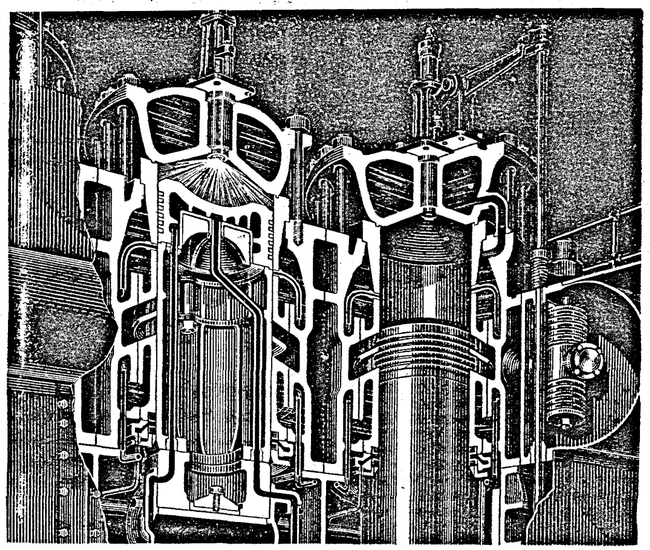
The U.S. Commerce Department has tightened its controls over exports of mercury because it is in short supply in the U.S.A. Bureau of Foreign Commerce officials said that, effective from 5th June, exports of mercury will require validated licences for shipment to all destinations except Canada. At present shipments can be made without export licence except when directed to Russia, Eastern Europe, Communist China or North Korea.

The Rubber Market

In the absence of new influences, prices in the London rubber market in the past week followed closely the trend at Singapore and fluctuated narrowly. Modest U.K. and Continental orders gave support, but outside interest was small. Towards the close of the period values improved slightly, mainly because sellers were reserved, and there was a scarcity of offers for shipment from the East. Final values were 8d higher on balance. The best grades of sole crepe lagged somewhat, but there was fair daily movement of lower grades, which hardened. Quotations were on the basis of 27½d per lb. for No. 1 spot.

Linseed Oil Market Dull

Business in linseed oil continued to be restrained and sellers showed reluctance to offer except at higher prices. But buyers were so far behind that only rarely could contact be made. The prevailing tone of Indian castor oil was easy and trading was slack, even though Indian B.S.S June-July shipment rates were quoted at £112 and commercial at £102 per ton c.i.f. Spot supplies of the Indian oil were however small, and for B.S.S. in Liverpool there was talk of offers at £130 and of Commercial at around £120.



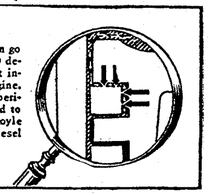
How oil makes an inferno useful!

Look inside a big Diesel engine – and you find an inferno of terrific heat.

Scorching temperatures and the actual flames generated inside the Diesel create the severest tests for oil. Not only is it important to prevent metal-to-metal contact between piston rings and cylinder wall, but the oil must also *seal in* the gases to save power.

The makers of Gargoyle lubricants were the first to lubricate Diesel engines correctly. Now, there are specially made oils for every type and size of Diesel. Gargoyle oils work on the principle which has proved to be the most vital factor in Industry: the *right* oil, in the *right* place, in the *right* way. 88 years of experience has shown them how!

Temperatures can go as high as 3,500 degrees Fahrenheit inside a Diesel engine. No wonder experience was needed to develop Gargoyle lubricants for Diesel engines!



Let this experience benefit you. Standard-Vacuum Industrial Lubricants give you correct lubrication with four special advantages:

- Reduced power consumption;
- More continuous production;
- Decreased maintenance;
- Lower lubrication costs.

THE CALCUTTA MONEY MARKET

CREDIT IN GOOD DEMAND

Wednesday, 9th June.

CONDITIONS in the money market are relatively unchanged, with money still in good demand. The advent of the rains has had the usual depressing effect on trade in upcountry areas. There has been little call for fresh funds from the jute mills, and the outstandings of the sugar industry have fallen further. The interbank call rate quotes 2¾ percent.

There have not been many bills reported this week, and those have generally been small. Remittance has been fair. The principal exchange rates are unchanged and quote: sterling T.T. and O.D. 1s 5 31/32d; three months' sight bills 1s 6 7/32d; four months' sight bills 1s 6¼d; the U.S. dollar Rs. 475.

* * * *

Subscriptions to the 3½ percent National Plan Loan 1964 during the period 10th to 31st May, 1954 according to reports so far received, amount to approximately Rs. 23.30 crores. The total subscriptions since 19th April, 1954, amount to approximately Rs. 80.56 crores.

* * * *

During the week ended the 4th June 1954 Government of India treasury bills for Rs. 1,17,50,000 were sold in favour of the Reserve Bank of India.

* * * *

Bullion ruled quiet last week and prices fell further because of bull unloading in face of the lack of support. Silver declined from the previous week's level of Rs. 159-7 to Rs. 155-12 quoted today, but the ready rate was 4 annas higher. The price was nevertheless unchanged at 72½d. in London and at 85¼ cents in New York.

Gold also dropped from Rs. 87-4 to Rs. 86-1 and arrivals exceeded offtake. The sovereign at Rs. 58-8 showed a loss of one rupee.

* * * *

A rise of Rs. 8.62 crores in notes in circulation to Rs. 1211.54 crores was the outstanding feature of the return of the Reserve Bank of India for the week ended 4th June, 1954, but the total note issue at Rs. 1245.44 crores showed a small decline of Rs. 77 lakhs. Notes held in the Banking Department consequently diminished by Rs. 9.38 crores to total Rs. 33.90 crores. Deposits of the Government of India were up by Rs. 2.81 crores to Rs. 103.89 crores while other Government accounts fell by Rs. 1.01 crores to stand at Rs. 19.54 crores. Balances of commercial banks at Rs. 40.10 crores revealed a decline of Rs. 3.69 crores. Balances held abroad declined by Rs. 65 lakhs to total Rs. 62.35 crores. Other loans and advances dropped from Rs. 48.02 crores to Rs. 45.56 crores, of which advances to scheduled banks against usance bills also declined from Rs. 21.27 crores to Rs. 15.90 crores. Investments increased by Rs. 9.78 crores to Rs. 85.43 crores. Ways and means advances were shown at Rs. 1.47 crores (Rs. 87 lakhs).

* * * *

The statement of the position of the Scheduled Banks for the week ended 28th May, 1954, discloses Demand and Time liabilities at Rs. 543.27 crores (Rs. 8.38 crores on account of borrowings from Banks) and Rs. 329.64 crores (Rs. 1.66 crores) compared with Rs. 541.35 crores (Rs. 8.03 crores) and Rs. 328.95 crores (Rs. 1.46 crores) respectively in the previous week. Cash and balances with the Reserve Bank have declined by Rs. 31 lakhs and Rs. 1.81 crores to aggregate Rs. 32.73 crores and Rs. 41.12 crores, respectively. There is a drop of Rs. 23 lakhs in investments to Rs. 324.25 crores. Advances and bills discounted at Rs. 572.58 crores reveal a fall of Rs. 7 crores. The ratios to total liabilities of cash and balances are, in consequence, shown at 8.5 percent and 65.6 percent against 8.7 percent and 66.6 percent.

* * * *

The return of the Imperial Bank of India for the week ended 28th May, 1954, shows a rise of Rs. 2 lakhs in total deposits to Rs. 209.40 crores. Investments in Government Securities are down by Rs. 5 lakhs to Rs. 82.54 crores, while other authorised investments are up by Rs. 10 lakhs to Rs. 10.49 crores. Loans, cash credits and overdrafts have decreased by Rs. 2.54 crores to aggregate Rs. 92.40 crores, while bills discounted and purchased have increased by Rs. 68 lakhs to stand at Rs. 31.81 crores. Cash and balances are, in consequence, shown at Rs. 16.66 crores or Rs. 41 lakhs less.

* * * *

For the benefit of small savers who cannot spend Rs. 5 or Rs. 10 at a time to buy National Savings Certificates, post offices sell National Savings Stamps of the value of four annas, eight annas and Rs. 1. These stamps can be affixed on a National Savings card provided free by the post offices and when the total value of stamps comes to Rs. 5 or Rs. 10, the card can be exchanged for a National Savings Certificate of equivalent value. The Government of India has now decided that as long as the National Plan Certificates remain on sale one or more savings cards bearing National Savings Stamps of a total value of Rs. 25 or Rs. 50 may, if the holder so desires, be exchanged for a National Plan Certificate of similar denomination.

* * * *

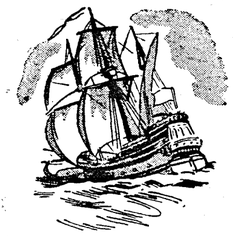
The recent rise of the free market value of Sterling, the Guilder, the Deutsche Mark and the Belgian Franc gave rise to rumours that some sort of convertibility for these four important monetary units could be expected before the end of the year. The June issue of Pick's World Currency Report, commenting on this problem, expresses hopes that such partial convertibility could be reached by the end of the summer, provided that no new world conflict arises in the meantime. Britain, under the pressure of the Germans, who want an early return to a fully convertible D-Mark, seems to be contemplating the identical step. Holland and Belgium would follow immediately. As the free market value of all four monetary units is only 1 percent, or less, below the official parity of the respective currencies, the step is at least technically feasible. Nevertheless, the Report expresses doubt that any full convertibility could be achieved this year. It would be a freeing only of all balances resulting from current commercial transactions and of all future capital investments. Old balances, resulting from financial or other transactions, would be freed gradually and remain under foreign exchange regulations. There is no doubt that even such an incomplete currency convertibility would be a major step on the road of monetary reconstruction to final financial liberty.

* * * *

According to the land-borne trade returns received in the Department of Commercial Intelligence and Statistics, the provisional figures of total value of foreign trade of India by land with Pakistan, Afghanistan, Iran and Burma during April 1954 were as follows (in lakhs of rupees):

	Exports to	Imports from
Eastern Pakistan	28	102
Western Pakistan	22	negligible
Other Countries	10	20
Total	60	122

Total trade amounted to Rs. 182 lakhs. Re-exports were nil and trade in treasure negligible. There was an adverse balance of trade amounting to Rs. 62 lakhs.



Billowing Sails

once carried the world's communications and commerce. Even then Lloyds Bank was providing its clients with information and facilities for overseas trade. Now, too, as then, Lloyds Bank continues to offer these services to those engaged in foreign business. With its own Branches at all major ports in England and Wales, and in India, Pakistan and Burma, and with affiliated Institutions and Foreign Agents and Correspondents in every large port and city throughout the world, Lloyds Bank is fully equipped to provide comprehensive service and finance for all classes of foreign trade.

DEFENCE OF BANK DEPOSIT INSURANCE

SOME ANSWERS TO CRITICISM

The Committee on Finance for the Private Sector—the Shroff Committee—has given its conditional approval to a scheme for the insurance of bank deposits. The condition is; "if, after detailed examination, there is consensus of opinion amongst banks regarding the desirability of this scheme". We print below the extracts from the Committee's report dealing with this subject, followed by an article from a correspondent answering some of the criticisms that have been urged against deposit insurance. The Shroff Committee says:—"An important proposal made to the Committee for strengthening the banking system and increasing the confidence of the public is that a system of deposit insurance on the lines of that obtaining in the United States should be introduced in India. This question was considered by the Rural Banking Enquiry Committee which suggested in paragraph 51 of its report that it should be "deferred until the process of consolidation of the banking system as envisaged by the Banking Companies Act has taken place, when conditions will be more propitious for the setting up of a practicable and satisfactory scheme of deposit insurance". A detailed scheme for the establishment of a Deposit Insurance Corporation in India, on the lines of the Federal Deposit Insurance Corporation in the U.S.A., has been prepared by one of the Members of our Committee. The salient features of the scheme are as follows:

. . "(i) The Deposit Insurance Corporation should be started by the Reserve Bank with an initial capital of Rs. 5 crores.

"(ii) The Corporation will insure the deposits of all banks admitted, up to a maximum of Rs. 5,000 for each depositor.

"(iii) Banks admitted to the insurance scheme will have to pay a premium assessed at the rate of 1/16th of 1 percent on their total deposits. The corresponding rate in the United States is 1/12th of 1 percent, subject to refund. When the Corporation works successfully, a part of the premium would be refunded to the banks as in the United States.

"(iv) The annual levy of premium on Indian scheduled banks at the commencement of the scheme based on their deposits at the end of 1952 would work out to about Rs. 40 lakhs, which is only 1.2 percent of their gross earnings during that year.

"(v) The Corporation will have the power to control the rates of interest paid by banks on various classes of deposits.

"The Committee has studied the scheme and feels that it merits further examination by banks. Some of the bankers, who appeared before the Committee, expressed the view that the cost involved is too high which banks can ill afford at the present juncture when their establishment charges as well as the rates of interest they have to pay on deposits are rising. The Committee, however, feels that the scheme has useful potentialities and recommends that it should be adopted if, after detailed examination, there is consensus of opinion amongst banks regarding the desirability of the scheme."

(FROM A CORRESPONDENT)

THE issue of insurance of bank deposits has of late received much attention. Recent discussion endorses the idea underlying insurance of bank deposits and shows agreement that "some way of protecting people of modest means from such losses in future would of course be welcome on general grounds, while it would also serve to increase public confidence in the banking system and thereby encourage an expansion of the bank deposits". Certain complexities, however, are regarded as detracting from the practical usefulness of insurance.

These disabilities may be summarised as below: (i) that the Indian banks are not near enough together in the scale of security to permit of a workable system of deposit insurance; (ii) that a few sound institutions would be bearing most of the cost of a system they do not need; (iii) that depositors will be careless in choice of banks regardless of management and business policies; (iv) that the reputation for security that certain banks have built up over many years by sound methods and scrupulous honesty will be worth nothing to them, for all banks thereafter will have the benefit of security; (v) that the less solid banks naturally offer higher interest rates to attract customers and under equal security bigger banks would have to compete with smaller banks by offering equally high interest rates, leading to a rise in the cost of banking; (vi) the cost of premia would result in an increase in the cost of banking; (vii) that U.S. banks are more evenly matched and no minority banks have to bear a major portion of the cost; (viii) American banking is so very different that it would be unsafe to graft an American feature on to the Indian system. But it is here submitted that these complexities are not such as should discourage introduction of insurance, because many of them are more imaginary than real.

Need for Rationalisation

In dealing with the first one, "that the Indian banks are not near enough together in the scale of security", a scheme of insurance of bank deposits in India can easily and probably will have to follow a policy of insuring all such bank deposits as are represented by sound or realisable assets in each bank. It is possible, of course, that a measure of rationalisation may have to be undertaken in order to enable a large number of existing banks to meet the conditions of eligibility for insurance. Provisions may have to be made for rehabilitation finance in the form of redeemable preferred capital. Recourse may also be necessary to affiliations or mergers. Such rationalisation will ensure speedy correction of existing weaknesses of the banking system without producing adverse repercussions on the sounder banks and without disturbing the economic advancement of the country. Moreover, such rationalisation will, on the one hand, prevent undue loss to depositors and hardship to borrowers arising through dislocation of banking services following closure of less sound banks, and on the other, create conditions under which extensive banking expansion, both through branch and unit banking should be easier and quicker. Benefits of undisturbed and planned expansion will surely accrue mainly to the larger banks. In this connection it may be mentioned that the U.S.A. brought a similar scheme into operation in the midst of a tremendous crisis and even then the successful rationalisation of banks was arranged without serious dislocation.

Coming to the second point, it is the sounder banks which need insurance, because it is really they who have to suffer through no fault of their own on account of the unjustified panic that sets in as a result of the failure of banks. Bank failures invariably have direct repercussions on sound smaller banks to a considerable extent. But the effect of such bank failures and consequent shrinkage in the credit base inflicts suffering, whether long or short in duration, on sound larger banks too. An examination of the loss in deposits of scheduled and non-scheduled banks will show that the larger banks have also lost deposits in the same proportion as smaller banks, and the depositors who have become bank-shy appear to have expressed their preference for the State-owned postal system, which has experienced a substantial and steady rise in deposits during the period 1948-52. Therefore the sound banks will probably regard the cost of the premium payable for such insurance as a contribution to the removal or the strengthening of the units that otherwise may cause panic in future, and also as a durable prophylactic arrangement under the protection of which they can take fuller advantage of their soundness.

As to the third point, that the depositors will be careless in choice of banks, it is submitted that depositors are neither careless nor careful, but remain carefree when things seem normal and get jittery when things become abnormal. Insurance is intended to protect both depositors and banks against the evil effects of this ambivalent disposition. The depositors will be protected in more ways than one. The insuring authority will ensure in its own interest that the banks, irrespective of size, remain in an insurable condition in both the matter of operating costs and choice of assets. The depositors will not lose any part of their money if they pay due attention to the warning that the limitation of the scope of insurance gives. Banks on the other hand will be much more cautious because of the threat of compulsory merger (to avoid incidence of loss of failure on the insurer) which would always be hanging over their heads.

On the fourth point, probably the larger banks would not admit that their main objection to the scheme is that the "junior" banks would be trying to accelerate maturity for themselves by borrowing from the experience of their older colleagues, instead of labouring through years of trial and tribulation as the pioneer banks had to do. But surely the very essence of advancement is to apply improved methods as early and as widely as possible for the benefit of the greatest number. The larger banks must realise that an economy based on the concept of ownership of private property cannot succeed if it has to depend for its continuing success on the monopolistic few; they must appreciate that the defeat of the principal enemy of private ownership can only be assured by the ever-increasing prosperity of larger numbers of units, be they persons, families, firms or companies. It appears that the cry of nationalisation of banks in U.S.A. which was seriously discussed in 1933 during a time of crisis, has been successfully negatived by the insurance of bank deposits, which gave the country a successful private banking system with over 13,439 sound banks. This has been brought about because many citizens of the United States were intimately connected with the large number of banks established all over the country. These banks and citizens conjointly maintain a resistance to the idea of nationalisation of the privately owned banks.

Cost of Insurance

On the question that introduction of an insurance scheme will result in an increase in the cost of banking, it appears that bigger banks did not consider it essential to put up the rate of interest on advances proportionately even when establishment charges went up by 0.84 percent of deposits for the Indian scheduled banks during 1949-52. Even when the bank rate went up by ½ percent the banks did not step up interest charges to borrowers to a corresponding extent. Therefore there should be no apprehension that a load of 0.06 percente of deposits imposed by the scheme of insurance of deposits will lead to any noticeable rise in interest rates for advances, especially when the cost of insurance, unlike other costs, is likely to be productive in its incidence, and to be more than made up by increased income from larger resources.

As to the point that in the U.S.A. the minority banks have not to bear the cost, a study of the deposit structure in the U.S.A. will show that the first 100 banks have deposits aggregating $ 80,274,870,000 as against total deposits of $ 171,357,000,000 with the insured banks, and that therefore 100 larger banks in the U.S.A. pay about 47 percent of the premia while the remaining 13,339 pay only 53 percent. In a democracy the cost of social existence has to be borne by those who are capable of doing so, although those less fortunate also get the benefit of adjusted distribution. The larger banks in America do not appear to grudge the premium load and as a matter of fact they are against withdrawal of the scheme, because of their realisation that a panic-free deposit structure has greatly assisted the steady growth of bank deposits. Larger banks do recognise that the balances of the smaller banks with the larger banks are steadily going up. At present they vary between 15 percent and 20 percent of the total deposits of the larger banks. In India also, if the smaller banks are protected against panic withdrawals and if, as a result of insurance, a number of unit banks can grow all over the country, then the larger banks will be directly benefited by the resources that the smaller banks will bring into the banking system by their efforts. These will be reflected in "junior" banks' balances with larger banks. Smaller banks will succeed in developing bank-mindedness in smaller towns and villages by their energetic efforts to secure deposits from people who hoard for safety. It is obvious that newly mobilised bank deposits which exceed the insurance limit of Rs. 5,000 will flow to the larger banks.

Contrast with American System

In conclusion it has been said that American banking is so very different from that of India that it would be unsafe to graft one American feature on to the Indian system. It is of course true that the banking system in the U.S.A. is in many ways different from that in India. But whether the banking system in India can afford to remain so different from the pattern of banking in the United States, and if so, whether it can survive the demand of bank nationalisation, is a matter of grave doubt. If there are a few good banks left in India and the rest go out of existence or remain in a dormant state, then the trouble created by the closure of a number of banks will be very serious. Nationalisation of banking may then be the demand of the common man without any appreciable dissension. India's economy has to look to the development of the internal economy and purchasing power. India cannot then continue the pattern of banking which was originally determined for it. India will have to reorient its ideas in the light of new conclusion about the banking system, and the earlier the leading bankers will give the lead the better. Inactive banking, in many cases, or absence of banking will lead to the emergence of a large number of State-sponsored organisations in different forms. That will mean that the private banking system will have conceded a further experiment in the nationalisation of deposit banking.

Charges and Costs

As to point five, an examination of the relevant figures shows that the interest paid by the major banks in India on their declining deposits, during the years 1948-52, has been showing a progressive rise which has been proportionately higher for the major banks than for the Indian scheduled banks taken together. The larger banks are actually offering higher rates of interest on savings and call deposits compared with what the smaller banks (which are incapable of doing so due to their weaker profit position) offer. There does not appear to be any reason to expect competition by smaller banks to pay higher rates of interest. On the contrary any scheme of insurance of bank deposits will have to provide for control of interest rates payable on the deposits, on the ground that the credit of all the banks for a deposit of up to Rs. 5,000 is the same, and therefore all banks, small or large, have to conform strictly to the regulation in that regard. Once the rate of interest is fixed for all at the same level, it is the smaller banks which will suffer from the handicap imposed by this regimentation and it is the bigger banks which will, in those circumstances, attract larger deposits at a lower rate of interest if they choose to be active.

It appears that operating costs of Indian banks will suffer an increase of about Rs. 40 lakhs on account of premia for insurance, calculated on the basis of 1952 deposit figures against a gross income for these banks of Rs. 34,38,00,000 during that year. This works out to only 1.2 percent of the total earnings of the Indian scheduled banks. For the Indian scheduled banks taken together this load appears to be remarkably small compared with the gains that seem likely to be realised. If it may be assumed that 50 percent of the gains in deposits of the postal system during the five years ending 31st December, 1952 came from withdrawals from the banking system and if it may further be assumed that the emphasis on "security" given in government advertisements accounts for 25 percent of the rise in postal deposits through release of hoarding, then the insurance of bank deposits would save banking from the encroachment of the latter to the tune of Rs. 14 crores a year on the average, apart from the new money which the banking system might be able to attract by emphasising the "safety" factor. Since it is widely acknowledged that there has been a big shift in income in favour of small depositors, the banking system will have to look to that source and employ weapons similar to those by which they are drawn to the postal system. To be able to do better, the scheduled banks will have to cater for the beneficiaries of the shift in income directly through their own branches, or create conditions under which unit banks capable of catering for them come into existence in large numbers all over the country, either as subsidiaries of the existing established banks or as separate individual units. Naturally this calls for the assurance of safety which the insurance of bank deposits can offer.

TREND AND PROGRESS OF BANKING IN INDIA IN 1953

RESERVE BANK'S ANNUAL REPORT

THE year 1953 marked the return of the banking system to comparatively normal conditions. This is the burden of the Reserve Bank's latest annual report on the trend and progress of banking in India.* The year 1951 saw a high level of banking activity, brought about by the post-Korean boom. The adjustment of the banking system to a new monetary policy introduced in November, 1951, was the prominent feature of the year 1952. Conditions in 1953 were on the whole, quiet for Indian banking and reflected the successful completion of the readjustment of the banking system to the disinflationary monetary policy. The Report adds further that a more normal relationship between the level of economic activity and that of bank credit appeared to have been reached during the year. Despite the higher levels of production and prices, as also of business activity, credit demands during the year were generally restrained and were adequately met by the banking system. This is reflected in a moderate contraction of bank credit amounting to Rs. 10 crores in 1953 as compared with a fall of Rs. 66 crores in 1952 and a rise of Rs. 118 crores in 1951. The expansion of bank credit in the busy season of 1952-53 was smaller at Rs. 86 crores than the expansion in the busy season of 1951-52. The contraction in the slack season of 1953, as in the previous year, was higher than the preceding busy season expansion. The smooth return of funds in the slack season reaffirms the belief expressed in the previous Report that the seasonal rise in advances now seems to be stemming from genuine trade requirements.

In meeting the moderate credit demands, the banks did not experience any strain as they supplemented their own resources by borrowings from the Reserve Bank. In this connection, the Report observes that since the reorientation of the Reserve Bank's open market policy over two years ago, the approach to the Reserve Bank for financial assistance has become a regular feature of banks policies to augment their resources in the busy season. This has led to more frequent controls between the central bank and the banking system and to a better mutual understanding which is welcome in the context of the responsibilities placed on the banking system in the five-year plan.

Deposit Fall Arrested

Total deposits of scheduled banks rose over the year by Rs. 8 crores, being the result of an increase in time deposits of Rs. 12 crores and a fall in demand deposits by Rs. 4 crores. The increase in deposits of banks in 1953 following the slight decline in 1952 seems to indicate that the post-Partition downward movement in deposits has been arrested. The rice in total deposits was made up of an increase of Rs. 17 crores in the deposits with Indian scheduled banks and a fall of Rs. 9 crores in those with exchange banks. It is interesting to observe that while in 1952, exchange banks' time deposits rose by over Rs. 10 crores, the increase in 1953 was no more than Rs. 0.4 crore. On the other hand, Indian scheduled banks increased the time deposits with them at about the same rate as last year, the rise in 1953 amounting to Rs. 12 crores as against Rs. 15 crores in the previous year. In the first four months of the year which witnessed the continuation of the 1952-53 busy season, scheduled bank investments in Government securities declined by Rs. 22 crores, as compared with the decline of Rs. 12 crores in the corresponding period of 1952, the decline being due not so much to the sales of securities in the market as the reduction in the holdings of treasury bills. In the ensuing slack season, scheduled banks increased their gilt-edged portfolios considerably, the increase between May and September amounting to Rs. 33 crores. Over the year as a whole investments in Government securities increased by Rs. 11.5 crores. The maturity pattern of scheduled banks' investments in Government securities showed marked changes; the holdings of medium-dated securities rose by about Rs. 45 crores over the year, while holdings of securities in other maturity groups showed a fall, the largest decline being in long-dated scrip.

The post-war decline in the number of offices of banks continued during 1953 also, the fall being 25. This decline was entirely accounted for by non-scheduled banks, the number of scheduled bank offices remaining unchanged over the year. Gross earnings, as revealed in the profit and loss accounts of 18 larger Indian scheduled banks for 1953, increased by Rs. 0.3 crore to Rs. 28.6 crores because of higher earnings through discounts and interest. The increase was only half the increase in total expenses which went up by Rs. 0.6 crore to Rs. 23.7 crores, mainly as a result of the rise in interest paid on deposits. Consequently, net profits of these banks declined for the second year in succession to Rs. 4.9 crores.

the Reserve Bank for the supervision and control over banks under the Banking Companies Act, 1949, are also briefly reviewed in the Report. The number of banks inspected during the year was 154 bringing the total number of banks inspected since March, 1950 to 514. The first round of inspections of scheduled banks and of practically all the reporting non-scheduled banks has thus been completed.

The role of the banking system in the context of its responsibilities in the five-year plan has to be related, the Report observes in the concluding chapter, not merely to measures designed to increase its resources but to a more effective use of them. While there is reason to believe that the working capital requirements of organised industry are being met in fair measure at present, the problem of providing adequate funds to the private sector, with special regard to the scope of assistance which banks might render, has been engaging the attention of the authorities for some time past and in 1953, the Reserve Bank appointed a committee to go into the question. (The report of the committee has since been released). Also, the development of banking facilities over a wider area is receiving increasing attention. In this connection, the Report invites attention, in an earlier chapter, to a factor limiting the scope of extending banking facilities over a wider area and a wider range of functions—viz., the paucity of adequately trained staff. To overcome this, the bank, with the help of the Indian Banks Association and the Indian Institute of Bankers, proposes to establish shortly a staff training college to impart training to the supervisory staff of banks. In conclusion, as regards the competition for deposits among banks, the Report says that the Reserve Bank has had the situation under observation and it is hoped that leading banks will agree amongst themselves on the question of fixing ceilings on certain types of deposit rates.

TREASURY BILL MATURITIES

THE Shroff Committee has brought up the question of business men being discouraged from ventures in one direction or another by fears of nationalisation, and it has urged the Government to make the necessary disclaimers. That might provide Delhi with a suitable opportunity to say once and for all that it is not going to nationalise the Imperial Bank. Rumours that it would do so, prompted by the report of the Estimates Committee, have been causing some anxiety in Bombay, as our correspondent there reports today. The demand for nationalisation of this premier trading bank is a hardy annual, brought to flower each year with the aid of two quite false beliefs: that it mostly does Government business, and that it is peculiarly susceptible to non-Indian interests. In the first place, the Imperial is far and away mainly a commercial bank. The most important consequence of its nationalisation would not be different management of Government accounts, but the withdrawal of large sums of private money by businesses which would prefer—on what I judge to be a very sound instinct—not to have their affairs managed by a Government bank. That the statement "the Imperial mostly does Government business" should have been written into the Estimates Committee's report only shows that some politicians do not know what it is they want to nationalise. As for the non-Indian interests, we all know that the old Bank of Bengal, one of the three components of the Imperial, was largely owned, back in 1809, by officers of the East India Company, but things have changed a lot since then. My understanding is that the ownership of the Imperial is now almost entirely Indian, many of the shareholders being quite small people whom it would be no advantage to dispossess. The non-Indian interest is certainly well under one-tenth. As for the bank's staff, its progressive and now almost complete Indianisation has often been the subject of mention in Parliament. "Nationalisation" used to be used in the old days for what we now call Indianisation, and in that sense I think it was a very proper demand that the Imperial should be owned and staffed by Indian nationals. Now that it is so, it is idle to continue to press the same old demand—unless the campaigners are quite clear on that fact that what they are asking for is State ownership of the country's biggest trading bank. Nationalisation of banking is not among the present Government's intentions, and there is absolutely no support in the country for it, so it would do no harm for the Government to make plain, as the Shroff Committee has suggested, that it does not propose to take the first step toward it by disturbing the present ownership of the Imperial.

I confess I did not know that the Maharajah of Burdwan was the owner of one of the most famous diamonds of history until "Londoner" of the *Evening Standard* announced that a diamond "nearly twice the weight of the Hope Diamond" is to be offered for sale by auction in London this month on the account of the Maharajah, who is described as "a 49-year-old Indian politician and company director". The jewel is catalogued as the Jehangir Diamond and is said to have belonged to the Burdwan family for many generations. It weighs 83.05 carats as compared with a mere 44 carats for the Hope Diamond. "Londoner" says that according to tradition the Jehangir Diamond was originally suspended from the beak of the peacock in the Moghul Peacock Throne at Delhi. Unlike some of the famous diamonds of history it has never been offered for sale before. Two of the best known diamonds in the world are, of course, in the possession of the British Royal Family. The Koh-i-Noor, originally owned by Nadir Shah and given to Queen Victoria by the East India Company in 1849, is in the British Crown

A DITCHER'S DIARY

Jewels. The Cullinan Diamond, which was found in 1905 at the Premier Mine in the Transvaal, was presented to King Edward VII in 1907.

At the end of a month's play in England Maqsood and Kadar of Pakistan occupy the first and third places in the table of English first-class cricket batting averages with an average of 71.75 runs over 9 innings and 65.50 runs for 8 innings respectively. In between, in second place, comes D. Kenyon of Worcestershire with an average of 69.07 for 14 innings, whilst Alimuddin (average 48.72 runs for 13 innings) is in the 15th place and F. Mahmood (46.52 runs for 5 innings) occupies the 18th place in the table. The 13th place goes to the Indian, Subba Row, (an average of 50 runs an innings over 13 innings) who plays regularly for Surrey. The first England versus Pakistan Test begins in a few days' time, and whilst the Pakistan team seems to have done reasonably well in county fixtures it will be up against opposition of a different quality in the Test games which will occupy much of the remainder of the tour. The Pakistanis seem to be at their best when they play a free and natural game, with their batsmen taking reasonable chances, and least comfortable when constrained to play with their eye on the clock. All reports suggest that their fielding is still a good deal below par, which may well be because they have not yet acclimatised themselves to the subdued English light, and heavy (sometimes rain-soaked) English pitches. But in a long five day match bad fielding can easily concede eighty or ninety precious runs. Kadar, their captain, is from the point of view of English cricket the most experienced player on the Pakistan side. He got a Blue at Oxford and played for three seasons for Warwickshire who, for the moment, are at the top of the English county championship table with six wins out of eight matches. So far, F. Mahmood heads the Pakistan bowling with 29 wickets for an average of 16.72 runs apiece. He is in fact the only Pakistani bowler who has won a place in the bowling averages table, and the team relies heavily on this apparently tireless medium paced trundler. If anything went wrong with him the side might well be in serious difficulties.

India has been fortunate in her American Ambassadors. Mr. Loy Henderson, Mr. Chester Bowles and now Mr. George Allen have all been men who, starting out with no special knowledge of India, have been very successful in interpreting Indian views and presenting Indian needs to Congressional and public opinion in the United States. It is often said that Indians and Americans have much in common, and I daresay there might be something in it, though this is the sort of statement that is made about any two countries on diplomatic occasions. More frequently one gets the impression that Indian and American politicians are talking different languages, and it must require agile liaison to make it clear in Delhi and Washington that apparent disagreements are not always sharp or even important. Nevertheless, some residuum of disagreement remains after the most skilful interpretations have been offered, some indissoluble core of opposition that cannot be explained away. And it is the fact that despite this basic disagreement American aid continues to flow and India retains her individual stand, that does both countries great credit. As Ambassador Allen pointed out in Calcutta the other day, America has not wasted her money in India, even on the most selfish calculation; while Mr. Nehru would be entitled to point out that India has not abated her neutrality one jot. The continuance of this partnership in diversity should not, I suppose, surprise us, for free nations are constitutionally suited to it but the threats to peace and freedom have been so constant in recent years that many good democrats are in no mood for diversity.

The news that the demand for geiger counters in Japan is going up by leaps and bounds reveals yet another field of consumer demand for the enterprising manufacturer. The geiger counter promises to become yet another sinister accoutrement of modern living, in the way the gas-mask was in Britain during the early years of the war. I have only a vague idea of what a geiger counter looks like, or what shapes and sizes it generally comes in. This is distressing, for if in the next few years we are to be showered with radio-active rain and served up with radio-active fish, there seems every likelihood that it will become as familiar an article of personal equipment or domestic utility as an umbrella or the kitchen clock. For anyone who has seen the jungle growth of television H-ariels in London or New York it will come as no surprise if within a few years geiger counters, perhaps shaped as door-knockers or disguised as window boxes. (I said I had no idea of their size) are an absolute must for any house wishing to be considered up-to-date. I have always thought that the habit of wearing watches on the left wrist constituted a challenge to the enterprising gadget maker to devise something for the right one. How much longer will we be spared the advertisement for gorgeous geigers "in a variety of handy sizes and a host of attractive colours"?

* * * *

The first of the three volumes of the British official history of the war at sea, which has been written by Captain Roskill R.N., has for the first time brought to public notice a *cause célèbre* of the early days of the conflict, though the facts were apparently well known to many senior officers of the Royal Navy. Admiral Sir Dudley North, Flag Officer Commanding North Atlantic, was relieved of his command after three French cruisers and three destroyers from the Vichy controlled port of Toulouse passed through the Straits of Gibraltar on 11th September 1940 on their way to Dakar, where they anticipated the abortive joint British and Free French expedition to establish de Gaulle's forces on the African coast. Sir Dudley North's case is that the official Admiralty policy was not to interfere with the movements of French warships, so long as they were not destined for any port under German command (he actually signalled the French squadron wishing them *bon voyage*); that the Admiralty were aware of the sailing of the French ships some hours before he or his colleague, Sir James Somerville, and could have given orders for their interception but did not; that his decision not to attack the Vichy ships carried the complete agreement of Admiral Somerville and the then Governor of Gibraltar, both of whom assumed that the general instruction in regard to the Vichy fleet held good. Sir Dudley has several times asked for a court-martial or court of inquiry, which have always been refused despite the fact that his request was on one occasion supported by six admirals of the fleet. The Admiralty have again declined to reopen the matter, which has recently been ventilated in the British Parliament. Captain Roskill's book seems to substantiate Sir Dudley North's claim to have the affair investigated, but not the latter's contention that he has been victimised because of his outspoken criticism of the earlier sinking of the French naval forces at Oran. He is not the first high ranking officer to feel he has been made a scapegoat. Naval and military history is strewn with examples of unfortunate misunderstandings, ambiguous signals and reinforcements that arrived too late or not at all.

THE ORIGINS OF DOCKYARD LABOUR UNREST

CONCILIATION TALKS IN BOMBAY DISPUTE ADJOURNED

(FROM OUR NEW DELHI CORRESPONDENT.)

THE conciliation talks in the Bombay dockyard labour dispute have been adjourned till 18th June. Meanwhile the points at issue are expected to be examined by the Ministries of Transport and Labour, it is learned. The trouble is said to have arisen from the recent wage increase given to stevedore labour engaged on a monthly basis. Before 1948, stevedore labour was engaged on a casual basis. Workers collected daily at the port and were engaged by sirdars in accordance with the demand, which fluctuated from day to day or from season to season according to the availability of cargo. In 1948, the Dock Workers Regulation of Employment Act was passed and the S. C. Joshi Committee was appointed to work out a decasualisation scheme. This scheme was enforced in Bombay in 1951 and in Calcutta and Madras in 1952. It is applicable only to stevedore labour which is employed in loading and unloading cargo on board the ship. The cargo on the shore is handled by Port Trust labour.

Under the scheme all employers and workers are registered and only registered workers are eligible for work. The workers are divided into monthly gangs and daily gangs, the latter forming a pool. The pooled workers are given a minimum guarantee of 12 days' wages in a month, irrespective of the work offered to them. For the remaining 18 days, the pooled workers receive an attendance allowance of Re. 1 a day. The workers are the employees of the Dock Labour Board, to which the employers have to pay the wages of workers plus 50 percent of the wages so paid to defray the cost of administration of the Board and of welfare schemes of the workers. In Calcutta, the levy is 80 percent of the wage bill.

More Scope for Pooled Workers

The scheme was so worked in Bombay as to provide the largest scope for pooled workers. About 60 gangs were engaged on a monthly basis as against 300 gangs in Calcutta. One result was that in Bombay pooled labour was able to get work for 60 shifts a month, while in Calcutta there was great deal of unemployment amongst pooled workers, who, however, were able to claim the 12 days' minimum guaranteed wages and 18 days attendance allowance, often without doing a stroke of work. It is estimated that the number of pooled workers in Calcutta is 10,000 as against the 4,000 normally in demand. A rough estimate of the cost of extra labour paid for idleness in Calcutta is placed at Rs. 12 lakhs a year. In Bombay, on the other hand, the pooled workers number about 4,500. As monthly gangs are not permited to be employed for extra shifts or on sundays, the pooled labour which has been inadequate in Bombay was given employment for 120 hours a week—a socially unwarranted practice.

A couple of months ago, Bombay employers of stevedore labour enhanced wages of their monthly workers by 33 percent. This created dissatisfaction amongst pooled labour, which was doing identical work and demanded a similar increase in its wages. The employers refused and the workers replied by adopting "go slow" tactics. The Chief Labour Commissioner, Mr. S. C. Joshi, hurried off to the scene, re-constituted the Central Dock Labour Board and held meetings to discuss the dispute. As a condition precedent, he was able to persuade pooled workers to abandon their "go slow" movement. The Board restricted the working of pooled labour to eight hours a day and six days a week. Overtime was also restricted. It was agreed that 600 workers would be added to the pool and the question of further additions considered.

As for the increase in wages, the employers demanded the introduction of a piece-rate system, which was resisted by the workers. In the alternative, the employers wanted to link the increase in wages to a minimum output. It was suggested that in case wages were increased the workers would give a guarantee for good work for three months after which, in the event of their work not being satisfactory, the issue were to be referred to a tribunal, which, would arbitrate on whether the system of piece-rates could be introduced. This scheme was found unacceptable by the Port Trust authorities, who claimed that any rise in the wages of pooled labour would have repercussions in that its own labour force would demand a similar rise in wages. This aspect of the problem is now being examined by the Ministries of Transport and Labour.

As far as Calcutta Port is concerned, the number of registered workers will have to be reduced to the normal demand of 4,000. It is learned that about 1,500 registrations are bogus. In any case, the retrenched workers will have to be compensated at a cost of several lakhs of rupees.

Stocks and Shares

SCATTERED GAINS IN STOCK MARKET

TEA AND JUTE SHARES FEATURE IN INCREASED ACTIVITY

Wednesday Evening.

THERE has been more activity in the share market, and most sections are very firm. Tea shares have been very active though with some signs of profit-taking. There has been more interest in jutes, although so far it has been selective rather than general. The undertone of the market is firm and there have been scattered rises over a wide front.

The speculative interest that has been taken in jute shares has helped prices. Howrahs showed a small improvement from Rs. 24-6 to Rs. 24-13, but Nuddea gained Rs. 6 and Anglo India Rs. 11 : India, Delta and Budge-Budge also recorded rises. It is too early yet to say whether these improvements in jute share prices will set a general revival in train.

Interest in coals has concentrated on Central India, which closed at Rs. 6-15, and Burrakur which were quoted at Rs. 10-7, x.d. Engineering shares have been generally steady and interest has been shown in Jessops, Braithwaites and Indian Standard Wagons. In oil shares Indo-Burma Petroleum and British Burmah Petroleum were actively dealt in. Paper shares are steady, though there has been less interest in this section, and prices show little change. There has been no feature in the miscellaneous group.

In minings, Indian Coppers have moved up smartly to Rs 3-5 on Bombay buying.

Gilt-edged are very steady, though Paper is a shade easier today. Details of the week's trading follow.

* * * *

The improvement reported in the gilt-edged section last week gained further momentum and at the close of business today the market was fully steady. Scrip, however, has been in very short supply, except in the case of long-dated issues. Prices have shown an all-round improvement and gains ranging from 2 annas to 4 annas have been recorded. Against the general trend, 3% 1946-86 met with some selling pressure and reacted from Rs. 82-3 to Rs. 82 : 3% Non-terminable Paper, however, was taken higher at Rs. 81-4 without attracting sellers. In short-dated, 2½% 1954 was wanted at the higher rate of Rs. 99-9-6, 2½% 1955 was steady at Rs. 98-10 with no declared sellers, 3% 1957 spurted to Rs. 98-6 while 3% 1958 was 2 annas better at Rs. 98-3. Amongst medium-dated loans 3½% National Plan Bonds were higher at Rs. 98-12, and 3% 1959-61 met with steady enquiry to improve to Rs. 96-3 ; 3% 1963-65 was taken higher to Rs. 92-14 ex-voucher, and 3% 1964 was also better at Rs. 92-15, while 2½% 1961 advanced to Rs. 91-3 as did 2¾% 1960 to Rs. 94-4. Two and three-quarter percent 1962 was steady at Rs. 92-2 and 4% 1960-70 improved a further 2 annas to Rs. 101-13. Long-dated loans also shared in the general improvement although there were more sellers in evidence ; 3% 1966-68 was taken higher to Rs. 90-5 and 3% 1970-75 was better at Rs. 86-6.

Following the general improvement in Central loans, more interest was shown in provincial issues and prices hardened during the week. Four percents Madras 1963 and 1964 were enquired for at Rs. 99-13 and Rs. 99-12, without attracting sellers, while 4% U.P. 1964 was taken higher to Rs. 99-11-6. Four percent U.P. 1963 had buyers up to Rs. 99-12 with few declared sellers, while 4% West Bengal 1963 was wanted at Rs. 100-3, with sellers asking one anna more. Four percent Bombay provincials were in demand at around Rs. 100-14.

Selected preference shares were in good demand but in the absence of sellers business completed was on a restricted scale. There was a slight revival of interest for jute preference shares, and some small business was written. Amongst jute, Clive 6% changed hands at Rs. 83 and Fort Gloster 2nd also at Rs. 83. Howrah 'A' were crossed at Rs. 111-8. There was a good demand for Bharat Collieries at Rs. 54, Birds Investments at Rs. 77 and Calcutta Electric were dealt in at Rs. 12-6. Chrestien Mica Industries were placed at Rs. 63, F. and C. Osler were reported at Rs. 62 and Indian Aluminium at Rs. 69-4. Several deals were recorded in Indian Iron and Steel at Rs. 108-8. Indo-Burma Petroleum were scarce at Rs. 100 as were Martin Burn at Rs. 104. New Victoria Cotton rose from Rs. 3-8 to Rs. 4-4 on interested buying, and Orient Paper 1st and 2nd changed hands at Rs. 102 and Rs. 76-8. Rohtas 'B' were recorded at Rs. 58.

* * * *

In the banking section, Imperial Fully-Paid and Contributory were quoted at Rs. 1,770 and Rs. 432. Punjab National were marked at Rs. 24-8 and United Bank of India 'D' Class shares at Rs. 3-15.

A solitary transaction was reported in the railway section, namely in Dehri Rohtas at Rs. 8-8.

Generally speaking, cotton shares were a dull market. Cawnpore Textiles were quoted at Rs. 8-4 and Kesoram at Rs. 23-14. New Victoria were active and improved from Re. 1-12 to Rs. 2, while Elgins were better at Rs. 15-12.

Enquiry was noted for a few selected coal shares. Burrakur improved to Rs. 10 and Central India to Rs. 6-11. Bengal were better at Rs. 485, while Bharat and Bokaro and Ramgur were both steady at Rs. 7-12 and Rs. 11. Equitable were marked at Rs. 34 and New Beerbhoom at Rs. 17-14.

Several transactions were reported in Talcher at Rs. 3-8 and Western Bengal at Rs. 6. Raneegunge were steady at Rs. 13-14.

After a dull opening, there was a revival of interest in jute shares following the firmness of the finished goods market, and in the past 48 hours a number of price gains were recorded. Howrah improved from Rs. 24-6 to close at Rs. 24-13. Here is a chart showing the price movements of a representative list of shares :—

Names	Opening 4-6-54	Closing 9-6-54
	Rs.	Rs.
Agarpara	14-10	16
Alliance	164	178
Anglo India	192	203
Belvedere	198	210
Birla	15-8c.d.	15-9
Champdany	150	157
Chitavalsah	11-8	12-3
Dalhousie	128	132
Gourepore	280	305
Kelvin	250	267
Nuddea	44	50
National	26-4	27

Electric supply shares were a restricted market and a handful of transactions took place. Agra were done at Rs. 147, and Calcutta Electric at Rs. 14.

Business in sugar shares was of a retail nature. Balrampur were done at Rs. 7-2, Belsund were quoted at Rs. 8-14 and Carew changed hands at Rs. 8. Ramnugger Cane were marked at Rs. 24-9 and Samastipur at Rs. 14.

* * * *

Engineering shares were once again an active market and prices were steady. Indian Irons fluctuated between Rs. 30-7 and Rs. 31-1, to close at the latter rate. Braithwaite were firm at Rs. 17-2 and Britannia Engineering on keen investment support spurted from Rs. 28-12 to Rs. 30-2. Burn & Company were steady at Rs. 194 as were Indian Galvanizing at Rs. 19, and Indian Steel & Wire Products at Rs. 49. Jessops were better at Rs. 29-2 as were Kumardhubi Engineering at Rs. 10-4, and Marshalls at Rs. 7-6. Saran changed hands at Rs. 10-12.

Good business was completed in the miscellaneous section the features being Orient Paper, Bengal Paper, Titaghur Paper, Metal Box, Angelo Brothers, Alkali & Chemical, Indo-Burma Petroleum, Martin Burn, National Tobacco, British Burmah Petroleum and India General Navigation. Bengal Paper improved one rupee to Rs. 60, India Paper Pulp were better at Rs. 213 as were Orient Paper at Rs. 20-4. Shree Gopal Paper were taken at Rs. 23-12. Titaghur Paper, after being done up to Rs. 42 turned sellers at the close at Rs. 41-14. Assam Bengal Cement were quoted at Rs. 4-6 and Sone Valley were dealt in freely at around Rs. 7. Business was reported in New Asiatic at Rs. 4-10 and Ruby General at Rs. 5-10. India General Navigation improved from Rs. 81 to Rs. 86. India Steamship were quoted at Rs. 8-9 and Port Shipping at Rs. 12-8. There was a good enquiry for Alkali & Chemical with the price improving from Rs. 16-12 to Rs. 17-8. Angelo Brothers on reports of more profitable working improved from Rs. 20-8 to Rs. 22. Large quantities of British Burma Petroleum changed hands between Rs. 4-2 and Rs. 4-5. British India Corporation were a shade better at Rs. 8-4 while Dunlop Rubber were steady at Rs. 33-14. Indian Aluminium were scarce at Rs. 132 but Indian Cables were easier at Rs. 19-8. Indian Wood Products changed hands at Rs. 33-8 ex-dividend and Jardine Henderson at Rs. 110-8. There was a steady enquiry for Indo-Burma Petroleum shares with the price improving further from Rs. 132 to Rs. 136. Martin Burn met with strong enquiry and rose from Rs. 22-3 to Rs. 23-4. Metal Box were higher at Rs. 18-8 while National Insulated Cables found sellers at Rs. 19-8. National Tobacco met with some enquiry and improved from Rs. 10-12 to Rs. 11-5. Other transactions included Rohtas Industries at Rs. 16, Rallis at Rs. 55-8 and Textile Machinery at Rs. 11-6.

In the Mining section there were sellers of Orissa Minerals at Rs. 41-2, while Karanpura Development improved from Rs. 15-4 to Rs. 16-4 and Indian Copper on rumours that the shilling shares might be converted into rupee shares rose from Rs. 3 to Rs. 3-5.

* * * *

Buoyant conditions have continued to prevail in the tea section and a large volume of business was put through. During the past 48 hours, however, some profit-taking has been noticeable at the higher levels though prices have been fairly well maintained. Here is a table showing the week's representative price movements :—

	Opening 4-6-54	Closing 9-6-54
ASSAM GARDENS	Rs.	Rs.
Baghmari	15	16
Bateli	26-8	28-4
Gohpur	40	41-8
Sapoi	18	17-8

Amongst Terai gardens, Hansqua were taken up to Rs. 23-12 and Jay Shree to Rs. 11-8. New Terai, however, had sellers at Rs. 17-12.

* * * *

The KATRAS JHERRIAH COAL COMPANY made a profit of Rs. 3.67 lakhs for the half-year ended January, 1954, compared with Rs. 1.54 lakhs in the previous half-year because of higher sales and lower manufacturing expenses. Depreciation is also Rs. 6,000 higher at Rs. 81,000. Taxation absorbs Rs. 1.57 lakhs (Rs. 76,000) and reserve fund is allocated Rs. 60,000. The dividend is the same at Rs. 2 per share, leaving a carry-forward of Rs. 91,079 (Rs. 77,361) Raisings were 1,22,229 tons (1,15,663 tons) and despatches 1,77,584 tons (1,39,961 tons).

* * * *

The BURRAKUR COAL COMPANY made a profit of Rs. 4.40 lakhs for the half-year ended December, 1953, compared with Rs. 7.49 lakhs in the previous half-year and this decline in profit was chiefly due to lower sales at Rs. 91.39 lakhs (Rs. 1.46 crores). Providing Rs. 3,92 lakhs (Rs. 3,73 lakhs) for depreciation, Rs. 3.77 lakhs (Rs. 2.35 lakhs) for taxation, transferring Rs. 55,000 (Rs. 98,000) to tax contingency reserve, Rs. 50,000 (same) to debenture redemption reserve, Rs. 50,000 (same) to rope reserve and bringing in Rs. 83 552, there is Rs. 4,28,860. The ordinary dividend has been doubled to 2½ percent, leaving a carry-forward of Rs. 1,71,099. Raisings were 4,71,163 tons (5,09,461 tons) and despatches 4,99,753 tons (4,83,282 tons).

New Delhi

PROSPECTS FOR THE SYNTHETIC OIL PROJECT

THE MERITS OF VARIOUS SITES

(FROM OUR NEW DELHI CORRESPONDENT.)

THE Synthetic Oil Committee which is meeting in Srinagar this week is to consider the project reports submitted to the Government of India some three years ago by the Koppers Corporation of the U.S.A., Ruhr-Chemie-Lurgi of Germany and the J. W. Kellogg Company of the U.S.A. The Koppers Corporation Inc., Pittsburgh, U.S.A., recommended a Rs. 31.6-crore synthetic petrol plant consisting of (a) a low temperature coal carbonisation unit, and (b) a tar hydrogenation unit for the manufacture of aviation petrol, motor petrol, and domestic coke. Ruhr-Chemie-Lurgi, Germany, suggested a synthetic petrol plant based on the Fischer-Tropsch synthesis for the manufacture of aviation gasoline, motor gasoline and diesel oil; it could be built with a capital investment of $58 million. The J. W. Kellogg Company, U.S.A. recommended the setting up of a $2.8 million refinery of one million tons capacity to produce aviation gasoline, motor gasoline and other petroleum products (kerosene, diesel oil, furnace oil, etc.) from imported crude petroleum. The Committee will also consider the offers of various foreign companies, particularly one from a company which has recently set up a synthetic oil plant in South Africa. It will discuss a note recently prepared by the Director of the Fuel Research Institute. The Committee's first task will be to determine whether a synthetic oil industry should be established in India. If it decides that there should be such an industry, it will select a scheme for the Government to consider.

The Director of the Fuel Research Institute summarising the position says in a note, that synthetic oil can be manufactured from coal by the following methods, either individually or in combination:

Hydrogenation of coal, for which the coal should have less than 5 percent ash, should be highly volatile, but at the same time should contain low oxygen. The only coal of this specification is found in Margharita and other Assam coalfields. Normally conversion from coal to oil by direct hydrogenation is of the order of 25 to 40 percent, depending on the type of coal.

Hydrogenation of tar—by medium or high pressure hydrogenation of coal tar either from high temperature or low temperature carbonisation of coals. The low temperature tars are particularly suitable for hydrogenation. The present production of high temperature tar is insufficient for any such scheme, so a low temperature carbonisation plant will have to be installed to produce tar for hydrogenation. The main products in the L.T.C. plant will be domestic coke and tar. Normally the conversion of tar to synthetic oil by hydrogenation is of the order of 80 percent by weight and about 100 percent by volume.

Fischer-Tropsch Synthesis

Coal coke or semi-coke can be gasified completely with steam and oxygen to produce carbon monoxide and hydrogen in the required proportions. The mixture of carbon monoxide and hydrogen is then passed over catalysts (such as the synthetic ammonia catalyst) either under atmospheric or under medium pressure when hydrocarbons similar to motor fuel waves, alcohols, etc. are synthesised. The reaction mechanism can be controlled so as to yield a major part of the product as motor fucl of approximately 70-80 octane grade (which can then be re-formed for the production of aviation oil). This method is known as the Fischer-Tropsch synthesis. In this process for manufacturing synthetic petroleum, 70 percent of the costs are incurred in preparing and purifying the synthesis gas and therefore the method of gasification is important. Apart from the types of coal specified above, low temperature char or coke are also suitable for complete gasification. By the Fischer-Tropsch process about five to seven tons of coal (depending on the rank and grade) can be converted into one ton of synthetic oil products.

The ultimate costs of manufacture by each of the processes are at present comparable. The hydrogenation process (both of coal and tar) directly yields aviation fuel of high quality, a diesel fuel of intermediate quality and fuel oil of the required specification. The Fischer-Tropsch method, on the other hand, yields a primary product consisting of petrol of motor fuel quality, high-class diesel oil and paraffin, which can be polymerised for the production of synthetic lubricants. This last point is important from the point of view of self-sufficiency in petroleum products. Without lubricants no internal combustion engine or even ordiary machine can function. The Fischer-Tropsch products also yield a certain quantity of alcohols, fatty acids, etc., which are sources of further chemical synthesis, but if the entire production of synthetic oil was based on he Fischer-Tropsch synthesis alone then large quantities of such by-products will be formed and it will be difficult to dispose of these products in such large quantities under the present conditions in this country. This is the reason why a combination of hydrogenation and the Fischer-Tropsch synthesis is recommended for Indian conditions. Also, the two processes are complementary.

Water Requirements

In the production of synthetic oil large quantities of steam, cooling water and hydrogen are required apart from coal and tar. The hydrogen can be manufactured by re-forming the synthesis gas itself or by the catalytic re-forming of water gas made in conventional generators. In all cases the requirements of water are extremely high. For each ton of synthetic oil produced, 50 to 100 tons of make-up water is required, either depending on the process adopted. The reliability and sufficiency of water supply is therefore a major factor in the siting of the synthetic oil plant. The choice of a suitable site therefore depends upon the supply of large quantities of coal and water at the same place, and also of course on market considerations.

For India the best policy on the development of a synthetic oil industry would be a combination of hydrogenation of tar for aviation fuel and gasification of coal and semi-coke and production of motor fuel and lubricants from the synthesis gas thus produced. Only in the case of Assam is a direct coal hydrogenation plant feasible and even desirable. Coals from Assam have proved most amenable to the hydrogenation technique. These considerations, along with these relating to raw material sources and the market for petroleum products, show that the following are possible sites for the location of the synthetic oil industry.

The Margherita coalfield has a production of over 300,000 tons per annum and the coals are very suitable for direct hydrogenation. The requirements of water can be met from the perennial river flowing alongside. The proximity of the existing oilfield is another advantage as the crude oil can be piped to the refineries or processed separately and blended with the natural petroleum products. The high proportion of sulphur in the coal can be recovered completely. The distance of the Margherita coalfields from Digboi is only about 12 miles Strategic reasons as well as the cost of transporting aviation and motor spiritt ot the Assam region will justify the establishment of at least one coal hydrogenation plant of a minimum capacity of 100,000 tons of oil per annum. Pipelines connecting the major airfields in North Assam could also be considered for the supply of aviation fuel to civil and military aircraft stationed in the region. This was done during the war.

Damodar Valley Region

In the Damodar Valley region, that is between Karanpura and Ondal, the Koppers Corporation has suggested the Durgapur area as the most suitable site for the first synthetic oil plant in India. The reasons are: the availability of suitable coals in the area for low temperature carbonisation for the production of tar and semi-coke; an abundant supply of water; a large market for petroleum products in the West Bengal area, particularly Calcutta (it is calculated that 40 percent of India's demand for petroleum products is located in this area) and the possibility of integrating the scheme with power generation, gas distribution, etc. The Durgapur site becomes even more attractive in view of the West Bengal Government's plan to set up a high temperature carbonisation plant with a capacity of 100 tons of tar distillation per day and its scheme for gas distribution between Chittaranjan and Calcutta. If a synthetic oil plant is located alongside this plant, a large portion of the tar from the West Bengal Government plant (which may normally be sold as fuel oil or for blending with pitch for road tar) can be supplied to the synthetic oil plant for hydrogenation, thus producing better quality fuel. The tail gases from the synthetic oil refinery are of high calorific value and can be blended with coke-oven gas to increase the clarofic value of the gas for distribution. This will add considerably to the economy of both plants. As the West Bengal plant will be the nucleus of a chemical industry, there are possibilities for the further integration of the two projects, but these are not discussed in the present note.

The best scheme for synthetic oil manufacture in this area would be to carbonise the semi-caking coals of high tar yield such as those from Dishergarh, Poniati, Hatnal, Sanctoria, etc. in externally heated vertical retorts for the production of domestic coke and low temperature tar. The large coke can be sold as domestic fuel, but the smaller size coke with non-caking slack coal can be gasified to produce synthesis gas for the Fischer-Tropsch synthesis. For carbonisation, the large-sized coals, namely 1" to 3", would be used. The slack below 1" would also be gasified in the Fischer-Tropsch synthesis plant along with low temperature coke breeze. Part of the slack coal can also be consumed in the 60,000 k.w. power station which is being planned at Durgapur by the West Bengal Government and in the power plant for the synthetic oil plant. The low temperature coke of high quality can then be despatched to the areas south and north of Durgapur and the major quantity of petroleum products will also be consumed within a 150-mile radius of that town.

The Korba Coalfield

The third suitable site for installation of a synthetic oil plant is the Korba coalfield. In the whole of the Madhya Pradesh and Orissa coalfield area, only the Korba coalfield possesses a site where the necessary qualities of coal and abundant supply of water can be found together. The plant in the Korba coalfield will also follow the same pattern as at Durgapur, namely a combination of low temperature carbonisation of coal, hydrogenation of tar, gasification of coke and slack coal and synthesis by the Fischer-Tropsch method. In view of the fact that the tail gas will not have any market in the area, the hydrogen required for the hydrogenation plant in this area should be prepared by re-forming the tail gas mixed with the synthesis gas. The low temperature coke produced in the Korba area can be supplied up to Nagpur in the west, up to Visakhapatnam in the south, and up to Katni, Allahabad and Jhansi in the north. At present all these areas are very short of domestic fuel and large quantities of forests are being destroyed to supply fuel wood to the population.

Another low temperature carbonisation plant could be located in the Pench Valley or rather in the Kanhan Valley area. The domestic coke produced in the Kanhan Valley area can be supplied to the Bombay market. The low temperature tar can be distilled locally, and will also produce products similar to petroleum products even without hydrogenation. The products obtained from distillation of low temperature tar are motor fuel, medium quality diesel oil, fuel oil, tar acids and pitch. All these will have a ready market in the Bombay area. Part of the distilled tar can also be brought to the hydrogenation plant at Korba for conversion into aviation fuel.

Other Possible Sites

The fourth possible site for the establishment of a synthetic oil plant is near the border of Rewa, Vindhya Pradesh, that is near the Rihan Dam. It is reported that large coal deposits occur in the area, but no information is available regarding quality and reserves. There is at present no mining activity there. Although this may be considered later, it can be ruled out for immediate purposes.

The fifth site for a synthetic oil plant may be in the Singareni coalfields. Here the coal can be gasified and directly converted into motor fuel and other products by the Fischer-Tropsch synthesis method. An abundant water supply is available in the Godavari river, which is not far from the coalfields. However, production from this field is at present insufficient to meet the normal demand for coal in the south and the cost of raising coal is high. Although the site should be kept in mind for future development, it will not be the most economic at present.

The sixth site for development of a synthetic oil industry will be the South Arcot lignite field.

Abundant quantities of lignite and water are available side by side, and the market is also favourable. The problem here is to produce the lignite cheaply on a very large scale. The method for synthetic oil production from lignite will follow the same course as at Durgapur—low temperature carbonisation of lignite, hydrogenation of the low temperature tar, and gasification of lignite char for the production of synthesis gas for the Fischer-Tropsch synthesis.

From the above discussion, it will be clear that priority should be given to the development of a synthetic oil industry in the following three areas for the present: (1) Durgapur in West Bengal; (2) Korba coalfield in Madhya Pradesh; (3) Margherita in Assam. In Korba and Durgapur, the process should be based on low temperature carbonisation of coal, hydrogenation of tar and Fischer-Tropsch snythesis from synthesis gas produced from coke breeze and slack coal. In Assam the plant should be based on direct hydrogenation of coal with sulphur recovery. The Assam coals are suitable for many other chemical purposes. Based on the hydrogenation plant, other chemical industries can be developed. The Fuel Research Institute has carried out much work on this coal, including hydrogenation. For example, the best forms of active carbon, ion exchange materials as well as ash-less carbon can be prepared from this coal.

The plant at Durgapur and Korba should each be on the basis of 250,000 tons of combined petroleum products per annum. The products will be domestic coke, aviation fuel, motor fuel, diesel oil fuel oil, lubricants and other chemicals. The Assam plant can be considered on the basis of 100,000 tons of petroleum products per annum. This is the smallest unit now being operated, as by Imperial Chemical Industries Limited at Billingham, U.K.

Capital Costs

The capital costs will be roughly of the order of Rs. 1,500 to Rs. 2,000 per ton of oil products per year. Thus the Korba and Durgapur plants will each cost approximately Rs. 40 to Rs. 45 crores. Capital costs in these areas will be higher because the low temperature carbonisation plant will also have to be installed, but they will be more than justified by the sale value of domestic coke, which will be an additional product, and will be particularly profitable if reasonable prices, such as those being allowed to the coke produced by the Oriental Gas Company, are given. The capital cost of the Assam plant will be of the order of Rs. 20 crores.

Thus for an investment of approximately Rs. 100 crores, India will be able to produce 600,000 tons of petroleum products against a total demand of 2½ million tons. In times of emergency, this production will be a major strategic factor in maintaining the armed forces in the field. All the plants should be so designed that in the next phase of expansion they can be doubled, so that it will be possible to produce nearly 1.2 million tons of petroleum products from coal.

Later it may be possible to manufacture synthetic oil by the Fischer-Tropsch method alone without producing any of the unwanted by-products. Research is being done to find out how the Fischer-Tropsch synthesis can be modified to produce only synthetic fuel and lubricants, avoiding the formation of by-products such as fats, waxes and alcohol. However, at present the combination plant suggested is most suitable.

The gasification processes used in these cases for production of synthesis gas and hydrogen may be based on the Lurgi pressure gasification system and Rectisol gas purification method. The same method is being used in South Africa for the production of 250,000 tons of synthetic oil per annum. Other processes for gasification, such as the gasification of powdered coal and high ash coals, should be investigated at the Fuel Research Institute for future developments.

Costs of Production

The costs of production of synthetic oil will depend on several factors. The first is the size of the plant (the bigger the plant the cheaper the product). Secondly, there is the cost of coal; the cost of mining should be about Rs. 7 to Rs. 8 per ton and this indicates that open-cast mechanised methods of mining will have to be adopted and mines hould be owned by the synthetic oil plant so that the coal can be delivered at the cost of mining and not at the market rate. Thirdly, it will depend on the prices for domestic coke and sale value, if any, of gas.

After a detailed examination for a plant at Durgapur area, the Koppers Corporation arrived at the following figures for the cost of production of synthetic oil in India (1948):

Aviation Petrol	10 As. to 13 As. per Imp. gallon.
Motor Petrol	14 As. to 15 As. per Imp. gallon.
Fuel Oil	Rs. 141.4 per ton.
Diesel Oil	Rs. 82.5 per ton.

Taxes, overheads and sales costs are not included in the above estimates. The above prices are based on market prices of motor petrol, diesel oil and fuel oil and the cost of aviation oil is arrived at after the credits for these have been adjusted against the total expenses.

Manufacture of Motor Trucks

The first Indo-British venture for the manufacture of heavy passenger and goods trucks in this country is progressing. An agreement was recently signed between Leylands of Great Britain and Asoka Motors Ltd. of Madras under which the new combine will undertake a phased five-year programme for the manufacture of 20,000-24,000 lbs. 'Leyland "Comet", and at a later stage Leyland 'Tiger Club", trucks in India. It has been agreed that Leylands should suggest who should be the first managing Director of the combine, and they have accordingly recommended Mr. A. Collins, at present the representative of the Society of Motor Manufacturers and Traders of the U.K. In addition Leylands are sending out to India seven of their top-ranking technicians to undertake the installation of plant and equipment the manufacture of trucks and to train Indian personnel to succeed them in due course. It is expected that by the end of the fifth year the new combine will be able to manufacture 53 percent of the truck components in India including its engine. The phased programme is as follows:

First year: Frame—all cross members, except front members, rivets, bolts, nuts, washers, rubber buffers.

Engine—Important components like inlet and exhaust valves, tappets, piston assembly, sump and other hardware items.

Transmission—gearbox and clutch assembly, front and rear axle, a number of hardware atems, chassis frames front and rear springs complete radiator and radiator pipe, complete fuel tank except support brackets.

Second year: 31 percent of c.i.f. prices.

Third year: 39 percent of c.i.f. prices.

Fourth year: 46 percent of c.i.f. prices

Fifth year: 53 percent of c.i.f. prices.

The firm will manufacture 100 percent of the radiator, silencer and exhaust assembly, propeller shaft and some of the other minor components during the phased period.

Trucks will also be manufactured in accordance with a phased programme by three other units. Hindustan Motors Ltd. will manufacture Studebaker trucks; Premier Automobiles Ltd. will make Dodge, De Soto and Fargo trucks; and Tatas in collaboration with Daimler Benz of Germany will produce Mercedes Benz diesel trucks. The last named combine will manufacture trucks of 14,700-18,700 ibs. capacity while the others will make lighter or medium weight trucks.

The success of the Government of India's new automobile policy will depend on the volume of sales. Sales turn will depend on the quality and price of automobile products. As imports of cars are banned, the Indian consumer will have to buy only Indian-made cars, irrespective of their quality. Price therefore will be the determining factor. The Government of India says its policy is to provide cheap motor transport. But high rates of taxation, Central and State, on automobiles and petroleum products, combined with the comparatively high cost of automobiles, will restrict their sale. The Government cannot maintain an industry by its own purchases. An expanding market is essential to the success of its policy.

Finances of Indian State Governments

Preparations are well in hand for the drafting of the second Five Year Plan. The Planning Commission has already issued circular letters to State Governments asking them to submit their schemes soon. The Finance Minister, Mr. Deshmukh, speaking at Hyderabad said that the second Five Year Plan would pay considerably more attention to the problem of unemployment.

The Reserve Bank Bulletin for May carries an article on "Finances of Indian State Governments," in which it says. "The additional resources raised by the States through taxes and loans from the public have been relatively small. The total tax revenue increased from Rs. 227.26 crores in 1951-52 to Rs. 245.32 crores, or Rs. 18.06 crores more, in 1953-54. The increase is accounted for almost wholly by land revenue following the abolition of intermediaries. Against this increase must be set off the increase in administrative expenditure incurred in connection with the implementation of land reforms. Taxes on motor vehicles and sales tax on petrol and lubricants also show an increase, but this has been neutralised by declines under some other heads, in particular State excises. There is no marked change in tax revenues in 1954-55, the receipts being estimated at Rs. 247.04 crores, the additional receipts are expected to be of the order of Rs. 3 crores."

The additional resources to be raised by State Governments during the five years amounted to Rs. 232 crores. Of this, Rs. 67 crores was mainly on account of proposals made by some State Governments after consultations with the Planning Commission. The Deputy Chairman of the Commission. Mr. V. T. Krishnamachari, addressed personal letters to State Governments, appealing to them, in vain, to honour their commitments. It is no longer a secret that, on political grounds, the Centre will largely finance the first Five Year Plan.

In view of this, what are the prospects for the second Five Year Plan? The sterling and cash balances can no longer be depended upon. The prospects for foreign assistance have been undergoing a rapid change and the Prime Minister has been emphasising the importance of self-reliance. The Taxation Enquiry Commission will make some recommendations in due course, and it is worth considering whether they will be implemented. Taking a purely hypothetical case, will the recommendations of the Commission be implemented if they favour the abandonment of prohibition and re-imposition of the salt duty? As matters stand, the emphasis is on reducing taxation, particularly to stimulate industrial production. In view of the pleas to reduce imports, customs revenue might fall still further in years to come.

In this context, a development programme, even of the size of the existing Plan, becomes a doubtful proposition. In the interests of planning, therefore, it would be advisable to appraise the financial resources for the second Five Year Plan before schemes are finalised for inclusion. It might prevent disillusionment later.

Planning Team's Report on Small Industries

While Messrs. Khandubhai Desai and K. P. Tripathi, whose views have been publicised in the latest issue of the Congress Economic Review, have been crusading against rationalisation in industry, the International Planning Team, whose report on small industries in India has now been released for publication, has asserted that "the challenge of rationalisation must be met as part of a forward looking industrial programme that will encourage and accelerate evolutionary growth. Without rationalisation the natural talents of Indian workers and craftsmen are being wasted in a hopeless race against modern technology. Unless and until these workers are helped to produce more goods and more wealth neither wages nor living standards can be raised. You cannot divide what you do not first produce." To prevent rationalisation to stop the processes of modernisation, it says, is not only illogical but will force the stagnation and retrogression of Indian small industry.

In large part the resistance to modernisation is based on fears which are widespread of technological unemployment. These fears are ill-founded and unjustified. The perpetuation of inefficient outdated methods have reduced employment more drastically than any modernisation could have done —and without opening prospects for the future.

Modernisation in fact creates employment. Improvements mean more and better products at lower and lower cost price and result in greatly expanded demands and markets, and thus expanded job opportunities. Reluctance or failure to appreciate this concept is not only responsible for many of the difficulties observed but are real obstacles in the way of any organic effort toward improvement. Many of these fears stem from the belief that rationalisation is an overnight process throwing workers out of jobs in masses as machines and labour-saving methods are introduced. On the contrary rationalising industry is a relatively slow evolutionary process which takes years and which India should accelerate. In large part workers displaced by improved methods will be shifted to other jobs created by the modernisation process.

Without modernisation, Indian industries which cling to obsolete equipment are condemned to mediocrity and eventual elimination. Only by adopting efficient methods of production, as soon and as widely as possible, can small and village industry take advantage of the good opportunity it now has to lay a basis for promising long-term development. This is not to say that handwork and manual skills do not have a place in the Indian economy. They have a permanent place. But it is unsound to use hand power for the sake of hand power, when machine power will enable industry to meet greater demands at greatly reduced cost, and enable Indian workers and craftsmen to produce according to their skills and capacities.

Private Initiative

The study team is strongly of the opinion that for lasting industrial growth private initiative should be encouraged to the fullest. The assumption is too widely made that the Government should assist in managerial responsibility, while profits remain with the manufacturer; it is not conducive to a sound conomic base for industrialisation. While Government initiative, controls and guidance will be needed at the beginning of an industrial development programme, the Government should make it clear that it is anxious for the private sector to take the initiative, and firmly intends to withdraw from management control at the earliest possible date where it has been necessary for the Government to initiate action. The growth of active, responsible, independent, small industries and a gradual rise of many among the more gifted artisans to the status of self-reliant small industrialists will be an important contribution to the social and economic structure of India.

The team took as its basic task the finding of ways and means of ultimately providing more and better employment for the people, especially in the rural areas. It is in substantial agreement in recommending a series of proposals which it believes will lead to such increased employment. It has studied the commendable efforts that have been made to assist small industries. These efforts have been largely sporadic and have dealt chiefly with isolated segments of the problem. Lacking a systematic approach they fall far short of making any appreciable impact toward the overall advancement of industrial development and no satisfactory overall solution or appreciable progress can be expected from them. It would be a false illusion to think otherwise.

The team has in consequence made an effort to base its proposals and recommendations on a systematic approach, not to the segmented problems of small industry, but to its overall problems—from raw materials supply, product design, techniques and equipment, to trade associations and to marketing and distribution. It also recommends the setting up of pilot plants to demonstrate efficient methods of increasing production raising wages and manufacturing higher quality products at lower cost. The team believes that such proposals will, if brought to successful fruition, make possible higher production and higher wages and accelerate and enhance the progress now being made to foster the welfare of small industry and of India's village workers and craftsmen.

London

RENEWED TALK OF STERLING CONVERTIBILITY

MR. BUTLER RE-STATES THE THREE PRE-REQUISITES

(FROM OUR LONDON CORRESPONDENT)

THAT there was quite a sizeable warning of an influx of "hot money" when reports were spread during the second half of April that the sterling exchange rate might be allowed to rise is apparent from the gold and dollar reserves figures for May. The first few days of the month witnessed an inflow of something like $90 million, according to the Treasury, and this persisted, though on a smaller scale, even after the rumours were denied and the Bank Rate was reduced. That the transactions were not purely speculative is confirmed by the fact that so far there has been no movement in the other direction, though it is appreciated that there may be a small outflow when the forward exchange cover runs off. In the meantime this windfall has been very welcome, for May saw the addition to the reserves of $165 million to bring the total at the end of the month to $2,985 million. It was the biggest rise for about three years, and included only $6 million of American defence aid and $39 million received from the European Payments Union on account of the large April surplus. Without these additions, the residual surplus was $120 million, compared with $119 million in April, $86 million in March, and only $2 million in February, and if one discounts the sterling boom of the first few days, mentioned above, the improvement would probably have been somewhere between $30 million and $40 million resulting from "normal" current transactions. It is confidently believed in Treasury circles that gains around that level might well continue for a month or two if nothing unexpected comes along. The June figures will at least have the benefit of a gold settlement from the E.P.U., half our May surplus which is put provisonally at £10.8 million, against the £28.2 million of April. This is usually the time of year when our surpluses with E.P.U. show a tendency to disappear.

Not unnaturally, this unexpected good fortune has given an impetus to the talk of convertibility. The Financial Editor of the *Manchester Guardian* examines the prospects both cautiously and realistically. Working on the hypothesis that we may expect a further slow expansion of the reserves, the total may well rise to about $3,250 million by the end of the year. In September comes the annual meeting of the International Monetary Fund, when he anticipates the question of a standby fund will certainly be raised and may even be settled. Present ideas suggest a total for this of $1,500 million, though this might perhaps be worked up a bit so as to bring the two reserves together to a round $5,000 million. While it is unlikely that any British official would accept that total as being "adequate" or would indeed be prepared to name such a figure, the outside layman might well consider it a comfortable sum on which to base the next advance in convertibility. The view that this might come before the end of this year has been spreading. The increase in the reserves is only one reason. Others are the steady maintenance of British exports and of sterling area commodity prices and the confidence which has been created by the striking revival of the City of London as an international finance and trade centre. He feels, therefore, that "it looks perfectly possible that a decisive step will be taken in the autumn or winter. But it would be foolish to expect the British Government to 'go the whole hog'—freedom for dollar imports, lifting of exchange restrictions for United Kingdom and sterling area residents, and security arbitrage. We still have to take one step at a time, and exaggerated talk can only lead to disappointment."

Three Conditions

On this question of convertibility Mr. Butler took advantage of a meeting of the National Production Advisory Council on Industry this week to re-state the Government's views. He reiterated the three conditions, decided upon at the Commonwealth Prime Ministers' conference two years ago, which are essential pre-requisites—sound finance within the sterling area; adequate reserves; and the adoption by the major countries of policies conducive to trade expansion—referred to the progress that had been made in the European Payments Union in respect of the third condition, and proceeded: "We have always attached much importance to 'good creditor policies' by the United States because we want to see a continuing dependable balance between the dollar area and the rest of the world—a balance which does not depend on transient measures, such as external United States aid. We want to be sure that in the long-term, as well as in the short-term, conditions look right for convertibility, and that it is not only a practicable move when we make it, but a secure policy which can be sustained in the future. But we must never forget in all this that we adopted the collective approach to freer trade and currencies, of which convertibility is an essential part, because it was in our interest to do so, and therefore we intend to carry on with all the advantages that come to us from following a consecutive policy."

It is obvious that the Chancellor of the Exchequer is not going to be rushed, for although he presented an encouraging picture of the progress over the past year, and particularly in the first five months of 1954—higher export figures, a smaller trade gap, rising production and the strengthening of sterling—he urged that industry should look further ahead and plan for expansion. The aim should be to double the standard of living in the next twenty years "and still have our money as valuable then as now." But we would have to be sensible, for we were entering a period when it would be more difficult to keep prices from rising. "Wages and dividend restraint" was one of the keys we wanted.

Decline in Industrial Production

There is certainly a need to damp down overoptimism. The latest estimates of industrial production by the Treasury, for the first time for many months, revise a previous estimate downwards. The March index figure has now been placed at 130 from the previous 132-133, while the provisional estimate for April is 124-125, against 118 in April last year. The significant fact is that although production is still advancing as compared with 1953, this appears to be showing a tendency to level off as the year progresses. Coal production is one of the headaches, and it is causing some concern. Consumption so far this year is up by about 2,000,000 tons on last year, output is just about at the same level, and stocks are slightly lower. The National Coal Board has secured a further assurance from the N.U.M. that it will do all in its power to help to secure the 2½ percent increase which was one of the obligations accepted as a condition of the last wage increase, but the practical steps to be adopted in giving effect to this have yet to be devised, and meantime output figures, though making a slightly better showing in the last couple of weeks, are a long way short of what is needed

Export Prospects

On the export front there have been some interesting developments during the week. Of most general interest is the announcement of an agreement which Mr. Butler reached with Prof. Erhard, the Federal Minister for Economic Affairs, during his visit to Bonn last month. As a result, Western Germany has agreed to drop tax incentives to exporters by the end of next year, when the present concessions in this respect come to an end. Both sides have accepted the fact that open or concealed subsidies to exporters reduce international trade, that natural competition is the best method of encouraging exporters and that it helps to avoid political tension. Interest will be fairly widespread also at the visit to England of a trade mission from Eastern Germany and the trade talks which are taking place at Geneva with Mr. Lei Jen-min, the Chinese Vice-Minister for Foreign Trade, with the object of establishing channels of trade for British industrialists outside what are termed "Communist-front organisations" in this country. The most interesting development, however, has been the conclusion of a contract by Vickers-Armstrongs Ltd. for the supply early next year to the American firm, Capital Airlines, of three Vickers *Viscount* turbo-prop airliners, with an option on a further 37—the initial order worth £1,000,000 and the total order, if completed, £16 million. British European Airways have contributed substantially in the negotiation of this "most significant postwar sales achievement of the British aircraft construction industry"—as it is described in America—by making available its operational results with this aircraft and agreeing, in the national interest, to postpone delivery of three of its *Viscounts*. Capital Airlines is one of the largest domestic air operators in the United States and the *Viscount* will be the first British airliner to be used on scheduled services in that country.

Rise in Iron and Steel Prices

Against the exporter, on the other hand, is the Iron and Steel Board's announcement raising iron and steel prices in the home market by an average of 2 percent to cover the increase in railway freight charges introduced in March, higher wage costs and dearer coal and coke. The increases range from 15s a ton for pig iron and heavy steel products to 2s 6d a ton for some of the lighter steels. The higher prices quoted for export have not been affected; indeed since then export prices for boilerplates and footplates three-sixteenth inch thick and over have in fact been reduced by £3 a ton to £37 and £37 5s, respectively, so that the margin between the two has actually been reduced.

Denationalisation Difficulties

Denationalisation is apparently a much more complicated process than nationalisation, as the disposal boards dealing with the steel and road haulage industries are finding out. The Iron and Steel Holding and Realisation Agency has made one more private sale, two former subsidiaries of Arthur Lee and Sons, of Sheffield, back to that company for exactly the same amount they received for them on nationalisation, to return about one-fifth of the industry back to private hands. The next major operation, the public offer of the £10 million ordinary shares in Stewarts and Lloyds, is due on 24th June. The terms will not be announced until 21st June but with both Lancashire Steel and United Steel quoted at a discount, they will have to be good to ensure success, even though the issue is again being sponsored by a City consortium. Former shareholders will be given preference, and a figure around 36s to give a yield of around 7 percent is considered likely.

Bombay

FAVOURABLE REACTION TO SHROFF COMMITTEE'S REPORT

NEED FOR BETTER "CLIMATE OF INVESTMENT"

(FROM OUR BOMBAY CORRESPONDENT)

THE Shroff Committee's report, with a definite suggestion that banks should increase their investments in the shares and debentures of reputed industrial concerns, and also make larger advances to approved parties against these securities, met with a prompt response from the stock exchange, which recorded a good rise in leading scrips on Friday afternoon in private trading. The report has on the whole been very well received by the business community. Many are inclined to believe that, apart from the practical nature of its recommendations on the supply of long-term and working capital for industry, it is one of the finest reviews of the position of banking and banking practices in the country published during the last 20 years. One of the features of the Committee's report is its comprehensive analysis of the "climate of investment." It is known that some part of the finance required for industrial expansion can be made available if the proper economic and political conditions are created. Methods to increase the supply of working capital by increasing the resources of the banks and by facilitating a larger supply of short-term credit are well appreciated by industry, but there is some disappointment about the recommendations on long-term finance. It is also believed that until the report of the Taxation Enquiry Commission is published, the greater part of the Shroff Committee's suggestions have little chance of being implemented by the Reserve Bank and the Finance Ministry. In a sense, the two reports will be complementary and it is realised that the recommendations of both the bodies will have to be considered together before changes are made in the present system of taxation.

Imperial Bank Nationalisation Rumour

Rumours have been heard here about the early nationalisation of the Imperial Bank of India—a recommendation made by the Estimates Committee of Parliament recently. Capital market circles fear that if the Government is coerced into taking this step, it might result in the transfer of large amounts of deposits to the exchange banks. Without benefiting the scheduled banks in any way, this might create a temporary dislocation in industry and commerce; the nationalised Imperial Bank might find it necessary to recall its large advances to various important industries. Another effect on the money market would be that as a result of the transfer of deposits from the Imperial Bank to exchange banks, the securities held by the Imperial Bank might have to be liquidated and this would depress the gilt-edged market.

It is learnt that no move is likely to be made by the banks in the near future to raise the rate of interest on advances on an agreed basis, as was once contemplated. While they have more or less agreed that some ceiling should be fixed for the interest rate on term deposits (a committee appointed by banks has been trying to devise a suitable scheme), the question concerning the rise in establishment costs, which would be inevitable under the Appellate Tribunal's award, will be taken up only after Government's decision on the award is announced. It is not expected that the Government will modify any important aspect of the award where the interests of bank employees are concerned. But some hopes are entertained that the burden might be spread over a period of years and that a scheme to subsidise new branches in unremunerative areas might be formulated.

Problem of Unemployment

Some people are disappointed and depressed over Mr. Deshmukh's realistic analysis of the problem of unemployment. The Central Finance Minister was not so optimistic about the immediate effect of the Five Year Plan on the employment situation. Talking to journalists at Hyderabad last week, he emphasised the fact that over a million men and women were added to the working population every year at the present rate of population increase. It was, therefore, not possible for one Five Year Plan to solve the problem. The country, he thought, should be satisfied if the initial plan set it travelling in the direction of solving the problem. But he promised that greater attention would be paid to the question of employment in the second Five Year Plan. After explaining the steps taken under the present Plan to reduce unemployment, he said that as the tempo of expenditure increased, it would be discovered gradually that the magnitude of unemployment was not on as serious scale as it appeared today. The true extent and nature of unemployment remained to be determined until the National Sample Survey report appeared. In the last analysis unemployment simply meant that certain resources were not being utilised to the fullest possible extent. No project was being held up for want of finance; Mr. Deshmukh thought the delay was chiefly because of a dearth of technical personnel such as overseers and engineers. It was, therefore, clear that unless the State Governments adjusted their training programmes in such a manner as to increase the number of technical men, it might not be possible to relieve unemployment to any appreciable degree. Another difficulty in this connection was that the country required capital goods from abroad but these could not be obtained as and when required.

Trouble in the Docks

The turn-round of ships in Bombay harbour and the rate of loading and unloading has improved considerably since the beginning of last week. The Chief Labour Commissioner, Mr. S. C. Joshi, whom the Government of India had deputed on an urgent request from the Chairman of the Port Trust, was able to persuade the 3,500 workers to give up their "go slow" strike although the dispute is still not settled. But the lightning strike of over 1,500 painting and chipping workers in the docks, who belong to the Port Trust General Workers' Union, still continues and this hampers the movement of ships. Fresh trouble is apprehended in the Naval dockyards where the I.N. flagship *Delhi* is berthed. A decision to call for an indefinite strike has already been taken by the Bombay Waterworkers' Union.

There also are doubts about the prospects of a settlement in the dispute between the seamen's unions and shipowners on one side, and the Government of India on the other, over the revised employment scheme. The new employment office, which will be the sole authority for recruiting seamen, has already begun to function. It was believed earlier that the National Union of Seamen had stopped agitating against this scheme when it agreed to send five names to the Director-General of Shipping to represent the workers on the 15-member Seamen's Employment Board. The Board, designed as an advisory body to the Employment Office, is to have five representatives of shipowners, and an equal number from the Government, including the Director-General of Shipping, who will be the Chairman. The Union has now announced that in agreeing to be represented on the Board, it does not mean any change in its opposition to the employment scheme. Its consent, according to a spokesman, was solely motivated by the fact that if it did not send its representatives to the Board, unrepresentative organisations would take advantage of the situation.

Deadlock in Cotton Delivery

Though the May contract in the forward cotton market expired on 25th May, it has left an awkward legacy of difficulties and complications. It has been the practice of the Board of the E.I.C.A. to fix the price differentials for cotton of superior or inferior varieties within the permissable range of delivery, on the basis of the premia or discounts enjoyed by them over the prevailing rate in the forward market. As the spot and the forward rates usually remain at the same level at the time the contracts mature, no difficulty was experienced in practice in settling outstanding contracts. But the present position is that because of manipulations in the market, forward deliveries in Standard Jarilla stand about Rs. 75 lower than the rates of the spot market. As the discrepancy was very large, a number of operators represented the matter to the Committee of the Association. When the Committee refused to depart from established practice, the issue was taken to the High Court by one of the constituents of the E.I.C.A. The Vacation Judge ruled that the Committee should have taken into consideration the price at which standard cotton was being sold in the ready market at the time when the price differentials were being fixed. Though the E.I.C.A. was not a party to this suit, the constituent concerned has refused to accept delivery at the rates fixed by the Committee, with the result that there is a considerable amount of uncertainty among operators as to how this deadlock will end. This has also made the position of the current August contract very uncertain, as the question of fixing proper price differentials in the light of the High Court's ruling has yet to be satisfactorily settled.

Slump in Oilseeds

The slump in the oilseeds and oil market has led the Board of the Bombay Oilseeds Exchange to urge the authorities to liberalise the export policy for castor oil. In spite of the reduction in the export duty on this oil, prices have gone down substantially during the last two weeks. The Board of the Exchange has pointed out that in addition to the large carryover of castorseeds, this year's crop is depressing the market. As the quantities released for export are small, it is feared that prices might fall further. Only a small quantity, less than 5,000 tons, had been exported by the end of April and the domestic market is in no position to absorb the balance. Both the U.S.A. and the U.K. are showing some interest in Indian castor oil at present because of the reduction in export duty. The Board's argument for liberalisation of quotas therefore seems valid. It has asked for free exports of castor oil; if that is not acceptable, it has suggested that the present releases might be increased substantially and the period for shipment extended to the end of the year. It has also asked for revival of the unused quota which expired at the end of April. With regard to kardi and niger seeds, for which there is little demand from abroad, the Board has urged the complete abolition of export duty together with an increase in the quantities permitted for export. There is a noticeable decline also in the prices of groundnut and groundnut oil. But in view of the fact that this oil is required for domestic and industrial consumption there is little hope of the Government agreeing to any increase in the export quota.

Discrimination between Power Consumers

Mr. E. D. Sheppard, Chairman of the Surat Electric Co., at the annual meeting criticised the Government's policy of charging a higher rate for the power supplied to the Company from the Grid than it charged smaller consumers outside the Surat area. Mr. Shepperd regretted that in spite of repeated representations, by the Company and by the Association of Electrical Undertakings against such discrimination, no action had been taken. The Government appeared to have taken the view that Tatas and other States also, discriminated between consumers as regards the rates fixed. Mr. Shepperd, however, pointed out that the degree of discrimination was very much less in all these cases and that it was based on special economic considerations. In the case of the Bombay Government, the discrimination was not justified on grounds either of business practice or of electrical engineering. Mr. Shepperd also expressed his disappointment at the failure of the Government to constitute the State Electricity Board as required under the Electricity Act, and hoped that this would be done within the present extended of time limit fixed by the Central Government.

SURPLUS LABOUR IN KANPUR TEXTILE MILLS

INDUSTRY'S CASE BEFORE VISITING ENQUIRY COMMITTEE

(FROM OUR LUCKNOW CORRESPONDENT).

PROBLEMS of U. P.'s textile industry were brought to the fore during the last fortnight by the report of the special officer appointed by the Government to report on rationalisation and by the visit of the Textile Inquiry Committee to Lucknow. Nearly five years ago seven units of Kanpur's textile industry had submitted schemes of rationalisation. Since then, it has been estimated, these mills have been carrying about 9,000 surplus workers representing over Rs. 1 crore per annum by way of wages. The special officer appointed by the Government has approved, in principle, a 20 percent reduction in labour in the mills concerned. Even this percentage is conditional on the mills installing the mechanical devices which they have proposed but which, according to the special officer, they have not yet installed. The findings of the officer on surplus labour as well as the wage structure and other allied matters were discussed in their general aspects at a tripartite conference in Naini Tal last week, but not much headway could be made in view of the firm stand taken by the Labour Minister, Mr. Sampurnanand, that rationalisation "should entail retrenchment of workers only to the extent to which they would be absorbed by retirements and natural wastages." In effect, therefore rationalisation, so far as Kanpur is concerned, would only mean stoppage of further recruitment and the leaving of vacancies, as and when they arise, unfilled. No agreement was possible at the conference on the question of standardisation of holidays either.

Besides some scattered units in other parts of the State, the textile mills in Kanpur alone have 5½ lakh spindles and over 10,000 looms, producing an average of 16,000 bales of cloth per month and offering employment to about 45,000 workers daily. The minimum wage offered in the Kanpur mills is Rs. 30 and no other State except Bombay pays at this rate. In Madras, Nagpur and Sholapur it is Rs. 26 while in Calcutta it is Rs. 20-2-5. When this minimum wage was first introduced in Kanpur on the recommendation of the Labour Inquiry Committee it was hoped that Bombay would be compelled to raise wages further. "For," the Committee argued at the time, "there is no reason why the upcountry workers who form roughly 13.5 percent of the textile workers of Bombay should at all go to Bombay if they can get the same wage in the United Provinces." This expectation has been belied and the minimum wage in Bombay continues to be the same as in Kanpur, namely Rs. 30. Besides this Minimum wage, workers in Kanpur mills also get a personal wage which works out at Rs. 4 per worker. This incidence is stated to be peculiar to Kanpur.

The Industry's Point of View

A memorandum submitted to the Textile Inquiry Committee by representatives of the industry makes the following additional points: "The actual wages paid by the mills in Kanpur per lb of yarn or per yard of cloth woven are very much higher than in Bombay or Ahmedabad, in spite of the same basic wage. This is due to the fact that the number of workers employed in Kanpur on a spindle or loom basis is greater than in the case of Bombay or Ahmedabad. In Bombay and Ahmedabad one operator often attends to two sides of the spinning frame as against one in Kanpur and similar is the case with regard to inter and roving frames. The draw-frame tender in Bombay has his wages fixed on the basis of 15 deliveries per worker as against 10 in Kanpur. Most of the Bombay mills have installed high-speed winding and warping as against the slow speed work in Kanpur. On the weaving side, mills in Bombay work on a three or four-loom system, up to a maximum of six, whereas in Kanpur the two-loom system prevails in most of the mills.....In the case of spinning, mills in Kanpur are employing seven persons per thousand spindles as against four in Bombay." By comparison with mills outside U. P., the units in Kanpur come off the worst in every respect. In regard to dear food allowance, whereas Calcutta pays only Rs. 30 per month Kanpur is paying Rs. 55. In calculating the cost of living indices, the weightage given to potatoes and ghee in Kanpur is 8 and 18 respectively. Another handicap from which the textile industry in Kanpur suffers is in respect of the number of working days. They are closed for about 52 Sundays plus about 18 holidays, that is a total of about 70 days which is larger than in any other State. The Kanpur worker is also alleged to have a chronic dislike for work on Sundays in lieu of holidays during the week as prescribed by the Factories Act. On the whole, the industry has a strong case for introducing a scheme of retrenchment and rationalisation, but it is extremely doubtful if they would be permitted to do so. The workers of some six textile mills in Kanpur have been able to challenge—successfully so far—the balance sheets of their managements who have been ordered by the State Industrial Tribunal to pay bonus at varying rates. The managements have filed an appeal against the verdict of the Tribunal before the Lucknow Bench of the Appellate Tribunal. The grounds of challenge number over 60 in each case, but the principal contention of the appellants is that the Tribunal erred in holding that the balance sheets and accounts, which were disputed by the workers, were inaccurate or unreliable.

The Handloom Weavers' Case

The presence of the Textile Inquiry Committee in the city was availed of also by the handloom weavers in the State to present their point of view. At present, handloom weaving gives employment to 10 lakh people. The annual turnover of the industry is estimated at 113 million yards, which is sufficient to meet 25 percent of the State's cloth requirements. It consumes raw material worth Rs. 15 crores and pays about Rs. 7 crores as remuneration. A memorandum submitted to the Textile Inquiry Committee has suggested reservation of warp of counts up to 20 and all towels for the handloom industry. The memorandum has also made the suggestion that the Reserve Bank of India should be asked to finance co-operative societies of cottage industry workers on the same terms and conditions as have been fixed for agricultural societies.

A Corporation for Housing

It has been decided by the Government to set up a corporation for urban housing. As a preliminary to this, it is proposed to undertake a State-wide survey of the extent of the housing shortage and the requirements of living space for various categories of people. At the last meeting of the Government Housing Committee, the Minister for Finance and Public Works, Mr. Hafiz Muhammad Ibrahim, threw out a hint that the Land Acquisition Act may have to be amended to include land for housing amongst the public purposes covered by the Act. While the corporation will cater to the needs of the urban middle class, the Government is separately tackling the problem of quarters for industrial labour. Last week plans were finalised for the construction of 7,400 more quarters for industrial workers in Kanpur and six other towns of the State, and work is to begin immediately. These quarters will constitute the third lot of such constructions which the State Government has undertaken under the Central Government's scheme of building subsidised houses for industrial labour. In the first two stages, 2,216 and 560 quarters respectively have already been completed and allotted. The Government has a further scheme of spending another Rs. 2 crores on industrial housing.

Gorakhpore Labour Organisation

A six-man committee consisting of representatives of labour, employers and the Government, under the chairmanship of Mr. Vishnu Sahay, Secretary to the Union Ministry of Labour, visited Gorakhpore to study the working of the Gorakhpore Labour Organisation. This organisation was created in 1943 to recruit unskilled labour for various military projects. It has been recruiting about 12,000 men every year. These men are now sent to work in the coal mines and they constitute perhaps the only organised labour force in the country in this sense. They live in barracks, wear uniforms and are repatriated to their native districts after 11 months of service. At the Indian Labour Conference held in Bangalore last year, labour spokesmen alleged that the continuance of this force was inimical to the interests of labour, that the movements of members of the force were restricted and that they were denied elementary trade union rights. These allegations have been refuted by the U.P. Government who run the scheme on behalf of the Government of India. The Vishnu Sahay Committee was subsequently appointed to inquire into the allegations. Whatever the findings of the Committee, there can be little doubt that the disbandment of the organisation will greatly add to the unemployment problem of the State.

EGYPT'S MOVE TO STOP IMPORTS OF CEYLON TEA

ANXIETY IN COLOMBO: HEAVY RICE SURPLUS

(FROM A COLOMBO CORRESPONDENT)

EGYPT'S recent decision to stop imports of Ceylon tea has caused much concern here. Ceylon must now seek new markets for 21 million lbs. of tea yearly, valued at Rs. 65 million at current prices. The chairman of the Low Country Products Association said that the ban, imposed "by one of our best customers," was a "severe blow to the trade." Only a few days earlier, Ceylon's Finance Minister, Sir Oliver Goonetilleke, was congratulated on what was considered a smart move to raise much-needed revenue for the Government. He increased the duty on tea exports from 45 to 60 cents a lb., calculating that this would yield Rs. 18 million in the present financial year and Rs. 50 million in the next one. The Government defended the higher rate on the ground that tea prices were at an average of Rs. 2.40 a lb. compared with Rs. 1.86 a lb. at the end of October, when the older rate was fixed. It was pointed out that under the sliding scale which preceded the flat duty exporters would today be paying Re. 1 on every pound of tea they sent out of the island.

It was explained here that Egypt had imposed the ban because there was "a surplus of Indian rupees in Egyptian hands which had to be used to purchase Indian commodities." If Egypt wished to continue buying Ceylon tea with Indian rupees, New Delhi's approval would have to be obtained. But such approval was considered unlikely. According to a spokesman of the tea trade, Egyptian consumers have a special liking for Ceylon fannings and black teas and pay good prices for them. The Egyptian Government might therefore be persuaded to take these teas in exchange for cotton, cement and phosphates manufactured in Egypt. If some kind of a deal cannot be arranged to keep the Egyptian market open, the average price of Ceylon tea is bound to fall, the spokesman said.

Triangular Trade

The Ceylon Government has been studying the possibilities of a deal with Egypt on the one hand and Japan on the other to preserve the tea trade. It has suggested that Ceylon could take Egyptian cotton for her tea and send it to Japan. Ceylon would then import Japanese goods up to the amount of the cotton purchases. The Ceylon Legation in Tokyo has placed this proposal before the Japanese Government while the Ceylon High Commission in London is in touch with the Egyptian Embassy. If this move for three-party trade fails, Ceylon may as a last resort approach the Indian Government for help. Ceylon has a big adverse trade balance with India, and it is felt here that if India agrees to release her rupee surplus in Egypt for Ceylon tea purchases this imbalance could be reduced. Meanwhile, there were brisk sales of low-grown teas at the Colombo sales on 24th May. These sales were attributed to the anxiety of local shippers to fulfil advance Egyptian orders before the ban came into effect.

Dealers in tea must be licensed by the Tea Controller after 1st July, under the Tea Thefts Prevention Act passed last year. They must also submit returns of purchases and sales to the controller regularly. Both manufacturers and dealers must further maintain registers of all their tea transactions. This is the first step the Government is taking against tea thieves, whose activities are increasing. Frequent complaints have been made recently by planting interest about the depredations of apparently well-organised bands. The planters allege that the thefts are encouraged, and even directed, by "pirate" dealers with their headquarters in Colombo and their agents scattered throughout the planting districts. Growing unemployment in the villages adjoining the tea estates is the main incentive to theft.

Too much Rice

The Ceylon Government, which two years ago was desperately looking abroad for rice, is now even more harassed by the problem of what to do with its huge surplus in this commodity. The markets are flooded with Burmese and Chinese rice, the Government granaries are overflowing and the Food Ministry is looking round without much hope for safe places of storage. This is not the sum of the Government's difficulties. Locally grown rice is piling up in villagers' bins because the agricultural co-operatives lack funds to buy it at the guaranteed Government rate of Rs. 12 a bushel of paddy. In addition to the unsaleable surplus of imported rice, the Government now faces the problem of finding money to finance the co-operatives if local producers are to be saved from ruin.

Ceylon's yearly rice needs are 800,000 tons. Current imports are 600,000 tons, of which the bulk comes from Burma and China. The Food Minister has announced that imports will be halved next year. Since the Government has already entered into a contract with Burma for 200,000 tons in 1955 it is apparent that exports from China under the rice-rubber contract will have to be reduced drastically. At the same time the Minister of Commerce hopes to sell China more than 50,000 tons—the amount in the contract—of rubber at 55 cents a lb. above the world price. Such optimism is not shared by everybody here. China is not expected to agree to a reduction in the rice quota and may on the other hand press for a lower price for Ceylon rubber. By 1960, the Food Minister proposes to make Ceylon self-sufficient in rice. The area is to be increased by 210,000 acres in the next six years, thus raising home production by 200,000 tons. The cost of opening up new paddy land is estimated at Rs. 48 crores. The Government does not say where this money will come from. It is certainly not available in Ceylon, for the budget estimates for the forthcoming financial year assume that the Government's major development projects will be financed from abroad, particularly by Australia and Canada.

WORLD CONSUMPTION OF WOOL IN 1953

SECOND HIGHEST FIGURE RECORDED

IN 1953 world consumption of wool amounted to 2,600 million lb., clean, according to a review recently published by the Commonwealth Economic Committee.* This was, with one exception, the highest figure ever recorded, being exceeded only in 1950, when the effects of the Korean war were particularly felt. The Commonwealth's share of the world total was some 600 million lb., or 23 percent, which represented a substantial improvement (of 22 percent) compared with 1952. World consumption was at its highest level during the first half of the year, when the wool textile industry was completing its recovery from the recession of the previous year and rebuilding working stocks of tops, yarns and tissues; in the second half of 1953 the rate of usage fell off to some extent, particularly in the United States, where the level of activity was the lowest for two years. Raw wool prices, however, remained generally firm. The recovery in consumption in 1953 was reflected in the industry's production of wool manufactures. World output of wool tops is estimated to have risen sharply by about 30 percent compared with 1952, while worsted yarn production increased by nearly 20 percent. The results for the woollen sector of the industry, which had been less affected by the previous year's recession, were not so striking; woollen yarn production in 1953 was only about 5 percent higher than in 1952. World output of woven cloth during the year is estimated to have shown practically no change compared with 1952.

Improvement in International Trade

A notable feature of the revival in activity in 1953 was the sharp improvement in international trade in wool and wool goods. While raw wool imports into eleven major consuming countries were some 13 percent heavier than in 1952, exports of tops, yarns and cloth from those countries increased by no less than 21 percent, 43 percent and 22 percent, respectively. These figures reflect a widespread relaxation of import quota restrictions during the year as well as the recovery in demand for wool goods generally. Australia, New Zealand, South Africa and Western Germany were among the important markets which progressively relaxed restrictions during 1953, though some others, notably Argentina, Brazil, Egypt and France, remained closed.

These trends are clearly brought out in the publication, which surveys in detail developments in the world wool textile industry and in international trade in wool manufactures during the past four years. It thus covers the cycle of wool textile activity from the Korean war boom of 1950-51, through the subsequent depression of 1951-52, to the recovery in 1953. The volume of 250 pages includes sections covering all the major wool consuming countries of the world, special attention being given to developments in the Commonwealth. Particular care has been taken to standardise as far as possible the presentation of the data for the various countries; for each of the main countries concerned a summary table is given which brings together in convenient form annual data on wool consumption, wool textile production, exports and imports. The number of statistical appendices has been increased to 24, and every effort has been made to include in them all the official and semi-official figures available on the subject, ranging from the consumption of raw wool and other materials by the wool textile industry to production and trade in finished cloth and carpets. One of the appendices shows, for the first time, a complete breakdown of estimated world wool consumption by individual countries. Another lists the import duties on wool and wool goods entering the main Commonwealth countries and the United States.

*"World Consumption of Wool, 1950-53" is obtainable from H. M. Stationery Office or from the Commonwealth Economic Committee, 2 Queen Anne's Gate Buildings, Dartmouth Street, London, S.W.1. (Price, 15s. net)

LIVERPOOL WOOL SALES

At the two-day series of auctions for the Indian and Pakistan wools held in Liverpool in May, a total of about 7,530 bales were offered for sale. The offerings included: Joria White 1,238 bales; White Bikaneri 1,202 bales; Ordinary Yellows 2,089 bales; and Greys and Black 1,327 bales. Prices in comparison with the April sales were more or less unchanged. Of the quantity offered, it is understood that about 2,700 bales were sold. There were substantial withdrawals because of higher limits.

WHOLESALE PRICE INDEX CONTINUES TO FAIL

THE official wholesale price index (base: year ended August 1939=100) declined by 0.5 percent to 395.0 during the week ended 22nd May. Relative to the corresponding weeks of the previous month and a year ago, the index was lower by 1.8 percent and 1.0 percent respectively. Foodstuffs fell by 1.6 percent to 364.2 as a result of declines in the prices of dal arhar (—9%), gram and gur (—5% each), wheat (—4%), rice at Patna (—3%) and coffee (—1%). The price of bajra, however, moved up by 1 percent. The index for Industrial Raw Materials showed an advance of 0.1 percent to 463.9 because of increases in the average export price of manganese ore (+34%), buffalo wet salted hides at Kanpur (+6%), rapeseed in Bombay (+4%), linseed in Calcutta (+3%), raw jute (+2%) and lac (+1%), although the prices of cow wet salted hides at Kanpur (—8%), groundnuts (—5%), castorseed (—4%), linseed in Bombay (—3%), raw silk, rapeseed in Calcutta and gingellyseed in Bombay (—2% each), raw cotton and raw wool (—1% each) recorded declines. The index for Semi-Manufactures stood at 362.1 as compared with 362.4 for the previous week. Items, which recorded noticeable variations were castor oil in Calcutta (—8%), groundnut oil and linseed oil (—4% each), zinc and brass (—3% each), mustard oil in Calcutta (—2%), coconut oil (—1%), groundnut cake (+3%), gingelly oil (+2%), castor oil in Madras and mustard oil at Patna (+1% each). Higher prices of jute manufactures (+2%) raised the index for Manufactures by 0.2 percent to 380.7 although the price of glass (—4%) showed a fall. Lower prices of chillies in Calcutta and black pepper (—5% each) brought down the index for the Miscellaneous group by 0.5 percent to 687.1 despite higher prices of cashewnuts (+3%) and chillies at Patna (—2%).

SUGAR PRODUCTION AND STOCKS

The opening stock of sugar with factories in India on 1st May, was 5.21 lakh tons, as against 9.80 lakh tons on the corresponding date of the previous season, but arrivals of foreign sugar up to 15th May totalled 2.54 lakh tons. Production of sugar during the fortnight ended 15th May was 20,000 tons, as against 26,000 tons during the same period of last year. No foreign sugar arrived in the country during the fortnight ended 15th May. Out of the stock with the mills, 53,000 tons were dispatched during the fortnight, as against 67,000 tons. The closing stock with the factories on 15th May was 4.70 lakh tons, as against 9.39 lakh tons on the same date last year. The total production of sugar for the season 1953-54, i.e., from 1st November, 1953, to 15th May, 1954, was 10.01 lakh tons (12.84 lakh tons). The total quantity dispatched during this period was 7.26 lakh tons, as against 8.47 lakh tons during the same period last season.

U.S. RULES OUT DUMPING OF SURPLUSES

Plans have been made for disposal of American agricultural surpluses so that the projected release of $1,000 million worth of U. S. surplus farm commodities over the next three years will not threaten the stability of world agricultural trade. Mr. John Davis, Assistant U. S. Secretary of Agriculture, has said that the U.S. Government does not wish to contribute to a world agricultural depression by "dumping" American farm surpluses on the world market. In an article in the New York Journal of Commerce Mr. Davis wrote "The U.S. Government is highly mindful of the need for stability in world agricultural markets and our policies are such as to contribute to that stability. The question of the extent to which the Department of Agriculture should exercise its authority to reduce prices for export must be resolved on a commodity by commodity basis in which the major considerations is the effect on farmers themselves, and on the nation's farm programme, as well as the broader objective of effectively utilising more of our agricultural surpluses for the benefit of both ourselves and our friends abroad." Mr. Davis said that suggested principles for governing foreign disposal of U.S. agricultural surpluses during the next few years included. (1) Authorisation for the President to make farm surpluses available to any nation or organisation of nations friendly to the U.S. for the purposes of expanding trade and promoting free world defensive strength and economic stability. (2) Disposal of $1,000 million worth of surplus agricultural commodities within the next three years. (3) Authorisation for the President to make $100 million worth of farm surpluses available for disposal regardless of the friendliness of the governments involved. (4) The sale of agricultural surpluses in return for foreign currency. (5) Maximum utilisation of private channels by participating nations in both sales and grants. (6) Discretional authority for the President to use relief agencies to handle distribution overseas. (7) Establishment of trade channels that will not disrupt those prevailing in foreign markets. (8) Use of Commodity Credit Corporation funds for costs incurred in making commodities available, including costs of delivery, on board vessels in U.S. ports.

GRADING SCHEME FOR WOOL EXPORTS

A further step in Pakistan's plan for grading its export wool has been the issue by the Government of a *Handbook for Grading of Wool in Pakistan*. This is intended to assist wool exporters, states the Pakistan Information Department in London, and gives all the information needed for the operation of the Pakmark Wool Grading Scheme. The Wool Test House, Karachi, is now grading all export wool and issuing test reports.

ALL ABOUT RICE

Now that India has overcome her food problems and is in a position to resume exports of rice, commodity traders will no doubt be interested to learn that the Commonwealth Economic Committee, which has for some time been issuing for official use a *Rice Bulletin* each quarter with supplements in the intermediate months, has decided to give a wider circulation to this extremely valuable resumé of up-to-date information on rice production and trade. The subscription rate for the *Bulletin* is £1 per annum, with an additional 15 shillings to cover air-mail delivery if preferred. The May *Bulletin* gives world figures, excluding the U.S.S.R., for harvested area and production, details of yield, exports for the early months of this year, with detailed analyses of the prevailing situation in Burma, Thailand, Indo-China, Korea, Formosa, the United States, British Guiana, Italy and Egypt, among the exporting countries, and a general review of imports into all the main markets, with special surveys here of the situation in India, Ceylon, Malaya, Hong Kong, British Borneo, Japan, Indonesia, the French Colonies, British Caribbean and the United Kingdom. The final table gives the cost of living indices for eight Far Eastern countries which are the principal rice-eating areas.

LONDON TEA SALES

AT last week's London tea sales the 24,576 packages on offer realised an average price of 4s 10.80d a lb, the same value as in the preceding week. There was no sale a year ago. Results obtained by some of the companies are given below.

	No. of Packages	Average per lb.
Amblamana	204	4/11
Anglo-Ceylon	562	5/0½
Bogowantalawa	426	5/0½
Carolina	258	4/11⅔
Central Provinces	1,125	4/11
Ceylon Amalgamated	186	4/10½
Consolidated Estates	636	4/11½
Damoders	408	4/9⅔
Dimbula Valley	66	5/
Damodera	408	4/9⅔
Eastern Produce	1,284	5/1
Hanipha	108	4/11⅔
Lanka Plantations	264	5/0½
Lunuva	546	4/11
Malayalam	360	4/8½
Namunakula	90	4/11⅔
New Dimbula	120	5/2½
Nuwara Eliya	156	5/4½
Ouvah	480	4/10⅔
Panawatte	96	4/9½
Pundaloya	246	5/1
Rajawella	1,062	4/11⅔
Rollo	168	5/1⅔
Scottish Assam	138	4/11½
Scottish Ceylon	138	4/11⅔
Scottish Tea & Lands	1,386	5/
Spring Valley	270	4/11½
Standard	954	5/1½
Tea Corporation	498	4/11½
United Planters	648	5/0½
Yataderia	54	4/8⅔

Tea Stocks Lower

Tea stocks in London and provincial warehouses on 28th May totalled 94,792,132 lbs. compared with 99,884,016 lbs. in the previous week. Landings during the week totalled 5,004,180 lbs. while deliveries were 10,196,064 lbs.

U.S. TEA SALES STILL RISING

Tea sales to wholesale and retail outlets hit an all time monthly high in January 1954. An index of packers who sell a large percentage of the tea in the U.S.A. showed an increase of 21.9 percent for January 1954 over January 1953, the biggest single monthly gain in U.S. tea history. February will also be good. No one yet knows how much of this tea is currently being consumed, nor whether the increase is permanent or temporary. The best guess is that consumption is continuing to increase but that the current rate will taper off.

RISE IN U.S. COFFEE PRICES

Sharply rising coffee prices resulting from crop failure in Brazil have been front-page news in the U.S.A. for the past month. Accusations of "speculation" have led to Congressional investigations and charges and counter-charges of market rigging. Public resentment has led to some consumer boycott, though not much, and some switching to tea, though how much it is too early to evaluate. Restaurants have been in the forefront of the "revolt" against coffee. To them increased coffee prices mean they must raise their cup price to customers, and this they are reluctant to do. In retaliation restaurants everywhere have been urging their customers to drink tea instead of coffee. Tea Council policy during this period has been to increase its promotion and publicity efforts to the extent the current budget permits to take full advantage of the increased interest in tea, but to avoid any act or statement which could be construed as a "slap" at coffee. One concrete example of such action was the production of a special display piece for use in retail grocery stores. Demand for the poster first came from several of the largest U. S. grocery chains. Reaction to the idea was checked with other grocery chains and tea packers. Their enthusiasm resulted in the production and distribution, within eight days in February, of 179,528 special posters, plus 7,728 pieces of regular Tea Council display material. In spite of adverse newspaper publicity resulting from the price situation, coffee sales to consumers are running at about the same level as in the past. No one in the tea industry believes that coffee's predicament will automatically give tea a permanent sales lift. What it has done is to bring tea, overnight, into new consideration with the public. The Tea Council's campaign is one reason why people are switching to tea. The real battle ahead will be to hold the gains that tea has been making.

U.S. TEA COUNCIL ADOPTS NEW ADVERTISING MEDIA PLAN

At a Board of Directors' meeting some time ago, the Tea Council approved a new-type media plan for its television campaign which it is believed will increase the effectiveness and efficiency of each dollar spent for advertising. In the past the Tea Council has advertised hot tea for 20 weeks in ten markets, iced tea for seven weeks in 27 markets, and for the other 25 weeks it has been "off the air." Under the new plan, which started this month, ten major markets t' at acount for 37.04 percent of all U. S. retail food sales will receive the Tea Council television messages throughout the entire year. In addition, 18 southern cities will be treated as "iced tea only" cities and will receive seven weeks of "iced tea" commercials each year; and two other cities will be "27 week" cities, one receiving 27 weeks of "hot tea" commercials and the other 20 weeks of "hot tea" and seven weeks of "iced tea" each year. Major advantage of the new plan is that for 23 percent more money the Council will get 125 percent more advertising messages.

COLOMBO RUBBER PRICES

The following prices have been issued by the Indian Rubber Board from the weekly rubber market report published by the Colombo Brokers' Association.

	Closing prices on 28-5-54. (Rupees per lb.)		Average prices for period. (Rupees per lb.)
Sheet:			
No. 1	1.10½		1.10½
No. 2	1.07½		1.07½
No. 3	1.04½		1.04½
No. 4	.80½		.80½
No. 5	.75½		.75½
		Sheet Cuttings 1	.65
		Sheet Cuttings 2	.60
Crepe:			
R.M.A. 1X	1.16-7		1.16½
R.M.A. 1	1.12-15		1.14
		Crepe No. 2	1.07½
		Crepe No. 3	.90½
Scrap Crepe:			
Sc. Crepe No. 1	.73/74		.73½
Sc. Crepe No. 2	.65/68		.67
Flat Bark	.61/64		.62½
		Sc. Crepe 3X	.64½

To arrive at f.o.b. Colombo prices add 20 cents per lb. to the above market prices.

GOOD BALING helps India's textile exports

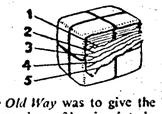
Good baling is of utmost importance to enable India's textile industry to improve its position in foreign markets. The Hon'ble Minister for Commerce and Industries has himself pointed out to the trade the importance of good packaging.

Many of India's leading textile mills are already using the amazing, new packaging material—'Alkathene' Film. 'Alkathene' Film, which is now made in India, is helping them to produce first-class waterproof bales.

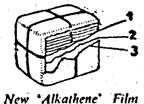
If you have not already done so, give 'Alkathene' Film a trial. 'Alkathene' Film combines superior physical properties with eye appeal. It will ensure that your textile bales reach their destination exactly in the same excellent condition in which they left your mills.

- ★ 'Alkathene' Film is transparent, tough and resilient. It successfully withstands baling pressures, and the strain encountered in transit due to rough handling.
- ★ 'Alkathene' Film is impermeable to moisture and will protect your bales in transit even during monsoon conditions.
- ★ 'Alkathene' Film has been approved by the Textile Commissioner.

And finally, 'Alkathene' Film, though it costs no more than any waterproof packing material, effects substantial savings. It cuts packaging costs, simplifies baling operations, reduces operational time and saves on freight charges. This is how 'Alkathene' Film does it:



The Old Way was to give the bale 2 wrappings of hessian interlayered with a double-sheet of tar-laminated paper, plus 1 extra sheet of kraft paper to protect the textiles from staining.



The New 'Alkathene' Film Way: Now, only 1 sheet of 'Alkathene' Film and two hessian wrappings are enough to provide *complete protection* against exposure and rough handling in transit. There is absolutely *no* danger of staining.

the revolutionary new protective packaging material

'ALKATHENE' Film

MADE IN INDIA

TOUGH • WATERPROOF • INEXPENSIVE

Surely you will want to know more about 'Alkathene' Film! Write, phone or call for free detailed literature and samples. Our Technical Service Department will be glad to help you put 'Alkathene' Film to best use.

Jute

JUTE MILL WORKING HOURS

THE FUTURE OF THE WORKING TIME AGREEMENT

THE question of the working hours of jute mills has, in recent weeks, again come into prominence and chairmen of several bodies connected with the gunny and jute trades and some others besides have taken upon themselves to make pronouncements on the subject. One reason for the resuscitation of the subject is the recommendations of the Jute Enquiry Commission. Another is that the present Working Time Agreement of the I.J.M.A. is due to expire at the end of the year. A third—and it is an excuse rather than a reason—is the alleged shortage of jute manufactures.

