They will be there!

BIF

Exciting Displays by 2,000 proud exhibitors from almost ever British industry with something new to show.

Inventions, developments and devices . . . designed by men wh know what the customer wants.

Keen Buyers from every country in the world . . . who know th value of being first where new designs and ideas are to be found.

Special Attractions . . . from the outstanding achievements of British industry to household goods and gadgets for the delight of every man and his wife . . . the Everest Expedition display at Earls Court; the British North Greenland Expedition display at Olympia; the gigantic mechanical equipment at Castle Bromwich.

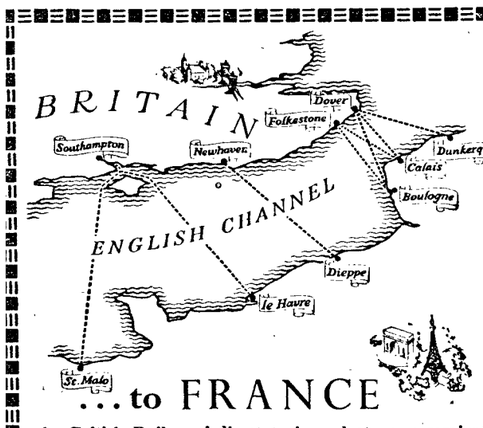
600 009 MAY 3 14 162484 Public Library

you must be there!

THE BRITISH INDUSTRIES FAIR

CASTLE BROMWICH · EARLS COURT · OLYMPIA

Trade buyers—daily 9.30–6. Public Admission—daily 2–6 (and all day Sat., May 8th) 2/6d to each building.
Fair closes at 4 p.m. on Friday, May 14th.
Catalogues price 2/6d at Fair entrances—or from B.I.F., Lacon House, London, W.C.1, after April 20th.



...to FRANCE

by British Railways' direct train and steamer services

Comfortable and reliable travel — whether your destination is Paris, Normandy, Brittany, the Riviera or even further afield.

Day and night services — including the famous "GOLDEN ARROW" (Pullman) and "NIGHT FERRY" (Through Sleeping Cars) between London and Paris.

Car-Ferry Services Dover-Boulogne and Dover-Dunkerque.
Drive yourself on — Drive yourself off!

Good food and courteous service throughout

For full information, apply principal Travel Agencies or Continental Enquiry Office, Victoria Station, London, S.W.1, or British Railways' Travel Centre, Lower Regent Street, London, S.W.1.

Bombs in Cold Blood

ONE of the hydrogen bomb's nicer characteristics is that it is very reluctant to explode. Extraordinarily high temperatures and intricately adjusted conditions are needed to set it off. In this respect it sets something of an example both to public opinion and to public men—an example that might be better heeded. In the tumult of discussion set off by the test explosion in the Pacific on March 1st, some normally level voices have been heard saying curiously wild things; and the damage caused by inadequate safety measures around Bikini may yet prove a small thing in comparison with the harmful effects of some of these hasty remarks.

Every allowance must, admittedly, be made for the unprecedented psychological atmosphere in which any discussion of such a weapon must be conducted. It is asking a good deal of human nature to expect men to speak with judicial calm of a device that can fell a city at a blow. For all that, it remains blindingly clear that a mood of alarm and bewilderment is the worst of all moods in which to pass sweeping judgments or to take fateful decisions. Yet in the past ten days, in just such a mood, and long before reliable information was available, sweeping judgments have been made and fateful decisions demanded.

Responsibility for the creation of the mood cannot be very easily allotted; if the blaze has been fanned by eager hands on this side of the Atlantic, the original tinder was provided, in the form of some brief but notably ill-chosen sentences, at the highest levels in Washington. But, whoever is to blame, the mood now exists; many people are, at least for the moment, disinclined to listen to quiet statements of fact from either scientists or statesmen; and it may be premature to ask that the problem of the bomb should be considered in the only way it ought to be considered—that is, in cold blood.

Yet cool heads and clear minds have never been more necessary. It may seem curious that there should be any need to underline the seriousness of the subject. But the need emerges plainly from the varied attempts that have been made in print and in speech to exploit the theme of the bomb, some for partisan, some for emotional, and some even for frankly commercial ends. A public that is often chided for its apathy toward vital issues is now, at a moment when its interest is fully aroused, being offered from many quarters not plain fact and sober argument, but emotion, sentiment, catchwords, and tubthumping tirades. This is, in the deepest sense, a most cynical frivolity.

What are the facts, and what is the real argument about? The bubble myth of an unlimitable explosion has now, one hopes, been disposed of by a whole series of authoritative statements, including those made by the Prime Minister on Tuesday and by Admiral Strauss at Mr Eisenhower's press conference on Wednesday. There is no danger—perhaps one should still say no present danger—of an experimental explosion getting out of control. What remains is the admittedly unappetising picture of continuing tests of weapons of increasingly giant force. It is perfectly reasonable to ask whether the tests need

go any further, now that such huge destructive power has already been demonstrated, and whether it would not be a wise political act to halt them rather than to keep on disturbing world opinion. What is unreasonable is to refuse to wait for the answers.

The answers are not simple ones: they cannot be conveyed in a six-inch headline; if they have any merit at all it is only that of being based on logical reasoning. The world is divided (and by the wish of only one of the halves; the barbed wire was all put up on the far side of the dividing line). The strongest nations on each side of the barrier both proclaim their possession of the hydrogen bomb. Both are aware of its obvious limitations; but they are equally aware that those limitations largely disappear if either side gains a completely decisive lead. The purpose of continued experiment on either side is to prevent the other from obtaining such a lead.

If it is suggested that the weapons have now reached a stage at which it is meaningless to speak of a decisive lead, or that the United States at any rate now commands a destructive power so great that to increase it would extend neither its value as a deterrent nor its actual effectiveness in war, then it is surely relevant to point out that the tests are extremely costly and laborious; that those who carry them out are the servants of a civilian government acutely aware of public pressure for financial economies; and that it is, therefore, most unlikely that any tests have been or will be made beyond those essential to the task of designing a reliable and manageable weapon.

★

Is there, however, a case for halting the tests in order to quieten public anxiety? To answer this question one must try to define what the public is really anxious about. As far as concerns this country, that is not very difficult. Sensible men will not take too seriously the idea of a planet totally devastated by a technical oversight. Nor is there the slightest reason to fear that the weapons tested off Bikini—that is, American-made hydrogen bombs—are in the least likely to be used over London. The real cause for fear is that Britain may become a target for bombs from the proving grounds of Soviet Central Asia; and the first object of British policy must be to avert that danger. As Bertrand Russell said in a masterly article in Thursday's *News Chronicle*, when asked whether he saw any virtue in the proposal that the experiments should be stopped,

"None whatever, unless we have found a way of causing the Russian experiments to be stopped, too."

Bombs can, of course, always be averted by the simple act of—to give it a plain name—surrender. But the idea of surrendering to a prison state would be rejected by every group in this country that has the least attachment to the idea of human freedom. There are only two other means of warding off the threat; that of deterrence (in plain terms, being ready to hit back at least as hard), and that of agreed acceptance of effective control. The deterrent effect of the possession of hydrogen bombs must not be exaggerated. A week ago Mr Adlai Stevenson neatly defined its limits, when he pointed to the kind of small-scale hostilities that an aggressor could start in full confidence that the United States would not risk broadening the conflict by using its mightiest weapons against him. But, if the hydrogen bomb will not prevent little wars, it may prevent them from being developed into major wars by the aggressor himself.

★

Deterrence, however, is a makeshift substitute for, not an alternative to, effective prevention. Effective international control of armaments has for nearly a decade been the declared and painfully pursued aim of the democratic nations. They have consistently refused to be distracted and cheated of their goal by Soviet offers of unenforceable peace pacts, unworkable schemes for international inspection, and meaningless slogans such as "outlaw the bomb." They hold to the unanswerable argument that there can be no outlawry without an enforced law; that an essential prerequisite of law enforcement is a clear knowledge of the facts; and therefore that no project for banning atomic weapons will be effective unless it provides for constant and vigilant inspection in every country.

This is not mere logic-chopping; it is common sense. If East and West simply promise not to use atomic weapons, then in present conditions neither side will trust the other's promise and both will continue to experiment with atomic weapons as they do now. Nothing will have been changed—except perhaps by making it more embarrassing for the governments of the free nations, which have to consider their public opinions, to keep up in the race. This has been the history of the promise not to use poison gas. Yet (as the history of poison gas appears also to suggest—though the circumstances are different in several important respects) the knowledge that both sides are prepared can achieve the same result as total prohibition. The one state of affairs that would make it almost certain that a hydrogen bomb will one day be dropped on a city would be if the more aggressive side gained a *de parte* superiority in the number or force of bombs and in the ability to drop them. Yet those are precisely the circumstances that would be brought about if the Labour Party's emotionalists, who were so eloquent in the House of Commons on Tuesday, got their way. That is what the Prime Minister meant when he said last week

> I am quite sure that anything like panic would be much more likely to lead to war than to a solution.

Panic, or near panic, is all the less excusable in view of the way the whole problem of inspection and effective prohibition has been minutely examined in public and private sessions of various United Nations organs over a period of years. That marathon debate began, in 1946, with the offer by the United States, at that time the sole possessor of atomic weapons, to abandon its privilege and put its unique power into an internationally controlled pool that would make atomic war impossible. The offer was welcomed by almost every government in the world except those of the Soviet group.

During the long sessions that followed, it became clear that the Soviet government, while protesting its devotion to the idea of inspection and control, would veto to the controls held by most other governments to be essential. As a direct result of this "double-think," the negotiations in Uno virtually ran into the sand five years ago; but their full history is on record, and it scarcely reveals the United States or its nuclear specialists as power-drunk fanatics. On the contrary, it brings out clearly the fact that but for Soviet opposition, agreement could have been reached before 1950 on an international system that would have done away with all such national experiments as that of March 1st.

Last December, a further American initiative was taken when President Eisenhower made his offer of a limited atomic pool for peaceful purposes. This offer, while not directly bearing on the problem of controlling nuclear weapons, held out the possibility of improving the general atmosphere and thus making easier a resumption of work on that problem. The Eisenhower offer remains open. Indeed, only a fortnight ago it was again expounded, in some detail, to the Soviet government; and the western powers stand ready to discuss both the President's proposal and broader issues of disarmament as soon as the Russians are willing to sit down at the table laid for them. If the agitated mood created in the past ten days has the effect of drawing public attention back to the facts and possibilities of this situation, some good may yet emerge from the whole discouraging episode of March.

Everybody who thinks about this terrible problem has the same objective: to see that the hydrogen bomb is never used. The best way of doing that is for both halves of the world to agree on a system of prohibiting it which both can trust. The second best course is to ensure that at least equal hitting power remains in the hands of the less aggressive and less secretive side. The worst course, and the one most likely to bring on the disaster, is simply to say that because the hydrogen bomb is horrible we will have nothing to do with it.

Signpost to the Budget

CHANCELLORS, like Grand National horses, do not always run to form; even when their stables publish the formbook in unexpected detail it is necessary to allow for such possible weaknesses as a tendency to rush fences or a preference for soft going or for restlessness under the Whip. But the Government's Economic Survey for 1954, which appeared as Cmd 9108 this week, is a surprisingly frank formbook. It describes, as usual, where the official statisticians think the economy has been in the past year. It explains, with rather unusual precision, where the Government thinks that the economy has got to now. And it throws out some broad hints about the sort of budget that Mr Butler ought to introduce next Tuesday if he believes what his experts have written.

The Survey is discussed in detail on page 39 of this issue, and here it is necessary only to underline the three main points that seem to arise from it. They are significant points indeed. First, if the statisticians are right, Britain passed in 1953 through the most prosperous year in its history; and yet it has disturbingly little of lasting value to show for that prosperity. The increase in production last year is estimated at £500 million; and the fall in import prices relative to export prices, together with increased earnings from oil investments and other so-called overseas "invisibles," seems to have hoisted the total addition to real incomes to somewhere around £800 million—a far bigger increase than has ever been recorded before. But when incomes increase in Britain there is no lack of claimants to spend them. The whole of last year's increment was gobbled up by an increase of £350 million in consumption and of nearly £500 million in defence, house-building, stockpiling and fixed investment in the nationalised industries. One result of the upsurge in these forms of spending was that there was less than nothing left to fortify the balance of payments; in fact, the external surplus actually fell, by £30 million to £225 million if one includes American aid and by £11 million to £123 million if one excludes it. Another result was that "the amount of money spent on fixed investment in (private) manufacturing industries is estimated to have been about the same" as in 1952. The two most important sectors of the British economy were last year's two Cinderellas.

That is the disappointment of the immediate past; and from it arises the second main message of the Survey, which is that it must be read as spreading equal disappointment—save only in one sector—among those who hope for extensive tax reliefs from next week's budget. The authors of the Survey make it plain that most of the sources of demand for any available resources that increased last year are likely to increase again in 1954; for example, consumption and defence expenditure were both rising throughout 1953, and even if they settle at their present level, their totals for this year will be higher than their totals for last. This does not necessarily mean that consumption and

other types of demand will have to be cut back by an increase in taxes next Tuesday; for one thing production was also rising last year, and even if it, too, levels out at its present level, its total in 1954 will be higher than its total in 1953. But the Survey declares that, on current trends and in the current year, "demand and activity should . . . be well maintained"; which seems to be the nearest approach that any official document can make towards stating that any tax reliefs which gave consumption a further shot in the arm would be folly. All eyes therefore turn to the one sector of the economy that the Survey lists as a "possible exception" to the general judgment that the expansionary plans laid in last year's budget have been brought to fruition: namely, to fixed investment in private manufacturing industry. The question arises: if an incentive to increased investment is given in the budget, will expenditure in other sectors have to be cut back or is there slack in the engineering industry which might absorb it?

★

The authors of the Survey answer that there is such slack. They go out of their way to deny that an increase in investment would necessarily divert resources from the export drive because "now that more steel is available and the defence load has levelled off, exports of capital goods are no longer being seriously impeded by the pressure of home demand. Indeed, a number of these industries have spare capacity which could be used for increasing exports or home investment." Later, in their assessment of the prospect for 1954, they state bluntly that "there will be resources available in the capital goods industries to provide both for an expansion of exports and for a higher rate of industrial investment. Increases in both directions are needed to provide a firm basis for the further development of the economy in future years." "But," they add in another passage, "so far there are no clear indications of any marked increase in capital expenditure by private industry." Rarely can there have been a clearer hint that the Chancellor may be about to go forth to try to create some.

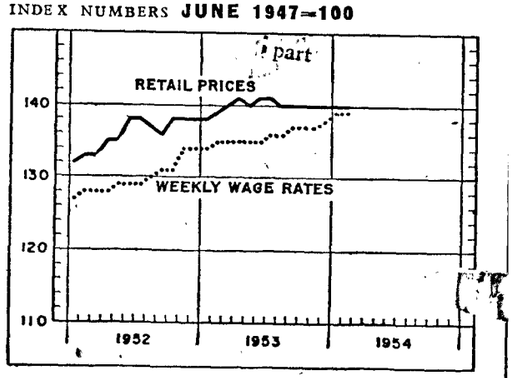
This looks, in short, very much like an official recipe for the sort of budget that was urged upon the Chancellor by *The Economist* last week. Mr Butler could and should give some tax reliefs which will induce private manufacturing industries to invest more; and it is on rearrangement of depreciation allowances that he is most likely to concentrate his attention. But if he is going to satisfy any other claimants for relief, at any rate to the extent of more than £20 million or so, he should rob some Peter to pay Paul; and in present circumstances anybody who searches for a Peter to rob is seeking to draw blood from a stone. The signpost points to a reform of depreciation allowances, and to practically nothing else.

Does it also point to another year of prosperity? This is the third main question raised by the Survey, and the answer to it is lost in the Atlantic mist. The Survey does not minimise the vulnerability of the sterling area to any deepening of the American recession. The downturn which began in America in the late summer of last year has already made some mark. The overseas sterling area—which shares the gold reserve with Britain—swung over from a balance of payments surplus of £151 million in the first half of 1953 to a deficit of £56 million in the second half, had it not been for those mysterious aircraft which flew Russian gold into London Airport last November and December, it seems certain that the reserves would have fallen in the last six months. If there is no recovery in America in the next few months, the familiar spectre of an autumn dollar crisis will be beckoning Britain on.

This is a spectre that must make any Chancellor shudder; but it is not, in icy fact, one that should make him alter his budget. The Survey finds a convenient but justifiable excuse for this conclusion, and one that does not involve official analysts in the almost equal political perils of calling the American government either level-headed and watchful or complacent and purblind. If the American recession deepens, says the Survey, it is the overseas sterling area's balance of payments that will suffer first; it hints that there is little that the British Treasury can do to obviate that. The repercussions of any deepening of the American recession upon activity in the United Kingdom itself are not now likely to be felt before the end of 1954. This, nevertheless, is not a long time. Even if next week's budget can be framed without particular reference to the state of the American conjuncture, that conjuncture remains the great question mark hanging over the world economy. It is that, more than anything else, which will determine whether the favourable year of 1953 will remain on the record like the favourable year of 1929, or whether it is to set the pattern of normality for the future. This is the question that is discussed in the following article.

UK WAGES AND PRICES

INDEX NUMBERS **JUNE 1947=100**



Recession Recedes?

THE profession of economic forecaster was never a very secure one, and it is now becoming downright hazardous. Never was a recession in trade more widely heralded than that which began in the United States in the latter half of last year. Never was the stage more finely set for it. There were doubters, as there always are, and wise men hedged their bets. But when every qualification was made, there did seem to be a clear margin of probability on the downward side.

Yet it begins to look as if this widespread expectation is going to be disappointed. This bet too must at once be hedged. It does not, of course, attempt to deny that there has been already a noticeable decline in the level of economic activity in the United States—though not of a size, taken by itself, to cause any great concern. Nor would it be safe to suppose that the indices will not move any lower. President Eisenhower told his press conference some little time ago that if the March unemployment figure showed no improvement he would begin to think that drastic remedial action would be necessary. As he said it, his advisers could almost be heard catching their breath and they have been trying to suggest ever since that March was really a slip of the tongue for May. Many of them think that the downward movement may well continue for another couple of months before it turns upward. The cautious would add that it is too soon yet to guess what might happen then. There are still some things that give rise to a certain apprehension. The inventories, or stocks, of business, whose swollen size is said to have been the original cause of the downturn, are still high. It is still uncertain whether the automobile industry will be able to sell the very large number of cars it is still making. The steel industry is another potential soft spot.

But there is never a time when all the straws point in the same direction, and when all the qualifications are once more said and done, the majority opinion in America has crossed back over the line. In the elegant language used for these matters on the other side of the Atlantic, it is thought that the indices will "saucer out" and that they will finish 1954 about as high as they began it. Perhaps the most significant sign of the shift of opinion is that some of the ardent politicians of the opposition, who were barely able to keep a note of triumph out of their gloomy predictions a few months ago, are now hurrying to cover.

If this revised outlook is justified by the event, it is obviously a matter of the greatest moment to other countries, more particularly to one whose present prosperity is as nicely poised as Britain's. Not only will the COMPA weather seem brighter, but the outlook for PRICboth domestic and international, will be much improved if the black cloud of an impending American depression can be removed. One thing is reasonably certain already, since it is already observable in the figures. The current recession, if it is one at all, is certainly not behaving as it was expected to. The originating cause—which is pretty generally accepted to be the excess inventories—created a number of pockets of primary unemployment, which has been, and is, quite heavy in a number of American localities. According to the rules, this primary loss of income should have given rise to secondary difficulties, which in turn would affect still wider circles, and so on until the "multiplier" had exhausted its effect. But it is not happening. The normal repercussions are not repercussing. There is the primary fall in incomes, and the process stops at that. The multiplier appears, for the present, to be much smaller than was supposed. This is not true within the American economy alone. One of the most celebrated of the predicted repercussions was on world trade. When America sneezed, it was said and believed, the sterling area caught pneumonia. So it was in 1949; so it is not in 1954—at least, not so far. With the fall in American industrial activity fully six months old and about as severe as that of 1949, sterling is still strong, the reserves are still mounting, and the commodity markets are reasonably firm.

★

Why has there been such an absence of the usual snowball effect? Has it just happened that way, or was it because somebody in Washington pushed the right buttons? It is important to know the answer, because if it was the latter, then one can hope that progress is being made with the art of preventing depressions, and planning for the future can proceed in that confidence. Unfortunately, it is very difficult to reach any such comforting conclusion from the evidence. It is true that the credit policy of the Federal Reserve Board has been right in its timing, tightening up while the trend was still inflationary, but turning round very promptly indeed last May when the first signs of changing weather appeared. But the same can hardly be said of the fiscal policy of the Administration which (perhaps for good reasons of another kind) has in these recent months almost seemed to invite a falling-off in activity. And in any event, these rather marginal adjustments in the volume of credit and in the size of the federal deficit seem too small and too remote to account for the phenomenon that immediately strikes any visitor to America as being the proximate cause of the failure of the snowball to start moving—namely, the universally high state of confidence. Not only in the bank parlour and the board room, but among the ordinary wage-earners, there seems to be a sublime assurance that nothing more is afoot than a slight and brief "correction." In some cities where unemployment is relatively severe,

Sir Winston's chestnuts out of the fire. When they tried to do so over German rearmament, they point out, they merely got burned. And the speech of May 11th stands as a lasting advertisement to the political advantages of inflating diplomatic balloons; some Labour leaders feel that it is their turn to inflate one now.

If You Can't Beat Them, Join Them

MR MOLOTOV is not given to pranks, though the Berlin conference showed that he fancies himself at ponderous jokes. If this were not so, his offer to consider whether the Soviet Union could join Nato would seem like some vast April Fool hammered and sickled out under the collective leadership which, as current Soviet propaganda insists, has replaced Stalin's autocracy. It bears all the marks of collective Marxist-Leninist wit. And it would not be surprising if it were received with the same hollow laughter that is said to have rung round the conference table in Berlin when Mr Molotov produced his plan for a Soviet-European Treaty Organisation (which we have termed Seto, though the Moscow Agitation and Propaganda Department later coined the name "General European Treaty of Collective Security in Europe.")

In Berlin Mr Molotov refused to answer when he was asked point-blank to say whether Seto was compatible with Nato. He hedged and replied that amendments might be considered. It was evident that he was disconcerted by the reception of his proposal that the United States and China should be granted the right to attend Seto meetings as observers. This gave away the purpose of Seto, which is all too clearly to remove Americans, infrastructure and all, from Europe. The octogenarian M. Herriot finds there is much in the idea of Seto, but otherwise its supporters in France have been far too few, it seems, for Soviet liking. Hence the latest move from Moscow.

Once again one must go to Lewis Carroll for the best comment on this new product of the Kremlin's collective mind. It recalls the ship that went hunting a snark. "The bowsprit got mixed with the rudder sometimes"—which is just what would happen if the Soviet Union came aboard that already somewhat uncoordinated craft, Nato. The end Carroll described was sad and inevitable, and it is easy to see that the fate which overtook the hunter of the snark would meet American bases in Europe; they would "softly and silently vanish away; for the snark *was* a Boojum, you see." "Quite so," Mr Molotov would remark as the last American sailed for home, "for Nato *is* Seto, you see."

Ding-Dong in Egypt

MUCH as Cromwell's "russet coated captains" quarrelled with him and one another about the nature and pace of return to representative government, so it is with Egypt's majors and wing commanders. The difference between the two situations is that whereas Protector Cromwell always dominated the scene, President Neguib alternates between ups and downs at each successive upheaval. He lost on the events of last week-end.

On the Thursday he presided over a junta which agreed, with a seeming lack of sophistication about human nature in general and Egypt's nature in particular, to an impossible arrangement. This was government by the Council of Revolution until July 24th, after which date it would melt back into the army. Meanwhile, political detainees were to be released, political parties to have unconditional right to reform, censorship and martial law to be at an end and—in this unbridled free-for-all—elections were to be held for a constituent assembly that would subsequently elect a president.

Experience everywhere goes to show that no ruling group can preserve public order when its days are numbered and potential successors are fighting for its shoes. Even Neguib, who has shown naiveté before, cannot have thought the proposition sound. A majority of junta members, though they voted for it, certainly did not do so. For, as they now tacitly admit, they at once set out to wreck it and with it Neguib's personal ambitions. Colonel Nasser and his supporters summoned to their aid the trade union groups, which on Monday paralysed Cairo with a strike against a return to the old parties, and were supported by a considerable volume of middle-class opinion that has been reminded what these were like by recent trials implicating Wafdist and other ex-leaders.

By Monday night, Neguib's gesture towards the political parties had been his undoing. All decisions about immediate liberalisation of the regime had been cancelled; the soldiers were to stay in power for a transitional period of at least three years—that is, until 1956—and such ambitions as Neguib had awakened in other groups were fobbed off with a promise of an "advisory national assembly representing all classes and organisations." Clearly, Nasser had won a round; the aplomb with which he was able to get demonstrators on to the streets and then off them again was impressive. Neguib's position is not a comfortable one. And the weaker the government in Cairo, the more it must deflect attention on to the Canal Zone and wrath on to Britain; the farther removed therefore the day of an Anglo-Egyptian settlement. Current Egyptian news is bad news for both the British taxpayer and the British army recruiting officer.

Constituencies' Chop and Change

Part

TO the normal hazards of political life is at present being added an unheralded ordeal by Boundary Commission. MPs were vaguely aware that the Commissions (which are impartial bodies made up of eminent lawyers, retired civil servants and the like, under the Speaker's chairmanship) had to review their handiwork by the middle of next year; but the sudden appearance of proposals covering to date some two-thirds of the country has been a shock. Mr Morrison unwisely reacted by publicly hinting at unfairness to Labour. He absolved the Commissions from partisanship; but if his doubts did not concern the umpire then they must have been directed at the rules, which are still largely those that he himself framed as Home Secretary in 1944.

INTERNATIONAL HARVESTER

Announces the

ANTHONY-HAMILTON

LOADER-DOZER

Less than 14 feet long and only 6½ feet wide, this new tractor/loader team can be driven to practically any site, used in underground workings, slung into ships' holds. Able to make pivot turns, it can get in and out of seemingly inaccessible places. Operating with only a few feet of forward and backward travel, it can do a fast, efficient loading job where other equipment would be hopelessly cramped. And that's not all . . in 10 minutes you can remove the bucket, fit the special attachment of landsides and blade, and be ready for work with a fully angling and tilting hydraulic dozer!

IT SAVES TIME—SLASHES COSTS!

★ *Struck capacity of bucket is a full ¾ cubic yard.*

★ *It takes only 8.8 seconds to raise the bucket from fill to dump position.*

★ *Hydraulic raising* AND *lowering gives positive digging action. Bucket can be held 10° below ground line.*

★ *One 4-position lever controls all bucket movements* —RAISE, LOWER, HOLD *and* FLOAT.

★ *Safe, delayed dumping action with plenty of reach and clearance for trucks with high sides.*

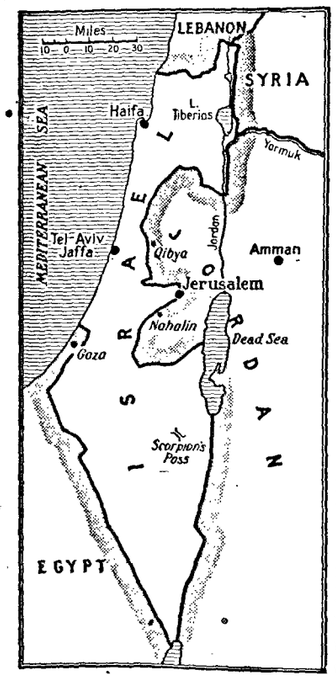
Palestine Truce in Danger

APART from Indo-China and perhaps Korea, the place at which a state of war is today nearest to birth is the Israel-Jordan frontier. Within the last ten days, most of the machinery for peaceful settlement of incidents has broken down. On March 23rd Israel withdrew from the United Nations Mixed Armistice Commission. On March 25th Mr Hammarskjöld, defeated by the refusal of Jordan, abandoned his attempts to convene an Israel-Jordan conference under the terms of their armistice agreement. On March 28th an armed band that made little attempt to disguise its Israel identity killed nine people in an attack on the Arab village of Nahalin; this no doubt took place in retaliation for the killing of eleven Jews in a bus on the Scorpions's Pass on March 17th.



Israel left the Mixed Armistice Commission allegedly in wrath at the refusal of the UN observer to vote in condemnation of Jordan for the Scorpions's Pass attack. (He abstained because evidence of Jordanian complicity stopped ten kilometres from the Jordan border.) In fact, it did so to pacify the very considerable local element that has lost all faith in UN's ability to settle frontier troubles. Jordan refused to accept the Hammarskjöld invitation because this amounted to accepting unlimited discussion of differences—a range of topics that amounts to a peace conference and that it refuses to tackle until Israel has complied with certain UN resolutions. In fact, it, too, has no longer any faith in the United Nations, and is under immense pressure from all its Arab neighbours to cede no points whatsoever.

All the incidents combined suggest that there is a deep division of opinion inside Israel about how to behave over a frontier problem that is warping the country's whole life and economy and that shows no sign of solution. One group, led by Mr Sharett, favours going on trying peaceful means that are seemly in the eyes of western allies. The other, of which Mr Ben Gurion is the prototype, is sure that nothing definite can happen unless Israel, by dramatic action, compels the world to apprehend its plight.

What do Israelis really hope for? Some, no doubt, for a firm stand to be taken by the three western powers who have already guaranteed that impossible frontier line, and for exoneration, therefore, from some of the burdens which it imposes. Some Arab residents in West Jordan would also welcome such a guarantee of quieter nights. But other Israelis now scarcely conceal their desire for an end to parleys and for some Jordanian attack that they could expand into a fight that Israel would surely win.

New Moves in the Two Germanies

THE Allied High Commissioners have now approved the amendments to the Bonn constitution which gave Federal Germany the right to set up armed forces, inside or outside a European community. After arguments with the French, a compromise has been reached among the allies, and the German government has merely been asked to undertake that it will not implement the amendments until the Bonn and Paris treaties are in force. At present Dr Adenauer has no objection to this restriction, as he has still not given up hope of the EDC, and is fully aware of the political dangers of a national army. But it is very unlikely that the ban will stay for very long. Some day Dr Adenauer's coalition partners will insist on its being removed, even if the same demand does not come from the United States and Nato headquarters. It is now clearer than ever that one way or another there will be a German army, and there are signs enough in Germany to show that none of the safeguards written into the EDC and Bonn treaties can be safely jettisoned, while any attempts by the French to strengthen them much further will be rejected in Germany.

Similar fears about the future are aroused by the forecast made by Professor Conant, the American High Commissioner, in a speech last week. He indicated that, even if the linked Bonn and Paris conventions are not ratified, German sovereignty will be restored. It is indeed certain that Dr Adenauer's government cannot be kept under occupation powers much longer, and the chief question is whether it will now be possible to retain the rights of the forces stationed on German soil that were part of the Bonn convention, and the limitations on German arms production that were attached to the treaty.

Before Professor Conant spoke, the Soviet authorities announced that "sovereignty" would be granted to the Pieck Republic. This move has been expected for a long time, as the Russians have consistently tried to build up the status of their puppet. The Ulbricht government would like to set up diplomatic as well as trade missions outside the Communist bloc; and in Germany it is still vainly trying, with Russian help, to secure recognition by Bonn. The immediate disadvantage to the west in the Soviet move lies in the fact that henceforth allied and West German applications for visas, and proposals for improvements in internal traffic, will be referred to German Communist officials instead of to the Soviet authorities.

But there is more to the Russian action than this. Behind it is doubtless a plan to introduce conscription in the Soviet Zone if West Germany is rearmed, and to link the Communist German state with the Soviet system of military alliances. This threat was vaguely made by Mr Molotov in Berlin and it has been more clearly repeated by Herr Ulbricht at the Socialist Unity party congress this week. The Pieck Republic, it seems, must be made into a fully fledged "People's Democracy," not only to threaten the west, but to make it more acceptable as an ally to the anti-German Poles and Czechs.

Bill for the Health Service

TWO years ago the Danckwerts award to general practitioners exploded any pretensions that the cost of the health service to the taxpayer could be kept below £400 million. Since then, the policy of a fixed ceiling has been abandoned in favour of a brake; this has allowed some increase in the estimates at points where the pressure is greatest, but it has prevented the service as a whole from taking a greater proportionate share of expanding national resources.

A feature of last year's estimates was the virtual stability of expenditure on the hospitals; even so, the amount voted for 1953-54 is expected to be considerably underspent. In the new financial year the hospitals are to be voted

HEALTH SERVICE ESTIMATES
(£ million)

	1951-52	1952-53	1953-54	1954-55
Net total cost (excluding civil defence)	**398**	**429***	**414†**	**430†**
Of which:—				
Advances to hospital boards.	274	296	297	308
For maintenance	*261*	*286*	*287*	*296*
General practitioner service	48	89	58	60
Pharmaceutical service:—				
Gross cost	44	48	52	52
Less patients' payments.	...	*7*	*7*	*7*
	44	41	45	45
Dental service: gross cost.	41	31	29	32
Less patients' payments.	*5.*	*11*	*7*	*7*
	36	20	22	25
Ophthalmic service:				
Gross cost	19	11	10	12
Less patients' payments.	*5*	*5*	*4*	*5*
	14	6	6	7

* Includes back payments under the Danckwerts award. † Includes the cost of the medical services and directly administered hospitals transferred last year from the Ministry of Pensions.

increases under the headings of both capital and maintenance, and they have been granted the small favour of being allowed to use their "free moneys" to supplement the money that the Ministry allocates to them for capital schemes. The estimate for maintenance includes provision for increases in wages and salaries that have not yet been authorised but may come into force before the end of next March.

The other main branches of the health service are all expected to cost slightly more than in 1953-54, the higher gross cost being partly offset by corresponding increases in patients' payments. After a sharp fall in the demand for dental treatment when the charges were first imposed, people are evidently beginning to return to the dentist's chair. But the most heartening feature of the estimates is the virtual standstill that appears to have at last been achieved in the cost of the pharmaceutical service. It looks as if the Minister of Health's appeals to doctors to prescribe less expensive drugs wherever possible is expected to have some effect, although there are no signs of a falling off in the actual number of prescriptions dispensed.

Television Trouble

THE debate on the second reading of the Television Bill was irritable and irritating. Although Sir David Maxwell Fyfe wisely tried to damp down excitement by sheer legal ponderousness, and although Mr Herbert Morrison tried initially to do the same thing by chirpy good humour, both men managed to set discussion rolling along the wrong lines. Sir David laid great emphasis on the safeguards designed to prevent the Independent Television Authority from becoming a new BBC, and said that the authority would put on its own productions only when the private enterprise contractors were unable to provide certain types of programme or to ensure continuity of service. The Government will be making a great mistake if it continues to proclaim so loudly that it has no intention of moving in the direction of a second public service programme even if the finances of the present scheme prove unsound.

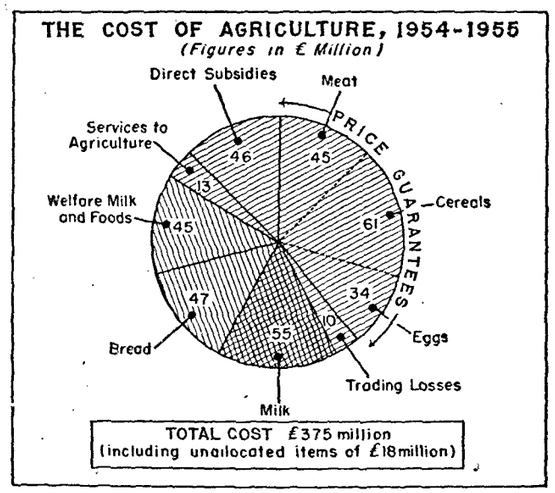
Mr Morrison finally lost his good humour—and his usually level head—when he accused the Assistant Postmaster-General of having "grossly misled the House" in his estimate that if "a second programme was provided now" by the BBC it would entail a licence fee of at least £5. Mr Gammans's figure was quite correct, since he was comparing like with like; Mr Morrison's alternative figures were based on the assumptions that a second programme would be brought in some time hence and that the number of licence-holders would increase rapidly in the meantime. One result of his muddling arithmetic is that some Labour backbenchers now honestly believe that the money paid by advertisers will somehow not save the licence-holder anything. Another result is that the Opposition as a whole is continuing to miss its great opportunity to sponsor the alternative which would be both effective and politically saleable. The ITA, as now proposed, provides an adequate framework for a second public corporation, *pari passu* with the BBC. If both were allowed to take advertisements, neither need be dependent on such revenue, but the licence fee could stay at £3. Labour still has a chance to put forward some such workable alternative, but it will need to shed its present fixation against advertising.

In the end the House divided on strictly party lines, although the Government supporters who first conceived the plan for commercial television did so with little enthusiasm. These Tory backbenchers' attitude is at least logical. They fear that the shackles now fastened to their infant may prevent it from learning to walk, and in committee they plan to unleash sundry amendments designed to set the programme contractors free. The Government has felt compelled to keep the committee stage on the floor of the House, so the critics will be able to muster their full strength. Some of the least tractable are threatening real trouble, but there is a saying among Tories these rebellious days: "Your constituency or your conscience." Whoever coined the phrase has so far proved an accurate if cynical judge of the pressures on this pressure group.

The Cost of Agriculture

ONE of the recurring difficulties in controversies over farm policy is that the contestants disagree not only about how much aid should be given to agriculture, but about how much is actually being given now. The Civil Estimates, published last week, put the total cost of agricultural and food subsidies in 1954-55 at £375 million; but this is before allowing for the £23 million that is expected to be saved as a result of the recent price review. Of this total of £375 million, £92 million represents consumer subsidies of a nutritional or welfare character; and a further £55 million (the general subsidy on milk) may be regarded as partly nutritional in its objective and partly a subsidy to producers.

The remaining categories allocated as shown in the chart represent various forms of aid to British agriculture. The services to agriculture include education and advice, losses incurred on the provision of machinery and labour at cheap



rates, pest control, and land drainage and flood services. Direct subsidies are given to reduce the cost of fertilisers and lime; to assist the ploughing up of grassland and the rearing of beef calves; to assist hill farming and marginal production; and to contribute to the cost of field drainage and water supply. The main price guarantees (apart from milk) relate to cereals, eggs, pigs and fatstock. The trading losses relate to residual operations of the Ministry of Food in relation to cereals, potatoes and eggs.

On the basis of these estimates (which are necessarily very tentative) the total cost of aid to British agriculture, as revised by the price review, can be put at £225 million (including half the milk subsidy). This is equivalent to just under one shilling on the income tax. For a variety of reasons—including the fact that the Government expects to make a profit of £108 million on sales from its stocks of de-controlled foods—these figures differ from the actual sums expected to be required for 1954-55 by the Ministries of Agriculture and Food.

Mr Stassen's Visit

THE communique issued after the brisk talks on east-west trade between Mr Stassen, M. Maurice Schumann and British government departments makes it plain that all three parties are agreed on the need for a revision of the strategic controls on goods exported to the Soviet bloc. The really difficult negotiations will come when individual items are discussed at the forthcoming talks in "Cocom" (the international committee that meets in Paris to co-ordinate the controls). Mr Thorneycroft has suggested in the House of Commons that these conversations may continue for two or three months.

Contrary to the general belief, the Americans are in fact very flexible in their attitude to east-west trade and the embargo system. As long ago as last February, before Sir Winston Churchill's famous statement, the US Administration had declared its belief in greater non-strategic trade with the Soviet bloc, and its desire to reappraise the system of controls. It would be a mistake, therefore, to assume that a reasonable compromise between the American and the British viewpoints is impossible; and much harm will be done to Anglo-American relations if the public is led to expect a drastic revision of the lists, which obviously the Americans (and possibly other allies) will find unacceptable on grounds of security. Moreover, those who suggest that Britain should "go it alone," if the Americans demur, ought to understand that they are proposing in fact to break down by unilateral action the valuable international mechanism of Cocom, and ultimately to abandon all vestige of strategic controls. There is no way of squaring this attitude with the wider, and generally accepted, policy of maintaining the security of the West through the North Atlantic Treaty Organisation.

It ought also to be understood that any relaxation of the embargo lists will not be measurable in terms of numbers of items struck off. The lists are complicated and highly selective, and a substantial revision might not be shown in a shortening of them, but rather in a reclassification of certain items. It would be unwise, moreover, to measure the revision against the numbers of Russian orders now held up that are ultimately allowed to pass; for the Russians made sure that they included in their shopping list a number of goods which, even in the most liberal interpretation, cannot be considered non-strategic.

Part
Comecon in Sight

THE Council of Mutual Economic Aid, better known as Comecon, held a two-day meeting last week in Moscow, attended by all the European members of the Soviet bloc, but not, it appears, by China. Thus Comecon, shrouded in secrecy almost since its foundation, comes back into a discreet limelight. Formed in January 1949 as a Soviet counter to the Marshall Plan, its task was to further the economic integration of the eastern bloc under Russian leadership, to co-ordinate the plans of the member countries, and to dovetail import and export quotas into those plans.

Comecon developed rapidly in the climate of the cold war, and on the eve of Stalin's death this agency of the Moscow *Gosplan* was supervising a vast and almost closed economy. But the new economic policy launched after Stalin's death, first in the Soviet Union and then in the satellites, has placed its tidy blueprints in jeopardy. The need to satisfy the consumer and the new emphasis on agricultural production must be a great strain on the available resources of the bloc. The chief purpose of last week's meeting was probably to co-ordinate the revised plans and to approve emergency trade programmes so as to prevent a collapse in production.

But there must have been a second topic on the Moscow agenda. By 1953 the flow of trade between what Stalin termed the "two world markets" had been reduced to a trickle and the members of Comecon were doing about three-quarters of their trade within the Soviet bloc. A certain resumption of trade with the West being part of the new Soviet economic policy, both the scale and the strategy of this operation were undoubtedly debated in Moscow. It was necessary to close the ranks and prepare a united front for the battles of Geneva and elsewhere. The meeting was a timely reminder to western optimists who expect ordinary trade to drive wedges between the Soviet Union and its European satellites; this is a weapon which, for obvious reasons, the other side can wield with greater vigour.

Cartel or Community?

THE export cartel organised by the steel producers of the European coal-steel community has until now lacked one vital characteristic of a full-blooded cartel. No attempt was made to assign to each member a fixed share of the export market. Apparently the cartel is now trying to make good this deficiency. According to a German economic journal, *Der Volkswirt,* discussions are taking place at the headquarters in Brussels, where the participants are wrangling over what base year to take for purposes of calculation, and over the export quotas themselves. The journal suggests that the final outcome may well be to reserve some 45-50 per cent of the steel export market for Belgium-Luxembourg, 30 per cent for France and 17-18 per cent for western Germany.

It is intended also to subdivide these national quotas as between the various firms. Still another restrictionist step contemplated by the members is to exclude from the steel export trade all those who were not already established and active before the war. Under the new arrangements the participants will be obliged to report not only the prices they charge but also the quantities sold. To administer the strengthened cartel it is claimed that a greatly enlarged apparatus will be required at the Brussels headquarters.

The immediate stimulus to this latest burst of activity was the rapid expansion of German steel exports which took place at the beginning of the year. Alarmed Belgian and French producers threatened that unless this initiative was checked, they would retaliate by competing in the German home market with a vengeance.

All of these developments bring the export cartel into direct conflict with the basic principles of the coal-steel

treaty and with the powers of the High Authority. There can no longer be the slightest ambiguity about the constitutional strength of the Authority's case against the cartel, since the treaty forbids all private agreements whose effect is to restrict or control production. M. Monnet has just departed for Washington, where he intends to conduct final negotiations for an American loan. On his return he will have to take up the challenge posed by the Brussels cartel if the community, as originally conceived, is to be preserved.

Pay Beneath the Plate

AGAINST the general background of wage increases a startling attempt is being made to reduce wages of "tippable" staff in licensed hotels and restaurants. When it first met in 1946 the Catering Wages Board took no account of tips in fixing minimum wages; it even assumed its recommendation might cause tipping to dwindle or even to stop in these establishments. But customers were not so brave or so brazen as it assumed. Two years ago, therefore, the Board started to consider the question afresh; it left "tippable" staff out of last year's wage increase. After long deliberation, it has now proposed that employers should, if they wish, reduce wages by £1 for men and by 10s. to 15s. for women, subject to the guarantee that if tips bring in less than the amounts they will make up wages to the existing minimum.

This is an attempt to swing an axe in a jungle. Examples still come to light from time to time of London restaurants where the cloakroom attendant is unpaid or is actually paying the management: and over the trade as a whole the average tippable employee would still, after the proposed cuts, be taking home considerably more than the minimum wage. The employers wanted the cut to be bigger for some classes of restaurant. The union representatives on the board opposed any reduction, but were outvoted when the independent members of the board sided with the employers.

The proposals have now to be printed, and 28 days are allowed for objections. Then, amended or not, they are submitted to the Minister of Labour. If he approves them, the workers will hardly be in a position to go on strike, for, except perhaps in Birmingham, they are not well organised. Moreover, some employers might not take advantage of the proposal immediately, for waiters are in a strong position during the summer months. The Catering Wages Board is, of course, really trying to correct a mistake it made in 1946; but it is—to say the least—a correction of an unusual sort.

Tories on the Screen

THE Conservative party's political programme on television last week was a deliberate contrast to Labour's the week before. While Labour's programme had been callowly devised but had carried a final and successful

emotional kick, the Conservative's was cunning but soporific. Mr Anthony Eden sat in his armchair while a drawing-room full of Conservative MPs and candidates—with accents carefully chosen to show that the party covered Scotland and Wales as well as England, and was also really very democratic—relayed to him questions that had been asked by their constituents. The cunning of the programme lay in the choice of the questions; they were the favourite questions that the Labour party has recently laid up for use by its own hecklers at electoral meetings, and were asked here in a flat way so that televiewers may henceforward regard them as bearded rather than barbed. Was Mr Eden aware that although the index said the cost of living had been stable for a year, the household bills of Mrs Somebody from Somewhere (a Welsh plasterer's wife with three children) just did not bear this out? Was it Tory policy to resist wage demands in order to keep British exports competitive? Did Mr Eden know that farmers were worried? Did he know that in one rat-infested slum in Glasgow eighteen people were sharing one toilet?

These, Mr Eden indicated, were precisely the sorts of question that were weighing on the government's mind; that was why it was pushing ahead with its slum-clearance programme, deficiency payments to farmers, and efforts to keep the cost of living as still as possible. In this it needed public support, as also in the all-important task of maintaining world peace; and on this—as peace was nearest to his heart—Mr Eden would like to say a few earnest final words himself. After these earnest words, which consisted largely—as in the speech of another Anthony—of declaring that opposition Brutuses were also honourable men, the programme came to an end. It is doubtful if any Labour or marginal voter can have been converted by it; but the object was clearly emollience rather than conversion. On this evidence, the Conservatives' basic electoral strategy is to make opposition histrionics look cheap and irresponsible stuff, and to tone down the political perspective to something approaching Mr Eden's own icy calm.

Battle of Kidbrooke

THE London County Council is to renew the battle over the Minister of Education's refusal to make the way easy for the new Kidbrooke Comprehensive School by sanctioning the closing of its established rival, Eltham Hill Girls' Grammar School. Its Education Committee has decided to send a deputation to the Ministry; and on Tuesday Mr. I. J. Hayward, leader of the Council, suggested that the support of the Association of Education Committees should be invoked. It is to be hoped that the Association will not be unwise enough to enter this highly political arena, even if its leading spokesman considers that the Minister interfered unjustifiably with a local authority's autonomy. There are already far too many political and far too few educational interests under dispute.

Miss Horsbrugh made her position plain in answer to Parliamentary questions last week. While she is no advocate of comprehensive schools, she has permitted a large number of schemes to go forward. There are 12 comprehensive schools already in existence in Britain; and by last December 36 proposals for further comprehensive schools had been received, of which 32 had been approved and 25 had been included in approved building programmes. Since Miss Horsbrugh came to office building approval has been given to more than 15 comprehensive schools in the LCC's province alone. This does not indicate any virulent attack on the LCC's programme, and is indeed in direct contrast to the tenor of its reproaches. It was merely bad luck that Kidbrooke, the first school to be completed, was one of the three or four which was planned to tie in with the closure of an existing grammar school.

Because the Minister regards comprehensive schools as experimental, she has said that she prefers them to be built in such a way that they can be organised later as separate schools, if this should prove desirable. This will not suit the books of those who want these schools to be committed beyond recall. To others it will seem commonsense—provided the chances of the success of the experiment in comprehensive education are not diminished by the alterations in design.

Investment in Council Houses?

A LONDON property investment syndicate is seeking to buy whole council housing estates, and is reported to have "a definite £2 to £3 million to spend, with possibly as much again if the scheme requires it." A Mr Goodman, of the firm of estate agents acting for the syndicate, has claimed that a net profit of not less than 6 per cent could be drawn from the investment with more efficient management; and that this could be earned after actually reducing rents and giving tenants the protection of the Rent Restriction Act, which at present they do not get. What, he asked, do most local councillors know about housing management?

This argument seems very tempting, and the arithmetic underlying it deserves close examination. Unfortunately that arithmetic is difficult to understand. Mr Goodman is reported to have said that a house bought at £1,200 might be let at 26s. instead of the 30s.-35s. that many councils are charging. Even without any allowance for management costs, that would not amount to 6 per cent; and most rents would therefore presumably have to bear a higher proportion to the purchase price than this. Mr Goodman also did not seem to have considered that some houses of this kind are let for as little as 12s. a week. What would happen to tenants whose rents have been adjusted to their means?

Any scheme to sell a council estate would have to be approved by the Ministry of Housing. So far no council has submitted such a scheme, although one or two have got to the point of discussing it with the agents. At present local authorities have power to sell council houses singly to their sitting tenants. They can sell prewar houses at twenty times the annual rent, and postwar houses at a price that covers the actual cost of construction. But a relevant circular expressly stated that "there is, of course, no question of selling or leasing houses to individuals or organisations for investment or speculation." In the House of Commons recently the Parliamentary Secretary to the Minister of Housing said that to gain ministerial approval the conditions of that circular would have to be observed. The chances that this novel take-over bid will succeed seem remote.

Letters to the Editor

Horizontal Weather

SIR—I notice that in your issue of March 27th you describe my proposal to allow firms to choose their own rates of depreciation on equipment as "administratively difficult" and "indiscriminate and expensive." You cannot prove that it would be expensive and I cannot prove that it would not be. But I suggest that it would be very inexpensive—much less expensive than initial allowances. In respect of the vast mass of routine outlay most firms would be likely to carry on with existing procedures; it is only the progressive, quickly moving firms, experimenting with new methods, that would opt for high depreciation rates. Remember that a price would have to be paid by a firm for this privilege, namely carrying the high depreciation rate in its own profit and loss account. The former types of outlay surely weigh much more heavily than the latter in the total of tax payments.

By like reasoning it is the initial allowance method, not my method, that is "indiscriminate." The former brings in some windfall cash to all firms, whether they need it or not. My method would only bring cash to a select number, namely to those who gave evidence that they needed it by being prepared to make a temporary sacrifice of profit in order to get it.

All reforms entail initial "administrative difficulty." But after the first impact my method would yield a great administrative saving. Think of all the arguments and correspondence between firms and the Inland Revenue about appropriate rates of depreciation that would come to an end. And think of the vast saving of clerical and accountancy labour in firms that could go over to one set of accounts, instead of having to keep two, as at present, one for the Inland Revenue and one for their published balance sheet.—Yours faithfully,

Holt, Norfolk ROY HARROD

★

SIR—In your leading article of March 27th you state that a policy of increasing the basic wear and tear allowances, i.e. shortening the assumed life of capital assets, "would be far more effective" than an increase in the initial allowances "as a stimulus to investment."

Why should this be so? For any given reduction in tax receipts, one would have thought that a system which links additional allowances directly to capital formation would be a better stimulus than one which grants them willy-nilly. You state earlier in the article that companies are not currently short of liquid funds. Nor is it easy to see why the "accelerated depreciation" you propose could more readily be made selective. Moreover, the operation of the balancing allowances system, another device closely linked to physical capital formation, means that in general the existing standard rates for wear and tear allowances do not imply a fixed life but only a maximum one for any particular capital asset.

Or is your argument that there are advantages in spreading the benefits of accelerated depreciation over a period of a few years rather than bunching them into the first year, as the initial allowance system implies? If so, should they not be weighed against the above points?—Yours faithfully,

A. R. PREST

Christ's College, Cambridge

Nato and Enosis

SIR—To your statement that "The four Nato members with interest in the Eastern Mediterranean—Britain, Greece, Turkey, United States—would do better to concert their attitude to sovereignty in Cyprus round a table than to argue it out before the Assembly of the United Nations" I want to add that the English must not think that Greeks are like the Egyptians or the Spaniards. We like the English and we respect them, and we do not want to throw them out of Cyprus; we just want the Cypriots to become Greeks.

If the Greek Government has permitted the United States Army to have base facilities in Greece on one occasion, then the English have the right to be there ten times more than the Americans, because events and circumstances of the past have strengthened our friendship much more. So, even if Cyprus becomes Greek the English can still have their own bases in Cyprus.—Yours faithfully,

BASIL PAPACHRISTOPOULOS

East Horsley, Surrey

Teachers' Pensions

SIR—As an actuary born of school-teaching parents I feel you are too harsh in your comments on the teachers. The teachers' scheme, set up by the Act, made no provision for the funding of the scheme. All that is done is that periodically the Government Actuary goes through a series of actuarial gymnastics to find out what would have been the liability if the scheme had been funded and whether the level of contributions will be sufficient in the future. There is no separate fund into which all receipts are paid and from which all pensions are drawn—all pensions and payments come out of or go into the Exchequer and so their identity is not preserved. Furthermore, retired teachers do not enjoy their pensions as of right, as members of a normal contributory pension scheme do. If a teacher takes up his profession temporarily again, as so many of them did to ease the postwar shortage, his pension is stopped to teach him a lesson. Consequently, it is arguable whether it is fair to apply cold actuarial logic to the teachers' scheme.

Even if it is granted that actuarial considerations do apply, it is a debatable point of actuarial equity whether or not the past generation's sin of having taught through an inflation should be visited on the next generation by making it pay a 6 per cent contribution.

Looking at the pension arrangements of other kindred professions, teachers feel that the comparative level of contributions in their scheme is weighted against them. Under the Federated Superannuation System for Universities, the employers pay 10 per cent and the employees 5 per cent. Under the Health Service Scheme the respective contributions are 8 per cent and 6 per cent, while under the Civil Service Pension Scheme the Government, or rather the taxpayer, bears the whole cost. It may be argued that the existence of a non-contributory pension scheme is taken into account in fixing the level of Civil Service salaries; but when inflation lifted these, did the Government Actuary go through the motions of valuing a notional Civil Service Pension Fund, and, finding it in a parlous financial state, recommend that the Civil Servants' (notional) personal contribution should be increased from *x* per cent to *y* per cent? I doubt it!—Yours faithfully, F. F. A.

Television Aunt

SIR—In your article of March 13th you write "The ITA is also to have stern powers to . . . enforce competition between the programme contractors, and to ensure that they do not annoy the actors' trade unions by using too many American films." This is surely a curious way to put it: as if this was only a matter of conciliating a trade union pressure group defending restrictive practices. Perhaps this is indeed all that the Government is concerned with: for in its zeal for commercialisation it has not shown conspicuous interest in either the educational possibilities of TV or its catering for any but majority tastes. But it is surprising to find *The Economist* indifferent to the disadvantages of having British screens dominated by American films. These will have recovered their costs in America and in general our producers, unprotected, cannot hope to compete with them. Furthermore they will cost dollars which we cannot afford. But this is stale stuff, which you would never forget in dealing with the problems of Canadian broadcasting or of the British film industry; and when it was not a matter a matter of digging at auntie BBC!—Yours faithfully,

ANTONY FLEW

Germany Through the Looking Glass

GERMAN HISTORY: SOME NEW GERMAN VIEWS.
Edited by Hans Kohn.
Allen and Unwin. 224 pages. 18s.

A NATION'S history is the mirror in which it recognises its identity, and to study the view that a nation takes of its own history is the surest way to discover its aspirations and its illusions. Since the overthrow of the Third Reich there has been a revolt, on the part of a number of German historians at least, against the orthodox view of German history as it has been taught in German universities and schools since the days of Treitschke and Sybel. Professor Hans Kohn, of the City College of New York, has taken the trouble to collect eleven examples of this German attempt to revalue the course of German history and to introduce them with a couple of essays of his own.

It is a matter for regret that in choosing his examples Dr Kohn has only represented one side of the debate and has not included any illustration of the arguments advanced on the other side. The result is an incomplete picture of German historical thought as it has developed since 1945, and unless this is clearly understood, the impression left on the reader may be misleading. For, as Dr Kohn recognises in his introduction, other historians, including some of the most eminent, have been more concerned to justify than to criticise the traditional view. The revival of German power may well give them the advantage over their critics.

Perhaps the most interesting, certainly one of the most radical, of the essays Dr Kohn has chosen is by a young Swiss historian, Walter Hofer, who has been teaching in the Free University of Berlin since 1950. Dr Hofer sees very clearly that it is a revision of values that is needed rather than of facts, and he selects three grounds of criticism of the accepted version of German history with which most of the other contributors are in agreement. The first is the exaltation of power, of the *Machtstaat*; the second, the glorification of war; the third, the erection of nationalism into an absolute value. To the non-German reader these criticisms may well appear too obvious to be worth discussion, but this is to underestimate the degree to which such ideas have been, and still are, natural assumptions for many German historians. Dr Hofer argues his case forcefully and is ably seconded by another young German historian, J. A. von Rantzau, of the University of Hamburg. Moreover, Hofer develops a second line of thought which leads to the heart of the problem.

It is altogether too easy, he points out, to say that Germany has been on the wrong track ever since the time of Frederick the Great. "What was represented as a fascinating rise, willed by historic destiny, now appears as a frightful fall, equally the work of destiny." In either case, the emphasis is on a destiny, once glorious, now tragic, which relieves the individual German of responsibility. In particular, the belief that historical destiny has treated Germany and the Germans badly, by delaying their achievement of national unity and by placing them in an exposed geographical situation, has stimulated the feverish assertion of their rights in an effort to catch up with other, more favoured nations.

The remaining essays are of unequal value. All lay stress upon the divergence between German and Western political thinking from the time of Fichte and Hegel onwards; and most are critical of the egocentricity of much German historical writing, its indifference to other points of view, its ignorance of what was happening outside Germany's borders. Of the two essays which deal with Bismarck, the first, by the Munich historian, Franz Schnabel, puts the not very convincing case for the federal solution of Germany's political problem which Bismarck rejected in favour of the unified nation state; the second, a sharp attack on the Bismarck legend by Alfred von Martin, insists that the German people cannot evade their responsibility for their own history by making a scapegoat of Bismarck—or of Hitler. There were, writes Dr Martin, "other" Germans better and wiser than Bismarck, but there was no "other" Germany, for the truth is that they represented nothing but themselves.

At the end the reader is impressed by the honesty and courage of those who have attempted to revise the Germans' view of their own history. Their chances of success are more in doubt. Perhaps the best thing for the Germans would be, not to revise, but to forget their history, for once they begin to look in the mirror again they may find the attractions of the old image too tempting. The only historical tradition Germany has is the one that runs from Frederick the Great by way of Bismarck and the Kaiser to Adolf Hitler; the "might-have-beens" of German history do not add up to an alternative. If there is to be an alternative it will have to be sought in the future, not in the past.

The Keynesian Trotsky

TOWARDS THE RESCUE OF STERLING.
By R. G. Hawtrey.
Longmans. 159 pages. 12s. 6d.

PROFESSOR R. G. HAWTREY holds a unique and rather embarrassing place in the history of modern economic doctrine. He might be called the Trotsky of the Keynesian revolution. In the early inter-war years, when economists were still struggling towards the truth about effective demand, Mr Hawtrey got farther than anybody. He was putting the finishing touches to his own theoretical model of economic behaviour when Keynes came dashing past him—with a glibber pen, a greater gift for exposition, and a much greater willingness to turn back from any unprofitable avenue of approach in order to go careering down a new one. Mr Hawtrey has gone on tending his own rather difficult and abstruse model just the same. The result is that while some economists of the younger generation may regard him as that very learned old man who writes all those odd books, those of maturer mind regard him with a respect that is much more flattering than mere reverence. And future chroniclers of the history of economic thought will also accord Mr Hawtrey a higher place than he is likely to attain on the best seller lists today.

There are two idiosyncrasies of the Hawtrey approach. He lays great emphasis on a correlation between excess spending and an excess supply of money, instead of relating potential demand from current incomes to the availability of current resources; and he labours the point that businesses nearly always hold more stocks than are strictly necessary, so that total spending can be sharply cut back when businessmen are suddenly induced by an increase in interest rates to swing over to stock economies. The latter point stands up very well in this review of economic developments between 1945 and the end of 1953. Mr Hawtrey would, of course, have resorted to a dearer money policy after 1945 much more swiftly than the authorities (and perhaps even than Keynes himself) would have done; and he would quite certainly have been right. It is possible that Mr Hawtrey still underestimates the extent to which the value of a dearer money policy today depends upon its effect in making lenders less willing to lend rather than in making borrowers less eager to borrow; but this is merely tantamount to saying that his model works better than he credits.

Unfortunately the other Hawtrey idiosyncrasy—the emphasis on an excess supply of money—makes this account of recent economic developments very difficult to understand. It leads to gross under-emphasis of the role of the budget in disinflationary policy since the war, and Mr Hawtrey's predisposition to relate the appropriate level of exchange rates to the internal supply of money convinces him that the devaluation of 1949 was a great mistake. In fact, he believes that sterling is still undervalued now and would like to see the exchange rate set free to rise. For the same "quantity of money" considerations he is obviously out of sympathy with the reflationary policy that has been followed in the past year and a half; the reduction in Bank rate last September leaves him bewildered. Strangely, too, in a book that flies the word sterling in its title, Mr Hawtrey pays less attention than one would expect to developments in the overseas sterling area since the war, and disregards the fact that developments there, much more than in Britain itself, have been responsible for bumping the currency along from crisis to crisis since the war. One is left with the impression that for a single currency area, ruled by a single government and with a perpetual political tendency towards inflation, the Hawtrey dialectic is intelligible and the Hawtrey prescription commendable; but that for the sterling area of today, striving to strike a balance across four continents between excessive demand and a wastage of resources, the dialectic is too complicated and the prescription of tougher and tougher money too simple to rescue sterling from what is temporarily a fairly mild distress.

Background of Indo-China

HISTOIRE D'UNE PAIX MANQUEE.
By Jean Sainteny.
Amiot-Dumonte. Paris. 260 pages. 19s.

A REAL contribution to an understanding of the situation in Indo-China is more than ever valuable now that the country is likely to be in the centre of international preoccupation in the near future. The development of hostilities and the emergence of Communist China as the main backing for the Viet-Minh have tended to push into the background the events that led up to the outbreak of the campaign. M. Sainteny, who was in charge of the French military mission in South China before the Japanese defeat and who was the leader of the first team of Frenchmen to return to Tonkin, later acquiring the status of Commissioner of the republic there, is in as good a position as anyone to explain the course of events; his testimony, supported by documents, has a ring of sincerity that makes it appealing provided, of course, one admits his principal thesis: that France had genuine interests in Indo-China and that if things had gone differently it might have been possible to maintain them without bloodshed.

M. Sainteny traces what went wrong largely to external factors. First of all the Japanese, having destroyed the Vichy governmental machine, did their best to start up Annamite nationalism against the French. More important was the determination, as he sees it, of the Americans responsible for Far Eastern policy, owing to what he calls their "*anti-colonialisme enfantin*," to keep the French out of Indo-China. He believes that the decision to have northern Indo-China occupied by Chinese troops was partly due to this, and partly intended as a recompense to China for the concessions it was forced to make to Russia at Yalta. He gives a lurid picture of the activities of Chiang Kai-shek's armies in northern Indo-China and makes it plain that their connivance helped the Indo-Chinese nationalists to arm themselves. All this time while the French position was being undermined by France's allies as well as enemies (he points out the very different and steadily helpful conduct of the British in Cochin-China) the French themselves were preoccupied with matters nearer home and French governments continued their usual habit of collapsing at every critical moment in the story. M. Sainteny believes indeed that at this early period Ho Chi Minh was prepared for an intermediate regime of relative independence within the framework of the French Union, and that the French Left, by encouraging the more extreme Annamites, and the French Right, by insisting on intransigence, helped to destroy any possibility of a peaceful solution on these lines.

It would, of course, be wrong to use this picture of events at that time as an indication of what may happen in Indo-China in the near future. It is clear, however, that the roots of Annamite nationalism and its Communist leanings were well established long before Chinese Communism reached down to the Indo-Chinese border and that Ho Chi Minh cannot necessarily be treated as anyone's puppet. It is equally true, however, that mere anti-colonialism, the belief that any population is capable of self-government without external aid and support, and that all one has to do is to give in to the "wave of the future" represents an evasion. M. Sainteny's story is deeply human in his picture of the sufferings undergone by the French population of Indo-China and of the losses suffered by the indigenous population when such things as the irrigation works set up by the French were neglected. Whichever way one looks at it it is not a pretty story.

Tranquil Mind

HALF A LIFE:
Count Constantine Benckendorff.
Richards Press. 319 pages. 25s.

THE author of this volume of memoirs is the son of Count Alexander Benckendorff, who was the Ambassador of Imperial Russia in Britain from 1900 until the February Revolution of 1917, and one of the most enlightened and distinguished figures of the old regime. His son joined the rapidly expanding Russian Navy in 1899, and served in the Russo-Japanese War, being taken prisoner by the Japanese at the surrender of the Port Arthur garrison. During the next years he lived largely on his family's country estate in Tambov province, and took an active part in local government, in the county *zemstvo* his liberal inclinations bringing him into conflict with the very conservative provincial governor.

Ernest Benn

Recalled to the Navy in the First World War, he served most of the time in Archangel or Murmansk. In 1917 he was a Liaison Officer with Allied Missions at the Army GHQ in Mohilev, until demobilised after the Peace of Brest-Litovsk. The year 1918 he spent partly in Moscow, partly in the country at or near his family estate, now divided among the peasants. Bolshevik rule made remarkably little impact on him, though he had a few disagreeable brushes with the Cheka and some experience of prison life. In the spring of 1919 he was called up to serve in the Red Navy. He worked for a time in the General Staff in Moscow, and also went on official missions to the then independent republics of Esthonia and Georgia. In the second, he was accosted by one of his cousins, who was in Tiflis as an emissary of General Wrangel, the White leader, who put to him proposals for common military action by Wrangel and the Bolsheviks against the Polish forces of Pilsudski, who were then invading Russia. The author transmitted the proposals to his Bolshevik chiefs, but it is hardly surprising that nothing came of them. The following two years were spent in alternating periods of General Staff service and prison. In 1922 he left the Navy, and became for a time a professional flautist, was allowed to visit his mother in London in 1923 and finally left the Soviet Union with his wife in 1924, at which point the book ends.

The prevailing impression of this book is tranquillity. The author lived through fantastically troubled times, but he survived them without a trace of bitterness. He describes his experiences with an enlightened and mildly humorous detachment. One is accustomed to think of the Russian Revolution as a cataclysm in which everything was on a vast scale—the shame and the glory, the heroism and the meanness. But Count Benckendorff's story shows how ordinary life went on in spite of everything. Perhaps the most striking part of the book is that dealing with his life in the country, partly in his own house and partly as a guest of a neighbouring family of former landowners, during the stormy year 1918. The Russian peasants who emerge from his recollections have little in common with the savage brutes, fit only to be chastised by the whips of Tsars or the scorpions of Commissars, imagined by writers of the extreme left or right. Count Benckendorff expresses his

> conviction that the Russian peasantry, far from being a mass of ignorant, backward, recently liberated slaves, are a highly intelligent, politically conscious and independent community, entirely capable of looking after their own country both in internal and external affairs, and therefore the determining factor in the present and future of their country.

This modest, intelligent and humane book throws light on one important and much neglected aspect of twentieth century Russia.

Bicentenarian

THE ROYAL SOCIETY OF ARTS, 1754-1954.
By D. Hudson and K. W. Luckhurst.
John Murray. 429 pages. 30s.

TO mark the occasion of the bicentenary of the foundation of the Royal Society of Arts, Mr Hudson and the society's secretary, Mr Luckhurst, have written a history of its achievements. This was obviously no easy task, for the outstanding impression this book leaves is of the astonishing diversity of interests of this distinguished society, much wider indeed than the shortened name by which it is known today would suggest. When it was born two hundred years ago at a meeting of a handful of men in a London coffee-house, it was christened "The Society for the Encouragement of Arts, Manufactures and Commerce," Royal being added in 1908. It has remained true to this liberal conception ever since.

But, while the aims of this society have been steadfast, its means of achieving them have changed. The society launched itself by offering prizes, prizes to stimulate agriculture, drawing, textiles, mechanics, mineral production—in fact, almost anything — and this system prospered for nearly a century. Today it has become mainly a paper-reading society and a valuable examining body in a wide range of subjects. But what a lot of pies this society has had its fingers in since the days when Dr Johnson gave it his blessing. Some slight idea of this is evident from the differing aspects in which it is probably best known to the public—for its sponsoring of exhibitions and, in particular, the Great Exhibition of 1851, and for the plaques which it mounted on the homes of famous people. But this book gives some fascinating sidelights on the society's many ventures, large and small. Who would have thought that it needed such distinguished patronage to encourage the production of medicinal rhubarb in this country, and that to do so a box of seeds had to be smuggled out of China through the help of the Russian medical service in Asia? Or that such a society would try to promote opium-growing here? And what enterprise it showed in erecting a three-storey building solely for the purpose of setting fire to it to test a fire-extinguisher and when, in its persistent fight against industrial accidents, it sponsored an apparatus for cleaning chimneys to avoid the use of climbing boys. Of course it had several unsuccessful ventures; among these was the opening in 1852 of the first public lavatories in London which met with a complete lack of appreciation.

All this provides interesting social history and the two authors have successfully blended their contributions into a whole which generally makes bright reading, although it occasionally lapses into a rather dull catalogue of events. There is perhaps a tendency to claim too much for the society, and the authors' pens are certainly not critical. But, although this book does not supplant the earlier work of Sir Henry Trueman Wood, it is a colourful addition to it. And it is refreshing to realise that in this age of specialisation, a society like this with almost universal interests, is thriving in its elegant Adam home in the Adelphi.

The Poincaré Franc

SOUVENIRS D'UN GOUVERNEUR DE LA BANQUE DE FRANCE.
By Emile Moreau.
Librairie de Médicis, Paris. 990 francs. 639 pages.

HAVING headed the Banque de l'Algerie for twenty years, Emile Moreau accepted reluctantly the request of M. Caillaux to assume the governorship of the Banque de France at a time when many feared lest the franc repeat the spectacular fall of the German mark. Every evening, from his appointment on June 24, 1926, until stabilisation came at the end of June two years later, he recorded his observations on the day's happenings, thus writing a blow-by-blow account of the fight for the franc. Yet this is not a tract for the times enabling the present arbiters of French monetary and economic policy to go and do likewise. Jacques Rueff, who was himself directly concerned at the time in assessing the optimum level for stabilisation, points this out in his excellent preface, while hoping that the example set by MM. Poincaré and Moreau will serve to inspire and guide those who tomorrow "*devront rendre à la France une monnaie.*"

Poincaré's prestige, and the technical skill of M. Moreau and his colleagues at the Banque de France, doubled the international value of the franc between July and December, 1926, and it was held at that level for the next eighteen months without resort to exchange control or other forms of compulsion. In the final stages M. Moreau had to threaten resignation to compel Poincaré to assume full responsibility and lead the attack in the Chambre des Députés for immediate *de jure* stabilisation against the supporters of revalorisation at the prewar parity, among whom M. Moreau himself had once been numbered.

Apart from its main story, the book contains a most interesting account of the continual struggle with the late Lord Norman, whom M. Moreau sees as the head of a conspiracy to use the League of Nations Finance Committee, and the British-sponsored stabilisation mechanism for the smaller European countries, to ensure financial control of all Europe for London and New York. M. Moreau also examines his relations with Dr Schacht and the Reichsbank, with Governor Strong and the Federal Reserve Bank, and indeed with most of the outstanding financial and political personalities of the day, few of whom he spares in his frank comments.

As a final testimony, appendices show the weekly returns of the Banque de France when M. Moreau became Governor and at the time of stabilisation. Six thousand million francs of gold and

Is money spent on advertising money well spent?

This largely depends on *where* it is spent as wastage can and does result from an unenlightened choice of publications in which the advertisement appears.

If your product sells to women with a specific and concentrated interest in their homes and families your problem is quite simple. GOOD HOUSEKEEPING is your obvious choice—the only magazine supported by the GOOD HOUSEKEEPING INSTITUTE—the famous authority on homes and homecraft.

GOOD HOUSEKEEPING is in fact as much a specialist magazine for the home as a yachting journal would be to a yachtsman, or a gardening paper to the enthusiastic gardener. Always remember this when planning advertising campaigns.

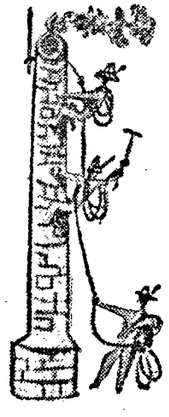
The Schweppshire Way of Life

2. SWEATED LEISURE

"It is in the do of doing that the use of useless lies . . ." And for those who choose the descending moving staircase as their path in the race up the ladder of life, this dictum of our Exischweppsialist Philosophy will be self-evident. Cora Punt, at the age of eight, was able to recite page 72 of Bradshaw's Railway Guide backwards, and engrave the first twelve stanzas of *Don Juan* on a single piece of bread and butter. See, here, the difficult yet pointless Plinge-plonge, or Underwater Ping-pong. Though they lost their singles against the Latvians, our boys' party won a game in the doubles and show real promise at this testing sport.



INSET. "Technically an interesting climb", said Major Colwyn-Bates, first up the difficult smoke-stack of this famous north country boiler factory. Air Marshal Plank, who organized the climb, told how the brickwork, though the smoke-stack was rotted with the fumes of typical smoke, offered scant foothold. "But the Schwerpas were splendid", he added, and all agreed that up to Ventilator 4, nobody could possibly have done without them.

Written by Stephen Potter, designed by Lewitt-Him.

Prices and the Public

THE ECONOMICS OF RESALE PRICE MAINTENANCE
By B. S. Yamey.
Pitman. 191 pages. 25s.

MR YAMEY'S book is full of wise saws and modern instances. The attempt to eliminate price competition in the distributive trades arose with the promotion of branded merchandise towards the end of the last century, and Mr Yamey has examined its history in the pages of the trade journals. He concludes (is this an exaggeration attributable to a bias in his material?) that price maintenance has generally been the result of organised groups of distributors wringing concessions from reluctant or tardy or indifferent manufacturers. In this connection, he pertinently criticises the Lloyd Jacob Report for its careless and misleading interpretation of the history of the confectionery trade and for supposing that cut-price retailers (in the interwar period) were injuring the sales of the better known brands of the leading manufacturers of chocolate by using them as "loss-leaders," that is to lure people into their shops to buy other products on which they were making a large profit. On the contrary, argues Mr Yamey,

> manufacturers usually treated price-cutters as good customers who reduced the margins on their goods, displayed them effectively in well-stocked and well-equipped shops, bought in large quantities and sold them at a rapid rate of turnover in fresh condition.

He therefore considers that even the qualified approval given by the Lloyd Jacob Committee to resale price maintenance was based on ambiguities and a misinterpretation of history. Mr Yamey strikes a final blow at the traditional "loss-leader" argument by pointing out that the "aggressive" retailers who cut prices (and against whom the unaggressive distributors desire protection) are normally outlets which sell all their merchandise cheap and that this is very often the legitimate outcome, welcomed by consumers, of economies of large-scale buying and low selling costs.

Price maintenance is a live political issue wherever it is practised. Mr Yamey refers to the recent legislation in North America and to the British White Paper and a main purpose of his study is to analyse the effects of price maintenance and to speculate on the changes which are likely to take place if price maintenance is abolished. He concludes that the result of abolishing resale price maintenance would be an intensification of price competition and of other competitive activities; he refers to recent experience in Canada and, earlier, in South Africa and to the behaviour of prices in countries where there is relatively little price maintenance, to support the view that this competition would not become destructive. Firmly established and popular brands would become more firmly entrenched than ever and the tendency towards concentration in both industry and trade would probably increase where firms had used price maintenance as a competitive device to attract the smaller retailers and had inadequate reserves for financing advertising campaigns. Abolition would favour vertical integration where it led to the growth of larger distributive firms whose concentrated buying power and ability to go into production threatened the cohesion of the group suppliers. Margins would be diminished, yet net profit, for distribution as a whole, would probably remain much the same.

This is an interesting and stimulating book on a topic of immediate importance and Mr Yamey shows considerable courage. In spite of a certain analytical weakness, the force with which he states his conclusions should recommend the book to all who have the public interest at heart. "The important factors explaining the growth of firms and the success of new types of retailing enterprise have generally included the effective use of the appeal of lower prices or of savings to the consumer." In brief, resale price maintenance retards technical advance.

Economics North of the Border

SCOTTISH JOURNAL OF POLITICAL ECONOMY. *The Journal of the Scottish Economic Society.*
Edinburgh: *Oliver and Boyd.* 101 pages. 7s. 6d.

THE resurrection, under a new name and with a revised constitution, of the long-quiescent Scottish Society of Economists, is a piece of nationalism that deserves an international welcome. The new Scottish Economic Society proposes, while not entirely neglecting theory, to hark back from economics to political economy in "the tradition inspired by Adam Smith"; to "encourage the discussion of Scottish economic and social problems"; to arrange the publication of reprints of Scottish economic classics and other appropriate works; and to produce, twice yearly, an economic periodical which its editor, Professor Cairncross, indicates will have a principal but not exclusive Scottish angle.

The contents of the first issue of this periodical strike, in fact, a neat balance between the regional and the universal. The first two articles are editorial, respectively a manifesto of the new society and a historical note on its forerunner. The third is a factual and statistical study of labour turnover in shipbuilding—which happens to be a predominantly Scottish industry, but whose problems in this particular field are constructive for other countries. An account of the founding, in 1873, of the Glasgow Chamber of Commerce is followed by a general treatment of the stability of membership in trade unions. What looks like the most narrowly and specifically regional article in the bill of contents, on "Transport Costs in the North of Scotland," turns out to be as generally salutary a dissection of the "postalisation" principle as one could wish to push under an English planner's nose. Some useful comparative notes on "Recent Economic Trends" round off this promising first number. The *Journal* should, on this showing, succeed in its aim of appealing "to an educated, but not—or not exclusively—to a professional audience."

Managing Trees

WOODLAND MANAGEMENT.
By W. E. Hiley.
Faber and Faber. 463 pages. 63s.

MR HILEY'S book is likely to appeal to a much wider public than its title implies, for it shows a deep and penetrating understanding of the current problems on private estates and of national policy. In view of his own academic training it is surprising that he should condemn such training for not providing ready-made answers to the day-to-day problems of management—an art which surely comes from experience. Although much of the book is concerned with the routine and the technical, it possesses the distinctive feature among comparable works of giving great prominence to economic criteria. Much of the evidence and reasoning is concerned with the significance of land, labour, materials and time in the assessment of profit. The very substantial tax concessions to woodland owners get due consideration. After reviewing the economic conditions of the recent past the author takes a reasonably optimistic view about the future of investments in forestry.

As the main purpose of the book is to assist the active manager of woodlands it appears to provide a closer appreciation of his problems than is provided by the usual text books. Some of the proposals are undoubtedly controversial. It sets out to take the relatively inexperienced by the hand and to lead them through the maze of problems they are certain to encounter. At the same time, the systematic approach gives Mr Hiley an opportunity of offering some weighty criticisms of the traditional practices and against the policy, or lack of policy, associated with the industry in the not too distant past. German practice; for example, has had too great an influence when Danish and South African innovations might be more appropriate.

One of the book's many merits is that it brings together for handy reference considerable data and information on a variety of subjects such as choice of species, taxation, legal restrictions, and Government assistance. The numerous tables, photographs, and diagrams are well chosen to illustrate points in the text. All those concerned with the management of woodlands will find in this book much to stimulate their interest. It will also help to clarify their ideas about the potential contribution which forestry can make to the national economy.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

McCarthy and the Constitution

Washington, D.C.

ALTHOUGH there is now a pause for the fixing of "ground rules" before the grand confrontation can take place between Senator McCarthy and the representatives of the Army, the tension in Washington has hardly relaxed. Commentators, having for the time being exhausted the possibilities of round-by-round, blow-by-blow analyses of the struggle so far, are turning to the constitutional aspects of the crisis. While some papers hostile to the Senator, such as the *Baltimore Sun*, have taken foreign observers to task for demanding action from Mr Eisenhower without explaining just what, under the American system, Mr Eisenhower is in a position to do, more and more American leader-writers are calling for the President to take the initiative.

Nevertheless, quite apart from Mr Eisenhower's inexperience in politics, the task of keeping a Senator in order is not an easy one, particularly if he is a committee chairman. A Senator is, after all, one of the two representatives of a sovereign state ; there is something almost ambassadorial about him. This helps to explain the extremes of courtesy and mutual forbearance which members of the Senate normally display to one another and their great reluctance to discipline an errant colleague. Senators are elected for six years and, as Mr McCarthy was sent to Washington for a second term at the same time as Mr Eisenhower won the Presidency, he will not have to face the voters of Wisconsin until 1958.

According to senatorial custom the chairmanship of the Committee on Government Operations came to Senator McCarthy automatically as the result of his being in length of service the senior Republican member of the committee. This is one of the Senate's fifteen standing committees, whose functions were defined in the Legislative Reorganisation Act passed in 1946. One purpose of this measure was to ensure that Congress be equipped to understand the workings of the executive ; the federal government had become so complex that no Congressman could be expected to be familiar with all its problems and procedures. Committees were therefore streamlined, so that Senators and Representatives could specialise in the work of particular departments, permanent committee staffs were provided, and independent research facilities were made available. Seen from one angle, the present crisis is the first resounding clash between the new bureaucracy of the legislature, represented by Mr Cohn, the chief counsel of Senator McCarthy's committee, and the old bureaucracy of the executive, in the person of Mr Adams, the counsel for the Secretary of the Army.

The Committee on Government Operations is unlike the other committees in that besides several specific tasks—to receive and examine the reports of the Comptroller General, to study the relations of the federal government with states and cities and with international organisations, and to keep a watch on plans for reorganising government departments —it is given by law a broad mandate to "study the operation of government activities at all levels with a view to determining its economy and efficiency." For this purpose it appoints from its membership a Permanent Investigating Subcommittee, which employs ten full-time investigators and four other senior staff members. On becoming chairman of the main committee Mr McCarthy put himself in charge of the subcommittee, as he had every right to do. The result of course is that concentration on the Subcommittee has been almost complete—$214,000 was appropriated for its work this year against only $10,000 for the main committee.

The power to investigate has been described by Senator Fulbright, a Democrat who was the only Senator to vote against this year's appropriation for Mr McCarthy's committee, as "perhaps the most necessary of all the powers underlying the legislative function." Without it Congress would be dependent on the Administration for the information on which it bases new legislation and would be unable to use its powers over appropriations to insist that existing laws be fully executed. Dr Griswold, the dean of the Harvard Law School, has recently called for an end to the kind of investigation whose sole purpose is to develop evidence for use in criminal prosecutions. But thirty years ago many liberal lawyers, including Mr Felix Frankfurter, who is now a Justice of the Supreme Court, were most enthusiastic about this form of investigation when it resulted in the exposure of Teapot Dome and other scandals connected with the Harding regime. More recently, lesser but damaging instances of corruption and laxity in the lower ranks of Mr Truman's Administration were brought into the open by the investigating subcommittee even though it was under Democratic leadership.

★

What, therefore, can be done to curb Senator McCarthy ? Most people would agree with the President that the primary responsibility lies with the Senate, and more particularly with the Republican leadership there. Characteristically, Senator McCarthy's fellow-Republicans on the subcommittee were only finally stung into action against him by a piece of personal discourtesy on his part: he released his memorandum containing accusations against the Army without consulting them and then flew off to Wisconsin, cancelling a committee meeting fifteen minutes before it was due to begin. But once they started acting they soon showed that a chairman is not all-powerful.

The Republicans' future action in the Senate will no doubt be governed by the outcome of next week's encounter. They have, however, already been given an opportunity to display a will to reform by embracing proposals that have been introduced for safeguarding the rights of witnesses. One of these grants them the right of cross-examination which, now that the shoe is on the other foot, Senator McCarthy is so vociferously demanding for himself. Moreover, the dirty linen that will doubtless be washed in public may bring the Senate as a whole to realise that its negligence in failing to supervise its own committees has made it vulnerable to counter-attack by the executive branch.

It is at this point that a President who has retained his popularity can do a great deal to fortify the conscience of the Senate. As the party leader he can insist that his party officers give no aid and comfort to Senators who are abusing their positions. As chief executive he can give his subordinates confidence that he, and, just as important, all members of his White House staff, will stand by them if they resist unwarranted pressure. He can take the initiative by putting his full weight behind legislative proposals to relieve the situation—such as those advanced by a liberal Republican in the House of Representatives and by two Democrats in the Senate for transferring all investigations of subversive activities to a special Joint Committee of both Houses, with proper safeguards laid down. If the Senate continues to evade its responsibility he can call its bluff by ordering the departments not to co-operate with the offending subcommittee. If Senator McCarthy should want to cite any witness for contempt he would have to get approval on the floor of the Senate, against the express opposition of the President, and in the unlikely event of his succeeding he would then face a doubtful issue in the courts—and even the possibility of a presidential pardon in the event of conviction.

The American Constitution is written, but the exact relationship between Congress and Administration at any given time is unwritten. It depends on a combination of many temporary circumstances. One of the present circumstances is the immense national popularity of this President. If in a moment of crisis he does not choose to make use of it he does not leave things as they are. He shifts the contemporary balance of the Constitution—and in the wrong direction.

Rocky Road to Geneva

AMBASSADORS are queuing up to discover precisely what Mr Dulles had in mind when he spoke of the need for "united action" to save South-East Asia if it seemed likely to fall under Communist control. The Administration is evidently determined not to repeat the errors it considers were committed over China, when the stakes were never made clear to the American people, or over Korea, which Mr Acheson placed outside the range of America's strategic interests ; this, it is charged, was a virtual invitation to the Communist attack. Presumably Mr Dulles hopes to stabilise the situation, both in the Far East and France, until the American schemes for creating a more effective Vietnamese Army bear fruit. But if the Administration means what it seems to mean, that, if the worst comes to the worst, South-East Asia is worth a war, those Republicans who have been so fearful and so critical of a "soft" policy in the Far East have been given a harder answer than they expected.

The Republican leaders in Congress have been profoundly suspicious that at Geneva Mr Dulles would be led to trade recognition of Communist China and its admission into the United Nations for an end to the war in Indo-China, and much of his speech was devoted to denying that he contemplated either possibility. Indeed, Mr Dulles's icy welcome from Congress on his return from Berlin has led to a deliberate playing-down of the Geneva Conference. Finding that no congressional leader of any standing, particularly in his own party, is willing to accompany him to Geneva and risk being wrecked on the China problem, Mr Dulles is hinting that he himself may hardly put in an appearance ; the American brief, it seems, may be handled by a deputy. The Republican leaders, however, are hard to satisfy ; they consider the meeting ill-advised because, if the United States stands firm, it will be exposed in an embarrassing minority of one.

The possibility that the Administration might be forced to send soldiers, as well as aircraft, training missions and money to Indo-China is, however, much the sharper horn of the Republican dilemma. No American, least of all the President, wants another Korea ; the Republicans, recalling the use they made of that war in the last election, shudder at the prospect. It is one of the attractions of Mr Dulles's theory of the power to retaliate that it seems to rule out new Koreas. But Mr Acheson may be right when he said, breaking a long silence to criticise the theory of "instant retaliation," that minor wars like Korea are the only ones the United States can afford ; the deliberate precipitation of a third world war is unthinkable.

Wishful Thinking on Trade Expansion ?

THE President's Message to Congress on foreign economic policy follows almost exactly the cautious report of the Randall Commission on the same subject, which was presented over two months ago. As a result of this restraint, whether or not the recommendations will encourage as great an expansion of international trade as the interest of both the United States and it allies requires, they at least do not ask more legislation that it is feasible for Congress to undertake during the present session. Much of what the President proposes can be done by executive action, other suggestions are still being studied and several of the necessary Bills are already being considered by Congress. If the President insists, time can undoubtedly be made for the rest of them, even though they will be dealing with the really controversial part of the recommendations. It is important that time should be found for this legislation for, as Mr Eisenhower has pointed out, his modest programme is closely inter-related ; if any part of it is dropped, then those who criticise it as inadequate will certainly be justified, and the

United States will have failed to give the world the lead that is essential.

The programme falls into four parts: first, foreign aid which, says the President, "we wish to curtail." This is a wish in which Congress concurs most heartily, and which it will probably make come even more true than the President likes when it begins to consider the continuation of the Mutual Security Programme. The second part is investment abroad "which we wish to encourage." A start has already been made in the tax reform Bill which has passed the House of Representatives and which gives substantial tax concessions to those who invest abroad. Congress is also asked to consider the broadening of the existing guarantees under the Mutual Security Programme against losses on new overseas investment. The application of the anti-trust laws to foreign investment is to be clarified and other countries are to be told what they have to do to attract private American capital. The President also reaffirmed the good news which Mr Dulles brought to the Caracas conference, that the Export-Import Bank would once more be allowed to take an interest in applications for economically-sound development loans.

The third part of the programme is currency convertibility, "which we wish to facilitate" as an indispensable condition of healthier international trade. The President welcomed the initiative already shown by the British Commonwealth in this respect and promised to "support the use of the reserves of the International Monetary Fund" to strengthen the currencies of countries which are ready for convertibility. The possibility of stand-by credits from the American central bank, the Federal Reserve System, is being studied.

★

Fourthly, there is trade "which we wish to expand." Most members of Congress share this wish until it comes to pinning it down with the hard political facts of tariff reduction. Then they think of the miners and watchmakers and dairy farmers whose votes they would like, and they decide that it may be safer to trust the figures of the protectionists, who contend that 15 million American workers would suffer if tariffs were lowered, rather than the calculations of the Randall Commission's experts, who claim that only 200,000 jobs would be lost if all American tariffs were removed.

These considerations are particularly strong at a time of economic recession and in the House of Representatives, where all the members face an election this autumn. There also the opposition to lower tariffs is led by the two members of the Randall Commission who were completely unreconciled to its report, Representatives Reed and Simpson. The Republican leaders in the House would like to extend the Reciprocal Trade Agreements Act for a year without amendment and postpone until 1955 the public exposure of the differences in their party on this issue. But this would also mean continuing for another year the basic uncertainties about American foreign economic policy which discourage the lowering of trade barriers by other countries. There have been a few indications recently that some of the protectionists in Congress are taking a more liberal view and there is at least a possibility that the President may get most of what he wants if he uses all his influence, and if public opinion is mobilised behind him by the various organisations which act as propaganda agencies for freer trade.

What he wants are a three-year extension of the Reciprocal Trade Agreements Act, with extra bargaining power added to it. He has asked for permission to reduce tariffs by 5 per cent a year even in cases where the full 50 per cent reduction allowed under the present Act has already been negotiated, as it has been for many of Europe's leading exports. In addition, the President would like, over the three-year period, to reduce by half tariffs on articles that are now being imported not, or hardly, at all, and to cut *ad valorem* duties that are in excess of 50 per cent to 50 per cent. The President agrees that the escape clause and peril point provisions should continue, but reasserts his right to ignore the Tariff Commission's recommendations if the national welfare requires it.

The **Reciprocal Trade Agreements Act** gives the President authority, without reference to Congress, to lower tariffs on specific imports in return for equivalent concessions granted to United States exports by other countries. The Act expires on June 12th.

The **escape clause** provision of the Act requires the Tariff Commission to report to the President whenever it finds that imports which have increased as a result of reductions in duty are injuring, or threatening to injure, domestic producers.

The **peril point** provision of the Act requires the Tariff Commission to warn the President when any proposed reduction in duty would injure domestic producers.

In both these cases the President can refuse to take the advice of the Commission, but must give Congress his reasons for doing so.

The **Buy American Act**, passed in 1933, requires government procurement agencies to give preference in awarding contracts to domestic suppliers, unless their prices are substantially higher than those offered by foreign bidders. In recent years "substantially" has usually been interpreted to mean 25 per cent or more.

The other important concession that he wants from Congress is authority to exempt from the restrictions of the Buy American legislation foreign bids for American government contracts which come from countries that in their turn treat American and domestic bids on the same footing. In the meantime the executive departments are to clarify and limit the applications of this Act—something which, from the evidence of recent practice in the letting of contracts, is very much needed. The President also wants further improvements in customs administration and procedure, some of which have already been passed by the House, and an increase in the value of purchases that returning tourists are allowed to bring in duty free. Foreign travel is also to be facilitated in other ways that do not require legislation.

In return for all this, Congress is to be rewarded by being given a chance, which it has long wanted, to consider the General Agreement on Tariffs and Trade if, after negotiation, the other signatories agree to changes in it which would confine the functions of the contracting parties to sponsoring trade negotiations, recommending trade policies and helping to settle trade disputes.

Congress Half-way Home

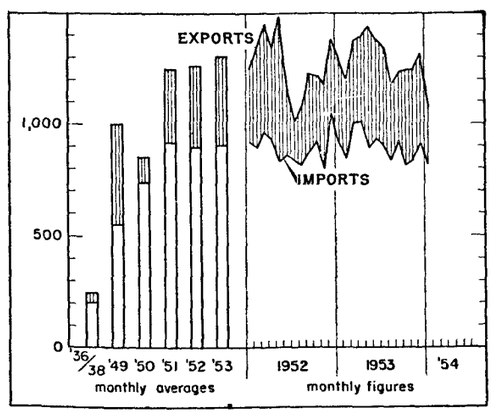
BY the calendar, the congressional session, which it is hoped to end on July 31st, is nearly half done, but in terms of what has been accomplished it has hardly started. This must be of profound concern to the President, who believes that his party needs a record of positive achievement if it is to win the autumn congressional elections. The hold-up is most pronounced, as usual, in the Senate, which does not limit debate. Here time has been spent, this year, in not doing things: in not passing the Bricker Amendment restricting the President's powers, and in not unseating the Democratic Senator Chavez. Senator Knowland, the majority leader, indignantly repudiates the suggestion, which is fairly widespread, that the Senate has been too busy watching the clash between Senator McCarthy and the Army to get down to work; he points out, quite rightly, that it is difficult to do business without a real majority. Nevertheless, even this handicap would not be so heavy if Republicans—including the majority leader—were not so fond of bolting the party line.

The moment is now at hand when delay is no longer possible unless Congress wants to face the voters with empty hands. A whole series of controversial measures in the President's programme must be tackled: the Administration's farm plan, statehood for Hawaii, housing, and tariffs, not to mention the essential, because vote-getting, extension of social security. The only major accomplishment is the passage of the excise tax Bill, which has been given priority because the tax rates it extends were due to expire this week—on April Fool's Day. There may be a certain symbolism in this: the Bill gives the President what he asked, the retention of just over $1 billion of revenue, but now that it has gone through the Senate it takes away, with the other hand, $999 million in excise cuts.

One of the President's few real successes so far has been the defeat, in the House, of the Democrats' attempt to write into the omnibus tax reform Bill an increase in the amount of income exempt from taxation. It was a narrow victory, and it may be overturned in the Senate, but it shows how effective a speech from the President can be. Mr Eisenhower has been somewhat chary of pressing Congress on; he apparently is personally reluctant to use either the carrot or the stick and, as far as patronage rewards go, he has little to offer, and a great many restless Congressmen to keep in line. But he may have no choice if the Republican party is to have a record to run on.

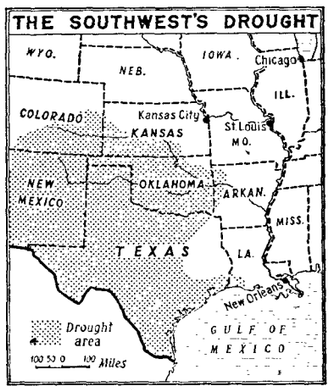
FOREIGN TRADE of the UNITED STATES

MILLION DOLLARS



Blowing Away

STORMS rather than showers are needed this April to avert from the southwest the threat of a new dust bowl that was whipped up by unusually high winds during March. They blew harder than they did in the nineteen-thirties, when the Great Plains last rose in the air; this is why the soil conservation methods—contour ploughing, windbreaks, cover crops and so on—which are much more widely practised and better understood today than they were then, have failed to prevent dust storms which have carried as far as northern Illinois and Wyoming. The sun has been hidden for days in Kansas and Oklahoma, and roads and fences are being obliterated and crops ruined by drifting sand all through the southwest. As early as February farmers from eastern Colorado, whose reserves and credit had been exhausted as a result of prolonged drought and poor crops, were appealing to Washington for emergency aid to help them "list" and "chisel" their fields. These are both methods of turning up clods of earth which will not blow away as the fertile topsoil has been doing throughout this abnormally dry winter.



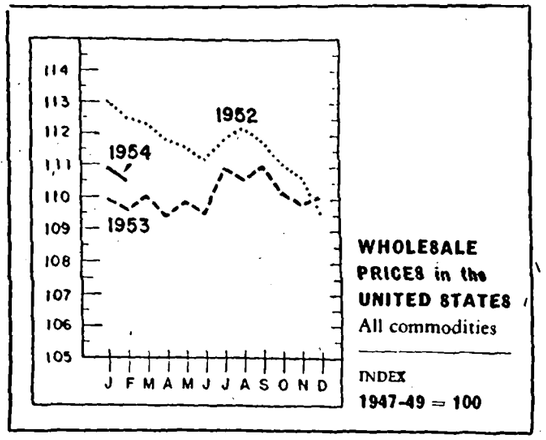
The drought has spread far beyond the area shown on the map, but it has been more sustained there than elsewhere. The rainfall in that area, which is usually very dry in any case, has been under fifty per cent of normal for four years. Reservoirs and rivers are almost empty and the level of underground water has fallen alarmingly. Special drought relief measures, particularly for cattle growers, were begun last autumn and will probably have to be extended. But the government may reap some benefit from the farmers' distress; the winter wheat crop may be severely damaged, which would help to solve one of the most troublesome surplus problems. Furthermore, farmers may be made to appreciate that the high price supports, which encouraged them to plough up unsuitable land during the rainy forties, are no help when that land is blowing away and crops will not grow on it. With dust in their eyes they may look more favourably on the President's unpopular agricultural programme, for this might make it more profitable to grow pasture than wheat on land that is not suited for grain.

New Look at the Stockpile

SINCE the passage, in 1946, of the Strategic and Critical Materials Act, which authorises the government to accumulate reserves of such materials in order to ensure that adequate supplies will be available in time of war, the actual amounts needed of the 75 or more materials that have been going into the stockpile have been constantly reassessed in the light of changing military requirements, but the basic assumptions of the policy have not apparently been reviewed. Now the President, recognising the change that has taken place in the strategic position of the United States since the Soviet Union acquired the air, and atomic, power to attack it directly, has ordered that, in planning for the stockpile, it should be assumed that in wartime no supplies will be available from abroad, except from neighbouring countries, and that even some domestic sources may have been put out of action.

This means that additional purchases of between thirty and forty metals and minerals are now considered necessary for the stockpile. This may save the Office of Defence Mobilisation from having to bear the full cost of some of the contracts which it made at the time of the Korean emergency in order to encourage production of critically short materials. It guaranteed minimum prices to producers who expanded their output and is now having to fulfil its guarantees. As a result ODM is expecting that before long it will have on its hands large surpluses of copper, lead, zinc, tin and other commodities which would not, under the old stockpile policy, have been needed for the strategic reserve and which ODM has promised will not be disposed of in such a way as to upset the market.

Moreover, coming at a time when buying for the stockpile under the original plan is about four-fifths complete—and has already stopped for a number of commodities—and when demand from other sources has been falling, the new policy makes a pleasant change for the American mining and smelting industry, something of which the President was certainly well aware. For the additional materials are to be bought almost entirely from domestic producers, the purchases are to be of considerable size and will be spread over a considerable period, and they are to be used to alleviate distressed conditions in the domestic mining industry. This will prevent mines that would be needed in wartime from closing down, but it will also have the immediate effect of relieving the government from some of the political pressure of the western mining interests which are already in distress. This pressure would undoubtedly have been felt even more severely when tariff policy is considered in Congress this year than it was last; then the demand for increased protection against imports of lead and zinc was overcome only with great difficulty. It is to be suspected that the special Minerals Policy Committee of the Cabinet was thinking as much of defending the Administration from this internal attack as it was of defending the country from future external attacks when it recommended the new policy; a long-range programme for strengthening the domestic mineral industry is expected to follow before long.



Conspiracy in New York

THE fourth week of the New York dock strike has seen federal and state authorities combining legal forces to end a situation which, they have decided, should be dealt with as a criminal conspiracy rather than as a labour dispute. Certainly crime is at the root of the strike, for it is the outcome of the attempt, begun last autumn, to rid the New York waterfront of the racketeering and corruption which permeated the dockworkers' trade union. After several attempts to induce the International Longshoremen's Association to clean itself up, the American Federation of Labour decided to establish a rival union. In December the National Labour Relations Board held an election to determine which union should represent the men in negotiations for a new contract. The new AFL union, most unexpectedly, came within 1,500 votes of winning and 4,000 votes were challenged. The NLRB was immediately asked to set aside the election on the ground that the old union had intimidated the dockers and the board is expected to rule in the course of this week that a fresh election must be held.

Meanwhile the new union has been gathering support at the expense of the old, which apparently decided that it had better make a show of strength by striking while it still had some strength to show. The walk-out, which began unofficially early in March and only later became an official strike, is in defiance of an injunction and the union leaders are now being accused of contempt of court. A grand jury investigating the dispute is also considering whether charges of conspiracy cannot be brought against both the union and certain shipping companies which have been making difficulties about employing members of the new union who were prepared to cross picket lines and brave threats of violence, and even actual attacks on their way home. Police protection has been provided and an increasing number of dockers, now amounting to over one-fifth of the normal labour force, have been gradually going back to work. Sympathetic strikes of tugboatmen and warehousemen have fallen through and in Baltimore the longshoremen's union, which decided not to strike, has been stopped by an injunction from refusing to handle cargoes diverted from New York. Some of this business will probably never return to New York even if the present strike does collapse. For over 5 million man-hours of work have been lost in the port since last October and more are likely to be before this union rivalry is finally settled.

Patching Up American Woolen

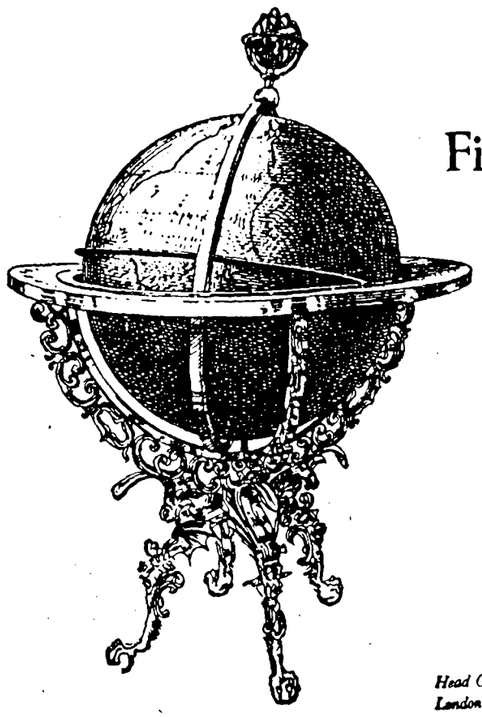
New York.

THE American shareholder can no longer be relied upon to stay at home and not mind his own business. The latest example of this is the battle now being fought for control of the American Woolen Company, in the course of which at one time as many as five distinct groups of shareholders were soliciting proxies; the composition of the board of directors has been changed several times and a few court injunctions have been tossed into the struggle for good measure.

The largest woollen and worsted cloth manufacturer in the United States, and once the leader of the industry, the American Woolen Company (the word is spelt in American with one l) has been losing heavily for the last two years. The management's proposed remedy was to retire all the preference shares, leaving only the ordinary shares outstanding, and to dispose of eleven of the company's least efficient New England mills, nine of which were already shut down, and concentrate operations in the remaining thirteen.

The shareholders counter-attacked with charges that the management had failed to spend enough money on new machinery to keep pace with technological changes, in spite of the high profits earned from the manufacture of military uniforms until 1952. They claimed that, if the preference shares were retired, virtually no money at all would be left for urgently needed re-equipment; that competitors had started before the war to build new mills and install new equipment in the southern states, to take advantage of lower costs there, but that the American Woolen Company did not join the "Drang nach Süden" until 1951 and then only by buying two out-of-date, inefficient properties; and finally that, unlike its competitors, the company had no adequate research facilities, and had neither the initiative nor the "know-how" to consider diversifying its products by weaving rayon or synthetic fibre blends.

A merger is now being proposed with the Bachmann Uxbridge Worsted Corporation. This firm is a leading manufacturer of woollens, worsteds and wool-synthetic blends, with well-diversified operations, and several new plants in the South; it has good research facilities and a management with an enviable reputation for foresight and efficiency. The corporation would surrender its identity in favour of the much larger American Woolen, but its enterprising management would remain in control of the merged company and it would acquire assets and considerable liquid funds at bargain basement prices, as well as the important tax benefits of American Woolen's recent heavy losses, part of which may be charged for tax purposes against the future profits of the merged company. This attempt to patch up the American Woolen Company provides a clear example of the dilemma of many textile firms: should they continue to operate old New England mills at a loss or build new ones in the South? Whatever cost advantages there are in operating in the South, and they have sometimes been exaggerated, they clearly can be realised only in new plants with new equipment.



First in world-wide banking

An extensive network of 57 overseas branches and of correspondents in every commercially important city throughout the free world has made The National City Bank of New York first in world-wide banking.

This great organization is staffed by men experienced in international trade and banking who can offer rapid, up-to-the-minute information on local conditions and developments. The London branches of The National City Bank are uniquely equipped to advise on trade with the dollar area.

Whatever your business and wherever your interests, The National City Bank of New York is able and happy to be of service.

THE NATIONAL CITY BANK OF NEW YORK

(ESTABLISHED 1812)

Incorporated with limited liability under the National Bank Act of the U.S.A.

The World Overseas

From Churchill Street to Cyprus Street

FROM A CORRESPONDENT IN GREECE

TO say that the Greeks like the British only when they bring gifts would be unkind and unfair. It is, after all, *some time since British policy brought gifts to Greece*; and it took one of the curtest snubs the Foreign Secretary has ever allowed himself to bring the barometer of Anglo-Greek relations from unsettled to stormy during the last three weeks. Even now one has the impression from Athens that the barometer in London needs tapping, and Greeks are heard commenting on the fact—if it is a fact—that the BBC carries no news of how Greece feels. How, they ask, can it be pretended that there is no problem about *Enosis* when their Prime Minister, General Papagos, has refused an invitation to visit London, and when it is thought inadvisable that the King and Queen should pay the state visit that Britain would like to offer? Whose fault was it, they ask, that the weekend before last saw Dr Adenauer being feted and Mr Eden baited by the Athens press? The picture of an eternal triangle that is painted has an element of the ludicrous in it: the passionate Mediterranean maiden, scorned by the arrogant Anglo-Saxon, turns to the up-and-coming Teuton; but it also has an element of truth.

Yet one cannot take without a pinch of salt the claim that all that has happened in the way of demonstrations was "spontaneous popular indignation." Youth may have flared up; but someone applied the match, and there are priests (they have their own guerrilla tradition in this country), Communists, and circulation-seeking journalists to dribble fuel on the flames. It is easy to dismiss student and schoolboy demonstrations with a shrug of the shoulders. For example, in the first stage of the disorder in Patras last weekend there was an element of ragging. It was the morrow of the Independence Day holiday, and the fifth and sixth formers returned to school only to be ordered on to the streets by their teachers. The official school banners were ready; the slogans were in immaculate English; the cheerleaders had got rhythm into their E-NO-SIS. As one child said afterwards: "It was such fun shouting and pushing." But another youngster was heard saying to a policeman who had boxed his ears: "Why do you knock us about for doing what we were told to do?"

An hour later a very different procession had appeared and was fighting to get to the British Consulate from the opposite end of the street. The young intelligentsia struggled with the police at one end; at the other end the police and a fire engine battled with the professional demonstrators, among whom a few Communists were observed making a comeback. Months of careful work on Anglo-Greek relations were lost in those four hours of ragging and rioting. And it is no small thing, in that sphere of emotions where *relations between nations are shaped, that the town which* had been liberated from the Communists by Colonel John Hunt's troops refused to tolerate a lecture on the Everest expedition, and that the Englishman who was one of the first into the islands to organise relief after the recent earthquake should have needed police protection.

The Everest lecture that could not be given in Patras was given without incident in Athens; the King and Queen of Greece attended and contributed to that small but significant total of gestures by which Greeks at the head of affairs have signified their desire that Anglo-Greek relations should not deteriorate any further. The latest of these gestures was Marshal Papagos's order last Saturday that meetings and demonstrations should stop. This, presumably, made it clear to *noumarchs*, bishops and school authorities that Athens did not want any further "spontaneous manifestations of national feeling." And it relieved the police of a responsibility that they had carried out with much patience and skill. (Someone who watched them using linked arms instead of truncheons remarked that British training methods were good.)

Why Not Even Talk?

Experts on Greece and the Greek political temperament are divided about what will now happen. Some say this is a spring fever that will pass; others maintain that this year's fever was different. If there are no more demonstrations, that will not mean that Anglo-Greek relations have been restored to normal; for there are many subtle ways of showing resentment and practising boycott. One thing seems certain: it is that even responsible Greeks who regret disorder and press extravagances will discuss the Cyprus problem in a manner more emphatic and impatient than before. They genuinely fail to understand why a government that will negotiate with Mau Mau, allow Egyptian interference in the Sudan, and proclaim Dominion status as the goal of Africans, refuses even to talk with old and still affectionate allies. And, what is more significant, it becomes every day more difficult for the bourgeoisie in the towns where anti-British demonstrations have taken place to protest against abuse and violence. They regret the tearing down of plaques indicating "Churchill Street"; but they do not remove the "Cyprus Street" signs that take their place. Nationalist feeling is being exploited by Communists, by clergy and by those who would like to see

Greece—under the strongest government it has had since the war—feeling the lash of discipline and direction.

It is not easy to be certain what Greeks expect of the British. Clearly they ask for a more skilful and courteous touch from Whitehall ; ointment is needed on sore places. Probably some of the demonstrators hope, without really expecting, that Cyprus will somehow become Greek by dint of shouting. Few of them, one is told, know or care about the economic and administrative consequences to the Cypriots of substituting Greek for British (or eventually Cypriot) rule. Few people would really like Marshal Papagos to visit General Franco as a gesture of Mediterranean fellowship. At the top the desire seems to be that London should talk with Athens and cease protesting that there is no problem. Those who understand the world of 1954 realise that bad Anglo-Greek relations over *Enosis* do not alter the fact that both governments have to work together in Nato, in the European economic institutions, even in economic reconstruction.

It is unlikely that the Greek government will place the Cyprus question on the agenda of the United Nations until the last possible moment, which is about the middle of July. And few here would enjoy the spectacle of Greece being supported by the Soviet Union in the Assembly.

There is, perhaps, the possibility of a breathing space of some three months during which moderate counsels will prevail in the Greek government. But it will not be easy to keep tempers calm in a cabinet that has no rallying point save Marshal Papagos himself, and in a political situation where *kudos* can be won by baiting the British. From London's point of view the crisis in relations—for it is a *crisis*—could not have come at a more embarrassing time. But, say the Greeks, they did not choose the moment, and a government of national unity cannot take snubs. It is a complex situation in which the Greeks—especially the church—are not blameless ; but there is still scope for diplomacy, and the old tradition of friendship still shows up strongly beneath the froth of national feeling and journalistic exuberance.

Recipe for Revolution

FROM OUR ROME CORRESPONDENT

THERE is a widespread impression outside Italy that the Montesi case is merely another Communist attempt to smear innocent democratic politicians. Such an interpretation is, to put it no higher, dangerously misleading. For the Communists are on to a good thing, a better one than even their most astute propaganda chief could have expected. And, although they shout loudest and hit furthest below the belt, they are by no means alone. The whole right-wing press, including such polemical writers as Signor Guareschi, of " Don Camillo " fame, have joined in the fray.

Even more important, such papers as the independent right-wing *Tempo*, and the two most reputable Italian dailies, the Milan *Corriere della Sera* and the Turin *Stampa* have been extremely critical of the government's handling of the affair. " After the events of the last few weeks," says the *Stampa*, " the relations of trust between the citizen and the state have been badly shaken. . . . These events reveal the uncertainties, the contradictions, the piteous lies, the lack of courage, the injustice, the precarious legal basis on which our life rests, and indeed our relations with the state and vice versa." And the paper goes on to list a few of the more shattering scandals which have recently darkened public life in this country. It is a list which could easily be added to. And it explains why the Italian man in the street, who starts with a prejudice *a priori* against the honesty of any government, has very little faith left in the integrity of the present administration.

It can hardly be said that the government has been very skilful in rolling back this tide of mistrust. Ever since last April, when the half-clad body of a young Roman girl was found on the beach near Ostia (the Roman seaside resort), the authorities have given the impression of wishing to hush the matter up. The first police verdict, of death by misadventure while going for a midnight bathe, was greeted by widespread scepticism. And it was only when the press took the matter up that the version current in high Roman circles from the start was brought to the public's attention. Even then one journalist was induced by the magistrates to retract his version. When, subsequently, he went back on his recantation, he was denounced for having spread false news. A fresh inquiry was opened simultaneously, but, the day before his trial was due to open, the law found that there were no grounds for revising the previous verdict. And this in spite of the accumulation of a great deal of fresh evidence, mostly sought out by the press, with justice slowly limping after.

Asylums and Dubious Deals

Other irregularities have come to light which would cause a raising of eyebrows even in a Balkan country. A witness for the defence was arbitrarily arrested on a charge of dangerous lunacy and locked up in an asylum for a few days. Signor Piccioni junior, the present Foreign Minister's son, who is widely regarded as being involved in the mystery (although armed with three different alibis), apparently consulted the head of police—who has since resigned—on means of suing papers who had mentioned his name, much as if the apparatus of justice was a private appendage of ministers and their families. His friend, Ugo Montagna, an unsavoury character according to the police report compiled on his activities, made a tax return to the municipality of just over the monthly allowance made to his mistress, and no action appears as yet to have been taken in the matter. Worse still, the chain of dubious building deals by which Montagna made his millions leads back to certain semi-public bodies (which flourish in Italy with mushroom-like vitality). These bodies in turn are controlled largely by the main party in power. Montagna shared an office with the son of a prominent Christian Democrat politician, whose name, by an unfortunate coincidence, cropped up in an earlier scandal. The member of parliament who made the accusations in that case was never sued for slander.

Many of the government's supporters privately admit that a large number of mistakes have been made, but they still seem to cherish the illusion that the existence of a scandal can be concealed by not talking about it, and conversely, regarding public discussion of it as an offence. Others, more subtly, contend that suspicions should only be voiced if proofs can be forthcoming—thereby confusing grounds for an inquiry and proofs of guilt. It has yet to dawn on the authorities that, if their regime and with it democratic values in Italy are to be saved, it is not sufficient to take drastic anti-Communist measures, however desirable. The most effective step to combat Communism is to deprive it of its propaganda weapons by ruthlessly purging the main government party of its rotten elements, by conducting a judicial inquiry into the Montesi death, and into the extent of the political pressure brought to bear since last April.

This is stiff medicine, but the only one likely to be effective. The ministerial inquiry now contemplated is hampered both by its restrictive terms of reference, and by the fact that it is regarded as being judge and jury at the same time.

Last of the Tigris Floods?

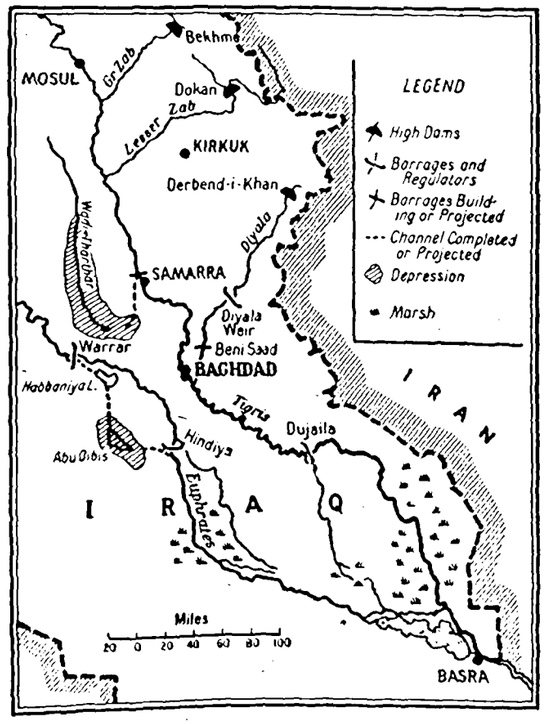
THE half of Baghdad that is on the east bank of the great and beautiful river Tigris is almost completely surrounded by water. The river itself, which is wider than the London Thames at high tide, and very much deeper, rose last Sunday to a height never before recorded in modern times—117 feet. It was saved from overwhelming the city only by the breaching of embankments to the north, as a result of which an ever growing lake spread to the north and east of the town and threatened it from its eastward side. This menace added itself to an existing one—the simultaneous flooding from the Diyala river, which had broken its banks on March 25th.

The peak of danger passed when the Diyala subsided, permitting a start with the draining off of the temporary lake into the Diyala channel. But a trail of damage remains. Losses in crops and property have been heavy in four provinces. The most poignant element in this scene of devastation is the thought that, two years from now, such a cataclysm will no longer be possible. The wealth from oil now being spent on flood control by the Iraq Development Board has already mastered the Euphrates flood and will, by the spring of 1956, have conquered that of the Tigris also.

Even in the immediate vicinity of the capital the damage done is immense. Of the main roads out of Baghdad, only that to the west, which starts on the river's right bank, remains unbroken. The wilful breach made in the left-bank bund to the north of the town entailed destroying the embankment that carries the railway line up the Diyala and on to Kirkuk. Factories that have been badly damaged include, besides about 100 brickworks, a new cement works, a big tannery and four cotton mills—plant valued in all at about I.D. 9 million (1 Iraq dinar = £1 sterling). The Iraq Development Board has often been blamed, not entirely without reason, for going ahead too slowly with its expenditure upon new enterprises, but this disaster supplies a large part of the explanation why there has been a slow start but will yet be a sudden blossoming. Flood control is the precondition of all major developments in Iraq's river regions ; not until it is complete are roads, railways, factories and irrigation works worth building in certain areas.

The flood-control system built and building is illustrated on the adjoining map. On the Euphrates, a channel permitting diversion of the spring flood waters into Habbaniya lake by means of a regulator at Warrar was completed over a year ago, and, when the 1953 flood was diverted into the lake, the volume of water in the river downstream was reduced by half. A barrage downstream of the channel into the lake will complete the project and will be finished by the end of 1955. Yet a further development will be storage in the Abu Dibis depression of waters in excess of the expanded capacity of the lake.

On the Tigris, the control scheme now being constructed involves the excavation of a 65 kilometre channel, and the parallel erection of a protective dyke, from a point opposite Samarra into the Wadi Tharthar depression. This work was begun in 1952 and will be completed in 1955. The second part of the scheme involves the construction of a barrage across the Tigris, work on which has just begun and which should be finished by March 1, 1956—that is, in



time to allow of diversion of the flood water of two years hence into the Tharthar depression.

One main difference between the Habbaniya and the Tharthar diversions as at present planned is that, whereas the former will have an outlet channel and serve as a reservoir for storage till the low water period in summer, the latter probably will not do so. Some geologists believe that the loss of water by seepage as well as evaporation in the Tharthar depression will leave none for irrigation. The projected high dams at Dokan and Bekhme on the two Zab rivers, though primarily serving irrigation, will, when constructed, also help to regulate the Tigris flow.

The Diyala dam project lags far behind the other two because the site at Derbend-i-Khan has not been thought by everybody concerned to be the best available. Wherever in the Diyala gorge it is finally built, a barrage complementary to it will be built lower downstream at Khan Beni Saad, both for irrigation and for flood control purposes.

But for the oil revenue and the Habbaniya scheme, the Euphrates flood would have been severe in 1953. The provinces now afflicted by the Tigris disaster will also have the Development Board to thank by 1956. But this thought can hardly comfort those now beset with food, housing, flood relief, and land recovery problems to the tune of perhaps 45 million Iraq dinars.

Danish Jet Crashes

FROM A CORRESPONDENT IN COPENHAGEN

LAST week the commander-in-chief of the Danish air force, General Foerslev, authorised the resumption of flying by jet aircraft after it had been prohibited for six days. The grounding had closely followed the publication of a letter from Hr Rasmus Hansen, the Defence Minister, to General Foerslev, in which he called for stricter discipline. The disappearance of a Shooting Star jet fighter over the sea near Aarhus on March 16th, in circumstances that suggested disregard of fight discipline, was the immediate occasion of the directive. The letter was interpreted in some quarters as a rebuke, foreshadowing General Foerslev's dismissal, but the commander-in-chief himself stated publicly that he welcomed this expression of government backing for his policy.

The loss of the Shooting Star came at the moment when a Nato team of specialists, expressly invited to Denmark by Hr Hansen, had just completed its report on the series of jet crashes, which have profoundly agitated Danish public opinion. Hr Hansen has been strongly pressed in the *Folketing* to make public the Nato mission's findings; but so far he has resisted these demands. Although the report remains secret, it is widely believed to contain strong criticism of the organisation and operation of the air force. The brief ban on jet flying will presumably have allowed some of the mission's recommendations to be translated into action.

Altogether 13 jet fighters of various types have crashed since May, 1953, with the loss of 16 young pilots. These figures appear alarmingly high to a small country for long wedded to neutrality and with a deep-rooted suspicion of militarism. Recently published statistics of low Norwegian air force losses in 1953—1.84 killed per 10,000 flying hours—have been indignantly quoted in the Danish press.

Behind the current agitation, and complicating the issue of air force organisation, lies a clash of personalities. Last autumn, for reasons never officially divulged, the young and able chief of the air staff, Colonel Birksted, resigned. His resignation was not accepted, and he remains technically on sick leave. It seems that Colonel Birksted, a gallant and much-decorated pilot who served with the RAF, disagreed with General Foerslev on fundamental questions of organisation. Between the commander-in-chief, representing the "old guard"—few of whom have combatant experience—and the young blood of the Birksted type, there is a "missing generation" in the air force. Hr Rasmus Hansen—who fortunately is not new to the game, having served at the Defence Ministry in the previous Social Democratic government as well as in this one—faces the difficult task of filling the higher posts with the best men, and of convincing a now wary public that there is nothing rotten in the state of Denmark's fledgling service.

Puzzle for Soviet Youth

THIS is a year of conferences in the Soviet Union. It opened with numerous meetings in the Kremlin of delegates from the countryside. Soon the trade unions are to hold their congress, to be followed in the autumn by the first congress of Soviet writers held in the last twenty years. Last week it was the turn of the Communist youth, the *Komsomol*, to hold its assizes in the Kremlin.

Numerically, the *Komsomol* is a very powerful organisation. Its membership, limited to young people between the age of 15 and 26, has grown from 22,000 on the morrow of the revolution to about 19 million. The bulk of the students in universities and technical colleges belong to it. Though the proportion is smaller in the countryside, nine out of ten collective farms have their Communist youth organisation. Most young men in the armed services are members of a cell. Indirectly the *Komsomol* controls yet another 20 million, through its "Pioneer" subs-rates which covers the younger schoolchildren.

Quantity, however, does not replace quality, and the congress was preceded and accompanied by a wave of "criticism and self-criticism." It was admitted that young men enter the movement automatically and receive no ideological training. "Survivals from the past" often guide their actions; cases were reported of young Communists marrying in the church rather than in the registrar's office, because "the ceremony is more attractive." Russia's gilded youth has also found its way into the *Komsomol*. Above all, the organisation and its leadership are apparently riddled with bureaucracy, and the movement has lost its romantic appeal.

Malenkov Knows Why

Premier Malenkov himself should know well the cause of this decline. In the early days of the Soviet regime, young Communists distinguished themselves not only in the heat of battle, but in the heat of debate as well. During Stalin's struggle for power the opposition found some of its most devoted and selfless supporters among young Communists, particularly among the students. Leningrad was the centre of the young opposition, but in Moscow the nut was not easy to crack either. Malenkov was then one of the chief purgers among Moscow's student youth.

The resistance was finally broken; recalcitrant *Komsomol* leaders were shot or deported. Many young Communists sought an outlet for their enthusiasm, or tried to forget their disillusionment, in pioneer part work in the far east or the distant north. They were joined by others who ran away from the purges. But a movement cannot live for ever on reserves of past enthusiasm. Progressively the *Komsomol* was transformed into a stratified obedient tool, a branch of party bureaucracy. Lively debates and the exchange of ideas were replaced by Stalinist indoctrination.

Now the new regime would apparently like to revive the old glamour and enthusiasm. Undoubtedly there is now scope for action: young Communists are expected to form the pioneering vanguard in the drive to conquer new land in distant Siberia or Kazakhstan. But can the old ardour be regained after years of Stalinist bureaucratic rule? Can heated discussions now be revived and the bureaucratic fist lifted? The congress has not revealed how the new regime is going to set about its task.

NOTES FROM SOUTH AFRICA

With the exception of the first two, these notes were contributed by our correspondent in South Africa

Mr Havenga's Optimism

THE budget which Mr Havenga opened on March 24th is the envy of taxpayers the world over. A sweeping range of tax concessions, affecting practically all classes of taxpayers, was announced; in a full year the cost to the exchequer is estimated at £22 million. Certain welfare payments such as old age, disability, and war pensions have also been increased. Mr Havenga's own description of it as "an optimistic budget" might err on the side of understatement.

The most expensive relief is the withdrawal of the compulsory savings levy, a thoroughly bad device which was introduced only last year; this will cost £7,600,000 of revenue in the full year. Industry will benefit also by the new initial allowance of 10 per cent on new plant and buildings. The ordinary taxpayer finds his primary tax rebate increased from £21 to £23, if he is single, or from £26 to £31 if he is married. At the top of the scale of incomes, a cut in the surcharge together with some smoothing of the rates ensures that the maximum tax rate paid by any taxpayer (including normal, super, and provincial taxes) is 10s. in the pound instead of 15s. 1d. Estate duty will be levied only on estates worth more than £15,000.

The tax reliefs have become possible mainly on account of a steadying of public expenditure on revenue account, and an estimated fall in loan account expenditure of £17 million compared with last year. In addition, revenue has been extremely buoyant. Mr Havenga proposes that in future the bulk of loan expenditure should be met out of public loans, instead of out of revenue as in the past. Presumably he is now confident that there is greater scope for public borrowing. Thus he has budgeted this year for only a small surplus of £200,000.

★ ★ ★

A Guess and a Gamble?

THE present economic situation of the Union does not warrant Mr Havenga's mood, but his optimism is based, no doubt, on a cheerful estimate of future trends. For instance, the balance of payments problem is expected to improve materially during the year, and the Finance Minister expects reserves of gold and foreign exchange to total £100 million at the year's end compared with a little over £90 million at present. But in the next few months seasonal factors are certain to deplete the reserves unless there is a sharp revival of confidence in South Africa to buck up the inflow of capital. The longer term prospects are certainly bright, since in a year or two the new Free State gold mines will be in full production, and uranium output will be increased. It may be over hopeful, however, to expect the balance of payments difficulties to disappear this year.

Another optimistic assumption is that inflationary dangers have receded. On many previous occasions Mr Havenga's expectations on this score have been proved wrong. And, indeed, a four per cent increase in the price level over the past year hardly justifies his assumption. But the minister is probably relying on a fall in the price level of imported goods to keep the general price level down. Moreover, if his estimate of the tailing off of public spending on basic services is realised, then it is more likely that the days of persistent inflation in South Africa are numbered.

Mr Havenga's windfall was the unexpectedly big increase in revenue—more than £15 million above expectations. This is a reflection of the increase in the national income of 8.6 per cent in the year ending June 30, 1953—partly accounted for by price increases, but also due to record levels of output in many sectors. Farmers enjoyed exceptional crops, and the Union is once more able to export maize and sugar. But welcome as Mr Havenga's enterprise is, one hopes that his judgment is based on more than a guess and a gamble.

Malan's Geography

WITH the possible exception of Dr Verwoerd, Nationalists provide different definitions of *apartheid* every time they speak about it, which is frequently. Thus, Dr Dönges has now admitted there is something in the "integratio 1" argument as used by Professor Fourie, a rising United Party economist; but that "integration" itself demands a special interpretation. Dr Dönges said: "We acknowledge 'integration' only as meaning the use of non-Europeans as labour." On the other hand, the FAK (Federation of Afrikaans Cultural Associations, with which body Dr Dönges is closely connected) has come up with the admission that so long as Natives are retained in industry at all, it would be unjust to keep them perpetually in subordinate positions. The FAK solution of the dilemma is a surprising one; some industries (unspecified) should be handed over to the Natives to be manned exclusively by them, while others should be reserved exclusively for white workers. This is called "vertical" (as opposed to "horizontal") *apartheid*.

All apostles of *apartheid*, however, sooner or later fall back on the reserves, referred to as the Natives' "true homeland." At Malmesbury this month, Dr Malan himself attempted to justify everything the Nationalists might do to Natives in "white areas" by referring to the Natives' great opportunities in the reserves. He said:

TRENDS OVERSEAS

Among the quarterly economic reviews released this week are:

CONTINENTAL SOUTH EAST ASIA
Many plans for development.
How realistic are they?

EGYPT AND THE SUDAN
Growing foreign interest.
Will business confidence revive?

BRITISH CARIBBEAN
Growing Canadian, American and Japanese competition.
Is the market expanding?

Fifty quarterly reports on over seventy countries are available to subscribers.
Let us tell you more about this service.

The Economist Intelligence Unit
22 Ryder St., London, S.W.1. Whitehall 1511, Ext. 129

We have the same right to remain here as the Natives. The Native did not come here before us; he came from outside at the same time as we did. Large parts of the Union were never in possession of the Natives. The land which they owned when the whites came, they still have, as reserves. These Native areas are seven times the size of England and Scotland together, twice the size of France, larger than practically any country in Europe. These were set aside for the Natives. We want it to remain thus so that the Natives can develop. But if the Native is being protected in this way, the white also has the right to protection, in his area. We need the Native and he needs us, but he cannot get the same rights as the Europeans in the European areas.

Senator Heaton Nicholls was prompt to scrutinise the Prime Minister's geography. He had, he said, examined Dr Malan's comparisons with some care. They presented something of a puzzle, but a little calculation showed how the puzzle could be explained. Dr Malan had carelessly included in South Africa's "Native Reserves" the whole of Bechuanaland (275,000 square miles).

* * *

The Race for the Job

In pursuit of *apartheid*, the Minister of Labour, Mr Ben Schoeman, proposes (in his Industrial Conciliation Bill) to replace the rate for the job by the race for the job. The Bill will give the Minister the power to determine the specific sort of work that may be performed by a particular racial group. The Bill contains other startling provisions. The Minister may at his unfettered discretion declare any industry "essential"; if he does, strikes in that industry become illegal. (Strikes by Natives are already illegal.)

Mr Schoeman will not, of course, recognise Native trade unions; he said on a former occasion that he hoped they would "bleed to death." However, some trade unions, with white leadership, have non-European members (Coloureds, or Natives, or both). In terms of Mr Schoeman's new Bill, a trade union or an employers' organisation which is open to more than one race may be refused registration. Trade unions will not be allowed to affiliate themselves to any political party; and no trade union (or employers' organisation) will be permitted to give financial aid to a political party, except from a special fund specifically established for that declared purpose. There are to be industrial tribunals for compulsory arbitration in disputes. Appeals by trade unions to the Supreme Court (hitherto allowed on points of fact) will in future be restricted to points of law.

The application of still more drastic *apartheid* to industries may prove difficult: 82 per cent of all South Africa's 4 million workers are non-Europeans, and 16 per cent of the skilled as well as 67 per cent of the semi-skilled work in industry is today performed by non-Europeans.

* * *

Bantu Education

The Bantu Education Act is now due to come into force. At present 900,000 Native children attend school; the education of this 40 per cent costs £8 million annually. Under the Act, which transfers Native education from provincial authorities to the Department of Native Affairs, it is proposed to give all Native children at least two years at school, by dividing the existing six-hour daily session into two daily three-hour sessions. The Department has declared it is not interested in educating an *élite* but wants to get down among the masses.

The other side of the picture has been best described by the Minister of Native Affairs himself. Dr Verwoerd has declared: "Natives will be taught from childhood that equality is not for them. They must not think of themselves as members of a broader, South African community, but as members of their own Bantu community." For 150 years, most Native children who got any education at all have got it thanks to church mission schools. These schools' curricula are laid down by the provincial education departments and the schools are compelled to conform to them. Nevertheless, under the Act, Dr Verwoerd has taken the power to close down any school catering for Natives if in his opinion the school is teaching Natives the wrong things. "I will," he said, "close down any school which preaches inadmissible doctrines . . . . Education will be taken from those who instil false expectations. People who believe in equality are not desirable teachers." After that, the Minister's assurance that he will use his powers "moderately," and has no animus against church mission schools has failed to convey much real comfort.

* * *

The Red Rose

Wearing a red rose in his buttonhole, the Minister of Justice, Mr Swart, proceeded in Parliament last week to close loopholes in the Suppression of Communism Act. He "named" a number of persons as Communists and banned them from attending all functions, including going to cinema and going to church. The Appeal Court invalidated the bannings on the ground that those "named" were denied access to the courts. Mr Swart also banned an MP, Mr Sam Kahn, from Parliament, on the ground that he was a "Communist." But Mr Swart's powers did not extend to preventing persons being elected to Parliament, so Mr Kahn (a Natives' representative) was replaced by Mr Brian Bunting, whom Mr Swart also had "named." Mr Bunting was ejected from Parliament in turn; but Miss Ray Alexander is now hoping to win the seat.

By further amendments of the already much amended Act, Mr Swart hopes to revalidate all his banning orders. In addition, though he apparently cannot order the electoral officer to refuse Miss Alexander's candidature, Mr Swart hopes to intimidate her with a possible three-year prison sentence if, having been elected, she tries to take her seat. Another power which the Minister now proposes to confer on himself is that of deporting any South African citizen, who is not a South African "by birth or descent," whom he deems a Communist. The fact that this violates a pledge given when the Citizenship Act was passed does not seem to worry him.

The United Party and the Labour Party are opposing this further tightening-up of the Act, not because they have a tender regard for Communists, but because they feel that real Communists can be suppressed without upsetting established legal processes, such as access to the courts, and also because they suspect that Mr Swart's definition of a Communist may be peculiarly his own. (Mr Swart "named" the building workers' secretary, Mr Huyser, for "fomenting strikes"; the last strike Mr Huyser "fomented" was in 1947, and it resulted in substantial gains for the building workers). Mr Swart's only answer to this is that he will use his increased powers "with discretion."

THE WIMPEY ORGANISATION

A 17-storey bank in Hong Kong; a dam in South Africa; a power station in Singapore; oil refinery and harbour construction in Aden; open-cast coal in Australia; University Buildings on the Gold Coast a dry dock in Karachi— these achievements bear ample testimony to the versatile and ubiquitous nature of

THE BUSINESS WORLD

Economic Stocktaking

Except at one point, the picture drawn by this year's Economic Survey of the present state of Britain's economy contains no major surprises; nor does its sketch of the likely trends of the current year. Industrial production in 1953 more than made good the previous year's setback; the gross domestic product rose by 4 per cent; and the economy enjoyed the benefit of a further large gain on the terms of external trade. But more than 40 per cent of these additional resources went to supply the rising appetites of consumers, and most of the remainder was absorbed by the increases in housing, defence outlays and stocks. There was little, if any, increase in fixed investment by manufacturing industry, while the surplus on the external balance of payments declined slightly—the good recovery in the gold reserves being matched by an increase in external liabilities. . . . The Survey expects the total demands on the economy to rise further this year, but production is likely to rise too. Its unexpected feature is an assumption that sufficient "slack" will exist in the capital goods industries to provide both for an expansion of exports and for a higher rate of industrial investment to raise productivity. Such a twofold expansion, and an effort to keep down costs and prices, are regarded as the paramount needs of the economy now.

THE value of the gross domestic product, the Economic Survey reports (quoting in advance from the preliminary White Paper on the national income) rose last year from £13,509 million to £14,563 million. This increase of £1,054 million was actually £25 million smaller than the 1952 increment, but prices of domestic output rose much more slowly than in that year—actually by about 4 per cent, while prices of all goods and services rose on average by only 1 per cent. In consequence, only about half the rise in gross domestic output was represented by higher prices, and real output expanded by about £500 million, whereas in 1952 it had contracted by £100 million.

Thanks to a fall of 12 per cent in import prices, Britain was able to bring in 9 per cent more imports for a payment of 4 per cent less; while export prices dropped by only 3 per cent. The gain from this swing in the terms of trade is estimated at £200-250 million. Moreover, contrary to the estimates based upon the trade returns, the volume of exports as computed for the balance of payments actually declined. Hence, although the total external surplus contracted only slightly, Britain's net intake of goods and services from overseas was no less than £345 million more than in 1952—adding to the resources available for use at home fully two-thirds as much as came from the increase in domestic output.

Sources of Demand

The biggest slice of the additional demand that both called forth and absorbed these new resources came from consumers. As a table on page 41 shows, their expenditure expanded, in real terms, by £350 million or 4 per cent, surpassing the peak that had been attained in 1950, before the encroachments of the defence programme. In money terms, the expansion was of course a good deal larger, from £10,403 million to £11,029 million. The second biggest slice of demand was that from gross fixed investment, which expanded by £215 million, of which two-thirds was attributable to new housing. Most of the remainder comprised additional investment by basic industries, notably power, fuel and transport. The growth of defence outlays lagged substantially behind last year's expectations, so that total demands for goods and services by the central government and the local authorities rose by only £110 million, despite the continued rise in

municipal expenditures. Necessarily, the recovery in production involved a substantial increase in total stocks and work-in-progress, the growth of which had been checked in 1952. A new inquiry into the experience of large firms in manufacturing industry suggests that the volume of manufacturers' stocks rose only slightly, but the authors of the survey suggest that total stocks—including those abroad and in transit—rose by £170 million at 1952 prices. Of this, some £90 million comprised the rise in recorded stocks of (mainly) imported primary commodities, and especially of food and feeding stuffs; stocks of raw materials rose only slightly. In sum, therefore, personal consumption accounted for two-fifths of the rise in aggregate home demand, fixed investment for one-quarter, investment in stocks for one-fifth, and defence outlays for most of the rest.

The External Surplus

The trend of the external balance of payments proved to be rather better than most recent estimates had suggested, and the actual out-turn of the year reaches the most sanguine of unofficial forecasts. Britain's total surplus for the first half of the year is now put at £13 million before crediting defence aid, or only half the estimate published in the White Paper issued last autumn. In spite of this downward revision the surplus for the full year is put at £123 million before aid, or only £11 million less than the revised estimate for 1952—a considerably smaller deterioration than was generally expected some months ago. The amount of defence aid declined from £121 million to £102 million, so that the gross surplus, including aid, was £225 million, compared with £255 million in 1952.

As the decline in the surplus demonstrates, the year's rise of £240 million in the gold and dollar reserves was more than balanced by a rise in Britain's external liabilities and a fall in official holdings of non-dollar currencies. The sterling balances, violently reversing their 1952 movement (they then fell by £373 million), rose by £213 million, despite a reduction of £40 million in the balances held by non-sterling countries, and despite an increase in the net outflow of investment funds from Britain to the rest of the sterling area.

As these figure imply, Britain's surplus with the overseas sterling area declined sharply, from £367 million to £179 million, but its 1952 deficit of £112 million with non-sterling countries was converted into a surplus of £46 million—after crediting aid receipts in both years. On that basis, Britain's current account with the dollar area was approximately in balance, for the first year since the war. The improvement in the overseas sterling area's balance in non-sterling payments was rather less marked, but it carried its non-sterling surplus to the substantial total of £274 million. Hence the sterling area as a whole earned a surplus of £320 million on its current transactions with the rest of the world. This compares with a surplus of only £50 million in 1952 and a deficit of over £500 million in the crisis year, 1951.

Over the year as a whole, Britain's exports to non-sterling countries were better maintained than those to the sterling area; the former dropped from £1,503 million to £1,465 million, while sterling exports dropped from £1,323 million to £1,210 million. Moreover, Britain's imports from non-sterling countries dropped much more sharply than its sterling imports rose. In addition, the "invisible" account with non-sterling countries showed a net credit of £37 million, in contrast with the 1952 net deficit of £35 million; the large net credit from sterling invisibles declined fractionally, despite a fall in net governmental payments.

Personal Incomes and Savings

Total personal income rose last year by £765 million to £13,537 million, more than three-fifths of this increase (or roughly the same proportion of the total) representing increases in wages and salaries, which together rose by £475 million to £8,630 million. The survey estimates that about two-thirds of this addition to the wage and salary bill was attributable to higher rates of pay and one-third to the general expansion of activity and employment. Personal income from rents, dividends and interest is estimated at £1,489 million, an increase of £83 million; receipts from national insurance benefits and other grants rose by £90 million to £1,000 million.

Thanks partly to the reliefs granted in last year's budget, net "disposable" income of individuals, after deduction of tax and national insurance contributions, rose by nearly 7 per cent, or £778 million. Since retail prices were only about 3 per cent higher than in 1952, there was a notable rise in real income. But the rise in the estimated money value of consumers' expenditure was £152 million less than the estimated rise in disposable money income. The excess of disposable income over traceable expenditures necessarily includes personal savings; it appears in the 1953 estimates at £928 million, compared with £776 million in 1952 and only £285 million in 1951. This residual is not seriously put forward by the statisticians as an adequate estimate of personal savings; but the fact that the big rise of 1952 has been confirmed in 1953 raises a presumption that personal savings in part have substantially improved, despite the rise in consumption.

Where Higher Output Went

In 1953, the country still needed more coal and steel than it could produce. But for all other industries, demand set the pace. The growth of demand within the economy, and the slight increase achieved in exports of goods made in Britain, thus stimulated greater activity in a wide selection of industries, which together brought about a rise of 6 per cent in industrial production. This took up much of the slack that had developed in industry in the setback of 1952. It was achieved without a proportionate rise in employment, by putting

men and machines more fully to work ; so productivity rose, sufficiently to offset rises in pay and keep labour costs steady in most industries. But the recovery was uneven.

About a quarter of the year's additional industrial output consisted of new cars, television sets, and other purchases by the home consumer, and perhaps another sixth went to rebuild stocks of manufactured and semi-manufactured goods. The rise of 60 per cent in deliveries of private cars to home buyers far outweighed a 2½ per cent fall in exports ; output was a record. There were smaller increases in production of other metal consumer goods, in the chemical trades (including petroleum refining), and in paper and printing. Textiles and clothing had been the largest factor in the 1951-1952 decline, and last year contributed most to the increase in total output. Exports and home demand both rose ; but special inquiries conducted for the survey suggest that two-thirds of the 15 per cent rise in output of soft goods went to replenish stocks.

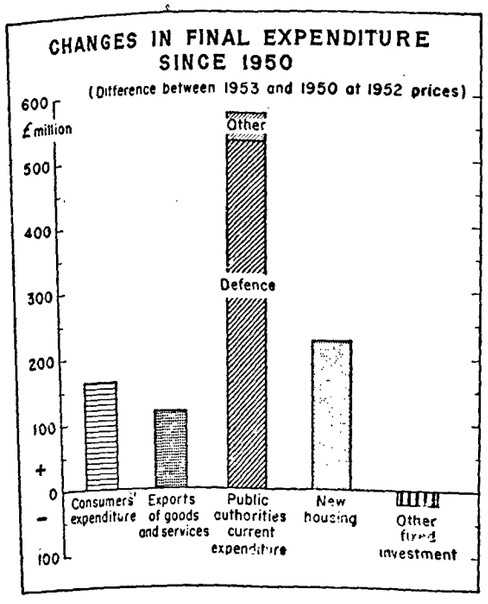
Another quarter of the increase in industrial output went into higher fixed investment—primarily in houses. The output of the building industry went up by 6 per cent last year, with an average labour force no higher than in 1952 ; so there was a marked increase in output per man, supported by larger supplies of materials. There was a slight increase in home supplies of plant and equipment—which went mainly, it would appear, into the basic industries. Part of this came from a rise of about 10 per cent in home deliveries of commercial vehicles, though output of these actually declined, because of a continued fall in exports.

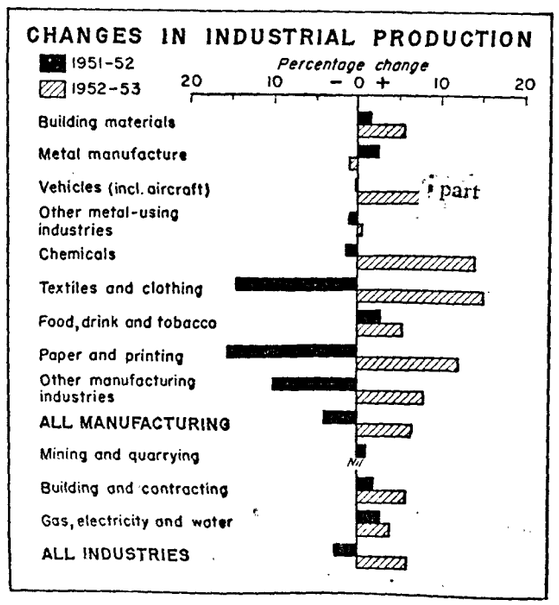
The final third of 1953's extra domestic output was devoted about equally to defence and to exports of home-produced goods. The rise of £50 million in production of metal goods for defence occurred mainly in the aircraft industry, in arms and ammunition, and in electronics ; at the same time there was a marked increase in exports of aircraft and armaments (largely to other Nato countries). The output of refined petroleum, which rose about 10 per cent to 23 million tons last year with the virtual completion of the British refinery programme, allowed an increase of 35 per cent in exports of petroleum products.

Resources for Further Progress

Some major sections of the engineering and metal goods industries, therefore, felt the stimulus of higher home demand and overseas orders, and the total output of metal goods last year was some 3 per cent higher than in 1952. It rose during the year, indeed, by about 5 per cent, taking up much of the spare capacity in the industry. Yet exports of metal goods, in total, fell by 3½ per cent ; the volume of orders on hand in engineering fell steadily until the autumn ; and despite some improvement since, orders are still not being obtained as fast as they are being worked off.

Few of these industries, except shipbuilding, were significantly affected by lack of materials ; but demand for some of them fell off just as the shortages or maldistributions of materials were coming to an end. Not only motor cars, but some capital goods such as mining equipment and railway wagons, had the advantage of bottled-up demand at home, and the machine tool industry, emerging from defence preoccupations, filled arrears of civilian orders for British industry and increased its exports slightly. Output of heavy electrical equipment rose steadily, while the demands on engineering for defence, which had risen early in 1953, thereafter remained about level, and took just over one-eighth of the output of these industries. It was in those





sections that make capital equipment for the consumer goods industries, in prime movers, and in the telephone and cable industries, that demand fell off most ; and there was a decline in output of semi-manufactures and in repair work.

In the capital goods industries, speaking broadly, deliveries today can be made within the time required for manufacture, while standard items are becoming increasingly available from stock. In some of these industries spare capacity certainly exists that could serve to increase exports or home investment or perhaps both—though any rapid revival of world demand for capital goods might call for some further growth in capacity in certain sectors. One impressive feature of the British industrial economy since rearmament began after Korea is the extent to which these engineering industries have fulfilled almost all the extra demands upon them (except for certain imports of defence tools and a limited amount of American military equipment) without any very marked expansion of total capacity or total manpower. But if capital goods continue to make up an increasing proportion of world trade, as seems likely, Britain may need to devote a yet larger share of its resources to engineering, as do its main competitors.

Last year's recovery in output, then, was most marked in the consumer goods industries, as the decline in 1952 had been equally marked. These industries are, in general, the heaviest users of imports ; but the resulting fluctuations in the volume of imports were damped down by the special imports of steel and manufactured goods for defence, which were very high in 1952 ; these slackened last year and thus reduced the volume of imports necessary to sustain last year's increase in production. Without these economies the rise in output would have required perhaps £200 million of extra industrial materials (at 1952 c.i.f. prices), in addition to the £160 million of food, drink and tobacco that went into home consumption and to rebuild stocks. In fact, last year's imports of raw materials and manufactures rose in volume by only about £115 million, reckoned at 1952 prices. Special imports of steel and defence machinery will decline even further this year ; so a further rise in industrial production—which the official statisticians now calculate would require perhaps £15-20 million of extra imports for every one per cent increase—should be possible without any major rise in total supplies from abroad.

Demand in 1954

In fact, however, the Economic Survey does not envisage any considerable rise in imports as a whole during 1954, though it emphasises that the total is strongly influenced not only by the trend in industrial production but also by the strength of consumer demand—especially for food, which is likely to rise further.

It is emphasised that demand for exports and the prospect for the national economy generally must depend, to a significant extent, upon the course of business activity in the United States. But it is pointed out that the repercussions of the American recession upon world trade and upon Britain have so far been relatively slight ; and although it emphasises that the American trend "must continue to be watched very closely on both sides of the Atlantic," the survey leans towards optimism. It also reiterates the conclusion reached at the Commonwealth conference last January that combined efforts by the non-dollar countries could prevent a moderate fall in US activity from having serious repercussions. In the absence of dislocation from overseas, it is thought that the volume of British exports should be maintainable at about its present level, despite the sharpening of competition ; and exports are now running at some 5 per cent above their 1953 average.

On the optimistic view, therefore, net demands on the domestic economy from the external balance of payments would be more likely to rise than to fall. And nearly all sectors of domestic demand are rising. Government and local expenditure on goods and services is expected to expand by £75 million (at 1952 prices), chiefly on account of defence outlays. Consumers' demand at the end of 1953 was running significantly above the 1953 average and there is no reason to expect any "marked fall" from this higher level. The real outlay on new housing is expected to become stabilised but there will be a larger expenditure on repairs and maintenance. Fixed investment in the basic industries is "on a rising trend," and there will be an increase in road works, building of shops and commercial premises, and in reconstruction of blitzed cities. The one sector, it seems, where expansion is not definitely in sight is fixed investment in manufacturing industry—though it is admitted that the incentives given in last year's budget have not yet had time to exert their full effects.

The survey's references to this sluggishness of industrial investment leave no doubt that, if the Chancellor sees scope for giving any further stimulus to the expanding economy, this is the point at which the injection should be made. But the discussion of the general balance of the economy carefully refrains from indicating whether, in the official view, there is any such scope—apart from the specific physical capacity that is regarded as available in certain capital goods industries. It is emphasised, on the one hand, that the level of demand must not be allowed to rise so high as to "impede the flexibility of industry" or to discourage exporters from pressing their goods in difficult markets ; nor, on the other hand, must it fall so low as to discourage investment and waste resources. The reader is left to guess which of these virtuous truisms is now uppermost in the official mind. The only pointer is the argument that in 1953 the expansion of domestic demand has only exceptionally reacted adversely upon the drive for exports. But this is not a very reliable pointer to 1954, because demand is rising further.

BAUME & CO. LTD., LONDON AND LA CHAUX-DE-FONDS

THE SCOTLAND YOU'LL SEE — BY CAR!

Not on the main highways of Scotland do you see such scenes as this. They are for the tourist who goes in search of Scotland by car. There is a wealth of history and romance to be found 'off the beaten track'—but you must go by car. There is beauty and legend hidden from the highways that can be explored at leisure — only by car.
So if you are coming to Scotland, reserve an S.M.T. Self-drive Hire car to take you round.

SMT

SELF-DRIVE HIRE SERVICE

The S.M.T. fleet consists of up-to-date 5/6 seaters and you can hire one for as long as you like . . . up to six people can travel as cheaply as one.
No connections to worry about, no set time table. Make your own time and linger where you will.
Write, telephone or cable to Dept. E.C.2 for the S.M.T. Brochure which gives you all the details.

So far as any electoral mathematician can judge, the party gains and losses in the present redistribution are in fact so far fairly evenly balanced, and to that extent Mr Morrison's complaint is nonsense. What may well have appalled him is the degree to which, irrespective of party, the machine he created holds the power of electoral life and death. Even in the present relatively limited changes some MPs are seeing their seats wiped out, while others are finding their constituencies virtually handed over to the opposing party. It is possible to appeal against the proposals, and the Home Secretary has the last word. In 1948 the Labour Government overruled the Commissions and ordered the creation of 17 additional seats. This, however, proved morally dubious, electorally unsuccessful (several of the seats swung Conservative in 1950 and 1951), and statistically bad practice; some of the extra 17 could not be justified and are now having to be removed with inconvenience all round. The parties would be well advised to accept the proposals—this time—with what grace they can muster.

This is not to say that the machinery should not be improved after the present reorganisation. It has at least two major defects—the seven-year period between revisions is in normal times too short, and the principles on which changes are made are equivocal. While local geography dictates wide discrepancies in rural areas and one-seat boroughs, cities with more than one member are continually threatened with disruption to meet the movement of a small percentage of voters out into the suburbs. Although it is right that major changes in population should be examined by impartial bodies of the present kind—and although it is not necessarily a bad thing that MPs should be made to feel less secure in the tenure of their jobs—there is a case for saying that the Commoners should not be induced to work so hard over their statistical quibbles.

Boring into Rent Control

WHEN the Housing Repairs and Rents Bill reached the report stage on Wednesday, the Minister of Housing quietly slipped into it a very important clause. Houses or flats completed after the Act is passed, as they are built without the aid of a subsidy, are to be exempt from control under the Rent Acts, and so too are dwellings provided by the conversion of existing houses if the final touches are added after that date. The object of this, as Mr Macmillan explained, is to encourage the building and conversion of homes to let, thus increasing the total stock of dwellings without increasing the call on public money.

Labour members quickly protested that this was the beginning of the end of rent restriction. For the long term—the very long term—there is reason to hope they may be right. The Government itself has a nice limited objective. It knows that people who might build or convert dwellings for letting are now frightened off by the risk that tenants, having agreed to the rent they ask might drag them before a tribunal, and have it knocked down to a figure that would not yield an adequate return; and also by the prospect of being unable to get rid of bad tenants at the end of their lease. The simple removal of these deterrents, however, will eventually sharpen the unfairness as between one landlord and another. By doing so, it may gradually weaken the whole structure of rent control; and make it easier for some Government, some day, to pluck up the courage to sweep away the biggest remaining obstruction in the British economy, which started as a proper attempt to alleviate the consequences of the housing shortage but has now become the chief cause of its continuance.

Parleys in Kenya

ON Tuesday, six leading Mau Mau terrorists were driven down to the small township of Nyeri for surrender talks with high government officials. The Kenya government is anxious not to raise or express extravagant hopes; but there are sober indications that General China, the captured Mau Mau leader, may be able to give some value for his reprieve from the death sentence by bringing in many of the terrorists who were formerly under his command in the Mount Kenya district. There is less hope of success in the Aberdares, where the self-styled Field-Marshal Dedan Kimathi—whose addiction to writing letters to the authorities prompted General Erskine's original surrender offer of last year—presumably still holds sway.

There is, of course, no other way of ending the emergency except by accepting the surrender of the terrorists; the European settlers' initial protest at the use being made of General China was induced by a mild hysteria. But the problem is by no means a simple one. Mau Mau has never been declared a rebellion; consequently there can be no question of negotiating the end of a civil war or of offering terms. The hard core terrorists will have to face any trial that is coming to them. But there is rarely sufficient evidence to prosecute them for the bestial crimes which everybody knows they have committed. General China, for example, was originally condemned to death for the comparatively mild-sounding misdemeanour of consorting with gangsters and being in possession of two rounds of ammunition.

For this reason, legal complications may arise from a recently announced decision of the Appeal Court. The Court quashed a sentence that had been passed on a surrendered Kikuyu, convicted of being in possession of a round of ammunition without lawful excuse. It felt that the man had a lawful excuse, because he had stolen the round from his Mau Mau gang to corroborate the story of his escape. In other words, possession of weapons is not in itself a crime; indeed, last year's surrender offer expressly invited terrorists to come in with their arms. If it is to keep faith with the loyal Kikuyu, the Government must not let this decision divert it from its declared policy of banishing hard core terrorists from the reserves and alienating their land; but in its anxiety not to discourage terrorists from surrendering it must not make the loopholes in the law too large. The success of attempts to bring the emergency to an end through parleys with the gang leaders largely depends on the government's ability to reconcile these twin objectives; further thoughtless outbursts of protest from the settlers would only postpone this desirable result.

Two Views on No Par Value

THE bulk of the evidence submitted to Mr Montagu Gedge QC and his colleagues on the Committee on Shares of No Par Value supported the proposal to allow such shares to be issued. The majority report of the Committee has reached this same conclusion, and puts the case for what is, in truth, a sensible administrative reform, in straightforward and sensible terms. It should be made possible, says the majority report, to issue ordinary shares of no par value and to convert existing ordinary shares with a nominal value into no par shares—or vice versa. The Gedge Committee has found that such fears as the Cohen Committee entertained in 1945 that no par shares might generate abuse or lead to extreme accounting complications need no longer be apprehended. The introduction of no par shares on a permissive basis, declares the majority report, would entail no elaborate amendments to existing company law. As for safeguards, provided that the whole proceeds of an issue of no par shares were carried to a stated capital account and not distributable in dividends and provided also that conversions of shares with a nominal value into no par shares were approved by extraordinary resolution of each class of shareholder, the majority report holds that no par shares would be neither more nor less open to abuse than shares having a nominal value.

So the once recondite mystery of no par turns out to be as clear as crystal. Whereas a couple of years ago scarcely a voice in the City could be heard in support of Sir John Barlow's Bill to permit the issue of no par shares, now accountants, industrialists, the insurance offices and investment trusts, the Stock Exchange and the lawyers give their general support to the identical principle. This at least, is a change towards enlightenment. But there is one quarter where darkness still prevails. To read the minority report of Mr W. B. Beard, or the evidence submitted by his colleagues at the Trades Union Congress, Mr George Woodcock and Mr Lionel Murray, is to be plunged into economic mediaevalism. The reason is with the majority, but the vehemence is with the minority; it is, perhaps, not surprising that the President of the Board of Trade has declared that time will be needed to study the report, but it will be a most dangerous conclusion if a modest reform based on sense and logic is to be destroyed because the TUC's grey mare runs wild in its impenetrable blinkers.

The argument, indeed, is no longer about the merits of making no par shares legal for those companies that would like to adopt them. That issue is conclusively settled by the majority report. The new argument—and it has been coming to a head for some time past—is about the rights of the unions to intervene in matters that by law and practice are the concern of the owners of companies—that is, of the shareholders. Although the TUC's evidence purported, in part, to raise technical objections to the issue of no par shares, it was not long before the real character of their objection appeared, as the following interchanges show:

> *Q.*—Your feeling is that the no par value shares would permit the payment of excessive dividends and would camouflage what the shares were worth. Is that putting it fairly?
>
> *A.*—I think you could put it more strongly; we should think that that would be the main purpose behind it.
>
> *Q.*—Now, what do you mean by an excessive dividend?
>
> *A.*—You do not expect me to put a figure to that, obviously?
>
> *Q.*—No, in whatever terms you please; what do you mean by an excessive dividend?
>
> *A.*—I could not say what I mean in terms of a figure, but it is something which, for our purpose, would strike an average trade unionist as being excessive in relation to the wage he is receiving and the general level of remuneration in occupations of all kinds.

Here indeed is a new principle of economic calculus. No par shares may be formally logical, but if the union rank and file mistrusts them, and their representatives find them too difficult to explain, they should not be permitted, on the ground that they would exacerbate industrial relations. Let us therefore live, the argument runs, with our familiar illusions and define "excessive" as suits our book.

But the argument does not stop at this *trahison des clercs*. It reaches out into wider claims on the part of "the workers" to a voice in affairs that concern the shareholders and to a claim for some, as yet unspecified, share of their equity. It is no longer a question of misconceptions about no par value; it is rather the emergence of a doctrine that the unions are entitled to a new status as part-owners and controllers of companies. First comes the assertion that "excessive dividends" (as defined by the trade union spokesmen themselves) are objectionable; then there follows the argument that "the workers" are morally entitled to part of the reserves of companies, on the ground that profits ploughed back represent potential wage increases that have been forgone as a result of their patience and restraint. This pincer attack has been employed by Mr Gaitskell, who was ready as Labour Chancellor to introduce a bill for the limitation of dividends, and in opposition has recently argued for "some system whereby the workers are given a fair share of the reserves accumulated thanks to their moderation." Gaitskell's Fork is being brandished to secure a more or less fixed-dividend ordinary share (fixed in the upward direction, that is, not in the downward) and to make it even harder than it already is to retain a surplus of earnings to plough back into industrial investment. "By capitalising the reserves," said Mr Murray in evidence, "the directors themselves make quite sure that the workers will never be able to tackle any of these reserves."

The dangers of this sloppy moralising, and even worse law and accounting, ought to be evident. The reserves do not belong to "the workers"; they are not the product of their forbearance and restraint; they do not exist in general as free cash, and they cannot be slipped to the shareholders by some deceitful magic. The bonus share is a means of keeping resources within the company, not of handing them out to shareholders. These are all misconceptions, and too easily exploited by mischief makers. The reserves belong to the company, and in the overwhelming majority of cases have long since been permanently re-invested in the business. The company is owned by its shareholders who are entitled to an aliquot share of distributed dividends and, in the rare event of liquidation, to an aliquot share of realised assets. "The workers" are concerned with none of this, save as they themselves can be shareholders. They are concerned with wage negotiations and working conditions and they are quite entitled to exploit high profits or high dividends in putting forward their claims. The success of some American labour unions in acting as a stimulus to more efficient and profitable management is an object lesson in what the unions can do as competitive partners in industrial progress. But self-interest needs to be enlightened. The dismaying thing about the TUC's opposition to the no par share is that, at bottom, it is based on a sentimental syndicalist view of the structure of industry as Transport House thinks it should be, and on an unqualified suspicion of industrial institutions as they are. In this atmosphere of negation, the chances of a relative minor reform such as the no par share may not be high; that is regrettable, but it is a small matter compared with the approaching dangers of economic stalemate and industrial retrogression.

Business Notes

Budget Bulls-eye—by Accident

THE budget surplus recorded for the fiscal year just ended has fallen within the inner ring of the target set up last April and the yield of revenue has actually reached the bulls-eye—but it cannot be said that this impressive performance has been due to good marksmanship. Heavy supplementary estimates had obscured the expenditure target altogether, and only some chance gusts of wind carried revenue to its mark. The original estimate for ordinary revenue, including a small net receipt from the Post Office, was £4,368.2 million; the actual revenue was £4,368.1 million. The original estimate for expenditure was £4,259 million and the revised estimate (including £5 million of supplementaries for the Post Office) was £4,488 million; but despite these large revisions the actual expenditure, at £4,274 million, came within £15 million of the original forecast. The ordinary surplus on the conventional budget account thus proved to be just under £94 million, compared with the first estimate of £109 million and with a realised surplus of £88 million in 1952-53. It should be noted, however, that the figures for both years are struck after abating the actual expenditure on defence by the sterling "counterpart" equivalent of the dollars received as defence aid. The increase in these special credits was much greater than that in the conventional budget surplus; and if defence aid had been excluded the out-turn for 1953-54 would have shown a deficit of £46 million, compared with a surplus of £3 million in the previous year.

Net expenditure "below-line" has been wildly short of the target; it was expected to rise by £25 million, but has actually fallen by £133 million, to £391 million. In consequence, the net deficit on the Exchequer account as a whole was £297 million (or £437 million before defence aid)

THE DEFICIT ANALYSED
(£ million)

	Expectation		Out-turn		
	Original Estimates	Expected Change from 1952-53 Out-turn*	1952-53	1953-54	Actual Change*

* Increased revenue, expenditure or surplus shown *plus*, decreased revenue, expenditure or deficit shown *minus*. † Later revised to £4,365 m. to take account of supplementary estimates for post office (*eliminating* the projected net receipt). ‡ After crediting sterling "counterpart" receipts of defence aid—£85 million in 1952-53 and £140 million in 1953-54. § Before taking account of net receipts of £10 million from Civil Contingencies Fund at March 31st.

Industrial Motors

BTH is particularly well placed to meet the needs of Industry for electric equipment in general—D.C. and A.C. (single or polyphase) motors and associated control gear in particular. Present day production represents the results of over fifty years' continued progress in original research, design, and manufacture, of all types and sizes of rotating electric machines—second to none in performance and reliability. No manufacturer can offer a wider choice in electric motors. Whatever the conditions of service or type of drive there is a BTH motor well suited to the job.

sequence of operations. One of the results of these gold operations has been to increase the demand for transferable sterling.

The new arrangements for sterling have been followed by administrative relaxations for the commodity markets. For coffee and cocoa where the markets already have the liberty to resell produce of dollar area origin within the EPU area that liberty is extended to cover the whole of the transferable sterling area. But where that liberty does not exist as with sugar and grains, no new right to sell dollar commodities against sterling is created.

The turn-over in the London gold market has been substantial ; well-informed estimates put it at several tons of gold a day, though the business last week failed to attain the exceptional dimensions reached in the first week of freedom. The Bank of England has intervened actively in the market both at and after fixing. It has been a seller of South African gold ; but the evidence of the past fortnight suggests that the Bank, acting for the Exchange Equalisation Account, has on balance been an appreciable buyer of the metal.

Steel and Schumania

THE British Iron and Steel Federation has ventured to break the charged silence upon Britain's attitude to the European Coal-Steel Community with a forthright essay upon the theme "Either-Or." It fears that beneath the blanket of diplomatic prudence, while this country officially considers its reply to M. Monnet's request for negotiations over "closer association," the idea is taking root that Britain can take up some position halfway into Schumania and halfway out. This view, in its current Statistical Bulletin, the federation is to some pains to rebut.

Britain decided not to join the Coal-Steel Community at the outset, in 1950, when it might have had a voice in settling the terms of the treaty that binds—or purports to bind—the Community members. Today, the federation argues, the "common rules" established in that treaty form a corpus of policy that must be accepted as a whole or not at all. Those common rules, in reality, abrogate the sovereignty of the nations that join, or even, the federation argues, enter into "close association with" the Community. It leaves to the politicians the question whether Britain should relinquish some sovereignty and join the Community, while not disguising its own view that Britain should not. If not, it suggests, the most that can be achieved will be some form of treaty between a sovereign nation and a slightly supra-national Community—which could perhaps cover such matters as some relaxations of tariffs (Gatt willing), perhaps some agreements on exports, and the exchange of information—which already exists—upon investment policies. But what Britain cannot do, the federation argues, is to pick and choose which of the common rules it shall follow and which not, under the cover of some formula drafted in Doublethink.

The federation is to be congratulated for bringing this argument into the open—and the National Coal Board, which leans over backwards to preserve protocol and conceal its own views on the matter, may well be cheering discreetly on the sidelines. The political overtones to this argument are not negligible, and deserve wider discussion. But the federation may well be right in thinking that some complimentary and equivocal form of words from the Foreign Office on this issue would merely irritate Schumania, now or when it came to the test ; and that the two industries concerned should not be used in a manoeuvre to blur the fact that this is a major political decision, not an essay in international public relations.

Headaches for OEEC

THE meeting of the Ministerial Council of the Organisation for European Economic Co-operation, which was due to take place before the end of March, has now been postponed until the end of this month or the beginning of May. The two main items on the agenda of the meeting are the extension of the European Payments Union after June 30 and the progress report on the liberalisation of trade within the OEEC community. On neither issue have officials been able to secure agreement ready for sanction by the council.

The outstanding problem on the liberalisation issue is that of the French laggard. France stiffened its import restrictions early in 1952 and since then has made only small relaxations. The proportion of imports (1948 basis) to be quota free is still only 20 per cent—against the OEEC minimum requirement of 75 per cent. Despite the pressure from France's partners in the OEEC—especially the worst hit such as Italy—the prospects of any radical liberalisation by France appear less promising today than at the meeting last October.

The difference between France and her neighbours is essentially an issue of expediency. Unfortunately that cannot be said of the differences separating the two schools of thought on the changes that should take place in EPU after June 30. The Managing Board has issued a report setting out those differences. So wide and difficult to bridge do they appear that the report can do no more than note the existence of fundamental disagreements.

The creditors have brought matters to a head by two proposals: the first is to harden EPU by increasing the ratio of gold to credits in the monthly settlements ; the second is that debtors should start repaying debts outstanding for more than eighteen months. The Germans lead the creditors and have mobilised the Dutch, Belgians and Swiss behind them. The British have spoken for the debtors and have argued that the extent of Britain's liberalisation—which has now reached 80 per cent—was based on the assumption that it would involve no losses of gold. This assumption would clearly be wholly falsified if Britain were called upon to take on large additional obligations to repay in gold part of its $550 million overdraft with EPU—all of which has been outstanding for over eighteen months.

The British opposition to funding and automatic repayment of these long-outstanding debts might be softened, given assurances of good creditor behaviour. The opposition to any hardening of the gold-credit settlement in EPU is likely to prove much more intractable. This is an issue on which the British representatives will battle to the end. They regard the adequacy of EPU credits as part of the formula for the great collective approach to freer world

trade and payments to which Britain and the rest of the Commonwealth pledged itself at the Sydney conference. The British attitude has, moreover, been considerably reinforced as a result of the recent meeting of Uniscan in London, at which the representatives of the Scandinavian countries declared themselves wholly in agreement with the British attitude on both these issues.

ICI Shows the Way

NORMALLY a quiet investment market is expected in the days immediately before the budget. This year there has been no period of stagnation, scarcely even a pause. Any doubts that investors felt seemed to be dispelled by the Economic Survey which fired a fresh rise in gilt-edged. So the new Stock Exchange account opened brightly on Wednesday with small investors as well as the big in pushing a wide range of prices upwards. *The Financial Times* industrial share index on Wednesday rose 1.5 points to 138.9 which is only 1.3 below its February peak. Gilt-edged and a wide range of industrial shares equally shared in the movement. Foreign bonds did likewise as investors revised their views on the credit-worthiness of Germany and Japan.

Unlike other pre-budget periods there has been no pause in the flow of new issues. The big event of the week was the heavy oversubscription of the £30 million ICI Loan stock and the start of dealings at 2⅝ premium over the issue price of par. The stock which was obviously attractive to institutions provided the greatest new issue success within memory. No less than £304,582,800 stock was applied for and the company did well in finding an allotment for all applicants. Applicants up to £1 million receive 10 per cent of their applications with a minimum of £50 stock, the larger applicants receiving about 8½ per cent of their requirements.

The ICI stock was not the only refinancing operation in the market. It has been flanked by other industrial borrowing and even in the gilt-edged market one small loan was allowed to come forward in the pre-budget week. The East Africa High Commission issued £2,045,000 of 4 per cent stock 1972/74 of which £445,000 was taken up by colonial government funds and £1,600,000 was offered to the public at £97 15s. per cent. Although this was a small issue in which a regular free market can hardly be expected, the terms were well received and the lists were promptly oversubscribed on Thursday. Applicants up to £400 received full allotment; from £500 to £5,000 the allotment was £400; and over £4,000, 10 per cent of the amount applied for.

Boost for Commodities

THE new American policy for the purchase of materials for the strategic stock (which is described on page 27), will be a favourable short-term influence on world commodity prices. Although purchases will be mainly of domestic products, foreign prices of the affected materials will benefit indirectly, and higher import duties on such metals as lead and zinc should at least be postponed. The strategic stock of these two metals was completed last year, but the additional purchases do not represent a change of official policy. The American government's contracts with domestic producers of lead and zinc oblige it to take up metal if prices fall to given levels, which vary with individual mines. Following the fall in prices earlier this year, the government was preparing to absorb further quantities of these and other metals, and it announced only last month that supplies in excess of stockpile requirements could be added to the stock, if the President deemed it to be in the public interest.

In copper, of which the strategic stock may still be short despite the purchase of 100,000 tons from Chile, the contractual floor price is generally about 24 cents a lb (£192 a ton). Allowing for the tariff of 2 cents a lb that would automatically come into force if the American price fell below 24 cents, the world price should tend to be maintained at about 20 to 22 cents (£160 to £176 a ton). The new policy also helps to explain the recent American purchase of another 20,000 tons of Indonesian tin, though the intended level of the strategic stock has already been exceeded by about 40,000 tons. This purchase will greatly ease the initial buffer stock operations of the International Tin Agreement, if it comes into effect.

The new policy may also help to stabilise commodity prices because the United States should be able to avoid paying scarcity prices in times of emergency, but in the long-term it may endanger prices, particularly of those commodities produced mainly outside America. Barring another war, the day will come when the strategic stock will be disposed of, at least in part. However carefully this is arranged, some prices are bound to suffer, and Congress may be less considerate to the interests of foreign producers than of domestic industries. Meanwhile American industrialists may carry smaller working stocks because their government is in effect standing behind them with ample supplies. Moreover, the new policy strengthens the already predominant influence of the United States on world commodity prices, and marks a further interference with the free markets.