Taking the last first, it may be pointed out that there is a scarcity of only some kinds of sacking for early deliveries and no overhead shortage but there are some interested parties who, to get relief from their own difficulties, would like to see an early increase in working hours. They argue, of course, and with some reason, that because the total stocks of jute manufactures have been declining for some months, the mills are not meeting world demand, but it remains to be seen how long that will continue. Stocks of hessian are on the increase showing that the mills are overproducing hessian at present. This may, of course, be only seasonal and, as the mills are now curtailing the output of hessian, the position may soon be rectified but there is no certainty that the total demand for Indian jute goods will continue to exceed production. If it does the Working Time Agreement provides the means of speedily increasing production. It is not likely, however, that the I.J.M.A. will be jockeyed into repeating the error of December 1951.

The second reason, namely, the approaching expiry of the present Agreement, is a more cogent one. It is known that some mills are against a renewal of the Agreement without some modification. The opposition comes mainly from those who have gone in for modernisation and who feel that the present agreement prevents them from realising the benefit of their foresight and their expenditure. They consider that they are being deprived of the benefit of their enterprise in order to protect inefficient units which could not possibly survive in an open field. There are, of course, other aspects of this argument. If, for instance, the field were thrown open to all, the victory might not in the end go to the modernised units who have sunk their capital in new machinery but to some of the less efficient units whose financial resources were more equal to the strain. In any case, whoever won, it would be a Pyrrhic victory.

Modification of Agreement

The Jute Enquiry Commission's recommendations which were mentioned above as the first reason for the revival of this controversy are to the effect that, in the long-term interest of the industry the agreement should be modified, if not abandoned. The Commission says that "the system of protection for inefficient units cannot continue indefinitely in the face of severe competition from overseas countries." The Commission suggests that the Jute Board which it proposes to set up should advise "the industry in settling matters connected with the readjustment of working hours and any compensatory action that might be necessary if uneconomic units have to be wound up on the ground that development and rehabilitation expenditure should be concentrated only in the more efficient units which can be worked intensively". The Commission proposes that, "as a first step, working hours of mills may be permitted to be raised to 48 hours. Mills embarking on considerable capital expenditure for modernisation could, thereafter, be exempted from the rigorous working-hour restrictions". As the mills would by then be working 48 hours per week that seems to contemplate double-shift working by the modernised units. Alternatively the Commission suggests the closing down of uneconomic units on a regulated basis and concentrating production in the more efficient units. All this, it says, must be considered in the context of displacement of labour and this is "an aspect to which greater attention should be given than the mere closing down of uneconomic units".

Potential for Expansion

All these proposals are somewhat nebulous but the time must come very soon when concrete proposals will have to be elaborated. When this is being done an objective must be kept well to the fore which seems to have escaped the attention of the Commission. That objective is to achieve not only efficiency and economy but, at the same time, to have a potential which will enable the industry to recapture at least a substantial share in its lost markets and to enter new ones. Those countries which have established their own industries will protect them but there is ground elsewhere to be recaptured from either competing jute manufacturers or competing materials. A quarter of a century ago the Indian industry was producing 100,000 tons per month with a smaller loomage than that now averaging 72,000 tons per month. The target to be aimed at should be 100,000 tons per month.

The industry has faced many problems in the past. Some have been solved successfully: the industry is suffering today from the bad handling of others. It can learn from its own experience but it could also, with advantage, study what has been done in other industries faced with similar problems and possibly the most profitable study would be the cotton industry in Lancashire in the slump of the 'thirties.

Further Fall in Sacking Stocks

The decline in mills' stocks of heavy sacking which has been going on for some months continued in May when they were further reduced by 7,500 tons bringing the total down to 50,000 tons at the end of the month. At the end of May 1953, stocks of sacking in mills' godowns were 89,200 tons. Hessian stocks, on the other hand, at 34,900 tons were up by 2,600 tons at the end of May 1954 compared with those at the end of April. Stocks of miscellaneous goods showed no change. The total stocks at the end of May were 86,500 tons compared with 91,400 tons at the end of April. At the end of May 1953, the total stocks were 138,800 tons of which 47,700 tons were hessian and 89,200 tons were sacking. It is interesting to note that, at the end of May 1953, sacking stocks alone were more than the total stocks at the end of last month.

THE JUTE MARKETS

SCARCITY OF SACKING CONTINUES

The predominant feature of the week under review has been local covering in certain classes of heavy sacking for which fancy prices have been paid by shippers who have been caught short. At one time it was expected that this position, which developed in April, would be easier in May and would gradually level out in June as contracts were mostly for equal quantities in April, May and June. It appears, however, that some shippers were able to get extensions which put off the evil day while, in other cases, shipments were deferred because of the sailing of ships being delayed by the "go slow" movement at the docks. It would seem that the present tightness may continue for some time longer and some think it may go on into July, though the switch from hessian to sacking and from B Twills to other classes of sacking should, before long, equate the supply to the demand.

The firmness in the B Twills phatka market has caused some reserve among jute sellers as it has given the impression of a strong gunny market and jute sellers have been expecting increased activity in the raw jute market. They either do not understand or prefer to ignore the fact that mills are deriving no advantage from the fancy prices being paid for ready goods of which mills have practically nothing to sell and are getting little demand for forward shipments for which they want to sell. Holders of old crop jute are keen enough to sell but are not willing to accept lower prices, nor do sellers show any inclination to enter into contracts for new crop at cheaper prices.

Manufactured Goods: There has been strong demand for some kinds of heavy sacking for ready shipment. High prices have been paid for A Twills, Liverpool Twills, sugar bags and cornsacks but the actual turnover has not been large and the prices paid have given a false impression of the market. For instance, on Monday A Twills ready were quoted at Rs. 165 against Rs. 133 for Oct-Dec, Liverpools at Rs. 150 ready and Rs. 124 Oct-Dec, sugars Rs. 148 against Rs. 124 and sacks Rs. 139 against Rs. 110. For other bags the difference in price between the ready and forward positions was only Rs. 9 to Rs. 6. As far as the forward positions are concerned mills report difficulty in selling any kind of heavy goods at the quoted rates. While all this has been going on, hessian has continued dull but prices have been maintained in sympathy with the market sentiment. Mills are keen to sell hessian for October-December and a fair amount of business has been reported. At the time of writing on Tuesday the market is easier on profit-taking in the phatka market.

The following are the opening prices on Wednesday morning:

		June	July	Aug.-Sept.	Oct.-Dec.
40" 8 oz.	Rs.	37-4	36-10	36-4	35-8
40" 10 oz.	Rs.	44-8	44-10	44-10	43-12
B. Twills	Rs.	114-8	113-8	112-4	109-0
Heavy Cees	Rs.	116-0	115-0	113-8	109-4
Cornsacks	Rs.	128-0	121-0	116-8	109-8

Raw Jute: There has been no large business during the week but there has been steady small-scale buying which has sufficed to keep the market steady while the upward trend in the B Twill phatka has encouraged sellers to hold out for quoted prices. Throughout the week there have been buyers at prices slightly below those quoted. In some cases sellers have accepted the prices offered by buyers while, in others, buyers have paid the prices asked. Northern and Dhubri jute was bought at Rs. 25 to Rs. 26-4 basis Bottoms for Old Crop for June-July shipment and at Rs. 26 to Rs. 26-8 for New Crop for Aug-Oct. Assam Old Crop was done at Rs. 25 to Rs. 25-8 basis Bottoms June-July and Assam New Crop at Rs. 25-8 to Rs. 26 basis Bottoms Aug-Oct. Old Crop Daissee was done at Rs. 28 to Rs. 28-8 for assortments varying from 30/70 to 50/50 Mids/Bots. The bulk of the Old Crop jute on offer is Middle but mills want to buy mostly Bottoms and X. Business has been reported in X ex Cossipur at Rs. 20-8 and ex Pakistan at Rs. 22 to Rs. 22-8 while New Crop Pakistani district X was reported done at Rs. 23. Pakistani Northern Cuttings were reported done at Rs. 62-4 and Tossa habi-jabi at Rs. 105.

At the time of writing, rates are a little easier because of lower phatka quotations in the gunny market. There is an unconfirmed report of one group having bought a large quantity of Pakistani jute.

The following are the opening quotations on Wednesday morning:

Indian Jute (1953 Crop):	Landed at Mills Rs. per md. basis Bots.	Shipment
Lower Assam	26-0	June-July
Upper Assam	25-8	"
Northern	26-0	"
Purnea	25-8	"
Murshidabad Tossa	27-0	"
Daissee ex Sheoraphuli	26-0	one month
Daissee ex Calcutta	27-8	"
Daissee Mesta ex Calcutta	24-8	"
Bihar Mesta	23-8	June-July
Northern ex Calcutta	25-8	one month
Local Packing	24-0	"
Bimli		June-July

Tossa prices are Rs. 2 per md. above the prices of white jute.

Pucca Bales:	Rs. per bale	Shipment
Mill Firsts	180-0	June-July
Mill Lightnings	165-0	"
Dundee Daissee		
2/3 S.G.	180-0	"
2/3 L.G.	165-0	"
Pakistani Jute ex Pakistan:	**Rs. per md. basis Bots.**	**Shipment**
Jat	27-8	June-July
District	26-8	"
Northern	26-0	"

New Crop (1954) is quoted at eight annas per maund above the price of Old Crop though, in some cases, business could be done at the same price as for old. New Crop daissee is offered at less than the price of old.

The Cossipur market has continued unchanged with imports about the same as those of last week and prices moving in sympathy with the B Twill phatka. Imports are now mostly Pakistani jute and the stocks—both Indian and Pakistani—are mostly low grade jute.

Mofussil: There is nothing to report from markets in India. Despatches to Cossipur continue on a very small scale from Western and Northern districts but shipments from Assam are negligible.

Crop reports are not satisfactory, there being too much rain and too little sunshine in nearly all areas.

In Pakistan business was interrupted by the Id holidays but, in any case, there has been little enquiry. In most places imports are small. In the absence of much demand prices are irregular but have steadied in sympathy with the B Twill quotations in Calcutta.

Current quotations are as under:

Pucca Bales:	Rs.	Kutcha Bales:	Rs.
Mill Firsts	132-0	Jat	21-0 basi Bots
Export Firsts	113-9	District	19-12 " "
Export Lightnings	102-0	Northern	17-12 " "
Dacca Tossa 4's	160-0	Tossa is quoted at Rs. 3 to Rs. 4 higher than White Jute.	
Dundee Tossa 4's	145-0		
Outport Tossa 2/3	114-0		
Outport Tossa 4's	90-0		

INDIAN JUTE CROP SOWINGS NEARING COMPLETION

In their eleventh crop report for the current Indian season covering the week ended 5th June, Messrs. Sinclair Murray & Co. Ltd., say that weather conditions have continued favourable and sowings are nearing completion. The crop in all districts is progressing satisfactorily.

DANPUR: Favourable weather has been experienced which has enabled cultivators to progress with sowings estimated at -/20/- as against -/2/6 on the corresponding date last year. Weeding operations have continued uninterrupted and plant condition is satisfactory, plants ranging in height up to 1ft 3in. The river level is normal for this time of the year.

JAIPUR ROAD: Rather heavy rainfall has interrupted sowings which now stand at -/20/- as against -/3/- on the corresponding date last year. However, week-end reports mention that sowings are now nearing completion. Condition of plants is good and they range in height up to 10ft. The river level is slightly higher than the normal for this time of the year.

RANAGHAT: Favourable weather conditions have been experienced and sowings now stand at -/16/- as against -/10/- at this time last year. Weeding operations have been continued and the condition of plants is satisfactory, plants ranging in height up to 2 ft. The river level is normal for this time of the year.

COSSIMBAZAR: Weather conditions have been very favourable and sowings have progressed rapidly. Sowings have been estimated at -/16/- as against -/6/- on the corresponding date last year. Condition of the young plants is very satisfactory and they range in height up to 1ft 6in. The river level is normal for this time of the year.

FORBESGANJ: Weather conditions have been very favourable and sowings to date amount to -/15/- as against -/16/- completed on the corresponding date last year. Condition of young plants is satisfactory and they range in height up to 2ft 9in. Weeding operations have been carried on where required.

NOWGONG: Sowings completed -/18/-. Favourable weather has been experienced. Weeding operations have been going on where required. Young plants are healthy and progressing well and now range in height up to 4ft 3in. The river is rising slowly and is about the same level as at this time last year.

GAUHATI: Sowings completed -/18/-. The weather has been mainly showery and a period of strong sunshine would be beneficial to promote growth. Weeding operations have been curtailed to some extent but the condition of plants is still satisfactory and they range in height up to 5ft. The river level has fallen slightly and is now 3in lower than last year at this time.

DHUBRI: Sowings completed -/17/-. The weather has been mainly showery and a spell of sunshine would be beneficial for the growth of plants and would allow the continuation of weeding operations.

Plant condition, however, is satisfactory on the low and midlands and they range in height up to 5ft. Because of wet weather conditions during the last two weeks, however, highland plants are slightly stunted and sunshine is needed to promote their growth. The river has been rising slowly and now stands at about the same level as last year at this time.

KHARUPETIA: Sowings completed -/17/-. The weather has been favourable with alternate rain and sunshine. Weeding operations have been completed in the low and midlands and are being carried on where required in the highland. Plant growth and condition are satisfactory and they range in height up to 4ft 6in. The river is rising slowly and is slightly higher than last year at this time.

DAISSEE DISTRICTS: Sowings completed -/24/-. Favourable weather has been experienced and the condition of young plants is satisfactory; plants range in height up to 2ft 6in. Weeding operations are going on where required.

N. B. As a basis of comparison last season's crop has been taken as -/16/-.

I.J.M.A. STOCK FIGURES FOR MAY

The Indian Jute Mills' Association reports total stocks of jute goods at the end of May 1954 as follows:

Total reported stocks of manufactured goods exclusive of Government orders.

Description	31st May, 1954. (Lakh Yds)	(Tons)	30th April, 1954. (Lakh Yds)	(Tons)
Hessain Cloth & Bags	13,07	34,454	12,02	31,995
Standard Hessian (included in above)	10,27	27,267	9,56	25,628
Sacking Cloth & Bags	11,55	49,730	13,10	57,280
Standard Sacking (included in above)	9,22	37,351	11,32	47,721
Rove. Rope, Twine, etc.		1,602		1,615

Total reported stocks of manufactured goods held on Government a/c.

Sandbags	1	27	1	27
Scrim Cloth	3	93	3	99
Hessian Bags & Cloth and Canvas	10	272	7	171
Sacking Cloth & Bags	11	299	7	236
Rove, Rope. Twine, etc.		1		3

Summary

	31st May, 1954. (Lakh Yds)	(000 Tons)	30th April, 1954. (Lakh Yds)	(000 Tons)	Increase over or decrease from last month (Lakh Yds)	(000 Tons)
Hessian						
Civil	13,07	34.5	12,02	32.0	+ 1,05	+ 2.5
Govt.	14	0.4	11	0.3	+ 3	+ 0.1
	13,21	34.9	12,13	32.3	+ 1,08	+ 2.6
Sacking						
Civil	11,55	49.7	13,10	57.3	- 1,55	- 7.6
Govt.	11	0.3	7	0.2	+ 4	+ 0.1
	11.66	50.0	13,17	57.5	- 1,51	- 7.5
Others						
Civil		1.6		1.6		0.0
Govt.		0.0		0.0		0.0
		1.6		1.6		0.0
GRAND TOTAL		86.5		91.4		- 4.9

*a + sign indicates an increase and — sign a decrease.

N.B. These statistics include figures of all members and of Gagalbhai. May figures include estimated figures of Kedarnath, Sri Ganesh, Rameshwara, Maheswari and Katihar. Against these are shown April figures in which Kedarnath and Katihar figures have been estimated.

HEAVY RAINFALL IN PAKISTAN JUTE AREAS

In their thirteenth crop report for the current season in Pakistan covering the week ended 5th June, Messrs. Sinclair Murray (Pakistan) Ltd. say that heavy rainfall has been experienced in all districts. As the crop is in various stages of growth this rainfall has been found excessive in some areas and weeding operations have been held up in these areas. River levels are generally higher than last year at this time.

NARAYANGANJ: Weather conditions generally have been wet for the most part. This wet spell has proved beneficial for the midland crop but has been found rather excessive for the highland seedlings and a spell of dry weather is now required. The river is 1½ft higher than last year at this time.

DACCA: Weather conditions have been wet but not entirely unfavourable. Condition of the plants is satisfactory but weeding operations have been suspended in some areas because of excessive rainfall. Plants range in height up to 4ft 3in. The river is about 1¼ft higher than last year at this time.

CHANDPUR: Rain has been experienced nearly every day and whilst this has been beneficial for the Tossa crop, a spell of dry weather would help the crop generally. Condition of plants is satisfactory and they range in height up to 6ft. The river is about 2½ft higher than last year at this time.

ASHUGANJ: Excessive rainfall has been experienced and a spell of dry, sunny weather would be beneficial. Condition of plants is, in the main, satisfactory, and they range in height up to 5ft 6in. The river is now about 1ft higher than last year at this time.

NIKLIDAMPARA: Rainfall has been experienced and whilst this is not unfavourable a spell of dry, sunny weather would prove beneficial. Condition of the plants is satisfactory and they range in height up to 5ft 9in. The river is about 2ft higher than last year at this time.

SARISHABARI: Favourable weather conditions were experienced until the latter part of the week when rainfall was excessive and fields have been water-logged and weeding operations have been suspended. A spell of dry, sunny weather would prove beneficial. Condition of plants is still satisfactory and they range in height up to 4ft 6in. The river is slightly higher than last year at this time.

SIRAJGANJ: Excessive rainfall was experienced and a spell of dry, sunny weather would prove beneficial. The condition of the crop is still satisfactory and a spell of dry, sunny weather would prove beneficial. Condition of plants is satisfactory and they range in height up to 3ft 6in, and in this area plants have to grow much higher before maturity. The river is about 1ft higher than last year at this time.

BHANGOORA: Excessive rainfall was experienced in this area and a spell of dry, sunny weather would prove beneficial. Condition of the standing crop is satisfactory although plants have to grow much more before reaching maturity. The river is rising and is now about 6ft higher than at this time last year.

THE FOREIGN JUTE MARKETS

CONTINENTAL MILLS LOOKING FOR FRESH ORDERS

(FROM OUR DUNDEE CORRESPONDENT).

As far as the Continent is concerned, conditions in the jute industry are not very bright and spinners and manufacturers in most countries are in need of fresh orders. Spinners are offering to sell yarns to this country at prices even less than those ruling here for local spins, import duty paid, which is 10 percent on single yarns and 15 percent on twists. Manufacturers are quoting prices for cloth for export at levels which are in close proximity to those ruling for Calcutta goods, and if India could secure a further reduction on the export duties, the mills would be more or less safe from Continental competition. No doubt, however, it is Pakistan which is causing anxiety, and here again the reduction of duty would benefit.

Trade in Dundee goods is quiet, but manufacturers are not yet anxious concerning the future. They consider that consumers will prefer their hessians to imported goods, and that demand will improve in due course. At the moment, there are no manufacturers in need of orders and they are mostly booked up till the end of August at least. As the future is still rather obscure, sellers are not keen to book up too far ahead. If Dundee employers could get more workers, production could be increased. The jute trade in this country is not declining for lack of orders, as has been suggested. On the contrary, the consumption of raw jute has greatly increased since the end of the war, from something like 550,000 bales to 800,000 bales per annum. The number of workers has certainly been very much reduced, but most establishments are now equipped with the most modern machinery and fewer employees are required.

Shippers of raw jute are maintaining their prices and many quote high prices for reasonably good quality. Mill Firsts and Mill Lightnings can be obtained at £100 and £80 respectively, but the Jute Controller has to pay more to secure suitable material. Good Tossa-2/3 is from £121 and grade from £110, with grade fours from £102, all c. and f. U.K. Calcutta goods are very firm at 72s 6d for 10 oz. and 55s. 9d for 7½ oz., June, 72s 6d and 55s 3d July and 72s 9d and 55s July-September, f.o.b. Calcutta. Liverpool Twills are strong, and now at the highest level ruling for many months past at 22s for July shipment, while B Twills are advanced again, after easiness, to 185s 9d, June, 183s 3d July and 181s 3d July-September. Prices for all Dundee yarns and cloth are very firmly maintained at the maxima.

Mr. E. R. Cuthill, who was for some years Assistant Jute Controller, has been appointed a director of R.E.B. Wilcox (Dundee), Ltd. Mr. Cuthill was head of the firm of E.R. Cuthill, gunny brokers, Dundee, now closed.

THE AMERICAN MARKET FOR INDIAN JUTE GOODS

MR. J. G. WALTON'S ADDRESS TO U.S. TEXTILE BAG MANUFACTURERS

MR. J. G. WALTON, Deputy Chairman of the Indian Jute Mills Association, addressed the summer meeting of the U. S. Textile Bag Manufacturers Association at Hot Springs, Va., on 24th May as follows:

"May I begin by saying on behalf of the other members of the delegation of the Indian Jute Mills Association and myself how much we value and appreciate your invitation to be present at this meeting of your Association and to be able to take part in your discussions. Those of you—still I fear too few—who have been present at our annual general meeting in the Royal Exchange, Calcutta, will recall that our ceremonies are marked by a rather larger degree of austerity than is the case here, and I think the delegation will all agree that we must suggest to our colleagues in Calcutta that they should—in this direction anyway—move with the times and follow the very pleasant traditions which you have established. There is, gentlemen, one regrettable absentee on this occasion, for our Chairman, Mr. Geoffrey Gardner, whom many of you met in 1952, was obliged to bow to the views of his medical advisers that in his present state of health a strenuous tour, such as we are about to make, could not be permitted. Geoff has asked me to express his very sincere regrets at not being able to be with you all at this meeting and I am sure you are all as sorry as we are that he has not been able to be here.

Visit of Goodwill Mission

"It is now 18 months since the visit of our Goodwill Mission in 1952 and though the interval has been—unavoidably—rather longer than we intended, it has perhaps advantages in allowing more time to bring events into perspective and to enable us to make an assessment of our industry and its markets based on a rather longer view than would have been possible last October. From that point of view whether we look at the industry as producers or consumers of jute goods, I feel that we must all admit that the last two years have been of great interest following as they did the dramatic disruption of the years 1947 to 1951. I think indeed that there were few, particularly in this country, who, when the repercussions of partition were appreciated and who experienced the tremendous difficulties of 1950 and 1951 could have foreseen the resumption of comparatively—and I would stress the word comparatively—normal conditions so quickly.

"For more than a year now we have had conditions of relative stability in supplies of raw materials and this has been reflected in the production and prices of our goods. Beginning with this country and followed by the Argentine last year, our hessian markets have shown a gratifying resilience and signs are not lacking that similar improvements may not be far off so far as sacking demand is concerned. As a result, we have been able to do something about the unhealthy and dangerous accumulation of stocks which was one of the main problems of the industry towards the end of 1952 and throughout the greater part of 1953. For the moment, hessian stocks have fallen to a satisfactory level and we look forward to satisfactory reductions in sacking during the next few months. It is true that this has not been accomplished without great effort and at heavy cost, for the working of the mills for a good part of the time has been uneconomic and substantial losses have been, and even now are being incurred. Despite this, we have for the last two years been in a position to give our main consuming markets, and particularly this our most important one, all the jute goods that they could absorb at prices which I think few will deny have been most reasonable. Additionally these supplies have been available at exceedingly stable prices, a factor of great benefit to us all.

Competing Industries

"On the other hand, we must not ignore those other aspects of the problems of adjustment whose main impact is still to be felt. Briefly, the most important economic effect of partition has been to destroy India's near monopoly of raw jute and jute goods, and to create what appears likely to be a highly competitive world industry. The most important potential element in that is undoubtedly the new industry which is represented by our good friend, Mr. Faruque, but clearly in the future as a producing industry the Indian jute mills and indeed the jute industry in all other countries must reckon on the distinct possibility of an extension of new manufacturing units in suitable areas and very probably also an increase in raw jute production such as has taken place in India since 1949. Not unnaturally we are concerned at the extension of a manufacturing industry whose potential production is even now in excess of physical demand. However, we realise that this is a matter which will be determined by each country in the light of its particular economic position and the general competitive position *vis-à-vis* other sources of supply. So far as the Indian Jute Mills Association is concerned, we are most keenly alive to these developments.

"I would like however, in this connection to quote a few figures to you to help to put this problem in its proper perspective. The estimated world jute loomage is in the region of 122,000—out of this 72,000 or almost 60 percent are in India. The new largest industry employs no more than 11,000 looms. A number of our competitors have arisen since the end of World War II, while others have been extensively modernised with considerable publicity—publicity which has left the impression in many quarters that the only modern machinery is that used by our competitors. Nothing could be further from the truth; the Indian industry has been for some time modernising quietly but steadily and in quantity has already outstripped all its rivals. Further, the pace of modernising is accelerating rapidly in India. Modernisation has so far been carried out by mills on their own initiative from their own resources, but as you may be aware the Government of India has indicated to us that finance can be made available for modernisation to those mills unable to raise the necessary funds from their own resources. A procedural scheme to make this possible is now—I may say—in an advanced stage. Apart, however, from our mechanical equipment, the Indian jute industry has many other natural resources. It has an almost inexhaustible supply of trained workers, an excellent tradition of supervisory service, an experienced network of business and finance working with the industry, and a tradition of cautious but at the same time far-sighted management.

"The partition of Bengal left the main jute growing areas in East Pakistan. We still buy a very considerable quantity of jute from that country and the Indian jute industry trusts that they will always be in a position to do so. At the same time vigorous efforts are being made not only to bring the quantity of Indian raw jute production a little m
with requirements but to produce a mark

ment in quality. Better jute would not only be advantageous to the Indian mills but would have the important advantage of giving the cultivator a better return for his labours than is sometimes possible now. An expert body has recently investigated very thoroughly the problem of improving the production of raw jute in India and has stated that by concentrating effort in those areas most suited physically to jute production and by improving the quality of seed, water supplies, etc., very considerable progress may be made in a short period of time in attaining the twin objectives of higher yield and better quality. The Indian Jute Mills Association has no inclination to complacency, but taking all the foregoing factors into account, and in the full knowledge of our long experience and the proved resilience of our industry, we are quietly but firmly confident that we can take those essential measures which will maintain our position in world markets.

Quality of Goods

"I would now turn to a subject which during the past 18 months has been under continual survey and consideration by my Association. That is the subject of the quality of our goods. Complaints which we have received have given us and continue to give us cause for very grave concern, although during the past few months I am glad to say there has been a welcome diminution in the number of complaints addressed to us. I appreciate that this is a most difficult and delicate matter, but I would ask you to maintain a just sense of proportion in dealing with it. Each month our mills produce approximately 120 million yards of hessian and 40,000 tons of sacking. We sell to thousands of dealers scattered throughout the world and eventually our products are used by a consuming public which runs into millions.

"In this perspective I respectfully suggest that the number of complaints which are brought to the notice of my Association, while more than previously, are not as bad as some would have us think. That said, I must also accept the fact that one of the long-term effects of partition, etc., is that the Indian mills are using a smaller proportion of Pakistan jute than hitherto and that this does have repercussions on such important factors in bag quality as colour and freedom from root and speck. So long as the present currency parity is maintained, it is not economically possible for the Indian mills to purchase larger quantities of the better quality Pakistan jute than they do at present, but there is no doubt also that these changes have introduced alterations in the traditional approach to quality. On the part of the mills, experiments have been made using larger proportions of Indian jute. On the other hand, there has been an equally marked tendency on the part of bag manufacturers to experiment with fabrics with the object of seeing if cheaper and lighter materials can be relied on to do the work of the conventional design. All this leads to the point that, whether as consumers or producers, there is undoubtedly a case for a clearer definition, firstly of what a given fabric can reasonably be expected to do and, secondly, what a buyer can reasonably expect from the seller if he stipulates a cloth of a certain pattern and construction. Burlap is a rough packaging fabric and it is not an easy matter without increasing prices to introduce suitable specifications in a material in which, for so many years with the ready acceptance of both buyer and seller, trade convention has been the governing factor. Above all things we must prevent the precipitate introduction of specifications which will result in burlap being priced out of its class.

Testing Tensile Strengths

"Since the Association received a copy of the joint letter regarding tensile strengths from the Business Relations Committees of the T.B.M.A. and the B.A.J.A. on 5th November last year, the strength testing of our products has been under the serious consideration of our Committee. Along with that letter a diagramatic description of your testing method was sent. Unfortunately, our method was dissimilar as different equipment was used and orders were immediately placed for Scott testing equipment from the U.S.A. I am glad to say that one of these machines was installed in our Research Institute just before I left Calcutta and that several mills are expecting to have them shortly.

"In addition to the tensile strength testing, however, we have also commenced at our Research Institute in Calcutta an extensive investigation to evaluate industry-wise the performances of our products. This investigation will be of tremendous help to our members in quality estimation and control and at a very early date should enable us to arrive at working tolerances in the various specifications of our products, including of course tensile strengths. I know that similar work is going on here and I hope that during the period of the delegation's visit there can be useful discussions on this most important subject. In the meantime, I would take this opportunity of assuring you of my Association's wholehearted co-operation in assessing standards for our mutual benefit. I would repeat what was said by the Chairman of the Association at the annual general meeting in Calcutta recently when he asked that our consumers, their agents and their shippers, should come to our assistance whenever occasion arises by giving us information when goods are at fault and making it as detailed as possible.

Competition from Substitutes

"While we are naturally preoccupied with competition within the international jute industry, the basic problem for the Indian industry and all its competitors in other countries is the extent to which we are holding our own against substitutes, particularly paper. In a sense, this is a problem of peculiar significance to this country, for I think that I am right in saying that, as a country of continuous technical development with a serious consideration of labour costs and also a psychological approach to new materials, there is a greater tendency here than in other markets to turn to new forms of packaging, new forms of containers and new methods of handling goods. On the other hand, technical development has a habit of spreading and while in other parts of the world we look to general economic improvement to produce an increase in the demand for jute goods, there is always the danger of the parallel introduction of substitute packaging materials which are at present more or less unknown. What is happening here will undoubtedly happen elsewhere and accordingly the reactions of individual consuming markets in this country to the improved conditions of price and supply of burlap during the last two years are a matter of great interest to us, and it will be one of the main objects of the delegation's tour to assess these reactions.

"There is one direction, however, in which it is hoped that a good deal of positive work can be done. While it is clear that for a time at any rate our main trade will continue to be in the orthodox standard fabrics, there will undoubtedly be an increasing demand for new types specially made to deal with particular requirments or, as an alternative, combinations of burlap with other types of material. One of the most impressive developments in the packaging industry is the vast extent to which containers are now adapted to meet particular needs and we see little reason why the ubiquitous burlap bag should not readily adapt itself to changed conditions. We feel and I think rightly that its potentialities have been far from fully explored. There are a number of very interesting possibilities of this nature which we propose to investigate and we hope that something may be accomplished fairly soon. In the meantime, however, I trust that if anyone feels that he would like the possibility of new constructions examined by Calcutta he will get in touch with Sandy Low who will pass on requirements for investigation by us. I say this particularly because the existing trade channels are slow and cumbersome and do not readily lend themselves to the development of new constructions or new fabrics.

Many Uses for Burlap

"Experiments during the war showed how diverse are the uses to which burlap can be put in combination with other materials, such as rubber, plastics, etc., and this is something to which we are going to give serious consideration. As bag manufacturers you may not be directly interested in such investigations, but anything which can increase the total off-take of burlap enabling the Calcutta mills to utilise their full productive capacity means lower costs for us and a lower price at which we can sell all our products.

"When our last delegation was here, the Association's publicity campaign had just begun. In the last 18 months it has developed, in direction, form and substance, always in discussion with the members of the Burlap Council Advisory Committee and with the close assistance and cooperation of your Association. We are most gratified with the development of the campaign which is taking place, but it will, of course, be one of the matters which we shall be discussing in some detail with the members of the Burlap Council Advisory Committee and with representatives of the trade and of consuming interests whom we meet during our tour.

"Our office in North America has now been open for four years and, so far as the industry is concerned, it has certainly been a step which has fully justified itself by the closer connection and, I think, the better understanding of our mutual problems which have existed ever since Sandy Low came among you. The trade in this country and we in Calcutta are greatly indebted to him for the immense amount of work which he has put in in establishing contacts, making friends and generally bringing us all closer together. Mr. Nugent too, I know, has continued to be a source of unfailing energy and inspiration and the work of the Burlap Council owes a very great deal to him.

"Finally I would like to express our sincere thanks to the members of this Association and to the bag trade as a whole in this country. Whatever has been gained in this market during the last two years is largely due to their efforts and we are most grateful for their continued faith in our product, a faith which I modestly suggest has been justified by the events of the last two years."

SURPLUS CAPACITY IN NON-FERROUS METALS INDUSTRY

DELIVERING his Presidential address at the seventh annual general meeting of the Indian Non-ferrous Metals Manufacturers' Association in Calcutta yesterday, Mr. J. N. Bhan, dwelt upon the problem of surplus capacity in certain sectors of the industry and mentioned, amongst factors responsible for low production, reduced demand, competition from the ordnance factories, inadequate supplies of raw ore in the case of antimony and labour troubles. He hoped that with more discipline and reasonableness on the part of labour and the increased industrialisation now in progress, the factories that have been experiencing slump conditions may once again be restored to a reasonable level of operations. On the question of metal supplies, though the prevailing conditions indicated better availability, Mr. Bhan advised that our efforts should be directed to the prospecting and exploring of occurrences at home. Expressing his thanks to the Ministry of Commerce and Industry for the import and export policies relating to non-ferrous metal items, Mr. Bhan referred to the difficulties arising from the competition entered into by ordnance factories with units of private industry. He suggested that ordnance factories, if they should at all produce for the civil market, may merely concentrate on items not available from the private sector, but they should normally be maintained by a straight vote from the national budget, without having to compete for custom in the civil market. He suggested moreover, regarding the purchase policy of the Government, that the indigenous manufacturers should be called upon to explain their difficulty about quoting lower prices, before orders are cross-mandated abroad; that purchases should be made only from factories that are well-equipped for the manufacture and testing of metals and that enquiries should be issued exclusively in India for all items needed by Government, to enable future planning. He also expressed himself against duplication of effort in different branches of the industry and suggested proper checking up of expansion schemes. Speaking on the question of tariff protection, Mr. Bhan advocated higher import duties as a sufficient deterrent to imports together with a judicious application of import control itself which, in his opinion, would be perfectly justified in the case of an under-developed country like ours where industries were mostly dependent on the home market. Mr. Bhan concluded by expressing his hope for the inauguration of a single organisation for the entire non-ferrous metals industry and the trade, in one Non-ferrous Metals Federation.

Calcutta Markets

GRAIN & SUGAR CARGOES MAIN FEATURE IN FREIGHT MARKETS

STEADY INTEREST IN COALS

THE markets continue to be dominated by grain and sugar cargoes although interest in coal remains steady. Cuban sugar maintained rates for Madras at $11 f.i.o and stowed and West Coast India at $10.60 f.i.o with taxes for charterers' account. Santo Domingo to Ceylon was covered at 87s. 6d. for July shipment. River Plate remained steady with 77s 6d repeated to the U.K. Australian charterers have conceded 71s for bulk wheat ex silo from Western ports to the U.K., June-July shipment, while a motor vesel has been taken for a similar voyage for bulk barley and oats at 77s 6d and 84s 6d respectively. Two fixtures are reported for bulk wheat from British Colombia to Japan at $6.50 June shipment. Two vessels were fixed for coal Calcutta-Korea at the lower rate of 56s and Hampton Roads-Japan was also lower at $10 for July shipment. Ore from Calcutta to Antwerp was fixed at 56s 6d f.i.o and trimmed and from Mormugao to Rotterdam-Emden range at 54s. Time charter rates remained fairly steady with a Liberty sized oilburner being fixed at 14s per ton deadweight for four months trading and 17s 4½d for a 9,430-dwt, vessel for a trip out to Australia-New Zealand with delivery at Cardiff.

SUGAR PRICES FALL

During the week ended 7th June, sugar sales in the Calcutta market averaged between 3,000 and 4,000 bags daily. Arrivals were 800 bags a day by rail, though stocks shot up to 175,000 bags because of inadequate offtake. Rates for ready sugar ex-Kantapukur delivery were Rs. 31 for ordinary grain, Rs. 31-8 for big grain, while the price of imported Formosan sugar was quoted at Rs. 30. Business was poorer in mill delivery sugar. The Government has however started receiving tenders for the disposal of imported sugar at Rs. 30-8, ex-dock basis.

LINSEED

In sympathy with the generally easier trend prevailing in oils and oilseeds at the main centres, local prices registered a further appreciable decline during the past week. Lack of buying interest from consumers was the main cause of the downward tendency; scarcity of supplies from up-country was offset by poor demand with only small quantities of settlement business being done at gradually decreasing rates. The oil market was inactive; forward delivery failed to attract any buyers, whilst consumers were very reserved. Latest quotations were as follows: Ready Rs. 17-12 per maund; July-August Rs. 18 per maund.

HIDES AND SKINS

The market in skins ruled easier and prices showed a downward tendency. Stocks were higher than in the previous week.

Bazar Sales

(Between 1st and 7th June, 1954)

Cowhides: Wet salted (Slaughtered) 4,000 pcs. on the basis of Rs. 10-8 to Rs. 22-4.

Goatskins: Wet salted (Daissee, Killed) 35,960 pcs. on the basis of Rs. 255 to Rs. 450; Assam-Dinajpur-Murshidabad 12,100 pcs. on the basis of Rs. 345 to Rs. 357-8; Purneah-Kissenganj 11,500 pcs. on the basis of Rs. 300 to Rs. 347; Muzaffarpore-Darbhanga-Pakur 12,900 pcs. on the basis of Rs. 335 to Rs. 345.

Bazar Stocks

(7th June, 1954)

Cowhides: Wet salted 78,800 pcs.

Goatskins: Wet salted (Daissee, Killed) 44,000 pcs; Assam-Dinajpur-Murshidabad Jalpaiguri 59,500 pcs.; Muzaffarpore-Darbhanga-Pakur-Patna-Purneah-Kissenganj 220,000 pcs.

SHELLAC MARKET FIRM

During the week ended 8th June, the market ruled firm. The range of quotations was as follows:

Standard Pure Buttonlac		Rs 140 to 142 buyers.
Pure Buttonlac		Rs. 133-8 to 137 buyers.
Lemon No. 1 Shellac		Rs. 135 to 139 done and buyers.
Lemon No. 2 Shellac		Rs. 132-8 to 137 done and buyers.
F. O. Std. I. Shellac		Rs. 130-8 to 134-8 done and buyers.
Pure TN Shellac		Rs. 128 to 132 basis done and buyers.
4% I.T.N. Shellac		Rs. 123-8 to 127 buyers.
No. 1 Kusmi Seedlac	3%	Rs. 127-8 to 129 buyers.
No. 2 Kusmi Seedlac	3%	Rs. 118 to 120 done and buyers.
Fine Bysaky Shellac (Manbhum)	3%	Rs. 115 to 118 done and buyers.
Fine Bysaky Shellac (C. P.)	3%	Rs. 112 to 115 done and buyers.
Ordinary Bysaky Seedlac (C. P.) under	5%	Rs. 109-8 to 110-8 done and buyers.
Ordinary Bysaky Shellac (C. P.)	5%	Rs. 106 to 107-8 done and buyers.
Kireelac		Rs. 55-8 to 58 buyers.

Shipments during June until the 5th were 2,611 packages.

LONDON INSURANCE LETTER

BIG OVERSEAS BUSINESS

THE expansion of British life assurance abroad is of considerable importance to the nation's "invisible" income, and there is evidently plenty of scope for further expansion. The offices' task seemed difficult at first, but the success has been so gratifying that more and more of their energies is being devoted to overseas business. Expansion continues at home, but there is no denying that the life-assurance market is competitive. Outside sources of income are welcome. The Prudential, the biggest life-assurance company, has been seriously transacting life business abroad for not much more than 20 years; yet the value of its overseas life policies in force at the end of last year, £300 million, was already larger than the whole sum assured in the ordinary branch 13 years previously. The Prudential's premium income from oversea life business exceeds £10 million a year. The territories that predominate in these overseas accounts are Canada, Australasia, and South Africa—they make up about seven-eighths of Prudential's overseas life business. It is interesting to note, however, that this office's overseas life business began in India, in 1924. Not until some years later was it decided to develop the business abroad on an extensive scale. The office began transacting life business in Canada in 1930, in Australia and New Zealand in 1931, in South Africa in 1932. Development in the Near and Middle East has been less spectacular but steady. Not all markets are open and undiscriminating; and, of course, the British companies have to face keen competition with long-established national or international companies in some areas.

No Wish to Control

Because it is still a subject of political controversy, the question whether the insurance companies exercise too much control over British industry has been discussed again by insurance chairmen this year. The accusation against which they are defending their businesses is that, by virtue of the huge resources at their disposal, they can buy enough shares to exercise effective control over many companies. The Prudential and the Pearl, both of whose investment portfolios are very large indeed, have statistically investigated their holdings with this controversy in mind. The Prudential finds that its equity investments, spread over nearly 1,100 British companies, represent on an average, on the basis of market values, less than 2½ percent of the capital of each company. The Pearl has investigated its larger industrial holdings ("which are naturally in the leading industrial concerns in the country", the chairman says), and it finds that they represent in the aggregate less than 1 percent of the total capital of the companies concerned. Such figures could, of course, disguise a dominant interest in a relatively small number of companies; but the Prudential revealed that there are only 14 companies in which its holding exceeds 25 percent, and that the holding represents a controlling interest in only two of them—one of which is Prudential's own subsidiary. Prudential Nominees, which is not used, as some nominee investments are, to conceal the identity of the real interest in a business. It is emphasised once again that the sole purpose of investing money in ordinary shares is to get the best yield obtainable, compatible with the security required. Security requires a wide spread; and even such large funds widely spread are not nearly enough to dominate many businesses. In any case, as the Pearl's chairman points out, "industrial management is a problem in itself, and of this insurance companies have no particular knowledge or experience". Hence the Prudential's deliberate policy, as stated by its chairman, is "not to acquire such large proportionate holdings in industrial companies that we might be called upon to intervene in matters of management and direction".

Control of Fire

Any outstanding month's figure for British fire losses is nearly always a high one; so the modesty of April's estimate, published by *The Times* at the end of May, was especially welcome. The figure of £326,000 compares with £2,184,000 for March and with a monthly average of 2 million for last year (with April's losses a little above the average). Damage in the first quarter of 1954 was so severe that the year's average so far, despite the marked improvement in April, is £2,354,000. One month does not make a trend, but it is a fact that fire losses in these times are so consistently high that a marked reduction may be significant. If it means that some of the lessons in fire-control that the insurance companies have been teaching are being learned and applied, then the development comes none too soon. It is often argued that the physical losses are exaggerated in value by the rise in prices; but there was no rise in prices that could justify an increase of 35 percent in average monthly fire losses in the first quarter of 1954 compared with the whole of 1953—which itself yielded the highest year's losses on record.

Option of Repayment.
(t) 3 months notice. (v) 1 month's notice. (w) Any int. day. (x) 3 months notice. (y) 3 months notice (z) 12 months notice.

(A) Repayable at par between the years 1924 and 1945 in instalments of not less than Rs 1,00,000 per annum by drawings to be held in June of each year.

(B) But befor 21st December 1966 Also redeemable out of a cumulative sinking fund of 1½ per cent per annum by purchase at any price less than par or by annual drawings at par

(C) Redeemable at pay in the event of the undertaking being purchased by the Corporation of Calcutta or Howrah, on 1st January 1945, or every seventh year thereafter

(D) These Bonds are deposited with Imperial Bank of India as security against overdraft.

(E) The holders of these Debentures have the right to convert them into shares of Rs 10 each between 1st January, 1955 and 31st December 1949 on giving 3 months' notice one Bond being exchangeable for 50 Ordinary shares

(F) Redeemable (a) at 102 per cent on 1st October, 1974 or in the event of voluntary liquidation or the undertaking being purchased or in the event of the security being enforceable or (b) out of a sinking fund by drawings at 102 per cent or by purchase at or under 102 per cent.

(G) The holder of each Debenture has the option to apply for Ordinary Shares to the nominal value of Rs 50 payable cash and this option expires at the end of 3 months from the date of notice of repayment by the Company.

(H) Up to and including the year 1943, holders may at any time convert into fully paid Ordinary Shares at the rate of 1 Share of Rs 10 for every £1½ of the stock All Ordinary Shares thus converted will rank for dividend part passu in all respects from the financial year following that in which the option is exercised and the holder will receive interest on the stock converted in respect of the financial year in which the option is exercised

(I) Holders of the fully paid up convertible Debentures may on any interest date up to 1st January 1943 convert into fully paid up Ordinary Shares each £50 debenture, for 50 Ordinary Shares of Rs 10 each on 1 month's notice

(J) If this option is not exercised before 30th September, 1942 the Company will not be entitled to exercise the option before 30th September 1946

(K) Repayable at par by 1986 by annual drawings on 1st July each year

(L) Option of repayment in part out of gross profits every year to a maximum of Rs 1,50,000 Notified to be redeemed at par on 1st November 1945

(M At par by 19 annual drawings

(N) Option of repayment on 6 months notice after 31st July, 1955 at Rs 2-8 per cent Prem

(O) At par all or any of this Debenture on 31st December, 1960 or on any subsequent interest date

(P) May be redeemed on 30th June 1966 or any subsequent half-yearly date for payment of interest up to 30th June, 1964 at a premium of 1% on giving 6 Calendar months' notice

(R) Option of repayment within 5 years from the date of issue on one month's notice

(S) The Company has the option to repay all or any at par by giving notice for 6 months expiring on any interest date after 30th September 1955 Any time on or after 1st October 1949 holders may convert each notice of Rs. 100 into 25 Ordinary Shares to take effect on 1st October in each year on giving 15 days notice prior to such day

(T) May be redeemed at depreciation of Rs. 20 per Debenture if redeemed earlier than 31st December 1955 on three months' notice

(U) May be redeemed on 30th June 1952 at 2 per cent Prem. on 30th June 1957 at a premium of 1 per cent or on 30th June 1961 at premium of 1 per cent.

(V) Redeemable at a premium of 2 per cent on 31-12-64 with option to redeem on 3 months notice on any interest date after 30-6-55 at same premium These Debentures are registered and are transferable by Transfer Deeds.

(W At par per cent premium between 1-1-60 and 31-12-64.

(X) Any time on six months notice.

(XX) At par on or after 1-12-59.

(XZ) Repayable at par on 31-12-64 with the option of repayment on 31-12-54 or any subsequent interest date at a premium of ½ per cent

(WZ) Repayable at the end of 10 years at a premium of 50 per cent per Debenture with the option of repayment earlier at any time after expiration of 5 years.

N—Nominal

(xx) To be redeemed at a premium of 10 per cent Rs 70,000 to be redeemed annually by drawing on 3 months notice with option to redeem all after from date of issue on 6 months notice Option not exercised repayment to be made after full term.

(v) These Debentures are registered and are transferable by Transfer Deed.

JOINT STOCK COMPANIES' PREFERENCE SHARES

Dividends are cumulative and the shares carry a preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. Months against names of companies indicate approximately times of payment of dividends.

SOURCES OF RISK CAPITAL FOR INDIAN INDUSTRY

INFLATION AND INVESTMENT: SHROFF COMMITTEE ON SHARE TRUSTS

THOSE parts of the Report of the Committee on Finance for the Private Sector that deal with the general economic climate were referred to on this page last week, as being the most important of the findings of Mr. Shroff and his fellow-bankers. There remain the narrowly financial recommendations of the Committee, which are full of interest but which the Committee presents with a warning that they will not by themselves transform the Indian industrial scene. In its study of the financial resources of private industry, it is notable that the Committee produces no evidence that mere shortage of finance was an important cause of the increase in unemployment which occurred last year and which led to the concern about industrial progress and the appointment of the Committee. It was of course no part of the Committee's job to prove that inadequacy of finance had restricted employment, but if there had been any solid evidence, the Committee would no doubt have reported it. The Planning Commission has gone on record with the view that finance has not so far been a limiting factor, and although the Shroff Committee does not wholly accept this view, it does not controvert it. It does state that working finance has not presented any problem for large-scale industry, and this confirms the opinion formed in the country's money markets in the past few years. This question might appear to have only historical interest, but it serves to place the financial recommendations of the Committee in their proper perspective. Financial opinion is now in favour of providing more ample funds to Indian industry and this is probably wise, but there is nothing in recent experience to show that it must be done with great haste, or that a painful increase in unemployment is the only alternative.

The Committee says that finance will undoubtedly be a limiting factor "in coming years if present trends in savings and supply of liquid resources continue". The reference to "coming years" presumably involves the assumption that Indian industry will be expanding and increasing its output in the near future. This is a fair assumption, but we can only make it if we expect that savings will continue to accumulate, because the expansion of Indian industry and the increase in productivity will have to be financed by prior or parallel savings, either personal or institutional, either voluntary or enforced. It is not as though higher production then called for more savings; the savings must come first or there is no expansion of productive resources. So if we proceed on the assumption that Indian industry will continue to expand, there is no problem about savings; we have already assumed their existence. What we have to worry about are liquid resources: working capital and purchasing power. On this question, the prevailing view is that some expansion of the supply of cash ought to precede the increase in production, or in the words of the Planning Commission: "Judicious credit creation somewhat in anticipation of the increase in production and the availability of genuine savings has also to play a part, for it is conceivable that without this kind of initial push, the upward process may not start at all or may fail to gather momentum".

*

This is a defensible view, as long as the people who hold it understand that they are declaring their belief in the stimulant effects of inflation. It has nothing to do (or should have nothing to do) with the unfounded belief that the output of goods cannot increase unless the supply of money increases along with it. This latter misunderstanding is now quite popular, and the International Monetary Fund Mission is thought to have given it its blessing. It leads to such false reasoning as this: "If a factory offers 100 pieces at one rupee each, Rs. 100 in purchasing power is needed to absorb its output. But if the factory doubles its production to 200 pieces, then Rs. 200 in purchasing power will be required if it is to sell its total output". So if India doubles her production, she must double her money supply! From the point of view of the national economy, this is quite false. The 200 pieces can be absorbed quite well with Rs. 100—if prices are cut, and/or the velocity of trade and circulation is increased. Before the country commits itself to wholesale and secular increase in money supply by Government-"managed" inflation it should explore ways of lowering prices and increasing the velocity of the credit already available.

Many of the Shroff Committee's recommendations bear directly on the question of increasing the velocity of circulation, especially by way of bringing present savings and idle cash into the banking system so that they can be put to better use, and by way of making better use of resources now lying with the banks. The Committee correctly sees the main problem as one of mobilising financial resources, deploying them most expeditiously and making them more flexible: it does not argue mainly for a total increase in their volume. In this, its recommendations are quite opposed to some of the inflationary nonsense—"inflation without tears"—that has passed for serious economic discussion in India lately. The Report says: "Admittedly, the Government can, through borrowing from the Reserve Bank, bring about as large an increase in money supply as it desires. But a correct policy requires that the creation of money does not set in motion inflationary forces of such a magnitude as will defeat the basic purpose of monetary expansion, namely, encouragement of savings from current income and investment in productive uses."

*

Granted that this is the objective of the Committee, its recommendations are logical: extension of banking facilities, reduction in their cost, quicker remittance between bank branches, coordination between conventional banking institutions and the shroffs, freer investment of bank funds with suitable guarantees so that security might not be abridged and more investment of insurance funds in industry. The main cause of the present low velocity of circulation in India is the exclusion of much of the money supply from the system of financial institutions. If money is to be drawn into them, the reluctance of present holders to part with their funds must be overcome, and for this, greater security and more impressive guarantees will be needed. This is especially so if the institutions, once they have received funds, are going to put them to unconventional uses—as when banks lend long to industry. So a good part of the Shroff Report is devoted to suggesting ways of impressing the holders of cash with the safety of lending their money to the banks and to industry. Apart from their ignorance and isolation, many people who hold money today are unwilling to put it into the banks or into shares because of recent painful experience with both. So many banks have collapsed and so many shares become scraps of paper in the last decade in India, that the difficulty of mobilising savings has been multiplied. This applies to private institutions of course; the Government has been able to raise more money by loans and by its post office savings schemes year by year.

Some of the measures the Committee proposes in order to increase the volume of savings entrusted to the banks and private industry are practicable and would no doubt be efficacious if the Government agreed to relent its own pressure on the same sources of finance. But obviously as long as the problem is to promise savers a *secure* form of investment in industry, the amount of risk capital that private enterprise can obtain from these measures is limited. This applies to all the extra money it is hoped to mobilise through the banking system and to most of the money hoped for from various consortiums and Government-sponsored institutions. So Indian industry seems to be still faced with its familiar difficulty: its main trouble is shortage of risk capital and the only way to get more money into the organised financial system is to promise that it will not be risked. This emphasises the principal limitation of the Shroff Committee's plans, which it frankly confesses when it says: "In endeavouring to assist industries, the existing institutions have to bear constantly in mind the need for securing the interests of those who have entrusted their resources to them, such as depositors and holders of insurance policies. Otherwise, the stability and development of these institutions may themselves be endangered. It is therefore prudent to expect that with all the modifications that we have suggested, the existing financial institutions can go only a part of the way in meeting the requirements of industrial finance".

*

To overcome this obstacle, the Committee goes on to suggest other institutions that might be able to provide risk capital, and it is by this standard only that such institutions should be judged. The ones it suggests are issue houses, investment trusts and unit trusts; and it adds a brief mention of the two industrial finance corporations now being set up, one wholly by Government and one by private industrialists with the assistance of the World Bank. Of the latter there is only this to be said. If the money that goes into them, and which they then lend to industry, comes from genuine domestic savings, it will reduce the amount of savings available to industry through the existing channels; if it comes from foreign savings, it will represent a net gain that otherwise might not have become available to industry. If on the other hand, it is not genuine savings at all but represents a contribution from Government made possible by deficit financing, it will threaten to undermine the structure of security—because it is hazardous to invite people to subscribe to fixed-interest stock through a variety of "safe" institutions and then to debase the currency. If the Government is going to "manufacture" its contribution to industrial finance, it would be safer to put one's money straight into industrial equity and not into fixed interest bonds.

The weakness of the proposal to establish issue houses and investment trusts is that they presuppose substantial initial savings, and cannot be expected to begin the process of saving for investment. The Committee acknowledges this when it says of issue houses that they might "involve some diversion of resources currently available for investment", and when it says of investment trusts that they need "substantial initial capital" and will need for their establishment action by "relatively large savers". But this is no final argument against them and the Committee is correct in urging that they be given careful consideration. It will be a net gain if some money now available for investment in industry (as it must be if it exists in "substantial" quantities, or in the hands of "large savers") were first diverted to the setting up of trusts and underwriting houses, which could then appeal to small savers to subscribe genuine risk capital in a form that was safe not because it was never risked but because it was risked over a wide range of reputable enterprises. These suggestions deserve further study and they should then point to joint action by leaders in the

field of private enterprise. Their importance is increased by the fact that they are after all the only source of new risk capital suggested in the Shroff Committee's Report. They are not of course the only source of new capital in the Indian economy. Another and more important lies in reduced taxation, but that is the concern of another committee.

THE SMALL INDUSTRIES OF INDIA

THE REPORT OF THE INTERNATIONAL PLANNING TEAM

ECONOMIC development inevitably involves a growth of small industries to satisfy changing tastes and needs, as a proving ground for new ideas and enterprising men, and to provide flexible and efficient specialist supplies to larger concerns. The report of the International Planning Team, sponsored by the Ford Foundation, reveals a sorry state of affairs in Indian small enterprise. At a time when small industry is being asked to play an increasing part in the economic development of the country it is imperative that the conclusions and recommendations of this impartial body should be studied with the utmost care. The chief problem Indian small industry faces is the psychological one of adopting a modern progressive attitude towards the problem of its own development. In India the report attributes the lack of the necessary urge for internal efficiency in small industries to the natural reluctance to change from familiar methods, and to fears on the part of labour that rationalisation and technological improvement will produce unemployment. The report rightly points out that this fear is due to ignorance of the true nature of the causes of unemployment, and an inadequate appreciation of the effects of economic expansion. Rationalisation is not an instantaneous process; while it is taking place there is usually ample opportunity for displaced labour to be absorbed elsewhere in satisfying increasing demand. The same can be said for the unemployment caused in the process of technological improvement, and the report wisely adds that the neglect of either of these two important aspects of efficiency will eventually cause the very unemployment that is feared, "and without opening prospects for the future."

The real urges to progress and development must come from the conditions of the market. Small industries are not usually of the "basic" variety, and the factor of consumer preference plays a determining rôle in the constitution of their markets. The report undoubtedly makes its most valuable contribution to future thinking on small industries when it emphasises that industrial products must be "geared to meet consumers' felt needs" and that these consumers comprise "markets of staggering possibilities". The future of the small industry lies in its ability to satisfy the requirements of the individual, and to persuade him to increase them. The study of female psychology may seem to be a subject far removed from the development of industry, but as the report so rightly points out, the women of India will become an increasing consumer factor, and the enterprising entrepreneur may well build his future prosperity on his ability, and that of his advertising agent, to appeal to women.

* * * *

The report makes a number of useful recommendations, three of which the Government has already decided to implement. The first proposes the establishment of at least four Institutes of Technology to meet the needs for co-ordinated research, and for basic technical assistance and training. The establishments would be located geographically and would act as service agencies to put the small industrialist in touch with modern advances in science and technology, business management, finance and marketing. The need for a marketing organisation should be met, the report suggests, by the establishment of a Marketing Servicing Corporation to determine consumer demands through surveys, and encourage producers to respond to these demands, to establish a market news service, and to secure and process orders from wholesalers and retailers. A third recommendation is for the formation of a Small Industries Corporation by the Government to co-ordinate supply orders so as to provide incentive for small-scale industrial development, and to ensure long production runs. These three recommendations are to be put into effect without delay. Others cover the need for a "National School of Design", "Export Development Offices" to promote overseas demand, the strengthening of local, State and national trade associations, and the encouragement of co-operatives and the withdrawal of the Government from their organisation. Finally the report deals with the difficulty which small industry, all too often badly managed and insecurely based financially, has in obtaining the capital necessary for development. The recommendations include the delegation of more authority by the commercial banks to their branches for the granting of overdraft facilities, the expansion of co-operative banks into the industrial field, the setting aside of Government development funds to provide loans for venture capital, an increase in the number of State Finance Corporations and their establishment in all States, and the introduction of a system of instalment credit to encourage the modernisation of industrial equipment.

The importance of the findings and recommendations of the team cannot be overstated, but it is in the way that its report shows the whole process of development to be primarily a state of mind that its chief value lies. Small industry in India must throw off its inefficient habits and prejudices and adopt the ideas of modern development. The fears which prevent rationalisation and modernisation must be dispelled by the firm belief that it is progress which maintains employment and increases wealth, not stagnation. And most important of all, the report gives its uncompromising support to the over-riding importance of consumer preference and individual demand in determining the state of the future market for the products of small industries.

WOMEN, WORK AND WAGES

A REPORT ON FEMALE LABOUR IN INDIA

THE Report on the Economic and Social Status of Women Workers in India (Labour Bureau, Ministry of Labour, Government of India, Re. 1) comes shortly after the successful Calcutta session of the National Congress of women. That the proceedings of the latter had about them an air of unreality has since been suggested by a woman correspondent in the *Statesman*, and it is significant that in explaining the many deficiencies of its report the Labour Bureau says quite plainly, "All the women's organisations in the country were addressed, but they had no information to furnish on the subject," the subject being the condition of women workers. It now remains to add that the Labour Bureau itself has not been able to secure much unfamiliar material, and it will surprise few if no action follows the publication of the report, just as nothing much came of the companion reports published previously by Mr. S. R. Deshpande. Most of these reports are undertaken at the suggestion of a trade union (this one on women workers was urged by the Indian National Trade Union Congress). A Government department sends questionnaires to employers' associations, State Governments and Chambers of Commerce, and out of their replies a report is collated, of which often the only use is made by writers of future reports on the same subject. If labour treats these reports with scepticism, and the public with cynicism, the Government has largely itself to blame. It publishes too many reports, and too little is done about them. This is only to be expected, for the writers of these reports will not yet accept the basic and obvious truth that the economic condition of a section of the people must bear some relation to the general economic prosperity of the community as a whole and neither charity nor welfare legislation can materially alter that. What the former can do is to add degradation to material misery ; all that the latter can do, and has already done to a considerable extent in India and elsewhere, is permanently to harm the very sources of wealth.

The report on women workers admits frequently that on almost all aspects of the employment of women in this country "complete information is not available." Anyway, according to the 1951 census, in the nine Part A States there were about 109 million persons gainfully employed, of whom about 31,100,000, or 28.6 percent, were women. Of the total number gainfully employed (109 million), 72.3 percent were engaged in agriculture. They are the most difficult to regulate, and such scrappy information about them as is available in the report must also be treated with reserve. It must be emphasised here, for it is so often forgotten, that about three quarters of the working population of India lie beyond the pale of enforceable labour legislation, that only a small minority benefits from welfare measures, and that it is only those industries which have organised themselves for better efficiency and greater standardisation which can be made to pay unrealistic wages and benefits. All this applies to women workers, and the report itself divides employers of women only under five heads; factories, mines, plantations, municipalities, and public works departments and river valley projects. Of the total industrial labour in the country, no more than 12.3 percent is female labour, although the proportion naturally varies between one industry and another. In the mines women form 20.5 percent of the total labour force, in the plantations it is as high as 46.6 percent. The report brings out quite clearly that the employment of women in almost all industries is on the decline—fewer women are being recruited, many vacancies are not being filled or filled only with men. One possible reason for this decline is that employment of women is proving uneconomic, which again may in part be the result of protective and welfare legislation.

* * * *

As in many other more industrialised countries, the wages of women workers in India are usually fixed at rates lower than those for men. What the I.L.O. calls "prevailing social customs and preconceived notions about women's employment" doubtless have something to do with the inequality in wages, but the chief reasons are the well known economic ones. Female labour is mostly unskilled, it is subject to more interruptions, and except in a small number of jobs, its efficiency and endurance are lower. In 1940 the Textile Enquiry Committee (Bombay) examined the question, and came to the conclusion that the differentiation was justified. When, therefore, the report under review says that "recent trends have been in favour of abolishing the distinction..... based merely on sex," it misses the point. The fact is that the difference is *not* based merely on sex. Artificial compulsions apart, which can only be short-term, it is productivity that must ultimately determine wages. But then, "recent trends" are to forget this even in the matter of male labour.

In improving the social status of the woman worker in India there is a great deal to be done, and much to be learnt from abroad. Some of the problems have not yet been solved anywhere—the working woman's functions at home, for instance, are difficult to lay down in any country. But there is evidence that the Indian woman suffers from special disabilities, and some of them are avoidable. The majority of the women workers in India are married, and the question is bound up with wider social problems which are outside the scope of this article, as they were of the report. But the independent woman of the future, meaning woman as a full citizen, will be brought into being not by equal wages, nor by feminist legislation—although both may help—but by a real change in the community's assessment of calculable exclusively in terms of wages. Women's work and worth, neither of which is calculable exclusively in terms of wages.

CURRENT COIN

U. S. Business Outlook.—United States business indicators have made another favourable showing in May, reports the National City Bank of New York in its monthly letter on business and economic conditions. When all the returns are in they are likely to show a continuation of the April record of stable production, lessened unemployment, and increased new orders. The eight months' drop in industrial output halted in April, when the Federal Reserve Board's index levelled off at 123 (1947-49=100). With the rate of steel and automobile production a little higher, the May figure should be as good or better. Taking general market activity into account as well as the production index, it now seems plain that March was the low point of the business decline. The turn for the better has not been sharp, and current indications favour stability rather than a marked rise. The important matter, however, is that the recession has not fed upon itself or turned into a downward spiral. Fears that curtailment of production and employment would lead to curtailment of consumption, to further cuts in production, and so on round the circle, have mostly disappeared. Tax reduction, the immense holdings of liquid assets available for a rainy day, abundant credit resources, unemployment compensation, and other stabilising influences have helped sustain personal incomes and consumption, and have thus provided an anchor against spiralling effects. Business confidence, which was gratifyingly strong all through the decline, remains optimistic. In fact, the disposition to take a rosy view has been so pronounced that President Eisenhower felt impelled at a recent conference to caution against it. Many business men feel, however, that they have a sound basis for optimism in the steady, though moderate, increase in orders. Month after month, they have watched shipments exceed new business booked, and unfilled orders decline. Even after production was cut back, the decline continued. Now it is encouraging to see the gap between shipments and orders narrowing in a good many lines, and production leveling out. Businesses, which for months were living off their inventories, and letting their commitments run down, are now buying more in line with current operations. For the most part, the increase has been gradual, but a few buying flurries have occurred, such as the scramble for cotton print cloths in mid-May. The increase in orders is a signal that the two major forces behind the recent decline—inventory adjustment and the pruning back of defence contracts—have lost much of their steam. Only about a third of the companies surveyed in May by the National Association of Purchasing Agents were still reducing inventories of purchased materials. However, it would not be safe to assume that inventory reduction as a whole is ended. Neither manufacturers nor distributors have as yet succeeded in cutting finished goods stocks appreciably. Looking at the overall level of inventories, the progress in inventory adjustment seems disappointingly slow, a decline of only 1½ percent from the peak last October. On the other hand, last spring business was building inventories at the rate of $6,000 million a year, but by the first quarter of 1954 was reducing them at a $5,000 million annual rate. From that viewpoint the adjustment seems much more impressive and accounts for the major share of the drop in production. The important point at present is that, while stocks may continue to decrease, the rate of change is likely to become more gradual. The progress made to date, the firmer tone in business, and the uncertainties of labour negotiations and the international situation all point in that direction. A slackening in the rate of inventory reduction and a return to buying more nearly in line with consumption eases the pressure on production. In most business cycles there is a period in which inventories are still going down at the same time as production is stable or rising. Evidently the U. S. is in such a period at this time.

* * * *

Oriental Going Mutual.—Now that the Board of Directors of the Oriental Government Security Life Assurance Co. Ltd., has formally passed a resolution recommending that the Company be converted into a purely policyholders' concern, the long-drawn-out preparations and negotiations for this important step, which will mark a milestone in the history of Indian life assurance business, have been taken a stage nearer completion. The Company is one of the earliest, and the most substantial units in the field of life assurance in this country. It would be the first important privately-owned insurance company to convert itself voluntarily into a mutual company under the provisions of the revised Act governing life assurance business. At one stage it appeared that the plan would be abandoned, because the Government of India insisted on nominating a prescribed number of directors to the board of the reconstructed company, despite the fact that it was to have no financial stake in the new concern. It is understood that this demand has been dropped by the authorities on condition that, from the formal date of conversion, the future board will have a majority of policyholders' directors on it, although the present shareholders' interest would not be completely extinct from that date. Under the revised scheme of control, management and compensation, the shareholders will be paid Rs. 8,800 in the Company's bonds, bearing interest at four percent, on the day it is converted into a mutual concern. These bonds will be repaid during ten years (by drawing lots every year for one tenth of the total issue) out of future valuation surpluses without touching the various reserves, which will be handed over to the new Company as they stand. At the outset the board of directors will consist of seven representatives of the policyholders and five of the bond holders, with the latter being progressively reduced as the bonds are redeemed, so that at the end of ten years the board will consist wholly of those elected by the policyholders. The next and final stage of this transformation will be the approval of the board's resolution by extraordinary meetings of the shareholders and policyholders, and its formal acceptance by the Government of India.

* * * *

The Progress of Rohtas.—Mr. Shanti Prasad Jain's speech from the chair at the 21st ordinary general meeting of Rohtas Industries Ltd, at Dalmianagar, Bihar, last week, shows that Rohtas Industries is determined to ride the crest of the boom in paper and its attempts to improve the quality of the paper made from bamboo and bagasse pulp are impressive. Mr. Jain's speech is printed in full on another page of this issue; in it he emphasises that modernisation of the factory, and constant laboratory experiment, should contribute towards the company's aim of producing paper up to the best standards of that made from wood pulp. The company has also decided to expand its paper-making capacity in order to gain economies of scale, and has obtained promises from the Government of Bihar concerning the leases of forest areas. The aim is eventually to produce papers at present imported such as bank, ledger, poster, kraft, match and manilla paper. The extension of the company's cement-making capacity is being hindered at the moment by the uneconomic freight rates which it is permitted to offset against its prices. The situation of the plant away from the limestone head results in higher transport cost of limestone and lower freight charges for the cement. A factory situated in the same region and drawing limestone from the same area can escape the freight on limestone by virtue of its being at quarry site and is able also to charge extra prices when sending the cement over long distances. Mr. Jain was able to report good progress in the Company's asbestos cement plant, but the activities in sugar are meeting difficulties from the fact that the irrigation charges imposed by the Bihar Government are causing growers to turn their land to paddy cultivation. Mr. Jain's report reveals that the year ended 31st October, 1953 was a successful one for the Company, despite a fall in the total sales proceeds.

* * * *

Finance for Under-developed Countries.—The views of 20 Governments on a proposed Special United Nations Fund for Economic Development (SUNFED) are summarised in an interim report prepared by Mr. Raymond Scheyven of Belgium and recently issued at U.N. Headquarters. It will be remembered that when the General Assembly discussed this subject last December Mr. Scheyven, then President of the Economic and Social Council, was appointed to examine, with the assistance of the Secretary-General, the comments of Governments on the establishment of this fund. Plans for SUNFED had been drawn up earlier by nine international experts. This Committee of Nine had proposed that Governments contribute an amount equivalent to $250 million as initial capital for the Fund from which long-term, low-interest loans could be made, mainly for non-self liquidating projects such as road-building, irrigation schemes, etc. SUNFED, it was felt, would meet a gap in existing international machinery for promoting economic development and at the same time help fill another gap—that between the money needed by under-developed areas and the capital available for their development. The interim report will go before the coming session of the Economic and Social Council, and the final report will go to the 1954 session of the General Assembly. Financing the development of under-developed countries is described by Mr. Scheyven as "the greatest problem of the present time" for, he points out, "on its solution depends the stability of the economic and social situation in a steadily expanding world economy". And he adds that the fact that two-thirds of mankind live in great proverty, which breeds discontent of every kind, can no longer be accepted. "The solution of this problem is therefore an important factor in the maintenance of peace." In addition to the replies from Governments, Mr. Scheyven paid visits to Washington, Paris, Brussels, The Hague, Copenhagen, Stockholm, Oslo and London; and later, after resuming contact with U.N. Headquarters, again to Washington and Ottawa. In all these capitals he had conversations with representatives of the Governments. The 20 Governments which replied were Belgium, Bolivia, Canada, Chile, China (Taiwan), Denmark, Honduras, India, Italy, Japan, the Netherlands, New Zealand, Norway, Panama, Saudi Arabia, Sweden, Switzerland, United Kingdom, United States and Yugoslavia. While all are broadly in favour of the idea of setting up SUNFED, there are, reports Mr. Scheyven, considerable differences of opinion when the Governments deal with the practical problem of establishing the Fund. He groups the replies in three categories. The first, from under-developed countries, express the view that the world situation—and in particular the situation of the under-developed countries—demands that SUNFED should be set up as soon as possible. Even if provided with only modest resources, the Fund would be an important part of U.N. machinery for ensuring the financing of economic development. They take the view that it is now time to draft the Statute of the Fund on the basis of the recommendations of the Committee of Nine. Countries in this first group say that they are prepared to contribute to the financing of the Fund to the extent their means permit. The second group of replies, from industrialised countries, express serious reservation as to the advisability and feasibility of setting up the Fund, now or even in the near future. They recall that the Assembly's resolution made the establishment of an international fund for financing development of under-developed countries conditional on supervised disarmament which would make it possible to make funds, at present absorbed in defence expenditure, available for the Fund. That condition has not yet been fulfilled. These countries also state that their economic and financial positions, especially their heavy expenditure on defence, do not allow them to make an appropriation to such a Fund at the present time. Even when supervised disarmament is achieved, these countries state, they will find it necessary to make essential investments in their own territories to ensure economic and financial stability. Some countries in this group state they will be able to contribute to the Fund only if the U.S is a participant. The third group of replies is also from industrialised countries, but these take the view that the Fund should be set up at once. In the group, says Mr. Scheyven, are Norway, Denmark and the Netherlands. Existing economic conditions in the under-developed countries are a serious cause of disequilibrium which is itself a permanent threat to peace. This group also believes that the Fund would not duplicate or diminish the effectiveness of existing agencies, but would reinforce them. They state they are prepared to contribute to the Fund immediately, within the limits of their financial resources. Mr. Scheyven adds that many of the replies in the 20 received agree with a point made by the Committee of Nine that setting up the Fund must not lead to the creation of a new international bureaucracy.

WIDESPREAD FALLS IN STOCK MARKET

GILT-EDGED COMPARATIVELY FIRM

London, 16th June.

WIDESPREAD falls were sustained in the stock market during the past week. The setback was the worst for some time following the decline on Wall Street and the deterioration in the international political situation. There was not a great deal of liquidation, but persistent small selling found the market without support, and a steady fall in prices was recorded in almost all sections. The main exception was the gilt-edged section, where medium-dated stocks remained firm. Irredeemable and long-dated issues, however, eased in places. Foreign bonds lost ground under Wall Street's influence and in view of the international situation. Japanese issues were also adversely affected by the latest news concerning that country's economic problems. Sharp losses were sustained both in Japanese and in German issues, while other Far Easterns and Europeans also receded. Rails were easier where changed. The industrial market made a depressing picture, and over the week appreciable falls have been sustained. Leading issues often recorded losses of around two shillings or more in places, while the more speculative of the recent favourites recorded the biggest falls. Gold shares were an erratic market but the general trend was toward lower levels. Business was small and was largely confined to the recent popular Free State issues and, to a lesser extent, to uranium shares. The June dividends were as expected, and had little effect on the dividend payers. Base metals lost ground and recorded a general fall, although the losses were not large. Oils similarly lost ground, while tea shares made a mixed showing. The recent good dividend and profit statements and the generally favourable outlook for the industry were offset by the general uncertainty of Wall Street and the international situation. Rubbers were fairly well maintained, helped by the rise in the commodity price.

The Money Market

Short loan conditions were again difficult during the past week. The market was hampered by the fact that it was a short working week, while they also had a bigger allotment of treasury bills to pay for. However, despite having to concede a slightly higher rate for bills on occasions, and a little bit more for outside money, borrowers were not unduly pressed. The market again raised its tender bid for treasury bills by a further 2d, as a result of which bill rates were lowered by 1/32 percent. Treasury bill applications totalled £418,325,000, of which £250 million were allotted at an average rate of 32s 3.56d compared with 32s 11.61d in the previous week. This week £260 million are offered. The Bank of England return for the week ended 9th June showed that notes in circulation were about £13 million up at £1,637 million, while bankers' deposits were about £1 million lower at £279 million.

Activity on Wall Street

The Greek market was the feature of New York bond dealings with 6 percents and 7 percents earlier in the week spurting up some six points. Renewed active demand for these was sparked by the news that the Greek Government would invite holders of the bonds to Athens to discuss the debt settlement. Buying interests, however, was eventually satisfied and prices slipped by two to three points. Elsewhere, Serbs were firm in fairly active turnover. Germans were easier in slow dealings, while Italians were fractionally mixed in a small volume of trading. Denmarks and Norwegians gave ground under light offerings. Polish issues were soft, with several selling at the 1954 lows. Japanese bonds tended to ease. Various Brazilian 3½ percents registered gains of one to four points at the outset but in subsequent sessions trading interests lagged. Chileans were under pressure with losses confined to fractions. Other South American issues were largely neglected. In the domestic list, rails were easy, as also were various industrial and utility convertible issues, where losses ranged from one to three points in sympathy with the recent sharp setback in security values. On the other hand, U. S. Governments and high grade corporates ruled firm. Federals were aided by the withdrawal of offerings, with 32 years 3¼ percents bid up to $110—their 1954 high.

Outflow of Gold from U.S.A.

The U. S. Treasury has announced that the outflow of gold from the United States was $63 million in the first three months of this year. This is the smallest figure since the third quarter of 1952, and compares with the outflow of $599 million in the first quarter of last year. The Treasury said that figures for the second quarter of this year, which are not yet complete, indicate that the outflow continues to be small. Net sales over April and May were only $4 million.

No Subsidy for U. S. Cotton Exports

The announcement by the U. S. Secretary of Agriculture that no subsidy will be introduced for cotton exports during the 1954-55 season has been welcomed by Lancashire cotton traders. The Liverpool futures market opened appreciably higher on Monday as the possibility of a subsidy on U.S. exports had been restricting trading and depressing Liverpool values well below normal parity with those in the U.S. Traders believe that the assurance that the international price of American cotton will not be subject to political interference is likely to promote confidence and help bring a steady broadening in turnover on the Liverpool market.

Improvement in Tramp Freight Rates

An improvement in freight rates for tramp steamers was recorded in the U. K. Chamber of Shipping index for May, which rose to 77.4 against 75.8 for April. All sub-indices showed improvement, especially the one for fertilisers, which gained 3.1 points to 82.2. Grain rose from River Plate on the U. K. and North European account. Some improvement was also noted for grain carriers from St. Lawrence to the U. K. Coal chartering made good progress and the index was adjusted from 71.6 to 72.9. The index for the sugar trade rose from 79.6 to 81.1. While the rise in values was generally welcomed by shipowners in most instances, earnings were just about sufficient to cover the running costs. On the other hand, the marked falling off in demand for vessels on time charter resulted in that index dropping from 65.5 to 59. Rates for motor vessels were badly affected, with the sub-index marked down to 59.6 against 72.2. They came more into line with oil-fired steamers at 58.4 against 58.8 in April.

Last week, the London freight market was generally quiet but some activity developed in the South African trade, including sugar from Durban to the U. K. at 62½s, and from Mauritius to the U. K. at the same rate. Queensland sugar operators are working in further July tonnage and shippers are now open for bulk wheat from West Australia to the U. K. at 67½s. Business included ore from Dungun to Japan at 29s, f.i.o., and rice from Whampoa to Colombo at 39s, f.o.b.

Poor Demand for Quicksilver

U. K. demand for quicksilver at the quoted level of £90 per flask, ex-warehouse London, is generally very poor, according to the trade. It appears that consumers are only buying when it is essential. The market nevertheless continues to present a firm front and a purchase of anything other than a small quantity would be impossible because of the limited stock position. Meanwhile, it is reported that there is a good deal of international demand. Japan, for instance, is seeking some 5,000 flasks and Indonesia about 1,000 flasks. Indonesia is believed to be seeking supplies for the newly erected chlorine soda plant.

Australian Flour Export Prices

Trade advices received in London indicate that from 15th June the Australian Wheat Board is assessing its own asking price for flour exports. The price is no longer tied to the wheat equivalent of the price of Canadian No. 3 Northern Manitoba wheat. The Board makes firm offers, or "offers on price to be fixed" basis, that is 30 days after sailing or 15 days prior to arrival at destinations, whichever is the latest. Buyers were allowed the option of changing existing contracts to the new procedure if notices were given by 14th June. Hitherto, fluctuations in Canadian wheat prices automatically affected Australian flour prices. Following the reduction in Canadian wheat prices last week, Australian flour on a c.i.f. basis fell by around 4s 2d per sack of 280 lbs.

Vegetable Oil Market

Russia is reported to be enquiring for Argentine linseed oil in London and the market is tending to be firmer. Coconut oil was quiet and inactive last week, while the recent reductions in Indian rapeseed oil were obviously overdone and sellers are now quoting substantially higher rates.

Finance in India & Abroad

THE CALCUTTA MONEY MARKET

CREDIT DEMAND STILL GOOD

Wednesday, 16th June.

LITTLE change is reported from the money market this week. Demand for accommodation is still good, although there is not quite so much competition for the money available. Advances to the sugar industry are now down to a very low level. There has been some buying of jute during the week and this has caused a rise in advances to the mills. Slightly more funds have been needed upcountry for grain and seed storage. The inter-bank call rate is unchanged at 2½ percent.

Rather more export bills have been reported this week, mainly on account of tea. Remittance has been moderate. The principal exchange rates are unchanged and quote:—sterling T.T. and O.D. 1s 5 31/32d; three months' sight bills 1s 6 7/32d; four months' sight bills 1s 6¼d; the U.S. dollar Rs. 475.

* * * *

The return of the Reserve Bank of India for the week ended 11th June, 1954 shows declines of Rs. 2.94 crores and Rs. 12 lakhs in notes in circulation and the total note issue to Rs. 1,208.60 crores and Rs. 1,245.32 crores, respectively. Notes held in the Banking Department consequently increased by Rs. 2.81 crores to total Rs. 36.71 crores. Deposits of the Government of India improved by Rs. 2.74 crores to Rs. 106.63 crores but other Government accounts diminished by Rs. 4.13 crores to stand at Rs. 15.41 crores. Balances of commercial banks at Rs. 43.50 crores showed a rise of Rs. 3.40 crores because of easier money conditions. Balances held abroad increased fractionally by Rs. 12 lakhs to Rs. 62.47 crores. Other loans and advances fell from Rs. 45.56 crores to Rs. 43.81 crores, of which advances to scheduled banks against usance bills rose from Rs. 15.90 crores to Rs. 21.23 crores. Ways and means advances were shown at Rs. 1.18 crores (Rs. 1.47 crores). Other features disclosed little change.

* * * *

During the week ended 11th June, Government of India treasury bills for Rs. 12,33,25,000 were sold in favour of the Reserve Bank of India.

* * * *

Bullion ruled quiet last week and prices fell sharply on large liquidation in the face of substantial arrivals from upcountry centres. The price of silver declined from Rs. 155-12 to Rs. 151-6 quoted to-day but the ready price was about 4 annas higher. The price, however, rose from 72⅜d. to 72⅝d. in London, while there was no change in the New York quotation at 85¼ cents.

Gold also moved lower from Rs. 86-1 to Rs. 84-2. The sovereign at Rs. 57-12 showed a loss of 12 annas.

* * * *

The return of the Imperial Bank of India for the week ended 4th June, 1954, shows a rise of Rs. 20 lakhs in total deposits to Rs. 209.60 crores. Investments in Government securities and other authorised investments are down by Rs. 2 lakhs and Rs. 29 lakhs to Rs. 32.52 crores and Rs. 10.20 crores, respectively. Loans, cash credits and overdrafts have increased by Rs. 1.74 crores to aggregate Rs. 94.14 crores, while bills discounted and purchased have decreased by Rs. 1.70 crores to stand at Rs. 30.11 crores. Cash and balances are, in consequence, shown at Rs. 13.04 crores or Rs. 3.62 crores less.

* * * *

The statement of the position of Scheduled Banks for the week ended 4th June, 1954, discloses Demand and Time liabilities at Rs. 539.45 crores (Rs. 8.31 crores on account of borrowings from Banks) and Rs. 329.62 crores (Rs. 1.65 crores) compared with Rs. 543.23 crores (Rs. 8.38 crores) and Rs. 329.64 crores (Rs. 1.66 crores) respectively in the previous week. Cash and balances with the Reserve Bank have increased by Rs. 69 lakhs and Rs. 48 lakhs to aggregate Rs. 33.42 crores and Rs. 41.60 crores, respectively. There is a rise of Rs. 2.26 crores in investments to Rs. 326.31 crores. Advances and bills discounted at Rs. 572.39 crores reveal a fall of Rs. 19 lakhs. The ratios to total liabilities of cash and balances and of advances and discounts are, in consequence, shown at 8.6 percent and 65.9 percent against 9.5 percent and 65.6 percent.

INDUSTRIAL PRODUCTS DEPARTMENT

A DITCHER'S DIARY

WEST Bengal—and for that matter, Bihar—lost a valuable servant in the departure last weekend of Dr. Sudhir Sen, Secretary of the Damodar Valley Corporation since 1948; but the business world has gained, for he leaves the DVC to become general manager of the Great Eastern Shipping Corporation in Bombay. I suppose anybody who leaves the DVC so soon after publication of the Rau report will be thought to be leaving because of it, especially since the Governments concerned have still not had the courtesy to circulate copies of the report outside Parliament. But I am letting out no secrets when I say that the investigators gave the Chief Executive Officer the best of chits and recognised, what anyone who has followed the progress of the DVC knows, that the man who deserves most credit for the success of the project to date is Dr. Sen. He was present at the very inception of the Damodar idea, for after his economic training in London and Bonn, he worked as an agricultural economist and statistician for the old Government of Bengal, and he was appointed secretary of the Damodar "Project" as far back as 1946. He then had the task of resolving the conflicts and differences between the Governments of India, Bengal and Bihar in an effort to adapt to Indian conditions the "autonomous regional agency" that has done so much good in the United States. This work took him to America, where he studied the TVA on the spot for many months, and to Russia, where he was Economic Adviser to the Indian Embassy. He has been a stalwart defender of the autonomous corporation idea in India, quite apart from the DVC, and his numerous writings on this subject have been among the freshest contributions to Indian administrative thinking—which so often in recent years has been bogged down in formalism and pedantry. The "autonomous corporation" has had no smoother a passage in India, for all that, than it had earlier in the States and in Britain, but it remains the most promising line of development for modern governments that are determined to do too much. Resistance notwithstanding, Sudhir Sen has sown a fertile seed in the Damodar Valley; may his service to the young Indian shipping industry be as fruitful.

* * * *

A story in *The Times* from its New Delhi correspondent says that the growth of the Indian capital's suburbs and the influx of refugees have resulted in damage to many ancient monuments, the large majority of which go back to long before the British period. Old Delhi dates from the middle of the eleventh century A.D. It was taken by Tamerlane in 1398, by Nadir Shah in 1739 and by the Maharattas in 1759. The British did not occupy it till 1803, and it was not until the end of 1911 that it became the official capital (in supersession of Calcutta), whilst New Delhi was not inaugurated as the capital till 1931. Indeed, there are many people living today—and not very old at that—who can remember the green fields running down to the banks of the Jumna which formed the site on which the massive buildings of New Delhi now stand. *The Times* despatch is based on reports in *The Stateman* which had earlier drawn attention to the depredations of the builder and contractor engaged in the work of creating a bigger and better Delhi suburbia. It is doubtful whether all ancient monuments could, or should, be preserved, particularly in a city which has changed hands many times in its long history and in which, until the present century, there was not a great deal of new construction. The aim should probably be to preserve some outstanding examples of the architecture of the past, or a worthy specimen of each of the main dynastic periods in the city's history. Meanwhile, one can only regret that amongst other acts of damage a portion of the wall between the Ajmere and Delhi Gates has been demolished, and that sundry other treasures of the past have been swept away. The continued occupation of the Purana Qila by refugees may be inevitable, but once they have gone there would seem to be a strong case for restoring the remains of this historic fortress to its former condition.

* * * *

My mention of the transfer of the Indian capital from Calcutta to Delhi reminds me of having heard that this was the best kept secret in the political history of a country where, it has been said, there *are* no secrets. In a land where, under the old régime, peanuts were once discovered being sold at the Darjeeling Races wrapped up in Top Secret documents from the Delhi Secretariat, it must have been quite a feat for the Government to keep quiet so momentous a decision. The Government had good reason to keep it quiet of course: all the negotiations for purchase of land in Delhi, where the Government offices now stand, had to be completed before the sellers knew that its value was about to rocket. Apparently the deals were put through with the assistance of the subterfuge (tacit naturally; I do not say any lies were told) that the land was required for the temporary use of the Delhi Durbar—at which in fact His Majesty announced that the land would be held for the accommodation of the new capital. Of all the people that were astonished by the publication of this famous secret, none could have been more aghast than the then author of this column. He had been sent to Delhi to cover the Durbar and, short of something to write about in the week before Their Majesties actually arrived, he wrote a long piece on how Delhi could never become the capital of anything. He called it that "ancient Mahomedan necropolis over which there is so much sentimental gush" and delivered himself of the opinion that "no power on earth" could ever again make it the metropolis of India, as it had been in Mughal times. It was with the most pained tones that he advised the readers of *Capital* the following week of the "bolt from the blue", the "administrative earthquake", the "arbitrary, despotic and inconceivable action" of Lord Curzon which, he added, "took all the relish out of the remaining ceremonies of the Durbar". I should think it did for so rash a journalist. The only moral I hope to draw from these recollections is that secrets can be kept in India, though the keeper must be prepared to meet charges of "arbitrary despotism" when his dark purpose is known.

* * * *

As a patient reader of them, I have often suffered from the dullness of official reports. Obliged to withhold the faintest impress of such personality as they may possess, compelled to be dry at all costs, the authors of these reports often write as though they were hardly human. Lately however I have seen several reports and handouts whose authors have made no successful effort to conceal their literary aspirations, and I am not sure that they are an improvement on their dull predecessors. Facetiæ are best left to columnists, and I respectfully commend this suggestion to the Labour Bureau of the Government of India. The merits of its report on the economic and social status of women workers in India are dealt with elsewhere in this issue of *Capital*, but the introduction to the report contains some very unusual observations. I do not mind its quoting Charles Kingsley's "Men must work and women must weep," although I have seen a few exceptions to this rule. Relevance apart, it is also entitled to quote eight lines of verse from Thomas Hood, and we can also let pass such a curious sentence as, "Even when 'Adam delved and Eve span' woman was not a 'drone' in the household but an active 'bee'." What is unexpected in a Government report is the very first sentence of the introduction. "Woman," it says, "is a fascinating subject for study." I couldn't, as they say on the District Line, agree more.

* * * *

The staff of the British Council have published a booklet (at their own expense) replying to the tireless campaign of abuse and ridicule that Lord Beaverbrook's newspapers wage against that publicly financed institution. They succeed in showing that the campaign is founded on animus rather than information and that it has included some rather dishonest presentations of the facts. We who see the Council at work abroad know that it often does valuable service, though of course as the offspring of bureaucracy out of culture its works are sometimes of questionable utility and quality. But Lord Radcliffe was complaining the other day at a meeting of the National Art Collections Fund of the neglect of British museums and the decay of British art collections. It certainly does seem strange that more money is spent on advertising British culture abroad than on nourishing it at home. Estates are broken up, galleries close for want of funds and works of art are sold to overseas buyers—but money is laid out in the corners of the earth to instruct the benighted foreigner in the British way of life. If officials must meddle in cultural matters, they should be able to arrange a more intelligent allocation of funds than this.

* * * *

The Institute of Chartered Accountants of Scotland celebrates its centenary this week. I understand that the Scottish chartered accountant members of the Association of United Kingdom Accountants here in Calcutta will observe the occasion tomorrow night with a dinner. The English accountants will be invited along as paying guests, which seems suitable in view of the profession and the nationality of their hosts. The Society of Accountants in Edinburgh, from which the Institute descends, was formed in 1854; whereas the Chartered Institute of Accountants of England and Wales did not come into existence till 1880 and the Society of Incorporated Accountants and Auditors until five years afterwards. In the intervening years these bodies have raised accountancy to the status of a profession—highly respected and (in some cases) highly paid. The responsibilities of accountants—professionally qualified and otherwise—have grown proportionately with the growth of modern commercial law and practice. The complexities of taxation, the development of company law, the techniques of industrial finance and the mathematical refinements of the modern balance sheet have created a corpus of accountancy doctrine which only accountants can hope to understand. In recent years professional accountancy has become one of the recognised pathways to industrial leadership, and it would be interesting to know the proportion of higher executive posts that are today occupied by men who have entered upon a business career with the magic letters C.A. after their name. With the law and medicine, accountancy now ranks as virtually one of the learned professions. Indeed, there are times when many of us stand much more in need of the accountant's guidance than of medical treatment or spiritual aid. Neither of these two latter are of much avail in that final interview with the income-tax officer.

Company Meeting

ROHTAS INDUSTRIES LIMITED

Managing Agents: Sahu-Jain Limited

Speech delivered by Shri Shanti Prasad Jain, Chairman, at the Twenty-first Ordinary General Meeting of the Company at 3 p.m., on Wednesday, the 2nd June, 1954, at Dalmianagar, Bihar.

Gentlemen,

I have pleasure in welcoming you to the 21st Ordinary General Meeting. The Audited Accounts of your Company for the year ended 31st October, 1953 together with the Directors' Report are already in your hands. With your permission, I shall take them as read.

Working Results

I consider that the working results of the year are such as to give us all a sense of satisfaction that the Company is having steady improvement in spite of the fact that the total sales proceeds during the year have registered a fall. This has been due to scaling down of cement price in stages beginning from December, 1952 by Rs. 14/7/- per ton in the item of packing charges. Cement output was lost to some extent on account of the overhaul of the plant. There has also been reduction in paper prices in the middle of February, 1953. With the improved output of the cement that is already evident from current production and the operation of the German Yankee Machine which has gone into production, the working results of the present year are bound to be better.

Paper

Since our last meeting your Directors have taken steps for placing order for two additional paper machines. The capacity of an economic unit before the war was reckoned at 5,000 to 6,000 tons of pulp. Today, it should be of the order of 25,000 tons of pulp. The management of your Company are keen to remove the disadvantages that attend small-scale production and they have, therefore, been planning for enlarging the capacity and to achieve larger production. The plans may be considered ambitious and even attended with some risk. But in its efforts to improve efficiency, your Company is assured of the support of the Government of Bihar who have promised to consider sympathetically its application for long-term lease of forest areas which supply raw material for the paper factory. Modernisation of your factory as contemplated will make it compare favourably with the standard paper factories abroad. But the price factor of the raw material is there. Besides, the quality of paper produced with bamboo pulp is appreciably different from that produced from wood pulp. Your Company will conduct laboratory experiments and concentrate on improving the quality of the paper produced from Bamboo and Bagasse pulp and will aim at progressively reaching a quality equal to production from chemical wood pulp. Barring the inherent defect in Bamboo pulp, achievement of better efficiency and economy will be possible with increase in capacity. It will also be possible to keep production well ahead of demand in this country which I expect would increase in the order of 15% per annum. Your Company will produce special and finest varieties of paper like Bank, Bond, Ledger, Poster, Kraft, Match, Manilla etc., which are largely imported at present. The expansion of your paper unit and the extensions already effected and in contemplation by certain other mills will raise the total production of the various items of paper in this country to 2,40,000 tons.

While dealing with expansion and improvement of quality, I would like to refer to the factor of price which is now fixed on the basis of a certain formula evolved by the Tariff Board. This formula takes into consideration the different varieties of papers manufactured, but no emphasis is given to the quality of each variety. During the war, the industry had to produce maximum tonnage and very little attention was paid to quality. It is essential now that premium and discount should be allowed to manufacturers producing different qualities in the same variety. The Government of India should urge the Indian Standards Institution to lay down specifications for different qualities in respect of all varieties so that manufacturers may get price according to quality. The manufacturers who pay attention to quality and produce goods of better quality will be compensated. This provision will result in general improvement in the quality of the products. It will be in line with the policy of the Industry Ministry which is anxious to imorove the quality of national products in every possible respect.

In the context of expansion, I would like to make one point. It is with regard to the need for the Indian industry to begin to think on the lines of specialisation in selected products. It is very desirable as it will increase efficiency and reduce the cost of production and thereby enable the factories to face competition better. Specialisation in qualities has not been so far possible in this country due to the small tonnage of total production. Now that the industry has expanded and there is still growing need for many new varieties of paper and board, development should take place on specialised lines. This will be of benefit both to the producer and the consumer.

Cement

Cement is a commodity for which there is growing demand in the country. The Planning Commission have visualised extension of cement production to about 5 million tons by 1955-56 from the rated capacity of 3.88 million tons per annum. The Industry Ministry, Government of India, wants even a larger target if the Railway Ministry could manage requisite transport. The needed expansion of the industry has to take place in areas like the Amritsar-Calcutta belt which experience greatest shortage in respect of cement and where in view of the large population and high consumption demand is expected to steadily increase. Ideal sites in this area with ample supplies of limestone and nearness to coal are limited. Obviously, therefore, expansion in the area has to take place largely at the site of the existing units.

Your Company has been anxious to extend its capacity and with the construction of the Mokameh bridge it will be best situated for supplies to markets in North Bihar and North Bengal. It, however, gets no encouragement to go ahead with expansion schemes. The Tariff Commission has made a distinction which is not understandable between new plants by existing manufacturers and new manufacturers. On account of this, your Company's second plant put up after the war did not get the advantage of the higher price allowed to new units. Your Company's cement factory is not situated at the limestone head which results in higher transport cost of limestone and lower freight on cement. The present delivered price of cement includes freight on cement equivalent to Rs. 15/- per ton and cement Companies are allowed to charge higher freight if their average works out higher. Under this basis of freight allowed for cement, it is not possible for your Company to set off the freight on limestone that it has to pay. A factory which is situated in the same region as yours and drawing limestone from the same area escapes the freight on limestone because it is at quarries site and is able also to charge extra price when sending cement to longer distances. The just claims of your Company in this respect if granted would have helped extension of its present capacity.

Asbestos Cement Products

Encouraging progress has been made in regard to your Asbestos Cement Plant. This factory has been placed by the Government of India in the approved list for I.S.D. supplies. In order to have supplies of asbestos fibre at more favourable terms, your Company are endeavouring to enter into arrangements with asbestos mines abroad. This will increase the competitive capacity of your product.

Sugar

Your factory has registered a higher production during the year because of larger supply of sugarcane. But the 1953-54 season has proved very disappointing. The total production of sugar in the country is only 10 lakh tons. It is perhaps the worst season in recent years. Want of adequate supply of sugar cane to help full season crush and of suitable variety that gives better recovery continues to be the thorny problem of the industry. We are aware that the Government of India are giving this matter their attention by assisting development of sugar cane from the point of view of better yield per acre and also permitting establishment of factories in South India where sugar cane cultivation is better and supply is more.

The problem of greatest importance is that the supply and quality of sugar cane should be improved. It was perhaps in 1943 that in Bihar due to a particular variety of sugar cane the recovery was increased by 1%. There has been no progress since. In fact a variety of sugar cane which contains 20% fibre and is heavy creating difficulty in milling is grown in South and North Bihar. The industry is not helped by cultivation of such unsuitable varieties of sugar cane. The Sugar Cane Research Institute has to devote greater attention to the question of ensuring that sugar cane cultivation is improved and the variety of cane available is such as to give substantially better recovery.

While the Bihar Government is anxious to assist the sugar industry, paradoxically however, additional difficulties are sought to be imposed. To assist better sugar cane cultivation the Government of Bihar are sinking tubewells. But the result is contrary to expectations. Because of disproportionate increase in the irrigation charges on sugar cane cultivation, the agriculturists took to cultivation of paddy. We had urged that the Government of Bihar should adjust irrigation charges so as to actively assist sugar cane cultivation with the expanded scheme of tubewells. It is to be hoped that the lower price of cereals will make sugar cane cultivation attractive to the agriculturists. Then there is the vexed question of imposition of sales-tax on sugar cane. Representations have been made on this point also to the Bihar Government. It will be appropriate for the Government of India to bring their influence to bear upon the State Government in these matters.

The greatest handicap to your factory is non-availability of sugar cane. We cannot shift the factory to a better location because the move will not get the approval of the Bihar Government. It is not possible either for us to run counter to the wishes of the State Government. If the handicap regarding sugar cane is removed, the main difficulty to your sugar factory will have been solved and the factory will be able to contribute in increasing measure to augment supply of sugar in the country. The capacity of your factory is high and there is also good market for your sugar which is classified as one of the best qualities in the market. In order to ensure larger supplies of sugar cane, your Company has arranged for the construction of additional railway sidings for transport of sugar cane. Here I should acknowledge the help accorded to us by the Government of Bihar in sanctioning a development loan towards construction of the siding. We are negotiating for another siding of 12 to 14 miles in length to enable transport of additional cane.

Unless sugar production in the country is helped to be augmented and the country made self-sufficient during the next few years the unfortunate position of our country having to import sugar from abroad will remain. This is a matter of great concern to the industry especially when for several years the country was managing without imports and the indigenous industry was able to meet the internal demand at a price at which, under the conditions pertaining to the industry in the country, sugar would not have been available anywhere.

Stores and Machinery

Your Company has had to import at present substantial percentage of spare parts for the cement factory and other units. Gradually, your Company has been following a policy of making such purchases increasingly from within the country. It may be that in the initial stages this policy will cost the Company more, but it is advantageous from the long-term interests of the country and consequently beneficial to your Company also. With this end in view your Company has taken steps to strengthen its engineering department and one of the engineers has been deputed to visit Europe for the purpose of studying the manufacture of spare parts especially for the cement industry. In regard to the paper industry extensions, it has been arranged that a percentage of the machinery such as beaters and refiners will be manufactured in the country and in the Company's own workshops. It may also be possible to meet the requirements of other paper factories in regard to these items in course of time.

Housing

Side by side the efforts directed towards improving the quality of the various products and expanding capacity, your Company has also been paying attention for the improvement of facilities to and in the living conditions of the supervisory staff and labour. Your Company will be spending about 50 lakhs of rupees on the construction of quarters for labour and staff. In this effort, support from the Central Government as well as the State Government is available to your Company. With the completion of these quarters every labourer working in Dalmianagar can live in suitable houses near the workplace itself, if he chooses, by paying economic rent. It is the keen desire of the management to provide greater facilities to make living still better. This will also be necessary with the growing number of employees on account of the increasing activities of the Company.

Company Law

While talking of development activities in the country, one question which comes to our mind prominently is the recent tendency to impose restrictions on the freedom and initiative of private enterprise. The amendments to the Indian Companies Act in the shape of a new Bill are before the Select Committee of Parliament. I need not refer to the various sections of the Bill which have been the subject of criticism from different quarters. It is not for me to anticipate what the ultimate shape of the legislation will be. But it is very relevant to point out that the most important consideration both for the people and the country is that every able-bodied person should be enabled to engage himself in employment of profit to himself and to the nation. The real question is whether the existing system has provided employment opportunities and whether its contribution has so far been towards steady development of the country and under conditions of freedom and proper support whether it could continue to render such benefit to the economy. One can always find defects in any system of organisation functioning in the country and human intelligence sets no limit to arguments. Criticisms by persons on ideological grounds should not be made to prevail in such matters. The measure of the value should be the service that a system renders to the country. I hope, therefore, wise counsel will prevail in the ultimate decision in regard to the various clauses of the new Bill that are in their present form detrimental to the nation.

I hope you will all share with me the expectation that your Company, as is evident from the results so far, will maintain the progress made in its working and that the various schemes for expansion and improvement in the quality of the products will further brighten the future prospects.

I would like to take this opportunity to thank the officers, staff and labour for the improvement that has been achieved and to express the hope that, in their future efforts also, they will be guided solely by consideration affecting the Company's prospects and their own welfare.

Stocks and Shares

FIRM PRICES AND INCREASED ACTIVITY IN STOCK MARKET

Wednesday Evening.

THERE has been considerable activity in the share market this week. Prices on the whole are very firm, though they closed slightly below the best levels. Engineering shares have been a good feature throughout the week and large gains are reported in some shares in this group. Indian Irons jumped to Rs. 32-7 at the week-end but have since weakened to Rs. 31-11. The fluctuations in Irons have been due to expectation of a possible reduction in the bank rate.

Prices of jute shares did not maintain the levels to which the speculative support had taken them last week. By the week-end interest had been withdrawn, and this week has seen no renewal. There has been restricted activity in coal shares and Burrakur have been steady at around Rs. 10-3. There has been a fair turnover in Central India.

The heavy activity in engineering shares has involved most issues; among those featured were Burn, Indian Galvanizing, Indian Standard Wagon, Jessops and Marshalls. In the miscellaneous group some managing agency shares have featured; substantial gains have been reported in Jardine Henderson, and Rallis. Hindustan Motors improved, and India General Navigation have shown a sharp rise; so have Indo-Burma Petroleum. Paper shares have been firmer. India Paper Pulp and Shree Gopal both recorded rises. Orient Paper and Titaghur were both steady.

Government securities have been firmer with plenty of buyers and few sellers. A large volume of business has been done, with longer dated loans in good demand.

Details of the week's trading follow.

* * * *

Rumours of a reduction in the bank rate and hopes that the subscription lists for the National Plan Loan might be closed at the end of the month, were responsible for the firmness in the gilt-edged section. Buyers were chasing prices without attracting sellers, and as a result gains of between 2 and 7 annas were recorded in most loans. Three percent Conversion Loan 1986, after being stationary for the major part of the week at around Rs. 82, found buyers at the close at Rs. 82-4. Three percent Non-terminable Paper, however, was stagnant at Rs. 81-4.

Here is a table showing the week's representative price movements:—

Loan		Opening 10-6-54	Closing 16-6-54
2½% Loan	1954 ...	99-9	99-12
2½% ,,	1955 ...	98-10	98 14
2½% ,,	1961 ...	91-3	91 4
2¾% ,,	1960 ...	94-4	94-7
3 % ,,	1957 ...	98-6	98-9
3 % ,,	1958 ...	98-3	98-7
3 % ,,	1959-61 ...	96-3	96-8
3 % ,,	1963-65 ...	92-14	93-1
3 % ,,	1964 ...	92-15 cv	93 xv
3 % ,,	1966-68 ...	90-5	90-8
3 % ,,	1970-75 ...	86-6	86-13
3½% ,,	1961 ...	98-12	99-2

* * * *

Provincials were strong with no sellers to meet the market, the exception being 4% West Bengal 1963 which was offered at Rs. 100-4. Four percent U.P. 1963 was taken higher at Rs. 99-13, while 4% U.P. 1964 was enquired for at Rs. 99-11-6, without attracting sellers. Similarly, there were buyers of 4% Madras 1963 and 1964 at Rs. 99-13, but scrip was in short supply. Four percent Bombay State issues were asked for at Rs. 100-15.

Preference share prices improved further. Alkali & Chemical were crossed at Rs. 105 with further buyers at this rate. Bengal Paper 6% taxable were done at Rs. 93, and several transactions were reported in Bharat Collieries between Rs. 53 and Rs. 54. There were ready buyers of Brooke Bond Tea at Rs. 79, and parcels of Associated Hotels changed hands at Rs. 62-12. Carew were better at Rs. 98, Calcutta Electric were done at Rs. 12-7 and Chrestien Mica at Rs. 65. Clive 6% were unchanged at Rs. 83, while Dalmia Cement Fully-Paid improved further to Rs. 97-8. Godfrey Phillips, after being sold down to Rs. 72-12, found buyers at the improved rate of Rs. 74. Indian Iron & Steel was wanted at Rs. 108-8, and Kumardhubi Engineering at Rs. 104. A parcel of Kettlewell Bullen 2nd was placed at Rs. 70 c.d., Rohtas Industries were better at Rs. 15-9 and a solitary transaction was recorded in Ryam Sugar at Rs. 8-8. Textile Machinery were crossed at the higher price of Rs. 90. In jute, Agarpara were a shade better at Rs. 120 and Hooghly were marked at Rs. 15-4.

Less attention was paid to banking and railway shares during the week. Amongst the few shares which changed hands in this section were United Commercial at Rs. 45 and United Bank of India 'D' Class shares at Rs. 4. No transactions were reported in railway shares, but there were ready buyers of Howrah-Sheakhala, Howrah-Amta and Shahdara (Delhi)-Saharanpur.

* * *

Contrary to the general trend, cotton shares were featureless, with the exception of Kesoram which were taken up from Rs. 23-12 to Rs. 25-14. Dunbar were unchanged at Rs. 200, Elgins were marked at Rs. 16 and New Victoria fluctuated narrowly around Re. 1-13. Swadeshi Cotton Preferred Ordinary were easier at Rs. 7-13.

Coal shares were on the whole neglected, and a nominal amount of business was put through. Raneegunge registered a sudden drop from Rs. 13-14 to Rs. 12-4, while Bengal and Bharat Collieries were unchanged at Rs. 485 and Rs. 7-14. Borrea were taken at Rs. 32, Burrakur fluctuated narrowly around Rs. 10-4 and Central India around Rs. 6-15. Equitable were marked at Rs. 33-15 and Katras Jherriah were crossed at Rs. 44. New Beerbhoom were steady at Rs. 18-14 and New Manbhoom, for reasons unknown, rose from Rs. 9 to Rs. 11-6. Pench Valley was steady at Rs. 26-8 as were South Karanpura at Rs. 10-8. Jainty Central were crossed at Rs. 3-8, and Talcher were 3 annas better at Rs. 3-12.

The slight improvement noted in jute shares last week proved to be shortlived, following market rumours that results of certain groups of jute companies for the half-year ended March 1954 were not likely to be very encouraging. Most of the business in this section was on dealers' account. India and Nuddea, which were taken up to Rs. 141 and Rs. 50-8 last week, declined to Rs. 137 and Rs. 48-8. In contrast, Bally recovered from Rs. 146 to Rs. 153. National receded from Rs. 27-4 to Rs. 26-12, probably because of the delay in finalising the arrangements for including these shares on the forward list. Amongst the few transactions reported were Kelvin at Rs. 270, Gourepore at Rs. 305, Empire at Rs. 20-12, Delta at Rs. 253, Alliance at Rs. 179, Budge-Budge at Rs. 151 and Belvedere at Rs. 212. Small business was reported in Kamarhatty and Kanknarrah at the higher rates of Rs. 190 and Rs. 141. Howrah fluctuated between Rs. 25-4 and Rs. 24-9, to close at Rs. 24-8.

Electric supply shares showed no material change. Agra were quoted at Rs. 147 and Patna at Rs. 11-6. Calcutta Electric were placed at Rs. 14, and there were buyers of Bareilly, Shahjahanpur and United Provinces.

The outstanding feature in the sugar section was U.P. which, on interested buying, rose from Rs. 15-8 to Rs. 19. Belsund, Carew and Darbhanga were a shade better at Rs. 9-2, Rs. 8-4 and Rs. 12-8. Ramnugger were subjected to profit-taking, with sellers at Rs. 24 and no takers.

The engineering section provided the highlight of the week, and substantial gains were recorded over a wide range of shares. Indian Iron, after being stagnant for weeks at around Rs. 31, suddenly spurted on Saturday under the influence of powerful bull support to Rs. 31-15, and later to Rs. 32-7, which is the highest price touched by the shares since September 1951. Tonight's closing quotation was Rs. 31-11. Other engineering issues coming in for heavy buying were Burn, which rose from Rs. 193 to Rs. 202, Indian Galvanizing from Rs. 19-3 to Rs. 20-8, Indian Steel & Wire Products Deferred from Rs. 50 to Rs. 55, Indian Standard Wagon from Rs. 81-8 to Rs. 88, Jessop from Rs. 29-4 to Rs. 30

GOVERNMENT OF INDIA
15 YEAR ANNUITY CERTIFICATES
(FREE OF INDIAN INCOME-TAX)

Annuity Certificates securing a monthly payment of Rs. 25, Rs. 50, Rs. 100 and Rs. 200 respectively for a period of fifteen years will be available from the 1st July, 1954 until further notice at issue prices given below:—

For monthly payment of	Rs. 25	issue price of Annuity Certificate	Rs. 3,500
-do-	Rs. 50	-do-	Rs. 7,000
-do-	Rs. 100	-do-	Rs. 14,000
-do-	Rs. 200	-do-	Rs. 28,000

These Certificates will be available to **individuals only** and no applications will be entertained from or on behalf of institutions, firms or corporations.

The maximum amount that may be invested in the certificates will be

For an individual	...	Rs. 28,000
For two individuals jointly	...	Rs. 56,000

Monthly payment will commence after expiry of one calendar month from the date of receipt of the purchase price. Such payment will be free of Indian income-tax and will not be taken into account in calculating the total income of the holder for the purpose of income-tax.

Annuity Certificates will be accepted for safe custody by Public Debt Offices and monthly payments remitted to the holders if so desired.

Applications will be received at the offices of the Reserve Bank of India at Bombay, Calcutta, Delhi, Madras and Bangalore; branches of the Hyderabad State Bank in Hyderabad State; branches of the Bank of Mysore Ltd. at Mysore, Shimoga, Mandya, Chickmagalur, Chitaldurg, Tumkur and Hassan; branches of the Imperial Bank of India at other places in India and all treasuries and sub-treasuries in India at places where there is no branch of any of the above banks conducting Government treasury business.

For full particulars apply to any of the above receiving offices.

and Marshalls from Rs. 7-4 to Rs. 7-12. Kumardhubi Engineering was an exception and the shares were depressed at Rs. 10.

Several features were noted in the miscellaneous section. India Paper Pulp spurted from Rs. 211 to Rs. 243, and Shree Gopal, on rumours of a bonus issue, rose from Rs. 24-4 to Rs. 26-12. Bengal Paper were Rs. 3 better at Rs. 63, and Orient Paper changed hands freely between Rs. 19-11 and Rs. 20-5. Titaghur fluctuated between Rs. 41-4 and Rs. 42. Star Paper were a shade better at Rs. 10-8. Assam Bengal Cement Ordinary and Deferred on publication of a satisfactory report met with good enquiry and improved from Rs. 4-8 and Re. 1-2 to Rs. 5-8 and Re. 1-8 respectively. Dalmia Cement were steady at Rs. 10-12, while Sone Valley fluctuated narrowly around Rs. 7-1. New Asiatic Insurance changed hands at Rs. 4-12 and a small lot of Triton was done at Rs. 164. There was an unsatisfied demand for Hercules Insurance at around Rs. 40 cum-rights. Shipping shares were very active with India General Navigation rising sharply from Rs. 86 to Rs. 97 to close at Rs. 95. Port Shipping, too, improved from Rs. 12-1 to Rs. 13-12, as did India Steamship on rumours of a higher dividend from Rs. 8-9 to Rs. 9-4; the latter shares closed lower at Rs. 8-15. All offerings of Calcutta Landing & Shipping were readily absorbed at around Rs. 20-10. Other features included Birds Investments which rose from Rs. 16-6 to Rs. 17-8, Indian Aluminium from Rs. 140 to Rs. 157, Indo-Burma Petroleum from Rs. 135-8 to Rs. 148, Rohtas Industries from Rs. 16-2 to Rs. 17-11, Shaw Wallace from Rs. 13-4 to Rs. 14-12 and Rallis from Rs. 56-8 to Rs. 68. Jardine Henderson on reports of a better dividend were taken from Rs. 112 to Rs. 123. After a long lapse, a solitary transaction was reported in Assam Match at Rs. 18-2. Angelo Brothers were unchanged at Rs. 21-14 and Assam Saws were dull at Rs. 6-4, following the recommendation of the directors to pass over the dividend. Balmer Lawrie were taken at Rs. 320, Bengal Flour at Rs. 22-12 and Britannia Biscuits at Rs. 13. British Burma Petroleum were a shade easier at Rs. 4. Eastern Investments were unchanged at Rs. 144, F. & C. Osler were depressed at Rs. 17-14 and National Tobacco eased to Rs. 10-8. Indian Cables and Indian Rubber Manufacturers were crossed at Rs. 19-12 and Rs. 15. Metal Box and Martin Burn were both steady at Rs. 18-12 and Rs. 22-14.

Mining issues were unchanged, with the exception of Karanpura Development which receded from Rs. 16-8 to Rs. 15-8. The Founders shares of this Company changed hands at Rs. 22-2.

* * * *

Although there has been less activity in the tea section during the last week, prices have not receded to any great extent and there are still strong buyers of selected scrip. From the Assam area, Baghmari were slightly better at Rs. 16-13, Bateli were unchanged at Rs. 28-8 as were Brooke Bond at Rs. 13-8, Dibrugarh at Rs. 14-2 and Dufflaghur at Rs. 43. Grob 'A' were taken at Rs. 24-4, Moheema were crossed at Rs. 8-4 and Naga Hills showed a big rise to be quoted at Rs. 25-8. A small lot of Seajuli changed hands at Rs. 28-8. Amongst Dooars scrip, Baradighi were better at Rs. 45-8 and Carron appreciated to Rs. 235, as did Gairkhata to Rs. 248. Hantapara came to hand at Rs. 269, Killcott at Rs. 22-14 and Rajabhat had sellers at Rs. 21-8. Darjeeling scrips had more buyers than hitherto, with Chamong appreciating sharply to Rs. 15-8 from Rs. 13-8, Poobong from Rs. 11-8 to Rs. 12-4, Singtom from Rs. 5-12 to Rs. 6-6 and Tukvar from Rs. 10-10 to Rs. 12-4. Amongst the remaining scrip, Eastern Cachar had buyers at Rs. 6 and Rungamattee at Rs. 153. Hattikhira were marked up to Rs. 20-8, on profit-taking came back to Rs. 19-8, and later closed at Rs. 21-10. Lackatoorah were marked up to Rs. 16-8 and Patrakola were dealt in around Rs. 214.

* * * *

The working of SHAW WALLACE & CO., LTD., for the year ended December, 1953 has produced satisfactory results. The profit at Rs. 25.60 lakhs, including Rs. 3,56,616 brought in, compares with the previous year's Rs. 25.81 lakhs (Rs. 3,47,991). The ordinary dividend has been maintained at 10 percent. General reserve is alloceated Rs. 2 lakhs (Rs. 3 lakhs) and investment reserve Rs. 1½ lakhs (same). Taxation absorbs Rs. 7.60 lakhs (Rs. 6.91 lakhs). The carry-forward is Rs. 3,67,879 (Rs. 3,56,616). On 1st January, 1954 Messrs. Shaw Wallace Ceylon Ltd. acquired the whole of the ordinary capital of Messrs. Lee Hedges & Co., Ltd., Colombo, and changed its name to Messrs. Shaw Wallace & Hedges Ltd. As a result of this transaction the business of the company's Ceylon associate has been put on a much broader footing and directors are confident that this move will prove beneficial to the group's results in the future.

* * * *

There is a decline of about Rs. 20,000 in the profit of the SEARSOLE COAL COMPANY to Rs. 1.39 lakhs for the year ended January 1954, compared with the year before. Adding Rs. 20,499 there is a balance of Rs. 60,777, of which the dividend has been maintained at 25 percent. Development reserve is allocated Rs. 10,000 (Rs. 20,000), leaving Rs. 19,527 to be carried forward. Raisings totalled 45,135 tons (50,033 tons) and despatches 43,561 tons (43,058 tons).

* * * *

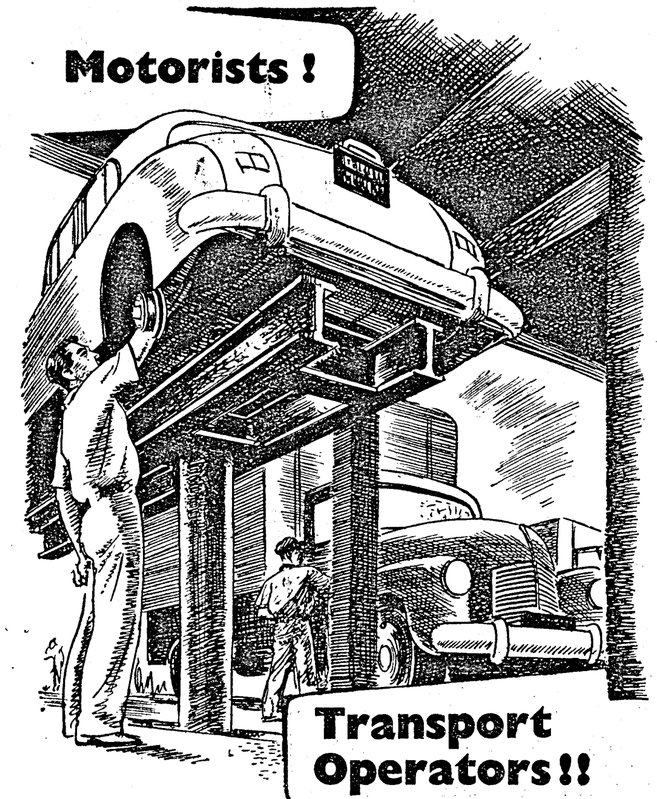
The FORT WILLIAM JUTE CO., LTD. made a profit of Rs. 6.79 lakhs for the half-year ended March 1954, compared with Rs. 8.12 lakhs in the previous half-year after raising depreciation by about Rs. 20,000 to Rs. 2.04 lakhs. Gunny sales increased by Rs. 5 lakhs to Rs. 80.56 lakhs but manufacturing expenses also rose. The ordinary dividend has been doubled to 10 percent. General reserve is allocated Rs. 5 lakhs against Rs. 1 lakh, leaving a carry-forward of Rs. 6,934 (Rs. 2,911).

* * * *

THE CALCUTTA ELECTRIC SUPPLY CORPORATION earned a gross revenue of £4,996,114 for the year ended December 1953, against £4,773,561 in the previous year, but the net revenue after depreciation was lower at £1,210,738 (£1,233,916). Normal expenditure rose by £128,942 to £3,668,587 especially because of the increased coal bill. Special reserve as directed by the Government of West Bengal is allocated £192,223. The final dividend is the same at 3 percent making 6 percent (same) for the year. The carry-forward is £157,731 (£161,233).

* * * *

The TEESTA VALLEY TEA COMPANY earned a profit of Rs. 2.34 lakhs for the year ended December 1953, compared with Rs. 1.05 lakhs in the preceding year, because of higher average sale prices and lower costs of manufacture. The dividend has been raised by 5 percent to 15 percent. General reserve receives Rs. 25,000, leaving a carry-forward of Rs. 50,114 (Rs. 46,657). The output was 3,64,018 lbs (3,84,635 lbs). The average sale price was 38.17 annas (35.62 annas) and the cost fell from 30.77 annas to 27.29 annas per lb. Estimates for 1954 have been made for a crop of 5,000 maunds at a cost of Rs. 6.59 lakhs.



THE WEEK'S TRANSACTIONS

(In the following list of stocks and shares in which transactions have taken place during the past week the figures indicate: Opening Quotations—Highest for the week—Lowest for the week—Closing Quotations—Quotation for the Corresponding Closing Date a Year Ago. the last named being shown in parenthesis and will not be given where such a quotation is not available).

Cast iron pipes for draining rain water and for sewage purposes are important items in an architect's list of requirements. So are flushing cisterns, water tanks, spiral staircases and many other cast iron products. ISCO, with many years of experience in manufacturing cast iron products of all kinds, undertake to supply these products to any design or specification.

EMPLOYERS' CRITICISM OF SOVIET PLANNING

THE NEW ECONOMICS OF A NEW POLITICAL SOCIETY

Soviet Planning. (Published by the Employers' Association, Calcutta. Price Re. 1. 138 pages). To the rapidly growing number of books—good, bad and indifferent—that are coming out on the subject of planning, yet one more has been added by the Employers' Association, Calcutta. The book, as the sub-title shows, claims to be "a comparative study of the nature of economic planning, and an analysis of the achievements of Soviet Russia, India, Japan, Germany, Britain and the U.S.A. since 1928", but the main aim is to debunk the notion, fondly cherished in many quarters and sedulously propagated by Communist parties all over the world, that the Soviet five year plans have transformed miraculously a land of poverty and misery into one of milk and honey within the framework of a Socialist State that has guaranteed its members full economic security.

The Association's case is as follows: (a) the economic progress in the Soviet Union has not been as spectacular as the propagandists and apologists would have us believe; (b) the consumers' standard has been deliberately sacrificed to the craze for rapid industrialisation of the country by giving complete priority to heavy industries and; (c) countries such as the U.S.A., Britain, Germany and Japan have achieved higher and quicker rates of economic progress through the system of private enterprise. To prove their case, the authors have poured a ton of labour into their work. The large bibliography and the copious footnotes quote such diverse sources as Colin Clark and Maurice Dobb, Jewkes and Beveridge, Hayek and the Webbs, the pronouncements of Soviet leaders and planners and the various State publications on planning and economic progress in the Soviet Union side by side with the work of U. N. Economic Survey Reports, the works of economic scholars in American universities and a large number of other economic publications. But one wonders if the Association's writers need have gone into all the portly publications they quote in their support, if their case was nothing more complicated than the above. Professor Jewkes alone would have met their requirements fully. Instead, by quoting so many big names in the field, they have unnecessarily exposed themselves to the charge of quoting some authors in the wrong way and in the wrong context. For instance, Maurice Dobb has been quoted not for his impressive and intelligent arguments in favour of Soviet planning, but very casually, often to take from his books quotations from a speech by Molotov or some other Soviet leader, without there being any reference as to why Dobb had to incorporate such inconvenient quotations or facts. A passing reference has also been made to Beveridge, along with Keynes, for what he says about individual liberty, but not what he says about the economics of full employment or about the way he thinks money should be spent or resources utilised to maintain the level of employment as high as possible. The U. K. Economic Survey for 1947 has been quoted also out of context, on the latter subject.

Much has been said about the wasteful and uneconomic utilisation of resources in the Soviet Union, but what about "New Deal" which the authors also give the label of economic planning? It is no doubt a fact that the Soviet planners laid far too much emphasis on heavy industries which eventually showed a disturbing lack of balance in the character of their economy, and their forcing down of the consumers' standard was a major economic sin, but are not we in India, which is wedded to democratic planning, also being asked to sacrifice our present consumption standards in the interests of a future of plenty? The authors clearly show an inadequate appreciation of the problems of planning, when they overdo their criticism of the Soviet Union's emphasis on heavy industries and their methods of forced saving; and what they say about the Soviet budgeting system does not do any credit to their understanding of Communism as a form of political society or of the theories of Public Finance. Economist Schultz, whom they quote in their chapter on the Soviet budgeting system, has given a very sensible definition of Public Finance in a book that deals with the U. S. fiscal system, which authors would do well to read. It is however easy to agree with the authors about what they say on the statistical jugglery in the Soviet Union—a deliberate device to inflate national income figures or conceal inconvenient facts, but what they say about the premises of economic planning in the Soviet Union, or in general, is entirely debatable and another book will be needed to deal with some of their faulty arguments and wrong conclusions. As for the failings or failures of Soviet plans, the authors disclose nothing startlingly new.

MORE ABOUT LABOUR LAW

Companion Volume to Digest of Labour Law Cases. By V. B. Kher. (Published by Thacker & Company Ltd., Bombay. Price Rs. 22-8. Pages 655 index 30.)

A few years ago Mr. Justice Deslin characterised Labour Law in England as "alive, illogical and contrary", a sentiment with which, as regards the same subject in India, the reviewer very heartily agrees. He has indeed come to the conclusion that in the not remote future it will be impossible for even a moderate-sized business, employing labour on any substantial scale, to be run at all without the retention of a full-time expert commercial lawyer on the premises. In the meantime a work of this kind will help to fill the gap, and will possibly save many a legal fee. At any rate a perusal of the relevant part of it, before he visits his solicitor, will enable an employer to know what he is talking about on a subject on which he would otherwise be hopelessly fogged. For instance, what is the essential legal difference between a closure, a lock-out and a lay off? A lock-out is "an act of belligerency", an instrument of coercion, a weapon of offence. Where an employer is not shutting down for those reasons, but as an economic necessity, if he does not make it clear that he is so doing he is likely to have it assumed against him that what he intended to be a *bona fide* closure was in fact a lock-out, with disastrous consequences. The industrial tribunals, and especially the Appellate Tribunal, have now at last succeeded in laying down various sets of principles, a great many of them necessarily quite inconsistent with the ordinary common law of Master and Servant. In his original work brought up to date by this large volume, the author has summarised the whole of the reported cases throughout the country as well as, in Part III, a considerable number of unreported decisions of the Appellate Tribunal, the latter a valuable addition. The reviewer, after a regular perusal of the decisions of the tribunals since the Act came into force, has concluded that it is administered, and was no doubt intended by the Legislature to be administered, with a definite leaning in the case of any doubt in favour of the workman and against the employer, much in the same way as has been the case in England and throughout the Commonwealth in the working of the Workmen's Compensation Act. Words with a hitherto plain unvarnished unmistakable meaning like "accident", "employment", "workman", "bonus", "gratuity", and so on have an entirely different interpretation in the new context. But the novel meanings have got to be learnt. For this reason a work of this kind is of the utmost value to anyone having anything to do with industrial relations. It is, with its companion volume, the first systematic and comprehensive attempt to compress in an understandable form the whole mass of case law on the subject, and the author, this time, is not guilty of an omission which is oddly frequent in law books these days; he has provided an excellent index. Thacker and Company have, as usual, been responsible for first-class paper, printing and general get-up.

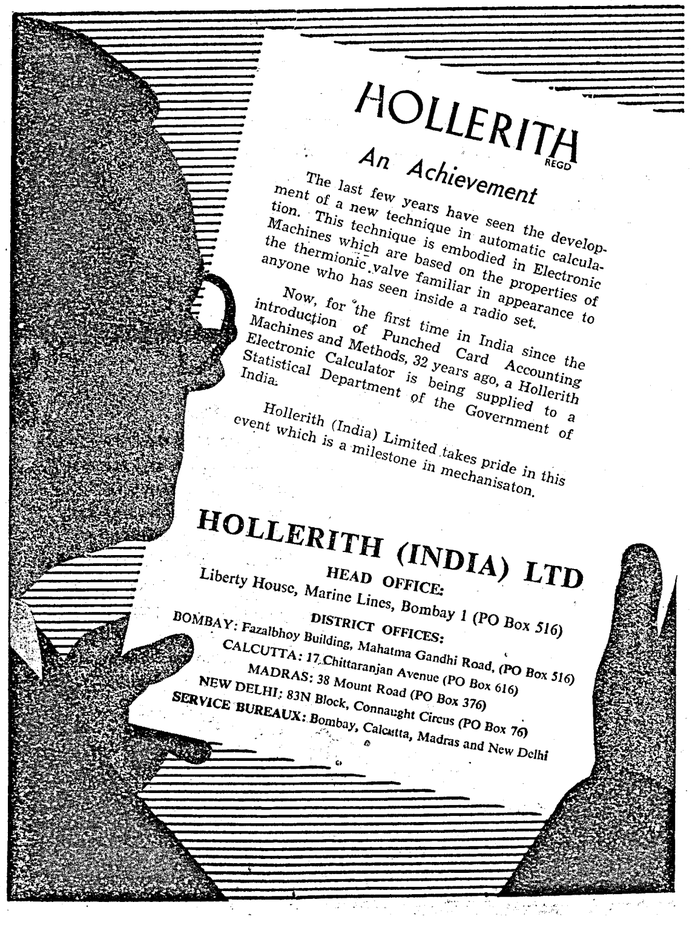
SALES TAX LAW

Inter-State Trade and Sales Tax—By Kharag Ram Chaturvedi (Published by the author, 178, Cross Street, Calcutta. Pages 260. Price Rs. 6-8).

A clear and concise summary of the underlying principles and the main features of Sales Tax legislation in the States of India. It should prove to be extremely useful as a quick reference book for those with business interests in States other than their own. Published at a time when the situation has been changing almost from day to day as the result of new decisions and enactments in the States, it is surprisingly up-to-date and comprehensive.

ROCK BLASTING MANUAL

A complete manual on rock-blasting incorporating contributions from various authors, all recognised specialists in their fields has been published by Messrs. Atlas Diesel of Stockholm, Sweden. The manual is a complete treatise dealing with the scientific, technical and practical aspects of rock-blasting in mining, tunnelling and excavating. It is based on a wealth of information obtained on projects in many countries, as well as from blasting research carried on for several years. The manual deals exhaustively with Rock-Blasting Methods, Planning and Practical Results, Compressed Air Supply, Drill Steels, Explosives, Charging, Drilling, Ventilation, Terminology and Geology. It is produced as a sturdy leather-bound ring filling book, with the loose-leaf material arranged on the decimal system. The modern indexing of the papers facilitates the insertion of subsequent contributions in their proper order. The manual can be had from the publishers' Indian agents, Messrs. Vulcan Trading Co. Ltd., 19, British Indian Street, Calcutta-1. Because of the limited edition and the fact that the book is a non-profit venture the manual is sold only to recognised members of the civil engineering and mining professions.



Without Prejudice

THE NIGHT WATCHMAN WITH THE BAD HEART

A WORKMEN'S COMPENSATION CASE

(BY OUR LEGAL CORRESPONDENT)

THE reader who is not bored by dialectics and our periodical investigations of the meanings of words and phrases is invited to consider again the word "accident", in the following circumstances. Atmeran Ramchandra Karangutkar was a night watchman employed by the Bombay Port Trust at its pumping station at Carmac Bunder Bombay and, as usual, he was on duty on the night of 20th August, 1951. The hours of this night duty were from 7 p.m. o 7 a.m. At 1 a.m. on 21st August he complained of pain in his chest and was asked to lie down. His condition deteriorated and at about 6 a.m. he died. He had been suffering from heart disease and it was a heart attack which caused his death. His widow made a claim for compensation under the Workmen's Compensation Act which was dismissed by the Commissioner for Workmen's Compensation, Bombay. We are concerned here only with one of the two grounds on which the Commissioner held that the claim must fail. That ground was that the night watchman did not die of *"injury by an accident* arising out of and in the course of his employment". (Italics ours). The widow appealed from this decision to the Bombay High Court (Chagla C. J., and Dixit J), whose finding has just been reported.

Now, in a claim such as this, the first essential thing that a workman or, if he is killed, his representative, has to prove is that he has suffered personal "injury" and that personal injury was caused by an "accident". And, in the words of the learned Chief Justice later, "It is well settled that the expression 'accident'.....must be construed in its popular sense. It has been defined as an unlooked for mishap; an untoward event which is not expected or designed." Well, you may say, taking that definition in its broadest sense, death is virtually always an accident. It is unlooked for. It is a mishap. It is an untoward event. It is generally not expected. And, except in cases of murder, suicide or execution it is not designed. But that is not the common sense, the colloquial, or the dictionary meaning of the word. Death from heart disease, one would have thought, is an incident but not an accident; the exact reverse of one in fact. Death from natural causes.

That was in effect what the learned Commissioner held. He said that he "failed to see what was the strain caused on the heart of the deceased by his duties as a night watchman" and he further observed that "it is impossible to link the death of the deceased with any exertion the deceased may have had on the day of his death." And so saying, the Commissioner dismissed the application. He was further of opinion that even assuming that the death was the result of an "accident", it was not an accident "arising out of and in the course of the employment" of the deceased and therefore did not satisfy the conditions laid down in S.3 of the Act. Hence the appeal.

* * * *

The non-legal reader, his judgment unhampered by a knowledge of the law reports and relying on the clear meaning of a plain unvarnished English phrase, may come to the following conclusions which the writer has come to after a good many years' experience of the working of the Act. It may be said at once that they are wrong conclusions, but everyone is entitled to his own opinion and, extravagant and presumptuous though the conclusion may be, it is submitted that starting from the year 1897 when the English Act came into operation the judges there, led astray by a natural sympathy for the underdog, have consistently strained the meaning of the English language in favour of the workman. The result is that there is a mass of conflicting decisions and one hardly ever opens the report of a case under the Act without seeing an observation from a puzzled Judge that it is impossible to reconcile them. In this case the learned Chief Justice went a bit further and commenting "that one must try and obtain such light as is possible, from the decisions", ruefully added that "any decision under the Workmen's Compensation Act is not an easy decision free from difficulty." Why should this be the fact it undoubtedly is, when any commercial man with an ordinary knowledge of the language or any elementary schoolmaster would have no difficulty at all in applying the facts of this case to the correct, everyday, grammatical meaning of the simple, direct, language of the Act? Let us test it out. Would not these be your conclusions? (1) This was not "an accident". (2) If I am compelled to assume that it was an accident it was not one "arising out of his employment." For, here we have a night watchman suffering from heart disease, suddenly feeling faint and in pain lying down and five hours later dying from his disease.

A night watchman. Of all the occupations in which a working man may engage, probably that of a night watchman is the least arduous and exposing a man to the least exertion. Indeed, unless he is apprehending a thief, he is exposed to virtually no exertion at all. Without being flippant or in any way unsympathetic to the particular one concerned one may say that in the title of his famous song "The Night Watchman", the late Mr. Wilkie Bard accurately summed up the duties as "Minding a 'Ole in the Ground." He can sit down or stroll about at his leisure how and when he likes. All he has to do is to keep his eyes open. This was what the doctor said and it was on the strength of it that the widow won her appeal. "The deceased had a heart attack before the attack which resulted in his death. Strain on the heart muscles is the cause of the death of a person suffering from heart disease. Standing for a long time, i.e., for an hour at a stretch will cause strain on the heart muscles which are already diseased. If a watchman with a diseased heart stands for an hour at a stretch or walks for an hour at a stretch it will cause a strain on his heart and may result in death. I am of opinion that the deceased died because of such a strain."

No doubt. But a man whose heart is in such a state as that is likely to die at any moment. He might be helping his wife in the house for an hour at a stretch or working in his garden or walking to a football match. In short you may think, as the writer does, that in this case the disease took its natural course, that the death was due solely to the disease, was not an unlooked-for mishap but one to be expected, was not due to injury by accident and did not arise out of his employment.

And you would be wrong. It is true that this is an extreme case stretching, almost distorting, to a limit beyond which it is hardly possible to go further without making sheer nonsense of it, the grammatical meaning of a plain English phrase. Nevertheless it is the logical outcome of a crop of English decisions each encroaching a little further than its predecessor in favour of the workman and faithfully followed by the Courts in India, so that in the case of this Bombay night watchman the High Court had on the authorities no alternative but to decide in favour of his widow. It is interesting to look back and see how this all came about. Matters came to a head and the Courts in England were, it is submitted, finally and conclusively set off on the wrong track some 45 years ago, in a case in which insurance companies covering workmen's compensation risks, dissatisfied with the general trend of County Court decisions up and down the country, determined to secure an authoritative decision one way or the other. So they took the case of the so-called accident said to have arisen out of and in the course of the employment of a workman named Hughes to the House of Lords. This workman was suffering from serious aneurism. He was in the act of tightening a nut by a spanner when he suddenly fell down dead. The dilated artery had ruptured. His widow made the usual claim under the Act and eventually it came before five Law Lords who disagreed in the proportion of three to two.

Lord Shaw, after pointing out that a decision in favour of the widow in such a case at this might prevent employees from employing at all persons suffering from certain kinds of diseases, uttered some cautionary words which might have halted the juridical slide down the slippery slope of sentimentalism had they commended themselves to the majority of his colleagues. He said: "In the present case it is impossible for me to attribute this unfortunate and afflicted woman's death to injury by accident as such pronouncement, however prompted by compassion for those bereaved, would be erroneous in fact and involve a liability which is not imposed either by the language or in the intention of the statute." Lord Atkinson took the same view but the other three Law Lords did not, and found in favour of the widow. The decision had to be followed and was followed in this Bombay case in which the widow was awarded Rs. 3,000 compensation with costs throughout.

(*Laxmibai v Chairman, etc., Bombay Port Trust.* A.I.R. 1954 (May) *Bombay.* 160)

SUGAR PRICES REDUCED

The Government of India have decided to reduce the present selling price of Rs. 30 per maund to Rs. 29-8 per maund f.o.r. destination station in respect of both indigenous and imported sugar with effect from 16th June 1954. The tenders received for the supply of sugar after 15th June 1954, will be allotted sugar at the reduced rate. In the case of imported sugar, the reduced price will apply to consignments arriving at the ports concerned after June, 1954. As hitherto the selling prices, in case of British refined, Cuban refined, Formosan and Czech sugars will be annas 8 per maund higher than for other qualities. In the case of indigenous sugar the price differentials will remain unchanged. The Government of India have also decided to reduce the rate of earnest money from Rs. 5 per maund to Rs. 2-8 per maund for tenders made for supply of sugar after 15th June 1954.

"Five wonderful years! Time to build, time to create. For my child it will bring health, free schooling. For my family, security . . . may be, with hard work, a home to call our own!"

Nearly a quarter of the funds of the Five Year Plan will be used in increasing, improving and widening the scope of our Social Services. Rs. 425 crores will go to raising the standard of living of the people, training 13,000 new doctors, 20,000 new nurses and midwives. By 1956, more than 60% of all children over six years of age will be in our 2,02,142 primary schools. This long-range planning makes manifest our faith in the future. Here, indeed, is . . .

a pledge to posterity

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

THE TATA IRON AND STEEL COMPANY LIMITED

TN 3935

PUBLIC ENTERPRISE IN NEW INDIAN INDUSTRY

PROBLEMS OF MANAGEMENT AND INDUSTRIAL RELATIONS

THE public sector of Indian industry has grown very much larger than is generally realised. A significant point to note about this growth is that the State has been slowly but steadily gaining control of vital strategic points in the economy, though the volume of public investment has not increased in direct proportion. Thus we cannot judge the importance of the public sector of the Indian economy today merely from the size of the capital investment or its contribution to the national income. In Britain under the Labour Government, with all the hasty drive for nationalisation, only one-sixth of the national economy actually passed under State ownership during the period 1945-50, but because of the vital and strategic segments taken over—such as the Bank of England, fuel and power, all means of public transport and iron and steel—the public sector gained a dominant place. The purpose of the industrial policy, if analysed carefully, of the present Indian Government will seem to be running on similar lines, though naturally, there are differences with regard to time and emphasis.

The public sector in India already includes the vast network of the Indian railways—the third largest railway system in the world—and with the nationalisation of civil aviation, the State is in a position to control the entire system of communications and transport. The Government has already taken over the Reserve Bank, the Central Bank of the country, and today it manufactures or proposes to manufacture on an exclusive basis a wide range of vital and strategic industrial products, such as aircraft, arms and ammunition, atomic energy, telephone, telegraph and wireless apparatus and ships; besides the State is now participating in a big way in the production of important producer and intermediate goods like iron and steel, locomotives, railway coaches, fertilisers and industrial explosives. It is also a big power producer, through the river valley projects.

Upward Turn

A definite upward turn in the course of public investment was marked with the nationalisation of the railways, coinciding with the end of the war. In the year 1948-49 the total amount of public investment stood at Rs. 875 crores, and it rose further to Rs. 1,200 crores at the end of 1950-51. These figures are exclusive of public investment in agriculture, small-scale industry, transport and residential housing, and of the productive capital assets owned by Port Trusts, municipalities and other semi-public agencies, which, together probably amounted to Rs. 1,000 crores. As against this, the value of productive assets owned by private enterprise (again excluding agriculture, small-scale industry, transport and residential housing) in 1950 was perhaps not more than Rs. 1,500 crores. (Planning Commission's estimates). This rising trend in public investment has been corroborated by the National Income Committee, whose report, covering the same period, gives the following figures with regard to the net output in the public and private sectors. Public sector: the net output rose from Rs. 240 crores in 1948-49 to Rs. 290 crores in 1950-51 or a rise of 12 percent; Private sector: the net output increased from Rs. 8,030 to Rs. 8,830 crores during the same period, or a rise of 10 percent.

The first five year plan does not provide for public investment in industry on an impressive scale, the total sum so provided amounting to just Rs. 90 crores excluding Rs. 50 crores which is a lump sum provision for expenditure on small-scale and cottage industries and for providing finance to set up the Industrial Development Corporation and trading organisations. For keeping public investment in industry within this relatively modest limit, the Planning Commission offers the following explanation: "While the emphasis of industrial expansion in the public sector during the first five year plan is on initiating and promoting investment in certain basic lines and on completing the projects on hand, the initiative and responsibility for securing the necessary expansion over the bulk of the field of the industry rest with private enterprise." In other words, industrial development in this country having been much too lop-sided (with most of the units in the private sector devoted to the production of consumption goods), the development of capital goods industries is absolutely necessary to prepare a sound base for quick industrial development. The State is therefore applying its resources in this direction first. But it is quite possible that during the next five year plan, when the State will be relatively free from its pre-occupation with the rural sector—where the Government has had necessarily to concentrate most of its effort on measures related to higher food production to strengthen the foundation of the economy—public resources will be diverted in a greater measure from power, irrigation and agriculture to the production of consumption goods and development of industry in general. Mr. Deshmukh, the Central Finance Minister, has already dropped more than a hint to that effect.

New State Enterprises

Nevertheless, the list of new State enterprises in the first five year plan, both of the Central and the States, is a significant one; it points to the consistent pursuit of the Government's main objective of industrial development based on the institutionalist approach of Welfare Economics. New Central Government undertakings under the Plan include an iron and steel plant, ship-building, a machine tool factory, the Sindri fertiliser factory, the Chittaranjan Locomotive Works, the rare earths factory, the Indian Telephone Industries, the Hindusthan Cables, the Mandi Salt Works, an all-steel railway coach factory, a penicillin factory, the National Instruments factory, a D.D.T. factory, a housing factory and such other enterprises as the Nasik Printing Press, the silver refinery and the new mint. New State Government enterprises include: expansion of the Bhadravati Iron and Steel Works, Mysore; the U. P. Government's cement factory, the N.E.P.A. mills and the Sirpur Paper Mills; and the Bihar Government superphosphate factory. Much has been made of the muddle in some new State concerns, notably the pre-fab housing factory, but progress in some of the bigger and more important concerns, such as the Sindri fertiliser factory and the Chittaranjan locomotive works more than offsets the debit side of the balance sheet. It can be said that generally new State enterprises have been working according to plan, though it is not possible to go into individual records of all of them within the space of a single article. Adequate information on the working of these concerns is available from the two progress reports issued by the Planning Commission on the Plan as also from the Reports of the Ministries of Production, Railways and Defence of the Government of India on Central undertakings. Various State Government publications provide information on undertakings in their charge.

To deal with some of the important concerns may not however be out of place here. Sindri Fertilisers and Chemicals Ltd. comes to mind first. The biggest fertiliser plant in Asia, built at a total capital cost of over Rs. 23 crores, it is now being run by a private limited company, with Government having the controlling voice. The first Annual Report of the Company with the audited statements and accounts for the period from January 1952 (when the Company took over the project from the Government) to March 31, 1953 shows a gross profit of Rs. 2.71 crores. The financial results may not be very satisfactory judged from the standards of private enterprise, but the production results have been satisfactory nevertheless, though the target of producing 1,000 tons of ammonium sulphate a day has not yet been reached. From 172,514 tons in 1952, production went up to 265,704 tons in 1953, as against the existing installed capacity of 350,000 tons. The rise in production has been fully reflected in prices, which is now Rs. 275 per ton f.o.r Sindri. Among the sibsidiary plants the catalyst plant has been completed and gone into pilot production; the coke oven plant is expected to start production soon. Chittaranjan has already produced its 100th locomotive, which was the target fixed for 1955-56. By 1952 it was producing 4,300 components as against 4,467 to be ultimately manufactured there. With this rate of progress maintained, the time is not far off when Chittaranjan, together with T.E.L.CO., will be able to produce the entire annual requirements of the Indian railways, placed at 170 engines a year. Of that Chittaranjan has to produce 120; the rest T.E.L. CO., with the whole range of components indigenously manufactured. The target for this self-sufficiency has been fixed at 1957. Progress of work at the Hindusthan Shipyards Ltd. has been satisfactory, it having built already some 16 ships, mostly of 8,000 DWT. The Hindusthan Machine Tools Ltd., another important new project, will shortly go into production. Hindusthan Steel Ltd. has started survey work for the steel plant at Rourkela. The heavy engineering project at Ambarnath, producing machine tools for the Defence Department, has already started manufacture.

Of the State Government projects, expansion of the steel works in Mysore has led to the introduction of the electric method of smelting iron. The N.E.P.A. Mill is scheduled to start production early next year; the annual production is expected to be 30,000 tons of newsprint or one-third of the total annual requirements of the country. These accounts are by no means exhaustive, but they indicate in a fair measure the rate of progress in new public undertakings.

Socialist Impatience

Socialist critics of the Government are however not satisfied with the Government's industrial policy and they would like the pace of nationalisation to be much faster. They overlook the complexity of industrial management and treat nationalisation as a purely political question. But nationalisation by itself does not solve any problem. It is only a means to an end. If officials lack the proper type of organisation and managerial skill to maintain the requisite degree of efficiency, then nationalisation creates more problems than it solves. Let us take the example of Labour Britain again. The motives of nationalisation are well known, but when in 1950 the Labour Party had to face the voters in the General Elections—an electorate that had not been very impressed with the progress of nationalised industries, with bleak winters seeming bleaker—it had perforce to modify its nationalisation stand substantially. Though the Labour Party did not admit that it had bitten off more than it could chew, it held out the offer of alternatives in the shape of competitive public enterprises within industries, consumers' and producers' co-operatives and so on. And nationalisation is not going to feature prominently in the Labour Party's next election manifesto, perhaps with the single exception of iron and steel which Labour threatens to renationalise if it comes back to power.

Mixed Economy Policy

The Government of India's mixed economy policy, based on an empiric approach, is basically sound. Under the present conditions of the Indian economy and the administrative setup, nationalisation of existing units of production would do more harm than good. The Government already controls the conduct of industrial concerns in private sector through the Industrial (Development and Regulation) Act and a host of fiscal and monetary devices. The problem of running nationalised industries or those new units of production in which the State is the major partner is important and difficult. In Britain and France, some undertakings are managed through public corporations, independent of the Ministry as regards administration and management and of the Treasury as regards financial control. Of course the principle of public accountability is maintained. In India, the Government is trying out the method of managing its concerns through the system of private limited companies. This has the advantage of combining economic mobility with effective public ownership, but time alone will show whether it is the answer to the problem.

Increasing participation of the State in industry does not, despite the dogmatic advocates of state capitalism in this country, automatically solve the problems of labour and the consumer. Quite the contrary, State monopolies can be as dangerous from the consumer's point of view as private monopolies, if the consumer does not have an effective voice in pricing policy. In Britain organised consumer opinion is consulted in such matters. In France, consumers are directly represented on the boards of public corporations. But in India, consumers have yet to exercise that right, particularly with regard to such monopolies as the railways and postal services. Rates tribunals exist to examine the rates and freight structure of various transport services, but it cannot be said that close consideration is always given to consumers' interests. Whatever be the social criteria of success or the tests of efficiency, satisfaction to the consumer must remain among the most important objectives of new public undertakings. As for the problem of industrial relations, it is unfortunately a fact that even in State concerns the wage interests of labour are not always in harmony with the interests of the consumer. If new public enterprises are to fulfil the social purpose which is their chief justification behind them, labour must accept an economic price. The experience of Britain however does not encourage the hope that trade unions can or will take a different view of State concerns where their own interests are involved. The "Socialist emulation" theory of the Webbs has not worked in practice and today some of the main opponents of new state ventures and of nationalisation are not the "die-hard Tories", but the trade unions affiliated to the Labour Party.

SURVEY OF RESEARCH IN PLASTICS

A report, entitled *Survey of Research in Plastics with Special Reference to the Development of Plastics Industry in India*, compiled under the auspices of the Plastics Research Committee of the Council of Scientific and Industrial Research has just been published. The report deals with all the problems of research in the various fields of plastics. Besides a chapter on fundamentals of high polymers, one chapter is devoted to natural resins and resin-like substances, a second to naturally occurring polymers, such as cellulose and allied products, proteins and casein, and rubber and its derivatives, a third to synthetic polymers built from materials with etheroid unsaturation. Later chapters are devoted to methods of processing, machinery and equipment, auxiliary materials for plastics and plastics industry in India. The Report also contains a special appendix devoted to a review of the work done under the Plastics Research Committee during the period 1940-53 and a comprehensive bibliography of the recent books relating to high polymers. The report, priced Rs. 5, covers 156 pages of text and contains 17 plates and can be had from the Publications Division, CSIR, Old Mill Road, New Delhi-2.

Bombay

CONDITIONS FOR GREATER FOREIGN INVESTMENT

U.S. CONSUL-GENERAL'S ADDRESS

(FROM OUR BOMBAY CORRESPONDENT)

MR. WILLIAM T. TURNER, U.S. Consul-General in Bombay, spoke frankly last week on "Some Comments on U.S. Foreign Economic Policy." Mr. Turner said that during his short stay in Bombay, he had heard much about the need for development in India and suggestions that American capital could fill this need. American business was not going to invest capital abroad for purely sentimental or charitable reasons. This country could hope to obtain American capital in future mainly from private sources and not from Government grants or aids. Such capital was always eager and ready to flow into a country where it could earn profits in a competitive field, where it could feel secure from undue control and interference and lastly, where it could be reasonably assured of the right to remit home a fair amount of earnings. If any country wished to attract American capital it would have to create these favourable conditions. After a pointed reference to the fact that there was no basic commercial treaty in existence between India and the U.S.A., in spite of the U.S. Administration proposing the negotiation of such a treaty of friendship, commerce and navigation with this country repeatedly during several years without success, Mr. Turner gave it as his opinion that American capital was not likely to be available to any area where there was no assurance or guarantee of rights based on treaty. Referring to the economic policy of the present U.S. administration, Mr. Turner laid stress on the fact that it was based on the principle of "trade, not aid" and that the President had in a recent message to Congress emphasised that as soon as possible all financial aid to underdeveloped countries should be replaced by loans and private investment. Mr. Turner added that his country's foreign economic programme consisted of four major parts: (1) curtailment of economic aid on a grant basis to foreign countries; (2) encouragement of private investment in other countries; (3) encouragement of currency convertibility as an indispensable condition for freer and healthier international trade; and (4) the expansion of trade generally.

Ahmedabad Millowners' Proposal

The Ahmedabad Millowners' Association has made two constructive suggestions to the Central Finance Ministry which, if accepted, might help both the textile industry and the authorities. A deputation from the Association led by Mr. Surottam Hutheesingh, its President, in an interview with Mr. M. C. Shah, Deputy Finance Minister at the Centre, asked that no income tax and corporation tax be levied on the managing agents' commission voluntarily surrendered in the interest of the company. This step might encourage managing agents to forgo the whole or a part of their commission in lean years, if they knew that the whole amount sacrificed by them would be retained by the company instead of a good part of it going as tax as at present. The Ahmedabad Millowners' Association has also questioned the necessity of maintaining separate excise staff in every industrial unit to supervise the collection of excise duty on cloth. In important centres like Bombay, Ahmedabad, Sholapur and Kanpur, where a large number of textile mills are located, the saving effected from having centralised excise offices to check returns of production and despatches by mills would save several lakhs of rupees for the Government. The Association has pointed out in support of its proposal that in the past only a small staff at the headquarters looked after the work of collecting excise duties. A similar procedure in the case of the sugar industry also would effect considerable saving in establishment charges because there were effective means to check output and despatches from production units. Location of staff at the mills' premises, apart from duplicating unnecessary expenditure for the Government, resulted in delays in the mills' working.

Recruitment of Seamen

The situation with regard to the recruitment of seamen remains unsatisfactory. The Seamen's Employment Office, which was opened at the beginning of last week, has met with very poor response from workers. The number of seamen registered for employment during the first four days amounted to less than 250 (even though it is claimed that there were nearly 6,000 to 8,000 seamen in the city eligible for registration and employment under the Indian Merchant Shipping Rules), because of the boycott of the Government scheme by the Indian Seafarers' Federation. It is, however, hoped that the deadlock will be resolved in the near future because the Indian National Trade Union Congress has undertaken to present the case of seamen represented by the National Union of Seamen of India to the Central Ministry of Transport. In the meantime there is no special inconvenience caused to the shipping companies because replacement of crews on a large scale on a number of ships had been made during the days preceding the coming into force of the Government scheme. The Indian Seafarers' Federation has in the meantime suggested the establishment of a tripartite National Maritime Board to revise the Indian Merchant Shipping Act, to lay down a national minimum wage scale and working conditions, and to revise the present scheme for training ratings. To this the Director-General replied that the Union Government would be willing to take up this question only after the problem of recruiting of seamen had been satisfactorily solved. He also explained the steps taken by the Government so far in respect of recruitment and said that for the present the authorities were devoting their full attention to the working of the employment scheme. Just at present there is a lull in the labour agitation in the docks. The truce secured by the Chief Labour Commissioner from Delhi with a promise that all the grievances of the dock workers would be satisfactorily settled without delay and the abandonment of the slow-down strike under his advice continue with the full support of the Stevedores and Dock Labourers Union. In fact, the President of this body again advised its members last week not to resort to slow-down tactics under any circumstances, because not only were all disputes capable of settlement by negotiation, conciliation and adjudication, but such tactics had their repercussions on the public, on the industry and on international trade and commerce. He also advised the workers to perform their duties with speed and efficiency, pending the final settlement of all existing disputes.

Stimulation of Exports

Mr. D. P. Karmarkar, Central Minister for Commerce, who was here on a visit last week carried on his campaign for stimulating exports of goods manufactured in the country. During this visit he had informal talks with representatives of trade organisations of manufacturers and exporters, when he stressed the importance of their participating in all important foreign exhibitions and observed that the Government planned to take part in two foreign exhibitions this year, one in the U.S.A. and the other in South-East Asia. He also supported the plan put forward by the Federation of Indian Chambers of Commerce and Industry for permanent exhibition sites at Delhi and Bombay. At the same time, Mr. Karmarkar warned manufacturers that they could compete with their foreign counterparts only if their product was up to mark. While the Government was trying to help them by encouraging exports, Mr. Karmarkar emphasised the need for non-official interest and initiative in this matter.

Power Supply from Mysore

Though it will not in any way affect power supply for industry in the Bombay-Poona area, Bombay State will benefit to the extent of about 11,500 k.w. of electric power which will be supplied by the Mysore State under an agreement which is being concluded between the two State Governments. The supply will come from the Jog hydro-electric projects of the Mysore Government, and will be distributed in the three southern districts of Belgaum, Dharwar and North Kanara. Transmission lines from the frontier of the Mysore State to these areas have already been completed by the Bombay Government at a cost of about Rs. 3 lakhs and the Mysore Government has completed the arrangements within its State to make this supply possible. After an interview to discuss the question with the Minister for Electricity of the Mysore State, Mr. Naik Nimbalkar, Bombay Minister for Public Works, announced that negotiations for the supply had been completed and only a few minor details remained to be settled.

Progress of Oil Refineries

Both the oil refineries in Bombay have been, making remarkable progress with the work of erection, so much so that while the Standard-Vacuum refinery hopes to fire its first boiler at the beginning of next week, the Burmah-Shell unit should be in a position to produce motor fuel and kerosene early next year. In the case of the latter this will be almost a year in advance of the original target. The Stanvac refinery will go into actual production in the second half of next month when it will begin to process crude oil, though the formal opening ceremony is not scheduled to take place till November. The refining capacity of the Burmah-Shell unit will be two million tons of crude oil per year which will be approximately two-thirds of the total capacity of the two refineries in Bombay. When it reaches full production, the Burmah-Shell output will amount to 156 million gallons of motor fuel, 72 million gallons of kerosene and 152 million tons of furnace oil. This will be the only refinery producing bitumens and the annual output of this as estimated at present will be 150,000 tons. The investment on this unit is expected to reach Rs. 25 crores.

The Stanvac refinery will represent the largest single dollar investment of private capital in India, equivalent to approximately Rs. 17.5 crores. It hopes to issue 90 million gallons of motor fuel, 40 million gallons of kerosene, 59 million gallons of diesel oil, 58 million gallons of industrial fuel and 49 million gallons of bunker oil. The Standard-Vacuum Company expects to get the first consignment of crude oil for processing in this refinery by the first week of July. Announcing this last week, Mr. William A. Williams, Managing Director of the Standard Vacuum Refining Co. of India, said that even though crude oil would be refined into motor fuel from next month, it was not likely that the price of petroleum products in the country would be lowered because of "several marketing factors." It would, however, reduce the drain of foreign exchange on the Indian Treasury by about Rs. 1.2 crores every year. Both the refineries are trying to provide residential accommodation for their staff on the sites and they have a programme to train Indian nationals to fill all technical jobs.

ANGLO-CHINESE TRADE PROSPECTS

RISING COST OF SOCIAL SERVICES

(FROM OUR LONDON CORRESPONDENT)

12th June.

IT will be interesting to see whether the widespread interest now being shown in the forthcoming visit to this country of a Chinese trade mission from Geneva will ultimately prove to have been justified. The invitation issued by the Federation of British Industries and other associations has been officially accepted and preparations are going forward in anticipation of the mission reaching here within the next fortnight. An essential preliminary was some authoritative guidance regarding the goods which would be exportable without contravening the restrictions imposed by strategic considerations. In this respect the Board of Trade and the Ministry of Supply have met the request of the F.B.I. to furnish British industry with a list of some 400 items which will definitely be exportable—as opposed to the usual procedure of listing only the restricted goods—and this appears in today's issue of the Board of Trade Journal. The list is actually a lot more comprehensive than it appears, for it represents groups, and in each of these there are, of course, many hundreds of related items which it would have been virtually impossible to record individually, though the Board of Trade has no doubt kept a complete list to check up applications for licences. The list includes textile machinery, paper-making machinery, office and food-processing machinery, industrial machines for turning out boots and shoes and bricks, woodworking machine tools, metal-working machines for civilian hardware, small concrete mixers, small air compressors, small passenger cars, bicycles, and certain types of industrial trucks. Industry is told that if an individual product is not in the list, that does not necessarily mean that an export licence will not be given, but it is emphasised that no change has been made in the restricted items.

The bulk of British business with China is probably transacted though Hong Kong, so it is very doubtful whether it will be possible to assess the real results of the Chinese mission's visit. What should be possible, however, is a more accurate assessment of the future scope of Anglo-Chinese trade under prevailing circumstances. For instance, can China, as has been suggested, step up her exports to £50 million a year from the current rate of some £10 million, and if she can, will she find in the list of importable goods the things she wants to counterbalance such an increase? Direct U.K. exports to China last year totalled 17½ million dollars, against a prewar figure of 29½ million dollars, so it would appear that the market is a restricted one. It also promises to be a competitive one, for German exports, both last year and prewar, exceeded those from this country, and the Germans were also negotiating at Geneva at the same time as we were. It is possible that the Chinese, in common with the recently revised policy of other Communist countries, may be willing to abandon the strict balancing of trade and be prepared to meet a deficit in gold or dollars.

Textile Talks with Pakistan

Meantime, another trade mission of a different kind is already here. It is a delegation representing Pakistan cotton associations, led by Mr. Mohammad Karamatullah, Secretary to the Government of Pakistan in the Ministry of Commerce, which in the coming week will be having consultations in Manchester with the Lancashire Pakistan Cotton Committee. The latter committee was set up last December and since then has been considering what steps might be taken to expand trade between the two countries—Lancashire's piece-goods and Pakistan's raw cotton. There is certainly scope for expansion, for Pakistan's offtake of British textiles has fallen off considerably even though she has always shown an interest in the better quality products for which Lancashire is reputed, but recently has been replacing by imports from Japan and certain Continental countries. On the other hand, Pakistan needs further outlets for her raw cotton crop. The factors affecting the availability, price and quality of Pakistan cotton will be the main subjects discussed at the meetings, for on the question of a *quid pro quo* in a larger offtake of piece goods it would merely represent a return to the former state of affairs.

Indian Railways' Locomotive Orders

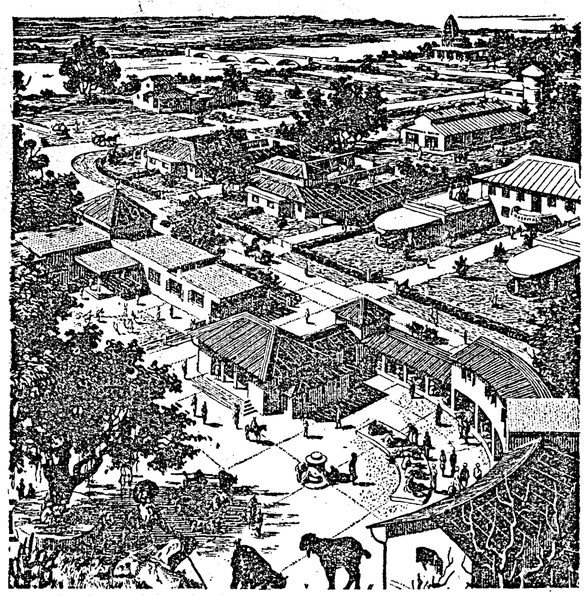
The presence here of Mr. F. C. Badhwar, Chairman of the Indian Railway Board, who leads the Indian delegation at the session of the International Railways Congress, provided an opportunity to a number of journalists to seek an answer to the question why so many orders for rolling stock for the Indian railways had been placed in Japan and on the Continent and not in Britain. Mr. Badhwar's explanation was that British manufacturers had been experiencing difficulties because of the shortage of steel supplies, with the result that they had had previously found it very difficult to give satisfsactory delivery dates, while uncertainty with regard to labour costs had made it almost impossible for them to quote firm prices. He admitted that more recently there had been some improvement in both these respects and in fact certain small orders for locomotives were under execution in Britain. On the other hand, India's need for locomotives was urgent and large numbers must be available to go into service before the end of 1955. Since the Japanese, German, Austrian, Belgian and Italian manufacturers had been able to meet this need at satisfactory prices large orders had been placed with them, and it was Mr. Badhwar's intention to visit the Continental countries before returning to India to finalise inspection and supply arrangements. Questioned with regard to the future, Mr. Badhwar said that during the past five years India had been developing her railway industries with a view to achieving a high degree of self-sufficiency as early as possible, including the manufacture of electric traction equipment and certain signalling equipment. Plans to electrify a large mileage of Indian railways—which represented the largest system in terms of route mileage among the hundred odd systems that were members of the International Railways Congress—were being drawn up, and it was hoped that the electrification of railways in the Calcutta area would be taken up almost immediately.

Too Much Wheat

The recent cuts by America and Canada in the price of wheat for export provides a striking example of the dangers attaching to bulk purchasing and the benefits which can be derived from allowing economic factors to have free play. Taking a long view, Britain refused to enter the last International Wheat Agreement because the producing countries wanted what was regarded as too high a guaranteed price. She is the largest importer, and by making her purchases on the free market, where prices have fallen steadily in view of the heavy stocks held in the main producing countries, has not only saved much foreign exchange but looks like saving a lot more in the future seeing that carry-over stocks by the end of July are estimated as being in the region of 840 million bushels in the United States, 550 million bushels in Canada, about 100 million bushels in Australia and the same figure in the Argentine against a total carry-over for all these countries of only 1,058 million bushels last year. Britain is coming in for some criticism for having stayed outside the I.W.A., but the fact remains that importing subscribers thereto are now showing considerable reluctance to take up their quotas. It looks as though the wheat-producing countries will be obliged to do some realistic thinking with regard to the future. The new President of the Liverpool Corn Trade Association, Mr. A. Batty, replied to the criticism in a statement which reads: "The futures market is taking the course anticipated by the trade. The reason it is so much below the price of the actual commodity is because traders believe world prices are too high. The Liverpool futures market before the war was recognised as the world's wheat barometer, and given freedom of trading it will inevitably revert to the old rôle. In spite of the present small volume of business it would appear that it is forecasting the future trend of price levels. The high prices asked by the main exporting countries have encouraged the importing countries to grow their own wheat, and many of them have become exporters. The big exporters, in consequence, are running the risk of losing their valuable markets unless they lower their prices."

Cost of "Welfare"

No one today wants to see the end of the Welfare State, but if it is not to kill itself by being financially overburdened, it is obvious that there must be some reorientation of thinking on the subject. Something must be done to keep the rising costs within limits. Full employment and greater productivity will perhaps look after the immediate future, but any failure to maintain these—and such a failure might result from factors over which we have little control—would render breakdown inevitable. This is the warning inherent in a series of tables in the latest issue of the Government's "Monthly Digest of Statistics" which shows that in the fiscal year 1952-53 the expenditure on all types of social services was £1,865.5 million, and that this had risen in each of the years from 1949-50 by £60 million, then £108 million and finally by £227 million. The largest single item in the 1952-53 total is National Insurance, with an expenditure of £507 million, an increase of £80 million on the previous year. Half of the increase occurred in retirement pensions, which cost £314 million. Only a small fraction was spent on unemployment benefits (£22.5 million), though these were doubled (1952 was the year of the textile slump). Sickness benefits absorbed £79 million. Next in size is the National Health Service, which spent £487 million—an increase of £41 million. Most of the rise was in the cost of general medical services, though patients paid £15 million, compared with £5 million the year before. Current expenditure on education took £368 million, £26 million more than the previous year: this does not include capital expenditure of £70 million on education. National Assistance grants (mainly to old and sick persons) increased by £27 million to £116 million. Family allowances cost £89 million, compared with £65 million the year before. The current cost of housing, chiefly maintenance and administration, was £85 million.



Better Farms
Better Homes
Better Health

Concrete by virtue of its inherent qualities of economy, durability and cleanliness is the ideal material for building roads, grain-silos, housing, dairy farms, wells, drainage systems, etc. Better farms, homes and communications mean health and wealth to our villages.

MR. DESHMUKH ON NATIONAL PLAN LOAN

"AN ECONOMIC EXPERIMENT IN CREDIT CREATION"

(FROM OUR MADRAS CORRESPONDENT)

MR. CHINTAMAN DESHMUKH, Union Finance Minister, who is now on a fortnight's tour of the State, told the Press here that the availability or otherwise of foreign assistance might make a big difference to the second five year plan. Another factor which would influence the next Plan, he said, would be the uncertainties of the recommendations of the Finance Commission. Mr. Deshmukh pointed out that as a result of the recommendations of the last Finance Commission, the Centre had to increase its contributions to the States by about Rs. 84 crores in addition to the Rs. 211 crores given as loans to the States. He was emphatic that the absence of any indication of Central aid need not be pleaded as an excuse for any State not drawing up its plans. He indicated that resources might be available for only one project on the Krishna river. The Finance Minister said that he was now touring the country to get himself acquainted with the problems and needs of the villages. The village people, he said, wanted schools, improved communications, medical facilities, improved water supply, etc. The States had been asked to assess these requirements of the people in all districts and submit their plans accordingly after taking into consideration the resources each State would have at its disposal. The Finance Minister found, during his present tour, that many villages wanted high schools. Secondary education had been nobody's child so far, Mr. Deshmukh said, adding that efforts would be made to implement the recommendations of the Secondary Education Commission. Some resources would now be diverted towards improving secondary education by starting multi-purpose model schools, imparting education leading to technical and professional studies.

Mr. Deshmukh said that food production would not be as urgent in the second Plan, as it had been in the first. In the first Plan, certain targets were laid down and attained. The second Plan would have to pay attention to chronic famine areas like Rayalaseema and other backward areas. Referring to the scope of industrialisation in the second Plan, the Finance Minister said that whatever resources were available after meeting all commitments in regard to irrigation and power schemes would be devoted to industrialisation. Describing the National Plan Loan now floated as an economic experiment in credit creation, he said that if the loan succeeded much larger resources might become available for industrialisation. Mr. Deshmukh continued that the first impression was that there had been a shortfall in the performance of the private sector under the first Plan. There had been only a slight delay in the implementation of the plans in regard to steel and oil refineries. As for the rest, he believed that development had been of the size expected. The Finance Minister also stated that the rôle and extent of the activities of private industry in the second five year plan had not yet been decided upon. For a comprehensive plan, one would have to take greater notice of the possible targets to be allotted for the private sector. Another factor would be the extent of aid the private sector might receive from the World Bank. If the Bank continued to take the same interest as in the first Plan, there were possibilities of industrialisation receiving stimulus, he concluded.

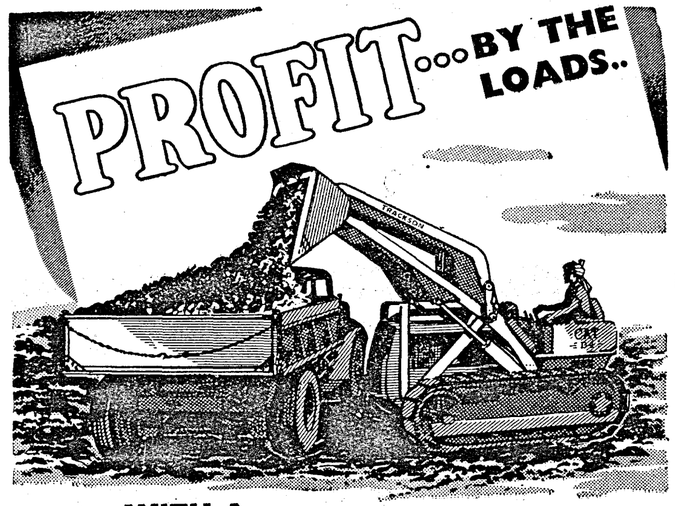
The Second Plan

The State Minister for Public Works, Madras, has just stated that the emphasis in the second five year plan would be mainly on the development of the backward and scarcity areas of the State. He expressed the view that the scope for major irrigation works had been almost exhausted in this State. Future projects would be directed more to power generation, supply of electricity to rural areas, developments of minor irrigation works and restoration of and repairs to existing works, river pumping schemes for irrigation, local development works, particularly those relating to drinking water supply and health works. The Government had decided, the Minister said, to draw up a programme for the taking over of private electricity undertakings and also to inform the managements concerned of the probable period after which the Government might take over particular concerns. This was intended to enable the licensees to undertake expansion schemes, if any, in their areas and make necessary investments with full knowledge of the term for which they would be able to run their concerns. Arrangements are also being made for extending financial assistance and loans to some of the companies, which were being run well, to help them extend their services to rural areas and for promoting schemes of rural electrification. The Government of India had offered financial aid for this purpose. The State Public Works Minister also said that the Kundah hydro-electric project would be the major project that Madras would be undertaking for power generation in the next stage of development. It would supply 1,45,000 Kws energy even at the first stage, and it was estimated to cost Rs. 28 crores.

Single-Teacher Schools

The Madras Government propose to open about 1,270 single-teacher schools during 1954-55 under a scheme of assistance from the Central Government, for the relief of educated unemployment. The Central Government has imposed the condition that after the period of Central assistance, the schools should continue to be maintained by the State Government permanently from their own funds. The scale of Central assistance to rural schools for payment of salaries to teachers will be as follows: In the first year the Central Government will pay 75 percent; in the second year the State and Central Governments will share equally the expense, and in the third year the Central Government will bear 25 percent; in the fourth and subsequent years the State Government will have to meet the entire expenditure. Secondary grade trained teachers will be recruited for the new schools to the extent to which they are available. For the rest untrained matriculates or under-graduates or graduates will be recruited. As experience in school administration and organisation will be necessary for starting new elementary schools and running them, newly recruited teachers will take the place of trained teachers in existing schools, releasing the latter to work in new schools. The rate of pay for teachers employed in new schools will be Rs. 45.

Mr. P. R. Gupta of Ruby General Insurance Company, Limited, has been appointed General Manager of the Company's life department with effect from 1st May, 1954.



WITH A "CATERPILLAR" D4-HT4 TRACTOR-SHOVEL TEAM!

There are four other Tractor-Shovel profit-makers, with bucket capacities of ¾ to 4 cubic yards, to match the work-ability of "Caterpillar" Diesel D2, D4, D6 and D7 Tractors

The gripping traction of a "Caterpillar" Diesel D4 Tractor packs heaped loads into the bucket of a hydraulically-operated HT4 Tractor-Shovel—and every load is a heaping load of profit!

The team is designed and built to do a variety of tasks at low-cost—excavating, loading, dozing, backfilling and others—with maximum efficiency.

Engine power is convested into big digging effort...a choice of five speeds enables the unit to meet every ground condition in loading, hauling or dumping. Hydraulic control is sure, fast and accurate—permits controlled dumping at any level.

You, too, can get in on these loads of profit. Our sales engineers can tell and show you how and where the team can work for you.

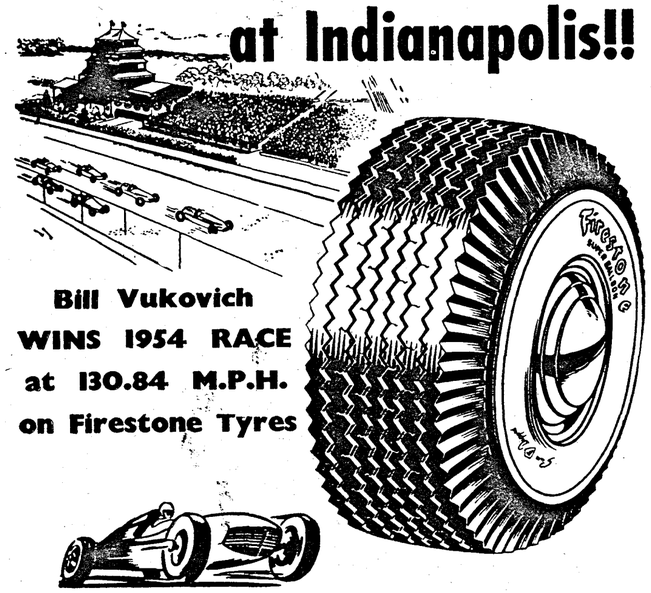
Firestone TYRES WIN AGAIN!!

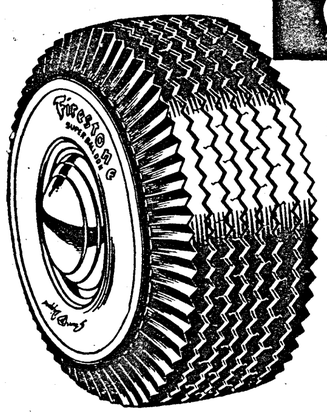
31 Consecutive Victories at Indianapolis!!



Bill Vukovich WINS 1954 RACE at 130.84 M.P.H. on Firestone Tyres

Choose the Tyre of Champions

Firestone



Champion race drivers DEMAND, BUY and USE the SAFEST tyre made! That's why Firestone Tyres have been on the winning cars at Indianapolis, now, for 31 consecutive races. Authorities say that 500 miles of driving in this world-famed event are equal to 50,000 miles of ordinary driving—5 years of average service crowded into approximately 4 hours. Race drivers buy Firestones for safety—you too can have the safest, longest wearing tyres made—buy Firestones today.

Year after year the Champions choose Firestone—The only tyres made that are Safety-Proved on the Speedway for your protection on the Highway.

Jute

CONTRACTS FOR SALE OF JUTE

THE remarks of the Jute Enquiry Commission regarding the I.J.M.A. Contract Form have given rise to some controversy but there is a general feeling in the trade that, while some modifications are desirable, the contract is on the whole fair and the seller who intends to give a fair tender has little to fear. It should also be noted that the Commission took evidence on the subject from the sellers' side but did not give others an opportunity of explaining their views. The chief complaints from the sellers' associations are in regard to the clauses relating to claims and arbitrations. It is generally admitted that the claims clause can be, and frequently is, taken advantage of by some buyers to enforce claims for which there is little justification because the sellers know that even a slight fall below the guaranteed standard will involve them in payment of the costs of arbitration, which in the case of small parcels are out of proportion to the value. The solution seems to be the introduction of a tolerance clause which was, in fact, suggested by some of the Associations. One curious fact which emerged from the Committee's remarks was the publication of a memorandum on the subject by an Association whose members seldom sell jute to mills and whose transactions are limited to Cossipur and other local markets. It is understood, however, that this Association is endeavouring to introduce the I.J.M.A. contract for use among its members in their dealings in local markets. It is also worthy of comment that in most of the transactions between sellers, it is the I.J.M.A. contract which is used. These two facts seem to indicate that the contract is not so one-sided as some of the representations tried to make out. Some of the Associations made representations against the arbitration clause, and particularly arbitration by the Tribunal operated by the Bengal Chamber of Commerce. So far as mills are concerned there are only one or two who want to make a change. As for sellers, they almost invariably, in transactions between themselves, stipulate for Bengal Chamber of Commerce arbitration.

Quality of Indian Jute

It is reported that a conference is to be held shortly to discuss the question of improving the quality of Indian jute. This matter, so far as the actual production of jute is concerned, was dealt with by the Expert Committee whose report is being acted on by the Governments of India and the States which grow jute. The forthcoming conference is to consider ways and means of raising the differentials between the higher and lower grades so as to encourage the growers to give more attention to the growing and preparation of the fibre. The question which arises is whether it is necessary to improve the quality. In the current season, and in many previous ones, it has been more difficult to sell high qualities than low qualities. At present it is difficult to sell any higher assortment than 30 percent Middles and 70 percent Bottoms and the unsold old crop stocks held upcountry by sellers are mostly Middles. In Cossipur, it is true, stocks are mostly of low quality but the reason that they are not attractive to mills is that they are mostly jungli jute but have been baled under marks purporting that they came from superior districts. The crux of the matter appears to be that the present quality of Indian jute is good enough for the manufactured jute goods which the Indian mills produce. If the Government wishes the mills to produce goods of higher standards than those at present being turned out, that is a different matter and requires a different approach, but it seems futile to attempt to raise the prices of good qualities when it is difficult to find a market for them at current prices.

THE JUTE MARKETS

Manufactured Goods: This has been a dull week in the goods market and very little business has been transacted, in spite of some fairly good enquiries being received over the week-end from overseas. Two reasons have been put forward for the failure of mills to take advantage of this business. The first is that mills, in general, had only very small balances to sell for the near positions, and although it would appear that there is a heavy demand for near position heavy goods by the higher prices quoted, there is no "real" business going on, the transactions being confined purely to speculative activity. Secondly, the enquiries received from overseas for forward delivery held out no attractions for the mills as far as price was concerned, and mills were chary about selling large quantities for these periods as it was rumoured that the Argentine Government had called for tenders for 5,000 tons of hessian goods, and a much smaller quantity of heavy goods for July-September shipment. These reports tended to steady rates after the week-end, and quotations were marked up in both sections of the goods market.

The artificial market created in the heavy goods section by the high price of near delivery goods continues to operate. At this time last month the difference between ready and forward delivery for A Twills was Rs. 85 per ton; today the difference is in the region of Rs. 140 per ton, although the demand for A Twills is probably less than it was a month ago. The same story is repeated in the B Twills section; the difference was Rs 30 per ton last month, but is nearly three times that amount today (approximately Rs 80 per ton). This is a far from healthy state for the market to be in, and can only be the result of speculation by bazar parties.

When the goods market opened at the beginning of the period under review, an easier tendency was apparent, and prices were marked down by about Rs. 1-4 in the heavy goods section, and 4 to 8 annas in hessians. In the absence of enquiries either from local sources or from overseas, rates continued to decline and on Saturday morning B Twills were quoted at Rs. 113-4 for ready shipment and Rs. 105 for Oct.-Dec. shipment, whilst 40" 10 oz. hessians were standing at Rs. 113-14 for ready delivery with only a 12-anna discount for forward shipment. Following on reports of the Argentine enquiry, and enquiries from the U.S.A., the market showed immediate reactions on Monday morning, and heavy goods jumped by between 12 annas and Rs. 1-4 in the near delivery positions, whilst the forward position remained constant. In hessians, all delivery positions showed an increase of 8 to 10 annas per 100 yards for all fabrics and a steadier feeling resulted. Mills are reported to have sold small quantities of hessians for July-September delivery for overseas shipment, but no business was reported in sacking at the enhanced rates. Towards the close conditions became easier, and only small fluctuations in price were recorded. Little or no business was reported, and mills showed very little interest at current levels.

The following are the opening prices on Wednesday morning:

		June	July	Aug-Sept	Oct-Dec.
40" 8 oz.	Rs	37-8	37-0	36-8	35-6
40" 10 oz.	Rs	44-6	44-6	44-8	43-8
B Twills	Rs.	113-6	112-4	110-4	105-8
Heavy Cees	Rs.	114-8	113-8	111-8	106-8
A Twills	Rs.	147-0	140-0	136-8	131-0
Cornsacks	Rs.	125-0	118-0	113-8	107-0

Raw Jute: In sympathy with the easier tendency in the goods market at the beginning of the week, raw jute quotations tended to sag. Mills showed very little buying interest and could not be tempted into the market even by sellers discounting their rates. On Saturday, however, a fairly large quantity of business was transacted in both Old and New Crop jute at about 8 annas below the general quotations, and this, coupled with the improvement in the finished goods market, caused raw jute to become steadier on Monday morning, although there was no significant change in prices. Sellers, although keen for business, were less inclined to discount their prices at this stage and once again, with mills tending to sit out of the market, easier conditions prevailed.

The business done during the week has been fairly equally distributed between Old Crop and New Crop purchases, prices paid for the latter being, in most cases, at a premium of 8 annas over Old Crop. Dhubri and Northern jute was bought at Rs. 24 to Rs 24-8 per maund basis Bottoms for June-July shipment, whilst the shipment period for New Crop jute from the same districts was August-September. Assam Old Crop jute was purchased at Rs. 24 to Rs. 25 per maund basis Bottoms for June-July shipment, and New Crop at 8 annas higher for August-September shipment. The higher priced Old Crop contracts were reported to have been done early in the week, but the quantities at this price were not large. In Daissee, mills have purchased Old Crop at prices ranging between Rs 26 to Rs. 28 per maund for June-July delivery, whilst New Crop Daissee was done at a discount of about Re. 1 and ranged between Rs. 25 to Rs. 27 per maund for September-October delivery. Business was also reported in Pakistan New Crop District jute at Rs. 27 per maund basis Bottoms for July-August shipment.

There are no reports of any transactions being done in pucca bales this week, but business is reported in Cuttings at Rs. 62 for Pakistan Northern Cuttings, and Rs. 58 to Rs. 60 for Tossa Cuttings for June-July shipment.

At the close the market is easier with sellers keen for business but not willing to discount the quoted rates. Mills continue to sit out of the market and only small business is reported. Over the week rates have fallen by Rs. 2 per maund, or Rs. 54 per ton.

The following are the opening quotations on Wednesday morning:

Indian Jute (Old Crop):	Landed at Mills Rs. per md. basis Bots.	Shipment
Lower Assam	24-0	June-July
Upper Assam	23-8	"
Northern	24-0	"
Purnea	23-8	"
Murshidabad Tossa	25-0	"
Daissee ex Sheoraphuli	26-8	"
Daissee ex Calcutta	26-0	"
Daissee Mesta ex Calcutta	23-0	"
Northern ex Calcutta	24-0	"
Local Packing	23-0	"
Bimli	22-0	"

Tossa prices are Rs. 2 per maund above the prices of White Jute.

Pucca Bales:		Rs. per Bale	Shipment
Mill Firsts		165	June-July
Mill Lightnings		150	"
Dundee Daissee	2/3 S.G.	165	"
	2/3 L.G.	150	"
Pakistan Jute (ex Pakistan):		**Rs. per Md. basis Bots.**	**Shipment**
Jat		26-0	June-July
District		25-8	"
Northern		25-0	"

New Crop quotations are 8 annas per maund above the price of Old Crop jute, and shipment periods go through from August to October. Daissee New Crop quotations are generally at a discount of Re. 1 per maund on Old Crop prices for September-October-November shipment.

Arrivals of raw jute into the local Cossipur jute markets have fallen off considerably this week, and the sentiment of the market has been easier. Sellers have been keen for business and have cut their rates to attract buyers, but except for a short spell over the week-end, when some business was done and the market steadied slightly, mills have shown no interest in local purchases. The rise was short-lived and towards the end of the period quotations again fell away. No fresh arrivals have been reported from the Sheoraphuli Daissee markets and in spite of a fair amount of Daissee purchases made at the week-end, prices in this market, in keeping with the general trend of the other markets, fell by about Rs. 2 over the week. Reports of the Daissee New Crop would appear to indicate that a bumper crop can be expected next season. The weather has been favourable and the young plants are healthy.

Mofussil: Upcountry markets in India continue to rule dull and lifeless, with no imports, and only very small business is taking place. In the absence of business, quotations are purely nominal and at the time of writing are based on Rs. 21 for Dhubri Bottoms.

Once again there is little to report from the Pakistan markets as imports are very small and the general trend of the market is quieter. Imports into the Narayanganj market average about 4,000 mds. per day, about half of which is in bales, and the other half loose. Crop reports indicate that the weather has again been unfavourable, with heavy rain and rivers rising.

Current quotations, which are nominal in the absence of business, are as under:

Pucca Bales:	Rs.	Kutcha Bales:	Rs.
Mill Firsts	128	Jat	26-8
Export Firsts	110	District	19-4
Export Lightnings	100	Northern	17-4
Dacca Tossa 4's	160	Tossa is quoted at Rs. 4 per maund higher than White Jute.	
Dundee Tossa 4's	128		
Outport Tossa 2/3	113		
Outport Tossa 4's	85		

Consumption of Raw Jute

In May 1954, mills reporting to the I.J.M.A. consumed 4,16,000 bales bringing the total for the eleven months July-May to 46,10,000 bales. In May 1953, the consumption was 4,32,000 bales and the total for July-May, 1952-53, was 48,84,000 bales.

SOWING COMPLETED IN ASSAM

In their twelfth crop report for the current Indian season covering the week ended 5th June, Messrs. Sinclair Murray & Co. Ltd., say that weather conditions have been variable with rather excessive rainfall in Assam, but elsewhere conditions have been satisfactory for the growth of the crop. Sowings have progressed but weeding operations have been curtailed in many districts owing to continued rainfall.

DANPUR: The weather has been mainly favourable and cultivators have been able to continue with sowings which are now estimated at -/26/- as against -/6/- on the same date last year. Weeding operations are being carried on where necessary with the exception of some low land areas where there is water-logging. Plant condition is satisfactory and they range in height up to 1ft 6in. The river has risen slowly but is below last year's level at this time.

JAJPUR ROAD: Sowings completed -/22/-. Unfavourable weather has been experienced and has affected weeding operations. However, sowings have now been completed and are estimated at -/22/- as against -/4/- at this time last year. A spell of dry weather with sunshine would be beneficial to help the growth of the young plants. Plant condition of early sowings is satisfactory and they range in height up to 1ft 4in. The river level is slightly higher than last year's level at this time.

RANAGHAT: Rather excessive rainfall has been experienced and a few days of dry weather would be beneficial for the standing crop as well as to allow cultivators to complete sowings. This year's sowings are estimated to be -/20/- as against -/13/- at this time last year. Weeding operations have been interrupted but plant condition is satisfactory and they range in height up to 2ft 6in. The river level is slightly higher than normal for this time of the year.

COSSIMBAZAR: Sowings completed -/24/-. Very favourable weather has been experienced and this has allowed cultivators to complete sowings at -/24/- as against -/14/- at this date last season. Weeding operations have been carried on freely and plant condition is very healthy, plants ranging in height up to 1ft 10in.

FORBESGANJ: Favourable weather conditions have been experienced which have been beneficial for sowings and growth of young plants. To date sowings are estimated at -/17/- as against -/16/- at the same date last year. Weeding operations have been carried on freely. The condition of young plants is very satisfactory and they range in height up to 3ft 3in.

NOWGONG: Sowings completed -/18/- The weather has been mainly wet and a spell of dry weather would now be beneficial for the standing crop. Weeding operations have been suspended but plant condition is good and they range in height up to 5ft. The river level is rising slowly and is still slightly lower than last year's level at this time.

GAUHATI: Sowings completed -/18/-. The weather has been cloudy with moderate rain; strong sunshine is now necessary to allow cultivators to carry on with weeding operations in the mid and highlands. Plant condition is satisfactory and they range in height up to 5ft 4in. The river level has fallen by 4ft 5in and is now 5ft 3in lower than last year at this time.

DHUBRI: Sowings completed -/17/-. Favourable weather has been experienced and this has allowed cultivators to resume weeding operations. The condition of plants is very satisfactory and they range in height up to 5ft 3in. Some harvesting has been reported in the lowlands in spite of the fact that the river has fallen and now stands 5ft lower than on this date last year.

KHARUPETIA: Sowings completed -/17/-. Hot and dry weather prevailed during the first part of the week but towards the end good rainfall was experienced. Weeding operations have been carried on where required and condition of plants is satisfactory; plants range in height up to 4ft 9in. The river level has fallen and now stands at the same level as last year at this time.

DAISSEE DISTRICTS: Sowings completed -/24/-. Alternate rain and sunshine has been experienced which has been favourable for the crop. Sowings have now been completed at -/24/- as against -/16/- sown at this time last season. Condition of young plants is healthy and they range in height up to 3ft.

Rainfall	For the week 1954	For the week 1953	Total from 1st Jany. 1954	Total from 1st Jany. 1953	Rainfall over the Week-end
Danpur	5.98″	1.20″	9.19″	3.50″	
Jajpur Road	4.00″	1.76″	13.35″	6.16″	
Ranaghat	3.56″	4.06″	20.88″	6.14″

N.B. As a basis of comparison last season's crop has been taken as -/16/-.

TOO MUCH RAINFALL IN EAST PAKISTAN JUTE AREAS

In their fourteenth crop report for the current season in Pakistan covering the week ended 5th June, Messrs. Sinclair Murray (Pakistan) Ltd, say that excessive rainfall has been experienced and a spell of dry, sunny weather is essential, both to promote growth and to enable cultivators to complete weeding operations. As the monsoon has now set in there is very little immediate prospect of long spells of dry weather. Whilst the level of the Brahmaputra is lower than last year at this time, other river levels are normal.

NARAYANGANJ: Heavy rainfall has been experienced and a spell of dry weather is now necessary. Fields are water-logged and this is bound to retard growth; weeding operations are also suspended. The river is about the same as last year at this time.

DACCA: Heavy rainfall has been experienced and a spell of dry weather would be beneficial. The river is normal for this time of the year.

CHANDPUR: Weather conditions have been wet and a spell of dry weather is necessary, both to promote growth and to allow weeding operations to be completed. The river is normal for this time of the year.

ASHUGANJ: Excessive rainfall has been experienced and a spell of dry, sunny weather is necessary. The river is about the same as last year at this time.

NIKLIDAMPARA: Weather conditions have been mainly wet and whilst this is not unfavourable a spell of dry, sunny weather would prove beneficial. Plants range in height up to 6ft 6in and the condition of the standing crop is, at the moment, satisfactory. Harvesting in the extreme lowland is at present in hand and about -/1/6 of the total crop has already been cut but what has been cut is mostly immature. This harvesting was done due to a rise in the river although at the moment it is only 6in higher than last year at this time.

SARISHABARI: Rainfall has been excessive and a spell of dry sunny weather is essential. Weeding operations are entirely suspended and the growth of the crop has not made much progress due to wet conditions. The river has fallen slightly and is now about 4ft lower than at this time last year.

SIRAJGANJ: Rainfall has been excessive and a spell of dry sunny weather is necessary both to promote growth and enable cultivators to proceed with weeding operations. The condition of the crop is still satisfactory and plants range in height up to 5ft 9in. The river has fallen slightly and is now about 3ft lower than last year at this time.

NAKALIA: Excessive rainfall has been experienced and a spell of dry weather is now essential. Weeding operations have been entirely suspended and the excessive rain has not helped growth. The river is now about 9in lower than last year at this time.

BHANGOORA: Rainfall has been excessive and a spell of dry sunny weather is essential. The condition of the standing crop is still satisfactory although dry weather now would undoubtedly promote growth. The river has fallen and is now about 1½ft lower than at the corresponding period last year.

Rainfall	For the week 1954	For the week 1953	Total from 1st Jany. 1954	Total from 1st Jany. 1953	Rainfall over the Week-end
Narayanganj	9.17″	2.03″	24.50″	22.78″	
Dacca	8.60″	5.98″	30.26″	29.01″

N.B. As a basis of comparison last season's crop has been taken as -/16/-.

THE FOREIGN JUTE MARKETS

PAKISTAN QUOTING LOWER PRICES

(FROM OUR DUNDEE CORRESPONDENT).

THE jute industry is obviously affected by the growing unsatisfactory conditions prevailing in certain parts of the world. Raw jute shippers in Pakistan are offering to sell at lower prices. It is said that holders of the fibre in that country are becoming anxious about their stocks and wish to dispose of them. It is feared that there may be drastic results accruing from the riots in that country. There is also the fact, however, that sowings under jute in Pakistan are larger this year and that a considerably bigger crop is expected, while it is also reported that the area in India has been increased somewhat.

Mill Firsts are now offered at from £99 to £100 and even some of the better class shippers who were quoting up to £108 per ton have reduced their terms to round about £100, while Mill Lightnings are quoted at from £88 to £90, and good daissee-½ at from £100 and Crack Tossa-2/3 at £117, with grade from £108 and grade fours from £99, all c. and f. U.K., showing a drop of from £1 to £3 per ton. This easier tendency is affecting consumers of jute goods and there is not much business being done.

In the U.K., buyers are showing very little interest in cloth and bags, but there are still no manufacturers showing any undue anxiety. The majority are comfortably placed with orders for delivery over the next several months, but where these are booked only provisionally business would be possible for reasonably early delivery. Prices are firmly maintained on the basis of 13.54d per yard for 10 oz. 40 in. hessians and 11.07d for 8 oz. Jute yarns are quiet and buyers are not keen to purchase forward. There are enquiries for quick delivery and small lots are being picked up in the case of hessian yarns for weaving. The whole position of spinners, however, is still satisfactory and prices are very firm at 16.08d per lb. for common 8lb. cops and 8lb. spools.

Calcutta goods have gone easier again, after showing strength, particularly for sackings. Liverpool Twills jumped to 233s but were later quoted at 223s 6d for July. B Twills are at 185s 9d June, 184s July and 181s 6d July-September, with 10 oz. 40 in. at 71s 6d, 71s 9d and 72s and 7½ oz. at 55s 6d, 55s and 54s 6d for the respective positions of shipment.

I.J.M.A. PRODUCTION FIGURES FOR MAY

The Indian Jute Mills Association reports figures for the production of jute goods during May 1954 as follows:

(A) Total reported production of manufactured goods exclusive of all Government orders.

Description	Quantity
1. Twist and Yarn	
(a) For sale	1,433 tons
(b) All other including that used in sewing bags	829 tons
2. Canvas	326 tons 7.6 lakh yds.
3. Gunny Bags (Tonnage exclude sewing twist)	
(a) Hessian	2,114 tons 100.8 lakh yds. 43.2 lakh Nos.
(b) Sacking	37,238 tons 864.9 lakh yds. 369.1 lakh Nos.
4. Gunny Cloth	
(a) Hessian	26,747 tons 10,42.9 lakh yds.
(b) Sacking	2,200 tons 46.2 lakh yds.
5. Other manufactures (including ropes)	289 tons
6. Total production (above figures combined)	
(a) All kinds	71,176 tons
(b) Hessian (both bags and cloth)	11,43.7 lakh yds.
(c) Sacking (—do—)	9,11.1 lakh yds.
(d) Canvas (—do—)	7.6 lakh yds.

(B) Total reported production of goods manufactured on Government account.

Description	Quantity
7. Sandbags	Nil
8 Scrim Cloth	9 tons
9. Hessian Bags and Cloth and Canvas	0.3 lakh yds. 124 tons 4.7 lakh yds.
10. Sacking Bags and Cloth	24 tons 0.5 lakh yds.
11. Rove, Rope, Twine etc.	Nil

Summary

	(000,000 yds.) May	(000,000 yds.) *Average	(000 tons) May	(000 tons) *Average
Hessian				
Civil	11,51	13,40	29.2	34.3
Government	5	1.71	0.1	4.6
	11,56	15.11	29.3	38.9
Sacking				
Civil	9,11	10,92	39.4	45.7
Government	0	44	0.0	1.8
	9,11	11,36	39.4	47.5
Other Manufactures				
Civil			2.6	2.4
Government			0.0	0.0
			2.6	2.4
		Grand Total	71.3	88.8

* Based on production figures from July 1948 to April 1949 full working months excepting March with full complement working 48 hours a week.

N.B.—The above figures include returns of Gagalbhai Jute Mills and of all members of the Association with the exception of three mills whose production figures for May have been estimated.

ATOMIC-POWER STATIONS FOR U. K. IN A FEW YEARS

The British Electricity Authority hopes to build large atomic-power stations employing standard 60,000 K.W. generating units within the next few years, the Authority states in a booklet, *Power and Prosperity*, just published. Steam turbines and alternators of conventional design would be used, with nuclear reactors and heat exchangers taking the place of coal-fired boilers. "The Authority hopes that it may shortly be placed in a position itself to commence the design and construction of such stations as part of its normal activities," the booklet says. While nuclear power does not offer any immediate relief to the nation's fuel problems, and must be considered rather as a long-term solution, there may be a useful contribution to the national grid from nuclear stations within the next decade.

CALCUTTA TEA AUCTIONS IN MAY

KEEN DEMAND FOR QUALITY TEAS

IN their monthly review of the tea sales in Calcutta during May, Messrs. Carritt Moran and Co. Ltd. say that Sale Nos. 1 and 2 of the New Season's crop were held on 17th and 31st May. Approximately 14,000 packages were catalogued in each sale and the offerings consisted almost entirely of teas from the Darjeeling and Dooars districts. First flush Darjeeling were well up to standard and a number of invoices with attractive leaf appearance and bright liquors were on offer. Dooars teas were a little disappointing and although leaf appearance was average for New Season's teas, cup quality was frequently dull and green. In Sale No. 2 the offerings generally showed a decline in quality as compared to the earlier invoices sold in the previous sale.

In Sale No. 1 there was a very strong demand for Darjeelings, particularly stylish whole leaf grades with useful flavour which often sold at very high rates. The broken and fannings grades, however, were in a little less demand but sold readily at satisfactory rates. Teas from the Dooars also met with very keen competition especially well-made whole leaf grades and those with useful first flush quality and prices ranged from Rs. 2-11 to Rs. 3 per lb. In Sale No. 2 commonest sorts and plain liquoring Dooars were easier, otherwise there was a fair demand for all descriptions. Buyers were discriminating and quality teas were keenly sought after. Stylish flavour Darjeelings again came to a strong market and sold well above valuations. The few tippy teas and whole leaf grades on offer met an exceptionally strong demand.

Sale No. 2 Clean Common B. P.	2 10 0	1 11 6

Internal Market

Sales Nos. 45 and 46 consisted of 1,284 packages of Old Season's and 485 packages of New Season's Leaf teas. There was a strong demand for the Old Season's offerings, most of which were residual in appearance and character. One or two lines of New Season's Darjeelings realised high prices, but a number of others were withdrawn as buyer's ideas were somewhat below brokers' valuations. Offerings in the two Dust Sales held during the month amounted to 30,420 packages of Old Season's and 467 packages of New Season's teas. In Sale No. 45 there was a good and fairly general demand. Dooars dusts were firm and medium Assams and black grainy types were half an anna dearer, whilst the better liquoring kinds were as much as one anna above previous rates. Best C.T.C. dusts were again strong and half to one anna dearer, but those with poor appearance and inferior liquors were only just steady. In Sales No. 46 there was a strong and general demand with commons and mediums half to one anna dearer. The few New Season's teas on offer sold at up to two annas above Old Season's teas with the smaller types proving the most popular.

Quotations

	1953-54 Rs. As.P.	1952-53 Rs. As. P.
Sale No. 45 Clean Common Dust	2 1 0	1 5 9
Sale No. 46 Clean Common Dust	2 1 6	1 5 9

Export sales up to and including Sale No. 2 totalled 31,195 chests at an average price of Rs. 2-13-4, compared with 48,439 chests at an average price of Rs. 1-13-10 a year ago. Internal sales at 905 chests of leaf and 3,420 chests of dust (Rs. 2-8-9 and Rs. 2-2-3) compared with 545 and 12,003 chests (Re. 1-12-5 and Re. 1-7-7) in the corresponding period last year.

At the beginning of the month business was transacted in Special Export Licences at 43 pies per lb. The price rose gradually until 26th May to 52 pies, but thereafter there was a sharp decline, and on 31st May business was transacted at 24 pies only, as Special Export Licences ceased to be valid after 31st May. For the first two weeks of the month, the price of Export Quota Rights Season 1954-55 remained steady at 48 pies per lb. The price appreciated thereafter, and touching 60 pies on 25th May, closed at 58 pies.

The estimated North India crop to the end of April 1954 was 15,825,131 lbs. as compared with 21,690,254 lbs. to the same date last year. The average figure at this date for the three years 1951-53 was 20,369,665 lbs. Most districts have reported more favourable weather conditions during the past month and it is expected that the shortfall of 5,865,123 lbs. will be made up.

Arrivals (in chests) in Calcutta warehouses during the period 24th April to 23rd May, 1954, with the corresponding figures of the previous year in parenthesis, were as follows: by rail 19,254 (54,904), by steamer 25,005 (40,963), by air 10,916 (6,791), making a total of 53,175 (102,658). Since the beginning of the season, 1st April, 1954 and up to 23rd May, 1954, arrivals have been 27,624 (56,329) by steamer; 23,346 (64,000) by rail; and 13,962 (11,439) by air, making a total of 64,932 (131,768) chests.

COFFEE PRODUCTION AND EXPORTS

BOARD'S MEETING IN BANGALORE

THE Indian Coffee Board, at its meeting in Bangalore last Friday, placed the revised estimate for the current 1953-54 season crop at 29,000 tons, made up of 22,250 tons arabica and 6,750 tons robusta. This is a record crop for India. The crop estimate for the coming 1954-55 season was placed at 22,000 tons, made up of 12,500 tons arabica and 9,500 tons robusta. An export allocation of 3,000 tons out of the 1953-54 crop, over and above the 5,000 tons already sold for shipment, was recommended. Taking into account that the pool stock as on 1st June was 20,175 tons, and allowing for an internal release of 1,750 tons per month for the next seven months, the Board felt that the 3,000 tons now recommended could be safely exported from the 1953-54 crop without affecting internal prices. The Board decided to consider the question of further exports in August next.

In regard to the pool payment on the 1952-53 crop, it was decided to distribute the balance of nearly Rs. 22 lakhs remaining after payment of Rs. 2-4 per point to the growers on the basis of the value of coffee delivered by them with reference to the existing Price Differential Scale. This may increase the point value to a little over Rs. 2-5. As for the pool payment on the 1953-54 crop, the Board declared a third payment to be made in June bringing up the total value of payments to Rs. 1-5 per point, and a further payment of 4 annas per point to be made in July.

Popularising Coffee

To popularise coffee in North India the Board decided to appoint agencies to sell coffee powder in important North Indian towns. With a view to persuading railway refreshment establishments to adopt the Board's standard method of brewing coffee, it was decided to arrange for preparing and serving coffee at the Coimbatore Railway Junction on a demonstration basis for a period of one month. The scheme of research in coffee technology undertaken by the Central Food Technological Research Institute, Mysore, on behalf of the Board was extended for another year from March 1955. The scheme, which commenced in 1952, is due to complete its first period of three years in March 1955.

The Board meeting was presided over by the Minister, Mr. H. Siddaveerappa, Chairman of the Board. It re-elected Mr. H. Siddaveerappa to be Chairman and Mr. S. N. Ramanna to be Vice-Chairman for its extended period of office ending 31st December, 1954. The Board appointed the following members to wait in deputation before the Select Committee on the revised Coffee Bill and give oral evidence on its behalf: Mr. S. N. Ramanna (Vice-Chairman of the Board): Mr. N. B Athrey; Mr. U. Subraya Mallia; Mr. M. A. Dharmaraja Iyer; and Mr. T. Raghavachari.

Mr. H. Siddaveerappa, Chairman, said at the meeting that the "current coffee year, which is due to end on 30th June, has witnessed a number of important developments in the Board's marketing, propaganda and research activities. Surveying the Board's marketing activities first, it will be seen that the Board has steadfastly continued its efforts to keep down coffee prices for the home consumer. You may recall that our all-time record price of Rs. 325-15 per cwt. was touched by Plantation A in the pool auction held at Mysore in September 1952. The average pool auction price for Plantation A in that month was Rs. 316-11 per cwt. and the average for 1952 as a whole was Rs. 251-11. As a result of the unrelenting pressure since then kept up on speculative influences, coffee prices in the country have been brought down to reasonable levels. As against the average pool auction price of Rs. 316-11 for Plantation A in September 1952, the price in December 1953 was Rs. 199-1. The average for the same type of coffee during the first quarter of 1954 now stands at Rs. 202-14. Coffee powder prices, which in the latter half of 1952 had ranged between Rs. 3 and Rs. 3-12 per lb, have been now brought down to between Rs. 2-4 and Rs. 2-12 per lb, that is by 25 to 30 percent.

Co-operative Societies

"Among the measures adopted by the Board to keep down prices, I may mention the holding of local auctions at important coffee consuming centres for the special benefit of small retail dealers, and the increased allotment of coffee to co-operative societies and the Propaganda Department for being directly retailed to the public at fixed fair price. There has been no doubt a fall in the offtake of coffee at these local auctions and by co-operative societies for some months, but it is in a way a measure of the success the Board has achieved in making coffee freely available in the market at reasonable prices. The view has been expressed by some that the comparatively low offtake of 15,184 tons in the country in 1953 as against 17,682 tons in 1952 and 18,383 tons in 1951 was to some extent due to consumer resistance. It is hoped that with the more reasonable prices now prevailing in the Indian market, the consumption will not only reach its old level but would tend to go up still further. It may be mentioned here that the quantity released during the last five months exceeds 9,000 tons.

"The firm policy enunciated by the Union Government that only the surplus coffee over and above full home requirements will be allowed to be exported and which has had the whole-hearted support of the Coffee Board is bound to keep internal prices within reasonable limits. I would like to take this opportunity to stress that coffee patrons in India have reason to be thankful to the Indian coffee industry, if they consider what the public in other important coffee consuming countries have to pay for their favourite beverage. In the U.S.A. the wholesale price of coffee comparable to our Plantation A is around Rs. 500 per cwt. and the powder retail price close to Rs. 6 per lb.

"On the coffee promotipon front, I would draw your special notice to the increased attention which the Propaganda Committee has been paying to popularising robusta. Thus monsooned robusta and robusta parchment are being tried both in the cup and as powder on an experimental scale in some selected coffee houses. And lately a start has been made to use a blend of arabica parchment and robusta parchment in the proportion of 3 : 1 in certain coffee houses for sale in the cup and also as powder. In view of the increasing tendency observed in the extension of robusta cultivation and the possibility of the robusta crop doubling itself to round about 15,000 tons in the near future, promotional effort on behalf of this type of coffee will need to be stepped up. There is also a proposal to extend our propaganda activities particularly in North India by opening new coffee houses in important centres where it is now almost impossible to get a good cup of coffee.

"I note that the Propaganda Department had during this year held demonstrations in the brewing of coffee at a few railway junctions with a view to show the railway authorities that the Board's method of preparing coffee could be usefully adopted by railway refreshment establishments. Though from our standpoint we feel we have successfully proved our case, it would seem that the railway authorities have not wholly accepted our conclusions. I trust that despite this initial discouragement, the Propaganda Committee and Propaganda Department will persist in their efforts to improve the quality of coffee served in railway stations. For a good cup of coffee is by far the best propaganda for coffee.

Research Department

"This year has seen the Research Department working at almost full strength, the one important post which has not yet been filled in being that of the Agronomist. The evolving and propagation of leaf disease-resistant and high-yielding material continues to be the chief concern of the Botanical Section. Six Station Selections of arabica and one robusta were in large circulation. Over 1,500 lbs of arabica seed and 900 lbs of robusta seed were issued to planters against 30 lbs and 50 lbs respectively in the year 1946-47. Sixty-four planters have seed blocks in their estates. The need for stepping up the distribution of improved seeds speedily and substantially has been fully realised by both the Research Committee and the Research Department and necessary steps are being taken in this direction. The manuring of coffee, land management and processing of fruit into parchment by accelerating the fermentation after pulping form the main items of work in the Chemical Section.

"The control of white stem borer of coffee and incidence of green bug were the main pre-occupation of the Plant Protection Section. The use of systemic insecticides has given encouraging results to control the latter. The use of Agrocide (BHC formulation) as a stem wash has definitely proved beneficial for the control of stem borer. It is encouraging to observe that many planters including small holders are taking to the use of the latter as an effective control against ravages of this pest.

Liaison Officers

"The six liaison officers, who have been for the past 18 months put through an intensive course of training in all aspects of coffee culture, have completed their probation and are to be posted to their regular assignments. Both the Board and the industry owe a deep debt of gratitude to all those planters who took these probationers for training under them on their estates and allowed them to draw freely upon their great storehouse of specialised knowledge and experience.

"The 13 and odd years the Coffee Board has been in existence mark a memorable phase in the history of coffee industry in India. This period has seen the industry restored from a position of threatened collapse following the outbreak of war to one of comparative confidence and stability. The best measure of this gain in confidence is provided by the expansion in area under coffee from 1,83,003 acres in 1939-40 to 2,40,038 in 1952-53 and by the increase in the average crop of coffee from 16,104 tons for the six years preceding 1939-40 to 22,443 tons for the six years preceding 1953-54. Thus the jump in area is by 31 percent and that in production is 39 percent. As a matter of fact, the current coffee crop of about 29,000 tons is the highest so far recorded in India and it is hoped that the present accent on production will give the necessary spurt for still higher production for which there is considerable scope.

"In his statement of objects and reasons introducing the new Coffee Bill, the Minister, Mr. T. T. Krishnamachari has very appropriately pointed out this aspect of the question, when he says that the Coffee Market Expansion Act, 1942, was passed to meet the situation which confronted the coffee industry on the outbreak of World War II, when

most of our European markets for coffee were lost. This resulted in a surplus of coffee in the country and a slump in prices. The situation today is entirely different. The internal consumption of coffee has increased considerably and it is of utmost importance to step up our production in order to meet the increasing demand of the home market, keep prices at reasonable levels and to meet our export requirements. The problem now is therefore one of the development of the industry rather than of marketing'. I am aware that some of the provisions of the Bill have been the subject-matter of controversy but I trust that the Bill, which is now before the Select Committee, will emerge therefrom in a form more or less acceptable to all sections of the industry and help set the industry on the road to further progress and prosperity.

Plantation Enquiry Commission

"Indian coffee has indeed a significant rôle to play in India's economy. At one time the area under coffee exceeded 3 lakh acres as against the present acreage of 2.4 lakhs. If the Malnad areas in South India with their immense potentialities are developed to their fullest extent, coffee production could perhaps double itself in a short time. This will add to the material prosperity of the country, solve the problem of unemployment to some extent and also contribute in a larger measure to international trade. Indian coffee is a product of high quality which, besides having established a name for itself in world markets for several decades, has an expanding market at home. I shall conclude by expressing the hope that the Plantation Enquiry Commission, which is due to start its work shortly, will with the active co-operation of the leaders of the industry succeed in devising a comprehensive scheme for the development of the industry to its full stature."

U.S. TEA EQUIPMENT DEVELOPMENT PROGRAMME GOING FORWARD

The brewing equipment research programme undertaken by the U. S. National Restaurant Association in co-operation with the Tea Council has made steady progress. A feature of the latest developments is a proposal by the Battelle Memorial Institute of Columbus, Ohio, to (a) design (b) construct, and (c) test new automatic and semi-automatic restaurant tea-making equipment. Battelle, one of the foremost experimental research laboratories in the U. S. A., estimates that it can do the total job, including the final step of interesting manufacturers in producing approved equipment on a commercial basis, in one year for $25,000. The Tea Council, which previously approved a $10,000 grant to the National Restaurant Association, has studied this proposal and approved the necessary additional funds to get Battelle working immediately. Lack of such equipment is the principal reason why good hot tea is not available in 90 percent of America's restaurants. If good tea was available and the public began to drink it as often in restaurants as they do at home, U. S. consumption could be increased 14 million lbs a year.

LONDON TEA SALES

The greater part of offerings at Monday's tea sale in London consisted of African varieties, which sold well at steady prices. Dusts, however, were irregular and often easier. There was a limited amount of new season's North Indian tea on offer, including some Darjeelings, which sold well at 69d to 95½d per lb. No standard common broken pekoe was offered. Offerings totalled 12,059 packages of Nyasaland, North Indian and other miscellaneous teas.

British Tea Imports

Total imports of tea into Britain during April totalled 29,128,000 lbs, according to the monthly summary of the International Tea Committee. Re-exports during the month were 4,641,000 lbs. Imports during April 1953 totalled 36,714,000 lbs and re-exports 3,322,000 lbs. The bulk of this April's imports came from India which supplied 13,901,000 lbs, followed by Ceylon with 9,175,000 lbs. Other suppliers were Pakistan 206,000 lbs, Indonesia 876,000 lbs, Kenya, Uganda, Tanganyika 1,115,000 lbs, Nyasaland 2,697,000 lbs, Mozambique 157,000 lbs and other countries 999,000 lbs. Of the re-exports, 2,117,000 lbs went to the United States.

COCHIN TEA SALES

At Sale K held on 8th June, a total of approximately 375,000 lbs. of Dust was on offer. There was a restricted demand at rates which were fully 2 annas below the last and many lots were withdrawn without bids. The limited quantity of Clean Black Leaf descriptions met with fairly keen competition at prices which were about 1 anna easier.

The Export Quota market eased to 49 pies, at which price limited business was done. Internal Sale No. L will be held on 22nd June.

At Sale No. 12, 1,450,000 lbs of tea were on offer. There was a good general demand, but prices declined by half to one anna, except for clean black teas, which were steady. Whole leaf and thin liquoring broken pekoes were difficult to sell.

There goes the Frontier Mail !

There goes the signal. And slowly many hundreds of tons of freight and food, people and post, move off into the Indian country-side. To keep her lines of communication open, India is spending about two annas of every Five-Year-Plan rupee on the railway system—the largest in Asia. And that amount is for rehabilitation of existing tracks and rolling stock only—more money will be found for the expansion of the railway system which will be necessary to meet the demands of the increased industrial activity.

The railways of India haul more tons of oil more miles than all other forms of transportation put together, and make it possible for the oil industry to transport their products across the vast distances of the country. We, in turn, supply Indian Railways with a great many petroleum products essential for their operation, such as lubricants, cutting, furnace, diesel and quenching oils, kerosine and also petrol for their motor transport.

BURMAH-SHELL ... IN INDIA'S LIFE AND PART OF IT

Commodity Markets

TRADE IN COTTON TEXTILES

EASTERN COUNTRIES MAKE GOOD PROGRESS

TEXTILE producers in the East appear to be gaining ground on those in the West. That is the outstanding feature of the Cotton Board's latest quarterly statistical review, which covers the first quarter of this year and shows that in that period cotton yarn output in the main non-Communist countries was about 3½ percent greater than in the same quarter of 1953 and about 1½ percent up on 1952. Individual experiences vary, however, for whereas in the United States and Canada mill activity was much below the previous year's levels, in the other countries taken together yarn output is now about 14 percent greater and, with the possible exception of Italy and Spain, each of them reports increased activity and some a considerable increase. Trade in cotton piecegoods in the quarter showed an increase of about 3 percent on the previous quarter (the final quarter of 1953), but this was due to Japan and India making substantial additions to their exports, for shipments from the United Kingdom, France, Germany and Italy were all less and the remaining exporting countries were only able to maintain their figures. By contrast, world trade in rayon piece-goods declined by 3 percent. Japanese exports showed a moderate increase, but those of all the others declined.

Reviewing the position in individual countries, the review points out that an unusually prolonged period of heavy absenteeism through illness was the main reason for British production being lower. The pre-Christmas peak of employment in the industry was not regained until April. Order books are still fairly full and delivery dates extended, so the volume of new business booked recently has been at a somewhat lower rate than in the early part of the year. The increase of 15 percent in both yarn and cloth production in the first quarter of this year compared with the corresponding period of last year is merely a reflection of the expansion which took place in 1953. Cotton cloth production is 16 percent greater whereas rayon and mixture cloth output is only 10 percent higher, so that it would seem that cotton has regained some of the ground previously lost to rayon. Spun rayon cloth showed a drop of as much as 11 percent between October of last year and March of this year.

Exports generally were disappointing compared with the final quarter of 1953. All the main markets took less cotton yarn, with the drop in shipments to Pakistan being particularly marked. The colonial market took less cotton cloth, with British West Africa showing a decline of 12 million square yards, which moderate increases in the shipments to Australia, New Zealand, South Africa, Southern Rhodesia and Pakistan were unable to offset. British West Africa was also responsible for most of the fall in rayon piece-goods shipments and the West Indies also took less, though there were moderate increases in exports to Australia, New Zealand and South Africa and quite a notable increase to British East Africa. Imports of grey cotton cloth totalled 41 million square yards in the first quarter of 1954, compared with a quarterly average of only 19 million square yards in 1953. India was much the largest source of supply, contributing 25 million square yards. Imports of cotton yarn from India have also increased substantially, amounting to 1,290,000 lbs. out of total imports of 2,990,000 lbs. in the quarter.

In the United States cotton consumption in the first quarter of this year was 9 percent less than in the corresponding period of 1953, but machine activity has in fact shown comparatively little change as there has been a tendency to spin finer counts. Cloth production in fact is actually a bit higher, if anything. Rayon cloth production, on the other hand, is definitely lower. Cotton piece-goods exports show little change, but those of rayon are down. Venezuela has been mainly responsible for taking less of both, but Cuba offset the loss in cotton cloth.

Holidays in January were responsible for a slight decline in Japan's cotton yarn output in the first quarter of 1954, but cloth production reached a new post-war high record at 775 million yards. Spun rayon yarn output also expanded notably, but production of rayon cloth was somewhat less than in the final quarter of 1953. Exports of cotton piece-goods increased significantly to 327 million square yards, against 279 million square yards in the previous quarter and only 186 million square yards in the first quarter of 1953. Pakistan reappeared as an important market after an absence of a year, taking 41 million square yards, while exports to Indonesia increased to 116 million square yards and there were larger shipments also to the Belgian Congo, Turkey, Iran and Siam. Exports to Australia remained at a relatively high level, but shipments to South Africa, British West Africa, Singapore, Hong Kong, Burma and the Philippines were less than in the preceding quarter, and there was little revival of trade with the United Kingdom or British East Africa. Rayon piece-goods exports also increased, to 122 million square yards as compared with 113 million square yards in the previous quarter, with Iraq and South Africa, the two largest markets, taking more.

Indian Mills Active

Activity in the Indian cotton textile industry remained at a very high level during the first quarter of this year, when output of both yarn and cloth was greater than in the corresponding period of 1953. Domestic demand for cotton goods is reported to be steady, although the effect of the increase in the excise duty on textiles in the Indian budget is not yet apparent. Exports of cotton piece-goods expanded by about 40 million yards between the final quarter of 1953 and the first quarter of 1954; it is reported, however, that shipments declined in March and again in April. The United Kingdom, Aden and the Sudan all took substantially increased volumes of cloth in the first quarter, and trade with Pakistan was resumed after a considerable interval. The most important markets are currently Aden, the United Kingdom, British East and West Africa, the Sudan, Australia and Indonesia. Shipments to Burma so far this year have been small compared with 1953 levels. The determination of the Indian Government to increase exports of cotton goods, which led to tariff concessions last year, is further demonstrated by the proposed setting up of an Export Promotion Council for Textiles.

Output of cotton yarn and cloth in the Western European countries considered as a whole was roughly 10 or 11 percent greater in the opening months of 1954 than in the same months in 1953, with only Spain and Italy not showing any improvement, though the latter has done a lot better in rayon yarn and cloth output. There is fairly general anxiety at the shrinking margin between the price of the raw material and the finished product, while the recovery of the French industry would be seriously threatened by the loss of Indo-China which is easily its best market and importing about twice as much cloth as it did before the war. Exports were generally lower, except from Holland and Switzerland, with the latter doing really well by post-war standards. Germany and Switzerland managed to expand their rayon piece-goods exports, but France and Italy showed declines.

Calcutta Markets

FAIR DEMAND AT TEA EXPORT SALE

IRREGULAR TREND IN DUSTS MARKET

AT Sale No. 3, held on 14th June, the export offerings consisted of approximately 21,900 packages. There was fair demand for the majority of the offerings at rates which were from 2 to 3 annas under the last sale. Thin liquoring Brokens and Fannings were the weakest feature, and at times sold between 3 to 4 annas under valuations. A few selected invoices of flavoury Darjeelings and stylish well made Leaf grades sold well but there was less enquiry for tippy sorts, but they still sold at satisfactory prices.

Quotations

	1954	1953
	Rs.	Rs.
Clean Common B.P.	2 8 0	1 0 0 to 1 1 0

Internal Sale

At the Internal Sale on 15th June, approximately 6,162 packages of Dusts were offered. These met with a fair general demand though the prices were rather irregular. Best Assam CTC's, especially the smaller types, were the strongest feature and sold from 2 to 3 annas above valuations. The few Darjeelings with flavour sold at satisfactory prices but those with plainish liquors sold nearly 2 annas below last rates. Mediums and Commons were from ½ to 1 anna easier. There was a good enquiry for clean black types suitable for Export and generally the smaller grainy Dusts received more support.

Quotations

	Rs.	Rs.
Medium Dooars Dust	2 0 6 to 2	1 0
Medium Assam Grainy Dust	2 1 6 to 2	2 0
Best Assam CTC Dust	2 7 0 to 2	8 0

The offerings of other grades consisted of 1,381 packages and represented a good selection of teas. The market followed the same trend as in the Export sale and prices generally showed a decline of 2 to 3 annas per lb.

INTEREST MAINLY IN WESTERN TRADES IN FREIGHT MARKET

DURING the past week interest has mainly been centred on the Western Trades, in which a number of fixtures have been made. A satisfactory feature has been the slight improvement in the volume of business for grain, and this included the first fixture of the season from Port Churchill to the U. K., which was covered at 50s. River Plate charterers have booked two vessels for July shipment to Antwerp-Rotterdam or Amsterdam, one at 72s and the other at 6d less. There are prospects of further tonnage being taken at these rates. Australian grain charterers have virtually withdrawn from the market but space has been booked for bagged sugar from Queensland to the U. K. at 102s 6d. Cuban sugar was fixed earlier in the week to Japan at $11.50 f.i.o. and free of taxes, and it is understood that further vessels are workable to West Coast India, Calcutta and Ceylon. Coal from Calcutta to Korea has been fixed at 55s 6d for July shipment. Hampton Roads Japan was fixed at the slightly higher rate of $10.10. A British vessel was fixed at 81s 3d for a full cargo of pig iron from Whyalla to Karachi June-July shipment. A July vessel was taken at $8.12 for salt from Aden to Japan. A 9,712 dwt vessel was fixed on Time Charter at 13s for three to five months' trading with delivery Tyne. A Liberty vessel was also fixed at 13s for three to four months' trading with delivery Vancouver.

SUGAR ARRIVALS INCREASE

During the week ended 14th June, sugar sales in the Calcutta market averaged between 4,000 and 5,000 bags daily. Arrivals were 1,000 bags a day and stocks amounted to 140,000 bags. Rates for ready sugar ex-Kantapukur delivery were Rs. 31 for ordinary grain and Rs. 31-8 for big grain. Foreign sugar, big grain, was quoted at Rs. 31-8 in private sales, but was Re. 1-8 lower on Government account. Business however was negligible. The Government announcement to reduce the price of sugar to Rs. 29-8 per maund f.o.r. destination station, from 16th June for indigenous sugar and for foreign sugar arriving after June, has kept the market in suspense with dealers holding off.

LINSEED

There was not much change during the past week and a slightly easier tendency prevailed because of the decline in prices in the oil section. Crushers were more or less out of the market and business was done on a very small scale by dealers in liquidation of previous sales; sellers were more in evidence especially for forward delivery. Very dull conditions prevailed in the oil section with millers unable to dispose of stocks bought mostly at higher prices. Latest quotation were as follows: Ready Rs. 17-8 per maund; July-August Rs. 17-12 per maund.

HIDES AND SKINS

The market ruled steady. Stocks were higher than in the previous week.

Bazar Sales

(Between 8th June and 14th June, 1954)

Cowhides: Wet salted (Slaughtered) 10,200 pcs. on the basis of Rs. 11-8 to Rs. 27.

Goatskins: Wet salted (Daisee, Killed) 36,360 pcs. on the basis of Rs. 275 to Rs. 425; Murshidabad-Assam-Dinajpur 26,200 pcs. on the basis of Rs. 345 to Rs. 385; Purneah-Kissenganj 8,800 pcs. on the basis of Rs. 340 to Rs. 345; Patna (Ord) Rs. 1,200 pcs. on the basis of Rs. 245; Muzafferpore-Darbhanga-Pakur 8,500 pcs. on the basis of Rs. 335.

Bazar Stocks

(14th June, 1954.)

Cowhides: Wet salted 90,600 pcs.

Goatskins: Wet salted (Daisee, Killed) 68,500 pcs; Assam-Dinajpur-Murshidabad 71,000 pcs; Muzafferpore- Patna- Pakur- Purneah- Kissengan 2,90,000 pcs.

SHELLAC MARKET FIRM

During the week ended 15th June, the market ruled firm but became quiet at the end of the week. The range of quotations was as follows:—

Standard Pure Buttonlac		Rs. 145 buyers.
Pure Buttonlac		*Rs. 139, 141, 140 buyers.*
Lemon No. 1 Shellac		Rs. 142 to 145 done and buyers; 143-8 value.
Lemon No. 2 Shellac		Rs. 140, 143, 142 done and buyers.
F. O. Std. I. Shellac		Rs. 137-8, 141, 139 done and buyers.
Pure TN Shellac		Rs. 135, 138, 136 basis done and buyers.
4% I.T.N. Shellac		Rs. 130, 133-8, 131 buyers.
No. 1 Kusmi Seedlac	3%	Rs. 130 to 133 buyers.
No. 2 Kusmi Seedlac	3%	Rs. 122 to 124 done and buyers; 122 buyers.
Fine Bysaky Seedlac (Manbhum)	3%	Rs. 119 to 121 done and buyers; 120 buyers.
Fine Bysaky Seedlac (C.P.)	— 3%	Rs. 116-8 to 119 done and buyers; 117-8 buyers.
Ordinary Fine Bysaky Seedlac (C.P.) under	5%	Rs. 113-8 to 116 done and buyers; 114-8 buyers.
Ordinary Fine Bysaky Seedlac (C.P.)	5%	Rs. 109 to 113-8 done and buyers; 109-8 buyers.
Kireelac		Rs. 60 done and buyers.

Shipments during June until the 12th were 10,452 packages.

MAHINDRAS' PLAN TO MANUFACTURE JEEPS APPROVED

The Government of India has approved a programme to manufacture a four-wheel drive vehicle of the Jeep class in the country, which was submitted by Messrs. Mahindra and Mahindra Ltd., in collaboration with Willys Overland Corporation. The firm has undertaken to manufacture 69 percent by value of the components of the jeep within three years. In accordance with the general policy of the Government, the import of other four-wheel drive vehicles of the same class will not, as a rule, be permitted.

Engineering and Transport

SOLVING PAKISTAN'S FUEL PROBLEMS

DETAILS OF THE SUI GAS PROJECT

THERE were few industrial plants in Pakistan at the time of partition. There are now an impressive number of enterprises recently launched or under development, based principally on the processing of local raw materials. Since 1950 the production of cotton cloth has increased 124%, and cotton yarn 295%. Two woollen mills have started production. In the new jute manufacturing industry, 1,400 looms are now in operation. The vegetable oil and tanning and leather industries have also shown considerable progress. Coal production has increased from 437,000 tons in 1950 to 577,000 tons in 1953, and electric power output has risen in the same period from 254 million kilowatt hours to 406 million kwh.

Development is restricted, however, by lack of fuel supplies, which explains the great interest that has been aroused by the Sui gas project. Hitherto, details of this have been meagre, but now that the International Bank for Reconstruction and Development, with six British banks participating, has made a loan of £5 million for the construction of a natural gas transmission line in West Pakistan, further details have become available. The project, based on the recent discovery of natural gas about 350 miles north of Karachi, will for the first time make this fuel available to industry, and is of great potential importance in Pakistan's economic development.

The loan has been made to the Sui Gas Transmission Company Ltd. This is a newly formed company in which three-quarters of the shares will be held by private investors in Pakistan and in the United Kingdom, and one-quarter by the Pakistan Industrial Development Corporation. Slightly more than one-half of the shares will be in Pakistani ownership; the Burmah Oil Company Ltd. and the Commonwealth Development Finance Corporation Ltd., of the United Kingdom, will hold the remainder. The Eastern Exchange Banks—a group of six banks doing business in Asia—have agreed to participate in the loan, without the International Bank's guarantee, to the extent of ££45,000. This represents the first seven maturities of the loan falling due semi-annually from August 1st, 1956, to August 1st, 1959. The participating banks are the Chartered Bank of India, Australia and China, the Eastern Bank Ltd., Grindlay's Bank Ltd., Lloyds Bank Ltd., the Mercantile Bank of India Ltd. and the National Bank of India Ltd.

The development of natural gas will provide Pakistan with an important domestic source of fuel. Pakistan has relatively meagre supplies of coal and oil. Of its annual coal requirements of about 1.2 million tons, 600,000 tons are now imported; and fuel oil imports average more than 500,000 tons a year. By providing relatively cheap and abundant supplies of the new fuel, the Sui gas project will in time save large amounts of foreign exchange. In the first year of operations gas from the project will be equivalent in fuel value to some 500,000 tons of coal, and as plant capacity is reached, it will be triple this amount.

The project consists of a 16-inch pipe line running from the Sui Gas Reservoir to Karachi, via Sukkur and Hyderabad, through the lower Indus River Valley, together with connecting lines to several large consumers. The well-head pressure is such that the gas will be self-propelling from Sui to Karachi when transmitting volumes up to 70 million cubic feet per day. When the requirements for gas exceed this quantity, compressors will be installed to transmit gas up to 110 million cubic feet per day, the designed capacity of the line.

Ready Next Year

The target date for the completion of the project is May, 1955. At the start of operations the fuel requirements of existing plants which can be easily reached along the pipe line are estimated to be 37 million cubic feet per day. The plants which initially will be connected include electric power, cement works, cotton textile and other industries. They will convert from present fuels to gas firing with benefits in dependability, operating efficiency and reduced maintenance and upkeep. The cost of gas compares favourably with the present price of liquid fuels. As volume of gas increases, the price will progressively fall, so that at the full capacity of the line, gas should cost much less than either fuel oil or coal.

The reserves of the Sui gas dome have been estimated at over 2,000,000 million cubic feet. This is enough to supply 110 million cubic feet of gas per day for over 50 years. As facilities for transportation, distribution and utilisation are developed, market forces will direct gas to those uses which can be served by natural gas to the greatest economic advantage. The capital cost of new industrial plants, for instance, would be reduced because, compared with oil-burning installations, gas requires no storage tanks or pumping equipment; and in comparison with coal, storage handling, pulverising, burning and ash-handling are unnecessary. Natural gas may also provide a raw material for chemical products, such as synthetic fertilizers.

The total cost of the Sui gas project will be equivalent to about £9 million and the International Bank's loan will provide the equivalent of £5 million of the foreign exchange needed. Sterling for the loan has been made available to the Bank by the United Kingdom out of its sterling subscription to the Bank's capital. The Bank's loan is for a term of 20 years and bears interest of 4¾% per annum, including the statutory 1% commission charged by the Bank. Amortization will begin on August 1, 1956. The loan is guaranteed by the Government of Pakistan, and will be secured by a trust deed with Baring Brothers & Co. Ltd., of London, as trustees.

The producer of the gas at the Sui field is Pakistan Petroleum Ltd., a company owned 70% by the Burmah Oil Co. and nearly 30% by the Pakistan Government. In February, 1954, the Pakistan Industrial Development Corporation and Burmah Oil Company brought about the formation of the Sui Gas Transmission Company to construct, own and operate the transmission system. Sui Gas Transmission Co. will purchase the gas from Pakistan Petroleum Ltd. When construction of the system is completed, Burmah Oil Co. (Pakistan Trading) Ltd., a subsidiary of the Burmah Oil Company, under a 20-year contract, will act as managing agents for the Sui Gas Transmission Co.

JESSOPS BUILD DURGAPUR SLUICE GATES

Damodar Valley Corporation is constructing the Durgapur Barrage across the Damodar river at a site some 14 miles below Raniganj. The pool formed by the Barrage will extend for a distance of about four or five miles upstream and the regulation of the water impounded will be by means of 34 free roller type sluice gates, entirely designed by Messrs. Jessop & Co. Ltd., and manufactured at their Dum Dum Works. The sluice gates are designed to suit 60 ft. clear openings between piers and comprise five left bank undersluices each 18 ft. deep, 24 weir gates each 16 ft. deep and five right bank undersluices each 19 ft. deep. All the the structural steelwork and the complete mechanical equipment, including the hoist gearboxes and drums were made at Dum Dum, and all materials used are indigenous, with the exception of the galvanised steel wire ropes, and the push button starters which have been imported. In the course of recent years Jessop & Co. have manufactured a total of 77 free roller and radial type sluice gates for various dam and barrage projects in India, but the gates now being manufactured for the Durgapur Barrage are the largest tackled so far. One of the 18 ft. deep gates has been completely assembled and has passed the maker's tests.

The same firm have a contract in hand for the manufacture of 34 electric level luffing wharf cranes for the Bombay Port Trust. This order was obtained in the face of severe competition from other well known makers of this type of crane both in England and the Continent. Four of these cranes are of three tons capacity and are destined for the Ballard Pier, 24 are also of three tons capacity and are destined for Alexandra Dock, and the remaining 6 are of 6 tons capacity, also for Alexandra Dock. The six ton cranes for Alexandra Dock are fitted with a change speed mechanism allowing them to lift loads of three tons at 275 ft. min, and loads up to six tons at 135 ft.-min. All other speeds for these cranes being as specified for the three tons cranes for Alexandra Dock and Ballard Pier. The first three ton crane for Ballard Pier has been erected, and is undergoing manufacturer's tests.

PATERSONS' ACCELATOR PLANT

THE Accelator plant of the Paterson Engineering Company (India) Ltd, of London and 21 Theatre Road, Calcutta, is of interest to the oil industry as a means of treating water and brine for flooding purposes for the secondary recovery of oil from underground formations and for the treatment of oilfield brines for disposal purposes. For these applications softening is unnecessary but highly efficient clarification is needed to prevent clogging of the formation into which water or brine is injected. By the Accelator, iron present in the water or brine is reduced to a trace, and turbidity and suspended matter are completely removed. It also produces a chemically stable finished water which will form little or no deposit in the distribution piping or input formation. The plant incorporates the novel idea of actually allowing precipitation to occur in the presence of comparatively fresh pre-formed slurry and means are provided for circulating this fresh slurry with the water being softened. Furthermore, provision is made for maintaining this sludge bed in a mobile condition and in such a manner that it actually squeezes the softened water from the bed, thus giving a relatively clear softened water in the upper part of the plant.

Working of the Plant

In general the plant consists of a vertical and relatively wide diameter main outer steel plate cylinder containing an inner reaction portion formed also of steel plate. Raw water mixes with the circulating mass of the precipitate, making contact and adhesion with the new reagents introduced in measured quantities into the primary mixing and reaction zone. From thence it is drawn by the propeller into the secondary mixing zone, where reaction being completed, it overflows to the slurry zone where separation takes place, the clarified water rises and flows into the annular collecting channel and the concentrated sludge is drawn off continually from the special compartments. The speed at which the softening process is carried out is shown by the fact that when samples are taken from the top of the centre tube it will be found that the reaction is almost complete. A sample of circulating slurry from the centre tube, when allowed to settle in a cylinder, starts to clear in a matter of seconds and within five minutes the supernatant liquor is brilliantly clear. The Accelator is applicable to an amazingly wide variety of liquid treating problems involving the precipitation (or coagulation) and removal of solid matter.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION, LIMITED
(Incorporated in England).

5% RUPEE DEBENTURE STOCK 1970
INTEREST FOR THE HALF-YEAR ENDED 30th JUNE, 1954.

NOTICE is hereby given that interest at the rate of Rs. 25/- (less Indian Income Tax) per Rs. 1,000/- of Stock will be paid on 1st July, 1954 to Debenture Stockholders registered on the books of the Company on 23rd June, 1954. Applications for transfers received at the Company's Office at Victoria House, Post Box 304, Chowringhee Square, Calcutta, upto 23rd June, 1954 will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above interest.

Debenture Stock Transfer Books will be closed from 24th June, 1954 to 30th June, 1954, both days inclusive.