Ford Looks Forward

THE full report of the Ford Motor Company is an account of success, admirably filling in the background to the trading results discussed in these columns last week. The statement by Sir Rowland Smith, the chairman, also shows how Ford intends to build on its achievements. The only fault in the report is the failure to make clear how much Briggs Motor Bodies contributed to last year's results.

Last year the group earned a profit, after depreciation but before taxation, of £15.8 million from the sale of 234,379 vehicles, involving a money turnover of nearly £106 million. The consolidated balance sheet shows that these record achievements were accompanied by the expenditure of £4.7 million on capital account (excluding the £5.6 million cost of acquiring Briggs) and an increase of about £2 million in stocks and work in progress. The group's portfolio of British government securities was also

Time to spare . . . with this power mower

and 12 monthly payments of **£2.7.5**
(Cash price **£32.5.0** *plus* **£6.8.0** *Purchase Tax)*

EASY on your time, EASY on your pocket, the ROTOSCYTHE does *everything* in *one* operation, and is so EASY to handle.

Why choose this particular mower? For these

ROTOSCYTHE REASONS:

- Light and easy to handle, the *engine* does the cutting.
- Cuts any length of grass by unique rotary action—your "after holidays" and "bad weather" troubles removed.
- Slices through all stalks, leaving a perfect finish.
- Collects *all* grass by vacuum suction.
- A full year's guarantee.
- Sucks up leaves, stalks, pine needles, etc.—no raking.
- It even removes moss by a simple adjustment.
- Gives an immaculate, smooth, banded finish.
- No regrinding, saving pounds each year.
- A free demonstration can be arranged.

POST THIS COUPON NOW for your FREE 20 page booklet "The Story of a Beautiful Lawn" full details of other Rotoscythes and the name of your nearest agent.

it is reported that retail expenditures have not fallen even as much as might have been expected from the primary loss of incomes. The life insurance companies report the strange phenomenon of new business and surrenders of existing policies both rising together—which can only mean that while some people are having to draw on their savings, others are unperturbed. If a small reduction in acceptance rates in New York City can produce this effect throughout the country, then there is much more magic in money than anyone has ever supposed.

*

What, then, is the cause? Again it is important to form a view, if only to be able to guess whether it will happen on another occasion. But unfortunately, it is very difficult to know, since the answer lies somewhere in the dark unexplored recesses of mass psychology—the most neglected of the social sciences. It may be partly due, by paradox, to the widespread slump talk itself. There is an old saying on the Stock Exchange that expected bad news, when it comes, puts the market up. Possibly this reflects a general trait of human psychology. (In which case, economic forecasters will after all turn out to have some social value; they can help the community by always being proved wrong.) In part, the present mood of confidence in the American people may be merely the fruit of the long period of astonishingly good trade. In that mobile and sanguine society, the collective memory is short, and just as the British people are accused of acting as if the Great Depression had never ended, the American people may have convinced themselves that it can never start again. It would be wrong wholly to exclude the possibility that the advent, after twenty years of New and Fair Deals, of a Business Administration may have had a more profound effect on the ordinary man's attitude than is apparent in the more sophisticated atmosphere of Washington.

All this is speculation, and nobody can be sure that he has caught hold of a piece of the truth. The phenomenon is undoubtedly there, and one cannot do more than guess whether or not it is a permanent change in the climate of opinion. The judgment may perhaps be ventured—without evidence, for there is none—that it is more of an occurrence than a reformation, more adventitious to the present circumstances than reliable for the future. When, in riding a bicycle, there is a small wobble, the weight of the body will help to restore balance. But if the wobble goes beyond a certain point, the weight of the body will bring the rider down. Clearly, the crucial point in the American economy is (at least for the moment) further over than anybody supposed. But it still exists, and if ever a trade fluctuation reaches it, then all the familiar snowballing effects will come into play. Indeed, they may have all the greater effect for having been suspended in the early stages.

If this explanation is correct (and this is one more bet that ought to be hedged), then it follows that the problem of preventing depressions is still with us. Certainly it would be wise to assume so. After all, it defies common sense to believe that a seriously impending depression can be headed off with nothing more than the few gestures that have been made in Washington. It cannot be as easy as all that to bring to an end a natural phenomenon that has lasted for as long as there are commercial records. It would be prudent to wait until there is much better proof than yet exists, if only because the penalty for being over-cautious is so infinitely smaller than the penalty for being over-credulous.

As a provisional conclusion, then, it can be said that if the American recession does not happen (the hedge is still there), it will be mainly because it does not happen and not because anybody has stopped it. From this it follows, of course, that it may happen another time. That is an uncomfortable thought, but it still seems a realistic one. And some solace can be drawn from the fact that every year granted to the world, especially to the Old World, to work its way out of the hazards that now surround it is a year of the purest gain.

England at War

We have to commence our paper this week with the announcement—that the nation is at war. Numerous rumours and alarms that such a condition might arise have prevailed at different times since 1815; but since that epoch, for the long period of thirty-eight years, England has been at peace with all the Powers of Europe. . . . It must now be clear to all that war could not have been averted by anything short of submission to or connivance at the ulterior designs of Russia; that those designs were of a nature which would have rendered any compliance on our part at once foolish and wicked; and that, even if yielded to at present for the sake of peace, they must soon have involved us in a war at least as inevitable and far more disadvantageous than that into which we are now about to enter. . . . All the zeal for peace, all the hatred of war, therefore, which distinguishes so many of our countrymen . . . must now be turned against the Potentate who has made peace impossible; who, with all Europe crying out against him . . . has yet spurned all reasonable compromise. . . . All that is valuable in intellectual advance; all that is noble and dignified in mental conquest; all that is cherished and essential in religious liberty; all true enlightenment, all civil rights, all worthy and secure enjoyment—are bound up with our triumph in the coming struggle. The extension, or even the consolidation, of Russian dominion over Europe is, we are solemnly convinced, synonymous with a surrender of nearly all that we have won by the efforts and the sacrifices of ages . . . with the retirement of the high and dear-bought civilisation of the West before the mediæval and benighted semi-barbarism of the East. We are fighting, therefore, in the noblest cause in which weapons can be wielded, or armour girded on, or treasure lavished, or willing blood poured out like water; and while ostensibly engaged only in defeating Russian troops and destroying Russian navies, we are, in sober unexaggerated truth, occupied in baffling, driving back, and crippling the enemy of all the highest interests and most sacred hopes of the human race.

The Economist

April 1, 1854

Notes of the Week

China is Warned

MR DULLES'S speech on Monday night must be judged by its results. In effect, he issued an ultimatum to the Communist powers that, unless they call off their offensive against South-East Asia, the United States will go in as a combatant ally of the French in Indo-China. The Secretary of State was almost certainly induced to make this announcement by the crucial doubt which hangs over the fate of Dien Bien Phu, and by the presumption that the Communists will seek to exploit their position in Indo-China to the utmost when it comes to bargaining at Geneva. Taken at its face value, the statement marks an historic shift in American policy towards Asia. It is a specific elaboration and extension of the new look in American foreign policy which Mr Dulles announced in January.

There are, however, several questions which spring to mind, and it is on the way they come to be answered that the full extent of Washington's mood and purpose must ultimately be assessed. Will the Chinese—and, to a lesser extent, the Russians—take Mr Dulles sufficiently seriously not to persist in seeing whether and how far he may be bluffing? And if they do not change their present tactics, at what point would America act—if and when Dien Bien Phu falls? How will direct American intervention be undertaken? Will an effort be made to act through the United Nations, as in Korea? If through Uno, how is aggression to be defined? If not, to what extent is this essentially American ultimatum to be concerted with America's allies, and in particular Britain? And—by no means the least important aspect of the problem—assuming that the American public is willing to take up another military burden on the Korean scale, how is that to be turned to full political advantage in South-East Asia itself?

Although these are all vital questions to which no one may yet know the answers, that they should be posed at all is a welcome step forward. Compared with the uncertainty about the American attitude which led up to the Korean war, Peking and Moscow have now been fully warned. Compared with the American indifference to the fate of the South-East Asian mainland which existed only five years ago, the wheel has turned full circle and this is now declared to be an area of direct interest to the United States.

The international background to Mr Dulles's speech was as important as its tone. Speaking with the forthcoming Geneva conference directly in mind, he emphasised that China can be accepted there only for the purpose of negotiating about Korea and Indo-China; that this constitutes no formal recognition of the Peking regime by the United States; and that America will continue to oppose Chinese admission to Uno. "It is now American policy," Mr Dulles said, "not to exchange United States performance for Communist promises." And again: "we dare not forget that during the period when we accepted Communist promises at their face value . . . the danger steadily grew." No one who sees the present danger growing in Indo-China, and so to the rest of South-East Asia as well, can fail to sympathise with the agonising dilemma in which the Americans are placed. The doubt must lie in the effectiveness of the decisions they have reached.

Hydrogen and Hot Air

THE Labour Party is never happier than when it has an excuse for being solemn, and the American miscalculation in the recent hydrogen bomb tests has given it an uneasy but obvious thrill. Opposition members came down to the House at question time on Tuesday ticking loudly and excitedly, and there was genuine surprise when the Prime Minister failed to explode. Ever since his May 11th speech Sir Winston has entranced the Left with a series of speeches which in idiom and sometimes even in doctrine have been Bevanist, but better expressed. Labour's questions on the H-Bomb were expected to usher in another instalment, and there was genuine irritation when he mumbled instead through a prepared and reticent brief. One theory advanced by Sir Winston's fans on the Left is that he was really provoking the Opposition to do its anti-American worst and so strengthen him in his dealings with the White House; they point out that within 24 hours more information had emerged from Washington and Sir Winston had cheerfully agreed to a debate he would not concede the previous day. The alternative (and correct) explanation, that Sir Winston was really being responsible, is dismissed as too unexciting to be true.

Meanwhile the stream of emotionalism on the Labour benches, which Sir Winston has so lavishly fed in recent months, has grown into a torrent engulfing not only the Left but the simpler-minded moderates. As this issue goes to press Labour's line for Monday's debate is still not settled, but it is clear that the party leaders are having to allow not only for reasonable anxieties about the details of the Pacific tests but for a recrudescence of all the familiar panaceas for every international problem—meetings of heads of states, disarmament conferences and the rest. More than 100 Labour MPs have signed a motion calling for the "outlawing" of the hydrogen bomb through a disarmament conference. The wiser heads recognise the dangerous irrelevance of advancing such theories at this time, but there is a rather huffy feeling on the Opposition front bench that the party moderates are under no obligation to pull

extended, rising from £6.2 million to £21.5 million. In all, the group's investments and other liquid assets rose from £22.5 million to nearly £39.2 million. But Sir Rowland explains that part of this high figure is offset by £18.5 million for company taxation and £5.3 million for PAYE and purchase tax, so that the net balance of liquid assets is £15.3 million. He adds that the company has "plans in view for development during the next few years which will require all this, and more from future earnings."

* On increased capital.

Sir Rowland does not lack the courage to take a decisive view of the future. He does not expect any "sudden evaporation of export markets" unless inflationary tendencies at home get out of hand, and he is confident that the company will this year at least maintain the 1953 level of exports (about £45 million) if no grave economic or political disturbances occur. He takes an equally confident view of prospects at home. Hopes of higher dividends in the future gained strength from this forthright review and the £1 ordinary shares put on another 2s. 9d. to 52s. 1d. They have been helped also by the announcement that the company is to adopt the policy of declaring interim dividends.

Vauxhall in Top Gear

In September Vauxhall Motors celebrated the fiftieth anniversary of the production of its first car. Fittingly, the half centenary was a year of records, in which the American parent company, General Motors, received at long last a worthwhile return on its investment. The stronger flow of raw and semi-finished materials enabled Vauxhall to reap a full return from the £14 million it has spent on re-tooling and re-equipment in the last five years. Vauxhall sold 110,141 cars and trucks last year, an increase of 38 per cent over the 79,162 vehicles produced in 1952, which was well above the average increase shown by motor manufacturers in this country. Of this number 66,435 vehicles were sold abroad, or 17 per cent more than in 1952. Like the other motor manufacturers Vauxhall is fighting to keep its place in overseas markets, but at home its customers are still willing to wait some time for delivery.

Following an increase of 32 per cent in the value of its sales, from £44½ to £58½ million, Vauxhall's net profits jumped from £1,652,000 to £3,427,000. This increase gave the company its chance to reward General Motors, which owns the whole of the equity, for its patience while the British subsidiary was being built up to full strength out of retained profits. Last December Vauxhall paid General Motors an interim dividend of £1,800,000 but this sum was immediately reinvested by General Motors in a new issue of Vauxhall's ordinary stock. General Motors is now to receive a final dividend of £1,637,500.

EARNINGS AND ASSETS
(£ '000s)

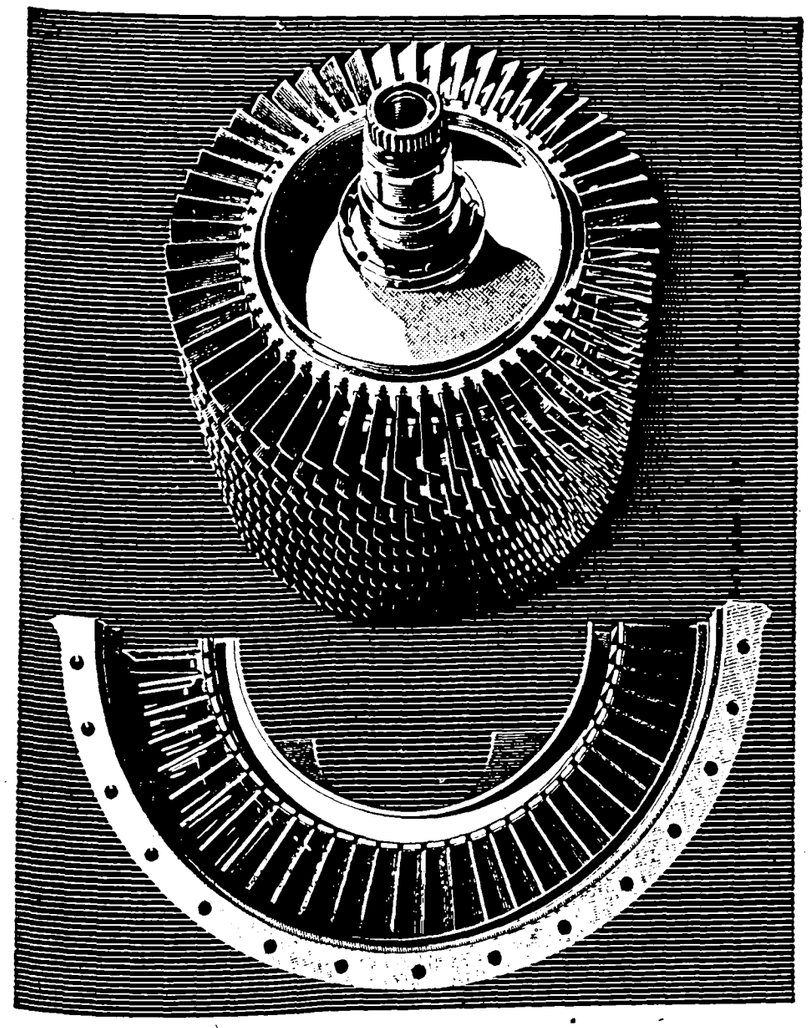
Ordinary capital	5,000	5,000	5,000

Vauxhall now has ample cash resources to pay this, or indeed a bigger, dividend. Cash balances and tax reserve certificates stand at over £9½ million—in part, the corollary of the decline in stock commitments—and the company is taking the opportunity to pay off the £3 million unsecured loan stock issued in 1949. Like its much bigger rival, Ford Motor Company, Vauxhall is well braced for the test of competitive markets.

Steel Profits and Premiums

In the prospectus offering United Steel ordinary shares to the public, the directors commented that the profit of £9 million in 1952-53 was "exceptionally high." Lowering their sights, they based their dividend forecast of 9 per cent on a profit of about £6 million in the current year. At the general meeting of the company the chairman, Sir Walter Benton Jones, raised the sights and investors' hopes once more, by saying that profits would be "appreciably higher" than the £6 million mentioned in the prospectus. That statement was enough to add 1s. 1½d. to the market price of United Steel's ordinary shares, which now stand at only 3d. discount on their issue price of 25s.

Amplifying this statement, Sir Walter remarked that at home the demand for steel has remained strong and, though export prices have fallen, the group's rate of production and revenue have been well maintained. The trading results so far this year have been better than the directors had expected. The single shareholder in Dorman Long, the Realisation Agency, heard more cautious views from its chairman, Sir Ellis Hunter. Having pointed out that "forward orders both for heavy steel products and constructional and engineering work remain strong," Sir Ellis drew attention to the contraction in the demand for re-rolled products. He seemed far more concerned with the fall in export premiums than Sir Walter, as well he might, seeing that £1.8 million of Dorman Long's profit of £7.8 million in 1952-53 came from these premiums. Sir Ellis was so concerned with the



more power at lower cost

The axial turbo-compressor is an essential feature of every Napier aircraft engine. This example is from the 3,000 e.h.p. Eland propeller-turbine; one of comparable design is used in the Nomad compound engine. Their exceptional efficiency is a major factor in achieving the unparalleled economy of these two remarkable engines.

Every new Napier design springs from 150 years of fine engineering experience.

appear to have figured in the Exchequer returns ; moreover the difference of three days between the dates of the bank statements and the Exchequer returns causes a distortion that could in the final weeks of the financial year easily account for the apparent discrepancy.

Aluminium's Ups and Downs

LAST year aluminium experienced an expanding demand in America, where new uses are growing, and a shrinking demand in Britain, where a larger supply of other metals, particularly steel, brought increased competition. The two trends are shown in the results of two of the big producers, Aluminium Limited and British Aluminium. British Aluminium is the only producer of ingots in this country, and is also one of the largest fabricators ; its results reflect mainly conditions in the home market and earnings have taken the full shock of the probably temporary decline in demand. Trading profits fell from £2,460,991 in 1952 to £882,117 in 1953. The two per cent bonus has been dropped. So the effective distribution is cut from 12 to 10 per cent and even the reduced rate is not fully covered by earnings. The £1 units fell 4s. to 35s. 9d.

Aluminium Limited is a Canadian company, controlling Aluminum Company of Canada and Northern Aluminium in this country, but though it has the largest share of the British market the group's results are not dominated by British conditions. Its three principal customers are the United States, Britain and Canada. The president, Mr Nathanael V. Davis, reports that those three last year took 87 per cent of the group's output, the United States taking no less than 44 per cent of the total. Deliveries to the United States were double the 1952 volume, and the effect on the group's results was such as might be expected from an expanding business in a period of more competitive markets. In quantity deliveries were a record ; the net profit showed a moderate decline.

Roads Below the Line

THE idea that expenditure on the roads should be financed by loan, which has now attracted the enthusiasm of the British Roads Federation, has little to commend it beyond the best of intentions, particularly in the form that the federation proposed this week. Holding, rightly, that a proportion of the annual expenditure on the road system will normally consist of new capital investment, the federation goes on to argue that the whole of road expenditure might be brought "below the line" in the budget. If this proposal were limited to new capital, there would be some logic in it. But the further proposal of a National Highways Authority to be set up with the duty of "national supervision over road needs and road expenditure" is dubious indeed. The authority would have power to cover expenditure on the roads by temporary borrowing and the issue of "British Road Stock," upon which the Treasury would be responsible for paying interest out of current taxation. The federation suggests that such an authority, which would decide how much money should be raised for the roads and how it should be spent, would be "analogous to" the nationalised fuel and transport industries.

This analogy fails at the outset: a highways authority, having nothing to sell, would have no revenue. There would be no vestige of any commercial criterion by which the wisdom and economy of its decisions to spend public money could be judged ; and hence no reason for removing this responsibility for public policy from the Treasury and the Ministry of Transport. An authority raising guaranteed loans to build toll roads designed eventually to pay for themselves would be understandable. But British industry frowns upon toll roads, holding that it has paid already for road development ; this attitude is fair, but it poses the question whether the economies in industrial costs that are put forward as possible from trunk roads would not be worth buying, even accepting the present road levies as part of the general tax burden.

The federation buttressed its proposal for a road loan with a survey of the physical resources required for a reasonable-sized road programme, arguing that these would be readily available—presumably to meet the inevitable argument that any proposal for large-scale road expenditure would be inflationary. This would in fact depend entirely upon economic circumstances. But the proposal to alter the machinery of spending on the roads in order to persuade a government to spend an adequate amount upon this inadequate national asset does not face the main issue. Nationalising the roads to get them out of the control of the Government is full of fascinating topsy turvydom, hardly a promising idea if one considers the experience of other nationalised industries. It is not machinery and method but determination and policy that will bring more and better roads.

SHORTER NOTE

The most significant statement that Sir Ernest Bailey made at the annual general meeting of Associated Electrical Industries was that total orders received during 1953 were smaller than in 1952. Even so, orders still amount to the "comforting total of £124 million with deliveries extending into 1957." In relation to an order book of that size his statement that invoiced shipments at home and abroad last year totalled £86.1 million, an increase of 13 per cent over the 1952 total of £76 million, provides a standard for comparison. Sir George closed his statement with a stern warning about the dangers of foreign competition, but softened its implications by pointing out that AEI is to embark on a long term expansion plan for the manufacture of heavy electrical plant, steam turbines and television and switchgear components.

Company Notes

DE HAVILLAND. The de Havilland Aircraft Company reached a new altitude of prosperity last year. Its profits, which in the year to September 30th soared from £1,678,043 to £2,639,193, include the profits made on the sale of the Comet I's but they have yet to benefit from the sale of the latest Comets now in production. Moreover, the absorption of about £6 million from last year's preference and equity issues into the business still has to have its full effect on earnings. At this stage, then, the directors could hardly be expected to do anything more than to live up to the forecasts made when the new shares were offered.

As forecast in last year's prospectus, the group's profits are substantially in excess of those earned in 1951-52. But as the tax bill, which must contain a considerable provision for EPL, has risen from £1,053,175 to £1,799,112 net profits have increased by no more than £223,560 to £820,768. The directors have also stuck to their promise to pay the same dividend as before—that is 7½ per cent on the original ordinary capital of £4,385,459, and a quarter of this rate, 1⅞ per cent, on the now £4,385,459 ordinary stock issued last June.

	Years to Sept. 30, 1952	1953
Consolidated earnings:—	£	£
Profit, before tax	1,678,043	2,639,193
Taxation	1,053,175	1,799,112
Net profit	*597,108*	*820,768*
Ordinary dividends	172,677	226,125
Ordinary dividends (per cent)	7½	7½
Retained by subsidiaries	282,179	321,156
General reserve	250,000	450,000
Added to carry forward	93,228	20,241

£1 ordinary stock at 27s. 9d. yields £5 8s. per cent.

With EPL out of the way and with the prospect of satisfactory profits, the company should have little difficulty in at least maintaining a rate of 7½ per cent on the enlarged equity capital of £8,770,918. But it would be foolishly optimistic to assume that the company will necessarily make payments greatly above this rate, for the recent issues of new shares cover only about a half of de Havilland's prospective capital requirements. And as the balance will be found from future profit retentions and bank loans, the curbing rein on dividends may be tight.

LEWIS'S INVESTMENT TRUST. Through Lewis's Ltd., Lewis's Investment Trust controls the activities of a chain of department stores in the Midlands and the north of England. Through Selfridge (Holdings) it controls the activities of one of London's largest department stores. Through these subsidiaries it has interests in the grocery and food trades. Hence, its report (for the year to January 31st) might be expected to throw light on the experience of department stores last year. Unfortunately, though the chairman, Mr. S. H. Leake, provides a running commentary on the financial results he gives only a few scanty details about the course of trade. All that is certain is that the group's turnover went up again last year ; this increase, however, was "not spectacular" but represented "a process of consistent growth." Mr Leake makes it equally clear that wages are still rising and when he compares these increases with the trend in selling prices (which seem to be no more than stable) he hints at a drop in net margins.

Total profits, however, advanced last year. The consolidated trading profits of Lewis's Investment Trust (which are an aggregation of all the profits earned by the group) increased from £4,216,306 to £4,346,769. Like the parent the two principal subsidiaries have reported increases in both gross and net profits. Similarly, their balance sheets show slight but significant increases in stocks. Mr Leake explains that the directors have deliberately adopted "a policy of moderate stock expansion to stimulate trade by increasing both the range and variety of merchandise." It is in this policy and the allied one of spending money on capital improvements and extensions that the department stores' answer to the growing success of the multiple stores may have to be found. Lewis's group is preserving its cash resources so as to cover its building commitments, of which the biggest is for the building of a store in Bristol. The 10,500 ordinary stockholders in the company will follow these plans with the closest interest, for they may contain the seeds of higher dividends. After the full report was published the 4s. ordinary stock units were marked up, so that at the current price of 32s. 6d. they offer the meagre yield of 4 per cent.

THE BRUSH GROUP. The impression given by the preliminary report of the Brush group is that the company is beginning slowly to pull clear of its troubles. Yet that is hardly more than an impression, for the report gives very few hard facts to prove that the reorganisation of the group (which effectively took place only a year ago) has had any startlingly beneficial effects. Two facts do point that way. First, the directors have raised the ordinary dividend from 4 to 6 per cent—an attempt, perhaps, to pass on a return of confidence within the organisation to the shareholders. Secondly, Brush has finally cut its losses on the disastrous Indian tube well contracts.

In 1952 the net loss on these contracts of £308,970 (after allowing for tax relief) was written off the year's profits. Last year's further net loss of £159,877 was covered by the sum of £180,000 transferred from general reserves in 1952 to meet just that contingency. A further provision of £250,000, presumably balanced in the profit and loss account by the appropriation of £250,000 to general reserves, has been made to cover any further operational losses on these contracts and the losses which will be incurred in closing down this operation.

	Years to Dec. 31, 1952	1953
Consolidated earnings:—	£	£
Sales	23,341,883	20,845,701
Operating costs	21,034,773	18,776,241

Ordinary dividends	50,400	79,200
Ordinary dividends (per cent)	4	6
General reserve	...	250,000
Added to carry forward	33,893	16,962

5s. ordinary stock at 6s. yields £5 per cent.

Either directly or indirectly, the Brush group sells about 75 per cent of its products abroad. Although the emphasis since the reorganisation has been on the manufacture of equipment other than diesel engines, the diesel side of the group's activities is still the backbone of the business. Judging by the fall in group turnover from £23,341,883 to £20,845,701, overseas markets must have been more difficult to penetrate last year. The drop in sales by £2½ million has been followed by a fall in trading profits of only £237,650, to £2,069,460. And after the complicated shifts in the accounts relating to the losses on the tube-well contracts and the release of taxation provisions, net profits have risen from £136,990 to £404,078, providing a much more substantial cover for the dividend.

★

CANADIAN PACIFIC. British shareholders hold just over a quarter of the equity and over 95 per cent of the preference stock in Canadian Pacific. Unlike investors in the United States they were not net sellers of CPR's equity last year. But the company's full report should drive home to them the lesson which once again was to be learned from

the preliminary report, discussed in these columns on March 13th. It is that "Canpacs" are not simply railway stocks; earnings from other sources, on which the true worth of the equity depends, can and do fluctuate alarmingly.

Last year the ratio of net railway earnings to gross earnings fell from 6.3 to 6.1 per cent, which with the two exceptions of 1948 and 1949 was the poorest ratio in the history of the company. Freight traffic fell by about 5 per cent, but thanks to the increase in freight rates, gross earnings advanced. This increase was matched, however, by a rise in operating costs, especially in wages and the cost of materials needed for maintenance. Net earnings from the railways remained

	Years to Dec. 31 1952	1953

$25 ordinary stock at $44 yields £6 4s. per cent.

practically unchanged; and ominously, though the company spent $86 million on additions and improvements to the railways, it had to defer part of its maintenance programme.

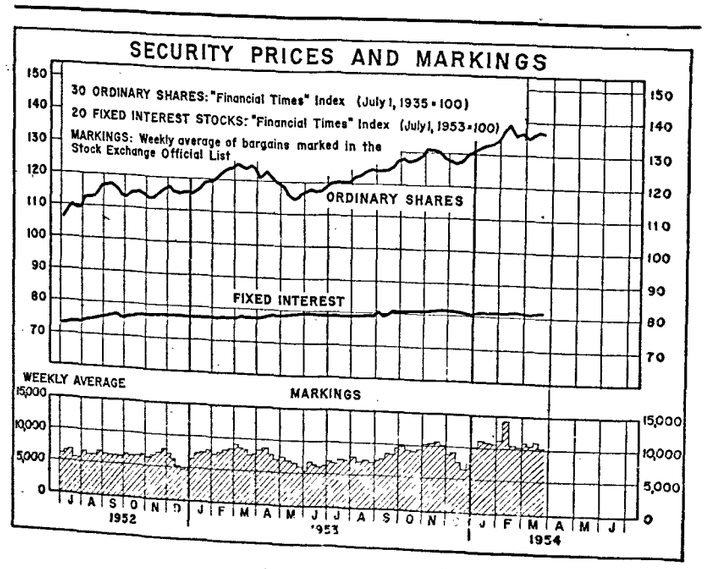
With railway earnings almost unchanged and the company fighting a losing battle to secure freight increases as fast as costs rise, the fate of the Canpac dividend (which was maintained at 6 per cent) turns on the receipt of income from the company's other interests. Last year the total income from these sources fell from $22.6 million to $16.8 million. A profit of $3.7 million from shipping was turned into a loss of $500,000 and dividend income fell by $3.7 million to $11.3 million, following the reduction in the dividends paid by the Consolidated Mining and Smelting Company of Canada. The only really promising feature was the rise in the receipts from petroleum rents, royalties and reservation fees by $3.7 million to $7.3 million; this improvement is shown in the land surplus account and not in the earnings statement. In all, 1953 must be regarded as a disappointing year for this trans-continental giant.

★

JOSEPH LUCAS. Towards the end of last year the directors of Joseph Lucas (Industries) decided to discontinue the payment of interim ordinary dividends. But their decision was so strongly criticised that it was quickly withdrawn. The directors seem to have taken the criticisms to heart, for now they have actually increased the interim payment, from 4d. to 6d. on each £1 share. This announcement was not accompanied by a warning that the higher dividend was an attempt to even out the interim and final payments. By raising this payment, therefore, the directors have implicitly endorsed their critics' case.

The new dividend will be paid on the redeemable preference shares (which are all owned by the Lucas Workers Bank) as well as on the ordinary shares. The directors have asked for Treasury permission to capitalise reserves and issue one new share for every redeemable preference and ordinary share in issue. If this consent is granted the company intends also to issue for cash at par 150,000 new £1 redeemable preference shares to the Workers Bank; these shares will participate in the scrip issue.

Following the news of the bigger interim payment, the £1 ordinary shares were marked up by 5s. 3d. to 64s., on the assumption—for assumption it is—that the final dividend will be raised exactly in line with the 50 per cent increase in the interim payment. This would make the full year's distribution for the year to July 31st next 3s. 3d. a share. Even on that basis the £1 ordinary shares at the current price of 62s. 6d. xd would yield only 5.2 per cent.



LONDON STOCK EXCHANGE

Next Account begins: April 21st.
Next Contango Day: April 21st.
Next Settlement Day: April 6th.

THE stock market, which had been reasonably firm at the end of the old account, began the long Budget and Easter account in good fettle. Reading into the Economic Survey the possibility of some tax reliefs to help investment, investors bought equity stocks, producing a gain on Wednesday of 1.5 points in the *Financial Times* ordinary share index to 138.9. British government securities were also firm, with buyers going longer.

An outstanding feature of the market was the surge forward in German issues in advance of the *ex gratia* payments and the publication of the formal settlement offer. Heavy buying was again reported from Switzerland and dealers in the foreign market became more convinced that much of this demand represented buying by the German authorities. In the two days before the price of the loans were adjusted downwards to the *ex gratia* payments the Young loan gained 7⅝ to 141 and the Dawes loan 4¼ to 94¼. Some profit-taking was reported on Wednesday and, after allowing for the *ex gratia* adjustments, the Young loan made a net loss of 2¼ and the Dawes loan of 3. The *ex gratia* adjustment in the case of the Dawes loan was 8¼, and 7¼ in the case of the Young loan. Japanese issues were buoyant on President Eisenhower's statement about special tariff considerations for Japan.

The most prominent feature in the generally firm equity market was a fresh bout of buying of "Gussies" which within three days, after some favourable comment over the week-end, gained 10s. 1½d. to 78s. 1½d. Other store issues were supported, as were textile shares; Horrockses rising on suggestions of a possible bid. The firm denial of the directors of the Ritz Hotel of take-over reports brought the shares 2s. 6d. down to 32s. 6d.

Oil shares were also firm with Royal Dutch leading the advance after suggestions of a share distribution had been renewed. Having remained quiet at the end of the account, Kaffirs turned a little firmer on Wednesday.

(1) From August, 1953, the index has been revised to show a more representative wheat price. (2) Figures up to July, 1953, relate to delivery prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. (3) The index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (4) Annual figures are based on unit values and are therefore influenced by changes in the composition of trade as well as price movements. (5) Surveys made twice a year; annual figures relate to October survey.

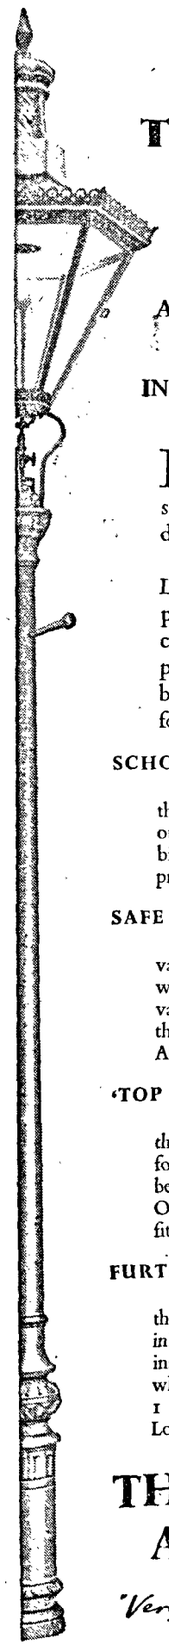
(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade; Belgium includes Luxemburg. (3) Average of third quarter.

THE LONDON OMNIBUS



A VEHICLE OF INFORMATION

LATE IN THE 90's this double-decker steam omnibus served the public up and down the Thames Valley.

Buses come and buses go. But one London Omnibus has been serving the public for over 200 years—the "omnibus" collection of all kinds of insurance policies for all kinds of people offered by the London Assurance. Here are a few of them:

SCHOOL SUMS

When fathers start adding up school fees they are sometimes nonplussed. By taking out an Educational Policy long before school bills get really formidable, they find this problem greatly simplified.

SAFE GUARD

You may be very cautious about your valuables. Your safe may be sound, your watchdogs may bite. But even so, valuables vanish and furs fly. Sentimental value apart, the loss won't hurt so much if you have an All-Risks policy to safeguard you.

'TOP HAT' EVENINGS

Directors and senior executives, unlike those they employ, are often left to provide for the evening of their much-taxed days as best they can out of savings. The London Omnibus carries a 'Top Hat' scheme; which fits almost anyone who wants a 'Top Hat'.

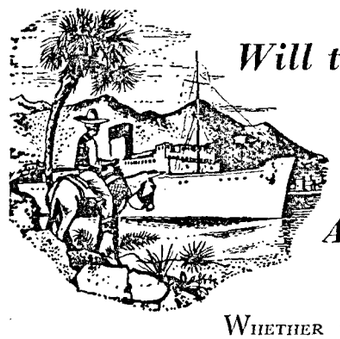
FURTHERMORE . . . .

If you would know more about any of the policies outlined here, if we can provide information about any other policies or about insurance problems generally—pray make what use of us you wish. Our address is 1 King William Street, Department V, London, E.C.4.

THE LONDON ASSURANCE

"Very good people to deal with"

EXPORT QUESTIONS NEED EXPERT ANSWERS



Will they take ships in South America?

WHETHER you are exporting liners or launches, tractors or transformers, the markets of Latin America pose special questions about currency, import regulations and exchange control. As the only British Bank with branches throughout Latin America, we are particularly well equipped to answer these questions promptly and accurately, and to advise and assist you in many other ways.

Our *Fortnightly Review*, a digest of reports sent in from our 56 Branches in South and Central America, is an invaluable summary of economic information for all who trade in these markets. We shall be glad to send you a specimen copy on application to :—

ABRIDGED REPORT

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

SEVENTY-THIRD ANNUAL REPORT OF THE DIRECTORS FOR THE YEAR ENDED DECEMBER 31, 1953

TO THE SHAREHOLDERS :

The volume of freight traffic was second only to that of the previous year, while gross earnings of your railway operations were higher than ever before as a result of increases in freight rates which became effective early in the year. Although the reduction in traffic volume was fairly general and was particularly marked towards the end of the year, there were important increases in certain commodities. The carryings of grain and grain products, while at a high level, declined somewhat despite the harvesting of one of the largest grain crops in Canadian history. Stocks of grain remaining available for rail shipment were the highest on record.

Mounting wage costs and the failure to achieve the traffic volume which had been hoped for at the beginning of the year made it necessary, by mid-year, to curtail maintenance expenditures and so to defer part of the work which it had been planned to undertake to maintain your railway property. Despite this step, working expenses increased by an amount sufficient to overtake the increase in gross revenues. Net earnings from railway operations were, therefore, at the same level as in the previous year, and thus, once again, were far from sufficient to provide a fair return on your railway investment.

The Income, Profit and Loss, and Land Surplus Accounts of your Company show the following results for the year ended December 31, 1953.

INCOME ACCOUNT

Gross Earnings		$470,571,371
Working Expenses		441,686,799

TIME INCORPORATED

(NEW YORK)

An Eventful Year

International Appeal of Company's Magazines

Strong Circulation Positions Maintained

Life en Español Wins Immediate Popular Acceptance

ANNUAL REPORT TO STOCKHOLDERS

THE annual report of Time Incorporated, New York (chairman of the board, Mr. Maurice T. Moore; President, Mr. Roy E. Larsen), covering the year 1953, has been circulated to stockholders. Time Incorporated publishes *Time*, *Life* and *Fortune* magazines, *House & Home* and the *Architectural Forum*. *Time* and *Life* also appear in various international editions.

Net profit for the year was $8,144,000, or $4.18 per share of common stock outstanding at the end of the year. This compares with a net profit for 1952 of $7,750,000, or $3.97 per share.

Dividends have now been paid by the company without interruption for the past twenty-four years. The 1953 dividends amounted to $2.50 per share, a total of $4,887,000, as compared with $2.37½ per share in 1951 and 1952.

Revenues from operations totalled $170,449,000 the highest in the company's history. This compares with $156,786,000 for 1952. The increase of $13,663,000 is attributable primarily to increases in advertising revenue.

Net profit before taxes of $16,259,000 for 1953 was the highest in the company's history, but the net after taxes was less than was reported for the years 1948 and 1950.

While circulation and advertising revenues during 1954 will depend to some extent on the course of the economy, they are presently running slightly ahead of the similar period last year. We expect to see them well maintained for the year as a whole. Costs and expenses will be at a somewhat higher level in certain areas, but operating efficiencies in many departments of the company are expected to offset any material increase in the over-all level.

THE YEAR IN REVIEW

The past year was one of expansion in many varied fields of activity.

At the beginning of the year, the company published its first foreign language magazine, *Life en Español*, which met with immediate popular acceptance in Spanish-speaking countries in Latin America.

During the year the company continued development work on another new magazine, a sport weekly. While final decision is reserved, we are proceeding on the basis that the magazine will come out this year. Currently we have a staff working on its editorial and publishing plans, under the direction of H. H. S. Phillips, Jr., as publisher, and Sidney L. James as managing editor.

In July *March of Time* production activities were suspended, although its inventory of programs continued to be sold to television stations.

Construction of the $27,500,000 pulp mill in south-east Texas, in which the company has a one-half equity interest, is proceeding on schedule and it is believed that this mill, when completed later in the year, will be one of the most modern mills of its kind in the world.

In June, 1953, the company purchased a controlling interest in the Intermountain Broadcasting and Television Corporation in Salt Lake City, the licensee of stations KDYL, KDYL-FM and KDYL-TV, and in March, 1954, contracted to purchase 100 per cent of the stock of Aladdin Radio and Television, Inc., in Denver, the licensee of stations KLZ, KLZ-FM and KLZ-TV.

CIRCULATION OF MAGAZINES

The average net paid circulations of the various editions of our magazines as compared with 1952 were as follows:

	1953	1952
Life	5,473,000	5,326,000
Time	1,769,000	1,710,000
Fortune	245,000	249,000
Time International (combined)	377,000	351,000
Life International	285,000	302,000
Life en Español	210,000	—
Architectural Forum	47,000	46,000
House & Home	97,000	106,000

As indicated by these figures, all the magazines continued to show strong circulation demand and reader acceptance.

Life passed the 5,400,000 mark and maintained its leadership among weekly magazines. Effective February 1, 1954, *Life* increased its circulation base for computing advertising rates by 200,000 to 5,400,000.

Time again showed an increase and as of January 4, 1954, it raised its circulation rate base from 1,700,000 to 1,800,000.

Fortune, *Architectural Forum* and *House & Home* continued their circulations at substantially previous levels. *House & Home's* slight loss reflected the dropping out of some initial non-professional subscribers.

The combined circulations of the four international editions of *Time* were 377,000 compared to 351,000 in 1952, with each edition showing an increase over 1952.

The circulation of *Life* International's world-wide English language edition declined from 302,000 to 285,000, reflecting in part the transfer of readers in Latin America from the English to the Spanish edition. *Life en Español*, starting at 149,000 circulation, averaged 210,000 for the year and at year-end, with 232,000 circulation, had the third largest circulation among all newspapers and general magazines in the Spanish-speaking world.

ADVERTISING REVENUES

Net advertising revenues for the company's publications totalled $127,512,000 in 1953, as compared with $113,310,000 in 1952.*

In a year of very aggressive competition in the magazine, newspaper, radio and television fields, advertisers placed the greatest dollar volume in *Life* in its history, an increase of approximately $9,700,000 over 1952. For the seventh consecutive year, advertisers invested more dollars of national advertising in *Life* than in any other magazine, radio or television network. On February 1, 1954, with an increase in *Life's* circulation rate base from 5,200,000 to 5,400,000, its advertising rates were increased approximately 6 per cent.

Time's 1953 advertising revenues were up more than $2,000,000 over 1952. As of January 4, 1954, with an increase of 100,000 in its circulation rate base, advertising rates were increased approximately 8 per cent.

Advertising pages in *Fortune* were 1,769 in 1953 as against 1,586 in 1952 and advertising revenue was up 12 per cent.

Advertising pages in *Time* International's four editions totalled 4,991 in 1953, compared to 4,519 in 1952, and revenue increased by more than 20 per cent. The advertising rates on all four editions are being increased in 1954 to reflect increased circulation and higher costs.

It is particularly noteworthy that the number of advertising pages carried by *Time's* Canadian edition in 1953 exceeded that of the next highest Canadian general magazine by more than 1,000.

Life International's English edition ran 658 pages, compared to the previous year's 695. *Life en Español* carried 626 pages of advertising, a record volume for an international magazine in its first year of publication.

The advertising in these foreign editions is becoming increasingly international in character with advertisers from more than 30 countries represented in their pages. Last year more than 1,400 pages in the six international editions were placed through our offices in Europe, Japan and Latin America. An additional 1,880 pages were placed through our offices in Toronto and Montreal.

House & Home's number of advertising pages increased 18 per cent in 1953 over 1952 and its net advertising revenue was up 50 per cent over 1952 because of increased volume and higher advertising rates put into effect in January, 1953. *Architectural Forum's* advertising volume remained substantially unchanged from the levels of 1952.

* Net advertising revenues are after deducting advertising agency commissions and cash discounts.

EDITORIAL OPERATIONS

In order to report, write and edit the material for the 11 editions of our magazines which were published during 1953, approximately 980 people were employed in the editorial departments. Full-time news bureaux are currently being maintained in 10 cities in the United States and in 17 capitals abroad, ranging from Toronto to Johannesburg to Tokyo. In addition, part-time correspondents are used in 133 cities in the United States and 148 cities abroad. Communications with this news-gathering network result in a flow of over four and a half million words a month into and out of the editorial departments of the magazines in the *Time & Life* Building in New York.

While in 1953 there were relatively few spectacular news stories, there was a continuing interest in the news, and the staffs of our magazines continued to do a vigorous editorial job in their respective fields.

In the course of the year, *Life* concluded its publication of Sir Winston Churchill's Nobel Prize winning history of the second world war and concluded arrangements with Harry S. Truman for the publication of his forthcoming memoirs. It continued its outstanding series, "The World We Live In," with seven more instalments.

To aid *Time's* regular coverage of current events, some changes in the format were made: "Business" was expanded to include a "Business Essay" and "Time Clock," while the editorial feature "Personality," an experiment begun last year, was dropped.

In August, *Fortune* started publication of a monthly series of 12 articles called "The Changing American Market." Based on a long-range research project, the series received wide business attention and has been adapted to a short animated economic film.

SPECIAL EVENTS

In February, 1953, the *Time & Life* Building in London was opened to serve as the permanent home of our English subsidiary company, Time-Life International Limited, for its operations in the British Isles. Because of the striking design of the building, its opening provoked international comment in architectural as well as publishing circles.

Reflecting its growing interest in home-building *Life* joined with its sister magazine, *House & Home*, in sponsoring a series of two-day round table meetings with industry leaders on such subjects as "Tomorrow's House" and "Conservation, Rehabilitation and Modernization." *Architectural Forum* also used the same technique for such subjects as "Urban Traffic," "School Planning" and "The Architect and His Client." The reports on these meetings were printed in our magazines and created widespread professional and popular interest.

Possibly the most important piece of research in the communications field was *Life's* "A Study of Four Media" conducted by Alfred Politz Research, Inc. This monumental research project compared for the first time the accumulative audiences reached by four national magazines, a newspaper supplement, four radio and five television programmes. In recognition of this study the Association of National Advertisers' Magazine Steering Committee broke precedent and passed a resolution commending *Life* which said in part: "Through the knowledge provided by research such as this, advertisers are able to exercise increasingly intelligent judgment relating to the value of various media and to the advertising strategies to be used in promoting their various products."

COMPANY MEETINGS

LEWIS'S INVESTMENT TRUST

PROGRESSIVE AND GROWING GROUP OF COMPANIES

PREVIOUS PEAK LEVELS SURPASSED

MR S. H. LEAKE'S REVIEW OF ACTIVITIES

The twenty-fifth annual general meeting of Lewis's Investment Trust Limited, will be held on April 22nd in Liverpool.

The following is an extract from the statement by the chairman, Mr S. H. Leake, OBE, which has been circulated to stockholders with the report and accounts for the year ended February 1, 1954:

It is my pleasure to present accounts reflecting results even better than the peak levels achieved last year. The increases we have to record are not spectacular, but they represent a process of consistent growth, consolidated at each stage, and then made the base for further development and progress.

The main totals of revenue may be analysed into groups as follows:

		Consolidated revenue	Taxation depreciation interest, etc.	Net profit
		£	£	£
Lewis's Ltd. & subsidiaries...	1954	2,678,304	1,519,332	1,158,972
	1953	2,548,825	1,501,551	1,047,274
Selfridge (Holdings) & subsidiaries ...	1954	1,191,313	719,177	472,136
	1953	1,212,070	762,552	449,518
LIT & subsidiaries other than above...	1954	711,036	446,359	264,677
	1953	699,295	458,138	241,157
Total... ...	1954	4,580,653	2,684,868	1,895,785
	1953	4,460,190	2,722,241	1,737,949

The apparent fall in the consolidated revenue of the Selfridge group is due to the incidence of special items; excluding these, the consolidated revenue shows an increase of £86,000, and the net profit an increase of £92,000.

DIVIDEND POLICY

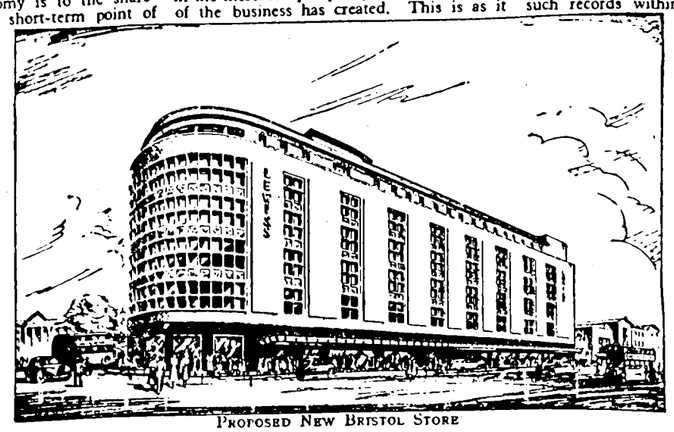
In formulating its dividend policy a board of directors faces two conflicting factors. On the one hand, their primary loyalty in a free economy is to the shareholders who, from the short-term point of view, are interested mainly in dividends. On the other hand, successive Governments have repeatedly appealed for moderation in the distribution of profits, and have imposed a sanction in the form of a penal rate of profits tax on all distributions. The true interest of the long-term shareholder probably lies somewhere between, in that profits ploughed into an expanding company avoid profits tax in the present and will earn additional profits in the future. With both points of view in mind, your directors, in recommending an increase in dividend of 5 per cent to a total of 32½ per cent, have endeavoured to preserve the pattern of distribution of recent years, and have thought it right and proper that the shareholders should receive roughly a proportionate amount of the increased profits earned.

It is accordingly of interest to compare the distributions of the last two years in relation to the consolidated profits. The profits of Lewis's Bank are not included in the consolidated accounts and for the purpose of comparison appropriate adjustment has been made:—

	1954 per cent	1953 per cent
Percentage of profits		
Distributed ...	34.4	33.1
Retained ...	65.6	66.9
	100.0	100.0

Last year I referred to a substantial increase in wages which we had been pleased to pay to our staff and which in turn had added materially to the operating costs of the business. Towards the end of the year under review another increase in wages took place, and there will be some further upward adjustment again in the current year. During the past five years our annual wage bill, excluding Selfridges, has increased by some £626,000. If Selfridges are included a further £353,000 has to be added to this figure. In order to arrive at a comparable figure for ordinary dividends paid we must take the gross amount, in order to eliminate changes in the standard rate of tax. We must also eliminate the additional ordinary capital raised in 1951 to finance the Selfridge acquisition. On this basis our gross ordinary dividend distribution in the Trust has increased by £232,973.

I think a fair inference to be drawn from these two comparisons is that our staff, our company reserves, and our ordinary stockholders (who exceed 10,500 and many of whom are our customers) have all participated in the increased prosperity which the growth of the business has created. This is as it should be, and I hope the same trend may long continue. At any rate these figures make it clear that the increase in ordinary dividend which we recommend will not, if adopted, be paid at the expense of any of the other partners in the business, nor be likely to jeopardise the finances of the group.



PROPOSED NEW BRISTOL STORE

RETAINED PROFITS

The total profits retained exceeded £1,250,000, which is spread over all companies, but lies mainly in the Lewis's Group. A progressive and growing group of companies can always find a profitable use for additional funds. For example, your directors have adopted a policy of moderate stock expansion to stimulate trade by increasing both the range and variety of merchandise, since the main purpose of a department store is to satisfy under one roof as wide a range as possible of customer demand with regular goods of keen competitive value as well as new and exciting merchandise. But the principal need to build up cash resources lies in our building commitments. I refer later to the Bristol Store project, but at this stage it should be noted that within a relatively short period of years a sum exceeding £1,500,000 will be required by Lewis's Limited, to finance the building, equipping and stocking of that store.

The consolidated balance sheet of the Trust reveals a position of considerable strength and the increase during the year of £1,200,000 in the total net assets reflects the policy of ploughing back profits for the development of the business.

LEWIS'S LIMITED

As I have already indicated, Lewis's Limited is our principal subsidiary. The stores which it operates in Liverpool, Manchester and Birmingham, as well as the clothing factory at Litherland, near Liverpool, have made the largest contribution to our improved results this year. That it should have been able to achieve such records within two years of its centenary year in 1956 is evidence of its virility. The total revenue at £2,544,378 has exceeded £2,500,000 for the first time. Its net profit, after tax, at £1,140,606, is £147,435 higher than last year, and this is the first occasion it has exceeded £1 million.

The subsidiary activities of Lewis's group have also been well maintained. Our clothing factory had a good year. Lewis's Bank Limited, increased its profit, all of which has been retained in order still further to consolidate its strength in the interests of its 100,000

Although losses have been incurred, it is felt that the property is a sound investment which should show a steady appreciation in value.

Until recently, Australia was our most important overseas market. Its potentiality is still outstanding, but it is temporarily closed by drastic import prohibitions, and licensing systems which have had the effect of killing much long-distance transport of goods by road, and driving the remainder to the state-owned railways. The motor industry is fighting this adverse situation very strongly. If and when the problem is satisfactorily resolved, it will be our aim to integrate and expand on the lines successfully adopted in Africa, including the provision of manufacturing facilities there.

The new Leyland MOS tank factory was completed in record time and was formally opened on October 23rd last by the Right Honourable Duncan Sandys, Minister of Supply, in the presence of an influential and representative gathering, with General Gruenther (Supreme Commander, SHAPE) as principal guest. This factory is the most modern of its kind in the world. It is a tribute to the company that the design and management of this great arsenal was entrusted to it.

THE CONSOLIDATED ACCOUNTS

Provision has in past years been credited to a special account towards the cost of replacing assets at rising prices. It is estimated that the replacement cost accrued on the expired useful life of the property and plant is, at current prices, approximately £7,377,458. To be set against this figure are the permitted wear-and-tear allowances and the reserve already specifically accumulated, totalling together £6,996,994. As the useful life of these assets runs out it will be essential to continue to make further substantial provisions to enable it to be renewed and kept thoroughly up to date.

Group capital expenditure this year amounted to £886,050 (against £798,321). Forward commitments are £233,353 (against £476,942).

The token reduction in the income tax rate is welcome, adding £13,331 to the net distributed dividends for the year.

THE DIVIDEND

Through the wage packet and by way of social services, the cost of which is mainly borne by industry, the net purchasing power in the hands of the rank and file considerably over-compensates for the depreciation of the currency, enabling luxury goods and services, out of reach of the preceding generation, to be acquired. We are not critical of this trend; it is indeed inherent in the accepted doctrine of the Welfare State, but in justice when appraising current union demands it must also be recognised that, although much new money has been ploughed back, the net worth of the ordinary dividend has not yet been adjusted to the depreciation of the currency.

A statement has been made by the Chancellor of the Exchequer at Glasgow—namely, that compared with immediate prewar years, the real worth of weekly earnings in 1952 had advanced by 28 per cent and the real worth of the same nominal dividends had declined by 35 per cent. The correction for 1953 was unlikely to make any material difference.

It would not be appropriate to recommend a higher dividend at present; it is felt that the stockholders' interest should, in equity, have consideration.

The disposable surplus, after bringing in provisions no longer required, is £909,050, plus the carry over from the previous year of £656,409, and after appropriation of £580,000 to general reserve is £985,459. Out of this latter figure the directors recommend that a dividend on the ordinary stock of 5s. per unit, less tax, be approved and paid on March 31, 1954. This dividend, together with that on the preference stock, absorbs £293,294 net, leaving a carry forward of £692,165. The ordinary dividend is at the same rate as that paid in recent years, and represents only 2 per cent net on the capital employed.

The report was adopted.

BEAUMONT PROPERTY TRUST, LIMITED

LARGER PROFIT

The twentieth annual general meeting of the Beaumont Property Trust, Limited, was held on March 30th in London, Mr Cyril W. Black, JP, MP, FRICS, FAI, chairman, presiding.

The following is an extract from his circulated statement:

The net profit for the year ended September 30, 1953, including dividends received from the subsidiary companies, amounted to £79,797, after providing £74,193 for income tax and profits tax. These figures compare with £68,483 and £71,987 respectively for 1952. All the subsidiary companies have made satisfactory progress during the year. Capital and revenue reserves of the group of companies, including carry forward, amount now to the very substantial total of £238,162, which is equivalent to approximately 33 per cent of the whole paid up ordinary capital of the parent company, or approximately 6s. 8d. in the £ thereon. In addition, there is a very substantial hidden reserve represented by the difference between the present market value of our properties and their book cost. The great majority of our properties were acquired prior to 1939 and, in view of the changes which have taken place in the value of money, are considered now to be worth substantially more than their cost of acquisition.

Your directors attach the greatest possible importance to building up reserves to the maximum degree possible consistent with the payment of reasonable dividends, and the strengthening of the capital position of the companies is a matter of continual concern to them.

INCREASED DIVIDEND

During the year dividends on our preference capital were paid on the due dates, and an interim dividend of 2½ per cent, less income tax, was paid on August 15, 1953, on the ordinary capital. After careful consideration, your directors reached the conclusion that the capital position and earnings of the group now justified a modest increase in the total ordinary dividend, and they are accordingly recommending a final dividend of 6 per cent, less income tax, making a total of 8½ per cent, less income tax, for the year.

Attention is drawn to the fact that the total dividend of 8½ per cent, less income tax, on the ordinary shares is amply covered by the profits derived from the letting of properties, without taking into consideration the profits realised from the sale of properties.

The group's properties are being maintained in an excellent state of repair, vacancies are infrequent and of short duration, and your directors are of opinion that our properties should continue to produce a satisfactory income for many years.

The report and accounts were adopted.

REFUGE ASSURANCE COMPANY LIMITED

INCREASED ALLOCATIONS OF SURPLUS TO POLICYHOLDERS

The chairman, in a statement submitted with the 1953 accounts, referred to the responsibilities of life assurance offices in the investment of the sums entrusted to them voluntarily by their millions of policyholders for which they were, in effect, the trustees. He stressed that regard must be paid to the nature of the contracts for which these investments were the reserves, and said that, whilst investments were made in a variety of securities, including a proportion in the "risk capital" of industry, the primary consideration must always be the interests of the policyholders who provide the sums to be invested. In whatever form the investments were made, whether in industry through ordinary or preference shares or debentures, in Government issues or in the nationalised industries, or through advances under house purchase schemes, the monies were put to good and effective use not only in the interests of the policyholders, but also of the country as a whole.

As from January 1, 1954, the company had commenced to transact in its own name most classes of general insurance business and thus, in conjunction with the life branches, now provided a comprehensive insurance service.

The unique value of life assurance to the married man with dependants was stressed, and a particular case was mentioned where a claim for over £2,000 had been paid on the death of a man aged 33, assured, after full medical examination, under a proposal made only 11 days previously.

The total new sums assured of the year were over £28 million, the total premium income nearly £17 million and the total assurances in force over £310 million.

ALLOCATIONS TO POLICYHOLDERS

In the ordinary branch a surplus of over £2,300,000 was allocated to policyholders to provide a bonus on with-profit policies at the rate of £1 10s. per cent on the sum assured in respect of each year's premium due in 1953 and paid, and also to make reversionary in form the bonus previously declared on a temporary basis in respect of premiums due in 1951 and paid. The rate of £1 10s. per cent is the highest bonus declared by the company since 1938.

In the industrial branch, £1,018,000 was allocated to policyholders to provide additional benefits by way of increases in claims and paid-up policies. The total surplus allocated to industrial branch policyholders, who have no contractual rights to a share in the profits, now amounts to over £12,700,000.

The value of the company's securities in the aggregate, on the basis of Stock Exchange prices, was appreciably more than at the end of 1952. The company now holds ordinary shares with book values of over £10 million, this being an increase of some £1½ million in the year. British Government and British Government Guaranteed securities together represent nearly 40 per cent of the company's total assets. Investments in mortgages increased by nearly £2 million, reflecting the continued popularity of the company's house purchase scheme.

The chairman concluded by referring to the amicable relations existing between the company and the staff associations and to the value placed upon them. He expressed his appreciation of the work of the staff in a very successful year.

ALUMINIUM LIMITED

RECORD VOLUME OF PRODUCTION AND SALES

VAST EXPANSION PROGRAMME SUBSTANTIALLY COMPLETED

The following is an extract from the report of Aluminium Limited for the year 1953 to be submitted at the twenty-sixth annual meeting of shareholders to be held on April 29th in Montreal:

Production of primary aluminium in 1953 exceeded any previous year in the company's history. Consolidated sales and operating revenues were $336 millions in 1953, compared to $333 millions in 1952 and $284 millions in 1951.

Expenditures of $129 million were made during 1953 in implementing the company's plant expansion programme. This amount brought total capital expenditures on the 1951-1954 programme to $435 millions, or more than 90 per cent of the projected total for the four-year period.

Net profit for the year 1953, after capital cost allowances (depreciation and depletion), income taxes and all other charges, including preferred dividends declared by subsidiaries, was $19,475,087, or the equivalent of $2.16 per share on the 9,013,994 shares outstanding at the end of the year.

GENERAL

Looking at the broad picture of the aluminium industry in the free world in 1953 it is noteworthy that more aluminium was produced and sold than in any previous year in the commercial history of the metal. Growth of smelting capacity, particularly in the United States, has proceeded at a rapid rate in recent years. Since the latter part of 1953 the increased supplies of aluminium have balanced total demand and currently there is sufficient production to meet all demands.

While defence and stockpiling needs will undoubtedly continue to require large tonnages, the present adequacy of supplies is stimulating further development of those civilian uses in which the metal is now generally accepted and is encouraging the active introduction of aluminium in new fields which have been under development for many years.

Aluminium now has full opportunity to prove its merits in competition with other materials, many of which have fallen in price. The era of greater competition will not all be easy, as experience in some of our markets has already shown in 1953, but, in our view, if the price of aluminium can be maintained at economic and competitive levels, the inherent advantages of the metal should maintain a healthy and growing demand in the years ahead.

In recent years the number of firms fabricating aluminium has greatly increased. The active interest of such fabricators is creating new markets for primary aluminium and should result in greater future consumption, particularly in such uses as building materials, transportation, electrical equipment, containers and irrigation tubing. Through its research and sales development activities the company is assisting its customers in all markets, particularly in those areas where the newer and modern uses of aluminium are not generally known. Attention and support are being given to new methods which hold promise of decreasing the cost of fabricating aluminium products.

OPERATIONS

BAUXITE AND ALUMINA.—Bauxite production was maintained at near-capacity levels in 1953 by all of the company's mining subsidiaries. Output of all grades of bauxite totalled 2,357,000 tons in British Guiana where a new calcining kiln and a modernised washing plant were brought into operation during the year.

At the new alumina factory in Jamaica, inital production problems were gradually resolved and enlargement of the plant to an annual capacity of 230,000 tons of alumina proceeded towards the completion date later in 1954.

ALUMINIUM INGOT.—All aluminium smelting facilities of the company's subsidiaries and affiliates were operated at maximum levels in 1953. The principal producer, Aluminum Company of Canada, Ltd., produced 545,800 short tons of primary aluminium at its four smelters in Quebec province, an increase of 9 per cent over 1952. Canadian capacity will be increased to 638,500 tons when the Kitimat smelter starts operations in the summer of 1954.

MARKETS AND SALES

In certain markets, particularly the United Kingdom, the demand for our products in 1953 was less than in 1952 but on balance a larger tonnage of aluminium, in a greater variety of forms and for more diversified end uses, was moved than in any earlier year.

Sales of aluminium in all forms and from all sources by consolidated subsidiaries of Aluminium Limited reached 597,779 short tons, thus exceeding sales in 1952 by 10 per cent.

The United States, the United Kingdom and Canada were the principal markets for the company's products, accounting for 87 per cent of total shipments. Deliveries in the United Kingdom were lower than in recent years, reflecting a decline in aluminium fabrication in that country.

EXPANSION PROGRAMME

The expansion programme undertaken by the company in 1950 and 1951 was substantially completed in 1953. By the year-end more than 90 per cent of the estimated total capital expenditures for the programme had been made and about one-third of the newly acquired assets were in operation. The remainder will be in operation in the summer of 1954.

The completion of the first stage of the programme is represented by new primary aluminium capacity of 71,500 tons per annum in the Province of Quebec and two new hydro-electric stations on the Peribonka River in the same province.

The new facilities added to those existing will, under normal water conditions, provide 94 per cent of the power necessary to operate the Quebec smelters at their rated capacity of about 547,000 tons annually.

KEMANO-KITIMAT PROJECT

The other principal portion of the expansion programme, known as the "Kemano-Kitimat project," is located in the Province of British Columbia. The interior lake system in British Columbia has been dammed at its outlet on the Nechako River and the storage reservoir, 357 square miles in area, is filling behind the coastal mountain range. In December the final portions of the ten-mile tunnel were driven through the mountain to carry the water to the hydroelectric generating station now excavated in the mountain base 2,600 ft below the tunnel intake. Installation of turbines and generating equipment, with a total initial capacity of 450,000 hp, is being completed in the Kemano powerhouse.

The transmission line system is ready to carry the electrical energy fifty miles to the new aluminium smelter site at Kitimat, where facilities with a capacity of 91,500 tons per annum are being readied for production. The harbour at Kitimat has been handling ocean cargoes for the past several months and the first shipment of alumina will be received in May from the company's new bauxite and alumina operation in Jamaica.

The task in British Columbia has been an arduous one and has resulted in expenditures in excess of original estimates, largely as the result of inflationary factors and the element of remoteness involved in a project far from populated centres. With operations soon to begin at Kitimat, the essential base for a large production has been established and the new site, with its potential of rapid and low cost expansion, is expected to be a sound and economic source of future production.

The total cost of the over-all expansion programme in the years 1951-54 inclusive, is estimated at $465 millions, of which the expenditure of $435 millions had been recorded in the accounts by the end of 1953 ($129 millions during the year), leaving $30 millions as the balance of capital expenditures to be incurred in 1954.

FINANCING

The major sources of new funds since the end of 1950 have been:

(a) Proceeds of the issue of new securities in the amount of $359 millions (including $50 millions debentures issued by Aluminium Company of Canada, Ltd., in March, 1954, out of which all its bank borrowings have been repaid);

(b) Retained earnings and provisions for capital cost allowances which together aggregated $140 millions in the years 1951 to 1953 inclusive.

GOLD COAST ALUMINIUM PROJECT

The projected integrated aluminium development based on the waterpower of the Volta River in the Gold Coast, West Africa, continues to occupy the company's attention. The Volta River project has a potential capacity of 230,000 tons of primary aluminium per year and its development is being jointly considered by the governments of the Gold Coast and the United Kingdom, The British Aluminium Company, Ltd., and Aluminium Limited.

A commission appointed by the two governments is investigating all phases of the project and the company is making technical information available to the commission as well as conducting various studies on its own behalf. The findings of the commission, will provide the basis for further negotiations looking to implementation of the project. In 1953, Aluminium Limited, increased its holdings in West African Aluminium Limited and obtained an option to purchase all other outstanding shares. West African Aluminium Limited has interests in certain Gold Coast bauxite deposits and holds concessions on the proposed Volta River power site.

FORD MOTOR COMPANY LIMITED

RECORD ACHIEVEMENT MARKS SILVER JUBILEE AT DAGENHAM

GROUP SALES EXCEED £100 MILLION

SIR ROWLAND SMITH'S REVIEW

The twenty-fifth annual general meeting of Ford Motor Company, Limited, will be held on April 26th, at Grosvenor House, Park Lane, London, W.

The following is an extract from the Statement by the Chairman, Sir Rowland Smith, MIMechE, which has been circulated with the Report and Accounts for the year ended December 31, 1953: The results of the Company's operations in 1953—the Silver Jubilee of Ford at Dagenham—reveal the highest achievement in its history and, with a well-established and wide range of products, the Company was able to consolidate its leading position abroad and to forge ahead at home.

Commonwealth markets have steadily improved from the difficult position created in the Spring of 1952 by import restrictions. Our diesel tractor was favourably received in the USA and, although car sales there declined, the overall dollar position improved due to increased car sales in Canada. Everywhere the outstanding qualities of the Consul and Zephyr have been reflected in a mounting demand.

In the passenger car field British manufacturers met with fierce competition overseas from the expanding German industry, whose products made rapid headway, particularly in the free markets of Belgium and Switzerland.

In the latter part of the year we announced four new passenger cars—the Ford Popular, the new Anglia, the new Prefect and the Zephyr Zodiac, which, together with the Consul and Zephyr, now form an unrivalled range.

In the commercial field, the introduction in early 1953 of the entirely new 4-cylinder "Cost Cutter" petrol engine was immediately successful; in recent weeks we have produced the diesel version of this engine at by far the lowest price in the market. This should stimulate the trend, already experienced, towards the increasing use of diesel engines for commercial purposes.

To sum up, our total export of cars, trucks and tractors fell very slightly below those of 1952.

The announcement on the eve of the Motor Show of the Ford Popular—the lowest priced car in the world—created a soaring demand which we have not yet been able to meet despite a production of over 250 of these cars a day. Our car deliveries at home totalled 87,302, well over a quarter of the 301,354 United Kingdom car registrations.

RECORD SALES

For the first time in our history the total value of group sales exceeded £100,000,000, and this during a year in which none of our unit prices was raised and some were reduced.

While these record sales were, of course, the principal factor, reduced costs of materials purchased, economies in our factories and the earnings on our Briggs investment contributed to the profit before tax of £15,824,570.

Taxation takes £10,693,243, of which £2,765,940 is for Excess Profits Levy.

The net profit for the year after tax was £5,131,327.

Capital expenditure during the year amounted to £4,708,320, excluding the Briggs acquisition. The total cost of acquiring Briggs Motor Bodies, Limited, was £5,638,999.

At the year end our resources in cash and Government securities had increased by £16,615,780 to £39,160,269.

THE OUTLOOK

Our own immediate prospects abroad change from time to time. With our varied range of products it is reasonable to assume that we should be able at least to maintain our 1953 level of exports if no grave economic or political disturbances occur.

NEW PRICE MARKET

Demand for the Ford Popular indicates that we have reached an entirely new price market. Secondhand values have declined greatly and buyers are more selective. In the United Kingdom alone there are over 1½ million prewar cars to be replaced, and few owners will abandon lightly the convenience and independence of a car of their own. Even if the replacement with a new car is beyond the financial resources of many, the demand should serve to support the secondhand market, and so influence indirectly the sale of new cars. Therefore, I take a confident view of our prospects at home, particularly as we are now fully represented with modern vehicles in a field which covers 95 per cent of the demand.

In view of the satisfactory trading results and the Company's sound financial position, your Directors are recommending a dividend of 12 per cent (subject to tax) on the ordinary capital. This represents to the ordinary stockholders a return after tax of 3.1 per cent on the capital employed and compares with the national average distribution figures ranging in recent years from 3.4 to 2.9 per cent, as quoted by the Chancellor of the Exchequer a few weeks ago. I believe that the proposed dividend can, in his words, be described as "a fair return on the capital employed, while retaining enough reserves to cover future risks and future development."

Your directors also propose that in place of the single annual dividend which has usually been paid in May, an interim dividend should, in the future, be paid in the second half of the year, followed by a final payment in May. This will, it is hoped, prove of convenience to stockholders.

ANTIQUATED ROAD SYSTEM

I cannot conclude without reference to a problem which is of great concern to us all, and that is the "hardening of the arteries" in our antiquated road system. The main roads of this country must be brought, and quickly, to a condition where they are a help and not a hindrance to industry. Here is a field in which really bold development plans over the next few years will yield ample reward, and every effort is being made to bring this home to the authorities.

The review concluded with a reference to organisation appointments and an acknowledgment of the co-operation and support received from suppliers, the Associated Companies overseas, and dealers during the year and of a fine year's work by staff and employees.

ASSOCIATED ELECTRICAL INDUSTRIES

RECORD PRODUCTION

The fifty-fourth annual general meeting of Associated Electrical Industries, Limited, was held on March 31st, in London.

Sir George E. Bailey, CBE, the chairman, in the course of his speech, said: During 1953 your company once again established a record rate of production. Shipments invoiced both home and abroad totalled £86.1 million compared with £76 million for 1952, an increase of 13 per cent.

Your board considered it essential to reduce the ratio of stocks and work in progress to turnover. I am pleased to say that we have achieved some success, having increased our shipments by £10.1 million without any significant increase in actual inventory. More remains to be done.

Total orders received during the year show a reduction compared with the previous year. This, together with our increased production, has naturally led to some reduction in the volume of orders in hand. However, it is gratifying to note that these still amount to the comforting total of £124 million with deliveries extending into 1957. This reduction carries with it some advantage in that it enables us to offer shorter deliveries for some products and so to increase our competitive advantage in those markets where deliveries are all important.

The group continues to play an important part in providing new generating plant for the British Electricity Authority. During 1953 we commissioned an aggregate capacity of turbo generators on the B.E.A. system of more than 750,000 kW. The Metropolitan-Vickers Company's share of this total, over 550,000 kW., constituted a record for that company.

EXPORTS

Your group continues to make an impressive contribution to the country's export trade. During 1953 our shipments abroad exceeded those of the previous year by 14 per cent and constituted a record in the history of the group.

You will have read in the press about the future use of atomic energy in generating electric power. These developments so far envisaged only the generation of heat for the raising of steam and will, therefore, still require turbines, alternators and ancillary plant for the generation of electric power. Naturally we are watching these developments alertly and our research and design engineers are ready to take an active part in the solution of the many problems associated with this form of energy.

I feel it necessary to emphasise again that the desperate measures being taken by our foreign competitors, coupled with the rising prices in this country, make it essential to redouble our efforts to reduce costs if we are to maintain our position. It is not sufficiently appreciated that since the war we have moved from a position of having no competition from German and Japanese manufacturers to one where they are increasing their engineering exports at a rapid rate. Most of their factories have been rebuilt on modern lines and fitted with first-class tools and equipment.

Stockholders will be interested to know that their board views the future with sufficient optimism to justify embarking upon a further long-term expansion plan for the manufacture of heavy electrical plant and steam turbines for both the M-V and BTH companies. Also the Edison Swan and Ferguson Pailin companies are expanding their facilities in the television component and switchgear fields.

The report was adopted.

FIELDING & JOHNSON LIMITED

FOUNDED 1720

Leicester

SPINNERS OF HOSIERY AND HAND KNITTING YARNS

Profit	1953	1952
	£	£
Profits after all charges except taxation	357,143	360,707
Add reserve for taxation not required	10,000	—
	£367,143	£360,707
Appropriation of Profits :—		
National Taxation	202,814	216,546
Dividends (net)	72,149	67,355
General Reserve	69,990	70,000
Increase in the profits carried forward	22,190	6,806
	£367,143	£360,707

Output in 1953 was the second highest in the post-war history of the Company. The profit of £357,143 is satisfactory in view of the smaller profit margins now prevailing.

The Ordinary Stock dividend for 1953 is equivalent to 25.57% on the increased issued Ordinary capital of £504,787, and 8.44% on the funds which are attributable to Ordinary stockholders.

Funds Employed	1953	1952
	£	£
Capital issued and fully paid :—		
Preference shares of £1 each	35,000	35,000
Ordinary stock (5/- units)	504,787	360,562
Reserves and undistributed profits	800,067	852,112
Amounts set aside for future taxation	225,000	230,500
	£1,564,854	£1,478,174
These funds were invested in :—		
Plant, machinery, buildings and other fixed assets	390,460	365,251
Net current assets	1,174,394	1,112,923
	£1,564,854	£1,478,174

Reserves totalling £144,225 were capitalised in September, 1953.

The figure of £390,460 for fixed assets is after providing accumulated depreciation totalling £401,648 (1953 : £36,191). Buildings and machinery are well maintained and much re-equipment has been undertaken in recent years.

The net current assets include £333,142 in cash and £106,375 in tax reserve certificates.

Annual General Meeting

The thirty-second annual general meeting of the company was held on March 30, 1954, at the Grand Hotel, Leicester, when the report and accounts were adopted, dividends approved and the retiring directors re-elected.

THE HALIFAX BUILDING SOCIETY

MR ALGERNON DENHAM'S STATEMENT

The one hundred and first annual meeting of The Halifax Building Society was held in Halifax on March 29th.

The President, Mr Algernon Denham, JP, presiding, said: In recent years it has been customary for us to report a record accretion in our assets which during the year have increased from £194.7 million to £214.3 million. Of our total funds 81.64 per cent are loaned on mortgage to 269,687 borrowers whose properties are so well spread and selected as to leave us free from anxiety.

Our paid up share department class 2 balances have increased by over £18 million during the year and the balances in our deposit department show an increase of £788,000. To our investors and depositors we have during the year paid or credited by way of interest and bonus £4,271,000, all interest and bonus being free of income tax as far as the investor is concerned.

On investments over £5,000 and on limited company accounts, the Society pays income tax at the standard rate and on other investments under a special arrangement at the composite rate of 4s. 10d. in the £. Over £200 million of our investors' moneys attract the composite rate and the standard rate is at present applicable to investments totalling only £2,179,000.

The surplus for the year of £869,005 is satisfactory and we have increased our general reserve by £500,000 to £10 million and our carry forward by £224,205 after providing £144,800 to cover the recommendation of a bonus of ½ per cent to our subscription and class 1 shareholders.

We appreciate the encouragement and drive which the Housing Minister is putting into his home-ownership campaign.

That it has been and is still necessary to exercise a measure of rent control in a period of housing shortage no one will dispute, but many anomalies can be removed. It is therefore commendable that a Government with a small Parliamentary majority behind it should, at long last, display the courage to remedy partially an admitted injustice.

I regret to observe a growing tendency on the part of some societies to attract investments of large capital sums from industrial concerns. This class of transaction, which is contrary to both the aims and aspirations of thrift institutions, makes no appeal to our Society or to the movement generally. As such investments may be subject to early withdrawal, your directors hold the view that their acceptance is to be deplored, bearing in mind that mortgage lendings are for long and lengthening periods, and I urge the Building Societies Association to consider making recommendations as to a limit on the intake of investments from any one source.

From January, 1952, our operative rate to class 2 investors has been 2½ per cent, and from April, 1952, to depositors 2 per cent, and at that time we decided to make a determined effort to maintain all our occupier-borrower mortgages at the then operative 4 per cent rate. Maintenance of the 4 per cent mortgages precluded, for the time being, our paying to class 2 shareholders a rate in excess of 2¼ per cent, but as our old 4 per cent loans are likely to be reduced during the year to half their 1952 total, the day is not far distant when our class 2 investors may have their patience rewarded, always provided that in the meantime there is no substantial downward trend in bank rate and in the value of money generally.

THE INVERESK PAPER COMPANY, LIMITED

BENEFITS FROM CAPITAL EXPENDITURE

SIR BERNHARD BINDER'S REVIEW

The thirty-first annual general meeting of the Inveresk Paper Company, Limited, was held on March 26th at Brettenham House, Lancaster Place, London, W.C.2.

Sir Bernhard Binder, FCA, the chairman, who presided, in the course of his speech, said:

As I pointed out last March, trading conditions then were difficult and most of our mills had been working short time. These conditions improved gradually during the latter part of our financial year as customers regained confidence.

PROFIT AND LOSS ACCOUNT

The group's trading profits amounted to £1,661,800, a reduction compared with the previous year of over £420,000, but after charging taxation the net consolidated profits are only £120,000 less at £573,600.

Having regard to all the facts the directors feel justified in recommending to you the payment of an increased dividend on the ordinary stock of 12½ per cent free of tax, which has been earned with a satisfactory margin.

Capital expenditure in postwar years amounted to nearly £5 million and further expenditure will be essential to continue the policy of equipping our mills with the most modern machinery.

The group reserves now total £6,300,000, of which the reserves in the parent company's balance sheet amount to £1,932,167, without taking into account the excess of the present value of its investments in its subsidiary companies over their original cost. As already reported, the directors recommend the capitalisation of £1,305,137 of these reserves to provide for the issue to ordinary stockholders of two new ordinary shares of 1s. each, fully paid, for each 2s. ordinary stock unit held.

In this connection it is interesting to note that whereas in 1933 the ordinary share capital was written down by £1,235,000, the amount capitalised out of reserves in 1951 and now proposed amounts in total to nearly £2 million.

THE OUTLOOK

The improvement in trading conditions still continues and we are now working full time. As a result, for the first five months of the current financial year the group's profits have shown a satisfactory improvement. However, recently prices for chemical woodpulp have progressively increased and are now about 90 per cent above those in 1949, an increase which in our opinion is unjustified and is detrimental to future normal trading conditions. Mechanical woodpulp has increased in price by 50 per cent since the end of the year 1949. Although today the price of esparto grass is higher than it was in 1949, the increase is not comparable with that of woodpulp, so that some measure of stabilisation has been achieved in this market and I would like to pay a tribute to the business acumen and foresight of our friends in North Africa in stabilising prices because it must ultimately be to our mutual advantage.

The paper industry is restricted by the Ministry of Materials in the amount of sterling it can spend annually on its raw material purchases, so that any rise in prices will reduce the amount we can import, making it impossible to maintain full production. In our opinion this restriction in the sterling allocation has been a great benefit to the paper industry and has exercised a restraining influence on the prices of our raw materials. Other costs have also risen which emphasises the necessity of securing further economies in working from continued judicial capital expenditure.

I cannot emphasise too strongly the need for stability in prices of our raw materials at reasonable levels to the ultimate benefit of both producers and consumers and the return to the prewar custom of contracting yearly at fixed prices for these materials.

The chairman concluded with a tribute to the managing director, management, staff and workpeople

The report was adopted and the capitalisation of reserves approved.

R. A. LISTER & COMPANY LIMITED

A RECORD YEAR

SIR PERCY LISTER'S SPEECH

The following are extracts from a speech made by the chairman, Sir Percy Lister, at the annual general meeting of R. A. Lister & Company Limited, the parent company of the Lister Group of Companies.

You will observe that the profit for the year before tax is £607,099 as compared with £677,073 for the previous year, and this despite the fact that the volume of products manufactured and sold by the group for the year under review established a new record.

During the financial year your companies have been in the forefront of those who have endeavoured to set an example that would help to arrest the upward tendency in the cost of living by reducing the prices of their products to the consumers, thereby conforming with the urgent appeal of the Chancellor of the Exchequer in his Budget speech last year. There is ample evidence not only in the form of increased turnover but from letters received from all parts of the world that our initiative in this matter has been fully appreciated. These further reductions in prices over and above those to which I made reference in my statement a year ago have only been made possible by the passing on of the benefits accruing from modern plant and equipment, new methods and processes.

OVERSEAS TRADING DIFFICULTIES

The abnormal trading conditions to which I made reference last year have unfortunately continued throughout the year under review, particularly in the export trade where many markets, through currency difficulties, have been virtually closed, and in the Commonwealth and Empire markets quotas and other restrictions have seriously restricted trade. It will be appreciated that the imposition of quota systems has perhaps the most devastating effect of all methods of trade restriction since enterprise, initiative and sales effort are largely neutralised by such practices.

AUSTRALIAN INTERESTS

Our Australian subsidiary has been particularly adversely affected by the economic difficulties aforementioned. The ad[illegible] of a modern mechanised foundry w[illegible] as opened during my visit to our Austra[illegible] ictory in April last should have added enormous strength to our Australian company's activities; but the repercussions of the Korean stock piling of wool, coupled with the drastic financial and economic restrictions imposed in Australia have necessitated our making a special provision of £150,000 against the investment in this enterprise. However, our products enjoy a very enviable reputation in Australia, where currently there are indications of improvement in trade, and we are convinced that we can look forward to a return of more normal and better conditions in this valuable market provided the primary producers of the vast bulk of Australia's exports are not unduly handicapped by the prevalent inflationary tendencies.

It will be observed that this special provision for our Australian investment has been partially offset by our ability to bring in £50,000 from a provision made in a previous year no longer required, together with a capital profit of £23,000 from the sale of a minority shareholding in an associated company.

DEVELOPING MARKETS

We, in company with many exporting industries, have been and still are going through a period of readjustment, having passed from a seller's to a buyer's market. Nevertheless, it is pleasing for me to be able to advise you that despite the aforementioned handicaps we have, by developing markets in which our interests were not fully developed, or in which trading conditions have improved, secured a substantially increased volume of trade in such markets. The home and overseas demand for our electric generating units and marine propulsion and auxiliary engines has shown gratifying expansion.

A large section of your company's activities has always been closely associated with the agricultural industry and in this connection the progress made in the development of new labour-saving products by the Agricultur[illegible] Division of Messrs Blackstone and Company, Limited, together with those of the parent company at Dursley, are proving beneficial, and, we believe, will help still further to establish and enhance the reputation of your company's products in this basic industry the world over.

The need for increased effort and productivity in the factory and in the sales operations of our industry is still the prime national requirement, and the recent appeal of the Chancellor of the Exchequer in this connection, like others that he has made, will not go unheeded, but it is safe to say that HM Government must also show their willingness to face new problems with a new approach and flexibility. Established practices of the past in many walks of life are having to give place to new methods and new approaches, and so in the development of our vital export trade it will be necessary to ensure that we minimise to the utmost the loss of trade in any market through our inability to do such reciprocal trade as will provide sterling to pay for our exports to such markets.

You will be pleased to know that our current order book, now free from the drawbacks of a heavy postwar backlog, is in a healthy condition and we are proud of our increasing trade with the dollar area.

DIVIDEND INCREASE

In recent years I have made reference t[illegible] your board's desire to increase the yield [illegible] our shareholders, without whose support a[illegible] co-operation over such a long period of tim[illegible] our task would have been infinitely mor[illegible] difficult and our steady progress would cer[illegible]tainly have been restricted. We are confi[illegible]dent, having regard to the strong financia[illegible] position which we have built up, that in[illegible] increasing the dividend from 9 per cent to 12 per cent, which in turn represents a yield of approximately 6 per cent, on the actual capital employed in the business, we are recommending what is only fair and equitable.

The report and accounts were adopted.

JAMES PASCALL, LIMITED

ANOTHER RECORD YEAR

The fifty-seventh annual general meeting of James Pascall, Limited, was held on March 31st at Mitcham, Mr R. Ellman Brown, FCA (the deputy chairman), presiding.

The following is an extract from the chairman's circulated statement:

I am glad to report to you once again a record year. Our trading profit shows an increase of nearly 66 per cent over the previous year, the net profit, before taxation, advancing by approximately 72 per cent. These figures represent the highest ever recorded by the company, and reflect the very considerable increase in output which we were able to achieve during the year. This was made possible by the derationing of sweets, the freeing of sugar from allocation control and the greater potential available to us as a result of our reconstruction programme. The measure of these achievements can be gauged by the fact that our output is now three times as great as in 1948. Still further development is planned.

I feel it is desirable to utter a word of warning about the future. We have every confidence in our ability to maintain fully our present level of sales, but there are signs that the full productive potential of the industry is in excess of demand, and it seems probable that this will lead to lower prices for certain types of confectionery. Furthermore, there is strong pressure from the distributors for increased margins, and many manufacturers have already offered more favourable terms, and so commenced a trend which may well become general. We also anticipate increased advertising and sales charges as an inevitable development from growing competition. It is clear that these factors will affect the average level of profit. Since we are confident in the quality of our products and in the public's appreciation, we propose to meet this situation in the only possible way, by increasing our output and sales.

EXPORT TRADE

Despite heavy competition both from home and foreign manufacturers, our export trade has been well maintained, and I am particularly glad to report that we fully hold our own in the dollar markets.

Out of our profit of £343,000 we have had to pay and provide for taxation amounting to £235,000, or, in other words, more than two-thirds of the profit.

Current assets still exceed the current liabilities by a substantial sum, and the cash at bank and in hand and tax reserve certificates total, this year, £207,000, as compared with £39,000 last year.

This year we decided to distribute a dividend of 40 per cent to the ordinary shareholders, as we did not think it fair that shareholders should be the only ones not to share in increased prosperity. Dividends in the future will depend on profits as they have done in the past.

The policy of the board is to bring the issued capital of the company into line with the capital employed in the business and with this in view your directors have again decided to submit to you a proposal that the capital reserve amounting to £35,653 shall be utilised in paying in full at par for 713,068 ordinary shares of 1s. each, and that such shares shall be distributed as fully paid to the ordinary shareholders at the rate of one share for every four shares held.

The report was adopted and the capital issue proposals were sanctioned.

RUBBER GROWERS' ASSOCIATION

PROBLEM OF FALLING PRICES

The ordinary general meeting of The Rubber Growers' Association (Incorporated) was held on March 30th in London.

Mr P. B. L. Coghlan (the chairman), in the course of his speech, said:

It will be recalled that shortly after our meeting last year, the International Rubber Study Group met in Copenhagen to consider measures to deal with a burdensome surplus. The representatives of American manufacturers, who were present at the meeting, issued a statement to the effect that they believed there could be no surplus of natural rubber during the next 12 months, and that they would buy every pound of natural rubber available to them at prices competitive with GR-S, which they intimated would not be substantially lower than the price of natural rubber at that time.

Figures are available for nine of the ten months which have elapsed since this statement was made, and these show that during this period the US has consumed 407,000 tons of natural rubber and has added 1,000 tons to commercial stocks, compared with 397,000 tons consumed in the nine months preceding the Copenhagen meeting and 24,000 tons added to stocks. The US rubber manufacturers have, therefore, taken off the market since their statement at Copenhagen, some 13,000 tons less than they did in the corresponding period before their statement was made.

SURPLUS OF NATURAL RUBBER

Despite the re-affirmation of their statement in October last, it can hardly be claimed that so far it has stood the test of time, nor can it be claimed there was no rubber available for US manufacturers to buy. The fact that today's price is 1s. 4¼d., compared with 1s. 9¼d. when the statement was made, is ample evidence that there has been a surplus of natural rubber.

Following the October, 1953, meeting of the management committee of the Rubber Study Group, the US Government modified its stockpile rotation programme, which was having a depressing effect on the market. It also revoked the directive which threatened the re-imposition of mandatory usage of synthetic rubber if the annual rate of consumption fell below a level which was more than double that required by Statute. These helpful moves are appreciated, but no action has been taken by the US Government in regard to its pricing policy of GR-S.

DISPOSAL OF SYNTHETIC PLANTS

Under the existing plans for the disposal of the Government synthetic plants, the earliest date by which these can be handed over to private enterprise is April 30, 1955. If the plants are disposed of to private industry at a fair valuation, it will be interesting to see if the present price is maintained. If there is an increase in the price when the plants are handed over to private industry, then it will support our contention that the US Government has been providing its manufacturers with an artificially cheap alternative to natural rubber, consequently depressing the price of the latter and thereby causing economic distress in South-East Asia. While we would all prefer to believe that the US Government has not been doing so, it is sometimes difficult to understand why Britain's premier dollar-earning commodity is probably the lowest priced raw material in post-war markets.

The report and accounts were adopted.

MENTMORE MANUFACTURING COMPANY

("Platignum Pens")

A CONSIDERABLE IMPROVEMENT

The eighteenth annual general meeting of the Mentmore Manufacturing Company, Limited, was held on March 25th in London.

Mr A. Andrews (chairman and managing director), in the course of his speech, said: We are pleased to announce a considerable improvement over last year. The net profit, before providing for tax, being £206,225, compared with £180,207, an increase of £26,018.

A substantial part of the increase in profit is accounted for by a very definite recovery in our export trade, due to the fact that the Governments of Australia and New Zealand relaxed restrictions considerably on imports of our type of goods.

Our Plastics Division has had a very good trading year, achieving a satisfactory increase in profits, and we are establishing a very good name as moulders to very many trades.

Our turnover is, to date, well ahead of the same period last year and there is every indication that trade will continue to expand.

As, of course, you are aware, this company's main product is the Platignum brand of writing instruments. The name Platignum has been established over many years by intensive advertising and good service to the public. In view of the world-wide publicity value of the name Platignum, your board have had under consideration for some time the advisability of changing the name of this company from the Mentmore Manufacturing Company, Limited, to Platignum Pens Limited.

The report was adopted.

JEREMIAH ROTHERHAM AND COMPANY

The fifty-sixth annual general meeting of Jeremiah Rotherham and Company, Limited, was held on March 31st in London, Mr F. Sydney Snowden, chairman and managing director, presiding.

The following is an extract from his circulated review:

Trading conditions in the past year have again been difficult. Sales in the earlier periods exceeded those of the previous year, but in the latter months did not come up to expectations, being adversely affected by the exceptionally mild weather which we then experienced. No doubt the uncertainty as to relief of Purchase Tax has also had a deterrent effect, but the recent statement of the Chancellor of the Exchequer that this tax must remain, at least for the time being, may react on the public to buy now, instead of waiting for Budget Day.

We were able during the year to put in a new passenger lift. It has already proved a boon and, beyond being greatly appreciated by our regular customers, should be a means of attracting more and more to the House.

In the profit and loss account, the balance brought down, after providing for directors' fees and taxation on current profits, amounts to £21,920 as against £13,176. After adding to this amount the net interest on the war damage claim and sundry tax credits, and the balance brought forward, there is £98,509 available. From this amount must be deducted £10,000 profits tax on the proposed distribution, leaving a disposable balance of £88,509. Your directors recommend a dividend at the rate of 6 per cent plus a bonus of 2½ per cent, less income tax.

The report was adopted.

THE PATALING RUBBER ESTATES, LIMITED

SIR ERIC MILLER'S SPEECH

The thirty-fourth annual general meeting of the Pataling Rubber Estates, Limited, was held on March 26th at the registered office of the company, 1-4 Great Tower Street, London, E.C.

Sir Eric Miller, the chairman, in the course of his speech, said: The total crop was 10,154,560 lb, a reduction of some 400,000 lb on that harvested in the year 1951-52 from all the estates concerned. During the year under review the price of No. 1 smoked sheet in the market fell from about 1s. 11d. to 1s. 5d. per lb. Fortunately part of our crop is turned out as sole crepe, which commands a premium over ordinary grades so that our overall average sale price London landed worked out at the more satisfactory figure of 2s. 1d. per lb; nevertheless it represents a fall on the previous year's average selling price of about 11d. per lb. On the other hand the all-in cost of production fell by just over 3½d. per lb, of which 1d. was attributable to lower export duties.

The working profit before taxation, but after charging export duty and cess was £315,961, equivalent to 7d. per lb on the crop.

REPLANTING PROGRAMME

During the year we planted 105 acres of virgin land and replanted 507 acres of old rubber. For the current year a replanting programme of just over 1,000 acres has been approved. At the end of October, 1953, the area planted with modern material was just under 10,000 acres, or 40 per cent of the acreage under rubber.

The consumption of rubber including synthetics in the USA during 1953 set up an all-time high record at 1,335,000 tons of which, however, only 553,000 tons were natural. What is happening in the field of synthetics is therefore of paramount importance. 1954 is likely to see lower aggregate consumption there, but the proportion of natural will be higher. Natural represented only 39.6 per cent of total US absorption in the first half of 1953 but it has gradually risen to 49 per cent in February, 1954. If it holds at about 50 per cent during 1954, which is a reasonable assumption, the offtake of natural will be substantially greater than it was in 1953.

PRODUCTION OF SYNTHETIC RUBBER

The Secretary of State for the Colonies has made some interesting comments on the projected production of synthetic rubber in this country. It seems to me desirable to keep a due sense of proportion and not imagine this development of special purpose synthetics to be any menace to natural. We cannot hope, however, to maintain our competitive position without high yielding trees, sound labour conditions, and a lowering of the exactions of Governments. The Pataling Company has made solid progress in the first essential and has the resources to pursue a steady course of further rejuvenation.

New uses keep being found for this wonderful material, which, as I have often said, takes so much of the harshness out of life. Whatever the outlook may be for a few months at a time there is no doubt whatever that the world will continue to require increasing quantities of rubber year by year, of which natural, with its special properties, will always command a full share. The Pataling Company was one of the pioneers and is well equipped to play a useful part in this expanding future.

The report and accounts were adopted.

MIDLAND COUNTIES MOTOR FINANCE COMPANY, LIMITED

RECORD RESULTS AND DIVIDEND

SIR GEORGE KENNING'S STATEMENT

The twenty-fifth annual general meeting of the Midland Counties Motor Finance Company, Limited, was held on March 30th, Sir George Kenning, chairman and managing director of the company, presiding. The following is his circulated statement:

In presenting the directors' report and accounts for the twenty-fifth year, I am happy to record another successful year and the best in the history of the company.

The consolidated profit and loss account for the year ended December 31, 1953, shows a profit of £165,759 compared with £119,802 in 1952, an increase of £45,957. After providing for directors' remuneration, audit fees, depreciation and taxation, the latter taking £100,555 (including £13,640 for excess profits levy) there remains £59,152 of which £8,044 is retained by the subsidiary companies and £51,108 is available for appropriation by your company.

The preference dividend (which is covered more than twenty times by earnings) takes £2,750 net, and, subject to your approval, your directors propose to transfer £10,961 to reserve account and to recommend a dividend of 20 per cent less tax on the ordinary shares which compares with 15 per cent last year. This increase is made on the increased ordinary share capital of £250,000 and the directors feel you will share their view that it is justified by the results.

This increase in the dividend costs £11,75(after tax, the total amount distributed by way of dividend costs £30,250 and the net amount retained in the business totals £30,186 after writing off minor amounts totalling £2,239 to tidy up the balance sheet.

Revenue reserves now total £186,782 and taxation reserve £88,059.

Assets consist almost entirely of hirers balances which total £2,113,038. Current assets exceed current liabilities by £618,23(compared with capital and reserves of £539,878.

These figures demonstrate the strength and liquidity of the company. The proportion of hirers' balances which have a life of less than two years is 89 per cent and the proportion of arrears and of bad debts is extremely low. The balances are well spread and the average advance is less than £150.

Your company recently increased its borrowing powers to £2 million, which is a modest sum in proportion to capital and reserves. The proportion of short term loans or deposits to capital is a conservative one.

EXCELLENT FACILITIES FOR DEPOSITS

Your company's scheme for the acceptance of deposits is available to the small and large investor alike and offers an attractive and secure method of earning a realistic rate of interest (at present 5 per cent, less income tax) while still conserving capital values and availability at very short notice. Deposits can be arranged with the minimum of formality and at no cost to the investor on deposit or on withdrawal.

FUTURE PROSPECTS

I am optimistic about 1954's prospects for the following reasons:

First, the large increase in business in 1953 can only be fully reflected in 1954.

Secondly, the increase in business has continued at the same rate during January and February this year.

Thirdly, these increases have been sustained without any notable increase in overheads.

Fourthly, I hope we shall not be faced with increased taxation to replace the excess profits levy which cost us £13,640 last year.

A lot of nonsense is talked both inside and outside Parliament about hire-purchase. It is merely a modern form of banking catering for the needs of the ordinary individual in the face of a system of taxation which has grown so cumbersome and burdensome that it tends and seeks to prevent the ordinary business man from reaping even a modest reward for his labours.

The report and accounts were adopted and the retiring directors, Mr. Bert Shentall and J. E. Bird, were re-elected.

AN ACTIVE BUSINESS MAN, aged 43, with considerable experience of sales organisation and general financial direction and until recently an executive director of a substantial public company, would be interested to hear of a suitable executive appointment where his experience and personality could justify a salary of some £3,000 p.a.—Reply Box 511.

IF YOUR PRODUCT is technical . . . and it needs advertising or some printed matter . . . get in touch with Geoffrey Dadd Ltd., the nationally known Technical Advertising Practitioners, 90 Epsom Road, Sutton, Surrey. Derwent 4444 (4 lines).

THE COUNCIL OF INDUSTRIAL DESIGN invites applications for the post of Senior Officer (one of three reporting to the Director). Some experience of industrial design problems. University education, journalistic and administrative experience, ability to write and lecture. Starting salary £1,600-£1,950 according to qualifications, rising to £1,950. Contributory pension scheme.—For further information and application form write to Establishment Officer, Council of Industrial Design, Tilbury House, Petty France, London, S.W.1.

A CAPABLE and versatile young Export Manager required to assist in expanding business of international company (London). Excellent French and German essential.—Write, giving age and experience, to Box 515.

JOURNALS: Bound volumes *The Economist*, 1920 to 1942.—Offers to Box 510.

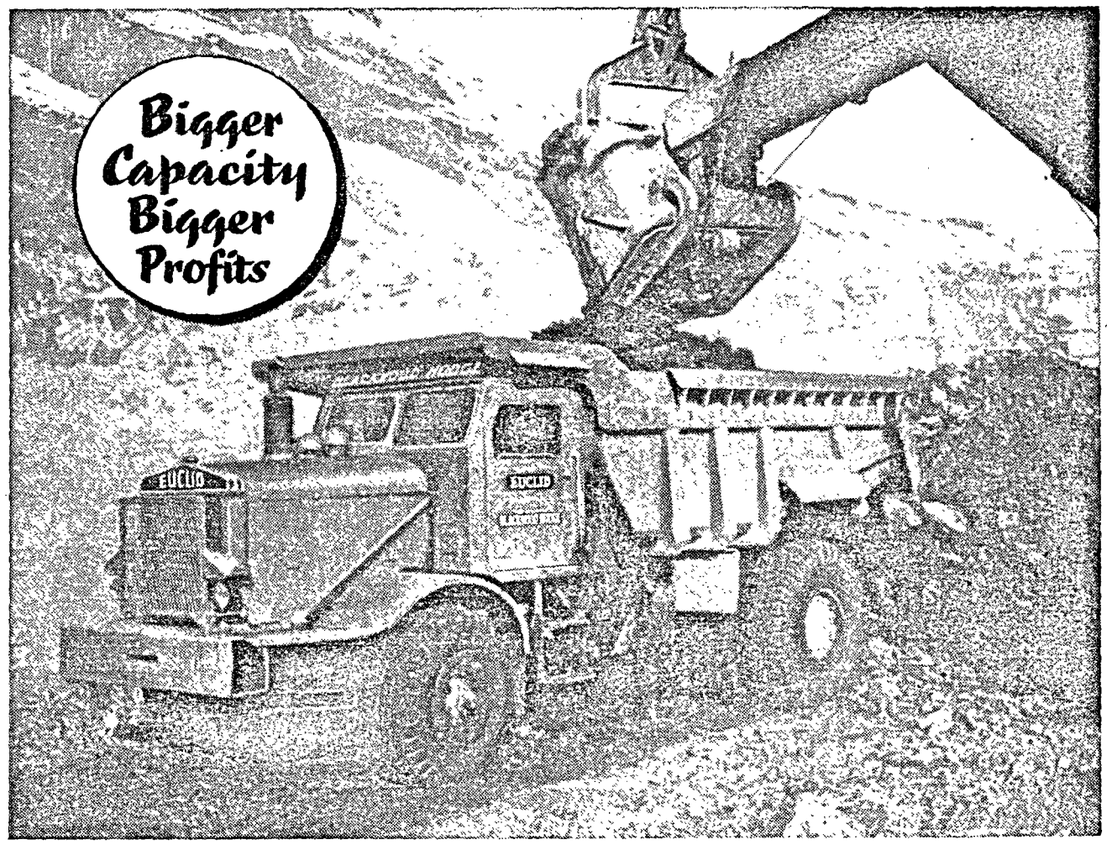
MANAGING DIRECTOR of a well-known Company situated Central London requires first-class secretary-shorthand-typist with experience in taking minutes. Age not more than 35. Good educational background and appearance essential. Five-day week, good salary, non-contributory pension scheme, good working conditions and prospects for a girl with initiative and personality.—Write Box 519. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

SENIOR MERCHANDISE MAN REQUIRED, with considerable grocery and toiletry retail experience.—Box 513. This vacancy has been notified in accordance with the Notification of Vacancies Order, 1952.

ECONOMIC DIGEST (monthly) will keep you informed of many important items you are liable to miss in the modern avalanche of articles, reports, lectures, memoranda. Free specimen copy with pleasure.—Economic Research Council, 18 South St., London, W.1.

CHEMIST, 1st Class Honours, B.Sc.London, A.R.I.C., considerable experience of development, manufacture and packaging of food products, including soft drinks, wishes to obtain senior appointment with progressive company. Sound knowledge of factory management and organisation and of commercial aspects of products.—Box 512.

STATISTICAL CLERK, experienced, H.S.C. Maths, requires immediate employment.—Box 507.



EUCLID 22-TON REAR-DUMPS

now at work in BRITAIN

Big, EUCLID 22-ton Rear-Dump Wagons are already at work in Britain. These larger EUCLIDS carry *MORE* loads . . . *BIGGER* loads in less time —operating costs are further reduced, profit is increased.

Rolls-Royce-powered 22-ton EUCLIDS are built in Gt. Britain and are available for early delivery. Place your order now—all orders executed in strict rotation.

EUCLID 22- and 15-ton capacity Rear-Dump Wagons, EUCLID Bottom-Dump Wagons and EUCLID Tractors & Scrapers are all available for Sterling.

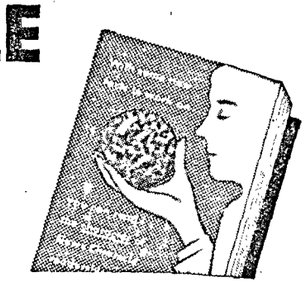
NEWS CHRONICLE

The findings in this booklet are based on a survey conducted originally for our private editorial use—but some of the information, we thought, would be very useful to advertisers or their agents. Copies of the booklet may be obtained by writing or telephoning to the Advertisement Director, The News Chronicle, Bouverie St., E.C.4. Central 5000.



Getting down to the rust, Mr. Toogood?

The man about the house shares with industry a constant concern in limiting damage from rust and corrosion. Phosphoric acid, made by Albright & Wilson, is the basis for many rust-removal techniques — from the large scale factory processes, capable of cleaning tanks or railway trucks, to the bottles of branded rust-removers which are an effective answer to the problem of removing rust in and around our homes.

The story of the Crittall window that had two baths

A Crittall steel window had two baths. The first was in molten zinc at 860° Fahrenheit, to give it a positively rust-proofed, galvanized surface. The window was then placed on the roof of Fulham Gas Works for twenty months, followed by another twelve months in the steam and fumes of the coke-quenching sprays. The second bath, at the end of the thirty-two months, was just to remove the accumulated quarter-inch thick layer of corrosive deposits. Was the Crittall Window any the worse for this tryi ! part experience? No, not a bit! Its tough galvanized surface was still as intact and corrosion-proof as the very day the window was made. That is why Crittall rust-proofed windows, with the very smallest outlay for ordinary, sensible maintenance, will outlast any building they are called upon to grace and protect.

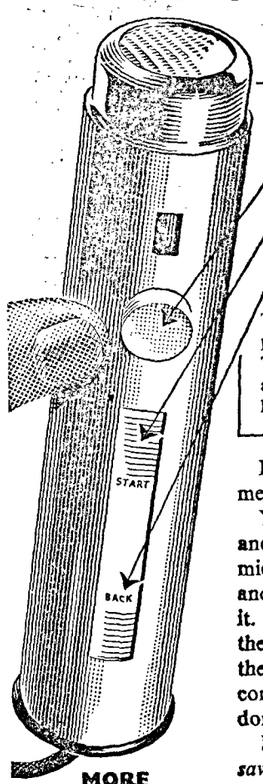
See the NEW TAPE-RITER

with finger-tip microphone control!



DICTATION QUICK AS THOUGHT!

1 PRESS TO RECORD

2 PRESS TO START OR STOP

3 PRESS TO RECAP

This remarkable new microphone puts all controls at your fingertips. Three simple movements control all dictation, correction and listening back.

Here is a revolutionary development in dictating machine design.

You can sit, stand, walk about—and still dictate. Or have the microphone right at your elbow and dictate whenever you feel like it. There is no need ever to touch the Tape-Riter during dictation; the microphone switches give you complete control, complete freedom to concentrate.

With the new Tape-Riter you can save up to 40% of the time you spend on paper-work; increase your secretary's output by up to 60%. These are facts you can hardly afford to ignore.

MORE EFFICIENCY-PLUS FEATURES

- ★ Quick-change, time-saving tape cartridge
- ★ 30 minutes recording on each tape
- ★ Crystal-clear voice reproduction

For beating the beach flies . . .

DIELDRIN is a Shell insecticide new to Britain, but already proved to be the most effective known control for Flies, Mosquitoes and many other disease-bearing and crop-destroying pests.

The South-coast beach fly *(Coelopa frigida)*, such a nuisance last Autumn, is no exception. This tough though harmless little customer has shown surprising resistance to many insecticides, but it succumbs completely to dieldrin.

The South-coast authorities concerned have taken appropriate measures to prevent the recurrence of the fly plague. Brighton Corporation, in the fore-front of the campaign, carried out prolonged trials of materials and methods, as the result of which they have now treated all their beac[h] part with dieldrin. Here, and at Worthing, dieldrin has completely routed the pest, leaving no trace of the operations to disturb the time-honoured enjoyment of Summer by the sea.

For killing the beach flies . . . for a lasting 'all clear'. . . for the solution of a new kind of holiday problem . . .

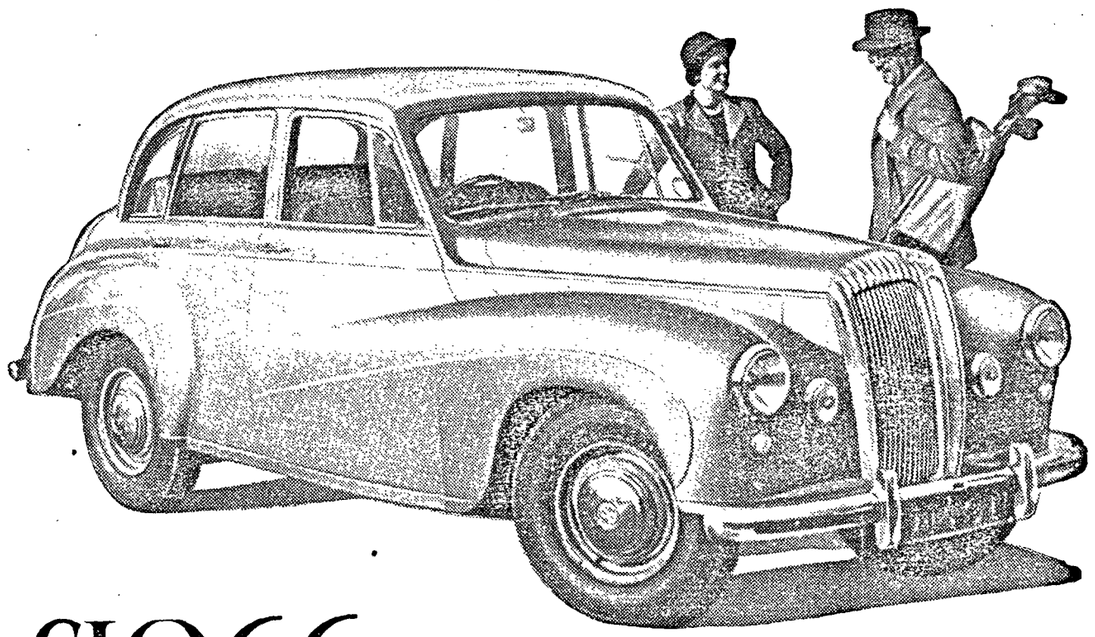
All over the country

it's a Daimler CONQUEST



£1066 *(plus £445.5.10 purchase tax)* and all this

ALL over the country proud owners of the Daimler 'Conquest' are congratulating themselves on the wisest choice they ever made. Very shrewdly, and for a medium price, they have picked themselves the finest combination of motoring qualities on the market today. *Here is what the 'Conquest' has to offer:*

Performance. Top speed over 80, cruising 70; acceleration through the gears 0-30 in 5 secs., 0-60 in 20.4 secs., 10-30 in top 9.7 secs., Petrol 26.5 m.p.g. at 30 m.p.h., 21 m.p.g. at 60 m.p.h. ('Motor' and 'Autocar' road test reports).

Special Mechanical Features. Preselector fluid transmission; automatic chassis lubrication; 75 b.h.p., OHV, 6 cylinder engine; *laminated* torsion bar suspension; water heated induction manifold; 11" brakes with 148 sq. ins. surface; 33 ft. turning circle.

Fine Quality Fittings and Finish. High quality real leather upholstery; deep pile carpets; polished walnut dash and woodwork; built-in heater and ventilating system; chrome-plated framing to windows.

Comfort and Luxury. Armchair comfort in deeply cushioned seating with adjustable armrests; unobstructed flat floor and ample leg room front and rear; front hinged wide doors for easy entrance; pivoting ventilating windows front and rear; large luggage boot 4′ × 3′ and separate spare wheel compartment; lockable glove box and 5 cubby holes for parcels in dashboard and doors. Wide range of beautiful colour combinations.

Long Life and Easy Maintenance. Precision engineering and rigid standards of manufacture and inspection ensure characteristic Daimler feature of long life. The mechanical perfection of fluid transmission and epicyclic gear box plus full automatic chassis lubrication achieve the ultimate in owner convenience and ease of maintenance.

Only by seeing *and* driving the Daimler 'Conquest' can you appreciate the reasons for its recognised success.

Write to Bureau 53, The Daimler Co. Ltd., Coventry, for the name of your nearest distributor and make arrangements to try this magnificent car as soon as possible.

Also the new Conquest 'Century' Saloon. Special series 100 b.h.p. engine, twin carburettors, 90 m.p.h., even quicker acceleration, bigger brakes, telescopic adjustable steering, improved seating and more leg room in rear, together with many other extras, including two suitcases specially designed to fit large luggage boot. These are included without extra charge in the basic price of £1172 plus £489.9.2 p/t.

Well Enough Alone

LAST week the "Economic Survey" laid down the experts' recipe for a sound budget. This week Parliament, the press and the City of London seemed surprised when Mr Butler implemented it. This reaction was disingenuous. There is little cause for surprise and none for disappointment. Not even the Tory politicians have a grievance, for the direct electoral effect of any budget wears off, in these fast-moving times, within a week or two; and in the end they will have more reason to bless the name of a Chancellor who keeps a steady course than of one who turns aside to try to win by-elections. Whether it be by skill or good fortune, there is at the moment a fair degree of balance in the British economy, and it was undoubtedly the right decision to leave well enough alone.

Apart from its details (all of which are small), the only general criticism of the Budget that has been voiced is that the Chancellor ought to have run the risk of a larger deficit in order to "give a fillip" to the public and induce a further spurt in hard work and productivity. If the Chancellor had had hundreds of millions to give away, he might have provided a real incentive. But all that can be said of the fillip argument when it is urged in the context of a score or so million pounds is that, while the effect on production would be highly problematical, the effect on consumption would be immediate. The Chancellor was right to resist this easy temptation.

That being so, however, he had very little scope for concessions of any kind, and it was wise to concentrate them very largely on the one part of the economy where a small sum of tax money can be expected to have a real, if small, effect—namely, on the creation of productive capital. The initial allowance—the benefit of which, as Mr Butler admitted, is largely temporary—is to be replaced by a new "investment allowance," which will be an improvement in two respects. The first is that it will confer a real and permanent benefit on industry—indeed, it can be described as a subsidy on new plant and machinery equivalent to tax on one-fifth of their cost. The second (though Mr Butler, understandably enough, did not say so) is that it can more easily be varied upwards and downwards in accordance with the needs of the times.

The investment allowance is Mr Butler's major bid for taking up the emerging slack in the capital goods industries. But two more of his concessions point in the same direction. The new permission to the Export Credits Guarantee Department to grant longer-term guarantees is an attempt to meet the often repeated complaint that the exporters of other industrial countries (notably the Germans) are in a position to give their customers much longer credit than British firms can afford. And the reduction of death duties on the physical assets of one-man businesses, though its main purpose is the avoidance of individual hardship, can also be expected to have some reaction on purchases of productive equipment.

When these incentives to investment have been allowed for, the other items in the Budget are small and call for little comment. Perhaps the

chief surprise among them is that the Chancellor should have chosen to pitch his concession on postwar credits in straight cash and across the grave, instead of in some new form of negotiable instrument, more widely if more thinly spread among the electorate. There may be rather more scope for criticism about the mite of reliefs that he has handed out to individual hard-pressed industries ; a hard-pressed industry is usually hard-pressed because it is uneconomic, and there is a distinct whiff of High Tory protectionism about some of these changes. But they are all very small. Chicory seems to be simply a gift to the humorists. The relief of between ½d. and 1½d. a seat on entertainment duty in cinemas is merely another handful of grass to the lean kine that were once regarded as among the best of the Exchequer's milch cows ; and if some small professional football clubs can really be saved from closure by taking another ½d. for each supporter who passes through their turnstiles, it would be pedantry to object.

Mr Gaitskell calls it a very dull budget. So it is. But that will be a criticism only to those who believe that the state should never stop tinkering with the economy. What is much more important than its dullness is that it is unquestionably a sound budget and an honest budget. To that praise, however, two provisos need to be attached. The first is that the prescription of the mixture as before will prove to be right only if the diagnosis on which it is based—that no change is to be expected in the general state of economic health—turns out to be correct. Mr Butler has had very good fortune since he took office, and it may be asking for trouble to assume that it will continue. He showed that he is well aware of this, and declared that he would not hesitate to revise his policy if, by the autumn, the symptoms are less promising. He was obviously thinking mainly of the possibility of deflation and unemployment appearing in the second half of the year. But the opposite is also not impossible. If, by September, American production is visibly on the mend, optimism may rise so high that it will be the old enemy inflation that has to be warded off.

The second proviso looks much further ahead than the autumn of 1954. In this longer context, no budget can be sound that acquiesces in the expenditure by the state of so monstrous a proportion of the national income. Not perhaps from one year to the next, but quite certainly from one decade to the next and from one generation to another, these swollen budgets will be the downfall of the British community. Either the expenditures must be reduced or the expansion of the national income must be very greatly speeded up ; there is no third path to safety, and politicians who refuse to face the choice are not helping their constituents but conspiring to ruin them. Mr Butler reviewed the three main heads of expenditure—defence ; food and agriculture ; and the social services—and could find in them little hope of large-scale reduction. If that is the considered view of Parliament (as it appears to be), then the stimulation by all possible means of industry and enterprise should go to the very top of the agenda for all political parties. Well conceived though the Chancellor's industrial concessions are, they are not much more than nibbling at the problem compared with what is required. Perhaps this is not the year to go much further. But it cannot be put off for ever. Mr Butler has shown that, as a bridge player, he knows when to play dummy. His next task—perhaps after the report of the Royal Commission on Income Tax, which is expected this year—will be to show that he also knows how to shuffle the cards.

The New Rift in Asia

IT is beginning to look as if the western allies will go into the Geneva Conference without that unity of purpose with which they emerged from Berlin. The irony of the widening difference between the French and American approaches to the problem of Indo-China is that it is occurring at the very moment when Washington is taking a much greater interest than hitherto in the fate of South-East Asia and when the Russians have openly declared that they favour a cease-fire. In two moves, Mr Dulles has in fact made an historic shift in America's policy ; one was his speech last week, threatening to use the military forces of the United States to prevent Communist expansion in South-East Asia, and the other has been his subsequent call for united international action in giving the maximum effect to this stand. But the French have had seven years of this war, seven years of frustration and hardship during which they have almost fought themselves to a standstill ; Marshal de Lattre once said of his soldiers in Indo-China that in this cruel war they had to live and fight *comme des chiens*. The Americans, on the other hand, while they have steadily shouldered an increasing share of the cost—and without this aid the part would have been lost long ago—are only now themselves directly confronted with the consequences of possible failure. It is natural that the emotional, and so the political, reactions of the two parties should be different.

The difference of approach is nevertheless dangerous, and it must be resolved if the Communists are not to profit from it. But resolution will not be easy ; indeed, it will not be possible, unless the public as well as the statesmen in Paris and Washington show a greater recognition than of late that it is essential to maintain a united front when dealing face to face with the Communists across the tables of diplomacy. It is easy to pay no more than lip service to the success with which the

western governments fought for their case in Berlin. And in any event the question now is whether the unity they have maintained over European affairs can be turned to the possibly even more complex and certainly more pressing issues of the Far East. And can it be done in time to withstand the shocks and pressures of Communist tactics at Geneva ?

It may be argued, and it is true enough, that the gap between French and American views about Indo-China is by no means the only crack at present appearing across the free world. Indeed, the uproar caused by the hydrogen bomb, the danger of Mr Molotov's Trojan horse tactics against Nato, the crucial massing in France of the forces opposed to EDC, all these are factors which tend to split the western alliance at a critical moment. But if a compromise could be found on the immediate problems of Far Eastern policy, it is safe to say that the other differences would look a little less disturbing. For in Europe there is at least no fighting, and if the celebration of Nato's fifth birthday means anything it is that Western Europe has won a breathing space and means to guard it.

★

In Asia, on the other hand, as the world follows the heroic stand of the garrison in Dien Bien Phu, the cold war is patently being fought with the urgent bitterness of the battlefield. The overriding French attitude is that this cannot be allowed to go on. It has for some time been the increasingly unanimous view of all the French political parties—though for different reasons—that France must get out of the Indo-Chinese war. As M. Laniel, the prime minister, put it in the Assembly on March 6th, whereas until last year there were two schools of thought, one in favour of negotiation, the other for a military victory, today agreement on negotiation is so general that "*ce n'est plus la peine que personne vienne le plaider.*" The only question is : how to negotiate ? And it is in searching for the answer to it that many Frenchmen have come to see the forthcoming Geneva conference in a special light. For in pitching their terms high, and in rejecting any question of surrender or the voluntary handing over of complete power to the Vietminh, they have reached the point of believing that American concessions can be bargained against Chinese—and Russian—acceptance of better terms for the French Union cause than would otherwise be possible. France, some of them say, has little enough to offer. But the Americans could recognise Communist China in return for an acceptable truce in Indo-China. And if Washington attaches a more realistic importance to South-East Asia, surely that is worth doing.

Unfortunately, the logic of this general argument, and the several variations of it which are current in Paris, runs directly contrary to the spirit of so much that Mr Dulles has been saying during the past three weeks. It also ignores the realities of the Administration's dependence on American public opinion. And for those Frenchmen who see and understand this fact, the sudden accretion of American support over Indo-China is bitter instead of sweet. For whatever the precise meaning of Mr Dulles's recent statements, the American aim is clear. While avoiding either the tragedy of a wider war or the sending of American forces into Indo-China, it is to enable and persuade the French to go on fighting long enough to win a favourable truce. Then, and only then, Washington appears to say, can there be any question of a French withdrawal. Sooner or later, such a withdrawal is certain and indeed right, but when it comes it must be so ordered that the whole of Indo-China does not fall under Communist domination.

It might seem that the difference between these two points of view is one of degree and not of kind. And to some extent that is true ; in fact, therein must lie the line of compromise which it is the urgent duty of Mr Dulles and M. Bidault to find, with Mr Eden's help. But the problem is complicated by the razor's edge on which the fate of Dien Bien Phu has stood, and by the fact that if this strongpoint falls it will provoke a first-class psychological crisis not only in Indo-China but in Paris too. There are, moreover, two additional aspects of the problem which, although secondary, add to the ill feeling and misunderstanding which have been caused. One is the question of control in Indo-China itself. France is quite unwilling to give up the direction of the war, either in whole or in part. Yet there have already been, for instance, serious American criticisms of French methods for training the Vietnamese army ; and, if the United States added its own military forces to its already massive economic aid, it would certainly demand, not without justification, a powerful if not dominating say in the military campaign. And this begs the other important question. The French still hope to keep the Associated States, or the rump that might be left of them after a truce, within the French Union. But Mr Dulles already speaks of "united action" as implying the need to associate American views with the conduct of political affairs in Vietnam. And while many Frenchmen have abandoned their former hopes of making the Bao Dai experiment work, they resent and fear the full impact of the American attitude, which some still condemn as superficial.

★

The British position in this dispute is unenviable. Britain, the partner and ally of both sides, is not only a specially interested party, since the fate of Malaya hangs on events in Vietnam, but because of its other commitments has so far been able to make little or no direct contribution to the struggle. In these circumstances, however, it would be churlish to deny that Mr Dulles's new statements are extremely welcome. For, in spite of the need to resolve France's dilemma and

the sympathy which this need evokes for the French people, the new American policy looks from London far more like doing good than harm.

Naturally there are risks. Apart from the risk of causing a western split at Geneva, there is the even more critical risk of provoking a conflagration which could no longer be confined to Indo-China. Indeed, one of the prime question marks over all that Mr Dulles has lately said about China and South-East Asia is its relationship to the new look in American foreign policy, and to the threat to retaliate against Chinese or Russian aggression with atomic weapons. But when the present dangers of America doing too much are compared with the days of fear that America would do too little, it is surely clear that a very big advance has been made.

Just how big must remain uncertain until the practical effect of Mr Dulles's statements is observable on Chinese policy, and until the rift between Paris and Washington can be bridged. Even without its latest emphasis, however, American policy towards Indo-China had already achieved two things in Peking. It had undoubtedly helped to promote a Chinese desire for a truce, if by that means American influence could be induced to withdraw. And it had already provided enough of a threat of retaliation to prevent the Chinese indulging in an open invasion with their own troops. Mr Dulles has now in effect gone further by warning the Chinese that, no matter how many battles the Communists may win in Indo-China, the United States cannot tolerate their total victory. And few can doubt that, however vague the new policy may be, in one way or another it will certainly be implemented, whether by the United States acting on its own or, as Mr Dulles is now attempting to do, in concert with all the other anti-Communist powers interested in South-East Asia.

For the British the practical problem is to put pressure on both their partners, but not too much. Like the French, many people in Britain do not see why the United States should not recognise Communist China, as part of a settlement in Indo-China and if by that means an otherwise reasonable truce can be obtained. Like the Americans, on the other hand, it is most certainly the British view that, having fought for so long, the French must be strongly urged not to quit Indo-China before a satisfactory political arrangement can be made. The difficulty common to both sides, however, is that the statesmen have very little room for manœuvre. Mr Dulles cannot, and therefore will not, recognise Communist China before American public opinion is far more satisfied with Chinese behaviour than it is now; and neither M. Laniel nor M. Bidault can promise to continue the war for a moment longer than is physically necessary to avoid a major disaster. If the British could send even a token force to Indo-China now that the Korean commitment is being reduced, they would be in a much stronger position to use their influence with both sides. But, short of that, too much pressure will only split the allies without producing the desired result. From such a position, the Communists alone would benefit—if not on the battlefield, then certainly at Geneva.

Understanding the *Entente*

A FIFTIETH anniversary implies that a majority of people had no direct experience of the original occasion. It is not surprising, therefore, that a good many who learn that the *Entente Cordiale* was fifty years old on Thursday, April 8th, should assume that in April, 1904, France and Britain fell into each other's arms to an accompaniment of fervently exchanged compliments. It can be fairly safely assumed, too, that some of the sentiments expressed during this week's celebrations will reinforce this misconception. For the *Entente* developed from a puny infant into a stalwart, and what is now remembered clearly is not its first bleak beginning but its later hour of pride.

Yet it is well worth recalling the unpromising circumstances of 1904—not merely to keep the historical record straight, and certainly not in order to becloud a notable jubilee, but because some aspects of the birth of the *Entente* may prove instructive at a time of debate on the proper relationship between Britain and France and between France and its continental neighbours.

If, in 1954, British impatience is stirred by French obsessions about the enemy of yesterday which inhibit the preparation of defences against the dangers of today, it should perhaps be remembered that fifty years ago a similar obsession with the past was common in Britain. In West and North Africa, in South-East Asia and the Pacific, and, above all, in Egypt, France and Britain had for twenty years and more been jostling rivals, intensely suspicious of each other's intentions, endlessly seeking a tactical advantage, and sometimes—as in the case of Fashoda—reaching the brink of a serious clash. The violently anti-British tone of the Paris press during the South African war did nothing to improve matters; nor did the outbreak of the Russo-Japanese war, which found France allied to one of the combatants and Britain to the other. The perennial tussle with France over Egyptian affairs had led Britain to depend more and more upon German support; and thus, while the evidence of massive naval building in the German dockyards mounted on the Admiralty's desks, both the Englishman in the street and many of his political leaders were still looking backward to the old squabbles, not forward in the direction of the new peril.

It must at once be admitted that France today faces a greater mental and emotional problem than Britain did in 1903-4. The British were not debating at that time whether to bind themselves to a nation that had been in military occupation of their homeland only a decade earlier. They were not, in fact, binding themselves to anybody. The treaty of April, 1904, was neither an alliance nor even an agreement on a broad positive programme. Like its forerunner, the arbitration agreement of 1903, it was essentially a clearing away of awkward problems, a mutual undertaking that the two nations would not go on treading on one another's toes. Egypt and Morocco were the biggest bones of contention over which it was agreed to fight no longer; the Mekong frontier, the Gold Coast, and the Sudan—an oddly contemporary assortment—had been among the other points of previous friction.

Nothing more than a colonial truce of this kind was to be expected in 1904. Britain had only lately been stripped of its dreams of splendid isolation by the odium generally directed upon it during the South African war; and in London there was no interest in any form of European alliance. Even if Britain had been willing, French opinion was hardly ready for a cross-channel alliance; Fashoda was still a bitter word in the mouth, and the Third Republic was primarily interested in an ally able to put large armies into the field on Germany's other frontier—which meant Tsarist Russia, whose Asian ambitions were such an object of suspicion to Britain, that in 1905 it was willing to guarantee Japan's Korean frontier against them.

★

Only gradually, then, was the cordial understanding, at first little more than an effort to end misunderstanding, converted into one of the main threads in the pattern of European relationships. The conversion was a German achievement; the growing German fleet, the widening of the Kiel canal, and the repeated snatches at Morocco all played their part. Slowly and remorselessly the logic of the situation drew the two cautious partners closer: tacit understandings became discreetly explicit, staff talks developed into a habit, letters full of caveats but not entirely void of meaning were exchanged; and, perhaps most significant of all, fleet dispositions were reshaped on the assumption of Britain's primary responsibility for naval defence in the north and of France's in the Mediterranean.

Three points must surely catch the eye. First, the very real external threat was the prime mover almost throughout. Second, as the military and naval links became closer they tended to become more solid too; it is impossible to unscramble eggs, and it is almost equally difficult to tear apart a programme for related dispositions of major fighting units without being left with a mere pulp on one's hands. The third point is that up to the outbreak of war in 1914 no formal alliance existed between Britain and France.

As to this last, the contrast between 1904—or 1914—and 1954 is so striking that there is every excuse for going again over familiar ground. Britain, the great isolationist at the turn of the century, is now committed not once but many times over to the defence of its continental neighbours; and its commitments to France are the closest of all. Successively, in the postwar Dunkirk treaty, in the Brussels treaty of 1948, in the North Atlantic treaty of the following year, and in the undertakings given with regard to the European Defence Community, what amount to a series of British guarantees have been given. Nor could any purpose have been served by refusing to give them. Military logic has now made it almost impossible to defend Britain without defending Western Europe. In other words, the nature of the external threat that presents itself, and the nature of the joint dispositions necessitated by that threat, have defined within narrow limits the degree of Britain's involvement on the Continent in 1954—much as they did in 1904 and the years that followed it. Is not this, in present circumstances, the most important reflection that should be brought to mind by the commemoration of the *Entente*?

The All-Absorbing Struggle

For two and twenty years the public mind has never been so completely taken up with a single topic of interest as now. The war absorbs all our faculties. No other subject has any chance of being attended to, either in Parliament or in the country. . . . On open nights there is almost as little doing in the House of Commons as ordinarily in the House of Lords. . . . The only debates that are prolonged past midnight are those concerning the Eastern Question. Out of doors the same pre-occupation prevails. The nation has concentrated all its interest upon the one subject. From the highest to the lowest class, all are absorbed in watching the preparations for the coming struggle. Few books save those relating to Russia and Turkey issue from the press or are asked for at libraries. Few articles in newspapers or reviews but those on foreign policy can obtain a perusal. . . . We feel in fact towards politicians who persist in forcing anything except the war upon our attention much as we feel in a drawing-room towards a *mal-adroit* who persists in talking when we are all crowding round some favourite performer, or in strumming on the piano when we are all bent upon listening to some brilliant converser. . . . We are entering upon a war of which we can neither indicate the course, limit the field, nor predict the duration. We may well feel confident as to the ultimate result: we can feel no confidence as to how late that result may come, nor how dearly it may be purchased. We are engaging in a struggle, for life and death it may be, with the most colossal power and the most subtle diplomatist in Europe. . . . It is still quite undecided whether this is to be a war of Europe against Russia, or of Liberty against Despotism. All we know for certain is this, that our great antagonist is a Sovereign of indomitable will, of consummate talent; master of boundless territory and of countless populations—inaccessible in his deserts, and possibly inflexible in his pride; and that, to combat him with advantage and with credit, we shall need all our national spirit, all our concentrated energies, all our unanimous resolution.

The Economist
April 8, 1854

Romance by the Jar

IN the flower-decked, satin-draped—and currently very prosperous—salons of the high class cosmetic manufacturers the continued purchase tax of 75 per cent is regarded with indifference. It is true that the trade as a whole is smarting under what it considers to be the injustice of taxing cosmetics as if they were a luxury—when razors and shaving soap, which produce a far more artificial appearance in men than ever cosmetics produce in women, are treated as essential. But not everyone in the business would have liked to see the tax reduced, for this might blur the class distinctions which divide the industry at three levels.

At the top are the luxury cosmetic houses which have organised a whole cult of beauty. At their Bond Street temples priestesses with peerless complexions and terrifying poise teach the faithful how to perform the sacred rites, and vestal virgins are sent up from provincial stores and chemists to be instructed in spreading the cult. Some firms in the middle section of the trade have their salons, too, but their prices are more moderate and their mystique less complicated. At the end of the scale are the manufacturers for the mass market, who distribute not through chosen agents, but to all comers, including the bazaar stores. This bottom section of the trade would have found a reduction of purchase tax very welcome. Some of the others are content that purchase tax should emphasise their distance from competitors in the group below them—does not the higher price help the customers to recognise the better product ?

As so many customers seem to want to pay a lot of money for cosmetics—in the faith that price is an indication of quality—it is not surprising that the industry is prosperous. It is now enjoying the fourth or fifth major boom in the five and a-half millenia of its history. Pots for unguents and for kohl eye paint were found in the tombs of the Egyptian Thynite dynasty (about 3100 BC). Since then the industry's fortunes have changed with the swing of morality's pendulum. Powder and paint were first brought into Europe from the East by Crusaders ; they were widely used by Elizabethan times, disappeared under the Commonwealth, came back with the Restoration, and reached their most extravagant use in the eighteenth century. Indeed, it is recorded that in 1770 a Bill was introduced which would have enacted that

> all women . . . that shall, from and after such Act, impose upon, seduce and betray into matrimony any of His Majesty's subjects, by scents, paints, cosmetic washes, artificial teeth, false hair, Spanish wool, iron stays, hoops, high-heeled shoes, bolstered hips, shall incur the penalty of the law in force against witchcraft and like misdemeanours and that the marriage, upon conviction, shall stand null and void.

This was, perhaps, an earnest of the reaction to come. Throughout the Victorian age, and down almost to the first world war, the trade receded. For shining virtue now demanded a shining nose.

The industry's expansion in the last thirty years has been extraordinary. It could still, however, expand a great deal more ; according to the Odhams survey nearly a quarter of some 4,000 women interviewed had not used powder in the previous week, a third had not used lipstick, and four out of five had not used cleansing cold cream. But no industry, except perhaps tobacco, has gained so much from the emancipation of twentieth century women. The disappearance of modesty as a major virtue and the need to look young and smart in offices greatly stimulated sales. So also did the new ineffectiveness of hellfire and social ostracism in keeping husbands faithful. Cosmetics are now so much a part of life that many girls learn about them in the schoolroom ; representatives of well-known firms, at the invitation of the school authorities, will come and lecture about personal hygiene and make-up, in that order—with only the subtlest references to their own products. Cosmetics, which for eighty years down to 1918 were the mark of the harlot, are now the toy of the teenager.

★

The industry now consists mainly of private companies selling proprietary brands, with a fringe of production by local chemists. It is dominated by American firms, which seized the lead from France between the wars, and which have their own factories in other countries. Most of the top class firms are American—Elizabeth Arden, Helena Rubinstein, Dorothy Gray, and so on, and so is the firm that, according to a recent survey by Odhams Press, has the largest share by quantity of the British market—Pond's. The largest British company (in the middle group) is Yardley's, which also operates on an international scale and has a big export business.

Is the industry's present prosperity a heyday that will pass ? There will no doubt be fashions in faces, as there always have been ; eyebrows will come and part shaded lids suggest anything from an air of myste[illegible] to a black eye. But the modern cosmetic industry claims to have entrenched its position through a scientific revolution. It has followed to its logical conclusion the old discovery that constant lubrication of the outer, corneous layer of the skin prevents the process of drying that comes with age, and thus somewhat delays the onset of wrinkles. If well-known firms of today began with a lady cooking beauty preparations in the kitchen they now employ their own qualified chemists who are experts in skin care. But if science has made possible the production of beneficial preparations, there are signs that it has not unduly impeded enterprise in other directions. The city analyst of Birmingham recently examined an eyelash grower, selling at a high price, and found that it contained merely petroleum jelly or vaseline, with a little colour and perfume ; he also reported that an astringent lotion was merely industrial methylated spirits bottled together with a light mineral oil, coloured pink and scented. Most formulas are a good deal more complex than that and undoubtedly more effective ; but to cite one example in the medium price grade—the cost of raw materials to a manufacturer may still be only a quarter of the cost of the fancy containers into which they are put. And even the best of the preparations might on analysis seem disappointingly prosaic to those who are accustomed to think in terms of petal bloom and breathtaking loveliness. A typical face powder is talc, kaolin, magnesium stearate and zinc oxide. Cold cream is usually water emulsified with, say, borax and beeswax, in mineral oil. Skin foods, if they are to penetrate, must be largely made, not of mineral oil, but of animal and vegetable oils. Lanolin, the grease from wool, which until fairly recently was avoided on the grounds that it encouraged the growth of hair (look what it did to the sheep), is an excellent emollient which is the basis of many such creams. The art of doing well in the cosmetics industry is to take substances such as purified lanolin and paraffin oil, which although effective, would in themselves be unpleasant to use, blend them and process them to an appetising colour, consistency and smell. The products, even if they have been on sale for years, must constantly be presented in new forms, new colours, with new names, and in new and ever more glamorous packs.

★

They must also be extensively advertised ; in 1952 some £4,500,000 was spent on advertising cosmetics and toilet preparations. Here the industry has run into one of its two major current problems. There is some concern about the effect of the new Merchandise Marks Act, under which a firm can be prosecuted if its advertising and descriptions seem misleading. No one knows where legitimate trade puff ends and misleading representation begins. What about the appellation skin food, in view of the fact that the skin cannot feed ? What about such advertisements as the following:

> Be popular with men tonight or your money refunded. This powder has been thoroughly tested by scientists and guaranteed to be definitely lectro-static.

The industry's other major headache is a result of the scientific revolution. This is a strange story. Today, and at last, the trade can claim that the lure of youth recaptured, which has always figured largely in cosmetic advertising, is not altogether fanciful. The elixir of life is now on sale at 25s. to 37s. 6d. a jar, in hormone creams. Hormones penetrate the skin, but it is not certain that they are safe in all circumstances. Only one or two British firms market them, and the field is mainly left to the high-class American firms, working on an agreed maximum quantity of hormone per ounce of cream. But even in small doses, according to most medical opinion, hormones are capable of disturbing effects, quite apart from the controversial question of whether they could cause cancer if administered over long periods.

The Council of the British Medical Association has been considering whether it should ask for restrictions on the free sale of hormone preparations, and has been seeking information through its branches. Enough is known to make a *prima facie* case for some control. Indeed, some people would go further. They say that now that the industry has undertaken treatment of the skin on such a wide scale, cosmetics should be put on the same basis as patent medicines ; and that it should be obligatory to state on the label what is in the jar. But could producers then perform their mission, as the chairman of the Toilet Preparations Federation put it, of "sustaining the spiritual confidence of the individual"? It would be a pity to be too precise, and spoil the customers' fun as well as the industry's economics. One can pay too much, certainly, but perhaps one can know too much, too.

Some Economic Terms

As an aid to public understanding, there is a clear need to compile an English-Doubletalk dictionary of some current economic terms. The following are suggested as a preliminary selection:

Adjust, (i) to lower (of a farm price: officialese)
(ii) to raise (of a farm price: agric.)
(iii) to devalue (of own currency)

Adjustment, recession (US)

Recession, slump (US)

Chaos, competition (agric.)

Order, monopoly (agric.)

Marché Noir, price controls (French)

Slave labourer, (1) a Japanese trade unionist (British)
(2) an American trade unionist (US)
(3) a Soviet slave labourer (rare: this usage is widely condemned as emotive)

Labour mobility, essential, a man leaving somebody else's factory to join one's own.

Labour turnover, excessive, a man leaving one's own factory to join somebody else's.

Cost of living index, official, an index deliberately biased by impartial statisticians.

Cost of living, The, a list of those prices that have recently gone up.

Notes of the Week

Sir Winston's Mushroom-Shaped Cloud

SIR WINSTON CHURCHILL'S aberration in the hydrogen bomb debate proved a double misfortune. He not only spoilt what would otherwise—thanks to Mr Attlee's statesmanship behind the scenes—have been an infinitely less harmful debate than had seemed likely last week. He even confused the issue he was trying to raise. Whether he chose the right occasion to rake up the Quebec agreement is debatable—he certainly did not choose the right language—but his motives were understandable. He had been attacked by backbench Labour MPs and by the left-wing press, sometimes in vicious terms; and remembering the effect of the campaign over "Whose finger on the trigger?", Sir Winston was entitled at some point to rebut the charges of neglecting vital British interests. If he was to be bitterly criticised for not having his hand on the bomb, he had a right to show the cause.

Yet it was the measure of Sir Winston's parliamentary failure that in the end he raised a storm for nothing; it was Mr Eden who explained the Government's case. He brought out the essential point that had confused the earlier wrangling: the American Congress's action in passing the McMahon Act had everything to do with the ending of Anglo-American consultation on atomic matters, but nothing to do with the loss of Britain's right to veto American use of the atom bomb on a third party. Mr Attlee could justly claim that the McMahon Act, by preventing a free exchange of information, also prevented the "full and effective collaboration" agreed at Quebec. But the Act did not affect the veto clause in the 1943 agreement; this apparently disappeared under the "new agreements" mentioned by Mr Attlee in January, 1951—which appear to have been made in 1947. Now Mr Eden has offered to ask the other signatories to those postwar agreements—Canada and the United States—to agree to their publication. After some of the conflicting statements made in Washington this week, clarification is clearly desirable.

It is a pity that this row should have obscured Mr Attlee's achievement in pulling his supporters away from the precipice of hysteria and irresponsibility over which earlier they had been intent on throwing themselves. The Government insisted on its right to decide on the timing of diplomatic moves; but with this proviso, was able to accept Labour's motion calling for an immediate initiative for a meeting of the heads of states. If the House of Commons on Monday recognised that the hydrogen bomb will not be stopped by pious platitude but only by hard negotiation, the credit belongs more to Mr Attlee than to anyone else.

Politics of the Budget

SOUND though it is in economics, Mr Butler's third Budget must obviously fail to match the political success of his first two. It may even be a bit of a liability and cost the Government some ground in the coming local elections, just as did the Cripps "no change" Budget of 1950. Last April the lack of targets reduced Labour to despair but this year they find themselves left with one or two. Their main case, as deployed by Mr Gaitskell, is that the Chancellor was unable to dole out any jam this year because he gave away too much a year ago and to the wrong people. Less jam for the rich in 1953 would have left him with enough to do something for the aged in 1954; that is the lachrymose cry which is going to meet the Tories in the constituencies.

The Tories are prepared to put up with this provided that they do not have to face an election just yet, and that in the meantime Mr Butler takes his axe to Government spending. The importance of a Budget in election calculations tends to be overestimated; an unpopular one, certainly one that is at worst no more than disappointing, can be overlaid by a general sense of well-being in the electorate, and the end of rationing is likely to be more clearly in the average voter's mind this summer than anything that Mr Butler did or did not do.

Not that an early election seems likely at the moment. The Tories must change their leader before going to the country; no one knows what Mr Eden might want to do but he might well wish to give his reshuffled team some time to settle down and show its paces. Mr Butler will want to wait for the reports from the Royal Commission on Taxation, from the Phillips Committee on the aged and from the Government Actuary on the National Insurance scheme. The Tories hope that he will then produce a popular Budget with an election following not many months later. And at least his present stand will save them from having to defend a rise in MPs' pay, for the Budget has made this a political impossibility.

But the Tories are convinced, on Mr Butler's own evidence, that no manipulation with the tax structure or the social insurance schemes will help him unless he takes a firm grip on Government spending. They winced on Wednesday as Mr Gaitskell taunted them with Sir Winston Churchill's tirades a few years back against "Socialist extravagance." Mr Assheton, the leader of the back bench hatchet men, gave notice that Mr Butler will be insistently prodded from behind along the path of economy. Whether any of the backbenchers would like the changes in policy which alone hold out any hope of large cuts in expenditure—a desertion of the farmers, for example, or a cut in social insurance—is an entirely different matter.

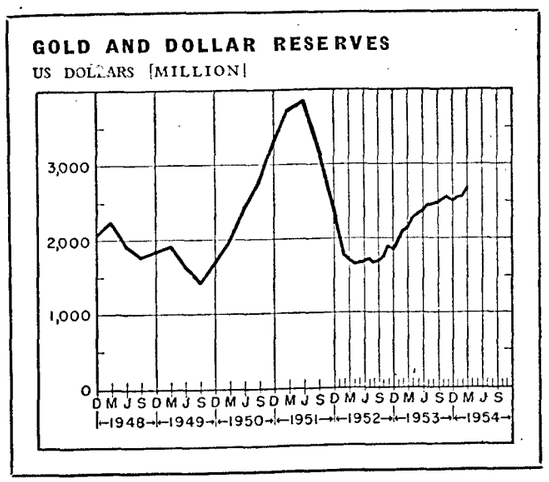
The Serious Side of Mr Molotov

WHILE celebrating the fifth anniversary of the North Atlantic Treaty, the western governments have had to consider the Soviet proposal to discuss joining their defence system. As Mr Eden has indicated, talks about this preposterous idea are being held now in Paris. The best reply to make to Mr Molotov would be to recall the obligations that are laid on members of Nato, and to point out that it would seem a waste of time to discuss whether the Soviet government could accept them. The days are long past when western leaders could be deceived by the Soviet rulers' claim to be defenders of democratic liberties. It is true that Mr Molotov would not hesitate to put his signature under commitments to defend democracy. But can it be imagined that the Soviet government would agree to all the infringements of sovereignty involved in membership of Nato—the independent assessment of each national economy in order to share out the burden of defence expenditure, the use of bases by allied air forces, joint manœuvres, standardised weapons and so forth? As General Gruenther has remarked, he would presumably find himself paying visits to Moscow as supreme commander over the Soviet army. At this point, if not before, the whole idea becomes one which it is almost impossible to take seriously, and there is little wonder that it has staggered the German Communists.

★

From the Russian point of view, however, the proposal makes sense of a kind. It is a logical move in the direction taken by Mr Molotov for some time past. The Soviet argument is no longer that there are two hostile camps in the world, but only one "peace camp," directed against the resurgence of German and, in Asia, Japanese militarism. Anyone who denies this statement is a "splitter." As the Soviet Note showed quite clearly, Russia proposes that Nato must become an anti-German coalition, and logically all the great powers who fought Hitler must be in it. By Marxist definition, the Soviet Union can never be an aggressor—though, as lecturers have only recently been reminding the Soviet public, revolutionary wars are always justified.

It is easy to see the endless vistas of talk that would open up if the western governments began to argue at a conference table about this Soviet proposition. And that is one of the main objectives of Mr Molotov in putting it forward. He wants an unbroken series of conferences, each of which will prevent the European Defence Community from taking shape, and would enhance the prospects of the Soviet alternative, "Seto." He proposed five new meetings in Berlin, and now a Nato conference is suggested as a sixth. Finally, behind Russian proposals, whether for the Geneva conference or any other, there lurks the intention to establish China as one of the five great powers which must settle the affairs of the world. The acceptance of talks with the Soviet Union about Nato and "Seto" would inevitably be followed by proposals to set up similar bodies in Asia, with China calling the tune.



Baton in the EDC Scales

"MARSHALS should be nominated only posthumously," a French minister is reported to have exclaimed last week. One understands his feelings, since France's only living marshal has just presented the government with its biggest headache for months. The riot at the Arc de Triomphe was merely a foretaste. As an article on page 123 shows, Marshal Juin's appeal extends beyond hot-headed youth of the storm-trooper type to the whole of the traditional Right, on whose support M. Laniel's government now depends so greatly.

By his haughty behaviour, however, the marshal rendered the government's difficult task somewhat easier. Nobody could question his right to hold unorthodox opinions on EDC; but by proclaiming them without warning and then refusing to meet the premier, he enabled M. Laniel to present the issue as a defence of government prestige and thus avoid the odium of dismissing the marshal simply for his dislike of the EDC treaty in its present form. Nato was bound to follow suit and reprimand the commander of its Central European forces, particularly as Holland, Belgium and Luxemburg have already ratified the treaty.

Freed from his official commitments, Marshal Juin may find himself pulled into the political arena in spite of his assurances to the contrary. Although, as heir apparent to the mantle of the strong man which once lay on General de Gaulle's shoulders, the marshal should be an obvious target for the Communists, his stand against the EDC suits their book very well. Are they confident that they can push without being led? If so, then Marshal Juin may find rallying to his banner the strangest of strange alliances, ranging from one extreme to the other. As could be expected, General de Gaulle has already given him his blessing. Indeed, at his press conference on Wednesday he outbid the marshal, pleading for peace in Indo-China and for an independent French policy of mediation between East and West.

The marshal's baton will weigh heavily in the scales in the struggle over EDC. The general public will be dazzled

by the array of military men now openly opposed to the present form of the treaty, the name of Juin joining those of de Gaulle, Weygand, Koenig and others ; and the title of marshal has for the French middle classes a *mystique* which it is difficult to counter with articles and paragraphs from the treaty. Finally, ratification is largely dependent on the votes of rightist Independents, who were expected to follow the lead of MM. Pinay, Laniel and Reynaud. Marshal Juin can provoke more dissension among their ranks than General de Gaulle ever could. Coming just after a demand by over half of the Socialist deputies that their party whips should be relaxed for the crucial vote, the marshal's challenge dims the hopes of an early ratification of the treaty by the French Assembly.

Railwaymen at Cross Purposes

THE railway wages dispute is like a cancer that is operated on only to break out elsewhere. Its latest manifestation was a threat by some 70,000 engine drivers and firemen to strike on April 24th, unless the Transport Commission came forward by that date with proposals for a new wages structure. The settlement in January, by which the unions got an increase of 6 per cent instead of the 4s. awarded by the railway tribunal, as the price of calling off the Christmas strike, was subject to certain conditions. These were that discussions should be held on ways of increasing efficiency and on a new wages structure. Deadlock was soon reached, because the three main participants were all at cross purposes.

The Commission thought that the first step should be to agree the minimum wage on which the new structure should be built. The National Union of Railwaymen, which includes in its membership most of the lower-paid workers, agreed, but was anxious to raise that minimum from the present 124s. 6d. to 135s. At the present differentials this would give engine drivers a maximum rate of £9 15s. But that did not satisfy the Associated Society of Locomotive Engineers and Firemen, who want a maximum of £10 5s. The commission was waiting for the unions to agree on the minimum rate before it made its own proposals. But the drivers and firemen forced its hand by threatening to strike, and on Wednesday Sir Brian Robertson, chairman of the commission, put before the unions proposals which they have now gone away to consider. If it is prepared to strike merely to force proposals ASLEF may not be very ready to compromise—and it does not need the support of the NUR to make its strike effective.

Meanwhile, the railway shopmen have been granted wage increases of 8s. 6d. for skilled men, 7s. 6d. for the semi-skilled and 6s. 6d. for the unskilled, in line with the settlement reached last week in the twelve-month dispute over wages in the engineering and shipbuilding industries. The employers, who had first said they could not afford a single penny, and then, after the courts of inquiry had reported, that they could not improve on an offer of 5 per cent, finally settled for about 6 per cent. The lesson for all unions will be never to take no for an answer, no matter how categorically it is given or how well it is supported by economic arguments.

Scrutinising Statistics

AT this time of the year there is a sudden abundance of figures in a series of statistical White Papers. Ungrateful though it may seem, two questions need to be asked about these statistics. Are they the most useful of their kind and are they accurate ? These matters are taken up by Mr C. F. Carter and Mr A. D. Roy in a timely study of official statistics recently made under the direction of a committee of leading statisticians.* They find some need for a pruning knife and some fields which are not adequately covered, but their main plea is for fuller explanation of how figures are derived and some better means than at present of judging their quality.

The horrid truth is that some of the figures which are commonly accepted as gospel truth are little more than guesses. But while the authors throw cold water with one hand, they extend encouragement with the other, for they hasten to add that British statistics are among the best in the world and rough estimates are preferable to none at all. This, however, is true only if it is clear which are largely guesswork. And it should be possible, as the authors point out, to grade the statistics or at least to pinpoint the less reputable ones.

The statistician, however, is always faced with the unhappy dilemma of striking a balance between timing and accuracy. A fairly good estimate in time is better than a count down to the last digit which comes too late. One recommendation made in this book deserving particular attention is that more use should be made of sample surveys, a technique in which Britain lags far behind the United States.

Mr Carter and Mr Roy find much to praise in the organisation of British statistical services. But they suggest that a central advisory committee, under the wing of the Central Statistical Office, should be set up to bring the statistics under regular review. Since so many departments are involved, this proposal has much to recommend it. One of the functions of such a committee should be to co-ordinate those statistics still issued separately from Northern Ireland, Scotland, and England and Wales—in particular the accounts of the national health service and certain of the population and education figures. There are still too many tantalising discrepancies.

Mr Markezinis Goes

FRIENDS and creditors of Greece will regret the resignation of Mr Markezinis from the cabinet of Marshal Papagos. He was the bright young man of a rather blimpish cabinet and looked like getting done some of the things that predecessors had merely talked about. His heart was set, for example, on floating successfully next June an internal loan that should bring funds back to Greece and show the world that even Greeks could be persuaded to save ; and he was one of the few public men in Athens who would insist that Greece could be made a prosperous country. It seems probable that his retirement was caused by an excess of ambition. He may have wanted more authority than his small political following justified. He was not popular in the country, took no pains to win favour in Parliament, and believed at heart in government from the back room. Some foreign advisers in Greece might not disagree.

The opponents of Mr Markezinis will not expect him to fade into obscurity in the way that Mr Venizelos appears to contemplate. He is a subtle tactician who enjoys studying in his leisure the politics of Machiavelli's Italy. He can hardly turn to the left because all his friends and followers are of the right. Moreover, the hold of the Rally on the country is likely to increase rather than diminish so long as Marshal Papagos is at the head of affairs. It is not impossible that the typical soldier statesman and the typical intellectual politician should later make peace with one another. Meanwhile, it remains to be seen what will be the effect of this quite unexpected resignation in the capitals where Mr Markezinis had personally succeeded in getting promises of credit. In Germany especially the prospects are less easy than he had made them out to be. It is to be hoped that the government will press on with patient and practical measures for developing the production of food and minerals ; otherwise public opinion will become more critical and the government will respond by taking a more authoritarian tone.

Congress Waltzes

IT is apparently not proving an easy task to export the Soviet "new look" to the satellites. At first the political and economic changes brought about by Stalin's successors spread only in haphazard fashion across the frontier. It was then decided to establish a uniform pattern for the Soviet bloc in Europe. The task of defining and proclaiming this new pattern was assigned to special Communist party congresses in all the satellite states, to be held in the early months of this year. The staging of these assizes, however, did not always work to schedule. The Bulgarian congress was held on time, and the East German one is just ending its proceedings ; but the Polish party congress took place only after a delay of two months, the Hungarian meeting has also been postponed by a month, and there is no sign of a Rumanian congress, although it was scheduled for March.

It is difficult to impose a line when the Kremlin itself is not agreed on its shape ; this is probably the chief cause of the uncertainty and delays. Struggles in Moscow must awaken echoes in the satellites, and local factions are probably often emboldened by the hope of support from one of the warring groups at the centre. Moscow clearly attaches great importance to all these congresses, to which top Soviet leaders are sent as fraternal delegates. But is their brief clear ? In some cases the presence of a permanent and senior watchman is evidently judged indispensable ; thus Mikhailov, a member of the Soviet presidium, has recently been sent as ambassador to Warsaw. But can he be certain that his group will keep the upper hand in Moscow during his absence ? The difficulties of imposing the "new look" on the satellites are yet another symptom of the unfinished struggle in the Kremlin.

Men with Muck-Rakes

A COURT in Lausanne has convicted a Swiss classical scholar, Professor André Bonnard, of engaging in political intelligence activity prejudicial to a Swiss organisation on behalf of a foreign organisation. A fifteen-day sentence was pronounced, but suspended. The charge was that M. Bonnard, at the bidding of Professor Joliot-Curie, had collected all the material he could find that was derogatory, or could be made to seem derogatory, to the International Committee of the Red Cross. The facts and fictions thus garnered were transmitted to the "World Peace Council," and duly publicised, expanded, embroidered, and endlessly repeated, by the Communist press and radio of the world. This highly organised hurling of synthetic mud at a body whose humane objectivity is so well known was suddenly and swiftly done as soon as it was suggested that the Red Cross should investigate the "germ warfare" stories in Korea. The episode is instructive ; the Swiss courts have shed revealing light both on the methods used on these occasions and on the extent to which widely respected persons are induced to take part in the muck-raking.

But it was a peculiarly Swiss episode. There was no question of espionage in the usual sense. Professor Bonnard's activities, if carried on in another democratic country, might have provoked a civil suit but would hardly have brought him to a criminal court. Only the strict laws that Switzerland has framed to avert the least tarnishing of its neutrality sufficed to convict the professor. It is an interesting thought that actions so helpful to subversive propagandists, which in a rigorously neutral country prove to carry legal penalties (and which would, of course, involve the most severe punishment in a Communist state), would go unpunished elsewhere in the western world. The maintenance of democratic principles requires that they should not be penalised in times of peace. The true remedy lies in the effective use of all legitimate means to refute the propaganda itself.

Caring for the Commonwealth

THE tone of last Friday's debate on Commonwealth relations in the House of Commons contrasted sharply with its many deplorable efforts on colonial affairs last autumn. Discussion was constructive, and centred on two main points. First, have administrative arrangements in Whitehall kept in step with the great changes that have been made in the structure of the Commonwealth in the last few years—in particular, with the advance towards self-government made by so many colonies ? Secondly, is enough being done to insure that a career in the overseas colonial service continues to attract first-rate men ?

All possible permutations on the theme of redefining the functions of the offices of state were suggested, but each seemed, to other speakers, to raise as many difficulties as it solved. Mr Alport, who introduced the debate, wanted to

see the administration of all economic services in the colonies brought into the purview of the Commonwealth Relations Office, with a rump Colonial Office left to deal with the political problems of the dependent empire. Others suggested the setting up of a special Africa Office (on the analogy of the old India Office). Mr Hopkinson, in winding up the debate for the Government, was right to shoot these proposals down. The functional division of labour between offices is now probably as efficient—and tactful—as can be expected. Mr Griffiths, for the Opposition, also recognised the danger that a Minister specifically charged with the affairs of one group of colonies might appear to be junior to a Minister in charge of another group; it would be a pity, however, if this were to obscure the fact that the present burden on the Colonial Secretary is far too heavy.

On conditions of service for colonial officers, Mr Hopkinson was more pliant. The idea of a single intra-commonwealth service, composed interchangeably of citizens from the member states, may not at present be attainable. But there is undoubtedly still some anxiety about their future among officers in colonies (like the Gold Coast) that are on the verge of independence. Although the Colonial Service is technically unified, the members remain servants of the colonies in which they work, with widely disparate terms of pay and allowances. Reorganisation so late in the day will be a hard task. But the Government has agreed that a review is urgently called for. It should concern itself with the technical experts recruited since the war no less than with the administrative staff. It might well also ask whether the cost of officers recruited in Britain and appointed, in the first place, by London should not fall on the British Exchequer. That could hardly be done directly, since the colonies would think they had no control over their officials if they did not pay their salaries; but it might be done by a system of grants in reimbursement.

Gaol for Jagan

THE renewed pantomime of arrests and demonstrations in Georgetown, which has been filling the newspaper headlines this week, should be taken seriously. Dr Jagan, the deposed People's Progressive party leader, has himself been arrested twice; he is now awaiting trial, beside twenty of his comrades, for various contraventions of the emergency regulations. The PPP leaders have been temporarily excluded from the political life of the colony; they cannot hold meetings and some have been confined within the boundaries of Georgetown. But they can hardly be expected to avoid petty infringements of these regulations. Mild prison sentences will bring them only publicity and polish up their tarnished glamour.

The dangers ahead are twofold. The lesser risk is that these alarms and excursions will touch off a passive resistance campaign on the Indian model. The greater—and longer term—fear is that the authorities will have to abandon their hopes of building up a sufficiently strong anti-Communist front among the local politicians to beat any challenge from the PPP when the emergency ends and the new constitution is brought into being. The commission of inquiry which visited Guiana is now mulling over this constitution in London.

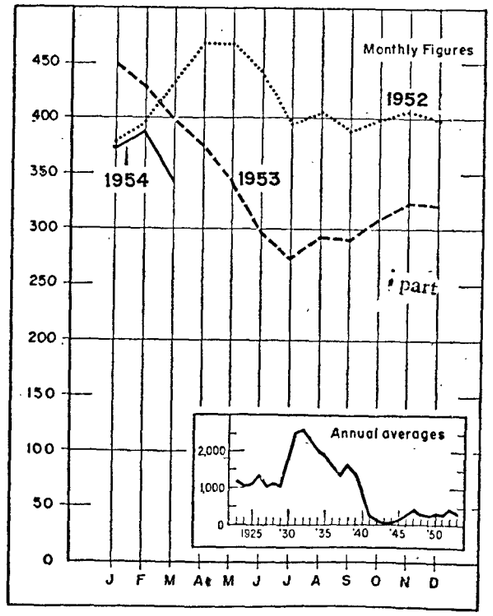
It is impossible to produce a foolproof constitution if the local population obstinately refuses to play the game. Before making a decision the Government will probably wait to see how its way of tackling the British Honduras crisis works. Mr Lyttelton has now announced that he will allow the elections there to take place as planned, on April 28th, despite the findings of Sir Reginald Sharpe's one-man mission of inquiry; this found conclusive evidence that the leading party—the People's United Party—has received money and other help from Guatemala. An official-dominated executive council is, however, to be retained as an insurance. It will, if need be, be able to ride roughshod over the views of the elected members of the legislative council. This may also prove the best way out of a bad hole in Guiana.

Decay in the Museum

THE fourth report of the Standing Commission on Museums and Galleries is the gloomiest that it has produced in its twenty-three years of existence. A good deal of progress was made after the war in getting the museums and galleries back into working order, but they have since been the victims of economy. In 1952 the Conservative Government cut their incomes by some £30,000, and building has perforce been restricted, whereas the collections are by their very nature expanding all the time.

The main cause for concern is the British Museum. Part of its collections must be stored for lack of space, and

UNEMPLOYMENT IN GREAT BRITAIN THOUSANDS



Paper from your native fibres

PULP AND PAPER INDUSTRY DEVELOPMENT

NEW YORK—A plan to help to develop the pulp and paper industry in Central and South America, Africa, and Asia with British and American money and skill has been announced here.

Lyddon and Company, Limited, wood pulp importers operating in Britain and the United States, and their American affiliates through common ownership, Parsons and Whittemore, said they were launching a programme to set up complete pulp and paper mills in those territories.

Mr. Karl Landegger, president of Parsons and Whittemore, said the companies' joint organization would develop projects based on pulping of short-fibred material found in many of the areas as well as offering equipment using standard grades of wood pulp.

He added that the organization would conduct preliminary surveys, deliver equipment that could not be produced locally, and supply technicians until local workers could take over. It would also assist local groups in obtaining raw materials and chemicals and selling the output.—*Comtelburo.*

World Program Based on Point 4 Developed to Build Paper Mills

Parsons & Whittemore Reveals It Would Be Active in South and Central America as Well as Africa and Asia

A plan to engineer, develop and build complete pulp and paper mill projects—in Point Four style—in various area of the world was announced yesterday by Parsons & Whittemore, Inc., of this city, supplier of pulp, paper and machinery for the industry.

In making the announcement Karl F. Landegger, president, said that the concern, which observes its centennial this year, would be active in South and Central America, Africa and Asia to develop projects based on pulping of short-fibered material found in many of these countries, in addition to offering equipment utilizing standard grades of woodpulp.

The company will contract to build a complete mill with any specified daily production and quality and will assist local groups in technical and management matters as well as financing.

Parsons & Whittemore recently concluded an agreement with the St. Regis Paper Company, a major producer of pulp and paper, calling for cooperation between the two concerns in the development of pulp and paper mills outside the United States. Under this agreement St. Regis would consider undertaking management contracts in mills to be developed by Parsons & Whittemore, thus assuring capacity operation of a saiable product.

Parsons & Whittemore, Inc., which is affiliated through common ownership with Lyddon & Co., Ltd., London, is supported in this field by The Black-Clawson Company, Hamilton, Ohio, paper-machinery manufacturer, and its divisions — Dilts Machine Works Fulton, N. Y., and Shartle Brothers Machine Company, Middletown, Ohio, and their subsidiary, the B-C International, Ltd., London.

In Great Britain the organization is associated with Millspaugh, Ltd., Sheffield, pioneer in the suction press and vacuum pick-up in the paper industry, and its Canadian subsidiary William Kennedy & Sons, Ltd.

Parsons & Whittemore will conduct these operations, according to Mr. Landegger:

¶ Make a preliminary survey and prepare an appraisal report.

¶ Engineer the complete project.

¶ Produce and deliver all the pulp and paper machinery and other necessary equipment that cannot be produced in the country where the mill is to be built.

¶ Supply the necessary trained personnel to assure proper operation of the project until local workers can take over.

¶ Assist the local group in obtaining financing over a period of years.

¶ Assist the local group in obtaining the necessary raw materials and chemicals to operate the mill after it is built, as well as sell the output through Parsons & Whittemore's own offices in fourteen countries.

The various companies with which the concern is affiliated are the major suppliers of machinery for the pulp and paper factories projected by it. Their engineering staffs will be available for these projects in order to deliver a going plant to the clients.

The Parsons & Whittemore-Lyddon organization also maintains the Pulp and Paper Research Company, Ltd., in London.

Parsons & Whittemore has a contract for a mill in Brazil to manufacture bleached sulphite from eucalyptus trees. Also being completed is a pulp and paper mill in Costa Rica using abaca fiber as a raw material

cheap night tourist fares

in Europe's finest air fleet

This summer BEA introduces more cheap tourist services. The only difference between them and normal BEA tourist services is that you travel by night. Nothing else is changed. You fly in the same aircraft: the famous ELIZABETHANS and VISCOUNTS. You enjoy the same comfort, the same good service. But, because you fly at off-peak hours, your air travel costs you less.

* Return fares from London

BRUSSELS £11
AMSTERDAM £11.11.0
GENEVA £21
HAMBURG £20
ZURICH £22.10.0
PALMA £34
MALTA £42
MILAN £27.10.0
PARIS £11
ROME £35
BASLE £21
NICE £26.10.0

* *Fares quoted are airport to airport.*

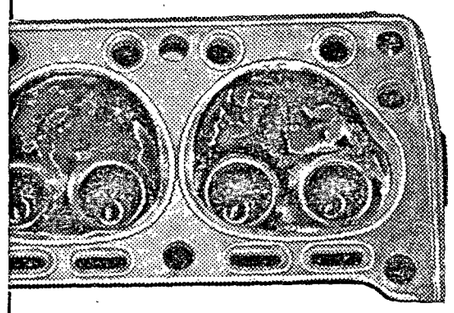
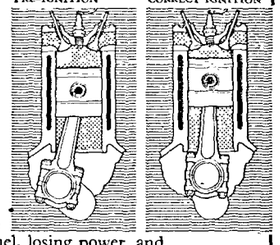
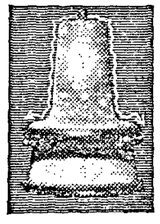
HOW SHELL WITH I·C·A IMPROVES YOUR MOTORING



1 *Look under the lid.* This is the head of a new engine in first-class condition, well-kept and carefully driven. But you can see the deposits that have already formed in the combustion chambers. These deposits glow under certain conditions, and only one glowing spot is needed to fire the petrol-air mixture in the cylinder too soon. This is the commonest form of pre-ignition — the one Shell with I·C·A eliminates.

2 *Sweeter running and full smooth power* have already been revealed in millions of cars by I·C·A (Ignition Control Additive). This is because of I·C·A's fireproofing effect on the deposits. The diagrams show how important this is. The cylinder on the left belongs to an engine running on ordinary petrol. A glowing spot of deposit has fired the mixture too early: the engine is running roughly, wasting fuel, losing power, and possibly being damaged. In the cylinder on the right I·C·A has conditioned the deposits and firing takes place in the proper manner. The engine is now able to run as smoothly and powerfully as the maker intended.





3 *The plug may fail* when these same deposits form on the insulator, for they fuse and form an electrical conductor which short-circuits the plug. This picture shows how the electrical charge is short-circuited uselessly back [illegible] part. I·C·A prevents this misfiring completely: it raises the electrical resistance of deposits and so prevents short-circuiting of the current. The plug again delivers a reliable, hot spark.

TRY THE TWO-TANKFUL TEST

During your second tankful of Shell with I·C·A — (the second one, because I·C·A must have time to work on the deposits already in your engine) — you will get *definitely smoother, sweeter running.*

SHELL WITH I·C·A

IT'S A REVELATION

cannot be properly maintained for lack of staff. The same shortage of staff is also seriously affecting the usefulness of the great library. There are not enough officials with linguistic qualifications to consider new acquisitions; no member of the staff can be spared to read booksellers' catalogues of old books; work on the catalogue is badly delayed and the subject index is five years out of date, while the catalogue of manuscripts is twenty-eight years in arrears. At the Colindale branch, where the newspapers are stored, thousands of volumes of newspapers remain unsorted.

That the British Museum should suffer so disproportionately is nothing less than tragic because of its unique value to scholarship. A work of art which is allowed to slip through an art gallery's fingers is not lost to humanity, but books and manuscripts that are uncatalogued and unavailable are useless; antiquities that are not properly looked after may deteriorate beyond repair. Some rearrangement of the limited sums spent on museums and galleries seems to be called for. And could anything be saved by better methods of organisation? The erudition that is required to direct these institutions does not always go with great administrative ability. Although the Treasury's Organisation and Management division has in recent years visited all the main institutions, it is difficult to believe that they are always run on the most economical lines.

Sweden and Britain

THREE hundred years ago tomorrow, a treaty of friendship and commerce was concluded between Lord Protector Cromwell and Queen Christina of Sweden. It might easily be argued that this showed remarkable vision on both sides; for today Sweden is Britain's foremost trading partner in Europe, and, apart from brief interruptions, Britain has been Sweden's best customer for over two hundred years. In fact, as the celebrants this week have very honestly pointed out, it was not quite as simple as that in 1654. Cromwell was set on the formation of a Protestant front; Sweden was a most desirable ally, being near the peak of its expansionist period, and dominating the southern and eastern shores of the Baltic almost as effectively as Russia does today; and, more immediately, if less ideologically, a solid ground for alliance between England and Sweden existed in their respective quarrels with the Dutch and the Danes, who had already made a compact to close the Baltic. But those who negotiated the Anglo-Swedish treaty were disappointed in its first results, and they would have been vastly surprised to learn that three centuries later it would be legally adjudged to be still in force, and, among surviving English treaties, second in antiquity only to that concluded with Portugal in 1386.

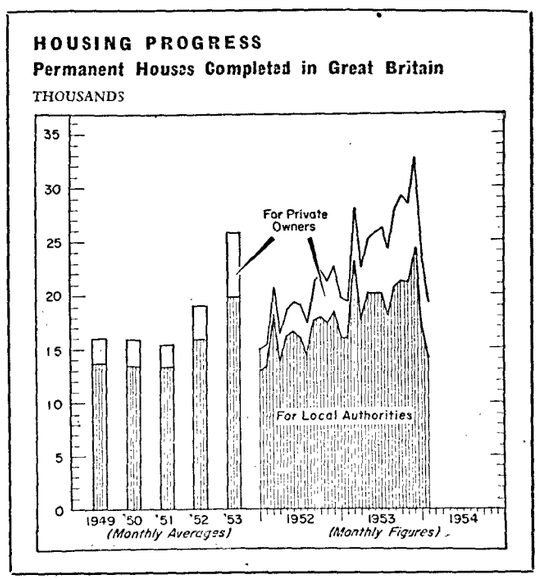
Very gracefully, the Swedes have used the tercentenary to recall the contributions that Britain has made to the development of their commerce and industry—as customer, technical collaborator, financier and supplier. But since 1952 Germany has replaced Britain as their biggest supplier; last year Sweden imported Kr. 1,488 million worth of German goods against Kr. 1,336 million of British. This is no more than a reversion to the prewar position; but there seems to be evidence that some purchases that the Swedes would be glad to make from Britain are frustrated by lack of interest on this side of the North Sea, and the memories awakened this week may serve a very practical purpose if they lead British firms to look a little more closely at an old and friendly market.