BANKS

H indicates that Share capital is half paid. O, C and Dd, indicate Ordinary Contributory and Deferred Shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

COAL COMPANIES

O. Po. F and Dd. indicate Ordinary, Preferred Ordinary. Founders' and Deferred shares, respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

TEA COMPANIES

O. Po and Dd indicate Ordinary, Preferred Ordinary and Deferred Shares, respectively. P next to the name of the company indicates that the Company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

NEW INDUSTRIAL ENTERPRISE IN INDIA SINCE THE WAR

A DECADE OF INNOVATION: WEAKNESSES AND PROMISE OF RECENT DEVELOPMENTS

THE factory system, which is what we usually mean when we speak of "modern industry", was introduced into India in the forties and fifties of the nineteenth century, that is roughly one hundred years after the industrial revolution in Britain. The first cotton mill was built in 1838 and the first jute mill in 1855, both in Bengal and both the joint efforts of Indian and British enterprise. The building of the railway system began at about the same time, and consequently the exploitation of coal deposits, which had been known for many years previously, then began in earnest. This was the birth of Indian industrialism. And it was just a century later that Indian industry began the astonishing expansion and proliferation that is the subject of the survey published along with this issue of *Capital*. Both these turning points, the introduction of the factory system in the mid-nineteenth century and the rapid expansion of the mid-twentieth century, occurred about the time of the two great constitutional changes of modern India's history, the assumption of power by the British Crown and the transfer of power to the Indian people. Appearances to the contrary, there is no intimate connection between these facts except in so far as the social ferment that produces political innovation also stimulates industrial enterprise. The efflorescence of Indian industry in recent years does not date from the transfer of power but had got well under way before independence; the second world war was a much more potent influence, just as the American Civil War promoted the growth of the nascent Indian textile industries.

The period between 1943 and 1954 was the most active in India's industrial history, and there is no sign that this era of innovation is drawing to a close yet. The index of industrial production maintained by the Government of India rose from 100 in 1946 to 144.2 in December 1953, which is significant enough in itself. But what we are concerned with in surveying new industries is exactly that part of industrial investment and inventiveness that cannot be reflected in an index of industrial production, which must measure the progress of industries already established in the base year. We are concerned with the new shoots, the new trails of enterprise. With regard to many of them, what is important is not the volume of their output or even the amount of new capital put to work in them, but the value they have as supplying complementary or critical products in any economy that is not so much expanding as filling up. In other words, their importance is less quantitative than qualitative. It is thus less easily assessed and one might often have to wait some years before the full significance of a new line of endeavour is appreciated. This happens when an industry "clicks", when apparently separate industries founded for dissimilar reasons discover that they are complementary as regards raw materials or end-products, or that they have a mutual interest in a market. At that stage, the industrial economy can quickly realise economies of scale, and the rate of progress, from being disappointingly slow, can suddenly become unexpectedly fast, as though the country had broken through an industrial "sound barrier". There can follow, in these cases, such meteoric rises to industrial power as have occurred in earlier years in Germany and Japan. That day might not be far off in India.

*

This process of industrial growth—haphazard beginnings that one day fit together like a jigsaw—must sound rather uncertain and fortuitous. Cannot industrial progress be planned more rationally, or at least (if global State-managed planning is not used) cannot private industrialists direct new investment to channels most likely to produce this result? That sounds simple but in fact it has never happened yet; certainly it has not happened yet in Russia. The complex pattern of an industrial economy is too broad for any one eye to take it in. In any case needs, processes and technique change rapidly during the process of industrial growth. As for private industrialists choosing to establish new industries that will fit in most readily with the overall pattern, no doubt they do weigh up such considerations before launching on a new venture but there is usually too much guesswork in the decision to affect the outcome with any certainty. This is especially true in a young economy such as India's where the whole approach to new industries is different from that of developed economies. In the United States, a new industry might be founded to meet an obvious need or an expected need which remains to be "created" by the industrialist himself. The decision on which new line of production to take up issues from a study of the economy as it is actually functioning. But in India that decision is usually taken after study of the import trade list.

That is to say, the Indian industrialist will often not look for gaps in the industrial economy which he might profitably fill. He will look, rather, to see which foreign goods are now being imported which might conceivably be manufactured within the country. It is this that decides the course of new industrial enterprise in India today. This is not a worse way of going about industrialising than any other, and it is probably inevitable in a country where technology is at a primitive stage. It is certainly no worse a way of industrialising than that exemplified by industries set up during a colonial régime, which are usually directed wholly toward the export trade. (India provides examples in two of her largest industries, tea and jute goods, which still have a comparatively small internal market.) So the pattern of Indian industrial development is determined at this stage of its history by the nature of the import and export trades; we have not yet reached the point where it is determined by a calculation of domestic requirements, actual and potential. This gives the new Indian industries several of their leading characteristics—their apparent disjointedness and their close connections with foreign industrial collaborators. Both of these features will become less noticeable as the economy fills up and acquires, as it were, its own momentum.

*

The expansion of Indian industrialism in the past decade has produced some obvious faults but most of them are temporary and constitute no argument against further advance toward industrialisation. Among them are the disabilities of industries that were launched in the hothouse atmosphere of the war and post-war shortages and inflation. Inexperience of a buyers' market, over-optimism about the level of demand, excessive dependence on immunity from overseas competition and on Government protection, and inadequate attention to standards and quality are faults that can be charged against some of the new Indian industries. The first two are already being remedied by the phase of stringency that has followed the Korean boom. The new industries (or such of them as have survived) now have a less heady notion of the market they can hope to serve. The contraction in the automobile industry is an illustration of this rather painful process of learning from early mistakes. The dependence on protection, either by tariffs or import controls, will be remedied, it is hoped, by the gathering strength of the new industries themselves, though this will take a longer period of years. Perhaps in some cases it may take a generation. The shortcomings of standards and quality are in part being improved by the two factors already mentioned, a buyers' market and longer experience. But in a more important sense they can only be finally remedied by further advances in industrialisation, which will promote technological education and raise standards of workmanship. It is true of nations, though not of men, that they sometimes have the choice of doing one thing badly or doing ten things well.

Two extreme attitudes are possible in discussing these flaws in the growth of new Indian industries: to claim that they are so serious that further progress in industrialisation should be slowed down, or to pretend that they are not important and therefore the country should charge ahead at breakneck speed, shutting out imports by tariffs and prohibitions. The Government of India has wisely favoured neither of these extremes but has sought to encourage new industries, giving them such assistance as they need but retaining an atmosphere of competitiveness and insisting that Indian standards and prices should be at least comparable with world standards and prices. One invites criticism from an impatient section of industrialists if one says that this moderate policy is best calculated to produce a healthy development of Indian industry; one even invites the accusation of hypocrisy if one points out that it is the policy that best safeguards the interests of consumers. But it is the soundest policy nonetheless, and it is one the present Government evidently intends to adhere to.

Another of the faults of recently established industries is technological, though it has social and economic causes. That is the desire to do everything under the one roof. Some of the new Indian enterprises have no counterpart abroad because one factory represents a dozen units; the whole of a machine will be manufactured by one company, when abroad the name-company is in fact not much more than a designer and assembler, relying for its components on a range of smaller units. This development was perhaps inevitable because of the urgent desire to emulate the highest levels of foreign industrial enterprise without waiting for the slow growth of ancillary industries. But it raises costs, and limits the contribution one industry makes to the growth of others. Further innovation in Indian industry could usefully be combined with a more energetic effort to foster independent ancillaries. The opportunity for this will come with the second five year plan which, unlike the first, will not be heavily biassed towards State projects in irrigation and hydro-electric supply, but will place more emphasis on the promotion of manufacturing industry.

—

*

If the next five year plan is as successful in expanding industry as the first has been in guaranteeing food supplies, improving agriculture and completing major river valley works, the next decade might see as great an extension of Indian industry as the past ten years have seen. In this process, the new industries described in the Survey we publish today will play a major part, together with such new enterprises as may be founded in the near future. The older industries for which India has been known will take a less important part in the expansion, for there is plainly less room for growth in the major export industries such as tea and jute. The basic industries, coal and steel, which are of course long established, will follow the rise of the new industries but even they will be affected in turn by several of them, such as oil, aluminium and plastics. Cotton textiles too, which although one of India's oldest industries would appear to have an assured future in the age of new industries, will be affected in its expansion by some of the fresh lines of production studied in our Survey, notably rayon and the new synthetic fibres. So it is with these new industries that much of India's industrial future lies.

THE HANDLOOM INDUSTRY

A HOPELESS RACE AGAINST MODERN TECHNOLOGY

AT the third meeting of the All-India Handloom Board in Bombay last week, Mr. T. T. Krishnamachari, the Minister for Commerce and Industry, knew exactly what he was up against. Once he said, "Politically it may not be possible to justify it (the use of co-operative societies in giving Government aid) because those people who are outside the co-operative field find a lot of political support. I am not concerned here in crossing swords with politicians of this type." In another place in his address he was obliged to appeal, "Let us forget ourselves as politicians and help the handloom industry." That politics has long stood in the way of a correct appreciation of the rôle of the handloom industry in the country's economy can scarcely be denied. For reasons which were only partially economic, home-spun cloth came to acquire in the popular mind a highly emotional association which, unfortunately, persists, although its political relevance has long since ceased to exist. Not unnaturally, the attitudes of yesterday are obstructing a solution of the problems of today.

As the address of the chairman of the Board showed, the problems of the handloom industry are not basically different from those facing comparable small industries in India, the International Planning Team's report on which was discussed on this page last week. Mr. T. Swaminathan, the Board's chairman, said, "If one were to look for a single major problem of the (handloom) industry, it is obvious that one would immediately find marketing the most crucial problem." The Ford Foundation team has put it in fewer words: "You cannot continuously produce unless you sell." Mr. Swaminathan did indeed refer to the need for "long term improvement of efficiency, designs, etc., of the industry," (and the little "etc" covers a multitude of essentials), but the inescapable impression from a reading of his speech is that Mr. Swaminathan's chief dependence is still on what the Government can do; and, next to that, on what he called the "hidden springs of sympathy and affection for the handloom weaver all over the country." On the first point it will be profitable to refer again to the International Planning Team's report; it counted "too great reliance upon Government to take action and upon Government purchasing orders" as one of the chief causes of the decline and lack of progress of small industries. This applies equally to the handloom industry, except that it is not so small, 2,100,000 being the estimated number of looms in the country. As for the second source of the Board's hope for an expansion of the market for the industry's products—pity for the weaver—it is surely obvious that it is not a very big "selling point," for if it were there would be no need for the Board to exist. It is in any event extremely unreliable as an economic factor; the wise seller prefers to depend on consumer preference.

* * * *

Mr. Swaminathan's report stated that the Board's secretariat had examined 522 schemes, of which no fewer than 398, worth Rs. 4.7 crores, were recommended to the Government of India for sanction. Unfortunately, little was disclosed of the contents of those schemes. If more sales depôts are being opened in the rural and semi-urban areas for the products of the handloom industry, a move is being made in the direction of "markets of staggering possibilities." But uneconomic depôts must not be subsidised indefinitely; that will only mean so much less money for effecting more important improvements in the internal organisation of the industry. Research, it is hoped, will help prevent the natural talents of Indian weaver being wasted in a hopeless race against modern technology. But again a bold acceptance of the fruits of research will be possible only after there has been a radical change in the attitude not only of the weavers but also of their political champions. "Perpetuation of inefficient outdated methods"—for the immediate plugging of a hole here and there in the employment picture, and at the expense of the organised mill industry—will aggravate unemployment in the long run, irreparably injure the cotton textile industry, and do no commensurate good to the handloom industry. It is as well that Mr. Krishnamachari made it clear at the meeting that he did not consider reservation of certain items of cloth an effective solution of the problems of the handloom industry. Neither can subsidy, even at Rs. 7 crores a year, be much more effective.

Even after designs and techniques are improved, every weaver is enlisted in the co-operative movement, elaborate marketing organisations are created within and without the country, and a Handloom Week is held every week, it may still be open to doubt whether, to quote Mr. Swaminathan, "foundations will be laid well and truly for the prosperity of the handloom weaver and his industry." In a country as poor as India, price is a prime consideration with the majority of the people and on this score the weaver is in no position to compete with the mills. The Government can, perhaps, at least for some time, afford to buy expensive handloom cloth for its own requirements in preference to mill cloth; the ordinary consumer cannot. Since only the latter can make the difference between an economic industry and an uneconomic one, perhaps it is not unreasonable to suggest that he be given his freedom to buy what he likes at the price he can afford. With his freedom he will contribute to the prosperity of the mill industry, which will then be able to expand and open fresh avenues of employment. For India's priceless handicrafts there will always be a market consisting of connoisseurs. In that specialised sphere there are almost unlimited possibilities to which the All-India Handloom Board can usefully devote its energies and resources instead of attempting to render artificial respiration to those who are at present producing expensive handloom cloth of indifferent quality but could easily be employed more profitably in some other department of the nation's economic effort.

THE TREND IN WORLD COMMODITIES

U.S. SURPLUS POLICY OVERSHADOWS INTERNATIONAL TRADE

THE trend of world commodity prices may be described as fluid after the recent dramatic reductions of North American export prices for wheat. The implications of this move, extending far beyond the wheat trade, are various and important. The significant fact is that the U.S. Administration is now taking action to dispose of some of the immense accumulations of commodities arising from the policy of supporting farm-produce prices. Other grains, and fats, are being sold at, approximately, their world prices. The international cotton markets foresee the possibility that some of America's cotton stock will be distributed similarly. These developments and possibilities are very disturbing to the commodity markets concerned. In London and Liverpool, for instance, dealing in wheat had to be virtually suspended in the confusion resulting from the recent price-cuts. Brokers and traders can adapt themselves relatively quickly, however. It is among non-American growers that anxiety for the future is most acute; while the political difficulty of curtailing the price-support policy seems to ensure that American farms will continue to produce too much; acreage-restriction schemes are never wholly effective.

In respect of wheat the growers are inclined to blame Britain for withdrawing from the International Wheat Agreement and so weakening the basis of values, but Britain's argument is, of course, that she did not produce the surpluses of wheat and that it is only sensible to take advantage of them by reducing the cost of imports. The criticism does, however, raise the question—in regard to foods in general, not only wheat—whether the policy of promoting home production is still (if it was ever) economic. The revival of agriculture in Europe and other areas which normally import food is not due only to official encouragement. Policy has also played an important part in it, and the policy of protection and subsidy produces curious complications—such as, in the case of wheat, the increase in the British Government's subsidy to farmers as compensation for lower prices, at the same time as the subsidy on imported wheat to keep down the cost of flour is reduced. Postwar trade in farm produce would have been healthier if the American price-support policy had never been evolved. In the period of scarcity prices were higher than they need have been. Now when scarcity, in the markets' sense, is generally overcome, the surpluses have to be unloaded, causing instability in international trade as well as losses to American taxpayers.

* * * *

These surpluses were not required for their own sake. The strategic stockpiles, on the other hand, were built up deliberately. Now stockpiling policy, which likewise raised prices in the period of scarcity, has obtruded itself again; and it is exerting on the prices of various industrial materials the opposite effect to that which the de-stocking policy is exerting on the prices of various foods. The U.S.A.'s new policy for stockpiling metals is comparable with the price-support policy for farm produce in that it is intended to assist a particular group of producers. In this case, however, the maintenance of their incomes is only incidental: the primary purpose, apparently, is to maintain their producing potential, while desirably adding to stocks. The London Metal Exchange and other interested bodies have argued that this policy has no direct bearing on international trade in metals, for it is America's internal concern. Yet the policy is now perceptibly affecting metal prices internationally. It is perceived that the new "long-term mineral stockpile objectives" authorised by President Eisenhower in March may mean a resumption of the kind of stockpiling (relating to some 40 different minerals) that was associated with the "Korean boom"; for the Administration envisages the possible devastation of American mining in a future atomic war.

Consumers of metals find themselves in an awkward predicament. For many months they kept their stocks at the lowest levels consistent with operating efficiency, fearing that the recession of American industry would weaken the value of metals. (Indeed, any temporary interruption of supplies showed that some consumers' stocks were below the safe minimum.) It is now recognised that this policy was mistaken. Values have fluctuated, but they have lately tended upward; and if American industry revives while stockpiling is in progress the upswing may be sharp. It takes longer to adapt supply to demand in the case of minerals than in the case of agricultural produce, and in the uncertain conditions of 1952-53 producers of industrial materials generally planned to reduce their outputs. No-one foresaw that European consumption would increase while American industry was in recession. If American industry emerges from recession some industrial materials may be scarce again later this year. A divergence between the two main groups of primary commodities is thus envisaged: foodstuffs declining in price, industrial materials rising. Tea, coffee, and cocoa might resist the trend, but surpluses of oils and fats, as well as of some dairy produce, can add their weight to the trend of grains. Among materials, even rubber is no longer in prospective surplus. The countries that rely on imports of food and materials can balance the one trend against the other; but they will have to take full advantage of the cheapening of foods.

CURRENT COIN

Index of Industrial Activity.—Corrected for seasonal fluctuations, *Capital's* Index of Indian Industrial Activity shows an increase of 1.3 points during October and November, 1953. Contributing chiefly to the rise were increases in jute manufactures, steel ingots, pig iron, cement and electricity. Notes in circulation and cheque clearances also rose because of better activity in the stock market.

* * * *

Trends of India's Foreign Trade in 1953.—The most notable thing about the trend of India's foreign trade in 1953 was that there was improvement both in the balance of payments position and in the net terms of trade, despite a fall in the total volume. According to the preliminary compilations of trade statistics, available from authoritative sources, the year ended with a substantially favourable balance at Rs. 56.9 crores, including invisible receipts, against a mere Rs. 1.7 crores during the previous year. These figures are likely to undergo some change in the course of the final revision, but such changes are unlikely to show any variations in the basic position. The improvement in the terms of trade is gratifying and the export promotion drive initiated by the Government since 1952 has played a major part in the emergence of such a surplus. Exports were actually greater than in the previous year, though the value was less, because of a fall of 16 percent in export prices. But the export quantity index recorded a rise of 2 points over 1952. Jute manufactures however were the unlucky item and suffered a set-back in both directions, the value particularly declining by Rs. 69.9 crores to Rs. 107.8 crores. The surplus on current account was largely due to a marked shrinkage of imports. According to the above sources, imports fell to Rs. 566.4 crores from Rs. 742.6 crores in 1952 largely because of higher domestic food and industrial production. That is good as far as it goes, but it must however be stressed that a surplus balance in trade should not be pursued for its own sake, under the present conditions of economic development and deficit financing. A close study of trade statistics relating to the year shows that the import fall on private account was due not only to the heavy reduction in raw cotton imports from the dollar area and raw jute from Pakistan, but also to a disturbing decline in important items like machinery, vehicles, medicines, drugs and chemicals. The decline was also steep in Government imports, both in relative and absolute terms, but since that decline was chiefly because of a substantial cutting down of food imports from the dollar area, the domestic situation having improved unexpectedly, that can be counted among the gratifying aspects of the position. This fact alone has brought about a far-reaching change in India's regional pattern of trade, the most important point of which is the sizable surplus of Rs. 30.5 crores achieved with the dollar area during the year as against a huge deficit of Rs. 111.2 crores of the previous year. Details of Indo-British trade are not available, but it may not be out of place to mention here that since the beginning of this year, India has achieved a large surplus with Britain. The April figures, the latest available, show that the same trend continued during this month as well, with India's exports well in excess of her imports. Taking the first four months of the year together, the position is as follows. India supplied one-eleventh of the total Commonwealth imports to Britain and took exports in the same proportion. Tea remained the leading item among India's exports. The other major items were leather, leather manufactures and dressed furs, of which about 70 percent of Britain's total imports was supplied by India. No separate figures are available for jute manufactures, but the statistics relating to "miscellaneous textile manufactures" which mainly cover jute piece-goods, sacks and bags and coir yarn, disclose a marked increase in value of over £4,000,000 to £7,186,000, compared with the same period in 1953. India remained, as usual, Britain's major customer for machinery and chemicals; in April India was the U.K.'s best customer for non-electric machinery and second best for chemicals.

* * * *

Textile Outlook.—In spite of the comparatively lower off-take due to the monsoon, cloth prices have been steady in Bombay and other cloth centres in the last few weeks. Although the market in Bombay presented a dull atmosphere last week there were fair inquiries from Amritsar, Delhi and other north Indian centres, for medium shirtings, long cloth, poplins and mercerised shirtings. Stocks with both mills and wholesalers are not very heavy, and in view of the fact that off-take will broaden to some extent during the next couple of weeks, the indications are that prices will be maintained around present levels for some time to come. On the export front conditions are not very cheerful and Britain is stated to have curtailed slightly her off-take of grey cloth. The Sudan and Aden continue to show little interest in Indian textiles, while inquiries from Indonesia have been few and far between because the authorities there have not granted any bulk import licence so far. About 7,300 bales of cloth have left for Burma and shippers are not hopeful of any further large-scale business from there in the near future because conditions appear to be so "dull." Apart from the conditions in Burma, Burmese traders appear hesitant to book orders for Indian cloth in view of Japan's recent cut in export quotations amounting to 10 percent. Despite reports of dull trading there have been regular inquiries from Pakistan for poplins, voiles and long cloth but no great volume of business has been closed in the last few weeks. Pakistani authorities have issued import licences to the trade to cover cotton textiles from soft currency areas from July to December, 1954. The expected cut in export duty has not materialised and shippers have had to reduce their quotations to the extent of 3½ percent. Shipment of cloth during early June has however been normal, despite uncertainty about the abolition of the export duty on coarse cloth. During the first 10 days of June, textiles passed for shipment through Bombay Port totalled 24 million yards comprising 5 million yards of coarse, 15 million yards of medium, 2.8 million yards of fine and 1.2 million yards of superfine varieties.

* * * *

U.S. Crop Prospects.—Another year of high-level agricultural production is predicted in a recent report of the U.S. Department of Agriculture (USDA) on crop planting. Although large plantings are expected to complicate the problem of huge Government-held surpluses, there will at least be the assurance of plenty of food for the United States and for world emergencies, and there will be a reservoir on which other friendly nations may depend in time of need. The survey forecasts total plantings of 282,500,000 acres. This is 11 million acres more than were planted last year. The figures indicate poor results from the appeal of the Secretary of Agriculture, Mr. Ezra Taft Benson, that a portion of the surplus-producing areas of past years be put to other uses to help solve the Government's crop-surplus problem. The survey does show however that the acreage of some crops, such as wheat and cotton, is being reduced through planting limitations voluntarily accepted by the nation's farmers in return for government assurance of price support. A cut-back of nine million acres in the two major grains, corn (maize) and wheat, is anticipated. But the small grains and sorghums are expected to use nearly 12 million additional acres. The 1954 wheat crop, because of Government planting restrictions and poor growing conditions in the "dust bowl" areas of Colorado, Kansas, Texas and New Mexico, may be nearly 25 percent less than the 1953 crop of 1,169 million bushels. But the carryover from the 1953 crop is expected to be more than 850 million bushels, so that record supplies will probably be available for the 1954-1955 marketing year. Oats are being planted on an area of record size and barley may have the largest seeding since 1944. Sorghum plantings may go even beyond the 28 percent increase forecast in the survey, according to USDA experts, because producers in the areas stricken by drought last year may turn to this crop as an alternative to wheat. Soyabean production is expected to reach an all-time record of 12 percent above 1953. Sizable increases are also expected in flaxseed, rice, dry beans, peanuts and hay. A reduction of 10 percent in potato crops is expected because of the past year's low prices. Cotton plantings are to be the subject of a later USDA report, but production in this crop is expected to drop considerably because growers voted strict controls, as did wheat producers. To alleviate the surplus storage problem the Government is encouraging on-the-farm storage. The USDA has just announced it will buy additional bins and other facilities for farmers to hold 100 million bushels of grain in addition to the 640 million bushels of government-owned space already available.

Protection for Sewing Machines.—Mr. M. D. Bhat, Chairman, opened the Tariff Commission's enquiry into the case for continuing protection and assistance to the sewing machine industry in Bombay last week. He said that the industry has been protected for more than seven years, and that it has made gratifying progress and amply justified the grant of protection. Capacity has increased from 8,000 sewing machines in 1946-47 to 66,700 at present. Actual production has risen from 7,000 in 1946-47 to 64,139 in 1953. At the last Tariff Board enquiry, the demand was estimated at 90,000 sewing machines comprising 54,000 domestic sewing machines and 36,000 industrial sewing machines. In connection with the present enquiry, varying estimates of demand have been received. Since the price of indigenous sewing machines is declining and the purchasing power of the people might increase as a result of industrialisation, the Development Wing expects the demand to go up to 124,000 sewing machines. This estimate was given by the Planning Commission in its programme of industrial development for the year 1955-56 and included 80,000 domestic machines and 44,000 industrial machines. Other estimates of demand received from producers and importers range from 70,000 to 155,000 sewing machines at present and 120,000 to 200,000 sewing machines for the future. The indigenous producers of sewing machines have asked for continuance of protection for a minimum period of three years. Some of them have also asked for a complete ban on imports of sewing machines, as according to them the entire domestic demand can be met by indigenous production. If such a ban cannot be imposed, they have suggested that a protective duty of 75 percent should be levied on complete sewing machines and of 100 percent on parts of sewing machines. In addition, they have asked for continuance of full facilities for importing such raw materials as are not available from indigenous sources. Although the sewing machine industry has made striking progress much still remains to be done to improve the quality of its products so as to bring it up to the highest international standards and to reduce costs of production. There is vast scope for developing the internal market by popularising its uses in remote places in the countryside and by making it available at a low price. Enlarging the scale of production and the lowering of prices will also enable the industry to built up large export markets. There are indications, however, that the tempo of world competition may increase but the industry need not fear such competition if it can develop its own strength by eliminating the deficiencies and weaknesses which impair its competitive position.

* * * *

Sale of British Ships Abroad.—The British Government has relaxed, with immediate effect, the restriction which has hitherto applied to the sale abroad of United Kingdom ships less than 15 years old. It will not now be necessary for the proceeds of such sales to be placed in a blocked account against replacement. What is more, funds at present lying in this account will, in general, be released. The relaxation will be widely welcomed by British shipowners, who have long held the view that the insistence of the Government on continuing wartime restrictions has had a damaging effect on the rebuilding of the merchant navy in the postwar period. Permission to sell ships less than 15 years old—which includes all war-built tonnage—has, up to now, only been granted if the owners were prepared to put the proceeds of the sale into a blocked account from which they could draw only for the purpose of replacement, either by new building or for meeting the cost of modernising existing tonnage. The latest concession follows the recent removal of the control on the sale abroad of British ships for scrap, which enables British owners to enter the world market and thus secure the best world prices.

Survey of New Industries in India

With this week's CAPITAL is published the 1954 mid-year supplement which deals with new Indian industries. The growing points of the Indian industrial economy, the new shoots that have been thrown out in the last few years—these are the subjects covered in the Survey. This 84-page issue will be supplied free to registered subscribers and will be available to others at Rs. 5 per copy. Enquiries may be addressed to the Manager, CAPITAL, 5 Mission Row, Calcutta 1.

STOCK MARKETS RECOVER PREVIOUS LOSSES

RENEWED DEMAND FOR INDUSTRIAL EQUITIES

London, 23rd June.

UNDER the influence of a number of favourable developments, the stock markets last week completely recovered from the previous bout of nerves, and with the return of buyers, prices forged ahead to record appreciable gains. The bulk of the previous week's losses were recovered, while industrial equities, which were encouraged by further good company news, established new peaks in many cases. The recovery was touched off by a sharp improvement on Wall Street, and further encouragement was given by the news of the forthcoming visit to Washington of Sir Winston Churchill and Mr. Eden. The improvement in the situation at Geneva also helped sentiment. Events at Guatemala did not have much effect on the market. The feature of a firm gilt-edged market was the return to favour of undated stocks following their recent neglect. Appreciable gains were established in these issues while long-dated stocks scored many gains. In the foreign market, Japanese recorded little change on balance, but Chinese bonds improved on trade hopes and the more encouraging international situation. Europeans moved up under the lead of Germans and Greeks. Good company and trading news stimulated a renewed demand for industrial equities, and prices not only recovered the previous week's losses, but in many cases moved above their recent best levels. The leaders were in demand, with Imperial Chemicals an outstanding feature. Virtually all industrial groups scored numerous appreciable gains. Free Staters and, to a lesser extent, uranium shares attracted most of the attention in the gold share market, but prices moved irregularly throughout. The Goldfields group dividends helped one or two dividend payers, which otherwise were quiet. Coppers were a strong market, while oils went sharply ahead on investment buying. Rubbers inclined to ease, but no definite trend developed in the tea share market. Good dividend news brought a number of gains but the tea share market as a whole was quiet.

The Money Market

Credit conditions last week were less stringent. An excess of treasury bill maturities over new payments and the release of Ministry of Health money brought about an improvement in the supply position, although the real benefit was not felt until towards the end of the week. During the first few days, conditions were rather patchy, and the banks, sensing the tight position of some houses, raised their bids for August and September bills, but there was some resistance to the higher rate. Treasury bill applications totalled £400,440,000, of which £250 million were allotted at an average rate of 31s 7.57d, compared with 32s 3.56d in the previous week. This week, £260 million will be offered. The Bank of England return for the week ended 16th June showed notes in circulation about £3 million up at £1,640 million, while bankers' deposits were about £8 million up at £287 million. Fine trade bills were unchanged.

Linseed Oil

Liberal arrivals of linseed oil appear to have dissipated the recent shortage of ready supplies, and sellers were more inclined to come to terms. Reports on castor oil were widely at variance, but sellers managed to establish a moderate price advance. In the edible oil section, easiness of groundnut oil was a feature and the promise of business in Indian oil of this class for shipment seems to have faded. In castor oil, on the one hand shortage of shipment supplies were forecast, and on the other bazaar talk was about the possible issuance of a supplementary export quota. Despite these factors, prices of Indian oil for shipment were firmer, although not a lot of business was done. Commercial on spot in Liverpool was reported to have been sold for £132, while in London B.S.S. was quoted not far short of 140s.

Hongkong Gold

The Hongkong gold market was irregular last week. It opened steady, touched a high of $(HK) 254 per tael on Wednesday and thereafter reacted on the improved international situation and better supplies. Arrivals in Macao were reported to be 100,000 ounces in two shipments, which was the largest amount this year. Market sources attribute the heavy arrivals to importers' anxiety to secure contract supplies before Macao's increased import fees become effective. The week closed bearish, but bullion traders do not expect a further decline. Official offtake was 7,600 taels, and unifficial 8,300 taels. Forward contracts were quoted at $(U.S.) 37.87 but no orders were reported.

Scientific Aids for Textile Industry

Sir Raymond Streat, Chairman of the Cotton Board, last week warned U.K. textile men that licences to manufacture the latest scientific aids for the cotton industry would, if necessary, be sold abroad. Sir Raymond was speaking at the annual general meeting of Shirley Developments Limited, the company formed to market, exploit and develop new machines and techniques in textile manufacture. "Our Company was formed with the primary objective of promoting the use of practical results of scientific research with the British cotton and allied industries. But it is clearly necessary for the Directors to have a policy about selling abroad," said Sir Raymond. "If the patents are not protected abroad, the competitor overseas can copy them. Protection against copying is only given in most countries if supplies from Britain are not restricted."

Quicksilver Values Rise

The rise in London quicksilver prices, ex-warehouse, continues unabated, with dealers now quoting £92½ to £95 per flask, against £90 to £92½ previously. During the past six months, prices have risen uninterruptedly by over £30. Spot supplies in London remain very tight, according to dealers, and still higher prices are envisaged.

Price of Gold

South Africa, the world's largest gold producer, will seek support for an increase in the price of gold at the Congress of Chambers of Commerce of the British Empire. A resolution submitted by the Association of Chambers of Commerce, South Africa, says that a substantial and uniform increase in the gold price in terms of all currencies would represent a major contribution to the economic welfare of the world. Mr. J. Hamilton Russell, a member of the South African Parliament, says in a supporting memorandum that the expansion of international trade is held up by import systems and exchange controls. Nervousness in most countries about relaxing restrictions is largely because of low gold reserves in terms of annual imports. The ratios of gold supply to gold reserves on the one hand, and the value of international trade on the other, must be brought back to something approximating pre-war figures if the present restrictions are to be relaxed, but gold reserves are now "woefully inadequate" to permit relaxations of fiscal and monetary policies. The United States is the principal market for gold and there has been no indication as to how the gold price can be changed without her support. Present prospects seem to be that she will not increase the price.

Conversion Offer Closed

The Bank of England has announced that the offer to holders of the 3 percent National Defence Loan, 1954-58, to exchange into the 2 percent Conversion stock, 1958-59, which was announced on 31st May, closed on 15th June. Of the £321 million 3 percent National Defence Loan, 1954-58, outstanding, approximately £292 million were tendered for exchange into the 2 percent Conversion stock 1958-59, excluding holdings on the post office register, which however are small in amount.

Activity on Wall Street

U.S. Government obligations displayed a firm undertone in moderate turnover last wek. Part of the demand reflected renewed talk that the Federal Reserve Board would lower banks' reserve requirements within the next month or two. Top quality corporates were generally about unchanged in quiet dealings. Rails were featured by a strong and active market for New York Central bonds, where new highs were recorded. World Bank activity was confined to small turnover in 3-1/2 percent 1969 and 3 percent 1976, with the latter selling at its highest for the year. Foreign bonds were slow. Germans reversed the decline and there were gains of two to four points in some issues. Greeks, after early irregularity, turned soft. Some Italians were fractionally higher. The 4-1/2 percents of 1962 scored useful gains while Norwegians were irregular. Australians and Japanese were little changed in limited turnover.

THE CALCUTTA MONEY MARKET

CREDIT DEMAND SLIGHTLY EASIER

Wednesday, 23rd June.

THERE has been little change in the money market again this week. Demand for credit is slightly easier, although it is still good, and no marked seasonal slackening has occurred yet. The call for advances from the jute mills has remained about the same, but the needs of the sugar industry continue to decline. Funds are still being required upcountry for seed and grain storage. There are lenders over in the interbank market and the call rate is unchanged at 2¾ percent.

There has been only a moderate amount of bills this week, and that mostly on account of tea and gunny. There have been some coal shipments this month. Remittance is reported to be less than last week. The principal exchange rates are unchanged and quote: sterling T. T. and O. D. 1s 5 31/32d; three months' sight bills 1s 6 7/32d; four months' sight bills 1s 6¼d; the U.S. dollar is Rs. 475.

* * * *

Bullion was quiet last week and prices fell further on large liquidation. Silver declined from the previous week's level of Rs. 151-10 to Rs. 150-8 quoted today, but the ready rate was about 3 annas higher. The price was, however, unchanged at 72½d. in London and at 85½ cents in New York. Gold also dropped in sympathy with silver and was quoted at Rs. 84-3 against Rs. 84-8. The sovereign at Rs. 57-8 showed a loss of 4 annas.

* * * *

Sharp falls of Rs. 18.98 crores and Rs. 18.27 crores in the total note issue and notes in circulation to Rs. 1226.34 crores and Rs. 1190.33 crores, respectively, were outstanding features of the return of the Reserve Bank of India for the week ended 18th June, 1954. The contraction in currency was adjusted by diminishing foreign securities by Rs. 20 crores to Rs. 668.15 crores. This was apparently done by a transfer of securities to the Banking Department and consequently balances held abroad rose by Rs. 16.07 crores to Rs. 78.54 crores. Deposits disclosed an all-round increase. Deposits of the Government of India and other Government accounts improved by Rs. 8.74 crores and Rs. 3.39 crores to stand at Rs. 115.37 crores and Rs. 18.80 crores. Balances of commercial banks at Rs. 44.17 crores were about Rs. 67 lakhs higher than the last return. Other loans and advances declined from Rs. 43.81 crores to Rs. 37.41 crores of which advances to scheduled banks against usance bills amounted to Rs. 18.23 crores (Rs. 21.23 crores). Investments at Rs. 85.27 crores showed a decline of Rs. 12 lakhs. Ways and means advances to Governments were shown at Rs. 1.43 crores (Rs. 1.18 crores).

* * * *

During the week ended 18th June Government of India treasury bills for Rs. 14,96,50,000 were sold in favour of the Reserve Bank of India.

* * * *

The statement of the position of Scheduled Banks for the week ended 11th June, 1954, discloses Demand and Time liabilities at Rs. 543.30 crores (Rs. 9.53 crores on account of borrowings from Banks) and Rs. 330.94 crores (Rs. 1.66 crores) compared with Rs. 539.45 crores (Rs. 8.31 crores) and Rs. 329.62 crores (Rs. 1.65 crores) respectively in the previous week. Cash has declined by Rs. 23 lakhs to aggregate Rs. 33.19 crores, while balances with the Reserve Bank have advanced by Rs. 63 lakhs to stand at Rs. 42.23 crores. There is a rise of Rs. 1 crore in investments to Rs. 327.31 crores. Advances and bills discounted at Rs. 561.13 crores reveal a fall of Rs 11.26 crores. The ratios to total liabilities of cash and balances, and of advances and discounts are, in consequence, shown at 8.6 percent and 64.2 percent against 8.6 percent and 65.9 percent.

* * * *

The return of the Imperial Bank of India for the week ended 11th June, 1954, shows a drop of Rs. 1.89 crores in total deposits to Rs. 207.72 crores. Investments in Government Securities are down by Rs. 4 lakhs to Rs. 82.48 crores, while other authorised investments remain unchanged at Rs. 10.20 crores. Loans, cash credits and overdrafts have declined by Rs. 2.56 crores to aggregate Rs. 91.58 crores, while bills discounted and purchased have advanced by Rs. 73 lakhs to stand at Rs. 30.84 crores. Cash and balances are, in consequence, shown at Rs. 17.78 crores or Rs. 4.74 crores higher.

* * * *

According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in India during March, 1954, amounted to Rs. 1455 lakhs compared with Rs. 1302 lakhs in the corresponding month of the previous year. Of the total customs revenue collections, import duties accounted for Rs. 1188 lakhs as against Rs. 940 lakhs, export duties for Rs. 249 lakhs as against Rs. 339 lakhs and land customs and miscellaneous for Rs. 18 lakhs as against Rs. 23 lakhs. The total gross collection of Union excise duties amounted to Rs. 889 lakhs as compared with Rs. 766 lakhs. From April, 1953 to March, 1954, the grand total of gross customs and Union excise revenue realised was Rs. 25533 lakhs compared with Rs. 26174 lakhs during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 12023 lakhs as against Rs. 11851 lakhs, export duties for Rs. 3851 lakhs as against Rs. 5598 lakhs, land customs and miscellaneous for Rs. 254 lakhs as against Rs. 377 lakhs and Union excise duties for Rs. 9400 lakhs as against Rs. 8348 lakhs.

* * * *

Provisional figures of foreign sea and airborne trade of India on private and Government accounts during May, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows:

Merchandise, excluding transit trade of Pakistan but including that of other land frontier countries: Exports Rs. 37,47 lakhs, re-exports Rs. 57 lakhs (transit trade Rs. 3 lakhs), Imports Rs. 19,77 lakhs (transit trade Rs. 6 lakhs). Total trade Rs. 87,81 lakhs.

Treasure: Exports (including re-exports) of gold Rs. 1 lakh; of Currency notes Rs. 20 lakhs; of others nil. Imports of currency Notes Rs. 88 lakhs; of others negligible.

Balance of Trade: The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subjects to this deficiency in import figures and to the exclusion of figures for transit trade, the total value of exports (including re-exports) of merchandise, gold and silver fell short of imports by Rs. 11,70 lakhs.

LONDON FINANCIAL LETTER

PROGRESS HESITATES IN BRITISH ECONOMY

THE distinct setback in the industrial sections of the London stock market during June must be attributed to deeper causes than the seasonal interruption of holidays. Nothing has perceptibly gone wrong in the British economy—nothing, that is, that was not perceptible months ago—but progress in mid-year is not so steady and impressive as it was in the earlier months. Production, with notable exceptions such as steel and motor cars, does not seem as buoyant. In one basic activity, coal-mining, it is seriously lagging. An ominous strike on the western region of the railways temporarily disrupted business in the West Country, and its causes have not yet been removed. The situation generates caution rather than doubt. There is no reason to suppose that the nation's recovery has stopped, if it can be assumed that external conditions will be favourable. But Britain is still sceptical of the alleged completion of the American "adjustment". And a possibility now envisaged is that the buoyancy of the West-European economies in general will not last until the American trend is firmly upward. This is a serious thought; for the American recession would undoubtedly have had much worse consequences if it had not been largely counteracted by the continuing improvement in Europe.

It is impossible to take a clear view while the international political outlook is clouded. But even if some of the clouds disperse they leave a kind of economic vacuum. As the United Nations World Economic Report 1952-53 has pointed out, reduction of defence expenditure requires economic policies to take up the slack. Such policies have not been applied altogether successfully in

LLOYDS BANK LIMITED — INCORPORATED IN ENGLAND

LB/G/60—1954

Trade with Australia and New Zealand

Business men trading with Australia and New Zealand are invited to use the complete banking service of the Bank of New South Wales.

The oldest and largest joint-stock bank operating in Australia and New Zealand, the Bank of New South Wales keeps in close touch with local conditions through over 850 branches and agencies (sub-branches) in Australia, New Zealand, Fiji, Papua and New Guinea. It is thus particularly well equipped to provide enquirers overseas with a full picture of the local business and rural scene.

America, and there is no evidence that the European nations have planned them realistically. It may be too early to judge the effects of last month's reduction of bank rate in this country, but so far the effects seem very slight. Just as tax-concessions will not necessarily stimulate consumption (American experience suggests that the additions to net incomes may be largely saved), so short-term credit policy will not necessarily stimulate investment. Publicly-owned enterprises in this country—especially fuel and power (including atomic energy)—are still investing heavily, but privately-owned enterprises are still in the aggregate investing too little. This disparity must somehow be corrected, and some people are still hoping for an autumn Budget as the speediest means.

Strength of Sterling

When the rumoured intention to widen the range of sterling's permissible variations was disclaimed and bank rate was reduced, the upward trend of sterling was of course checked. There was however no sign of a relapse, and the evidence of underlying strength had a tonic effect in London. Subsequent study of the trends is not quite so reassuring. Reasonably enough, the sterling-dollar rate is always most closely watched, as reflecting most accurately the trend of the currency; and this rate has remained very near to the upper limit of $2.82. It seems, however, that this rate is temporarily less accurate than the continental rates in reflecting the trend, and the continental rates have weakened. In its first few months the reopened gold market has caused many surprises. One of its effects—hardly surprising, perhaps, because it works so obscurely—is to disguise the "true" value of the dollar in terms of sterling by calling forth sales of dollars wherewith to purchase gold, for gold can normally be bought in London only against dollars or against special sterling acquired with dollars. Because foreign purchasing of gold has continued on a considerable scale, the dollar has been subjected to abnormal pressure without which, probably, it would have strengthened in terms of sterling along with the European currencies. It is not necessary to assume, however, that the recovery of sterling has been reversed. The funds that flowed into London some months ago from New York and from European centres have evidently been repatriation on a larger scale than was at first apparent but when the repatriation (so far as it goes) is completed, sterling should be steady or firm. Just as its strength was exaggerated by the inflow of funds, so the outflow presents an appearance of weakness. But it does appear that the desire to hold more money in London permanently was also exaggerated.

Market for Securities

For some years after the war, while the Stock Exchange was still unable to function as a free capital market (even now the Capital Issues Committee has to approve new issues for more than small amounts), it was often said that the Stock Exchange would never be restored as an effective intermediary between the entrepreneur and the saver who could help to finance his enterprise. The latest figures of the value of quoted securities published by the Council of the London Stock Exchange disprove statistically any idea still lingering that the institution is withering away. The market valuation of all securities quoted on the Exchange was £30,102 million at the end of March—and it must have risen substantially further in the weeks to early June. The increase compared with a year before was nearly £3,000 million—more than 10 percent. The highest figure ever previously published was £28,078 million relating to early-April 1947, about the end of the great "bull market" that began in 1940.

THE Indian Jute Mills Association delegation to the U.S.A. dispersed last week after its members had visited London and Dundee where they had meetings with spokesmen of various U.K. jute interests. It was a fitting end to a tour which, like earlier ones, has done much to consolidate the public relations work in America which is going on all the year round and which, everyone agrees, is indispensable to the continuing prosperity of the industry. Approximately half of the hessian output of the Calcutta mills goes to North American markets and provides India with her largest single dollar sale. Thus from every point of view the American market occupies a key positiqn in the economics of the industry. Furthermore, it is in America (with its penchant for new techniques) that the jute industry meets its most aggressive competition. Here the manufacture of paper containers has made considerable headway, and both jute and its traditional rival cotton are somewhat on the defensive. A London correspondent tells me that representatives of the U.K. jute trade were invited by the London committee of the I.J.M.A. to meet the delegation on Tuesday of last week, and some eighty or ninety guests from various sections of the U.K. trade turned up for cocktails at the Association's offices in Baltic House. Among them were representatives of the Indian High Commission in London, and from the American Embassy there came none other than 'Bill' Gibson who for several years was the U.S. Commerce Department's rapporteur on jute in Calcutta. The United Kingdom Jute Goods Association was strongly represented at the party and before its departure for Dundee the following evening the delegation were entertained to dinner by Mr. H. K. Price, the newly elected president of the U.K.J.G.A. The London and Dundee visits thus followed the pattern of previous years, and in a short speech Mr. Walton emphasised that though the delegation had been mainly concerned with the American trade they had no intention of overlooking the valuable connections which the Calcutta mills had in the U.K. The I.J.M.A. organisation in the U.K. is, in fact, doing valuable propaganda amongst agricultural interests in that country advertising Indian jute goods as such. I am told that it now exhibits at practically every county agricultural show of any consequence and that its stall is a familiar feature at all such gatherings. Also its secretary is in considerable demand as a lecturer at such institutions as young farmers' clubs and study groups.

* * * *

Ever since Woodrow Wilson entered an international conference room and left the door open, diplomacy has never been the same. No longer do governments communicate with one another exclusively through their embassies, which in consequence have in many cases been reduced almost to the status of post offices. Heads of states must themselves now parley, or else the uninformed will accuse them of indifference or worse. Neville Chamberlain's meeting with Adolf Hitler in 1938 was at the time considered by many to be a courageous contribution to lasting peace; they know better today. But pathetic, because dangerous, illusions persist in the popular mind about other conferences at that level. Teheran, Yalta and Potsdam have somehow escaped the stigma attaching to Munich, although it must now be clear to everyone that the surrenders made at the first three have proved no less fatal than those at the last-named. "I think," Roosevelt wrote to Churchill in March 1942, "I can handle Stalin personally better than either your Foreign Office or my State Department;" that was the end of the hitherto usual channels of diplomacy. Sir Winston Churchill himself is in part responsible for the continuance of popular faith in top-level talks as a solvent of all differences; it is to be sincerely hoped that his visit to Washington this week-end will for the first time vindicate the belief. Similar good wishes from the majority of the people everywhere will attend the discussions between Mr. Nehru and Mr. Chou En-lai. I do not know what it is that invariably favours the totalitarians at such conferences, unless it be the democracies' desire to avoid war at all costs. A possible alternative explanation is that the former choose the timing of these talks rather shrewdly, just when their bargaining strength is at its highest. Yalta came after the Red Army's spectacular victory in Poland; Delhi comes after Dien Bien Phu, and—may one say it? —Tibet.

* * * *

M. Molotov's reply to the 16-nation declaration on the Geneva conference can scarcely be described as very original. The authors of the statement, he said, would have to answer to world opinion and their consciences for it. "History" in place of "world opinion" would have been more in conformity with the usual Communist jargon, for they have persuaded themselves that history is on their side. For all that, it remains a cheap trick of evading contemporary judgement; when the phrase has any meaning at all, it only means that future success will justify present methods and, in this instance, future success is by no means assured. The reference to the Western countries' consciences is more surprising, for conscience, I had innocently thought, was a bourgeois concept devised to deceive the proletariat of the world. Is it possible that even an arch-materialist like M. Molotov is no longer immune to the promptings of his conscience? I should not, of course, be surprised, for many are the things that lie thereon. But perhaps there is a more obvious explanation. *La conscience*, I recently read in the *Times Literary Supplement*, is *the* keyword of contemporary French criticism. "The Marxist," it said, "the Catholic, the bourgeois and the existentialist agree on its usefulness if not on its meaning." Even the Marxist writers in France, I gather, are anxious to "keep *la conscience* holy." This technique of draining words of their accepted meanings may be politically paying, at least in the short run; but may it not, also, imply a possible loss of the spiritual initiative which, we were told last year by a Reith lecturer, lay with the Soviet Union, and not with the West?

* * * *

The monsoon is not without its compensations, one of which is the annual series of chamber music concerts presented by the Calcutta School of Music. The first concert of the 1954 series was held last night. My appreciation of chamber music is marked more by untutored enthusiasm than critical restraint. I imagine the same can be said of most members of the excellent audience which these concerts always attract. There is a world of satisfaction in music, which is open to those who have ears to hear with and emotions to be stimulated, and I can recommend the performances at Loreto House to such music-lovers as are not already familiar with them. The Calcutta School of Music has earned the thanks of us all for presenting a series of entertainments which can only involve a great deal of patience and effort, is such an excellent outlet for local talent, and provides funds which can be used to bring eminent foreign artistes to a city all too often regarded as being too remote.

* * * *

With his usual glibness, Priestley once spoke of "bogus American glad-hanging politicians, real-estate boomers, rotarians, Kiwanis, yapping know-alls, smart-alecks, and the rest"—which, I thought, was slightly unfair to all parties. In his address to the Bombay Rotary Club last week, on the occasion of its silver jubilee, Wilfrid Russell permitted himself to be, as he put it, "a bit pompous." (and pomposity was not discouraged by Paul Harris, the founder of the movement), but he did say a few things which need frequent iteration. In fact he put up a blunt defence of the free enterprise system, and his tongue was anywhere except in his cheek. After citing several examples of how free enterprise grows and works (often with very little capital) to the benefit of employees, consumers and business men themselves, he said, "There is nothing wrong with profits." The sentence sounds almost original—so assiduously has the contrary been propagated by people whom Mr. Russell did not hesitate to call "a sort of counter vested interest." His second thesis was that the Rotary movement—which he claimed had provided capitalism with an ethic and a conscience—could not have come about without the drive and enthusiasm of free enterprise "in expanding economies and in an atmosphere of true democracy." The two are indeed related; where enterprise as not free, little else is; those who are agitating for a new economy should know that when they get it they will also get a new democracy, a "people's democracy." To talk of Priestley again, it is perhaps significant that his political coming of age was announced a few years ago with an open revocation of his earlier faith in socialism. For all I know, today he may be a little more tolerant of rotary too.

* * * *

It used to be said barely fifty years ago that the best qualification a man could have for business or administration was a first in classics from Oxford or Cambridge. The intellectual exercise in acquiring obscure learning was believed to be the best means of developing the mental strength and discipline needed to master this world's problems. Certainly many eminent and successful men started their careers with no other recommendation. The emphasis lately has been on specialist training; the liberal education being regarded as an excellent recommendation for anything except earning a living. I have often felt that the world has been judging the man with the general background too harshly, and that business and Government will continue to lose a great deal unless it is appreciated that when the time comes to take the broader view, the man with the wider learning can be worth his weight in gold. I am glad to see that a reaction from specialisation has started to set in, and that, at least in Britain and the United States, the requirements set out in the "Situations Vacant" advertisements are beginning to look less like a list of ingredients for a recipe. There is little chance of the first in classics ever regaining its popularity, but in the United States especially there is now a growing appreciation of the value of the type of training which fits a man for nothing in particular. The U.S. Chamber of Commerce recently published a survey which went so far as to attribute the progress and prosperity of the American economy directly to education, and with the usual American love for the "Did you know?" type of investigation, went on to attempt a statistical correlation of the level of education in various States with their economic development. This has too great a resemblance to the old problem of whether the hen or the egg came first, to impress me. But I cannot help feeling that this tendency to relate education, and not just instruction, to economic development, has much to recommend it.

THE PROGRESS OF THE D.V.C.

SUCCESS ACHIEVED IN SPITE OF OBSTACLES & DISCOURAGEMENT

By Taya Zinkin

REVISITING the DVC is a surprise the more pleasant because such amazing progress was unexpected, if one had followed it from Press reports, as I did. I had been to the DVC in October 1950. It was then in a sad condition. There were no approach roads worth the name, morale was low everywhere because of an obvious lack of co-ordination, there was no chief engineer and the result of his absence was evident even to the inexperienced eye. In one place work had been held up for lack of earth-moving equipment, yet a few miles away earth-moving equipment was rusting idly, and the DVC was trying desperately to import that particular equipment from abroad. Even in those early days there was a halo of scandal hanging over the project and it really looked as if the mess would grow and the achievements dwindle. But on the contrary the messes have dwindled and achievements grown, until today the DVC is something India can be justly proud of. If one followed the progress of the Corporation, as most people who are not in the fortunate position of being able to go to the DVC must, from the Estimates Committee's reports, and from leakages to the Press of other reports, one would feel that crores of rupees of public money were being thrown to the winds. One sunny landmark only would be the Bokaro Power Station, which was inaugurated by the Prime Minister of India, and at whose birth presided a Fairy Queen, the World Bank with its dowry of $18.5 million.

The first surprise on revisiting the DVC were the roads; they are excellent. At Maithon, where three and a half years ago there was only a small guest house and the prospect that in due course there might be a dam somewhere, there is today a full-fledged township, with offices, workshops and pleasant houses well laid out. Moreover there is a three-quarter completed dam, majestic in the distance, surrounded by giant batching plants and modern equipment of all descriptions. Maithon buzzes with efficiency. "Why do you have so many machines and so few men?". I asked, thinking of the cry for employment. The engineer showing me round explained that, at the most, Maithon could accommodate 50,000 men if it were not mechanised. Substitution of men for machines would delay the completion of the work by three years. Compared with the advantages to the 15,000,000 people downstream in terms of flood control, irrigation, extra crops and subsidiary employment, the temporary employment of 50,000 people is unjustifiable. Thus at Maithon the old truism "time is money" has been fully remembered, to the credit of its planners. Whether it is the manufacture of a dam or boiled sweets, time is always money. A self-styled technical expert had told me with a snigger that all the Government of India projects were heavily over-equipped in earth-moving equipment, which just went to show how badly they were managed. At Maithon there are 46 dumpers; their efficiency of operation is still only 45-50 percent of the theoretical optimum which would apply if the DVC were in the middle of the State of Illinois. But the DVC is in the middle of the States of Bihar and Bengal, and it is therefore good planning to accept requirements by taking efficiency into consideration. As it is, efficiency is going up all the time and for the next order of dumpers, to take one example only, the numbers required will be reduced by 15 percent of those of last year. This is considerable progress and there is no short cut to learning to operate a dumper; it takes so many hours, or miles, and only practice can teach maximum efficiency. Moreover the DVC has been learning creditably from its earlier mistakes. The equipment used at Maithon will go on to Panchet Hill, the neighbouring dam, which is specially phased to take all the equipment from Maithon. This goes for men too and at Panchet Hill the young Indian engineers will find the opportunity of applying what they have learnt at Maithon. Most critics of the DVC overlook one simple fact. Concrete dams are new everywhere. India had, at Independence, only one such dam, and therefore the Indian engineers could not be trained in the construction of concrete dams, competent though they may be in the construction of other types of dams. India could not afford to learn concreting methods through mistakes, and there was therefore no alternative but to import a foreign expert who would, in his turn, train Indian engineers on the spot. To blame the DVC for the absence of a chief engineer for 1½ years, is to castigate the Corporation for the fetters clamped on it by the Centre. For a long time the Finance Ministry would not agree to the fees of such an expert and the Ministry concerned insisted that the Indian scene should be exhausted before looking abroad. There seemed little purpose, if two Ministries were to interfere, in having an autonomous Corporation. Yet, despite these considerable handicaps the DVC has done very well.

Employment Opportunity

At the Durgapur Barrage which is nearing completion, there was another pleasant surprise. There are one hundred "intellect mazdoors" earning Rs. 2-8 a day, standing in the dust and the heat on the works site. They are matriculates from Bengal, and a few of them even hold University degrees. They enter into registers the number of headloads or lorry loads which have to be paid for by the DVC to the contractors. This new shift from clerical to an almost manual type of occupation of the bhadralog is most encouraging, for if it spreads it will go a long way to solving the problem of unemployment in Bengal. Less edifying was the attitude of the villagers rehabilitated by the DVC after the flooding of their lands. These villagers refuse to help themselves in the smallest way although they got a better, bigger house than before, a pleasanter village and even more land. Wherever one goes there is a tearful woman, while the husband or the father of the household complains, "My roof is leaking, the Government must repair it, it is Government's roof", or, "My wall is cracked and the rain seeps through, it is Government's wall". Even the amenities given such as windows, and a well planned village with latrines, are grounds for complaint. The windows are boarded up, there has not been a single tree planted in the village, the porches are used for cattle or fodder and the latrines for dumps of scrap. It means that the women of the village have to wait from dawn to dusk, which they apparently prefer to the seclusion of a well-walled latrine, and the men stick to the orthodox spots, the footpath, and the well hillock. Probably the greatest heartbreak in the DVC is the present failure to educate its inhabitants. Even consolidation of holdings, on which the Department concerned is very keen, has been creeping at a snail's pace and one can only admire the patience and enthusiasm of the officers in charge.

Power Shortfall

At Bokaro, the apple of the DVC's eye, there was an unexpected disappointment. Of the installed generating capacity of 150,000 kw only 28,000 kw are actually being generated because of the lack of transmission lines and transformer stations. The demand for current is there, although probably not for all the potential power, but the existing demand cannot not yet be satisfied. One of the results of the lack of generation is that the three TCA experts who are at Bokaro to train the staff in operating the plant, cannot give them the full advantage of their experience since only one turbine works and that only at half capacity. It seems odd to the layman that Bokaro should, despite the fact that it operates below capacity, still take 26,000 kw from Sindri, instead of trying to generate as much as possible if only to train its own staff. But this is of course only a drill; there seems to be no doubt that in due course the plant will be fully employed and that the demand for electricity will also keep pace with the production; there are Durgapur, Calcutta, the coal fields, and many other industries to be supplied.

From Bokaro it is only eight miles to Konar where a dam nearly completed is expected to provide cooling water for Bokaro. The dam is far ahead of Bokaro's requirements, yet it was the desperate need to have water in time for Bokaro which has been responsible for the mid-way changes of design made because of somewhat hasty preliminary investigations. Konar is a wonderful sight. A very well designed dam is nearing completion and the quality of the concrete appears excellent. Its cost per unit is certainly considerably cheaper than that of the Waitharna dam, also built by contractors, or of a similar dam in Ceylon. Konar's cost per concrete unit is Rs. 65-12; Waitharna's is Rs. 90 and Ceylon's Rs. 103. Even at Tilaya, which was done departmentally, the cost was Rs. 75, and if one adds to the Konar costs the percentage representing the subsidy on cement given by the DVC, it only brings the cost up to Rs. 73. In favour of having given the contract to an outside agency is the fact that there were no spare Indian engineers in Government Departments to do the job, and one would have had to import foreign experts and face questions in Parliament about their pay and their number. Of the criticisms hurled at Konar only one is valid, and that in principle rather than in fact, because Cæsar's wife must be above suspicion; one should not as a general rule give the contract to an ex-consultant. Tilaya too was a surprise. Instead of the confusion of 3½ years ago there stands an impressive dam and a 50-square-mile lake as beautiful as a Swiss lake, and with as good a road circling it.

Success Despite Difficulties

The DVC has done extraordinarily well. The odds were heavily against success because of Central interference which deprived it of the services of a chief engineer for one and a half years at the beginning, and until recently of those of a permanent chairman for 10 months. Private enterprise of the highest efficiency has its own troubles even when it is truly autonomous. I know of a plant which has taken three years more to build, and at double the original cost, yet no questions have been asked. There has been no scandal because the technicians answerable to the board knew, just as the board did, that everything had happened because of contingencies beyond their control. The DVC has had to contend with a long series of such contingencies—from devaluation to the post-war rise in prices, from post-war bottlenecks in shipping and equipment to the congestion due to the Korean boom, from the demoralising effect on the staff of leaks to the Press to the Estimates Committee's reports. Indeed for the DVC to have survived is a tribute to the patriotism of the people on the job. Mistakes there may have been, but mistakes occur everywhere that something new is tried, but it is far better to make mistakes and to go ahead than not to make mistakes and to remain static. The DVC could probably have been built more slowly, and with fewer mistakes, but time is as important as money, and the money saved by avoiding mistakes (and there would have been others) would have been more than cancelled by the loss to the country of the benefits for which the DVC is being put up. As Mr. Nehru said once: "Far better to make mistakes and to learn by them than to do nothing".

Stocks and Shares

FIRM TENDENCIES PERSIST IN STOCK MARKET

INTEREST TAKEN IN JUTE SHARES: COALS SHOW IMPROVEMENT

Wednesday Evening

THE share market has shown a very firm tendency this week. Brisk dealing in Indian Irons sent the price up to Rs. 32-10, but it had weakened at the close to Rs. 32-5. Coal shares have been steadier due to reports that Britain might soon be importing coal from India; Burrakur improved to Rs. 10-12, and New Beerbhoom rose sharply to Rs. 19-7.

Activity in engineering shares has continued throughout the week with Burns spurting to Rs. 220; Indian Standard Wagon and Indian Steel & Wire both featured. In the mining section Burma Mines showed gains. Tea shares have absorbed some profit-taking and closing levels are generally higher.

There has been renewed interest in jute shares largely due to the rumour (now confirmed) that the mills' working hours were to be increased. Substantial gains have been reported throughout the section; National closed at Rs. 28-3, Howrah improved to Rs. 25-14 and Nuddea to Rs. 50-8. Jute has been showing a steadier tendency for some weeks now.

Miscellaneous scrip have been steady throughout the week, and some gains have been reported with sustained support in managing agency shares. Paper shares were largely unchanged, but Sone Valley Cement improved, and so did Calcutta Trams.

Calcutta Electrics met with good demand, and the price has strengthened to Rs. 15-3.

The trend in Government securities has been maintained with prices definitely firmer and most quotations marked up an anna or two.

Details of the week's trading follow.

* * * *

The gilt-edged market ruled steady throughout, though shortly before the weekend some selling was in evidence which was quickly absorbed and prices again recovered. Three percent Conversion Loan 1986 after receding to Rs. 82-3, recovered to Rs. 82-7 with buyers over. Three percent 1896 was in demand due to the approach of the interest date (30th June), but there were no sellers to meet the market. In short-dated loans, 2½% 1954 was asked for at Rs. 99-12, while 2½% 1955 recorded a smart rise of 4 annas to Rs. 99-2. Three percent 1957 was taken higher to Rs. 98-10 as was 3% 1958 to Rs. 98-8. In the medium-dated group, 3% 1959-61 was steady at Rs. 96-8, while 3½% 1961, after being offered at Rs. 99-1, found buyers at the close at this rate. Three percent 1963-65 was marked up higher to Rs. 93-3, while 3% 1964 also improved to Rs. 93-3. Two-and-a-half percent 1961 moved up further to Rs. 91-7, as did 2½ % 1960 to Rs. 94-3 and 2½% 1962 to Rs. 92-6. Four percent 1960-70 was in demand at Rs. 101-14 with sellers asking Rs. 102. Long-dated loans were unchanged with buyers of 3% 1966-68 at Rs. 90-8 and 1970-75 at Rs. 86-12.

Provincial loans continued steady with no sellers, and prices recorded a further improvement. Four percent Madras 1963 and 1964 were both asked for at the higher rate of Rs. 99-15, without attracting sellers, while 4% Bombay State issues were taken to Rs. 101. Four percent U.P. 1963 and 1964 were marked up by one anna in each case to Rs. 99-14 and Rs. 99-13, and 4% West Bengal found buyers at Rs. 100-4. There was a scattered enquiry for several Provincial issues, but sellers were scarce.

There was a sustained enquiry for selected miscellaneous and jute preference shares, and buyers were willing to pay one to two rupees above previous quotations to obtain their requirements. Amongst jute, a small lot of Anglo-India changed hands at Rs. 117, and Hukumchand at Rs. 111-6. Kinnison were done at Rs. 117-8 and National at Rs. 123. Reliance were crossed at Rs. 114-12. In the miscellaneous group, Rohtas Industries 'B' were taken at Rs. 53-12, Birds Investments were crossed at Rs. 78-12, Calcutta Electric were done at Rs. 12-8 and Dishergarh Power 4½% at Rs. 91-12. Indian Iron were readily absorbed at around Rs. 108-8.

In the banking section, Imperial Fully-Paid and Contributory were slightly easier at Rs. 1,765 and Rs. 427. Hind Bank were marked at Rs. 25-14 and Punjab National Bank spurted from Rs. 25-8 to Rs. 28. United Commercial had sellers at Rs. 44-8 while United Bank of India 'D' Class shares changed hands at Rs. 4.

A solitary transaction was reported in the railway section in a small lot of Howrah-Sheakhala at Rs. 59.

The feature in the cotton section was Kesoram which rose from Rs. 25-10 to Rs. 27. Bengal Nagpur were quoted at Rs. 13-3, Cawnpore Textiles at Rs. 9-2 and Dunbar at Rs. 202. Elgins were steady at Rs. 16-14 and several deals were reported in New Victoria at Re. 1-14.

Some enquiry was noted during the week for selected coal shares, including East Indian, Katras Jherriah, Borrea and Bharat Collieries. Burrakur were steady at around Rs. 10-10, as was Bengal at Rs. 495 and Central India at Rs. 7-15. East Indian were taken at Rs. 28-2, Equitable were steady at Rs. 35, New Beerbhoom at Rs. 19-7 and New Manbhoom at Rs. 11-12. South Karanpura changed hands at Rs. 10-4 and Union at Rs. 22-12. Western Bengal were unchanged at Rs. 6. On reports that Bharat Collieries had received a good contract, the shares spurted from Rs. 7-14 to Rs. 9.

After a dull opening, jute shares steadied towards the close on rumours that mills' working hours might be increased from 42½ to 45 hours per week. The following table illustrates the improvement which has taken place amongst certain scrips.

	Opening 16-6-54		Closing 23-6-54	
	Rs.	As.	Rs.	As.
Agarpara ...	15	12	16	8
Auckland ...	118	0	122	0
Budge-Budge ...	150	0	159	0
Delta ...	253	0	262	0
Kamarhatty ...	195	0	205	0
National ...	26	12	28	3
Nuddea ...	48	8	50	8
Union ...	184	0	193	0

Howrah improved steadily from Rs. 24-8, to close at Rs. 25-11.

Good business was reported in Calcutta Electric with the price moving up from Rs. 14 to Rs. 15-3. Benares were done at Rs. 18-4, Dacca at Rs. 9, Jubbulpore at Rs. 12-8, Patna at Rs. 11-14 and a small lot of U. P. at Rs. 150. Upper Jumna changed hands at Rs. 17-9.

Sugar shares were dull and inactive, and prices showed little variation. Balrampur were crossed at Rs. 7-5, Belsund were marked at Rs. 9-4, Carew at Rs. 8-2, Cawnpore at Rs. 37 and Darbhanga at Rs. 12-10. Ramnugger were taken at Rs. 23-10 and U. P., after being done up to Rs. 19, turned sellers at Rs. 17-12.

Engineering shares were steady throughout and substantial business was put through. Indian Irons fluctuated between Rs. 32-10 and Rs. 32-2 to close at 32-5. Bhartia Steel were steady at Rs. 12-4 as were Braithwaite at Rs. 18. Britannia Engineering moved up from Rs. 31 to Rs. 32-2, without attracting sellers. Burn improved sharply from Rs. 204 to Rs. 220, and Indian Galvanizing after being taken up to Rs. 22-2 turned sellers at Rs. 20-4, but later recovered to Rs. 20-12. Following news of the capital reconstruction scheme, Indian Steel & Wire Products Fully-Paid Ordinary and Deferred rose to Rs. 72 and Rs. 55 respectively. Indian Standard Wagon were a feature, rising from Rs. 87 to Rs. 94. Jessop were steady at Rs. 29-8, as were Marshalls at Rs. 7-13 and Kumardhubi Engineering at Rs. 10-6 and National Iron at Rs. 7.

In the miscellaneous section, Bengal Paper met with good enquiry improving to Rs. 64. India Paper Pulp were also strong at Rs. 231, while Orient Paper were unchanged at Rs. 20-2. Shree Gopal were steady at Rs. 26-6 and Titaghur were unchanged around Rs. 41-8. Sone Valley improved from Rs. 7-1 to Rs. 7-8, and New Asiatic from Rs. 4-8 to Rs. 5-1. India General Navigation were slightly easier at Rs. 95, while India Steamship were steady at Rs. 9-1. Alkali were firm at Rs. 17-2, but Angelo Brothers reacted from Rs. 22 to Rs. 20-12. Assam Saws changed hands at Rs. 6-7, British Burmah Petroleum were slightly easier at Rs. 4-2 and British India Corporation fluctuated narrowly around Rs. 8-4. Calcutta Trams met with good enquiry improving from Rs. 12-14 to Rs. 13-8, as did Eastern Investments from Rs. 144 to Rs. 149. Gillanders Arbuthnot were steady at Rs. 110, while Indian Cables were easier at Rs. 19-7. Indian Aluminium were firm at Rs. 158 and Indian Wood Products were crossed at Rs. 34. Indo-Burma Petroleum receded from Rs. 145 to Rs. 137, while Jardine Henderson, Martin Burn and Rohtas Industries were steady at Rs. 122, Rs. 23-12 and Rs. 18-2. Metal Box after being taken up to Rs. 18-12, eased to Rs. 17-12. Similarly, Rallis dropped from Rs. 68 to Rs. 64.

In the Mining section, Orissa Minerals were freely offered at Rs 39-8 and Indian Copper were dealt in around Rs. 3-4. Burma Mines, following the publication of a satisfactory progress report, improved to Rs. 2, and Non-Ferrous Metals in sympathy rose to 14 annas.

On the whole, tea shares have been erratic and whilst in some cases prices have been marked up, others have depreciated. There has been a fair volume of business written throughout the week. Among Assam gardens, Bishnauth had buyers up to Rs. 38-2 as did Grob 'A' at Rs. 27, Grob 'B' at Rs. 13-14, Ledo at Rs. 17 and Seajuli at Rs. 33-12. Brooke Bond were steady throughout at around Rs. 13-6, while Bateli lost ground at Rs. 25-8, Rajgarh at Rs. 28-14 and Teen Ali at Rs. 23. From the Dooars area Banarhat had sellers at Rs. 460 as did Ellenbarrie at Rs. 137. Baradighi were unchanged at Rs. 45, while there were buyers of Bhatkawa at Rs. 32-4, Ethelbari at Rs. 12-10, Hantapara at Rs. 280, Nagaisuree at Rs. 240 and Sarugaon at Rs. 29-4.

Darjeeling scrips were on the whole better, Chamong being taken at Rs. 17, Nagri Farm at Rs. 27-4, Singtom at Rs. 7-12 and Sungma at Rs. 8-2. Tukvar, after being done up to Rs. 14-4 closed easier at Rs. 13-14. Amongst other scrips, Hattikhira provided the feature, being marked up sharply from Rs. 19-8 to Rs. 24-4, while Rungamattee

were better at Rs. 160, as were Patrakola at Rs. 227, Atal at Rs. 6-10 and Gungaram at Rs. 380. New Terai were unchanged at Rs. 17-12.

* * * *

The profit of Rs. 3.95 lakhs of the BORMAH JAN TEA CO. (1936) LTD. for the year ended December 1953 compares favourably with the previous year's loss of Rs. 7,908. The ordinary dividend has been declared at 7½ percent (nil). General reserve is allocated Rs. 46,500 and buildings reserve Rs. 60,000. The carry-forward is Rs. 5,960 against a debit balance of Rs. 32,144 brought in. The crop was 7,305 maunds (7,101 maunds) and the average sale price rose from 22.28 annas to 32.16 annas per lb. Estimates for 1954 have been made for a crop of 7,400 maunds at a cost of Rs. 7.12 lakhs.

* * * *

The HATTIKHIRA TEA COMPANY has produced excellent results for the year ended December, 1953. There is a profit of Rs. 10.39 lakhs against the previous year's loss of Rs. 6.97 lakhs. Adding Rs. 20,824 there is a balance of Rs. 8,60,187, of which dividend has been declared at 25 percent (nil). Reserve is allocated Rs. 4 lakhs and taxation equalisation reserve Rs. 1 lakh. There is a carry-forward of Rs. 45,187. There was a crop of 18,052 maunds against 14,563 maunds and the average sale price rose from annas 14-7 to Rs. 1-11-5 per lb. Estimates for 1954 have been framed for a crop of 19,000 maunds at a cost of Rs. 17.26 lakhs.

* * * *

Allowing Rs. 1.55 lakhs for depreciation, bringing in Rs. 69,978, writing back Rs. 1.75 lakhs from tax provision and making other adjustments, there is a debit balance of Rs. 97,203 of the ASSAM SAW MILLS & TIMBER COMPANY and this has been carried forward. The dividend has been passed (4 annas per share). The directors report that although the reconstructed factory at Namsoi went into production towards the end of October 1952, this period coincided with a very severe slump in the tea industry, and the resulting curtailment of purchasing by that industry reduced the demand for tea chests very seriously. The directors also state "that the 1953-54 period shows a considerable improvement in the trading position, although purchases of chests by the tea industry still remain considerably below the normal of recent years, resulting in severe price-cutting competition. Provided, however, we are able to obtain the assistance which we consider is our due in improving our communications, we hope still to be able to expand our production and show profitable results."

New Delhi

U.N. TECHNICAL AID ALLOCATIONS

NEW PROJECTS FOR 1954

(FROM OUR NEW DELHI CORRESPONDENT)

THE 1954 allocations of the Technical Assistance Committee of United Nations are now known. The provision for India consists of $986,068 and 103 experts. The estimates for projections of approved schemes for 1955 are placed at $648,445 and 70 experts. Some of the new projects approved for 1954 are as follows:

For soda ash, glass, soap and textiles, which are made in adequate quantities in India, an expert is to advise on the setting up of new plants. Carbon black is needed for the rubber industry and an expert is to advise on raw materials, availability of labour and the erection of new plants. Three design experts are to help in the building of the Bhakra-Nangal dam as part of the Sutlej river multi-purpose development scheme. A mechanical engineer specialising in the manufacture of moulds is to aid the development of the glass industry. Aid is to be given to the Damodar Valley authorities in determining the most suitable type of craft and bulk cargo installations for the area. Advice on instructor training is required, and it is proposed to reorganise the existing centre at Koni-Bilaspur which, in the first instance, is intended to serve Indian needs but may later provide regional facilities for other Asian countries. A study will also be made of other Government training centres, and recommendations made for their improvement. Four fellowships will be awarded for the study of the technical and administrative phases of labour management. An expert will develop facilities to meet the rising requirements for skilled workers in motor vehicle maintenance at a motor vehicle maintenance and repair training centre. Another expert will advise the All-India Handicrafts Board on the development of selected handicrafts by suggesting improvements in techniques, designs and marketing methods. A grain storage expert will advise the Government on grain storage and distribution, and on the kind and capacity of storage structures to be provided. Another expert will be provided to advise the Government on the production of plywood products. Provision is also made for six fellowships for industrial development, four fellowships for transport and communications, two fellowships each for mineral resources development and public administration, and one fellowship each for public finance and tele-communications.

Completed Projects

Some of the projects completed in 1953 are as follows: Four lecturers and an executive secretary have run a series of training courses in statistical quality control in four Indian cities, giving classroom and factory instruction to about 140 students. The Indian authorities are continuing the programme. An expert has advised individual companies on the design and manufacture of moulds for the plastic industry and on the best use of the manufacturing facilities at the companies' disposal. As part of the Government's port development programme, two dredging experts have surveyed 37 minor ports and made recommendations for their development. A hydrographic surveyor continued his work at certain ports in Bombay State, and will stay on until the end of 1954 under the regular programme. Thirty-two fellowships for the study of highway engineering, housing, mineral resources, social welfare, transport and various industries were awarded and taken up, while a further nine fellowships in industrial fields will be taken up in 1954. During 1953, 11 fellowships were awarded under the regular programme. A telephone expert has surveyed the automatic telephone installations in a number of Indian cities, and has prepared plans for the progressive introduction of direct inter-city drilling facilities together with a national numbering system. An expert has studied ways and means of introducing handicrafts and cottage industries among plantation workers to supplement their earnings during off-seasons. The services of an expert have been provided to advise the Government on land and water use development problems. Three experts appointed to survey civil aviation activities in India completed their work during 1953. Six fellowships in different fields of civil aviation, awarded in 1952, were taken up during the year. A consultant has made a survey of food hygiene problems in India, and his findings and recommendations are being communicated to the Government.

Technical Advisers for Sindri

Some of the 1953 projects continuing in the current year are mentioned below: During 1953 three technical advisers were provided for the fertiliser plant at Sindri; one assisted in the general management of the plant, one advised on the erection of new coke ovens, and the third trained staff to operate and maintain the plant's control instruments. A handicrafts marketing specialist has surveyed handicraft production in Uttar Pradesh and has made recommendations for the future manufacture and marketing of these products, with special reference to increasing their export.

Two experts have advised the Government on the organisational problems of the social security system and the development of the panel-doctor system, whilst a third was principally engaged in training the staff of the Employers' State Insurance Corporation and developing an efficient programme. The team made various recommendations which will involve an amendment of the Employers' State Insurance Act, as well as detailed proposals for the establishment of an adequate social security training system, particularly in connection with the extension of the social security scheme to Bombay.

A team of production engineers has demonstrated to the cotton textile and engineering industries how productivity and workers' earnings can be raised by the application of modern techniques of work study and plants organisation and, where appropriate, by the introduction of systems of payment by results. Selected management and trade union personnel were trained under actual working conditions, and have since achieved marked increases in output and general efficiency in their own plants; increases in productivity ranging from 6 to 250 percent in cotton textiles and 12.5 to 116 percent in the engineering industry have been recorded. Procedures used by the team included the establishment of reliable recording methods and the setting up of production control points; improvement of working conditions; establishment of standard procedures to ensure more effective operation; improved quality and better use of materials; improved control of materials and methods of handling; and the introduction of simplified methods and reduction of idle machine time. Arrangements are being made for the establishment of a National Productivity Centre which will be staffed by a director and for senior experts from abroad, two Indian experts and other Indian personnel.

Training-Within-Industry

During 1953, an expert has discussed with the Government proposals for a national plan to develop training-within-industry. He has also chosen 20 textile mills in which training-within-industry will be fully developed; organised courses for the senior officers in each mill, and job-relations and job-methods institutes for training officers from the mills, and given a number of lectures in several large cities. It is intended to prepare the national training-within-industry plan in 1954, and particular attention will be given to the training of staff to put it into operation.

Since 1951, the Food and Agricultural Organisation has been advising the Government of Uttar Pradesh on the operation and maintenance of farm machinery, the organisation of workshops, and the in-service training of operators, maintenance and repair men; and during 1953 the Government has continued to implement the recommendations of the nine experts who have been at work. Workshops have been organised; stores set up with modern indexing systems; and a technical laboratory opened at the central workshop. Improvements in operation and maintenance systems in the field have almost eliminated breakdowns, and have enabled many tractors which were out of commission when the project began to be put into running condition. The workshops are now able to manufacture some 60 different implements; the capacity of tractor and vehicle shops has been increased several hundred percent and the Bareilly workshops can completely overhaul 250 tractors and 50 vehicles a year. Four farm machinery experts will continue supervisory work and in-service training during 1954.

During 1953 three specialists in artificial insemination have helped the Government with its intensive programme to raise the quality of milk from cattle. One of the experts has given advice on general questions connected with the introduction of an artificial insemination scheme, while the other two have held demonstrations and organised training courses in the latest methods; they will continue their work for a short period in 1954. A fourth expert, co-operating with the first three, is assisting in the improvement of breeding, feeding and rearing dairy stock for the Bombay milk scheme. He is also advising on the large-scale production of forage crops. A dairy technologist is helping the organisers of the Bombay milk scheme to find ways of using surplus milk and to set up a bottling and processing plant. Although the principal occupation of the inhabitants of the hilly areas in Uttar Pradesh is sheep breeding, the quality of the meat and wool produced is very poor. A sheep production expert is accordingly assisting the State Government to develop sheep husbandry on scientific lines, while a specialist in wool production is advising on the wool requirements of manufacturers and on the operation of experimental sheep farms. In 1954, a grassland expert who has surveyed the seasonal scarcity of fodder in Uttar Pradesh will stimulate research into grassland management and fodder production, and will help the Central Government to make trials of suitable grass and forage crops.

Hides and Skins Specialist

A specialist in hides and skins has assisted the Central Government and the Government of Uttar Pradesh each to set up a disposal centre for uneconomic animals. These centres have complete units for flaying, tanning and the utilisation of carcases. Under the expert's direction and with the assistance of the Ford Foundation, a training and administration centre for hides and skins has also been established to improve tanning practices and to establish the occupation as a rural industry. Seven community centres have now been set up with assistance furnished under the U. S. bilateral programme at which training is given in correct methods of flaying and leather production; co-operative societies are also being formed for the disposal of hides and skins.

Two agricultural statisticians have advised the Indian Council of Agricultural Research on its programme, delivered lectures and conducted study groups at various centres. During 1954, a statistician will assist the Council with its programme of improvement of current crop and livestock statistics.

A timber engineer is helping the Forest Research Institute at Dehra Dun to organise a Timber Engineering Section. During 1953, a timber extraction expert has advised on the introduction of modern mechanical methods of timber extraction and transportation, and in 1954 a further expert on this subject will demonstrate the use of a Skyline crane which the Food and Agriculture Organisation is supplying; he will also supervise the establishment of a modern timber extraction branch at the Research Institute. An expert is to advise how the advance of the desert in Rajasthan towards Delhi and the fertile Indo-Gangetic Plain may be controlled by means of afforestation. As part of the world survey of pulp and paper resources being undertaken by the Food and Agricultural Organisation, a pulp and paper industrialist will visit India in 1954.

The specialist in textile research has trained research workers and advised on the study of the surface of cotton by gas absorption methods, fractionation of cellulose by thermal diffusion, interrelation of yarn structure and its physical properties, and recovery of cellulose from certain mill wastes.

Proposals for Tank Factory

The Government of India has decided to establish a tank factory and is now examining propo-

sals made by a British and a German firm. The German firm, Daimler-Benz, has offered to set up a factory for the manufacture of the 13½-ton French prototype by Forges and Chantiers de la Mediterranee, a large French shipping company which also manufactures a wide range of other products. The tank was recently exhibited in India. The Leyland Motor Company, which builds Centurion tanks, has offered to set up a factory in India to manufacture 35-ton Centurion tanks, in three years, using 50 percent of Indian material. The Government's decision is expected shortly and is expected to be in favour of Leylands.

Diesel Rail Cars

The General Manager of the Northern Railway, Mr. K. B. Mathur, said here last week that his administration was considering the introduction of diesel rail cars on certain metre-gauge sections where speedy and frequent passenger service was needed. The 50-mile Chunar-Robertsganj-Churk line, which had been constructed at an estimated cost of Rs. 2.6 crores, would be opened to traffic on 12th July, he added. The line, which would serve the Uttar Pradesh Government's cement factory at Churk and facilitate the execution of the Rs. 35-crore Rihand Dam project under the five year plan, was expected to be opened by the Prime Minister. Referring to development plans, Mr. Mathur said that the transportation capacity on the Delhi and Ferozepore divisions and also on the metre-gauge could be expanded for additional traffic expected from the Bhakra-Nangal project.

It was proposed to increase the capacity for traffic via Moghulsarai from about 1,600 wagons to 2,000 wagons per day by the construction of new crossings and stations, lengthening of loops to take longer trains, remodelling of yards, including the Allahabad yard, and signalling improvements in the Lucknow, Allahabad, Moradabad and Delhi divisions. The General Manager said that plans to increase the traffic capacity of the Delhi area had been drawn up. These included the provision of more metre-gauge platforms and lines at Delhi, modifications and extensions in the New Delhi yard, and development of existing facilities at Nizamuddin to handle coal and other mineral traffic which was at present received at New Delhi. At Delhi Station, the Railway wanted to add two more platforms by utilising the space that was not being used by the military authorities. It was also proposed to build a new modern hall for third-class passengers. In the broad-gauge, five more platforms could be provided after the loco shed was removed.

Purchase of Aeroplanes

The Indian Airlines Corporation is likely to purchase ten to 12 four-engined, 14-seater *Heron* aeroplanes for operation on its feeder services. An early decision is expected. Enquiries show that it will take another six months before the internal air services are fully integrated. The first 12 months' working of the Corporation may disclose a loss of nearly Rs. 1 crore, it is feared here.

Nepal Asks for Planes on Loan

Nepal has asked for the loan of five civil aircraft and a team of technicians to develop its air services, it is learned. This follows the visit of Messrs. Shanker Prasad and Jain to Khatmandu recently to appraise Nepal's needs in regard to civil aviation.

Electricity from Bhakra-Nangal

The Ayyangar Committee on the phasing of electric power supply from the Bhakra-Nangal Project has made its report. The Committee, it is learned, holds that the demand for electricity would justify the installation of a second generating plant by 1962, so orders for another generator on the main dam could be placed by 1957. The Punjab Government is, however, insisting that sanction for the second generator should be accorded at once. The fault largely lies with the irrigation engineers who, instead of locating the generating plant on the main dam, located it on a canal the water flow through which is likely to be interrupted for some days in a year, thus interrupting the supply of electricity. For this and other reasons, the second generating plant is likely to be sanctioned. The next meeting of the Control Board is fixed for 2nd July at Simla.

New Import Policy

The Government of India's July-December import policy is expected to be announced this week. Apart from small variations and some more token imports, the present policy is likely to continue. The Finance Minister's expectations of an import surplus might not be realised. Indian demand being what it is, any import surplus could only be at the cost of Indian industries. Already the Federation of Indian Chambers of Commerce and Industry is up in arms even against token imports. It wants the Government to force the Indian consumer to buy Indian goods, irrespective of their quality and price. The Congress High Command has supported the demand against increased imports for reasons of employment. The Communists have joined hands with both the Congress and the Federation. In such circumstances, any increase in the import of consumer goods seems unlikely. The Government has already been very liberal with the import of capital goods and industrial raw materials. Imports of these two categories may be further liberalised. But such imports would depend on the volume of investment in the private sector.

Bombay

MR. B. M. BIRLA DISCUSSES EMPLOYMENT & IMPORTS

NEED TO INCREASE DOMESTIC PRODUCTION STRESSED

(FROM OUR BOMBAY CORRESPONDENT)

DURING his second visit to Bombay as President of the Federation of Indian Chambers of Commerce and Industry, Mr. B. M. Birla took the opportunity of reviewing several important problems relating to trade and industry at a Press conference last week. He appeared to be concerned about the volume of unemployment, but looked at the problem from a new angle. Saying that the country's imports were about Rs. 400 crores, he suggested that goods worth Rs. 200 crores out of these were such as could be manufactured at home. If industrial production could expand within a reasonable period of time to this extent, it could provide employment for 15 lakh people. This could set up a chain reaction of more purchasing power, greater demand and still higher production, thus increasing the scope for employment indefinitely. But Mr. Birla was not unmindful of the difficulties. He calculated that to secure additional production to replace imports worth Rs. 300 crores annually would require an investment of Rs. 1,500 to Rs. 2,000 crores. Finding so much capital was no easy task, especially as the capacity to save in the cities had been reduced by unemployment increasing the number of persons depending on the actual earners, apart from other causes, Mr. Birla argued that it was beyond the capacity of the Government to create opportunities for employment for these large numbers. It was, therefore, for the people, including the business community, to find ways and means of breaking this vicious circle of growing unemployment leading to reduction in savings.

In this connection, Mr. Birla complained against the failure of the business community in Bombay, which had taken a lead in the past in starting new industries, to maintain the pace of investment. While admitting that during the current year several plans had been made by Bombay business men to establish new industries and expand the existing ones, he felt that the capital market in Western India could gather more resources. He also suggested that, while it was imperative to utilise domestic resources to the utmost, it would still be necessary to depend on imported capital, though he did not say how foreign capital was to be attracted for investment here. Even now, nearly half the industries in India, considering the total capital invested, were controlled by foreign interests, he said. He warned against any move to acquire some of these concerns, even though the smaller ones amongst them were reluctant to expand their activities because of fears of nationalisation. The capital which might be required to take these over could be more profitably employed for starting new industries or increasing the capacity of those under Indian management. At the same time he pointed out that the failure of this sector of industries to contribute its normal share of expansion added to the responsibility of the Indian sector to increase its investment to maintain the tempo of expansion. Coming to the main difficulties in the way of rapid expansion, Mr. Birla mentioned tax burdens, the general attitude of workers and lack of transport facilities. He regretted that, apart from expansion, the railways had failed even to rehabilitate themselves during the last eight years.

Mr. Birla estimated that there were nearly 60 million people engaged in business with about 40 million more directly dependent on them. They constituted the second largest group in the country's economy, the first being those living on agriculture. Both the authorities and the public should realise, he said, that any setback to the prosperity of the former class was bound to have its impact on the economy. Mr. Birla announced that the Federation was actively examining the question of convening a traders' convention at New Delhi during the next cold weather, to consider the problems and difficulties of that class and to restore the traditional contacts amongst members of this class scattered all over the country, which were lost during the period of controls.

Textile Production Controls

While nothing has so far been authoritatively announced with regard to the ending of production controls on cotton textiles, it is now confidently expected in textile circles that these controls are likely to be removed at an early date following certain suggestions made by the industry to the Central Government. The subject was discussed at the recent meeting in Bombay of the Textile Controls Committee appointed by the Union Government, at which Mr. T. T. Krishnamachari, Central Minister for Commerce and Industry, was present. Representatives of millowners and of textile workers also attended. The operation of these controls was reviewed, and the millowners' contention was that mills should be allowed to decide the pattern of production (subject to the restrictions on *dhotis* and *sarees* imposed to safeguard the interests of the handloom industry) according to the requirements of the consumers. The Textile Controls Committee is believed to have examined the situation in the industry and found that the general progress made by it since the removal of price control on cotton textiles had been satisfactory.

Subsidising Cottage Industry

It seems that the Government of India has decided to resist the plea made on behalf of cottage industries that the principle of imposing a cess on large-scale industries to support their counterparts in cottage industry should be extended. While defending the imposition on mill-made cloth, Mr. T. T. Krishnamachari, the Union Minister for Commerce and Industry, told the All-India Handloom Board, which held its third meeting here, that it was not feasible to extend this principle to other sectors; there were obvious limitations to taking recourse to fiscal measures to aid specific industries. He advised the members of the Board to direct their deliberations in a constructive manner with a view to enable the weavers to earn a little more money, instead of indulging in fiery speeches. Mr. Krishnamachari was also equally outspoken about the proposal to reserve certain varieties of cloth production for the handloom industry and openly confessed that he did not believe the reservation of production of selected items of cloth would encourage the handloom industry or offer any lasting solution to the many ills it suffered. This reservation, even to the limited extent which was in operation, would not help the industry for all time, though he was prepared to keep an open mind about it till the Kanungo Committee expressed its opinion. In his lengthy review of the handloom industry at this meeting, Mr. Krishnamachari said that while there was still plenty of room for improvement, the handloom industry could be said to have been well set on the road to progress. As far as the Central Government was concerned, it had done all it could by placing Rs. 7 crores annually at the disposal of the Board for helping the industry.

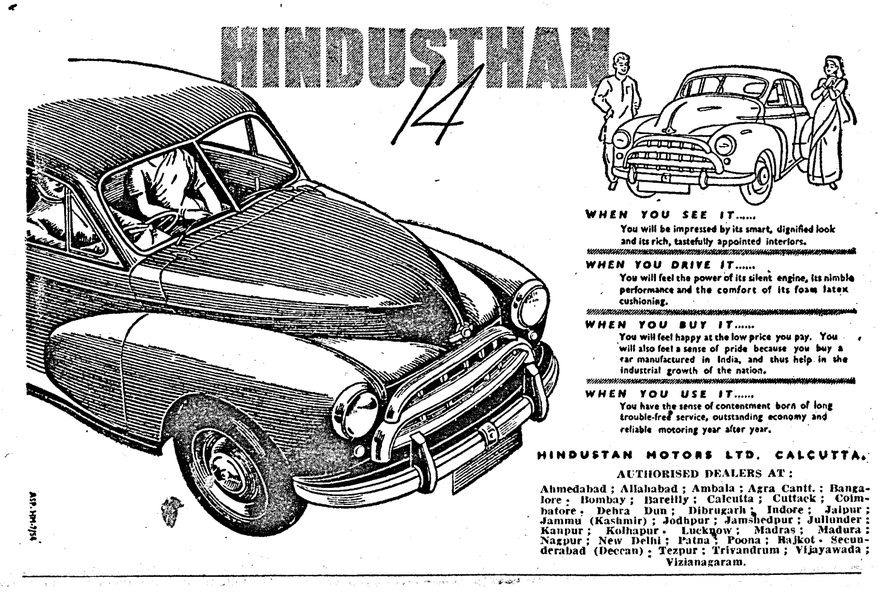
Employees' Health Insurance Scheme

It has now been decided to bring the Employees' Health Insurance Scheme into operation in Greater Bombay on 2nd October, Gandhiji's birth anniversary. Feverish preparations are going on at the State Labour Ministry and at the offices of the Health Insurance Corporation. It has also been decided to establish as a part of this scheme a 300-bed hospital exclusively for industrial workers; arrangements for this were finalised at a conference of representatives of the Bombay Millowners' Association, the State Government and the Employees' State Health Insurance Corporation last Thursday. The Millowners' Association is contributing a little over Rs. 54 lakhs for this hospital from the Rs. 72 lakhs raised from its members for the Mahatma Gandhi Memorial Fund. The capital cost of the hospital will be met from this contribution of the Millowners' Association, while the State Government and the Health Insurance Corporation will share the cost of maintenance every year. According to Mr. Shah, the State Minister for Labour and Health, about 425,000 workers employed in 16,000 factories in the Greater Bombay area will be covered by the health insurance scheme. A staff of 2,500 persons will be necessary to enable the Corporation to recover contributions and to keep detailed records regarding every worker. A difficult part of the work under the scheme is the selection of 400 doctors as panel practitioners, each of whom will be allotted between 1,000 to 2,000 workers.

Compensation for Air Companies

Exasperated by the long delay in paying compensation for the nationalisation of air transport, shareholders of airway companies recently held a meeting under the auspices of the Bombay Shareholders' Association at the Bombay Stock Exchange. Mr. K. R. P. Shroff, President of the Bombay Native Stock and Share Brokers' Association and Vice-President of the Shareholders' Association, strongly urged the Government to pay compensation immediately, to enable the companies to make at least an interim payment to shareholders. The meeting passed a resolution recording its protest against the Government's delay in payment and drawing its attention to the fact that the schedule to section 25 of the Act had already laid down principles for determining the amounts to be paid as compensation in respect of aircraft engines, frames and screws. The resolution urged the Government to make immediate payment to the companies as compensation in respect of these specified items. It was stated at this meeting that about Rs. 4½ crores were locked up as a result of this delay; it had caused many shareholders to throw their shares on the market at a sacrifice. The Association was of the opinion that delay in the payment of compensation for nationalised industries, which had occurred in the case of not only air transport companies but also the Bombay Electric Supply and Tramway Company and the Indian Radio and Cable Communications Company, was bound to undermine investors' confidence. The shareholders appointed a nine-men action committee under the presidentship of Mr. K. R. P. Shroff, to represent their views to the Government and to protect their interests in general.

Certain problems relating to insurance came into prominence last week with the holding of the annual general meeting of the Indian Insurance Companies' Association here. Mr. Lakshmidas P. Gokuldas, Chairman of the Association,



EPCO
EMULSOL
(Jute Batching Soap... Emulcifier)
The predominating feature of this Emulcifier is that its alkalinity represents a very accurate adjustment and free hydrated alkali is neutralised with guaranteed maximum emulcification properties.
EAGLE PAINT & PIGMENT INDUSTRIES LIMITED

saw a bright future for insurance business in India. Touching on the delicate and controversial subject of reduction in premium rates for various types of insurance, Mr. Gokuldas observed that the Tariff Committee had been directed by the Controller of Insurance to consider the feasibility of a downward revision of rates in general insurance business. He said that the prevailing tariff rates were not high and that the rates for the bulk of the cargo in marine insurance were dictated by international factors. He also recalled the general complaint all over the world that cargo rates had reached an uneconomic level. With regard to motor insurance, Mr. Gokuldas pointed out that the rates, though they were increased last year, stood at a much lower level than those prevailing elsewhere. As for the fire rating system, it closely followed the pattern and level of tariffs in the insurance world. Trying to draw an overall picture, Mr. Gokuldas said that the premium income was shrinking and the war and postwar era of expansion of premiums had definitely ended. Insurance business was now called upon to get used to a lower level of income. Though from the point of view of claims experience, 1953 had been a good year, development in 1954 pointed to the belief that the process of reduction of rates had been carried a bit too far and that there was no scope for further reduction as asked for by the Controller of Insurance. Mr. Gokuldas deprecated suggestions made by certain sources regarding nationalisation of insurance. He criticised the growing tendency on the part of the Central and certain State Governments to encroach upon this sphere of economic activity which was efficiently served by private enterprise.

You're in the hands of a million-miler when you fly Pan American

Like the Master of Over-ocean Flying shown here, more than 1200 Pan American pilots have flown over one million miles each. 100 of them have flown over three million miles.

That's the kind of experience Pan American gives you, plus all these extras at no extra fare:

- More frequent flights at more convenient times to more places.
- Superb food and service. Meals aloft by Maxim's of Paris on all first class flights.
- More berths to more cities (small charge)... bedlength Sleeperette* service on first class flights.
- More overseas flying experience—carried over 13 million passengers over one billion miles.
- Choice of tourist or first class service around the world.

Let your Travel Agent arrange your trip—his services are free. Or call Pan American in:

OVERSEAS TRADE FIGURES FOR MAY

RECENT EXPANSION WELL MAINTAINED

(FROM OUR LONDON CORRESPONDENT)

ALL recent talk about further steps being taken towards sterling convertibility in the near future boiled down to a couple of questions by Mr. Gaitskell and the answers of Mr. Butler during question time in the House of Commons last week. As expected, the Chancellor of the Exchequer was most cautious, neither confirming nor denying recent speculations, though his refusal to increase the travel allowance on the ground that he "did not wish to give an unduly optimistic view to the country" hardly suggests that he is contemplating throwing open the whole field of imports and financial payments. He reiterated the three pre-requisites, and re-affirmed that in respect of all three we were making "very nice progress," but would go no further. Meantime, convertibility talks between officials of the E.P.U. countries are taking place in Paris, and it is understood that the subject which is receiving the most attention is the gradual extension of the recent lifting of discrimination against dollar imports to goods other than foodstuffs and raw materials to test the volume of demand which would emerge. Such a move would probably be attractive to some sterling area countries, particularly if it were accompanied by the extension of convertibility to sterling-area residents, but it hardly ties up with Mr. Butler's known views on the subject and would undoubtedly increase the competition which British industry is already experiencing in the export market. Bearing these facts in mind, it appears to be a fairly safe guess that full convertibility is still a long way off and that it will be preceded by a succession of piecemeal relaxations and a considerable amount of consultation and discussion.

Trade Figures for May

The "nice progress" is confirmed by the overseas trade figures for May, when recent expansion was well maintained. Exports and re-exports last month were worth £237.9 million, against £232.9 million in April and an average of £233.7 million in the first three months of the year. They represent an appreciable improvement on the figures for May 1953, and are even a bit better than those for 1952. The import side was also encouraging. At £280.4 million, total imports compared with a value of £284.3 million in April and an average of £273.7 million in the first quarter of the year. The Board of Trade points out that the monthly average of imports (£277 million) in the first five months of 1954 is 2 percent less than the rate in the first half of 1953. The adverse visible trade balance for the month works out at £42.6 million, or about £9 million less than in April, but is about £2½ million higher than the average for the first quarter. The second quarter of the year, however, usually produces some deterioration in this respect. What is probably more important is that the average trade gap so far this year is about one-third less than the gap in the first six months of last year. On visible trade, therefore, Britain is showing an increasing improvement on both 1953 and 1952, which explains in some measure the improvement in the gold and dollar reserves and the firmness of sterling exchange. As for trade with the dollar markets, exports to the United States in May at £12.5 million were £300,000 more than in April, but to Canada the figure was exactly the same, £12.9 million.

Can this improvement be maintained? Production and employment figures suggest that it can, but once again it is necessary to emphasise that optimism must be tempered by other developments not so favourable. For instance, the Board of Trade index of basic material prices rose for the third successive month in May, reaching 144.6, compared with 140.4 in February, when prices were at their lowest level since August 1950. Raw wool, raw rubber, raw cotton, copper and lead were all higher, but the increase was partly offset by lower prices for tin ingots, linseed oil and palm kernel oil, to show a total rise of ½ percent in the month. In view of this rise in basic material prices, industry has done well to keep its selling prices fairly stable. The *Board of Trade Journal* publishes price index numbers for about 100 industrial products, and of these more than half showed no change in May, while as many as one-third were no higher than they were in January. Seeing that raw material costs are a major factor in production costs, that is no small achievement, but the stability of prices is now being assailed in ways other than these. Wage increases, for instance, to say nothing of the rise in fuel and transport costs. The first may be localised to particular industries, as also the higher cost of imports, but the last two will have general application throughout the economy.

Re-Thinking on Wages

In respect to wages there has apparently been some re-thinking on the part of the T.U.C. Mr. Arthur Deakin, the General Secretary of the Transport and General Workers' Union, who is its Chairman, dealt with the subject when he addressed the National Union of Seamen in London on Thursday. He reminded delegates that he had said, very strongly and firmly, that he was in favour of a policy of acting with restraint in submitting wage claims. A great number of organisations were being forced into the position of submitting wage claims—by the decision of their membership assembled in conferences—which they had no possibility of realising. If rumours are to be believed, Mr. Deakin is preparing the way for the T.U.C. conference at Brighton in September, at which will be presented a report on the economic situation prepared by the Economic Committee, which will contain a recommendation that, provided prices and profits are stabilised by the Government, unions should be ready to accept restraint in pay demands. Several suggestions along these lines are now being considered with the object of producing plans to regulate wage claims and prevent a free-for-all among the hundred or so unions affiliated to the Trades Union Congress. How is the stability of the cost of living to be judged? The Ministry of Labour's retail price index—which, incidentally was a point lower on 18th May at 141, or only one point higher than the level in May last year—is not accepted as a guide by labour, yet the T.U.C. has refused to participate in an inquiry into the relationship between wages, prices and the economic situation, which might have produced something more convincing. The rulings of arbitration tribunals and wages boards seem to be equally unacceptable, if recent experience is any guide. The Agricultural Wages Board has just rejected a claim for a substantial increase in wages put forward by unions on behalf of farm workers—the usual start to wage claims elsewhere because of the effect on food prices—but the union leaders have refused to accept the decision as final and are to consider what further action should be taken. It is to be hoped that the T.U.C. plans will also include some yardstick for measuring the real cost of living.

Steel Denationalisation Issue

Last week, with both gilt-edged and equities touching lower levels than for quite a while, grave doubts were entertained regarding the outcome of the next large public offer in the process of denationalising the steel industry—next week's offer of 10 million Ordinary £1 shares of Stewarts and Lloyds Ltd. at 35s a share (5s on application). Applicants will have the choice of paying either in cash, or by tender of 3½ percent Treasury stock, 1971-81 (formerly British Iron and Steel), 3½ percent guaranteed stock, 1979-81, which will be accepted at £97 9s 1d, or 2s 10d more than the market quotation at present. Since then, however, not only has the market improved, but the Iron and Steel Holding and Realisation Agency have concluded the resale to Vickers, Limited, and Cammell, Laird, and Company, Ltd. of the 6,000,000 A Ordinary shares and 2,000,000 B Ordinary shares respectively in the capital of English Steel Corporation Limited at a price of 25s a share, retaining "for disposal" later five million preference shares and £5 million 4½ percent debenture stock. In addition, Stewarts and Lloyds have produced most encouraging figures regarding recent business, and the City's interest in the new issue is reported to be excellent with the prospect of a larger public demand than for the two previous denationalisation issues. Market sentiment at the moment can be gauged from the highly successful result of the Government's conversion offer to holders of the £321 million of 3 percent National Defence Loan, 1954-58. The result was much better than the market expected and the Government has on balance raised a good net sum from the whole operation with which to retire floating debt, something in the region of £70 million.

The Chinese Trade Mission

The Chinese trade mission, invited to this country by the Federation of British Industries with Government backing, is expected in London in just over a week. It will be led by Mr. Tsao Chung-shu and Mr. Shih Chih-ang, vice-managers of the China National Import-Export Corporation, and will include seven trade experts, an interpreter, and a secretary. They are expected to visit factories in Britain and will stay about ten days. The F.B.I., the China Association, the London Chamber of Commerce, the Association of British Chambers of Commerce, and the National Union of Manufacturers have formed what is called the "Sino-British Trade Committee" to deal with all matters connected with the coming visit and with future trading relations with Communist China. The committee has already held a series of meetings and has largely completed arrangements for the coming visit. The members of the Chinese mission include a number whom British business men have already dealt with either in East Berlin or Peking. In a statement the F.B.I. commented: "The Sino-British Trade Committee notes with satisfaction that the Chinese have agreed to this wider approach to trade with the United Kingdom in spite of restrictive channels hitherto used by them in this country."

Brevities

The Council of the Institute of Chartered Accountants announces the establishment in the University of Cambridge of the P. D. Leake Professorship of Finance and Accounting. The appointment of the professor rests with the university.

For the first time, the Stock Exchange Official List has printed the premium on United States and Canadian securities as "nil." Just before devaluation the premium was as much as 36 percent. Although this official premium is not quite the same as that used by dealers on the London Stock Exchange, who are quoting ¼ percent premium, this figure reflects the limited interest people are now showing in American shares.

Pakistan

SLOW PROGRESS IN POWER DEVELOPMENT PLANS

DOWNWARD TREND OF FOOD PRICES

(FROM OUR KARACHI CORRESPONDENT)

FOR some time past a certain amount of uneasiness has been felt at the slow rate of progress of power development in Pakistan. To supplement the long-term projects and to provide the power necessary to keep pace with the rapid advance of industrialisation, the Government of Pakistan evolved in 1951 what was then known as the Two Year Plan comprising the construction of a number of thermal stations, both steam and diesel, to furnish a total of 140,000 k.w. generating capacity. The allocation of the installations was: In East Bengal, Sidhirganj 30,000 k.w. (steam) and 10,000 k.w. (diesel), Chittagong 10,000 k.w. (diesel); Khulna 10,000 k.w. (diesel); and in West Pakistan, Lyallpur 30,000 k.w. (steam) and 10,000 k.w. (diesel), Karachi 30,000 k.w. (steam), and Hyderabad (Sind) 15,000 k.w. (steam). All these schemes are now in various stages of construction with the exception of the Lyallpur steam project which has been abandoned, but it is not expected that they will come into full-scale operation before the end of 1955. The major long-term development schemes have, more understandably, also been rather tardy in getting under way. The path has, of course, not been smooth and very great difficulties have been encountered. The Central Engineering Authority, which was charged in 1948 with the speedy expansion of power facilities, found itself heavily preoccupied with irrigation schemes which, because, of a succession of bad seasons and other causes, were awarded a very high priority. Additional retarding factors in the implementation were the difficulty of procuring first class technical engineers, the need for consultation and co-ordination with the various donor nations under the Colombo Plan and American aid, and the change in the picture in West Pakistan occasioned by the discovery of Sui gas. A further indication of the various problems facing the responsible authorities was made by Choudhury Mohammad Ali, the Finance Minister, in the current Assembly Session when winding up the debate on the Budget. The Minister who, incidentally, is not one easily provoked to public criticism of other people's efforts, stated, "I think that the engineers of the Punjab Government in the Department of Electricity have not served that Government well. There have been cases where plants were lying for some years without being put to use. In another project in the Punjab, the Rasul hydro-electric project, the capital cost turned out to be much higher than the original estimate and therefore the cost per unit of electricity is excessive".

Vigorous steps are now being taken by the Government to ensure that the various plans will go forward in the future with all possible speed. A new body, an entirely separate organisation to be known as the Central Electricity Commission, is to be set up and is to act in an advisory capacity on all electricity problems. This Commission will eventually give way to a Power Development Corporation which is to be an autonomous body invested with powers to put development of electricity on a sound commercial basis. Khan Abdul Quayyum Khan, the Industries Minister, has now left for Europe to undertake a tour which will include Switzerland, Sweden, Denmark, Germany, the U.K. and France. The purpose of his mission is to visit installations, both hydel and thermal, and, more especially, to study the workings and organisation of various statutory bodies such as the British Electrical Authority.

Consultants from Canada

A Canadian firm of consulting engineers has been engaged to prepare a new power development plan for West Pakistan; the previous plan will, of course, require considerable revision owing to the harnessing of Sui gas, including the new Central Power Station to be situated in the Dera Ghazi Khan area to provide power to the South Punjab and Bahawalpur State, and to the possibility of the abandonment of the 100,000 k.w. Mianwali Power Project on the grounds that it is not economically feasible. An American firm has been engaged to carry out a similar survey for East Pakistan. In addition it has been decided by the Government, as a matter of policy, that consulting engineers should be appointed to undertake the actual engineering of all major thermal and hydro-electric projects throughout the country.

Purchase Procedure Revised

The Minister for Industries has recently undertaken an overhaul of the hitherto rather cumbrous workings of the Department of Supply and Development. The purchase procedure has been considerably revised with a view to the elimination of exasperating bottlenecks and frustrating delays. A welcome improvement is the authorisation now given to the Department to issue import licences against contracts placed by it thereby cutting out the shuttle service which importing firms had to maintain between the Department and the C.C.I. & E.'s office for licences. A long-standing complaint from East Pakistan has been met by authorising the Deputy Director-General of Supply and Development at Chittagong to take full action in the majority of purchases without reference to his headquarters at Karachi.

Rice Surplus in East Pakistan

The food situation in Pakistan is now extremely satisfactory and the shadows of shortages have completely receded. But fresh problems have arisen over the provision of storage facilities to cope with the new crops and the prudent insistence by the Government that the American gift wheat must be consumed first and that the proposed 500,000-ton wheat reserve and the 100,000-ton rice reserve must be built up from this year's harvest. According to official statistics the wholesale price per maund of wheat in the middle of last month at Lyallpur was Rs. 8-10 as against Rs. 12-8 at the same time last year; the price of medium quality rice at Chittagong, per maund, was Rs. 15-8 as against Rs. 25 in May, 1953. It is understood that prices have shown a further downward trend since then. It is remarkable that East Bengal this year has not only attained self-sufficiency in rice but may also be in a position to export. The provisional figure of the surplus is estimated at one lakh tons. West Pakistan this year has already exported 70,000 tons and it is more than likely that there will be a further two lakh tons surplus before the end of the season.

CONFERENCES ON LABOUR IN KANPUR MILLS

LABOUR MINISTER'S SUPPORT FOR RATIONALISATION

(FROM OUR LUCKNOW CORRESPONDENT).

THE principles of rationalisation agreed to at the tripartite conference in Naini Tal early this month have already become the subject of open controversy. The Labour Minister, Mr. Sampurnanand, has come out as a strong advocate of rationalisation which alone, he says, can stave off disaster for Kanpur's textile industry. According to him, there has already been a drop of a few thousands in the labour force employed by the Kanpur mills and the dwindling opportunities for employment can only be successfully met by a scheme of rationalisation which is bound to result in greater scope for employment in future. He has also pointed out that when the scheme is implemented the workers stand to gain materially in respect of wages. But a section of labour leaders both in U.P. and elsewhere have started an agitation against anything in the nature of rationalisation, quoting Congress policies and directives. At the moment, the Government has entrusted the scheme of rationalisation to a committee consisting of representatives of employers and labour, with the Labour Commissioner as Chairman.

The tripartite conference on the textile industry has been followed by a similar conference on the problems of the sugar industry. The main question for discussion was the payment of bonus to workers in sugar factories for the year 1953-54. There was a demand that the present step system should be given up in favour of the slab system but again the matter was finally entrusted to a committee. Another committee was also appointed to report on the question of payment of retaining allowance by sugar factories to the workers. In 1949-50 a similar question arose, when it was decided by the High Court that the retaining allowances indicated in the Government order were legal and valid. The majority view at the conference was that cases relating to 1950-51, 1951-52 and 1952-53 should be dealt with on the lines of this decision, but no agreement was possible on the categories of workers who should in future be entitled to such allowances. The millowners pressed for a decision on the age limit at which a worker should be made to retire, but this latter was also referred to the committee appointed to report on retaining allowances.

Oil Industry's Crisis

U.P.'s oil industry, which has its home in Kanpur, seems to be facing a crisis precipitated, according to oil mill interests, by a severe shortage of wagons in recent months. Two 'dal' mills employing about 500 workers have closed down after incurring a loss estimated at Rs. 5 lakhs, largely due to accumulation of stocks. The 10 remaining oil mills in Kanpur are working only on partial strength, rendering nearly 1,000 workers idle. The accumulated stocks of 'dal' and oil are estimated to be nearly 25,000 maunds. Though the crisis had been brewing for some time, it came to a head only this month—from 6th June to be precise—when the supply of wagons is stated to have been completely suspended.

Minimum Wages in Agriculture

The U.P. Government, it is understood, is considering proposals to extend the Minimum Wages Act to all agricultural cultivation in the 12 districts comprising low-wage areas in the State, and farms of 50 acres or above in the remaining districts. In 1951, the State Government had appointed a committee to recommend minimum wages in agriculture, and on the basis of the Committee's recommendations, these rates have been fixed at Re. 1 per day or Rs. 26 per month, without perquisites, for adults and As. 10 per day or Rs. 16 per month for children. The rates are applicable only to workers employed in farms of 50 acres or more. A review of the working of the Act during the last year shows that 1,64,392 agricultural employees were covered by it on 73 farms.

Where the Shoe Pinches

It has been decided by the U.P. Small-Scale and Cottage Industries Board to set up a pilot project for the shoe industry at Agra. The city of Agra once produced 25,000 pairs per day but now the output has been reduced to nearly half. The Ford Foundation team which recently reported on small-scale industries in India made a special reference to Agra to show how perpetuation of inefficient methods has resulted in loss of employment to thousands of workers. The Government has sanctioned Rs. 80,000 as loan to the industry and Rs. 18,700 as grant, besides making a provision of Rs. 70,000 for the purchase of raw material to be supplied to manufacturers. The Government scheme for the development of the shoe industry, it is estimated, would result in the production of at least 40,000 pairs daily.

Banaras silk goods and scarfs, which is another cottage industry to claim the attention of the Board, has been disturbed by reports that the United States Government have imposed a ban on the import of these goods under the Flammable Fabrics Act. The State Government has made representations to Delhi to move the U.S. Government to lift the ban.

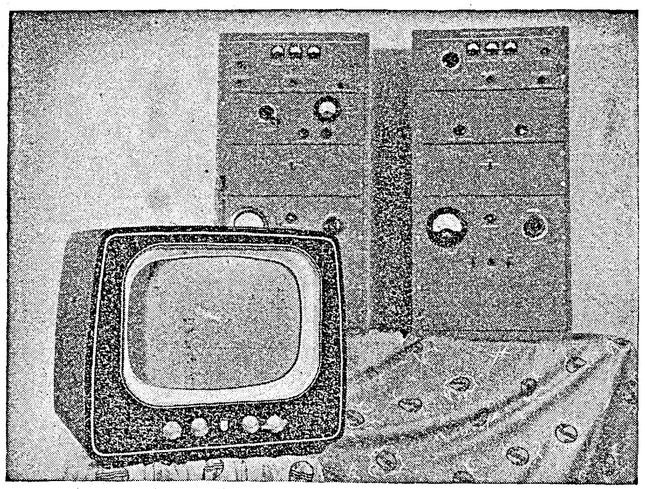
The Government of India has decided to take over the State Government's Weaving Institute at Banaras for converting it into an all-India research centre for the handloom industry. This decision was announced at a meeting of the U.P. Handloom Board at Naini Tal this week, when the targets for 1954-55 were considered, and tentatively fixed at the production and sale of handloom goods worth Rs. 1.25 crores. Forty-two sale depôts and 25 dye-houses have already been started, and it is expected that by the end of the year there will be 75 depôts and 50 dye-houses in the State. The number of production centres will also be increased to 75, providing employment to 50,000 workers.

Decline in Excise Revenue

There is a decrease of Rs. 18 lakhs in the excise revenue of the State derived from the annual auctioning of shops of country liquors and intoxicants last year and this year. This is not a tribute to the success of prohibition which is in force in a few isolated districts, because the incidence of excise crimes is on the increase. This is also supported by the findings of the random sampling survey conducted some time ago by the Government. It is felt that contractors who come to bid at the auctions have combined amongst themselves to keep the bids down. In order to break the racket, the Government has under consideration a proposal to open its own liquor shops. This experiment was tried for a brief while at Dehra Dun when the Congress party first came into office. Another proposal under the consideration of the Government is to impose a levy on the sale of every bottle of country liquor.

Agitation against Irrigation Rates

Rival claims on the success of the agitation against enhanced irrigation rates are being made by its sponsors, the Praja-Socialists, and the Government. The P-S.P.'s contention is that the mere fact that a large number of people have actually paid the enhanced rates is no criterion of their popularity. In the controversy, it has been alleged by a P-S.P. leader that when the Congress launched a no-tax campaign against the British Raj, some of the prominent Congress leaders now in office paid their taxes so that their estates would be safe. Politics apart, it would appear to be a fact that the present rates are the highest in the country, barring the sugarcane rates in Bombay. There have been two enhancements in recent years in irrigation rates in U.P., resulting in an increase of these rates from 250 to 325 percent in respect of productive canals and 300 to 400 percent in respect of unproductive canals. Irrigation rates on sugarcane, rice and wheat have risen from Rs. 10 to Rs. 32, Rs. 6 to Rs. 14-10, and from Rs. 5 to Rs. 14-10 between 1946-47 and now. Such a steep increase in so short a period lends point to the criticism that the Government seems to view irrigation more or less as a commercial proposition whereas the water rates should be such as are fairly chargeable keeping in view the returns on the land to the tiller after due allowance is made for his investment of capital and labour.



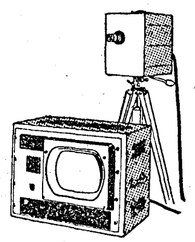
Television in India . . .

Philips take pride in introducing experimental television in India.

The Government Engineering College, Jabalpur, is being equipped with the Philips experimental television equipment, which originates from the television equipment used in the Philips Laboratories for research and test purposes. It comprises all the basic elements to be found in every television transmission outfit. One 100 Watt video transmitter and one 60 Watt audio transmitter provide for the transmission of picture and sound. The sensitive television camera for live pick-ups forms part of a closed circuit television equipment which can be linked with the video transmitter.

It must be stressed that this equipment is not designed for regular television broadcast service. It is built as laboratory equipment and is primarily meant for the training of students and technicians in the basic principles of television.

With this equipment Philips have given extremely successful television demonstrations in many countries of the world.



Television Recording and Reproduction Equipment for Educational and Industrial Purposes.

INDUSTRIAL TRENDS IN THE UNITED KINGDOM

THE EFFECTS OF "VERTICALISM" IN INDUSTRY

(FROM A SPECIAL CORRESPONDENT)

London, by Air Mail.

DISCUSSIONS on "verticalism" have not been prominent in Britain for some time; but they are now coming to the fore again. The term—an ugly one—means, to use the classic definition, the policy of ensuring that "all processes of production, direct and indirect, from the provision of the raw materials to the sale of finished products, are concentrated under the control of one firm, as the result of the combination of a number of formerly independent firms." As a matter of fact, it is only in the more striking cases, such as Unilever and Imperial Chemical Industries, that so absolute a position can be reached. Most practitioners of verticalism have to be content with partial control, and are seldom able to go the whole length of the way from raw materials to the final article for consumption. Carrying out of the policy, in elementary fashion, goes back as far as Victorian times; but it was not till thirty years ago, in the first days of the rationalisation of industry movement, that it acquired significance in the sense of today. The development was one of the attempted answers to the profound industrial depression that followed the 1914-1918 war, the chief object being to do away with superfluous effort and to make the remaining endeavours more efficient. This meant, among other things, the reduction of the amount of labour employed, and also the elimination of various concerns as redundant or incapable of separate existence. Because of these objects and their consequences, the movement was much assailed. It was still more attacked when the rationalisation policy was extended to include price fixing agreements, national and international. The cry of monopoly was at once raised, has never completely died down, and needs little cause to swell its volume. Public opinion on this matter being easily roused, Government have provided a safety valve in the shape of the Monopolies and Restrictive Practices Commission which regularly issues reports on alleged infringements coming within its province. It has just issued an indictment of the calico printing industry, the largest finishing member for which is alleged, by means of price fixing agreements to have stultified competition.

Price Fixing Agreements

No one in the textile industry agrees with the Commission's expressed view—not even those firms supposed to have been victimized. It might be said that this lack of endorsement is probably because of the many other price fixing agreements which exist within the textile industry, and which may, in their turn, become the subject of official investigation. Though natural, this would not be fair comment. There is an increasing recognition among the more responsible sections of the industry that questions of price ought not to be divorced from considerations of quality. When standards have been established and are faithfully observed, after having involved a good deal of capital outlay as well as additional expenditure out of revenues, then it is thought to be only right that companies should relate the prices of articles to these facts, and charge accordingly. Price fixing agreements are, indeed, held to be essential to industrial progress and to be approved in principle. The only legitimate criticism is if the prices have been fixed too high. But the approach of the Commission to this subject has been dominated by the belief that there is an inherent opposition between price fixing agreements and "free competition" and that the latter must be safeguarded. Clearly, a consumer's purchases have to be governed by the funds at his command. For this reason, the lower priced article is to his advantage—even though it is not as well turned out and will not last as long. Possibly, too, the purchaser does not want an article to last more than a limited time, and expects his wishes to be met in that direction and reflected in the price. Indeed, this is a tendency frequently met with today, and one in marked contrast to the requirements of past generations.

However, price control is only one aspect of verticalism and by no means the most characteristic or the most difficult. As it happened, this episode of the report on the finishers to the calico industry almost synchronised with an address given to the Textile Institute Conference on 10th June under the title of Vertical and Horizontal Organisation. Horizontal organisation was then defined as a specialising by process, as against vertical organisation's specialising by product. The lecturer thought that either term could be applied if the specialising were in two or more major directions. Making two the eligible number seems to be a modest qualification, but the use of the word "major" should be noted.

Varieties of Integration

Integration or unification of industrial undertakings, which, each in its own way, is what verticalism or horizontalism really is, is usually at the outset a complicated task, although simplification of the things handled is the ultimate aim. First of all, there has to be the bringing together of the various components; amalgamation follows wherever possible, but this may take considerable time. As the lecturer observed, although the policies are accepted as essential to the conduct of modern business the literature available on the subject is scanty. This deficiency explains the lack of clarity, or conciseness of many of the terms employed to describe the policies. A contributory cause, however, is the growing tendency of firms to widen their interests, with the result that integration, even of the vertical kind, tends to spread out from side to side. Manufacturers often endeavour to create some sort of relationship, both in production and marketing, between a wide range of apparently dissimilar things, but which, in their comprehensive organisation can be linked together in some way which will react to the Company's benefit. Moreover, some kinds of integration are of an indirect nature. Thus a firm finds that a raw material which it uses for a product is also useful for another product which it has not manufactured hitherto, but which it can easily produce with existing machinery. It therefore turns out the second product also. Economists have given the name of *lateral* integration to this form of activity. It is a development not without resemblance to horizontalism, although the concern is with an article, rather than with a process. Further; very large firms practice verticalism as well as horinzontalism. Integration may take surprising forms as, for instance, when they are caused by seasonal factors. An amusing example is that of a well-known sausage-making concern. Sausages are out of season in the very months when ice cream is in full favour. The Company's factory lends itself to meeting the public's wishes in either direction. The logic of the situation is to produce sausages in winter and ice cream in summer.

The safeguard against possible disintegration, which is always a besetting danger when verticalism has been carried out, is the existence of a central financial control which cannot be usurped or undermined. The Textile Institute's lecturer made the point that cost reduction, even if pronounced, does not by itself justify a change of industrial structure. That does not mean that the prospect of securing economy is not a powerful incentive. One would think that any improvement in industrial structure must inevitably have a lower cost of product among its results. Nevertheless, it can be granted that it is a sound business maxim not to allow a single motive (unless it is an overwhelming one) to originate fundamental business changes.

The opinion might be reasonably entertained that the practice of verticalism or horizontalism is largely the exercise of common-sense, or at most, the bringing to bear of acumen. That, in other words, is merely the acquisition of what is useful or the joining together of like with like. But these are only the germs. Financial, economic, technical and other considerations have to be taken into account before long and at that stage generalising ends. Moreover, verticalism has to be incepted from a position in the middle of things, not from the beginning with its prevailing, if deceptive, atmosphere of freedom to act. It has to work backward, as well as to try and estimate and forestall future developments. The only sound and enduring basis for action is the employment of scientific method, so far as its application can be ascertained. The initial step is to discover what has been done by successful businesses at one time similarly placed to the one in which vertical changes are to be introduced. There is never an exact comparison possible and allowances have to be made; but much that is valuable can be learned. For example, it is established as desirable that, whilst the manufacturer can but rarely undertake the function of merchanting also, he should be in very very close contact with the merchanting side. It may be that, from the point of view of national policy, a Government might have to decide whether vertical integration should be encouraged or horizontal, whether in industry as a whole the unifying emphasis should be put upon product or process, or whether both should be equally encouraged.

The lecturer at the Textile Institute Conference drew his examples and conclusions from only one section of industry, that of textile finishing. But his remark that whether the horizontal system is preferable to vertical integration seems to depend on a country's historical background, its area and population and availability of ancillary industries is true whatever the industry being thought of. Horizontalism, in the experience of the older industrial countries, is recognised as providing a flexibility absent from verticalism, which, however, often provides a directness of industrial aims not to be found in the former.

Call to the Nation

THREE years ago, in March 1951, the people of India started to build themselves a better life. Our first Five-Year Plan aimed at growing more food, producing more goods, improving social services and creating more employment.

Progress so far has been impressive. We have already spent nearly a thousand crores of rupees in this mighty adventure of building a New India. We no longer depend on outside help for food. We have built huge dams like Tilaiya, set up thermal power stations like Bokaro, established factories like Sindri and constructed cities like Chandigarh. We make our own railway locomotives and assemble our own motor cars and aircraft. Through Community Projects and Rural Extension Service, we have laid the foundations of rural prosperity.

ALL-OUT EFFORT NEEDED. In spite of this progress, an all-out effort is needed during the remaining two years to achieve the target we set for ourselves. To pay for this effort India still needs about thirteen hundred crores of rupees.

The National Plan Loan is a Call to the Nation to rise to the occasion. The Five-Year Plan is the People's Plan. It is the people's duty to contribute their share to the success of this venture. IT IS YOUR DUTY AND MINE.

BRITISH TEXTILE REVIEW

A SATISFACTORY START IN COTTON FUTURES TRADING

THE first phase of dealing on the reopened Liverpool cotton futures market has not been active, but the relatively small scale of dealing is in no way disappointing. This is customarily a quiet period of the year (little business has been reported from New York), and in any case the time between the reopening in May and the ending of the Raw Cotton Commission's cover scheme in August is transitional. A large volume of outside business in the market would not be welcome officially until the Commission's stocks had been substantially liquidated. A fair volume of hedges has been transferred from the official cover scheme, and straddle buying, mostly American, has been a feature. Business will probably continue approximately on this pattern until the cover scheme is closed. What matters is that an efficient futures market is now in being, ready to handle much larger business later in the year.

It is, of course, too early to say that the misgivings that characterised the preparatory period are all dispersed. The serious test will come after the period of transition. But one important possibility that worried traders before the reopening was seemingly exaggerated. There has been, and is still, much discussion of the possibility of an American export subsidy that would weaken the whole basis of cotton prices, and it was thought that a good deal of hedge selling might emerge as a precaution. But such selling has not been in evidence. It seems that holders of long commitments see no risk sufficient to justify their accepting prices much below the parity between Liverpool and New York.

Sobering Thoughts

Much that was said at the International Cotton Congress at Buxton was relevant to the whole textile industry of this country, and of Western Europe generally. Specially noted were the remarks of Dr. W. T. Kroese, Netherlands representative on the International Cotton Committee. He saw no sign, he said, that the growth of the cotton textile industry in countries which had been purely agricultural was nearly ended, but it did seem to him that the rate of relative decline of the industry in Western Europe was slackening. He said, encouragingly, that Lancashire seemed much less vulnerable than it was 40 years ago. But he hinted that India might be taking the place of Japan as the most formidable competitor in many markets, and that in consequence Japan might penetrate even further into the West European sphere of competition.

The president of the Congress, Mr. W. T. Winterbottom, who is president of the Master Cotton Spinners' Federation, was sceptical of the cost-reducing possibilities of machine-harvesting of cotton. It was recognised, he said, that machine-picking lowered the quality of the lint; so the spinner had to decide whether to take hand-picked cotton at higher prices or to accept the need for additional machinery and higher waste losses with cheaper machine-picked cotton. His own view was that it was "absurd to waste valuable shipping space in bringing this useless trash across the Atlantic" when many U.S. mills had installed additional screening machinery to deal with the trash in mahcine-picked cotton. He foresaw, however, that the trend towards mechanical harvesting, in the U.S.A. and elsewhere, would continue.

Whatever their policy in respect of materials, many Lancashire spinners are demonstrating that new equipment does yield profits—and dividends—if it is fully employed. This seemingly obvious fact has been disputed, because of the high cost of machinery and the heavy burden of taxation. Various results lately published have shown that re-equipment is fully justified, provided that it is accompanied by re-deployment of labour, preferably with two-shift working. Organisations in which these conditions have been fulfilled have kept their machinery fully employed while at other mills machines have been rendered idle by the shortage of labour.

Seasonal Revival

The weather has not, on the average, favoured the summer trade in clothing, but a few spells of hot sunshine have sufficed to bring customers—particularly, of course, women—to the shops. For some months previously demand had disappointed many retailers, and they had been ordering cautiously, with the consequence that stocks had been accumulating at the wholesale level. Mr. Laurence Weidberg, the chairman, said in his annual report to the National Association of Clothing and Rain Wear Manufacturers that clothing prices would probably be rising by the autumn; with anything like seasonable weather, he asserted, "I am prepared to risk a free forecast of a good autumn season". This is not, however, an inflationary development but rather a corrective. In a period when wages and prices of cloth have been rising, many manufacturers have had to reduce their prices in order to unload stocks on a weak market.

Unless the corrective materialises, some branches of the textile industry may find themselves in difficulty later in the year. The firm close to the wool season has reminded Yorkshire that it cannot afford a squeeze between rising costs and price-resistant final buying. The rayon industry, which was producing slightly more in January and February than in the same months of 1953 and 1952, established its output firmly at new peak levels in March, and the strong demand from users which has called forth the increase in production must be matched at the consuming end. It seems, however, that on the basis of current relative prices the rayon industry is not risking another setback. Its output, which slumped by nearly 70 percent between the peak of 1951 and the nadir of 1952, has since risen by about 350 percent, while output of cotton yarn, which fell by 55 percent, has since risen by about 100 percent. The present strength of rayon reflects a change from cotton to rayon on Lancashire's spindles. Courtaulds has again demonstrated its confidence by acquiring a big site near Grimsby for a factory to produce "Fibro" viscose staple fibre; its capacity will be 100 million lbs. a year. The company's existing "Fibro" works in North Wales is reputedly the biggest rayon staple factory in the world.

WHOLESALE PRICE INDEX DECLINES

THE official wholesale price index (base: year ended August 1939=100), declined further by 1.3 percent to 385.2 during the week ended 5th June as compared with 390.4 for the previous week. Relative to the corresponding weeks of the last month and a year ago, the index was lower by 3.5 and 4.9 percent respectively. Foodstuffs fell sharply by 2.5 percent to 348.1 as a result of declines in the prices of wheat at Hapur (—15%), rice at Patna (—12%), dal arhar (—9%), gram (—8%), jowar (—4%), wheat at Jabalpore (—3%) and gur (—1%), although the prices of bajra and coffee (+2% each) showed advances. Industrial Raw Materials declined by 0.6 percent to 452.7 on account of lower prices of cottonseed at Amravati and groundnuts (—4% each), rapeseed in Bombay and linseed (—3% each), Bengal raw cotton in Bombay, rapeseed in Calcutta and castorseed (—2% each), raw jute, gingellyseed and copra (—1% each), despite increases in the average export price of manganese ore (+5%), lac (+4%), Punjab-American raw cotton in Bombay and rapeseed at Kanpur (+1% each). The semi-Manufactures group also moved down by 0.8 percent to 356.9. Items, which recorded noticeable variations were: castor oil in Madras (—17%), coconut cake (—9%), gingelly oil (—7%), groundnut oil (—5%), sheep skins and linseed oil (—4% each), groundnut cake and gingelly cake (—3% each), goat skins, coconut oil and coir yarn (—1% each), castor oil in Calcutta (+3%) and mustard oil at Kanpur (+1%). There was a fall of 0.3 percent to 378.4 in the index for Manufactures because of declines in the prices of silk manufactures (—7%) and dyestuffs (—1%). The prices of jute manufactures (+1%), however, recorded advances. Despite rises in betel nuts (+5%) and cashewnuts (+2%), the Miscellaneous group moved down by 5.5 percent to 645.5, because of the reappearance of tobacco-jati poola at a lower level after two months and a decrease in the prices of black pepper and chillies (—7% each).

MIDDLE CLASS COST OF LIVING INDEX NUMBER FOR CALCUTTA

(Base: August, 1939=100)

THE Middle Class Cost of Living Indices by groups, have now been brought up to May, 1954. As compared with April, the May Index for Food shows a rise of 4 points, while those for Clothing, Miscellaneous and Fuel and Lighting remain unchanged at 488, 268 and 239 points, respectively.

Combining all the factors, the Middle Class Cost of Living Index for Calcutta shows that the cost of living advanced by 1 point during May, 1954.

Compiled and constructed by the Statistical Department of "Capital".

SUGAR PRODUCTION AND STOCKS

The opening stock of sugar with factories in India on 16th May, 1954, was 4.70 lakh tons as against 9.39 lakh tons on the corresponding date of the previous season, but arrivals of foreign sugar from 1st November, 1953 to 15th May, 1954, totalled 2.50 lakh tons. The production of sugar in the country and arrivals of foreign sugar during the fortnight ended 31st May was 400 tons and 55,000 tons respectively. Out of the stock with the mills, 64,000 tons were despatched during the fortnight ended 31st May, as against 74,000 tons during the same period of last year. The closing stock with the factories on 31st May was 4.06 lakh tons (8.73 lakh tons). The total production of sugar for the season 1953-54, i.e. from 1st November, 1953 to 31st May 1954, was 10.01 lakh tons, as against 12.92 lakh tons during the corresponding period of the previous season. The total quantity despatched from 1st November to 31st May was 7.90 lakh tons, as against 9.21 lakh tons during the same period of the last season.

Jute

MILLS TO INCREASE WORKING HOURS TO 45 PER WEEK

IT has been announced by the I.J.M.A. that all member mills within the Association will increase working hours to 45 hours per week with effect from 12th July, 1954. Although it is too early at this stage to say precisely what effect this will have on the local jute and gunny markets, it is not expected to cause any large repercussions. The total increased production which will result from the new working hours is only a little over one day's production, or about 2,500 tons per month. In terms of jute this will mean that mills will use a further 72,000 maunds per month in making the increased tonnage, which is only about 3 to 4 percent of their total monthly consumption.

Over the past few months, exports from Calcutta have been greater than mills' output, and this has caused optimism in Calcutta, as also has the satisfactory balance that has been established between mills' production and stocks of jute manufactures. If the present trends continue, there is no reason to doubt that mills will have any difficulty in disposing of the increased tonnage.

Pakistan Jute Licence Fee Restored

It was announced in a Press Note issued by the Government of East Bengal on 15th June that the realisation of the jute licence fee, which had been suspended by an order passed by the United Front Government, was to be reintroduced with immediate effect; the Government had issued instructions to the officers concerned to levy and realise the fee as before. This licence fee, which originated some years ago and was based on the acreage under seed, was introduced with a view to restricting the acreage sown and thus stabilising the price of raw jute. Orders were promulgated laying down the maximum acreage any one grower could put under seed, and a licence was issued in respect of this. Strict penalties were imposed on anyone contravening the orders, and jute planted in excess of the licensed acreage was ordered to be destroyed by the Government inspector.

As part of its electoral campaign, the United Front Party promised the withdrawal of the order, and this was carried out on its coming to power. Consequently, a large area was sown in excess of the quantity required to produce the 42 lakh bales of jute which was the target set by the Pakistan Government for the 1954-55 season. To nullify the effect of the excess acreage, the Pakistan Government has issued further orders to the effect that there will be compulsory destruction of all excess jute grown. It is understood from reports from Pakistan that this has already commenced in the highland areas, and it is thought that the Government might give the growers concerned some sort of compensation, as this jute was, in effect, sown by them in good faith. It is reported that growers in the lowland areas have forestalled the destruction of their crop by gathering an early harvest, but it is generally thought in the trade that the orders for destruction of the growing jute will not be implemented in full, in spite of the fact that the Pakistan crop is reported to be about 4 annas more than last year.

Australia to Withdraw Controls

It was announced from Australia that control over the purchase and distribution of woolpacks will end from 1st January, 1955, and over cornsacks from 1st February, 1955. Private purchases of these commodities will be permitted from July and August, 1954, respectively. Until now Australia's purchases have been on a small scale, as internal consumption was fed from the very large stocks she had built up, mainly at higher rates, and the Government was not willing to allow the purchase of more bags in spite of low prices until these stocks had been disposed of. It is not expected that there will be a big rush to buy, now that controls are to be lifted, as previously all purchases were financed by the Control Commission which bought large quantities at a time and distributed them. Private parties will now have to finance their own purchases, and for this reason they will, of necessity, have to operate on a hand-to-mouth basis in spite of Australia's reportedly large wheat crop.

Argentine Order

In regard to the Argentine order, good business was done for forward shipment in hessians, and prices advanced rapidly as a result this week. The much smaller sacking order was quickly absorbed in the market and had very little effect on heavy goods prices. The Argentine has emerged as India's best customer for burlap next to the U.S.A., having absorbed over 100,000 tons in 1953. This is her second entry into the market this year, her first order amounting to approximately 30,000 tons. Although it is still early in the season, it is confidently expected that this year's purchases will not fall very far short of last year's record figure. This confidence in the future is somewhat reflected in the forward quotations for hessians, which have been on a par with, and on occasions in advance of, the near delivery prices. Apart from the Argentine order, there was very little activity in the hessian market; prices fluctuated within narrow limits and in accordance with the speculative B Twills counter.

Cut in U. K. Jute Prices

As a result of the further fall in jute prices in Pakistan, it was announced by the Ministry of Materials in London on Sunday that there would be a cut of £5 per ton in the Control's selling price of raw jute. The reduction affects all grades of jute, making the new price for Mill Firsts £103 per ton. Former price schedules have been withdrawn and the prices came into effect from 21st June.

THE JUTE MARKETS

Manufactured Goods: Apart from the business put through this week on account of the Argentine Government, there is very little to report in the goods market. At the opening on Thursday morning 40" 10 oz. hessians were quoted 4 annas higher than the previous day and stood at Rs. 44-10 for June delivery, whilst forward delivery was at a premium of 2 annas, being quoted at Rs. 44-12 per 100 yards. Sacking, on the other hand, was slightly easier, in spite of the small Argentine heavy goods order, and although ready delivery B Twills remained unchanged at Rs. 113-8 per 100 bags, forward delivery positions fell by 4 to 8 annas. As a result of business done on the previous day both sections of the market registered marked advances on Friday morning, and ready 10 oz. hessians touched Rs. 45-8, which was 14 annas higher than the previous day, and the highest hessians had been for two months. Similar advances were recorded in heavy goods, but the advance was short-lived. On Saturday morning, in the absence of further enquiries, rates receded to near the former levels, and easier conditions prevailed. As very little interest was shown either by local buyers or overseas consumers, conditions after the week-end were dull, and small price fluctuations were recorded, but these were mainly governed by speculation. The only alteration in the market at the opening on Tuesday morning was a slight weakening of the forward position quotations, especially in heavy goods, but an easier feeling prevailed in all sections.

At the close the markets are again easier, but it is interesting to note that the opening hessian prices on Wednesday morning are about 8 annas higher than at this time last week, whilst heavy goods, except in the B Twills and heavy Cees ready positions, are Re. 1-8 to Rs. 3 lower.

The following are the opening prices on Wednesday morning:

	June	July	July-Sept.	Oct.-Dec.
40" 8 oz.	Rs. 38-0	37-8	36-12	35-0
40" 10 oz.	Rs. 44-12	44-10	44-6	42-12
B Twills	Rs. 114-2	111-0	108-8	103-12
Heavy Cees	Rs. 115-0	112-0	109-12	104-0
A Twills	Rs. 145-0	138-0	134-0	128-8
Cornsacks	Rs. 121-8	115-8	110-2	104-12

Raw Jute: Following the easier conditions reported at the close of last week, the jute market opened on a steadier tone at the beginning of the period under review on account of fairly good business transacted with mills last Thursday. Up to this point mills had displayed little buying interest, as a result of which sellers, keen for business, were cutting their prices, especially for Old Crop jute, in an endeavour to induce mills to come into the market. By Thursday morning the stage had been reached whereby sellers were reducing New Crop quotations also, and rates for New and Old Crop jute had reached parity. It is estimated that about one lakh maunds of jute were purchased throughout Thursday, the majority being New Crop at lower rates. This caused prices to rise 8 annas on Friday morning, with New Crop jute reverting to the 8-anna premium over Old Crop jute. Once again a fair amount of business was put through, and the market ruled steady with sellers keen for business though reluctant to meet any counter bids from the mills, except perhaps for small quantities of Old Crop jute. Small business was done on Saturday, but by Monday morning an easier feeling prevailed although general quotations were unchanged. For the next two days, in sympathy with the lethargic finished goods market, conditions were easier and practically no business was reported, but in spite of the weaker sentiment quotations were unchanged.

Once again the business conducted during the week was fairly evenly distributed between Old and New Crop jute. Fairly large quantities of Dhubri and Northern Old Crop jute were purchased at Rs. 23-8 to Rs. 24 per maund basis Bottoms for June-July shipment, whilst New Crop jute from the same districts was done at Rs. 24 to Rs. 24-8 per maund basis Bottoms for shipments extending from July to September. Assam Old Crop jute was done at Rs 23 to Rs. 23-8 per maund for June-July shipment and New Crop Assam at 8 annas higher for August-September shipment. Once again New Crop Daissee was at a discount over Old Crop Daissee, and was done at Rs. 25 for Sept.-Oct. shipment, against Rs. 26 to Rs. 27 for Old Crop Daissee for June-July shipment. Local packing Old Crop Jungli jute was reported at Rs. 21 per maund basis Bottoms for ready delivery.

Small business was reported in Pakistani Old Crop Jat jute at Rs. 24 per maund basis Bottoms for June-July shipment.

There are no reports of any pucca bale transactions having taken place this week.

Over the week raw jute rates have shown very little change, and quotations at the close are practically unchanged from last week.

The following are the opening quotations on Wednesday morning:

Indian Jute (Old Crop):	Landed at Mills Rs. per md. Basis Bottoms.	Shipment
Lower Assam	24-0	June-July
Upper Assam	23-8	"
Northern	24-0	"
Purnea	23-8	"
Murshidabad Tossa	25-0	"
Daissee ex Sheoraphuli	26-8	"
Daissee ex Calcutta	26-0	"
Daissee Mesta ex Calcutta	22-8	"
Northern ex Calcutta	24-0	"
Local Packing	23-0	"
Bimli	21-8 for F.A.Q.	"

Tossa prices are Rs. 2 per maund above the quotations for White jute.

Pucca Bales:	Rs per bale.	Shipment
Mill Firsts	160	June-July
Mill Lightnings	145	"
Dundee Daissee 2/3 S.G.	160	"
2/3 L.G.	145	"

Pakistan Jute (ex Pakistan):	Rs. per md. Basis Bots.	Shipment
Jat	25-8	June-July
District	24-8	"
Northern	24-8	"

New Crop quotations are 8 annas per maund above the price of Old Crop jute for August-September-October shipment. Daissee New Crop quotations are at a discount of Re. 1 to Rs. 2 on Old Crop rates for September-October-November shipment.

There has been very little change in the local Cossipore markets this week, incoming wagons being reduced to about 15 or 20 per day. In spite of this, there are still fairly large stocks being held, but mostly of low quality jute. Sellers are anxious to liquidate their holdings, and are discounting their rates with this in view. Fairly large quantities of Bills of Lading have been on offer and sellers are reducing their price in order to sell them, for if they are not sold before arrival, they immediately become suspect by the mills who then only pay lower prices. Quotations have fallen slightly over the week and only small business is reported. There is very little to report from the Daissee markets, and on the whole sellers have only Middle quality Old Crop jute to dispose of. There has been a small demand for Old Crop Bottoms only, but in these cases premiums of Re. 1 to Rs. 1-8 have been paid. Quotations over the week have remained constant and the Daissee markets are steady. Favourable conditions have been reported from most of the Daissee growing districts, and it is reported that the new plants have reached a height of about four feet. Sowings for the new season are said to be in the region of 24 annas of last year's crop, but as this figure includes Daissee Mesta sowings, which are far higher than last year, it is difficult to assess the extent of the true Daissee crop, and it may not be very much higher than previous years.

Mofussil: Reports from the Indian upcountry markets indicate that conditions are dull and inactive. Very little business is going on and practically no imports are reported in any area. In the absence of business quotations are purely nominal and are based on Rs. 20-8 per maund for Dhubri Bottoms. Crop reports have been favourable this week from most districts, sowings are completed and in all cases are in advance of last year.

In Pakistan the markets opened on a quiet tone with very little business reported. However, following the announcement of the reintroduction of the licensing fee, and the compulsory destruction of all jute grown in excess of the licensed acreage, there was a spurt of buying, and steadier conditions prevailed. Imports into Narayanganj are unchanged at about 4,000 maunds daily on a 50/50 baled and loose basis. Towards the close prices again fell back as business slackened and the market was quiet. New Crop reports indicate that conditions in general have been satisfactory in most areas, but that river levels are higher than last year. They are rising steadily, and may make cultivators gather an earlier harvest, most of which will be in an immature condition.

Current quotations in Narayanganj are as follows:

Pucca Bales:	Rs.	Kutcha Bales:	Rs.
Mill Firsts	124	Jat	19-8
Exports Firsts	107	District	18-0
Export Lightnings	96	Northern	16-8
Dacca Tossa 4's	159	Tossa is quoted at	
Dundee Tossa 4's	126	Rs. 4 to Rs. 5 per	
Outport Tossa 2/3	110	maund higher than	
Outport Tossa 4's	82	White jute.	

Arrivals of Raw Jute

During May 1954, arrivals of raw jute in Calcutta and mills' stations were 3,51,574 bales compared with the revised figure of 3,17,424 bales for the previous month. Of last month's total 2,44,600 bales were of Indian origin and 1,06,974 bales were imported from Pakistan. Of the increase of 34,150 bales arriving in May 31,274 bales were from Pakistan. The total arrivals for the eleven months July-May were 48,96,521 bales, of which 35,17,382 bales were Indian jute and 13,79,139

bales came from Pakistan. In the corresponding eleven months of the 1952-53 season total arrivals were 50,17,485 bales, of which 38,04,772 bales were from India and 12,12,713 from Pakistan.

SOWINGS OF INDIAN CROP COMPLETED

In their thirteenth crop report for the current Indian season covering the week ended 19th June, Messrs. Sinclair Murray & Co. Ltd. say that excepting in the Orissa area conditions have been favourable and the crop in most districts has made satisfactory progress, and now sowings in all areas have been completed. The river in Assam is higher than last year at this time and if the rise continues the cultivators will have to harvest the crop in an immature condition.

DANPUR: Sowings completed -/32/-. Weather conditions have been mainly wet and a spell of strong sunshine would be beneficial. It would promote growth and allow cultivators to continue with their weeding operations. The river has risen and is slightly higher than last year at this time.

JAJPUR ROAD: Sowings completed -/22/-. Wet conditions have prevailed and a spell of dry sunny weather would prove beneficial. Condition of plants is fairly satisfactory and they range in height up to 2ft. 6in. The river is slightly higher than last year at this time.

RANAGHAT: Sowings completed -/24/-. During the early part of the week wet conditions prevailed but latterly favourable weather has been experienced. Condition of plants is satisfactory and they range in height up to 3ft. The river is normal for this time of the year.

COSSIMBAZAR: Sowings completed -/24/-. Favourable weather conditions have been experienced and the crop has made satisfactory progress with plants ranging in height up to 2ft. 6in.

FORBESGANJ: Sowings completed -/17/-. Favourable weather conditions have been experienced. The condition of the standing crop is satisfactory and plants range in height up to 3ft. 9in.

NOWGONG: Sowings completed -/18/-. Favourable weather conditions have been experienced and the crop continues to make satisfactory progress with plants ranging in height up to 5ft. 9in. Harvesting has been taken in hand on a small scale in the extreme lowland areas. The river has risen and is higher than last year at this time.

GAUHATI: Sowings completed -/18/-. Weather conditions have been mainly favourable although a spell of dry sunny weather would prove beneficial. The crop continues to make satisfactory progress and plants range in height up to 6ft. The river has risen about 11ft. during the week and is now 8ft. higher than last year. Telegraphic reports are to the effect that the level has fallen slightly from the top.

DHUBRI: Sowings completed -/17/-. Favourable weather has been experienced and the condition of the standing crop is satisfactory with plants ranging in height up to 5ft. 6in. The river has risen and is now 2ft. higher than last year at this time.

KHARUPETIA: Sowings completed -/17/-. Weather has been favourable with alternate rain and sunshine. Condition of plants is satisfactory and they range in height up to 5ft. 3in. The river has risen and is slightly higher than last year at this time.

DAISSEE DISTRICTS: Sowings completed -/24/-. Weather has been favourable and the crop has made satisfactory progress with plants ranging in height up to 4ft. Sowings of mesta in these districts are reported to be much more than last year, to the detriment of Daissee sowings, from the point of view of quantity.

N.B. As a basis of comparison last season's crop has been taken as -/16/-.

SATISFACTORY PROGRESS OF PAKISTAN CROP

In their fifteenth crop report for the current Pakistan season covering the week ended 19th June, Messrs. Sinclair Murray (Pakistan) Ltd. say that weather conditions have been better and in general the crop has continued to make satisfactory progress. On the eastern side most of the lowland crop has been harvested or is in the process of being harvested. With the better weather conditions, cultivators have again been able to push ahead with weeding operations. River levels are generally higher than last year at this time but the rise is fairly steady. In the event of the river continuing to rise, cultivators will have to harvest their crop in an immature condition.

NARAYANGANJ: Favourable weather conditions have been experienced and harvesting of the lowland crop is proceeding fairly freely. Weeding operations are again in hand and the mid and highland plants are in a satisfactory condition and range in height up to 6ft. The river is about 1ft. higher than last year at this time.

DACCA: Rainfall was experienced nearly every day but was confined to showers and there have been fairly long periods of sunshine. The condition of the standing crop continues to be satisfactory. The river is about 9in. higher than last year at this time.

CHANDPUR: Weather conditions were not unfavourable but a spell of sunny weather would be beneficial. The condition of the crop in general is described as fair and plants range in height up to 7ft. The river is about 1½ft. higher than at the corresponding period last year.

ASHUGANJ: Weather conditions have been favourable but a spell of dry, sunny weather would prove beneficial. Harvesting has been taken in hand on the lowland and the condition of the mid and highland crop is satisfactory with plants ranging in height up to 6ft. 6in. The river has risen 1ft. but is still about 1ft. lower than last year at this time.

NIKLIDAMPARA: Fairly good weather conditions were experienced and the condition of the standing crop is satisfactory with plants ranging in height up to 7ft. With the steady but slow rise of the river, harvesting is being taken in hand slowly although the major portion of the lowland crop has already been harvested. The river has risen and is about 1ft. higher than last year at this time.

SARISHABARI: A spell of dry, sunny weather would prove beneficial for the standing crop although weather conditions could not be described as unfavourable. The crop continues to make satisfactory progress and plants range in height up to 6½ft. With the drier weather, weeding operations have been resumed. The river is about 2ft. 9in. higher than last year at this time.

SIRAJGANJ: Weather conditions have been dry but cloudy and a spell of sunshine would undoubtedly prove beneficial. The condition of the standing crop is satisfactory but the river is 3ft. higher than last year at this time and it is hoped there will be a check on the rise. Otherwise the crop in this area will have to be cut in an immature state. The river has risen about 5ft. and is now about 3ft. higher than last year at this time.

NAKALIA: Favourable weather conditions have been experienced, although a further spell of sunny weather would be beneficial. The condition of the standing crop has improved and plants range in height up to 4ft. 6in. The river is about 1ft. higher than last year at this time.

BHANGOORA: Weather conditions have been favourable but a further spell of dry sunny weather would undoubtedly prove beneficial. The condition of the crop is satisfactory in general but sunshine is required to promote growth. The river has risen but is still about the same as last year at this time.

INSTRUCTIONS TO GROWERS ON MANURING OF JUTE

Instructions to growers on the proper application of fertilisers and manures to increase the yield of jute are given in a booklet released by the Indian Central Jute Committee. The booklet will be translated into the regional languages of the jute-growing States for mass distribution. The vegetative growth of the jute plant that determines the yield of fibre is, it is stated, highly responsive to nitrogenous fertilisers, both organic and inorganic. Addition of organic manures such as town compost is considered essential to maintain the tilth and fertility of soils in the jute-growing areas, usually poor in organic matter content. Since all the forms of nitrogen derived from organic manures are not available to the crop during its growing period, the use of inorganic fertilisers, especially ammonium sulphate, is also recommended. To obtain the best results from manuring, the booklet prescribes a dosage of 40 to 80 maunds of town compost for mixture with soil at the time of land preparation, followed by 25 to 50 seers of ammonium sulphate for application as top dressing when the plants become about one month old. In the case of acidic soils, it is desirable to use three to six maunds of lime per acre as a basal dressing. Normally, an application of one maund of ammonium sulphate is expected to give an additional yield of two maunds of dry fibre per acre, which will bring the cultivators an extra profit of about Rs. 26.

THE FOREIGN JUTE MARKETS

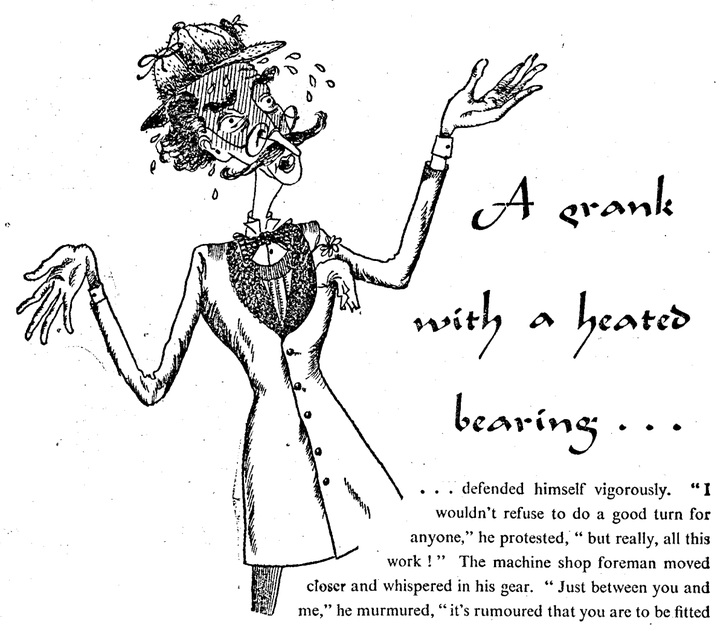
(FROM OUR DUNDEE CORRESPONDENT).

By Air Mail

THERE are several rumours floating around regarding the extent of the new crops, but it seems that sowings are well up this year on last. It is said that Pakistan's intention is to destroy all surplus sowings, but this is not believed.

Calcutta goods have been irregular, mainly because of speculative operations. Latest quotations show that Calcutta closed firmer at 73s 6d for 40in. 10 oz., June and July, and 73s 9d July-September, with 7½ oz. at 57s 3d, 56s 6d and 55s 3d respectively, f.o.b. B Twills have recovered to 186s 9d June, 184s 9d July and 181s. July-September, f.o.b.

Continental spinners and manufacturers are reducing their terms for yarns and cloth, but in the case of the latter they are not able to compete very strongly with Calcutta. If the Indian mills increase their production and secure the abolition of the export taxes on goods, the Continent would have little hope of business, except on grounds of quality.



A crank with a heated bearing . . .

. . . defended himself vigorously. "I wouldn't refuse to do a good turn for anyone," he protested, "but really, all this work!" The machine shop foreman moved closer and whispered in his gear. "Just between you and me," he murmured, "it's rumoured that you are to be fitted with Tecalemit Automatic Lubrication!" The crank spun round swiftly. "In that case," he said, "I shall grind no more axis!" The machine shop foreman sighed with relief and went to prepare for the arrival of his oil highness—the Tecalemit man.

Tecalemit lubrication systems—fully automatic, semi-automatic or manually operated—feed every bearing with the correct amount of oil or grease at the correct intervals of time, regularly... unfailingly... efficiently. A Tecalemit engineer will gladly call to discuss your particular lubricating problems with you.

EXPANDING THE TEA MARKET IN THE U.S.A.

PROGRESS IN 1953 REVIEWED

THE annual report of the U. S. Tea Council states that 1953 has been an historic year for tea in the United States. It has seen the emergence of a new Tea Council, now owned jointly by the Governments of India, Ceylon and Indonesia, in full partnership with the Tea Association of the U.S.A. It has seen consumption of tea by Americans reach an all-time high, both in the home and outside in public eating places—a total of 103.3 million lbs. It has seen imports climb to 105 million lbs. 11 percent more than the previous year (the previous year was 12 percent above 1951).

"Sales of tea in grocery stores, the best measure of consumption of tea in the home, increased 7 percent in 1953. This comes on the heels of a 6 percent increase in 1952, after the three previous years had been virtually static. Those packers who support the Tea Council Fund had a sales increase of 8.2 percent as shown by their contribution of 1 cent per lb. on all tea sold. This healthy growth in the world's number two foreign market for tea presents a challenging paradox. In the face of steadily increasing consumption, it is still true that America, the richest and the greatest potential market in the world, consumes less than one-fifteenth as much tea per capita as the United Kingdom. We consume less than one-fourth as much per person, as our neighbour to the north, Canada. On a per capita basis, there are eight other countries not including those where tea is grown which drink more of the world's most popular beverage than we do. It was not always so and there are unmistakable signs today that tea in the U.S.A. stands on the threshold of a renaissance, the extent of which may well exceed our hopes and expectations of a few years ago.

Americans Like Tea

"If the Tea Council's campaign has proved anything, it has proved that Americans like tea and can be influenced to drink it; and that the tea industry, working together in full partnership with the producing countries, can expand the market beyond anything that would have been believed a few years ago. One is tempted to conclude that tea as a beverage has far greater intrinsic merits—far greater sales appeal than the industry, until recently, has been able to project to the American people. There is no secret why tea has not been better understood by Americans. The ability to project the merits of tea to the public, in competition with the insistent clamour of other beverages, is not only a matter of cooperation between all segments of the tea industry, but also a matter of money. Tea's achievements to date become even more striking when we consider that so far there have been only enough funds for our television campaign to reach an area representing 40 percent of the grocery food sales. This fact alone is suggestive of the far greater market that can be developed.

International Tea Conference

"The momentary uncertainty in the future of tea promotion in the United States was happily terminated on 14th January when representatives of India, Ceylon and Indonesia conferred with delegates of the Tea Association of the U.S.A. It is a tribute to the statesmanship of all parties that within 48 hours an agreement was signed to set up the Tea Council of the U.S.A. as a non-profit corporation for the promotion of tea consumption in the United States regardless of brand or of country of origin. On 1st April the members of the new corporation held their first meeting and elected directors: six from the producing countries and six representing the U.S.A. The intervening time had been necessary to wind up the affairs of the old unincorporated Tea Council and of the Tea Bureau, Inc.; and to incorporate the new Tea Council of the U.S.A., Inc. In the meantime, funds were at hand so that the campaign was carried on without a break. During 1953 attendance of resident directors at meetings was 98 percent. This fact points up the interest and diligence which representatives of both the producing countries and the U.S.A. have applied to the Tea Council's business. The fact that directors from India, Ceylon and Indonesia were sitting down with directors from the United States—each contributing special knowledge and experience—has undoubtedly enhanced the effectiveness of the Council's operations. All decisions of the Board have been unanimous. This reveals that what has been called 'international partnership marketing' is not only an ideal but a thoroughly practical one.

"While both the producers and the U.S. trade have always actively participated in the conduct of the campaign, this new direct partnership has given the interest of all partners a new vitality. Thus, what seemed at one moment to be a threat to the continuity, if not the very life of the campaign, has turned out to be a source of great present and future strength.

Two Good Advertising Campaigns

"As is well-known, we run two advertising campaigns a year: one for hot tea; the other for iced tea. Because of the success of the 1952-53 television commercials for hot tea last summer we used television spots for iced tea as well. The basic campaign ran for seven weeks in 25 markets, with additional minor coverage in 22 markets. Six campaign ideas were first pre-tested in printed form. The winning theme, which was: 'Iced Tea—the Summertime Refresher That Doesn't Leave You Thirsty,' was then expressed in television commercials.

"In 1952-53 our hot tea commercials (Take-Tea-and-See) ran in 10 markets for 26 weeks. This market accounts for 36 percent of the grocery food sales. This season, beginning last November and continuing through to March, we were able to expand our coverage to two more large metropolitan markets—Pittsburgh and San Francisco. The total area now reached accounts for 40 percent of grocery food sales.

"The effectiveness of any advertising campaign will depend primarily on two things: the quality of the advertising and the amount of money spent. Experienced advertisers know that it often takes several years starting from scratch, to develop advertising themes that have the power to move people. Sometimes it takes longer, for advertising is an art rather than an exact science. Therefore, it is a major achievement that the Council has now been able to develop two highly effective advertising campaigns, one for hot tea and one for iced tea. We believe, too, and on good grounds, that our choice of television to project our story is getting us the utmost effect in terms of the funds at our disposal.

"It is conceivable that we could find an even better theme, or so improve our present commercials, that it would make a marked difference in the results we are getting. We shall be working on this. But it is unlikely that any improvement we can make would be as important to tea's progress as broadcasting our present message to the total market, instead of to 40 percent as at present.

"The effectiveness of combined advertising and merchandising efforts of the entire tea trade during the past two years is seen by the growing volume of sales. Here is the record of grocery sales, measured by independent audit of a nationwide cross-section of stores:

	(million lbs.)
1949	69.2
1950	69.3
1951	68.3
1952	72.6
1953	77.6

More Tea in Restaurants

"A powerful merchandising job has also been done in the restaurant field, particularly with iced tea. In fact, the use of especially designed materials has been wider and far more in evidence in restaurants, drug stores and cafeterias than in grocery stores.

"The use of iced tea materials has been far greater than that of hot tea. This greater demand for iced tea materials, many of which were ordered and paid for by tea packers, reflects the popularity of iced tea, which for the time being far outstrips the restaurant's enthusiasm for hot tea. Iced tea is brewed by the gallon, in advance, using 1 oz. or 2 oz. tea bags. Compared to hot tea, it is easy for the restaurant operator to handle. Now that the tea industry's campaign for the 2 oz. formula (per gallon) making iced tea double strength has been under way for five years, the quality of the beverage is improving and consumption is zooming. We can say 'zooming' advisedly. In five years iced tea bag sales to restaurants and institutions have jumped 239 percent! So great has been the increase that it is even noticeable to the casual observer when eating out during the summer months. Not only do you see iced tea on nearly every table, but it is now, for the most part, a rich, appetising amber colored drink instead of a weak, tasteless brew. This not only means several million lbs. more consumed by restaurants each year, but in time it will be bound to influence the habits of people at home. In fact, it is probably already doing so.

Restaurant Sales of Hot Tea

"The fact that packers order less hot tea restaurant materials reflects the fact that the restaurants, for the most part, are not selling hot tea in volume. This in turn reflects the fact that the average restaurant finds hot tea more difficult to make and serve than hot coffee and other beverages. The directors of the National Restaurant Association have come to the conclusion that for many restaurants this problem will not be solved until a tea urn is developed which will make good tea as easily available as most other beverages. The National Restaurant Association requested a research grant from the Tea Council to help develop the necessary equipment. With the approval of the Directors of the Tea Association, this grant was made and a group of outstanding men from the restaurant industry are now at work on this problem. While there will always be an important place for the individually brewed pot of tea in restaurants, there can be no doubt that the development of the right tea brewing equipment will be a short cut to mass consumption of tea in public eating places. This market can be doubled within a few years once the proper equipment is available at a reasonable price.

Automatic Vending Machines

"Automatic vending of beverages has shown a tremendous growth in the past five years. It is destined to show an even greater growth in the future. At the present time, tea is virtually not available in automatic vending machines, whereas coffee, soft drinks, milk, orange juice and other beverages are. The Directors of the Tea Council have authorised a thorough investigation into the feasibility of winning a position for tea in this important and growing market. Tea's success in vending machines depends on the possibility of developing a stable concentrate of good quality. Preliminary investigations look most promising. Here again, the importance of this field goes beyond the pounds of tea involved. Wherever beverages are offered, tea must be available at least on an equal basis with the others or it will steadily lose ground in the public eye. Half of tea's battle in every situation is competing for attention. Many more people will drink tea if they "think" tea.

Tea in the Armed Forces

"Nowhere on the American scene has tea been under a greater disadvantage than in the armed forces. There are three meals a day, 90 times a month, when the master menu schedules a beverage for men in the armed forces. Hot tea appears at only four meals a month. Tea Council staff has been working with the Food Service Division of the Armed Forces for two years to help them determine the acceptability of tea. As a result of very careful tests, it is quite clear that there is substantial demand for hot tea on the menu at every meal during most of the year—with iced tea for the balance. It is hoped that during the course of the coming year tea will be offered on the menu so that the men and women of the armed forces will have their choice. This move, already accepted in principle by the Army, will not only be a popular one with personnel, but it will also save the armed forces a large sum of money, because tea is less than half as expensive as other beverages. There are still problems of servicing and handling tea to be overcome, but the Tea Council's staff is assisting the Food Service Division in their solution.

Industrial Catering

"Industrial catering, or in-plant feeding, is another field which has had a spectacular growth in recent years and will grow even more in the future. Here, too, tea has been submerged by other beverages. The reason is simple: other beverages are easier to prepare and serve. When speed of service is important, as it is in mass feeding cafeterias, tea gets left at the post. Last year the merchandising staff set up installations of tea urns, similar to the British multi-pot used so extensively in the U. K. and Canada. Twelve cafeterias, with a daily customer count of over 10,000, served tea in urns and achieved an average increase of 89 percent. This was one more proof that when good tea is easily available, consumption increases.

The Out-of-Home Market

"These, then, are the tasks we have been tackling in collaboration with tea packers and importers in the out-of-home market during the past year and to which we shall continue to devote ourselves during 1954: (1) Educate restaurants to make iced tea 'twq-ounces to the gallon,' and provide them with materials to promote it; (2) Improve individual pot service of hot tea in restaurants by stressing the need for: (a) enough tea (pot-sized bag or two cup-sized bags), (b) boiling water, (c) bag in the pot and water poured on top; (3) Work with

armed forces to install optimum brewing practices in connection with establishment of tea service at every meal; (4) Work with the Steering Committee of the National Restaurant Association to develop and test automatic tea-making equipment; (5) Assist industrial caterers in installing tea urns; (6) Develop programme to determine feasibility of selling hot and iced tea in automatic vending machines.

The out-of-home market consumes 20 to 25 percent of the tea and, as can be seen, it presents a syndrome of challenging merchandising problems. These problems cannot be solved by advertising alone. The tea industry has been working actively on these problems for five years. Looked at in one way, the progress has been spectacular; for instance, the 239 percent increase in sale of iced tea bags. Located at in another way, the progress has been agonisingly slow: restaurant consumption of hot tea is still half of what it should be.

"It was agreed at the January, 1953 International Tea Conference that the producing countries would contribute a total of $850,000 for the calendar year. The U. S. trade was to contribute $520,000. Part of these funds were, of course, expended, although at a reduced rate, during the first quarter of 1953 by the old, unincorporated Tea Council and the now abolished Tea Bureau Inc. These first quarter expenditures have previously been accounted for. Unexpected funds were handed over to the new Tea Council. The U.S. trade actually contributed $567,000 during 1953, or $47,000 more than had been agreed upon. This was due to increased sale of tea on which the packers contributed 1 cent per lb. and the importers 1/10 cent per lb. The budget for 1954 was submitted in July, 1953 and by the end of the year Ceylon and India had indicated they would each increase their contribution over 1953 by $25,000 and Indonesia increased hers by $5.000. On the basis of this past year's figures, the U.S. trade's contribution is set at $567,000. By the end of the year, it was evident from reliable audits of grocery stores that the increase in tea sales which had been in progress for two years was not only being maintained, but was proceeding at a somewhat faster pace. Then, early in January—a period not strictly speaking covered by this report—an increase in the price of coffee precipitated a flood of publicity and an even sharper upswing in tea sales. The figures for packer contributions for January are approximately 21 percent ahead of the same month last year. It is evident that the U.S. trade's cintributions for 1954 will exceed the $567,000 figure set earlier.

Better Consumption Prospect

"The Directors of the Tea Council have agreed that a unique opportunity faces tea at present and that the Council should put forth the greatest effort and expenditure possible to take advantage of this situation. There are so many opportunities for profitable expenditure of funds under present conditions that we are in the pleasant predicament of sometimes finding it difficult to afford our success. That we shall have a spectacular increase in tea consumption at the outset of 1954 is now evident."

LONDON TEA SALES

At last week's London tea sales the 30,144 packages on offer realised an average price of 4s 9.66d a lb, against 4s 10.80d at the previous sale and 3s 8.77d a year ago. Results obtained by some of the companies are given below :—

	No. of packages	Aver. per lb.
Alliance ...	240	4/11¾
Amalgamated ...	180	4/9½
Assam-Dooars ...	48	5/0½

Tea Stocks Fall

Tea stocks in London and provincial bonded warehouses on 11th June totalled 89,239,104 lbs compared with 94,692,132, lbs on 28th May. In the period 29th May to 11th June 9,753,196 lbs were landed and 15,206,184 lbs delivered.

COCHIN TEA SALES

At Sale No. 12 held on 14th June, the total of approximately 14,47,000 lbs. of tea on offer met with a good demand at generally firm rates. Quality was about average for the time of year. Best liquoring descriptions were in good demand at firm rates, as were Medium and Low Medium sorts. Commonest teas however declined ½ anna whilst thin liquoring Brokens were often difficult of sale. Black Leaf "Middle East" types were about steady. Whole Leaf grades sold well but at slightly easier rates.

Quotations

	1954	1953
	Rs. as. ps.	Rs. as. ps.

The Export Quota market remained quiet during the week with prices quoted at 49 pies. Export Sale No. 13 will be held on 29th June.

NORTH INDIAN TEA CROP REPORTS

The following summary of crop and weather telegrams received from different districts for May, 1954, has been sent to the Indian Tea Association, London.

Upper Assam : Weather generally seasonable but excessively wet in Sonari, Doom Dooma and Naharkatia ; some red spider in Dibrugarh ; outturn last month about normal to good ; immediate prospects fair to good.

Central Assam : Weather generally seasonable but rainfall excessive in Jorhat and Moran ; severe storms without hail are reported from Moran ; outturn last month about normal in Nazira ; crop and quality suffered in Jorhat ; immediate prospects fair to good.

Lower Assam : Weather conditions generally normal; the crop in Bishnauth and Mangaldai is coming forward quicker than usual ; red spider blight prevalent in Tezpur, Borsola and Nowgong; crop prospects generally favourable.

North Cachar : Weather conditions normal in Happy Valley ; rainfall has been deficient in Lakhipur but excessive in North Cachar ; red spider blight prevalent and in Lakhipur it is severe ; outturn last month about normal to good ; immediate prospects fair to good.

South Cachar : Weather favourable in Chutla Bheel and Longai, hot in Chargola and abnormally dry in Hailakandi interfering with outturn ; red spider blight prevalent and in Chargola it is severe but is lifting in Longai ; outturn last month about normal ; immediate prospects fair to good.

Eastern Dooars : Weather seasonable ; blight not so severe ; crop behind last year but prospects improving.

Western Dooars : Dry weather is interfering with outturn ; the outturn to date is considerably under last year ; good rain has fallen generally and prospects are now brighter ; the crop is coming forward slower than usual ; red spider blight prevalent in some districts.

Darjeeling : Outturn last month poor ; immediate prospects fair ; weather conditions in most districts are normal for the time of year ; helopeltis and red spider blight prevalent in some districts ; thrips severe in some districts.

Terai : Rainfall is much below normal for the season to date ; bushes received severe setback due to drought ; crop prospects generally are unfavourable ; helopeltis and red spider blight prevalent.

TEXMACO

Boiler & Heavy Engineering Division ◈ Ring Spinning and Drawing Frames

TEXMACO is dedicated to sharing and solving your production problems.

By supplying exactly the right machine for your job, Texmaco secures for you incredible economies in time and cost plus higher quality production all along the line.

can meet your requirements in Smoke Tube, Marine, Water Tube and Locomotive Boilers, Flues, Mechanical Stokers, Economisers, Chemical and Pressure Vessels, Coal Handling Plant, Chimneys, Ductings, Cranes, Wagons and Rolling Stock, Penstock Pipes, Sluice and Spillway Gates for Hydraulic Dam Projects, etc.

are the products of extensive research and designed for improved yarn production in point of quality and quantity under varying mill conditions.

In addition to complete units a wide variety of spare parts and conversion material can be manufactured to required specifications.

address your enquiries to TEXTILE MACHINERY CORPORATION LIMITED BELGHURRIAH, 24-PARGANAS, WEST BENGAL.

COMPANY AND PUBLIC NOTICES

THE BRITANNIA BISCUIT CO., LTD.

NOTICE is hereby given that the Sixty-third Ordinary General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company, 15, Taratola Road, Alipore, Calcutta, on Tuesday the 20th July, 1954 at 11 A.M. for the following purposes :—

(1) To receive the Directors' Report and to pass the audited accounts for the year ending 31st March, 1954.

(2) To declare the Final Dividends recommended by the Directors.

(3) To elect Directors in place of retiring Directors.

(4) To appoint Auditors and fix their remuneration.

(5) To transact any other business as may properly be brought before the Meeting.

The Transfer Register will be closed from the 16th July to 22nd July, 1954, both days inclusive.

By Order of the Board,
A. P. CHANDA,
Director & Secretary.

15, Taratola Road,
Alipore,
Calcutta, 18th June, 1954.

As Dividend Warrants are sent only to registered shareholders or their mandatees, shares held on Blank Transfers should be submitted with complete deeds for registration of transfers before the Register of members is closed. No applications for Warrants will be necessary.

McLEOD & CO., LTD.

AT a Meeting held on 16th June, 1954, the Board of Directors of the above Company sanctioned the payment of the following Interim Preferential Dividends in respect of the year ending 31st December, 1954 :—

on 5% (Taxable) First Preference shares at the rate of 2½% per annum, less income-tax; and,

on 5% Second Preference shares at the rate of 2½% per annum without deduction of income-tax,

payable to those members (or their mandatees) whose names appear on the Company's Registers of Members on 1st July, 1954 as the registered holders of the above Shares.

NOTICE is hereby given that the Preference Share Transfer Books of the Company will be closed from 26th June, 1954 to 1st July, 1954, both days inclusive.

By Order of the Board,
McLEOD & CO., LTD.,
A. T. DOIG,
Managing Director.

"McLeod House",
3, Netaji Subhas Road,
Calcutta—1.
18th June, 1954.

JESSOP & CO. LTD.

NOTICE is hereby given that the Twenty-second Ordinary General Meeting of the Shareholders will be held on Friday, 23rd July, 1954, at 12 noon at the Registered Office, 63, Netaji Subhas Road, Calcutta-1, to transact the following business :—

1. To receive and adopt the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 31st October, 1953.
2. To declare a Dividend.
3. To elect a Director.
4. To appoint Auditors for the current year and to fix their remuneration.

By Order of the Board,
ANDREW YULE & COMPANY LTD.,
Managing Agents.

Calcutta, 23rd June, 1954.

IN THE MATTER OF INDIAN COMPANIES ACT VII OF 1913
—AND—
IN THE MATTER OF THE INDIAN STEEL & WIRE PRODUCTS LIMITED

NOTICE is hereby given that by an order dated the 1st June, 1954 and made in the above matter on an application presented to the Court by the abovenamed company the Hon'ble Mr. Justice R. S. Bachawat in chambers has directed separate meetings of (1) the holders of ordinary shares and (2) the holders of Deferred shares in the capital of the abovenamed company for the purpose of considering and, if thought fit, approving with or without modification, the Scheme of Arrangement proposed to be made between the company and the holders of the ordinary shares and the holders of Deferred shares respectively. The said meetings will be held on Friday the 23rd day of July, 1954 at the registered office of the company at 7, Wellesley Place, Calcutta, as regards the meeting of the holders of the said ordinary shares at 3 P.M., as regards the meeting of the holders of the said Deferred shares at 4 P.M. or so soon thereafter as the said meeting of the Ordinary shareholders has been concluded, at which place and respective times all the aforesaid holders of the ordinary shares and deferred shares are requested to attend.

A copy of the said Scheme of Arrangement and the explanatory circular can be seen at the office of Messrs. K. B. Ghose & Co., Solicitors, at No. 6, Old Post Office Street (2nd Floor), Calcutta on any working day between 11 A.M. and 4 P.M.

The holders of the ordinary shares and deferred shares may attend such meetings respectively and vote in person or by proxy provided that all proxies are deposited at the registered office of the company not later than 72 hours before the times fixed for holding the said meetings respectively. Proxy forms can be obtained from the company's registered office.

The Court has appointed Sir Indra Singh or failing him Sardar Ajaib Singh, directors of the company, to act as the chairman of the said meetings.

The said scheme will be subject to the subsequent approval of the Court to be given at a hearing which has been fixed for the 2nd August, 1954.

By Order of the Board,
INDRA SINGH,
Chairman.

7, Wellesley Place,
Calcutta 1.
Dated this 12th day of June, 1954.

THE INDIAN STEEL & WIRE PRODUCTS LIMITED
Notice of Extraordinary General Meeting

NOTICE is hereby given that an Extraordinary General Meeting of the abovenamed Company will be held at its registered office at 7, Wellesley Place, Calcutta, on Friday the 23rd day of July, 1954 at 11-30 A.M. in the forenoon when the following resolutions will be proposed as special resolutions:—

1. That the Articles of Association of the abovenamed Company be altered in manner following :—

(a) The following articles be inserted after article 151—"151-A. Any general meeting may resolve that any moneys, investments, or other assets forming part of the undivided profits of the Company standing to the credit of the reserve fund or any capital redemption reserve fund or in the hands of the Company and available for dividends (or representing premiums received on the issue of shares and standing to the credit of the share premium account) be capitalised, paid or distributed amongst such of the shareholders in such manner or proportion as may be decided by the Company on the footing that they become entitled thereto as capital and that all or any part of such capitalised fund be applied on behalf of such shareholders in paying up in full or in part either at par or at such premium as the resolution may provide. any unissued shares or debentures or debenture stock of the Company which shall be distributed accordingly or in or towards payment of the uncalled liability on any issued shares or debentures or debenture stock, and that such distribution or payment shall be accepted by such shareholders in full satisfaction of their interest in the said capitalised sum. "151-B. For the purpose of giving effect to any resolution under the two last preceding articles, the directors may settle any difficulty which may arise in regard to the distribution as they think expedient, and in particular may issue fractional certificates, and may fix the value for distribution of any specific assets and may determine that cash payments shall be made to any members upon the footing of the value so fixed or that fractions of less value than Re. 1/- may be disregarded in order to adjust the rights of all parties, and may vest any such cash or specific assets in trustees upon such trust for the persons entitled to the dividend or capitalised fund as may seem expedient to the directors. Where requisite, a proper contract shall be filed in accordance with Section 104 of the Act, and the Directors may appoint any person to sign such contract on behalf of the persons entitled to the dividend or capitalised fund, and such appointment shall be effective.

(b) The following articles be inserted after article 17. "17-A. For the purpose of reorganisation and consolidation of shares of different classes, or division of shares into shares of different classes, the directors may settle any difficulty that may arise in regard to distribution as they think expedient and may issue fractional certificates on such terms and conditions as they think fit."

2. That subject to the Scheme of Arrangement circulated amongst the shareholders copy whereof is placed before this meeting being sanctioned by the Court and becoming operative a sum of Rs. 10,00,000/- being part of the undivided profits standing to the credit of the reserve fund of the Company be capitalised and utilised for the payment and issue as fully paid up of 1,00,000 Ordinary Shares of Rs. 10/- each. The 1,00,000 Ordinary shares shall be distributed amongst and allotted as fully paid up to the holders of the said 2,00,000 Deferred shares in the capital of the Company in the proportion of ½ of an Ordinary share for each Deferred share held by such holders respectively on the footing that they become entitled thereto as Capital.

Note : The Scheme of Arrangement referred to above is an arrangement proposed under Section 153 of the Indian Companies Act, 1913, between the Company and the holders of Ordinary shares and the holders of Deferred shares inter alia for conversion of Deferred shares into Ordinary shares and a copy of the Scheme has been forwarded to the members of the Company along with a circular letter dated the 12th day of June, 1954.

By Order of the Board,
INDRA SINGH,
Chairman.

7, Wellesley Place,
Calcutta—1.

INDIA ORDERS BRITISH BUS CHASSIS

Transport undertakings in India have placed substantial orders for medium-capacity bus chassis with Leyland Motors Ltd. of Lancashire. The orders, valued at nearly £300,000, cover a total of 190 "Comet 90" chassis of the recently introduced forward-controlled type with a sub-cab structure designed to merge into 7 ft. 6 in. wide locally-built bodies. Delhi Transport Service has on order 140 of these Comet buses for general service. They will join a large fleet of about 150 Comets with 44-45 seater bodies already in service.

COPYING WITHOUT CARBON PAPER

A method of treating paper so that multiple copies of business letters and forms can be made without the use of carbon paper has been perfected by the National Cash Register Company at Dayton, Ohio. The system uses a colourless chemical coating on the underside of the top sheet of paper. The impact of a typewriter character—or the pressure of a pencil—on the first sheet drives this chemical into contact with a clay-like coating on the face of the second sheet of paper. This causes a chemical reaction, which turns the clay-like material blue and reproduces the writing. The company says that as many as seven copies can be made by this method.

Calcutta Markets

SLIGHT DECLINE IN FREIGHT MARKETS

TIME CHARTER SECTION QUIET

THERE is little of interest to record in markets over the last week and values have tended to be slightly lower. Coal from Calcutta to Korea has declined steeply to 54s against 59s paid at the beginning of the month. Requirements are now said to be covered against current contracts. Two cargoes of coal were arranged from Odessa to River Plate at 51s and 51s 6d respectively for early and late July shipment, whilst $10 was repeated from Hampton Roads to Japan. Grain cargoes were fixed at 42s 9d St. Lawrence-U.K. and 50s from Churchill and River Plate-Continent repeated 67s for August.

The time charter section was very quiet and liner companies appear to have satisfied their current requirements.

SUGAR MARKET DULL

During the week ended 21st June, sugar sales in the Calcutta market averaged 3,000 bags daily. Arrivals were 2,000 bags a day and stocks amounted to 110,000 bags. Rates for ready sugar ex-Kantapukur delivery were Rs. 30-10 for ordinary grain and Rs. 33-2 for big grain. Foreign sugar sold at Rs. 30-4 for ordinary grain and Rs. 30-12 for big grain. The market ruled quiet as the demand was poor, and the prices fell somewhat. Meanwhile, the Government has started accepting tenders at the rate of Rs. 29-8-6 per maund f.o.r. destination, in respect of domestic sugar.

HIDES AND SKINS

The market ruled dull. Stocks were higher than in the previous week.

Bazar Sales

(Between 15th June and 21st June, 1954)

Cowhides: Wet salted (Ord.) 6,600 pcs. on the basis of Annas 7-9 to Annas 8-3; Wet salted (Ord.) 16,000 pcs. on the basis of Rs. 7 to Rs. 7-8; Wet salted (Slaughtered) 13,400 pcs. on the basis of Rs. 10-8 to Rs. 25.

Goatskins: Wet salted (Daisee, Killed) 73,500 pcs. on the basis of Rs. 250 to Rs. 425; Assam-Dinajpur-Murshidabad 34,000 pcs. on the basis of Rs. 325 to Rs. 357-8; Purneah-Kissenganj 6,800 pcs. on the basis of Rs. 342-8; Muzafferpore-Darbhanga-Pakur 2,500 pcs. on the basis of Rs. 310 to Rs. 335.

Bazar Stocks

(15th June, 1954.)

Cowhides: Wet salted 115,300 pcs.

Goatskins: Wet salted (Daissee, Killed) 41,000 pcs; Assam-Dinajpur-Murshidabad 57,000 pcs; Muzafferpore - Darbhanga - Patna - Pakur - Purneah - Kissenganj 310,000 pcs.

LINSEED

A generally firm undertone prevailed throughout last week and price levels were well maintained although trading was very small. Little interest was shown by buyers who were purchasing only small lots for their immediate requirements; traders were in the market for forward delivery at slightly higher prices but little business resulted as sellers were reserved. Very dull conditions prevailed in the oil section and activity was negligible. Latest quotations were as follows: Ready Rs. 17-10 per maund; July-August Rs. 17-14 per maund.

SHELLAC MARKET FIRM

During the week ended 22nd June, the market ruled firm. The range of quotations was as follows :

Standard Pure Buttonlac	Rs. 145 to Rs. 155 value.
Pure Buttonlac	Rs. 140 to Rs. 147-8 done and buyers.
Lemon No. 1 Shellac	Rs. 144 to Rs. 150 done and buyers.
Lemon No. 2 Shellac	Rs. 140 to Rs. 147 done and buyers.
F. O Std. 1 Shellac	Rs. 137-8 to Rs. 145 buyers.
Pure T.N. Shellac	Rs. 134-8 to Rs. 142-8 basis done and buyers.
4% I.T.N. Shellac	Rs. 130-8 to Rs. 137-8 buyers.
No. 1 Kusmi Seedlac 3%	Rs. 130-8 to Rs. 132-8 value; Rs. 138-8 buyers.
No. 2 Kusmi Seedlac 3%	Rs. 122-8 to Rs. 130-8 done and buyers.
Fine Bysaky Seedlac (Manbhum) 3%	Rs. 118-8 to Rs. 128 done and buyers.
Fine Bysaky Seedlac (C.P.) 3%	Rs 116 to Rs 124-8 done and buyers.
Ordinary Bysaky Seedlac (C.P.) under 5%	Rs 112-8 to Rs. 120 done and buyers.
Ordinary Bysaky Seedlac (C.P.) 5%	Rs. 108-8 to Rs. 114-8 done and buyers.
Kireelac	Rs. 60 to Rs. 61 buyers.

Shipments during June until 19th were 20,562 packages.

"CAPITAL" INDEX OF INDIAN INDUSTRIAL ACTIVITY **

The *Capital* Index of Indian Industrial Activity (Base : 1935) has now been brought up to November, 1953. Compared with the preceding month there were increases in Jute Manufactures (2.5 points), Steel Ingots (23.5 points), Pig Iron (10.7 points), Cement (6.6 points), and Electricity (5.5 points), while decreases occurred in Paper (26.0 points), Cotton Consumption (11.6 points), Coal (8.8 points) and Wagons Loaded (1.1 points).

The Indices for Cheque Clearances and Notes in Circulation also increased by 3.5 points and 3.3 points, respectively.

Correlating all the factors the *Capital* Index of Indian Industrial Activity advanced by 1.3 points during November, 1953.

BANKS

H indicates that Share capital is half paid. O, C and Dd, indicate Ordinary Contributory and Deferred Shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

JUNE, 1954

McLEOD & COMPANY LIMITED

McLEOD HOUSE, 3, NETAJI SUBHAS ROAD, CALCUTTA.

1887 TO 1954.

From a modest beginning in 1887 McLeod House today holds a prominent position in Jute, Tea and other industries in India, as Managing Agents or Agents of the following:—

JUTE MILLS

Kelvin Jute Co., Ltd.
Empire Jute Co., Ltd.
Presidency Jute Mills Co., Ltd.
Chitavalsah Jute Mills Co., Ltd.
Nellimarla Jute Mills Co., Ltd.
Alliance Jute Mills Co., Ltd.
The Alexandra Jute Mills Co., Ltd.
Waverley Jute Mills Co., Ltd.
Eastern Manufacturing Co., Ltd.

TEA GARDENS

Bhatkawa Tea Co., Ltd., Rajahbhat Tea Co., Ltd., Ranicherra Tea Co., Ltd., Tirrihannah Co., Ltd., Dibrugarh Tea Co., Ltd., Teloijan Tea Co., Ltd., Tyroon Tea Co., Ltd., Roopacherra Tea Co., Ltd., Bormah Jan Tea Co., (1936) Ltd., Baghmari Tea Co., Ltd., Amluckie Tea Co., Ltd., Dejoo Valley Co., Ltd., Margaret's Hope Tea Co., Ltd., Sungma Tea Co., Ltd., (Sungma T. E., Turzum T. E.), Tingamira Tea Seed Co., Ltd.,

INSURANCE

Principal Agents:

LAW UNION & ROCK INSURANCE CO., LTD.
THE BRITISH INDIA GENERAL INSURANCE CO., LTD.
LONDON & LANCASHIRE INSURANCE CO., LTD.

SHIPPING

Agents:

AMERICAN PRESIDENT LINES, LTD.
CHIP HWA SHIPPING CO., LTD.
BURMA NAVIGATION CORPORATION, LTD.
GILL AMIN & CO., LTD.

ENGINEERING

Managing Agents:

BRITANNIA ENGINEERING CO., LTD.

Manufacturers of: Jute Mill and Tea Machinery, Railway Engineering Components, Machine Tools, "Colfix" Bitumen Emulsion for Road Dressing.

Distributors of: "Leslie" Ball Bearing Jute Spindles, "Hotfix" Hot Asphalt Road Dressing Material.

LIGHT RAILWAYS

Burdwan Katwa Railway Co., Ltd. Ahmadpur Katwa Railway Co., Ltd., Bankura Damodar River Railway Co., Ltd., Kalighat Falta Railway Co., Ltd., Katakhal-Lala Bazar Railway Co., Ltd.,

AGENCY DEPARTMENT

The wide range of McLeod's other interests is indicated by the following list of Agencies:—

E. BOYDELL & CO., LTD.
Dumpers, Shunting Tractors and Loading Shovels.

McDONALD'S "DEFLECTOR" TEA FANNERS.

JOSEPH HIBBERT & CO., LTD.
Jute Sizing Machines.

C. F. WILSON & CO. (1932), LTD.
Oil Engines.

BRUNTONS (MUSSELBURGH), LTD.
Bright M. S. Shafting.

RIV OFFICINE DI VILLAR PEROSA SPA.
Ball & Roller Bearings.

COOPER PEGLER & CO. LTD.
Anti-Malarial and Anti-Blight Spraying Equipment.

W. G. BAGNALL, LTD.
Steam Locomotives.

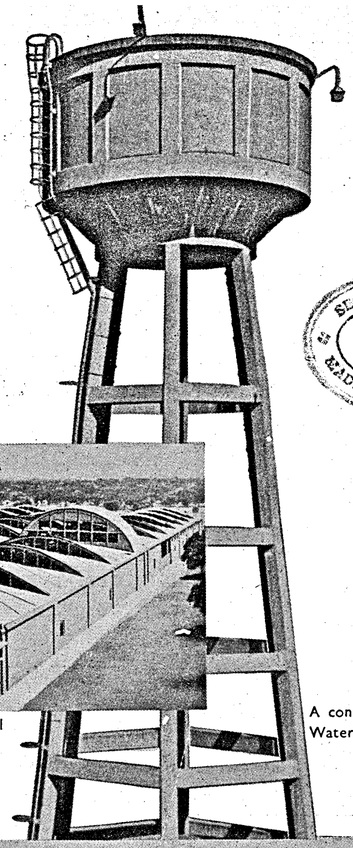
T.-LINE PAPER
Tea Chest Paper Linings.

TRUEMETER CO., LTD.
Automatic Counting and Measuring Instruments for Industrial purposes.

SOC. P. AZ. ING. F. FIORENTINI & C.
Excavators, Cranes, Concrete Mixers & Stone Crushers.

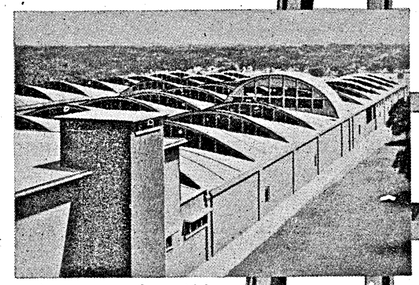
P. O. BOX 78 CABLES "OUTLINE" CALCUTTA.

ACC cement gives Concrete shape to the Five Year Plan



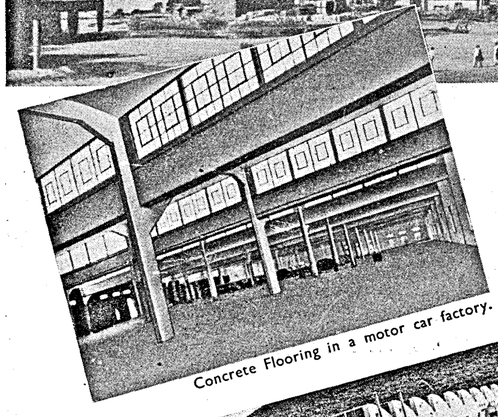
A concrete Water Tower

Every month, lakhs of tons of ACC cement are being used towards the completion of the major projects of the Five Year Plan. In the construction of mighty dams, irrigation canals, extensive factories and power houses, ACC cement is playing a vital role.

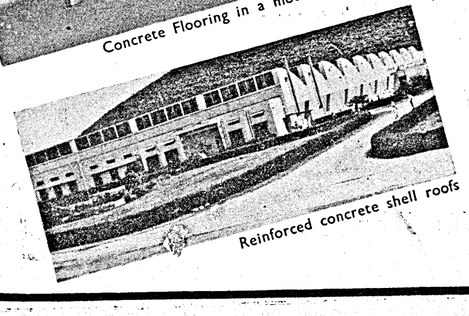


Large spans of conoidal shells for roofing

Cooling Towers – Ahmedabad



Concrete Flooring in a motor car factory.



Reinforced concrete shell roofs

For technical assistance in any problem of concrete construction, please write to:

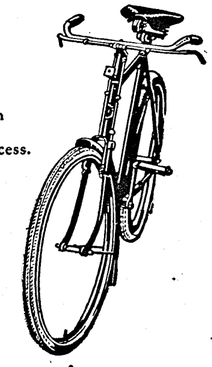
the people's preference

More than 200 components go to make a modern bicycle and we in Hind Cycles now manufacture 95 per cent of these. All under one roof too!

Our method guarantees that every component conforms to the same high standard. Precision-built from the best raw materials every component has to pass through a gruelling test before it is sent for assembly. This is the secret behind Hind Cycles' success.



And the success of Hind Cycles has indeed been truly remarkable. The manufacture of Hind cycles commenced twelve short years ago. The detailed attention paid to quality soon established them in popular favour. So great was the demand for these sturdy, dependable machines that production had to be continually stepped up and the annual output is now over 1,20,000 cycles. Over 7,00,000 of the 21,00,000 cycles in use in India today are Hind cycles. In other words,

ONE OUT OF EVERY THREE CYCLES IN THE COUNTRY TODAY IS A **Hind.**

Such results in the course of a little over a decade are truly remarkable and make it obvious that Hind cycles are the people's preference.

Hind CYCLES LTD.

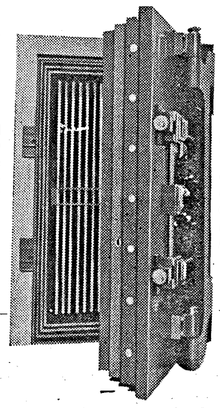
Godrej show the way

LEADERS IN THEIR LINES, through their *proved* technical know-how, resources and thousands of workers, Godrej have been serving various regions of usefulness in steel equipment for Homes, Offices, Hospitals, Canteens, Libraries—Steel Windows, electrically-welded Steel Tubing.... in toiletries containing epoch-making G-11 (Hexachlorophene), purer Washing Soap (Grains), Glycerine, Fatty Acids... Their new lines will be Typewriters, Refrigerators...

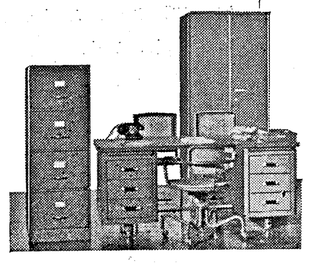
With well over half a century of pioneering activities—outstripping older concerns abroad—Godrej have saved the country many crores of rupees by manufacturing mass-produced articles which in many respects have set patterns universally. With their 33 PATENTED INVENTIONS, the Godrej specifications have revolutionised steel equipment manufacture and *at much lower prices*. During the wartime AMMUNITION EXPLOSIONS in the Bombay docks, except for Godrej Safes, other makes had surrendered their contents to the holocaust... Moreover, Godrej were the first anywhere, 34 years ago, to manufacture high-class toilet soap *exclusively* from Vegetable Oils.

Remember! it's the hidden values that determine your money's worth. Godrej are grateful for the confidence they enjoy *on merits*—including that of world-renowned firms.

Over 400 SAFE-DEPOSITS and VAULTS, including the GOLD VAULTS for the Reserve Bank, are all by Godrej, besides large supplies in their other lines to ALL BANKS, Government mints, treasuries and other departments, business houses and the vast public throughout the country, and abroad.



Godre Crane-Hinge Vault-Door for tested *Protection against Fire and Flooding, Hammer, Drill, Oxy-acetylene Blowpipe and Explosives.*



Godrej STEEL TABLES and CHAIRS...You can't do better than STORWEL...Godrej Patent FILING SYSTEMS.

Recent Lines

Godrej
STEARIC ACID
For Textile, Rubber, Leather, Lubricants, Candle, Metallic Stearates, Carbon-paper, Plastics manufacture.

Also in Cartons.
Godrej WASHING SOAP (Grains)
CHEAPER - QUICKER - BETTER
For Quick, Smooth, SAFE shaves
Godrej SHAVING STICK with G-11
(as in CINTHOL Toilet Soap...)

Godrej GLYCERINE
Manufactured in a fully-automatic plant of the latest design.

Godrej STEEL WINDOWS
In keeping with the utility and beauty of present-day architecture. Rust, Weather, Fire-Resisting.

Offices or Stockists all over India and abroad.

BELFAST (North Ireland).

EQUIPMENT FOR DUST REMOVAL

TRADE SIROCCO MARK

MACHINERY FOR TEA ESTATE FACTORIES

The collection and disposal of dust is a problem common to practically every industry. The dust created during many manufacturing processes is not only injurious to the health of the operatives, but militates against efficient production. Modern "Sirocco" Dust Removal and Collection Equipment is the outcome of many years of experience in dealing with problems of this nature. Fully illustrated descriptive literature available on request.

The range of "Sirocco" Tea Preparing Machinery comprises complete equipment for the Tea Factory—equipment with a high reputation throughout the Tea Producting World for design, craftsmanship and operation, resulting from almost seventy years' service to the Industry and "Sirocco" After Sales Service is Second to None.

this man is carrying the secret of

INCREASED PRODUCTION ✻

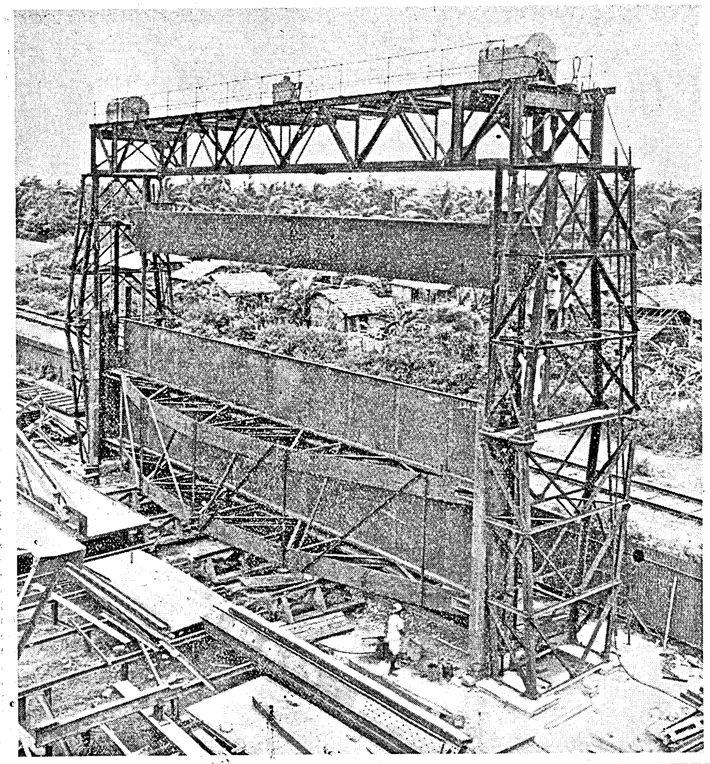
The thing itself is really no secret: the world knows of it. It is a humble thing, procured and served with the greatest of ease, yet its effect on human output and consequently on industrial production, is considerable. The secret is a cup of good hot tea.

✻ **PRODUCTION** is a nation's wealth, not gold and silver which are only its manifestations. Over nine million workers are committed to various sectors of the country's industrial front, and on their assiduity will depend much of our desired prosperity. Cheerful and contended workers produce more. They are the human assets of industry, greatly aided by a seemingly humble thing: a nice hot cup of tea. The Central Tea Board will gladly assist industrial establishments regarding tea service for workers.

Issued by the Tea Board. CTB—50

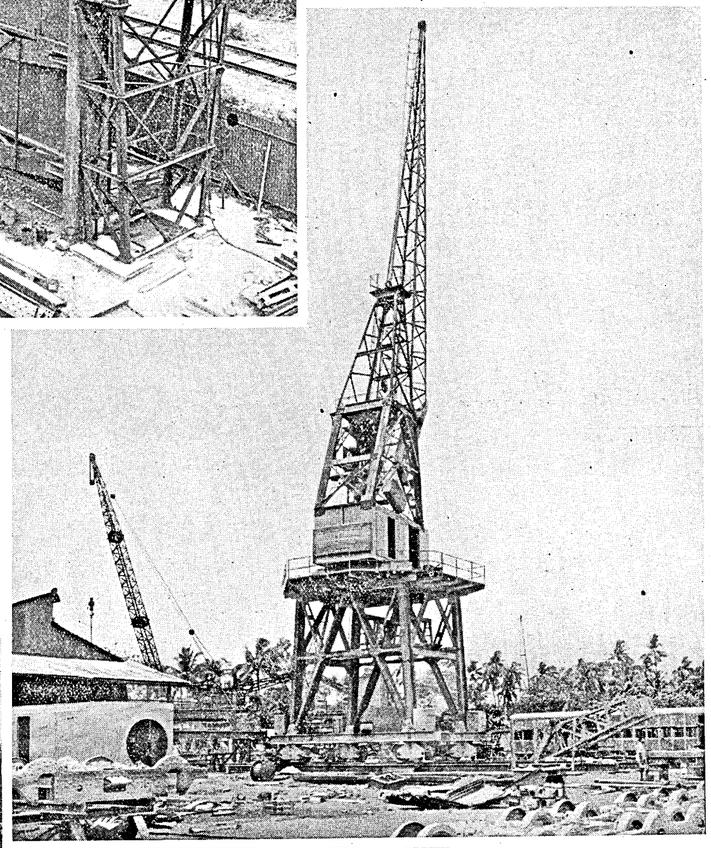
RECENT PRODUCTS of INDIAN ENGINEERING INDUSTRY by

JESSOP & Co Ltd
ENGINEERS
CALCUTTA-1.

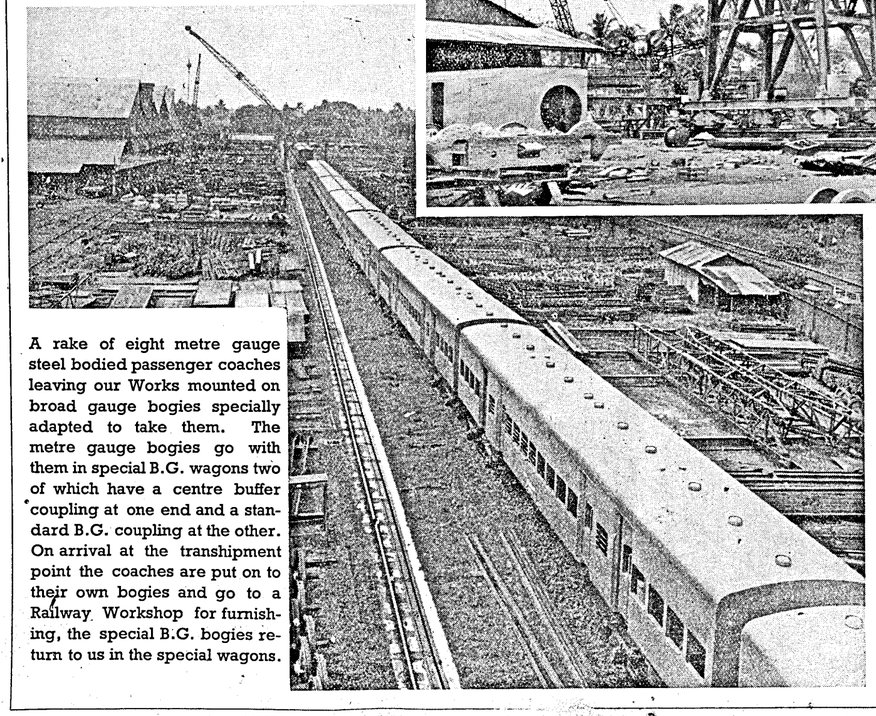


One of the 18 [ft. Gates] for the Durgapur Barrage (D.V.C.) erected in our Works. The contract is for 5 Undersluice Gates 60 ft. by 18 ft., 5 Undersluice Gates 60 ft. by 19 ft. and 24 Weir Gates 60 ft. by 16 ft. The hoist is by electric motor with emergency hand operation.

Note:—For trial purposes the necessary height has been obtained by mounting two trestles one on top of the other, the lower being upside down.



Above: One of the four 3 ton electric level luffing Wharf Cranes for Ballard Pier for the Bombay Port Trust erected for test in our Works. These Cranes have a maximum radius of 75 feet and a minimum of 22 feet with a hoisting speed of 275 feet per minute. The Luffing Speed is 150 feet per minute, slewing 1.25 revolutions per minute and travelling 50 feet per minute. The contract also includes twenty-four 3 ton Cranes and six 6 ton Cranes for Alexandra Dock.



A rake of eight metre gauge steel bodied passenger coaches leaving our Works mounted on broad gauge bogies specially adapted to take them. The metre gauge bogies go with them in special B.G. wagons two of which have a centre buffer coupling at one end and a standard B.G. coupling at the other. On arrival at the transhipment point the coaches are put on to their own bogies and go to a Railway Workshop for furnishing, the special B.G. bogies return to us in the special wagons.

INDUSTRIAL DEVELOPMENT IN INDIA SINCE THE WAR

● By G. L. Bansal, M.P. ●

By the beginning of the second World War, paradoxical as it may seem, a stage had been reached in India where further industrial development could take place not so much by increasing capacity and production in established industries, but by diversifying the pattern of our economy. The production of cotton textiles in 1938 was 4,306 million yards, of sugar 994,000 tons and of jute manufactures 1,266,000 tons. In fact, production in these lines in the late thirties very nearly touched the peaks which have not been surpassed to any considerable extent till now. Though on a per capita basis this production was far from large, in the context of real income in the country the scope for further expansion in these industries did not appear to be substantial. And yet by all counts India was still in the initial stages of industrial development. This paradoxical state of affairs was brought into sharp relief during the second World War. In 1938 the country produced very nearly a million tons of steel and there were a few units which undertook the manufacture of a few articles like light structurals, castings, pipes and tubes, etc. But there was hardly a machine-tool industry worth the name and the country was almost entirely dependent on imports for her requirements of machinery and millwork. In the field of chemicals also, apart from sulphuric acid and a few other chemicals which were manufactured in small quantities, the pre-war production in most lines was either non-existent or negligible.

The outbreak of the war had two important consequences for Indian industry. In the first place, war effort required more production of those things which were needed for the prosecution of the war but which were already being produced in the country. More steel was needed and the armies had to be provided with clothing, shelter and other equipment. Thus the production of steel, cotton textiles, paper, cement, glass, etc., had to be stepped up. Secondly, as a result of the war, imports were severely curtailed and many items for which the country depended on imports in the past had to be manufactured under the stress of war-time shortages. This provided to business talent and enterprise various outlets in the field of manufacture, as a result of which not only were substantial increases recorded in the production of some of the older established industries, but various new lines of production also came to be started. It is estimated that industrial production in the country went up by something like 20 percent between 1939 and 1945. The new industries that were set up during the period include ferro alloys, non-ferrous metals and metal fabricating industries like copper sheets, wires and cables, mechanical engineering industries like diesel engines, pumps, bicycles and sewing machines, machine tools and cutting tools, certain items of textiles, tea and oil processing machinery and chemicals like caustic soda, chlorine, super-phosphates, photographic chemicals, bichromates, etc.

Post-War Progress

At the end of the war and with the gradual emergence of somewhat normal conditions, many of the new industries naturally faced difficult times. Government, aware of the likely difficulties, gave an assurance that industries developed and started during the war would not be left "high and dry". An interim Tariff Board was appointed in November, 1945 to enable protection to be granted to some of the new industries. At the same time many of the older industries were facing difficulties of another kind arising out of the fact that it was difficult to replace the worn-out capital equipment because supplies were scarce. The outlook for industrial development was also clouded by the fact that the political situation immediately after the war was highly uncertain. The stock markets had a subdued tone and the budget for the year 1947-48—the unfortunate Liaquat Ali Budget—acted as a further damper on business outlook. The situation was aggravated by intense labour strife. To make matters worse came the partition and its aftermath. Apart from its disturbing impact on the fabric of the nation, it created special problems for two of India's staple industries, viz., cotton textiles and jute. Although nearly 90 percent of all industrial establishments remained in the Indian Union, the somewhat strained relations between India and Pakistan seriously hampered the functioning or industry partly by reducing the availability of some raw material like raw cotton and raw jute and partly by curtailing the market. It is against this background that post-war industrial development has to be viewed.

The fall in industrial production in 1947 was viewed with grave concern and the Conference on Industrial Development held in December, 1947 recommended measures to overcome difficulties, such as the inadequacy of transport, unsatisfactory relations between management and labour, shortage of raw materials, difficulty in obtaining capital goods, supply and exchange limitation on the import of essential requirements of industry and the paucity of technical personnel. The Industrial Policy Statement of 6th April, 1948 representing the beginnings of a coherent, albeit regulatory, industrial policy, stressed the desirability of having a "dynamic national policy.....directed towards a continuous increase in production by all possible means". The decontrol of cotton textiles and sugar which provided a stimulus for increased production in 1948 did not mark a permanent recovery. Difficulties were experienced by certain other industries also, such as the chemical and engineering industries, as a result of liberalisation of imports in June, 1948. The production in 1949 therefore was once again lower than in 1948.

Devaluation

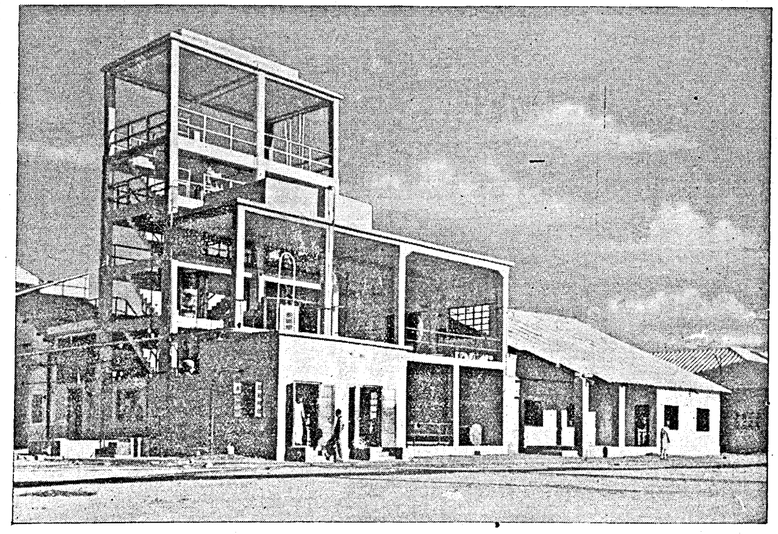
The next phase of post-war industrial history is marked by the devaluation of the Indian rupee in September, 1949. The absence of accord on the exchange ratio question between India and Pakistan created special difficulties for the jute industry and its production fell from 9.23 lakh tons in 1949 to 8.35 lakh tons in 1950. In the case of cotton textiles, because of a two-month strike in the middle of 1950, production was reduced substantially in that year. Thus in the case of the two major Indian industries, cotton textiles and jute, which account for nearly half the weightage in our index for industrial production, output declined well below the 1948 levels. The index of cotton textiles production which was 110.5 (base 1946 = 100) in 1948 was 99.9 in 1949 and 98.8 in 1950. In the case of jute the index declined from 100.2 in 1948 to 84.8 in 1949 and 76.8 in 1950.

The next important development was the outbreak of the Korean war in June, 1950, which created difficulties in procuring supplies of raw materials from abroad. An informal conference of industrialists was called by the Industry and Supply Minister in July, 1950 which considered measures for achieving maximum production in the private sector of the economy. In March, 1951 the import policy was liberalised to enable industries to procure raw materials from abroad and arrangement was arrived at on the question of the exchange rate of the Pakistan rupee in February, 1951. That year actually marked the phase of increasing industrial production which has continued since. The general index of industrial production went up from 105 in 1950 to 117.2 in 1951, 128.9 in 1952 and 135.1 in 1953. These movements of the general index, however, cover wider variations in respect of different commodities. For instance, even when the general index of industrial production was rising significantly, the movements in the manufacture of jute goods were unsteady. Thus the index of jute manufactures increased from 76.8 in 1950 to 87.4 in 1952 but again declined to 79.8 in 1953. On the other hand, the production index in cotton textiles moved up from 93.8 in 1950 to 104.3 in 1951, 117.7 in 1952 and 125.1 in 1953. In the case of cement also, the production index moved up from 136.3 in 1949 to 169.5 in 1950, 207.2 in 1951, 229.3 in 1952 and 245.1 in 1953. The most spectacular increases, however, were in the field of chemical industries. The index which was 102.7 in 1947 had moved up to 194.3 in 1949. There was a further and sharper improvement to 260.2 in 1951 and in 1953 the index stood as high as 515.6. The following table gives the general index of industrial production as also the index of some selected industries:

Index of Industrial Production

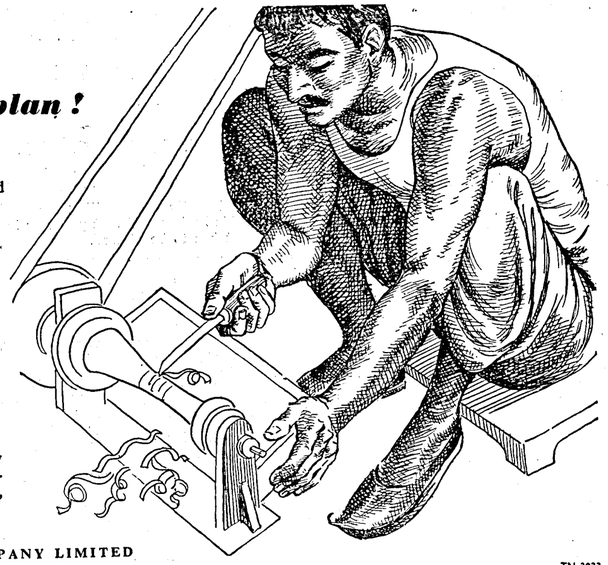
	Genl. index.	Coal.	Cement.	Paper and Paper Boards.	Cotton cloth.	Jute.	Chemicals	Steel ingots and metal for castings.	Genl. Engg. & Elec. Engg.
1947	97.2	103.9	93.9	87.8	96.2	96.6	102.7	97.1	95.2
1948	108.4	103.2	100.7	92.4	110.5	100.2	158.5	97.1	136.5
1949	105.8	108.9	136.3	97.4	99.9	84.8	194.3	104.6	167.2
1950	105.0	110.8	169.5	102.7	93.8	76.8	229.0	111 2	203.1
1951	117.2	118.8	207.2	124.4	104.3	80.4	260.2	3.88.8	265.7
1952	128.9	125.4	229.3	129.7	117.7	87.4	112.0	112.0	233.0
1953	135.1	124.1	245.1	130.4	125.1	79.8	515.6	116.5	258.6

The broad picture of industrial development in post-war years therefore is one of an initial period of difficulty followed by three years of continuously rising production. One important point, however, deserves to be noted. The main feature of industrial development in post-war years is a diversification of industrial production. Many new lines of manufacture have come to be started particularly in the field of engineering and chemical industries and the increase in installed capacity in these sections has been considerable. On the other hand the older established consumer goods industries have, broadly speaking, not shown any substantial increases in installed capacity. This was in some cases because additions to installed capacity were not allowed by Government; for instance, in the case of sugar until recently and in the case of the weaving section of the cotton tex-



Hydrochloric acid plant at Tata Chemicals

yes, it is my plan !



Lights will be switched on in a thousand villages. Handlooms, lathes will hum and spin. Every small community will become the hub of a growing village industry. There will be work for everyone. The Five Year Plan provides for Rs. 127 crores to be spent on developing and adding to our power resources. Multi-purpose hydro-electric schemes will supply cheap power to industry. Here is proof of a nation's determination to take its place amongst the leaders of the world.

Lakhs of tons of Steel will be used to implement the many diverse projects of the Plan. And so, in numerous significant ways Steel will provide the foundations for a richer, more rewarding future for our nation and our people.

tile industry even now. In certain other industries like the jute industry, there was also no incentive to start new factories because in the changed environment after partition the Indian jute industry was beginning to lose the original advantages it possessed. Certain other established industries like tobacco manufactures, paints and varnishes, soap, rubber products, etc., have not shown any rise in installed capacity although there has been some diversification of production. The same is broadly true of glass and glassware although additional capacity for the manufacture of sheet glass has come into being in the last few years. The older industries in which there has been a notable increase both in installed capacity and in production are cement, paper and vanaspati. The following table shows the production and installed capacity of cement, paper and vanaspati:

	Cement (In '000 tons)		Paper & Paper Boards (In '000 tons).		Vegetable Oil Products (In '000 tons).	
Year	Installed capacity.	Production.	Installed capacity.	Production.	Installed capacity.	Production.
1946	2,015	1,542	105.0	106.0	192.2	135.1
1947	2,115	1,448	105.0	93.1	202.7	95.1
1948	2,115	1,553	105.0	97.9	216.2	129.7
1949	2,815	2,102	110.0	103.2	283.7	155.5
1950	3,125	2,613	113.4	108.9	319.7	171.6
1951	3,045	3,195	135.3	131.9	321.7	172.3
1952	3,795	3,538	146.5	137.5	339.2	190.8
1953	4,188	3,780	151.0	138.2	368.2	191.6

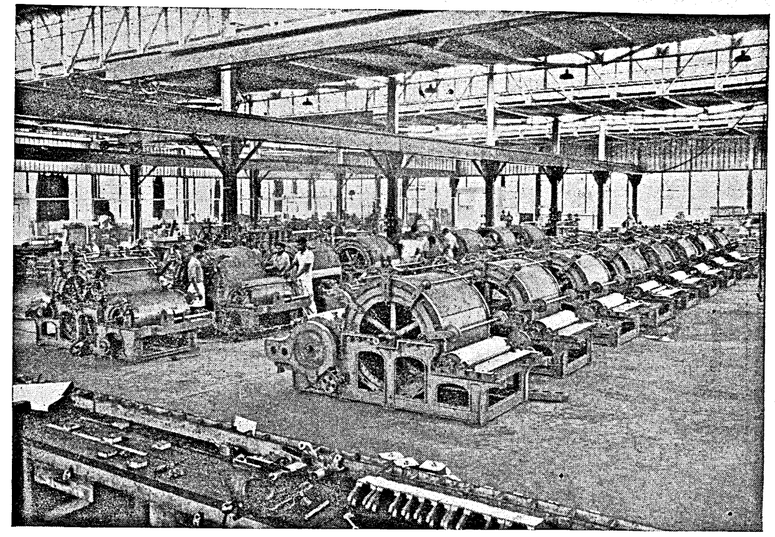
Apart from developments in established industries, the last few years have witnessed the setting up of many new lines of production. In the private sector, some of the important industries established recently include the assemblage and manufacture of automobiles, production of aluminium, diesel engines, power-driven pumps, graded machine tools, textile machinery, ball and roller bearings, numerous light engineering products, such as bicycles, sewing machines, hurricane lanterns, electrical engineering goods like dry batteries, storage batteries, electric fans, electric cables and wires, electric lamps, electric motors and transformers, radio receivers, fertilisers like sulphate of ammonia and superphosphates, heavy chemicals like sulphuric acid, soda ash and caustic soda. A large variety of drugs and pharmaceuticals are also now manufactured in the country. Other industries have also come to be established such as manufacture of rayon filament including staple fibre, plywood tea chests, machine screws, razor blades, conduit pipes, house service meters, domestic refrigerators, insulators, leather cloth, linoleum, titanium dioxide, etc. While it is not possible to deal here with all these industries which by all accounts make an impressive list, one can get an idea of the range and extent of development by referring to the increases in installed capacity and production of certain industries.

Production of Chemicals

For instance, the production of the chemical group of industries as a whole was in 1953 more than five times the production in 1946. In the case of general engineering and electrical goods also, the production was more than 2½ times that in 1946. No doubt, the rates of increases are apt to be somewhat exaggerated because in the initial year the production was very small, the industry having just started. It is, however, interesting to note that production of certain chemicals like caustic soda rose by about 8 times and that of soda ash by nearly 5 times, of ammonium sulphate by about 14 times and of super-phosphates by 10 times. In the field of engineering industries the production of sewing machines in 1953 was 10 times that in 1946, of bicycles more than 6 times, hurricane lanterns more than 9 times and diesel engines nearly 8 times, of electric motors more than 3½ times and of power transformers about 8 times. These figures do indicate in a sense the substantial increases in production.

The following table gives the installed capacity and production of selected chemicals:

	Sulphuric Acid. (Tons)		Caustic Soda. (Tons)		Soda Ash. (Tons)	
Year	Installed capacity.	Production.	Installed capacity.	Production.	Installed capacity.	Production.
1946	80,000	60,000	10,500	2,900	54,000	12,000
1947	80,000	60,000	10,500	3,314	54,000	13,624
1948	1,00,000	80,000	12,000	4,383	54,000	29,150
1949	1,50,000	99,458	13,500	6,303	54,000	17,918
1950	1,50,000	1,02,480	19,068	10,846	54,000	43,790
1951	1,79,108	1,06,935	21,174	14,722	54,000	47,528
1952	1,91,976	96,072	34,944	17,064	54,000	44,328
1953	1,89,000	1,07,796	38,112	22,636	61,200	56,880



A batch of carding engines lined up on the assembly floor at the works of the Machinery Manufacturers Corporation Limited.

The increase in the consumption of sulphuric acid as also of caustic soda and soda ash is indicative of the industrial prosperity of a nation and the increases in capacity are symptomatic of the increased utilisation of these products by other industries. The production of sulphuric acid was, however, affected adversely in 1952 by the lack of demand of super-phosphates for which it is an important raw material. As for caustic soda, there has been an almost continuous increase excepting in the year 1948 when liberal imports affected certain units engaged in production. In the case of soda ash also, liberal imports led to the closure of the units engaged in production in 1949. Production in 1952 was affected by labour trouble as also to some extent by the closure of a plant for renovation, etc. The dependence on the import of these items is being gradually reduced. More than one-third of our requirements of caustic soda are being met from internal sources, whereas in respect of soda ash more than half of the demand is being met by the two units engaged in production. The soda ash and caustic soda industries are expanding and the need for the establishment of one or two additional plants and a few units for the manufacture of caustic soda was indicated by the Planning Commission. The installed capacity of ammonium sulphate has increased substantially as a result of the establishment of the Sindri Plant which went into production in October, 1951. The installed capacity in 1953 was 4,26,852 tons and production was of the order of 3,19,620 tons. As for super-phosphates, there has been no substantial increase in capacity since 1950. The production in 1953 at 46,860 tons was less than 25 percent of the installed capacity.

Amongst the engineering items, installed capacity has greatly increased in the case of diesel engines, power-driven pumps, sewing machines and bicycles, to mention only a few. The manufacture of textile machinery and stores of all kinds has also made great strides in recent years. The following table gives the installed capacity and production for diesel engines and power-driven pumps:

	Diesel Engines. (Nos.)		Power-driven Pumps. (Thousands).	
Year.	Installed capacity.	Production.	Installed capacity.	Production.
1946	780	473	—	—
1947	1,400	685	10.6	6.1
1948	4,000	1,025	12.5	8.1
1949	4,600	2,076	23.4	14.3
1950	5,300	4,596	33.5	30.3
1951	5,300	7,246	34.9	48.0
1952	6,324	4,248	43.2	32.4
1953	13,164	3,720	60.0	25.2

As will be seen from the above table the installed capacity for diesel engines has moved up from 780 in 1946 to 13,164 in 1953. The heavy imports in the year 1951-52 made under the policy of blanket licences affected the growth of the diesel engine industry. The production fell from 7,246 in 1951 to 4,248 in 1952 and 3,720 in 1953. But the policy of restricted imports which has been pursued since July, 1952 is now beginning to show results and the rate of production towards the end of 1953 was slightly higher than in 1951 and it is hoped that in the coming years the industry will be able to establish itself on a sound footing. In the case of power-driven pumps while the installed capacity has increased from 10.6 thousand to 60 thousand in 1953, the production has in fact declined from 48,000 in 1951 to 25,200 in 1953. Here again the main cause of reduced production has been liberal imports. The present installed capacity is approximately equal to the present estimated demand and the main problem is one of utilising existing capacity more fully.

Unlike diesel engines and power-driven pumps, certain light engineering industries such as sewing machines and bicycles have uniformly shown increases in capacity as well as in production. The following table gives figures of installed capacity and production of sewing machines and bicycles since 1946:

	Sewing Machines. Nos.		Bicycles. Nos.	
Year	Installed capacity.	Production.	Installed capacity.	Production.
1946	14,700	6,121	54,500	42,983
1947	12,000	5,860	60,000	31,865
1948	24,000	20,019	94,000	61,895
1949	25,500	25,029	94,000	80,022
1950	37,500	30,892	1,20,000	1,03,153
1951	37,500	44,461	1,20,000	1,14,275
1952	41,496	50,040	1,20,000	1,96,956
1953	41,496	62,424	4,17,500	2,64,168

In the case of sewing machines the installed capacity rose from 14,700 units in 1946 to 41,496 units in 1953. During the same period, production increased from 6,121 units to 62,424 units. Besides sewing machines, manufacture of industrial sewing machines equivalent to Singer 31-K15 has also been started by one of the units and the production of this type is expected to be sufficient to meet the current requirements in the country. The progress of the bicycle industry has been phenomenal in the last few years. The production of complete bicycles has increased from 42,983 in 1946 to 2,64,168 in 1953. The installed capacity also rose from 54,500 in 1946 to 4,17,500 in 1953 and the present gap between the installed capacity and production is accounted for by the fact that some of the new units have come into production only recently and have not yet attained full production. The demand for cycles as estimated by the Planning Commission is expected to rise to about 5,00,000 cycles by

Chimneys etc., etc.,

Consult us for Gunniting core Drilling, Grouting, Sewage & Water Purification problems.

We undertake Piling Works under Hindustan-Zeiss process.

1955-56 and it is expected that almost the entire demand for bicycles could be met from indigenous production.

Electrical Engineering

In recent years considerable development has taken place in the field of electrical engineering goods. That there is a great deal of demand for electrical machinery of various types, such as control and switch gears, generators, alternators and dynamos, electric turbo generating sets, etc., is clear from the fact that the imports of these items have been showing a continuous increase. The only important item of electrical machinery which has shown a continuous decline is electric motors. This decline is due to the recent growth of the electric motor industry in the country. The installed capacity has increased from 60,000 H.P. in 1946 to over 200,000 H.P. in 1953. Production has also shown an increase from 45,600 H.P. in 1946 to 1,62,000 H.P. in 1953. Production is largely confined to motors up to 30 H.P., but there are schemes for expanding the range of production and for manufacturing motors between 40 to 100 H.P. The following table gives the installed capacity and production since 1946 in electric fans, electric motors and power transformers:

	Electric Fans. ('000 numbers.)		Electric Motors. (Thousand H.P.)		PowerTransformers (Thousand K.V.A)	
Year	Installed capacity.	Production.	Installed capacity.	Production.	Installed capacity.	Production.
1946	138	110.4	60.0	45.9	78.0	39.0
1947	250	160	100.0	38.0	102.0	32.0
1948	250	180	150.0	60.0	175.0	82.0
1949	300	179	200.0	68.1	225.0	108.9
1950	278.4	193.6	149.5	81.8	270.0	171.9
1951	277.8	216.5	149.5	142.0	270.0	194.2
1952	294.0	195.6	200.4	157.2	303.6	214.8
1953	303.6	206.4	200.4	162.0	327.6	308.4

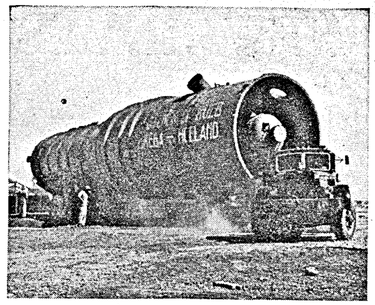
In addition to the development in the private sector, some industries of a basic character have been established by Government. These include the Sindri Fertiliser Factory, the Chittaranjan Locomotive Works, the Machine Tool Factory at Jalahalli, the Prototype Machine Tool Factory at Ambarnath, the Coach Factory at Perambur, the Dry Core Cable Factory at Rupnarainpur in West Bengal, Indian Telephone Industries, Bangalore, National Instruments Factory at Calcutta, Penicillin Factory at Pimpri near Poona and the DDT Factory at Delhi. Two basic transport industries now operated by Government are the Hindustan Aircraft Limited, Bangalore, and the Hindustan Shipyard Limited, Visakhapatnam. Some of these factories like those manufacturing machine tools, penicillin or DDT are expected to go into production shortly. But others like the Sindri Fertilisers have already been brought on a working basis and are in production. When all these governmental projects go into production, they will no doubt make a significant contribution to the industrial potential of the country. For instance, a number of industries can be started centring on Sindri. The construction of the Coke Oven Plant to produce 600 tons of coke per day is expected to go into operation by September, 1954. The construction of the by-product plants to manufacture benzene, benzol, naphthalene and tar are also stated to be proceeding according to schedule. A company has taken up the construction of a plant to produce 300 tons of cement per day to start with and the calcium carbonate sludge from Sindri is to form the raw material for the production of cement. Similarly, India's requirements of paper insulated, lead covered and armoured telephone cable will soon be met from the production of Hindustan Cables Ltd. The factory has been planned to produce 470 miles of cables of different specifications valued at nearly a crore of rupees at the present price levels.

Collaboration with Foreign Capital

A mention may be made of developments which have been initiated in collaboration with foreign capital in the field of industry. Amongst the industries in which foreign capital has been permitted to be invested in 1953 are dyes, drugs, hydrogen peroxide, clinical thermometers, gold gilded glass beads, food essences, abrasives, cycle parts, lifts and water meters. There were in the same year other cases involving co-operation with foreign technical talent. Some of the schemes of this kind sanctioned during the year include the manufacture of laminated and coil springs for automobiles, air conditioners, barfil rollers, Bunsen and other burners, security articles, radio sets, machine tools and workshop equipment, vibrating table frames, diesel engines, switchgear and allied products, piles, reinforced cement concrete pipes, fountain pens and fountain pen ink, perfumes, cosmetics and oils, technical benzene hexachloride and lindane. The most important development in the field of foreign participation in Indian industry is the setting up of three oil refineries, two at Trombay and the third in Visakhapatnam. The two refineries being set up in Trombay Island have a total annual throughput capacity of about 3.2 million tons of crude oil per annum and will yield approximately 2.8 million tons of refined petroleum products, including motor spirit, kerosene, diesel oils, furnace oil and bitumen. The third refinery at Visakhapatnam will have an initial capacity to refine 5 lakh long tons of crude oil per annum and thus the total capacity of the three refineries would approximately amount to 3.7 million tons of crude oil. In terms of refined oil, considering the import of nearly 3.4 million tons in each of the years 1951-52 and 1952-53, the requirements of petroleum products will be refined in India to the extent of nearly 80 percent.

In addition to projects which have already matured or schemes which have been initiated there are quite a few lines in which expansion or development is being considered. Recently agreements have been entered into with a firm of German steel producers for the setting up of a steel plant at Rourkela in Orissa. The steel plant is to have an initial ingot capacity of half a million tons per annum with provision for the capacity being doubled later. The plant is expected to be ready for operation in 1958. It is expected that simultaneously with the commencement of production, it might be possible to install additional capacity so that the production will rise to one million tons by 1962. Among the schemes which are expected to go into production in the near future in the field of engineering industries are the manufacture of switchgear, train lighting cells, dry charged batteries, miniature lamps and auto lamps, transformers and electric motors. Other schemes which recorded progress during the year include the manufacture of shock absorbers for automobiles in Madras, automobile radiators, sparking plugs, bicycle parts, radio receivers and components, fuel injection equipment, power driven pumps, tungsten carbide tips and tipped tools, etc. In the case of aluminium the existing smelting capacity of the Indian Aluminium Co. at Alwaye is in the process of being doubled and the scheme is expected to be completed soon. Another scheme has been sanctioned for the setting up of a new aluminium smelter at Hirakud with an initial capacity of 10,000 tons to be ultimately raised to 20,000 tons per annum. It is understood that an extrusion press at Alwaye and a wire rod mill at Kandara are expected to commence production in 1954. In the field of chemical and allied industries many new items were produced for the first time in this country during last year. These include a number of important drugs, such as the new antitubercular drug isonicotinic acid hydrazide, aureomycin, sodium salicylate and saccharine, triple superphosphate among fertilizers, hard rubber combs, unsupported sheets of P.V.C. and films of polythene. Amongst the future expansion schemes the more important ones are the proposal to increase production of soda ash by another 36,000 tons and caustic soda by 7,000 tons in the course of a year or two. In November, 1953 an agreement was concluded with a foreign firm for the establishment of a company to be known as the Indian Explosives Ltd., for the manufacture of India's requirements of commerical blasting high explosives. Recently Government announced the formation of a company—Bharat Electronics Ltd.—for undertaking the production of radio and radar equipment required by the defence services. Government are stated to have under active consideration a scheme for the manufacture of heavy electrical equipment. There is also a scheme to manufacture synthetic oil from lignite available in large quantities in South Arcot.

So far we have discussed industrial development during the last years in terms of increases in installed capacity and production. Another way of looking at industrial growth is by assessing investments in industry. At the present moment no comprehensive data exist regarding the amount of industrial investment taking place during any particular period. Such figures of new investments as are available are not capable of being used to make any firm estimate of investment. For instance, on the basis of amounts sanctioned for capital issue, we find that in 1948 permission for additional capital issues was given to the extent of Rs. 125.7 crores. But the figure declined to Rs. 59.6 crores in 1951 and Rs. 39.8 crores in 1952. It was again Rs. 81.4 crores in 1953. These figures, however, include applications for capital issue in fields other than industry and further the fact that sanction was granted for capital issue does not necessarily mean that the amount was subscribed to. An alternative way of estimating the rate of investment in the private sector is the one used



The main column of the feed preparation unit en route to the site of the Burmah-Shell oil refinery at Bombay.

by the Federation of Indian Chambers of Commerce and Industry. Broadly the method is to take the figure of imports of machinery and millwork during a particular period and then deduct from it imports on Government account, as also imports of certain items which though coming under the category of machinery and millwork are not strictly speaking industrial machinery, for instance typewriters, domestic refrigerators, etc. To this figure of imports on private account will have to be added amounts which are required for other fixed assets, such as buildings, etc. Thus an estimate can be arrived at of the total investment which must have taken place in order to install and utilise the imported plant and machinery. On this basis it has been calculated that during the period 1946-51 the annual rate of investment in industry (including working capital) was of the order of Rs. 90 crores per annum. In the succeeding two years also, it is estimated that the annual rate of investment would be of the order of Rs. 105 to 110 crores. No doubt this is a very rough calculation, but it would seem that it is not very far off the mark. If it is compared with the figures of estimated investments in the latter half of 1952 and the full year 1953 on the basis of licences granted by the Licensing Committee under the Industries (Development and Regulation) Act, the Federation's calculation does not seem to be off the mark. Between September, 1952 to December, 1953 licences were granted for an investment estimated at Rs. 115 crores, i.e., at an annual rate of about Rs. 80 crores. It needs to be borne in mind, however, that the details provided of capital required at the time of seeking a licence are incomplete and further the figures of the licences granted are restricted only to the industries covered by the Industries (Development and Regulation) Act. If allowance is made for these two factors, it would appear that industrial investment has been around Rs. 90 to 100 crores annually over the last few years.

This rate of investment, though apparently impressive, is not as high as it should be in an economy like ours where the urgent need is to create fresh avenues of employment in non-agricultural sector. It is in this light that the Governmental policies, both in the industrial and fiscal fields, have to be viewed. There has been in recent months a good deal of talk about the establishment of an Industrial Development Corporation and another Corporation in collaboration with the International Bank for Reconstruction and Development, both of which are intended to help promote industrial development by providing finance to an extent it may not be forthcoming from the capital market and also by the provision of technical know-how and general guidance as to the new lines that should be undertaken for development. The question of fiscal policy is also under examination of the Taxation Enquiry Commission, and it is hoped that their Report will tackle this problem in a manner calculated to lead to rapid progress in the industrial sector.

Judged from normal short-term standards, by and large, industrial progress and outlook in the country can be said to have been satisfactory, but from a long-range developmental point of view, we have done no more than arrive at the fringe of the problem. A stage has been reached now where the core, namely, that of changing the capital base of our economy, must be tackled with vigour if the rises that have been witnessed in the recent past are to be sustained and a more rapid rate of industrialisation attained. It is hoped that the two Development Corporations and private enterprise would now pay more attention to the setting up of a larger range of basic industries and the manufacture of capital goods. The future of industrial development of the country lies in diversifying the pattern of production and more than that in enlarging the capital base.

NEW INVESTMENT IN INDIA IN THE LAST DECADE

● By P. A. Seshan ●

BIG strides have been made in the private industrial sector in the last two and a half decades, and in the past decade particularly. Prior to 1938, industrial development in this country was neither planned nor sustained. For various reasons progress could not be achieved in particular directions. Since the 'thirties, however, the basis of the industrial structure has been considerably broadened and it is no exaggeration to say that in selected sectors phenomenal progress has been achieved. This was made possible mainly by the stock exchange booms of 1936-37 and 1944-46 and, more recently, by active co-operation between Indian and foreign interests and by the expansion of the public sector. There is, however, an essential difference between the developments that have stemmed from the stock exchange boom of 1936-37 and those which have their origin in the boom in new company floatations in 1944-46 and in the happenings in the post-independence period.

In the late 'thirties, except for the promotion of some chemical units, new floatations related mainly to further development in established industries like textiles, paper, steel and sugar. During the war years a completely new industry came into being with the establishment of many hydrogenation factories; and the real beginnings in respect of the automobile industry were made. But it was only after 1943 that Indian interests, either on their own or in co-operation with foreign interests, ventured into new fields to an impressive extent. The climate in the latter half of World War II was so favourable for new company floatations that there was an unprecedented response from small investors. It is doubtful whether, in the near future, there will be a return to the conditions that obtained during this boom period. In fact, it is even difficult to say whether the stock market will again perform in the years to come that important rôle it filled from 1930 to 1946.