WHO and the Wolf

THE World Health Organisation, which is six years old this week, is a healthy child with more solid achievements to its credit than some of its fellow United Nations agencies. With an annual budget of $8½ million, it was never intended to become a world health service. It has been mainly concerned with helping its 84 member countries to help themselves, by providing them with expert advisers, publicising the latest medical research and methods, and arranging training courses and conferences. It has become best known, however, for its part in the mass campaigns against tuberculosis, malaria and other diseases which have been carried out since the war, first in Europe and later in Asia, Latin America and Africa.

Learning through "activity methods" is popular these days, but there have recently been signs that the young organisation's enthusiasm for field activity—or "operationalism" in current jargon—is getting a little out of proportion. In its latest annual report, the Director-General, Dr Candau, said that WHO faced an "extremely serious and prolonged" financial crisis in 1953 because of a "substantial reduction" in technical assistance funds. He repeated this complaint at a meeting in London on Wednesday.

It is at first a little difficult to see on what grounds he cries "wolf" so urgently. He refers to his agency's original plans for spending $9½ million on technical assistance last year; but it knew as early as February that its allocation would be only $5 million. It is true that, as a result of the slow rate at which contributions came in, it actually received only $4.6 million; but it was helped by the UN



Children's Fund, and there is a special reserve fund set up to meet just such emergencies.

Enlightenment comes, however, with his appeal to the World Health Assembly—which is due to meet in May—to provide a budget large enough to make the organisation independent of the uncertainties of the UN technical assistance programme. Most of the other specialised agencies are believed to be thinking along the same lines ; apart from the stability and continuity which such a move would bring, it would enable the financial burden to be distributed more fairly instead of being carried almost entirely by a handful of donor countries. But it is unlikely that the less developed countries, which are in a majority, will support a change ; under the present system they get more and pay less.

Cheaper Clothes for Russians

SPRINGTIME price cuts have become a routine feature of Soviet economic life, and last week's reduction was the seventh in succession since the devaluation of the rouble in 1947. It is through price reductions rather than through an increase in nominal wages that the Kremlin passes on to the consumers a slice of the growing national income. Last year Stalin's successors presented the Soviet public with a particularly glittering gift ; prices of most foodstuffs and products of light industry were slashed, and thanks to this cut the consumers were expected to "save" 53,000 million roubles in a full year. This time the reward is more modest and the annual "saving" is estimated at about 20,000 million roubles—though obviously each year the cut is applied to a lower price level.

Soviet price reductions do not spring directly from changes in the costs of production, but are the result of conscious governmental policy. The planners can reduce the turnover or sales tax falling on a given commodity and thus cut its final price. Theoretically, in their monopolistic position, they could reduce the price of a commodity and still leave its supply unchanged. The result, however, would be shortages, queues, and a black market. In practice the turnover tax is used to balance supply and demand, and springtime price reductions are a fair guide to the goods the government expects to provide in greater quantity in a given year.

The government clearly does not expect to reap this year the full benefits of its new agricultural policy. Last year's bounty was probably obtained by running down stocks. This year there is to be no cut in the price of meat, dairy products and vegetables. Among staple foodstuffs, only bread, tea and salt are to be cheaper.

The switch to higher production in light engineering must also take time. Thus the prices of sewing machines and vacuum cleaners are to be somewhat lower (though these goods are still scarce), but those of bicycles, motorcycles, and wireless sets remain unchanged. The chief reductions affect footwear and clothing. Here the government now has apparently something to offer, and, on top of last year's big reductions, prices of most textiles have now been cut by amounts varying from 7 to 20 per cent. The new regime seems to pay a particular attention to housewives, and women will benefit more than men from the new prices of clothing.

It is impossible to draw firm conclusions from the price lists available because of the scarcity of data on wages. From the evidence available it would seem that prices have not yet completely returned to the prewar level, but on the whole wages have risen more than prices. Thus the average Russian is now probably better off than before the war and is reaching the standard promised him for 1942. This is a real gain, after the poverty of war and the immediate postwar period, but as Malenkov himself has emphasised, it is small compared with Russia's industrial capacity. Malenkov has promised to raise the standard of life substantially "within the next two or three years." After last year's big cut and this year's more modest reduction, the Soviet public will wait till next spring and that of 1956 to see whether the new regime will really keep its pledge.

The Right to Mislead

THE minority report—effectively the Trades Union Congress report—of the Gedge Committee on no-par-value shares has raised an important point of principle. It was a remarkable document, remarkable less for what it contained than for what it did not contain. As was explained in *The Economist* last week, the majority of the committee after lengthy debate of legal and accounting aspects of the proposal to allow companies to issue shares of no par value, came down in favour of it. The TUC representative objected but not primarily on grounds of technicalities ; his minority report boiled down to a simple claim that whatever the rank-and-file worker dislikes, or is said to dislike, about company policy shall be regarded as impermissible. The dislike need not be rationally based ; its grounds need not be explained ; indeed, no evidence need even be shown for its existence. In this instance the dislike imputed to the rank and file should more realistically be ascribed exclusively to their politically minded leaders.

The trouble with the no-par-value share, from their point of view, is that it deprives them of an easy means of misleading the muddleheaded. The nominal value at which the shares of a seedling company were issued is apt to be only a small fraction of their market value when, by way of successful enterprise and steady reinvestment of profits, the seedling has become a sturdy tree. After all, how essentially immoral is the annual harvesting of five pounds' worth of apples from a tree which, ten or fifteen years ago, was purchased for a mere five shillings ? Inability to point to those five shillings and to draw the appropriate conclusions about the greed of orchard owners and the proper wages of gardeners would be a painful loss to the Socialist armoury.

The particular question of the no-par-value share is a technical one, about which the general public is not likely to get very excited. But the TUC's attitude, so clearly confessed, is of much wider application. The trade unions claim nowadays to be almost a separate estate of the realm, with at least the right of veto over a very wide range of public affairs. Rarely is a commission appointed without their having a direct representative. But apparently they still think of themselves mainly as the delegates of a narrow interest in a class war. Had they not better choose which they wish to be ?

Letters to the Editor

The Dollar Rate

SIR—May I reply somewhat belatedly to your correspondent S.G. and his letter of February 24, 1854, on the New York mode of quoting sterling ? (*The Economist*, March 13th). It really starts a little earlier with Henry VIII's debasement of the immemorial English silver standard and Elizabeth I's reform. By her mint indenture of 1601 silver was valued at 5s. 2d. an ounce in sterling and as this value was reaffirmed through Locke in 1695, it was binding on Newton when he rated gold in sterling in 1717. In the course of rating the guinea he determined the value of the Spanish silver dollar at 4s. 4d. sterling and as the United States adopted the Spanish silver dollar of average weight as their own standard in 1785 this value, then taken at 4s. 6d., is through Elizabeth's indenture the basis of your correspondent's nominal par of exchange of $4.44, also decreed by the US tariff collection act of 1789. But when the Thirteen Colonies were dependencies of Great Britain and had their own fluctuating £ s. d. currencies they naturally quoted sterling by fluctuating premiums and assisted, or hindered, by bimetallic variations, merchants carried the habit into the nineteenth century.

Attempts in 1832 and 1839 to quote in modern form were unsuccessful. It was not until 1874 that it was established and your correspondent's troubles would then have been over. Along with the demonetisation of the silver dollar ("the crime of 1873") it was part of the greenback reforms. More specifically, as sterling was quoted at a premium, a US government bond at par in New York was quoted as if at a discount in London (where US quotations were further complicated by a Stock Exchange dollar of account taken at 4s.) and US public credit suffered. Also at the rate binding for duty purposes (at $4.84 from 1842) the tariff level was too low. So by an "Act to Establish the Customs House Value of the Sovereign or Pound Sterling of Great Britain and to Fix the Par of Exchange," Congress fixed the rate as $4.8665, derived from the bimetallic ratio of 1834, and decreed that from January 1, 1874, all contracts based on the assumed par of fifty-four pence to the dollar "shall be null and void." Public credit was restored and the tariff raised. Clear of its discount the dollar, after ninety years, looked the pound squarely in the face. But the Southern Dominions remained steadfast to the old premium method until our own time, Australian bankers adopting the modern mode of quotation only in 1930.—Yours faithfully,

H. A. SHANNON

Washington, March 19, 1954

Farming in Transition

SIR—Part of your case against continuing present levels of guaranteed farm prices rested on the assertion that British prices are above world prices. Of course, if the cost of home-grown food is greater than its cost on the world market, then it is uneconomic to preserve or expand a high level of high cost domestic agricultural production. However, before this argument can be used it must be shown that home prices are really higher, and this is very difficult so long as the value of the pound is protected by exchange controls. So long as these controls exist there is a real sense in which the pound is over-valued. Consequently, it is not permissible to translate international prices directly into pounds at the present rate of exchange. It may very well be the case that at a valuation of the pound which would permit free international transactions *and* a solvent balance of payments British agricultural prices are not higher than world prices. The present, apparent low sterling cost of imported food rests to some undetermined extent upon the fact that the value of the pound is maintained *because* Britain does *not* attempt to import more food. Greater imports of more "cheap food" might put such pressure on sterling exchange that in the end all imports would be dearer.

The same point may be put another way. Perhaps one of the costs to be paid in order to reap the advantages of a pound valued at $2.80 is the maintenance of a high level of domestic agricultural production, which in turn requires a domestic price or cost *apparently* above the world level.—Yours faithfully,

Yale University WALTER C. NEALE

Equal Pay

SIR—It is felt by a very large number of persons that justice should be done, and equal pay for equal work granted. The only argument raised against it is that many men are married, and so have more responsibilities.

There is another injustice, to which attention is seldom drawn, namely that many married couples have to pay more income tax than they would, if they were unmarried, or than two men or two women, or a brother and sister living in the same house would have to pay.

Surely Mr Butler has a splendid opportunity of removing both these injustices at the same time. If he continued the joint assessment of a married couple's income but allowed them double the allowances all the way up the scale, including starting sur-tax at double the figure for a single person, he could grant equal pay at once. This would involve re-casting the income tax allowances and reduced rate relief to provide the necessary income. It would give much needed relief to young married couples, and would ensure that single men and women were treated alike.

He might well give some additional reduced rate relief for children, and so further help the families that most need it.

Is it too much to ask that you should bring your influence to bear to achieve this result ?—Yours faithfully,

F. D. CAMPBELL ALLEN

Harrow

Apartheid in the Universities

SIR—While it is true that some of the criticism of South Africa comes from ignorant outsiders, I cannot help feeling that Mr D. W. R. Hertzog's letter from Stellenbosch will not really enlighten the ignorant outsider about conditions in the Universities of the Witwatersrand and Cape Town, where contact between students of different races is not regarded as abnormal.

To depart from outside theorising, there is no evidence whatever that the mingling of students in our open University of Cape Town is leading to bloodshed or lynchings. In fact, so far is this from being the direction in which our policy of the open door is leading, that a main criticism of the behaviour of our White students at present is that their votes have elected two Africans to the Students' Representative Council.

I cannot say whether these are wise choices on the part of our students or not. In a university of 4,000 students there are many whom one does not know. I do, however, know one of the two Africans (who is no candidate for lynching) quite well, as he is one of my own students. I am quite willing to affirm (not as an ignorant outsider) that his presence at the University is unlikely to lead to friction and bloodshed. In fact, his presence illustrates very well one of the major benefits which experience over many years (in my case 24 years) has persuaded us at the University of Cape Town is likely to flow from our open-door policy. He is a good missionary for more tolerance towards European foibles among his fellow Africans.

The policy of the open Universities in South Africa is not one forced upon us by outsiders who have nothing to lose. It is cherished by us, who have everything to lose, on the basis of experience. It is saddening that so little understanding of our position should be shown by someone from our sister University town only thirty miles away, who appeals to broad generalisations instead of to the real facts of the situation as known to us far from ignorant insiders at Cape Town. —Yours faithfully, H. M. ROBERTSON

Mill the Genius

THE LIFE OF JOHN STUART MILL.
By Michael St. John Packe.
Secker and Warburg. 583 pages. 42s.

JOHN STUART MILL was without doubt one of the greatest personalities and thinkers of the nineteenth century. The many-sidedness of his gifts and achievements is somewhat breath-taking. Schooled in the classics and mathematics, he achieved a mastery of philosophy, politics, and economics which would have made him the ideal product of the new Oxford school of PPE. His treatises on logic and political economy gained in his own time an authoritative status; today he is better known for his later writings on liberty, female emancipation, and other celebrated political themes. But his scholarship was combined with a busy life in politics, journalism, and administration. He was the moving spirit in the creation of the *London and Westminster Review,* the mid-century exponent of Mill's own softened brand of radicalism. He was active in many political causes, and late in life became member of Parliament for Westminster. His income, however, was won in the service of the East India Company, where he eventually became Chief Examiner—an office which carried virtually the responsibility of a Secretary of State.

The biographer who would make such a genius both human and credible faces a heavy task. Moreover he must work under the shadow of Mill's own famous life of himself, that excellent guide to an intellectual climate but inadequate key to the man. These circumstances perhaps explain why Mr Packe's is the first biography of Mill that can reasonably be termed "definitive." It is a long book, but no longer than the subject requires. Its excellence lies in the very nice balance that is struck between the personal life of Mill, his career, and his thought. Moreover, in the result Mill the man comes strikingly to life. He was earnest and high-minded, but not without humour; his passions were intellectual rather than emotional, but he was sensitive and sociable; he was extremely generous with his time and knowledge and (except as regards comment about his relationship with Mrs Taylor) very tolerant. He made several close friendships. He was fond of travel, and he made numerous tours (often on foot) of England and the Continent. The mystery, which Mr Packe adds to rather than solves, is how he found time for it all.

Mr Packe also achieves a good balance between the different phases of Mill's life. His greatest weakness is a failure to show the emotional springs of the two great relationships in Mill's life—those with his father and with Mrs Harriet Taylor. His famous upbringing—the imprinting on the clean sheet of his infant mind of his father's stern rationalism—is passed over fairly lightly. The author points out that, for all his subsequent detestation of his father's methods, J. S. Mill derived unique advantages from his efforts and sacrifices; but the relationship between the two Mills remains strangely unreal. Later it is clear that Mill fell equally under the domination of Mrs Taylor, and Mr Packe shows that she did indeed become an active partner in the development of his thought. Intellectually they worked as one, with Harriet supplying the passion and inspiration and Mill the power of analytical thought. Emotionally, their combination of *avant garde* theory and puritanic practice, of high-mindedness and touchiness, of sensitivity to matters of principle and blindness to practical consequences (especially as these affected the amiable Mr Taylor) remains rather inhuman. Vital as their relationship was, Mr Packe cannot quite pin down its essence.

The vigour of the intellectual and social life of mid-nineteenth century London is well conveyed. Then there was nothing of the narrow specialisation of thought, backed by the wearisome cult of expertise, which is so inimical to good talk today. Mill, Carlyle and their contemporaries would discourse freely and frequently on almost any subject, and the ladies in their circle were almost equally talented. The temporary rapprochement between Mill and Carlyle—two men poles apart in character and beliefs—is nicely sketched.

Mr Packe also brings out the significant part taken by Mill in many important events. His support of Lord Durham may have tipped the scale in winning self-government for Canada and preventing that country from treading the American road. Later his campaign against the ruthless methods employed by Colonel Eyre, the Governor of Jamaica, though unsuccessful, was influential in reforming colonial administration. The conditions on which Mill became an MP—no campaigning, no payment of his expenses, no support for local interests and freedom to promote exclusively his own theories—must permanently excite the envy of aspirants to Parliament. By then he was old and greatly respected. He thwarted the attempt to prohibit tub-thumping in Hyde Park; he almost achieved female suffrage fifty years before it was actually won; and he provided Mr Gladstone with many points in his programme.

Mr Gladstone aptly described Mill as the saint of rationalism. Allied with this was an intense individualism. That is why his "Liberty" remains the most powerful, as it is today the most timely, of his many works. If his theories were based on a somewhat crude psychology, they still provide the finest vision there is of a purified individualism, of a society in which diversity is welcomed and liberty is checked only by the demands of personal integrity. It is a kind of society to which Europe may yet turn, for all its rapid running in the opposite direction. Mr Packe ably shows how behind Mill the genius there existed a rich and humane personality, a good example of the civilisation which it was his aim to promote.

Members, Classes and Issues

MEMBERS OF THE LONG PARLIAMENT.
By D. Brunton and D. H. Pennington.
Allen and Unwin. 277 pages. 21s.

SIR LEWIS NAMIER suggested this subject to the authors, and their book throws at least as much light on the advantages and disadvantages of the Namier approach to parliamentary history as on the Long Parliament itself. The aim of this approach is to penetrate the screen of institutions, parties and principles and to reveal the real structure of politics in the shifting groups or connections dominated by local or sectional concerns and held together by interest and the arts of management. The technique is that of mass biography, conducted on the principles of a social survey or market research. As Professor Neale put it in a recent article on "The Biographical Approach to History," "The essence of the game is—if I may use its jargon—to 'biograph' everyone, ask the right questions, and assemble the facts in tables where their significance may be readily grasped." Both Sir Lewis Namier's work on the eighteenth century and Professor Neale's on the Elizabethan parliaments have shown the rich rewards which this approach can yield.

The prospect of studying the Long Parliament in this way must have seemed both exciting and formidable to the authors: exciting because of the scale and number of the issues; formidable because it was necessary to collect information on over eight hundred members of the Commons. Mr Brunton and Mr Pennington are thoroughly conversant with the rules of the game. They have asked of each member questions under exactly those headings specified by Professor Neale: class, occupation, education, age, parliamentary experience, family relationships and residence in relation to constituency. They have discussed the original members who united to destroy the agencies of personal monarchy and divided to fight the Civil War; they have examined the new members brought in to take the places of the Royalists; and they have considered the composition of the Commons in the last period of all when only a radical remnant was left by the Army purge.

From all this the authors have only found it possible, as they repeatedly emphasise, to draw limited and negative conclusions. The only significant difference between Royalist and Parliamentarian members revealed by these tests is that the Royalists were much younger men, suggesting perhaps that it was easier for the older men to be influenced by what Locke was to call "a long train of abuses, prevarications and artifices, all tending the same way." Otherwise the social composition of each side was very similar, containing gentry, lawyers and merchants, old families and new, advancing and declining fortunes. Moreover the authors show that the new members elected to replace the Royalists came from much the same social background, and they prove that the purge of 1648 cannot be explained in class terms. But, as they are careful to add, these negative conclusions are also very limited and do not even disprove the Marxist interpretation of the period, since the conduct of members may have been regulated by class divisions which were not reflected in the composition of the Commons.

It is not the fault of the authors, who have combined patient scholarship with unassuming good sense, that this biographical analysis has not produced more general and positive conclusions, and they have given some of the reasons themselves. "To say of an MP that he was a Royalist or an Independent," they remark, "shows hardly anything of his outlook or activity"; and for the great majority of members it is impossible to establish, save in the very roughest way, what their politics were. Another reason is that we have still little more than provocative hypotheses on the relation between social changes and political sentiment in the country as a whole in the early seventeenth century. Above all the political situation was very different from that which the Namier method was designed to analyse. As Mr Hexter pointed out in his admirable study of Pym,

> eighteenth century connections thrived on an abundance of controlled patronage and a dearth of issues; during the Civil War there was a dearth of controlled patronage and an abundance of issues.

New Analyst of Russia

THE DYNAMICS OF SOVIET SOCIETY.
By W. W. Rostow.
Secker and Warburg. 298 pages. 18s.

ONE of the most persistent of contemporary myths is that there is a special breed of persons—"Russian experts"—who possess a fund of esoteric knowledge of all things Russian, from which those who have not been initiated into the appropriate mysteries are excluded. It is forgotten that, for the understanding of Russian economics or politics, a knowledge of economics and politics *tout court* is at least as necessary as a knowledge of the Russian tongue. If one may paraphrase the well-known saying of Clemenceau about wars and generals, the Soviet Union is too serious a matter to be left to "Russian experts." On the other side of the Atlantic this is better understood than on this. First-class work on Soviet social and political problems has been done by such writers as Fainsod, Moore and Inkeles. But throughout the western world it remains disappointingly true that most of the best social scientists, economists and historians have shied away from the Russian field.

It is therefore pleasant to welcome to it Professor Rostow, a distinguished historian of American and British capitalism, who has undertaken the present work on behalf of the Centre for International Studies of the Massachusetts Institute of Technology; he has had the assistance of a number of specialists in the Russian and Soviet fields.

The first three-fifths of the book is no more than a summary of the contents of various fairly well-known secondary works by Anglo-Saxon writers. Mr Rostow summarises not only their facts but their ideas, including at times scraps of their text. To most, though curiously not to all, of the sources he has used, he acknowledges his debt.

In the last hundred pages he gives his analysis. He stresses the priority of power in the policy of the Soviet leaders, in the economic and social fields no less than in the political. In this reviewer's opinion, the emphasis is the right one. Totalitarianism is a new subject and an indivisible subject, and it requires new methods of study. The old methods, which maintain the compartments between political institutions, economic statistics, cultural life and foreign policy, will no longer serve. This is equally true whether the approach of those who use these obsolete methods is conservative, liberal, Marxist or quasi-Marxist. Mr Rostow's analysis points in the right direction. It cannot, however, be said that he has any new ideas to contribute. What he says has already been said, for example, at greater length but not less clearly, by Professor Fainsod of Harvard. The lack of new ideas does not necessarily prove failure on Mr Rostow's part. It may prove only that there are no new ideas to be had, in fact that all that at present can be said has been said. One might, however, have expected that, as an expert on the industrial revolutions of America and Britain, Mr Rostow would have contributed a new angle on the problem of the formation of social classes in the Soviet Union. The forces that impelled the industrialisation of Russia, whether in the last decades of Tsardom or, at a much faster rate, during the Stalinist Revolution, were indeed very different from those that shaped the corresponding processes in the West. Yet there is surely sufficient in common, and sufficient contrast, to allow a writer of Mr Rostow's stature to say something both significant and new.

This book has, however, the merits of clarity and brevity. For this reason one hopes that it will be read by a wider public than the other more detailed works it summarises. If so, it may help to attract into the Soviet field other economists and political scientists who have no claim to be esoteric "Russian experts." Let us hope so, for they are badly needed.

A Sampling Inquiry

SOCIAL ACCOUNTS OF LOCAL AUTHORITIES (*National Institute of Economic and Social Research, Occasional Paper No. XVI*).
By J. E. G. Utting.
Cambridge University Press. 89 pages. 16s.

MR UTTING is almost more concerned to travel than to arrive. Much of this compact book is given up to a discussion of the sampling techniques employed in his survey of local finances, undertaken for the National Institute of Economic and Social Research; a comparison of the merits of the various methods; an analysis of the response to his *questionnaires*; the mathematics of the errors to be expected in the results; the testing of those results against figures later collected by the central government authorities. The local government official who might otherwise be tempted to study the book will probably find all this rather forbidding, despite a lucid argument and impeccable display, but for the working statistician it contains

'These are two important and exceptionally valuable books . . .'

THE ORIGINS OF PRUSSIA
The Development of the Social and Political Institutions of Brandenburg, Pomerania and Prussia from the Teutonic Knights to the Great Electors
By F. L. CARSTEN 30*s. net*

This book traces the growth and decline of the principal institutions and social classes in these principalities which formed the basis of the Prussian State of the eighteenth century.

OXFORD UNIVERSITY PRESS

some healthy empiricism. It establishes beyond doubt that many of the significant statistics of local authorities are amenable to sampling methods, and that the labour and expense of obtaining complete returns can be avoided, though with the important reservation that the largest authorities must often be included in every sample.

This leads immediately to the question, on which the author just touches, how far similar methods can be used in comparable fields: in particular, can the financial aggregates of companies be safely estimated by returns from a sample of companies or by study of a sample of their accounts? The book leads to a presumption that there is a good chance of doing this, but two issues remain to be decided. First, are companies, when properly grouped, similar enough to local authorities, whose "organisation and structure undoubtedly leads to a homogeneity which makes them particularly well suited to the use of sampling methods"? In other words, in what way, if at all, can we group companies so that sampling will produce valid results? Secondly, what size-measure do we take? Mr Utting took rate income as the size-measure for local authorities, relying on what he deemed a fair degree of constancy from one authority to the next in the ratio of rates to government grants, the other main form of income. But he appears to have established this degree of constancy by diagrammatic methods only, and other inquiries have suggested that the ratio varies appreciably. The statistics arrived at do not seem to have been much affected by this, but the lesson for other samplers remains. What is now needed is that someone—why not the Census of Production office?—should do for companies what Mr Utting did for local authorities. To establish that sampling could satisfactorily be used in future censuses would offer hope of important savings in manpower and expense, and that it could be used in other inquiries would foster this much needed research.

The statistics finally produced by Mr Utting were mostly not available much in advance of the official figures and they go into not much more detail. However, the separation of wages and salaries from other payments was a significant result of his painstaking labours: subsequently the central authorities began to collect such figures, but they are rather less useful because, for one thing, they omit national insurance contributions. Another achievement is the separation of rates on residences from those on other premises, a division not elsewhere obtainable. In 1948-49, no less than 58 per cent of rates were levied on residences.

For the rest, the noteworthy end-product is the casting of the statistics for the three years to 1948-49 in a social accounting framework, of which the separation of trading services from non-trading and the erection of "savings-and-investment" accounts are the central features. Students of the national income will profitably ponder upon the structure of these various accounts and upon the entries in them. They bring out clearly the large draft on the national resources for local capital formation (but Mr Utting does not, unfortunately, show what an overwhelmingly large part of this was for housing). The accounts are in fact a useful appendix to earlier national income white papers.

Past and Future

THE FUTURE OF THE WEST.
By J. G. de Beus.
Eyre and Spottiswoode. 185 pages. 12s. 6d.

THIS is mostly familiar stuff set forth in good plain language. The first part of the book is competently potted Spengler and Toynbee with a few words on a forerunner, Nicolai Danilevsky. Mr de Beus believes, rather surprisingly, that the views of Spengler and Dr Toynbee are not well enough known in Europe and America, and he has provided a clear outline of their main arguments and a succinct statement of some of the principal criticisms levelled against them. He is fairer and more favourable to Dr Toynbee's basic metahistorical scheme than is fashionable at the moment, but he ignores much of the attacks made by professional historians. Mr de Beus not only expounds; he also accepts. He accepts the view that history should be studied in terms of "civilisations," things which rise and fall, are born and die; and he accepts the view that western civilisation has reached a crisis. He is therefore, like all thinkers with this bias, much occupied with symptoms of decay and with the question of stopping the rot. His principal inquiry is into the "creative forces" in western civilisation, which may or may not be strong enough to make the next age one of greatness rather than decadence.

Having adopted the Toynbee scheme and terminology Mr de Beus has no difficulty in showing that we are at the stage of a "time of troubles," but at this point he goes further and, stepping outside the scheme, maintains that the question of war or peace dominates the lives of all men and women of all nations—which is simply not so. He is a Toynbeean rather than a Spenglerian in that the present, though a point of crisis, is not for him necessarily the gates of doom: our fate is still in our own hands. All depends on how three major challenges are met: the internal menace of the disunity of Europe; the external menace of the anti-westernism of the new nationalisms of Asia and Africa, and Communism. Is our creative genius up to it? Mr de Beus surveys Europe and the United States and thinks that on the whole it is.

Mr de Beus is one of those lucky people for whom "the readings of history are clear." He presents his diagnosis with clarity and modesty, and many of his exhortations will be readily accepted even by those who find the past less simple and a less sure guide to the future.

Mediterranean Island

THE BANDIT ON THE BILLIARD TABLE. *A journey through Sardinia.*
By Alan Ross.
Derek Verschoyle. 184 pages. 25s.

THERE are new travel books galore about the Mediterranean islands—Balfour on Cyprus, Durrell on Rhodes, Cronin on Sicily and now Mr Ross on Sardinia. Books of this kind, to be worth buying, must fill one of two requirements. Either they must tell the intending traveller what to do, or they must be so well written that in the arm-chair one attends the *festa*, smells the cistus and tastes the wine at the end of the day. Mr Ross wins marks only in the first category. He is honest enough not to make Sardinia irresistible. It is only now emerging from centuries of deathly malaria, which has within the last few years been cured by the Rockefeller Foundation and DDT. Even in the future, it will never be ringed with Amalfis because its southern half is arid and sprinkled with mining villages called Carbonari and as dirty as their name. Only the green north-west and an island off the south-east tip called Carloforte are made to sound really inviting; elsewhere, billiard balls click all night, trams rattle, lidos are backed by hoardings, Vespas hoot and prospects of road racing recall the Isle of Man. Good living costs thirty shillings a day, and Italians marooned on the island by their duties long for the *continente*.

The island has an interesting story and would have been better served if Mr Ross were not so keen to strive after unusual vocabulary. One grows limp from "breasting" aromas, and watching clouds "bandaging" the mountains or (at the Lido) "girls shiny as oilskin carrying light in the hollow of their faces." Spirits flag, also, at too many touches of sophistication; the sea is "Pernod-coloured" and the "pure beauty" of the acolyte behind the cardinal at the *festa* would have "pleased Pirelli's creator"; as for the ladies, they dress "not so sexily as French girls" and one woman's breasts were "like the sudden glimpse of a waterfall." Some people contrive to take their favourite pub in Fitzroy Street with them wherever they go.

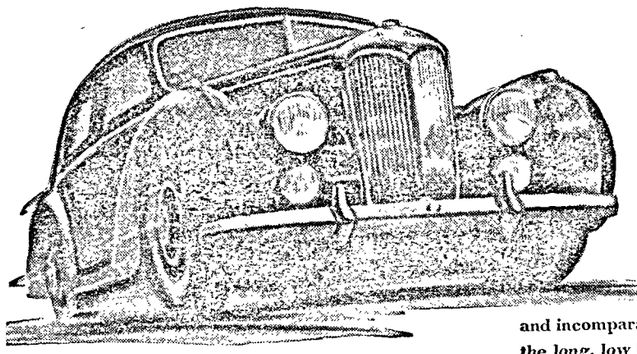
You're right ahead—with the New Riley



1½ litre Saloon

You're right ahead with *POWER* and that in the long run contributes most to your motoring enjoyment.

No other 1½ litre car gives you the same spirited performance with such consistent reliability. You're right ahead with safe, sure road-holding at speed, and incomparable steering. These are part of the Riley tradition. And the long, low lines of the luxurious body proclaim to all that this is one of England's outstanding cars.

For the sheer pleasure of driving, there's nothing quite like a Riley 1½ litre Saloon—built to give you years of *Magnificent Motoring*.

Service in Europe—Qualified Riley Owners planning a Continental Tour are invited to see their Riley Dealer for details of a Free Service to save foriegn currency.

The brilliant New Riley 'PATHFINDER'
It's the most powerful, roomiest Riley ever. Your Dealer will be pleased to tell you all about this great-hearted car.

Continuous Performance

'EVERYTHING FLOWS, NOTHING IS STILL' said the Greek sage Heracleitus 2,500 years ago—but he might have been speaking of an I.C.I. chemical plant today. One of the main lines along which chemical manufacturing is developing is in the introduction of continuous processes to replace production in batches. This line of development is also being followed, of course, in other, more familiar fields. Just as the smooth surge of power from the jet engine is replacing the supply of little 'packets' of energy by the piston engine, so in modern chemical plants the continuous transformation of raw materials into finished products is replacing the batch by batch methods of yesterday. In these developments, I.C.I. is playing a pioneering part.

There are still certain products where so many different varieties of material have to be specially made that 'batch' production is unavoidable but, whenever possible, I.C.I. has introduced continuous processing, and most new plants—such as those now operating or under construction on the great new site at Wilton, in North Yorkshire—are designed to operate 60 minutes in every hour, night and day. One outstanding example is the new Wilton plant for making an important synthetic resin for the plastics industry. This resin used to be made in a series of stages; today, the finished product emerges on a conveyor belt in a continuous stream. A process of this type places heavy demands upon the designers of special instruments and automatic controls, because these devices are the very crux of the operation. But the skill and experience of I.C.I.'s engineers and instrument experts has been equal to all eventualities, and the latest I.C.I. plants set new standards for efficiency in production.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Bombs and Allies

Washington, D.C.

"PROVIDENCE," according to an old saying, "looks after children, drunks and the United States of America." The past two weeks have made many people wonder whether the third of these wards, having exploited the ultimate mysteries of physical matter, may not have placed itself outside the protective pale. For seldom have United States policy and intentions been subject to such misfortunes of timing and lack of co-ordination as the coincidence of the latest hydrogen bomb explosions with the debate on the policy of "massive retaliation" and with Mr Dulles's attempts to suggest a policy of "united action" in Indo-China to the nations of the free world.

To begin with there was much stronger public feeling about the awful potentialities of the hydrogen bomb, as gradually revealed by the inadequate information on the explosion of March 1st, in the two most densely-populated island nations, Japan and Britain, than in the United States. Even when Representative Chet Holifield, who had been an eye-witness, described the explosion as "so far beyond what was predicted that you might say it was out of control," or when the President spoke of the "astonishment" of the scientists, the headlines were bigger in the foreign than in the American press. There was indeed a discernible sense of impatience with the political debate that had flared up in Britain, particularly as it became clear that the shower of radioactive ash which had fallen on the crew of the Japanese *Fortunate Dragon* had been the result of unforeseen meteorological conditions in the upper air rather than because the explosion had in fact got out of control. Perhaps the American public, having absorbed since childhood a much headier dose of science fiction than the British, can more easily digest news of explosive "megatons," of islands being blown out of the water, or clouds twenty-five miles high.

But the clamour for an authoritative explanation of what had happened eventually arose not only from across both oceans, but from Congress as well. As a result on Wednesday of last week the President turned over most of his press conference to Mr Lewis Strauss, the chairman of the Atomic Energy Commission, who had returned from Eniwetok two days before. Mr Strauss read to a crowded conference a not very informative account of the explosion and of the action that had been taken to avert harm, after, as he said, with the *hubris* characteristic of scientists, "the wind failed to follow the predictions but shifted south." However, it was not his statement which made the next day's headlines, but his reply to a question on the potential size of a hydrogen bomb. "An H-bomb can be made large enough to take out a city, to destroy a city." "How big a city?" "Any city." "New York?" "The metropolitan area, yes." At that the reporters evacuated the conference and stampeded for their telephones. The next day almost every newspaper carried a map of Manhattan or Washington with concentric rings of potential destruction superimposed upon it, even though the White House later explained that Mr Strauss had meant that a bomb could put a city out of commission, not level it.

★

The first casualties of Mr Strauss's verbal bomb were the officials responsible for civil and continental defence in its various aspects. Civil defence has been one of the victims of the Republican economy drive. Whereas the original plans drawn up by the previous Administration called for an expenditure of $600 million this year on shelter construction and the dispersal of industry, in President Eisenhower's latest request to Congress the amount has been reduced to $75 million, while the dispersal programme has virtually been abandoned. Mr Strauss's announcement galvanised the Civil Defence Administration and the Office of Defence Mobilisation, which is responsible for the dispersal of industry, into action again, though whether they will get funds enough to launch an effective programme is doubtful. New York City's civil defence director said that, with this latest news from Washington, evacuation had become the only solution: "The shelter idea is out." But he added that it would take three days to clear the city's inhabitants on foot, and seven and a half days to clear the 1,800,000 vehicles in the metropolitan area, while the longest warning that could be expected would be two hours.

Although some progress has been made with the establishment of an early warning system, the McGill line which runs across northern Canada, and the building of guided missile sites around ten of the principal cities, Mr Strauss's statement has brought home to Americans the fact that their cities are as vulnerable as those of Britain or Japan. As Senator Duff, an Eisenhower Republican, said last Saturday: "American supremacy is due to concentration of our industries. Our national strength can well become our national weakness." At the very best the meaning of total war is that whenever an enemy aircraft shows up in the radarscopes over the Canadian wilds, the whole population of New York, Chicago, Boston and San Francisco must take to the country, for it will be impossible to tell

for which city the aircraft is headed. Although the President, *in his radio and television speech on Monday night*, tried to allay the general sense of alarm which he detected in American public opinion, the briefest contemplation of the implications of a hydrogen war for the United States itself leads to uncomfortable conclusions.

In consequence, the most serious casualty so far has been Mr Dulles's policy of "massive retaliation." As Mr Joseph Harsch wrote in the *Christian Science Monitor*:

> The "deterrent" power of "instant retaliation" had possessed a defensive and even comforting overtone when John Foster Dulles spoke of it in January. Its overtones were different in March. There was small comfort in the thought of available retaliation for those who might be in the path of the occasion for retaliation.

As it happened, Mr Strauss's statement almost coincided with the first comprehensive and authoritative criticism of the "instant retaliation" thesis from Mr Dean Acheson, writing in the *New York Times Magazine*.

★

But last week did more than precipitate the serious and thoughtful discussion of the new turn in American strategy which that turn deserves. It exposed the lack of intellectual co-ordination between the various policies of the Administration, despite the importance that has been attached to this co-ordination by the strengthening of the National Security Council under President Eisenhower. Mr Strauss's statement on the effect of the hydrogen bomb not only alarmed American public opinion about the implications of policy that contemplated the use of atomic weapons, but also weakened the principle of collective security by showing that the United States and the Soviet Union had at their disposal a weapon which could make it almost foolhardy for any other nation to be allied to either one or the other. Mr Walter Lippmann pointed out that

> it has become impossible for small or middle-sized countries within easy reach of an aggressor who is armed with atomic weapons to commit themselves to intervene in a world war.

Yet two days before, at the Overseas Press Club, Mr Dulles dropped a broad hint about "united action" in Indo-China if the situation there deteriorates, which was nothing less than an invitation to Britain and other interested powers to recognise the same obligations for collective security in that area as they recognised in Korea or in the setting up of the North Atlantic Treaty Organisation. He amplified this on Monday before the House Foreign Affairs Committee.

Superficially there is no connection between the statements of Mr Strauss and Mr Dulles. The spring tests of the Atomic Energy Commission take place according to a predetermined schedule in which the winds and weather are the prime considerations; the scientific argument and experiments proceed according to physical, not political, laws; Mr Dulles had probably no knowledge when he issued his call that Mr Strauss was in possession of information that would scare every smaller ally of the United States into insensibility. Yet it was a clear failure of political imagination at the central point of co-ordination—the White House—that the incompatibility of these two important statements went blithely undetected. As Mr Lippmann has said:

> What in the world has gotten into us that we have lost the capacity to put ourselves in the place of other peoples, and to realise how they feel? Here we are having public *tantrums about how we may be demolished* by atomic weapons flown across the Arctic Ocean, lobbed in at us from submarines, carried in among us from suitcases. And yet we cannot seem to appreciate why small countries that are much nearer, that have no defences, do not want to go half-way round the world to take part in wars of collective security, which could become a war with the Soviet Union.

Retail Trade's Easter Egg

THE increase of 54,000 in the number out of work in March was much less than in any month since last October and is being taken as a sign that the rise in unemployment is levelling off. For this reason the March increase has not given the signal, as President Eisenhower suggested it might some months ago, for federal action to halt the economic recession. Nevertheless, the President must be feeling happier about the recent cuts in excise taxes than he did when he signed the Bill containing them on the last day of March. For then he said that he accepted the Bill in the hope that the tax reductions might stimulate business enough to offset some of the loss in revenue, estimated at $999 million. And now it is being hoped that business will also be stimulated enough to bring in April the seasonal fall in unemployment that should have come in March.

Last month's unemployment is attributed in part to the late Easter, which has delayed the usual spring upturn in retail trade. This explains, to some extent at least, why retail sales have been running behind last year. This week, for the first time, the Easter advantage is with this year's trade; in 1953 Easter Day fell on April 5th, in 1954 there were two more weeks of normally heavy buying to come. This week is also the first full week since excise taxes were reduced. The complete effect of these reductions will not show in trading statistics, since they are based on the dollar, not the unit, volume of sales and the tax cuts mean lower dollar prices.

It is far from certain, however, how much lower dollar prices will actually be. The reduction in tax, to 10 per cent from 20 per cent of the price, which affects at the retail level the so-called luxury items—furs, jewellery, luggage and toilet articles, most of which had been selling badly—is apparently being passed on in full. But those tax reductions which apply at the manufacturing level—on cameras and light bulbs, reduced to 10 from 20 per cent, on sporting goods, mechanical pencils and lighters, reduced from 15 per cent to 10 per cent, and on household appliances, from 10 to 5 per cent—are not necessarily being passed on to retail traders. This is particularly true in those cases where the manufacturer has been meeting competition by absorbing the tax himself. Many cinema proprietors also seem to be pocketing at least part of the reduction in the tax on admissions to entertainments, instead of giving their patrons the benefit.

Even so, shoppers are certainly being offered, and are taking advantage of, very substantial price reductions. Many retail traders are using the opportunity to lower prices by more than the tax in order to get rid of slow

oving stocks. These cut price sales are another reason hy it may be difficult to assess the exact stimulus which the ix reductions give to trade. The pattern is also being istorted by a rush of delayed purchases that were postoned in March because it was thought that tax reductions ere coming. Businessmen note that the declines in peronal incomes and hire purchase buying that had much to o with the recent fall in retail trade are still going on nd they are wondering if the Easter egg that the congresional tax-cutters have given to them may not turn out to e addled.

States' Rights and Labour Laws

Washington, D.C.

RATHER unexpectedly it begins to look as if Congress may after all get around to amending the Taft-Hartley Labour Act at this session. The House Committee is expected to approve a Bill before Easter, which is likely to go a good deal further in an anti-labour direction than the President wishes, while the Senate Committee has already reported a Bill which follows his recommendations almost exactly. Among the important features of the Senate Bill, which was accompanied by the muttered curses of the Democrats on the committee and only the faint praises of the Republicans, are two gestures to the grand old cause of states' rights. Both were suggested by Mr Eisenhower in a letter to the chairman, in which he described them as the first conclusions of a study group that was going into the "complex" question of the relationship between state and federal laws about labour relations. One provision reserves the right of any state to make laws preparing for emergency action in case a labour dispute should provide "a clear and present danger to the health and safety of the people." The other allows the states to pick up jurisdiction when the National Labour Relations Board declines to exercise it on the grounds that the case is not substantially concerned with interstate commerce.

The new board, which now at last has a majority of members appointed by President Eisenhower, apparently intends to withdraw from some of the wide interpretations which its predecessor put on its powers and which were upheld by the Supreme Court. A change in the law is therefore needed, for the courts have decided that, as things stand, the states are for ever excluded from an area in which the board has once acted. As a result many of the state labour laws are at present virtually dead letters, with the marked exception of the "right to work laws" which ban compulsory membership of trade unions. These were specifically allowed by the Taft-Hartley Act to over-ride federal law. They spread rapidly in 1947, the year of the Act, particularly in the southern states, where the comparative weakness of trade unions is part of the bait put out for new industries. This year they began to spread again, Mississippi and South Carolina being the latest additions; at present sixteen out of forty-eight states have such laws.

Despite their opposition on principle to the Taft-Hartley Act, trade union leaders are well aware that it has in fact shielded them from the effects of more severe state laws at a time when public opinion (somewhat distorted by the over-representation of rural interests in the state legislatures) was swinging against the unions. They are therefore

opposed to any return of authority to the states, but they are particularly alarmed by the plan to let the states legislate for emergencies. The two main concessions made to labour in the President's original recommendations for changes in the Taft-Hartley Act may in fact be cancelled out by the concessions which he is now making to the states. Unless the state "right to work" laws may be over-ridden, it is meaningless, in the sixteen states where they apply, to propose that the maritime and construction unions should be permitted to insist on new workers joining the union within seven days instead of, as with the usual union shop, within thirty. The proposal that the ban on secondary boycotts should be relaxed, to the extent that strikers in one part of a construction project should be able to picket employers in other parts of the same project, could be rendered equally futile if the NLRB chose to relinquish jurisdiction to a state with tougher laws about picketing.

Foreign Operations in 1955

AS was to be expected from the importance which President Eisenhower attaches to preventing any further losses to the Communists in South-East Asia, in the interests of the security of the free world, the largest single sum in the foreign operations budget for the 1955 fiscal year is allotted to Indo-China. In the programme for the twelve months beginning on July 1st, which Mr Stassen presented to the Foreign Affairs Committee of the House on Tuesday, $1.1 billion is asked for that area. This is made up of $300 million for military equipment, $800 million for direct forces support, a new category which provides food and other supplies, and small amounts for economic and technical aid. Altogether the Far East and the Pacific area are allocated $1.8 billion, nearly twice the $948 million that is asked for Europe, which is to receive less than half as much aid from the United States as during the current year. The Near East, Africa and South Asia are allowed $569 million, of which over $100 million is for India, Latin America is to get $47 million, and non-regional programmes $165 million.

The total for direct forces support, which also includes provision for the manufacture of aircraft in the United Kingdom for the Royal Air Force, and for aid to Jugoslavia, Turkey and Formosa, is $945 million. Mutual defence assistance—military equipment and training—is to cost $1.6 billion and mutual defence support, which once upon a time was economic aid, is put at $223 million. The only places in Europe which are now eligible for the last are West Berlin, Spain and Jugoslavia, but between $200 and $400 million is allowed for off-shore procurement of military supplies in Western Europe. $241 million is asked for the relief and rehabilitation of Korea, $306 million for development assistance to promote economic and political stability, and $132 million for technical co-operation, which consists mainly of teaching, training and the exchange of information. Mr Stassen regards this last section as "of the greatest significance in the long pull over the decade ahead," and asks for nearly $25 million more than was appropriated for the purpose last year.

For the whole programme only $3.5 billion is asked, compared with $4.7 billion appropriated last year and $6

billion the year before. Mr Stassen believes that this is enough to carry out the essential tasks in the year ahead. But members of the House committee are already thinking that it is too much. In particular they want to know what has happened to funds already appropriated but not yet spent. Mr Stassen confessed that he still had $1.6 billion in hand that was not specifically allocated and $9 billion that had not been paid out although it had been committed.

Whose Water?

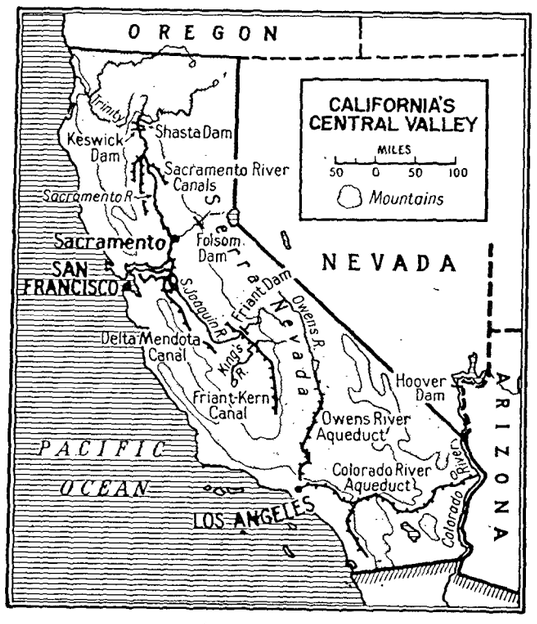
FROM A CORRESPONDENT IN CALIFORNIA

IN California the Republican Administration's new policy on the development of water and electricity resources, a reversal of the New Deal's paternal approach, has raised once more the whole question of a long-range water policy for the state. Basic economic and political issues are involved because of California's dependence on irrigation for its agricultural expansion and because the state's size and geography make sectional rivalries inevitable. This reappraisal applies particularly to the huge Central Valley irrigation project. Two years ago the State Legislature appropriated $10 million to be used as a token payment for the purchase of this undertaking from the federal government. Arguments were still going on as to whether such a purchase was in fact desirable when the Administration's announcement last summer opened up the prospect of acquiring effective state control without actually buying the project.

The Administration's objective is to give common responsibility, financial as well as administrative, to federal, state and local governments for public works developments. The Bureau of Reclamation in the Interior Department and the Army Engineers are to be restricted to the construction of major projects and local agencies are to do their own planning and managing as far as possible. The federal government will continue to finance flood control work, but irrigation costs will be repaid by local water users; where necessary, electricity revenue is to be increased to help pay for reclamation work.

Water is the key to California's prosperity not only in its agricultural valleys but in the industrial centres which cluster around the major cities. Without Colorado River water from the Hoover Dam, 400 miles to the east in Nevada, there would be no aircraft industry in Southern California, and oil production there also requires great quantities of water. The cattle on the ranges in the San Joaquin valley often drink water mined from underground sources, for annual rainfall averages less than five inches in this valley. Continuous over-pumping is lowering the ground water level and bringing the hazard of salt water intrusion. Fresh sources must be found both for irrigation and for percolation to restore the underground supply in many parts of the state. In the north, however, the Sacramento River, with a much more satisfactory flow than the San Joaquin, and the better rainfall make this area's enormous fruit and cereal crops and dairy production possible. It is these two river basins which comprise the so-called Central Valley. Farther south, below the mountains, Southern California has no reliable rivers at all.

It is, therefore, understandable that the search for water has constantly preoccupied Southern California. It led first to the appropriation of the Owens River years ago, over the bitter and violent protests of local settlers, to supply Los Angeles 300 miles away. A second major source was secured in 1935 with the completion of the Hoover Dam, which made possible the channelling westward of some 5,000,000 acre feet of Colorado River water. (An acre foot is the amount of water required to cover one acre to a depth of one foot.) Even so, the search for water goes on in the south. No scheme is too fantastic, or too expensive, for consideration—from plans to bring water from the North-west's Columbia River down to Southern California, to those for desalting the sea, and mining for supposedly untapped "geological waters" in the most unlikely spots. All plans for expansion in the Los Angeles area depend on winning various legal disputes over water rights now going on between California and Arizona, and between California and the federal government, and on full recognition within the state of Southern California's needs and claims.



These claims will be re-emphasised now that California may have an opportunity of managing its own water resources again. The fact that 55 per cent of the state's voters live in the Los Angeles area, and might therefore have a controlling voice, is cited, for example, as one reason for leaving the Central Valley Project in federal hands. As the debate over water in California shifts to new ground, it is important to recall that this mammoth project, which transfers surplus waters from the Sacramento River basin to the arid San Joaquin River basin adjoining, was originally a state project, planned by state engineers. But by the time the plans were completed and approved the depression had arrived and the only possible way of financing the project was with federal funds. It was as a rescue and relief project, therefore, that the Bureau of Reclamation undertook to build the CVP.

The state authorities could not have foreseen that the New Deal planners who were to take over the Interior Department would find in the CVP a chance to demonstrate a social theory and at the same time to build powerful political influence in the Far West. The ideas then prevailing in bureau offices, which featured the breaking up of the "factories in the fields," the solving of the migratory labour problem along with the water problem, appeared more than fanciful to the individualistic ranchers of the Central Valley. Further shocks were in store for them when they discovered that the Reclamation Bureau, taking advantage of changes made in the law in 1939, was proposing to operate as a public utility instead of, as in the past, allowing the local irrigation authorities to take over the installations by degrees. Another snag, from the farmers' point of view, was the limitation on lands which might receive water from the project, to individual holdings of not more than 160 acres. This limitation is fixed by the laws relating to public lands and public works, but in California it is contended that it should not apply to established agricultural holdings.

Thus the bureau's attempt to make the CVP a model for publicly-owned water (and power) facilities has clashed inevitably with California's doctrine of private water rights, and with the free enterprise philosophy of the state's ranching and electricity interests. Beyond the legal disputes is the added complication that CVP water merely supplements existing water supplies. For throughout the Central Valley much irrigation water continues to be drawn from wells. A large landowner can, therefore, remain outside the local irrigation system and simply pump the water he needs without interference from the bureau's officials. But he is depleting the underground water resources when he does so and threatening the interests of all water users in the valley.

The CVP is now about half completed. 1953 was the first full year of operation of the initial features of the project—the dams, pumping plants and canals which provide one million acre feet of water and 2,245,000 kilowatt hours of power a year. Sales of this water to local irrigation authorities in the Central Valley, and of power at Shasta and Keswick dams to public and private electricity distributors, brought the United States Treasury $5,500,000 in 1953 and the return so far on an investment of some $400 million up to $50,931,707. The CVP is thus shown to be a going concern.

★

The question in California is, whose concern is it? Both the ranchers and the aggressive Pacific Gas and Electric Company think there is hope that it may become the state's, as a result of the more friendly climate both in Congress and in the Administration, which has been illustrated by the legislation giving ownership of offshore oil lands to the states and by the withdrawal of federal opposition to the private development of hydro-electricity on King's River. There is also a new Bill, sponsored by Senator Price Daniel, a Democrat, of Texas, which would exempt established agricultural areas served by publicly-built water works from the 160-acre limit on acreage; it seems fairly safe to predict that this measure may soon be approved by Congress.

With these federal hurdles to state control removed, it no longer looks as if it will be necessary for California actually to buy the Central Valley project. The Legislature

has already withdrawn half of the $10 million down payment fund for CVP and put it back into the General Fund. What seems more likely now is a concerted move at last, by all elements in the state, to get federal loans for needed extensions of the CVP system ; the federal budget for the coming year includes $10 million for loans to local irrigation agencies. Such a move is foreshadowed in the hearings on the Trinity River project which the Interior Committee of the House of Representatives will hold this month in California. This proposed project is the cheapest new source of another 600,000 acre feet of badly needed water for the Central Valley. The Californian delegation to Congress seems united for once on getting it started. What remains to be seen is whether this same spirit can prevail long enough to achieve the establishment of a consolidated water agency to take over the responsibilities now shared by many overlapping state bureaux, and whether Californians are prepared to pay the cost of home ownership for water.

Slow Start for Colour

New York

THE race to bring more colour into American homes started officially last December, when the Federal Communications Commission finally approved standards for the "compatible" system of colour television—compatible in that colour programmes can be received, in black and white, on existing television sets. Most of the competing firms had been limbering up for several years yet today, three months after the start, they have barely completed the first lap—and all of them, not unexpectedly, are already out of breath.

Estimates of the number of colour television sets that will be produced this year range from 70,000 to 200,000 ; last year 7 million black and white sets were sold. Colour television is not expected to penetrate the mass market until 1956 at the earliest, and probably not until 1957. The reasons for this slow progress are clear: colour television sets cost too much, both to buy and to service ; the screens are too small ; and there are too few colour programmes.

The heart of the colour television set, and the place where its weaknesses are found, is the colour picture tube. Each of these tubes costs from $125 to $175, compared with only $40 for a black and white picture tube, and in addition twice as many ancillary tubes, and three times as many component parts, are needed as in a black and white set. The resulting circuits have so far proved too complex for anything more than a very limited form of mass production. And after all this the colour tube now in production gives only a "squint-sized" picture of 12½ inches in diameter—to a public which insists on a minimum-sized picture of 21 inches on its black and white sets. The main research effort is therefore directed at producing a larger, cheaper colour tube, which can be fitted into simplified circuits.

The first colour set on the market, a 12½ inch model, now reduced in price to $1,100 (just under £400), is still at least four times as expensive as a comparable black and white set. Even so, the manufacturer has admitted that each set costs $3,000 to make. Colour programmes, also, are more expensive to produce, but advertisers are unwilling to pay large additional sums for programmes which will be seen—in colour—by very few consumers. Therefore colour television broadcasts have been limited, so far, to two to four hours a week. Since even these programmes can be seen perfectly, in black and white, on an ordinary set, the incentive to buy colour is not great. Until costs of production come down this cycle cannot be broken, and sales of colour sets will continue to be limited, as they are at present, to a few "two-car garage" customers, and to people with a professional interest in television. All the major companies will have colour sets on the market this year, but most of them will remain in the dealers' showrooms ; it will probably be 1957 before a really satisfactory set from the selling point of view makes its appearance. The objective is a 21-inch screen costing $500—only twice as much as a comparable black and white set.

SHORTER NOTES

The Senate has insisted, by a large majority, that statehood must be given to Alaska as well as Hawaii. The Bill passed by the House of Representatives last year, however, confers statehood on Hawaii only ; this is in accordance with the President's wishes, for he does not consider Alaska is yet ready for statehood. At the moment it looks as if both House and Senate might refuse to compromise, which would mean that neither Territory would become a state at this session.

★

The longest and costliest strike in the history of the Port of New York came to an end last week, after a month of strife and violence and an estimated loss in trade of $1½ million, when the leaders of the International Longshoremen's Association yielded to federal and state pressure. If the union had not complied with the ruling of the New York State Supreme Court and the requirement of the National Labour Relations Board to terminate the strike "forthwith," the ILA would have lost its right to a place on the ballot with the new American Federation of Labour trade union, when the dockers decide which union shall represent them as their bargaining agent in negotiations for a new contract. As expected, the NLRB has invalidated last December's election and directed that another be held.

★

The Administration's latest attempt at saving money, or rather at making it, is to go into the used stamp business. The first trial sale held by the government included a collection of some fifty pounds of domestic and foreign stamps, clipped from letters coming into government agencies and the White House over a ten-day period, and auctioned off to the stamp dealers. The Administration is not yet certain that the stamp business will contribute to balancing the budget ; it is now comparing its costs of collecting the stamps to the mere $339 netted from its first sale.

★

Last year Americans spent nearly $1.3 billion on travel abroad, $115 million more than in 1952. Of this, $383 million was paid out for ocean and air fares, almost half of it to foreign carriers, and the rest was spent within foreign countries.

Dense-medium coal washing

NO. 2 IN A SERIES ON RESEARCH & DEVELOPMENT

Dense-medium coal washing is a commercial application of the laboratory sink-and-float technique in which a liquid of controlled density allows clean coal to float and dirt to sink. This process is important for washing certain "difficult" coals, and its wider use is envisaged in the National Coal Board's *Plan for Coal*. Simon-Carves have played no small part in the great strides made in dense-medium washing. Some early steps were taken in conjunction with an American firm, and further fundamental work on a laboratory and pilot-plant scale was done by the Simon-Carves scientific staff. A number of Simon-Carves dense-medium plants are in commercial service, and development is being vigorously pursued in collaboration with the National Coal Board and a leading French firm of coal preparation engineers.

Commonwealth Debate at Lahore

FROM A CORRESPONDENT

IN his opening address to the fifth unofficial Commonwealth Relations Conference, the Prime Minister of Pakistan alluded to the three outstanding dates in Commonwealth history, 1867, 1926 and 1947. The British North America Act of 1867 marked the inception of the Commonwealth ; 1926, the formal description of its conventional characteristics ; 1947, its extension to Asia. The importance of the Lahore conference derived from the opportunities it gave to appraise the practical implications of Asian membership.

The emphasis of India and Pakistan on the completeness of their national sovereignity is still pronounced. Something which older Commonwealth members take for granted is asserted by them as though it might be still in question. It was because the right of secession and of neutrality was expressly conceded that Pakistan, in the words of its Prime Minister, remained a member of the Commonwealth, while Indian delegates noted that opposition to Indian membership had lost much of its force because of incontrovertible evidence of the independence of India's foreign policy. Behind this emphasis lay a difference in experience between the older and the Asian members which deeply influenced their respective outlook on world affairs. For the older the lessons of history were the lessons primarily of European history, of the dismal consequences of appeasement in the thirties, of the formidable menace of Soviet expansion in the forties. But for Asia what remained uppermost was the struggle to overthrow imperialism in the thirties, its achievement for some in the forties, and the uncomfortable reminder from Indo-China that it was incomplete. Delegates from the West might simplify the issue in the cold war to one of right and wrong, but for Asian delegates this was not possible because there was more than one issue about which they felt deeply and in which they felt questions of right and wrong were at stake.

If the conference demonstrated anything, it was that the colonial aspect of the war in Indo-China was a major liability for the West in its political relations with Asian peoples ; and that contrasting interpretations of Communist intentions arose mainly from geographical circumstances. Where Britain, Canada and South Africa thought of Russia first, Pakistan, Ceylon and above all India thought first of China. They were strangely oblivious of recent events in Europe ; the Berlin Conference had made no apparent impact on their minds. In contrast, the failure of the West to defend Burma and Malaya in 1942 had left an indelible mark. Yet, when so much has been said, the remarkable thing was the extent of the support for the western interpretation of the Communist menace. From Ceylon, from Malaya, and from Pakistan the weight of opinion was on the need for defence measures against it ; and the Indian delegation, though it enjoyed backing from others as individuals, was left isolated in its continuing support for the idea of "an area of no war." This is a significant development, though the ambivalence in the Pakistani attitude to the use of US aid was only too apparent. The aid was nominally intended to build up resistance to possible Communist aggression, but Pakistanis openly proclaimed that what they needed most was re-insurance against India. Kashmir, where the policy of procrastination was clearly felt by other delegates to be undermining India's moral position, retained for this reason the melancholy distinction of being the most disintegrating of intra-Commonwealth disputes. It is much to be hoped that welcome Indian reassurances of an early settlement will prove well founded.

Sincere Apostles of *Apartheid*

In the discussions on racial and colonial policies it was the South Africans who were left isolated. They had a small but representative delegation, and the sincerity, even the altruism, which inspired the apostles of *apartheid* (or differential development, as they preferred to describe their policies of racial separation) impressed their colleagues. But it did not change their opinion, though unquestionably it enhanced their understanding of the complexity of the South African racial problem. As one Asian delegate remarked, this was the first time that he had realised how the lot of the great Bantu majority was apt to be lost to sight in his country through concentration on the treatment of the Indian minority in Natal. But though the educative value of these debates on racial policies, the first to take place at a Commonwealth conference, was considerable, what was important was the weight of opinion, in a multi-racial Commonwealth, against racial discrimination in any form. It was United Kingdom spokesmen who underlined bluntly that Britain in self-interest alone was bound to be on the side of Gold Coast democracy and against dominant white minority rule. The doctrine accepted outside South Africa was equal rights for all civilised men and equal opportunities for all men to become civilised. But it was the direction, not the pace, that was felt to be of first importance.

The wide measure of agreement on racial questions was underlined in the discussion on colonial policy. The principal points of difference were in respect of the submission of political information on dependent territories to the United Nations, and on the uncooperative attitude of the United Kingdom in debates on colonial policy at Uno. This was attributed to the "discreditable company" she kept there, for in the Indian sub-continent Britain is clearly distinguished from other colonial powers. Few things at the conference were more impressive than the tributes Britain received from Asian delegates for the sincerity of her intentions and the quality of her administration in colonial territories. An Australian delegate remarked, towards the close, that colonial policy had become a source of Commonwealth unity. No one dissented.

Agreement on economic policies was more in accordance with expectations, but it was none the less reassuring. The overriding concern in Asia was with development. The Colombo Plan has given substance to the idea of Commonwealth in Asia. It had also afforded an opportunity for the association of older with Asian members in a way equally acceptable to both. It was through the Commonwealth that New Zealand, Australia and Canada had their closest contacts with Asian opinion, and there was no doubt that for them this was something that enhanced its value. No one was disposed to regard the enlarged Commonwealth as anything but fragile, but what the Lahore conference brought out was the variety of interest and the measure of support and good will which it could enlist from all its members and from those who aspired to join their ranks. It was an interesting, illuminating and on the whole encouraging conference, which suggested that the Commonwealth still possessed a healing touch and had great opportunities before it.

Atomic Fever in Japan

FROM OUR TOKYO CORRESPONDENT

THE atom-dusting of Japanese fishermen has had "radio-active" influences extending far beyond the unhappy victims themselves. In a flash of revelation, the Bikini explosion of March 1st illumined the sensitivity and fears of the Japanese, their prickly complexes about sovereignty and independence, and their conviction of doomed vulnerability. All this ferment, torturing doubt and pathetic self-assertion was summed up in the shrill question repeatedly put by a Japanese newspaperman at the Foreign Minister's press conference on the 23 radio-active fishermen and their deadly catch of fish: "Have the Americans apologised to Japan yet?"

The young man's question disclosed the dangerous, unpredictable Oriental fires smouldering beneath Japan's unreal surface calm today. "Impassive" is the most grotesque popular misidentification ever applied to the Oriental. The subsequent unreasoning Japanese reactions have developed logically from that demand for an "apology," which awakened all the twenty-year-old echoes of inferiority and arrogance . . . the sudden reckless firing on British gunboats, the "off with their trousers" humiliation of Britons outside the Tientsin concession, the feverish clamour for naval parity at the expense of national solvency, the harakiri attack on Pearl Harbour.

Japanese scientists, earnest, unselfish and patriotic, have insisted jealously on their right to treat the ailing fishermen independently, if inefficiently. They are suspicious of immediate American offers of help. They have refused the American offer to examine and decontaminate the ill-fated "Lucky Dragon" at the only properly equipped laboratory in Japan—in Yokosuka, the old Imperial Navy base, still occupied and operated, to the anger of the Japanese, by the US navy. Headlines proclaimed that the Americans were trying "to destroy evidence" and were treating the hapless fishermen as "guinea-pigs." It was asserted that the bewildered US atomic authority, Professor Eisenbud, despatched post haste from Washington to soothe the Japanese and damp down anti-American feeling, was concerned only with ensuring the safety of tuna fish exports to the United States and with minimising Japanese compensation claims. Even the *Asahi*, the distinguished daily with a shining postwar record of courageous defence of individual liberties, joined in this hysteria.

Chips off the Dragon

Meantime, more than one hundred groups of Japanese "officials," many of them political and most of them self-appointed, got into the act, inspecting, analysing and reporting—often in contradiction—the effects of the macabre visitation. Then there was a spy scare: "shady foreigners" were furtively chipping radio-active fragments off the "Lucky Dragon." Finally, an anti-American Socialist party "expert" reported—reverently quoting, with magnificent lack of humour, "American sources"—that radio-active dust from Soviet hydrogen test explosions in Siberia was falling like the gentle rain from heaven on Japan three days every week.

The West must not miss the lesson of this fleeting insight into the twisted and fearful mentality of contemporary Japan. The country is now nearing an open manifestation of the disillusion, frustration and despair which the Emperor's surrender decree, the national instinct for obedience to authority and a benevolent and soporific occupation have so far stifled but not extinguished.

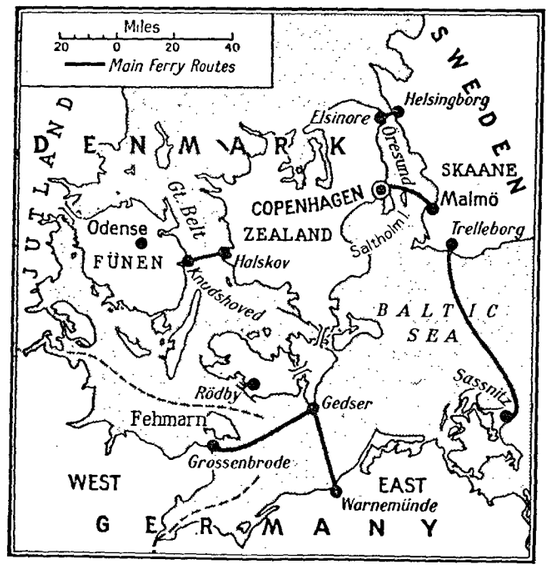
There is no political stability. There is growing and unreasoning resentment against American "interference." A half-hearted move for austerity in economy is inflaming a violent challenge by labour. The population continues to increase at the rate of a million a year. Exports are still priced out of competition. The old Japanese values have been sabotaged or sapped. Corruption scandals are—unjustifiably, by western standards—undermining the weak conservative government, with the only alternative a risky elevation of the Nenni-like Socialists. The latter appear to believe that US support—which they denounce—will still be forthcoming to build a new neutral Japan which would fondly ape Nehru's India but incline always more closely, affectionately and profitably towards its Chinese neighbours—picking up the old China trade without, it is suggested, learning any new Communist habits.

The popular political line hardens: kick out the American forces and resist rearmament. Above all, the influence of the Imperial Throne has wavered—although, paradoxically and undemocratically, it may yet be the salvation of western hopes for Japan's future. Meanwhile, two years after the peace treaty, Japan's own epitaph on occupation memories and fond American delusions remains that haunting query: "Have the Americans apologised to Japan yet?"

Bridging the Baltic

FROM A CORRESPONDENT IN COPENHAGEN

JACK FROST performed a feat that has baffled several generations of Danes and Swedes when, during the February cold snap, he threw a bridge (of ice) across the Sound—the Oresund—that divides their two countries. The consequent dislocation of the Elsinore-Helsingborg and Copenhagen-Malmö ferry services, despite the valiant efforts of a small fleet of icebreakers, demonstrated once more the weakness of Scandinavian communications. Ice in the bottleneck lent added interest to the joint announcement of the Danish and Swedish Traffic Ministers that, to implement a recommendation of the Nordic Council, working parties would be set up in Copenhagen and Stockholm to study the project for bridging the Sound. Their report is unlikely to be on the council's agenda until its session in February, 1955. But although Scandinavians remain slightly sceptical, the feeling grows that the long-debated "Oresund Project" has been brought one step nearer realisation. Soviet Russia, ever alive to the strategic



significance of developments in the Sound, has reacted swiftly. An article in the Moscow paper *Communist* denounced the "war bridge" that would link Sweden with the "Atlantic aggressors."

The working parties will examine a plan produced this year by a team of Danish and Swedish contractors for a quadruple carriageway linking Copenhagen and Malmö. The Sound is here 11¼ miles wide and six fathoms deep. The road would be carried by a causeway and tunnel from Kastrup, near Copenhagen's airport, to Saltholm island. Thence a bridge four miles long, the longest in the world, would carry traffic, 75 feet above the sea, to Skaane. It would require seven years to complete at a cost of 465 million Danish kroner (£23¼ million).

The Danish and Swedish State Railways, on the other hand, favour a link between Elsinore and Helsingborg, where main line facilities already exist. Here, however, in the 3-mile-wide narrows there are depths of 20 fathoms and currents of four to five knots. Meanwhile, each summer the queues of vehicles waiting to cross the Sound grow longer. In 1946-7 the ferries carried 38,000 cars, 2½ million persons and 300,000 tons of freight. By 1952-3 the comparable figures had rocketed to 190,000, 5 million and 800,000. Now an enterprising British company is said to be planning the introduction of a motor-car air-ferry service linking Malmö directly with Odense on Fünen.

A darling project of the Danes, to eliminate another major bottleneck by bridging the Great Belt, has been shelved *sine die*. A Great Belt bridge would take 15-20 years to build and cost 1,700 million kroner (£85 million), which Denmark would have to raise alone. Instead, the Traffic Minister recently announced in the *Folketing* that new berthing facilities at Knudshoved and Halskov were planned which, at a cost of 89 million kroner (£4½ million), would cut the 75-minute Great Belt passage to 60 minutes.

The opening of the Gedser-Grossenbrode ferry service in 1951 cut by two hours the travel-time between Scandinavia and the south and west. Since 1953 the Scandinavian-Italian Express has run that way, while the Nord-Express still follows the roundabout Great Belt-Jutland route. But the Grossenbrode route is only a makeshift for the projected "Bird's Flight Route" via Rödby (Lolland) and Fehmarn Island. Denmark is ready to find the D.Kr.100 million (£5 million) necessary to complete installations on its side. The *Deutsche Bundesbahn*, however, which is chronically impecunious, has no money to construct a bridge from Fehmarn to the Schleswig-Holstein mainland. Already the *Bundesbahn* has been attacked for squandering money on Grossenbrode.

Both Denmark and Sweden have resumed ferry services to Eastern Germany. The Gedser-Warnemünde ferry carries 300-400 tons of goods daily in both directions, and a trickle of 10-15 passengers each week. The Danes ship mainly meat, fish and fats, and receive cars and chemicals. Goods traffic is heavier on the Swedish Trelleborg-Sassnitz route. Already twice-weekly train services in both directions link Stockholm with Berlin and Warsaw. There is still only a handful of passengers for these destinations. But the Swedish State Railways are ready to handle 200 passengers per train when the new "Sassnitz Express" commences the additional twice-weekly service in both directions between Stockholm and Munich this June.

Marshal of France

AT the age of 65, Alphonse Juin has been deprived of all his French posts and is expected to lose his European command within a matter of days. Yet France's only living marshal is unlikely to leave the stage. Indeed, after the Auxerre bombshell—the speech against the present form of EDC which provoked the storm—the name of Juin will be on the lips of French politicians more often than ever before. Though his hands have been freed by release from official functions, Marshal Juin has proclaimed that he does not intend to dabble in politics. But there is much in the career of this professional soldier that may rally around him important groups of the right wing.

Admittedly, his career has been purely military, the typical rise of a brilliant colonial soldier, exceptional only

in his humble origin. More intimately even than Franco's, Marshal Juin's advance is linked with North Africa. The son of a French policeman, he was born in Bône in Algeria and went from his school there to St. Cyr. Graduating with excellent results from France's Sandhurst, he immediately went to North Africa, and it took a war to bring him back to France. He was wounded in the first world war, and at its close once again returned to North Africa. There he served under France's greatest colonial soldier, Marshal Lyautey. For a brief period he followed Lyautey to France, acting as his chief of staff, only to return to Morocco to quell local revolts. His close links with the French *colons* in North Africa and his reputation as a "strong man" date from that period. As a reward for his services he was promoted general on the eve of the last war.

The second world war meant another "European interlude," but not a very long one. After an exceptionally tough defence he was taken prisoner in Lille, but was liberated in June, 1941, after the intervention of General Weygand. Back he went to North Africa, and succeeded Weygand as commander-in-chief there. His great attraction for the traditional French Right, much of which was pro-Vichy, is that, unlike General de Gaulle, he was not a resister of the first or even second hour. He joined Giraud only in November, 1942, after the allied landing in North Africa. But if he lacks the *mystique* of the resistance, once he went over he distinguished himself as a military commander ; he was head of the French expeditionary corps in Italy, and towards the end of the war relinquished this post to take over that of chief of the French general staff.

Strong Man in Morocco

In 1947 a strong man was sought for Morocco, and the then General Juin was the obvious choice for resident-general. Of his four years' stay there it may be said that it was a sustained attempt to resist nationalist pressure on French privileges and a permanent struggle with the Sultan. It was General Juin who egged on the Pasha of Marrakesh and other feudal lords against the "urban" Sultan, and although he was no longer there at the time of last year's *coup* and the sultan's deposition, the event was hailed throughout France as his personal victory. Since 1951, Juin has been in France as Nato's commander for Central Europe. In 1952 he received the marshal's baton.

It was said at the time that the baton was being placed in dangerous hands, or at least in the hands of a man with a dangerous tongue. The Auxerre speech and the subsequent snub to M. Laniel are not the first incidents. In 1952, on the anniversary of Verdun, Marshal Juin's panegyric of Pétain raised a storm. A year later, elected to the French Academy, he delivered a jingoist maiden speech on Morocco which provoked a violent rebuke from M. Mauriac. Finally, on the eve of the last presidential election, he openly showed his contempt for that institution, declaring that he certainly would not seek a post which carried more *corvées* than prestige and power (President Auriol retorted that he henceforward hoped to have one duty less: that of receiving Marshal Juin).

Can the Marshal now help becoming a centre of attraction for the French Right ? He has the backing of the North African settlers and their powerful allies at home (his wife comes from a family of wealthy Algerian *colons*). For the traditional Right, including the collaborators, he has advantages which General de Gaulle did not possess. He is also the strong man, the soldier who never flirted with the Left. For the middle classes he has the glamour of a marshal. In many circles the gendarme's son had already been described as a potential saviour from Communism and parliamentary decadence. The political rifts over EDC may provide him with new backers. Many French commentators now wonder whether this jobless Marshal may not become, in times of even greater stress, a new Boulanger.

Kenya After the Constitution

RARELY in Kenya's short but turbulent history has political argument been fiercer than in the last few weeks and months ; and no wonder. Nothing to compare in importance with Mr Lyttelton's constitutional changes has happened since European settlement began. The inhabitants of the colony, white, brown and black, are for the first time all to be given a voice in the government of their own country. Three elected Europeans, two elected Asians, and one African have now agreed to take office in the new Council of Ministers.

That agreement was reached at all is something of a miracle. The Europeans are prepared to see their representatives sit round the table with the leaders of other races for the sake of an escape from the frustrations of a perpetual opposition. But to many it must seem a sad comedown from the days of Lord Delamere, when the settlers regarded it as their inexplicably disregarded right to play a leading—or a lone—hand in the government.

The other races, too, have had to bargain hard. The Asians, with one seat each for Hindu and Moslem, have won more than many Europeans and Africans would wish, but no more than a shrewd assessment of the balance of power would accord them. Only the Africans, with a single seat in the Council, see themselves as prophets unrecognised in their own country. It is now probably impossible to establish what chances there were, if any, of a solution more favourable to the Africans—a racial representation of 4:2:2—being accepted ; but such straws of evidence as exist seem to indicate that the Asians objected quite as much as, or more than, the Europeans. At all events it is symbolic of the new plan's reception that when Mr Lyttelton left the airport, the Africans alone were not there to wave him off. Even so Mr Ohanga, who was asked to fill the African seat in the Council of Ministers, has now accepted the appointment.

The lack of enthusiasm with which the reform has been greeted may, paradoxically, be a good omen. The moderate leaders have gone too far to be upset by the normal hazards of political life. Mr Blundell, Mr Nathoo, Mr Patel and Mr Ohanga must from now on be as thick as thieves—and by their example they may bring alive a real sense of racial co-operation amongst the sceptics and the ill-disposed in their respective electorates.

They may, however, equally well relapse into lobbying for their special interests. This danger is increased by some tricky procedural questions that will have to be settled. What, for example, will be the relationship between Mr Blundell, when he becomes a Minister, and his European supporters in the Legislative Council ? If they remain on the opposition benches, little will have been gained in the way of constructive co-operation. But the alternative—that a bunch of settlers will be prepared to turn overnight into meek backbenchers behind the government—seems equally unpromising. Mr Patel has analogous difficulties with the Indian Congress. Perhaps Mr Ohanga, with, as yet, no organised electorate behind him, will find his protests turn into genuine relief as he watches the difficulties of his colleagues.

Probably the best that can be hoped for is a general lowering of the political temperature. The constitution cannot be changed, though it can be revoked, before 1960. This means that, if everyone plays the game, Kenya can look forward to a six-year lull, during which it has a chance—probably its last chance—of working out an agreed answer to its problems. Even if the business of squaring accounts with Mau Mau is left on one side, the catalogue is formidable enough. African local government must be built up again from its ground-roots. A plan for agriculture—the colony's one hope of prosperity—must be vigorously set in hand both in its European and in its African branches, and the government must do more to promote exports. Extra land must be found for Africans where overcrowding has reached intolerable proportions. The position of Africans in industry will have to be radically redefined. An immigration policy—Asian and European—will have to be thrashed out afresh. And so on.

Where the Flesh is Rawest

Unfortunately, hardly any of these problems can be settled by mere administrative efficiency. They all touch, where the flesh is rawest, on the status and the rights of Africans. And each flick on the wound will make the Africans more insistent that their advancement should again find expression in political organisations. Everyone agrees that sooner or later this must come about ; and sooner, rather than later, Africans in the Legislative Council must be elected by African constituents. But here the snowball begins. The principle of direct election is separated by only a narrow margin from the principle of counting heads. Who, when the barrier of Colonial Office rule is down, is finally to balance the rival claims of five million Africans, some hundred and fifty thousand Asians, and forty thousand Europeans ?

These are thoughts to chill the marrow of European settlers battling with their acres in the White Highlands. They are few in number ; but for all their many faults they represent the backbone of any effort to bring the colony on economically or politically—and for this reason any comparison between political progress in East and West Africa falls wide of the mark. It is the merest eyewash to suggest that a plan for increased African representation or for bringing Africans on to a common electoral roll with the Europeans and Asians could succeed without European good will. But the evidence of the recent past suggests that the Europeans will not be dogs in the manger if they are given a feeling of security. Is it not too much to expect that Africans on the East Coast will learn to show as much understanding of the part played by European agriculture in Kenya as Africans of the West Coast are now showing of the importance of European capital and commerce ? If six years can bring a return of confidence on those lines, then Kenya has everything to hope for.

The Voice of the Pheasant

FROM A CORRESPONDENT

A TURKEY was once given the job of grading the eggs for a collective incubator. Suddenly he refused to accept one on the grounds that it might be mistaken for a duck egg. The hen who had laid it expostulated, but to no purpose. "*You* wouldn't think it was a duck egg," he told her. Neither would I. But there may be a pheasant who would think so—and worse."

When this story of Mr Malishevsky's appeared in the Soviet weekly *Ogonyok* a few years ago, his pheasant must have brought back to his readers a touch of old Russia, where the *fazan* symbolised the man in authority who acted according to no rules ascertainable in advance.

Unfortunately for him the *fazan* was not altogether a thing of the past. Some pheasant mistook Malishevsky's pleasantry for a duck egg ; it proved to be his swan song, Or so it appeared until a week or two ago. *Ogonyok* meanwhile smothered any further tendencies to satire beneath pictures of open Russian faces, brimming with admiration and gazing (before Stalin's death) at skeletons of vast hydro-electric plants and canal locks and (since Malenkov's accession) at seven-inch television screens and fringed silk lampshades the shape of a camel's hump. Recently, however, Mr Khrushchev lowered his bull head and charged the hitherto sacred walls of comforting but misleading statistics ; and through the resultant breach the once-browbeaten intellectuals entered a more realistic world behind him. So at the end of March it was not unduly surprising to find even Mr Malishevsky back in his old corner in *Ogonyok*.

His first little fable (he himself calls them a cross between a fable and a fairy story, and has invented the meaningless name of *skirli* for them) was a comment on the new situation in which Soviet artists find themselves.

The wolf, he says, gave the hare a document assuring him of safe passage and promising not to catch him. But he did catch him. The hare produced the document, and the wolf asked to see the signature.

"It is your signature," said the hare.

"What of it ?" answered the wolf. "Show me what is written above it."

"That is yours as well."

Having read it, the wolf said he could never have given his signature to such a promise ; and he tore up first the paper and then the hare.

"Others say," adds the author, "that he tore up the hare first, and some that he did not even bother to tear up the paper."

The second story tells, in seven lines only, of the tribulations of a bear who went in for farming. He wanted to make a *duga*, the round wooden arch that in Russia connects one shaft of a cart to the other over the back of the horse. He took a growing birch and began to bend it so that the trunk should form a semicircle ; but before it had done so, the tree broke. The bear thought this over, but told himself that he had done the right thing. "You must first do a thing and think about it afterwards," he said to himself. "How do you know whether it will succeed or fail until you have done it—or failed to do it ?"

The last of these good-mannered stories has the bland title of "The Benevolent Ant," and tells how a man resting on an old tree stump put down the book he was reading.

An ant who was living there walked over to the open page and read the words "Giant Mushroom" underneath a picture. The ant, who had never been further afield than his tree stump, had never seen any other mushrooms than the fungi growing there. So he cut out the word Giant and the word Mushroom, saying as he did so that it was not right the reader should be exposed to such palpable lies.

Ever since the priests of Delphi threw Aesop over a precipice, infuriated by the relevance of his wit as well as its irreverence, the lot of the fabulist has always been a hard one. How loudly is the voice of the pheasant to be heard in the land of the Soviets in future?

Pakistan Rounds the Corner

BY OUR KARACHI CORRESPONDENT

LAST year, on the occasion of the presentation of the Budget, the clouds of anxiety hung heavily over the Pakistan Assembly. The foreign exchange situation had deteriorated to an alarming extent and there was strong evidence that famine conditions could only be averted by heavy purchases from overseas. The postwar boom, extended beyond its time by the Korean war, was over and, as a country which depended primarily on its export of raw material, Pakistan had to face the reckoning, husband its resources, and face up to its problems.

In the event, as the Finance Minister's current budget speech has revealed, the revenue estimates were exceeded by over Rs. 9 crores. The view that the clouds are beginning to lift is also supported by the fact that Chaudhri Mohammad Ali has estimated an increase of revenue for the coming year of Rs. 5.76 crores. The increase will come mainly from customs, central excise and sales tax. The enhanced estimated revenue has enabled the minister to embark on overdue schemes of basic development and also to make provision for the necessary gearing-up of the civil administration.

The revenue expenditure during the year 1954/55 is put at Rs. 111.37 crores as against Rs. 107.83 crores last year. Most of the increased amounts are for basic development schemes. The minister's buoyant assessment of the future is exemplified in his new proposals which give a modicum of relief to the taxpayer and enhance the value of real wages. The increase in the purchasing power and productivity of the populace must be the keynote of Pakistan's policy for some years to come.

The import duty and excise duty on motor spirit has been reduced by 8 annas, which should in its turn considerably reduce the cost of distribution of goods. The reduction of the duties on coconut oil, copra and spices to 30 per cent will bring much needed relief to the man in the street and the man in the field, in whose budgets such items bulk large. A step which will be welcomed by business men and industrialists is the proposal to readjust the taxation on capital goods and machinery. A great deal of difficulty has been experienced in the past over the import of machinery and spare parts owing to the fact that capital goods two years ago were exempted from import duty and sales tax. The main trouble arose from the definition of the term "capital goods." The Finance Minister now proposes that all machinery, including capital goods and spare parts required by industry, should be liable to an import duty of 5 per cent and should be exempted altogether from sales tax.

The proposals relating to income tax provide a measure of relief to the sorely pressed middle classes, who have probably been the hardest hit over the past two years. The maximum not liable to income tax has been raised from Rs. 3,600 per annum to Rs. 4,200 per annum and it is anticipated that no less than twelve thousand persons will be affected thereby. To encourage savings the exemption on account of insurance premia and contributions to provident funds is to be raised to one-fifth of total income subject to a maximum of Rs. 8,000.

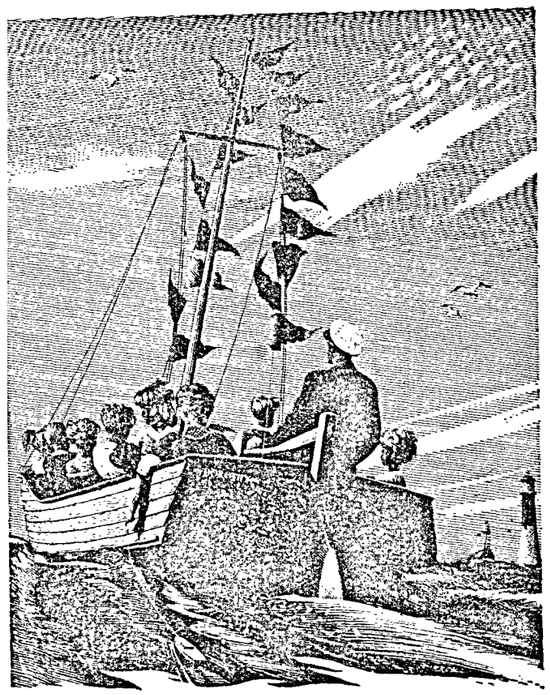
The government is only too well aware that there are certain dangers inherent in the process of rapid industrialisation. Two proposals which may go some way to lessening the possibility of the creation of slum areas and of a discontented labour force are the raising of the initial depreciation allowance to 25 per cent for buildings constructed by industrial undertakings for their employees, and deduction against profits of expenditure on schools and hospitals for employees.

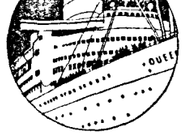
All these proposals, broadly speaking, are aimed at providing relief to the lower income groups and it is certainly there that relief is most needed. Undoubtedly there will be some murmurings that the business profits tax has been retained and that income tax and super tax remain very high, but on the whole the minister has been just and humane with the limited funds at his disposal.

Turning to the capital provisions which are, in essence, the mainspring of the country's future development effort, the Finance Minister has followed the classical economic line and refused to drink the heady wine of deficit financing. (Although India has more industrial resources than Pakistan there are many who doubt the wisdom of Mr Deshmukh's proposal to meet his huge deficit of Rs. 250 crores by increasing the Treasury bill issue.) Chaudhri Mohammad Ali's proposal to raise the capital expenditure in the coming year from Rs. 82.99 crores to Rs. 96.72 crores is bold and imaginative, although his methods are conservative. It is true that in last year's budget there was an element of deficit finance in that the cash balances were drawn down from Rs. 32.64 crores to Rs. 19.67 crores, but that drain has now been stopped and the forecast of the cash balance at the close of the coming year is Rs. 20.61 crores. Credit has been taken in the capital section for internal loans, Rs. 15 crores and external loans, Rs. 12.7 crores, as well as Rs. 15.78 crores on account of foreign aid. A windfall comes from the proceeds of the gift wheat, estimated at about Rs. 16 crores.

It is interesting to consider the protean appearances of the wheat gift in the finance of the country, and in some ways it might be considered almost as the fulcrum of both last year's and this year's budget. In the first stage the gift saved Pakistan some Rs. 20 crores of foreign exchange; in the second stage the 70 per cent free distribution relieved the government of heavy internal expenditure; and in its third and final stage the balance accruing from the sale of the remaining 30 per cent is to make a substantial contribution towards the development programme in the coming year.

Ending on a personal note, the most cheering feature of Pakistan's seventh budget day was the appearance and bearing of Chaudhri Mohammad Ali himself. He delivered his very lengthy speech with authority and vigour and he now seems, like the country, to be well on the road to recovery.





Whether a trip round the lighthouse or a voyage across the world—nickel helps

A trip on a motor boat—traditional part of a seaside holiday—and a voyage to the new world require vessels of a very different type. For the motor boat a 12 h.p. engine may be adequate, but the Queen Elizabeth can call on 160,000 h.p. to drive her 83,673 tons through the water, not to mention additional power to provide for the comfort of her passengers and the safety of the ship.

Nickel plays a part in both of them. It strengthens and toughens the steels and alloys used in their engines, and, in the case of the big ship, goes also into decorative metal work, galley equipment and navigational aids. Throughout industry nickel helps equipment to perform better and last longer.

Basic chemical ingredients are as vital to the world's plastic industries as flour and sugar are to pastry-cooks. One of these basic chemicals is *Hexamine*, a material essential for the manufacture of thermo-setting plastics for many purposes, including telephone, radio and television. The large independent company of Brotherton, established in 1878, is now one of the world's chief manufacturers of this basic chemical.

A BIG NAME IN THE CHEMICAL WORLD

Brotherton

One of the world's largest manufacturers of hydrosulphites, liquid sulphur dioxide and hexamine. Makers of an extensive range of Metachrome dyes for dyeing wool in all its forms.

Brotherton & Co. Ltd., City Chambers, Leeds, 1. Also at Manchester, Glasgow and London. Works at Birmingham, Wakefield & Birkenhead.

THE BUSINESS WORLD

The Budget Analysed

MR BUTLER aptly described his budget last Tuesday as a "carry-on" budget—the nearest approach to a literal no-change budget that has been seen since the closing years of the war. He made no more than five proposals for tax changes, all of them concessions; but only one of them will affect his revenue by more than £1 million this year, and the total effect will be a mere £4 million—apart from £19 million to be distributed, outside the budget proper, to those who inherit postwar credits.

This budget is therefore by far the easiest of postwar budgets to describe; but, to judge from the misplaced public optimism of recent weeks, many people may find the underlying policy particularly difficult to understand. To the ordinary observer it appears paradoxical that in 1953, after a year of business recession and falling government revenues, the Chancellor was able to give large tax reliefs; yet in 1954, after a year of record output, rising gold reserves and a general air of prosperity, he has virtually nothing to spare. But this contrast is in fact the whole reason for the change in Mr Butler's tactics. Last year, when business activity was running below capacity, it was both wise and safe to give it the stimulus of tax relief; this year it is likely to run so close to capacity that any further general stimulus would be imprudent—though the Chancellor has emphasised his readiness to alter his fiscal policies later in the year if this assumption proves seriously wrong. As it is, the one vital sector of the economy in which spare capacity is thought to exist does get a special stimulus through the ingenious device of the new "investment allowance".

This shift from reflationary budgeting to carry-on budgeting followed naturally from the wider economic changes portrayed in the Economic Survey. Thanks to the rise in business profits last year and to the increased level of wages and salaries that will obtain in the current year, Mr Butler was able to reckon upon an additional yield of £69 million from income tax, despite the £50 million loss of revenue that was expected to result from last year's reintroduction of the initial allowances. In other tax revenues the expected increases, mainly from customs, were almost precisely offset by expected decreases, mainly from profits tax and EPL. But non-tax revenues promised almost £100 million more, in consequence of the expected liquidation of trading stocks of the Ministry of Food. On the existing basis of taxation, therefore, total above-line revenue was estimated at £4,537 million, or £169 million more than the actual receipts of 1953-54. This prospective increase in revenue was, however, wholly swallowed by the estimated rise in expenditure. Total above-line expenditure, after taking credit for the reduction shown in the recent revision of the first estimate for the Ministry of Food (thus allowing for the effects of the annual review of agricultural prices) is estimated at £4,522 million.

The Chancellor was therefore confronted with a prospective above-line surplus, on the conventional accounting, of £14 million, compared with a realised surplus of £94 million in 1953-54. By contrast, the prospect before him twelve months ago was for a conventional surplus of £278 million (at 1952-53 tax rates), compared with a realised surplus of £88 million in the old year. The true contrast, moreover, is even more marked than this, because of the big capital receipts that have been brought into the estimates for 1954-55. If all capital items—in expenditure as well as revenue—are excluded from the above-line reckoning, as is done in the official "alternative classification," the realised surplus of 1953-54 comes to £234 million and the 1954-55 prospective surplus is £181

million less than that, at £53 million. Both forms of above-line accounting, moreover, take credit for the sterling counterpart of the dollars expected to be received in defence aid; if these credits are excluded, the Chancellor has an above-line deficit on either basis.

On the below-line account, of course, a substantial deficit is again expected, despite the steep contraction that has occurred in the new borrowings of the local authorities from the Public Works Loan Board, and despite the rising trend of below-line receipts. On the conventional accounting, these receipts, mainly repayments to the Exchequer of various types of advances made by it in earlier years, totalled £182 million in 1953-54; they are expected to rise to £191 million in 1954-55. New loans to local authorities are provisionally put at the virtually unchanged figure of £300 million, but payments for war damage settlements will be substantially reduced. On balance, net outgoings below-line are expected to fall slightly, from £391 million to £388 million (in contrast with £524 million in 1952-53). The prospective deficit on the Exchequer finances as a whole was therefore estimated at £374 million at 1953-54 tax rates, compared with £297 million last year.

The Chancellor made it very plain, however, that his decision to make no major tax changes was not dictated by this tautening in his own finances:

> The budget's aim must, of course, always be to maintain the balance of the economy as a whole, whatever the mathematics above or below the line. Its aim, in short, must be to maintain employment and encourage production, while avoiding inflation and ensuring a healthy balance of payments. The realities of our situation may therefore call for either a surplus or a deficit on the conventional budget.

But Mr Butler's conclusion, as the Economic Survey had foreshadowed, was that the economy is enjoying already just the "right sort of general climate" and seemed likely to continue to do so. The benefits of last year's reliefs, he thought, were still working themselves out according to plan, and therefore ought to be given "more time to produce further beneficial effects." On a somewhat longer view, he was seriously concerned about the rising trend of expenditure, and about the risk that further increases in wages and profit margins might price British goods out of export markets; but at present he saw no need to "strain after any significant surplus" on the conventional budget.

Given the absence of any general slack in the national economy, he was therefore unable to pursue the basic aims of raising productivity, industrial investment and exports by giving any broad "incentive" reliefs in taxation. Any assistance given for these purposes had to be both modest and specific. For exports, a little aid has been contrived by non-budgetary means—by arranging that the facilities of the Export Credit Guarantee Department shall be rather more freely available to facilitate the granting of extended credit terms to overseas buyers of major items

of capital goods. And industrial investment is to benefit from an interesting departure, discussed in detail below, from the postwar system of initial allowances. By this device the Chancellor is giving significant relief at no immediate cost to the Exchequer, and at only slight cost over the next few years, but at "considerable cost" in the longer run. Professional men and the "self-employed" who had hoped for pensions with similar tax reliefs as are enjoyed by the employed have been disappointed. Mr Butler wanted more time to study Mr Millard Tucker's report and declared that "in any event the cost of the proposals would make it impossible for me to implement them in present circumstances."

His other proposals were all minor ones; and they, too, were specialised, being mainly designed to alleviate particular anomalies. The most costly one, involving an additional charge of £19 million "below-line" this year and £2 million a year in future, concerns the postwar credits. In future, anyone who inherits unpaid credits will receive payment in the year in which the deceased owner would have reached the qualifying age, instead of having to wait until he (or she) reaches that age himself; a beneficiary may also claim payment if the original owner has died at over the qualifying age but without claiming payment.

Investment Allowances

Last year the Chancellor of the Exchequer restored the initial allowances (which his predecessor had suspended from April, 1952) at 20 per cent. Last Tuesday, he acknowledged that this was a limited step in the right direction of encouraging industry to put more money into productive investment—an interest free loan which on certain reasonable assumptions given by the Financial Secretary in last year's debates on the Finance Bill might eventually grow to a stable figure of £675 million.

The Chancellor has decided (and this presumably without the benefit of advice from the Royal Commission on Taxation of Profits on the point) to sweep away the present system of initial allowances by a new system to be called "investment allowances." The initial allowance confers no permanent benefit upon the industrialist, but only enables him to bring forward, in point of time, tax allowances that he will be eventually entitled to; thus it may encourage him to undertake investment when his cash resources are short and additional present relief from tax is helpful. The investment allowance is different in kind. It will give an immediate addition to the full annual depreciation allowances, amounting to the tax on 20 per cent of new plant and machinery and on 10 per cent of new industrial and agricultural buildings with no countervailing reduction in the allowances in later years. For approximate purposes, the cash relief will thus represent about 10 per cent of the cost of plant and 5 per cent of the cost of buildings.

The investment allowance is in the nature of a subsidy to new investment, and it calls for the marginal comment that, for all its merits, it is an expedient no more welcome than other subsidies, and one that would hardly be called for if the principles of replacement cost accounting had ever obtained a hearing among accountants and Chancellors. Investment allowances will certainly help to mitigate the erosion of industrial capital caused by wrong pricing and penal taxation, and industry will welcome them precisely because they carry no fiscal hangover to be paid for in future years. But industry will also have in mind the possibility that if initial allowances could be varied from 40 per cent to nil and back to 20 per cent in three years, investment allowances, too, may vary with the length of the Chancellor's foot.

★

Among the immediate beneficiaries, shipping companies and investors in other large capital goods stand out. Investment allowances apply to capital expenditure incurred (that is, which becomes due and payable) from April 7th; initial allowances (apart from the exceptions noted below) cease at the same time. On plant and machinery (20 per cent) and industrial buildings (10 per cent), the new investment allowances are at the same rate as the old initial allowances. Expenditure on agricultural buildings (10 per cent) and on plant and buildings used for scientific research (20 per cent) will now qualify for investment allowances. Mining works may choose either a 20 per cent investment allowance or a 40 per cent initial allowance. The old initial allowances will be kept for secondhand plant or machinery and for "ordinary" motor cars.

The cost of changing from initial allowances to investment allowances is estimated to be negligible in the coming year, and about £4 million in 1955-56. This follows from the fact that the new allowance will not be deducted in computing the written down value of the asset for the purpose of annual allowances, as the following figures for £100,000 expenditure on plant incurred on April 7, 1954, or after, will show. It should be noted that in general the first allowances on such expenditure will not begin to affect tax payments until January 1, 1956. Thereafter the cost will increase year by year, depending on the level of new investment:—

	Allowances	Written down value		Allowances	Written down value
Year I	£	£		£	£
Initial	20,000		Investment	20,000	
Annual (10%)	*10,000*		*Annual*	10,000	
		70,000			90,000
Year II					
Annual	7,000	63,000	Annual	9,000	81,000
Year III					
Annual	6,300	56,700	Annual	8,100	72,900
Eventual Total	**100,000**	**Nil**	**Eventual Total**	**120,000**	**Nil**

The projected total benefit of the new allowance depends upon assumptions about the rate of new investment in the assets that qualify for it. The following table shows the course of investment by industries in the main categories:—

GROSS FIXED INVESTMENT
(£ Million)

	1950	1951	1952	1953
Vehicles, ships and aircraft (20%)..	267	273	267	312
Plant and machinery (20%).....	630	742	790	815
Buildings and works (excl. housing).	394	428	473	516

If for the sake of assumption, half the expenditure on buildings and works ranks for industrial and agricultural investment allowance of 10 per cent, the total allowances (including initial allowances for " ordinary " cars) would be of the order of £250 million, and the cash value of the relief of, say, £125 million. This compares with £84 million estimated cost in a full year of last year's restored initial allowances. But this higher scale of investment incentive will be compensated in part by the expiring benefit of and the emerging tax liability under the old initial allowances on investment expenditures incurred in past years. The new investment allowances will not distort the tax relief in time as did the initial allowances; and since the written down value of the assets will be higher, the new system will involve fewer complications about balancing charges.

The inclusion of plant and buildings for scientific research in the 20 per cent class of investment allowance should perhaps finally lay the myth that research in British industry is directly hampered by the taxation system. Its treatment is already very favourable. All non-capital expenditure on research and contributions to other bodies doing research in a company's field, is allowable; capital expenditure on research by or for industry can already be written off over the short period of five years, 60 per cent being allowed in the first year and the remaining 40 per cent over four years. Direct comparisons with the United States are difficult; but the Advisory Council on Scientific Policy concluded last year that the treatment of research seemed to be as favourable in Britain as in America, and the new allowance may provide an extra fillip.

Cessation and Company Reconstructions

In the Finance Bill debates last July the Economic Secretary, Mr Maudling, declared that the Government was studying "deliberately and carefully" methods of dealing with legitimate tax avoidance through company reconstructions. In 1952-53 a large number of cotton textile companies, whose profits had been falling, dissolved and reformed themselves to gain the tax advantage under the cessation provisions of the tax code, whereby tax is assessed on the profits of the final year, and not (in general) on the profits of the preceding year. The "abuse" of which so much complaint was made is more apparent than real, for the cessation provisions, confusing though they undoubtedly are, are matched by the charging to tax of commencing profits more than once. And if, after a reconstruction of this kind, taxable profits again rise, the device recoils on the head of the tax avoider.

But Mr Maudling insisted that the use of this device ought not to be exploited by any reputable company—indeed, that it would not necessarily be to its advantage if it did so—and that drastic action would follow if the revenue should suffer. Mr Butler now proposes that the cessation and commencement provisions should not be available to any company reconstruction in which three-quarters or more of the interest belonged to the same persons before and after the change.

Help for Small Industry

At a very small cost to the revenue, the Chancellor has decided to tidy up, and make some limited concessions in, estate duties designed to give assistance to family businesses. The lengthy series of memoranda on estate duty anomalies has had its effect, and proposals for dealing with a number of anomalies, particularly those arising on the valuation of a controlling interest in a private company, will appear in the Finance Bill. The Bill will also grant two major concessions to controlling shareholders in family businesses, which are mauled most severely when death duty assessments are made. Together with the postwar surtax concessions, the special treatment for death duty now to be accorded to family businesses must surely be regarded as a reasonable answer to their difficulties.

In general, the Chancellor intends to maintain the principle of valuing a "controlling" shareholding in a private company on the basis of the worth of the company's net assets. But where part of a controlling shareholding that has been valued on the assets basis is sold to an independent purchaser, "the estate duty valuation of the shares actually sold shall be brought into line with the sale price." This is an important change in the principle that shares, whether those of a public or private company, should be assessed for death duties at their value on the day of death. Purposely, it seems, the Chancellor has limited this concession. It is not apparently to be granted, as might reasonably be argued, to minority shareholdings in a private company or to shareholdings in a public company. If only part of the controlling interest is sold to pay off the duty, the remaining shares will presumably be assessed according to asset values. In that case, will two estate duty values, possibly very different, emerge for the same shares?

The controlling shareholder in a private company may perhaps gain more from the second concession, for "where industrial premises or plant and machinery

are used for the purpose of trade carried on by the deceased—or, where the assets basis applies, by the deceased's company—the estate duty on these assets will be reduced by 45 per cent." This reduced rate of 55 per cent will be the same as that charged on agricultural land. The Chancellor estimates the cost of this new relief in 1954-55 at £500,000 and in a full year at £1,500,000. The concession will help the one-man business, the partnership and the director-controlled family business—and, apparently, no one else. Minority shareholdings in a private company are still, apparently, to be left out in the cold; their shares will still be valued on earnings and yield considerations. Some critics, remembering the facts *in re Holt*, may argue that these minority shareholders should have at least been granted the protection of an independent tribunal to consider appeals on share valuations.

The concession is limited in yet another way, for it will specifically apply to "industrial premises or plant and machinery." Presumably, the definition to be adopted for such premises and plant will be that already established in income-tax law and practice. In that case, it would exclude, for example, retail shops and other buildings employed in the distributive trades and the concession would not then be extended to those trades where the family business is most common.

Export Credit Plans

The Chancellor's references to the freer use of export guarantees do not really mark a sharp departure in the Export Credit Guarantee Department's recent practice. The object is to enable manufacturers of heavy capital goods to accept orders where long credit is involved without affecting their normal borrowing powers. Certain of the insurances that the department has recently made with bankers already have that effect.

It is proposed that in future the department should more readily enter into direct insurance contracts, not with the manufacturer, but with the banker who is to provide the finance. This form of contract will start normally at the point of acceptance of the goods by the foreign buyer; but occasionally at the point of shipment. At that point, therefore, the banker will look to the foreign buyer and to the ECGD guarantee and, to the extent of that guarantee, will have no recourse against the manufacturer. Securities or promissory notes thus guaranteed may be readily saleable to institutional investors.

This system of insurance does not replace the Export Credit Department's existing methods. Two alternative forms of contract, one between the manufacturer and the department and the other between the banker and the department, will run side by side. Indeed if the manufacturer wants his pre-acceptance or pre-shipment risks covered he will have to cover them with a policy between himself and the department even if he is not to be a party to the later insurance. The new system is likely to be of use when the contract is long and big and when the manufacturer's normal finances would be distorted unless the transaction could be clearly separated from his normal borrowing powers.

City experts in export finance are irritated by the decision that not more than 85 per cent of the credit element in any transaction can be covered by the contract between the banker and the department, whereas up to 90 per cent can be covered when the contract is with the manufacturer. The manufacturer's finances remain at risk for the uninsured portion of the contract. It is argued that to say "85 per cent can be insured if you do the business one way and 90 per cent if you obtain the money from the same banks under a different contract" is a mistake. This decision, based presumably on the department's view that a special risk is being accepted, comes at a time when the Treasury appears to be anxious to encourage more business under Section 2 of the enabling Act—that is business that the department accepts for reasons of high policy and not as purely commercial risks. The recent substantial contracts with Turkey are an example.

Half Way Down Wardour Street

The concession in Entertainments Duty on cinema seat prices is about half of what this industry has been asking, though nearly twice as much as some people in Wardour Street expected to get. The Chancellor promised last year to look closely at the trend of cinema admissions and box-office receipts, which have declined sharply in recent years, apparently under the impact of competition from television. The cinemas contribute some £37 million out of the total of £44 million raised in Entertainments Duty—a rate of about 35 per cent on their gross takings.

That decline in admissions has meant that the cinema exhibitors, and to a smaller extent the film distributors and producers, have benefited less from increases in seat prices and certain concessions in duty than they or the Customs and Excise Department had forecast; and the industry's united plea for a reduction of £7 million in duty was "merely to achieve the figures aimed at in 1951." The Chancellor, though impressed by the exhibitors' evidence that their increasing costs were not matched by increasing receipts, did not feel it necessary to go as far as that, "and in any case . . . could not afford to do so." He has put up the limit of exemption from duty on the cheapest seats from 8d. to 9d., and reduced duty farther up the scale by from ½d. to 1½d.; this should give away about £3,500,000 a year. The new scale might, incidentally, make for greater flexibility in seat prices, but the cinema trade is unlikely to pass any of the cuts on to its audiences. Reductions of ½d. a seat in duty on live theatres and sport, which pay much lower rates than the cinemas, will cost about £450,000 in a full year; these are not likely to be passed on to the spectator, either. Together, therefore, the concessions may cost perhaps £4,100,000 in a full year, and in 1954-55 (starting from May 30th) about £3,500,000.

The Foreign Balance in 1953

ONE of the turning points in Britain's postwar economic history will surely be the interruption in 1953 of the sequence of its odd-year balance of payments crises. Last year provided a balance of payments surplus and an accretion to the gold and dollar reserve that the most optimistic did not dare to envisage at the beginning of the year. In 1952 the balance of payments showed a surplus of £255 million, of which £121 million came from defence aid from the United States. That surplus owed much to an improvement in the terms of trade almost as dramatic as the deterioration of 1950-51. At the beginning of last year, ministerial speeches held out a target of £300 million as the desirable surplus and were judged absurdly optimistic. The actual surplus of £225 million for 1953, which includes £102 million of defence aid from the United States, is highly gratifying. How was this surplus achieved, how was it distributed, how was it financed and how did it fit in to the wider pattern of sterling area transactions with the non-sterling world? On these main questions, the Balance of Payments White Paper for 1953 sheds light in dazzling detail.

The main change in the balance of payments last year was a reduction of £151 million in earnings from exports and re-exports. This drop in export earnings between 1952 and 1953 tends to convey a misleading impression of the course of exports over the last two years. In the first half of 1952, export earnings still benefited from the tail-end of the post-Korean boom of trade in the rest of the sterling area; they fell sharply in the second half of 1952, but the first half of last year saw a slight recovery which gathered considerable momentum in the second half of 1953. A reduction of £71 million in payments for imports represented a drop in total cost of 4 per cent, but it veiled an actual increase of 9 per cent in the volume of imports compared with 1952. Once again the terms of trade contributed powerfully to Britain's balance of payments; import prices in 1953 were 12 per cent lower than in 1952, while export prices fell by only 3 per cent, and the overseas balance benefited to the extent of between £200 and £250 million from these relative price changes.

A second item that handsomely assisted the balance of payments last year was a further increase in invisible earnings. The main contribution in this category came from increased sales of oil to non-dollar countries and reduced purchases from dollar countries; these accounted for most of the rise of £49 million in "other receipts." British expenditure on shipping services to other countries fell by £51 million because of lower freight rates, and since British shipping earnings fell by £35 million there was a net gain of £16 million from shipping services. Tourist expenditure also brought in more last year, the net result of a substantial expansion of both sides of the tourist account. With the increased travel allowance more Britons went and spent abroad, but the Coronation drew to this country a record number of overseas visitors. Given the policy of greater freedom in the exchanges, the reopening of the gold and commodity markets, and the increased confidence in sterling which has brought to Britain a greater volume of the world's merchanting and financing business, the prospect for invisible earnings seems promising. If the Persian oil dispute is settled, overseas oil income should recover further ground.

The regional distribution of the balance of payments shows some notable and welcome changes over the past three years. In its payments with the dollar area, the United Kingdom had a deficit of £431 million in 1951 which was reduced to £172 million in 1952 and last year, at a mere £4 million, almost vanished. Exports to the dollar area last year rose from £411 million to £446 million, while imports from it fell from £605 million to £516 million; invisibles also made a marked contribution, for the deficit of £121 million in 1952 was reduced to £56 million. The improvements in the direct UK-dollar area balance of payments was matched by an impressive improvement in the account with OEEC countries which showed deficits of £201 million in 1951 and £26 million in 1952, but a surplus for the UK of £104 million in 1953. The balancing factor in the total account was a much reduced surplus in the British payments account with the rest of the sterling area, which fell from £367 million in 1952 to £179 million in 1953. On these figures, the long sustained complaint that British exporters were too ready to wallow in the easy markets of the sterling area and not prepared to fight for hard-currency earnings must surely lose some of its substance. Last year saw a considerable diversion of British exports to the dollar and OEEC areas; import restrictions applied by Australia and other sterling countries played some part in this switch, but British industry was sufficiently competitive to steer more trade into the more difficult markets.

Last year's balance of payments surplus is only one element in the criss-cross pattern of the United Kingdom's capital account. The main totals in this account are the current surplus of £225 million, the addition of £240 million to the gold and dollar reserves, a net capital investment of £207 million overseas and an increase of £222 million in UK short-term sterling liabilities to the rest of the world. Table II gives a detailed break-down of these changes.

The most notable item in that table is the investment of £158 million in the rest of the sterling area during a period when Britain's sterling liabilities to the area rose by £253 million. In 1952, capital investment in the sterling area had been estimated at £94

Sources of the Surplus

million, while the sterling liabilities to the area had risen by £111 million. There is a hint of " borrowing short and lending long " in these figures, though last year it should be disarmed by the fact that the gold and dollar reserve, which is held by the United Kingdom as banker's cash reserve for the use of its depositors, rose by £240 million.

★

Last year, the balances held for dollar area and other Western Hemisphere countries increased by £62 million, conceivably because of the attraction of relatively high money rates in London ; but the sterling liabilities to other non-sterling countries continued to shrink. Since the end of 1945, they have fallen by £459 million and the latest figure of £773 million itself includes an appreciable amount of sterling which is immobilised in some degree—for example, the balance in the Egyptian Number 2 account, and the Portuguese sterling loan to the United Kingdom, the repayment of which does not begin until next year. These figures are thus in conformity with other evidence of a growing shortage of sterling in the hands of non-sterling countries. That evidence includes purchases of sterling by a number of countries from the International Monetary Fund—£44 million sold to Japan last year, £10 million to Brazil and £2 million to Turkey ; these purchases are reflected in the fall in the sterling held by non-territorial organisations. Excluding these liabilities to international organisations, the total of sterling held abroad at the end of 1953 amounted to £3,708 million. This total shows an increase of £271 million in two years, largely composed of an increase

in balances held by sterling area countries. Britain's liabilities to the sterling area are at first sight ominous, but, in fact, the entire overseas holdings of sterling at the end of 1953 would cover less than a year's current expenditure by the holders in the United Kingdom—roughly as it was before the war. In 1945 the comparable total represented about two years' such expenditure.

But it should not be forgotten that before the war the gold reserves were approximately equal to the United Kingdom's short-term external liabilities, and that happy balance, unfortunately, no longer exists. Against a gold reserve of close on £1,000 million, the United Kingdom now has short-term sterling liabilities of £3,708 million ; it owes about £2,000 million on longer term to countries outside the sterling area, mainly the United States and Canada ; and it owes £200 million to EPU. This makes a total of over £5,900 million on the liabilities side. On the other side of the account, the valuation that might be placed on British overseas investments (capitalising last year's investment income of £272 million at 7 per cent) would be about £3,800 million which, together with the gold and dollar reserves would yield a total of about £4,800 million. On capital account the United Kingdom is now a debtor on a substantial scale, whereas before the war it was a substantial creditor. That is a major transition of which the implictions are too often ignored. It will need many more surpluses on the balance of payments comparable with those of the past two years to make good the damage to Britain's external strength that resulted from six years of World War II and the years of peace during which Britain was content to live on its fat.

Business Notes

Unprickable Bubble

THE Stock Exchange staged a budget revel ; it staged it before budget day—on Monday. All the traditions of the pre-budget quiet period were broken. The *Financial Times* index of ordinary share prices reached a new peak at 141.9 and the number of bargains recorded in the Stock Exchange official list rose by 4,673 to 16,847, the highest since February 8th. Many jobbers reported their busiest day in postwar markets. The small man and the big institution were in it together. There was buying of those long-dated gilt-edged stocks which are tax free to residents abroad because sterling was strong and seemed headed for greater freedom, buying of both industrials and gilt-edged because bank rate would be reduced, buying because there would be 6d. in the £ off income tax, and buying because there would be 6d. a gallon off petrol. [illegible] deed was foreseen—everything except the Chancellor's decision to introduce a no-change budget.

The extraordinary sequel was that even Mr Butler could not prick the bubble. The morning after was not quite as good as the night before, but the afternoon after was even better. There was no break in the steady progress of the *Financial Times* Industrial Index, which reached fresh peaks of 142.6 on Budget day and 143.4 on Wednesday. A little rather hesitant marking down by jobbers on the Wednesday morning and a little rather timid selling by the disappointed speculators of two days earlier soon brought

buyers in again and as the accompanying tables show that the general level of prices of industrials and of gilt-edged on Wednesday evening had been maintained. Cinema shares did not respond to the cut in entertainments tax but rightly some of the shares in the capital goods industries where gains from the new investment allowance, added to the depreciation allowance, may be significant have forged further ahead. By Wednesday afternoon market people were reporting good steady buying. The institutions have not—at least not yet—made any change in investment policies. Investment by non-residents in non-tax deducted gilt-edged is still in progress as sterling maintains its strength ; the general public are certainly not sellers.

* Ex. dividend. (*a*) After 100 per cent share bonus September 11, 1953. (*b*) After 100 per cent share bonus December 15, 1953. (*c*) After one for two share bonus and capital reorganisation January 5, 1954.

Two possible deductions can be drawn from this remarkable display of underlying strength, each containing a part of the truth. The City holds many important investors who think that the decision to have substantially no fresh budget was right [illegible] sent times and who rather enjoy their malicious deduction that it goes to show that no early election is contemplated. Secondly, it can be argued that the pre-budget speculation was a mere veneer and that investment markets draw their present strength from much larger and deeper forces quite capable of absorbing any small selling from disappointed speculators. The strength of sterling, the inflow of foreign money that it is bringing and the heavy flow of institutional investment in which the pension funds play so big a part, certainly does add up to a much greater force, though that too is a force of incalculable duration.

More Gold Flows In

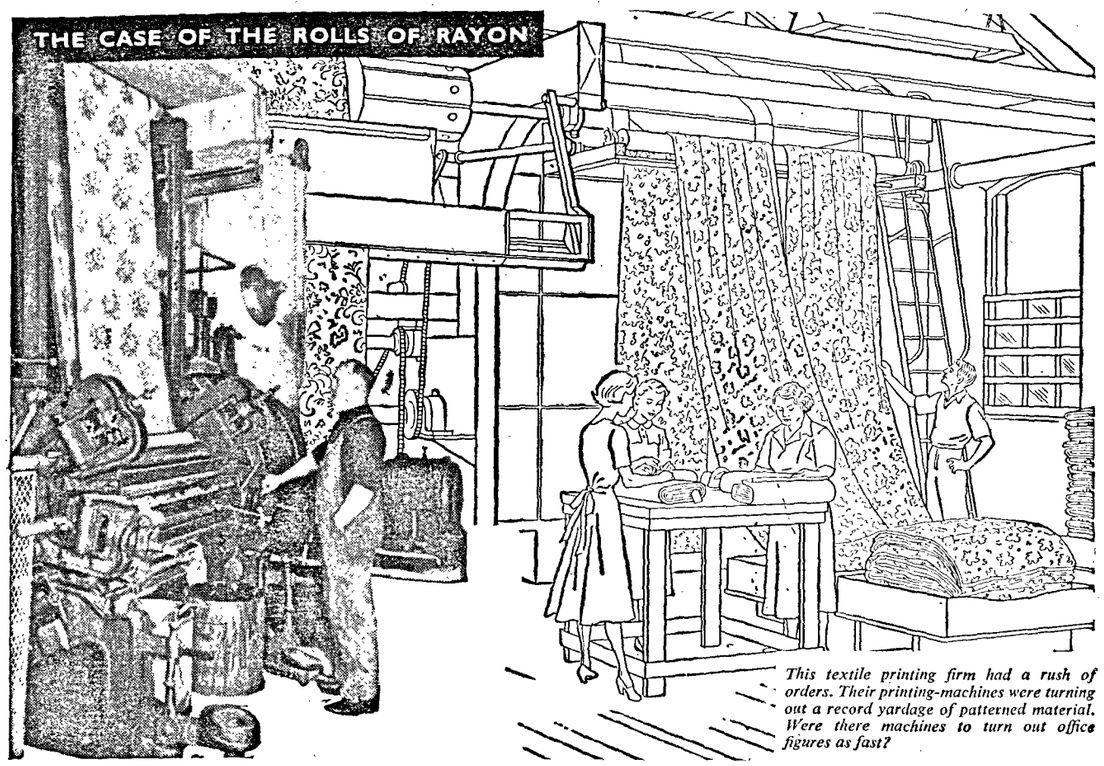
THE sterling area achieved a gold and dollar surplus of $102 million during March ; this was the biggest surplus since April of last year, and brought the gold and dollar reserves up to $2,685 million on March 31st, their highest since November, 1951. Special items in the $102 million surplus last month were $14 million of American defence aid and $2 million from the settlement of the February EPU surplus. Excluding those two items the sterling area trade and payments transactions during the month brought a credit of $86 million. This is the season when payments should be moving in favour of the sterling area, and during March the United Kingdom built up a surplus of £4.8 million with EPU. This will be settled in mid-April as to 50 per cent in gold and 50 per cent by reduction of the UK overdraft, bringing it down to £194 million.

The seasonal influences favouring the sterling area balance of payments in March were accompanied by special factors which helped the build-up of the gold and dollar reserves. One of these was the receipt of further consignments of Russian gold, both direct to the Bank of England and, by more circuitous routes, to the London gold market. Another factor has been the attraction to London of a considerable volume of foreign money temporarily employed here on arbitrage operations. At prevailing short money rates in London, New York, Amsterdam and Zurich, it is profitable for operators in the foreign centres to use money in London and cover the exchange risk by forward transactions. It is estimated that as much as £40 million may be thus employed in London. The immediate impact of that influx of money is to increase the Exchange Equalisation Account's holding of dollars and other currencies.

Though the gold market has been less active in the first week of April demand has outstripped supply and the price has touched 248s. 11½d. per ounce. In the last few days less newly mined sterling area gold has been offered in the market. There has also been less Russian gold on offer. The Russian authorities appear to be unwilling to accept a price below the American parity of $35 per ounce. They could obtain that figure on the Continental markets, while transferable sterling was below $2.79. To the Russians it is immaterial whether they are paid in registered or transferable sterling. The rate for transferable sterling then strengthened to 2.79\frac{5}{8}$, a movement that put an effective stop to shunting of Russian gold from the Continent to London. The rate has now come back to 2.79\frac{1}{8}$-$\frac{1}{4}$. Russian sales of gold in London restarted on Thursday and the reserves of the Exchange Equalisation Account should again be fortified from that source.

CDFC's First Report

THE Commonwealth Development Finance Company has issued its first report and accounts. They cover the year to March 31st last and must be amongst the promptest on record. At that date £2,850,000 (that is 10 per cent of the " A " shares and 30 per cent of the " B "



This textile printing firm had a rush of orders. Their printing-machines were turning out a record yardage of patterned material. Were there machines to turn out office figures as fast?

"Finished"—
but the office work was only starting . . .

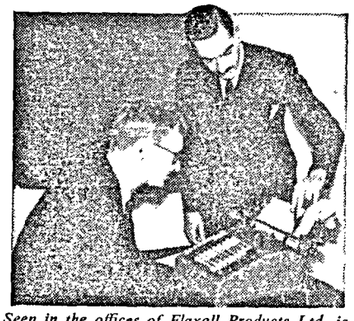
Flaxall Products Limited, of Belfast, Northern Ireland, have become a thriving business since the end of the war. Their main business is printing and finishing textiles—especially rayon and the famous Irish linen.

But production in their offices, they found, was not keeping pace with production at their Carrickfergus factory. Bookkeeping was being done by hand, and monthly statements frequently went out late. Control over an increasing volume of postings to Sales, Purchases, and Nominal Ledgers was becoming more difficult every day.

Not wishing to engage more office staff. Flaxall put the problem to Burroughs.

After investigation, Burroughs suggested that the firm should install one of their electrically-operated Desk Bookkeeping Machines to handle all Ledger work, Statements (and Purchase Tax computations), and some Commodity Analysis. This course was adopted.

Result: With this Burroughs machine at work, Flaxall Products Limited have solved their bookkeeping problem without adding any new office staff. Now, their monthly statements go out on the dot, and their accountant can control all figure-work without being directly involved in its production.



Seen in the offices of Flaxall Products Ltd. is Mr. T. R. W. Dark, the Chief Accountant. With him is Mr. B. McM. Thomas, the Burroughs man who installed their Burroughs Desk Model Bookkeeper—the machine that helped to solve the Case of the Rolls of Rayon.

What about you?

If your business could benefit from faster, accurate figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs market the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilming Equipment. Remember, once you have any Burroughs machine, Burroughs Service *guarantees* its efficiency in operation.

Call Burroughs *today*. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities round the world.

FOR EXPERT ADVICE ON BUSINESS FIGURING CALL IN Burroughs

the Monopolies Commission hoped. The majority of the Commission held that since it might not be possible to amend the earlier agreements fundamentally without injuring British Match's interests overseas, the agreements should be left alone, subject to certain minor changes; and could suggest only a rigid price control system. The President of the Board of Trade would not accept price control, but urged British Match to amend its quota arrangements, and to carry out certain minor recommendations of the Commission. The company has now done both.

British Match has in fact obtained the new agreement with the Swedish combine without disturbing their existing arrangements to co-operate in certain overseas markets. It has had to concede the Swedes the power to end the agreement at one year's notice, while itself remaining bound until 1961 and then having to give three years' notice, and the payment for technical help, while reasonable in itself, is perhaps a reminder that the Swedish company was perfectly satisfied with the old agreements as they stood. Abolition of the quota arrangements, as the Commission's minority observed last year, may not of itself ensure "vigorous competition" between the two major groups; but it leaves other makers or importers wholly free to compete, if they want to.

Air Corporations' Out-turn

THE full accounts of the nationalised air corporations for 1953-54 are not likely to be published for another six months, but it has already been stated that during the year, British Overseas Airways Corporation earned a substantial profit, and British European Airways a substantial loss. In the previous year, 1952-53, BOAC made a small operating profit of £10,000, before payment of interest, but was left, after meeting all charges, with a deficit of £800,000. The past year's operating profits seem likely to leave the corporation with a small balance after meeting interest charges. These results are far better than seemed possible at one time in the year, for costs were rising during the summer, but long-distance traffic seems to have recovered from the check it received in 1952, and to have caught up with the increased capacity that the airlines were offering for sale.

British European Airways' traffic also expanded during the year, but not sufficiently to offset the widespread introduction of tourist fares (at an average discount of 20 per cent) on most of the corporation's routes. This experience is shared by most European operators, and BEA's earnings per ton mile dropped 8 per cent during the year. The net result is expected to be a big increase in the £1.5 million deficit, after meeting all charges, of 1952-53. The interest charges to be met by BEA will have been increased substantially by the £10 million loan raised during the summer to pay for the corporation's new fleet, but the real and persisting difficulty lies in the nature of the corporation's operations, where booking and passenger handling costs are no lower than on long-range operations, but the value of the ticket sold is one-eighth that of BOAC's average. A drastic overhaul of booking and handling methods to cut these high costs may not be possible within the present structure of international air transport—other airlines have already turned down suggestions that a cancellation fee should be charged on bookings not taken up—but it would certainly be worth attempting.

Nine-Year Export Credits

MUCH longer export credits are now being arranged for British firms accepting approved export orders, if it is considered necessary in order to hold foreign competition in check and if the nature of the capital goods involved justifies long credit. The nine-year financing arranged between Lazard Brothers and English Electric to cover an important order from the Turkish Government is the most recent and most outstanding example. The arrangements, approved by the exchange control authorities and flanked by an insurance from the Export Credits Guarantee Department, will enable the bonds which the Turkish Government will deposit to be placed privately among the City's financial institutions, who will thus be the real providers of finance.

English Electric Company and George Wimpey have jointly agreed the principles of a contract for a hydro-electric project at Hirfnli on the Kizilirmak, Turkey's largest river, about 65 miles from Ankara. A rock-filled dam will be built by George Wimpey 280 feet high, and a 100,000 kilowatt electric power station to feed power into Turkey's national grid will be supplied by English Electric. The total expenditure is estimated at 90 million Turkish liras (£11½ million); the sterling payment to this country will amount to about £6 million.

Although the total sterling cost is £6 million and the maximum period of credit nine years, the effective amount outstanding and the effective length of the credit will both be much less. The incidence of the payments on account will keep the total debt well below the maximum figure and the fact that there are to be substantial early payments means that it will be about two years before any part of the credit is used. As it will take approximately four years to complete the project, Turkey will have had five years' use of the new works before the final payment is due.

Radioactive Sales

THE four new buildings formally opened this week at the Radiochemical Centre at Amersham form the first part of a project to put the supply of radio-active materials on what scientists consider a "quantity production" basis. Amersham is a branch of the Department of Atomic Energy, and its function is to handle the sales of radio-active materials produced in one or other of the atomic piles. Materials that give off powerful radiation are a new and intriguing scientific tool, but their growing use depends to a large extent on the assurance of a reliable source of supply.

The commercial importance of Amersham lies in supplying these materials in forms that can be used by customers—and this means not only extracting and purifying the radio-active element itself, and supplying it to a given assay, but frequently in making a specially-tailored compound containing the radio-active element. Radio-active carbon, or radio-active strontium, are frequently useless to the industries, hospitals or laboratories that want to use them. But benzene, sugar or amino-acids in which all the carbon atoms are radio-active, or strontium bonded on to foil or wire that

can be installed in industrial or medical equipment, become so valuable that customers are prepared to pay as much as £350 for a single microcurie, which represents a fragment of a gram of material.

The processing and preparation of these materials is not easy, not because the operations are at all complicated, but because they have to be carried out by remote control as a protection from the lethal quantities of radiation given off by some of the materials in bulk. The Centre is sending out about 12,000 consignments a year; its total turnover in 1953 was £114,000, and at this rate the Centre is breaking even. As soon as arrangements have been completed for transferring some of the business that is at present being transacted from Harwell, the rate of despatch is expected to double, and the Amersham centre will begin to show a profit. Investment in plant and buildings is about £500,000, which is—atomically speaking—very small beer, but the potential business likely to be done at Amersham may be much greater than present figures suggest, now that it has the facilities for supplying a really wide range of compounds in considerable quantities. One effect of the new Atomic Energy Bill may be to expand Amersham's range of commercial activities quite considerably, especially in the direction of industrial applications. There is still a big barrier of prejudice to be overcome against factory use of unshielded radiation sources, but Amersham may be in a better position to break it down than the one or two companies that have tentatively attempted to develop this field.

The Londoner's Ride

RAILWAY and 'bus services in the London area are today contributing some £5 million a year less than they should to the central charges of the Transport Commission, and the Commission's application for a rise in London Transport and British Railways fares in the area has been inevitable ever since the last increase in wages. Against the rising trend in costs, the London Transport Executive is now experiencing a continuing decline from the postwar boom in travel; television and the growth of private motoring, Sir John Elliott said last week, are affecting travel in London today to "an ever-increasing extent." The cheap evening fares introduced recently "are not doing badly"; but the total revenue on evening travel is only about £500,000 a year out of London Transport's total receipts of £71 million, and Sir John felt that cheap fares at other times—say mid-day—could not possibly attract enough extra passengers to outweigh their cost.

The increases asked for should amount to about £5 million; under the normal procedure of public inquiry, they can hardly be brought into force, if granted, before the autumn. A number of the increases in fares could have been dealt with under the emergency procedures laid down in last year's Transport Act, under which the Tribunal may grant an increase in charges without a public inquiry or the Commission may order increases before the Tribunal examines the reasons for them; but other items could not, and the Commission decided against two bites at this unpalatable cherry.

Trends in Sweden

Sweden has been Britain's largest European customer over the last four years. What are business prospects there? Will the present prosperity continue? Which sectors of demand are expanding? How susceptible would the Swedish economy be to a world recession? Such questions are discussed in our ninth report* on economic conditions in Sweden issued this week. Let us tell you more about this service for businessmen.

Treasury Loans to Industry

THE unsuccessful venture in manufacturing hard glaze china in Durham, in which the Treasury appears to have lost more than £200,000, obtained this loan from the State under the Distribution of Industry Act, 1945. That Act empowered the Treasury to make loans, and indeed grants, to companies beginning operations in development areas; no grants have in fact been made, but the Treasury had lent nearly £3,500,000 by the end of March last year, and had written off about £150,000; loans totalling £2,716,682 were outstanding. The Durham China Company, which was set up in 1948 and was put into the hands of the Official Receiver last October, has stated that the Treasury's loan, with accrued interest, amounted to £215,000, of which perhaps £12,000 may be repaid; a roughly similar amount to the Treasury's loan had been invested by the bankers, Montagu Samuel.

The Treasury has confirmed the fact of this loan but not the amount lent; its policy is not to reveal the names of borrowers or the amounts that it lends, though some of these are disclosed by the companies concerned. Its loans under this Act are incidentally separate from those to the actual industrial and trading estate companies by the Board of Trade, which at present amount to some £4,700,000. Some indications of the scale of the Treasury's present lending, and of the loans that may go into individual ventures, may be drawn from the appropriation accounts for 1952-53. During that financial year it lent some £270,000, which was about £1,630,000 less than it had estimated. This saving, it reported, was due to "delay by the promoters in commencing two large projects." Whether the details of loans of the magnitude that this seems to suggest should remain undisclosed seems open to question.

Coping With Surpluses

THE recent meeting in Washington of the FOA working party on the disposal of farm surpluses achieved little. This was partly because disposal, when rightly circumscribed by a desire to avoid harming normal exports, has little scope. The value of the meeting was also diminished by uncertainty about the fate of the American Administration's new farm policy in Congress. The most important results were thus negative—a closer exchange of views between the United States and other countries represented (Argentina, Britain, Egypt, France, India, Holland and New Zealand), and the decisions neither to set up any new international machinery nor to espouse any grandiose schemes. The report, which will be considered in Rome next June, is no doubt right in saying that the long-term solution to the surpluses lies in higher consumption through increased incomes and the growth of population, together with adjustments in production; but in the meantime, as it points out, action is needed to dispose of existing surpluses and prevent the accumulation of new ones. Sales on concessional terms, or grants, in aid of development are considered to offer better prospects than any other form of special disposal for moving substantial amounts of surpluses into truly additional consumption. It is emphasised that the mere segregation of stocks cannot provide a real solution unless it is accompanied by other measures to bring supply and demand into balance.

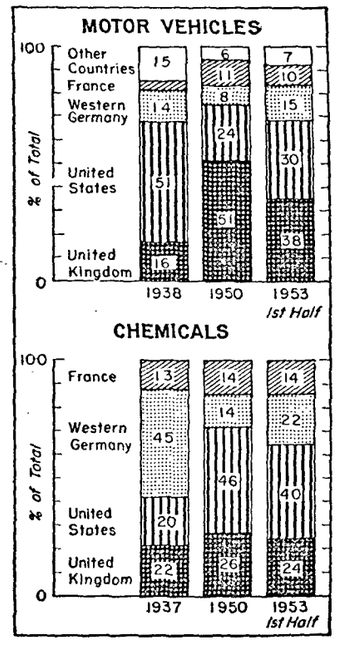
Such action really devolves on the United States, where the bulk of the surpluses is concentrated. The American Administration cannot hope for much success in reducing farm output, but there are signs that it is becoming a more aggressive exporter of its surpluses against payment in local currencies. The recent sales of American wheat and barley to Japan and of wheat to Spain are examples. Though the money will, in Japan, be used to finance off-shore procurement, defence and development, and in Spain for the construction of military bases, it is understandable that the chairman of the Australian Wheat Board should call these sales "dumping." Definitions of "development" and "normal exports" can seldom be precise. The policy may be extended. The American Secretary of Agriculture favours a "dynamic' export policy, and wants to send abroad salesmen directly answerable to his department. The State Department wants such representatives to be under the ambassador, thus subordinating their activities to general foreign policy considerations. Other exporting nations may well pray that the views of the State Department will prevail.

Shell-Royal Dutch Scrip Issues

THE long-awaited capitalisation of reserves by "Shell" Transport and Trading and Royal Dutch follows hard on the heels of the report of the Gedge committee on no par value shares. That committee's dictum that a scrip issue from capitalised reserves "adds nothing and detracts nothing from the shareholders' aliquot share of the equity of a company" is relevant. The important event for the investor is whether or not the amount distributed as dividend goes up. The distribution of free shares itself means nothing.

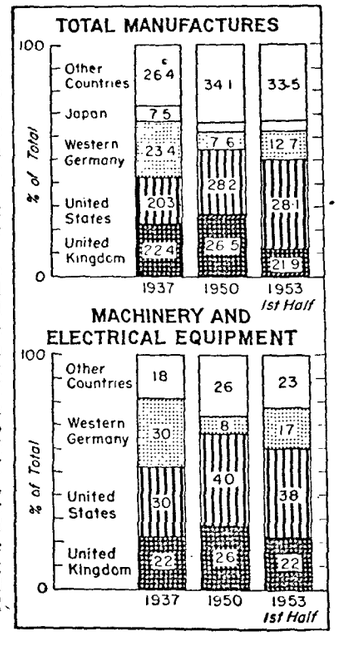
With the consent of the Treasury, Shell intends to capitalise £10,902,939 from its share premium account (amounting to £25,847,869 at the end of 1952) and to issue one new free £1 ordinary share for every £4 of stock held. Royal Dutch is to capitalise fl. 202,727,600 from its capital surplus account (totalling fl. 224,277,000 at the end of 1952) and to issue new free ordinary shares in the same one for four ratio. The new shares do not rank for the 1953 dividends, which will soon be declared. The directors of

Britain's Share of Trade



How have British exports fared in comparison with those of the rest of the world? An analysis by the Board of Trade gives a disquieting answer. Britain's share in the total exports of ten main exporting countries (excluding commodities and the strategic shipments of the United States) was probably a trifle higher in 1953 as a whole than in the first half; hence the decline in its share in the previous two years seems to have been arrested. If so, it halted at about the prewar level of 22 to 23 per cent, compared with 26.5 per cent in 1950.

While Britain's share has fallen back, the share of other countries, apart from Japan, has remained well above the prewar level, and for Germany and Canada it is still increasing. The share of the United States in 1950 was 8 per cent larger than in 1937, and it was still 8 per cent larger in the first half of 1953. Excluding Germany, the share of other European countries was 6 per cent larger in 1950 than before the war, and had only shrunk to just under 5 per cent in 1953. The share of Germany, which since the war means only half Germany, albeit the predominantly industrial half, forged ahead from 7.6 per cent in 1950 to 12.7 per cent in 1953, which is still only half the share held by Germany before the war, and just over half the present and prewar share of Britain. The sobering conclusion seems to be that Britain, which ended the war with its industrial machine intact, has failed to consolidate a larger share of world markets.



both companies add that "the company's dividend policy will continue to be governed, among other considerations, by the necessity of maintaining its finances on a sound basis." This comment echoes a similar statement made by the directors of Shell in 1952 when they issued a similar number of shares in a scrip issue.

Nevertheless these latest issues caused excitement in the stock market. Reports from Amsterdam that a scrip issue was to be made sent up the price of the Shell and Royal Dutch ordinary shares well before the announcement was made. And after it became known the Shell £1 ordinary stock units put on another 5/16 to 5 11/16 and the Royal Dutch fl. 100 ordinary shares another 1¼ to 44. If Shell were to maintain its current dividend rate of 15 per cent tax free on the increased ordinary capital the £1 ordinary units, allowing for the new issue, would yield £6 3s. 4d. per cent and the Royal Dutch units on the basis of the current price of 42¼ and the current dividend rate of 16 per cent would yield £4 8s. 10d. per cent.

No Dealings in Dawes

THE only paradoxical feature of the formal publication of the German debt settlement in this country was that jobbers last Friday suspended dealings in the Dawes loan. This odd result arises because under the debt arrangements the Bank of England is appointed the agent only for the British tranche of the loan, but when the sterling issue of the Dawes bonds was made these bonds were issued in France, Belgium, Holland and Switzerland as well as in this country. Up to now no distinction between the various tranches has been made in dealings. British residents hold bonds of all the tranches, and jobbers cannot always tell in which they are dealing. But British bondholders can assent to the German offer only in respect of bonds of the British issue.

It seems that nothing can be done—unless the German government agrees to some new arrangements—until the debt offer has been formally made in the other countries where the bonds were issued. The offer has already been published in France and its publication in Belgium and Switzerland is expected shortly. But Holland has still to ratify the settlement, so dealings in Dawes wait on the Dutch.

The Watchdog Barks

A COMPANY'S auditor is the servant of the shareholders, not of the directors. He is also the shareholders' last line of defence. Fortunately the occasions when he has to issue the kind of qualification which cuts at the very roots of his own certificate are rare. But such occasions, as past history shows, are not to be lightly disregarded. Last week the accounts of Hide and Company, the store group, carried a serious reservation by the company's auditors about some notes on the balance sheet.

> . . . We have not been able to obtain all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit. In consequence we are unable to state whether in these respects the balance sheet and the said notes give the information required by the Companies Act, 1948, in the manner so required or give a true and fair view of the state of the company's affairs in regard thereto. . . .

The notes referred to describe a share transaction in 200,000 "A" ordinary shares in Hide and Co., with special voting rights. In the course of buying two businesses, during the year to January 31, 1953 covered by the accounts, Hide and Co. gave, as part of the purchase consideration, 200,000 "A" ordinary shares of 1s. each and 8,744 ordinary stock units of 1s. each of the parent company which had previously been held within the group. The "A" ordinaries are unquoted; in the purchase consideration given by Hide and Co., they were taken at a value of 5s. per unit. The chairman, Mr L. P. Jackson, with the approval of the board, is now seeking to buy them back from third parties at a price which he has not yet revealed to the shareholders. The auditors asked for details and have qualified their report because information was not forthcoming. This share transaction is to be put up for the approval of the shareholders at the annual meeting on April 30th. Is there any reason why shareholders should have to wait until this date before they are given adequate information by which to judge it?

Edible Oils Firmer

PRICES of some edible oils have recovered slightly from their sharp fall in the last two months. Copra, which fell by some £25 to £67 a ton, is now about £70 a ton, c.i.f. Continent for nearby shipment, and coconut oil, which fell from £135 a ton, is about £102 a ton. Palm kernels, which fell by some £20 to £48 a ton, have risen to about £51 a ton, and palm kernel oil, which also fell by some £20, is slightly higher at about £97 a ton. The decline has been checked by covering purchases by some sellers and by the temporary withdrawal of offers of palm kernels by the marketing boards in British West Africa; demand from consumers has also improved a little since the market became steadier. The firmer trend may be temporary, for the surpluses of copra, palm kernels and of American cottonseed oil—which produced the earlier decline—are likely to press on the market for some time. The Commodity Credit Corporation apparently intends to sell about half—200,000 tons or more—of its huge stock of cottonseed oil this year. In the last two months it has reduced the price by £6 to about £100 a ton, cif Continent, but so far its sales have been small.

A further decline in the market would no doubt be welcomed by manufacturers of margarine and cooking fats and other users in Britain, but would be less agreeable to the Ministry of Food. The Ministry is still the sole importer of most oils and oilseeds, and when private imports are resumed on June 1st it will have some outstanding contractural supplies from abroad, as well as stock, to sell at prices based on the world market.

Prices of palm oil and groundnut oil, on the other hand, have been fairly steady at about £78 to £82 and £150 to £160 a ton respectively, and may remain roughly within this range. Supplies of groundnut oil are still tight, owing to the ban on exports from India and China. Though consumers will presumably try to replace it with other oils at current prices, there are some uses, such as certain brands of margarine and salad oil, for which it would be difficult to displace groundnut oil. The better qualities of palm oil are meeting a good demand, and producers are well sold forward.

Chile—A Reluctant Seller?

THE resumption of sales of Chilean copper has had no effect so far on the London market, where prices are still steady at or above £235 a ton for standard prompt metal, and some £227 a ton for three months. Little is known about the Chilean sales to Britain and the Continent, but Chile still appears to be a reluctant seller, despite the reduction in output and the accumulation of stocks. The Central Bank is believed to be asking about 30 cents a lb (£240 a ton) for electrolytic, cif Continent; the Continental price is just over £240 a ton and the price charged in London by the Government broker—the only source of electrolytic in the market—is about £238 a ton, or some £3 above the standard price. As Chilean copper takes two months or more to reach Europe, a price of 30 cents is virtually equal to the present prompt price for what is in fact forward copper. On the other hand, Chile may have made some sales on the basis of average market prices in the month of delivery.

Whatever the price, its sales up to now are estimated at not more than 15,000 to 20,000 tons. Whether buyers will raise their bids, in view of the continuing tightness of electrolytic, or whether Chile will lower the price, is an open question. Buyers are evidently able to obtain their marginal requirements at present prices, and Chile may be prepared to await the probable revival of industrial activity in America to stimulate demand from that country. American demand could hardly absorb all of Chile's output, but it would certainly help. It is even conceivable that following the new American policy on strategic purchases, which may include Chile as a "neighbouring" source of supply, Chile is hoping to sell more copper to the stockpile (in addition to the 100,000 tons sold last month). By withholding supplies Chile missed the best of the market, but it has not yet had to pay dearly for that loss.

SHORTER NOTES

A final payment of £1.2 million to Britain by UK-Dominion Wool Disposals Limited marks the liquidation of the most profitable of inter-government trading organisations. The organisation was set up after the war to dispose of over 10 million bales of Commonwealth wool on behalf of Britain, Australia, New Zealand and South Africa. It made a net profit of £171.5 million which, with the balance of wartime profits, brought the total distribution to the four governments to £199.5 million. Britain has received half of this sum; the other half was paid to the wool growing Dominions in proportion to their sales.

★

In discussing the decision of Roan Antelope Copper Mines to build an electrolytic copper refinery the impression was given in a recent issue of *The Economist* that the Rhodesian copper belt will have only three electrolytic refineries and the Anglo-American group only one. While this is partly correct there is an electrolytic tank house at Nchanga Copper Mines, which is being extended and from which cathodes of 99.9 per cent purity, go on to Rhodesia Copper Refineries to be turned into commercial shapes.

★

The Casablanca High Draft Company of Salford, which builds high draft equipment for cotton spinning and preparatory machinery, has completed an agreement with the Whitin Machine Works of Whitinsville, Massachusetts, the largest American builder of spinning machinery, by which Whitin will incorporate in its cardroom and spinning machinery the latest developments of the English high drafting equipment.

Company Notes

HUDSON'S BAY. The Governor and Company of Adventurers of England trading with Hudson's Bay hold a unique place in the London Stock Exchange, not merely because they are the oldest British company still alive. "Bays" have also provided a sterling route for British investment into Canada. In the last few years it has been an expensive route. The shares were forced up to new peaks when investors staked a claim in the Canadian oil boom through "Bays" and when an American syndicate were active buyers. At this time the company was under pressure to transfer its domicile to Canada, but the directors resisted it. As a result the price of the shares looks high. Investors have therefore to weigh long term prospects, which remain unblemished, against the short term consideration that the company's principal interest is in the wholesale and retail trade in Canada, where prosperity will presumably fluctuate with the general level of prosperity in the Dominion.

Bigger returns for shareholders are, however, beginning to percolate through. In the year to January 31st last, profits before tax advanced from £2,764,095 to £3,060,842, and after tax from £1,394,104 to £1,530,842. This advance gave the directors the opportunity to raise the effective gross return to ordinary shareholders from 14¾ per cent to 17 per cent. For 1953-54, a final dividend from trading of 8½ per cent and a final tax free distribution of 1¼ per cent from land sales has been added to an interim trading dividend of 4 per cent and a tax free distribution of 1¼ per cent from the land account. In 1952-53, the full year's trading dividend was equivalent on the present capital to 10 per cent and the tax free distribution from land sales was equivalent to 2½ per cent. In all, the latest distributions absorb £492,214, compared with £396,264 in 1952-53. The yield on "Bays" is usually calculated by lumping the trading and land distributions together, and on this basis the £1 ordinary shares at the current price of 104s. 3d. yield 3¾ per cent.

On this price, the "rights" issue of 623,056 new £1 ordinary shares at 70s. each (in the ratio of one for eight) offers a substantial turn to shareholders. In announcing this issue the directors have not gone beyond the general statement that "the company requires additional finance for the purposes of its business."

The full report at the end of this month will undoubtedly specify in which directions this new money is to be used.

★

SAVOY HOTEL. The £1 ordinary stock units of the Savoy Hotel now stand at 50s., having lost 1s. 6d. following the preliminary report for 1953. The 7 per cent £1 preference stock units stand at 25s. This preliminary report does nothing to prove that the ordinary units are worth the 62s. 6d. and the preference units the 31s. each that the directors' friends paid Mr Samuel in order to keep control. They have not found the anodyne for the headaches of the morning after a share bid.

All they have done is to add a bonus of 5 per cent to the 10 per cent ordinary dividend, bringing, as the market had expected, the full year's distribution up from 10 to 15 per cent. This dividend is paid out of a net profit which has risen by £42,933 to £202,460. The gross trading balance rose from £477,829 to £525,684. The dividend is covered about 1½ times by earnings. In addition the directors propose to issue one free new ordinary stock unit for every £8 held and one free new preference share for every £10 held.

The scrip issue of preference shares is subject to a modification of voting rights bringing them "into line with modern practice." At the moment the preference stock votes equally with the ordinary. Presumably, the directors' intention is to limit the votes on the preference units to any occasion when either the dividend is in arrears or when resolutions are proposed which affect that class's rights.

The plan reduces the size of the investment needed to control the company on matters affecting its normal activities, including the disposal (subject to the rights of debenture holders) of its assets. In the market it is believed that once the proposal is carried through the directors will sell off (apparently at a loss) the preference units that they bought from Mr Samuel. But it is not at all clear how much further forward this proposal brings the directors' promise to submit the company's future plans at the general meeting, probably including "proposals intended to benefit preference and ordinary holders."

★

LINER HOLDINGS. A year ago the chairman of Liner Holdings, then known by its more familiar name of Elder Dempster, described the 1952 profit of £4.9 million as "exceptional and unlikely to be repeated in normal times." Investors ignored the warning and looked forward to a substantial increase in the ordinary dividend in 1953. In one sense, they were right, for profits in 1953 advanced to £5.8 million—an improvement that must owe something to the new ships brought into service on the West African routes in 1952. The ordinary dividend was also increased. But the increase fell well short of expectations, and after its announcement the £1 ordinary stock units fell by 2s. to 32s. 6d., to offer a yield of 5½ per cent.

Effectively the dividend has been raised from 7½ to 9 per cent. The 9 per cent dividend is payable on a capital of £6,871,490 as increased by last year's 100 per cent scrip bonus. In 1952 and 1951 a dividend of 15 per cent was paid on the original capital of £3,435,745. Thanks to the increase in the tax charge from £1,992,814 to £2,662,526, the rise in net profits has been limited to £103,408—to £2,110,415. And the directors still show themselves anxious to appropriate the greater part of these earnings to the reserves of subsidiaries, presumably to meet the cost of the ships now under construction. It will be interesting to see whether the chairman in the full report also describes the latest profit as "exceptional." If he does investors will have another reason for disappointment.

LONDON STOCK EXCHANGE

Next Account begins: April 21st.
Next Contango Day: April 21st.
Next Settlement Day: April 27th.

THE "stand-still" Budget brought only a very minor and temporary check to the advance in the stock market. The *Financial Times* ordinary share index, having crossed its earlier peak of 140.6 recorded in January, 1947, went blithely on to stand at 143.4 when the market closed on Wednesday. The most active day was Monday when 16,847 bargains were marked. Gilt-edged securities, particularly the longer dated issues, shared in this advance. With interest concentrated largely on the equity market, the foreign market was quieter than of late and though there was some activity in German issues on Tuesday this sector of the market was in general overshadowed by the suspension of dealings in the Dawes loan.

Gains were scattered freely throughout the industrial market and by the close on Wednesday many of the market leaders were quoted at their highest prices for the year, with Woolworth at 75s. 9d., "Gussies" at 79s. 9d. and Ford at 56s. 6d. Engineering and capital equipment shares had been strong before the Budget and after it went ahead still further with Alfred Herbert, the machine tool manufacturers gaining 6s. (to 115s.) on Wednesday. When the market opened on Thursday ICI, which has a large capital development programme in front of it, put on 4s. 6d.

Cinema shares improved a little in response to the cut in entertainment duty and then slipped back to close with hardly any change on balance. In the shipping P. & O. climbed to a new peak in anticipation of the forthcoming dividend but Liner Holdings were marked down on disappointment with the latest dividend. English Electric and George Wimpey were marked up on the news of the Turkish contract. Hector Powe rose 3s. 9½d. to 8s. 0½d. in response to the bid from Hope Brothers for the shares. Bradford Dyers gained another 2s. 9d. (to 37s. 9d.) after the announcement of the scrip issue. One of the few issues to fall in this strong market, which included oils and to a lesser extent Kaffirs, was Thomas Tilling which were marked down on the repetition of the dividend.

(1) Petroleum production in Canada in 1938 includes natural gasoline. Annual figures of electricity production in Australia are for 12 months ended June 30th of year stated and for New Zealand 12 months beginning April 1st; monthly figures for New Zealand represent about 87 per cent of total generation. (2) Copper and tin refer to metal production. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct tax s

Financial Statistics

EXCHEQUER RETURNS

For the eleven days ended March 31st, there was an "above-line" deficit (after allowing for Sinking Funds) of £51,770,000 compared with a deficit of £68,768,000 in the previous week and a deficit of £78,301,000 in the corresponding period of last year bringing the cumulative surplus to £93,638,000 (£88,124,000 in 1952-53). There was a net "below-line" receipt of £44,217,000 which brought the total cumulative deficit to £285,586,000 (£435,694,000 in 1952-53).

* In consequence of official purchases of tender bills in connection with cash subscriptions to the Exchequer Stock issued in October, it was impossible to calculate the division between tap and tender bills until all the bills purchased had passed their original maturity date.

THE MONEY MARKET

CREDIT continued generally short in Lombard Street in the week covered by the Bank return, though active intervention by the authorities saved the market from a repetition of the previous week's penalty borrowing at the Bank. Before the week-end considerable official purchases were made directly as well as indirectly through the banks; though on Saturday there was a sharp turn-round to a marked credit surplus; balances were offered down to 1 per cent and remained unlent. In the first three days of this week conditions tightened again, but official help on a significant scale was needed only on Tuesday.

The market maintained its bid at £99 9s. 5d. at last week's Treasury bill tender, despite the stringency of the preceding days. Total applications for the £270 million of bills offered dropped by £6 million to £399 million, so that the market's allotment rose from 52 to 58 per cent.

In the bullion market strong demand from the Continent forced the price at the fixing steadily upward during the week (as is shown in the table below). The peak price of 248s. 11½d. was reached after Wednesday's fixing, but by the close dealings were back at 248s. 10½d.

The Bank return shows a pre-Easter outflow of notes of £15.3 million. Public accounts more than reversed the previous week's exceptional increase and fell back by £17.3 million to £13.3 million and bankers' deposits increased from their exceptionally low level of £262.7 million to £284 million.

COMPANY MEETINGS

THE BRADFORD DYERS' ASSOCIATION LIMITED

SATISFACTORY RESULTS : EXPECTATIONS REALISED

PROGRESS OF OVERSEAS SUBSIDIARIES

MR JAMES EWING'S SPEECH

The fifty-sixth annual general meeting of *The Bradford Dyers' Association Limited* was held on April 6th at the Midland Hotel, Bradford.

Mr James Ewing (the chairman), who presided, in the course of his speech said:

The trading results of our home branches in 1953 were maintained at a satisfactory level and fulfilled the expectations indicated at our meeting a year ago. We were then emerging from the textile depression of 1951-1952 and, with few exceptions, our home branches throughout the year have been fully employed. Costs were tending to rise seriously but this influence has been partly offset by the fuller capacity working, which has enabled us to meet the increasing costs without raising our prices. The prices for our services are regulated by our trade federations and are compiled after an examination by independent accountants of the costs of production of the main producers. There is no room for speculative prices in a service industry like ours, nor can we recoup ourselves if volume of yardage falls below the accepted level of activity upon which the price lists are determined. Whether they are considered in the light of their relationship to capital employed or on the basis of profit margins per yard, our prices are reasonable and fair and bear favourable comparison with charges for similar services in other large textile producing countries with which our customers have to compete. The dyeing charge rarely exceeds 5 per cent of the retail sales price of a garment, whether it be rayon, cotton or wool.

Our foreign subsidiary companies have been well employed but, owing to keener competition, the trading results are down compared with the previous year. Having regard to the circumstances prevailing in these markets, *the results are on the whole* satisfactory.

For the first quarter of this year our orders in the United Kingdom have been well maintained, although they are not quite up to the level of last year. The rayon and synthetic markets have increased in volume and orders in higher qualities of cottons are encouraging. There has been a definite fall in the wool section, but I believe this is only a temporary recession. It is difficult to forecast the future, but there is no visible sign of any immediate marked falling off in business. But as 40 per cent of our UK branches' output is for export markets we cannot ignore the effect upon international trade that any deepening of the recession in USA would have, nor the effect of the entry by Germany and Japan, not to mention India, into these markets.

BALANCE SHEET AND ACCOUNTS

The trading profits of our branches and subsidiary companies in this country show a substantial recovery from the recession which affected the previous year and are less than 5 per cent below the record figures of the year 1951. The overseas subsidiaries have had more difficult conditions to contend with and, in consequence, their trading profits show a decrease of almost 30 per cent on the previous year. Total trading profits are £2,397,520, an increase of £280,555.

After providing for depreciation, taxation and other charges, and deducting minority interests and profits retained by subsidiaries, there remains £552,191, which is the net profit for the year available to the parent company and which is more by £284,051 than the corresponding figure for last year and only about £17,000 less than for 1951.

As a result of a final settlement of our liabilities in respect of the old Excess Profits Tax and of Profits Tax for previous years, we have been able to restore to our profit and loss account £260,000 from taxation reserves. *Adding £160,501 brought forward* from last year, a total of £972,692 is available for appropriation.

While the outlook of our overseas subsidiaries is by no means discouraging, the board consider that, in present circumstances, the reserves of the subsidiaries should be maintained intact, and the item "intangible assets" eliminated from our consolidated balance sheet. The taxation of £260,000 over-provided in past years and now brought back, with an additional amount of £140,000 from the year's profits, has been applied in reduction of the book value of our investments in subsidiary companies. We consider that these investments now stand in our books at an adequately conservative *figure and that we are in a strong position to* meet any difficulties if they arise.

You will be asked to approve a provision of £50,000 for pensions. This is on account of the capital liability in respect of cost-of-living allowances to pensioners, pensions to female employees and other superannuation commitments which are not covered by annual contributions.

OVERSEAS COMPANIES

BEIDA DYERS, SAE, EGYPT

We regret to announce that in June last the chairman of Beida Dyers, Mr Elias Andraus, died in London. The company was most fortunate in being able to call upon Mr Abdel Maksud Ahmed to succeed Mr Andraus as chairman. Mr Maksud is a leading industrialist in Egypt and is chairman and managing director of the Misr Bank and other companies with which our company is closely allied.

We are pleased to report a successful year's trading on the part of the company. Its total production for the year ended September 30, 1953, was no less than 76 million yards, well up to the level of the previous year. This was no mean achievement, having regard to the difficult economic conditions prevailing in Egypt. We express our appreciation of the outstanding services rendered to the company by the staff and of the co-operation afforded to us by Beida Dyers' sister company at Kafr el Dawar.

In November last, Mr Holt and I visited Egypt. We met the Minister of Commerce and the Minister of Finance, and were privileged to have a special interview with the President, General Neguib. We discussed our project in Alexandria and our objectives with these gentlemen and received assurances that our enterprise was very favourably regarded by them and that they welcomed our assistance in promoting a sound industry, based upon Egypt's own raw material. Naturally, the political changes in that country cause us some uneasiness, but we believe that the Egyptian Government is fully alive to the necessity of encouraging foreign assistance in developing secondary industries.

BRADFORD DYEING ASSOCIATION (USA)

BDA (USA) has been able to maintain reasonably full employment during the past year for its workpeople and plant. With its fine quality work in shrunk finishes under the "Rigmel" trade mark, it has kept its place in the forefront of cotton goods finishers and progress has been made with other speciality finishes such as crease-resist and stabilised effects. A large volume of goods for the Defence Programme was processed, but this business is now tapering off. With the falling off of business in the second half of the year, the company had to meet very severe price competition and profit margins suffered accordingly. Clothing stores too are one part of the retail trade which is having poor sales experience and replacement orders are, therefore, not coming forward to the producers of textiles.

BRADFORD DYEING ASSOCIATION (CANADA) LIMITED, MONTREAL

DOMINION SILK DYEING AND FINISHING COMPANY LIMITED

DOMINION SILK PRINTING LIMITED, DRUMMONDVILLE AND MONTREAL CANADA

The textile industry of Canada has had a difficult time during the past year and our subsidiary companies in that country have been no exception. *Our wool branch has* continued to show losses, due to a drastic fall in goods available for dyeing and finishing. On the other hand, our rayon interests have weathered the storm satisfactorily despite the very marked reduction in yardage available to them for finishing. This adverse state of affairs is mainly due to heavy imports from USA and the United Kingdom. Textile manufacturing is the one big industry in Canada which has failed to share in the general prosperity of that country.

We are confident that in this great and growing country there is room for British enterprise.

Early in January this year we completed negotiations for the acquisition of the remaining 35 per cent interest in the Dominion Dyeing and Printing Companies. An offer was made to the stockholders on the basis of book value as disclosed in the audited accounts and balance sheets. We are now taking steps to consolidate the three companies into one and this will enable us to effect economies in operation. Our plans are to develop all sections of the business, mainly

based on our wider experience in the United Kingdom. Although we do not expect immediate large returns on our investment, we are confident that in years to come the investment will prove invaluable, not only in this country's general interest but also to our stockholders.

DAVIES, COOP AND COMPANY, LIMITED, AUSTRALIA

We have to report that under the terms of our agreement with Davies, Coop and Company, Limited, Melbourne, steady progress is being made to achieve our joint objective. Technologists from branches in this country are now working in Australia as members of the Davies, Coop staff.

The new dyeworks at Footscray, Melbourne, is now in process of erection. If the programme is adhered to (and we can foresee no difficulty), machinery will be installed during the months of July, August and September, by which time it is hoped that some production will have started. Full production should be reached early in 1955.

This works is being equipped to process fabrics made from cottons, rayons and synthetics, to the high standards with which BDA is associated throughout the textile world.

THE MERCHANDISE MARKS ACT, 1953

The introduction of the new Merchandise Marks Act of 1953, which involves all those who are engaged in trade in a responsibility for protecting the public from false or misleading descriptions, not only as in the past of origin or material content but now also of quality or behaviour, places an even greater emphasis than heretofore upon trade marks and upon the qualities associated with them.

The finisher's trade mark identifies the finisher with the qualities for which he is responsible. Because they are synonymous with high standards of finishing, the BDA trade marks are extensively used at home and abroad on fabrics and garments.

The new Act probably impinges most directly upon the operations of the retailer and it should be welcomed by him as a means of increasing his reliance upon the claims which his suppliers make for the goods which he handles. Where, as they so often must, these claims include finishing qualities which affect the fitness for purpose of the fabric, BDA trade marks will assume an ever-increasing importance because both the supplier and the retailer may have confidence in the qualities which they identify.

TRADE FEDERATIONS

The Piece Dyeing Industry is well served by its trade federations, which are gradually extending the scope of their objectives in maintaining still higher standards of production and in collaborating with the other sections of the industry. No one today questions the absolute necessity for combined action by producers through their trade federations, which are now an integral part of modern industrialism. A very definite lead in this direction has been recently given by the Government in the Constitution of the British Iron and Steel Board. Whilst the problems of the steel industry are not quite analogous to those of our trade, I venture to suggest that in the new steel board there is an example of a modern type of trade federation which might be copied by the larger industries, in particular our own. It has the advantage of meeting Government requirements, whilst at the same time giving adequate protection to the community, without interfering with the day to day regulation and direction of the industry.

The report and accounts were adopted.

TELEPHONE & GENERAL TRUST LIMITED

WELL-ESTABLISHED LEVEL OF EARNINGS

CAPITAL INCREASE AND BONUS ISSUE PROPOSALS

The twenty-eighth annual general meeting of the Telephone & General Trust Limited will be held on April 27th in London.

The following is an extract from the circulated statement of the chairman, Sir Alexander Roger, KCIE:

The profit of £104,820 which is arrived at after charging taxation shows an increase of £14,631.

The well-established level of earnings and the strength of the reserves built up since 1926, backed by the value of our investments, enable your directors to recommend an increase in the ordinary dividend. We have, therefore, provided for a final dividend of 7 per cent, making 10 per cent for the year on the £1 million of ordinary stock, together with 10 per cent on the "A" ordinary stock.

After providing also for the 7 per cent preference dividend, the carry forward amounts to £110,659 against the adjusted balance of £102,671 brought in.

In addition to the proposed increase in the rate of ordinary and "A" ordinary dividend we are proposing, subject to Treasury consent, to make a bonus issue from capital reserve of one new ordinary share of £1 fully paid for each £10 of ordinary or "A" ordinary stock held.

This requires an increase in capital of £110,000 beyond the £1 million of ordinary stock already authorised and issued. Your directors propose, however, that the authorised ordinary capital be increased by £600,000 to a total of £1,600,000 in order that they may be in a position to make further issues if and when necessary for the economic and proper performance of our operational and investment functions.

Capital reserve has been increased to £450,000 by the transfer of £83,000 from investment suspense account. In addition we have revenue reserves amounting to £340,659.

The valuation of £2,667,095 for quoted general investments represents an appreciation of £1,356,895 on the net book cost of £1,310,200.

GROUP ACCOUNTS

The group reserves total £1,243,919 and show an increase of £142,971 over the previous year.

The net assets of telephone operating and servicing subsidiary companies at £3,337,280 have increased by £485,580 after writing off £15,029 balance of hurricane damage expenditure—an effective increase of £500,609 in these net assets.

PORTUGAL

In 1927 the Trust obtained a substantial share investment in The Anglo-Portuguese Telephone Company and has since then remained closely associated with it.

The company is now engaged on a new and intensive expansion and development programme whereby it is hoped that before the close of 1957 the waiting list will be insignificant. The unceasing demand, however, is a measure of the healthy business which lies before the company.

Because of the broad vision of the Portuguese Government and its determination to modernise and organise its industries at home and overseas to the great advantage of its national economy, I am of the firm belief that Portugal continues to offer an attractive field for our investment.

WEST INDIES

The expansion and development of the three telephone companies in the West Indies goes on apace. In this they have the full financial and technical support of the Trust and its servicing company of consulting engineers and commercial advisers—Telephone and Associated Services, Limited—and of our associated manufacturing companies.

TELEPHONES AND THE TRUST'S INVESTMENTS

Much time and thought is devoted by the directors and executives of the Trust to its investment policy. Our general investment portfolio of market securities which has been carefully built up over the years is, of course, pre-eminent in these studies. Linked with this, too, is the company's policy in relation to the several overseas telephone undertakings in which we have an especial interest. We believe that telephones are a good investment. Indeed, as the Trust's name indicates, we have from its inception had substantial interests in this field of public utility. The steady returns we have received from participation in telephone companies have done much to provide the strength by which the Trust has progressed over the 28 years of its existence—borne out today by the asset value of the Trust's ordinary shares.

The Trust's association with the manufacturers of telephone equipment and cables, together with the consulting service offered by our engineering subsidiary, Telephone and Associated Services, means that we have within the Trust group a unique organisation covering the complete financing, construction and operation of the most modern telephone systems. This organisation has not been built up without a great deal of hard work on the part of all those connected with the Trust, and I envisage for it a future which I feel will adequately compensate for the great efforts which have gone into its making.

Friends who know our kind of business often ask me if there is any saturation point for telephone development, and I tell them that like most other things this matter is governed largely by economic considerations. It is, however, a matter of fact that nowhere does telecommunication demand seem to abate. Ten-year development plans drawn up by our engineers may become out-dated by unforeseen demand for telephone service. Better education and improved social standards the world over have led to the demand for telephone service in most homes being on a par with that for the radio and the television set. Modern living conditions obviously necessitate first-class telephone service, and the greater the number enjoying the service the greater the facilities for all subscribers.

From the foregoing you will appreciate that my confidence in this kind of public utility investing is quite undiminished, offering as it does security, a steady return and public service which is today appreciated to the full.

EQUITY & LAW LIFE ASSURANCE SOCIETY

INTERIM BONUS RATES REPEATED

INVESTMENT POLICY

SIR RICHARD HOPKINS'S SPEECH

The annual general meeting of Equity & Law Life Assurance Society was held on April 7th at the Chartered Auctioneers' and Estate Agents' Institute, 29 Lincoln's Inn Fields, London.

The Rt Hon Sir Richard Hopkins, PC, GCB, the chairman, who presided, said:

Gentlemen,—I rise to move: "That the report and accounts for the year ended December 31, 1953, be received and adopted and entered on the Minutes." These have been in your hands for several days and I assume may be taken as read.

My first duty today is a sad one, namely to refer to the death of our old colleague, William MacColin Kirkpatrick. Mr Kirkpatrick joined the Board of the Society in 1941 during the darkest days of the war, and for 13 years was most regular in his attendance at our meetings. In fact, until his last illness he was never absent owing to ill-health—we shall miss him greatly.

The first subject in the report and accounts with which I wish to deal is new business. Since the war we have rebuilt our new business-getting organisation, and the fruits of this rebuilding are shown in the figures for 1953. Within those figures there is one with which we are particularly pleased, namely new with-profit sums assured amounting to over £5 million (net).

VALUATION SURPLUS

And now the results for 1953, the first year of our new triennium. First, you will see that we are again paying interim bonuses at the same high rates as we declared at the end of 1952. You will be glad to know that the actuarial valuation which we make each year for our own internal purposes disclosed a surplus sufficient to maintain these rates with a satisfactory margin to spare. Next, the three main factors on which we rely to provide surplus—interest, mortality and expenses. The gross rate of interest rose from £5 13s. 6d. per cent per annum in 1952 (ignoring the windfall due to the liquidation of Equity & Law Investment Trust Limited) to £5 16s. 8d. during 1953. It appears to us that this higher rate of interest should at least be maintained during 1954. I would, however, draw your attention to the fact that the general rate of interest has now been falling for nearly two years and to the steady rise which is taking place in the Society's funds—£2,500,000 in 1953. The investment of a considerable amount of new money each year must necessarily affect the rate of interest which we earn on our funds.

As to mortality, we again received a substantial contribution to surplus from our life assurance policies, but the annuitant mortality experienced was very close to that which we expected.

EXPENSES OF MANAGEMENT

There are many methods by which the expenses of management of a life assurance office can be measured—one method is to express them as a proportion of the funds. It is a severe test when an organisation is expanding, since in the initial phases the expenses increase more rapidly than the funds. You will be interested to know that while this test showed our expenses of management to be increasing more rapidly than our funds during the first few years after the war, little or no relative increase has taken place during the last two years.

Before I leave the report and accounts there is one other matter on which I wish to comment, namely the margin which exists between the market values of our assets and the values at which they appear in the balance sheet. This margin is now very substantial and is, of course, due in part to the rise in security values caused by the fall in the general rate of interest to which I have already referred.

INVESTMENT POLICY

And now a word about the policy which we pursue with our investments. It is sometimes implied that institutional investors are backward in providing capital for industry, especially risk capital, and I wish to rebut such a suggestion most strongly. We seek—and this is especially true of our investments in ordinary shares—to invest in progressive and remunerative industries and to support such new issues of capital as are made from time to time. This seems to us to be the very essence of the national interest in that we direct the savings of our policyholders into worthwhile enterprise.

It cannot be stated too often that the life assurance funds of this country represent the savings of hundreds of thousands—of millions—of policyholders; they are held in a sense of trust to enable the claims of policyholders and annuitants to be met as and when they arise. They are invested in a wide spread of assets—as shown in the balance sheet in your hands—to the benefit of all concerned.

COMPETITIVE POWER ESTABLISHED

The triennium upon which we have now entered marks the successful end of the phase of rebuilding our organisation after the war and the establishing of our competitive power in obtaining new business—both these aims have been excellently accomplished. We have begun the next phase by devising a novel group pension scheme which we call the "Equity Pension Scheme." The distinguishing feature is that it introduces into this type of contract the element which, in the time-honoured language of the insurance world, is called the with-profit element, but which might perhaps be equally called the profit-sharing or bonus element. Although we are not alone in entering this field, we are glad to be among the leaders in advocating this development for, if it attains the acceptance which we hope, it will introduce into this important and growing class of insurance a degree of flexibility which it has so far lacked.

MILLARD TUCKER REPORT

Recently we have turned our thoughts to the "Report of the Committee on the Taxation Treatment of Provisions for Retirement," generally known as the Millard Tucker (No. 2) Report. The Chancellor has said that this year he does not propose any change in this part of the income tax system, but doubtless, in due course the Government will indicate their intentions regarding the far-reaching suggestions made concerning annuities, pension funds and self-employed persons. As regards pension schemes as we understand them today—that is schemes effected by employers for employees—the Equity Pension Scheme was deliberately devised in such a form that it could change with the times. In any event, however, I would emphasise this—the traditional forms of life assurance, whole life assurances and endowment assurances, will always have a most important part to play.

I would particularly like to welcome today our branch managers, members of our branch staff, and also some of our agents. In these changing times many new and intricate problems require to be solved, not only at head office, but by those who have to expound new ideas to the general public. We are confident that both our head office staff and our branch organisation are equal to these tasks.

TRIBUTE TO MANAGEMENT AND STAFF

The surplus earning capacity of the Society continues to be very satisfactory. Our bonus more than bears comparison with that of any other office, and I think that those who have effected with-profit policies with us will agree that the phrase first used by Sir Geoffrey Ellis from this chair six years ago—"outstanding value in life assurance"—is being fully justified.

The Society continues to owe a great debt of gratitude to its general manager, Mr R. J. Kirton. During the last year Mr Kirton has added materially to the range of his responsibilities. He has done so without in the least impairing the watchful and experienced skill with which he handles the various problems thrown up by a Society such as this.

I wish to close these remarks by offering my thanks to the Society's staff for a good year's work and, in particular, for the way in which they are dealing with the increased volume of business.