The third stage of industrial development, which has been in progress for some time now, has thus been made possible mainly by the large new company floatations just before the débâcle in the stock market in August 1946. The accumulated reserves and current allocations from profits of established companies have also helped in greatly effecting additions to capacity or promoting new enterprises. Efforts also have been made to raise additional capital and to borrow from the Government and the Industrial Finance Corporation. More recently, foreign capital has been seeking investment in new fields on a large scale, and new links have been forged between Indian and foreign interests. The net effect of all these developments has been to give a good start to independent India's attempt to found new industries.

In order to get a clear idea of the extent of development and the volume of investment between 1943 and 1953, it would be necessary to study the figures relating to the paid-up capital of joint-stock companies, the consents given by the Controller of Capital Issues, the imports of machinery of various types and the trend of production. I shall confine my analysis, however, mainly to an assessment of the volume of investment that has been effected by the various established and new industries, and of how the required funds were found in a period, first of hectic business and stock market activity and, later, of extreme depression in the capital market.

Increase in Paid-up Capital

It is unnecessary to emphasise that it is difficult to obtain a complete picture because of the paucity of relevant statistics and the difficulty involved in interpreting even the available data. The increase in the paid-up capital of joint-stock companies does, no doubt, give a rough estimate of the total capital raised, fresh and additional. But loan capital is excluded and there is no means of knowing the availability of resources other than the paid-up capital held in the form of free reserves, accumulated through the allocations from current earnings and the appropriations towards depreciation charges. The consents to new capital issues are not very helpful either though some idea can be had of the amount of capital freshly raised and the new directions in which the minds of entrepreneurs were working. Details regarding the capitalisation of reserves are also available. It is not, however, correct to presume, except when the stock markets were booming as in 1944-46 and new floatations were taken up avidly, that mere consents by the Controller of Capital Issues led to the raising of the requisite capital. In the past few years, consents have lapsed, and because of the difficult conditions in the capital market after 1947 it has not been possible to secure any large support from the outside investing public for new ventures. It is, therefore, necessary to adopt different approaches to arrive at broad conclusions by using the available data.

Before proceeding with an analysis of the character of investment in various industries, it would be appropriate to study the figures relating to the paid-up capital of joint-stock companies since 1942-43 and the consents to new capital issues since May, 1943. Thus we will understand to what extent the developments of the past decade have set new records for industrial development in India. The paid-up capital of joint-stock companies increased between 1943 and 1953 by Rs. 542 crores (See Table A)—without making any adjustment in the 1942-43 figure for partition. Probably 50 percent of this increase was due to the industrial corporate sector. This is the biggest increase for any decade in India's history. In 1918-31 paid-up capital rose by Rs. 150 crores, and in 1931-40 by Rs. 55 crores, allowing for the separation of Burma. Since May, 1943 consents to new capital issues have been as much as Rs. 1,205 crores, of which over Rs. 772 crores were on account of the industrial group. The respective figures are given below:—

TABLE I

Showing Trend of paid-up Capital of Joint Stock Companies in 1918-53.

Year ended March	No.	(In Rs. crores)
1918-19	2,789	106.61
1939-40	11,372	303.68
1942-43	12,770	336.13
1943-44	13,689	353.74
1944-45	14,859	388.97
1945-46	17,343	424.24
1946-47	21,853	479.47
1947-48†	22,675	569.56
1948-49	25,340	628.31
1949-50	27,558	723.89
1950-51	28,532	775.42
1951-52*	29,461	841.41
1952-53*	29,953	878.16

*Estimated.

†Figures after 1947-48 relate to the Indian Union.

TABLE II

Showing Consents given by the Controller of Capital Issues since 1943.

Period	Industrial	Non-Industrial	Total
	(In crores Rs.)		
17- 5-1943 to 30- 9-1945	159.62	100.94	260.56
1-10-1945 to 31- 3-1947	224.87	155.09	379.96
1- 4-1947 to 31- 3-1948	92.49	70.50	162.99
1- 4-1948 to 31- 3-1949	61.32	50.61	111.93
1- 4-1949 to 31-12-1949	26.42	8.25	34.67
1- 1-1950 to 31-12-1950	59.68	15.07	74.76
1- 1-1951 to 31-12-1951	44.00	15.55	59.55
1- 1-1952 to 31-12-1952	32.69	7.10	39.79
1- 1-1953 to 31-12-1953	71.40	10.00	81.40
	772.49	433.11	1,205.61

It will be seen that there is a parallel (not identical) increase in the consents to new capital issues and in paid-up capital until 1949, though even here it cannot be said that all the consents were "utilised" and fresh capital was actually raised. But it has been estimated that the new capital subscribed in 1943-47 amounted to a minimum of Rs. 200 crores, and the Government benefited almost to this extent through investments in gilt-edged securities. It was stipulated that funds which were not immediately utilised should be jointly invested in the name of the companies concerned and the Central Government in government securities and released at a later date when they were required for the desired purposes.

Direction of New Investment

These figures, however, do not serve our present purpose completely as it has to be indicated how the available resources were utilised and what sums were invested in established and new industries in 1946-53. In this direction, the statistics provided by Government are not helpful as the classifications are unscientific and no attempt has been made even to remedy obvious defects. The paid-up capital of such prominent units as the Tata Iron & Steel Company Limited has been included in the group "iron ore", instead of "iron, steel and shipbuilding". Nevertheless from the data available for over a decade an attempt has been made to find out which particular groups have progressed.

Table B (given at the end of this article) will show that since 1942-43 the paid-up capital of 17 selected groups has increased significantly, and that out of the total increase in the paid-up capital of all joint-stock companies by Rs. 542 crores, the groups under reference have accounted for Rs. 241 crores.

TABLE III

Showing increase in paid-up capital of selected groups in 1943-53.

Industry	(Crores Rs.)
Chemicals & allied industries	+ 37.05 *
Iron & Steel and Shipbuilding	+ 28.00 +
Engineering	+ 17.96
Clay, Stone, Cement etc.	+ 15.38
Aluminiumware	+ 1.90
Cotton Mills	+ 60.80
Jute Mills	+ 7.81
Mills for Wool, Silk, etc.	+ 7.99
Paper Mills	+ 7.57
Oil Mills	+ 9.92
Coal Mining	+ 13.11
Iron Ore	Nil
Mica	+ 1.61
Petroleum	— 0.02 ++
Other Mining	+ 4.87
Tea	+ 12.98
Sugar (including jaggery)	+ 14.00
	+240.93

* Includes Rs. 17 crores on account of Sindri Fertilisers & Chemicals Limited.

\+ Includes Rs. 3 crores on account of Hindusthan Shipyard Limited.

++ The paid-up capital of the oil refineries has obviously not been included under this head. Later figures will reveal the increase.

These figures do not show the amount of "genuine" investment, in the sense of direct subscriptions to additional or new issues and not capitalisation of reserves. If the need for distinction on this basis is borne in mind, it will be found that much new capital has gone into "chemicals and allied industries", "iron and steel and shipbuilding", "engineering", "clay, stone, cement", "mills for wool, silk etc.", "oil mills" and "cotton mills". Out of the increase in paid-up capital on account of the group shown in the table amounting to Rs. 241 crores, the first six groups mentioned above accounted for as much as Rs. 116 crores. The above figures, however, indicate only the direction of investment as between groups, and the accent on development in new directions. In order to find the volume of investment (which necessarily means the utilisation of the paid-up capital, ordinary, preference or deferred shares, loan capital in the form of debentures, and reserves, if any), the progress made by old and new industrial units which are fairly important in their fields has to be examined.

As regards the part played by the established industrial sector in bringing about an increase in the production of essential producer and consumer goods, an interesting study entitled *Achievements of Private Enterprise in 1947-52* was published by the Employers' Association, Calcutta, last year. An analysis of the experience of 138 companies in 1946-50 disclosed that almost every available rupee was effectively utilised and that the earlier free reserves, the return of E.P.T. deposits, the raising of additional capital and the appropriations from current earnings were made good use of. The most striking progress was made by the cement and paper industries, while the capacity of many existing textile units was expanded. The jute industry also embarked on a programme of rehabilitation, and it has recently been indicated by the Jute Enquiry Commission in its report that as much as Rs. 4.87 crores has been spent by 15 mills on modernising their machinery in whole or part. Another 13 units are in the process of modernisation at an approximate cost of Rs. 3.6 crores. On the basis that 138 companies spent annually Rs. 12 crores on additions to block, the established sector must have spent about Rs. 50 crores, or about four times the former figure, for the paid-up capital of the 138 companies under reference was roughly one-fourth of the total paid-up capital of the industrial sector in 1944-45 when the new companies had not attained so much prominence. From an analysis of the figures relating to these companies for later years, it is possible to say that the tempo of investment has been maintained and that the total for a seven-year period can be placed at Rs. 84 crores or Rs. 336 crores for the whole established sector.

Though there has been a near trebling of cement production, a record in respect of cloth output, a significant increase in paper and steel output, the investment in new industries has been equally important. In these cases, the fixed capital outlay was limited to the amount of paid-up capital, loan capital and loans given by the Industrial Finance Corporation. This is borne out by a study of the balance-sheets of 58 new companies (specially compiled) which came into being after 1944 and which started operations in recent years. Such additional (as distinct from fresh) investment as there has been related only to the sums secured through amounts written off on account of depreciation. The position will be seen in the consolidated balance-sheet given below :—

TABLE IV

Consolidated Balance Sheet of 58 new companies—1951(52)

(in crores of rupees)

Liabilities :		
Paid-up Capital	...	38.74
Debentures	...	2.66
Reserve Funds	...	0.96
Tax Reserves	...	0.68
Debts	...	28.80
P. & L. Balance	...	—1.56
Total	...	70.28
Assets :		
Gross Block	...	47.18
Depreciation	...	8.06
Net Block	...	39.12
Liquid Assets	...	31.16
Total	...	70.28

Against the paid-up capital of Rs. 38.74 crores the value of the gross block was Rs. 47.18 crores, the amount found by depreciation being Rs. 8.06 crores. The companies included in the consolidated balance-sheet can be said to represent a 40% or 50% sample of those that were floated after 1944. The total capital invested on account of the entirely new companies can thus be said to be not less than Rs. 100 crores.

The Central Government also have made a big entry into the industrial field, as will be evident from the figures given earlier. The Sindri Fertiliser Factory, which started production in October, 1951, accounted for an investment of over Rs. 20 crores on 31st March, 1953. Hindusthan Shipyard Limited is being expanded fast while Telephone Industries Limited has been functioning actively in co-operation with A.T.E., Liverpool. Investment in the public industrial sector (Central), excluding the railway undertakings and defence establishments, might be estimated at Rs. 35 crores.

Estimate of Total Investment

Summarising this enquiry, established industrial sector can be said to have invested annually at the rate of Rs. 50 crores on buildings, plant and machinery since 1946. Since, in the years 1943-46, it was not possible to devote attention to additions to capacity or replacements and renewals, because of pre-occupation with the war effort and the scarcity of capital goods, it would be reasonable to say that the total investment in fixed capital in 1943-53 was around Rs. 325 crores. Capital invested by the new industrial units, including earned depreciation charges, as has already been stated, can be estimated at over Rs. 100 crores. The investment in the public industrial sector (Central) was Rs. 35 crores, excluding railway undertakings and defence establishments. (No account is taken of the capital expenditure that is being incurred by the oil refineries which are expected to cost ultimately Rs. 60 crores.) Thus, the total investment in the various industrial sectors, comes to Rs. 450 crores. Of this, investors in this country might have accounted for Rs. 200 crores, about 50% of the increase in the paid-up capital of joint-stock companies in 1943-53, after allowing for capitalisation of reserves. If the amounts raised by way of debentures, premia on issue of new shares etc. were added, the net additional capital available would be nearer Rs. 250 crores than Rs. 200 crores. Thus, apart from larger support from the average investor, the total of available resources was considerably augmented by capital formed within the corporate sector, loans from the Industrial Finance Corporation and other agencies, and foreign capital. This impressive total has not been achieved at any time before in India's history even allowing for the increased cost of plant and machinery. It is difficult to say whether the same tempo can be maintained in the coming years in the absence of positive measures to promote capital formation and stimulate investment activity.

PROGRESS OF DEFENCE INDUSTRIES IN INDIA

● By Mahavir Tyagi ●

Minister for Defence Organisation

THE development of defence industries in India has to be viewed against the background of certain important factors which have a direct bearing on it. Firstly, the state of defence industries that were left to India as a legacy of British rule; secondly, the defence policy of India which confines the rôle of our armed forces to that of defence against aggression only; thirdly, the direct relationship between development of defence industries and the general industrial advancement of the country.

When India attained independence, her defence industries were merely an adjunct of British war potential. Her ordnance factories were manufacing minor equipment and even for the manufacture of that equipment the major components came from the United Kingdom. India did not have the drawings or designs for whatever was manufactured here and had to depend on foreign technicians to keep her machines going.

During the war, defence production was slightly stepped up and some new factories were added to the seven or eight that existed before the war. The end of the war, however, found these factories half-starved for work.

Aim of Self-Sufficiency

That, then, was the basis on which India had to build her defence industry. But from the very outset it was realised that the aim should be the attainment of self-sufficiency in the production of arms and ammunition and the past seven years have seen steady progress in that direction. Self-sufficiency in this context, however, takes into consideration the fact that we are not joining any armament race or a race for the unlimited enlargement of our Armed Forces. We have no aggressive designs and our Defence Services exist for, and are conditioned by, only one consideration, namely, the defence of India against external aggression. Our requirements in defence equipment are, therefore, circumscribed by the extent of danger from outside that we might expect.

Another limiting factor is the availability of funds. Large amounts of money have at present to be diverted to projects which are essential for the nation's future developmet and, therefore, cannot be available for building up our defence production.

First Important Step

The first important step for providing in India facilities for the development of new weapons and equipment was the establishment of a machine tool prototype factory at Ambernath which was opened by the Prime Minister on 13th January, 1953. This has the dual purpose of furthering the development of new types of weapons and equipment and, at the same time, meeting the requirements of ordnance factories for machine tools.

A large number of machine tools are required annually by the ordnance factories, both as replacement of worn-out or old and uneconomical machines as well as for new work, for special purposes or for expansion. Besides, in times of emergency it will be necessary to step up the activities and output of the ordnance factories and for this purpose more machine tools will be needed. They may not be available from other countries at the time, or even if available, there are likely to be difficulties in transporting them to India. A machine tool-cum-prototype factory, serving the needs of the ordnance factories, would not only enable them to manufacture prototypes for fresh development but will also serve their day-to-day needs, making them self-sufficient for machine tools.

Artisan Training School

But production of weapons, equipment and tools needs trained technicians and for that purpose an artisan training school has been attached to the factory. The school is expected to meet the requirements in trained personnel, not only of the Ambernath factory but also of other factories.

The production, development and training programme at the factory is proceeding, generally, according to plan. The main difficulty at present in the production of machine tools is the limited design facilities available. This is, however, expected to be overcome within the next few years. A programme for training the design staff has been drawn up and some staff has been sent to Switzerland for training. The detailed production programme of the factory has taken fully into consideration the resources in design and machine capacity in order to get the maximum return, and efforts are at present concentrated on the production of machines that are required in relatively large numbers.

At the Artisan Training School the first batch of 83 trainees has completed the three-year course and the second and third batches are now under training.

Aircraft Manufacture

Another vital unit in the chain of defence industries in India is Hindustan Aircraft Limited, which has made a distinct contribution in the shape of a newly-designed trainer aircraft HT-2. It has been thoroughly tested and found satisfactory for training purposes. The operational tests are now in progress and as soon as these have been completed the factory will start production both for the Air Force and for civil demands. The factory is already assembling *Vampires* that are in use in the I.A.F. and an advanced trainer aircraft is in the process of development. Here, too, as in other fields, the aim is self-sufficiency and the possibility of manufacturing aero-engines is being explored, while efforts are also being made to produce more components of aircraft.

Bharat Electronics

Bangalore, where Hindustan Aircraft Ltd. is situated, is shortly to have another important industry, Bharat Electronics, which is expected to go into production early in 1956. The factory will produce signals and wireless equipment, primarily for the Defence Services. The estimated cost of the factory is Rs. 9.5 crores, including Rs. 2.5 crores as working capital. A training school for Indian personnel will also be attached to the factory and is expected to be established by the end of 1954. Meanwhile, a number of trainees have been sent to France for a year's training. A French firm, with which a contract has been entered into for the establishment of the factory, will render service and assistance as adviser to the Government in every way in all matters relating to the factory. The factory will be registered under the Indian Companies Act and will function on commercial lines with a board of directors.

As necessary adjuncts to defence industry, a Defence Science Organisation and a Development Directorate have been established which in their own respective spheres help the industry through research and development of new designs for weapons and equipment.

In addition to these key factories, which are destined to play a vital rôle in the development of defence industries, there are at present about 20 factories producing a variety of arms and equipment. Plans are in hand for the establishment of more factories for the production of modern complicated equipment as well as for expanding the capacity of existing factories to produce more defence items.

Civilian Goods

Wherever defence requirements do not fully occupy any ordnance factory's production capacity, it is switched to the production of civilian goods. During the year 1953-54, trade orders to the tune of Rs. 129 lakhs were carried out by ordnance factories in addition to meeting the demands, for certain items, of the Posts and Telegraphs Department and the Railways.

The aim is to change over to indigenous production in respect of as many items as possible and during the last few years considerable progress has been achieved and imports are being steadily reduced. The goal of complete self-sufficiency may still be far off, but we are marching steadily towards it and hope to reach it in the not-too-distant future.

INDIA'S NEW FERTILIZER PLANT AT SINDRI

ITS CONTRIBUTION TO INCREASED FOOD PRODUCTION

● By A. K. Chanda ●

Lately Secretary to the Production Ministry

THE importance of chemical fertilizers in the economy of a country is progressively coming to be realised. There is an intimate and direct relation between the quantities of chemical fertilizers used and the yields per acre of the major agricultural crops. High yields are associated with high rates of fertilizer application and similarly low yields go with low rates of application. Germany, for instance, uses about 100 kilogrammes of fertilizer per hectare and the average yields of grain are about 2,200 kilos per hectare. In certain other European countries, where there is no organised use of fertilizers, the average yields are about 600 kilos per hectare. The same holds good for several Asian countries. It is also significant that when, during the war years, fertilizer consumption dropped in several countries, the average yields of paddy also dropped in a marked manner. Similarly, in the post-war period with the resumption of fertilizer consumption there has been a corresponding rise in the yield of paddy. Thus, whether in Europe or in Asia, a high level of fertilizer consumption is essential for high crop yields, and fertilizers have been used as a national means of solving the problem of food production.

The origin of the idea which has transformed Sindri from being an obscure village, scarcely on the map, into the seat of the largest chemical engineering plant in Asia can be traced back to the troubled years of war, when, in the wake of the Bengal Famine, public opinion was sharply focussed on the need for increasing our food production. It was natural that the Foodgrains Policy Committee of the Government of India should recommend, as a beginning, the establishment of a factory to produce 350,000 tons of nitrogenous fertilizers per annum. Thus the paramount need of food production constituted the motive force of this project, and yet it is necessary to remember another equally important reason which led to the establishment of Sindri. This was the expectation that the production of artificial fertilizers would mark the beginning of a heavy chemical industry which was clearly indispensable to a large-scale industrialisation of the country. Thus, both as an instrument for attaining self-sufficiency in foodgrains and as a key basic industry in itself, the idea of establishing a State factory for the production of fertilizers became the accepted policy of the Government.

Raw Materials and Location

Then followed technical missions from abroad, which came and made a survey of the possibilities of fertilizer manufacture from the angle of raw materials and location, and numerous conferences and discussions with the State Governments. As a result it was decided that one factory to produce 350,000 tons of ammonium sulphate should be set up by the State at a suitable place in Northern India. It is interesting to recall that at the same time the Government envisaged another factory of similar proportions being set up in South India. Once the decision was taken the choice of Sindri for the location became obvious and easy. Sindri was in the heart of the coalfields area. The factory required very large quantities of both coal and coke. Besides, it was on the bank of the Damodar river, with plans for construction of dams for storing water. Meanwhile, an infiltration gallery in the river bed could easily supply the very large quantities of water required by the factory and the township.

The first sod was turned at the site in the middle of 1945, and the heavy constructional work started a year later. A well-known American firm was appointed as consultant and entrusted with the designing of the plant, supervising its construction and seeing the factory into production. A consortium of U.K. plant manufacturers was employed to supply certain speciality plant and also to erect the whole plant in accordance with the consultant's experts.

All through the years 1946 to 1950 work proceeded apace at the site. Much thought and toil went into the building of each section of the giant plant. Then on 20th December 1950, the first boiler in the power plant was fired. This marked the end of heavy construction and the commencement of the stage of testing and initial operation. On 13th April 1951, the first generator in the gas plant was lit and then, through quick steps, initial production of ammonia was established on 28th August, and by a happy coincidence, the first glistening crystals of ammonium sulphate rolled down the conveyor belt on 31st October 1951, which was Diwali Day.

The factory is spread over an area of 336 acres and falls into four main sections—the power plant, the gas plant, the ammonia synthesis plant and the sulphate plant. The power plant is one of the biggest generating units in India, with a capacity of 80,000 K.W. It provides not only electric power to the factory but also process steam for the gas plant. The process in the gas plant consists in the blowing of alternate streams of steam and air over burning coke to give a gas mixture which is suitable for ammonia synthesis. After necessary purification the final gas mixture contains nitrogen, hydrogen and carbon dioxide. It is led into the ammonia synthesis plant where the carbon dioxide is removed and the nitrogen and hydrogen are synthesised under high pressure to form ammonia. The liquid ammonia is stored in huge containers known as "Horton Spheres." From here it is sent to the sulpha plant and reacted with carbon dioxide to form ammonium carbonate. Finally, ground gypsum is reacted with the carbonate solution and the resultant chemical reaction gives ammonium sulphate which is crystallised and separated leaving behind calcium carbonate sludge as a by-product.

The main raw materials required are thus coal for the power house, coke for the gas plant and gypsum for the sulphate plant. Gypsum comes from the Jodhpur and Bikaner divisions of Rajasthan.

Once commenced, production has been steadily on the up-grade. During the year 1952 Sindri produced 172,000 tons; the 1953 production was 265, 000 tons. It is true that the management have encountered certain operating difficulties which have not permitted the attainment of the rated capacity of approximately 1,000 tons a day. But these are now being tackled resolutely and there is every expectation of overcoming them soon.

The Problem of Management

The launching of this enterprise which, on account of the size of capital investment involved, had necessarily to be State-owned, threw up the problem of the suitable form of management organisation. This was a matter of key importance. The State was increasingly going in for industrial production, and to lead the way for other State enterprises, the Government was anxious to set an example of efficient and economic production at Sindri. Economy and efficiency were in any case vital, as the success of the enterprise depended ultimately on making the fertilizer available to the cultivator at prices well within his reach. If he felt that the price of the fertilizer was uneconomic, he would not be interested in its utilisation. This was a danger which obviously had to be avoided. After much thought and debate the Government decided to entrust the management to a private limited company registered under the Indian Companies Act. The board of directors is nominated by the President, and comprises, in addition to officials, eminent industrialists and a trade union representative. Although subject to the Government's directive in all broad matters of policy, the Company enjoys a large measure of autonomy and initiative in day-to-day operation and administration. The pattern of management was in fact an experiment designed to combine business efficiency with the traditions of public service, the attainment of the public good being the common aim. Experience of the working of the Company during the last two years has shown that the experiment has fully justified itself. Not only has the Government been able to press into service the wisdom and experience of eminent private industrialists, but it has also been possible to build up sound and healthy labour relations. This spirit of mutual understanding and co-operation constitutes a happy augury for the future of State industrial undertakings. Whatever disputes between the management and labour have arisen have been settled peacefully by mutual discussion. The welfare of the workers has been the special concern of the management.

In planning and building the township the ultimate object has been to provide each and every worker with a suitable house fitted with electricity and sanitary services. Present accommodation no doubt falls short of the requirements but every year Sindri is building more houses for its staff. Each colony of workers is provided with its own shopping centre, market, schools, dispensary, maternity clinic and recreation centre. The management runs at present two high schools, one middle school and four primary schools. All the employees and their dependents are entitled to free medical treatment. Construction of a permanent building for the hospital with 50 beds (to be extended later to 100) is in progress, and in the meantime, the hospital and dispensaries are located in temporary buildings.

The balance sheet and the annual profit and loss account of the Company are regularly laid before Parliament. In addition, the Articles of Association of the Company provide for the audit of the accounts by the Auditor-General. In these ways and also by the frequent exercise of the right of interpellation and debate in Parliament, the affairs of the Company are kept under constant review. The accountability to Parliament and thereby to the tax-payer is fully secured, as indeed it should be for an undertaking which is financed entirely by the State.

Distribution of the Product

The distribution of Sindri's product is a task which is both important and onerous. The ultimate consumers are spread over the length and breadth of the country, in its remotest village-and hamlet. It is essential to ensure that every farmer gets the fertilizer at the time and place he needs it. Until Sindri sets up its own organisation, distribution is done through the "fertilizer pool" administered by the Food and Agriculture Ministry of the Government of India. This pool was created in war-time when there was a great shortage of fertilizers, and by reason of the experience acquired over several years, it continues to play a most useful rôle at the present time. Sindri sells its production to the pool which in turn allots quotas to the various States. The distribution to the consumers is the responsibility of the States and is done through a variety of agencies, departmental depôts, private firms or co-operative organisations.

The importance of the price factor has been referred to. Sindri's price should be fully responsive to the farmers' willingness and ability to utilise the fertilizer. Sindri has followed only one policy in this regard, to bring the fertilizer within the easier financial reach of the agriculturist. As the rate of production has increased so it has been possible to reduce the price. Starting with Rs. 350 per ton, Sindri has steadily reduced its price to Rs. 300, Rs. 285 and finally, with effect from early this year to Rs. 275 per ton. An attempt to simplify the distribution has also been made by pooling the railway freight at Rs. 35 per ton, with the result that any consumer, no matter in which part of the country, can now obtain ammonium sulphate through the agency of the State Government at any rail head in India at Rs. 310 per ton. To this has to be added, of course, the incidentals of distribution charges incurred by the State Governments inside the State, but these will not exceed Rs. 30 per ton in any case.

Ultimately the success of Sindri will depend upon its ability to stand on its own in the technical sphere, on creation of an efficient corps of technicians, and on the skill and resourcefulness of its workers. Technological development plays an important part in the organisation of the factory, and before long it will no doubt be necessary to have a strong research centre also. Upon the corps of officers and men has devolved the task of streamlining production, raising efficiency and continually reducing the costs of production. I might refer to one achievement which, though perhaps minor in character, signalises the direction of development at Sindri. The normal operation of the factory requires about 140 tons of catalyst (for oxidation of carbon monoxide) which used to be imported at a cost of over Rs. 10,000 per ton. Sindri technologists got to work to devise a catalyst plant, and in a little over a year and at a cost of Rs. 3.5 lakhs they had constructed a plant which is now working at the maximum capacity producing the catalyst at a cost of Rs. 2,500 per ton. Thus a recurring economy of about Rs. 10 lakhs a year has been secured through the efforts of our technical staff.

The expansion of fertilizer production at Sindri and the development of ancillary and allied industries are the result of conscious planning directed by vision and imagination. The calcium carbonate sludge which issues as a by-product of the factory lends itself to the manufacture of Portland cement. A private cement company has entered into an agreement with Sindri for the purchase of the sludge and before long there will be a cement factory adjoining the fertilizer plant and producing 300 tons of cement per day. The need for Sindri to manufacture its own coke was implicit in the planning of the project, and now a set of coke ovens are being built which will produce about 600 tons of coke per day. The coke-oven plant provides for the recovery of all the by-products of coke manufacture like benzol, naphthalene and tar. These by-products will form a valuable addition to the raw materials required by our heavy chemical industry. The gases issuing from coke ovens are proposed to be tapped to manufacture two other new nitrogenous fertilizers, urea and ammonium nitrate. The Fertilizer Mission sponsored by the Technical Co-operation Administration of the United States of America went abroad early in 1953 to study the various processes for the manufacture of urea and ammonium nitrate. Based on their report, the Government has called for tenders from some reputed foreign firms for the manufacture of these fertilizers. The fulfilment of these plans will not only increase the sum total of nitrogenous fertilizers in the country but also introduce an element of diversity in supply. These fertilizers have already established their position in Europe and America, and agricultural experts have spoken reassuringly of their suitability to Indian soils and crops. At present the various State Governments are engaged in popularising the use of these fertilizers by an organised campaign of propaganda and demonstration.

It cannot be emphasised too strongly, however, that so far as nitrogenous fertilizers are concerned, Sindri represents just a beginning, and there is very vast scope and need for expansion. Sindri's present production if applied solely to food crops can yield an additional 750,000 tons of foodgrains. This is about sufficient to feed four million persons which incidentally is the annual increase in our country's population. It is on this ground that it has been picturesquely urged that if we are to solve the country's food problem through nitrogen alone, we need a new Sindri every year! We have over 100 million acres of land cultivated with paddy and wheat and at present barely 5 percent of this gets the benefit of nitrogenous fertilizers.

The high significance of Sindri to the nation consists not merely in pointing the way to the solution of our food problem and incidentally saving valuable foreign exchange. It consists even more in creating the nucleus of a heavy chemical industry to serve as a prelude and instrument for the further industrialisation of the country. It is also Sindri's function to create a training ground for our engineers and scientists. I might mention that but for a few foreign experts, who will also be replaced in the near future, this huge plant of which we are all so justly proud, is fully manned by Indians. The Sindri Company has evolved and put into effect a training scheme which will help to create the corps of technicians and engineers required to man our expanding industries. The problems of production, of maintenance and of continuing technological advance at Sindri will stimulate the engineering and inventive genius of our scientists and give a fillip to scientific research. In all these ways Sindri can confidently look forward to playing a no mean part in developing our industrial resources and thereby raising the material happiness and welfare of our masses.

THE AUTOMOBILE INDUSTRY IN INDIA

● By Sir L. P. Misra ●

MANUFACTURE of automobiles has come to be recognised in industrially advanced countries as one of the key industries, for apart from its utility for defence, it provides convenient transport facilities on roads and leads to the development of ancillary industries which create, in turn, a number of sub-industries in their respective fields. Some idea of what the automobile industry can do for other industries will be obtained from the following statement which shows the percentage of consumption by the automobile industry in the U.S.A. of some of the raw materials being produced there in such huge quantities.

Raw Materials	Percentage of annual production used by automobile industries in the U.S.A.
Strip steel	49%
Gasoline	90%
Rubber	80%
Plate Glass	75%
Leather	68%
Aluminium	9.7%
Copper	13.7%
Zinc	12.1%
Nickel	23%
Cotton	10%

In addition to the great incentive given to ancillary industries in the U.S.A., every seventh worker there depends for his livelihood directly on the automobile industry. Apart from these advantages to the country, the Government becomes a direct gainer from the taxes realised from the industry. For example, the Government in the U.S.A., where taxation on automobiles is comparatively low, collected from only one of its leading automobile manufacturing firms about Rs. 450 crores in direct taxation alone. Even in India where the industry is still in its infancy and the comparative number of motor vehicles in respect of population and area the lowest amongst the civilised nations, the taxes realised have already come to about Rs. 65 crores in a year.

Advantageous as this industry is to a country, it is not easy to develop, for it requires a considerable amount of technical knowledge and experience not easily available in a backward or even in a semi-developed country. Only about a dozen countries in the world have so far been able to take up successfully the actual manufacture of automobiles. Even in these countries success has been achieved after many failures. For example, out of about 2,530 firms which started manufacturing automobiles in the U.S.A., about 20 have survived and out of them the first four are producing more than 85 percent of the total number of automobiles manufactured in the country.

Assembly of Motor Vehicles

From its very start, the automobile industry in India had to face a number of hurdles, and it is still struggling. Motor vehicles started coming into India in large numbers after the termination of the first world war. They used to be imported ready for the road. Later on, just before the beginning of the second world war, one or two firms in the trade started importing them in a semi-knocked-down condition in which the body and the chassis used to come assembled and were put on the axles and wheels on their arrival in India. During the last war the import of vehicles for public use had to be severely curtailed and the vehicles imported for war work had to be shipped in a knocked-down condition and assembled in India just to reduce the loading space in ships so much in demand in those days.

It was only in 1947 that the Government took up the question of manufacture of automobiles in earnest and decided, as a preliminary measure, to restrict the import of vehicles to such models as were to be manufactured in the country. To save foreign exchange and to utilise local labour and local material to the maximum possible in the circumstances, the Government further ruled that the vehicles of the approved models were to be imported in a completely knocked-down condition. The import of a number of components like tyres, batteries etc. was also progressively restricted to encourage the use of components of indigenous manufacture. As a result of the policy pursued, about 14 firms got enlisted as would-be manufacturers of automobiles. The total capital invested by these firms in India till last year was about Rs. 9½ crores, out of which Rs. 5 crores represented the subscribed capital of Hindusthan Motors and Rs. 2.25 crores of the Premier Automobiles. The rest of the firms were working with a capital of about Rs. 2¼ crores between them. The Government reviewed the position from time to time but as the industry was not making the progress promised and expected, the Government referred the case to the Tariff Commission in 1952 for recommending what steps should be taken to establish the automobile industry on a proper basis. The recommendations of the Tariff Commission were considered by the Government last year and a definite policy formulated for the consolidation of the existing industry and its further development in the country.

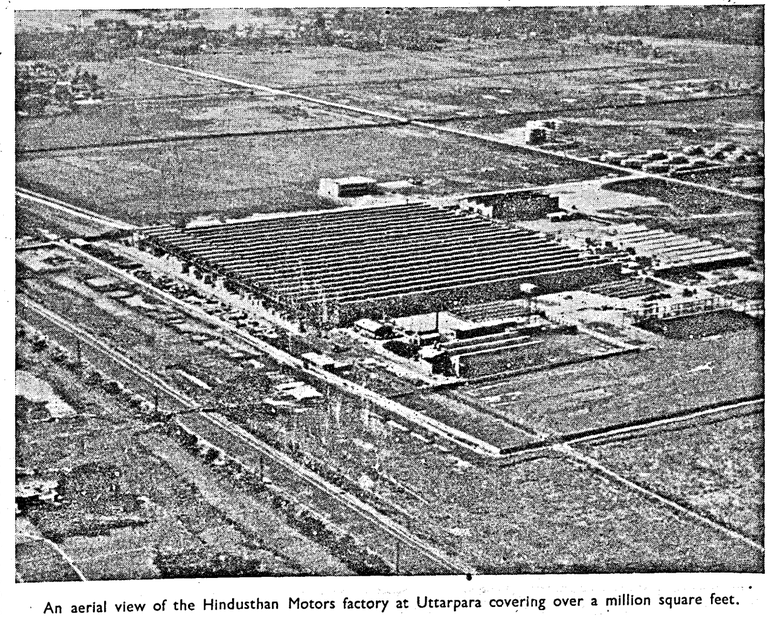
New Automobile Policy

Under this policy the assemblers who pleaded inability to take up the manufacture of the vital fast moving parts like engine, gear box, axles etc., of the models they were importing for sale in India, have not been granted further licences for imports while those who submitted a phased programme of manufacture of components of the approved models marketed by them have been asked to work to their programmes. Their progress is being watched and licences for any particular period are to be issued for the import of only such components as do not figure in their programme of manufacture in that period. This policy provides an automatic incentive to all genuine manufacturers of automobiles, and had to be adopted for many of the importers who enlisted themselves as future manufacturers of motor vehicles had been confining their activities mostly to the assembly of ready made components imported into the country, and had done very little for the development of their manufacturing programmes on the strength of which they secured their enlistment as approved importers. This was by no means an unusual occurrence. The assembly of a motor car out of ready made imported components is, in a semi-developed country, the most remunerative part of the automobile business as the assembly can be done with a small capital and with the technical "know-how" locally available. The vehicle assembled becomes a local product and therefore entitled to the patronage and encouragement of the Government and the people. It is generally for this reason that in semi-developed countries an assembler becomes in course of time the greatest obstacle to the development of the automobile industry. India was no exception. Out of the 14 assemblers, efforts were made by two to develop manufacturing operations. The rest remained content for over five years with assembling ready made parts imported from abroad and purchasing what were available locally like tyres, rubber components, batteries etc.

It would, however, not be correct to say that the industry has made no substantial progress so far. As things stand at present, the Hindusthan Motors factory at Uttarpara, which was adequately equipped a few years back, has already been manufacturing the vital fast moving parts like engine, gear box and front and rear axles of their Hindusthan cars for the last three years. They have been doing all the castings of grey iron components including the engine block and forging even important parts like crankshaft etc. in their own foundry and forging shop. Engines, gear box, axles etc. made by Hindusthan Motors have been on roads for over two and a half years. To maintain the reputation of their products, Hindusthan Motors have maintained a liberal policy for replacement of the parts manufactured by them and, reported to be unsatisfactory. The total replacements on vehicles on the roads have not, however, come to even 0.5 percent. Considering the highly specialised technique and the difficult "know-how" involved in the manufacture of the engine, gear box and axles etc., this is no mean achievement, for the industry started from scratch only seven years back. A number of ancillary industries in the country have also been assisted, with the result that the foreign contents of the Hindusthan car priced at about Rs. 10,400 come to about Rs. 3,300. With the rapid development taking place in the Hindusthan Motors workshops even this amount will be substantially reduced in the course of the next 18 months. In fact, their target is to produce either in their own shops or in ancillary industries all except the proprietory (patented) parts and a few others the manufacture of which is outside the normal sphere of a manufacturer of automobiles.

Scale of Production

It will be noticed from what has been explained above that the Hindusthan Motors workshop forms today the spearhead of the development of this industry. The problems confronting it are, however, not peculiar to it. They will have to be



An aerial view of the Hindusthan Motors factory at Uttarpara covering over a million square feet.

faced by other manufacturing shops as soon as they reach the stage of development attained by Hindusthan Motors about two and a half years back. An automobile manufacturing shop has to be equipped with expensive automatic machines and cannot become a paying proposition without mass production. Its main and ever-present problem is to utilise as fully as possible the capacity of the shop. To reduce the capital cost, the capacity of the Hindusthan Motors workshop at Uttarpara has been kept down to the minimum consistent with efficiency of production. It stands at eight vehicles per hour or about 60 to 64 vehicles per shift of eight hours in a day. To reduce this capacity further would have been uneconomic and led to inefficiency of production. In fact, as things were developing after the war, this capacity was not sufficient to meet the full requirements of the country without working multiple shifts. If the postwar developments pertaining to the utilisation of motor vehicles on roads in India had progressed as in other countries there would have been a gap between supply and demand even after utilising the full capacity of the Hindusthan Motors workshops. This shop has unfortunately not yet been able to work even to 20 percent of its capacity. The main hurdle now is not lack of "know-how" or capacity, but of the sale of what it can produce. As sales depend only on what the market can consume, it is essential for the success of the automobile industry that the handicaps restricting the automobile market in India should be reviewed and removed if possible.

During 23 years (1930-31 to 1952-53) India imported approximately 433,000 vehicles— 209,000 motors cars and 224,000 commercial vehicles of all descriptions—giving an average import of approximately 19,600 motor vehicles per year. Instead of the automobile market expanding in India, it actually contracted to about 15,000 in 1952 and about 9,500 in 1953. The only plausible conclusion which can be drawn from this contraction is that not only is the market for motor vehicles not expanding but that even the vehicles scrapped or getting over-age are not being replaced, and this has happened in a period when under the impetus of the five year plan there has been a substantial increase in production all round.

In fact, industrial production during the last two years has risen from an index of 117 to 135, and agricultural production from 95 to 105. The Government have earmarked about 29 percent of the financial resources of the plan for the development of the transport facilities in the country and cannot be accused of having neglected its transport requirements.

A general view of the Hindusthan Motors machine shop with some of the manufactured crankshafts in the foreground

Inadequate Railway Capacity

The railways, which provide, at present, more than 90 percent of the requirements of the country—both in ton and passenger miles—have been given an unprecedented amount of Rs. 95 crores for their development in this year and are likely to receive the same amount or even a greater amount in 1955-56. They have manfully struggled to do the best they could to meet the demands of the traffic offering. But the fact remains that even with this large allotment of funds, they will not be completing their rehabilitation programme by the end of the plan, and much less provide for the substantial increase in production resulting from the plan. If the future developments under the plan are not to be throttled for lack of transport facilities, other methods of transport available—rivers and roads—will have to be developed to fill the gap created by inadequacy of transport capacity on the railways.

Unfortunately our important rivers have been so woefully neglected in the past that it is almost impossible in the next few years to develop steamer services on them sufficiently to meet the growing requirements of even riverine stations. It is true that country craft can be developed quickly to cater for some of the slow moving traffic, originating and terminating at riverine stations. But country craft can fill only a small percentage of the huge gap between supply and demand. The rest of the deficit can, therefore, be made good only by development of motor traffic on roads. The Government has been spending large amounts on the improvements of the existing roads and on building new roads in the past. It would be spending about Rs. 30 crores on roads this year and may spend the same or an even greater amount next year. It is, no doubt, true that what has been done or is being done, in this connection, remains very far below what was envisaged in the Nagpur Plan. But it cannot be denied that the position in respect of roads is much better today than what it was at the time of the formulation of the plan. The total mileage of various types of roads in India has now gone up to more than 250,000. So the roads are there—also the traffic—but it is very disconcerting to find that motor traffic on them has not only not developed proportionately to these improvements and extensions but has on many roads suffered a setback. What is needed is a greater number of motor vehicles plying as public carriers to deal with the traffic offering.

Heavy Taxation

There has been a general complaint that this state of affairs has been brought about by the excessive taxes levied on motor cars and trucks by the States and the Centre. There is no doubt that under the mistaken impression that in this land of bullock-carts motor transport was the privilege of the rich and could be taxed to any extent desired, without injuring the interests of the masses, very high taxes have been levied. The tax per ton-mile on trucks licensed as public carriers has mounted up to an average of about 23 pies per ton-mile, while the total cost of carrying a ton-mile on the railways comes to about 9½ pies.

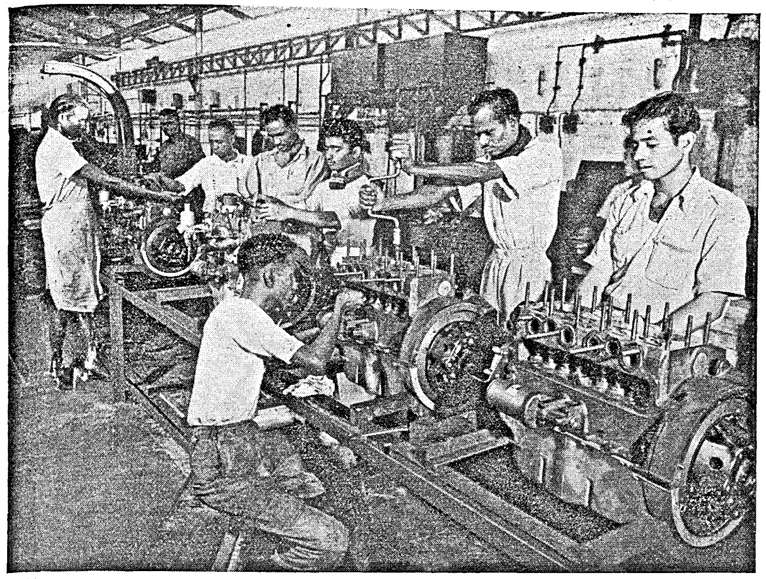
Unfortunately, taxes on motor vehicles are easy to collect. The protest they raise, comes only from owners of the vehicles, a small minority, and cannot therefore gather much momentum. Governments in India have therefore been utilising this method of taxation just to increase their resources and irrespective of its baneful effect on the economic development of the country. It cannot, however, be ignored that so far as public carriers are concerned, the taxes, high or low, are passed on to the consumers and are harmful only to the extent that they increase the cost of transport and therefore, tend to decrease volume. In India the position at present is, however, quite different. As explained above, motor transport is not sufficient to cope even with the existing production clamouring for transport, with the result that the gap created by the shortage of transport facilities on the railways will become bigger and bigger as production increases under the impetus of the plan.

Such a state of affairs cannot be viewed with equanimity as it is not in the interest of the plan. Something has got to be done to eradicate this unsatisfactory state of affairs. It will be noticed from what has been explained above that as long as traffic is available for motor vehicles, public carriers will not be deterred by taxes from running, unless actively discouraged as at present through other causes. The real cause for inadequacy of motor transport on roads, in spite of the roads and traffic being available, has to be looked for elsewhere. Anyone familiar with this problem will readily agree that the main reason for more motor vehicles not having been put on the roads as public carriers is mostly due to the restrictions on their movement placed under the present Motor Vehicles Act.

Motor Vehicles Act

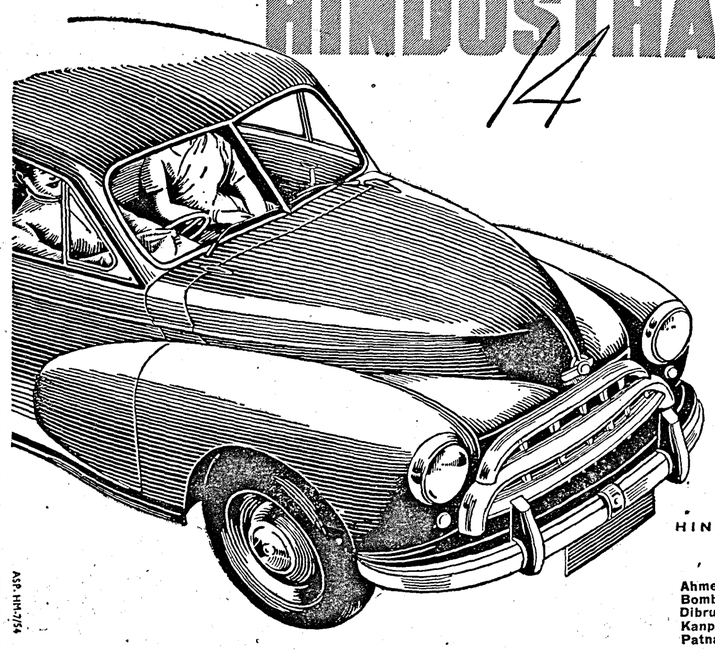
These restrictions have, as mentioned below, a history of their own. There was a serious economic depression in the country in the year 1931-32. Railway earnings had dropped to the low figure of about Rs. 86 crores in a year. The railways then had more carrying capacity than was being utilised and could not afford in these circumstances to see high-priced traffic carried by motor vehicles on parallel roads. It was obvious then that unless some brake was placed on motor traffic on the roads, the railways would have to increase their third class fares and also railway freights on cheap commodities. The Motor Vehicles Act was enacted to counteract the diversion of traffic from the railways to the roads. It served a useful purpose for a number of years. Transport conditions have, however, completely changed since then. As mentioned earlier, the railways are not only carrying all the traffic that is offering, but shall not be able to carry the increasing traffic likely to be offered for some years to come. It is, therefore, imperative that in view of the change in the transport conditions in the country, the policy embodied in the Motor Vehicles Act should be reviewed. Previously, a vehicle licensed as a public carrier could ply anywhere in India with the result that it went wherever traffic was offering and kept itself fully utilised all the time. In fact, trucks used to run from Peshawar to Calcutta, loading and unloading whatever was available on route. It was a family-owned and family-operated truck and generally a very remunerative business proposition. Under the present Motor Vehicles Act, the licences issued for a public carrier are for a particular zone in which it is not possible to find traffic all the year round. In addition, there are numerous restrictions on the movement of public carriers not only to other States but even to other zones as well; with the result that the operation and maintenance of the vehicle under the restricted movements and combined with heavy taxes now levied have become an unremunerative business. If the large funds spent on the roads in India are to be fully utilised in the interests of the masses and if the deficit in transport facilities resulting from the shortage of capacity on the railways, is to be made good, it is essential that the limitation imposed on the area of operation of public carriers under the present Act should be removed as early as possible. For so long as the owner of a public carrier is not permitted to go wherever the traffic may be offering and thus keep his vehicles fully occupied throughout the year, there is very little chance of motor traffic on roads filling the transport gap to any appreciable extent. This restriction on the area of operation of public carriers is entirely self-imposed. It is not necessary to continue it when the interests of the country require its removal. Further, its abolition will involve no expenditure to the Government. In fact, it will add to their earnings as the number of public carriers increases on roads.

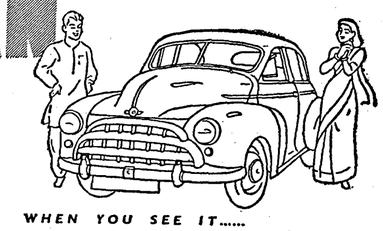
In India where motor traffic is still in its infancy, it is difficult to realise that it can satisfactorily meet the shortage in the carrying capacity of the railways. We must not, however, forget that the traffic handled in America is acknowledged to be the heaviest of any country in the world. Yet, the major portion of this traffic is being handled on roads. It is true that our roads have not reached the standard of development of roads in the U.S.A., but the amount of traffic to be handled here is correspondingly less. Even in their present condition Indian roads are capable of filling the gap created by the shortage of carrying capacity on the railways, if public carriers are not actively restricted in their movements and allowed to keep themselves fully utilised throughout the year. Removal of such restrictions will increase their number according to the growth of traffic under the plan and will be effecting thereby a steady expansion of the automobile market in India, which is such a pressing need of the automobile industry.



Assembly of the engine from components manufactured in the Hindusthan Motors shops.

HINDUSTHAN 14





WHEN YOU SEE IT.....
You will be impressed by its smart, dignified look and its rich, tastefully appointed interiors.

WHEN YOU DRIVE IT.....
You will feel the power of its silent engine, its nimble performance and the comfort of its foam latex cushioning.

WHEN YOU BUY IT.....
You will feel happy at the low price you pay. You will also feel a sense of pride because you buy a car manufactured in India, and thus help in the industrial growth of the nation.

WHEN YOU USE IT.....
You have the sense of contentment born of long trouble-free service, outstanding economy and reliable motoring year after year.

HINDUSTAN MOTORS LTD. CALCUTTA.

AUTHORISED DEALERS AT:
Ahmedabad; Allahabad; Ambala; Agra Cantt; Bangalore; Bombay; Bareilly; Calcutta; Cuttack; Coimbatore; Dibrugarh; Indore; Jaipur; Jodhpur; Jamshedpur; Jullunder; Kanpur; Lucknow; Madras; Madura; Nagpur; New Delhi; Patna; Rajkot; Secunderabad (Deccan); Tezpur; Trivandrum; Vijayawada; Rangoon; Colombo.

A TYPICAL NEW LIGHT ENGINEERING ENTERPRISE

MAKING SEWING MACHINES, FANS AND LANTERNS

● By Sir Shri Ram ●

BEFORE the second world war, the Indian light engineering industry, in the true sense, did not exist. The efforts made by a few industrialists starting an odd enterprise here and there such as the manufacture of sewing machines, electric fans, hurricane lanterns, bicycles, textile machinery, telephones, electric meters, type-writers, etc., was mainly directed towards job production. There was acute scarcity of production engineers, labour was not trained properly, nor was proper equipment provided. Production technique was based on a very loose system, and technicians worked mainly by rule of thumb. This period can be compared with that which existed 60 or 70 years ago in the countries which are now highly industrially developed. A few far-sighted people did realise that without establishing engineering industries we would always be dependent upon foreign countries to meet our increasing needs of machinery, equipment, tools and various items of daily use. But during the 30's the world passed through a period of great depression accompanied by severe competition and it was almost impossible for a newcomer to establish a mass production light engineering industry. Those who tried did so at great financial risk.

Sometimes good comes out of evil. When the world was at war and millions of people were being rendered homeless and every country was producing munitions day and night for the destruction of its enemies, India was called upon to play her part as a member of the British Empire. It was a great chance for the country. We benefited immensely from what we learned of production technique. Our technicians realised what was possible in this country and what could be accomplished. Consequently there came into being a number of light, medium and heavy engineering industries. Some of them have made remarkable progress in the post-war period; the country has become self-sufficient in the supply of a number of items and in others has achieved an exportable surplus. It is in fact very creditable that such remarkable progress has been made in such a short time. Today first-class light machine tools are being produced. In light diesel engines we have become almost self-sufficient, and the quality and price are both very attractive. In electric motors and transformers, the majority of the requirements of the country are being met. Production of bicycles has reached a very good level. In textile machinery, carding engines, ring frames and looms are being successfully produced. Most of the country's requirements in small tools are being met from home sources. Light automobiles are coming up very well. In electric fans, hurricane lanterns, sewing machines and a host of other items, the country has already become self-sufficient, and has even started exporting some of these items.

An illustrative example of this progress is the Jay Engineering Works. In 1935 a company was promoted under that name by Mr. B. D. Basil, with a capital of Rs. 2½ lakhs and with the object of taking over a small industry running in the outhouse of a residential building, employing no more than 50 workers and with less than Rs. 2 lakhs investment. Very soon it was realised that neither the capital nor the space as it then existed would suffice. The present Chairman took upon himself the responsibility for immediate assistance, and the capital of the company was raised to Rs. 15 lakhs. The present site was purchased in the year 1938. Sewing machine manufacture, which was to be one of the company's chief concerns, has now developed into a fine art and represents a considerable achievement even in the highly advanced countries, but in India, which has little background of production engineering, the task was immeasureably more difficult. With such a specialised product very little is known of the technique outside the industry. The Jay Engineering Works Ltd., took upon its shoulders the task of nursing a most intricate precision industry involving the manufacture of 300 components and the performance of 2,000 operations. It had just started making something which could be called a sewing machine when the second world war started. The work of making sewing machines had to be given up to make way for war work. Progress was almost at a standstill until 1946 when the company again started establishing its main line, the Usha sewing machine. During the war the manufacture of Jyoti hurricane lanterns and Usha electric fans was also undertaken.

In 1944, with the help of the Industries & Supplies Department, machine tools for the factory and tool room were procured, together with measuring and testing equipment and heat-treating plant from the U. K. and U.S.A., for an estimated output of 3,000 sewing machines a month working on a two-shift basis. After a close study of the designs and workings of different known models available in the market the new Usha was developed. The company's technicians studied details of the functional designs of the sewing machines, the relative motions of different makes of machines and, keeping Indian conditions in view, were able to improve upon the ideas of well known makes. During the period from 1937 until 1946 the company lost money except for the period from April 1941 to March 1945. At the end of 1946 the financial position was very serious.

Production Obstacles

The want of technical skill and a production engineering background were obstacles, but a much bigger difficulty was the legacy left through making a wrong start. Not a single drawing existed and whenever any difficulty arose reference was made to the Pfaff components, of which the old Usha was more or less a copy. The machine tools, or jigs and fixtures were all of antiquated and poor construction. Gauges were almost non-existent and no accurate components, micrometers or calipers, were in use for measurement. A good deal of tempering and tinkering was done in assembly. The final finish and good working of an assembled machine entirely depended upon the skill of the individual worker. Some machines were really good while others constantly gave trouble to customers, who often abandoned them in disgust. The trouble did not end there. Even the company's best workers developed bad habits, and at the time of reorganisation some were very non-co-operative. They seemed to think that with the latest type of machines which we were importing, and the new tooling we were designing and making, their importance would be reduced. Moreover, because of their conservatism, they thought the methods they had been following were better than the more scientific methods which were being introduced. At the same time there was a ray of hope in so far as the bulk of the staff were keen to adopt new methods. They resolutely carried on their difficult task and ultimately overcame prejudice. In addition to all this, the country's backwardness in engineering lines made the task still more difficult.

In other countries no single sewing machine manufacturer produces all the components himself. Most of them obtain their castings, forgings and other spare parts from outside suppliers. Specialised toolmakers, raw material manufacturers, etc. are ready to give the necessary help and advice without any obligation, whereas the Indian company had to undertake the analysis of all the important components to establish proper specifications for the raw materials, and had to develop suitable methods for successfully producing the more intricate parts. In 1946 the services of a British expert, Mr. J. D. Scaife, were obtained. He helped considerably in further improving the quality of work and efficiency.

The Present Position

In the year 1947 the company turned the corner and started making a profit. Since then there has been a steady improvement in efficiency and in the quality of its products. Nothing succeeds like success, and the company was encouraged by its achievements to increase its targets. In the period that followed, production was totally reorganised, the latest machine tools were bought and an up-to-date tool room was established. The company now has a very modern semi-mechanised foundry to meet requirements for castings, a wood-working and plywood shop fitted with the latest machinery to produce laminated boards for cabinets, a heat-treatment shop fully equipped with electric furnaces, salt cyaniding baths, an induction heating arrangement, and electric hardening and tempering baths, with automatic controls to impart long life by proper heat treatment to sewing machine parts. The machine shop has over 500 modern machine tools, single and multi-spindle autos multi-tool turning lathes, capstans, turrets, multi-spindle drills, production and hydromatic millers cylindrical, surface and centreless grinders, automatic gear shapers, lapping and super-finishing machines, to produce components to high precision limits for inter-changeability and long life. Besides the above, the engineers have designed and made over 50 special purpose machine tools for the sake of economy, ease in operation and accuracy. The arm and the bed of the sewing machine, which are the heavy items, and involve high transport cost, a large number of operations and accurate alignment have been organised on a line-production system. Use has been made of special purpose machines made at the works or imported from Germany. There was difficulty in obtaining bright bars for the automatics and a bright bar drawing and straightening machine had to be installed. For the flower designs on components, which are very popular with the public, coining presses were installed. A complete arrangement was made for producing forgings on beche hammers.

To bring the finish of the product in line with well-known makes, a complete plant for copper, cadmium, nickel and bright chromium plating was installed. A good deal of research has been conducted on improving the finish of components. A metal finishing chemist was sent to Japan for further training. Automatic conveyorised plant has been installed for enamelling and to ensure a consistently good finish. The assembly is organised on the line-production system under the guidance of an experienced German engineer, who has had long experience of similar work in German factories. For research and development the company sought the help of German experts, and four Germans were obtained for the development of the foundry, tools, equipment, methods and study of mechanism of the sewing machine. About a dozen young engineers are attached to them, and besides helping they are getting good training in production engineering, works simplification, method studies, designs, and inspection and development of new models. This is a very important part of the business and entails heavy expenses amounting to Rs. 50,000 a month.

Today the company is producing 300 machines a day and the plant is capable of producing 10,000 sewing machines, on a two-shift basis, every month. It is hoped to reach this target in the very near future. Besides the sewing machine model developed in 1947-48, several other models meant for tailors, for families, and for industrial use have been added to the range of production.

It is also planned to produce 10,000 electric fans a month in the near future. At present production has reached over 200 fans a day. Production of hurricane lanterns stands at 5,000 a day and it is hoped to reach a target of 8,000 lanterns a day within a year. The total capital employed exceeds Rs. 2½ crores.

For the perfect interchangeability which is necessary for mass production, a separate inspection department has been established, and an expense amounting to about 6 percent of the total labour cost involved in the manufacture of sewing machine is incurred. The standard spare parts are even interchangeable with similar models produced by other manufacturers. The inspection starts from the incoming raw materials and goes on at all stages until the finished product is packed and despatched. Each sewing machine bears an inspection tag which is signed by the viewers. If any complaint is received about the machine, the fault is investigated and it can be ascertained if there has been any negligence on the part of the person inspecting. Before the Government of India invited U.N. experts on statistical quality control to India, the company had secured the services of the world renowned expert, Dr. T. Hanada, who trained heads of departments in the use of statistical quality control.

Personnel Training

Since knowledge of the highest scientific technique is the basis of manufacturing perfection, the company has, from time to time, sent members of its higher technical staff to the leading industrial

countries so that they may improve their knowledge. That policy continues. A "Training Within Industry" scheme under which supervisory staff are trained in the better handling of labour, materials and methods has been introduced. A technical training school for training foremen and supervisors in matters dealing with labour, the utilisation of machinery, assessment of workloads and the technique of improvements generally has been established. There is a regular course for training skilled technicians. In addition refresher courses are provided to older workers to improve their knowledge and skill. This has helped gradually to improve the standard of workmanship and the approach to solving problems. Recently a course for the members of the staff in "Personnel Management" was arranged.

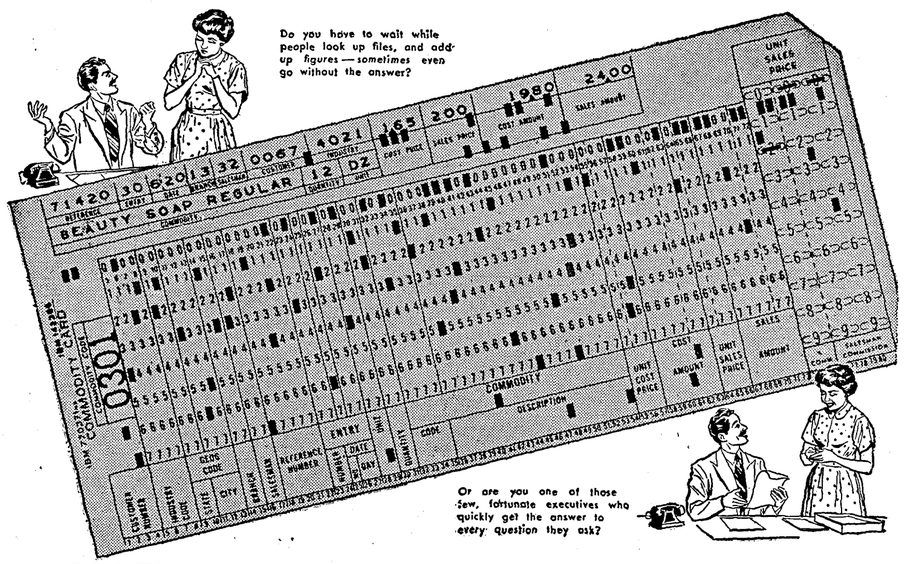
Extensive work has been carried out on material handling throughout the factory. A separate department has been created for this purpose to investigate problems connected with transport and storage of materials. Besides reducing the cost of direct labour on handling materials, it has resulted in improving working efficiency because a smoother flow of materials is maintained in all stages of operations. The studies were not confined only to the transport of materials. Full consideration was given to the problem of how many feet a certain component travels for the subsequent operations and this method of work simplification brought to light various inefficiencies and needless effort. On various components the whole sequence of operations and lay-out of the plant have been changed after this investigation. Wherever it was found necessary, conveyors have been introduced or other mechanised transport have been provided.

Sales and Service Organisation

The company has nearly 600 branches, agents and sub-agents all over the country. It has organised nearly 300 servicing centres. There are over 50 tailoring and embroidery schools in different parts of the country where nearly 4,000 girl students attend daily. Export markets in 26 countries have been established, and 1,500 sewing machines, 1,000 electric fans and 40,000 hurricane lanterns a month are being exported. Arrangements have been made for the training of servicing mechanics for various branches and agencies. Trade mechanics are being provided to various service centres. For the successful production and marketing of light engineering products, all these were absolutely necessary because customers had some initial prejudice against Indian goods. Two-and-a-half years ago a suggestion scheme was put into operation. Suggestions were asked for from employees for reducing costs, eliminating waste and improving efficiency. The results are highly encouraging and the staff are becoming more and more suggestion-minded.

For industry to prosper it is necessary that the customer's viewpoint is always given first consideration. A good quality product must be made available at the lowest possible price and for this it is necessary that the employees are made cost-conscious. A cost reduction scheme has been introduced in which each department has to make comparison with its own past costs and the department which effects the highest reduction in cost gets the first prize. This has created great enthusiasm amongst employees and they started questioning their own supervisors and suggesting ways and means to bring down cost. This is a new idea to the industry and it has been found extremely successful in bringing about cost reductions.

It is wrong to think that sooner or later large-scale industries aim at devouring the small industries. As a matter of fact the large and small industries can and should be so well integrated that they serve each other and the small-scale industry becomes a feeder industry for the large-scale enterprise. Experiments in Japanese methods of creating small cottage industries have been started. Training has been given and tools and equipment provided together with materials and specifications. Large industry always aims at reducing the direct and indirect labour cost to the minimum possible extent. For that, it has to invest huge sums in the initial stages on equipment and tools, but the same type of work could be done with much simpler equipment with very small investment. It is the integration of light engineering industries with cottage industry that will provide most employment in India.



IBM Electric Accounting

can increase your business efficiency

When you ask a question, you want the answer *soon* and you want it *right*. You'd probably agree that quick, accurate answers could save your business a lot of money.

That is why so many organisations rely on IBM Punched Card machines — because they give you, at a moment's notice, all the facts and figures you need.

Not only for 'big business'

Almost every business, large or small, can benefit from IBM accounting. Though varying considerably in their functions and capacities, IBM machines have a single basic characteristic — the ability to save time for the businessman in meeting the complexities of modern business.

Better still, each IBM installation is fitted exactly to your needs — there is no such thing as a 'standard' IBM setup. Experts study your individual problems, and submit a plan for your approval. The enormous flexibility of IBM machines ensures that the final system is tailor-made to your requirements.

IBM Service

Delivery of any IBM equipment marks the *beginning*, not the end, of our customer relationship. For along with the equipment, IBM provides — on a continuing basis — for its maintenance, for training and instruction of operators and supervisors — all the things, in fact, that help the customer obtain maximum value from his IBM equipment.

Saving time in 79 countries — 30 languages

Billing • Payroll • Statistics

Stores Accounting • Accounts Receivable

Financial Statements • Cost Accounting, etc.

For the smaller business

IBM Service Bureaus, located in principal cities, bring the advantages of high-speed, versatile IBM Punched Card Accounting within the reach of almost any business. IBM Service Bureaus are staffed by experienced personnel, and equipped with the latest IBM electronic and electric machines. All work is performed on a confidential basis. The cost is modest.

IBM World Trade Corporation

(Incorporated in U.S.A. with limited liability)

Kasturi Buildings, Jamshedji Tata Road, Bombay 1.

PROGRESS OF INDIAN SHIPPING SINCE INDEPENDENCE

A LONG WAY TO GO BEFORE SELF-SUFFICIENCY IS ACHIEVED

• By M. A. Master •

INDIA had no national shipping policy before she became independent. The history of Indian shipping in the British régime was summed up by Mahatma Gandhi in these words: "Indian shipping had to perish so that British shipping might flourish". A more definite charge was levelled against the British when in his evidence before the Joint Select Committee Sir Alfred Watson stated, "I recognise that Indian company after Indian company, which endeavoured to develop a coastal service, has been financially shattered by the heavy combination of the British interests". It was in 1944, when independence was not far away and when thousands had died in Bengal because food could not be imported into India for want of ships, that a welcome change was noticeable in the attitude of the then Government of India towards this important industry of the country. In the statement on "Post-war Shipping Policy" issued in 1944, they confessed that "for a country of its size, the length of its coast-line and its strategic position, athwart one of the world's main sea-routes, India possesses a distressingly small number of deep sea ships". They had to recognise that "the acquisition of an adequate share in the world's carrying-trade should be the aim of our post-war shipping policy".

The Reconstruction Policy Committee on Shipping was appointed in 1944 and the report of its sub-committee was submitted to the Government in January, 1947. Its recommendations as regards the building of an Indian merchant navy of two million tons in five to seven years, the percentages of trade to be acquired—100 percent in the coastal, 75 percent in the adjacent, and 50 percent in the overseas trades—the necessity of adopting a dynamic shipping policy, and the recognition of the principle of financial assistance to Indian shipping as has been given in such important maritime countries as Britain and America, were endorsed by the Government of India. This constitutes the first landmark in the formulation of a national shipping policy for the country. Shipping came to be understood in its widest sense. Construction of ships in India, expansion of Indian tonnage, financial assistance for its acquisition, widening the sphere of operations by the establishment of new shipping services in the overseas trade, provision of training facilities to build an efficient sea-personnel and the formation of a Consultative Committee for the rapid and all-round development of an Indian merchant navy were the problems entailed in the pursuance of a dynamic shipping policy by independent India.

Expansion of Tonnage

How is this new policy being translated into action? Let us first examine what additional tonnage India has acquired since she attained independence. In doing so, we must remember that it was after a hard struggle and much sacrifice that India was able to build up, up to the outbreak of the last war, a small merchant navy consisting of only 53 ships—both small and big —with a total gross registered tonnage of 126,079. Even this small fleet played an important part in assisting the Allies during the war. Several ships were lost by enemy action. At the end of the war. Indian tonnage consisted of only 42 ships with a gross registered tonnage of 98,286. This represented less than one-eighth percent of the total world tonnage. It is against this background that we have to weigh the value of the progress India has made in acquiring additional tonnage under *Swaraj*.

The echoes of coming independence, the appointment of a shipping policy committee in 1944, the acceptance of the recommendations of that committee, and the announcement of a dynamic shipping policy in 1947—all this provided the much needed incentive, encouragement and driving force for launching a hazardous venture like shipping. The money market was comparatively easy. The freight rates were rising. There was no serious difficulty in securing foreign exchange. Private enterprise was able to raise new capital. New shipping companies came into existence. Two of them—*the India Steamship and the Bharat Line* —brought a substantial amount, over Rs. 4 crores, into the shipping field. Forty-nine ships were acquired, almost all second-hand, during the years 1946, 1947 and 1948. Seven ships were either lost, sold, or scrapped. Indian shipping was thus able to acquire an additional 2,34,204 gross registered tons in a period of three years. No one can deny that private enterprise can legitimately look back with pride and satisfaction upon the part it played in building up the navy of supply at a critical period in the history of India.

It was, however, not possible to maintain this pace of progress in subsequent years. The budget presented by Mr. Liaquat Ali Khan for 1947-1948 with its high rates of taxation, the breakdown of negotiations with British shipowners in London, the continuous rise in the price of both new and second-hand ships all over the world, the growing tightness of the money market and the increasing difficulties which the industrial, monetary, and labour policies of the Government placed in the way of capital formation seriously affected the ability of private enterprise to acquire tonnage as rapidly as in the immediate past.

Reservation of Coastal Trade

There were, however, two redeeming features in the situation. The reservation of the coastal trade to India ships from August 1950 was welcomed with gratitude throughout the country. Although the vindication of this national right, recognised the world over, came at a time when the coastal trade had lost its former importance and when the traffic on the coast had suffered a serious decline, it cannot be denied that it provided a great stimulus for the acquisition of fresh ships to meet the requirements of the trade. Private enterprise did not show at this time that spirit of risk and venture, which it had shown during the previous triennium, but Indian shipowners continued to meet the needs of the coastal trade by chartering ships instead of adding to the coastal fleet either by construction or acquisition. They, therefore, became only the agents of the foreign owners. This defeated the real object of reservation, which was all-round training in the operation and management of ships and saving in foreign exchange.

Financial Assistance

Another encouraging feature of the otherwise deteriorating situation was the Government's announcement in 1951-52 of financial assistance, by way of loans, for construction or acquisition of ships. This wise step enabled the Government to pass another important milestone in the implementation of its national shipping policy. It was, however, unfortunate that the terms and conditions, under which the loans were to be advanced, were unattractive in respect of the percentage of the cost of ships to be advanced, the rate of interest to be charged, and the period in which the loan was to be repaid. This was brought to the notice of the Government by Indian shipowners on several occasions, but the Government did not change its loan policy. The shipowners could not, therefore, take as much advantage of it as they would have liked to do, and it did not become as effective and fruitful as it would have been otherwise. The result has been that while 58 ships with a total of 183,598 gross registered tons were constructed or acquired during the last five years and a quarter, 26 ships of 85,012 gross registered tons were either sold, scrapped, or lost during the same period. There was, therefore, a nett addition of less than a lakh of gross registered tons during the last quinquennium. While ships of an aggregate tonnage of 234,204 gross registered tons were added to the Indian fleet during the first three years of Independence, the addition during the last quinquennium was only 98,586 gross registered tons. Indian tonnage, therefore, stood on 1st May 1954 at 116 ships with an aggregate tonnage of 431,076 gross registered tons. It is not even half percent of the total tonnage of the world. It is less than 22 percent of the target of two million tons which the Government had placed before the country in 1947. It is far short of the tonnage we need—at least 600,000

gross registered tons—to fulfil our existing commitments.

It was natural that this disappointing progress in the acquisition of additional tonnage during the last quinquennium should have caused serious concern both to the Government and to Indian shipowners. Mr. Lal Bahadur Shastri, the Transport Minister, informed the Consultative Committee of Shipowners at the beginning of the year that "we are all keen that we must achieve our target fixed for the first Plan period". The Prime Minister recently remarked, when opening the new buildings of the Marine Engineering College at Calcutta, that he "was not satisfied with the target set by the five year plan for the expansion of the merchant marine", and rightly added that "the pace must be much quicker". The Government, therefore, considered it essential to revise and liberalise their terms and conditions of loans. Mr. Alagesan, the Deputy Minister for Transport, declared in the House of the People in March last that "it was intended originally to give only 66⅔ percent for coastal ships and 75 percent for overseas ships. Now that has been relaxed and we propose to give even up to 80 percent and 85 percent of the purchase price. Also, the rate of interest to overseas shipping has been reduced to 2½ percent. In the case of loans to coastal lines, if the loan is repayable within four years it will be 4 percent; for more than four years, it will be 4½ percent." The period of repayment has been substantially increased and it is understood that loans may be made repayable within fifteen years. Moreover, the total amount of loans to be advanced has been increased from Rs. 15 crores to Rs. 19.5 crores of which Rs. 5.68 crores has already been advanced with promises of further substantial advances. This active and responsible interest evinced by the Government, in consultation and co-operation with the Indian shipowners, for adding further tonnage to the existing fleet of the country augurs well for the future. We are grateful to the Government for giving a new orientation to its policy and changing it from that of a "mere passive onlooker" to that of an "active co-operator".

Ships under Construction

In addition to the existing tonnage of 431,076 gross registered tons, two ships have already been launched and three ships are under construction at Vizag. It will be able to build five more ships during the period of the Plan for which orders have long been booked. Three ships are under construction in foreign countries. It is hoped that all these 13 ships will be delivered before the end of the Plan period. They will add about 70,000 gross registered tons to the existing tonnage. The Transport Minister has further assured us that the Yard expects to book further orders for constructing 21,000 gross registered tons. Shipowners have also promised to buy further second-hand tonnage from abroad. It is believed that as a result of the welcome and timely change in the policy on financial assistance there is every possibility of building and acquiring such additional tonnage during the next two years as will enable us to bridge the gap between the existing tonnage and the modest target of 600,000 gross registered tons laid down in the Plan.

But whether or not we reach the target of 600,000 gross registered tons at the end of March 1956—although that tonnage is what we urgently require to meet our existing commitments—is not a question of fundamental importance. What we have to remember, and carefully consider, are the two vital circumstances which profoundly affect our position as a maritime power. The first is, as remarked by Mr. C. H. Bhabha, the Chairman of the Government Shipping Corporation, that "we are far behind even the minimum requirements as regards the tonnage for carrying our trade". Our ships are not able to carry today even five percent of our overseas trade. The second is that the countries which dominated our foreign trade in the prewar period are rapidly re-establishing their position in our trades. Moreover, all other maritime countries are continuously expanding their fleet. If we have to reach even the minimum target of two million tons, set before the country by the Government, we shall have to give, as Sir Ramaswamy Mudaliar, the Chairman of the India Steamship Company has urged, "the highest priority to the problem of adding to the tonnage of Indian shipping". We must, however, confess that we have not made the fullest use of our opportunities and resources for building up a merchant navy worthy of India during the first seven years of *Swaraj*. Let the Government and the people now display such a sense of responsibility and make such effective use of their opportunities that the historian of the future might say, "*Swaraj* was yours, you really deserved it".

We shall now consider what new services Indian shipping has built up during the post-independence period. As is well-known, all activities of Indian shipping were practically confined to coastal trade till the end of the second World War. The only service which the Scindia Company had tried to establish in the overseas trade, in 1937, in spite of foreign competition, was the carriage of pilgrims between India and Jeddah. Even for establishing its position in its own home waters, Indian shipping had to undergo a sacrifice of over a crore of rupees. The Scindias had to sign an agreement—which was called a "slavery bond"—to live and grow in its own home waters. Its activities were strictly confined to coastal waters. It was not allowed to carry a single ton in the overseas trade of its own country. The Government turned down the proposal of another independent Indian company to start a fast passenger service in 1935 on the ground that the arrangement made by Scindia was binding on the whole of India.

Negotiations in London

Overseas trades are governed and dominated by a number of Conferences. Experience had shown that British shipping interests had a powerful and effective voice in the deliberations and decisions of those Conferences. The Government of independent India, therefore, thought that it was desirable to enter into negotiations with the British shipping interests for securing for Indian shipping its proper place in the overseas trade of its own country. To arrive at a proper understanding with the Conference Lines for enabling Indian shipping to carry her legitimate share of the overseas trade of India, the Government of India sent to London in 1947, with the concurrence of His Majesty's Government, a delegation of Indian shipowners. These negotiations for India's participation in her overseas trade failed.

But it was a matter of great significance that for the first time in the history of Indian shipping, the Government of India had not only appreciated the views expressed and the line of action taken by the Indian delegation in London, but they solidly stood behind them. In a Press Note issued on 27th July 1947 the Government of India made it clear to all that "there never has been any difference of opinion between the Indian Government and the Shipping Delegation as regards the scope and purpose of the negotiations. The desire of the Indian Delegation and the Indian Government that negotiations should be on an overall basis for the allocation of increased shares, both in coastal as well as overseas trades, to Indian shipping, was made abundantly clear to His Majesty's Government and must, therefore, presumably be known to British shipping interests also. It had also been explained that the recommendations made by the Shipping Policy Committee would form the background of the negotiations from the Indian side". This unequivocal support of the Government of India to the demands made by the Indian shipowners in London must have influenced the approach and policy of the Conference Lines towards Indian shipping in subsequent months.

It may be interesting to recall in passing incidents which led the Scindia Company to take the courageous decision to start a regular service in the overseas trade of India. Mr. Bhabha, the then Commerce Minister, requested the Chairman of the Scindia Company, Mr. Walchand Hirachand, to meet him in Bombay five days later, that is on 22nd December 1947. The meeting between Mr. Walchand Hirachand, as the Chairman of the Scindia Company, and Mr. C. H. Bhabha, as the Commerce Minister of the Government of India, took place, not in a Government office, but in the premises of the Central Bank, and would always remain as a landmark in the development of Indian shipping. It was decided that the Scindia Company should immediately start an overseas service between India and the United Kingdom. Mr. Bhabha, as the Commerce Minister, assured Mr. Walchand that the Government would give all support to Scindia in this new venture. Mr. Walchand was as prompt in action as he was quick in decision. Within two months of this memorable meeting, the India-U.K. Continental Line was inaugurated by the Scindia Company—on 3rd February 1948—with the sailing of the s.s. *Jala Bala* from Bombay. This was the second overseas service started by Scindia. The first overseas service, between India and America, had been inaugurated from the American side with the sailing of the s.s. *Jala Kanta* on 17th March 1947, and from the Indian side with the sailing of the s.s. *Jala Kanya* on 30th May of the same year. The Indian flag, however, was not carried by the Scindia Company alone in international waters. The India Steamship had, under the able guidance of their Chairman, Sir A. Ramaswamy Mudaliar, also decided to discontinue running their eight ships as tramps and placed them on a regular liner service between India and the U.K.-Continental ports.

Conference Membership

It was not all smooth sailing. Both the companies were admitted in the beginning only as associate members and not as full members of the various Conferences governing the India-U.K.-Continental trades. None of the companies were allowed to run more than eight ships in these trades. They had the right to attend but not to vote at the meetings of the Conference Lines. This absence of the right to vote had serious repercussions when the Dutch "freight-war" broke out in 1949. The rates were reduced almost from 90s to 1s 6d per ton. The Indian lines were asked to agree to accept only eight percent of the overseas trade between India and the Continent, while 45 percent was to be given to the Dutch. They could hardly entertain such a preposterous proposition. Despite the fact that the Indian representatives had no vote, one of them was ultimately requested to join the sub-committee of three to decide the issues raised by the "freight-war." Without agreeing to mortgage the overseas trade of their own country, the Indian representative played a prominent part in settling the Dutch "freight war" and the lead that they gave in arriving at the final arrangement saved the other Conference Lines a substantial sum of money. We must put on record here the

deep gratitude of the shipowners to their own Government because at every stage the Indian representatives were acting in the matter with the fullest concurrence and approval of the Government of India.

From the very beginning, each of the two Indian lines had asked for the right to run 17 ships in the India-U.K.-Continental service. In 1950 both the lines were admitted as full members of the India-U.K.-Continental Conference and were allowed to run up to 12 ships each for a period of four years. It must be added that the lines had the full support of the Government in their negotiations and in all the demands they had put forward before the Conference Lines. This identity of views and demands between the Indian shipowners and the Government of India and the solid support which the Government gave them in their endeavour to advance the position of Indian shipping in the overseas trade of the country will always be recalled with pride and gratitude as the effective implementation of a national shipping policy. It shows what progress even a hazardous industry like shipping can make when private enterprise is able to secure the co-operation and solid support of the government of the land.

State Aid to Private Enterprise

There was still a large number of important overseas trades where the Indian flag had yet to make its appearance. It was not an easy task to do so. Shipping is an industry which requires crores of rupees to establish regular services for the carriage of India's overseas trade. Since the introduction of Mr. Liaquat Ali Khan's budget, capital formation in India had to face special and increasing difficulties. At the conference of the representatives of Indian shipowners held in Bombay on 3rd November 1947, Mr. Bhabha, the then Commerce Minister, gave expression to the views and policy of the Union Government, in the following words: "Besides, very few of the shipping companies in this country have the resources to buy a sufficiently large number of these ships, and it has been increasingly borne in upon Government that if at the present stage of the development of the shipping companies in this country, Government have to rely on private enterprise, the growth and development of our mercantile marine will be disappointingly slow. The Government of India have, therefore, come to the conclusion that their new shipping policy must be broad-based on the active co-operation of the State with enlightened private enterprise, in an endeavour to secure for India her rightful place among the maritime nations of the world."

This new policy of joint economy did not make any headway during the next triennium. It was only in 1950 that the first corporation, namely the Eastern Shipping Corporation Limited, was formed with an authorised capital of Rs. 10 crores. It has not yet been able to build up a sufficiently large fleet to establish regular services on new overseas routes. Even today, that is nearly seven years after the announcement of the policy of joint economy, it has got only three vessels of its own, while one vessel has been taken on time charter. It has, therefore, been found difficult to run regular services on the routes which it has in view. It is still a matter of satisfaction that the Corporation is going ahead with its building programme. It has recently acquired two passenger vessels from Scindia. In all probability, the ships of the Corporation will shortly be establishing regular services between Calcutta and Australia, Calcutta-China and Japan, Bombay and the East African ports, in addition to its present regular service between Madras-Nagapatam and the Straits. The Corporation will also inaugurate before long a regular passenger service between India and the Andamans. It may be added that while the State, with its huge resources, has taken seven years to put in Rs. 7 crores for building up the fleet of the Corporation, the capital employed by private enterprise in shipping has gone up from Rs. 3½ crores in 1945 to more than Rs. 25 crores at the end of last year. Moreover, the Bharat Line, one of the ventures of private enterprise, has started a regular service between India and the Persian Gulf. Indian shipowners do not lack the spirit of enterprise, nor are they afraid to take risks. What they are anxious to ensure is the maintenance of a healthy and encouraging climate wherein they can make the best and the fullest use of all the opportunities that are available to them, particularly the patronage which the Government, as a shipper, could extend to them with the enormous quantities of cargo which is imported, every year, into the country under their ownership or control.

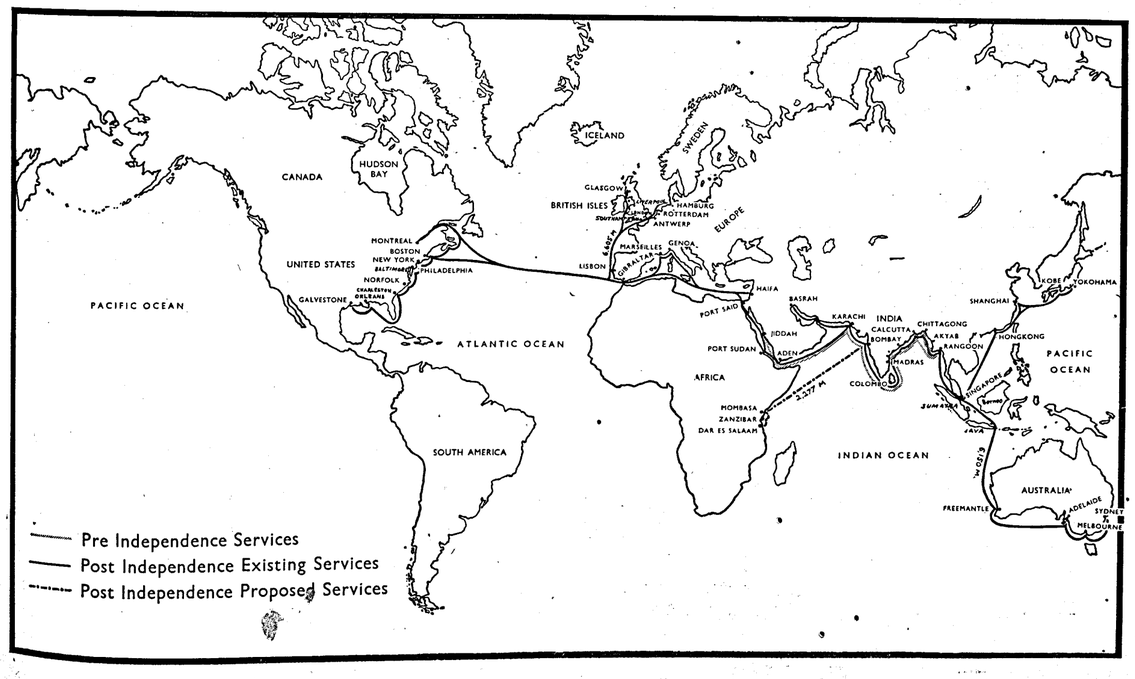
Training Facilities

An adequate and efficient sea personnel is essential for building up the maritime strength of a country. The success of both the navy of supply as well as the navy of defence will depend largely upon the training, experience, and skill of the officers and seamen who will man the ships. These seamen will serve as our ambassadors when they visit foreign lands and they will have to be trained for those responsible duties. It is a matter of satisfaction that the Government of India have established new institutions for providing greater and better facilities for training the young men of India as executive officers and engineers as well as seamen for creating an efficient sea personnel for our country. We must not fail to acknowledge here the useful service to Indian shipping rendered by the Government of India under British rule with the establishment of the training ship *Dufferin* in December 1927. It is interesting to note that up to October 1953, 1217 cadets were admitted into the training ship *Dufferin*; 101 were under training, and 898 were pursuing their sea-career, as recorded at the end of last year. These cadets have provided officers to the navy of supply as well as to the navy of defence, pilots and harbour masters to the ports, and administrative officers of the mercantile marine department of the Government of India.

Since the advent of independence, the standard of admission has been raised and greater opportunities have been provided for bringing them into practical touch with the problems of the sea. Although the Governing Body had requested the previous Government, on several occasions, for the establishment of a college which could give practical guidance to those who had to appear in examinations for obtaining their certificates of competency, the proposal for starting such an institution, recognised indispensable in all maritime countries, was always turned down on grounds of economy. We are now happy that the Nautical and Engineering College was opened in Bombay in October 1948. The fact that over 1,500 students, appearing for their examinations, took advantage of this college by March last, conclusively proves that it has met a long-felt need. Out of these 1,500 students, 800 secured their certificates of competency by the end of last year.

Cadets were no doubt trained on the engineering side by the *Dufferin* from 1935-1949, so that they could become engineer officers at sea after undergoing further training on board the ship. It was felt, however, that they were not getting the theoretical and practical knowledge essential for passing their examinations. The Government, therefore, established a new institution called the Marine Engineering College at Calcutta. It was recently opened by the Prime Minister. The realistic way in which that college is tackling the problem of training marine engineer officers for the merchant service has won appreciation from responsible quarters. It is held that the training scheme of the college, which is expected to turn out junior engineer officers well equipped to understand and handle the many problems which arise in modern machinery installations, is comparable with the best schemes in the United Kingdom. Forty-eight cadets passed out of this college in 1953; 38 of them have already been placed on ships for gaining their sea experience before they obtain their certificates as second engineers.

There was no pre-sea training for our young men before they went to sea as seamen. To inculcate discipline, to foster the spirit of the brotherhood of the sea, and to break a number of social and other prejudices, as well as to give them some practical knowledge of their profession and initiate them into sea life, two training ships have been established—*Bhadra* at Calcutta and *Mekhala* at Cochin. *Bhadra* was started in May 1950 and *Mekhala* in February 1951. The young boys undergo a course of practical training for three months. Up to 31st March 1954, 1,576 boys were trained for the sea in *Bhadra* and 1,437 in *Mekhala*. We are



obliged to our Government for providing such training facilities. The Government, we are happy to note, have been raising the standards of training all round and have thus been discharging their responsibilities in the same spirit of service to their people as has been done in the leading maritime countries of the world.

Consultative Committee of Shipowners

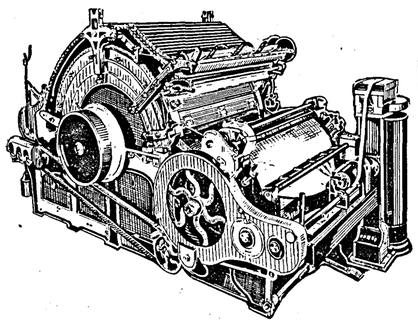
Shipping is essentially an international industry. National shipping has its own domestic problems such as depreciation on original cost and replacement value, income-tax concession, size of the ships to be employed in different trades, financial assistance for expansion, economic operation of tonnage, etc. The government of the country, however, has to take decisions on a number of complex and complicated problems in implementing the shipping policy of the country. Whether a maritime country should join the inter-governmental maritime consultative organisation as a member or not, whether a government, as one of the biggest shippers, should have the freedom to serve its cargo to such ships as it likes, how to help national shipping to secure entry as a member of shipping conferences consisting of different flags: these and similar problems call for continuous consultations and definite decisions at the highest level. The Government of India have constituted a Consultative Committee of Shipowners to advise them in all matters of general policy relating to Indian shipping. While it is true that they have not appointed a statutory body like the Indian Shipping Board, recommended by the Shipping Policy Committee, it must be acknowledged that the scope of the Consultative Committee and the field of problems that it can cover are much broader and more comprehensive than those of the proposed Shipping Board. We are proud of our Government for constituting such a Consultative Committee of Shipowners. Three meetings of that Committee have already been held. Although the proceedings of the meetings are not published, it is understood from responsible quarters that such important problems as Government freight and the issue of discrimination, purchase of ships on government account, how to make the terms and conditions of the loans to be granted for the acquisition of tonnage attractive and acceptable to Indian shipowners, building up of the nucleus of a tanker fleet, and joining the I.M.C.O. as a member, figured prominently in the deliberations of the Committee. A frank and heart to heart talk between the shipowners and the Government is essential in shaping the shipping policy of the country. It is well known that although more than three and a half million tons of petrol, kerosene, and other oils are imported into India every year, constituting nearly 16 percent of its overseas trade, not a single ton of oil has up to now been carried by a tanker owned by Indians. The assurances given to the oil refineries made it impossible for private enterprise to carry such oil in tankers owned by Indians. It is, however, satisfactory to learn from recent pronouncements of Ministers that the Government themselves have decided to construct two tankers and have been able to persuade Indian shipowners to do so. It may not be easy for the Indian shipowners to participate in the carriage of oils. The Consultative Committee has justified its existence by obtaining an assurance from the Government that they would as a first step secure, despite the assurances given to the oil refineries, the right to carry in tankers owned by private enterprise at least a fair share of the refined products round the coast of India.

Directorate-General of Shipping

With her coast-line exceeding 3,000 miles, with her overseas trade exceeding 20 million tons per annum, with the strategic position she occupies in the Indian Ocean, with the vital rôle she is expected to play in South-East Asia, India must have a separate Ministry of Shipping, like Railways and Communications, for discharging her increasing responsibilities and for building up her maritime strength. Shipping found an insignificant place in the Commerce Department of the old régime. India now has to build up both her navy of supply as well as her navy of defence. She cannot retain her sovereignty without doing so. We are, therefore, indebted to our national Government for establishing a Directorate-General of Shipping in Bombay in 1949.

Apart from dealing with the day-to-day problems that arise in the coastal and overseas trades in India, the Directorate-General has been evincing very lively interest in the training institutions for our sea personnel, and has been organising useful measures for the welfare of our seamen. Immediately after the constitution of the Directorate-General, a committee was appointed for recommending what steps should be taken for providing better amenities and facilities for our deck passengers. The Director-General was the chairman of that committee. Although the measures, which the Government have implemented for improving the lot of deck passengers and the comforts under which they could travel, might not come to our fullest expectations, it cannot be denied that the first steps which they have taken would conduce to considerable improvement consistent with the economic factors which could not be ignored. They are now taking steps to regulate and control the employment of seamen, and although the introduction of the system of collective bargaining between shipowners and seamen should be the goal, the proposed new system, it is hoped, will enable the Government to remove a number of grievances regarding corruption, etc., and should, in due course, enable seamen to build up sufficient strength and unity for collective bargaining. The Director-General also plays a prominent part as a special director in the working of the Eastern Shipping Corporation, a joint venture of the State and private enterprise, and is thus able to play a very useful rôle in the development of our new overseas services.

Practical and useful as is the work which the Directorate-General of Shipping has been doing at present in connection with the various important problems affecting the shipping industry, the future of the Indian merchant navy will depend upon the courage, conviction, care, faith, and vision with which that Directorate can create an atmosphere and generate forces for the nation's shipping policy to find rapid, dynamic and successful expression in fruitful and extensive fields. Many an opportunity has been lost during the last five years for carrying the national flag forward in international waters. Instead of leaving the future of Indian shipping entirely in the hands of private enterprise, if the Directorate-General of Shipping will consider it its responsibility to find early and effective ways to reach the target of two million tons during the next five years and inspire the shipowners with their faith and conviction and secure for them the help, the facilities and opportunities which they urgently need, not only will they be able to build up an efficient merchant navy worthy of India's maritime position and power, they would also thereby render a great national service in building up the India of the future—the India which will fulfil our hopes and aspirations and make us live in a land of peace, plenty and prosperity.



MMC Revolving Flat CARDS

Many hundreds of MMC Revolving Flat Cards, manufactured in Calcutta, are now operating in textile mills in India and abroad.
All reports confirm that these Cards satisfy the highest standards of material, workmanship and performance.

Outstanding New Features

1. Five distinct setting points, used singly or in combination to control setting to .001 inch.
2. Johnson bronze bearings for cylinders and doffers.
3. Ball-bearings to lickerin pedestals.
4. Self-lubricating 'Oilite' bearing at several locations.
5. William's patent stripping motion for flats.
6. Drop lever with new disengaging handle.
7. Fluted lap roller with positive gear drive from feed roll helps uniform feed of lap at the back with minimum possible stretching.
8. Roller-bearings to cylinder and ball-bearing. Comb Boxes also provided as optional equipment.
9. Cards can be geared for any production in a mill's organization.

INDIA'S MACHINE TOOL INDUSTRY

● By D. S. Mulla ●

Vice-President of the Indian Machine Tools Manufacturers' Association

SUCH wide publicity has been given to the atom bomb, and atom warfare, that we have lost sight of those basic tools—machine tools—which have made possible not only the atom bomb but all the other engineering achievements that contribute to life as we know it today. Primitive man achieved much with the very simplest of tools—the inclined plane, the lever and the wheel. But it was not until the early nineteenth century that machine tools as we know them today were first developed, and only since then has progress accelerated, and productivity reached great heights. It is a far cry from the simple boring and turning lathes of the eighteenth century, to the high production, almost automatic, machine tools of today; yet the time in which all this has been achieved has been remarkably small. This is because as better machine tools are made, they in turn help to produce even better machine tools; today there is no modern machine or implement that can be made without a machine tool. One might say that the stage of civilisation we have reached today owes its very existence to the machine tool, and that this age should rightly be called the "Machine Tool Age".

Europe, the United States and even Japan have made very rapid strides in industrialisation because they have had a basic machine tool industry. India unfortunately had no machine tool industry until the outbreak of the last war, when circumstances forced the Government then in power to encourage the manufacture of machine tools. From that small beginning, and the help then given, the industry has gradually reached its present position. Even today it can hardly be called an industry. Its output is barely 15 percent of the country's requirements. Its production in terms of different types of machines is limited. Yet when one considers the difficulties and the hardships this industry has had to face since the war, little or no assistance from the Government, unwarranted prejudice on the consumer's part, the mere fact that the industry not only exists but is progressing rapidly, speaks a lot for the products it turns out and for the men who run it.

Machine Tools in India

The earliest record of machine tools made in India goes back to 1890; but from then until 1939, barely 100 machine tools a year were made, and these by factory owners mainly for their own use. The reason was that machine tools were so easily and so cheaply available from abroad—specially from the U.K.—that it was not thought necessary to encourage the manufacture of machine tools in this country; nor perhaps would it have been profitable. With the outbreak of war, conditions changed and foreign machine tools were increasingly difficult to obtain. As Indian industry geared itself to the manufacture of defence equipment, the demand for machine tools increased, although the situation even as late as 1939 was not very acute, as reduced imports still continued to come through.

Early in 1941, however, apprehensive of the future, the Government of India passed the Machine Tool Control Order, and appointed a Machine Tool Controller to make an inventory of machine tool production, regulate imports, improve the quality of local products and secure for the armed forces, ordnance factories and war industries the best quality machine tools. With this end in view, a system of licensing was introduced, and manufacturers with necessary facilities for technical supervision and necessary plant and equipment were given manufacturing licences. This marked the beginning of the Indian machine tool industry as it exists today. From 1941 to 1943 a number of firms obtained licences for the manufacture of machine tools, and production in India, supplemented by whatever imports were available from abroad, sufficed to a large extent to provide the country with its immediate requirements. In 1943, however, with the entry of Japan into the war and the closing of the Mediterranean route to shipping, the situation took a sudden turn for the worse. India's reliance on imports to supplement her machine tool manufacturing capacity proved a serious obstacle to equipping her industrial plants. Since imports of all kinds were largely cut off unless required for high priority war jobs, the infant Indian machine tool industry was called upon to make tremendous efforts to fill the gap and supply the country's requirements.

Under the Control Order, schemes were put into force to regulate and control more strictly the distribution of machine tools, even those manufactured in this country, and a number of engineering firms were even asked to come forward and undertake the manufacture of quality machine tools, in addition to those firms which were already engaged in this work. In order to develop and expand the Indian machine tool industry, the Government took several measures through the Machine Tool Controller. As a result of these steps, industry made good progress as will be seen from the fact that whereas in 1942 the total number of graded machine tools manufactured in India was 273, in 1946 this number had increased to 4,121 valued at Rs. 1,13,00,000. The efforts and progress made by the Indian machine tool industry during the war years was greatly appreciated by the United Kingdom Machine Tool Mission which came to India in 1944.

The Organisation of the Industry

While the Indian machine tool industry made this remarkable progress in a comparatively short period, it must be admitted that the general organisation of the industry was not a specialised one. This was due to the hurried manner in which the manufacture of machine tools was undertaken and expanded under the stress of war. Firms which were previously engaged in the manufacture of general engineering items took over the production of machine tools, but had also to retain their other general engineering activities. Later on, however, there were distinct signs that the tendency to specialise in the manufacture of machine tools was gaining ground, and some well-known manufacturers switched over to manufacturing machine tools exclusively. This was a very welcome sign and the sooner this specialisation is accomplished, the better will it be for the industry as a whole The organisation of the machine tool industry in the more industrially advanced countries of the West owes its pre-eminence to specialisation; and there is no denying the fact that for the most efficient production of machine tools in India, specialisation of plant, equipment, and layout for the production of machine tools only, would be more economical and would materially help in building up the industry. However, circumstances as they are today are not very conducive to such specialisation. This was one of the points brought up in July, 1946, when the Tariff Board carried out an exhaustive enquiry into the machine tool industry. In the report issued in 1947, the Tariff Board's recommendations included:

(a) Grant of subsidy and other financial assistance.
(b) Strengthening the Inspection Organisation and rendering its service free of charge.
(c) Continuation of the Machine Tool Control on a quantitative basis up to 31st March, 1950.
(d) Grant of large quotas of pig iron, coke and coal to the machine tool manufacturers.
(e) Purchase of machine tools for all Government and quasi-Government departments to be restricted as far as possible to indigenous goods.
(f) Engagement of highly competent foreign specialists to render technical advice and guidance to machine tool manufacturers.

Six years have passed since the Tariff Board report was issued, but very few of the recommendations made were accepted, and fewer still implemented. It was only as late as 1950 that control over imports of machine tools was operated efficiently, and it has only how begun to show good results.

The Demand for the Indian Product

The position of the industry in 1949 was far from happy. Sales of machine tools had steadily fallen, and large stocks of unsold machine tools accumulated with the manufacturers. Production had to be so severely curtailed that in 1950 the industry produced less than 1,000 machines. valued at only Rs. 26,00,000 as against its peak production of 3,700 machines, valued at Rs. 1,12,00,000. The reasons for the relatively low demand for Indian machine tools are : (a) the prejudices of the Indian public, including Government and semi-Government bodies, against buying Indian-made machine tools ; (b) the Government's policy in recent years of placing a number of engineering and other items on Open General Licence, which has put small manufacturers out of business. These manufacturers were among the largest buyers of Indian machine tools.

Since 1947 the Government has held numerous meetings with the Indian Machine Tool Manufacturers' Association, and though the Government has declared time and again that it would consider extending subsidies or loans to buy balancing equipment, and loans for development expenses on new designs, for one reason or another these questions were delayed. In the end, the Government told the industry that due to financial stringency no financial aid was possible even though the maximum aid the industry asked for was only Rs. 25 lakhs, and that too on a returnable basis. This plea of the Government seemed quite unjustified, particularly in view of the fact that at that time it was negotiating a technical agreement with a Swiss firm to erect a State-owned machine tool factory costing Rs. 9.5 crores.

The industry, left to itself, managed to struggle through 1950 and there was a slight recovery in 1951 and 1952, due probably to the outbreak of the Korean war; production reached over Rs. 40 lakhs in both those years. According to the latest figures, there are fifteen Grade I machine tool manufacturers. The grading is done by the Directorate of Inspection, Government of India, and Grade I machine tools are those that meet the specifications laid down by Dr. Schlesinger of Germany in the Schlesinger Test Charts. These are internationally accepted along with such other test charts as those by Lt.-Col. Salmon of France and the Institution of Mechanical Engineers in England. The total capital employed by the Grade I manufacturers is not exactly known but is certainly less than Rs. 1 crore, and the annual rated capacity of these firms when working on normal production would be a little over Rs. 1 crore,—that is, the annual output approximately equals the capital outlay, which is considered quite fair for the machine tool industry. But as pointed out the industry is at present barely working to 50 percent. of its normal production capacity.

The Import Position

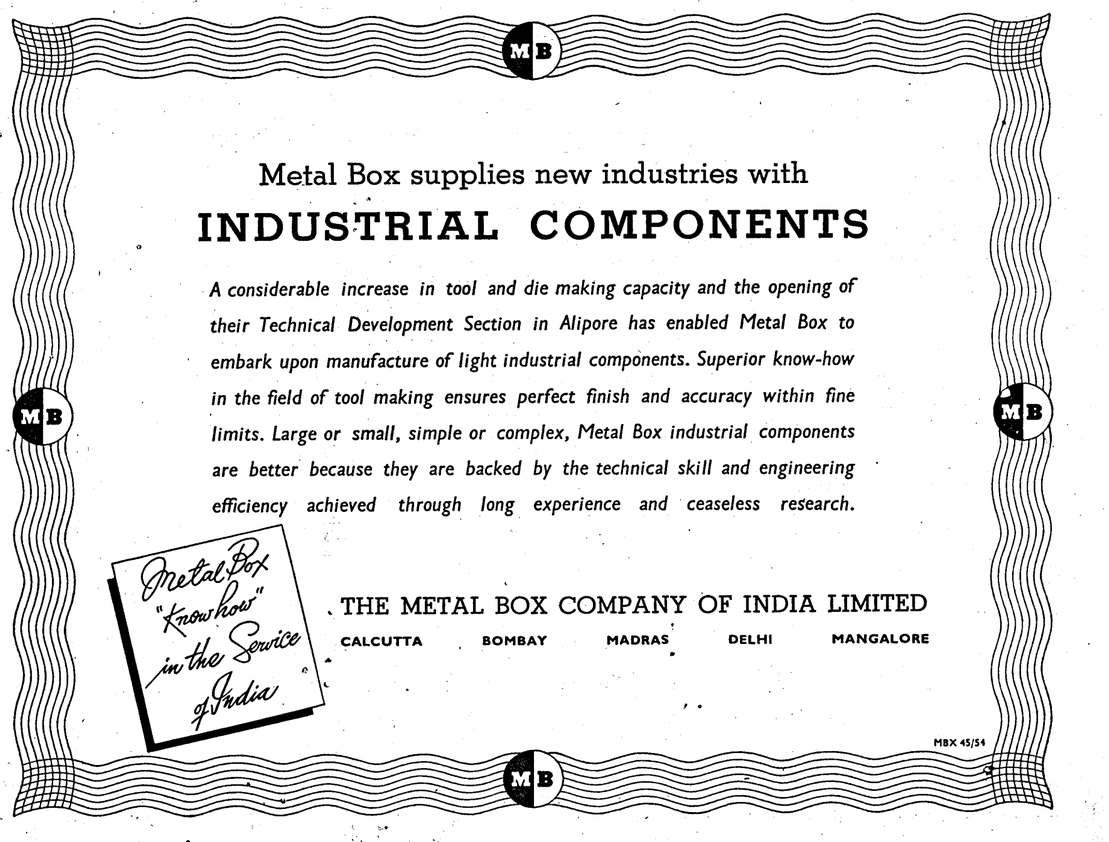
The only figures for imports that are available to the industry are those given in the "Accounts relating to the Foreign (Sea, Air and Land) Trade and Navigation of India". In this Government document, under " Machinery & Millwork (III J) ", there appears a sub-section "Metal Working Machinery (including machine tools)", which shows as one item "Machine Tools", namely drilling, grinding, milling, planing, shaping, machines and lathes; the second item "others" gives no indication of what machinery it includes. Though the industry had suggested as early as 1946 that a more detailed classification of imports be kept, no action has been taken. Today both the industry and, it appears, the Government are left guessing as to what exactly have been, and are, the country's requirements of different types of machine tools. This lack of essential statistics has been a very serious drawback to efficient planning by the industry and the Government.

In fact, as can be seen from one of the Planning Commission's reports, more attention is paid to the information published by the U.K. Board of Trade on the export to India than to the information available from the Government's own departments. The import figures of all metal working machinery (including machine tools), are shown in Table I. The industry in the last five years has considered very carefully the question of the country's requirements of machine tools, and has come to the conclusion that the annual demand for machine tools (not "Others") in the next few years will not exceed Rs. 3 crores. This figure does not include the import of machine tools through Messrs Oerlikon of over Rs. 5 crores in the next few years for the Prototype Machine Tool Factory, and for the Hindustan Machine Tool Factory.

The high import of machine tools up to now has been mainly to satisfy the pent-up demand of private industry, railways, ordnance and other Government demands, and even taking into account the progressive industrialisation visualised in the five year plan, the requirements are not under normal circumstances likely to exceed the estimate of Rs. 3 crores.

The Problem of the Industry

One of the main problems facing the industry is the prejudice of the Indian customer, the largest single customer today being the Government. The extent of the prejudice is reflected in the Planning Commission's report on the "Programme of Development 1951-56". The report on this industry, given in Section B 7, was made without the in-



dustry ever being consulted. It seems to be there only to justify the action taken by the Government of India in spending over Rs. 9 crores on the State-owned machine tool project.

The second problem facing the industry is lack of capital for expansion and development work, and for the purchase of new plant and equipment. For the industry to be able to sell all it can produce, it has to cater to a widely differing market. On the one side is a customer who wants an inexpensive job shop machine, and on the other side is a customer who insists on a very "high production, high speed" machine. To be able to make each of these economically, at a price to satisfy both the customers, would require production of both types in quantities far greater than either customer can absorb. Rationalisation is not the solution to this problem, because though by increased output of one type or another the cost may be reduced, to achieve this within the present set-up of the industry, production would have to be increased to a point far beyond the demand. A more practical solution would be to diversify manufacture into smaller batches of different types and sizes of machine, and to achieve lower costs through a higher volume of production. This would naturally mean (a) a different technique of manufacture, which would in turn require new capital, and (b) better statistical information of the country's requirements of the different types of machines, neither of which is available to the industry.

Competition from Government

One more problem facing the industry is the competition which it must face from the Government's project when it is completed. Though assurances have been given to the industry that there will be no competition, the question of who shall decide what is "competitive" finally rests with the Government. Here again Government's attitude seems to be quite clear, for in the same report of the Planning Commission it is stated that as far as the Indian machine tool industry is concerned, "the bulk of machines manufactured are simple and primary types of machine tools" and "mainly copies of old machine tools". This is unjustified and unfair, for had the Commission consulted the industry when making its report, it would have seen that the industry can make, and is making today, modern production machines that adhere to the rigid specification required in the class I railway workshops, ordnance factories and other key industries, and they are quite capable of giving the same performance in those workshops that either similar imported machine tools are now giving, or the machine tools to be made in the Government factory can give. If the products of the industry are to be described as "simple and primary", then one can only say that judged by these standards the machine tools to be produced by the Government factory will also be "simple and primary". The machine tools that the industry is building today are basic machine tools (not primary) namely lathes, drills and the shaping machines. Less basic are milling machines, radial drills and planing machines. Let the Government leave these basic machine tools to the industry which can make them, and concentrate on specialised or heavy-duty machines, such as plano-millers, plano-grinders, gear-cutters and grinders, jig borers and similar other machines which the industry cannot manufacture due to economic reasons. The State factory can and should manufacture only these types of machines, and then only can the expenditure of Rs. 9.5 crores be justified.

Production Programmes

The programme of manufacture and the development work the industry has undertaken in the last two years are remarkable, specially under the handicap it faces. Among the newer machine tools now in production are high speed production lathes up to 8½" centre, plain and universal milling machines, fully geared head pillar drills up to 1¾" capacity, and modern high speed shaping machines with 24" stroke. Under development, and likely to be in production in the near future, are high speed production lathes up to 9½" centre, hydraulic shaping machines and 5' radial drills. It can now be seen that the industry, in spite of all handicaps, has advanced quite steadily, and Government's contention that the industry is only making primary and simple machine tools can hardly be justified.

Altogether one feels that the Government project has been very badly conceived, specially when in its first stage of manufacture it is considering manufacturing 400 8½" centre lathes. Originally the production of these was to have commenced by August, 1951, but due to changes in Government plans, the stage reached so far is that orders for machine tools worth 10 million Swiss Francs (Rs. 1.2 crores) have been placed through Oerlikon Buehrle & Co. of Zürich, who are the technical consultants to the Government of India. The equipment has started arriving at Jalahalli, and the hangars for the machine shop are nearing completion. The factory is expected to go into initial production towards the end of 1953 and be in full production by 1955-56. The total estimated cost is Rs. 9.5 crores. The output expected is approximately Rs. 4 crores. The industry has time and again tried to convince the Government that the project is quite unsound, but the Government has gone ahead. The Government even today could well reconsider its decision, and instead of setting up its own factory, aid the private industry to expand. For its part, the industry would confidently take up the challenge to go ahead and produce all the Government's requirements of machine tools, at less than half the Government's capital cost, and probably at lower prices.

The Stanvac Bombay refinery

—THE SYMBOL OF
INDIA'S GROWING
INDUSTRIAL STRENGTH

STANDARD-VACUUM REFINING COMPANY OF INDIA LTD.

STANDARD - VACUUM

V. 9999

INDIA'S FIRST MODERN OIL REFINERY

STANDARD VACUUM'S ACHIEVEMENT

A NEW milestone was reached in India's march towards industrial progress with the construction of the Stanvac Bombay Refinery. The completion of this Rs. 17½-crore project has given the country the first major multi-product refinery—which is also one of the most modern in Asia. It has brought about, in one bound, a 500 percent increase in India's refining capacity, from 5.400 to 30.400 barrels per day. By turning out more than 300 million imperial gallons of six different fuel products a year, the plant will, to that extent, obviate the need to import finished petroleum products. It is estimated that this will relieve the foreign exchange drain on the Indian treasury by an equivalent of more than Rs. 120 lakhs every year. Benefits such as these, which flow directly from the operation of the refinery, often obscure from view the indirect but equally beneficial effect of the refining industry on the country's economy. Since the pervasive influence of the oil industry touches every facet of our economy, the operation of the Stanvac Refinery cannot but impart added firmness and strength to the total industrial picture.

How important a need the Refinery has fulfilled can best be appreciated when the position is viewed against the background of the industrial development of the country. The postwar years saw India's predominantly agricultural economy acquire a strong industrial bias. The inauguration of the five year plan accelerated the process. An unmistakable sign of this was the rise in the rate of consumption of energy, which recorded an increase of 37 percent in five years from 1948. Indications were not wanting that the process of industrialisation would continue, making further calls on the supply of energy. It was evident that assured supply of all available sources of energy was a precondition to the continued industrial advancement of the country. In this context the importance of petroleum fuel products can be measured by the fact that oil's share in the total energy supplied had risen from 17.3 percent in 1948 to 23.9 percent in 1951.

Dependence of Imports

Prior to the establishment of the Stanvac Refinery, India was almost wholly dependent on imports for these products. Apart from the serious weakness—so painfully demonstrated by the closure of the Abadan refinery—of depending largely on imports, there was the overriding problem of conserving valuable foreign exchange required to meet growing demands. The position was that while on the one hand India's industrial progress demanded an increase in the supply of petroleum products, dwindling foreign exchange pointed to the need for curbing imports. This paradoxical situation could only be resolved by constructing a refinery in India. Standard-Vacuum was the first to build a modern oil refinery in the country because of its early recognition of pressing needs.

The Rs. 17½ crores needed for the project represents the largest single investment of private American capital to be made in India since independence. Apart from setting an example which might be followed with advantage by other foreign investors, this large slab of non-Indian currency will go a long way in filling the financial gap in India's five year plan. The Refinery's contribution to the Indian Exchequer in the shape of taxes will be considerable. Provision has been made for the participation of the Indian investing public in this project through debenture loans and preference shares. In addition, this new industry has opened up new vistas of employment and opportunities for teaching new skills to the youth of the country. The Stanvac Refinery will eventually be providing steady employment for about 500 people all of whom, with the exception of about 40 refining technicians, are Indians. Eventually most of the foreigners will be replaced by Indians as rapidly as the latter can complete special training and gain the practical experience necessary to operate the complex Refinery equipment. The construction of the Refinery itself had created a substantial amount of new employment. Several million man-hours of work were required to complete the project, at which nearly 7,000 Indian workers were employed during the peak period. The policy of purchasing in India as much of the necessary supplies and equipment as could be obtained locally provided income to many Indian firms supplying timber, cement, brick, hauling services and many others too numerous to mention.

Saving in Foreign Exchange

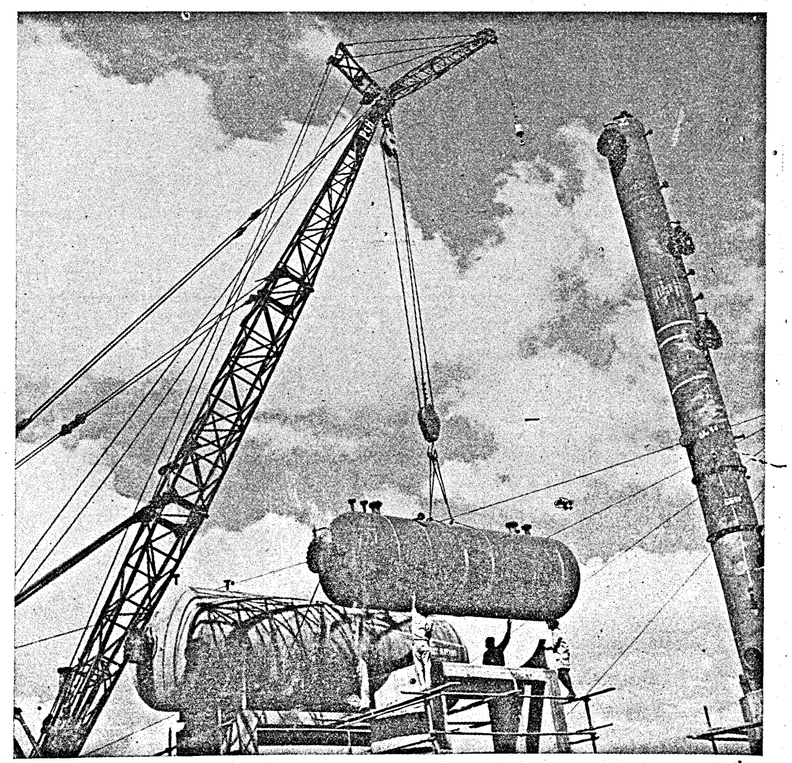
The saving in foreign exchange, to which references have already been made, is of such major significance that it would bear further amplification. The saving will result from the fact that the cost of crude oil purchased abroad is lower than the cost of the finished product from the same source. Besides, crude oil is easier to carry and it can, provided the refining capacity is available, be turned into any of the numerous petroleum products that India needs. This, however, does not mean that the cost of individual products will come down as a result of indigenous refining. It costs more to refine a barrel of oil away from the source of production, and for every ten barrels of crude brought here only about nine barrels are recovered in the finished form, the rest being used by the refinery as fuel. Bringing this extra barrel of refinery fuel increases the transportation cost and this is one important factor in the total manufacturing costs as compared with the refinery located near the oil wells.

The foregoing were some of the considerations which served as the background for the discussions between the Government of India and Standard-Vacuum concerning the erection of a refinery in India. Talks, which began on 10th October, 1951, brought into sharp focus the mutuality of interest between India and Standard-Vacuum. The long history of fair dealing between them created a co-operative atmosphere and a meeting of minds was achieved with surprising speed. By 30th November, 1951, an agreement covering the erection of the Stanvac Refinery at Bombay had been worked out. It may be mentioned in passing that subsequent agreements for the construction of other refineries were patterned after the original agreement with Standard-Vacuum.

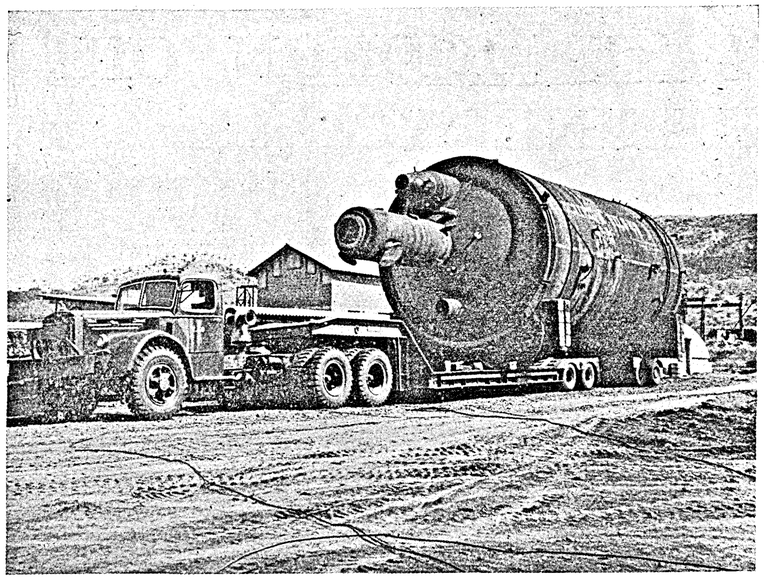
Choosing The Site

Broadly, the agreement provided that the Indian Government would exercise the normal checks and controls a sovereign Republic would have over any enterprise within its borders. At the same time, the Company was assured that it could operate in an atmosphere which was not unreasonably restricted. The agreement has been hailed as an outstanding example of how Government and private enterprise can co-operate to the benefit of both.

The factors which were taken into account before deciding on Trombay as the location provided a good example of extensive planning and research which must precede every step in a project of this magnitude. A detailed survey involving experts of three nations was carried out in order to analyse the comparative advantages of locating the Refinery at one of the major ports, namely, Bombay, Calcutta, Visakhapatnam and Madras. Among the factors considered were land values and methods of acquisition, atmospheric conditions, water and power supply, transportation and stocking facilities and geological data. After a thorough



Traced against the monsoon sky, the huge Guy Derrick towered over the combination unit of the Stanvac Bombay Refinery a few months ago. The Derrick was used for lifting heavy machinery. The same Guy Derrick was used for the construction of Britain's largest refinery at Fawley.



The 26-wheel lorry which carried some of the heavy equipment from the dock side to the Stanvac Bombay Refinery, involving one of the most unusual unloading and transportation jobs ever undertaken at Bombay.

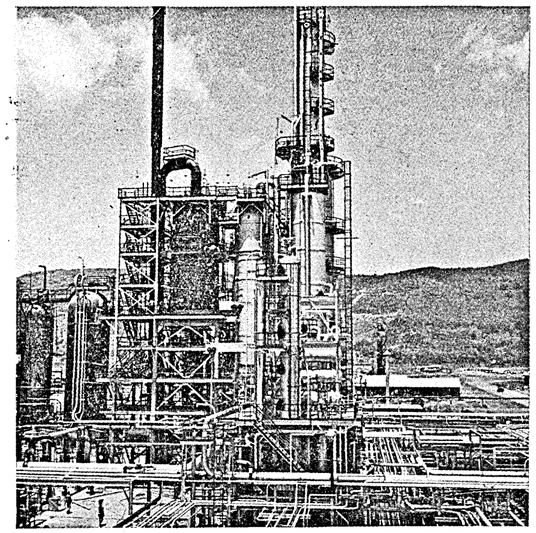
examination of the relevant technical factors it was concluded that if a refinery had to be provided for the West Coast of India, it would be best located at Bombay, as the city was the focal point for distribution on this coast. Moreover, an overwhelmingly large percentage of petroleum products, it was estimated, would be required on the West Coast; 77 percent of the demand was centred round Bombay. Furthermore, Bombay had an excellent harbour and was the terminus of two of India's largest railway systems and consequently had the necessary marshalling yards and other facilities. Bombay was also considered to be outside the earthquake area and the subsoil of Trombay Island, it was found, could withstand the heaviest loads, in other words, a refinery.

Contract for Construction

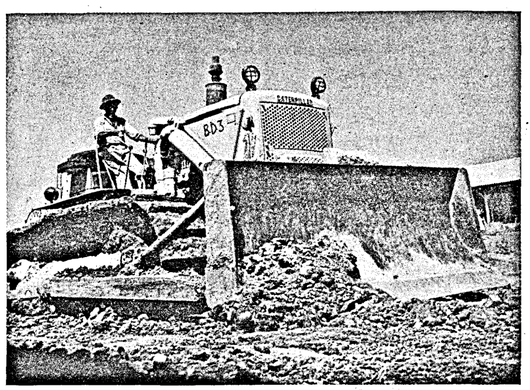
A major step in the erection of the Refinery took place in June 1952 when Mr. William A. Williams, Chairman and Managing Director of the Refining Company, came to India. The contract for construction was awarded to the Lummus Company. Meanwhile the tremendous job of engineering and planning, involving thousands of blueprints, purchasing and shipping schedules, process designs, studies, etc. was being pushed ahead. The 280-acre site was made available by the Government on 25th December, 1952. Four days later the first shovel full of earth was turned. From that stage onwards progress was rapid. Within 75 days, Indian contractors using up-to-date equipment completed 90 percent of the clearing work on the 280-acre site. A dedication ceremony in which the Governor of Bombay, Mr. G. S. Bajpai, was the guest of honour and the U. S. Ambassador, Mr. George V. Allen, was present, was held on 5th June to mark the conclusion of the first phase of the construction work. At that time the site was not only cleared and graded for the most part but warehouses and pipe shops and a huge concrete mixing plant capable of turning out 600 cu. yards of concrete per day were erected. The extent of the task can be measured by the fact that the grading job alone means moving 320,000 cu. yds. of soil. Before the Stanvac Refinery was completed, more than 24,000 cu. yds. of concrete had to be poured and strengthened by 225 miles of steel reinforcing rods, weighing 690 tons.

The Second Phase

The second phase, that of actually erecting steel and placing the major equipment on its foundations, was begun and carried through despite the worst monsoon in history. To handle the huge vessels, one of which measures 144 feet, a special landing mole had to be built at Pir Pau. The vessels were off-loaded from the ocean-going cargo ships at Alexandra Docks and transported to Pir Pau on a barge, on which was mounted a 26-wheel lorry which drove off the mole to the refinery site on a specially built road. By October practically all the major vessels in the Combination Unit had been placed on their foundations. Since an ordinary crane would have been quite incapable of handling these vessels, a guy derrick and boom capable of handling up to 100 tons at a time was installed. Three months later work had reached a stage where electrification was undertaken preparatory to the start-up operations. Today the skyline is dominated by an imposing group of vessels and towers reaching about 200 feet in the sky fronted by an intricate maze of pipes and tanks, pumps and compressors, furnaces, stills and towers pulsating with the flow of oil.



Combination unit—the heart of the refinery—so called because this unit combines three processes of refining—crude distillation, naptha reforming and heavy gas oil catalytic cracking. In most existing refineries these processes are carried out in separate units.



Modern earth-moving equipment such as is shown above was used to clear the 280 acres of land on which the Stanvac Bombay Refinery now stands.

Source of Crude Oil

The crude oil, which will come mostly from the Persian Gulf area, will ultimately be landed from 100,000-barrel ocean-going tankers at a terminal which has been built at Butcher Island by the Bombay Port Trust. A large portion of the finished products, kerosene, gasoline, industrial fuels, etc. will also be pumped out from the Refinery to storage areas elsewhere in Bombay and some of them will also be handled by rail tank wagons.

The largest single product to flow from the Refinery will be gasoline—more than 90 million imperial gallons a year, or enough to keep every car, bus and truck in India going for four months out of the year. The more than 40 millions of kerosene which the Refinery will be able to produce annually will be enough to supply light for all the lamps in India for two months.

The yearly output of 59 million gallons of diesel oils represents a quantity sufficient to keep 100 tractors working eight hours a day for 40 years, or enough power to plough 40 million acres of India's soil. If applied to rice-milling machinery this amount of diesel fuel would mill more than 40 million tons of that important food staple. The industrial fuel oil from this refinery—some 58 million gallons a year—will be enough to keep a textile mill with 30,000 spindles and 900 looms operating eight hours a day for 110 years. The bunker fuel to be produced—49 million gallons a year—could propel a 10,000-ton freighter around the world 120 times.

Combination Unit

Refining the crude at the Standard-Vacuum Refinery will be done in what oilmen call a "Combination Unit". This is a processing unit which incorporates both crude distillation and catalytic cracking—the latter taking certain fractions of the oil and changing their chemical composition to give larger yield and better quality in the final product. The particular Catalytic Cracking Unit equipment which has been installed in Trombay is known as the Model IV Catalytic Cracking Unit and is simpler, easier to operate and more stable in operation than earlier models which were pioneered in the United States about ten years ago. The Model IV has also the advantage of using 30 percent less steel than earlier models while giving the same volume of product output.

Cat Cracker

The function of a Catalytic Cracking Unit (or "cat cracker") is to alter chemically the hydrogen molecules in the crude fractions as distinct from physically separating them by distillation—one of the other main methods of oil processing. Cracking which is one of the most advanced processes in the industry breaks some of the crude oil molecules apart and gives a greater yield of the more valuable products. Further processing, purifying, blending, etc. are necessary before the products are ready for the market.

It is the inclusion of the most up-to-date equipment known to the petroleum industry such as the "cat cracker" that has made the Stanvac Refinery one of the most modern in the world. It is much more than a vital and efficient plant turning out products which would be instrumental in raising the standard of living of the Indian people. It is a visible symbol of the faith one great country has in the future of another.

INDIA'S LARGEST REFINERY NEARING COMPLETION

BURMAH-SHELL PROJECT AHEAD OF SCHEDULE

BY 1957, three oil refineries, two in Bombay and one in Visakhapatnam, are expected to be in full production, involving a total capital investment of Rs. 50 to 60 crores. This is the first instance of large-scale investment of foreign capital in India on mutually acceptable terms and in a vital and complicated new industry. It is bound to have a profound impact on the economy of the country. When all the three refineries go into full production they will refine approximately 3,600,000 long tons of crude oil per annum producing motor spirit, kerosene, high speed diesel oil, light diesel oil, furnace oil and bitumen. All these products are in great demand in the Indian market. The new refineries, when in full production in 1957, are expected to meet at least 80 percent of India's requirements of petroleum products, now running at the level of approximately 3.75 million tons a year. This consumption is expected to increase progressively and by 1957 is estimated to reach a figure of over four million tons.

Last year the total consumption of petroleum products in India was:

	Tons.
Kerosene	11,52,840
Motor Spirit	7,65,281
Light Diesel Oil	4,08,658
High Speed Diesel Oil	2,92,428
Furnace Oil	5,76,382
Aviation Spirit	88,929
Lubricants	1,55,986
Bitumen	1,26,762
Mineral Turpentine	8,051
Solvent Oil	9,580
Vapourising Oil	39,110
Paraffin Wax	8,790
Jute Batching Oil	68,002
Total	37,00,799

Of the three refineries planned for India, the Burmah-Shell Refinery will be the largest. It is being built by Burmah-Shell Refineries Ltd., on a 450-acre site in Trombay Island, about ten miles north-east of Bombay City. It will have a refining capacity of two million tons of crude oil per annum and will involve a total investment of at least Rs. 25 crores. Before the Refinery comes on stream early in 1955, Burmah-Shell Refineries Ltd., will be formed into a public company. Preference shares to the extent of Rs. 2 crores will be made available to the general public.

The total output of the two Bombay refineries—that of Burmah-Shell Refineries Ltd. and the Standard Vacuum Refining Company of India—will be about 3,100,000 tons per annum. Burmah-Shell Refineries Ltd. will account for approximately two-thirds of the total refinery capacity of the two Bombay refineries, and over 50 percent of the total refining capacity of the three refineries. The Burmah-Shell Refinery alone will produce each year:

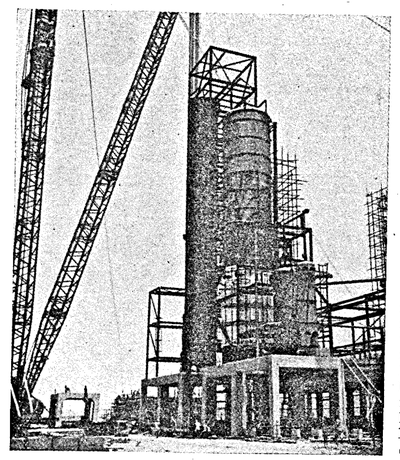
	Tons.
Motor Spirit	500,000
Kerosene	255,000
High Speed Diesel Oil	138,000
Light Diesel Oil	127,000
Furnace Oil	655,000
Bitumen	150,000

The output of India's largest refinery of each of the above products will be by far the greatest in India. In addition Burmah-Shell Refineries Ltd., will be the sole manufacturer of bitumen at the rate of 150,000 tons yearly.

The Background Story

The Burmah-Shell Refinery will incorporate the most modern features of refinery design to meet the oil needs of India. The main refinery operations will comprise crude distillation, vacuum distillation, catalytic cracking, gas separation, products treating, bitumen manufacture and packing. The catalytic cracking unit will both increase the yield and improve the quality of gasoline.

The plan to establish refineries in India was investigated thoroughly by the oil companies soon after the war. Two important factors may be mentioned as directly responsible for quickening the undertaking of refinery construction in India. The most important was the loss of the Abadan Refinery, which cut off the main source of supply of petroleum products to India. The other factor was that the Digboi Refinery (the first and the only existing oil refinery in India, owned by the Assam Oil Company, which is a subsidiary of Burmah Oil Company) met only seven percent of India's total petroleum requirements. For many years now the production at Digboi has been steady at about 180,000 gallons a day or about 250,000 tons per year. The bulk of India's supplies, therefore, had to be imported mainly in the form of refined products. But even before the Abadan crisis, the Government of India showed a keen interest in the development of the petroleum industry. Schemes were submitted by Messrs. Koppers Inc. of America, and Messrs. Lurgi Gesselschaft for the establishment of a synthetic petrol plant for the manufacture of, 150,000 tons of different petroleum products using 1.7 million tons of non-coking coal from the Damodar Valley area.



Main fractionating columns of the crude distillation unit at the Burmah-Shell Refinery at Bombay.

In 1948, at the request of the Government of India, five major oil companies sent out a Technical Mission to investigate the possibilities of installing refineries on the East and West Coasts of India. Mr. H. J. Trow, the present General Manager and Managing Director of Burmah-Shell Refineries Ltd., was the representative for the Shell Group. During its three-month stay in India, the Technical Mission visited Bombay, New Delhi, Calcutta, Madras, Visakhapatnam, Nagpur, Baroda, Ahmedabad and Bhavnagar. A comprehensive report, which recommended Bombay and Visakhapatnam as the most suitable places for refineries, was submitted to the Government of India.

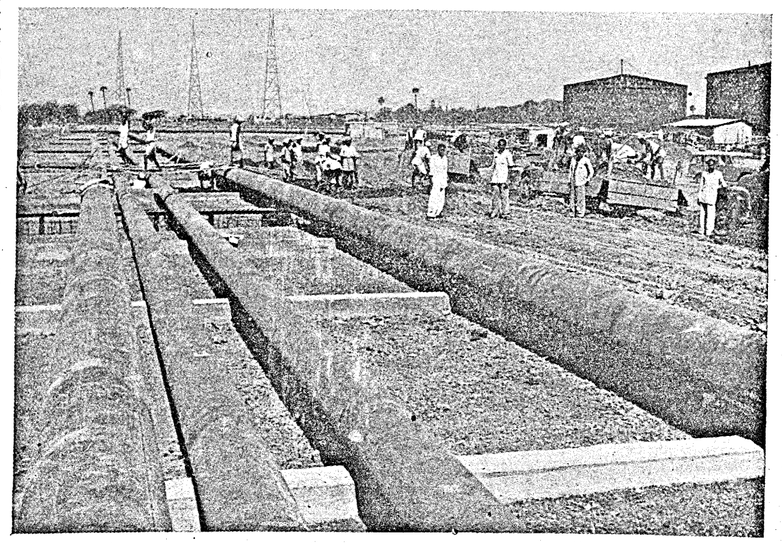
Selection of Site

Following on these discussions. Burmah-Shell indicated their willingness to provide a modern refinery at Bombay. The choice of Bombay was influenced by the fact that the distribution of about three-quarters of India's total estimated requirements of oil products is handled on the West Coast. Besides being the focal point of oil distribution, Bombay has an excellent harbour adaptable to the needs of a modern oil terminal. The large natural harbour of Bombay has an anchorage for 200 ships. It is reasonably well sheltered, even though it cannot be called cyclone proof.

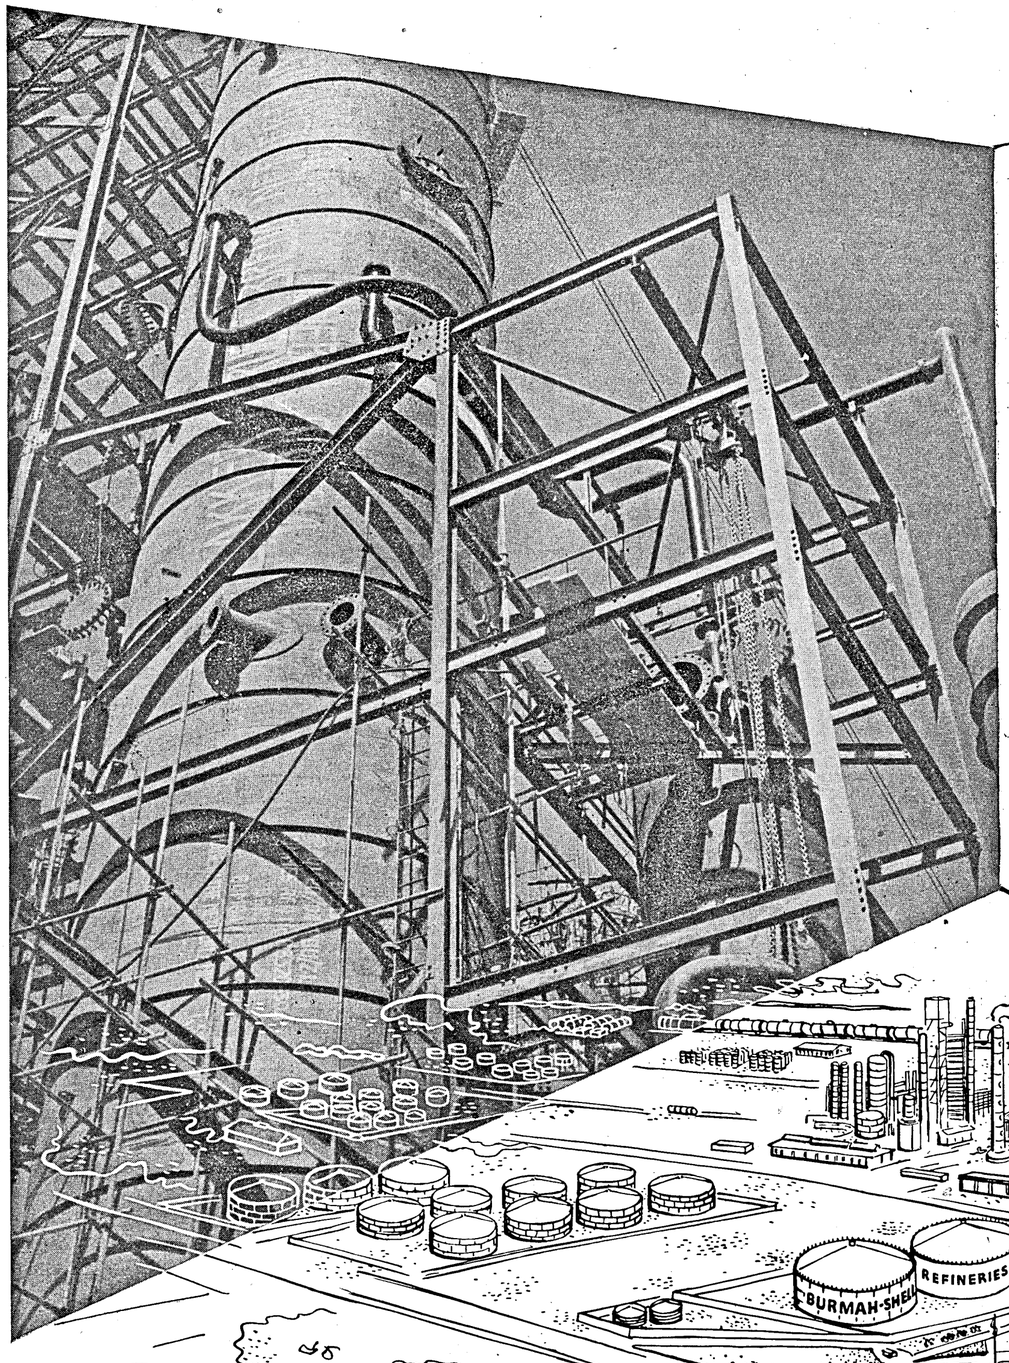
The historic agreement was thus signed between the Government of India and the Burmah-Shell Group of Companies on 15th December, 1951. The year 1952 was devoted to the necessary initial planning and investigation work required for a project of this magnitude. Arrangements were made with the Survey of India to prepare new maps specially for the Refinery Survey. These maps gave accurate information of what lay on the surface of the land, but detailed investigations had then to be made to determine what lay underneath the surface. It was known, for example, that only a few miles away, on a newly developed tank farm site, lying between Sewree and Trombay, nearly 35 feet of soft blue clay was to be found beneath the surface of the soil before reaching hard moorrum suitable for foundations.

The next stage in the construction of the refinery was the detailed sub-surface exploration work. This was undertaken by a team of experts with the aid of the most modern drilling equipment. They probed the sub-surface soil of the Refinery site to study the rock structure and to determine how deep

(Continued on page 42)



Product pipelines in the central pipe track of the Burmah-Shell Refinery at Bombay.



The shape of things to come...

India's demand for oil, especially Diesel Oil, has grown tremendously in recent years, its total requirements in 1952 being about 80,000 barrels a day of which domestic refining capacity supplied about 5,000 barrels. The country's intensive development programme is likely to accelerate consumption so that by 1956 consumption is expected to be over 100,000 barrels a day.

The projected plant of Burmah-Shell Refineries will have a crude oil distillation capacity of 40,000 barrels a day or 2,000 tons a year. It will be going on stream early in 1955 and will be the most modern and by far the largest oil refinery in the country. It will produce straight-run motor spirit, kerosine, and gas oil. Kerosine will be further treated and there will be a fluid "cat-cracker". Fuel oils and Bitumen will also be produced.

The authorised capital of the company is 25 crores.

BURMAH-SHELL REFINERIES LTD..... IN INDIA'S LIFE AND PART OF IT

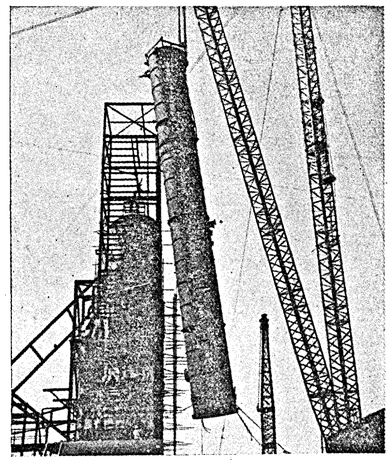
they must go to ensure the stability of the heavy Refinery units. By this method the experts were able to decide which land areas were most suitable for different forms of construction. Fortunately it was found that, over the entire area envisaged for the refinery, rock was relatively near the surface of the ground, thus economising on the size of foundations but increasing the difficulties of excavation for the deep sewers.

Bombay Government Surveyors and recorded on the village maps used for land record purposes. It was on 15th January, 1953, that the land acquisition agreement for the Refinery site was signed with the Collector of Bombay and a month later a start was made in taking possession of the land. With the aid of the Government of India Surveyor, boundary pillars were sunk deep in the ground.

Construction Work Begins

The greater part of this 450-acre site, consisting of waste and arable land, has now been handed over, and construction work is well in hand. Certain structures on the site have had to be cleared. Some of the most important of these structures were the existing Bombay Port Trust pipelines through which practically all the white petroleum products imported by tanker into Bombay are pumped. These passed right across the centre of the Burmah-Shell Refinery site and have now been moved. Their removal cost about Rs. 13 lakhs, and was done in such a way as to maintain the continued import of white petroleum products into Bombay.

One of the first pieces of work to be undertaken, therefore, was the construction of a new earth bund, 100 feet wide and 4,000 feet long, on the south and south-west of the Refinery site which served as the new track on to which the existing Port Trust pipelines have been moved. A considerable part of the site has now been cleared and levelled, roads built, temporary offices, stores sheds, and workshops erected. Some of the heavy columns including the main Crude Distilling Column are already in position, and foundation work for the Catalytic Cracking Complex is nearly complete. In all, about 60,000 tons of steel will be used, 20,000 cubic yards



At the Burmah-Shell Refinery at Bombay, the secondary tower for the crude distillation unit is being hauled into position by special construction crane.

The Burmah-Shell Refinery will need specialised personnel to run the many complicated plants that make it up. In this connection an extensive training programme for Indians in all phases of oil refining is in hand by Burmah-Shell Refineries Ltd. Some 43 Indian trainees are already being trained in Refinery work in Great Britain and Holland and in Bombay or on site in Trombay. Special courses of extensive training are being arranged on an individual basis in the refineries and laboratories of the Shell group in Europe.

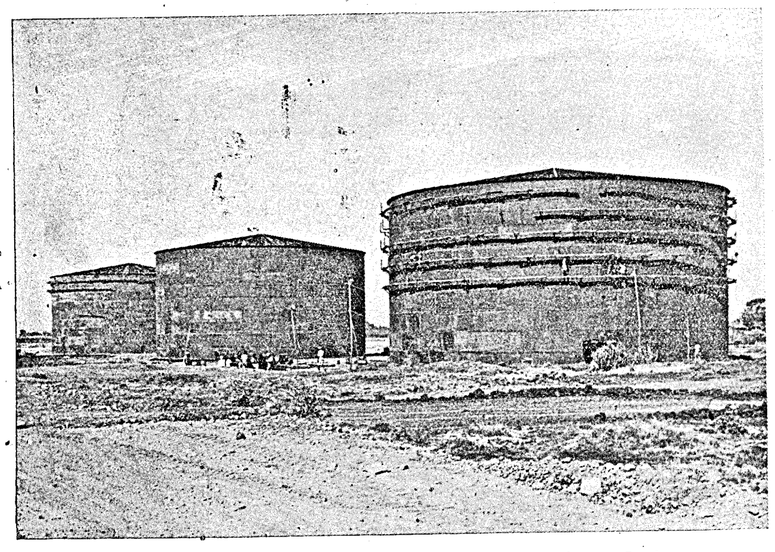
Apart from the main Refinery work, now under way at Trombay, residential quarters for 18 flats and a number of bungalows for senior key operating personnel are being built, at a short distance from the Refinery. Burmah-Shell Refineries Ltd., have also given Rs. 40 lakhs to the Bombay Government to build new housing quarters for 500 labour families. The Company will also provide a ten-acre recreation ground for their staff and labour. Messrs. Tata Hydro Electric will be constructing a large new thermal electric supply station from which the Refinery will draw its supplies of electrical energy via the Bombay Grid. The Central Railway is also building a new arterial siding to connect the Refinery and Tatas with the main line Railways in the vicinity of Kurla. Side by side with this, the Bombay Municipality is constructing a new water main through which the Refinery will draw its requirements of one million gallons of fresh water per day.

Advantages to India

The advantages accruing to India from the installation of the refineries are far-reaching. Apart from the impact which the three oil refineries will have on industry and the economy of the country as a whole, their installation will also have a psychological effect on future foreign investments in India. The planned investment of Rs. 50 to 60 crores by the oil industry and the confidence it signifies, will create a climate favourable for further large-scale investments in other basic industries of national importance. Evidence is not lacking in that direction.

Another very important advantage will be the saving in foreign exchange, particularly of India's limited dollar resources now used for imports of petroleum products. In future the imports will mainly be of crude oil, and for every gallon of petrol that we may buy in future at a roadside pump, for every gallon of diesel oil which may be consumed in industry, the element of cost in the price which represents payments for labour and other sundry charges will have been incurred in India. This is a gain of importance, when we consider that the saving in foreign exchange on this account is estimated to be at least Rs. 6 to Rs. 10 crores a year. Of this, Burmah-Shell alone will be responsible for Rs. 4.3 to Rs. 6 crores per year.

Another benefit to India will be the development of a corps of technical personnel specialising in modern petroleum refining. Remunerative employment will be provided to scores of Indians and opportunities will be available to highly skilled technicians for studying techniques hitherto not available to Indian nationals. Thus India's largest Refinery will go into production when India's needs are greatest. By 1956, when the two Bombay refineries will be in full production, the consumption may well reach a figure of nearly four million tons, since many of the big multi-purpose projects undertaken under the five year plan should be properly under way.



Gasoline and kerosene main storage tanks at the Burmah-Shell Refinery at Bombay.

The Bombay Government agreed to acquire this land for Burmah-Shell Refineries Ltd., under the normal Land Acquisition Act procedure. But before this could be taken in hand, the boundaries of the Refinery site had to be measured by the

of concrete poured, 12 miles of roads constructed, about 100 miles of electric cable laid, 400,000 cubic yards of earth moved and tankage to hold about 430,000 cubic metres of oil erected. The largest diameter Plant Steel Column will be 27 feet and the highest plant column will be 130 feet. Stacks for the furnaces will be 200 feet high. About 200,000 tons of cooling water will be pumped each day from Bombay Harbour for plant requirements.

The Burmah-Shell Refinery, which was originally intended to be completed by 1st January, 1956, is now ahead of schedule and is expected to come on stream in early 1955. Full allowance in the site layout has been made for future expansion of the Refinery as and when this is justified by increased demands for petroleum products. But the main intention is to supply products for which there is a known demand and which, at present, India has to import. Aviation spirit, solvent oil, mineral turpentine, lubricating oils and jute batching oil will not be refined in Bombay and will continue to be imported.

The crude oil to be processed in the Burmah-Shell Refinery is expected to come from the Persian Gulf area and will be carried in tankers of up to 30,000-ton capacity. These modern tankers are considerably larger than those which have normally brought supplies to Bombay. They will use the new marine terminal which is being built by the Bombay Port Trust at Butcher Island, in the middle of Bombay Harbour. This new marine terminal will be linked with the Refineries by submarine pipelines.

INDIA'S HEAVY CHEMICALS INDUSTRY

● By Hitindra Malik ●

THE rapid, almost phenomenal, growth of the chemical industry in a brief span of ten years since the end of the war has raised it from a modest position to rank among the country's six foremost industries today. Investment in the private sector has risen from Rs. 119,159,000 in 1946 to approximately Rs. 300,000,000 in 1953 and the country now has 245 chemical manufacturing units employing about 36,000 workers with an annual wages bill of Rs. 24,484,000, in addition to Rs. 17,603,000 paid to employees other than workers. But development in the heavy section of the industry has been comparatively slow.

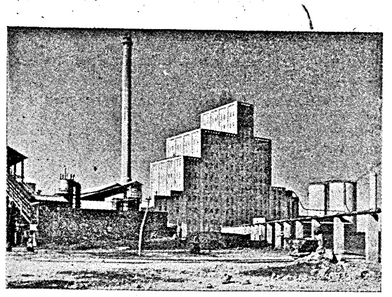
Classification of chemicals into groups will necessarily be arbitrary but, in general, heavy chemicals are those which are produced in bulk at a relatively low cost and are used either in the manufacture of other chemicals or as raw materials in other industries. Heavy chemicals are the basic raw materials on which industry as a whole depends. In fact, the industrial efficiency of a country can be measured by the quantum of its heavy chemicals output. Of these, soda ash and caustic soda—the two alkalis—are the most important, along with sulphuric acid. Domestic production of soda ash has risen from 12,000 tons in 1946 to 56,650 tons in 1953 and it is expected that a production figure of 66,000 tons will be achieved by the end of this year. But there is room for further expansion. The current annual demand is computed at 115,000 tons, and this is a growing demand. As other industries develop, notably the glass, textile, chemical and pharmaceutical industries, the offtake of soda ash will correspondingly increase. On the basis of the expected rate of industrial development, it is estimated that the annual consumption of soda ash will amount to 155,000 tons by 1955-56. The five-year plan, however, only envisages an installed capacity of 86,000 tons by that time.

The reason for the slow rate of progress, and for the comparatively modest expansion plans for the future, is that the soda ash industry has had to contend with serious difficulties. It is one of the most secretive industries in the world and the bulk of the world's production is confined to a few manufacturers. Any technological advances made within the industry are seldom divulged. Hardly any foreign technical assistance was available when the Indian industry came into production. Indian manufacturers have had to learn by a process of trial and error.

The chief difficulty lies in designing plant. Complete soda ash plants are just not available. Blueprints have to be specially drawn up to suit the requirements of each individual manufacturer taking into account local conditions and the quality of raw materials available. Each unit has to be designed separately because each unit is fabricated by a different engineering manufacturer. There are about nine major units in the ammonia soda process of manufacturing soda ash, now universally used, and balancing them presents another problem. If all the units have not been designed to work in consonance or if there is any defect in adjustment, the entire process is thrown out of balance. This is what happened in the case of India's two soda ash factories.

Modification of Plant

Tata Chemicals with their Rs. 13,800,000 plant at Mithapur, which accounts for about 70 percent of the country's production, ran into difficulties from the very beginning when they came into operation in 1947. They have had to carry out modifications to their plant in three stages at an expenditure of Rs. 4,000,000 involving the ash plant, brine evaporator, salt works and service plants. This has hampered the efficient working of the unit. In the first stage production was limited to 50 tons a day and then raised to 110 tons when the second stage was completed. The third and final stage is only now in hand and when the new carbonating tower is installed this year it is expected that Tatas will be equipped to produce 140 tons a day, which was the original target. Similarly, the Dhrangadhra Chemical Works have had their difficulties, despite the fact that they were able to purchase their plant at the nominal cost of Rs. 287,000 from the Dhrangadhra State, the original owners of



Tata Chemicals' soda ash plant.

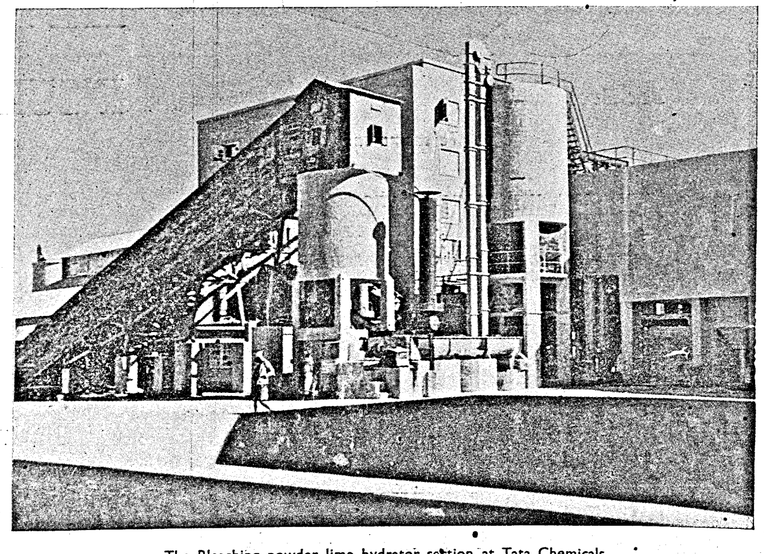
the works. Drastic modifications have had to be carried out, and are still being carried out, at an estimated cost of Rs. 3,500,000 which will enable the plant to function all the year round and produce 90 tons a day—its production capacity—when all the modifications have been completed.

The Indian alkali industry received another major setback in 1948-1949 when soda ash and caustic soda, among other chemicals, were placed under the Open General Licence. Imports of soda ash in that year shot up to 163,567 tons valued at Rs. 53,520,000, the highest ever, against 67,948 tons valued at Rs. 13,274,000 the previous year. Most of these imports were of a speculative character and far in excess of the country's needs. Stocks accumulated and prices fell sharply. The Dhrangadhra Chemical Works and Tatas had to close down their plants for a period of four to five months. Indian output in 1949 dropped to 17,913 tons, compared with 29,148 tons in the previous year. The industry then appealed for protection, which was granted. The revenue duty of 18 percent *ad valorem* preferential on imports from Britain and her colonies and the standard duty of 30 percent were converted into protective duties of 40 and 50 percent respectively. The tariff value was fixed at Rs. 13-8 per cwt. and a subsidy of Re. 1 per cwt. was also given to Indian manufacturers. Imports were again restricted. The question of protection was reviewed in 1951 and, in view of the altered conditions, the rates of import duties were revised to 30 percent *ad valorem* preferential on imports from Britain and her colonies and 40 percent *ad valorem* standard with the tariff value remaining at Rs. 13-8 per cwt. The subsidy, however, was abolished. This protection will remain in force up to 31st December, 1954. With protective tariffs, a stabilised import policy which restricts imports to the excess of the demand over domestic production and modification plans nearing completion, the Indian soda ash industry is now coming into its own.

Thus far it has been a period of consolidation rather than of extension and this phase is not yet over. Plans for increased production pertain to the existing units and, although the government is investigating the possibility of setting up new plants, there are no concrete schemes yet for new soda ash factories. So complex is the technique of production that India has only two soda ash factories and they are likely to remain the only ones for some time. Indian production is confined to light soda ash which, although suitable for most industries, is unsuitable for the glass and bichromates industries which require heavy soda ash. The glass industry with a total annual demand of 40,000 tons is among the leading consumers of soda ash. The disadvantage of using light soda ash in the glass industry is that the rate of output is affected because light ash shows a greater tendency to foaming and consequently lowers the filling capacity of the pots. In the recuperative and regenerative furnaces, the losses in the form of dust are greater with light ash. Such losses not only affect the composition of the melt, but also clog the recuperative galleries and remunerative chambers and this entails constant repairs. Although glass factories can modify their plant so as to be able to use light ash, such modifications are uneconomic. Heavy soda ash has, therefore, to be imported. But in due course the Indian industry will have to consider the production of heavy ash because the glass industry is important and an annual off-take of 40,000 tons is not without its economic significance.

Caustic Soda

Like the soda ash industry, the caustic soda industry has also progressed. Today there are seven units with a total invested capital of Rs. 19,500,000 which manufacture caustic soda. Production increased from 2,904 tons in 1946 to nearly 22,536 tons in 1953, but this is far below the annual consumption which is estimated at about 60,000 tons. Like all basic chemicals, the offtake of caustic soda will increase as India's industrial progress gathers momentum. The soap industry, which is among the main consumers of caustic soda, has planned a vast expansion programme. It is expected that by



The Bleaching powder lime hydrator section at Tata Chemicals.

1955-56 India will produce 200,000 tons of soap annually for which increasing supplies of caustic soda will be required. Similarly, the rayon industry, which is of recent origin, will require increasing quantities of caustic soda as yarn output increases. With an annual consumption of 60,000,000 lbs., India is the biggest importer of rayon yarn in the world and the domestic yarn industry looks forward to a progressively increasing share in this business. Based on these and other developments in the paper and textile industries, it is expected that the demand for caustic soda will amount to 87,000 tons by 1955-56. The five year plan envisages two additional units which would bring the rated capacity of the country up to 37,125 tons by 1955-56. This will still leave a serious deficit.

The importing spree which hit the soda ash industry also affected caustic soda manufacturers. As a result of caustic soda being placed under Open General Licence in 1948-49 imports in that year rocketed to 90,616 tons, valued at Rs. 76,172,000—a record figure for any year. Indian manufacturers found it extremely difficult to sell their production and had to curtail their manufacturing programme. Today, with a stabilised import policy which is aimed at making up the deficit in the country's requirements, and protective tariffs, the Indian industry is able to sell its entire production and to make plans for the future.

But there is another problem which has hindered the growth of this industry and which is likely to impede further progress. The problem relates to manufacturing processes. There are two processes of manufacturing caustic soda. The first is the electrolytic process by which a solution of brine is electrolysed which gives rise to caustic soda, chlorine and hydrogen. The second process is the causticising process by which a solution of soda ash is treated with lime and this reaction results in caustic soda and calcium carbonate. The first process is the more economical and is commonly used in this country and abroad. Tata Chemicals are the only manufacturers in India who use both processes.

A problem is posed by the chlorine which is a by-product if caustic soda is manufactured by the economical electrolytic process. For every one ton of caustic soda manufactured by this process 9/10 of a ton of chlorine is simultaneously produced. On the basis of the present manufacturing programme of caustic soda, approximately 13,500 tons of chlorine are produced annually as a by-product while the total demand for chlorine in the form of gas, bleaching powder and hydrochloric acid is estimated at 9,000 tons a year. What is more, if the production of caustic soda is stepped up according to schedule, the country will have approximately 31,000 tons of chlorine on its hands. The disposal of chlorine gas is no easy matter. An atmosphere polluted with chlorine gas would not be healthy. Although the manufacture of bleaching powder involves the simple process of absorbing chlorine gas in slaked lime powder, the demand for bleaching powder is steadily diminishing. Last year only 1,950 tons were produced against a rated capacity of 7,800 tons. Other bleaching agents like peroxides are displacing chlorine products in the textile industry, while newer and more effective insecticides and disinfectants have made the direct use of chlorine gas and bleaching powder obsolete. The orthodox uses of chlorine are no longer economical.

Tata Chemicals are, therefore, experimenting with the causticisation process of manufacturing caustic soda to perfect a technique which would make it more economical and to integrate it with the general soda ash programme. As it is, the causticisation process is considerably more expensive. The main reason is that in this process soda ash, a comparatively expensive raw material, is used instead of the cheaper brine solution. Moreover, the use of soda ash for this purpose is wasteful when ash production still falls short of the demand. If the causticisation process is continued, the increased manufacturing programme of caustic soda will require an additional 50,000 tons of soda ash every year which could profitably be used by other industries. But plentiful supplies of chlorine open up vast possibilities of industrial development, for chlorine is a vital raw material for a number of other industries which are still undeveloped in India. For instance, the manufacture of insecticides like D.D.T. benzene hexachloride and paradicholorobenzene is a major industry in itself. All of these require chlorine and all of them are in demand in view of the Government's extensive programme of plant protection, malaria control and locust control. Tata Chemicals have embarked on a scheme of manufacturing benzene hexachloride and when their 1,500 ton plant comes into operation a substantial proportion of the chlorine generated in their caustic soda plant will be used in the manufacture of a remunerative product. The insecticide industry is still in its infancy, and as it develops the offtake of chlorine will increase. Then there is the whole field of solvents like carbon tetrachloride and ethylene dichloride and the synthetic rubber industry and chlorinated rubber and a large range of organic chemical products which all depend on chlorine.

Chemicals for Plastics

Another major industry is the plastics industry. Although finished products are manufactured in India on a large scale, the basic raw materials (like moulding powders, synthetic resins, polyvinyl chloride) and semi-finished materials have to be imported from abroad, and on these India spends about Rs. 16,000,000 every year. Here is a field of industrial expansion for which the basic raw material is available. Another group of raw materials—benzene, acetylene and ethylene, which are used in conjunction with chlorine in the plastics industry—will soon be available when the oil refineries at Trombay come into operation. The plastics industry is assuming growing significance as new uses for plastic products are discovered, notably in surgery and in specialised equipment for the defence forces.

All these industries consume so much chlorine that in Europe and the United States there is, at times, a chlorine shortage in spite of the fact that the electrolytic process of manufacturing caustic soda is used which results in enormous supplies of chlorine as a by-product. This is a classic example of a basic chemical being a vital raw material for other industries. In this case the development of the caustic soda industry is being obstructed because other industries are not sufficiently developed to absorb its by-product which is an equally important industrial chemical.

Sulphuric Acid

Sulphuric acid is of sufficient importance to be included among heavy chemicals; and it conforms to the definition of heavy chemicals in as much as it is produced in bulk and is used as a raw material in industry. The sulphuric acid industry is perhaps the oldest chemical industry in the country and it had its beginnings towards the end of the 19th century. But it was the war with its defence requirements which gave the sulphuric acid industry its real impetus. Progress has been maintained in the postwar years. By the end of 1950 there were 43 units—30 chamber plants and 13 contact plants—with an annual productive capacity of 150,000 tons in terms of 100 percent acid. Today, with a capital investment of Rs. 20,000,000, the country has 47 manufacturing units with an annual rated capacity of 190,000 tons. It is expected that the annual demand will have risen by 1955-56 to about 200,000 tons of which the superphosphate industry alone will require 116,000 tons. It is quite likely that the target figure of 180,000 tons by 1955-56 of superphosphate will be increased in which case more sulphuric acid will be required. In any case, the use of fertilisers is on the increase and as Indian agriculture develops along scientific lines and more and more land is brought under cultivation as a result of the Government's irrigation and development schemes, increasingly larger quantities of sulphuric acid will be required. Then there are the new iron and steel works as envisaged by the Krupps-Demag-Government of India agreement which will need sulphuric acid for pickling steel. The uses of sulphuric acid are numerous and it is often said that its consumption is an index of a country's industrial standing. The dyes and the explosives industries, which are yet in their early development stages, all need sulphuric acid as a raw material. The limiting factor in the production of sulphuric acid is the basic raw material—sulphur. There are no sulphur deposits in India and the industry depends on imported sulphur.

CALCUTTA

Alarmed at this complete dependence on foreign supplies of a vital raw material, the lack of which could paralyse her industry, India is making every effort to re-orient her sulphuric acid industry so as to be able to use domestic raw materials other than imported sulphur. Pyrites and gypsum seem to be the two raw materials, which India possesses, and which may replace sulphur. Pyrites are available, as is so far known, in the Simla Hills, Bihar and Mysore. The first two sources appear to be suitable but the Mysore deposits have yet to be conclusively proved. Bihar is expected to yield 40,000 to 50,000 tons of pyrites, and geological prospecting may reveal further deposits. In regard to gypsum, small deposits occur in a number of places but the most promising ones are in Rajasthan and near Trichinopoly. The Rajasthan deposit, which has been fully explored, is estimated to yield 20,000,000 tons. Only 25 percent of this quantity is expected to be over 87 percent quality, which is the minimum grade accepted by the fertiliser factory at Sindri for the manufacture of superphosphates. This source may therefore have to be exclusively reserved for the Sindri factory until new deposits are found. Meanwhile, technical investigations into the process of using sodium sulphate to produce sulphuric acid by the electrolytic and chemical processes and magnesium sulphate from seawater bitterns for the simultaneous manufacture of sulphuric acid and magnesia are envisaged. The extraction of sulphur from high sulphur bearing coals and the recovery of sulphur by bacteriological processes are other possibilities.

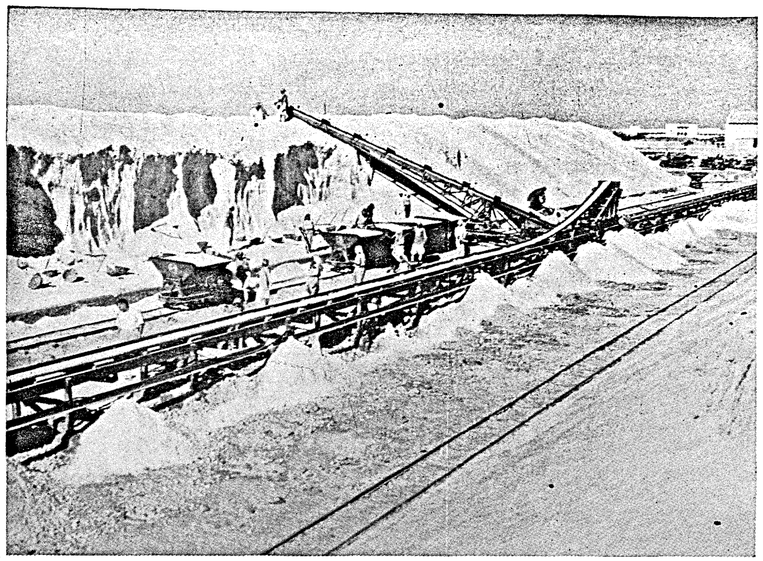
Small Units

The existing sulphuric acid units are generally small, which has led to uneconomic production, and then to increased costs of production in the consuming industries. The biggest plant in the country has a productive capacity of 75 tons per day. The plant at the Tata Iron and Steel Works has a daily capacity of 50 tons which is used entirely by the works. The average capacity of a plant installed in India works out to 10 tons a day while one of the plants is so small that it only manufactures 180 tons a year. A plant with a minimum rated capacity of 100 tons a day is considered a reasonably economic unit.

Neither is the problem of small units confined to the sulphuric acid industry. The same problem faces the caustic soda industry which could effect large-scale economies in production with a larger turnover and increasing sales of chlorine. The cost of production of caustic soda would partly be a charge on the chlorine, and both products could, therefore, be sold at an economic price to the consuming industries. If the alkali industry does not depend on foreign supplies for its raw materials as the sulphuric acid industry does, it has its own raw material problems. Salt, which is one of the most important raw materials in the soda ash industry, is obtained in India from the sea which is always costlier than mined salt as used in Britain and the United States. Salt in the form of brine costs an American manufacturer about 50 cents per ton at the plant whereas purified brine costs Tatas about Rs. 18 per ton at their Mithapur plant. Limestone, the other important raw material, although plentiful in India, is not of standard quality. The Indian material is only 96 percent pure. On the other hand, Indian coke has the high ash content of 24 percent compared with 14 percent in its American counterpart.

Poor Quality of Raw Materials

The poor quality of raw materials adds to the cost of manufacturing because greater quantities of raw materials have to be used. For example, the Indian manufacturers use 2.33 tons of salt per ton of soda ash manufactured, compared with 1.5 tons used by the British and American industry. Indian manufacturers use two tons of limestone per one ton of soda ash, compared to 1.20 tons used by foreign manufacturers. In large-scale heavy industry every single factor of economy is of importance. Long distances between manufacturing plants and raw materials and consuming centres of the finished product pose problems of freight and carrying charges which add to the ultimate cost of the manufactured chemical which, in turn, has repercussions on industry as a whole. For example, Tatas have to import limestone from Porbunder for their soda ash plant at Mithapur. The freight paid over a distance of about 270 miles amounts to approximately Rs. 11-13 per ton which means an incidence of 214 percent on the ex-quarry cost of about Rs. 5-8 per ton. Considering Tatas use about 60,000 tons of limestone annually, transport charges come to a considerable figure and are a heavy charge on the finished product. The cost of limestone at the works comes to about Rs. 17 per ton against a cost of 75 cents per ton to an American manufacturer. Again, coke imported from Bengal for the Mithapur plant, which uses about 120 tons a day for generating power, costs Rs. 40 per ton. A manufacturer in the United States has to pay approximately $3 a ton.

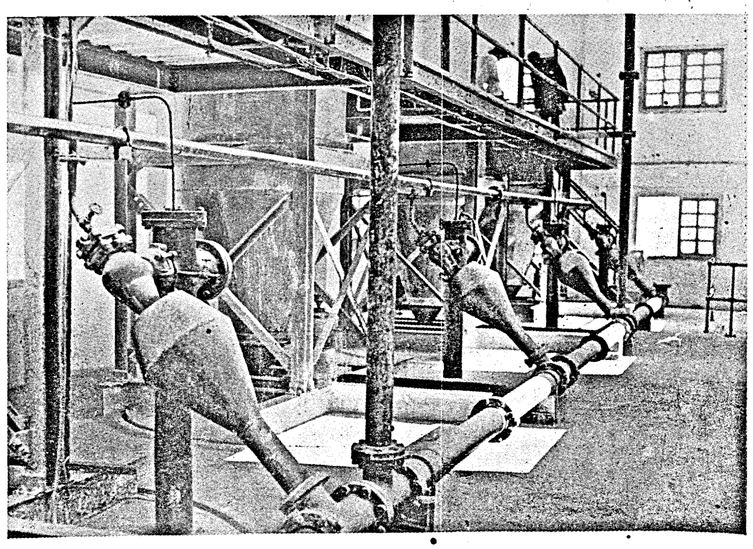


Mechanical stacking of washed salt.

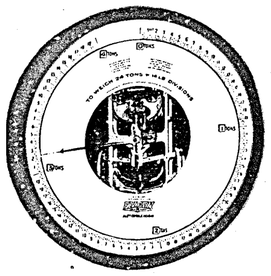
Problems of Distribution

The same difficulty applies to the distribution of finished products. The coastal freight on soda ash from Okha, the nearest port from the manufacturing centre, to Calcutta amounts to Rs. 43 per ton while the freight from a British port to Calcutta amounts to only Rs. 68 per ton. In the case of bleaching powder, the freight rate from Okha to Calcutta is Rs. 92 per ton while the freight charges from a British port to Calcutta are actually less—Rs. 73-12 per ton. It is estimated that these excessive freight rates—the highest coastal rates in the world—account for nearly 20 percent of the total cost to the consumer.

It would be absurd to compare India's heavy chemicals industry with the more advanced industry of Britain or the United States. Large-scale economies of production have still to be achieved and the dependent industries have to be developed before the Indian heavy chemicals industry can achieve that mass production which alone will make it economic. The poor quality of India's raw materials cannot be remedied, but technological advances can modify these disadvantages. The difficulties caused by freight charges and haulage can be remedied, and it is to be hoped that when industrialisation gathers momentum these problems will sort themselves out by closer collaboration between the State and the industry. A great future lies ahead of the basic heavy chemicals industry—an industry of very great strategic importance—and indeed, with its growth is inextricably bound up the future of industrial India.



Bleach tower ejector at Tata Chemicals.



WHAT DOES MODERN WEIGHING MEAN?

It means reading from a dial indicator.

It means that weight reading is as simple as telling the time.

It means that taring calculations are eliminated.

It means more rapid weighing with less possibility of error.

It means greater precision.

- MORE PRODUCTION
- LESS COST
- MORE PROFIT

It means that the advantages of complete economic efficiency are now within the reach of all.

The Avery range is sufficiently extensive and varied to meet the requirements of every industry. Contact us now, and let us give you our recommendation for the most economic installation, without cost or obligation.

INDUSTRIAL EXPLOSIVES

NEW PLANT TO BE BUILT IN BIHAR

BEFORE the invention of explosives the breaking of rock presented a formidable task, involving the expenditure of a great deal of time and labour. The first known stage in scientific rock breaking was fire setting, an operation which consisted of burning wood fires against a rock face for three or four days and then quenching them with water. The sudden cooling and the resultant contraction stresses induced a system of cracks in the rock enabling it to be broken up and handled. This primitive art flourished in India and elsewhere in very early times and examples of it can still be encountered in remote places today. The first explosive was Blackpowder, invented by Roger Bacon in the 13th century, but its application to industrial use appears to have been long delayed, as the first recorded instance of its use as a blasting explosive was in Hungary at the beginning of the 17th century, but it is almost certain that its use in India dates back earlier than this. Blackpowder is still used extensively here; it is easily manufactured as its ingredients, with the exception of sulphur, are readily available from indigenous sources.

High explosives, developed by the inventive genius of Alfred Nobel, made their appearance in India towards the end of the 19th century and their use has steadily increased ever since. Blackpowder, although cheap and easily made, is limited in its application and the adoption of more modern methods in mining and quarrying, the demand for increased production of coal and other minerals and the introduction of machinery where formerly only hand labour was employed, created a demand for the more versatile high explosives. Unlike Blackpowder, the composition of which is fixed within fairly narrow limits, these can be made of widely differing compositions to give varying strengths and other characteristics required for diverse conditions. Research on high explosives is increasingly maintained to meet special requirements, always with the additional aim of greater safety in their use.

In anticipation of the wider employment of explosives, the Indian Explosives Act was passed in 1884. In 1893 an Explosives Department of the Government was formed and a Chief Inspector of Explosives was appointed. All notifications, etc. made under the Act were collected and published in practical form as Rules which were subsequently revised and simplified in the Explosives Rules 1940, a code of unusual lucidity, which with minor amendments is still in operation. Strict control was kept on the quality and condition of explosives imported and stored in India, as well as on their distribution, possession, sale and use, a control which is exercised to this day.

Post-War Increase

Since the war there has been a remarkable rise in the consumption of explosives occasioned by greatly increased coal production, the intensification of mechanisation in mines and quarries to meet growing labour costs and difficulties, and especially the elaborate irrigation and hydro-electric projects which constitute such an important part of the five year plan. To illustrate this: the consumption in the year 1946 was less than 1,700 tons, while in the first four months of 1954 over 1,800 tons have been used, an increase of over 200 percent. More and more engineers appreciate the flexibility of modern explosives and the old methods of blasting with Blackpowder are gradually disappearing. The increasing use of explosives gives clear evidence that engineers in India are keeping pace with the most modern developments in mining and civil engineering and are profiting by experience gained in other parts of the world. At the Bhakra Dam, to quote one example, some of the largest single blasts ever fired, one of more than 90 tons of explosives, have been successfully carried out.

High explosives were first brought into India by agents acting for Nobel's Explosives Co. Ltd. who established a chain of magazines for storage and distribution in all parts of the country where explosives were needed. Later this company was absorbed in the organisation known as Imperial Chemical Industries Limited, but the manufacture of explosives for India has been carried on uninterruptedly at the factory founded by Alfred Nobel at Ardeer in Scotland, except for a period during the last war when, to minimise shipping risks, supplies were sent from an associated factory in South Africa.

For some time it has been felt that explosives have become so vitally important to industry that it would be unwise, in the event of another war, to have the manufacturing base so far away, with the consequent risk of essential work being interrupted through the loss of supplies on the long and hazardous voyage. It was thought also that consumption had reached a point where a manufacturing unit of economic size could be installed. Military explosives had been made in India for a long time but the complicated manufacture of the industrial types had not been attempted on more than a laboratory scale. In wartime, industrial explosives are as vital to war production as military ones and the continuance of their manufacture must be safeguarded and not be liable to interruption through demands of the services. A new chapter in this story was reached on 5th November 1953 when the Government of India and *Imperial Chemical Industries Limited* signed an agreement for the erection of a factory in India, the first of its kind, where high explosives for industrial use would be produced. The new company is named Indian Explosives Limited.

Much exploratory work had previously been done on investigating a suitable site, the choice eventually falling on an area near Gumia in Bihar, close to the main centres of consumption, the coal mining areas of Bihar and Bengal. Work on the design of this factory, planned to produce 5,000 tons a year of industrial explosives and giving employment to considerable numbers, was begun immediately and in due time Indian engineers will be able to obtain the explosives that they need for mines, quarries, public works, etc., freshly made in India, secure from the risk of interruption of their work by the hazards of the sea.

NBC

NBC BEARINGS PLAY A VITAL ROLE IN INDIA'S INDUSTRIES

In India's march towards industrialisation, NBC bearings are playing an increasingly prominent role because engineers all over this country have learned from experience that to reduce machinery breakdowns, increase production and cut costs, NBC bearings are indispensable. Manufactured in India to the same exacting specifications of the world-renowned Hoffmann bearings, NBC bearings are today being used in factories and machinery, both big and small, all over India.

When you specify NBC bearings for your machinery, you are getting all that the best bearings must possess: precision smooth running and long life.

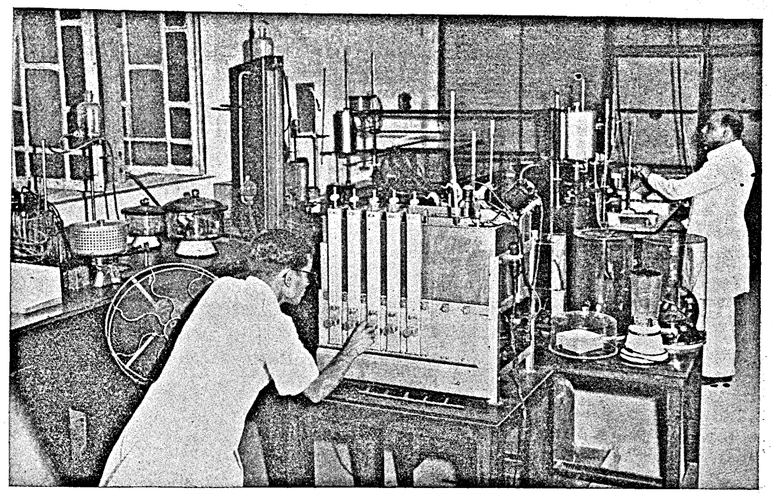
DRUGS AND PHARMACEUTICALS

● By Dr. K. A. Hamied ●

PHARMACY, the art of making medicines, was practised in ancient times by physicians who acted both as doctors and pharmacists. It was based on empirical knowledge of the action of herbs and minerals in the various diseases of mankind. In our time the progress of medical science and the rapid advance in chemistry made pharmacy an exact science. The increasing demand for drugs and medicines and new discoveries in the field of chemotherapy made it impossible for physicians to cope with the making of complicated drugs which required more and more scientific knowledge and technical skill. The manufacture of drugs and medicines in the course of time became an industry by itself known as the pharmaceutical industry. In India the foundation of the pharmaceutical industry was laid by the great scientist, Dr. Sir P. C. Ray, who established a small firm known as Bengal Chemical and Pharmaceutical Works which has since developed into a very substantial concern. In Western India, Rajmitra B. D. Amin with the help of some associates established the first pharmaceutical factory under the name Alembic Chemical Works at Baroda. Many pharmaceutical manufacturing concerns followed, especially in Bengal, such as the Bengal Immunity Co., Standard Pharmaceutical Works and others. Till the end of the first world war the advance made by the pharmaceutical industry in India was of no great significance. Between the wars, the industry made considerable progress and at the time of the second world war, although still not highly developed, it was in a position to cope with the situation created by the shortage of medical supplies, which gave a very great impetus to this industry. An idea of the growth of the pharmaceutical industry during war years can be had from the table given below showing the purchases made by the Government Medical Stores from Indian pharmaceutical manufacturers and also from abroad during the years 1938-1943:

Year	Total Purchases Rs. (Lakhs)	Purchases in India Rs. (Lakhs)	Imported Rs. (Lakhs)	Percentage of Indian-made Drugs to Total Requirement
1938-39	237	16	221	7
1939-40	286	25	261	9
1940-41	325	104	219	32
1941-42	557	279	278	50
1942-43	495	348	147	70

It is indeed a great credit to Indian pharmaceutical manufacturers that they met the requirements of the medical stores as well as the public during these critical years. Since then, the pharmaceutical industry has made rapid strides and today we possess about 50 well-organised and most up-to-date pharmaceutical concerns manufacturing high quality drugs and medicines equal to the best in the world. These do not include a large number of small mushroom concerns which have somehow obtained manufacturing licences from the Drugs Controllers in various parts of India, especially in West Bengal. (A very interesting article on this aspect of the pharmaceutical industry was published in the *Journal of the Indian Medical Association*, March 1954, page 271.) The pharmaceutical industry employs over 10,000 people and has a turnover of about Rs. 10 crores per year.



Section of a pharmacological laboratory showing Warburg apparatus for measurement of cell respiration

Among the well-known pharmaceutical concerns, the Bengal Chemical & Pharmaceutical Works Ltd., which started 50 years ago, have made great progress and today rank with the biggest chemical and pharmaceutical works in India. Besides manufacturing drugs and medicines their main interest today is in the development of heavy chemicals, such as sulphuric acid and other acids, ferric alum and some fine chemicals. They are also manufacturing such toilet articles as soap, hair oil and also surgical cotton, hospital furniture, etc. The Alembic Chemical Works, the biggest in Western India, have recently commenced manufacturing antibiotic preparations and are also producing chloroform, ether and ethyl chloride. They have their own glass factory for manufacturing bottles and a well-equipped workshop. Bengal Immunity specialise in making sera and vaccine and are conducting also a therapeutic research institute under the able guidance of Dr. Basu. The Standard Pharmaceutical Works under the supervision of Dr. Ghosh, besides producing drugs and medicines, are doing important research work in synthetic drugs.

Injection department—filling and sealing of ampoules.

Move to Bombay

In recent times the centre of gravity of the pharmaceutical industry has been gradually shifting from Bengal to Bombay. During the last two decades several important pharmaceutical manufacturing concerns have come into existence in that part of India. The Chemical, Industrial & Pharmaceutical Laboratories, Ltd., briefly known as "Cipla", was established in 1935 and has since developed under the guidance of several highly qualified chemists and pharmacists into a leading modern pharmaceutical concern. Pharmaceutical research and correct standardisation of drugs has been their guiding principle. Their laboratories are well equipped for pharmacological therapeutic research under the guidance of Dr. Bhattacharya. Among other concerns in this part of India mention must be made of the Unichem Laboratories, Fairdeal Corporation, Chemo-Pharma Laboratories and the Teddington Chemical Factory. All of them are well equipped with modern apparatus and have contributed considerably to the development of the pharmaceutical industry.

After World War II many foreign concerns like Glaxo Laboratories, Ciba Pharma and May & Baker established manufacturing activities in Western India, especially in Bombay. Among the very recent ones are the Lederle Laboratories of America who have established a huge chemical and pharmaceutical enterprise in Bulsar under the name of Atul Products. Another famous American Company, Messrs. Squibbs, have combined with Sarabhai Chemicals and are working under the name Sarabhai Chemicals. The foreign pharmaceutical manufacturing companies in India have a great advantage over Indian companies in so far as they possess large capital, which the Indian concerns are unable to command. They have also the advantage of well-established foreign names and trade marks which give their products a much easier scope of sale over the Indian made products. Growing internal competition, together with existing foreign competition, have created new problems for Indian pharmaceutical concerns.

Fine Chemicals Industry

To understand the present position of the pharmaceutical industry and the future scope of progress it is necessary to clarify what the phar-

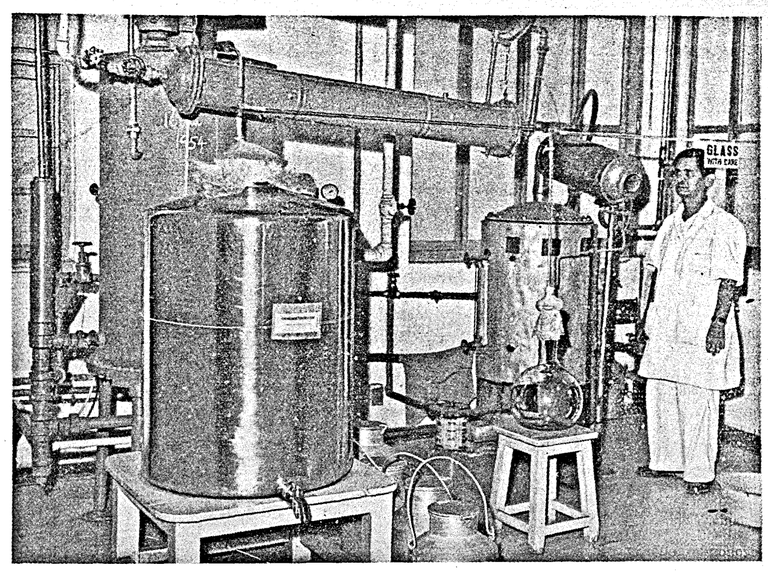
Branches at: CALCUTTA - DELHI - MADRAS

maceutical industry actually aims at. It is not essentially a basic industry by itself. It has for its object the manufacture of ready-for-use drugs and medicines from fine chemicals, minerals, herbal and animal raw materials. The fine chemical industry both organic and inorganic, is the basis of the pharmaceutical industry. As long as this fine chemicals industry is not developed in India, the pharmaceutical industry will remain dependent on foreign imports of raw materials. So far as drugs of vegetable origin are concerned, India has made enormous progress in recent times. India is a storehouse of natural herbs and other vegetable products which yield valuable alkaloids and glucosides. Among the most important of these are ephedrine, quinine, strychnine, atrophine, santonin, caffeine, morphine and codeine. India's production of these materials is almost sufficient to meet her full demand. Another important Indian herb which has become world famous during the last few years is Rauwolfia serpentina. The alkaloids from Rauwolfia serpentina are now recognised as the best treatment for hypotension. They have created a world demand. There are hundreds of other natural products of the vegetable kingdom known to indigenous medicine which in the course of time may become well-known to the Western system of medicine as well. This requires considerable research and the scientist working in pharmaceutical factories with the help of physicians will do well to concentrate their attention on this natural wealth of the country. In all this type of work whether for research or for production, various types of solvents play an important rôle, especially ethyl alcohol and methyl alcohol. Unfortunately the ban in some States on the use of ethyl alcohol and the excessive excise duty levied by Government are a hindrance to research and development.

Another line in which great progress has been made in India is the production of biologicals. India today is completely self-sufficient in all kinds of sera and vaccine and the quality is as good as can be desired. The standard pharmacopœial preparations consisting of tinctures, galenicals, liniments, etc. are produced in sufficient quantities to meet the entire demand of the country.

The manufacture of tablets either of the proprietary type or standard pharmacopœial tablets has sufficiently developed in India and production today exceeds the demand. The production of injectables also has developed sufficiently and all types of parenteral preparations of exceedingly good quality are now manufactured by every leading firm. Among proprietary medicines marked progress has been made in preparing a number of excellent remedies to combat common diseases prevalent in India, viz., vitamin deficiencies, colds and coughs, digestives, tonics and sedatives. In fact the production capacity for all these medicinal preparations is much higher than the demand. A large portion of the manufacturing capacity is lying idle on account of imports from foreign countries of all types of preparations including tablets, injectables and proprietary medicines.

Yet another line of pharmaceutical manufacture in which great advance has been made during recent years is the production of liver extract both injectable and oral. The methods of manufacture and standardisation of liver extract have been fully developed and perfected by many firms and

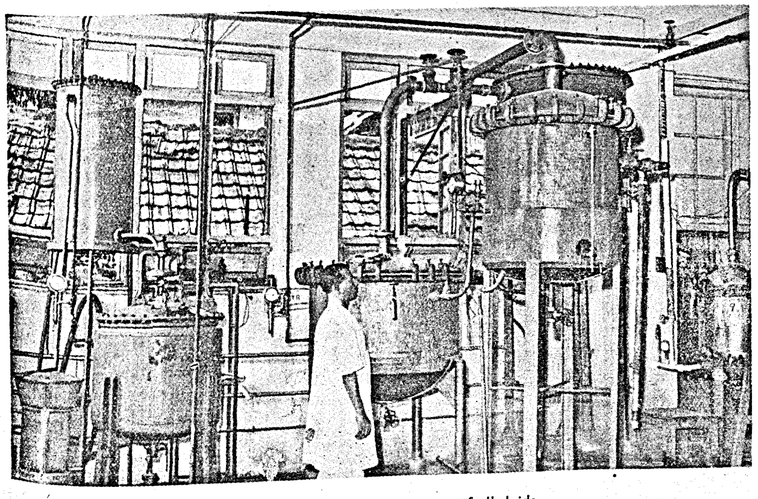


Section of water distillation, double-distilled, pyrogen free.

the quality of injectable liver extract now produced in India by some of the well-known firms is at par with any similar foreign preparations.

Chemotherapeutic Preparations

Progress has also been made in the synthesis of many chemotherapeutic substances by a number of firms in West Bengal as well as in Bombay. Such products as 5,7-Di-iodo-8-hydroxyquinoline, Pyridin B. Carboxylic Acid Diethylamide, Dehydrocholic Acid, Idochlor-Oxyquinoline, Urea Stibamine, Carbarsone, Sulpharsphenamine, Chlorobutanol, Nicotinic Acid, P-Aminosalicylic acid, Di-amino diphenyl sulphone (D.D.S.), and Saccharin, are being made in India. The manufacture of sulpha drugs from imported raw materials has been undertaken by Atul Products who are manufacturing sulphadiazine. The whole range of chemotherapeutic substances which have now replaced the older methods of treatment have not yet been fully started by any of the manufacturing concerns. It is in this field of manufacture that India lags behind. Not only sulpha drugs but also innumerable sedatives, hypnotics, antipyretics like phenacetin, aspirin, pyramidon are not made in India. Besides these the most important pharmaceuticals like thiamine hydrochloride, ascorbic acid, calciferol, alpha-tocopherol are also not manufactured in our country. The manufacture of these does not come entirely under pharmaceutical manufacture, but under fine chemicals. The manufacture of all these depend on a well developed coal tar intermediate and fine organic chemical industry which unfortunately is absent from India today. The chemotherapeutic side of the pharmaceutical industry therefore cannot develop unless the chemical industry based on coal tar intermediates first develops. Even without waiting for the establishment of a coal tar intermediate and fine organic industry, the chemotherapeutic industry can make appreciable advance if its difficulties are removed and facilities are provided by the Government.



Extraction Plant for manufacture of alkaloids.

Existing conditions in India, the labour trouble, high taxes and controls of various types, have removed all incentive to start any of these industries, which require enormous capital to establish. The industry therefore today is in a quandary. Unless the Government changes its industrial policy and returns to the days when industry was free, there cannot be any bright prospect of immediate development of these large-scale industries. A number of other factors are also retarding the development and expansion of the existing industry. The restrictions on the import of raw materials not available in India, the excessive customs duty on such raw materials—ranging from 30 to 60 percent—are not allowing the industry to expand. Whereas the raw materials of all other industries are practically free from duty or have to pay only a nominal duty, the raw materials required by the pharmaceutical industry have to bear such excessive rates of duty. Equipment for the pharmaceutical industry has also to pay a high tariff rate of 30 to 40 percent, whereas equipment for other industries is charged only 5 to 10 percent import duty. Scientific research, which is part and parcel of the pharmaceutical industry, is also suffering on the same account. Chemical equipment and apparatus for research and all apparatus for biochemical and pharmacological work is subject to customs duty of 30 to 40 percent, like luxury articles. It is difficult to see how the industry can advance, and scientific research progress, when these restrictions and high tariffs on raw materials and scientific apparatus continue.

The opinion expressed by the Bhore Committee appointed by the then Government of India to enquire into the pharmaceutical industry is very important. The Committee in their report say: "We do, however, wish to point out that the story of what has been accomplished in this war, though it is no more than a beginning, is convincing proof that, given the will, organised effort can, with the help of the scientific assistance which it is possible to command, make this country almost, if not entirely, self-sufficient in the matter of drugs and medical requisites. It would be little short of a national calamity if even the position now attained after five years of war were allowed to be lost when the urge to maintain and improve it has ceased to operate or if other considerations were permitted to intervene and stifle a young industry of the greatest national importance to the country. The administration should be chargeable with gross negligence if the position now attained were not made the starting point for building up an indigenous source of supply, which will be able to meet the overwhelming bulk of the country's demand for medical requisites."

DEVELOPMENT AND USE OF INSECTICIDES IN INDIA

BEFORE the last war, a number of chemicals such as Derris products, nicotine sulphate, lead arsenate, sulphur, Paris green, pyrethrum etc. were used throughout the world for the control of insects of agricultural, public health and veterinary importance. In India the use of these insecticides was on a comparatively small scale, because cultivators in general did not know of them and, in any case, some of the insecticides were much too toxic to be handled by persons untrained in their use. For agricultural purposes, Derris products were largely used, mainly because of their non-toxicity to animals, but after the loss in the war of the main source of their supply, reseach work was intensified in various parts of the world to find substitutes. In this search, the insecticidal properties of DDT (dichloro diphenyl trichloroethane) and BHC (benzene hexachloride) were investigated and both were found to be far superior to Derris, and to possess the outstanding property of marked persistence, because of which they become known as residual insecticides. In addition, their low toxicity to mammals allows of their safe handling by unskilled labour. These two insecticides found immediate applications against a large number of insects of economic importance and their residual properties opened up a new chapter in the technique of the control of insect-borne diseases, particularly malaria. Previously malaria control measures had consisted mainly of larval control, but it was found that by applying these insecticides on the walls of dwellings and cattlesheds it was possible to control malaria as the deposits remained effective for some months against adult mosquitoes.

As BHC was on the U. K. Government's secret list until the closing stages of the war, it was only introduced into India, as 'Gammexane' formulations, in 1945, at which time DDT was already fairly widely known, principally for malaria control and particularly by the Army. For agricultural uses, BHC, because of its cheapness and its remarkable effectiveness against a wide number of pests of major economic importance such as locusts and grasshoppers rapidly became the more generally used of the two. The use of DDT in this field is, therefore, largely confined to the control of certain pests against which it has proved more effective than BHC, e.g. jassids, and on crops such as tea on which BHC, because of the risk of taint, cannot be used.

In the education of cultivators in plant protection measures, however, very little progress was made until the end of the war and while excellent work is now being done, under the aegis of the Plant Protection Directorate in New Delhi, by State Plant Protection Units, community projects, Agricultural Extension Services etc., there is still much to be accomplished. In many parts of India, however, the cultivator has come to realise the importance of insect control and is prepared to purchase and use insecticides on his crops. In 5% BHC dust (the general purpose dust) he has a cheap, easily available and easy-to-apply formulation. Plantation owners already fully appreciate the need for plant protection measures, as the subcontinent has always before it the example of the destruction of the coffee industry in Ceylon by the epidemic of rust in 1868. On tea and coffee, insects—though less important than diseases—have still been tackled efficiently, perhaps the most important development being the control of the mosquito blight by the use of DDT. Against mites on tea, not controlled by BHC or DDT, lime sulphur or dispersible sulphur are used with success and a number of new acaricides (particularly effective against mites) are at present being developed.

Since the discovery of BHC and DDT, other insecticides of the same nature have been introduced. Among these are Aldrin and Dieldrin but more technical and economic data both from experiments and large-scale field use is necessary before the full scope for their usefulness in India can be accurately assessed. Others are "Chlordane" and "Toxaphene".

Organo-phosphorous compounds, such as HETP, Parathion and Malathion, have recently proved very effective but their use is restricted, on account of their high toxicity to mammals. Another interesting development is the systemic type of insecticides. These are absorbed by the plant system and thus act as a poison to insects attacking the plants. Much, however, still remains to be done to ascertain their suitability for use under tropical conditions and on food and plantation crops such as tea and coffee.

The consumption of insecticides in India falls very broadly into three spheres—agricultural uses, the protection of foodgrains and other materials in storage, and public health measures (control of insect-borne diseases of man.) At present, the most important of these as a consumer of insecticides is the public health field, outstanding in which is the Government National Malaria Programme which at present uses a large tonnage annually of DDT imported under American aid. It also intends later to consume DDT made at the Government factory at New Delhi, and privately manufactured Indian insecticides. Agricultural uses cover both plant protection, including locust control, and veterinary measures (control of ticks, lice mange and fleas on animals), these are next in importance. Finally, large quantities of both Indian and imported foodgrains have been saved in storage through the use of insecticides.

From the above it is clear that insecticides play a very important part in India's economy and it is, therefore, logical that their manufacture in India should be regarded as important. In 1948 world demand for BHC had outstripped supplies and the quantity used in India had become sufficiently large to make it desirable to manufacture it here.

NEW FINISHES FOR NEW PRODUCTS

● By G. H. Gates-Reed, M.I.A.M.A. ●

INDIA'S "Industrial Revolution" has inevitably produced significant changes in the structure and objectives of the paint industry. There are three main influences. The indigenous paint manufacturer's need to satisfy the demands for an ever-widening range of special formulations for the varied products of the new heavy and consumer goods industries now being set up entails the use of new formulas, new chemical and equipment, extensive research, and more rigid testing of basic materials before and during production. This has resulted in the greater dependence of the paint industry upon the chemical industry for materials, replacing the mainly indigenous natural raw materials—linseed and other oils, rosin, natural pigments, etc.—around which the industry had developed. Thirdly, industrial finishes have again resulted in the industry's need to meet considerably increased manufacturing and "selling" costs, the latter being induced by the need to give much more extensive sales service. At the same time allowance has had to be made for the fact that there has been no marked compensatory increase in the demand for the more easily produced and sold "bread and butter" lines of standard domestic, structural and marine paints around which the industry grew.

The first point is obviously of great importance and the prime influence, which will be felt increasingly as industry develops, to the advantage of the paint industry, virtually guaranteeing for it a healthy progressive future. In an industrial economy, a strong and highly specialist paint industry is essential. Apart from the acknowledged uses of paint to protect buildings, structures and equipment, almost every industry requires paint products of one formulation or another to protect and bring "shelf-appeal" to the articles they manufacture. All the new industries that have opened up in India since the war are important users of paint products; the automobile industry needs cellulose and synthetic finishes; the cycle and sewing machine industries, stoving enamels; the manufacturers of boilers, locomotives, steam rollers, and railway rolling stock and equipment, a range of many special finishes; the electrical industry, all types of insulating varnishes and machine finishes; and these are only a few instances. All are virtually new industries to India or have developed rapidly since the war. This fact, together with the Government's decision to make India independent of imported paint products as rapidly as possible, has produced a tremendous re-orientation of outlook.

Increasing Demand for Specialised Finishes

In the past, demand for these specialised finishes from indigenous industries was so small that it could best be satisfied by overseas sources. Production here would have been uneconomic. But today, to meet what is now an economic and growing demand lakhs of rupees have been put into the installation of new paint manufacturing and testing equipment. Whereas in the past nitrocellulose and synthetic finishes were imported, today several of the leading manufacturers have installed the necessary equipment. Insulating varnishes of a wide range are also produced in India now in quantity for the first time. In his "Economic Survey" on India, the United Kingdom Senior Trade Commissioner in India writes in his report (1952-1953) (H.M.S.O.): "There has been notable progress in the manufacture of nitrocellulose lacquers and industrial finishes based on synthetic resins. At least five producers have undertaken the manufacture of synthetic resins, the production of which has increased from 8 tons in 1948 to 66 tons in 1950. A scheme for the manufacture of about 750 tons of phenolic and alkyd resins per annum has also received the support of the Indian Government. Three units, including one with a capacity of 4,000 gallons per month, are producing cellulose lacquers for industrial application. The output of these in 1950 was 32,569 gallons which was roughly double that of 1949.

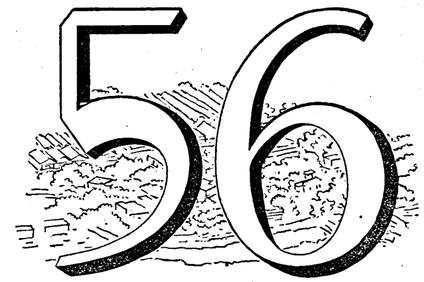
"Further increase in the production of cellulose paints can be expected when a new factory which is being erected at Rishra is completed".

Actually, the Rishra factory is now in production, nearly Rs. 20 lakhs having been spent on it. In the same period India's oldest established paint company opened an electrical test laboratory essential to the production of reliable insulating materials, equipped with test gear which is generally used only in government test laboratories. These are a few instances of the healthy and progressive attitude shown by the paint industry which prompted the Trade Commissioner further to report: "As regards the potential demand in India, increased industrialisation of the country will create additional demands for paints, varnishes and other finishes both by quantity and in the range of types. It is not to be expected that this would provide opportunities for additional imports but that existing productive capacity with perhaps some further slight expansion will be able to satisfy any such demands."

Dependence on the Chemical Industry

Regarding the greater dependence of the paint industry upon the chemical industry, although the word *ersatz* is now out of fashion, each year this becomes what one could truly call, industrially at any rate, the *ersatz* or synthetic age. Along with the rest, the paint industry—and paint making as such is older than industry itself—finds that today the majority of the most advanced surface coatings evolved after years of research, are either wholly or partly "laboratory" products calling for basic materials from the synthetic chemical industry.

It is undeniable that the finishes of the old formulations will not serve modern industrial needs—not because of eventual inferior results, but because of their slow drying. A way had to be found to reduce paint finish drying time from a matter of days to one of hours or even of minutes; otherwise the finishing lines of mass-production units become production bottlenecks. The old white lead-linseed oil paints can take days to become tack free and weeks or months to harden off. In this connection the development of the synthetic resins group and of cellulose based paints has been revolutionary in its import. Had it not transpired then the mass-production output of a thousand articles in daily use would have been seriously reduced or at least considerably complicated. Even now the paint industry is not satisfied that the last word has been said, and research continues—for painting costs and drying times must be cut still further and that without any loss of appearance or protective value to the finish. "The finishing costs of a product may be 10 to 50 percent, or more, of its production costs":



Years of Dunlop Enterprise

John Boyd Dunlop invented the first practical pneumatic tyre in 1888. Ten years later, Dunlop enterprise brought the first pneumatic tyres to India. In the following years, a marketing network was gradually built up; today there are thirteen Dunlop offices distributed throughout the country. In 1936, when the volume of demand justified local manufacture, Dunlop set up India's first tyre factory at Sahaganj, 35 miles from Calcutta. In the 18 years since, Dunlop enterprise has continually expanded the manufacturing range. Starting with car, truck, cycle, and bullock cart tyres in 1936, aero tyres were added in 1940, cycle rims in 1946, and tractor tyres in 1948. Production of Dunlopillo, the original latex foam cushioning, commenced in 1951. In 1952, the factory started the manufacture of industrial belting and, in 1953, of tyres for jet aircraft, the first to be made in India.

DUNLOP *Equips the Wheels of the Nation*

DX 390D

an item to be taken seriously. At the same time, industry demands enhanced appearance and greater protection for its products.

Carbon dioxide and ammonia, calcium carbide, carbon monoxide and hydrogen, coal tar derivates, nitrogen, and sulphuric acid as the parent acid of most acids, are among the many products of the chemical industry required to produce the alkyd, phenolic, urea etc. groups of synthetic resins required today where once only natural copal gums and natural rosin dissolved in linseed oil were used for all paint production. In this context the Indian Government is supporting a scheme for the manufacture of about 750 tons of phenolic and alkyd resins per annum. Although natural pigments are still used, generally they are not bright enough for modern needs and here again the chemist and the chemical industry have stepped in. In many cases however the chemists of the paint industry can supply the answer within the industry itself.

The paint industry is entirely dependent on the chemical industry's ability to produce and supply sulphuric acid (H_2SO_4), just as the chemical industry itself cannot do without this product. It is used in the manufacture of nearly all the chemicals referred to in this article, as well as for the refining of linseed oil and the preparation of fatty acids from vegetable oils. Sulphuric acid is also required in the production of hydrochloric and nitric acids, all very essential to modern paint processes. However, enough has been said to indicate the importance of these changes to the paint industry, and the need for a sound chemical industry and for the bilateral development of these industries. Although India has a long way to go towards being self-sufficient in the production of all essential chemicals, much headway has been made in the last few years and plans for the future are healthy.

Regarding the third influence, industrial finishes are as often as not what one might call custom built finishes specially formulated for a particular job, often even modified to suit the type of equipment by which they will be applied. They can be considered "mass-produced" only when the order involved is for a large quantity and a regular supply. So far, generally speaking, Indian industry has not yet developed sufficiently for such large orders for specialised industrial finishes to be forthcoming. As a result, although leading manufacturers are offering ranges made up of scores of special formulations, the quantities involved are relatively small and this has inevitably increased manufacturing costs and problems. Besides, in relation to the business available, competition is extremely keen. Excessive eagerness to supply the cellulose finishes for the automobile industry, an outlet somewhat over-assessed by all, is an example—further aggravated by the expiry of units in that industry itself. Time and the expected expansion of India's industries will naturally relieve this situation, but at present it is an interesting aspect of the paint industry's economic set-up that has been produced by that industry's own determination to supply manufacturers' needs from the start.

Rise in "Unseen" Selling Costs

It has in its turn produced increases in unseen "selling" costs, a result again of the paint industry's determination to give manufacturers technical service. In many cases, the manufacturers enquiring about paint finishes for their products have been dealing with new or relatively strange equipment and processes and have sought the wider advice of the paint salesman on general points of finishing processes, equipment etc. Again "trial and error" tests have had to be undertaken, often calling for long journeys to factory sites and many man-hours by the paint technician and the paint manufacturers' laboratory staff. In other words, the selling of industrial finishes is much more costly than is the case with established structural finishes. As has been indicated earlier, often the result is at present only a comparatively small order.

But these are the "growing pains" of the formative years when the Indian paint industry is taking upon itself the complete duties of the paint supplier to an industrialising nation. Established in 1902, the industry has in the past fulfilled its limited purpose satisfactorily and gained great experience of the difficult local conditions which must influence manufacturing methods and formulations. There are approximately 150 paint factories in India but of these 100 are very small indeed. The industry is concentrated in Calcutta and Bombay. According to *India at a Glance* (Orient Longmans), "there are 18 units with a total annual capacity of 36,360 tons in Calcutta and 17 units with an annual capacity of 19,860 tons in Bombay, while in all other parts of the country put together there are 15 units having a capacity of 8,580 tons per annum. The total installed capacity of the 50 major units is of the order of 65,000 tons on the basis of a double shift working for 300 days per annum". According to Government figures, less than 5,000 persons are employed in the registered paint factories in India, and yet it is undoubtedly one of the most essential and important light industries in her industrial economy. It is as well then that the Indian paint industry has shown itself to be conscious of the important part it has to play in India's industrial plans.

(Continued from page 52)

Imperial Chemical Industries Limited offered their assistance to the Alkali & Chemical Corporation of India Ltd., to build and bring into operation a unit big enough to supply India's immediate needs and capable of expansion as the demand grew. It was particularly convenient for A.C.C.I. Ltd. to undertake this manufacture as they already produced chlorine, one of the two raw materials—benzene also being available from Indian sources—and had at their Rishra factory, staff and workers with long experience in the control and operation of heavy chemical processes. They, therefore, decided to install plants capable of a yearly output of 500 tons of benzene hexachloride which would be turned into forms such as dusts, water dispersible powder, and liquid formulations, suitable for various applications. While the plant to make benzene hexachloride was being built, the manufacture of dusts from imported benzene hexachloride was started by A.C.C.I. Ltd. at Rishra in 1950, other formulations being added to the selling range as plant became available. The first step towards making India independent of imported benzene hexachloride was taken in April 1952 when A.C.C.I. Ltd., began to make benzene hexachloride on a commercial scale. In the near future the country's productive capacity of BHC will be considerably increased by the new unit which Tata Chemicals are establishing in Western India.

As far as DDT is concerned, the Government of India with the assistance of UNICEF and WHO decided to build a factory in Delhi to produce 700 tons per annum Technical DDT and work on it is already in progress. It is understood that the Government are contemplating the setting up of a second DDT factory in some other part of India.

A Significant Stride...

In every stride of these two sacred feet the whole country found a new hope and strength.....The opening of Ballarpur Paper Mills has proved to be as significant a stride in India's industrial sphere. It is destined to lead India a long way ahead towards self-sufficiency in paper. Today, this Mill is the most modern of its kind in India—incorporating the latest and best methods of paper production—managed and guided by a team of expert personnel.

THE PLASTICS INDUSTRY IN INDIA

PLASTICS are an integral part of modern civilisation, and find their place everywhere in industry and in the home. In particular, the advances that have taken place in the electrical and allied industries, and in new material for textiles and clothing would not have been possible without the spectacular development in plastics in recent years. Present-day plastics include materials which are as transparent as glass but not brittle, fibrous like silk and wool but not affected by mildew or moths, resilient and tough like leather, or elastic like rubber. All these materials have something in common in that they are composed of "macromolecules", that is big molecules, which may be linear, spatial or 3-dimensional in structure. Depending on the nature of the small units which go to build up these molecules and the manner in which they are aligned within the molecule, one gets materials that are more familiarly known as rubbers, plastics and fibres. Plastics are therefore closely allied to rubber and fibre.

The plastics industry hardly existed in India before the beginning of the last war, although India was familiar with the moulding of natural resin lac even as far back as the Mahabharat period. Shellac is one of the important export products of this country with an annual production of 30/40,000 tons. The impact of developments in plastics technology has of late been increasingly felt in India. Manufacturers in foreign countries have foreseen the importance of the plastics industry to India and have developed technical service organisations to give technical assistance to consumers of their products. Of special note is the plastics and rubber technical service laboratory set up at Tiljala in Calcutta by Imperial Chemical Industries (India) Ltd, in 1951 for this purpose. Here customers can go with their problems in the applications of plastics and can get training for their technologists in the handling of these materials.

The Government of India have taken a major part in the encouragement of the industrial use of plastics and in furthering their manufacture. During the post-war period, panels have been set up to develop these industries. Other independent organisations have taken similar steps and of particular note has been the creation by the Council of Scientific and Industrial Research of a separate division to study polymers and plastics in the National Chemical Laboratory at Poona.

Private industries have been established, and to meet the need to have an organisation to discuss common problems the All-India Plastic Manufacturers' Association was formed in 1945 in Bombay, the representatives of this Association visiting Western countries to study developments abroad and to explore means of co-operation.

Advances in the consuming industries in recent years have been considerable, and the present consumption of plastics or materials which can be simply converted into plastics, such as moulding powders, is estimated as follows. (The bulk of these requirements are still imported.)

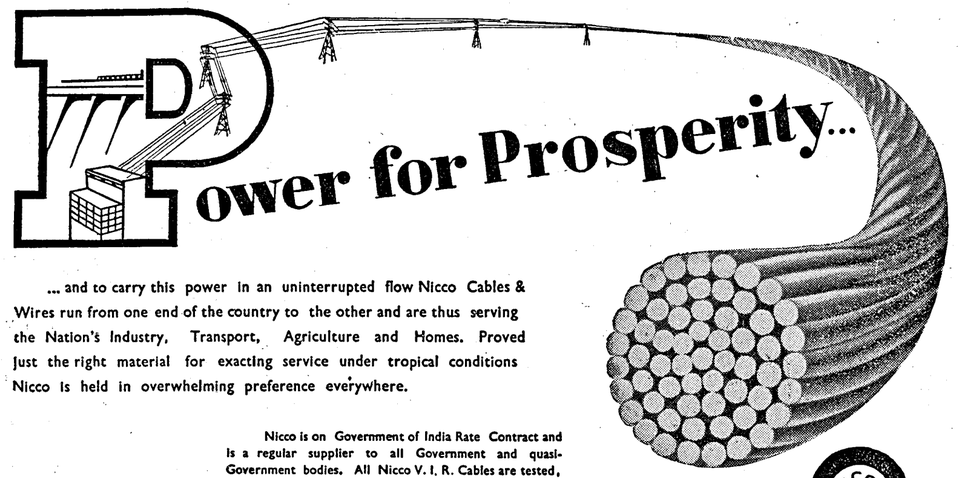
	Tons.
Phenol formaldehyde moulding powder	1,000
Urea formaldehyde moulding powder	400
Polystyrene	2,500
Cellulose acetate and cellulose acetate powders	500
Celluloid and acrylic sheets ("Perspex")	200
P. V. C. sheets	400
P. V. C. Resins and compositions	400
Nylon and casein	50
Industrial nitrocellulose (for lacquers and leathercloth)	250
Polyethylene Granules	600

Some of the outstanding achievements of the consuming industries during recent years constitute the manufacture of insulated cables, leathercloth, laminated sheets and p.v.c. sleevings for cable covering. Import of finished plastic goods is practically negligible and on the other hand these products manufactured in India have found an expanding market in the neighbouring countries such as Ceylon, Burma, Malaya and the Middle East.

At present there are about 100 factories producing moulded products in the country, and several small ones operated on a cottage industry scale. It is estimated that about Rs. 7 crores is invested in the industry, which provides employment for about 12,000 workers. The articles manufactured have a very wide range, from the cheap glittering articles of children's delight to polyethylene packaging film. The great increase that has taken place in the manufacture of compression and injection moulded goods since 1948 is shown by the rise in production from a figure of 0.37 million gross articles in that year to a present-day production of four times that quantity. Of special interest is the plant set up by ICI (India) Ltd, in Calcutta for the production of polyethylene film ("Alkathene"); this film which in other physical forms is used for insulating purposes in the electrical trades, is prepared in thicknesses ranging from one to seven thousandths of an inch and is in great demand as a moisture-proof packaging material for a large variety of products. About 200 tons a year of this new material are now being produced.

Turning now to the basic manufacture of plastics, it is true that no plastics industry can flourish in a country that does not possess a well established basic chemical industry. This has not yet been achieved in India but will undoubtedly, given time, develop. Nevertheless progress in the plastics field has been achieved. A significant development in the industry has been the manufacture of phenol formaldehyde resin. There are at present three units producing P. F. moulding powders with a total installed capacity of 800 tons per annum. Indigenous powder is of general purpose type, and the industry is tariff-protected, manufacturers being allowed a rebate of import duty on the chemicals used in the manufacture of the powder, subject to the condition that at least 200 tons of the powder per annum are produced. Imports of only special grades of the powder not made by indigenous manufacturers are allowed.

As to the future, the proposed manufacture at Sindri of urea and formaldehyde will open the way to the manufacture of urea-formaldehyde powders and resins, for uses allied to those of the P. F. type. One day in the future we may expect to see the new synthetic fibres which enter more and more into our daily lives just as wool and cotton have in the past, made on our doorstep.



Power for Prosperity...

... and to carry this power in an uninterrupted flow Nicco Cables & Wires run from one end of the country to the other and are thus serving the Nation's Industry, Transport, Agriculture and Homes. Proved just the right material for exacting service under tropical conditions Nicco is held in overwhelming preference everywhere.

Nicco is on Government of India Rate Contract and is a regular supplier to all Government and quasi-Government bodies. All Nicco V. I. R. Cables are tested, sealed and certified by the Government.

THE EXPANSION OF THE ALUMINIUM INDUSTRY IN INDIA

● By A. L. Sabharwal ●

IT is just over 11 years since the first aluminium ingot was produced in India. India's primary aluminium industry is therefore relatively new. But its progress, particularly during the last few years, has been remarkable and its scheduled expansion at the end of the first five year plan period from an installed annual capacity of 4,000 tons to one of 20,000 tons is spectacular, representing a 400 percent increase. The aluminium industry in India mines its own bauxite, refines the ore to produce alumina, smelts the alumina electrolytically and rolls aluminium ingots into a range of fabricated products.

The possibility of starting an aluminium industry in India has received the attention of scientists and industrialists since 1900, when a company called the Indian Aluminium Company (no connection with the present company of that name) was formed. That company's main interest was hollow-ware and not primary aluminium; it made little progress and soon went out of existence. The need for an aluminium industry however continued to receive official and public attention, and in the years immediately preceding the last war, the aluminium industry in India made its beginning with the formation in 1937-38 of the Aluminium Corporation of India Limited and the Aluminium Production Company of India Limited (now known as the Indian Aluminium Company Limited).

The Indian Aluminium Company set up its rolling mills near Calcutta, and started production in 1941, using imported ingots. A smelter was set up by the Company shortly thereafter near Alwaye and the first ingot was produced there in 1943. Finally, in 1948, the Company achieved integrated production by establishing an alumina plant in Muri (Bihar), and bauxite mining facilities at Lohardaga (Bihar). The Company has five leases for mining bauxite, four of which relate to deposits in the Lohardaga area and one in Belgaum district of Bombay State. The dispersed nature of the Company's production facilities was due to the fact that when the Alwaye plant was established, electric power, of which 10 K.W.H. are required per pound of metal, was not available elsewhere in adequate quantity or at sufficiently low cost.

The Aluminium Corporation of India commenced production of aluminium in 1944. Alumina was first produced by the Corporation on an experimental scale in 1942. The Corporation's alumina, smelting and rolling plants and power generating unit are all located at Jaykaynagar near Asansol (West Bengal). The Corporation also mines its own bauxite in Lohardaga (Bihar).

Output Expansion

At the start of the five year plan period the primary aluminium capacity of the industry was 4,000 tons annually and rolling capacity 3,500 tons annually, as follows:

Annual Capacity (In long tons)

	Primary Aluminium	Rolling
Indian Aluminium Company	2,500	4,200
Aluminium Corporation	1,500	500
	4,000	4,700

As stated elsewhere, the plan envisages the expansion of India's primary aluminium capacity to 20,000 tons by 1955-56, so that the respective capacities of the two producers at the end of the plan period are scheduled to be:

Annual Capacity (In long tons)

	Primary Aluminium	
Indian Aluminium Company	2,500	15,000
Aluminium Corporation	1,500	5,000
	4,000	20,000

This target is to be accomplished by expanding the existing units to 5,000 tons each and by setting up an additional smelter at Hirakud (Orissa) with an initial capacity of 10,000 tons.

The two primary ingot producers are actively engaged in implementing the plans for expanding their respective works at Alupuram and Asansol. By the middle of 1954 the Corporation expects to complete the erection of a third boiler at Jaykaynagar, which will enable it to step up production of virgin aluminium from the current level of 1,500 tons to 2,500 tons a year. Provision for three boilers had been made in the original plan, but only two were installed because of war-time difficulties. Also by mid-1954, the Indian Aluminium Company's smelting capacity at Alwaye will be increased to 5,000 tons a year, as compared with the existing capacity of 2,500 tons. The full production of 2,500 tons has however never been attained by the Company at Alwaye because of inadequacy of power obtainable from the Government of Travancore-Cochin. A considerable increase in the power availabilities in Travancore-Cochin is soon expected with the completion of a water storage dam and installation of additional generating plant. No recurrence of power shortage is expected, and the Company looks forward to steady operation of its increased capacity from the middle of 1954. The Company has been licensed to build a 10,000 ton smelter at Hirakud and negotiations are in progress for obtaining the required facilities.

The two primary producers are also engaged in expanding their rolling facilities. As recommended by the Indian Tariff Board (now Tariff Commission) in its 1951 report on the continuance of protection to the aluminium industry, the Corporation is increasing rolling capacity so that its entire ingot production can be converted into sheets and circles. A loan of Rs. 50 lakhs was obtained by the Industrial Finance Corporation for this expansion and for the purchase and installation of the third boiler for the power plant. The Corporation has now erected all of the new rolling mill equipment and the increased capacity is estimated at 3,000 tons of finished products per annum.

The original plans of the Belur rolling mills of the Indian Aluminium Company contained provision for expansion of output when justified by market demand. The current expansion of capacity to 7,000 tons of common alloy products from the existing capacity of 4,200 tons will be completed within the next few months.

The "heart" of the above expansion is the provision of a reversing drive to the hot mill. Ingots up to a maximum of 500 lbs. will be rolled. To meet the requirements of increased production and larger sized ingots, it has been necessary to increase melting, casting and pre-heating capacity which is already in partial operation. An additional 20" × 40" strip-finishing mill has been installed and it is proposed to add two 28" × 48" flat sheet stands. This will increase manufacturing limits for sheets to over 6 ft. in width. The larger weight of ingots which can be rolled on the reversing hot mill will increase the length of finished sheet or plate by 100 percent in some cases.

During 1953 there were two events of special note in the progress of aluminium rolling in India. For the first time INDAL M57S (equivalent to NS4 of BS-1470) and INDAL 26ST (equivalent to DTD610B) were produced on a commercial scale at the Company's Belur plant. The alloy M57S is a 2 percent magnesium work-hardenable general purpose alloy, which has found a ready market in transportation applications. The alloy is 26ST fully heat-treated and produced to most exacting specifications, as it is used mainly in aircraft construction.

Connected Industries

With the progress of aluminium smelting and rolling, industries which use the primary industry's products have also expanded in recent years. India's only aluminium-foil plant, Venesta Limited, brought into operation at the beginning of 1953 a modern 4-high, light gauge, foil rolling mill together with sufficient reeling and interleafing capacity to take care of the manufacture of India's entire requirements of cigarette foil. The quality of foil produced in this plant is equal in all respects to imported foil. Lacquering foil to different colours; laminating foil with bitumen to kraft paper and with glue to ordinary paper; embossing foil to standard patterns or customers' designs—these are other directions in which the foil plant is progressing.

Two companies are now setting up rod mills with a total capacity of 8,000 tons a year, to meet the requirements of aluminium cables. Of the two companies, namely, Aluminium Industries Limited and Indian Cable Co., the former has achieved remarkable results in furthering the use of aluminium conductors for low-tension electrical distribution in place of solid copper conductors.

ELECTRIC POWER SUPPLY FOR NEW INDUSTRIES IN WEST BENGAL

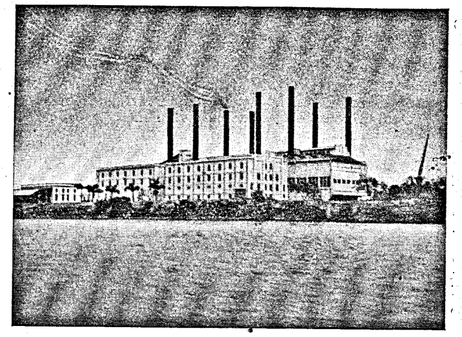
IT is an old adage that it is not a good thing to put all of one's eggs into one basket and it has been a weakness of the industrial balance in north-east India that the prosperity of the area was too heavily dependent upon the fortunes of one or two large industries. Now that a number of years have elapsed since the last major world upheaval, it may be interesting, first of all, to look back and see just what has been happening to industry in this part of the world and an excellent means of doing this is available in an analysis of the electrical consumption of individual industries since the war.

To begin with, although Calcutta looks largely the same as it did at the end of 1947, in point of fact there has been in the city what might almost be termed a minor industrial revolution. During the last quarter of 1947, the jute industry in Calcutta was responsible for nearly 40 percent of the total industrial consumption of electricity in the city, but during the last quarter of 1953 the same industry was responsible for only 32 percent. Yet during this period, the actual consumption of the jute industry itself has increased by no less than 55 percent and, in spite of this very substantial increase, it is indeed remarkable that the 1953 jute mill consumption, expressed as a percentage of the total industrial consumption, should have fallen in so marked a degree. Even more significant however is the increase in demand which has taken place during these years. The total demand in the city of Calcutta in January 1948 amounted to just over 150,000 KW. In January 1954 a figure of 250,000 KW. was very nearly reached—the actual figure being 248,000 KW. This is equivalent to a mathematical increase of 65 percent and although it does not necessarily represent an increase of 100,000 KW. or mean that industrial activity in the city has increased during the period by 65 percent, it is a pointer to the fact that the increase has been very substantial. Even so, in the case of many of the larger subsidiary industries, elecrical consumption has doubled since the last quarter of 1947. This is true in the case of cotton and other textile mills, engineering workshops, paper mills, aluminium workshops, chemical works and shoe factories. It is a particularly healthy sign that this high rate of increase should have been recorded in engineering workshops and aluminium workshops since this presupposes a high level of activity in the smaller industries.

New Major Industries

Perhaps one of the most important industries that has been established in Calcutta since the war is the manufacture of vegetable ghee. The plants now operating in the city of Calcutta are responsible for a consumption of energy totalling more than 10 million units a year. The process is an interesting one. The raw material is of course an oil obtained from vegetable sources. The source is not of paramount importance—ground nut, palm and many other oils are suitable for the process which is called hydrogenation. The major by-product is soap and in fact there is practically nothing wasted. Oil goes into the factory and out of it comes vegetable ghee, soap, and a chemical substance, the waste being a fluid resembling ordinary bath water. An immense quantity of vegetable ghee is produced daily in Calcutta and the existence of a very steady demand enables the selling price to be maintained very close to actual cost.

Another new industry of considerable importance and well served by electricity, is the glass and ceramic industry. Until the war, almost all of the country's consumption of glassware and ceramics was imported but this is no longer true to-day. In the field of ceramics, India is handicapped by a lack of fine quality china clay and her imports of this single commodity cost more than Rs. 27 lakhs a year. The clay is not required merely to manufacture household and other china but for the production of paper and textiles. It is here that the Central Glass and Ceramics Institute in Calcutta is doing excellent work in testing samples of indigenous clays and instituting research into methods of improving the manufacturing processes now used where indigenous clays are employed. As a result of the efforts of the Institute, it is probable that in a few years' time, the import of foreign clays will be substantially reduced and the manufacture of ceramics substantially increased. Needless to say, electricity can and will play a vital part in the processes which will be used. India is a long way behind in the manufacture of fine glass but already in Western India decorative glass for architectural purposes is being manufactured and a fine example may be seen in the form of a decorative panel in the entrance hall of the Central Glass and Ceramics Institute. As an example of what can be achieved by a relatively new industry in a few years, a visit to the Bengal Pottery Company in Calcutta will prove to be instructive. This concern, which manufactures pottery of all sorts, now employs no less than two thousand operatives many of whom are skilled or highly skilled in the potter's art. The finished product is impressive value for money, and although the firm does not attempt to produce artistic china of the very finest quality, it has succeeded in the aim of its executives which is to produce household china of good quality at a price within the reach of millions, and this must be reckoned a very considerable achievement.



One of Calcutta's modern power stations

This glance at two important forms of new enterprise, both of which rely on electricity for their motive power, is indicative of a trend which has resulted in the very considerable expansion of industrial effort in West Bengal in recent years. In Calcutta, the city has come to rely on the availability of a supply of electricity day and night for industrial purposes as an understood thing. The citizen has heard vague reports of difficulties experienced in other cities in India, such as Bombay, and other countries in the world such as the U.K., but although he has doubtless extended his sympathy momentarily, he has probably not exerted himself in the matter sufficiently to enquire how it is that Calcutta, and in fact a large part of the State of West Bengal, seems to be better off in this respect than anywhere else in the country. Probably too, he does not even wonder if this state of affairs is an accident and if it is an accident, to what factor his good fortune should be attributed.

Accurate Estimation of Future Demand

The business of supplying electricity resolves itself into a mixture between a desire on the one

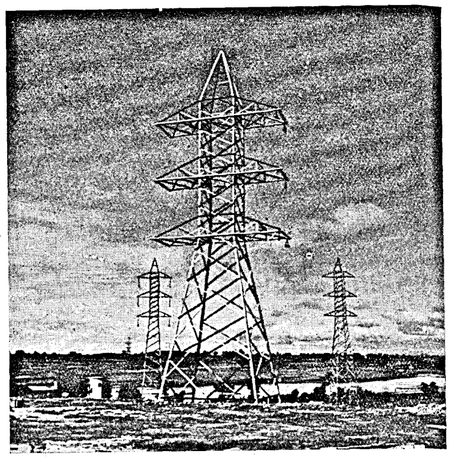
hand to be in a position to supply consumers' demands in full at all times and a desire on the other hand to restrict the purchase of new plant to the minimum consistent with the first desideratum, since only by so doing can the cost of the product be kept to a minimum. The cost of the product where the supplier generates his energy can never be stationary. Immediately after the installation of new plant, the cost per unit sold must rise suddenly and fall gradually until it is once again necessary to install further generating plant. This rise and fall in generating cost is seldom passed on to the consumer, but it is nevertheless a significant factor in the profit and loss account of the supplier. Even so, the supplier or licensee must not be tempted to an excess of optimism or pessimism in assessing future demands for, far from benefitting financially, he may be faced with economic disaster. The enforced closing of mills and restrictions on hours of work, etc., are phenomena which are only too well known in many cities, but although the supplier in these cases is certainly utilising his plant to its fullest capacity and has none lying idle, he has had to sacrifice enormous sums in revenue which more than offsets the relatively low production cost. In other words, when in doubt, it does not pay to take chances on the future demands of consumers; it pays to make ample provision for their requirements—where finance permits.

Finance for Expansion

Where finance permits. Aye there's the rub! At least that is where it has been since the war in this country. However excellent an engineer may be at assessing the future demand of industry, he also has to be able to provide finance for expanding the capacity of his generating plant and transmission and distribution systems. The extent of such finance can best be shown perhaps by an example. In Calcutta, when there is a thunder-storm of the nor-wester type on a summer afternoon, the density of the cloud is sufficient to darken the city to such an extent as to induce a large number of people to switch on their lights at the same time. When the storm is over—say an hour later—the same people switch them off again. What does this mean in terms of cash? Well, it can be reckoned up fairly accurately and it is fair to say that the thunder-storm necessitates an increase in capital investment of approximately Rs. 2½ crores. It happens this way. The people who get up from their seats and switch lights on and off as a result of a thunder-storm, when added up in terms of electrical demand, reach in a city like Calcutta, the impressive total of nearly 30,000 KW. Now the normal daily demand of the city may be say 250,000 KW, and this demand is at its maximum each day between say 2 p.m. and 4-30 p.m. If there were no thunder-storms to worry about, then generating plant sufficient to supply a demand of 250,000 KW or a little bit more would be adequate. But with the threat that at any time a thunder-storm may increase this demand by 30,000 KW, the unfortunate licensee has to have this amount extra up his sleeve—although this "extra" plant will only earn revenue on perhaps four or five days a year! To spend Rs. 2½ crores so as to earn money for perhaps one hour or so on perhaps five days a year is certainly "bad business", and it is no wonder that supply authorities all over the world have refused to finance these "peaks" as they are called. The only alternative is, of course, the power cut in various forms, when such peaks occur.

This example will at least have shown the size of the capital sums involved in supplying electricity to a large city, and it is the very immensity of the finance involved which has led States all over the world to interest themselves in this business. The State of West Bengal is here doubly fortunate. It has in its capital city a licensee who has met the demands of consumers and who supplies electricity to industry at rates which are lower than those of any other steam generating undertaking in the world. Now in addition, joining hands with this sound example of private enterprise in this field, is the Damodar Valley Corporation, a concern financed by public monies, but a quasi-autonomous body whose enterprise is now visible for all to see in the area in which the Corporation is empowered to generate and transmit electricity, namely the Damodar Valley.



A D.V.C. 132,000-Volt transmission line.

Inter-connection of C.E.S.C. and D.V.C.

In April the formal execution took place in Calcutta of the agreement entered into by the Calcutta Electric Supply Corporation and the Damodar Valley Corporation whereby the latter will erect transmission lines to Calcutta via Asansol and Khargpur in order to make available to the city an additional supply which, even in the initial stages, will not be less than 45,000 KW. The supply will be afforded by means of extra high voltage transmission lines operating at a pressure of 132,000 volts and it is expected that inter-connection will be completed during the year 1956. This scheme brings into focus the question as to whether it is cheaper to move coal or electricity over long distances. This is an absorbing subject which has engaged the attention of many experts in the U.K. in recent years and it is now generally recognised that only where coal is very much more expensive than it is in India is it actually cheaper to transmit high voltage electricity rather than to move coal. Fuel however is not the only point to be considered: whenever it is economically possible to interconnect major sources of power, it is desirable to achieve this since by so doing a considerable saving in stand-by plant may result. In the cost of a generating station which is not interconnected with another power source, it is quite usual for the capacity of the plant installed to be double that of the demand supplied. With large-scale inter-connection which is usually called "a grid" the amount of stand-by plant which must be held in reserve can be reduced to negligible proportions. Again, the advantage of diversity is obtained, mainly because the maximum demand in the area supplied by one power source may not take place at the same time as the maximum demand in the area supplied by the other. Thus, where supplies are interchanged considerable savings can be effected. Inter-connection may sometimes actually make for greater reliability in an area and reliability is, of course, a point which is of the utmost importance to the industrialist who is faced with a large daily wage bill irrespective of whether or not the supply is on or off. Frequent interruptions and breakdowns can enhance the cost of every article produced in the area concerned so that reliability is an important factor in reducing production costs to a minimum. The industrialist in Calcutta has had little cause for complaint in this direction in the past and the fact that a part of his supplies will eventually be transmitted over a considerable distance may not at first appeal to him. It is true that lightning did and still does cause interruptions to long distance transmission systems, but the incidence has been greatly reduced in recent years by technical developments in the field of protective equipment. Also, with duplicate and quadruplicate supplies, the risk is reduced to insignificant proportions. Every confidence is therefore placed in the capacity of the D.V.C. engineers to provide and erect a transmission system which will supply Calcutta with a part of its power requirements without affecting the present high standard of reliability.

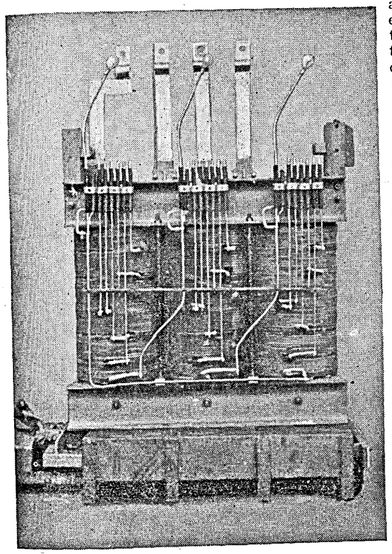
THE ELECTRICAL MANUFACTURING INDUSTRY IN INDIA

G.E.C.'s CONTRIBUTION TO NEW LINES OF PRODUCTION

THE General Electric Co. Ltd. of England has now been represented in India for nearly 50 years by its subsidiary, the General Electric Co. of India Ltd. Its interest in the local manufacture of certain of its electrical products had its genesis in the well-equipped workshop in Magnet House, Chittaranjan Avenue, Calcutta, to which the local Company moved its head office in 1932. This workshop was set up in the first place for the repair, servicing and testing of the company's products, such as fans, motors, household appliances and measuring instruments, but it very soon started the manufacture and assembly of switchboards, L. T. Switchgear, overhead line material and various accessories. About 1938, it was decided to separate the workshop from the purely manufacturing activities and plans were formulated to set up an entirely separate factory for the manufacture, in the first place, of ceiling and table fans. A modern and well equipped single-storey factory building of approximately 18,000 square feet was erected for this purpose in Garden Reach, Calcutta, and was ready to go into production towards the end of 1939. Meantime, however, World War II broke out and, at the Government's request, plans for fan production were shelved and the factory was turned over to the production of specialised stores for the Defence Services.



Winding of 600 KVA transformer showing H. T. tappings.

Post-War Progress

Until almost the end of the war, the factory was thus engaged; then, at the Government's request, the question of producing fans was revived. A. C. electric motor manufacture was commenced on the termination of the War and to cope with this, factory building was extended. By 1946, it had grown to three times its original area, to 54,000 square feet. Three years later it was decided to extend the range of products manufactured in India so as to include the assembly of radio receivers and assembly-cum-manufacture of electricity meters, manufacture of power transformers and possibly later such equipment as X-ray apparatus, household appliances and exhaust fans. To provide the additional space required for this the construction and equipment of a three-storey building was commenced in 1950, which was to add a further 54,000 square feet of factory floor space plus ancillary buildings for foundry, stores and repair shop, totalling a further 30,000 square feet. The completion of these additional manufacturing resources was effected in 1953. To ensure the smooth running and efficient organisation of this factory a separate subsidiary company, the General Electric Co. of India (Manufacturing) Ltd., was created. The name "Paharpur Works", derived from the district in which it is situated, was given to the factory.

Training Facilities

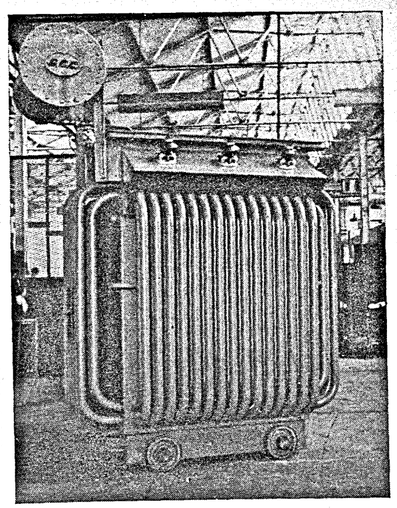
There are now about 1,000 persons employed in this factory, working under the supervision of highly qualified technical officers, both British and Indian, who have been trained in the Works of the G. E. C. Ltd. in the United Kingdom. Facilities are provided for the training of both trade and engineering graduate apprentices and from time to time selected members of the staff are sent to the U. K. for further training in the various Works of the parent company. The products of the Paharpur Works are made to the same high quality and rigid standards as have been established for those manufactured in the U. K. To ensure that these high standards are maintained, not only are regular tests carried out during the course of manufacture but samples are sent to the U. K. from time to time for further tests. They comply with the applicable British Standards, I. S. I. or other Government specifications and carry exactly the same guarantee as the articles made in England.

Ceiling Fans

Ceiling fans were the first articles to be produced at Paharpur Works in accordance with a regular manufacturing schedule. Today a full range of A. C. induction and capacitor type ceiling fans as well as 16" fixed and oscillating type table fans are being produced there. Only high quality electrical steel sheet for the stampings and electrolytic grade copper for the rotor windings, are used in their construction and this ensures that a high efficiency is maintained throughout their life. G. E. C. fans made in India comply with the appropriate B. S. and I. S. I. specifications and for many years have been accepted by the Government for supply against successive D. G. S. & D. Rate Contracts. The latest addition to the range of fans manufactured at Paharpur Works is the "Everest" A. C. capacitor ceiling fans—a highly efficient fan, of modern streamline design and low current consumption, the credit for whose development is to a large extent due to the Calcutta factory. Already the demand for it is exceeding production.

A. C. Motor Production

The production of A. C. motors was a natural follow-on to that of A. C. fans and today motors from 1 to 50 H.P. are being manufactured at the Paharpur Works. In addition to standard A. C., 3-phase, screen-protected, squirrel-cage motors, the present range of locally-made motors also includes totally enclosed, cowl-cooled types as well as slip-ring and loom motors. Motors made at the Paharpur Works are normally tested to I. S. 325/1951 but special tests required by customers can also be arranged for. In addition to fans and motors, the original single-storeyed building of the Calcutta factory is also utilised for the manufacture of power transformers. Manufacture commenced early in 1953 and already the range being produced there includes three-phase power and distribution transformers up to 750 K.V.A. at 11 kV on the H.T. side. These are manufactured to customers' individual requirements and special consideration is given to ensure that the transformers are suitable for operation under the arduous climatic conditions prevailing in many parts of India. All transformer designs are based on technical information compiled by the Research Laboratories and Works of the G.E.C. in Britain and those of 6 kV and above are specially strengthened to withstand switching and lightning surges. Transformers are normally tested to B.S.S. but any other special tests required by the customers are complied with. The future policy of the Organisation is to expand the Works so that transformers up to 2,000 KVA can be manufactured in the near future. The fabrication and assembly of all types of switchboards, distribution boards, fuseboards, busbar chambers and busbar trunking to customers' specifications is also undertaken in the Paharpur Works. The factory is starting the manufacture of I.C. switch fuses, knife-switches and transmission line equipment.