The report and accounts were unanimously adopted.

JOHN HOLT & CO. (LIVERPOOL) LIMITED

HIGH LEVEL OF TURNOVER MAINTAINED

The fifty-seventh annual general meeting of John Holt & Company (Liverpool) Limited will be held on April 23rd in Liverpool.

The following is an extract from the circulated statement of the chairman, Mr John A. Holt:

Although trading conditions in West Africa continue to be difficult, there was an overall improvement in the profit margins during the last few months of the financial year. Turnover continued at a high level and again the figure of £23 million, which was recorded in the previous year, has been exceeded.

At the close of the year our stocks throughout West Africa were in a sound and clean condition, and we are ready to meet the competition which faces us during the next few years. All our high-costed stocks have been sold and our textiles trade is once more making a contribution to our profits.

For the greater part of the year, produce markets have remained steady, with only minor fluctuations. The exception is cocoa.

We continue to act as Licensed Buying Agents for the Produce Marketing Boards in both Nigeria and the Gold Coast. Our trade in other produce continues to be satisfactory, and makes a useful contribution to our revenue.

In the Gold Coast and Nigeria, authoritative statements have been made by both Governments, which show clearly that they recognise that the future development of those countries depends largely upon the extent to which capital can be attracted from overseas.

The profits of The Guinea Gulf Line, Limited (formerly John Holt Line, Limited), have been put to reserve in order to build up the funds necessary to finance the replacement of its steamers in due course. We cannot, therefore, reasonably expect a dividend from this Subsidiary until its own financial status is assured.

NATIONAL PROVIDENT INSTITUTION FOR MUTUAL LIFE ASSURANCE

INCREASED INTERIM BONUS RATES

The annual meeting of the National Provident Institution for Mutual Life Assurance will be held on April 13th at 48 Gracechurch Street, London, E.C.3.

The following are extracts from the address which will be submitted by the chairman, Mr L. E. D. Bevan:

At the conclusion of the annual general meeting last year, Mr Vincent Wodehouse Yorke retired from the chairmanship after serving ten years in this capacity.

At that time and since, we have endeavoured to assure Mr Yorke how greatly we valued all he has done for the institution. I myself eagerly take this opportunity of expressing my gratitude to Mr Yorke, and I am indeed glad to be able to count upon his willingness to extend to me the benefit of his great experience.

Before I pass to the review of the past year's affairs it gives me special pleasure to tell you that our manager and actuary, Mr J. F. Bunford, has been elected president of the Institute of Actuaries. This is the highest honour that his profession has to offer.

Last year the net business was not greatly short of £5 million and it is satisfactory to observe that business in connection with pension schemes continues to account for some 20 per cent of the total.

Our funds—representing life assurance and annuity contracts—increased by more than £1,500,000 and passed the £20 million mark during 1953.

The result of investment policy over the years you may see reflected in the very satisfactory rates of interest which we show—namely, £6 6s. 3d. per cent gross and £4 15s. per cent net of tax. Even allowing for the fact that these rates are calculated on funds represented by assets standing well below their market value, they are undoubtedly outstanding rates in the life assurance world.

During the past year we have invested about £600,000 in British Government stocks, about £200,000 in Commonwealth stock, and about £1,200,000 in debentures and preference and guaranteed stocks. Moreover, we have increased our interest in real property either by purchase or by mortgage to the extent of nearly £250,000. Movements from class to class have caused reductions in some categories, for example, in foreign Government securities and home corporation loans. There has also been a slight reduction in our total investment in ordinary shares, and I would like you to know that we have in fact made considerable changes within this class during the year. Our interests in ordinary shares are widely spread.

USE OF POLICYHOLDERS' SAVINGS

You have been told by Mr Yorke in recent years of the active and enterprising policy which we try to follow in the investment of your funds, seeking as good an income as possible while preserving the security of capital. The "turnover" of ordinary shares last year illustrates well our endeavours to anticipate market changes and our constant search for "betterment" of the portfolio.

I have drawn attention to these matters because I think they are important to our own members and, indeed, to a wider public. The comments that I have made about our own investment policy and the beneficial use of policyholders' funds apply with equal force, I feel sure, to the practice of other life offices, although different offices naturally develop their policy in different ways. The factor that is certainly common to all offices is that while their first concern is to invest policyholders' funds for the security and benefit of the policyholders, investments are made with the national interest and the Commonwealth economy well in mind.

INTERIM BONUS RATES

You will have learnt with pleasure of your directors' decision to increase the rates of interim bonus on policies becoming claims by death or maturity on and after February 1, 1954, after reviewing the results of our operations for 1952 and 1953. Our mortality has been favourable and our expense ratio satisfactory, while the interest rate earned on the funds has exceeded 6 per cent gross in each of the past three years.

The new interim bonus rates represent increases of 5s. to 7s. 6d. per cent per annum over those previously ruling, so that the rates on full-profit policies become—

For whole-life assurances £2 17s. 6d. per cent per annum—with even higher rates for certain policies of long duration.

For endowment assurances £2 per cent to £2 15s. per cent per annum—according to the age at maturity.

Our profit-earning capacity has been enhanced by our policy of investing part of the funds in ordinary shares.

I am absolutely sure that those who contend—as some do, on political grounds—that the investment of life assurance funds should be under the control of some central state body are entirely overlooking the great benefits that come to policyholders through the sense of personal responsibility for their interests which lies firmly on the shoulders of directors and managers of the individual offices. I am convinced that under any form of state control an entirely different balance of responsibilities would apply, and it is difficult to see how it could be to the advantage of policyholders.

I would add one final word on this subject. Let no one talk of "wealthy insurance companies" as some are apt to do when speaking of the large life funds of insurance offices. These funds are, in effect, held in trust for millions of policyholders, and represent part of their savings—in many cases quite a large part.

The position of your office as I see it today is extremely sound. There is a comfortable margin between the market value of the assets and the figures at which they appear in the balance sheet. The excellent rates of interim bonus that we have recently announced are an indication of our confidence in the financial strength of the institution.

VINE PRODUCTS LIMITED

INCREASED DEMAND FOR VP WINES

The twenty-eighth ordinary general meeting of Vine Products Limited was held on April 2nd at Surbiton, Surrey.

Mr A. Mitsotakis, chairman and managing director, in the course of his speech, said: Lord Marchwood has been compelled, through ill-health, to resign from the chairmanship and the board of the company. I am sure I shall be voicing the general feeling if I place on record our deep regret at his resignation.

For many years now, we have been able to report uninterrupted progress in the expansion of the trade carried on by the company. This is due to the continued favour of the public which recognises the pre-eminent quality of our products, and I must add that our sales in the memorable year of 1953 have certainly been helped by the Coronation.

An increased rate of dividend on the ordinary capital is recommended in place of the previous distributions from capital profits. I venture to think that stockholders will consider this a satisfactory substitution. The capital reserves thus remain at the same figure as last year—i.e., £252,793.

The consolidated balance sheet discloses that the already strong position of the company has been enhanced by the increase of £112,387 in the total capital and reserves of the company.

The net profit, before taxation, is £47,094 higher than last year. It is gratifying to record that, although costs generally have risen, the increasing demand for your company's products this year has considerably more than offset these charges. I hope that you will consider the accounts as very satisfactory.

This home industry has reached its present success and pre-eminent position because it fills a long-felt want by providing the less affluent members of the community with good sound wines at reasonable prices.

In addition, we believe that it is now widely recognised that the British wine industry deserves support because it assists the aims of British economy in many directions, as, for instance, by contributing in both direct and indirect forms of taxation; by employing British labour and capital and by a progressively increasing export trade. In this belief we should feel confident about the future.

The report was adopted.

	Years to Dec. 31,	
CONSOLIDATED EARNINGS:—	1952 £	1953 £
Trading profit	537,619	585,886
Total income	551,358	601,224
Depreciation	34,447	37,235
Taxation	202,167	214,565
NET PROFIT	313,161	347,857
Ordinary dividends	161,350	207,450
Ordinary dividends (per cent)	17½*	22½
General reserve	100,000	50,000
Added to carry forward	35,811	74,407
CONSOLIDATED BALANCE SHEET:—		
Fixed assets, *less* depreciation	293,695	306,465
Trade investments	7,193	29,688
Net current assets	2,274,489	2,373,413
Stocks	1,281,362	1,256,523
Cash & gilt-edged stocks	800,580	890,070
Capital reserves	252,793	252,793
Revenue reserves	973,947	1,086,334
Ordinary capital	922,000	922,000

* In addition, shareholders received a tax free distribution of 2½ per cent arising from the realisation of shares in an associated company.

BANK OF SCOTLAND

PROGRESS TOWARDS COMPLETE UNIFICATION

LORD ELPHINSTONE ON AMALGAMATED BANKS' RESULTS

The annual general meeting of the proprietors of the Bank of Scotland was held on April 6th, within the head office, Edinburgh. The Right Honourable Lord Elphinstone, KT, governor of the bank, presided and in the course of his speech, said:

During the past year further progress has been made towards complete unification of the bank and the Union Bank of Scotland, Limited.

It is not yet possible to state definitely the date at which fusion of the banks will be finally achieved as this depends on factors outwith our control. I can, however, say that the directors of both banks are unanimously agreed that it should be accomplished as expeditiously as legal and Parliamentary procedure will permit.

BALANCE SHEET

Dealing first with the bank's balance sheet it will be observed that deposits are some £6 million greater and the total of over £99,400,000 is the highest recorded at balance sheet date in the bank's long history.

The consolidated balance sheet is designed to present the combined bank's position on the same basis as it will appear after the fusion of the banks has been accomplished. Total assets are in excess of £210 million, and against liabilities to the public amounting to over £201 million there is held in cash balances with other banks, money at call, et cetera, an amount representing over 33⅓ per cent of such liabilities. The combined investments of the banks, the great bulk of which are in British Government securities, amount to over £95,600,000 and their market value is in excess of that figure. Advances total £37,800,000 and obligations undertaken on behalf of customers amount to over £8,850,000.

I wish to refer to the decision of the directors to recommend that the dividend for the year be increased by 1 per cent to 13 per cent by the payment of a final dividend of 7 per cent. The former rate of 12 per cent was established when the bank's capital was reorganised in 1938. It was reduced on the outbreak of war to 11 per cent and re-established five years later in 1945 at 12 per cent. The modest increase now proposed is little more than token recognition of the change in the value of money which has occurred in the past fifteen years and the directors feel that their proposal is well justified from every aspect.

The directors' report deals this year with the combined profits of the two banks but it should be noted that the profits of the Union Bank included are only for a period of approximately eleven months.

The combined net profits on this basis after provision for taxation, contingencies and all known bad and doubtful debts amount to £578,587. Of this amount there has been retained by the Union Bank £115,986, leaving £462,601, to which is added the balance brought forward of £185,460, making available £648,061. From this there has been transferred to reserve for contingencies £100,000 and staff pension fund £40,000, leaving £508,061.

The interim dividend of 6 per cent actual less income tax required £148,500 and the final dividend of 7 per cent actual less income tax now recommended will require £173,250, together £321,750, leaving a balance carried forward by the Bank of Scotland of £186,311, to which falls to be added the balance carried forward by the Union Bank of £65,629, making a combined balance carried forward of £251,940.

I trust you will have found these results and decisions satisfactory.

While the future is not free from uncertainty we can look back on a year of solid achievement in Britain's economic recovery. Given continued political stability and some incentive to greater productivity by further taxation reliefs another stage in the long road back to economic freedom may be possible in the year that lies ahead.

CONDITIONS IN SCOTLAND

In Scotland the past year has been more prosperous in nearly every field of business enterprise. Unemployment figures have fallen and there has been a recovery in the textile trade. The importance of Scottish textiles in export markets continues to grow and the distilling trade has achieved a new record in exported output. The production of steel has again reached a new record and supplies to industry have been more nearly approaching requirements though in some special grades there is still a shortage. It is a source of satisfaction to note that there has been marked development in the lighter engineering industry and in several districts modern works are now engaged in producing machines of a type which were previously imported. The coal mining industry, however, presents a less satisfactory position. Production has again lagged behind anticipated results and the future is not free from the danger of a coal shortage developing.

The volume of support which the bank accords to the farming community and the agricultural industry as a whole continues to be extensive.

The report was adopted.

JAS. WILLIAMSON & SON, LIMITED

BETTER TRADING CONDITIONS

RECOVERY IN NET PROFIT

LORD PEEL'S STATEMENT

The annual general meeting of Jas. Williamson & Son, Limited, was held on April 2nd at Lancaster. The Rt Hon The Earl Peel (chairman of the company) presiding.

The secretary (Mr L. Beswick) read the notice convening the meeting and Mr R. W. Gorman, FCA, of Messrs Viney, Price & Goodyear, read the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 24, 1953, and was taken as read:

Those of you who have been shareholders for more than one year will notice that we are this year presenting our accounts to you in a new form. We have made this change not because the narrative form has now become more usual but because we feel that it presents the accounts more clearly.

INCREASED VALUE OF TURNOVER

You will see from the accounts that our net profit, which fell to £242,107 in 1952, has recovered in 1953 to £615,652. The profits in 1952 were reduced largely by what I regard as an exceptionally steep fall in market values, but the greater part of the increase in net profit in 1953 is due to generally better trading conditions. The selling prices of all our main products were substantially reduced at the end of 1952 and the beginning of 1953, and in spite of this we succeeded in increasing the value of our turnover and maintaining our large export trade. Australia, which has traditionally been an important market for both linoleum and table oilcloth, returned to more normal trading conditions, but the extra business which we were able to do there was unfortunately largely counter-balanced by restrictions in other traditional markets such as Brazil and Turkey.

In the course of the year we put on the market a range of printed plastic table covering which, together with plastic floorcovering, considerably widens our scope for development. Our Crestaline vinyl floorcovering which we introduced to the market a few years ago has until now only been manufactured in small quantities, but it has already established for itself a high reputation.

CRUSHING BURDEN OF TAXATION

In our production generally we are now beginning to feel the benefit of the money spent on development during the last few years, and it is our intention to continue this policy so far as we are permitted by the crushing burden of taxation. It is difficult to reconcile the rates of taxation since the war, which almost inevitably operate against savings and investment—whether by companies or individuals—with the current cries for greater productivity which can only be achieved by the creation of a greater incentive. A substantial reduction in direct taxation is the most certain way of creating that incentive.

Last year I spoke of the high cost of replacements and modernisation of plant. These costs continue to rise and your directors recommend the addition of £85,000 to plant replacement reserve—bringing the total provided for this purpose to £650,000. They also recommend the elimination of the stock depreciation reserve by transferring the balance of £50,000 together with a further addition from profits of £50,000, making £100,000 in all, to general reserve. The general reserve now amounts to £800,000 available to meet any future contingency.

PURCHASE OF RAW MATERIALS

We welcome the return of freedom to purchase our own raw materials in the open market but we must remember that this may make it necessary to hold and to finance larger stocks.

Since the company was converted from a private one to a public one in 1947, dividends have been maintained at 10 per cent, less tax, except for 1952 when the rate was dropped to 7½ per cent. Your directors feel that advantage should now be taken of the improved results and recommend the payment of a final dividend of 10 per cent, less tax, which, with the interim dividend of 2½ per cent, already paid, will make a total of 12½ per cent, less tax, for the year.

TRIBUTE TO EMPLOYEES

We have recently lost by retirement twenty-two employees who between them had served the company for 989 years, and I mention this because the loyalty expressed in those figures is not uncommon in your company, either among the staff or hourly-paid workers. I would like to thank all who have served us so well in the past year and who have helped to secure the results which have been achieved.

The report and accounts were adopted and the dividend as recommended was approved.

The retiring directors, Mr J. A. Black and Sir Cuthbert B. Clegg, were re-elected, and, the remuneration of the auditors, Messrs Viney, Price & Goodyear, having been fixed, the proceedings terminated.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

WIDER INVESTMENT POWERS SOUGHT

The one hundred and thirteenth annual general meeting was held on April 6, 1954, Mr A. H. Sayer, MC, JP, the Society's chairman, in the chair.

The chairman, in moving the adoption of the reports, said: In the Ordinary Department the Society issued policies of a total sum assured of £3,947,000, which is a record and £439,000 greater than the total for the year 1952. The premium income amounted to £3,927,000, an increase of £149,000. The total gross interest income increased by £69,000 to £1,136,000, equivalent to a rate of interest earned of £4 8s. 4d. per cent on the whole of the funds, and the net interest rate earned was £4 0s. 7d. per cent. Assets have increased during the year by over £1,250,000 and have now reached the large total of over £30 million. This money is, of course, policyholders' money which is necessarily accumulated to enable claims to be met as they fall due.

As in former years, a large part of the new funds was invested at 4½ per cent by way of advances to persons buying houses under the Society's house purchase plan. The very large amount of surplus allocated to investments reserve in 1951 and 1952 has made it unnecessary to build up the balance sheet reserves any further this year. The reserves stand at a total of £3,050,000, being 10 per cent of the assets.

ORDINARY AND INDUSTRIAL DEPARTMENTS

The liabilities under policies both in the Ordinary and Industrial Departments have been valued assuming a rate of interest of 3 per cent per annum. This is the same basis as was used at the end of 1952. But in other ways the valuations of both Departments have been strengthened, the Ordinary Department by £75,000 and the Industrial Department by £125,000.

As a consequence of improved interest earnings and favourable mortality experience, the emerging valuation surpluses have been good and the directors have declared a reversionary bonus in the Ordinary Department at the rate of 30s. per £100 sum assured.

In the Industrial Department, £70,000, as compared with £50,000 last year, has been allotted for the benefit of Industrial Department policyowners.

There are now over 130,000 policies in force in the Fire and Accident Departments. The premium income of the Departments has increased from £49,000 to over £199,000 in the past ten years. A satisfactory trading profit has been shown.

On February 24, 1954, a special general meeting of members was called to consider a Bill to amend the Society's Act of Parliament. For some time the directors had felt that the Section of the Act dealing with the powers of investment, was restrictive and contrary to the best interests of the Society.

The new Bill has as its main purpose the enlargement of the Society's powers of investment.

While seeking powers to invest in ordinary shares, the Society has no wish to obtain control of any business whatsoever. It will continue to invest policyholders' money solely in the best interests of policyholders.

It will be recalled that in 1944 the Society attempted to right the long-standing injustice that life annuities, which are composed actuarially of both capital and income, are taxed as though they were all income. In 1949, Parliament shut the door that the Society had opened, but, fortunately, the recommendations of the Millard Tucker Committee, which has recently issued its Report, come up to the highest expectations of the Society. If effect is given to them, then every person in the country may, if he or she effects a life anuity, be placed in as favourable a position as the relatively small number of persons who between November, 1948, and Budget day in 1949, took out special annuity policies with this Society.

The report and accounts were adopted.

SCOTTISH WIDOWS' FUND & LIFE ASSURANCE SOCIETY

POSTWAR RECORD OF SUSTAINED PROGRESS

The one hundred and fortieth stated annual meeting of the Society was held in the Society's head office, Edinburgh, on Tuesday, April 6, 1954, Mr Alastair C. Blair, CVO, WS (chairman of the ordinary court of directors), presiding.

In moving the adoption of the report and accounts, which were taken as read, the chairman said:

Last year the new ordinary assurance business, before deducting sums reassured with other offices, was over £10,850,000—compared with £8½ million five years ago—and this was a record for the eighth successive year. The net figure, after deducting reassurances, was also a record and exceeded £10 million for the first time in our history. In addition, although our new group pension business was on a lower level last year, the new group insurances associated with pension schemes and the additions to existing group insurances amounted to nearly £5 million and brought our total new assurance business to well over £15 million for the second successive year.

MARKED AND RAPID PROGRESS

As we are dealing today with a period of five years, it is of interest to examine the expansion of our operations in a broad way, and you may like to have some figures illustrating the growth of the Society since before the war. First, during the five years to December 31, 1953, the total net new assurance business completed, including group assurances, amounted to more than £68 million, as compared with just over £32 million in the preceding quinquennium and with under £24 million in the five years, 1934-1938, the last complete prewar quinquennium. In the second place, as a result of the large new business, our premium income, which last year was about £6½ million, is now some 90 per cent higher than it was five years ago and more than three times what it was in 1938. Thirdly, our total assurance funds, which today exceed £66 million, are nearly 50 per cent more than they were five years ago and almost double their prewar level. Your Society has thus made marked and rapid progress since prewar days and especially since the war ended.

EMINENTLY SUCCESSFUL INVESTMENT POLICY

The problems connected with the investment of the large expansion of funds in the changing economic and financial conditions of the past five years have occupied the close attention of your directors. A comparison of the balance sheets at the end of 1948 and 1953 shows that the total assets—now over £69 million—have risen by some £20 million, of which £5 million has been invested in British Government securities and more than £10 million has been added to our holdings of ordinary stocks which now represent 30 per cent of our assets. Our investments in debenture, preference and ordinary stocks, which can be regarded broadly as our stake in industry, amount in the aggregate to over £37 million—compared with £26 million five years ago and represent 54 per cent of our assets.

It is clear from these figures that savings, which have been placed with the Society to secure life assurance cover and pension provision, have not only enabled us to take up more Government securities but have helped to provide capital for industry, directly or indirectly, and have thereby rendered a valuable service to the national economy.

The investment policy we have followed as our business and funds have expanded has been eminently successful and members must be gratified to see that we have been able to show such a high average rate of interest for the year 1953 on the whole of the assurance and annuity funds—£5 13s. 9d. per cent before deducting income tax.

ASSETS IN ORDER AND FULLY SECURED

As required by the terms of our Act on the occasion of a quinquennial valuation the assets at December 31st have been carefully examined by the directors who are satisfied that they are all in order and fully secured. The stock exchange securities have been valued at market selling prices and there is a substantial margin between the aggregate market values on that stringent basis and the values at which the investments stand in the balance sheet.

SUSTAINED HIGH LEVEL OF BONUSES

Taking the assets valued on the conservative basis I have mentioned and setting against them the total liabilities valued on a basis even more stringent than was used five years ago, the result is to show a surplus which has enabled us to declare a bonus at the high rate of 40s. per cent per annum compound. This is a result which must give much satisfaction to members and, as we have fixed the rate of intermediate bonus for the time being at the same high rate of 40s. per cent per annum compound, you will see that we have confidence in the ability of the Society to maintain its long-established reputation for a sustained high level of bonuses.

It is perhaps not always fully appreciated how rapidly a compound bonus at a high rate increases as the term of the policy lengthens. For example, if a 40s. compound bonus were allotted throughout the whole duration of a policy, the bonus to be added at the end of twenty years would be at the rate of 53s. per cent per annum on the original sum assured, while at the end of 40 years the rate of new bonus on the original sum assured would be as much as 78s. per cent per annum. Of course, no one can say what bonus rates will be in the future but the Society's great financial strength, high interest earnings, favourable mortality experience and economy of management—you will note that last year our expenses were only 10¾ per cent of our premium income—are outstanding features which enable members to look forward with every confidence to the continued prosperity of our Society.

The directors' report and the accounts as audited were adopted unanimously.

BONDOR LIMITED

FURTHER IMPROVEMENT IN TURNOVER

MR JOHN GOODENDAY'S STATEMENT

The following is an extract from Mr John Goodenday's statement circulated with the report and accounts:

The more stable conditions which have prevailed in our business and in the textile industry generally are reflected in a further improvement in turnover. The cash value of sales was 6 per cent greater than in 1952, and although exports account for only a relatively small part of the total volume they were 18 per cent higher than in 1952.

The profit from trading operations in the consolidated profit and loss account amounts to £1,209,472, as compared with £1,071,594 in 1952, and the net profit available for distribution after providing for depreciation, debenture interest, taxation and other expenses amounts to £322,602, representing an increase of £36,856 as compared with the previous year. Again a heavy burden is thrown upon us due to the incidence of excess profits levy which has cost a further £128,000. This means that in the past two years we have been penalised for our enterprise to the extent of £218,000, which has had to be provided out of our net earnings for this tax.

NEW ACQUISITION

The most important event of the year under review has been the acquisition of the business of Julius Kayser (Aust.) Pty. Limited from Julius Kayser of New York. Details of this transaction were given in the circular addressed to stockholders prior to the extraordinary general meeting held on December 3, 1953, and a separate balance sheet of that company as at December 31, 1953, together with a profit and loss account in respect of the first six months' trading of their current financial year, which commenced on July 1, 1953, is included in the accounts now submitted. In the last quarter of 1953 two of your directors visited Australia and on their return provided the board with a comprehensive review of the activities and affairs of that company. Its turnover is approximately one-third that of this company and its own production facilities are evenly divided between hosiery and underwear. In addition, it markets a large volume of gloves, which are either imported or obtained from a local source of production. We are already shipping merchandise to the Australian company, and there is every reason to anticipate that this volume will increase materially in the future.

AUSTRALIAN COMPANY'S RECORD PROFIT

It is my pleasure to report that the profits of the Australian company for the first six months of their current financial year ending June 30, 1954, which amount to £135,651, after providing for £83,990 Australian taxation, are the largest ever achieved in that company's history in the first half of its financial year. It is, however, necessary to remind stockholders that the business in Australia is seasonal and that a greater volume and a higher rate of profits are achieved in the first half of the financial year than in the second.

The investment in the Australian company cost your company £745,156, and was financed by the issue of £750,000 5½ per cent cumulative preference stock. It will be noted that the net asset value of the Australian company, without taking goodwill into account and after allowing for the small minority interest and the profits earned since December 15, 1953, referred to above, is £1,172,536. In the 1954 consolidated accounts of your company, a capital reserve of more than £400,000 will be created, representing the difference between the cost of the Australian investment and the book value of the assets, as shown in their balance sheet. Your board has every reason to believe that your company has made a good investment, which will make a material contribution to its earning capacity.

Since the buyers' market in textiles which evinced itself in 1951, the consuming public have become increasingly selective in their buying. Our executive, designers and technicians are meeting this challenge by continuously striving to improve the styling and quality of Kayser Bondor merchandise. As stockholders may have observed in our advertisements, there is a guarantee of quality attached to every garment. It is worthy of comment that despite the fact that our volume has risen every year, the number of complaints has consistently diminished. The bedrock of our policy is a continuous improvement in quality and there is a determination in all branches of our business that Kayser Bondor goods shall be regarded as the best value that can be obtained in our field. Although we never cease to seek economies in production, the search for quality is more important than increase of profits. We believe that the pursuit of such a policy places our business on the firmest foundations.

So far this year our turnover has been maintained and as far as I can foresee there is every reason to anticipate an expansion in our volume and earnings in the current year.

WILLIAM BEARDMORE & CO., LIMITED

INCREASED TURNOVER

SIR ALEXANDER WILLIAMSON'S STATEMENT

The following statement by Sir Alexander Williamson, CBE, BSc, MInstCE, accompanies the report and accounts of the company for the year ended October 3, 1953:

As mentioned in the directors' report all the property, rights, liabilities and obligations of the Iron and Steel Corporation of Great Britain were by virtue of the Iron and Steel Act, 1953, transferred to the Iron and Steel Holding and Realisation Agency on July 13, 1953, and the securities of the company previously vested in the corporation became vested in the agency. Accordingly the company is now a subsidiary company of the agency.

The trading profit for the year to October 3, 1953, covering a period of 53 weeks, amounted to £681,521, and, while showing a reduction of £62,693 compared with that in the previous year, is considered satisfactory.

Turnover was in excess of that of 1952 and the margin of profit on deliveries was maintained, but profits of a "windfall" nature arising from adjustments in the prices of our products were lower than in the previous year and more than account for the reduction shown in the trading profit.

United Kingdom taxation amounting to £481,322, representing approximately 70 per cent of the trading profit, has been provided in the accounts. This percentage is higher than last year despite the reduction in the standard rate of income tax, but it should be borne in mind that the company now has to provide profits tax on dividends payable to the Iron and Steel Holding and Realisation Agency. In the previous period no such provision was required.

The figures in the group balance sheet show little change overall on those as at September 27, 1952, and do not call for any special comment.

NEW HIGH RECORD OUTPUT

During the period covered by this review supplies of raw materials for steel making have been freer than for some years past and the output of steel from our melting shop has been a new high record to which our electric furnaces have made a valuable contribution both in quantity and quality, particularly during the latter part of the year.

The manufacture of our main commercial products, steel forgings and castings, has continued at near-maximum capacity. In the machine shops, through which the majority of our production has to pass, we have been working under pressure throughout the year, but difficulty is still being experienced in getting skilled men to replace any who leave, and we are short of heavy turners.

In the Steel Foundry we successfully completed the manufacture of the very heavy steel castings for large presses for the USA to which I referred in my review last year.

Satisfactory progress is being made with our specialised products, and we have successfully manufactured many rotor forgings in alloy steel for land and marine main steam turbines working under extreme conditions of temperature, pressure and speed, also for alternator rotors. Research in materials for gas turbines is continuing and we have developed a material for rotors which shows high promise at advanced temperatures.

Our capacity for the manufacture of Work Rolls was expanded during the year and we were able to increase substantially our deliveries. Higher production is being accompanied by higher quality and that our customers are satisfied is demonstrated by the receipt of repeat orders in increasing quantities. We are expanding further our capacity for this important product, and we are continuing research to meet increasingly exacting conditions of work.

The production of aircraft carrier steam catapult components has proceeded continuously, and supplies are in accordance with Admiralty requirements. In connection with the provision of fins for ship stabilisers we are now producing cast steel fins and flaps for the larger sizes. Some of these sets were completed during the year under review, and more are now in course of production.

Our relations with our workpeople during the period under review have been satisfactory and I would take this opportunity to thank all members of the staff and other employees for their services, loyalty and co-operation during the year.

CURRENT TRADING

You will hardly expect me to forecast the future in the uncertain and obscure conditions which surround us. While the activities on the commercial side of our business are still substantial, the volume of orders now being received has dropped and there is evidence, particularly with the falling away of demand for products connected with the shipbuilding industry, that this curtailment is likely to continue and may well be accentuated if the present demands for increased wages are pursued. On the armament side of our business orders have fallen considerably and the position with regard to potential future demand is obscure.

These factors militate against a continuance of the profits realised in the past two years which it should be realised reflected favourable trading conditions.

RALLI BROTHERS LIMITED

COMPETITIVE TRADING CONDITIONS

MR JACK VLASTO ON CURRENT PROSPECTS

The annual general meeting of Ralli Brothers Limited will be held on April 28th in London.

The following is the statement by the president, Mr Jack Vlasto, which has been circulated with the report and accounts:

The death of Mr George Euthymopulo occurred last December, less than four months after he had joined our board. We all deeply regret the passing of this old friend, who had put in over 40 years of meritorious and devoted service with the Ralli organisation in India.

Our consolidated trading profit of £1,298,110, although appreciably lower than last year's figure of £1,843,744, is nonetheless satisfactory. During the year covered by the accounts now before you, the competition encountered in all branches of our merchanting business tended to become more severe. In general, we held our position as buyers or sellers in the various markets and maintained our share of trade with a turnover of about £45 million. To do this, however, we had often to work for a smaller return than was previously obtainable. Of our subsidiaries, Ralli Estates, Limited, whose annual production of sisal fibre is now within sight of 5,000 tons, and The Maritime Shipping and Trading Company, whose strength will reach six ships next month when the 11,400-ton "Georgidore" is delivered, both showed satisfactory results although well down as compared with their previous year's record profits. Berg River Textiles, Limited, was not, unfortunately, amongst those cotton mills which found working conditions easier. Margach and Margach again did well.

RALLIS INDIA LIMITED

What is disappointing in our 1952-53 results is the need to write off £200,000 from the book value of trade investments. Last November, restrictions were imposed by the Government of India on Rallis India's business which affected an important part of their export and import trade. These arose out of the implementation of the Government bulk purchase agreement of Uganda cotton of crop 1951-52 under which Rallis India, as Indian importers working for a small fixed return, received import licences for 38,816 bales for distribution according to allocations made to the mills by the Government of India. Owing to the sharp fall in cotton prices which took place after the fixation of the bulk purchase price but before the arrival of the cotton in India, a number of the Indian cotton mills were reluctant to enter into contracts with importers in the terms of their undertaking to the Government of India, and Rallis India were obliged to start storing cotton in Bombay. The Uganda Lint Marketing Board, unable, for various reasons, to slow down following shipments as requested, offered us and other Uganda exporters the alternative assistance of deferred payment which we, in turn, offered to Rallis India. In November, the chairman of the LMB visited Delhi for general discussions with the Government of India. I understand that he, interpreting certain parts of the agreement differently from the Government of India, urged them to pay for the unsold balances and thus permit accounts to be finalised. At that time Rallis India still held about 4,000 bales unsold on which substantial storage charges had for long been accruing and which, despite various special concessions, were proving slow and difficult to sell to mills at the agreement prices. The restrictions, I understand, were imposed by the Minister of Commerce and Industry because Rallis India accepted deferred payment terms, in which I can see no offence whatsoever, and because he believed quite wrongly, that Rallis India had engineered the visit of the LMB chairman. Although, after explanations and inquiries, the restrictions were eventually lifted, Rallis India, under conditions already very difficult, suffered great harm for four months in loss of business. Much as I regret recounting this extraordinary incident, shareholders are entitled to know what lies behind the substantial write-off in trade investments.

THE OUTLOOK

Our current year's trading, which began on September 1st, does not look at all encouraging so far. Markets have been difficult to gauge correctly and, owing to the intensity of competition which has become even more severe, earnings all round are meagre. In certain articles we have lost ground but overall turnover is fully maintained because our cotton sales, despite their exclusion for a period from the important Indian market, are running ahead of last year. A welcome feature in the present bad patch, which contains several unexpected setbacks, is the receipt from Brazil of all outstanding payments due to us some of which date back for several years. This was achieved under special arrangements with the Bank of Brazil involving a substantial purchase of cotton on our part.

We are increasing our investment in Berg River Textiles, which company is raising its issued capital with a view to increasing its manufacturing capacity. We are also participating in a small further issue being made by The Crescent Jute Mills Company of Pakistan. We are making arrangements in Iraq to take a more active part in the purchasing of barley for export through a majority holding in a small local company. Our developing Dindira tea estate in Tanganyika, which was adversely affected by last year's drought, has recovered well and the latest reports are the most encouraging we have received. Both Ralli Estates and The Maritime continue to show satisfactory results.

Our thanks are again due to our staff all over the world for their devotion and unstinted efforts to promote the interests of the company under conditions which have now become very difficult.

JOHN EMSLEY LIMITED

The seventh annual general meeting of John Emsley Limited was held on April 2nd at Bradford, Mr Harold Jeques, chairman and joint managing director, presiding.

The following are extracts from his circulated statement: The trading results for the year ended November 30th last, show a considerable profit. An interim dividend of 10 per cent, less tax, has been paid on the ordinary shares and the board recommend a final dividend of 15 per cent, less tax.

Full-time running has been maintained throughout the year for all machinery in the group that could be adequately staffed and production has been maintained at much the same level as in recent years.

Our American subsidiaries have again materially helped in the distribution of our manufactures and whilst not yet contributing to the profits, have made considerable progress; their turnover has been doubled.

Buildings, plant and machinery have been maintained in good condition and the policy of modernising by electrification of the mills, new machinery, individual driving, and improved lighting is being continued so that the whole plant is capable of meeting the demands made.

I feel that there are difficult times ahead of us. The incidence of high taxation has tended to lessen production; a worker will not increase production if the reward for his increased effort is greatly reduced by taxes. Another hindrance to this country's trade is the importing of textile machinery by the countries of our customers overseas and the consequent competition with our goods.

The orders on the books of the operating subsidiaries are still sufficient to ensure full-time running for some months to come. New business is not easy to come by at present and is only being secured at margins considerably lower than were obtained during the year to November, 1953.

The report and accounts were adopted.

TRADE INDEMNITY COMPANY

PREMIUM INCOME AGAIN INCREASED

SIR JOHN MAKINS ON RAPID EXPANSION OF CREDIT INSURANCE

The thirty-sixth ordinary general meeting of Trade Indemnity Company, Limited, was held on April 8th in London.

Sir John Makins, the chairman, presided.

The following is an extract from his circulated statement:

Turning first to the underwriting accounts, the gross premium earned in 1953 came to £1,184,063 against gross claims paid, less salvages, of £268,261. After deducting brokerages and reinsurances from the premiums, our retention was £375,069, and after deducting claims recovered from reinsurers from claims paid, our share was £57,295.

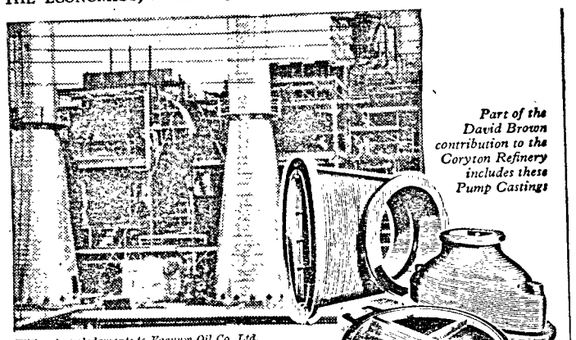
The total of claims paid, less salvages, in 1953 was £26,094 less than in 1952 on a larger premium income, but you will recollect that in the earlier year we had to deal with the aftermath of a severe recession in the textile trade. In that context I warned you a year ago that we had left behind the exceptional conditions of the war and immediate postwar years and had entered a phase when normal trade fluctuations would again have an effect on our operations. In spite of the improvement in 1953, I see no reason to revise my opinion.

The balance of the underwriting account transferred to the profit and loss account is £211,616. Interest on investments and other income (gross) comes to £33,149. The total is thus £244,765 against which taxation will absorb £137,786 (56 per cent) leaving a net profit for the year of £106,979. To this must be added the balance of £123,739 brought forward from 1952, less £50,000 capitalised and applied in paying up 50,000 £1 shares issued to members in 1953; and non-recurring items of £1,021. The result is an amount of £181,739 out of which the directors recommend payment of a dividend of 10 per cent, less income tax, which will absorb £22,000.

I will anticipate the proceedings of the extraordinary general meeting by mentioning the proposal to increase your company's capital by £50,000, thereby bringing it up to £450,000 in fully paid £1 shares.

GENERAL REMARKS

You have seen that our premium income has again increased—actually by 11.28 per cent compared with 1952. The expansion in the volume of business insured has, of



Part of the David Brown contribution to the Coryton Refinery includes these Pump Castings

With acknowledgments to Vacuum Oil Co. Ltd.

THIS THAMES-SIDE PLANT WILL PROCESS NEARLY A MILLION TONS OF CRUDE OIL ANNUALLY

The Vacuum Oil Company's new £12,000,000 refinery at Coryton, on the Thames Estuary, will be one of the few in the world designed specially for the manufacture of high-grade lubricating oils. It will process approximately 900,000 tons of crude oil annually. To this important benefit to Britain's economy, David Brown have contributed no less than 140 sets of complex valve castings for the power plant and boiler house alone, apart from large quantities of tube supports and pump castings for most of the main refinery units, etc.

SAS to Scandinavia

for a holiday you'll never forget

You *must* go to Scandinavia this year. Marvellous food, sunshine, and friendly people—the majority of whom speak English. The "Inclusive" plan is completely individual and the combined cost includes return air travel by scheduled 4-engined SAS services, full hotel accommodation and all meals, at a total cost only slightly more than the normal return fare. Bookings can only be made through your travel agent. Ask for the full colour SAS brochure containing 50 suggestions for holidays in all parts of Denmark, Norway and Sweden, or write direct to SAS.

Daily flights to Scandinavia, 1st-class and tourist, from London and Glasgow (Prestwick).

SCANDINAVIAN AIRLINES SYSTEM 5 CONDUIT STREET LONDON W.1.

ask the typist

Gone are the days when the typist, busy at work on a schedule, would try to wave away that urgent letter. Now, in a matter of moments, she simply removes the long carriage complete with schedule. Your letter is typed and the schedule completed later. This remarkable Imperial feature of interchangeability applies to platen roller and type-unit as well: all three major units are made in varying styles or sizes. The typist can rely on one Imperial 65 to do the work of many different typewriters.

Exclusive Imperial design and expert engineering have made the Imperial 65, above everything else, the *typist's* typewriter.

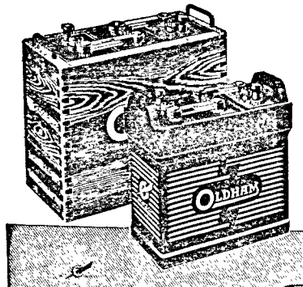
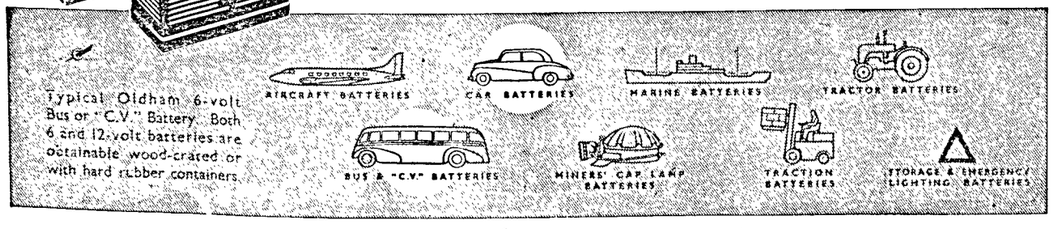
WHENEVER wheels turn, there goes the Oldham battery. The power that turns the starter, lights the lamps, is a hidden power, a modest, unobtrusive but nevertheless vital item of equipment. The product of 30 years' evolution, the Oldham car, bus or "C.V." battery of today has a unique combination of features — Fibrak Insulation for higher performance, X-metal grids for longer life, Cold-Start plates for a split-second start in the coldest weather. These innovations are indicative of the care, the knowledge, the *quality* built into every Oldham battery. Not only on the roads, but on the sea, in the air and even underground . . .



OLDHAM

Serves the World

OLDHAM & SON LTD · DENTON · MANCHESTER · ESTABLISHED 1865



Typical Oldham 6-volt Bus or "C.V." Battery. Both 6 and 12-volt batteries are obtainable wood-crated or with hard rubber containers.

They will be there!

BIF

MAY 3-14

Exciting Displays by 2,000 proud exhibitors from almost every British industry with something new to show.

Inventions, developments and devices . . . designed by men who know what the customer wants.

Keen Buyers from every country in the world . . . who know the value of being first where new designs and ideas are to be found.

Special Attractions . . . from the outstanding achievements of British industry to household goods and gadgets for the delight of every man and his wife . . . the Everest Expedition display at Earls Court; the British North Greenland Expedition display at Olympia; the gigantic mechanical equipment at Castle Bromwich.

THE BRITISH INDUSTRIES FAIR

CASTLE BROMWICH · EARLS COURT · OLYMPIA

Trade buyers—daily 9.30-6. Public Admission—daily 2-6 (and all day Sat., May 8th) 2/6d to each building.
Fair closes at 4 p.m. on Friday, May 14th.
Catalogues price 2/6d at Fair entrances—or from B.I.F., Lacon House, London, W.C.1, after April 20th.

Money from old rope

The development of profitable by-products from so-called waste materials is one of the most important aspects of industrial research.
To be successful, this work calls equally for controlled analysis of the material; for an objective assessment of the possibility of finding or developing a market for any of the saleable constituents; and for the design of methods of processing these on an industrial scale

Sondes Place Research Institute includes these among the services it offers to firms with waste-material problems in widely different industries

Present-day industrial research in many spheres is fully discussed in the Institute's occasional bulletin, ***'Report'.*** *May we put your name on our mailing list?*

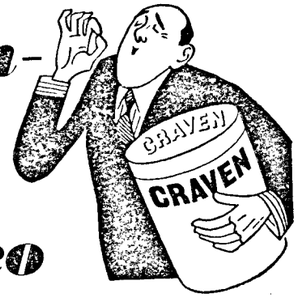
Craven— tobacco to live for



IN TIMES OF STRAIN and trouble a Craven smoker turns to his tobacco for comfort and solace. And slowly, but surely, the mellow and cool burning CRAVEN casts its richly comforting spell to make life easier and brighter. "*It is*" said Sir James Barrie in 'My Lady Nicotine' "*a tobacco to live for.*" Every Craven man knows how right he was.

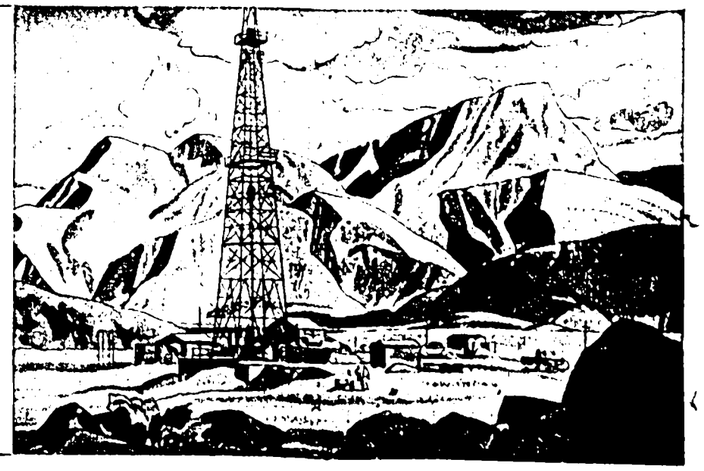
Try CRAVEN

Obtainable in 3 fragrant, slow burning, deeply satisfying blends.

Craven Mixture 4/7 oz.
Craven Empire de luxe Mixture 4/3 oz.
Craven Empire Curly Cut 4/4 oz.

'ENGLISH ELECTRIC'

By providing power for driving drilling rigs, power for pumps in pipe lines to storage tanks and tankers, and power for some of the world's largest refineries, ENGLISH ELECTRIC serves the oil industry at every vital stage and in fields as far apart as South America, the Middle East and the Far East.



bringing you

The world's demands for both oil and electricity are ever-increasing, and ENGLISH ELECTRIC's extensive activities in both fields are typified by the powerful main line locomotive hauling this train. Using oil engines to generate electricity, it develops 1500 h.p. and is but one example of the ways in which ENGLISH ELECTRIC provides better transportation for people all over the world.

A Nato for South East Asia?

THE agreement between the American and British Governments that the Foreign Secretary announced in the House of Commons on Tuesday afternoon is not, as Mr Eden was careful to emphasise, an agreement to set up a mutual defence organisation for South East Asia and the Western Pacific on the lines of the one that already exists in the North Atlantic. It is an agreement to consider jointly the possibility of doing so, and anyone who has given thought to the complex problems of that area will have no difficulty in compiling a list of awkward questions that stand in the way. There is a long road of negotiation ahead. Nevertheless, this week's decision on the route to be taken is a considerable step forward. The left wing of the Labour party, of course, is sure that it is really several steps backward. They made it clear on Tuesday that they are very angry—though perhaps their greatest anger was directed against Mr Stanley Evans for daring to dispute their claim to speak for the majority of the Labour party, let alone that "majority of people in Great Britain" whose "deep resentment" Mr Bevan was so sure he could announce. If the whole idea of a Nato for South East Asia is to emerge from the cloud of suspicion that the left-wingers and fellow-travellers will try to drape around it, it needs defending from the start, and most specifically, against the charges that they levelled at it on Tuesday.

The first of these was, in Mr Bevan's words, that it was "a surrender to American pressure." There, are, of course, some people whose anti-Americanism has become so pathological that they scream "surrender to dictation" whenever they find London and Washington in a posture of agreeing with each other on anything. But in this particular case to say that Mr Eden knuckled under to American pressure is not only untrue, it is the opposite of the truth. Let us not say it too loud, lest somebody on Capitol Hill overhear and start getting Mr Dulles into trouble, but the fact is that it was he who made the agreement possible by retreating from positions that American policy had previously taken up—the more praise to him. Mr Eden did not do what Mr Dulles wanted him to do—which was to join in an immediate minatory declaration on the specific subject of Indo-China; while Mr Dulles did do what the British Government has for a long time been hoping that successive American Administrations would do—namely, to look kindly on the idea of a comprehensive security pact for the whole of South East Asia and the Western Pacific.

Mr Eden did not yield to pressure; he performed a very adroit piece of evasive action. To say this is to confirm that there was American pressure. And now that the incident seems to be on the way to a relatively happy conclusion, it is appropriate to say that, for a day or two, there was far more pressure than there should have been. Their European allies have been trying for years to get the Americans to take South East Asia seriously, without notable success. Now that at last, suddenly, they do, they show all the enthusiasm of the convert and expect immediate agreement to a course of action which seemed in

London and in Paris to be unduly precipitous. The alarm felt in London would probably have been far less if Mr Dulles had not appeared to be threatening the Chinese with the atom bomb, in the immediate future, if they did not behave. Mr Dulles may well have been horrified to learn that such a construction had been put on his words—almost certainly there is no such intention—but the succession of his speeches over recent weeks had seemed to lead to that logical conclusion. His task in London was fully as much to allay unwarranted alarm as to stiffen resolution.

The fact is, for all the fuss that has been made of it, that the disagreement between Washington on the one hand and London and Paris on the other has been mainly one over tactics. Mr Dulles's visit may have served to reduce it to its real proportions, while giving all three governments an opportunity to affirm what is important—that all three regard the fate of South East Asia as crucial for the peace of the world, and that all three are willing to play their part, according to their means and their differing responsibilities, in defending it.

★

The second charge of the Bevanites against Tuesday's agreement is that it is "a deliberate attempt to sabotage the Geneva Conference" (the orator was Mr Donnelly). This seems to be based on a complete misreading of Communist psychology. It is true that the traditional method of bargaining between two English gentlemen is for each to try to put the other under some moral obligation, before the bargaining proper begins, by being nice to him. If you can "create a favourable atmosphere" by giving your opponent something at the start, then he will feel in honour bound to make a concession to you. The more practical wing of the Labour party could tell the intellectuals that things do not work out like that, even in English labour negotiations. Still less is this a rewarding tactic when dealing with international Communists, who are apt to take the preliminary gesture of friendly intentions as a confession of weakness. Over and over again, experience has proved that strength and firmness in dealing with them, so far from giving offence, is the way to get results.

The Communists are nothing if not realists. They will go into a huff if they think they can gain anything by it. But they will not be driven into a huff by any joint declaration that the British and American Governments may make. On the contrary, they will assess very carefully, and take into their calculations, every piece of evidence that is presented to them on the state of mind of their opponents. The more resolute we are, the more likely are they to make, after prolonged and stiff bargaining, the concessions on which a settlement can be based. The Americans, for all the occasional impatience of their diplomacy, deserve the fullest credit for always having seen this clearly. It is a legitimate complaint against American policy, especially in the Far East, that it is apparently unwilling to make any concessions at all, even for full value received; it will not consider recognition or a loosening of trade restrictions even as bargaining weapons. But if it is wrong of the Americans to refuse to give something for something, they are magnificently right in insisting that they will give nothing for nothing.

★

The third charge levelled on Tuesday was that a Nato for South East Asia would be regarded as having "the purpose of imposing European colonial rule upon certain people in that area" (Mr Bevan again). To this there are really two answers. The first is that there is no colonialism in South East Asia today of which anybody in the West should feel ashamed. In Indo-China itself the French, though admittedly only at long last and with every show of reluctance, have just about committed themselves to the policy that the states of Laos, Cambodia and Viet Nam shall be fully in control of their own destiny and free to leave the French Union if they choose. French policy in Indo-China, in short, is now virtually the same as the Attlee-Cripps policy towards India was in 1946; was that base colonialism? As for Malaya, nobody with the interests of all its three races at heart can believe that the country would be happier or better off if the British administration were withdrawn at once. Every other country in the area is already self-governing. Where, therefore, is this colonialism that so disturbs Mr Bevan? If the Americans, with their persistent blindness on this issue, have been brought to see that the European powers have no objectives or intentions in South East Asia that are not compatible with the obligations of trusteeship for developing peoples, should that not be saluted by everybody in this country as a victory for common sense?

The other answer to the charge of colonialism is that if South East Asia is abandoned to be overrun by the Chinese Communists, then the result will not only be a strategic disaster for the western nations (to which the peoples of South East Asia might be indifferent), but the subjection of these countries to a colonialism far more tyrannical in its impact on the ordinary man and far more ruthless in its exploitation of him than anything they have ever suffered at the hands of the West even in its most unregenerate days. Let Mr Bevan say: does he think the ordinary Malayan or Siamese or Vietnamese would be better off, materially or spiritually, under Soviet colonialism than under the system of government that the West holds out to him? Until the armed threat has been repelled, there is no third choice open.

Mr Dulles said, on leaving London, that he was well pleased with the results of his visit: "the best talks in forty-eight hours that I have ever had." This is gratifying—but only if the sequel proves it so. For the obstinate, intractable, complex problem of Indo-China remains. There are signs that the Communists—certainly the Russians and perhaps

the Chinese—desire a truce. But do they want a truce of a kind that would be satisfactory to the western powers and to the Associated States of Indo-China—a truce, that is to say, that would effectually prevent any further resort to arms by the Communists in the greater part, if no longer in the whole, of Indo-China? That is the question that the Geneva conference will have to answer. If the Communists agree to such a truce, they will be giving up—or at least deferring—part, and a large part, of their aims. Why should they do that unless the alternative seems to them less attractive? Is it not therefore in the non-Communist world's interest to leave Mao Tse-tung in no doubt of the unpleasant consequences for him of a deliberate choice for war? That is Mr Dulles's logic, and it is unassailable.

The Phœnix Franco

GENERAL FRANCO has recently been behaving as if he thought he ought to play a more important role on the international stage. He has been mixing high-handedness towards Britain and France, his critical rivals in the Mediterranean, with blandishments towards the Arabs, his potential supporters and clientele; and he has invited (so far without result) Marshal Papagos, the Greek Prime Minister, to Madrid in the hope of adding him to the list of distinguished visitors whose attitude towards the Spanish regime has been mellowed by Spanish hospitality.

This is not a new departure. Abuse of Britain because of Gibraltar is a hardy annual of Falangist propaganda; and Arab friendship has been assiduously—if not very effectively—cultivated for years. When Señor Artajo, the Spanish Foreign Minister, made his much talked-about tour in the Middle East in 1952, he let it be known that Spain would like to become the linch-pin of a Mediterranean defence pact; and it was not through any negligence in preparing the ground that this aspiration came to nothing. Señor Artajo followed up his Middle East pilgrimage with an extended tour of the Far East. Last summer, the signature of a concordat with the Vatican provided a real feather for the Caudillo's cap, even though he had to give a great deal to the Church in order to get it. Now the Latin Union, which embraces the Romance-speaking countries of two continents, has agreed to hold a congress in Madrid, and there is talk that it might establish its headquarters there.

General Franco, in short, has for years lost no opportunity of, as it were, showing the flag. He has worked hard, consistently and—let it be admitted—with considerable skill to improve Spain's international standing. With the signature of the agreement about American bases last September his policy seemed to have paid him valuable dividends. It is in large part this success in at last breaking out of his long diplomatic isolation and in demonstrating that Washington, at any rate, thinks it is worth while to invest good money in him, that is encouraging him to renew his efforts to put Spain on the map as a factor that counts, at least in the Mediterranean. But do Franco's hopes rest on firm foundations, or is he merely bemused by his own hot air? Is he really any more important than he was, say, five years ago, when the western powers thought it wise and safe to keep him in a back seat?

★

Spain's importance, of course, waxes and wanes according to the temperature of the cold war, for its geographical position is obviously of interest to the strategists. It watches over the passage between the Atlantic and the Mediterranean; it has excellent harbours which would be useful in western hands, and deadly if used by enemy submarines; and it can—in time—give the Americans additional bases and elbow room in Europe, that is to say, more room to manœuvre and alternative lines of communication. With the new emphasis on peripheral defence, Spain has undoubtedly acquired new importance in western strategy; if it had not, Franco would never have been able to strike with the Americans what was evidently a hard bargain. Yet the fact remains that Spain is not vital to western defence in the way that France, Great Britain and Italy are vital.

Spain's value to the West is mainly a geographical one. It does not, therefore, matter so greatly that in any present emergency, Franco's armed forces, with their obsolete weapons, ships and aircraft, could contribute little to the West's armed strength. But the country's internal political and economic stability is obviously a matter of general concern. The alliance of a country torn by civil dissension is valueless; and this remains true however much on other grounds, one may disapprove of the government in power. General Franco arrived at the top by way of revolution and civil war, and if the strong arm, stout prisons and censorship on which he relies should fail him, he runs the risk of departing by the same route. Yet it would be merely wishful thinking to maintain that the air of stability with which he has surrounded his regime is altogether spurious. The Caudillo owes his continued success largely to the skill with which he has played off the contending forces within the country—Army, Church, Falange, workers—one against the other. There is no sign that he is losing his skill or that the undoubted unpopularity of the bases agreement among some sections of the population has affected his position.

On the contrary, the agreement, with its promise of modern weapons and equipment for the armed forces and its careful safeguarding of Spanish sovereignty, must have tightened the links between Franco and the Army, just as the signature of the concordat last summer must have increased the Spanish Church's stake in the Franco regime.

Perhaps the most serious danger to the government lies in popular discontent arising out of economic instability and persistent hardships. In recent months there has been a fairly general round of wage increases, but they have not been sufficient to catch up with the cost of living. Last year's drought was almost calamitous and may well have been the factor that decided Franco to settle with the Americans. This year's orange crop, on which Spain depends for the best part of its foreign exchange, has been so seriously damaged by frost that exports have had to be stringently rationed among Spain's principal customers. The money that is beginning to flow into the country as a result of the bases agreement cannot affect the vagaries of the weather; but it could, if well used, do much to put the currency on a firmer footing. On the other hand, if unwisely used it might bring serious inflation, great economic damage and greater misery. General Franco can no longer shuffle the blame for the country's economic miseries on to foreigners who stubbornly refuse to lend a helping hand.

On the whole, however, it will be surprising if American aid does not turn out to be a blessing to the Spanish economy. In any case, now that the Americans have a stake in the country, it is a reasonable assumption that they will help it out of its more serious economic difficulties. General Franco has, indeed, some excuse for congratulating himself; it would be idle to deny it, however much some people may deplore it. He owes his improved fortunes, however, almost entirely to the fact that he has been "taken up" by the Americans because of his country's strategic position. Like other authoritarian regimes, that of General Franco has an interest in the persistence of tension and rivalries in the outside world. He has opportunities for mischief-making in the Mediterranean that will need to be carefully watched, not least from Washington.

Europe's Currency Tangle

AT the beginning of next month the Finance Ministers and some of the Foreign Ministers of Western Europe will meet in Paris to settle the fate of the European Payments Union. It is now practically certain that they will agree to extend its life for a year beyond its present expiry date on June 30th next. This may sound dull news. But it should in fact be greeted with a sigh of relief. For it will mean that a compromise agreement has been reached in a bitter controversy that has been raging in the past few months between the British and the Scandinavians on the one hand and the Germans, Swiss, Belgians and Dutch on the other. The controversy has been a complicated one; it has owed many of those complications to the fact that that darling Humpty Dumpty word of modern economic science, the word "convertibility," means something entirely different in its British/Scandinavian context from in its German/Swiss context. But since the controversy, and the continuing series of compromises that may be needed to bridge it in the coming year, have a major bearing on the level of European trade and prosperity, it is worth while for the ordinary man to tie a wet towel around his head and try to understand what the trouble has all been about.

The European Payments Union is the mechanism under which West European countries agree that their balance-of-payments surpluses and deficits with one another need not be settled wholly in gold or dollars, but can be partly financed by the grant of credits from surplus to deficit countries. The fact that deficits do not lead automatically to full payment in gold has enabled member countries to agree that they will not impose stringent licences on imports from one another. In fact, solvent countries are supposed to keep at least 75 per cent of their intra-European imports free from licensing restrictions, and all major EPU powers except France are at the moment able to live up to this rule. Thus a mechanism for settling payments has contributed towards a freer movement of trade.

There have always been two contingencies that might break up this eminently sensible system. The first danger has been that those countries that tend to be chronically in surplus in their intra-European trade—recently they have been Germany, Switzerland, Belgium and Holland—might grow weary of granting credits to those countries that tend to be chronically in deficit. During the negotiations for the renewal of EPU this year these four major creditors showed clear signs of such weariness. They put forward three propositions:

(1) That deficit countries should meet a larger proportion of their currently accruing deficits in gold so that surplus countries should not have to grant such large credits. Britain and Scandinavia opposed this proposal vehemently. They said that creditors should not be given an inducement to build up large surpluses; creditors should rather work to reduce them by removing their remaining import restrictions, by lowering tariffs and by granting greater freedom to outward movements of capital

(2) That debtors should meet some of their longest-established past accumulations of debt (and thus creditors receive payment for some of their longest-established past credits) in gold. After initial muttering, Britain has announced its willingness to accept a compromise here; briefly, it has agreed that it will pay out £30 million in gold to the four major creditors straight away (subject to satisfactory arrangements about settlement of the remaining £160 million of its debt).

(3) That countries which have not freed 75 per cent of their intra-European imports from licensing restrictions should be told plainly that they have got to live up to their obligations. France is the only major country in the dock here, and at one time it looked as if the OEEC authorities were being given a diplomatic stick of dynamite to hold. These authorities (who live in Paris) seemed likely to be charged with the task of telling France that it should subject its high-cost industries to greater foreign competition, because the Germans wanted it to. Fortunately, however, Dr Erhard, the German Minister of Economics, has recently toned down this demand; and France has now agreed to liberate 65 per cent of its European imports before the end of the year.

Throughout these controversies the British and the Scandinavians (the Swedes, though not current debtors in EPU, believe in easy credits because many of them still think there is going to be an American slump) have been the loudest opponents of the German-Swiss-Belgian-Dutch *démarches*. The British have had some good reasons for their stand, but circumstances (and a little stiff-neckedness) have combined to make them look hypocritical. The main circumstance has been that it is widely believed in Europe that—whatever happens to the sterling area's general balance of payments this year—the sterling area's particular deficit with EPU is bound to increase.

★

There are several reasons for this. First, Britain's EPU deficit does not depend wholly on the sterling area's own balance of payments; about £50 million of sterling a year also gets into the EPU clearings as a result of "transferable sterling" payments from outside. These are the sterling payments made to European central banks by Iron Curtain, Latin American and some other countries; for example, a great part of Germany's exports to China is now financed by transfers of Chinese sterling (part of which might originally have reached Chinese hands as a result of Russia's recent gold sales in London). The recent extension of the transferable sterling system is expected to increase the amount of sterling that finds its way back into the EPU clearings after thus travelling round the world. Secondly, the prices of the sterling area raw materials that are most commonly bought by continental countries are lower than a year ago. Thirdly, British engineering exports are now flagging badly in Europe; in these purse-pinched markets the extra quality of many British products simply does not offset their extra cost, and servicing facilities are not good.

It is against this background that continental countries have viewed Britain's opposition to the creditors' claims. It is understandable that they should allege that the long-winded old aristocrat has simply been seeking to put off payment of his past and future tailor's bills. This charge is not strictly fair. Britain has two respectable and sensible reasons for wanting to keep EPU in being at the present time. First, if the American recession should deepen—and the British Government is not yet prepared to lay any heavy wagers against it—European trade and employment can best be kept afloat on a sea of easy credits. Secondly, if an advance is eventually to be made beyond EPU to a system of convertible currencies, Britain wants it to be from a starting point where all countries have already removed import licences as far as is politically feasible—and the EPU system holds out an inducement to creditors and an exhortation to debtors to do precisely this.

★

This British attitude leads on to consideration of the second factor that might break up EPU—the threat that comes from Britain instead of from the creditors. The threat is that of sterling convertibility. In the British sense of the term, "convertibility" would mean that any foreigner who received sterling could turn all of it into gold or dollars; obviously, in these circumstances, no foreigner would bring his earnings of sterling into the EPU clearings (where only part of them would be convertible into gold or dollars), and the EPU would come to an end. The continental countries believe that Britain may in fact make an attempt at convertibility towards the end of 1954 or the beginning of 1955. They argue that Mr Butler was very enamoured of the project two years ago; that he has been pleasantly surprised at the way in which sterling has stood up to the first nine months of a moderate American recession; and that if, by next autumn, it should be clear that American activity and imports were rising again, he would show that there is life in the old love yet.

Cautious observers in Britain will hope that the Europeans are over-emphasising Mr Butler's romanticism; they may also note that the Europeans' wish is to some extent an energetic father to their thought. A year ago most European countries were opposed to sterling convertibility; they feared that such an advance might only be achieved with the aid of more licensing restrictions on British imports. Now, however, the four big European creditors would welcome sterling convertibility in 1954 and 1955; it would mean that the sterling which they now receive in such ample measure would be directly convertible into gold, and would therefore bring their worries about excessive sterling credits to an end. It may have been at least partly *pour encourager les autres* that the Germans, Dutch and Belgians have recently been making noises to suggest that they might surge ahead of Britain by making their own currencies convertible first.

These noises are apt to be misleading; the only sort of convertibility towards which Germany, Holland and Belgium may conceivably soon advance on their own is the sort of convertibility that is already enjoyed by the Swiss franc. "Swiss style convertibility" is totally different from the British concept of convertibility. It means simply:

(1) That Swiss citizens are more or less free to invest their capital in the dollar area.

(2) That Switzerland's restrictions on imports from the dollar area are no sterner than its restrictions on imports from other countries.

It will be seen that this system (which is appropriate only for a currency that is almost wholly held by its own nationals, and not—as sterling is—widely held by foreigners) does not carry with it any threat to EPU; Swiss residents who hold Swiss francs can turn them into dollars, but foreign central banks which hold Swiss francs still have an inducement to hand those francs into the EPU clearings and get part payment in gold. Holland, Germany and Belgium—in that order—are already very near to enjoying "convertibility" in this Swiss sense. They could go the whole distance, with a great fanfare of trumpets but with little real change, at almost any moment they chose.

Although a Dutch-German-Belgian advance to Swiss-style convertibility would not break up EPU, there are three reasons why Britain might suffer if such advances were made too precipitately. The first is that if these three countries ceased wholly to discriminate against dollar imports, their markets might start to re-sell dollar products to other European countries, thus increasing their EPU surpluses. The second is that if Dutch, German and Belgian nationals could transfer their capital to the dollar area, a loophole might be created through which some sterling might be transferred into dollars too; indeed, under certain conditions, and provided it can escape British exchange controls, some sterling can already be converted into dollars via D-marks and Swiss francs at a discount of only around ¼ per cent. Thirdly, if four major European currencies were called "convertible" in this misleading sense, there might be greater pressure on sterling to become convertible in the true international currency sense. This may sound absurd, but the notion that sterling was one of the few European currencies still called "inconvertible" would weigh heavily on the Bank of England's mind.

The situation, in short, is as delicate as it is complicated. Britain is certainly correct to stand by the principal tenet of its present policy: that EPU, with its credit facilities and consequent opportunity for trade liberalisation, should be kept in being unless or until the non-dollar world starts earning so many dollars—and looks like continuing to do so—that an advance to a wider international system of freer payments and trade becomes possible. But in standing by that principle, at a time when the sterling area's deficit with Europe seems very likely to widen, Britain has laid itself open to misrepresentation; and that misrepresentation may already have spread further among the Finance and Foreign Ministries of Europe than the technicians at the Treasury realise. The danger is that if the controversy at a technical level becomes too complicated and bad-tempered, the solution eventually sought at a political level could conceivably be too simple and precipitate. The EPU is now about to be renewed because, despite many squabbles about details, everybody realises that it is necessary. It would be a pity if later in the year there was an attempt to abandon it for something wider and more risky—not because the participants thought that a discontinuance of the American recession made EPU unnecessary, but because a continuance of their own squabbles made them doubtful whether EPU would still work.

Urban Rides—II

Changes on the Mersey

BY A SPECIAL CORRESPONDENT

UP in the north-west of England there is a gentleman-merchant of the old school. His counting house is on the grand scale, a little old-fashioned, but solid, and with the very latest electronic appliances unostentatious in the corners. "The old boy was a keen business man once," say his colleagues, "but a bit of a back number nowadays. His trade's fallen off and he can't keep all his people busy. They tell me his family even gets some sort of public relief." But they are only judging by the dust in the entrance hall. The merchant himself is busy with more important matters.

"Relief? Nonsense! Certainly my old trade's not what it was. I should know when the tide's changing—I've watched it long enough. But I've seen this thing coming for twenty years, and I've planned accordingly. I'm branching out into Manufacture. Panic improvisation? Fuddling consumer industries? Not a bit of it! I'm doing the thing properly. Vehicles, engineering, electrical goods. Things with a future as exports. I was feeling my way in the thirties, but I really got my hand in during the war." And sure enough, through his untidy backyard, and out on the green fields beyond, there are his modern workshops, model dwellings and new arterial roads. He suspects he may yet have the laugh on his cotton-spinning friends.

Until the second quarter of this century, Liverpool flourished as a port and market, and needed few other interests. It handled almost a third of Britain's overseas trade, took a large share of the merchanting, banking and insurance business that went with it, and also made a good thing out of processing bulky imports, such as sugar, grain and oil seeds. While other regions were specialising in manufacturing this or that, Liverpool was specialising in commerce; and its legacy of civic architecture, its fine cultural tradition, its very sophistication, show that it had chosen profitably.

But the pattern of British overseas commerce was altering in many ways before the war, and has altered even more since; and most of the changes have been detrimental to Liverpool. The soaring national values of foreign trade during the past few years have not brought automatic prosperity to all ports; the work of a port, though not unaffected by the value of its cargoes, is related mainly to their bulk. The national policy of cutting back imports has fallen trebly hard on Liverpool, which in 1939 sent out only one ton of cargo for every three brought in; in particular, the policy of relying increasingly on home-grown food has meant a permanent loss to its large grain and meat-importing business. The present export boom cannot altogether offset these losses, though while it lasts it mitigates their effects. But there was a time when Liverpool's exports were drawn largely from the North, and destined for the Far East and the New World; they were shipped through Merseyside as a matter of course. Nowadays both the origins and the destinations of Britain's exports are much more varied, and Liverpool has to compete for its share. Add to this the fact that the cream of the trans-atlantic passenger traffic has been skimmed by Southampton and Heath Row—and that the Manchester Ship Canal has given Lancashire a full-grown port in its very heart—and it becomes evident that Liverpool, as a port, has outlived its palmiest days. It still shares with London an immense superiority to all other British ports; but the era of seemingly limitless expansion is over.

TOTAL SHIPPING TONNAGE, ENTERED AND CLEARED
(Million tons)

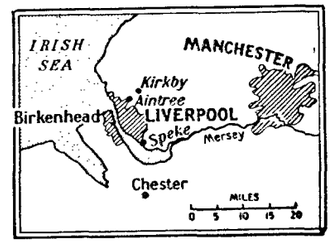
	UK	Merseyside	*Merseyside as percentage of UK*
1937	262·4	35·4	*13·5*
1938	252·9	35·4	*14·0*
1946	149·6	22·0	*14·7*
1948	201·9	29·6	*14·6*
1950	232·3	32·5	*13·9*
1952	255·9	33·0	*12·9*

At first sight, this may seem no cause for alarm. If Liverpool can hold its present position in the commercial and shipping worlds, if it can keep its seven miles of docks busy, that is surely achievement enough in the bleak postwar world—even for Liverpudlians. But there is one good reason why they regard stability as not enough: the long-standing problem of local unemployment.

Liverpool's chronic unemployment problem is peculiarly its own. Prewar conditions have left it the legacy of a large pool of unskilled labour, hired "off the stands" and chronically underemployed, which, notwithstanding the National Dock Labour Board, will affect the character of its labour force for many years yet. Liverpool is also the Promised Land for the North Welshman drifting into urban employment and the emigrant Irishman looking towards England; and although there has also been a steady flow of migration out of Liverpool, there remains an unusually high proportion of "foreign" population in the city—much of it unskilled and unused to settled work. In 1947, over half the unemployed were said to be unskilled workers. Population, too, is growing fast. Liverpool's birth rate has long been much higher than the rest of the country's, and since this means a high proportion of young people the rate is likely to be maintained. Here again, the city's large labouring class is making its presence felt.

★

There is, indeed, a special flavour about the social composition of Liverpool that is part and parcel of its economic climate; an awareness of "the masses" that is heightened by the gulf that lies between them and the army of self-consciously white-collared office workers. The handful of administrators and business men who dominate the city council (one of the most steadily Conservative to be found among the large towns) has an almost paternalist attitude to its flock. "Our unemployed" have been regarded as a responsibility and a challenge by the city's leaders for the past twenty years. A great deal was said and written in the thirties about the need to provide alternative employment for a working population which was too dependent on dock work, transport, and the primary processing industries. No doubt there had always been many idle or semi-idle poor in Liverpool. The nineteenth century assumed they were necessary to the city's progress; the twentieth century concluded that still further progress was necessary for their elimination.



Deus haec otia fecit says the city's motto, and in 1936 the corporation decided that it should itself make an industrial zone to complete the picture. By the Liverpool Corporation Act of that year it took powers to develop industrial estates on the rural perimeter beyond the ring of suburban housing. The first result was merely that some factories moved out from inner Liverpool to more modern locations at Speke and Aintree. But the rearmament programme of the late thirties helped to bring in new industries; and during the war the building of a large Royal Ordnance Factory at Kirkby gave a flying start to yet a third industrial zone, which promises to be—at 1,800 acres—the largest trading estate in Britain. These three corporation estates, each on the edge of extensive corporation housing developments, are almost—but not quite—three satellite towns; they are intended ultimately to employ

56,000 people. In 1949, the whole of Merseyside (Liverpool and district, plus Birkenhead and district) was made a Development Area, so that the government could help neighbouring local authorities which were too small to follow Liverpool's example unaided. Since then Liverpool Corporation's efforts have been merged into those of the whole conurbation, although, of course, they still dominate it.

EMPLOYMENT IN POST-WAR FACTORIES
(mid-1952)

	Number of Workers	*Percentage of Men*
Chemical and allied trades	2,250	*66*
Engineering and electrical goods	9,320	*66*
Vehicles	3,830	*86*
Metal goods	1,010	*75*
Food, drink and tobacco	2,020	*37*
Paper and printing	1,230	*38*
Others	11,960	*58*
Total	31,620	*63*

The new estates have not been immune from criticism. It is sometimes said that too much of Liverpool's new industry is light women's work on consumer goods, although it is men who most need jobs and although exportable goods incorporating a high degree of skill are obviously Liverpool's—as they are Britain's —safest meal ticket for the future. But these gleaming new premises cannot be filled at will with ideally enterprising managements and skilful workmen; there are not enough of either in the whole country to go round. And, with almost half the workers in its postwar factories engaged on chemicals, engineering goods and vehicles, Merseyside's new manufacturing areas have a larger share of what seem to be expanding industries than many of its established rivals, which passed through their industrial revolutions a century or more ago.

The combined effect of revived port activity, new building and new factory employment was to bring down the unemployment rate on Merseyside from 5.7 per cent to 3.7 per cent between 1947 and 1952 (compared with 1.9 per cent and 2.3 per cent in the country as a whole). So far, so good. But the real test of success has hardly begun. When the whole area has achieved some sort of peacetime equilibrium, will it succeed in providing jobs for more of the "old unemployables," more of the adult immigrants, more of the flood of school-leavers? And if it does so in boom years, how will it get along in slump? All that can be said is that Liverpool has adopted the contemporary formula—diversified activities, modern road communications and heavy capital investment in industries old and new. It has done so with a gusto that deserves to succeed.

Notes of the Week

Bevan in the Indo-China Shop

ONCE again Mr Bevan has come to the rescue of the Conservative Party. The effect of his sudden arrogation of command over Labour's foreign policy last Tuesday was electric. Mr Eden's statement on his talks with Mr Dulles had been interspersed with the yelps and barks that are an automatic reaction from certain Labour left-wingers whenever a statement on Anglo-American policy is sprung on them without previous party discussion and disciplining. Mr Attlee got up and steered Labour's reply along the lines of cautious moderation to which he is accustomed; the master of the foxhounds was clearly flicking the gentle switch with which he has so effectively—and with such great advantage to his party—controlled his pack in the last few weeks. Then, as soon as he had sat down, Mr Bevan walked along the front bench and did his best to contradict his leader.

It is still too early to say whether the damage to Labour will be serious; the party's capacity for opening rifts in its own ranks is only equalled by its capacity for pretending later that the rifts do not exist. But Mr Bevan's impetuosity —if it was impetuosity—has once again manifested itself at precisely the wrong moment. Until this incident it had seemed certain that there would be a gay tilt to Labour's bonnet this Easter, and for once it was not wholly due to the bees within.

The party was excited that Mr Butler's budget had been so dull; some Socialists even realised that if they had deliberately combusted industrial workers' wage claims two months ago, the general public might now be blaming them for this need for restraining dullness. Labour was delighted that it had gained an extra 3.6 per cent of the poll at the East Edinburgh by-election last week, after seven successive swings to the Tories in each of the previous by-elections since the end of last year. It was revelling in its recent unity and newly-strengthened respect for Mr Attlee's leadership. Some of the non-Bevanites who opposed German rearmament after Berlin felt that they had exhausted their quota of revolts for this year, and even suspected that their attitude

in that quarrel might have been wrong; and the whole party now recognised that the tactics Mr Attlee adopted in the debate on the hydrogen bomb were correct. It was a delightful experience for the Opposition on that occasion to find the Government falling into Labour's own usual error of turning aside soft words by wrath. It is still not clear whether Mr Bevan's intervention on Tuesday was due to his failure to appreciate all this; or to so keen an appreciation of it that he was determined to seize back the limelight he was losing; or merely to irrepressible emotion. What is clear is that he has cast a cloud over Labour's jovial spring.

Pensioners and the Budget

THE old-age pensioners dominated the four-day debate on the Budget, and when the Chancellor of the Exchequer wound up on Monday he gave what some Tories hope was a hint that the Government may bring in a Pensions Increase Bill during the current financial year. Mr Butler was very careful. He said that to "give any undertaking would not be honourable," and reminded the House again that the old will be one to four of the working population in 1979 compared with only one to nine in 1931. "When we take our decisions, therefore," he said, "let us take them with all the gravity that that means for the younger and working population." But he also said that the position of the old-age pensioners is clearly a "first priority for this or any other Government"; and reiterated that although recent practice has been to link a pensions rise with a budget, the two are really separate operations.

The timing of any Pensions Bill should normally depend on when the Government gets the reports of the Government Actuary and the Phillips Committee; if these were to hand by the autumn, a Bill could be on the Statute Book by Christmas—but, on the present timetable, it does not seem that they will be. As Mr Butler left little doubt that national insurance contributions will have to go up too, a pensions increase may not be the political palliative generally expected; but both backbench Tories and the Labour Party are urging the Chancellor on.

Apart from this pensions problem, there is little need for Tory pessimism on account of the budget. The debate showed that its economic basis is generally accepted. Labour's criticisms took the line that this year's parsimony was an inevitable consequence of last year's lavishness. Conservatives were inclined to emphasise the need for avoiding a recurrence of parsimony next year, chiefly by firm handling of Government expenditure and an increase in productivity. Mr Butler gave no fresh hint of how he intends to attain his objective of greater public economy; indeed there was a hint of defeatism in his emphasis on not letting expenditure rise rather than on cutting it. As for productivity, Mr Robens had some sensible things to say from the Opposition front bench about the need for modernising industry, but his complaints about restrictionism were not extended from the boardroom to the workshop; the finest tools in the world are no use to a workman if his union prevents him from using them properly, but neither party seemed anxious to rub this argument home.

Labour's Views on Transport

As a potted history of public transport since the beginnings of the railways, the first of the Labour policy pamphlets that are to spell out the general words of "Challenge to Britain," can be accepted without too much demur, despite the false emphasis at many points in the story. But as a piece of thinking on what Labour intends for the future, the three last pages (out of thirty-two) are as muddled and obstinately myopic as could be. If there is a challenge here, it is to the Labour party, and not to the country. The policy proposals rest on three assertions, in which the elements of truth are interwoven with prejudice. First "free" competition (has anybody ever suggested it?) is incompatible with regular service and the provision of unremunerative services—both, of course, part of the British birthright. Secondly, the acceptance of public obligation leads to "constant financial difficulties." Thirdly, "unequal competition" leads to the carriage of goods by "uneconomic means" and to "unnecessary duplication" of services. There is only one solution—"the elimination of competition by the unification of transport services under public ownership."

So the new "policy" leads back to the 1947 Act, for which the pamphlet displays a nostalgia singularly at odds with other people's recollections, giving every atom of credit for what went right and ignoring so much of what went wrong. To have transport pitched into the melting pot with every change of government is a most appalling prospect. So are the additional fetters that are proposed for privately owned transport—back to the 25-mile radius for private operators ("in the public interest," of course) and suggestions for the restriction of "C" licences by requiring "proof of need" or by limitation of radius. It is hardly surprising to find the pamphlet suggesting that such sensible features of the 1953 Act as the greater flexibility of railway charging powers should be retained. But these were the essential elements in the more competitive framework for public and privately owned transport which the 1953 Act envisaged. They have not yet been put to the test. If the cry is "Back to complete public ownership and even stricter control," these provisions would be a positive danger; for then, only the Transport Tribunal would afford any ultimate protection for the transport user.

Mr Dulles in Paris

MR DULLES'S flying visit to Paris must have been long enough to prove to him that statesmen other than himself have great difficulties with public opinion when framing their foreign policy in the Far East. His proposals for "united action" over Indo-China came at the very moment that the Laniel government was getting a grip on parliament in this matter, and they may be too much for the Assembly to swallow. The government's strengthened position was partly due to the national pride aroused by the heroic stand of Colonel de Castries's garrison in Dien Bien Phu; but it was also due to its repeated protestations that it was willing to negotiate with the enemy. Knowing that patriotic fervour is a fickle and transient mood, M.

Laniel insured himself against a parliamentary coup by appropriating his opponents' trump card. It is feared in Paris that Mr Dulles has now blown it away, and that many will now lay on western policy the blame for any failure in the Geneva conference.

Eager though they were to be helped in Indo-China, the French are little attracted by the idea of internationalising the struggle there. For right-wing supporters of the Laniel cabinet this is a colonial war and they found even the promise of independence for Vietnam hard to swallow. They consoled themselves with the hope that at least France's economic interests in Indo-China could be preserved. Now it is feared that American predominance in the struggle against Ho Chi-minh may lose France both face and substance. For the mass of the people, moreover, joint action against China raises the threat of world war, while a "united declaration" too strongly worded could be presented to a war-weary country as an unnecessary prolongation of bloodshed.

When the western foreign ministers prepare their briefs for Geneva they will have to bear the French mood in mind. Should Communist propaganda succeed in persuading public opinion that a chance of peace was lost at Geneva owing to American pressure, then a military reverse—be it in Dien Bien Phu or the Tonking delta—could provoke a major political crisis. Bad news from Indo-China might bring the government down and parliament might refuse a majority to anyone not pledged to end the war at any cost. Hasty moves made now may be regretted in the autumn, when the rainy season is over; and strong words rouse in France an echo quite different from their effects in the United States. It is a pity, but it is a fact.

Last Act on EDC

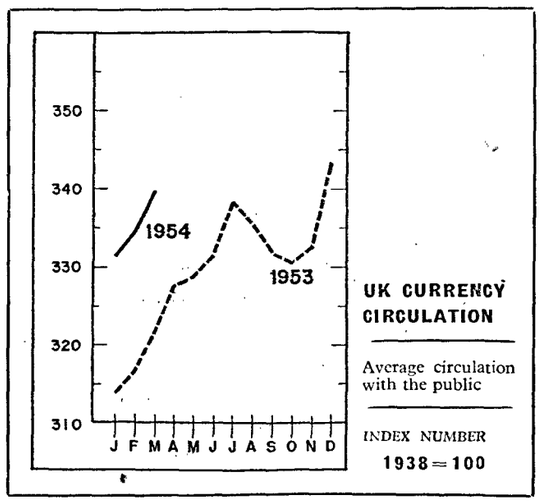
IN the bitter struggle and controversy over the European Defence Community the great moment has come for which the British Government has been so long preparing. The form of association with the EDC that it is ready to create is now known to the French cabinet, and an announcement in the House of Commons is expected as *The Economist* goes to press. It cannot disappoint French ministers, for they have known for some time what the British proposals would be. It will certainly disappoint all French opponents of the EDC, many of whom would have persisted in their opposition even if Britain had agreed to become a full member. What is uncertain is the effect of what Mr Eden has to say on moderate opinion, the floating vote on this vital matter.

The manner of making known what must be a historic decision is unskilful. The eve of the Easter holiday is hardly the moment for making a full impression on French public opinion. Nor is a statement in the House of Commons as effective a medium as Whitehall persists in thinking. It will be at the mercy of correspondents and commentators who have watched for over two years the hesitant, grudging manner in which British policy has bit by bit revised its attitude towards a project that it encouraged. It may prove to have come only in the nick of time, for Germans are becoming understandably restive and criticism of Dr Adenauer's policy—blocked at several points by France—is growing. What is welcome is the evidence that the government now accepts in its foreign policy, what it has for some time admitted in its strategy, that the air defence of the British Isles begins beyond the Rhine and that Britain should speak in the councils of EDC as the leading air power of Europe.

Disarmament Waits for Moscow

DURING their brisk two days of talk in London, Mr Eden and Mr Dulles found time to discuss the latest steps in the direction of international co-operation over atomic energy. It is now over five months since President Eisenhower laid before the United Nations Assembly his proposal for an atomic "pool" to which all countries could contribute, and in which all could work together, to develop nuclear energy for peaceful purposes. The Assembly had already passed a resolution urging the major powers to consult privately together on the whole question of disarmament, and it was clearly the view of the majority of governments that the Eisenhower offer would be a good starting point for these consultations. Even if its results were bound to be modest in the initial stages, it could provide a new angle of approach towards breaking the long-standing deadlock on disarmament between the Soviet Union and the majority.

Moscow's first brusque rebuff to the President's proposal was quickly modified when Mr Molotov saw what a bad impression it had made on world opinion; but the Soviet government has yet to show any real interest in the Eisenhower plan, as to which it may be fairly described as dragging its feet. Just a month ago, a detailed elaboration of the plan was handed by Mr Dulles to the Soviet ambassador in Washington. No reaction has yet been revealed. If the Russians now finally agree to the disarmament talks that were urged by the UN Assembly, endorsed at Berlin, and again proposed last week by the British representative at Uno, it is to be hoped that they will make clear at least



their general attitude towards the kind of co-operation proposed by Mr Eisenhower. Moscow still proclaims itself as the only true champion of disarmament; unbroken silence, and a marked reluctance to sit down at the conference table, are strange ways of acting this role.

No Surrender in Kenya

THE attempt to bring in many of the terrorists in Kenya through negotiations with the gang leaders has failed. But the failure is not total. After the lull in fighting that accompanied the final phases of the negotiations, a fierce new offensive is being mounted; it promises to be all the more effective for the valuable information collected during the tense weeks of contact with the terrorists. Even if this is the only crumb of comfort to emerge, the Government was clearly right to persist, despite the protests of many European settlers, in using General China's offer of his services as go-between with the terrorists.

Reports suggest that the surrender attempt came within an ace of success. On March 30th a meeting was held with the terrorists' representatives, at which the Government undertook to cease operations within certain well-defined forest areas for a limited period; in return the terrorists' representatives undertook to try to persuade their gangs to come in. What happened next is obscure, but it seems that the gangs were by now split into militant and malleable wings. By the evening of April 6th, unknown to the Government, a great throng of terrorists, some thousand strong, had collected near the forest edge to discuss surrender, and other large gangs were moving in their direction. Then came the fatal incident. A gang (presumably of militants), strayed out of the forest and opened fire on security forces, which were deployed for a sweep in the area. In the resulting battle 25 terrorists were killed. The news that the security forces were firing stampeded the gathering inside the forest. The terrorists dispersed, convinced that the Government's surrender offer was no more than a trap to surround and massacre them.

After this tragedy the Government had no real choice but to call the whole thing off. That the operation came so close to success in an atmosphere poisoned with suspicion is both a tribute to the authorities and a justification of their attempt. Those settlers who have throughout opposed the Government's strategem have not, of course, missed the opportunity of reading the Government a lesson. But it may fairly be asked whether their open hostility did not contribute materially to the terrorists' jitters, and so to a failure that Kenyans—European and African alike—may have bitter cause to rue.

Some Economic Terms

The following is a second selection of terms for the English-Doubletalk dictionary which was suggested in last week's issue of *The Economist*. Any reader who, in the interests of pure research, has further contributions to make will find his proposals welcome.

Manchesia, centre of protectionist agitation

Birmingham, centre of free trade agitation

Manchestertum, English name for present German economic doctrine

Schachtianism, German name for present English economic doctrine

Empire, the British Commonwealth of Nations, minus India (because of Nehru) and Canada (because of the dollar gap)

Empire Free Trade, Empire protectionism

Dumping, imports

En Principe, no (French)

Transferable Sterling, a variety of sterling so-called because it is not transferable into dollars.

The Bomb Goes to Coventry

COVENTRY CITY COUNCIL has made itself ridiculous by announcing that it has decided to disband its local civil defence committee, in order to "strengthen the hands of international statesmen in their efforts to outlaw the [hydrogen] bomb"; and the Home Office has rightly reminded it of its duty and asked it to reconsider this silly decision. The closure of the committee does not involve the immediate disbandment of the city's civil defence organisation; but the leader of the Labour council has intimated that he now regards civil defence as a whole as a waste of time and public money.

The councillors' illusions about the extent of their influence upon international statesmen are hardly more surprising than their illusions about the lessons to be drawn from their action. What they have done, certainly, is to think up another easy excuse for the apathy about civil defence which is already so evident among many local authorities, and greatly to discourage all those who have given time and effort to this cause. But they have not shown that the existence of the hydrogen bomb makes civil defence unnecessary. However large the area of damage there is always a periphery, where houses are burning and people are trapped and injured; and obviously, the larger the explosion the larger the periphery and amount of partial destruction. Coventry councillors have, in effect, voted to let their people die in the ruins on the apparent assumption that a bomb will land plumb on Broadgate and blow all the citizens tidily into paradise at the same instant. All this is quite apart from the question of whether, with both sides in possession of the bomb, it might be used by neither. Conventional bombs might be used instead, and Coventry should remember only too sadly that a civil defence organisation is needed to cope with them.

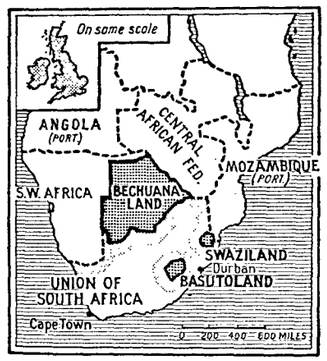
In his letter to Coventry, the Permanent Under Secretary to the Home Office admits in reticent officialese that civil defence measures will have to be reviewed "in the light of

recent developments." It is clear that this must be done very promptly if the precarious edifice of civil defence is not to collapse altogether.

Malan and the Protectorates

DR MALAN'S motion calling for resumption of negotiations with Britain about the transfer to the Union of the three British protectorates will no doubt be approved by the South African parliament; but it will bring not a moment nearer the event he desires. Why, then, having wilted from the alternative of seeking a petition from both Houses to the Privy Council, did he choose this course instead of reopening negotiations directly with London through diplomatic channels?

His intentions are obvious. On the one hand the Nationalist cabinet realise that they have in the protectorate issue another stick with which to chastise the opposition. The United Party dares not go back on the principle of incorporation, so vigorously championed in the past by their late leader, General Smuts, nor, as the party that lives and dies by the sanctity of the Constitution, can they afford to ignore the Union's undeniable right to seek incorporation. But, as the guardians of the Commonwealth link, and with due regard to the susceptibilities of their English-speaking members, they are loth to join in a wrangle with Britain. Another object of the move is to cement "backveld" support for the Nationalists by playing on an anti-British theme. On the other hand, however, Dr Malan's motion may be no more than a clumsy gesture, designed to impress the British public and parliament with South Africa's determination to get a settlement. In fact, the protectorate problem is not a real issue at all in the Union. Then there is the question of timing. Why does Dr Malan raise the matter now, whereas only a year ago he shrank from his oft-repeated promise to make it his main electoral plank? Perhaps the answer is to be found in the fact that he is 80 and he would like to retire in a blaze of glory, having settled the protectorate problem.



The firm statement of policy made by the British Government is obviously right in making it clear that, as in the past, there can be no question of retreating from pledges given to the people of the protectorates, and to parliament. But, if Dr Malan persists with his demand for a resumption of negotiations, the Government should accede since it has a duty to the inhabitants of the three territories, many of whom make their livelihood in the Union, not to take any action which might be prejudicial to their interests. Nevertheless it should be made clear to the South African Government from the outset that the present moment is inopportune for a transfer of sovereignty. The basis of this contention is the same as it was in 1925, when, in the words of the then Secretary of State, Mr L. S. Amery (with which General Hertzog agreed), "the native policy of the Union is about to be subjected to radical revision."

Belgium Gropes for a Government

BELGIUM'S quiet elections have created a situation that is confused and full of possibilities of friction. In Brussels, there is nothing novel about the prospect of a coalition or minority government; in fact, the Christian Social government that has just tendered its resignation after four years in office was the only one-party government Belgium has had since 1918. But that does not imply that most Belgians greet the reversion to normal with enthusiasm. For one thing, there is an awkward piece of unfinished business in hand, in the shape of the constitutional amendments required to permit Belgium to enter the European Defence Community. The EDC treaty was ratified by the last parliament, although its passage opened up rifts within the parties; but amendments of the constitution call for a two-thirds majority, and to get this the three main parties—Christian Social, Socialist and Liberal—may have to bury their hatchets, if only for a month or so.

That is not going to be easy. Although the Christian Social party has lost its clear majority (of 108 seats out of 212 in the Chamber of Representatives), it retains 95 seats and, being still the largest party, shows little desire to sacrifice its Catholic principles in order to come to terms with the Socialists or the Liberals. These two parties, having won respectively 86 and 25 seats, are theoretically in a position to form a coalition government, but in the past their different approaches to economic and social issues have shown them to be uneasy partners. Indeed, neither of the two larger parties is particularly happy about the decisive position that the Liberals now occupy; yet they are unlikely to join together to "dish the Whigs." And there are no other possible allies in sight; a couple of dissidents and a Communist party now reduced to four seats make up the rest of the Chamber. Some Belgians must be thinking regretfully of the last election year, 1950, when the "royal question," so painful at the time, nevertheless provided the country with a clear issue—and a clear majority.

Higher Pay for Hospital Doctors

THE new salary scales for the medical staff of the hospitals are a direct reflection of the Danckwerts award to general practitioners. The remuneration of both groups of doctors is based on the reports of the Spens committees, which were published in 1946 and 1948. The medical profession and the Labour Government accepted these reports, but profoundly disagreed over what is called the "betterment factor"—that is, the percentage increase to be added to the Spens scales to bring them into

What happens when your Senior Executives retire?

Many enlightened firms appreciate only too well their obligations to staff and senior executives. They know that with taxation at its present level no employee can hope to save enough to ensure a reasonable degree of security on retirement. They know that good executives can be attracted away by companies offering better security. Yet nothing is done to organise pension arrangements because of apparent difficulties and an impression that no ready-made scheme can meet their particular requirements.

The long experience of Arbon Langrish proves, however, that the application of specialist knowledge to individual cases can overcome apparent complications and provide a pensions solution (including 'Top Hat' arrangements) which is less onerous for the firm and thereby enable executives and staff to work loyally without the fear of a future insecure retirement.

Arbon Langrish consider each individual problem in confidence and of course without obligation. Independent of any Insurance Company they have an unrestricted choice of the whole Insurance Market and provide an unbiassed service.

The advice of Arbon Langrish

is available to principals, solicitors, and accountants, on all matters relating to pensions plans, 'Top Hat' schemes, and estate duty problems

How far ahead?

No guided missile, but a new kind of welding torch made by the Arc Manufacturing Co. Ltd. Yet it *does* reveal the shape of things to come, for plastic materials are used almost exclusively in its construction. The handle, shield and the turned components at either end are of three different grades of BAKELITE Laminated. Here, tough and versatile, is a material available *now* that has the properties needed in the tools of tomorrow. It is one of the many successes of the Bakelite organisation, whose pioneering has been mainly responsible for making plastics a part of everyday life.

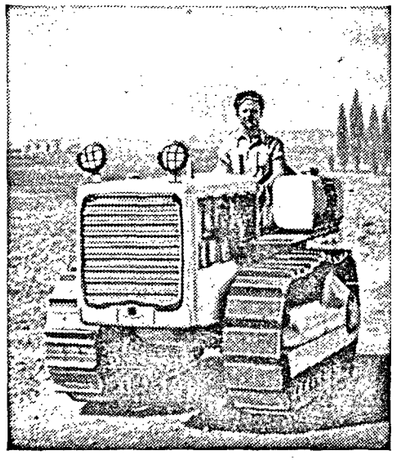
War on the Locusts

MIGRATING SWARMS OF LOCUSTS are again ravaging crops in the Middle East. The damage they cause is inconceivable; a single swarm may weigh 20,000 tons and eat its own weight in green food every day.

To combat this menace Anglo-Iranian has helped to produce an effective carrier for poisons. Sprayed from the air these poisons have destroyed countless millions of locusts.

This is a start. But the surest control of locusts is the cultivation of the waste lands where they breed. For this job mechanised farming equipment is needed. And this equipment needs oil—plenty of oil. Anglo-Iranian supplies the oil. Anglo-Iranian products are the power behind progress in many parts of the world.



THE BP SHIELD IS THE SYMBOL OF THE WORLD-WIDE ORGANISATION OF

Anglo-Iranian Oil Company LIMITED

line with present-day prices. The Labour Government adopted 20 per cent over 1939 values; in 1952 Mr Justice Danckwerts awarded general practitioners 100 per cent. The question was: should hospital doctors be entitled to a similar percentage increase?

The Conservative Government immediately and emphatically denied that they should. The consultants' negotiators had accordingly to decide whether to press for 100 per cent betterment or to make the best terms they could. If negotiations in Whitley Council had broken down, the Government might have referred the whole question to a committee of inquiry, whose finding might then have replaced the Spens report as the basis of consultants' remuneration—and been less favourable to them. Wisely, therefore, the consultants' joint committee abandoned the 100 per cent claim. Instead—and justifiably—it asked for increases that would restore the balance between hospital doctors and general practitioners which the Danckwerts award had upset. This the Government was much more disposed to accept. If in the first years of the health service general practitioners were paid too little by comparison with their colleagues in the hospitals, young consultants are now being paid too little by comparison with general practitioners to compensate them for their longer years of training.

The increase from £1,700 to £2,100 in the starting salary for consultants is intended to restore the balance. (It is noteworthy that the increases taper off at the top of the scales, consultants with the highest "distinction awards" receiving increases of £50 only.) But two comments need to be made. First, the new scales may well have repercussions in other professions, particularly in the universities. Secondly, it is time to ask whether there are not too many posts in hospitals, graded for consultants, which are in fact specialist posts—not at all the same thing. Dilution must of course be avoided; but where the clinical responsibility of two so-called consultants varies widely there is a case for recognising that difference in the salaries they earn.

Graduate Wives

ON the subject of women graduates there is a rich assortment of folk-unwisdom. That a university degree automatically labels its holder as a kind of freemartin, a sexless freak, is an opinion now happily obsolete. According to a milder version, which lingered on to distress eugenists, women graduates are notably less likely to marry than other women; and, when married, produce fewer children to inherit their presumably superior abilities. Once married—*still* according to folklore—the graduate is likely to prove an unadaptable wife and to henpeck her husband into the divorce courts; alternatively she will spend her married life in miserable frustration, weeping into the sink for her lost career. On the usefulness of women graduates' *academic qualifications the idée reçue* varies. The old battleaxes who regarded marriage and motherhood as betrayal of The Cause are probably all dead by now, but their influence still shows itself in a tendency among teachers and dons to tut-tut over every promising young *professional who gives her domestic concerns priority;* while the same "wastage" is quoted by anti-feminists to prove that the higher education of women is mostly money down the drain.

The recent PEP broadsheet "Graduate Wives"* is a salutary corrective to this mythology. Based on the replies to a questionnaire answered by over a thousand married graduates (of 1930 and later years) and by 420 of their non-graduate friends and relations, it discloses that the marriage rates of the two groups are practically identical; that they are, on balance, equally prolific (rather more graduates being childless, but fewer non-graduates having large families); that there is no significant difference in their divorce rates; and—perhaps most surprising—that the burden of full-time, unrelieved housework is carried as contentedly by first-class honours women as by anyone else.

Only 15 per cent of the graduates questioned were doing a full-time job; another 20 per cent were either working part time or expecting to resume their careers when the children were older. If the value of a university education is assessed entirely according to the paid career which it makes possible, the amount of money down the drain is on this reckoning formidable indeed. Only a handful of graduates, however, considered their university training a waste of time; and, as the final paragraph of this PEP broadsheet points out, one must not neglect "the indirect contribution which a trained mind and cultured outlook can make to family life and to the life of the nation. . . ." *Possibly it is the domestically occupied* graduate who may preserve the idea, which today is in danger of being lost, that the aim of a university is to produce civilised people and not merely high-powered salary earners.

Soviet Germany Loses the Race

IT is now nearly a year since the Soviet German government started on its "new course" to improve conditions for the workers. So far the Communist planning system has failed to respond adequately to the call for more consumer goods and foodstuffs. This was admitted in Herr Ulbricht's recent speech to the Socialist Unity Party Congress, delivered in the presence of Mr Mikoyan, the Soviet Minister of Trade, and his associate, Mr Suslov. It revealed that the desperate efforts of the party to carry out the new orders are largely lost in a vast tangle of red tape. Mr Mikoyan was evidently under orders from the Kremlin to flatter the German Communists. Among other compliments, he remarked on the German tradition of skill; but at one factory which he visited he was told that no less than fifty per cent of the material sent it had to be rejected on account of bad quality, and Herr Ulbricht himself referred bitterly to shortcomings in exports.

Western economists who make terrifying comparisons of production in the Communist and capitalist worlds—very much to the disadvantage of the capitalists—are apt to overlook the contrary evidence offered by East Germany. Yet in the two Germanies there is opportunity for seeing the two systems applied by the same industrious, efficient people. It is true that everything is not right in that com-

* "Graduate Wives." *Planning*, Vol. XX, No. 361, PEP, 16, Queen Anne's Gate, S.W.1. 44 pages, 2s.

parative paradise for the entrepreneur, Federal Germany; and a large part of the difference between the west and east of the country is due to the fact that the Russians have been milking the Soviet zone of reparations, while the Americans poured aid into the hands of their Germans. Nevertheless, East Germany remains testimony against the Communist economic system.

At the moment, Communist chances of making a good impression on the Western Germans seem remote. There is for the time being nothing to undo the effect of Herr Ulbricht's announcement that food rationing, which was to have been abolished four years ago, must still be retained. Farms lie waste, or are inefficiently worked by temporary managers, owing to the flight of peasants to the west, and the "People's Republic" must import 750,000 tons of grain. When it is recalled that Poland and Czechoslovakia, too, are forced to buy large quantities of grain, and the Russians themselves need larger supplies, an obvious link appears between speeches of Herr Ulbricht and developments in the Soviet Union. It is only too clear why the Soviet planners are so deeply concerned about the fact that in 1953 nearly ten million acres less than in 1940 were sown with grain, and why hundreds of thousands of young Communists are being despatched to bring waste lands into cultivation. Unless the Communists are helped by a severe recession in the west, they must rely on superhuman efforts to improve their own conditions in order to win the great political struggle in Germany.

Tremors Around Lysenko

IT was suggested in these columns last July that Trofim Denisovich Lysenko, the high priest of Soviet genetics, was slipping from his throne. For years his supremacy had been the symbol of Stalinist dogmatism and intolerance in science; with the party's official blessing he had laid down scientific "laws" by decree and feared no opposition from "heretics." After Stalin's death, however, there were signs that the days of his reign were numbered. The suggestion was greeted with scepticism by many and provoked the scorn of the *Daily Worker* which seemed anxious to deny that a certain degree of freedom was being introduced into Soviet science. Now, as a climax to much other evidence, Lysenko is taken to task both implicitly and directly in the latest issue of *Kommunist*, the Soviet party's theoretical organ.

A leading article entitled "Science and Life" attacks officialdom, administrative rules, and rule by decree in Soviet science; it reveals the existence of nepotism and of conservative cliques. Above all, it criticises monopolies in science and the impossibility for "people who hold other views" to get a hearing. Not only does the Lenin Institute of Genetics, of which Lysenko is the head, get its share of blame, but he himself is involved in a case quoted by the article. A few months ago a writer in *Botanichesky Zhurnal* who dared to criticise some of Lysenko's views was immediately assailed, not with arguments but with abuse, as "a follower of Weisman and Morgan, a vulgariser of Marxism, etc." and was given no opportunity to reply. Whether Lysenko, pupil of Michurin, is right or wrong in his controversy with the western pupils of Mendel, Weisman or Morgan is for scientists to resolve. The point of general significance is that for years Lysenko's opponents had been hunted out of their jobs and dared not question his dogma.

His fall from infallibility is largely due to lack of practical achievements. In the West he is thought of above all as a practitioner, and the Kremlin probably expected from him quick results in the form of higher crop yields. From Khrushchev's speeches and other comments on the state of Soviet agriculture it seems that these hopes were not fulfilled. Stalin's businesslike successors apparently will not allow their former master's fetishes to obstruct progress. The *Kommunist's* attack has implications far beyond the Lysenko controversy. Why should criticism of the official line stop at genetics or science? Why should not the airing of "other views" be beneficial in politics as well? The blows aimed at Lysenko's pedestal must cause tremors in the whole structure of Stalinism, in which respect for authority and orthodoxy was fundamental.

Doneraile Fair

LAST week, Miss Honor Tracy, the well-known Irish journalist, was awarded £3,000 damages for libel against Kemsley Press, Ltd. The circumstances of the libel were complicated. Miss Tracy had written an article for the *Sunday Times* describing certain goings-on in the village of Doneraile, County Cork, over a new house for the village priest. The priest, Canon O'Connell, complained that the article libelled him; and the newspaper negotiated a settlement under which it apologised and paid £750 to the Canon, destined for the Society of St. Vincent de Paul in Doneraile. Miss Tracy complained that, in apologising to the Canon and later publishing an apology in their own columns, the newspaper's proprietors libelled her. The jury found in her favour. In the present state of the law a newspaper's legal adviser must nearly always be a sad man, convinced that the other side's case is stronger than his own; and the only apt comment on *Tracy v. Kemsley Press, Ltd.*, is that its history should be written by Miss Tracy herself—and in Doneraile, for what village could understand it better? The Canon has his house and his apology. The Society of St. Vincent de Paul has its £750. Miss Tracy has her £3,000 award. God bless us, the villagers might very well say, we love ye all.

By a coincidence last week also saw the publication of the correspondence between the Roman Catholic Bishop of Leeds, Dr Heenan, and the BBC over another apology; and on this apology criticism need not be withheld. Dr Heenan had intimated that there was religious intolerance by Protestants in Northern Ireland (which everybody knows there is); and, in a true spirit of BBC impartiality, he had referred in the same breath to Catholic intolerance in Spain. Later that day the BBC apologised to Northern Ireland in general (there seems, as yet, to have been neither protest from nor apology to Spain). Two apologies do not make a grovel, but the British habit of saying "Sorry" to anyone who treads on their toes seems to have become something more than a habit of speech. Indeed, there are times when the BBC in particular, by its customary reaction to anyone who says "Boo" loudly enough in its ear, creates doubt in the mind as to what sort of a bird it is.

Who's Who?

THE Julia of George Orwell's "Nineteen Eighty-Four," who "apparently had not even noticed that the name of the enemy had changed," and "thought we'd always been at war with Eurasia," was not a particularly stupid young woman. She was merely uninterested in public events which did not impinge directly on her private life; so the Ministry of Truth's techniques for falsifying the past—indeed effectively abolishing it—met with no such resistance in her mind as an inconveniently retentive memory might impose. The reader usually consoles himself that memory cannot really be as malleable as all that, that there must be a limit to what the public will swallow in despite of experience and prior knowledge.

With its usual knack of dispelling comfortable democratic illusions, Mass Observation recently produced some relevant evidence. One thousand people were asked to identify five names lately and prominently in the news: Senator McCarthy, Dr Kinsey, Sir Edmund Hillary, Gordon Pirie, and John Reginald Halliday Christie. Only one person in six knew that Senator McCarthy was campaigning against Communists; only half of those questioned could place him at all. The same proportion successfully identified Dr Kinsey. (Among the unsuccessful, one happy guesser assigned to him the authorship of "The Water Babies.") The largest number—820 out of 1,000—spotted Christie, the Notting Hill murderer. Sir Edmund Hillary was runner-up, his name and achievement being known to just under three-quarters of Mass Observation's sample; what that knowledge amounted to may perhaps be indicated by the respondent who identified him as having gone "to the top of that big hill with a black man called Sing-Sing."

Perhaps it hardly matters. Perhaps it merely means that the reprieve from oblivion is rather shorter and more partial than one had thought. But if, as the daily newspapers that make the most money seem rightly to assume, the common man is more interested in personalities than in ideas, in identifiable exploits than in gradual trends, then—taking a line through his degree of acquaintance with these five headline-hitting figures—how wonderfully ignorant the Common Man must be about practically everything in the realm of current events and recent history; how easy for Big Brother, his ascendancy once established, to manipulate that ignorance; and what a miracle it is that democracy, theoretically presupposing a rational and well-informed citizen body, should creak along even as well as it does.

SHORTER NOTES

The Arab League meeting that finished in Cairo last week put an end, tacitly, to Egypt's contention that no armament deals with western powers are timely till Egypt's own quarrel with Britain is settled. It resolved "that every Arab state has the right to purchase arms within the limits of its sovereignty and the collective security pact;" all that is asked is that the sale be unconditional. This regularises several recent purchases of arms, notably that from America by Saudi Arabia; in fact Egypt, which has bought from Germany and is negotiating with Japan, is the only Arab state that is bent on seeking "neutral" sources of supply.

Hong Kong business circles note a steady falling off in offers of mainland products which they associate with the Peking government's drive to get rid of the remaining private merchants and replace them with state monopolies. There are signs also that Russian demands are taking up more and more of China's output; there are, for example, hardly any groundnut and other vegetable oils available. Peking's flotation of National Reconstruction Bonds has had an adverse effect on the flow of remittances from overseas Chinese to the mainland; it is estimated that the total may be down as much as 30 or 40 per cent compared with the previous year.

★

The reported failure of the committee set up by the Organisation for European Economic Co-operation to reach agreement on the question of export subsidies revives the danger of a bitter competitive struggle among the main competing countries in this field. German newspapers have replied to the criticism of German practices in the recent budget debate in the House of Commons by alleging similar, though concealed, subsidies in Britain. Unless action is taken at the government level in OEEC mutual recriminations may be followed by destructive competition.

A Decimal Coinage

SIR—With reference to decimal coinage, I do not know whether the following system has ever come before you. I would suggest that on and after a certain date there should be only 10 pence in the shilling. Our currency would then be 10 pence = 1 shilling; 10 shillings = 1 half-sovereign. For the sake of shortness, I would style the half-sovereign—our unit—a queen. Thus, 1 queen = 10 shillings = 100 pence; the sovereign = 2 queens being of course retained. Regarding 3d., 4d., and 6d. pieces, they would continue to exchange for 3 pence, 4 pence, and 6 pence respectively, being, however, 3-10ths, 4-10ths, and 6-10ths of a shilling; but to facilitate exchanges, I would coin 5d. pieces, and cease coining 6d. pieces. The crown would remain as it is; the half-crown being worth, however, 2s. 5d., instead of 2s. 6d. as formerly. The greater portion of our large contracts being made in shillings or in pounds sterling, the alteration would have but a slight effect on old-standing arrangements; and, if need be, where based on the penny, the difference could easily be arranged by a reference to the *old* and *new* relations of the penny to the shilling. The exchanges of the common people, which are based on the penny, are generally made for ready money, and prices would very soon be adjusted to suit the change from 12 to 10 pence in the shilling. The great merit of the plan I propose is, that it does not necessarily change the name of any coin, or alter the recognised value of any gold or silver piece. There is an apparent alteration in the value of the 3d., 4d., and 6d. piece, but this is merely from the habit of looking on such coins as parts of a shilling more than as convenient forms for carrying pence.

Begging your reference to this matter if at all worthy of your remarks, I am your obedient servant,

Glasgow, April 4, 1854 NUMBER 10.

ON April 16, 1922, Rathenau and Chicherin signed the Treaty of Rapallo. To Russia it represented a major step along the line of a clearly defined policy. In December, 1920, Lenin had announced: "Our foreign policy while we are alone and while the capitalist world is strong consists in our exploiting contradictions." On the German side there was at this stage no such clarity of purpose. The Social-Democrats, the strongest party throughout almost the whole of the Weimar period, were western in their orientation. But by 1922 the army and heavy industry had largely re-established their control over German policy, and, searching for allies and markets, both looked eastwards.

Although Rathenau signed the treaty with reluctance, its reception left him no choice; as Mr Bonn, a member of the German delegation to the Genoa Conference, has put it, a momentary aberration had to be presented as a deliberate act of policy. As such it has often been regarded; for certainly until the death of Stresemann no German government was blind to the advantage, in dealings with the western powers, provided by a close understanding with Russia. Common hostility to Poland cemented the alliance of the "have-nots," of Russian communism and German nationalism, an alliance, which, in spite of the many strains it was exposed to, lasted for a decade. Not until 1934 did the break come, though the relationship had gradually deteriorated from as early as 1931.

Not all of Mr Kochan's judgments will receive universal approval; but his book, based on a careful study of the available sources, brings out admirably the difference between the German and Russian attitudes towards the relationship of the two countries during the Weimar period. Once hope of a successful proletarian revolution in Germany had been abandoned, Moscow regarded the Rapallo policy as an essential defensive measure against the possibility of a capitalist coalition. Viewed from Berlin Russian friendship was the essential offensive weapon in Germany's struggle against Versailles.

While Mr. Kochan proves a thesis, Mr Hilger tells a tale, and a fascinating one it is. Born in Moscow, interned during the First World War, Mr Hilger left Russia in 1918, only to return two years later to take charge of the repatriation of German prisoners. In 1922 he joined the staff of the Moscow Embassy, and for the next twenty years he worked to bring about lasting Russo-German friendship. Now, in collaboration with an American scholar, he has told the story of these years in a book described as a "memoir-history of German-Soviet relations." Its impartiality is as astounding as it is refreshing, and can only be explained in Mr Hilger's own words:

> I have always had two home countries, Germany as well as Russia. I am attached to both of them with affection and nostalgia.

To the story of Nazi-Soviet collaboration Mr Hilger adds little, but for the period preceding that unholy alliance his book is a mine of new information, particularly perhaps on military and economic matters. At last it may be taken as proven that from 1922 onwards the German Cabinet was fully aware of the co-operation between the Red Army and the *Reichswehr*. Far more surprising than the confirmation of this long-held suspicion is the fact that Russo-German economic relations survived the political break almost unscathed. Thus in December, 1935, Schacht could inform Kandelaki, the head of the Soviet trade mission in Berlin, that Germany was willing to grant Russia a credit of 500 million marks. In the end the negotiations broke down, but not before Kandelaki had suggested a political rapprochement between the two countries. It seems strange that to unsentimental Marxists the *mariage de convenance* should have proved as hard to forget as a love match.

Three years ago Mr E. H. Carr concluded his survey of Russo-German relations during the inter-war years with the question whether a German government, free to conduct an independent foreign policy, would again reject the advice of Frederick the Great and Bismarck to "cultivate the friendship of these barbarians." Mr Hilger ends with an assertion, not a question. Germany

> can either seek security against the Soviet threat by alliance with the western powers, or else she can ally herself with the Soviet Union. But in the event of the latter, Western Germany, and probably the rest of Europe, would doubtless share the fate of the East European satellites.

Advocates of a neutralised Germany should find much food for thought in these conclusions.

Old and New in Turkey

A VILLAGE IN ANATOLIA.
By Mahmut Makal. *Translated from the Turkish by Sir Wyndham Deedes, and edited by Paul Stirling.*
Vallentine Mitchell. 206 pages. 18s.

THIS book is Turkey's most controversial best-seller. Published shortly before the 1950 elections, it provided the Democrats with formidable ammunition in their campaign against the People's Party government. Its author, a young village teacher, was first imprisoned on suspicion of being a Communist, and then, after his release through the pressure of enlightened public opinion, feted in all the main cities of Turkey. He was barely twenty years old; yet his vivid pictures of the poverty and backwardness in some Anatolian villages came as a startling eye-opener to many educated Turks, who had imagined that Ataturk's Revolution could repair the neglect of centuries in a few years.

Mahmut Makal is one of the pioneers of rural education in Turkey; at the time of which he wrote barely half of Turkey's 35,000 villages had a government primary school. He saw—and grappled with—the first impact of western ideas on these, until very recently, extremely isolated Anatolian villages. He saw the village lad terrified by his first visit to the cinema. He heard the reactions of the villagers to the woman politician with polished nails and a permanent wave. Above all, he contended with the obstinate bigotry of the villagers, who clung to their old beliefs and their holy men and would have none of his new-fangled ideas.

Much of what the author has to say is very illuminating. But without the excellent introduction and footnotes contributed by the editor, the general picture of the Anatolian village four or five years ago would be highly misleading. The villages where the author lived and worked happened to be in a particularly barren part of the plateau; and the period of which he wrote happened to be one of exceptionally severe famine. (Today, after several excellent harvests, these villages must present quite a different picture.) Moreover, in describing local customs, for instance, marriage customs, the author sometimes ignores their original meaning and justification, or else, by generalising from a special case, gives quite a false impression.

This is clearly not deliberate dishonesty. Here is a young man, himself a peasant, who, after five years' schooling in western ideas in a village institute in a relatively advanced part of Anatolia, returns to his own countryside. He is dismayed by the contrast between what he has been taught and what he finds there; and he passionately wants to draw attention to his people's backwardness and poverty and get something done about it. Not the least interesting part of a very interesting book is the meeting of old and new in an intelligent, sensitive and highly articulate young man.

Epic Survey

THE ENGLISH EPIC AND ITS BACKGROUND.
By E. M. W. Tillyard.
Chatto and Windus. 558 pages. 25s.

IS *Hamlet* Tragedy? Mr Tillyard recently decided that it is not: *Hamlet* is a Problem Play, belonging with *Measure for Measure* and *Troilus and Cressida*. Is the *Decline and Fall of the Roman Empire* History? In his new book Mr Tillyard, in effect, pronounces another negative. Gibbon's work is Epic—and it therefore belongs with *Piers Plowman, The Faerie Queene, Arcadia, Paradise Lost*, Bunyan's *The Holy War* and Pope's *Iliad*.

There is some hazard in thus pressing boldly beyond form to spirit when endeavouring to distinguish and establish literary kinds. In formal terms Gibbon certainly wrote a history, Langland an allegory and Sidney a romance; librarians at least would do ill if they reclassified such works according to feelings which they severally felt them to occasion; and even distinguished critics are chargeable with an element of unprofitable subjectivism when they attempt something of the same sort. Nevertheless the procedure may be defended as both philosophical and scientific: philosophical as endeavouring to disengage the *ethos* of individual works and scientific as applying inductive method in a field where it is wholly appropriate.

In capacious mind, which has for long ranged widely over many literatures, fresh relationships must continually suggest themselves as here and there a common temper or a similar balance of elements is remarked. A process of this sort, and much subsequent deliberate comparison and study, has led Mr Tillyard to acknowledge four main criteria for Epic. These are (1) high quality and high seriousness, (2) amplitude and inclusiveness, (3) the powerful and sustained exercise of the conscious will, giving control commensurate with the amount included, (4) a choric element, requiring that the poet "express the feelings of a large group of people living in or near his own time." The first criterion excludes *Leonidas*, the second *Madame Bovary*, the third *Don Quixote*, and the fourth all works essentially timeless and therefore belonging to Tragedy.

The test thus devised, although a good one, is, of course, unlikely to gain universal acceptance. That *The Holy War* is very notably epic is likely to remain a minority opinion, and there are many who would plead for a viewpoint admitting at least some glimpse of, say, *The Prelude* or *Don Juan*. Nevertheless, as with *Hamlet* and the Problem Plays, we are made conscious of seeing familiar work in a new and revealing perspective. This would be much. But the Master of Jesus has given us more than a stimulating thesis. His book has itself something of the true epic amplitude. It will endure as a noble and commanding survey of many of the high places of English literature.

The Hohenzollern Lands

THE ORIGINS OF PRUSSIA.
By F. L. Carsten.
Oxford University Press. 309 pages. 30s.

THE Prussian state, which has had a fateful influence on the course of European history in the last two centuries, was founded by the Great Elector, who died in 1688. This book is concerned with the earlier history of those scattered Hohenzollern lands, which he drew together in strict subordination to himself, as well as with the way he accomplished this crucial task. German historians have already explored these matters with characteristic thoroughness, but this is the first systematic English account of the whole subject solidly based on their detailed work.

As such it is welcome, for little is generally known here of this fascinating, if rather complicated, piece of German history. What is not less important, the book throws new light on some of the more obnoxious features of later Prussian society, for the dominance of the Junkers and the grinding serfdom of the peasantry were inherited from this earlier period. Frederick William and his successors, even had they been so minded, could have done little to change these things; they could only make use of them.

Mr Carsten divides the subject into three distinct parts. First he describes, very competently, the growth of a vigorous colonial society in Brandenburg, Pomerania and the Prussia of the Teutonic Knights from its tenth century beginnings to the climax of its prosperity in the early fourteenth century. Conversion and settlement brought Germans and Slavs together. Conditions for the peasantry had to be attractive, and, in consequence, seignorial power was strictly curbed, while the Hanseatic towns on the Baltic prospered exceedingly.

Next this society is shown in full decline during the fifteenth and sixteenth centuries. Plague, war and the European economic depression of the later middle ages impoverished Brandenburg, Pomerania and Prussia alike. The towns decayed; the peasantry fell into serfdom; the territorial princes ceased to count; and the Junkers came into their own, ruling through the various Provincial Estates. Here Mr Carsten's touch is less sure. Like most historians he finds the economic decline of the later medieval period easier to describe than to explain. Nor does he provide a sufficient reinforcement of political and administrative history for his argument. There is, for example, no satisfactory explanation of the constitution of the Estates, whose activities he describes in detail.

Finally an admirable section is devoted to the activities of the Great Elector, although here again a more generous stiffening of straight political history would have been welcome. We learn how Frederick William adroitly broke the power of the Estates in Brandenburg and ducal Prussia, although less completely in Cleves and Mark, and then came to terms with the Junkers. After that he founded his despotic authority, which was steadily enlarged by his successors, on a uniform military administration, for there was little else that his hereditary lands had in common.

Old Age in Business

THE AGE STRUCTURE OF THE CORPORATE SYSTEM.
By William Leonard Crum.
University of California Press (Cambridge University Press). 193 pages. 26s.

IN England a decent respect for mature years in a company is one of the few things which investors have learned. Every issuing house knows that the shares of an old-established family business sell like hot cakes to a narrower yield than those of a new venture. That is natural, for the business which was going strong when Mr Gladstone was introducing his budgets has had the chance of putting some fat on its back before taxation reached its present height; the business which was in its infancy when Mr Gaitskell was introducing his budget has not. In America old age has not been regarded as a virtue; new ventures have been objects of admiration and desire.

But it falls to an American professor to challenge the American view by proving statistically that old age has investment merit. Professor Crum occupies a chair of economics in the University of California. The publication by the United States Treasury of the dates of incorporation of nearly half a million of the corporations making returns in 1945 and 1946 gives him his opportunity to sift and re-sift the evidence through 181 heavy statistical pages. What does he find? First there is a tendency to middle-age spread in total assets—a middle-age spread which starts early; it begins with corporations born in 1929, which will not see twenty-five again and ends with those of thirty, founded in 1924. This is qualified by the fact that "very large corporations tend to have much greater age than very small corporations." On the score of profitability, too, old age has the advantage: "young corporations are clearly and emphatically more likely to show loss (in 1946 or 1945) than older corporations," for corporations may have to live through several precarious years before they show a profit. Finally, the risk of a corporation failing to survive diminishes as its age advances.

The analysis has one striking defect which the author frankly acknowledges. His statistics deal only with age since incorporation, not with the age of the underlying enterprise. Try as he will, he cannot overcome this defect except to the small extent of showing that those corporations known to be successors of other undertakings show a smaller risk of loss than new ventures. In England the difference between date of incorporation and date of starting the business would destroy the value of the analysis: incorporations have so many spurious

THE SIXTH AND FINAL VOLUME OF

SIR WINSTON CHURCHILL'S

WAR MEMOIRS

Triumph and Tragedy

With this sixth volume Sir Winston Churchill brings to an end his history of the Second World War. It covers the whole of the tremendous climax from the Anglo-American landings in Normandy on June 6th 1944 until the surrender of all our enemies fourteen months later—a period which saw the death of President Roosevelt, the murder of Mussolini, the suicide of Hitler, the fateful conferences at Yalta and Potsdam; a period during which the Flying Bombs and the V2 rockets were loosed in bombardment of Britain; when the German army was at last beaten in Italy, forced out of France, and broken in the Fatherland, while Soviet Russia established herself in the heart of Western Europe; a period which saw the Allied advance through Burma, the transfer of Allied pressure to the Pacific theatre, the dropping of the first atomic bomb on Hiroshima and the eventual defeat of Japan.

KREDITWESEN

(THE JOURNAL OF FINANCE AND CREDITS)

Editors: Erich Achterberg and Volkmar Muthesius

The publishers of this Journal, with the assistance of the association's representative of banking in Western Germany, have now published in German a 5th Edition of the

Handbook of Finance and Credit

(Handbuch des gesamten Kreditwesens),

the standard reference book for the German credit system.

Its 1,270 pages of text contain in full all the laws and ordinances relating to money and credit which have been enacted in the German Federal Republic and in the Soviet zone of occupation since the currency reform, including the arrangements for external debts. A list of all the credit institutions in both Western and Eastern Germany is also included.

Fully cloth bound.

Price DM.38.

Descriptive leaflets can be obtained on application to

VERLAG FRITZ KNAPP *(Publishers)* FRANKFURT on MAIN GERMANY

causes, such as changes from private to public company form for flotation and the saving expedients leading to the formation of new companies. In America it seems not quite fatal.

Professor Crum's book is heavy reading and its conclusions mainly confirm general experience. The author's service is that he has opened up a new line of investigation.

A Promising Venture

"OCCIDENTE": *An Anglo-Italian Review of Politics, Bi-monthly.*
Printed in Turin, Distributed in England by Parker's, Oxford.
No. 1, January-February, 1954. 96 pages. 4s. 6d.

"OCCIDENTE" is eight years old in Italy, but it has now started life afresh as an Anglo-Italian, bilingual review. Signor de Marchi, to whose energy it is due, has always been a member of the editorial board and has constantly enlisted English contributors along with French, German, Italian and other writers.

The readers of the first number are informed of English inhibitions about "intellectuals" generally, and about political theorists in particular, in an excellent article by Asa Briggs. To read it is to realise how blessed this island is in its lack of profound political and moral dilemmas such as beset France and Italy just now. England was not always so unconcerned with political theory, and in a quiet sort of way there is plenty of concern today about, for instance, how Parliament spends its time and what trade unions may become. But we are not uneasy about our political system as a whole. We seem to be on speaking terms with our difficulties; the Italians (with a few exceptions) are not. "Occidente" wants to get people talking to each other about them, and the first number sets the ball rolling. This is exciting and full of possibilities.

But it has one pitfall. Signor de Marchi writes: "Almost every number presents me with the difficulty of finding a trained historian or constitutional lawyer to write about contemporary problems in the way that most eminent Oxford or Cambridge dons would unhesitatingly do." He is talking about Italians. Perhaps he himself must step down a little into a less exalted sphere than that of continental academic writers. He is clearly most anxious to break down their isolation, but people tire easily, not only in England, of what ought to be and are interested in what is. Why has Catholic Action never started Women's Institutes in Italy? What alternatives has it embarked on, if any? What exactly were the worker priests doing in France? The Continent is now either Catholic or Communist in its mass recreation. What happens when heretics from either great organisation begin to create new places of discussion, entertainment and social assistance? There are such ventures going on quietly all the time, which it would be interesting to hear about.

Favourite Viceroy

THE VICEROYALTY OF LORD RIPON.
By S. Gopal.
Oxford University Press. 245 pages. 21s.

FROM now on, many of the important books on the history of the British Raj in India will be by Indians. Mr S. Gopal, the son of Sir S. Radhakrishnan, the philosopher and Vice-President of India, has set an excellent example. His study of the viceroyalty of Lord Ripon is scholarly, readable and just.

For Indians, Lord Ripon is perhaps the favourite viceroy of the long line which ended with Mountbatten. The way in which he won their regard is in itself striking. He was not a man of first-class mind or ability. On the great issue of his viceroyalty, the stand upon racial justice over the Ilbert bill, he compromised and gave way at least partially to the agitation of the British community in India. Nevertheless he caught the imagination of Indians because he was regarded as standing for the ideals and expressing the opinions of Gladstone and Bright. The peculiar strength of the British in India was that they conveyed the idea that certain ideals were essentially British, however much the contemporary practice of British administration in India may have fallen short of them. Mr Gopal has a perceptive sentence:

> The Viceroy whom the English condemned as Indophile became to Indians the most English of all Viceroys in that he was the prophet and champion of their freedom.

Mr Gopal thinks that Lord Ripon was the first viceroy to make the westernised Indian middle class feel that its co-operation and friendship were genuinely sought. By doing so he laid the foundation of the understanding between them and the British which was to survive all the bitterness of the struggles between this class and the Raj.

Mr Gopal gives some striking facts about the way in which India showed its regard for Ripon, and the British in India remembered their hostility. In 1915, thirty years after he left India, his statue was set up in Calcutta. The British residents had refused to subscribe a penny and it was paid for entirely by the Indians.

Sea-Birds' World

SEA-BIRDS.
By James Fisher and R. M. Lockley.
Collins. 320 pages. 25s.

OVER two thousand books and papers on birds are published every year. Before this material can be made available to the ornithological public, it must be sorted and summarised. This can be done by writers interested in different examples relevant to one particular problem, or by writers primarily concerned with one kind or group of birds. This latest "New Naturalist" volume deals with a group—the sea-birds of the North Atlantic. This category, although artificial—the black-headed gull, for instance, is largely an inland bird and far less marine than many ducks—brings together very different birds with similar ways of life.

The authors have successfully made the excursions into specialist fields of knowledge that were necessary for adequate review: distribution, evolution, population dynamics and (less successfully) behaviour are discussed in a series of chapters that remain readable in spite of the information with which they are crammed. This information is supplemented by photographs, and also by excellent distribution maps drawn on projections which, although at first sight bizarre, have been cunningly selected to give a "bird's-eye," rather than a "north temperate human," view of the range of each species.

There are some interesting accounts of life histories in the later chapters, but on the whole the authors provide a comprehensive rather than an intimate view of the sea-birds' world; they tell us something about the factors that control the success or failure of the several species—the increase or decrease of their populations, the expansion or contraction of their ranges. This enables us to understand sea-birds in proper perspective as successful products of an evolutionary process; as members of species which, originating perhaps thirty million years ago, are still managing to force a living from the oceans; and as members of a community of species whose requirements are so intricately interwoven that, although living together, they barely compete.

Although the uninitiated will find the facts a little indigestible (a more substantial background of theory would have helped to give them relevance), ornithologists will continue to refer to this book for many years to come.

Shorter Notices

EGYPTIAN COTTON
By C. H. Brown.
Leonard Hill. 16s.

Mr C. H. Brown was for thirty years employed in the Botanical section of the Egyptian Ministry of Agriculture at Giza to improve the grade of Egyptian cotton, and he did not leave the country until the outbreak of anglophobia which took place in 1951. Nobody therefore is better qualified to give an account of cotton cultivation, or of the diseases which attack the plant and the constant struggle of the experts to produce the optimum grade; and his book will be of great value to those who are interested in cotton growing. There is a short chapter on the economics of the industry and of the complicated arrangements for marketing cotton in Alexandria, but the information on this aspect of the cotton question is less full than on cotton growing. On the working of the Alexandria futures market, for instance, the reader is referred to another work, and this detracts somewhat from the general value of Mr Brown's otherwise admirable book.

It is not surprising, in the light of his background, that Mr Brown does not believe that the country is running any serious risk by its present dependence on one crop, and he is of the opinion that the "simplest way for Egypt to get more wheat is to grow more cotton." In these days of

competition from new cotton growing countries, to say nothing of artificial fibres, it is an opinion which is far from being self-evidently true.

★

IN THE SHADOW OF THE MAHATMA : *A personal memoir.* By G. D. Birla. *Orient Longmans.* 338 pages. Rs 5/8/-.

This book, to which the President of India, Dr Prasad, has contributed a foreword, consists very largely of letters. They cover, however, the period of some thirty years, leading up to the death of Gandhi and the transfer of power in India; they include many intimate letters which passed between Gandhi and Mr Birla—in whose house the Mahatma died; and they have been skilfully and readably arranged with a connecting text. The result is not a book for the casual reader. But it is the kind of work that makes its own special contribution to history, because of Mr Birla's unique role in the movement for Indian independence. And it can hardly fail to prove a lasting source of information to all who are interested not only in the life of one of the greatest men of the century, but in the whole remarkable story of how the British left India.

★

ADVERTISING AND PSYCHOLOGY. By Leslie E. Gill. *Hutchinsons University Library.* 182 pages. 8s. 6d.

This is a disappointing little book. If, anywhere in it, there is an illuminating or original idea, it has escaped the diligent eye of, at any rate, one reviewer. As Mr Gill observes in his introduction, advertising as a means of influencing people's thought and behaviour involves the application of many of the fundamental aspects of psychology. Surely such a subject need not be dull even in a book which aims, modestly enough, to constitute only a brief introduction; yet the author by burdening his writing with an unreasonably heavy weight of the obvious has contrived to make it so. Occasional relief is provided by flashes of unintentional humour, such as Mr Gill's description of the sex impulse as "a powerful determinant of human behaviour, affecting as it does the sale of a tremendous range of commodities."

Despite its faults, this book contains much sound information which will certainly be of interest to the student of advertising—though surely not, as the publishers also assert, to students of psychology or to the general reader.

Letters to the Editor

Horizontal Weather

SIR—Mr Harrod defends his proposal for allowing firms to choose their own rates of depreciation for tax purposes by saying that they will have to "pay a price" for the privilege of accelerated depreciation by carrying the high depreciation rate in their own accounts and so making "a temporary sacrifice of profit in order to get it."

His belief that few businesses will be prepared to pay the price implies a very poor opinion of the intelligence of directors (or else of his own). Most businesses pay out far less in dividends than the profits which they show in their accounts. There is no "sacrifice" or "price" in recording part of this difference as "accumulated depreciation allowances" instead of "undistributed profits"—especially as the directors' report can explain about the high rates used (and even state what the profit would have been with normal rates). Only exceptionally need this accounting procedure affect dividends: there is nothing in it even to prevent withdrawals from reserves, if necessary! And in return it brings the firm an interest free, unsecured loan from the Treasury.

From a wider angle the incentive to use unrealistic depreciation rates in order to postpone tax payments is most undesirable precisely if it has to be applied to the published accounts. Neither shareholder nor worker would feel that these could be relied on to give that "true and fair view" of the position which the auditor has to certify if the rates can be varied *ad lib* from asset to asset, and so from year to year.—Yours faithfully,

W. B. REDDAWAY

Clare College, Cambridge

Constituencies' Chop and Change

SIR—I like your comment that the machinery for constituency revision "holds the power of electoral life and death." It does, and however much the machinery may be improved it will continue to do so—as long as we cling to single-member constituencies.

So long as a city or county has to be carved up into more or less equal single-member constituencies, the votes cast in that area will give one result if the boundaries are drawn in one way and a different result if they are drawn in another. But if Bristol or Bedfordshire were one constituency, electing its six or four members by PR, the result would depend *only* on the votes cast. There would be no boundaries to be drawn within such an area, and therefore no possibility of gerrymandering, real or imaginary. London or Lancashire, of course, would have to be divided into constituencies of reasonable size, but the boundaries to be drawn would be far fewer and they could affect the result only very little if at all.

Moreover, boundary revision would only rarely be necessary. If Leeds has to have six MPs instead of seven, that would mean only that the returning officer would do his sums differently, dividing the total votes by seven instead of eight. And the MP to disappear would be the one the voters felt they could best spare, not the one agreed upon by his party for sacrifice.—Yours faithfully,

ENID LAKEMAN

Proportional Representation Society
London, S.W.1

Ramp or Mouldy Turnip?

SIR—I am sorry that your otherwise well-informed article of March 13th gives currency to the suggestion that 200,000 houses a year are falling into disrepair. I know of no statistical basis whatever for this figure. As far as I can trace, it first appeared in a book written by Mr Aneurin Bevan in 1944. It is a fact that this figure is still occasionally quoted and I am sure you accepted it in good faith, but I am not aware that it has ever been accepted officially.

The truth is that there is very little statistical information available; but in the House of Lords Debate on December 10, 1952, Lord Lloyd, who spoke for the Government, produced his own figures to suggest that this particular estimate is unacceptable. He stated:—"... to the best of my own calculation there is no justification for saying that houses are going out of commission at the rate of anything like 200,000 a year."—Yours faithfully,

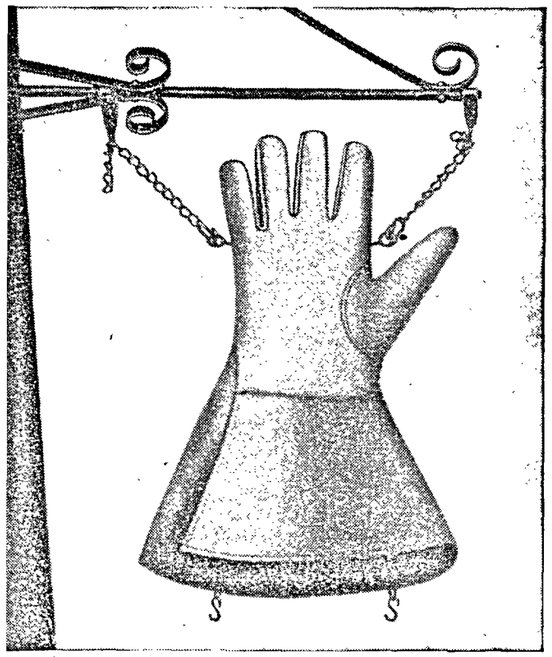
GEOFFREY D. M. BLOCK

London, N.W.3

Germany and EPU

SIR—Your Business Note of February 20th states that "dollar goods imported into Germany as a result of this relaxation of import licensing may not be re-exported to hard-currency countries unless they are further processed in Germany." The official text of the German announcement makes it clear that goods imported from the dollar area can be re-exported without further processing to hard-currency countries. They may not, however, be re-exported to member countries of EPU or to soft-currency countries without any further processing in Germany.—Yours faithfully,

Hamburg H. H. A. BOKS



How near at hand?

THIS ancient Glover's sign is mentioned as being "rather rare"—how *very* different from the blue-and-white shield sign of Ford Dealer Service! No matter how remote or rugged the road, there is a Ford Dealer somewhere reasonably near at hand. And here is something which is equally true: no matter what Ford Dealer you go to, you will find a consistently good service, complete with all those advantages which make such a difference to Ford-owners. For instance, the mechanics who look after your car will be Ford-trained ... there will be special Ford-designed equipment ... spare parts will be readily available ... and your bill will be kept down to a minimum because, throughout Ford Dealer Service, all charges for spares and mechanical repairs are low and fixed. This is, in fact, a Service which magnificently measures up to the ideal of 'Five-Star' Motoring ... Yet another reason why Ford motoring costs less.

The first Handbook to Retirement

Retire and Enjoy It answers a long-felt need, for it is the first practical guide through the many problems of retirement—problems which every year face 85,000 more men and women in this country. The result of five years' intensive research by Cecil Chisholm, *RETIRE AND ENJOY IT* is designed to make retirement a time of fulfilment. It deals with ways and means of making the pound stretch further and of meeting the rising costs and heavy taxation which threaten the comfort and security of the elderly. Here, fully discussed, are such matters as spare-time earning, investment, saving, budgeting, where to live, hobbies—and useful hints on keeping fit. Cecil Chisholm's arguments and suggestions, backed by clearly set-out facts and figures, will encourage a happy and successful retirement.

Elections Again

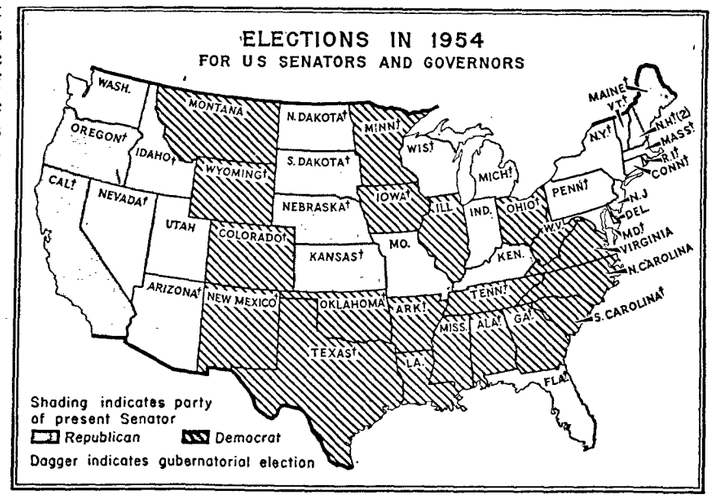
Washington, D.C.

ONE official of an international organisation remarked recently that there were twelve weeks in every four years when it was possible to discuss policy with the American government without domestic political considerations interfering with the Administration's judgment. None of those twelve weeks occur this year before November 2nd, when the electorate will have to choose an entire new House of Representatives with 435 members, 35 out of 96 Senators, 34 out of 48 State Governors and innumerable other officials right down to the traditional dog-catchers.

But long before November the attention of politicians will be concentrated on the conventions or, more often, the primary elections, at which each party's candidates are chosen, for signs of popular feeling. The first of the primaries took place on Tuesday in Illinois to choose the Republican who will have the honour of running against the present Democratic Senator, Mr Paul Douglas. The fact that Mr Douglas has been chosen by the "eggheads" of the Washington press corps more than once as the best Senator of them all will have little effect on the predominantly Republican State of Illinois.

Mr Douglas's fate will probably be decided by the progress—or the failure to develop—of the recession of which he has become the prophet. Even without a recession on the scale which he fears, however, the farm policies of Mr Ezra Taft Benson could save him. Some months ago Mr Douglas had almost decided that it was not worth exposing himself to the kind of tactics that his senatorial colleague from Illinois, Mr Dirksen, and his Wisconsin neighbour, Mr McCarthy, both Republicans, were expected to use against him; but a prolonged trip through the normally Republican agricultural areas of the state made Mr Douglas change his mind.

Next week will see New Jersey choosing its candidates, but that has now become a formality. The Republicans, chastened by their surprising defeat in the contest for the Governorship last autumn, when they preferred a party hack to Representative Clifford Case as candidate, have persuaded their present colourless Senator, Mr Hendrickson, to withdraw and allow Mr Case a clear field. The Democrats have induced Representative Howell to run against him, but nobody in New Jersey is likely to have much chance against one of the best of the "Eisenhower Republicans." Mr Case has always had strong bipartisan support in his district and is likely to continue to get, and to deserve, it in the state as a whole.



In May there will be two interesting primary races in the South between liberal and conservative Democrats. Senator Sparkman may have quite a lot of trouble in Alabama from Representative Battle, the author of the Battle Act, who will be able to use against Mr Sparkman some of the things he said when campaigning in a wider field as Vice-Presidential candidate with Mr Stevenson in 1952. And in North Carolina a rather dim figure called Lennon, who was appointed to the Senate when Senator Willis Smith died and who immediately announced that he would be happy to serve on Senator McCarthy's committee at a time when all the other Democrats had withdrawn from it, will be opposed by one of the leading liberals in the state, Mr Kerr Scott.

Memories of the 1952 campaign, which may be dangerous to Mr Sparkman, might be fatal to Senator Kefauver in the August primary in Tennessee. Representative Sutton will be able to campaign against him on the basis of an impeccable southern record and will, no doubt, enjoy reminding the voters of the curious machinations by which Mr Kefauver tried so desperately to get the presidential nomination at

Chicago two years ago. The only other Democratic primaries of interest in what should be safe states are in Texas and Oklahoma. In Texas, the Democratic leader in the Senate, Mr Lyndon Johnson, who won the nomination in 1948 by less than 100 votes, has to try again at the end of July. It is no exaggeration to say that his belief that his brand of statesmanship is vital to his party for the next six years has inhibited its strategy in the Senate for more than a year and that his colleagues will be thankful when his fate has been decided. In Oklahoma there will be a battle of millionaires between two ex-Governors, the incumbent Senator, Mr Kerr, and his successor in the state, Mr Turner. Mr Kerr may be a little too interested in the natural gas industry but his courage—he was the first Senator publicly to come to the help of Mr Truman after he had dismissed General MacArthur—would be missed in Washington.

★

The ubiquitous Mr McCarthy will probably have an influence, direct or indirect, on a number of primaries in both parties as well as on the election campaign itself. The first chance to judge his effectiveness this year will come in Maine on June 21st when one of his protégés, so little known otherwise that he is called "the Jones boy," has been put up in an attempt to destroy the Republican Senator, Mrs Margaret Chase Smith. At present it seems likely that Mr McCarthy has made the mistake of misunderstanding Maine's dislike for "foreign intervention" and that Mrs Smith is safe. But he had to attack her because she was the author of the 1950 "Declaration of Conscience," by far the most severe criticism of McCarthyism yet made in the Senate. For a similar reason—that he is the only survivor of the three Democrats on the committee which censured Mr McCarthy after the first investigation ever undertaken of his activities—Senator Green of Rhode Island is expecting a rough campaign in the autumn.

But how much the Republican National Committee, which up to the present believes firmly in the electoral value of McCarthyism—and is even prepared to argue that its author must be preserved to save the hide of that proper Bostonian, Senator Saltonstall of Massachusetts—will want to use Mr McCarthy by the autumn must depend on how he emerges from his battle with the Army. If he emerges in poor shape and his national popularity continues to decrease at the pace suggested by recent opinion polls, his party may find itself in a somewhat difficult position. There are few states which have shown the good sense—or have had the sharp warning—of New Jersey and there is a tendency on the part of Republican organisations to choose old-fashioned machine politicians and trust to the "Communists-in-Government" issue to pull them through.

The Democrats have, on the other hand, been cleaning house and picking candidates with more to recommend them than mere Rotarian bonhomie. It was no accident that Mr Stephen Mitchell announced that the Democratic National Committee, of which he is chairman, would give no support in California to Mr James Roosevelt, who is having matrimonial difficulties, or to Representative Condon, who has been accused of being a security risk, until their "personal problems have been disposed of in the proper place." Nor is it an accident that, in Colorado, where an incumbent Democratic Senator is retiring, the choice is likely to be made between two first-class men—Mr John Carroll who, before being beaten for the Senate by Mr Millikin in 1950, was considered one of the best Congressmen, and the Mayor of Denver, Mr Quigg Newton.

Both Houses are closely divided now and, as the party in power usually loses some strength in the mid-term elections, the Democrats might reasonably expect, whether they want to or not, to win both. They have already an actual majority of one in the Senate, but as the batch of Senators coming up for re-election this year are those who won in 1948 and are, therefore, predominantly Democratic, the party's prospects are less good than in the House, where it is possible to prove statistically that the Democrats should gain some twenty seats. It may well be, however, that this year detailed calculations will prove to have been misleading and that national confidence in President Eisenhower, which so far seems undimmed, will produce the majorities in Congress that the electorate denied him in 1952. If, on the other hand, the voters draw a sharp distinction between the President and the congressional Republicans, or if they are sufficiently apprehensive about some of the Administration's domestic policies to forget the personality of its leader, the Democrats could be embarrassingly successful in November.

Wind out of McCarthy's Sails?

SENATOR McCARTHY had already indicated last week where he expected to find a wind of popular approval to blow him triumphantly through the coming congressional inquiry into his dealings with the Army. In his reply to Mr Edward Murrow's admirable indictment on television of his methods, the Senator, diverting attention to the sensation of the hour from the weakness of his own counter-attack on Mr Murrow himself, asked why, if there were no Communists in government, had research on the hydrogen bomb been delayed for eighteen months when the Russians were known to be developing such a bomb? Mr McCarthy was expected to answer his own question when he helped Texas to celebrate its independence day next week—the opening of the congressional inquiry has been postponed to allow him to do so—and to blow up a gale which would make up to the public for the recent becalming of the McCarthy ship. For the other members of the investigating subcommittee which the Senator heads have refused to allow him to go on with his revelations until his own conduct has been investigated.

The wind (provided through the Senator's mysterious sources of secret information), with which he was planning to fill his sails, was the disclosure that the Administration was investigating the reliability and loyalty of Dr Robert Oppenheimer, the outstanding atomic scientist who was in charge of the development of the atomic bomb and who has advised the government on such matters ever since. But some at least of the credit for this discovery has now been denied to Mr McCarthy by the newspapers which have reported, and the Atomic Energy Commission which has confirmed, that Dr Oppenheimer has been refused access to restricted information since the end of last year, and is being investigated in private this week as a security risk by a special panel of the commission's personnel board.

The details of the grave charges against Dr Oppenheimer have also been published, with his consent, and fall into two groups, both casting more doubt on his judgment than on his loyalty. First there is a long list of his activities during the nineteen-thirties and early war years, which show the left-wing sympathies and lack of prudence in dealing with Communists and fellow-travelling organisations that were so common in those days. These indiscretions must always have been known to the government's security officials. Secondly, however, Dr Oppenheimer is accused of having delayed work on the hydrogen bomb; to this he replies that while he, and other scientists who were also consulted about its desirability, did oppose it on scientific and technical grounds, once President Truman had decided that the thermonuclear programme must go on, he co-operated fully in solving the technical problems involved.

★

Meanwhile the Defence Department, also admitting by its actions that, as usual, Senator McCarthy has some justification for his charges, has announced a new, or rather a more far-reaching, policy for keeping "subversives" and Communist sympathisers out of the armed forces. The occasion of the outbreak of war between Mr McCarthy and the Army was the case of a conscripted dentist who refused to answer questions about his alleged Communist connections. Now the loyalty and security procedures that have been applied to the civilian branches of the government are to be extended to the services. There is some concern as to what the effect will be on morale and discipline, but at least the Army has done its best to dispose of what had become a side issue in its struggle with the Senator.

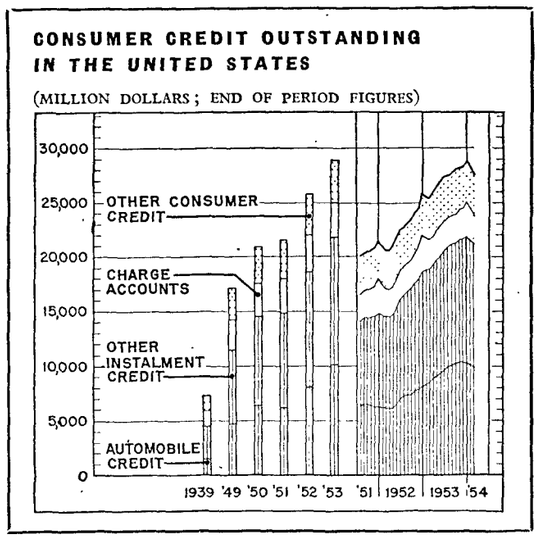
The main battle is over whether or not Senator McCarthy tried to bring pressure to bear on the Army to secure special treatment for a member of his staff and whether or not the Army attempted to bring pressure to bear on him to call off his investigators. The battle is to be joined on April 22nd before the Senator's own committee—but without him in the chair—now that at last a special counsel to direct the proceedings has been found. This is Mr Ray Jenkins, an experienced and able trial lawyer from Tennessee, who has apparently managed never to take a stand for or against Mr McCarthy.

Tough on Communists

THE official answer to Senator McCarthy, whether the Administration has been Democratic or Republican, has always been that the federal authorities, with the help of the law, are able and willing to deal effectively with Communists, both in and out of government and that it is the responsibility of the executive, not of Congress, to do so. For political reasons the present Administration, of course, insists that it is both more able and more willing to do this than was its predecessor, and last week the Attorney-General, Mr Brownell, broadcast an account of how successful it had been, as a sequel to President Eisenhower's earlier warning against hysteria about the Communist threat.

That threat, said Mr Brownell, is being countered successfully, in several ways. The Federal Bureau of Investigation is doing a "magnificent job" in discovering and watching Communists. As a result of its efforts, which Mr Brownell had the grace to admit had been begun under President Roosevelt, 36 Communist leaders have been convicted under the Smith Act since the present Administration came to office, and 67 since 1948, for conspiring to overthrow the government by force. Anxious as he is to be tough on Communists, Mr Brownell does not, as he told a House committee a few days later, want the Communist party outlawed by making membership in it a criminal offence. He felt that such a law would make it more difficult to track down Communists and would probably be unconstitutional in any case. Nevertheless, Mr Brownell does want a number of new legal powers; they were outlined by the President in January, but little has yet been done about the necessary legislation.

The Bill that has got farthest is that which would permit the use in court, in cases involving the national security, of evidence obtained by tapping telephone wires. This has passed the House, after members had demonstrated their concern for civil liberties by insisting that a court order must be obtained before wires were tapped; Mr Brownell had wanted the decision to be left to the Attorney-General. Senator Ferguson has now made a start with a Bill to take American citizenship away from those who conspire to overthrow the government, which was the President's most unusual proposal. Mr Brownell also requested increased penalties for peacetime espionage, including the death penalty, for sabotage and for shielding fugitive Communists. Another piece of legislation that he would like would permit employers to dismiss from defence plants in time of emergency people thought likely to engage in sabotage and espionage, and would eliminate Communism from trade unions in vital sections of the economy. Both copper mines and the electrical equipment industry have been having difficulties of this kind with their trade unions, and a Bill to deal with these is now being prepared in the Senate. Finally Mr Brownell wants an extension of the statute of limitations, and power to grant immunity from prosecution to witnesses who would incriminate themselves if they gave evidence, so that they would no longer be able to use their constitutional rights as an excuse for not testifying.



Reinsuring Health

FROM A SPECIAL CORRESPONDENT

IT is probable that the United States is the most health-conscious nation in history. Americans pay millions of dollars annually for vitamin pills in an effort to avoid illness, and further millions to specialists to see whether the effort has been successful. There are more physicians, relative to population, in the United States than in any other country except Israel. Expenditure on civilian health reached $13.6 billion in 1951, an increase of 120 per cent over 1936, even after allowing for price changes. In health facilities, however, as in so many things, the United States presents no homogeneous picture. New York, a rich state, has 209 doctors to every 100,000 inhabitants; Mississippi has only 74. Over the country, 39 per cent of the people live in places of less than 2,500 inhabitants, yet such places have only 13 per cent of the nation's doctors. Country boys, upon graduating from medical school, head for the cities, where more lucrative practices and fewer hardships are found. It was estimated in 1947 that three million lives could be saved in the United States in the succeeding ten years if all states enjoyed the health standards of the highest ranking state.

In addition to such geographical inequalities, there are the special problems faced by the less well-to-do people, even in very well-to-do states, in trying to pay their medical bills. By June of 1953, some 89.5 million people, or 58 per cent of the civilian population, carried some kind of insurance covering medical care, a phenomenal growth since 1940. Then only 9 per cent of the population was covered for hospital costs, as against 57 per cent in 1953; the figures for surgical costs are 4 per cent and 48 per cent respectively. The American Medical Association, which once showed little enthusiasm for health insurance of any kind, now supports these voluntary plans as a bulwark against "socialised medicine," its name for the provision by the federal government of something like the Lloyd George scheme of 1911. Private insurance companies are branching out into the field, and the mails in recent years have suddenly been flooded with advertisements for a "low cost, modern plan of hospital protection . . . sold from one day to 80 years of age."

★

It is doubtful, however, whether voluntary, private insurance can ever solve the problem unassisted. For one thing, the distribution of health insurance, like that of medical services, has been uneven. The recent survey by the National Opinion Research Centre, at the University of Chicago, shows that only 41 per cent of families earning less than $3,000 a year carry any health insurance at all, even hospital coverage, while the figure for families earning over $5,000 is 80 per cent. Of those employed in mining and manufacturing, between 80 and 90 per cent have some form of coverage, but in agriculture, fisheries, and forestry the range is from 30 to 39 per cent. These figures underline the long recognised fact that the voluntary plans have done well among the urban middle-classes and industrial workers, but have not met the problem as far as the urban poor or the rural population are concerned.

Furthermore, the degree of coverage given by privately financed policies varies greatly. Only 4 per cent of the population is insured for "substantially complete physicians' services." Even when a policy appears to cover a given kind of service, actual practice may prove disconcerting: the Actuarial Society of America, analysing 100,000 surgical claims under voluntary programmes, found that the benefit payments covered, on the average, only 55 per cent of the doctor's charges. This kind of thing happens partly because of limitations and exceptions written into the policies; a limit is usually set on the maximum benefit to be paid to the policy-holder, in order to safeguard the solvency of the insurance scheme. Sometimes, however, doctors have simply accepted the fee from the insurance company as a kind of basic minimum, and have then proceeded to charge the patient whatever they thought he could afford to pay in addition. Many so-called "non-profit" health plans are controlled by doctors, who offer needed services in return for regular payments instead of fees; in such cases, the line between profits and salaries becomes somewhat elusive.

Perhaps equally serious, many state and local medical societies have tried actively to block the establishment of group practice arrangements, in which doctors with various specialties pool their skills and equipment for the benefit of all their patients—arrangements which, when linked with comprehensive insurance plans, provide the nearest approach to ideal medical security for the citizen. Group practice grows in spite of this, but less than 3 per cent of the doctors in the United States have adopted it. The Magnuson Commission—named by President Truman to investigate the nation's health needs—noted in its report last year:

> The genius for organisation, so characteristic of American life in general, is conspicuous in health services by its absence. . . . In industry, the application of this principle has made possible our enormous productivity and our high standard of living. By contrast, the lack of organisation that prevails in medical practice is the despair of the industrialist and the labour leader.

★

Faced with all these problems, President Eisenhower's Administration has proposed a characteristically middle-of-the-road programme, in which Mr Truman's compulsory national health insurance schemes, which had never borne fruit, are emphatically abandoned, while the quieter aspects of past federal policies, such as subsidies for hospital construction, are maintained, in some cases on a diminished scale, in others with increased support. But the most interesting of the President's proposals is contained in a Bill introduced in Congress last month which would establish a programme of federal reinsurance, to aid the voluntary insurance organisations both to broaden their benefits and to extend them to more people. The reinsurance idea has worked well in the field of securing bank deposits, but that does not necessarily mean that it will in the more complex field of health. Spokesmen for private insurance companies and for the AMA have already condemned the Eisenhower proposals as opening the way for the dreaded socialisation of medicine, but there are signs that the exaggerated congressional awe of the AMA's influence in the country at large may at last be subsiding.

The proposed reinsurance programme would begin with a capital fund of $25 million, to be retired by the income from premiums paid by participating private insurance organisations. Clearly, this would represent no more than an experiment on a small scale. To begin to make serious progress, not only would a far larger capital be needed, but it is also probable that the federal government would have to subsidise, on a continuing basis, the reinsurance system. Otherwise, the premiums to be paid by insurance organisations would have to be high, since by definition, reinsurance is designed to aid in the coverage of greater risks, on the average, than those now being covered. And if the reinsurance becomes expensive, so will the original insurance; the hope of extending its coverage to the poorer elements in the population may thus be dissipated.

Against such pessimism, of course, it can be argued that a limited scheme may at least afford the government valuable experience to guide it in expanding the programme at some future date. Without this experience, it is impossible to answer such thorny questions as how to pick and choose among applicants for reinsurance, how to avoid subsidising inefficient insurance schemes while at the same time guarding against unfair discrimination, and how and to what extent the reinsurance plan should be used to encourage the growth of such desirable things as group practice of medicine. It might be added that $25 million worth of effort to solve the problem of health-for-all, though a modest start, would, if Congress can bring itself to approve it, represent more actual progress than Mr Truman's habit of annually submitting an ambitious blueprint for compulsory national insurance to a Congress which had no intention of ever acting upon it at all.

Housing in Ruins

THE attitude of the House of Representatives to the public housing programme has always been surprising: a programme which is an essential companion of slum clearance, and under which the federal government helps local authorities to build low-cost housing accommodation, would seem to have special appeal for a body whose members come chiefly from cities and must stand for re-election every other year. Yet in practice the House always delights in denying funds for public housing, whether they are requested by a Democratic or a Republican Administration—the support for the programme has been as bipartisan as has the opposition to it—and leaving it to the Senate to repair at least some of the damage.

The Senate seems likely to come to the rescue this year as usual, although it may not be as successful as usual. For the House, in an unbusinesslike hurry to get the government out of the housing business, left the programme in such a state of ruin that an appeal may have to be made to the courts before it can be rebuilt. The damage was begun last year, when Congress specifically stated that no new public housing units were to be started; this year the House Appropriations Committee allowed funds for 22,000 new units. The opponents of public housing claimed, and their claim was upheld, that after last year's ban this constituted new legislation, which is not permitted in a money bill. But they then found that, in the view of the Administration at least, they had not, as they thought, pulled down public housing altogether, but had provided for an increase, to about 35,000, in the number that could be built in the coming 1955 fiscal year. For the Administration insists that it had irrevocably committed itself to build that number, even though they have not yet been started, before last year's ban on new contracts was imposed.

Whether or not these 35,000 public housing units rise out of the parliamentary confusion, only the Senate can provide the 35,000 more which the President wants for each of the following three years; he is prepared to settle for 35,000 for the 1956 fiscal year—plans for them should be started soon—but the House refused to authorise even that number in the Housing Revision Bill which it passed as soon as it had finished with the 1955 appropriation. In that Bill the House, under pressure from ex-servicemen's groups, also refused the President discretionary power to adjust the interest rates on mortgages to ex-servicemen and on other government-guaranteed loans. This not only denies him a useful weapon against economic recession, but also apparently makes other sections of the Bill unworkable. This the House does not seem to have realised, for when it came to such things as providing aid for slum clearance and making mortgages and loans for rehabilitating old houses more freely available, the House thought it had given the President all he wanted to encourage private building activity. Here again the Senate has a substantial repair job on its hands, which may be made more difficult by the discovery of a possible scandal in the government housing agency.

Bourbons Feel Their Age

New York

WHISKEY distillers are not, after all, to get help in moving the "mountainous" stocks of which they have been complaining. For the excise tax of $10.50 a gallon did not revert to $9 on April 1st as had been expected, and there is little hope that Congress will act at this session on the Saylor Bill, which would have permitted distillers to keep liquor in bond for twelve years, instead of the present eight, before paying taxes on it; the question has become urgent because it is now eight years since whiskey production was resumed on a large scale after the war. But luckily, although some small distillers may be in difficulties, Bacchus, helped perhaps by St Patrick, has provided the aid that the government refused.

Total apparent domestic consumption of all whiskey (including imports), which to the industry's dismay fell by 5 per cent in 1952, rose again last year by 6 per cent to 195 million American proof gallons; (1 British proof gallon is the equivalent of 1.37 American). And although liquor consumption a head has fallen since the war, and whiskey has been losing ground to gin and other spirits, another switch in taste has helped the whiskey distillers. Americans are now drinking more straight bourbon, which consists entirely of aged whiskies, and less blended, which may contain as much as 65 per cent of unaged "neutral" spirits. Therefore disappearances of aged whiskey from bond (including a relatively small volume of exports and allowing for losses due to evaporation) have been rising faster than final sales and the mountain of stocks, at 717 million proof gallons, or about 6½ years' supply, is really no more than a fair-sized hill. When it is realised that only 42 million gallons of this were over six years old, and 227 million over four years old, at the end of 1953, it is clear that the industry as a whole will not be compelled, by the operation of the tax laws, to force excessive quantities of eight-year-old whiskey on the market this year.

Scotch whisky distillers therefore need not fear that their exports will be arriving in the middle of a battle of the bourbons, even though some price cutting has taken place, particularly among the more expensive bottled-in-

bond whiskies, and competition is likely to be intensified. Nevertheless it should be possible to maintain, for the proprietary brands of Scotch whisky at least, the gradual improvement in their market position in the United States which has developed during the last five years. Annual arrivals of Scotch have gone up by almost 50 per cent over that period, but annual arrivals of Canadian rye and bourbon whiskies have doubled in the same period; at 8.9 million American proof gallons in 1953, they have almost caught up with imports of Scotch. The Canadian whiskies have been helped to capture markets in which Scotch whiskies might have shared, had it not been the supply that was tight, by the advertising advantage of having only two leading brand names to publicise, while it takes ten brands to make up only 80 per cent of the exports of Scotch whisky to the United States.

Accounting for Welfare

GOVERNOR DEWEY recently signed a Bill giving the State Superintendent of Insurance power to examine the records of trade union welfare funds. This is the first fruit of an investigation ordered last year after it was shown that welfare funds in the state had lost $275,000 through payment of excessive fees. In Washington two congressional committees are already responding to the President's request for a study of how these funds and their beneficiaries can be protected from mismanagement and downright fraud. Hearings held last year showed that a number of trade union officials, particularly those of branches of the powerful Brotherhood of Teamsters (or lorry drivers), had accepted bribes from insurance companies hoping for contracts.

The growth of company-financed pension and welfare schemes was greatly stimulated during the war; they took the place of the wage increases which were then forbidden by law. By 1947 the Taft-Hartley Act required employers to bargain on welfare schemes, a requirement which the Supreme Court later upheld. Today, over 10 million workers are covered more or less adequately—usually for old-age pensions, but frequently also for hospital and medical costs, disablement and death benefits. Some estimates put the total reserves of such plans at $25 billion, a sum large enough to make itself felt in the stock markets. Employers are resigned to regarding social insurance as a business cost, but few are enthusiastic about their right, under the Taft-Hartley Act, to help administer the schemes.

The most comprehensive plans, and ones which have never been charged with anything worse than improvidence, are those established for the miners by Mr John L. Lewis. The soft coal fund has reserves of nearly $100 million, and last year paid out $139 million in old-age and disability pensions, medical and hospital costs, rehabilitation treatments, and death benefits. Work has just begun on two of the ten hospitals planned for the mining areas. All this money comes from royalties of 40 and 50 cents a ton on the coal mined, a fact which, combined with depression in the mines, has gone far to tame the redoubtable Mr Lewis, who used to order a strike at the drop of a pick. The anthracite fund has had to cut its pensions from $100 to $50 a month.

The evidence already produced of corruption and inefficiency in some welfare schemes has brought promises of house-cleaning from both the American Federation of Labour and its most powerful affiliate, the Teamsters. They are clearly anxious to ward off outside regulation. But even if they act in time—and the unions move slowly—the size of the funds and their important place in the structure of social security probably make some form of government regulation inevitable.

SHORTER NOTES

The Interstate Commerce Commission has denied that the New York Central Railroad's petition for an investigation of Mr Robert R. Young's activities in the struggle for control of the company constitutes sufficient grounds for the institution of the inquiry requested. In rejecting the petition, the commission did not entirely rule out the possibility of future action, after further investigation, but it seems unlikely that it will act before May 26th when the question of control will be determined by the proxy voting at the company's annual meeting.

★

The broadcasting companies have won their fight against the 1949 order of the Federal Communications Commission banning "giveaway" programmes on radio and television as a violation of the lottery laws, as a result of the Supreme Court's ruling that the tests imposed by the commission to determine what constituted lotteries was a form of censorship that violated the freedom of speech and press guaranteed by the First Amendment to the Constitution. The fate of the "giveaway" programmes, in which prizes are given to listeners and viewers who can answer a simple question, is left to public opinion, which has already decided that such programmes have gone somewhat out of fashion.

★

The mass immunisation programme of the National Foundation for Infantile Paralysis is the most promising attempt yet made to prevent the occurrence of polio. To counteract the effect upon the campaign of the rumour, fostered by Mr Walter Winchell's broadcast, that the new vaccine "claimed to be a polio cure may be a killer," the US Public Health Service has announced that the minimum safety specifications require that the vaccine shall pass the triple tests of the manufacturer, the inventor, Dr Salk, and the National Institute of Health. Although forty-four states have agreed to participate in the mass vaccinations, the success of the programme will depend upon achieving the consent of the parents of the 500,000 children to be tested.

★

The Internal Revenue Commissioner was so preoccupied collecting everyone else's federal taxes that he forgot to pay his own state taxes. His excuse, that he thought his book-keeper was taking care of the matter for him, did not deter the State of Virginia, where he lives, from fining the Commissioner $25 for the oversight.

ENGAGEMENT BETWEEN ANSON'S "CENTURION" AND THE TREASURE SHIP "CAVADONGA", 20TH JUNE, 1743, by Samuel Scott

BEFORE THE THUNDER and smoke of battle, the tensest moment: the ships sliding towards each other over the hissing sea, the guns run out, the crews still...and waiting. When someone murmurs the blasphemous grace "For what we are about to receive..."

Yet the men that died from round shot, from steel, were few compared to those who died from scurvy, the real scourge of the sea in those far-off days. And it was not only at sea that men died through lack of proper food, or from diseases caused by dirty food.

Today we know far better what to eat. And how to treat our food. How to keep it fresh and free from contamination. Much of our food today is protectively wrapped...from the baker, from the factory, from the shops. Wrapped, it may be, in packaging made by Bowaters. For Bowaters make wrappers and containers of many kinds—for food protection and a thousand other purposes in commerce and industry, all of them contributing, in their several ways, to the health, pleasure and efficiency of modern living.

Bowaters

An international organisation making paper, board and packaging materials that answer the needs of industry and trade throughout the world.

The World Overseas

German Trade With the East

FOR West Germans trade with the Soviet bloc appears to be of greater importance than it is to Britain. There are a number of good reasons why this is so. The first is tradition. In the minds of the older generation of German industrialists and bankers Eastern Europe is still Germany's "natural market"; the memory is alive still of the "Rapallo period," 30 years ago, when German industry was bound by a treaty of trade and friendship with the young Soviet Union. West Germany would clearly like to gain its prewar position as heavy industrial supplier to the Communist countries, before they industrialise themselves further. Germans are anxiously watching the development of coal and steel production in territories that used to be dependent on the Ruhr; but there is a feeling that somehow, if trade barriers were removed, the Soviet satellites might halt their march towards self-sufficiency and turn again to the west.

The stability of trade with the Soviet Union in the pre-Hitlerite era is another reason for German determination to revive it. It was not great, as the table shows, but it had stayed fairly constant during the great slump. Though Hitler ruined trade with the Soviet Union itself, Germany even in his day played a dominant part in the economies of the Balkan countries, as almost the sole market for their surplus grain and (in the case of Bulgaria) for tobacco. Hungarian and Polish eggs and meat, Soviet and Polish timber, Czech yarn and Soviet oil, formed the bulk of eastern exports to Germany, while Germany sent mainly iron and steel, machinery and chemicals—that is, those products which again form the Federal Republic's chief exports.

For Germans, unlike the British, the revival of trade with Russia is a matter of national prestige. Though the Bonn government is a member of the Cocom (the co-ordinating body in Paris which draws up the list of restricted and prohibited exports to the Communist world) and the Bonn authorities have control over licences, the Germans are certain that they are penalised because their country is occupied. The British, Dutch, French and Italians are all, Germans believe, snapping up contracts which they are forced to reject. American officials in Germany keep, or try to keep, an eye on illegal traffic to the East in German goods, and shipments in transit through the German free ports. All this means that the restrictions on trade tend to be regarded by the Germans as part of the occupation regime which nobody can be blamed for evading. Moreover, "east-west trade" includes exchanges with other Germans across the zonal frontier in which it is felt that foreigners should not interfere. (It may be remarked, however, that interzonal trade has proved just as unsatisfactory to the Federal Republic as business dealings with other Soviet satellites, and the Westerners are constantly trying to make the Easterners work off chronic deficits.)

Federal Germany has bilateral offset trade and payments agreements with all the Soviet satellites, except Rumania. With Rumania, for the first time, a pact was recently concluded by the Eastern Committee, taking the place of the Bonn authorities. This body is an advisory association to which the German industrialists and civil servants belong.

GERMAN TRADE WITH THE EASTERN BLOC
(As Percentages of Total German Imports or Exports)

	1930–34		1953*	
	Imports	Exports	Imports	Exports
German imports from or exports to:—				
USSR	4·6	5·9	0·4	0·04
Czechoslovakia	3·4	4·1	0·4	0·2
Poland (incl. Danzig)	2·1	2·1	0·5	0·3
Hungary	0·9	0·9	0·3	0·4
Bulgaria	0·7	0·3	0·1	0·06
Rumania	1·7	1·1	0·05	0·2
Total USSR and Satellites	**13·4**	**14·4**	**1·75**	**1·2**

* Federal Republic only.

It was formed in order to offset the disadvantage felt by individual firms in dealing with a Communist state trading organisation. With the Soviet Union itself, Federal Germany has no trade and payments agreements and is not allowed to conclude one until the Bonn convention, ending the occupation regime, is in force. But there is a strong demand for this handicap to be overcome quickly, by use of the Eastern Committee or otherwise, and the Russians themselves have made overtures in this direction. Meetings have taken place between German businessmen and Russians, and some shipbuilders have just returned from a trip to Moscow, at which the two parties tried to find a way of financing a large contract.

The actual experience of the Germans in their trade treaties with the East has been disappointing in the extreme. In the lean years, the Communists could not offer the foodstuffs or scarce raw materials that Federal Germany needed, and demanded too high prices when small quantities of these "hard goods" became available. Now that larger quantities are offered, the German

importers do not want them. Wheat and sugar have become as "soft" today as slivoviça was in 1949. The Russians and the satellites are much more eager to sell but even Soviet manganese ore is no longer a bait to the Germans, unless it is to be priced below the figure at which importers buy from their staple suppliers.

German eagerness to develop trade with the Soviet bloc is due much more to desire to sell in that market than to buy foodstuffs or raw materials there. The big problem facing West Germany today is how to find an internal market for the wheat and other primary products of countries such as Turkey, Argentina and Greece which are unable to pay for all the German machinery, steel, chemicals, and other manufactures they have bought, and would like to buy. A D-mark gap has developed in the world, and the Germans, who are unwillingly granting large credits to their old customers in Western Europe and the under-developed countries, have hardly begun to realise that they must take the medicine they hold out to the Americans—that is, they must lower their tariffs, and buy more, or invest abroad.

It would be an alarming political development if West Germany were ever to switch its purchases of wheat from the United States, Canada and Australia to the Soviet Union, in order to find a slump-proof market among the Communists. But there are a number of factors that stand in the way of such a change. Chief among them are the Soviet Union's shortages and the surpluses in the free world, not to mention the postwar orientation of German traders and public taste towards the West. Now that America has begun to give away its wheat to its allies, and Turkey tries to sell surplus wheat to pay off its debts to German exporters, it is hard to see why Russia should gain control of the German larder. But, on the other hand, if the Soviet area is to develop its purchases from Germany, and cannot pay in commodities, it is obvious that the question of German credits to the Communists must come up in some form, at some time.

(*A second article will deal with German trade with China.*)

The Sudan's British Servants

THE number of British citizens still serving in the Sudan is smaller than Egyptian propaganda about their allegedly nefarious influence would lead anyone to suppose. Some 110 men are in administrative posts and about 1,150 in technical jobs; this total should be set against the size and population of the Sudan which are, respectively, about one-third of the area of the United States and nearly nine million people. A fifth of these British employees are in pensionable jobs, the rest on contract. Numerically, their claims to notice may be small, but, morally, they merit the thoughts of their fellow-nationals on account of the personal dilemma in which they are at present placed.

No European serving in Africa expects his job to be immune against "Africanisation," and on this score they have no complaint. But they are worse off than Europeans in other territories, for instance, in Nigeria, because whereas others are in a position to retire at any time on accrued pension or gratuity—that is, to leave for a more promising job without loss of all right to compensation—the Sudan government official is not so. Some terms of compensation for those retiring or dismissed may be fixed later. The Sudan prime minister has said, unofficially, that he means this to be so. But meanwhile he has not said publicly that he has raised the question with his cabinet, and so far as the British official knows, he forfeits all pre-existing rights if he goes. He therefore plods on, among Sudanese many of whom think they can fill his shoes overnight, and who are blandly ready to detract, day by day, from the authority whereby he keeps his sector of their national machine in working order. His role is comfortless and exacting.

The Sudanisation Committee that is now hard at work in Khartoum is the body charged, under the Anglo-Egyptian agreement of 1953, with replacing foreigners by Sudanese in "the administration, the police, the Sudan Defence Force and any other government post that may affect the freedom of the Sudanese at the time of self-determination." "Foreigners" means British, for there are only about 150 Egyptians and 50 experts of other nationalities in the service. The committee consists of five members, one British, one Egyptian, and three Sudanese nominated by the Sudan government. All these last are anglophobe members of the National Unionist party, and the committee is therefore likely to be keen to axe British staff as soon as possible. Last week, it discussed with the British governors of the nine provinces of North and South Sudan how fast it could go and whether a start should be made with senior or with junior posts. It has so far shown no sign that it has absorbed a point made to it by several outsiders: that it should bear in mind future problems of promotion, and avoid large intakes of men of the same seniority at the same moment.

Threat to the Gezira Scheme?

Before any action can be taken, however, its recommendations go up to the cabinet and, if need be, to the Governor-General's Commission, either of which bodies may be more alive to the dangers of over-rapid Sudanisation. The cabinet must decide how far ruthless wielding of the axe among the British administrative staff will deprive the nation of technicians with irreplaceable local experience—the teachers, doctors, soil chemists, animal husbandry experts and others who are in short supply all over the world. Most of these are on short-term contracts, and can easily find other jobs if they decide they see greater attraction in working for some more experienced government.

For the Sudan, this question of retaining essential technicians in its service is especially important, because future economic viability almost entirely depends upon a single piece of apparatus—the Gezira cotton scheme watered from the Sennar dam. This is now largely staffed by Sudanese, but still depends for full efficiency on a stiffening of foreign supervisors in the ginneries, in the field and, in particular, on the marketing side. Any action that caused these key men to go would be a national disaster. A Cairo radio programme called "Sudan Corner" is busy picking holes in their work, and—as a by-product of this attack—also in the Sudan government's contribution towards the regularity of the functioning of the Gezira scheme.

There is sure to be Egyptian pressure for replacement by Egyptians. Khartoum will be reminded that Egyptian technicians are cheaper than Europeans, and this is so if—

as has happened in Libya—the Egyptian government is prepared to continue to pay their Egyptian stipends, so that they get two salaries. This proposition is made by Egyptians who have dismissed all thought that there are not yet nearly enough local men trained to meet all rural Egypt's similar needs. Moreover, it is uncertain that the Egyptians yet understand what are the jobs with which the Sudan needs help. On March 30th, Egypt was reported as having offered to establish a branch of Cairo University in Khartoum, and to begin by opening faculties of arts and law. What is really needed is colleges of science, technology and agriculture; but these are not subjects popular either with Cairenes or with the Sudanese white collar class, too many of whom still think it nobler to wield a pen than to dirty one's hands.

The Sudan's British servants have done their work in an intemperate climate, and in conditions in which hard work has been expected of them and has been gladly given. If, now, Sudanisation becomes synonymous with treatment that disregards the effort they have put into their work, they will have had a raw deal. But the chief loser thereby will be the Sudan if, as a result of such behaviour, it gets a bad name as an employer and frightens away the good applicants of the future. This danger has been discerned by a few of Africa's politicians, notably by Dr Nkrumah of the Gold Coast.

India's Opportunity?

THE Indian government can hardly be congratulated on the manner in which it has chosen to press its claims to the small French territories along the coast. At one point, recently, the stream of Notes and official accusations from Delhi descended to a complaint that somebody had stolen the bicycle of an Indian newspaper reporter in Pondicherry. This, surely, was diplomacy touching bottom. Last weekend a new Note demanded the *de facto* transfer of the settlements in advance of further negotiation about their *de jure* status. Although France has offered to allow the people of the settlements to decide by plebiscite, under international supervision, whether to pass under Indian rule, and although it has already shown its good faith by yielding up Chandernagore, the Indian government appears to prefer old-fashioned annexation to self-determination. Meanwhile, its partisans in Pondicherry are busily annexing outlying bits of the settlement piecemeal.

The French position is obviously vulnerable. Unlike Goa, the main Portuguese territory in India, the French settlements are minuscule; they lack both economic resources (Goa has considerable manganese and iron ore fields) and easily recognisable characteristics such as the Goanese have acquired by racial origin, religion and culture. Pondicherry is not even a territorial unit; like the principalities of the old German empire, it comprises several neighbouring but scattered areas, communication between which is only possible when the Indian authorities permit. At present they do not permit, and this accounts for the ease with which some of these little parcels of land have been "liberated." Moreover, the government in Paris is obviously too busy to give the matter its full attention at present. France's difficulty, it seems, is Mr Nehru's opportunity, and it has been seized with a less graceful gesture than is usually associated with Hindu hands.

Polish Planners Change Course

SINCE the Soviet rulers have started to speak openly of Russia's economic ills, the satellite leaders have been busy discovering similar symptoms of disease. This over-zealous imitation sometimes takes farcical forms; but there is no doubt that the symptoms often are similar, for they spring from a similar cause—they are the result of too rapid industrialisation. Poland, like the Soviet Union and like the other satellites, is now to modify its policy of industrialisation at all costs. An attempt is apparently being made to restore the balance between booming heavy industry, lagging light industry and stagnating agriculture. To proclaim this new economic policy was the primary task of the congress of the Polish United Workers' Party held last month. Indeed, the new party secretary, Boleslaw Bierut (who was premier until then), as well as the other leading speakers, dwelt mainly on economic achievements and on the new tasks now facing the Polish economy.

Thus the pendulum swings some way back after four years of ruthless concentration on basic industry. When the current Six-Year Plan was drawn up at the close of 1949 the stress was already laid on heavy industry and industrial production was to be raised by 85 to 90 per cent. By mid-1950 this was branded as an "opportunist deviation." Poland was to play its share in an emergency mobilisation of the Soviet bloc. The target of industrial production for 1955 was stepped up to 158 per cent above the 1949 level and the emphasis on basic production was accentuated still further. The distortion proved even greater in practice, as for the last four years light industry and agriculture were treated as poor relations allowed only the remnants of scarce resources. Only at such a price could the main targets be achieved. Given its choice of priorities, the Plan, on the whole, did work and Mr Bierut did not make as sweeping concessions as his East German or Hungarian colleagues. He insisted on the extremely rapid development of machine building and chemical industries and claimed that Poland is now Europe's fifth industrial power. True, processing capacity has slightly outstripped the raw material basis, with iron ore and copper extraction as the chief laggards. Taken as a whole, however, basic industry has according to the official figures kept ahead of its schedule.

It is impossible to estimate what toll the population had to pay for this rapid expansion of manufacturing output. Official figures are misleading, if only because they do not reveal how many Polish textiles, shoes or sugar were

exported. In any case, it is now admitted that the plans to improve the consumer's lot could not be fulfilled. The rapidly rising urban population has been the main sufferer (there are now about 6 million workers and employees outside agriculture—double the 1946 level—and urban population has risen from one-third to nearly half the total). The deficiencies in the supply of manufactured consumer goods have hit it both directly and through the resulting shortage of foodstuffs. With few industrial goods offered in exchange, the peasants had little incentive to produce more and even less to sell. Indeed, it is in the countryside that the planners have met their greater defeat and no bones are made about failure in this sphere.

POLAND'S INDUSTRIAL PRODUCTION
(million tons)

	1949	1950	1951	1952	1953	1955‡
Hard coal.....	74·1	78·0	82·0	84·5	88·7	100·0
Electric power*.....	8·3	9·4	11·1	12·7	13·6	19·3
Crude steel.....	2·3	2·5	2·8	3·2	3·6	4·6
Cement.....	2·3	2·5	2·7	2·7	3·3	5·0
Cotton fabrics†.....	406·5	435·0	465·5	474·5	499·0	607·0
Woollen fabrics†....	50·0	56·5	62·5	65·5	70·5	75·0

* billion kWh. † million metres. ‡ Plan.

The vagaries of Nature have combined with peasant discontent to bring about this failure. Polish agriculture has not yet recovered from the disastrous drought of 1951. The Plan foresaw a 50 per cent increase in agricultural production by 1955, but after four years even official claims put the rise at only 9 per cent. This year again, Poland will have to import grain from the Soviet Union. Livestock numbers have in fact been reduced since 1950.

It was difficult to extract greater supplies from the countryside as the bulk of the land is still in the hands of smallholders. The collective farms, though their number has increased last year by about 3,000 to some 8,000, still own only 1.3 million hectares of agricultural land and state farms 2.5 million hectares. Altogether the Socialist sector accounts for less than one-fifth of the land and less than a quarter of total agricultural production. The government has tried several methods of stepping up food supplies to the towns. In 1950 it wiped out the peasants' savings in order to force them to sell. At the beginning of last year an attempt was made to use the pulls of the market: rationing was abolished ; peasants were allowed to sell on the free market after fulfilling their compulsory deliveries ; but at the same time the prices of industrial consumer goods were raised. All proved of no avail and last year again food supplies, particularly of meat and fats, were insufficient.

Promises to Peasants

Now a rapid increase of agricultural production through a dual policy of modernisation and incentives becomes a major task of the planners. It is intimately connected with the projected stepping up of the output of light industry. Industrial workers are promised more food and more manufactured goods. Peasants are promised better prices for their products and a more plentiful supply of industrial goods in exchange. A step in that direction has been taken through a general reduction of prices for consumer goods, both agricultural and industrial, by about 10 per cent, with particular emphasis on such articles as building materials or farming implements which are in great demand in the countryside. More fertilisers and machinery have also been promised. Total agricultural output is to be raised by 10 per cent within the next two years.

The plans have now to be put into practice. It is claimed that the share of consumption in the national income will rise, that of investments falling from 28 per cent in 1951 to about one quarter in 1953 and to less than one fifth in 1955. Besides, agriculture and light industry are now to be given a larger slice of total investment, though it is not disclosed how much bigger. The planners will obviously try to apply the scalpel rather than the axe to investment in basic industry and to get some results through higher productivity and the elimination of waste. But some shift at least is apparently contemplated and heavy industry should cease to receive exclusive priority. It has been stated that even trade policy will be revised so as to give more scope for imports of raw materials for light industry and of manufactured consumer goods.

For once a turn in the party line is not likely to meet with public hostility. At worst it will be received with scepticism. The peasants may fear that the time of reckoning has only been postponed for a time, since the government took pains to stress that it has not abandoned collectivisation as the ultimate goal. The urban population in turn may fear that this is only a manœuvre and that the planners have not really got rid of their bias towards heavy industry. The proof of the pudding is in the eating. The government should soon be able to find out whether its new policy has gained it much popular support.

New Deal for Steel Consumers?

FROM almost the first moment of its existence, the working of the so-called " single market " in steel has been less than perfect. The steel producers of the European Coal-Steel Community, in spite of their obligations under the treaty, have disregarded their published price lists within the common market whenever it paid them to favour some consumers and to discriminate against others. The issue is of very great importance. For not only is the first principle of the treaty at stake—the principle of non-discrimination—but so also is the power of the High Authority to maintain discipline in its own home market.

Recently the High Authority put on trial a new system designed to prevent these discriminatory practices. Steel producers were told that, after February 1st, price lists would have to be changed if their actual selling prices diverged by 2½ per cent or more from their published prices, as calculated over an average of the previous 60 days. In other words, if at the end of the two month period, that is, by April 1st, it was found that a certain producer had been underselling or selling above his published prices by more than 2½ per cent, he would be legally bound to make the corresponding adjustments in his published list. (In practice, producers, driven by the threat of growing stocks, were with few exceptions selling to selected customers at prices well below the list figure.)

To help enforce this new decision the High Authority hired five Dutch firms of chartered accountants, who, in company with steel experts from the authority, have been making regular examinations of the books of steel firms in the community. So far the system appears to be working with a considerable degree of success, despite its unpopularity with producers, who are bitterly opposed to the inspection of their books by supra-national " police." Since it went into operation there have been few complaints from consumers and few reports of the " black market " sales that had previously flourished throughout the community. During February the steel producers also submitted new schedules in which they dutifully brought their official prices down very nearly to the level of their real prices. In short, steel producers seem to be obeying the rules.

If in the long run the new price technique does prove effective, the High Authority will have accomplished at least three of its major objectives. It will in the first place strengthen the hand of the consumer, by giving him freer access to supplies and enabling him to shop around for the cheapest price. Hitherto the fear of being discriminated against has kept the consumer tied to his traditional suppliers. If the principle of non-discrimination can be made to work it will also mean less protection for the inefficient producer ; and finally it will open the first large crack in the producers' *entente* that for years has dominated the continental steel market. The net effect should be to lower prices for all steel consumers.

By their insistence on the strict observance of published prices, within the fixed 2½ per cent limit, officials at Luxemburg are fully conscious that they have departed from the classical ideal of a free market. But an element of control, it appears, is the price that must be paid for the principle of non-discrimination. After nearly a year of the common market in steel, Luxemburg is ready to acknowledge that producers will inevitably interpret a free market to mean freedom to discriminate and, more often than not, to discriminate on a national basis. " Ordered freedom " has therefore become the watchword at Luxemburg.

Haiti Looks for a Wheelwright

FROM A CORRESPONDENT

HAITI managed to put on a brilliantly gay face to celebrate its 150th anniversary of independence this year, but times are harder than ever. While neighbouring countries have been prospering on high coffee prices, and investing the returns in development, Haiti has had a small coffee crop, disastrous prices for its sisal, and trouble all along the line.

Once the country was rich, so rich that it provided half Louis XIV's revenues and allowed Voltaire to remark that France could well afford to leave the frozen wastes of Canada to England so long as it held the treasure-house of the Antilles. Now Haiti has to support 3,500,000 people on 11,000 square miles of which only one-fifth is fertile. It is, moreover, virtually without industry since it has neither capital nor skills.

As one of the world's poorest and most primitive countries (the annual average consumption is valued at $8 per person), Haiti has received special attention from the United States and United Nations aid programmes. Whatever hope it may have for pushing slowly above a starvation economy rests primarily on what the bevy of experts attached to these programmes can achieve. The main American project is the Artibonite Valley dam and irrigation undertaking based on a $14 million Export-Import Bank loan. Its purpose is to create fertile new acres, provide some power, and serve as a model of improved agricultural techniques. The United Nations has been working on a variety of smaller projects. The most useful has been a survey which concluded that tourism is the one industry which can be quickly and profitably expanded in Haiti and suggested measures to help in its development. By far

the most successful project was the UN's anti-yaws campaign, conducted with military efficiency ; it completely wiped out the debilitating disease which had infected half the population.

Apart from the elimination of yaws, however, it is open to doubt whether Haiti is getting full value for the money and effort spent on it. The country provides a good example of how ignorant and awkward modern people are at helping completely primitive societies. The UN literacy programme, for example, spent half a million dollars and managed to teach fifty people to read. A large part of this sum went on devising and modifying a phonetic alphabet for Haitians who speak pidgin French and 98 per cent of whom are illiterate, then writing some booklets in this new, garish code, and finally, trying to persuade people to look at them. The booklets sought to do double duty, giving helpful hints along with reading lessons. A typical one showed immense mosquitos killing people who failed to provide their homes with even primitive sanitary arrangements. But the normal Haitian reaction was, " Thank heaven we live as we do. Our country may be small and underdeveloped, but we have small and underdeveloped mosquitos. How horrible for the Americans to live with such big bugs."

VISITING EXPORT MARKETS ?

If you wish to get the feel of conditions in the countries you are about to visit, you could do no better than take along our three-monthly reports. They are concise but comprehensive : the economic situation is discussed, prospects for business are analysed : the political situation is summarised : and a wealth of useful statistical information is appended. Maps and, where necessary, charts illustrate the text. Fifty reports covering over seventy countries are available every three months—on subscription or singly from :

The Economist Intelligence Unit
22 Ryder Street, London, S.W.1
Whitehall 1511 Extension 129

A programme to convince farmers that they should grow vegetables to supplement their thin gruel diet failed by the same fault of super-sophistication. The experts forgot that the destitute Haitian can neither conserve nor market a perishable crop. He has no pots or jars in which to preserve vegetables, and his transport is limited to the fifteen or twenty kilos his wife can carry on her head. After a three or four day trip to market, she is not willing to go again until next season. So most of the vegetables rotted in the field.

This experience inspired the chief of the UN mission, a wise and capable Frenchman, M. Paoul Aglion, to send for a wheelwright who could teach the Haitian farmers how to make wheelbarrows. But among the specialists in contour ploughing, the organisers of tractor stations, the electrical engineers, and the road-building experts, it was not easy to find a man who actually knew how to make a wooden wheel with his own hands.

Roads, power, irrigation are all essential, but it is obvious that without a steady flow of people and funds to work them, Haiti will not really be much better off. What the country must learn, in order to help itself, are the cheap techniques that advanced countries have long forgotten. *Technical aid to Haiti is a job for rural experts from countries like India, Greece, or Nicaragua.*

Rumanian Oil

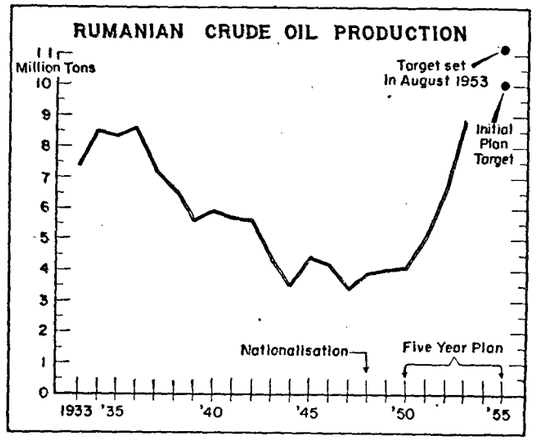
BY A CORRESPONDENT

SOVIET oil has begun to appear on world markets in fairly substantial quantities for the first time since before the war; and it is extremely probable that some, at least, of the oil sold by the Soviet Union in recent months to Finland, Argentina, Western Germany, Israel and elsewhere, in fact comes from Rumania. The Rumanian government has announced that in 1953 crude oil production beat all records. (The prewar peak, reached in 1936, was 8.6 million tons. Last August the Premier, Gheorghiu-Dej, claimed an output of "over 9.3 million tons" by the end of the year and set the target at "over 11 million tons"; the initial target of the Five-Year Plan was 10 million tons.) Yet although neither the 1953 plan target nor the figures given by Gheorghiu-Dej were reached, crude oil output was still higher than ever before.

The most accurate estimate, which is confirmed by reliable information from Bucharest, was given in an article by I. Dumitru, the Minister of the Oil Industry, in *Scanteia* on February 5th. He said that the 1953 crude oil production was 236 per cent higher than the 1947 level and 13 per cent above that of 1952. As the official figure for 1947 was 3.8 million tons, it appears that last year's output was 8.9 million tons. This, together with the new oil machinery and other related industries, perhaps represents the only real achievements of the Communist regime in Rumania.

Indeed, Rumanian oil production, which had been steadily declining since 1936 and which suffered a serious setback after the war, has made an amazing recovery in the last few years. It has done this in spite of disaffection among the workers and other difficulties which led to the disgrace of several successive ministers and to several "show trials." This achievement was possible chiefly because the Russians are extremely interested in the expansion of the Rumanian oil industry over which they now have virtually complete control.

The "sovrompetrol" companies in which Rumania and Soviet Russia each have, nominally, a 50 per cent share and which in the beginning controlled only 33 per cent of the oil industry, today control almost all prospecting, over 80 per cent of total production and 95 per cent of exports. The initial contribution of the Russians to the sovrompetrols was only the former German shares and the dismantled



Rumanian machinery taken as booty to the Soviet Union, plus an ever-increasing number of "experts" and management personnel. In the last few years, however, they have been sending new machinery as well and they have created, as an appendix to the oil trust, a new industry for the manufacture of oil machinery. Successful exploration and ruthless exploitation have done the rest.

It is true that the new oilfields have been brought into production in the Pitesti region, in northern Oltenia and particularly in Moldavia, and that in the last province rich sediments have been discovered. It is no less true, however, that excessive drilling, intensive exploitation at the expense of exploration drilling, and the reopening of abandoned wells, hitherto considered uneconomic even by the regime's experts, have contributed a great deal to make this exceptional increase possible, although they imperil the future prospects of the industry. In the article quoted above the Minister said that over 6 per cent of last year's production came from "secondary recuperation" and that 3 per cent of the total functioning drills had formerly been abandoned. These are certainly not the most economical forms of exploitation. Yet the Rumanians have offered petroleum products to Egypt at a price 15 per cent below the world market level.

But this is not the only paradox concerning Rumanian oil. Such record production might be expected to bring some improvements in the daily life of the Rumanian people. But oil products are still hard to come by and they are still expensive. This year there is once again no central heating in innumerable blocks of flats for want of oil, and the peasant is finding it as difficult as ever to fill his lamps. Towards the end of last month the unrationed sale of lamp oil was introduced; but the minimum price is three times the price of the rationed oil, and the peasants, unlike the townspeople, can no longer obtain rationed oil at the old price.

Broken Hill...

... Boom Town of the Eighties

By the side of a desolate hill set in the desert of Australia, and surrounded by scattered cattle stations, grew up a town built on a dream come true. It was a miners' dream of fantastic wealth waiting for the digging. Unknown in 1880, Broken Hill was a silver magnet in 1884 to miners, stockmen, sailors who had left their ships, clerks whose hands found pickshafts hard and blistering. It was a magnet, too, for some human parasites who lived, leech-like, on others' earnings. It was a boom town, made so by the labour of the men in the mines, but offering sweet pickings of gullible men with money to those with the craft to extract it. While work went on at furious speed underground and on the surface, men at kerbsides offered shares in mines which never existed and in mines salted with ores fired from shot guns.

Despite all difficulties the great prosperity continued. Fortunes were made—and some were lost—as the extent of the wealth of the Hill became clearer. Open-handed miners spent their money as fast as they earned it. They spent in pubs, in gambling dens, on clothes—on anything that money could buy. The streets, unmade, were filled with fortune makers and fortune hunters. Well-dressed men and elegant women strolled together to display their possessions. Soon the population of Broken Hill reached twenty-six thousand, and to most of them nothing mattered beyond the richness of the diggings—and the enjoyment of those riches.

The pioneers of those rough days laid solid foundations for the vast industry which now exists with The Zinc Corporation, Limited of Australia at its core. Its products spread throughout the world. The miners' dreams of boom-town are yet being fulfilled.

Now, at Avonmouth in the West of England, the largest zinc smelter in Europe produces the entire output of primary zinc for the United Kingdom as well as sulphuric acid and other related products.

Lead, Silver, Zinc

The formation of The Consolidated Zinc Corporation Limited in 1949 united the bond of common interest between Imperial Smelting Corporation Limited of Great Britain and The Zinc Corporation, Limited of Australia. The two companies have for many years been associated in the development of the non-ferrous metal production of the Commonwealth. Their activities are the mining of lead, silver and zinc ore in the Broken Hill Mines of Australia and the production of zinc metal, sulphuric acid, fluorine chemicals and zinc pigments in the United Kingdom.

WORKERS IN THE TEAM—Number 6 in a series

REG HARDING travels hundreds of miles a week to visit sites where building and civil engineering works are in progress. He is a field service engineer: it is his job to see that transport and plant is maintained in efficient condition.

He controls the fitters who have their workshops on the sites, the inspectors and mobile servicing units; and he is a personal link with the great central plant and transport depot where major repairs and overhauls are carried out.

He has broad shoulders and inexhaustible good humour. The men appreciate his sympathetic understanding of their needs as much as his technical knowledge; and the depot values his help in ensuring that the service which it provides is effective where it matters—on the sites.

Reg is an individualist who would not change jobs with anyone. *He is also a link in the chain of co-operation. His job, like many others, is part of an organised and willing effort by which many great construction works are completed efficiently and on time.*

Fleet users...

Why it pays to send your vehicles to MEASHAM

Every new vehicle delivered means a used one to dispose of . . . travellers' cars . . . delivery vans . . . lorries . . . Measham deals with the situation twice a week! That's why the big concerns buy and sell at Measham: Government Departments, Local and Police Authorities, firms with vast fleets of private cars and commercial vehicles. Big organisations have to think big; and they have found over the years that Measham's immediate market offers the most buyers, the widest selection of vehicles, and the best and fairest terms. One or a fleet—it's Measham every time!

THE BUSINESS WORLD

Stores and Chains

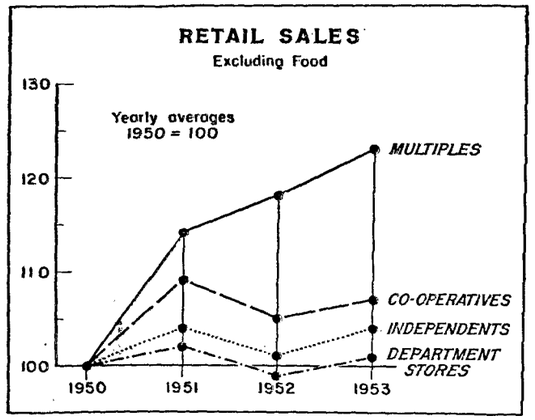
AS the annual accounts of the big shops come in, they repeat the same story of rising profits and buoyant trade. Each month's official statistics of retail sales show that the multiple shops are going ahead faster than all others. It would appear that last year the sales of most shops, excluding food, expanded by about 4 per cent, with sales of the co-operatives lagging behind. The big multiple chains, however, did much better than the average; their sales went up a clear 6 per cent. Total retail turnover (food excepted) was probably in the region of £2,600 million, of which more than half was shared among the "large retailers"—department stores, the multiples and the co-operatives. The turnover of a substantial department store group is reckoned in tens of millions and the turnover of any one of the biggest multiples must approach £100 million a year; and the retail co-operative stores together do perhaps £150 million worth of business a year, outside food and coal. When the figures are of this order, a small percentage variation either way can mean a difference of millions of pounds in cash receipts.

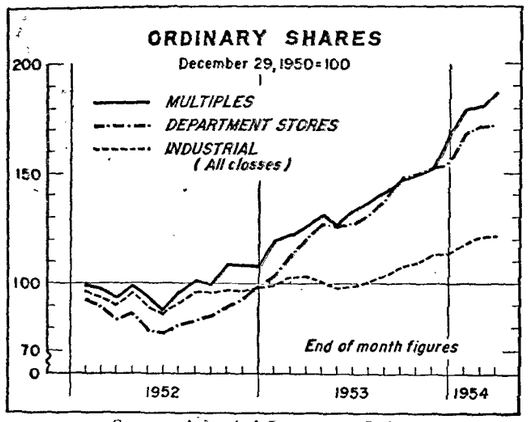
How far is this expansion of the multiples likely to go? The department stores feel that it has gone quite far enough already. These retailing mammoths need a huge turnover to cover their high overheads; it is difficult in these days to operate a department store successfully on a turnover of much less than £750,000 a year. The stores cannot afford to see any substantial portion of their sales diverted to the multiples. The chart shows that, in the past three years, money turnover in department stores has hardly risen, though controls and shortages are forgotten. This is a danger signal.

There is no special magic about the multiple stores' methods of trading that renders them invulnerable to competition. A big chain like Marks and Spencer can "think big" and does enjoy economies of scale; but in retail trade this can be a short cut to disaster, if the size or taste of the market is misjudged, as some of the tailoring multiples have learned to their cost. The successful multiple concentrates first on a narrow range of goods that are known to sell quickly, and then restricts production to an equally narrow price range. It will order grey cloth in immense quantities and will arrange with clothing manufacturers for the production of a vast number of garments; but it will maintain a vital element of flexibility in colour, in design, and in the styles into which the cloth is made up. It will keep an almost continuous check on goods in stock, and take complete stock at least once a fortnight, compared with the twice yearly stock-taking of the average retailer. The special contribution of Marks and Spencer to this system has been the scrupulous control over the quality of the merchandise, extending from the count of the yarn and the construction of the cloth down to the final detail of ironing the garment before it goes on the rail; but there is no reason why the same close control should not be exercised by any large shop.

★

Modern selling methods have played a big part in the growth of the multiples. They have exploited to the full the type of display that best encourages what retailers heartlessly call "impulse" buying. All goods are put on display where the customers can see them and touch them. Self-service food shops have found that open display leads to an immediate increase in turnover without any corresponding increase in costs, and open display seems equally effective even without self-service. This "self-selection" method of display is one reason why the multiple stores have much higher sales per square foot of floor space than their department





Source : Actuaries' Investment Index.

store competitors. Department stores are adopting the same methods.

While the department stores can increase their turnover by imitating the multiples' selling methods, it is not easy for them to meet the multiples on price. A department store will always have proportionately higher overheads ; on the other hand, it has a wider range of goods over which to spread these costs. It may not be possible for a department store to place orders so big that it can get rock-bottom prices from suppliers as the multiples do ; but the average mark-up used by the multiples is probably little lower than that of the department stores—some judges (but not all) would group the two on either side of 25 per cent—and a department store can compete on price by accepting a lower margin on some goods and using a higher mark-up on goods which the multiples do not handle.

Such competition, however, suggests that the unit profit margins of the department stores must narrow.

The effects of competition, moreover, extend beyond profits. Many of the stores are having to accept heavier commitments in stocks ; some of them may have to grant more liberal credit terms to their customers ; a few of them may buy out existing shops and others may build new ones. In all, their liquid balances (which at the moment are comfortably high) will feel the squeeze. What do these prospects suggest for shareholders in the department and multiple stores ?

Equities of these stores were in the van of the stock market boom. Woolworth and Marks and Spencer are accepted—perhaps a shade too confidently—as typical "growth stocks" offering modest yields. In the last year or so the shares of the department stores have begun to compete for this proud position in the market with lofty prices and low yields. In part, investors are impressed by improved profits and higher dividends and perhaps more impressed by the activities of Mr Samuel and Mr Clore. Extensive freehold properties that were—and still are—considerably undervalued in balance sheets imply large untapped wealth. There have been many rumours, often associated with the name of Debenhams, that the companies themselves might follow in the steps of the share-bidder, by selling their freeholds at current values and taking the properties back on lease. But directors generally have been concerned with the fact that new leases would mean much heavier rent-rolls, and increased rates, cutting deeply into earnings.

Some of these stores' shares,

up to prices well beyond what they ... on the basis of declared profits and dividends. Now, perhaps, some of the speculators will have to think again, for many other boards support the stern resistance of the Debenhams board to such a property deal. They may have to pin their hopes instead on the belief that the directors (made more conscious of their responsibilities by the efforts of the share-bidders) will gradually try to bring dividends more closely in line with earnings. This is likely to be a slow process and made all the slower by the growth of competition, the tighter rein on profits and scarcer liquid resources. Set against the shares of the multiple giants, the equities of a fair number of department stores seem well valued.

In this growing competition, the initiative rests for the present with the multiples, and the department stores are adopting their rivals' methods in order to compete in the immensely valuable low-price market. But it might be a grave tactical error to slip from emulation into imitation. The traditional weapons of the department store are the immense variety of its merchandise, search for novelty, and willingness to experiment with new styles. If the majority of consumers demand value rather than variety, they can only respond with price competition and a thorough overhaul of trading methods. No one would say that the stores are presenting an unbroken front to the multiples' attack. Some of them have little taste for this fight and are prepared to restrict their trade to goods and price ranges that the multiples do not touch. But expenditure on personal consumption, after all, is expected to continue to rise this year, and the shoe does not yet pinch. And a hard core of department store managements is determined that no more ground shall be lost. The success of the steps that they are now taking may decide how and in what form the department store system of trading can survive.

Hot War in Cold Drinks

FIRST shots in the 1954 soft drinks "war," which has been expected to begin this spring, have now been fired. "Pop in for a Pepsi," says the newspaper advertisement ; "Let's have a Coke," retorts the poster. In coming weeks, this advertising is likely to become more general and more aggressive. When sugar was derationed last autumn, clearing the way for the "new" soft drinks, views in the industry were sharply conflicting. Some spoke of "the pop war," of a revolution in drinking habits ; in three years, others said, the whole thing would be the biggest flop on record. Perhaps the subject can now be discussed with less heat and more light.

The fivefold increase in soft drink consumption in Britain, since 1924, from 45 to 220 million gallons, was due in part to the growth in population from 45 to 50 millions. But consumption per head rose also (from less than one to 4½ gallons per head*) because of increased incomes, changing social and drinking habits and, not least, heavier taxation of alcoholic drinks. Predictions of a large and early increase in consumption of soft drinks seem to have been based less upon assessment of prospective changes in drinking habits than on the too easy assumption that the influence of heavy advertising will be automatic. Advertising will, no doubt, stimulate interest in the cola drinks, at least initially. But clever advertising may not be enough. In the long run, sales of soft drinks will expand only if they suit the tastes, habits and pocket of the consumer.

In 1952, Americans drank between 10 and 12 gallons of soft drinks per head—nearly three times the British level. But there are at least three differences between America and Britain that go far to account for this disparity. First, the American standard of living is far higher than the British: and the price of the American-style drinks will govern their sales in Britain. About half of the current British consumption of 140 million gallons of mineral waters is bought for 5d to 7d a 26-oz bottle, largely by working-class parents and children. The 15.5 million gallons of squashes and cordials similarly cost about 6d for 26 oz when diluted by water. Coca-Cola sells at 5d. or 6d. for 6 oz (and more in hotels and restaurants), Pepsi-Cola at 5d. or 6d. for 10 oz. Canada Dry and Seven-Up are also in the higher price groups.

Secondly, the public house and beer have deeper roots in Britain than any corresponding institution or drink in America. They will not be saved by their traditions alone. But if beer is to yield some ground to soft drinks, it will be gradually and over a long period—which might be very much lengthened by countermeasures in the brewing industry itself, if taken in time.

Thirdly, the British summer is not as sweltering or as long as the American. The American feels the need for a cold drink even in winter, because his houses, offices and factories are centrally heated (and he can afford the fuel). Britain may in time take to cold drinks in its autumns and winters ; but hardly in a rush.

So much for demand. What about marketing ? The sponsors of the American-style drinks are only now planning to bottle and distribute them throughout the whole country. The cost of transporting bottled drinks is high, so that the area that can be served economically by one bottling plant is not large. As with beer, milk and other bottling, soft drink bottling plants must

* Compare Belgium 4½ gallons a head, Denmark 3, France 2, Holland 1½, Germany 1¼, Norway 2, Sweden 5⅓ (all 1950).

generally be decentralised. Very roughly, and depending on the density of population and the number of lines of equipment, a bottling plant can serve an area perhaps 20 miles in radius. Most sales of the new drinks, therefore, have begun in the thickly populated London area and the larger cities. Bottling plants for Coca-Cola, Pepsi-Cola and Seven-Up are gradually spreading into the provinces, but no company so far has more than 15. The United States is served by no less than 1,100 bottlers of Coca-Cola and 600 bottlers of Seven-Up. The population, of course, is three times as great and is spread more evenly, and the areas to be covered are far greater. Even so, there is clearly a long way to go before Britain is "fully covered with cola."

In America the cola drinks in grocers, chemists, stores, etc., are generally stored in a "cooler." How far Britain will want its cola cold remains to be seen. Retailers are recommended to sell Coca-Cola chilled; once tasted chilled, it is generally preferred that way, especially in warm weather. Ice-boxes are not expensive, but coolers cost from £80 to £1000 each.

The demand for a cold drink on a hot day is satisfied on impulse. Placing Coca-Cola "within an arm's length of desire" has been a main theme in its marketing; and refrigerated slot machines abound in American railway stations, garages, factories, offices, and hospitals. One of every five soft drinks sold in America, indeed, comes from a slot machine. These refrigerated slot machines for soft drinks are now being made in Britain; one firm hopes to place 35,000 in the next five years, and others have started up. But in America the refreshing bottles clatter out of half a million slots.

If the British buyer wants his soda-pop chilled, sales for home consumption will need some kind of ice-box in the kitchen. In the United States a fifth of Coca-Cola is still sold from soda fountains; of the four-fifths bottled, 20 per cent is packaged in 6-bottle carry-home cartons, and no doubt more is bought for home drinking in smaller quantities. More than half the Pepsi-Cola is taken home. But 35 million out of 42 million dwellings in America have a mechanical refrigerator and 4½ million have an ice-box. In Britain only 1¼ million households out of 14½ million have a refrigerator, fewer than one in ten. It may be possible to develop a low-priced cooler for home use; but the day of carry-home cartons for chilled drinks in Britain looks some way off.

★

Some optimists in the trade have suggested that soft drink consumption will increase threefold in three years. Personal expenditure on soft drinks in 1952 was probably some £50-£55 million; it is not easy to believe that another £100 million or more annually can quickly be found for soft drinks. That guess would assume, presumably, that consumption per head would rise to 13 gallons, or even more than the latest American figure. It is possible; but few convincing reasons have been advanced for supposing it likely. It may well be that the coming promotion of the new drinks would raise total consumption above its present level, but not, for some years, to 10 gallons.

Whether or not total consumption rises greatly, there may well be a redistribution of markets within the soft drinks industry. The new drinks must be expected to overlap and capture the markets of some established brands. But the victims will not necessarily be the small firms. Their productive equipment is not always very efficient technically, but their distribution costs are low: they are near their customers, and they do not advertise. Those that have a door-to-door service need not fear the chilly colas for a long time. It may be the medium-sized firms, too big to rest on local connections and reputation and yet too small to justify modern high-speed bottling plants, that will be swamped by the flood of cola.

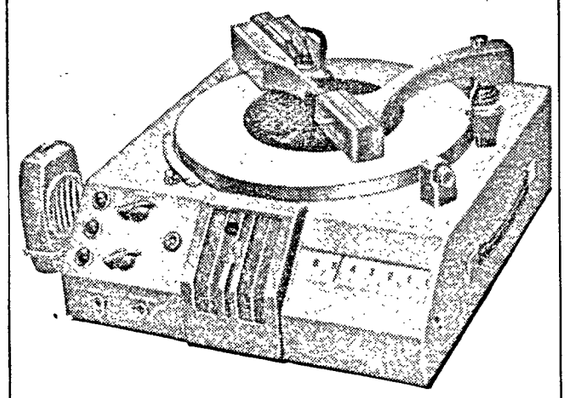
An increase in total expenditure on soft drinks, on the other hand, might come from various sources. A continued increase in national income is one. Expenditure on other goods that quench thirsts or contain sugar are a second. Soft drinks from vending machines in factories and offices may spread, though it will not be an easy job to displace tea or coffee. And if soft drinks satisfy the body's need for energy-giving sugar, they may displace sweets, cakes, and ice-cream; some vigorous promotion of soft drinks—mainly as yet fruit squashes—has begun in the cinemas.

The most discussed victim of the colas is beer; but the power of the challenge is by no means clear. Several brewers are bottling some of the newcomers. A fair number have long manufactured soft drinks for their own houses and some for restaurants and clubs. Almost every brewer is "interested" in soft drinks because he owns retail outlets which sell them. On grounds of taste and palate, beer seems to have little to fear. Soft drinks are mostly sweet. For hundreds of years hops have been added to beer to make it bitter. If palates have been changing gradually from bitter to sweet, beer can be, and is being, brewed less bitter; beer also has long been carbonated to give it the sparkle to which the advance of soft drinks has, in part, been attributed. In an expanding economy, soft drinks and beer can grow together. Although soft drinks provide the licensed house with only a small part of its takings, they may help it to win the classes of customer who might otherwise never know beer and the public house in their modern forms. To some people in the licensed trade the possibility of increasing soft drinks appears not only as a challenge, but also as an opportunity.

Little evidence has been produced so far to support prophecies of an early flood of soft drinks, drowning many small firms and displacing other confectionery or drinks. A gradual increase spread over the years seems more likely. This would give time for adjustment in the industries affected. They have no reason for panic, but the new competition must be taken seriously in formulating their own marketing plans. The outcome depends largely upon how quickly they meet the challenge.

The
Emidicta
Dictation System

Some things are common to all of us. We have a price on our time; we desire efficiency with economy; we have, too, a cautious tendency to doubt all remedies. Sometimes, even today, consultants of the Emidicta Advisory Bureau are told that the Emidicta 'wouldn't fit in here'.... and yet famous firms both large and small are reaping the rewards of this system. You have but to reach out, for there is a solution to your problem.



The System is built around

2400E★ Standard Office Model—6 minutes' actual dictation per disc—giving 20/30 minutes' typing.

2400E (Z/IC)★ A New Executive's Model (12 minutes' actual dictation per disc).

★ Both are dual-purpose dictation/transcription models with many other features including telephone recording (*may be connected to G.P.O. lines*).

PORTABLES

2401 (A.C. Mains) Transcription/dictation model.

2402 (Battery/Spring) Dictation only—independent of mains supply.

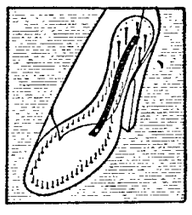
STEEL STEPS OUT

How much steel in a high-heeled shoe? None, you say. But there is. Unseen, unnoticed, steel gives the trimmest shoe long-lasting strength.

A slim steel shank supports the arch. The heel is attached by strong steel pins. Over 100 steel tacks secure the upper to the insole in almost every pair of shoes. Are these tacks not heavy? In the interests of lightness new micro-tacks have been produced; 30,000 to the lb.!



In this way and a thousand other ways, steel is adding to your comfort.

More than 8,000 tons of steel went into making over 130,000,000 pairs of boots and shoes last year. Exports brought in something like £8,500,000.

STEEL is at your service

Business Notes

Closing Arguments on EPU

ACTIVE discussions are continuing in Paris on the problem of the extension of the European Payments Union beyond June 30th next. The United Kingdom has now tabled its formal proposals ; as expected, Britain has expressed its readiness to accept a degree of funding and repayment of debts that have been outstanding for eighteen months or more—provided that the main creditors, with whom the funding and repayment would be negotiated bilaterally, give assurances that they will pursue "good creditor policies." The British proposals, it should be emphasised, do not countenance a "hardening" of the Union by any increase in the ratio of gold to credit in the monthly statements, whether for debtors or creditors. The basic tenet of the British attitude still is that EPU must be kept as a liberal trading club, so that any increase in the incentives to build up surpluses would be wholly inappropriate.

These British proposals are directed primarily to the problem of the German surplus, for Germany now has an accumulated credit balance of over $500 million in EPU, and shows no sign of being able to reduce the rate of growth in these credits. Britain's views on the appropriate remedies of this problem have been reinforced by a report of a special working party of the Economic Committee of OEEC on the policy that Germany should follow if it is to remain a good member of the Union. The report makes a number of tentative recommendations, in particular, that there should be a further liberalisation of imports into Germany and—on a much more controversial plane—that Germany should adopt a much more expansionist domestic credit policy. The response of the German authorities to this advice, as to the British proposals, has been unfavourable. They emphasise Germany's high degree of liberalisation of imports, the reflationary effect of the recent large-scale reduction in income-tax, and the ever-increasing freedom of transfer not only of earnings on old blocked marks but of the balances themselves, which can now be transferred into any non-dollar currency. Yet Britain can point to the anomaly of Germany's tax remissions to exporters, its continuing restrictions and high tariffs on imports of agricultural goods, and its quite exceptionally high interest rates.

The Paris discussions are at the moment taking place bilaterally, so that the controversial points at issue are unlikely to be thrashed out in general session before the eve of the next Ministerial meeting, to be attended by Mr Butler, that is due to open on May 5th. It now seems likely that the overriding problem before the Ministers will be to reconcile the British and the German viewpoints. The "French problem" has now been largely mitigated ; France has already increased its percentage of liberalised trade with Europe from 20 to 53, and has undertaken to step this up to 65 per cent before the beginning of November. France also seems prepared to follow Britain in opening negotiations on the funding of its long-outstanding debts to the Union.

Paying for the Coal Plan

THE prospective deficit of £17 million for this year that led the National Coal Board to raise its prices this week by an average of just under 5 per cent was calculated without taking into account the last general rise in miners' wages. That rise will cost nearly £10 million a year ; but the board, at least formally, still considers that a rise of 2½ per cent in output this year, which might wholly offset the consequent rise in labour costs, can be achieved. This week's increases in coal prices—which are designed to clear off the £17 million in the remaining eight months of 1954, and will amount to about £26½ million in a full year—have been decided upon to meet other increases in the board's costs, particularly in capital charges.

Between nationalisation and the end of 1952 the Board spent £184 million in capital investment, and last year its rate of spending rose, perhaps to £55 million or more. Its accounts for 1952 showed funded and temporary advances from the Minister of Fuel and Power totalling £63 million, and last year the board again appears to have borrowed heavily from this source to finance its investment. This is presenting it with a problem familiar to any enterprise that is spending heavily over a long period on capital developments that necessarily take a long time to fructify ; it has temporarily to bear a heavy burden of unproductive investment, and one that will grow for some years before it begins to be reduced as major projects come into full operation. In addition to sharply rising interest charges, the board's depreciation provisions are rising steadily ; though it does not charge depreciation on major projects, such as shaft sinkings, until operations begin, much of its expenditure is on less distinct developments and equipment, which it may begin to write off before they are being fully utilised. The board might have been well advised, in justifying its increases in price, to set out these rises in its capital charges in more detail. Little of the capital put into the industry under its 15-year plan is yet beginning to yield extra coal ; but this year's face-saving agreement over wages may strengthen the view of the miner that any and every increase in output derives entirely from his extra effort, and that all the eventual benefits of mining reconstruction can be earmarked in advance for wages.

Opening the Concertina

IN raising coal prices this week, the National Coal Board has again shifted slightly from a price policy based upon "scientific grading" towards ordinary commercial principles. Calorific values are one thing: the fact that certain coals are in great demand or extremely costly to produce is another, and the board is continuing gradually to take more notice of supply and demand. The general increase of 2 per cent in most coals sold in Britain other than to domestic consumers is complemented by a further "opening of the concertina" for domestic coals and for carbonisation and large coals generally. The greater the demand or the higher the cost, the more expensive the coal; this week's changes make the best domestic grades much dearer and a few grades of house coal considerably cheaper, while raising the prices of the best coking and industrial large coals much more than those of inferior grades. The effect is to raise the price of large coals by an average of 6½ per cent, of carbonisation coals in general by 5 per cent, and of the rest by 3 per cent: its effect upon industrial customers, therefore, is highly selective:

	Increase per ton s.	d.
Gas	3	0
Electricity	1	5
Railways	4	4
NCB Coking Plants	4	4
Other Coking Plants	3	8
Iron and Steel	2	11
Coastwise Bunkers	4	8
Trawler Bunkers	4	10
General Industry and other Inland Disposals	2	0

The effect upon the domestic consumer will be somewhat softened at first by the fact that these increases will come into effect on May 3rd, at the same time as the summer price rebates that the Board gives to encourage storage at home before the winter. These will give householders a chance to buy all but the two highest grades of coal, during the summer, at cheaper prices than they are paying to-day. The eventual increases, moreover, do not affect the three lowest grades of domestic coal, which together make up about 40 per cent of the coal that householders buy.

Oil Negotiations in Teheran

THE representatives of the consortium that has reached provisionally agreement about handling Iranian oil, if production is resumed, have been in Teheran for the past week, on the invitation of the Iranian Government, to negotiate the terms on which operations in the oilfields and at the Abadan refinery can be restarted. On Monday, Mr Eden expressed the hope of the Government that the negotiations would lead to "a durable settlement." The details of the consortium that he gave confirmed unofficial reports recently in circulation. Its composition is as follows:

	per cent
Anglo Iranian	40
Standard Oil of New Jersey	40
Socony Vacuum	
Standard Oil of California	
Gulf Oil	
Texas Corporation	
Shell	14
Compagnie Française des Pétroles	6

Mr Eden was questioned about "suitable contributory compensation" from the other members of the consortium to Anglo-Iranian and he made it clear that these seven members would pay for the share they took in the consortium. Evidently, these would be payments analogous to the purchase of a share of goodwill; they must be regarded as distinct in kind from the payment by Iran to Anglo-Iranian in compensation for the oil assets that were nationalised. Meanwhile, all hangs on a successful outcome to the Teheran negotiations; until then, agreement remains provisional. But Mr Eden did well to remind the House of the part that the members of the consortium would then be able to play in the marketing of Iranian oil—"a problem that has still to be resolved in the course of the discussions with the Iranian Government." But in marketing, as distinct from production, they would be principals, and not partners.

Crisis for the Comet

THE wreckage of the Comet that lies 3,000 feet down on the Mediterranean sea bed has shocked and shaken the confidence of the aircraft industry, for it has brought home, in a peculiarly tragic way, how little men yet know about the air. Ten days after Comets had been put back into passenger service after the intensive checks that followed the Elba disaster in January, another Comet crashed in circumstances virtually parallel with those reported on the previous occasion. It seems that there is a choice between only two conclusions—structural weakness or the ugly possibility of sabotage. The Minister of Transport has withdrawn the Comets' certificates of airworthiness.

It must be hoped that the public inquiry that has been promised into these two disasters will unearth the truth. But meanwhile all is dark, and no amount of excitable comment (such as some offered in Parliament last Monday) brings any light. But it is fair to recall some pertinent features of the Comet's history. Comets have been flying since 1949; teething troubles during flight trials were negligible, and during the first year's passenger service, the Comets gave British Overseas Airways Corporation less trouble than any other new aircraft on record. The loss of a Comet over Calcutta was attributed to exceptional weather conditions, and there is no evidence to disprove it. The aircraft had been flying for nearly five years before these two so far inexplicable tragedies occurred, one almost immediately after the other. If, after full inquiry, they have to be attributed to structural failure, it would demonstrate that present knowledge of aerodynamics did not go deep enough for the engineers who inspected the Comets so minutely when they were grounded in January to track down the source of the trouble.

The wreckage that has come back from Elba so far has served to eliminate a number of possible causes of that particular disaster, but it has so far provided no direct and positive evidence. There is still hope that a detailed examination of the larger pieces now on their way back to England may show what took place. The future of the Comet closely depends on the result of these examinations, for no substantial wreckage will ever be recovered from last weekend's crash; failing that, the long-term research on fatigue in aircraft that the Royal Aircraft Establishment at Farnborough has had in hand for some years will have to proceed until the source of the trouble is no longer in doubt. The destruction tests on the first prototype Comet are a part of this programme, and without some lead from them, it is difficult to know what further tests can usefully be carried out on the remaining Comets.

Steel Demand Remains High

THE British steel industry is continuing to find buyers for more steel than it has ever produced before; partly because imports have been cut to less than half of last year's rate, but mainly because of the continued buoyancy of demand. Last month the industry turned out nearly 365,000 ingot tons of steel a week, equivalent to nearly 19 million ingot tons a year; the annual rate for the first quarter of 1954 was more than 18¾ million ingot tons. The Iron and Steel Board, which this week issued the monthly figures with rather more detail and comment than has ever been done before, says that "There should be capacity for the production of 18½ million tons of steel in 1954, if this output is required."

It also published—for the first time—the results of the half-yearly censuses that have been taken of merchants' and consumers' stocks ever since 1950. The absolute figures

STOCKS OF STEEL, 1950–53
('000 tons)

Period	Producers	Merchants	Consumers	Total	Change
End 1950..	997	208	2,790	3,995	...
End 1951..	585	165	2,640	3,390	−605
Mid-1952 ..	657	198	2,775	3,630	+240
End 1952..	739	235	3,020	3,994	+364
Mid-1953 ..	914	315	3,190	4,419	+425
End 1953..	1,017	345	3,200	4,562	+143

here are subject to revision, and in any case may convey an exaggerated impression of accuracy, since returns rendered of stocks depend somewhat upon definition and somewhat upon the consumer's state of mind; but the changes are extremely significant, particularly the continued growth in merchants' and consumers' stocks during the period of so-called "steel shortage" and the official maldistribution scheme. These stocks showed little change during the last six months of 1953, a period during which steel supplies to the home market amounted to some 7¾ million ingot tons, or about 5½ million tons of finished steel—which would indicate that actual consumption of finished steel in this country may now be something over 11 million tons a year.

A Monopoly Competes

BRITISH NYLON SPINNERS has reduced its prices sooner and further than most people expected. The cuts amount to about 15 per cent on fine denier yarns and about 10 per cent on staple fibre. British nylon prices which until Thursday were fractionally above American are now the lowest in the world. This has been arranged in spite of the fact that British Nylon Spinners still foresee well over a year in which they will be unable to supply all the yarn and staple for which they have a demand. The Pontypool plant extensions planned to bring production up from 10 million lb a year to 30 million should reach 25 million by the end of this year and full production by the end of 1955. That is not expected fully to satisfy demand. The new plant at Doncaster which is being built into the shell of British Bemberg's factory should fill the unsatisfied demand; it will be ready in about 18 months' time.

Why then has the price cut been made now? First because it is desired to give British manufacturers of woven and knitted nylon goods and mixtures a fair opportunity in overseas markets. South Africa provides a good example; since the lifting of import restrictions there American competition in fabrics has grown. Secondly for the paradoxical

WORLD PRICES OF NYLON
(Per lb)

Denier	Britain Old Price	Britain New Price	USA du Pont	Germany "Perlon"	Canada
	s. d.	s. d.	s. d.	s. d.	s. d.
Yarn 15.....	46 9	39 9	42 10	...	51 10
„ 20.....	...	...	...	48 7	...
„ 30.....	20 10	17 9	19 3	40 4	23 7

„ 3 and 6..	11 3	10 3	10 9	11 1	11 7

reason that British Nylon Spinners has a monopoly in this country and recognises the responsibility that monopoly implies. Other textile fibres, for example rayon staple, may come down in the summer. British Nylon Spinners decided to play their full hand early. As a result nylon, jointly owned by ICI and Courtaulds, now comfortably undercuts Terylene wholly owned by ICI. Production of Terylene is not yet big enough to offer serious competition to nylon; but some day it may in the fields of underwear, woven fabrics, in some industrial uses, and as a mixture with wool.

The present move does not seem to be the prelude to any changes in the capital or ownership of British Nylon Spinners. It is to remain wholly owned by Courtaulds and ICI and it is hoped that the authorised capital of £8 million plus ploughed back profits will approximately suffice to carry through the development programme.

Competition in Petrol

SINCE premium petrol came back on the market fifteen months ago, the price of the commercial grades has been brought down from 4s. 2¾d. a gallon to 4s. 0½d. a

gallon, the last cut being at the end of March. The price of derv fuel was cut at the same time, but by ½d. a gallon. Now the Esso Petroleum Company has posed a fresh problem in price strategy by cutting the price of its mixture petrol, a grade midway in quality between commercial and premium, by ½d. to 4s. 3½d. This makes it 2d. a gallon cheaper than the premium grades marketed by the other oil companies, but 3d. dearer than commercial petrol. Since last autumn the major problem of the oil companies has been the persistently heavy demand for premium petrols at the expense of the cheaper grades. Even with the wonderfully flexible catalytic crackers, the refineries are bound to produce a certain minimum proportion of lower grade petrol from every ton of crude oil refined, and it is not proving easy to tempt the market to consume all that is produced. Two successive price cuts were made last autumn, followed by a further general reduction last month. The spread of petrol prices now extends from 4s. 0½d. for commercial grades to 4s. 6½d. for the top premium grade marketed by Esso—at a price 1d. a gallon dearer than that of the other premium grades. When premium petrol first returned to the market, the spread was far narrower, from 4s. 2¾d. to 4s. 6¾d. a gallon.

If price differentials of 5d. and 6d. a gallon are proving barely sufficient inducement to persuade motorists and fleet owners to accept the slightly lower performance that comes with using commercial grades, the standard commercial rebates given to big users are also losing their attraction. Oil companies are apparently having to offer rebates of as much as 1½d. a gallon in order to get the custom of big fleet owners. To the companies themselves, these concessions are substantial ; to users paying 2s. 6d. tax on every 1s. 6½d. gallon of commercial petrol, they have lost much of their significance. When the tax is greater than the price of the petrol, these small variations in petrol prices lose their power to influence demand and tend to drive competition into other channels such as "additives," and, on a different level, special financial arrangements with garages.

New Issue Activity

ALTHOUGH the budget fireworks that carried the share markets aloft have finished, the flow of normal refinancing operations is being resumed. Plans are now going forward for a number of issues against an investment background that remains favourable. Early prospects include two issues by companies both built up by single industrialists from small beginnings. An offer is expected to be made early next month of the 6½ per cent £1 preference shares in Cyril Lord Textiles sponsored by Ocean Trust and Hoare and Company, Mr Lord and his partner retaining the equity of the business. As a fabric designer and pioneer in the adaptation of synthetic textiles, he has built up since the war a manufacturing and merchant converting business which is to have a nominal capitalisation of £2 million in one million preference and one million ordinary shares.

Another welcome addition to the list of Stock Exchange securities is the 10s. ordinary share of F. Perkins, the manufacturers of diesel engines. These shares, which up to this week were unofficially dealt in under rule 163 (2), are now quoted at around 35s. 6d., on the basis of a 20 per cent dividend. This Peterborough business, which is Mr Perkins' personal achievement, receives a quotation on the publication of its 1953 accounts which themselves imply that the company may shortly need to issue new capital. The chairman announces that the board has the question of increased working capital under active consideration. Present capitalisation consists of £1,500,000 of 4½ per cent first mortgage debenture stock and £1,300,000 in 2,600,000 10s. ordinary shares.

In the sphere of mining finance, African and European Investment announces plans to issue 1,580,000 new 10s. ordinary shares as part of its programme for following up its investments in the Orange Free State and elsewhere. Of the new shares 780,000 are being offered to existing ordinary shareholders at 45s. per share (compared with a market price of 48s. 1½d. for the existing stock) in the proportion of one for every 10 stock units held, and underwritten by Anglo American Corporation of South Africa for a 2½ per cent commission. The remaining 800,000 new ordinary shares will be subscribed by Anglo American Corporation of South Africa at 50s. per share. The shares to be subscribed by Anglo American will not rank for the one in ten "rights" issue. The operation refunds on a permanent basis Anglo-American's present investment of £1,700,000 in 4½ per cent unsecured notes.

Car Prices in Competition

THERE have been reports for some months of price reductions in the car export markets, but the variety of import restrictions in force in the majority of markets makes it difficult to obtain a fair price comparison between different makes of cars from different countries. The Swiss market, with no local automobile industry, but with a connoisseur's interest in car design and no import restrictions to curb individual preferences, provides one of the most reliable barometers for indicating competitive prices. The accompanying prices are those asked at the recent Geneva Motor Show. The price trends for the coming spring and summer—the car buying season in the Northern Hemisphere—tend to be set at Geneva, and the lists show that this year the manufacturers of medium-priced cars in Britain, France and Germany have made quite significant reductions in the prices that they were asking at last year's show.

Jump in Exports

BRITISH exports recovered handsomely last month, even allowing for the fact that March had 27 working days, three more than February. The provisional trade figures, which were ready conveniently for the President of the Board of Trade's speech last Monday at the close of the Budget debate, show that exports jumped by £45 million to £246.4 million fob, and re-exports by £3.3 million to £11.6 million. The average daily rate of total exports rose from £8.7 million in February to £9.6 million, although it was still £400,000 below the rate in November. The improvement in March retrieved much of the ground lost in the two previous months, and the average value of

UNITED KINGDOM TRADE
£ million—monthly averages or calendar months

	Imports c.i.f.	Exports f.o.b.	Re-exports f.o.b.	Trade deficit
1953 1st quarter	272·4	208·5	10·0	53·9
2nd ,,	291·7	210·0	8·0	73·7
3rd ,,	274·8	211·6	8·5	54·8
4th ,,	276·1	230·6	8·7	36·8
1954 1st quarter*	274·1	224·4	9·3	40·3
March*	298·6	246·4	11·6	40·6

* Provisional

exports, excluding re-exports, for the first quarter has reached £224.4 million a month, only 3 per cent less than the average for the last quarter of 1953 and 8 per cent above that of the first quarter. The even bigger rise of £56.6 million to £298.6 million cif in imports in March

EXPORTS TO NORTH AMERICA

	U.S.A.	Canada	Total
1953 1st quarter	12·7	11·3	24·1
2nd ,,	13·9	15·7	29·5
3rd ,,	13·9	12·8	26·7

1954 1st quarter*	11·9	10·5	22·4
March*	12·9	11·2	24·1

* Provisional

reflects mainly the longer month ; the daily rate was little higher than in February. The average value of imports in the first quarter, at £274.1 million a month, was almost the same as in the previous six months and in the first quarter of last year. The gross visible trade deficit in the first quarter was £40.3 million a month, £3.5 million above the monthly average in the last quarter of 1953, but £15 million below the average for the whole of last year.

Despite the American recession, exports to North America shared in the general recovery, rising by £3.6 million to £24.1 million. Shipments to the United States were £2.2 million higher at £12.9 million and the daily rate was also higher than in February. Shipments to Canada, which are affected not only by the recession but by the closing of the St. Lawrence, were £1.4 million higher at £11.2 million, but the daily rate was unchanged.

Confidence for Cotton

THE recent speech by Mr Oliver Jacks to the shareholders of Ashton Brothers and Company (Holdings) deserves study, for Mr Jacks has both confidence and first-hand knowledge. Ashton Brothers in recent years has grafted a successful merchanting business onto its old-established spinning and manufacturing departments and has kicked open the door of the dollar market in British cotton poplins. Now, like a breath of fresh air, Mr Jacks tells the world that the harm that the Anglo-Japanese agreement will do to Lancashire is being much exaggerated, and that in any case the challenge of Japanese competition is one which sooner or later must be faced. He does not expect that Ashton Brothers productions (sheets, pillow cases, towels and shirtings) will be much affected by it. He speaks with a confidence that was commoner in Lancashire a generation ago, when cotton was still the world's biggest exporting industry.

Two other leaders of the textile industry have also spoken of the Anglo-Japanese agreement though in less confident tones. Mr James Ewing, the chairman of Bradford Dyers, refuses to take an alarmist view, but he criticises the Government for not having consulted representative bodies in the industries mainly concerned before making it. Had that been done he believes that the same ends could have been achieved with a less harmful impact upon British exports. It fell to Mr W. T. Winterbottom, the chairman of Fine Spinners and Doublers, to tell the Federation of Textile Works Managers' Associations what the first effects of the agreement have been. Japanese merchants, he said, had complained that importers in this country had made offers for substantial quantities of Japanese grey cloth at prices well below current Japanese export quotations. No business had been done because the bids were so low. Mr Winterbottom was concerned at the loss of confidence which would result if a few quick deals were made at cut prices to Lancashire merchants of all people. It is also fair to point out that spinners and manufacturers would suffer if Lancashire merchant converters could only maintain their competitive position by using Japanese grey cloth.

Tin's Rapid Climb

PRICES of non-ferrous metals have recently been buoyant, but tin has bounded upwards—and then fallen part of the way back again. Two months ago, cash tin was

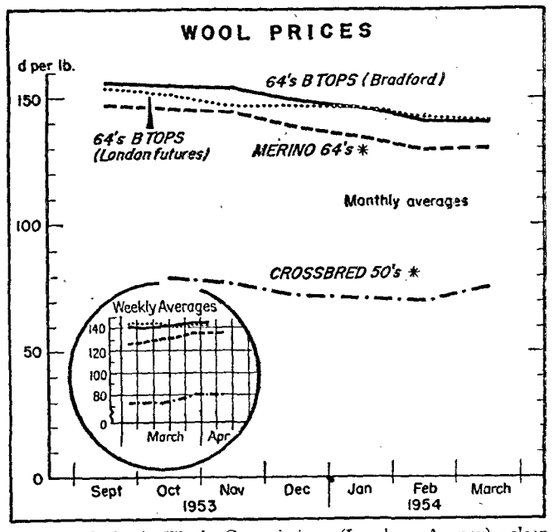
£650 a ton; it then climbed rapidly to £750, dropped to £725, and has recently shot up, reaching £825 last Monday. That price, however, was purely nominal, for no cash tin was in fact traded that day. On Tuesday cash tin was sold for £780 a ton, and the price has dropped further since then. The three months' price has been similarly erratic, but usually at a wide discount of between £30 to £50 a ton. These market spasms have been caused primarily by the continued shortage of supplies passing through the market—as distinct from supplies going direct to industry. Narrow markets spell wide fluctuations. There is no surplus of tin, and the prevailing discount for three months' tin discourages operators from selling forward.

The immediate strength of the market has several causes. Consumers, who had been buying from hand to mouth and running down their stocks, fear that the war in Indo-China may become another Korea, threatening to cut off supplies. There is also more confidence that the International Tin Agreement will come into effect. And last week Argentina bought 500 tons of tin and Chile 200 tons; these purchases were not unusual, but they were large in relation to supplies. Though the apparent world surplus of tin is some 35,000 tons a year, the renewal of the American contract with Indonesia for 20,000 tons reduces the real surplus to some 15,000 tons. This is not large in relation to an annual world consumption of about 130,000 tons, and may be no more than is necessary for the smooth distribution of supplies. As the sharp fall in the price last year from £950 to £565 a ton was caused by the threat of surplus, it is reasonable to expect the price to remain buoyant now that the threat has, at least for the time being, disappeared.

Recovery in Wool Prices

THE recovery in raw wool has carried prices of crossbreds back to the opening levels of the season; prices of merino wools, which had more ground to make up, are still below them. Prices of wool tops in Bradford, and of futures in London, have reflected the higher trend, although —as the chart shows—their relationship to raw wool prices is not always direct. The recovery has been due to a fairly widespread improvement in demand from the wool textile industries after stocks had been run down and when little of the season's sterling wool remains for disposal. Demand from Britain and the Continent was also stimulated by the need to place orders before the Dominion auctions closed for Easter. Though Russia and East European countries have been buying steadily, their bidding has been more restrained, and purchases of sterling wools by the United States have shown scarcely any improvement. Bradford bought heavily in London this month and the Continent has also taken substantial quantities. Greasy crossbred fleece wools were 10 per cent dearer than at the close of the previous auctions on March 5, and greasy merino wools were 2½ to 5 per cent dearer. The next London auctions will not begin until the middle of May.

Crossbred prices have been particularly firm owing to the shortage of sterling crossbreds, South American prices being considered too high by Britain and other countries which do not enjoy special rates of exchange with Argentina and Uruguay. The sizeable export orders secured by Bradford for crossbred tops, notably for China, have accentuated the shortage in this country. Owing partly to these export orders, and partly to some substitution of cheaper crossbred wools for merino in worsted cloth, output of crossbred tops in Britain has recently increased, while output of merino tops has fallen. Merino wools are in more ample supply and, in this country at least, in rather less demand for



* New Zealand Wool Commission (London Agency)—clean prices, delivered United Kingdom, for sales in London and the Dominions.

woollen cloth, in which there also seems to have been some substitution of crossbred wools for merinos. With the main part of the season over, there is every indication that the wool-growing Dominions will have enjoyed as good a year as in 1952-53. In the eight months ending in February exports of New Zealand wools, for example, rose to £44 million from £37 million in the same period of the previous season.

Uranium Progress

FURTHER progress in the exploitation of South Africa's uranium resources is disclosed in the mining returns for the March quarter now beginning to come in. West Rand Consolidated Mines was the first South African mine to earn a profit from uranium. The original plan was for the company to build a uranium extraction plant (with a monthly capacity of about 40,000 tons) and a sulphuric acid plant. The cost of the project, which came into production at the end of 1952, was put at about £1,600,000. So far the company has spent £1,778,852 on the plant, including interest on the £1,680,000 loan received from the Atomic Energy Board (acting as the agent of the British and American governments). Once the first plant was erected West Rand undertook to consider extending production.

The directors now say in their 1953 report that "the best means of obtaining the target of production undertaken by the company would be by means of increasing

Different People Different Times

We have more electricity today than we have ever had before. In the past six years 40 new power stations have been brought into operation and power supply has increased by 50 per cent. At the same time, more and more people want to use electricity. They want it in greater quantities than ever.

Nevertheless, the whole of the generating plant is only working at full output for short periods once or twice during the day. It could work to capacity almost all the time: it would be much to everybody's advantage if it did.

If electricity were more widely used by factories, farms, shops, homes, offices and for street lighting — this would keep the generating plant more fully loaded. The demands on the power stations coming from these different classes of consumers would be diversified. That is to say the loads would not occur simultaneously but, in the main, at different times of the day—and continuous full output from the generating plant would reduce the cost of electricity.

...burning bright

SOME eight thousand miles from London lie the jungles of Malaya.

We, the British, are the people who brought to this ancient land of tiger and jungle a common law and order, who constructed railways and roads, pushed back the jungle, built towns and cities, developed the tin mines and introduced the rubber tree. We have made it one of the most important countries in the world.

The rubber plantations of Malaya, which now supply industry with an enormous volume of cultivated rubber, were begun from the Brazilian seeds shipped to Britain towards the end of the 19th Century and propagated in Kew Gardens.

Today Dunlop Malayan Estates Ltd. cultivates 80,000 acres, the largest rubber plantation property in the world under single control. It employs many thousands of Tamils, Chinese and Malays. They work for good wages and live in good houses. They have schools, hospitals, crèches, laundries, bus services, entertainments and temples.

This is an age of greatly differing ways of living. We have no reason to be too modest. The British way of life has brought to millions a new conception of living, a greater prosperity, a wider freedom. Whether we work alone or as colleagues in one of our great industries, such as Dunlop, we still have to finish the job we started —the creation of a common prosperity and a common wealth of work and happiness for all peoples of the world.

DUNLOP *makes things better for everyone*

DUNLOP RUBBER COMPANY LIMITED · ST. JAMES'S HOUSE · ST. JAMES'S STREET · LONDON, S.W.1

PR/2

the capacity of the plant." The extension, including the expansion of the sulphuric acid plant, will cost about £550,000 and West Rand has applied to the Atomic Energy Board for loan facilities to cover the new expenditure. The extended plant should be in operation by the end of this year. West Rand's plant treats ore from the Bird Reef which has a higher uranium content than the other reefs in the mines. The uranium content, however, is low compared with that of producers outside South Africa.

West Rand is one of the mines which has deliberately mined ore of poor gold content but relatively rich in uranium. The result is reflected in last year's figures which show a fall in gold profits from £1,500,000 to about £420,000; but this is more than compensated for by a uranium profit of £1,367,998. Shareholders looking forward to still bigger uranium earnings will regard the decline in gold earnings with equanimity, but they may feel a tinge of envy when they see that another budding uranium producer, Stilfontein, is showing rising figures for both gold and uranium. The March return shows a rise in gold profits from £322,605 to £378,509 and in uranium profits from £44,833 to £71,575. Daggafontein and Western Reefs have also announced advances in their quarterly uranium profits, from £257,000 to £313,000 and from £228,000 to £270,000 respectively.

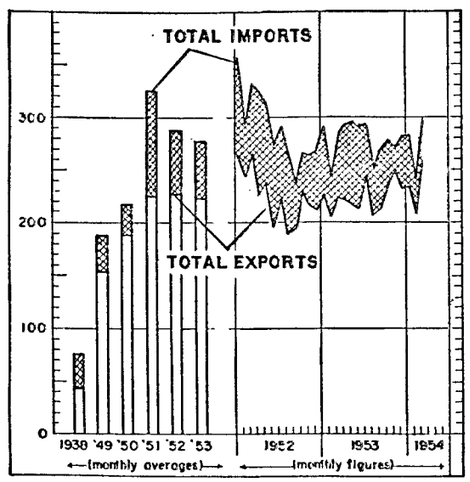
Productivity Loans Hang Fire

INDUSTRIALISTS and farmers have shown little anxiety to take up loans from the £1 million of "counterpart funds" earmarked by the Government as a revolving fund for loans to produce quick increases in productivity. Fewer than 430 applications have been received in the seven months since the scheme started, and a large number of these have had to be rejected because they did not suit the purposes of the fund. Of the 320 applications received from industrial firms, the advisory committee has approved only 32—involving about £320,000 out of the £700,000 set aside for industry. It still has 40 under consideration, but 250 or so have been turned down or withdrawn. Just over 100 firms have applied for loans from the £300,000 set aside for agriculture; 33 loans have been approved, totalling only £25,000, and another 47, which would involve £40,000, are still being considered.

Some industrialists have complained of the conditions under which these loans are offered: the Board of Trade prefers its loans to be a first charge on the company's assets, wants repayment in five years or less, and is charging 4 per cent interest. They are holding up the example of the Ministry of Fuel and Power's loans to industry for the installation of fuel saving equipment. The £1 million fund set up for this in May, 1952, attracted few applicants during its first year, when commercial terms were charged. In June, 1953, these loans were made interest free for the first two years, and the repayment period was increased to the taxation life of the asset, with a maximum of 20 years; the number of applications trebled in the next 10 months and eight times as many loans were approved, so that about £270,000 has now been lent and schemes involving £230,000 are under consideration. But there seems little case for any similar change in the conditions of the productivity loans. It is not unreasonable to expect small items of equipment that will raise productivity quickly to be written off in five years or so, and there is no case for giving particular little pieces of re-equipment specially favourable rates of interest.

THE UK TRADE GAP

£ MILLION



SHORTER NOTES

In a note on the Shell-Royal Dutch scrip issues last week it was wrongly stated that Shell was to issue one new free £1 ordinary share for every £4 of stock held and that Royal Dutch was to issue new free ordinary shares in the same one for four ratio. In fact, both Shell and Royal Dutch are to make scrip issues in the ratio of one new ordinary share for every five held. If the current price of Shell's £1 ordinary units of 5½ is adjusted to this issue, then their yield, if the current tax free dividend of 15 per cent were maintained on the increased capital, would be £5 19s. per cent. Similarly, the yield offered by the Royal Dutch fl. 100 ordinary units at the current price of 42⅜ and the current dividend of 16 per cent would be £4 5s. per cent.

★

The directors of Cammell Laird took the stock market by surprise this week. As in 1952 they have declared an ordinary dividend of 15 per cent, less tax, but in addition they have declared a tax-free bonus of 4 per cent, compared with a similar bonus of 2 per cent in 1952. Moreover, they have recommended a special tax-free distribution of 2s. 6d. on each 5s. ordinary share from capital profits and a scrip issue of one new free 5s. ordinary share for every two units now in issue. After this announcement, the 5s. ordinary units rose by 2s. 3d. to 18s. At this price, if the tax-free bonus of 4 per cent is lumped together with the 15 per cent dividend, the yield is nearly 6.2 per cent.

Company Notes

VICKERS. The decision by the directors of Vickers to leave the ordinary dividend unchanged at 15 per cent did not surprise the market. After the announcement the £1 ordinary stock units lost only 3d. to 59s., leaving the yield almost unchanged at 5.2 per cent. The repetition of the dividend is in keeping with the steadiness of net profits. They have risen by a mere £6,356 to £2,850,994, though there was apparently a decline of about £250,000 in gross profits for net earnings are struck after a tax charge of £3,745,876 (compared with £4,003,645 in 1952).

Until the full accounts are published it would be unprofitable to speculate how the main items of the group's activities—aircraft construction, the rearmament programme, and the shipyards — have impinged upon the profit figure. But the investor can still make some deductions. He will note that in reducing the company's holding of 3½ per cent Treasury stock (which arose from the nationalisation of English Steel) from £12½ million to £5½ million, a loss of £669,971, compared with a loss of £374,086 in 1952, has been incurred. This has been charged against profits (though it has been balanced by a transfer from the surplus arising from the nationalisation of English Steel). The investor can assume that after the recent rise in gilt-edged the potential loss on the residue of the holding must be much smaller.

The investor will also note that the Chancellor's new investment allowances should help Vickers both as a supplier of capital equipment and as a company which is still expanding its own productive capacity—witness the decision to advance another £1,500,000 to Powers-Samas and the group's growing interest in the manufacture of civil and military aircraft. The scope of Vickers' interests may also be greatly altered if agreement is reached to buy back its controlling interest in English Steel; at the moment, however, the board can hardly be criticised for not revealing the price at which it is willing to buy.

The investor cannot fail to gather the impression that little is likely to go wrong with the fortunes of Vickers this year. Yet he would be wise to consider the proposed 100 per cent free scrip issue exactly as the market has treated it—as an attempt to bring issued capital in line with employed capital but without any of the usual overtones murmuring an increase in dividend payments.

★

UNITED DRAPERY STORES. The preliminary report of United Drapery Stores (for the year to January 31st) has added to the standing of the company's 5s. ordinary stock units. The advance in their price from 43s. 6d. to 51s. 3d. suggests that investors now rank them among the "growth stocks" in the stores group—an appraisal that became possible last year when the company bought out Prices Trust.

Immediate support for a favourable view can be found in the decision to raise the ordinary dividend from 40 to 50 per cent and to issue one new free 5s. ordinary share for every existing stock unit. On a smaller scale this chain of drapery and furniture stores seems to be doing almost as well as Great Universal Stores. If the profits earned by Prices Trust in the seven months from July 1, 1953, are excluded from the calculation, trading profits have risen from £2,359,050 to £2,781,541 and net profits (in spite of an increase in the taxation and depreciation provisions) from £667,814 to £850,039.

	Years to Jan. 31, 1953	1954
Consolidated earnings:—*	£	£
Trading profit	2,359,050	2,781,541
Depreciation	150,412	256,363
Taxation	1,508,661	1,674,270
Net profit	*667,814*	*850,039*
Ordinary dividends	319,463	405,083
Ordinary dividends (per cent)	40	50
Retained profits	344,020	440,419

5s. ordinary stock at 51s. 3d. yields £4 17s. per cent.

* Latest year's figures exclude profits earned by Prices Trust in seven months from July 1, 1953.

If the profits of Prices Trust are included, then the group earned a trading profit of £3,113,006. Therefore Prices Trust (whose shops are to lose the name of "Fifty Shilling Tailors" and to be called John Collier) has earned in its seven months within the United Drapery group a profit of about £330,000, compared with earnings of about £164,000 in the year to June 30, 1953. Shareholders must remember that 1952 and 1953 were dismal years for the multiple tailors. The optimists would suggest that a full year's profits from Prices Trust and the disappearance of EPL (which took £309,000 from the 1953-54 profits) point to bigger dividends from United Drapery Stores.

★

BICC. British Insulated Callender's Cables, the electrical cable and equipment manufacturers, is one of the few electrical companies to report a fall in profits in 1953. Trading profits have fallen from the record level of £9,522,076 to £8,344,074. Thanks, however, to a sharp reduction in tax, net profits have actually risen—from £3,069,756 to £3,661,896. The decline in gross earnings bears out the chairman's warning of a year ago that conditions during 1953 were not likely to be as good as in the record year of 1952, when copper prices were high and competition was less keen. The "substantial falling off" in the rate of new orders to which he then referred has had an obvious effect.

	Years to Dec. 31, 1952	1953
Consolidated earnings :—	£	£
Trading profit	9,522,076	8,344,074
Total income	9,690,989	8,804,675
Depreciation	906,996	1,117,015
Taxation	4,869,146	2,819,395
Net profit	*3,069,758*	*3,661,896*
Ordinary dividends	673,075	679,250
Ordinary dividends (per cent)	10	10
Capital reserves	18,632	650,874
Revenue reserves	1,834,692	1,834,854
Added to carry forward	483,769	596,493

£1 ordinary stock at 43s. 6d. yields £4 12s. per cent.

Shareholders in British Insulated, however, benefited from the fall in the tax provision. The directors were able to leave the ordinary dividend unchanged at 10 per cent while appropriating a little more to reserves. In addition, equity shareholders are to receive a tax-free distribution of 2½ per cent from profits made on the sale of investments and properties in 1953 and earlier years.

★

REYROLLE. Unlike BICC, Reyrolle, specialising in the manufacture of switchgear, is among those electrical equipment manufacturers whose profits are still rising. Last year trading profits advanced from £2,786,148 to £3,111,067. This increase followed a rise in production to a new peak, but the result fell "slightly short of the target aimed at." The chairman, Sir Claude Gibb, does not explain whether this means that the group's industrial capacity failed to fulfill all the demands made upon it. It certainly does not seem to refer to any difficulty in securing raw materials for Sir Claude specifically draws attention to the "marked easing" in the flow of materials to the group's factories—a fact that may help to explain why the book value of stocks has risen from £5,194,360 to £6,061,931.

The directors have decided to distribute more to ordinary shareholders. In 1952, the full year's dividend was 12½ per cent.

	Years to Dec. 31, 1952	1953
Consolidated earnings :—	£	£
Trading profit	2,786,148	3,111,067
Total income	2,894,876	3,226,241
Depreciation	119,565	120,584
Taxation	1,817,895	1,888,153
Net profit	*907,506*	*1,159,105*
Ordinary dividends	133,566	195,898
Ordinary dividends (per cent)	12½	13⅛
Retained by subsidiaries	3,523	14,343
General reserve	200,000	300,000
Specific reserves	470,000	551,688
Added to carry forward	69,072	128,824
Cons. balance sheet:—		
Fixed assets, *less* depreciation	1,138,264	1,320,403
Net current assets	6,225,577	8,2[illegible],989
Stocks	5,194,360	6,061,931
Cash	1,370,215	2,531,283
Reserves	5,110,942	7,230,333
Ordinary Capital	2,035,294	3,052,911

£1 ordinary stock at 80s. yields £3 9s. per cent.

In 1953, the directors added to the interim dividend of 6¼ per cent (paid on a capital of £2,035,294) a final of 7½ per cent, declared on a capital of £3,052,941 as increased by the "rights" issue of 1,017,647 shares last October. This issue, at 40s. a share, enabled the company to take up its quota in the issue by C. A. Parsons and Company, the manufacturers of steam turbines and electrical equipment in which Reyrolle has a large interest; it also reinforced cash balances. This reinforcement will help the company to meet its tax liabilities and to pay for the extensions "to the assembly shop for extra high voltage switchgear and other projects now in hand."

Presumably, all that shareholders can now expect is that the full rate of 13¾ per cent will be maintained on the increased capital. They certainly must regard the tax free distribution of 2½ per cent from the surplus realised on the sale of the company's holding in Morphy-Richards as an exceptional payment. Beyond those assumptions shareholders should not venture in view of the chairman's warning that competition has grown fiercer and that to meet it the company has lowered its selling prices. On this view, the yield of £3 9s. per cent may look slender.

★

BRITISH-AMERICAN TOBACCO. The increase in the tax-free ordinary dividend of British-American Tobacco from 1s. 1d. to 1s. 3d. on each 10s. share was discussed in these columns on February 27th. The accounts now underline the comment then made that the preparation of these accounts is no mean feat and that it is the blocking of profits earned in many countries that forces the company to retain most of its earnings in the reserves of subsidiaries.

One aspect of this situation is that the shareholder has to take it on trust more than in most companies that his directors are pursuing as generous a dividend policy they can within the limits imposed by exchange controls. Another aspect is that the retention of profits, thus forced on the company, enables it to cover its immense commitments in stocks and debtors, which in a tobacco company can be regarded as stocks at one remove, without the aid of outside funds. Compared with Imperial Tobacco (which has a substantial stake in BAT) the group's bank overdrafts are negligible. Yet its stocks total over £156 million (compared with £159 million in 1951-52). Indeed, in the latest year—thanks to this reduction in stock commitments—the group reduced its bank overdraft and added about £2,800,000 to its cash balances and tax reserve certificates.

	Years to Sept. 30, 1952	1953
Consolidated earnings:—	£	£
Trading profit	46,265,944	45,808,754
Leaf devaluation surplus*	1,047,243	598,410

Bank overdrafts	2,304,411	1,876,001
Reserves	127,263,569	127,207,716
Ordinary Capital	23,757,761	35,573,172

10s. ordinary stock at 38s. 9d. yields £5 14s. per cent.

*Transferred to replacement reserves.
†Tax free.

Full as the accounts are in accounting detail, they do not give the shareholder any guidance as to the course of the group's trade last year. Until the chairman makes his statement at the annual general meeting, all that the investor may legitimately assume is that the comparative stability in profits at a time of rising costs suggests that the volume of trade was at least maintained.

LONDON STOCK EXCHANGE

Next Account begins: April 21st.
Next Contango Day: April 21st.
Next Settlement Day: April 27th.

ALTHOUGH gilt-edged securities continued to make a strong advance, industrial equities lost a little of their recent bloom this week. The *Financial Times* ordinary share index had climbed to 145.0 just before the week-end, but had fallen back to 144.0 by the close on Tuesday. Dealers in the gilt-edged market reported a heavy demand for British Government stocks from the institutions and on Tuesday, for instance, old Consols and Daltons both put on 11/16 to the common price of 66. Most of the buying orders were for the long and undated stocks. The longer dated home corporation and Dominion and Colonial stocks shared in the advance. In the foreign market, Japanese bonds improved on Tuesday on reports that the sterling issues would be granted a New York quotation in a few days' time. German issues remained dull, as dealings in Dawes remained suspended.

Further substantial gains, particularly in capital equipment equities, were made in the industrial market just before the week-end, though de Havilland were marked down 4s. 3d. to 25s. 9d. following the grounding of the Comets. A few of the better class issues, especially in the engineering and brewery groups, were given some support when dealings began on Monday. But elsewhere in the market (unsettled as usual by the approach of the Easter holidays) prices began to falter when profits were taken. And on Tuesday, in spite of a rally in the late afternoon, falls predominated in the market. The heaviest falls were made in those shares which had been in the van of the recent advance. Oil shares moved rather irregularly, but Wakefield jumped 7/32 to 2 15/16 on Tuesday on buying in anticipation of next month's dividend. Rubber and tea shares were firm in a quiet market. The fresh rise in the price of non-ferrous metals was reflected in an improvement among the metal shares. In the Kaffir market, some support was given at first to the OFS issues but the market then turned dull when selling was reported from the Cape.

[1] Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and in Western Germany on July–December, 1948=100. [2] Index numbers of unit value which compare the current average value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. [3] Notes only for France and Austria. [4] Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. [5] Average of third quarter.

Financial Statistics

EXCHEQUER RETURNS

For the ten days ended April 10th, there was an "above-line" deficit (after allowing for Sinking Funds) of £11,162,000 compared with a deficit of £51,770,000 in the previous eleven days and a surplus of £5,152,000 in the corresponding period of last year. Net expenditure "below-line" absorbed £10,009,000, bringing the total deficit to £21,171,000 (£9,021,000 in 1953-54).

THE MONEY MARKET

CREDIT conditions in Lombard Street were varied in the week to Wednesday last. On Thursday before the weekend some houses were under pressure and the authorities gave relief by small purchases through the banks; but conditions eased on the following days, and on Saturday overnight money was offered at rates down to 1 per cent. At the beginning of this week credit tightened; the authorities again came to the aid of the market through the banks on Tuesday, and some houses were forced to sell July bills at 2⅜ per cent (as against the usual rate of 2⅛ per cent). On Wednesday the market was easier and the authorities gave a smaller amount of support direct.

At last week's Treasury bill tender the market again maintained its bid at £99 9s. 5d. per cent for the £270 million of bills on offer. As applications fell from £399 million to £392.2 million, the market's allotment rose from 58 to 59 per cent. At Thursday's tender the offer was reduced to £230 million, compared with maturities next week of £210 million, so that the excess of new bills will shrink from £40 million to £20 million.

In the bullion market turnover was somewhat smaller than in the opening weeks of dealing; and prices at the fixings declined from the peak of 248s. 10½d. on Thursday of last week to 248s. 7d. on Tuesday and Wednesday.

A misty night. Skilled hands are at work on the warehouse window. A click, and it's open. A lorryload of carpets is stolen—and a valuable contract lost.

Adequate insurance will make good the loss—*but the advice of an insurance expert might have prevented the theft.* For the British Insurance Companies have vast experience of the methods of burglars; and it is part of their everyday service to help you to keep them out. If you have any misgivings about *your* anti-burglary precautions ring up your Insurance Company and ask their advice. It costs you nothing. It is all part of the British Insurance Service.

COMPANY MEETINGS

BRITANNIC ASSURANCE COMPANY, LIMITED

CLAIMS PAID £107 MILLION

£1,742,000 ALLOCATED TO POLICYHOLDERS

Mr J. A. Jefferson, FIA, presiding at the eighty-eighth annual general meeting on April 2, 1954, said:

I am again pleased to lay before you evidence of sound and solid progress in 1953. The life premium income was £11,228,000—an increase of £428,000—and gross interest £3,401,000—an increase of £304,000. The total funds increased by £5,454,000 to £85,370,000, the mortality experienced was satisfactory, and the net rate of interest earned improved. In both life branches our expense ratios were moderate and slightly reduced, and we have declared increased bonuses.

ORDINARY BRANCH

The ordinary branch premium income reached £3,787,000, compared with £3,639,000 and the fund increased by £2 million to £31,504,000. Net interest amounted for the first time to over £1 million, and the rate rose from £3 5s. 6d. per cent to £3 6s. 8d. per cent. Net sums assured under new policies, after deduction of reassurances, totalled £7,047,000 at annual premiums of £361,000 and single premiums of £33,000. New business was somewhat less than in the previous year due to a tightening up of our requirements under our house purchase scheme.

Death claims, although £36,000 more, were at about the same level as two years ago. Maturities, however, at £1,346,000 showed an increase of £150,000. For very many years the bulk of our claims payments in this branch have been made to surviving policyholders, who have thus reaped the reward of their own thrift. Surrenders at £360,000 were £30,000 up, but the figure is not large when compared with the volume of our business. Expenses were at the very moderate rate of 11.79 per cent.

The Millard Tucker Committee, which was set up in 1950 by the then Chancellor of the Exchequer to consider the financial and taxation problems in connection with provisions for retirement, has recently reported. The report is a lengthy document of a very involved character, and we shall not know until the Chancellor makes his Budget speech whether he is going to accept the whole or a part of the recommendations. There can be no question whatever that the great body of self-employed persons, professional men, shop-keepers and others, have been at a serious disadvantage compared with the employees of large firms who have been able to contribute to an approved pension scheme.

If the recommendations are implemented, this disadvantage will be removed, and we are studying the position closely so that we shall be able to offer a satisfactory scheme to such people.

INDUSTRIAL BRANCH

The industrial branch premium income increased by £280,000 to £7,441,000, while the fund increased by £3,076,000 to £46,338,000. The net rate of interest earned was £4 3s. per cent, which was 3s. 9d. higher than the previous year.

Death claims at £1,585,000 were up by £69,000. Maturities amounted to the substantial sum of £1,591,000. It is interesting to note that these payments on death or maturity averaged £60,000 per week.

The expense rate at 26.66 per cent was virtually unchanged and has in fact varied little since 1943, when it was 27.98 per cent. We regard it as an achievement to have been able to reduce it during a period of rapidly rising costs, particularly as during the same period we have been able to improve staff conditions.

It is interesting to note that whereas in 1938 our new premiums were almost equally divided between whole life and endowment assurances, last year approximately 90 per cent were for endowment assurances and only 10 per cent for whole life policies.

Endowment assurances are essentially savings and represent one of the chief forms of saving in the country today. Savings through home service insurance would not be made without the regular call of the agent at the home of the policyholder, and we know that in nearly two thirds of the cases there is no other form of regular saving in these homes.

The ordinary branch earned surplus of the year was £1,015,606—a record in the history of the branch and for the first time in excess of £1 million. The directors have allotted £782,158 (as against £708,854 in the previous year) to policyholders and have been able to declare a reversionary bonus of £1 12s. per cent compared with one of £1 10s. per cent in the previous year.

The industrial branch surplus earned in the year was £1,824,454. The directors have allotted £900,000 (as against £800,000) for bonuses to Britannic policies, which again enables them to improve the vested reversionary bonus scheme. Bonuses attached to premium-paying policies in force on December 31, 1953, on which 10 years' premiums had then been paid, will now be 9 per cent of the sum assured, increasing by 1 per cent for each additional year's premiums paid, up to a maximum of 33 per cent after payment of 34 or more years' premiums. All the policies to which these bonuses have been added were issued without any right to share in profits.

INVESTMENTS

Nineteen fifty-three was a year of steadily rising prices in all classes of securities and we end up 1953 in a much stronger position as regards the valuation of our assets. In fact, we are able to give a certificate that the assets are fully of the value stated in the balance sheet without taking into account any part of our investment reserves.

We have again increased our holdings of ordinary shares—this year by £1,364,000—and the ratio of our assets in this class is now 16 per cent of the total. Much has been said and written during this past year about the importance of risk capital in industry, and I consider that £14 million in this class of security, out of total assets of just under £87 million is a reasonable but not excessive proportion of our policyholders' moneys to have at stake.

I think it should be restated that in the investment of a life assurance company's funds, the directors' first duty is to their policyholders. The directors are in a position of trust in relation to their policyholders, and they have a duty to see not only that the money entrusted to them through the medium of premiums is kept secure, but also that it should return the best rate of interest possible. It is now being suggested that the primary consideration in the investment of insurance offices' funds should be the "national interest." This is a high-sounding phrase, which carries in itself the unproved assumption that investment in the policyholders' interests cannot be at the same time investment in the national interest, and this is something I would challenge straight away. I believe that by investing in the best interests of the policyholders, which means investing in the best securities and the most efficient industries, we are, at the same time, investing in the national interest.

The Rt Hon Peter Thorneycroft, President of the Board of Trade, said recently that he believed that the guiding principle in the investment of insurance funds was the interests of the policyholders; these considerations were certainly present in the minds of the investors of those funds; they sought safety, and very properly so.

A peculiar development in the financial world during recent years has been operations which have become known as "take-over" bids, followed very frequently by the liquidation and re-leasing of the companies' properties. Where a "take-over" bid is inspired by the desire to bring efficiency to a mismanaged business, or to promote further efficiency by amalgamation, the transaction may be of great benefit. Further, where a concern finds itself short of working capital, the sale of its properties and the acceptance of long leases may be a very desirable way of raising money. In some cases, however, this transaction provides the directors of the company with money which they cannot use in the business. The shareholder is then faced with the risk that his money will be used in some extraneous project in which his directors are not expert, or in which he had no intention of interesting himself when he originally purchased shares in the company.

The amount outstanding under our house purchase scheme increased during the year by £1,088,000, and we now have just over 17½ per cent of our total assets invested in this way. During the last five years we have advanced £14 million under our scheme, which we still regard as a suitable investment for a part of our funds, and it is of course a valuable source of new life and general business.

In the fire and accident branch the premium income increased by £35,000 to £633,000. The claims experience was satisfactory and our gross profit for the year was the record one of £41,031, compared with £33,700 for the previous year.

STAFF

We are again transferring £200,000 to the staff pension fund, which affords valuable

and comprehensive security for the members of our staff, for it now provides pensions for the widows and children of deceased pensioners and members of the staff.

The satisfactory results of the year are a reflection of the efforts of our staff, and I end—as always—with a sincere word of thanks to them. It gives me great pleasure to do so and to say that our relations continue to be firmly based on mutual goodwill and co-operation.

The report and accounts were adopted.

CO-OPERATIVE INSURANCE SOCIETY LIMITED

MR S. LEONARD KASSELL'S REVIEW

Mr S. Leonard Kassell, chairman, at the eighty-sixth annual general meeting held on April 14, 1954, said:

This is the first annual report which it is my privilege to submit to the shareholders since my election as chairman, and I am naturally very gratified that the results for the year under review are very satisfactory.

The general picture presented by the statement of accounts and balance sheet for the year 1953, is one of progress in all departments and a substantial recovery in the volume of our ordinary life new business. Contrary to general assumption, this recovery is not due to an expansion in our house purchase business and has been secured by an increase in straightforward life assurance business, an expansion which we believe will continue during 1954.

FINANCIAL STRENGTH

During the year our income reached a total of £37,621,559, and our assets increased by £11,691,670 to £134,029,518, most of which relate to our life funds.

This increasing income means of course that increasing sums of money have to be invested and this is undoubtedly one of the greatest responsibilities which falls upon your board.

It is now generally appreciated that life assurance is one of the best and most widely adopted forms of saving in this country.

The CIS, as an office transacting both ordinary and industrial life assurance, is in an exceptional position as it is entrusted with the life assurance premiums of persons in all walks of life.

We now have over 11 million life policies in force and it is a measure of our responsibility that we hold over £120 million in trust for the holders of these policies. It is our duty to make sure that this fund is administered to their best advantage.

FACILITIES FOR POLICYHOLDERS

Through our full-time agents our policyholders have excellent facilities for life assurance and saving and there is little doubt that were it not for the regular calls made by our agents, most of this saving would not be made through any other channel.

By making small regular payments our policyholders not only secure the inestimable advantages of life assurance, the provision of which is still the primary purpose of our life department, but they are able to secure also the advantages which accrue to them from investment facilities and opportunities made available to them collectively as members of the general body of CIS policyholders. These facilities could not in most cases be taken advantage of by them as individuals.

FUNCTIONS OF THE SOCIETY

The rapid growth of an office such as the CIS, in which practically all the policyholders are persons of moderate means, is of undoubted social significance. It indicates that such persons are steadily acquiring a direct interest in the capital assets of the country, as represented by property and other securities in which their funds are invested.

I have gone to some length to deal with this aspect of our affairs as there is, I think, a certain amount of misunderstanding inside and outside the co-operative movement as to the functions and responsibilities of the CIS.

ADMINISTRATIVE COSTS

Our methods of operation are constantly under review with a view to securing greater efficiency and reducing costs. The fact that during 1953 our commission and expense ratio was further reduced in all departments shows that our efforts were not unsuccessful and I am satisfied that there was no diminution in our standards of efficiency.

LIFE DEPARTMENT

I have already referred to the recovery in the volume of new business in the ordinary section where the total sums assured completed during 1953 amounted to £21,797,619, being an increase of £5,182,909 over the figure for 1952.

Despite the fact that we are relying on individual life assurance policies, we are looking forward to a further increase in new business this year.

We are laying greater stress on the need to provide, through life assurance, for an income to be payable in the event of the death of the breadwinner, and we have prepared a special scheme showing how life assurance policies with income benefits can be used to provide for definite commitments such as mortgage repayments to be met in the event of death. A new option policy for children is also to be introduced shortly, which will provide valuable benefits and options for the child, and will in addition provide a regular income to help keep the child should the parent die before the policy matures.

We are also introducing a special option for women on our whole life and endowment assurance policies, so that on marriage the policyowner can alter the policy to make it an assurance on her husband's life, and receive a return of all the premiums previously paid less the first year's premium on the new assurance. With this new option, our policies will provide a particularly attractive method of regular saving for the younger women.

MOTOR DEPARTMENT

This account continues to make rapid progress, and the very satisfactory increase of £378,302 during the year brings the motor premium income to £3,293,464.

FIRE DEPARTMENT

The 1953 results for the fire department are very favourable. The net premium income, which amounted to £1,459,517, showed an increase of £50,000 over 1952.

ACCIDENT DEPARTMENT

The premium income in the personal accident account was £120,720. The results were again satisfactory.

In the general insurance account, which includes miscellaneous business such as public liability, burglary and employers' liability, the premium income amounted to £1,328,507, which was £120,134 more than the corresponding figure for 1952.

An interesting example of the service which the CIS renders to its policyholders is given by the severe storms and floods which occurred on the east coast of England and in the Thames Valley on January 31 and February 1, 1953. During 1953 payments amounting to £113,000 were made under the society's policies, in respect of claims arising from these floods. Seventy per cent of these claims were paid by the accident department. The balance related to claims under fire and motor policies.

PROFIT AND LOSS ACCOUNT

After making adequate reserves for contingencies, the total amount to be distributed to policyholders in respect of our operations for the year 1953 is £3,107,000, of which £2,685,000 is due to our ordinary life and industrial life policyholders.

The report and accounts were adopted.

CONWAY STEWART AND COMPANY

(Fountain Pen and Gold Nib Makers)

CONTINUED PROGRESS

MR S. W. JARVIS'S SPEECH

The nineteenth annual general meeting of Conway Stewart and Company, Limited, was held on April 14th at the Holborn Restaurant, High Holborn, London, W.C., Mr S. W. Jarvis (chairman and managing director) presiding.

The secretary (Mr W. G. F. Nash, ASAA) having read the notice convening the meeting and the report of the auditors,

The chairman said: The accounts and directors' report for the year ended December 31, 1953, have been in your possession for some little time, and with your permission I will take them as read. (Agreed.)

I am pleased, once more, to be able to present to you accounts which reflect the continued progress of your company. The balance sheet at the end of 1953 showed that net current assets had increased by £14,000. The past year presented many difficulties, including continued import restrictions in South Africa, Australia and New Zealand, despite which the value of our sales was again a record, and the net profit, after taxation, was greater than for 1952.

IMPROVED EXPORT OUTLOOK

While there has been a reduction in the import licence value into South Africa, restrictions on imports of fountain pens into Australia have virtually ceased and in New Zealand relaxed. The outlook for exports of your company's goods during 1954 is, therefore, better than for 1953, which represented over 40 per cent of the total turnover.

In the home market our prospects are bright, and I anticipate an increase in sales. Costs, however, continue to rise, but your directors expect to counter any advance in costs by increased efficiency in production.

As the volume of business has grown considerably since the present company was formed in 1935, your directors felt it was desirable that some of the reserves should be capitalised. Your directors recommend the issue of bonus shares, in proportion of two for every three held, and this will bring the capital of the company more in accord with the actual capital employed in the business.

TRIBUTE TO STAFF

I would take this opportunity of paying a very warm tribute to the members of our staff for their continued co-operation and loyal support.

The report and accounts were unanimously adopted, and a final dividend of 30 per cent (making 40 per cent for the year) was approved.

The retiring director, Mr R. H. Garner, was re-elected, and the remuneration of the auditors, Messrs Chalmers Wade and Company, was fixed.

At a subsequent extraordinary general meeting, resolutions were passed authorising the issue of bonus shares.

Proceedings terminated with a vote of thanks to the chairman, directors and staff.

F. PERKINS LIMITED

(Manufacturers of High Quality Diesel Engines)

RECORD TURNOVER

IMPORTANT OVERSEAS DEVELOPMENT

MR F. A. PERKINS ON NEED FOR VERSATILITY IN MANUFACTURING

The twenty-second annual general meeting of F. Perkins Limited, will be held on Monday, May 10, 1954, at the Mayfair Hotel, London.

The following is the statement by the chairman Mr F. A. Perkins, which has been circulated to shareholders with the report and accounts for the year ended December 31, 1953:

The report and accompanying accounts are the twenty-second in the history of the company. They have been set out as last year.

At the time we gave you various information on our activities, which we thought would be of interest to you. This year we are again supplying you with such additional information.

I am pleased to be able to report to you that we have been able to increase our turnover to the record figure of £13,216,796 in 1953, an increase of £1,842,593, being 16 per cent over the 1952 figure. This increase in turnover was obtained without raising the price of our products, despite the fact that during the year there have been increases in wages and services.

The net profit for the year after charging all working expenses and depreciation was £778,645 as compared with £710,433 for the previous year. After giving the matter of dividend careful consideration, the directors recommend a dividend of 20 per cent for the year, which compares with 15 per cent for last year.

Full details of the appropriations of the profits are shown both in the accounts and the directors' report.

OUTPUT

Our output has been seriously affected by the restricted supply of crankshafts, in fact, we have again to say that this is a severe limitation on our production. The purchases of stampings from the Continent to which I referred last year were in a large part essential in maintaining the increased output. These contracts have now expired and the reserve of £65,000 made last year in connection with these purchases from the Continent, being no longer required, has been credited in the appropriation account. The emphasis has now moved to machining capacity, and our programme for 1954 will be maintained with difficulty. Steps are now being taken, to be effective in 1955, which should ensure adequate cover for future requirements.

The capital commitments standing at £575,000 at December 31, 1952, are to-day £168,000, which represents the completion of the programme of re-equipment started in 1951.

Last year I referred to the increased figure of stock and work in progress, and I am sure that you will all be satisfied to see this item reduced by £1,112,532 and now standing at the low figure of £2,208,800 in spite of the increased turnover. We had a balance in hand at the bank at the end of the year, and I am pleased to be able to tell you that this position has continued up to now in the current year. Our increasing turnover will, however, lead to a need for an increase in our working capital requirements and the board has this question under active consideration.

The demand for long term credit in certain overseas markets still continues, but nevertheless we have been successful in maintaining our trade debtors at approximately the same ratio to the turnover as last year.

For 20 years our Company has been pioneers of the lightweight high speed diesel engine. The time has now come when one of the vehicle manufacturers has begun to follow our lead and to manufacture diesel engines for their own vehicles. Nevertheless new uses for our engines are arising every day. You will be pleased to hear that we confidently expect to increase our output for 1954 by a similar percentage to last year, and we look forward to this growth continuing through 1955.

NEED FOR VERSATILITY IN MANUFACTURING

A manufacturing company is a living entity and like a living animal can only survive by virtue of its adaptability to changing circumstances. For an industry so competitive as the manufacture and supply of components to the automotive industry, adaptability and flexibility is one of the essentials for success.

The growing impact of the accumulation of scientific knowledge and of changing economic conditions calls for versatility in manufacturing to meet the technical requirements of the customers, and this must be paralleled by equal resource in a sales policy which will meet the changing economic conditions.

We are therefore preparing to be able to offer improved and better engines.

DEVELOPMENT IN INDIA

At the same time we are developing our marketing organisation to deal with the changing conditions overseas and in particular with the general demand for indigenous manufacture in different countries. Because of this your board decided that it was in the interest of the Company to co-operate with the Government of India in fulfilling its ambition to establish an indigenous automotive manufacturing industry. With this object in view an agreement was signed in January, 1953, between your Company and our distributors in India to provide for the assembly of the engine in India and to lead on to the manufacture of the details of the engine by progressive and practical stages.

With this important step, the first to be taken by your Company in the matter of overseas manufacture, and with the considerable importance we attach to the Indian market, my board thought that I should pay a visit to India and satisfy myself that the action they have taken was in the best interests of our Company. Arriving at Bombay on January 2nd of this year, I was able to make a concentrated but thorough examination of the Indian market and of the industrial potential.

I am able to report that our products have had a very gratifying reception throughout India, there being no less than 14,000 Perkins engines in use, and some 80 per cent of the diesel vehicles on the road are powered by Perkins engines. I believe our programme for India has secured for the Company an appreciable part of the Indian market for commercial vehicle diesel engines for some time to come. I found our distributors held in very high esteem throughout India, and in linking our fortune with theirs I am convinced that we have an association which is most effective and as promising as any in that country.

OTHER MARKETS

At home another of the largest manufacturers of commercial vehicles has standardised on our P6 and R6 engines in their 5 and 7 ton trucks. In the 20 cwt van class another manufacturer has been very successful with the introduction of the P3 engine as the power unit. Satisfactory arrangements have been made with some of the leading North American manufacturers of vehicles and industrial equipment for supply of Perkins Engines for their sterling area markets.

During the year a new dollar market was opened with substantial orders from Cuba. Spain and Italy have both shown very satisfactory business with substantial increases on last year.

Our Subsidiary Companies in Australia, Canada, France and South Africa continue to look after our interests in the countries concerned. An engine reconditioning plant has been installed at Dandenong, Australia, and an exchange engine scheme covering some 17,000 engines in use in that Dominion has now been put into operation.

Our training schools for instructional work in the good maintenance of diesel engines, among the largest in the country, have been re-modelled and some 200 pupils pass through them every month.

TRIBUTE TO EMPLOYEES

A great part of the credit for the success of the year's trading is due to our employees of all ranks both in the field, in the offices and works, and to all of them we tender our very best thanks.

A notable example of private enterprise is the united effort of 28 employees to build their own houses. Building of a very superior type house with garage commenced last March, and up to date 14 houses have been occupied and the remaining 14 will be completed during the summer. All this has been done with only a temporary loan of £1,200 from the Company. Just as soon as the municipal authorities are able to find new sites, another 30 families are ready to embark on a similar enterprise.

NORTH BRITISH & MERCANTILE INSURANCE

ANOTHER SUCCESSFUL YEAR

The annual general meeting of the North British & Mercantile Insurance Company, Limited, will be held on May 6th in Edinburgh.

The following is an extract from the circulated statement of the chairman, the Rt Hon Lord Brand, CMG, DCL :

FIRE DEPARTMENT: Premiums at £16,239,922 show an increase of £192,925 over the 1952 figure of £16,046,997, while losses, amounting to £7,811,461, 48.10 per cent of premiums, compare with the previous year's figure of £7,315,300, 45.59 per cent. We are able to report a profit of £963,414, 5.93 per cent, transferred to the profit and loss account.

CASUALTY DEPARTMENT : Total premiums in the casualty department were £5,077,266, being £329,568 in excess of the 1952 figure of £4,747,698. Losses were £2,575,669, against £2,391,869, the percentage of losses to premium income being 50.73 per cent, compared with 50.38 per cent for 1952. Commission, expenses and overseas taxes accounted for £2,003,395, against £1,853,461 in the previous year, the respective ratios being 39.46 per cent, against 39.04 per cent in 1952. The underwriting profit is £366,374, representing 7.22 per cent of premiums, compared with £290,943, representing 6.13 per cent for 1952.

MARINE DEPARTMENT : The Marine income for 1953 was £1,702,750, compared with £1,845,375 in 1952. Claims were £1,321,578, against £1,384,701 in the previous year, and expenses of management and overseas taxes were £294,922, compared with £252,730 in 1952. We have transferred £216,855 from our Marine fund to profit and loss account.

LIFE DEPARTMENT : The total group life and group endowment assurance for 1953 was lower by nearly £3 million than in 1952. The actual figures were £3,124,437, against £6,119,281, and this is reflected in the total new business completed which, after deducting reassurances, amounted to £10,283,433 last year, compared with £13,713,864 in 1952.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The results for the year are summarised in the consolidated profit and loss account. Net interest on investments amounts to £945,913, compared with £864,023 in the previous year. The transfers from the fire, accident and marine accounts total £1,546,643, as against £1,825,353 in 1952. In addition, we have taken credit for the balance remaining of the shareholders' profit from the 1949 quinquennial valuation in the life department amounting to £49,881. A further valuation will take place at the end of this year.

The proposed dividend of 10s. per share, which is the same as last year, and the preference dividend, will absorb £643,500. United Kingdom taxes require £617,934. There is also an item of £195,000 transferred to the general reserve, making a total for that reserve of £500,000. We have made the usual transfers to the staff pension fund and the widows' pension fund.

We are left with a final balance on the account of £13,622,933, representing the aggregate amount carried forward in the accounts not only of the "North British," but also of its associated companies at home and overseas.

BREVITT LIMITED

DEMAND WELL MAINTAINED

The fifth annual general meeting of Brevitt Limited was held on April 14th in London, Mr E. S. Harding (the chairman) presiding.

The following is an extract from his circulated statement: The confidence I expressed a year ago has, I am glad to say, been justified, as will be appreciated on a perusal of the accounts and the directors' report.

The group profit before charging taxation shows an increase of £77,000 and the net profit, after providing for taxation, an increase of £93,879. The preference dividend having been paid or provided for up to the end of the year, a sum of £24,500 has been placed to preference shares redemption reserve, and a sum of £2,500 to replacements reserve.

Your directors have felt themselves justified this year in recommending a slightly increased dividend at the rate of 25 per cent per annum, less tax at 9s. in the £. The amount carried forward, including the amounts retained by the subsidiary companies, is £97,599, and the total capital and reserves now stands at £629,837.

The demand for the Brevitt goods is well maintained and your directors will continue to do their utmost to maintain and enhance the Brevitt reputation.

The group reorganisation mentioned in my last statement has been completed during the year with beneficial results. Your directors now have under consideration schemes for development on the production side, which it is hoped may come into effect in the reasonably near future.

I wish again to convey to the management, staff and operatives thanks and appreciation of their efforts during the past year.

The report was adopted.

GENERAL REFRACTORIES LIMITED

GENEFAX HOUSE, SHEFFIELD, 10

A comprehensive range of refractories serving all industries is produced by the Company and its Subsidiaries at their Works and Quarries situated in many parts of England, Scotland, Wales, and in Belgium. Research and technical field service facilities are available. The Company has Offices and Representatives throughout the United Kingdom and Agents in all parts of the world.

SUMMARISED CONSOLIDATED BALANCE SHEET OF GENERAL REFRACTORIES LTD., & SUBSIDIARIES.

Based on figures as at 31st December, 1953.

	£	£	£
Issued Capital	1,040,000	Fixed Assets	3,130,399
Capital Reserves	190,673	*Less* Accumulated Depreciation	1,617,501
Revenue Reserves and Unappropriated Profits	755,144		1,512,898
Liabilities	1,569,345	Trade Investments, etc.	10,407
		Current Assets	2,031,857
	£3,555,162		£3,555, 62

SUMMARISED APPROPRIATION ACCOUNT OF GENERAL REFRACTORIES LIMITED.

	£
Profit for the year after providing for Depreciation, Taxation, etc.	222,472
Net Distribution for year to Stockholders	100,100
Retained in the business	£122,372

EXTRACTS FROM THE CHAIRMAN'S STATEMENT

Your Company has again experienced a very satisfactory year's trading, and I am sure you will be as glad as I am to see that the trading profits of the group amounted to £704,269, to which all member Companies made satisfactory contributions. This excellent result represents an increase of £71,131 over the year 1952 and reflects the progressive vigour and efficiency of the Group.

During the year our manufacturing resources were fully employed, and fresh tonnage records were again established.

I am pleased to report that new sales records were again established in both the home and export markets in 1953. This is particularly gratifying in view of the change over from a seller's to a buyer's market.

Your directors recommend the payment of a dividend of 17½ per cent. (less income-tax at 9s. in the £). The Company's financial position remains very strong, the surplus of current assets over current liabilities in the Company's balance-sheet amounting to £604,692, the corresponding figure in the consolidated balance-sheet being £983,177.

As regards the prospects for the future, competition is increasing and quality of production and delivery dates are again becoming dominant features of our business. We have in fact returned to normal trading conditions, and the abnormal conditions arising from the war and the succeeding years of scarcity are probably at an end.

Copies of the Accounts and Chairman's Statement may be obtained from the Secretary, Genefax House, Sheffield, 10.

BALLITO HOSIERY MILLS, LIMITED

INCREASED NET PROFIT AND DIVIDEND

SIR CYRIL ENTWISTLE'S SPEECH

The twenty-fifth annual general meeting of the Ballito Hosiery Mills, Limited, was held on April 8th at St. Albans, Sir Cyril F. Entwistle, MC, QC, chairman of the company, presiding.

The chairman, in the course of his speech, said: The net profit for the year, before deduction of tax, amounts to £168,836, which shows an increase over the previous year of £48,900—that is, an increase of 40 per cent. In view of the difficulties I pointed out in my speech last year, I am sure you will regard this as a highly satisfactory result.

We are accordingly able to recommend an increase in the dividend on the ordinary shares from 25 per cent to 33⅓ per cent. We also recommend a transfer to general reserve of £40,000, as against £25,000 for the previous year, and an increase in the carry forward from £34,898 to £37,846.

The total of all our reserves now amounts to the figure of £436,944, which sum is the equivalent of over 7s. per share of the present issued ordinary share capital.

You have received notice of an extraordinary general meeting to be held immediately after this meeting, at which a resolution will be moved for the making of a bonus issue of shares on the basis of one free ordinary share for every four held.

PRODUCTION

In 1952 we commenced a three-year plan for increased production to be brought about by complete modernisation of plant. Progress has been limited due to delays in building, but the plan is now running smoothly.

The factory extension to which I referred in my last report was completed in August, 1953, since when a considerable amount of new machinery has been installed. In addition, the whole of our new machinery from our branch factory at Earl Shilton has been brought to St. Albans.

The shortage of nylon yarn is still acute, but supplies of foreign yarn have enabled us to step up our production, which is reflected in our increased profits.

The installation of machines of finer gauge and improved design is still continuing, and the wisdom of this policy will, we hope, be more than justified in 1954. It has been our policy to replace all our prewar fully fashioned machinery and over 95 per cent of our plant is now postwar in date.

EXPORTS AND HOME TRADE

Again I am very pleased to report our export trade has exceeded the previous year, and the figures are a record for all time.

Our Ballito brand is enjoying great popularity in practically every market in the world, and regular and steady repeat business reaches us from all markets.

During the past year we were able to change over the whole of our machinery to nylon production, and therefore are now giving our customers more regular supplies of our various types of Ballito nylon stockings.

We are, unfortunately, not yet able to meet the total demand for our productions, but new machinery is coming into operation weekly, and further machines are on order and will be coming through later in the year, which will help us to increase distribution in the home trade.

I should now like to refer to the circular letter dated January 1, 1954, that was sent to the shareholders informing them of a tentative approach by a finance house with a view to purchasing a controlling interest in the company. I endeavoured in that letter to give what I hoped were convincing reasons for advising shareholders not to consider at the present time disposing of their holdings. Your board much appreciates the overwhelming support given by shareholders to this letter.

As a result of this letter and the inability of the finance house to disclose the names of the persons associated with them, it was mutually agreed that negotiations should not at this time be entered into.

In view, however, of this approach I think it desirable that shareholders should have the fullest information we can give them so that they can form an adequate judgment on the value of their holding.

FINE MODERN FACTORY

I need not repeat all that is stated in the letter of January 1st, but I wish to emphasise particularly that practically the whole of our machinery is of the most modern and efficient type, and that the full benefits of the very considerable expansion of our machine capacity during recent years have not yet had time to be realised. Such expansion is continuing and will continue.

We have as fine and modern a factory as there is in the whole country, a skilled and contented band of workers, and two managing directors of great experience and ability in whom I have the fullest confidence.

When the above approach was made, your board thought it desirable to have an independent valuation of the fixed assets of the company. On the basis of this valuation the net assets value of the present issued ordinary capital is over 20s. per share.

THE CURRENT YEAR

With regard to the prospects for the current year, it is early days to venture on any forecast, but I will give you the facts to date. During the last four months of the year under review the profits averaged over £20,000 per month, as against an average for the year of £14,000 per month. The first three months of the year for seasonal reasons are normally not so good as the remaining months, but the profits for the first three months of the current year are estimated to average also over £20,000 per month.

All the signs look promising for the remainder of the year. There may, of course, be some reductions in gross profit margins, but these should be offset by increased productive capacity and increased supplies of nylon yarn. Unless there is a general recession of trade affecting the industry as a whole, of which there is no indication, your board has every confidence that the rate of dividend now recommended for the year under review will be maintained in respect of the current year on the increased capital to be issued by the extraordinary meeting that follows this meeting.

In future the board have decided to pay an interim dividend on the ordinary shares on or about October 15th in each year.

The report was adopted, and at a subsequent extraordinary general meeting the proposed capitalisation of reserves and bonus issue of shares were approved.

ASHANTI GOLDFIELDS CORPORATION

£2 MILLION PLAN JUSTIFIED

REASONS FOR CONSERVATIVE DIVIDEND POLICY

The fifty-seventh annual general meeting of Ashanti Goldfields Corporation Limited will be held on May 5th in London.

The following is an extract from the circulated statement of Major General Sir Edward L. Spears, Bart, KBE, CB, MC, FInstD (chairman and managing director):

The year under review has been one of steady progress towards completion of the enormous programme of work that was initiated after the war. There have been no setbacks such as we experienced last year, but these important capital developments are not yet reflected by increased earnings.

On profits of £886,107 we are charged a total of £534,611 for taxation in this country and the Gold Coast, or more than 60 per cent before any provision may be made for reserves.

An interim dividend of 9.6d. per unit of stock was paid in November, 1953, and a final dividend of the same amount, making 1s. 7.2d. for the year, is recommended by the board.

In order to pay a dividend of 2s. per unit stock last year we drew £59,772 from profits brought forward. This year the profits, after deducting EPL, which is a first charge, are only £5,000 better than last year, so that the dividend could not have been maintained at the same rate without further withdrawal from past profits. The board are not prepared to recommend this in view of the heavy expenditure on capital account now being incurred.

HEAVY DRAIN ON RESOURCES

Although the premium received in the year under review was considerably less than we had hoped, it amounted to some £120,000. It is unlikely that we shall receive any such amount during the current year, nor can we reckon on any substantial decrease in costs; so that in spite of the disappearance of EPL we do not expect that the results will enable us to recommend an increase in the dividend this year. Expenditure on shafts and capital equipment will continue into 1955. Moreover, depreciation will absorb more of our income until this expenditure becomes revenue producing. While this heavy drain on our liquid resources continues we must pursue a conservative policy; and the rate of dividend will depend upon the investment we have made enabling us to produce more gold.

Since the war we have spent no less than £1,302,000 on plant and equipment and £618,000 on shafts. We have found the whole amount from our own resources, without making any call on the members or the public for new capital.

Shaft Sinking and Development: The results last year and in recent months, particularly in depth, have been most encouraging and continue to be so.

In our postwar programme the most important need was to develop new ore reserves by extending existing shafts and replacing the obsolete and inadequate main and timber shafts by a new deep shaft of much larger capacity for operations in depth.

The chairman then referred to his visit in January to the property, and continued: The decision to sink the Eaton-Turner shaft was one of major policy which required an

act of faith in the future of this great mine. As the work has progressed, developments at depth have justified that faith. But, as I have indicated, the time and cost involved have represented a heavy burden and a serious drain on our liquid resources without any immediate increase in earnings. We can truly say that without it the prospects would have been by no means bright. When it is in full operation I believe it will justify the policy we have followed.

THE PYRENE COMPANY

RECORD SALES AND PROFITS

MR FRANCIS A. J. HARRISON'S STATEMENT

The fortieth annual general meeting of The Pyrene Company, Limited, will be held on May 6th at Winchester House, Old Broad Street, London, E.C.

The following is the statement by the chairman and managing director, Mr Francis A. J. Harrison, which has been circulated with the report and accounts:

Your company's year, 1953, was both successful and eventful. It was successful in that record results were achieved and eventful, particularly because it provided the first occasion on which the general public had the opportunity to participate in the company's affairs. This was rendered possible by the acquisition by British interests of the controlling shares from the former United States parent company, the subsequent reorganisation of the capital structure, and the offer for sale to the public of ordinary and preference shares with permission to deal obtained from the Council of the London Stock Exchange.

DIVIDEND ESTIMATE EXCEEDED

The results of the company's operations surpassed the previous records of 1952 in sales, gross profits and net profits before tax. Your directors recommend a total distribution on the ordinary share capital amounting to 22½ per cent, as compared with the estimate of 20 per cent in the offer for sale. On this basis, and after providing for all taxation, the net profit remaining from 1953 operations is £191,444. This is slightly lower than the 1952 figure, when the total ordinary dividend was 17½ per cent on the one class capital and when no distributed profits tax was chargeable on dividends paid to the former parent company in the United States.

Sales in 1953 succeeded in overtaking the previous high record of 1952 when they were increased by 31 per cent over the previous year. Home sales were practically level while lower Government requirements were more than offset by direct export sales which, increased by 36 per cent, accrued from shipments to 91 countries. With indirect exports, the value of the company's export contribution represented 45 per cent of total sales.

The net profit of £574,016 before tax was £63,692 (12 per cent) higher than in 1952, after charging £24,219 in respect of extra depreciation compared with only £6,262 in 1952.

Total assets at £2,647,800 increased by £320,760, following an increase last year of £310,253. Net assets after deducting pension fund increased by £106,685 to £1,428,296. Cash increased by £274,362 to £492,400. This has since been affected by the purchase of the share capital of the Pyrene Manufacturing Company of Canada, Limited, to which I refer later. Rigid control of inventories has resulted in a reduction by £94,858 to £849,470. Gross capital expenditure during the year was £225,620. It has been considered necessary to transfer £100,000 to general reserve.

At the end of 1953 the estimated amount of capital expenditure sanctioned was £44,539, but it is estimated that a further £80,000 will be required.

Unexecuted orders at December 31, 1953, were a little lower than at the beginning of the year. Incoming orders since the beginning of 1954 have kept approximately level with outgoing shipments. Sales over the first three months of 1954 are running at a slightly higher annual rate than that of 1953.

FORTY YEARS OF PROGRESS

On February 25th the company reached its fortieth anniversary. Having been started by its founder chairman, Mr Wallace B. Phillips, with only one product, the world-famous Pyrene Fire Extinguisher, the company's range of products has been built up over the years to cover all approved fire-extinguishing media in the form of appliances most suitable for the application of such media to the risks for which they are advised. These appliances range from the small Pyrene pump-type extinguisher to 10-ton foam crash-tenders for airfields and large foam trucks for oil company and refinery use. Special built-in installations are provided for such specific hazards as electricity generating plants, ships, aircraft, vehicles, chemical and other plants having dangerous fire risks. With its staff of specialists, your company is in a position to provide the soundest advice on the most suitable forms of fire protection whatever the risks involved. Shareholders are invited to avail themselves of this impartial service.

The number of car bumpers and the number of customers supplied with bumpers as standard equipment has increased during the year.

The Metal Finishing Division has extended its field of activity, and Parkerizing, Bonderizing and Pyluminizing Processes as well as the many special treatments for metal provided by this Division now have wider applications than ever.

On January 14, 1954, your company completed the purchase of the whole of the share capital of the Pyrene Manufacturing Company of Canada, Limited. The price of US $675,000 was paid out of the company's own resources.

We believe that this acquisition will eventually make a valuable contribution to your company's profits and to the country's dollar earnings.

Our thanks are due to the staff and employees in all departments, who have co-operated enthusiastically in the work of the year. We shall continue to devote our efforts to the most effective use of the company's resources in maintaining and developing its interests.

ALBERT E. MALLANDAIN

IMPROVED RESULTS

The seventeenth annual general meeting of Albert E. Mallandain Limited was held on April 14th in London, Mr Albert E. Mallandain (chairman and managing director) presiding. The following is an extract from his circulated review for 1953:

We have been able to take full advantage of the improvement in conditions both at home and abroad. The demand in the home market for the company's products has been well maintained and our fancy goods have been specially in demand in connection with the Coronation celebrations. Our export trade has also shown a most satisfactory increase both in volume and value. This improvement has been achieved partly as a result of the gradual easing of import restrictions in certain of our established overseas markets and partly by the development of fresh markets.

The net profit for the year 1953 amounted to £74,467, compared with the previous year's figure of £59,414. From these earnings has to be met the heavy burden of taxation, which this year at £44,760 exceeds 60 per cent of the year's profits. After this appropriation the profits available amount to £29,707. Your board therefore have felt justified in recommending the payment of a dividend of 50 per cent, less tax.

Your directors have constantly in review the maintenance and development of our overseas markets and we look forward confidently to obtaining our full share of the available trade. Your business is in good shape. Our order books are well filled, and I anticipate that the company will at least maintain its present profit level.

The report and accounts were adopted.

NOTICES

THE REGIONAL ECONOMIC COMMITTEE OF THE BRITISH WEST INDIES, BRITISH GUIANA AND BRITISH HONDURAS invites applications for the post of Assistant Trade Commissioner in Canada.

Annual salary in the scale $3,600 x $150—$4,800 (Can.) plus a representation allowance of $1,400 (Can.) per annum, with a house allowance of $1,200 (Can.) p.a. and a child allowance of $500 (Can.) p.a. for each dependent child under 18 years of age, up to three in all. Salary and allowances are tax free in Canada. Passages will be paid on assumption and termination of appointment for the Assistant Trade Commissioner and family up to five in all from and to the place of engagement.

The appointment will be for a period of two years in the first instance; the post does not at present carry pension or superannuation rights.

Candidates should possess a sound knowledge of office organisation and administrative experience of trade and commerce. They should also be proficient in the assembly and presentation of statistical material, commodity market reports, publicity material, etc.

Applications, with full details of candidates' education, special qualifications and experience, together with supporting documents and names of two referees, should be addressed to the Executive Secretary, Regional Economic Committee, Hastings House, Barbados, before May 15, 1954. Further information regarding the appointment may be obtained from the office of the Trade Commissioner for the British West Indies, British Guiana and British Honduras, 40 Norfolk St., London, W.C.2 (Temple Bar 1908).

THE National Council of Labour Colleges requires a divisional organiser for division 3—Cambridge and Ipswich area. Salary £500 rising by £15 a year to £575. Superannuation Scheme. Applicants must be able to lecture on a number of N.C.L.C. subjects and should apply to J. P. M. Millar, Gen. Sec., N.C.L.C., Tillicoultry, Scotland.

EXCHANGE CONTROL relaxations on the international use of Sterling fully explained in the March issue of our 5,000-word monthly Bulletin. Annual subscription £6 6s. home, £7 7s. overseas, single copies pro rata.—Evitt Publications, 8 Great Winchester Street, E.C.2. 'Phone: LONdon Wall 1488/89.

IMAGINATION and thoroughness do not always go together, but Honours Graduate (Economics), 33, believing he has both, would welcome a responsible position where he can give them full scope, preferably in EXPORT or SALES MANAGEMENT. Full practical experience of export up to executive level, selling experience at home and abroad. German, French, Italian.—Write Box 518.

THE Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Sciences, you may wish to sell (*periodicals excluded*).

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 14 New Bridge Street, E.C.4.

PORTUGUESE Evening Classes. All grades. Portuguese Language Committee, 2 Belgrave Square, S.W.1. SLO 7180.

The Quiet Phenomenon

IN an age of many anxieties, the usual penalty that a country must pay for stability and quiet progress is oblivion. Portugal has paid this penalty. For a quarter of a century it has been free from dramatic crises, and its affairs have received astonishingly little attention in other countries. This is something to be deeply regretted. What has happened in Portugal in the past twenty-six years has been unique; and there are half a dozen reasons why this quiet phenomenon deserves the careful attention of other nations —and most particularly, of Britain.

What are these compelling reasons? The most obvious is the hard fact of the Portuguese economic renaissance. Thirty years ago, the country might have been justly described as an economic pariah. A full century of political turbulence and administrative failure had brought it down into an abyss of debts, deficits and despair. The public finances were chaotic, the general economy paralysed by universal lack of confidence, and Portugal's international credit had never been lower. It is often wrongly assumed that its present state of respected economic health is simply the result of a profitable neutrality. In fact, while the war meant keen bidding for such exports as wolfram, it also dealt severe blows to a country so dependent on imports of food, fuel and machinery and on the sale of wine and other non-essentials. If, today, Portugal's budgets are comfortably balanced, its reserves of gold and foreign exchange high and mounting, and its former stagnation replaced by slow but steady progress, this is primarily the result not of any lucky bonanza but of the country's own efforts.

A few months ago this fact took human shape, with the return to Lisbon of M. Jacques Rueff, the French economist. In 1927, M. Rueff was one of the experts, sent by the League of Nations, who ruled that Portugal should be granted a fresh loan only if it agreed to strict international surveillance of its finances. Portugal rejected these terms; and now, a quarter century later, it has had the gratification of hearing M. Rueff himself declare that it had been right to reject them, and to seek salvation within its own boundaries.

One illusion, however, must here be dismissed. Although the country's revival has been shaped and directed by one man, Dr Antonio de Oliveira Salazar, and carried out under an authoritarian regime, which frankly proclaims its distaste for parliamentary democracy; although both the parliamentarians of the last years of the monarchy and those of the early republic amply demonstrated their incapacity, modern Portugal provides no evidence to support the claim that the "iron hand" is in itself a cure for economic difficulties. The Portuguese officers who overthrew the parliamentary regime in May, 1926, came nowhere near a solution to the country's basic problems until, nearly two years later and after many misgivings, they appointed Dr Salazar to be Minister of Finance with virtual authority over all economic affairs.

What Dr Salazar has since achieved must not be exaggerated. (It is seldom exaggerated by the Prime Minister himself, who regularly reminds his fellow countrymen of the tasks that still lie ahead.) Even today, Portugal is not ashamed to avow itself an under-developed country, and as such to accept technical aid from the United Nations. But here again something about Portugal catches, or ought to catch, the eye. It is the fashion today for under-developed countries to clamour for vast sums of foreign aid, while, on the other hand, rebuffing their former trading partners and pursuing misty mirages of autarky. All such countries might well take a good look at Portugal, which has a marked preference for pulling itself up by its own bootstraps, and recognises its dependence on foreign trade.

Notably, moreover, it is a non-industrialised country with extensive possessions overseas. At first sight this would seem a unique situation. But, if the familiar "salt-water fallacy" is set aside, there emerge interesting comparisons with such countries as Brazil, India, and perhaps even China, not to mention many smaller nations whose governments are responsible for remote and backward tracts. Portugal's record on race relations compares well with that of most such governments. Might they not also profit from a study of its policy of economic development in Africa?

Nor have the other European colonial powers any less need to follow events in "Overseas Portugal." Not only the general policy of political integration, but also the current attempt to settle a large white population in tropical Africa, call for their attention. Not only is the economy of Mozambique and Angola directly linked with that of British and

often the only effective form of agriculture among the hills. Of the active farming population in this area, only a third are employees. In the southern prairies, on the other hand, over 70 per cent of the farming population consists of workers paid daily or weekly. *Latifundio* is here the rule, and although the plains are sparsely peopled seasonal unemployment is a recurrent and serious problem. Professor Salazar himself, speaking recently of "the extreme irregularity with which land is distributed over our country," said

It is more than doubtful whether, despite our respect and even our love for private landed property, the phenomenon can continue indefinitely without some legal orientation or corrective process for the more serious evils.

Irrigation, so directed by the state that it encourages the smaller and more intensive farmer (inevitably to the disgruntlement of the larger), is seen as the eventual, but slow, solution to the problems of the plain. Meanwhile, however, the prolific north, where little marginal land remains to be broken, still seeks outlets for its children. They have peopled Madeira and the Azores; they have swelled the cities; they have flocked to Brazil, the United States and Venezuela. Still the population of Portugal and the Islands rises; from 6,033,000 (66 to the square kilometre) in 1920 to 8,441,000 (92) in 1950, and in recent years, in spite of emigration, at the rate of some 80,000 a year. Internal colonisation, of land reclaimed from the sea, newly irrigated, or otherwise brought under cultivation, is one way in which the problem is being tackled; another is white settlement in the Angola highlands—but here there is obvious difficulty in adapting a *Minhote* smallholder to the wildly unfamiliar role of managing a plantation.

Apart from its growth, the population presents a further obstacle to economic progress by its need for more education. The 1950 census showed the creditable figure of 4,295,000 persons able to read, as against only 2,193,000 in 1930; but only 1,115,000 of them could boast of primary, and 134,000 of secondary education. Technical training is now making considerable strides, but there remains an acute shortage of skilled and experienced men to fill the gap between the college-educated engineer and the ordinary workman.

What does their homeland offer to these eight million Portuguese? In the past, it has not even enabled a primarily agricultural people to feed themselves. The need to import corn was one of Pombal's problems in the eighteenth century; it was one of Dr Salazar's first preoccupations in this. By various inducements, including guaranteed prices and sales in a protected market, an impressive increase in sowing has been obtained. Over 2.4 million hectares are now under cereals, potatoes and beans, against only 1.5 million before the war. But yields remain poor, with only 8-9 quintals of wheat obtained per hectare, a low figure even by south European standards; and droughts and floods still present an annual threat to the major crops.

MAJOR FOOD CROPS
('000 tons)

	1937–39 (average)	1951	1952	1953
Wheat	448	554	572	630
Maize	352	473	476	317
Potatoes	593	1,209	1,025	1,020

To these figures must be added some 400,000 to 450,000 tons of rye, oats and barley, and in good years about 140,000 tons of rice. The cultivation of the latter has been much increased, but it too is vulnerable to drought; in 1953 only 120,000 tons were yielded. In broad terms, Portugal is now almost self-sufficient in cereals in good years; but in bad

ones it must still buy 2-300,000 tons of wheat, and further long-term problems are presented both by the population growth and by the tendency for people to eat more wheat-bread and less maize as general living standards improve.

Meat, too, is bound to be more in demand if standards continue to rise. Until now it has been little eaten by the majority of Portuguese; estimates of consumption vary between 10 and 15 kilos a year per head. Quality is held down by poor grazing and by the fact that cattle are primarily draught animals in Portugal. Dairy products suffer in the same way, providing only about 20 kilos of milk and cheese (some of this coming from sheep, in season) per head annually. The livestock census of 1940 recorded 973,000 cattle, 3,948,000 sheep, 1,253,000 pigs, 1,244,000 goats and 453,000 horses, mules and donkeys. Abnormally large slaughterings are the rule in drought years, and it may be doubted whether any spectacular increase in numbers of livestock is a practical aim; but quality could certainly be much improved, especially on the small farms.

However, it is misleading to relate the country's food supplies too closely to the pattern familiar in northern Europe. Portugal eats at least twice as much fish as meat; it uses olive oil (and, today, African fats and oils) for its cooking; and it draws a wide variety of fruit from the Adjacent Islands as well as from its own orchards. But fish presents a paradox. The fishing villages are one of the most

Now I know what Humber quality means!

Seating for six, first-class workmanship throughout, and the beauty of graceful flowing lines. found in half a dozen places in Alentejo and north of the Douro, but in conditions at present uninviting to exploitation). The pyrites of Alentejo, on the other hand, has long served both the export trade and the domestic manufacture of sulphur and chemicals; of the 756,000 tons produced in 1952, a third went to domestic users. (Sulphur is much in demand in Portugal as, among other uses, a fungicide for the vineyards; annual consumption, now easily met from domestic sources, averages 12,000 tons.)

Two factors limit the export of pyrites: its low value in relation to bulk, which discourages the trade when shipping is scarce or costly; and Portuguese anxiety about the high rate of extraction in relation to known reserves. Similar fears have recently been expressed as to hematite, but these would seem groundless if one officially published estimate which places the Moncorvo reserves as high as 200 million tons is to be accepted. As to the other main export minerals, no question arises of exhaustion of reserves, which are vast, and likely to prove vaster as the surveying of Portugal's mineral resources continues its slow course.

Recent exploration has, admittedly, somewhat enlarged the picture of coal deposits; but it has also confirmed the gloomy fact that low-grade anthracite and lignite is all that can be expected. The lignite is so poor that, although there are several deposits in Estremadura, only that at Cabo Mondego, which is well placed for cheap haulage, has been worked on any scale in recent years. But prospects are brighter for the anthracite mines astride the lower Douro at Pejão and São Pedro da Cova, for the Six-Year Plan includes the building of a large thermal power station equipped to use their product.

Neither Portugal nor its overseas territories produce petroleum (although a strike near Lisbon was reported last year, and exploration continues). The country's dependence on imported fuels has thus been a primary concern for many years, especially in wartime. In 1938 over 1.1 million tons of coal and coke—two thirds from Britain and most of the rest from Germany—and 196,000 tons of petroleum products were imported. War meant a shortage of fuel so acute that destructive inroads were made into the forests, and most industries suffered a severe setback. Not until 1948, when Britain resumed its place as chief supplier, did coal imports recover their prewar level; and meanwhile the demand for petroleum had trebled. (In 1933, 32,000 vehicles were in use; in 1948, 74,000; in 1952, 103,000.) Although Portugal's one oil refinery was worked to capacity in the effort to cut costs by importing petroleum as crude, in 1950 the total paid for imported fuels was 11 per cent of the cost of all imports, and demand was still rising steeply.

In 1951, however, the whole position as regards power began to change; for in that year the first two of the big postwar hydro-electric plants went to work, and output of hydro power rose from 437 to 813 million kwh. In 1952 it reached 1,200 million; and by 1958 a capacity of 2,000 million kwh is planned. This great addition to Portugal's economic strength comes appropriately enough from the oldest and least promising of its natural resources: the swift northern rivers, cutting steeply through the bleak hills, unnavigable and infertile, but yielding at last to the engineer the power that Portugal must have if it is to stride forward. Where once only the tree grew, symbolic of the old Portugal, the turbine now spins; and its quiet revolutions will largely determine the future fate of the country.

The Conto

is an admirable Portuguese device, used throughout these articles, for reducing the number of digits when referring to large sums. It is a thousand escudos. Thus, in round figures, with 80 escudos to the £ and 28 to the US $, a conto is worth £12 10s., or US$35. (Before sterling and escudo devaluation in 1949, however, the conto was worth £10 or US$40.)

Development and Reluctant Dragons

INDUSTRY is officially credited with a third of Portugal's gross national product; agriculture and forestry with little over a quarter. These estimates, as in most countries where smallholders are numerous and reticent about the contents of their sheds, probably do an injustice to agriculture. The Finance Minister himself has shown some justified scepticism about the various national product and income figures available for Portugal; for instance, the gross product, at factor cost, for 1951 has been placed at several levels between 40 and 46.5 million contos, and a rather hasty calculation of national income for 1950 at 33 million contos was ill received because, taking price rises into account, it implied a lower real income than the 15.5 million estimated for 1938.

What is fairly certain, however, is that industry today provides no notably greater proportion of the national wealth than it did before the war. This does not imply that industry has been completely static; it now employs a third more people than before the war, and its total real output is estimated to have risen by a quarter. But progress has been uneven. Indeed, Portuguese industry lends itself to striking contrasts rather than to generalisation. At one end of the scale there are several large and complex enterprises; outstanding among them is the vigorous Companhia União Fabril, with a dozen factories producing fertilisers, chemicals, soap, jute goods, cigarettes, and metal products, with its own bank, shipbuilding yards and shipping line, and what amounts to its own township at Barreiro across the Tagus from Lisbon. At the other end are, for example, nearly 400 tanning and leatherworking establishments with an average of less than ten employees each.

But size is not always an accurate gauge of efficiency. In Portugal's Lancashire, the valleys around Braga where the cotton mills crouch above the streams that provide them with power, a small but progressive textile company may be found next door to a larger concern that shows every sign of decay. Some sections of the textile industry provide the clearest examples of the stagnation that security can bring in its wake. With their markets protected both at home and in Africa, many mill-owners have rested on fading laurels. The government has tried to jolt them out of this apathy by such measures as forbidding imports of second-hand machinery, but a good many mills still use antiquated equipment and fail to train workers in new techniques.

The cork processing industry provides an instructive contrast. Essentially an export industry—Portugal provides half of all world cork exports—its fate depends mainly on straightforward competition; and in many fields it must now compete with artificial substitutes. Although one of the oldest Portuguese industries, it has shown itself aware that it cannot survive merely by relying on a well established reputation. On the one hand, efforts have been made to extend the efficient techniques already used by the leading firms to the more backward ones, and to extend scientific methods even to small-scale strippers. On the other, the best firms in the industry have vigorously developed the newer uses for cork, particularly in agglomerated forms; the ingenious processes now employed not only open up new markets but also make profitable use of much material that would formerly have been mere waste. Thanks largely to these efforts, Portugal, which in 1938 exported 11,000 tons of cork in worked forms, valued at 50,000 contos, in 1953 exported 32,000 tons worth 472,000 contos—and this in a year of low prices and serious temporary depression.

The Hand of the State

It is difficult to assess the real impact of the corporative system on industry. In some cases, mismanaged or apathetic concerns have been stimulated to new life, either by the guidance of the corporative institutions or at least by the publicity turned on to them by the system. In other cases, the guilds, syndicates and semi-official councils would seem

to have merely claimed credit for the successes of the enterprises themselves. And the corporative bodies have, of course, earned some unpopularity where they have served, in war and other emergencies, as little more than extensions of the state bureaucracy.

Complaints from industry of too much state intervention would, however, ring more true if private enterprise in Portugal as a whole was more enterprising. The Prime Minister, for his part, tirelessly reiterates his fear that

> apart from tending to corrupt governments, the economic force of the state can only be created and maintained to the detriment of individual liberty.

But in expounding the new Six-Year Plan, Dr Salazar was forced to add that

> The inertia into which some sectors of our economy appear to have fallen shows that a strong thrust is required. . . . We are offered the alternative of either waiting until private individuals start along the road that must be trodden in order to satisfy the general need, or taking the initiative in undertakings that would normally be inappropriate to governmental activity. . . . Nothing is demanded of private individuals, no capital belonging to them will be forcibly mobilised, but we must ensure that the train of national resources takes a certain course and meets certain requirements.

The new plan is by no means the first plunge into state capitalism taken by this government devoted to the principles of free enterprise. A rather tenuous plan for industrialisation was introduced in 1935; this, however, had shown few results by the time that war halted imports of heavy equipment. Between 1944 and 1946 a series of decrees launched a whole set of development programmes, covering hydro-electric power, ports, merchant shipping, reafforestation, internal colonisation of neglected land, and general industrialisation. Investment in development from 1946 to 1951 averaged about a million contos a year. The new plan, running from 1953 to 1958, calls for investment in metropolitan Portugal of 7½ million contos (£94 million), the annual average being thus only 25 per cent greater than in the previous period. (The provision in the plan of a further six million contos for colonial investment is, however, a sizeable increase on the previous record.)

Electric power, to which 2.7 million contos are allotted, takes pride of place in the plan in metropolitan Portugal. It is a continuation of the impressive work already done since the war. On the Zezere river, the big Castelo do Bode dam and power station, opened in January, 1951, is being supplemented by two smaller stations, Cabril and Bouça. On the Cavado and its tributary Rabagão in the extreme north, the Vila Nova station, opened in June, 1951, has already been joined by that at Salamonde, opened last summer; a third station, Caniçada, is now being built, and the plan covers a fourth, Paradela. Altogether, the average annual output from the two river systems is expected to be 1,600 million kwh by 1958, as against 580 million from the first two stations alone.

The plan also covers the first stages of work on the upper Douro, where it forms the frontier with Spain. The two countries have divided this stretch of the river into two sectors, Portugal having full rights to exploit the northern one. In this vertiginous area, however, painful work on road building had to be done before even access to the site

for the first station, at Picote, was possible. The potential output of the frontier Douro is very high—it has been reckoned at 1,600 million kwh; but its full exploitation must evidently await the next decade. Meanwhile, with a proper respect for the severity of the recurrent droughts that afflict Portugal—1953 was a dry year, and cut hydro output from the 1952 record of 1,200 million kwh down to under 1,000 million—the plan provides for the building of a new thermal power station equipped to use the low-grade anthracite from the fields near Oporto. This would bring a great relief in drought years, for the 401 existing thermal plants only muster 500 million kwh between them and mostly use imported coal.

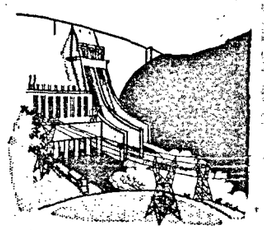
There is no doubt about Portugal's need for these additions to its power resources. The Minister of the Economy pointed out last June that 40 per cent of the population and 64 per cent of all parishes still had no electricity; that in many places the local supply was very poor; that the total demand, after rising by about 7 per cent a year from 1927 to 1950, was now rising much more steeply, and that a demand for 1,960 million kwh of permanent energy plus 300 million kwh of temporary energy must be reckoned with by 1958. There are, therefore, good reasons for devoting over a third of all metropolitan expenditure in the plan to power development; if Portuguese industry is to expand, the rivers must supply the essential means.

Agriculture as Cinderella

It is not so clear that communications need the third of all plan expenditure allotted to them (which does not include the separate programme for roads). The main items covered are the electrification of the Lisbon-Oporto railway as far north as Entroncamento, further improvements at Lisbon, Leixoes and smaller ports, and the acquisition of two more oil tankers and a passenger ship for the Africa route. All these works will help to conserve or earn foreign exchange; but it has been asked whether the railways, in particular, merit so much expenditure at a time when road transport is robbing them of a good part of their custom. Admittedly transport has in the past proved the key to many of Portugal's problems; the tremendous improvement of roads in the past 25 years has lifted whole regions out of semi-isolation. Some disproportion, however, remains between the 2.4 million contos to be spent on communications, and the 826,000 allotted to irrigation and agricultural colonisation. The Prime Minister himself expressed doubts about the relegation of agriculture to the role of Cinderella in the plan when he said:

> The budgetary expression of a development plan as regards agriculture ought to be very different from this one. I hope the next plan, six years from now, will be wholly satisfactory in this respect.

The 880,000 contos allotted to selected basic industries provide for expanding the state-sponsored oil refinery near Lisbon to an annual throughput capacity of a million tons; which would enable Portugal to import nearly all its petroleum as crude; for foundries and plant to produce modest initial quantities of pig iron and rolled steel; for increased output of cellulose and fertilisers; and for a tinplate plant with an annual capacity of 25,000 tons.



The plan as a whole cannot be called over-ambitious; indeed the Corporative Chamber criticised the original draft for excessive caution, but failed to persuade the government to put the net total up by more than 100,000 contos. Dr Salazar has held to the principle of budgeting according to clearly available resources, and of keeping to a minimum Portugal's dependence on foreign finance. An Export-Import Bank loan of $17 million (490,000 contos) for the Lourenzo Marques-Rhodesia railway has been obtained; but although the plan may call for a further half million contos from foreign sources, the Prime Minister has expressed his hope that this will not be necessary. Meanwhile, Portugal itself faces the task of finding eight million contos for the plan, of which 1½ million will be passed on to the oversea provinces. Half of the eight million is to come—and should come without difficulty—out of budgetary and state development funds; the other half is expected from the semi-governmental social security funds (*Previdencia*), the commercial and savings banks, insurance companies and the private investor. But according to the Finance Minister, the private investor can be counted on for only 750,000 contos during the whole six-year period.

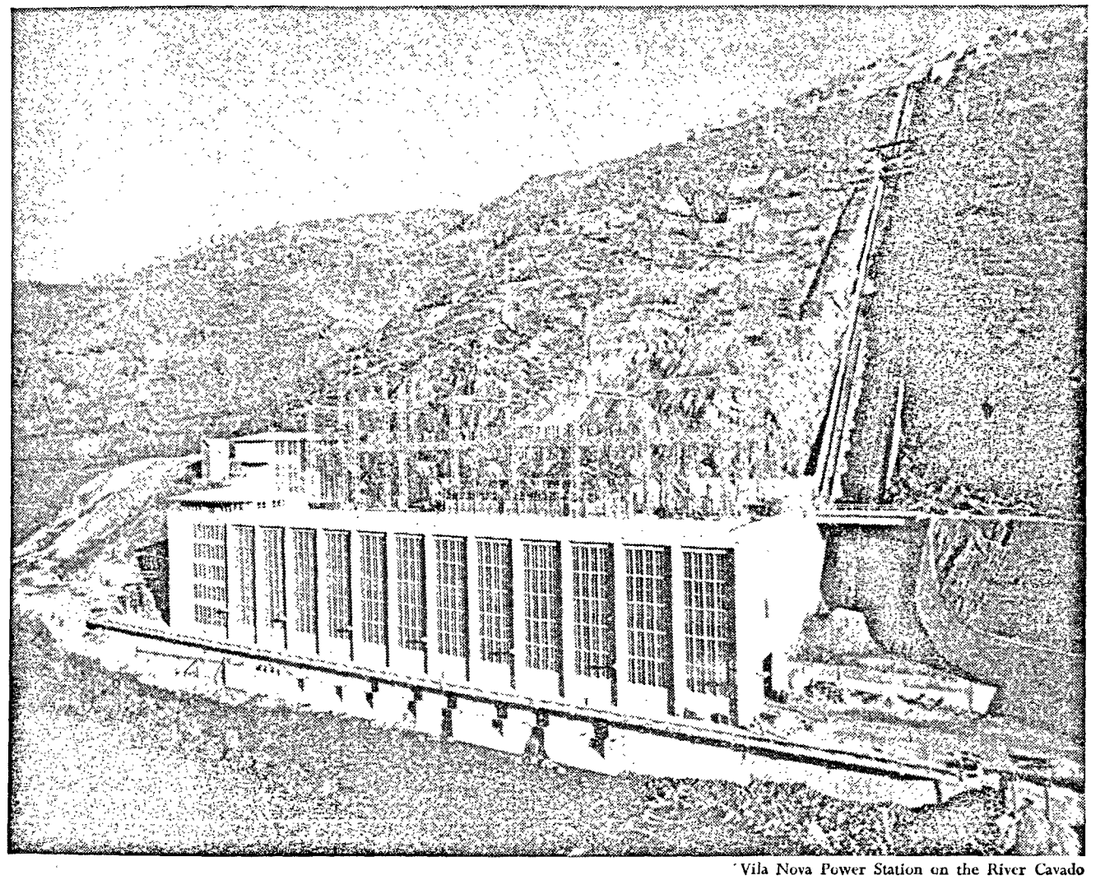
The Coy Investor

Here emerges the nigger in Portugal's economic woodpile: the coy investor, or rather non-investor. Very rich men are, admittedly, few in Portugal; but the now large class of persons with substantial capital show a marked preference for either keeping it in liquid forms or buying land. Relatively low taxation of the larger incomes, the sense of security given by a quarter of a century of sound public finance, and the numerous openings for new enterprises

POWER FOR PORTUGAL



Vila Nova Power Station on the River Cavado

Important contributions to Portugal's growing prosperity have recently been made by new hydro-electric power stations to generate electricity for industrial development schemes.

'ENGLISH ELECTRIC' and 'METROPOLITAN-VICKERS', known throughout Portugal as The British Group, have jointly supplied all the water turbines and electrical equipment for three new hydro-electric power stations. Those at Castelo do Bode and Vila Nova are already in operation. The third, at Cabril, will be commissioned this year.

The total installed capacity of these stations is 390,000 kVA, which almost equals the entire capacity of all other generating stations in the country. The full electrical power demand of Lisbon was at one time provided by the output from a single alternator at Castelo do Bode.

enjoying protection by tariff or otherwise, might be expected to tempt a large proportion of this idle capital into industry; but this has not happened. Similar apathy has been shown in recent years by many industrialists who have failed to seize the most obvious opportunities to extend their operations at times when they had plenty of new-made profits with which to buy equipment. Some of them seem able to rouse themselves only when fighting off an attempt by a more vigorous Portuguese firm to break into a field of production which they have managed to monopolise by securing state protection.

It is this inertia of private capital that has forced Dr Salazar's government to develop a split personality. The government, holding as fast as it can to its faith in free enterprise, seeks in most cases to draw private capital into its economic enterprises from the start, and to sell out its own share as soon as each new project is firmly on its feet. The hydro-electric companies provide an example of this technique. But, as long as the investor remains lethargic, it is difficult for the state to extricate itself from such undertakings without weakening them; for, as a general rule, only when the investor sees the government participating in an enterprise is he willing to put his own money into it. The result is that the state, directly or through the various institutions which it virtually controls, has itself become a gigantic capitalist: its dividends on its own investments now bring in a million contos a year, financing one sixth of the whole budget, and exceeding the annual amount that it proposes to contribute to the Six-Year Plan.

The OEEC, in its last annual survey of Portugal, suggested that the final remedy for the situation was heavier taxation of the higher incomes, possibly combined with the floating of larger public loans. The complicated tax structure, although it has been slowly modified in the general direction of a graduated tax on incomes, certainly leaves room for a considerable increase in revenue from the more wealthy citizen. But since the OEEC suggestion amounts to urging the state to become an even bigger capitalist, it is not likely to find favour in Dr Salazar's eyes. In the matter of financing industry, the government is not such a reluctant dragon as the average investor; but it is by no means an enthusiastic one.

Beyond the Seas

THE main stream of Portugal is neither Tagus nor Douro. It is the ocean itself. This has been so for five centuries, ever since Prince Henry the Navigator went to Sagres and there, peering from Europe's last headland at an empty but challenging horizon, launched the expeditions to West Africa that burst Europe's bonds. The Portuguese will never forget—and nor should any other people—their glorious century of leadership in exploration and commerce, the oceanic urge that carried them to India, Malaya, Japan and Brazil.

The names remain—Cape Verde, Lagos, Agulhas, Natal, Curaçao, Magellan; Portuguese-speaking Brazil, its relationship to the older country now intriguingly parallel to that of the United States to Britain, still aborbs emigrants, although less easily than some Portuguese could wish; and in southern Africa, newer colonisations now succeed the vanished empires of Guinea, the Indies and South America. The carrack and the navigator's spheres remain true emblems of the country's needs and tasks. Oversea connections and trade are as vital to it as to Britain—and the government's grasp of this point is reflected in its heavy expenditure on improving the ports and in the doubling of the merchant marine tonnage (now over 500,000 tons) since the war.

There is no doubt as to the proud place in the country's trade now occupied by the "Oversea Provinces." (Portugal is not ashamed of such words as "colonial," but that is their accepted title.) In 1953, they furnished 16 per cent of Portugal's imports, and took 27 per cent of its exports. They meet its needs of coffee, tropical fats and oils, supply

most of its sugar, supplement its maize and meat, and—according to the Lisbon press—they provide the textile mills with raw cotton at about half the price that Portugal would have to pay in the world market. They are also a heavily protected market, not only for the products of the mills but also for most other Portuguese exports. (The Congo treaty provisions as to free trade apply only to the northernmost sectors of Mozambique and Angola.) In 1952, Portugal supplied 47 per cent of Angola's imports and 28 per cent of Mozambique's ; the percentages would be higher if both territories' imports had not included much heavy equipment obtainable only from foreign sources.

The oversea provinces are also important earners of foreign exchange, including dollars from the sale of coffee, cacao and sisal. In 1952, 70 per cent of Angola's exports and 58 per cent of Mozambique's went to countries outside the escudo area ; Portuguese India, too, has in the past few years become a sizeable exporter of manganese and iron ore. But exports are not the only form in which the provinces contribute to the escudo area's balance of payments.

Foreign exchange, largely sterling, comes in from such major "invisibles" as the Rhodesian and South African transit traffic through Mozambique ; Belgian and Rhodesian transit through Angola; the earnings of up to 80,000 Mozambique Africans working in the Rand mines (although the scale of this item is sometimes exaggerated, and the Portuguese seem prepared to cut it down despite the resultant loss of sterling) ; the services of the Cape Verde fuelling station, and of the airports serving trans-Atlantic routes ; and the little publicised commercial activities of Macao.

Under Dr Salazar's government, Portuguese policy for the oversea provinces has been sharply changed—both politically and economically. The trend toward local autonomy has been replaced by emphasis on the absolute unity of metropolitan and oversea Portugal—a principle reflected in the quiet but firm assertion, made in reply to Delhi's recent demands on Goa, that it is constitutionally impossible to consider the cession of any part of the national territory. The colonial economy, too, has been brought much more closely under the metropolitan eye ; corporative institutions have been set up in Africa as in the home provinces, and some striking expansion achieved (in 1938 the African territories exported 18,000 tons of coffee and 13,000 of cotton ; in 1952, 48,000 and 36,000). In apparent contrast, Dr Salazar's principle of strict budget balancing was as briskly and as firmly applied overseas as at home ; there was

to be an end of the over-free borrowing that had made Angola, in particular, notorious. This principle, however, is modified in the new six-year plan ; the oversea provinces are to find from their own resources only half of the six million contos (£75 million) to be spent in them.

White settlement, in the high Cunene valley in south Angola and elsewhere, is one of the projects featured in the plan. The difficulties involved have already been mentioned ; but in recent years the rate of emigration to Africa (excluding emigrants who returned) has been over 10,000 a year. Angola's white population is already close to 90,000 and Mozambique's over 50,000 ; the total "civilised" populations—entitled to full legal rights whatever their race—being respectively about 150,000 and 100,000. But while the settlers in Africa develop the colonial economy, the considerable financial support which Portugal gets in the form of remittances from its sons overseas comes primarily from Brazil, the United States and Venezuela ; and the recent collapse of Brazil's payments position, involving the stoppage of these remittances, was a real blow. So, too, was the temporary loss of the Brazilian market for Portuguese wines and other traditional products ; in 1953 exports to Brazil were worth only 74,000 contos, less than £1 million, against 329,000 in 1951.

The fact that this Brazilian headache has been common to both Portugal and Britain is a pointer to something more important. Portugal, a country that must trade to live, is by no means a mere exporter of raw materials and importer of manufactures. On the contrary, it buys some 60 per cent more of raw materials (excluding fuels) than it sells ; it spends more on buying these raw materials than on all its purchases of machinery, appliances, vehicles and miscellaneous manufactures ; and raw materials make up little over a third of its exports. Admittedly, another quarter of its exports consist of food and drink ; but most of these items are in a fully processed form, the product of canning factories or of the complex operations of the wine "lodges."

Moreover, Portugal exports three times as many textiles as it imports ; and although its chief market for them is colonial, sales to foreign countries roughly equal its total expenditure on imported textiles. (High quality Madeira embroideries sold in the United States and Venezuela largely account for this ; last year these dollar sales were worth £1½ million.) Portugal even exports more than it imports under the heading of "miscellaneous manufactures," and here colonial sales account for only a third of

the total. Thus, the country's industrial weakness emerges plainly only in the quarter of its import bill that is spent on machinery, vehicles, and heavy or complex equipment.

Unfortunately the true weakness of Portugal's trading position lies deeper. It is that a good half of its staple exports to foreign countries are highly vulnerable to general world trends, even to world fashions. This applies both to steel-hardening minerals and to canned fish, port wine and nuts. The sardine itself may be a fickle fish (as recently as 1948 it virtually disappeared from the Portuguese fishing grounds for two years); but Portugal has found customers for its sardines almost as undependable. By their very nature, canned fish, wines, almonds, figs, embroideries, and some kinds of cork and wood products are early casualties whenever a buying country is forced to restrict its imports; and when a period of such restriction coincides, as it is all too likely to do, with a slump in "strategic" commodities, the outlook for Portugal is bleak.

Portugal's trade thus rises and falls on the waves of the Atlantic world. (The Soviet bloc has recently entered the picture as a buyer of cork, but takes less than six per cent of this and under 3 per cent of all exports.) No less than 80 per cent of all exports (setting aside those of the colonies)

now go to the Nato and OEEC countries and their dependencies. Since 1951 the United States has replaced Britain as the foremost customer; in 1953 it took 17 per cent of all Portuguese exports, chiefly in the form of cork, wolfram, tin ore, embroideries, wool, anchovies and other fish. Since 1950, Germany has returned as an important customer as well as a supplier, ranking third and taking 7 per cent of all exports last year; its 1953 sales to Portugal, however, were more than twice as great as its purchases. Belgium, France, and Scandinavia are Portugal's next most important markets.

The importance of these markets is reflected in the agitated record of Portugal's membership of the European Payments Union. By February, 1952, its cumulative net surplus had rocketed to 114 million. Drastic measures were taken to reduce this swollen figure; on the one hand, export quotas were tightened and 30 per cent of earnings from exports of certain products were temporarily blocked; on the other, liberalisation of imports was extended (from 84 to 92 per cent for metropolitan Portugal and from 60 to 82 per cent for the oversea provinces). This accelerated the descent from the Korea boom position that was in any case affecting Portugal by mid-1952, and by the beginning of 1953 the cumulative surplus with EPU was down to 68 million; at the beginning of 1954 it was 56 million—still 80 per cent of the quota.

But the fact that Portugal can balance its books with the outside world at all is made possible only by the contribution of the oversea provinces. Its importance is shown by the fact that in 1953 metropolitan Portugal's imports could be as high as 9.5 million contos and its exports as low as 6.3 million, without causing either alarm or a fall in reserves of gold and foreign exchange; the reserves in fact rose slightly, and now equal the value of two years' imports into the whole escudo area. Striking trade deficits have, indeed, been habitual for many years; only between 1941 and 1943 was the sequence broken.

METROPOLITAN PORTUGAL'S TRADE BALANCE
(Million contos)

	1938	1942	1946	1948	1950	1951	1952
Imports	2.3	2.5	6.9	10.4	7.9	9.5	10.0
Exports	1.1	3.9	4.6	4.3	5.3	7.6	6.8
Balance	−1.2	+1.4	−2.3	−6.1	−2.6	−1.9	−3.2

The table reflects both the postwar buying spree, which

reached its peak in 1948, and the marked narrowing of the trade gap in 1951, when Korea had swung both the volume of exports and the terms of trade strongly in Portugal's favour. But the continuing trade deficit itself is the most obvious feature. Since mid-1949, contributions towards closing the gap have been made by American aid; ECA and MSA grants and loans between 1949 and 1952 totalled nearly two million contos; and off-shore purchases are now playing their part. Normally, moreover, Portugal can nowadays count on about 700,000 contos a year in remittances from oversea emigrants and 1-200,000 in dividends on investments abroad; these items have been reduced by the blocking of remittances from Brazil. And since 1950 the increase in the merchant fleet, together with tourism, payments for airport facilities, and lesser "invisibles," has transformed metropolitan Portugal's deficit on services into a surplus now running at about 200,000 contos a year.

It is to Africa, however, that the country looks for the greatest contribution to solving the balance of payments problem. In 1951 the oversea provinces showed a trading surplus with the outside world of 1.7 million contos and a further surplus on invisibles of 0.6 million; in 1952, despite the slump in colonial products, the corresponding figures were still 1.1 and 0.6 million; and it is estimated that their total surplus with foreign countries in 1953 will prove to be well over two million contos, and perhaps nearly as great as in the peak year 1951. Small wonder that the prices of coffee, sisal and copra are anxiously followed in Lisbon, for on them, fully as much as on cork, wolfram or wine, depends the fate of the escudo area.

Old Ally, Modern Partner

THE most conspicuous characteristic of the British trader in Portugal is conspicuousness. His competitors from Germany, Belgium or France seem to blend with the background. But English names stand proudly over the doors of old-established firms, and new arrivals from London also prefer to trade under their true colours. This habit has been criticised. It is argued, and reasonably, that Portugal, intent on developing its own economy, must always prefer semi-Portuguese firms to wholly foreign ones, and must place contracts so as to give the maximum employment to its own workers. But the matter is not quite so simple. Many British firms have shown that, without masking their identity, they can collaborate very successfully with Portuguese concerns; and Portugal—unlike some countries—is shrewd enough to judge by results rather than by the label on the bottle.

Moreover, friendship between Portugal and Britain remains a very real thing—although well-meaning English-

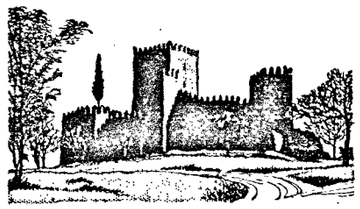
men occasionally mar it by revealing their confident assumption that England has loyally befriended Portugal in all its troubles since 1386. The alliance concluded in that year is undoubtedly still in force (it was formally reaffirmed in 1904), but the relations between the two countries through the centuries have varied ; and their good relations today spring from the sensible and understanding behaviour of twentieth century Portuguese and Britons as much as from the marriage of King João I to John of Gaunt's daughter Philippa. Fortunately, friendship has never become one-sided adulation. Modern Portugal sees Britain steadily and sees it whole, and any criticisms pass between the two countries as between friends.

The fact that British merchants no longer predominate in Portugal's trade undoubtedly makes this friendship easier. The Portuguese today, with their good reputation for settling accounts, are desirable customers and free to buy almost where they will. (Exchange control limits dollar purchases to essentials, but exports to the Americas have now developed so successfully that in 1953 Portugal achieved a surplus in its dollar trade.) In other ways, too, Portugal has fully regained its self-respect ; it is an equal



partner in Nato and the European economic organisations, and master in its own house in Africa. Portuguese patriotism and desire for national progress are untainted by xenophobia. Portuguese and Englishmen can, and do, take common pride in such joint achievements as the Castelo do Bode, Cabril, and Vila Nova power stations, and the great Marshal Carmona bridge at Vila Franca de Xira, opened in 1951, which has vastly improved road communications between Lisbon and the south.

But there can be no complacency about the outlook for Anglo-Portuguese trade. It has already suffered severe blows. The collapse of British coal supplies during the war hastened Portugal's efforts to reduce its dependence on imported fuel. Portugal's entry into the EPU, and its subsequent efforts to take more imports from the other members, further depressed Britain's share of the trade. Greater Portuguese production of manufactures has supplanted former imports; and this trend will continue. Britain's exports to Portugal must in future depend primarily on machinery, vehicles, and an occasional large ship (Portugal can now tackle construction up to 16,000 tons itself), with iron and steel manufactures, chemicals, and electrical goods playing lesser parts. In all these fields there is keen competition from continental Europe ; as regards heavy equipment it is the keener because of the publicity given up to the Six-Year Plan.

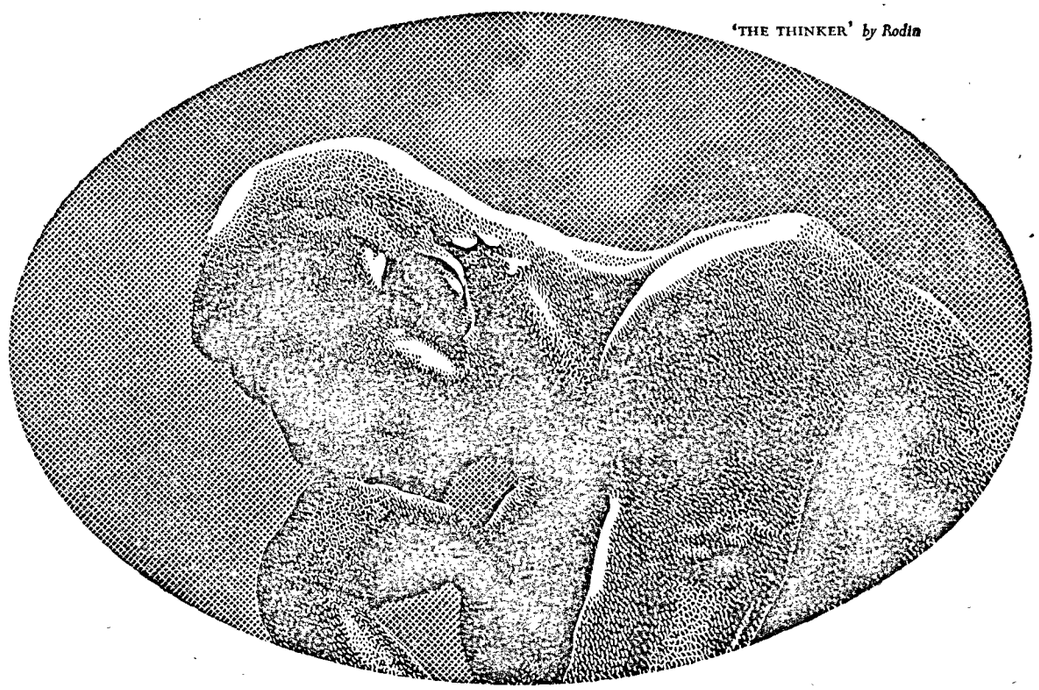
In 1953, Britain virtually retained its prewar share of Portugal's imports (allowing for the country's increased imports from the African territories). Germany was climbing the ladder rapidly, but had not recovered its 1938 position of equality with Britain. Belgium's exports to Portugal in 1953, while equal in value to Germany's included one large ship, the only one bought by Portugal last year, which accounted for 40 per cent of the total. German cars, including Fords and diesel taxis, have now found more favour than British ones in Portugal, although Britain still leads in the sale of trucks and tractors ; and German or semi-German firms have lately won important contracts for wharves and railway bridges. Thus it is quite possible that during 1954 Germany may emerge as Portugal's foremost supplier.