600 KVA outdoor pattern transformer.

House Service Meters

In the new three-storey extension building, one whole floor, which is air-conditioned, is devoted to the assembly of house service meters. These are being produced in collaboration with Messrs. Chamberlain & Hookham Ltd., one of the leading manufacturers of meters and allied equipment in Great Britain and an associated company of the G.E.C. Production commenced with the assembly of entirely imported components but the proportion of local-made components is being continually increased, the ultimate goal in view being that as great a proportion as possible be Indian-made. The present capacity of this section of the factory is 50,000 meters per annum but there is room for further expansion should the demand necessitate it. An essential feature of an electricity meter is that it should maintain a high standard of accuracy over a reasonable period and this entails that the original design should be basically correct and that the utmost care should be taken in assembly and testing. This section of the Paharpur Works is air-conditioned and laid out on the most modern lines. The Test Department is equipped with specially designed Test Panels of the latest type and the delicate and extremely accurate Precision-Grade Test Meters are calibrated against instruments of first grade accuracy, which are duplicated so that one set can be checked at any time against instruments of Sub-Standard accuracy. This not only provides a continuous check on the quality of the workmanship but also ensures that all meters produced have the same high standard of accuracy.

Radio Receivers

Another floor of the extension building of the Paharpur Works is devoted to the assembly of domestic radio receivers. The range at present being produced there includes A.C., A.C./D.C. and battery sets, with or without bandspread arrangements. These receivers are distinguished by the simplicity and attractiveness of their design, well thought out lay-out of components, affording easy accessibility for adjustment and maintenance, strong sensitivity and excellent tone quality. Apart from the regular lines of manufacture mentioned in this article, the G.E.C. has also taken a prominent part in helping to develop the local manufacture of lighting fittings not only in its own workshops at Calcutta, Bombay and Madras but also by assisting and encouraging indigenous metal workers and vitreous enamelling manufacturers.

THE RAYON INDUSTRY IN INDIA

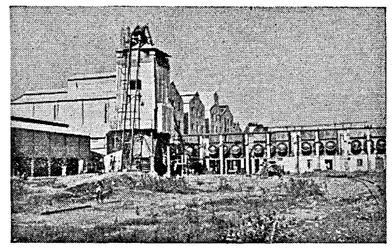
● By M. L. Schroff ●

TEXTILE fibres can be classified under two headings; natural fibres such as cotton, silk and wool; and man-made fibres such as rayon, acetate silk and other synthetic fibres. It was in 1884 that the first patent was taken out, for the manufacture of artificial silk by a nitro-cellulose process, by the French scientist, Count Hilaire de Chardonnet, who is regarded as the "Father of the Rayon Industry". In 1890, another patent was taken out by Despaissis for its manufacture by the cuprammonium process and in 1892 Cross and Bevan took out a patent to manufacture artificial silk by the viscose process. The artificial silk produced by the cuprammonium process is known by the name of Bemberg because it was he who first commercially exploited it in Germany in 1918. The cellulose acetate process was patented by Dreyfuss, Camille and Henri in 1917-1918. Though the processes for the manufacture of artificial silk were invented during the latter part of the 19th century, their commercial exploitation started only after 1902 and onwards. The above processes use cellulosic material—cotton linters, cotton waste, wood pulp etc.—as raw material. The name "artificial silk" was later changed into "Rayon". To-day the viscose and cuprammonium process products go under the name of rayon, whereas cellulose acetate retains its name as a separate entity. Nitro-cellulose fibres have practically disappeared from the market due to their inflammability. During recent times many other fibres, not based on cellulosic raw material, have come into the market and are known under the name of non-cellulosic man-made fibres. One of the best known of these is "Nylon," but there are manufactured over a dozen synthetic fibres using chemical substances as starting raw materials. The synthetic fibres resemble real silk in lustre but are quite different otherwise in their properties and behaviour towards dyes.

Artificial Fibres in India

The manufacture of man-made fibres in India is of recent growth. While some industrialists had been considering the establishment of the rayon (viscose and cuprammonium) industry in India for the last 10 years, no practical shape, however, was given to their plans until 1950 when India produced, for the first time, 25,000 lbs. of viscose filament yarn. Cuprammonium yarn is manufactured only to a very limited extent in the world and that only for its special quality. It is not of any importance to India at the present time. It is true that a foundation was laid for the manufacture of acetate silk in 1947 in Hyderabad State by the then existing Government there; but, as it happens, the progress in the public sector of the industry is extremely slow and expensive. The actual production of the acetate silk did not start in India until this year after the factory was transferred to Birla Bros. about a year ago. At present there are four factories in India, out of which two manufacture viscose filament yarn, one manufactures staple fibre by the viscose process, and one manufactures acetate silk. The names are: (1) Gwalior Rayon Silk Manufacturing Co. Ltd., Nagda, Madhya Bharat. (Viscose stable fibre) (2) National Rayon Corporation Ltd., Kalyan, Bombay. (Viscose filament yarn) (3) Sirsilk Ltd., Sirpur-Kaghaznagar, Hyderabad. (Acetate filament yarn) (4) Travancore Rayons Ltd., Perumbvoor, Travancore-Cochin. (Viscose filament yarn)

The Gwalior Rayon Silk Manufacturing Co. managing agents:—Birla Bros. (Gwalior) Ltd. was erected in the record time of 14 months with a capital of Rs. 3.25 crores and having a capacity of 12 million lbs. of staple fibre as compared with the Government sponsored Sirsilk factory for the manufacture of acetate silk which cost about Rs. 6 crores, took over 7 years to start production and has a capacity of 4 million lbs. The combined



Factory of Sirsilk Ltd.

capacity of the two viscose yarn factories is 10 million lbs. a year. The imports in India of the rayon plus acetate filament yarn in the years 1949-50 to 1952-53 are given below:

Imports of Rayons plus Acetate:

	Quantity in lbs.	Value c.i.f. in rupees.	Price per lb.
1949-50	36,939,060	10,45,62,067	Rs. 2.85
1950-51	35,284,436	14,71,12,932	4.17
1951-52	36,507,055	17,28,91,361	4.73
1952-53	22,239,238	7,85,09,071	3.52
	Staple fibre and yarn.		
1952	21,235,000	4,52,00,000	
1953	17,528,000	2,52,00,000	

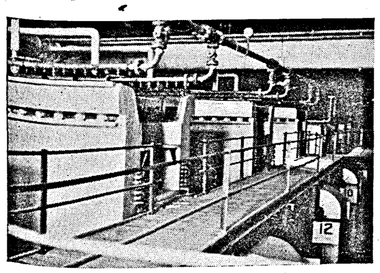
Production and import in India of Art silk Yarn.

	Imports	Production
1949		Nil
1950		250,000 lbs.
1951		7,700,000 ,,
1952	19,130,000 lbs.	8,040,000 ,,
1953	34,893,000 ,,	9,680,000 ,,

The annual consumption in India of rayon and acetate silk filament yarns and also the staple fibre spun yarn has been estimated to be of the order of 60 million lbs. There are about 313 mills having 25,459 looms engaged in producing artificial silk fabrics distributed in India as shown.

Bombay Province.	No. of Mills	No of looms	
(1) Bombay City	184	12,240	
(2) Surat	79	4,271	
(3) Ahmedabad	29	2,208	
(4) Other towns	12	366	
	304		19,085
Saurashtra	9	...	1,240
Punjab	-	...	1,879
Bengal	-	...	755
			22,959
Others		...	3,500
			25,459

The annual production of National Rayon is 5.6 million lbs. and that of Travancore Rayon 4 million lbs., both the mills producing 120 and 150 denie bright yarn of first quality. To eliminate competition from low grade imported yarns the Government recently banned the imports of third and fourth quality yarns of the above deniers. The production of staple fibre has started only within the current year and the same is true of acetate silk and hence no production figures for these have been given above. Further, the import statistics of the Government of India do not make any separate classification for viscose yarn and acetate yarn and hence it is very difficult to tell the proportion of the two types of filament yarns. It was only in 1950-51 that acetate yarn was imported in India for the first time, but at present its consumption is estimated to be about 1.5 million lbs. per annum against the production capacity of 4 million lbs. The initial difficulties connected with the dyeing and weaving of acetate yarns have now been solved and India is likely to consume larger amounts of this quality of yarn because of its special qualities.



Spinning section at Sirsilk Ltd., Hyderabad State.

Impetus to Other Textiles

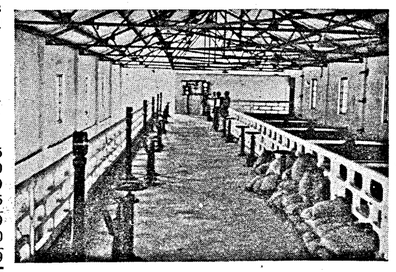
The development of the artificial silk industry in India has given great impetus to the textile industry as various types of quality fabrics have started being manufactured here. From the point of view of the total production of the world, it would be interesting to know that the production of rayon plus acetate is 18 percent of total production of the fibres (rayon and acetate and wool and cotton and silk), whereas cotton covers 71 percent, wool 11 percent and silk less than one percent. In 1922, the rayon and acetate production was one percent, cotton 81 percent, wool 17 percent and silk 1 percent. The above figures would show that there is a gradual increase in the production of man-made fibres whereas even the total production of cotton fibres has gone down; wool and silk have suffered the most. The estimated capacity of the world production of man-made fibres in 1951 was 4,218 million lbs. whereas the production capacity in 1953 was 6,057 million lbs. There is a gradual increase in the production of these fibres. There was an increase in 1951 over 1950 of 16 percent in rayon production (viscose plus cuprammonium process) 2 percent in acetate and 52 percent in non-cellulosic man-made fibres, the production figure for the last being 261 million lbs.

The Raw Materials

The raw materials for the manufacture of acetate silk and viscose silk are given below in a tabulated form:

Raw material per lb. of yarn. Viscose:

wood pulp and cotton linters,	per lb.	1.15 to 1.25 lbs.
caustic soda,	per lb.	1.4 lbs.
carbon bisulphide,	per lb.	0.35 lbs.
sulphuric acid,	per lb.	1.7 to 1.9 lbs.
corn sugar	per lb.	0.5 lbs.
all other chemicals,	per lb.	0.4 lbs.



Water filtration : plant operating platform.

THE LIGHTHOUSE AIR-CONDITIONED NEW EMPIRE AIR-CONDITIONED TIGER

14 HOLES THROUGH THE GLOBE

In 1953, **AtlasDiesel** Jackhammers with SANDVIK COROMANT STEEL drilled 1,12,000 miles of holes into the earth. This is equivalent to drilling 14 holes right through the globe. It is positive proof of Atlas's world-wide popularity.

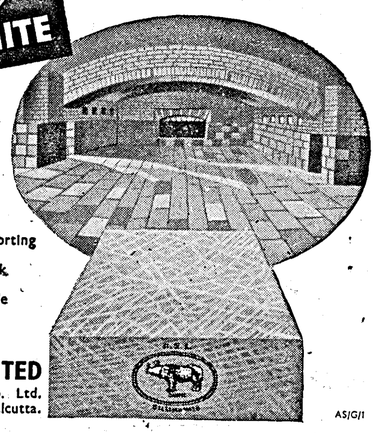
THE SUPER REFRACTORY

KHASI SILLIMANITE

offers the following advantages for building glass tanks, basins or furnaces :—

- Longer life without frequent replacement of furnace linings.
- Smaller load on the furnace supporting structure.
- Lower running cost on tank block cooling systems.
- Assures better glass. Less trouble from stones and iron.



Details from

ASSAM SILLIMANITE LIMITED

Managing Agents: Steel Brothers & Co. Ltd. Clive Buildings, Netaji Subhas Road, Calcutta.

AS/G/1

Besides the above, 100-200 gallons of good soft water are required to produce one pound of rayon.

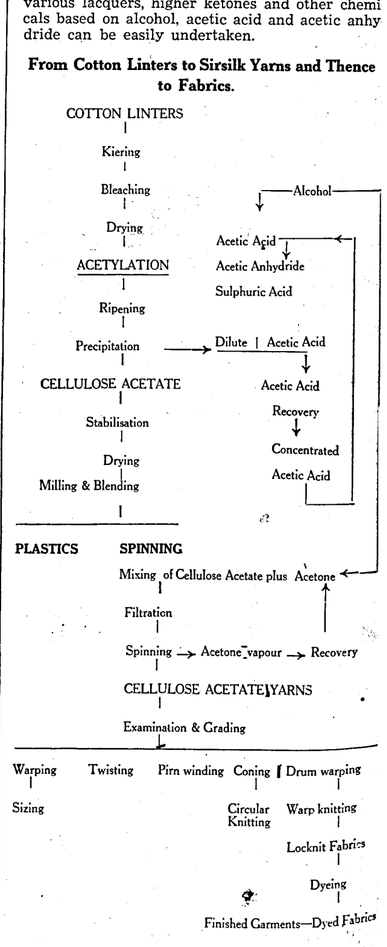
Acetate :

bleached cotton linters ...	0.70 lbs.
acetyl group which combine with the linters plus ten percent loss during recovery (expressed as acetic acid)	0.54 lbs.
sulphuric acid ...	0.07 lbs.
acetone lost during processing and recovery ...	0.40 lbs

In case of the viscose process wood pulp is imported whereas other raw materials are manufactured locally or at the site of the plant itself. There is no sulphur in India and hence sulphuric acid and carbon bisulphide have to be manufactured from imported sulphur. Thus, it will be seen that in times of war or other emergencies, there might be a great difficulty in carrying on with the production of viscose filament yarn and staple fibre. It is necessary that a committee be appointed in collaboration with industrialists to study the details of manufacture of wood pulp and of sulphuric acid from vast gypsum deposits in India. Some alternative source of sulphur is also to be found to manufacture carbon bisulphide.

In contrast to the viscose process, in case of the acetate process, all the raw materials are of indigenous manufacture. Of course, there are certain difficulties at present in securing full requirements of cotton linters, but at times of emergency they can be easily replaced by cotton waste and it is expected that with the internal growing demand for linters, adequate quantities of a suitable quality will become available during the next two years. Other chemicals used as raw materials are manufactured from alcohol which is a by-product of the sugar industry. Of course, there is consumption of sulphuric acid here also, but the quantity used is extremely small as compared with that used in the viscose process. From the above point of view it will be seen that the acetate process can stand on its own feet. Its flow sheet is given below. There is still a great future for the expansion of the rayon industry and for the establishment of auxiliary chemical industries for the manufacture of fine chemicals associated with the acetate process. The manufacture of acetylsalicylic acid various lacquers, higher ketones and other chemicals based on alcohol, acetic acid and acetic anhydride can be easily undertaken.

From Cotton Linters to Sirsilk Yarns and Thence to Fabrics.



METAL WINDOWS ARE NOW MADE IN INDIA

THE manufacture of metal window frames, in the form in which they are used today, originated in the United Kingdom at the end of the 19th Century with the advent of rolled steel sections. Over the last 50 years, great strides have been made in their development, until today they are manufactured in an extensive range of standard and non-standard sizes and types for every conceivable kind of building.

Metal windows can be manufactured in rolled steel sections or from extruded bronze or aluminium sections. Windows made from bronze are still among the finest obtainable, but the high cost of bronze in recent years has virtually limited them to monumental buildings of national importance, such as the Bank of England and the British Houses of Parliament, both of which are fitted with bronze window frames, the latter having been manufactured as early as 1837 by Hopes. The use of aluminium has increased rapidly in the last few years, particularly in America, but the cost of the metal itself still limits the use of aluminium windows.

The largest category of metal windows is still manufactured in rolled steel sections. These sections are today usually very light and have to be rolled to very fine tolerances to enable the window frames to be mass produced, and to fit tightly so as to remain watertight.

Windows manufactured from steel sections can be divided very roughly into three main groups:—(a) Factory windows known as steel sashes; these are made from a range of universal sections in standard or special sizes and are generally used for factory type building; (b) Standard metal windows and doors, used generally for domestic work; and (c) "Purpose Made" windows manufactured from a range of universal sections in medium and heavy section, used for first class office buildings and first class work of all types where standard windows are not big enough or strong enough.

Metal windows can be properly manufactured only in special workshops, as their efficiency depends on (i) supply of the necessary rolled steel sections, (ii) supply of proper hinges, fittings, etc., and (iii) the provision of up-to-date modern plant for welding, punching, cutting, etc. Windows made on an up-to-date plant with correct sections and fittings, together with technical skill on the part of labour in "bedding" windows, are first class products. "Bedding" is the fitting of the opening casement to the fixed casement frame so that they fit properly at all points on two surfaces.

U. K. the Largest Manufacturer

Windows were first mass produced after the 1914-18 war by Crittalls in England and other manufacturers very quickly followed suit so that the United Kingdom is still the largest manufacturer of metal windows in the world today; their manufacture is a major British industry. Metal windows are also manufactured in the U.S.A. and on the Continent of Europe, whilst Australia, New Zealand and South Africa have smaller industries which are still protected by tariff walls.

Until the last war there was little scope for the sale of metal windows in India and the few that were used were imported exclusively from the United Kingdom. The availability of Burma teak in large quantities, and of excellent quality, together with cheap labour, made it impossible for any metal window manufacturer to compete in price. The closure of the Burma teak forests during the war and the shortage of good timber in this country, together with a determined sales drive by the British metal window manufacturers after the war has created a steadily growing market for the use of metal windows in this country. Today metal windows are used on most of the first class buildings, for offices, factories, and the better class residential buildings.

In 1946 the Indian Galvanizing Co. (1926) Ltd., (managing agents: Balmer Lawrie & Co. Ltd.) foresaw the future trend and with Henry Hope & Sons Ltd., one of the largest and most influential of the metal window manufacturers in the United Kingdom, decided to install a small plant in Calcutta. This plant was installed in 1949 and went into production in the summer of 1950 manufacturing galvanized steel sashes to B.S.S. for factory type buildings, and in 1953 the manufacture of glazed steel partitions was added. The large number of factories erected after the war created a demand for this type of window which the factory helped to meet. The factory is now being expanded and, next month, will be in production of hot dip galvanized standard metal windows and doors, the demand for which has steadily increased during the last few years and which are suitable for office and residential buildings. Another enterprise, Steel Age Ltd., is already manufacturing standard windows at Hyderabad, backed by the technical knowledge of Gibbons Ltd., another well-known British manufacturer. Two more Indian companies, Messrs. Godrej & Boyce Ltd. of Bombay, the well-known lock and safe manufacturers, and Man Industries Ltd., of Jaipur have also entered this field and are manufacturing windows and doors in rolled steel sections. Man Industries Ltd., are also rolling the sections necessary for the whole trade and although they are not yet able to roll all the sections (the balance is still being imported from the United Kingdom and Belgium) within the next two or three years they will be able to supply all the sections necessary for the manufacture of rolled steel windows and doors.

Expansion Expected in Next 10 Years

It will be seen therefore that the industry thus being formed, whilst still in its infancy, can already supply the first two categories of windows; the third, "purpose made" windows, will be locally manufactured within a few years, but the demand for this type of window in India is small because of its considerably higher cost, and the standard window today has been improved and increased in size by the introduction of a slightly heavier section so that in nearly all cases the standard window is suitable for office type buildings, laboratories and buildings where previously the "purpose made" window would have been used.

The Government, through its Development Wing, has already stopped the import of metal windows into this country, except in special cases, to help develop the local industry and through the Indian Standards Institute hopes to produce shortly an Indian Standard Specification for standard windows to help maintain quality, bearing in mind the slightly differing uses to which standard windows are put in this country compared with the United Kingdom. It will be some years before the industry is able to stand on its own feet, as the quantities now manufactured are small and costs are consequently high compared with the British manufacturers who manufacture hundreds of tons per week and export all over the world; but within ten years this industry should make great strides, and the use of metal windows will increase considerably in this country.

SCOPE FOR NEW INDUSTRIES IN THE DAMODAR VALLEY

● By S. S. PALIT ●

Deputy Development Officer (Industries), Damodar Valley Corporation.

THE industrial potential of a region no doubt depends on its minerals, forestry and other natural resources, but its evaluation is also dependent upon the mental attitude, initiative, technical ability and will of the people of that area. Things which are otherwise neglected may be valuable when proper conditions are created for their use. For example, population is a problem in India today; but if plans could be drawn up and facilities provided to utilise the man-power, it could become an asset. Again the Damodar was a "river of sorrow", but implementation of the DVC Project should convert it into a "river of joy".

In planning the programme of industrialisation for a region such as the DVC operational area, it is good to start with a regional planning study. This study will be a long-term project, extending probably over five years, under the guidance of an expert committee specially appointed for the purpose, and will encompass land, mineral, forest and fishery resources, the labour skill available or that which may be developed, the current industrial production and its market outlet the consumer goods currently required by the inhabitants and those for which local sales might be developed, the communications system, the traffic density on existing roads and the desirability of opening out new ones, utilisation of construction camps as townships with centres of small-scale industries, mapping of suitable sites for starting large-scale basis industries with available minerals, and the sociological, legal and economic factors, which may affect the development of the region. Special studies should also be made as to the type and method that may be followed for rationalisation of small-scale and village industries with the minimum dislocation, and how best co-ordinated plans could be drawn up to use labour displaced by rationalisation in construction jobs. It is neither necessary nor desirable for such a study to be completed before field work is started on the more obvious industrial projects. Actual experience in the planning and operation of certain industries is necessary to determine some related factors and to make regional planning realistic. Planning is a continuous function, and plans must be modified according to results secured in actual working. Even more important, the people themselves must express their needs and desires and play an integral part in determining the plans which will affect their future.

Collective Action Needed

Industrial development of a region postulates collective action on a big scale to create favourable conditions for industries to grow. Apart from finance, equipment, labour and raw material, other essential pre-requisites are easy transport, quick communication, enough water supply, and cheap electrical energy. Arrangements for these can be made only through Government agencies. The Damodar valley being one of the richest areas in natural resources and there being an urgent need for stopping the flood ravage coupled with the "felt need" for improving the economic condition of its inhabitants, an autonomous corporation was set up in 1948 under an Act of the Union Government. According to the Act, the main functions and responsibility of the Corporation are: *Group I.* (a) Irrigation, water supply and drainage, (b) Generation, transmission and distribution of electrical energy, (c) Flood control and the improvement of flow conditions in the Hooghly river, and (d) Promotion and control of navigation in the Damodar river and its tributaries and canals; *Group II.* (e) Afforestation and control of soil erosion in the Damodar Valley; *Group III.* (f) Promotion of public health and the agricultural, industrial, economic and general well-being in the Damodar valley and its area of operation.

These functions could be grouped in three distinct categories: *Group I.*—Primary and direct objectives. (These are pre-planned construction jobs with available data for working out designs and estimates); *Group II.*—Secondary and complementary objectives to Group I. (Data available by mechanical calculation); *Group III.*—Ultimate objectives for Group I & II. (Data not available readily. Definite policy for industrial development work yet to be determined).

The End of the Beginning

The first phase of the construction work is well ahead and all the primary objectives are about to be fulfilled soon. This will provide multiple benefits and opportunites to the people of which some details are as follows:

1. *Dams*—Tilaiya is completed, Konar almost ready and the two major earth dams at Maithon and Panchet Hills are scheduled to be completed by 1955 and 1956 respectively.

2. *Barrage and Canal Systems*—Construction of head works consisting of a barrage across the Damodar river at Durgapur is well ahead and scheduled to be completed by June, 1956. The canal system involved following works:—

(i)	Main canals	121 miles.
(ii)	Branch canals	335 ,,
(iii)	Distributaries	674 ,,
(iv)	Drainage canal	422 ,,
	Total	1,552 miles.

Eighty-five miles of main canal on the left bank of the Damodar will be navigable. About 25 percent of the canals has been completed and the remainder is scheduled for completion by 1957;

3. *Irrigation*—The canal system would irrigate a total area of 10,26,000 acres of land in the lower valley. The approximate value of additional crops obtainable due to irrigation facilities has been estimated at Rs. 30 crores per year. The extra income will increase the purchasing power of the cultivators and thereby help stimulate industrial growth.

4. *Water Supply*—Due to the creation of reservoirs at Tilaiya and Konar, a perennial supply of water in the Damodar and its tributaries is already available. About 100 cusecs could be made available for industrial use and an almost unlimited supply for the purpose of cooling, washing etc., provided the effluence drained back does not contaminate the canal water. Supplies could be had at any point of the rivers, main canals and reservoirs by arrangement with the Corporation.

5. *Generation of Electricity*—The Bokaro thermal station, largest in the East, and the hydro-electric plant at Tilaiya are ready. Hydro-electric plants at Konar, Maithon and Panchet Hill are yet to be constructed. Details of the present and future installed capacity under the first phase of the programme are:

(i)	Present	Thermal	1,80,000 KW *
		Hydel	4,000 KW
(ii)	Future	Thermal	2,30,000 KW *
		Hydel	1,86,000 KW

* includes supplies from Sindri.

6. *Transmission & Distribution*—The DVC power transmission system embraces a wide operational area extending to Jamshedpur on the south, Dalmianagar and Patna on the north-west and Calcutta on the south-east. The present work in hand for grid lines, excluding the lines for Dalmianagar, Patna and Calcutta, is as follows:—

132 KV lines	350	route miles.
66 KV lines	30	,, ,,
33 KV lines	90	,, ,,
Total	470	route miles.

Supply of power for the electrification of the Eastern Railway, to reduce the traffic congestion, is also under consideration. Supplies are made at 33 KV. Any industry having a reasonable demand and located at a reasonable distance from a grid sub-station can be supplied power direct by the DVC at short notice. Distribution to small consumers is made by the State Government concerned or the licensee. The basic rate ceiling per KWh of energy from DVC is one anna; while the minimum can be as low as half an anna, according to the size and the load factor of the industrial unit.

7. *Transport*—As it is, the Damodar valley is well served with a net-work of rail and road communications. Two national highways—the Grand Trunk Road and the Ranchi-Patna national highway—pass through the valley. The total existing road mileage is over 1,200 miles within the catchment area. In addition, transport facilities provided by the DVC are: (i) Roads—About 100 miles of roads together with culverts and bridges have already been constructed by the Corporation in the least accessible parts of the upper valley. A net-work of additional road communication system totalling approximately 500 miles will open soon, because most of the canal banks will be provided with roads for inspection purposes. These roads will connect even the interior villages of the lower valley. Completion of the Durgapur Barrage with a 25ft. wide road will link the districts of Burdwan and Bankura. This would open a new trade route leading up to Puri. The Damodar today cuts across the first class road-way between Dishergarh and the other bank of the river on to Adra, Purulia and Ranchi. With the completion of the Panchet Dam this impediment will be removed and communication will be continuous throughout the year. (ii) Water Transport—The 85 mile-long navigation canal links Durgapur with the river Hooghly 30 miles up-stream of Calcutta. It has been designed to carry barges of 250 tons capacity each. A dock is also proposed to be constructed at Durgapur with suitable jetties to handle 2 million tons of cargo per year. The main cargo will be coal from Raniganj. Heavy industries around Durgapur, when set up, would consequently have the special facility of cheap water transport up to the Calcutta port. It may also be possible for those industries to avail themselves of cheaper transport when empty barges from Calcutta return after unloading the coal. In addition to the navigation canal, new opportunities of water transport will be open to industrialists and inhabitants in the lake area. The total submerged area of the lake under the first phase construction of the DVC is, Tilaiya 14,600 acres; Konar 6,600 acres; Maithon 26,500 acres; Panchet Hill 22,800 acres; Total 70,500 acres, or, 110 sq. miles. The total perimeter of the lake area would be approximately 300 miles, having hundreds of villages and important industrial units located on the shore line. Plying of country boats and facilities for joy rides would be extra amenities.

8. *Labour*—Trained labour is one of the essential factors in industrial enterprise. Construction activities of the Corporation in the last five years have given considerable training opportunities to thousands of people in various types of work. It would be interesting to note the employment statistics of the Corporation for the year 1953:

		Numbers
(i)	Officers (over 400 technical personnel).	583
(ii)	Monthly paid technical staff (other than officers).	1,754
(iii)	Monthly paid non-technical staff (other than officers)	1,875
(iv)	Average daily paid labour including contractors' labour (Maximum in any month 68,300 and minimum 24,200 nos.)	37,069
	Total	41,281

The first phase of the construction work of the DVC will start tapering down from 1955. It would gradually throw out of employment thousands of trained labour. This labour, many of whom are technical personnel, would be of great potential value to the development of new industries in the valley.

9. *Plant and Equipment*—For construction various types of plant and equipment have been purchased by the DVC. After the completion of the construction work, many of these would be surplus and may be profitably utilised for setting up new industries. The main categories of equipment are (a) workshop machinery for (i) Mechanical workshop, (ii) Structural workshop, (iii) Medium size foundry-shop, (iv) Timber workshop, (v) Road transport repair-shop, and (vi) heavy earth moving equipment repair-shop; and (b) miscellaneous equipment—earth moving equipment, vehicular transport, stone crushers and batching plant, concrete mixture, concrete breakers, diesel generating sets, air compressors, water pumps, rock boring equipment, pile driving equipment, road rollers, graders, tractors, vibrators, hollow brick manufacturing plant, tipping wagon and traction equipment, filtration and water supplying plant, etc.

10. *Construction Camps*—In the first phase of the Damodar Valley Project, seven construction camps have been built with modern amenities. With the exception of Bokaro, where buildings will continue to be occupied by the staff of the thermal plant, most of the houses and amenities provided in other camps will be surplus, immediately after DVC construction work is over. Good roads, hospitals, marketing centres and facilities for filtered water supply and sewage disposal are available in all the camps. Provision for schools and parks have also been made in major camps. These surplus houses and the township would help economic development of the industrial centres. The number of buildings and the volume of filtered water supply in different construction camps are:

Place	No. of buildings	Filtered water supply per day
Tilaiya	110	50,000 gallons.
Konar	113	50,000 ,,
Maithon	1,300	5,00,000 ,,
Panchet Hill	400	2,00,000 ,,
Durgapur	500	1,00,000 ,,
Sonamukhi	35	10,000 ,,

11. *Fishery*—As stated earlier, the four lakes at Tilaiya, Konar, Maithon and Panchet Hills will have a submerged area of over 100 sq. miles. Fisheries would be developed in all the lakes. Fish have already been cultivated at Tilaiya and promising results obtained. Apart from food production, fisheries would develop employment opportunities in fishing, storing, packing, transport and marketing.

12. *Resettlement*—The Corporation is taking great care to resettle the displaced population of the submerged lake areas. Model villages with roads, wells, community centres, schools, and good houses were built for the people in the Tilaiya area. It should set an example of ideal village conditions.

13. *Reclamation and Soil Conservation*—There are about 6,68,000 acres of cultivable up-land in the operational area requiring reclamation. Of this about 5,000 acres have already been reclaimed by the department for displaced population. This department of the DVC should render great service to the nation if reclamation work is continued even after fulfilling the need of displaced persons from the lake areas. Reclamation work and after-treatment of the land require specialised knowledge and experience of soil conditions. Opportunities are there to utilise the services of the experienced hands, under a joint programme with the States, to reduce pressure on land. Similarly soil conservation is important to stop silting up of the main reservoirs. Six small dams have already been built in the head-waters of the river system.

14. *Afforestation and Agriculture*—Schemes relating to improvement of forestry and agriculture are well ahead. Implementation of these would open out opportunities of developing various industries and thereby help improve the economic condition of the area.

A short resume of the minerals available in the valley and its neighbouring areas and their industrial uses are given below:.

HOVANESIAN BROS LTD.,

104, STEPHEN HOUSE, POST BOX NO. 376, CALCUTTA—1.

Exporters of: SHELLAC, BRISTLES, KAPOK, OILS, GUNNY BAGS, HESSIAN, CARPETS AND COLONIAL PRODUCE

Minerals	Industrial Uses	Remarks
(1) Natural abrasive	Millstones, sharpening hones, pebbles for mills, sand paper, grinding stones, etc.	Most of these industries can be started with small capital.
(2) Artificial abrasive	Silicon carbide, fused alumina, boron carbide.	Availability of electricity and raw materials provides an excellent opportunity to start a carborandum industry.
(3) Apatite	Iron and Steel, phosphorus for match and alloy, industries using phosphates, Calcium phosphate of more soluble form.	It is important to investigate use of electric rotating furnace in manufacturing concentrated superphosphate and calcium metaphosphate fertiliser.
(4) Asbestos	Asbestos cement roof sheeting, paints and roofing cements, heat resisting articles, compressed sheet, blocks and brick linings, asbestos yarns, cordage and cloth, paper, etc.	Asbestos roofing sheets have great demand in India. New installations for this together with cement manufacture can be started in Singhbhum or Manbhum Districts where lime-stone and asbestos are available.
(5) Barytes	Manufacture of lithophone, white pigment, rubber goods, filler in paper and cloth, glass, enamels, furnace lining, etc.	It is most important to increase Indian production of barytes and processing of lithophone and white pigment. Money value of imports during 1946 was Rs. 1,82,50,203 against Indian production of Rs. 3,68,689. Barytes available near Ranchi and Purulia.
(6) Bauxite	Aluminium, aluminium sulphate and salts, aluminium foils and powder, duralumin, alumina abrasives, refractory bricks, aluminium chloride, quick-setting alumina-cement, etc.	Installation of new plants for manufacture of aluminium and its alloy is essential. India does not have copper and her requirements of H. T. conductors are imported. Manufacture of aluminium conductor would be a profitable industry and would get State support. Ideal site available near Lohardaga.
(7) Chromite	Low chromium steel for armour plate, cast chromium steel, stainless steel, chromium nickel ferroalloys, electrical resistance alloys, Chemical uses for chromites, dichromites, chromic acid etc.	Strategic materials. Every effort must be made to produce chromium steel, stainless steel and electrical resistance steel.
(8) Clays:—		
(a) China Clay—	Pottery, electrical porcelain, paper, rubber, textile, chemicals, etc.	There is scope for setting up more plants for washing and processing of clay.
(b) Fire Clay—	Refractory uses.	
(9) Coal	Metallurgical, general industry, by-product industries of innumerable types.	By-product industries, particularly heavy chemicals and dye-stuff require special attention.
(10) Copper	Alloy of all types.	Extensive survey for ore deposits necessary.
(11) Graphite	Crucibles, pencils, lubricants, paints, dynamo brushes, electrodes, dry batteries.	Crucible industry was started during war which needs further development. Graphite, clay and kaolin are available in Manbhum.
(12) Iron Ore	Uses well-known.	Good deposits available.
(13) Kyanite	Spark plugs, refractory bricks, ceramics.	
(14) Lime-stone	Mortar, cement, calcium carbide, bleaching powder, flux, etc.	Important to set up cement and calcium carbide plant.
(15) Manganese Ore	Ferro-manganese, oxidising agents, glass, dry cells, ceramics, manganese metal, chemicals, fertilisers, welding rod.	Ferro-manganese production should be increased. Electric furnace may be installed for production with small capital.
(16) Mica	All types of electrical apparatus, appliances and other insulating purposes.	It is essential to carry out research for finding alternative uses of low grade and waste mica, particularly for home market. Manufacture of cheap roofing material in form of rolled sheet is one possibility.
(17) Ochre	Paints, pigments, oil cloth, paper, rubber goods, cement, ceramics.	There is scope for developing more units of paints.

SWITCH TO ELECTRICITY
FOR LIGHT OR POWER

Managing Agents:

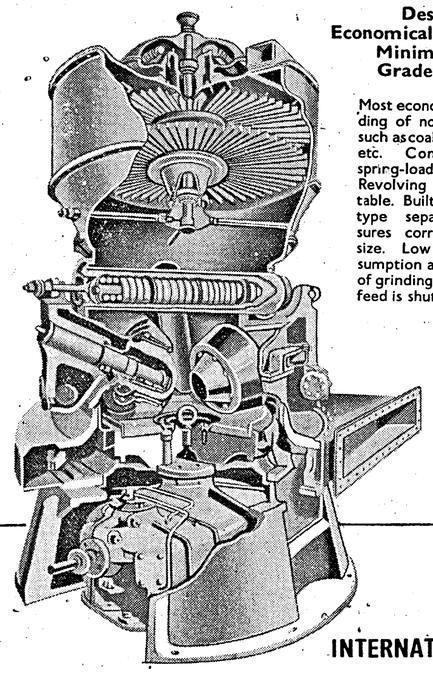
KILLICK INDUSTRIES LTD.

Home Street, Fort, Bombay.

LOPULCO mills

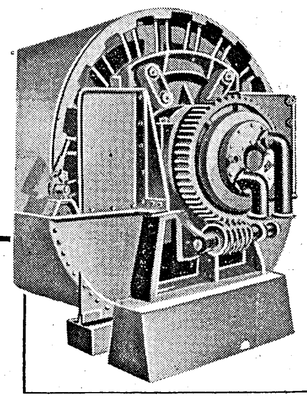
Designed for
Economical grinding
Minimum wear
Graded output

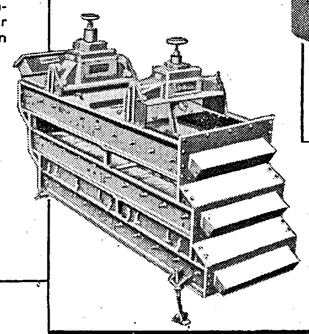
Most economical grinding of non-abrasives such as coal, phosphate etc. Compensated spring-loaded rollers. Revolving grinding table. Built-in whizzer type separator ensures correct output size. Low power consumption and no wear of grinding parts when feed is shut off.



ROVAC ENDFLOW FILTERS

For efficient filtering of slimes and concentrates from metal ores. Designed to save filter cloth, labour, maintenance and transport costs.





HUMMER
ELECTRIC SCREENS

Specially designed for protection and rapid change of screen cloth. Suitable for closed-circuit work with crushers and grinding mills. High capacity ensures increased efficiency and a tensioning device ensures controlled grading. Low consumption and maintenance. Needs no specially trained operator.

INTERNATIONAL COMBUSTION (INDIA) LTD.

ICL

101, PARK STREET, CALCUTTA-16

ICL 5/54

Minerals	Industrial Uses	Remarks
(18) Sulphur	Sulphuric acid, fertilizers, textile, paper, rubber.	Electric furnace should be used instead of reverberatory furnace. Experiment on pilot plant from DVC Development fund is necessary. A strategic material: should be a State enterprise.
(19) Vanadium	Metallurgy—alloy steel, armour plate, high-speed steel, Chemicals—Sulphuric acid, photographic developer, paints, fertiliser, etc.	
(20) Quartz and Feldspar	Pottery, glass, enamel.	Large quantities of quartz and feldspar as overburden are quarried at great expense in mica mines of Kodarma. These are left unused in heaps. If careful collection is made and a crushing and grinding mill with air separation arrangement is made, this could be sold at a premium to ceramic industry. It would be of help to mica and ceramic industries.

Because of its mineral resources, many basic industries started developing in the valley and its neighbouring areas in recent decades. Prominent among them are iron and steel, iron foundry and iron spun pipes, steel casting and re-rolling, wire and wire products, copper smelting, alumina, coal mining and processing, coal by-products, mica mining and primary processing, refractory bricks and clay, sanitary ware, lac industry, etc.

Judicious location of site is of paramount importance in the choice of a new industrial enterprise, and the advantages offered by the Damodar Valley Project were already known to the industrialists. All these considerations must have determined the location of so many industries in the valley area after independence, such as the Fertilizer Factory, Sindri; Locomotive Works, Chittaranjan; Indian Aluminium Co. Ltd., Muri; Hindusthan Cable Factory, Chittaranjan; Sen Raleigh Bicycle Factory, Asansol; Hindusthan Pilkington Glass Industries, Ltd., Asansol; Glass Factory, Ramgarh; Hindusthan Radio & General Electric Co., Karanpura; Chemical Factory for Ultra-marine, Dhadka, Asansol; and R. C. C. Spun Pipe & Pole Manufacturing Concern, Barakar.

Apart from the above, there is scope for many new industries, some of which have already been discussed under "Mineral Resources". More important ones, for which opportunities are offered by the Damodar Valley Project, are Blast Furnace for production of pig iron; Open hearth steel furnace; Electric steel furnace for (a) tool steel, (b) special alloy steel, (c) steel casting; Steel wire drawing & wire rope; Malleable steel casting; Pump manufacturing; Foundry & engineering workshop; Motorcycle & small engine; Agricultural implements; Heavy electrical equipment; Domestic appliances; Electrical resistance alloy for heating elements; Aluminium & its alloys; Aluminium H. T. conductors; Ferro-manganese plant (Electric furnace process); Rubber reclamation plant; Storage batteries; Miner's lamp; Cement; Asbestos roofing sheet; Concrete Pipe & Secondary distribution pole; Kaolin washing & processing plant; Quartz & feldspar grinding industry; High tension insulator; Pottery; Tiles & bricks; Coke oven & Gas generating plant; Coal by-products; Dyestuff, etc; Synthetic oil; Caustic soda; Sulphur; Sulphuric acid; Super phosphate & Calcium metaphosphate fertiliser; Paints & pigments; Calcium carbide; Rayon; Wood preservation; Cold Storage & Food preservation; and Micanite & Mica products.

This list includes primarily the large or medium-scale industries which will be of interest to prospective investors who wish to locate enterprises in the region. Many others might be added. For the people of the Valley, particularly, there are many small-scale industries which can be initiated, or developed from the traditional crafts and cottage industries.

Well-being of People

A multi-purpose valley project like the DVC can lead us not only to the solution of our economic problems, but also to the general well-being of the people. A river valley has a variety of conditions within it. Some areas within the region have special problems. The foremost problem in the Damodar valley area is the pressure of population on land. Unlike TVA, where the average farm holding was 75 acres, in the Damodar valley area it is only 2.5 acres, and that scattered around village fields. Therefore, irrigation facilities alone will not solve unemployment and under-employment problems, and other sources of employment have to be found out. The only practical answer is industrialization. Industrialisation of a selected region cannot, of course, occur in a vacuum. It has to be influenced by national policies and the trend of national and international economic expansion.

INDUSTRIAL DEVELOPMENT IN WEST BENGAL

● By Dr. N. Das, I.C.S. ●

Secretary, Commerce and Industries Dept., West Bengal.

AS is well-known, the main emphasis of the first Five Year Plan is on a substantial and rapid improvement of agriculture with a view to increasing the supply of foodgrains on the one hand and of industrial raw materials on the other. Of the total outlay envisaged under the Plan in the public sector, the share of industries has been 8.4 percent only. In the State of West Bengal, the proportion allotted to industry has been even less—only 1.7 percent of the total State outlay of Rs. 69.10 crores earmarked for the promotion of industries.

This does not mean that the Government of West Bengal is unaware of the need for adequate outlay to encourage and develop industries. It should not be forgotten that West Bengal is already one of the most highly developed industrial areas in India; as such, the framers of the Plan have thought it fit, in the larger interests of the country, to incur a greater proportion of the outlay on industry in areas which are comparatively undeveloped. Secondly, and this is more important, under the Industries (Development and Regulation) Act, the responsibility for the development of most of the major industries has devolved on the Central Government. The part that the State Government can play for the promotion of major industries like jute, cotton textiles, tea, and iron and steel, is, therefore, limited. As a logical consequence, the Government of West Bengal has been compelled to confine itself to the sector of cottage and small industries. The programmes for the development of such industries have naturally been less spectacular than those for large industries. It should be pointed out, however, that the problems of cottage and small scale industries are, in a sense, much more complex than those of large industries. Given the necessary capital and managerial ability, it is comparatively easy to prepare the blueprint of a big industrial undertaking, but the integrated development of a number of small establishments requires far more intensive planning and calls for much greater vigilance on the part of the Government than a development plan related exclusively to large industries.

The Economic Landscape

In order to understand the complexities of the situation, let us have a look at the economic landscape first. The latest census (1951) has revealed that, in West Bengal, during the last half-century, the proportion of earners in non-agricultural livelihoods per 10,000 of the total population has declined from 770 in 1901 to 671 in 1951. Secondly, the total number (earners and dependants) deriving their livelihood from the organised sector of industries has been in the neighbourhood of 14½ lakhs only. As many as 23½ lakhs (earners and dependants) still depend for their livelihood on cottage and small industries. While the total number of workers daily employed in organised industries have risen in most other States, there has been an actual fall in West Bengal.

NUMBER OF WORKERS EMPLOYED IN ORGANISED INDUSTRIES IN DIFFERENT STATES.

	1945	1951
Assam	58,070	68,614
Bihar	168,408	175,558
Bombay	735,774	808,093
Madhya Pradesh	110,263	115,978
Madras	279,176	422,291
West Bengal	702,821	648,303

In the context of the growing population in West Bengal (the situation has been accentuated by an influx of displaced persons from East Pakistan), this has meant a considerable strain on the resources and ingenuity of the State. An analysis of the efforts made by the State Government for the promotion of cottage and small industries shows, however, that since 1947 progress has been steady and, in some sectors, really gratifying.

The most important cottage industry in West Bengal is handloom cotton weaving. The principal problems facing the industry in West Bengal have been (a) lack of finance, (b) lack of adequate marketing arrangements, and (c) adherence to old and antiquated techniques. The bulk of the weaving population is still dependent on the *mahajans* for their finance, raw materials and sale of finished products. Although there are as many as 931 primary co-operative weaving societies and the number of members is 78,000, co-operative finance was, until recently, the exception rather than the rule. Secondly, in the procurement of raw materials, West Bengal's handloom weaving industry is at a special disadvantage *vis-à-vis* other States, because the bulk of the yarn has to be purchased from South Indian mills through a chain of middlemen. The result is that when the yarn reaches the weavers, its price is much higher than in many other States. This puts up the price of the finished goods and makes the position of the handloom industry more difficult.

Nevertheless, during the past six or seven years, special steps have been taken by the State Government to meet the situation. Yarn is being distributed in an increasing measure through co-operative agencies. A Government sales emporium has been opened in Calcutta and arrangements have also been made for the sale of handloom products through sales depôts attached to co-operative industrial unions. A West Bengal State Handloom Board has also been functioning since 1948, with a technical body under it, to advise the Government in all matters concerning the handloom industry. Certain fields of production have been reserved for handlooms since the middle of 1950 while the production of dhotis by mills was restricted to 60 percent of their average monthly production during 1951-52. Finally, the Government is giving a subsidy for the marketing of handloom products. The result has been all-round progress, as is evident from the following figures:—

	1947	1953
No. of looms	86,300	1,47,000
No. of people employed in the industry (on the basis of 3 persons per loom)	2,58,900	4,41,000
Annual Production	40.25 million yds.	80 million yds.

The future programme of the Government of West Bengal for the development of the handloom industry includes (a) a scheme for organising weavers' co-operatives and the provision of working capital to weavers, (b) a scheme for the supply of improved appliances, (c) a scheme for the establishment of five regional dye houses, and (d) a scheme for running a model block printing and pattern-supplying factory.

The Silk Industry

Next in importance to the handloom industry is the silk industry. The silk industry has been facing enormous difficulties not only in West Bengal but in other States as well—mainly because of keen competition from artificial silk and rayon and fluctuations in the prices of raw silk. The decline in the purchasing power of the people has also contributed to the difficulties of the silk industry. Vigorous steps had, therefore, to be taken by the West Bengal Government (a) to grow improved cocoons and arrange the supply of good quality raw silk at an economic price, and (b) to introduce new designs and motifs so that West Bengal silk products could compete, on equal terms, with the products of Kashmir and Mysore. The different sectors of the industry—rearers, reelers as well as weavers—have been organised on a co-operative basis and special arrangements have been made for the marketing of silk products through the Government sales emporium at Calcutta and other depôts. The problem of the silk industry is a long-term one, involving as it does the imperative need for lessening the cost of production and improving the quality of silk. Research is, therefore, being conducted to produce F1 crosses by mating indigenous silk worms with foreign races. It is hoped that the hybrids so evolved will help the production of cocoons with a superior silk content.

Today, there are approximately 4,500 silk looms in West Bengal, providing employment to about 3 lakhs of people. The annual production of raw silk is about 3.5 lakh lbs. while the production of silk fabrics is over 2,80,000 yards per annum. The future programme of the Government includes (a) the establishment of a Foreign Race Seed Station at Kalimpong, (b) a scheme for co-operative silk worm rearing on the lines followed in Japan, (c) a scheme for a cold storage room for preserving silk cocoons, moths, etc., and (d) a scheme for the supply of refrigerators to aided granures.

Brass and Bell-metal

Another industry which deserves special mention is the brass and bell-metal industry. Here, the difficulties have been the serious competition from aluminium and enamel wares and a change in the habits of consumers. Inability to procure raw materials at reasonable prices and adherence to antiquated methods of production have further aggravated the situation. In order to bring down the cost of production and improve the quality of products, the Government of West Bengal has taken steps to install, at convenient centres, rolling plants with arrangements for polishing the metal; the first such plant is being installed at Bankura.

Since 1947, the handmade paper industry has also received the special attention of the Government of West Bengal. This industry is concentrated in certain special areas—at Mainan in Howrah, Dasghara in Hooghly, Mahadevnagar in Murshidabad and Sriniketan in Birbhum. Makers of handmade paper are going through a very difficult time on account of competition from machine-made paper. Antiquated methods of production have put up the price of handmade paper well above the economic level. A special research unit of the Directorate of Industries has been carrying on experiments on the utilisation of local raw materials and improved techniques of production for the last five years and the industry which was almost dying out from this State has now recovered sufficiently to bring production to the 1947 level. A co-operative society is being formed at Mainan with the help of a grant sanctioned by the All India Khadi and Village Industries Board and arrangements are also being made for the training of rural craftsmen in improved techniques of production.

Plan for New Industries

The above are only some of the cottage industries about which the Government of West Bengal has taken special steps to prevent an economic collapse. The future programme, however, includes the development of new industries—for the products of which there already exists a considerable demand within the State. Thus, the West Bengal Government hopes to set up in the not too distant future a well-organised lock industry and an industry for the manufacture of toys and sports goods. The development of the palm gur industry and resuscitation of small engineering industries in the Howrah district, which is called the Sheffield of West Bengal, also feature in the future development programme of this State.

In the sphere of large-scale industry, there is one industry which has received special attention. It is the salt industry. West Bengal's requirements of salt are estimated at 54 lakh maunds per annum, but only about 2 lakh maunds are manufactured locally. West Bengal has a sea coast of about 195 miles where, according to experts, salt could be manufactured at an economic price to meet the entire local demand. A scheme for the setting up of a salt factory on the Contai sea coast was prepared by the French salt experts from Salicum, Paris, some time in 1951. This scheme is now being scrutinised by a local committee, and preliminary investigations into the salinity of sea water, fluctuation in temperature, wind velocity, humidity, rainfall, rate of evaporation, etc., are being carried out. If the project materialises, West Bengal will become self-sufficient in salt and consumers in this State would be able to obtain their requirements at a cheaper price than at present. Meanwhile, the West Bengal Government has given direct financial and other assistance to a private concern, namely, the Bengal Salt Co. at Dadanpatra on the Contai sea coast. This factory has increased its production of salt from 26,000 maunds in 1947 to over 1,07,000 maunds in 1953. Production is expected to reach the figure of 1,50,000 maunds in the current year.

Another important State-sponsored industry is the quinine industry. West Bengal and Madras are the only two States in which cinchona is cultivated and quinine manufactured on a commercial scale. In both States, the cultivation of cinchona and the manufacture of quinine are Government undertakings. In West Bengal the cultivation of cinchona has made a great advance since 1947, as the following figures show :—

ACREAGE UNDER CINCHONA

	Acres
1947-48	4,005
1948-49	4,382
1949-50	4,667
1950-51	4,952
1951-52	5,191
1952-53	5,409

The bark harvested and the quinine extracted have, however, been maintained at constant figures

—at 19,00,000 lbs. and 60,000 lbs. respectively—as a matter of policy. Because of keen competition from synthetic anti-malarial drugs, quinine has suffered a temporary eclipse and the Government has thought it prudent to place on the market only that quantity which it can easily absorb. Meanwhile, considerable improvement in quality has been effected: the standard was raised to B.P. 1932 in 1949 and to B.P. 1948 in 1951. By modernising the laboratory attached to the Government quinine factory at Mungpoo and by conducting intensive research, the cost of production has also been effectively lowered: today, West Bengal quinine compares favourably in price and quality with the best known imported brands of quinine. The programme of development includes (a) researches to obtain a richer and larger output of quinine from the cinchona bark, (b) manufacture of other quinine products besides cinchona alkaloids and (c) the growing of medicinal plants like ipecac, digitalis, ergot, and sarsaparilla so that these may be utilised in the local manufacture of drugs.

Large Industrial Projects

A number of large industrial projects are also under the active consideration of the Government. Of these, special mention may be made of a coke-oven-cum-gas grid project and the project for a blast furnace plant for the production of foundry iron. Under the former project, 850 tons of coke will be produced daily and 3,600 million cubic ft. of gas will be available annually for industrial and domestic purposes. In addition, the by-products of coal which are at present burnt out in the coalfields would be exploited commercially and at least 15,750 tons of crude tar, 4,200 tons of ammonium sulphate and 5,600 tons of benzol would be available per annum. The latter project is intended to produce annually 3,50,000 tons of foundry iron for the fabricating and engineering industries in and around Howrah and Calcutta, and also for industries which will come into existence in the D.V.C. area. Although no final decision has yet been reached about the location of these two plants, experts have advised that they should be located in or near Durgapur in the Asansol area, as this area possesses certain special advantages which would enable coke, gas and foundry iron to be produced and distributed economically.

Another scheme of considerable industrial importance which is being actively considered is the Calcutta sewage gas production project. This scheme aims at utilisation of the sewage of the city of Calcutta. At present the sewage flows through underground sewers and open channels to a place called Bantola, where primary mechanical sedimentation takes place: the sludge is then sun-dried and used as fertiliser. It is now proposed to generate gas from this sludge by a process of fermentation: the sludge itself would continue to be used as manure. According to expert estimates, about 1.5 million cubic ft. of gas per day would be generated by this process while about 250 tons of manure a day would also be available for sale.

We thus see that, within its limited responsibilities, the State of West Bengal is playing a positive rôle in the development of industries. The recent setting up of the State Financial Corporation with an authorised capital of Rs. 2 crores and a paid up capital of Rs. 1 crore will also help industrial development, particularly in the private sector. Finally, the proposed State Development Corporation, when formally established, will supplement the activities of the State Financial Corporation by assuming direct responsibility for development in certain specified spheres. The future outlook is, therefore, of some promise and hope. While it is too early to say what resources are likely to be allocated for industrial development in the second Five Year Plan, it is almost certain that emphasis will shift from agriculture to industry. In that context, the projects and plans which are now under scrutiny will acquire a new significance.

(Continued from page 57)

Conductor grade aluminium will be produced in India for the first time at the Alwaye plant and supplied to the Kundara works of Aluminium Industries Limited. The Indian Aluminium Company will set up by the end of 1954 an extrusion press at Alwaye with an annual capacity of 1,200 tons.

In addition to packaging foil, cables and extrusions, aluminium sheets and strips are used in the transportation industries. Prefabricated aluminium houses and sprinkler irrigation equipment have been introduced in India, while aluminium grain silos have begun to be manufactured in the country. The expansion of the aluminium industry was based as much on these expanding uses as on the fact that aluminium is the only non-ferrous metal for the manufacture of which India has adequate mineral resources.

NEW INDUSTRIES IN SOUTH INDIA

SOUTH India as a whole—comprising Travancore-Cochin, Madras, Andhra, Mysore and Coorg—has not registered any spectacular progress since independence either in the establishment of new industries or in the development of new lines of production in the established industries. This negative and general statement does not quite apply to Mysore State which easily leads South India in the matter of new industries, and even this progress is, in the main, confined to the public sector. Although Mysore appears to possess congenial conditions for basic large-scale enterprises, development there sharply brings out the uneven location of new industries in South India whose older industries are no more evenly distributed among the different States.

Progress in Mysore

Mysore, naturally, should engage one's first attention. The Mysore Iron & Steel Works at Bhadravati, although an old enterprise owned and operated by the State Government, has nearly completed a postwar development programme with financial help from the Government of India. This programme covers expansion of cement production, direct recovery of acetic acid from pyroligneous liquor obtained as a by-product of the wood distillation plant, installation of Bessemer electric Duplex plant and of three electric pig iron furnaces, etc., involving a fresh capital outlay of about Rs. 50 million till the end of 1954. The programme has nearly doubled the output of finished steel. The acetic acid plant is stated to be the first of its kind in India, with a capacity of two tons of glacial acetic acid per day for which there is good demand from the textile, rubber, rayon, lacquer and paint industries; wood tar, methanol and methyl acetone are also recovered. The Ferro-Silicon plant attached to the Works in 1950 is stated to be the only one of its kind in India producing 5,000 tons annually; it is further stated that, when the plant is worked to full capacity, it will not only meet the entire requirements of the country but also export some quantities. Furnaces are under erection for producing other ferro alloys like Ferro-Manganese, Ferro-Chrome and Ferro-Phosphorus; plans are also under way for the manufacture of slag cement from the slag tapped out of the blast and electric furnaces. Special type pig iron containing nickel and chromium is also manufactured. The Bhadravati works, with such diversified production, has the reputation of being the first iron and steel works in the country to adopt electric smelting of iron ore.

Two concerns in which the Government of India have a major interest, and the Government of Mysore a minor one, are situated in Bangalore. The Hindustan Aircraft Limited, a wartime enterprise, has taken up in the postwar years the manufacture of H.T. 2 and Indian designed trainer aircraft, jet fighter aircraft under licence, all-metal rail coaches, all-metal single and double-decker buses and locomotive parts and high precision spares for the railways and engineering industries. The concern has satisfactorily progressed with its plans to build from 100 to 180 bogie passenger coaches per annum. With nearly Rs. 40 million already invested, this enterprise which was started in 1940 for the repair and overhaul of aircraft has thus come to take up several new lines of production. The other concern, the Indian Telephone Industries, Ltd., is a postwar enterprise. Established in 1948-49 with a capital investment of about Rs. 25 million, this is an entirely new industry for India producing telephone instruments used on public subscribers' premises, main equipment for telephone exchanges, private automatic exchanges for commercial and industrial purposes, railway control telephones, etc., for the home market as well as for export to the neighbouring countries in Asia. The factory manufactures all telephone components except the condenser and uses only a few raw materials of special structure and tolerances like magnetic steels, fine wires and special fibres from foreign sources. Production, which started to schedule, is now at an annual rate of 40,000 telephone instruments and 30,000 auto exchange lines. The research section of the concern has to its credit the development of a single-channel telephone carrier equipment, a secraphone, and a voice frequency repeater.

Two other Government of India concerns, now being established at Bangalore, are the Machine Tool Factory and the Bharat Electronics, Ltd., with projected capital outlays of Rs. 95 million and Rs. 90 million respectively. Work on the latter project is still in a preliminary stage, with a training scheme just under way in collaboration with a French firm. This concern is intended for the manufacture of a wide range of wireless equipment like radio and radar equipment of all types including transmitters, receivers, amplifiers and ancillary equipment. When the factory will go into production is not known. The machine tool project, however, is at a fairly advanced stage of execution although its foundry at Bhadravati is yet to be established. This factory, with which a Swiss firm is associated, is nearing completion and is expected to produce annually 900 high speed lathes, 240 heavy duty drilling machines and 460 heavy duty shaping machines—all valued at about Rs. 40 million. The first lathes to come out of the factory will be 8½". As the estimated annual demand for machine tools in railway workshops, ordnance factories and key industries is just 1,500, the annual manufacturing programme of the factory is considered adequate although restricted imports of certain special types of machine tools will still be necessary for some years to come. The Government factory will not undertake the manufacture of those types and designs of machine tools which are already manufactured or proposed to be manufactured by private industry.

Two entirely new Government of Mysore industries, entrusted to the management of a private firm called the Radio & Electricals Manufacturing Co., Ltd. at Bangalore, are for the manufacture of plastic insulated electric cables and wires and of house service meters. These two industries have a capital outlay of about Rs. 5 million. An older Government concern, the Mysore Lamp Works, has just taken up the manufacture of miniature lamps—a new line. An older Mysore Government enterprise, the Government Electric Factory, has under way a scheme for the manufacture of high-

Frame assembly in T.-I. cycles.

power transformers, and of electric motors and switchgear on a mass scale.

The only large-scale Government of India enterprise to be situated in Madras State is the integral coach building factory at Perambur in Madras City where the Southern Railway already had its loco and carriage works. Construction of the factory is well under way at a capital cost of Rs. 40 million. It will have the capacity to build, on the basis of a single shift, 300 to 350 all-steel integral type coaches per annum; it is expected to go into production in 1955, producing 50 coaches in 1955-56.

Hindusthan Shipyard

The only outstanding new enterprise in the public sector in Andhra State is the Hindusthan Shipyard, Ltd., which the Government of India is operating in partnership with the Scindia Steam Navigation Company, the former owners of the Vizagapatam shipyard. Till 1952 when the Government of India took over the shipyard, Scindias had built eight cargo ships, each of 8,000 deadweight tons, since the first keel was laid in 1946. The Central Government's financial outlay on the development of the shipyard for the period 1951-52 to 1956-57 would amount to Rs. 180 million of which the subsidy alone would be Rs. 30 million. The development programme for expanding the yard to an economic size is expected to reduce the prices of ships to those quoted by British shipyards and to effect a reduction in the subsidy.

Travancore-Cochin's Resources

Some striking progress in the public industrial sector has been registered in recent years in Travancore-Cochin which has some natural advantages for mineral and chemical industries. The Indian Rare Earth Factory at Alwaye, a joint enterprise of the Central and T-C. State Governments, has been established with the assistance of two French firms. With a capital investment of about Rs. 8 million, the plant is capable of processing 1,500 tons of monazite sand per annum. The factory is scheduled to manufacture 360 tons of mixed rare earth compounds as chlorides or carbonates valued at about Rs. 10 million, 1,800 tons of trisodium phosphates, crude thorium oxide equivalent to 203 tons of thorium nitrate and 15 tons of uranium oxide and 200 tons of dilute caustic soda solution.

The Travancore Titanium Products, Ltd., is another noteworthy enterprise in which the State Government has participated to the extent of 51 percent of its share capital of Rs. 7.5 million. The object of the company is to manufacture titanium dioxide pigments from ilmenite which, like monazite, is found in abundance.

Two other concerns of comparatively recent origin in which the Government of Travancore-Cochin has participated are the Fertilisers and Chemicals (Travancore) Ltd., and the Travancore Rayons Limited. In the first concern at Alwaye, in which the Government of Madras has also participated, investment by the two Governments has come to about Rs. 25 million. The Alwaye concern has a plan under way for manufacturing, besides its usual ammonium sulphate production, an additional 45,000 tons of nitrogenous fertilisers including ammonium chloride, and has also expanded its production of phosphatic fertilisers from 18,000 to about 45,000 tons. Travancore Rayons Limited, although strictly a private enterprise, is largely financed by the State Government which has taken up about Rs. 10 million worth of ordinary shares and debentures. The only rayon-producing unit in South India, Travancore Rayons, produces 1,800 tons of rayon yarn and 720 tons of transparent paper per annum.

Progress in the Private Sector

The private sector also has registered some striking progress in the development of new industries in Mysore State. The Mysore Kirloskar, Ltd., a wartime enterprise with a capital investment of Rs. 2.5 million, have been manufacturing Grade I machine tools at the rate of 80 machines a month; they have recently completed the first few units of their RL type of all-geared head motorised heavy-duty lathes. The Mysore Machinery Manufacturers, Ltd., a postwar enterprise at Bangalore, manufacturing textile machinery, have plans under way for the production of preparatory weaving machinery, like winding, warping and sizing machines. The Mysore Electro-Chemical Works, recenly established at Bangalore, have a rated capacity of 20,000 storage batteries per annum. Kirloskar Electric Co., Ltd., again of recent origin, manufacture, in technical collaboration with the Brush Engineering Co., of the U.K., a wide range of electric motors of various types from 50 h.p. to 200 h.p. The firm has already begun producing motors above 100 h.p. and has nearly reached a capacity of 75,000 h.p. per annum per shift.

Cycles Made in Madras

Compared to the public sector, the private sector in Madras State has fared better, having to its credit some new enterprises, started since 1947. Hercules (India) bicycles are now manufactured by the T. I. Cycles of India, Ltd., at their factory at Ambattur near Madras; the factory which has a production capacity of 100,000 cycles per annum has recently opened its components section. The Pioneer Cycle Industries (India) Ltd., are also setting up a factory for the manufacture of cycle spare parts and accessories. Standard Motor Products of India Limited, assemblers and progressive manufacturers of Standard and Triumph cars and Ferguson tractors, have their factory at Vandalur near Madras; the number of tractors assembled is probably about 500 a month, but it is not known how many cars are now produced. Ashok Motors, Ltd., have been assembling Austin cars and Austin and Leyland commercial vehicles in their factory at Ennore near Madras. Simpson & Co., Ltd., Madras, are engaged in the assembly and progressive manufacture of Perkins diesel engines, automobile components and spare parts, light engineering products, etc., and in coach building.

In the sphere of electrical industries, Oldhams & Sons, Ltd., Madras, have been manufacturing storage batteries for the last few years; the annual rated capacity of the firm is 25,000 batteries. Radio and Electricals Ltd., Madras, is a new enterprise manufacturing electric transformers and radio receiving sets. Madras Electric Industries, Madras, have plans to produce up to 1.5 million pieces of electric lamps per annum. Electric motors are a comparatively recent line of manufacture in which some of the engineering concerns already mentioned are engaged.

Expansion in Chemicals

In chemical industries, Addisons Paints & Chemicals Ltd., Madras, which went into production in 1949 with a capital investment of about Rs. 4 million, is a pioneer lacquer and paints industry manufacturing a wide variety of materials including the automobile and industrial finishing ones. The nitro-cellulose lacquers of this concern are stated to be of good quality. The Industrial Chemicals, Ltd., in Tirunelveli, are manufacturing calcium carbide, which is a new chemical industry. A number of starch manufacturing concerns have been set up near Salem since 1945. While Messrs. Parry & Co., Ltd. have expanded their production of sulphuric acid and Mettur Chemical & Industrial Corporation Ltd., their production of caustic soda, two new entrants into the field are the Heavy Chemicals, Ltd., Tuticorin, and Travancore-Mettur Chemicals, both for manufacturing caustic soda.

Little New in Andhra

The private industrial sector in Andhra has little to its credit in the matter of new industries. The Raja of Venkatagiri Plant for the manufacture of sulphuric acid and superphosphate is a new enterprise of note. The distilleries for the manufacture of power alcohol have been set up in recent years in the Circars, and they have just come into operation. According to the Andhra Chamber of Commerce, no new industry of any importance has come into being in the Andhra area since independence although there are prospects for many mineral industries. But the Andhra State may well have the distinction of having at Vizagapatam the projected petroleum refinery of Caltex (India) Limited. When this project, aiming at an annual refining capacity of one million tons of crude petroleum, gets under way, it would be a partial compensation for industrial underdevelopment in Andhra.

Travancore-Cochin

The private sector in Travancore-Cochin has done well in the establishment of new industries. A major enterprise of recent origin is the Indian Aluminium Company Ltd., which, in collaboration with the Canadian Aluminium Company, produces pig aluminium at its Alwaye plant with a smelter capacity of 5,000 tons per annum. The company has also acquired a factory for the production of aluminium paste and powder pigment up to a capacity of 500 to 750 tons per annum. The Aluminium Industries Ltd., at Kundara near Alwaye, a new enterprise in the electric cables and wires industry, is manufacturing aluminium conductors (A.C.S.R.) at an annual rate of 2,000 tons.

Conclusion

The above survey of new industries and of new lines of production in the established industries in South India does not claim to have covered all developments in the matter of expansion of older industries. Two factors—shortage of electric power and establishment of new units in old industries like the textiles, sugar, cement, chemicals, pharmaceuticals, glass, paper, plywood, matches, power alcohol, soap, vegetable oils and vanaspati—have been responsible for the comparatively poor flow of capital into new industries. Among the new industries for which, according to the Madras Industrial Planning Committee of 1948, there are good prospects in Madras and Andhra are: copper mining, steel re-rolling mills, extraction of magnesium metal from magnesite, dry cell industry using pyrelusite, electrical generators, galvanizing plant, prime movers, white cement from magnesite, pressed boards from bagasse, pneumatic tyres, etc. Further, Madras and Andhra are endowed with a variety of minerals for which mining leases have been given, among which are: asbestos, barytes, bauxite, chromite, corundum, celestite, calcite, copper ore, china clay, emery, graphite, gypsum, ipsum, kyanite, limestone, manganese, magnesite, mica, ochres, phosphatic nodules, red oxide of iron, shells, steatite, white shale and slabs. As these minerals can be mined in economic quantities, there are good prospects for mineral industries, especially in the Andhra area. But further industrial development in Madras and Andhra, according to all indications, would depend almost entirely on successful lignite mining in South Arcot; successful production of coking coal from lignite; suitability of Salem iron ores for an iron and steel industry; generation of more hydro-electric power in Andhra; and thermal power in Madras. Above all, land reform.

B.O.A.C. service is world-famous. And the secret of this high standard is experience. Experience gained by B.O.A.C. during 35 years of caring for the comfort of passengers. Experience which produces only the best in courtesy, attention, flying skill and comfort.

When you fly by B.O.A.C. your journey is made easy and pleasant by a staff whose training is based on this accumulated experience. And to every service B.O.A.C. adds that hard-to-define quality of friendly ease and courtesy which is traditionally British.

TEXTILE MACHINERY INDUSTRY

● By R. L. Rajgarhia ●

THE textile machinery industry is one of the capital goods industries recently set up in India. Much importance attaches to it by reason of its close association with the foremost industry in the country, the textile industry, as also by reason of the scope provided by it for setting up several small-scale ancillary industrial units, or alternatively of providing work for the not inconsiderable volume of idle capacity in various engineering units. Prior to 1939 this country was entirely dependent on foreign imports for textile machinery. Not even component parts like spindles and rings were manufactured in India. A major part of the investment (Rs. 107 crores) in India's cotton textile industry was going towards capital equipment imported from abroad. Apart from the heavy strain on the foreign exchange resources of the country which such dependence involves, the absence of an indigenous capital goods industry was felt as a serious handicap, especially during the war years when supplies from abroad were entirely cut off and the mills were unable to obtain essential items for replacement. In any case no country can hope to attain a high level of development in the textile industry without developing side by side an efficient machinery industry. Though factories have been set up in India for producing spinning ring frames, drawing frames, speed frames, carding engines, looms, and preparatory and finishing machinery, several lakhs of rupees worth of machinery have been imported during the last few years mainly on account of the carry-over of import licences previously issued. These imports are bound to decline in the coming years as increasing efforts are made to meet requirements from indigenous production units where adequate capacity has already been installed.

The textile machinery industry was started in India in 1939, when the Textile Machinery Corporation Ltd., popularly known as Texmaco, was formed with the object of producing in progressive stages complete spinning and weaving units. The initial plans, however, received a setback, for World War II intervened, and the Texmaco factory at Belghurriah was taken over by the Government of India for war purposes. After its return at the end of 1945 it had to be re-equipped, and it was not before 1948 that normal operations could be resumed. Since then the factory has been producing and marketing spinning ring frames, drawing frames and spare parts—rings, spindles, fluted rollers, tin rollers etc. Plans are under way for producing carding engines and speed frames. During the war part of the equipment intended for the production of weaving machinery was transferred from the Belghurriah factory to Gwalior where a separate manufacturing unit was set up called Texmaco (Gwalior) Ltd. for producing looms and also preparatory and finishing machinery for textile mills.

Other Ventures

Since the Birlas' pioneering venture, several other manufacturing concerns have been set up in India. The following are the important units in existence today:—Textile Machinery Corporation Ltd., Belghurriah; Textool Co. Ltd., Coimbatore; National Machinery Manufacturers Ltd., Bombay. The last named, though now engaged mostly in assembling, have plans for manufacturing complete units within a few years. For the manufacture of carding engines: Machinery Manufacturers Corporation Ltd., Calcutta. For the manufacture of looms: Texmaco (Gwalior) Ltd., Gwalior; Mysore Machinery Manufacturers Ltd., Bangalore. Besides these, there are some units which have produced components of spinning ring frames and looms whenever there was a large demand for them, such as Ramakrishna Industrials, Coimbatore; Cooper Engineering Co. Ltd., Satara; Acme Manufacturing Co. Ltd., Bombay; Achalpur Engineering Works, Ellichpur; and Laxmirattan & Co. Ltd., Bombay.

The demand for new plant installations has been variously estimated with reference to the need for expansion of the textile industry, for replacement of existing plant and for balancing existing uneconomic production units. There is a great potential demand for machinery for expansion and replacement purposes because (a) the per capita annual consumption of cloth in the country is not more than 16 yards which is very low compared with world standards; (b) much ground has to be covered in attaining a reasonable level in exports of cloth; and (c) nearly ninety percent of the existing plant in India's textile mills is old, worn-out and obsolete.

There is, however, a wide gulf between "potential demand" and "effective demand," the latter being circumscribed by the problem of rehabilitation finance in the Indian textile mills industry. In the rehabilitation of worn-out machinery the textile industry is facing a colossal problem. The position is far from satisfactory even in the best managed firms which have built up depreciation reserves during boom periods, since allocations towards depreciation reserves were based on original cost of plant and bear no relation to present-day replacement costs. As machinery costs nearly five times as much as in prewar years, the inadequacy of capital resources to cope with replacement needs will be apparent. Various representations have been made to the Government of India on this subject. The Taxation Enquiry Commission is expected to go into this question and suggest suitable remedial measures. Until a satisfactory solution is found for this problem it will continue to keep the demand for new installations at a low level.

In deference to the foregoing considerations the Planning Commission has set a modest programme for the development of the indigenous machinery industry which, together with the progress achieved to date, is shown in the following table.

	Rated Capacity				Actual Production			
	1951	1952	1953	1956*	1951	1952 Jan./Aug.	1953 Jan./Aug.	1956
Ring spinning frames	396	396	396	800	260	285	145	700
Looms	3600	4000	4200	8000	1894	1338	1644	8000
Carding engines	600	600	600	600	Nil	119	55	600

* Target

Judging from the volume of imports during the period in question, one could unhesitatingly say that the demand has not been in excess of the installed capacity in indigenous manufacturing units; in fact under present conditions existing capacity can meet the indigenous demand in full in respect of the particular items manufactured here.

Production Costs and Prices

It will be evident from the figures given above, that the output of the industry, though keeping pace with demand, is much below installed capacity. This naturally tends to increase production costs. Foreign competition compels the indigenous producer to keep his prices within economic limits, with the result that the margin of profit is too small to provide for adequate reserves for depreciation and further expansion. This affects future development. In the meanwhile it is of interest to observe that Indian machinery is being sold at prices about 20 percent less than those for corresponding models imported from the U. K.

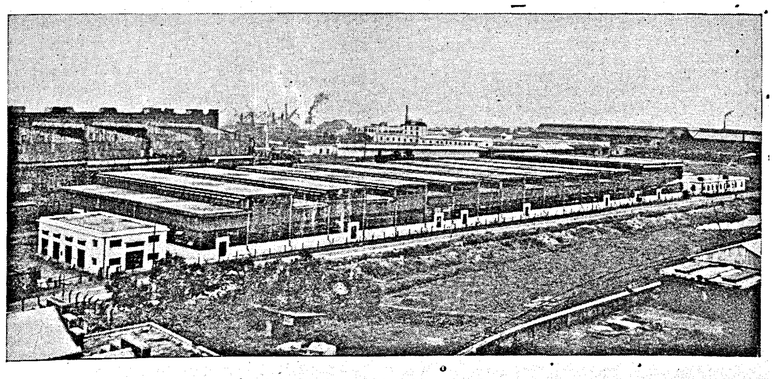
Quality of Indian Products

The indigenous manufacturers have to contend with what is called "consumer prejudice", a feeling that machinery made in India is of inferior quality compared with foreign machinery. This prejudice is due to the long association with foreign machinery, and to the lack of publicity on the modern production techniques adopted in India. In modern mass production units, wherever they are situated, there cannot be any appreciable difference in quality so long as accepted standards are maintained in the choice of raw material, plant and equipment, and production methods; and finally, where the appropriate tests are applied to finished products to ensure precision, and performance under required conditions. There are also tests to ascertain whether a given component will continue to give satisfactory performance over as long a period as another. The factories recently set up in India have installed the most up-to-date plant and have adopted the same production and testing methods as in the advanced countries. There were no doubt grounds for complaint in regard to quality during the early pioneering days and they were due to a lack of technical know-how and non-availability of suitable raw materials. But these difficulties have been speedily overcome by Indian manufacturers by importing specialists from abroad, sending Indian technicians to foreign countries for advanced studies, and all the important producers have secured technical collaboration with reputed foreign manufacturers. Texmaco for instance have collaboration with the SKF Ball Bearing Co. Ltd., and the Casablanca High Draft Co. Ltd., well-known manufacturers of roller-bearing spindles and high draft equipment. The National Machinery Manufacturers Ltd., Bombay, have collaboration with Platt Brothers Ltd., for the production of ring frames. Similarly, Machinery Manufacturers Corporation, Calcutta, have collaboration with Whitins Machine Co. (successors to H & B. American Co.) for the manufacture of carding engines. Indian manufacturers have to conform to the standards set by the foreign collaborators and frequently their products are tested for quality in the collaborating firms' laboratories. The quality of the Indian manufactures has been a subject of discussion at the tariff enquiries in 1949 and 1951, and at the enquiry in April this year; and the evidence on record proves that machinery made in India is in no way inferior in point of quality of material or less efficient in point of performance compared with machinery imported from abroad.

The Future Outlook

The present is a transitional period and much anxiety naturally prevails as to the ultimate fate of the ventures already launched. Considerable co-ordination would be needed for reconciling the various conflicting interests involved and before the existing industrial units attain a measure of stability in regard to production. At present the industry enjoys protection through tariff duties and also through import control based on balance of payments considerations. One hopes these facilities will continue until the infant industry is able to stand on its own legs.

The multitude of types and designs in machinery used in the Indian mills is a factor that imposes a severe strain on the indigenous manufacturer's plan for balanced production. Substantial economies in time and production costs could be achieved, by a certain amount of standardisation without in any manner affecting the consumer's interests. This will incidentally help the development of several small-scale ancillary industries and relieve the principal manufacturing units from the task of producing various small components. This industry has been fostered so far by the sympathy extended to it by the textile industry; the fortunes of the one are inextricably bound up with those of the other. In the centenary year of the textile industry, peak levels of production have been attained despite various handicaps. I take this as a welcome sign of better things to come in future both for the textile and textile machinery industries.



An exterior view of the Machinery Manufacturers Corporation's Sonai works.

SOME NEW INDIAN ENTERPRISES

Machinery Manufacturers Corporation

THIS Company was organised in 1946 for the specific purpose of building a plant manufactory to serve the needs of the textile industry. It is managed by Messrs. Mahindra & Mahindra Ltd. of Gateway Building, Apollo Bunder, Bombay. It has an issued capital of Rs. 85 lakhs, inclusive of special preference shares to a total value of Rs. 25 lakhs held by the Government of India. It has borrowed Rs. 50 lakhs from the Industrial Finance Corporation of India. The present Board of Directors consists of Sir Purshotamdas Thakurdas (Chairman), Sir Sobha Singh, Mr. M. A. Chidambaram, Mr. Mathuradas M. Parekh, Mr. S. G. Barve, I.C.S. (ex-officio), Mr. T. Swaminathan, I.C.S. (ex-officio), Mr. P.C. Malhotra (ex-officio), Mr. K. C. Mahindra and Mr. A. K. Mitra. In 1947 the Company succeeded in securing the technical collaboration of a long established and well-known firm of textile machinery manufacturers in the U.S.A. who furnished not only the designs for manufacture of textile machinery in India but complete technical "know-how" including plant lay-out, process manuals, material specifications, etc. Selected Indian engineers were trained at their works in the U.S.A., while American engineers were deputed to India for short periods to train Indian labour and supervisory personnel. The M.M.C. factory at Kidderpore, Calcutta, which was set up in 1950 at a cost of approximately Rs. 1 crore, is well-equipped and laid out, and embodies the latest developments in the field of engineering technology. It commenced manufacture of carding engines in May 1951 and within the short space of less than three years has supplied over 500 carding engines to nearly 60 mills in India, Pakistan and Hongkong and secured further orders for approximately 600 carding engines. These carding engines have been accepted by leading Indian textile mills as being equal in workmanship and performance to the imported ones. The rated capacity of the factory on single-shift is 600 machines per annum, which is sufficient to meet India's entire requirement of carding engines.

The Indian Cable Co. Ltd.

THE electrical cable industry was founded in India over thirty years ago by the Indian Cable Co. Ltd. Until the outbreak of the last war, the original cable factory, located in the Tatanagar industrial region, had been responsible for a modest contribution to India's slowly growing needs for everyday types of domestic and industrial cables. With the disruption of normal international commerce resulting from the war, the Indian industry found itself called upon to meet a vastly expanded demand for electrical cables, both for the Services and for domestic needs. The experience and development acquired during these years of continuous production at high levels, have paved the way to ambitious schemes of expansion, not only of the existing types of rubber insulated cables, bare copper and aluminium conductors, and winding wires, but involving also the setting-up of plant and buildings for the production of a variety of electrical conductors not hitherto produced in India.

These schemes of development had already reached a stage at which they were easily dovetailed into the country's overall proposals for industrial expansion embodied in the five year plan. Since 1948, the new plant installed at the rapidly growing Indian Cable Company township of Golmuri, Tatanagar, is steadily expanding and will continue to do so for some time. The first phase of the Company's expansion was completed with the setting-up in 1952 of a new non-ferrous hot rod-rolling mill of the latest type, in which copper and aluminium bars and ingots are transformed into rods from which electrical wires are produced. A pilot plant for the production of thermoplastic insulated cables, using P.V.C. as its raw material, is also now in production. Although this type of cable has been manufactured in India since after the war by the Government factory in Bangalore, the Indian Cable Company plant will, it is expected, usefully augment production of a type of cable the uses and popularity of which are growing. The smaller sizes of P.V.C. insulated wires are of particular interest to the automobile, radio and tele-communication industries. Wartime technical developments in the field of thin-wall insulation for winding wires, used widely in the armatures of electrical motors, have since led to the adoption of synthetic enamel insulations, which are gradually superseding the older textile covering. Work on the new factory buildings and the installation of modern equipment for the manufacture of synthetic enamel winding wires is now well advanced at Golmuri. The production of these wires in India is of importance to the rapidly expanding light electrical industry.

The major development in the Company's plans for the future lies, however, in the manufacture of paper-insulated power cables for voltages up to 11 K.V. In such cables the dielectric, or insulating material, consists of a special high grade paper, which is applied as tape in layers over the bare conductor wire. A conductor thus insulated is impregnated with a special insulating compound, which imparts added strength to the dielectric properties of the paper insulation. Protective coverings, such as lead alloy sheathing, galvanised wires, or steel tapes, may then be applied to increase the mechanical strength of the whole cable, and render it resistant to rough usage and deterioration under service conditions. Hitherto almost every mile of such cables has had to be imported, and without them, the distribution of electricity at high voltages would scarcely be possible. The annual volume of imports of paper-insulated power cables is very considerable, and a source of supply of these within India will obviously have important economic and strategic significance. The 600-foot long factory for the production of paper-insulated cables is now all but completed, and many items of the very extensive plant have already reached the factory, which is expected to be in production in the next two years.

In expanded productive capacity and opportunities for increased employment, the execution of these projects by the Indian Cable Co. Ltd., signifies a positive advance towards the achievement of the five year plan's industrial targets. The step-up in the production of a wide range of electrical conductors also provides the necessary backing to the continued expansion of the generation and distribution of electrical power, which is one of the main pillars of the Plan.

The Ball Bearing Industry

BALL bearings are of prime importance to a country striving for industrialisation and self-sufficiency. They play a most important rôle in mechanisation, where the problem of fighting friction arises. There are only a few well planned ball and roller bearing industries in the world that produce bearings to international standards of quality. The second world war has proved their imperative existence in the field of industrial and economic recovery of a country. Ball bearing producing countries in Europe and America, themselves being entangled in war, and rebuilding and strengthening their industries during the post-war period, had practically cut down their supplies to India, and Indian industries experienced the very drastic and adverse effect of shortage of bearings not only for requirements in industrial products, but also for replacement in machinery. The need for a ball bearing industry in India was deeply felt, but the intricacies and complications in the manufacture of precision bearings which have to be within 1/10,000 of an inch in accuracy in some respects, did not encourage the prospective Indian industrialist to move into this line. Being fully aware of these complications and difficulties, but feeling this vital gap in the industrialisation of India, Birlas decided to establish a fully equipped ball bearing industry in India. They negotiated with, and had the technical collaboration of Messrs. Hoffmann Manufacturing Co., Ltd., of Chelmsford, U.K., who stand as pioneers in the manufacture of anti-friction bearings of world repute. The project was taken in hand immediately and detailed plans were drawn up for a factory to be established at Jaipur to produce bearings of international standards of quality.

The Company was floated under the name of National Bearing Company, Ltd. A modern air-conditioned factory building with reinforced concrete roof and hollow glass bricks for north lighting was constructed and equipped with a fully self-contained plant for complete ball bearing manufacture comprising machines of the latest development and design, specially intended for the manufacture of steel balls and bearings. A team of young Indian engineers was sent to the Hoffman factory for comprehensive training in the technique of manufacture of ball bearings and components. These engineers acquired full knowledge of all details at all stages and sections in a period of less than two years. These services of experts from the Hoffmann factory were borrowed and British and Indian technicians came to India and were able to train Indian labour in operating the specialised machines, and producing high precision work in a very short period. The first ball bearing completely manufactured in this factory was assembled in May 1950. Since then the factory has been producing all popular bearings required by the Indian industries and meeting the growing demands of India for this component. Every year a good number of sizes and types is added to the production schedule, and so far this factory has covered about 80 sizes. This year the manufacture of roller bearings has also been put on the production schedule and very shortly the factory is hoping to put roller bearings on the market.

Looking to the establishment of locomotive and carriage factories in India, the National Bearing Co., Ltd. has decided to make roller bearing axle boxes to Hoffmann design, which are universally appealing to railway engineers for their outstanding features, such as simplicity of design, interchangeability, great ease of mounting, etc. Originally, the factory had to import its raw materials from abroad but when export quotas were reduced in foreign countries due to re-armament, the means of getting this raw material from home sources had to be investigated. Within a short time the steel required for the manufacture of ball and roller bearings was made, and the difficulty of getting raw materials from foreign countries was overcome. Now the alloy steel is produced in India for ball and roller bearing manufacture, of the same standard of quality and specification as is used by foreign manufacturers. The annual demand in India, as assessed by the Tariff Commission, is 9 lakhs of ball bearings and one million gross steel balls. The production capacity of the National Bearing Factory is 18 lakhs of bearings and 21 lakh gross steel balls per annum. It can be seen that the production capacity of the National Bearing Factory is much more than is required to feed Indian industries and as such this factory now looks ahead for export of its products to neighbouring countries.

Quality Steel Ropes

THE establishment of the manufacture of steel wire ropes in India by the National Rolling & Steel Ropes Ltd., Managing Agents, Associated Industrial Development Co., Ltd., is a new industry in India. It illustrates the spirit of progress which is rapidly gaining ground in the field of engineering in this country.

Whilst the steel wire and steel rope industry is very old in Europe, it has always been considered in the East as one of the more intricate production processes, demanding extreme skill and knowledge and one which is best left to the experts. It is therefore an achievement to have produced a variety of steel wire ropes of different sizes, types, and constructions in competition with the well known and established imported products. The indigenous ropes are made to conform to the current British specifications governing the production of these goods. They are tested in accordance with the relevant B. S. specification at the Government Test House, Alipore, and are certified accordingly. The production of these indigenous ropes is planned to expand until it covers all varieties used in the engineering, mining, shipping and allied industries. There is a very wide variety of steel ropes, all designed to meet specific requirements. In the mining industry these requirements are most meticulous and the mining industry represents one of the largest users of this product.

The plant in operation by this, the only indigenous producer, is modern and is under the direction of expert technicians who are steadily building up a force of skilled Indian operators. Already there is evidence that the technique is being well assimilated. Development of the steel rope industry is however being planned on cautious and progressive phasing. It is expected that eventually every phase—the production of the special quality steel, the rolling of the steel into rods, the drawing of the rods to wires of various tensile strengths and gauges, and the final manufacture of the rope into its large variety of sizes, types and constructions—will be accomplished by the pioneer producer.

A. P. V. Engineering

IN building up an all-round chemical engineering industry, it is essential that there should be a number of medium sized firms who specialise in the various aspects of chemical engineering manufacture and design, which are not attractive, for a variety of reasons, to the larger companies. Specialisation in certain such fields has brought the A.P.V. Engineering Co. Ltd. a reputation in India, and much of the highly specialised chemical plant which was formerly imported from the U.S.A. and the Continent can now be manufactured in this country. Stainless steel fabrication of all kinds is now undertaken. The progressive medium sized companies are also turning their attention to handling such difficult materials as monel metal, stainless steel clad metals and homogeneous lead lining. The growing use of the semi-rigid plastics in the chemical industry has encouraged the A.P.V. Engineering Co. Ltd. to examine this new field and to commence active participation in it. On the design side, the use of India's own chemical engineers, supported initially by overseas technicians, is increasing. Many Indian technicians have received excellent training in overseas organisations and have brought back to India technical skills in both design and fabricating. Coupled with the continuous flow of technical information from overseas associates, customers for chemical engineering plant may rest assured that in approaching the small but dynamic chemical engineering industry in India they are securing excellent technical and manufacturing advice with the tremendous advantage that the fabricating firms, being located in India, are on the spot for up-to-date consultation. It is of substantial advantage to the Indian chemical industry to deal with firms of repute in India wherever possible, the more so because of the peculiar and widely varying climatic conditions in India, which often affect operation of chemical units.

Tin Box Industry

THOUGH the can making industry is not a new industry in India (by 1939 well organised factories with some of the latest can-manufacturing machinery and equipped for lithographing tinplate were already established), since the War capacity has greatly increased and the range of products produced by the industry has been extended. It now not only offers plain and decorated tinplate containers but in addition, crown corks, aluminium rigid collapsible tubes and, this year, will be producing aluminium rolled-on pilfer-proof seals which were heretofore entirely imported into India. Thus the industry has kept pace with contemporary world developments in the field of packaging and the Indian manufacturer is at no disadvantage compared with his counterparts overseas. A supply of high quality packaging material is a pre-requisite to the development of many consumer goods industries. Of the new industries growing up in India a number have required technical and other assistance in meeting their packing problems and the tin box industry has, and is, meeting this need by making available to these young industries the experience and knowledge of packaging problems acquired in India and overseas. Climatic and commercial factors peculiar to India have necessitated the Indian can-makers developing new shapes and styles of containers and the introduction of various tamper-proof devices. In an endeavour to give the various new enterprises every opportunity to get their goods on to the market at competitive rates and in containers comparable in every way to the imported variety the tin box industry accepts orders for lithographed tins involving quantities which would be considered uneconomical and unprofitable in other parts of the world. There is however a further way in which the can-making industry is assisting the development of new industries in India. During the last war many items of war stores were manufactured by the industry, particularly by the Metal Box Company, using its tool-making skill and applying its mass-production methods to the manufacture of many items ranging from knapsack buckles to land mines. It succeeded in relieving many of the supply difficulties of the Allied Armies in South-East Asia by supplying hundreds of millions of items of stores. Similarly today, when many new industries are starting up and either do not wish to, or cannot afford to, instal expensive tool-rooms and press equipment, it is possible for the can-making industry to come to their assistance by providing certain of the components they require. This has in fact taken place and the largest can-making company in India is already undertaking work of this nature. Thus whilst the can-making industry is not a new industry in itself, its range of production is continually extending and changing to meet the requirements of consumer goods manufacturers; and it is playing an important rôle in the development of industry in India by servicing the new consumer goods industries in India with suitable containers and light industrial components.

Mine Lighting

EVER since man discovered mineral wealth in the crust of the earth he has continued on an increasing scale to use all his ingenuity in achieving the most efficient means of obtaining this wealth. Mechanisation has played a very important part in assisting man to achieve his aims, and with the increase of mechanisation the call for light has been one of the primary considerations. In many foreign countries, within a short span of years the oil lamp has been superseded by the electric lamp and the latter is rapidly being displaced by the cap lamp. Messrs. Oldham & Son Ltd., Denton, England, were the pioneers in the development of the cap lamp and obtained official approval for the first one in England in 1920. This was far from perfect but a great step forward was made in 1935 with the introduction of the Oldham Wheat cap lamp. This lamp introduced revolutionary conceptions into mine lighting and lamp room control. It was the first of its kind to be known as the "self service cap lamp". It is approved for use in gaseous mines, and its light to weight ratio is very favourable. It is robust and has been found to be very economical. The lamp is placed on and off charge by the user, and maintenance has been kept to a lower level than had been achieved hitherto. Recently the Oldham Wheat cap lamp has been introduced into India. Arrangements have already been made to manufacture progressively mine lighting equipment at the Oldham factory in Madras.

The Oldham Wheat Cap Lamp is of one piece construction and consists of a tough-ended bakelite headpiece, and a four volt unspillable accumulator. The battery is carried around the man's waist and the headpiece is conveniently attached to the miner's helmet. A sweat resisting short lay cable connects the accumulator to the headpiece. The lamp itself is little more than 2½" in diameter, the body is made of toughened bakelite and is fitted internally with an aluminium parabolic reflector and a non-corroding special alloy lens ring which carries the ⅛" armoured glass and the rubber channel washer, the latter being water-tight. The shape of the reflector has received special attention and is finished in different states of polish. The matt is designed to give a diffused light over a solid angle of 130° without glare, and its centre beam has ten times the average light over the whole angle. For inspection purposes the polished reflector is used which throws a high intensity beam as desired. Centrally mounted at rear of the body is a metal clip which secures the headpiece to the wearer's helmet. A rotary switch is situated on the right side of the beam piece which allows the wearer to switch the lamp on and off. Beneath the metal clip is located a key switch which allows the contacts to be made "live" when the lamp is placed on the frame for charging. The headpiece is permanently connected to the battery through a short lay twin-cored cable which serves both for carrying the current to the headpiece bulb, and whilst charging, carrying the current from the charging contacts to the accumulator. The charging and storage frame is of simple construction and each lamp's headpiece position is fitted with charging contacts. When the lamp headpiece is attached to the storage frame by a simple rotary movement the battery is automatically on charge. There is no fear of electric shock since a constant potential form of charging has been evolved to permit self-servicing to be worked in its simplest form. The maximum voltage on the frame is four volts. The charging current is obtained through the low voltage static charger which converts the alternating current into a direct current by the aid of the selenium rectifiers. When the lamp is taken "off charge" the ingenious barrel lock automatically makes the exposed metal contact "dead". It is therefore impossible to obtain a spark by shorting the two charging contacts.

The Oldham Wheat accumulator is completely unspillable and gives the same characteristic as a "wet battery". The secret of the acid retention is the use of the "Sponac" separators which are of a special material which absorbs up to 15 times its own weight in liquid. Secondly, in actual use, almost the whole of the electrolyte for the working of the cell is contained within its separators. The battery groups are fitted into a moulded hard-rubber container which has completely eliminated corrosion, reduced weight and bulk without sacrificing strength, and fits snugly to the wearer. The operation and maintenance of this lamp is known as the Oldham "self service" system. For the first time the miner automatically undertakes many of the routine duties which were formerly carried out by the lamp man. More storage batteries are ruined through inefficient charging than by any other cause and not every lamp man possesses the technical ability of an electrical engineer. Particular attention has been paid to the method of charging employed, and a system of charging was developed in which the human error is reduced to the very minimum. The engineers first made the charging automatic and completely fool-proof, secondly induced a high safety factor, thirdly eliminated moving parts and finally meeting conditions where accumulators may be in varying stages of discharge. From first to last, the whole operation has been planned to ensure recharging in ideal conditions with the minimum of skilled technical supervision. A further point on maintenance is the fact that there is no necessity to renew the electrolyte in the battery and indeed the colliery is not called upon to provide acid; only distilled water is used for topping-up. This of course is necessary to replace the evaporation of water due to the electro-chemical action.

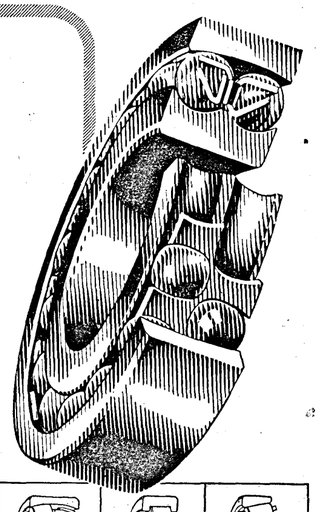
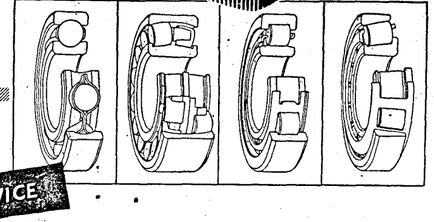
SKF

Manufacturing the most comprehensive range of ball and roller bearings...



In every division of India's industry—in heavy steel plants, in large textile mills, and in small workshops—wherever Ball and Roller Bearings can make operations smoother and production cheaper, there you will find SKF. SKF has its own organisation in India with a technical staff always at hand to help you select the most suitable and economical bearings from a range so complete that the correct bearing-type for any application can be supplied and installed.



QUALITY BEARINGS FOR LASTING SERVICE

THE SKF BALL BEARING COMPANY LTD

Bombay P.O. 71

Madras P.O. 66

ompany was floated in 1939 and started orking in the year 1940. A bicycle consts of 200-odd parts, the main ones being rames, forks, handlebars, rims, mudguards, hubs, hainwheels and cranks, brakes, chains, spokes and ipples and freewheels. There are other smaller arts such as seat-pillars, cotterpins, chain adjusers, fork crowns, high draw bars, brake levers nd more than 22 kinds of nuts. The main parts, uch as frames and forks, have again various components such as bottom shells, lugs, fork heads, ork rings, pedal axles, depal cups, hub axles, hub ups, etc. Hind Cycles Ltd. is today manufacturng not only all the parts but even the components, ncluding freewheels and chains, under one roof. aw materials consist of bars, sheets, wires and ubes. Tubes are not made in India and have to e imported. Bars, sheets and wires are now eing manufactured in India of a satisfactory uality, but they have got to be treated before hey are used, the main reason being that in inishing, India does not still make the raw aterials of required specifications. Bright cold rawn bars and strips have to be imported. The lant of Hind Cycles Ltd. consists of tool room, achine hall, and shops for hardening, plating, olishing, bonderising, enamelling and brazing. The machine hall consists of turning machines like apstan, automats and semi-automats, power resses and various types of automatic and semiutomatic machines, milling, drilling, welding, crew-cutting, threading, cold-heading and various ther types of single purpose machines. The platng plant consists of bonderising, nickel, chrome nd barrel plating. The bicycle frames, forks and mudguards are enamelled in a semi-automatic onveyor type of oil-fired furnace. For cranks and edal axles, the plant consists of a forging machine, rop stamp and power hammer, etc. Beginning ith 3,000 bicycles in 1943, Hind Cycles today roduces 500 bicycles a day. Production in 1952 as 130,000 bicycles. In 1953 Hind Cycles produced 20,000 bicycles, though its production capacity is 80,000 a year. This was because of heavy imports nd paucity of demand.

Paper Cones and Tubes

THE well-known manufacturers of paper tubes and cones, the Textile Paper Tube Co. Ltd. of Romiley, England have in conjunction with Messrs. A. & F. Harvey Ltd., Madurai, made arrangements for the manufacture of paper cones, tubes and other specialities in India. The Indian Textile Paper Tube Co. Ltd., as the new company will be called, will have its factory at Punalur (Travancore-Cochin) and will commence production within the next 12 months.

Godrej & Boyce

THE Godrej reputation was first made on their impregnable safes and safe-vaults. But the range of steel products manufactured by them caters to the needs of homes, offices, hospitals, canteens, libraries, etcetra. During the war they supplied very large quantities of hospital and other equipment, including tens of thousands of beds, and when the people of India went to the polls, Godrej supplied a million and a half ballot boxes at the low rate of Rs. 5 each. While expanding in their present lines, they explore new fields of usefulness. Their recently developed line of steel windows meets the requirements of present-day architecture. For manufacturing electrically-welded steeltubing, they have recently installed a fully-automatic tube mill of the latest design. Another new line of theirs will be typewriters, the dies of which are manufactured by themselves, unlike foreign manufacturers who get their dies and fixtures made by others to their requirements. Godrej have also embarked on their project of manufacturing refrigerators.

Expansion in their chemical line continues. Recently, they have started manufacturing fatty acids in the most up-to-date plant, which render economical and purer the manufacture of soap by this process of making this allied product. Their stearic acid is used in many industries like textile, rubber, leather, lubricants, candle, metallic stearates, carbon-paper and plastics. Godrej's glycerine plant is of the fully-automatic design. Their washing soap in the new concentrated grain-form is effective and economical for industrial uses, besides eliminating washing chores for housewives.

Kraft Paper

SO far as India is concerned, kraft paper was first produced in the Orient Paper Mills in 1939. This mill was set up with the intention to strike out in a new line of endeavour different from the other mills in India which were manufacturing the protected grades of paper, viz. printing and writing papers. Important technical problems had first to be solved; was bamboo, the principal paper-making raw material in India, suitable for the manufacture of kraft paper? The promoters of the new mills initiated technical investigations in the U.K., Sweden and India. Preliminary investigations in Sweden having proved favourable, a highly qualified expert was brought out from Sweden to make further enquiries into the matter at the Dehra Dun Forest Research Institute. The investigations carried out here established the possibility of making quite a good quality of kraft paper from bamboo. This was the origin of the kraft paper industry in India.

To produce kraft, the stock has to be specially treated to make the paper strong, flexible and highly resistant to sudden strains. The kraft paper usually marketed in this country is brown in colour, glazed on one side and rough on the reverse, and surfaced with ribbings or close lines. The manufacture of kraft paper with these special qualities necessitates additional equipment to the machinery used for the manufacture of other kinds of paper. The ribbings are brought about by the use of ribbing felts while the Yankee Cylinder not only does the glazing but also facilitates drying.

This new enterprise did not come into its own without difficulties. Foreign kraft offered the stiffest competition, the price dropping to unprecedented levels just before the war. Kraft paper was not included in the scope of protective tariffs and representations for this facility before the 1938 Tariff Board failed because no mill was then actually turning out kraft paper. The war brought automatic protection which, however, also brought in its train one great disadvantage. With a ready market for Indian kraft irrespective of quality, a certain amount of complacency naturally set in, which curbed the incentive to improve quality. This was not altogether the fault of the producing unit as there was pressure from Government for increased production for war purposes. In postwar years Indian kraft has improved in quality but is not yet equal to the imported variety. Foreign kraft is coming into the country in small quantities but the Indian industry can hold its own on price. It is noteworthy that the cost of production in India is lower than in any other country. India imported kraft paper in prewar times to the extent of 10,110.6 tons per annum on an average. The country's requirements have since increased rather than declined and some other producers of imitation kraft are already in the market.

A great future lies ahead for kraft manufacturers if only the quality is improved. On account of the high cost of gunny bags, America has been using multi-wall paper bags for a variety of purposes formerly served by jute bags. Here in India the cement industry requires large quantities of bags which kraft manufacturers may endeavour to meet by studying the great technical improvements effected abroad in the paper and pulp industry during and since the war. A notable development in the war years was the production of wet strength paper and now paper bags are used for marketing fish, meat, vegetables, etc. without the least fear of breakage.

Another packing material which has immense prospects is paper board. We have some 20 or more mills in India making straw board and paper boards with a rated capacity of about 50,000 tons. Most of these are small units of indigenous design and manufacture, which are not producing to capacity for various reasons. It is only the integrated paper and board mills that are economically in a sound position. The demand for boards is estimated by our planners to mount to 90,000 tons by 1956. In postwar years the import of boards has been at the rate of approximately 4,000 tons per annum, and there seems to be little fear of overseas competition.

Quite a considerable amount of self-sufficiency has already been achieved. The bulk of the country's demand for straw board, grey board, duplex and triplex boards is being manufactured at home. A commencement has been made with the production of art board. A vast field, however, remains unexplored. Paper board is now being made in America with considerable strength properties so much so that paper board provides packing even for heavy machinery. Paper board containers have long replaced wood for the transport of fruits and vegetables in that country. The manufacture of board is not as complicated a process as the production of paper. The raw materials are practically the same but the pulping treatment is less elaborate and is not as expensive. The machinery installed in many of the smaller

board mills has been designed and made locally and quite a good quality of board can be made in such mills if only careful attention is given to the manufacturing process. In the larger units producing both paper and board, modern machinery of European or American origin is installed and the output is naturally superior.

Ballarpur Paper & Straw Board Mills

THE Ballarpur Paper & Straw Board Mills Ltd., the first paper mill in Madhya Pradesh, went into production on 21st November, 1953. This was the result of the sustained and careful planning which had gone into the setting up of the mill costing about Rs. 2 crores. The mill is designed to manufacture high quality printing and writing paper at the rate of 20 or 25 tons a day. The plant and machinery, supplied by John Inglis Co. Ltd., of Canada, have instrumentation on a large scale, making control almost automatic and embodying the latest practices in heat, water and chemical recovery. The mill is the most modern of its kind in India; its colony provides residence for the entire staff, and besides quarters for workers there are school and medical facilities, canteens, parks, children's play ground and a club. The managing agents, Messrs. Karam Chand Thapar & Bros. Ltd., took charge of the project in the middle of 1951 and laid its foundations. The story of the project, however, goes back further, to a time when the present managing agents were not associated with it. Starting in 1947, under very favourable auspices and with the Government of Madhya Pradesh as one of its promoters, the Company met with such fluctuating fortunes in its initial stages that at times it appeared doubtful whether the project would ever be completed. The management changed hands thrice, and there was also a change of site after the discovery of coal under the original site on which construction work had already made some progress.

In 1949 the then managing agents resigned, and the M.P. Government took over full control, and on the recommendation of the Provincial Industries Committee, appointed an enquiry committee with Mr. A. D. Shroff of Tatas as chairman. The committee recommended the transfer of management to a private firm "having considerable industrial experience in general and the know-how of paper manufacture in particular". It was at this stage, in April 1951, that Messrs. Karam Chand Thapar & Bros. Ltd., stepped in as the managing agents of the company, and the project began to take shape. Despite shortages of cement and steel and other constructional material, the erection of the mill was carried through, and on 8th June, 1953 the first sheet of paper came off the machine.

The mill is situated very near the source of the principal raw material, bamboo. The potential capacity of the areas leased to the mills is expected to meet the requirements of the mills even with further expansion. It will take a few years to develop the full capacity of the areas, and during the interim period about 80 percent of the bamboo required will have to be imported from the more distant forests leased to the mills by the Government. The rapid development of the potential raw material resources nearer home assume special importance in the context of the contemplated expansion programme of the mill. Today a mill with a capacity of 20 to 25 tons a day can at best be regarded as a border-line unit. The management is therefore actively engaged in chalking out a programme of increasing the capacity with a view to making the scheme economic. In the first two years it is expected that production will be raised to 30 to 35 tons per day. The second stage will probably call for substantial block investment to step up production to 50 to 55 tons per day.

The five year plan envisaged the establishment of two new units: Ballarpur Paper & Straw Board Mills Ltd., and Cauvery Paper Mills Ltd., the former having a rated capacity of 8,000 tons per annum and the latter 3,000 tons per annum. With these two units, and with the expansion of the existing units, the rated capacity of the paper industry is expected to reach the target of 2,11,000 tons per annum as set out in the Plan. In achieving this target the contribution of Ballarpur Mills will be substantial by the end of the first phase of the Plan.

Jute Carpets

JUTE fibre which has long been used in preparing sacking and packing materials is now widely used in manufacturing carpets. In India, jute carpets were first manufactured by Birla Jute Mfg. Co. Ltd. A jute carpet is a woven mat of jute fibre. Weaving is done by power looms and various colour combinations are effected. Cards have to be cut for different designs, of which there are mainly four types for carpet manufacture. The first is the Jacquard; this type of matting is colourful with some design woven on its body. It is manufactured in rolls having various widths ranging from 24" to 72". To prepare a full size carpet or matting, pieces have to be cut according to the width and length of the area to be covered, and if a longer size is required, pieces in required lengths are cut from the roll, and then joined together with the help of a sewing machine which can do the required zig-zag sewing. It should not be possible to feel these joints. It is, in fact, joining a piece to a piece, and not a piece over a piece; and is done in such a way that it cannot be detected. The second is the "Dobby" where the weaving is almost the same as in case of the Jacquards. This item is available in plain colours and with stripes in different widths. The "Tapestry" is the third. This type is produced in various colour schemes with or without borders. Tapestry is a cut-pile material and gives a velvety feel. This material is mainly used for covering drawing rooms and floors, and the chassis of motor cars. The fourth is the "Runners". This is a light material which can be used not only for covering floors and staircases, but can also be used for making hand-bags, etc. Indian manufacturers, apart from meeting local requirements, have now found ready markets for this commodity in overseas countries. The export of this item has shown a marked increase in recent years. To provide further stimulus the Government of India has recently abolished the export duty on jute carpets and mattings. There are now no restrictions on their export to any country except the Union of South Africa.

Indian Linoleum

LINOLEUM is a synthetic, smooth-surfaced, pliable and hygienic floor covering. The name was coined by Frederick Walton from Linum (Flax) and Oleum (Oil) and the first factory was founded by him at Staines, Middlesex, in the year 1862. Since then other British manufacturers have started its manufacture under that name and, at present, there are about 30 factories throughout the world. The House of Birlas established the first, and still the only factory in India, at Birlapur, 24-Parganas. Production started in the middle of 1951, and since then the concern has been making steady progress, supplying the entire demand in India, and making substantial exports to foreign countries. The capacity of the plant is one million square yards per annum of different qualities of linoleum and felt-base floor coverings. The entire Indian demand is roughly 300,000 square yards. No reliable data of imports in the past are available, as the import of oil and floor cloth, including linoleum, are bracketed together in the sea-borne trade statistics. Imports have been stopped recently, as the products of India Linoleums Ltd. were found to be in no way inferior to imported products, and their quality was very highly spoken of in foreign countries. Linoleum is included in the list of items for export from India in the trade agreements with a number of countries, including Sweden, Norway, Turkey, Egypt, Rumania and Yugoslavia.

Radio Manufacture By H. M. V.

SUBSTANTIAL progress in the indigenous manufacture of radio equipment has been made by the Gramophone Co. Ltd. The H.M.V. factory at Dum Dum now manufactures a comprehensive series of radio receivers and radiograms, ranging from the small and inexpensive dry battery receiver for the needs of the rural population, through larger high performance dry battery and battery-vibrator models, five, six and seven valve models for A.C. and A.C./D.C. operation, including models specially adapted for the 110 volt electric supplies encountered in the planting areas, and table and console autoradiograms, up to the large deluxe type autoradiogram. Manufacture commences with production from raw materials and piece parts of components, including such items as H.F. coils, transformers and chokes, I.F. transformers, audio and mains transformers and chokes, valve holders, loudspeakers, dial scales, etc., and various mechanical components and parts. Quality is controlled at the highest level throughout, by careful inspection and testing at each stage of manufacture, and for this purpose the factory is elaborately equipped with special precision mass production testing equipment designed and manufactured by Electric & Musical Industries Ltd. at Hayes, Middlesex, the home of "His Master's Voice". Of special interest is the electronic high frequency heating equipment recently installed for final assembly of loudspeakers. This ultra-modern technique, in which heat is induced locally by the application of radio frequency current in special jigs reduces assembly time to a fraction of that required by normal methods. H.M.V. products maintain the quality and finish of their cabinets, all of which are manufactured at Dum Dum in what is claimed to be the finest and best equipped cabinet factory in the East.

Sundatta Cotton-Seed Utilisation Ltd.

THE appearance in Bombay of the company named Sundatta Cotton-Seed Utilisation Ltd., on 1st May 1951, marked the beginning of highly-capitalised industrial production of cottonseed oil in India. This country is one of the largest cotton growers in the world, but before the incorporation of this company there had been little attempt to utilise cottonseed industrially. The chief reasons for this would seem to have been competition from the groundnut crushing industry which produces a similar edible oil, and the fact that processing requires expensive specialised machinery. The cottonseed crushing industry is already well established in Pakistan, where there is a general shortage of oil bearing seeds but it made a slow start in India because of the ready availability of groundnuts with an oil content of 45 percent. Processing in India has been complicated by the low oil content of the type of cotton-seen usually grown, but with the increased demand for a longer staple there has been a general tendency to grow more American-type cotton. This has contributed a source of seed having a much higher yield and providing, in addition, a valuable by-product known as "linters". The oil itself can be used as a welcome addition to groundnut oil by the makers of vanaspati, while the linters provide one of the best sources of the raw material for the rayon industry. Cottonseed cake, which is what is left when the oil has been extracted, is an excellent cattle food possessing a much greater nutritive value than raw cottonseed.

Calcium Carbide

THE prewar annual consumption of calcium carbide in India amounted to about 3,000 tons but as a result of wartime industrial expansion the present requirement is about 6,500 to 7,000 tons. Out of this about 53 percent is imported from Norway and Sweden, about 36 percent from Canada and the rest from other European countries. So far there has been practically no production of calcium carbide in this country, as the two experimental plants set up in South India could not even produce 10 tons of carbide in the last two years. A calcium carbide

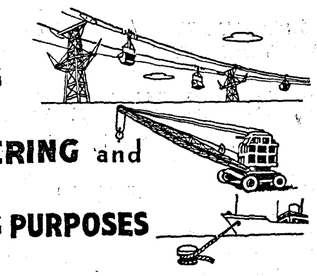
STEEL WIRE ROPES

for

MINING



ENGINEERING and

SHIPPING PURPOSES

For the first time in India—we are now producing Steel Wire Ropes of all types and descriptions. Into the making of these ropes goes all the skill of a team of experienced technicians, working in our plant of the very latest model, which explains their balanced perfect construction — their exceptional *strength* and *flexibility*.

The range of our products includes :—

Steel Wire Ropes, Black and Galvanized of all types of constructions

Steel Wires, Black, Galvanized and Patented, including High Tensile Wires

Steel Rods and Bars rolled in our own Rolling Mills

★ *Trade enquiries are invited*

Messrs. BALMER LAWRIE & CO., LTD.

plant with a capacity of 10 tons a day is being set up by Messrs. Birla Brothers Ltd., at Birlapur, 24-Parganas, about 20 miles from Calcutta. It will be the first plant of its kind in India, and is expected to go into production by September 1954. The largest consumption of carbide in this country is for gas welding and cutting and to a limited extent for acetylene lighting. Acetylene, which is a well known illuminating gas, is the starting point of a wide range of synthetic resins of polyvinyl type, useful for plastics of various types, and of synthetic acetic acid and synthetic rubber. Calcium cynamide, a widely used artificial manure all over the world, is also made from calcium carbide.

For the production of carbide on an industrial scale, according to the practice followed in the main producing countries like America, Canada, Norway and South Africa, the following raw materials are required: electric power, 200 K.V.A. a ton of carbide a day; anthracite or coke, 14 cwts, a ton of carbide; lime, 1.1 tons a ton of carbide; electrodes 65 lbs. a ton of carbide. As anthracite is not available in India, coke must be used. The coke should have low ash content, preferably not exceeding 12 percent, and be low in phosphorus, sulphur, silica, iron and volatile matter. The lime required is in the unslaked state with lime content (CaO) not below 93 percent and the phosphorus, alumina and magnesia content should be strictly limited. The silica, iron oxide and sulphur content should also be low. The lime must be of the dense variety and such that it will not crumble during any part of the carbide process. As metallurgical coke available in India contains about 19 percent ash, the above figure of coke requirement will not hold good and the consumption, therefore, will be more in proportion to the ash content of the coke used. The solutions for utilisation of indigenous material may be either by production of low ash coke by washing the coal or mixing suitable carbonaceous material with the coke to bring down the ash content, the latter being governed by economical and technical considerations.

Good limestone deposits in India suitable for the calcium carbide industry are not favourably located. However, this difficulty may be overcome in the course of the present development of the country. This being an electro-chemical industry, good power supply is necessary. Power is required as A.C., 3-phase supply of normal periodicity, at the carbide furnace at approximately 100 volts between phases. Special transformers, therefore, form a component part of the furnace plant. Furnaces may be single phase also, but 3-phase furnaces are preferred for greater heat and electrical efficiency. Electrodes may be the pre-baked (graphite or graphitised carbon) type or the Soderberg type. The Soderberg electrode is a self-baking type and is made by daily adding a paste. The paste is made from petroleum coke, pitch and tar. Pre-baked electrodes are generally imported from America or Germany but Soderberg types are available from indigenous sources.

As there is little refining done in the carbide furnace, it is advantageous to use as pure raw materials as possible, thus minimising the diluent effect of their impurities. Out of the impurities present in the raw material, silica is the greatest. Part of this is volatilised in the furnace, some is reduced and combines with the iron present to form ferrosilicon alloy and a large part of it combines with lime to form a low fusion point calcium silicate, which dissolves in the molten carbide. The same is true for the aluminium and iron oxides although probably most of the iron goes into ferrosilicon. A large part of sulphur and phosphorus is dissolved in the carbide as calcium sulphide and calcium phosphide. The presence of magnesia results in increased viscosity of the molten carbide and tends to cause serious difficulties in the tapping.

In the carbide manufacturing process, the coke and lime are received for the electric furnacing operation after having been processed to assure a proper degree of dryness and physical size. These raw materials are then mixed in the required proportion and charged in the furnace. Small furnaces are charged by hand in order to distribute the material properly. A pool of calcium carbide forms below the suspended electrodes and this accumulation is tapped into a laddle through the taphole in the side of the furnace. The main reaction in the production of calcium carbide is, on paper at any rate, a relatively simple one and can be represented by the equation

$$CaO + 3C = CaC_2 + CO$$

Lime + Coke = Calcium Carbide + Carbon Monoxide.

This reaction is, however, reversible and molten carbide in an atmosphere of carbon monoxide will revert completely to lime and carbon on cooling. An optimum temperature at which the reaction proceeds most satisfactorily, therefore exists. The aim of the process is to obtain a product with about 80 percent calcium carbide yielding 4.8 cu. ft. of acetylene per lb. An attempt to prepare a material of greater purity than this proves uneconomic.

The tapped carbide is allowed to cool for some time and then, having been pre-crushed by hand, enters a crusher and is crushed to sizes under 4". The crushed carbide then goes to screens and is classified in specified sizes.

Earth Moving Equipment

GIANT hydro-electric projects such as Bhakra Nangal, D.V.C., Hirakud, and Tungabhadra are nearing completion, and plans have been made to commence work on five other major projects, Kosi, Koyna, Krishna, Chambal and Rihand. On these projects modern earth moving equipment is indispensable. The use of such new and unfamiliar machinery in India requires the teaching of skills so that the equipment might be properly serviced and maintained. The Blackwood Hodge organisation which operates throughout the world and is probably the largest single organisation concerned exclusively with the supply and servicing of heavy earth moving equipment and allied machinery, are distributors for the world famous "Euclid" off-the-highway trucks, "Marion" excavators, "Cummins" diesel engines and other earth moving and material handling equipment. Blackwood Hodge (India) Ltd., opened an office and workshop in Calcutta, now its head office, in 1948. Later in the same year, a branch office in Delhi was opened, closely followed by branch offices in Madras, Bombay and Lucknow. All the major projects and contractors and industrial concerns are using Blackwood Hodge equipment. Here, however, as elsewhere, Blackwood Hodge (India) Ltd., has not built up its reputation solely as suppliers of earth moving equipment. Maintenance is the keynote to successful and economic machine operation.