Much will depend on the placing of the next batch of Development Plan contracts. In some cases, British firms tendering for these have been beaten on price by Continental rivals more ready to adopt cheaper standards. Portugal's anxiety to keep the cost of the Plan within the limits set by available resources fully explains its preoccupation with price ; but it may be questioned whether it is prudent to cut too near the bone on projects so vital to the national economy—especially where the equipment must stand up to great strains and abrupt climatic changes. Where British firms in general may perhaps be more fairly criticised is in regard to their rigidity on unimportant details ; this sometimes gives the impression that while, for example, the Swiss or the Belgians take the Portuguese market very seriously, some British concerns are too busy elsewhere to give it full attention.

★

What of the other side of the picture? Portugal's trade with Britain is unbalanced (its 1953 imports being 1,452,000 contos and exports 792,000); but this applies to all Portugal's other major trade partners except, lately, the United States. However, Britain takes a much smaller share of Portugal's exports than before the war ; and the main casualty here has been port wine (although Britain is still by far the biggest buyer of port). It is strongly contended in Oporto that Britain's duties on heavy wines are primarily to blame for the fact that, in 1953, it imported only 70,000 hectolitres of port, against 196,000 in 1937. But this claim founders on the fact that British imports of sherry from Spain have risen while those of port have fallen. It is clear that port is the victim of a social change. For every British household where a decanter of port is ritually circulated after dinner, there are now a hundred where a bottle of sherry is permanently on hand in the sideboard awaiting the casual guest. Too busy to perform the ceremonies they feel port requires, and ashamed to treat it in the disrespectful manner of the French and the Scandinavians, the British await guidance on the right way to reintroduce this admirable but exacting wine into their cautious social pattern. The inspired suggestion that port goes ideally with television may yet solve their problem and that of Portugal's exporters ; but it will need to be hammered home.

This, however, may serve to point a wider moral. The trend of Portugal's trading pattern has been towards the reduction of non-essential imports ; why should we pay, the Portuguese very shrewdly argue, for what we can make ourselves, or do without ? The snag is that so many of their own exports are also non-essentials. A cou cannot reasonably look to a future in which it has suc fully shut out other nations' minor manufactures relying on them to buy its wines, nuts and anchov1952 moral here is equally applicable to both Portu10.0 Britain. Both can prosper only as traders ; and t6.8 obvious reasons why a fair proportion of their trade 2 continue to be reciprocal—and some of it non-essentia



'THE THINKER' *by Rodin*

Thoughts are free from toll

WILLIAM CAMDEN (1551-1623)

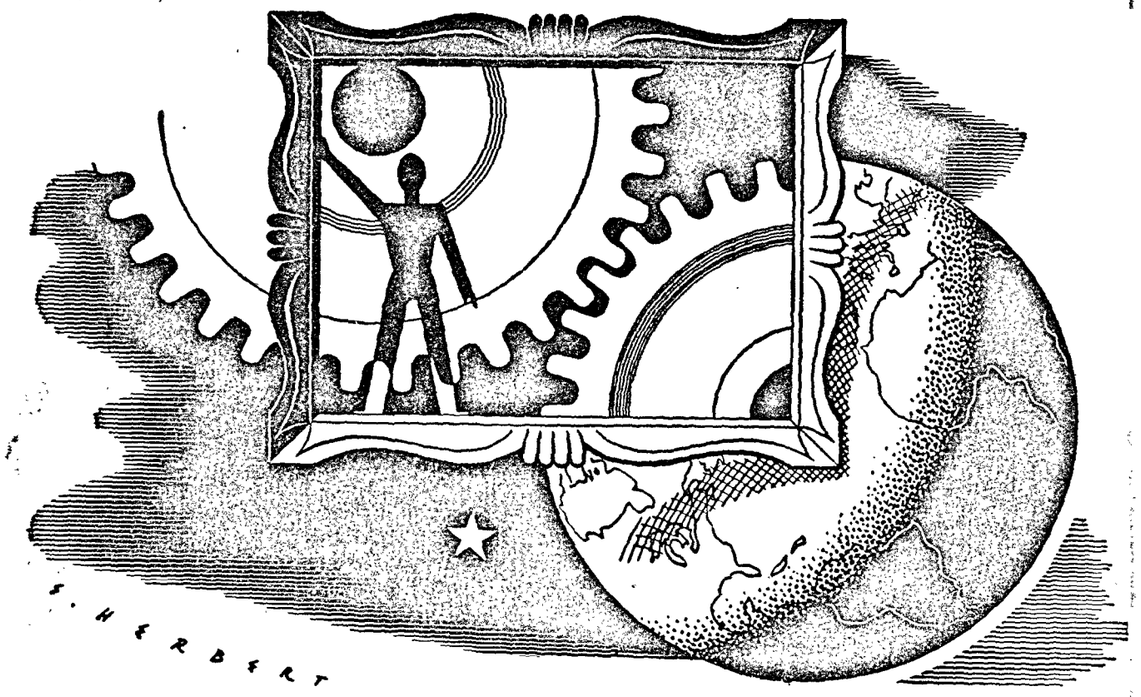
To think is not expensive. It needs no apparatus, no personnel, no premises. The only equipment is in one's head: the gears and pinions of the brain, and the lever that sets them turning.

Everyone can be a thinker. Not a great thinker, perhaps; but the creator, now and then, of a thought that has great consequences. And that is the measure of a thought's greatness: the ripples that it spreads.

At the back of every new industry is such a thought. Can 'it' be made some other way instead? Marketed or assembled more simply? Processed or refined by that method or in this place, instead of as before? A progressive industry is the translation of these thoughts into machinery, buildings and organisation.

But the climate in which such thoughts can first arise, and can be expressed in action, is one of free enquiry and research. Without this, invention gives way to maintenance. A trained man can be a technician; it takes a free man to be a thinker.

ESSO *Esso Petroleum Company, Limited*



Because each member of the Ward Group of Companies can call on any of the others to supplement its knowledge and experience, the competence of the entire group is immeasurably increased.

A PICTURE OF INDUSTRIAL SERVICE

Here is a picture of interdependence with a real practical meaning. It is the modern interpretation of the picture Thos. W. Ward must have had in mind when he started his business 75 years ago—a visualisation of closely integrated manufacturing resources and service departments united in the common task of helping in the development of industry and commerce. As the scope of the Ward Group's activities has extended, so has its capacity for serving its many customers throughout the world.

The T.W.W. Service Includes :-

In the April issue, Fortune puts this question...

Is the U. S. recession over?

A respectable case can be made that the 1953-54 business readjustment may be about over. To be sure, industrial production has ebbed 12 per cent since last summer, and some cities and industries are feeling the unpleasant after-effects of that decline. But in the economy as a whole, production appears to be leveling and should soon rise. Steel use, for example, is now outrunning production by 15 per cent. As CEA Chairman Arthur Burns recently observed, "a foundation is being laid for a new economic advance."

FOR WHAT the U. S. has been experiencing to date, Burns and most other economists agree, has been primarily an inventory readjustment; the most clucked-over inventory readjustment in history, perhaps, but an unclogging of the nation's supply pipelines nevertheless. The turnabout from inventory building to inventory reduction has cut demand for goods by $14 billion a year while "final purchases" have dropped less than half that much.

WHAT complicates matters, of course, is that the nation has also been readjusting from a part-war to a peace economy. In most discussions of this larger transition, however, two immensely important facts have had less attention than they deserve. The first is that consumers have remained remarkably unperturbed by all the glooming and brooding about the economic outlook. Savings have risen slightly, but only because people have been paying off debts (and getting in shape for a new round of credit buying).

WHILE the politicians and pundits have been arguing whether we are in a "depression," "recession," or "readjustment," the consumer has been blithely treating the present for what it is, a period of unusual prosperity. Although sales of specific items such as cars and appliances have sagged sufficiently to make news (both have picked up recently), last month Americans were earning and, in the aggregate, spending just about as much as in the record year 1953.

THE SECOND fact that is frequently overlooked is that most consumers have never had it so good. Consumer prices have not changed appreciably for more than two years now. Price stability for that long in a time of rising wages and incomes is unprecedented. It even connotes a sort of economic millennium. For price-stability with rising wages has meant a rise in the "real" standard of living for millions of Americans and a respite from the corrosive effect of inflation for those living on fixed incomes. With prices right and consumers buying, it might well be asked what all the shooting is about.

UNEMPLOYMENT, of course, is the answer. The March figures, when announced, conceivably may record a further rise in joblessness. And Dwight Eisenhower, in effect, promised to take "remedial" action if any substantial rise occurred in March. But there is one fact about the present unemployment situation worth noting. The present range of 3,400,000 to 3,700,000 unemployed is remarkably low for a year of business decline. In the 1949-50 recession the work force was smaller and unemployment rose considerably higher—i.e., to 4,700,000.

IF THE government provides a salubrious business climate (it has already provided ample money and credit), the nation's long-term readjustment from war to peace may be accomplished as expeditiously and with as little relative discomfort as has been the current inventory cleanup. For the business community, no less than the consuming public, seems remarkably confident about the future. As Sears, Roebuck's retiring chairman, General Robert E. Wood, remarked, "The people of this country couldn't talk themselves into a depression if they tried."

A GOOD many business executives apparently agree with General Wood. Despite all the recession talk, a substantial number have announced impressive expansion programs. According to the F. W. Dodge reports, in fact, new construction awards rose to an all-time high for the first two months of the year, and non-residential construction awards were up 21 per cent from a year ago. General Motors' billion-dollar pledge of faith in the economy and in its own ability to expand sales beyond the $10-billion level naturally made the biggest headlines.

BUT THERE were other sizable corporate bets being placed on continued industrial growth and prosperity. General Electric planned to spend $160 million on expansion in 1954 and a like amount in 1955; Standard Oil of Indiana earmarked half a billion dollars for expansion in the next two years; Standard of California mapped a $275-million expansion and drilling program for 1954. The Bell System companies will lay out $1.4 billion; the electric utilities $3 billion as compared with $2.8 billion last year. Steel firms, despite all the forebodings of the Cassandras, plan to invest another three-quarters of a billion dollars in modernization and added capacity in 1954.

BUSINESSMEN do not invest such large sums in expansion unless they expect their sales to increase. Nor do they commit such sums if they believe new plant is going to become much cheaper than it is today. And consumers do not keep spending as freely as they have been if they expect their incomes or prices to drop substantially. Thus, by their actions to date, both businessmen and consumers have demonstrated considerably steadier nerves than have the political and professional pundits.

AND THIS raises an interesting question for the "experts" to ponder in their contemplation of the economic outlook. When there is such widespread confidence in the long-term prospects for prosperity, can any readjustment possibly get very bad? The fact that neither businessmen nor consumers appear perturbed about the outlook for next year or the year after is probably the best assurance that this "recession" year will turn out to be the second best in the nation's history, and that the present inventory readjustment, if not already completed, soon will be.

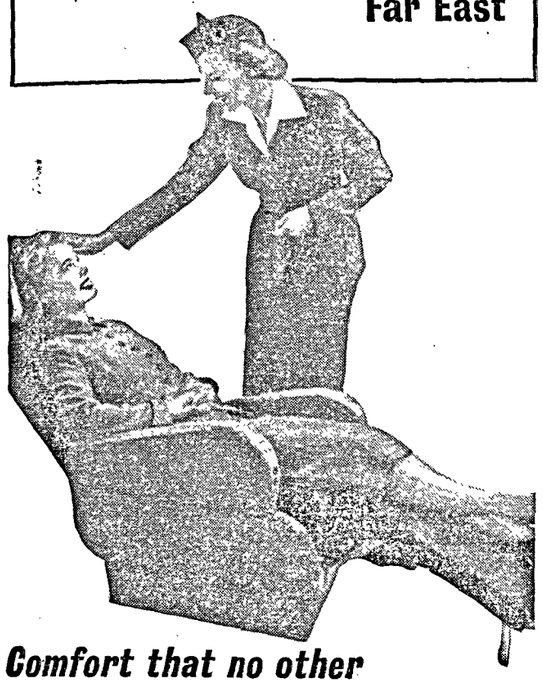
For your journey to the Middle East, Pakistan, India, Far East



Comfort that no other Airline offers . . .

Starting on April 25th, Pan American offers its famous Sleeperette* service on first-class flights to the Far East. This means comfort that no other airline offers on this route; a wide, deep-cushioned chair that becomes, at the touch of a button, a full-length bed. And the passenger list is reduced to give you room to enjoy fully this added luxury.

or the lowest air fares ever!

With the extension of "Rainbow" Clipper* Tourist Service to Tokyo, Pan American now offers lowest-ever tourist fares to the Middle East, Pakistan, India and principal cities of the Far East. You travel comfortably, with excellent meals free, in a Super 6 Clipper—the fastest and most modern aircraft on tourist service anywhere. Return fare to Beirut only £124. 4. 0. To Calcutta £255. 12. 0. To Tokyo £412. 4. 0. To other destinations proportionately low.

See your Travel Agent, or PAN AMERICAN

Who Goes Left?

THE meeting of the Parliamentary Labour Party after the re-assembly of the Commons next week will be one of the most crucial in its history. For Mr Attlee and his closest colleagues will then have to give some indication of the way in which they propose to handle Mr Bevan's latest and noisiest breakaway from the party line. In the past, the effort has been concentrated on "preserving the unity of the party"—which has meant that, after he has talked himself out, Mr Bevan has given some sort of indication of reformed behaviour, while the official leaders of the party have sidled towards him in the matter of policy. The result has been to continue the Attleeite leadership of the party with a more Bevanite hue to its policy. Hitherto, this has been mainly a matter for the party itself. But the issues on which Mr Bevan has built his new platform of revolt are such that this time the answer concerns the whole nation. Are Mr Attlee and Mr Morrison and Mr Gaitskell determined this time to fight both Mr Bevan and his ideas? Or will they once more try to neutralise him by outbidding him?

To the politician, of course, it is always the clash of personalities that fills the stage. The more important is it to understand the issues that are at stake. In the statement that he issued after resigning from Labour's Shadow Cabinet, and in an article that he wrote for last week's issue of *Tribune,* Mr Bevan has made clear what his line of opposition will be. He will oppose the Government's present plans for collective security in Asia, to which Mr Attlee gave a cautious and qualified blessing, because he regards them as plans for provocative encirclement of the Chinese. He will oppose the present plans for confronting the Red Army in Europe, which were first drawn up in the time of the Labour Government, because he does not want any arms to be put into the hands of what he calls "the reactionary government (which) has been financed into existence in Western Germany." Finally, and most vitally, he will oppose the basic principle of foreign policy that Ernest Bevin laid down—the principle of according paramount importance to the Anglo-American alliance—because he believes that this lays Britain "open to indefinite blackmail." "We shall never be able to make America understand our attitude and adapt herself to it," writes Mr Bevan, "until we are prepared to break with her unless she does." By demanding American adaptation to "our attitude," Mr Bevan is, of course, demanding an American surrender to his own system of appeasement, which he knows will not be made. This is a deliberate recipe for striking down the free world's shield.

There is no mystery about how Mr Bevan has acquired these views—no mystery, that is, except perhaps to Mr Bevan himself and to some of his colleagues in the Labour Party. For more than a year every step in Soviet and Chinese policy has been cunningly and carefully devised to induce non-Communists to utter and believe precisely this brand of nonsense. Within the broad context of history, it will not seem surprising that this one restless, disappointed man of prominence has snatched

at their bait. But that will be no excuse for others, who will know what they are doing, to move in the same direction, however much they may wish to outmanœuvre the fish that has been caught on the line. For, odd though it may seem, the danger of a tragic mistake in Labour policy is being exacerbated by the force of the anger against Mr Bevan as a man. He has, for once, been far too brusque and rude even for some of his usual followers. The tempters are therefore telling Mr Attlee that he has a golden opportunity both to ditch Mr Bevan and to cement party unity ; by this they really mean that they think he has an opportunity to capture the Bevanite wing of the party from Mr Bevan by putting on a few of its clothes. The tempters are quoting, and trying to adapt to new and very different conditions, Mr Attlee's own comment on the previous Bevanite crisis of 1951 : that there is "no real difference of principle" involved. This plea was heard from half a dozen Labour platforms during the Easter weekend.

★

There are two reasons why Mr Attlee ought to reject this plea—indeed, why he must do so if, in trying to save his party, he is not to see it damned instead. The first reason is, quite simply, that Mr Attlee knows in his heart that the argument is not true. Sometimes it is right to keep a great party together, even at some cost to its principles. But the differences of principle between Mr Attlee, who knows that with all its annoyances the Anglo-American alliance is the chief hope of peace for the world and of security for Britain, and Mr Bevan, who wants to smash it, are the most important differences of principle in the modern world. To put party above peace and salvation would be damnable—and Mr Attlee and Mr Morrison and Mr Gaitskell must know it.

Nor have they very much room for compromise. It is true that, on the surface of things, they have left themselves avenues of escape. Mr Attlee attached two conditions to his approval of the South-East Asian Nato —that it should have Asian members and that it should not be used to buttress obsolete colonialism. He could always say that the first meant that Mr Nehru must approve and the second that the French must first leave Indo-China. But he knows quite well that to say yes on impossible conditions is merely a hypocrite's way of saying no. Again, it is fairly easy to ride off from the problem of the European Defence Community by talking about the need for concessions to the genuine uneasiness about German rearmament. Mr Attlee knows that the issue is not whether the Germans shall be rearmed—the right to be armed cannot, in any case, be withheld from them for very long—but whether they shall be rearmed in a way that strengthens the western alliance or weakens it. He is under plenty of pressure to make these equivocations ; there is plenty of support in the Labour party for them, and it may take a full exertion of the block vote of the big unions to keep the party conference in line. But if Mr Attlee yields, it will be clear beyond any disguising by fine words that he has run away on an issue that he knows to be vital.

★

The second reason why unity of the party would be too dearly bought at the price of a sly acceptance of Mr Bevan's policies, is that it would not be real unity at all. Those who are now urging Mr Attlee to cement party unity, by lending his name to the story that there is "no real difference of principle involved" in the present controversy, are really urging him to drive out of his party at least as many people as they seek to keep within it. After any Attleeite surrender to his views, Mr Bevan would initially look a little discomfited and in rather more lonely eminence on the left, but he would soon find some way of raising the bids and attracting the restless wing of the party back to him. In the centre, Mr Attlee would ride more comfortably for a time, and he might win back some right-wing Bevanites. But there would then spring up, for the first time, a dissenting group on the right, disgusted at the betrayal of Labour's own policies. This group might not be very strong in the Parliamentary Party or in the constituency parties. But it would be stronger in the unions, where the memory of Ernest Bevin is still fresh. And it would be stronger still among the electors.

Mr Attlee may say that this threat of large-scale defection is exaggerated ; that the force of public reaction to any shabby or sensible manœuvre in foreign policy is always smaller than outside observers suppose. There is some truth in this. Certainly it is nonsense to say, as Mr Bevan did last week, that there will be a "universal" reaction one way or the other in a controversy so esoteric as that about the alleged encirclement of the Revolutionary Chinese. But there is one group of people who will promptly desert Mr Attlee if he deserts the principle of collective security now. These are the heirs of the old radical tradition, the people who hate the thought of turning Tory, who used to vote Liberal and then took to voting Labour and who —if the party would only let them—would like to go on voting Labour, at least more often than not.

Right up to the end of the Labour government, the party kept the support of most of these people (as the voting figures showed). Labour's handling of the basic principles they hold was, on the whole, not as bad as some of the gloomiest of them had feared, even though it was not as intelligent as the rosiest optimists of 1945 had hoped. But this section of opinion has already been severely shaken by Labour's performance in thirty months of opposition, by the irresponsibility, by the sentimentalism, by the class prejudice, and above all by the spectacle of leaders who apparently do not dare to stand up for the principles they embraced when in office. The wild men of the Left are not frightening in themselves ; Bevanite men carrying out Attleeite principles—as (with one or two exceptions) in the Labour government—are not too much to swallow. But there can be no such acceptance of Attleeite men carrying out Bevanite policies, least of all when these policies put the security of the free world at stake. That would be the parting of the ways. It would leave the Labour party with only its instinctive—and none of its reasoning—supporters to fall back on ; and the plain and fortunate fact is that—at any rate in the absence of a Tory debacle —there are not enough of those to vote any Labour government back to power on their own.

Such, then, is the dilemma that faces Mr Attlee at this fateful juncture of his party's history. The answer he ought to give to it is plain. At the meeting of the Parliamentary party next week, he should say that Labour supports the principle of collective security in Asia ; he may justly mention Mr Nehru's participation as a *desideratum*, but not as a pre-condition. He should say that Labour still stands by its decision to support the European army ; he may emphasise that Socialist uneasiness about German rearmament is a deeply felt emotion and that safeguards against German militarism must be kept continuously strong, but he should not elevate this apprehension into a barrier in the way of the free world's defence. He may fairly claim that the clash of personalities within the Labour movement is not important, but he must make it clear that the clash of policies is. He must speak for England, and not for Russia or Mr Nehru, now.

Return to Geneva

ON Monday the Foreign Ministers are to gather in Geneva for the first major political conference held in that city since prewar days. Their arrival will wake some strange echoes. This was the capital city of the unstable peace between two world wars. In Geneva, in the thirties, Japan's aggressions against the less bellicose China of those days, and Mussolini's invasion of Ethiopia were vainly condemned. Faint hearts and false hopes combined to prevent the great majority of peaceful nations from taking any effective action to check the aggressors. Litvinov's dictum that "peace is indivisible" did not deter his successor, Mr Molotov, from conniving at Hitler's conquest of Poland and the wave of aggression surged on to engulf a score of countries in Europe, Africa and Asia.

A very different situation confronts the diplomats who meet in Geneva next week. However formidable the problems they face, they are not gathering merely to wring impotent hands and seek sedative formulæ that would conceal from an anxious world the fact that aggression has scored another easy victory. Two subjects are on their agenda, Korea and Indo-China ; and although Indo-China has stolen the limelight in recent weeks, as a result of the heroic defence of Dien Bien Phu and the agitated debate in both Paris and Washington, at Geneva it is Korea that ranks first. It is highly unlikely that the conference will achieve the agreement on the reunion of Korea that all parties declare to be their goal. With a huge Chinese army poised north of the armistice line, and Mr Syngman Rhee still uttering threats of a "march north," the position in Korea remains dangerous and unpromising. But it also remains a fact that in Korea aggression did not achieve a walkover, as it had done in Manchuria, Ethiopia and Czechoslovakia.

In 1950, for the first time in history, forces from over a dozen nations rallied under the banner of a world organisation to defend an invaded country. The aggressor was repelled and his armies shattered ; and even when a Chinese army of over a million men, with Soviet aircraft and arms, poured into Korea without even a formal declaration of war, it not only failed to attain its professed aim of pushing the United Nations forces into the sea, but was in turn pushed back beyond the 38th Parallel. Prewar Geneva never came within sight of such a successful defence of peace.

Moreover, next week's conference itself represents a further quiet achievement. It may settle nothing ; but it is essentially the right kind of conference on Korea, and that alone is important. Last summer, although the Communists finally agreed to an armistice after two years' haggling, they blocked the road to a peace conference by insisting that it should discuss not only Korea but many other issues. In other words, the Peking government was ready to sell peace to the wretched Koreans only at a high price—the price including the satisfaction of its own demands as regards Formosa, a veto-wielding position in Uno, and economic concessions from the free world. (In Genevan terms, it was as if Mussolini had made a settlement in Ethiopia dependent on acceptance of his claims to Tunis, Corsica and Nice.) The United Nations' firmness on this issue bore fruit in February, when Mr Molotov committed an unenthusiastic China to a conference limited to discussing only Korea and Indo-China. This was Peking's third major climb down since it launched its troops into Korea ; and, like the previous instances—the transfer of the truce talks from Communist-controlled Kaesong to Panmunjom in no-man's-land, and the dropping of the demand for forcible return of all prisoners—this climb down was the result of a patient calling of Communist bluff.

The moral is still timely. Mr Molotov may have been baulked, for the time being, of his pet objective—an endless perspective of palavers unlimited either in time or space. At Berlin, in January and February, the western foreign ministers cut through his treacly

offerings to the hard centre, the stubborn refusal to allow free all-German elections, and departed leaving this awkward fact exposed to the air. But now, only nine weeks later, they must face the Communists across the table again; and even if Mr Molotov and Chou En-lai do not drag all kinds of extraneous issues into a conference intended to deal with first things first, they are all too likely to drag their feet, in the hope that public impatience and nervousness will force the delegates from the free countries to make concessions, or, better still, force them apart.

For this purpose Indo-China will serve the Communists better than Korea. Even the turbulent Mr Rhee has committed himself to quiescence for the first ninety days of the Geneva conference; and it will be remembered that the South Korean president has already let several similar deadlines pass without turning from bark to bite. The unsettled conclusion of the Korean war is at least as troublesome to the Communists as it is to the free world; China, in particular, is restive under the economic restraints that its adventure brought upon it. Indo-China is a very different affair. It is less of a drain on Chinese and Soviet resources than the Korean campaign, and the bloody expenditure of Communist cannon-fodder at Dien Bien Phu does not disturb Mao Tse-tung's digestion or inhibit Malenkov's gaiety when he goes to see *Le Bourgeois Gentilhomme;* the corpses are neither Chinese nor Russian. Moscow may have some interest in any arrangement that would keep the United States from establishing itself too firmly in South-East Asia; but it has also a clear interest in pinning the French army down in Indo-China and thereby obstructing the road to the European Defence Community. The recent protestations from the Communist capitals that an Indo-Chinese cease-fire is much to be desired ring somewhat hollowly against the sound of General Vo Nguyen Giap's massed artillery and of Russian-built trucks bringing in fresh ammunition.

To expect the Communist delegates to come to Geneva next week with a genuine anxiety to stop the bloodshed in Indo-China would, therefore, be ludicrously naive. They come, rather, with an obvious feeling that in Indo-China time is on their side, and with every intention of playing the Panmunjom game over again. Their hopes are high, for they can see as plainly as anybody in the free world how in both Paris and Washington counsels are divided and possibilities of action limited. There is not the least evidence that a display of western firmness at Geneva will provoke the Communists into any new adventures more dangerous than those on which they have already embarked. The only thing that might lead them to such rash steps would be the appearance of a yawning rift between the powers that face them across the table. If peace is to be restored in the Far East, it is far more important that the free nations should remain agreed among themselves throughout the Geneva conference than that they should hasten to accept the Communists' terms at its very beginning.

Comrades in Conspiracy

LAST week-end 650 delegates assembled in Battersea Town Hall for the twenty-third National Congress of the British Communist Party. It was a Congress that was important not for the views it expressed—they were drearily familiar—but for the strategy it revealed. Most of the first day was taken up by Mr Harry Pollitt, the party's general secretary, who presented the Executive Committee's report. He spoke for well over three hours, and by the time he sat down the patient comrades could have been in no doubt about the coming year's campaigns and slogans; indeed there was no doubt even before Mr Pollitt's marathon began. There will be new claims for wage increases, for higher social insurance benefits, no rent increases ("here is the greatest single opportunity for a united mass movement that has recently occurred"), an end to British subservience to America, unfettered East-West trade ("this not only means jobs for the workers, it means securing an important political victory over the whole aggressive policy of the United States"), the withdrawal of British troops from all colonial and dependent countries, the admission of China to the United Nations, no arming of Germany, and the prohibition of weapons of mass destruction. The response to all this from the floor was the usual mixture of approval, self-congratulation and calls for redoubled effort.

But, in making the familiar reflexes to the familiar battle-cries, most of the delegates missed the real burden of Mr Pollitt's message. His main concern was with the frustrating paradox that faces the British Communist Party. The party leadership claims that in recent years Communist propaganda has successfully penetrated into large sectors of the labour movement, and even further afield; but it sadly admits that it has failed to build up mass support for the party itself. Both the claim and the admission deserve examination; and so do the leaders' hints of what the comrades intend to do about it.

The party's claim to penetration into other organisations is not exaggerated. There has been remarkable Communist and crypto-Communist penetration both into the constituency Labour parties and into the trade unions. The first of these successes is sometimes soft-pedalled; the second is not. When last week's Congress assembled, the Central Executive of the Communist Party included the general secretary of the Foundry Workers, the assistant general secretary of the Electrical

Trades Union, the general secretary of the Fire Brigades Union, the general secretary and two area presidents of the National Union of Mineworkers, and the vice-president of the National Union of Vehicle Builders. The delegates included more than a hundred members of the Amalgamated Engineering Union, ranging from shop stewards to national organisers and embracing such prominent party veterans as Joe Scott, Wal Hannington, Syd Abbott, Claude Berridge, Les Ambrose and Peter Kerrigan. The last of these, Mr Kerrigan, is a member of the party's Political Bureau and head of its Industrial Department; he was also the recipient two years ago of the AEU's Order of Merit.

★

The everyday impact of such men on industrial relations is immense. At Battersea last week the party openly—and probably correctly—claimed much of the credit for the recent militancy of the engineers, the electricians, the railwaymen, the builders and the petrol tanker drivers; significantly, too—in view of last month's union attempt to interfere with BOAC's sale of Hermes aircraft—one delegate boasted that the party's branch at London Airport had recently doubled its membership. The party intends to work even harder to foment strikes in the months ahead. "The more of these threats we can begin to organise in 1954," said Mr Pollitt, "the better for all of us."

In the political, as in the industrial, field the British Communist party can also claim some notable successes in the past year; here again their disguised influence in the unions and in the constituency Labour parties has been the dominant factor. During the spring and early summer of 1953 at least a dozen trade union conferences passed resolutions taken straight out of the party's programme. Twelve conferences, ranging from the Amalgamated Engineering Union to the Fire Brigades' Union, voted for unfettered East-West trade; almost as many demanded a Five Power Pact; seven conferences recorded votes against bacteriological methods of warfare; and half a dozen called for a reduction in the term of National Service to one year. Even the National Union of Students started on the journey back to the party fold. Summarising these and similar victories Mr Pollitt declared:

> At the 1953 Trades Union Congress the policy of ending American domination, of friendship and trade with the Socialist world, and of social change, received between two and three million votes, and at the 1953 Labour Party Conference one and three-quarter to two million votes. The outstanding new feature of these very significant votes was the emergence of a powerful group of trade unions, including the engineers, electricians and railwaymen in alliance with the majority of the constituency Labour parties. And let there be no mistake: all these developments have been enormously influenced by the work and propaganda of the Communist Party.

There should be no mistake, least of all at Transport House.

This is the rosy side of the Communists' balance sheet. The gloomier side, from the party's point of view, is that whenever the comrades appear in their own colours, instead of operating through somebody else, the broad mass of both union and non-union voters will have nothing to do with them. The card-carrying membership of the British Communist party has remained stable at a mere 35,000 for several years (together with about 3,000 in the Young Communist League). The circulation of the *Daily Worker* fell steadily from 115,000 in 1951 to 87,000 by the end of 1953; in the same period the circulation of the *Labour Monthly* fell from 15,000 to 13,000, and the *Communist Review* had to close down last year because of lack of support. The ten Communists who stood at the General Election in 1951 received only 21,640 votes between them and all lost their deposits, and there seems to have been a further fall in the party's popularity with the electorate since then. In the 1952 local government elections the party had put forward 162 candidates, who received together 50,000 votes; in 1953 the party's 152 candidates could muster only 36,000 votes. When the 890,000-strong Amalgamated Engineering Union elected its president in 1951, the Communist candidate, Mr Claude Berridge, had polled more than 37,000 votes; in its 1954 election Mr Berridge received only 33,000 votes.

★

It is very annoying for declared Communists to realise that they cannot obtain positions of any standing in the country so long as they present themselves for election under their own flag; but they are not going to allow this annoyance to warp party strategy. The leadership has therefore recognised that one of its main objectives must be to strike down the barriers that debar it from working its way further into the counsels of the Labour Party. In Mr Pollitt's words, "it is vital to challenge and smash all the bans, purges and proscriptions coming from Transport House."

Throughout the thirty-three years of the British Communist party's existence the Labour party has refused to accept its affiliation, and has proscribed the Communist front organisations created for purposes of infiltration. In addition, some trade unions, including the Transport and General Workers' Union with its million and a quarter membership, have banned Communists from holding executive posts. In 1954 the Communists hope to whittle at least some of these bans away. They are convinced that in this endeavour they can count on the support of the majority of the constituency Labour parties, and also on a group of militant trade unions which accounts for 1½ million votes at any Labour Party conference. In Mr Pollitt's words:

> In 1921 the Right Wing leaders . . . refused the affiliation of the Communist Party. By this step and further bans and exclusions since then the Right Wing leaders have been able up till now to tie the Labour Party more and more securely to the coat-tails of capitalism. . . .

Today they attack the Bevanites and the Leftward-moving workers in general. . . . There is no conflict between the Communist Party and the mass of the membership of the Labour Party. . . . The whole future of the Labour Party depends on . . . the re-establishment of the original federal basis of the Labour party and the removal of all bans and proscriptions.

The first open test of the new policy—which, in the industrial field, is to be called " the fight to re-establish democracy in the unions "—came the day after Mr Pollitt delivered his report. It resulted in a Communist setback. By 26,580 votes to 12,540 the Clerical and Administrative Workers' Union defeated a resolution to delete a union rule under which members of organisations proscribed by the TUC and the Labour Party are ineligible for election as delegates to bodies to which the union is affiliated. This, however, was only the opening shot in a battle which will be fought out in many other trade union conferences in the months ahead. The primary aim of the Communist conspiracy in Britain today is not to overthrow Her Majesty's Government by force ; but (quite legally) to undermine Her Majesty's Opposition by stealth. It would be wishful thinking to assume that in each and every case the industrial workers and the constituency Labour parties will reply as effectively as the clerks have done.

Sterling Area Stamina

WHAT has happened to the long-expected sterling crisis ? Defying the almost universally held fears, Britain and the sterling area have lived through nine months of the American recession and still there is no sign of imminent disaster. Yet in 1949, when business in the United States actually receded somewhat less quickly and less deeply than it has now, the sterling area was immediately affected by transatlantic tremors, and almost at once stared disaster in the face. What is different now ? Is it luck or good management ? Or has something basic changed ?

It may be that appearances flatter only to deceive. The worst may have already started to happen ; but in the state of our knowledge of economic matters the dread figures—if in fact they are so alarming—would be known only in two or three months' time. It may thus be premature to assume that the sterling area is in fact riding out the storm. But, in spite of the lag in economic intelligence, enough is known to say that the present American recession has had—to put it no higher—a delayed impact on the sterling area. And this in itself may turn out to be a mercy, if recovery in the United States is not too long delayed.

Perhaps the best way to explain why the sterling area has escaped so lightly this time is to compare the basic economic conditions of today with the circumstances of 1949. Two facts stand out. The first is that the current American recession has been unique because (as explained in an article in *The Economist* of April 3rd) the primary inventory readjustment has failed to cause the expected repercussions, inside the United States as well as outside. The second is that the sterling area is in incomparably better health than in 1949. How have these factors immunised the sterling area from the virus ?

So far as can be judged from the latest information from America, the diagnosis made by President Eisenhower's economic advisers, of a " rolling readjustment " brought about by large-scale adjustments of overswollen inventories, still holds good. There are, indeed, signs—though admittedly as yet only slight—that the process, which has been orderly throughout, may now be reaching an end. And still there is no sign at all of secondary repercussions or of the dreaded spiralling effect. If there is one single explanation of this phenomenon, it is that confidence in the recuperative powers of the American economy has remained unshaken in every sector—in business, among consumers, and in the government. Sterling area commodities have, of course, been equally affected by the shake out in inventories ; but with confidence remaining high—unlike 1949—they have not been the object of panicky liquidation. Actually, on this occasion, for reasons that are still not clear, some American producers appear to have anticipated the downturn in business ; for there is evidence that an orderly and moderate cut-back in American purchases of some commodities from the sterling area occurred in the first half of 1953, before the onset of the recession.

Equally important is the improved state of health of the sterling area itself. There are a number of reasons why it is stronger in 1953 than it was in 1949: there is no longer an inflation-bred sellers' market, to any significant degree, either in Britain or in the overseas sterling area ; freer commodity markets and exchanges, by enabling the price mechanism to function, have eliminated artificial prices and exchange rates ; supplies of non-dollar materials and manufactures have increased ; and the sterling countries have more effectively recognised that responsibility to keep their purchases from dollar markets within bounds. These, among other reasons, explain why sterling is no longer regarded in the world at large as a grossly overvalued currency, as it was in 1949. Consequently there is no tendency now, as there was then, to speculate against the pound. Indeed, the tendency has, if anything, been the other way. Moreover, since 1949, a change has come about in the ownership of sterling balances, which are now held for the greater part in relatively " safe hands."

These appear to be the two major differences between 1949 and the present ; but there are some additional, if rather technical, differences whose importance cannot be correctly evaluated at this stage. There is, for instance, the question of aid. In 1949 dollars were being supplied to Britain and other countries as economic aid in the Marshall programme. In the present period almost all American aid is for defence purposes, and a growing proportion of this takes the form of offshore purchases, that is orders placed in Britain for aircraft, munitions, and other defence materials. Not only is the total of dollars obtained now actually larger than in 1949, but—other considerations aside—it is a better form of aid in circumstances of recession. British firms have firm long-term orders which not only assure them of stability during the recession but also enable them to place long-term orders in the sterling area for their raw materials.

Another important difference from 1949 is the state of the commodity markets. Prices have shown no tendency to fall ; indeed, in recent weeks they have actually been rising. Probably this is because commodity markets, which had boomed to fantastic heights during the Korean war, had been thoroughly shaken out before the onset of the recession in America last July. Furthermore, for technical supply reasons, two of the beverages, cocoa and tea—both fortuitously supplied from the sterling area—had been depressed too far, and have since staged an energetic recovery.

From all these factors one conclusion emerges with reasonable clarity: the course of events in 1949, whereby a minor decline in American production precipitated a major decline in the sterling area's dollar earnings, is evidently not nearly as normal a pattern of economic behaviour as has been generally supposed. The belief would perhaps never have become so widespread if 1949 had not appeared broadly to repeat the experience of 1938. One must now conclude (or so it seems) that, while 1938 and 1949 happened to be (in this respect) two examples of the same kind of American recession, 1953-54 happens to be an example of another kind. What should be guarded against (though it is very likely to happen) is the general embracing of a new doctrine that the outside world in general, and the sterling area in particular, can ride out any future disturbance in America without difficulty or damage. The path of wisdom (provisionally at least) is to ponder on the strength of two familiar platitudes. The first is that circumstances alter cases—which means, in this particular context, that most of the model-building of the macro-economists is a waste of time, since most of their constants are really variables. The second is that, for the preservation of economic stability, the maintenance of confidence in the commercial community is worth a pack of planners.

Notes of the Week

In Big Brother's Footsteps?

THE Chinese Communist delegates in Geneva will be scrutinized with the same sort of curiosity that greeted the Bolshevik envoys at the Genoa conference over thirty years ago. They are making their first bow on the broad international stage and the public has, therefore, very few clues about the motives and calculations behind the newcomers' actions. Can reference to Soviet precedents perhaps help ? In many respects China has been following the example of its revolutionary predecessor: in industry and in agriculture the planners set the Soviet Union as a model ; even Stalinist " democracy " is set officially as the political objective. China is in the peculiar position of having by its side a partner with years of experience and of being dependent on that partner's help for its development.

China's position is both similar to and different from that of post-revolutionary Russia. Though its frontiers are less vulnerable, China, too, probably has a complex about foreign capitalist intervention. But it does not feel isolated, and its expansionist tendencies may be due more to the dynamism of a young revolutionary state than to a search for a *cordon sanitaire* of satellite neighbours. The early Bolsheviks in Russia believed that the fate of their revolution depended on the victory of Communism in industrialised Western Europe ; Chinese leaders know that the establishment of Communism in, say, Indo-China or Malaya is not a condition of their present survival. On the other hand, the failure of the revolution in Western Europe was a hard fact that the Bolshevik leaders had to face ; their Chinese counterparts can claim that in South-East Asia they are working on much more favourable soil.

It was the failure of the revolution to spread beyond Russia that brought the Bolsheviks to international conference tables. The result at home was Stalinism and the " building of socialism in one country." Russia turned to its own development, hoping that the capitalist world would decay from its own contradictions. The Chinese are now

charges and it also put forward a scheme for local government reform. This would involve the creation within county council areas of authorities equal to county boroughs ; it is not quite a sensible scheme, but it is a carefully reasoned one. The Co-op party should realise that the closer it keeps to the Co-op store, the bigger its political " divvy " will be.

Purge in Egypt

COLONEL NASSER has resumed the premiership in Egypt and all who hope for stability there are watching him at work much as a street crowd watches the man with a pick who, now and then, hacks at the wall beneath his feet. For he has within the last ten days demolished some of the props from which the Revolution Command Council has hitherto derived useful support. Of these, the most important is a group of good civilian ministers who gave it service. When Colonel Nasser announced the new cabinet last Sunday all six of these were missing from the list ; they are said to have withdrawn for health reasons, but a more likely cause of their disappearance is that he suspects them to have made contact with former politicians during the recent momentary resurgence of the parties. Of the six, the least easily replaceable is the former Finance Minister, Abdel Gelil el Emary, who is one of the best bankers in the Middle East and to whom personally is due the credit for Egypt's recovery from the financial doldrums of 1952. Dropping him is dropping a pilot indeed.

President Neguib must also be rated a casualty. He seems worn out by the strain of struggle with the *junta* and has once more been reduced to the role of figurehead, retaining the Presidency, but without power to gainsay Colonel Nasser so long as the latter commands a majority in the *junta*.

Other one-time supporters who have been jettisoned are several politicians who had given the regime service, but who are now lumped with the real black sheep and deprived of political rights ; the object of this step is to keep the prospective National Consultative Council free from the old influences. Another victim is the press ; individual journalists and whole newspapers have been indicted for serving past regimes as " hired pens." Some of the people thus demolished are unworthy of any sympathy, but a few leave gaps that the *junta* will find it hard to fill.

Loss of support from this upper crust is being made good by gains on other fronts. Colonel Nasser now seems to have won a broader backing from the army than he at one time possessed. He is also working hard to strengthen his backing from peasant, worker and minor official ; if words to all of these can be converted into deeds, as were those to a few hundred peasants when he made a fresh distribution of title deeds to smallholders last Monday, he may have replaced old props with new. It is too early to say whether silencing patrician adversaries and winning plebeian supporters will afford him the stability that he would need in order to talk with Britain.

Some Economic Terms

The following is a third selection of contributions for the proposed English-Doubletalk Dictionary of modern economic terms. Suggestions from readers are now flowing in, and are still welcome.

Taxable capacity, maximum, the present level of taxation

Profits, this year's revenue minus last year's costs

Accountancy, sound, paying taxes out of profits, q.v.

Accountancy, unsound, paying dividends out of profits, q.v.

Management, conservative, management in the interests of the directors

Take-over bid, speculative, a proposal to manage in the interests of the shareholders (Note: there appears to be no word for actually managing in the shareholders' interests)

Counterpart Funds, a system of accounting whereby European countries appear to spend on their defence programmes money which is only credited them after it has already been spent on dollar wheat

Foreign Investment, gifts from the US Government

Imperialism, not sending gunboats. See also foreign investment

Imperialist, a foreigner whose assets are expropriated

Imperialist, unrepentant, a foreigner expropriated as above, but who then complains.

Another Iraqi Cabinet Crisis?

IRAQI politicians should read the story of Humpty Dumpty and learn from it that all the King's horses and all the King's men cannot put their country together if they keep staging great falls for cabinets. Iraq is endowed with huge potentialities in money, water, and living space ; yet these cannot be used for the development it so sorely needs if ministers change so often that a young and far from strong civil service is the only element of continuity. This weakness was not so menacing when the Development Board was in the charge of a Director with a status outside the cabinet ; now that this post has been converted into a Ministry, it changes hands with alarming frequency. Even before the present cabinet crisis, it had done so twice already in 1954.

Dr Jamali's cabinet is reported to have resigned because it asked for a dissolution. It has not been popular with a parliament largely composed of landowners because it has wanted to impose a land tax ; now it is accused of " mishandling the flood situation " (which it may have underestimated at the start, but so did Canute) and of flirting with thoughts of the Turco-Pakistani pact. This last, which men with a window on the world, such as the King, the Regent and Nuri Pasha, know to be worth bearing in mind, cannot be the cause of the downfall. Pressures exercised by politicians for personal ends are a more probable explanation. But the news could be good news for Iraq's common man only if a minimum of portfolios were to change hands.

A Day for Nato

THE meeting of the Council of the North Atlantic Treaty Organisation that is being held in Paris this week-end is important less because it gives an opportunity for Foreign Ministers to exchange views on the eve of the Geneva Conference than because it was due to take place in any case. The gathering on Friday was not suddenly convened but is a long-scheduled meeting of the Council, with Ministers present, to discuss general political developments affecting members with world-wide interests. During the last three years the Council has steadily, but with little fanfare, added political content to the bare bones of a defensive military alliance. Increasingly it is becoming the place where governments seek a better understanding and a common assessment of problems of common interest. Much of this is done by the Deputies who are permanently in Paris. But periodic meetings with Foreign, or Defence or Finance Ministers present—or all three—are essential. The easier the agenda the more likely they are to have the kind of exchanges that are the essence of a genuine Atlantic community.

Until recently this April's meeting was expected to have a thin agenda. Now the hydrogen bomb, the proposed Nato for south-east Asia, the Soviet suggestion for a new collective security arrangement in Europe and the Geneva Conference mean a busy day, especially for Mr Dulles. A thorough exchange of views will hardly be possible in a meeting, part of which will be given over to a public session marking the fifth anniversary of the Treaty. But at least the Atlantic alliance has reached the stage where it no longer pretends that the political and strategic problems of Europe can be kept strictly separate from those of the rest of the free world.

The Queen in Uganda

WHEN the Queen arrives in Uganda next Wednesday she will be embarking on what has become the most controversial part of her world tour. Early this year, the Great Lukiko—the parliament of the Baganda tribe, which constitutes nearly a quarter of the population of Uganda—passed a resolution humbly requesting that, in view of the banishment of the Kabaka, the Queen's visit should be " postponed " until a more propitious time. The Lukiko was no doubt sincere in passing this resolution ; but for obvious reasons the Governor and the British Government could hardly be expected to accept it. They did, however, concede, in deference to local sentiment, that the Queen's visit to Mengo, the capital of Buganda, should be left out of the programme. Further modifications have recently been announced in view of the security situation over the border in Kenya.

It is to be hoped that the success of the Queen's mission will not be blighted by any foolish demonstrations on the part of disaffected elements ; if it is, the public should understand from what a narrow section these demonstrations may come. The Prime Minister of Buganda, who has shown great good sense and loyalty throughout the drawn-out controversy over the Kabaka's exile, will certainly not be to blame. He will be in attendance when the Queen arrives at the airport, and will read a loyal address of welcome. In this he is doing no more than traditions of Baganda hospitality demand, but he has not escaped extremist criticism—particularly from the Uganda National Congress, a body that misses few opportunities of representing moderation as a betrayal of Uganda interests.

Meanwhile, despite the commendable restraint shown by both sides (which has allowed the Governor to end the state of emergency), the main issue of the Baganda dispute is still a long way from solution. The Baganda will not begin to be convinced of the permanency of the Kabaka's exile until the court case, in which the validity of the Governor's action is in effect being challenged, has been decided. At best this will not be for some months. It is a hopeful sign that the Lukiko has agreed to appoint a committee to discuss future constitutional developments with Sir Keith Hancock when he arrives on his special mission to Buganda later this summer. But agreement to discuss does not mean that agreement on the controversy itself will be reached. In public at any rate, all sections of opinion remain as firm as ever in their insistence that the return of the Kabaka is the *sine qua non* of any settlement.

Talking Shop

THE Easter conference of the Union of Shop, Distributive and Allied Workers provided a wide-ranging—and disappointing—sounding-board of the present state of Labour opinion. By a large majority the conference voted to become the first big union to support the minority of the Labour Party in its opposition to German rearmament. Mr Alfred Robens, the former Minister of Labour who voted with the Bevanites on this issue in the Shadow Cabinet, came down to the conference to reiterate the views he had then expressed. He was supported by Mr Padley, the left-wing MP who is president of the union ; another distinguished member, Mr Burke, the present chairman of the Labour Party, was regarded as a mildly interesting heretic when he put forward Labour's official view from the floor of the hall.

In voting against German rearmament, the conference was

merely making an unwise choice in a matter on which its most eminent members disagreed with one another. The delegates, however, also passed a resolution demanding an immediate increase of 15 per cent in the wages of the union's 330,000 members. They did this in the teeth of the unanimous opposition of the executive—not always, however, very wisely expressed. The general secretary, Mr Birch, naturally agreed that there should be a wage increase; indeed, conveniently ignoring the fact that the distributive trades have been gaining workers since 1948, he spoke of a growing scarcity of suitable entrants. But he thought it impracticable to demand an all-round increase for 50 or more different trades. This may have seemed simply obstructive to many members, whose wage increases have been very nearly uniform in recent years—negotiated as they are through wages councils which closely follow one another in their recommendations. Mr Birch was also brave enough to attribute the demand to Communist inspiration. The delegates were annoyed by this suggestion. They felt they were only following the current convention: no conference without a wage claim, and a starting-point of 15 per cent in imitation of so many of last year's claims.

Finally, Mr Birch made what may be the first of a series of important statements by trade union leaders about the future of collective bargaining. He opposed the Ministry of Labour's proposal that all national agreements in industry should include a provision to go to arbitration if necessary. This was a disappointing statement. It is true, as Mr Birch said, that if mutual confidence is lacking the mere existence of an agreement would not cause disputing parties to accept arbitration; but it might help to create that confidence, and to exert a brake on hot-headed action. Mr Birch had a better case when he attacked the proposal for an impartial body to advise on wages policy, which the TUC's economic committee discussed last week. The General Council of the TUC has not yet pronounced on it, but there are indications that it will probably agree with Mr Birch. Like him, it may feel that any such advisory body would have a superhuman task to keep in theory above politics, while yet concerning itself with one of the foremost political questions of the day.

Margins for Margarine

THE anguish that seems inseparable from decontrol has now descended on a section of the grocery trade. In two weeks' time, on May 8th, butter, margarine and cooking fats are to be freed. The largest manufacturers, in announcing their prices for branded margarine, have allowed for a retail margin of 12½ per cent, compared with the 10 per cent that the shops have earned for selling the standard margarine produced under control. This has angered the National Federation of Retail Grocers, representing most of the small shopkeepers. It claims that the margin should be 19 per cent, as it was before the war. It also—and more justly—objects to the discounts offered on quantity, which discriminate in favour of the big grocer and which induce the small man to buy all his margarine from the one firm in order to qualify for them.

The Federation is not, however, in a strong position to enforce its claims, because it is not supported by the multiple grocers; and the percentage profit, after all, is calculated on sales that have more than doubled since before the war.

The grocers are expecting the demand for the best quality margarine to be heavy at first, while people satisfy their curiosity about whether it really does taste like butter. At one time, it was even thought that competition from this new margarine at 1s. 9d. a lb might prevent free butter from rising above its present controlled price of 3s. 8d. a lb. It now seems probable, however, that there will be a sharp enough increase to give the Opposition a talking point. Thanks partly to drought in New Zealand, there may later be insufficient butter to provide for consumption of as much as 4 oz per week per head; in addition, Russia is now a buyer in the butter market. As a new product, the best margarine will not appear in the cost of living index. The index will, however, record the reduction of 2d. per lb in the standard quantity now marketed, as well as any increase in the price of butter; there should therefore be plenty of room for the arithmetically contorted controversies in which politicians delight. Whatever happens to the butter price, however, there can be no hardship if a palatable and equally nutritious alternative is on sale at 1s. 9d.

Ministry for the Middle Class

MANY a City-bound business man must have been stirred to thought on Thursday morning when he read the news that a special ministry to deal with the problems of the middle classes was on the political horizon in Belgium. Eyebrows will be raised even further when it is realised that this novel project is expected from a predominantly Socialist coalition. It is, in effect, a skilful stealing of political trousers. The late government in Brussels, that of the Christian Social (Catholic) party, had left many shopkeepers, craftsmen and other self-employed workers dissatisfied, in particular as regard social security benefits, which are concentrated on employees. M. van Acker, the Socialist leader, who now hopes to return to power in partnership with the Liberals, will evidently not only conciliate his partners but also gain middle-class goodwill for his own party if he meets the demands of the self-employed.

But the idea of a Ministry for the Middle Classes, however attractive at first glance, raises some doubts. How would its scope be defined? In Britain, at all events, efforts to find precise definitions of the middle-class or classes have invariably failed. Here—as in Belgium—it is increasingly unfashionable to admit that one is either below or above the shadowy boundaries of the *bourgeoisie*. Middle-class habits and standards are steadily encroaching on council house and mansion alike. And this encroachment brings with it a spread of one of the basic attitudes of the middle-class, a dislike of official supervision. Thus the ideal Ministry for the middle-class might well be described as a counter-ministry—a department whose chief task would be to protect its charges against the inspectors, circulars and buff forms of other organs of the state.

Japan's Reparations

LAST week negotiations between Japan and the Philippines were resumed, following upon an offer of the Japanese to settle outstanding reparations claims. So the subject of Japanese reparation debts to its South-East Asian creditors, the Philippines, Burma, Indonesia, and Indo-China, takes on a new lease of life. For many years the negotiations have been futile, because, on the one side the formerly occupied countries claim impossible sums, while on the other Japan, while offering the minimum, has sought to use reparations as a means of speeding its economic penetration of the area.

Japan's offer is said to amount to 400 million dollars (the Philippine claim was 8 billion); but only a token amount is likely to be paid in cash. The balance is to take the form of services, such as salvaging sunken ships in Philippine waters, and of capital goods for developing the country's natural resources. It is not stated whether the investments will be developed on a co-partnership basis; but in any event it is a wily move by the Japanese, for not only will they ensure for themselves supplies of much-needed raw materials, such as iron ore, but they will also create markets for their own capital goods industries. The proportion of Japan's trade with South-East Asia has been growing; but, with the China market virtually closed, it must turn still more energetically southward.

Though British, and particularly Hongkong's, trade may be affected, Japan's efforts to settle the reparations problem should be welcomed. It has for too long embittered international relations in this vital region. With the possibility of a Far Eastern Nato in the air the settlement of the problem assumes greater urgency.

The Right to Work

LAST week Mr L. C. Huntley, a West Hartlepool engineer, failed to secure an injunction from the Chancery Court against certain officers of the Amalgamated Engineering Union. He asked for an interim injunction to restrain them from preventing him from obtaining and holding a job in the area in which he lives. In its elements, the story of Mr Huntley's conflict with these union officials is simple. He is a member of the AEU, and he refused to take part in the one-day token strike called by it last December. The central authorities of the union were prepared to limit his penalty to an expression of censure on his lack of union solidarity. The local officials thought otherwise. According to Mr Huntley, they threatened to take action against anybody who employed him; and, in recounting his story in court, he at least satisfied Mr Justice Harman that he had suffered a good deal of persecution.

The legal position is that if the motives animating the local union officials were the furtherance of a trade dispute, they can escape from civil liability for the results of their activities. The court understandably declined to decide without a full hearing whether the officials had other motives than this. Mr Huntley, however, is still free to proceed to a full trial.

Whatever the outcome, and whether Mr Huntley succeeds in taking further action or not, it is a misfortune that successive cases of this kind, where individual workers allege that they have been persecuted by union officials, are having to be fought out through the courts. They are having an irritant effect upon the temper of the public, and one day this may blow up into a demand for a radical change in the law—of a sort that the unions will justly resent. To some trade unionists Mr Huntley has been getting what was coming to him. To others—and those others include some of the most responsible union leaders—trade union solidarity is not so overwhelmingly important that it can justify robbing the right to work from a fellow member because he dislikes the idea of a one-day token strike. If responsible unionists feel this way, there is something that they—and they alone—can do about it. Will no trade union leader promote a Geneva Convention to govern the conduct of the class war, with particular reference to those who once enlisted under their own banners? Or are they content with the parallels that can be drawn with earlier examples of unrestricted warfare? Those parallels are not pretty.

Paying for Negligence

THE Ministry of Health has now revised its advice to hospital authorities confronted with a patient's claim for damages based on negligent treatment. The new circular deals with cases in which both hospital and individual doctor are sued, and its general tenor is to advise the hospital and the doctor (in effect, his insurers, the medical defence society) to agree between themselves how they will share the cost of any damages or any sum paid in settlement. If there is no agreement, then the damages are how to be borne in equal shares. This is a familiar form of British compromise, and it should end the unhappy spectacle of a hospital authority pressing in court a claim for full indemnity from one of its own staff. But it raises by implication some important points of principle.

First, the circular suggests, in effect, a united front by the defendants. A patient may come out of a hospital rather worse than he went in; did something go wrong inside the hospital or was the worsening of his condition inevitable? The united front of hospital and doctor will, if skilfully advised, say nothing about anything, for nothing is more helpful to a claimant than arguments between those who are accused of negligence. Is it in the public interest that both hospital authority and doctor should now have a mutual financial interest in each other's silence?

The resulting position of the doctor is equally important. There are two opposing points of view. The *Lancet*, for instance, dislikes the idea that in future the hospital authority may pay for the cost of an individual doctor's mistake. May not that make him too much the servant of the authority, bound to do its bidding? Hospital authorities, conscious of their risk, may lay down rules to cover, if possible, every contingency; and who, then, would be treating the patient, the doctor or the management committee? Against this there is the common-sense view that it is unusual—and by ordinary standards unjust—for any employer to demand that his employee shall pay out of his

own pocket, directly or indirectly, the cost of mistakes which he risks making because of that employment. The present serious shortage of casualty officers in hospitals is at least partly due to the reluctance of a young doctor to face the personal risk of claims for negligence, with the reflections they are bound to cast on his professional competence. This latest circular from the Ministry is too financially slick to be reassuring. It is to be hoped that both the medical and the legal professions will keep an alert eye on how it operates.

Welfare in Prisons

THE fourth International Course in Criminology, which has been discussing recent advances in the study and treatment of offenders, came to an end in London last week. High on the list of practical suggestions was the proposal that full-time, trained social workers should be introduced into all ordinary closed prisons. The slow tempo of life in these old fortress-type gaols, the short hours of work, the lack of effort required, the inability to make one's own decisions, the fact that the bare essentials of existence are provided by others without the need or the possibility to provide for oneself, make any ordinary training for freedom extremely difficult. Many long-term prisoners develop "gate fever" as their day of discharge draws near, not joyous anticipation but real fear of what is beyond. This fear is not altogether unjustified; the ex-prisoner may find it very hard to be accepted by his friends and neighbours, and is certain to find it hard to get a job. There is truth in the old saying that sometimes a man's real punishment begins when his sentence ends.

Another saying is that after-care should begin from the moment the offender enters prison. Prison social workers could turn this desideratum into reality. Plans for a prisoner's return to normal life could be made at the beginning of his sentence; his family difficulties could be smoothed out; and he should be made to feel that when he leaves prison he can come to terms with his new mode of life. Equally important, the social worker in a prison (like the probation officer outside it) would be skilled in the technique of "case-work" and would come in close personal contact with an offender; he might sometimes be able to do much to change the individual prisoner's attitude, and put something positive into the otherwise rather negative regime of the ordinary closed prison.

Delegates at the international course in criminology stated that prison social workers are already being used in Belgium, Denmark, France, Holland, Sweden, Finland and elsewhere. In this country, last year's report of the Maxwell Committee on Discharged Prisoners Aid Societies made a similar recommendation. So far the Home Secretary has not decided to implement it—though he has not turned it down. Perhaps the deliberations of the criminologists recently assembled in London will help him to make up his mind.

War Aims

How is Russia to be effectually crippled and disabled from future mischief? By depriving her of her more recent and unassimilated conquests, and restoring them to the Powers from which they have been torn. Georgia must be rescued and replaced, and Circassia maintained as an independent barrier, to keep Russia for ever on this side of the Caucasus. The Crimea must be taken also, and Sebastopol stormed at any cost, and the navy sheltered there captured or destroyed. Bessarabia longs for the day of her emancipation, and would probably rise on the first thorough disaster that happened to the Russian arms, if assured of the faithful and permanent support of the allies. The Danubian Principalities must be freed from the curse of Russian occupation and of Russian protectorate for ever. Finland must be restored to Sweden, and the Isles of Aland must be held either by Sweden or by England. If these things are done, Russia will cease to be formidable; and whether she accepts a peace or not will be a matter of no moment whatever. . . . These are unquestionably great achievements—difficult and costly. But if they are at once necessary and possible . . all that we have to consider is the best and promptest means of effecting them. The details must of course be left to the naval, military, and financial authorities intrusted with the conduct of the war. The duty of the public is confined to the insisting that no efforts, however great, which are essential, shall be wanting, and that no funds needed for the purpose shall be refused. . . . For we must remember that of all wars a long war is the most costly, and an indecisive war the most absurd; and that, if to go to war in a bad cause is the greatest of sins, to go to war for an object which you are not resolved at all hazards to gain, is the most unpardonable of all follies. Now, our object in the present struggle is not to drive the Russians back over the Pruth and to force the acceptance of the modified Vienna note; but to secure *for the future* Turkey from Russian encroachment, Germany from Russian dictation, civilisation and liberty from Russian barbarism.

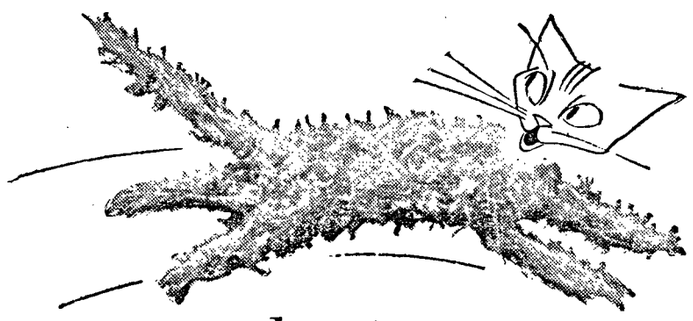
The Economist
April 22, 1854

SHORTER NOTES

The Russian-manned trading organisation known as Amtorg Trading Corporation, which has offices in New York, has suddenly come to life after nearly five years' hibernation. It has been making enquiries from American manufacturers for a wide range of machine tools and other metal products. Formerly it used to be the main channel for placing Soviet orders in the United States. American observers connect this development with the current East-West trade drive and with Soviet hopes of an early relaxation of the embargo.

★

It looks, after all, as if the Greek Government will pursue the Markezinis programme without Markezinis. The reshuffle of ministers announced recently leaves two members of his New Party in the key ministries of economic co-ordination and finance. The plan marches on towards a budget precariously balanced with the help of the drachma counterpart of American funds, towards reduced expenditure, towards exploitation of mineral wealth and the electrification of the countryside. It remains to be seen whether Marshal Papagos can persuade the Americans that a smaller army is desirable and whether the rising cost of living can be checked or its effects on the population mitigated.



asbestos cat

Only an inhabitant of the lower regions could possibly have any use for an Asbestos Cat. But if our export department received an order for one, they would scarcely turn a hair. Seriously, the uses of Asbestos in industry are growing at a fantastic rate.

Apart from its first great natural property, the fibrous structure of asbestos renders it easily adaptable to many uses, often in combination with other materials. It can be spun, woven and moulded. We, ourselves, turn it into many products. Amongst these are Caposite and Caposil, both Preformed and Plastic heat insulations, also Capasco Moulded Brake Linings and Asbestolux Incombustible Building Board. It is available as yarn or cloth, as mattresses for locomotive boilers and also has its uses in those transports of delight, the jet liners.

Asbestos may solve some problem that's proving a bit of a headache in your branch of industry. If you think so, consult the people who know best about Asbestos . . .

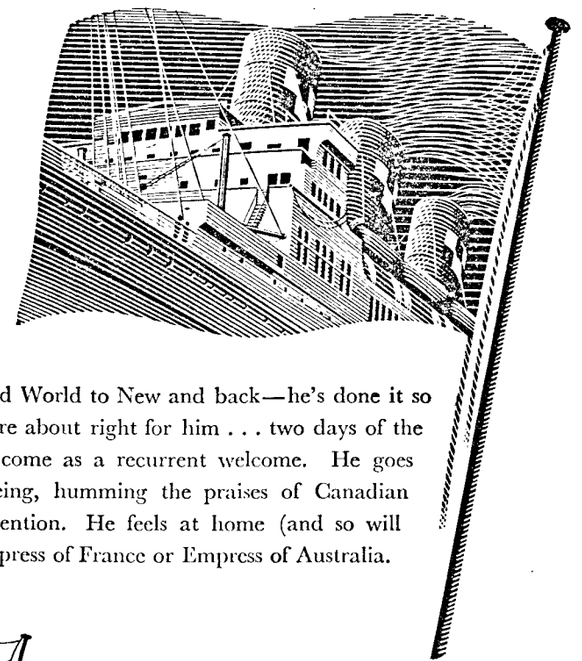
How to cross the Atlantic



The knowing man knows his way from Old World to New and back—he's done it so often. Four and a half days of Atlantic horizons are about right for him . . . two days of the riverside scenery of the lovely St. Lawrence come as a recurrent welcome. He goes ashore at Quebec or Montreal full of well-being, humming the praises of Canadian Pacific menus and general care and attention. He feels at home (and so will you) in the Empress of Scotland, Empress of France or Empress of Australia.

Letters to the Editor

A Nato for South East Asia

SIR—Your article on "A Nato for South East Asia" puts the case for Mr Eden's "agreement to consider" as well as, or better than, it has been put before. Those whom you criticise as "the Left wing of the Labour Party" (although I believe that it will be found that in this matter ours is, broadly, the position of the Labour movement as a whole) will wish to comment upon it. Our views arise from two basic convictions, one of which you deny and the other of which you state, but then disregard. First you deny that there is "any colonialism in South East Asia today of which anyone in the west should be ashamed." That you can so regard the French record in Indo-China over the past eight years reveals a difference between us which no argument is likely to bridge. You go on to describe the hopelessly belated and still, at the time of writing this letter, unimplemented, offer of self-government to the three Indo-Chinese states—an offer which does not include the indispensable right to leave the French Union—as "virtually the same as the Attlee-Cripps policy towards India"! This issue of colonialism will be found to be decisive. For the question is this: Is the Indo-Chinese war a case of "Communist aggression," such as must necessarily be resisted by all non-Communists, as the North Korean aggression was resisted by the Government of which Mr Bevan, myself and several others whose attitude you criticise, were members? Or is it, on the contrary, a tragic and hopeless attempt to perpetuate colonialism where such a policy has become wholly impossible, to the benefit of Asian Communists alone?

It will be found that everything turns on this issue. For no doubt there might be much to be said for a South East Asia Defence Pact which India, Ceylon and Burma would join. But that would mean the actual, instead of the verbal, end of French colonialism in Indo-China. And that, in turn, would now, unfortunately, almost certainly mean that at least a part of the country will come under some form of Communist, or pro-Communist, rule. One must face the fact that such have become the consequences of the incredible stubbornness of French policy.

You mention our own position in Malaya. Let me repeat what I have said both in and out of office: We can only finally win in Malaya by means of creating a fully native, fully self-governing and fully independent Malayan society, which, we hope, will remain in the Commonwealth, but which will be as free as Burma was to leave it if it so desires. That will be a most complex and difficult task. But our only hope is to get on with it, and to get on with it faster than we are doing at present.

To deny that colonialism is the essence of the question in South East Asia is blindness indeed. Those whose attitude you criticise are therefore determined to do all in their power to prevent the forces, and the influence, of this country being engaged on the hopeless course of attempting to hold the present geographical or political "line" in Indo-China. Certainly we must do all in our power to see to it that the new nations of South East Asia emerge as non-Communist societies, such as Burma. That very purpose will be finally compromised if we enter a pact for the support of the French or the Vietnamese position, at least in Tonkin and Northern Indo-China.

★

The second cause of our attitude is, as you write, a basic distrust of the policy of the present American Administration in Asia. You berate us for showing this distrust, but even in your article you give us ample grounds for it. You write that American policy in the Far East "is apparently unwilling to make any concessions at all, even for full value received." You add that Mr Dulles "appeared to be threatening the Chinese with the atom bomb in the immediate future if they did not behave." (And repeated American statements make it clear that by "behave" is meant not a willingness to conclude an armistice on, for example, some partition line, but the immediate stopping of all aid to Ho-Chi-Minh, without, of course, the Americans stopping their far larger flow of aid to the Vietnamese and the French). You agree that "for a day or two there was far more [American] pressure than there should have been." (And the usually well-informed Diplomatic Correspondent of the *Observer* writes that should an armistice not be concluded at Geneva on the American terms, this pressure on us will become "overwhelming.")

What makes you think it unnecessary to resist such an American policy as that? In fact almost the only good word which you can yourself find to say for it is that the Americans "are magnificently right in insisting that they will give nothing for nothing." Of course it is true that the only way to bargain with the Communists, or with most other people, is to have a striking point beyond which you will not go, and to show the utmost firmness in holding to it. But on your own showing what the Americans are trying to get us to support them in doing is not that, but an unwillingness to make any concessions at all, the choice of a fatally untenable striking point, and a threat to use A- or H-bombs on China. What is magnificent about that?

In these circumstances no other attitude will be found to be possible for the British Labour movement than a determination that Britain shall not support an American Far Eastern policy which must, if it is long enough pursued, lead to a morally and politically unjustified war on China. For in South East Asia moral and political factors will be found to outweigh military factors. Nuclear bombs upon Chinese cities will not prevent a Communist conquest of Asia: they are the one thing which could ensure it.—Yours faithfully,

House of Commons. JOHN STRACHEY.

[We confine our comment on Mr Strachey's letter to two points where, we think, he has misunderstood our position.

1. We make no defence of French policy in Indo-China in the past, even in the recent past. We believe that now, under the pressure of circumstances, they have come "at long last and with every show of reluctance" (our words last week) to the point of granting complete independence to the Indo-Chinese states. It is true that this has not been formally announced in Paris; but it is clear that it cannot be resisted there. If so, the battle against "colonialism" has been largely won.

2. There are many things about American policy in the Far East that we dislike. But the overriding issue is that the peace of the world depends on the maintenance of the alliance of the free western nations. So long as that alliance is maintained, we do not believe there will be a war. If it is broken, atomic war becomes very probable. This does not mean that we must always defer to the Americans or refrain from speaking out when we think they are wrong. It does mean that the paramount aim of British foreign policy should be to preserve the alliance.—EDITOR.]

Horizontal Weather

SIR—In reference to my proposal for optional depreciation rates and to my argument that the firm would have to "pay a price" for getting an accelerated rate from the Inland Revenue, since it would have to carry that same rate in its own books, Mr Reddaway argues that this would be no sacrifice, since the firm could simply transfer to "depreciation account" what would otherwise have stood as "undistributed profit." Maybe that would happen in many cases, though not necessarily in all. The fact remains that if a firm has to commit itself in advance to a high depreciation rate, it is sacrificing one degree of freedom—always a vital matter in business—in the use of its funds, as well as in many cases messing up its own system of accounts. I believe that under my system firms would adopt precisely those rates of depreciation that they would choose to apply if there were no income or profits taxes at all. The great thing is that firms which have reasons for wanting to write off quickly should be free to do so. This point, so vital for British competitive efficiency, Mr Reddaway ignores. But in the majority of cases there would probably be no change of practice.

No, argues Mr Reddaway; this is

holding "a very poor opinion of the intelligence of directors (or of his own)"; they will all rush in and opt for high rates because of the saving of interest involved. In my own mind, were I a director, the small saving of interest would weigh little indeed against the loss of freedom involved; and I believe that is how the minds of most directors would work. On the question of intelligence I say nothing.

Finally, Mr Reddaway argues that a quick write-off would not give a "true and fair view" of the position. Mr Reddaway knows quite well that where there is risk—of falling markets, of obsolescence—it is very difficult to determine a "true" rate of write off. I suggest that what the directors think it wisest to do in each particular case is likely to be much closer to the "truth" than any arbitrary Inland Revenue scales.

May I take this opportunity to quote Mr E. Browaldh, Managing Director of Svenska Handelsbanken, speaking on March 12, 1954, of the voluntary system in Sweden, whose suspense three years ago was an anti-inflation measure:

> This right has in actual fact served as a powerful lever for promoting our industrial development and has thereby been of immense significance for the entire growth of prosperity in the country.

—Yours faithfully,

ROY HARROD

Christ Church, Oxford

Roads Below the Line

SIR—In your note of April 3rd you give the impression that the British Road Federation is suggesting that the whole of the road expenditure might be financed by loans. This is not its idea at all. The proposal is that new construction should, like other capital investment, be financed by borrowing.

You criticise this proposal in that a Highways Authority would have no revenue, but surely the same criticism would apply to education. Schools are built by local authorities out of borrowed money but the authority has no revenue beyond the local rates. I suggest that the same principle could apply to roads and interest on loans could come out of motor taxation.

Industry obviously wants new roads and bridges quickly and if the Government cannot find all the required revenue now, surely there is nothing wrong in the suggestion about road loans.—Yours faithfully,

R. GRESHAM COOKE

British Road Federation, W.1

[The British Road Federation's statement said that "expenditure on the roads, particularly new construction, should rank as capital investment," and proposed that the National Highways Authority should be "charged with national supervision over road needs and road expenditure." The point made in the note that roads are not revenue-raising referred to the proposal to transfer responsibility for the expenditure of public money from Parliament to an independent authority. Local education committees are responsible to their own authorities and to the central government. On the need for new and better roads, there is no question.—EDITOR.]

Books & Publications

The Understater

AS IT HAPPENED.
By C. R. Attlee.
Heinemann. 227 pages. 16s.

MR ATTLEE is a reticent man. He does not gossip about current political issues and he rarely gives away secrets. These characteristics, valuable to him as a politician, limits his success as a writer of memoirs. There is so much that he could have told, but that, quite coolly and deliberately, he chooses not to. He discusses the speculation about his sudden reversal in 1945 of the offices of Ernest Bevin and Mr Dalton, but adds to it only the following magnificently bare sentence: "Various reasons impelled me to my final decision, which was, I think, justified in the event."

At the same time this is a fascinating book. Directly it may tell us little that is new, but indirectly it tells us a great deal about its author. Mr Attlee is a unique politician. He has been the leader of a major political party for a longer continuous period than any other man in the modern political history of this country. And his leadership has been successful. He was the first majority Labour Prime Minister; he came very near to winning three successive general elections—a feat achieved by no other party leader and by only one Government since 1832—and he will assuredly leave the Labour Party, despite all its present troubles, much stronger than he found it. In addition, he commands wide personal respect outside his own party, and is the subject of a growing fund of half-ironical, half-admiring stories—one of the hall-marks of a fully established political reputation.

Most of these stories culminate in an Attlee laconicism. "We will watch that," he is reputed to have told the Labour Party meeting at which the hydrogen bomb was first raised, before quickly going on to nominate speakers for the second reading debate on some minor measure. This side to his character is quite perfectly expressed in "As It Happened." The title itself strikes the keynote, and in the course of the book there is hardly a facet of politics that does not receive its share of cool understatement. "There was, therefore, in my view, no real difference of principle," he writes, and the Bevanite resignations are dismissed.

Perhaps the best part of the book is that dealing with Mr Attlee's childhood and early manhood. He emerges from it clearly as one who, far from being a professional rebel, is of a profoundly conformist habit of mind. He is a middle-class man who came to socialism without being in revolt against his social background. He is a university man who has few of the values or the habitual reactions of the intellectual. As such he has more instinctive sympathy with the reactions of the trade unionist or of the average Labour voter than have most of his kind. This, combined with a deep integrity of central purpose and the most sensitive political antennæ, is a large part of the secret of his success.

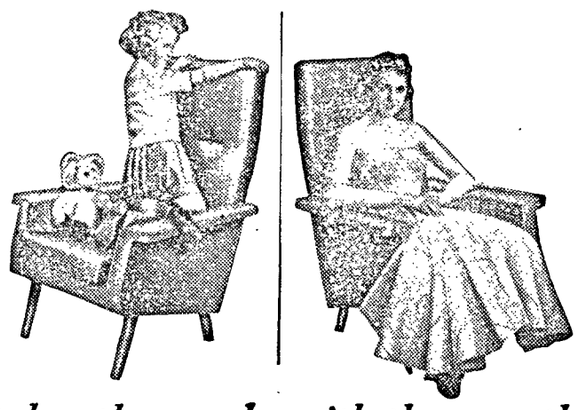
Nineteenth Century Trade Cycle

A STUDY IN TRADE CYCLE HISTORY: *Economic Fluctuations in Great Britain,* 1833-42.
By R. C. O. Matthews.
Cambridge University Press. 240 pages. 25s.

THIS work is an attempt to apply modern economic theory in the analysis of short period fluctuations between 1833 and 1842. Modern theory is elegant and refined: the evidence available for the early nineteenth century is crude and fragmentary. And economists who attempt to press theory into the service of history are apt to be praised by historians for their analytical capacity, and by economists for their command of the historical sources. Mr Matthews should escape such ambiguous praise. For he combines a mastery of the most recent theory with a knowledge of early nineteenth century economic history that will commend his work to the most seasoned historians of the period.

The work is arranged by subject and not chronologically. The first seven chapters are devoted to various problems of Britain's external accounts. Then follow three chapters dealing with industry. There is one chapter on money and banking—from a strictly economic point of view the best in the book—and a concluding chapter in which the author surveys the various phases of the cycle. It is always difficult in a detailed study such as this to strike a balance between analysis and narrative, but Mr Matthews has handled the problems of presentation with considerable success. And though the argument is often rigorous, he writes with such clarity and avoidance of jargon that historians with little knowledge of economic theory ought to be able to follow him. Trade cycle history has sometimes degenerated into platitudes heavily disguised in technical language; much of the argument of this work is difficult, but the author is a master of the art of making difficult things seem tolerably simple.

Leather upholstery



takes the rough—with the smooth

... nothing looks and wears so well or gives more comfort than leather

"YOUR FURNITURE AND YOUR COMFORT" is the title of a booklet which tells more of the colourful leathers which are now available for the upholstery of modern and traditional furniture for the home, the boardroom, the office, clubs and hotels. *Write to:* The Dressed Hide Leather Publicity Committee, Leather Trade House, Barter Street, London, W.C.1.

Inserting an X-ray tube into its oil-filled, ray-protective and shock-proof casing.

PROGRESS IN ELECTRONICS

IN 1895, Röntgen startled the world with the discovery of an entirely new form of radiation. Whilst engaged in the study of electric discharges in vacua, he detected an invisible ray which had the remarkable property of penetrating human tissue to present a shadow picture of bone formation on a photographic plate.

The radiations, which became known as X-rays, were at first used primarily to produce medical radiographs. In those early days such radiographs required exposure times of about fifteen minutes; but today, with the aid of modern X-ray tubes, diagnostic radiographs of extremely high definition are obtainable in less than 1/800th second.

A significant contribution by Mullard to this outstanding progress is the rotating anode diagnostic tube. Providing a high X-ray intensity from an optically sharp point source, these tubes produce radiographs of high quality and definition in very short exposure times.

The latest Mullard achievement in this field is the development of a rotating anode tube of such high power and short exposure time that it enables motion-picture studies to be made of internal bodily functions. This tube is already proving of immense value in the diagnosis of diseases of the heart and circulatory system, as well as of the stomach and the brain.

The scope of X-ray science is continually expanding. In addition to medical radiography, X-rays are being applied to the treatment of cancer, the study of the structure of matter, the non-destructive examination of materials, and the detection of foreign particles in foods. The Mullard organisation, with its extensive research and manufacturing facilities, is contributing to further progress by the production of X-ray tubes of the highest quality.

(MT441D)

Only poor theory in uncertain hands produces a simple clear-cut explanation of trade cycle history in terms of a sample number of influences. Mr Matthews's explanations are subtle and complicated, and, in so far as he identifies any pattern in his cycle, it cannot be said to conform neatly to any particular theory. Some parts of it resemble reasonably well the various versions of the cycle based on the multiplier and acceleration principle, but parts of it do not; some of the events, for example the clustering of railway schemes after the success of the Liverpool and Manchester line, are interpreted on lines analogous to those of Schumpeter. The real skill in investigating an historical episode in the light of theory is the ability to identify the appropriate theoretical categories and to judge how rigorously they may properly be used. Mr Matthews has this skill in a very high degree. He is also prepared to allow full weight to influences which do not figure in theory at all, to the extraneous and the fortuitous. It is therefore impossible to summarise his argument. But some general points stand out. It has often been said that the trade cycle in nineteenth century England was an "imported" phenomenon, imported mainly from the United States. However true of other periods, this generalisation does not hold good for 1833-42. The mainstay of the cycle in this period was British investment. Another interesting point is the importance which the author attaches to the speculative "mania" in determining the course of the cycle; this was an influence which always figured largely in the comment of contemporaries but has dropped out of more recent explanations.

Only one general criticism might be made. Almost half the book deals with Britain's balance of overseas trade; as against this, the iron industry has only three pages and the coal industry only two. This distribution of space is, perhaps, natural since foreign trade is the topic on which statistical evidence is ample, but in a second edition Mr Matthews ought to strengthen his sections on iron and coal.

Taking Decisions

UNCERTAINTY AND BUSINESS DECISIONS.
Edited by C. F. Carter, G. P. Meredith and G. L. S. Shackle.
University Press of Liverpool. 112 pages. 10s. 6d.

IN 1949 Mr Shackle, now Professor of Economics at the University of Liverpool, published his "Expectation in Economics." This contained a devastating criticism of the application of probability theory, based upon relative frequency, to the analysis of economic decisions. By its nature this concept of probability cannot bear upon a unique event, that is, upon a happening which is not one of a fairly large series. It is therefore of no assistance to a theory of business decisions under conditions of uncertainty, for conditions change too much. After explaining this, Mr Shackle devoted the major part of his book to the development of a theory. That is to say, he provided a "model" of how decisions are taken regarding alternative courses of action whose outcomes are of uncertain expectation. His theory is logically constructed and, to him at least, intuitively plausible.

The present book contains a summary by Mr Shackle of his theory and seven papers on it, which were delivered at last year's meeting of the British Association. There is also a summary by Professor Meredith and two shorter notes. The seven main papers were given by economists, philosophers, a mathematician and a psychologist; thus the book displays a diversity of approach which, as is not unusual with inter-disciplinary colloquia, provides much instruction but few conclusions.

It is apparent that the theory is as yet insufficiently developed to be subjected to testing; thus Mr Roy "can only dimly envisage" empirical work with this aim in view. There is therefore a need for revision or development of the theory, and several contributors take steps in this direction, most notably Professor Carter. He criticises the supposition that anyone taking a decision focuses his attention on only one gain and one loss from among the many possible outcomes of a course of action. He argues instead that one of a set of outcomes may be regarded as the most likely even though none of the set would occasion surprise.

The book contains no information about how business men actually take decisions. In this respect the title is too wide. On the other hand it is too narrow in that the subject is of interest to others besides economists, as is indicated by the participation in the symposium of the representatives of other disciplines. Professor Shackle's theory concerns choice as a whole and thus relates to generals and gardeners as much as to business men.

Literary Detection

THE ANNOTATOR
By Alan Keen and Roger Lubbock.
Putnam. 229 pages. 21s.

IN 1940 Mr Keen acquired a copy of Hall's *Chronicle* with some 3,600 words of marginal annotation, written in an Elizabethan hand. The parts of Hall thus annotated roughly corresponded to the historical material used by Shakespeare in his *Henry IV* and *Henry V*. Mr Keen, despite moments of doubt, believes that here is some of Shakespeare's preliminary work for his major histories, and that the notes are in his handwriting. The present book at last prints the notes in full and constructs an account of the poet's early years which would make it possible for him to have had access to this copy of Hall. The signature "Richard Newport" found on a later page of the volume has apparently been identified with that of Sir Richard Newport of Shropshire, and Mr Keen has found a remote connection between the Newports and the Alexander Houghton of Lancashire who in 1581 had in his service a player called William Shakeshaft. It is therefore assumed that the poet had been sent to Houghton by his recusant father to escape from the too Protestant atmosphere of Stratford, returned to marry Anne Hathaway after Houghton's death, and after the birth of his twins in 1585 entered the service of Sir Thomas Hesketh, to whom Houghton had recommended "Shakeshaft" in his will.

"The Annotator" is modestly written, and its authors admit that they have no proof either of Shakespeare's authorship of the annotations or of the events in his early life that are here outlined. The investigation has clearly been pleasurable, but the biographical conjectures are shots in the dark and, now that the annotations are given in full, one is bound to remark their extraordinary lack of interest; they are nearly all brief indications of what is to be found in Hall's text, and the writer's only hint of his own views is to be found in one or two anti-Protestant comments. Of course one should not expect the poetic phrase (at least it would be unfair to demand it), but it is difficult to believe that Shakespeare at about the age of twenty would not have shown a touch of fancy, excitement or shrewdness. If he did so strangely make these annotations, they can have helped him very little in his writing of *Henry IV* and *Henry V*. Many of them, indeed, have no relation to anything in the plays. The few verbal parallels that Mr Keen and Mr Lubbock have noted carry little conviction.

Wasted Sacrifices

SUNK. *The Story of the Japanese Submarine Fleet, 1942-1945.*
By Mochitsura Hashimoto. Translated by Commander E. H. M. Colegrave, RN.
Cassell. 229 *pages.* 15s.

THIS account, by an experienced Japanese submarine commander of the Second World War, is based also on facts provided by surviving colleagues, and contains much that has not hitherto been available. The English text occasionally lacks clarity, and for the layman there could have been more annotation.

Many of the Japanese submarines were larger and had a greater surface speed than any built by other nations, and the sacrificial devotion of the crews was beyond question. Yet these assets were offset by strategic ineptitude in the application of new devices. Having rapidly occupied a vast complex of distant islands and bases, the Japanese began to experience within eight months the immense difficulties of preserving their gains in the face of the developing Allied counter-strokes. Their submarines had been rigidly trained for attacks on the superior American fleet; but before long the radar-equipped ships and aircraft of the enemy were turning the tables on them. Instead of concentrating against the shipping that was so vital to the American "island-hopping" strategy, the Japanese submarine potential was largely dissipated on unrewarding subsidiary missions: provisioning

or evacuating isolated garrisons; reconnaissance of distant enemy bases; pin-prick bombardments along the Pacific Coast; midget attacks in Australia; and 15,000-mile voyages to German-occupied France. Only in the Indian Ocean, where Allied anti-submarine resources were weak, did the Japanese achieve a measure of success against shipping.

Radar—so vital to survival—was not fitted until the middle of 1944. By then some of the bigger submarines were being equipped with *Kaiten*; four or six of these "human" torpedoes were clamped to the upper deck and released while submerged, with suicide pilots to guide them at 30 knots towards their victim—a ship at sea or at an anchorage. The author is at his best when relating his own experiences, as for instance when his submarine left Japan on a *Kaiten* mission:—

> *After a grand send-off we left harbour* accompanied by a host of crowded motor-boats, whose occupants were chanting in unison the names of *Kaiten* pilots. These sat in their respective craft, wearing white towels round their heads, and brandishing their swords.

But these strange weapons achieved practically nothing. Japan ended the war with only a handful of surviving submarines, including two giants of 3,400 tons, each carrying three aircraft. They were about to start for the Panama Canal, there to launch their torpedo-bombers against the locks—the last of many futile diversions.

Business Guide

THE BACKGROUND OF BUSINESS.
By H. V. R. Geary.
Oxford University Press. 224 pages. 9s. 6d.

THIS short book is designed to help the student who is preparing for the examinations in commerce and business economics held by such bodies as the Royal Society of Arts and the London Chamber of Commerce. It must be judged in the light of the needs of such students and of the existing literature available to cater for them, rather than from the viewpoint of the advanced student, who would disagree with several statements both of fact and of theory.

An introductory chapter discusses in general terms the types of industrial and commercial activities, the specialisation and interdependence of firms, industries and countries, and the aims of economic activity. The author then describes the various forms of financial ownership and control in different types of organisation, and discusses some of the factors affecting the size of the firm and the methods employed to reduce the severity of competition. The next section deals with the nature of money, the banking system and the operations of the capital market. After a more detailed consideration of the firm itself with a description of forms of internal organisation, accounting aids to management, sources of long-term and short-term capital and the incidence of risk, the book then turns to commercial activities, including wholesale, retail and international trade and transport. The final chapter gives a summary of laws affecting different aspects of business.

This is undoubtedly a welcome addition to the type of book available to students. It might also be helpful in the teaching of economics in schools. For those who do not wish to pursue their studies further it indicates how the world of business works, and describes the functions of different economic institutions. In general it eschews abstract economic theory.

The faults of the book arise mainly from the compression necessary to cover such a wide field in about two hundred pages. In particular one would like a more detailed discussion of the principles underlying specialisation, which in fact form the background to many of the institutions and problems discussed in the book. In particular the section on management and organisation would benefit greatly from a general discussion of the need for delegation before different types of administrative organisation are considered. This might involve a small amount of repetition, but in many instances the book would be improved by this, and it is generally useful for the student to see how different aspects of the same principle have relevance to many different problems.

In its present form the book is certainly a useful introduction. A second edition, revised in details and somewhat in scope, could be even more helpful to the student starting on a study of economics.

Documents for Germany

GESCHICHTE DES ZWEITEN WELTKRIEGES IN DOKUMENTEN. *I: Der Weg zum Kriege*, 1938-1939.
Edited by Michael Freund.
Verlag Herder, Freiburg. 486 pages. DM. 28.

AS anyone who has travelled in post-war Germany knows, there is both great curiosity and great confusion about what happened in the world during the years when the German people lived under Hitler's rule. No adequate history of those years has yet been published in Germany, and it is therefore a promising idea to make a collection of the most important historical documents dealing with the Second World War, which can be used as a basis for teaching and discussion. The present volume is the first of a set of three edited by Professor Michael Freund of Kiel University and is intended to launch a still larger project, *Weltgeschichte der Gegenwart in Dokumenten.*

Of the two hundred documents selected, seventy-seven have been taken from the German Foreign Office Documents published jointly by the British, American and French Governments, and a further forty-two from the British Foreign Office Documents edited by Sir Llewellyn Woodward and Mr Rohan Butler. These form the nucleus of the collection to which are added a number of extracts from the French Yellow Book, the Polish White Book, the Nuremberg proceedings, Professor Feiling's life of Neville Chamberlain and the memoirs of Bonnet and Coulondre. Any selection is bound to be arbitrary in some measure, but none of the essential documents for the period between the *Anschluss* and the occupation of Prague appears to have been omitted. Thus Hitler's secret military directives, which reveal his intention of destroying Czechoslovakia from the beginning, are printed in full, and the editor rightly insists that Hitler was interested in the wrongs of the Sudeten Germans only in so far as these provided him with a means for the disruption of the Czechoslovak state.

Criticism of the collection may, however, legitimately be made on two grounds. The first is the starting point which Dr Freund has chosen. Even if space obliged him to omit the earlier years, a proper appreciation of Hitler's foreign policy must at least begin with the discussion of November, 1937, recorded in the Hossbach minutes and must include the annexation of Austria. Nothing is more revealing of Nazi methods in diplomacy than the secret history of the *Anschluss* as it was disclosed at the Nuremberg trials. Without this background, it is difficult to appreciate the quarrel that Hitler deliberately picked with the Czechs as part of a much wider and carefully calculated plan for the piecemeal annexation of Central Europe.

The second criticism is concerned with the form in which Dr Freund has chosen to present his material. Instead of leaving the documents to speak for themselves, he has linked them together with an historical commentary. It would surely have been better to have followed the example of Chatham House and publish the documents without comment. No matter how objective the editor may strive to be, inevitably any account of these years is bound to be controversial. By mixing the documents with constant editorial interpretation the publishers are in danger of detracting from the authority of a series which on other grounds is welcome as a useful contribution to the serious discussion of contemporary history in Germany.

American Central Banking

THE FEDERAL RESERVE SYSTEM, 1945-1949.
By J. S. Fforde.
Oxford University Press. 351 pages. 35s.

IN his introduction Mr Fforde states two aims. The first he puts thus:

> Adaptation to changing environment is said to be a necessary condition for survival. This book traces the adaptation of the Federal Reserve System to a drastic change in its environment and, hence, its reaction to a threat of extinction.

This is a provocative thought, and it might perhaps be supported; but the reader would be well advised not to carry the troublesome evolutionary analogy

with him as he trudges through what is of necessity a long recital of the minutiae of Treasury, central bank, member bank and non-bank transactions. The second statement is more valuable. This book

> is a study of a problem-solving activity that concentrates on the major questions that arose and upon the particular financial field in which they dwelt.

In order to examine the "problem-solving activity" in the years he has chosen, Mr Fforde leads the reader through a month-by-month account of Treasury financing and refunding decisions and operations; Federal Reserve purchases and sales; shifts of securities between bank and non-bank investors; weekly changes in interest rates for varying maturities of Government and corporate securities; and, frequently, changes in various business indicators. In short, one examines hundreds of trees, some almost leaf by leaf, but one rarely sees the forest. This is doubly unfortunate, since in the first forty-five pages there is an excellent summary of the 1933-45 period, which might well have served as a model for the closer study of the later years.

Although published only this year, the book was apparently written before the Patman Committee published its three fat volumes of answers to questionnaires and transcript of hearings (the valuable Douglas Committee material of two years earlier was, however, used). The Patman Committee volumes would have provided much additional light on some of the questions that appear to trouble Mr Fforde. Even so, it is difficult to see why he thinks the Federal Reserve authorities are concerned about a "vagueness" in their powers or in their status *vis-à-vis* the President and the Treasury. Most monetary officials in the United States have no doubt that the framers of the Constitution took particular pains to reserve to Congress only—and certainly not to the Executive—the power "to coin money and regulate the value thereof"; they are also sure that Congress delegated that power to the central bank in the Federal Reserve Act of 1913, and, finally, that the delegation extends as far as, and until, Congress draws a line. The significance of the Patman Committee "investigation" was that Congress did not draw the line.

Shorter Notices

AMERICAN FOREIGN ASSISTANCE
By William Adams Brown, Jr. and Redvers Opie.
The Brookings Institution, Washington, D.C. 615 pages. 43s.

This is the second attempt of the Brookings Institution to examine American experience with different forms of foreign assistance; it follows the publication of "Current Issues in Foreign Economic Assistance" in May, 1951.

The new study analyses the record of the $94 billion programme of assistance to foreign countries made available by the United States during the twelve years 1941-1952 — from Lend-Lease to Mutual Security. The various experiments in foreign assistance are examined in considerable detail with regard to chronological development, geographical distribution, the type of programme and the policy issues involved; but far too little attention is paid to the circumstances giving rise to the various operations, the underlying reasons for the successive stages of activity and the results achieved.

The authors maintain, in brief, that the broad purposes of the American foreign assistance policy have been to strengthen countries making common cause with the United States in resisting aggression and to strive for the establishment throughout the world of the stability and progress that are essential to the security and wellbeing of the United States. The task now before America, after twelve years of foreign assistance, is to adopt policies which will reduce or eliminate the need for continued dollar assistance. The authors conclude that the outlook for such initiative on the part of the United States at present cannot be said to be very bright.

★

MAJOR PROBLEMS OF UNITED STATES FOREIGN POLICY, 1954.
Prepared by The Brookings Institution, Washington.
Faber. 429 pages. 29s.

This, the seventh volume in the series of annual studies of problems of American foreign policy, represents a part of the programme of research and education inaugurated in 1946 by the International Studies Group of the Brookings Institution.

The current volume includes a survey of the "key developments" in American foreign policy during 1953 and the "developing problems" confronting the United States at the beginning of 1954; an analysis of the basis of American foreign policy; the pattern of postwar international relations and the factors conditioning American action in international affairs; and a study of American-Soviet relations in the form of a "Problem Paper," presented as an illustration of the type of material prepared within the government as a preliminary to policy decisions.

Since the material included in this 1954 volume was prepared before the end of 1953, the relative importance of the problems selected for examination may change, and the issues emphasised may become less significant by the end of this year.

★

THE BRITISH SUBMARINE.
By Commdr. F. W. Lipscomb.
A. and C. Black. 283 pages. 25s.

Alone among the modern engines of war submarines are meant to work unseen and unheard, thus accentuating the mystery which surrounds them, their crews and their operations. Stories of their famous deeds of war and press reports of sad disasters in times of peace are all that most people have heard of their affairs; here is a book which enables them to learn much more.

In it Commander Lipscomb tells us how they work and what part they play in naval warfare, and at the same time giving an outline of the fifty years' history of the British submarine service. Much of this information is being put before the public for the first time and the chapter on escape from sunken submarines might well be studied by every writer and reporter of such matters.

The general picture of submarine history, submarine warfare and submarine technicalities is too broad a subject to be sketched in some 250 pages, but the author's attempt at this grand, though intricate, canvas certainly merits warm commendation. The knowledge is there and references have been thoroughly searched; but the story is somewhat patchy, an impression which might have been avoided if the author's style had been more fluent and his proof reading better.

INTERNATIONAL TRADE STATISTICS.
Edited by R. G. D. Allen and J. Edward Ely.
John Wiley, New York (London: *Chapman and Hall*). 448 pages. 54s.

This book is an enlightening guide through the maze of foreign trade statistics, describing how they are obtained, their scope and their failings. It is written by a team of experts in a number of countries and in international organisations. From the general principles of classification and valuation and the ways in which other statistics, such as index numbers of volume and price, are derived from the original figures, the book leads to an examination of the practices of individual countries. Those of the United States and the United Kingdom are discussed in some detail, but there are notes on those of most other countries. A particularly useful section appraises the trade statistics of Commonwealth countries, including the colonial territories.

In spite of the progress made towards international comparability, particularly in the use of the standard international classification (now adopted in the British trading accounts), this survey shows that much remains to be done. Greater uniformity can be hoped for as more attention is given to it. In the meantime this book can help to prevent users of trade statistics from making too many blunders.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Pacific Pact Comes to Life

Washington, D.C.

DUST had been accumulating for several years in State Department files and senatorial offices on proposals to set up a Pacific equivalent to the North Atlantic alliance. The idea had been advanced in various forms but, with a wary reference to the importance of timing in such matters, had always been gently laid aside. For the proposal ran up against a host of difficulties. It contravened the basic military principle that American troops should not be committed to the Asian mainland ; in many people's minds the only departure from this, the intervention in Korea, confirmed its essential wisdom. It also went against the political principle that any close link between the United States and the colonial powers should be avoided. This principle arose partly from the general tradition of anti-colonialism and partly from the rather naïve view that the United States, although it had become a major protagonist on the international scene, could still draw dividends from its old role as a disinterested observer.

Finally there was a vague hope that in time countries like India, Indonesia and Burma would be driven by the mounting Communist danger to themselves to decide, as Pakistan has now done, that they must join a regional alliance. It was felt that any premature calling of Asian countries to "stand up and be counted" would prejudice this natural process, that a "little Pacific Pact" at once was the enemy of a "big Pacific Pact" later on. But although the Pacific Pact was pigeonholed for the time being, the ground had been prepared for it to the extent that several foreign governments and a number of strategically placed Senators and Representatives felt a certain pride of authorship in the idea and were therefore predisposed to welcome its revival. This has proved very convenient for Mr Dulles, who badly needed a quick diplomatic success that would both reassure allied public opinion and do something to soothe his senatorial critics.

"Lets See—New Zealand, Thailand, Knowland—"

Herblock in the *Washington Post*

All Foreign Secretaries have to do a balancing act—usually between different allies—but Mr Dulles is in the peculiar position of having to do it between his allies on the one hand and the leaders of his own party on the other. Not the least of his embarrassments is that his only reliable support comes from the Democrats, the nominal opposition, on the Senate Foreign Relations Committee, and his main opposition from the Republicans. Senator Wiley, the Republican chairman of the committee, is a loyal mouthpiece of the State Department and he deserves every credit for having risked his political career by his fight to preserve intact the President's power to conduct foreign policy ; but the harsh fact remains that he carries little weight with his party. The Republican leader in the Senate, Mr Knowland, whose traditional task is to rally the party behind the Administration's policy, is in practice Mr Dulles's most formidable critic. Sincerely believing that it is morally indefensible to have any dealings with the Chinese Communists, Mr Knowland led a very sharp attack on Mr Dulles when he came back from Berlin with the agreement to hold the Geneva conference.

Congressional spokesmen of both parties have made it clear to the Secretary of State that they expect him to avoid a repetition in Indo-China of both the Chinese situation, where the Communist victory in the civil war was supposed to have been caused by the lack of adequate outside help for their opponents, and the Korean situation, where, in the name of collective security, the United States supplied most of the troops and suffered most of the casualties. The National Security Council in Washington has decided that Indo-China is the key to the whole South-East Asian peninsula, that if it falls all will fall, and that, as in the case of western Europe, this must not be allowed to happen because the transfer of the area's economic resources to the Communists would represent a decisive shift in the balance of power. Mr Dulles is therefore in the position

that, with the French clearly going to Geneva to try to negotiate a settlement in Indo-China, he himself cannot accept any of the three possible solutions—a coalition government, a partition of Vietnam, or the abandonment of Viet Minh by the Chinese in return for economic concessions and the admission of Communist China to the United Nations—yet he must somehow justify the decision, taken on his personal responsibility, to hold the conference.

Mr Dulles's first expedient was the scheme for a "united declaration" to deter the Chinese Communists from direct intervention ; but this idea became so associated with the policy of "instant retaliation" and the hydrogen bomb that it was quickly dropped and the dust blown off the Pacific Pact instead. There is considerable satisfaction in Washington that this proposal has achieved its first objectives. It has produced a demonstration of allied unity at an important psychological moment, just before Geneva and just when Mr Dulles's critics were fastening on the fact that the holding of the Geneva conference seemed to be driving the allies apart, and it also produced a revival of respect for Mr Dulles's personal skill as a negotiator. Meanwhile, he appears to have been spreading the impression that these preludes to the conference are far more significant than the conference itself.

★

There is still a long way to go before the Pacific Pact is a reality. The British and French governments only undertook to "discuss the possibility" and no detailed draft has yet been put forward on the American side ; it has not even been decided whether to propose a unified command. Some, at least, of the original objections to such a pact are not being overlooked. Congressional speeches have been concentrating on the need to remove all taint of "colonialism" from the struggle in Indo-China, and the State Department is being urged to put the utmost pressure on the French to give the Vietnamese, Laotians and Cambodians "complete independence." The State Department, which thoroughly sympathises with this point of view, has been trying to moderate this enthusiasm by pointing out that there would be chaos if the French suddenly withdrew and that there could be no surer way of handing over the whole country to the Communists.

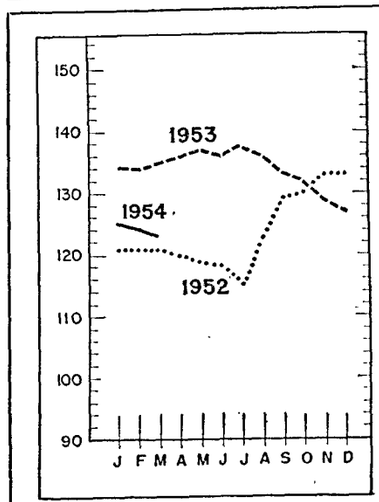
The National Security Council has evidently visualised the possibility of the French withdrawing completely since a member of it, the Vice-President, Mr Nixon, has said that in that event the Administration would have to face the political unpopularity of sending in American troops. To judge from Congressional reactions to this remark, which has caused quite a sensation in Washington, Mr Nixon did not underestimate the unpopularity of such a move. For his own party it would mean the abandonment, on the eve of a crucial election, of its most certain claim to fame while it has been in office—the ending of American casualties on the mainland of Asia. Although most of the Senators who have spread their views on the Congressional Record this week have admitted that they might endorse an American commitment in Indo-China if President Eisenhower himself made clear the case for it and if that case included a substantial commitment by America's allies, this last condition is one which is unlikely to be fulfilled if Mr Dulles takes up the intransigent position at Geneva which seems to many observers to be the only course that he has left himself.

Economic Easter Parade

WITH Easter week came a parade of statistics that bring little spring gaiety to the economic forecasts. For March should see the opening of the statistical growing season, yet most of the figures for that month obstinately failed to shoot upward, even though they no longer showed any serious downward trend. The industrial production index holds fairly steady at 10 per cent below last July's peak and the gross national product for the first quarter of this year, running at an annual rate of $359 billion, fell by rather less than it had in the preceding quarter. Unemployment went up in March only slightly, compared with an increase of over half-a-million in February, but March is the month in which it usually declines and in which the total number of employed usually rises by more than it did this year.

One springtime touch is that, although total personal incomes have been dropping, as the result of the decline in wage payments, consumers had as much to spend, after the January tax reductions, in the first quarter of this year as in the last one of 1953. And in the two weeks before Easter they seem to have been spending more of it. Helped by warm weather, retail sales compared well with the pre-Easter weeks last year, when Easter came earlier. Nevertheless, the pattern of these sales, concentrated mainly on spring clothing and gifts, does not suggest to retail traders, who long ago gave up being optimistic, that the Easter level will be maintained. A return to a regular sales figure running from 2 to 4 per cent behind last year is expected. It is durable goods, especially automobiles, that have recently suffered from declines in consumer spending.

An encouraging sign, however, is the rise in outlays for new construction which, moving in the opposite direction to industrial output, has gone up steadily ever since last August. The building plans of state and federal governments and of private firms suggest that this satisfactory trend will continue. Certainly it is not going to be discouraged by lack of funds. The Federal Reserve Banks have just reduced their rediscount rate to 1½ from 1¾ per cent, but this is the result not so much of a desire to encourage an expansion of credit as of a realisation that the old rate



INDUSTRIAL PRODUCTION in the USA

INDEX NUMBER
1947-49=100
Seasonally Adjusted

was out of step with other interest charges, which have been driven down by the plentiful supply of money available for loans.

One of the causes of last quarter's recession was that the federal government's spending was dropping. It ran at an annual rate of around $60 billion all last year, but in the first quarter of 1954 it fell to a rate of $55.5 billion, which was only slightly offset by a rise in local government spending. There have been hopes that the federal government would be spending more in the current quarter, but now there is new official pressure for reduced expenditures : disappointing tax receipts are making it look as if otherwise the deficit at the end of the fiscal year next July will be about $4 billion, nearly a billion more than was forecast in January.

Guarantees for EDC

DISCUSSION of the Geneva conference and of the implications for the United States of the Indo-Chinese situation have distracted congressional attention from the President's reassurances to the six countries belonging to the European Defence Community. This is just as well, for the first reaction from the Senate was concern lest the President is exceeding his constitutional powers in guaranteeing that, once the EDC treaty is ratified, the United States will keep its " fair share " of armed forces in Europe and that the level of these forces and the use to be made of them will be settled by agreement with the other signatories of the North Atlantic Treaty. The leading members, from both parties, of the Senate Foreign Relations and Armed Services Committees who protested that they had not been consulted about these guarantees were obviously speaking for the election record, for on second thoughts they must have realised that the President's message contains little that is new or that has not been discussed with them in the past, even if not on this specific occasion.

The message is, in fact, as far as the old controversy about the presidential right to send troops abroad is concerned, merely a restatement of American commitments made and accepted by Congress in the North Atlantic Treaty and elsewhere. The approval of the Senate was implicit in the resolution which ended the " great debate " three years ago, and which stated, in words very similar to those used last week by the President, that " the threat to the security of the United States . . . makes it necessary for the United States to station abroad such units of the armed forces " as may be needed to make a fair contribution to the defence of the North Atlantic Treaty area. What does seem, however, to be an addition to the general understanding of the North Atlantic Treaty is the President's statement that it is of indefinite, not of only twenty years, duration, a point which only Senator Mansfield queried.

The protests from the Senate, however, weakened the effect in Europe, especially in France, of the President's confirmation of the lasting significance which the United States attaches to the North Atlantic Treaty, and to its subsidiary, the EDC, as a deterrent to aggression and as an enduring alliance. This weakening is most unfortunate, since the only purpose of the message was to reassure opinion in France and Italy on the eve of the debate on the EDC Treaty, in order to improve its chances of ratification. The particular fears that the President wanted to counteract are that the " new look " in American defence policy will mean the withdrawal of land forces from Europe and the exposure of the continent to devastation in the event of war, and that the United States may abandon Europe altogether once EDC is in force, and leave France at the mercy of a rearmed Germany.

Industrial Heretics

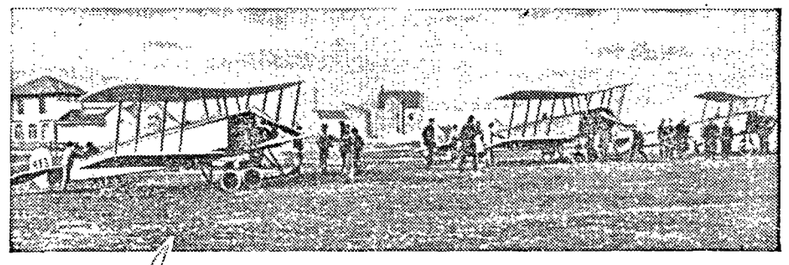
New York

AMERICAN manufacturers expect their sales to decline by an average of 2 per cent this year ; but they still intend to expand the capacity of their plants by 4 per cent. This is the most significant conclusion of the latest survey, made by the McGraw-Hill Publishing Company, of the plans of American businessmen for capital spending in 1954 and after. To achieve the 4 per cent increase in capacity, manufacturers propose to spend as much for new industrial plant and equipment as they did last year—about $12.3 billion. This shows a striking improvement in business confidence, since manufacturers reporting to the Department of Commerce earlier this year—admittedly a larger sample in which more small firms were represented—expected to spend 7 per cent less on new plant and equipment in 1954 than in 1953. All these figures refer to manufacturing industry only, and if the revised plans reported to the McGraw-Hill experts are carried out, the 1954 total for capital spending by all industries will fall only slightly below last year's $28.4 billion.

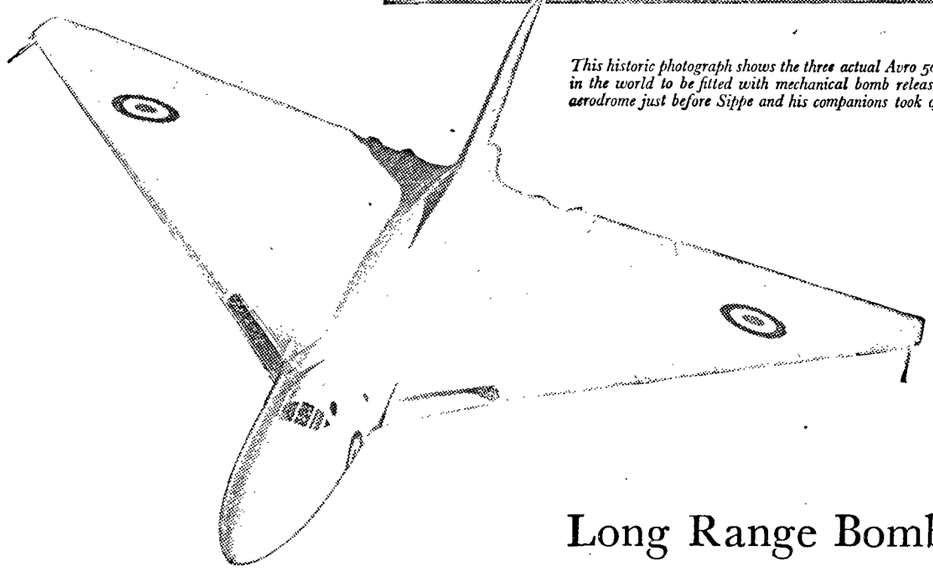
The significance of the McGraw-Hill survey lies partly in the assistance it gives to hard-pressed economists who are trying to assess the probable size of one of the major factors on which business activity in the United States depends. But of greater general interest is its penetration, by the rudimentary economic radar of a sample survey, into an area of notoriously poor visibility—the motives of a businessman when he plans his capital expenditure. To a student of Keynes it is heresy for manufacturers to expand capacity when sales are declining. Economists have long ceased to rely on hard and fast rules, but a direct or, at least, a positive relationship between the trend of current sales and businessmen's expectations of future sales, and between sales expectations and expenditures on new plant and equipment, has normally been assumed. It is now clear that in the United States two important qualifications must be made. In the first place, although sales prospects are still the major influence determining capital spending, the " long view " is increasingly dominant. It is not this year's sales, or even next year's, but sales three and four years hence that count. Manufacturers as a group expect sales to decline by 2 per cent this year, but they expect an increase of 12 per cent by 1957, and it is at 1957, at the other side of the valley, that they are looking. The most striking example is the automobile industry: led by the General Motors Corporation with its plan for spending a billion dollars in the next two years, the automobile companies are concerned far more with increasing their share of the market in 1957 than with the prospect of being unable to sell this year all the cars they can produce with their existing capacity.

"BOMBS AWAY"–the story of an R.A.F. bomber

NO. 2 IN A SERIES ON THE AVRO VULCAN



This historic photograph shows the three actual Avro 504's—the first bombers in the world to be fitted with mechanical bomb releases, lined up on Belfort aerodrome just before Sippe and his companions took off on their heroic raid.



Long Range Bombing...

Mission One...Nov. 1914

Morning–Nov. 21, 1914. It was 09.55 and very cold when Flight Lieutenant S. V. Sippe climbed into the cockpit of his Avro 504 –the first bomber in the world to be fitted with mechanical bomb release. The place, Belfort aerodrome. The destination, Friedrichshafen. So Sippe and his two fellow pilots, Sqdn. Leader Briggs and Flt. Cdr. Babington, set out in their tiny tri-formation to make history. For this was the first-ever planned long distance bombing raid, a flight of some 250 miles over enemy territory to the German Zeppelin base on Lake Constance. The flight took Sippe all but four hours and only 11 bombs were dropped by the entire force. Yet with 80 h.p. motors, virtually no instruments and the added complication of a swinging detour round neutral Switzerland, what a truly wonderful achievement this was . . . perhaps one of the most outstanding of many Avro " firsts " in aircraft history. Today Avro have yet another first, again in the realm of bombers–the mighty Avro Vulcan. Mr. Duncan Sandys, the Minister of Supply, and Air Chief Marshal Sir John W. Baker, Controller of Aircraft, Ministry of Supply, recently made a test flight in this revolutionary machine. After the flight the Minister said " We are all very much encouraged by the splendid performance of the Vulcan . . . the world's first Delta-shaped bomber. In test flights in the last few weeks, the Vulcan has shown its capability of more than meeting the exacting requirements in both height and speed laid down in the R.A.F. specifications of performance. For a large aircraft, it is also proving itself exceedingly manœuvrable at high altitudes and speeds . . . and there is little doubt that the Vulcan still has quite a lot up its sleeve." Avro Vulcans are now in super-priority production for the Royal Air Force.

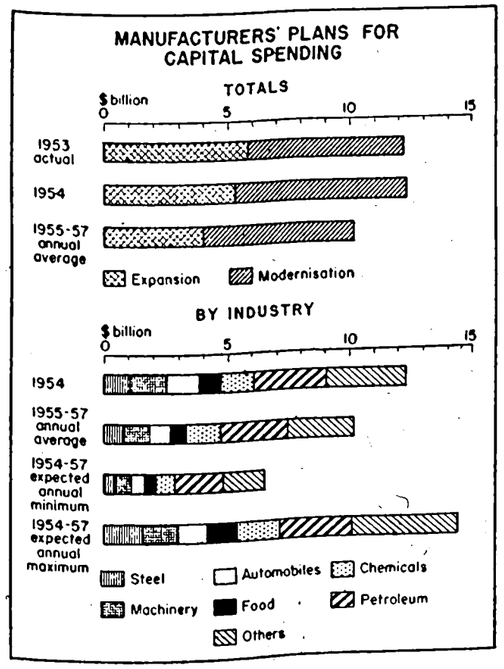
The second qualification is that an increasingly large part of capital expenditure is devoted not to expanding capacity but to replacement and, above all, modernisation. The expansion of capacity and the improvement of existing facilities are often, of course, inseparable twins. But it is estimated, however arbitrarily, by the companies reporting to the McGraw-Hill survey, that no less than 57 per cent of their capital spending this year will be for replacement and modernisation, and that this share will increase even further, to 61 per cent, over the period 1955-57.

The significance of this expenditure for modernisation lies partly in the fact that it may well be increased as sales decline and competition becomes keener. Much of the modernisation now being undertaken is clearly designed to reduce labour costs and improve quality in anticipation of fierce competition ahead. The survey itself provides an indication of the aggressive outlook of American manufacturing industry, in that businessmen expect their own sales to grow, on the average, three times as fast as those



of industry as a whole. This optimism is accompanied, as might be expected, by expectations of large expenditures on research, mainly for the purpose of diversifying manufacturing facilities and introducing new products.

As a guide to the trend of business activity, the estimates must be taken with some reserve. In the first place companies report that, if sales drop sharply, they may spend only half as much as they now plan to do in 1954. Except in 1950, when the outbreak of the Korean war brought an unexpected increase in capital outlays, actual expenditures have in the past come very close to the estimates, but it is readily admitted that the accuracy of the surveys has never been tested in a period of serious recession. Secondly, although the McGraw-Hill sample covers about 25 per cent of the total industrial labour force, it tends to be concentrated in the industries where capital expenditure is highest, and in the largest firms in those industries. The smaller firms, which are not fully represented in the survey, are more likely to cut their capital spending and also to base it, in the accepted manner, on more immediate sales prospects than are their larger rivals.

Moreover, despite the optimistic forecast for manufacturing industry, total capital spending, even in a sample weighted in favour of the larger firms, is still expected to be slightly less than last year in an economy which requires a regular annual increase to maintain full employment. By slowing down the decline in industrial production instead of accelerating it, with their unorthodox attitude to capital spending, confident American businessmen have reversed the traditional Keynesian role of investment, but their heresy does not go nearly far enough to reverse the decline itself.

Full Use of the Atom

THE purpose of the Bill revising the McMahon Atomic Energy Act, introduced last week, is to permit the fullest possible use to be made of this new source of power, both in peace and in war. In the past eight years the potentialities of atomic energy have been realised to an extent and with a speed that was inconceivable in 1946 and further development is now seriously hampered by the restrictions that were imposed, mainly for the sake of security, at a time when the United States had a monopoly of the atomic bomb. The new Cole-Hickenlooper Bill closely follows the lines recommended by the President earlier this year and it has been drafted in the Joint Congressional Committee on Atomic Energy. Nevertheless, when hearings, to be both public and private, begin on it in May, criticism is to be expected both from those who consider it would make too much secret information too easily available, and from those who think that private industry might hold up the utilisation of atomic power for peaceful purposes if the government relinquished its responsibility for this type of development.

In the first place the draft Bill, keeping a promise given by the President in his EDC message, would enable fuller military use to be made of atomic weapons by allowing the Atomic Energy Commission to give America's allies information needed for the making of defence plans and the training of troops in the use of, and protection against, atomic weapons. Information on the design and manufacture of these weapons could not, however, be exchanged. Secondly, the draft Bill would encourage the fuller use of atomic energy for peaceful ends in the United States, by allowing private individuals to own and operate nuclear reactors under licence from the AEC, and in other friendly countries by permitting the AEC to release to them fissionable material for industrial and research purposes, and information on how atomic energy could be applied to such purposes.

This amendment to the McMahon Act will enable greater attention to be given to the peaceful possibilities of atomic power; this hopeful development, as Mr Strauss, the chairman of the AEC, recently pointed out, has already been facilitated by the "enhancement of our military capabilities" resulting from the successful hydrogen bomb tests. Without such an amendment the President's imaginative proposal for an international pool of fissionable material

could not be put into practice. This proposal, Mr Strauss has also just revealed, is now in a more concrete form than had been generally realised, as the result of conversations that have been going on with other governments.

Search by Wiretap

ALTHOUGH the passage by the House of Representatives of a Bill to make legal the tapping of telephone wires has been regarded as a victory for the Eisenhower Administration, which proposed the measure as part of its anti-Communist programme, the Attorney General, Mr Brownell, failed to obtain his "anti-traitor" Bill in the form he wanted. His was the latest attempt, in a long succession of fruitless efforts, first begun by a Democratic Attorney General in 1938, to make information obtained by wiretapping admissible as evidence in the federal courts. The Supreme Court has ruled that the use of such evidence is prohibited by the Communications Act of 1934 which provides that

> no person, not being authorised by the sender, shall intercept any communication and divulge or publish the contents . . . of such intercepted communication.

In spite of the doubtful legal position, federal agents have continued to tap telephone wires and Mr Brownell's request was for legislation that would not only authorise evidence to be obtained by this means in future in connection with federal investigations of persons suspected of subversive activities, but would also allow evidence already so obtained to be used in the federal courts in such cases. The House does not seem to have had any misgivings about this retroactive provision but, following a lead given by the Democrats, it decisively rejected Mr Brownell's urgent appeal for sole control over the process of wiretapping. By 221 votes, 188 of them cast by Democrats, to 166, all from Republicans, the House insisted that the approval of a federal judge, considered a more reliable guardian of civil liberties than the Attorney General, who is head of the prosecuting arm of the government, must be obtained in each instance that federal agents wished to tap telephone wires; this in effect provides the same constitutional safeguard as is given by a search warrant.

While the "dirty business" of wiretapping, once condemned by Justice Holmes, has thus been somewhat cleaned up by the House, there is no assurance that the Senate will accept the Bill in the same form, or for that matter in any form at all; even during the war years Congress was unwilling to act on similar proposals. Nor is it certain what the attitude of the Supreme Court would be should such a measure survive the legislative process. In 1928 the Court held that to tap communication lines was not an invasion of the personal rights guaranteed by the Constitution; nevertheless, four out of nine Justices disagreed with the majority and to Justice Brandeis it was clear that the constitutional guarantees of freedom from search and seizure should cover wiretapping. He declared, in his angry dissent, that

> an intrusion of privacy is not necessarily to be justified merely because it is made in the name of law enforcement; the greatest dangers to liberty lurk in insidious encroachment by men of zeal, well-meaning but without understanding.

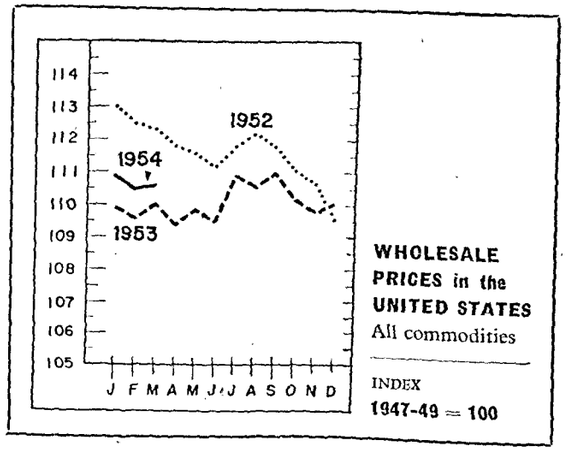
Miracles Down to Earth

New York

THIS week about half the 113,000 looms that weave synthetic textiles have been closed down, although many of them for only a few days, in an attempt to drive up the prices of these fabrics. Stocks are not excessive, but most synthetic textiles have been selling at a loss. This cut-throat competition has spread even to the so-called "miracle" fibres, which can no longer rely on their versatility alone; prices of these yarns have recently been reduced. They now range from $1.60 a pound for Dacron staple to $1.28 for Dynel, with nylon, still by far the most important commercially, Orlon and Acrilan in between; but ordinary rayon fibres cost only 35 cents a pound. The prices of the miracle fibres will have to come a good deal further down to earth before they can win a significant increase in their share of today's weak textile market; in 1953, however, these non-cellulose synthetics, most of which are derived from petroleum or natural gas, accounted for 4.3 per cent of all fibres consumed in textile mills, compared with under 1 per cent in 1947.

The competition is not only with wool, cotton and rayon but with each other and the buyer no longer takes the miraculous nature of the new fibres on trust; now he subjects them to strict tests of quality as well as of price. New synthetic fibres and improved versions of existing ones are reaching the market every month. From the manufacturers' point of view there are, however, many technical problems still to be overcome. The difficulty of dyeing these fibres, especially when blended, may be met in some cases by the new process of "dope-dyeing," in which the pigment is put into the fibre before it is spun. As a counterpart to their water-repellent properties, they also tend to generate static electricity, a major problem in weaving operations. Finally, the field in which there is the most to be learned, the blending of synthetics with other fibres or with each other, is also the field in which it is generally conceded that the future of the industry lies.

The difficulties from the consumers' point of view, apart from the high price, are that these non-cellulose synthetics may be too hot in summer—although nylon tricot, more porous than the rest, has done something to correct this fault—that their low melting-point is apt to prove embarrassing, and that it is difficult to give them such qualities



as "scroop," the trade name for the rustle that women like. A new process, known as texturing, does, however, give them an artificial bulk and softness that improves their feel. Their resistance to damage in washing machines is not uniformly high and the nylon sock manufacturer who is reported to have gone out of business because his socks never wore out is definitely an exception. Nevertheless, to many consumers the practical advantages of the new fabrics make them worth while: they are strong, light, waterproof, washable, unshrinkable and exceptionally quick-drying, and resist wrinkles that are not wanted while retaining the pleats and creases that style demands.

★

SHORTER NOTES

Of the nine Republicans who fought last week for their party's nomination as candidate for US Senator from Illinois, Mr Joseph T. Meek, president of the Illinois Federation of Retail Associations and an ardent advocate of the Bricker Amendment and Senator McCarthy's anti-Communist crusade, emerged as the victor with a substantial majority over his "Taft-MacArthur," "Abraham Lincoln," and "Eisenhower" opponents. The lines in next November's fight will be very clearly drawn for the Democratic candidate is the liberal Senator Douglas, who has supported President Eisenhower's foreign policy and is an avowed opponent of the "big business" which Mr Meek represents.

Another battle for control of a railway has just been decided, with less expensive publicity than that which is characterising the New York Central fight. In this struggle over the New York, New Haven and Hartford Railroad, the arguments were over similar questions of financial policy and the ability of the present management. The challenger, Mr Patrick McGinnis, has now won; his candidates for the board of directors were given a small majority of the 20 million proxy votes cast over those of the company's president, Mr Frederic Dumaine. The latter's supporters may, however, challenge the validity of the vote.

★

The Federal Trade Commission has started a new round in the argument over AD-X2, the additive which is supposed to prolong the life of storage batteries, by charging its manufacturer, Mr Jess Ritchie, with "false, deceptive and misleading advertising," and demanding that he stop making untrue claims for his product. Last year the first round of the argument involved the Secretary of Commerce, the head of the Bureau of Standards, who was dismissed and then reinstated, the Assistant Secretary of Commerce, who resigned, the Senate Small Business Committee, the Massachusetts Institute of Technology and the National Academy of Science. The second round is not likely to be conducted at such a high political and scientific level but it may last even longer.

SCURRY: YOU BRAVE BULLS

Another Angas Digest 304 is just off Press. Its title is '*The Brave Bulls.*' It shows:

1. How the high and nervous market (which is bravely bucking the trend of trade) is honeycombed with close stop-loss orders.

2. How a rush to take profits on a few reluctant days, can cause these close 'stops' to be touched off, *cumulatively*.

3. How the sale of only 2,000 shares in a 2-million-share company can cause the price to slump $2 (from say $22 to $20). And how the market-value can shrink $4,000,000 as a result of only $40,000 worth of sales. *Leverage* 100 *to* 1.

4. How this loss of so-called 'value' can make Americans (and their wives) feel poorer, and cause them to stop buying in the shops.

* * *

Learn the economics of the market itself. And of profit-taking shake-outs, and of panics. Be wise and learn the theory of Price and Value . . . which is the basis of all market forecasting.

Investors are warned not to be misled by the recent "error of optimism" . . . even though the Dow Averages have gone through the roof because the public think more inflation is now inevitable.

They look at gov't debt and the national budget, arguing that since there is a budget deficit there will be inflationary borrowing from the banks. But they forget that forces are also in motion which may cause business simultaneously to reduce its borrowing . . . so that there may be no inflation whatever on net balance—possibly deflation!

To sell out *now* certainly looks crazy, and of course too soon. But will you get out at the top? (Only 4 per 1000 can.) Or will you ride the cycle downward again, this time?

In order to have cash to re-buy in the next crash at bargain counter prices, send $2, for Digest 304, *Scurry . . . You Brave Bulls*, which explains the difficulty of side-stepping a major or even a minor slump.

The cost of Digest 304 is $2 ☐ Or *Free* with subscription • 12 mos. $25 ☐ • 3 mos. $8 ☐ *cash*

Actual subscribers will also receive Free our Digest 302, which is attracting world wide attention:

Why Gov't Has Not, Cannot, and Will Not Stop This Recession In Time, $2 ☐

Also Digest 303 **"Prepare Once More To Scurry," $2 ☐**

What Major Angas says today usually becomes "news" a few months later. Buy the "news" in advance.

MAJOR L. L. B. ANGAS, Inc., 480 Lexington Avenue, New York 17, N. Y.

E-417

Remember?

This advt. will probably remind you of a similar (much ridiculed!) advt. sent out around the top of Jan. 1953, prior a 30-point fall in the Dow. Later we re-bought on Sept. 14 at Dow 256.

* * *

Although past achievements mean nothing concerning the future, the following is our (approx.) past annual record.

1953 ..... 85 Dow Points;
1952 ..... 60 Dow Points;
1951 ..... Worth 60 Dow Points;
1950 ..... 48 Dow Points. But we missed 20 points!
1949 ..... 31 points up (despite missing much of rise);
1948 ..... 50 net points up (though Dow ended year where it began);
1947 ..... caught 30 points fall, but missed summer rise. No losses;
1946 ..... 50 points better than the Averages;
1945 ..... missed 34 points of boom (but no losses);

•

1944† ..... 22 points up;
1943 ..... 20 points up;
1942 ..... 10 points down on Dow Averages;
1941 ..... 38 points better than the Averages;
1940 ..... 40 points up;
1939 ..... 20 points better;
1938 ..... plus 40%;
1937 ..... minus 33⅓%;
1932/36 ..... plus 360%; avoided whole prior bear market.

†20 *points with Dow around* 140 *is worth* 40 *Dow points with Dow near* 280.

encroachments on the legitimate rights of the French-speaking province. Mr Duplessis claims that the provinces have a "priority" in the field of direct taxation; and Mr D. C. Abbott, the federal Finance Minister, who comes from Montreal, replies that this is true neither in law nor in fact. But the claim provides Mr Duplessis with an excuse for demanding that Quebec taxpayers should be allowed to deduct their provincial income tax from the tax paid to the federal government. The provincial rate has been fixed at a level of about 15 per cent of the federal rate. Since 1947, as a part of the elaborate tax rental agreements, Ottawa has been ready to allow a 5 per cent deduction in respect of taxes paid to a province. If this were raised to 15 per cent at Mr Duplessis's behest, says the federal government, why should it not be raised to 50 per cent? On this principle the federal government would soon be left with no revenues except the provincial leavings.

So residents of Quebec are now starting to pay an extra 10 per cent on their income tax. In political terms the key fact is probably that the bulk of the rural voters will not be affected directly. But resentment there must be; and the question is who will it be directed against? Will it turn against the "nationalists," led by Mr Duplessis, who get elected to provincial power, or against the Liberals, led by Mr St. Laurent, who get elected to the federal parliament? The outcome is still impossible to prophesy. But the clear, sad fact is that another major issue has been created to divide French-speaking Quebec from the rest of Canada. Mr Duplessis's stock tactic has been to fight with the federal power. The Liberal governments at Ottawa for years past have used great ingenuity to avoid fighting with him. But he has at last discovered means—very expensive means, too—to back them into a corner where they must fight back.

Israel Goes on Spending

FROM A CORRESPONDENT IN ISRAEL

IN February the Israeli Minister of Finance tabled the budget for the financial year 1954-55 and shocked the Knesset and the public by proposing expenditure of 571 million Israeli pounds, of which I£260 million was for development. By April 1st, when the Knesset passed a budget swollen by another million and a half, the news was received with calm. The public had meantime digested the Treasury's explanation that the huge budget—greater than last year's by I£182 million, or 47 per cent—was in no way due to expansion of government services or activities, and that its cause was an adjustment of the dollar rate to I£1.80 for all government expenditure, and the increased prices and wages resulting from this adjustment.

Although, in Israel, the dollar had long been officially valued at $2.80 to the pound, the government had continued to allocate dollars for various purposes, such as the foreign service, at much lower rates. The difference was charged to an exchange equalisation fund which did not appear in the ordinary budget. The taxpayer was therefore unaware of the volume of expenditure.

The Treasury has now based all its estimates on the unified rate of $1 to I£1.80, and in so doing has taken a step long recommended by advocates of realistic calculation and the adaptation of Israeli prices to world market levels. As long as the Treasury stuck to a multiplicity of rates for the dollar, there was no end to negotiation between the authorities on the one hand and investors and exporters on the other on special rates for special purposes or cases. The shortcomings of such a system are obvious—complicated calculations arising out of guess-work about rates, encouragement to speculators, and handicaps to honest producers who hope for profits from increased efficiency and sales.

Acceptance of the dollar rate of I£1.80 is, however, only part of the explanation of the I£182 million increase. The other is the steady rise in prices, wages and salaries. Wages and salaries in Israel are throughout linked to the cost of living index, and are adjusted every three months or so by an agreement between the trade unions and the Manufacturers' Association. A rising spiral is today taken so much as a matter of course that complacency set in again despite the huge budget. The producer hoped to transfer the burden to the consumer; the worker looked to the rising index to provide him with higher wages; the government, which has to pay officials, workers and contractors and to keep institutions going, professed to believe higher taxation would solve its problem.

The Coalition Survives

Debate as to whether this will be possible has been going on for months. The government, not daring to increase direct taxation, proposes, first, to improve collection of income tax, backing the tax-collector with an armoury of alarming fines, and, secondly, to raise indirect taxes. It has been attacked fiercely on both points—from the left because indirect taxes are "reactionary," from business interests for the familiar reasons about income taxation stifling initiative. Nevertheless the government managed to get its budget through by a comfortable majority, thanks to the coalition of Mapai and the General Zionists. Though differences on economic issues go fairly deep between them, the spirit of compromise proved strong enough to keep the coalition together.

There are, however, many people in Israel who are not content with these two explanations of rising government expenditure, and who suspect another cause—expanding government services. Whatever the cause, the fact remains that the government syphons off so large a percentage of the national income that little is left for non-governmental activities. The Treasury argues that taxes in Israel are lower than in Britain. Its opponents retort that whereas the Israeli needs 55 per cent of his income for essential minimum requirements and has only 14 per cent left for free and productive expenditure, the British taxpayer enjoys 35 per cent for the latter. The Israeli has therefore less not only for use according to his personal taste but for savings.

In fact, shortage of money and credit were so keenly felt last year that economic activities were considerably hampered. And it is generally admitted that the shortage of money and credit is only partly due to higher prices and the deflationary policy of the government. It is largely caused by credit demands made on the banks by the government. If prices are to rise further—and even cautious official estimates speak of a rise of at least 11-12 per cent during the current financial year—more money will be needed to keep the wheels of the economy turning. If the government is to lay its hands on I£572 million, how is the private entrepreneur and investor to find the credit he needs?

Is your desk too tight at the knees?

That, sir, is what comes of buying it off the peg. It really doesn't fit, does it? At Catesbys however we tailor desks and chairs to fit the individual's size, shape and personality. If you are an ample Administrator or a towering Tycoon get on to Peter Catesby right away and be fitted out smartly with the uncommonly comfortable desk your magnificence deserves. We are happy to supply made-to-measure desks for the choosey few, no matter what part of the world they're in.

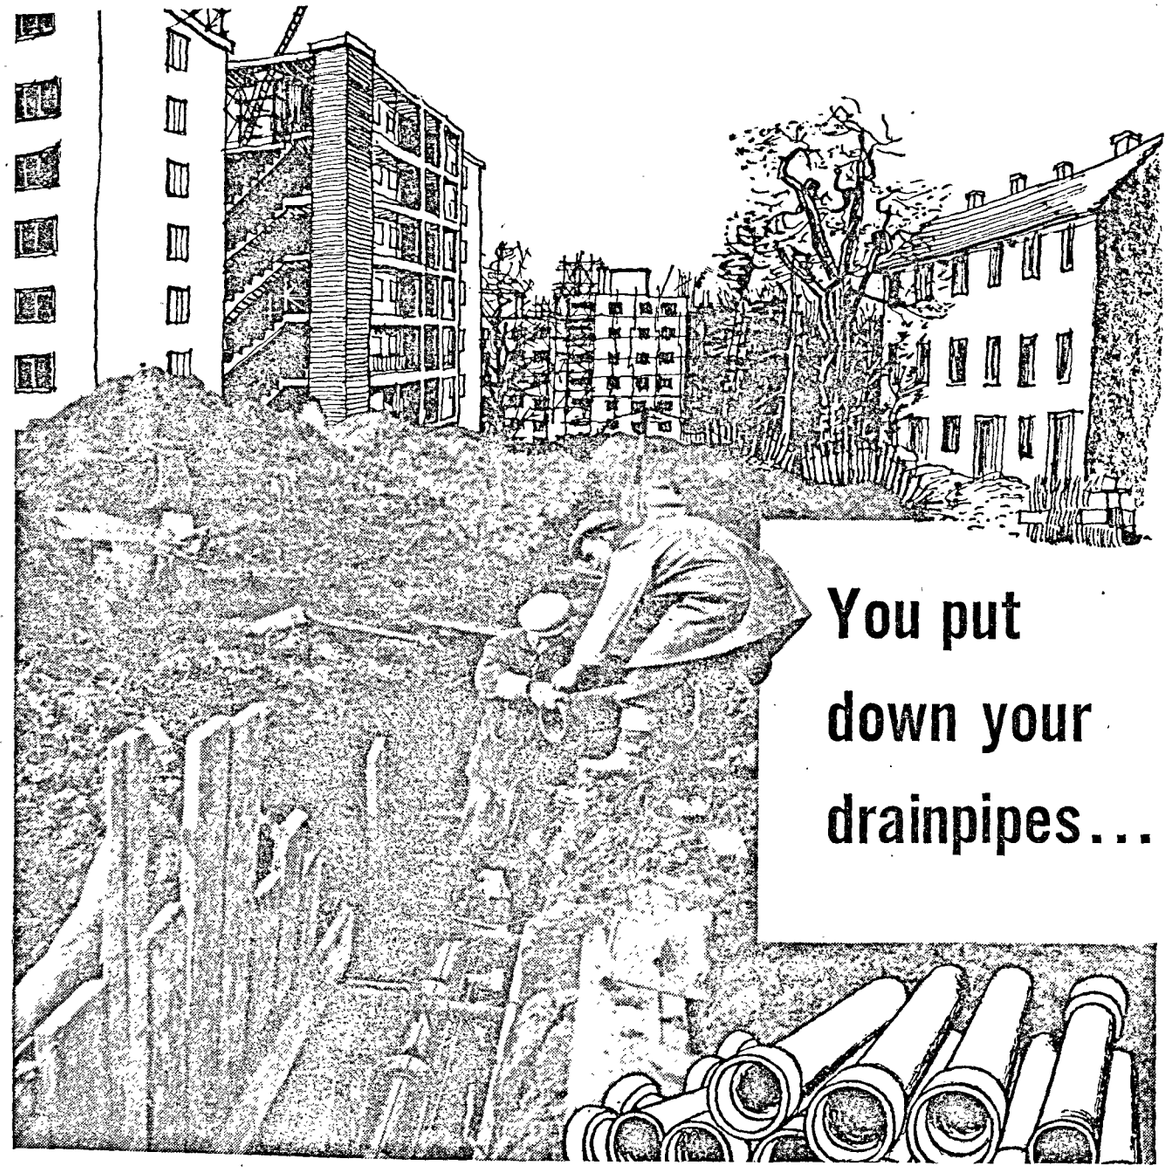
Drambuie originated in the Isle of Skye where it was made in accordance with the recipe presented to a Mackinnon by Prince Charlie in 1745. The secret remains in the same family to this day.

Drambuie

THE DRAMBUIE LIQUEUR CO. LTD., EDINBURGH



You put down your drainpipes...

If you never want to have to dig them up again put down

You fill in the trenches, put down rubble and hardcore on the top, then concrete over. Over your drainpipes stands a factory—or a main road—or a new housing estate. You never want to have to take those drainpipes up again, whatever happens.

And anything might happen. You don't know what new development there might be in five or ten or fifty years from now. You don't know what might be going into those pipes.

If your pipes are salt-glazed vitrified clay pipes, they can stay down for centuries, doing their job. Vitrified acid-resisting salt-glazed clay pipes have perfectly smooth hard surfaces which never corrode into that first slight roughness which can start a blockage. They can take anything that's coming to them.

Salt Glazed VITRIFIED CLAY pipes and conduits

NATIONAL SALT GLAZED PIPE MANUFACTUPERS' ASSOCIATION

A Cry for Cuts

When the Treasury first tabled its budget there arose a cry for cuts at any price. But its estimates weathered the Finance Committee of the Knesset. It turned out that a reduced budget could be achieved only by streamlining the administration—which needs time—or by curtailing services. This last no party was ready to advocate, as it meant curtailing services which the Israeli citizen has learnt to consider are his due. In addition, there is expenditure connected with unemployment. In the period of over-employment before the introduction of the New Economic Policy in 1952, relief was envisaged only as a means of raising working morale ; today, unemployment is seen as a social evil that must be kept in bounds by public works and at the expense of the tax payer. There are also subsidies for food, fuel and agriculture, which run into tens of millions but are considered indispensable because without them the poor man's nutrition would fall below subsistence level, and because farmers would refuse to go on producing if they were to fail to get prices which are now maintained only by the subsidies.

The passing of the budget raises two questions: firstly, is the rate of I£1.80 to the dollar, now recognised throughout by the Israel government, the last stage in the devaluation of the Israel pound which stood at I£0.36 to the dollar five years ago ? And secondly, can the Israel economy carry so huge a budget ?

The answer to the first question will greatly depend on the ability of the government to withstand the pressure of exporters and would-be investors for higher rates. It was in order to encourage exports that the government began granting premiums. In recent months there have been murmurs that the rate is insufficient to enable producers to make ends meet, as the internal market is shrinking and competition abroad has to be met. There can be no doubt that there is still room for much streamlining of production in Israel in order to reduce costs and make products able to compete abroad. As long, however, as there is a way to get veiled subsidies in the form of higher dollar rates, there is not enough stimulus towards higher efficiency and increased output. If the government gives in to further pressure for higher rates to exporters and investors it will be impossible to stick to the present rate for other purposes.

When Aid Ceases

As to the ability of Israel to finance the budget at its present level there can be only one answer: the country will be unable to shoulder the burden once outside assistance diminishes. The chairman of the Bank Leumi, Mr Hoofien, doyen of Israel's banking world, has just told the public in no uncertain terms that it must prepare for a time when outside assistance will fall off, and that as it appears to be unwilling to lower the standard of living, a beginning must be made at the top—that is, in government expenditure. His thesis is not new. But until now no party and no individual has set forth exactly how the scaling down of the budget is to be accomplished. Vested interests have been at work to maintain standards at the level to which they have developed during years when outside assistance was astronomic.

A radical change, involving rigorous retrenchment, will probably not take place until foreign help actually falls. A year ago, when income from the United States began to taper off, reparations from Germany filled the breach. Warnings such as Mr Hoofien's need to be frequent, loud and insistent if both government and people are to prepare for a future with less foreign aid—maybe a not too distant future.

M. Faure Beats the Protectionists

THE OEEC method of persistent but gentle coaxing rather than bullying has paid dividends in the case of France, which last week made a big step towards the official goal of liberalising three-quarters of its foreign trade. With only 18 per cent of its imports free from quantitative restrictions, France was the chief laggard in the European drive. Now the proportion is to be raised to 53 per cent immediately and to 65 per cent by next November. This is, in fact, more than was generally expected and marks a victory for M. Faure, the Minister of Finance, over his protectionist colleagues in the cabinet. The government, however, has not yet agreed on the final list of goods to be freed from quota restrictions. A first list has already been published, but some hard bargaining is still going on between the administration and the interested parties ; the second list is not expected before the end of the month.

To gain his point, M. Faure had to accept the imposition of a new *ad valorem* import duty ranging from 10 to 15 per cent, to be levied on one-third of the goods now freed. The proceeds will form a special fund intended to help to modernise potentially competitive firms, to compensate those which have to close down and to assist in the redistribution of labour.

Liberalisation is only a means to an end. It has found favour with many French commentators, who see the draught of fresh air through a breach of the protectionist wall as offering the only real chance to revive the French economy ; they prefer temporary shocks to being steadily stifled in a hothouse atmosphere. The use of the new fund will show whether the dose of liberalisation will be allowed to affect the patient. If the money is used to adapt branches of French industry to competitive conditions, it will fulfil its temporary function ; but if it becomes another guarantee for the survival of the unfit, the whole liberalisation experiment will prove a failure and France will merely be left with yet another tariff in its already powerful arsenal.

Thus M. Faure's victory will be a Pyrrhic one unless it is to be coupled with a concrete programme to modernise the French economy. A recent report comparing French and foreign prices—the so-called Nathan report, which must have helped the government to compile its lists—did not try to pin down the high price of most French goods to a single cause. It mentioned the relatively high cost of labour (due partly to shorter minimum hours and to a stricter adherence to the principle of equal pay). But it also emphasised the often old equipment, the small scale of the average firm, the high cost of distribution, the antiquated methods of farming—in other words, the backwardness of the French economic fabric in comparison with its more dynamic competitors. If France is to liberalise its trade and at the same time solve its balance of payments problem

without permanent American aid, this state of affairs cannot persist. The fate of French liberalisation will thus largely depend on the success of the new modernisation plan—covering the four years up to 1957—which the government has now finally approved and which will be analysed in a later article.

Trade *versus* Industry in Hongkong

FROM A CORRESPONDENT

HONGKONG began its modest Five Year Plan as soon as the tremendous job of restoration had been completed, and building of all sorts is going on at a rate that perhaps surpasses the period between the wars when Shanghai was transformed almost overnight from a still provincial city to a seething metropolis of six million. In China the scale of development is, of course, incomparably greater, but so far Hongkong has had far greater development per head. And in this industry has played a great part.

Before the war the two civilian shipyards and the naval yard were the biggest industrial employers. Now manufacturing industries take the palm. At the end of the industries exhibition last January, the acting Government Director of Commerce and Industry was able to announce that exports of local manufacturers had so greatly increased that if all export products originating in Hongkong were lumped together they would amount to 30 per cent of total exports. Many additional industries are being established, and how rapidly they are growing was shown when the China Light and Power Company (which serves Kowloon and the New Territories but not the congested Hongkong island) revealed that no less than 345 factories of various sorts and sizes had been added to its power load in 1953.

A year ago the entrepot traders and the manufacturers fell into controversy as to which of them was the more important to the economic life of the Colony. The challenge came, of course, from the up and coming industrialists. But, valuable as their contribution has been during the difficult postwar years, it is more significant as a pointer to the future than as a rival at present of the entrepot trade. For the present Hongkong has still to depend largely on the latter. It is reassuring to see the expansion of its markets and clientele in South East Asia. China has diverted 70 per cent of its trade to the Soviet Union and the satellite states. Hongkong's export trade has changed so much that 70 per cent of it now goes to other places than mainland China. Its traders are at the mercy of sudden and arbitrary restrictions by the governments of countries like Siam and Indonesia and life, as always in Hongkong trade, has to be lived dangerously. But even so last year exports to Indonesia came a close second to exports to China.

The total value and also, singularly enough, the actual volume of trade for 1953 was a bare one per cent less than in 1952. The total was HK$6,606.4 million. The upswing of trade in the first half of the year gave a total of $3,675.8 million for that period, but in the second half there was a 20 per cent drop. This was characteristic of the ups and downs in the Colony's trade. Of the total imports of $3,779 million, China easily led with $857 million; and of the total exports of $2,733.7 million China took $540.3 million.

Thus Hongkong's nascent industry still has a long way to go to compete with the volume of the ordinary import and export business. But it has come to stay—and to grow. The entrepot trade has indeed held up better than the pessimists expected. It is realised that consumer goods will have no market on the mainland and that even the "luxury" buying which Chinese government agents undertook on a limited scale, such as watches for the military, will be reduced to a minimum. But it is felt that if there is a relaxation of the United Nations ban on the marginal range of goods a considerable amount of business will be available that at present is forbidden. Indeed, people who have close connections with Canton and Tientsin believe that a proportion of the money collected by the sale of the National Construction bonds will be spent in Hongkong.

Competition from the satellite states, especially Czechoslovakia, is recognised to be quite keen. Visitors who came in from Canton to look over the Hongkong industries fair last January gave full credit to local exhibitors but contrasted the show unfavourably with the South China goods interchange exhibition in Canton some months ago. This covered an immense area, and not only showed the whole range of goods made in China—already far greater than before the war—but also many selected manufactures of the Soviet Union and satellite states. "Everything was done in a big way there," said one eye-witness, "and the products of Czechoslovakia especially were much admired." British manufacturers' organisations will have to think about the part Hongkong could play as the shop-window of British manufactures on the doorstep of a state with 500 million people who are undergoing a vast economic transformation.

What's What at Geneva

THERE is a good deal of confusion—some of it deliberately fostered, some of it natural—about the Geneva conference that is to open next week. It seems worth while setting out the hard facts about the conference in summary form.

Objects of the Conference

There are two, laid down in the joint communique issued by the American, British, French and Soviet foreign ministers at the end of their Berlin meetings, which proposed that:

(a) a conference should meet "for the purpose of reaching a peaceful settlement of the Korean question";
(b) "the problem of restoring peace in Indo-China will also be discussed at the conference."

This, then, is not a general conference on the Far East. Communist China's claims on Formosa and similar issues are not on the agenda.

Governments Represented

The four sponsoring powers have invited to Geneva representatives of Communist China, North Korea, South Korea, and the countries that contributed to the United Nations forces in the Korean campaign: Australia, Belgium, Canada, Colombia, Ethiopia, Greece, Luxemburg, Netherlands, New Zealand, Philippines, Siam, South Africa, and Turkey.

For the discussion on Indo-China, "other interested states" will also be invited to Geneva. The question who is "interested" will not be finally decided until the conference has met. If representatives of Vietnam, Laos and Cambodia are invited and agree to come, with or without spokesmen for the Viet Minh rebel "government" (which is recognised by the Soviet Union), there will be over twenty delegations at Geneva.

Nature of the Conference

Communist propagandists have tried to present Geneva as a great-power conference—their aim being to show that China is now accepted as one of the great powers. But this claim, as the facts cited above show, does not hold water.

Nor is it, officially, a United Nations conference, although the choice of Geneva makes it possible to use some UN facilities there.

As regards Korea, however, it is substantially the political conference envisaged in the armistice agreement signed last July, and endorsed by the UN Assembly. The armistice proposed that

> a political conference of a higher level of both sides be held by representatives appointed respectively to settle through negotiation the questions of the withdrawal of all foreign forces from Korea, the peaceful settlement of the Korean question, etc.

For six months after the armistice, however, the Communists refused to come to a conference of this kind, insisting that other Asian nations should also be invited and that the "etc." should be expanded to cover a whole range of other problems, not connected with Korea.

Meanwhile, the Soviet government was pressing for an even more ambitious conference, at which the great powers—it was claimed that Communist China must rank among them—would deal with all major political issues. At Berlin, Mr Molotov at first repeated this demand, but eventually agreed to the western suggestion that Korea must be settled first. The Peking government followed his lead, abandoning its former conditions; and the way was at last open to the Geneva conference, which had originally been offered to the Communists last August.

A Victory for Gheorgiu-Dej

RUMANIA'S premier, Gheorgiu-Dej, is the last of the satellite rulers to conform to the new principle of collective leadership. At a plenary session of the Rumanian Communist party, held earlier this week, it was announced that control of the party and government will no longer be concentrated in the hands of a single individual and that Gheorgiu-Dej has resigned his post as general secretary. This formal change should not be interpreted as a set-back for him. In fact, on closer scrutiny it marks a victory; the attempts to undermine his position have failed, at least for the moment.

Indeed, Gheorgiu-Dej's departure from the secretariat is purely nominal. In the reshuffle he has managed to get all his opponents out of this important body and to staff it with his own men. The new secretariat consists of four people, all apparently supporters of Gheorgiu-Dej, and is headed by his closest friend and collaborator, Gheorge Apostol. Apostol spent years with him in jail before the war and was his agent in the trade unions in the postwar period. It was also Apostol who was assigned two years ago to lead the attack against Ana Pauker, the great rival of Gheorgiu-Dej.

Sinister Street

Thus once again a triumph for Gheorgiu-Dej spells a defeat for Ana Pauker. He had managed previously to eliminate her and her main supporters from leading posts in the party and government. But since Stalin's death there have been persistent rumours of an attempted Pauker come-back.

Reliable information confirms that Ana Pauker is not in gaol. She lives with her daughter in a modest flat in Strada Dr Obedenaru, a street which other excellencies in disgrace have chosen for their residence. She moves freely and even does minor jobs for the party and the Ministry of Foreign Affairs. She is still, at least officially, a member of the party and of its central committee. But if she is really thinking of regaining her former position and power, her plans have now been crossed. The two members of the secretariat with alleged pro-Pauker leanings—Kishinevsky and Moghioros—have now been removed from that organ and, though they still keep their jobs as vice-premiers, are probably on the way out.

Faction fights in the satellites are a deadly business and it would be unwise to forecast the final outcome, in particular because they are largely echoes of the unfinished struggle in the Kremlin. In Rumania, too, the fight is probably not yet over. Gheorgiu-Dej has won a round, but there are plenty more to come. The party congress which was to be held in March has now been postponed till the end of October and, in addition to economic difficulties, internal dissensions may well have played a role in the delay. Much may still change in the balance of forces during the six months preceding the party assizes.

Auntie Government in India

FROM OUR BOMBAY CORRESPONDENT

GOVERNMENTS in India take the same view of their public as Victorian aunts of their small nephews. The public, they feel, is always up to mischief, always in need of a delicate chastening by its kind mentors in the local cabinet. "Go and see what Johnny is doing, and tell him not to" is the universal motto of Indian governments, the one cry to which civil servants and politicians, ministers and legislators, all subscribe. The public itself, bred on a long tradition of paternal government, has almost come to believe that Auntie really does know best.

Nowhere does this attitude come out more clearly than in the arts; perhaps because both government and the public are just philistine enough to believe it their duty to be cultured. Thus, the government is encouraging "wholesome" books in the Indian languages. It has founded a Dance Academy. It loves cultural missions. It has nominated several writers, a film star and a dancer to the Upper House of Parliament. It has founded a National Academy of Letters. Clearly culture is a good thing. And the public must have it, whether it wants it or not. The government's All India Radio puts on one long Third Programme. Its Hindi is so refined that many listeners cannot follow it. Film music has been almost completely banned as vulgar. Yet nobody objects—much. Those who like film music—the majority—switch over to the commercials from Radio Ceylon; and everybody agrees that India's great tradition of classical music must be preserved, even if nobody actually wants to listen to it. So with the films. When the Information Minister, last year, wanted a pre-censorship, he had no political motive. He simply thought films vulgar and inane; and the whole House agreed with him. It was rather like a House of Commons debate on American comics. Nobody, of course, put in a word for the public which, long, tedious and respectable though its films are, seems to like them that way. Nobody apparently had even been to the cinema often enough to realise that the member who talked of how Indian films bring out the beast in man must have had his beast very near the surface—nobody in an Indian film can so much as kiss.

Monogamy for Manufacturers

The same sort of fussing is reflected in the attitude of both government and parliament to industry. In reconstituting the tea and coffee boards, for example, the government took to itself the power to nominate the representatives of employers and employees, so that true Tweedledee-Tweedledum harmony might be ensured. In the past, when they were elected, they sometimes actually thought they knew better than Delhi about such commercial matters as propaganda and marketing; at one tripartite conference, the tea employers and workers even got together to suggest that the sacrifices imposed by the 1952 slump in the industry should not be borne by them alone, but should be shared by the government through a cut in the export duty. Parliament quite agreed the minister had to see there was no repetition of such indiscipline.

Parliament's belief in bureaucratic wisdom is, however, shown at its most touching in the Industries (Regulation and Development) Act, as amended in 1953. It covers nearly all manufacturing industry, and all that an industrialist can now do without permission is to get married (and even then, in Bombay and Madras, the marriage must be monogamous). Permission is required to start a new undertaking, to expand substantially an existing one—and the adjective substantial remains undefined—to locate a plant, to move machinery from one part of the plant to another if this involves the crossing of a road, to manufacture a new article—defined to include a new brand—in an existing plant. Not all the rules under the amended act have been published yet, but it seems likely that a manufacturer will need the government's permission to change the name of his lipstick from "Temptation" to "Lust."

Beside all this, it is almost a bagatelle that the government also gives itself powers to control the supply, distribution and prices, not only of finished goods, but also of goods in process; or that it enables itself to investigate, and after investigation to take over without explanations, the management of any firm which the government thinks is likely to raise prices, lower quality, reduce production or generally behave in a way "highly detrimental" to the public interest or that of the industry. There is, of course, no appeal, no rights for the shareholders, no limitations on the time for which government management continues.

A Docile Public

Only the Supreme Court knows better than the government. It has just held that the constitutional guarantee of property rights covers also the right of a shareholder to choose his management for himself. The constitution is based on the assumption that the public is grown up, a fact of which the courts have perpetually to remind governments too anxious for their charges' welfare always to respect their liberty. There is, indeed, no evidence that the public considers itself too grown up for this governmental concern. The Stock Exchange did not go down a point when the Industries (Regulation and Development) Act was passed. So many of the new managing agencies which have come in since the war have merely looted their companies, that even government officials may seem preferable. Nobody protested against the 1951 Act which made it compulsory to obtain the government's permission before a managing agency changed hands, and it was the managing agents, not the shareholders of the Sholapur Mills, who went to the Supreme Court against the government's taking over of the company.

Auntie, the investor accepts, really does know best. As for the general public, it has never had any doubts. Is it not the government which provides canals, water, famine relief? Does not the constitution make prohibition and education, and the provision of work for all, proper governmental objectives? To the peasant, the government has always been *Ma Bap Sarkar*—Mother Father Government. He sees no reason to wonder whether the collection of gentle Liberal, Asquithian Aunts who make up the government of India are really the best people to decide the names of perfumes and make film scrips exciting yet decent, though he does protest a little when the government of Bombay decides that only Anglo-Indians and Europeans may send their children to English-speaking schools. After all Auntie was born a long time before Johnny; by sheer weight of age she must know best. Did not Chandragupta Maurya behave in just the same way in the days of Alexander the Great?

Starch

does surprising things IN SUCH SURPRISING PLACES

Example:

STARCH IN FOUNDRIES

Bonding materials made from starch are widely used by foundrymen as binding agents in the making of sand cores. These 'cereal binders', as they are called in the trade, are economical in use; they help to make firm, clean, permeable cores which break down easily after casting; and they fortify moulds against erosion. The first cereal binders ever offered to the foundry trade were the Kordek and Kordol range developed 20 years ago by Corn Products Company Limited, the Industrial Division of Brown & Polson. Today, Kordek and Kordol are the most widely used cereal binders in the industry, and their names are household words among foundrymen everywhere.

Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 different products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in the building of this large and varied business. We have learnt a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

CORN PRODUCTS COMPANY LIMITED

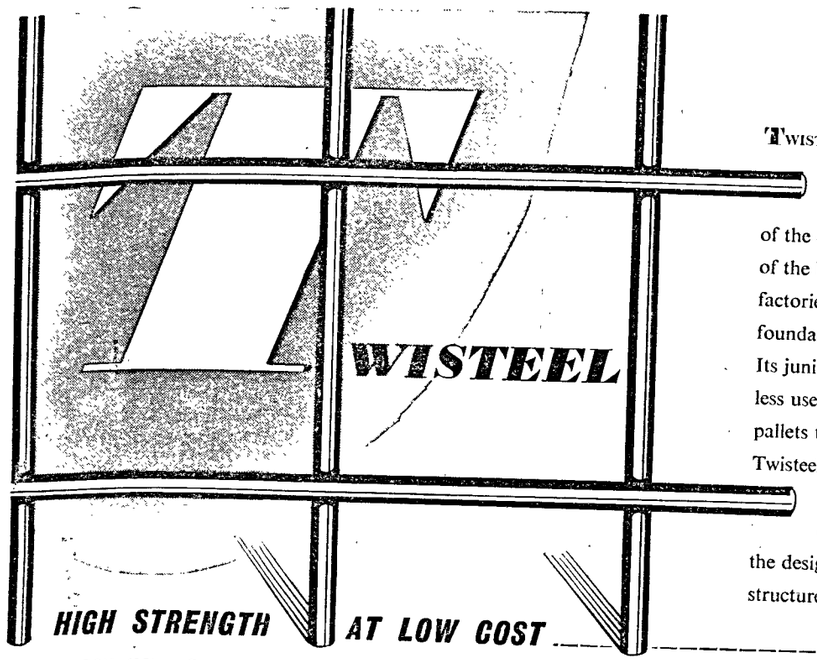
Brown & Polson

ELLINGTON HOUSE, 135/130 STRAND, LONDON, W.C.2



TWISTEEL is a name you should know. TWISTEEL make Wireweld steel fabric which forms the heart of the concrete roads you ride upon, of the barrel vaults that roof your new factories, of the concrete floors and the foundations for your machines. Its junior partner Gridweld has countless uses from machine guards and pallets to simple fencing. Twisteel's advisory service is at your disposal: its staff includes engineers who are experts in the design of reinforced concrete structures.

THE BUSINESS WORLD

Prepared Positions in Lancashire

THERE was never much doubt that the Monopolies Commission would find that "conditions to which the Act applies" existed in calico printing. One of the conditions laid down in the Monopolies and Restrictive Practices Act of 1948 exists whenever a combine does a third or more of the business of an industry, and the Calico Printers' Association, Ltd., does nearly half. A second condition exists whenever persons doing a third or more of the trade are held to be acting so as to restrict competition; and the Federation of Calico Printers, which covers some 98 per cent of this textile finishing trade, fixes minimum prices, allots its members quotas of the total annual turnover, and has closed and "sterilised" certain works, obtaining covenants banning their future use for calico printing.

What was less sure was whether the Commission would decide that these two monopolistic conditions "operate or are likely to operate" against the public interest, and what it would suggest should be done about them. The Commission has in fact held that the price-fixing arrangements, as supported by the Federation's "percentage quantum" scheme, restrictions on use of premises, and certain agreements between Calico Printers' Association and other finishing combines to restrict the use of premises and against "overlapping," are contrary to the public interest and should be brought to an end. Apart from these agreements and its participation in the Federation's "price management" policy, Calico Printers, as a combine, incurs no general criticism. These uncompromising recommendations are logical enough, even though they follow a not wholly unsympathetic report. They are at the same time likely to cause more controversy, and have wider repercussions, than any monopoly report to date.

Price management in calico printing, as elsewhere in Lancashire, was an attempt to heal the scars of the thirties. In form, it dates from the concentration of the industry in 1942, under Government control, and was converted into a private agreement of the industry as late as 1949. No government has ever blessed the industry's quota scheme; but the redundancy scheme under which the Federation closed and sterilised six calico printing works, comprising 55 calico printing machines, was approved by the Board of Trade to the extent of certifying levies to pay compensation under the scheme as trade expenses for tax purposes, and obtained a loan from the Finance Corporation for Industry. Moreover, the price management scheme, and indeed the formation of the Calico Printers' Association many years before in 1898, are episodes in the long, cruel decline of cotton; calico printing began to shrink in the eighties, long before Lancashire as a whole came under pressure. More or less similar minimum pricing schemes exist in other sections of the industry, while the elimination of redundancy received legislative sanction in the thirties and approval in the Cotton Working Party Report of the forties. In general, if not in every detail, much of what the Monopolies Commission has found to condemn in calico printing would be considered by many people in Lancashire as the justifiable self-defence measures of an industry beset by misfortunes beyond its control.

Another disputed feature of the Commission's categorical verdict is that it could find little evidence of the actual, as against the theoretical, effects of this "price management" policy on costs and prices. The firm of accountants that it employed found it impracticable to obtain representative costs for individual lines and styles, and no comparisons seem to have been made to decide whether printing costs had increased more

than other costs as a result of "price management." The Commission noted that during certain years after the 1949 agreement about 50-70 per cent of calico printing was done at prices higher than the listed minima; it records, but did not attempt to check, the Federation's evidence that British printing prices in general were lower in 1952 than European. It calculates that for groups of companies that cover 90 per cent of printing business, profits on capital employed, at historical costs, were 26 per cent in 1949 and 29½ per cent in 1950 (CPA's were 20 and 27½ per cent). A "replacement cost" valuation of fixed assets would have brought these profits down to about 13¾ per cent in 1949 and 16¾ per cent in 1950 for a sample of companies (and to 15½ per cent in 1949 and 21¾ per cent in 1950 for CPA). But these profits were in boom years, and the Commission makes no comment on them. Nor does it record many specific complaints from other sections of the industry, as distinct from general criticisms that prices were too high and insufficiently flexible; several interests that were consulted approved of "stability" and "standard charges." The Cotton Board felt unable to give more than statistical information; the Board of Trade mentioned the impressive research work of CPA (which among other achievements can number the discovery of "Terylene"); and the TUC, which is itself in the price-fixing business, told the Commission that neither of its "affiliated unions concerned believes that it has any evidence to submit to the Commission."

★

Lacking evidence of the direct effects of this pricing policy—which was designed against times of depression, but has so far operated mainly in a boom—the Commission has reached its conclusion on grounds of economic principle. This has brought the epithet "doctrinaire" from those faint friends of the free economy to whom competition so often appears as "cut-throat." It does not radically weaken the conclusions, though data would have been instructive; the Commission's usual reliance upon "empiricism," to tell the truth, has always been in part illusory, however much its members, as staunch Britons, dislike being accused of *a priori* reasoning. The principle, after all, is the pure milk of Manchester:

> We believe, however, that it is generally true that price competition provides the keenest stimulus of all to the pursuit of efficiency, and that its absence is bound in some degree to lessen the incentive to reduce costs. . . . And if it should turn out that, notwithstanding all Lancashire's exertions, her exports . . . decline in future for reasons beyond her control, these arrangements will, we believe, only create a false sense of security and delay the adjustments and redeployments which will have to be made.

The Commission accepts the "sincerity and strength of feeling" shown by the calico printers in defending their arrangements, and their "almost passionate conviction" that only in such ways can a decent living be ensure for the industry. Its own views (which on some tec nical details, it should be said, are not wholly convinc ing) must necessarily be wider; and in particular it somewhat less ready than the industry to assume th the blizzard of the thirties will come again.

It is on this assessment of the future that action upo the Commission's recommendations, by the Board o Trade or the industry, may turn. The calico printer do not appear disposed to abandon their sea-ancho merely on account of bad publicity. They remain sur that their industry, which is certainly susceptibl to fluctuations of fashion and is unable, as a processo of other people's goods on commission, to print fo stock, is entitled to co-operate for stability. If the believe that the industry's capacity still exceeds what i can count on continuing to employ, they may cling t their restrictions on selling machines or "water-rights" (which the Commission could not trace as having dis couraged anyone from entering the industry, though some people in Lancashire would suggest at least one example); and the Board of Trade may find it awkward to condemn a redundancy scheme that it approved five years ago.

★

The Commission would not object to a voluntary undertaking about minimum prices, without quotas or other sanctions; whether this would satisfy the printers remains to be seen. They will undoubtedly argue that unrestricted competition, if hard times come again, might lead to yet more amalgamation, as CPA may have the most resources in the long run; and they will gain considerable support in Lancashire, which has never taken kindly to lectures from London on how to perish in a decently competitive posture. If it is accepted that Lancashire's trade must inevitably decline further, the Government may indeed be chary of pressing one section alone of the cotton industry to abandon even defence measures that may today cause inflexibility and in depression might survive no better than the Federation's old "gentleman's agreement" in the thirties. But this future decline is perhaps not quite inevitable. If the report should set Lancashire thinking again, and not simply of gallant rearguard actions, the indirect results of its recommendations might be of considerably more value than the direct.

Building Societies and Housing

A Survey on page 335

Profits in Flood

THE prediction made in these columns six months ago that this spring would see bumper profits has now been overtaken by the event. It is almost equally certain that the profits to be reported in the next three months will rise further, and unless there is a sudden fall in industrial activity or in prices, 1954 as a whole will be a year of big earnings. Of the 537 company reports analysed in the first quarter of this year, 494 were from industrial companies caught in the sample; just over half of these closed their financial years at the end of December or later and just under half of them between the end of August and the end of November. Viewed as a whole, these reports cover a calendar year in which industrial production rose by about 6 per cent or overlap into an earlier period when industrial production went up by about 3 per cent. The advance in their combined trading profits by 9 per cent, from £291.4 million to £317.8 million, was the inevitable outcome.

Not all industries, however, have contributed to this advance, or shared in it equally. In the analysis of the profits of 23 industrial groups reproduced on pages 324 and 325, five groups (shipping, shipbuilding, silk and rayon, tea and oil) do not contain enough companies to bear the weight of generalisation. Of the remainder only the rubber plantation companies have reported a sharp decline in earnings but, far more significantly, the engineering and iron and steel companies have reported moderate declines. The explanation must rest partly on the facts that last year, fixed investment in manufacturing industries failed to increase, order books began to thin out and in overseas markets the pace of competition quickened. At home the only marked increase in investment occurred in building and in the fuel and power industries. Abroad the longest order books for British goods were for electrical equipment. Thus it happens that within the broad category of capital goods industries the building companies have reported the sharpest increase in earnings while the electrical equipment manufacturers achieved yet another advance in profits, though far less substantial than that reported in 1953. Profits earned by the motor and aircraft industries have also risen sharply, in conformity with the continuing demand for British military and civil aircraft and with the growing momentum of vehicle production.

By far the biggest advances in profits, however, have been achieved by industries closely in touch with consumers—those trades, in short, that had to bear the weight of the recession and of losses on stocks in their 1952 accounts. This rebound in profits follows directly on last year's increase of about 4 per cent in total expenditure on consumption. It has been most marked in the clothing, footwear and textile industries, where the biggest single rise in production was achieved last year. The retail stores, particularly the chain stores, have benefited directly from the rise in consumption and so, too, have brewing, tobacco and the food trades though to a lesser extent. The revival in the consumption trades has also made its pleasing mark on the accounts of the manufacturers of domestic appliances (grouped in this sample under "electrical equipment") and of the plastics companies (heavily represented in the "chemicals and paint" group).

Equity earnings and dividends have been given new buoyancy by this advance in trading profits, and only the rubber companies have reduced the net amounts distributed to ordinary shareholders. Net earnings available for equity distribution by the 537 companies have risen from £76.6 million to £97 million. From these earnings the companies paid out in net ordinary dividends £44.6 million, compared with £35.3 million in the previous year. But before any political capital is wrung out of these figures they must be put through the statistical mangle, for they include the earnings and dividends of Vauxhall Motors. This company's net equity earnings shot up from £6.2 million to £9.4 million, and its ordinary dividend from £158,000 to £3.4 million but the dividend did *not* go into the pockets of British investors; it was paid out to the American parent company, General Motors. If the Vauxhall figures are excluded, net equity earnings total £87.5 million, compared with £70.4 million, and net ordinary dividends £41.2 million, compared with £35.1 million. These are net dividends, however, entered into accounts after deducting income tax at the standard rate; about £1.8 million of the apparent increase of £6.1 million in ordinary dividends reflects last year's reduction in the standard rate of tax from 9s. 6d. to 9s. in the £, a concession given to other incomes as well as dividends. In effect, the directors of 536 companies were responsible for putting about £4¼ million more into the pockets of their ordinary shareholders.

★

The increase in dividends was the direct corollary of the advance in profits, though it also owed a good deal to directors reacting to share bids, to the genuine view that shareholders were entitled to an improvement in their lot and perhaps something to the improvement, patchy though it was, in liquid resources. The total net liquid assets of the 537 companies rose by about £34 million, though the proportion of assets held in liquid form remained unchanged at just over 13 per cent of total assets. This reinforcement took place in spite of an increase of about £14 million in stocks and of an increase of about £108 million in the gross book value of fixed assets. About £40 million of

this increase in fixed investment represented money spent by the iron and steel companies. Without being conclusive, these figures are at least consistent with the fear that British industry was doing nothing more than to replace its worn-out equipment. The implication of the *Economic* Survey that too much of last year's increase in production was syphoned off into consumption and too little used to build up productive capacity, seems to be borne out by this rough statistical test.

The balance sheet analysis of the 537 companies also helps to confirm the rather tentative conclusions recorded in the Economic Survey about last year's movements of stocks. Over the whole of British manufacturing industry there seems to have been little change in the value of stocks, though there was a slight increase in volume. But stocks of steel increased last year, as did the value of work in progress passing through the engineering industry; this movement is reflected in the sample by the rise of £13 million in the stocks held by the "iron and steel" companies (which include some representatives of the heavy engineering industry). The increase in stocks held by the clothing and textile industries and by retail stores is also mirrored in the analysis, where the biggest increase of all has been reported by the wool companies. These increases, however, have largely been balanced by the voluntary reduction in stocks held by companies which benefited from the readier flow of raw materials last year; hence it is

that the most marked reductions in stocks have been reported by the "motor and aircraft" and the "miscellaneous manufacturing" groups. British industry has therefore been able to add a little more to its liquid resources, and it is only where a sharp increase in fixed and working capital has taken place (as in the case of "iron and steel" companies) that the analysis shows any serious inroads into these liquid balances.

Investment in stocks and in capital equipment is, however, likely to increase this year. Many British companies, if they wish to avoid any further calls on liquid assets, may have to plough back much of the increase in profits they can expect in the next few months. Company reports published this summer, referring to financial years that ended on or before the end of March, should show a rise in profits at least comparable with that reported in the first quarter of this year. But the pattern of profits may look like a patchwork quilt. There may be dull colours represented by the capital goods industries (apart perhaps from the building trades) where profits show little change. The bright colours can be expected from the companies manufacturing and distributing consumer goods; these companies should report the biggest increases in profits simply because a year ago they reported the biggest declines. But whether this will be a signal for another round of dividend increases will depend on whether American recession and wage increases at home cast a dark shadow across the quilt.

Business Notes

Spring in the Markets

THERE is no holding back investment markets. This week a new Stock Exchange account opened with a fresh advance to new high levels. *The Financial Times* index of industrial equities on Thursday reached an all time peak of 146.9, having risen 2.2 points during the week, and by 14.6 points since the end of last year. Fixed interest securities are also at their highest point of the year; the index has reached 113.52, a rise of 1.62 since the end of 1953. But this week's rise in the markets has been accompanied by no flurry of ragged buying. The number of Stock Exchange markings did not go up with the rise in prices. The volume of business just remained substantial.

Growing confidence in the sterling economy is undoubtedly the chief reason for the market's advance. It shows itself in the greater willingness of the British resident investor to be fully invested, for the institutions to buy the longer dated gilt-edged stocks, and for private individuals to pick up securities which have been associated with good news. The market rise springs also from the greater confidence which foreign investors feel in the London market. The persistent strength of the sterling exchange rate marks the fact that foreign money is still on the move into London. By now there is enough of it to have an appreciable effect on investment markets.

Part of this money is of the permanent investment type. It has been seeking such investments as those longer dated British Government securities which are tax free to foreign residents. The rise in War Loan owes something to foreign buying of this kind. Another part of the foreign money is of the much more mobile type which can properly be called "hot." The appearance of such funds marks not only a confidence in sterling but also the fact that money rates are declining in other centres. The weekend reductions in the Federal Reserve re-discount rates from 1¾ per cent to 1½ per cent in Chicago, New York and San Francisco were not a deliberate attempt by the American monetary authorities to cheapen money; they merely marked the acceptance of a *fait accompli*. In London, too, it is becoming increasingly difficult for the owners of such balances to use them profitably. The attractions of holding a balance in London have increased now that gold is a free market and the exchanges are moving towards freedom, but there are more attractive fields for its investment than three months' Treasury bills with their return of 2$\frac{3}{32}$ per cent and the "hot" money is reported to be seeking other fields for temporary asylum including the local authority loan market.

The FBI and "Freedom to Co-operate"

AT the annual general meeting of the Federation of British Industries last week, Sir Harry Pilkington welcomed the "bold and imaginative" new investment

allowance "with open arms." The small initial cost of this innovation in the Budget, he emphasised, was only in comparison with the cost of the initial allowances that it replaces; so far as the FBI can estimate, the concession applies, even at Britain's present inadequate scale of industrial investment, to well over £500 million of capital expenditure annually, and represents some £70-£80 million in extra resources for industry.

The federation's annual report, also presented last week, affords glimpses of FBI policy on a number of major issues that have not yet been resolved. It shows that a second inquiry into the effects of inflation on industry's capital resources, completed last year, though insufficient to permit an estimate whether depletion of real capital was still going on, did show that far more companies were setting aside special reserves to replace fixed assets, in addition to normal provision for depreciation. The federation offered detailed advice to the Transport Commission upon the reorganisation of the railways; gave evidence to the committee considering the censuses of production and distribution, attempting to "strike a balance between the extreme views that of those who would like the census abolished and others who value the statistics it provides and would indeed like them to be more detailed"; and continued discussions with the British Electricity Authority over industrial tariffs and the use of private generating plant. It encouraged its member associations to send full information to the Monopolies Commission in connection with the Commission's general inquiry into "exclusive dealing" and "collective boycott" practices—in the hope that the Commission "would be brought to realise how extensive and various were the practices concerned and how great the dislocation that would follow from their interruption." Sir Harry's presidential address, too, contained a passing reference to restrictive practices in British industry, on which the federation has set up a study panel:

> Occasional abuses of the freedom to rationalise, to organise, and to co-operate, are trifling in their effects on productivity and on prices compared with the cost of compulsory isolation. Our country has struck to the principle that to check abuses of industrial co-operation, cases should be judged on their merits. This simple principle has been abandoned in other countries.

This latest freedom, it would seem, is one aspect of productivity upon which British industry is not prepared to follow the example of the United States.

Purchase Tax Easter Egg

THE Finance Bill—published just before Easter—contains one unexpected addition to the handful of tax changes announced in the Budget; a change, and a fairly radical one, is to be made in the method of assessing the amount of purchase tax payable on each retailer's goods. Purchase tax is calculated on the wholesale value. When goods pass direct from manufacturer to retailer and not through a wholesaler's hands an imaginary wholesale margin called "uplift" is added to the manufacturers' price before the duty is assessed. "Uplift" has been a bone of contention between retailers and the Customs and Excise for several years, and it is now to be modified.

The purpose of "uplift" was to avoid giving the big retailer who could deal direct with manufacturers a tax advantage compared with the small retailer who necessarily deals through wholesalers, but retailers always maintained that the manufacturers' price covered certain wholesaling costs. The committee, under the chairmanship of Mr. Frederick Grant, QC, that spent 12 months on this highly technical matter accepted part of the retailers' contention but it was not prepared to recommend that the value of the goods for purchase tax should always be the price paid by the retailer to his supplier, whether manufacturer or wholesaler, and instead proposed the abolition of uplift except when the retailer obtained an especially favourable price, usually because of the size of his order.

These recommendations have been exactly embodied in the Finance Bill. The price paid by a retailer to a manufacturer will in future be accepted as the wholesale price when calculating the amount of purchase tax due on the goods—provided that the price is one that would be paid by "retail traders in general." Between now and next January, when the new system comes into operation, the Customs and Excise department and the trade associations must find a workable formula for deciding the point at which a retailer ceases to rank among "traders in general" and becomes big enough to enjoy what the bill calls a "purchasing advantage." Any trader with a "purchasing advantage" will still have some uplift added to the price he pays, to bring his tax assessment into line with that of the small shopkeeper dealing in the same goods. The size of the "uplift" will presumably depend on the local tax officer's assessment of the degree of advantage enjoyed, a difficult point to decide. It may be that the big retailers—the multiples, the variety chains and the department stores—will find themselves with much the same liability for uplift as they were before the change was introduced.

Death Duty Concessions

THE concessions on estate duty for family businesses, as spelled out in the Finance Bill, are more generous than the Budget speech suggested, but their benefit is limited to sole traders, partnerships and "controlling" shareholders in family businesses (whose shares are valued under Section 55 of the 1940 Finance Act according to asset values). Industrial assets (as defined for rating, not income tax, purposes) in the estates of such persons will be charged at 55 per cent of the ruling rate of death duty. In valuing these assets, the Estate Duty Office is enjoined to set liabilities as far as possible against non-industrial assets in arriving at the net asset value. This stipulation will mean a smaller total charge for duty than if liabilities were deducted proportionately from all assets.

To prevent Section 55 being applied in all its rigour to a shareholder who accidentally, or temporarily, secured "control" over a company at any time within five years of his death, the death duty provisions have been sensibly amended so that, in effect, the asset valuation of shares will not be applied unless "control" had been exercised continuously for two years or more. Previously, for example, Section 55 would have been invoked if at any time within five years of his death the holder of, say, £2,000 of the ordinary capital of £10,000 had made a temporary loan of £7,000, thus giving an interest of more than 50 per cent in the aggregate share and loan capital of £17,000. Similarly, it might catch in its net a preference shareholder who in one year received more than 50 per cent of the total interest payments because the ordinary dividend was passed. Now, holdings in the estate of a shareholder who "controlled" a company for less than two years continuously will be valued on yield and earnings considerations, as in the case of minority shareholdings. Nor will the asset method of valuing shares be applied when shares have been passed within five years of the death of the donor as a gift *inter vivos* to an employee of a company; such shares will now be valued as if they are a minority shareholding.

Only the estate of a "controlling" shareholder will benefit from the second concession. If, within three years of death, his shares are sold, the selling price will be substituted for their asset value to arrive at the duty to be charged. Certain provisions have been drafted to prevent any contrived sales designed to secure the benefit of this concession.

Productivity and Steel Deliveries

LAST year's increase in steel output, to 17.6 million ingot tons, was accompanied by an increase in productivity, whether measured in terms of labour or of capacity. The industry's index of labour productivity in steel melting and rolling rose from 142 in 1952 (1938=100) to 148 last year; and the British Iron and Steel Federation's annual report, published this week, records that the average output per blast furnace went up to 126,000 tons of pig iron (compared with 92,600 tons in 1946) and average open-hearth furnace output up to 52,600 ingot tons of steel (this was 36,800 tons in 1946). Such a measurement of productivity in terms of capacity, of course, combines the effect of bringing in new and larger furnaces with increases in driving rates; the steel industry, which has always been justifiably chary of measuring productivity merely in terms of labour, circulates internally very full data on the performance of operating equipment, to enable steel makers to assess their own ranking in efficiency.

* Excluding second-hand material and private imports, as well as sheets, tin, terne and blackplate, tube fittings, and high speed, tool and magnet steel.
† Provisional.

The annual report, which is able once again to draw the comparisons between steel consumption by different industries that were interrupted during the allocation period, permits itself some confidence:

> In 1954 further new capacity will be available; the necessary supplies of raw materials are assured; and if present trends hold, domestic demand—both for investment and for indirect steel exports—should continue to expand.

Last year, it estimates, those "indirect exports" of steel goods amounted to about 4½ million ingot tons, more than three times the rate in 1938. It hazards no predictions about trends in the steel export market this year, where competition is still sharpening; one sign of the times is its disclosure that the Government has recently been asked to consider relaxing its embargo on the export of steel to China.

Shipping and the Shareholder

SHAREHOLDERS of the big liner companies have long felt that they had a bone to pick with their directors: earnings were soaring, even disclosed earnings, and the shipping companies, like the banks, enjoy an exemption from the 1948 Companies Act that enables them to tuck away part of the gross profits into hidden reserves. Assets were also, on break-up terms, worth far more than the market prices of the shares. Yet dividends appeared to rise most sluggishly. The directors also had their point of view. They knew that they had to replace moderately cheap ships with new ships that were not only expensive, but also at prices that were quite unascertainable at the time when the orders were placed. They had to earn depreciation on these and cover other rising costs in freight markets which would obviously become far more competitive. They were also determined that shipping fleets were not going to be broken up or sold just because ship prices had run ahead of share prices.

The publication in the last few days of the last year's figures of four big liner companies should provide an inkling whether the shareholders or the directors had most right on their side. The companies are Cunard Steamship Company, Peninsular and Oriental Steam Navigation Company, whose figures are examined in detail on page 319, Orient Steam Navigation (controlled by P and O) and Union Castle. Two of them show the impact of lower freight rates. P and O's profits before tax fell by about 40 per cent; Cunard's profit fell by about 25 per cent; but Orient's profit actually increased for the year ended September 30th from £328,561 to £481,006 even after making an undisclosed contribution (against nil) to reserves. But even earnings from the declining freight market of 1953 cover the dividends most handsomely. P and O is actually increasing its distribution for the year ended September 30th from 20 to 22 per cent and issuing a one-in-one deferred share bonus, which would surely not have been made if the amount to be distributed was likely to fall.

Cunard maintains with great ease its 16 per cent payment. Union Castle has disappointed the market by again paying 7½ per cent.

The investor may feel that the dividends of these giants have been pinned back to a level at which they can be maintained and perhaps improved even though profits are now falling. He should not lose sight of the fact that he is dealing with the aristocrats of the shipping business. These are big liner companies. They deal with cargo as well as passengers, but conferences fix their charges and they sail to schedules. For tramp owners following trade round the world in search of worthwhile cargoes, the Chamber of Shipping's index of freights is likely to be a more reliable guide. It reveals the devastating fact that the present level of tramp freights is little more than half what it was at the beginning of 1952; the March index (1952 equals 100) was 77.4, compared with 77.6 in February, but with 146.4 at the beginning of 1952. For time charters the rate is about one-third of its level at the beginning of 1952; the March figure of 63.4 compares with 62.0 in February, but with 184.5 at the beginning of 1952.

Rubber at Colombo

THE International Rubber Study Group meets in Colombo on May 3rd with the outlook for natural rubber more favourable than it was when the management committee met last October. The real surplus in 1953 was only about 40,000 tons, and may be even smaller this year. The share of natural rubber in total American consumption again increased in March—to 49.2 per cent—and the price has been firmer in recent weeks. The attitude of the United States has also been more helpful, though help has stopped short of raising the price of synthetic. So while proposals for an international buffer-stock were killed last October, and buried by the Randall Commission's report, the near outlook for the industry is not too disturbing. Attention may be given at Colombo to the long-term prospect, particularly to the management committee's proposal that the rate of replanting should be increased. This was suggested as one means of reducing the surplus; as the old trees were cut out production would fall. Another reason is the probability that the long-term trend consumption of all rubber is still upwards, and that unless additional sources of natural rubber are created, the eventual shortage will be met from synthetic. New trees, when they come to maturity, can produce three times as much rubber as the old.

But speculation about a possible shortage, and its implications for natural rubber, is largely academic. What matters is that the share of natural rubber in total consumption is ultimately determined by the industry's ability to compete with the price of synthetic, and that replanting is the most effective method of reducing its costs of production. Governments of the producing countries represented at Colombo will doubtless point out that replanting is seriously retarded by the present low price, and claim that the United States should raise the price of synthetic to a level which fully covers production and capital costs. Such action, even so, might not help very much, nor for very long, for cheaper ways of producing synthetic will almost certainly be developed. A more effective aid to replanting would be to ease the burden of taxation. In Malaya, where a joint government and industry commission will shortly examine the competitive position of the industry, taxation is the heart of the replanting problem. In Indonesia, replanting is also hindered by chaotic labour conditions, the uncertainty of land titles, and restrictions on remittances of profits and on the entry of European planters.

Hunter and Mystère

THIS week the Ministry of Supply admitted that some of the difficulties experienced with the Hunter fighter were connected with its dive brakes—a phrase that implies that the aircraft's performance was not meeting specifications. Hunters will not be in squadron service before the end of the year. The first squadron of Swifts was formed in February, but it is not known whether the more powerful Mark 4 version is yet cleared. Both of these aircraft were ordered at the beginning of 1951. The delays caused by snags in both machines that came to light during development flying, sometimes after several months of testing, explain why the Ministry of Supply will in future order a batch of "pre-production" prototypes for new aircraft in order to get in a greater number of flying hours before the service versions go into production.

A great deal of ground has been lost through these delays. In France, the Mystère IV, which is the contemporary of the Swift and Hunter, was ordered by the American government on off-shore purchase only last spring. Deliveries were to start this summer, and whereas twelve months ago it seemed improbable that so stringent a schedule could be met the latest reports suggest that production is now starting to run ahead of schedule. Technically, the Mystère IVs are the equal of the Swift and Hunter; the more advanced version, the Mystère IVB, is their superior, for it flew at supersonic speeds in level flight in March, and no British fighter has yet done this. Early this month, the aircraft crashed and killed the Dassault company's chief test pilot, but the cause of the accident has been identified as a defect in one of the electrical circuits that jammed his controls. The unusual speed with which the Mystère series has been designed and put into production makes the Dassault organisation a serious challenge to the British industry and upsets some dearly-held beliefs about the "normal" pace of aircraft development.

Britain Uses More Oil

BRITAIN'S consumption of petroleum products, which faltered in its upward trend in 1952, again rose substantially last year. Total deliveries of all petroleum products amounted to more than 19 million tons, 8-9 per cent higher than in 1952, when an increase of less than 4 per cent was achieved; the total may be compared with an estimated consumption of some 9 million tons in 1938. There was an increase of 300,000 tons in deliveries of motor spirit last year (these had actually declined in 1952), an increase of some 350,000 tons in fuel oil deliveries, and an

first

In 1831, Faraday discovered how to convert movement into electric current. He did it by electromagnetic induction—he made the first dynamo.

The giant turbo-alternators of today bear little resemblance to Faraday's primitive apparatus. But they work on the same principle, generating electrical energy for light, heat and power.

Often called the 'Father of Electricity', Faraday numbers among his progeny the world-famous A.E.I. family of today—a group of British companies that have been responsible for many Firsts. Firsts in invention, development, quality.

Associated Electrical Industries (for that is what A.E.I. stands for) are proud to follow where Faraday led. A.E.I.'s research is in the Faraday tradition.

The companies of A.E.I. will continue to work together, and separately, to discover and put into practice better ways of generating, distributing and using electricity.

AN ALL BRITISH ACHIEVEMENT

increase of about 160,000 tons in deliveries of gas/diesel oils and derv fuel. This last figure is an indication of the continued swing towards diesels on the road and the farm; deliveries of vaporising oil, used in tractors, showed a slight decline.

SALES OF MOTOR SPIRIT, 1951, 1952 and 1953

	1951	1952	1953
Sales by Dealers:			
Premium Grades	—	—	2,197,300
Commercial Grades	3,463,700	3,492,700	1,578,300
Direct Sales to Commercial Consumers:			
Premium Grades	—	—	255,400
Commercial Grades	1,990,600	1,947,800	1,709,100
TOTAL—Premium Grades	—	—	2,452,600
Commercial Grades	5,454,300	5,440,600	3,287,300
Total	5,454,300	5,440,600	5,740,000

The general rise in consumption of gas, diesel and fuel oils reflected the recovery in industrial activity; once again the steel industry recorded the largest increase in consumption of these fuels. The Petroleum Information Bureau's annual statistics, recording this increase in business, disclose for the first time the proportion of total motor spirit sales achieved by the new premium grades; these accounted for nearly 60 per cent of sales by dealers—mainly to private motorists—and about 15 per cent of sales direct to commercial consumers.

Green Light for Airwork

Now that the Civil Aeronautics Board in America has at last given Airwork Ltd., an independent British airline, permission to operate an all-freight service from this country into the United States, the last necessary formality has been completed and the company is free to go ahead with its proposed North Atlantic freight service. There is considerable speculation over its next move. One of the first fruits of the government's new civil aviation policy was the granting last year of a licence to Airwork to operate an all-freight service to America. When Airwork first applied for the licence in 1952 it was generally known that had British Overseas Airways Corporation not been bound by an undertaking to withhold applications for freight services for twelve months to give the new policy a chance to get established, BOAC too would have been in the running for a similar licence.

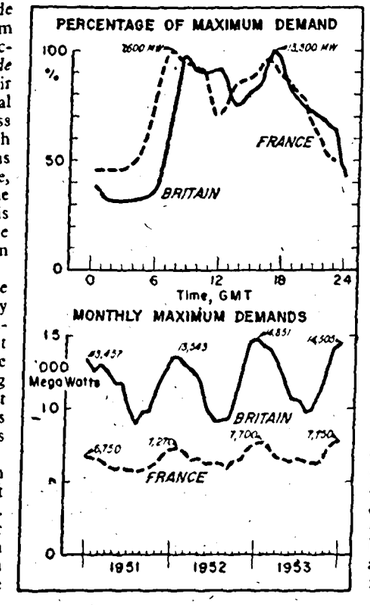
Since the licence was granted, opinions about the amount of freight traffic that might be forthcoming have undergone several revisions, and far from envying Airwork's franchise, there are many who now wonder if the company has saddled itself with a difficult responsibility. Airwork has not yet bought the freighters that it will need to operate on the North Atlantic, but this is more likely to be due to reluctance to buy on a falling market while there was still doubt about the American authorities' attitude to its application to fly into America than to any reluctance to make use of the British licence once it had been granted. All-

Sharing Electricity with France

FOLLOWING tests last summer in which lengths of 132,000 volt cable made in Britain and France were laid out from the coast near Dover, the British Electricity Authority and *Electricité de France* have now reported to their governments that the major technical problems of transmitting power across the Channel have been solved. A British company has developed a continuous process for manufacture of power cable, which will undoubtedly be used if the two countries' politicians approve this electrical *entente*. If approved now, the undersea power link could be laid in summer 1957.

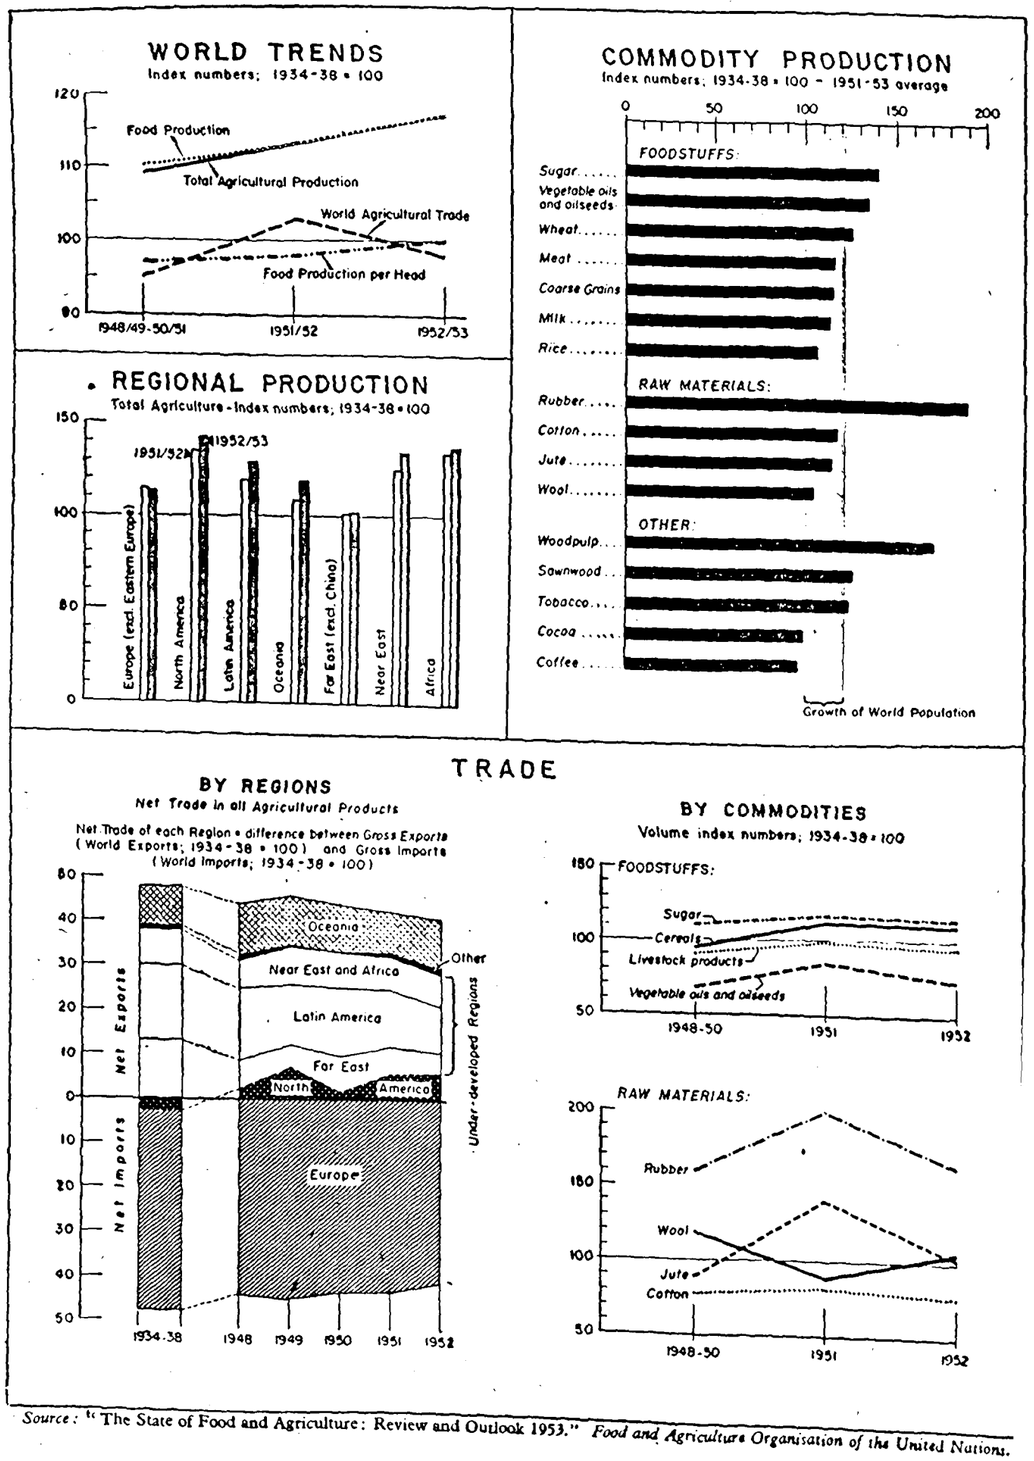
The two electricity authorities have estimated that the cable, which initially will carry 100,000 kW, would make possible a reduction in generating plant capacity of this order and could be made possible in both countries—a total saving of about £10 million in capital cost against which the cable connection is expected to cost some £4,300,000, thus saving £5,700,000.

If the link is to help power plant in both countries to be utilised to best advantage, peak loads must be shared. This is only possible if they do not occur at the same time and if there is an appreciable difference in peak level. In fact "diversity" of demand between the two countries was about 580,000 kW at peak hours during the "cold snap" that hit both Britain and France early this year, and figures extending over the last four years (shown graphically in the charts) suggest that a minimum winter diversity of 300,000 kW at time of peak demand could be relied on. The French peak comes about one hour ahead of the British, and there are also significant weekly and seasonal differences.



Three types of energy exchange are envisaged in the scheme as outlined to the Institution of Electrical Engineers recently by Messrs D. P. Sayers, M. E. Laborde, and F. J. Lane. "Spill" energy from overfull water power reservoirs in France, which would otherwise go to waste, could save some coal in Great Britain. Secondly, "hydro-electric—*thermal power exchanges*": in summer, when dry weather would deplete reservoir levels under normal operation in the French network, underloaded British power stations could supply the energy needed there more efficiently, getting power back at winter peaks when British plant would be over-stressed but French reservoirs full. Finally, power could be exchanged between the different groups of thermal power stations in the two countries, where an economic advantage could be gained from the differences of cost, at given periods and electrical load levels. It has been estimated that at least £600,000 a year might be saved in these three ways.

World Agriculture



Source: "The State of Food and Agriculture: Review and Outlook 1953." *Food and Agriculture Organisation of the United Nations.*

freight air services are aimed at the kind of traffic that [illegible] through the doors of a passenger aircraft, or like as freight hold, and there are signs that there is enough of this kind of traffic potentially available on both sides of the Atlantic to justify a third all-freight service in addition to those already operated between Europe and America by Pan-American World Airways and the Dutch KLM. A third Scandinavian-operated freight service was in fact withdrawn only through shortage of aircraft. The talks going on between BOAC and Airwork are presumably directed towards arrangements for the diversion by BOAC of freight unsuitable for passenger holds—which the corporation has at present to turn away. If the two operators can reach an understanding on the collection and handling of freight in both countries, Airwork's real economic problem, which is not the existence of sufficient traffic, but its collection, will be greatly simplified.

Reasonable Prices for State Lorries

THE latest news from the Road Haulage Disposal Board and the Transport Commission suggests the prospects for the sale of nationalised road haulage businesses to private owners may have become rather more hopeful. The two organisations have been able to accept bids for 179 out of 238 transport units without premises that they offered in earlier sales but which then fetched no acceptable bids. Most of these units were put up again for tender in exactly the same form, and the highest bids now received totalled £583,707 as compared with £411,489 at the first offer. In 31 cases the bids accepted were more than double the highest bids at the earlier sales, and in only three cases were the prices accepted lower than the highest bids before. But all the bids received were rejected for 11 transport units comprising 51 vehicles, and no bids at all were received for 48 units comprising 180 vehicles.

These latest results bring the sales to about 30 per cent of the vehicles offered; only 3,078 vehicles have been sold, out of 10,046. Of those sold, 2,316 were in units without premises, and indeed 80 per cent of the vehicles offered in this way have been sold. Even though the would-be operators are now offering prices that the Board and Commission consider "more reasonable," there seems little doubt that many of the premises used by the British Road Services will have to be sold separately, if the task of transferring some 30,000 vehicles to private ownership is to be completed in any "reasonable" time.

Cotton Market and Exchange Control

THE exchange control arrangements for participants in the raw cotton marketing scheme have now been circulated to banks and cotton firms. They closely follow the pattern set by other commodity schemes in which there is a considerable "dollar element," and where, therefore, free arbitrage might involve substantial dollar losses arising from purchases in the dollar area and sales outside it. As in all commodity schemes, participation will be restricted to persons and firms "having a continuing interest in the import and marketing" of this commodity. They will have to be recommended to the Bank of England by the Liverpool Cotton Association and, where appropriate, by the Manchester Cotton Association. The futures market in cotton will be a genuinely free market in which participants will be allowed to operate or arbitrage outside the sterling area for their own account or for a non-resident. Non-residents will be welcomed to the Liverpool futures market. Differences due to or from them will be payable in the currency of the non-resident or in the appropriate type of sterling—American or transferable.

For transactions in physical cotton—as distinct from the "paper transactions" of the futures market—participants will be free to buy in any part of the world and import into the United Kingdom. Cotton which has been paid for in US or Canadian dollars or in American or Canadian account sterling may be re-exported to another sterling area country only if approval has first been obtained from the Exchange Control in that country. Where dollar cotton is re-exported outside the sterling area payment must be exacted in US or Canadian dollars, or in American or Canadian account sterling. Thus for cotton, as for cereals, resident sterling is convertible into dollars when the commodity is needed for domestic consumption, but non-resident sterling is not so convertible. This approximates to the Swiss conception of convertibility which, like charity, begins at home.

The participants will be called upon to render the usual monthly returns to the Bank of England and make their relevant books and documents available for examination by the bank. Once again the principle of the "closed shop" is espoused; but to judge from the experience of the other commodity schemes it will not be abused.

Higher Dividends in Lombard Street

THE three discount houses that make up their accounts at or near the end of the fiscal year all report an increase in profits and all have raised their distributions. They are Smith St Aubyn and Jessel, Toynbee, whose accounting dates are to March 31st, and Cater Brightwen, whose year runs to April 5th. In the words of Mr R. H. Jessel the expansion of profits partly reflects the "immediate benefit" derived from the reduction of Bank rate from 4 to 3½ per cent in September last. Any reduction in money rates involves not only an increase in the running profit margin on bills held in portfolio that have been bought at higher rates but also a capital profit if such bills are resold. The most striking result is that shown by Smith St Aubyn, whose profits rose from £100,578 to £206,374, and thus were doubled for the second year in succession. The final dividend is being raised from 4 to 5 per cent making a total payment for 1953-54 of 10 per cent, against 8 per cent for 1952-53. The final, moreover, is being paid on the ordinary capital as increased, by the bonus issue of last August, from £525,000 to £630,000. Even so, allocations to general reserve are £75,000 this year (plus £15,000 to make good the excess of the capital bonus over the amount previously carried on share premium account), against £25,000 in

1952-53 though the carry-forward has been reduced by £28,500, or by rather more than in the previous.

Jessel, Toynbee's published profits are only moderately higher—they rose from £111,664 to £115,918—but the contrast with Smith St Aubyn's figures affords no reliable guide to the relative profitability of the year's experience. Discount houses, as banks, are permitted great latitude in their reserve policy, and carry substantial undisclosed reserves. Jessel, Toynbee has made no increase in its final dividend, but the total payment is up from 8 to 10 per cent—a rate that the board considers "strikes a fair balance" between the claims of shareholders and the companies' reserves. The house experienced a slight reduction in its bill portfolio, while that of Smith St Aubyn rose quite fractionally; but both show a moderate expansion of bond portfolios. Jessel, Toynbee remarks that there was "no marked change" in the supply of commercial paper —after its steep decline since early 1952. This house gives its usual useful breakdown of its bill portfolio according to types of acceptor. It is interesting to note that over the past year the proportion of bills accepted by fifteen acceptance houses has fallen, whilst the role of trade paper and acceptances by dominion banks has increased.

Cater Brightwen, whose preliminary statement only is so far available, announces an increase in profits from £140,408 to £160,694. The final dividend rate, payable on the ordinary capital increased from £800,000 to £1 million by the bonus issue of last December, is reduced only from 8¼ to 7½ per cent. This gives a total dividend for the year of 15¾ per cent, equivalent on the former capital to a dividend of 17.6 per cent, compared with 16½ per cent actually paid for 1952-53.

Titanium in Canada

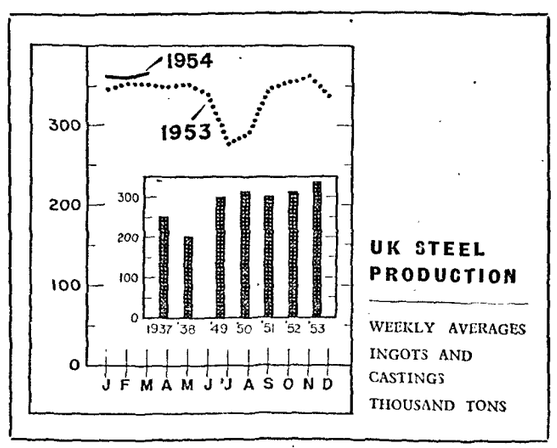
THE purchase by the Hawker Siddeley Group of a Toronto company, Canadian Steel Improvement, that specialises in precision forging of steel and light metals, is chiefly notable because the new subsidiary has been forging titanium, and this side of its work is to be expanded. Sir Roy Dobson, who announced the purchase on his return from Canada last week, said that the company would handle titanium through from the raw sponge in which it is first produced to the finished product. This indicates that the company will put in facilities to produce ingots, which is almost as troublesome a technical operation as the primary reduction of this light metal from titanium ores. Some fabricators on this side of the Atlantic have so far burked at making their own ingots, in the hope that improved primary and secondary refining methods may come along.

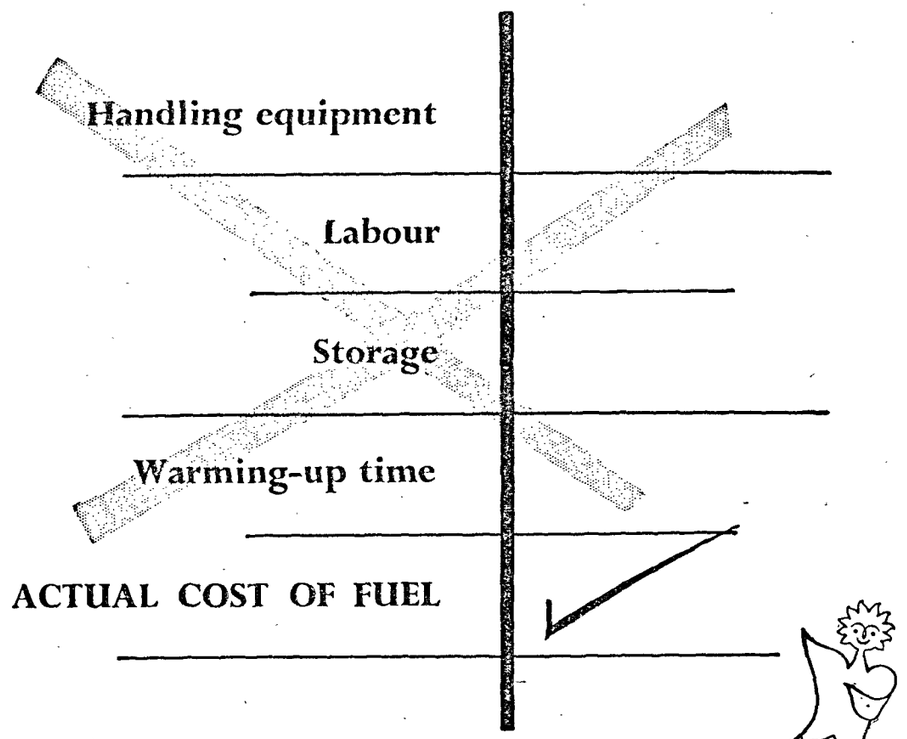
Rise in Prices of Materials

THE Board of Trade's price index of basic materials, which excludes fuel and the materials of the food-manufacturing industry, rose by 1 per cent in March to 141.7 (1949=100). This was the first appreciable rise for a year, and it follows two years of almost uninterrupted decline. The rise sprang from a 4.1 per cent increase in raw cotton prices, a 0.7 per cent gain in raw wool, and higher prices for non-ferrous metals. Copper rose by 3.5 per cent, lead by 4.8 per cent, tin by 8.6 per cent and zinc by 2.6 per cent. Other materials which rose in price included woodpulp and imported hardwood. These increases were slightly offset by a fall in prices of East African sisal, hides and skins, linseed oil and a few other items. The higher prices of non-ferrous metals were mainly responsible for a fractional rise in the price indices of materials used by the mechanical and electrical engineering industries, which in recent months have been several points above their lowest point of 1953. The benefit which British manufacturing industry has enjoyed of cheapening raw materials over a two-year period went hand in hand with an improvement in the terms of trade. British industry was able to sell its products at relatively steady prices while enjoying cheaper raw materials.

Tungsten Prices Soar

THE market in tungsten ore rarely stays still, and has recently bounded upwards almost as fast as it fell. Wolfram has doubled in price in the last six weeks, rising from a trough of less than 100s. a unit (of 22.4 lb) cif Continent to 215s./225s. The selling price of the Ministry of Materials, which is based on the market, plus a premium for handling and delivery charges, is now 235s. for wolfram. British consumers must still buy three-quarters of their requirements from the Ministry, which is no doubt delighted at this opportunity of reducing its accumulated loss on tungsten trading. The rebound appears to have started because one or two Continental consumers were forced to cover against orders for ferro-alloy, the concentrated form of tungsten that is used in the manufacture of high speed steel and other cutting tools. Producers took this as a sign that demand was reviving, and have succeeded in forcing the market higher. Despite the fact that much of the supply comes normally from the East the possible extension of the war in Indo-China does not seem to have stimulated buying, but the producers may well feel that it strengthens their hands.





A CLEAN BILL OF GAS

When you pay for gas, you pay for fuel, clean and simple. There are no extras to take into account, no storage or handling costs, no stokers to be paid, little in the way of maintenance overheads. Gas is quick to heat, flexible in its application to the needs of the thousands of industrial and commercial users it serves and infinitely controllable all the way down from fierce heat to merest glimmer. Its calorific value is constant. There is no anxiety about what the next delivery will be like (or whether it will arrive) because gas delivery is also constant, a stream of latent, reliable heat going right to the point where it is required. There are many instances in which the specialist advice of the gas industry could ensure better results for the money spent on fuel. Is yours one of them?

What does 'not knowing' cost?

THE COST of 'not knowing' about how gas can serve you can only be measured by an expert, such as your Industrial Gas Engineer. His services are free. To solve your problem, he can draw upon the resources of the whole Gas Industry through the Gas Council's Industrial Gas Development Committee. If you would like advice about gas, get your secretary to fill in these details (or pin this advertisement to your letter heading) and send to your Area Gas Board or to

The Gas Council, 1, Grosvenor Place, London, S.W.1

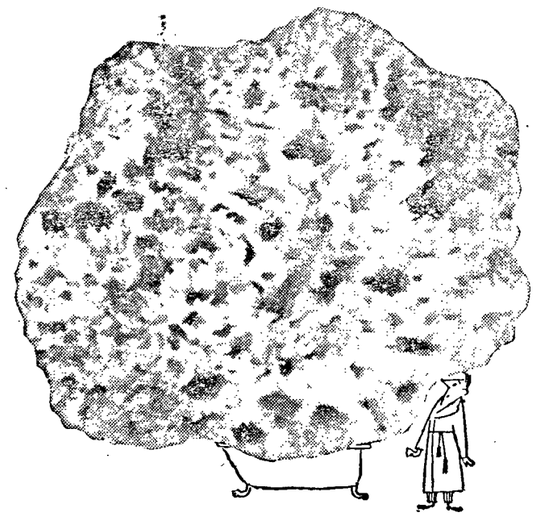
WE NEED HEAT FOR.....87

*The Gas Industry makes the **fullest** use of the nation's coal*

GC. G5A

We suggest that you throw out the sponge



We suggest that the linings of many furnaces are, in effect, sponges — heat sponges: they soak up heat that should go into the charge. On batch-type furnaces this is not only a waste of fuel but a waste of time and quite unnecessary. It can pay very handsomely to get rid of this heat sponge. And it can be done very simply — by using M.I. bricks for the lining instead of ordinary refractories: they require only a fraction of the heat (and fuel) to bring them up to the same working temperature.

M.I. refractories are low heat-storage hot-face insulators which can be used as direct furnace lining up to 1540°C (2800°F). They may be used in either new or existing furnaces. Either way they permit faster throughputs and lower fuel consumption, whilst with new furnaces the whole structure is lightened, with savings in steel, foundations and floor space.

The BIG Yellow 'CATS'

ARE PURRING BEFORE THE HEARTH

Before new hearths and homes can arise, row upon row, Caterpillar earth-movers must get to work. On building sites up and down the country, where soon there will be houses, hospitals, offices, schools and factories, you can see the distinctive yellow of the 'Cats' (world-famous nickname for these world-famous machines) and hear the powerful, purposeful throb of their engines. These are busy times for the 'Cats', speedily doing the spadework for Britain's building developments.

50 YEARS ON TRACKS 1904-1954

DIESEL TRACTORS AND EARTHMOVING EQUIPMENT

The price at which the market will level out is as uncertain as ever. Consumers' stocks are low, but consumption appears to have shown only a slight increase, and supplies available to the market, as distinct from those still being delivered under long-term contracts, are conjectural. The largest producer, China, is rumoured to have some 28,000 tons available. The South Korean mines, which have recently been producing at the rate of about 9,000 tons a year, have been ordered to close down since the United States failed to renew its long-term contract. The order is probably no more than a bargaining move, and it is still possible that the United States will renew the contract, if a price can be agreed. The recent recovery in the price of tin may have encouraged some producers in Burma and Siam, where tungsten is frequently produced jointly with tin, to concentrate on tin production. A price above 200s. will probably encourage many of the smaller tungsten mines to resume production, and even a moderate increase in supplies might suffice to check the rise.

SHORTER NOTES

All the outstanding $13,236,000 of 5 per cent refunding bonds of the Manila Railroad have been bought by the Philippine Government from Manila Railway (1906) for a sum of approximately $13 million in cash. The purchase consideration is expected to be received in London within a few days. The sum of money to be received is more than sufficient to cover repayment in full of the claims of the "A" and "B" debenture stocks amounting with accumulated arrears to £153 and £141 respectively, with a substantial amount remaining for the junior stocks.

★

United Sua Betong Rubber Estates has increased its final dividend from 12½ per cent to 15 per cent, thus maintaining the total distribution for the year 1953 at 20 per cent, notwithstanding the reduction in the interim dividend from 7½ per cent to 5 per cent and a fall in the year's net profit after tax from £183,360 to £169,763. The directors also propose a one for two free distribution of £1 ordinary shares.

★

Increased profit and dividends are announced by Home and Colonial Stores, the retail provision merchants controlled by the Unilever group. Group net profits after tax were £1,141,723 compared with £850,987, and a bonus of 3 per cent is added to the 12 per cent dividend, making a total of 15 per cent compared with 12 per cent.

★

A 5½-mile railway tunnel through the Rimutaka mountains of New Zealand was "holed through" this week—less than three years since driving began and a year ahead of schedule. The job was done by the Morrison-Knudsen Company of New Zealand, subsidiary of the Idaho construction engineering company, and Downer and Co., a Wellington contracting firm. The two companies are also associated in driving a 1,700-foot tunnel for the New Zealand railways at Maoribank; this was begun late in 1953 and is expected to be completed in mid-1954.

Company Notes

PENINSULAR & ORIENTAL. The sharp decline in shipping earnings is discussed on page 309 of this issue. A more detailed examination of the preliminary figures of P & O and Cunard suggests that notwithstanding their fall the equity stocks of both companies remain as sound (though not as exciting) as ever.

P & O reports the biggest fall. Profits before tax for the year ended September 30th were down by nearly 40 per cent, from £13,921,856 to £8,476,052. Before all charges (including the repeated provision of just over £9 million for depreciation) the trading surplus appears to have fallen by about £6 million to £17 million. Cunard has reported a decline of about 25 per cent in its profits before tax for the year ended December 31st. The differing experience of the two companies may partly be a reflection of the different timing of the financial years, but both companies are exempt from full disclosure of their reserves and provisions by the Shipping Companies Exemption Order of 1948, so that actual gross earnings are not disclosed in full. It could also have happened that passenger traffic across the Atlantic in Coronation year held up rather better than passenger traffic east of Suez. But both companies must have suffered a decline in cargo freight earnings.

The decline in gross profits earned by P & O has been balanced by a very abrupt fall in taxation (from £7,043,424 to £3,054,390) and this has provided the cushion for equity earnings. Net profits before the transfers to replacement reserves have fallen by £1,456,770 to £5,421,662 and, after these appropriations (which have been reduced from £3,372,864 to £2,293,586) and the payments to minority shareholders, these earnings have declined by only £254,861 to £2,491,558.

Ordinary dividends were thus protected and the directors of P & O have decided to pay out a little more. The total deferred ordinary dividend has been raised from 20 to 22 per cent. The directors have also decided to capitalise £6,888,777 from reserves (which now total over £85 million) in order to issue a one for one deferred stock bonus. On this new capital the interim dividend (payable in November) is to be 3 per cent, effectively the same rate as was declared last year. The critics of the P & O dividend policy, of whom there are many, will argue that the latest increase is a minor concession that was long overdue. However much sympathy they may have with this view, shareholders on the latest year's showing may feel fairly confident that the massive cover of earnings and assets on the dividend should carry the deferred stock through a general decline in stock market values with little difficulty. The immediate reaction in the stock market, where the £1 deferred units were marked down 4s. to 81s. (to offer a yield of 5.4 per cent), reflected disappointment with the actual size of the dividend increase rather than any attempt to reappraise the long-term prospect.

★

CUNARD STEAMSHIP. In a minor key, the preliminary report of Cunard Steamship (for the year to December 31st) echoes that of P & O. Cunard's profits before tax have fallen by about 25 per cent, from £8,182,339 to £6,141,657, but thanks to a fall in the tax provision (from £4,557,691 to £3,076,318) net profits have declined by only £560,406 to £3,061,072. The tax saving is proportionately smaller in Cunard than in P & O, which supports the possibility that the two companies may have pursued different policies on hidden reserves.

The directors of Cunard have decided to leave the ordinary dividend unchanged. The full year's payment is again 16 per cent. Although the earnings cover (of the order of 70 per cent) is smaller than in P & O (where equity earnings are over 100 per cent) it is still very high, providing a substantial buffer against any further decline in profits. Realising that P & O could afford to be more generous than Cunard with its dividends, the "bulls" have not taken such an optimistic view of the prospects for the Cunard £1 ordinary stock units as of the P & O deferred

units. Recently the yield offered by the Cunard £1 ordinary stock units has been over 2½ points higher than that offered by the P & O units. But the market in shipping shares always seems to be the home of the optimist (rightly attracted by massive assets and earnings), and, after the preliminary announcement, Cunard's £1 units were marked down 4s. 3d. to 39s., to yield about 8.2 per cent. On the face of it, the Cunard units hardly deserve to stand at such a large discount compared with P & O.

★

WHITBREAD. In a listless brewery market the £1 "A" ordinary stock units and 5s. "B" ordinary units of Whitbread and Company stand head and shoulders above most other shares. They are active and strong and are among the few brewery equities which can have the tag of "growth stock" pinned to them. Since the shares were brought to market in 1949 the company's profits have advanced steadily, carrying dividends year by year along with them. Whitbread's results have consistently moved against the trend of falling beer consumption and falling brewery profits. It is no secret that the company's success turns on the sale of bottled beer all across the country and overseas (backed up by an extensive advertising campaign).

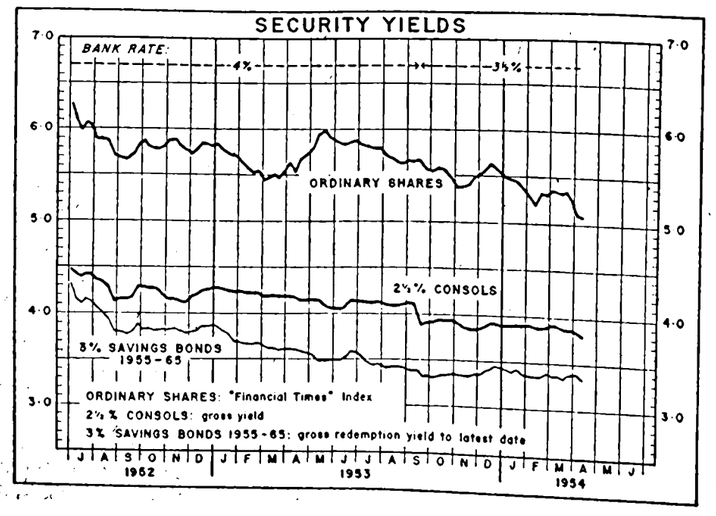
Last year, Whitbread added to its laurels. Net profits increased from £903,015 to £1,363,256 and profits before tax appear to have advanced from £1.8 million to £2.5 million. This increase has been followed by the customary increase in equity dividends. The directors have decided to make a one for two bonus issue to both the "A" and "B" ordinary shareholders and on the newly increased capital of £4,609,800 to pay a final dividend of 15½ per cent. Together with the interim dividend of 8 per cent, the total distribution for 1953 is equivalent to 21 per cent on a capital of £4,609,800; this compares with the 1952 dividend of 25 per cent paid on a capital of £3,073,200. If the bonus issue is taken out of the reckoning the ordinary dividend has in effect been raised from 25 to 31½ per cent.

The news of this dividend led to a rise of 8s. 6d. in the £1 "A" ordinary units to 107s. 6d. and a rise of 3s. in the 5s. "B" units to 28s. At these prices the "A" units yield £5 17s. per cent and the "B" units £5 12s. per cent; the difference in the yield reflects the fact that every "B" unit has five votes while every "A" unit has only one vote. These yields are only slightly below the average run of brewery share yields, for the directors have seen to it that shareholders have benefited quickly from the company's climb to a place among the giants of the industry.

★

PRESSED STEEL. The principal customer of the Pressed Steel Company is British Motor Corporation, though it also supplies motor bodies to other vehicle manufacturers. The burst of activity among these manufacturers in recent months prepared the way for the announcement of higher profits from Pressed Steel. Last year its net profits remained almost unchanged at just over £800,000, but profits before tax advanced from £2.5 million to £2.9 million. Almost the whole of this increase has been absorbed in taxation (which has risen from £1.7 million to £2.1 million).

The stickiness in net earnings, however, has not prevented the directors from recommending quite a substantial increase in the dividend. For 1953 they have declared a full year's dividend of 17½ per cent on a capital of £3,314,444 (as increased by the 100 per cent share bonus in October). For 1952 the total distribution was 25 per cent (including a 5 per cent Coronation bonus). In effect, the dividend has thus been raised from 12½ to 17½ per cent. This news added 6d. to the price of the 5s. ordinary stock units, which at the current price of 16s. 6d. offer a yield of 5.3 per cent.



LONDON STOCK EXCHANGE

Next Account begins: May 5th.
Next Contango Day: May 5th.
Next Settlement Day: April 27th.

AFTER the holiday the stock market opened on a confident note and on the first day of the new account equity prices jumped ahead again. The continued strength of sterling and buying by institutions kept gilt-edged prices very firm and by the close on Thursday War Loan was quoted at 89⅞ and old Consols at 67½. The biggest advance in equity prices took place on the first day of the new account when the *Financial Times* ordinary share index gained 1.2 points to a new peak of 146.1. In the foreign market German issues hardened on hopes that part of Germany's EPU surplus would be used to accelerate the redemption of prewar debts; in two days the Young loan gained 1½ points to 132½. Japanese issues lost heavily on the report of Japan's shortage of foreign currency. Baltic bonds were marked up on the formation of a committee to press the case for a distribution of ex-enemy assets. Manila Railway issues were marked up sharply on the report that the Philippine Government was to buy out the railway; within two days the "A" debentures jumped 26 points to 130 and then after the report had been confirmed they gained another 8 points.

Most equities shared in the advance. One of the most buoyant sectors was that dealing in textile shares. Cheered by the Amalgamated Cotton preliminary report such shares as J. & P. Coats gained 1s. to 60s. 3d. and English Sewing Cotton 6s. to 64s. 3d. Elsewhere, Spillers gained 4s. 4½d. to 49s. 9d. on the increased dividend and share bonus. Hudson's Bay put on 3s. 3d. to 115s. after a line of shares which had been overhanging the market had been absorbed. The market in shipping shares, which after the week-end had improved a little from the initial setback caused by the dividend announcements of P & O and Cunard, received another knock on Thursday when it was announced that the Union Castle dividend was to be left unchanged. The Union Castle shares were marked down from 29s. 9d. to 25s. before recovering to 27s. 6d.

Figures cover general trade as far as possible. Area totals include estimates for countries for which data are not available. Data refer to calendar years with the following exceptions in 1938 :—Australia, year ending June; India and Pakistan, year beginning April; Iran, year beginning June. (1) Excludes China (mainland), USSR, and non-reporting countries of Eastern Europe. (2) Including the trade of Newfoundland in 1938 amounting to $36 million in exports and $51 million in imports. (3) Excluding trade with Taiwan in 1938. (4) Based on two months' data.

Financial Statistics

EXCHEQUER RETURNS

For the week ended April 17th, there was an "above-line" deficit (after allowing for Sinking Funds) of £31,215,000 compared with a deficit of £11,162,000 in the previous ten days and a deficit of £57,855,000 in the corresponding period of last year, bringing the cumulative deficit to £42,377,000 (£52,703,000 in 1953-54). Net expenditure "below-line" absorbed £7,373,000, which brought the total cumulative deficit to £59,759,000 (£82,352,000 in 1953-54).

THE MONEY MARKET

APPLICATIONS for the reduced volume of £230 million of bills on offer at last Thursday's Treasury bill tender rose by £25 million to the record level of £417.2 million, and the market raised its bid by 2d. to £99 9s. 7d. per cent. The upshot was a fall of over 8½d., to £2 1s. 7.41d. per cent, in the average rate of discount, while the market's allotment fell from 59 to 44 per cent. At yesterday's tender the offer was again for £230 million.

In the four days of market dealing in the week covered by the Bank return, conditions in Lombard Street, became gradually easier. On Thursday before the holiday credit was generally short, and help from the authorities, given directly to the market, was necessary; but when the result of the Treasury bill tender was known the banks' buying rate for June maturities eased from 2⅛ to 2⅛ per cent, and later in the week the rate for early July bills eased correspondingly. On Saturday some official purchases, made through the banks, were still necessary, but after the holiday market supplies of credit were adequate.

The gold market has had a quiet week. Only on Tuesday was there any considerable business after the fixing, with prices ranging up to 248s. 9d.

The Bank return shows an outflow of notes of £6.1 million. With last week's outflow of £16.8 million, this brings the total efflux since the January low point to nearly £80 million. In 1953 the outflow in the weeks before the (earlier) Easter peak was £68.4 million.

UNILEVER LIMITED
AND
UNILEVER N.V.

The Boards of Unilever Limited and Unilever N.V. RESOLVED to-day to RECOMMEND to the Annual General Meetings of their respective Companies which will be held on 31st May, 1954, the DECLARATIONS of FINAL DIVIDENDS on the Ordinary Capitals in respect of the year 1953 payable on 14th June, 1954, at the rates forecast by the directors at the time of the announcement of the Interim Dividends in November, 1953, namely :

1. In the case of Unilever Limited a DIVIDEND of 9¼ % actual (1/11.4d. per £1 of stock) less income tax at 9/- in the £, making 15¾% for the year ended 31st December, 1953 (1952—13¼ % for the year), PAYABLE TO STOCKHOLDERS REGISTERED in the books of the Company on 8th May, 1954.

2. In the case of Unilever N.V. a DIVIDEND of 8¼ % actual (Fl.87.5 per share of Fl.1,000) making 14 % for the year ended 31st December, 1953 (1952—12 % for the year).

The total dividends are equivalent in value under the terms of the Equalisation Agreement between the two Companies.

Trading conditions in general have been favourable and results satisfactory. The value of turnover at £1,310,121,000 is the largest so far achieved. After charging depreciation of £15,154,000 (1952—£16,825,000, including the addition to reserve for replacement of fixed assets), the combined trading profit of the Group's operations throughout the world was £61,652,000 (1952—£38,921,000).

Taxation for the year amounted to £33,860,000 (1952—£22,180,000) and the consolidated net profit £25,824,000 (1952—£21,056,000).

The consolidated net profit for 1952 included £1,868,000 withdrawn from reserves for stocks and £4,918,000 of exceptional items and non-recurring profits. There has been no need to make any changes in the stock reserves in respect of 1953 and exceptional items are negligible.

The results for the Groups separately were :—

	Consolidated Net Profit	*Profit of Parent Company*
Unilever Limited	£16,891,000 (£13,343,000)	£7,325,000 (£6,247,000)
Unilever N.V.	£8,933,000 (£7,713,000)	£4,720,000 (£4,141,000)

The Reports and Accounts of both Companies will be issued on 6th May, 1954.

22nd April, 1954.

COMPANY MEETINGS

LEGAL & GENERAL ASSURANCE SOCIETY LIMITED

REVIEW OF OPERATIONS FOR THE YEAR 1953

STATEMENT BY THE CHAIRMAN, THE HONOURABLE W. B. L. BARRINGTON

The annual general meeting of Legal & General Assurance Society Limited will be held on May 12th at Aldwych House, Aldwych, London, W.C.2.

The following is an extract from the statement by the chairman, The Hon W. B. L. Barrington, which has been circulated to shareholders with the report and accounts:

LIFE ASSURANCE AND ANNUITY FUND

Once again I am in the happy position to report that the new life assurance business transacted by the society during 1953 created yet another record.

The total net new sums assured, including additions in existing group policies, amounted to £81,481,132, an increase over the previous year of £9,134,111. The deferred annuities issued amounted to £9,752,287 per annum. It will be noted that the figure for new deferred annuity business under group life and pension schemes is very much larger than in the previous year. The main reason for this is that the society has brought its practice into line with that adopted by the Life Offices Association by treating all new entrants and increments under existing schemes as new business. By so doing the society is assisting the association to compile statistics of pension scheme business on a comparable basis for all offices.

The total net premium income amounted to £27,864,326, an increase of £2,044,290 over that of the previous year.

MORTALITY

I am able to report that, after investigation into the mortality experience, the results in the life assurance section were favourable.

RATE OF INTEREST

The gross rate of interest earned on the life assurance fund, excluding the amount invested in purchased reversions, was £4 11s. 5d. per cent, as compared with £4 8s. 9d. per cent in the previous year. The corresponding net rate was £4 0s. 10d. per cent, as compared with £3 19s. 2d. per cent for the year 1952.

EXPENSES OF MANAGEMENT

The total cost of commission and expenses of management expressed as a ratio to the life premium income was 9.41 per cent, as compared with 9.49 per cent for the previous year.

FIRE INSURANCE ACCOUNT

The net premium income of the fire insurance account, including the business of the "Gresham Fire," amounted to £2,048,337.

The net profit of £81,456 on the account has been added to the additional reserve, which now stands at £379,956.

ACCIDENT INSURANCE ACCOUNT

The net premium income amounted to £1,380,247, an increase for the year of £105,115. The net profit of £50,471 on the account has been transferred to additional reserve, which now amounts to £215,066.

MARINE ACCOUNT

The net premium income, which last year amounted to £393,476, showed a small decrease compared with the previous year of £20,249. As mentioned in the report, the account for 1951 has been closed and there is a balance on the year of £25,149, which is retained in the fund.

PROFIT AND LOSS ACCOUNT

The balance brought forward in the profit and loss account amounted to £608,506. The directors recommend the payment of a final dividend of 4s. 3d. a share, which, together with the interim dividend paid on January 1, 1954, makes a total dividend of 6s. 9d. per share. The amount carried forward is £468,396.

ASSETS

The assets of the society now amount to £207,953,498, having increased during the year by £28,381,858.

PROPOSED ALTERATIONS TO THE SOCIETY'S MEMORANDUM AND ARTICLES OF ASSOCIATION

First of all I must explain that the purpose of the proposed change is to enable the society to be in a position to offer to the public policies which, on appropriate terms, have the right to participate in the profits earned by the life assurance and annuity fund.

I think, perhaps, that it is necessary to remind the shareholders that the society ceased to issue participating policies of this type in the year 1919, at the time when the society obtained powers to transact fire, accident, and other classes of miscellaneous insurance. The bonus record of the society had for many years, up to that time, been a very favourable one, a reversionary bonus at the high rate of 38s. per cent compound having been consistently declared for 25 years prior to the cessation of this class of business.

PRESENT REQUIREMENTS

In the light of modern conditions the directors are now of opinion that the society is at a disadvantage by its inability to transact business under with-profit tables which are competitive, and as under the provision of the Companies Act of 1948 the shareholders possess the power to vary the objects of the society, they are now asked to pass the necessary resolutions giving effect to the directors' recommendation to resume normal with-profit business.

The directors, therefore, recommend that the society should assume full liability for future bonuses at the maximum rate of 38s. per cent per annum as a guaranteed benefit under all with-profit policies existing at May 12, 1954. The actuary has reported to them that as at December 31, 1953, and after treating as a liability the accrued bonus for the two years which had then elapsed since the end of the previous quinquennium the amount required by way of additional reserve to provide for the guarantee of future bonuses was £2,537,012 and he has certified that on that date there was a surplus in the life assurance and annuity fund in excess of that sum.

The new Article No. 8 describes fully the nature of the guarantee to be given in respect of the existing with-profit policies.

WITH-PROFIT CONTRACTS

Having made full provision for the existing with-profit policyholders, the society will then be free to institute a new series of with-profit contracts under which the new participating policyholders will depend for their bonus exclusively upon the profits of the life assurance and annuity fund. The new Article 9 describes the suggested method of bonus distribution which, stated briefly, is that the new participating policyholders will be entitled to 90 per cent of the profits derived from their own class of policy, together with any further sum which the directors in their absolute discretion may allocate to them from other profits derived from the life assurance and annuity fund.

BANK LEUMI LE-ISRAEL BM

NEED FOR ECONOMIC INDEPENDENCE

MR S. HOOFIEN'S SPEECH

The annual general meeting of Bank Leumi le-Israel BM was held on April 8th in Tel-Aviv. Mr S. Hoofien (chairman) presided.

In his introductory remarks the chairman referred to the stock bonus of I£1 for every I£4 held, resolutions as to the distribution of which had been passed that very morning at separate class and extraordinary general meetings. The paid-up capital was thus increased from I£1,600,000 to I£2 million and the open reserve fund had also been increased to I£2 million by appropriations which the directors had made of I£550,000 from the profit and loss account and contingencies reserve. The balance of net profit amounted to I£502,766, compared with I£455,705 for the previous year. Out of this sum an amount of I£200,000 had been appropriated for the payment of dividends to the stockholders, and the directors had every hope of being able to maintain the present rate of dividends (12½ per cent) on the increased capital. Deposits stood at I£115,285,462 (1952: I£94,907,391) and loans at I£76,743,965 (1952: I£55,783,090).

The chairman touched upon the government's intention to set up a central bank in the course of the current year and explained why its early establishment was considered important. The bank had actively participated in all the preparations for the setting up of the central bank. When the Issue Department and the Government Loans Administration, also various government accounts, were taken over by the central bank, Bank Leumi would be able to bend all its energies to its main task as the country's leading commercial bank.

AGRICULTURAL DEVELOPMENT POLICY

In the main part of his speech the chairman dwelt on the re-orientation of the country's agricultural development policy. He had brought this subject up for public discussion in his speech at the preceding general meeting, when he had advocated a shifting of the emphasis in agricultural policy from the production of animal to vegetable foods, and the growing of greater amounts of staple

and industrial crops as well as the utilisation of natural pastures for grazing. Some progress had been made, but the progress was too slow and the agricultural price policy must be geared to the aims of the new agricultural development policy.

STEPS TOWARDS ECONOMIC INDEPENDENCE

The chairman then passed on to the central problem of how to lead the country's economy towards independence from outside help. This took the form of the very large amounts raised by Jews abroad (especially in the USA), grants, reparations from Germany and foreign loans. The maintenance of Jewish support on the same scale for many years was not a matter of certainty, and all the other sources would also tend to dry up in time; nor were they, under the control of Israel. This foreign aid was, as a matter of policy, used for development purposes, while the ordinary and defence budgets were met from taxation in Israel. He pointed out, however, that it was from these sources that the foreign exchange for most of the country's import requirements were derived and that their cessation would raise grave problems unless the country steered towards independence from outside support. How could such independence be achieved? The natural answer was increased production and reduced consumption.

He analysed the possibilities of increasing production in industry and agriculture and by the development of natural resources; in his opinion, agriculture offered the best hope of achieving important results by planning. He then turned to the question of reducing consumption. The population had shown no readiness to reduce consumption. It was up to the Government to decide whether it considered the reduction of personal consumption essential and whether it had the power to enforce such policy as it considered necessary.

As to public consumption: the most important item in that respect was defence. Since circumstances still kept this subject outside the scope of public discussion, it was all the more essential that the maximum economy be exercised in all other items of public expenditure. All items of the Government and local authority budgets should be examined from the point of view whether a small and poor country could permit itself the expenditure involved.

The problem of preparing the country for economic independence would from now on have to be constantly kept in view. There was still time, but not too much.

THOMAS TILLING LIMITED

YEAR OF PROGRESS AND CONSOLIDATION

MR W. LIONEL FRASER'S REVIEW

The fifty-seventh annual general meeting of Thomas Tilling Limited will be held on May 19th at Crewe House, Curzon Street, London, W.

The following is an abridgment of the review by the chairman, Mr W. Lionel Fraser, CMG, circulated with the report and accounts for the year ended December 31, 1953:

The profit and loss appropriation account shows that the profit of the group attributable to Thomas Tilling Limited after providing for taxation and minority interests is £380,040, which is a little above that of last year.

The preference dividend for the year has been paid and the directors now recommend the payment of a dividend on the ordinary stock of 7½ per cent, which is the same as was paid for 1952. The unappropriated profits retained by subsidiaries have increased by £160,000 during the year.

SUBSIDIARY COMPANIES AND ASSOCIATED COMPANIES

The chairman then reviewed the activities of the subsidiary companies:

Bagshawe and Company, Limited (manufacturers of conveyers and elevators, mechanical chains and malleable iron castings).

Cornhill Insurance Company, Limited,

Daimler Hire, Limited,

Mark Dawson and Son, Limited (worsted spinners),

Hobourn Aero Components, Limited (manufacturers of light engineering components, textile machinery, electrical convection heaters),

James A. Jobling and Company, Limited (manufacturers of "Pyrex" brand glassware),

Newey and Eyre, Limited (industrial electrical engineering suppliers),

Spray and Burgass, Limited (dyers and finishers),

Stratstone, Limited (distributors of Daimler and Lanchester cars),

F. Troy and Company, Limited (building, civil engineering and painting contractors),

and of the associated companies, i.e., those in which a substantial minority interest is held:

John H. Ashton, Limited (mahogany and hardwood merchants),

British Steam Specialties, Limited (manufacturers and distributors of valves, gauges, etc.),

Heinemann Holdings, Limited (book printers and publishers),

Timothy Hird and Sons, Limited (worsted combers and spinners),

E. R. Holloway, Limited (comb manufacturers, fancy goods, etc.),

Lime-Sand Mortar, Limited (ready-mixed mortar and ready-mixed concrete manufacturers, sand and gravel producers),

Stevensons (Dyers), Limited (hosiery dyers and finishers),

Western Motor Holdings, Limited (motor-car distributors).

After referring to the company's holdings of freehold and leasehold properties, and the acquisition of 2 million ordinary shares of the Brush Electrical Engineering Company, Limited, since the end of the year, the review then continued:

KEENER COMPETITION AND RISING COSTS

In the main the above reports tell a tale of progress and consolidation. Nothing spectacular was to be expected at this stage, although many of our companies have intriguing potentialities and your directors have faith in the future of them all.

The significant theme running through the reports is one of keener competition and rising costs, clearly indicative, as everybody knows, that the easy-come, easy-go days are over. This adjustment sets us a stiff task, but it is all to the good provided we accept the challenge and strive for greater productivity at reduced costs. Certain it is that the consequential problems are already being tackled in our group of companies. We believe firmly in high wages, that is to say, full and proper payment for the job. They afford the incentive which human beings need and mostly deserve and they create better and more harmonious conditions and relationships, without which there can be no true progress. But higher wages must be accompanied by extra work and greater output, for otherwise we shall inevitably go down the road to inflation and catastrophe.

This Industrial Holding Company, as we describe ourselves, now comprises ten main subsidiary companies and eight associated companies. We are not only bigger numerically, we now all know one another better, and we are a happy team. We exchange ideas, we discuss one another's problems and difficulties, and we do business together. Indeed, we can see our concept of Tillings as a family of firms, with an ever widening community of interests being translated into reality.

BOARD'S POLICY

Perhaps I may be forgiven if, for the sake of new shareholders, I explain the basic principles which guide and direct your board's policy. This can probably best be done by quoting a few points from my past reviews when I said substantially, as follows:

(1) We envisage for ourselves a positive and active role whereby we can use our funds in a constructive and useful manner by further direct participation in industry, and by the development and expansion of our existing interests.

(2) We are creating a loosely bound, well co-ordinated group of companies, free and unlimited in their possibilities, but in whose destiny we can play some real part.

(3) Our main emphasis is always on the quality of management, and our underlying companies are all admirably directed by men of character and ability. Their boards enjoy complete latitude to conduct their affairs in their own way, subject always to the benign guidance and supervision of the parent company, notably on matters of general policy and finance.

(4) We have embarked upon a long-term undertaking, and we are only in its early stages.

(5) If we are to be successful, we must show sound judgment in our actions, whilst not lacking in courage and enterprise. We must not fear to take reasonable risks, and we cannot expect our path to be free from care and anxiety.

In the light of their experience to date, your directors reaffirm those broad principles. As time goes on, the number of our companies will mount, if for no other reason than that of defence against oppressive death duties, or because smaller companies must search for support and protection in these strenuous days, but possible newcomers must expect us to be very discriminating. So far as we can, we shall broaden our participation in industries in which we are already interested, or in kindred industries. We went some way in this direction last year, but it may not always be possible, and we shall not decline to consider attractive propositions outside our existing scope.

FUTURE PROSPECTS

Your board are pleased with the acquisitions so far made, and they remain confident as to the future of your varied interests, which are spread over many industries. If, as I profoundly believe, this country is to continue to flourish and prosper, there would seem to be no reason why your company should not flourish and prosper too.

THE LONDON & LANCASHIRE INSURANCE COMPANY, LIMITED

THE HON R. M. PRESTON'S REVIEW OF THE RESULTS

The annual general meeting of The London & Lancashire Insurance Company, Limited, will be held on May 12th at 7 Chancery Lane, London, W.C.2.

In a circulated statement the Hon R. M. Preston, DSO, chairman, reports that the aggregate premium income of £27,879,852 differed little from the previous year, but the total profit was rather higher at £1,443,013.

The fire department premiums amounted to £11,185,272 and yielded a profit of £786,201, which was somewhat less than 1952. Nearly half the premiums of the fire account were earned in the United States. Although the ever-present risk of damage by fire continued to be the principal purpose of insurance in that department, there were additional hazards which were included in varying types of policies, such as the risk of damage by or from flood, storm, tempest, riot and civil commotion, earthquake and the like. In the United States more damage was caused by tornado last year than in any other year of its recorded history. Though insurance against loss arising from tornado formed a small proportion of the whole of the business, nevertheless, results suffered as a result of such damage.

The accident department premiums had increased by some £1,300,000 to £12,255,095, and the previous year's result had been bettered by the account yielding a profit of £156,812. Many differing types of insurance were included in that department, of which the most important in volume was probably motor insurance. Indeed, motor insurance produced approximately one-half of the total premiums of the department, and in many parts of the world was still an unremunerative business. In some countries, including the United Kingdom, an upward adjustment of premium rates was still, in his opinion, overdue and would eventually have to be faced. Another important section was employers' liability insurance which, in this country, had an incurred claims ratio of over 70 per cent last year, and rates of premium might call for further adjustment.

Marine insurance business, which was conducted by "The Marine" and the "Standard Marine," had produced satisfactory profits which related to 1951 and previous years, but it was clear that there were leaner times ahead.

The Law Union & Rock Insurance Company, Limited, which handles the life business, had had a very satisfactory year.

Interest earnings and the stockholders' share of the life profits amounted to £782,071, but that did not take into account the profits tax which had to be paid in respect of interest. For 1953 the whole of the sum of £124,310 charged in the account related to interest. In effect, therefore, after deduction of all taxation thereon, the interest earnings for the year were £657,761.

The interim dividend last November was increased by 6d., and the total dividend for the year is 6s. 6d. per £1 stock, costing £650,526 net of income tax.

The statement concluded by paying a tribute to the general manager, Mr F. J. Cottle, the other executive officers and the staffs.

OLDS DISCOUNT

EXTRACTS FROM THE CIRCULATED STATEMENT OF THE CHAIRMAN, MR W. A. OLDS

We have achieved new records. Trading profit for 1953 is £364,851, an increase over 1952 of £82,578. Provision for taxation is £235,000, nearly 65 per cent of trading profit. Group assets total £6,169,281. Reserves and carry forward are nearly double the equity capital.

The companies formed to undertake business in the British West Indies and Eire are developing satisfactorily.

There is no sign of any diminishing demand for our services and facilities. During the first three months of 1954 business was at a higher level than for the same period of 1953.

RECORD OF PROGRESS IN STAGES DURING LAST 16 YEARS

	Profit before Taxation	Ordinary Dividend Paid (Net)	Profit Retained after Taxation
	£		£	£
1938 ...	23,363	13¼%	9,969	1,438
1945 ...	53,873	15 %	10,100	15,273
1949 ...	161,030	20 %	*30,938	27,192
1953 ...	364,851	25 %	55,000	62,201

*and bonus share issue.

The 25 per cent ordinary dividend for 1953 represents 8.7 per cent (gross) on the ordinary stock and reserves.

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa,)

ABRIDGED REPORT OF THE DIRECTORS FOR YEAR 1953.

After providing £433,700 for United Kingdom taxation the profit for the year is £1,227,105, plus £351,686 brought forward, making a total of £1,578,791. The Directors have placed £600,000 to the credit of Exploration Reserve Account, and have declared a final dividend of 10d. United Kingdom currency per share free of United Kingdom Income Tax, absorbing £387,500, and making, with the interim dividend of 6d. per share, a total distribution of 1s. 4d. per share free of United Kingdom Income Tax or £620,000 for the year, leaving £358,791 to be carried forward.

Holdings of shares, debentures and other securities have been taken into the Accounts at cost or under but in no case above the market value of December 31st last, or, where no market price exists, above the Directors' valuation. The Directors, as on other occasions, have thought it expedient to write down the book cost of certain holdings below both cost and market price.

The Accounts include for the first time a Consolidated Balance Sheet and a Consolidated Profit and Loss Account.

The Rt. Hon. The Viscount Leathers, C.H., rejoined the Board of Directors in October, 1953, when he also rejoined the Board of a subsidiary, Bay Hall Trust Limited.

A copy of the Corporation's Annual Trade Cycles Chart, revised to date, is enclosed with the Report.

GOLD MINING INTERESTS

Summary of the operating results for the past year of the Companies operating in the Transvaal and Orange Free State in which the Corporation is largely concerned:—

	East Geduld Mines, Ltd	Geduld Proprietary Mines, Ltd.	The Grootvlei Proprietary Mines, Ltd.	Marievale Consolidated Mines, Ltd.	St. Helena Gold Mines Ltd.	Van Dyk Consolidated Mines, Ltd.
Tons milled ...	1,610,000	1,125,000	2,203,000	749,000	799,000	1,022,000
Yield per ton dwt.	6.03	3.19	4.26	4.89	4.05	3.31
Working Costs per ton	29s. 11d.	33s. 10d.	28s. 2d.	39s. 5d.	42s. 9d.	41s. 6d.
Working Profit per ton	45s. 9d	6s. 5d.	25s. 4d.	22s 0d.	8s. 3d.	2d.
Total Working Profit	£3,684,000	£362,000	£2,789,000	£824,000	£330,000	£35,000
Net Profit ...	£1,760,000	£874,000	£1,347,000	£451,000	£262,000	£81,000
Dividends: Total	£1,575,000	£840,000	£1,287,000	£394,000	—	—
Per Stock Unit or Share	3s. 6d.	11s. 6d.	2s. 3d.	1s. 9d.	—	—

The net profit figures include revenue from other sources. Thus East Geduld Mines' dividend income in 1953 on its shareholding in The Grootvlei Proprietary Mines was £60,480 and Geduld Proprietary its 1953 on its shareholding in The Grootvlei Proprietary Mines was £60,480 and Geduld Proprietary Mines' dividend income in 1953 on its shareholdings in East Geduld Mines and The Grootvlei Proprietary Mines was £6,19,294.

Tonnage milled and working profits of St. Helena Gold Mines Limited continue to increase steadily. The ore reserves at 31st December last were estimated at 2,000,000 tons, assaying 5.3 dwt. per ton over a stoping width of 51 inches.

THE WITHOK PROPRIETARY COMPANY.—The Corporation retains a substantial interest in the Company which owns the mineral rights over 4,823 morgen on the Farm Withok No. 7, District Brakpan, Transvaal, and certain freehold rights thereon.
Interests in Gold Mining Companies not under the administration of the Corporation:—

STILFONTEIN GOLD MINING COMPANY.—Production and profits have continued to show a steady improvement throughout the year. The uranium plant came into production in October last.

WESTERN HOLDINGS.—This Company commenced milling in July, 1953, since when production and profits have progressively increased. Development work continues to show a high percentage payability with good values on the Basal Reef. The capacity of the reduction plant is being extended to 125,000 tons per month.

OTHER MINING INTERESTS

SAN FRANCISCO MINES OF MEXICO.—This Company earned a Working Profit of £3,027,000 in the year ended 30th September, 1952, and paid a dividend of 6s. (unchanged) per 10s. Stock unit in respect of that year. In the year to 30th September, 1953, 693,209 tons of lead-zinc-silver ore were milled compared with 657,000 tons in the previous year. A strike of workmen resulted in complete suspension of operations for two weeks in May, 1953. The steep fall in lead and zinc prices since Mid-1952 has drastically reduced the profits being currently earned.

CHROME MINES OF SOUTH AFRICA.—Notwithstanding the fact that production and sales were again restricted by the limited number of trucks made available by South African Railways, the net profit for the year ended 30th June, 1953, after making provision for taxation and depreciation, amounted to £121,157. The Company has substantial orders on hand at satisfactory prices.
The Corporation is also interested inter alia in the following Company:

TSUMEB CORPORATION.—The net profit for the year ended 30th June, 1953 was £3,186,622 compared with £4,645,443 for the previous year and dividends totalling 12s. 6d. (12s.) per share were declared. During the first nine months of the current financial year dividends totalling 7s. 3d. per share have been declared.

OTHER INTERESTS

BAY HALL TRUST.—The net profit for 1953 was £99,432. A dividend of 7½ per cent. (7 per cent.) free of tax was declared. The Trust's investments as at 31st December last showed an appreciation of £450,918 over book cost of £2,291,849.

BRITISH ZENKA.—As a consequence of a sharp recession in trade, the Company was forced to reduce its production considerably in 1952. After writing down stocks of raw materials by £103,743, the Company incurred a net loss for the year of £95,494 compared with a net profit in the previous year of £419,415. £50,000 was appropriated from General Reserve and a dividend of 6 per cent. was paid, the carry forward being reduced from £136,662 to £90,976.

SOUTH AFRICAN PULP AND PAPER INDUSTRIES.—The net profit for 1953 after providing for taxation and depreciation amounted to £324,947 compared with £424,149 for the previous year and dividends totalling 2s. per share (unchanged) have been declared. These profits were made from the operations at the Company's Enstra Mill near Johannesburg. The extensions to this mill are now virtually complete. Completion of the Company's new Tugela Mill in Natal is proceeding apace and it is anticipated that this mill will commence production about the middle of the current year. In order to provide further funds for the completion of the present expansion programme and further working capital the Company is raising £800,000 by an issue of 6% Registered Unsecured Convertible Notes.

EXPLORATION

Drilling operations by Capital Mining Areas, Limited, have indicated the existence of payable Kimberley Reef covering a limited area which it is believed will prove to be sufficiently large to justify underground prospecting in due course. Further drilling remains to be done before this area can be more accurately defined. Drilling on other parts of this Company's ground has given inconclusive results. Nothing of economic importance has so far been disclosed in the areas held by the other five exploratory Companies mentioned in last year's Annual Report.

In view of the lack of encouraging results Central Mineral Exploration, Limited, stopped all prospecting work on its concessions in Tanganyika during the year under review.

Copies of the full Report and Accounts can be obtained on application at the London Office, Princes House, 95, Gresham Street, E.C.2

COW & GATE LIMITED

A VERY SUCCESSFUL YEAR

The forty-fifth annual general meeting of Cow & Gate Limited was held on April 23rd at Guildford, Mr W. R. Bramwell St. John Gates (chairman and joint managing director) presiding.

The following is an extract from his circulated statement:

I am pleased to report a very successful year in all sections of the business.

We have since the war suffered intense competition from other infant foods which have been available in the shops. But we are convinced that we should do our best to maintain, regardless of cost, the superb quality of our products, which have made the name of Cow and Gate so famous. We believe this policy to be a right one and we are confirmed in our opinion by the fact that the sales of our baby food have increased in volume both at home and abroad in the year under review.

As far as fresh cream is concerned, we were ready, as soon as the regulations forbidding the making of cream were relaxed, to give the public the best that could be produced. We sold a lot of cream to begin with, probably due to its novelty attraction, but sales have since dropped off, as we anticipated they would.

Our creameries and factories benefited last year by what in the trade we call "top gallons." The weather was very favourable for milk production and for the first time for some years there was a steady flow of milk for manufacturing purposes, thus enabling us to operate our plants at full capacity.

On the retail side the acquisition and amalgamation of a number of businesses, in areas where we were already operating, has further consolidated our position.

DECONTROL OF DAIRY PRODUCTS

The decontrol of all manufactured dairy products, except butter and cheese, becomes operative from April 1, 1954. As a result of representations by both manufacturers and distributors, we are given to understand that there are to be modifications of the original marketing schemes which in prewar years gave the producers tremendous authority over the whole milk industry. We welcome these modifications because we believe that if the milk industry is to be successful, there must be close collaboration between producers, manufacturers and distributors, and that one of the major duties of any statutory authority must necessarily be to see that the consumer also gets a fair deal.

I think it is now recognised that a prosperous home agriculture is one of the bulwarks in our defence programme. The fostering of British agriculture must be a sound policy and those industries engaged in the manufacturing and distributing of milk must be encouraged also as equal partners with the producer.

For the first time the net profit exceeds £1 million—being £312,000 above last year's figure of £749,000. In view of the year's excellent results, your directors feel justified in recommending that the ordinary dividend for the year ended September 30, 1953, should be at the rate of 17½ per cent, less tax.

I am glad to report that the approximate trading results of the group for the December quarter, 1953, compare favourably with those of the corresponding period of the previous year.

The report and accounts were adopted and the dividend, as recommended by the board, was approved.

UNITED KINGDOM PROVIDENT INSTITUTION

NEW SUMS ASSURED AGAIN A RECORD

SIR JOHN BENN'S SPEECH

The one hundred and thirteenth annual general meeting of the United Kingdom Temperance and General Provident Institution was held on April 14th. Sir John Benn, the chairman and managing director, said: This is the fifth successive occasion on which I have had the pleasure of reporting a further increase in our annual business. In 1953 net new sums assured reached the record figure of £7,546,877, while premium income amounting to £2,960,712 was also our largest to date. Further headway was made by our subsidiary, the United Kingdom Fire and Accident Insurance Company.

The further increase in the rate of interest earned on the book value of the funds last year is reflected in the increase of 3s. per cent in the compound bonuses we have declared for 1950-53, namely, 38s. per cent per annum on with-profit policies in the General Section and 40s. per cent per annum in the Temperance Section. These rates are equivalent to simple bonuses of 45s. and 47s. per cent per annum over the business as a whole.

The full advantages of the compound reversionary bonus are explained in a supplement to the report entitled "Your Bonus." Our report shows that the surplus disclosed by the actuarial valuation is so substantial that, after declaring bonuses and transferring £475,000 to the contingencies fund, there is a carry forward of £673,845. Our assets are again shown in the balance sheet at considerably less than current market values.

Bearing in mind that we have again declared increased bonuses while adding to our reserves, it seems clear that investment in risk capital is not inconsistent with the first responsibility of a life office—to safeguard its policyholders' money. On the contrary, I believe that such investments as part of a well-balanced portfolio are now the best, if not the only, means to achieve this objective.

While most life assurance companies now engage in risk-taking investment, with advantage also to industry and the country, some people doubt whether we are, in fact, achieving very much in this direction.

Personally, I do not fear enquiry into the life assurance business from any quarter, for although we do command considerable resources, we can justly claim that we make good use of them from the national standpoint. The impression that there are shortcomings in our investment policy perhaps arises from the size of our operations. The figures may suggest that too much power is in too few hands, but the fact that eighty or more life offices are competing for custom affords ample protection against the abuses of monopoly.

Looking to the future, the outlook for our Institution is bright. We have just secured a licence to extend our Head Office building in order to provide for the expansion of our business in the next few years. This Spring has shown a substantial improvement on the opening months of 1953 and I am hopeful that the trend will steadily continue. This is no mere boast or wishful thinking, but reflects the confidence which our mutual Institution enjoys among an ever growing public. With the continued co-operation of members, agents and staffs throughout the United Kingdom, we shall pursue our vigorous efforts to the general advantage.

HANDLEY PAGE LIMITED

SUCCESS OF THE "VICTOR"

The annual general meeting of Handley Page Limited was held on April 22nd in London, Sir Frederick Handley Page, CBE (chairman and managing director), presiding.

The following is an extract from the chairman's review:

During 1953 our four-jet crescent-wing bomber, the Victor, has been fully engaged on an exhaustive test programme of flights high in the stratosphere and close to the sonic barrier. In every aspect of performance tested so far, it has exceeded the operational requirements laid down.

Although the Victor's performance is so outstanding, its basic design has great potentialities and the promise of even better performance and greater striking power.

Modern aircraft bring with them an increasing complexity and many fresh aerodynamic and structural research problems. Future developments are constantly under investigation. Your company is carrying out an active research programme into the problems and possibilities of sustained supersonic flight. Research into boundary-layer control has continued during the year; it is directed particularly towards increasing range and operational economy.

The group net profit, after providing £403,831 for taxation, is £243,574, an increase of £53,636.

We have continued to receive encouragement in our tasks and visits from Ministers and executives of all ranks in government departments and from the principal executives of organisations concerned with air affairs.

The report and accounts were adopted.

CRUSADER INSURANCE

ANOTHER RECORD YEAR

The annual general meeting of Crusader Insurance Company Limited was held in London on April 15th.

In the course of his statement to shareholders, the chairman, Col. Sir Gilbertson Smith, TD, DL, CA, said that during 1953 record results had been achieved in all sections of the company's business; the total net premium income rose from £1,098,000 to £1,220,000 and assets increased from £4,171,750 to £4,538,285. New life assurances amounted to £2,876,304 in sums assured. The life and annuity premium income was £553,435, an increase of £47,953. The directors declared a bonus on "with profits" whole life and endowment assurance policies for the year ending 31st December, 1953, at the rate of 34s. per £100 assured. (1952: 32s.)

Premiums in the fire branch increased by 35 per cent to £81,858. Direct writing of fire business overseas had been extended by arrangements made in Belgium and Holland.

The sickness and accident and miscellaneous premium income was 11 per cent higher at £527,284.

The company's group service department, which exists to help employers and employees in arranging staff welfare plans, had continued its work to such good effect that the company now had over 400 plans in operation, either in connection with group life pensions or sickness and accident insurance.

After paying tribute to a keen and loyal staff, with special reference to those in the company's "Veterans' Association," the chairman concluded: "With their help and that of their colleagues, I am confident that we shall continue to play a worthwhile part in this human and vital business of insurance."

NOTICES

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE
(University of London)

Applications are invited for appointment in October, 1954, to a Lectureship and an Assistant Lectureship in Economics. Salary scales £600 x £50—£900; £900 x £50—£1,150 and £500 x £50—£600 per annum respectively with superannuation benefits and family allowances. In assessing the starting salary due consideration will be given to age and experience. Candidates are invited to give in their application an indication of any special interests in the field of economics.

Applications, with the names of three referees, should be received not later than May 17, 1954, by the Secretary, London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2, from whom further particulars may be obtained.

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE
(University of London)

Applications are invited for appointment in October, 1954, to an Assistant Lectureship in *Economic History with special reference* to the economic history in the ancient world. Salary scale £500 x £50-£600 per annum, with superannuation benefits and family allowances. In assessing the starting salary due consideration will be given to age and experience.

Applications, with the names of three referees, should be received not later than May 12, 1954, by the Secretary, London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2, from whom further particulars may be obtained.

THE EDINBURGH AND EAST OF SCOTLAND COLLEGE OF AGRICULTURE invite applications for the temporary post of AGRICULTURAL ECONOMIST. The appointment will be for one year.

Candidates should hold a degree in Agriculture or Economics or Agricultural Economics.

Experience in Agricultural Economics or a knowledge of farm accounting would be an advantage.

Salary up to a maximum of £700 according to experience. The post is not superannuable.

Forms of application for the above post may be had from the Secretary, 12 George Square, Edinburgh, with whom applications and copies of testimonials should be lodged within two weeks of the appearance of this advertisement.

TOP level executive required as PLANNING MANAGER by large organisation with many branches, engaged in Light Precision Engineering. To be wholly responsible to the Works Director for machinery specification, design and manufacture of jigs, tools and gauges, and all processing and ancillary equipment for large flow line production and small quantity programmes. Responsible also for factory layout, capital expenditure and Work, Motion and Time Study Departments. Position offers adequate scope for further advancement, and only men who can offer proof of past experience at Senior Executive level will be interviewed. Our employees have been advised of this vacancy. The salary level has not been fixed, but it will be a substantial one commensurate with the character and the ability of the successful applicant. Full details of age, qualifications and positions held.—Box 520.

MIDLAND FIRM of manufacturing chemists, manufacturing proprietary medicines and a full range of cosmetics, require an executive experienced in marketing and advertising. This is a newly created position and is permanent and progressive, allowing a wide measure of freedom and scope for creative and administrative talents. Applicants should be somewhere between the ages of 30 and 40 years of age, and it is essential that they have already held a senior position with a company marketing nationally advertised lines. Salary would be commensurate with experience and ability. —Applications, in strictest confidence, to Box 526.

EXPORT MANAGER required by important Manchester engineering group, already doing substantial export business.

Applicants should have a sound knowledge of export business and experience in the sale of technical products abroad.

Engineering training or degree an advantage.

The appointment is a senior one, has excellent prospects and is fully pensionable.

Age 35-45.

Remuneration about £2,500 per annum.—*Applications*, which will be treated in strictest confidence, should be addressed to Harold Whitehead and Partners, Ltd., Management Consultants, 31 Palace Street, London, S.W.1.

WANTED by a light engineering company of world wide repute, a number of young men between 25 and 35 years of age. Applicants must be of good general education, preferably to University standard. They must be able to show by their record of education and experience in either industry or commerce that they possess personal and other attributes to qualify them for training for high level appointments.—*Apply Box 523.*

THE Administrative Staff College desires to appoint an additional member to its Directing Staff. Candidates must have substantial industrial experience in production or development. They should be not less than forty years of age. The appointment may be either on secondment from industry or in the direct service of the College. —Further detail can be obtained from the Principal, Administrative Staff College, Henley-on-Thames, to whom all applications should be addressed.

REQUIRED: German-speaking young business man, accustomed to work independently and experienced in the sale and distribution of trade-marked articles, for position in Great Britain, capable of development. Experience in confectionery or food field desired. Detailed offers in German with Curriculum Vitae, salary required and picture to be addressed to PEZ-HAAS Inc., 75 West Street, New York 6, N.Y.

ANY COUNTRY'S PERIODICALS supplied regularly. Business, scientific, technical and general publications. You pay in sterling for all publications including U.S. and Canadian. You pay publishers' charges only. Similar Book Service.—Write to Carrilics, Temple Chambers, Temple Avenue, Fleet Street, London, E.C.4, or telephone CENtral 1977.

GERMAN Dr. of Economics (28) wishes 6 or more months' work in trade or industry in Great Britain.—Box 529.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS IN ECONOMIC & SOCIAL STUDIES

Applications are invited for the above studentships, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £250 or £300 per annum. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University.—Applications should be sent not later than June 1, 1954, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

AUSTRALIAN NATIONAL UNIVERSITY, CANBERRA

RESEARCH SCHOOL OF SOCIAL SCIENCES

Applications are invited for appointment to a READERSHIP IN ECONOMIC HISTORY.

Salary range £A1,788—£A2,038 (gross).

Reasonable travel and removal expenses are payable.

The post is permanent and one year's study leave, with travel allowance, will be granted after each five years' service.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is May 31, 1954.

VICTORIA UNIVERSITY COLLEGE, WELLINGTON, NEW ZEALAND

Applications are invited for the post of SENIOR LECTURER IN HISTORY.

The salary will be £1,092 8s. per annum, rising by annual increments of £50 to £1,292 8s. per annum. The initial salary will be determined according to the qualifications and experience of the appointee.

Approved fares to Wellington will be allowed for the appointee, his wife and his children.

The successful applicant will be expected to take up his duties on August 1, 1954, or as soon thereafter as may be agreed upon.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in New Zealand and London, is May 31, 1954.

KUMASI COLLEGE

CORRECTION.—The Salary Scales shown in the advertisement which appeared in the issue of *The Economist* dated March 13, 1954, should have read:

"Senior Lecturers £1,400—£1,850 p.a."

and not £1,400—£1,500, as stated. The appointments will remain open until May 14, 1954.

MARKET RESEARCH ASSISTANT (female) required with previous research experience and/or applied statistical knowledge. University degree preferred. Accuracy and general intelligence essential. Confidential post as assistant to Research Director. Age limits 22-35.—Apply, in writing, to *Personnel Director, John* Haddon & Co., Ltd., 11/12 Salisbury Square, London, E.C.4.

THE BRITISH INSTITUTE OF MANAGEMENT requires an ASSISTANT MANAGER FOR THE EDUCATION AND TRAINING DEPARTMENT. The appointment which involves individual responsibility and an ability to work with others, will be mainly concerned with education for management at technical college level. Experience of industrial education and training is necessary and teaching experience would be an advantage. Salary according to qualifications. The post is pensionable. Applications, in writing, should be addressed to the Director, 8 Hill Street, W.1, and should be marked "EDT."

AN ASSISTANT is required in the Statistical Department at the London Head Office of an iron and steel manufacturing company. Enthusiasm for the use of statistics and statistical methods is essential and one of the following qualifications is desirable :—

1. A University Degree (with a bias to statistics).
2. Associateship or Fellowship of the Association of Incorporated Statisticians.
3. Certificate or diploma of the Royal Statistical Society.

Applicants, who should not be more than 30 years of age, are invited to send full particulars of education, training and experience, to Box 527.

A WELL-KNOWN Industrial Company requires a Chartered Accountant, experienced in Management Accounting, to fill a responsible vacancy on its permanent staff. Those who have held positions of responsibility in industry will be considered, and a University Degree is desirable but not essential. The prospects are outstanding. A commencing salary up to £1,500 a year will be paid, but the successful applicant would be expected to reach upwards of £2,000 within five years. The appointment is pensionable. Applications are invited from accountants not over 35 years of age, giving full details of qualifications, posts held, etc., in confidence, to Box 525.

B.B.C. requires Talks Producer (British) to formulate ideas for and produce discussions, talks and talks features for rebroadcasting in North America. Sound academic background and general knowledge, appreciation of style of spoken and written word, imagination, tact and sympathetic interest in all kinds of people are essential. First-hand knowledge of U.S.A. and Canada and of their people and affairs and experience of writing would be an advantage. Salary £870 with 5 annual increments to maximum £1,175. Requests for application forms (enclosing addressed envelope and quoting reference "143 Ect.") should reach Appointments Officer, Broadcasting House, London, W.1, within 5 days.

MARKET RESEARCH. Applications are invited from male graduates in economics for an appointment in the Market Research Department at the Head Office of a major oil company. Aged 23-26. Salary will be based on qualification and experience. Social Club. Luncheon vouchers. Pension and Life Assurance scheme. Application, giving full details, to Box 531, quoting ref. MAA.79.

THE Council of Industrial Design requires immediately a temporary Senior Recruitment Officer, man or woman, for about six months. University education and experience of recruiting senior staff essential. Age preferably 30-50. Part time arrangement considered. Salary: men, £800-£1,200 p.a.; women, £700-£1,000 p.a., according to qualifications and experience. Applications in writing with details of age, education and posts held with dates to The Establishment Officer, Tilbury House, Petty France, S.W.1.

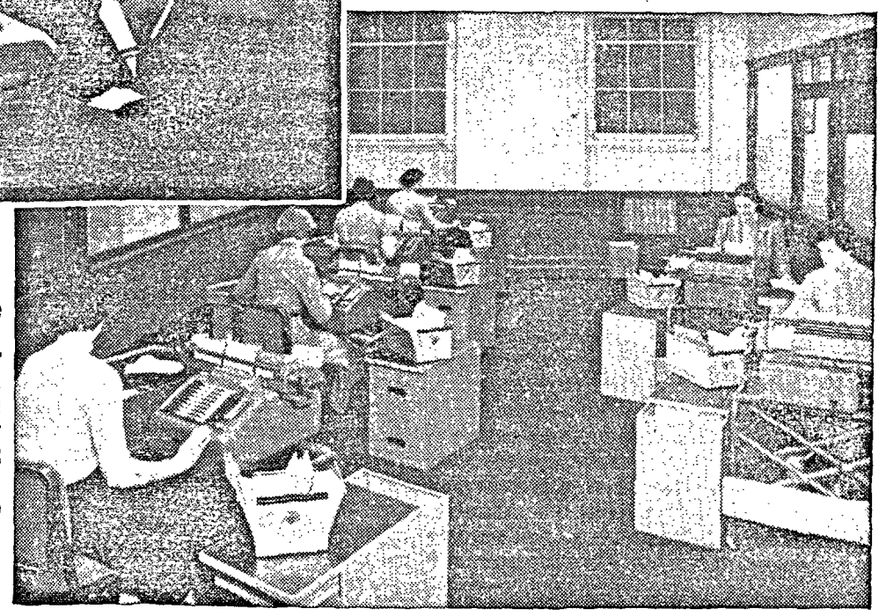
In a small office—
switch one machine to all jobs

In a large office—
switch all machines to one job



...That's Sensimatic Accounting

OUT WITH OFFICE DELAYS, posting "peaks," *overtime*—in with *Sensimatic* control over the production of accounts! A small firm may need only *one* Burroughs Sensimatic Accounting Machine to handle all its different routines. The large organization, which can switch every Sensimatic simultaneously to one type of work, will certainly reduce the size of its machine installation.

The Sensimatic's endless versatility originates in the Sensimatic control unit—which directs this unique machine through any *four* different posting operations in any combination. There's no limit to the number of control units you can use on one machine.

Call Burroughs about the Sensimatic now. Five versions are obtainable (giving as many registers, or combinations of registers, as you need), and you'll be surprised at the low cost.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service Offices in principal cities.

*WHY "SENSIMATIC"?

This is the sense-plate of the Sensimatic which guides the machine automatically *through every mathematical function and carriage-movement of any four posting operations. Turn the selector switch and you're on (say) Accounts Receivable; another quarter turn and the machine's set for Stock Records, and so on.*

BUILDING SOCIETIES AND HOUSING

The Bounding Giant — How Many Houses?

Baits for Borrowers — Better Houses for the Money

The Bounding Giant

THERE occurred among the building societies last year the greatest expansion they have experienced—a growth of around £170 million (about 11½ per cent) in total assets. Even for a movement that has doubled in size in the last eight years and quadrupled in the last twenty two, such expansion is phenomenal. All the evidence suggests that the movement has not yet reached its limits even if the pace of further expansion may now become a shade more moderate. Building society people believe that for the next few years annual figures should continue upwards and show some exciting bumping races as one mammoth society chases another for the first, second, third or fourth place.

Almost everything went right for the societies last year. Money poured in from investors at 2½ per cent net on shares and 2 per cent net on deposits; it poured out again on mortgage loans at 4½ per cent as the private house building programme gathered speed. The societies need an equilibrium which will encourage the investor without discouraging the borrower and still leave a margin of about 2 per cent, out of which to meet expenses, pay tax on share and deposit interest, and make up for the lower return obtained on such assets as have to be kept liquid. That equilibrium seems to have been found. Shareholders and depositors provided upwards of £160 million more; mortgagors borrowed upwards of £300 million and after allowing for regular repayments the mortgage debt went up by about £140 million. Some of the smaller societies could probably have used more money with advantage, but the inflow was still impressive.

Moreover, the investor's money was again being used for its proper purpose of home building and home buying. New houses were rising fast and the building societies were resuming, to a corresponding extent, their main job of financing the purchase of new homes. Too often in the years immediately after the war, the building societies' rising aggregates reflected the inflow of "hot money" and the outflow of advances on existing properties changing hands at ever increasing prices. Last year's expansion of mortgages was based more on new bricks and mortar, and last year's inflow of investment money was more healthy than in some recent years.

Most societies have avoided the temptation of dipping too deeply into their holdings of liquid assets in order to lend more money than was coming in from shareholders and depositors. The analysis on page 338 of the 36 biggest societies in the movement shows that the general tendency has been to run down slightly the ratios of liquid assets to liabilities to shareholders and depositors and the ratio of reserves to total assets, but the trend has been kept in strict moderation and responsible societies have maintained liquid ratios in the region of 15 per cent or better.

These reserve and liquidity ratios are of the utmost importance to intending investors. The investor accepts 2½ per cent net on shares or 2 per cent net on deposits for the very reason that he is promised repayment at short notice. The society lends out the bulk of its assets on mortgages which will be repaid only gradually over a period of years. In a way the societies are always borrowing "short" and lending "long," but provided that an adequate liquid ratio is maintained they can do so without risk, just as the banks can without risk hold in cash very much less than their total liability to their depositors. If the recent tendency for business undertakings to use the societies as a temporary home for funds which they will wish to employ themselves when the opportunity arises were to become large, the discriminating investor would require higher

BUILDING SOCIETY GROWTH
(Figures for 1953 estimated)

	1951	1952	1953
	(£ million)		
Total assets	1,357	1,478	1,650
Due to shareholders	1,057	1,186	1,345
Due to depositors	208	197	200
Due on mortgage	1,158	1,263	1,405
Advanced on mortgage (during year)	268	266	300
Number of shareholders (mn.)	2.36	2.47	2.64
Number of depositors (mn.)	0.62	0.60	0.59

liquid ratios to match it. But most building society men feel that the tendency is not out of hand. And there is one strong force limiting its growth ; company money does not enjoy the special tax arrangements that apply to small personal investments. On individual investments up to £5,000 the societies pay income tax on behalf of members' interest, not at the standard rate but at a "composite rate" representing the tax liability of a sample of building society shareholders, taking the standard rate man with the low tax man and the no tax man. For the last financial year the composite rate was 4s. 10d. in the £ while the standard rate was 9s. With no change in the standard rate this year, the composite rate is unlikely to show much change.

On all company money and on individual investments over £5,000 the societies have to pay the full standard rate of tax, which they can only do by paying a lower net rate to such investors. Since last year, moreover, surtax payers have been obliged to gross up building society interest in their returns and to gross it up at the full standard rate. The composite rate takes account of those investors whose incomes are below the level that attracts standard rate tax, and they do not enjoy the right to reclaim tax on their interest. There is no sign that either the very rich or the very poor are discouraged from building society investment by these requirements of the tax law.

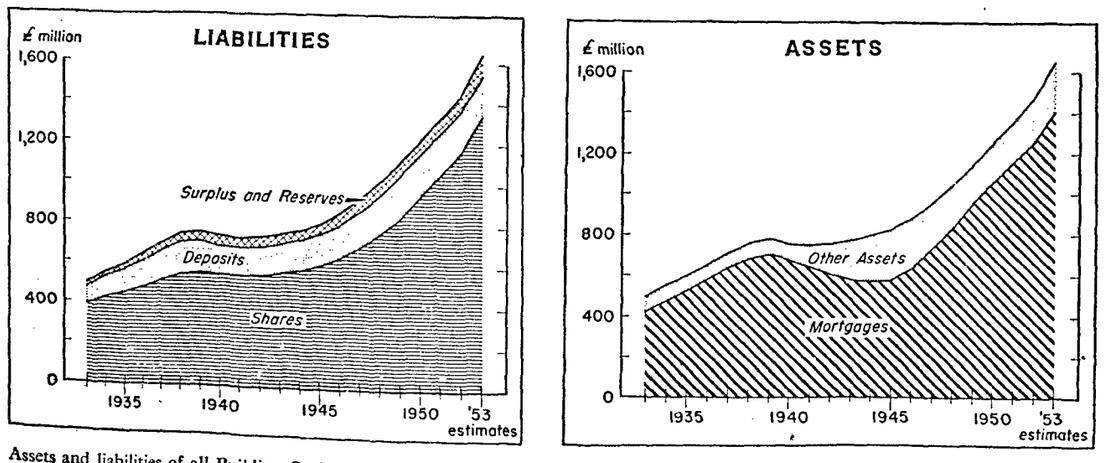
Now that the building societies have found equilibrium between the rates they pay on shares and deposits and the rate they charge on mortgage, they will be reluctant to alter them. They move their rates only in response to pronounced and prolonged changes in interest levels. Last autumn's one-half per cent reduction in Bank rate produced no change, but it did make investment in building societies more attractive to investors. A further small change in either direction would probably again be disregarded. Changes in rates by individual societies will, however, occur. The Halifax, the biggest society, may come up to the general level of 2½ per cent net on shares, compared with its present 2¼ per cent. With its 19 per cent liquidity ratio it will then be a very strong competitor for the investor's favours. There remains also a fringe of societies (with one exception small) which pay more than the general rate. They will presumably continue to do so.

The intending investor can still regard building society shares and deposits as attractive. The yield obtainable from a building society share paying 2½ per cent net is £4 10s. 11d. gross, which does not compare unfavourably with gilt-edged yields. Investors have seen the advantage and have poured money into the societies at a time when some other forms of national saving have not been prospering. Undoubtedly that flow of investment also owes something to the revenue probe which obliges bankers, including savings banks, to disclose interest payments in excess of £15 a year, but the societies have rightly done nothing to encourage transfer of savings from the banks.

It is inevitable, too, that when money is flowing freely into the building societies from investors of every income group, the big societies should attract most of it. There are approximately 800 building societies in this country. The large majority are small but well-managed local concerns. The mere fact that the salient figures for three dozen of the largest are analysed in this issue does not imply that there are no others as good ; often the family solicitor or local bank manager will be particularly well informed about local societies.

The best advice that can be given is to set out the general principles which ought to govern building society investment. First, a high percentage of liquid assets is vital ; the rigid application of that rule also automatically excludes all those societies (there are not many such) that have any appreciable bank overdraft. Secondly, it is advisable to study with care all those societies which bid above the market for money. In deciding to put his money in a building society the investor has already made up his mind to be content with a modest yield in return for freedom from fluctuation in capital value and the right to withdraw at short notice. There is no justification for compromising that decision for the sake of a fraction of one per cent extra. It is a reasonable assumption that those societies that bid highest for money are those that need it most. A third guide is available: the fact that a building society is a member of the Building Societies Association creates at least a presumption that it observes the ordinary standards of fair dealing which are deeply entrenched in the movement. The converse is not true ; there are good societies outside the association, but the difficulty is to know them. Even after these precautions the investor will not know whether the society of his choice has pursued a cautious lending policy on mortgages. Most of the strong ones, however, can afford to do so. Having made his choice along those lines the investor still has to decide whether to place his money on deposit at 2 per cent or to buy the shares paying 2½ per cent. His decision will depend on the purpose of his investment. By becoming a depositor he acquires a first charge on the society's assets, and he usually gains the right to slightly quicker repayment. The sacrifice of ½ per cent in interest might be worth while to the fairly wealthy investor depositing temporarily a substantial sum which he intends to use at short notice, either on the Stock Exchange or in his own business. But the ordinary small saver may feel that he has taken every precaution to choose a strong society and that the risk of anything happening to jeopardise its share capital is sufficiently remote. That is certainly true of the best societies in the movement. They cater well for investors who are prepared to give up ideas of capital gains and be content with a modest regular return coupled with security. Their members will not get rich quickly, but they may still sleep soundly.

TWENTY YEARS OF EXPANSION



Assets and liabilities of all Building Societies in Great Britain—Source : Report of the Chief Registrar of Friendly Societies for 1952 ; figures for 1953 are estimates made by *The Economist*.

Baits for Borrowers

THE building societies already play a big rôle in the nation's housebuilding plans ; the Government and some of the local authorities would like to make it bigger still, for an obvious reason. Houses built by the local authorities for letting involve a subsidy per house of £35 12s. per year for 60 years, of which £26 14s. a year comes from the Exchequer and £8 18s. a year from the local rates. Houses built for sale, whether by the local authority or a private builder, involve no public subsidy. If the house building programme is likely to remain at or near 300,000 houses a year, heavy drafts on local and public funds will continue unless the proportion of houses built by the local authorities for letting is reduced. Hence the growing preference in high places for houses for sale ; hence also the emerging untidiness of local authorities building houses for sale in competition with private builders.

With their strong finances and long experience of the housing business, the building societies are well qualified to assist a change towards a higher proportion of houses for sale. The consequence will probably be that building society figures continue to rise even if the nation's total housing output does not. The chairman of the Co-operative Permanent society, indeed, recently estimated the potential market for new houses for sale to owner-occupiers at 200,000 a year. A time of buoyant demand for house mortgages may also be a time for circumspection about lending standards. All societies are aware of the problem of persuading an intending mortgagor that though the property he wishes to buy justifies the loan he is seeking, his family income does not. In practice, it is not the house but the breadwinner's earnings that pay off the mortgage. How far is it justified to stretch that traditional prudence ?

Shortly—and possibly by the time of the annual congress of the Building Societies Association in London at the beginning of next month—there should be the announcement of a scheme of co-operation between the Treasury, the local authorities, and the societies to increase the proportion of the valuation of a property which can normally be borrowed from 80 per cent to 90 per cent. Powers making such an extension possible already exist under the Small Dwellings Acquisition Act and the Housing Acts, but they have been comparatively little used. The present project is for an agreed plan within the framework of the Housing Acts by which these larger advances should be more freely given, any resulting loss being shared between the three partners, the Treasury, the local authority and the society.

Present lending practice of the societies, however, probably approaches more closely to 90 per cent advances than is generally supposed. The normal practice is to lend up to 80 per cent of the purchase price or the surveyors' valuation, whichever is lower. But that 80 per cent is often extended to 85 per cent for the small properties involving loans of under £2,000, and to 90 per cent or more for specially attractive propositions such as the sale of rent-controlled properties to sitting tenants. And if the mortgagor is willing to support his security with an appropriate life insurance policy, most societies would lend up to 90 per cent.

These figures are a good deal higher than the founding fathers of the movement would ever have thought proper. But their justification rests on the proof that the societies do their business with a remarkably small loss ratio. In 1952, out of total mortgages on 1,675,385 properties amounting to £1,263 million, only £2,129,000 (0.17 per cent) were over 12 months in arrear and only £827,000 (0.065 per cent) were properties actually in the possession of the mortgagee. The final loss on mortgages realised was only £609,000 (0.048 per cent of the mortgage debt). It seems to be recognised that the loss ratio may be higher when the initial personal stake of the borrower is reduced. The Government and the local authorities naturally hope that the saving in housing subsidy will outweigh their share of the loss. Their best hope of being right about that would be to leave the societies to select the borrowers.

Moves to reduce the initial down payment on houses for sale may not be the only fillip which the building societies are encouraged to give to the housebuilding programme. The chairman of the Abbey National society in his recent speech disclosed "the germ of an idea" for the co-operation of the societies in the building of houses to let. Sir Harold Bellman did not particularise, but it seems that he was thinking in terms of a three- or perhaps four-cornered

arrangement whereby an estate would be developed by a housing association possibly in association with a builder, the building society standing behind the association. This would not mean a return to the builders' pool system of the years between the wars, but it has some family resemblance to it.

All these are methods of sales pressure, of letting the owner-occupier occupy on easy terms. All carry some measure of risk, to the building society movement and also to the public. From the building society point of view they are pump-priming devices, coming into action when the pump is working well and the societies are enjoying a rapid and on the whole healthy expansion. They can lend on mortgage all the money they can get in in the form of share and deposit investments from the saving public. If they seek more investment money, they may have to look to less steady sources for it. Indeed, the time must come (unless house building continues to boom and prices again rise fast) when a large corpus of mortgage money will be flowing back to the societies; then they will have to use their wits if they are to avoid slowing down in their activities.

From the public point of view, it may seem rather odd that when finance for all other forms of hire purchase is considered potentially inflationary and is kept under official control, the hire purchase of houses is being actively extended by the Government. Yet the Government is in the business up to the hilt. It offers to advance Treasury money at a rate which undercuts the societies. Four and a quarter per cent is the charge for a local authority mortgage of over 15 years duration; four per cent is the rate which the Treasury charges the local authorities for the money from the Local Loans Fund; and the cheapest new mortgage from a building society is 4½ per cent. It seems extraordinary that these facilities have not been used to an extent which caused the societies serious worry.

It is equally extraordinary that the opportunity to live in council houses at heavily subsidised rents has had hardly any effect on the urge to become an owner-occupier paying the full price. The government-local authority-building society joint plan is likely to meet with some success because of that owner-occupier instinct. In the long run it may even promote the habit of saving, for the owner-occupier responsible for regular mortgage repayments will perforce become a saver. In the shorter run these schemes for saving housing subsidies by inducing people to buy seem at best a poor substitute for a rent system that would not automatically confer a subsidy on council house tenants whether they need it or not and that would encourage some private building of houses to let.

The trend is again towards freedom in building and the speculative builder is regaining a little of his prewar position. The familiar advantages and the familiar costs are returning. A fairly high rate of output, competitive prices and easy purchase terms are the advantages. A high density per acre and savings on quality and appearance are the dangers. The Ministry of Housing and Local Government seems prepared to accept them. The experience of local authorities has recently been that when they reject

What is the HALIFAX?

The Halifax is the popular name for a popular Building Society with headquarters in Halifax, Yorkshire.

The Halifax is a mutual Society which for a hundred years has encouraged thrift by providing facilities for savers and investors on the one hand and for home buyers on the other hand.

The Halifax affords for investors the double satisfaction of a good rate of interest with income tax paid by the Society and of indirectly helping to provide loans for homes.

The Halifax provides a speedy and efficient service for home buyers who month by month reduce their indebtedness to the Society and approach complete independence in homes of their own.

The Halifax has assets of £214,000,000—real evidence of public confidence—480,000 investment accounts and 270,000 mortgage accounts.

The Halifax is a national organisation which operates through 111 branches and 650 agencies—every one of which can be relied upon to provide personal and helpful service.

the World's Largest BUILDING SOCIETY

Home Ownership and Investment booklets are available at any of the Society's branches and agencies.

BRANCHES & AGENCIES THROUGHOUT THE UNITED KINGDOM

"Tell me, please — where should I invest this money?"

Professional men are no strangers to questions such as this. So many people who quite suddenly come into possession of substantial sums are at a loss to know how to invest them.

A little probing reveals the essentials they seek—safety for capital, accessibility without trouble in case of need, a reasonable and regular rate of interest.

Where can you find these needs better served than by investment with a Building Society? There is the added advantage that income tax is paid by the Society.

We shall be glad to send you full details.

CO-OPERATIVE PERMANENT BUILDING SOCIETY

NEW OXFORD HOUSE · LONDON · W.C.1

OVER 100 YEARS EXPERIENCE IN THE SERVICE OF INVESTORS

a plan on grounds of appearance alone, the Minister usually overrules them. It is neither the achievement nor the fault of the building societies that they find themselves cast for a big rôle in the new policy. But if they play the rôle wisely and with restraint their experience and expert knowledge can ensure that the expanses of rustic flettons that seem to be England's destiny will be backed by sound finance and occupied by solvent householders.

How Many Houses?

BY A CORRESPONDENT

HOW many houses does this country want? The inconvenience and social ill-effects of having too few are grievously familiar; but a country whose limited savings are much needed for industrial and overseas investment cannot afford to build too many. The "right" number depends on rent and subsidy policy, on the size and distribution of incomes, on the trends of population, and on changing habits of living. The guesses presented below may help to set some limits in answer to the first question.

A convenient starting-point is the census night of 1951. There were then 13.3 million occupied dwellings in Great Britain. These include some which, although split up in a satisfactory way into flats, are regarded as single dwellings because the flats have no separate access to a street or public staircase. There will also have been some houses temporarily vacant on the census night. In round figures, 13½ million is a good estimate of the stock of houses (including flats) in 1951. The census distinguishes 14½ million private households, but many of these include what is termed, in the elegant official language, a "fissionable element"—that is, the nucleus of another potential household, commonly a married son or daughter living in the parental home. There are also bachelors and spinsters who would marry if they could find a house; there are old people who would prefer to keep a place of their own; there are people living in lodgings or in hotels during the delays of house-hunting. The potential extra demand from all these classes can be estimated as 900,000 houses at 1951 prices and rents.

There were thus nearly 15½ million households and potential households in 1951, and only 13½ million houses to hold them. About half of this deficiency was overcome by a doubling-up of households—that is, where two families share a house but do not eat at the same table. The rest was overcome by an amalgamation of households, with everyone eating together. Half the doubling-up is in Greater London, where it is the joint result of large houses and high rents. In an area of small and overcrowded dwellings, like Scotland, doubling-up is much less frequent, no doubt because it is usually physically impossible to fit two families into the same house. Amalgamation of households is much more evenly spread; but it is low in both London and Scotland, and high in the Midlands, Merseyside and Wales.

In estimating the deficiency of houses it must not be supposed that either doubling-up or amalgamation of households will disappear completely. Each may encourage a sensible and economic use of property too large for present-day households. Let it be assumed, for the purpose of this argument, that both doubling-up and amalgamation are reduced until each affects 2 per cent of the number of dwellings; for comparison, doubling-up affected 19 per cent of dwellings in Greater London in 1951, but only 1½ per cent in Leeds and district; while amalgamation affected about 6 per cent of dwellings in London and Scotland, and 10 per cent in Wales.

Given this assumption, some 1½ million more dwellings were already wanted in 1951. By 1970 there will be about 10 per cent more men who are or have been married. Since much the most frequent kind of household is one with a married or widowed head, it looks as though provision will have to be made for 10 per cent more households—and that would call for another 1½ million dwellings. The increases will be mainly at ages above 50, but it would be rash to assume that many of the coming generation of grandparents will be able to live with their children.

Thus a reasonable social requirement emerges that there should be, in 1970, at least 3 million more houses than there were in 1951; "at least" is reasonable because the number of unoccupied houses is now inconveniently low for people to move with fair freedom from one part of the country to another. But how many houses will naturally pass out of use—through conversion to another purpose or final decay? And how many more will be replaced in the course of slum clearance? There appears to be no solid evidence for the suggestion that 200,000 houses a year are falling out of use; it must be a gross exaggeration for otherwise the housing situation would not have improved as much as it has done. According to the White Paper, "Houses: The Next Step,"* published last November, there are

HOUSING NEEDS UP TO 1970	
Irredeemably decayed in 1951 (say)	500,000
For replacement, at 150,000 a year for 20 years	3,000,000
Requiring replacement by 1970	3,500,000
Newer houses lost by conversion to shops, offices, etc., or demolished for roads or other building (say)	250,000
Dwellings for new families	3,000,000
	6,750,000
Built 1951-3.....	750,000
	6,000,000
Required annual rate of building, 1954-70, Great Britain.....	350,000

140,000 houses still standing which were scheduled for demolition before the war, and the total number of irredeemably unfit houses "certainly runs into hundreds of thousands." This gives a starting point—the backlog of slum clearance which must be tackled as soon as possible. How many more houses become ripe for replacement each year? There is no reason why a house should not be habitable even at five hundred years old, but those houses that it is tolerable to preserve beyond a century must be very few. In particular, 2¼ million of the houses let by private landlords are over a hundred years old, and 4 million are over seventy-five years old; these are predominantly the

* Cmd 8996.

dull rows of 19th century industrial housing. The stock of housing, therefore, is already somewhat overweighted by age, and to right this it is necessary to replace more than 1 per cent of the stock of houses each year. In fact, it is desirable to replace at least 3 or 3½ million of the 4 million rented "over 75s" by 1970; for by that time the youngest of them will be over 90.

But these fanciful figures of demand must not be spun out without reference to the price. Let it be supposed that by 1970 real income per family is substantially higher—perhaps by 20 per cent—and that rent controls and subsidies have been much further reduced. How would these changes affect the demand for housing? Few people need or want two houses, and prices and incomes affect mainly the relative demand for the different qualities of house. The stock of houses required will be affected only to the extent that high rents and low incomes may encourage sharing, or low rents and high incomes may make it less necessary. But if there is a strong demand for new houses, while old and inconvenient houses fail to command a rent which covers their repair costs, the rate of replacement will rise; and if new houses stand empty because they are considered unreasonably expensive, and the maintenance and improvement of old houses is more attractive, the rate of replacement will fall. Which way will the balance tip?

If the question is put in terms of building houses to let to working-class families—especially the poorer families, who are most likely to be found in the houses that require replacement—there is little doubt that a high rate of construction would depend on a continued subsidy. This would be so even if rent control of private property were removed, and even if real incomes were to rise substantially—simply because the full unsubsidised rent of new property would be considered an unreasonably large proportion of normal family incomes, especially of large families with several children. The unsubsidised rent, including rates, of a new three-bedroomed council house is now of the order of 40s. to 45s. a week; even if the net advantages of living in a new house (rather than one fifty years old) are put as high as 20s. a week, the landlord of the older property would have no difficulty in letting and even improving it.

It follows that a boom in building small houses for rent can only be at the expense of the taxpayer. The experience of the thirties in England, however, recalls another kind of boom—the building of unsubsidised houses for sale to the middle classes, who moved outwards into their rows of suburban villas and freed older houses for poorer families. The prospects of a repetition of that experience must be affected by the great deterioration in middle-class real incomes, after tax, since the thirties. A really substantial boom in building houses for sale would depend on the availability of building society or other finance, on easy terms, to the better-paid industrial workers, coupled with state assistance in meeting the "down payment." The experience of Northern Ireland shows that the movement could also be helped on its way, at relatively low cost, by offering capital subsidies for the building of small houses for sale. The movement of families to these houses would hasten the decay of the centres of the cities, but do nothing to replace them.

It is thus a fair guess that a "free market" would not give an average of 350,000 new houses a year—in other words, judgment of what might be socially desirable runs far ahead of individual willingness to pay for it. Such a rate could be achieved, at great expense, by continued subsidies to local authority house-building—which could be directed to the orderly replanning of cities. It could perhaps be achieved, at much lower expense, by fostering the building of houses for sale—but this would not of itself solve the problem of decay, nor would it directly assist the worst-housed families. Common sense suggests that the best of both policies will still be needed.

Better Houses for the Money

BY A CORRESPONDENT

FOR several years, efforts have been made to reduce the cost of new houses. The results have not been spectacular; they have indeed barely kept pace with the increase in building costs. For about a year costs have been stable, but it seems unlikely that they can be held at their present level for much longer. Must the country, then, at the outset of a drive to encourage home ownership, face a further rise in the cost of new dwellings? Or is there hope from further attempts to lower costs or to get better value for the same amount of money?

The first attack on housing costs was made some three years ago by reducing floor areas. The present Government took over the plans for "The People's House" prepared under the previous administration, which aimed at saving about 150 sq ft on the average three-bedroomed local authority house. It is difficult to find out what has since happened, but the average house of this type probably still contains something over 900 sq ft. Certainly, British houses are larger than comparable units on the Continent, or in America.

Smaller houses, however, involve a different pattern of living, and this is not easily changed. It is generally held here that without such a change in ways of living no significant further economies are to be obtained by squeezing the floor area of houses or flats. Whether the programme contains too many houses with three or more bedrooms is more arguable. Figures for the first three quarters of 1953 show that about 56 per cent of all new dwellings approved for local authorities and new towns had three or more bedrooms. This is a higher proportion than in 1951 or 1952. It suggests that the types of dwellings now being built may not suit the future needs of the population.

The second approach to economy has been through a rationalisation of the byelaws. Significant savings have been made by removing out-of-date and unduly restrictive rules. But much more remains to be done, and appreciable further economies could be obtained by allowing designers more freedom within a general framework of minimum standards. The byelaws of many local authorities are still basically negative; they betray at many points their origin in a desire

I must know that my capital is absolutely secure..

INTEREST ON SHARES 2½% PER ANNUM INCOME TAX PAID BY THE SOCIETY

I can't afford to take chances. I must know that I can withdraw all my savings in full, whenever I need them. That's why I invest in Leek & Moorlands. There's no chance of depreciation and my money earns 2½% interest with Income Tax paid by the Society—equal to over 4½% gross if you pay tax at 9/- in the £.

to prevent speculative builders building badly by traditional methods. The effect is not only to stop bad traditional practice, but also very often to inhibit or forbid sound non-traditional practice.

Such a case is the byelaw in force in one of the biggest housing authority's areas requiring that no wall should be less than 8½ inches thick; its effect is to reduce or eliminate the savings to be obtained from cross-wall construction, since it makes no distinction between load-bearing and non-load-bearing walls. Clearly, the byelaws should lay down in principle the performance required of all walls in terms of resistance to weather, fire and heat-loss, while the structural properties of load-bearing walls should be taken care of by the standard codes of practice. Many byelaws contain other unnecessary and extravagant requirements based, very often, on outmoded ideas of the performance of buildings. Though it is several years since the Girdwood Committee's recommendation that ceiling heights of 7 ft 6 in should be accepted, there are still byelaws requiring room heights of at least 8 ft. Such rules, if redrafted positively and in terms of principle, would still give adequate protection to tenant or purchaser, while setting the designer free to seek better value for money.

The approach to economy in housing should involve study of housing layout as a whole, for substantial savings could well be obtained from the introduction of new ideas and the closer co-ordination of the different interests involved in the development of an estate. It may be that the Ministry of Housing and Local Government could help in this by linking their approval of expenditure on roads and services more closely with the approval of expenditure on the houses themselves. At present, these two approvals are given separately, and there is insufficient incentive for the local authority to reduce its cost on roads and sewers. This, of course, affects private developers as well. Most authorities' byelaws still require a minimum distance of 70 ft between frontages. This rule, which will soon be a hundred years old, appears to be largely based on the idea of a 24-ft carriageway with footpaths on each side—a type of road layout unnecessarily expensive in capital and in maintenance costs, aesthetically depressing and often dangerous.

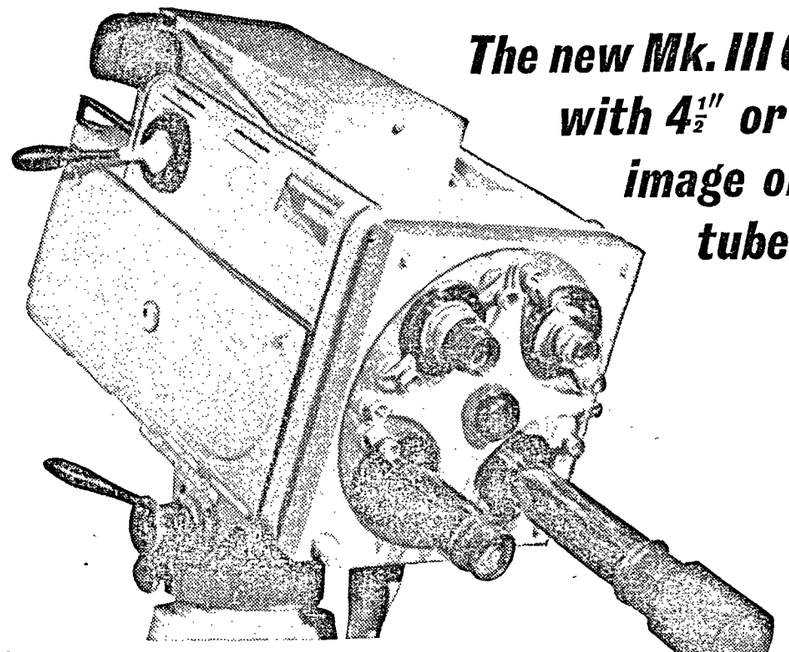
Why should not road widths on housing estates be thought of, not in terms of arbitrary measurements, but in terms of the volume and speed of the traffic they will have to carry? If roads were laid out in short lengths with fairly sharp corners, widths could be reduced—in some cases—to 16 ft. Since fast traffic along such roads would be impossible, footpaths on both sides would be unnecessary, and storm water drains, if required at all, could be kept to one side of the road. Aesthetically, as well as economically, there is a good deal to be said for thinking of service roads on housing estates more on the lines of the country lane than of the arterial road.

Two further avenues to better value in housing have, as yet, hardly been explored—improved organisation on the site and cheaper prefabricated components. The Building Research Station has shown that the average number of man-hours expended per house is in the region of 2,500, but the range is from 1,500 to 4,500 man-hours. Site and weather conditions will naturally account for some part of this disparity, but much of it is due to factors that ought to be under the control of the building owner and the contractor. Better preparation by the architect and the contractor before work starts on the site, and better management on the site by the contractor, can speed up construction and reduce total cost.

Building workers have less machine power to assist them than workers in other industries. Additional machinery on the site is beginning to be seen, and if site management and pre-planning can be improved it will no doubt help to reduce costs. There is also good reason to expect that a determined effort could improve and cheapen factory-made components of various kinds. Although many of the prefabricated structural systems which were introduced immediately after the war have proved uneconomic, it is significant that four or five non-traditional systems of construction for houses are still holding their own against brick building in the market. Another wide field for improvement is in factory-made components to be incorporated in either traditional or non-traditional contracts. It is surprising that the Ministry of Housing and Local Government and some of the big housing organisations have failed to exploit their "countervailing power" as large customers of industry. Why should certain factory-made building components be more costly than precisely comparable articles made, say, in Denmark? A prefabricated concrete staircase can be made for about £14 in Denmark with an excellent terrazzo finish. The same article, but with an inferior finish, costs about £10 more in this country. Similarly, metal windows are made in Denmark below the prices charged for similar components in this country. In school building, non-traditional systems of construction and various other fittings and components have been developed which are at least competitive with traditional products. Would not a similar effort in housing pay for itself?

These are some of the ways in which better value for money might still be obtained in the building of houses. But generalised recommendations cut little ice; control is dispersed and while there has been plenty of good advice and some intelligent experiment, the lever has not been powerful enough to shift the mass. Nor is salvation yet being provided in the field of private enterprise. One important source of finance for private house building insists that all the houses for which it lends money shall have hipped roofs, bay windows and no clinker blocks (providing better thermal insulation than bricks) for internal wall linings. Such a concern could do with more up-to-date technical advice. The Ministry of Housing's experiments have so far concentrated on particular facets of the problem and their methods of administrative control over housing costs are not calculated to give designers adequate incentives to genuine economy.

What seems to be needed is a concerted attack on the whole collection of problems by the Ministry of Housing and Local Government, in association with one or two of the more important housing organisations—and why should private firms be excluded? The attack should start with a complete overhaul of the byelaws and other rules and regulations governing both the construction of the individual houses, and the layout of the whole development. The experiments should also involve collaboration with nominated contractors from the beginning of the design stage, costs and labour deployment being analysed throughout the whole sequence of the operations. Selected manufacturers of components should also be brought in at the earliest stage in a determined and continuous effort to reduce cost, improve quality, and provide the site craftsmen indirectly with a higher ratio of machine power. Such a campaign might well result in better houses for the money.



The new Mk. III Camera with 4½" or 3" image orthicon tube . . .

The use of the new Marconi camera BD 687 with 4½" or 3" image orthicon tube and the employment of better circuit techniques in the camera channels have reduced to a negligible degree such faults as black halos, edge effects and electronic ghosts; whilst resolution, grey scale and signal-to-noise ratios are greatly improved. Ingenious design has led to simplicity of control and provided for fully remotely controlled applications.

Besides the camera the channels BD 808/809 comprise a Camera Control and Preview Monitor, Regulated Power Supply Unit and Focus Supply Unit.

so many projects depend on

Plessey

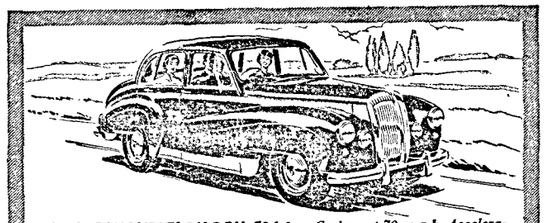
The Plessey Company Limited
Ilford · Essex
electronics • radio and television • mechanics
hydraulics • aircraft equipment

So diverse are the interests of **Plessey** *in the Aircraft, Radio, Television, Electrical and Mechanical Engineering industries, that it is difficult to instance any large project in these fields which does not at some vital stage depend upon the Company. The service offered to top managements in industry or Government service is unique. Expressed briefly, it is the development of an idea through to prototype stage and on to production—cheaply, efficiently and in time to meet a market.*

If you have a new product in rough outline that is ripe for specialist development you cannot do better than talk it over with **Plessey.**

PP5h

You don't have to choose between



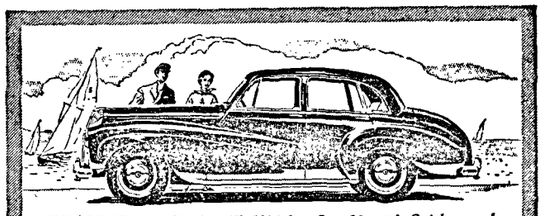
THE 'CONQUEST' SALOON. *75 b.h.p. Cruises at 70 m.p.h. Acceleration 0-30 in 5 secs., 0-60 in 20.4 secs. through the gears and 10-30 in 9.7 secs. in top* (Autocar & Motor *road test reports). Petrol from 26.5 m.p.g. at 30 to 21 m.p.g. at 60. Price £1066 plus £445.5.10 purchase tax.*

✲ **PERFORMANCE**
✲ **COMFORT**
✲ **GOOD LOOKS**
✲ **ECONOMY**
✲ **EASY HANDLING**
✲ **EASY GARAGING**

...you'll find them all in a Daimler CONQUEST

THE NEW range of CONQUEST cars offers the finest combination of motoring qualities on the market today. In designing the CONQUEST range Daimler determined to embody *in one type of car all those fundamental qualities which would* satisfy a high percentage of motorists having individual needs and widely differing tastes.

Test this out for yourself. Go to your Daimler Dealer today, try the Daimler CONQUEST for speed, acceleration, cornering, smoothness, easy handling in traffic or parking and then assess whether you have had to forgo, in any degree whatsoever, the comfort, spaciousness and silence for which the Daimler has always been specially noted. Add to this, really good luggage accommodation and an over-all size convenient for garaging, and you will appreciate that the CONQUEST in a rather special and individual way meets the points *you* would specially consider when buying a new car.

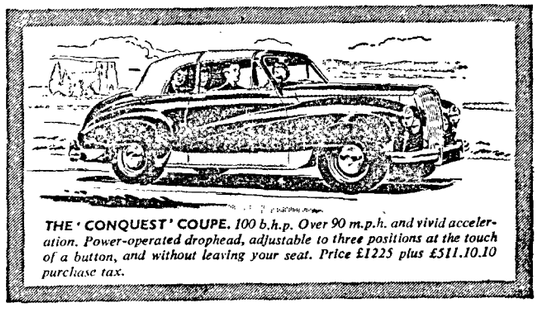


THE 'CONQUEST CENTURY'. *100 b.h.p. Over 90 m.p.h. Quicker acceleration. 1" wider brakes to cope with extra speed. Many extras including telescopic adjustable steering, greater leg room in rear, 2 suitcases to fit large luggage boot. Price £1172 plus £489.9.2 purchase tax.*

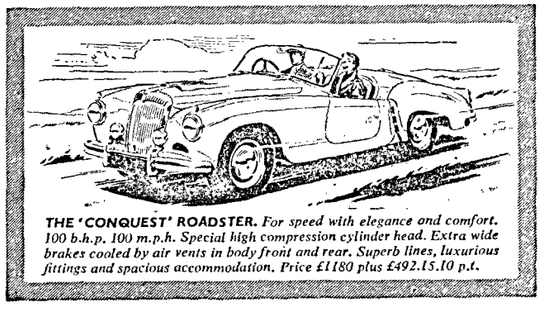
Low maintenance costs

It will be some time after purchase that you will also realise that your car has hidden qualities not apparent on first inspection and sometimes overlooked in new car buying. Your CONQUEST will probably surprise you in the savings it will bring in low maintenance costs and time 'off the road'. Automatic chassis lubrication plus pre-selector fluid transmission—(exclusive Daimler production car feature)—will take care of that unobtrusively, month in—month out, without thought or worry on your part. The Daimler CONQUEST offers you a wonderful combination of motoring qualities—it is a truly 'modern' car yet embodies all the dignity and prestige of the Daimler tradition. Your Daimler Dealer is waiting to give you every facility to test these claims for yourself.

An illustrated brochure on whichever of these models interests you will be sent to you on request to Bureau G 58, The Daimler Co., Ltd., Coventry, together with the address of your nearest Dealer.



THE 'CONQUEST' COUPE. *100 b.h.p. Over 90 m.p.h. and vivid acceleration. Power-operated drophead, adjustable to three positions at the touch of a button, and without leaving your seat. Price £1225 plus £511.10.10 purchase tax.*

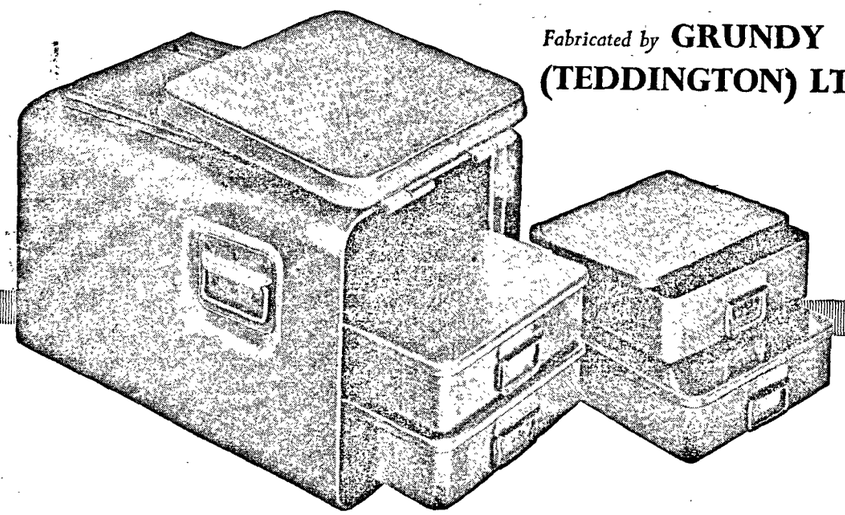


THE 'CONQUEST' ROADSTER. *For speed with elegance and comfort. 100 b.h.p. 100 m.p.h. Special high compression cylinder head. Extra wide brakes cooled by air vents in body front and rear. Superb lines, luxurious fittings and spacious accommodation. Price £1180 plus £492.15.10 p.t.*

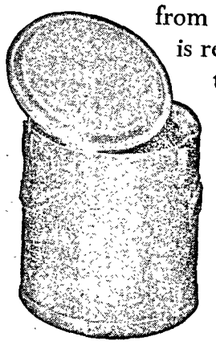
'OUT OF PEDIGREE COMES PACE'

Aluminium Containers for cooked foods

Fabricated by **GRUNDY (TEDDINGTON) LTD**



The efficient and hygienic distribution of hot meals from central kitchens to distant dining halls demands the use of special containers. The qualities of aluminium make it the ideal metal for construction of these units.



The ductility of aluminium simplifies the fabrication of the double-skinned cork-insulated welded containers, which are easily portable because of their light weight. Aluminium is immune from many forms of chemical action, so that absolute cleanliness from oven to plate is assured. Full flavour is retained en route since aluminium helps to keep the contents at an even temperature. The internal aluminium trays, being bright and clean in appearance, may be used as serving dishes.

Over 400,000 containers have been supplied by Grundy (Teddington) Ltd. for school meals, and manufacture on this scale is only possible by tooling-up for semi-line production. Aluminium alloys supplied by The British Aluminium Co. Ltd. are used.

The Cork in the Bottle

THE sigh of relief that greeted Sir Winston Churchill's statement on Indo-China in the House of Commons on Tuesday was more human than heroic, more notable for the fears it expressed than for any sense of solidarity with the defenders of Dien Bien Phu. It is difficult to quarrel with the Prime Minister's argument—cold-blooded though it is—that no undertakings about British military action to assist France and Vietnam could be given so long as nothing was known of what might come out of the conference that began, not inauspiciously, on Monday in Geneva. It is doubtful whether American and British armed intervention in the only form that would be immediately possible—by aircraft from aircraft carriers—could have won anything more than a breathing space for General de Castries and his men, and the effects of such action in Geneva would have been unpredictable.

But the need for restraint at this particular stage of the Geneva talks in no way weakens the need to face clearly what might be in future the consequences for this country of a dramatic turn in the war in Indo-China. Long drawn out though the fighting has been, British public opinion has never been encouraged to think out what it means ; and as a result, now that a crisis has blown up, people are inclined simply to cry for peace without caring who wins or loses. Any war can always be stopped at any time if one side gives in. But if the French and their Associated States give up the struggle now, the results will be most dangerous for the British people.

Indeed, that way of putting a stop to the war in Indo-China would actually bring an atomic war nearer. It is the considered opinion of the military experts that Indo-China is, in President Eisenhower's words, the cork in the bottle. If it falls to the Communists, then there will be the greatest difficulty in preventing them from overrunning, in their own time, the whole of South East Asia, reviving the insurrection in Malaya, spreading into Indonesia, spilling over into the whole Indian Ocean area and thrusting a long red tongue of menace down to the shores of Australia. It is perfectly idle to suppose that at some stage in this quite possible chain of events Britain would not try to put its foot down. Indeed, we should be drawn into armed resistance as soon as the red tide reached the frontier of Malaya—which is an early stage, the next but one or two. If these are the possible, the quite probable, consequences of letting Indo-China go, then it is obviously the right policy for Britain to help keep the cork in the bottle now. Recent history provides plenty of awful examples of the failure to marry logic and courage while there is still time. Men of the Left, in particular, should remember that it was faint-hearted miscalculation of risks and obligations by Britain and France that brought General Franco to power in Spain.

The other certain way of bringing the war to an end is to win it. Must we rush to this other extreme and promise the French whatever help they need to drive the Communists right out of Indo-China ?

But at best this would be a long and costly job, and if the western powers intervened on one side, the Chinese might intervene on the other. It is true that, as Korea showed, this would not inevitably and automatically precipitate the third world war. But it might do so ; and even if it did not, another Korea is not a prospect that anybody, in Washington or anywhere else, would wish to have to contemplate. There are some people who maintain that there is no third choice, that the war in Indo-China will be lost if it is not won, that any truce would be such a victory for Ho Chi Minh and such a loss of face for the Europeans and their associates that the whole of Indo-China would be Communist within six months. If this is really so and we are faced with a brutal choice between helping the French to win victory and sharing in the disastrous consequences of their defeat, then we shall have to choose victory, facing now and in company the risks we would cheerfully confront rather than surrender Malaya and the road to Australia. To say this is not to take the chance of war light-heartedly ; it is simply to face a little earlier in the game the facts that everyone would face when and if the time came.

★

But fortunately matters do not yet seem to have come to this stark choice. There may be a middle course between defeat and victory, and the task of Geneva is to try to find it. In searching for an acceptable settlement, there should be no false pride about accepting help from anybody who can give it. If Mr Nehru's proposals provide a basis for negotiation, let them be explored. But in the anxiety for a settlement let the essential conditions not be forgotten. Any compromise that simply saves faces all round will not do. The imperative proviso is that it effectively keeps the cork in the bottle.

This raises two questions. First, is such a truce technically possible? It was difficult enough to arrange in Korea. But in Indo-China there is no continuous and consistent battle-front along which a division can be made, assisted by natural features ; the Communist guerrillas are widely spread behind the French front. Nevertheless, a line could be drawn if there were a will to do it ; and it could be policed if the neutrals would help to do it. Although the position of any non-Communist regime in southern Indo-China would hardly be comfortable, it would not be hopeless so long as Communists were kept out of office and its territorial integrity were guaranteed by the powers.

The second question is whether such a compromise is politically attainable—will the Communists agree to it ? That is what the western ministers are trying to find out at Geneva. The omens are not unfavourable. The Russians have gone on record in favour of a truce, having presumably decided that the chances of the crisis breaking out into a general war have become too great. It may also be that the Chinese are primarily interested in protecting their southern flank by a buffer state ; they might well be satisfied with a relatively small area in the north, provided they could rely on it being safely Communist. What M. Bidault can get out of Ho Chi Minh will depend on the conclusions that Mr Molotov and Chou En-lai come to about America's and Britain's intentions. They are more likely to come to the right conclusions if they believe that Mr Dulles and Mr Eden, while sincerely seeking a truce, are equally determined to be firm if a truce eludes them. Thus once again plain logic suggests that it is firmness that makes for a settlement, and that those who are clamouring loudest for peace are really the ones who are heading for war. If the Communist negotiators think they can see the shadow of Mr Bevan behind Mr Eden's chair, or of M. Mendès-France behind M. Bidault, there will be no truce. Why should there be if they think they can play for an allied surrender ?

★

Thus there is a fairly clear line of policy to be pursued in this tangled Indo-Chinese imbroglio, though it is a delicate and a complex one. But the great difficulty in following it lies less in Geneva than in Paris. For it depends on the French keeping up their morale and their determination to go on fighting alone for a while longer. To say that they are ready to quit is a vast over-simplification. There is every shade of opinion, and several of them actually within M. Laniel's cabinet, where some of the Gaullists object to American pressure for granting what they regard as too much "independence" to Bao Dai and the Vietnam state ; others fear that Mr Dulles will do his utmost to stop M. Bidault from negotiating with the Communists ; some want and others fear the internationalising of the conflict. M. Bidault gained his free hand at Geneva only after stormy discussions in which several members of the cabinet threatened to resign. No one knows whether the cabinet could survive the fall of Dien Bien Phu or any threat of deadlock in the discussions at Geneva.

To France's friends and allies, this threatened loss of nerve at the crucial hour, after so much courage and endurance have been shown, is distressing. But it is also understandable in human terms. Why, after suffering so much, should France fight on alone for even a day more simply to protect the interests of others —for if one thing is now clear it is that only the shadow of French authority, if indeed that, will survive in the Far East ? Mr Eden and Mr Dulles will have to take these feelings into account as they perform their balancing feat. If they stiffen the French against accepting an unsatisfactory truce, they will have to make it clear that they really do want a satisfactory one. In refusing military help now, they can hardly avoid promising it if the truce cannot be secured. In asking the French for more patience, they will have to reassure them that they will not be kept waiting indefinitely.

These are difficult tasks. But they are not beyond the resources of diplomacy. In the end, of course, it is not the conferences of the diplomats that will decide the fate of South East Asia, but Asian opinion itself. An independent southern half of Indo-China would have no hope of surviving unless it could draw on the moral forces of the rest of free Asia. But for the moment those forces have no military power, and the immediate problem is military before it is political. That indeed is the crux of the present Asian emergency. And that is why both those who fear they may have to use force and those who fear that force alone is not the answer are each right. Mr Dulles's task, and Mr Eden's, is not only to determine the correct priorities but to see that the people of Britain and the United States understand them, too. Unless they succeed, the Communist leaders are bound to win any truce that may eventually be signed.

Taxing Personal Incomes

THE second report of the Royal Commission on the taxation of profits and incomes has arrived, later than had been expected, after the Budget and the Finance Bill ; but if next year Mr Butler feels in the mood to order "forward march" instead of "carry on" he will find plenty for his budget box in this report. The Royal Commission has taken a more or less self-contained section of its task—personal taxation—on which it offers conclusions and recommendations, leaving for a final report the question whether individual or business taxation should have a priority in reform. No review of personal taxes could be more fairly argued or more admirably presented.

In general, the Royal Commission finds that the present framework of personal taxation is satisfactory. Its predecessor in 1920 had reached more or less the same conclusion: "Our recommendations, though numerous and far-reaching, do not amount to a suggestion for any fundamental change in the nature of the tax. As it was in 1842, so in essential features it should remain." The essential feature, which the present Royal Commission examines in detail, is that personal taxation should be progressive, becoming more steeply graded as incomes rise. But there is no inevitably "right" system of progression, no demonstrable formula that can be used to justify different rates of tax on different incomes, and nothing more precise in the ultimate balance of sacrifice demanded of different incomes than the exercise of good judgment.

Two things follow from such general conclusions. The first is that the Royal Commission, after a careful examination, has rejected various proposals for a proportionate or flat-rate tax. One proposal associated with the name of Lady Rhys Williams sought to integrate the personal income tax with the system of social security payments ; another suggested a simple tax for low incomes (avoiding the complications of PAYE) to be levied in conjunction with regular income tax on higher incomes. The Royal Commission is sceptical about the advantages claimed for such proposals ; it holds that the administrative savings would be relatively small, that their simplicity on paper would prove illusory in practice, that they are based on a much exaggerated view of the deterrent effect of PAYE on work, and that equity would be badly served by them. Progression must be the principle.

If, then, the framework is satisfactory, and no revolutionary changes in the system of personal taxation are called for, the task becomes the relatively minor one (though it is still vastly complicated) of moulding the various instruments in the tax system to achieve the best form of graduation and differentiation. The personal reliefs, the reduced rates on lower incomes, the graduated surtax on higher incomes, and the differential relief for earned income—all these elements must be blended to secure equity and smooth progression. The Royal Commission turns its attention first to the bottom of the scale, and having already rejected the idea of a flat-rate tax on all incomes, considers where the exemption limit should, in principle, be fixed. "We feel no doubt," declares the report, "that no income tax should be levied upon any income which is insufficient to provide its owner with what he requires for subsistence." But is not the evident desirability of an exemption limit better associated with the disproportionate cost of screwing a small tax revenue from small incomes than with the shadowy concept of subsistence ? As Mr Hicks observes in a thoughtful reservation on this point, the income tax cannot be regarded in isolation from indirect taxation, and subsistence must take account of benefits from social security funds that can only be paid for, broadly speaking, by those who receive them.

★

That point having been made, however, there is everything to be said for the exemption limit for small incomes that the Royal Commission proposes for it is of a form that is not automatically transmitted throughout the entire income tax scale. To raise the exemption limit by increasing the personal allowance benefits all taxpayers throughout the scale, and affects the progression of the whole tax system. This fact, the report holds, leads to a distortion of the tax structure at the lower end of the scale, "in that the starting point of liability is lower than it could reasonably be expected to be if the needs of subsistence are borne in mind." The Royal Commission suggests that the earned income relief should start at a minimum lump sum, graduated according to the personal allowances of the taxpayer. The simplest scheme of this sort, for which the report gives examples, would raise the present starting point at

which the single person pays tax from £155 to £183 (£120 personal allowance plus £63 minimum lump sum relief), though it would make no difference to his tax liability if he earned more than £283 (at which point the two-ninths earned income allowance equals £63). For the married man with two children, the present starting point would be raised from £489 to £518, and there would be a tax saving up to £618. The cost of this "modest scheme" is put at £8 million; but a more ambitious scheme (raising the single man's starting point to £226 and giving him some tax advantage up to £476, with corresponding figures of £560 and £810 for the married man with two children) would cost about £56 million, of which less than a quarter could be attributed to the exemption of lower incomes.

★

There is room for plenty of argument about the level of exemption that is appropriate for small incomes; the Royal Commission has offered two examples that lie readily to hand because they fit the present personal allowances and also the bands of income within which reduced rates of tax apply. Any number of *pro forma* schemes could be devised if the allowances and the reduced rate areas were varied. But the majority report holds, rightly, that these are matters for budgeting, and not for detailed proposal; the signatories of the minority report would go a good deal further than the more modest of the schemes outlined by the majority, and would raise the starting point for the single man to £220 and for the married man with two children to £606. But the two sets of recommendations point in the same direction; the differences are of judgment about where the line of personal exemption should be drawn.

Having provided suggestions for equity at the bottom of the scale, the report finds that the present tax structure overrates the taxable capacity of the family man in the middle and upper income ranges, compared with that of the taxpayer without dependants. It proposes a number of changes that would break through the present fiscal barrier of £2,000 and get rid of the sudden jump in the burden of tax when incomes rise above that figure. At present, earned incomes enjoy no further relief when they rise above £2,025; the upper limit, it is proposed, should be raised to £2,500, and further relief at half the rate (that is, at one-ninth instead of two-ninths) should be afforded on earnings between £2,500 and £3,000. A further extension is suggested for the separate earned incomes of married couples, giving earned income relief up to maximum joint earnings of £5,000. These extensions of the earned income allowance would naturally be to the benefit of all incomes that qualified for them, whether they belonged to single or married persons, but the changes proposed would lean considerably towards the benefit of family incomes.

On the child allowance, the Royal Commission has echoed the theme of a recommendation of the Royal Commission on Population—that the allowance should be in some degree proportional to income and not fixed in size. It is now £85 for each child; the Royal Commission would keep this figure for incomes up to £850, make it 10 per cent of income between £850 and £1,000, and allow £100 plus 6 per cent of the income over £1,000 up to a maximum of £160 for each child. But it proposes, further, that these allowances should be given both against income tax and, in effect, against surtax by raising the starting point for surtax (now uniformly £2,000) by £160 for each child. As a corollary to this, they would lower the starting point for surtax payable by single persons from £2,000 to £1,500.

These proposals, taken together, would go a considerable way to meet the case that the burden of taxation on middle class family income is unduly heavy by comparison with the burden carried by other taxpayers. The total effect of these proposed changes on the revenue (including the extension of earned income relief) would be of the order of £25 million, which would hardly imperil the national finances. But such proposals are bound to provoke the usual political cries. "Why should the married man with two children who earns £3,000 get away with £180 less tax while the fellow with £500 saves a miserable £1 2s. 2d.?" This is one crude example of the illogical doctrine that reliefs granted to people who pay taxes must, by some twisted standard of equity, be matched by compensation to those who escape.

★

It will be much harder to make out a logical case for denying reliefs of this order to a class of taxpayers whose burdens have mounted and whose direct drawings on social security schemes are often small. It is to be noted that the minority report, though it makes some points that well deserve careful thought, does not basically deny the general merits of the majority proposals, even though it would appreciably modify them in detail. It endorses the extension of the relief for earned incomes; though in doing so the signatories seem to throw out a hint that their thoughts are turning towards a capital gains tax; it also endorses the principle of the variable child allowance, though it demands a compensating reduction in the single person's allowance as his income rises above £1,000. These differences of view do not extend appreciably beyond the inevitable differences of judgment that are always found when any two parties embark on a discussion about fairness in taxation. It is true that in most respects the majority have the better of the argument; but until the Royal Commission has concluded its work on business profits, the picture of an improved personal income tax that they present will still lack its wider frame. It must be hoped that the Royal Commission's heavy task will be completed in sufficient time to give the Chancellor of the Exchequer full opportunity to frame major reforms in the tax system in readiness for next year's Budget.

A Liberal Alternative?

IT is difficult to discuss the present state of the Liberal party without sounding either far too woolly or far too cruel; and the task is doubly delicate for those who are instinctive adherents of the liberal tradition, and who still feel that (on an average, and with aberrations) Mr Clement Davies and his colleagues strike the right note on rather more major issues than the leaders of either of the other two parties. For to suggest that any significant proportion of the British electorate, in a sudden revival of confidence and fervour, is likely to entrust its fortunes to the Liberals in the foreseeable future is absurd; and it is a perilously short step from recognition of this absurdity to the appearance of sheering at the flag that is still kept flying so bravely.

It is important, however, to try to tread this narrow dividing line while passing comment on last weekend's annual Liberal Assembly at Buxton. Behind the brave exterior, the question for the Liberals to face is whether they shall try to keep their ship afloat by acting as a political party, which can hardly exist without trying to win seats in Parliament, or by turning themselves into a pressure group which would try to get concessions out of the two major parties by offering or withholding their votes in the constituencies without putting up candidates of their own—or conceivably by pursuing one policy in some constituencies and the other in the rest. This is not by any means as easy a choice to make in practice as it is to discuss in the abstract. But if they are to play either part with any success at all, the Liberals will first have to find satisfactory answers to two questions. First, what do they want the man-in-the-street to assume that Liberalism stands for? Secondly, in what sections of opinion do they hope either to exert pressure or to recruit support?

The misfortune of Buxton was that some Liberals—and, in particular, the party's new ginger group, the inaptly named Radical Reformers—seemed to want to give rather tepid compromising answers to these questions. They believed that the Liberal battle line should be drawn up a little to the left of where radicals traditionally (but wrongly) think the Tories are, and a little to the right of where the Labour party traditionally (but wrongly) says it is. The Liberals, on this view, should make all the popular promises about social services that their two rivals make while in opposition but cannot quite perform while in office. This would mean abandonment of the role of a pressure group, because there is no point in pressing the other two parties in the direction they already want to go; it would mean concentration of Liberal effort on trying to win over support by falsetto cries of "me too."

This would be a great mistake. The gap between Butlerism and Gaitskellism is now too small to drive a Rotary Club, let alone a major national party, between. It is a waste of time to shrimp about for support for a third party in these narrow waters, because there are now only two small classes of shrimps to be caught there. The party might catch some of the young, who always prefer to be non-conformist; indeed, there have been recent signs of a so-called Liberal revival in the universities, and it is from this revival that the Radical Reformers have gathered strength. Unfortunately, past experience suggests that most of these young rebels of the centre are all too likely to conform to one or other of the two major parties as they mature. The second, and more embarrassing, type of recruit to be caught by a flexible and undistinctive policy are those who favour particular and peculiar projects that neither of the other two parties feels any need to adopt. It must sadly be recorded that there were too many representatives of these two groups—of the immature and of the cranks—at Buxton; and Liberals will be deceiving themselves (but nobody else) if they translate this into a claim that their party has the fire of youth in its belly and a large number of members with singularly original minds.

★

There is, in short, no future for the Liberals as a party of the dead centre or as a platform for unexciting individual idiosyncrasies; they can survive in any organised form whatever only if they proffer a programme which is distinctive but which is not odd. The party must know in its heart what sorts of policy fall foul of these definitions. A policy that is odd is one that is conceived solely out of a desire to be different; it is difficult to believe that many of those who embrace the project for compulsory co-ownership in industry—which aroused an acrimonious debate at Buxton but no flicker of interest anywhere else—have any other motive than this. A distinctive policy, on the other hand, is one that great numbers of people feel strongly about but that both Socialists and Tories have rejected. And these distinctive policies usually have one characteristic in common. Since Socialists and Tories are engaged in a desperate day-to-day battle for votes, they feel bound to reject any policies that would cost them votes at the next election. They cannot embrace anything that would be immediately unpopular, however much they may believe the electors would like it later on (such as a policy of slashing expenditure on some social services in order to reduce taxation). Nor can they touch anything that would be opposed by an articulate and disciplined minority, even if the great unorganised majority would like it. In short, they cannot be bold or far-sighted because they have so much to lose.

This, surely, is one void the Liberals can fill. The prescription—of courting opposition that the major parties dare not face—may seem unusual. But the Liberal party is in an unusual position. In the short

term it has nothing to lose but its deposits ; and as a me-too party in the middle, it is not going to save many of them—or even many of its present six seats in Parliament.

What are these distinctive policies that the Liberals would do well to adopt ? Since the British people can never assimilate and associate with one party too many ideas at once, it is important above all for the Liberals to be concise. Their most promising openings can be summarised under three heads. In the first place, a third party or pressure group might gain greatly in the long run if it could infuse the electorate with the idea that it stands for an advance to lower taxation by way of certain specific (and, in the short term, unpopular) cuts in Government expenditure. By recommending that Government subsidies to farmers should gradually cease, the party has already pinned its flag to one such reform ; it should lose no opportunity of emphasising that a shilling could be struck off the income tax if this policy could ever be brought wholly into effect.

In addition, some delegates at Buxton showed interest in Mr Colin Clark's recent proposals for denationalising some of the benefits—and some of the expenses—of the welfare state. This brand of liberalism perhaps cannot go very far and very fast, because the party is also determined to appear as the champion of the old, who will account for an increasing proportion of the electorate from now on. But it is quite possible to suggest schemes whereby some hundreds of million pounds a year might be struck off the expenditure on the social services, while still improving specific payments in relief of real need ; and—since the Conservatives are not going to dare to advocate such schemes for a long time—a Liberal party that sponsored them might eventually attract surprisingly wide support (or, at least, attention) from dissidents on the right.

★

Secondly, the Liberals could make themselves the avowed champions of the middle classes—that is, of all those who have no property but whom the trade unions do not cater for. It is an astonishing thing that, with a real national income nearly a quarter larger than before the war, several millions of hard-working and by no means rich people should submit, to all appearance so tamely, to a real standard of living lower than they had fifteen years ago. They have had to submit because they have had no champion. The Labour party has no interest in championing them. The Conservative party, which needs to collect nearly fourteen million votes to get into power, dare not even appear to do anything against " the workers." But the Liberals could come forward as the champions of the middle class without risking anything. This is not merely a matter of raising the real incomes of an unjustly treated class—though that is important. The middle classes have other grievances, of which perhaps the outstanding one is their resentment at the steady attack on the educational standards that mean so much to them.

Thirdly, there are some quite specific, but more restricted, proposals of policy that the Liberal party could advocate. It could put itself at the head of all those people whose minds have moved beyond nationalism, and turn this sometimes vague internationalist enthusiasm into specific and realistic projects in which Britain could join. It could do so with the more political profit to itself because the Socialist party, once so full of ideals of world brotherhood, is now so narrowly nationalistic. The Liberals believe in advancing towards the devolution of administration and government in Scotland and Wales, which both the major parties have rejected. Equally, they can mount a full-scale attack against monopoly and restrictive practices, where the other two parties have to move very gingerly. But, having chosen a few sharp lines of attack, the Liberals should not overweight themselves with too much confusing luggage. Their aim should not be to make everybody like them a little, but to turn some people into enthusiasts.

★

Specific proposals for cutting taxation, for championing the salariat, for a few (a very few) hard-and-fast reforms in other fields. It is not perhaps a programme that could set the Thames on fire. It is also—one must be honest about this—not a programme that would immediately pay off in terms of parliamentary seats won. But, if the Liberals are to survive, either as a party or as a pressure group, their most important objective must be to persuade the public that they stand for something distinctive and intelligible. They need not have a policy for all the issues of the day, provided they really believe in, and will fight for, the proposals they do put forward. Nor need they be frightened about stirring up opposition and anger. Indeed, that is their present task. By lifting Liberalism into active public controversy, by removing it from the crushing path of a Conservative party that is itself moving left and a Socialist party that ought to be moving right, a programme that aroused some people's anger with their interest would be pure gain. It might even be the first step in reviving Liberalism, if not as a major political party, at least as a recognisable political force.

Is Your Plant Growing?

Do you know what the new investment allowance in the Budget means to you?

You're in a much better position to see what it's worth if you consult the indices on capital replacement costs prepared by The Economist Intelligence Unit ; these will show you just how prices of capital equipment have moved in your industry over the last fifteen years.

Atomic Politics

FURTHER American tests of the power of the hydrogen bomb are due to take place at any time now. Their results within an area of 445,000 square miles could be even more pulverising than those that *caused so much bewildered alarm last month* and provoked the emotional and unsatisfactory debate of April 5th in the House of Commons. Indeed, there is no certainty that the passions that flared up on that occasion will not again embarrass Anglo-American relations, this time in the middle of crucial negotiations at Geneva. The heated exchanges that have passed between Government and Opposition have left public opinion confused and worried about what understanding exists between the United States and British governments on the development and use of atomic power, whether for military or industrial purposes. The ordinary person can only guess that a sensible explanation of present arrangements lies somewhere between the extreme left-wing view that British policy is powerless to control or influence American action and the Prime Minister's last word on the matter:

> Speaking generally, I do not consider that any change in our procedure is called for at the moment, nor can I *think of one that would be helpful.*

The key words in this statement are probably " at the moment " ; but, to understand why, it is necessary to put together the various pieces of information that have been made public.

First there is the crucial question of who would decide, in time of war, on the use of atomic or hydrogen bombs. It is clear that formally this power lies in the hands of the President of the United States. As head of state he cannot declare war without the consent of Congress, *but he could order the use of the bomb in* an emergency, without declaration of war, by means of a procedure designed to prevent any misunderstanding or infringement of orders. The British cabinet has a similar responsibility, but its power to wage atomic warfare is so limited, compared with the American, that it weighs little in the balance of strategy and policy-making. Ten years ago, it was different. From 1943 to 1945 the President was pledged, by the Quebec agreement of 1943 between Mr Roosevelt and Mr Churchill, not to use the bomb against a third party without British consent. But that understanding was so secret that most members of the British War Cabinet seem to have known nothing of it ; and in any case it has now lapsed. How it lapsed is not quite clear. Some people seem to hold that the agreement was a personal one that died with Mr Roosevelt—though Mr Truman who ought to know, is not one of them. Others hold that it continued until it was replaced by the new (and equally secret) agreement of 1948. What is clear is that, for a period of at least two and possibly five years, Britain had the right to give or refuse consent to American use of the atomic bomb and exercised that right in the decision to attack Hiroshima and Nagasaki. Since then no such right has existed.

Why then, did Britain not succeed in keeping that right in the agreement of 1948 that is still in force ? Sir Winston Churchill, in the debate on April 5th, appeared to taunt Mr Attlee with having surrendered the right of veto in exchange for receiving complete freedom of action in developing atomic energy for industrial and other civilian uses in Britain. It looks as if the suggestion is both unfair and inaccurate. In the first place, it is clear that American opinion was in no mood at any time after the war to accept a specifically British veto on America's use of America's bomb, even though British scientists had contributed so much to devising it. British security measures were under suspicion, there were ambitious plans for international control of atomic energy, and the intimate ties of Nato were foreseen by no one. Moreover, the McMahon Act of 1946, even though it forbade only the release of information on the making of bombs, was in spirit clearly designed to safeguard the American right to decide about the use of the new weapon. Had the supporters of that Act known about the Quebec understanding it is by no means certain—as Sir Winston seemed to imply in the House of Commons—that a renewal of that understanding would have been possible.

★

In the second place, it is manifestly absurd to suggest that Mr Attlee traded the right of veto against the precious right to go ahead with work on the non-military uses of atomic energy. Whatever may have been said on this matter in the 1948 agreement—the contents of which are still secret—it is clear that British research on atomic power for industry was well under way before 1948. The Quebec understanding was regarded by the few who knew about it as having lapsed and was intended, in any case, primarily to ensure that Britain —which was not then making the bomb—should not use jointly acquired atomic knowledge to gain industrial and commercial advantages over the United States—which was concentrating on making the bomb. If there was a bargain in 1948 in this matter between London and Washington, it looks as if Mr Attlee secured little more than a confirmation of *faits accomplis*. The present arrangement on the civil side appears to be far from generous in spirit or practice. All that exists between Britain, Canada and the United States is an exchange of information " over a limited field " about the civilian use of atomic energy.

Apart from these facts, what else is known ? Because

of the McMahon Act no agreement exists between the United States and Britain about the exchange of information on the design and production of atomic weapons. Each country goes its own way. Some information is imparted by the Americans to the other members of Nato—about the effect of atomic weapons and their possible strategic and tactical uses, but on a strictly "take it or leave it" basis. This state of affairs is obviously unsatisfactory if it is compared with the intimate collaboration of wartime; it appears as a blot on the pattern of Anglo-American and Atlantic partnership. In practical terms it means this: that Britain has had to spend more time, money and effort on making its own atomic bomb than would have been necessary had there been no McMahon Act; that Britain has had no share in the making of hydrogen bombs and therefore could claim no formal right to a say in their development; that allied military planning is less well-informed about atomic possibilities than it should be; and that the United States is denied access to some part of Britain's important scientific achievement.

★

These, however, are not the matters that really worry the Government's critics and some of their supporters in Parliament. Their concern is with the fact—or what they believe to be the fact—that it lies only with the Americans to decide, for the free world, how many and how big hydrogen and atom bombs shall be made, and to decide where and how to use them. They are alarmed by the Prime Minister's statement that

> We have no agreement with them [the Americans] which entitles us to claim any form of joint authority. They are acting entirely within their rights as agreed between them and the late government.

It has suddenly been understood that Britain has no claim to a decisive voice in atomic power politics such as it won during the war by the efforts of its scientists. If its voice is listened to none the less, it is by grace of the President of the United States. Hence the mingling of resentment with genuine alarm, the unholy alliance between moral indignation and anti-American propaganda that provoked Sir Winston Churchill into turning what should have been a council of state into a party brawl. In fact, as the Labour front bench well knows, things are not nearly as bad as they sound. Contact between London, Washington and Ottawa is so intimate and continuous that a situation in which atomic weapons might be used without consultation is virtually unthinkable. For example, American aircraft could not set out from British airfields on a bombing mission without a joint decision by the American and British governments. But it is the kind of contact that cannot be set down in black and white without destroying its spirit and limiting freedom.

Sir Winston tried to convey this to an excited House and failed. He might have said, but wisely did not say, that if the full measure of consultation between President Eisenhower and himself on matters of high strategy were made known it would arouse dangerous excitement. On one side of the Atlantic there would be fresh outbursts of Bevanite isolationism and on the other vehement opposition to the efforts now being made to change the McMahon Act and to interest the Russians in Mr Eisenhower's plan for sharing the materials and techniques needed for the industrial use of atomic power.

★

The lesson of these facts is clear. Britain could, if it wished, propose a formal, public undertaking by the United States, Britain and Canada that the atomic and hydrogen bombs would not be used by any of them without the consent of all. The most reasonable basis for such a request—and it is to Congressional ears that it must sound reasonable—would be the argument that no government with the atomic weapon should, by using it, expose other countries to retaliatory atomic attacks. But on such a basis every country in Western Europe would have as good a claim to be consulted. Such wide-ranging claims would almost certainly be rejected by Congress, for good constitutional reasons and with the support of American public opinion. Therefore, to make them, without the probability that they would be accepted, would be to leave matters worse than they now are.

The only alternative for the British Government is to use its still considerable influence in Washington to create such a state of confidence and understanding in the Atlantic alliance that consultation on the most crucial and secret matters becomes for Americans a matter not of duty but of habit and inclination. Time alone can bring opportunities for more formal and wider commitments. For the moment, it remains to be seen what will take the place of the McMahon Act and what progress can be made between Washington and Moscow on the Eisenhower plan for an atomic energy pool. But on the really crucial question—who is to decide how and when atomic weapons are to be used—it would be foolish to expect that the American President would or could do more than accept, personally and informally, a moral obligation to consult the British Prime Minister. It is very doubtful indeed whether, if the roles were reversed, any British Prime Minister would make a binding commitment—though he might well be willing in practice to keep in touch with his allies. If any British Government wants more than this in future, it will have to press for it in company with other allies of the United States. For American public opinion might in time be persuaded of the need for an Atlantic policy in these matters, but is most unlikely to accept a purely British claim to a veto on American action. Anything even remotely resembling that was possible only in wartime, in secrecy and between the personalities who then stood at the head of affairs.

Notes of the Week

Gloves off at Geneva

DURING the first two days of the Geneva conference, it seemed that the placidity of the lakeside city had cast its spell over the contestants. The problem of chairmanship was quickly settled, without the Peking government's pretensions to great-power status being either accepted or so openly rejected as to cause an immediate breach. The speeches of the foreign ministers of both South and North Korea surprised their hearers by their moderation. But by Thursday the picture had darkened. A hard hitting speech by Mr Dulles on Wednesday afternoon (summarised, with other proceedings at Geneva, on page 386), was at once followed by a speech in which the Chinese foreign minister, Chou En-lai, fully justified earlier fears by dragging in matters as remote from Korea or Indo-China as West German rearmament and European security. Chou had, in fact, little to say about the problems before the conference. His themes were the greatness of China and its leadership of an Asia that was threatened only by American plans for enslavement and war. As well as praising Mr Molotov's proposals at Berlin for the reorganisation of Europe into a security system headed by the Soviet Union, Chou invited the countries of Asia to form a similar system among themselves. The pattern of Communist planning thus emerged clearly: a Europe led by Russia and an Asia led by China, the United States being excluded from both, or at best accorded a tip-up seat in the doorway.

Neither for Korea nor for Indo-China was there much comfort in the way the Chinese foreign minister sought to transform a conference intended to solve their problems into a forum for Peking's familiar demands and ambitions. On the other hand, the earlier episode of the chairmanship, which must have involved Mr Molotov in some delicate explanations to the Chinese of his failure to press their claims to formal recognition as one of the "Big Five," may be taken as an indication that the Communists do not want to wreck the conference. The question remains, however, whether they really want to reach settlements in Korea and Indo-China, or only to maintain the conference as a forum for further ventilation of their demands in other directions.

First Words on Korea

ONE might believe that Mr Molotov has had on his desk for the past nine years a single document marked "Policy for Germany and Korea." The similarity in Soviet plans for the two countries was already remarkable in the days before the Americans withdrew from Korea; and after their departure Stalin put into operation a plan for invading the evacuated south which he may have intended to use also for Germany, if the Americans had not shown their intention of staying there. Now at the Geneva conference the North Korean General Nam Il has put forward proposals that seem intended to restore the similarity between Soviet policies for Germany and Korea. He asks for the appointment of a joint North-South Korean commission, which would prepare an electoral law and co-ordinate financial, trade, transport and "cultural" affairs between the two parts of the country, in preparation for elections that would be "truly democratic." The only difference between this proposal and that made by the Russians in Berlin is in the wording, which has been made less blatant. The Korean "Commission" would evidently have just as much power as would have been given under the Molotov plan for Germany to a nominated all-German government. This, it will be recalled, was to take office before elections were held on the Communist model.

But the Molotov plan for Germany had a feature that was intended to prevent the country falling into western hands: there was to be a Soviet-designed peace treaty, the terms of which would be dictated and the execution of which would be supervised by the occupation powers. As there are no occupation powers in Korea (only belligerents in a state of truce) perhaps a foreign commission is intended as a substitute. It may provide the clue to the final clause in General Nam Il's proposals. This incomprehensible bit of Russian-Chinese-Korean-English reads as follows:

> The need shall be recognised to ensure the peaceful development of Korea on the part of the appropriate states most interested in the preservation of peace in the Far East and thus to create conditions facilitating the early solution of the task of Korea's peaceful unification as a sovereign, independent and democratic state.

A sentence so complicated must be important. But if other delegates at Geneva do not create conditions facilitating the early solution of the task of understanding what the Communists are driving at the conference will get nowhere.

At the moment it seems likely that their idea is to keep the Chinese in Korea after the withdrawal of troops which, it is suggested, should take place within six months. The period before elections took place would be long and would be used for securing support for Communism in the south as well as for urgently needed reconstruction. It may be that India, and perhaps the UN commission that is looking after reconstruction in the south, would be asked to join the Chinese and the Russians in similar work for the north. The more the Communist proposal is examined, the more it seems likely that Mr Molotov will modify his tactics in Geneva in the light of his experiences in Berlin. That is to say, he will keep to the main lines of the policy offered for Germany, but use new and deceptive tactical concessions to get it carried out in Korea.

Asians to Curb Asians

THE speech Mr Nehru made last week on Indo-China was, unfortunately, less remarkable than the speech he did not make. Reports from Colombo at the weekend suggested that the Indian Prime Minister was considering whether the five Asian countries that are now conferring there could offer to assume responsibility for peace in Indo-China after a cease-fire. It is now said that this idea is unworkable: that Burma, Ceylon and Indonesia could contribute no policing forces, and that Indian and Pakistani troops could not work harmoniously together. These arguments may be questioned; but, at all events, Mr Nehru himself has not yet raised the issue in public. In his address to the House of the People in Delhi, he limited himself to calling for an end to threats and increased fighting; for a cease-fire, to be arranged through a working group representing only the belligerents; for Indo-Chinese independence; for direct negotiation between the belligerents; and for a solemn agreement on non-intervention.

All of this deserves consideration, so far as it goes. But does it go far enough? The sad history of the Spanish civil war should be studied in Delhi. "Non-intervention" then meant that only the more unscrupulous powers, who would sign anything but admit nothing, continued to intervene. How could a similar tragedy be averted in Indo-China? Mr Nehru suggests that the United Nations should draw up a convention providing for enforcement. By the time that was done it might well be too late. Ironically, moreover, no new convention would be needed if the "Uniting for Peace" machinery approved by the UN Assembly in 1950 was universally accepted. Its only critics in the Assembly were the Soviet group, Argentina—and India.

The excellent record of General Thimayya's troops in Korea last year aroused hope that India had come to accept its full share of the painful responsibilities of leadership in a torn world. If Southern Asia will not man its own bulwarks against attack, who will? Any western intervention is at once condemned as a new imperialism. The free Asians themselves, on the other hand, enjoy a vast moral advantage. Even if they could place no more than token forces in Indo-China as part of a settlement there, would that not be a useful deterrent to peacebreakers?

New Leader for the Left?

IT would be an over-simplification to say that the leadership of the left wing of the Labour party is now passing to Mr Harold Wilson, and that of the party as a whole to Mr Nehru. But the past week has seen two significant moves in those directions, and it remains to be seen how serious they will be.

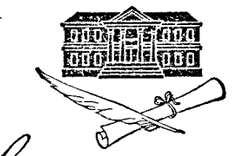
Mr Wilson's decision to take the seat on the "Shadow Cabinet" vacated by Mr Bevan, while reaffirming his "entire agreement" with Mr Bevan on the policy issues involved, is a carefully executed *chassé* along the party floor. Behind the conventional reference to "the interests of the party," Mr Wilson is one of the many left-wingers who believes that he is often a more plausible advocate of Bevanite policies than Mr Bevan is. While Mr Bevan glooms on the back benches among the Adullamites of the far left Mr Wilson will now be alongside the middle men, who rather like Mr Bevan's policies but cannot stomach the man himself. From this vantage point he believes that he can bring a stage nearer the doctrine of "Bevanism without Bevan"; those who hope that he is not really the horse for this course have no doubts about his wind, but some about his staying power.

Operation Bromide

IN the face of this new apparition on its left, the Labour leadership is stumbling towards a policy in rather better heart than a week ago. During the Easter weekend Mr Attlee had plainly decided that he must do something to paper over the split in the party; but at that time he must have feared that he could not do this without opening a split in the country, which would leave Labour on the opposite side of the gap to most of the floating voters whose support it needs. Now, however, Sir Winston Churchill's statement of policy—especially his firm denial that there is any new British commitment in Indo-China—has not clashed as fiercely with Mr Nehru's peace initiative as at one time seemed probable; and Mr Attlee and his supporters on Labour's National Executive have had a sudden accession of hope that everything may, after all, turn out peaceful at the end of the night.

The National Executive's bromidic resolution on Indo-China was devised with this hope in mind. It may not have gone as far as the Bevanites—or the Wilsonites—would like, but presumably no section of the Labour party is going to be angry because the Executive has said it "is as much opposed to Communist imperialism and domination as it is to colonial exploitation." Similarly, the Executive has felt fairly safe in announcing that it would oppose any British action in support of "imperialist policies" in Indo-China, because it has not yet defined where imperialism would end and opposition to Communist domination begin.

Labour has still to apply its platitudes to the practical issues; in particular it has not yet indicated whether—if the matter comes to a test—it would really insist that Mr Nehru should have the right to veto the whole SEATO project. At the moment, however, Labour's attitude towards the Indian Prime Minister falls little short of canonisation. Most Labour questions to Sir Winston after his statement implied that he should not move a step in Asia without Mr Nehru's approval, and when a Tory was so unmannerly as to mention Kashmir there were cries of protest. However, Labour was so busy being nice to Mr Nehru that it forgot to be angry with Sir Winston, and the latter may now hope that the H-bomb fiasco is forgotten. Mr Attlee may hope so too. Three weeks ago it would have seemed fantastic to suggest that Mr Attlee would be anxious to see Sir Winston's failure (and his own triumph) on that occasion slide into oblivion. Now, however, he must be anxious, above all, to see tempers cool. His one hope is that the complicated international situation in South East Asia may be smoothed over by some complicated compromise—before he is forced to lend his name to any utterances in which he would not really believe and which he would soon regret.



The business asset that can become a personal loss

Many a successful man, who does not hesitate to grasp daily business problems and deal with them, fights shy of coming to grips with the personal problem of estate duty. He knows in his heart that the future of his dependants and probably also of his business can be seriously affected by the crippling effect of estate duty when it falls due—as most assuredly it will. But he rightly feels that there is no facile ready-made answer to his problem.

The long experience of Arbon Langrish proves, however, that the application of specialist knowledge to individual cases can often cut through apparent complications to provide a solution—a solution by which the successful man is able to prevent a business asset from becoming a very real financial loss to his dependants and perhaps his staff.

A discussion with one of the advisory staff of Arbon Langrish will be treated in confidence and is of course without obligation.

Independent of any insurance company Arbon Langrish have an unrestricted choice of the whole Insurance Market and provide an unbiassed service.

The advice of Arbon Langrish

is available to principals, solicitors and accountants, on all matters relating to estate duty, settlements, gifts and pensions.

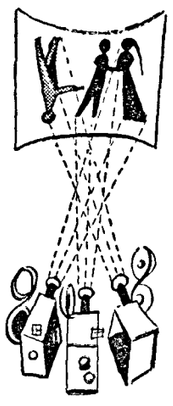
The Schweppshire Way of Life

3. COUNTY INSTITUTE OF CAREERISATION

In Schweppshire old crudities are abandoned, ancient myths dispelled. We no longer imagine that (a) we know what we know, nor what (b) we are nor still less (c) what we want to be.

By a simple system of bloodgrouping, footprinting and the totally irrelevant questionnaire, not only are our careers decided for us but, more revolutionarily, the problems of everyday life. "Shall I take a Bicycle holiday in the Lakes?" Insert your career card, press buttons 786, 33 and 412, and the Electronic Mixer will tell you what to do.

"Cards" with holes punctured in the appropriate places, look like, and often are, old pianola rolls. The form, which may take four months to fill up, contains typical simple questions which must be answered with "YES", "NO", or "SORT OF". e.g. *Do you hate Handel? Do you like being photographed? Do you pronounce "Often" "orfn"? Do you only cut toenails when they saw through socks? Do you have greengrocer whose mother voted Liberal? Do you think of radio short-waves as looking like a gunners' tie?*



By Schweppidiascope attachment (see inset) your future career is projected on to a screen. If, in answer to the question "Am I a rejected lover or a loyal wife", the reply is "no answer", it does not mean that the machine has gone wrong. It can safely be said that for the era which gave the wrong jobs to the right people, we have substituted the Age of the Wrong People in the Right Jobs.

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

Paying for Local Government

THE representatives of the local authorities have agreed to a general review of salary scales, following strong pressure from the National and Local Government Officers' Association on behalf of its 225,000 members. This decision was overdue. Pay and conditions throughout almost the whole of the local government service were regulated by the national charter which the Association negotiated in 1946. There have been several salary increases since then (the last was earlier this year), but the senior grades have come out of them badly. Many posts of considerable public importance are now underpaid, and in many areas there are difficulties in recruiting suitable staff.

The local authorities' representatives apparently hope that higher salaries at the top may be offset by lower rates of pay for low-grade clerical work; but it will be surprising, to say the least, if they escape without some increase in the total salary bill. Such an increase would strengthen the case for strong measures to bring about a more economic use of local government staff. Although rates have risen less steeply this year than last—the average rate increase for county boroughs has been 4½d., compared with 1s. 9d. in 1953—many local authorities are still drawing down their balances; and the outlook for ratepayers next year looks bleak.

Some economies might be secured by the introduction of an Organisation and Methods Service, on a co-operative basis among local authorities and in line with the Coventry investigation; but hopes of this sort should not be pitched too high. More effective economies could be ensured (and better avenues of promotion opened up) if the total number of local authorities were to be reduced. There are nearly 1,400 minor local authorities in England and Wales, and 597 of these have a population of under 10,000. It would be wrong to amalgamate such units, if they were working well, solely on grounds of economy; but they have already lost many powers simply because they are too small and poor, and this gradual debilitation has added to the wasteful use of staff. In particular, the union of urban with rural districts could produce new authorities which were little larger in area but much stronger in wealth and population. They could be given back a number of functions, and the efficiency of the local government service would be improved. It is becoming more and more obvious that in the course of the next few years the whole field of local government should be dug over and planted anew.

From Saigon to Casablanca

WHEN the British gave independence to India and Pakistan and Burma they were not seriously worried about the effects in the African colonies. The withdrawal was friendly, orderly and long foreseen—and a lot of British officers, civil servants and business men remained. There was no disastrous *sauve qui peut*. When British personalities advise the French to quit Indo-China as quickly as possible, they forget first that a repetition of what happened in India is not possible with a Communist army on the warpath; second that the Communists want every Frenchman out of Indo-China; third, that what happens to Indo-China must have repercussions in North Africa.

The problem is already before France. The Emperor Bao Dai has been in Paris, prompting from the wings while a Franco-Vietnamese conference draws up terms for a treaty of independence. He has just refused to sign a twin set of draft treaties—the one granting Vietnam full independence, the other laying down the conditions of its membership of the French Union—on the grounds that they do not guarantee completely "unity and independence as a fully associated partner." His chief delegate in Paris has since confused spectators by signing the declaration that was meant to preface the two treaties. Bao Dai doubtless calculates that refusal of the second treaty will win him good marks from his nationalist subjects, and that the Americans will back him against the French if he stands out against compromise with the Communists in the manner of Chiang Kai-shek and Syngman Rhee.

Two contrary reactions in France are significant. One is that France would be lucky if his manœuvres were to free it from its obligations to him and enable it to negotiate a truce in Indo-China, without regard to his dislike of any compromise—for example, a partition of territory with Vietminh. The second is dismay that the Vietnam link with the French Union may be in jeopardy. There were to have been five "associated states"—the highest grade of membership in the Union—consisting of the three kingdoms of Indo-China, and the states of Tunisia and Morocco. The first three signed on, the other two did not. If the Emperor now withdraws, the hope—still cherished in some quarters—that Tunisia and Morocco will join the club must fade, perhaps die. As these territories are only a stone's throw from France and full of French settlers who hope for co-citizenship with Africans, the alarm of their friends in France is understandable. But it is unfortunate for the Quai d'Orsay if, just as it lights the pipe of peace with Ho Chi-minh, the French settler in Morocco is heard shouting that the house is on fire.

Neck and Neck in Moscow

FOR "Sovieticians" there is food for thought in the proceedings of the Supreme Soviet (or parliament) which ended this week. There has been a significant change of protocol. At the end of a similar meeting last autumn the two chambers—the Soviet of the Union and the Soviet of Nationalities—sat together to hear a major political speech by Malenkov. This time there were two major *exposés*: the premier Malenkov addressed one Soviet, while the secretary of the party Khrushchev spoke to the other. Both dealt with home as well as foreign policy, covering the same ground in slightly different terms. One had the impression that whereas last autumn Malenkov was still *primus inter pares*, now he may no longer be much more equal than his colleague.

There is no doubt that the tug-of-war goes on both in the Kremlin and outside. The creation of a "committee of state security" subordinated to the cabinet must be seen in this context. The exact composition and functions of this new body are not yet known, but it will probably be used as a counter-weight to the Ministry of Internal Affairs

(MVD) or may even be used to control it. Many must have thought that the security men had not said their last word with Beria's departure and that it would be worth while keeping a check on them. As the new body is a governmental one, premier Malenkov may well be trying to get the security services under his hand.

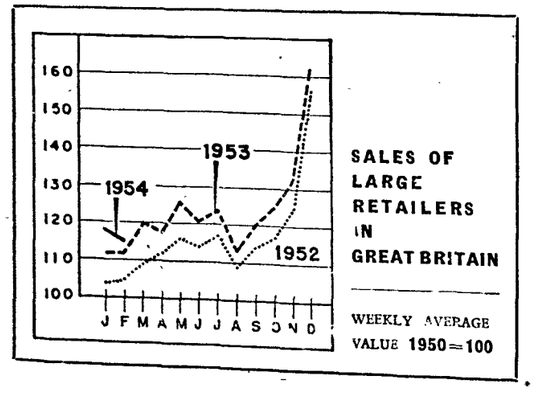
Otherwise this annual budgetary session brought no surprises on the home front (the budget itself is reviewed on page 380). The reappointment of the parliamentary presidium and of the government proved a mere formality: nobody of consequence was left by the wayside. Some minor ministries were subdivided, thus strengthening the new trend towards decentralisation. After Stalin's death the number of ministries was drastically reduced, but—as Mr Malenkov admitted—undue centralisation brought about its own muddles.

The Next Dominion

THE Gold Coast has reached the last rung of the ladder before full independence is attained. Mr Hopkinson was able to tell the House of Commons on Wednesday that, with the exception of a proposal that handling of the Gold Coast's affairs from London should be transferred from the Colonial Office to the Commonwealth Relations Office, the suggestions put forward by Dr Nkrumah last June have been adopted almost in full.

Under the new constitution, the Governor's authority will be confined to defence, foreign affairs, Togoland, and certain matters pertaining to the police and the judiciary. In everything else a cabinet of representative African ministers will have complete responsibility, and a "privy council" will advise the Governor on the discharge of his duties. The new legislative assembly will be composed exclusively of directly-elected members; representatives of the commercial interests and the chiefs will disappear, but Dr Nkrumah's responsible attitude to both should temper any fears they may feel. A clause is to be inserted in the new constitution (at Dr Nkrumah's request) guaranteeing fair compensation to any foreign enterprise in the hypothetical event of nationalisation. After the elections, which are to be held in June, Dr Nkrumah (if he is still Prime Minister) will also set up a committee to consider the establishment of a special House of Chiefs.

A new permutation in the seemingly endlessly adaptable Commonwealth pattern has thus come into being—a halfway house for countries with the will, and within one step of the means, for full independence. Britain has guaranteed that this independence can be achieved within the Commonwealth; but full membership of the Commonwealth will require the agreement of the other member states. The Gold Coast should not suppose that mere Malanism will be an enduring barrier to such membership; in the end, its case —and the hopes of Africans everywhere —will be judged by the hard test of its performance.



Clean Sheet for Dr Nkrumah

THE announcement of these constitutional reforms had presumably been held up until the publication this week of the satisfactory findings of the commission of inquiry into corruption in the Gold Coast. This commission was appointed as a result of Mr Braimah's resignation last November from Dr Nkrumah's cabinet, in which he had been Minister of Communications and Works. His stated reason for resigning was that his conscience was troubled by his acceptance of a gift of £2,000 from a contractor. At the same time he made allegations of corruption against some of his colleagues, including Dr Nkrumah himself; and he eventually declared that he had a "special mission" to ensure that the allegations of corruption in high places were investigated, because if there was any truth in them, "then our self-government would be a failure." The commission found that it was primarily fear of exposure, rather than a sense of mission, that led Mr Braimah to resign. Nevertheless, he was right in saying that he had put self-government itself on trial.

The result of that trial has been general acquittal. Dr Nkrumah, it should be said at once, emerges from the report with his reputation unscathed. The commission exonerated him completely from the four allegations made against him. No other minister was concerned in the inquiry, but allegations were made against three ministerial secretaries. Two of these, Mr Ohene Djan and Mr Atta Mensah, have already been tried and sentenced to imprisonment on charges of criminal corruption, and have appealed against their conviction. These charges were not connected with the Braimah inquiry. The commission found that Mr Djan had improperly obtained the sum of £100 from a partner in a firm of contractors, but that other allegations against him and Mr Mensah could not be substantiated or were unjustified. The conduct of Mr Edusei, the third ministerial secretary concerned, in one respect fell below what should be expected of a public servant. His secretaryship has now been revoked.

One warning—to European contractors in any developing country as much as to the Gold Coast itself—may legitimately be read from this report. Although the commission has cleared Dr Nkrumah's government, it has also shown how difficult inexperienced African politicians must often find it to live up to the high standards of public conduct set by British administrators—especially as the standards of private conduct set by some European contractors can sometimes be a less desirable guide. If ever corruption does occur, there must be two parties to it.

Marketing's Forgotten Men

THE sunny side of decontrol has been to the fore this week with the Government's triumphant announcement that all consumer rationing will end on July 3rd. The rough side, for the Government, lies in the haggling over new marketing schemes for agricultural products. There have been three recent developments. First, the terms on which the Potato Marketing Board will be revived have now been agreed. The board will purchase any surplus potatoes at the guaranteed support price; but, in order to give it a small incentive to economy similar to that lately held out to the milk board, the Government will reimburse only 95 per cent of its losses.

For fatstock, the National Farmers' Union has already submitted a voluntary marketing scheme (producers having been denied compulsory powers except over bacon pigs), and the union has now promoted as well a commercial company, which will operate on an annual turnover that may exceed £100 million. So long as no special favours are shown to this company, the public may benefit in this case from a genuine bout of competition with the insufficiently competitive auction markets.

The most important battle now raging is over wheat, for which marketing arrangements are still not decided. The producers want to disguise the necessity for a large public subsidy (which arises because the British guaranteed price is so far above the import price) by rigging the market through import restrictions or an import levy. Fortunately, a producers' board for wheat is not likely to be sanctioned. The president of the National Association of British and Irish Millers pointed out this week that the wheat subsidy could be administered, as it was before the war, without any interference with a free market. The proper way to reduce the subsidy itself (and it is a pity the Government has delayed doing so) is to relate the price guaranteed to the quantity produced, as also was done in the prewar Act.

But the wrangle over wheat aptly illustrates the dangers of the Government's present policy of drift. The National Farmers' Union knows what it wants and is energetically pursuing it; it hopes to buttress the Government guarantees (which may fail some day) with a complete network of producers' monopolies having compulsory powers. The Government wants only to extricate itself from marketing entanglements in the way which creates least fuss—which means meeting the wishes of the organised producers except where distributors are strong enough to insist on a compromise arrangement. In the process taxpayer and consumer are liable to be forgotten men.

Tidier Grants-in-Aid?

IN its report on grants-in-aid, published this week, the Select Committee on Estimates has steered a careful and skilful course along the narrow line of its terms of reference. It was not the committee's business to assess the technical sufficiency of accounting and audit; nor was it required to pass policy judgments on the importance, or the conduct, of those bodies to which grants-in-aid are given. Its job was rather to suggest ways in which Parliament might be placed in a better position to judge of both—while avoiding proposals that would produce just that cumbersome procedure, and use of sledgehammers to crack nuts, which the grants-in-aid technique has been designed to avoid.

The main problem is that grants-in-aid vary very widely in their historical origin, in their present purpose, their size, the proportion which they bear to the beneficiaries' total resources, and the degree to which their use is subject to official scrutiny. The grants-in-aid, paid by departments to institutions or bodies not subject to their day to day control, are generally a means of getting something done to which departmental machinery and the procedures of intra-departmental finance are unsuited. But it is clearly historical accident—rather than watertight logic—which dictates that Scottish education should be grant-financed according to a formula devised in the 1880s, or that the hollow shell of the Road Fund should survive as a channel through which departmental moneys reach their destination, or that the Forestry Commission Fund should be fed by grant-in-aid rather than by an ordinary vote, or indeed that this or that disbursement should rank as a "grant-in-aid" rather than as a "contribution," an ordinary "grant," or a "loan."

The committee's main recommendations are that anomalies should be corrected by transferring expenditure, wherever no compelling reason to the contrary remains, to the appropriate departmental vote; that there should be caution in the authorising of new grants-in-aid; that the Government should provide more information in each relevant estimate about grant-in-aid commitments; and that all British contributions, whether by subscription or voluntary donation, to international bodies, should be classified as grant-in-aid (so that there should be consistency in the amount of information made available about them). The committee's aim throughout is to preserve parliamentary responsibility even when this is indirectly exercised; and the importance of this aim would be in no way diminished were all the recipients of grants-in-aid currently conducting their affairs with an efficiency and economy well above the national average.

No Pushover for Perón

SOME commentators seem to have jumped rather hastily to the conclusion that this week's Argentine elections were a clear victory for General Perón. Admittedly, nobody expected the voters to shake the government. Only half of the Congress, the vice-presidency, and provincial and municipal councils were concerned in the elections. The ruling party had a monopoly of the press and radio, enormous funds, and the backing of the whole apparatus of the state. Two formerly important opposition groups had been almost liquidated, the Conservatives by economic spoliation and physical violence, the Socialists by the defection to the Peronista camp, under extreme pressure, of several of their

leaders. The vice-presidential candidate of the surviving opposition party, the Radicals, was the little known Señor *Larralde; the Peronista candidate,* Admiral Teisaire, was a nationally famous veteran. The Radicals, with all these *odds against them,* nevertheless secured about a third of the votes cast, and in Buenos Aires they obtained over forty per cent. After a decade of dictatorship, this was a striking feat for a harassed and handicapped opposition party that is still associated in many Argentine memories with the worst features of the old regime.

The Radicals have, in fact, taken as much advantage as they could of the confusion that President Perón's recent switches of policy have sown in the minds of some of his supporters. The president's wooing of foreign, and particularly American, capital last year has enabled them to accuse him of betraying the very same national interests that he has always claimed to champion. Taunts of this kind stung the government into the ill-judged action of arresting Señor Larralde and other Radical leaders just after the elections. In some places in the provinces the Radicals were bold enough to provoke violent clashes, which caused several deaths on polling day and led the president to threaten that in future he would not let the "criminal hordes" shoot first. Two good farming years and last year's drastic action against all opposition elements (except the Communists) have not apparently sufficed to end General Perón's anxieties.

New Zealand's Housing Loan

THE recent announcement by the Prime Minister and Minister of Finance, Mr Holland, that his government will borrow £12 million from the trading banks to finance additional housing has aroused vehement protests by the leader of the opposition and former Labour Minister of Finance, Mr Nash, and the President of the New Zealand Federation of Labour, Mr F. P. Walsh. The exact terms on which the money is being raised have not been declared but it is likely to be at a lower rate than the present bank rate of 4 per cent. It will be lent to the State Advances Department which is the government agency used for financing housing development. The burden of the protests is that this type of borrowing is inflationary and not essentially different from using the government controlled reserve or central bank to create the necessary extra credit.

Mr Holland has strenuously denied this. He has reminded Mr Nash that he saw little objection to creating credit during his own term of office as Minister of Finance, and Mr Walsh that not very long ago he was the advocate for the workers before the Court of Arbitration when he asked for wage increases costing £62 million a year. Mr Holland has also claimed that the public accounts for the past financial year, when they are published, will show a substantial reduction in government borrowing from the banks and, by inference, a financial position so improved that the government will be shown to be fully justified in borrowing £12 million for housing. This move by Mr Holland has placed his Labour opponents in a difficult position, for the need of more houses is, by common agreement, one of New Zealand's crucial domestic issues and one on which both Mr Nash and Mr Walsh find it difficult to be critical.

On the other hand the government stands committed to reduce inflation and it is difficult, on the details so far given, to perceive how Mr Holland can carry out his proposals without increasing inflationary tendencies. Final judgment must be withheld until Mr Holland decides to give the exact details of the proposals, but it is already obvious that this housing loan will be a considerable issue during the coming general election. The argument that it will provide houses for possibly 20,000 people, is likely to count more on the hustings than the economic objections so far expressed.

Battle of the Books

A FORMIDABLE host of distinguished authors have risen in wrath against their publishers; the occasion is the proposed agreement between publishers to demand, in contracts with new writers, a share in the subsidiary sums which a book may earn through film, radio or other adaptations. As so often in such struggles, many of the arguments used by either side have been irrelevant. The publishers have claimed that they carry, as their authors do not, all the overheads of the business from which both earn their livelihood, and must, in the authors' own interest, have the means to cover them; the authors have replied that they make a bigger and more speculative investment than publishers do, since, without benefit of swings and roundabouts, they embody months or years of initially unpaid work in manuscripts which may yield a labourer's pay or nothing at all. The publishers have declared that the break-even point in publishing is now so high that only the certainty of reaping a greater share in the earnings of a real winner can compensate for the loss on the not-quite-good-enough venture which, a few years ago, would at least have paid its way; the authors have pointed out that the material rewards of authorship have observably fallen since the war far more than those of publishing.

Neither these generalisations nor individual hard-luck stories are really relevant. There may in many instances be a genuine obligation, from the unknown author to the publisher who gives him a start, which can as properly be embodied in a clause relating to subsidiary rights as in one relating to royalty scales and options. There are other instances where the claim that the publication of a book by a "new" author is a gamble is absurd. The question is not whether one or the other set of circumstances is more representative of the author's or publisher's lot; it is whether a rigid uniformity should be imposed—in this of all trades—regardless of what circumstances may be. Fortunately, some publishers have now had a delayed access of caution. For the sake of solidarity in face of the relatively weak "new" writer, they are not eager to lose the goodwill of those established names from which the bread and butter and current prestige of publishing are derived. In these circumstances a fully monopolistic publishers' front seems unlikely. And the experience of cartel-builders in other spheres shows that the only beneficiaries from a less than totally inclusive cartel are those concerns which firmly stay outside it.

Ireland without Issues

AFTER Mr de Valera's government had presented a budget that was not after all an electioneering one—it gave certain minor reliefs which it will be difficult either to attack or enthuse about—the *Dail* was dissolved last week; and campaigning has now begun for the third general election in the Irish Republic in just over six years. After each of the previous two, in 1948 and 1951, there was a change of government; and the principal point of interest at present is whether history will be repeated on May 18th.

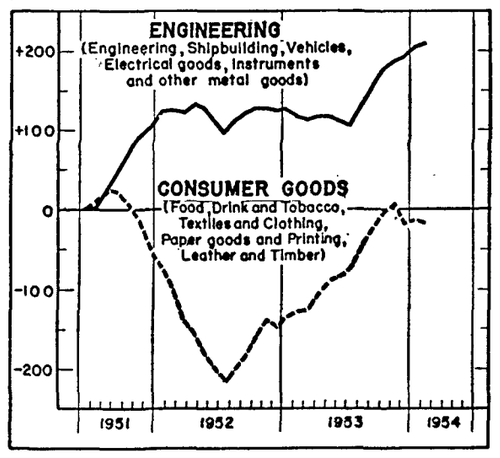
Although it is generally expected that the Government will lose some seats, it seems unlikely that voting by proportional representation will give any clear-cut decision. This is very largely due to the absence of any issue on which there can be a trial of strength. No party has anything special, still less anything useful, to say about "partition"; international affairs, in the wider sense, have been barely mentioned in the last three years. Politics have been dominated by such ordinary domestic issues as the high cost of living and the high level of taxation; unless policies are drastically revised, there seems little prospect of any halt to the growth of public expenditure and thus of any radical cure to either of these ills.

STATE OF PARTIES IN THE DAIL

	After General Election, 1948	After General Election, 1951	At Dissolution, 1954
Fianna Fail (de Valera)	68	69	72
Fine Gael (Costello)	31	40	45
Labour	19	16	15
Farmers	7	6	7
Clann na Poblachta (MacBride)	10	2	2
Independents	12	14	6
	147	147	147

CHANGES IN EMPLOYMENT In GREAT BRITAIN

INCREASES OR DECREASES SINCE JUNE 1951 [THOUSANDS]



The present balance of the parties gives little reason to expect such a revision. Much of the present instability is due to the gradual weakening of *Fianna Fail,* which has been by far the largest single party for more than twenty years. Its principal opponent, Mr Costello's *Fine Gael,* has steadily regained strength since 1948; but if it is to hold office it must, as during its period in power from 1948 to 1951, obtain the support of other parties, of which Labour will be the most important. In a rough-and-ready way *Fine Gael* is more inclined to lower levels of public expenditure and taxation than *Fianna Fail,* and certainly its interest in agriculture is stronger; but these leanings would obviously be modified by an alliance with Labour. Parliamentary majorities have been so difficult to get, and still more difficult to keep, in Ireland in the last few years that manœuvres have become more important than policies; in these circumstances, the prospects of a stable government emerging next month may depend mainly on the manner in which any seats lost by Mr de Valera are distributed among the opposition parties.

Earnings at the Bar

NO one can quarrel very much with what the Attorney-General said when he discussed barristers' fees at the annual meeting of the Bar this week. It is what he did not say that provokes thought. It is true that the level of many barristers' fees has not, in the past twenty-five years, risen to the same extent as either the cost of living or earnings elsewhere. It is equally true that the only specific recommendations in the Evershed Report (Cmd. 8878) last summer were for the reduction of some of the fees payable to junior counsel and the abolition of the system by which the client pays an additional fee towards the cost of the barrister's clerk. In its recommendations about the minimum fees payable to barristers, the committee did no more than urge that the problem should be tackled by the Bar Council and the Law Society together, which is not likely to produce any speedy result. The Attorney-General could properly remind his audience—if it needed reminding—that the Legal Aid Act was passed on the basis that fair remuneration would be paid for work "actually and reasonably" performed.

But Sir Lionel Heald, as he admitted, was speaking only as a member of the Bar. If and when he comes to consider the problems before the legal profession in his capacity as a law officer of the Crown, he will have to take into account all the points that he left out this week. The Legal Aid Act is an instrument that supports the legal profession, both branches of it, out of public funds. The public is therefore entitled to demand that the words "reasonably done" shall be given the same emphasis as the words "actually done"; and this raises the old question whether the division between the two branches of the profession rests on any rational basis. For some things a barrister is paid too little, and he certainly suffers a purse-pinched apprenticeship; for others he is paid too much, which suggests that some of the things he does now could adequately be done by a solicitor alone. The Evershed Committee was precluded by its terms of reference from considering any aspect of a fusion between the

two branches. A minority of the Committee not only thought that a pity; it urged that a fresh committee should be appointed to consider it. That was nine months ago, and nothing has happened since. It is time for such a committee to be set up.

Red Light for Eager Traders

WILL the Soviet embargo on purchases of wool from Australia, which was curtly announced at the same time as Moscow's rupture of diplomatic relations, be recognised for what it is—a bright warning sign? Businessmen who are inclined to enthusiasm over the prospects of vastly increased east-west trade should ponder it well. On Monday Mr Malenkov, with unconscious humour, assured the world that only western restrictions impede the profitable expansion of this trade. Perhaps his speech to the Supreme Soviet had been written well in advance; at all events, his words rang a little hollow, for only forty-eight hours earlier the sudden ban on Australian wool had revealed how closely Soviet trade is harnessed to Soviet politics.

Yet there was nothing new in the Soviet action on wool. Anyone who stops to think must realise that the strictest controls imposed on east-west trade by democratic governments are dust in the balance when compared with the control exercised on the Soviet side. No trading department in a Communist state could even contemplate a deal that conflicted with the current policy of the ruling party. Any free nation that puts more than a handful of its trading eggs into the Soviet basket is, therefore, placing itself at the mercy of Soviet economic pressure. As Australia has just learnt, merely to grant asylum to a refugee may lead to the immediate and savage application of that pressure. Will this unusually clear warning be heeded—in Hamburg and Osaka as well as in London?

It may also be asked whether the British businessmen who are now in East Berlin talking to the Chinese realise the political timing of this gathering. The Moscow trade talks were timed to coincide with the Berlin conference, and impressive announcements from the offices of the Chinese in East Berlin are obviously intended to create a sensation at Geneva—both in the political conference and in the east-west trade talks that are being held by the Economic Committee for Europe.

Stopping the Oil

DELEGATES from thirty countries (and observers from eleven more) met in London on Monday to consider international action to prevent the pollution of the sea by oil. The conference, which has been convened on British initiative, is being asked to accept the recommendations made last summer by a British committee of enquiry. As the countries represented at the conference own 95 per cent of the world's shipping, they have a real chance to end a squalid nuisance. The problem is no doubt aggravated by the oil discharged from the eroding tanks of wartime wrecks, but the chief long-term offenders (as samples from the beaches show) are tankers and oil-using ships.

Attempts have been made to stop this menace before, and voluntary agreements limiting the discharge of oil within 50 miles of the coast are now fairly widely respected. But what is needed now, and what is being sought, is a complete ban (eventually enforceable by law in each major ship-owning country) on the discharge of any oil on the high seas. This would involve considerable new investment on the part of the shipping and oil companies and of the port authorities. Since most of the oil is swept into the sea with tank washings and oil-contaminated ballast water, new processes would have to be employed to separate the residue from the water, and special tanks would have to be built at ports and fuelling stations to receive the residue.

Britain is peculiarly badly hit by—and is also peculiarly sensitive to—oil pollution, which makes a sordid mess of so many of its beaches and condemns sea birds to a glutinous death. As a result interested parties in Britain have agreed voluntarily to carry out the committee's recommendations. It is to be hoped that less interested parties abroad will be as helpful. Even if they are, the necessary measures will be expensive and take time; the beaches are already so polluted that it will take far more than Lewis Carroll's proverbial half a year to sweep them clean.

Masters and Men

The strike at Preston, and generally in the North, seems nearly at an end. . . . The general circumstances of society—such as the diminution of trade, the very short harvest, and high prices—have . . . been influential in placing the workmen in a worst position than they were, and have been plainly manifested at Stockport. There the workmen obtained the rise of 10 per cent, but these circumstances have since compelled the masters to withdraw it. They are unable to meet the expenditure. The profit they are now making will not allow it, and their proposition to reduce wages has been met by a strike. This has clearly been brought about by the state of the markets, and ought to convince the workmen that uncontrollable circumstances of this description, and not combinations of either masters or men, determine at all times the rate of wages. The manufacturers have had nothing to do with increasing the rate of interest for money, except as they, in common with all producers, have increased their exertions, have produced more, and have required more floating and fixed capital to carry on their business. They have only contributed to the dearness of provisions by consuming more, and enabling those they employed to consume more. They have had nothing to do with provoking the war, which is at variance with their interest. . . . They were not the finders of the gold in Australia, or the exporters of goods for which there grew up, in consequence of the gold discoveries, an immense demand. . . . Neither for the abundance of employment, and consequent high rate of wages which have prevailed, were they any more to be praised—except as they were industrious, enterprising, skilful men, carrying on their own business successfully—than they are now to be blamed for the diminished demand and lessened wages for manufacturing labour. They may cause high wages, but they never cause low wages, any more than they cause the high price of food.

Letters to the Editor

A Nato for South East Asia

SIR—In your second comment on Mr Strachey's letter you say:

> "the over-riding issue is that the peace of the world depends upon the maintenance of the alliance of the free western nations."

Surely this view could, in certain circumstances, lead to the alliance being regarded as an end in itself instead of being what it is, a means whereby world peace can be preserved. There would seem to be no good reason and several bad ones why Great Britain—in order to maintain the alliance—should participate in any action which Her Majesty's Government believe to be more likely to precipitate a world war than to ensure peace.

For example, supposing the choice lay between accepting a Communist controlled government in Northern Indo-China or participating in military operations against Communist China and our American friends demanded the latter course, would *The Economist* argue that we should agree to go to war with China in order to preserve the alliance? I would not. I agree that we should go a very long way in order to preserve the alliance but the view now being expressed in so many papers that we must always go all the way for this purpose, however much we may think it the wrong way, seems gravely to weaken our influence with the Americans. I suspect that Mr Dulles may sometimes be rather glad to say to some of his supporters(?) "Sorry, Boys! but the British won't take it."—Yours faithfully,

STEPHEN KING-HALL

Bordon, Hants

[Commander King-Hall did not read our comment far enough; four lines lower we wrote: "This does not mean that we must always defer to the Americans." Clearly, we should not, and could not, promise to follow them wherever they went. But every decision of policy is a weighing of alternative evils, and we should never lose from mind, in any disagreement we may have with the Americans, that very very few disasters could do as much harm to the British people as a breakdown of the western alliance.—EDITOR.]

Investigating McCarthy

SIR—I note that *The Economist* in its issue of March 20th remarks that Senator Leverett Saltonstall of Massachusetts, "much as he would enjoy making Mr McCarthy uncomfortable," declines to do so for political reasons.

Why should Senator Saltonstall enjoy making Senator McCarthy uncomfortable? Senator Saltonstall is no cautious agnostic on the subject of McCarthyism. His statement to the *Christian Science Monitor* on January 2, 1954, shows clearly enough that his attitude toward Senator McCarthy is one of substantial approval. The Saltonstall statement at that time was as follows: "I believe in encouraging the routing of subversives out of our government. While I don't approve of all Senator McCarthy's methods, I do think his overall purpose of eliminating subversives from governmental service has been helpful. I believe the majority of the American people approve of it. He has been helpful in stimulating action in the government and in keeping us keyed up to the dangers subversives present to our life as free men."—Yours faithfully,

ARTHUR SCHLESINGER, JR.

Harvard University, Cambridge, Massachusetts

Tremors Around Lysenko

SIR—You may be interested to know, in view of your rumours of "tremors" around Lysenko, in your issue of April 17th, that Lysenko has been one of the leading lecturers appointed by the Central Committee of the Communist Party of the Soviet Union to brief members of the Central Committee before going out to the countryside to supervise the vast new schemes for cultivating the new areas.

This announcement was made quite a time after the criticism of Lysenko to which you and two or three other papers have given such quite disproportionate publicity.—Yours faithfully,

PAT SLOAN

British Soviet Friendship Society, E.C.1

[Mr Sloan does not answer our point, which was that the once sacred Lysenko is no longer beyond the reach of criticism. Would he maintain that Lysenko's "monopoly" still prevails in Soviet genetics?—EDITOR.]

Doneraile Fair

SIR—It is a source of continual irritation to us in this part of the United Kingdom that English opinion of Ulster, where it exists at all, is so confused as to be ludicrous. Charges of intolerance are always framed in the vaguest possible manner, so that it is difficult to know exactly what is implied and, therefore, what to refute. On what definition of intolerance can the term be applied to Northern Ireland, when the following facts are taken into consideration:

(*a*) Persons of any religion are eligible for election to parliament, to local authorities or to any public office.

(*b*) Roman Catholic schools are built and maintained with the aid of a 65 per cent state grant (*cf.* 50 per cent in England), and staffed at state expense.

(*c*) School meals and school transport are available equally to state and voluntary schools.

Politics in Northern Ireland are complicated by the fact that one party does not accept the provisions of the constitution, so removing the basic premise of the party system. The problem resolves itself into the old, and perhaps insoluble, one of how far a state can tolerate those who are disposed to wreck it. Faced with this situation the liberal policy of the government here may be ultimately suicidal; I fail to see how it can be described as intolerant.

The policy of the BBC is to permit political attacks only in programmes in which both sides are represented, either in one specific broadcast or in a series of broadcasts. The people of Northern Ireland have every right to an apology when the BBC negligently permits a political attack in a "religious" broadcast. I would suggest that Radio Eireann is quite capable of conducting any anti-Ulster propaganda that is required—and at no cost to Ulster wireless licence holders!—Yours faithfully,

LOCAL GOVERNMENT OFFICIAL

Belfast

Romance by the Jar

SIR—In your issue of April 10th you give the impression that vaseline is a synonym for petroleum jelly.

We appreciate that the misuse of the word is an extract from a report by the City of Birmingham Analyst, with whom we have already been in contact, but we would point out that "Vaseline" is a trade mark or brand name applied to all products of our manufacture and not the name of a particular product.—Yours faithfully,

D. G. MCDONALD

Cheseborough Manufacturing Co. Ltd. London, N.W.10

Travel Agents

SIR—Now is the time to plan holidays, and the following experience may be of interest as a warning to your readers. Earlier this year I approached a travel agency with which I was not familiar and asked them to arrange accommodation in France. They gave me a quotation which included a booking fee (shown separately) and I accepted it. When I reached the hotel I found that I had been charged ten shillings per person per day in excess of the correct tariff, money which had been taken from me in foreign currency under the guise of hotel expenses. Booking fees are payable in sterling, and it is illegal for an agency to make a concealed profit. Nevertheless, legal actions are tedious affairs, and the fact that I had accepted the original quotation would have made recovery in court an uncertain matter. It is clearly necessary when dealing with an agency for the first time to check their quotations carefully.—Yours faithfully,

London, S.W.3 D. H. MACKENZIE

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

McCarthy *versus* The Army

Washington, D.C.

THE battle now being fought out under the flood lights in the Senate's main committee room means many different things to many different people. To Senator McCarthy the hearings on his dispute with the Army are the outcome of a conspiracy by "devilishly clever men" with the object of "derailing" his investigation into the "infiltration of Communists into the military under the Truman-Acheson regime" and into the "gross mishandling" of the subject by the service authorities. To Mr Stevens, the Secretary of the Army, the hearings are to expose "an example of the wrongful seeking of privilege, of the perversion of power" on the part of Senator McCarthy and his committee counsel, Mr Roy Cohn, who tried to use their ability to vary the intensity of their investigations of the Army in order to secure the privilege of an easy military career for their colleague, Mr David Schine, who had been conscripted. To Mr Joseph Harsch, of the *Christian Science Monitor*,

> the real issue is not whether the Senate can decide between one of its own members and the Army, but whether the American people in their own good time will accept or reject the essential claim of the Senator from Wisconsin to be the indispensable man in American public life. . . . In truth the Senator is not so much on trial as he is on exhibition.

In the sight of millions with access to television sets, the Senate's Permanent Investigating Sub-committee, which is charged by law with checking the economy and efficiency of the executive branch of government and is allowed to employ a substantial staff for the purpose, has been sitting in judgment on the conduct and veracity of its chairman and of the two senior members of its staff in their dealings with the Department of the Army. Simultaneously, and interwoven with this inquiry, all the committee's recent investigations of the Army have been reopened, but with Senator McCarthy acting this time only as prosecutor, not as chairman. This is the peculiar result of the inability of the committee and its special counsel, Mr Ray Jenkins, who has been retained to conduct these proceedings, to derive from the rival "bills of particulars" that were submitted in advance by the Senator and the Army any narrow definition of the issues to be determined.

Mr Stevens has spent day after day at the witness table trying to uphold the Army's charges, against ferocious cross-examination, and denying repeated suggestions that first by obsequiousness and then by threats he tried to avoid a ruthless exposure of his department's incompetence. Doggedly he has asserted his right to have asked for the temporary suspension of Senator McCarthy's melodramatic methods because they were damaging military morale, and has insisted on the grim reality of the arrogant hectoring to which he was subjected.

Although the members of the committee give the impression of making genuine attempts to get at the truth, there seems a fundamental impropriety in their being the judges. One of the underlying points at issue is the amount of forbearance that the legislative branch of the government ought to show to the executive branch by giving it time to solve in its own way problems which are essentially executive ones—in this case the handling of security risks. In such a conflict a legislative committee cannot but have bias.

Doubts are also rising about the much vaunted rules, similar to those of a court of law, specially agreed for these hearings. At the present rate of progress—only one of the six principals in the case has so far been heard—the inquiry will be going on for months. Moreover, Mr Jenkins, who is a well-known defence counsel in murder cases, persists in putting grossly offensive suggestions to the responsible head of the United States Army in the aggressive manner appropriate to his normal practice.

★

From the very outset of the proceedings, Senator McCarthy, whose place has been moved from the centre of the table at which he normally presides to one end of it, sought to move with him the initiative and the centre of attention. By use of his right of cross-examination (which everyone concerned possesses under the special procedure), but still more by raising points of order, he set out to establish three contentions—that the central issue was the investigation of Communists, that the case in so far as it affected Private Schine was utterly trivial, and that it was not the Army which was a party to the dispute, but only a few

> civilians in the Pentagon who have been working night and day to attempt to shift an investigation of Communism into an investigation of one private in the Army.

There is no doubt that Mr McCarthy is seriously worried about the already noticeable effect on public opinion of the daily repetition of the headline, "McCarthy *v.* The Army." But for all his emphasis on "individual civilians," the television viewers will have seen Mr Stevens escorted on either side by uniformed generals and will have identified the figure of General Ridgway, the military head of the Army, moving in beside his civilian chief to lend him moral support as he was waiting to take the witness stand.

Both in the preliminary exchanges in writing and in the hearings themselves, the traditional McCarthy method of replying to charges by diverting attention with other insinuations has been painfully apparent. Mr Welsh, the Army's special counsel, was reminded that he had a law partner who "in recent years" belonged to an organisation found by the Un-American Activities Committee to be the "legal bulwark" of the Communist Party; General Reber, who gave evidence about attempts to obtain a direct commission for Mr Schine, was told that his brother, a former Acting High Commissioner in Germany, had been classed as a security risk when he left the State Department (there is no other authority for this). Mr Struve Hensel, an Assistant Secretary of Defence who helped to draw up the Army's case, was accused of attempting to discredit the committee because his own business dealings in the last war were about to be investigated by it. The record is being swollen with fresh allegations altogether remote from the original dispute.

★

Although Senator Joseph McCarthy may not be disappointing his fervent admirers, there is reason to think that his position has weakened over the last few weeks, even though there is little, if any, prospect that the local "Joe Must Go" movement in Wisconsin will succeed in getting him out of the Senate. A Gallup poll, of which the results were published a month ago, three weeks after the original charges were made by the Army, showed that 46 per cent of those questioned disapproved of Senator McCarthy, as against 38 per cent who were in his favour. This compares with a 50 per cent vote for him in January, when there were only 29 per cent against him. A bitter attack on him by the Roman Catholic Bishop Sheil of Chicago as being a "pitifully ineffective anti-Communist" could have done him no good, while in the Senate a Republican, Mr John Sherman Cooper of Kentucky, has admitted that he made a mistake when he voted in favour of giving the McCarthy committee its very substantial appropriation. But the most important sign of change is that Mr McCarthy's fellow-Senators generally, including those on the investigating subcommittee, no longer seem to be afraid of him. Whatever the final outcome of these hearings, it is unlikely that he will again be allowed to wield the undiluted authority of the Senate in the form of a one-man committee.

Industry and the Atom

Washington and New York

THE long-awaited Bill to amend the Atomic Energy Act of 1946, sponsored by the Joint Congressional Committee on Atomic Energy, is now before both Houses of Congress. It has two chief aims: to grant President Eisenhower the powers he requested to give information on atomic energy to America's allies; and, in the words of its sponsors, to provide "the basis for licensing what is hoped will be a great new industry in atomic energy." The Atomic Energy Commission is willing, and would be allowed by the Bill, to relinquish its monopoly of atomic production, although it would still be prepared to assume, if necessary, most of the responsibility for further development. While the government would remain the sole owner of all "special materials"—a new term embracing materials for both fission and fusion processes—the commission would be permitted to license the use of these materials "at a fair price" to private industry. Firms would be licensed to own and operate nuclear reactors—the atomic piles, or furnaces, in which the heat is generated—and to sell the energy to electricity undertakings and other consumers at a "reasonable and non-discriminatory price" and the by-products to licensed industrial users. Somewhat unexpectedly, the Bill offers no compromise on the thorny question of patent rights, but proposes, without qualification, that normal patent rights be permitted in the peaceful application of atomic energy.

The Bill has a very good chance of being enacted by the present Congress—but not in its present form. There is general agreement on both matters of principle, but on questions of method a compromise has still to be reached. The Bill itself is essentially a working draft, prepared by the chairman with the assistance of a few members of the Joint Committee, and by no means has the committee's unanimous approval. Representative Holifield, the committee member who is the most outspoken critic of the Bill in its present form, urges Congress

> to be on guard against an atomic "giveaway" programme through legislative loopholes which would permit the selfish exploitation of atomic resources developed with public funds.

The Atomic Energy Commission's policy on the industrial development of atomic power envisages a five-pronged attack on existing technical problems. It calls for the construction, already under way, of one full-scale experimental power reactor—the first to be built in the United States—and four prototype or pilot-sized power reactors. The main project, a nuclear central station developing 60,000 kilowatts of electricity, is of a "pressurised water-cooled reactor" type, similar in design to that developed by the Westinghouse Electric Corporation for submarine propulsion. This type of reactor is the only one ready for full-scale construction, and it will give industry much-needed experience of the reliability and life of a large atomic plant, and provide some firm data on operating and maintenance costs.

The smaller projects will explore approaches which may prove to be more economic in the long run. The most promising are the "fast breeder reactor" and the "homogeneous reactor," although they are not expected to be ready for large-scale experimental testing for at least another five years. The fast breeder, which produces at least as much fissionable material as it consumes, has already proved itself technically feasible on a small scale. The homogeneous reactor utilises fuel in a water solution—the so-called atomic "soup"—and has the advantage of simplifying reactor design and reducing chemical processing costs. The other two experimental reactors are expected to be completed earlier but are less likely to produce power at an economic price.

★

Industry's participation in the programme was, until very recently, limited to designing, constructing and operating plants under contract to the Atomic Energy Commission. For the pressurised water reactor plant, however, industry was invited to participate commercially for the first time. The successful bidder, one of nine, was the Duquesne Light Company, a Pittsburgh utility firm,

which is expected to contribute, directly and indirectly, some $30 million towards the total cost of the project, with little chance, apparently, of being able to recoup its investment.

For the past three years, the commission has been encouraging industrial study teams. Altogether some eight of these teams—mostly from chemical and electric utility companies—have had access to the commission's facilities and technical data. The first detailed reports submitted by these groups were based explicity on the assumption that the plants would be dual-purpose—that they would produce weapon-grade plutonium or other fissionable material for sale at high prices to the government, in addition to producing power. The commission, however, has now changed its policy to favour single-purpose reactors designed primarily to produce power, with any by-products realising no more than their commercial value. The most active group studying the single-purpose approach is headed by the Dow Chemical Company and the Detroit Edison Company, with some twenty-five associated firms. These companies are working on the lines of a fast breeder reactor, and have just set aside $2.3 million of their own money to finance further research this year, with the eventual objective of financing an experimental plant.

While industry is interested in research and in the experimental work of the commission, no company is yet prepared to finance a full-scale project. Apart from the restrictions on ownership and patent rights under the 1946 Act, the chief impediment lies in the uncertain economies of nuclear power production. The actual fuel cost of a conventional power plant in the United States averages about 3 mills (3/10 of a cent) per kilowatt-hour of electricity. Nuclear power has every prospect of competing with this, in spite of a number of technical difficulties, but the key drawback at present is the very high capital cost of nuclear power plants. A conventional power plant costs between $160 and $200 per kilowatt of capacity, while the first full-scale nuclear power plant is expected to cost four times as much. Lower fuel costs, together with the proceeds from the commercial sale of by-products, would give nuclear power plants some advantage in running costs, but at present they are far from being competitive. The commission's objective is to reduce the total cost of producing nuclear power (allowing for fixed charges) to 8 mills a kilowatt-hour by 1960. On the assumption that any future increase in the efficiency of conventional plants will be offset by rising costs, nuclear power, according to the commission, might then be competitive with some ten per cent of the nation's conventional production.

★

The new Bill is designed to encourage greater participation by private industry in the face of uncertain economic prospects. The great incentive to industry is that of keeping the government out of the nuclear power business. The Duquesne Light Company's very low bid was undoubtedly based, in part, on the desire to take the lead in this. The other attraction is the benefit of patent rights to those first in such a fertile field. Firms are, however, unlikely to acquire this benefit unconditionally. A few large companies, as contractors to the government, have already gained at the public expense a long technical lead in atomic "know-how." There is, accordingly, strong opposition to any procedure which would enable them to obtain a patent monopoly. A possible compromise would impose compulsory licensing for a period of five years on private firms which take out patents in atomic energy. It would remain to be seen whether, under those conditions, private industry would be prepared to assume the financial risk of these undertakings, at least until it had had the benefit of the results of the commission's current five-year programme of reactor development.

That nuclear power is technically feasible, and will one day be economic, is no longer in doubt. But there appears little chance of any important nuclear power production in the United States for at least another ten years. Moreover, the potential contribution of atomic power is commonly over-estimated. There is as yet no large-scale, commercially feasible method of directly converting atomic energy into electricity. Therefore the only change nuclear power can make in the electricity industry is to substitute a new fuel for an old one, and to replace the firebox and boiler by a nuclear reactor. Since the steam turbines, electric generators and transmission systems will all remain substantially the same, the area in which atomic energy can effect a cost reduction is essentially limited. Within the United States, the most significant effect of atomic energy is likely to be the equalisation of fuel costs between regions and the resulting impact on industrial location. Outside of the United States, where the cost of conventional power may be much higher, the contribution of atomic energy can be much greater.

The industrial use of atomic energy is, however, by no means confined to the generation of power. A major, if not revolutionary, contribution is likely to come from the use of radioactive isotopes in such industrial processes as control and quality improvement, and also the use of the new metals and chemicals involved in the fission process. If the industrial development of atomic energy is accompanied by a substantial reduction in prices of the radio-active by-products, the tail may eventually be wagging the atomic dog.

Wool Gathering in the Senate

THE Eighty-third Congress, with only three months of its second session to go—members have now no hope of getting away from Washington before the end of July—will have to concentrate on its work if it is to enact "the greatest, most affirmative programme offered to the American people in a generation," as the Vice-President has promised it will. As usual the chief hold-up is in the Senate, even though it did not allow itself an Easter holiday, and as usual legislation is being sidetracked while investigations go full steam ahead. Admittedly the housing investigation which has been attracting attention recently is a necessary forerunner of housing legislation. For Senators can hardly be expected to give the federal government additional powers in connection with loans and mortgages until assurance has been given that present powers are no longer open to abuse by builders.

The Senate Banking Committee is now enquiring into the excessive profits that have been made at the expense of taxpayers and homeowners by builders who mortgaged properties at more than they cost, or borrowed unnecessarily large sums for home improvements, under the government guarantee and insurance schemes, and then pocketed the

difference. This is the Eisenhower Administration's first scandal and its exposure has been followed by a spate of forced resignations of housing officials, in an attempt to prevent the Democrats making election capital out of it. This they can hardly do, since many of the abuses occurred —and were first discovered—during the Truman Administration.

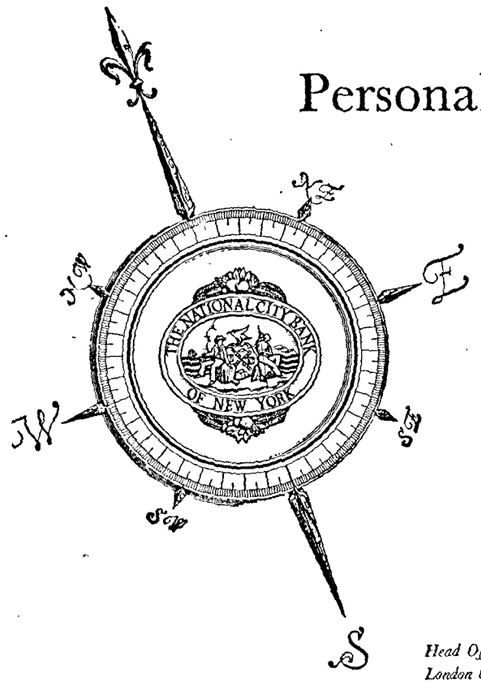
Election considerations are also behind the long argument over the Bill giving subsidies to wool producers; it took a week, and a threat of a presidential veto, to defeat amendments to a Bill to which there was in principle little opposition. The trouble arose over an attempt, by both Democrats and Republicans who feared that the Senate would have no time later on for controversial agricultural legislation, to add a rider to the Wool Bill continuing the present system of high and rigid price supports for the basic crops—wheat, maize, cotton, tobacco, rice and peanuts—for another two years. This system is due to lapse at the end of this year, unless Congress acts, and the Administration wants to substitute a modified and more flexible system. The fight over the rider to the Wool Bill confirms the impression that a prolonged and possibly unsuccessful struggle will be involved.

The House of Representatives has already made the farmers a present by increasing the appropriation for the Department of Agriculture; all other appropriations so far have been for less than was asked by the President. His requests, however, were so comparatively moderate this year that the House found it impossible to make any substantial cuts, at least until it came to the huge sums for defence. There the Appropriations Committee has recommended $28.7 billion, $1.2 billion less than the Present asked. This is being debated on the floor this week and after that the only substantial appropriation left will be for foreign aid. The Senate has not yet acted on a single Appropriations Bill and the House-approved Tax Bill is also still in the Senate Committee.

Needed Public Works

ONE of the few Bills on which Congress has completed action at this session authorises the federal government to spend nearly $1 billion a year for two years, beginning in July, 1955, on highway development. Most of this money would be allotted to states on a matching basis, which means that state governments would be required to provide equal sums for road building, so that potentially the total amount of new spending on roads under the Bill could come to about $3½ billion. Even under the Truman Administration only about half-a-billion dollars a year was appropriated for highways. Under the new Bill the President can ask for funds to be made available almost at once, instead of waiting until 1955, should he feel that the time has come to speed up expenditure on this type of public works.

Another Bill which has been passed, although in differing versions, by both houses of Congress, should also mean increased spending on construction. This is the Lease-Purchase Bill, which permits the federal government to make contracts for new buildings under which rent payments would be set off against the purchase price, so that eventually the government would own the building. It is hoped, probably vainly, that this may mean the end of the temporary structures that disfigure the capital. It seems



Personal service the world around

THE NATIONAL CITY BANK of New York maintains a world-wide network of 57 overseas branches and of correspondents in every commercially important city throughout the free world.

Businessmen who consult The National City Bank are thus assured of individual and personal service the world around. Their particular interests can be assisted and furthered by up-to-the-minute reports from the experienced group who man this extensive banking chain.

The London officers of The National City Bank are always happy to advise on all aspects of world trade and banking and are, as well, especially trained to deal with enquiries regarding the dollar area. A visit to any branch of The National City Bank of New York will help solve your problems.

certain, however, that it will mean numbers of new post offices and other federal buildings in local communities. Some of them are likely to be begun soon so that Republican candidates will have something to show the voters next November.

Most of these buildings are undoubtedly needed to cope with the growth in population and in government activity. It has also been calculated that far more ought to be spent on roads than is at present planned, if economic expansion is not to be strangled on overcrowded highways and city streets. A figure of $40 to $50 billion has been mentioned, and the President himself has said that an annual expenditure of $8 billion is needed to ensure an adequate road system; in 1953 the total amount spent by federal, state and local authorities for this purpose was about $5 billion. Indeed, the President's Economic Advisers are reported to have discovered, as they made plans for public works to be used should the recession become serious, that in fact many of these projects, for schools, airports, water development and so on as well as for roads, ought to be started at once, not as pump-priming operations but to keep up with the country's growth.

Wage Guarantees — 1954 Style

THE workers at the Willys Motors plant in Toledo, Ohio, have just created a sensation by accepting what is, in effect, a wage reduction of 5 per cent, although it is camouflaged as a conversion from a piece-rate system to the straight hourly wage basis that is now general in the automobile industry. The reduction was sweetened by the promise of a bonus to be paid out of the savings the company expects to make as a result of lower wage costs and increased efficiency. Together it also hopes that these will once more enable it to compete effectively in the industry, something it has not recently managed to do. The wage agreement also guarantees work for 40 hours a week—or a lay-off for a full week, so that unemployment benefit may be drawn—and Willys employees are therefore being congratulated on having obtained the guaranteed wage that is expected to be the objective of other automobile workers when they bargain for a new labour contract next year.

A guaranteed annual wage is the objective of the steel workers this year—their contract expires in June—and the electrical workers have already asked the General Electric Company for it. Both these unions want higher wages as well, but cannot expect to get much of an increase now that the cost of living has levelled off. The fact that sales have also levelled off, or even declined, is to trade unionists no answer to a demand for higher pay, for they argue that the best remedy for falling business is to give the workers more to spend. Their argument for a guaranteed wage follows the same lines: it would maintain buying power and therefore counteract the swings in the business cycle which, employers insist, make it impossible for them to give such guarantees.

What is really meant by a guaranteed wage nowadays, as is made clear by the electrical union's demands, is a promise by the employer to supplement unemployment insurance payments. The General Electric Company is being asked to put 5 per cent of its weekly payroll into a fund from which would be made up the difference between a laid-off worker's normal earnings for a 40-hour week and the amount he receives in unemployment compensation or from another job which pays less than he earned with the company.

Leaden Duty?

FROM A CORRESPONDENT IN COLORADO

THE smelter-stacks are smokeless and the mine-hoists idle at many a small community tucked away in the folds of the Rocky Mountains as a result of the long-continued slump in the mining of lead and zinc, one section of the American economy that has been enduring a depression in the midst of general prosperity. Mine-operators are becoming as critical of the Eisenhower Administration as they ever were of Mr Truman's, although for years they looked forward to the coming of a Republican Administration as a veritable escape from bondage. They attribute their troubles entirely to "foreign competition" and to the alleged failure of the American government to protect American industry. The recent change in the Administration's stockpiling policy—which promises increased purchases of lead and zinc among other metals—was given only a lukewarm reception. Although prices were pushed up by this news, producers regarded it as temporary relief which did not touch the long-term problems of the industry.

Mine-operators are eagerly awaiting the findings of the Tariff Commission, which held hearings on their emergency application for tariff relief last November. In the meanwhile, the same commission has handed to Congress a 550-page report on the domestic lead and zinc industries in answer to a request by the House Ways and Means Committee and the Senate Finance Committee. The report gives an extensive survey of the ills of the industry, but fights shy of making a definite recommendation in favour of higher tariffs or import restrictions, although some such relief is implicit in its findings. While producers are disappointed at the somewhat negative character of the survey, it is probable that the Tariff Commission will be more decisive in its report to the President on behalf of the industry.

Imports of lead and zinc have risen steadily, until last year the United States imported more zinc than it mined—755,000 tons as against 640,000 tons. And for some years (except in 1951 when the US ceiling price was lower than the world price) it has imported more lead than was mined domestically. The two metals are almost invariably found together; their prices slumped early in 1954 to little more than 9 cents a pound for zinc and 12 cents for lead, while operators say that a combined price of 30 cents is about the lowest profitable level for these Rocky Mountain mines.

Foreign competition is by no means the only cause of this trouble. In this field, as in most American nonferrous mining, the cream of the deposits was long ago skimmed off, and the deposits left for exploitation are of progressively lower-grade and harder to get at; imports, generally speaking, come from richer and more virgin deposits in countries still exploiting their "cream." Moreover, this is an industry in which labour is almost completely organized, and the unions have invariably refused to take the cuts in wage-rates that might have allowed the mines to stay open. In most workings the ores contain gold, silver, and copper in addition to lead and zinc. Before and during the last war, gold and silver were profitable enough to provide a

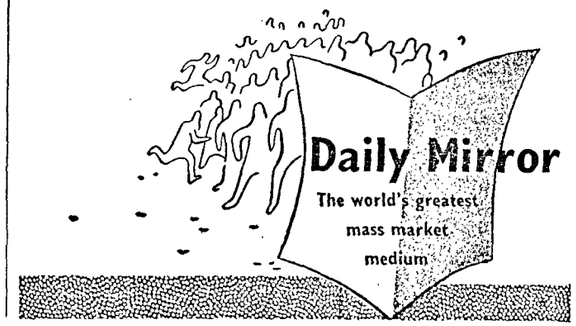
Tomorrow's customers?

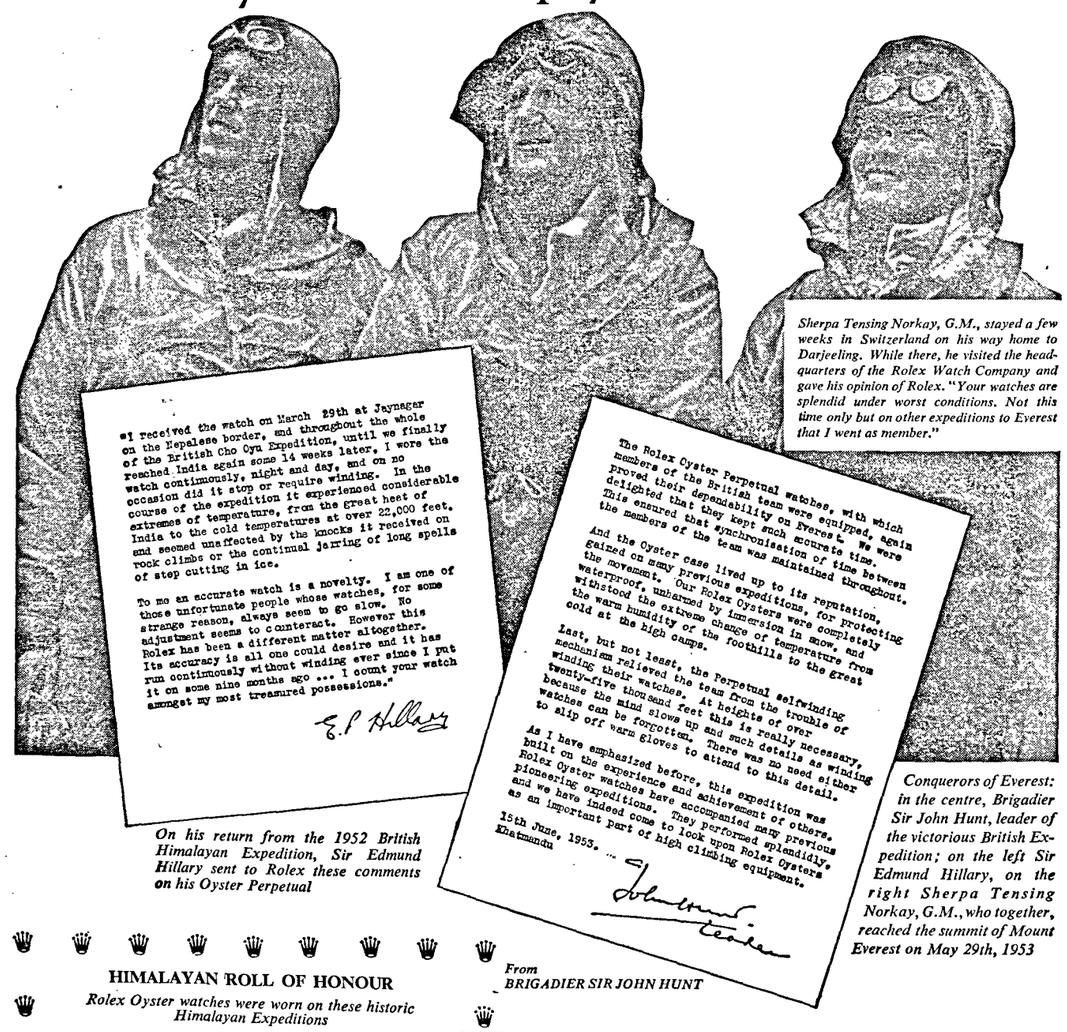
They've just got engaged and have started to plan for the future. Do your products come into their scheme of things? Are they destined to be your customers? Today? Tomorrow, perhaps?

With its strikingly realistic presentation of news, its fearless facing of facts, the Daily Mirror appeals powerfully to vigorous young readers. In fact, the majority of the 4,600,000 or more people who buy it every day belong to the younger generation. These are the people with the longest buying years ahead of them—a generation with the ambition to possess better and lovelier things.

With the biggest daily sale on earth, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. And—Daily Mirror readers are young readers. Your customers today—next month—next year.



Himalayan climbers pay tribute to Rolex



"I received the watch on March 29th at Jaynagar on the Nepalese border, and throughout the whole of the British Cho Oyu Expedition, until we finally reached India again some 14 weeks later, I wore the watch continuously, night and day, and on no occasion did it stop or require winding. In the course of the expedition it experienced considerable extremes of temperature, from the great heat of India to the cold temperatures at over 22,000 feet, and seemed unaffected by the knocks it received on rock climbs or the continual jarring of long spells of step cutting in ice.

To me an accurate watch is a novelty. I am one of those unfortunate people whose watches, for some strange reason, always seem to go slow. No adjustment seems to counteract. However this Rolex has been a different matter altogether. Its accuracy is all one could desire and it has run continuously without winding ever since I put it on some nine months ago ... I count your watch amongst my most treasured possessions."

E. P. Hillary

On his return from the 1952 British Himalayan Expedition, Sir Edmund Hillary sent to Rolex these comments on his Oyster Perpetual

The Rolex Oyster Perpetual watches, with which members of the British team were equipped, again proved their dependability on Everest. We were delighted that they kept such accurate time. This ensured that synchronisation of time between the members of the team was maintained throughout.

And the Oyster case lived up to its reputation, gained on many previous expeditions, for protecting the movement. Our Rolex Oysters were completely waterproof, unharmed by immersion in snow, and withstood the extreme change of temperature from the warm humidity of the foothills to the great cold at the high camps.

Last, but not least, the Perpetual selfwinding mechanism relieved the team from the trouble of winding their watches. At heights of over twenty-five thousand feet this is really necessary, because the mind slows up and such details as winding watches can be forgotten. There was no need either to slip off warm gloves to attend to this detail.

As I have emphasized before, this expedition was built on the experience and achievement of others. Rolex Oyster watches have accompanied many previous pioneering expeditions. They performed magnificently, and we have indeed come to look upon Rolex Oysters as an important part of high climbing equipment.

15th June, 1953.
Khatmandu

From BRIGADIER SIR JOHN HUNT

Sherpa Tensing Norkay, G.M., stayed a few weeks in Switzerland on his way home to Darjeeling. While there, he visited the headquarters of the Rolex Watch Company and gave his opinion of Rolex. "Your watches are splendid under worst conditions. Not this time only but on other expeditions to Everest that I went as member."

Conquerors of Everest: in the centre, Brigadier Sir John Hunt, leader of the victorious British Expedition; on the left Sir Edmund Hillary, on the right Sherpa Tensing Norkay, G.M., who together, reached the summit of Mount Everest on May 29th, 1953

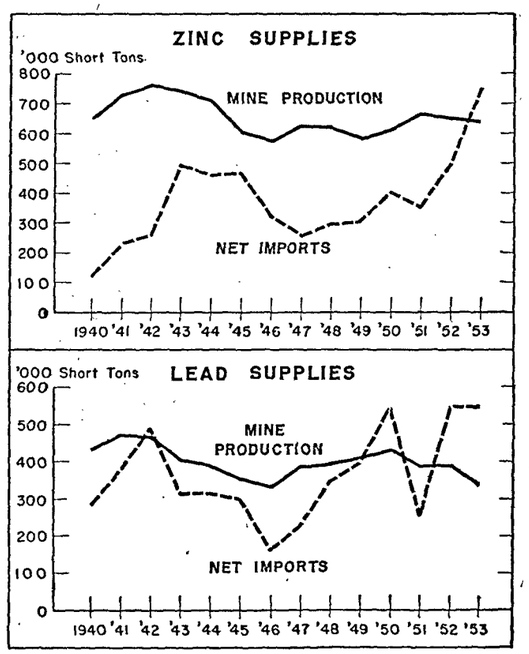
subsidy for the production of the other metals. But as general costs have moved upward, this subsidy has vanished except in the case of ore especially rich in the precious metals.

Of the reality of the depression back in the mountains there is no doubt. The communities grouped around the workings of some of the big mines are entirely dependent on them. When operations shut down, they rapidly become "ghost towns" since there is no other means of subsistence open, save a few opportunities for increased catering to tourists, hunters, fishermen and skiers. The decline in employment between early 1952 and October 1953 was as high as 32 per cent. Many miners have moved "over the hill" and gone to work in the uranium-mining industry which is booming a hundred or so miles away. But despite all the talk of American mobility, large numbers of miners do not want to move; and naturally such migration as there



is only heightens the problems of tradesmen and others in the deserted towns.

Throughout the years since the inauguration of the reciprocal trade policy, tariffs on zinc and lead have slowly moved downward until they are now at levels of 0.6 cents for zinc ores per pound of contained metal and 0.7 cents on the metal itself. For lead they are at 0.75 cents on the ore and approximately 1.06 cents on the metal. Under present law they could be raised by emergency action to 2.55 cents on lead metal, 2.10 cents on zinc metal, and 1.8 cents in each case on the metal content of ores. The industry frankly does not think this is enough, but it is "better than nothing" in the words of Mr Andrew Fletcher, president of St Joseph Lead Company and of the American Institute of Mining and Metallurgical Engineers. The Tariff Commission claims that whether higher tariffs or other import restrictions should be imposed is a question of public policy for Congress to decide. The solution favoured by the mine-operators is a "floating" tariff that would automatically bring American producers a minimum price of about 15 cents a pound for each metal. This would of course protect the American producer at the expense of foreign competitors. In fact Mr Fletcher, previously quoted, expressed dissatisfaction with any solution that did not penalise and cut down what he called "world overproduction."

Clearly the Administration, if it desires to assist the zinc and lead producers, is going to be hard pressed to find a formula which does not run directly counter to its avowed trade policies. The whole issue is bound to receive attention in the coming debates on tariff policies. But it seems unlikely that the present Administration, with its commitments in the field of world trade and its obligation to encourage world production of these two vital nonferrous metals in case of war, will wholly satisfy the demands of the metal producers.

SHORTER NOTES

The appointment of Mrs Eve Bowring, vice-chairman of the Republican party in Nebraska, to the Senate seat recently made vacant by the death of Senator Dwight Griswold restores the Senate political alignment of 47 Republicans, 48 Democrats and 1 Independent, temporarily upset by the loss of the Republican Senator. Mrs Bowring, Nebraska's first woman Senator, regards herself as a "forward-looking Republican" and an Eisenhower supporter; she will not be a candidate for a full term next November.

★

Most of New Jersey's municipalities have voted to legalise within their own borders small-stake gambling in the form of raffles and bingo, a game involving the betting on sequences of numbers, if the game benefits civic, religious or other welfare organisations. Overwhelming approval was given last week in local elections, to minor gambling for charitable causes following the adoption last November of an amendment to the state constitution which permitted such gambling in principle, but left the final decision to local option.

★

Mr Meyer Kestnbaum, a moderate Republican and a friend and supporter of General Eisenhower, has been appointed by the President to succeed Mr Clarence Manion as chairman of the Commission on Inter-Governmental Relations, which is to report on problems involving the federal and state governments. Mr Kestnbaum is also president of a leading clothing manufacturing company, director of the Community Fund of Chicago, and chairman of the businessmen's national Committee for Economic Development; but he should be able to devote more attention to the study of federal-state relations than did Mr Manion, who spent most of his time campaigning for the Bricker Amendment.

The World Overseas

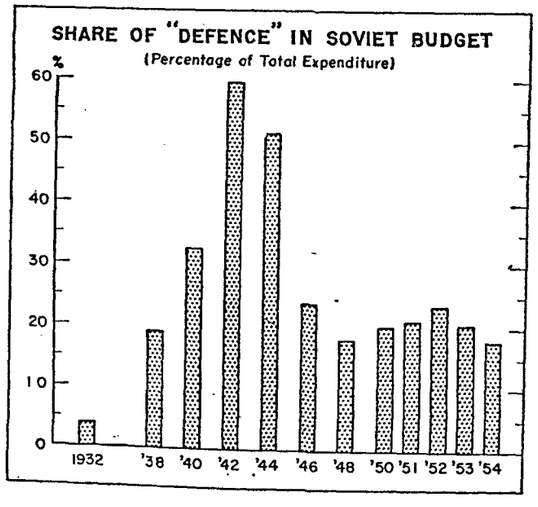
Secrets of the Soviet Budget

ARSENI ZVEREV, the Soviet finance minister, has now presented his second post-Stalin budget, but the financial picture of Russia's "new look" is still far from clear. For the current year revenue is estimated at 572,500 million roubles and revenue at 562,800 million roubles, leaving a reduced surplus of about 10,000 million roubles; there are, however, many gaps in this balance sheet. Indeed, Zverev was even more secretive this time than he had been last autumn. He produced almost no details of last year's actual accounts, thus leaving the puzzle of the unaccounted items unsolved; and unspecified items loom larger in this year's statement. Zverev keeps so many cards hidden that caution is advisable in assessing his game.

Suspicion is naturally most lively in relation to defence. The main feature of budgeting since Stalin's death has been the reduced share of expenditure on defence, that is, on the actual upkeep of the armed forces and their direct supplies. This year admitted expenditure on defence is reduced by a further 10,000 million roubles and its share of total expenditure has fallen to less than 18 per cent. But can one be sure that the cut in Soviet arms spending is genuine, as long as a big part of the budget remains shrouded *in mystery*? It has been argued that atomic and hydrogen bomb plants are controlled by and financed through the "security services," whose accounts are camouflaged in the unspecified parts of the budget. Thus what would be cut in the open may well have been more than offset under cover. This argument was more valid last year, when the unexplained items suddenly doubled, than in the current one, when they are swollen in roughly the same proportion as total expenditure.

A cut in direct Soviet spending on defence is quite possible. It could be justified not only by the needs of the other branches of the economy but by changes in Soviet strategic thinking, not dissimilar to those imposed on the West by the atomic age. The Russians may no longer think that the piling up of conventional weapons or even the maintenance of a swollen army are indispensable. The installation of new armaments plants would, in any case, come under "grants to the national economy," while much atomic research and preparation may well be labelled higher education. All the chief spokesmen in this budgetary debate insisted on the fact that the Red Army is getting the latest atomic and hydrogen weapons, while Malenkov made it plain that Soviet scientists work for defence as well as for peaceful purposes. In the circumstances, a cut in the standing army and in conventional armaments may well have been approved by the Kremlin.

In the long run economic potential is more important than the actual stockpile, and investment in the national economy is the main beneficiary of this apparent cut in direct defence expenditure. This has made possible the stepping up of grants both to agriculture and consumer goods industries, though heavy industry is still at the head of the priority list. The share of social services is scarcely changed at all, while expenditure on administration is undisclosed. The uncertainty is probably the result of the amalgamation and then deconcentration which have followed Stalin's death, though great stress has been put on the need to prune staff and eliminate bureaucratic waste.



On the revenue side, the uncharted territory now accounts for nearly one-third of the total. In the open accounts there has been a further switch from turnover tax—a purchase tax levied primarily on consumer goods—to profits taxes which are deducted from profits of State enterprises. This is a logical sequel of the progressive reduction of prices of consumer goods. The share of direct taxes and state loans has declined still further. But Zverev has failed to reveal from where he will get the other funds for his budget, and many a finance minister must look with envy at a colleague who can withhold so much information from the scrutiny of the deputies and the public.

Linking the turnover tax with the estimated "saving" from price cuts, it is possible to get a rough yardstick of expected consumption. According to these calculations, based on official figures, Soviet consumption rose by about 10 per cent last year but is expected to increase by less than 6 per cent in the current one. In other words, the unprecedented gifts to the consumers after Stalin's death will not be repeated on the same scale; stocks probably cannot be run down much further. True, output of consumer goods is rising, and the plan in this sphere is apparently to be achieved in the current year, twelve months ahead of schedule. Yet in almost all the speeches during the debate it was possible to detect an emphasis on the primary importance of heavy industry slightly more pronounced than in recent months. Basic production continues to advance with great strides. According to Malenkov, in the current year steel production should reach 41.2 million tons, coal extraction 345 million tons and electricity generation about 157,000 million kWh. The Kremlin cannot afford any slowing down of its huge economic machine, and pains have been taken to emphasise that further benefits to the consumer will have to come largely out of increased productivity.

India and the Foreign Settlements

FROM OUR BOMBAY CORRESPONDENT

INDIANS usually refer to the French and Portuguese possessions on their coasts as "pimples"—*tiny, but painful.* India has 300 districts; all the "pimples" put together are smaller than one district; and the 320,000 people of the French possessions, the 624,000 of the Portuguese, together equal only a quarter of the population of the city of Bombay. The pimples are also of small value to their present owners. The French have to subsidise Pondicherry, the Portuguese have to pay for most of the troops they keep in Goa. They provide a handful of jobs for Frenchmen and Portuguese, a few Indian subordinates for other French and Portuguese colonies; that is all. Even to India their economic value is limited if not actually negative. Marmagoa, as a port in Indian hands, might relieve Bombay; Goa's iron and manganese ore would provide foreign exchange. But at present these settlements are nests of smugglers and bootleggers. Bombay, Madras and Saurashtra, the states in which they are situated, all have prohibition; the settlements all have cheap drink and no restrictions. India has severe import controls and an absolute ban on gold and diamonds; Pondicherry is a free port, Goa is full of English chocolates, Japanese fountain pens, American stockings, Swiss textiles, French perfumes, and whisky. Pondicherry swarms with Belgian and Dutch diamond merchants, Goa with Gulf Arabs bringing gold. Nobody quite knows what the Indian revenues lose because of the settlements (one semi-official estimate puts gold smuggling alone at £30 million, though this is certainly too high) but it is probably not less than the whole revenue of Assam and Orissa.

Not merely is the Indian government defrauded of its revenues, and crime made easier for its citizens, but in the process a large vested interest in the *status quo* is built up in the pimples. The hooligans who disperse pro-merger processions in Pondicherry belong to smuggling gangs; the businessmen who support Portugal in Goa do so because there they avoid Indian income tax (Goa has no income tax) or make money out of running gold.

Will They Go Quietly?

To Indians there can be no other reason for supporting France or Portugal. The possessions are parts of metropolitan France or Portugal, but their inhabitants are neither French nor Portuguese, and only a tiny fraction understand either language; the vast majority speak Tamil, Malayalam, Gujerati or Konkani, exactly like their Indian neighbours. Goa's superfluous educated go to India, not Portugal, to earn a living. A few squares of Nova Goa are reminiscent of Mediterranean Europe, the bars of Pondicherry have a French nostalgia; that is all. Even in religion, a bare majority in Goa and a vast majority in Pondicherry are Hindus, not Catholics.

To Indians, therefore, Goa and Pondicherry are simply *terrae irredentae;* bits of India that were lost during the period when India itself was under colonial rule and which should now come back to the motherland. The issue, to them, is too obvious even for the niceties of a referendum. If the much more important British left without, so can the French and the Portuguese. The only question is whether they will go graciously like the British, or have to be kicked out.

Hitherto the Indian government has been patient. It permitted French and Portuguese officials and even police to cross its territory; it let the settlements use the rupee as their currency although that greatly facilitates smuggling, it was lax in its control of the frontier. It has only just now insisted on visas and identity cards for French Indians coming to India, it has not put any restrictions on French or Portuguese Indians getting jobs in India or remitting money, and until recently it has permitted essential supplies to go in freely, although a real economic blockade would make it quite impossible for such tiny enclaves as Portuguese Daman (82 square miles, 60,000 people) or French Yanam (5½ square miles, 5,700 people) to function.

But now the government's hand is being forced in two ways: by the popular movement in French India, which took it by surprise, and by the intransigence of Dr Salazar.

The French Indian movement is led by the very men, notably M. Goubert, on whom the French have relied for their support all these years, and through whom they won the last French Indian elections. The other French Indian leaders have been pro-Indian all the time. The Indian public have, therefore, grown impatient. They consider the present upsurge under this leadership final proof of French Indian preferences, and regard the demand for a referendum as proof of French bad faith. The French Indian police, they feel, cannot be trusted not to be heavy handed in the hope of perpetuating their privileged position and their stake in smuggling, and no Indian believes that a referendum could be fair so long as they remain. It is, therefore, only at the cost of giving a valuable talking point to the Communists that Mr Nehru has been able to stand firm against taking over the villages "liberated" by M. Goubert and his friends.

Poisonous Pimples

Dr Salazar's intransigence undermines Mr Nehru's position more seriously still. So long as Portugal will not even consider negotiations, India must be pushed slowly towards more and more active steps, especially since it is a constant Communist and fellow-travelling cry that Goa is being turned into an American base and that the new airport that is being built there is intended one day to carry American hydrogen-bombers. The untruth of these allegations does not prevent their being widely believed.

By thus making Mr Nehru perpetually vulnerable to Communist outcries, the pimples poison India's own blood stream; they also help to poison India's relations with the West. Mr Nehru is constantly reproved for failing to understand the totalitarian menace of Communism; yet the only place where Indians actually live under a police state is Goa, and none of Portugal's Atlantic allies uttered a word of protest when, for example, a Goan surgeon was deported to Lisbon for a nationalist remark made at a private tea party. In India the names of Dupleix and Vasco da Gama arouse the same sort of memories as Cromwell's in the Irish Republic.

Anglo-Germans Confer

FROM OUR SPECIAL CORRESPONDENT

ANGLO-GERMAN gatherings tend to be occasions at which the Germans ask no questions about British or world affairs, but give the English a one-sided battering on German grievances. The conference of the German-English Association at Königswinter last week end was a happy exception, as information was exchanged and the affairs of Asia as well as Germany were discussed. Of the four study groups, two dealt with Asian matters, in connection with the Geneva Conference and the proposed South East Asian defence pact. It was, indeed, one of the best results of the meetings that Germans learnt some of the favourable points about British rule in India and the unpleasant facts of Pandit Nehru's neutrality. The Germans, who were inclined to condemn the French in Indo-China for fighting a "colonial war," were given good reasons for thinking the West must stem the tide of Communism. In economic and technical aid, it was generally agreed that they must play a part; but the question whether they would ever fight for the West in Asia was left discreetly alone.

Königswinter gave hope for a future federal West European parliament, because it showed that divisions of opinion tend to run along party, rather than national, lines. Twenty-five British MPs from both sides of the House and a number of German politicians were in attendance. The Germans may be forgiven if they concluded that Labour has no more Bevins, and that public school intellectuals—speaking rather better German than the Conservatives—are the only spokesmen of the British working man.

Mr Richard Crossman, MP, firing from the hip at Herr von Brentano, Dr Adenauer's representative, put the German demands for reunion much more clearly and more positively than the German socialists. On the other hand, many Germans, notably Dr Tillmans, a Berlin Christian-Democrat member of the *Bundestag*, were as factual, quiet and good-humoured exponents of the case for western integration as the best of British Conservatives. And Herr Abs, West Germany's most able banker, could not have been bettered for wit, charm and national modesty in his short speech on Germany's conflict with Britain in the European Payments Union. Germans, he remarked, show incredible patience as debtors; would it not be a good thing for them to show some of the same patience as creditors?

A Coalition of Armies

After Königswinter there is no longer any excuse for the British Labour Party to think that the German Social-Democrat leaders are against rearmament, *tout court*. Herr Ollenhauer made it plain that the SPD is only against the European Defence Community. The party is "for a coalition and against integration." The SPD has two policies, one for the period before reunion with the Soviet Zone and the other for the period after that distant day. For the first period the party proposes that, instead of the EDC, there should be a coalition of armies, including Germany, Britain and Scandinavia. Whether it would be attached in any way to Nato or form a Third Force no one could find out from Herr Ollenhauer. After German reunion, the SPD has an even more nebulous proposal that Germany should take part in a world-wide security system (of the world against Mars?). Germany would be a member of the United Nations, and its national army would be no danger to the world, it seems, because it would be "under the control of Uno."

The test of all proposals for east-west security systems, whether they come from the German Socialist leaders, from Mr Molotov, Sir Winston Churchill or Mr Crossman, is whether they mean maintaining or breaking the British and West European alliance with America. Before approving or rejecting any of them, the question must be asked—is Nato a temporary expedient to face a danger that no longer exists or a permanent institution? Few of the German members of the Königswinter gathering seemed to grasp this point, though it emerged quite clearly from another proposal put forward by a British Socialist group against the protest of others from London. This suggestion was that, after German reunion with the Soviet Zone, the Russians should be told that, in return for free elections in the European Soviet satellites, Britain and the West European states would clear their territories of American bases. It is hard to say how Mr Bevan and British rank-and-file opponents of German rearmament would like this proposal. It would mean that Britain would exchange its alliance with America for one with a German national army that would be the strongest on the continent except for the Soviet forces—in return for a promise that the Russians made once before to President Roosevelt and the British Prime Minister. In comparison with this idea, Mr Crossman's interim proposal that the Russians should at once be asked to agree to an "Austrian solution" for Germany sounded practical.

Mr Molotov came off well at Königswinter in contrast to Mr Eden. The British and German Socialists effectively based their arguments on a distorted version of what happened at the Berlin conference. Here they are in the company of German nationalists. The field was left clear for opponents of the British and German governments to declare that the western side at Berlin put up maximum conditions on which they did not negotiate because they wanted German rearmament to begin. Mr Molotov, it was implied against all the evidence, would have exchanged abandonment of EDC for free elections, and showed readiness to compromise. Journalists and historians may well ponder sorrowfully on this twisting of recent facts.

Dollars for the Coal-Steel Community

WHEN the Common Assembly of the European Coal and Steel Community meets on May 11th in Strasbourg for its regular annual session, M. Monnet, the president of the High Authority, will be able to report the successful conclusion of his negotiations for an American loan. The $100 million loan to the Community will, according to the agreement signed in Washington on April 23rd by the United States government and the High Authority, run for 25 years, bear interest of 3⅞ per cent, and be repaid in 22 equal instalments beginning with the fourth year.

At a time when foreign assistance, particularly to Europe, is being cut down wherever possible and there is great political pressure to reduce government expenditures, the granting of a loan of these proportions is a testimonial to the negotiating skill of M. Monnet. What is more important, it is also another indication of the widespread Congressional and popular American support for and belief in the idea of European unity. Although the loan which has just been granted required no new Congressional approval, since the money will be found from funds already appropriated, the President, the Senate Foreign Relations Committee and the House Foreign Affairs Committee all went on record last June as favouring a loan to the Community. Their support was clearly based on the fact that, as President Eisenhower wrote at the time, such a loan "would foster European integration in a tangible and useful way." The need to modernise and develop the production of coal, coke and iron ore, and thus to increase coal production and reduce the cost of steel production, is unquestioned. But the communiqué makes clear that the loan is essentially a vote of confidence in the Community of Six rather than a loan to assist production.

A government loan simply to boost coal production from its current levels or to improve the competitive position of European steel would not, presumably, have had priority over various competing claims for the limited foreign assistance funds. Nor would it have attracted much public support. In announcing even this essentially political loan certain reassurances were given to American industry. On the one hand, the United States government stated that it was consulting with certain of the governments that are members of the Coal and Steel Community for the removal of quota restrictions maintained on the import of United States coal; on the other, the High Authority confirmed that nothing in the treaty would preclude the removal of the quotas.

More Investment to Come

The most tantalising part of the communiqué, and potentially the more important, is the information that the United States government and the High Authority are continuing negotiations with a view to finding "new means" by which private capital both in the United States and in Europe can be mobilised for investment in Europe's basic industries. M. Monnet, in outlining his views on the investment needs of the Community to a special session of the Common Assembly in January, emphasised the need for reducing the current dependence of the coal and steel industries on short-term bank loans carrying high-interest rates. M. Monnet, by using the American money to make long-term, low-interest loans, and perhaps to guarantee other loans, may make some impact on the European capital market, but hardly on the scale required. Perhaps the "continuing negotiations" will lead to something more far-reaching. However, regardless of further developments, the pleasant sound of $100 million jingling in his pocket should strengthen M. Monnet's hand in his inevitable tussles with the cartels, and boost the prestige of the Coal and Steel Community at a critical time.

Worries for Kuwait

FROM OUR SPECIAL CORRESPONDENT

WITHIN the last three years, Kuwait's name has become a synonym for coming into a fortune. During the last two of them, its wealth has been converted at breath-taking speed into state services, and Kuwait town has experienced a boom that has almost doubled its population and filled it with strangers, both Moslem and infidel. Now, suddenly, that boom is halted and a pause for breath has been ordained. Some of the Persian Gulf's roaming labour force has left for home with its takings; some is hanging round in hopes of more jobs. This summer, therefore, will be a time of readjustment, and perhaps of some discomfort for anyone who had begun to take boom conditions for granted. All the signs are that they will recur, though never at quite the pace of 1952-53.

The Sheikh of Kuwait is his own master. The British protection which a predecessor first sought in 1897 as a bulwark against pressure by a big neighbour—at the time, Turkey—has never been irksome. There was no interference with Kuwait's internal affairs, and it was therefore to British experts that the Sheikh turned as soon as develop-

ment on a large scale began to grow too complicated for the old-fashioned machinery of personal rule. He installed ministries, all held, naturally, by members of the ruling family, and attached British experts to some of them. These gave him one piece of advice that has subsequently been criticised, but has presented Kuwait with quite as many advantages as drawbacks. They recommended that he should entrust construction of the major public utilities to five first-class British contractors, each working on a cost plus basis and each taking a Kuwaiti partner with whom the profit was equally shared. The advantages of the arrangement over that of hard price tenders open to competition were that it offered a guarantee of high quality in the way of workmanship and materials ; that it caused a boom in Kuwait bazaar because contractors who were not pinned to a price tended to buy their requirements there instead of seeking them in cheaper markets ; and that it limited the influx of foreigners into a town that was, and still is, sadly short of accommodation. The drawbacks were costs that mounted unduly through lack of limitation, the heartburnings the scheme caused among all leading Kuwaitis who were not "Big Five partners," and the bad

name it earned for Britain, which was regarded by all Middle Eastern contractors as exercising a dog-in-the-manger grip upon Kuwait.

The system was abandoned last year, but some of its virtues are apparent now that there are thirty and forty tenders for every job. Execution is fraught with delays, and there are temptations to commission work that is cheap and may be poor. Commissioning on the old basis, Kuwait has acquired thirty-nine first-class schools, many of them æsthetically beautiful, the best state hospital and sanatorium for hundreds of miles in any direction, a sea-water distillation plant that provides the first local sweet water in its history, a 30,000 kw power station the first unit of which should open in August, and roads in and just outside the town which endow it with traffic blocks and a rush hour.

Kuwait state publishes no accounts, but it is clear that in both 1952 and 1953 public expenditure was greater than had been estimated. Ministries had vied with one another not only in budgeting for, but in spending their new wealth. When, early this year, one estimate tendered for a deep water port greatly exceeded expectations (it also exceeded the estimates of lesser-known and more optimistic contractors) the Sheikh and his Minister of Development came to the conclusion that too much was being spent. They therefore drew in their horns and summarily called off all but the most urgent jobs in hand. In a state with Kuwait's original social pattern, such an edict would have been accepted without question ; time will show whether it is prudent to turn workers on and off like a tap once they include some men with twentieth-century standards.

Twenty-five miles to the south of the town, the present oilfields—source of all the wealth—seem primly remote from the hurly burly: workers go home only at weekends, if then. When next the oil company breaks new ground, it is said that it will do so to the north of Kuwait Bay, in the area adjoining Iraq. Just to the far side of that frontier, Iraq's Basra Petroleum Company is concentrating its efforts on some deep wells from which it is getting oil of excellent quality ; the same may be available on the Kuwaiti side of the line. Once the Kuwait Oil Company is operating both to north and south of Kuwait town, its life is likely to become more integrated with that of the townsman. Such a development might shake the company's even tenor but would lend a much needed element of stability to the town's ups-a-daisy working life.

A Powerful Neighbour

The newest source of oil that is actually in production is in the Neutral Zone to the south of the territory—an area originally delineated by treaty in 1922, and in which, as the outcome of that old agreement, the Sheikh of Kuwait shares an " undivided half interest " with the King of Saudi Arabia both as to sovereignty and as to oil. The Saudi share of the zone used to be part of the concession of the Arabian American Oil Company, but was exchanged by it for some undersea rights by a deal done with King Ibn Saud in 1948. Subsequently, the King sold his half share of the rights to the Pacific Western Oil Company. The concessionnaire in the Kuwaiti share of the Neutral Zone is the American Independent Oil Company. The latter, after drilling five dry holes, struck oil at Wafra in March, 1953—a field which is at present yielding about 10,000 barrels per day, and from which the oil is exported by means of a small pipe to a point in Kuwait proper a few miles south of the busy K.O.C. jetty at Mina al Ahmadi. The two oil companies also share an " undivided half interest" in the zone, and half of the oil so exported therefore belongs to Pacific Western.

Last month, when King Saud visited Kuwait on his way home from his Arab tour, he visited the Neutral Zone and expressed the desire that Pacific Western—his protegé—should have a pipe of its own. This is due to reach the sea at Ras al Zor in the Neutral Zone, not far from the Kuwait border. In a zone that is unrelieved desert, and in which under 300 workers are at present employed, political complications have been dormant up to date. But they may well arise if production expands, and it becomes necessary to decide which ruler is going to police, tax and otherwise take responsibility for which area. Not for the first time, the Kuwaitis may feel the weight of a more powerful neighbour.

Meantime, their preoccupations are elsewhere. When are they to resume their programme of social advancement ? Of outstanding items on their agenda, the most important is a channel for sweet water (of which they now have none that is not artificially and expensively distilled) to be driven

to Kuwait from the Shatt-al-Arab. Negotiations with Iraq on this topic have been satisfactory and prospecting is already under way. Other developments that need attention are housing and sewage ; there is plenty to do, and there will be the money with which to do it, if they get their second wind after the heat of their scorching summer is over.

Peru Shortens Sail

ONE of the world's strangest *tableaux vivants* relaxed last month from the frozen posture it had maintained for over five years. The famous case of Señor Haya de la Torre, which had repeatedly perplexed the International Court, was solved—at least as regards its legal aspects. Since January, 1949, Sr Haya, the leader of Peru's outlawed left-wing *Aprista* party, had been cooped up in the Colombian embassy in Lima, where he had sought sanctuary much as pursued men fled to church altars in the Middle Ages. The government of General Odria respected the embassy's diplomatic immunity, but ringed it with troops and searchlights to prevent the escape of its arch-enemy ; and only after sixty-three months of wrangling has Sr Haya been allowed to go into exile in Mexico.

Does President Odria's action reflect his increased confidence, or his realisation of the need to end a deadlock that was harming Peru's international relations ? Peru has undoubtedly good reason to end its long quarrel with Colombia. General Perón's long arm has been reaching northwards from Argentina in recent months; it has embraced Ecuador and touched Colombia, and Peru, like Brazil, has seen the danger and looked around for means of checking it. But in letting Sr Haya go, President Odria must be aware of the new risks he is running. The big landowners and big businessmen of Peru, who are implacably opposed to the *Aprista* policies of social reform, have more than once threatened to withdraw their support from the government if it lets Sr Haya escape. President Odria's introduction of a fairly large social security system and other social legislation has angered the diehard industrialists in the coastal cities; and it is reported that some of them, together with *nouveaux riches* who have prospered under the present regime but resent the airs of the older aristocracy, see a possible champion in General Zenon Noriega, the President's chief minister, who is not without supporters in the army itself.

Divided Exiles

Moreover, now that Sr Haya is in a better position to direct his own party from abroad, he may heal some of the rifts among the *Apristas*. They have been indulging in a complex faction fight. Of those in exile, some have flirted with Perón, some with the Communists. The party members inside Peru have also split ; the extremists, whose abortive *putsch* in late 1948 precipitated General Odria's seizure of power, still plan revolution and the liquidation of the old ruling class, while more moderate *Apristas* have concentrated on trade union work and tried not only to earn the government's toleration but also to make the unions more independent of their own party, with an eye to the long-term future. Again, while some *Apristas* have reverted to Sr Haya's early hostility to the United States, others hold to the policy of " inter-Americanism without imperialism " which their leader adopted during the war, and declare themselves wholly on the side of the West in the cold war.

Rifts on the right, a new unity among the *Apristas*, and, moreover, the contagion of the recent social upheavals in Bolivia, where the Indians have been given land and a new status, could together present the Odria government with serious problems. Yet the president seems quietly confident. He has shown himself more than a fair weather pilot. The booming prosperity which Peru enjoyed two years ago has now faded, and the ambitious mood of those days, which led the government to embark on heavy expenditure for public works and long-term development, has faded with it. Both the demand for and the prices of Peru's main exports have fallen considerably from their " Korea " peak, and output of petroleum has failed to live up to the exaggerated hopes of 1950. Heavy state spending meanwhile led to currency inflation and a sharp increase in the cost of living. In 1953 Peru's external trade deficit grew to $72 million, against $50 million in 1952 ; and although the inflow of foreign capital filled much of the gap, the Central Bank's reserves fell from $56 to $53 million—enough to cover only two months' imports. The sol, which had held steady at an exchange rate of about 15 to the US dollar from 1949 to 1952, fell to 22 in January of this year.

Holding the Trade Door Open

The government has, however, shown few signs of alarm. Indeed, as the trade gap widened some observers have grown anxious about its dogged pursuit of free trade and free exchanges. Last autumn the Finance Minister announced that this basic policy would not be abandoned ; but at the same time some corrective measures were applied. Public works were curtailed, and credit tightened ; but the door was still held firmly open to foreign trade, the only restriction imposed being a temporary reduction in the importing of cars, distributors of which were already overstocked.

In a frank and exhaustive economic report to the nation which he broadcast at the end of February, President Odria publicly recognised the need for a big reduction in governmental spending and for a firm limitation of credit and currency circulation. He declared his main purpose to be " to re-establish normality in our foreign exchange market and confidence in our currency." He added that the $30 million fund created in February, with American and International Monetary Fund help, to stabilise the sol, would not be used to maintain an artificial rate of exchange.

By March the sol had regained a value of 19 to the dollar, or 53 to the pound. Most businessmen now feel that the president will be as good as his word ; and, apart from those with a vested interest in the former swollen public works programme, they welcome a degree of retrenchment that could ease the trade problem by restoring the sol to a steady rate. If the government shortens sail on the lines President Odria has indicated, good grounds for confidence as to the economic prospect will exist. The cotton and sugar crop position is healthy ; the public and private money spent on new irrigation projects during the boom years is now bearing fruit ; the oil fields, although offering no spectacular possibilities, still hold out hopes that within a few years Peru could be exporting well over five million tons of oil annually. The

diversity of the country's resources—in addition to its crops, it exports lead, copper and zinc in quantity, possesses rich iron ore deposits and is a major source of vanadium and bismuth—gives Peru an advantage over those of its neighbours who depend on one main export commodity. These natural endowments, together with Peru's present reputation for paying its bills, and the absence of the restrictions on trade and exchange that are so maddening in some Latin American countries, make it a market well worth the closer attention of British and other traders.

Journal of Geneva

APRIL 26th. All went smoothly on this, the first day of the Geneva conference. In the morning Mr Eden visited Mr Molotov and obtained his agreement to a proposal that the chair should be occupied in turn by Siam, Britain and the Soviet Union. Accordingly, when the conference opened in the afternoon, the Siamese foreign minister, Prince Wan Narathup, presided. Prince Wan made some announcements on procedure, one of them being that observers from governments not taking part in the conference would be excluded (Eastern Germany is one of the countries that have sent such observers). This first formal session lasted only half an hour.

The four sponsoring powers were to meet later in the day to discuss which countries should be invited to Geneva for the talks on Indo-China. At the last minute, however, Mr Molotov held back, presumably because a meeting of the four would prejudice China's claim to rank with them.

M. Bidault issued an appeal to the Vietminh to allow the evacuation of wounded from Dien Bien Phu, recalling that the Franco-Vietnamese forces had previously granted a short cease-fire to enable the Communists to remove their own casualties.

April 27th. In the morning, M. Bidault saw Mr Molotov and proposed that the three Associated States of Indo-China, Vietnam, Laos and Cambodia, be invited to Geneva. Mr Molotov said that the Vietminh must be represented; he also raised the question of inviting to the Indo-China talks four or five other nations such as India, Burma, Siam, Indonesia and Australia.

Mr Dulles then called on Mr Molotov and discussed Mr Eisenhower's proposals for an international atomic pool.

Mr Molotov took the chair at the meeting of the full conference. The South Korean foreign minister, Pyun Yung Tai, spoke first, and showed a calm mood that surprised many delegates. He argued that no new elections in South Korea were needed, but that free elections should be held in the North. It would not be right for the United Nations, which had sent troops to Korea to resist aggression, to withdraw them at the same time as the Chinese; that would be like "a burglar dropping his weapon on condition that the policeman is disarmed simultaneously." He appealed to China to resume its traditionally peaceful attitude to Korea.

The North Korean foreign minister, General Nam Il, presented a set of written proposals, which may be summarised as calling for:

1. All-Korea elections, for a new assembly which should form a single government, to be supervised by a commission jointly appointed by the existing assemblies of South and North. The commission should ensure that the elections were democratic and free of foreign influence or terrorism, and should secure freedom of assembly and of the press.

2. The commission should also take immediate steps to link North and South Korea in such matters as trade, finance, and freedom of movement.

3. All foreign troops to be withdrawn from Korea within six months.

4. "The need shall be recognised to ensure the peaceful development of Korea on the part of the appropriate states most interested in the preservation of peace in the Far East and thus to create conditions facilitating the early solution of the task of Korea's peaceful unification. . . ."

Nam Il did not enlarge on this last cryptic point. The only other speaker at the conference was Dr Zuleta Angel, the Colombian foreign minister, who argued that only UN supervision could ensure genuinely free elections. A Chinese spokesman told a press conference in the evening that this was unreasonable because the United Nations had been a belligerent.

April 28th. M. Bidault, Mr Eden and Mr Dulles met in the morning to discuss invitations to the Indo-China talks, and M. Bidault then saw Mr Molotov on the same question. When M. Bidault asked Mr Molotov about the evacuation of wounded from Dien Bien Phu, Mr Molotov said he could not intervene, and suggested that Vietminh representatives should come to Geneva to discuss the matter.

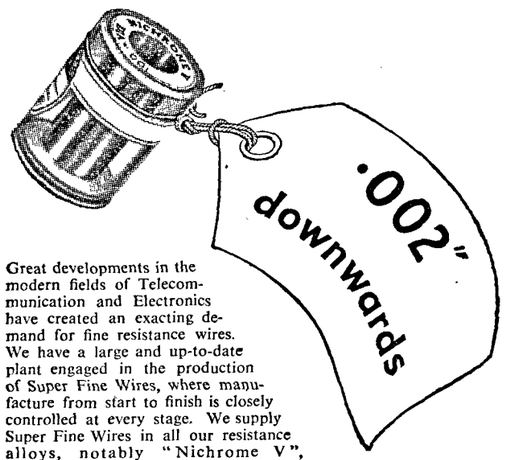
Mr Eden presided when the conference met. Mr Dulles spoke first. He rejected Nam Il's proposals, particularly in their equating of North Korea, which held only a quarter of the Koreans, with the South. Nam Il had also sought to exclude the United Nations from supervising elections. America did not want to keep troops in Korea indefinitely, but it had withdrawn them too soon once before and seen the consequences. The UN forces had to withdraw to a great distance, the Chinese only across the frontier. Not only Korea, but the authority of Uno was at stake. The UN efforts to unify Korea had been blocked by the Communists since 1947. No new plan for Korea was needed; a solution already existed in the UN resolution of October, 1950, which created a commission to observe free elections in the North. The commission should now be allowed to proceed with its work, and this meant the withdrawal of the Chinese army.

Chou En-lai on Germany

Chou En-lai, the Chinese foreign minister, who spoke next, raised several issues unconnected with Korea. The rearming of Western Germany, he said, must be prevented, weapons of mass destruction prohibited, and European security organised on the lines of Mr Molotov's proposals at Berlin. China could not tolerate the "occupation" of Formosa by the United States. Japanese "militarism" must be checked. All foreign troops and bases must be withdrawn from Asia, which wanted peace and freedom; but the United States was creating, in the Pacific pact, an aggressive bloc to spread war over and enslave all Asia. All Asian countries should safeguard peace by assuming mutual obligations towards each other.

As to Korea, China did not admit that the question of prisoners of war had been solved; the conference should settle this problem. Chou supported Nam Il's proposals, and rejected all that Mr Dulles had just said.

SUPER FINE WIRE



Great developments in the modern fields of Telecommunication and Electronics have created an exacting demand for fine resistance wires. We have a large and up-to-date plant engaged in the production of Super Fine Wires, where manufacture from start to finish is closely controlled at every stage. We supply Super Fine Wires in all our resistance alloys, notably "Nichrome V", "Nichrome", "Karma" and "Advance", in sizes from .002 in. (0.05 m/m.) downwards.

BRITISH DRIVER-HARRIS CO. LTD
MANCHESTER 15

Nickel and Nickel Alloy Specialists: for furnace elements, domestic appliances, thermo-couples, telecommunications, lamps, spark plugs. fine wires, etc.

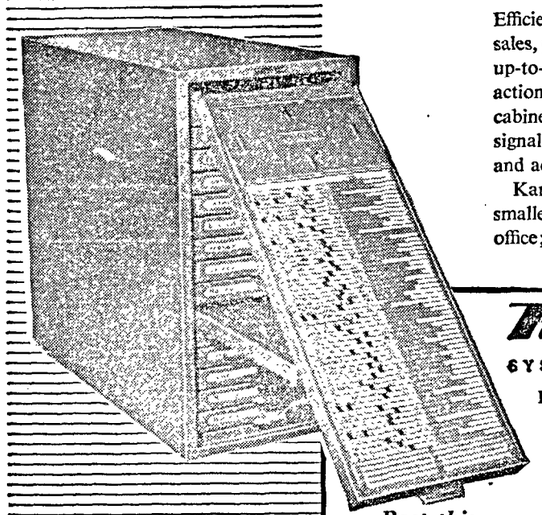
KARDEX *puts business facts to work*



Efficient management depends on facts. Facts, for instance, about sales, personnel, production, materials and inventory. Facts kept up-to-date and visibly recorded for swift translation into executive action. Kardex puts business facts to work for you. Its space-saving cabinets concentrate all records for quick reference. Its visible signals spotlight items needing management action. Its simplicity and accuracy bring new speed and ease to routine clerical work.

Kardex adapts easily to meet the record-keeping needs of the smallest business or the largest organisation. It will fit into *your* office; put accurate fact-power at *your* service.

Post this coupon now!

SIMON ENGINEERING GROUP

Dense-medium coal washing

NO. 2 IN A SERIES ON RESEARCH & DEVELOPMENT

Dense-medium coal washing is a commercial application of the laboratory sink-and-float technique in which a liquid of controlled density allows clean coal to float and dirt to sink. This process is important for washing certain "difficult" coals, and its wider use is envisaged in the National Coal Board's *Plan for Coal*. Simon-Carves have played no small part in the great strides made in dense-medium washing. Some early steps were taken in conjunction with an American firm, and further fundamental work on a laboratory and pilot-plant scale was done by the Simon-Carves scientific staff. A number of Simon-Carves dense-medium plants are in commercial service, and development is being vigorously pursued in collaboration with the National Coal Board and a leading French firm of coal preparation engineers.

THE BUSINESS WORLD

Profits from the Liners

DEMAND for British shipping, which fell precipitately during 1952 at the end of the Korean boom, showed no recovery last year, while shipowners gained little respite from the upward trend of operating costs. Some fall in shipping profits, therefore, was inevitable; and the latest batch of results from the leading liner companies show that the decline was general, if not quite universal, affecting this more stable end of the shipping market as well as tankers and tramps. The big liner companies have still been able to earn a living, but the decline in their earnings has focused new attention upon their operating economies and their particular problems of replacing ageing tonnage.

Liners total about 8 million tons gross and make up half the tonnage of the British merchant fleet; they run on regular schedules, concentrating on regular business, and spreading their risks between passengers and freight. Hence they are less vulnerable to sharp fluctuations in shipping business than tramps and those tankers employed on single voyage charters—though much more vulnerable than the tankers and ore-carriers that may be chartered for seven to ten years' work sometimes even before the promoter raises the money to build. Through their different conferences, the liner companies can hold their freight rates much steadier than the rates settled for tramp shipping on the Baltic. Since the war they have been augmenting their tonnage and sailings by taking a large number of tramps on time charter, and some of the charters fixed in 1951 and 1952, before the collapse in rates, involved some of the companies in extremely unprofitable contracts; but most of these expensive charters have probably been worked off now.

Liners have, therefore, come through the last two years of declining activity better than the tramps. Against the doleful curve of the tramp freight index, the conference freight rates have been relatively firm. In certain trades there has been distinct rate cutting, particularly by foreign shipowners, and a number of the conferences have been compelled to concede lower rates for shippers, for example in the West African and Australian trades. Part cargoes, rather than full holds, are becoming more frequent in most trades; but this lower volume of trade has at least reduced congestion and improved turn-round in port.

Such indications as exist of the trend of passenger business on British liners are not altogether reassuring. Last year the number of people travelling to and from Britain rose by 5 per cent, to about 7½ million, but all the extra travellers were carried by air. The airlines carried 20 per cent more passengers than in 1952, while fewer people came to or from this country by sea than in 1952 or 1951. True, 70 per cent of all passengers still travelled by sea, and the total of 5¼ million seagoing passengers was about 20 per cent higher than in 1947;

the liner companies believe that air travel has created a growing demand for international travel, from which they have gained some benefit. But the number travelling to and from Britain by air last year was two and a half times the number in 1947, and the share of the airlines in travel to and from these shores had grown from 18 per cent to 30 per cent in the seven years. Not all of these sea passengers sail in British ships, and those that do account for only part of the traffic of the British liner companies. But of all travellers between Britain and countries outside Europe, about 80 per cent (the proportion has dropped slightly) went in ships under Commonwealth flags, and the numbers shown for these ships, too, were lower in 1953 than in the two previous years.

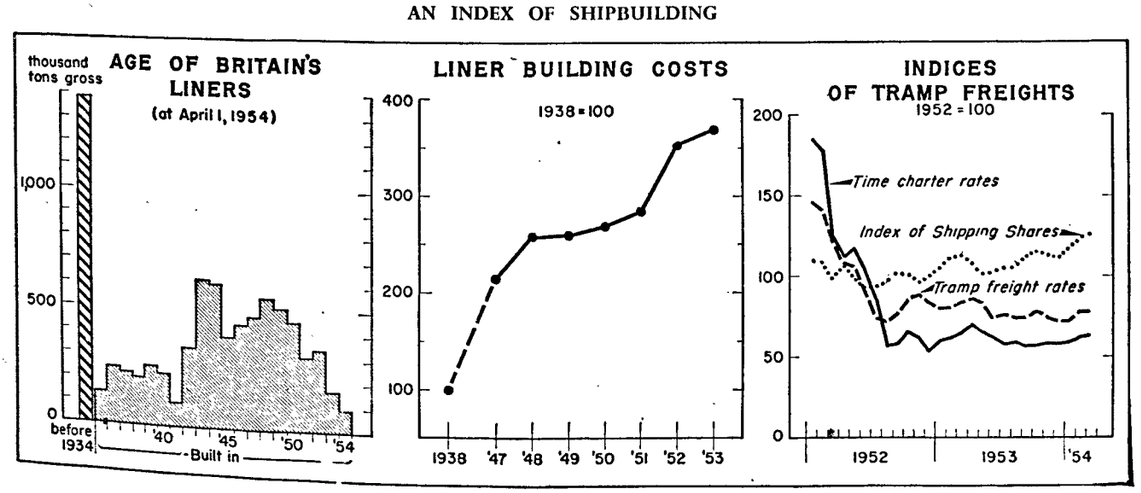
Some elements in shipping costs moderated last year; after a rise in oil bunker charges last summer, there came several reductions in fuel oil prices, though coal bunkering charges rose. The cost of delays in port was reduced; turn-round has improved at most ports. General port charges continued to increase almost everywhere, though a notable exception was a reduction in transit charges through the Suez Canal. Seamen's wages are still rising; the last increase of 7 per cent took effect at the end of January. Repairs and surveys show no signs of costing less; certain British owners have been using shiprepairers abroad, less to obtain lower rates than to get the work done more quickly. As for capital charges, British shipyards are still not prepared to quote fixed prices, though some foreign yards will (at high levels); and the weight of capital charges upon new ships has sharply reduced the advantages to be gained from greater efficiency.

Thus in 1953 shipowners had to work hard for their money. Commodity prices were falling; governments, particularly the British government, were climbing out of bulk trading, leaving warehouses well stocked and temporarily reducing the demand for shipping. The general trend of shipping profits in 1953 was bound to be downwards, though it is broken by occasional exceptions like Orient Steam Navigation, whose important additions to the fleet have swelled last year's earnings. Compared with the exceptional figures of 1952, some sharp falls have been announced. These include a drop in gross profits from £6.4 million to £4.0 million (36 per cent) for United Molasses, and of about 13 per cent to £700,000 for John I. Jacobs, although that company has chartered some of its vessels several years ahead at remunerative rates.

Among the liner companies, Royal Mail shows profits before tax for the calendar year about halved at £1.0 million, compared with £2.1 million; Union Castle showed a modest increase of about 8 per cent, at £2.4 million, thanks to a lower depreciation charge; Cunard reports a fall of around 25 per cent to £6.1 million in its operating surplus; and P and O a fall of about 39 per cent to £8.5 million; Liner Holdings, with additional tonnage, is among the select few to show an increase in gross profits, by 19 per cent to £4.8 million. An example of the severe decline in tramp earnings is revealed in the fall in profits, after tax, of Silver Line, from £586,000 to £224,000.

Such declines in earnings ought not to rattle the serious investor, nor does it appear that they have done so. The Actuaries' index of shipping shares has risen while freights have been falling and the slight decline in shipping shares in the last few days appears not out of proportion to the general reaction in share markets. The investor in the big liner companies and in some of the smaller companies is receiving a dividend that is well covered—possibly too well covered—even by today's reduced earnings. Many shares have a massive backing of tangible assets, since fleets usually still stand in balance sheets well below their current values and leading shipping companies have been allowed to hold hidden reserves. Shipowning is not so desperate that it has become unprofitable for competent owners with modern fleets.

AN INDEX OF SHIPBUILDING



Although a considerable tonnage of liners has been built for British owners since the war, it would be an exaggeration to claim that the country's liner fleet as a whole is reasonably modern. The chart shows that nearly 1.4 million tons gross, or about a sixth of the total, consists of ships that are more than 20 years old. But shipowners face the common postwar problem of replacement at inflated prices more acutely than most industries. An index of shipbuilding prices compiled by the Liverpool Steam Ship Owners' Association put 1953 prices for building a cargo liner at about four times the 1938 price; and the signs of more stable building costs have not yet convinced even the shipbuilders. Last year there were some cancellations of orders on the shipyards' books, and in the first three months of this year new orders exceeded cancellations by only 40,000 tons. New liners are still being delivered, and the two years' orders still outstanding include a considerable amount of tonnage for the British companies; but Mr Butler's new investment allowance would have to stimulate a quite unlikely burst of new orders before the speed of replacing the fleet caught up with the rate of obsolescence.

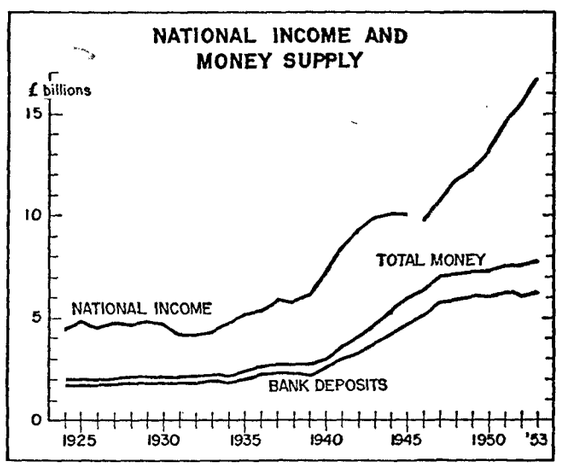
The balancing charge imposed on the proceeds of ship sales for more than their written down values, the Treasury rule that ties down the proceeds of a British ship sold to a foreign flag to the specific purpose of building another ship, together with the determination of company managements not to be bought out, has prevented any large-scale changeover in the management of fleets. The break-up value of shipping shares is generally much ahead of the market price, and by the same token the basic competitive power of the British shipping industry is probably high. In an industry which fluctuates as wildly as does shipping dividends are likely to remain conservative.

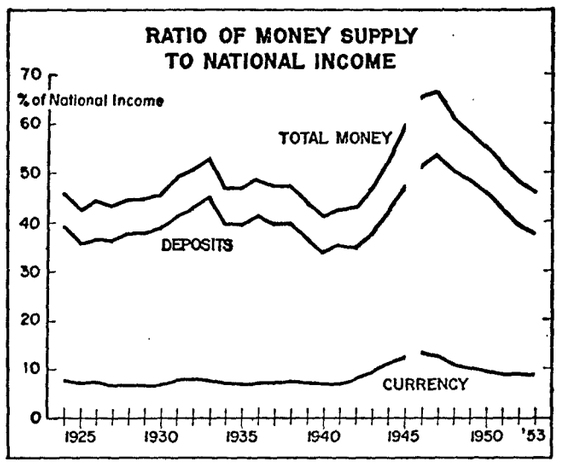
The easy money phase for the companies and for their shareholders is probably over, but not all the omens for the industry are unfavourable. Freights are reasonably steady at the present low level, as are the prices of the commodities which the ships carry; when war clouds darken the demand for shipping is high. If the present decline in shipping earnings goes little further the industry will have passed through one of the shallowest of its many depressions and will have come through with its reserves almost untouched; but years of careful management will be needed before the expensive ships recently built have been written down out of earnings to figures at which their owners can be sure of earning a reasonable return.

Habits in Money

AROUND the holiday seasons of the year, when the purse-strings of the public are suddenly loosened and then drawn tighter to make up for its lighthearted spendings, tradesmen and many other people are conscious of wide fluctuations in the public's holdings of currency. But these are essentially seasonal and short-term fluctuations. Over longer periods, public habits in the use of currency—and also of money in its wider sense, which includes bank balances—are extraordinarily consistent. Under stable economic conditions there is a relatively stable relationship between a community's income and its holdings of money. Variations in the ratio of money to income are, indeed, normally a sign of economic instability; and, inevitably, there have been abnormally wide variations during the past fifteen years of war and postwar inflation. But recently the ratio seems to have been settling down again.

The amount of money that a community elects to





hold at a given level of income depends on two main factors: the policy of its monetary authorities; and the money-holding habits of its individuals. Individuals' habits are not wholly independent of monetary ease or stringency imposed by the authorities; a dearer money policy (such as that introduced in March, 1952) will make borrowing more expensive and lending more remunerative, and so make people economise in the amount of money they hold, while an easy money policy will do the opposite. In theory, indeed, if the policy is sufficiently strong and persistent, the authorities can induce the public to hold almost any given volume of money; but in practice the influence of monetary policy is rarely so dominant as this. Such interactions apart, the public's money habits are essentially a product of the nature of the economy, of its economic and financial institutions and its historical and social customs.

The volume of money, and especially the volume of currency, is no longer taken, as it once was, as the decisive yardstick of inflation or deflation. Both the cause and measure of inflation or deflation are nowadays sought in the relations between consumption, production and investment, as shown in the all-embracing national income accounting. The changes in the money supply and in money-holding habits that accompany changes in income now tend to be regarded as reflections of changes in the underlying real factors, rather than as primary influences themselves.

But, whatever the precise causal relationship, phases of marked inflation or deflation do show a clear pattern of change in public habits in money-holding. The same pattern of change is, indeed, discernible in communities whose money habits and levels of income differ quite widely. The accompanying table and charts trace the composition of the money supply and its relationship to the national income over the past three decades in Britain. But the pattern displayed is not just a reflection of the financial idiosyncrasies of the British public; especially for the period since 1939, it is broadly typical of the trend in most western countries.

Several broad features of the pattern stand out strikingly. First, in the years before the war there is a notable stability in the ratio of money supply—and a still greater stability in the ratio of public holdings of currency—to the national income. The ratios dip sharply in the early phase of the war, and then, led by the currency ratio, rise steeply, reaching wholly abnormal levels by the early postwar years. The ratio of currency to income, it will be seen, was almost doubled in the period 1940-46. Then, in the latest period, these changes are neatly reversed, so that by 1953 the currency pattern had been almost restored to that of 1938, whilst the ratio of deposits to income was actually substantially lower than it was before the war.

The true trend, moreover, is probably somewhat smoother than the charts show, since they have perforce been based upon statistics that do not present continuous series. The deposits series is broken in 1936, when the admission of the District Bank raised the number of clearing banks from ten to eleven and contributed to the rise in the ratios for that year. More serious are the distortions caused by the use of differing sets of national income statistics to obtain any lengthy run. This explains part of the fall shown in the ratios in 1934; and even after 1938, when official estimates take up the story, there are similar distortions, since these figures have been subjected to differing degrees of official revision. The sharp increase in the ratios in 1946 is probably partly due to changes of this kind. Fine conclusions from such a correlation would be unwise, even for the period from 1946, when the series ostensibly become fully continuous.

Yet some broad tendencies in money habits are clearly deducible. In periods free from strong inflation (including suppressed

‡ Average estimated circulation with public—i.e., total average circulation minus average bank holdings at nearest date.
§ Preliminary estimate.

inflation), the public's holdings of currency keep to a remarkably stable proportion of its income—at around 8 per cent, though with a slight tendency to rise. Its holdings of bank deposits at such times also keep pretty closely in step with income, but still not sufficiently to prevent the ratio of total money to income from falling when income is rising and from rising when income is falling (which it seems to have done only in the early thirties and in 1938). This tendency, admittedly, did not show itself in 1933 and 1936, but the average for the first of these years felt the impact of cheap money, and the second was affected by tidal movements of "hot" money. The pattern that seems to have been normal before the war can be discerned again in the later postwar years. In 1952, however, the average level of deposits actually fell, although national income rose sharply; but this non-conformity to the rule was quite clearly attributable to the new monetary policy at home and the general climate of disinflation in world markets. These influences were probably more significant than any change in the public's money habits as such.

The most marked feature of this return to the prewar pattern has been the decline in the importance of currency in the money supply. The reasons are readily apparent. The steep rise in the currency ratio after 1941 may have been largely due, at first, to the growing number of troops concentrated in Britain, but the later rise to the peak in 1946 was certainly caused principally by the growth of black markets and tax evasion in the fertile soil of strong but largely suppressed inflation. In 1947 the fear of currency measures to catch the tax evaders and, thereafter, the shrinkage of the black markets, and also of the pressure of inflation have cut down these special demands for currency. But one important influence set in motion by the war still remains—the redistribution of the national income in favour of the wage earners. Thus it is not surprising that the proportion of currency in total money, although falling from about 21 per cent in 1945 and 1946 to 17½ per cent in 1952, and around 19 per cent in 1953, is still well above its prewar level of 15 to 16 per cent.

The long-term tendency for the importance of currency to increase has, however, been very much less marked in Britain than in other western countries. In both Western Europe and the United States the shift has gone much further—not only since 1938, but throughout the thirties, too. This trend has left Britain among the countries with the highest ratio of deposits to currency, whereas in 1929 the ratio in countries such as Switzerland, Sweden, Denmark and the United States was two or three times as high as Britain's. The range between the absolute levels of this ratio in the several countries is still, however, extraordinarily large. Yet here, as in the pattern of money-to-income ratios, there is evidence of a common reaction in money habits to wider economic changes.

Business Notes

Flight to Shelter

SUDDENLY, almost as a flight of starlings takes the air and wheels round, investors took flight on Monday and remained nervous until Thursday, when some buying was accompanied by forecasts of renewed strength in sterling. The heavy buying which went on almost without a pause for months has dried up; instead there has been selling, not heavy or conceived in panic, but sufficient to depress prices appreciably each day through the range of gilt-edged and industrial stocks; those genuine buyers who could wait, did so and their prudence reaped its return. Such movements do not necessarily mark a change from a "bull" market to a "bear" market; there have been few reactions since the rise started and share markets were in all probability overbought. Stock jobbers knew that fairly large amounts of stock might come their way if they did not widen their prices. The reaction should make markets healthier when the selling bout is ended. In the meantime it can hardly fail to postpone some new capital plans and may be inconvenient in particular to Birmingham City Council which is reported to be planning to launch a new loan shortly.

The movement had a counterpart—a brisk rise in commodity prices in which wheat, rubber and the metals as well as gold took part though the advance was not fully held. The two movements, a fall on the Stock Exchange from which commodity shares are largely exempt, and a rise in commodity markets is associated usually with troubles or rumours of wars. This movement was started by Mr Eden's weekend return to London and the opening of the Geneva conference. Some of the more speculative operators may have suddenly made up their

minds that Indo-China was a more serious business than they had supposed. It has to be remembered too that there is now more foreign money employed in London and possibly employed with more volatile tactics than have

recently been seen. Still the explanation is barely adequate. Indo-China has been a serious factor for months. Investors never worried about it when they had their buying boots on. But when the market is overbought any news is bad news.

Accounting Deluge

THIS is the time of the year when the flood of company reports and dividend announcements is at its height. The simple explanation of this deluge is that more British companies choose to end their financial years on December 31st than on any other date and it takes about four months to prepare a big company's accounts for publication. Many of the minnows of British industry swim along in the flood but this is the particular time when the leviathans exhibit their prowess and strength. The sophisticated investor reaches for his slide-rule and the unsophisticated investor adds up his dividend cheques.

Many of these cheques are higher than they were a year ago. The reports of seven companies are discussed in detail on pages 402, 403 and 404 of this issue. Five of these companies—Unilever, Imperial Chemical, Hudson's Bay, Brush and Monsanto Chemicals—have announced higher equity dividends. The remaining two—the Shell-Royal Dutch group, and Vickers—have been content to leave their dividends unchanged.

But several of these industrial giants some time ago either gave investors a clear hint what the dividend would be or provided enough material for an accurate guess. Bigger dividends and higher profits were discounted in the market long before the event. Hence, the publication of these reports had only a marginal effect on stock market prices this week. Where adjustment to prices was needed it was generally because investors had erred on the side of optimism.

New York and London Money Rates

THE easing of money rates in the United States has proceeded a step further in the past week. Three more Federal Reserve Banks have followed those of Chicago, New York and San Francisco in reducing their official rediscount rates from 1¾ to 1½ per cent; and, more significant still, the New York rate for American Treasury bills has dropped to its lowest for more than six years. At the weekly tender immediately following the reduction of the New York rediscount rate the average allotment rate for Treasury bills fell only slightly, from 1.066 to 1.027 per cent; and, since the official rate had been ineffective for so long, it had been thought in London that any substantial drop in New York market rates was rather unlikely. At last Monday's tender in New York, however, the average Treasury bill rate dropped by nearly ¼ per cent, to 0.886 per cent. In view of the increasing part that foreign funds have played in the London market in recent months, this movement inevitably raises the question whether further pressure will be put upon London rates.

Ever since the turn of the year the discount houses have been encountering recurrent spasms of strong competition at the tenders for British Treasury bills, and a fortnight ago they sought to sustain their own intake of bills by raising their bids—with the result that the average allotment rate dropped from 42s. 3d. per cent to 41s. 7d. per cent (still, however, a slightly higher rate than obtained during February and early March). At last week's tender the average rate was virtually unchanged, but total applications dropped only fractionally below the peak of £417 million reached on the eve of the Easter holiday; and since then there has been the easing of New York rates. This week's tender, due just after this issue of *The Economist* went to press, is therefore of particular interest. The New York rate is now well under half the level ruling in London; the differential last week, as measured by the average allotment rates at the respective tenders, was nearly 1.2 per cent. This margin does not, however, offer the strong attraction to mobile banking funds that it might appear to do. Despite the prevalent confidence in sterling, foreign banks would not switch balances without covering their exchange risk, and in present conditions the cost of obtaining this cover offsets most of the interest margin.

Inspector for the Savoy

RIGHTLY the President of the Board of Trade has at last decided to appoint an inspector to examine the Savoy Hotel affair. Acute feelings and important principles were raised last November when the Savoy board, fighting to avoid loss of control to Mr Harold Samuel and Mr Charles Clore, snatched away the freehold of the Berkeley Hotel and transferred it to Worcester Buildings (London) with provisions which would have prevented any shareholders holding a majority of Savoy Hotel shares from exercising any control over the Berkeley. It is precisely that operation which Mr Milner Holland, QC,

Enterprise

The United Steel company is a national enterprise. In Cumberland, Yorkshire, Lincolnshire and Rutland the organisation operates coke ovens, iron ore mines, limestone quarries, blast furnaces, iron foundries, steel works, forges, rolling mills and other plant essential to its business.

From the mining of the ore to the finished manufactures there is an integration of production involving over thirty thousand individuals engaged in various combinations of administrative faculties, technical attributes and manual skills of a high order.

Such an enterprise is flexible and adaptable and the United Steel company, through the services of a unified organisation, is able to meet the individual requirements of the consumer of almost every kind of steel.

Steel makes history

THE INCOMPARABLE hammer beam roof of Westminster Hall has endured for more than five hundred years: but only just.

This century saw part of the roof on the point of collapse. Death-watch beetles had reduced thick beam ends to thin and brittle shells. Holes gaped in the main collar beams.

The whole roof was strengthened by an ingenious system of steel plates and tension rods secured by bolts to the timbers. The flèche was rebuilt around a skeleton of steel. So skilfully was all this done that the steelwork is now invisible.

In many ancient buildings throughout Britain skilful hands and the strength of steel have helped to preserve our ancient heritage of wood and stone.

Westminster Hall, in the care of the Ministry of Works, is open to the public

has now been instructed to investigate. His terms of reference are:

> To investigate the affairs of the Savoy Hotel Limited and the Berkeley Hotel Company, with special reference to the formation of Worcester Buildings Company (London) and the transfer to that company of the freehold of the Berkeley Hotel.

It could be argued that that is now all past history. Mr Samuel who asked for the inquiry was in fact bought out at his own high price. Worcester Buildings (London) has been wound up. Is it necessary to wash dirty linen in public at this stage? The reaction of the Savoy directors in publicly welcoming the investigation lends no support to that view. Indeed, having themselves asked for the inquiry which revealed Mr Samuel and Mr Clore as buyers of Savoy shares, Mr Wontner and his colleagues on the Savoy board could hardly decline to recognise that sauce for the goose is sauce for the gander. But the major principle arises—whether directors in defence of a company that they are appointed by shareholders to run can be allowed to alienate property that belongs not to the directors but in the last resort to the shareholders.

The public may also hope that Mr Holland's report will throw light on a further matter raised by the Savoy affair. The source of the finance with which Mr Samuel's dominating holding was bought out has never been more exactly described than "the directors and their friends." If it is reasonable to assume that the inspector will have to identify these wealthy friends for his own information, is it not equally reasonable that Savoy shareholders and the investing public should know who the true owners of the Savoy equity now are? If, as Mr Wontner pleaded, the Savoy is a national institution, is its control not a matter of public interest?

A wider point will also be in the minds of intelligent shareholders. How far is it justifiable to shuffle voting rights for the purpose of maintaining control in a business? The Worcester Buildings plan was an extreme proposal for depriving an equity of its voting power. But the principle of underweighting the voting rights in the part of a family business that has to be sold to the public to cover death duties is common enough. Similarly, the non-voting equity share has been adopted by many companies of high status, sometimes for cash issues but more frequently for bonus issues. One result is to make it easier for entrenched managements to maintain control of companies and to disenfranchise owners of part of the equity. It is time to consider how far the process ought to go.

What Price Steel?

FEW ventures are less rewarding than attempts to compare steel prices throughout the world, as the statisticians of the European Coal-Steel Community and the British Iron and Steel Federation were reminded last week. The Federation has regularly published for some years past a comparison of home trade prices for steel in the United States, a number of European countries, and in Britain, and its latest revision appeared in its annual report. This happened to be published within a day or two of the second report of the High Authority upon operations in the common market for coal and steel, which also essayed a steel price comparison. Almost inevitably, the two, where they appeared to be talking about similar products, did not agree.

There are several good reasons for these discrepancies. Most of the prices quoted for European steel in the report from Schumania were for Bessemer qualities, comparing these steels direct with the open-hearth steel produced in Britain and America. For bars and many light-rolled steel products, that comparison is fair, despite the fact that Continental steelmakers would charge more for open-hearth steel—simply because the consumer of these products does not care about the difference in quality. But most British consumers, at any rate, are prepared to pay an extra charge for open-hearth qualities in structural steel products, plates, joists and angles, sheet and strip; and the British comparison always counts in the charges that would be added on the Continent for open-hearth quality in these products. The British comparison, again, is of the prices the consumer would pay—which include excess charges for typical amounts and sizes, plus production and turnover taxes where these are charged on the Continent; the Schumanian comparison is of "basis prices"—which incidentally involved some disputable estimates of the transport element contained in certain British prices, which are delivered prices.

The discrepancies, however, may not have been without value if they set both organisations seeking a more satisfactory basis—and conceivably an agreed one?—for these international comparisons. Both approaches have their merits; the British table shows the steel consumer what he has to pay here and what he would have to pay in other countries, while the European comparison is seeking to establish some genuine comparison of works costs—or at least of works prices—in steel production. These objects might usefully be combined.

Repayment of Standstill Debts?

THE West German authorities are known to be considering a further important relaxation in their restrictions on debt transfers; this could have a significant influence on the Anglo-German financial negotiations now in progress. The measure contemplated is the release of a further large block of the standstill debts. These are the short-term debts owed to British, American and Swiss banks that have been outstanding and frozen ever since the standstill arrangement of September, 1931. The London Debts Agreement of 1952, which covered all German contractual debts, provided for meagre treatment of the standstill creditors. Repayments of their frozen debts were limited to 15 per cent of the principal; they were also made conditional upon the granting of new credit lines available for drawings for the financing of new business up to an equivalent amount. The object of this "re-commercialisation" was to ensure that Germany would lose by the unfreezing of only such foreign exchange as it no longer required. Over the past year, Germany has not in fact been short of sterling, nor has it experienced any internal shortage of liquid funds, so that demand for new sterling credit has been small. The major part of the portion of the old

standstill credits that have been repaid has not therefore been "re-commercialised." It is now suggested that the German authorities are about to release an additional 50 per cent of the outstanding standstill credits for repayment —again subject to the principle of "re-commercialisation."

This step could clearly have an important effect on the course of the present negotiations on the possibility of funding the portion of Britain's debts to the European Payments Union that is attributable to Germany. These negotiations have been running into heavy weather, and there seems little prospect that agreement will be reached before the meeting of the Ministerial Council of the OEEC next week. The optimists now hope that the release of the standstill credits will facilitate agreement by making Germany less exacting in its demands and Britain less concerned at the danger of a continuation of the large surplus in German payments with Europe.

It is, however, likely that the net transfer of credits will fall considerably short of the gross amount of standstill credits that are released. The German right of re-commercialisation has a highly restrictive effect on the number of creditors' applications for transfer. Moreover, it has for some time been possible for creditors to liquidate their debts at very little cost through the blocked mark route. Now that all blocked marks originating before March 31st of this year have been freed, the discount on the blocked mark has dwindled to under 5 per cent.

Engineering Exports Rise

BRITISH trade figures for the first quarter of 1954 turned out well thanks to the high March export figures of £246.4 million. Engineering products have led the advance and now stand well above the 1952 level. Textiles have made a rather less impressive advance. The engineering group which includes several relatively new and thriving trades—aircraft, television and radar among others—is filling an increasing proportion of the British export total.

UNITED KINGDOM EXPORTS

	1952	1953		1954
	Year	1st Qtr.	2nd Qtr.	2nd Half	1st Qtr.
	£ million—monthly averages				
Food, beverages and tobacco	13	12	11	13	13
Basic materials	7	8	8	8	9
Mineral fuels and lubricants	10	13	11	13	13
Manufactured goods :—					
Metals	26	28	28	29	28
Engineering products	83	79	82	81	87
Textiles, not incl. clothing	28	26	26	29	29
Other manufactures	41	36	37	40	39
Total United Kingdom exports	215	208	210	221	224

A modest further improvement in the British terms of trade in March is both unexpected and welcome, but it has not necessarily come to stay; prices of British exports held steady, while prices of imports declined, although it has recently appeared that the long period of improving terms of trade had given place to one of stability. The latest improvement springs mainly from a reduction in the prices of basic materials. British manufactured exports have also fallen in price, but other British exports remained steady.

	Import Prices	Export Prices	Terms of Trade*
	(1953=100)		
1953, March	102	101	101
" April	102	100	102
" May	100	100	100
" June	99	99	100
" July	100	100	100
" August	99	100	99
" September	98	100	98
" October	99	100	99
" November	98	99	99
" December	98	99	99
1954, January	98	99	99
" February	97	99	98
" March	96	99	97

* A decline represents an improvement.

Significantly in the terms of trade calculation basic material prices fell while in the Board of Trade's wholesale price index, also for March, they rose a point. The difference is one of timing. The wholesale price index is based on current prices; the terms of trade on declared values of goods which may have been bought some time earlier. The present improvement in the terms of trade owes much to falls in wool and rubber and both those commodities have since risen.

Mexico's Devaluation

THE business community in Mexico was taken by surprise over the Easter week-end by a devaluation of the peso from 8.65 to 12.50 pesos to the US dollar; and, to judge from cabled reports, it has not discovered even now precisely why the Government was impelled to so drastic a step. The devaluation is equivalent to a cut of about 31 per cent in the dollar value of the peso that had been maintained since mid-1949, and gives a new parity with sterling (at $2.80) of 35 pesos to the £. The Mexican economy, it appears, has been facing a combination of pressures stemming from a domestic inflation—a rise in the visible external deficit, a flight of capital, and an accumulation of domestic liquid funds that seemed likely to give further impetus to the rise in imports. Against this background, it might have been thought that the need for corrective measures would have been self-evident; and, since the devaluation, the Government has disclosed that the external strains had been mounting fast. At end-1953, the reserves of the Bank of Mexico, at $242 million, were some $50 million below their level of the previous spring; during January and February they dropped, on balance, by only a further $5 million, but thereafter the outflow gathered speed, reaching $14 million in March and a further $21 million in the first fortnight of April—so that on the eve of devaluation they were down to $201 million.

To judge from the pace at which prices of imported goods are reported to be rising, the objective of checking

imports of non-essentials should be achieved, but in view of the pressure upon domestic costs it is much more questionable whether any stimulus at all will be imparted to exports. The Government is, indeed, planning to cut down the "windfall" for exporters by raising the export taxes so as to absorb three-quarters of the exchange advantage; it seems likely that the rise in domestic prices will wipe out the remainder. And, unless a policy of disinflation can be launched, the cut in imports will intensify the pre-emption of supplies by the home market. This scarcely seems a propitious atmosphere either for the big investment programme that the Government is reported to be planning or for the entry of foreign capital that the devaluation is officially expected to encourage.

Innovations and Exports

THE Board of Trade's estimate this week that some £288 million was earned last year by the exports of new British industries involves a fairly broad interpretation of the word "new." The Board took three categories:

1. New goods that were not produced in Britain on a commercial scale or exported before the war.

2. "Virtually New" goods of which exports were less than £10,000 in 1938 and more than £400,000 in 1953.

3. "Greatly Expanded Exports" of which the value in 1953 was more than £3 million and 20 times the corresponding value in 1938.

This, of course, brings in refined petroleum; and the Board has added aircraft in for luck, though this does not quite suit even its third definition. Together these two industries accounted for nearly half of the export value that the Board could boast. But the total value is not of much significance, and there is not much reason to cavil at the demarcation; what bears study are the details in its tables.

The Board is entitled to take its figures as reflecting

> the adaptability of many of our important industries to the rapid changes that have occurred in world demand for manufactured goods, and the advanced position that has been reached by British industry in many spheres of scientific and technical development.

Of most of the products and the industries mentioned here, that praise rings true. But it is also true that a fairly large proportion of the real innovations in this list are the result of research or development during the war, and an equally significant proportion are the work of industries that have been established or greatly expanded in Britain since the war largely because America's former customers were short of dollars. In many of the latter, much of the impetus has come from the subsidiaries in this country of the original American manufacturers. Indeed, the innovations on this list that can genuinely be traced to the privately financed scientific and technical progress of British industry are disquieteningly few—though the list is far from exhaustive, and may paint the technological picture slightly greyer than it is.

Marking Time on the Comet

THE de Havilland Aircraft Company's decision to suspend all production work on the Comet is clearly the only one under the circumstances. How much of its present technical lead the company will lose as a result will be conditioned by how long the suspension continues and by the nature of the modifications that the designers may eventually decide to make. Until some positive cause can be attributed to the two recent tragedies, it is possible that other designers of big jet aircraft may also feel some apprehension; for whatever decisions are eventually made about the Comet may have repercussions on other designs.

The delay will not affect experimental work, so that the completion of the prototype Comet III should proceed on schedule, with the first flight taking place towards the late summer. There is plenty of other work at de Havilland factories for the men affected, and had de Havilland alone been involved it is unlikely that any issue would have occurred over the decision to hold up production work

pending investigations on the wreckage of the Comet that has been salvaged off Elba (not all of which is yet in this country). But Short Brothers and Harland, which are building Comets on de Havilland's behalf in Belfast, have no alternative work for men employed on Comet lines, and numbers will have to be dismissed almost immediately. The company has contracts to build its own anti-submarine Seamew and the Bristol Britannia airliner as well as the Comets and Canberra bombers already in production, but neither new line is yet complete.

Storing the Sugar

ON the eve of the International Sugar Council meeting next week in London comes a revealing disclosure of the present ample supplies. A small overflow from the purchase of one million tons which the British Government made from Cuba last year to make derationing safe is having to be stored temporarily on the Continent. It is being held in barges at Rotterdam and Antwerp on the understanding that it will eventually be shipped to the United Kingdom. Cuba has been quick with these shipments. Only 115,000 tons now remains to be shipped, and warehouses are bulging. By cutting its world free quota to 750,000 tons Cuba has so far been able to keep the world price steady at around 3.38 cents per lb. But the International Sugar Agreement will be subjected to a severe test. The Council's powers to cut the effective quotas of the exporting members at next week's meeting are limited to a further 5 per cent, making 20 per cent in all. The Cuban delegation, it is believed, wishes that the powers of curtailment were greater.

Dearer Paraffin

THE oil companies have taken the unusual step, for the time of year, of increasing the price of paraffin by ½d. a gallon, bringing the wholesale price of the cheaper grades up to 1s. 4d. a gallon. This unexpected increase appears to be due to an unexplained rise in Gulf prices; summer is the time when a positive glut of heating oils of this kind is likely to develop in the United States and is not usually chosen as the season for a price increase. Stocks of petrol, fuel oil and distillates have been embarassingly high throughout the winter and are only now beginning to run down to more normal proportions. The last change in British paraffin prices, a reduction of ¾d. a gallon, took place almost exactly twelve months ago, when the lifting of price control on petroleum products was followed by a general reduction in retail prices.

The published figures for both production and consumption of paraffin in Britain give a totally unreal picture of the market, because they ignore the demand for paraffin as a constituent of aviation turbine fuels. Figures concerning paraffin used in this way, like those concerning high octane aviation petrol, are not published for security reasons. Kerosene is the natural fuel for jets, but because of the limited quantity contained in any given quantity of crude (the oil industry has not yet devised a process comparable to cat cracking that will raise the yield of kerosene) service aircraft operate on a blend of kerosene and low-grade petrol known as "wide-cut" fuels. Civil gas turbine aircraft run on pure kerosene, because of the wider safety factor it provides. This must have introduced a new element of inelasticity into the kerosene market both here and in the United States.

The "Pru" Grows Again

THE very size of the Prudential Assurance draws the public eye to its accounts. In 1953 most limbs of the giant grew further—except the relatively unimportant marine account where, in line with general experience, premium income declined. Ordinary new life business (including group life insurance increases) rose by £8.2 million, or 6.9 per cent, to £127.3 million. The rate of growth was higher abroad than at home and a little higher than the indicated trend for all offices. In the industrial life branch, however, new sums assured were slightly down at £78.1 million compared with £78.4 million, whereas in industrial assurance as a whole there was an increase in new business of about 2½ per cent compared with 1952. Non life business brought in a premium income of £11.9 million on which the Prudential earned underwriting profits of £749,000 compared with £645,000 on £11.0 million in 1952. Even the unrewarding motor accounts, with a premium income of £3.5 million, made a small profit in 1953. Rather better overseas results from that class of business were general last year, and the Prudential presumably shared in them.

Once again the Prudential's total assets have increased; the rise last year was £44.6 million to £709.4 million. Although the new money went mainly into British Government securities (£14.9 million), British funds accounted for a smaller proportion of the total assets than in 1952 (42.3 per cent compared with 42.9 per cent). The Prudential is one of the offices which has steadily increased its stake in industrial equities. In the quinquennium 1949-53 ordinary shareholdings rose from £52.3 million to £83.4 million and equities, which accounted for 9.9 per cent of total assets in 1949, had risen to 11.8 per cent last year. The proportion is close to the average for all offices.

The Film Industry Takes Heart

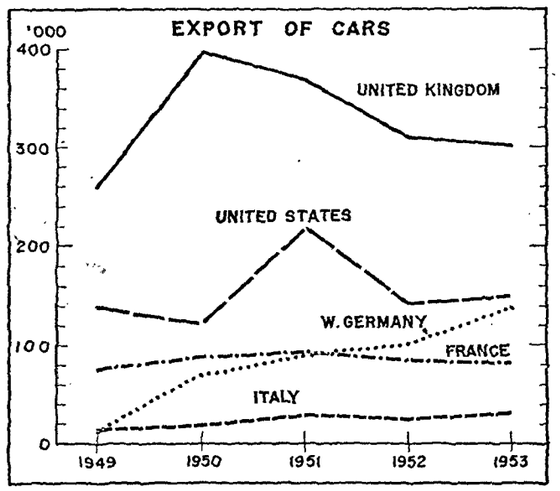
THE Government had a little more good news for the cinema industry this week, when its statistics of admissions showed that in the last quarter of 1953 rather more people went to the cinema than in the last three months of 1952. This slight increase, combined with the slower rate of decline in admissions during summer and autumn 1953, emboldened the Board of Trade to observe that "this seems to herald a pause in the downward trend of cinema attendances of the last few years." The exhibitors took special encouragement from the fact that in Southern England, where television ownership is highest and of the

longest standing, admissions rose slightly more. For the year as a whole, box-office takings were £108.8 million, compared with £109.9 million in 1952; after paying Entertainments Duty and the levy to British producers, net takings were practically unchanged, and exhibitors as a whole obtained £44.6 million after paying for film hire, about £150,000 less than the year before.

How far this steadying of cinema business reflected a flush of popular films, a somewhat maturer public attitude towards television, or merely the greater amount of money in people's pockets, remains unknown. It may contribute towards warming the exhibitors' hearts towards the new wide-screen techniques, since some of the films made by these systems have proved magnificent box-office wherever they have been shown; whether it will persuade them to instal the expensive "stereophonic sound" systems that some of the American producers would like to make obligatory is less certain. The film industry's attitude towards television remains apprehensive, however; only when commercial television looms on the scene in a year or two, they feel, will they be able to gauge the full strength of this potent competitor for the public gaze.

Buoyant Car Exports

THE motor industry was producing cars at the rate of 14,700 a week during March, the highest level it has ever reached. This brought output during the first quarter of the year up to 183,000 cars, nearly a third more than the numbers produced during the same period last year when



the last remnants of steel licensing were being removed. Exports of cars also rose sharply, the total number shipped during the quarter being 84,000 compared with 67,000 in the first quarter of 1954. The relaxation of import controls in Australia and New Zealand had much to do with this. Shipments to Australia went up from 9,456 to 17,241 and to New Zealand from 4,053 to 7,804.

A stimulus of this kind was badly needed. The chart shows that, while the British industry is far and away the biggest exporter of cars, its foreign sales have been contracting steadily while those of some other exporting countries, Western Germany in particular, have been rising. West German exports, at 137,889 cars last year to the British industry's 302,223, are still less than half the British total, but the progress that has been made since 1949, when fewer than 14,000 cars were sent out of Germany, is nevertheless formidable, and the German cars seem to have elbowed out the French and Italian models as serious competitors of the British medium-priced, medium-powered export car. Volkswagen salesmen are ranging far afield and individual British manufacturers will need the support of a high rate of output and sales, to which the home market can make only a partial contribution, if they are to meet this competition.

Road Haulage and the "C" Licence

ALTHOUGH the numbers and sizes of the goods vehicles that operate on British roads are regularly measured in official statistics, and some details of the operations of the road fleet owned by the Transport Commission are also published, any statistical estimates concerning the activity of the million or so vans and lorries concerned has until now been extremely sketchy. In late 1952, however, the Ministry of Transport conducted a sample inquiry among road haulage operators of all types of licence and vehicle; and this week the results were presented in a paper read to the Royal Statistical Society.* Road Haulage Executive vehicles appear to have been used far more intensively than privately owned vehicles; they ran on the average longer though less frequent journeys with more varied loads, and were filled much nearer to vehicle capacity. The vehicles owned by the former Railway Executive, on the other hand, were engaged in highly specialised local collection and delivery services, involving large tonnages, very short hauls, and many trips. Altogether nationalised lorries accounted for about 8 per cent of the vehicle miles, nearly 10 per cent of the tonnage carried, and about 22 per cent of the ton mileage of all road goods vehicles.

DOMESTIC FREIGHT TRANSPORT, 1952
(Estimates)

	Million tons carried	Million ton miles of work
Road	900	19,000
Rail	300	22,000
Inland Waterways	10	—
Coastal Shipping	40	10,000
	1,250	51,000

The paper affords some information on the operations

* "The Outlines of the Road Goods Transport Industry," by K. F. Glover and D. N. Miller.

of vehicles in the large "C" licence fleet that has grown so rapidly since the war, in which traders transport their own merchandise; these licences today account for five out of every six lorries on the road. The type of work often regarded as typical of "C" licence operations, local delivery services, did not in fact add up to a large volume of traffic in terms of ton miles, although a third or more of "C" lorries, including many of the heavier ones, were engaged upon it. Many firms appeared to use their "C" trucks on quite long hauls; in fact more than a half of the traffic carried on hauls of more than 40 miles travelled in "C" vehicles. Altogether "C" licence work was responsible for the major part of all road haulage work; it accounted for over 75 per cent of the vehicle miles, 54 per cent of the ton miles, and just under 60 per cent of the tonnage. The findings of this inquiry are interesting, though some of the figures thrown up need to be treated with caution. It would appear that the road fleet carried about 900 million tons of freight in 1952, or about three times as much as went by rail. But the railways carried their loads on the average more than three times as far; so in terms of ton mileage road and rail were almost equally important as carriers of freight.

Strong Demand for Nickel

INDUSTRIALISTS in many fields have found to their cost that when government controls were withdrawn shortages and the sellers' market also suddenly vanish. That happens for two reasons: governments do not usually withdraw controls until they are satisfied that the period of shortage is over, and consumers adopt a different stock-holding policy in a free market. But there is an exception to this type of experience—International Nickel Company of Canada. Throughout the speech of Mr John F. Thompson, the chairman, runs the theme that though the controls on nickel were withdrawn last year in the company's chief markets, the United States, Canada and the United Kingdom, a large unsatisfied demand for nickel remains. When supplies become more freely available he expects larger outlets, in particular for special irons in the foundry industry and for better quality electro-plating.

Why then did International Nickel show a slightly lower profit in 1953? Deliveries were a record and the price was slightly higher. Mr Thompson provides the answer. It was due to a time lag. The company's financial results are the result of a race between technical improvements and rising costs, particularly wages and taxes. The development of cost saving processes takes time, and in a period of inflation rising costs tend to gain a lead.

SHORTER NOTES

In about a month's time Stewart and Lloyds will begin shipments to Karachi under the contract for 350 miles of 16-inch seamless steel pipe for the Sui Gas transmission line that the company obtained this week against strong foreign competition. The order involves a tonnage of over 40,000 tons and exceeds £2 million in value; it is one of the largest individual orders for steel pipe ever obtained in Britain.

★

The Committee of Lloyd's has issued a statement about the operations of some Lloyd's underwriters whose business has been conducted under the agency of Mr A. E. M. Wilcox. The Committee point out that "the syndicates of which the said underwriters are members have ceased to underwrite and the winding up of their underwriting accounts is proceeding in accordance with the practice obtaining at Lloyd's. All the underwriting liabilities of the underwriters will be paid in full and the holders of policies subscribed by such underwriters are therefore in no way prejudiced by the decision to discontinue underwriting in the syndicates in question."

Company Notes

UNILEVER. The directors of Unilever Ltd, and Unilever NV have given shareholders their first short glimpse of the 1953 results of a trading empire. This empire, built on the needs of the housewife, embraces over 300 companies, trading across the world. Last year added to the stature of this giant. The value of the sales of the two "partners," Unilever Ltd and Unilever NV, advanced from £1,227 million to £1,310 million. This figure is the largest yet achieved and it has doubled since 1948. The combined profits of the British and Dutch companies jumped from £38.9 million to £61.6 million. The directors permit themselves a masterpiece of understatement: "trading conditions in general have been favourable and results satisfactory."

Profits are shown after charging £15.2 million for depreciation; in 1952 depreciation absorbed £11.5 million and a further £5.3 million was appropriated to fixed asset replacement reserves. The dropping of the replacement reserve appropriation and the sudden increase in the depreciation provision suggests that the Unilever group has revalued its fixed assets. Already, four of its subsidiaries have announced just such a revaluation. It is a matter for congratulation that Unilever, which played the role of pioneer in pointing out that historical cost depreciation was wholly inadequate in times of inflation and must be supported by specific appropriations to reserves if the earning power of the assets was to be maintained, seems to have decided on a realistic contemporary valuation of its assets.

Taxation has absorbed nearly £33.9 million, compared with £22.2 million, but the combined net profits of the diarchy have risen from £21.1 million to £25.8 million. These figures understate the real improvement, for in 1952 net profits included nearly £1.9 million withdrawn from stock reserves and another £4.9 million relating to exceptional items and non-recurring credits. In 1953 there was, apparently, no need to make any changes in stock reserves and "exceptional items" were of minor importance. The combined profit of £25.8 million is made up of a profit of £16.9 million from Unilever Ltd and a profit of £8.9 million from Unilever NV. From these profits the two companies will pay the ordinary dividends that the directors forecast last November when the interim dividends were increased. The full year's ordinary dividend of Unilever Ltd has been raised from 13½ to 15¾ per cent and that of Unilever NV from 12 to 14 per cent. As the dividend rates have been known for nearly six months, it is not surprising that the price of the £1 ordinary stock units of Unilever Ltd remained unchanged at 68s. 3d. immediately after the preliminary statement had been published. Since then in the general decline in the markets they have fallen to 65s. 9d., to offer a yield of 4.8 per cent.

★

SHELL-ROYAL DUTCH. Unlike the Unilever shareholders, equity shareholders in Shell and Royal Dutch did not know in advance what dividends their companies would declare. But, after the announcement of the one for five share bonuses, they could make a shrewd guess that the rates would be left unchanged (at 15 per cent, tax free, for Shell and 16 per cent for Royal Dutch). That happened, and the few optimists who expected a little more were disappointed. Shell £1 ordinary stock units therefore fell 2s. 6d. to 5$\frac{19}{32}$ and the Royal Dutch fl. 100 units by 17s. 6d. to £43 after the announcement.

The Shell-Royal Dutch preliminary report also roughs out the achievements of a giant. The group controls about one tenth of world oil production. Last year the gross sales proceeds and other income of the Shell-Royal Dutch group increased by just under 5 per cent, from £1,616 million to £1,700 million. About £348 million, compared with £303 million in 1952, was paid out in sales taxes, excise duties and similar levies, but the group's net income rose by just under 4 per cent, from £125 million to £130 million. The increase in net earnings seems to have been limited to a mere £5 million because of the decline in tanker freight rates (which on the average were 40 per cent lower than those ruling in 1952). As the group's method of allocating costs and charging prices has the effect of turning its tanker fleet into a operating subsidiary, the reduction in these rates reduces the profits of the parent company. Fortunately, the adverse effect of these reductions was "offset to a great extent" by "the increase in mid-1953 of world prices for crude oil and products and higher earnings by the Shell Oil Company in the United States."

Again the greater part of the group's net income has been ploughed back into the business and the dividends paid out to Royal Dutch and "Shell" Transport and Trading (in the 60/40 ratio) total only £22.2 million—almost exactly the same distribution as was made in 1952. Ploughed back profits support the group's immense capital development programme. Last year about £220 million, compared with £188 million in 1952, was spent on capital account. Although this represents the largest capital expenditure programme in the history of the group, total resources held in cash and securities were increased by £54 million to £315 million.

Such an immense backing of assets and earnings will encourage shareholders to expect the present dividend rates to be maintained on the equity capitals as increased by the share bonuses. On that assumption and if the current price of the Shell £1 units of 5$\frac{15}{16}$ and of the Royal Dutch fl. 100 units of 42½ are adjusted accordingly, the yields would be 5¾ per cent and 4¼ per cent respectively.

★

IMPERIAL CHEMICAL INDUSTRIES. When the £30 million issue of an unsecured loan stock was announced by ICI in March, shareholders were told that the ordinary dividend would be raised from 13 to 15 per cent and that profits in 1953 exceeded those earned in 1952. The preliminary report confirms the forecast of a higher dividend and it shows that the directors in talking of profits have almost as great a gift for understatement as the Unilever board. Profits before depreciation and taxation jumped last year by nearly 22 per cent, from £39.8 million to £48.5 million. This is the measure of recovery from 1952 when ICI's profits (though not the value of its sales) were reduced by the recession in the textile, plastics and paper trades and by the steep decline in raw material prices. The group is now sharing in the revival of these industries.

ICI cannot fail to benefit also from more stable prices; it is a sign of confidence that the directors have decided to write back £2.5 million from stock reserves, compared with appropriations to these reserves of £700,000 in 1952 and £7 million in 1951. This transfer and the increase of about £3.8 million in net profits has enabled the board to increase the appropriations to general and fixed asset reserves as well as to pay out a bigger dividend. The group has a formidable capital development programme in front of it, and though nearly half of the expected cost of £70 million in the next three years will be met from the proceeds of the recent loan stock issue, this programme may oblige the directors to hold a curbing rein on equity dividends.

	Years to Dec. 31, 1952	1953
Consolidated earnings:—	£	£
Gross profit	39,755,729	48,519,162
Depreciation	10,138,595	11,551,012

Added to carry forward	*Dr.49,144*	*Dr.151,643*

£1 ordinary stock at 59s. 6d. yields £5 1s. per cent.

*This sum has been released from stock replacement reserves of £11,700,000, reducing them to £9,200,000.

VICKERS. The repetition of the Vickers dividend at 15 per cent and the loss the company made in selling part of its holding of 3½ per cent Treasury stock were discussed in these columns a fortnight ago. The company's full accounts now show that the stability in net profits conceals an improvement in trading profits (which have advanced from £8.3 million to £9.2 million). Much of this increase has been absorbed by higher provisions for depreciation and for further expenditure on completed work and by the loss on the sale of gilt-edged securities. The full report, however, does give every indication that 1953 was an exceptionally busy year for the Vickers group. Most of its principal manufacturing divisions were kept working at or close to full capacity; the number of its employees rose; and its wage bill went up from £26.4 million to £29.8 million. The consolidated balance sheet, too, bears the mark of a very active year. The value of stocks increased from £77.8 million to £88 million, partly offset by a rise in instalment payments on contracts from £53.3 million to £59.7 million. But the increase in working capital commitments and in fixed capital expenditure helps to explain why the group's holdings of gilt-edged securities were reduced from £12½ million to £5¼ million.

	Years to Dec. 31, 1952	1953
Consolidated earnings:—	£	£
Trading profit	8,293,479	9,162,975

Ordinary capital	12,315,484	12,315,484

£1 ordinary stock at 57s.xd yields £5 5s. per cent.

In a comprehensive review of the group's many activities, Sir Ronald Weeks, the chairman, throws some light on future prospects—though he makes no reference to the future of English Steel. Shareholders will welcome this peep into the future, and they can hardly avoid the impression that the Vickers divisions (thanks to a backlog of orders) should do as well this year as they did in 1953. But if they look beyond this year's dividend they will find the prospect less reassuring. Of the major industrial divisions, only those manufacturing civil and military aircraft promise a rapid expansion. Elsewhere, as in the shipbuilding, ship-repairing, road and rail transport and engineering sectors, the chairman draws attention to the growth of competition (particularly in overseas markets) and to the slackening flow of orders. If this is so, shareholders may feel that the proposed 100 per cent share bonus should be mainly regarded as a means of matching issued capital more closely with employed capital.

HUDSON'S BAY. Shareholders in Hudson's Bay Company have to look at the full report in two different ways. First, they must look at the prospects of the company's oil interests, vested in Hudson's Bay Oil and Gas Company in which Hudson's Bay has a 25 per cent interest; it is on these that the present high price of the shares is largely based. Secondly, they must look at the prospects for the retail and wholesale trades in Canada, because these decide the immediate course of the company's profits and dividends.

Last year, Hudson's Bay Oil and Gas Company spent another $11.7 million on exploration and development; and another 41 producing wells came into production. But these are early days and, though the company should in the long run benefit from the building of oil pipelines in Canada, the directors reaffirm that it may be some years before any "significant return" is obtained on the money already spent and to be spent. Part of the proceeds of £2,154,000 which will be raised by the latest "rights" issue of 623,056 £1 ordinary shares at 70s. each will finance further developments.

The remainder of the new money will be used to extend and modernise the company's stores in Western Canada. Hudson's Bay earns the greater parts of its profits from these stores. In 1953-54 it was the improvement in retail sales and profits that was primarily responsible for the increase in trading profits from £2,764,095 to £3,060,842 and, ultimately, for the increase in the ordinary dividend from trading. The trading dividend was raised from 10 to 12½ per cent, a rate that the directors expect to be able to maintain on the increased capital. They believe that immediate prospects are reasonably encouraging, though shareholders must also remember that the American recession can have its effect on retail sales and profits in Canada. As future capital receipts from land sales will be "relatively unimportant" they must wonder how much longer the tax-free dividend from these receipts—it was again maintained at 2½ per cent in 1953-54—will sweeten the trading dividend.

	Years to Jan. 31, 1953	1954
Consolidated earnings:—	£	£
Retail stores:		
Sales	32,260,000	34,186,000
Profit, before tax	1,776,000	1,997,000
Wholesale department:		
Sales	12,656,000	13,937,000
Profit, before tax	333,000	322,000
Fur trade:		
Sales	26,443,000	21,676,000
Profit, before tax	333,000	320,000
Combined trading profit	2,764,095	3,060,842

£1 ordinary stock at 110s. 0d. yields £3 2s. per cent.

★

MONSANTO CHEMICALS. Last year Monsanto Chemicals — the English subsidiary of an American parent —marched back along the road to recovery. The full report fills in a few more details of this progress. The preliminary statement, which was discussed in these columns on February 27th, showed that sales had risen by 9 per cent to £10,852,854, that trading profits had advanced from £1,476,400 to £2,354,084 and that the ordinary dividend was to be increased from 18½ per cent to 20 per cent. The chairman, Mr Edward A. O'Neal, now reveals that the company's factories at Newport and Ruabon were able to operate at more efficient production levels, except in the pharmaceutical and rubber chemical groups where demand fell considerably short of capacity. Exports, which in 1953 represented about 40 per cent of total sales, continued to play an important part in the group's activities, rising by about £300,000 in the face of growing competition.

Thanks to the reduction in raw material prices, the recovery in sales did not involve the Monsanto group in any further commitments on stocks; in fact, the book value of stocks declined slightly, from £3,202,398 to £3,005,583. The group continued with its development programme, though at a slower pace than in earlier years. At the moment Monsanto Chemicals seems to be taking its breath before proceeding on the second stage of its programme. The remaining £2 million of the 5 per cent unsecured loan stock was called up last May, but at the end of the year most of that money remained in liquid form—in preparation, no doubt, for another bout of development. These plans may have to be implemented at a time when competition both at home and abroad is more likely to intensify than to decline.

★

THE BRUSH GROUP. In the last few years every annual report from Brush has aroused the comment that there was a need for consolidation. The latest report for 1953 suggests that at long last the group has entered this period of retrenchment and reorganisation. The chairman, Sir Ronald Matthews, says that the directors are "determined to achieve balance and stability." And this apparently means balance and stability within the present structure of the group for the directors consider "existing manufacturing facilities" to be "fully adequate" for the business.

The directors have already begun to translate the new policy into action. Last September £940,000 was raised by an issue of 6 per cent preference shares and in 1953 they deliberately reduced stock commitments from £12.2 million to £10.5 million. These changes led to a reduction in the group's bank loans, trade liabilities and other debts. Bank overdrafts, at £5.8 million, still have a prominent place in the balance sheet, but that document looks more healthy than it did. It was this improvement, apparently, that encouraged the directors to raise the ordinary dividend from 4 to 6 per cent. The group still has to steady itself at a time when sales and profits will be harder to earn. Last year turnover and profits fell, largely because of the reduced demand for small diesel engines. In the last few months there has been an improvement in the number of new orders but the intake of orders still falls short of production. The directors believe that the volume of orders is sufficient to ensure "reasonable employment" in the group's factories this year.

LONDON STOCK EXCHANGE

Next Account begins: May 5th.
Next Contango Day: May 5th.
Next Settlement Day: April 27th.

THE tide turned in the stock market this week. The *Financial Times* ordinary share index, which had advanced to 147.1 just before the weekend, had fallen back by the close on Wednesday to 144.2. The ebb in prices began in the gilt-edged market, where the biggest losses occurred in the undated and long dated stocks. War Loan was particularly vulnerable on Monday after going "ex dividend"; its net loss on that day, after allowing for the dividend element, was ⅞ and it closed at 87⅛. The price continued to fall and on Wednesday it touched 86 before closing at 86⅜. In the same period old Consols made a net loss of ¾ to 65¾. Banking and insurance shares were generally dull in line with the fall in gilt-edged prices but Royal Exchange rose ¾ to 167/8 in response to the dividend and share issues. In the foreign market Japanese issues were sold rather heavily before rallying on Wednesday.

Almost all the leading equities lost ground. Paper, store and textile shares suffered some of the heaviest losses, though rayon shares staged a slight rally when the market opened on Thursday. Tobacco shares were unsettled by further references to lung cancer and "Imps" dropped 2s. 4½d. to 51s. 6d. and "Bats" 1s. 7½d. to 39s. 9d. on Monday; these shares rallied a little later in the week. The de Havilland equity shares lost 1s. 3d. to 23s. 6d. on the suspension of work on the Comet I and Comet II, and other aircraft shares were dull. Oil shares weakened in line with the rest of the market; the biggest losses were reported in Burmah Oil. Rubber and tea shares remained quiet. Kaffirs made rather a mixed showing. Prices faltered on Monday but on Tuesday a modest improvement in demand for a few OFS issues was quickly reflected in higher prices; President Brand made the biggest gain (and on Wednesday touched the new peak of 54s. 6d. before closing at 52s. 9d.) and this gain was linked with the fact that the options to take up new shares expire at the end of this week. Renewed selling of uranium issues, notably Randfontein, led to further losses on Wednesday.
